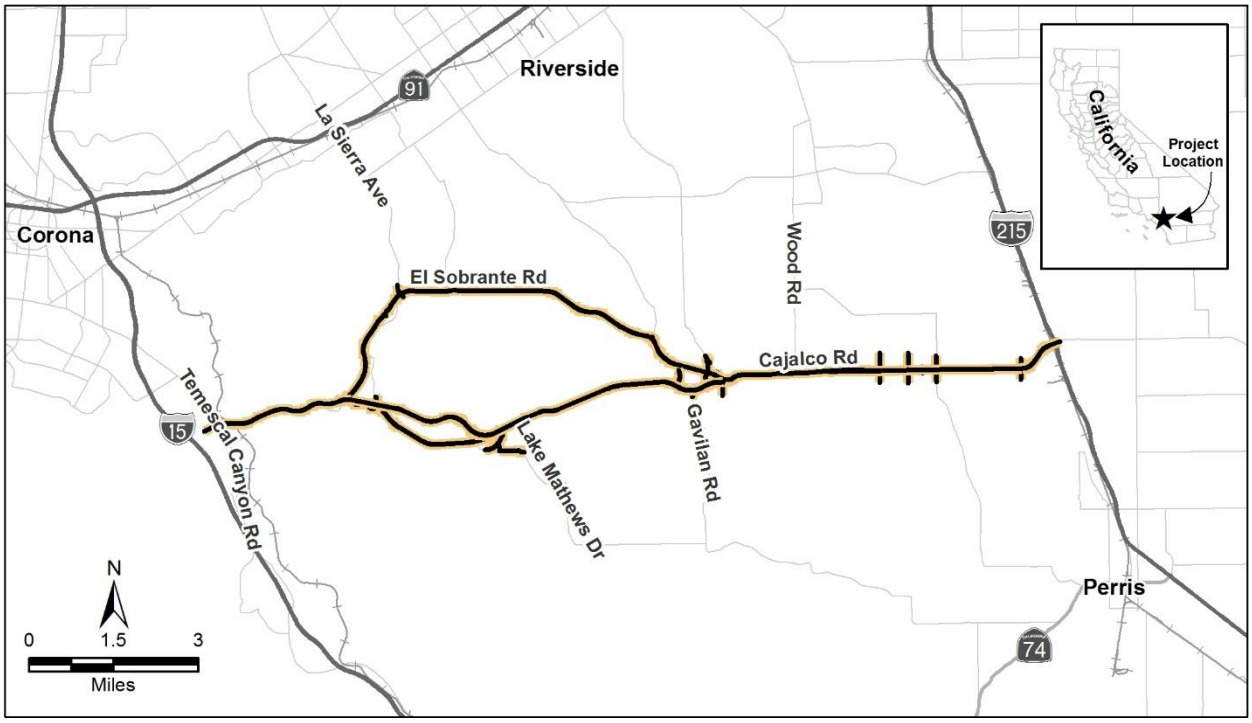
Cajalco Road Widening and Safety Enhancement Project

City of Corona and Unincorporated Riverside County, California
District 08-RIV-Cajalco
PN RIV090903/EA STPL 5956 (195)

Draft Environmental Impact Report/ Environmental Impact Statement and Draft Section 4(f) Evaluation



Prepared by the
State of California Department of Transportation and County of Riverside

The environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 USC 327 and the Memorandum of Understanding dated December 23, 2016 and executed by FHWA and Caltrans.

November 2021

General Information about This Document

What's in this document:

The Riverside County Transportation Department (County), in cooperation with the California Department of Transportation (Caltrans), as assigned by the Federal Highway Administration (FHWA), has prepared this Environmental Impact Report/Environmental Impact Statement (EIR/EIS) with Section 4(f), which examines the potential environmental impacts of the alternatives being considered for the proposed project located in Riverside County, California. Caltrans is the lead agency under the National Environmental Policy Act (NEPA). The County is the lead agency under the California Environmental Quality Act (CEQA). The document tells you why the project is being proposed, what alternatives we have considered for the project, how the existing environment could be affected by the project, the potential impacts of each of the alternatives, and the proposed avoidance, minimization, and/or mitigation measures.

What you should do:

Please read this document. Additional copies of this document and the related technical studies are available for review at:

This document may also be downloaded at the following website: https://rcprojects.org/cajalco-road-widening.

We would like to hear what you think. If you have any comments about the proposed project, please attend the public hearing and/or send your written comments to Caltrans by the deadline.

Public Hearing:

January 6, 2022 – 6:00 p.m. – 7:30 p.m.
Virtual webinar via Zoom (with court reporter); Link: https://bit.ly/CajalcoRd-PublicHearing
Webinar ID: 989 4172 4476; Passcode: 5851. Zoom technical support: (909) 313-0351.

To attend without internet access, use the following call-in numbers: +1 (669) 900-6833, enter Webinar ID and Passcode above. Para Español: +1 (646) 749-3122, código de acceso: 829-144-717.

Send comments via postal mail to:

Mary Zambon, Environmental Project Manager
County of Riverside, Attn: Cajalco Draft EIR/EIS Comment Period
3525 14th Street, Riverside, CA 92501
Send comments via email to: cajalcoroad-rctd@rivco.org
Be sure to send comments by the deadline: January 18, 2022

What happens next:

After comments are received from the public and reviewing agencies, Caltrans, as assigned by the FHWA, may: (1) give environmental approval to the proposed project, (2) do additional environmental studies, or (3) abandon the project. If the project is given environmental approval and funding is obtained, Caltrans could design and construct all or part of the project.

Alternative formats:

For individuals with sensory disabilities, this document can be made available in Braille, in large print, on audiocassette, or on computer disk. To obtain a copy in one of these alternate formats, please write to Aaron Burton, Branch Chief Caltrans District 8, 464 West 4th Street, San Bernardino, CA 92401; or call Mary Zambon, (951) 955-6759; or use the California Relay Service 1 (800) 735-2929 (TTY to Voice), 1 (800) 735-2922 (Voice to TTY), 1 (800) 855-3000 (Spanish TTY to Voice and Voice to TTY), 1-800-854-7784 (Spanish and English Speech-to-Speech) or 711.

Abstract: The Cajalco Road Widening and Safety Enhancement Project proposes to address anticipated growth and mobility needs, improve interregional travel and Improve roadway alignment and intersection design to enhance safety along Cajalco Road unincorporated Riverside County. Potential substantial environmental effects include those related to aesthetics, community character, traffic, increased noise levels, cultural resources, habitat conservation plan consistency, and greenhouse gas emissions. Please submit comments by January 18, 2022.

Summary **S-1**
S.1 NEPA Assignment S-1
S.2 Overview of Project Area S-1
S.3 Purpose and Need S-2
S.3.1 Project Purpose S-2
S.3.2 Project Need S-2
S.4 Proposed Action S-3
S.4.1 Identification of Locally Preferred Alternative S-4
S.5 Joint CEQA/NEPA Document S-5
S.5.1 Determination and Disclosure of Impacts under CEQA and NEPA S-5
S.6 Project Impacts S-6
S.6.1 Summary of Potential Impacts S-6
S.6.2 Significant Impacts and/or Substantial Adverse Effects S-35
S.7 Coordination with Public and Other Agencies S-36
S.8 Permits and Approvals S-37
S.9 Unresolved Issues S-39
S.10 Areas of Controversy S-39

Chapter 1. **Proposed Project** **1-1**
1.1 Introduction 1-1
1.2 Purpose and Need 1-2
1.2.1 Project Purpose 1-2
1.2.2 Project Need 1-2
1.3 Independent Utility and Logical Termini 1-32
1.3.1 Logical Termini and Sufficiency in Length 1-33
1.3.2 Independent Utility 1-33
1.3.3 Nonrestrictive Alternatives 1-33

Chapter 2. Project Alternatives **2-1**
2.1 Project Description 2-1
2.2 Alternatives 2-1
2.2.1 Project Alternatives 2-1
2.2.2 Comparison of Alternatives 2-94
2.2.3 Alternatives Considered but Eliminated from Further Discussion 2-102
2.3 Permits and Approvals Needed 2-106

Chapter 3 **Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures 3-1**
Human Environment 3.1-1
3.1 Land Use 3.1-1
3.2 Farmlands 3.2-1
3.3 Growth 3.3-1
3.4 Community Impacts 3.4-1
3.5 Utilities/Emergency Services 3.5-1
3.6 Traffic and Transportation/Pedestrian and Bicycle Facilities 3.6-1
3.7 Visual/Aesthetics 3.7-1
3.8 Cultural Resources 3.8-1
Physical Environment 3.9-1
3.9 Hydrology and Floodplain 3.9-1
3.10 Water Quality and Storm Water Runoff 3.10-1
3.11 Geology/Soils/Seismic/Topography 3.11-1
3.12 Paleontology 3.12-1
3.13 Hazardous Waste/Materials 3.13-1
3.14 Air Quality 3.14-1
3.15 Noise and Vibration 3.15-1
3.16 Energy 3.16-1
Biological Environment 3.17-1
3.17 Natural Communities 3.17-1
3.18 Wetlands and Other Waters 3.18-1
3.19 Plant Species 3.19-1
3.20 Animal Species 3.20-1
3.21 Threatened and Endangered Species 3.21-1
3.22 Invasive Species 3.22-1
3.23 Relationship between Local Short-term Uses of the Human Environment and the Maintenance and Enhancement of Long-Term Productivity 3.23-1
3.24 Irreversible and Irretrievable Commitments of Resources That Would Be Involved in the Proposed Project 3.24-1
3.25 Cumulative Impacts 3.25-1

Chapter 4. **California Environmental Quality Act Evaluation 4-1**
4.1 Determining Significance under CEQA 4-1
4.2 CEQA Environmental Checklist 4-1
4.2.1 Aesthetics 4-3
4.2.2 Agriculture and Forest Resources 4-18
4.2.3 Air Quality 4-24
4.2.4 Biological Resources 4-36
4.2.5 Cultural Resources 4-89
4.2.6 Energy 4-105
4.2.7 Geology and Soils 4-109

4.2.8 Greenhouse Gas Emissions 4-115
4.2.9 Hazards and Hazardous Materials 4-123
4.2.10 Hydrology and Water Quality 4-131
4.2.11 Land Use and Planning 4-141
4.2.12 Mineral Resources 4-144
4.2.13 Noise 4-146
4.2.14 Population and Housing 4-302
4.2.15 Public Services 4-306
4.2.16 Recreation 4-309
4.2.17 Transportation 4-312
4.2.18 Tribal Cultural Resources 4-336
4.2.19 Utilities and Service Systems 4-345
4.2.20 Wildfire 4-350
4.2.21 Mandatory Findings of Significance 4-353
4.3 Wildfire 4-359
4.3.1 Regulatory Setting 4-359
4.3.2 Affected Environment 4-359
4.3.3 Environmental Consequences 4-359
4.3.4 Avoidance, Minimization, and/or Mitigation Measures 4-362
4.4 Climate Change 4-363
4.4.1 Regulatory Setting 4-363
4.4.2 Environmental Setting 4-366
4.4.3 Project Analysis 4-370
4.4.4 CEQA Conclusion 4-374
4.4.5 Greenhouse Gas Reduction Strategies 4-375
4.5 Energy Conservation 4-383
4.6 Summary of Measures for Impacts under CEQA 4-384

Chapter 5. **Comments and Coordination 5-1**
5.1 23 USC 139 Efficient Environmental Review 5-1
5.1.1 Coordination Plan 5-2
5.1.2 Notice of Initiation 5-2
5.1.3 Lead, Cooperating and Participating Agencies 5-4
5.1.4 Permits and Approvals Status 5-11
5.2 Scoping Process 5-13
5.2.1 Initiation of Scoping 5-13
5.2.2 September 2011 CEQA Public Scoping Meetings 5-16
5.2.3 October 2012 NEPA Public Scoping Meetings 5-38
5.3 Additional Resource Agency Consultation and Coordination 5-46
5.3.1 Western Riverside County Regional Conservation Authority 5-46
5.3.2 Riverside County Habitat Conservation Authority 5-51

5.3.3 Metropolitan Water District of Southern California 5-53
5.3.4 United States Army Corps of Engineers 5-56
5.3.5 Regional Water Quality Control Board 5-57
5.3.6 Riverside County Flood Control and Water Conservation District 5-58
5.3.7 Riverside-Corona Resource Conservation District 5-59
5.3.8 Native American and Section 106 Coordination 5-59
5.3.9 Transportation Conformity Working Group 5-73
5.4 Additional Public Participation 5-75
5.4.1 Public Outreach 5-75
5.4.2 Environmental Stakeholder Groups 5-76

Chapter 6 **List of Preparers 6-1**
6.1 California Department of Transportation (Caltrans) 6-1
6.2 County of Riverside 6-2
6.3 Consultants 6-2

Chapter 7. **Distribution List 7-1**
7.1 Federal Agencies 7-1
7.2 State Agencies 7-3
7.3 Utilities 7-5
7.4 Regional/Local Agencies 7-7
7.5 Tribal Groups 7-16
7.6 Religious Institutions, Interested Groups, Organizations, and Individuals 7-16
7.7 Businesses 7-36
7.8 Education 7-49
7.9 Elected Officials 7-50
7.10 Emergency Responders 7-53
7.11 Libraries 7-54
7.12 Media 7-54
7.13 Project Team - Non Agency 7-55
7.14 Property Owners Located within 0.25-Mile Radius 7-55
7.15 Occupants within 0.25-Mile Radius 7-134

Summary

S.1 NEPA Assignment

California participated in the "Surface Transportation Project Delivery Pilot Program" (Pilot Program) pursuant to 23 USC 327, for more than five years, beginning July 1, 2007, and ending September 30, 2012. MAP-21 (P.L. 112-141), signed by President Obama on July 6, 2012, amended 23 USC 327 to establish a permanent Surface Transportation Project Delivery Program. As a result, the Department entered into a Memorandum of Understanding pursuant to 23 USC 327 (NEPA Assignment MOU) with FHWA. The NEPA Assignment MOU became effective October 1, 2012, and was renewed on December 23, 2016, for a term of five years. In summary, the Department continues to assume FHWA responsibilities under NEPA and other federal environmental laws in the same manner as was assigned under the Pilot Program, with minor changes. With NEPA Assignment, FHWA assigned and the Department assumed all of the United States Department of Transportation (USDOT) Secretary's responsibilities under NEPA. This assignment includes projects on the State Highway System and Local Assistance Projects off the State Highway System within the State of California, except for certain categorical exclusions that FHWA assigned to the Department under the 23 USC 326 CE Assignment MOU, projects excluded by definition, and specific project exclusions.

The Riverside County Transportation Department (County), serving as lead agency under the California Environmental Quality Act (CEQA), in cooperation with the California Department of Transportation (Caltrans), serving as lead agency under the National Environmental Policy Act (NEPA), proposes to widen Cajalco Road, or a combination of Cajalco Road and El Sobrante Road, between Temescal Canyon Road to the west and Interstate 215 (I-215) to the east.

S.2 Overview of Project Area

The proposed project is located in Riverside County, California and covers a distance of approximately 15.7 miles. In general, Cajalco Road and El Sobrante Road through the project area are two-lane undivided roadways with one 12-foot lane in each direction and shoulders of varying widths. The proposed project includes the widening of Cajalco Road, or a combination of Cajalco Road and El Sobrante Road, between the I-215 southbound ramps and Temescal Canyon Road in the County of Riverside. A limited portion of the westernmost part of the alignment is located in the City of Corona. The project would widen Cajalco Road, or a combination of Cajalco Road and El Sobrante Road, to four lanes between Harvill Avenue and Temescal Canyon Road, and to six lanes between the I-215 southbound ramps and Harvill Avenue, to improve east-west mobility and to provide increased capacity and improved traffic flow and safety. (See Figure 1-1, Regional Location, and Figure 1-2, Project Vicinity Map, in Chapter 1 of this document.)

Portions of the project are located within the boundaries of the Western Riverside County Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (WRC MSHCP) Stephens' kangaroo rat Long-term Habitat Conservation Plan (SKR HCP), Lake Mathews-Estelle Mountain Core Reserve (LM-EM Reserve), Metropolitan Water District of Southern California (MWD) Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP), and Lake Mathews Multiple Species Reserve

(LMR). Evaluation of the project's consistency with the plans and goals adopted by the multiple HCPs is included in this EIR/EIS.

The project is partially funded and is in the Southern California Association of Governments' (SCAG) financially constrained 2021 Federal Transportation Improvement Program (FTIP) (Project Number RIV090903), which was found to conform by FHWA on April 16, 2021.[1] The project is also included in the list of the modeled projects in the SCAG 2020–2045 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS) (Project Number 3A04WT137), which was found to conform by FHWA on June 5, 2020. Analysis concludes that the project's operational emissions (which include the ozone precursors reactive organic gases [ROG] and NO_X) meet the transportation conformity requirements imposed by the EPA and SCAQMD. Please see copies of the listing of the project in the 2020 RTP and the 2021 FTIP in Appendix G of this document.

S.3 Purpose and Need

S.3.1 Project Purpose

The purpose of the Cajalco Road Widening and Safety Enhancement Project (project) is to:

- Improve the transportation facility to address anticipated growth and mobility needs;
- Improve interregional travel by improving east-west mobility in Riverside County; and
- Improve roadway alignment and intersection design to enhance safety.

S.3.2 Project Need

By Year 2040, the population of unincorporated Riverside County is estimated to increase by 39.1 percent and employment is projected to increase 122.1 percent. Adjacent cities are also projected to experience similar growth, with the greatest increases in population and employment anticipated for Perris at 65.1 percent and 113.2 percent, respectively, and Corona at 10.5 percent and 33.1 percent, respectively (SCAG 2016). Regional traffic is predicted to increase with the projected growth in population and employment.

In Riverside County, the circulation system is intended to accommodate a pattern of concentrated growth, providing both a regional and local linkage system between unique communities. Travel, including freight movement, extends past the Riverside County boundary and as a result, the transportation system must be capable of adequately meeting a wide range of needs. Not only

[1] The project is currently described in the 2021 FTIP as "CAJALCO RD. WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON RD. TO HARVILL AVE AND FROM 4 TO 6 LANES FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND A BRIDGE RECONSTRUCTION OVER A WATER CROSSING." The County of Riverside has submitted an amendment that would update the description as follows: "IN RIVERSIDE COUNTY ON CAJALCO RD - WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON. BRIDGE/EAGLE CANYON ROAD TO HARVILL AVE AND FROM 4 TO 6 LANES WITH THREE LANES IN THE WESTBOUND DIRECTION FROM TEMESCAL CANYON RD TO TEMESCAL CANYON BRIDGE, THREE LANES IN THE EASTBOUND DIRECTION FROM TEMESCAL CANYON ROAD TO JUST EAST OF EAGLE CANYON ROAD, AND THREE LANES EASTBOUND AND WESTBOUND FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND THE CONSTRUCTION OF NEW, AND RECONSTRUCTION OF EXISTING, BRIDGES AS NEEDED." This amendment will be obtained prior to adoption of the Final Environmental Document.

does the County need to accommodate the traffic that it generates, it also must accommodate the pass through traffic. At the east and west terminus of the project, Cajalco Road is a four-lane facility; however, between the east and west limits of the project, the majority of Cajalco Road is a two-lane facility, creating a bottleneck between I-215 and I-15.

Numerous driveways and intersecting cross-streets present conflict points that affect safe and efficient operation of Cajalco Road. Between January 2015 and December 2017, 355 collisions occurred on Cajalco Road between Temescal Canyon Road and I-215; of the 355 collisions, seven were fatal and 150 resulted in injury. The majority of collisions occurred along the approximately 6-mile stretch of Cajalco Road between Alexander Street and Harvill Avenue, with 145 collisions over the three-year period. Compared with the statewide average accident rate for similar type facilities, the collision rate of 1.673 per million vehicle miles (MVM) is higher than the Statewide average of 1.163 per MVM.

S.4 Proposed Action

The proposed project includes the widening of Cajalco Road, or a combination of Cajalco Road and El Sobrante Road, between the I-215 southbound ramps and Temescal Canyon Road, in the County of Riverside, California. A limited portion of the westernmost part of the alignment is located in the City of Corona. The project would widen the roadway to four lanes between Harvill Avenue and Temescal Canyon Road, and to six lanes between the I-215 southbound ramps and Harvill Avenue, to improve east-west mobility and to provide increased capacity and improved traffic flow and safety.

Portions of the project are located within the LM MSHCP. Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements.

Several project alternatives have been developed and refined based on public and agency input, and minimizing environmental impacts. Alternatives that were considered but eliminated from further analysis are discussed in this EIR/EIS in Section 2.2.3, *Alternatives Considered Eliminated from Further Discussion*. The following project alternatives carried forward are described below. The alternatives are:

- **Build Alternative 1 – Cajalco Alignment:** Cajalco Road would be widened from Temescal Canyon Road at the west to I-215 at the east, replacing the two-lane roadway that currently exists. Minor alignment changes would be constructed between Temescal Canyon Road and Gustin Road. The estimated cost for this alignment is $358,699,000.
- **Build Alternative 2C – Modified Cajalco Alignment:** Cajalco Road would be widened from Temescal Canyon Road at the west to La Sierra Avenue, and from just west of Lake Mathews Drive to Interstate 215. A new four-lane segment of Cajalco Road would be constructed between La Sierra Avenue and just west of Lake Mathews Drive. The estimated cost for this alignment is $401,379,000.
- **Build Alternative 4 – El Sobrante Alignment:** Cajalco Road would be widened from Temescal Canyon Road at the west to La Sierra Avenue, and from Gustin Road east to Interstate 215. Between Gustin Road and La Sierra Avenue, El Sobrante Road would be

improved from the existing two-lane facility to a four-lane facility and would generally follow the existing El Sobrante Road from La Sierra Avenue to the east, to Cajalco Road. The estimated cost for this alignment is $514,615,000.

- **No-Build Alternative – No Project Alternative:** The existing two-lane segments of Cajalco Road and El Sobrante Road between I-215 and Temescal Canyon Road would remain as a two-lane roadway, and would not be widened or otherwise improved.

S.4.1 Identification of Locally Preferred Alternative

A comparative, conceptual-level analysis of project alternatives for the Cajalco Road Widening and Safety Enhancement Project was performed to evaluate the alternatives' performance relative to transportation objectives, benefits, impacts, and costs. A number of performance criteria were initially developed, and many screened out as preliminary findings indicated similar results among the alternatives. Criteria indicating differences in outcomes among alternatives involving transportation objectives, benefits, impacts and costs, were further compared. After comparing and weighing the benefits and impacts of all of the feasible alternatives, the County of Riverside identified Build Alternative 1 as the locally preferred alternative, subject to public review. County support of the recommendation is documented in a memorandum dated June 11, 2020. Figures showing Build Alternative 1 are in Chapter 2 of this document.

The shortest of the three east-west build alternative routes between I-15 and I-215, Build Alternative 1, provides the most direct east-west regional route of the three build alternatives, achieves the purpose and need of the project, and is expected to cost substantially less than Build Alternative 4, currently approximately $155,916,000 less, and $42,680,000 less than Build Alternative 2C. Build Alternative 1 would further provide improved safety along Cajalco Road between La Sierra Avenue and Cowan Road by fixing curves south of the lake, avoid MWD facilities located along the north and west sides of Lake Mathews, including MWD's dam, and affect 89 acres fewer of MWD-managed lands than Build Alternative 4, and 44 acres fewer than Build Alternative 2. Build Alternative 1 would further provide the greatest number of wildlife crossings of the three build alternatives, and result in less impacts involving farmland and residential relocations than Build Alternative 4.

If a planned, separate east-west transportation corridor between I-15 and I-215 identified in the regional transportation model is not implemented in the future, traffic projections indicate higher volumes along Cajalco Road between I-15 and I-215. Build Alternative 1 would include adequate right of way between Temescal Canyon Road and Harley John Road to accommodate two additional lanes in the future; if constructed, the additional lanes would help to address the increased traffic projected along Cajalco Road.

Table S-1, Summary of Potential Impacts and Proposed Measures by Alternative, on page S-7, provides additional information about the differences in potential impacts between the project alternatives. Section 2.2.2, *Comparison of Alternatives*, in Chapter 2 of this EIR/EIS provides further discussion regarding identification of Build Alternative 1 as the Locally Preferred Alternative.

S.5 Joint CEQA/NEPA Document

The project is subject to federal, as well as County of Riverside and state environmental review requirements because the County of Riverside proposes the use of federal funds from the Federal Highway Administration (FHWA) and/or the project requires an approval from FHWA. Project documentation, therefore, has been prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The County of Riverside is the project proponent and the lead agency under CEQA. FHWA's responsibility for environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 United States Code Section 327 (23 USC 327) and the Memorandum of Understanding dated December 23, 2016, and executed by FHWA and Caltrans. With NEPA Assignment, FHWA assigned and the Department assumed all of the United States Department of Transportation (USDOT) Secretary's responsibilities under NEPA. This assignment includes projects on the State Highway System and Local Assistance Projects off the State Highway System within the State of California, except for certain categorical exclusions that FHWA assigned to the Department under the 23 USC 326 CE Assignment MOU, projects excluded by definition, and specific project exclusions.

Some impacts determined to be significant under CEQA may not lead to a determination of significance under NEPA. Because NEPA is concerned with the significance of the project as a whole, often a "lower level" document is prepared for NEPA.

After receiving comments from the public and reviewing agencies, a Final EIR/EIS will be prepared. The County and the Department may prepare additional environmental and/or engineering studies to address comments. The Final EIR/EIS will include responses to comments received on the Draft EIR/EIS and will identify the preferred alternative. After the Final EIR/EIS is circulated, if the County and the Department decide to approve the project, a Notice of Determination will be published for compliance with CEQA, and a Record of Decision will be published for compliance with NEPA.

S.5.1 Determination and Disclosure of Impacts under CEQA and NEPA

One of the primary differences between NEPA and CEQA is the way significance is determined. Under NEPA, the determination of significance is based on context and intensity. Some impacts determined to be significant under CEQA may not be of sufficient magnitude to be determined significant under NEPA. Under NEPA, significance is used to determine whether an EIS, or some lower level of documentation, will be required. Once a decision is made regarding the need for an EIS, it is the magnitude of the impact that is evaluated and no judgment of its individual significance is deemed important for the text. NEPA does not require that a determination of significant impacts be stated in the environmental documents.

CEQA, on the other hand, does require the CEQA lead agency, County of Riverside, to identify each "significant effect on the environment" resulting from the project and ways to mitigate each significant effect. If the project may have a significant effect on any environmental resource, then an EIR must be prepared. Each and every significant effect on the environment must be disclosed in the EIR and mitigated if feasible. In addition, the CEQA Guidelines list a number of

mandatory findings of significance which also require the preparation of an EIR. There are no types of actions under NEPA that parallel the findings of mandatory significance of CEQA.

S.6 Project Impacts

S.6.1 Summary of Potential Impacts

Table S-1 on page S-7 summarizes the potential impacts under CEQA and NEPA of the project alternatives and the proposed avoidance, minimization, and mitigation measures. This project also contains a number of standardized project measures commonly employed on Caltrans and/or Riverside County projects, as well as project design elements, collectively identified as project features (PF) or Standard Project Measures. While the Standard Project Measures are not required to mitigate otherwise significant impacts of the project, the project features enable to the project to comply with local and State design requirements, and are thus included in Table S-1 under each affected resource, as applicable.

Details for each environmental subject evaluated are presented in Chapters 3 (NEPA) and 4 (CEQA) of this EIR/EIS.

Table S-1. Summary of Potential Impacts and Proposed Measures by Alternative[2]

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
Cost	$358,699,000	$401,379,000	$514,615,000	No impact; does not preclude costs associated with necessary and ongoing maintenance of existing facilities.	None
Land Use	*Permanent:* 218 acres of permanent acquisitions required, including 122.85 acres from the LM MSHCP area. *SCAG RTP/SCS:* Consistent with funded project description and Plan goals. *County General Plan and Area Plans*: Consistent with applicable Circulation, Land Use, and Area Plan policies. *County Climate Change Action Plan:* Consistent with applicable greenhouse gas (GHG)-reduction policies, with the exception of Policy AQ 20.3. *County Comprehensive Trails Plan*: Consistent with applicable goals. *Cities of Corona and Perris General Plans*: Consistent with applicable goals and policies. *Western Riverside County MSHCP:* Generally consistent with applicable goals and policies. *Stephens' Kangaroo Rat HCP*: Inconsistent with applicable goals and policies; requires acquisition of land from Existing Core C of SKR HCP Core Reserve areas. *Lake Mathews MSHCP:* Inconsistent; does not accommodate proposed project. *Lake Mathews Reserve Management Plan*: Inconsistent with Goal 1; generally consistent with Goal 2; and consistent with Goal 3. *RCRCD Long-Range Objectives*: Generally consistent with Goal 2.	*Permanent:* 239 acres of permanent acquisitions required, including 114.44 acres from the LM MSHCP area. *SCAG RTP/SCS:* Mostly consistent with funded project description; consistent with Plan goals. *County General Plan*: Consistent with applicable Circulation and Land Use policies. *County Climate Change Action Plan:* Consistent with applicable GHG-reduction policies, with the exception of Policy AQ 20.3. *County Comprehensive Trails Plan*: Consistent with applicable goals. *Cities of Corona and Perris General Plans*: Consistent with applicable goals and policies *Western Riverside County MSHCP:* Generally consistent with applicable goals and policies. *Stephens' Kangaroo Rat HCP*: Inconsistent with applicable goals and policies; requires acquisition of land from Existing Core C of SKR HCP Core Reserve areas. *Lake Mathews MSHCP:* Inconsistent; does not accommodate proposed project. *Lake Mathews Reserve Management Plan*: Inconsistent with Goal 1; generally consistent with Goal 2; and consistent with Goal 3. *RCRCD Long-Range Objectives*: Generally consistent with Goal 2.	*Permanent:* 240 acres of permanent acquisitions required, including 110.98 acres from the LM MSHCP area. *SCAG RTP/SCS:* Inconsistent with funded project description and Plan goals. *County General Plan*: Consistent with applicable Circulation and Land Use policies. *County Climate Change Action Plan:* Consistent with applicable GHG-reduction policies, with the exception of Policy AQ 20.3. *County Comprehensive Trails Plan*: Consistent with applicable goals. *Cities of Corona and Perris General Plans*: Consistent with applicable goals and policies. *Western Riverside County MSHCP:* Generally consistent with applicable goals and policies. *Stephens' Kangaroo Rat HCP*: Consistent; would not conflict with applicable goals and policies. *Lake Mathews MSHCP:* Consistent; would not conflict with applicable goals and policies. *Lake Mathews Reserve Management Plan*: Inconsistent with Goal 1; generally consistent with Goal 2; and consistent with Goal 3. *RCRCD Long-Range Objectives*: Generally consistent with Goal 2.	No impact on land uses. *SCAG RTP/SCS:* Inconsistent with funded project description and Plan goals. *County General Plan and Area Plans*: Inconsistent with Policies C1.1, C3.2 and LU1.5, TCAP 11.1, TCAP 11.2, MVAP 9.1 and MVAP 9.2. *County Climate Change Action Plan:* Inconsistent with most applicable GHG-reduction policies. *County Comprehensive Trails Plan*: Consistent with applicable goals. *Cities of Corona and Perris General Plans*: Inconsistent with Corona General Plan Policies 1.1.3, 6.1.3 and 6.1.12, and Perris General Plan Goals I, II, VIII, and Policies I.A, II.B, and V.A. *Western Riverside County MSHCP:* Generally consistent with applicable goals and policies. *Stephens' Kangaroo Rat HCP*: Consistent with applicable goals and policies *Lake Mathews MSHCP:* Consistent; no changes would occur. *Lake Mathews Reserve Management Plan*: Generally consistent with goals, objectives, and strategies. *RCRCD Long-Range Objectives*: Generally consistent with Goal 2.	**PF FA-1**: Access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway. **PF FA-2:** Farmland temporarily affected during construction activities returned to conditions that allow for continued use and function. **PF VIS-4:** Apply Minimum Lighting Standards. All artificial outdoor lighting and overhead street lighting will be limited to only those locations where it is absolutely necessary for safety and security requirements. Lighting will be designed using the Illuminating Engineering Society's design guidelines and in compliance with International Dark-Sky Association–approved fixtures. All lighting will be designed to have minimum impact on the surrounding environment and will use downcast, cut-off type fixtures that are shielded and direct the light only toward objects requiring illumination. **PF AQ-1:** Caltrans construction requirements, as specified in Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control), and all air pollution control ordinances and statutes that apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code. **PF LU-1:** Traffic Management Plan (TMP). The TMP will include the following elements: construction staging plans, public awareness campaign, analysis of impacts on traffic, options for lane closures, and alternate route strategies. In addition, the TMP will address access, circulation, parking, public transportation, and pedestrian and bicycle facilities. To compensate for the loss of natural lands on the LMR and in the WRC MSHCP plan area (which includes the SKR HCP), the County will coordinate with the Lake Mathews Reserve Management Committee (LMRMC), Western Riverside County Regional Conservation Authority (RCA), U.S. Fish and Wildlife Service (USFWS), and California Department of Fish and Wildlife (CDFW) to develop a suite of mitigation measures that demonstrate biological equivalency to offset the loss. Refer to measures **NC-17 (NES BIO-17)**, **NC-18 (NES BIO-31)**, **NC-19 (NES BIO-15)**, and **NC-20 (NES BIO-21)**. Temporary impact areas will be addressed through preparation of a habitat mitigation and monitoring plan (HMMP) and onsite restoration to original conditions; see Measure NC-19. **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area **NC-20 (NES BIO-21):** Replacement of Public/Quasi-Public (PQP) Lands
Farmlands/ Timberlands	*Permanent:* • Conversion of 7.69 acres (0.2%) of important farmland to nonagricultural use.	*Permanent:* • Conversion of 7.85 acres (0.2%) of important farmland to nonagricultural use.	*Permanent:* • Conversion of 23.44 acres (0.8%) of important farmland to nonagricultural use.	No impact	**PF FA-1**: Access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway.

[2] Some measures listed in Table S-1 are summarized; refer to corresponding section of this EIR/EIS for full measures.

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
	• Farmland Impact Conversion Rating <160. *Temporary:* 10.8 acres of farmland during construction.	• Farmland Impact Conversion Rating <160 *Temporary:* 10.8 acres of farmland during construction.	• 4.79 acres of Williamson Act farmland converted to nonagricultural use; Williamson Act land converted <100 acres. • Farmland Impact Conversion Rating <160 *Temporary:* 9.86 acres of farmland and 2.12 acres of Williamson Act land during construction.		**PF FA-2**: Farmland temporarily affected during construction activities returned to conditions that allow for continued use and function. **PF COM-1:** Signage provisions shall be made available to businesses whose temporary or permanent visibility and vehicular access changes as a result of the project. **PF COM-2**: In accordance with the federal Uniform Relocation Assistance and Real Property Acquisition Act of 1970 as amended (42 United States Code Sections 4601–4655), provide compensation to eligible recipients for property acquisitions. Relocation assistance payments and counseling will be provided by the transportation agencies to persons and businesses in accordance with the federal Uniform Relocation Assistance and Real Property Acquisition Act, as amended, to ensure adequate relocation and a decent, safe, and sanitary home for displaced residents. All eligible displacees will be entitled to moving expenses. All benefits and services will be provided equitably to all residential and business displacees without regard to race, color, religion, age, national origins, and disability, as specified under Title VI of the Civil Rights Act of 1964. In addition, the Nonresidential relocation assistance program (RAP) provides assistance to businesses, farms, and nonprofit organizations in locating suitable replacement properties and reimbursement for certain costs involved in relocation.
Growth	Would improve accessibility of the area, allowing for higher traffic volumes and addressing anticipated growth.	Would improve accessibility of the area, allowing for higher traffic volumes and addressing anticipated growth.	Would improve accessibility of the area, allowing for higher traffic volumes and addressing anticipated growth.	Growth related impacts as a result of the No-Build Alternative would not be anticipated.	
Community Impacts	*Permanent*: • 62 complete acquisitions • 221 partial acquisitions • Displacement of 19 residential properties (62 residents) • Displacement of one commercial business (9 employees) • Displacement of one government facility (16 employees) • Community cohesion/character: - Changes semi-rural/suburban character to a more urbanized character with increased roadway pavement/lanes/structures/ lighting/traffic/truck traffic. - Would not introduce a new barrier that would divide any existing communities, separate residences from community facilities, result in substantial growth, or impede connectivity between neighborhoods. - Changes in access; changes to aesthetic character and aesthetics; local safety enhancements; proposed acquisitions and relocations would not substantially affect community character; would not introduce new land uses or	*Permanent*: • 62 complete acquisitions • 225 partial acquisitions • Displacement of 19 residential properties (62 residents) • Displacement of one commercial business (9 employees) • Displacement of one government facility (16 employees) • Community cohesion/character: - Changes semi-rural/suburban character to a more urbanized character with increased roadway pavement/lanes/structures/ lighting/traffic/truck traffic. - Would not introduce a new barrier that would divide any existing communities, separate residences from community facilities, result in substantial growth, or impede connectivity between neighborhoods. - Changes in access; changes to aesthetic character and aesthetics; local safety enhancements; proposed acquisitions and relocations would not substantially affect community character; would not introduce new land uses or	*Permanent*: • 76 complete acquisitions • 267 partial acquisitions • Displacement of 21 residential properties (69 residents) • Displacement of one commercial business (9 employees) • Displacement of one government facility (16 employees) • Community cohesion/character: - Changes semi-rural/suburban character to a more urbanized character with increased roadway pavement/lanes/structures/ lighting/traffic/truck traffic. - No development features are proposed that would divide an established community or limit movement, travel, or social interaction between established communities. - Changes in access; substantial changes to aesthetic character and aesthetics; local safety enhancements; proposed acquisitions and relocations would not substantially affect community character; would not introduce new land uses or facilities that would be incompatible with existing land uses.	No impact; no improvements would be implemented that would affect community character.	**PF LU-1:** Traffic Management Plan (TMP). The TMP will include the following elements: construction staging plans, public awareness campaign, analysis of impacts on traffic, options for lane closures, and alternate route strategies. In addition, the TMP will address access, circulation, parking, public transportation, and pedestrian and bicycle facilities. **PF COM-1:** Signage provisions shall be made available to businesses whose temporary or permanent visibility and vehicular access changes as a result of the project. **PF COM-2**: In accordance with the federal Uniform Relocation Assistance and Property Acquisition Act of 1970 as amended (42 USC Secs. 4601-4655), provide compensation to eligible recipients for property acquisitions. Relocation assistance payments and counseling will be provided by the transportation agencies to persons and businesses in accordance with the federal Uniform Relocation Assistance and Real Properties Acquisition Policies Act, as amended, to ensure adequate relocation and a decent, safe, and sanitary home for displaced residents. All eligible displacees will be entitled to moving expenses. All benefits and services will be provided equitably to all residential and business displacees without regard to race, color, religion, age, national origins, and disability, as specified under Title VI of the Civil Rights Act of 1964. In addition, the Nonresidential RAP provides assistance to businesses, farms, and nonprofit organizations in locating suitable replacement properties and reimbursement for certain costs involved in relocation. **COM-3:** Prior to any partial or full property acquisitions that would result in residential or business relocations and/or loss of business revenue, a Relocation and Reimbursement Mitigation Plan will be prepared by the County of Riverside in accordance with federal Uniform Relocation Assistance and Real Property Acquisition Act of 1970, as amended (42 United States Code Sections 4601–4655) requirements, and in conjunction with the Relocation Assistance

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
	facilities that would be incompatible with existing land uses. - Would not affect Victoria Grove or Lake Hills/Home Gardens communities. • Environmental Justice: - Potential disproportionately high and adverse to minority population involving property acquisitions and displacements. <u>*Temporary:*</u> • Temporary, partial roadway closures, and construction-related noise and visual impacts.	facilities that would be incompatible with existing land uses. - Would not affect Victoria Grove or Lake Hills/Home Gardens communities. • Environmental Justice: - Potential disproportionately high and adverse to minority population involving property acquisitions and displacements. <u>*Temporary:*</u> • Temporary, partial roadway closures, and construction-related noise and visual impacts.	- Widening of El Sobrante Road and La Sierra Avenue from a two-lane roadway to a four-lane roadway would change the aesthetic character of the land adjacent to El Sobrante Road and La Sierra Avenue by making a roadway wider and more urban-like. In addition, realigning La Sierra Avenue could make the roadway feel more urban-like as well. The feel of the roadway would change for travelers and residents along the roadway, specifically the residents of the community north of Lake Mathews. • Environmental Justice: - Potential disproportionately high and adverse to minority population involving property acquisitions and displacements. <u>*Temporary:*</u> • Temporary partial roadway closures, and construction-related noise and visual impacts.		Program. The purpose of the Relocation and Reimbursement Mitigation Plan is to minimize economic disruptions related to relocation and loss of property. The plan will include consultation with affected property owners to ensure full consideration of information related to property valuation, and disclosure of information regarding property rights, the relocation and reimbursement process, and available resources. **PF FA-1**: Access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway. **PF FA-2:** Farmland temporarily affected during construction activities returned to conditions that allow for continued use and function. **PF UT-1:** Coordination of utility relocation work with utility companies to ensure minimum disruption to customers in the service areas during construction **PF VIS-1:** Contouring and Replanting Disturbed Areas. Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades and hydro-seeded with a County of Riverside–approved native plant seed mix. **VIS-2:** Replace or Relocate Site Features and Landscaping Affected by the Project. Where appropriate and to the degree possible, landscaping and related appurtenances, such as fencing, privacy walls, and other similar features, removed from private properties as a result of construction will be relocated, replaced, or restored in place and in kind to address visual impacts. **PF VIS-3:** Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity. Any noise barriers constructed as a result of the proposed project will be designed and constructed in a manner that complements and blends with nearby existing noise barriers. **PF VIS-4:** Apply Minimum Lighting Standards. All artificial outdoor lighting and overhead street lighting will be limited to only those locations where it is absolutely necessary for safety and security requirements. Lighting will be designed using the Illuminating Engineering Society's design guidelines and in compliance with International Dark-Sky Association–approved fixtures. All lighting will be designed to have minimum impact on the surrounding environment and will use downcast, cut-off type fixtures that are shielded and direct the light only toward objects requiring illumination. **PF VIS-5:** Basin and Flood Control Drainage Facility Treatments. New or expanded basins and the new flood control drainage facility would be soft-bottom where hydraulically feasible; however, some would need to be concrete-lined. The soft-bottomed basins would further be vegetated where vegetation would not interfere with the intended use of the facilities **PF VIS-6:** Temescal Creek Bridge Design. Section 14.7.1 of the City of Corona El Cerrito Specific Plan Scenic Corridor Design Standards will be applied in the design and construction of the widened Temescal Creek Bridge. **PF VIS-7:** New Bridge Architectural Treatments. Aesthetic treatments that are consistent with County design and engineering standards, and complement area conditions, will be applied to new bridge structures. **VIS-8:** Replace Disturbed Vegetation along Landscaped Freeways. The County of Riverside will work with the appropriate Caltrans district landscape architect to determine which disturbed portions of landscaped freeways within the project limits require replanting and

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					to what extent. At a minimum, replanting will follow the guidance in Section 92.3 of the Streets and Highways Code. **HAZ-1 (a–d):** 9001 Cajalco Road (Assessor's Parcel Numbers [APNs] 279-231-004, 006, -011, and 281-140-021) **PF HAZ-2:** Health and Safety Plan **PF HAZ-3:** Waste Handling, Transport, and Disposal **HAZ-4 (a–g):** 21020 Cajalco Road (APNs 318-061-027 and -030) **PF HAZ-5:** Creosote-treated Wood Waste **HAZ-6 (a–c):** Agricultural Land Uses **HAZ-7:** Yellow Paint **HAZ-8:** Asbestos-Containing Material and Lead-Based Paint **PF NOI-1:** Do not exceed 86 A-weighted decibels maximum noise level at 50 feet from job site activities between 9:00 p.m. and 6:00 a.m. (2018 Caltrans Standard Specifications [SSP], Section 14-8.02, Noise Control). **NOI-2:** Construct soundwall S-624 at the right of way at a height of 10 feet, provided that the survey process approves soundwall S-624. **NOI-3:** Construct soundwalls S-650 and S-652 (property line) at heights of 8 feet, provided that the survey process approves. **NOI-4:** Inclusion of Quiet Pavement (CEQA Measure). The County will require the construction contractor to provide an asphalt mix that provides 5-decibel minimum tire pavement noise reduction, and will include this mix during construction and paving of the proposed project.
Utilities/Emergency Services	All effects on utilities would be temporary and would be rectified when relocations of certain utilities and project construction are complete. No demand for new or expanded emergency facilities or services. Temporary, localized, site-specific disruptions to the utilities and emergency services in the project area, primarily related to construction-related traffic changes from trucks and equipment and partial and/or complete street and lane closures, some requiring detours.	All effects on utilities would be temporary and would be rectified when relocations of certain utilities and project construction are complete. No demand for new or expanded emergency facilities or services. Temporary, localized, site-specific disruptions to the utilities and emergency services in the project area, primarily related to construction-related traffic changes from trucks and equipment and partial and/or complete street and lane closures, some requiring detours.	All effects on utilities would be temporary and would be rectified when relocations of certain utilities and project construction are complete. No demand for new or expanded emergency facilities or services. Temporary, localized, site-specific disruptions to the utilities and emergency services in the project area, primarily related to construction-related traffic changes from trucks and equipment and partial and/or complete street and lane closures, some requiring detours.	No impact	**PF UT-1:** The County will coordinate all utility relocation work with the affected utility companies to ensure minimum disruption to customers in the service areas during construction. All public utility lines, pipes, and cables that are disturbed or removed to accommodate the proposed project will be replaced or relocated within the project limits to continue to meet the needs of residents and businesses in the community. **HYD-1:** The County of Riverside will coordinate directly with MWD to obtain approval for right of way acquisition involving the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin. The County will coordinate directly with MWD in the preparation of a site-specific Drainage Study to evaluate the changes in runoff and floodplain encroachment into the Cajalco Creek Dam and Detention Basin and the Cajalco Creek Sedimentation Basin, and determine whether the conversion of right of way would affect operation of the dam and basins. If operation of the basins is affected by the project, engineering recommendations will be provided, and implemented as necessary, to ensure continued operation of the dam and basins. **PF LU-1:** Prior to construction, the County of Riverside will develop a TMP that will include the following elements: construction staging plans, public awareness campaign, analysis of impacts on traffic, options for lane closures, and alternate route strategies. In addition, the TMP will address access, circulation, parking, public transportation, and pedestrian and bicycle facilities.
Traffic and Transportation/ Pedestrian and Bicycle Facilities	*Permanent*: Safety Improvements for 15.7-mile length of Cajalco Road. Vehicle miles traveled (VMT): 14,779,906 Vehicle hours traveled (VHT): 399,326 East-west corridor distance: 15.7 miles	*Permanent*: Safety Improvements for 15.7-mile length of Cajalco Road. VMT: 14,721,152 VHT: 399,326 East-west corridor distance: 15.7 miles	*Permanent*: Safety Improvements for 9 miles of Cajalco Road. VMT: 14,811,302 VHT: 398,527 East-west corridor distance: 16.8 miles	No safety improvements. VMT: 14,659,917 VHT: 396,569 East-west corridor distance: 15.7 miles Would not accommodate additional future lanes along Cajalco Road that would address projected deficiencies.	**PF LU-1:** Traffic Management Plan (TMP). Prior to construction, the County of Riverside will develop a TMP that will include the following elements: construction staging plans, public awareness campaign, analysis of impacts on traffic, options for lane closures, and alternate route strategies. In addition, the TMP will address access, circulation, parking, public transportation, and pedestrian and bicycle facilities.

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
	Improvements supporting roadway, pedestrian, and cyclist safety: medians; paved roadway shoulders; left- and right-turn pockets; restrictions on left turns from Cajalco Road onto local streets; improvement of curves between Temescal Canyon Road and El Sobrante Road; adding roadway signage; improvement of existing intersections varying from minor widening and turn pockets; installation of new traffic signals, object markers, and safety lighting at intersections; and designated crosswalks at improved and new intersections. Improvements along Cajalco Road from Harley John Road to Harvill Avenue include curb and gutter and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane. Truck traffic percentages in the future year (2044) are forecast to increase up to 1.62 percent in comparison to 2044 no-build conditions. Truck percentages are projected to increase up to 0.14 percent as compared to the existing conditions. Projected truck traffic is not anticipated to result in an increased risk to pedestrian or cyclist safety, as the projected limited increases would be consistent with the overall projected traffic volumes through most of the project limits. Average speeds for traffic traveling along Cajalco Road are projected to average 37 mph and decrease by approximately 5–10 mph during peak hours. A cul-de-sac would be placed at the northern terminus of existing Gustin Road and Gustin Road would be realigned through undeveloped parcels to intersect with Cajalco Road west of the cul-de-sac. This change would redirect traffic away from residences east of Gustin Road and closer to the Lake Mathews Market. Access to the undeveloped parcels exists under current conditions and would not be increased or decreased as a result of the Gustin Road realignment. Between west of La Sierra Avenue and Lake Mathews Drive, includes a new connection between Dirt Road and Richey Way south of the existing segment of Cajalco Road and west of Lake Mathews Drive. The new road connection would connect Dirt Road to Richey Way. This new road connection would provide emergency access for residences and businesses west of Lake Mathews Drive as well as improved connectivity and accessibility within the Lake Mathews community. Because Dirt Road and Richey Way are existing roadways that are accessible by the public,	Improvements supporting roadway, pedestrian, and cyclist safety: medians; paved roadway shoulders; left- and right-turn pockets; restrictions on left turns from Cajalco Road onto local streets; improvement of curves between Temescal Canyon Road and El Sobrante Road; adding roadway signage; improvement of existing intersections varying from minor widening and turn pockets; installation of new traffic signals, object markers, and safety lighting at intersections; and designated crosswalks at improved and new intersections. Construction-related access and delays addressed with TMP.	Avenue, which could temporarily affect businesses along the project corridor. Construction-related access and delays addressed with TMP.		
Visual/Aesthetics	*Permanent:* Visual impacts in response to viewer response and resource change rated High for Key Views #1, 2, and 6A; Moderate-High for Key Views #3 and 4; and Moderate for Key View #5. Approximately 83 additional acres of pavement and hardscape. Widened and realigned roads, resulting in removal of vegetation, including approximately 380 small trees and shrubs, and 105 large mature trees. Substantial additional hardscape (such as structures/concrete drainages/intersection and street light standards). Within the Rural Residential Visual Assessment Unit (VAU), impacts on the existing visual character and quality would range between moderate and high, even with implementation of project measures, and therefore result in adverse visual effects. Within the Open Space VAU, impacts on scenic views and existing visual character and quality would be moderate-high to high even with implementation of project measures, and therefore result in adverse visual effects. No scenic vistas would be affected under Build Alternative 1. Within the Suburban Residential VAU, impacts on the existing visual character and quality would be moderate with implementation of project measures, and therefore would not result in adverse visual effects. There are no scenic vista views within the Suburban Residential VAU; therefore, no scenic vistas would be affected. Within the Commercial VAU, impacts on the existing visual character and quality would be moderate with implementation of	*Permanent:* Visual impacts in response to viewer response and resource change rated High for Key Views #1, 2, and 6B; Moderate-High for Key Views #3 and 4; and Moderate for Key View #5. Approximately 84 additional acres of pavement and hardscape. Widened and realigned roads, resulting in removal of vegetation, including approximately 390 small trees and shrubs, and 105 large mature trees. Substantial additional hardscape (such as structures/concrete drainages/intersection and street light standards). Within the Rural Residential VAU, impacts on the existing visual character and quality would range between moderate and high, even with implementation of standard measures, and therefore result in adverse visual effects. Within the Open Space VAU, impacts on scenic views and existing visual character and quality would be moderate-high to high even with implementation of project measures, and therefore result in adverse visual effects. In addition, Build Alternative 2C may result in adverse visual effects on scenic vistas within the Open Space VAU because roadway realignment would alter the availability of existing scenic vistas. However, the realignments may introduce new scenic vista views. Within the Suburban Residential VAU, impacts on the existing visual character and quality would be moderate with implementation of project measures, and therefore would not result in adverse visual effects. There are no scenic vista views within the Suburban Residential VAU;	*Permanent:* Visual impacts in response to viewer response and resource change rated High for Key Views #1 and 2; and, Moderate-High for Key Views #3, 4 and 7. Approximately 105 additional acres of pavement and hardscape. Widened and realigned roads, resulting in removal of vegetation, including approximately 400 small trees and shrubs, and 195 large mature trees. Substantial additional hardscape (such as structures/concrete drainages/intersection and street light standards). Within the Rural Residential VAU, impacts on the existing visual character and quality would range between moderate-high and high, even with implementation of project measures, and therefore result in adverse visual effects. Within the Open Space VAU, impacts on scenic views and existing visual character and quality would be moderate-high to high even with implementation of project measures, and therefore result in adverse visual effects. The greatest visual change in this VAU would be the widening and realignment of La Sierra Avenue, which would require large areas of cut and fill to accommodate the widening and traverse the undeveloped, hilly terrain. In addition, an approximately 1,800-foot-long arch bridge would be constructed along the realigned section of La Sierra Avenue, introducing new bridge infrastructure where none presently exists. Within the Suburban Residential VAU, impacts on the existing visual character and quality would be moderate-high even with implementation of project measures, and therefore would result in adverse visual effects. There are no scenic vista views	No impact	**PF VIS-1:** Contouring and Replanting Disturbed Areas. Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory. **VIS-2:** Replace or Relocate Site Features and Landscaping Affected by the Project. Where appropriate and to the degree possible, landscaping and related appurtenances, such as fencing, privacy walls, and other similar features, removed from private properties as a result of construction will be relocated, replaced, or restored in place and in kind to address visual impacts. Slopes will (1) be graded to 4:1 or flatter; (2) be gentle, smooth, and well transitioned with slope rounding, and topsoil and duff salvaged and reused; and (3) have contours naturally formed that tie gracefully into the existing adjacent roadside and landforms. Rock cut slopes will be irregular for a natural appearance, with rounding of the tops and ends of cut slopes. Steep, obvious cuts and fills will be avoided to improve project aesthetics associated with roadside slopes. Standard fence types (chain link, barbed wire, and/or wire mesh) will be used unless fences of special design need to be used in certain cases, such as for wild animal control. In special cases, alternative options such as powder-coating, the use of iron, and other enhancements will be considered. Replacement vegetation will reflect adjacent communities and natural surroundings, serve as a visual buffer for objectionable views of the roadway facility for adjacent land uses, soften visual impacts associated with graded slopes and large structures, and act to frame or enhance good views. For specific plant species within the limits of habitat conservation plan areas, replacement vegetation will be reestablished in the ratios identified in Measure NC-15 (NES BIO-14): no less than 3:1 mitigation ratio for riparian, 1:1 for riverine resources, and 2:1 for permanent shading of riparian vegetation and wetlands. Temporary impacts on riparian-riverine vegetation may be replaced through restoration at their current locations at a not-less-than 1:1 ratio or through the purchase of In-lieu Fee Program or other permittee-responsible mitigation bank credits, or through another approved mitigation program. A Tree Avoidance, Minimization, and Replacement Plan will be developed in consultation with a certified arborist for trees removed during project construction.

Implementation of Measure VIS-2 and Standard Project Measure PF VIS-4 would ensure that project light and glare would not result in adverse visual effects. *Temporary:* Construction activities and equipment would affect views of and from the project site during the construction period.		**PF VIS-3:** Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity. Existing noise barriers in the project vicinity utilize a combination of solid barriers and landscaping to improve site aesthetics. Any noise barriers constructed as a result of the proposed project will be designed and constructed in a manner that complements and blends with nearby existing noise barriers. Aesthetic treatments such as color and/or texture will be considered for the walls, and their compatibility with existing conditions, and with applicable goals and policies of the County, will be considered prior to final design. The County's Resident Engineer, or Project Engineer under contract to the County, will ensure that the aesthetic treatments included in the final Plans, Specifications, and Estimates (PS&E) are implemented by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction. **PF VIS-4:** Apply Minimum Lighting Standards. All artificial outdoor lighting and overhead street lighting will be limited to only those locations where it is absolutely necessary for safety and security requirements, such as intersections. In most cases, lighting will consist of County lighting standards that are up to 35 feet in height, and the minimum required for driver safety. Lighting will be designed using the Illuminating Engineering Society's design guidelines and in compliance with International Dark-Sky Association–approved fixtures. All lighting will be designed to have minimum impact on the surrounding environment and will use downcast, cut-off type fixtures that are shielded and direct the light only toward objects requiring illumination. Therefore, lights will be installed at the lowest allowable height and cast low-angle illumination while minimizing incidental light spill onto adjacent properties or open spaces, or backscatter into the nighttime sky. The lowest allowable wattage will be used for all lighted areas, and the number of nighttime lights needed to light an area will be minimized. Light fixtures will have non-glare finishes that will not cause reflective daytime glare. **PF VIS-5:** Basin and Flood Control Drainage Facility Treatments. New or expanded basins and the new flood control drainage facility would be soft-bottom where hydraulically feasible; however, some would need to be concrete-lined. The soft-bottomed basins would further be vegetated where vegetation would not interfere with the intended use of the facilities (i.e., conveyance of water). Seeding with appropriate species would be determined in coordination with a County-approved biologist, and consistent with the requirements of the WRC MSHCP, LM MSHCP, and/or SKR HCP, where applicable. **PF VIS-6:** Temescal Creek Bridge Design. Section 14.7.1 of the City of Corona El Cerrito Specific Plan Scenic Corridor Design Standards will be applied in the design and construction of the widened Temescal Creek Bridge. **PF VIS-7:** New Bridge Architectural Treatments. Aesthetic treatments that are consistent with County design and engineering standards, and complement area conditions, will be applied to new bridge structures. **VIS-8:** Replace Disturbed Vegetation along Landscaped Freeways. The County of Riverside will work with the appropriate Caltrans district landscape architect to determine which disturbed portions of landscaped freeways within the project limits require replanting and to what extent. At a minimum, replanting will follow the guidance in Section 92.3 of the Streets and Highways Code. Landscaping will be drought resistant whenever feasible. Recycled water will be used for irrigation when practicable. When appropriate and consistent with integrated pest management strategies as defined in subdivision (d) of Section 14717 of the Government Code, landscaping will include California native wildflowers and native and climate-appropriate

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					vegetation as an integral and permanent part of the planting design, with priority given to those species of wildflowers and native and climate-appropriate vegetation that will help rebuild pollinator populations.
Cultural Resources	Adverse effects on NRHP- and CRHR-eligible Potential Prehistoric Archaeological District (PPAD), three NRHP- and CRHR-eligible individual archaeological sites, and two site loci. No adverse effects on three NRHP- and CRHR-eligible Traditional Cultural Properties (TCPs).	Adverse effects on NRHP- and CRHR-eligible PPAD, three NRHP- and CRHR-eligible individual archaeological sites, and two site loci. No adverse effects on three NRHP- and CRHR-eligible TCPs.	Adverse effects on NRHP- and CRHR-eligible PPAD, five individual archaeological sites, and two site loci. No adverse effects on three NRHP- and CRHR-eligible TCPs.	No impact	**PF CR-1:** Discovery of Human Remains. If human remains are discovered during construction, California Health and Safety Code Section 7050.5 states that further disturbances and activities shall stop in any area or nearby area suspected to overlie remains, and the County Coroner contacted. If the remains are thought by the County Coroner to be Native American, the coroner will notify the Native American Heritage Commission (NAHC) who, pursuant to Public Resources Code (PRC) Section 5097.98, will then notify the Most Likely Descendant (MLD). Further provisions of PRC 5097.98 are to be followed as applicable. **PF CR-2:** Unanticipated Discoveries. If cultural materials are discovered during construction, all earth-moving activity within and around the immediate discovery area will be diverted until a qualified archaeologist can assess the nature and significance of the find. Unanticipated discoveries will be treated according to the Project Discovery and Monitoring Plan.
Hydrology and Floodplain	*Permanent:* • Four, nonsignificant floodplain encroachment locations: one at Temescal Creek and three at Cajalco Creek. • 4.95 acres (7% of basin) of the Cajalco Creek Dam and Detention Basin and 3.69 acres (12% of basin) of the Cajalco Creek Sedimentation Basin would be converted to roadway right of way. *Temporary:* Potential temporary impacts could occur during construction exposing soil to the potential for erosion and downstream transport of sediments to occur. A Storm Water Pollution Prevention Plan (SWPPP) and construction best management practices (BMPs) aimed at reducing pollutants of concern in stormwater runoff would be implemented under the Construction General Permit.	*Permanent:* • Four nonsignificant floodplain encroachment locations: one at Temescal Creek and three at Cajalco Creek. • 4.95 acres (7% of basin) of the Cajalco Creek Dam and Detention Basin and 3.69 acres (12% of basin) of the Cajalco Creek Sedimentation Basin would be converted to roadway right of way. *Temporary:* Potential temporary impacts could occur during construction exposing soil to the potential for erosion and downstream transport of sediments to occur. A SWPPP and construction BMPs aimed at reducing pollutants of concern in stormwater runoff would be implemented under the Construction General Permit.	*Permanent:* • Four nonsignificant floodplain encroachment locations: one at Temescal Creek and three at Cajalco Creek. • 0.12 acres (<1% of basin) of the Cajalco Creek Dam and Detention Basin and 3.55 acres (11.5% of basin) of the Cajalco Creek Sedimentation Basin would be converted to roadway right of way. *Temporary:* Potential temporary impacts could occur during construction exposing soil to the potential for erosion and downstream transport of sediments to occur. A SWPPP and construction BMPs aimed at reducing pollutants of concern in stormwater runoff would be implemented under the Construction General Permit.	No impact	**HYD-1:** The County of Riverside will coordinate directly with MWD to obtain approval for right of way acquisition involving the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin. The County will coordinate directly with MWD in the preparation of a site-specific Drainage Study to evaluate the changes in runoff and floodplain encroachment into the Cajalco Creek Dam and Detention Basin and the Cajalco Creek Sedimentation Basin, and determine whether the conversion of right of way would affect operation of the dam and basins. If operation of the basins are affected by the project, engineering recommendations will be provided, and implemented as necessary, to ensure continued operation of the dam and basins. **PF WQ-1:** 401 Certification – The project proponent will obtain a 401 Certification from the Regional Water Quality Control Board (RWQCB) for activities that may result in impacts on State Water Quality Standards. **PF WQ-2:** 404 Permit – The project proponent will obtain a Section 404 permit from the U.S. Army Corps of Engineers (USACE) for activities that would discharge materials into waters of the U.S. **PF WQ-3:** Post-Construction BMPs – Post-construction BMPs will be implemented to the maximum extent practicable, consistent with the requirements of the NPDES permit and Waste Discharge Requirements for the County of Riverside's Municipal Separate Storm Sewer System Permit in place at the time of project approval. **PF WQ-4:** Construction SWPPP – The project will comply with the SWRCB Construction General Permit in effect at the time of the project goes to construction, by developing and implementing a SWPPP that calculates the site's risk level during construction, includes guidelines for monitoring and reporting, and provides Erosion Control Plan and BMP details for the construction site. **NC-6 (NES BIO-6):** Construction personnel will strictly limit their activities, vehicles, equipment, and construction materials to the proposed project footprint and designated staging areas and routes of travel. Construction limits adjacent to sensitive resource areas will be demarcated using environmentally sensitive area (ESA) fencing (e.g., orange snow fencing, silt fencing). **NC-10 (NES BIO-10):** Plans for water pollution and erosion control (i.e., SWPPP) will be prepared in accordance with project aquatics permits. The plans will describe sediment and hazardous materials control, dewatering or diversion structures, fueling and equipment

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					management practices, and use of plant material for erosion control. Plans will be reviewed and approved by the County prior to construction (WRC MSHCP Volume I, Section 7.5.3). **NC-15 (NES BIO-14):** Compensation for permanent impacts on riparian-riverine resources will occur as a combination of enhancement, restoration, and/or creation, as long as there is no net loss of riparian-riverine resources. **WET-1:** Compensation for direct permanent impacts on USACE wetland and non-wetland waters of the U.S. (WoUS), and CDFW streambed and associated riparian habitat, will occur as a combination of enhancement, restoration, and/or creation, at a ratio that achieves no net loss of wetland WoUS.
Water Quality and Stormwater Runoff	*Permanent:* • 83-acre increase in impervious surface area; stormwater runoff increased ~2.6 acre-feet. Flow rates would increase ~11.4 cubic feet per second (cfs). • Improvements to drainage system. • Potential increase in pollution from stormwater due to increased traffic. *Temporary:* Disturbance of 503 acres during construction would result in an increase in erosion and sedimentation and require control measures; construction may involve possible water contaminants.	*Permanent:* • 84-acre increase in impervious surface area; stormwater runoff increased ~2.62 acre-feet. Flow rates would increase ~11.5 cfs. • Improvements to drainage system. • Potential increase in pollution from stormwater due to increased traffic. *Temporary:* Disturbance of 526 acres during construction would result in an increase in erosion and sedimentation and require control measures; construction may involve possible water contaminants.	*Permanent:* • 105-acre increase in impervious surface area; stormwater runoff increased ~3.22 acre-feet. Flow rates would increase ~14 cfs. • Improvements to drainage system. • Potential increase in pollution from stormwater due to increased traffic. *Temporary:* Disturbance of 505 acres during construction would result in an increase in erosion and sedimentation and require control measures; construction may involve possible water contaminants.	No impact	**PF WQ-1:** 401 Certification – The project proponent will obtain a 401 Certification from the Regional Water Quality Control Board (RWQCB) for activities that may result in impacts on State Water Quality Standards. **PF WQ-2:** 404 Permit – The project proponent will obtain a Section 404 permit from USACE for activities that would discharge materials into waters of the U.S. **PF WQ-3:** Post-Construction BMPs – Post-construction BMPs will be implemented to the maximum extent practicable, consistent with the requirements of the NPDES permit and Waste Discharge Requirements for the County of Riverside's Municipal Separate Storm Sewer System Permit in place at the time of project approval. **PF WQ-4:** Construction SWPPP – The project will comply with the SWRCB Construction General Permit in effect at the time of the project goes to construction, by developing and implementing a SWPPP that calculates the site's risk level during construction, includes guidelines for monitoring and reporting, and provides Erosion Control Plan and BMP details for the construction site. **PF VIS-1:** Contouring and Replanting Disturbed Areas. Potential for fault rupture is considered remote. *Temporary:* Construction activities would include grading, areas of cut and fill, and new slopes, exposing soil to potential erosion.	No impact	**PF GEO-1:** Caltrans’ procedures regarding seismic design, as detailed in Section 19, “Earthwork,” of the Caltrans Standard Specifications Manual, is also anticipated to prevent any adverse effects related to seismic ground shaking. Seismic design would also meet County of Riverside requirements for near-source design parameters under the Uniform Building Code. **PF GEO-2 (a-e):** Core Sample Tests. Borings will be taken in accordance with Table 10-1 of the American Association of State Highway and Transportation Officials’ Load and Resistance Factor Design Bridge Design Specifications for number, spacing, and depth of borings; rock core samples collected to estimate rock quality designation; seismic refraction survey and refraction microtremor survey to evaluate rock rippability and shearwave velocity, respectively; test pits or other methods to collect data for evaluation of the soil cover over the competent soil or bedrock and stability of the steep descending slope; and, sufficient field and laboratory testing to classify the subsurface materials and define liquefaction, shear strength, compressibility, and corrosion properties of the soils and rock encountered. **PF GEO-3 (a-c):** Excavation and Stabilization Techniques. Temporary excavations and installation of spread footing foundations will include techniques in accordance with Caltrans standards prior to placing fill. In the event that near-slope materials are not adequate to support spread footings, cast-in-drilled-hole piles socketing into the bedrock could be considered. Subgrade conditions and need for subgrade preparation or stabilization measures, particularly in the vicinity of the slope, should be evaluated in detail in the Plans, Specifications, and Estimates (PS&E)-level investigation. The need for foundation overexcavation or use of deep foundations should be addressed in the Foundation Report after performing the PS&E-level investigation. **PF GEO-4:** Appropriate backfill materials would be used in accordance with Caltrans standards. Select fill materials should be used for mechanically stabilized earth wall construction, and use of oversize materials generated in cuts screened prior to use as backfill materials.

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					PF GEO-5: Structure approach embankment is that portion of the fill material within approximately 150 feet longitudinally of the structure in accordance with Figure 208.11 of the Highway Design Manual. Structure abutment embankment fill would be compacted to not less than 95 percent relative compaction in accordance with Section 19-5.03B of the Standard Specifications (2015). Poor quality material, such as expansive soils, would be precluded from structure abutment embankments unless treated and placed in accordance with Caltrans Geotechnical Manual Section 3.1.2. **VIS-2:** Replace or Relocate Site Features and Landscaping Affected by the Project. **PF WQ-4:** Construction SWPPP – The project will comply with the SWRCB Construction General Permit in effect at the time of the project goes to construction, by developing and implementing a SWPPP that calculates the site's risk level during construction, includes guidelines for monitoring and reporting, and provides Erosion Control Plan and BMP details for the construction site.
Paleontology	Areas of high sensitivity for paleontological resources, and therefore, could result in permanent impacts on paleontological resources. Existing fossil localities in nearby similar rock units have produced substantial vertebrate paleontological resources, so high sensitivity for resources, especially within the Lake Mathews Formation south of Lake Mathews.	Areas of high sensitivity for paleontological resources, and therefore, could result in permanent impacts on paleontological resources. Existing fossil localities in nearby similar rock units have produced substantial vertebrate paleontological resources, so high sensitivity for resources, especially within the Lake Mathews Formation south of Lake Mathews.	Areas of high sensitivity for paleontological resources, and therefore, could result in permanent impacts on paleontological resources. Existing fossil localities in nearby similar rock units have produced substantial vertebrate paleontological resources, so high sensitivity for resources. Would not affect the Lake Mathews Formation, which is the main source of fossil localities in the project vicinity.	No impact	**PAL-1:** A Paleontological Mitigation Plan (PMP) shall be prepared by a qualified paleontologist in accordance with Caltrans, County of Riverside Planning Department, and the Society of Vertebrate Paleontology guidelines during the final design phase of the project. The PMP will detail all the measures to be implemented in the event of paleontological discoveries.
Hazardous Waste/ Materials	Two Recognized Environmental Conditions (RECs), one Historical Recognized Environmental Condition (HREC), and Areas of Concern (AOCs): • REC: Mobil Baldwin located at 21020 Cajalco Road. Involved unauthorized release of gasoline affecting onsite soils. Undergoing remediation. • REC: located at 9001 Cajalco Road. Former red clay mine and rock quarry that contains elevated concentrations of arsenic. • HREC: Lake Mathews General Store, located at 17679 Cajalco Road. Formerly associated with soil and soil vapor contamination; site granted closure May 2017. • AOCs: - Existing structures proposed for removal may contain ACMs or LBP. - Existing yellow striping proposed for removal may contain lead and chromium. - Agricultural chemicals may be present in near-surface soils. - Creosote-treated wood waste may be generated during proposed removal / relocation of utility poles. - PCBs may be encountered during the disturbance of pole-mounted transformers.	Build Alternative 2C would be subject to the same RECs, HREC, and AOC identified for Build Alternative 1. Between east of Silverton Court and west of Lake Mathews Drive, Build Alternative 2C would be subject to additional agricultural AOC.	Build Alternative 4 would be subject to the same RECs and HREC identified for Build Alternative 4 would be subject to the AOCs identified for Build Alternative 1 between Temescal Canyon Road and west of Silverton Court, and between Gustin Road and I-215. Between east of Silverton Court and west of Gustin Road, the AOCs identified under Build Alternative 1 would be located along La Sierra Avenue and El Sobrante Road.	No impact	**HAZ-1 (a–d):** 9001 Cajalco Road (Assessor's Parcel Numbers [APNs] 279-231-004, 006, -011, and 281-140-021) **(a):** Detailed Site Investigation **(b):** Riverside County Department of Environmental Health Notification and Soil Remediation, if required **(c):** Health and Safety Plan **(d):** Soil Management Plan, if required **PF HAZ-2:** Health and Safety Plan (HASP). The HASP would provide direction for the identification, evaluation, and control of the wide variety of chemical, physical, biological, and ergonomic hazards that may be encountered during construction activities. The HASP will also address the management of potential health and safety hazards to workers and the public, and will be prepared and implemented prior to initiation of the construction activities. **PF HAZ-3:** Handling, Transport, and Disposal of Waste. Wastes and petroleum products used or encountered during construction will be collected, transported, and removed from the project site in accordance with Resource Conservation and Recovery Act regulations and federal/Occupational Health and Safety Administration standards, including Waste Management and Materials Pollution Control Best Management Practices (BMPs) – Spill Prevention and Control, Materials; and Waste Management BMPs, Hazardous Waste Management. **HAZ-4 (a–g):** 21020 Cajalco Road (APNs 318-061-027 and -030) **(a):** Continued Coordination with Oversight Agencies **(b):** Abandonment of Existing Monitoring Structures **(c):** Soil and Groundwater Investigation (Optional) **(d):** Health and Safety Plan **(e):** Soil Management Plan; prior to construction

					(f): SCAQMD Rule 1166 permitting and VOC monitoring **(g):** Groundwater Disposal **PF HAZ-5:** Handling, Transport, and Disposal of Creosote-treated Wood Waste **HAZ-6 (a–c):** Agricultural Land Uses **(a):** Preliminary Site Investigation (PSI) **(b):** Corrective Action (if PSI concludes contaminants present at levels above regulatory threshold standards) **(c):** Soil Management Plan – Agricultural Land Uses **HAZ-7:** Yellow thermoplastic and yellow-painted traffic stripes. Yellow paint and thermoplastic striping survey will be conducted along the project alignment for striping that will be removed. Handling of this material would be consistent with Caltrans Standard Special Provisions 36-4 and 14-11.12, or with 84-9.03C, as applicable. **HAZ-8:** Asbestos-Containing Material (ACM) and Lead-Based Paint (LBP). Surveys for hazardous building materials including ACM and LBP will be conducted for structures that will be removed in as part of the project. A certified contractor will be retained to abate any identified ACM or LBP in accordance with all applicable laws, including Occupational Health and Safety Administration guidelines. Handling of ACM waste would be conducted consistent with Caltrans SSP 14-11.16, and LBP would be handled according to SSP 36-4.
Air Quality	*Permanent:* Particulate matter 10 micrometers or smaller (PM_{10}) and 2.5 micrometers or smaller ($PM_{2.5}$) predicted to increase by 1.3%. MSAT emissions at Horizon Year 2044 are anticipated to be considerably less than Baseline Year 2014 levels. *Temporary:* During construction, short-term degradation of air quality may occur during construction due to release of particulate emissions (airborne dust) generated by excavation, grading, hauling, and other activities related to construction.	*Permanent:* PM_{10} and $PM_{2.5}$ predicted to increase by 0.8%. MSAT emissions at Horizon Year 2044 are anticipated to be considerably less than Baseline Year 2014 levels. *Temporary:* During construction, short-term degradation of air quality may occur during construction due to release of particulate emissions (airborne dust) generated by excavation, grading, hauling, and other activities related to construction.	*Permanent:* PM_{10} and $PM_{2.5}$ to increase by 1.7%. MSAT emissions at Horizon Year 2044 are anticipated to be considerably less than Baseline Year 2014 levels. *Temporary:* During construction, short-term degradation of air quality may occur during construction due to release of particulate emissions (airborne dust) generated by excavation, grading, hauling, and other activities related to construction.	Less vehicular capacity resulting in greater operational emissions for some pollutants.	**PF AQ-1:** The project would conform to Caltrans construction requirements, as specified in the Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). The contractor will comply with all air pollution control ordinances and statutes which apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code. Exhaust emissions control measures will also be employed. **PF AQ-2:** South Coast Air Quality Management District Rule 403 (Fugitive Dust) further requires that fugitive dust control measures be applied to all construction projects in the South Coast Air Basin, unless said project is specifically exempted by the rule.
Noise and Vibration	*Permanent:* Noise is expected to increase for receivers in close proximity to the roadway with the increased traffic. Three receivers would exceed the noise abatement criteria (NAC) of 67 A-weighted decibels (dBA) hourly noise equivalent level ($L_{eq[h]}$). Receivers M-93, M-105, and M-118 are predicted to have a design year noise level of 74, 74, and 69 dBA $L_{eq(h)}$, respectively. No other receivers are predicted to result in a substantial increase. For the benefit of the receptor associated with receiver M-93, Noise Barrier S-624 was found to be feasible and reasonable for heights of 6, 8, and 10 feet. For the benefit of the receptors associated with receivers M-105 and M-118, Noise Barriers S-650 Property Line and S-652	*Permanent:* Noise is expected to increase for receivers in close proximity to the roadway with the increased traffic. Three receivers would exceed the NAC of 67 dBA $L_{eq(h)}$. Receivers M-93, M-105, and M-118 are predicted to have a design year noise level of 74, 74, and 69 dBA $L_{eq(h)}$, respectively. No other receivers are predicted to result in a substantial increase. For the benefit of the receptor associated with receiver M-93, Noise Barrier S-624 was found to be feasible and reasonable at barrier heights of 6, 8, and 10 feet. For the benefit of the receptors associated with receiver M-105 and M-118, Noise Barriers S-650 Property Line and S-652 Property Line would be reasonable and feasible at heights of 8, 10, and 16 feet.	*Permanent:* Noise is expected to increase for receivers in close proximity to the roadway with the increased traffic. Four receivers would approach or exceed the NAC of 67 dBA $L_{eq(h)}$. Receivers M-93, M-99, M-105, and M-118 are predicted to have a design year noise level of 75, 66, 75, and 70 dBA $L_{eq(h)}$, respectively. Receiver M-98A would increase by 15 dB (48 dBA $L_{eq(h)}$ in the existing year and 63 dBA $L_{eq(h)}$ during the design year. For receiver M-98A, Noise Barrier S-565 was found to be feasible but not reasonable, therefore, this barrier is not recommended. For the benefit of the receptor associated with receiver M-93, Noise Barrier S-624	*Permanent:* Noise is expected to increase for receivers in close proximity to the roadway with the increased traffic. Noise levels would range from 37 to 71 dBA $L_{eq(h)}$; three receivers would exceed the NAC of 67 dBA $L_{eq(h)}$. No noise abatement would be considered or implemented. *Temporary:* No project-related construction or noise would occur.	**PF NOI-1:** Do not exceed 86 A-weighted decibels maximum noise level at 50 feet from job site activities between 9:00 p.m. and 6:00 a.m. (2018 Caltrans SSP, Section 14-8.02, Noise Control). **NOI-2:** Construct soundwall S-624 at the right of way at a height of 10 feet, provided that the survey process approves soundwall S-624. If soundwall S-624 is not approved, design and construct a soundwall 8 feet in height at the same location. (Barriers were determined to be feasible and reasonable under all build alternatives.) **NOI-3:** For all build alternatives, construct soundwalls S-650 and S-652 at the property line with respective lengths of 330 and 285 feet, at heights of 8 feet, provided that the survey process approves. **NOI-4:** Inclusion of Quiet Pavement (CEQA Measure). The County will require the construction contractor to provide an asphalt mix that provides 5-decibel minimum tire pavement noise reduction, and will include this mix during construction and paving of the proposed project. **PF NOI-5:** Construction noise would be temporary and limited to the duration of the construction. Noise control measures will also be

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
	ROW would be reasonable and feasible at heights of 10, 12, 14, and 16 feet. *Temporary:* Noise from construction activities may intermittently dominate the noise environment in the immediate area of construction; measures are proposed to reduce noise impacts from construction.	*Temporary:* Noise from construction activities may intermittently dominate the noise environment in the immediate area of construction; measures are proposed to reduce noise impacts from construction.	was found to be feasible and reasonable at barrier heights of 6, 8, and 10 feet. For the benefit of the receptors associated with receiver M-105 and M-118, Noise Barriers S-650 Property Line and S-652 ROW would be reasonable and feasible at heights of 10, 12, 14, and 16 feet. Noise Barrier S-650 (Property Line) and Noise Barrier S-652 (Property Line) were found to be feasible and reasonable at barrier heights of 8 and 10 feet. For the receptor associated with receiver M-99, noise abatement was not considered, as any noise abatement would remove access to the property's driveway. Impacts on receiver M-99 would be potentially significant. *Temporary:* Noise from construction activities may intermittently dominate the noise environment in the immediate area of construction; measures are proposed to reduce noise impacts from construction.		incorporated into the project contract specifications in order to minimize construction noise effects.
Energy	*Permanent:* Annual Energy Consumption associated with long-term operational use would require 19,601,538 million British thermal units (MMBTU) and 156,812,301 Gallons of Gasoline Equivalent. *Temporary:* Temporary construction-period activities would require the consumption of the equivalent of 462,000 gallons of diesel fuel, or approximately 64,000 MMBTU.	*Permanent:* Annual Energy Consumption associated with long-term operational use would require 19,504,966 MMBTU and 156,039,730 Gallons of Gasoline Equivalent. *Temporary:* Temporary construction-period activities would require the consumption of the equivalent of 462,000 gallons of diesel fuel, or approximately 64,000 MMBTU.	*Permanent:* Annual Energy Consumption associated with long-term operational use would require 19,623,207 MMBTU and 156,985,653 Gallons of Gasoline Equivalent. *Temporary:* Temporary construction-period activities would require the consumption of the equivalent of 462,000 gallons of diesel fuel, or approximately 64,000 MMBTU.	Annual Energy Consumption associated with long-term operational use would require 19,429,723 MMBTU and 155,437,786 Gallons of Gasoline Equivalent.	**PF LU-1:** Traffic Management Plan **PF AQ-1:** Caltrans construction requirements, as specified in Caltrans' SSP, Section 14-9.02 (Air Pollution Control), and all air pollution control ordinances and statutes that apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code. Includes grid-based electricity and/or onsite renewable electricity and/or practical powered generators, construction idle restrictions, and alternative fuels. **PF VIS-4:** Apply Minimum Lighting Standards. All artificial outdoor lighting and overhead street lighting will be limited to only those locations where it is absolutely necessary for safety and security requirements. Lighting will be designed using the Illuminating Engineering Society's design guidelines and in compliance with International Dark-Sky Association–approved fixtures. All lighting will be designed to have minimum impact on the surrounding environment and will use downcast, cut-off type fixtures that are shielded and direct the light only toward objects requiring illumination. **PF SW-1:** Consistent with Caltrans Standard Specification 14-10, non-hazardous construction-period waste shall be recycled.
Natural Communities	*Permanent:* 210.04 acres permanent impacts on WRC MSHCP cores and linkages. 76.58 acres permanent impacts on Natural Communities of Concern; 28.16 acres within LM MSHCP. *Temporary:* During construction, vegetation removal and increased human presence, as well as indirect impacts due to increased noise, dust, light, reduced water quality, edge effects, and vibration. 11.46 acres temporary impacts on Natural Communities of Concern.	*Permanent:* 215.39 acres permanent impacts on WRC MSHCP cores and linkages. 85.20 acres permanent impacts on Natural Communities of Concern; 37.06 acres within LM MSHCP. *Temporary:* During construction, vegetation removal and increased human presence, as well as indirect impacts due to increased noise, dust, light, reduced water quality, edge effects, and vibration. 11.79 acres temporary impacts on Natural Communities of Concern.	*Permanent:* 82.32 acres permanent impacts on WRC MSHCP cores and linkages. 79.78 acres permanent impacts on Natural Communities of Concern; 22.24 acres within LM MSHCP. *Temporary:* During construction, vegetation removal and increased human presence, as well as indirect impacts due to increased noise, dust, light, reduced water quality, edge effects, and vibration. 10.55 acres temporary impacts on Natural Communities of Concern.	No permanent or temporary impacts on natural communities of concern beyond those that would be expected to occur from the existing facility.	**NC-1 (NES BIO-1):** Clearing of natural vegetation (including sage scrub) will be performed outside of the active breeding season for birds, as defined in the WRC MSHCP (March 1 through June 30) (WRC MSHCP Volume I, Section 7.5.3), except for RSS habitat judged to be potentially suitable and/or occupied by coastal California gnatcatcher and located within WRC MSHCP Criteria Areas and PQP lands. For these areas, the habitat removal restriction is extended from June 30 to August 15. In addition, for riparian-riverine vegetation occupied by least Bell's vireo (LBV), vegetation removal restrictions occur through September 15. Table 3.17-20 in Section 3.20, *Animal Species*, summarizes the clearing restrictions of sensitive vegetation communities. If clearing of vegetation needs to occur within these timeframes due to construction schedule, a preconstruction nesting bird survey will

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					need to be performed prior to any vegetation removal activities (refer to Measure **AS-5 [NES BIO-27]**). **NC-2 (NES BIO-2):** Active construction areas will be watered regularly to control dust and thus minimize impacts on adjacent vegetation (WRC MSHCP Volume I, Section 7.5.3). **NC-3 (NES BIO-3):** When work is conducted during the fire season adjacent to any natural vegetation communities, appropriate firefighting equipment (e.g., extinguishers, shovels, water tankers) will be available on the project site during all phases of project construction to help minimize the chance of human-caused wildfires. **NC-4 (NES BIO-4):** A qualified biologist will prepare and present an environmental training program for project and construction personnel (WRC MSHCP Volume I, Section 7.5.3) prior to grading or staging. All sensitive areas will be fenced as presented in Measure **NC-6 (NES BIO-6)**, below. **NC-5 (NES BIO-5):** The qualified project biologist will monitor construction activities to ensure that practicable measures are being employed and avoid incidental disturbance of habitat and species of concern outside the project footprint (WRC MSHCP Volume I, Section 7.5.3). **NC-6 (NES BIO-6):** Construction personnel will strictly limit their activities, vehicles, equipment, and construction materials to the proposed project footprint and designated staging areas and routes of travel. Construction limits adjacent to sensitive resource areas will be demarcated using environmentally sensitive area (ESA) fencing (e.g., orange snow fencing, silt fencing). **NC-7 (NES BIO-7):** Exotic plant species removed during construction will be properly handled to prevent sprouting or regrowth (WRC MSHCP Volume I, Section 7.5.3). Vegetation removed from the project site will be covered while being carried on trucks, and vegetation materials removed from the site will be disposed of in accordance with applicable laws and regulations. **NC-8 (NES BIO-8):** Construction equipment will be cleaned of mud or other debris that may contain invasive plants and/or seeds and inspected to reduce the potential of spreading noxious weeds before mobilizing to the site and before leaving the site during the course of construction. The cleaning of equipment will occur at least 300 feet from ESA fencing to prohibit the spread of invasive species. **NC-9 (NES BIO-24):** The project site will be kept as clean of debris as possible. All food-related trash items will be enclosed in sealed containers and regularly removed from the site(s) (WRC MSHCP Volume I, Appendix C). **NC-10 (NES BIO-10):** Plans for water pollution and erosion control (i.e., SWPPP) will be prepared in accordance with project aquatics permits. The plans will describe sediment and hazardous materials control, dewatering or diversion structures, fueling and equipment management practices, and use of plant material for erosion control. Plans will be reviewed and approved by the County prior to construction (WRC MSHCP Volume I, Section 7.5.3). **NC-11 (NES BIO-11):** The limits of disturbance (LOD), including the upstream, downstream, and lateral extents on either side of any stream adjacent to the project impact footprint, will be clearly defined and marked in the field. **NC-12 (NES BIO-12):** During construction, the placement of equipment within a stream or on adjacent banks or adjacent upland habitats occupied by WRC MSHCP covered species that are outside of the project footprint will be avoided (WRC MSHCP Volume I, Section 7.5.3 and Appendix C). **NC-13 (NES BIO-9):** Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades,

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					decompacted to eliminate compressed soils and allow for plant establishment, and hydro-seeded with a County-approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory. **NC-14 (NES BIO-13) (Mitigation):** A Determination of Biological Equivalent or Superior Preservation (DBESP) report that provides analysis of direct and indirect impacts, avoidance, minimization, and compensatory mitigation, if necessary, along with the functions and values of the resources being affected as related to Section 6.1.2 of the WRC MSHCP Volume I will be prepared and submitted to RCA, USFWS, and CDFW for review and approval prior to finalization of the environmental document. **NC-15 (NES BIO-14) (Mitigation):** Compensation for permanent impacts on riparian-riverine resources will occur as a combination of enhancement, restoration, and/or creation, at a ratio that achieves no net loss of riparian-riverine resources. Compensation can also occur through the purchase of mitigation bank credits through the Riverside-Corona Resource Conservation District In-lieu Fee Program (ILFP), Santa Ana Watershed Association ILFP, a permittee responsible mitigation bank, and/or other approved mitigation provider and/or creation of riparian-riverine resources, including federal and state jurisdictional water resources. For riparian resources a mitigation ratio of no less than 3:1 is proposed, and for riverine resources no less than a 1:1 ratio is currently proposed. A mitigation ratio of no less than 2:1 is proposed for permanent shading of riparian vegetation and wetlands[3] to address temporal loss of these habitats. Mitigation for all aquatic resources will be biologically superior or equivalent to resources occurring on site. The temporary impacts on riparian-riverine resources may be replaced through restoration of the temporarily affected area to pre-project conditions at a ratio of no less than 1:1, or through the purchase of mitigation bank credits, a permittee responsible mitigation bank, or other approved mitigation program. Details of the compensation for riparian-riverine resources will be provided in the Determination of Biologically Equivalent or Superior Preservation (Measure **NC-14 [NES BIO-13]**). Because the federally and state-listed as endangered least Bell's vireo occupies the riparian-riverine areas at Temescal Creek, Cajalco Creek, and other unnamed drainages proposed for impact, the compensation for both Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine and least Bell's vireo should also be integrated. Compensatory mitigation will be coordinated with U.S. Army Corps of Engineers (USACE) Clean Water Act (CWA) 404 authorization, Regional Water Quality Control Board (RWQCB) CWA 401 Certification, California Department of Fish and Wildlife (CDFW) Fish and Game Code 1602 Streambed Alteration Agreement acquisition (measure **WET-1** in Section 3.18), and Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine requirements to ensure efficiencies with the mitigation effort. Final mitigation ratios will be determined after consultation with the USACE, RWQCB, U.S. Fish and Wildlife Service, and CDFW. **NC-16 (NES BIO-19):** A Wildlife Fencing Plan will be developed and implemented for the preferred build alternative. Prior to finalizing the wildlife fencing design, the impacts of and interaction between wildlife fencing and other fencing (e.g., Lake Mathews and other local fencing) in the project area of the preferred Build Alternative shall be fully assessed and analyzed. If it is determined that fencing

[3] Mitigation ratios may differ based on the location of riparian/riverine resources within the limits of disturbance. For example, riparian habitat within Temescal Wash may be mitigated at a higher ratio due to the quality of functions and values for wildlife movement, "live-in" habitat for sensitive species (i.e., least Bell's vireo), and water quality functions.

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					in the project area (i.e., either project-related fencing or other fencing) will hinder or interfere with wildlife movement or the function and value of wildlife crossings, the wildlife fencing plan (and project design) shall include design considerations that will lessen these impacts. **NC-17 (NES BIO-17) (Mitigation):** Compensation for permanent loss of habitat on the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area will be accomplished through the acquisition of replacement lands; a ratio no less than 1:1 is currently proposed. The County will purchase lands which will provide equivalent or greater habitat value and be located adjacent to the existing LM MSHCP area to ensure the reserve remains whole. The replacement lands will be managed by the Lake Mathews Reserve Management Committee (LMRMC) and the Metropolitan Water District of Southern California (MWD) in perpetuity as part of the larger Lake Mathews Reserve. If adequate replacement lands are not available at the time of land acquisition, the remainder of the necessary lands will be purchased from a mitigation bank (if available), and supplemental actions identified in Measure **NC-18** (**NES BIO-31**) implemented in coordination with LMRMC and MWD. **NC-18 (NES BIO-31) (Mitigation):** To compensate for the loss of natural lands on the Lake Mathew Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area, the County of Riverside will coordinate with Lake Mathews Reserve Management Committee (LMRMC) to develop a suite of mitigation measures that demonstrate biological equivalency to offset the loss, including the acquisition of adequate replacement and restoration of lands (Measures **NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]**), fencing to aid in management of the Lake Mathews Multiple Species Reserve (LMR) (Measure **NC-16 [NES BIO-19]**), and funding to be used toward LMR management. The County of Riverside will develop the funding mechanism with input from the LMRMC that will be used to support management of new reserve lands acquired for the LM MSHCP area and any existing reserve lands, along with shared maintenance and security costs for the LM MSHCP area. **NC-19 (NES BIO-15) (Mitigation):** Restoration of temporary impact areas on the Lake Mathew Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan area will be accomplished through on-site restoration of those temporarily affected areas. A Habitat Mitigation and Monitoring Plan will be developed in consultation with Lake Mathews Reserve Management Committee, U.S. Fish and Wildlife Service, and California Department of Fish and Wildlife. **NC-20 (NES BIO-21) (Mitigation):** Public/Quasi-Public (PQP) lands in Existing Core C and Proposed Extension of Existing Core 2 and Proposed Linkage 3 that will be permanently removed are proposed to be replaced at a minimum 1:1 ratio. This will be coordinated with riparian-riverine compensation (**BIO-14**) and jurisdictional resources permitting (Measure **WET-1** in Section 3.18), as feasible. An evaluation of existing functions and value of PQP conserved lands within the project area will be performed as part of the Project Equivalency Determination, to provide accurate estimate of potential impacts (direct and indirect) and ensure the proposed replacement lands are equivalent or superior to those lands proposed for impact. Prior to land acquisition, an equivalency report will be provided that analyzes the existing biological resources being permanently removed compared to the biological resources supported by the lands proposed for acquisition. The resource mitigation values will need to be equivalent or superior to what is being removed. The

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					Lake Mathews Reserve Management Committee (LMRMC) will be consulted regarding mitigation lands proposed within Lake Mathews Multiple Species Reserve PQP conserved lands, and provided opportunity for input on the selection of lands. Execution of this mitigation measure will include compensatory mitigation needed for least Bell's vireo (refer to Measure **TE-2 [NES BIO-23]** in Section 3.21.4) and Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine resources (Measures **NC-14 [NES BIO-13]**, **NC-15 [NES BIO-14]**, **NC-17 [NES BIO-17]**, and **NC-19 [NES BIO-15**]) as feasible. The Equivalency Determination will be reviewed by the Western Riverside County Regional Conservation Authority (RCA), U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Wildlife (CDFW), and LMRMC, and approved by RCA, USFWS, and CDFW.
Wetlands and Other Waters	*Permanent:* 3.61 acres direct impacts and 0.04 acre indirect shading effects on USACE and RWQCB jurisdictional waters. 10.2 acres of impacts and 0.18 acre indirect shading effects on CDFW streambed and associated riparian habitat. 0.08 acre of rehabilitation to USACE and RWQCB jurisdictional waters and 0.16 acre of rehabilitation on CDFW jurisdictional waters. Within the LM MSHCP, 1.19 acres of permanent impacts on USACE and RWQCB jurisdictional waters and wetlands. No permanent impact on wetlands within LM MSHCP area. *Temporary:* 2.08 acres of USACE and RWQCB jurisdictional waters (0.34 acre within LM MSHCP) temporarily affected. 5.67 acres temporary impacts on CDFW streambed and associated riparian habitat. There could be temporary impacts depending on the location of staging areas or any additional work needed for construction.	*Permanent:* 3.94 acres direct impacts and 0.04 acre indirect shading effects on USACE and RWQCB jurisdictional waters. 10.04 acres of permanent impacts and 0.17 acre indirect shading effects on CDFW streambed and associated riparian habitat. 0.07 acre rehabilitation to USACE and RWQCB jurisdictional waters and 0.17 acre of rehabilitation on CDFW jurisdictional waters. Within the LM MSHCP, 1.18 acres of permanent impacts on USACE and RWQCB jurisdictional waters and wetlands. No permanent impact on wetlands within LM MSHCP area. *Temporary:* 1.78 acres of USACE and RWQCB jurisdictional waters (0.34 acre within LM MSHCP) temporarily affected. 5.59 acres temporary impacts on CDFW streambed and associated riparian habitat. There could be temporary impacts depending on the location of staging areas or any additional work needed for construction.	*Permanent:* 1.44 acres direct impacts and 0.04 acre indirect shading effects on USACE and RWQCB jurisdictional waters. 7.08 acres of impacts and 0.17 acre of indirect shading effects on CDFW streambed and associated riparian habitat. There would also be 0.08 acre rehabilitation on USACE and RWQCB jurisdictional waters and 0.18 acre rehabilitation on CDFW jurisdictional waters. Within the LM MSHCP, 0.06 acres of permanent impacts on USACE and RWQCB jurisdictional waters. No permanent or temporary impacts on wetlands within LM MSHCP area. *Temporary:* 1.56 acres of USACE and RWQCB jurisdictional waters (0.02 acre within LM MSHCP) temporarily affected. 5.8 acres temporary impacts on CDFW streambed and associated riparian habitat. There could be temporary impacts depending on the location of staging areas or any additional work needed for construction.	No impacts	**WET-1:** Compensation for direct permanent impacts on U.S. Army Corps of Engineers (USACE) and Regional Water Quality Control Board (RWQCB) wetland and non-wetland waters of the U.S. (WoUS)/waters of the State (WoS) and California Department of Fish and Wildlife (CDFW) streambed and associated riparian habitat will occur as a combination of enhancement, restoration, and/or creation, at a ratio that achieves no net loss of wetland WoUS. Compensation can occur through the purchase of mitigation bank credits through the Riverside-Corona Resources Conservation District In-lieu Fee Program (ILFP), Santa Ana Watershed Association, a permittee responsible mitigation bank, and/or other agency-approved mitigation provider. No less than a 3:1 mitigation ratio is proposed for USACE/RWQCB wetlands and CDFW riparian vegetation and wetlands. A ratio of not less than 1:1 for USACE/RWQCB non-wetland WoUS/WoS and CDFW streambed is currently proposed. A mitigation ratio of no less than 2:1 is proposed for permanent shading of USACE wetlands and CDFW riparian vegetation (including CDFW-regulated wetlands)[4] to address temporal loss. Mitigation for all jurisdictional resources will be biologically superior or equivalent to resources occurring on site. Temporary impacts on USACE/RWQCB wetland and non-wetland WoUS/WoS and CDFW streambed, and associated riparian habitat, may be replaced through restoration of the temporarily affected area to pre-project conditions at a ratio no less than 1:1 or through the purchase of ILFP or mitigation bank credits, a permittee responsible mitigation bank, or other approved mitigation program. Compensatory mitigation will be coordinated with USACE Clean Water Act (CWA) 404 authorization, Regional Water Quality Control Board (RWQCB) CWA 401 Certification, CDFW Fish and Game Code 1602 Streambed Alteration Agreement acquisition, and Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine requirements to ensure efficiencies with the mitigation effort. Final mitigation ratios will be determined after consultation with USACE, RWQCB, U.S. Fish and Wildlife Service, and CDFW.
Plant Species	*Permanent:* Impacts within WRC MSHCP area covered by WRC MSHCP. Within LM MSHCP area, 120.31 acres permanent impacts on natural vegetation communities and 0.14 acre roadbed removal (beneficial impact). LM MSHCP suitable habitat would be affected for: round-leaved filaree (97.15	*Permanent:* Impacts within WRC MSHCP area covered by WRC MSHCP. Within LM MSHCP area, 111.21 acres permanent impacts on natural vegetation communities and 0.16 acre roadbed removal (beneficial impact). LM MSHCP suitable habitat would be affected for: round-leaved filaree (64.99	*Permanent:* Impacts within WRC MSHCP area covered by WRC MSHCP. Within LM MSHCP area, 56.52 acres permanent impacts on natural vegetation communities and 0.70 acre roadbed removal (beneficial impact). LM MSHCP suitable habitat would be affected for: round-leaved filaree (27.10	No impacts	Avoidance and minimization measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8) and NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** would be implemented to reduce potential indirect impacts on special-status plant species under Build Alternatives 1, 2C, and 4, and to ensure consistency with the WRC MSHCP. Paniculate tarplant seeds will be collected prior to project construction and disseminated following construction (**PL-1 [NES BIO-22]**).

[4] Mitigation ratios may differ based on the location of riparian/riverine resources within the limits of disturbance. For example, riparian habitat within Temescal Wash may be mitigated at a higher ratio due to the quality of functions and values for wildlife movement, "live-in" habitat for sensitive species (i.e., least Bell's vireo), and water quality functions.

	acres), Coulter's matiljia poppy (28.99 acres), long-spined spineflower (100.47 acres), small-flowered morning glory (122.23 acres) would be affected. There would also be removal of 135.33 acres of suitable habitat for Palmer's grapplinghook, Parry's spineflower, smooth tarplant, and small-flowered microseris. *Temporary:* 20.79 acres temporary impacts on natural vegetation communities within LM MSHCP area.	acres), Coulter's matiljia poppy (38.86 acres), long-spined spineflower (82.38 acres), small-flowered morning glory (113.96 acres) would be affected. There would also be removal of 126.91 acres of suitable habitat for Palmer's grapplinghook, Parry's spineflower, smooth tarplant, and small-flowered microseris. *Temporary:* 22.44 acres temporary impacts on natural vegetation communities within LM MSHCP area.	acres), Coulter's matiljia poppy (24.14 acres), long-spined spineflower (33.87 acres), small-flowered morning glory (51.27 acres) would be affected. Direct impacts are anticipated over 6.80 acres on several thousand paniculate tarplant. There would also be removal of 63.03 acres of suitable habitat for Palmer's grapplinghook, Parry's spineflower, smooth tarplant, and small-flowered microseris. *Temporary:* 8.76 acres temporary impacts on natural vegetation communities within LM MSHCP area.		Replacement for the loss of potentially suitable habitat for LM MSHCP covered species will be required by MWD within the LM MSHCP area; a 1:1 ratio is proposed (**NC-17 [NES BIO-17]**). Temporary impacts will be addressed through preparation of an HMMP and onsite restoration (**NC-19 [NES BIO-15]**). **PL-1 (NES BIO-22):** Paniculate Tarplant Seed Collection – Seeds for paniculate tarplant will be collected prior to construction activities. Seeds will be stored and redistributed after construction is completed.
Animal Species	*Permanent:* • Habitat permanently affected for the following species (acres): - Burrowing ow: 211.11 - Special-status bats: 241.30 - Southern California legless lizard: 87.45 - California glossy snake: 194.55 - Coast western patch-nosed snake: 194.55 - Two-striped garter snake: 7.18 - Least bittern: 0.06 - Long-eared owl: 9.39 - Short-eared owl: 116.76 - Vaux's swift: 4.99 - Clark's marsh wren: 0.06 - Oregon vesper sparrow: 148.05 - Yellow-headed blackbird: 0.94 - Southern grasshopper mouse: 69.19 - American badger: 176.41 • Habitat indirectly affected by shading effects for the following species (acres): - Burrowing owl: 0.58 - Special-status bats: 1.35 - Southern California legless lizard: 0.70 - California glossy snake and Coast western patch-nosed snake: 0.52 - Two-striped garter snake 0.40 - Long-eared owl: 0.35 - Short-eared owl: 0.22 - Vaux's swift: 0.32 - Oregon vesper sparrow: 0.57 - Southern grasshopper mouse: 0.26 - American badger: 0.45 • Habitat beneficially affected for the following species (acres): - Burrowing owl 8.61 - Special-status bats 9.29 - Southern California legless lizard 3.08	*Permanent:* • Habitat permanently affected for the following species (acres): - Burrowing owl: 226.96 - Special-status bats: 256.76 - Southern California legless lizard: 96.02 - California glossy snake: 195.77 - Coast western patch-nosed snake: 195.77 - Two-striped garter snake: 5.77 - Least bittern: 0.06 - Long-eared owl: 8.41 - Short-eared owl: 123.33 - Vaux's swift: 4.43 - Clark's marsh wren: 0.06 - Oregon vesper sparrow: 154.82 - Yellow-headed blackbird: 16.27 - Southern grasshopper mouse: 79.56 - American badger: 176.75 • Habitat indirectly affected by shading effects for the following species (acres): - Burrowing owl 1.18 - Special-status bats 1.93 - Southern California legless lizard 1.01 - California glossy snake 1.12 - Coast western patch-nosed snake 1.12 - Two-striped garter snake 0.39 - Long-eared owl 0.38 - Short-eared owl 0.50 - Vaux's swift 0.34 - Oregon vesper sparrow 0.84 - Southern grasshopper mouse 0.58 - American badger 1.06 • Habitat beneficially affected for the following species (acres): - Burrowing owl 12.26 - Special-status bats 12.85 - Southern California legless lizard 3.44	*Permanent:* • Habitat permanently affected for the following species (acres): - Burrowing owl: 201.28 - Special-status bats: 216.37 - Southern California legless lizard: 103.11 - California glossy snake: 149.72 - Coast western patch-nosed snake: 149.72 - Two-striped garter snake: 5.08 - Least bittern: 0.06 - Long-eared owl: 6.36 - Short-eared owl: 54.95 - Vaux's swift: 2.42 - Clark's marsh wren: 0.06 - Oregon vesper sparrow: 106.62 - Yellow-headed blackbird: 2.21 - Southern grasshopper mouse: 85.91 - American badger: 138.12 • Habitat indirectly affected by shading effects for the following species (acres): - Burrowing owl: 3.97 - Special-status bats: 5.16 - Southern California legless lizard: 4.13 - California glossy snake and Coast western patch-nosed snake 4.02 - Two-striped garter snake: 0.39 - Long-eared owl: 0.38 - Short-eared owl: 0.28 - Vaux's swift: 0.35 - Oregon vesper sparrow: 0.78 - Southern grasshopper mouse: 3.56 - American badger: 3.83 • Habitat beneficially affected for the following species (acres): - Burrowing owl: 6.55 - Special-status bats: 7.39 - Southern California legless lizard: 4.36 - California glossy snake: 6.21	No impacts	Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, and **TE-3 (NES BIO-30)**, will ensure the indirect effects on non-listed special-status species from construction activities are avoided and/or minimized. The following avoidance and minimizations measures address the direct and indirect impacts on non-listed special-status animals: **AS-1 (NES BIO-25):** A burrowing owl (BUOW) management plan will be developed to ensure avoidance of impacts on BUOW within WRC MSHCP BUOW survey areas. In the plan, the following information, at a minimum, will be included and performed during each phase of project construction: a) Focused Survey for BUOW – Performed following the WRC MSHCP protocol between the window of March 1 through August 31 and in the survey season prior to scheduled construction. The survey will include the LOD of the selected Build Alternative and up to a 300-foot buffer if performed between February 1 and August 31. b) Preconstruction Survey for BUOW – Performed within 30 days prior to ground disturbance regardless of whether the species is found during the focused survey. The survey area would be the LOD and at least a 300-foot buffer and required only within WRC MSHCP BUOW survey areas. c) Protocol for Presence – Steps necessary for handling the presence of BUOW (if found during either of the two surveys), which may include full avoidance, if feasible, or passive relocation by a qualified ornithologist. d) Agency Approval – The BUOW management plan will be submitted for review by RCA, USFWS, CDFW, and LMRMC (for the LMR area only). **AS-2 (NES BIO-16):** The WRC MSHCP requires that shielding be incorporated in project designs to ensure ambient lighting in WRC MSHCP conservation areas is not increased (WRC MSHCP Volume I, Section 6.1.4). Night lighting will be directed away from natural lands within existing and proposed WRC MSHCP conservation areas in order to support potential linkage and core functions during construction. This is intended to protect species within existing and proposed WRC MSHCP conservation areas from direct night lighting during construction, if activities occur at night. Table 3.20-7 provides the areas where night lighting restrictions applies for each build alternative. **AS-3 (NES BIO-28)**: Preconstruction clearance surveys for sensitive wildlife species will be performed within three days prior to construction to flush the species from the construction footprint following the installation of ESA fencing. ESA fencing must be sufficient to prevent the entry of animals into the LOD as feasible. No nesting birds will be flushed during the nesting season. Bats will

Burrowing wildlife will be relocated from the site as feasible during preconstruction clearance surveys. **AS-4 (NES BIO-26):** A bat management plan will be developed to ensure mortality to roosting bats does not occur to ensure CEQA compliance and consistency with the LM MSHCP. The following items will be included in the plan, at a minimum: a) For each location determined to be suitable for special-status bat species or large colonial roosts, a preconstruction survey will be conducted to determine if the location is occupied by roosting bats. b) For each location confirmed to be occupied by bats, the plan will provide details both in text and graphically where exclusion devices will need to be placed, the timing for exclusion work, and the timeline and methodology needed to exclude the bats. c) Monitoring activities and schedule will be included, including frequency of monitoring, which structures would need to be monitored, and reporting requirements. d) Draft plan will be submitted for review to USFWS, CDFW, and LMRMC. **AS-5 (NES BIO-27):** A nesting bird management plan will be drafted to provide a comprehensive approach to addressing nesting birds prior to the commencement of construction phases. It will include, at a minimum, the following items: a) Project biologist and monitoring biologist qualifications. b) Methods for preconstruction surveys for nesting birds protected under the Migratory Bird Treaty Act and California Fish and Game Code, which will be performed prior to the start of all project phases during the bird breeding season. Preconstruction nesting bird survey requirements may be superseded by the Lake and Streambed Alteration Agreement. c) Methods and timing (including seasonal considerations) for addressing nesting birds, raptors, and colonial nesting birds (i.e., swallows), including avoidance buffers; avoidance measures to reduce disturbances to active nests; and deterrent methods. d) Reporting requirements. This nesting bird management plan will be coordinated with and submitted for review by USFWS, CDFW, and RMC (as the plan pertains to the LMR area). **AS-6 (NES BIO-29):** Construction staff will not be permitted to bring their pets in, or adjacent to, the construction area. **AS-7 (NES BIO-20):** ESA fencing must be sufficient to prevent the entry of animals into the LOD. Once the ESA fencing has been installed (**NC-6 [NES BIO-6]**), a preconstruction reptile and amphibian clearance survey will be conducted no more than three days prior to site grubbing and grading of lands in the area. If construction is to follow in stages, then the preconstruction clearance survey would be scheduled to follow just prior to site grubbing and grading. Clearance surveys will be conducted during the appropriate time of day when reptiles and amphibians are active. Table 3.20-8 in Section 3.20, *Animal Species*, describes where this measure is applicable for various species.
Threatened and Endangered Species	*Permanent:* Habitat would be permanently affected. Listed below the total acres affected by species: Arroyo Toad: 8.08 Coastal California Gnatcatcher: 67.09	*Permanent:* Habitat would be permanently affected. Additionally, a biological monitor shall be present for activities occurring within or adjacent to riparian habitats where the potential for noise levels to exceed 60 dBA may occur at the edge of suitable habitat. If construction noise is negatively affecting LBV, or other nesting birds, as determined by the biological monitor, work shall cease (unless authorized by the wildlife agencies) until adequate sound barriers can be constructed to reduce noise levels at the edge of the riparian corridor. It may be most effective to construct noise barriers prior to March 15 to ensure construction delays do not occur. All noise barriers will need to be placed within the LOD. **TE-2 (NES BIO-23):** The permanent removal of occupied LBV habitat will be mitigated; a 2:1 ratio is proposed, with compensatory mitigation occurring as creation and/or restoration. For all LBV occupied habitat temporarily removed during construction, restoration would occur at the original location; a 1:1 ratio, including meeting performance criteria, is proposed. Temporal loss of riparian habitat will be addressed by mitigation for riparian-riverine resources (see Section 3.17, *Natural Communities*). Compensatory mitigation for LBV impacts should be coordinated with the riparian-riverine resources mitigation (**NC-15 [NES BIO-14]**), PQP lands mitigation (**NC-20 [NES BIO-21]**), and aquatics permitting mitigation (WET-1). **TE-3 (NES BIO-30):** Prior to the start of construction activities, an SKR management plan will be developed for project activities occurring on the Riverside County Habitat Conservation Agency (RCHCA) SKR Reserve to minimize direct impacts on the species. At a minimum this measure will include: (1) Preconstruction surveys by a qualified biologist; and (2) Avoidance and minimization measures to reduce impacts on SKR. The SKR management plan will be consistent with existing reserve management guidelines that will be coordinated with RCHCA. In addition, the management plan will submitted for review by RCHCA, USFWS, CDFW, and LMRMC (as the plan pertains to the Lake Mathews Multiple Species Reserve area).
Invasive Species	*Permanent:* Some affected areas within the right of way would remain undeveloped to serve as a shoulder and/or maintenance buffer. Areas left as bare ground could create favorable conditions for invasive plants and promote the spread of these species. *Temporary:* Construction vehicles and equipment could transport invasive plant species from previous work sites to project limits of disturbance and adjacent buffer areas.	*Permanent:* Some affected areas within the right of way would remain undeveloped to serve as a shoulder and/or maintenance buffer. Areas left as bare ground could create favorable conditions for invasive plants and promote the spread of these species. *Temporary:* Construction vehicles and equipment could transport invasive plant species from previous work sites to project limits of disturbance and adjacent buffer areas.	*Permanent:* Some affected areas within the right of way would remain undeveloped to serve as a shoulder and/or maintenance buffer. Areas left as bare ground could create favorable conditions for invasive plants and promote the spread of these species. *Temporary:* Construction vehicles and equipment could transport invasive plant species from previous work sites to project limits of disturbance and adjacent buffer areas.	No Impact	**NC-2 (NES BIO-2):** Active construction areas will be watered regularly to control dust and thus minimize impacts on adjacent vegetation (WRC MSHCP Volume I, Section 7.5.3). **NC-3 (NES BIO-3):** When work is conducted during the fire season (as identified by the Riverside County Fire Department) adjacent to any natural vegetation communities, appropriate firefighting equipment (e.g., extinguishers, shovels, water tankers) will be available on the project site during all phases of project construction to help minimize the chance of human-caused wildfires. Shields, protective mats, and/or other fire preventative methods will be used during grinding, welding, and other spark-inducing activities. Personnel trained in fire hazards, preventative actions, and responses to fires will advise contractors regarding fire risk from all construction-related activities (WRC MSHCP Volume I, Section 7.5.3). **NC-5 (NES BIO-5):** The qualified project biologist will monitor construction activities to ensure that practicable measures are being employed and avoid incidental disturbance of habitat and species of concern outside the project footprint (WRC MSHCP Volume I, Section 7.5.3). Special attention will be provided to ensure that the ESA fencing required in Measure **NC-6 (NES BIO-6)** is maintained. Additionally, ongoing monitoring and reporting will occur for the duration of the construction activity to ensure implementation of best management practices. This will be done in concert with Measure **NC-6**, below, which includes the fencing of sensitive areas (e.g.,

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					riparian-riverine resources and jurisdictional waters and wetlands adjacent to the LOD and conserved lands). **NC-6 (NES BIO-6):** Construction personnel will strictly limit their activities, vehicles, equipment, and construction materials to the proposed project footprint and designated staging areas and routes of travel. The construction area(s) will be the minimal area necessary to complete the proposed project and will be specified in the construction plans. Construction limits adjacent to sensitive resource areas will be demarcated using ESA fencing (e.g., orange snow fencing, silt fencing). The ESA fencing will be reviewed at a frequency deemed necessary by the biological monitor (as indicated in Measure **NC-5 [NES BIO-5]**) until the completion of all construction activities. For the ESA fencing installed within WRC MSHCP Core Reserve (RCHCA SKR Reserve and LM MSHCP area), the fencing must exclude reptiles and amphibians (to greatest extent feasible) from entering the LOD. Employees will be instructed that their activities are restricted to the construction areas (WRC MSHCP Volume I, Appendix C). Access to sites will be from pre-existing access routes to the greatest extent possible (WRC MSHCP Volume I, Section 7.5.3 and Appendix C). **NC-7 (NES BIO-17):** Exotic plant species removed during construction will be properly handled to prevent sprouting or regrowth (WRC MSHCP Volume I, Section 7.5.3). Vegetation removed from the project site will be covered while being carried on trucks, and vegetation materials removed from the site will be disposed of in accordance with applicable laws and regulations. **NC-8 (NES BIO-8):** Construction equipment will be cleaned of mud or other debris that may contain invasive plants and/or seeds and inspected to reduce the potential of spreading noxious weeds before mobilizing to the site and before leaving the site during the course of construction. The cleaning of equipment will occur at least 300 feet from ESA fencing to prohibit the spread of invasive species. **NC-10 (NES BIO-10):** Plans for water pollution and erosion control (i.e., SWPPP) will be prepared in accordance with project aquatics permits. The plans will describe sediment and hazardous materials control, dewatering or diversion structures, fueling and equipment management practices, and use of plant material for erosion control. Plans will be reviewed and approved by the County prior to construction (WRC MSHCP Volume I, Section 7.5.3). **NC-12 (NES BIO-12):** During construction, the placement of equipment within a stream or on adjacent banks or adjacent upland habitats occupied by WRC MSHCP covered species that are outside of the project footprint will be avoided (WRC MSHCP Volume I, Section 7.5.3 and Appendix C). **NC-13 (NES BIO-9):** Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades, decompacted to eliminate compressed soils and allow for plant establishment, and hydro-seeded with a County-approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory. **NC-19 (NES BIO-15) (Mitigation):** Restoration of temporary impact areas on the LM MSHCP area will be accomplished through onsite restoration of those temporarily affected areas. A Habitat Mitigation and Monitoring Plan will be developed in consultation with LMRMC, RCA, USFWS, and CDFW.
Short-Term Use – Long-Term Productivity	*Permanent:* Long-term losses would include: • Permanent removal of residential and nonresidential uses and a possible permanent loss of those uses in the	Long-term and short-term losses and gains would be the same as those identified for Build Alternative 1.	Long-term and short-term losses and gains would be the same as those identified for Build Alternative 1.	No impact

	community along the ultimate, Cajalco Road alignment if they are not relocated in the immediate project vicinity; • Permanent conversion of FMMP important farmland and open space to roadway use; • Permanent, limited impacts on residents, business patrons, and travelers such as altered viewsheds, the visual presence of noise barriers, and a change in the aesthetic character of the land adjacent to the corridor due to the wider roadway; • Permanent limited increases in noise and vibration at certain locations along the project corridor; • Permanent loss of archaeological sites and the values associated with those sites; • Permanent loss of paleontologically-sensitive land; • Permanent increase in impervious surfaces resulting in increased stormwater runoff and requiring new drainage facilities, and; • Permanent impacts on plant resources, wildlife resources and open space. Long-term gains would include: • An improved transportation facility to address anticipated growth and mobility needs, as identified in the County of Riverside General Plan Circulation Element Policy 1.5; • Improved interregional travel by improving east-west mobility in Riverside County; • Increased efficiency of the movement of people and goods along Cajalco Road, which is expected to provide regional economic benefits; • Reduction in travel times to community facilities due to roadway efficiency, and; • Improved roadway alignment and intersection design to enhance safety along Cajalco Road. *Temporary / Short-term:* Short-term losses would include: • Economic losses experienced by businesses from temporary displacements, relocations, or traffic detours; • Temporary construction impacts on residents and visitors such as increased noise, impaired air quality from dust and debris, blocked viewsheds, and				

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
	motorized and non-motorized traffic delays or detours; • Temporary loss of productivity on and near sites used as temporary construction staging areas. • Temporary increase in travel time to community facilities; • Temporary, localized disturbance of FMMP important farmlands; • Temporary disturbance of soils during construction increasing the chance of erosion and temporary water quality impacts, and; • Temporary impacts on plant resources, wildlife resources and open space. Short-term benefits would include: • Increased revenue for the local region generated during construction, and possibly limited temporary employment opportunities.				
Irreversible Commitments	Considerable amounts of fossil fuels, labor, public capital, and highway construction materials such as cement, aggregate, and bituminous material would be expended and would not be retrievable following construction. Large amounts of labor and natural resources would be used in the production of construction materials, and are generally not retrievable. However, they are not in short supply, and their use would not have an adverse effect upon continued availability of these resources. Lands currently committed to conservation, including those in the LM MSHCP, LM-EM Reserve, and RCRCD, would be converted to other uses. Construction would require a substantial, one-time expenditure of both state and federal funds; ongoing costs would also be required for roadway maintenance. Savings in travel time and improved transportation system efficiency would offset the use of these materials, labor, resources, and funds.	The commitment of resources would be similar to those identified for Build Alternative 1.	The commitment of resources would be similar to those identified for Build Alternative 1.	No impact

T u'uv, Qax alku Pay mik, and Qax alku Kw imik TCPs: 234.03 acres permanently incorporated to transportation and 62.67 acres of temporary use (1% of Traditional Cultural Properties). De minimis use.		**BIO-7:** Removal of vegetation and exotic species during construction (NC-7 [NES BIO-7]) **BIO-8:** Reduce potential for spread of noxious weeds (NC-8 [NES BIO-8]) **BIO-9:** Hydroseeding bare ground after construction is completed (NC-13 [NES BIO-9], PF VIS-1) **BIO-10:** Water Pollution and Erosion Control Plans. Plans for water pollution and erosion control (i.e., Storm Water Pollution Prevention Plan [SWPPP]) will be prepared in accordance with project aquatics permits. The plans will describe sediment and hazardous materials control, dewatering or diversion structures, fueling and equipment management practices, and use of plant material for erosion control. (NC-10 [NES BIO-10], PF WQ-1, PF WQ-2, PF WQ-4) **BIO-11:** Defining the Limits of Disturbance. The limits of disturbance (LOD), including the upstream, downstream, and lateral extents on either side of any stream adjacent to the project impact footprint, will be clearly defined and marked in the field. Monitoring personnel (biology) will review the LOD prior to initiation of construction activities (NC-11 [NES BIO-11]) **BIO-12:** Placement of Construction Equipment. During construction, the placement of equipment within a stream or on adjacent banks or adjacent upland habitats occupied by Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) covered species that are outside of the project footprint will be avoided (NC-12 [NES BIO-12]) **BIO-13:** Determination of Biologically Equivalent or Superior Preservation (DBESP) report (NC-14 [NES BIO-13]) **BIO-14:** Compensation for permanent impacts on riparian-riverine resources (NC-15 [NES BIO-14]) **BIO-15:** Restoration of temporarily affected lands on the Lake Mathews Reserve and creation of a Habitat Mitigation and Monitoring Plan (NC-19 [NES BIO-15]) **BIO-16:** Night light shielding within potential WRC MSHCP conservation areas (AS-2 [NES BIO-16]) **BIO-17:** Compensation for permanent loss of habitat within LM MSHCP (NC-17 [NES BIO-17]) **BIO-18:** Noise Reduction for Equipment. Between March 15 and September 15, all heavy equipment will install and maintain mufflers or other noise-reducing features will be installed when working at Temescal Creek and Cajalco Creek. Additionally, a biological monitor shall be present for activities occurring within or adjacent to riparian habitats where the potential for noise levels to exceed 60 A-weighted decibels may occur at the edge of suitable habitat. If construction noise is negatively affecting least Bell's vireo or other nesting birds, as determined by the biological monitor, work shall cease (unless authorized by the wildlife agencies) until adequate sound barriers can be constructed to reduce noise levels at the edge of the riparian corridor. Do not exceed 86 A-weighted decibels maximum noise level at 50 feet from job site activities between 9:00 p.m. and 6:00 a.m. (TE-1 [NES BIO-18]; PF NOI-1) **BIO-19:** Wildlife Fencing Plan. A Wildlife Fencing Plan will be developed and implemented for the preferred build alternative. (NC-16 [NES BIO-19]) **BIO-20:** Environmentally sensitive area (ESA) fencing sufficient to prevent the entry of animals into the limits of disturbance will be installed prior to, and maintained during, construction. (AS-7 [NES BIO-20]) **BIO-21:** Replace PQP lands in Core C and Proposed Linkage 3 at a 1:1 ratio (NC-20 [NES BIO-21])

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					BIO-22: Collection of Paniculate Tarplant Seeds (PL-1 [NES BIO-22]) **BIO-23:** Apply Minimum Lighting Standards (PF VIS-4) **BIO-24:** Removal of trash and debris (NC-9 [NES BIO-24]) **BIO-25:** Post-construction best management practices (BMPs. Post-Construction BMPs will be implemented to the maximum extent practicable, consistent with the requirements of the National Pollutant Discharge Elimination System permit and Waste Discharge Requirements for the County of Riverside's Municipal Separate Storm Sewer System Permit in place at the time of project approval. (PF WQ-3) **BIO-26:** Exhaust emissions control measures during construction (PF AQ-1) **BIO-27:** Fugitive dust control measures (PF AQ-2) **BIO-28:** Handling, Transport, and Disposal of Wastes. Wastes and petroleum products used or encountered during construction will be collected, transported, and removed from the project site in accordance with Resource Conservation and Recovery Act regulations and federal/Occupational Health and Safety Administration standards, including Waste Management and Materials Pollution Control BMPs – Spill Prevention and Control, Materials; and Waste Management BMPs, Hazardous Waste Management. (PF HAZ-3) **BIO-29:** Pet Policy. No pets will be allowed in, or adjacent to, conserved lands (AS-6 [NES BIO-29]) **BIO-30:** Stephens' Kangaroo Rat Management Plan. Prior to the start of construction activities, a Stephens' kangaroo rat (SKR) management plan will be developed for project activities occurring on the Riverside County Habitat Conservation Agency (RCHCA) SKR Reserve to minimize direct impacts on the species. (TE-3 [NES BIO-30]) **BIO-31:** Preconstruction Surveys (AS-3 [NES BIO-28]) **BIO-32:** Funding for reserve management, maintenance, and security on Lake Mathews Reserve (NC-18 [NES BIO-31]) **BIO-33:** Cajalco Creek Dam and Detention Basin, and Cajalco Creek Sedimentation Basin (HYD-1) **CR-1:** Discovery of Human Remains **CR-2:** Unanticipated Discoveries **PF NOI-1:** Do not exceed 86 A-weighted decibels maximum noise level at 50 feet from job site activities between 9:00 p.m. and 6:00 a.m. (2018 California Department of Transportation Standard Specifications, Section 14-8.02, Noise Control). **NOI-2:** Construct soundwall S-624 at the right of way at a height of 10 feet, provided that the survey process approves soundwall S-624. **NOI-3:** Construct soundwalls S-650 and S-652 (property line) at heights of 8 feet, provided that the survey process approves. **NOI-4:** Inclusion of Quiet Pavement (CEQA Measure). The County will require the construction contractor to provide an asphalt mix that provides 5-decibel minimum tire pavement noise reduction, and will include this mix during construction and paving of the proposed project. **PF NOI-5:** Construction noise would be temporary and limited to the duration of the construction. Noise control measures will also be incorporated into the project contract specifications in order to minimize construction noise effects.
Cumulative Impacts	Would not contribute to cumulative adverse impacts related to air quality, geology, hazardous materials/wastes, traffic, utilities	Would not contribute to cumulative adverse impacts related to air quality, geology, hazardous materials/wastes, traffic, utilities	Would not contribute to cumulative adverse impacts related to air quality, geology, hazardous materials/wastes, traffic, utilities	No impact	Measures for each resource affected are identified in Section 3.25, *Cumulative Impacts*. No new, additional avoidance, minimization, or

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
	and emergency services, energy, parks and recreational facilities, land use, community, environmental justice, noise, visual/aesthetics, hydrology, water quality, natural communities, wetlands and other waters, plant species, threatened and endangered species, animal species, and paleontological resources. Would contribute to a cumulative loss of farmlands and cultural resources. Anticipated cumulative impacts include the permanent loss of farmlands and adverse effects on cultural resources, as a result of construction and other future land development and infrastructure projects.	and emergency services, energy, parks and recreational facilities, land use, community, environmental justice, noise, visual/aesthetics, hydrology, water quality, natural communities, wetlands and other waters, plant species, threatened and endangered species, animal species, and paleontological resources. Would contribute to a cumulative loss of farmlands and cultural resources. Anticipated cumulative impacts include the permanent loss of farmlands and adverse effects on cultural resources, as a result of construction and other future land development and infrastructure projects.	and emergency services, energy, parks and recreational facilities, land use, community, environmental justice, hydrology, water quality, natural communities, wetlands and other waters, plant species, threatened and endangered species, animal species, and paleontological resources. Would contribute to a cumulative loss of farmlands and cultural resources, and cumulatively considerable contribution to impacts involving visual/aesthetics and noise. Anticipated cumulative impacts include the permanent loss of farmlands, adverse effects on cultural resources, increased ambient noise level and loss of scenic resources, as a result of construction and other future land development and infrastructure projects.		mitigation measures are identified that would avoid cumulative impacts identified for the build alternatives.
Climate Change	*Permanent:* Annual GHG emissions estimated to increase 0.88 percent.[5] Carbon dioxide (CO_2) emissions predicted to be 1,377,419 metric tons per year by 2044; 0.88 percent increase over 2044 No-Build Conditions. *Temporary:* Construction GHG emissions would result from material processing, onsite construction equipment, and traffic delays due to construction.	*Permanent:* Annual GHG emissions estimated to increase 0.38 percent.[3] CO_2 emissions predicted to be 1,370,635 metric tons per year by 2044; 0.38 percent increase over 2044 No-Build Conditions. *Temporary:* Construction GHG emissions would result from material processing, onsite construction equipment, and traffic delays due to construction.	*Permanent:* Annual GHG emissions estimated to increase 0.99 percent. CO_2 emissions predicted to be 1,378,941 metric tons per year by 2044; 0.99 percent increase over 2044 No-Build Conditions. *Temporary:* Construction GHG emissions would result from material processing, onsite construction equipment, and traffic delays due to construction.	CO_2 emissions are predicted to be 1,365,350 metric tons per year by 2044.	**GHG-1:** The project will incorporate the use of energy efficient lighting, such as light-emitting diode (LED) traffic signals. LED bulbs—or balls, in the stoplight vernacular—consume less electricity than traditional lights, which will also help reduce the project's carbon dioxide emissions. **PF LU-1:** Traffic Management Plan. **PF VIS-1:** Contouring and Replanting Disturbed Areas. Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades and hydro-seeded with a County of Riverside–approved native plant seed mix. **VIS-2:** Replace or Relocate Site Features and Landscaping Affected by the Project. Where appropriate and to the degree possible, landscaping and related appurtenances, such as fencing, privacy walls, and other similar features, removed from private properties as a result of construction will be relocated, replaced, or restored in place and in kind to address visual impacts. **PF VIS-4:** Apply Minimum Lighting Standards. The lowest allowable wattage will be used for all lighted areas, and the number of nighttime lights needed to light an area will be minimized. Lighting will be designed for energy efficiency, with daylight sensors or timers with an on/off program. **VIS-8:** Replace Disturbed Vegetation along Landscaped Freeways. The County of Riverside will work with the appropriate Caltrans district landscape architect to determine which disturbed portions of landscaped freeways within the project limits require replanting and to what extent. **PF AQ-1:** The project would conform to Caltrans construction requirements, as specified in Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). Measures may include, but are not limited to: maintain and operate construction equipment; trucks and vehicles in loading and unloading queues would have their engines turned off when not in use; all equipment shall be properly tuned and maintained; restrict idling of construction vehicles to no longer than 5 consecutive minutes; use electricity from power poles, rather than temporary diesel- or gasoline powered generators if or where feasible; use onsite mobile equipment powered by alternative fuel sources (i.e., methanol, natural gas, propane, or butane) as feasible; use solar-powered signal boards.

[5] Differences in VMT and CO_2 emissions between Alternatives 1 and 2C based on results of traffic modeling conducted for each alternative.

Affected Resources	Build Alternative 1 Cajalco Alignment	Build Alternative 2C Modified Cajalco Alignment	Build Alternative 4 El Sobrante Alignment	No-Build Alternative No Project Alternative	Avoidance, Minimization and Compensation Measures
					NC-13 (NES BIO-9): Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades, decompacted to eliminate compressed soils and allow for plant establishment, and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory. **NC-15 (NES BIO-14):** Compensation for permanent impacts on riparian-riverine resources will occur as a combination of enhancement, restoration, and/or creation, as long as there is no net loss of riparian-riverine resources. **WET-1:** Compensation for direct permanent impacts on USACE wetland and non-wetland WoUS, and CDFW streambed and associated riparian habitat, will occur as a combination of enhancement, restoration, and/or creation, at a ratio that achieves no net loss of wetland WoUS. **PF SW-**1**:** Consistent with Caltrans Standard Specification 14-10, non-hazardous construction-period waste shall be recycled.

[This page left blank intentionally.]

S.6.2 Significant Impacts and/or Substantial Adverse Effects

As summarized in Table S-1 and discussed in detail in Chapter 4, the following impacts of the build alternatives were determined to be significant, adverse, and unavoidable under CEQA, after implementation of avoidance, minimization, and mitigation measures, as well as project design features:

- Long-term aesthetic impacts
- Conflict with provisions of an adopted Habitat Conservation Plan and Natural Community Conservation Plan
- Long-term increase in ambient noise levels in the project vicinity above levels existing without the project (Build Alternative 4)
- Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b) as it relates to evaluating a project's transportation impacts in the context of vehicle miles traveled.
- Impacts on cultural resources
- Generation of direct and indirect greenhouse gas emissions

Also summarized in Table S-1 and discussed in detail in Chapter 4, the following impacts of the Build Alternatives were determined to be significant under CEQA, but with the incorporation of identified avoidance, minimization, and/or mitigation measures, the impacts have been avoided, minimized or reduced, thereby resulting in less-than-significant impacts:

- Long-term and short-term effects on species identified as a candidate, sensitive, or special-status species
- Long-term and short-term effects on state and federally protected wetlands, riparian habitat, and other sensitive natural community
- Impacts on native wildlife nursery sites
- Impacts on paleontological resources
- Hazards involving routine transport, use, or disposal of hazardous materials, and/or upset and accident conditions involving the release of hazardous materials
- Conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect
- Long-term increase in ambient noise levels in the project vicinity above levels existing without the project (Build Alternatives 1 and 2C)
- Short-term exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels
- Short-term substantial or periodic increase in ambient noise levels in the project vicinity

- Redirection of flood flows through alteration of the existing drainage pattern of the site or area, or through the addition of impervious surfaces
- New source of substantial glare that would negatively affect daytime or nighttime views in the area
- Short-term impacts on traffic and public services associated with the provision of new or physically altered governmental facilities
- Installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts on the environment

S.7 Coordination with Public and Other Agencies

As part of the NEPA and CEQA process, a scoping meeting is required as part of the preparation of an EIR and EIS. In September 2011, a Notice of Preparation (NOP) of an EIR was received and accepted by the State Clearinghouse on September 6, 2011, and advertised to the public and mailed to elected officials and local, state, and federal agencies having jurisdiction or discretionary approval within the project corridor. Public scoping meetings were held September 26 and 29, 2011. At the time of NOP issuance, a complex Environmental Assessment was proposed for addressing analysis of the proposed project under NEPA.

In September 2012, following receipt of comments and agency feedback in response to the NOP, a Notice of Intent (NOI) to prepare an EIS was advertised to the public and mailed to elected officials and local, state, and federal agencies having jurisdiction or discretionary approval within the project corridor. The NOI was published in the Federal Register on September 26, 2012, and public scoping meetings held October 24 and 25, 2012. An agency Scoping Meeting was also held on October 24, 2012.

Various agencies were invited to participate in the project as cooperating, participating, and/or responsible agencies, as applicable. Under 23 USC 139, letters of Invitation requesting various agencies' involvement as cooperating and/or participating agencies were distributed October 1, 2012. Based on responses to the letters of invitation, a list of cooperating and participating agencies interested in involvement in the project were identified and interagency review roles established. A summary of consultation and coordination is provided in Chapter 5, *Comments and Coordination*. All agencies on this list have been requested to comment on key components of the environmental document prior to public circulation.

Public outreach efforts include public information meetings held October 10, October 16, and November 14, 2013, and July 14 and August 5, 2015. Additional community meetings have been held and are described in Chapter 5.

S.8 Permits and Approvals

Table S-2. Permits and Approvals Needed

Agency	Permit/Approval	Status
U.S. Fish and Wildlife Service (USFWS)	• Section 7 consultation for Threatened and Endangered Species • Section 7 consultation with USACE on Section 404 permit • Joint Project Review (JPR) • Concurrence with County Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) Consistency Determination • Approval of minor amendment to WRC MSHCP • Concurrence with Determination of Biologically Equivalent or Superior Preservation (DBESP) • Equivalency Analysis of Public/Quasi-Public Lands Replacement • Approval of replacement lands pursuant to the Habitat Conservation Plan (HCP) for the Stephens' kangaroo rat (SKR) • Approval of Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) discretionary action • Approval of SKR HCP Minor Amendment	1. Section 7 consultations are to be conducted following identification of a Preferred Alternative and preparation of the WRC MSHCP Consistency Determination, which will serve as the Biological Assessment. 2. MSHCP Consistency Determination and DBESP to be prepared and submitted for USFWS concurrence following identification of a Locally Preferred Alternative and prior to approval of the Final EIS. 3. The JPR Application will be submitted following preparation of the MSHCP Consistency Determination and DBESP. 4. Minor amendment to the WRC MSHCP will be requested by the County EIS Record of Decision (ROD). 5. JPR finding following approval of Minor Amendment, and after EIS ROD. 6. Approval of replacement lands pursuant to the SKR HCP, WRC MSHCP minor amendment, and LM MSHCP discretionary action will be requested by the County after the EIS ROD is approved.
United States Army Corps of Engineers (USACE)	Section 404 Permit for fill or dredging waters of the United States	Application to be submitted prior to construction.
California Department of Fish and Wildlife (CDFW)	• Section 1602 Lake and Streambed Alteration Agreement • JPR • Concurrence with County MSHCP Consistency Determination • Approval of WRC MSHCP Minor Amendment • Approval of replacement lands pursuant to the SKR HCP • Concurrence on DBESP • Approval of LM MSHCP discretionary action • Approval of SKR HCP Minor Amendment	1. Section 1602 Notification is to be submitted and agreement obtained prior to the start of construction. 2. The MSHCP Consistency Determination and DBESP will be prepared and submitted for concurrence following identification of a Preferred Alternative and prior to certification of the Final EIR. 3. Amendment to the WRC MSHCP to be requested by the County after the Final EIR is certified. 4. Approval of replacement lands pursuant to the SKR HCP, WRC MSHCP minor amendment, and LM MSHCP discretionary action will be requested by the County after certification of the Final EIR.

Agency	Permit/Approval	Status
California State Water Resources Control Board	• Coverage under the General Permit for Discharges of Stormwater associated with Construction Activity (Construction General Permit, Order No. 2009-0009-DWQ) • Water Discharge Permit, approval of NOI to comply with General Construction Activity • National Pollutant Discharge Elimination System (NPDES) Permit	• Following completion of the Final Design phase of the project. • NOI to be submitted prior to construction. • Application to be submitted prior to construction.
Western Riverside County Regional Conservation Authority (RCA)	• Minor Amendment under Section 7.2.2 • Concurrence with County MSHCP Consistency Determination and JPR finding	• Minor amendment to the WRC MSHCP will be requested by the County following approval of a Preferred Alternative. • JPR finding and concurrence with County MSHCP Consistency Determination following approval of Minor Amendment, and prior to EIS ROD.
County of Riverside, Riverside County Habitat Conservation Agency (RCHCA)	• Approval of replacement lands pursuant to the SKR HCP • Section 4(f) consultation • LM MSHCP discretionary action	• Approval of replacement lands pursuant to the SKR HCP will be requested by the County after certification of the Final EIR. • Section 4(f) consultation will be completed prior to completion of the Final EIR/EIS.
Regional Water Quality Control Board 8 (RWQCB)	Section 401 Water Quality certification	Application to be submitted prior to construction.
County of Riverside	Temporary construction permits and relinquishment of County right of way to MWD	To be coordinated during Final Design phase of the project.
City of Corona	Approval of encroachment permits and street construction permits, and improvements within public right of way	Actions/permits would be issued prior to start of construction.
Riverside County Flood Control and Water Conservation District (RCFCWCD)	Encroachment permits for improvements affecting RCFCWCD facilities	Application(s) to be submitted prior to construction.
Caltrans, District 8	Encroachment Permit for work within I-215 right of way	Application to be submitted prior to construction.
Metropolitan Water District of Southern California (MWD)	• LM MSHCP discretionary action • Section 4(f) consultation • Land transfers between MWD and County	• Consultation and discretionary action following approval of Preferred Alternative; land transfers following Final EIR/EIS. • Section 4(f) consultation will be completed prior to completion of the Final EIR/EIS.

Agency	Permit/Approval	Status
Burlington Northern Santa Fe (BNSF)	• Encroachment permit • Required for work performed within railroad right of way	To be acquired prior to any construction activity occurring within BNSF right of way.
California Public Utilities Commission	Compliance with Public Utilities Code Sections 1201 through 1205, for grade separated structure over BNSF rail line	Application to the California Public Utilities Commission to occur during Final Design phase of the project.
State Historic Preservation Officer (SHPO)	• Concurrence with agencies' determinations of eligibility and findings of effect • Memorandum of Agreement	• SHPO concurrence with determinations of eligibility and findings of effect confirmed. • Memorandum of Agreement consultation will be completed prior to completion of the Final EIR/EIS.
Participating Native American Tribes	Required consultation under National Historic Preservation Act, Section 106, including (but not limited to): determinations of eligibility, findings of effect, and future work that includes involvement with the Memorandum of Agreement, Archaeological Monitoring Plan, and Data Recovery Plan	Native American consultation for the project is ongoing.

S.9 Unresolved Issues

The LM MSHCP does not currently accommodate the roadway widening and improvements through the LM MSHCP area, including the Lake Mathews Multiple Species Reserve (LMR), proposed by the build alternatives. Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements. Coordination between the County, MWD, RCHCA, and Lake Mathews Reserve Management Committee (LMRMC), including member resource agencies, has been ongoing since 2011 to address concerns involving the design and placement of the build alternatives, wildlife crossing opportunities, protection of wetland resources, and the management and security of LMR and Lake Mathews facilities. As a result of the coordination, a number of design modifications have been made to the build alternatives to avoid or otherwise minimize impacts on Lake Mathews facilities and LMR wetland resources, and enhance wildlife crossing opportunities. Additional measures to aid in the management and security of LMR and Lake Mathews facilities have been discussed with MWD and RMC member agencies, and will be further coordinated as part of the discretionary action.

While no other specific unresolved issues are noted at this time for the project, through the public review of this Draft EIR/EIS, other issues may be identified that would require resolution prior to approval of the Final EIR/EIS, the Notice of Determination under CEQA, and the issuance of a Record of Decision under NEPA.

S.10 Areas of Controversy

Based on comments received on the Notice of Preparation and Notice of Intent for project, as well as input received from the public, environmental advocacy groups, and resource agencies, areas of

controversy may include changes in traffic circulation, trucking and traffic speed, community impacts, growth, business and residential relocations, impacts involving the WRC MSHCP, LM MSHCP, SKR HCP, including threatened/endangered species and wildlife crossing opportunities, impacts on cultural resources, and impacts involving greenhouse gas emissions.

Chapter 1. **Proposed Project**

1.1 Introduction

The Riverside County Transportation Department (County), in cooperation with the California Department of Transportation (Caltrans), proposes to widen Cajalco Road, or a combination of Cajalco Road and El Sobrante Road, between Temescal Canyon Road to the west and Interstate 215 (I-215) to the east. Caltrans, as assigned by the Federal Highway Administration (FHWA), is the lead agency under the National Environmental Policy Act (NEPA). The County is the lead agency under the California Environmental Quality Act (CEQA). The proposed project is located in Riverside County, California, and covers a distance of approximately 15.7 miles. In general, Cajalco Road and El Sobrante Road through the project area are two-lane undivided roadways with one 12-foot lane in each direction and shoulders of varying widths. Please refer to Figures 1-1 and 1-2 for project location and vicinity maps.

Between Temescal Canyon Bridge and Harvill Avenue, the project would widen the existing two-lane roadway to four lanes, and between Temescal Canyon Road and Temescal Canyon Bridge, and Harvill Avenue and the I-215 southbound ramps, the project would widen the existing four-lane roadway to six lanes, to improve east-west mobility and to provide increased capacity and improved traffic flow and safety. Portions of the project are located within the Metropolitan Water District of Southern California (MWD) Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) (see Figure 1-2). Because the LM MSHCP does not currently accommodate roadway improvements, or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. The total cost of the proposed project, including right of way, would range from $358,699,000 to $514,615,000, depending upon the build alternative selected.

The project is partially funded and is in the Southern California Association of Governments' (SCAG) financially constrained 2021 Federal Transportation Improvement Program (FTIP) (Project Number RIV090903), which was found to conform by the Federal Highway Administration (FHWA) and Federal Transit Administration (FTA) on April 16, 2021.[1] The project is also included in the list of the modeled projects in the SCAG 2020–2045 Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS) (Project Number

[1] The project is currently described in the 2021 FTIP as "CAJALCO RD. WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON RD. TO HARVILL AVE AND FROM 4 TO 6 LANES FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND A BRIDGE RECONSTRUCTION OVER A WATER CROSSING." The County of Riverside has submitted an amendment that would update the description as follows: "IN RIVERSIDE COUNTY ON CAJALCO RD - WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON. BRIDGE/EAGLE CANYON ROAD TO HARVILL AVE AND FROM 4 TO 6 LANES WITH THREE LANES IN THE WESTBOUND DIRECTION FROM TEMESCAL CANYON RD TO TEMESCAL CANYON BRIDGE, THREE LANES IN THE EASTBOUND DIRECTION FROM TEMESCAL CANYON ROAD TO JUST EAST OF EAGLE CANYON ROAD, AND THREE LANES EASTBOUND AND WESTBOUND FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND THE CONSTRUCTION OF NEW, AND RECONSTRUCTION OF EXISTING, BRIDGES AS NEEDED." This amendment will be obtained prior to adoption of the Final Environmental Document.

3A04WT137), which was found to conform by FHWA and FTA on June 5, 2020. Analysis concludes that the project's operational emissions (which include the ozone precursors reactive organic gases [ROG] and nitrogen oxides [NOx]) meet the transportation conformity requirements imposed by the U.S. Environmental Protection Agency (EPA) and South Coast Air Quality Management District (SCAQMD). Please see copies of the listing of the project in the 2020 RTP and the 2021 FTIP in Appendix G of this document.

1.2 Purpose and Need

1.2.1 Project Purpose

The purpose of the Cajalco Road Widening and Safety Enhancement Project (project) is to:

- Improve the transportation facility to address anticipated growth and mobility needs.
- Improve interregional travel by improving east-west mobility in Riverside County.
- Improve roadway alignment and intersection design to enhance safety.

1.2.2 Project Need

1.2.2.1 Capacity, Transportation Demand, and Safety

Existing Capacity and Level of Service

The proposed project is located within western Riverside County between two major transportation corridors, Interstate 15 (I-15) and I-215, and traverses through a number of local communities. The ability of the transportation facility to facilitate east-west movement between the two corridors, while serving the transportation needs of the local communities, relies heavily upon capacity and level of service. Roadway capacity is determined by the number of vehicles that can reasonably pass over a given section of roadway in a given period of time. Level of service (LOS) is a measurement of the ability of a roadway to accommodate traffic. LOS conditions are designated as "A," indicating best free-flow conditions, through "F," indicating worst-case, congested conditions.

Maximum traffic volumes measured in terms of average daily traffic (ADT) for each LOS (A through E), for arterial roadways in Riverside County, are listed in Table 1-1, below.

Table 1-1. Arterial Level of Service

Number of Lanes	Maximum Two-Way Traffic Volume (ADT)				
	LOS A	LOS B	LOS C	LOS D	LOS E
2	10,800	12,600	14,400	16,200	18,000
4	21,540	25,130	28,700	32,300	35,900
6	32,340	37,730	43,100	48,500	53,900

Cajalco Road east of Day Street	2	26,390	F
Source: Caltrans 2017a. Shaded cells represent unacceptable LOS (LOS standard exceeded)			

Under existing conditions, two-lane Cajalco Road currently operates at unsatisfactory LOS F between El Sobrante Road and Day Street, and satisfactory LOS C and A between Temescal Canyon Road and El Sobrante Road. El Sobrante Road currently operates at satisfactory LOS B east of La Sierra Avenue.

Sixty-nine roadway intersection were studied within the project area and compared with LOS criteria for both signalized and unsignalized intersections, measured as the delay associated with each LOS grade, as well as a qualitative description of intersection operations at each corresponding grade, as presented in Table 1-3, below. In order to maintain consistency with County standards, LOS D was established as the design standard for intersections.

Table 1-3. Intersection Level of Service Definitions

LOS	Description	Signalized Intersection Delay (seconds per vehicle)	Unsignalized Intersection Delay (seconds per vehicle)
A	Excellent operation. All approaches to the intersection appear quite open, turning movements are easily made, and nearly all drivers find freedom of operation.	≤10	≤10
B	Very good operation. Many drivers begin to feel somewhat restricted within platoons of vehicles. This represents stable flow. An approach to an intersection may occasionally be fully utilized and traffic queues start to form.	>10 and ≤20	>10 and ≤15
C	Good operation. Occasionally drivers may have to wait more than 60 seconds, and back-ups may develop behind turning vehicles. Most drivers feel somewhat restricted.	>20 and ≤35	>15 and ≤25
D	Fair operation. Cars are sometimes required to wait more than 60 seconds during short peaks. There are no long-standing traffic queues.	>35 and ≤55	>25 and ≤35
E	Poor operation. Some long-standing vehicular queues develop on critical approaches to intersections. Delays may be up to several minutes.	>55 and ≤80	>35 and ≤50
F	Forced flow. Represents jammed conditions. Backups form locations downstream or on the cross street may restrict or prevent movement of vehicles out of the intersection approach lanes; therefore, volumes carried are not predictable. Potential for stop and go type traffic flow.	>80.0 or V/C >1	>50

Existing LOS for each of the study area intersections is presented in Table 1-4, below.

Table 1-4. Intersection Level of Service – Baseline Conditions

	Intersection	Control Type	AM Peak Hour		PM Peak Hour

TWSC – Two Way Stop Control
AWSC – All Way Stop Control
SR-60 = State Route 60
Delay – Average control delay in seconds
Shaded cells represent unacceptable LOS (LOS standard exceeded)

As indicated in Table 1-4, five intersections currently operate at unsatisfactory LOS E or F during AM or PM peak hours:

- I-15 SB ramps and Ontario Avenue
- La Sierra Avenue and El Sobrante Road
- Alexander Street and Markham Street
- I-215 SB ramps and Cajalco Expressway/Cajalco Expressway
- I-215 NB ramps and Cajalco Expressway/Ramona Expressway

The 13 study intersections along Cajalco Road between Temescal Canyon Road and Harvill Avenue currently operate at satisfactory LOS A, B, C or D.

Regional Population Forecasts

Using socioeconomic data, including growth forecasts and economic trends, SCAG evaluates the need for and identification of long-range transportation projects throughout the Southern California region, including Riverside County, for the RTP/SCS. The 2016 SCAG RTP/SCS indicates that the population for Riverside County in 2015 was 2,316,000 and estimated that the County population would be 3,183,000 in 2040. Given these numbers, there will be a nearly 40% increase in the County population between 2015 and 2040. Regional traffic is predicted to increase with the projected growth in population.

Compared to eastern Riverside County, the western portion of the County contains the greatest concentration of population and has experienced the greatest growth pressures. The majority of this population is concentrated in the incorporated cities.

The County of Riverside General Plan Circulation Element Policy 1.5 states: "Evaluate the planned circulation system as needed to enhance the arterial highway network to respond to anticipated growth and mobility needs."

Table 1-5 indicates growth trends, and projected population and employment, for Riverside County, Riverside County unincorporated areas, and for cities adjacent to the project (Corona, Perris and Riverside).

Table 1-5. Population/Employment Projections and Growth Trends

	Population				Employment			
Area	2012	2040	Annual Growth Rate	Total Growth 2012–2040	2012	2040	Annual Growth Rate	Total Growth 2012–2040
Riverside County[1]	2,253,312	3,139,038	1.39%	39.3%	573,600	888,600	1.55%	54.9%
Unincorporated Riverside County	359,000	499,200	1.39%	39.1%	70,500	156,600	4.36%	122.1%
Corona	156,000	172,300	0.37%	10.5%	66,400	88,400	1.18%	33.1%
Perris	70,700	116,700	2.32%	65.1%	15,100	32,200	4.04%	113.2%
Riverside (City)	310,700	386,600	0.87%	24.4%	120,000	200,500	2.4%	67.1%

Sources: SCAG 2016a.
[1] Caltrans 2019.

By Year 2040, the population of unincorporated Riverside County is estimated to increase by 39.1% and employment is projected to increase 122.1%. Adjacent cities are also projected to experience similar growth, with the greatest increase in population and employment anticipated for Perris at 65.1% and 113.2%, respectively.

Level of Service Projections

Riverside County includes RTP/SCS-listed projects, as well as Western Riverside Council of Governments' (WRCOG) Transportation Uniform Mitigation Fee (TUMF), Measure A networks, and local Capital Improvement Programs (CIP), in their travel demand model for the County, Riverside Traffic Analysis Model (RIVTAM). Traffic forecasts based on RIVTAM and baseline data were developed for the proposed project study area, and include projected ADT, LOS, vehicle speed, Vehicle Miles Traveled (VMT), Vehicle Hours Traveled (VHT) and Vehicle Hours Delay (VHD). A comparison of existing and projected ADT and LOS for

roadway segments within the project limits and intersections within the project study area, is provided in Tables 1-7 and 1-8 on the following pages.

Table 1-6 indicates the projected ADT and LOS in Year 2044 for traffic along mainline Cajalco Road within the project limits.

Table 1-6. Traffic Volumes and Level of Service – Existing and 2044 No-Build Forecast Conditions

As indicated in Table 1-6, two-lane Cajalco Road is projected to continue operating at unsatisfactory LOS F between El Sobrante Road and Day Street in future Year 2044. When compared with existing conditions, ADT traffic on Cajalco Road is estimated to increase an average of 38.2% by Year 2044.

Projected LOS for each of the study area intersections are presented in Table 1-7.

AM Peak Hour – 6 a.m. to 9 a.m.
PM Peak Hour – 3 p.m. to 7 p.m.
TWSC – Two Way Stop Control
AWSC – All Way Stop Control
Delay – Average control delay in seconds
Shaded cells represent unacceptable LOS (LOS standard exceeded)
[1] Two Way Stop Control under 2024 conditions.

In 2044, 30 of the 69 study intersections are forecast to operate at unsatisfactory LOS under year 2044 No-Build conditions. Eighteen intersections are forecast to operate at unsatisfactory LOS during AM peak hour and 25 during PM peak hour. Between Temescal Canyon Road and Harvill Avenue, Cajalco Road is projected to operate at an unsatisfactory LOS at five of the 13 study intersections along Cajalco Road under year 2044 No-Build conditions:

- No. 12 Cajalco Road and Temescal Canyon Road
- No. 23 Cajalco Road and Gavilan Road
- No. 26 Cajalco Road and Harley John Road
- No. 36 Clark Street and Cajalco Road
- No. 42 Seaton Avenue and Cajalco Road

The remaining eight study intersections located on Cajalco Road between Temescal Canyon Road and Harvill Avenue are projected to operate at satisfactory LOS under year 2044 No-Build conditions.

Projected Capacity Needs

Traffic forecasts for Year 2044 are provided in Tables 1-6 and 1-7, above. Table 1-6 indicates ADT along Cajalco Road between Harley John Road and Day Street is forecast to increase from between 18,280 and 19,890 vehicles (2014) to between 23,800 and 27,330 vehicles (2044) under

the No-Build Alternative (2044). Increased ADT along segments of Cajalco Road between Temescal Canyon Road and Harley John Road, and between Day Street and I-215, and along El Sobrante Road, in Year 2044 are also predicted. Table 1-7 indicates the following five intersections within the project study area currently operate at an unacceptable LOS (2014):

- I-15 southbound ramps and Ontario Avenue – LOS E in the AM peak hour
- La Sierra Avenue and El Sobrante Road – LOS E in the PM peak hour
- Alexander Street and Markham Street – LOS F in the AM peak hour
- I-215 southbound ramps and Cajalco Expressway/Ramona Expressway – LOS F in the AM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway – LOS E in the AM peak hour

In addition, and as presented in Table 1-7, the following 30 intersections are projected to operate at an unacceptable LOS in the forecast Year (2044) No-Build condition:

- I-15 southbound ramps and Ontario Avenue – LOS F in the AM and PM peak hour
- I-15 northbound ramps and Ontario Avenue – LOS F in the AM and PM peak hour
- Bedford Canyon Road and El Cerrito Road – LOS F in the PM peak hour
- Cajalco Road and Bedford Canyon Road – LOS in the AM and PM peak hour
- Cajalco Road and I-15 Southbound ramps – LOS F in the PM peak hour
- Cajalco Road and Temescal Canyon Road – LOS F in the AM and PM peak hour
- I-15 northbound ramps and Weirick Road – LOS F in the AM peak hour
- La Sierra Avenue and Victoria Avenue – LOS F in the AM and PM peak hour
- La Sierra Avenue and El Sobrante Road – LOS E in the AM peak hour, and LOS F in the PM peak hour
- Cajalco Road and Gavilan Road – LOS F in the PM peak hour
- Gavilan Road and Lake Mathews Drive – LOS F in the PM peak hour
- Harley John Road and Washington Road – LOS F in the PM peak hour
- Cajalco Road and Harley John Road – LOS F in the AM and PM peak hour
- Alexander Street and Markham Street – LOS E in the AM peak hour, and LOS F in the PM peak hour
- Clark Street and Cajalco Road – LOS F in the PM peak hour
- Seaton Avenue and Cajalco Road – LOS F in the AM peak hour
- Sycamore Canyon Road and State Route 60 (SR-60)/I-215 southbound ramps – LOS F in the AM and PM peak hour
- SR-60/I-215 northbound ramps and Fair Isle Drive/Box Springs Road – LOS F in the AM peak hour, and LOS E in the PM peak hour

- Day Street and SR-60 westbound ramps – LOS F in the PM peak hour
- Day Street and SR-60 eastbound ramps – LOS E in the PM peak hour
- I-215 ramps and Eucalyptus Avenue – LOS F in the PM peak hour
- I-215 northbound ramps and Alessandro Boulevard – LOS E in the AM peak hour
- I-215 northbound ramps/Old 215 Frontage Road and Cactus Avenue – LOS F in the AM peak hour, and LOS E in the PM peak hour
- I-215 northbound ramps and Harley Knox Boulevard – LOS F in the PM peak hour
- I-215 southbound ramps and Cajalco Expressway/Ramona Expressway – LOS F in the AM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway – LOS E in the AM and PM peak hour
- I-215 southbound ramps and Nuevo Road – LOS F in the PM peak hour
- I-215 northbound ramps and Nuevo Road – LOS E in the AM peak hour
- Webster Avenue and Ramona Expressway – LOS F in the PM peak hour
- Indian Street and Ramona Expressway – LOS E in the AM peak hour, and LOS F in the PM peak hour

East–West Mobility in Riverside County

In Riverside County, the circulation system is intended to accommodate a pattern of concentrated growth, providing both a regional and local linkage system between unique communities. Travel, including freight movement, extends beyond the Riverside County boundary, and, as a result, the transportation system must be capable of adequately meeting a wide range of needs. Not only does the County need to accommodate the traffic that it generates, it also must accommodate the pass through traffic. Regional east-west transportation corridors that connect I-15 and I-215 are limited; the nearest east-west corridors are State Route 74 (SR-74) located approximately 4.5 miles south of Cajalco Road/Cajalco Expressway at I-215, and State Route 91 (SR-91) approximately 4.5 miles north of Cajalco Road at I-15 (refer to Figure 1-3). Thus, Cajalco Road serves as an important regional link between I-15 and I-215 and would require improvements in order to meet increasing transportation demands and to continue to function as a transportation corridor.

[This page left blank intentionally.]

VMT is a key transportation indicator that represents the total miles traveled by all vehicles throughout a particular study area or a region. VHT represents total hours traveled by vehicles considering system-wide traffic congestion in a given study area. VHD represents total hours of delay for vehicles across a particular study or a region. Table 1-8, below, presents summaries of daily VMT, VHT, and average speed within the study area under existing conditions, and projected daily VMT, VHT, and average speeds under Year 2044 No-Build conditions.

Table 1-8. Baseline and Year 2044 VMT, VHT, VHD, and Average Speed Summary – No-Build

Indicator	AM Peak Period (6 AM to 9 AM)		PM Peak Period (3 PM to 7 PM)		Daily	
	Baseline	2044 No-Build	Baseline	2044 No-Build	Baseline	2044 No-Build
VMT	1,681,352	2,861,258	2,795,721	4,859,804	8,585,374	14,659,917
VHT	50,618	80,884	91,554	162,260	234,475	396,569
VHD	17,166	27,460	35,000	69,595	66,516	125,131
Average Speed	33.2	35.4	30.5	30.0	36.6	37.0

The VMT is forecast to increase nearly 71% from existing conditions, and the VHT is forecast to increase by more than 69% over existing conditions. The average speed is projected to increase by 0.4 mile per hour (mph) as compared to the existing conditions. The projected minor increase in average speed may be attributable in part to the redirection of traffic to a separate proposed transportation corridor between I-15 and I-215. This separate corridor is included in RIVTAM as the Community Environmental Transportation Acceptability Process (CETAP) western transportation corridor between I-15 and I-215, and would provide an alternate east-west route to Cajalco Road if constructed in the future. Based on a comparative analysis of projected future traffic conditions that assumes inclusion of the CETAP transportation corridor between I-15 and I-215, and projected future traffic conditions without CETAP, future No-Build traffic conditions are projected to improve along certain study area segments and intersections with inclusion of the CETAP transportation corridor. Without the separate western CETAP transportation corridor between I-15 and I-215, however, future No-Build traffic conditions are projected to worsen along study area segments, as indicated in Table 1-9 on the following page and illustrated on Figure 1-4 (see page 1-21).

Under 2044 "Without CETAP" conditions, two-lane Cajalco Road is projected to experience higher volumes than the "With CETAP" conditions included in the traffic analysis because regional, east-west traffic between I-215 and I-15 would be expected to continue to use Cajalco Road in the absence of a CETAP corridor. The differences in projected volumes between "With" and "Without" CETAP along Cajalco Road are projected to range between 5,210 and 7,590 ADT west of Harley John Road, and between 4,430 and 5,010 ADT east of Harley John Road. These differences would result in a projected LOS F (instead of LOS C) for the segment of Cajalco Road between Temescal Canyon Road and La Sierra Avenue, and LOS B (instead of LOS A) between La Sierra Avenue and El Sobrante Road. Without additional capacity or other planned improvements to accommodate increased volumes under "Without CETAP" conditions, segments of Cajalco Road would be expected to operate at a lower capacity than the traffic volumes modeled "With CETAP" conditions.

Table 1-9. Traffic Volumes and Level of Service – Forecast Conditions with and without CETAP

Baseline 2014 and Year 2044 Forecast Conditions with and without CETAP – No-Build						
	Baseline 2014		Year 2044 With CETAP[1]		Year 2044 Without CETAP[2]	
Roadway Segment	Volume (ADT)	LOS	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	9,321	A	13,460	C	21,050	F
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	8,740	A	4,310	A	11,340	B

System Safety Needs – Existing Accident Rates

Traffic collision data obtained from the County for the 3-year period from January 2015 to December 2017 was reviewed for Cajalco Road between Temescal Canyon Road and Harvill Avenue (a distance of approximately 16 miles), for La Sierra Avenue between Cajalco Road and El Sobrante Road, and for El Sobrante Road between La Sierra Avenue and Cajalco Road (a combined distance of approximately 8 miles) (County 2018a). Table 1-10 on the following page compares the actual collision rate to the statewide average collision rate for the roadway segments identified above.

During the 3-year period, there were 355 collisions on Cajalco Road between Temescal Canyon Road and I-215, including seven fatal accidents. The majority of collisions occurred along the approximately 6-mile stretch of Cajalco Road between Alexander Street and Harvill Avenue, with 145 collisions over the 3-year period. Compared with the statewide average accident rate for similar type facilities, the total collision rate of 1.673 per million vehicle miles (MVM) for this section of Cajalco Road is higher than the statewide average of 1.163 per MVM. The next highest number of recorded collisions for Cajalco Road, 82, occurred along the approximately 3.2-mile-long section of Cajalco Road between Temescal Canyon Road and La Sierra Avenue. Compared with the statewide average accident rate of 1.680 per MVM, the actual total collision rate, 1.765 per MVM for this section of Cajalco Road, is higher than the statewide average. Statewide average accident rates were also exceeded along Cajalco Road between Harvill Avenue and I-215.

Of the 355 total collisions along Cajalco Road, 150 resulted in fatalities or injuries, with the majority, 56, occurring between Alexander Street and Harvill Avenue. The next highest number of recorded collisions resulting in fatalities or injuries along Cajalco Road, 41, occurred along the approximately 3.2-mile-long section of Cajalco Road between Temescal Canyon Road and La Sierra Avenue. Both stretches of Cajalco Road are two-lane facilities that lack raised medians between opposing traffic. Between Alexander Street and Harvill Avenue, most intersections lack left- and/or right-turn pull-outs, and a number of four-way intersections lack traffic signals. A number of residential driveways also connect directly with Cajalco Road along the north and south sides of Cajalco Road. Between Temescal Canyon Road and La Sierra Avenue, roadway conditions include steep slopes and tight curves.

Table 1-10. January 2015 to December 2017 Collision Data – Roadway Segments

Road Segment	Collision Type								
	Fatal			Fatal plus Injury			Total		
	Number	Actual Rates (MVM)	Statewide Average[1] (MVM)	Number	Actual Rates (MVM)	Statewide Average[1] (MVM)	Number	Actual Rates (MVM)	Statewide Average[1] (MVM)

Sources: County 2018a; Iteris 2019.
MVM = Million vehicle miles
Shaded cells represent exceedance of statewide average.
[1] Statewide average based on averages for similar facility type:
Comparative facility used for roadways between Temescal Canyon Road and Harley John Road is a two-lane, mountainous rural highway with design speed less than or equal to 55 mph.
Comparative facility used for roadways between La Sierra Avenue and Harley John Road is a two-lane, rolling rural highway with design speed less than or equal to 55 mph.
Comparative facility used for roadways east of Harley John Road is a two-lane, flat rural highway with design speed less than or equal to 55 mph.

Collision data for the sections of La Sierra Avenue and El Sobrante Road within the project limits indicated a total of 60 collisions, including six fatal accidents. The majority of collisions occurred along the approximately 5.8-mile stretch of El Sobrante Road, with 39 collisions over the 3-year period. However, the statewide average accident rate of 1.230 per MVM for the approximately 2.4-mile section of La Sierra Avenue between Cajalco Road and El Sobrante Road is exceeded at 1.856 per MVM.

Table 1-11 on the following page indicates the total number and types of collisions at, or in the vicinity of, individual intersections along Cajalco Road within the project area during the 3-year period. As indicated in the table, the majority of accidents (49) occurred in the area of the La Sierra Avenue intersection; 16 of the collisions involved hit objects and nine were head-on. A total of 44 persons were injured. The next highest volumes of collisions occurred at or near Clark Street and Temescal Canyon Road, respectively, with 35 collisions at Clark Street and 32 at Temescal Canyon Road. Of the 35 collisions at or near Clark Street, 22 were rear-end and six were broadside; 23 persons were injured. Of the 32 collisions at or near Temescal Canyon Road, one person was fatally injured and 22 others were injured; the majority of collisions involved hit objects (10) and overturns (8). Additional intersection areas that had high collision volumes are Alexander Street (25), Haines Street (22), Wood Road (21), Lake Mathews Drive and Brown Street (20), and Day Street (19).

Table 1-11. January 2015 to December 2017 Collision Data – Intersection Areas

Location (Cajalco Road)	Existing Traffic Control	Total Collisions	Collision Detail

Sources: County 2018a; Iteris 2019.
2WSC = 2 Way Stop Control
[1] Total number of persons injured.

As shown in Table 1-11, the types of collisions occurring at intersection areas within the project limits during the 3-year period varies; the majority of collisions were rear-end, hit object, and broadside.

The existing roadway along Cajalco Road is generally a two-lane undivided facility between Temescal Canyon Road east of I-15 and Harvill Avenue west of I-215, with left-turn lanes primarily limited to signalized intersections. The only divided segment of Cajalco Road is

between Wood Road and Carpinus Drive where an unpaved median exists. Within the project limits, 11 intersections along Cajalco Road and two along El Sobrante Road are currently signalized. The remaining 26 intersections along Cajalco Road and 10 intersections along El Sobrante Road are unsignalized, some with "STOP" sign controls, and others lacking any stop controls. The proposed project includes roadway improvements that would enhance safety, including, but not limited to, additional travel lanes, curve reductions, signalized intersections, and raised medians. These safety enhancements, in addition to those listed in Table 1-12, would be expected to reduce the number of the accidents along Cajalco Road.

Table 1-12. Safety Enhancement Measures

Accident Type	Safety Enhancement Measures
Head-on	Improve striping and marking, paint centerlines and turn area, re-examine speed limits, and improve alignment (e.g., improve curves to meet design speed).
Sideswipe	Provide separate turn lane and/or left-turn signal phase (if signalized), install street name sign, widen roadway, and re-examine speed limits.
Rear-End	Improve intersection and/or traffic signal visibility (upgrade to mast arms, large lenses, street name signs, better street lighting), increase yellow intervals, provide left-turn lanes, and re-examine speed limits.
Broadside	Install traffic signal, install stop sign, improve intersection lighting/visibility, provide separate left-turn lanes and/or signal phase, add all red intervals, prohibit left turns, provide two-way left-turn lane, install raised median, and paint centerline and lane line striping.
Hit Object	Improve intersection lighting, stripe intersection, install object markers, and install advance warning signs.
Overturn	Widen roadway, widen shoulders, improve sight distance, install object markers, install advance warning signs, install striping, and re-examine speed limits.
Auto-Pedestrian	Install stop signs/traffic signal, install crosswalk at controlled intersections, remove crosswalk at uncontrolled intersections, provide pedestrian signal/phase, improve intersection lighting/visibility, prohibit pedestrian crossing certain legs, provide left-turn lanes, paint limit lines, prohibit parking, examine potential for signal timing improvements, and re-examine speed limits.
Source: AECOM 2011.	

Roadway realignments to reduce curves, improved striping, and construction of medians separating the roadbeds would be expected to reduce head-on collisions. Sideswipe accidents would be reduced by constructing separate left-turn lanes, widening the roadway, and improving street signing and signal phasing. Rear-end collisions would be reduced by improving intersection turn controls, signing, and signal visibility. Broadside collisions would be reduced by improving signing and signal visibility or restricting mid-block left-turns, and by controlling left-turn moves. Accidents that result in hitting roadside objects or rollovers would be reduced by improving the alignment to meet current design standards for the design speeds, installing object markers, widening paved shoulders, and improving striping and signage. Design speeds for the project corridor are anticipated to range between 45 and 55 mph, similar to existing speed limits, and would be confirmed during final design in accordance with County of Riverside Roadway Design Requirements Standard No. 114.

The improvements identified above would also benefit cyclists and pedestrians along the project corridor as there are limited sidewalks and crosswalks for pedestrians, and roadway shoulder areas for cyclists. The addition of new traffic signals with designated crosswalks—and Americans with Disabilities Act (ADA)-compliant sidewalks along one side of Cajalco Road in some locations where residential and commercial properties are present—would provide more

opportunities for pedestrians to use and cross Cajalco Road safely. Improvements that would support cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue would include proposed curb and gutter and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane.

Refer to Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, for additional discussion regarding project safety benefits.

1.2.2.2 Roadway Deficiencies

Driveways and Intersecting Roadways

The existing two-lane roadway of Cajalco Road has numerous driveways and intersecting cross-streets, which present conflict points that affect the operation of the roadway. Vehicles currently enter and exit Cajalco Road to access residences and businesses located directly along Cajalco Road, as well as to areas accessed via connecting cross-streets. There are numerous cross-streets and driveways on Cajalco Road where these turning movements occur. Vehicles using these access points must slow in speed during their approach and sometimes stop within the travel lane to avoid turning into cross traffic; vehicles entering Cajalco Road from these access points initially travel at a slow rate of speed, impeding traffic flow. Uncontrolled access points reduce the overall capacity of the roadways and increase the potential for vehicular accidents. The proposed project would address direct access points with controlled median, designated turn lanes, and intersection improvements.

Route Continuity

At the east and west terminus of the project, and between east of Wood Road and Carpinus Drive, Cajalco Road is a four-lane facility; however, between the east and west limits of the project, the majority of Cajalco Road is a two-lane facility. The narrower roadway sections within the project area create bottlenecks between the existing four-lane sections and decreases route continuity.

Structural Section Limitations

Regional travel trips, commuting, and freight movement extend beyond limits of the project area and Riverside County; therefore, the transportation system must be capable of adequately accommodating a wide range of transportation system needs and pass-through traffic. Caltrans has identified roadway design standards to provide for safe transportation of regional truck traffic, including oversized trucks under the Surface Transportation Assistance Act (STAA) of 1982. The STAA requires specific lengths, width limits, structural composition, and turning radii for travel lanes for large trucks to operate on the Interstate System, the non-Interstate Federal-aid Primary System, and certain primary routes (collectively referred to as the National Network). While Cajalco Road is not identified as a National Network facility, the roadway currently lacks design features such as adequate widths for truck turning movements and additional travel lanes for vehicle passing opportunities. The project is proposing to incorporate STAA standards to better accommodate trucks that currently use Cajalco Road to safely pass through the project area. Roadway design will accommodate trucks of up 53 feet in length for semitrailers, and up to 28 feet 6 inches for each trailer on double semitrailer trucks, by reducing curves to allow larger

trucks to travel safely through the corridor. Current and projected (Year 2044) percentages of truck use for roadway facilities within the project corridor are presented in Table 1-13, below.

Table 1-13. Truck Traffic Volumes (Percentage) – Existing (2014) and Forecast-Year (2044) No-Build Conditions

Roadway Segment	Existing (2044) Conditions		2044 No-Build Conditions	
	Eastbound	Westbound	Eastbound	Westbound
Cajalco Road West of Temescal Canyon Road	11.90%	11.97%	12.01%	11.98%
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	11.90%	12.02%	11.99%	12.01%
La Sierra Avenue between Cajalco Road and El Sobrante Road	4.14%	4.17%	3.92%	3.89%
El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road	6.74%	6.85%	6.78%	6.73%
El Sobrante Road East of Mockingbird Canyon Road	3.07%	2.75%	3.22%	3.30%
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	3.36%	3.55%	3.18%	3.36%

Source: Caltrans 2019.				

As indicated in Table 1-13, truck traffic volumes within the project corridor represent between approximately 2.35 and 12.02 percent of the total traffic volumes, with the highest percentage of trucks occurring at the west end, east of I-15 on- and off-ramps. Continued use of the corridor by trucks is anticipated, with a projected increase of up to 0.54 percent of the total traffic volumes by Year 2044.

The existing 40.67-foot-wide Temescal Creek Bridge (Bridge No. 56C-155) currently accommodates two lanes of traffic (one lane each direction) and does not allow for additional lanes that would accommodate projected increased traffic demand without widening or replacement. In addition, the bridge has a sufficiency rating of 77.1 (fair) per National Bridge Inspection Standards; bridges that have a sufficiency rating of 80 or less and are structurally deficient qualify for rehabilitation under the Federal Highway Bridge Program. Bridges that have a sufficiency rating of 50 or less and are structurally deficient qualify for replacement under the Federal Highway Bridge Program (Caltrans 2017b).

Improvements that promote access control and facilitate local circulation as well as regional traffic would address operational needs within the project area. Additionally, construction of a new structural section that would extend overall pavement life and meet standards for STAA

trucks would address existing structural section limitations. Less frequent pavement maintenance would reduce future maintenance costs as well as the number and frequency of delays for the traveling public.

1.2.2.3 Social Demands and Economic Development

As discussed above, a nearly 40% increase in the County population is projected to occur between 2015 and 2040, and employment is projected to increase 122.1%. Adjacent cities are also projected to experience similar growth, with the greatest increase in population and employment anticipated for Perris at 65.1 and 113.2%, respectively. Regional traffic is predicted to increase with the projected growth in population.

Local land use plans that guide growth and future development in the project area include the County of Riverside Temescal Canyon Area Plan, Lake Mathews/Woodcrest Area Plan, and Mead Valley Area Plan; the City of Corona Dos Lagos Specific Plan and El Cerrito Specific Plan; and the City of Perris General Plan. Each plan contains goals and policies regarding existing and future land uses within their respective plan areas. Please refer to Section 3.1, *Land Use*, for specific goals and policies of each plan that relate to the project. The proposed project is primarily located within a largely semi-rural, undeveloped part of Riverside County with limited remaining land permitted for development, as community land use designations severely limit the amount of development per acre and designated open space and conservation areas prohibit development. Large areas of land are committed to conservation under the Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP), LM MSHCP and Stephen's Kangaroo Rat Habitat Conservation Plan (SKR HCP), and these areas would not accommodate development. Growth that is expected to occur within the project vicinity is anticipated to occur primarily through infill development in designated parts of the county and cities per the local land use plans and zoning. For a list of planned projects within the project vicinity, please refer to Table 3.1-2 in Section 3.1, *Land Use*, of this EIR/EIS.

Cajalco Road and El Sobrante Road through the project area are currently two-lane facilities for most roadway segments; between El Sobrante Road and Day Street, Cajalco Road currently operates at LOS F during peak hours due to traffic volumes that exceed roadway capacity. Thus, Cajalco Road as it is currently designed would not accommodate projected additional future traffic. Circulation Element Policy C1.1 of the Riverside County General Plan states that the County transportation system is to be designed to respond to concentrations of population and employment activities, as designated by the Land Use Element and in accordance with the Circulation Plan, Figure C-1. Policy C1.5 adds that the planned circulation system is to be evaluated as needed to enhance the arterial highway network to respond to anticipated growth and mobility needs.

The Circulation Plan classifies Cajalco Road as a six- or eight-lane Expressway, 128 to 220 feet in width; El Sobrante Road is classified as a four- or six-lane Arterial Roadway, 128 feet in width. While the proposed project would not include the full six or eight lanes for Cajalco Road as described in the Circulation Element, the project would increase the current capacity of Cajalco Road with an additional two lanes, thus responding to anticipated growth and mobility needs. The proposed project would not preclude future improvements to Cajalco Road as such improvements may be constructed as development occurs and as funding becomes available.

1.2.2.4 Modal Interrelationships and System Linkages

Situated between the cities of Perris, Corona, and Riverside, and between I-15 and I-215, Cajalco Road serves as a connecting link between regional airport, rail, port, and mass transit facilities. Cajalco Road is also used by Riverside Transit Agency for public commuter and transportation services in the project area with bus routes that serve Metrolink users and regional commuters, as well as the local communities of Mead Valley and Woodcrest, and nearby cities of Corona, Riverside, Moreno Valley, and Perris (Riverside Transit Agency 2019). The arterial roadway system, which includes Cajalco Road and El Sobrante Road, also plays a critical role in goods movement, providing first and last-mile connections to regional ports, manufacturing facilities, intermodal terminals, warehousing and distribution centers and retail outlets (SCAG 2016).

Interface with Airport, Rail, Port, and Mass Transit Facilities

Airports regionally located in the project area such as March Inland Port Airport, Corona Municipal Airport, San Bernardino International Airport, and Ontario International Airport, rely on roadway and rail networks that pass through or near the proposed project, in order to transport and transfer cargo, and provide commuter air travel services (Caltrans 2014). These roadway and rail networks include I-15 and I-215, and Burlington Northern Santa Fe (BNSF) railroad. Under the Fixing America's Surface Transportation (FAST) Act, I-15 and I-215 were designated as part of the Primary Highway Freight System and are key transportation facilities for goods movement between ports, airports, rail and distribution centers (FHWA 2015; SCAG 2016b). SCAG also identifies I-15 as a Major Freight Highway Corridor. Cajalco Road supports these key transportation facilities, serving as a connecting corridor between I-15 and I-215.

BNSF Intermodal Yard (18 miles north) and San Diego BNSF (78 miles south) transport goods along BNSF railroad facilities that parallel with I-215 through the project area. The Metrolink 91/Perris Valley Line (91/PVL), a north-south public commuter and rail service using BNSF railroad facilities between 4th Street in Perris and Central Avenue in Riverside, provides local and interregional commuter services between south Perris and Downtown Riverside Station, and to connecting rail stations for interregional travel. Opened in June 2016, the 91/PVL is one of seven regional Metrolink routes in Southern California, and provides access to stations with connecting trains to Los Angeles, Ontario, San Bernardino, Santa Ana, and Carlsbad. Refer to Figure 1-3 for area Metrolink stations and other public transportation facilities. Ridership on 91/PVL averages 3,034 riders/day during weekdays and 610 on weekends (Southern California Regional Rail Authority 2019). Interregional mass transit encompasses multiple modes of service, including high-speed rail, intercity rail, and interregional bus services that carry people long distances and provide connections between regions. Effective mass transit is important because it increases the diversity of options available to serve various needs. (Caltrans 2015).

In addition to intercity rail, interregional bus services, such as Amtrak Thruway, Greyhound, and Megabus, offer an important interregional mass transit mode using the existing interregional system. Interregional bus services utilize the existing interregional system—not only freeways and highways, but also local streets and roads, which are generally used for the first and last miles of trips. As mentioned above, Riverside Transit Agency includes bus routes that rely on local arterial roadways, such as Cajalco Road, to serve Metrolink users and regional commuters.

It is important for roadways to be designed in a manner that accommodates bus service; travel lanes and intersections must be wide enough for the buses to maneuver safely, and roads

designed to ensure safe bus stops and transfer of passengers (Caltrans 2015). Furthermore, regional east-west transportation corridors that connect I-15 and I-215 are limited; the nearest east-west corridors are SR-74 located approximately 4.5 miles south of Cajalco Road, and SR-91 approximately 4.5 miles north of Cajalco Road (refer to Figure 1-3). Therefore, Cajalco Road, as an important facility for public transportation routes and connections, and regional link between I-15 and I-215, would require improvements in order to meet increasing transportation demands, anticipated growth, and continue to function as a transportation corridor.

1.2.2.5 Air Quality Improvements

In addition to serving as an important regional link between I-15 and I-215, Cajalco Road serves public commuter and transportation needs of the local communities by providing access to Riverside Transit Agency transfer locations and Metrolink stations, via transfers, located in Corona and Perris. Riverside Transit Agency and Metrolink accommodate a large volume of regional and intra-regional commuters that would otherwise use I-15, I-215, and other roadway facilities. Continued use of Cajalco Road for this purpose in the future would require improvements in order to meet increasing transportation demands and to enable Cajalco Road to continue to function as a transportation corridor. Some of the improvements proposed by the project that support public transportation, community access to transportation, and alternative transportation include additional travel lanes, bike lane/shoulder, crosswalks, and bus turnouts; these improvements would aid in increased future mobility and would support air quality improvement by encouraging efficient transportation use (County 2018b). Improved community access to public transportation, as well as community pedestrian and equestrian use, would be accommodated with the addition of new traffic signals with designated crosswalks and ADA-compliant sidewalks along one side of Cajalco Road in some locations where residential and commercial properties are present. Improvements that would support cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue would include curb and gutter and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane.

1.3 Independent Utility and Logical Termini

Logical termini are defined as the (1) rational end points for a transportation improvement project and (2) rational end points for a review of environmental impacts. Logical termini prevent segmentation, which may arise if a transportation need extends throughout an entire corridor, but environmental issues and transportation need are inappropriately discussed for only a segment of the corridor.

A project with independent utility or independent significance (1) can function as a standalone improvement and not force immediate transportation improvements elsewhere, or on the remainder of the facility (highway) and (2) does not restrict consideration of other reasonably foreseeable transportation improvements in an adjoining section.

FHWA regulations (23 Code of Federal Regulations [CFR] 771.111(f)) require that a proposed project:

- Connect logical termini and be of sufficient length to address environmental matters on a broad scope;
- Have independent utility or independent significance (be usable and be a reasonable expenditure even if no additional transportation improvements in the area are made); and

- Not restrict consideration of alternatives for other reasonably foreseeable transportation improvements.

1.3.1 Logical Termini and Sufficiency in Length

This Environmental Impact Report/Environmental Impact Study (EIR/EIS) assesses operational and safety conditions on Cajalco Road and El Sobrante Road between Temescal Canyon Road and I-215; as well as the operational conditions of a larger study area that encompasses Cajalco Road and El Sobrante Road, and areas within the project vicinity affected by projected population and employment growth, and increased traffic, along the east-west Cajalco Road corridor, as well as portions of the north-south I-15 and I-215 corridors located at the western and eastern limits of the proposed project.

The approximately 15.7-mile Cajalco Road project alignment begins at Temescal Canyon Road in the City of Corona and terminates at the I-215/Ramona Expressway Interchange in Riverside County. West of Temescal Canyon Road, Cajalco Road is currently undergoing improvements that include widening to meet roadway profiles of the new I-15/Cajalco Road Interchange. Thus, the intersection of Cajalco Road and Temescal Canyon Road serves as a logical point from a traffic perspective to terminate the project at its western limits. The eastern limits of the project terminate at the I-215/Ramona Expressway Interchange. The proposed project would be designed to match the profile of the I-215/Ramona Expressway Interchange and thus serves as a logical point for the eastern terminus.

The proposed build alternatives extend approximately 15.7 miles between Temescal Canyon Road and I-215 in western Riverside County, providing local circulation and safety improvements as well as connections to north-south travel routes (I-15, La Sierra Avenue, El Sobrante Road, Harley John Road, Gavilan Road, Wood Road, and I-215) while also improving an east-west travel route. As a result, the proposed project meets the definition of logical termini and is of sufficient length to address environmental matters on a broad scope.

1.3.2 Independent Utility

The proposed project would provide a usable facility that meets travelers' needs for east-west travel in this part of western Riverside County even if no other improvements, such as construction of a western CETAP corridor, are implemented. Therefore, the build alternatives would have independent utility/independent significance and would be usable and a reasonable expenditure even if no additional transportation improvements in the area are made.

1.3.3 Nonrestrictive Alternatives

FHWA Regulation 23 CFR 771.111(f)(3) requires that proposed transportation improvements "…not restrict consideration of alternatives for other reasonably foreseeable transportation improvements."

The western end of the proposed project is adjacent to the eastern limits of the I-15/Cajalco Road Interchange Improvement Project (EA0J6100, RIV010208). The geometric improvements recommended by the I-15/Cajalco Road Interchange project were reviewed and considered in developing traffic forecasts and subsequent traffic analysis in this project for consistency purposes. The western end of the proposed project is also in the vicinity of the northern limits of the I-15 Express Lanes Project Southern Extension, which includes the addition of two tolled

express lanes within the median of I-15 in each direction for a distance of 14.5 miles between Cajalco Road in Corona and SR-74 in Lake Elsinore. Preliminary studies are under way, and construction could begin as early as 2025.

The eastern end of the proposed project is adjacent to the western limits of the Mid County Parkway Project (RIV031218). The Mid County Parkway will connect to State Route 79 (SR-79), I-215, and multimodal bus and rail facilities that support Metrolink's 91/PVL. Construction of the new I-215 Placentia Avenue Interchange, the first of several design packages for the project, began in August 2020. The eastern end of the proposed project is also adjacent to the I-215 North Project, which includes the widening of a 10.75-mile section of I-215 from Nuevo Road to 60/215 Interchange, for one carpool lane added to I-215 in each direction and a northbound auxiliary lane to improve traffic merging onto SR-60.

The proposed project would not physically affect the ability of the I-15/Cajalco Road Interchange Improvement Project or I-15 Express Lanes Project Southern Extension to be constructed east or west of I-15, or on I-15. The proposed project would also not physically affect the ability of the Mid County Parkway Project or I-215 North Project to be constructed east or south of I-215, or on I-215. Therefore, the build alternatives of the proposed project would not restrict consideration of alternatives for other reasonably foreseeable transportation improvements.

Chapter 2. Project Alternatives

This section describes the project action and the design alternatives that were developed to meet the identified need through accomplishing the defined purposes, while avoiding or minimizing environmental impacts. The alternatives are:

- Build Alternative 1 – Cajalco Alignment
- Build Alternative 2C – Modified Cajalco Alignment
- Build Alternative 4 – El Sobrante Alignment, and
- No-Build Alternative – No Project Alternative

This chapter defines the project in further detail and discusses the project alternatives considered.

2.1 Project Description

The proposed project is located in Riverside County, California, and includes the widening of Cajalco Road, or a combination of Cajalco Road and El Sobrante Road, between the Interstate 215 (I-215) southbound ramps and Temescal Canyon Road. A small portion of the westernmost part of the alignment is located in the City of Corona. The proposed project covers a distance of approximately 15.7 miles.

Within the project limits, existing Cajalco Road and El Sobrante Road are two-lane undivided roadways with one 12-foot lane in each direction and shoulders of varying widths.

The project would widen the roadway to four lanes between Harvill Avenue and Temescal Canyon Road, and to six lanes between the I-215 southbound ramps and Harvill Avenue, to improve east-west mobility and to provide increased capacity and improved traffic flow and safety.

2.2 Alternatives

2.2.1 Project Alternatives

Several project alternatives have been developed and refined based on public and agency input, and minimizing environmental impacts. Two project build alternatives, Build Alternative 1 and Build Alternative 2, were originally identified for the proposed project. Design variations of Build Alternative 2 were developed in response to public and agency input, and minimization of environmental impacts; impact potential of the design variations were compared, and Build Alternative 2C carried forward as a result. Two additional project alternatives, Alternative 3 and Alternative 4, were also added to the proposed project in response to public and agency input. Alternative 3 was eliminated from further consideration due to environmental constraints, and the following three build alternatives (Alternatives 1, 2C and 4) are currently proposed to address the project purpose along with a No-Build (No Project) Alternative. The project alternatives are described below.

2.2.1.1 Common Design Features of the Build Alternatives

The project would widen and improve segments of Cajalco Road between the I-215 southbound ramps and Temescal Canyon Road in the County of Riverside. Proposed roadway widening and improvements under all alternatives would include:

- Two 12-foot standard lanes in each direction along segments of Cajalco Road between west of Temescal Creek Bridge and Harvill Avenue;
- Three lanes in each direction along segments of Cajalco Road between the I-215 southbound ramps and east of Harvill Avenue, and between Temescal Canyon Road and west of Temescal Creek Bridge;
- Combined 8-foot shoulder/bike lane;
- Roadway medians of varying widths[1];
- Safety enhancements;
- Intersection improvements and safety lighting;
- Standardized project measures;
- Wildlife crossings and fencing;
- Erosion control features and practices;
- Utility relocations and right of way acquisitions;
- Landscaping and tree planting;
- Bridges, culverts, detention basins and drainage facilities; and
- Temporary construction easements (TCEs) and staging.

Standardized Project Measures

This project contains a number of standardized project measures that are employed on most, if not all, Caltrans projects and were not developed in response to any specific environmental impact resulting from the proposed project. These measures are listed under their respective topics below and are addressed in more detail in the Environmental Consequences sections found in Chapter 3.

In addition to the standardized project measures commonly employed on Caltrans projects, the proposed project incorporates standard project measures commonly employed on County transportation projects as well as project design elements, collectively identified as project features (PF) or Standard Project Measures.

[1] Final design will comply with the policies, principles, and standards contained in Caltrans' *Highway Design Manual*.

Roadway Widening and Safety Enhancements

Roadway Widening

The project would widen an east-west roadway alignment between I-215 and Temescal Canyon Road, from two to four lanes between Harvill Avenue and Temescal Canyon Road, and to six lanes between the I-215 southbound ramps and Harvill Avenue, to improve east-west mobility, and to provide increased capacity and improved traffic flow and safety. The widened roadbed would allow for the addition of median areas to separate cross traffic, and turn lanes and turn pockets at designated locations to accommodate through traffic and control cross-traffic movement. New striping is proposed along Cajalco Road, between Temescal Canyon Road and Grand Oaks, and between the I-215 southbound and northbound ramps; however, the limit of roadway construction at the west end of the project would end at Temescal Canyon Road, and at the I-215 southbound ramps at the east end of the project. See Figure 2.2-1 for typical cross-sections that would apply for all build alternatives.

Safety Enhancements

Safety enhancements proposed for the project include the following:

- Construct medians;
- Pave roadway shoulders;
- Add left- and right-turn pockets in select locations;
- Restrict left turns from Cajalco Road onto local streets except in locations where traffic signals are present;
- Restrict north-south cross traffic to designated intersection areas;
- Construct Americans with Disabilities Act (ADA)-compliant sidewalks along one side of the portions of the project where residential and commercial properties are present;
- Improve curves between Temescal Canyon Road and El Sobrante Road;
- Add roadway signage;
- Improve existing traffic signals along Cajalco Road and install new traffic signals at select locations;
- Install object markers and safety lighting at intersections; and
- Construct designated bus pull-outs at select locations along Cajalco Road.

Medians and Intersection Improvements

Medians of various widths and types are proposed to provide for the separation of opposing traffic, control cross traffic, provide a recovery area for out of control vehicles, allow space for speed changes and for left- and U-turns, and minimize headlight glare. The median between Temescal Canyon Road and La Sierra Avenue along Cajalco Road would be designed wide enough to accommodate two additional travel lanes (one in each direction) in the future. The actual construction of these lanes is not proposed and is not an option that is being considered for

inclusion as part of the proposed project. The intent of including the additional median area is to ensure that future impacts on the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP), Lake Mathews Multiple Species Reserve (LMR), Lake Mathews-Estelle Mountain Core Reserve (LM-EM Reserve), and Western Riverside County Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (WRC MSHCP) Criteria Areas would be minimized to the extent feasible if the roadway is widened to six lanes in the future. Any future roadway improvements would occur independently of the proposed Cajalco Road Widening and Safety Enhancement Project and would therefore be subject to separate environmental review and approvals under the National Environmental Policy Act (NEPA), the California Environmental Quality Act (CEQA), and all applicable laws.

The proposed project is not an allowable use or activity under the LM MSHCP. Because the LM MSHCP does not currently accommodate the roadway improvements that are designated in the Circulation Element of the General Plan, or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and the LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements.

Between Temescal Canyon Road and west of La Sierra Avenue, and between Wood Road and Alexander Street, the median of Cajalco Road would be unpaved, except for roadway intersections, bridges, and intersection and bridge approaches, where the full roadway would be paved and striped for turn lanes, through lanes and crosswalks where crosswalks are provided. Low growing vegetation may be considered within the unpaved median areas; however, taller vegetation and trees are not currently proposed to accommodate safe sightlines. Between Cowan Road and Wood Road, and between Alexander Street and I-215, the median of Cajalco Road would be paved to accommodate turn lanes and raised medians for traffic control, as well as intersections and crosswalks where crosswalks are provided. See Figure 2.2-1 for typical cross-sections common to all build alternatives.

Some deviations from the existing alignment are proposed for reducing impacts on existing properties, reducing roadway curves, and improving access. Left-turn lanes and right-turn pocket lanes are proposed to be constructed along the roadway at selected intersections to accommodate through traffic and control cross-traffic movement. These left- and right-turn lanes would be designed to accommodate vehicles with trailers and provide alternate access options for local residents and business owners.

Improvements to existing intersections are proposed and would vary from minor widening and turn pocket additions to complete reconstruction and installation of new signals. Under all build alternatives, new signals with pedestrian crosswalks are proposed at the following intersections with Cajalco Road: Eagle Canyon Road, Cowan Road/Gustin Road, Carpinus Drive, and Seaton Avenue. The signals would replace the “STOP” signs currently used to control traffic entering Cajalco Road at these intersections. They would allow for improved control of cross-traffic and traffic flow, safer pedestrian crossing, intersection safety lighting, signing, and striping. Please refer to Sheets 1A and 6 of Figures 2.2-2 and 2.2-5, Sheets 1A through 4 of Figure 2.2-3, and Sheets 1A and 7 of Figure 2.2-4 for intersection improvement locations under all build alternatives. Refer to Section 2.2.1.2, *Unique Features of the Build Alternatives*, for additional intersection improvements proposed for each build alternative.

Figure 2.2-5 - Sheet 6
Build Alternative 4 (West End)
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

New and relocated street lighting is proposed at new and existing intersections that are improved within the project limits. Changes in lighting would be addressed with Standard Project Measures **PF VIS-4** and **AS-2 (NES BIO-16)**, listed below. Refer to Section 3.7, *Visual/ Aesthetics*, and Section 3.20, *Animal Species*, of this Environmental Impact Report/Environmental Impact Statement (EIR/EIS) for additional detail.

- **PF VIS-4: Apply Minimum Lighting Standards:** All artificial outdoor lighting and overhead street lighting will be limited to only those locations where it is absolutely necessary for safety and security requirements, such as intersections. In most cases, lighting will consist of County lighting standards that are up to 35 feet in height, and the minimum required for driver safety. Lighting will be designed using the Illuminating Engineering Society's design guidelines and in compliance with International Dark-Sky Association–approved fixtures. All lighting will be designed to have minimum impact on the surrounding environment and will use downcast, cut-off type fixtures that are shielded and direct the light only toward objects requiring illumination. Therefore, lights will be installed at the lowest allowable height and cast low-angle illumination while minimizing incidental light spill onto adjacent properties or open spaces, or backscatter into the nighttime sky. The lowest allowable wattage will be used for all lighted areas, and the number of nighttime lights needed to light an area will be minimized. Light fixtures will have non-glare finishes that will not cause reflective daytime glare.
- **AS-2 (NES BIO-16): Light Shielding –** The Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) requires that shielding be incorporated in project designs to ensure ambient lighting in WRC MSHCP conservation areas is not increased (WRC MSHCP Volume I, Section 6.1.4). Night lighting will be directed away from natural lands within existing and proposed WRC MSHCP conservation areas in order to support potential linkage and core functions during construction. This is intended to protect species within existing and proposed WRC MSHCP conservation areas from direct night lighting during construction, if activities occur at night.

Roadway Curves and Realignments

Various sections of Cajalco Road would be realigned, bypassing existing roadway curves with new sections of widened roadway with decreased or eliminated curves. Limited realignments for all build alternatives would occur along sections of Cajalco Road between east of Temescal Creek Bridge and west of La Sierra Avenue and would vary in lengths from approximately 600 feet to 2,200 feet. Please refer to Sheets 1A through 2A of Figure 2.2-2 for realignment locations. An approximately 430-foot-long section of Gustin Road south of Cajalco Road would also be realigned. Where existing roadways would be bypassed, existing pavement would be partially or completely removed depending on adjacent property access need, and partially or fully graded, and contoured, to maintain slope stability. Where site conditions allow, removed roadbed areas would be returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with natural vegetation. Additional and different sections of Cajalco Road would be realigned under Build Alternatives 1, 2C, and 4, and sections of La Sierra Avenue, El Sobrante Road, and Harley John Road would be realigned under Build Alternative 4. Please refer to corresponding discussions under each build alternative in Section 2.2.1.2, *Unique Features of the Build Alternatives*.

Where Cajalco Road intersects with existing roads within the project limits, intersection improvements would be made to accommodate the widened Cajalco Road and maintain continuity with intersecting street operations. Some intersecting roadways would be widened and regraded at the improved intersections to match the new roadway profile, and new striping would be added to accommodate new through and turn lanes within the widened portions of the roadways. The intersection of Gustin Road and Cajalco Road would be redesigned and relocated west to intersect with Cowan Road, an intersecting roadway on the north side of Cajalco, creating a new four-way intersection west of the existing Gustin Road/Cajalco Road intersection. The existing intersection of Gustin Road with Cajalco Road would be replaced with a new cul-de-sac at the northern terminus of existing Gustin Road.

All access roads within Metropolitan Water District of Southern California (MWD)– and other resource agency–managed areas would be retained, or alternate access would be provided in coordination with MWD and resource agencies.

The proposed project would involve excavation and fill activities for roadbed removal, realignments, grading, and other project features, such as bridges and retaining walls. Earthwork in the project area would be performed in accordance with the requirements of applicable government agencies, and recommendations from the preliminary geotechnical reports, including the following (refer to Section 3.11, *Geology/Soils/Seismic/Topography*, of this EIR/EIS for additional detail):

- **PF GEO-1:** Implement the California Department of Transportation's (Caltrans') procedures regarding seismic design, as detailed in Section 19, "Earthwork," of the Caltrans Standard Specifications Manual. Seismic design would also meet County of Riverside (County) requirements for near-source design parameters under the Uniform Building Code (UBC).
- **PF GEO-2(a-e):** The following fieldwork and laboratory testing will be performed prior to construction: Borings will be taken in accordance with Table 10-1 of the American Association of State Highway and Transportation Officials' Load and Resistance Factor Design Bridge Design Specifications for number, spacing, and depth of borings; rock core samples collected to estimate rock quality designation; seismic refraction survey and refraction microtremor survey to evaluate rock rippability and shearwave velocity, respectively; test pits or other methods to collect data for evaluation of the soil cover over the competent soil or bedrock and stability of the steep descending slope; and sufficient field and laboratory testing to classify the subsurface materials and define liquefaction, shear strength, compressibility, and corrosion properties of the soils and rock encountered.

If cultural materials and/or human remains are discovered during earthmoving activities, Standard Project Measures **PF CR-1** and/or **PF CR-2**, below, would be employed. Refer to Section 3.8, *Cultural Resources,* of this EIR/EIS for additional detail.

- **PF CR-1: Unanticipated Discoveries.** If cultural materials are discovered during construction, all earth-moving activity within and around the immediate discovery area will be diverted until a qualified archaeologist can assess the nature and significance of the find. Unanticipated discoveries will be treated according to the Project Discovery and Monitoring Plan.
- **PF CR-2: Discovery of Human Remains.** If human remains are discovered during construction, further disturbances and activities shall stop in any area or nearby area suspected to overlie remains, and the County Coroner contacted. If the remains are thought

by the County Coroner to be Native American, the coroner will notify the Native American Heritage Commission (NAHC) who, pursuant to Public Resources Code (PRC) Section 5097.98, will then notify the Most Likely Descendant (MLD) on the respectful treatment and disposition of the remains. Further provisions of PRC 5097.98 are to be followed as applicable.

Pedestrian, Bicycle and Transit Facilities

ADA-compliant sidewalks would be constructed or replaced along one side of the portions of the project where residential and commercial properties are present. Pedestrian crosswalks that cross Cajalco Road would be added at Eagle Canyon Road, Cowan Road/Gustin Road, Carpinus Drive, and Seaton Avenue. The crosswalks would include safety lighting, signing, and striping. Along Cajalco Road from Harley John Road to Harvill Avenue, 8-foot shoulders that would serve as a combined shoulder/Class II and Class III bike lanes would also be constructed.[2] New or replacement bus pull-outs are proposed for the following locations (refer to Figure 2.2-3):

- East of Brown Street, eastbound Cajalco Road (south side of road) (STA #792);
- East of Brown Street, westbound Cajalco Road (north side of road) (STA #794);
- West of Clark Street, westbound Cajalco Road (north side of road) (STA #815);
- East of Clark Street, eastbound Cajalco Road (south side of road) (STA #821);
- West of Day Street, westbound Cajalco Road (north side of road) (STA #841);
- East of Day Street, eastbound Cajalco Road (south side of road) (STA #846);
- West of Seaton Avenue, westbound Cajalco Road (north side of road) (STA #894);
- East of Seaton Avenue, eastbound Cajalco Road (south side of road) (STA #899);
- West of Harvill Avenue, westbound Cajalco Road (north side of road) (STA #920); and
- East of Harvill Avenue, eastbound Cajalco Road (south side of road) (STA #925).

Wildlife Crossings and Fencing

Wildlife Crossings

Between Temescal Creek Bridge and Harley John Road, wildlife crossings of various widths and types would be constructed beneath the roadway; a wildlife undercrossing with bridge structure may also be constructed between Temescal Canyon Road and La Sierra Avenue (refer to Sheet 1B of Figures 2.2-2, 2.2-4, and 2.2-5). Roadway features such as shoulders, fencing, and

[2] County of Riverside defines Class II and Class III Bikeways as follows:
Class II Bikeways, or bike lanes, are intended for preferential use by bicycles, and are provided for within the paved areas of roadways. Bike lane pavement striping and other markings, and bikeway signs are intended to promote an orderly flow of traffic by establishing demarcations between lanes designated for bicycles and lanes designated for motor vehicles. Bike lanes are one-way facilities that follow the flow of motor vehicle movement.
Class III Bikeways, or bike routes, are intended to provide continuity within the bikeways system, usually by connecting discontiguous segments of Class I and Class II Bikeways. Bike routes are shared facilities, either with motor vehicles on roads or with pedestrians on sidewalks, and bicycle usage of the facilities is considered secondary. Bike routes are not marked on pavement but are supported by signs. (County of Riverside 2020).

bridges would be designed to support and facilitate wildlife use of the wildlife crossings. Placement and design of the wildlife crossings are based primarily on guidance provided in Section 7.5.2 of the WRC MSHCP, *Guidelines for Construction of Wildlife Crossings*; however, modifications were applied as needed to accommodate site conditions, species requirements, and design specifications. The design process included consideration of resource agency guidelines and recommendations, consultations with mule deer and puma experts as well as biologists experienced in wildlife crossing design, and current literature on wildlife crossings (Beier and Loe 1992; Bissonette and Hammer 2000; Caltrans Division of Research, Innovation and System Information 2014; Clevenger and Huijser 2011; Cramer et al. 2014; Foreman and Alexander 1998; Foreman et al. 2003; Jacobson et al. 2016; Meese et al. 2009; Road Ecology Center 2017; Soule and Gilpin 1991; Spencer et al. 2010; Van der Ree et al. 2015).

A landscape-scale approach in conjunction with the methods described above was applied and the results coordinated with local managing resource entities, including the Western Riverside County Regional Conservation Authority (RCA) and the Lake Mathews Reserve Management Committee (LMRMC), to determine the appropriate modifications necessary for effective crossing locations for a variety of wildlife species, including mule deer, mountain lion, and medium and small mammals. The approach included a review of land and aerial species as well as consideration of geography, land use (current and future), vegetation/land cover, water courses (perennial and intermittent), topography, WRC MSHCP linkages, and contiguity and connectivity between areas of preserved open space within a five-mile radius of the west end of the proposed project. In addition, species ecological needs and behavior were considered when assessing the landscape for potential small, medium, and large wildlife crossing locations. Please refer to Appendix J, Table J-1, for a listing of wildlife crossings proposed under each build alternative and Figure J-1 for their locations.

Although not required, all proposed small and medium wildlife crossings would be designed with widths two times the WRC MSHCP established height (width = 2 x height) for increased openness and better facilitation of animal movement. In addition, large and extra-large crossings would be designed to accommodate large animals and mule deer movement. Minimum crossing dimensions and their frequency within the project are provided in Table 2.2-1.

Table 2.2-1. Minimum Adopted Crossing Dimensions and Frequencies

Wildlife Crossing Size	Minimum Height/Width[1]	Maximum Recommended Crossing Length	Maximum Target Distance Between Crossings[2]	Species Facilitated
Small	Height 1.5–3 feet Width 3–6 feet	210 feet	984 feet	Small animals
Medium	Height 3–5 feet Width 6–10 feet	210 feet	984 feet	Medium (e.g., coyote, raccoon) and small animals
Large	Diameter and/or height/width 5.1-14.9 feet (minimum 10 feet targeted)	210 feet	0.93 mile	Large animals (e.g., mountain lion), medium animals, and small animals

Wildlife Crossing Size	Minimum Height/Width[1]	Maximum Recommended Crossing Length	Maximum Target Distance Between Crossings[2]	Species Facilitated
Extra Large	Height 15 feet Width 30 feet	210 feet	0.93 mile	Mule deer, mountain lion, medium animals, and small animals

Sources: RCA 2003; Caltrans 2018a

[1] Dimensions derived from WRC MSHCP minimum size requirements and agency input. WRC MSHCP specifies minimum sizes for small, medium, and mule deer crossings; refer to Section 7.5.2 for details. Large crossing sizes were determined as the minimum size required to facilitate mountain lion and elements such as a dry shelf. All small and medium crossing widths would be double the crossing height.

[2] Distances as indicated in the WRC MSHCP have been converted from meters to feet and kilometers to miles.

At locations near wildlife crossings, 3-foot walls with an 18-inch lip projecting into the adjacent open space would be constructed where feasible to direct small wildlife toward the crossings. Additional design elements have been incorporated based on agency guidance and updated best management practices in road ecology. All of the crossings would have earthen bottoms and many would also function as drainage facilities or culverts; these "wet" crossings would be designed to allow for animal passage using shelf features above the water flow.

Fencing

Fencing would be installed along project roadways through the LMR and LM-EM Reserve areas to provide security for MWD facilities, protect sensitive resources, and deter access into preserve areas. At wildlife crossing locations, fencing would be designed to integrate with and support the crossings, and facilitate use of the crossings by wildlife. Fencing placement and design details would be included in a Wildlife Fencing Plan coordinated between the County, MWD, and agencies involved in management of preserve areas. Placement and design of the fencing will take into consideration the guidance provided in Section 7.5.2 of the WRC MSHCP, *Guidelines for Construction of Wildlife Crossings*, as well as the results of coordination described above for the accommodation of reserve management, maintenance, access, and security. The Wildlife Fencing Plan will be developed as detailed in Standard Project Measure **NC-16 (NES BIO-19)**, below. Refer to Section 3.17, *Natural Communities*, of this EIR/EIS for additional detail.

- **NC-16 (NES BIO-19):** A Wildlife Fencing Plan will be developed and implemented for the preferred build alternative. Prior to finalizing the wildlife fencing design, the impacts of and interaction between wildlife fencing and other fencing (e.g., Lake Mathews and other local fencing) in the project area of the preferred build alternative shall be fully assessed and analyzed. If it is determined that fencing in the project area (i.e., either project-related fencing or other fencing) will hinder or interfere with wildlife movement or the function and value of wildlife crossings, the wildlife fencing plan (and project design) shall include design considerations that will lessen these impacts. Final Wildlife Fencing Plans will include the following considerations at a minimum:
  - guidelines on fencing design;
  - access gates design;
  - construction requirements for fence ends; and
  - facilitation of escape opportunities.

Security fencing 6 to 10 feet in height would be installed within the right of way along Cajalco Road where detention basins are proposed, for open channel drainage facilities proposed between Alexander Street and east of Haines Street. Security fencing would also be considered for limited, undeveloped areas adjacent to Cajalco Road for the protection of cultural resources. Standard fence types (chain link, barbed wire, or wire mesh) would be used unless fences of special design need be used in certain cases, such as for wild animal control. In special cases, alternative options such as powder-coating, the use of iron, and other enhancements would be considered. Iron fencing and/or block wall, or a similar type of ornamental fencing, would be considered in lieu of chain link fencing for separating Cajalco Road from the open channel and residences north of the open channel between Alexander Street and Brown Street, and for large detention basin areas. (Refer to Sheet 2 of Figure 2.2-3 for the open channel location; refer to Sheet 1A of Figures 2.2-2, 2.2-4, and 2.2-5 for large detention basin location.)

Erosion Control

Retaining Walls

Retaining walls would be constructed where feasible to avoid or otherwise minimize permanent right of way acquisition and utility impacts, as well as to accommodate construction staging. Please refer to Figures 2.2-2 through 2.2-5 for proposed retaining wall locations.

Slope Easements

Slope easements are proposed in the more steep and hilly terrain areas of the build alignments between Temescal Creek and Harley John Road. The slope easements would be used for the construction and maintenance of slopes located along steep areas adjacent to the proposed roadway right of way. Please refer to Figures 2.2-2 through 2.2-5 for proposed slope easement locations for all build alternatives. Any temporary cuts for the proposed project shall be safely sloped in accordance with Occupational Safety and Health Administration (OSHA) guidelines, or properly shored. Property owners would be compensated for areas proposed to be utilized as slope easement.

Best Management Practices

Best management practices (BMPs) for erosion control would be provided as part of the proposed project where feasible. Each project build alternative would include the following standard project measures as part of the project. Refer to Sections 3.7, *Visual/Aesthetics*, 3.10, *Water Quality*, 3.11, *Geology/Soils/Seismic/Topography*, and 3.17, *Natural Communities*, of this EIR/EIS for additional detail.

- **PF VIS-1: Contouring and Replanting Disturbed Areas.** Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory.
- **PF WQ-3**: **Post-Construction BMPs** – Post-construction best management practices will be implemented to the maximum extent practicable, consistent with the requirements of the National Pollutant Discharge Elimination System permit and Waste Discharge Requirements

for the County of Riverside's Municipal Separate Storm Sewer System Permit in place at the time of project approval.

- **PF WQ-4: Construction SWPPP** – The project will comply with the State Water Resources Control Board Construction General Permit in effect at the time the project goes to construction, including developing and implementing a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP is a project-specific document that includes an Erosion Control Plan and construction site best management practices (BMPs), which are implemented to minimize sediment and erosion during construction. The SWPPP would also include post-construction erosion control measures such as re-vegetation of disturbed soil areas. A Qualified SWPPP Practitioner (QSP) would be required to regularly inspect and maintain the BMPs to ensure they are in good working order, as required in the Construction General Permit. The QSP would implement appropriate hazardous material management practices, spill prevention measures, and other good housekeeping measures to reduce the potential for chemical spills or releases of contaminants, including any non-stormwater discharge off site. Construction-related impacts on water quality would be avoided or otherwise minimized with the implementation of construction BMPs identified in the SWPPP, such as fiber rolls, silt fence, stabilized construction entrance/exit, and concrete washouts.
- **PF GEO-4:** Appropriate backfill materials would be used in accordance with California Department of Transportation standards. Select fill materials should be used for mechanically stabilized earth wall construction, and use of oversize materials generated in cuts screened prior to use as backfill materials.
- **PF GEO-5:** Structure approach embankment is that portion of the fill material within approximately 150 feet longitudinally of the structure in accordance with Figure 208.11 of the Highway Design Manual. Structure abutment embankment fill should be compacted to not less than 95 percent relative compaction in accordance with Section 19-5.03B of the Standard Specifications (Caltrans 2018). Poor quality material, such as expansive soils, must be precluded from structure abutment embankments unless treated and placed in accordance with California Department of Transportation Geotechnical Manual Section 3.1.2. Expansive soil materials for this requirement are defined as having either an Expansion Index (ASTM D 4829) greater than 50, or a Sand Equivalent (California Test Method 217) less than 20. This requirement is exclusive of the structure backfill and pervious backfill material requirements as shown on the plans and set forth in the Standard Specifications under Sections 19-3.02B and 19-3.03E, Structure Backfill, and 19-3.02C and 19-3.03G, Pervious Backfill Material, respectively.
- **NC-10 (NES BIO-10):** Plans for water pollution and erosion control (i.e., Storm Water Pollution Prevention Plan [SWPPP]) will be prepared in accordance with project aquatics permits (refer to Section 3.10, *Water Quality*, for additional details for the SWPPP). The plans will describe sediment and hazardous materials control, dewatering or diversion structures, fueling and equipment management practices, and use of plant material for erosion control. Plans will be reviewed and approved by the County of Riverside prior to construction (Western Riverside County Multiple Species Habitat Conservation Plan [WRC MSHCP] Volume I, Section 7.5.3). The following measures will be incorporated into the plans, as applicable, to ensure consistency with the WRC MSHCP:

- Water pollution and erosion control plans will be developed and implemented in accordance with Regional Water Quality Control Board (RWQCB) requirements (WRC MSHCP Volume I, Appendix C) and will ensure that no fluids or sediment from construction will enter into the environmentally sensitive area (ESA) fenced areas.
- Sediment and erosion control measures will be implemented until such time soils are determined to be successfully stabilized (WRC MSHCP Volume I, Section 7.5.3).
- No erodible materials will be deposited into watercourses or areas demarcated with ESA fencing. Brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks (WRC MSHCP Volume I, Section 7.5.3 and Appendix C).
- Projects that cannot be conducted without placing equipment or personnel in riparian vegetation areas should be timed to avoid the breeding season of riparian-associated species identified in WRC MSHCP Global Species Objective No. 7 (WRC MSHCP Volume I, Appendix C). Breeding season as defined by the WRC MSHCP is March 1 through June 30.
- If stream flows must be diverted, the diversions will be conducted using sandbags or other methods requiring minimal instream impacts. Silt fencing or other sediment trapping materials will be installed at the downstream end of construction activity to minimize the transport of sediments off site. Settling ponds where sediment is collected will be cleaned out in a manner that prevents the sediment from reentering the stream. Care will be exercised when removing silt fences, as feasible, to prevent debris or sediment from returning to the stream (WRC MSHCP Volume I, Section 7.5.3 and Appendix C). Short-term diversions will consider impacts on wildlife (WRC MSHCP Volume I, Section 7.5.3).
- Equipment storage, fueling, and staging areas will be located on non-sensitive upland sites with minimal risks of direct drainage into riparian areas or other sensitive habitats (WRC MSHCP Volume I, Section 7.5.3 and Appendix C). These designated areas will be located in such a manner as to prevent any runoff from entering sensitive habitat. Necessary precautions will be taken to prevent the release of cement or other toxic substances into surface waters. Project-related spills of hazardous materials will be reported to appropriate entities, including, but not limited to, the applicable jurisdictional city, U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, and the RWQCB, and will be cleaned up immediately and contaminated soils removed to approved disposal areas (WRC MSHCP Volume I, Appendix C).
- All equipment maintenance, staging, and dispensing of fuel, oil, coolant, or any other toxic substances will occur only in designated areas within the proposed grading limits of the project site. These designated areas will be clearly marked and located in such a manner as to contain runoff (WRC MSHCP Volume I, Section 7.5.3).

- **NC-13 (NES BIO-9):** Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades, decompacted to eliminate compressed soils and allow for plant establishment, and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory.

Right of Way Acquisitions and Relocations

Property Acquisitions and Relocations

Partial and full property acquisitions are proposed to accommodate the widened roadway, areas of realigned roadway, utility relocations, cut and fill, and related project facilities. Where relocations may be required, relocation assistance payments and counseling would be provided in accordance with the Uniform Relocation Act and Real Property Acquisition Policies Act of 1970, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. This commitment is included in the project as Standard Project Measure **PF COM-1**, below. Please refer to Section 3.4.2, *Relocations and Real Property Acquisitions*, of this EIR/EIS for additional detail.

- **PF COM-1:** As part of project implementation, relocation assistance payments and counseling would be provided by the County of Riverside to persons and businesses in accordance with the Federal Uniform Relocation Assistance and Real Properties Acquisition Policies Act of 1970, as amended (42 United States Code Sections 4601-4655). The County of Riverside will provide compensation to eligible recipients for property acquisitions. All eligible displacees would be entitled to moving expenses. In addition, assistance to businesses, farms, and nonprofit organizations in locating suitable replacement properties and reimbursement for certain costs involved in relocation, would be provided.

Partial acquisitions and temporary occupation of farmland would also occur; Standard Project Measures **PF FA-1** and **PF FA-2**, below, would ensure continued access, viability, and use of remaining farmland. Please refer to Section 3.2, *Farmlands*, of this EIR/EIS for additional detail.

- **PF FA-1**: Access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway.
- **PF FA-2**: Farmland temporarily affected during construction activities will be returned to conditions that allow for continued use and function as farmland following construction of the project. Any compensation deemed necessary for continuation of pre-project farming operations affected by the project will be negotiated in accordance with the federal Uniform Relocation Assistance and Property Acquisition Act of 1970, as amended (42 United States Code Sections 4601-4655).

Partial and full property acquisitions may require the removal of existing landscaping such as fencing, walls, and vegetation. Measure **VIS-2** and Standard Project Measure **PF VIS-3** would address affected properties by replacing landscape features to the degree possible. Please refer to Section 3.7, *Visual/Aesthetics*, of this EIR/EIS for Measure **VIS-2** and additional detail regarding Standard Project Measure **PF VIS-3**.

- **PF VIS-3: Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity.** Existing noise barriers in the project vicinity utilize a combination of solid barriers and landscaping to improve site aesthetics. Any noise barriers constructed as a result of the proposed project will be designed and constructed in a manner that complements and blends with nearby existing noise barriers. Aesthetic treatments such as color and/or texture will be considered for the walls, and their compatibility with existing conditions, and with applicable goals and policies of the County, will be considered prior to final design. The County's Resident Engineer, or Project Engineer under contract to the

County, will ensure that the aesthetic treatments included in the final Plans, Specifications, and Estimates (PS&E) are implemented by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

Utility Relocations

Existing utility poles/lines along Cajalco Road between Temescal Canyon Road and La Sierra Avenue, and between Cowan Road and I-215, would be relocated as needed under all build alternatives to accommodate the widening. Additional utilities within the project limits—including overhead and underground electrical, underground gas, overhead and underground telephone, overhead cable telephone, water, septic tank, petroleum pipeline, and underground fiber optic—may also be relocated as necessary. At bridge locations within the project limits, utilities would be relocated either into the bridge or outside of the new bridge/roadway, as needed, to accommodate the proposed improvements.

Avoidance or relocation of the following utilities within the project limits would be coordinated with local providers:

- AT&T – cable lines near the intersections of Cajalco Road/Seaton Avenue and Seaton Avenue/Marquez Road
- Western Municipal Water District – water pipelines near where Cajalco Road intersects Cowan Road, Carpinus Drive, Hollis Lane, Gustin Road, Extravaganza Lane, and Silverton Court, as well as sewage pipelines where Cajalco Road intersects Wood Road and Carpinus Drive
- Century Link – fiber optic cables near the intersection of Wood Road and Clark Street

While changes in the placement of some utilities would be considered permanent, any effects during their relocation would be temporary and would be rectified once relocations and project construction are complete. Relocated utilities would be relocated on site within the environmentally evaluated footprint of this project. Standard Project Measure **PF UT-1**, below, is included in the project to avoid or otherwise minimize related impacts. Please refer to Section 3.5, *Utilities/Emergency Services*, of this EIR/EIS for additional detail.

- **PF UT-1:** The County of Riverside will coordinate all utility relocation work with the affected utility companies to ensure minimum disruption to customers in the service areas during construction.

U.S. Postal Service Mailbox Relocations

U.S. Postal Service (USPS) mailbox receptacles within the limits of proposed roadway improvements would be relocated and replaced with grouped mailboxes placed in accordance with Sections 631.441 (Delivery Requirements), 632.524 (Location), and 632.525 (Grouping), of the USPS Postal Operations Manual. Mailboxes would be designed in accordance with USPS requirements as well as County of Riverside Standard No. 812 (Multiple Mailbox Installation for New Sidewalk).

Bridges, Culverts, Detention Basins and Drainage Facilities

Bridges

The following proposed replacement, widened, and new bridges, are proposed for all build alternatives:

- Bridge No. 56C-155: The existing 40.67-foot-wide, 171-foot-long Temescal Creek Bridge over Temescal Creek along Cajalco Road at STA #22, would be removed and replaced with a widened, 120.33-foot-wide, 440-foot-long, four-span bridge structure (see Figure 2.2-2).

  A single-span bridge replacement design was originally proposed for this location and was subsequently modified in response to input received from resource agencies, as well as environmental constraints and engineering factors. The current bridge design minimizes impacts on the Temescal Wash Mitigation area managed by the Riverside-Corona Resource Conservation District (RCRCD) while providing additional capacity for accommodating Temescal Creek flows. Bridge column placements and design were refined to minimize obstructions to flow and impacts on the creek bed.

- New bridge (STA #110): A new bridge along Cajalco Road would be constructed between slopes west of La Sierra Avenue at STA #110 (see Figure 2.2-2). The new, 112.8-foot-wide, 106-foot-long, single-span bridge would serve as a wildlife crossing for animal movement between critical habitat areas north and south of Cajalco Road in this area, currently constrained by the existing roadway.

- New bridge (STA #740): A new bridge for westbound lanes of Cajalco Road would be constructed over Cajalco Creek north of existing Cajalco Road near Barton Street at STA #740 (see Figure 2.2-3). The new, 57.2-foot-wide, 301.5-foot-long, two-span bridge would cross Cajalco Creek upstream of existing Cajalco Road. Existing Cajalco Road south of the new bridge would serve eastbound traffic with two eastbound lanes. Existing 102-inch and 48-inch culverts beneath the eastbound lanes of Cajalco Road at this location would be replaced with a four-cell, 20-foot-wide, and 14-foot-high reinforced concrete box (RCB) culvert.

  An at-grade roadway with culvert replacement design originally proposed for this location was modified in response to input received from resource agencies and Tribal interests, as well as environmental constraints and engineering factors. The current bridge design minimizes impacts on the Alexander Wetlands Mitigation area managed by RCRCD while providing the necessary capacity to accommodate Cajalco Creek flows. Bridge column placements and design were refined to avoid, or otherwise minimize impacts on, specific locations within the Cajalco Creek area that have been deemed highly sensitive by local Native American Tribes.

- Bridge No. 56-C196: The existing 83.8-foot-wide, 125-foot-long, three-span Ramona Expressway Overhead Bridge over Burlington Northern Santa Fe Railroad along Cajalco Road at STA #935, would be widened to a 119.8-foot-wide, 125-foot-long bridge structure (see Figure 2.2-3).

Cast-in-drilled-hole piles, or shallow-spread footings, would produce less vibration during use and may be used at bridge locations depending on engineering designs and geotechnical

conditions. The following standard measures—in addition to Measures **PF GEO-4** and **PF GEO-5** identified under *Erosion Control*, above—are further included in the project to address bridge construction, including geotechnical conditions and aesthetic treatments. Refer to Section 3.7, *Visual/Aesthetics*, and Section 3.11, *Geology/Soils/Seismic/Topography*, of this EIR/EIS for additional detail.

- **PF VIS-6: Temescal Creek Bridge Design**. Section 14.7.1 of the City of Corona El Cerrito Specific Plan Scenic Corridor Design Standards, shall be applied in the design and construction of the widened Temescal Creek Bridge:

  1. Outstanding scenic vistas and visual features shall be preserved and protected for the enjoyment of the traveling public as viewed from the roadway.

  2. The design and appearance of new structures and/or equipment within scenic corridors shall be compatible with the setting or environment.

  6. Trees and other roadside planting shall be utilized to protect and enhance the view from the roadway.

  7. Earthmoving operations which expose soil surfaces which would be visible from the scenic corridors shall be required to reestablish vegetation to bind the soil, prevent water or wind erosion and reestablish a natural vegetative appearance.

- **PF VIS-7: New Bridge Architectural Treatments.** Aesthetic treatments that are consistent with County design and engineering standards, and complement area conditions, will be applied to new bridge structures.

- **PF GEO-3: Excavation and Stabilization Techniques**. Temporary excavations and installation of spread footing foundations will include the following techniques. If loose or otherwise unsuitable materials are present below foundation level, limited overexcavation and replacement with lean concrete slurry may be needed to transmit foundation loads to competent soils.

  – **GEO-3(a):** In the event that near-slope materials are not adequate to support spread footings, cast-in-drilled-hole (CIDH) piles socketing into the bedrock could be considered.

  - **GEO-3(b):** Subgrade conditions and need for subgrade preparation or stabilization measures, particularly in the vicinity of the slope, should be evaluated in detail in the Plans, Specifications, and Estimates (PS&E)-level investigation.

  – **GEO-3(c):** The need for foundation overexcavation or use of deep foundations should be addressed in the Foundation Report after performing the PS&E-level investigation.

Additional bridges are proposed along each of the build alternative alignments between the Temescal Creek Bridge and Barton Street; these additional bridges are described under their respective build alternative in Section 2.2.1.2, *Unique Features of the Build Alternatives*.

Culverts

Existing culverts within the roadway alignment of all build alternatives would be replaced with improved culverts and additional, new culverts constructed to accommodate drainage and

channel water flows. As mentioned under *Wildlife Crossings and Fencing*, some culverts would also be designed to accommodate use as a wildlife crossing.

Between Alexander Street and Clark Street, a series of several pipe culverts, as well as a trapezoidal channel, and an open rectangular concrete channel with an overflow inlet structure, would be constructed along Cajalco Road crossings of Cajalco Creek (refer to Figure 2.2-3). These interconnected facilities would include the construction of a new three-cell 14-foot-wide, 8-foot-high RCB culvert at Alexander Street; a trapezoidal channel with 80-foot-wide bottom along the north side of Cajalco Road; a three-cell, 10-foot-wide by 5-foot-high RCB culvert under Brown Street and Florence Street, along the north side of Cajalco Road; an open rectangular concrete channel, 30-foot width bottom, 6 feet deep with an overflow inlet; and a three-cell, 10-foot-wide by 5-foot-high RCB beneath Cajalco Road and Haines Street. An inlet structure would be constructed immediately upstream of Haines Street along the south side of Cajalco Road to collect flow from the upper portion of Cajalco Creek.

Detention Basins

Detention basins are included in the project design in order to minimize concentration of stormwater flow crossing the roadway. Several small stormwater detention basins would be constructed along the north and south sides of the roadway under all alternatives, and a few, larger basins would be constructed for locations anticipated to experience additional stormwater volumes. For all build alternatives, a large detention basin is proposed along the south side of Cajalco Road just east of Temescal Creek at STA #32 (see Sheet 1A of Figures 2.2-2, 2.2-4 and 2.2-5). Additional basins are proposed along each of the build alternative alignments; these additional basins are described under their respective build alternative in Section 2.2.1.2, *Unique Features of the Build Alternatives*.

Under each of the build alternatives, modifications to the existing Cajalco Creek Detention Basin and Sedimentation Basin, and Inlet Channel (connecting the two basins), located north of Cajalco Road and east of El Sobrante Road, would occur. The proposed project would include Standard Project Measure **PF VIS-5** for proposed basins and larger drainages to ensure the most natural appearance feasible for the introduced features.

- **PF VIS-5: Basin and Flood Control Drainage Facility Treatments**. New or expanded basins and the new flood control drainage facility would be soft-bottom where hydraulically feasible; however, some would need to be concrete-lined. The soft-bottomed basins would further be vegetated where vegetation would not interfere with the intended use of the facilities (i.e., conveyance of water). Seeding with appropriate species would be determined in coordination with a County-approved biologist, and consistent with the requirements of the WRC MSHCP, LM MSHCP, and/or SKR HCP, where applicable.

Drainage Facilities

In more hilly areas, cross-slopes would be included where appropriate to better conform to the natural terrain and handle drainage. Along the more populated sections of Cajalco Road from Harley John Road to Harvill Avenue, curb and gutter would be installed along with the drainage facilities described above to handle on-site as well as off-site storm runoff and limit drainage flows across the roadway.

BMPs for water quality treatment would be provided as part of the proposed project where feasible. Each project build alternative would include the following standard project measures—in addition to Measures **PF WQ-3**, **PF WQ-4**, **NC-10 (NES BIO-10)**, and **NC-13 (BIO-9)**—identified under *Erosion Control*, above, as part of the project. Refer to Sections 3.10, *Water Quality*, and 3.17, *Natural Communities*, of this EIR/EIS for additional detail.

- **PF WQ-1: 401 Certification –** The project proponent will obtain a Clean Water Act Section 401 Certification from the Santa Ana Regional Water Quality Control Board for activities that may result in impacts on State Water Quality Standards.
- **PF WQ-2: 404 Permit** – The project proponent will obtain a Clean Water Act Section 404 permit from the U.S. Army Corps of Engineers for activities that would discharge materials into waters of the U.S.
- **NC-11 (NES BIO-11):** The limits of disturbance (LOD), including the upstream, downstream, and lateral extents on either side of any stream adjacent to the project impact footprint, will be clearly defined and marked in the field. Monitoring personnel (biology) will review the LOD prior to initiation of construction activities (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3 and Appendix C). This will ensure avoidance of jurisdictional areas and riparian habitat.
- **NC-12 (NES BIO-12):** During construction, the placement of equipment within a stream or on adjacent banks or adjacent upland habitats occupied by Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) covered species that are outside of the project footprint will be avoided (WRC MSHCP Volume I, Section 7.5.3 and Appendix C).

Temporary Construction Activities, Easements, and Staging

During construction, materials needed for and generated by the project would require transport between the site and material source sites and landfills. Table 2.2-2 presents the volumes under each build alternative that are anticipated as a result of the project.

Table 2.2-2. Construction Haul Estimates

Alternative	Quantity and Type of Earthwork (cubic yards)				Days
	Excavation	Fill	Imported Borrow	Export Disposal	
1	1,859,300 CY	1,859,100 CY		200 CY	1
2C	2,511,200 CY	2,587,000 CY	75,800 CY		169
4	2,855,400 CY	1,243,300 CY		1,612,100 CY	274
Source: Caltrans 2017a.					

Haul routes between the project site and would occur predominantly along the existing Cajalco Road, El Sobrante Road, and La Sierra Avenue. Possible import and export sites within 40 miles of the project include, but are not limited to, All American Asphalt Quarry, Mobile Sand Company, Sierra Plant Pit, and El Sobrante Landfill.

The following standard project measures incorporated into the project would be employed during construction activities to address noise, temporary changes in access, wastes generated during construction, and temporary changes in air quality. Refer to Sections 3.1, *Land Use*; 3.4, *Community Impacts*; 3.13, *Hazardous Waste/Materials*; 3.14, *Air Quality*; 3.15, *Noise and Vibration*; 3.17, *Natural Communities*, and 4.2.19, *Utilities and Service Systems*, of this EIR/EIS for additional detail.

- **PF LU-1**: Prior to construction, the County of Riverside (County) will develop a Traffic Management Plan (TMP) that will include the following elements: **construction staging plans, public awareness campaign, analysis of impacts on traffic, options for lane closures, and alternate route strategies**. In addition, the TMP will address access, circulation, parking, public transportation, and pedestrian and bicycle facilities as described below:
  - Prior to construction, the County will coordinate with local agencies, emergency services, and law enforcement to minimize disruptions to access, circulation, and parking.
  - Prior to construction, the County will coordinate with local jurisdictions to adjust signal timing on arterial streets during construction to minimize traffic congestion.
  - Prior to construction, the County will provide appropriate signage as needed throughout construction. The construction contractor will maintain appropriate signage to direct pedestrians, bicyclists, and vehicular traffic via alternate routes. Disabled access will be maintained during construction.
  - Prior to construction, the County will coordinate with public transportation agencies to provide rerouting information, including operating schedules, to the public.
  - The County will maintain pedestrian access points to businesses, parks, and schools within the construction area throughout the construction period, where feasible. If usual access points are lost, provisions for alternative access to the affected parcels will be made. Appropriate signage will be placed to inform pedestrians and bicyclists of the alternative access to local businesses. Disabled access will be maintained during construction where feasible.
  - Appropriate signage and advanced warning will be implemented to direct pedestrian, bicycle, and vehicular traffic to alternate routes as deemed necessary.
  - If short-term full roadway closure is necessary, it will be scheduled for nighttime to minimize impacts on motorists.
- **PF COM-2:** Signage provisions shall be made available to businesses whose temporary or permanent visibility and vehicular access changes as a result of the project. Temporary and permanent sign relocations will conform with County of Riverside Codes 17.254.030(A), 17.252.030, 17.252.040, and 17.252.070 and placed within the project limits. Relocated signs will be placed at heights that do not exceed surrounding structures or obstruct views.
- **PF HAZ-2. Health and Safety Plan.** The Health and Safety Plan (HASP) would provide direction for the identification, evaluation, and control of the wide variety of chemical, physical, biological, and ergonomic hazards that may be encountered during construction activities. The HASP will also address the management of potential health and safety hazards to workers and the public, and will be prepared and implemented prior to initiation of the

construction activities. Instructions, guidelines, and requirements for handling hazardous materials to ensure employee safety as provided in Chapter 16, "Hazardous Materials Communication Program," of the California Department of Transportation's Safety Manual will be included in the HASP. The HASP should be prepared and stamped by a Certified Industrial Hygienist (CIH) and will provide appropriate administrative controls, engineering controls, and personal protective equipment necessary to eliminate or reduce hazards to both project personnel and the community.

- **PF HAZ-3. Handling, Transport, and Disposal of Wastes.** Wastes and petroleum products used or encountered during construction will be collected, transported, and removed from the project site in accordance with Resource Conservation and Recovery Act regulations and federal/Occupational Health and Safety Administration standards, including Waste Management and Materials Pollution Control Best Management Practices (BMPs) – Spill Prevention and Control, Materials; and Waste Management BMPs, Hazardous Waste Management. The following California Department of Transportation (Caltrans) and other regulations will also be followed, as applicable:
  - All hazardous waste will be stored, transported, and disposed of as required in California Code of Regulations (CCR) Title 22, Division 4.5; Code of Federal Regulations (CFR) Title 49, Parts 261–263;
  - Applicable Caltrans requirements as stated in Section 7-109, Solid Waste Disposal and Recycling Reporting, of the Caltrans Construction Manual, Waste Management and Materials Pollution Control BMPs, and Standard Special Provisions (SSPs), will be implemented.
  - Handling of thermoplastic material would be conducted in accordance with Caltrans SSPs 36-4 and 14-11.12, or with 84-9.03C, as applicable. Thermoplastic waste will be disposed of in accordance with SSP 36-4. Environmental Rules and Requirements as outlined in the Caltrans Construction Manual—7-103H (1) Caltrans & Contractor Designated Disposal, Staging, and Borrow Sites—will be followed as required.
  - Handling, transport, and disposal of any contaminated media determined to exceed maximum concentration levels will be performed in accordance with all applicable state and federal regulations. If a commercial landfill will be used to dispose of soils: (1) soils will be transported to a landfill appropriately permitted to receive the material and (2) the contractor is responsible for identifying the appropriately permitted landfill to receive said soils.
- **PF HAZ-5. Creosote-treated Wood Waste.** When handling creosote-treated wood waste (TWW), the following should be observed:
  - Proper removal and disposal of any materials or waste will be consistent with Caltrans' Standard Special Provision (SSP) 14-11.14.
  - Proper removal and disposal of all stained pole-mounted and/or pad-mounted transformers will be required for the utility company or agency operating them.
  - TWW material (being stored) should be labeled TREATED WOOD WASTE - DO NOT BURN OR SCAVENGE, and should include the handler's name and address as well as the accumulation date.

  - TWW will not be stored directly on the ground. TWW will be segregated from other wastes and stored in containers or on plastic sheeting, covered, and secured.
  - TWW will not be burned, scavenged, reused, recycled, or commingled with other waste prior to disposal.
  - TWW will be hauled by a Department of Toxic Substances Control (DTSC)-registered hazardous waste transporter.
  - All TWW will be disposed of at an approved landfill (liner-equipped/ permitted Class I landfill).
  - TWW handlers that generate more than 10,000 pounds in any calendar year will obtain a DTSC ID Number and submit the notification within 30 days of exceeding the 10,000-pound limit.

- **PF SW-1**: Consistent with Caltrans Standard Specification 14-10, non-hazardous construction-period waste shall be recycled.

- **PF AQ-1**: The project would conform to California Department of Transportation (Caltrans) construction requirements, as specified in the Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). The contractor will comply with all air pollution control ordinances and statutes which apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code. Exhaust emissions control measures may include, but are not limited to, the following:

  1. General contractors shall maintain and operate construction equipment so as to minimize exhaust emissions. During construction, trucks and vehicles in loading and unloading queues would have their engines turned off when not in use to reduce vehicle emissions. Construction emissions should be phased and scheduled to avoid emissions peaks and discontinued during second-stage smog alerts.
  2. All equipment shall be properly tuned and maintained in accordance with manufacturer's specifications. The equipment must be checked by an Automotive Service Excellence–certified mechanic and determined to be running in proper condition before it is operated.
  3. All on-road and off-road equipment shall comply with California Air Resources Board (ARB) commercial vehicle idle regulations. California Code of Regulations Title 13, Section 2449(d)(3), which was adopted by ARB on June 15, 2008, restricts idling of construction vehicles to no longer than 5 consecutive minutes.
  4. Use electricity from power poles, rather than temporary diesel- or gasoline powered generators if or where feasible.
  5. Use onsite mobile equipment powered by alternative fuel sources (i.e., methanol, natural gas, propane, or butane) as feasible.
  6. Use solar-powered signal boards.
  7. Develop a construction traffic management plan that includes, but is not limited to: (1) consolidating truck deliveries; (2) providing a rideshare or shuttle service for construction workers; and (3) providing dedicated turn lanes for movement of construction trucks and equipment on and off site.

- **PF AQ-2:** South Coast Air Quality Management District (SCAQMD) Rule 403 (Fugitive Dust) requires that fugitive dust control measures be applied to all construction projects in the South Coast Air Basin, unless said project is specifically exempted by the rule. Construction projects that are classified as "large operations" (i.e., 20 hectares [50 acres] or larger) are required to submit a fully executed Large Operation Notification Form (Form 403 N) to the Executive Office of SCAQMD within 7 days of qualifying as a large operation and to maintain daily records to document the specific control actions taken. The control measures incorporated in the rule are available in a Rule 403 Implementation Handbook, and include:
  - Water or dust palliative will be applied to the site and equipment as frequently as necessary to control fugitive dust emissions.
  - Soil binder will be spread on any unpaved roads used for construction purposes and all project construction parking areas.
  - Trucks will be washed off as they leave the right of way as necessary to control fugitive dust emissions.
  - Equipment and materials storage sites will be located as far away from residential and park uses as practical. Construction areas will be kept clean and orderly.
  - Track-out reduction measures, such as gravel pads at project access points, will be used to minimize dust and mud deposits on roads affected by construction traffic.
  - All transported loads of soils and wet materials will be covered prior to transport or adequate freeboard (i.e., space from the top of the material to the top of the truck) will be provided to reduce PM10 and deposition of particulate during transportation.
  - Dust and mud that are deposited on paved, public roads due to construction activity and traffic will be removed to decrease PM.
  - During construction, dust palliatives will be used as specified in the Department's Standard Specifications, Section 18-1.03A, General.
  - Construction equipment fleets will be in compliance with Best Available Control Technology requirements.
- **PF NOI-1:** Do not exceed 86 A-weighted decibels maximum noise level at 50 feet from job site activities between 9:00 p.m. and 6:00 a.m. (2018 California Department of Transportation Standard Specifications, Section 14-8.02, Noise Control[3]).
- **PF NOI-5:** Construction noise would be temporary and limited to the duration of the construction. The following noise control measures will also be incorporated into the project contract specifications in order to minimize construction noise effects:
  - Whenever a construction site is within one-quarter of a mile of an occupied residence or residences, no construction activities shall be undertaken between the hours of 6 p.m. and 6 a.m. during the months of June through September and between the hours of 6 p.m. and

[3] The 2018 SS 14-8.02 was released following completing of the project Noise Study Report; however, the time requirements of 9:00 p.m. and 6:00 a.m. remain unchanged between the 2015 and 2018 versions of SS 14-8.02.

7 a.m. during the months of October through May. Exceptions to these standards shall be allowed only with the written consent of the building official (County of Riverside Code).

- All noise-producing project equipment and vehicles using internal combustion engines will be equipped with mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features in good operating condition that meet or exceed original factory specifications. Mobile or fixed "package" equipment (e.g., arc-welders, air compressors) will be equipped with shrouds and noise-control features that are readily available for that type of equipment.
- To the extent feasible, sound control blankets shall be placed such that the line of sight from ground-level construction equipment and sensitive receptors would be blocked. For example, an 8-foot-high sound control blanket that has a minimum Sound Transmission Class rating of 28 would provide a noise level reduction of 11 A-weighted decibels when the construction equipment is approximately 50 feet from the sound control blanket while the receptor is approximately 10 feet on the other side.
- All mobile or fixed noise-producing equipment used on the project that is regulated for noise output by a local, state, or federal agency will comply with such regulation while in the course of project activity.
- Electrically powered equipment will be used instead of pneumatic or internal combustion–powered equipment, where feasible.
- Material stockpiles and mobile equipment staging, parking, and maintenance areas will be located as far as practicable from noise-sensitive receptors.
- Construction site and access road speed limits will be established and enforced during the construction period.
- The hours of construction, including noisy maintenance activities and all spoils and material transport, will be restricted to the periods and days permitted by the local noise or other applicable ordinance. Noise-producing project activity will comply with local noise control regulations affecting construction activity or obtain exemptions therefrom.
- The use of noise-producing signals, including horns, whistles, alarms, and bells, will be for safety warning purposes only.
- No project-related public address or music system will be audible at any adjacent receptor.
- All residential units located within 500 feet of the construction site shall be sent a notice regarding the construction schedule. A sign, legible at a distance of 50 feet, shall also be posted at the construction site. All notices and the signs shall indicate the dates and duration of construction activities.

- **NC-2 (NES BIO-2):** Active construction areas will be watered regularly to control dust and thus minimize impacts on adjacent vegetation (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3).
- **NC-3 (NES BIO-3):** When work is conducted during the fire season (as identified by the Riverside County Fire Department) adjacent to any natural vegetation communities, appropriate firefighting equipment (e.g., extinguishers, shovels, water tankers) will be available on the project site during all phases of project construction to help minimize the

chance of human-caused wildfires. Shields, protective mats, and/or other fire preventative methods will be used during grinding, welding, and other spark-inducing activities. Personnel trained in fire hazards, preventative actions, and responses to fires will advise contractors regarding fire risk from all construction-related activities (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3).

- **NC-4 (NES BIO-4):** A qualified biologist will prepare and present an environmental training program for project and construction personnel (Western Riverside County Multiple Species Habitat Conservation Plan [WRC MSHCP] Volume I, Section 7.5.3) prior to grading or staging. As new personnel are added to the project, they will be required to participate in the training. The training will include a description of the species of concern and their habitats, the general provisions of the federal Endangered Species Act and California Endangered Species Act and the WRC MSHCP, the need to adhere to the provisions of the acts and the WRC MSHCP, the penalties associated with violating the provisions of the acts, the general measures that are being implemented to conserve the species of concern as they relate to the proposed project, and the access routes to and project site boundaries within which the project activities must be accomplished (WRC MSHCP Volume I, Appendix C). All sensitive areas will be fenced as presented in Measure **NC-6**, below.
- **NC-5 (NES BIO-5):** The qualified project biologist will monitor construction activities to ensure that practicable measures are being employed and avoid incidental disturbance of habitat and species of concern outside the project footprint (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3). Special attention will be provided to ensure that the environmentally sensitive area fencing required in Measure **NC-6** is maintained. Additionally, ongoing monitoring and reporting will occur for the duration of the construction activity to ensure implementation of best management practices. This will be done in concert with Measure **NC-6**, below, which includes the fencing of sensitive areas (e.g., riparian-riverine resources and jurisdictional waters and wetlands adjacent to the limits of disturbance and conserved lands).
- **NC-6 (NES BIO-6):** Construction personnel will strictly limit their activities, vehicles, equipment, and construction materials to the proposed project footprint and designated staging areas and routes of travel. The construction area(s) will be the minimal area necessary to complete the proposed project and will be specified in the construction plans. Construction limits adjacent to sensitive resource areas will be demarcated using environmentally sensitive area (ESA) fencing (e.g., orange snow fencing, silt fencing). The ESA fencing will be reviewed at a frequency deemed necessary by the biological monitor (as indicated in Measure **NC-5** [**NES BIO-5**]) until the completion of all construction activities. For the ESA fencing installed within Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) Core Reserve (Riverside County Habitat Conservation Authority Stephens' Kangaroo Rat Reserve and Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan area), the fencing must exclude reptiles and amphibians (to greatest extent feasible) from entering the limits of disturbance. Employees will be instructed that their activities are restricted to the construction areas (WRC MSHCP Volume I, Appendix C). Access to sites will be from pre-existing access routes to the greatest extent possible (WRC MSHCP Volume I, Section 7.5.3 and Appendix C).

- **NC-7 (NES BIO-7):** Exotic plant species removed during construction will be properly handled to prevent sprouting or regrowth (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3). Vegetation removed from the project site will be covered while being carried on trucks, and vegetation materials removed from the site will be disposed of in accordance with applicable laws and regulations.
- **NC-8 (NES BIO-8):** Construction equipment will be cleaned of mud or other debris that may contain invasive plants and/or seeds and inspected to reduce the potential of spreading noxious weeds before mobilizing to the site and before leaving the site during the course of construction. The cleaning of equipment will occur at least 300 feet from environmentally sensitive area fencing to prohibit the spread of invasive species.
- **NC-9 (NES BIO-24):** To avoid attracting predators of special-status species, the project site will be kept as clean of debris as possible. All food-related trash items will be enclosed in sealed containers and regularly removed from the site(s) (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Appendix C).

Temporary Construction Easements

TCEs would be necessary during construction of the project; it is anticipated that the project will be constructed in phases and localized TCEs utilized for each area of the project being constructed only. Preliminary locations proposed for TCEs under each build alternative are shown in Figures 2.2-2 through 2.2-5.

Temporary Staging Areas

Designated staging areas would also be utilized during construction and geotechnical borings would be conducted within the project's limits of disturbance (LOD) as needed for design of the project. Preliminary locations identified for staging under all build alternatives are:

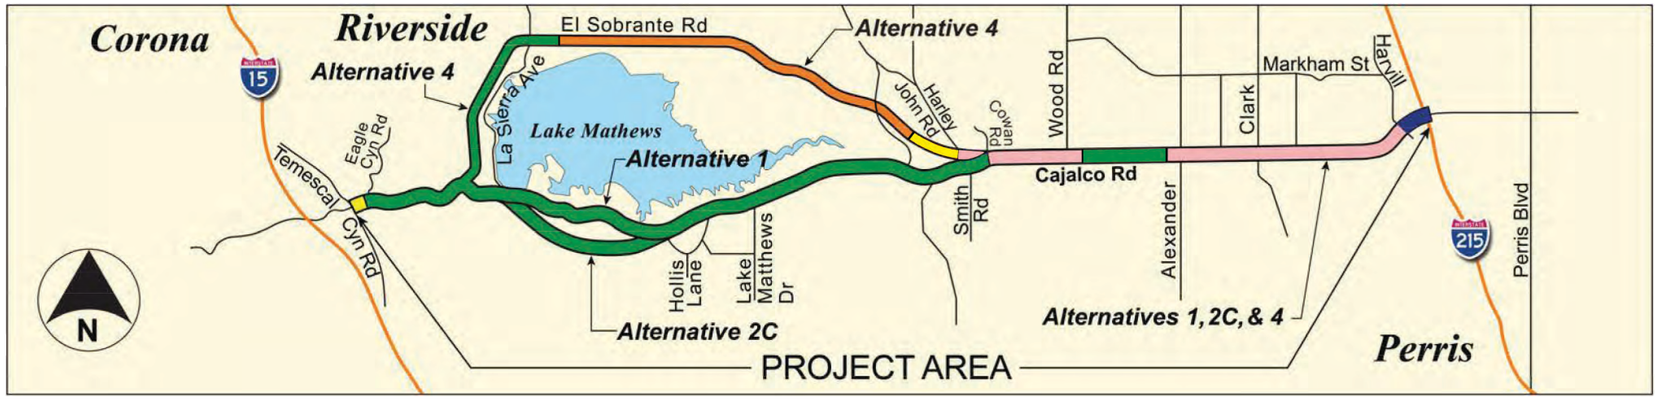
- Between Temescal Canyon Road and Temescal Creek (STA #15, Sheet 1A of Figures 2.2-2, 2.2-4, and 2.2-5);
- Southeast corner of Cajalco Road and realigned Gustin Road (STA #593, Sheet 6 of Figure 2.2-2, Sheet 7 of Figure 2.2-4, and Sheet 6 of Figure 2.2-5); and
- Southeast corner of Cajalco Road and Barton Street (STA #745, Sheet 1B of Figure 2.2-3).

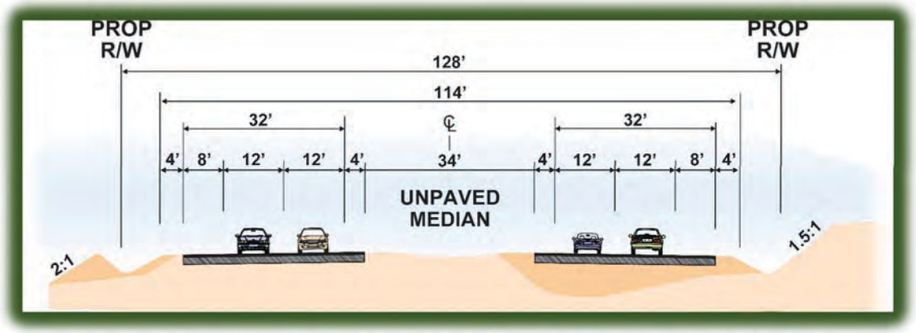
Additional staging areas are proposed along each of the build alternative alignments; these are described under their respective build alternative in Section 2.2.1.2, *Unique Features of the Build Alternatives*. Staging plans would be developed during the design phase of the project, coordinated with the County, and finalized prior to project construction. Temporary advanced signage during construction would be required, which would involve portable changeable message signs or other temporary signage that would not require any ground disturbance.

2.2.1.2 Unique Features of the Build Alternatives

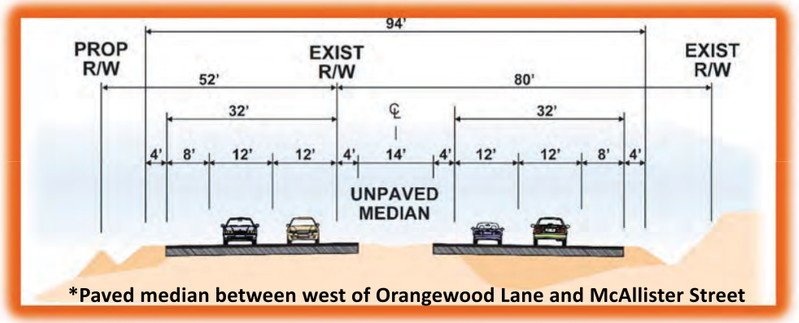
Build Alternative 1 (Cajalco Alignment): Widen Existing Cajalco Road from Temescal Canyon Road to I-215 including Minor Alignment Changes between Temescal Canyon Road and Gustin Road

As indicated in the summarized description of Build Alternative 1, above, Build Alternative 1 would include improvements only to those segments of Cajalco Road identified. Improvements to, or the decommissioning of, other area roadways not directly associated with intersection improvements (i.e., intersecting roadways) are not proposed under this alternative.

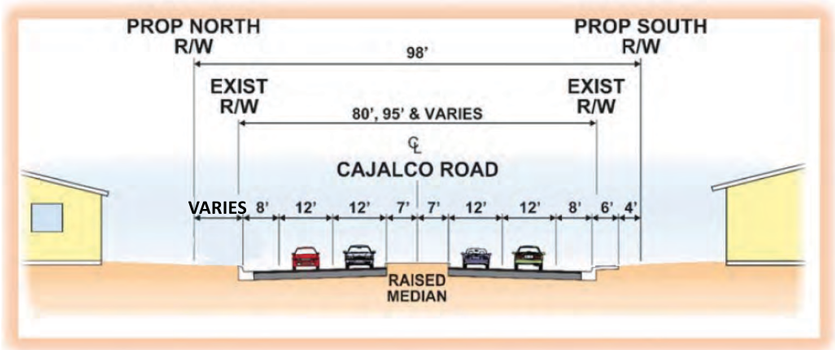




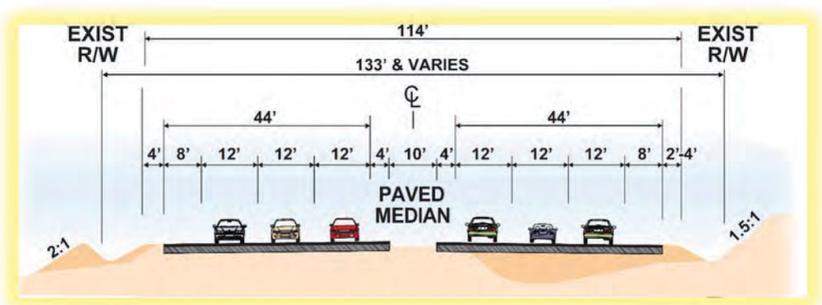
Temescal Creek Bridge to Cowan Road (Build Alternatives 1 and 2C)
Temescal Creek Bridge to El Sobrante Road (Build Alternative 4)



El Sobrante Road - East of La Sierra Avenue to West of Harley John Road (Build Alternative 4)*



Harley John Road to Cowan Road (Build Alternative 4)



El Sobrante Road - West of Harley John Road (Build Alternative 4)

Refer to Figure 2.2-1 Typical Cross-Sections Common to Build Alternatives 1, 2C and 4, for additional areas of the project this cross-section applies to.

Figure 2.2-6
Typical Cross-Sections Unique to Build Alternatives 1, 2C and 4
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

Safety Enhancements

Proposed safety enhancements unique to Build Alternative 1 are described below.

Medians and Intersection Improvements

Between Temescal Canyon Road and Harley John Road, portions of the alignment travel through the boundaries of the LM MSHCP with limited opportunities for roadway expansion; thus, for the segment of Cajalco Road between Temescal Creek Bridge and Harley John Road, the median would be designed wide enough to accommodate two additional travel lanes (one in each direction) if constructed in the future (see Figure 2.2-6). For this segment of Cajalco Road, the median would be unpaved, except for roadway intersections, bridges, and intersection and bridge approaches, where the full roadway would be paved and striped for turn lanes, through lanes, and crosswalks where crosswalks are provided. Medians for remaining segments of Cajalco Road under Build Alternative 1 would be consistent with those described for all build alternatives in Section 2.2.1.1, *Common Features of the Build Alternatives*, and depicted in Figure 2.2-1. Improvements to existing intersections are proposed and would vary from minor widening and turn pocket additions to complete reconstruction and installation of new signals. In addition to the installation of new traffic signals at the intersections identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, new signals would be installed and intersection improvements applied at the following intersections with Cajalco Road: Cajalco Road west of Lake Mathews Drive (new intersection), Lake Mathews Drive, Archer Road, and Kirkpatrick Road.

Roadway Curves and Realignments

Under Build Alternative 1 (see Figure 2.2-2), the project would generally follow the existing alignment of Cajalco Road between Temescal Canyon Road and I-215. West of Lake Mathews Drive and north of Lynette Lane, Cajalco Road would be realigned, bypassing the Hollis Lane residential area to the south, and would include the construction of a bridge south of Lake Mathews. The new bridge would reduce grading impacts and provide opportunities for improving connectivity between habitat areas. A cul-de-sac would be added at a new terminus of existing Cajalco Road west of Hollis Lane/Lynette Lane, and the remaining segment of existing Cajalco Road west to the new, realigned Cajalco Road would be removed. A connection between Dirt Road and Lake Mathews Drive would also be constructed for secondary access to residences in the Hollis Lane/Lynette Lane area. Refer to Figure 2.2-2 for realignment locations.

Wildlife Crossings and Fencing (Build Alternative 1)

Between Temescal Canyon Road and Harley John Road, and at Cajalco Creek, 73 wildlife crossings of various widths beneath Cajalco Road would be constructed. Fencing would be installed along Cajalco Road through the LMR and LM-EM Reserve to provide security for MWD facilities, protect sensitive resources, and deter access into preserve areas. Fencing placement and design details would be included in a Wildlife Fencing Plan coordinated between the County, MWD, and agencies involved in management of preserve areas. The Wildlife Fencing Plan will be developed as detailed in Measure **NC-16 (NES BIO-19)**. Refer to Section 3.17, *Natural Communities*, of this EIR/EIS for additional detail. Security fencing 6 to 10 feet in height would also be installed within the right of way along Cajalco Road where detention basins

are proposed (refer to Sheets 2A through 6 of Figure 2.2-2 for large detention basin locations specific to Build Alternative 1).

Right of Way Acquisitions and Relocations (Build Alternative 1)

Under Build Alternative 1, approximately 147 acres composed of 223 partial and 62 complete property acquisitions are proposed to accommodate the widened roadway, areas of realigned roadway, utility relocations, cut and fill, and related project facilities. Where relocations may be required, relocation assistance payments and counseling would be provided in accordance with the Uniform Relocation Act and Real Property Acquisition Policies Act of 1970, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents.

Approximately 202 existing utility poles are located within the project limits of Build Alternative 1 along Cajalco Road. Affected utility poles/lines would be relocated within the project limits as needed to accommodate the roadway widening between Temescal Canyon Road and Harvill Avenue.

Bridges, Culverts, and Detention Basins (Build Alternative 1)

Bridges

In addition to the proposed new and replacement bridges identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following new bridge and large culverts are proposed under Build Alternative 1:

- New bridge: A new bridge along realigned Cajalco Road west of Lake Mathews Drive would be constructed over a drainage at STA #268 (see Figure 2.2-2). The new, 112.8-foot-wide, 160-foot-long, single-span bridge would also serve as a wildlife crossing for movement between the north and south sides of Cajalco Road in this area.
- Large culvert replacement: Three 48-inch culverts located at the intersection of Cajalco Road and Harley John Road, at STA #512 (see Figure 2.2-2), would be replaced with a four-cell, 20-foot-wide by 10-foot-high RCB.

In addition to the proposed standard measures identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, Standard Project Measure **PF GEO-3**, Excavation Techniques, would also be included for the proposed bridge at STA #268.

Detention Basins

In addition to the proposed, large detention basins and Standard Project Measure **PF VIS-5** identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following large detention basins are proposed under Build Alternative 1:

- South side of Cajalco Road just east of La Sierra Avenue at STA #179 (see Figure 2.2-2).
- North side of realigned Cajalco Road west of Hollis Lane at STA #266 (see Figure 2.2-2).
- North side of Cajalco Road east of Lake Mathews Drive at STA #362 (see Figure 2.2-2).
- North side of Cajalco Road west of Archer Road at STA #397 (see Figure 2.2-2).

In addition to the proposed staging area locations identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following preliminary staging area location has been identified for Build Alternative 1 where right of way may not be adequate to accommodate construction:

- Southwest corner of Cajalco Road and realigned Silverton Court (STA #163, Figure 2.2-2).

Build Alternative 2C (Modified Cajalco Alignment): Widen Existing Cajalco Road between Temescal Canyon Road and from just west of Lake Mathews Drive to Interstate 215; Construct New Segment of Cajalco Road between La Sierra Avenue and just west of Lake Mathews Drive

As indicated in the summarized description of Build Alternative 2C, above, Build Alternative 2C would include improvements only to those segments of Cajalco Road identified. Improvements to, or the decommissioning of, other area roadways not directly associated with intersection improvements (i.e., intersecting roadways) are not proposed under this alternative.

Safety Enhancements

Proposed safety enhancements unique to Build Alternative 2C are described below.

Medians and Intersection Improvements

Between Temescal Canyon Road and Harley John Road, portions of the alignment travel through the boundaries of the LM MSHCP with limited opportunities for roadway expansion; therefore, for the segment of Cajalco Road between Temescal Creek Bridge and Harley John Road, the median would be designed wide enough to accommodate two additional travel lanes (one in each direction) if constructed in the future (see Figure 2.2-6). For this segment of Cajalco Road, the median would be unpaved, except for roadway intersections, bridges, and intersection and bridge approaches, where the full roadway would be paved and striped for turn lanes, through lanes, and crosswalks where crosswalks are provided. Medians for remaining segments of Cajalco Road under Build Alternative 2C would be consistent with those described for all build alternatives in Section 2.2.1.1, *Common Features of the Build Alternatives*, and depicted in Figure 2.2-1.

Similar to Build Alternative 1, improvements to existing intersections are proposed and would vary from minor widening and turn pocket additions to complete reconstruction and installation of new signals. In addition to the installation of new traffic signals at the intersections identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, new signals would also be installed at the following intersections with Cajalco Road: Cajalco Road west of Lake Mathews (new intersection), Lake Mathews Drive, Archer Road, and Kirkpatrick Road.

Roadway Curves and Realignments

Under Build Alternative 2C (see Figure 2.2-4), the project would generally follow the existing alignment of Cajalco Road between I-215 to west of Lake Mathews Drive Road, and between La Sierra and Temescal Canyon Road. Between west of Lake Mathews Drive and La Sierra Avenue, a new four-lane segment of Cajalco Road would be constructed north of existing Cajalco Road. Existing Cajalco Road between La Sierra and just west of Lake Mathews Drive would be closed to public traffic. The existing pavement in this portion of existing Cajalco Road would be partially or completely removed, and fenced to prevent access. The remaining dirt, gravel or

partially paved road may be used by MWD for access in managing the Lake Mathews dam and reservoir facilities, and by MWD and the Riverside County Habitat Conservation Agency (RCHCA) for managing areas of the LMR and LM-EM Reserve.[4]

Similar to Build Alternative 1, a cul-de-sac would be added at a new terminus of existing Cajalco Road west of Hollis Lane/Lynette Lane, and the remaining segment of existing Cajalco Road west to the new, realigned Cajalco Road, removed. A connection between Dirt Road and Lake Mathews Drive would also be constructed for secondary access to residences in the Hollis Lane/Lynette Lane area.

In addition to the proposed realignment of sections of Cajalco Road identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, additional sections of Cajalco Road would be realigned between west of La Sierra Avenue and west of Lake Mathews Drive. Please refer to Figure 2.2-4 for realignment locations.

Wildlife Crossings and Fencing (Build Alternative 2C)

Between Temescal Canyon Road and Harley John Road, and at Cajalco Creek, 70 wildlife crossings of various widths beneath Cajalco Road would be constructed. Fencing would be installed along Cajalco Road through the LMR and LM-EM Reserve to provide security for MWD facilities, protect sensitive resources, and deter access into preserve areas. Fencing placement and design details would be included in a Wildlife Fencing Plan coordinated between the County, MWD, and agencies involved in management of preserve areas. The Wildlife Fencing Plan will be developed as detailed in Measure **NC-16 (NES BIO-19)**. Refer to Section 3.17, *Natural Communities*, of this EIR/EIS for additional detail. Security fencing 6 to 10 feet in height would also be installed within the right of way along Cajalco Road where detention basins are proposed (refer to Sheets 3B through 6 of Figure 2.2-3 for large detention basin locations specific to Build Alternative 2C).

Right of Way Acquisitions and Relocations (Build Alternative 2C)

Under Build Alternative 2C, approximately 198 existing utility poles are within the project's LOD along Cajalco Road. Affected electrical poles/lines would be relocated within the project limits as needed to accommodate the roadway widening between Temescal Canyon Road and Harvill Avenue.

Under Build Alternative 2C, approximately 158 acres composed of 224 partial and 62 complete property acquisitions are proposed to accommodate the widened roadway, areas of realigned roadway, utility relocations, cut and fill, and related project facilities. Where relocations may be required, relocation assistance payments and counseling would be provided in accordance with the Uniform Relocation Act and Real Property Acquisition Policies Act of 1970, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents.

[4] The Lake Mathews Multiple Species Reserve (LMR) was established under the LM MSHCP in 1995. In 1996, the Stephen's Kangaroo Rat Habitat Conservation Plan established the Lake Mathews-Estelle Mountain Core Reserve (LM-EM Reserve); the northern portion of the LM-EM Reserve encompasses the LMR. MWD partners with RCHCA in management of the LMR and northern portion of the LM-EM Reserve.

Bridges, Culverts, and Detention Basins (Build Alternative 2C)

In addition to the proposed new and replacement bridges identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following new bridges and large culverts are proposed under Build Alternative 2C:

- Large culvert replacement: Three 48-inch culverts located at the intersection of Cajalco Road and Harley John Road, at STA #512 (see Figure 2.2-4) would be replaced with a four-cell, 20-foot-wide by 10-foot-high RCB.
- New bridge: A new bridge along realigned Cajalco Road east of La Sierra Avenue would be constructed over a drainage at STA #175 (see Figure 2.2-4). The 112.8-foot-wide, 80-foot-long, single-span bridge would also serve as a wildlife crossing for movement between the north and south sides of Cajalco Road in this area.
- New bridge: A new bridge along realigned Cajalco Road west of Lake Mathews Drive would be constructed at STA #242 (see Figure 2.2-4). The 112.8-foot-wide, 200-foot-long, two-span bridge would also serve as a wildlife crossing for movement between the north and south sides of Cajalco Road in this area.
- New bridge: A new bridge along realigned Cajalco Road west of Lake Mathews Drive would be constructed at STA #267 (see Figure 2.2-4). The 112.8-foot-wide, 200-foot-long, two-span bridge would also serve as a wildlife crossing and LM-EM Reserve maintenance undercrossing, and would be designed with a minimum 15-foot clearance height for mule deer passage, and 50-feet width each side of the bridge footings for sheep passage.

In addition to the proposed standard measures identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, Standard Project Measure **PF GEO-2**, Excavation Techniques, would also be included for the proposed bridge at STA #242.

In addition to the proposed, larger detention basins identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following large detention basins are proposed under Build Alternative 2C:

- South side of Cajalco Road east of La Sierra Avenue at STA #184 (see Figure 2.2-4).
- North side of Cajalco Road east of Lake Mathews Drive at STA #367 (see Figure 2.2-4).
- North side of Cajalco Road west of Archer Road at STA #402 (see Figure 2.2-4).
- Northeast corner of Cajalco Road and El Sobrante Road at STA #474 (see Figure 2.2-4).

In addition to the proposed staging area locations identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following preliminary staging area locations are identified for Build Alternative 2C where right of way may not be adequate to accommodate construction:

- Southwest corner of Cajalco Road and realigned Silverton Court (STA #163, Figure 2.2-4)
- Along new segment of realigned Cajalco Road west of Hollis Lane (STA #247, Figure 2.2-4)
- Along new and removed segments of realigned Cajalco Road west of Hollis Lane (STA #270, Figure 2.2-4)

Build Alternative 4 (El Sobrante Alignment): Widen Existing Cajalco Road between I-215 and Gustin Road; Realign El Sobrante Road from a Point Approximately One Mile West of Harley John Road to Gustin Road; Widen and Improve El Sobrante Road between Gustin Road and La Sierra Avenue; Realign La Sierra Avenue between El Sobrante Road and Cajalco Road; Widen Existing Cajalco Road with Minor Alignment Changes between La Sierra Avenue and Temescal Canyon Road

As indicated in the summarized description of Build Alternative 4, above, Build Alternative 4 would include improvements only to those segments of Cajalco Road, La Sierra Avenue, and El Sobrante Road identified. Improvements to, or the decommissioning of, other sections of Cajalco Road or La Sierra Avenue are not proposed under this alternative.

Safety Enhancements

Proposed safety enhancements unique to Build Alternative 4 are described on the following page.

Medians and Intersection Improvements

Between Temescal Canyon Road and Harley John Road, portions of the alignment travel through the boundaries of the LM MSHCP with limited opportunities for roadway expansion; therefore, for the segments of Cajalco Road and La Sierra Avenue between Temescal Creek Bridge and El Sobrante Road, the median would be designed wide enough to accommodate two additional travel lanes (one in each direction) if constructed in the future (see Figure 2.2-6). For these segments of Cajalco Road and La Sierra Avenue, and the segment of El Sobrante Road between McAllister Street to west of the new Harley John Road intersection, the median would be unpaved, except for roadway intersections, bridges, and intersection and bridge approaches, where the full roadway would be paved and striped for turn lanes, through lanes, and crosswalks where crosswalks are provided. Medians for remaining segments of Cajalco Road under Build Alternative 4 would be consistent with those described for all build alternatives in Section 2.2.1.1, *Common Features of the Build Alternatives*, and depicted in Figure 2.2-1.

Improvements to existing intersections are proposed and would vary from minor widening and turn pocket additions to complete reconstruction and installation of new signals. In addition to the installation of new traffic signals at the intersections identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, new signals would also be installed at the following intersections under Build Alternative 4: Cajalco Road west of La Sierra Avenue (new intersection), El Sobrante Road and La Sierra Avenue, El Sobrante Road and McAllister Street, and El Sobrante Road and Harley John Road (new intersection).

Roadway Curves and Realignments

Between Gustin Road and I-215, the improvements would be identical to Build Alternatives 1 and 2C. Between Gustin Road and Temescal Canyon Road, El Sobrante Road would be improved from the existing two-lane facility to a four-lane facility and would generally follow the existing El Sobrante Road from La Sierra Avenue to the east. The El Sobrante Road intersection with La Sierra Avenue would be improved. La Sierra Avenue would be slightly realigned to the west from the intersection with El Sobrante Road to just west of Tin Mine Road.

At a point approximately 1 mile west of Harley John Road, El Sobrante Road would be realigned to provide a smoother transition from Cajalco Road to El Sobrante Road. In addition, existing Cajalco Road would be realigned to the west of Harley John Road to tie into El Sobrante Road.

In addition to the proposed realignment of sections of Cajalco Road identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, additional sections of Cajalco Road, and sections of La Sierra Avenue, El Sobrante Avenue and Harley John Road, would be realigned between west of La Sierra Avenue and Gustin Road. Please refer to Figure 2.2-5 for realignment locations.

Between La Sierra Avenue and Temescal Canyon Road, the western portion of Build Alternative 4 would extend south to existing Cajalco Road, and then west along Cajalco Road to Temescal Canyon Road. Between El Sobrante Road and Cajalco Road, La Sierra Avenue would be realigned to the west of the existing La Sierra Avenue alignment, and an approximately 1,115-foot-long arch bridge constructed along the realigned section of La Sierra Avenue, north of the transition with Cajalco Road.

Between the realigned La Sierra Avenue intersection with Cajalco Road and Temescal Canyon Road, the roadway improvements would be the same as proposed under Build Alternatives 1 and 2C. The portion of Cajalco Road between La Sierra Avenue and Gustin Road would remain in its current configuration. Additional new traffic signals would be installed at the realigned intersection of El Sobrante Road with La Sierra Avenue/main MWD Lake Mathews facility entrance, and the new intersection of El Sobrante and Harley John Road.

Wildlife Crossings and Fencing (Build Alternative 4)

Between Temescal Canyon Road and Harley John Road, and at Cajalco Creek, 51 wildlife crossings of various widths beneath Cajalco Road, La Sierra Avenue and El Sobrante Road, would be constructed. Fencing would be installed along Cajalco Road, La Sierra Avenue and El Sobrante Road through the LMR and LM-EM Reserve to provide security for MWD facilities, protect sensitive resources, and deter access into preserve areas. Fencing placement and design details would be included in a Wildlife Fencing Plan coordinated between the County, MWD, and agencies involved in management of preserve areas. The Wildlife Fencing Plan will be developed as detailed in Measure **NC-16 (NES BIO-19)**. Refer to Section 3.17, *Natural Communities*, of this EIR/EIS for additional detail.

Right of Way Acquisitions and Relocations (Build Alternative 4)

Under Build Alternative 4, approximately 159 acres composed of 274 partial and 71 complete property acquisitions are proposed to accommodate the widened roadway, areas of realigned roadway, utility relocations, cut and fill, and related project facilities. Where relocations may be required, relocation assistance payments and counseling would be provided in accordance with the Uniform Relocation Act and Real Property Acquisition Policies Act of 1970, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents.

Under Build Alternative 4, approximately 281 existing utility poles are within the project's LOD along Cajalco Road, La Sierra Avenue and El Sobrante Road. Affected utility poles/lines would be relocated within the project limits as needed to accommodate the roadway widening between Temescal Canyon Road and Harvill Avenue. Piezometers located within MWD-managed areas that are within the project limits would require relocation and additional engineering to ensure

continued protection and stability of MWD Upper and Lower Feeder Pipelines and Northern Lake Mathews Dike facilities.

Bridges, Culverts, and Detention Basins (Build Alternative 4)

In addition to the proposed new and replacement bridges identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following new bridges and large culverts are proposed under Build Alternative 4:

- New bridge: A new bridge along realigned La Sierra Avenue northeast of a new intersection with Cajalco Road, would be constructed over a drainage at STA #145 (see Figure 2.2-5). The new, 108.8-foot-wide, 301.5-foot-long, two-span bridge would also serve as a wildlife crossing for movement between the north and south sides of Cajalco Road in this area.
- New bridge: A new bridge along realigned La Sierra Avenue northeast of a new intersection with Cajalco Road, would be constructed at STA #157 – 169 (see Figure 2.2-5). The new, 120.4-foot-wide, 1,115-foot-long arch bridge would span MWD facilities associated with the Lake Mathews Dam and accommodate maintenance access roads associated with Lake Mathews' facilities beneath the bridge between the east and west sides of La Sierra Avenue.

  A shorter bridge structure positioned closer to Lake Mathews was originally proposed at this location and was subsequently modified in response to input received from MWD, as well as environmental constraints and engineering factors. Multiple variations of bridge designs were developed and considered by MWD, and the current design selected, with additional refinements, to avoid or otherwise minimize impacts on MWD facilities and access.
- New bridge: A new bridge along realigned La Sierra Avenue northeast of new intersection with Cajalco Road, would be constructed over a spillway at STA #179 (see Figure 2.2-5). The new, 112.8-foot-wide, 200-foot-long, two-span bridge would also accommodate maintenance access roads associated with Lake Mathews' facilities beneath the bridge between the east and west sides of La Sierra Avenue in this area.
- Replacement bridge: An existing bridge along an MWD access road that crosses over an existing inlet channel between realigned El Sobrante Road and existing Cajalco Road, at approximately STA #565 (see Figure 2.2-5), would be replaced with an approximately 43-foot-wide, 245-foot-long, two-span vehicular bridge that would accommodate the inlet channel between an existing MWD detention basin and sedimentation basin.

No additional large detention basins from those identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, are proposed under Build Alternative 4.

In addition to the proposed staging area locations identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, the following preliminary staging area locations have been identified where right of way may not be adequate to accommodate construction:

- At new southwest corner of realigned La Sierra Avenue and Cajalco Road (STA #140, Figure 2.2-5)
- Along realigned La Sierra Avenue midway between Cajalco Road and El Sobrante Road (STA #185, Figure 2.2-5)
- Along north side of El Sobrante Road, west of Rawhide Lane (STA #458, Figure 2.2-5)

2.2.1.3 Transportation System Management (TSM) and Transportation Demand Management (TDM) Alternatives

Transportation Systems Management (TSM)/Transportation Demand Management (TDM) measures are strategies to enhance the efficiency of the transportation system while lowering cost. TSM measures seek to increase the number of vehicle trips that can be carried without adding lanes. TDM focuses on regional strategies for reducing vehicle trips and miles traveled and increasing vehicle occupancy. The total population of the nine census tracts within the project study area was approximately 73,679 in 2016, and the populations of the Cities of Corona and Perris were 167,836 and 77,879, respectively, in 2017 (U.S. Census Bureau 2018). As identified in California Government Code § 65080 (b) (1) the policy element of transportation planning agencies is based on populations that exceed 200,000 persons for their regional transportation plans in regards to the development of measures of mobility and traffic congestion, including, but not limited to, daily vehicle hours of delay per capita and vehicle miles traveled per capita.

The populations within and nearest to the project area are not larger than 200,000 persons, as a result does not meet the requirements of California Government Code §65080. Therefore, a separate TSM/TDM alternative was not evaluated for the project.

Although TSM measures alone could not satisfy the purpose and need of the project, the following Transportation System Management measures have been incorporated into the build alternatives for this project: construction of new and improvements to existing traffic signals; inclusion of turning lanes and turn pockets; bus turn-outs; and sidewalks.

2.2.1.4 No-Build (No Project) Alternative

Under the No-Build (No Project) Alternative, existing two-lane segments of Cajalco Road and El Sobrante Road between I-215 and Temescal Canyon Road would remain as a two-lane roadway, and would not be widened or otherwise improved. The roadways would remain as constructed with the exception of the portion of Cajalco Road between Brown Street to Day Street where a center turn lane is in the planning stages and is schedule to be constructed well in advance of the proposed project. Many segments of Cajalco Road would continue to operate at unacceptable traffic levels, similar to existing conditions, and would worsen without transportation improvements. Implementation of this alternative would not address regional growth trends expected for this portion of the county. Additionally, current grade deficiencies in the existing roadway would not be addressed or corrected under this alternative.

Security and wildlife benefits from the implementation of improved and new fencing, and the construction of between 51 and 73 new wildlife crossings proposed under the build alternatives that would facilitate improved safe animal movement, would not occur.

Implementation of this alternative would not improve connectivity between I-215 and I-15 in Riverside County and would not meet project objectives of providing improved speed, capacity, and turning movements to an existing roadway. This alternative would not provide the safety features associated with the proposed project and hence will not improve traffic safety of the existing Cajalco Road.

2.2.2 Comparison of Alternatives

A comparative, conceptual-level analysis of project alternatives for the Cajalco Road Widening and Safety Enhancement Project was performed to evaluate the alternatives' performance relative to transportation objectives, benefits, impacts, and costs. A number of performance criteria were initially developed, and many screened out as preliminary findings indicated similar results among the alternatives. Criteria indicating differences in outcomes among alternatives involving transportation objectives, benefits, impacts and costs, were further compared, and the results summarized in Table 2.2-3 on the following page.

Table 2.2-3. Alternatives Comparison Table

Project Feature or Environmental Effect	Build Alternative 1	Build Alternative 2C	Build Alternative 4	No-Build (No Project)
Project Purpose and Need				
Improve the transportation facility to address anticipated growth and mobility needs	Yes; improvements to 15.7 miles of Cajalco Road. Cajalco Road capacity increased with two additional through lanes and multiple turn pockets between Temescal Canyon Road and I-215; future Cajalco Road improvements that would address projected growth and mobility needs would be accommodated with right of way for two additional future lanes between Temescal Canyon Road and Harley John Road.	Yes; improvements to 15.7 miles of Cajalco Road. Cajalco Road capacity increased with two additional through lanes and multiple turn pockets between Temescal Canyon Road and I-215; future Cajalco Road improvements that would address projected growth and mobility needs would be accommodated with right of way for two additional future lanes between Temescal Canyon Road and Harley John Road.	Yes; improvements to 8.9 miles of Cajalco Road. Cajalco Road capacity increased with two additional through lanes and multiple turn pockets between Temescal Canyon Road and La Sierra Avenue, and Cowan Road and I-215; future Cajalco Road improvements that would address projected growth and mobility needs would be accommodated with right of way for two additional future lanes between Temescal Canyon Road and La Sierra Avenue.	No transportation facility Improvements
Improve interregional travel by improving east-west mobility in Riverside County	Yes; Cajalco Road capacity increased with two additional through lanes, multiple turn pockets and controlled median between Temescal Canyon Road and I-215. Most direct route between I-15 and I-215.	Yes; Cajalco Road capacity increased with two additional through lanes, multiple turn pockets and controlled median between Temescal Canyon Road and I-215.	Yes; capacity increased for segments of Cajalco Road, La Sierra Avenue and El Sobrante Road with two additional through lanes, multiple turn pockets and controlled median between Temescal Canyon Road and I-215. Travel distance would increase, however, affecting east-west mobility in comparison to Build Alternatives 1 and 2C.	No east-west mobility Improvements
Improve roadway alignment and intersection design to enhance safety	Yes; safety Improvements to 15.7 miles of Cajalco Road: Reduced curves, intersection controls, center median, and residential cul-de-sac.	Yes; safety Improvements to 15.7 miles of Cajalco Road: Reduced curves, intersection controls, center median, and residential cul-de-sac.	Yes; less than Alternatives 1 and 2C. Safety Improvements to 8.9 miles of Cajalco Road: Reduced curves, intersection controls, center median, and residential cul-de-sac. No improvements to 6.8 segment between La Sierra Avenue and Harley John Road.	No safety Improvements
Traffic / Circulation				
Vehicle miles traveled (Year 2044)	14,779,906 VMT	14,721,152 VMT	14,811,302 VMT	14,659,917 VMT
Travel distance / project length	15.7 miles	15.7 miles	16.8 miles	15.7 miles

Project Feature or Environmental Effect	Build Alternative 1	Build Alternative 2C	Build Alternative 4	No-Build (No Project)
Cajalco Road between Temescal Canyon Creek and La Sierra Avenue (Year 2044)	18,530 ADT / LOS A	18,530 ADT / LOS A	30,810 ADT / LOS D	13,460 ADT / LOS C
Projected Cajalco Road Capacity Deficiencies between west of Hollis Lane and Lake Mathews Drive, and between Lounsberry Road and Harley John Road (Year 2040)	Addresses projected Cajalco Road capacity deficiency by adding two additional lanes and turn pocket. Includes right of way for two additional future lanes.	Addresses projected Cajalco Road capacity deficiency by adding two additional lanes and turn pocket. Includes right of way for two additional future lanes.	Does not address projected Cajalco Road capacity deficiency between west of Hollis Lane and Lake Mathews Drive, and between Lounsberry Road and Harley John Road.	Does not address projected Cajalco Road capacity deficiency between west of Hollis Lane and Lake Mathews Drive, and between Lounsberry Road and Harley John Road.
Biological and Water Resources				
Wetlands and Other Waters impacts (USACE-RWQCB / CDFW)	3.61 acres / 10.2 acres	3.94 acres / 10.04 acres	1.44 acres / 7.08 acres	None
Riparian/riverine impacts	17.1 acres	15.41 acres	10.23 acres	None
Sensitive natural communities permanent impacts (total)	76.58 acres	85.2 acres	79.78 acres	None
Sensitive natural communities permanent impacts (LMR and LM-EM Reserve)	28.16 acres	37.06 acres	22.24 acres	None
Vegetation community benefit (addition due to roadbed removal)	23.08 acres	28.84 acres	18.04 acres	None
Threatened and Endangered Species Habitat Impacts (acres)	Arroyo Toad: 8.08 Coastal California Gnatcatcher: 67.09 Least Bell's Vireo: 7.85 Stephens' Kangaroo Rat: 125.29 *Shading effects:* Arroyo Toad: 0.41 Coastal California Gnatcatcher: 0.22 Least Bell's Vireo: 0.36 Stephens' Kangaroo Rat: 0.22 *Roadbed removal benefits:* Coastal California Gnatcatcher: 2.85 Least Bell's Vireo: 0.07 Stephens' Kangaroo Rat: 5.8	Arroyo Toad: 6.66 Coastal California Gnatcatcher: 76.21 Least Bell's Vireo: 6.43 Stephens' Kangaroo Rat: 116.53 *Shading effects:* Arroyo Toad: 0.39 Coastal California Gnatcatcher: 0.56 Least Bell's Vireo: 0.34 Stephens' Kangaroo Rat: 0.5 *Roadbed removal benefits:* Coastal California Gnatcatcher: 3.30 Least Bell's Vireo: 0.05 Stephens' Kangaroo Rat: 9	Arroyo Toad: 6.24 Coastal California Gnatcatcher: 88.4 Least Bell's Vireo: 5.75 Stephens' Kangaroo Rat: 63.11 *Shading effects:* Arroyo Toad: 0.4 Coastal California Gnatcatcher: 3.56 Least Bell's Vireo: 0.35 Stephens' Kangaroo Rat: 1.09 *Roadbed removal benefits:* Coastal California Gnatcatcher: 8.12 Least Bell's Vireo: 0.06 Stephens' Kangaroo Rat: 3.3	No adverse or beneficial impacts.
Lake Mathews Multiple Species Reserve impacts	121.51 acres	113.2 acres	58.39 acres	None

Project Feature or Environmental Effect	Build Alternative 1	Build Alternative 2C	Build Alternative 4	No-Build (No Project)
RCHCA impacts	7 acres	32.91 acres	7 acres	None
WRC MSHCP impacts	114.41 acres	124.53 acres	58 acres	None
Wildlife movement (improved and increased opportunities)	Security fencing along Cajalco Road south of Lake Mathews replaced with improved security/wildlife fencing and implementation of multiple wildlife crossings.	Security fencing along Cajalco Road south of Lake Mathews replaced with improved security/wildlife fencing and implementation of multiple wildlife crossings.	Security fencing along Cajalco Road south of Lake Mathews would remain in place; wildlife crossings would not be added. Obstructions to wildlife movement would not be addressed.	Would not improve ability of wildlife to cross roadways or provide crossing opportunities south of Lake Mathews. Obstructions to wildlife movement would not be addressed.
Proposed wildlife crossings (total)	73 crossings	71 crossings	51 crossings	0
Proposed wildlife crossings (Large and Extra Large)	27 crossings	31 crossings	15 crossings	0
Improved/new fencing opportunity (approximate)	96,000 linear feet	107,400 linear feet	81,400 linear feet	0
Water Quality and Stormwater Runoff (permanent impacts)	83-acre increase in impervious surface area; stormwater runoff increased ~2.6 acre-feet. Flow rates would increase ~11.4 cubic feet per second (cfs).	84-acre increase in impervious surface area; stormwater runoff increased ~2.62 acre-feet. Flow rates would increase ~11.5 cfs.	105-acre increase in impervious surface area; stormwater runoff increased ~3.22 acre-feet. Flow rates would increase ~14 cfs.	No impact
Community				
Property Acquisitions (total area)	147.2 acres	158.2 acres	159 acres	None
Property Acquisitions (parcels)	62 complete properties 221 partial properties	62 complete properties 225 partial properties	76 complete properties 267 partial properties	None
Property Acquisitions (occupied)	93 properties	93 properties	107 properties	None
Residences displaced (total)	19 residences	19 residences	21 residences	None
Businesses displaced	2 businesses	2 businesses	2 businesses	None
Farmland/agricultural impacts (converted)	7.69 acres	7.85 acres	23.44 acres	None
Noise: Residential receptors exposed to 67 dBA or greater (with abatement)	0 receptors exposed	0 receptors exposed	2 receptors exposed	-
Visual: Visual Character and Quality (overall change)	Least	Moderate	Greatest	None
Air Quality: Particulate Matter (PM10 PM2.5)	PM10 and PM2.5 predicted to increase by 1.3%.	PM10 and PM2.5 predicted to increase by 0.8%.	PM10 and PM2.5 to increase by 1.7%.	Less vehicular capacity resulting in greater operational emissions for some pollutants.
MWD Facilities and Operations				
Total MWD lands affected	177.16 acres	160.69 acres	206.33 acres	None

Project Feature or Environmental Effect	Build Alternative 1	Build Alternative 2C	Build Alternative 4	No-Build (No Project)
Beneficial impacts (existing ROW transferred to MWD and reduced roadbed [acres])	13 acres	12.41 acres	11.69 acres	None
Additional/improved fencing (security and wildlife)	76,520 linear feet	77,320 linear feet	74,600 linear feet	No improvement
Northern Lake Mathews Dike	Not affected	Not affected	Major excavation in 1,000-foot restricted zone.	Not affected
Upper and Lower Feeder Pipelines	Not affected	Not affected	Encroaches; requires additional engineering for pipeline protection.	Not affected
MWD Future CPA Pipe Route	Not affected	Not affected	Encroaches; may require additional roadway modification to accommodate.	Not affected
Piezometers	Not affected	Not affected	Requires relocations of affected units along El Sobrante Road; may interfere with planned future units	Not affected
Lake Mathews Dam interface and embankment boundary	Not affected	Not affected	Possible encroachment with bridge piers; DOSD coordination required	Not affected
Outlet Tower Mitigation Site[5]	Not affected	Not affected	Affected	Not affected
Cajalco Creek Dam and Detention Basin / Cajalco Creek Sedimentation Basin (impacts)	4.95 acres / 3.69 acres Continuity between Cajalco Creek Dam/ Detention Basin and Sedimentation Basin maintained	4.95 acres / 3.69 acres Continuity between Cajalco Creek Dam/ Detention Basin and Sedimentation Basin maintained	0.12 acres / 3.55 acres Bisects Cajalco Creek Dam/ Detention Basin and Sedimentation Basin. Adds public throughway between water supply facilities.	Not affected
Cost				
Right of Way	$64,091,824	$65,844,023	$68,637,363	-
Construction	$161,848,376	$186,267,670	$271,644,057	-

Biological Mitigation	$43,742,000	$46,820,000	$24,929,000	-
Mobilization/Administration/ Oversight/Contingency	$72,831,800	$83,820,410	$122,239,980	-
Total:	**$358,699,000**	**$401,379,000**	**$514,615,000**	**-**
Construction Timeframe				
Approximate duration	4 years	4 years	4.5 years	-

[5] 0.124 acre MWD Outlet Tower Mitigation Site located west of La Sierra Avenue.

As indicated in Table 2.2-3, the shortest of the three east-west build alternative routes between Temescal Canyon Road and I-215, Build Alternative 1, achieves the purpose and need of the project and is expected to cost substantially less than Build Alternative 4, currently approximately $155,916,000 less, and $42,680,000 less than Build Alternative 2C. Build Alternative 1 would further provide improved safety along Cajalco Road between La Sierra Avenue and Cowan Road by fixing curves south of the lake, avoid MWD facilities located along the north and west sides of Lake Mathews, including MWD's dam, and affect 89 acres fewer of MWD-managed lands than Build Alternative 4, and 44 acres fewer than Build Alternative 2. Build Alternative 1 would further provide the greatest number of wildlife crossings of the three build alternatives, and result in fewer impacts involving farmland and residential relocations than Build Alternative 4.

The project alignments traverse areas managed by MWD for the operation of Lake Mathews and related facilities. Total impacts on MWD-managed areas would be approximately 117 acres under Build Alternative 1, 161 acres under Build Alternative 2C, and 206 acres under Build Alternative 4. Through close coordination with MWD, the project alternatives have been designed to avoid many facilities; some facilities remain within the project footprint, and would be affected. MWD facilities affected by any of the build alternatives include the Cajalco Creek Dam and Detention Basin, Cajalco Creek Sedimentation Basin, and the Inlet Channel separating the two basins (MWD 2011). These facilities are located along the north side of Cajalco Road between El Sobrante Road and Harley John Road. Some impacts may be offset by the transfer of portions of existing County right of way areas to MWD, and removal of sections roadbed within the LMR and LM-EM Reserve, and other habitat areas. Total beneficial impacts would be approximately 13 acres under Build Alternative 1, 12.4 acres under Build Alternative 2C, and 11.7 acres under Build Alternative 4.

All other MWD facilities would be affected by Build Alternative 4 only. The Northern Lake Mathews Dike includes a "1,000-foot restricted zone" in which MWD prefers avoidance of excavation activity for the protection of the dike and related facilities (AECOM 2012). Within this zone are a number of piezometers and segments of the Upper and Lower Feeder Pipelines. Piezometers within the project limits would require relocation and additional engineering would be required to ensure continued protection and stability of the pipeline and dike facilities. Along La Sierra Avenue, the Build Alternative 4 alignment crosses an MWD proposed future CPA Pipe Route, encroaches within an existing mitigation area established by MWD, and crosses over the Lake Mathews Dam interface and embankment boundary. Coordination with MWD resulted in a large span bridge in place of fill within the Lake Mathews Dam interface and embankment boundary; however, MWD has expressed continued concern with any project elements in the vicinity of this area (MWD 2015, 2017).

All build alternatives would result in the acquisition of property for right of way. Under Build Alternatives 1 or 2C, acquisitions of partial and complete properties would affect 92 occupied properties, resulting in the displacement of 19 residences and two businesses. Under Build Alternative 4, 101 occupied properties would be affected, resulting in the displacement of 21 residences and two businesses (Caltrans 2018b).

Approximately 23.72 acres of farmland would be converted to nonagricultural use under Build Alternative 4; Build Alternatives 1 and 2C would result in the conversion of approximately 6.88 and 6.5 acres of farmland, respectively.

2.2.2.1 Identification of a Locally Preferred Alternative

The designation of the locally preferred alternative is intended to convey the County's preference, as the CEQA lead agency, for a specific alternative based on the information available prior to public review of the Draft EIR/EIS, including potential impacts and reasonable mitigation measures. After comparing and weighing the benefits and impacts of all of the feasible alternatives, the County identified Build Alternative 1 as the locally preferred alternative, subject to public review. County support of the recommendation is documented in a memorandum dated June 11, 2020. Final identification of a preferred alternative will occur after the public review and comment period. Refer to Figure 2.2-2 for Build Alternative 1.

The rationale for identification of the preferred alternative follows.

Build Alternative 1 would achieve the purpose and need of the project, and provides similar operational improvement as the other two build alternatives (Build Alternative 2C and Build Alternative 4).

According to the *2018 Collision Summary Report* for the project area, between January 2015 and December 2017, 44 vehicular accidents occurred along the 6.8-mile stretch of Cajalco Road between La Sierra Avenue and Harley John Road; 17 of the accidents resulted in injury and one resulted in a fatality (County 2018). Build Alternatives 1 and 2C would include roadway and intersection improvements such as reduced curves, intersection controls, center median, and residential cul-de-sac, that are anticipated to reduce the number of types of vehicle-involved accidents for this 6.8-mile section of Cajalco Road. Build Alternative 4 would not include improvements to this section of Cajalco Road (AECOM 2018).

Collision data also indicates the 5.8-mile stretch of El Sobrante Road between La Sierra Avenue and Cajalco Road warrants attention in terms of traffic safety improvement. During the same 3-year period, 39 vehicular accidents occurred along the 5.8-mile section of El Sobrante Road; 15 of the accidents resulted in injury and four resulted in fatalities. While Build Alternative 4 would include some improvements that would address traffic safety along this section of El Sobrante Road, such as improved intersections and a center median, the 6.8-mile section of Cajalco Road between La Sierra Avenue Harley John Road would remain as is, without safety improvements. El Sobrante Road is identified in the Riverside County General Plan Circulation Element as a planned 128-foot-wide arterial roadway; thus, future improvements to the roadway are planned for independently of, and in addition to, the proposed Cajalco Road Widening and Safety Enhancement Project.

A separate east-west transportation corridor between I-5 and I-215 is also proposed under Community Environmental Transportation Acceptability Process (CETAP); construction of this separate corridor is currently included as an assumption in the analysis of future traffic in the project *Traffic Operations Analysis Report*. If the separate east-west corridor is not constructed, traffic projections indicate higher volumes along Cajalco Road between I-5 and I-215. Between Temescal Creek Bridge and La Sierra Avenue, projected volume increases without the other east-west corridor would range between an additional 15,330 to 22,640 ADT in Year 2044 (Caltrans 2017b). Between La Sierra Avenue and Harley John Road, projected volume increases without the other east-west corridor would range between an additional 6,650 to 24,680 ADT. To meet minimum LOS standards and accommodate the additional traffic volumes, additional travel lanes would be necessary.

Build Alternatives 1 and 2C include the accommodation of two additional traffic lanes in the future, within the roadway median of Cajalco Road between Temescal Creek Bridge and Harley John Road. Build Alternative 4 would also accommodate two additional traffic lanes in the future, but only for the segment of Cajalco Road between Temescal Creek Bridge and La Sierra Avenue. Between La Sierra Avenue to east of McAllister Street, additional future widening of El Sobrante Road would be constrained by existing residences along the north side of El Sobrante Road and MWD's Lake Mathews northern dike facility to the south. Additional roadway capacity would be needed east of La Sierra to accommodate future traffic volumes.

In the absence of the CETAP Corridor, regional traffic volumes connecting between I-215 and I-15 are expected to use Cajalco Road. Under Future (2044) without CETAP conditions, Cajalco Road would require a total of six lanes between Temescal Canyon Road and Lake Mathews Drive in order to achieve an acceptable County level of service target of LOS D along this segment of Cajalco Road.

According to input received from participating and cooperating agencies, Build Alternative 4 would be the least desirable by California Department of Fish and Wildlife (CDFW) but preferable for United States Fish and Wildlife Service (USFWS) and RWQCB.[6] CDFW also indicated interest in a project alternative that would (a) align with existing Cajalco Road; (b) take into consideration wildlife movement patterns and needs; and (c) provide opportunity to improve crossings that are currently barriers to wildlife movement. Build Alternative 1 would be consistent with "a" (align with existing Cajalco Road) and would also address "b" (wildlife movement patterns and needs) and "c" (opportunity to improve crossings that are currently barriers to wildlife movement), by adding multiple wildlife crossings, and fencing to protect wildlife from the roadway and guide them to the crossings, along Cajalco Road south of Lake Mathews. Build Alternative 2C would be somewhat consistent with "a" and would also address "b" and "c," by adding multiple wildlife crossings, and fencing to protect wildlife from the roadway and guide them to the crossings, along Cajalco Road and realigned portions of Cajalco Road, south of Lake Mathews. Build Alternative 4 would be the least consistent with "a" and would partially address "b" and "c," by adding multiple wildlife crossings, and fencing to protect wildlife from the roadway and guide them to the crossings, along portions of Cajalco Road and La Sierra Avenue, and along El Sobrante Road. Wildlife crossings would not be added along Cajalco Road south of Lake Mathews, and existing security fencing along Cajalco Road between La Sierra Avenue and Harley John Road would remain in place.

Engineering, mitigation and right of way estimates prepared for the project indicate overall project cost would be greatest for Build Alternative 4 at $514,615,000. This would be $155,916,000 higher than the cost of Build Alternative 1 ($358,699,000), and $113,236,000 higher than the cost of Build Alternative 2C ($401,379,000).

Factors considered by the County in identifying the locally preferred alternative included agency and community input, the ability to mitigate impacts on biological resources, the ability to minimize impacts on MWD LMR and facilities, and the ability to mitigate impacts on existing residences and businesses located in the project area.

2.2.2.2 Planned Project Schedule (Major Milestones) through Construction

After the public circulation period, all comments will be considered, and the Project Development Team (PDT) will confirm selection of a preferred alternative and make the final determination of the project's effect on the environment. Under CEQA, the County will certify that the project complies with CEQA, prepare findings for all significant impacts identified, prepare a Statement of Overriding Considerations for impacts that will not be mitigated below a level of significance, and certify that the findings and Statement of Overriding Considerations have been considered prior to project approval. The County will then file a Notice of Determination with the State Clearinghouse that will identify whether the project will have significant impacts, if mitigation measures were included as conditions of project approval, that findings were made, and that a Statement of Overriding Considerations was adopted. With respect to NEPA, Caltrans, as assigned by the Federal Highway Administration (FHWA), will document and explain its decision regarding the selected alternative, project impacts, and mitigation measures in a Record of Decision.

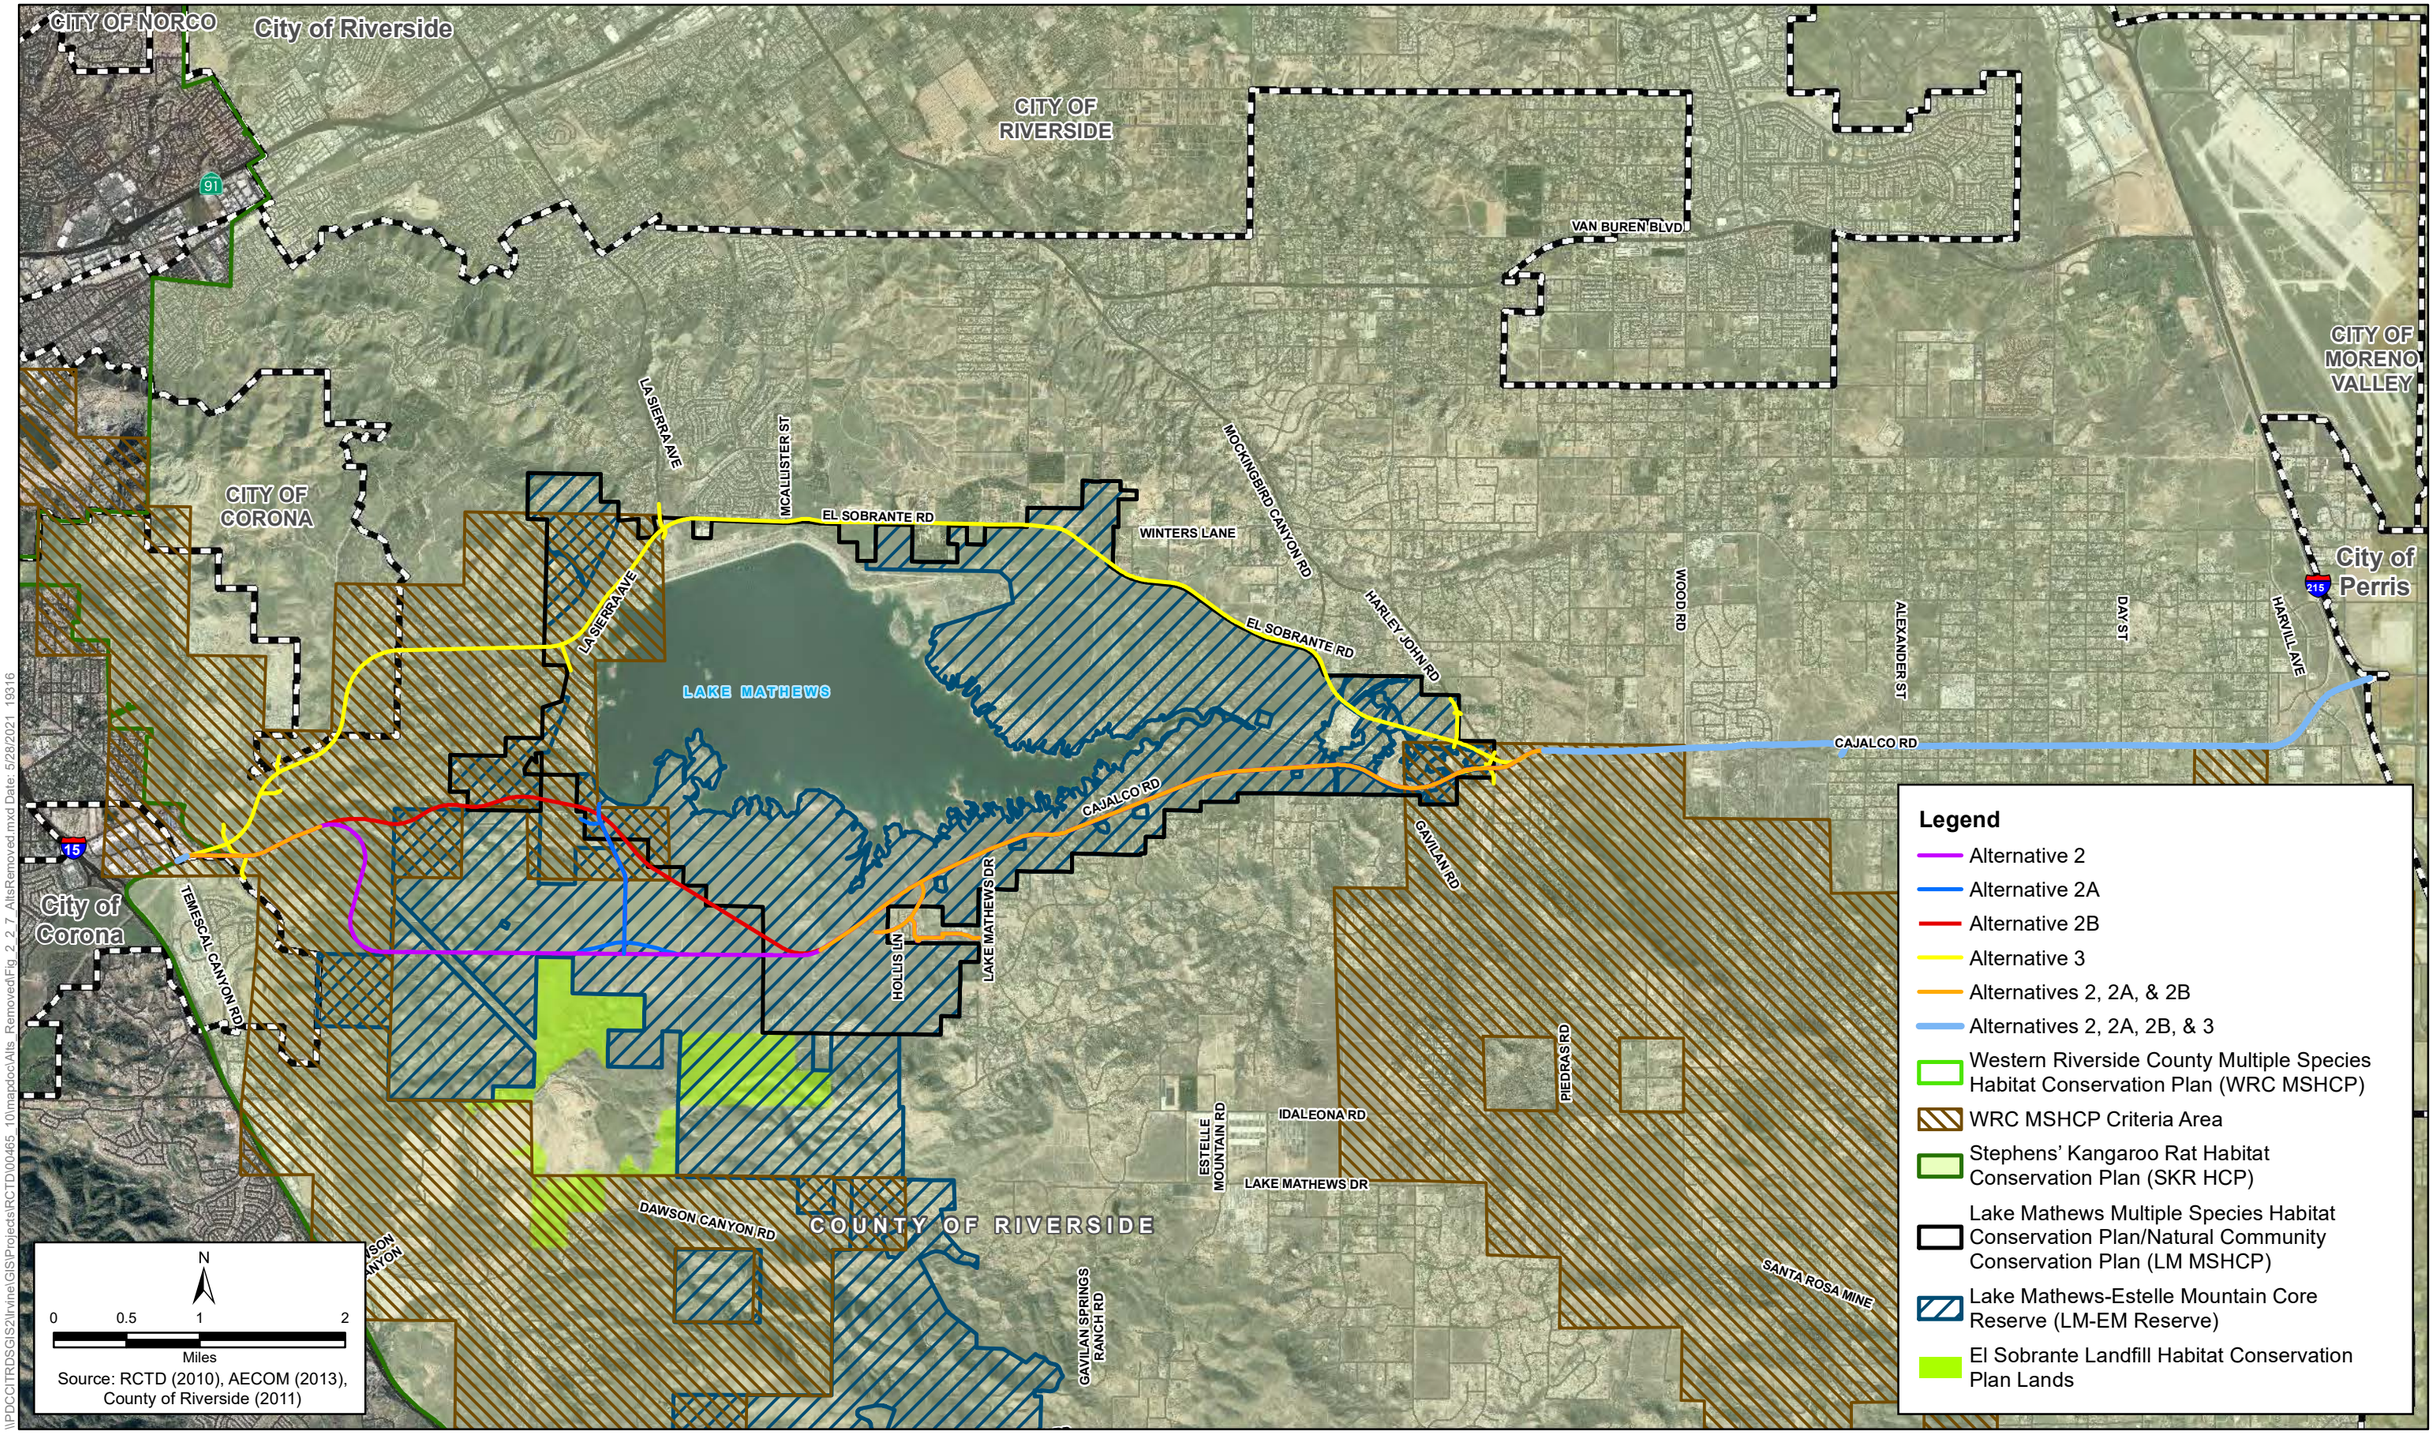
The anticipated schedule for the three major project development milestones; project approval, final design, and construction, all based on the timing of funding availability, is as follows (as of preparation of this EIR/EIS):

- Project Approval and Environmental Document (PA&ED) – fall 2022
- Completion of Final Design – spring 2023
- Completion of Right of Way acquisition process – spring 2023
- Begin construction – fall 2023
- End construction/Open to traffic – fall 2027

2.2.3 Alternatives Considered but Eliminated from Further Discussion

2.2.3.1 Build Alternatives 2, 2A and 2B

At the time of filing the Notice of Intent to prepare an EIS for the proposed project in September 2012 (FR. Document No. 2012-23679), the alignment of Build Alternative 2, between Temescal Canyon and I-215, followed the alignment included in the 2008 Riverside County General Plan Circulation Element (County 2008). Between I-215 and Hollis Lane, the alignment shared the same design and alignment of Build Alternative 1; between Hollis Lane and Eagle Canyon Road, this western portion of Build Alternative 2 deviated from existing Cajalco Road and established a new four-lane roadway segment through undeveloped land south of existing Cajalco Road. Specifically, just east of the Hollis Lane intersection with Cajalco Road, the alignment of Cajalco Road deviated from the existing alignment, extended west through undeveloped land, and turned north to transition back to join existing Cajalco Road, east of Eagle Canyon Road. From this point to the western terminus at Temescal Canyon Road, the alignment followed the existing roadway and included reconstruction of the bridge at Temescal Canyon Creek, as described for Build Alternatives 1 and 4. Refer to Figure 2.2-7 for a map of alternative alignments previously considered.



\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\Alts_Removed\Fig_2_2_7_AltsRemoved.mxd Date: 5/28/2021 19316

Figure 2.2-7
Alternatives Considered but Eliminated 2A, 2B, and 3
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

Alternative 2A, a design variation of Build Alternative 2, was developed in response to public and agency comments concerning access between La Sierra Avenue and residents located south of Lake Mathews. Alternative 2A added a southern extension of La Sierra Avenue that would connect with realigned Cajalco Road. (Refer to Figure 2.2-7.)

Under Alternative 2A, both the new segment of Cajalco Road and southern extension of La Sierra Avenue would traverse through an existing Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP) Core Reserve (managed by RCHCA) as well as a portion of the LM MSHCP LMR, managed by MWD and RCHCA. The reserves are also part of the WRC MSHCP Core A and are classified as Public/Quasi-Public (PQP) lands under the plan.

Through discussion and coordination with RCHCA, MWD, USFWS, CDFW, and the RCA, regarding Alternatives 2 and 2A, further design options were explored to address two major environmental constraints:

- The La Sierra Avenue extension would not be a covered activity under the WRC MSHCP and would require a Major Amendment to the plan; and
- The La Sierra Avenue extension would (in addition to the Alternative 2 greater alignment) significantly and substantially disrupt the ecosystem function of the existing SKR HCP Core Reserve by placing an additional barrier to wildlife movement.

Build Alternative 2B, another variation of Build Alternative 2, was developed in consideration of the above constraints, and included an alignment with fewer impacts on Core Reserve lands and biological resources than the alignments of Build Alternatives 2 and 2A. Under Alternative 2B, the La Sierra Avenue extension was removed and the alignment modified to follow the boundary of the two existing reserves (LM-EM Reserve and LMR) instead of splitting the SKR HCP LM-EM Reserve lands into three parts. Between I-215 and just west of Hollis Lane, the Alternative 2B alignment shared the same design and alignment of Build Alternatives 2 and 2A; west of Hollis Lane, the realigned Cajalco Road turned northwest at a roughly 45 degree angle until intersecting with La Sierra Avenue at its' intersection with existing Cajalco Road. At this point, the Alternative 2B alignment shares the same design and alignment of Build Alternatives 1, 2 and 2A west to Temescal Canyon Road (see Figure 2.2-7).

Further design improvements were applied to Alternative 2B for safety and resource management purposes, resulting in the development of the current Build Alternative 2C.

2.2.3.2 Build Alternative 3

Build Alternative 3 was introduced along with Build Alternative 4 in 2013 in response to public and agency input for the consideration of east-west routes north of Lake Mathews. The alignment of Build Alternative 3 was the same as that for Build Alternative 4 between the intersection of La Sierra Avenue and El Sobrante Road, and the eastern project limits at I-15. Between Temescal Canyon Road and El Sobrante Road, the alignment of Build Alternative 3 traveled through undeveloped lands northeast from Temescal Canyon Road, turning east where it intersected with existing La Sierra Avenue (Figure 2.2-7). Variations of this segment of Build Alternative 3 were developed in effort to avoid or otherwise minimize impacts on sensitive conservation areas and MWD facilities.

In November 2016, Build Alternative 3 was eliminated from further consideration following environmental surveys, and additional feedback regarding the alternative from resource agencies

and MWD. The alternative was eliminated due to environmental constraints and potential conflict with planned MWD facilities.

2.3 Permits and Approvals Needed

Table 2.2-4 provides a list of permits, licenses, agreements, and certifications that would be required for project construction.

Table 2.2-4. Permits and Approvals Needed

Agency	Permit/Approval	Status
U.S. Fish and Wildlife Service (USFWS)	• Section 7 consultation for Threatened and Endangered Species • Section 7 consultation with USACE on Section 404 permit • Joint Project Review (JPR) • Concurrence with County Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) Consistency Determination • Approval of minor amendment to WRC MSHCP • Concurrence with Determination of Biologically Equivalent or Superior Preservation (DBESP) • Equivalency Analysis of PQP Lands Replacement • Approval of replacement lands pursuant to the Habitat Conservation Plan (HCP) for the Stephens' kangaroo rat (SKR) • Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) discretionary action • Approval of SKR HCP Minor Amendment	1. Section 7 consultations are to be conducted following identification of a Preferred Alternative and preparation of the WRC MSHCP Consistency Determination, which will serve as the Biological Assessment. 2. MSHCP Consistency Determination and DBESP to be prepared and submitted for concurrence following identification of a Locally Preferred Alternative and prior to approval of the Final EIS. 3. The JPR application will be submitted following preparation of the MSHCP Consistency Determination and DBESP. 4. Minor amendment to the WRC MSHCP will be requested by the County EIS Record of Decision (ROD). 5. JPR finding following approval of Minor Amendment, and after EIS ROD. 6. Approval of replacement lands pursuant to the SKR HCP, WRC MSHCP minor amendment, and LM MSHCP discretionary action will be requested by the County after the EIS ROD is approved.
United States Army Corps of Engineers (USACE)	Section 404 Permit for filling or dredging waters of the United States	Application to be submitted prior to construction.
California Department of Fish and Wildlife (CDFW)	• Section 1602 Lake and Streambed Alteration Agreement • JPR • Concurrence with County MSHCP Consistency Determination • WRC MSHCP Minor Amendment approval • Approval of replacement lands pursuant to the SKR HCP • DBESP Concurrence • LM MSHCP discretionary action • SKR HCP Minor Amendment approval	1. Section 1602 Notification is to be submitted and agreement obtained prior to the start of construction. 2. The MSHCP Consistency Determination and DBESP will be prepared and submitted for concurrence following identification of a Preferred Alternative and prior to certification of the Final EIR. 3. Amendment to the WRC MSHCP to be requested by the County after the Final EIR is certified. 4. Approval of replacement lands pursuant to the SKR HCP, WRC MSHCP minor amendment, and LM MSHCP discretionary action will be requested by the County after certification of the Final EIR.

Agency	Permit/Approval	Status
California State Water Resources Control Board	• Coverage under the General Permit for Discharges of Stormwater Associated with Construction Activity (Construction General Permit, Order No. 2009-0009-DWQ) • Water Discharge Permit, approval of Notice of Intent (NOI) to comply with General Construction Activity • National Pollutant Discharge Elimination System (NPDES) Permit	Following completion of the Final Design phase of the project. NOI to be submitted prior to construction. Application to be submitted prior to construction.
Western Riverside County Regional Conservation Authority (RCA)	• Minor Amendment under Section 7.2.2 • Concurrence with County MSHCP Consistency Determination and JPR finding	Minor amendment to the WRC MSHCP will be requested by the County following approval of a Preferred Alternative. JPR finding and concurrence with County MSHCP Consistency Determination following approval of Minor Amendment, and prior to EIS ROD.
County of Riverside, Riverside County Habitat Conservation Agency (RCHCA)	• Approval of replacement lands pursuant to the SKR HCP • Section 4(f) consultation • LM MSHCP discretionary action	Approval of replacement lands pursuant to the SKR HCP will be requested by the County after certification of the Final EIR. Section 4(f) consultation will be completed prior to completion of the Final EIR/EIS.
Regional Water Quality Control Board 8 (RWQCB)	Section 401 Water Quality certification	Application to be submitted prior to construction.
County of Riverside	Temporary construction permits and relinquishment of County right of way to MWD	To be coordinated during Final Design phase of the project.
City of Corona	Approval of encroachment permits and street construction permits, and improvements within public right of way	Actions/permits would be issued prior to start of construction.
Riverside County Flood Control and Water Conservation District (RCFCWCD)	Encroachment permits for improvements affecting RCFCWCD facilities	Application(s) to be submitted prior to construction.
Caltrans, District 8	Encroachment Permit for work within I-215 right of way	Application to be submitted prior to construction.
Metropolitan Water District of Southern California (MWD)	• LM MSHCP discretionary action • Section 4(f) consultation • Land transfers between MWD and County	Discretionary action and consultation following approval of Preferred Alternative; Land transfers following Final EIR/EIS. Section 4(f) consultation will be completed prior to completion of the Final EIR/EIS.
Burlington Northern Santa Fe (BNSF)	• Encroachment permit • Required for work performed within railroad right of way	To be acquired prior to any construction activity occurring within BNSF right of way.
California Public Utilities Commission	Compliance with Public Utilities Code Sections 1201 through 1205, for grade separated structure over BNSF rail line	Application to the California Public Utilities Commission to occur during Final Design phase of the project
State Historic Preservation Officer (SHPO)	Concurrence with agencies' determinations of eligibility and findings of effect	SHPO concurrence with determinations of eligibility and findings of effect confirmed. Section 4(f) consultation will be completed prior to completion of the Final EIR/EIS.

Agency	Permit/Approval	Status
Participating Native American Tribes	Required consultation under National Historic Preservation Act, Section 106, including (but not limited to): determinations of eligibility, findings of effect, and future work that includes involvement with the Memorandum of Agreement, Archaeological Monitoring Plan, and Data Recovery Plan	Native American consultation for the project is ongoing.

Chapter 3. Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures

Chapter 3 includes the identification of regulations, description of environmental setting and conditions, and explanation of methodologies applicable to the resource topics discussed, as they relate to the proposed project. These are discussed under the Regulatory Setting and Affected Environment sections for each resource topic. This information is used to establish setting and context for assessing the potential for the proposed project alternatives to result in permanent and/or temporary direct, indirect, and cumulative effects. The analysis of potential effects, and the identification of proposed avoidance, minimization and/or mitigation measures, where applicable, is in conformance with the National Environmental Policy Act (NEPA), 40 Code of Federal Regulations (CFR) 1508.8, and consistent with the NEPA lead agency's guidance for the preparation of joint Environmental Impact Report/Environmental Impact Statement (EIR/EIS) documents. For this EIR/EIS, the guidance used is the California Department of Transportation's (Caltrans') current Standard Environmental Reference. The analysis and proposed measures, as applicable, are provided under the Environmental Consequences section for each environmental topic. Analysis of the proposed project alternatives under the California Environmental Quality Act (CEQA) is provided in Chapter 4 of this EIR/EIS.

This project contains a number of standardized project measures that are employed on most, if not all, Caltrans projects and were not developed in response to any specific environmental impact resulting from the proposed project. In addition to the standardized project measures commonly employed on Caltrans projects, the proposed project includes the incorporation of standard project measures commonly employed on Riverside County transportation projects, as well as project design elements, collectively identified as project features (PF) or Standard Project Measures. These Standard Project Measures are identified and described in the *Environmental Consequences* sections of each resource topic, as applicable, within this chapter. The proposed project alternatives analyzed in this chapter include three build alternatives and a No-Build Alternative:

- Build Alternative 1 – Cajalco Alignment
- Build Alternative 2C – Modified Cajalco Alignment
- Build Alternative 4 – El Sobrante Alignment
- No-Build Alternative – No Project Alternative

Because the alignments of each build alternative extend through the boundaries of the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP), Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP), and Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP), and include design elements that are either inconsistent with or that exceed requirements of the current plans, actions that would allow for the LM MSHCP, WRC MSHCP, and SKR HCP to

accommodate the proposed project would be required and are therefore included in the analysis of each build alternative, where applicable.

While the LM MSHCP includes procedures for four types of amendments that facilitate course corrections and other amendments to the LM MSHCP and accompanying agreements, the LM MSHCP does not include a prescribed amendment or process to allow changes to the plan in response to public safety and/or access needs. Therefore, an appropriate discretionary action or actions coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements, and may include a new LM MSHCP amendment along with the development of procedures for the amendment.

Because the LM MSHCP involves multiple management areas, managing documents, governing structures, and existing agreements, the amendment or other discretionary action or actions necessary to accommodate the project would address the various agreements, conservation easements, permits, and approvals associated with the areas managed within the LM MSHCP, including the existing State Ecological Reserve and Mitigation Bank lands within the LMR, and Lake Mathews facility and operations areas. Such agreements may include:

- Implementation Agreement with U.S. Fish and Wildlife Service (USFWS) for implementation of the LM MSHCP and the ESA authorizations and assurances;
- Section 2081/2835 Memorandum of Understanding/Permit with California Department of Fish and Wildlife (CDFW) regarding approval and implementation of the LM MSHCP as an NCCP and the ESA/NCCP authorizations and assurances;
- Cooperative Management Agreement with USFWS and CDFW concerning management of the combined Reserve;
- Mitigation Banking Agreement for establishment and use of the mitigation credits assigned to the Mitigation Bank lands; and
- Settlement and General Release Agreement between Metropolitan, CDFW, Riverside County Habitat Conservation Agency (RCHCA), and the San Bernardino Valley Audubon Society that specifies requirements for the management of LMR lands and new development or construction within the LMR by the signatories and stakeholders, including MWD.

The agreements above include multiple responsible parties that would be notified of the proposed action or actions, and included in the coordination of the modifications necessary to accommodate the project while maintaining the intent, framework and integrity of the agreements and LM MSHCP. It is anticipated that MWD, as the primary managing entity of Lake Mathews and surrounding operations, will be included in the development of procedures for the discretionary action; however, it should be noted that MWD is not a joint project lead nor co-sponsor of the project.

Modifications to the LM MSHCP and associated agreements, easements, and permits, including the identification of proposed mitigation, requires approvals by regulatory and responsible parties, and is subject to NEPA where such agreements, easements, and permits apply, and to CEQA. Therefore, analyses involving the LM MSHCP are provided under separate headings in Chapter 3 (NEPA) and Chapter 4 (CEQA) for each build alternative, *Lake Mathews MSHCP*.

As a part of the proposed actions involving the LM MSHCP, WRC MSHCP, and SKR HCP, the portions of the project alternatives that travel through the LM MSHCP area would be designed wide enough to accommodate two additional travel lanes (one in each direction) in the future. The actual construction of these lanes is not an option that is being considered for inclusion as part of the proposed project. The intent of including the additional roadway right of way is to ensure that future impacts on conserved lands protected under the WRC MSHCP, LM MSHCP, and SKR HCP, would be minimized to the extent feasible if the roadway is widened to six lanes in the future. Although this is not an alternative that is being considered as part of the proposed project, impacts associated with the potential future construction of these two additional travel lanes are being disclosed in the impact discussion included in this EIR/EIS, and are provided under a separate heading for each build alternative, *Future Six-Lane Facility*.

Resources Evaluated in this Chapter

This chapter evaluates the potential effects of the project involving the following resource topics:

Human Environment

3.1 Land Use, including:
- 3.1.1 Existing and Future Land Use
- 3.1.2 Consistency with State, Regional, and Local Plans and Programs
- 3.1.3 Parks and Recreational Facilities

3.2 Farmland

3.3 Growth

3.4 Community Impacts, including:
- 3.4.1 Community Character and Cohesion
- 3.4.2 Relocations and Real Property Acquisition
- 3.4.3 Environmental Justice

3.5 Utilities/Emergency Services

3.6 Traffic and Transportation/Pedestrian and Bicycle Facilities

3.7 Visual/Aesthetics

3.8 Cultural Resources

Physical Environment

3.9 Hydrology and Floodplain

3.10 Water Quality and Storm Water Runoff

3.11 Geology/Soils/Seismic/Topography

3.12 Paleontology

3.13 Hazardous Waste/Materials

3.14 Air Quality

3.15 Noise and Vibration

3.16 Energy

Biological Environment

3.17 Natural Communities

3.18 Wetlands and Other Waters

3.19 Plant Species

3.20 Animal Species

3.21 Threatened and Endangered Species

3.22 Invasive Species

3.23 Short-Term Use – Long-Term Productivity

3.24 Irreversible Commitments

3.25 Cumulative Impacts

Resources Considered but Determined Not to Be Relevant

As part of the scoping and environmental analysis conducted for the project, the following environmental issues were considered but no adverse impacts were identified. As a result, there is no further discussion about these issues in this document.

- Coastal Zone: There will be no effect on coastal resources because the project is not within a coastal zone.
- Wild and Scenic Rivers: The project is not located near a designated Wild or Scenic River.
- Timberlands: There are no Timberland Production Zones within the project area; therefore, this topic is not discussed further.
- Sole-Source Aquifer: The project is not within a designated Sole-Source Aquifer.
- This project is located outside of National Marine Fisheries Service (NMFS) jurisdiction; therefore, an NMFS species list is not required and no effects on NMFS species are anticipated.

3.1 Land Use

Unless otherwise noted, this section of the Draft EIR/EIS is based on the *Community Impact Assessment* and *Errata* prepared for the project (Caltrans 2018a, 2021).

3.1.1 Existing and Future Land Use

3.1.1.1 Affected Environment

The proposed project is located within Riverside County, predominantly within unincorporated parts of the county, but also in limited portions of the City of Corona and the City of Perris. The portion of the project within the city limits of Corona would include improvements from the western terminus of the project to Eagle Canyon Road. The portion of the project within the city limits of Perris would accommodate the placement of temporary signs during construction and potential restriping of the bridge over Interstate 215 (I-215), only. The project would also pass through or directly adjacent to six communities within the study area: Mead Valley, Lake Mathews/ Gavilan Hills, Woodcrest/Mockingbird Canyon, Victoria Grove, and Lake Hills/Home Gardens.

The study area is defined as a 0.5-mile radius of proposed project right of way and includes the populations and communities within those portions of unincorporated Riverside County and the Cities of Corona and Perris that are most likely to experience potential impacts or fragmentation from the physical improvements associated with the project.

Regional Setting

Riverside County

Riverside County is east of Orange County, north of San Diego and Imperial Counties, and south of San Bernardino and Los Angeles Counties. Riverside County is the fourth-largest county in the state, encompassing approximately 7,400 square miles and extending westward from the Colorado River to within 14 miles of the Pacific Ocean (County 2020).

Riverside County is roughly divided into eastern and western portions by the San Jacinto and Santa Rosa Mountains. The proposed project is located within the western portion of the county.

The eastern portion of Riverside County is bounded by the Colorado River on the east and the Santa Rosa and San Jacinto Mountains on the west. Desert terrain and less-populated communities distinguish this portion of the county from the western portion of the county. The majority of eastern Riverside County's population is concentrated in the Coachella Valley.

City of Corona

The City of Corona is located within the western half of Riverside County and extends from approximately 1 mile west of the intersection of State Route 91 (SR-91) and State Route 71 (SR-71) to the intersection of Buchanan Street and SR-91. Land uses in the City of Corona range from residential in the southeastern part of the city east of Temescal Canyon Road, industrial uses adjacent to Temescal Canyon Road, commercial uses west of Temescal Canyon Road, and agriculture and open space east of Temescal Canyon Road. Additional residential land uses are present north and south of the study area.

City of Perris

The City of Perris is located within the western half of Riverside County. It extends from Harley Knox Boulevard in the north, to Goetz Road in the south, to Lukens Lane in the west, and to Sherman Road in the east. The proposed project's eastern terminus is at the city's western limit, at land designated as Perris Valley Commerce Center Specific Plan.

Local Communities

Mead Valley

Mead Valley is located within unincorporated Riverside County, west of the City of Perris and north of the Cities of Lake Elsinore and Canyon Lake. Cajalco Road is the primary east-west road through Mead Valley. The main land use within Mead Valley is residential single-family homes. In addition, there are some commercial and industrial developments and open space.

Lake Mathews/Gavilan Hills

The Lake Mathews/Woodcrest community is located within unincorporated Riverside County, and surrounds Lake Mathews. Single-family homes and conservation/open space are the primary land uses within the area. Other land uses include agricultural and limited commercial and industrial developments.

Woodcrest/Mockingbird Canyon

The community of Woodcrest is northeast/east of Lake Mathews, north of Cajalco Road and El Sobrante Road, and shares this area with the community of Mockingbird Canyon, herein referred to as Woodcrest/Mockingbird Canyon. Conservation/open space, agriculture, and single-family homes are the primary land uses for Woodcrest/Mockingbird Canyon.

Victoria Grove

The community of Victoria Grove, which contains 1,120 homes, is located immediately northwest of McAllister Street. Land uses west and southwest of the intersection of La Sierra Avenue and El Sobrante Road include single-family residences within the Lake Hills community and open space.

Lake Hills/Home Gardens

Situated west of the community of Victoria Grove and La Sierra Avenue, and east of Home Gardens, is the community of Lake Hills. While Home Gardens is not directly in the vicinity of the project, it is in close proximity to the Lake Hills community and therefore the communities are herein referred to as Lake Hills/Home Gardens. Conservation/open space, single-family homes, and facilities/utilities are the primary land uses in the area.

Temescal Canyon

Temescal Canyon is north and south of Cajalco Road at the western end of the project. Undeveloped land, residential, and industrial uses are the primary land uses in this project area.

Habitat Conservation Plan and Natural Community Plan Areas

Western Riverside County Multiple Species Habitat Conservation Plan Reserve Lands and Lake Mathews-Estelle Mountain Core Reserve

The Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) areas encompass approximately 1.26 million acres and includes all unincorporated Riverside County land west of the crest of the San Jacinto Mountains to the Orange County line, as well as the jurisdictional areas of the Cities of Temecula, Murrieta, Lake Elsinore, Canyon Lake, Norco, Corona, Riverside, Moreno Valley, Banning, Beaumont, Calimesa, Perris, Hemet, and San Jacinto. It covers multiple species and habitats within a diverse landscape, from urban centers to undeveloped foothills and montane forests, all under multiple jurisdictions. Lands with the WRC MSHCP plan area are designated for the protection of 146 native species of plants, birds, and animals, and the preservation of a half-million acres of their habitats (RCA 2003).

The Lake Mathews-Estelle Mountain Core Reserve (LM-EM Reserve) is a habitat reserve that is a component of the WRC MSHCP for the SKR HCP and the LM MSHCP. The LM-EM Reserve encompasses approximately 11,243 acres and is jointly owned and managed by Metropolitan Water District of Southern California (MWD), CDFW, USFWS, RCHCA, Bureau of Land Management, and Western Municipal Water District (RCHCA 1996; MWD 2021a). It is one of seven Core Reserves of the SKR Core Reserve system in Riverside County, located between southeast of Corona to north of Lake Elsinore and from east of Interstate 15 (I-15) to Lake Mathews. This Core Reserve was established under the SKR HCP and is currently considered public/quasi-public (PQP) conserved lands and Existing Core C under the WRC MSHCP.

Portions of the project would occur within WRC MSHCP lands designated for species protection and LM-EM Reserve lands.

Lake Mathews Multiple Species Reserve

The Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) encompasses 5,993.5 acres owned by MWD around Lake Mathews in western Riverside County. The LM MSHCP includes 728.6 acres designated for MWD operations and maintenance activities at Lake Mathews, 154.5 acres for water facility improvements and related projects, and 5,110.4 acres of the Lake Mathews Multiple Species Reserve (LMR), a multi-jurisdictional reserve managed for various species of flora and fauna indigenous to western Riverside County (MWD 2021b). The LMR is comprised of a 2,565.50-acre State Ecological Reserve and 2,544.90-acre Mitigation Bank for use by MWD and RCHCA (MWD and RCHCA 1995; MWD 2021). The Mitigation Bank also accounts for 1,269.3 acres of Stephens' kangaroo rat occupied habitat intended to fulfill conservation requirements of the SKR HCP. The Conservation Easement that covers Mitigation Bank lands was conveyed to the County by MWD and the Conservation Easement is managed by RCHCA. Portions of the project would occur within LM MSHCP plan areas, including State Ecological Reserve and Mitigation Bank areas of the LMR.

Riverside-Corona Resource Conservation District Lands

The Riverside-Corona Resource Conservation District (RCRCD) is a local government agency (special district) that helps conserve the natural resources of areas within western Riverside and

San Bernardino Counties. The district includes 200,000 acres (312 square miles) of land in western Riverside and San Bernardino Counties. RCRCD owns and manages 135-acres in the Temescal Canyon area that adjoins the LM-EM Reserve, and holds multiple conservation easements along Temescal Wash, which support a number of sensitive plant and animal species (RCRCD 2016). Portions of the project would occur within RCRCD conservation areas.

Lake Mathews Tower Outlet Mitigation Site

The 0.124-acre Lake Mathews Outlet Tower-Facilities Riparian Habitat Restoration/Enhancement site is located within an MWD operations area west of La Sierra Avenue. It was established as mitigation in cooperation with USACE. Portions of the project would affect the site under Build Alternative 4.

Study Area

Existing land uses in the 0.5-mile radius study area are shown on Figure 3.1-1 and General Plan land use designations are shown on Figure 3.1-2. Both existing and planned land uses within the western limits of the study area that surround the intersection of Temescal Canyon Road and Cajalco Road are a mix of commercial, industrial, and residential uses. Immediately northwest of the intersection is a strip mall that contains a mix of commercial businesses, including restaurants and retail stores. The Crossings at Corona shopping center is located immediately east of I-15. Directly southwest of the intersection is undeveloped land, and farther southwest is a trucking center, an office building, and single-family homes. Southeast of the intersection is another trucking center and farther southeast is the community of Dos Lagos, which contains single-family homes and the Dos Lagos Golf Course. Northeast of the intersection is undeveloped land, and farther northeast is a commercial storage center.

From Eagle Canyon Road to Lake Mathews Drive, predominant land uses within the study area are mining and open space. This stretch of the study area also includes scattered rural estates and communities of single-family houses. Land uses within the study area from Lake Mathews Drive to the I-215 southbound ramps are a mix of open space, residences of rural communities, and commercial businesses. Businesses located along Cajalco Road include automobile-oriented services, restaurants, financial service stores, retail stores, a movie theater, and agricultural stands. These businesses are located primarily near the intersections of Cajalco Road with I-15, Brown Street, Harvill Avenue and I-215.

Between La Sierra Avenue and Gustin Road, the alignment of Build Alternative 4 differs from the alignments of Build Alternatives 1 and 2C. Under Build Alternative 4, El Sobrante Road would be widened and improved between La Sierra Avenue and Gustin Road, and Cajalco Road would not be widened and improved the length of this segment. In addition, Build Alternative 4 would realign La Sierra Avenue between El Sobrante Road and Cajalco Road. The community of Victoria Grove, which contains 1,120 homes, is located immediately northwest of El Sobrante Road and McAllister Street. Land uses west and southwest of the intersection of La Sierra Avenue and El Sobrante Road include single-family residences within the Lake Hills community and open space. Between McAllister Street and Palm Road, primary land uses along El Sobrante Road are farmland and open space. Between Palm Road and Gustin Road, primary land uses along El Sobrante Road are open space and rural residences. This portion of the study area also includes farmland and commercial businesses.

Zoning in the study area is shown on Figure 3.1-3 and the zoning designations for Riverside County are defined in Table 3.1-1. The portion of the study area within the City of Corona is zoned as commercial, commercial/office, agricultural, general industrial, low-density residential, and golf. East of Temescal Canyon Road, within unincorporated Riverside County, the primary zoning designations are rural residential, residential agricultural, mining, and conservation areas. Areas around Lake Mathews are zoned as conservation areas, rural residential, and residential agricultural. To the east of Wood Road, zoning is primarily residential, commercial, and light agriculture, or governed by a specific plan. Around the intersection with I-215, land is zoned as manufacturing-service commercial, rural residential, and Perris Valley Commerce Center Specific Plan Zone.

Table 3.1-1. Riverside County Zoning Definitions

Zoning Code	Definition
A-1	Light Agriculture
A-1-1	
A-1-5	
A-1-10	
A-2-2	Heavy Agriculture
A-2-10	
A-P	Light Agriculture with Poultry
C-1/C-P	General Commercial

Table 3.1-2 presents development and transportation projects identified within the study area.

Table 3.1-2. Planned Development and Transportation Projects within or Near Project Vicinity

ID	Name	Jurisdiction/Location	Proposed Uses	Status
1	Magnolia Avenue Bridge Widening	City of Corona Magnolia Avenue from All American Way to El Camino Avenue	Widening Magnolia Avenue from four lanes to six lanes and widening the existing bridge over the Temescal Creek Channel.	Design phase; environmental studies in progress. Plans, Specifications, and Estimates anticipated to begin May 2021.
2	Ontario Avenue Widening	City of Corona Ontario Avenue from California Avenue to State Street	Widen the north side of Ontario Avenue to increase the vehicle capacity.	Planning and design in progress; traffic studies anticipated 2020.
3	I-15 Express Lanes Project	County of Riverside I-15 from Cajalco Road to State Route 60	Addition of two tolled express lanes to I-15 in each direction, a distance of approximately 15 miles.	Construction initiated April 2018 and continuing through 2020.
4	Arantine Hills Specific Plan	City of Corona	A specific plan that proposes 1621 residential units on 129 acres, 38 acres of general commercial development, 40 acres of mixed-use development, 37 acres of open space, and 15 acres of park land.	Precise Plan (PP16-012) and a merchant builder map (TTM37030) approved for the first phase of development; under construction. Second phase is under plan check. City Approved 12/19/2018. General Plan Amendment (GPA2018-0001) with Specific Plan Amendment (SPA2018-0001), Parcel Map (PM 37036), and amendment to the Development Agreement (AEC724, DA15-001).
5	Cajalco Road/ I-15 Interchange	City of Corona Cajalco Road and I-15, on- and off-ramp	Replace existing two-lane Cajalco/I-15 interchange bridge with a standard six-lane bridge and to reconfigure the on- and off-ramps to meet the projected traffic volumes for year 2035.	Construction completed.
6	Convenience store, car wash and gas station	County of Riverside North of Cajalco Road, east of Temescal Canyon Road, and west of Eagle Canyon Road	Approximately 5,881-square-foot convenience store, 1,262-square-foot car wash facility, and a 6,549-square-foot fuel canopy area that will house 10 fuel dispensers. In addition, 2.6 acres dedicated in accordance with MSHCP.	Constructed.
7	Two 30,000-square-foot industrial buildings	City of Corona East of Temescal Canyon Road and south of Cajalco Road	Parcel map to subdivide two lots. Two new 30,000–square-foot industrial buildings on 3.60 acres.	Construction completed.
8	McKinley Grade Separation	City of Corona McKinley Street and BNSF crossing	Build a grade separation on the McKinley railroad BNSF crossing.	Design contract awarded July 2018. Construction anticipated to begin mid-2021.

ID	Name	Jurisdiction/Location	Proposed Uses	Status
9	I-15 Express Lanes Southern Extension	County of Riverside I-15 between Cajalco Road in Corona and State Route 74 (Central Avenue) in Lake Elsinore	Add two Express Lanes in both directions within the I-15 median.	Undergoing engineering and environmental study; initiation of construction anticipated 2025.
10	Lake Hills Specific Plan #144	County of Riverside	1,650-acre residential development; 1704 units.	Specific Plan adopted January 1998. Partially built out.
11	91,000-square-foot shopping center	County of Riverside North of La Sierra Avenue and El Sobrante Road intersection. APNs 270190017 and 270190022	91,000-square-foot shopping center.	Pre-application review approved; permits are in process.
12	Victoria Grove Specific Plan #270	County of Riverside North of El Sobrante Road, east of La Sierra Avenue	86.8-acre residential development.	Specific plan adopted 12/1999. Nearly built out. 12.55-acre residential parcel remains undeveloped. SP00270A1: Add 86.8 acres (residential); approved. TR29282: Division of 7.7 acres into 24 single family lots; approved and construction completed
13	103-acre residential subdivision	County of Riverside 13100 El Sobrante Road	103-acre residential subdivision; 271 units.	TR36730: Approved TR36730E01: Approved extension of time. IP180069: Undergoing review.
14	Greentree Ranch Specific Plan #394	County of Riverside North of El Sobrante Road between McAllister Street and Mockingbird Canyon Road	Development of 513 residential units on 327.4 acres of land.	Notice of Preparation May 2017. Undergoing review.
15	Van Buren Boulevard and Little Court	City of Riverside 18171 Van Buren Boulevard	Development of a retail commercial center on 2 contiguous parcels; 7.17 acres; 10,700-square-foot retail, 10,000-square-foot daycare, 2,500-square-foot drive-thru restaurant, 10,000-square-foot office, and 8,000-square-foot medical office	Revised design plans submitted September 24, 2019; undergoing review.

ID	Name	Jurisdiction/Location	Proposed Uses	Status
16	117.7-acre residential subdivision	County of Riverside South of Cajalco Road, east of Gustin Road and west of Wood Road	Subdivision of 117.7 acres into 112 single family residential lots.	TR30752: Sched B Division 117 AC into 112 Res Lots W/9 Open Space Lots; Approved. TR30752E03: Third extension of time expires July 2021. TR31608: Subdivide 41 acres into 65-sq. ft. open space lot; approved. TR31608E02: Second extension for TTM31608; expires July 2021.
17	18-hole golf course with clubhouse and ancillary facilities	County of Riverside South of Cajalco Road and west of Wood Road	18-hole golf course with clubhouse and ancillary facilities.	Approved.
18	Boulder Springs Specific Plan #229	County of Riverside North of Cajalco Road; east of Wood Road and west of Alexander Street	981-acre specific plan that proposes 1421 dwelling units on 798 acres of land. H.B. Ranches: Subdivision of 283.3 acres into 468 residential lots.	Specific plan adopted 10/4/1988. Permits obtained or in process; some parcels constructed. Time extensions granted for H.B. Ranches Tentative Tract Maps Subdivision to January 9, 2021.
19	I-215 North Project	County of Riverside I-215 between Nuevo Road in Perris and State Route 60 in Riverside	Widen 10.75-mile section of I-215 from Nuevo Road to 60/215 Interchange for one carpool lane added to I-215 in both directions.	Final design and environmental permitting, although funding is required to complete project.
20	Majestic Freeway Business Center Specific Plan #341	County of Riverside North of Cajalco Expressway, south of Nandina Avenue, west of I-215 and east of Decker Road	Construction of 6.2 million square feet of light industrial buildings and 1.2 million square feet of manufacturing, distribution, and warehouse facilities on 325 acres of land. Development of 1,138,800-square-foot industrial building.	Under construction.
21	26.73-acre industrial development	County of Riverside West and east of Harvill Avenue, south of Cajalco Expressway, and north of Cajalco Road	Subdivide 26.73 acres into 10 industrial lots. Five office buildings and light industrial.	Approved; under construction.
22	Hotel	County of Riverside Northeast of Dree Circle and Harvill Avenue	A three-story 51,994-square-foot, 103-room hotel with 5,656-square-foot banquet/conference/restaurant area on 3.2 acres	Under construction.
23	Villa Verona Apartment Community	City of Perris	Multi-family residential development on 17.33 acres; includes two- and three-story buildings with one-, two-, three-, and four-bedroom units.	Project approved. Project has not been submitted for construction.

ID	Name	Jurisdiction/Location	Proposed Uses	Status
24	Duke Warehouse – Perry Street	City of Perris Southeast corner of Perry Street and Barrett Avenue	Industrial development project; 148,297 square feet including 3,000 square feet of office and 3,000 square feet of mezzanine office space on 7.26-acre site.	Approved late 2019.
25	Duke Warehouse – Perris Boulevard	City of Perris Northeast corner of Perris Boulevard and Markham Street	Industrial development project; 55 acres; 1.2 million square feet.	Completed.
26	Duke Warehouse – Patterson Avenue	City of Perris Southeast corner Patterson Avenue and Markham Street	Industrial development project; 37.5 acres; 811,260 square feet.	Completed.
27	Mid County Parkway	County of Riverside 16-mile transportation freeway between I-215 and State Route 79	16-mile transportation corridor (freeway) between I-215 and State Route 79.	Construction of I-215/ Placentia Avenue interchange completed.
28	First Perry Logistics Project	City of Perris Adjacent to Redlands Avenue, north of Ramona Expressway	Industrial development project; 11 acres; 240,000 square feet.	Completed.
29	Stratford Ranch Residential Project	City of Perris West of Evans Road, north of Ramona Expressway	Residential development project; 270 lots.	Partially constructed.
30	Nuevo Road and Nuevo Bridge Replacement Project	City of Perris Nuevo Road from Wilson Avenue to Perris Valley Storm Drain Channel	Widen Nuevo Road to its ultimate width (i.e., 128-foot curb-to-curb street section with a 14-foot median and 10-foot sidewalks on either side), including replacement of the Nuevo Road Bridge at the Perris Valley Storm Drain Channel.	Under construction.

3.1.1.2 Environmental Consequences (Existing and Future Land Use)

Permanent Impacts

Build Alternative 1—Cajalco Alignment

Build Alternative 1 would permanently acquire 218 acres of property and would require the following acquisitions: full acquisition of 17 residential parcels, full acquisition of two nonresidential parcels, partial acquisition of 67 residential parcels, partial acquisition of five nonresidential parcels, and partial acquisition of 149 vacant parcels. In addition, roadway alignment modifications along Cajalco Road would result in the acquisition and conversion of lands from the LM MSHCP area, including the LMR; construction of a new, secondary access between Lake Mathews Drive and Dirt Road would also result in the conversion of portions of

residential-agricultural zoned properties to transportation. These acquisitions would change land uses from their current uses to that of a transportation facility. However, the acquired residences and businesses that require relocation represent a small percentage (0.002 percent of all residences and 0.005 percent of all businesses) of the existing residences and business within Riverside County, as there are approximately 831,400 housing units and 36,500 businesses within the County (U.S. Census Bureau 2015).

The project is planned for in the Riverside County General Plan. Land use changes as a result of the conversion of conservation lands to a transportation facility, however, would require the coordination of mitigation, including replacement lands, with the managing resource agencies. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. This is discussed in more detail in the opening discussion of Chapter 3.

Future Six-Lane Facility (Build Alternative 1)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not change existing land uses because additional property acquisitions are not anticipated.

Lake Mathews MSHCP (Build Alternative 1)

Build Alternative 1 would result in the acquisition and removal of approximately 122.85 acres of land from the LM MSHCP area, including 121.51 acres from the LMR. These acquisitions would change land uses from their current uses to that of a transportation facility. Land use changes as a result of the conversion of conservation lands to a transportation facility, however, would require the coordination of mitigation, including replacement lands, with the managing resource agencies. There has been extensive, ongoing coordination between the County and MWD, and the Lake Mathews Reserve Management Committee (LMRMC), to develop a mitigation plan to compensate for the loss of lands within the LMR and to address the goals of the LM MSHCP. Please refer to Mitigation Measures **NC-17 (NES BIO-17)** through **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*, for additional information on mitigation.

Modification of the LM MSHCP and LMR to allow for the proposed project, as well as address areas removed or otherwise affected by the build alternatives, will be coordinated between the County and LM MSHCP responsible parties.

Table 3.1-3 on the following page presents permanent impacts on existing land uses, planned land uses, and zoned land uses under Build Alternative 1.

Table 3.1-3. Land Use and Zoning Impacts – Build Alternative 1

Land Use/Zoning	Existing Land Use Impact (acres)	Designated/ Planned Land Use Impact (acres)	Zoned Land Use Impact (acres)
Residential/Rural Community *Zoning:* R-1, R-4, R-5, R-A-1, R-A-1/2, R-A-5, R-A-10, R-A-2, R-A-2 ½, R-R, R-T	48.70	83.32	88.34
Commercial/Business Park *Zoning:* C-1/C-P, C-O, C-P-S	5.69	24.50	8.47
Industrial/Mineral Resources *Zoning:* I-P, M-H, M-R, M-R-A, M-SC	4.05	14.31	2.63
Agricultural/Grazing *Zoning:* A-1, A-1-1, A-1-5, A-1-10, A-2-2, A-2-10, A-P	3.12	None	26.33
Conservation/Open Space/Water *Zoning:* N-A, W-1	200.02	235.38	90.91
Public Facilities/Utilities	31.23	29.42	None
Roadway/County Right of Way	2.05	2.05	None
Vacant/Undeveloped *Zoning:* W-2, W-2-10, W-2-M-1/2	94.28	None	None

Western Riverside County Multiple Species Habitat Conservation Plan Reserve Lands and Lake Mathews-Estelle Mountain Core Reserve

Build Alternative 1 would directly affect PQP lands in the WRC MSHCP, and one of the long-term SKR HCP Core Reserve Areas (Existing Core C). Mitigation Measure **NC-20 (NES BIO-21)** listed in Section 3.17, *Natural Communities*, is proposed to compensate for the loss of land and habitat in WRC MSHCP PQP lands and SKR HCP Core Reserve Area.

Riverside-Corona Resource Conservation District Lands

Build Alternative 1 would impact RCRCD conservation areas within Temescal Wash and an area located south of Cajalco Road near Wood Road. Mitigation Measures **NC-15 (NES BIO-14)** listed in Section 3.17, *Natural Communities*, and **WET-1** listed in Section 3.18, *Wetlands and Other Waters*, are proposed to compensate for the loss of riparian-riverine and wetland and non-wetland resources.

Lake Mathews Tower Outlet Mitigation Site

Build Alternative 1 would not affect the Lake Mathews Outlet Tower-Facilities Riparian Habitat Restoration/Enhancement site located within the MWD operations area.

Build Alternative 2C—Modified Cajalco Alignment

Build Alternative 2C would permanently acquire 239 acres of property and would require the following acquisitions: full acquisition of 17 residential parcels, full acquisition of two nonresidential parcels, partial acquisition of 67 residential parcels, partial acquisition of five nonresidential parcels, and partial acquisition of 153 vacant parcels. Furthermore, Alternative 2C would result in the acquisition and removal of lands from the SKR HCP and LM MSHCP areas, including the LMR. These acquisitions would change land uses from their current uses to that of a transportation facility. The acquired residences and businesses that require relocation represent

a small percentage (0.002 percent of all residences and 0.005 percent of all businesses) of the existing residences and business within Riverside County, as there are approximately 831,400 housing units and 36,500 businesses within the county (U.S. Census Bureau 2015). Land use changes as a result of the conversion of conservation lands to a transportation facility, however, would require the coordination of mitigation, including replacement lands, with the managing resource agencies.

Future Six-Lane Facility (Build Alternative 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not change existing land uses because additional property acquisitions are not anticipated.

Lake Mathews MSHCP (Build Alternative 2C)

As mentioned above, Build Alternative 2C would result in the acquisition and removal of approximately 114.44 acres of land from the LM MSHCP area, including 113.2 acres from the LMR. These acquisitions would change land uses from their current uses to that of a transportation facility. Land use changes as a result of the conversion of conservation lands to a transportation facility, however, would require the coordination of mitigation, including replacement lands, with the managing resource agencies. There has been extensive, ongoing coordination between the County and MWD, and the LMRMC, to develop a mitigation plan to compensate for the loss of lands within the LMR and to address the goals of the LM MSHCP. Please refer to Mitigation Measures **NC-17 (NES BIO-17)** through **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*, for additional information on mitigation.

Modification of the LM MSHCP and LMR to allow for the proposed project, as well as address areas removed or otherwise affected by the build alternatives, will be coordinated between the County and LM MSHCP responsible parties.

Table 3.1-4 presents permanent impacts on existing land uses, planned land uses, and zoned land uses under Build Alternative 2C.

Table 3.1-4. Land Use and Zoning Impacts – Build Alternative 2C

Land Use/Zoning	Existing Land Use Impact (acres)	Designated/ Planned Land Use Impact (acres)	Zoned Land Use Impact (acres)
Residential/Rural Community *Zoning:* R-1, R-4, R-5, R-A-1, R-A-1/2, R-A-5, R-A-10, R-A-2, R-A-2 ½, R-R, R-T	48.68	85.96	99.62
Commercial/Business Park *Zoning:* C-1/C-P, C-O, C-P-S	5.69	24.50	8.47
Industrial/Mineral Resources *Zoning:* I-P, M-H, M-R, M-R-A, M-SC	4.05	14.31	2.63
Agricultural/Grazing *Zoning:* A-1, A-1-1, A-1-5, A-1-10, A-2-2, A-2-10, A-P	3.12	None	41.15
Conservation/Open Space/Water *Zoning:* N-A, W-1	207.55	242.91	84.17

Land Use/Zoning	Existing Land Use Impact (acres)	Designated/ Planned Land Use Impact (acres)	Zoned Land Use Impact (acres)
Public Facilities/Utilities	30.25	28.44	None
Roadway/County Right of Way	2.05	2.05	None
Vacant/Undeveloped *Zoning:* W-2, W-2-10, W-2-M-1/2	96.77	None	None

Western Riverside County Multiple Species Habitat Conservation Plan Reserve Lands and Lake Mathews-Estelle Mountain Core Reserve

Build Alternative 2C would directly affect PQP lands in the WRC MSHCP, and one of the long-term SKR HCP Core Reserve Areas (Existing Core C). Mitigation Measure **NC-20 (NES BIO-21)** listed in Section 3.17, *Natural Communities*, is proposed to compensate for the loss of land and habitat in WRC MSHCP PQP lands and SKR HCP Core Reserve Area.

Riverside-Corona Resource Conservation District Lands

Impacts to RCRCD lands under Build Alternative 2C would be the same as those identified under Build Alternative 1.

Lake Mathews Tower Outlet Mitigation Site

Build Alternative 2C would not affect the Lake Mathews Outlet Tower-Facilities Riparian Habitat Restoration/Enhancement site located within the MWD operations area.

Build Alternative 4—El Sobrante Alignment

Build Alternative 4 would permanently acquire 240 acres of property and would require the following acquisitions: full acquisition of 18 residential parcels, full acquisition of two nonresidential parcels, partial acquisition of 69 residential parcels, partial acquisition of 12 nonresidential parcels, and partial acquisition of 186 vacant parcels. Partial acquisition of the vacant and residential parcels would be necessary for construction of a new connection between Cajalco Road and El Sobrante Road south of Harley John Road, and new terminus of Harley John Road with cul-de-sac north of the new connection. These acquisitions would change land uses from their current uses to that of a transportation facility. However, the acquired residences and businesses that require relocation represent a small percentage (0.002 percent of all residences and 0.005 percent of all businesses) of the existing residences and business within Riverside County, as there are approximately 831,400 housing units and 36,500 businesses within the county (U.S. Census Bureau 2015). Therefore, appreciable land use change would not occur as a result of the implementation of Build Alternative 4. However, the new connection between El Sobrante Road and Cajalco Road, as well as other roadway alignment modifications along El Sobrante Road, Cajalco Road, and La Sierra Avenue, would result in the acquisition and conversion of lands from the LM MSHCP area, as well as impact the Lake Mathews Outlet Tower-Facilities Riparian Habitat Restoration/Enhancement site located within the MWD operations area.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not change existing land uses because additional property acquisitions are not anticipated.

Lake Mathews MSHCP (Build Alternative 4)

As mentioned above, the new connection between El Sobrante Road and Cajalco Road, as well as other roadway alignment modifications along El Sobrante Road, Cajalco Road, and La Sierra Avenue, would result in the acquisition and conversion of approximately 110.98 acres of land from the LM MSHCP area, including 58.39 acres from the LMR. These acquisitions would change land uses from their current uses to that of a transportation facility. Land use changes as a result of the conversion of conservation lands to a transportation facility, however, would require the coordination of mitigation, including replacement lands, with the managing resource agencies. There has been extensive, ongoing coordination between the County and MWD, and the LMRMC, to develop a mitigation plan to compensate for the loss of lands within the LMR and to address the goals of the LM MSHCP. Please refer to Mitigation Measures **NC-17 (NES BIO-17)** through **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*, for additional information on mitigation.

Modification of the LM MSHCP and LMR to allow for the proposed project, as well as address areas removed or otherwise affected by the build alternatives, will be coordinated between the County and LM MSHCP responsible parties.

Table 3.1-5 presents permanent impacts on existing land uses, planned land uses, and zoned land uses under Build Alternative 4.

Table 3.1-5. Land Use and Zoning Impacts – Build Alternative 4

Land Use/Zoning	Existing Land Use Impact (acres)	Designated/ Planned Land Use Impact (acres)	Zoned Land Use Impact (acres)
Residential/Rural Community *Zoning:* R-1, R-4, R-5, R-A-1, R-A-1/2, R-A-5, R-A-10, R-A-2, R-A-2 ½, R-R, R-T	59.52	137.70	88.90
Commercial/Business Park *Zoning:* C-1/C-P, C-O, C-P-S	5.71	27.20	8.47
Industrial/Mineral Resources *Zoning:* I-P, M-H, M-R, M-R-A, M-SC	4.06	14.31	2.64
Agricultural/Grazing *Zoning:* A-1, A-1-1, A-1-5, A-1-10, A-2-2, A-2-10, A-P	24.69	None	65.82
Conservation/Open Space/Water *Zoning:* N-A, W-1	101.58	137.35	47.87
Public Facilities/Utilities	78.05	76.14	None
Roadway/County Right of Way	2.05	2.05	None
Vacant/Undeveloped *Zoning:* W-2, W-2-10, W-2-M-1/2	119.09	None	24.55

Western Riverside County Multiple Species Habitat Conservation Plan Reserve Lands and Lake Mathews-Estelle Mountain Core Reserve

Build Alternative 4 would directly affect PQP lands in the WRC MSHCP, and one of the long-term SKR HCP Core Reserve Areas (Existing Core C). Mitigation Measure **NC-20 (NES BIO-21)** listed in Section 3.17, *Natural Communities*, is proposed to compensate for the loss of land and habitat in WRC MSHCP PQP lands and SKR HCP Core Reserve Area.

Riverside-Corona Resource Conservation District Lands

Impacts to RCRCD lands under Build Alternative 4 would be the same as those identified under Build Alternative 1.

Lake Mathews Tower Outlet Mitigation Site

Build Alternative 4 would affect the Lake Mathews Outlet Tower-Facilities Riparian Habitat Restoration/Enhancement site located within the MWD operations area. Mitigation Measures **NC-15 (NES BIO-14)** listed in Section 3.17, *Natural Communities*, and **WET-1** listed in Section 3.18, *Wetlands and Other Waters*, are proposed to compensate for the loss of riparian-riverine and wetland and non-wetland resources.

No-Build Alternative

The No-Build Alternative would not affect existing land uses because the proposed project would not be constructed, avoiding conversion of existing land uses.

Temporary Impacts

Build Alternatives 1, 2C, and 4

Construction activities would result in temporary impacts on circulation and access due to detours and short-term partial closures of Cajalco Road, Richey Way, and Harley John Road, as well as temporary closure of sidewalks or crosswalks under any of the build alternatives. Under Build Alternative 4, detours and short-term partial closures of La Sierra Avenue and El Sobrante Road would also occur. Only temporary signage during construction and potential restriping along the freeway overpass would occur within the City of Perris; all other construction activities would occur in unincorporated Riverside County or the City of Corona. Temporary circulation impacts may result in some disruption for residents within the study area who use Cajalco Road, La Sierra Avenue, and/or El Sobrante Road to commute within the area and region, including to and from schools. Construction activities and partial lane closures may also affect business access along Cajalco Road and El Sobrante Road. However, effects on access to residents, schools, and businesses would be temporary, and emergency access would be maintained at all times via detours and through implementation of a Transportation Management Plan (TMP) as part of Standard Project Measure **PF LU-1**. Therefore, temporary construction activities would not cause changes to land use due to the coordination with businesses, residents, commuters, and emergency service providers through a public awareness campaign that would occur.

- **PF LU-1**: Prior to construction, the County of Riverside (County) will develop a Traffic Management Plan (TMP) that will include the following elements: **construction staging**

plans, **public awareness campaign**, **analysis of impacts on traffic**, **options for lane closures**, **and alternate route strategies**. In addition, the TMP will address access, circulation, parking, public transportation, and pedestrian and bicycle facilities as described below:

- Prior to construction, the County will coordinate with local agencies, emergency services, and law enforcement to minimize disruptions to access, circulation, and parking.
- Prior to construction, the County will coordinate with local jurisdictions to adjust signal timing on arterial streets during construction to minimize traffic congestion.
- Prior to construction, the County will provide appropriate signage as needed throughout construction. The construction contractor will maintain appropriate signage to direct pedestrians, bicyclists, and vehicular traffic via alternate routes. Disabled access will be maintained during construction.
- Prior to construction, the County will coordinate with public transportation agencies to provide rerouting information, including operating schedules, to the public.
- The County will maintain pedestrian access points to businesses, parks, and schools within the construction area throughout the construction period, where feasible. If usual access points are lost, provisions for alternative access to the affected parcels will be made. Appropriate signage will be placed to inform pedestrians and bicyclists of the alternative access to local businesses. Disabled access will be maintained during construction where feasible.
- Appropriate signage and advanced warning will be implemented to direct pedestrian, bicycle, and vehicular traffic to alternate routes as deemed necessary.
- If short-term full roadway closure is necessary, it will be scheduled for nighttime to minimize impacts on motorists.

Temporary construction easements (TCEs) would be required during the construction period to facilitate access to construction work areas, resulting in temporary acquisition of 61 acres of property under Build Alternative 1, 66 acres under Build Alternative 2C, and 63 acres under Build Alternative 4. These TCEs would occur on parcels adjacent to the project corridor, as discussed in Section 3.4.2, *Relocations and Real Property Acquisitions*. These would not affect existing land uses adjacent to the project corridor because the need for these TCEs would be temporary, and the parcels would be returned to the landowner after construction is complete.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, construction may result in intermittent traffic delays until the project is completed; however, the delays would be temporary and are not anticipated to be substantial enough to interfere with existing land uses.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Construction would temporarily affect approximately 22.13 acres of land within the LM MSHCP area under Build Alternative 1, 25.63 acres under Build Alternative 2C, and 10.06 acres under Build Alternative 4. This is not anticipated to affect existing land uses adjacent to the project corridor because the TCEs would be temporary, the temporary effects on these properties would not prevent long-term use for conservation purposes, and the land would be returned to conservation use after construction is complete.

Table 3.1-6 presents temporary land use impacts anticipated under each build alternative.

Table 3.1-6. Build Alternatives 1, 2C, and 4 – Temporary Land Use and Zoning Impacts

Land Use/Zoning	Existing Land Use (acres)			Designated/ Planned Land Use (acres)			Zoned Land Use (acres)		
	Build Alternative			Build Alternative			Build Alternative		
	1	2C	4	1	2C	4	1	2C	4
Residential/Rural Community *Zoning:* R-1, R-4, R-5, R-A-1, R-A-1/2, R-A-5, R-A-10, R-A-2, R-A-2 ½, R-R, R-T	20.88	20.90	19.52	37.23	37.27	37.81	35.12	41.16	26.40
Commercial/Business Park *Zoning:* C-1/C-P, C-O, C-P-S	3.15	3.15	3.16	6.80	6.80	7.05	1.82	1.82	1.92
Industrial/Mineral Resources *Zoning:* I-P, M-H, M-R, M-R-A, M-SC	2.32	2.32	2.31	6.04	6.04	6.03	2.70	2.70	2.69
Agricultural/Grazing *Zoning:* A-1, A-1-1, A-1-5, A-1-10, A-2-2, A-2-10, A-P	1.22	1.22	4.12	--	--	--	5.45	6.14	14.11
Conservation/Open Space/Water *Zoning:* N-A, W-1	23.81	31.86	13.20	29.38	37.43	18.80	16.20	12.39	12.18
Public Facilities/Utilities	5.20	4.84	13.97	5.07	4.71	13.83	--	--	--
Roadway/County Right of Way	3.84	3.84	3.84	3.84	3.84	3.84	--	--	--
Vacant/Undeveloped *Zoning:* W-2, W-2-10, W-2-M-1/2	28.50	28.71	27.23	--	--	--	--	--	3.62

WRC MSHCP Reserve Lands, LM-EM Reserve, RCRCD Lands and Tower Mitigation Site (Build Alternatives 1, 2C, and 4)

Temporary impacts to WRC MSHCP, LM-EM Reserve, and RCRCD lands would be addressed by Measures **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12), NC-14 (NES BIO-13)** and **NC-15 (NES BIO-14),** Measure **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*.

No-Build Alternative

The No-Build Alternative would not affect existing land uses because the proposed project would not be constructed, avoiding conversion of existing land uses.

3.1.2 Consistency with State, Regional, and Local Plans and Programs

3.1.2.1 Affected Environment

Southern California Association of Governments Federal Transportation Improvement Program

The Southern California Association of Governments (SCAG) Federal Transportation Improvement Program (FTIP) is a capital listing of all transportation projects proposed over a 6-year period for the SCAG region. The projects include highway improvements; transit, rail, and bus facilities; high-occupancy vehicle lanes; signal synchronization; intersection improvements; and freeway ramps, among others.

The FTIP is prepared to implement projects and programs listed in the Regional Transportation Plan (RTP) and is developed in compliance with state and federal requirements. The project is fully funded and is in the SCAG financially constrained 2021 FTIP as Project Number RIV090903, which was found to conform by the Federal Highway Administration and Federal Transit Administration on April 16, 2021.[1]

Southern California Association of Governments 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy

The Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) is a long-range transportation plan that is developed and updated by SCAG every 4 years. The RTP/SCS provides a vision for transportation investments throughout the region. Using growth forecasts and economic trends that project out over a 20-year period, the RTP/SCS considers the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address mobility needs.

County of Riverside General Plan

The Riverside County General Plan is a comprehensive, long-term general plan, adopted in 2015. The elements of the general plan make up the framework for decision-making regarding growth and development in the county and contain goals and policies that are pertinent to the proposed project (County 2015).

[1] The project is currently described in the 2021 FTIP as "IN RIVERSIDE COUNTY ON CAJALCO RD – CAJALCO RD. WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON RD. TO HARVILL AVE AND FROM 4 TO 6 LANES FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND A BRIDGE RECONSTRUCTION OVER A WATER CROSSING." The County of Riverside has submitted an amendment that would update the description as follows: "IN RIVERSIDE COUNTY ON CAJALCO RD - WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON. BRIDGE/EAGLE CANYON ROAD TO HARVILL AVE AND FROM 4 TO 6 LANES WITH THREE LANES IN THE WESTBOUND DIRECTION FROM TEMESCAL CANYON RD TO TEMESCAL CANYON BRIDGE, THREE LANES IN THE EASTBOUND DIRECTION FROM TEMESCAL CANYON ROAD TO JUST EAST OF EAGLE CANYON ROAD, AND THREE LANES EASTBOUND AND WESTBOUND FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND THE CONSTRUCTION OF NEW, AND RECONSTRUCTION OF EXISTING, BRIDGES AS NEEDED." This amendment will be obtained prior to adoption of the Final Environmental Document.

Temescal Canyon Area Plan

Temescal Canyon is an area within western Riverside County. The Temescal Canyon Area Plan contains a Land Use Plan, statistical summaries, policies, and accompanying exhibits that explain the physical, environmental, and regulatory characteristics of the area (County 2018a). The Temescal Canyon Area Plan has limited applicability to the project because the project would only overlap with the plan area at the western end of the proposed alignment; the majority of the project would be within unincorporated Riverside County.

Lake Mathews/Woodcrest Area Plan

Lake Mathews/Woodcrest is a community within unincorporated Riverside County. The Lake Mathews/Woodcrest Area Plan contains a Land Use Plan and identifies issues, articulates community visions, and recommends strategies for improvement and for achieving the visions. The purpose of the plan is to serve as a guide for the future development and improvement of the community (County 2016).

Mead Valley Area Plan

Mead Valley is a community within unincorporated Riverside County. The Mead Valley Area Plan contains a Land Use Plan and identifies issues, articulates community visions, and recommends strategies for improvement and for achieving the visions. The purpose of the plan is to serve as a guide for the future development and improvement of the community (County 2018b).

County of Riverside Climate Action Plan

The County of Riverside Climate Action Plan (CAP), adopted in 2015 and updated November 2019, includes greenhouse gas (GHG) inventories of community-wide and municipal sources, GHG reduction targets, and measures to aid in the reduction of GHG to meet reduction targets (County 2019). In addition to the identification of new measures designed to reduce GHG emissions, the CAP references relevant General Plan policies that also support GHG emissions reduction. Because the new measures included in the CAP apply to new development and long-term planning, the General Plan policies relevant to both GHG emissions reduction and the proposed project have been included in this section and assessed for consistency. The application of the relevant General Plan policies in the reduction of GHG related to the proposed project and Climate Change are assessed in Chapter 4, *California Environmental Quality Act Evaluation*, Section 4.4, *Climate Change*.

County of Riverside Comprehensive Trails Plan

The February 2018 Riverside County Regional Park and Open-Space District Comprehensive Trails Plan defines policies, operational and maintenance requirements, implementation guidance, funding and partnership recommendations, and design standards for trails within Riverside County (Riverside County Regional Park and Open-Space District 2018).

City of Corona General Plan

The City of Corona's General Plan addresses a multitude of land use-related issues and is designed to provide policy guidance for the next 20 years and beyond. The most recent complete General Plan was approved by the City Council in 2004, but it has been amended numerous times since to address changes in the direction of development, as well as to meet statutory and regulatory requirements (City of Corona 2004). The City of Corona General Plan has limited applicability to the project because the project limits extend within the plan area at the western end of the proposed alignment, near Temescal Canyon Road; the majority of the project would be within unincorporated Riverside County.

Dos Lagos Specific Plan and El Cerrito Specific Plan

The portion of the project within the limits of Corona, south of Cajalco Road and west of Temescal Creek, is within the Dos Lagos Specific Plan (City of Corona 2012); the portion of the project within the limits of Corona north of Cajalco Road and west of Temescal Creek is within the El Cerrito Specific Plan (City of Corona 2011). The specific plans provide guidelines for development within each of the two plan areas and have minimal influence on existing County facilities that occur along the plan area boundaries, such as Cajalco Road. However, the guidelines and policies of the plans are reviewed for consistency with the proposed project where the project would occur adjacent to or within the plan areas. Dos Lagos Specific Plan guidelines are primarily for residential development and defer to policies of the City's General Plan. El Cerrito Specific Plan guidelines are primarily for commercial development; however, the El Cerrito Specific Plan also includes design standards applicable to the plan area. For both specific plan areas, the project would minimally encroach beyond existing County right of way.

City of Perris General Plan

The City of Perris 2030 General Plan was adopted in 2005, but has undergone updates in 2008, 2013, 2015, and 2016. The General Plan is a 30-year guide for local government decisions on growth, capital investment, and physical development in the City of Perris. It guides future development plans and gives direction on how to implement future projects (City of Perris 2005). The City of Perris General Plan has limited applicability to the project because a limited portion of the eastern end of the proposed project alignment is adjacent to the plan area; the majority of the project would be within unincorporated Riverside County.

Western Riverside County Multiple Species Habitat Conservation Plan

The WRC MSHCP is a comprehensive, multi-jurisdictional habitat conservation plan focusing on conservation of species and their associated habitats in western Riverside County. The WRC MSHCP's goal is maintenance of biological and ecological diversity within an urbanizing region. As described in Section 3.1.1, *Existing and Future Land Use,* the WRC MSHCP plan area encompasses approximately 1.26 million acres. The Western Riverside County Regional Conservation Authority (RCA) is a government agency formed in 2004 with the core activity of acquiring reserve land. The agency implements the WRC MSHCP, which outlines a plan to protect 146 native species of plants, birds, and animals and preserve a half-million acres of their habitats (RCA 2003). The County signed the Implementation Agreement on December 15, 2003.

This plan provides, among other things, impact mitigation for future County projects on circulation element roads in the covered area of western Riverside County.

The project would be located within the boundaries of the WRC MSHCP and would therefore be subject to its requirements (RCA 2003).

Habitat Conservation Plan for the Stephens' Kangaroo Rat

The SKR HCP provides for the establishment, expansion, and ongoing management of permanent reserves in a manner that will ensure conservation of the Stephens' kangaroo rat in western Riverside County, while also providing opportunities to benefit other species of concern. The area covered by the plan includes 533,954 acres within the jurisdictions of RCHCA member agencies in western Riverside County (RCHCA 1996). Portions of the project would be located within the boundaries of the SKR HCP and would be subject to its requirements in those areas.

Lake Mathews MSHCP

The LM MSHCP functions as a comprehensive conservation and management program for 65 wildlife and plant species within a 5,993.5-acre planning area around Lake Mathews in western Riverside County. The LM MSHCP was developed in response to the creation of the 5,110.4-acre LMR in 1995 through a Cooperative Management Agreement (CMA) among MWD, the RCHCA, CDFW, and the USFWS. The LM MSHCP also serves as an implementation agreement between MWD and the RCHCA to address and mitigate impacts to sensitive species and resources resulting from MWD activities and operations within the plan area, future MWD projects in the region, and conservation goals of the SKR HCP. The LM MSHCP serves to protect natural habitat types within the LMR, restore degraded habitat conditions for covered species through improvements to suitable habitat, and ensure the continuation of operations and maintenance of MWD facilities.

The 5,993.5-acre plan area is comprised of a 2,565.5-acre State Ecological Reserve and 2,544.90-acre Mitigation Bank for use by MWD and RCHCA, that together form the 5,110.4-acre LMR, and 883.1 acres designated for lake facilities, operations, maintenance, and future projects (MWD and RCHCA 1995; MWD 2021). The State Ecological Reserve was created in 1979 as mitigation for impacts of the State Water Project on wildlife within property owned by the Department of Water Resources (DWR) and MWD. The Mitigation Bank was created by the LM MSHCP as a preemptive agreement to mitigate for potential impacts to sensitive species within the Plan Area Projects areas. The remaining 883.1 acres of planning area includes 154.5 acres allocated for future Plan Area Projects and 728.6 acres of Operations Areas currently utilized by MWD. (Dudek 2013).

Portions of the project would be located within the boundaries of the LM MSHCP plan areas and would therefore be subject to requirements of the LM MSHCP and related Lake Mathews Reserve Management Plan, and the existing agreements described below for those areas.

Lake Mathews Reserve Management Plan

The Lake Mathews Reserve Management Plan (RMP) guides management goals, objectives, and strategies of the LMR for a 15-year period (2013–2028); it is considered a living document that is changed and updated as needed. The primary objective of the RMP is to outline management

of the LMR to maintain viable populations of sensitive wildlife and plant species (covered species) through a habitat approach, by managing large habitat blocks for these species. The plan outlines the biological resources and sensitive species to be considered during management activities, the general and species-specific goals for the LMR, and the plans and schedules needed to achieve these goals. (Dudek 2013). The RMP identifies the following three primary goals for guiding Reserve management within the LM MSHCP:

1. Protect existing natural habitat types on the Combined Reserve;
2. Improve degraded habitat by enhancing or restoring suitable habitat for Covered Species within the Reserve;
3. Ensure that operation and maintenance of Lake Mathews as a water supply facility are not impaired.

Lake Mathews Agreements and Easements

Cooperative Management Agreement

The CMA (December 1995) established the framework for creating the LMR and LM MSHCP, and also established the LMRMC as the governing body for the LMR. The LMRMC consists of one representative from each of the four agencies with jurisdiction in the LMR, each with assigned roles and duties: MWD, RCHCA, CDFW, and USFWS. The purpose of the LMRMC is to manage the Reserve in such a way that the goals and objectives of the plan are attained in accordance with all governing documents. Daily management is the responsibility of the Reserve Manager and additional staff (e.g., Assistant Manager, Field Crew) as determined based on appropriate needs. Funding is provided through an endowment established by the RCHCA and managed by MWD. (Dudek 2013).

Mitigation Banking Agreement

The Mitigation Banking Agreement (December 1995) was established among MWD, RCHCA, CDFG, and USFWS, to mitigate for MWD's water delivery, treatment, and storage facilities in western Riverside County. In creating the Mitigation Bank, MWD mitigated for projects located within the Plan Area (as defined in the MSHCP) as well as projects located outside of the Plan Area. A total of 2,544.9 acres owned by MWD in the vicinity of Lake Mathews were dedicated as a Mitigation Bank per the aforementioned agreement. Further, the Mitigation Banking Agreement provided for the Existing Reserve, adjoining the Mitigation Bank, to be incorporated into the Lake Mathews Reserve that is to be managed conjunctively with the remainder of the Lake Mathews-Estelle Mountain Core Reserve designated by RCHCA under the SKR HCP. (Dudek 2013).

Memoranda of Understanding

Two separate Memoranda of Understanding (MOU) were authorized as part of the approval of the LM MSHCP, CMA, and Mitigation Banking Agreement. A Fish and Game Code Sections 2081 and 2835 MOU was entered into agreement in December 1995 among MWD, RCHCA, and CDFW. A second MOU was entered into by MWD, RCHCA, and USFWS. The MSHCP/NCCP was prepared to ensure issuance of appropriate incidental take permits for listed

species and species that may become listed in the future through Section 10(a) of the Federal Endangered Species Act and Section 2081 of the California Endangered Species Act.

Audubon Settlement Agreement

A lawsuit following the establishment of the Reserve resulted in the Settlement and General Release Agreement (Audubon Settlement Agreement, Audubon 2002) between the San Bernardino Valley Audubon Society (Audubon), MWD, CDFW, and RCHCA which resulted in the settlement and release of claims Audubon had against MWD. This agreement also provided for conditional public access to the LMR.

Lake Mathews Reserve Conservation Easement Grant

On June 21, 2005, MWD granted a conservation easement, Lake Mathews Reserve Conservation Easement Grant, to the RCHCA, to ensure that the area covered by the easement will be retained as open space in perpetuity. It restricts uses of the property that would significantly impair or interfere with the property's conservation values and authorizes the credit for 1,269.3 acres of occupied SKR habitat toward the RCHCA's obligations under the SKR HCP.

RCRCD Long-Range Objectives 2016-2021

The Long-Range Objectives 2016-2021 is a long-term action plan prepared by RCRCD that defines objectives used by RCRCD to plan future projects, programming, and district operations, and assess resource management and outreach needs (RCRCD 2016). The RCRCD is a non-regulatory local agency (special district) that works to permanently protect land that has habitat, scenic, and/or agricultural values through preservation (donations of land and conservation easements), restoration, and management.

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

In November of 2014, the Riverside County Airport Land Use Commission adopted the *March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan* (ALUCP), which provides detail for land use compatibility planning around the March Air Reserve Base/Inland Port Airport (Riverside County Airport Land Use Commission 2014).

3.1.2.2 Environmental Consequences

Table 3.1-7 analyzes the consistency of the proposed project and the No-Build Alternative with the relevant plans and programs. As detailed in Table 3.1-7, Build Alternatives 1, 2C, and 4 would conflict with the current LM MSHCP. Because the LM MSHCP does not currently accommodate the transportation improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Changes in the LM MSHCP as well as changes to the lands managed by the LM MSHCP would be addressed by mitigation coordinated with MWD and other responsible agencies. Build Alternatives 1, 2C, and 4 are not anticipated to conflict with the goals or policies of any other relevant plans and programs.

Consistency with each plan is discussed in more detail in the sections following Table 3.1-7.

Table 3.1-7. Consistency with State, Regional, and Local Plans and Programs

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
SCAG RTP/SCS 2020–2045			
Funded Project Description	**Consistent.** Build Alternative 1 would be consistent with the funded project description; Build Alternative 2C would be mostly consistent.	**Inconsistent.** Build Alternative 4 would not be consistent with the funded project description.	**Inconsistent.** The No-Build Alternative would not be consistent with the funded project description.
Goal 2: Improve mobility, accessibility, reliability, and travel safety for people and goods	**Consistent**. Build Alternatives 1 and 2C would include design improvements that would enhance safety as well as increase the capacity of Cajalco Road and its ability to accommodate traffic.	**Consistent.** Build Alternative 4 would include design improvements that would enhance safety as well as increase the capacity of segments of Cajalco Road, El Sobrante Road, and La Sierra Avenue and their ability to accommodate traffic.	**Inconsistent**. No improvements would be made that would support mobility, accessibility, or travel safety.
Goal 3: Enhance the preservation, security, and resilience of the regional transportation system	**Consistent**. Build Alternatives 1 and 2C would retain most segments of existing Cajalco Road and improve the facility as a component of the existing regional transportation system.	**Consistent.** Build Alternative 4 would retain most segments of existing Cajalco Road, El Sobrante Road, and La Sierra Avenue and would improve segments of the facilities as components of the existing regional transportation system.	**Consistent**. Existing transportation facilities would remain and future improvements would not be precluded.
Goal 4: Increase person and goods movement and travel choices within the transportation system	**Consistent**. Build Alternatives 1 and 2C would increase the capacity of Cajalco Road, better accommodate goods movement, and support choices in transportation such as bus and train by improving a connecting facility and local bus stops.	**Consistent.** Build Alternative 4 would increase the capacity of segments of Cajalco Road, El Sobrante Road, and La Sierra Avenue; better accommodate goods movement; and support choices in transportation such as bus and train by improving a connecting facility and local bus stops.	**Inconsistent**. No transportation improvements would be made that would support productivity of the transportation system.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
County of Riverside General Plan			
C 1.1: Design the transportation system to respond to concentrations of population and employment activities, as designated by the Land Use Element and in accordance with the Circulation Plan, Figure C-1.	**Consistent**. Build Alternatives 1 and 2C would increase the capacity of Cajalco Road, responding to transportation needs of population and employment activities. The roadway right of way would vary between 85 and 230 feet, and the Circulation Element classifies Cajalco Road as an Expressway with minimum right of way widths of 184 to 230 feet. The build alternatives would not preclude the construction of future transportation facilities identified in the Circulation Plan.	**Consistent**. Build Alternative 4 would increase the capacity of segments of Cajalco Road, El Sobrante Road, and La Sierra Avenue, responding to transportation needs of population and employment activities. The roadway right of way would vary between 120 and 150 feet and the Circulation Element classifies La Sierra Avenue and El Sobrante Road as Mountain Arterial (110-foot right of way) and Arterial (128-foot right of way), respectively. Build Alternative 4 would not preclude the construction of future transportation facilities identified in the Circulation Plan.	**Inconsistent**. No improvements would be made that would respond to concentrations of population and employment activities.
C 1.3: Support the development of transit connections between Riverside County and regional activity centers in other counties as well as transit connections that link the community centers located throughout the county and as identified in the Land Use Element and in the individual Area Plans.	**Consistent**. Build Alternatives 1 and 2C would expand the existing network and provide for the development of alternative travel modes, including additional bus turnouts for bus routes.	**Consistent**. Build Alternative 4 would expand the existing network and provide for the development of alternative travel modes, including additional bus turnouts for bus routes.	**Inconsistent**. No transportation improvements would be made that would support the development of transit connections in the area.
C 1.4: Utilize existing infrastructure and utilities to the maximum extent practicable and provide for the logical, timely, and economically efficient extension of infrastructure and services.	**Consistent**. Build Alternatives 1 and 2C would primarily use existing roadways in order to improve efficiency.	**Consistent**. Build Alternative 4 would partially use existing roadways in order to improve efficiency.	**Inconsistent**. Would not utilize existing infrastructure and utilities to the maximum extent practicable.
C 1.5: Evaluate the planned circulation system as needed to enhance the arterial highway network to respond to anticipated growth and mobility needs.	**Consistent**. Build Alternatives 1 and 2C would enhance the arterial highway network and respond to anticipated growth and mobility needs.	**Consistent**. Build Alternative 4 would enhance the arterial highway network and respond to anticipated growth and mobility needs.	**Inconsistent**. No transportation improvements would be made that would respond to anticipated growth and mobility needs.
C 1.6: Cooperate with and where appropriate lead local, regional, state, and federal agencies to establish an efficient circulation system.	**Consistent**. The County is coordinating with multiple agencies and jurisdictions to improve mobility, transportation, and traffic congestion.	**Consistent**. The County is coordinating with multiple agencies and jurisdictions to improve mobility, transportation, and traffic congestion.	**Inconsistent**. No transportation improvements would be made in support of establishing an efficient circulation system.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 3.1: Design, construct, and maintain Riverside County roadways as specified in the Riverside County Road Improvement Standards and Specifications. The standards shown in Figure C-4 may be modified by Specific Plans, Community Guidelines, or as approved by the Director of Transportation if alternative roadway standards are desirable to improve sustainability for the area.	**Consistent**. Build Alternatives 1 and 2C would design, construct, and maintain Riverside County roadways as specified in the Riverside County Road Improvement Standards and Specifications.	**Consistent**. Build Alternative 4 would design, construct, and maintain Riverside County roadways as specified in the Riverside County Road Improvement Standards and Specifications.	**Consistent**. Would maintain Riverside County roadways as specified in the Riverside County Road Improvement Standards and Specifications.
C 3.2: Maintain the existing transportation network, while providing for future expansion and improvement based on travel demand, and the development of alternative travel modes.	**Consistent**. Build Alternatives 1 and 2C would expand the existing network and provide for the development of alternative travel modes, including additional bus turnouts for bus routes.	**Consistent**. Build Alternative 4 would expand the existing network and provide for the development of alternative travel modes, including additional bus turnouts for bus routes.	**Inconsistent**. No improvements would be made and congestion would continue to worsen, impeding mobility and accessibility for people and goods in the region.
C 3.3: Implement design guidelines that identify intersection improvements consistent with the lane geometrics in Table C-2 unless additional lanes are needed to maintain consistency with Policy C 2.2. Where roadway classifications change on a continuous alignment, the standards of the higher classification will normally be transitioned on a portion of the roadway that has the lower classification, particularly where the change takes place at roadway intersections. This may result in additional right of way or lanes being required above the standards shown in Figure C-4 for the segment with the lower classification to accommodate the transition.	**Consistent**. Build Alternatives 1 and 2C would implement design guidelines for intersections consistent with lane geometrics in Table C-2.	**Consistent**. Build Alternative 4 would implement design guidelines for intersections consistent with lane geometrics in Table C-2.	**Consistent**. No improvements would be made or design guidelines implemented.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 3.12: Improve highways serving as arterials through mountainous and rural areas to adequately meet travel demands and safety requirements while minimizing the need for excessive cut and fill.	**Consistent.** Build Alternatives 1 and 2C would implement design guidelines that utilize existing alignments where appropriate to adequately meet travel demands and safety requirements while minimizing the need for excess cut and fill.	**Consistent:** Build Alternative 4 would implement design guidelines that utilize existing alignments where appropriate to adequately meet travel demands and safety requirements while minimizing the need for excess cut and fill.	**Inconsistent**: No transportation improvements would be made to highways serving as arterials through mountainous and rural areas.
C 3.13: Design street intersections, where appropriate, to assure the safe, efficient passage of through-traffic and the negotiation of turning movements.	**Consistent**. Build Alternatives 1 and 2C would design street intersections to ensure safe, efficient passage of through-traffic and the negotiation of turning movements.	**Consistent**. Build Alternative 4 would design street intersections to ensure safe, efficient passage of through-traffic and the negotiation of turning movements.	**Inconsistent**. No new street intersections would be designed and any existing unsafe intersections would remain.
C 3.14: Design curves and grades to permit safe movement of vehicular traffic at the road's design speed. Design speed should be consistent with and complement the character of the adjacent area.	**Consistent**. Build Alternatives 1 and 2C would design curves and grades to permit safe movement of vehicular traffic at the road's design speed.	**Consistent**. Build Alternative 4 would design curves and grades to permit safe movement of vehicular traffic at the road's design speed.	**Inconsistent**. No new curves would be designed and any existing unsafe curves would remain.
C 3.15: Provide adequate sight distances for safe vehicular movement at a road's design speed and at all intersections.	**Consistent**. Build Alternatives 1 and 2C would provide adequate sight distances for safe vehicular movement at a road's design speed and at all intersections.	**Consistent**. Build Alternative 4 would provide adequate sight distances for safe vehicular movement at a road's design speed and at all intersections.	**Inconsistent**. No changes to sight distance would be made and any existing unsafe sight distances would remain.
C 3.17: Ensure dedications are made, where necessary, for additional rights-of-way or easements outside the road rights-of-way that are needed to establish slope stability, or drainage and related structures. These dedications shall be made by land dividers or developers to the responsible agency during the land division and land use review process.	**Consistent**. Build Alternatives 1 and 2C would ensure dedications are made for additional rights of way or easements.	**Consistent**. Build Alternative 4 would ensure dedications are made for additional rights of way or easements.	**Not Applicable**. No dedications would be required because no improvements would be made.
C 3.18: Align right-of-way dedications with existing dedications along adjacent parcels and maintain widths consistent with the ultimate design standard of the road, including required turning lanes.	**Consistent**. Build Alternatives 1 and 2C would align right of way dedications with existing dedications along adjacent parcels and maintain widths consistent with the ultimate design standard of the road.	**Consistent**. Build Alternative 4 would align right of way dedications with existing dedications along adjacent parcels and maintain widths consistent with the ultimate design standard of the road.	**Not Applicable**. No dedications would be required because no improvements would be made.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 3.20: Determine location of General Plan road rights of way and levels of road improvements needed based primarily upon land uses and travel demand.	**Consistent**. The alignment and level of improvements for Build Alternatives 1 and 2C were developed based upon land uses and travel demand.	**Consistent**. The alignment and level of improvements for Build Alternative 4 were developed based upon land uses and travel demand.	**Inconsistent**. No improvements would be made, which does not take into account land uses and travel demand.
C 3.24: Provide a street network with quick and efficient routes for emergency vehicles, meeting necessary street widths, turn-around radius, secondary access, and other factors as determined by the Transportation Department in consultation with the Fire Department and other emergency service providers.	**Consistent**. Build Alternatives 1 and 2C would require partial lane closures of Cajalco Road. However, the TMP would provide construction project information to emergency service providers to ensure adequate service. During operations, conditions for emergency vehicles would improve due to additional lanes at standard widths.	**Consistent**. Build Alternative 4 would require partial lane closures of Cajalco Road. However, the TMP would provide construction project information to emergency service providers to ensure adequate service. During operations, conditions for emergency vehicles would improve due to additional lanes at standard widths.	**Inconsistent**. No improvements would be made and congestion would continue to worsen, impeding emergency routes.
C 3.28: Reduce transportation noise through proper roadway design and coordination of truck and vehicle routing.	**Inconsistent**. Build Alternatives 1 and 2C would be constructed in accordance with roadway design requirements; however, the alternatives would result in some increases in noise levels at sensitive receptors due to additional traffic lanes.	**Inconsistent**. Build Alternative 4 would be constructed in accordance with roadway design requirements; however, the alternative would result in some increases in noise levels at sensitive receptors due to additional traffic lanes.	**Inconsistent**. No improvements would be made and existing noise levels would remain.
C 3.29: Include noise mitigation measures in the design of new roadway projects in the County of Riverside.	**Consistent**. Build Alternatives 1 and 2C include noise mitigation measures.	**Consistent**. Build Alternative 4 includes noise mitigation measures.	**Not Applicable**. Noise mitigation measures would not be required for the No-Build Alternative.
C 3.30: Design roadways to accommodate wildlife crossings whenever feasible and necessary.	**Consistent**. Build Alternatives 1 and 2C include wildlife crossings in the design.	**Consistent**. Build Alternative 4 includes wildlife crossings in the design.	**Inconsistent**. No wildlife crossings are included for the No-Build Alternative.
C 4.4: Plan for pedestrian access that is consistent with road design standards while designing street and road projects. Provisions for pedestrian paths or sidewalks and timing of traffic signals to allow safe pedestrian street crossing shall be included.	**Consistent**. Build Alternatives 1 and 2C include pedestrian access and facilities and changes to signal timing to allow safe pedestrian crossings.	**Consistent**. Build Alternative 4 includes pedestrian access and facilities and changes to signal timing to allow safe pedestrian crossings.	**Inconsistent**. No pedestrian facilities or improvements are included for the No-Build Alternative.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 4.9: Review all existing roadways without pedestrian facilities when they are considered for improvements to determine if new pedestrian facilities are warranted. New roadways should also be assessed for pedestrian facilities.	**Consistent**. Build Alternatives 1 and 2C evaluated if pedestrian facilities should be added where there are none now, and added them if warranted.	**Consistent**. Build Alternative 4 evaluated if pedestrian facilities should be added where there are none now, and added them if warranted.	**Inconsistent**. No pedestrian facilities or improvements would be included.
C 6.1: Provide dedicated and recorded public access to all parcels of land, except as provided for under the statutes of the State of California.	**Consistent**. Build Alternatives 1 and 2C would ensure access to all parcels is maintained.	**Consistent**. Build Alternative 4 would ensure access to all parcels is maintained.	**Not Applicable**. No changes to access would occur.
C 6.3: Limit access points and intersections of streets and highways based upon the road's General Plan classification and function. Require that access points be located so that they comply with Riverside County's minimum intersection spacing standards. Under special circumstances the Transportation Department may consider exceptions to this requirement.	**Consistent**. Build Alternatives 1 and 2C would limit direct access along Cajalco Road but would ensure access to all parcels is maintained while meeting the County's minimum design standards.	**Consistent**. Build Alternative 4 would limit direct access along segments of Cajalco Road, La Sierra Avenue, and El Sobrante Road, but would ensure access to all parcels is maintained while meeting the County's minimum design standards.	**Inconsistent**. No changes to access would occur, resulting in no limitations on access points.
C 6.4: Discourage parcel access points taken directly off General Plan designated highways. Access may be permitted off of General Plan designated highways only if no local streets are present.	**Consistent**. Build Alternatives 1 and 2C would limit direct access along Cajalco Road but would ensure access to all parcels is maintained.	**Consistent**. Build Alternative 4 would limit direct access along segments of Cajalco Road, La Sierra Avenue, and El Sobrante Road, but would ensure access to all parcels is maintained.	**Not Applicable**. No changes to access would occur, resulting in no limitations on access points.
C 6.5: Provide common access via shared driveways and/or reciprocal access easements whenever access must be taken directly off a General Plan designated highway. Parcels on opposite sides of a highway shall have access points located directly opposite each other, whenever possible, to allow for future street intersections and increased safety.	**Consistent**. Both build alternatives would limit direct access along Cajalco Road but would ensure access to all parcels is maintained.	**Consistent**. Build Alternative 4 would limit direct access along segments of Cajalco Road, La Sierra Avenue, and El Sobrante Road, but would ensure access to all parcels is maintained.	**Inconsistent**. No changes to access would occur, resulting in no limitations on access points.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 11.3: Design the physical layout of arterial and collector highways to facilitate bus operations. Locations of bus turn outs and other design features should be considered.	**Consistent**. Build Alternatives 1 and 2C have been designed to facilitate bus operations and include additional bus turnouts for bus routes.	**Consistent**. Build Alternative 4 was designed to facilitate bus operations and include additional bus turnouts for bus routes.	**Inconsistent**. No improvements for bus operations would be made.
C 20.1: Ensure preservation of trees identified as superior examples of native vegetation within road rights-of-way through development proposals review process. Where the County of Riverside deems preservation to be infeasible, relocation and/or replacement shall be evaluated by a qualified arborist to ensure that impacts are mitigated.	**Consistent**. Neither build alternative would affect trees identified as superior examples of native vegetation within road rights of way.	**Consistent**. Build Alternative 4 would not affect trees identified as superior examples of native vegetation within road rights of way.	**Consistent**. The No-Build Alternative would not affect trees identified as superior examples of native vegetation within road rights of way.
C 20.2: Provide all roadways located within identified flood areas with adequate flood control measures.	**Consistent**. Build Alternatives 1 and 2C would provide larger openings to more efficiently convey flows at Temescal and Cajalco Creeks, which is expected to result in lowering of the upstream water surface and improvement of flood areas.	**Consistent**. Build Alternative 4 would provide larger openings to more efficiently convey flows at Temescal and Cajalco Creeks, which is expected to result in lowering of the upstream water surface and improvement of flood areas.	**Inconsistent**. No improvements at Temescal and Cajalco Creeks would be made, which would not improve flood areas.
C 20.3: Locate roadways outside identified flood plains whenever possible.	**Consistent**. Build Alternatives 1 and 2C would encroach into the floodplain, but it would not be a significant encroachment. Both build alternatives would provide larger openings to more efficiently convey flows at Temescal and Cajalco Creeks, which is expected to result in lowering of the upstream water surface and improvement of flood areas.	**Consistent**. Build Alternative 4 would encroach into the floodplain, but it would not be a significant encroachment. Build Alternative 4 would provide larger openings to more efficiently convey flows at Temescal and Cajalco Creeks, which is expected to result in lowering of the upstream water surface and improvement of flood areas.	**Consistent**. No improvements would occur within floodplains.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 20.4: New crossings of watercourses by local roads shall occur at the minimum frequency necessary to provide for adequate neighborhood and community circulation and fire protection. Wherever feasible, new crossings shall occur using bridging systems that pass over entire watercourses and associated floodplains and riparian vegetation in single spans Dip or culvert crossings shall be avoided, but, where their use is unavoidable, they shall be designed to minimize impacts on watercourses.	**Consistent**. Build Alternatives 1 and 2C would implement designs that minimize impacts on watercourses and improve circulation for the community and emergency services.	**Consistent**. Build Alternative 4 would implement designs that minimize impacts on watercourses and improve circulation for the community and emergency services.	**Consistent**. No improvements would occur within watercourses; therefore, no impacts on neighborhood and community circulation would occur.
C 20.5: In order to protect the watershed, water supply, groundwater recharge, and wildlife values of watercourses, the County of Riverside will avoid siting utility infrastructure and associated grading, fire clearance, and other disturbances within or adjacent to watercourses, if there are feasible alternatives available, and discourage special districts and other governmental jurisdictions outside of Riverside County's authority, from doing so. Where such watershed utility siting locations cannot be avoided, the impacts on watercourses shall be minimized.	**Consistent**. Build Alternatives 1 and 2C would implement designs that minimize impacts on watercourses.	**Consistent**. Build Alternative 4 would implement designs that minimize impacts on watercourses.	**Consistent**. No improvements would occur within watercourses; therefore, no new impacts would occur.
C 20.6: Control dust and mitigate other environmental impacts during all stages of roadway Construction.	**Consistent**. Build Alternatives 1 and 2C would implement best management practices to control dust and mitigate environmental impacts during roadway construction.	**Consistent**. Build Alternative 4 would implement best management practices to control dust and mitigate environmental impacts during roadway construction.	**Consistent**. No improvements would occur therefore no mitigation for dust and environmental impacts would be necessary.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 20.8: Protect Riverside County residents from transportation generated noise hazards. Increased setbacks, walls, landscaped berms, other sound absorbing barriers, or a combination thereof shall be provided along freeways, expressways, and four-lane highways in order to protect adjacent noise-sensitive land uses from traffic-generated noise impacts. Additionally, noise generators such as commercial, manufacturing, and/or industrial activities shall use these techniques to mitigate exterior noise levels to no more than 60 decibels.	**Consistent**. Build Alternatives 1 and 2C would implement designs to mitigate transportation noise impacts on adjacent noise-sensitive land uses.	**Consistent**. Build Alternative 4 would implement designs to mitigate transportation noise impacts on adjacent noise-sensitive land uses.	**Consistent**. No improvements would occur; therefore, noise mitigation measures would not be necessary.
C 20.10: Avoid, where practicable, disturbance of existing communities and biotic resource areas when identifying alignments for new roadways, or for improvements to existing roadways and other transportation system improvements.	**Consistent**. Build Alternatives 1 and 2C would avoid, where practical, disturbance to communities and biotic resources areas.	**Consistent**. Build Alternative 4 would avoid, where practical disturbance, to communities and biotic resources areas.	**Consistent:** No improvements would occur; therefore, existing communities and biotic resources areas would not be affected.
C 20.11: Implement the Circulation Plan in a manner consistent with federal, state, and local environmental quality standards and regulations.	**Consistent**. Build Alternatives 1 and 2C would be consistent with the circulation plan and adhere to federal, state, and local environmental standards and regulations.	**Consistent**. Build Alternative 4 would be implemented to be consistent with the circulation plan and adhere to federal, state, and local environmental standards and regulations.	**Inconsistent**. The No-Build Alternative would not improve circulation and existing safety concerns.
C 20.14: Encourage the use of alternative non-motorized transportation and the use of non-polluting vehicles.	**Consistent**. Build Alternatives 1 and 2C would incorporate bus transit into the design to encourage use of alternative transportation.	**Consistent**. Build Alternative 4 would incorporates bus transit into the design to encourage use of alternative transportation.	**Inconsistent**. The No-Build Alternative does not encourage alternative transportation use.
C 20.15: Implement National Pollutant Discharge Elimination System Best Management Practices relating to construction of roadways to control runoff contamination from affecting the groundwater supply	**Consistent**. Build Alternatives 1 and 2C would implement best management practices to mitigate environmental impacts during roadway construction.	**Consistent**. Build Alternative 4 would implement best management practices to mitigate environmental impacts during roadway construction	**Consistent**. No improvements would occur; therefore, no mitigation for dust and environmental impacts would be necessary.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 21.4: Construct and improve traffic signals at appropriate intersections. Whenever possible, traffic signals should be spaced and operated as part of coordinated systems to optimize traffic operation and reduce congestion.	**Consistent**. Build Alternatives 1 and 2C would include placement and signaling synchronization to optimize and reduce congestion.	**Consistent**. Build Alternative 4 would include placement and signaling synchronization to optimize and reduce congestion.	**Inconsistent**. No improvements would be made; therefore, spacing and signal optimization would not assist in reducing congestion.
C 23.1: Implement street and highway projects to provide safe, sustainable, and economical goods movement in areas where large concentrations of truck traffic exist or are anticipated to exist.	**Consistent**. Build Alternatives 1 and 2C would improve existing transportation infrastructure and improve and facilitate goods movement throughout the area.	**Consistent**. Build Alternative 4 would improve existing transportation infrastructure and improve and facilitate goods movement throughout the area.	**Inconsistent**. No improvements would be made, impeding mobility, accessibility, and economic development in the region.
C 23.2: Implement roadway standards, where practicable, to accommodate large trucks where extensive truck travel involving regional movement of bulk goods is anticipated.	**Consistent**. Build Alternatives 1 and 2C would implement established roadway standards to facilitate regional movement of bulk goods through the region.	**Consistent**. Build Alternative 4 would implement established roadway standards to facilitate regional movement of bulk goods through the region.	**Inconsistent**. No improvements would be made, impeding mobility, accessibility, and economic development in the region.
LU 1.5: The County of Riverside shall participate in regional efforts to address issues of mobility, transportation, traffic congestion, economic development, air and water quality, watershed and habitat management with cities, local and regional agencies, stakeholders, Indian nations, and surrounding jurisdictions.	**Consistent**. Riverside County is actively participating in regional efforts to improve mobility, transportation, traffic congestion, and economic development.	**Consistent**. Riverside County is actively participating in regional efforts to improve mobility, transportation, traffic congestion, and economic development.	**Inconsistent**. No improvements would be made and congestion would continue to worsen, impeding mobility, accessibility, and economic development in the region.
LU 14.1 Preserve and protect outstanding scenic vistas and visual features for the enjoyment of the traveling public.	**Consistent**. As described in the Visual Impact Assessment prepared for the project, both build alternatives would add some obstructive components, such as bridges, but they would not obstruct scenic vistas or other visual features for the enjoyment of the traveling public (Caltrans 2018b).	**Consistent**. As described in the Visual Impact Assessment prepared for the project, Build Alternative 4 would add some obstructive components, such as bridges, but would not significantly obstruct scenic vistas or other visual features for the enjoyment of the traveling public (Caltrans 2018b).	**Consistent**. Scenic views or visual features would not be altered because no improvements would be made.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
LU 15.2: Proposed project shall be consistent with applicable Airport Land Use Compatibility Plan.	**Consistent:** Changes to the roadway alignment for both build alternatives would not affect the Airport Land Use Compatibility Plan, as the alignment would be consistent with approved land use within the March Air Reserve Base/Inland Port ALUCP Zone D (Flight Corridor Buffer).	**Consistent:** Changes to the roadway alignment would have no impact, as the alignment would be consistent with approved land use within the March Air Reserve Base/Inland Port ALUCP Zone D (Flight Corridor Buffer).	**Consistent.** No improvements would be made; therefore, there would be no impacts on the March Air Reserve Base/Inland Port ALUCP Zone D (Flight Corridor Buffer).
Temescal Canyon Area Plan			
TCAP 11.1 Design and develop the vehicular roadway system per Figure 7, Circulation, and in accordance with the functional classifications and standards specified in the Circulation Element.	**Consistent**. Build Alternatives 1 and 2C would increase the capacity of Cajalco Road and would not preclude future construction of a six-lane roadway within this area plan, which would be consistent with Figure 7 and the functional classifications and standards specified.	**Consistent**. Build Alternative 4 would increase the capacity of sections of Cajalco Road and would not preclude future construction of a six-lane roadway within this area plan, which would be consistent with Figure 7 and the functional classifications and standards specified.	**Inconsistent**. No improvements would be made and the vehicular roadway system would not be developed in accordance with Figure 7.
TCAP 11.2 Maintain Riverside County's roadway Level of Service standards as described in the Circulation Element.	**Consistent**. Build Alternatives 1 and 2C would increase the capacity of Cajalco Road and decrease LOS for certain roadway segments and intersections.	**Consistent**. Build Alternative 4 would increase the capacity of sections of Cajalco Road. It would increase the capacity of El Sobrante Road and La Sierra Avenue and would decrease LOS for certain roadway segments and intersections.	**Inconsistent**. No transportation improvements would be made and LOS would worsen.
Lake Mathews/Woodcrest Area Plan			
LMWAP 5.1 Adhere to the Riverside County Right-To-Farm Ordinance and any subsequent ordinance assuring the ability of farmers to continue with long-established agricultural activities throughout the Lake Mathews/Woodcrest area.	**Consistent**. Build Alternative 1 would affect 7.69 acres and Build Alternative 2C would affect 7.85 acres of FMMP Important Farmland. There is also the potential for temporary, limited interference with some farm activities during construction.	**Consistent.** Build Alternative 4 would affect 23.44 acres of FMMP Important Farmland. There is also the potential for temporary, limited interference with some farm activities during construction.	**Consistent**. Under the No-Build Alternative, no improvements would be made and no farmland or agricultural activities would be affected.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
Mead Valley Area Plan			
MVAP 9.1 Design and develop the vehicular roadway system per Figure 8, Circulation, and in accordance with the Functional Classifications section in the General Plan Circulation Element.	**Consistent**. Build Alternatives 1 and 2C would increase the capacity of Cajalco Road, which would be mostly consistent with the planned transportation facilities in the Circulation Plan and would not preclude future facilities that would be consistent.	**Consistent**. Build Alternative 4 would increase the capacity of sections of Cajalco Road; and it would increase the capacity of El Sobrante Road and La Sierra Avenue. While the current design of the build alternatives would not be consistent with Figure 8 and the functional classifications and standards specified, which specifies Cajalco Road as a 220-foot-wide expressway, Build Alternative 4 would not preclude implementation of this facility in the future.	**Inconsistent**. No improvements would be made and the vehicular roadway system would not be developed in support of the classifications identified in Figure 8.
MVAP 9.2 Maintain Riverside County's roadway Level of Service standards as described in the Level of Service section of the General Plan Circulation Element.	**Generally Consistent**. Both build alternatives would increase the capacity of Cajalco Road and decrease LOS for certain roadway segments and intersections.	**Generally Consistent**. Build Alternative 4 would increase the capacity of portions of Cajalco Road. It would increase the capacity of El Sobrante Road and La Sierra Avenue and would decrease LOS for certain roadway segments and intersections.	**Inconsistent**. No transportation improvements would be made and LOS would worsen.
County of Riverside Climate Action Plan – Policies Supporting Greenhouse Gas Emissions Reduction			
Energy Efficiency in Buildings			
AQ 4.1: Require the use of all feasible building materials/methods which reduce emissions.	**Consistent**. Build Alternatives 1 and 2C would be constructed using materials and methods that comply with all relevant County of Riverside Uniform Building Code (UBC) requirements.	**Consistent**. Build Alternative 4 would be constructed using materials and methods that comply with all relevant County of Riverside UBC requirements.	**Consistent**. No construction would occur that would require the use of building materials or methods.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
AQ 4.6: Require stationary air pollution sources to comply with applicable air district rules and control measures.	**Consistent**. The project would conform to Caltrans construction requirements, as specified in the Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). The contractor will comply with all air pollution control ordinances and statutes, which apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code.	**Consistent**. The project would conform to Caltrans construction requirements, as specified in the Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). The contractor will comply with all air pollution control ordinances and statutes, which apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code.	**Consistent**. No stationary air pollution sources would be used for construction.
AQ 4.7: To the greatest extent possible, require every project to mitigate any of its anticipated emissions which exceed allowable emissions as established by the SCAQMD, MDAQMD, SCAB, the Environmental Protection Agency and the California Air Resources Board.	**Consistent**. Build Alternatives 1 and 2C would include measures to mitigate anticipated emissions, including: • Maintenance and operation of construction equipment so as to minimize exhaust emissions. • All on-road and off-road equipment shall comply with California Air Resources Board (ARB) commercial vehicle idle regulations. California Code of Regulations Title 13, Section 2449(d)(3). • Use electricity from power poles, rather than temporary diesel- or gasoline-powered generators if or where feasible. • Mobile equipment powered by alternative fuel sources (i.e., methanol, natural gas, propane, or butane) as feasible. • Solar-powered signal boards. • Construction traffic management plan that includes: (1) consolidating truck deliveries; (2) rideshare or shuttle service for construction workers; and (3) dedicated turn lanes for movement of construction	**Consistent**. Build Alternative 4 would include measures to mitigate anticipated emissions; including: • Maintenance and operation of construction equipment so as to minimize exhaust emissions. • All on-road and off-road equipment shall comply with California ARB commercial vehicle idle regulations. California Code of Regulations Title 13, Section 2449(d)(3). • Use electricity from power poles, rather than temporary diesel- or gasoline-powered generators if or where feasible. • Mobile equipment powered by alternative fuel sources (i.e., methanol, natural gas, propane, or butane) as feasible. • Solar-powered signal boards. • Construction traffic management plan that includes: (1) consolidating truck deliveries; (2) rideshare or shuttle service for construction workers; and (3) dedicated turn lanes for	**Consistent**. No emissions sources would be used for construction.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
	trucks and equipment on and off site.	movement of construction trucks and equipment on and off site.	
OS 16.3: Implement public transportation systems that utilize alternative fuels when possible, as well as associated urban design measures that support alternatives to private automobile use.	**Consistent**. Build Alternatives 1 and 2C would incorporate bus transit and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Consistent**. Build Alternative 4 would incorporate bus transit i and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Inconsistent**. The No-Build Alternative would not encourage alternative transportation use.
OS 16.4: Undertake proper maintenance of County physical facilities to ensure that optimum energy conservation is achieved.	**Consistent**. Build Alternatives 1 and 2C would include routine and non-routine County maintenance performed in compliance with all relevant County requirements.	**Consistent**. Build Alternative 4 would include routine and non-routine County maintenance performed in compliance with all relevant County requirements.	**Consistent**. The No-Build Alternative would include routine and non-routine County maintenance performed in compliance with all relevant County requirements.
OS 16.8: Promote coordination of new public facilities with mass transit service and other alternative transportation services, including bicycles, and design structures to enhance mass transit, bicycle, and pedestrian use.	**Consistent**. Build Alternatives 1 and 2C would incorporate bus transit and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Consistent**. Build Alternative 4 would incorporate bus transit i and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Inconsistent**. The No-Build Alternative would not encourage alternative transportation use.
Regional Agency Coordination/ Education and Outreach			
LU 1.5: The County of Riverside shall participate in regional efforts to address issues of mobility, transportation, traffic congestion, economic development, air and water quality, watershed and habitat management with cities, local and regional agencies, stakeholders, Indian nations, and sur-rounding jurisdictions.	**Consistent**. The County is coordinating with multiple agencies and jurisdictions to improve mobility, transportation, and traffic congestion.	**Consistent**. The County is coordinating with multiple agencies and jurisdictions to improve mobility, transportation, and traffic congestion.	**Inconsistent**. No transportation improvements would be made in support of establishing an efficient circulation system.
Water Conservation			
AQ 20.14: Reduce the amount of water used for landscaping irrigation through implementation of County Ordinance 859 and increase use of non-potable water.	**Consistent**. Build Alternatives 1 and 2C would include the use of drought-resistant landscaping and recycled water when feasible, and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.	**Consistent**. Build Alternative 4 would include the use of drought-resistant landscaping and recycled water when feasible, and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.	**Inconsistent**. The No-Build Alternative would not include changes that would reduce the amount of water used for landscaping irrigation or increase use of non-potable water.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
C 5.2: Encourage the use of drought-tolerant native plants and the use of recycled water for roadway landscaping.	**Consistent**. Build Alternatives 1 and 2C would include the use of drought-resistant landscaping and recycled water when feasible, and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.	**Consistent**. Build Alternative 4 would include the use of drought-resistant landscaping and recycled water when feasible, and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.	**Inconsistent**. The No-Build Alternative would not encourage the use of drought-tolerant native plants or recycled water for roadway landscaping.
Reduce Automobile Use			
AQ 20.3: Reduce VMT and GHG emissions by improving circulation network efficiency.	**Inconsistent**. While Build Alternatives 1 and 2C would improve circulation network efficiency, slight increases in vehicle miles traveled (VMT) and GHG would be anticipated.	**Inconsistent**. While Build Alternatives 1 and 2C would improve circulation network efficiency, slight increases in VMT and GHG would be anticipated.	**Inconsistent**. No improvements would be made to improve circulation network efficiency.
C 4.1: Provide facilities for the safe movement of pedestrians within developments, as specified in the Riverside County Ordinances Regulating the Division of Land of the County of Riverside.	**Consistent**. Build Alternatives 1 and 2C incorporate sidewalks into the design where feasible for the safe movement of pedestrians.	**Consistent**. Build Alternative 4 incorporates sidewalks into the design where feasible for the safe movement of pedestrians.	**Inconsistent**. The No-Build Alternative does not include the addition of sidewalks.
C 4.9: Review all existing roadways without pedestrian facilities when they are considered for improvements to determine if new pedestrian facilities are warranted. New roadways should also be assessed for pedestrian facilities.	**Consistent**. Build Alternatives 1 and 2C incorporate sidewalks into the design where feasible for the safe movement of pedestrians.	**Consistent**. Build Alternative 4 incorporates sidewalks into the design where feasible for the safe movement of pedestrians.	**Inconsistent**. The No-Build Alternative does not include the addition of sidewalks.
C 5.2: Encourage the use of drought-tolerant native plants and the use of recycled water for roadway landscaping.	**Consistent**. Build Alternatives 1 and 2C would include the use of drought-resistant landscaping and recycled water when feasible, and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.	**Consistent**. Build Alternative 4 would include the use of drought-resistant landscaping and recycled water when feasible, and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.	**Inconsistent**. The No-Build Alternative would not encourage the use of drought-tolerant native plants or recycled water for roadway landscaping.
LU 2.1: Accommodate land use development in accordance with the patterns and distribution of use and density depicted on the General Plan Land Use Map (Figure LU-1) and the Area Plan Land Use Maps.	**Consistent**. Build Alternatives 1 and 2C would accommodate planned land use developments with the provision of improved roadway, transit, and pedestrian facilities.	**Consistent**. Build Alternative 4 would accommodate planned land use developments with the provision of improved roadway, transit, and pedestrian facilities.	**Inconsistent**. No improvements would be made that would accommodate planned land use developments.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
LU 11.4: Provide options to the automobile in communities, such as transit, bicycle and pedestrian trails, to help improve air quality.	**Consistent**. Build Alternatives 1 and 2C would incorporate bus transit bus stops, sidewalks, and roadway shoulders for bicycle use, into the design.	**Consistent**. Build Alternative 4 would incorporate bus transit bus stops, sidewalks, and roadway shoulders for bicycle use, into the design.	**Inconsistent**. The No-Build Alternative would not options to automobile use.
OS 16.3: Implement public transportation systems that utilize alternative fuels when possible, as well as associated urban design measures that support alternatives to private automobile use.	**Consistent**. Build Alternatives 1 and 2C would incorporate bus transit and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Consistent**. Build Alternative 4 would incorporate bus transit and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Inconsistent**. The No-Build Alternative does not encourage alternative transportation use.
OS 16.8: Promote coordination of new public facilities with mass transit service and other alternative transportation services, including bicycles, and design structures to enhance mass transit, bicycle, and pedestrian use.	**Consistent**. Build Alternatives 1 and 2C would incorporate bus transit and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Consistent**. Build Alternative 4 would incorporate bus transit and sidewalks, and roadway shoulders for bicycle use, into the design to encourage use of alternative transportation.	**Inconsistent**. The No-Build Alternative does not encourage alternative transportation use.
Renewable Energy/Alternative Fuel			
AQ 13.2: Cooperate with local, regional, state, and federal jurisdictions to better manage transportation facilities and fleets.	**Consistent**. Through Build Alternatives 1 and 2C, the County is coordinating with multiple agencies and jurisdictions to better manage transportation facilities.	**Consistent**. Through Build Alternative 4, the County is coordinating with multiple agencies and jurisdictions to better manage transportation facilities.	**Inconsistent**. No transportation improvements would be made in support of improved management of transportation facilities.
County of Riverside Comprehensive Trails Plan			
Goal: Provide Accessible Trails. The County shall create a trail system that is accessible to all users, whenever feasible, is enhanced for users with different abilities, and promotes a safe system.	**Consistent**. Both build alternatives are traversed by planned Regional and Community Trails as future improvements. The design of the build alternatives does not include these improvements; however, neither of the build alternatives contain any components that would prevent access to any future trails that could be constructed.	**Consistent**. Build Alternative 4 is traversed by planned Regional and Community Trails as future improvements. The design of the build alternative does not include these improvements; however, Build Alternative 4 does not contain any components that would prevent access to any future trails that could be constructed.	**Consistent**. Trail systems would not be altered or access impeded.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
Goal: Simultaneously Develop Land, Transportation, and Trail Improvements. Development in Riverside County will blend development and transportation impacts into the considerations and needs of the Countywide Trail System. The County will identify trail alignments to be incorporated into plans and to market potential return on investment to developers and commercial areas.	**Consistent**. Both build alternatives are traversed by planned Regional and Community Trails as future improvements. The right of way does not include these improvements; however, neither of the build alternatives contain any components that would prevent access to any future trails that could be constructed.	**Consistent**. Build Alternative 4 is traversed by planned Regional and Community Trails as future improvements. The right of way does not include these improvements; however, Build Alternative 4 does not contain any components that would prevent access to any future trails that could be constructed.	**Consistent**. Trail systems would not be altered or access impeded.
City of Corona General Plan			
6.1.3: Provide for safe roadway conditions by adhering to nationally recognized improvement standards and uniform construction and maintenance practices.	**Consistent**. Both build alternatives would adhere to nationally recognized improvement standards and uniform construction and maintenance practices.	**Consistent**. Build Alternative 4 would adhere to nationally recognized improvement standards and uniform construction and maintenance practices.	**Inconsistent**. No transportation improvements would be made that would address roadway safety.
6.1.12: Provide all residential, commercial, and industrial areas with efficient and safe access for emergency vehicles.	**Consistent**. Both build alternatives would require partial lane closures of Cajalco Road. However, the TMP would provide construction project information to emergency service providers to ensure adequate service.	**Consistent**. Build Alternative 4 would require partial lane closures of Cajalco Road. However, the TMP would provide construction project information to emergency service providers to ensure adequate service.	**Inconsistent**. No transportation improvements would be made that would support efficient and safe access for emergency vehicles.
6.2.3: Coordinate impacts of new roadway connections with adjacent cities and Riverside County to ensure consistency in design and operations of the new facilities and connections.	**Consistent**. Public meetings, which are open to all, have been held and have allowed for discussion and coordination of impacts of both build alternatives.	**Consistent**. Public meetings, which are open to all, have been held and have allowed for discussion and coordination of impacts of Build Alternative 4.	**Consistent**. No impacts would occur, negating the need for coordination of impacts.
Goal 9.1: Ensure that there is an adequate service level of law enforcement provided for all residents, visitors, and businesses throughout the City of Corona	**Consistent**. Both build alternatives would require partial lane closures of Cajalco Road. However, the TMP would provide construction project information to law enforcement to ensure adequate service. The operation of either build alternative would not result in growth; therefore, operation would not prevent an adequate service level of law enforcement.	**Consistent**. Build Alternative 4 would require partial lane closures of Cajalco Road and/or El Sobrante Road and La Sierra Avenue. However, the TMP would provide construction project information to law enforcement to ensure adequate service. The operation of Build Alternative 4 would not result in growth; therefore, operation would not prevent an adequate service level of law enforcement.	**Consistent**. Would not result in growth or other impacts that would adversely affect level of service.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
Goal 9.2: Ensure that there is an adequate service level of fire protection provided for all residents, visitors, and businesses throughout the City of Corona	**Consistent**. Both build alternatives would require partial lane closures of Cajalco Road. However, the TMP would provide construction project information to fire protection providers to ensure adequate service. The operation of either build alternative would not result in growth; therefore, operation would not prevent an adequate service level of fire protection providers.	**Consistent**. Build Alternative 4 would require partial lane closures of Cajalco Road and/or El Sobrante Road and La Sierra Avenue. However, the TMP would provide construction project information to fire protection providers to ensure adequate service. The operation of Build Alternative 4 would not result in growth; therefore, operation would not prevent an adequate service level of fire protection providers.	**Consistent**. Would not result in growth or other impacts that would adversely affect level of service.
City of Perris General Plan			
Goal I: A comprehensive transportation system that will serve projected future travel demand, minimize congestion, achieve the shortest feasible travel times and distances, and address future growth and development in the City.	**Consistent**. Both build alternatives would increase the capacity of Cajalco Road. A limited portion of the project is adjacent to Perris; the build alternatives would not interfere with, nor impede, implementation of this goal.	**Consistent**. Build Alternative 4 would increase the capacity of a portion of Cajalco Road. Because only a very small portion of the project is adjacent to Perris, Build Alternative 4 would not interfere with, nor impede, implementation of this goal.	**Inconsistent**. No improvements would be made and congestion would continue to worsen, impeding mobility and accessibility for people and goods in the region.
Policy I.A: Design and develop the transportation system to respond to concentrations of population and employment activities, as designated by the Land Use Element and in accordance with the designated Transportation System, Exhibit 4.2 Future Roadway Network	**Consistent**. Both build alternatives would increase the capacity of existing roadways. A limited portion of the project is adjacent to Perris; the build alternatives would not interfere with, nor impede, implementation of this policy.	**Consistent**. Build Alternative 4 would increase the capacity of existing roadways. Because only a very small portion of the project is adjacent to Perris, Build Alternative 4 would not interfere with, nor impede, implementation of this policy.	**Inconsistent**. No improvements would be made and congestion would continue to worsen.
Goal II: A well planned, designed, constructed and maintained street and highway system that facilitates the movement of vehicles and provides safe and convenient access to surrounding developments.	**Consistent**. Both build alternatives would increase the capacity of Cajalco Road. A limited portion of the project is adjacent to Perris; the build alternatives would not interfere with, nor impede, implementation of this goal.	**Consistent**. Build Alternative 4 would increase the capacity of a portion of Cajalco Road. Because only a very small portion of the project is adjacent to Perris, Build Alternative 4 would not interfere with, nor impede, implementation of this goal.	**Inconsistent**. No improvements would be made and congestion would continue to worsen.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
Policy II.B: Maintain the existing transportation network while providing for future expansion and improvement based on travel demand, and the development of alternative travel modes.	**Consistent**. Both build alternatives would expand the existing network. A limited portion of the project is adjacent to Perris; the build alternatives would not interfere with, nor impede, implementation of this policy.	**Consistent**. Build Alternative 4 would expand the existing network. Because only a very small portion of the project is adjacent to Perris, Build Alternative 4 would not interfere with, nor impede, implementation of this policy.	**Inconsistent**. No improvements would be made and congestion would continue to worsen.
Policy V.A: Provide for safe movement of goods along the street and highway system.	**Consistent**. Both build alternatives would increase the capacity of existing roadways and their ability to accommodate traffic. A limited of the project is adjacent to Perris; the build alternatives would not interfere with, nor impede, implementation of this policy.	**Consistent**. Build Alternative 4 would increase the capacity of existing roadways and their ability to accommodate traffic. Because only a very small portion of the project is adjacent to Perris, Build Alternative 4 would not interfere with, nor impede, implementation of this policy.	**Inconsistent**. No improvements would be made and congestion would continue to worsen, decreasing safety and reliability for people and goods in the region.
Goal VIII: Enhanced traffic flow, reduced travel delay, reduced reliance on single-occupant vehicles, and improved safety along the City and State roadway system.	**Consistent**. Both build alternatives would increase the capacity of Cajalco Road. A limited portion of the project is adjacent to Perris; the build alternatives would not interfere with, nor impede, implementation of this goal.	**Consistent**. Build Alternative 4 would increase the capacity of a portion of Cajalco Road, which would improve mobility. Because only a very small portion of the project is adjacent to Perris, Build Alternative 4 would not interfere with, nor impede, implementation of this goal.	**Inconsistent**. No improvements would be made and congestion would continue to worsen.
Western Riverside County Multiple Species Habitat Conservation Plan			
7.2.2: Planned Roads Within Existing Public/Quasi-Public Lands Circulation Element Roads: New Circulation Element roads, or improvements to existing Circulation Element roads proposed within existing Public/Quasi-Public Lands include Cajalco Road, Butterfield Stage Road, Anza Road, Bautista Canyon Road, Gilman Springs Road and Roads crossing the Santa Ana River, including a potential new crossing at Schleisman Avenue.	**Generally Consistent**. The proposed roadway widths would be within the allowable right of way limits for the facility; however, related roadway improvements, slope easements, and/or appurtenant facilities are anticipated to extend beyond 128 feet in limited areas. This would require the acquisition of land within Criteria and PQP designated areas. A minor amendment is anticipated to be required to accommodate the additional right of way needed. Mitigation Measure **NC-20 (NES BIO-21)** (Section 3.17, *Natural Communities*) is proposed to compensate for the loss of land and habitat on WRC MSHCP PQP lands.	**Generally Consistent**. The proposed roadway widths would be within the allowable right of way limits for the facility; however, related roadway improvements, slope easements, and/or appurtenant facilities are anticipated to extend beyond 196 feet in limited areas. This would require the acquisition of land within Criteria and PQP designated areas. A minor amendment may be required to accommodate the additional right of way needed. Mitigation Measure **NC-20 (NES BIO-21)** (Section 3.17, *Natural Communities*) is proposed to compensate for the loss of land and habitat on WR MSHCP PQP lands.	**Not Applicable.** Transportation facilities would not be proposed; the No-Build Alternative would not preclude future implementation of Covered Activities. Transportation facilities or wildlife crossings would not be proposed. No construction would occur that would require Standard Best Management Practices.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
	Both build alternatives would include the construction of wildlife crossings consistent with WRC MSHCP Guidelines and include Standard Best Management Practices as outlined in Appendix C of the WRC MSHCP.	Build Alternative 4 would include the construction of wildlife crossings consistent with WRC MSHCP Guidelines and would include Standard Best Management Practices as outlined in Appendix C of the WRC MSHCP.	
7.5.1: Guidelines for the Siting and Design of Planned Roads Within the Criteria Area and Public/Quasi-Public Lands	**Generally Consistent**. The proposed roadway widths would be within the allowable right of way limits for the facility; however, related roadway improvements, slope easements, and/or appurtenant facilities are anticipated to extend beyond 128 feet in limited areas. A minor amendment is anticipated to be required to accommodate the additional right of way needed.	**Generally Consistent**. The proposed roadway widths would be within the allowable right of way limits for the facility; however, related roadway improvements, slope easements, and/or appurtenant facilities are anticipated to extend beyond 196 feet in limited areas.	**Not Applicable.** Transportation facilities would not be proposed; the No-Build Alternative would not preclude future implementation of Covered Activities.
7.5.2: Guidelines for Construction of Wildlife Crossings. Pursuant to Section 6.6.2 E(2) of this document, roads that have the potential to result in impediments to wildlife movement will include both general considerations and specific design guidelines for the construction of wildlife crossings where appropriate	**Consistent**. Both build alternatives would include the construction of wildlife crossings consistent with WRC MSHCP Guidelines.	**Consistent**. Build Alternative 4 would include the construction of wildlife crossings consistent with WRC MSHCP Guidelines.	**Not Applicable.** Transportation facilities or wildlife crossings would not be proposed.
7.5.3: Construction Guidelines and Appendix C – Standard Best Management Practices	**Consistent**. Both build alternatives designs would include Standard Best Management Practices as outlined in Appendix C of the WRC MSHCP.	**Consistent**. Build Alternative 4 design would include Standard Best Management Practices as outlined in Appendix C of the WRC MSHCP.	**Not Applicable**. No construction would occur that would require Standard Best Management Practices.
Habitat Conservation Plan for the Stephens' Kangaroo Rat			
Established conservation of approximately 15,000 acres in Core Reserves within the plan's boundary for Stephens' Kangaroo Rat. Managed under the WRC MSHCP.	**Inconsistent**. Both build alternatives would require the acquisition of land from one of the long-term SKR HCP Core Reserve areas, Existing Core C. Mitigation Measure **NC-20 (NES BIO-21)** (Section 3.17, *Natural Communities*) is proposed to compensate for the loss of land and habitat in this area.	**Inconsistent**. Build Alternative 4 would require the acquisition of land from one of the long-term SKR HCP Core Reserve areas, Existing Core C. Mitigation Measure **NC-20 (NES BIO-21)** (Section 3.17, *Natural Communities*) is proposed to compensate for the loss of land and habitat in this area.	**Consistent**. No changes to the SKR HCP or area would occur.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan			
5,110.4-acre Multiple Species Reserve at Lake Mathews in western Riverside County created through a mitigation banking agreement that conserves 2,544.9 acres (Mitigation Bank) adjacent to 2,565.5-acre State Ecological Reserve (Existing Reserve)	**Inconsistent.** The current plan does not include provisions for the improvement of non-MWD transportation facilities. Both build alternatives would involve the construction of transportation facilities within the LM MSHCP area. Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)** (Section 3.17, *Natural Communities*) are proposed and would reduce potential direct and indirect impacts and ensure that any removed and disturbed breeding habitat is replaced and restored.	**Inconsistent**. The current plan does not include provisions for the improvement of non-MWD transportation facilities. Build Alternative 4 would involve the construction of transportation facilities within the LM MSHCP area. Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)** (Section 3.17, *Natural Communities*) are proposed to reduce potential direct and indirect impacts and ensure that any removed and disturbed breeding habitat is replaced and restored.	**Consistent**. No changes to the LM MSHCP or area would occur.
Lake Mathews Reserve Management Plan			
Primary Goal 1: Protect existing natural habitat types on the Combined Reserve	**Inconsistent.**	**Inconsistent.**	**Generally Consistent**.
Primary Goal 2: Improve degraded habitat by enhancing or restoring suitable habitat for Covered Species within the Reserve	**Generally Consistent**.	**Generally Consistent**.	**Inconsistent.**
Primary Goal 3: Ensure that operation and maintenance of Lake Mathews as a water supply facility are not impaired	**Consistent**.	**Consistent**.	**Not Applicable**. No construction or operations would occur that would affect Lake Mathews.
RCRCD Long-Range Objectives 2016-2021			
Goal 1: Assist Land Users with Resource Planning and Management; GOAL 3: Foster Stewardship through Education, Citizen Science, and Outreach; Goal 4: Help Create Sustainable Communities and Partnerships; Goal 5—Conduct Programs Efficiently	**Not Applicable.** The project does not propose programs that would involve or hinder RCRCD Goals 1, 3, 4 or 5.	**Not Applicable.** The project does not propose programs that would involve or hinder RCRCD Goals 1, 3, 4 or 5.	**Not Applicable.** No programs or actions would involve or hinder RCRCD Goals 1, 3, 4 or 5.
Goal 2: Conserve Habitat Land and Species	**Generally Consistent**. Both build alternatives would involve impacts to habitat land and species; project	**Generally Consistent**. Build Alternative 4 would involve impacts to habitat land and species; project	**Generally Consistent**. No changes to habitat land or species would be anticipated.

Policy	Build Alternatives 1 and 2C	Build Alternative 4	No-Build (No Project) Alternative
	alignment and design adjustments have been applied to avoid or otherwise minimize impacts, and measures are proposed to compensate for impacts.	alignment and design adjustments have been applied to avoid or otherwise minimize impacts, and measures are proposed to compensate for impacts.	
March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan			
The March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan contains no relevant policies because the project does not involve the construction of structures that would have any effect on airport land use or operations.

Build Alternatives 1 and 2C - Cajalco Alignment and Modified Cajalco Alignment

SCAG FTIP and RTP/SCS 2020–2045

Build Alternatives 1 and 2C are consistent with the scope included in the 2021 FTIP under ID RIV090903 (SCAG 2021). In addition, Build Alternatives 1 and 2C would be consistent with the project description provided in the 2020–2045 SCAG RTP/SCS as project ID 3A04WT137, because both alternatives include widening Cajalco Road from Temescal Canyon Road to I-215 (SCAG 2020b).

Build Alternatives 1 and 2C would also be consistent with the goals of the SCAG RTP/SCS because both alternatives would increase the capacity of Cajalco Road, which would improve mobility and accessibility for people and goods in the region. This would increase the roadway's ability to accommodate traffic, which would result in improved travel safety and reliability for all people and goods in the region. These improvements would also help preserve and ensure a sustainable regional transportation system and maximize the productivity of the transportation system.

County of Riverside General Plan, CAP, and Comprehensive Trails Plan

Build Alternatives 1 and 2C would be consistent with the County of Riverside General Plan and Riverside County Regional Park and Open-Space District Comprehensive Trails Plan. Riverside County is actively participating in regional efforts to improve mobility, transportation, traffic congestion, and economic development by proposing both build alternatives. Both build alternatives would increase the capacity of Cajalco Road, which would accommodate increased concentrations of population and employment activities, improving the efficiency of transportation within Riverside County; however, the build alternatives would be inconsistent with the planned transportation facilities outlined in the Circulation Plan.

The General Plan Circulation Element, Figure C-1, classifies Cajalco Road as an Expressway, with a minimum right of way of 184 feet to 220 feet. The proposed right of way for Cajalco Road varies throughout the project limits. Between Temescal Canyon Road and Temescal Canyon Bridge, the proposed roadway right of way would vary between approximately 115 and 145 feet; between Temescal Canyon Bridge and Carpinus Drive, between approximately 120 and 128 feet; between Carpinus Drive and Alexander Street, between approximately 120 and 230 feet; between Alexander Street and Harvill Avenue, between approximately 85 and 135 feet; and between Harvill Avenue and I-215, between approximately 120 and 145 feet.

Between Carpinus Drive and Alexander Street, a new bridge over Cajalco Creek is proposed just west of Barton Street, for Cajalco Road westbound traffic; due to the spacing between the eastbound and westbound lanes at the proposed bridge, the maximum right of way width at this location is anticipated to be approximately 230 feet. While the total roadway right of way width exceeds the width identified for Cajalco Road in the General Plan (220 feet), the approximately 400-foot section of right of way would be necessary to accommodate the proposed bridge while avoiding sensitive resources between the east- and westbound lanes.

Between Temescal Canyon Bridge and Harley John Road, project impacts would extend beyond the proposed 128-foot roadway right of way to accommodate slope easements and appurtenant

facilities. This would be consistent with the general plan designation and would not preclude future widening up to 220 feet[2].

Both build alternatives also provide for the expansion of the existing transportation network and the development of alternative travel modes, including additional bus turnouts for bus routes. In addition, neither build alternative contains elements that would significantly obstruct scenic vistas or other visual features for the enjoyment of the traveling public (Caltrans 2018b).

Build Alternatives 1 and 2C would be consistent with relevant policies of the County of Riverside CAP, with the exception of Policy AQ 20.3. While Build Alternatives 1 and 2C would include bus transit facilities, sidewalks, and roadway shoulders for bicycle use that would encourage use of alternative transportation, and roadway improvements that would improve circulation network efficiency, slight increases in VMT and GHG would still be anticipated.

The proposed project alignment traverses areas where Regional and Community Trails are currently planned as future improvements in the vicinity (County General Plan Circulation Element Figure C-7) of Build Alternatives 1 and 2C. Development of these trails is not included as part of the defined project right of way; however, these alternatives would not impede implementation of the Comprehensive Trails Plan because neither alternative includes components that would prevent development of or access to future trails.

Area Plans - Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley

Build Alternatives 1 and 2C would be consistent with the Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans. Only very small portions of the project would be included in the Temescal Canyon Area Plan. Because of this, Build Alternatives 1 and 2C would not interfere with, nor impede, implementation of this area plan.

Both build alternatives would increase the capacity of Cajalco Road, which would improve level of service (LOS) standards for people and goods in the region over no project conditions. For example, the number of deficient intersections and freeway segments would be greatest under the No-Build Alternative and decrease under all build alternatives (Caltrans 2017).

Build Alternative 1 would affect 7.69 acres and Build Alternative 2C would affect 7.85 acres of Farmland Mapping and Monitoring Program (FMMP) Important Farmland, resulting in impacts on 23 farms in the Lake Mathews/Woodcrest Area Plan. There is also the potential for temporary, limited interference with some farm activities during construction. However, given the small percentage of the total FMMP Important Farmland that would be converted within the entire study area, adverse impacts on FMMP Important Farmland would not result. Farmers would still be able to use their land. See Section 3.2, *Farmlands*, for additional information about impacts on farmlands.

In the Temescal Canyon Area Plan, neither build alternative would preclude future construction of a six-lane roadway within this area plan, which would be consistent with Temescal Canyon Area Plan Figure 7 and the functional classifications and standards specified. In the Mead Valley Area Plan, the current design of the build alternatives would not preclude the functional classifications and standards specified in the Mead Valley Area Plan in Figure 8, which specifies Cajalco Road as a 220-foot-wide expressway.

[2] Future widening up to 220 feet is not currently proposed as part of any build alternative.

Cities of Corona and Perris General Plans

Build Alternatives 1 and 2C would be consistent with the Cities of Corona and Perris General Plans. Only very small portions of the project would be included in or adjacent to either the City of Corona or Perris. Because of this, Build Alternatives 1 and 2C would not interfere with, nor impede, implementation of either city's policies.

Even though the build alternatives would be only partially within or adjacent to the cities, the build alternatives would still improve existing transportation infrastructure and increase the capacity of Cajalco Road in or adjacent to both cities, which would enhance both cities' fiscal viability by improving the efficiency of the transportation of goods and services, adhere to nationally recognized improvement standards and uniform construction and maintenance practices, improve mobility and accessibility and reduce congestion and travel times for people and goods in the region, and accommodate increased concentrations of population and employment activities. Both build alternatives would require partial lane closures of Cajalco Road during construction, which could result in delays for emergency service providers who use these roadways. However, the implementation of the TMP (see Standard Project Measure **PF LU-1**) would provide construction project information to emergency service providers to ensure adequate service. During operations, conditions along Cajalco Road, including delay and LOS, would improve, which would benefit emergency service providers because Cajalco Road is the most direct route between the Cities of Corona and Perris and the communities in between.

As discussed in Section 3.3, *Growth*, the operation of Build Alternatives 1 and 2C would not result in growth; therefore, operation would not prevent an adequate service level of law enforcement or fire protection services. During operations, conditions along Cajalco Road, including delay and LOS, would improve, which would benefit law enforcement and fire protection services because Cajalco Road is the most direct route between the Cities of Corona and Perris and the communities in between.

Public meetings, which are open to all agencies, and coordination with participating and cooperating agencies as part of the Efficient Environmental Review (23 U.S. Code 139) process, have occurred and have allowed for discussion and coordination of impacts of Build Alternatives 1 and 2C.

Western Riverside County MSHCP and Stephens' Kangaroo Rat HCP

The proposed roadway improvements of Build Alternatives 1 and 2C would be Covered Activities under Volume I, Section 7.2.2 (Circulation Element Roads) of the WRC MSHCP. Compliance with WRC MSHCP Volume I, Sections 7.5.1 (Guidelines for the Siting and Design of Planned Roads within the Criteria Area and Public/Quasi-public Lands), 7.5.2 (Guidelines for Construction of Wildlife Crossings), and 7.5.3 (Construction Guidelines), and Appendix C (Standard Best Management Practices) is required. Impacts associated with the proposed roadway improvements that would include slope easements and appurtenant facilities are anticipated to extend beyond the 128-foot right of way and would require a minor amendment to the WRC MSHCP to accommodate the additional right of way needed. Build Alternatives 1 and 2C would directly affect PQP lands in the WRC MSHCP, and one of the long-term SKR HCP Core Reserve Areas (Existing Core C). Because impacts that extend beyond the 128-foot right of way would exceed the allowable impact area under Section 7.2.2, Build Alternatives 1 and 2C

would conflict with Section 7.2.2 of the WRC MSHCP, and with the SKR HCP, and the acquisition of replacement lands would be required.

WRC MSHCP Volume I, Figure 7-1, identifies that Riverside County General Plan Circulation Element roadway for Build Alternatives 1 and 2C allow for a 128-foot-wide roadway right of way. While the proposed roadway right of way width for Build Alternatives 1 and 2C within the Criteria Area is 128 feet, project impacts associated with related roadway improvements and/or slope easements and appurtenant facilities are anticipated to extend beyond the 128-foot right of way. For this reason, a minor amendment of the WRC MSHCP, as described in Volume I, Section 6.10.2, would be required for Build Alternatives 1 and 2C. As part of the amendment, the County may coordinate with RCA to negotiate an adjustment of right of way for another County facility to accommodate the additional right of way needed for Build Alternatives 1 and 2C. A consistency review by RCA, USFWS, and CDFW would also be performed to ensure that the project is consistent with the requirements of the WRC MSHCP.

Build Alternatives 1 and 2C would occur in Existing Core C of the SKR HCP. Public facilities projects receive coverage under this HCP for potential take of SKR; however, because the proposed project would affect SKR Core Reserve lands, a Core Reserve Land Disturbance Report would be prepared that documents the impacts on SKR and identifies compensatory mitigation. The report would be submitted to the RCHCA Board of Directors for final approval and the fully executed report included in RCHCA's annual report to the CDFW and USFWS.

Mitigation Measure **NC-20 (NES BIO-21)** listed in Section 3.17, *Natural Communities*, is also proposed to compensate for the loss of land and habitat in WRC MSHCP PQP lands and SKR HCP Core Reserve Area.

Lake Mathews MSHCP and Reserve Management Plan

Under Build Alternatives 1 and 2C, Cajalco Road would be expanded and realigned within the LM MSHCP and LMR; appurtenant facilities including drainage basins, culverts, bridges, and wildlife crossings would also be constructed. Because the LM MSHCP does not currently accommodate the right of way necessary for construction of these facilities, a discretionary action coordinated between the County and LM MSHCP responsible parties a would be required in order to accommodate the proposed project. Build Alternatives 1 and 2C would also encroach into the LM MSHCP and remove habitat for LM MSHCP target species, which is not currently permissible under the LM MSHCP. Modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties. This coordination will include the consideration of the 1995 Cooperative Management Agreement and Mitigation Banking Agreement, and Memoranda of Understanding, involving MWD, RCHCA, CDFW, and USFWS, the 2002 Audubon Settlement and General Release Agreement involving MWD, CDFW, and RCHCA; and, the Lake Mathews Reserve Conservation Easement Grant and utility easements with RCHCA and various utility providers.

Following selection of the preferred alternative, any adjustments to the right of way or another County road facility may be negotiated with RCA during the WRC MSHCP minor amendment process to accommodate the project alternative. Additionally, there has been extensive, ongoing coordination between the County and MWD, and the LMRMC, to develop a mitigation plan to compensate for the loss of lands within the LMR and to address the goals of the LM MSHCP.

Please refer to Mitigation Measures **NC-17 (NES BIO-17)** through **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*, for additional information on mitigation.

RCRCD Long-Range Objectives 2016-2021

As indicated in Table 3.1-7, Build Alternatives 1 and 2C would be generally consistent with Goal 2 of the RCRCD long-term action plan. In response to early coordination with RCRCD in the project development process, alignment and design modifications have been applied to the project to minimize impacts to RCRCD lands. The following standard project measures and mitigation measures are further proposed to reduce or otherwise compensate for impacts: **PF WQ-1** through **PF WQ-3** in Section 3.10, *Water Quality and Stormwater Runoff*, **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **NC-15 (NES BIO-14)**, and **NC-16 (NES BIO-19)**, in Section 3.17, *Natural Communities*, and **WET-1** in Section 3.18, *Wetlands and Other Waters.*

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The March Air Reserve Base/Inland Port ALUCP contains no relevant policies; Build Alternatives 1 and 2C would not involve the construction of structures that would have any effect on airport land use or operations.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

SCAG FTIP and RTP/SCS 2020–2045

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, the future expansion would not be fully consistent with the scope in the SCAG RTP/SCS because the SCAG RTP/SCS only includes construction of four lanes. However, the Future Six-Lane Facility would be consistent with the goals of the SCAG RTP/SCS for the reasons described above for Build Alternatives 1 and 2C.

County of Riverside General Plan and Comprehensive Trails Plan

The addition of two lanes, if constructed in the future, would also be consistent with the County of Riverside General Plan and Comprehensive Trails Plan for the same reasons as described for Build Alternatives 1 and 2C. No additional right of way would be anticipated; therefore, the widths of Cajalco Road would be consistent with the General Plan.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

The addition of two lanes, if constructed in the future, would be consistent with the Temescal Canyon Area Plan and Lake Mathews/Woodcrest Area Plan for the same reasons as described for Build Alternatives 1 and 2C. No new right of way would be required, avoiding any additional impacts on farmland.

Within the Temescal Canyon Area Plan, two additional lanes within the median of Cajalco Road, if constructed in the future, would be consistent with Temescal Canyon Area Plan Figure 7 and the functional classifications and standards specified, which include construction of a six-lane

roadway within this area plan. Median design that would potentially accommodate additional lanes in the future would not extend east of Harley John Road under Build Alternatives 1 and 2C and is thus not anticipated to affect the Mead Valley Area Plan area.

Cities of Corona and Perris General Plans

The addition of two lanes, if constructed in the future, would be consistent with the Corona General Plan for the same reasons as described for Build Alternatives 1 and 2C. The limits of the median design that would accommodate two additional lanes would not be within the Perris General Plan area.

Western Riverside County MSHCP and Stephens' Kangaroo Rat HCP

No additional right of way within the WRC MSHCP or SKR HCP areas would be anticipated; thus, the two additional travel lanes, if constructed in the future, would be consistent with Volume I, Figure 7-1, of the WRC MSHCP, and would not involve additional impacts on the SKR HCP.

Lake Mathews MSHCP and Reserve Management Plan

The addition of two lanes, if constructed in the future, would be expected to be constructed within the median areas of existing roadway right of way and no additional right of way within the LM MSHCP area would be acquired; thus, the two additional travel lanes would be consistent with the LM MSHCP.

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The Future Six-Lane Facility, if constructed, would not occur within the March Air Reserve Base/Inland Port ALUCP area.

Build Alternative 4 - El Sobrante Alignment

SCAG FTIP and RTP/SCS 2020–2045

Build Alternative 4 would be partially but not fully consistent with the FTIP. In addition, Build Alternative 4 would be partially but not fully consistent with the scope in the SCAG RTP/SCS. The project description in the SCAG RTP/SCS does not match Build Alternative 4, because the RTP only describes the project as an expansion of Cajalco Road, not La Sierra Avenue or El Sobrante Road. If Build Alternative 4 is selected as the preferred alternative, an amendment to the SCAG RTP/SCS would be required to modify the project description. However, Build Alternative 4 would be consistent with the goals of the SCAG RTP/SCS for the reasons described above for Build Alternatives 1 and 2C.

County of Riverside General Plan, CAP, and Comprehensive Trails Plan

Build Alternative 4 would be consistent with the Riverside County Regional Park and Open-Space District Comprehensive Trails Plan for the same reasons as described for Build Alternatives 1 and 2C. The proposed alignment and roadway right of way widths for Cajalco Road between Temescal Canyon Road and La Sierra Avenue and between Cowan Road and I-

215, under Build Alternative 4, would also be inconsistent with County of Riverside General Plan designated roadway right of way widths for the same reasons as described for Build Alternatives 1 and 2C.

Build Alternative 4 would also include modifications to the alignments and roadway widths of La Sierra Avenue and El Sobrante Road. The County General Plan Circulation Element, Figure C-1, classifies La Sierra Avenue and El Sobrante Road as Mountain Arterial (110-foot right of way) and Arterial (128-foot right of way), respectively. The proposed roadway right of way for La Sierra Avenue under Build Alternative 4 would vary between 135 and 145 feet, and the proposed roadway right of way for El Sobrante Road would vary between 120 and 150 feet. Both roadways would also involve project impacts extending beyond the roadway right of way to accommodate slope easements and appurtenant facilities. While the proposed modifications to La Sierra Avenue and El Sobrante Road would be consistent with the number of lanes identified in the County of Riverside General Plan for each type of roadway facility (two to four lanes for Mountain Arterial, and four to six lanes for Arterial), the proposed roadway right of way widths would not be consistent with those identified for their respective facility types.

Build Alternative 4 would be consistent with relevant policies of the County of Riverside CAP, with the exception of Policy AQ 20.3. While Build Alternative 4 would include bus transit facilities, sidewalks, and roadway shoulders for bicycle use that would encourage use of alternative transportation, and roadway improvements that would improve circulation network efficiency, slight increases in VMT and GHG would still be anticipated.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

Build Alternative 4 would be consistent with the Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans. Only very small portions of the project would be included in the Temescal Canyon Area Plan. Because of this, Build Alternative 4 would not interfere with, nor impede, implementation of this area plan.

Build Alternative 4 would increase the capacity of portions of Cajalco Road and El Sobrante Road, which would improve mobility for people and goods in the region over no project conditions; however, areas between El Sobrante Road and La Sierra Avenue would experience a minor decrease in LOS. For example, the number of deficient intersections and freeway segments would be greatest under the No-Build Alternative and decrease under Build Alternative 4 (Caltrans 2017).

Build Alternative 4 would affect 23.44 acres of FMMP Important Farmland, resulting in impacts on 46 farms in the Lake Mathews/Woodcrest Area Plan. There is also the potential for temporary, limited interference with some farm activities during construction. However, given the small percentage of the total FMMP Important Farmland that would be converted within the entire study area, adverse impacts on FMMP Important Farmland would not result. Farmers would still be able to use their land for agricultural activities. See Section 3.2, *Farmlands*, for additional information about impacts on farmlands.

Similar to Build Alternatives 1 and 2C, Build Alternative 4 would not preclude implementation of the facilities specified in the Temescal Canyon Area Plan or Mead Valley Area Plan.

Cities of Corona and Perris General Plans

Build Alternative 4 would be consistent with the Cities of Corona and Perris General Plans for the same reasons as described for Build Alternatives 1 and 2C. This is because the portions of Build Alternative 4 that fall within the Cities of Corona and Perris have the same design as the design for Build Alternatives 1 and 2C.

Western Riverside County MSHCP and Stephens' Kangaroo Rat HCP

The roadway improvements proposed under Build Alternative 4 are a Covered Activity under Volume I, Section 7.2.2 (Circulation Element Roads) of the WRC MSHCP. Compliance with WRC MSHCP Volume I, Sections 7.5.1 (Guidelines for the Siting and Design of Planned Roads within the Criteria Area and Public/Quasi-public Lands), 7.5.2 (Guidelines for Construction of Wildlife Crossings), and 7.5.3 (Construction Guidelines), and Appendix C (Standard Best Management Practices) is required. Related roadway improvements including slope easements and appurtenant facilities may extend beyond the 196-foot right of way and would require a minor amendment to the WRC MSHCP to accommodate the additional right of way needed. Build Alternative 4 would also directly affect PQP lands in the WRC MSHCP, and one of the long-term SKR HCP Core Reserve Areas (Existing Core C). Because impacts that extend beyond the 196-foot right of way in limited areas of the project would exceed the allowable impact area under Section 7.2.2, Build Alternative 4 would conflict with Section 7.2.2 of the WRC MSHCP, and with the SKR HCP, and the acquisition of replacement lands would be required.

WRC MSHCP Volume I, Figure 7-1 identifies the Riverside County General Plan Circulation Element roadway right of way for El Sobrante Road as 196 feet. While the proposed roadway right of way width for Build Alternative 4 is not anticipated to exceed the 196-foot right of way through the Criteria Area, related roadway improvements and/or slope easements and appurtenant facilities may exceed the 196-foot roadway width in limited areas, such as sections between McAllister Street and Vista Del Lago Drive, just west and east of Palm Road, and west of Lockwood Avenue, along El Sobrante Road. Therefore, a minor amendment of the WRC MSHCP, as described in Volume I, Section 6.10.2, may be required for Build Alternative 4. As part of the amendment, the County may coordinate with RCA to negotiate an adjustment of right of way for another County facility to accommodate the additional right of way needed. A consistency review by RCA, USFWS, and CDFW would also be performed to ensure that the project is consistent with the requirements of the WRC MSHCP.

Build Alternative 4 would occur in Existing Core C of the SKR HCP. Public facilities projects receive coverage under this HCP for potential take of SKR; however, because the proposed project would affect SKR Core Reserve lands, a Core Reserve Land Disturbance Report would be prepared that documents the impacts on SKR and compensatory mitigation. The report would be submitted to the RCHCA for Board approval.

Mitigation Measure **NC-20 (NES BIO-21)** listed in Section 3.17, *Natural Communities*, is also proposed to compensate for the loss of land and habitat in WRC MSHCP PQP lands and SKR HCP Core Reserve Area.

Lake Mathews MSHCP and Reserve Management Plan

Build Alternative 4 would expand and realign La Sierra Avenue and El Sobrante Road within the LM MSHCP and LMR; appurtenant facilities including drainage basins, culverts, bridges, and wildlife crossings would also be constructed. Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Build Alternative 4 would also encroach into the LM MSHCP and remove habitat for LM MSHCP target species, which is not currently permissible under the LM MSHCP. Modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties. This coordination will include the consideration of the 1995 Cooperative Management Agreement and Mitigation Banking Agreement, and Memoranda of Understanding, involving MWD, RCHCA, CDFW, and USFWS, the 2002 Audubon Settlement and General Release Agreement involving MWD, CDFW, and RCHCA; and, the Lake Mathews Reserve Conservation Easement Grant and utility easements with RCHCA and various utility providers.

Following selection of the preferred alternative, any adjustments to the right of way or another County road facility may be negotiated with RCA during the WRC MSHCP minor amendment process to accommodate the project alternative. Additionally, there has been extensive, ongoing coordination between the County and MWD and the LMRMC to develop a mitigation plan to compensate for the loss of lands within the LMR and to address the goals of the LM MSHCP. Please refer to Mitigation Measures **NC-17 (NES BIO-17)** through **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*, for additional information on mitigation.

RCRCD Long-Range Objectives 2016-2021

As indicated in Table 3.1-7, Build Alternative 4 would be generally consistent with Goal 2 of the RCRCD long-term action plan. In response to early coordination with RCRCD in the project development process, alignment and design modifications have been applied to the project to minimize impacts to RCRCD lands. The following standard project measures and mitigation measures are further proposed to reduce or otherwise compensate for impacts: **PF WQ-1** through **PF WQ-3** in Section 3.10, *Water Quality and Stormwater Runoff*, **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **NC-15 (NES BIO-14)**, and **NC-16 (NES BIO-19)**, in Section 3.17, *Natural Communities*, and **WET-1** in Section 3.18, *Wetlands and Other Waters.*

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The March Air Reserve Base/Inland Port ALUCP contains no relevant policies; Build Alternative 4 would not involve the construction of structures that would have any effect on airport land use or operations.

Future Six-Lane Facility (Build Alternative 4)

SCAG FTIP and RTP/SCS 2020–2045

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, the future expansion would not be fully consistent with the scope in the SCAG RTP/SCS because the SCAG RTP/SCS only includes construction of four lanes. However, the Future Six-Lane Facility under Build Alternative 4 would be consistent with the goals of the SCAG RTP/SCS for the reasons described above for Build Alternative 4.

County of Riverside General Plan and Comprehensive Trails Plan

The addition of two lanes, if constructed in the future, would be consistent with the County of Riverside General Plan and Comprehensive Trails Plan for the same reasons as described for Build Alternative 4. No new right of way would be anticipated and the widths of Cajalco Road and La Sierra Avenue would be consistent with the general plan.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

The addition of two lanes, if constructed in the future, would be consistent with the Temescal Canyon and Lake Mathews/Woodcrest Area Plan for the same reasons as described for Build Alternative 4. No new right of way would be required, avoiding any additional impacts on farmland.

In the Temescal Canyon Area Plan, two additional lanes within the median of Cajalco Road and La Sierra Avenue, if constructed in the future, would be consistent with Temescal Canyon Area Plan Figure 7 and the functional classifications and standards specified, which include construction of a six-lane roadway within this area plan.

Median design that would potentially accommodate additional lanes in the future would not extend east of Cowan Road under Build Alternative 4 and is thus not anticipated to affect the Mead Valley Area Plan area.

Cities of Corona and Perris General Plans

The addition of two lanes, if constructed in the future, would be consistent with the Corona General Plan for the same reasons as described for Build Alternative 4. The limits of the median design that would accommodate two additional lanes would not be within the Perris General Plan area.

Western Riverside County MSHCP and Stephens' Kangaroo Rat HCP

The addition of two lanes, if constructed in the future, would be expected to be constructed within the median areas of existing roadway right of way and no additional right of way within the WRC MSHCP or SKR HCP areas would be acquired; thus, the two additional travel lanes would be consistent with Volume I, Figure 7-1, of the WRC MSHCP, and would not involve additional impacts on the SKR HCP.

Lake Mathews MSHCP and Reserve Management Plan

The addition of two lanes, if constructed in the future, would be expected to be constructed within the median areas of existing roadway right of way and no additional right of way within the LM MSHCP area would be acquired; thus, the two additional travel lanes would be consistent with the LM MSHCP.

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The Future Six-Lane Facility, if constructed, would not occur within the March Air Reserve Base/Inland Port ALUCP area.

No-Build Alternative

SCAG FTIP and RTP/SCS 2020–2045

The No-Build Alternative would be inconsistent with the FTIP and SCAG RTP/SCS because it would not implement the project, making it inconsistent with the funded project description. The No-Project Alternative would also be inconsistent with the goals of the SCAG RTP/SCS because no improvements would be made and congestion would continue to worsen. This would not maximize mobility or accessibility for people and goods in the region, ensure travel safety and reliability, preserve and ensure a sustainable transportation system, or maximize the productivity of the transportation system.

County of Riverside General Plan and Comprehensive Trails Plan

The No-Build Alternative would be inconsistent with many of the policies from the County of Riverside General Plan. No improvements would be made and congestion would continue to worsen, affecting mobility, accessibility, and economic development in the region. It would also not respond to concentrations of population and employment activities.

The No-Build Alternative would be consistent with policies stating that existing utilities should be utilized and scenic vistas and visual features protected because it would not require the extension of infrastructure or services, and scenic views or visual features would not be altered because no improvements would be made. The No-Build Alternative would also be consistent with the Comprehensive Trails Plan because trail systems would not be altered or access impeded.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

The No-Build Alternative would be inconsistent with many of the policies from the Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans. Under the No-Build Alternative, no improvements would be made and the vehicular roadway system would not be developed in accordance with Figure 7 from the Temescal Canyon Area Plan, and mobility would worsen. In addition, the vehicular roadway system would not be developed in support of the classifications identified in Figure 8 from the Mead Valley Area Plan.

The No-Build Alternative would be consistent with the agricultural policies from the Lake Mathews/Woodcrest Area Plan because no improvements would be made and no farmland or agricultural activities would be affected.

Cities of Corona and Perris General Plans

The No-Build Alternative would be inconsistent with many of the policies from the Cities of Corona and Perris General Plans. Under the No-Build Alternative, no improvements would be made and mobility would continue to worsen, decreasing safety and reliability. This would also impede mobility and accessibility for people and goods in the region.

Western Riverside County MSHCP and Stephens' Kangaroo Rat HCP

The No-Build Alternative would be consistent with the WRC MSHCP and SKR HCP because no changes to the plan area would occur, and the alternative would not preclude future implementation of Covered Activities.

Lake Mathews MSHCP and Reserve Management Plan

The No-Build Alternative would be consistent with the LM MSHCP because no changes to the LM MSHCP or area would occur.

RCRCD Long-Range Objectives 2016-2021

The No-Build Alternative would be consistent with the RCRCD long-term action plan because no changes to RCRCD lands would

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The No-Build Alternative would be consistent with the March Air Reserve Base/Inland Port ALUCP because no changes to the area would occur.

3.1.2.3 Avoidance, Minimization, and/or Mitigation Measures

The proposed project would include the preparation and use of a TMP under Standard Project Measure **PF LU-1** that would address temporary effects during construction from changes in access and roadway closures and detours, which will ensure access is maintained for all modes of transportation for residents and businesses in the study area. Standard Project Measure **PF LU-1** further includes a public awareness campaign that would inform and coordinate with motorists, business owners/operators, residents, elected officials and government agencies, and emergency service providers regarding construction activities and associated impacts. Please refer to Section 3.1.1.2, *Environmental Consequences (Existing and Future Land Use)*, for Standard Project Measure **PF LU-1**. No additional avoidance, minimization, or mitigation measures are proposed.

Build Alternatives 1, 2C, and 4 would conflict with three goals or policies of relevant regional and local plans and programs: the LM MSHCP, the WRC MSHCP, and the SKR HCP. To compensate for the loss of natural lands on the LMR and in the WRC MSHCP plan area (which includes the SKR HCP), the County will coordinate with the LMRMC, RCA, USFWS, and CDFW to develop a suite of mitigation measures that demonstrate biological equivalency to offset the loss. Please refer to Measures **NC-17 (NES BIO-17)** through **NC-20 (NES BIO-21)** in Section 3.17, *Natural Communities*. Temporary impact areas will be addressed through preparation of a habitat mitigation and monitoring plan (HMMP) and on-site restoration to original conditions; see Measure **NC-19 (NES BIO-15)** in Section 3.17 for additional information.

3.1.3 Parks and Recreational Facilities

3.1.3.1 Regulatory Setting

The Park Preservation Act (California Public Resources Code [PRC] Sections 5400–5409) prohibits local and state agencies from acquiring any property that is in use as a public park at the time of acquisition unless the acquiring agency pays sufficient compensation or land, or both, to enable the operator of the park to replace the park land and any park facilities on that land.

3.1.3.2 Affected Environment

Parks and recreational resources include any park, recreational facility, open space area, recreational bikeway, or other recreational trails within 0.5 mile of the proposed project. There are eight parks and recreational areas within 0.5 mile of the build alternatives. Of these eight properties, five are public schools with outdoor playgrounds and other recreational facilities, which are assumed to be open to the general public. Two of the remaining properties are outdoor parks, and one is a privately owned golf course. Table 3.1-8 provides a description of these resources and the distance of each from the proposed project.

Table 3.1-8. Parks and Recreational Facilities within the Study Area

Park/Recreation Resource	Location	Description	Distance from Project
Charles Meigs (Mead Valley) Community Center	21091 Rider Street Perris, CA 92570	Community center includes outdoor playground, picnic area, basketball courts, and large multiple use turf area.	0.3 mile
Victoria Grove Park	Schoolhouse Road Riverside, CA 92503	Victoria Grove Park contains a playground, basketball court, baseball field, and large multiple use turf area.	0.4 mile from Build Alternative 4 only
Lake Mathews Elementary School	12252 Blackburn Road Riverside, CA 92503	Elementary school; includes 14.5-acre recreation space with open play field, baseball field, basketball court, and blacktop with children's game areas.	0.3 mile from Build Alternative 4 only
Dos Lagos Golf Course	4507 Cabot Drive, Corona, CA 92883	Approximately 115-acre public golf course located within the Dos Lagos mixed-use development.	0.1 mile
Tomas Rivera Middle School	21675 Martin Street Perris, CA 92570	Middle school; includes 13.5-acre recreation space with track, open play field, three baseball fields, and blacktop with children's game areas.	0.3 mile
Manuel L. Real Elementary School	19150 Clark Street Perris, CA 92570	Elementary school; includes large multiple-use area, two baseball backstops, and multiple-use turf area.	0.1 mile
Columbia Elementary School	21350 Rider Street Perris, CA 92570	Elementary school; includes a 3.9-acre recreation space with two baseball fields and blacktop with children's games.	0.2 mile
Val Verde High School	972 Morgan Street Perris, CA 92571	High school; includes 4.5-acre recreation space with one baseball field, open play field, and blacktop with children's games.	0.3 mile

Riverside County currently has one developed trail and one partially developed trail. The Santa Ana River Trail is fully developed and is maintained by the Riverside County Regional Park and Open Space District. The developed trail is not within the project study area. In addition, the

partially constructed 16-mile-long Class 1 bike path and pedestrian trail in the cities of Hemet and Menifee, known as the Salt Creek Trail, finished construction of one segment in 2020 (County of Riverside Transportation Department n.d.). However, the multiuse trail is over 11 miles south/southeast of Cajalco Road Project and will not be affected by construction or operation of any of the build alternatives. However, a number of future planned trail facilities identified on Figure C-7 of the County of Riverside General Plan Circulation Element are within the project study area:

- A Combination Trail (Regional Trail/Class I Bike Path) north of Cajalco Road between Temescal Canyon Road and La Sierra Avenue, along La Sierra Avenue north to the City of Riverside, along El Sobrante Road between La Sierra Avenue and Cajalco Road, and along Cajalco Road between El Sobrante Road and approximately Barton Street
- Southern Emigrant Trail/Butterfield Overland Trail in the area of Interstate 5 (I-5) and Temescal Canyon Road
- Regional Trail (Urban/Suburban) that intersects Cajalco Road at Temescal Canyon Road, La Sierra Avenue, Harley John Road, and Wood Road, and intersects El Sobrante Road at McAllister Street and Mockingbird Canyon Road
- A Class II Bike Path along Cajalco Road, between approximately Barton Street and I-215

Additional future planned trail facilities within the study area are also identified in the Riverside County Regional Park and Open-Space District Comprehensive Trails Plan:

- Tier 1 (Backbone) facility: Southern Emigrant Trail/Butterfield Overland Trail in the area of I-5 and Temescal Canyon Road
- Tier 2 facilities that surround Lake Mathews and follow the existing alignments of Cajalco Road, La Sierra Avenue, and El Sobrante Road
- Tier 3 facilities that follow existing roadways throughout the project study area

Tier 1 trails incorporate historical alignments, regional trails with dedicated plans, trails currently existing or under construction, and trails with long-distance connectivity. Tier 2 trails often form networks internal to parks, often without providing external connectivity. Tier 3 trails are local and community trails, which generally either fall outside County jurisdiction or are composed of trail networks with only local connectivity.

No formally designated bicycle routes or facilities, such as marked bicycle lanes, are currently located along Cajalco Road, La Sierra Avenue, or El Sobrante Road, within the project limits. Cyclists that use these roadways currently use roadway shoulders where available.

According to input received from the community during public scoping meeting and in response to the Notice of Preparation for the EIR, equestrians currently use roadways north and south of Lake Mathews Market and Lake Mathews Feed and Pet Supply to access these businesses. No formally designated horse trails are within the project limits; however, roadways and roadway shoulder areas that are anticipated to be used for equestrian purposes based on community characteristics and input (i.e., rural residences and availability of unpaved roads and roadway shoulders) include, but are not limited to, limited sections of Cajalco Road and El Sobrante

Road; Gavilan Road, Harley John Road, Smith Road, Gustin Road, Cowan Road, and Mockingbird Canyon Road; and roads that intersect with the roads identified above.

In addition to existing parks and recreational facilities and planned trail networks, there are four resource conservation areas within the study area that allow limited public use or access related to the purpose of the conservation area only, as described in Table 3.1-9. Of the four resource conservation areas, the LM-EM Reserve and LMR are considered Section 4(f) properties due to the primary purpose of the reserve as a wildlife refuge.

Table 3.1-9. Protected Lands within the Study Area

Park/Recreation Resource	Location	Description	Distance from Project
Lake Mathews-Estelle Mountain Core Reserve	Riverside County	This reserve and wildlife refuge encompasses 11,243 acres and is jointly owned and managed by MWD, CDFW, USFWS, and RCHCA. It is a habitat reserve that is a component of the WRC MSHCP for the SKR HCP and the LM MSHCP. The core reserve is home to the Stephens' kangaroo rat habitat. Other primary conserved vegetation communities include coastal sage scrub, chamise chaparral, European grassland, and mixed European grassland/coastal sage scrub.	Within limits of disturbance
Lake Mathews Multiple Species Reserve	Riverside County	The LMR is a 5,110-acre area around Lake Mathews for the preservation of native habitats supporting 65 sensitive plan and animal species. The LMR was established following approval of the 5,994-acre LM MSHCP. Owned by MWD; MWD partners with RCHCA to manage the Reserve. Management overseen by the Reserve Management Committee comprising representatives from MWD, RCHCA, CDFW, and USFWS.	Within limits of disturbance
Riverside Corona Resource Conservation District Mitigation Lands	Riverside County	RCRCD is a local government agency that helps conserve the natural resources of areas within western Riverside and San Bernardino Counties. The district includes 200,000 acres (312 square miles) of land in western Riverside and San Bernardino Counties. Approximately 92 acres of conserved land are in the project study area along Bedford Wash and Cajalco Creek/Wash.	Within limits of disturbance
Western Riverside County Regional Conservation Authority Conserved Lands	Riverside County	RCA is a government agency formed in 2004 with the core activity of acquiring reserve land. The agency developed the WRC MSHCP, which outlines a plan to protect 146 native species of plants, birds, and animals, and preserve a half-million acres of their habitats (RCA 2003). The WRC MSHCP encompasses approximately 1.26 million acres (1,966 square miles) and includes all unincorporated Riverside County land west of the crest of the San Jacinto Mountains to the Orange County line, as well as the jurisdictional areas of the Cities of Temecula, Murrieta, Lake Elsinore, Canyon Lake, Norco, Corona, Riverside, Moreno Valley, Banning, Beaumont, Calimesa, Perris, Hemet, and San Jacinto. As of January 2018, RCA under the WRC MSHCP has acquired 56,945 acres of conservation land and has identified a total of 500,000 acres of land that will constitute conservation land.	Within limits of disturbance

As indicated above, public access and use of the conservation areas are limited; advance coordination with the managing agencies would be necessary to access the areas, and use would be limited to the purpose of the conservation area. Recreational activities that the conservation areas may support, depending on the plan provisions, include bird watching, walking/hiking,

nature exploration, and environmental research, and advance coordination would be required for such uses.

3.1.3.3 Environmental Consequences

Permanent Impacts

Build Alternatives 1, 2C, and 4

Build Alternatives 1, 2C, and 4 would not require partial or full acquisition of any parks or recreational facilities. The nearest recreational facilities to the project are Dos Lagos Golf Course and Manuel L. Real Elementary School, which are approximately 0.1 mile from the project limits. According to the traffic analysis prepared for the project, the proposed project would not result in a substantial change in traffic or traffic patterns that would affect the primary roadways used for access to the golf course, Temescal Canyon Road, or Manuel L. Real Elementary School (Cajalco Road and Clark Street). Due to the distance of the golf course and school facilities from the project, a notable difference in noise levels would not be anticipated as a result of the project. The golf course and school are located within residential communities. No impacts are expected on the properties surrounding the golf course or school, or on roadways that directly access the golf course or school; therefore, no direct or indirect adverse effects would be anticipated. Pedestrian safety and access to Manuel L. Real Elementary School may improve with additional sidewalks and designated bus turnouts proposed along Cajalco Road.

The remaining recreational facilities listed in Table 3.1-8 would similarly be protected from direct or indirect adverse effects based on the results of the traffic and noise analyses, and their distances from the project limits. Access to the Charles Meigs (Mead Valley) Community Center, Columbia Elementary School, and Tomas Rivera Middle School may also benefit from additional sidewalks and designated bus turnouts proposed along Cajalco Road.

While trails, or Class I or II bike paths, are not proposed as part of the project, improvements that would support pedestrian, equestrian, and cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue include curb, gutter, and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane. The project would not preclude future consideration of trail and bicycle facilities identified in local plans or interfere with continued use of local, unpaved roadways for equestrian uses.

Land from agency-managed conservation areas would be permanently acquired, as shown in Table 3.1-10. The LM-EM Reserve and LMR would experience the greatest impacts of the agency-managed conservation areas. Build Alternative 2C would result in the greatest amount of permanent and temporary land acquisition of the LM-EM Reserve, followed by Build Alternative 1 and Build Alternative 4. The RCRCD Mitigation Lands and RCA Conserved Lands would experience a much smaller acquisition impact under all three build alternatives, less than 2 acres.

Table 3.1-10. Conserved Lands Permanent Impacts Summary – Build Alternatives 1, 2C, and 4

Conservation Area	Build Alternative 1 (acres)	Build Alternative 2C (acres)	Build Alternative 4 (acres)
Lake Mathews Multiple Species Reserve	121.51	113.20	58.39
Lake Mathews-Estelle Mountain Core Reserve	128.51	147.31	65.39
Riverside Corona Resource Conservation District Mitigation Lands	1.44	1.44	1.44
Western Riverside County Regional Conservation Authority Conserved Lands	1.65	1.65	1.65

Existing roadways currently travel through wildlife refuges and result in traffic noise. Build Alternatives 1, 2C, and 4 would widen these existing roadways and would cause increased levels of traffic noise in areas already exposed to traffic noise. Increased noise from traffic would be unlikely to affect how users interact with and use the wildlife refuges because the increased traffic noise would not be substantially perceptible by people. However, increased traffic noise may alter wildlife behavior or use of areas adjacent to the roadway. Impacts on wildlife are discussed in more detail in Section 3.17, *Natural Communities*. Therefore, impacts on parks, recreational facilities, and wildlife refuges during operation would be minor.

There are wildlife refuges within the project vicinity that are protected by Section 4(f) of the Department of Transportation Act of 1966. This project will result in a "use" of those facilities as defined by Section 4(f). Please see Appendix A, Section 4(f), for additional details. As indicated above, the LM-EM Reserve and LMR are considered Section 4(f) properties and would be affected by Build Alternatives 1, 2C, and 4.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and Harley John Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not affect parks and recreational facilities, trails, or bicycle uses. This is because the two additional lanes would be added into the median, requiring no additional land or right of way.

Lake Mathews MSHCP (Build Alternatives 1, 2C and 4)

Table 3.1-10 identifies the impacts on the LM MSHCP area, which is owned by MWD and includes the LMR. Build Alternative 1 would result in the permanent acquisition of 121.51 acres of conserved LMR lands, Build Alternative 2C would result in the permanent acquisition of 113.20 acres of conserved LMR lands, and Build Alternative 4 would result in the permanent acquisition of 58.39 acres of conserved LMR lands. Modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties.

Temporary Impacts

Build Alternatives 1, 2C, and 4

Build Alternatives 1, 2C, and 4 would not require temporary construction easements within any parks or recreational facilities. The nearest recreational facilities to the project are Dos Lagos Golf Course and Manuel L. Real Elementary School, which are approximately 0.1 mile from the project limits. Although construction of Build Alternatives 1, 2C, and 4 would require the use of construction equipment that would generate temporary increases in noise and dust, the noise and dust would not prevent the regular use or enjoyment of the golf course or any other facility within the study area due to the distances from the project limits and because the activities would be intermittent and temporary. Implementation of the project would result in a temporary increase noise related to construction activities that may intermittently dominate the noise environment in the immediate area of construction. However, no adverse noise impacts from construction are anticipated because construction would be conducted in accordance with Caltrans Standard Specifications, Section 14.8-02 (Standard Project Measure **PF NOI-1**). Additionally, these effects are not anticipated to affect the regular use or enjoyment of these facilities beyond what they currently experience from existing traffic noise from freeways and roadways. This would also be the case for wildlife refuges.

The anticipated areas of agency-managed conservation lands that would be temporarily occupied or otherwise affected are shown in Table 3.1-11.

Table 3.1-11. Conserved Lands Temporary Impacts Summary – Build Alternatives 1, 2C, and 4

Conservation Area	Build Alternative 1 (acres)	Build Alternative 2C (acres)	Build Alternative 4 (acres)
Lake Mathews Multiple Species Reserve	21.59	23.21	9.37
Lake Mathews-Estelle Mountain Core Reserve	22.13	25.63	10.06
Riverside Corona Resource Conservation District Mitigation Lands	1.56	1.56	1.56
Western Riverside County Regional Conservation Authority Conserved Lands	0.5	0.5	0.5

Construction would also result in intermittent traffic delays under all build alternatives until the project is completed; however, the delays would be temporary and are not anticipated to be substantial enough to affect parks and recreational facilities. Temporary impacts on pedestrians, cyclists, and equestrians would be minimized with Standard Project Measure **PF LU-1** (TMP).

With regard to Section 4(f) resources, all of the parks and recreational resources identified in Table 3.1-8 are protected under Section 4(f), with the exception of Dos Lagos Golf Course and Victoria Grove park, which are privately owned. As wildlife refuges, the LM-EM Reserve and LMR are protected by Section 4(f). Both the LM-EM Reserve and LMR would experience temporary use from all build alternatives. More information regarding Section 4(f) resources and impacts are included in Appendix A, Section 4(f) Evaluation.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and Harley John Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, construction may result in intermittent traffic delays until the project is completed; however, such delays would be temporary and would not be anticipated to be substantial enough to affect parks and recreational facilities.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Table 3.1-11 identifies the temporary impacts on the LM MSHCP area, which is owned by MWD and includes the LMR. Build Alternatives 1, 2C, and 4 would result in 21.59, 23.21, and 9.37 acres of temporary easements of conserved LMR lands, respectively. Modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives would be coordinated between the County and LM MSHCP responsible parties.

No-Build Alternative

The No-Build Alternative would not result in impacts on parks and recreation facilities because construction activities would not occur.

3.1.3.4 Avoidance, Minimization, and/or Mitigation Measures

In addition to the avoidance and minimization measures for property acquisitions identified in Section 3.4.2, *Relocations and Real Property Acquisition*, replacement for the permanent loss of habitat within the LM MSHCP by Build Alternatives 1, 2C, or 4 will be required by MWD at a minimum 1:1 ratio (see Measures **NC-17 [NES BIO-17]** and **NC-19** [**NES BIO-15]** in Section 3.17, *Natural Communities*). Temporary impact areas would be addressed through preparation of a TMP (see Standard Project Measure **PF LU-1** in Section 3.1.1.2) and an HMMP, on-site restoration to original conditions (see Measures **NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]** in Section 3.17), and compliance with noise-reducing measures (see Standard Project Measure **PF NOI-1** in Section 3.15, *Noise and Vibration*)

[This page left blank intentionally.]

3.2 Farmlands

3.2.1 Regulatory Setting

The National Environmental Policy Act (NEPA) and the Farmland Protection Policy Act (FPPA, 7 United States Code [USC] 4201-4209; and its regulations, 7 Code of Federal Regulations [CFR] Part 658) require federal agencies, such as the Federal Highway Administration (FHWA), to coordinate with the Natural Resources Conservation Service (NRCS) if their activities may irreversibly convert farmland (directly or indirectly) to nonagricultural use. For purposes of the FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance.

The California Environmental Quality Act (CEQA) requires the review of projects that would convert Williamson Act contract land to non-agricultural uses. The main purposes of the Williamson Act are to preserve agricultural land and to encourage open space preservation and efficient urban growth. The Williamson Act provides incentives to landowners through reduced property taxes to discourage the early conversion of agricultural and open space lands to other uses.

3.2.2 Affected Environment

Information from the *Cajalco Road Widening and Safety Enhancement Project Community Impact Assessment* and *Errata* (Caltrans 2018, 2021) and the United States Department of Agriculture (USDA) "Farmland Conversion Impact Rating" (Form CPA 106, Appendix I of this EIR/EIS) were used in the preparation of this section of the document.

The California Department of Conservation, Office of Land Conservation maintains a statewide inventory of farmlands. These lands are mapped by the Division of Land Resource Protection as part of the Farmland Mapping and Monitoring Program (FMMP). For the purposes of this analysis, FMMP important farmland includes lands identified as Prime Farmland, Unique Farmland, Farmland of Statewide Importance, and Farmland of Local Importance.

- *Prime farmland* is rural land with the best combination of physical and soil characteristics for the production of crops and used for irrigated agricultural production at some point during the 4 years prior to the mapping date.
- *Unique farmland* is land other than prime farmland that has lesser quality soils that are used for the production of high-value specialty crops (e.g., citrus and nuts) and has been cropped at some time during the 4 years prior to mapping.
- *Farmland of statewide importance* is land that does not qualify as prime or unique farmland and has been used for irrigated agricultural production at some time during the 4 years prior to the mapping date.
- *Farmland of local importance* is defined by, and under the authority of, the Board of Supervisors of each county. Riverside County defines farmland of local importance as "Soils that would be classified as Prime and Statewide but lack available irrigation water. Lands planted to dryland crops of barley, oats, and wheat; lands producing major crops for Riverside County but that are not listed as Unique crops. These crops are identified as returning one million or more dollars on the 1980 Riverside County Agriculture Crop Report.

> Crops identified are permanent pasture (irrigated), summer squash, okra, eggplant, radishes, and watermelons; Dairylands, including corrals, pasture, milking facilities, hay and manure storage areas if accompanied with permanent pasture or hayland of 10 acres or more; Lands identified by city or county ordinance as Agricultural Zones or Contracts, which includes Riverside City "Proposition R" lands. Lands planted to jojoba which are under cultivation and are of producing age."

The FMMP mapping inventory of lands within the 0.5-mile study area indicates a total of approximately 4,280 acres of important farmland composed of 63.2 acres of Prime Farmland, 305.3 acres of Unique Farmland, 88 acres of Farmland of Statewide Importance, and 3,823.4 acres of Farmland of Local Importance (California Department of Conservation 2016a). These FMMP important farmland acreages are listed in Table 3.2-1, below, and their locations within the study area are shown on Figure 3.2-1a.

Table 3.2-1 further indicates additional FMMP inventory acreages for lands within the study area designated as Grazing Land, Urban and Built-Up, Other Land, and Water, as well as the acreages within each FMMP inventoried land use type that are committed to urban development and water storage per 7 CFR 658.2(a). Lands committed to urban development and water storage are shown on Figure 3.2-1b. These areas were factored into the FMMP inventory totals to determine an adjusted total of approximately 2,869 acres of important farmland within the study area composed of 61 acres of Prime Farmland, 281.3 acres of Unique Farmland, 82.7 acres of Farmland of Statewide Importance, and 2,444 acres of Farmland of Local Importance. Combined, the 2,869 acres of important farmland represent approximately 31% of the total study area.

Table 3.2-1. FMMP Important Farmland and Other Lands within Study Area

Categories	FMMP Inventory (acres)[1]	Urban Development - Roadway (acres)[2]	Urban Development - Water (acres)[3]	Urban Development – Other (acres)[4]	Total FMMP (acres)
Prime Farmland	63.18	2.08	0.14	-	60.97
Unique Farmland	305.28	23.5	0.31	0.15	281.32
Farmland of Statewide Importance	87.84	4.44	0	0.75	82.66
Farmland of Local Importance	3,823.38	326.95	430.12	622.34	2,443.97
Total Important Farmland:	**4,279.68**	**356.97**	**430.56**	**623.24**	**2,868.91**
Grazing Land	3,190.48	176.12	30.05	649.12	2,335.17
Urban and Built-Up Land	2,433	515.44	164.45	856.5	896.61
Other Land	6,163.23	526.01	2,076.02	394.57	3,166.62
Water	1,107.88	0.03	1,107.85	-	0.00
Study Area Totals:	17,174.26	1,574.57	3,719.7	2,523.43	9,267.32

Figure 3.2-1b
FMMP Inventory and Lands Committed to Urban Development - Study Area
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

As shown on Figure 3.2-1a, within the study area, limited farmlands are mapped between Temescal Canyon Road and Harley John Road. East of Harley John Road, farmland occurs intermittently within the study area, along Cajalco Road and north of the intersection of Cajalco Road and Harley John Road. Important farmland is also adjacent to Cajalco Road northwest and southeast of the intersection with Wood Road, and in the vicinity of the Lake Mathews Multiple Species Reserve (LMR). FMMP important farmland also exists intermittently within the study area along El Sobrante Road at the following locations: northwest of the intersection of El Sobrante Road and Lockwood Road; northwest of the intersection of El Sobrante Road and Vista Del Lago Drive; and west of the intersection of El Sobrante Road and Vista Del Lago Drive.

3.2.2.1 Williamson Act Contract Land

The California Land Conservation Act of 1965, commonly known as the Williamson Act, provides incentives through reduced property taxes to deter the conversion of agricultural and open space lands. The act enables local governments to enter into contracts with private landowners for promoting the preservation of agricultural land. In return, landowners receive property tax assessments that are based on farming and open space uses instead of property tax assessments based on full market value of the property. Local governments receive an annual subvention (subsidy) of forgone property tax revenues from the state via the Open Space Subvention Act of 1971.

A total 353.32 acres of land under Williamson Act contract occur within the 0.5-mile study area for all build alternatives. As shown on Figure 3.2-2, the alignment of Build Alternative 4 is the only build alternative that includes Williamson Act land within the study area. Williamson Act land is intermittently within the study area north and south of El Sobrante Road from La Sierra Avenue to Mockingbird Canyon Road. There is Williamson Act land located adjacent to El Sobrante Road at the following locations:

- Immediately northeast of the intersection of Cajalco Road and McAllister Street.
- North and south of El Sobrante Road approximately 0.7 mile west of the intersection of El Sobrante Road and Vista Del Lago Drive.

According to CEQA Guidelines, Section 15206, cancellation of Williamson Act contracts for parcels exceeding 100 acres is considered to be "of statewide, regional, or area wide significance," and would be subject to additional noticing and review requirements under CEQA.

3.2.2.2 Lake Mathews MSHCP

Within the project study area, the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) and the LMR span approximately 5,994 acres and 5,110 acres, respectively, of open land around Lake Mathews. The LM MSHCP does not allow for land uses that are not directly associated with management of the LMR or Lake Mathews' reservoir and dam facilities. While there are lands that meet the California Department of Conservation's FMMP Important Farmland criteria within the LM MSHCP area—primarily Farmland of Local Importance—they are committed to preservation purposes of the LM MSHCP. These limited areas are not actively farmed and are sometimes grazed by sheep for vegetation management purposes. There are no lands under agricultural preservation contract, including the Williamson Act, within the LM MSHCP.

3.2.3 Environmental Consequences

Table 3.2-2 below and Figure 3.2-2 show the acres of FMMP important farmland and Williamson Act land that would be temporarily affected and permanently acquired under all build alternatives. Consistent with 7 CFR 658.2(a), lands committed to urban development (existing and planned roadway right of way) and water storage (Metropolitan Water District) were not factored into the total farmland impacts of each build alternative (refer to Figure 3.2-1b).

Table 3.2-2. FMMP Important Farmland and Williamson Act Land Impacts

	Build Alternative 1		Build Alternative 2C		Build Alternative 4	
Categories	**Permanent (acres)**	**Temporary (acres)**	**Permanent (acres)**	**Temporary (acres)**	**Permanent (acres)**	**Temporary (acres)**
Prime Farmland	0	0	0	0	0.47	0.05

Source: California Department of Conservation 2016a
Note: Lands committed to urban development per the city and county zoning codes, public right of way, and designated roadway widths for Cajalco Road and El Sobrante Road per the General Plan have been excluded from these FMMP calculations (7 CFR 658.2(a)).

3.2.3.1 Permanent Impacts

Build Alternative 1—Cajalco Alignment

Table 3.2-2 and Figure 3.2-1b indicate the acreage and locations of FMMP important farmland that would be temporarily and permanently acquired under Build Alternative 1. Proposed project improvements involving the acquisition of farmland and permanent easements would affect FMMP important farmlands mapped as Unique Farmland and Farmland of Local Importance. Because no Prime farmland would be converted, Build Alternative 1 would not result in the conversion or loss of Prime farmland within the County. Build Alternative 1 would require permanent conversion of 7.69 acres of FMMP important farmland, which represents 0.27 percent of the FMMP important farmland in the study area. Build Alternative 1 would not affect land under Williamson Act contract.

Impacts on mapped farmland were evaluated using the USDA "Farmland Conversion Impact Rating" (Form CPA 106, Appendix I of the EIR/EIS), which was completed in coordination with NRCS. Form CPA 106 helps determine the impact the project may have on farmlands within the study area. NRCS and the applicable federal agency review criteria for projects including, but not limited to, soil productivity, water conditions, proximity to other urban and rural land uses, impacts on remaining farmland after the conversion, and indirect or secondary effects of the project on agricultural and other local factors. NRCS must complete the land evaluation part of the form, and the federal lead agency completes the site assessment portion. Up to 100 points for relative value—and up to 160 points for the site assessment—are possible, for a total combined score of up to 260 points. Projects sites receiving a total score of less than 160 need not be given further consideration for protection, and no further evaluation is required under the FPPA (CFR 658.4(c)(2)).

Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

NRCS reviewed and completed Parts II, IV, and V of the form on September 27, 2019. Refer to Appendix I for the completed Form CPA 106 for all build alternatives of the proposed project. The total site assessment rating for Build Alternative 1 is 90, well below the threshold score of 160 (CFR 658.4(c)(2)), largely due to the location of the acquisition on each parcel and the small size of project encroachment relative to the overall parcel. With the proposed improvements to, and realignments of, an existing roadway facility, and acquisitions as proposed, no agricultural parcels would be bisected, and the remainder of each parcel could continue to be used for agricultural purposes. Access to remaining areas of agricultural parcels would be ensured with the implementation of Standard Project Measure **PF FA-1**, below.

- **PF FA-1**: Access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway.

Compensation to individual landowners for property impacts would be addressed and negotiated through the right of way acquisition process, as warranted (refer to Standard Project Measure **PF COM-1** in Section 3.4.1, *Community Character and Cohesion*).

Given the limited percentage of FMMP important farmland that would be converted within the study area, viability and quantity of, and access to, the remaining farmland of affected properties for agricultural use, and total assessment rating comparative to the threshold score, substantial adverse impacts on FMMP important farmland are not anticipated as a result of Build Alternative 1.

Future Six-Lane Facility (Build Alternative 1)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not affect farmland resources because no further acquisition of right of way or easements within designated farmlands are proposed for the six-lane facility.

Lake Mathews MSHCP (Build Alternative 1)

Under Build Alternative 1, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities—including a drainage basin, culverts, bridges, and wildlife crossings—would also be constructed. As indicated under Affected Environment, above, the LM MSHCP does not allow for land uses that are not directly associated with management of the LMR or Lake Mathews reservoir and dam facilities. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Changes to the LM MSHCP that allow for the proposed project would result in the conversion of limited areas of FMMP-criteria farmland within the LM MSHCP area. Given the limited percentage of FMMP important farmland that would be converted and low site assessment rating under Build Alternative 1, and further limited farmland areas within the LM MSHCP, substantial adverse impacts on FMMP important farmland would not occur.

Build Alternative 2C—Modified Cajalco Alignment

As shown in Table 3.2-2 and Figure 3.2-1, Build Alternative 2C would require permanent conversion of 7.85 acres of FMMP important farmland composed of 0.19 acre of Unique Farmland and 7.66 acres of Farmland of Local Importance, which represents 0.27 percent of the FMMP important farmland in the study area. Because no Prime farmland would be converted, Build Alternative 2C would not result in the conversion or loss of Prime farmland within the County. Build Alternative 2C would not affect any Williamson Act land.

The completed Form CPA 106 for the proposed project indicates the total site assessment rating for Build Alternative 2C is 90, well below the threshold score of 160 (CFR 658.4(c)(2)), largely due to the location of the acquisition on each parcel and the small size of project encroachment relative to the overall parcel. Refer to Appendix I for the completed Form CPA 106 for all build alternatives of the proposed project. With the proposed improvements to, and realignments of, an existing roadway facility, and acquisition as proposed, no agricultural parcels would be bisected and the remainder of each parcel could continue to be used for agricultural purposes. Access to remaining areas of agricultural parcels would be ensured with the implementation of Standard Project Measure **PF FA-1**. Compensation to individual landowners for property impacts would be addressed and negotiated through the right of way acquisition process, as warranted (refer to Standard Project Measure **PF COM-1** in Section 3.4.1, *Community Character and Cohesion*).

Given the limited percentage of FMMP important farmland that would be converted within the study area, viability and quantity of, and access to, the remaining farmland of affected properties for agricultural use, and total assessment rating comparative to the threshold score, substantially adverse impacts on FMMP important farmland are not anticipated as a result of Build Alternative 2C.

Future Six-Lane Facility (Build Alternative 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not affect farmland resources because no further acquisitions of right of way within designated farmlands are proposed for the six-lane facility.

Lake Mathews MSHCP (Build Alternative 2C)

Under Build Alternative 2C, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities—including a drainage basin, culverts, bridges, and wildlife crossings—would also be constructed. As indicated under Affected Environment, above, the LM MSHCP does not allow for land uses that are not directly associated with management of the LMR or Lake Mathews reservoir and dam facilities. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Changes to the LM MSHCP that allow for the proposed project would result in the conversion of limited areas of FMMP-criteria farmland within the LM MSHCP area. Given the limited percentage of FMMP important farmland that would be converted and low site assessment rating under Build Alternative 2C, and

further limited farmland areas within the LM MSHCP, substantial adverse impacts on FMMP important farmland would not occur.

Build Alternative 4—El Sobrante Alignment

FMMP Important Farmland

As indicated in Table 3.2-2 and shown on Figure 3.2-1, Build Alternative 4 would require permanent conversion of 23.72 acres of FMMP important farmland composed of 0.47 acre of Prime Farmland, 3.08 acres of Unique Farmland, 0.99 acre of Farmland of Statewide Importance, and 18.89 acres of Farmland of Local Importance, which represents 0.83 percent of the FMMP important farmland in the study area. The conversion of 0.47 acre of Prime farmland under Build Alternative 4 would represent the conversion or loss of 0.04 percent of the 117,484 total acres of Prime Farmland within the County (California Department of Conservation 2016b).

The completed Form CPA 106 for the proposed project indicates the total assessment rating for Build Alternative 4 is 130, below the threshold score of 160 (CFR 658.4(c)(2)), largely due to the location of the acquisition on each parcel and the small size of project encroachment relative to the overall parcel. Refer to Appendix I for Form CPA 106 for all build alternatives. With the proposed improvements to, and realignments of, existing roadway facilities, and acquisition as proposed, no agricultural parcels would be bisected and the remainder of each parcel could continue to be used for agricultural purposes. Access to remaining areas of agricultural parcels would be ensured with the implementation of Standard Project Measure **PF FA-1**. Compensation to individual landowners for property impacts would be addressed and negotiated through the right of way acquisition process, as warranted.

Given the limited percentage of FMMP important farmland that would be converted within the study area, viability and quantity of, and access to, the remaining farmland of affected properties for agricultural use, and total assessment rating comparative to the threshold score, adverse impacts on FMMP important farmland are not anticipated as a result of Build Alternative 4.

Williamson Act Contract Land

A total of 4.79 acres of land from the eight properties currently under Williamson Act contract listed in Table 3.2-3 would be permanently acquired and incorporated into the transportation system under Build Alternative 4.

Table 3.2-3. Williamson Act Land Impacts – Build Alternative 4

Assessor's Parcel Number (APN)	Contract No.	Parcel Size (acres)	Acquisition Area (acres)
270-140-001	19479	36.88	0.96
270-140-004	19063	19.4	0.82
270-140-005	20110	9.70	0.41
270-160-010	19288	8.24	1.12
270-160-016	20143	9.7	0.35
270-160-022	20510	4.41	0.36
270-160-026	20145	9.44	0.40
270-160-027	19508	9.55	0.37
Source: County of Riverside, Carla Reis-Trovillion, Assessor-County Clerk-Recorder, (email) September 5, 2019.			

Because Build Alternative 4 would not exceed the state threshold of 100 acres of Williamson Act contract cancellations, an adverse impact on Williamson Act land would not occur.

Section 51291 of the Williamson Act requires notification to the Director of Conservation and the local governing body responsible for the administration of agricultural preserves of the intended acquisition of lands within an agricultural preserve or property restricted by Williamson Act contract for public use. Because Build Alternative 4 is one of three build alternatives under consideration for the proposed project, the Director of the Department of Conservation was notified of potential acquisition of the properties listed in Table 3.2-3, above, on September 17, 2019.[1] The notification is included in Appendix I of this EIR/EIS and includes the following:

- Explanation of its preliminary considerations of the findings of Government Code §51292 (a) and (b);
    a. "The location is not based primarily on a consideration of the lower cost of acquiring land in an agricultural preserve (§51292(a))."
    b. "There is no other land within or outside of the preserve on which it is reasonably feasible to locate the public improvement (§51292(b))."
- A description of the agricultural preserve land it intends to acquire; and
- A copy of the Land Conservation Act contract on property that pertains to any land subject to the restrictions of such a contract between the local governing body, city, or county responsible for the administration of the agricultural preserve where the property to be acquired is located.

In response to the notification, the Department of Conservation responded in an email to the County on September 27, 2019, stating that the Department of Conservation offers no comments to the proposed acquisition of the property and advising that Government Code §51291(c) requires Riverside County to notify the Department of Conservation once the property is acquired. Refer to Appendix I for full response.

If Build Alternative 4 is identified as the preferred alternative, a second notice would be provided to the Department of Conservation within 10 working days following acquisition of the properties, and include the following:

- General explanation of the decision and the findings made pursuant to Government Code §51292.
- General description, in text or by diagram, of the agricultural preserve land acquired (a vicinity map is good); and
- Copy of the applicable Land Conservation Act contract(s).

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of

[1] The County of Riverside serves as the local governing body responsible for administration of the contracts listed in Table 3.2-3.

the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not affect farmland resources. Construction may result in intermittent traffic delays that may temporarily affect farming operations until the project is completed; however, with the implementation of a Traffic Management Plan (TMP), the delays would be temporary and are not anticipated to be substantial enough to interfere with farming operations. Please refer to Section 3.1, *Land Use*, for Standard Project Measure **PF LU-1**.

Lake Mathews MSHCP (Build Alternative 4)

Under Build Alternative 4, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities—including a drainage basin, culverts, bridges, and wildlife crossings—would also be constructed. As indicated under Affected Environment, above, the LM MSHCP does not allow for land uses that are not directly associated with management of the LMR or Lake Mathews reservoir and dam facilities. As such, FMMP-criteria farmland within the LM MSHCP is not currently used for farming purposes. Further, conversions of FMMP within the LM MSHCP would not occur. No Williamson Act land would be affected within the LM MSHCP.

No-Build Alternative

The No-Build Alternative would not affect FMMP-designated farmland or Williamson Act land because the proposed project would not be constructed, avoiding any conversion of FMMP-designated farmland or Williamson Act land.

3.2.3.2 Temporary Impacts

Build Alternatives 1, 2C, and 4

Table 3.2-2 indicates the acres of FMMP important farmland and Williamson Act land that would be temporarily affected under each build alternative. Construction of the project would involve temporary, localized disturbance and temporary construction easements, affecting some FMMP Important Farmlands within the project study area. Build Alternatives 1 and 2C would involve temporary occupation of 10.8 acres of FMMP important farmland during construction, and Build Alternative 4 would involve temporary occupation of 9.86 acres of FMMP important farmland. The temporarily impacted acreages under each build alternative represent approximately 0.4 percent of all the total FMMP important farmland in the study area. Given the small percentage of FMMP Important Farmland with temporary impacts within the study area and implementation of Standard Project Measure **PF FA-2**, below, adverse impacts on FMMP important farmland would not be anticipated as a result of the build alternatives.

- **PF FA-2**: Farmland temporarily affected during construction activities will be returned to conditions that allow for continued use and function as farmland following construction of the project. Any compensation deemed necessary for continuation of pre-project farming operations affected by the project will be negotiated in accordance with the federal Uniform Relocation Assistance and Property Acquisition Act of 1970, as amended (42 United States Code Sections 4601-4655).

Build Alternatives 1 and 2C would not involve temporary impacts on Williamson Act land. Under Build Alternative 4, however, 2.12 acres of Williamson Act land would be temporarily

occupied and would experience impacts during construction. Because the temporary impacts of Build Alternative 4 would not exceed the state threshold of 100 acres of Williamson Act contract cancellations, and be returned to conditions that allow for continued use and function as farmland following construction of the project under Standard Project Measure **PF FA-2**, the proposed project would not result in an adverse temporary impact on Williamson Act lands.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road under Build Alternatives 1 and 2C, and within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road or Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that construction activities would be limited to median areas and previously acquired roadway right of way; therefore, the additional lanes would not affect farmland resources.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under any of the build alternatives, temporary construction activities and associated impacts on FMMP Important Farmland within the LM MSHCP area would be the same as those described under Build Alternatives 1, 2C, and 4, above.

3.2.4 Avoidance, Minimization, and/or Mitigation Measures

Standard Project Measures **PF FA-1**, **PF FA-2**, **PF LU-1** (TMP) in Section 3.1.1, *Land Use*, and **PF COM-1** (property acquisitions) in Section 3.4.1, *Community Character and Cohesion*, would be included in the proposed project to address impacts identified above.

3.3 Growth

3.3.1 Regulatory Setting

The Council on Environmental Quality (CEQ) regulations, which established the steps necessary to comply with the National Environmental Policy Act (NEPA) of 1969, require evaluation of the potential environmental effects of all proposed federal activities and programs. This provision includes a requirement to examine indirect effects, which may occur in areas beyond the immediate influence of a proposed action and at some time in the future. The CEQ regulations (40 Code of Federal Regulations [CFR] 1508.8) refer to these consequences as indirect impacts. Indirect impacts may include changes in land use, economic vitality, and population density, which are all elements of growth.

The California Environmental Quality Act (CEQA) also requires the analysis of a project's potential to induce growth. The CEQA guidelines (Section 15126.2[d]) require that environmental documents "…discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment…"

3.3.2 Affected Environment

The Community Impact Assessment (CIA) and *Errata* prepared for this project (Caltrans 2018, 2021) was used in the preparation of this section of the document.

Many factors other than a project's construction affect the amount, location, and rate of growth in a project study area, including the following:

- Market demand for new development
- The availability of other access, existing roads, or planned roads
- Developable land
- National and regional economic trends
- The availability of other infrastructure, such as water and sewer systems
- Governmental policies
- Climate

The population of Riverside County has grown since 2015 and is expected to continue growing through 2040. Population growth projections developed for the Southern California Association of Government's (SCAG's) 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) indicate that the population of Riverside County is expected to increase from 2,316,000 to 3,183,000 between 2015 and 2040, which is a 37.4-percent increase (SCAG 2016). The same report indicates that the population of the City of Corona is expected to increase from 156,000 to 172,300 between 2012 and 2040, which is a 10.5-percent increase, while the City of Perris is expected to increase from 70,700 to 116,700, which is a 65-percent increase. See Section 1.2.2.1 (*Regional Population Forecasts*) in Chapter 1, *Proposed Project*, for a detailed discussion of regional population trends.

Population growth is an important factor in determining future travel demand. Increases in population, housing, and employment, as projected by SCAG's 2016–2040 RTP/SCS, and the more recently adopted 2020–2045 RTP/SCS, result in greater demand for transportation facilities and services. Increased travel demand results in congestion on roadways if capacity does not keep up with the demand. Cajalco Road between Temescal Canyon Road and Interstate 215 (I-215) has been identified as needing additional capacity to address existing and projected demands from the growth and development that is currently taking place in communities close by, and this growth is expected to continue. The general plans of Riverside County and the Cities of Corona, Riverside, and Perris promote transportation improvements to help support their anticipated population growth. The City of Riverside is included in this analysis because it is a large city in the project region, even though it is not within a half mile of the project alignments.

SCAG's RTP/SCS explains that one of the building blocks of creating more sustainable communities is managing demands on the transportation system in ways that reduce or eliminate traffic congestion during peak periods of demand.

With the project study area, the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) and Lake Mathews Multiple Species Reserve (LMR), span 5,993.5 acres and 5,110.4 acres, respectively, of open land around Lake Mathews. The LM MSHCP does not allow for development within its boundaries that is not directly associated with management of the LMR or Lake Mathews' reservoir and dam facilities.

3.3.3 Environmental Consequences

In 2006, the California Department of Transportation (Caltrans), in conjunction with the Federal Highway Administration (FHWA) and the United States Environmental Protection Agency (U.S. EPA), developed guidance to address California's specific challenges relating to growth-related impacts, focusing on the influence that transportation projects may have on growth and development. The guidance includes a two-phase approach for the evaluation of growth-related impacts; "first-cut screening" utilizes the questions below to identify potential for growth-related effects, and whether further analysis is necessary.

a. How, if at all, does the project potentially change accessibility?

b. How, if at all, do the project type, project location, and growth-pressure potentially influence growth?

c. If there is project-related growth, is it reasonably foreseeable as defined by NEPA?

d. If project-related growth is reasonably foreseeable, would it affect resources of concern?

The following presents the results of the first-cut screening for each project alternative.

3.3.3.1 Areas of Potential Future Growth

Because growth-related effects represent permanent impacts of a project, there is no discussion of temporary impacts in this section aside from the creation of short-term construction jobs. Impacts would be considered significant for growth if the project influences growth in excess of what is projected in general plans (land use elements) or in forecasts made by regional planning agencies (such as SCAG). The extension of services and facilities to an individual site can reduce development constraints for other nearby areas and can serve to induce further development in

the vicinity. Indirect or secondary growth-inducing impacts consist of growth in the area by additional demand for housing, employment, and goods and services associated with population increases caused by, or attached to, new development.

As part of the environmental review for the project, public and agency comments were taken into consideration in the analysis. Relevant to this section, the San Jacinto Chamber of Commerce commented that it believes that the project is critical to promoting growth to the east of the project boundaries and that it is a "true catalyst of economic development." The expanded discussion provided below addresses San Jacinto Chamber of Commerce concerns.

The boundary for the identification of areas of potential growth is a 0.5-mile buffer from the build alternative alignments, as this should supply a sufficient area to analyze potential localized growth impacts. The boundary on the eastern and western project limits ends at Interstate 15 (I-15) at the western terminus and I-215 at the eastern terminus, as the benefits of the project would end at the larger freeways. The project is a local project along existing roadways in a semi-rural, partially developed area of unincorporated Riverside County. The project would not add regional connectivity, but would enhance interregional travel by improving east-west mobility in Riverside County and would enhance localized travel and relieve existing patterns of congestion. The new roadway would provide greater capacity and reduced travel times, and therefore improved accessibility for the area.

Identification of the areas of potential future growth within the boundary involved locating cumulative projects in the project vicinity, examining land use and zoning regulations within the project area, and reviewing relevant general plan goals and policies. Combined, these items provide a holistic picture of current growth trends in the area as well as how the proposed project could induce or influence growth within the project area and general region of western Riverside County.

Cumulative Projects

In addition to the project, there are a number of development and transportation projects that have been identified as planned, approved, or recently constructed within the general project vicinity that are anticipated to occur regardless of implementation of this proposed project. Each of these projects would be subject to all applicable federal and state environmental compliance requirements, as appropriate. A list of the projects considered in this analysis is provided in Table 3.25-1 in Section 3.25, *Cumulative Impacts*, and the locations of the projects are depicted on Figure 3.3-1, below.

General Plans

In addition to the projects identified within the project area, general plans also play an important role in development patterns of a place or region. General plans typically consist of development policies and text setting forth objectives, principles, standards, and expectations. They are essentially establishing long-term plans for the physical development of the county or city for which they have been authored. Under NEPA and CEQA, growth inducement is not necessarily considered detrimental, beneficial, or environmentally significant. Typically, the growth-inducing potential of a project is considered significant if it fosters growth or a concentration of population in excess of what is assumed in relevant master plans, land use plans, or projections made by regional planning agencies.

The growth-inducing potential of a project could be considered significant if it influences growth in excess of what is projected in general plans (land use elements) or in forecasts made by regional planning agencies. See Table 3.1-7, Consistency with State, Regional, and Local Plans and Programs, in Section 3.1, *Land Use*, for a consistency analysis of the proposed project and the No-Build Alternative with the relevant plans and programs.

County of Riverside General Plan

The Riverside County General Plan is a comprehensive, long-term general plan adopted in 2015. The elements of the general plan make up the framework for decision-making regarding growth and development in the county and contain goals and policies that are pertinent to the proposed project (County 2015).

Lake Mathews/Woodcrest Area Plan

Lake Mathews/Woodcrest is a community within unincorporated Riverside County. The Lake Mathews/Woodcrest Area Plan contains a Land Use Plan and identifies issues, articulates community visions, and recommends strategies for improvement and for achieving the visions. The purpose of the plan is to serve as a guide for the future development and improvement of the community (County 2016). Victoria Grove and Lake Hills are developed communities for residential uses and include a limited number of various home-based businesses. The communities are situated between businesses in Mead Valley, Temescal Canyon, and the City of Riverside.

Mead Valley Area Plan

Mead Valley is a community within unincorporated Riverside County. The Mead Valley Area Plan contains a Land Use Plan and identifies issues, articulates community visions, and recommends strategies for improvement and for achieving the visions. The purpose of the plan is to serve as a guide for the future development and improvement of the community (County 2018a).

City of Corona General Plan

The City of Corona's General Plan addresses a multitude of land use-related issues and is designed to provide policy guidance for the next 20 years and beyond. The most recent complete general plan was approved by the City Council in 2004, but it has been amended numerous times since to address changes in the direction of development, as well as to meet statutory and regulatory requirements (City of Corona 2004). The City of Corona General Plan has limited applicability to the project because the project limits extend within the plan area at the western end of the proposed alignment, near Temescal Canyon Road; the majority of the project would be within unincorporated Riverside County.

Temescal Canyon Area Plan

Temescal Canyon is an area within western Riverside County. The Temescal Canyon Area Plan contains a Land Use Plan, statistical summaries, policies, and accompanying exhibits that explain the physical, environmental, and regulatory characteristics of the area (County 2018b). The Temescal Canyon Area Plan has limited applicability to the project because the project

would only overlap with the plan area at the western end of the proposed alignment; the majority of the project would be within unincorporated Riverside County.

City of Perris General Plan

The City of Perris 2030 General Plan was adopted in 2005, but has undergone updates in 2008, 2013, 2015, and 2016. The general plan is a 30-year guide for local government decisions on growth, capital investment, and physical development in the City of Perris. It guides future development plans and gives direction on how to implement future projects (City of Perris 2005). The City of Perris General Plan has limited applicability to the project because a limited portion of the eastern end of the proposed project alignment is adjacent to the plan area; the majority of the project would be within unincorporated Riverside County.

3.3.3.2 Areas of Potential Growth Analysis

Areas of potential growth in the general vicinity of the project have been identified by pinpointing Vacant/Undeveloped lands with the zoning W-2, W-2-10, W-2-M-1/2 designations, Controlled Development Areas and Controlled Development Areas with Mobile Homes, within or near the project area. As shown in Table 3.3-1 below, the Riverside County General Plan supports areas for infill and development in economically underutilized, obsolete, and dilapidated commercial and industrial sites within existing urbanized areas, and vacant lands on the periphery of existing development. As can be shown in the table below, area-specific plans applicable to the project area anticipate infill in vacant and undeveloped lands as well as residential, commercial, and business areas. Given the project is approximately 16 miles in length, it would be beyond the scope for this effort to identify each economically underutilized, obsolete, and dilapidated commercial and industrial site, as that process would be too speculative and subjective. Therefore, vacant and undeveloped lands have been identified as areas for potential development and infill as areas with controlled development within a half mile of the project. These areas have been calculated into acres and are reflected in the table below. Areas where potential future planned development could occur are shown on Figure 3.3-1 as "Undeveloped" and described in detail in Table 3.3-1.

Table 3.3-1. Areas of Potential Future Growth

Location/Type of Growth (numbers correspond to Figure 3.3-1)	Resources of Concern and Constraints (e.g., natural resources, cultural resources, other sensitivity)
City of Corona	
Infill: The City of Corona 2020–2040 General Plan anticipates that future infill would include vacant lands in the city, redevelopment of existing sites, and effective reuse of obsolete industrial lands.	• Future infill development is anticipated to occur within obsolete industrial lands and vacant lands, and existing sites could expose people or structures to wildland fires. • Development allowed under the proposed general plan could result in substantial adverse impacts either directly or indirectly through habitat modifications to candidate, sensitive, or special-status plant and wildlife species. • New urban uses may affect scenic vistas within the Planning Area.
Note that the City of Corona General Plan is the overarching document for the area-specific plan for Temescal Canyon specified below. Therefore, acres calculated below for the area-specific	Development constraints include many areas of the city already being developed/urbanized; the Cleveland National Forest to the south/southwest and the Prado Basin are natural areas that limit outward growth.

Location/Type of Growth (numbers correspond to Figure 3.3-1)	Resources of Concern and Constraints (e.g., natural resources, cultural resources, other sensitivity)
Temescal Canyon community falls within this general plan purview.	
City of Perris	
Infill: The City of Perris 2014–2021 Housing Element (adopted 2013) anticipates that housing growth is expected to occur in vacant lots.	• Loss of agricultural land, as it is expected to be converted for urban uses • Impacts on biological resources can be expected as a result of infill. • Ninety-eight historic sites occur in the city limits. • Areas sensitive to archaeological resources located throughout the city. • Availability and quality of water • Sensitive geologic and seismic conditions • March Air Reserve Base
Potential Growth Area City of Perris Approximate acreage: 13 acres	As identified in the City's general plan, development constraints could include governmental, market, infrastructure, and environmental factors, such as land use controls, outdated zoning, seismic hazard zones, flooding, etc.
Riverside County	
Infill: The County of Riverside General Plan (2015) supports infill in economically underutilized, obsolete, and dilapidated commercial and industrial sites within existing urbanized areas, and vacant lands on the periphery of existing development.	• Areas sensitive to floods • San Andreas fault and county fault zones • Land use compatibility • Biological resources • Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan
Note that the Riverside County General Plan is the overarching document for the area-specific plans specified below. Therefore, acres calculated below for area-specific communities in unincorporated Riverside County fall within this general plan purview.	Development constraints include multiple conservation and mitigation lands, historic resources, archaeological and tribal resources, biological resources including candidate, sensitive, or special-status plant and wildlife species, and lands subject to severe natural hazards.
Unincorporated Community of Temescal Canyon	
The Temescal Canyon Area Plan (2018) intensifies and mixes uses at a development node adjacent to I-15, more accurately reflects topography and natural resources in the Santa Ana Mountains and Gavilan Hills with appropriate land use designations, and avoids high-intensity development in natural hazard areas. The plan utilizes more detailed land use designations than what are applied than for the countywide general plan.	• Santa Ana Mountains • Cleveland National Forest • Santa Ana River • Gavilan Hills • Temescal Wash • Flooding and dam inundation • Wildland fire hazard • Seismic and slope hazards
Potential Growth Area Temescal Canyon Approximate acreage: 497 acres	The Open Space Foundation Component land uses compose the majority of the unincorporated planning area for this community. The Cleveland National Forest and Prado Basin account for much of this acreage. Therefore, the Temescal Canyon community has a wealth of natural resources that provide natural barriers to development, which puts the emphasis on the importance of the remaining limited land area to house and employ the existing population, to accommodate the growth pressures in western Riverside County.

Location/Type of Growth (numbers correspond to Figure 3.3-1)	Resources of Concern and Constraints (e.g., natural resources, cultural resources, other sensitivity)
Unincorporated Community of Mead Valley	
The Mead Valley Area Plan (2018) states that growth is focused in areas that are well served by public facilities and services or where they can readily be provided. Note that the County of Riverside General Plan establishes standards and policies for development within the entire unincorporated Riverside County territory, into which Mead Valley falls.	• Open space and rural setting • Flooding and dam inundation • Wildland fire hazard • Seismic and slope hazards • Mount Palomar Observatory
Potential Growth Area Mead Valley Approximate acreage: 1,100 acres	Constraints to development include local open space policies, floodplain hazard areas, preservation of agricultural lands, and many of the policies in the area's general plan have an emphasis to protect local open space areas.
Lake Mathews/Gavilan Hills/Woodcrest/Mockingbird Canyon/Lake Hills/Victoria Grove	
Infill: The communities of Lake Mathews, Gavilan Hills, Woodcrest, and Mockingbird Canyon are covered under the Lake Mathews/Woodcrest Area Plan (Revised 2016). Specific land use areas already targeted for development: Open Space, Agriculture, Rural, Rural Community, and Community Development.	• Loss of agricultural land, as it is expected to be converted for urban uses • Lake Mathews reservoir • Harford Springs Wildlife Reserve • Open space and rural setting • Flooding and dam inundation • Wildland fire hazard • Seismic and slope hazards
Potential Growth Area *Lake Mathews/ Gavilan Hills/Woodcrest/Mockingbird Canyon/Lake Hills/Home Garden/ Victoria Grove* Areas[1]: Approximate acreage Lake Hills/Home Gardens: 10 acres Approximate acreage Lake Mathews/ Gavilan Hills: 1,507 acres Approximate acreage Victoria Grove: 11 acres Approximate acreage Woodcrest/ Mockingbird Canyon: 770 acres	Constraints to development include Lake Mathews reservoir and watershed area, open space and conservation areas, flood hazard areas, and hills, mountains, and watercourses that frame the valley that work as natural barriers. In addition, many policies are geared toward preserving the rural nature of the area and emphasize the need for adequate and available infrastructure to support proposed development.
Sources: City of Perris 2008, 2013; County of Riverside 2015, 2018a, 2018b	

As can be seen in the table, within a half mile of the project, the local general plans have identified approximately 3,908.46 acres where growth is anticipated. As can be seen on Figure 3.3-1, the planned projects in the project vicinity are primarily located along the shared portion of the project alignment on the western end of the project terminus near Temescal Canyon Road in Corona (projects 4-7), near the shared portion of the alignment on the eastern terminus near Cajalco Road in Mead Valley (Projects 16 through 18 and 20 through 22), and in the City of Perris near the Ramona Expressway (Projects 24 through 29). In addition, there are three planned projects near El Sobrante Road where Build Alternative 4 would be constructed (Projects 11 through 13, with 14 a little farther to the north). Planned growth is already anticipated to occur near the alignments, regardless of which build alternative is chosen.

[1] According to the County of Riverside General Plan Lake Mathews/Woodcrest Area Plan (2003), the Lake Hills and Victoria Grove communities are covered under the Lake Mathews/Woodcrest Area Plan.

These projects nearest the proposed alignments are a mixture of residential, transportation, recreational (golf course), business, and industrial projects. Each of these projects would be subject to its own environmental review.

Both existing and planned land uses within the western limits of the study area that surround the intersection of Temescal Canyon Road and Cajalco Road are a mix of commercial, industrial, and residential uses. Immediately northwest of the intersection is a strip mall that contains a mix of commercial businesses, including restaurants and retail stores. The Crossings at Corona shopping center is immediately east of I-15. Directly southwest of the intersection is undeveloped land, and farther southwest is a trucking center, an office building, and single-family homes. Southeast of the intersection is another trucking center and farther southeast is the community of Dos Lagos, which contains single-family homes and the Dos Lagos Golf Course. Northeast of the intersection is undeveloped land, and farther northeast is a commercial storage center.

These areas are consistent with the County's plan for infill and development to occur in undeveloped/vacant lands, and in residential and business/industrial areas (see Figure 3.3-2). This indicates that the planned development of the project area would occur regardless of implementation or operation of any of the build alternatives. The widened and realigned roadway proposed by the project would provide greater capacity and reduced travel times, and therefore improved accessibility for the area. There is potential for commercial and residential development with increased accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans.

3.3.3.3 Build Alternative 1—Cajalco Road Alignment

a. How, if at all, does the project potentially change accessibility?

Build Alternative 1 would result in modifications to accessibility by increasing the capacity of Cajalco Road, adding traffic flow controls such as center medians and turn lanes, realigning sections of Cajalco Road and intersecting roadways, adding a new roadway connection, constructing designated bus pull-outs, and adding crosswalks and sidewalks.

Increased Capacity

Under Build Alternative 1, the existing two-lane Cajalco Road facility would be widened to four lanes (two eastbound and two westbound) between east of Temescal Creek Bridge and Harvill Avenue. Between Temescal Canyon Road and Temescal Creek Bridge, two eastbound lanes would be added, and between Harvill Avenue and I-215 southbound ramps, two additional through lanes (one in each direction) would be added, for a total of six through lanes along these segments of Cajalco Road. Refer to Figures 2.2-1 and 2.2-3 in Chapter 2, *Project Alternatives*.

Undeveloped lands directly along Cajalco Road, and along certain intersecting roadways, are primarily committed for conservation under the Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP), LM MSHCP, Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP), and Metropolitan Water District of Southern California (MWD) water management facilities; however, limited undeveloped parcels occur along Cajalco Road. Furthermore, undeveloped parcels not limited by habitat conservation plan restrictions also occur along intersecting roadways with Cajalco Road and may be more accessible from anticipated improvements in east-west mobility, traffic flow, and travel times along Cajalco Road.

The increased capacity of Cajalco Road is anticipated to improve east-west mobility, traffic flow, and travel times along Cajalco Road. This can allow for increased access to businesses along Cajalco Road and to undeveloped areas—which exclude conservation lands, as those cannot be developed—that can be accessed by roadways that connect with Cajalco Road. The project would widen the roadway to four lanes between Harvill Avenue and Temescal Canyon Road, and to six lanes between the I-215 southbound ramps and Harvill Avenue, to improve east-west mobility and to provide increased capacity and improved traffic flow and safety. However, no new access will be provided regionally, as this is an existing transportation corridor. This build alternative addresses projected Cajalco Road capacity deficiency by adding two additional lanes, and turn pockets and includes right of way for two additional future lanes for the segment of Cajalco Road between Temescal Creek Bridge and Harley John Road. The intent of including the additional median area is to ensure that future impacts on the conservation areas, which the majority of the proposed six-lane alignment is located within, would be minimized to the extent feasible if the roadway is widened to six lanes in the future. Increased capacity could provide easier accessibility for motorists in the project area.

Roadway Realignments and Connections

Under Build Alternative 1, Cajalco Road would be realigned between west of Lake Mathews Drive and La Sierra Avenue. The purpose of the realignment is to reduce the curves required along Cajalco Road, which improves the safety of the roadway and allows for increased speeds.

This realignment benefits the Lake Mathews community by placing the new segment of widened and higher-capacity roadway farther from existing homes, and vehicles traveling between Corona and Perris would no longer need to travel directly through the portion of the Lake Mathews residential community that fronts Cajalco Road. The redirection of traffic north of the residences would occur within the LM MSHCP area that would be fenced from access.

South of the existing segment of Cajalco Road west of Lake Mathews Drive, a new road connection approximately 1,350 feet in length would connect Dirt Road to Richey Way. The eastern terminus of Richey Way at Lake Mathews Drive would also be widened slightly and graded. This new road connection would provide emergency access as well as improved connectivity and accessibility within the Lake Mathews community. Because Dirt Road and Richey Way are existing roadways that are accessible by the public, the new connection would not create new access to previously inaccessible areas; it would remove an existing curve on Cajalco Road and enhance access and circulation within the Lake Mathews community.

The intersection of Gustin Road with Cajalco Road would be shifted approximately 265 feet to the west to align with Cowan Road and create a new four-way intersection. A cul-de-sac would be placed at the northern terminus of the existing Gustin Road and Gustin Road would be realigned through undeveloped parcels to intersect with Cajalco Road west of the cul-de-sac. The change would redirect traffic away from residences east of Gustin Road and closer to the Lake Mathews Market. Access to the undeveloped parcels exists under current conditions and would not be increased or decreased as a result of the Gustin Road realignment. Because the Lake Mathews Market is currently accessible available via Gustin Road and Cowan Road, the realignment of Gustin Road would not introduce new access to the market.

Between Carpinus Drive and Alexander Street, Cajalco Road eastbound and westbound lanes would be divided, and a maximum right of way width of approximately 400 feet utilized to accommodate a new bridge over Cajalco Creek just west of Barton Street. Access to undeveloped lands north and south of the divided road segment would not increase because design elements that would promote access such as roadway turnoffs or parking areas would not be included, and the roadway would be fenced on the north side between Carpinus Drive and Alexander Street and on the south side between Carpinus Drive and Barton Street.

Build Alternative 1 would not provide new access to areas that are currently undeveloped; however, the increased capacity of Cajalco Road is anticipated to improve east-west mobility, traffic flow, and travel times along Cajalco Road. This can allow for increased access to businesses along Cajalco Road and to undeveloped areas that can be accessed by roadways that connect with Cajalco Road. There is potential for commercial and residential development with increased accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans.

Traffic Flow Controls

A comprehensive field review of intersection lane configurations and traffic control devices was completed for all build alternatives for this project. Median areas, turn lanes, and turn pockets would be placed at designated locations to accommodate through traffic and control cross-traffic movement. Under Build Alternative 1, new signals are proposed at the following intersections with Cajalco Road: Eagle Canyon Road, Cajalco Road west of Lake Mathews Drive (new

intersection), Lake Mathews Drive, Archer Road, Kirkpatrick Road, Cowan Road/Gustin Road, Carpinus Drive, and Seaton Avenue. The signals would replace the stop signs currently used to control traffic entering Cajalco Road at these intersections. The signals would allow for improved control of cross-traffic and traffic flow, as well as pedestrian crossing, intersection safety lighting, signing, and striping.

Medians of various widths and types are proposed to provide for the separation of opposing traffic, control cross-traffic, provide a recovery area for out-of-control vehicles, and allow space for speed changes and for left and U-turns. Left-turn lanes and right-turn pocket lanes are also proposed to be constructed along the roadway at selected intersections to accommodate through traffic and control cross-traffic movement. These left- and right-turn lanes would be designed to accommodate vehicles with trailers and provide alternate access options for local residents and business owners. These changes would affect current local access patterns for residents and businesses that directly front Cajalco Road. Regional access patterns would not be changed under this alternative. However, Build Alternative 1 would improve interregional travel by improving east-west mobility in Riverside County.

Transit and Pedestrian Facilities

Build Alternative 1 would replace existing bus stops utilized by Riverside Transit Agency (RTA) along Cajalco Road with improved bus pull-outs that would allow for buses to fully exit travel lanes and through traffic at designated stops. The improved mobility along Cajalco Road between Corona and Perris would be expected to benefit both local and regional commuters that use Cajalco Road and RTA to connect with Metrolink's 91/Perris Valley Line in Perris and the Corona Transit Center in Corona.

Americans with Disabilities Act (ADA)-compliant sidewalks would be constructed along one side of Cajalco Road in some locations through the Mead Valley community where residential and commercial properties are present to improve local pedestrian movement. Traffic signal and crosswalk improvements are also proposed to assist with crossing Cajalco Road, which would benefit community members and schools and would provide more pedestrian access to local community members.

b. How, if at all, do the project type, project location, and growth-pressure potentially influence growth?

Roadway widening and capacity-increasing projects have potential to indirectly influence growth by creating conditions that attract additional residents or new economic activity. In general, a roadway widening project may affect the overall growth in the area studied, the location of growth within the area, and the rate of growth by providing new access, more direct access, or an improved level of service (LOS) on existing roadways. Growth expected to occur within the project vicinity is anticipated to occur primarily through infill development in designated parts of the county and cities per local land use plans and zoning.

As can be seen on Figure 3.3-1, the planned projects in the project vicinity are primarily along the shared portion of the project alignment on the western end of the project terminus near Temescal Canyon Road in Corona (Projects 4 through 7), near the shared portion of the alignment on the eastern terminus near Cajalco Road in Mead Valley (Projects 16 through 18 and 20 through 22), and in the City of Perris near the Ramona Expressway Projects 24 through

29). These areas are consistent with the County's plan for infill and development to occur in undeveloped/vacant lands, and in residential and business/industrial areas (see Figure 3.3-1). This indicates that the planned development of the project area would occur regardless of implementation or operation of any of the build alternatives.

Project Type

This project is a capacity-increasing transportation project. Under Build Alternative 1, the existing two-lane Cajalco Road facility would be widened to four lanes (two eastbound and two westbound) between east of Temescal Creek Bridge and Harvill Avenue. Between Temescal Canyon Road and Temescal Creek Bridge, two eastbound lanes would be added, and between Harvill Avenue and I-215 southbound ramps, two additional through lanes (one in each direction) would be added, for a total of six through lanes along these segments of Cajalco Road. Roadway realignments would also occur between the Temescal Creek Bridge and Lake Mathews Drive to reduce existing curves. Median areas, turn lanes, and turn pockets would be placed at designated locations to accommodate through traffic and control cross-traffic movement. Refer to Figures 2.2-1 and 2.2-3 in Chapter 2, *Project Alternatives*.

As described in Section 3.1, *Land Use*, Cajalco Road is being improved in accordance with the County of Riverside General Plan Circulation Element. The General Plan Circulation Element, Figure C-1, classifies Cajalco Road as an Expressway, with a minimum right of way of 184 feet to 220 feet. The proposed right of way for Cajalco Road varies throughout the project limits. Between Temescal Canyon Road and Temescal Canyon Bridge, the proposed roadway right of way would vary between approximately 115 and 145 feet; between Temescal Canyon Bridge and Carpinus Drive, approximately 120 and 128 feet; between Carpinus Drive and Alexander Street, approximately 120 and 400 feet; between Alexander Street and Harvill Avenue, approximately 85 and 135 feet; and between Harvill Avenue and I-215, approximately 120 and 145 feet.

While the total roadway right of way width exceeds the width identified for Cajalco Road in the General Plan (220 feet) between Alexander Street and Carpinus Drive, the approximately 400-foot section of right of way would be necessary to accommodate the proposed bridge while avoiding sensitive resources between the east- and westbound lanes. Between Temescal Canyon Bridge and Harley John Road, project impacts would extend beyond the proposed 128-foot roadway right of way to accommodate slope easements and appurtenant facilities. This would be consistent with the general plan designation.

Project Location

The proposed project is largely in a semi-rural, partially developed area of unincorporated Riverside County. The cities of Corona, Riverside, and Perris are to the west, north, and east, respectively. Build Alternative 1 generally follows existing Cajalco Road through the established communities of Mead Valley, Lake Mathews, and Temescal Canyon, as well as adjacent to lands committed to conservation under the WRC MSHCP, LM MSHCP, and SKR HCP, and lands committed to water storage and management (Lake Mathews).

Build Alternative 1 is intended to alleviate existing patterns of congestion rather than create a new route to an area not currently served by major transportation routes. Build Alternative 1 would promote better circulation and safety along Cajalco Road. While the improvements would increase capacity of Cajalco Road, Build Alternative 1 is not expected to substantially influence

growth within the region because it is identified in the SCAG RTP/SCS regional projections and would not subject new areas to development that are not currently accessible. Build Alternative 1 is consistent with the SCAG RTP/SCS. Build Alternative 1 would conflict with the current LM MSHCP. Because the LM MSHCP does not currently accommodate the transportation improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Changes in the LM MSHCP as well as changes to the lands managed by the LM MSHCP would be addressed by mitigation coordinated with MWD and other responsible agencies. Build Alternative 1 is not anticipated to conflict with the goals or policies of any other relevant plans and programs.

Growth Pressure

Compared to eastern Riverside County, the western portion of the County contains the greatest concentration of population and has experienced the greatest growth pressures. The majority of this population is concentrated in the incorporated cities.

Because this is a transportation project, along with the semi-rural, partially developed conditions of the project area and the constraints to growth, such as the limited quantity of developable land and considerable environmental constraints, the proposed project is not expected to result in direct impacts related to growth in the form of providing access to new areas that are currently inaccessible. However, it is possible that the project, including the associated increased capacity and reduced travel times, could make areas surrounding employment centers, where developable land is still available, more appealing for future development if peak travel commute times are reduced. This could result in indirect effects related to growth in the form of growth pressure on surrounding areas that can support future growth. There is potential for commercial and residential development with increased accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans.

Build Alternative 1 would not directly promote additional growth within the region. Build Alternative 1 could indirectly contribute to growth pressure in the region near the shared alignment near Temescal Canyon Road where there are residential and industrial land uses, and the eastern end of the proposed project that is shared among the three build alternatives where there is residential, undeveloped, industrial, and commercial land uses, more appealing for future growth by reducing congestion and resulting in travel time savings for commuters. Planned growth in the region is not dependent on the proposed project and is not expected to be substantially influenced by the proposed project.

Growth in the Cities of Corona, Riverside, and Perris is expected to be planned infill development that would occur independent of the proposed project. Although the limits of the City of Riverside are not within a half mile of the project alignments, the City is included in this analysis because it is a large city in the project region that connects with the project via La Sierra Avenue and other north/south County roadways. The Cities of Corona and Perris are included, as small portions are within the project footprint. Additionally, with limited remaining land permitted for development, as community land use designations severely limit the amount of development per acre and designated open space and conservation areas prohibit development,

the project, as proposed, would not accommodate development or potential growth-inducing facilities.

Therefore, in terms of project location, the proposed project would not be anticipated to result in substantial direct growth-related impacts; however, it could result in indirect impacts in the form of growth pressure for areas in the vicinity of the shared alignment near Temescal Canyon Road on the western terminus of the project, and also on shared project alignment near the eastern terminus where additional development could occur. There is potential for commercial and residential development with increased accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans

c. Is project-related growth reasonably foreseeable as defined by NEPA?

Project-related growth is not reasonably foreseeable. As discussed above, transportation improvements under Build Alternative 1 would occur in an area with limited potential for development and would not provide access to areas previously inaccessible to the general public. Thousands of acres within the project study area are committed to conservation under the WRC MSHCP, LM MSHCP, and SKR HCP, and would not accommodate development or potential growth-inducing facilities.

Build Alternative 1 is identified in SCAG's 2021 Federal Transportation Improvement Program (FTIP) as a planned and programmed project, and is consistent with facilitating existing and planned growth rather than influencing regional growth. There are a variety of existing and planned land uses within the project area, such as residential, commercial, industrial, mixed-use, and open space. The circulation elements of the general plans of Riverside County and the cities that comprise the project area promote transportation improvements to help address planned growth. Refer to Section 3.1, *Land Use*, for a full list of the relevant policies. In addition, Build Alternative 1 would improve interregional travel by improving east-west mobility in Riverside County without influencing regional growth.

Based on the aforementioned semi-rural and dedicated conservation lands condition of the project area and the fact that the project type is a planned transportation project planned to anticipate future growth rather than facilitate it, the proposed project is not expected to result in substantial direct impacts related to growth. It is reasonably foreseeable that the reduced congestion and travel time savings on Cajalco Road between Corona and Perris achieved by the proposed project could indirectly contribute to growth pressure in areas where additional growth could occur by increasing accessibility in the region. The proposed project would not remove or change existing obstacles to growth, such as the availability of water or other utilities or service systems, the presence of resource constraints, public attitudes toward growth, land use policy or zoning constraints, or other market constraints; therefore, growth that could occur is expected to be primarily in the form of planned growth, not unplanned growth. This planned growth is expected to occur in areas where developable land that is already zoned or designated for residential and/or commercial land uses is available.

d. If project-related growth is reasonably foreseeable, would it affect resources of concern?

While Build Alternative 1 would result in modifications to accessibility, the transportation improvements would occur in areas with limited potential for development due to land use constraints and the fact that the majority of the Build Alternative 1 alignment is along an existing transportation corridor, and access to areas previously inaccessible would not occur.

Build Alternative 1 would permanently acquire 218 acres of property and would require the following acquisitions: full acquisition of 17 residential parcels, full acquisition of two nonresidential parcels, partial acquisition of 67 residential parcels, partial acquisition of five nonresidential parcels, and partial acquisition of 149 vacant parcels. In addition, roadway alignment modifications along Cajalco Road would result in the acquisition and conversion of lands from the LM MSHCP area, including the LMR; construction of a new, secondary access between Lake Mathews Drive and Dirt Road would also result in the conversion of portions of residential-agricultural zoned properties to transportation. These acquisitions would change land uses from their current uses to that of a transportation facility. However, the acquired residences and businesses that require relocation represent a small percentage (0.002 percent of all residences and 0.005 percent of all businesses) of the existing residences and businesses within Riverside County, as there are approximately 831,400 housing units and 36,500 businesses within the County (U.S. Census Bureau 2015).

The project is planned for in the Riverside County General Plan. Land use changes as a result of the conversion of conservation lands to a transportation facility would require the coordination of mitigation, including replacement lands, with the managing resource agencies. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements.

Future planned development in the Cities of Riverside, Corona, and Perris is anticipated to be primarily developments that are currently in progress and infill development. Infill development is not expected to result in impacts on resources of concern other than water, as many of the other resources of concern, such as geologic conditions or the March Air Reserve, are unlikely to be affected by potential growth. If water availability is constrained at the time of future development then construction of the project would put more stress on the resource of concern. However, future infill projects would be subject to environmental review and would be required to identify adequate water supplies prior to development; therefore, impacts related to water supply from infill projects are not expected to be significant and should not constrain future growth in the project vicinity.

New development or redevelopment is expected to occur in the form of planned development within existing undeveloped areas that are zoned or otherwise designated for residential and/or commercial development in the Cities of Corona and Perris and the unincorporated communities of Mead Valley, Lake Mathews/Gavilan Hills, Victoria Grove, Woodcrest/Mockingbird Canyon, Lake Hills/Home Gardens, and Temescal Canyon. Such areas that meet these criteria have been identified to assess the potential for impacts on resources of concern. The build alternatives would not be expected to substantially influence the amount, location, and/or distribution of growth in the cities, unincorporated areas, or the portion of Riverside County within the project

study area because the project would not encourage population density, construction of new housing, or opportunities for capital investment by the public or private sectors.

Build Alternative 1 is not anticipated to substantially influence growth to an extent that other resources of concern, as identified in each of the general plans or area specific plans, would be negatively affected by any secondary growth impacts related to the project, as the project would not necessitate the construction of housing, employment, and goods and services associated with population increases caused by, or attached to, new development.

Based on the analysis provided in this section, reasonably foreseeable growth is expected to be primarily planned growth that could occur as a result of growth pressure that could be indirectly influenced by the reduced congestion and travel time savings on Cajalco Road achieved by the proposed project.

Future Six-Lane Facility (Build Alternative 1)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not result in additional growth because accessibility would not change and new roadways would not be constructed in currently undeveloped areas. Because project-related growth is not reasonably foreseeable, further analysis of growth-related effects is not required.

Lake Mathews MSHCP (Build Alternative 1)

Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. The implementation of roadway improvements within the LM MSHCP boundary, however, would not facilitate or otherwise substantially influence growth as the LM MSHCP restricts development within its boundaries, and lands would continue to be committed to conservation. Therefore, growth is not planned for, nor would it occur, within its boundaries. Because project-related growth is not reasonably foreseeable, further analysis of growth-related effects is not required.

3.3.3.4 Build Alternative 2C—Modified Cajalco Road Alignment

a. How, if at all, does the project potentially change accessibility?

Build Alternative 2C would have similar effects on accessibility as those described under Build Alternative 1. Under Build Alternative 2C, a segment of Cajalco Road south of Lake Mathews, between La Sierra Avenue to just west of Lake Mathews Drive, would be realigned as part of a new roadway segment, as opposed to widening of an existing roadway. The purpose of the realignment of Cajalco Road is to reduce the curves required along Cajalco Road, which improves the safety of the roadway and allows for increased speeds.

Increased Capacity

Build Alternative 2C includes improvements to 16.3 miles of Cajalco Road, with increased capacity on Cajalco Road with two additional through lanes and multiple turn pockets between Temescal Canyon Road and I-215; future Cajalco Road improvements that would address projected growth and mobility needs would be accommodated with right of way for two additional future lanes between Temescal Canyon Road and Harley John Road.

The increased capacity of Cajalco Road is anticipated to improve east-west mobility, traffic flow, and travel times along Cajalco Road, which is an existing transportation corridor. This can allow for increased access to businesses along Cajalco Road and to undeveloped areas that can be accessed by roadways that connect with Cajalco Road. However, no new access will be provided regionally, as this is an existing transportation corridor. This build alternative addresses projected Cajalco Road capacity deficiency by adding two additional lanes and turn pockets and includes right of way for two additional future lanes. Increased capacity could provide easier accessibility for motorists in the project area.

Roadway Realignments and Connections

Under Build Alternative 2C, the project would generally follow the existing alignment of Cajalco Road between I-215 to west of Lake Mathews Drive, and between La Sierra and Temescal Canyon Road. Between west of Lake Mathews Drive and La Sierra Avenue, a new four-lane segment of Cajalco Road would be constructed north of existing Cajalco Road. Existing Cajalco Road between La Sierra and just west of Lake Mathews Drive would be closed to public traffic. The existing pavement in this portion of existing Cajalco Road would be partially or completely removed and fenced to prevent access. The remaining dirt, gravel, or partially paved road may be used by MWD for access in managing the Lake Mathews dam and reservoir facilities, and by MWD and the Riverside County Habitat Conservation Agency for managing areas of the LMR and Lake Mathews-Estelle Mountain Core Reserve.

Similar to Build Alternative 1, a cul-de-sac would be added at a new terminus of existing Cajalco Road west of Hollis Lane/Lynette Lane, and the remaining segment of existing Cajalco Road west to the new, realigned Cajalco Road would be removed. A connection between Dirt Road and Lake Mathews Drive would also be constructed for secondary access to residences in the Hollis Lane/Lynette Lane area.

In addition to the proposed realignment of sections of Cajalco Road identified in Section 2.2.1.1, *Common Features of the Build Alternatives*, in Chapter 2, *Project Alternatives*, additional sections of Cajalco Road would be realigned between west of La Sierra Avenue and west of Lake Mathews Drive.

Existing Cajalco Road between La Sierra and just west of Lake Mathews Drive contains conservation lands on either side of it, and it would be closed to public traffic. The existing pavement in this portion of existing Cajalco Road would be partially or completely removed, and fenced to prevent access. The remaining dirt, gravel, or partially paved road may be used by MWD for access in managing the LMR, and Lake Mathews dam and reservoir. This new roadway would not substantially change accessibility because there would be no public access to adjacent MWD properties along this portion of the roadway. Because no new public access points would be created by the new roadway, access to this area would not change. However,

there is potential for commercial and residential development with increased accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans.

Traffic Flow Controls

Similar to Alternative 1, Alternative 2C would offer medians of various widths and types to provide for the separation of opposing traffic, control cross traffic, provide a recovery area for out-of-control vehicles, and allow space for speed changes and for left and U-turns. Additionally, similar to Build Alternative 1, a cul-de-sac would be added at a new terminus of existing Cajalco Road west of Hollis Lane/Lynette Lane, and the remaining segment of existing Cajalco Road west to the new, realigned Cajalco Road would be removed. As stated above, a connection between Dirt Road and Lake Mathews Drive would also be constructed for secondary access to residences in the Hollis Lane/Lynette Lane area, thus changing local access patterns in this area. Regional access patterns would not be changed under this alternative. However, Build Alternative 2C would improve interregional travel by improving east-west mobility in Riverside County.

Transit and Pedestrian Facilities

Build Alternative 2C would replace the same bus stops along Cajalco Road as Build Alternative 1 and result in the improved mobility identified under Build Alternative 1 for Cajalco Road between Corona and Perris; therefore, Build Alternative 2C would be expected to benefit both local and regional commuters that use Cajalco Road and RTA to connect with Metrolink's 91/Perris Valley Line in Perris and Corona Transit Center in Corona.

b. How, if at all, do the project type, project location, and growth-pressure potentially influence growth?

As with Build Alternative 1, Build Alternative 2C has limited potential to influence growth because it is in an area with limited potential for development and would not create a new route to an area not currently served by a major transportation route. It is also included in the SCAG RTP/SCS regional projections and would not subject new areas to development.

As can be seen on Figure 3.3-1, the planned projects in the project vicinity are primarily along the shared portion of the project alignment on the western end of the project terminus near Temescal Canyon Road in Corona (Projects 4 through 7), near the shared portion of the alignment on the eastern terminus near Cajalco Road in Mead Valley (Projects 16 through 18 and 20 through 22), and in the City of Perris near the Ramona Expressway (Projects 24 through 29). In addition, there are three planned projects near El Sobrante Road where Build Alternative 4 would be constructed (Projects 11 through 13, with 14 a little more to the north). These areas are consistent with the County's plan for infill and development to occur in undeveloped/vacant lands, and in residential and business/industrial areas (see Figure 3.3-1). This indicates that the planned development of the project area would occur regardless of implementation or operation of any of the build alternatives.

Project Type

This project is a capacity-increasing transportation project. Under Build Alternative 2C (see Figure 2.2-4 in Chapter 2, *Project Alternatives*), the project would generally follow the existing alignment of Cajalco Road between I-215 to west of Lake Mathews Drive, and between La Sierra and Temescal Canyon Road. Between west of Lake Mathews Drive and La Sierra Avenue, a new four-lane segment of Cajalco Road would be constructed north of existing Cajalco Road. Existing Cajalco Road between La Sierra and just west of Lake Mathews Drive would be closed to public traffic. The existing pavement in this portion of existing Cajalco Road would be partially or completely removed and fenced to prevent access. The remaining dirt, gravel, or partially paved road may be used by MWD for access in managing the Lake Mathews dam and reservoir facilities, and by MWD and the Riverside County Habitat Conservation Agency for managing areas of the LMR and Lake Mathews-Estelle Mountain Core Reserve.

Build Alternative 2C is also being improved in accordance with the County of Riverside General Plan Circulation Element, as it has the same proposed right of way along Cajalco Road. See the discussion above for Build Alternative 1, or refer to Section 3.1.2.2 in Section 3.1, *Land Use*, for more information. Therefore, Build Alternative 2C would be consistent with the general plan designation.

Project Location

The proposed project is in a largely semi-rural, partially developed area of unincorporated Riverside County. The Cities of Corona, Riverside, and Perris are to the west, north, and east, respectively. Under Build Alternative 2C, the project would generally follow the existing alignment of Cajalco Road between I-215 to west of Lake Mathews Drive, and between La Sierra and Temescal Canyon Road. Between west of Lake Mathews Drive and La Sierra Avenue, a new four-lane segment of Cajalco Road would be constructed north of existing Cajalco Road. Existing Cajalco Road between La Sierra and just west of Lake Mathews Drive would be closed to public traffic.

The discussion under *Project Location* for Build Alternative 1 also applies for Build Alternative 2C.

Growth Pressure

The discussion under *Growth Pressure* for Build Alternative 1, above, also applies for Build Alternative 2C.

c. Is project-related growth reasonably foreseeable as defined by NEPA?

For the same reasons as those described under Build Alternative 1, project-related growth is not reasonably foreseeable under Build Alternative 2C.

d. If project-related growth is reasonably foreseeable, would it affect resources of concern?

Build Alternative 2C would permanently acquire 239 acres of property and would require the following acquisitions: full acquisition of 17 residential parcels, full acquisition of two nonresidential parcels, partial acquisition of 67 residential parcels, partial acquisition of five nonresidential parcels, and partial acquisition of 153 vacant parcels. Furthermore, Build

Alternative 2C would result in the acquisition and removal of lands from the SKR HCP and LM MSHCP areas, including the LMR. These acquisitions would change land uses from their current uses to that of a transportation facility. The acquired residences and businesses that require relocation represent a small percentage (0.002 percent of all residences and 0.005 percent of all businesses) of the existing residences and businesses within Riverside County, as there are approximately 831,400 housing units and 36,500 businesses within the county (U.S. Census Bureau 2015). Land use changes as a result of the conversion of conservation lands to a transportation facility, however, would require the coordination of mitigation, including replacement lands, with the managing resource agencies.

While Build Alternative 2C would result in modifications to accessibility, the transportation improvements would occur in areas with limited potential for development due to land use constraints, and access to areas previously inaccessible would not occur. There is potential for commercial and residential development with increased accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans

Build Alternative 2C is not anticipated to substantially influence growth to an extent that other resources of concern, as identified in each of the general plans or area specific plans, would be negatively affected by any secondary growth impacts related to the project, as the project would not necessitate the construction of housing, employment, and goods and services associated with population increases caused by, or attached to, new development.

Based on the preceding first-cut screening, project-related growth is not reasonably foreseeable, and further analysis of growth-related effects is not required.

Future Six-Lane Facility (Build Alternative 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not result in additional growth because accessibility would not change and new roadways would not be constructed in currently undeveloped areas. Because project-related growth is not reasonably foreseeable, further analysis of growth-related effects is not required.

Lake Mathews MSHCP (Build Alternative 2C)

Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. The implementation of roadway improvements within the LM MSHCP boundary, however, would not facilitate or otherwise substantially influence growth as the LM MSHCP restricts development within its boundaries and lands would continue to be committed to conservation. Therefore, growth is not planned for, nor would it occur, within its boundaries. Because project-related growth is not reasonably foreseeable, further analysis of growth-related effects is not required.

3.3.3.5 Build Alternative 4—El Sobrante Alignment

a. How, if at all, does the project potentially change accessibility?

The widening of Cajalco Road, La Sierra Avenue, and El Sobrante Road has potential to indirectly influence growth by reducing barriers to growth by creating conditions that attract additional residents or new economic activity. In general, a roadway widening project may affect the overall growth in the area studied, the location of growth within the area, and the rate of growth by providing new access, more direct access, or an improved LOS on existing roadways. Build Alternative 4 would result in modifications to accessibility by increasing the capacity of portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road, and adding traffic flow controls such as center medians and turn lanes. The increased capacities of Cajalco Road, La Sierra Avenue, and El Sobrante Road are anticipated to improve east-west mobility and traffic flow along these roadways.

Increased Capacity

Build Alternative 4 includes improvements to 9.4 miles of Cajalco Road. Cajalco Road capacity would be increased with two additional through lanes and multiple turn pockets between Temescal Canyon Road and La Sierra Avenue, and Cowan Road and I-215; future Cajalco Road improvements that would address projected growth and mobility needs would be accommodated within the right of way for two additional future lanes between Temescal Canyon Road and La Sierra Avenue and an additional two lanes on Cajalco from El Sobrante Road to I-215.

Build Alternative 4 would increase capacity of Cajalco Road, La Sierra Avenue, and El Sobrante Road with two additional through lanes (one eastbound and one westbound), and multiple turn pockets and turn lanes, between Temescal Canyon Road and I-215. Travel distance would increase, however, affecting east-west mobility in comparison to Build Alternatives 1 and 2C. This build alternative does not address projected Cajalco Road capacity deficiency between west of Hollis Lane and Lake Mathews Drive, and between Lounsberry Road and Harley John Road. Increased capacity could provide easier accessibility for motorists in the project area but is not anticipated to provide increased access on a regional scale, as the widenings would occur on existing roadways.

Roadway Realignments and Connections

Between Gustin Road and I-215, the improvements would be identical to those under Build Alternatives 1 and 2C. Between La Sierra Avenue and Temescal Canyon Road, the western portion of Build Alternative 4 would extend south to existing Cajalco Road, and then west along Cajalco Road to Temescal Canyon Road. Between El Sobrante Road and Cajalco Road, La Sierra Avenue would be realigned to the west of the existing La Sierra Avenue alignment, and an approximately 1,800-foot-long arch bridge constructed along the realigned section of La Sierra Avenue, north of the transition with Cajalco Road.

Between the realigned La Sierra Avenue intersection with Cajalco Road and Temescal Canyon Road, the roadway improvements would be the same as proposed under Build Alternatives 1 and 2C. The portion of Cajalco Road between La Sierra Avenue and Gustin Road would remain in its current configuration. Additional new traffic signals would be installed at the realigned

intersection of El Sobrante Road with La Sierra Avenue/main MWD Lake Mathews facility entrance, and the new intersection of El Sobrante and Harley John Road.

Build Alternative 4 would include realignment of segments of Cajalco Road, La Sierra Avenue, and El Sobrante Road, in addition to widening existing segments of roadway. The realigned, new segments would occur east of existing La Sierra Avenue, where there would be a new transition between Cajalco Road and La Sierra Avenue; another new segment would occur east of Lake Mathews where El Sobrante Road would transition and connect with Cajalco Road. The southern terminus of Harley John Road would become a cul-de-sac north of the new El Sobrante/Cajalco Road transition. These new roadway segments would not create new public access because there are limited entrances and exits along these roadway segments, primarily limited to MWD lands, which are not available for development, and the realigned roadway segments would connect to existing roadways. Because Build Alternative 4 would increase the capacity of existing roadways, and not construct new roadways in currently undeveloped areas, Build Alternative 4 would not provide new access to areas that are currently undeveloped. There is potential for commercial and residential development with increased accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans.

Traffic Flow Controls

Under Build Alternative 4, improvements to existing intersections are proposed and would vary from minor widening and turn pocket additions to complete reconstruction and installation of new signals. New signals are proposed at the following intersections with Cajalco Road: Eagle Canyon Road, Cowan Road/Gustin Road, Carpinus Drive, and Seaton Avenue. New signals are proposed at the following intersections with El Sobrante Road: La Sierra Avenue, McAllister Street, and Mockingbird Canyon Road. The signals would replace the stop signs currently used to control traffic entering Cajalco Road at these intersections. They would allow for improved control of cross-traffic and traffic flow, and would add pedestrian crossing, intersection safety lighting, signing, and striping.

Similar to Build Alternative 1, Build Alternative 4 would offer medians of various widths and types to provide for the separation of opposing traffic, control cross-traffic, provide a recovery area for out-of-control vehicles, and allow space for speed changes and for left and U-turns. Build Alternative 4 would not provide access to areas that were previously inaccessible, and intensification of land uses or removal of residential communities would not occur. The shift in the alignment of La Sierra Avenue would not provide new access to previously inaccessible areas because the new alignment of La Sierra Avenue would still mostly be in an area where roads and access currently exist, not in a new, inaccessible area. However, segments of Build Alternative 4 would extend through an area of conservation land that is currently inaccessible. This area would remain inaccessible to vehicles because Build Alternative 4 would not provide any right or left turns into this conservation area. In addition, the area would remain inaccessible because development is not permitted in the conservation area. Cajalco and El Sobrante Roads are major transportation corridors and would continue to function as such with the implementation of Build Alternative 4.

Transit and Pedestrian Facilities

ADA-compliant sidewalk would be constructed along sections of Cajalco Road within the Mead Valley area. The sidewalk would be designed such that it is consistent with the local general plan Circulation Element. Along Cajalco Road from Harley John Road to Harvill Avenue, curb and gutter and 8-foot-wide shoulders would be provided as part of the proposed project to serve as a combined shoulder/bike lane.

b. How, if at all, do the project type, project location, and growth-pressure potentially influence growth?

As with Build Alternatives 1 and 2C, Build Alternative 4 has limited potential to influence growth because it is located in an area with limited potential for development due to land use and zoning controls such as county and local city general plan land use designations, development restrictions, lands committed to conservation, and lands currently or in the process of being developed. In addition, Build Alternative 4 would not create a new route to an area not currently served by a major transportation route.

Project Type

This project is a capacity-increasing transportation project. For Build Alternative 4, between Gustin Road and I-215, the improvements would be identical to that under Build Alternatives 1 and 2C. Between La Sierra Avenue and Gustin Road, the alignment of Build Alternative 4 differs from the alignments of Build Alternatives 1 and 2C. Under Build Alternative 4, El Sobrante Road would be widened and improved between La Sierra Avenue and Gustin Road, and Cajalco Road would not be widened and improved the length of this segment. In addition, Build Alternative 4 would realign La Sierra Avenue between El Sobrante Road and Cajalco Road.

In the areas that differ from Build Alternatives 1 and 2C, Build Alternative 4 traverses areas zoned for facilities/utilities, agricultural/grazing, undeveloped lands, and conservation/open space (see Figure 3.1-1, Existing Land Uses, in Section 3.1, *Land Use*). Build Alternative 4 would increase the capacity of segments of Cajalco Road, El Sobrante Road, and La Sierra Avenue, responding to transportation needs of population and employment activities. The roadway right of way would vary between 120 and 150 feet and the Circulation Element of the County of Riverside General Plan classifies La Sierra Avenue and El Sobrante Road as Mountain Arterial (110-foot right of way) and Arterial (128-foot right of way), respectively. Build Alternative 4 would not preclude the construction of future transportation facilities identified in the Circulation Element. This would be consistent with the County of Riverside General Plan designation.

Project Location

The proposed project is in a largely semi-rural, partially developed area of unincorporated Riverside County. The Cities of Corona, Riverside, and Perris are to the west, north, and east, respectively. Between La Sierra Avenue and Gustin Road, the alignment of Build Alternative 4 differs from the alignments of Build Alternatives 1 and 2C. Under Build Alternative 4, El Sobrante Road would be widened and improved between La Sierra Avenue and Gustin Road, and Cajalco Road would not be widened and improved the length of this segment. In addition,

Build Alternative 4 would realign La Sierra Avenue between El Sobrante Road and Cajalco Road.

Build Alternative 4 is intended to alleviate existing patterns of congestion rather than create a new route to an area not currently served by major transportation routes. Build Alternative 4 would promote better circulation and safety along Cajalco Road. While the improvements would increase capacity of Cajalco Road, Build Alternative 4 is not expected to substantially influence growth within the region because it is identified in the SCAG RTP/SCS regional projections and would not subject new areas to development that are not currently accessible. Build Alternative 4 is inconsistent with the SCAG RTP/SCS funded project description, although it is consistent with and the SCAG RTP/SCS goals 1 through 5. Additionally, Build Alternative 4 would conflict with the current LM MSHCP. Changes in the LM MSHCP as well as changes to the lands managed by the LM MSHCP would be addressed by mitigation coordinated with MWD and other responsible agencies. Build Alternative 4 is not anticipated to conflict with the goals or policies of any other relevant plans and programs.

Growth Pressure

The discussion under *Growth Pressure* for Build Alternative 1, above, also applies for Build Alternative 4.

c. Is project-related growth reasonably foreseeable as defined by NEPA?

For the same reasons as those described under Build Alternative 1, project-related growth is not reasonably foreseeable under Build Alternative 4.

d. If project-related growth is reasonably foreseeable, would it affect resources of concern?

While Build Alternative 4 would result in modifications to accessibility, the transportation improvements would occur in areas with limited potential for development due to land use constraints, and access to areas previously inaccessible would not occur.

Build Alternative 4 would permanently acquire 240 acres of property and would require the following acquisitions: full acquisition of 18 residential parcels, full acquisition of two nonresidential parcels, partial acquisition of 69 residential parcels, partial acquisition of 12 nonresidential parcels, and partial acquisition of 186 vacant parcels. Partial acquisition of the vacant and residential parcels would be necessary for construction of a new connection between Cajalco Road and El Sobrante Road south of Harley John Road, and new terminus of Harley John Road with cul-de-sac north of the new connection. These acquisitions would change land uses from their current uses to that of a transportation facility. However, the acquired residences and businesses that require relocation represent a small percentage (0.002 percent of all residences and 0.005 percent of all businesses) of the existing residences and businesses within Riverside County, as there are approximately 831,400 housing units and 36,500 businesses within the county (U.S. Census Bureau 2015). Therefore, appreciable land use change would not occur as a result of the implementation of Build Alternative 4. However, the new connection between El Sobrante Road and Cajalco Road, as well as other roadway alignment modifications along El Sobrante Road, Cajalco Road, and La Sierra Avenue, would result in the acquisition and conversion of lands from the LM MSHCP area.

Future planned development in the Cities of Riverside, Corona, and Perris is anticipated to be primarily developments that are currently in progress and infill development. Infill development is not expected to result in impacts on resources of concern other than water, if water availability is constrained at the time of future development. Future infill projects would be subject to environmental review and would be required to identify adequate water supplies prior to development; therefore, impacts related to water supply from infill projects are not expected to be significant.

The build alternatives would not be expected to substantially influence the amount, location, and/or distribution of growth in the cities, unincorporated areas, or the portion of Riverside County within the project study area because the project would not encourage population density, construction of new housing, or opportunities for capital investment by the public or private sectors.

Build Alternative 4 is not anticipated to substantially influence growth to an extent that other resources of concern, as identified in each of the general plans or area specific plans, would be negatively affected by any secondary growth impacts related to the project, as the project would not necessitate the construction of housing, employment, and goods and services associated with population increases caused by, or attached to, new development.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not result in additional growth because accessibility would not change and new roadways would not be constructed in currently undeveloped areas. Because project-related growth is not reasonably foreseeable, further analysis of growth-related effects is not required.

Lake Mathews MSHCP (Build Alternative 4)

Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. The implementation of roadway improvements within the LM MSHCP boundary, however, would not facilitate or otherwise substantially influence growth as the LM MSHCP restricts development within its boundaries and lands would continue to be committed to conservation. Therefore, growth is not planned for, nor would it occur, within its boundaries. Because project-related growth is not reasonably foreseeable, further analysis of growth-related effects is not required.

Conclusion for Build Alternatives 1, 2C, and 4

The widened and realigned roadway would provide greater capacity and reduced travel times, and therefore improved accessibility for the area, and this may be an attractant for growth that is anticipated. There is potential for commercial and residential development with increased

accessibility and traffic, which may result in some development and conversion of open space land; however, this growth is consistent with local plans and is anticipated in these plans.

Although only Build Alternative 1 is specifically mentioned in the 2021 FTIP, the proposed project as a whole is identified in the 2021 FTIP as a planned and programmed project and is consistent with facilitating planned growth. While the proposed project may result in a change in travel patterns for some drivers in the area, as many may choose to use Cajalco Road under Alternative 1 or 2C, and El Sobrante Road under Alternative 4, the proposed project itself would not cause development to occur in the region due to land use controls such as County and local city general plan land use designations, development restrictions, lands committed to conservation, and lands currently or in the process of being developed.

The build alternatives would not be expected to substantially influence the amount, location, and/or distribution of growth in the cities, unincorporated areas, or the portion of Riverside County within the project study area because the project would not encourage population density, construction of new housing, or opportunities for capital investment by the public or private sectors. In addition, under the Community and Environmental Transportation Acceptability Process project, which would provide a western transportation corridor between I-15 and I-215 and an alternate east-west route to Cajalco Road, the anticipated traffic conditions would remain relatively similar, with or without the proposed project. Therefore, the build alternatives would not induce traffic to be diverted to Cajalco Road. Consequently, the build alternatives are not anticipated to substantially affect the rate or location of future development within the project area or region.

Based on the preceding first-cut screening, project-related growth is not reasonably foreseeable, and further analysis of growth-related effects is not required.

3.3.3.6 No-Build Alternative

The No-Build Alternative would not address projected Cajalco Road capacity deficiency between west of Hollis Lane and Lake Mathews Drive, and between Lounsberry Road and Harley John Road. The No-Build Alternative would not result in growth impacts because an expanded transportation facility would not be constructed. However, all projects identified in Table 3.25-1, Planned Projects within Project Vicinity, would be constructed even if the No-Build Alternative were selected. The anticipated growth in Riverside County by SCAG and as identified in the relevant general and area specific plans remains unchanged under the No-Build Alternative. Because project-related growth is not reasonably foreseeable, further analysis of growth-related effects is not required.

3.3.4 Avoidance, Minimization, and/or Mitigation Measures

Because project-related growth is not reasonably foreseeable, and thus is anticipated to have a less-than-significant impact on growth, avoidance, minimization, and/or mitigation measures are not required.

3.4 Community Impacts

3.4.1 Community Character and Cohesion

3.4.1.1 Regulatory Setting

The National Environmental Policy Act (NEPA) of 1969, as amended, established that the federal government use all practicable means to ensure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings (42 United States Code [USC] 4331[b][2]). The Federal Highway Administration (FHWA) in its implementation of NEPA (23 USC 109[h]) directs that final decisions on projects are to be made in the best overall public interest. This requires taking into account adverse environmental impacts, such as destruction or disruption of human-made resources, community cohesion, and the availability of public facilities and services.

Under the California Environmental Quality Act (CEQA), an economic or social change by itself is not to be considered a significant effect on the environment. However, if a social or economic change is related to a physical change, then social or economic change may be considered in determining whether the physical change is significant. Since this project would result in physical change to the environment, it is appropriate to consider changes to community character and cohesion in assessing the significance of the project's effects.

3.4.1.2 Affected Environment

Unless otherwise noted, this section of the Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) was prepared based on information from the *Community Impact Assessment* (CIA) and *Errata* (Caltrans 2018a, 2021) and *Draft Relocation Impact Report* (DRIR) (Caltrans 2018b); public input received during public scoping meetings (September 26 and 29, 2011, and October 25, 2012) and community information meetings; and comments received in response to the Notice of Preparation (NOP) of an EIR (September 2011) and Notice of Intent to Prepare an EIS (September 2012). For a full list of public meetings held and their locations, please refer to Table 5-15 in Chapter 5, *Comments and Coordination*.

The study area for community impacts has been defined to include the following 2015 U.S. Census Bureau census tracts located within 0.5 mile of the proposed project: 414.09, 419.09, 419.10, 420.07, 420.08, 420.09, 420.10, 429.03, and 429.04 (see Figure 3.4-1) (U.S. Census Bureau 2015). The study area is intended to encompass an area where the potential population, housing, and neighborhood impacts of construction and operation of the project would be reasonably foreseeable. Population characteristics such as age, ethnicity, and income are further studied at the census block group level to aid in the characterization of local communities and evaluation of impacts related to the project. Housing characteristics are based on data at the census tract level to include residents in less densely populated areas outside of established neighborhoods. Data for Riverside County (County), City of Corona, and City of Perris are also provided for reference and comparative purposes.

The study area for economic conditions is Riverside County and the Cities of Corona and Perris. The study area for community facilities is the area within 0.5 mile of the build alternatives.

Community characteristics include an array of information reflecting the history, present conditions, and anticipated future of an area and its population. *Cohesion*, an important characteristic of a community, is the degree to which residents have a "sense of belonging" to their neighborhood, a level of commitment of the residents to the community, or a strong attachment to neighbors, groups, and institutions, usually as a result of continued association over time. Cohesion also refers to the degree of interaction among the individuals, groups, and institutions that make up a community.

Study Area Communities

As indicated above, input received from the public was considered in the identification and characterization of communities within the study area. Two public scoping meetings were held in September 2011; the first meeting was held on September 26, 2011, at Tomas Rivera Middle School (21675 Martin Street, Perris, CA 92570), and the second was held on September 29, 2011, at Lake Mathews Elementary School (12252 Blackburn Road, Riverside, CA 92503). Notices for the meetings were distributed to agencies, organizations, interested groups, individuals, and residents within 500 feet of the proposed project and made available on a website and at the County office and local libraries. Two additional public scoping meetings were also held in October 2012; the first meeting was held on October 24, 2012, at Lake Mathews Elementary School in Riverside, and the second was held on October 25, 2012, at Tomas Rivera Middle School in Perris. Multiple community meetings regarding the project were also held; refer to Table 5-15 in Chapter 5, *Comments and Coordination*, for a full list of public meetings held.

Attendees of each scoping meeting had the opportunity to learn about the project and ask questions of representatives from the County involved with the planning process. Attendees were also able to provide input on the proposed alternative alignments and issues to be addressed in the EIR/EIS through comment cards made available at the meetings. A court reporter was present at the public meetings. Verbal comments and comment cards received during the meeting and calls, emails, and comment cards submitted during the public scoping period are summarized in Tables 5-5 and 5-6 in Chapter 5, *Comments and Coordination,* and included in Appendix H.

Comments received from the public, community groups, environmental stakeholder groups, and agencies included following topics: environmental impacts involving biological resources, cultural resources, air quality, and noise; community impacts involving safety, traffic, property access, and property acquisition; and general project inquiries and comments involving project phasing, the project as an economic catalyst, funding equity, information requests, and statements in support of or against the project.

Information provided during the public meetings and public scoping periods was considered along with the information provided in the CIA and DRIR to identify communities within the project area. Based on the information and geographic scale of the project, multiple communities were identified.

There are six distinct communities in the project vicinity: Mead Valley, Lake Mathews, Woodcrest, Victoria Grove, Lake Hills, and Temescal Canyon (see Figure 3.4-2). The community of Mead Valley is immediately west of Interstate 215 (I-215) and is situated north and south of Cajalco Road west to approximately Barton Street. The community of Woodcrest is northeast/east of Lake Mathews, north of Cajalco Road and El Sobrante Road, and shares this

area with the community of Mockingbird Canyon, herein referred to as Woodcrest/Mockingbird Canyon. The community of Lake Mathews is west and south of Lake Mathews and west of the community of Gavilan Hills. While Gavilan Hills is not directly within the vicinity of the project, it is in close proximity to the Lake Mathews community and therefore the communities are herein referred to as Lake Mathews/Gavilan Hills. The community of Victoria Grove is a planned residential community of 1,120 homes immediately northwest of McAllister Street and El Sobrante Road. Situated west of the community of Victoria Grove and La Sierra Avenue, and east of Home Gardens, is the community of Lake Hills. While Home Gardens is not directly within the vicinity of the project, it is in close proximity to the Lake Hills community and therefore the communities are herein referred to as Lake Hills/Home Gardens. Temescal Canyon is north and south of Cajalco Road at the western end of the project. Population characteristics of each community are based in part on the census tract and block group data associated with each community, as identified in Table 3.4-1.

Table 3.4-1. Community Census Tract and Block Groups

Community	Census Tract and Block Group
Mead Valley	Census Tract 420.08 (Block Group 1)[1]
	Census Tract 420.09 (Block Group 3)
	Census Tract 420.10
	Census Tract 429.04
Lake Mathews/Gavilan Hills	Census Tract 414.09 (Block Group 4)[1]
	Census Tract 420.07[1]
	Census Tract 420.08 (Block Group 1)[1]
	Census Tract 429.03 (Block Group 1)[1]
Woodcrest/Mockingbird Canyon	Census Tract 420.08 (Block Groups 1 and 2)
Victoria Grove	Census Tract 414.09 (Block Group 1)
Lake Hills/Home Gardens	Census Tract 414.09 (Block Group 2)
	Census Tract 414.09 (Block Group 3)
Temescal Canyon Community	Census Tract 414.09 (Block Group 4)
	Census Tract 419.09 (Block Group 1)
	Census Tract 419.09 (Block Group 3)
	Census Tract 419.10 (Block Group 1)
	Census Tract 420.07 (Block Group 2)[1]
[1] Census Tracts 414.09 (Block Group 4), 420.07 (Block Group 2) and 420.08 (Block Group 1) encompass more than one community.	

The Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) Lake Mathews Multiple Species Reserve (LMR) is a conservation area that is included in the analysis of community impacts due to changes proposed to the LM MSHCP to allow for the proposed project. The LMR does not contain any residential populations, neighborhoods, housing, or community facilities other than a water resource facility. The communities of Woodcrest, Mockingbird Canyon, Lake Hills, and Victoria Grove border the northern and eastern boundaries of the conservation area, and the Lake Mathews and Gavilan Hills communities border the southern boundary.

Housing Characteristics

As shown in Table 3.4-2, 52.5 percent of housing units in the study area, which includes portions of the Cities of Perris and Corona, are owner-occupied, while 47.5 percent are renter-occupied. The majority of housing in the study area is occupied (93.8 percent), and only 6.2 percent of housing units are vacant (see Table 3.4-2). In addition, as shown in Table 3.4-3, the majority of householders have lived in their housing units for more than 5 years, with 67.6 percent of householders having moved into their housing in 2009 or earlier. A comparison of housing characteristics of the study area with the adjacent Cities of Perris and Corona indicates that the study area has a higher percentage of renter-occupied units (47.5 percent) than the Cities of Corona (34.1 percent) and Perris (40.9 percent). The vacancy rate within the study area (6.2 percent) is similar to the rates in the Cities of Corona (4.2 percent) and Perris (6.4 percent).

Housing characteristics within the study area vary between the communities of Mead Valley, Lake Mathews/Gavilan Hills, Woodcrest/Mockingbird Canyon, Victoria Grove, Lake Hills/ Home Gardens, and Temescal Canyon and share some similarities with the housing characteristics of Riverside County in terms of housing ownership and rentals. The percentages of owner-occupied housing units and renter-occupied housing units within the study area and within Riverside County are 52.5 percent and 55.6 percent, respectively. However, the study area holds a higher percentage of occupied units and a lower vacancy rate (93.8 percent and 6.2 percent) than the County (85.8 percent and 14.2 percent), as well as a higher average number of persons per household for owner- and renter-occupied units (3.75 and 3.88 percent) when compared to the County (3.2 and 3.31 percent).

A comparison of the housing characteristics for each of the communities within the study area indicates a higher percentage of home ownership within the communities (between 64.4 and 86.4 percent) compared to that of the overall study area (52.5 percent) and Riverside County (55.6 percent). Housing characteristics specific to each of the study area communities are described further under each community, below and following Tables 3.4-2 and 3.4-3.

Mead Valley

Within Mead Valley, there are approximately 8,243 housing units, the majority of which are occupied (93.5 percent). Of the occupied units, 64.4 percent are owner-occupied and 35.6 percent are renter-occupied (see Tables 3.4-2 and 3.4-3). The average household size of the owner-occupied units is 4.11 persons per household, and the average household size of renter-occupied units is 4.51 persons per household. In addition, as shown in Table 3.4-3, the majority of householders have lived in their housing units for more than 5 years.

Compared to the housing characteristics of the County and overall study area, the Mead Valley community has a higher percentage of owner-occupied housing units and a lower percentage of renter-occupied housing units. Mead Valley also has a higher percentage of occupied units than that of the County, nearly equal to that of the study area. Of the owner-occupied units, the percentage of householders that have lived in their housing units for more than 5 years is similar to that of the overall study area. Average household sizes for both owner-occupied and renter-occupied units within Mead Valley are greater than those identified for the County and study area.

Table 3.4-2. Regional and Local Housing Characteristics—Tenure

Area	Total Housing Units	% of Owner-Occupied Housing Units	% of Renter-Occupied Housing Units	Year Householder Moved into Unit by Percentage

Source: U.S. Census Bureau 2016c.

Lake Mathews/Gavilan Hills

Within the Lake Mathews/Gavilan community, there are approximately 10,451 housing units, the majority of which are occupied (93.7 percent). Of the occupied units, 77.5 percent are owner-occupied and 22.5 percent are renter-occupied (see Tables 3.4-2 and 3.4-3). The average household size of the owner-occupied units is 3.55 persons per household, and the average household size of renter-occupied units is 3.97 persons per household. In addition, as shown in Table 3.4-3, the majority of householders have lived in their housing units for more than 5 years.

Compared to the housing characteristics of the County and overall study area, Lake Mathews/ Gavilan Hills has a substantially higher percentage of owner-occupied housing units and a lower percentage of renter-occupied housing units. The community also has a higher percentage of occupied units than that of the County but a lower percentage than that of the study area. Of the owner-occupied units, the percentage of householders that have lived in their housing units for more than 5 years is lower than that of the overall study area. Average household sizes for both

owner-occupied and renter-occupied units within Lake Mathews are greater than those identified for the County but lower than that of the study area.

Woodcrest/Mockingbird Canyon

Housing characteristics within the study area portion of the Woodcrest/Mockingbird Canyon community (Tract 420.08) indicate that there are approximately 2,370 housing units, the majority of which are occupied (92.9 percent); 84.3 percent of the housing units are occupied by their owners and 15.7 percent are renter-occupied (see Tables 3.4-2 and 3.4-3). The average household size of owner-occupied units is 3.41 persons per household, and the average household size of renter-occupied units is 4.35 persons per household. In addition, as shown in Table 3.4-3, the majority of householders have lived in their housing units for more than 5 years.

Compared to the housing characteristics of the County and overall study area, Woodcrest/ Mockingbird Canyon has a higher percentage of occupied units than that of the County but a lower percentage than that of the study area. Of the occupied units, the percentage of owner-occupied units is substantially higher, and renter-occupied units lower, than that of the County and study area. Of the owner-occupied units, the percentage of householders that have lived in their housing units for more than 5 years is lower than that of the overall study area. Average household sizes for owner-occupied units are higher within Woodcrest than the County, but lower than for the study area; the percentage of renter-occupied units within Woodcrest is greater than that of both the County and study area.

Victoria Grove and Lake Hills/Home Gardens

Because the Victoria Grove and Lake Hills/Home Gardens communities share the same census tract and have similar characteristics of planned housing developments, their housing characteristics are described collectively. There are 4,917 housing units, 1,120 of which are in the Victoria Grove community. Of the total combined housing units, most are occupied (97.4 percent). Of the occupied units, 86.4 percent are owner-occupied and 13.6 percent are renter-occupied (see Tables 3.4-2 and 3.4-3). The average household size of the owner-occupied units is 3.79 persons per household, and the average household size of renter-occupied units is 4.28 persons per household. In addition, as shown in Table 3.4-3, the majority of householders have lived in their housing units for more than 5 years.

Compared to the housing characteristics of the County, overall study area, and other communities within the study area, the Victoria Grove and Lake Hills communities have a higher percentage of occupied units and the highest percentage in comparison with the other study area communities. Of the occupied units, the percentage of owner-occupied units is substantially higher, and renter-occupied units lower, than that of the County and study area, with the highest and lowest, respectively, of the study area communities. Of the owner-occupied units, the percentage of householders that have lived in their housing units for more than 5 years is higher than that of the overall study area. Average household sizes for both owner-occupied and renter-occupied units within Victoria Grove and Lake Hills/Home Gardens are greater than those identified for the County and study area.

Temescal Canyon

Within the Temescal Canyon community, there are approximately 10,550 housing units, the majority of which are occupied (92.9 percent). Of the occupied units, 78.2 percent are owner-occupied and 21.8 percent are renter-occupied (see Tables 3.4-2 and 3.4-3). The average household size of the owner-occupied units is 3.44 persons per household, and the average household size of renter-occupied units is 3.51 persons per household. In addition, as shown in Table 3.4-2, the majority of householders have lived in their housing units for more than 5 years, with 65.2 percent of householders having moved into their housing in 2009 or earlier.

Compared to the housing characteristics of the County and overall study area, the Temescal Canyon community has a higher percentage of occupied units than that of the County but a lower percentage than that of the study area. Of the occupied units, the percentage of owner-occupied units is higher, and renter-occupied units lower, than that of the County and study area. Of the owner-occupied units, the percentage of householders that have lived in their housing units for more than 5 years is lower than that of the overall study area. Average household sizes for owner-occupied units and renter-occupied units are higher within Temescal Canyon than the County, but lower than that of the study area.

Business and Economic Characteristics

Major employers in Riverside and San Bernardino Counties include, but are not limited to, March Air Reserve Base; University of California, Riverside; University of Redlands; Amazon Fulfillment Center; various tribal casinos and resorts; and numerous hospitals and medical centers. Employment in nearby Orange County can be accessed via State Route 91 with the additional toll lanes recently constructed in the Corona area.

Businesses within the study area include automobile-oriented services, restaurants, convenience stores, financial service stores, retail stores, a movie theater, and agricultural products. The majority of businesses are primarily near the intersections of Cajalco Road and I-215 and Cajalco Road and Interstate 15 (I-15), with some businesses along Cajalco Road and El Sobrante Road between I-215 and I-15. Access to businesses in the study area generally depend upon freeway and roadway access.

Properties in the project area generate both property and sales tax revenue for Riverside County. As detailed in Riverside County's 2016–2017 Comprehensive Annual Financial Report, overall tax revenues in the county were approximately $417 million, representing approximately 12 percent of total revenues (County of Riverside Auditor-Controller/Treasurer/Tax Collector 2017). In terms of sales and receipts, the largest business sectors specific to Riverside County are retail trade, wholesale trade, and health care and social assistance, as shown in Table 3.4-4. The largest business sectors in the county, in terms of employees, are accommodation and food services, health care and social assistance, and administrative and support and waste management and remediation services.

Table 3.4-4. Riverside County Economic Statistics, 2012

Business Type	Number of Businesses	Sales or Receipts ($1,000)	Annual Payroll ($1,000)	Number of Employees
Utilities	58	N/A	150,610	1,803
Wholesale trade	1,568	18,716,807	1,071,927	21,800
Retail trade	4,996	25,058,857	2,128,922	81,017
Transportation and warehousing	1,082	1,552,499	800,581	19,993

Accommodation and food services	3,350	5,230,919	1,376,810	75,061
Other services	2,444	1,331,675	372,941	14,761
Source: U.S. Census Bureau 2012.				

As of 2018, there were approximately 1,084,900 people in the Riverside County labor force (California Employment Development Department [CEDD] 2018b). Table 3.4-5 shows the labor force, unemployment percentage, and median household income for the Cities of Perris and Corona and Riverside County.

According to the CEDD, in January 2018, approximately 1,034,100 persons were employed and 50,800 persons were unemployed in Riverside County, resulting in an unemployment rate of 4.7 percent, as shown in Table 3.4-5. This decreased from 5.2 percent in 2017 (CEDD 2018b, 2018c). The unemployment rate in California in January 2018 was 4.6 percent (CEDD 2018a). This suggests that unemployment in the region is on par with that of the state. The decrease in unemployment within Riverside County from 2017 to 2018 suggests that job growth is occurring within the county.

Table 3.4-5. Labor Force, Unemployment, and Per Capita Income

Jurisdiction	Labor Force	Percentage Unemployed	Median Household Income ($)
Riverside County	1,084,900	4.7%	56,603
City of Corona	81,600	3.1%	74,149
City of Perris	30,800	6.0%	49,325
Source: CEDD 2018b; U.S. Census Bureau 2016b.			

As shown in Table 3.4-5, the median household income within Riverside County is $56,603, which is lower than the median household income in the City of Corona ($74,149) but higher than the median household income in the City of Perris ($49,325). Median household incomes within the communities within the project area are presented in Table 3.4-6 on the following page.

Table 3.4-6. Study Area Median Household Incomes

Jurisdiction/Census Tract	Total Population	Median Household Income
Riverside County	2,298,032	$56,603
City of Corona	159,595	$74,149
City of Perris	72,547	$49,325
Study Area[1]	65,988	$69,623
Mead Valley	12,947	$54,871
Census Tract 420.08 (Block Group 1)[2]	4,032	$112,105
Census Tract 420.09 (Block Group 3)	2,328	$39,583

Mead Valley

Local residents within the Mead Valley community can access businesses via walking, driving, public transportation (bus), and bicycle. Businesses along Cajalco Road within Mead Valley include a 76 gas station and Circle K Market at the intersection of Cajalco Road and Brown Street, Mead Valley Market (El Mercado de Mead Valley) at the intersection of Cajalco Road and Florence Street, automobile-oriented services, restaurants, and liquor stores. Major businesses are on the eastern fringe of Mead Valley at the intersection of Cajalco Road and Harvill Avenue, and include an Arco gas station with car wash and ampm convenience store, 76 gas station, Circle K Market, Jack in the Box restaurant, and Farmer Brothers restaurant.

As indicated in Table 3.4-6, median household income within the Mead Valley community ranges between $31,942 and $112,105, with an average of $54,871.

Lake Mathews/Gavilan Hills

The Lake Mathews/Gavilan community is primarily rural residential and includes a limited number of businesses, primarily along Cajalco Road. Local businesses include Palm Plantation, on the north side of Cajalco Road west of Lynette Lane; K-9 Companions, south of Cajalco Road on JJ Lane; and Lake Mathews Market and Feed Store on the south side of Cajalco Road west of Gustin Road. Local residents within the Lake Mathews/Gavilan Hills community can access businesses via walking, driving, public transportation (bus), and bicycle. According to input received from members of the Greater Lake Mathews Rural Trails Association, the Lake Mathews Market and Feed Store are also accessed by equestrians.

As indicated in Table 3.4-6, median household income within the Lake Mathews/Gavilan Hills community ranges between $42,944 and $112,105, with an average of $67,725.

Woodcrest/Mockingbird Canyon

Businesses within the Woodcrest/Mockingbird Canyon community along the north side of Cajalco Road between El Sobrante Road and Barton Street include the Sand Haven Pines tree farm at the intersection of Cajalco Road and Wood Road. Businesses along El Sobrante Road include the La Vista Nursery, GoneStraw Farms, Rancho Gozales (nursery), Dos Pinos Ranch and Nursery, Greensource Nursery/Harvest Growers Incorporated, Trinity Therapy Riding Center. Businesses along Harley John Road within the study area include Better K9, Wholesale Nursery, and Nava's Growers.

As indicated in Table 3.4-6, the average median household income within the Woodcrest community is $103,344.

Victoria Grove and Lake Hills/Home Gardens

Victoria Grove and Lake Hills are developed communities for residential uses and include a limited number of various home-based businesses. The communities are situated between businesses in Mead Valley, Temescal Canyon, and the City of Riverside.

As indicated in Table 3.4-6, median household income within the Victoria Grove and Lake Hills communities are similar and range between $85,018 and $105,391, with an average of $97,127.

Temescal Canyon

A major shopping center, Crossings at Corona, is immediately northwest of the Cajalco Road and Temescal Canyon intersection, within the Temescal Canyon community, and includes multiple restaurants, department stores, clothing stores, furniture store, banks, a liquor store, a salon, a pet store, a bookstore, and a movie theater. Local residents within the Temescal Canyon community can access the businesses via walking, driving, public transportation, and bicycle. Just east of the shopping center, at the northeast corner of Cajalco Road and Temescal Canyon Road, a recently constructed Circle K gas station with minimarket fronts Cajalco Road. Farther east along Cajalco Road, there are several large mining and rock quarry operations, including Robertson's Corona Quarry on the south side of Cajalco Road just west of Temescal Canyon Road and Hanson's Eagle Valley Quarry and 3M Company Main FST Quarry north of Cajalco Road.

As indicated in Table 3.4-6, median household income within the Temescal Canyon community ranges between $42,944 and $78,313, with an average of $60,014.

Population Characteristics

According to the 2011–2015 American Community Survey released by the U.S. Census Bureau, the total population of Riverside County in 2015 was 2,298,032, as shown in Table 3.4-7. As shown, 26.8 percent of Riverside County's population is under 18 years of age, while 12.8 percent of the population is 65 years of age and over. The study area's age composition is similar to that of the county, with a slightly higher percentage of the population under 18 years of age (27.3 percent) and a lower percentage of seniors (9.9 percent). Population characteristics within the study area communities indicate 30 percent of the Victoria Grove community and 29.5 percent of the Mead Valley community are under 18 years of age, while 15.6 percent of the Lake Mathews community and 15.5 percent of the Temescal Canyon community are 65 years of age and over.

Table 3.4-7. Population and Age Distribution

Area	Total Population	Age			
		Under 18	Percentage	65 and Over	Percentage

As shown in Table 3.4-8 on the following page, the two primary populations within Riverside County are Hispanic and White, as they represent 47.0 and 37.8 percent of the population, respectively. Asians and African Americans represent the third and fourth largest groups, as they represent 6.0 and 5.9 percent of the population, respectively. The population characteristics of the study area are very similar to that of Riverside County. As with Riverside County, the two primary populations within the study area are Hispanic and White, representing 52.9 and 36 percent, respectively. Also, as with Riverside County, Asian and African American groups represent the third and fourth largest populations at 5.8 and 4.9 percent of the population, respectively.

[This page left blank intentionally.]

Mead Valley

According to the U.S. Census data in Table 3.4-7, the Mead Valley community within the project study area is the most populous of the six study area communities, accounting for 19.6 percent of the study area population. Of the community population of 22,381, 52.7 percent is under 18 years of age and 10 percent is 65 years of age and over. Table 3.4-8 indicates 71.1 percent of the community is Hispanic or Latino, 19.9 percent is White, 7.3 percent is Black or African American, and 0.8 percent is Asian.

Lake Mathews/Gavilan Hills

According to the U.S. Census data in Table 3.4-7, population characteristics within the project study area of the Lake Mathews/Gavilan Hills community indicate a population of 9,912, 24.5 percent of which is under 18 years of age and 3.1 percent is 65 years of age and over. Table 3.4-8 indicates 45.3 percent of the community is Hispanic or Latino, 54.9 percent is White, 3.5 percent is Black or African American, 2.4 percent is Native American, and 1.3 percent is Asian.

Woodcrest/Mockingbird Canyon

According to the U.S. Census data in Table 3.4-7, the Woodcrest/Mockingbird Canyon community within the project study area is the least populous of the six study area communities at 7,744, and accounts for 11.7 percent of the study area population. A total of 22.7 percent of the community is under 18 years of age while 12.2 percent is 65 years of age and over. Table 3.4-8 indicates 38.3 percent is Hispanic or Latino, 51.8 percent is White, 5.6 percent is Black or African American, and 3.1 percent is Asian.

Victoria Grove

According to the U.S. Census data in Table 3.4-7, population characteristics within the project study area of the Victoria Grove community indicate a population of 8,174, 29.5 percent of which is under 18 years of age and 9.1 percent is 65 years of age and over. Table 3.4-8 indicates 20.2 percent is Hispanic or Latino, 47.7 percent is White, 10.9 percent is Black or African American, 0.1 percent is Native American, and 15.2 percent is Asian.

Lake Hills/Home Gardens

According to the U.S. Census data in Table 3.4-7, population characteristics within the project study area of the Lake Hills/Home Gardens community indicate a population of 9,191, 29.2 percent of which is under 18 years of age and 4.1 percent is 65 years of age and over. Of the community population of 9,191, Table 3.4-8 indicates 40.7 percent is Hispanic or Latino, 33.5 percent is White, 3.6 percent is Black or African American, and 17.6 percent is Asian.

Temescal Canyon

According to the U.S. Census data in Table 3.4-7, population characteristics within the project study area of the Temescal Canyon community indicate a population of 9,472, 26.5 percent of which is under 18 years of age and 10.5 percent is 65 years of age and over. Table 3.4-8 indicates

49 percent is Hispanic or Latino, 45.5 percent is White, 0.7 percent is Black or African American, 0.4 percent is Native American, and 3.5 percent is Asian.

Community Facilities

Community facilities within the 0.5-mile study area include places of worship and schools, as shown in Table 3.4-9 and Figure 3.4-3. Figure 3.4-3 also shows emergency services and utilities in the study area, which are discussed in further detail in Section 3.5, *Utilities/Emergency Services*. The community also has a community center, library, fire station, elementary schools, a middle school, and a high school.

Table 3.4-9. Community Facilities in the Study Area

Map ID	Facility Name and Description	Location	Distance from Project
C1	Lake Mathews Elementary School Public school; includes 14.5-acre recreation space with open play field, baseball field, basketball court, and blacktop with children's game areas.	12252 Blackburn Road, Riverside, CA 92503	0.3 mile
C2	County Community Center Public meeting facilities	16453 El Sobrante Road, Riverside, CA 92503	0.2 mile
C3	Bible Way Missionary Baptist Place of worship	20871 Hunter Street, Perris, CA 92570	0.2 mile
C4	Charles Meigs (Mead Valley) Community Center Community center includes indoor meeting rooms, outdoor playground, picnic area, basketball courts, and large multiple use turf area.	21091 Rider Street, Mead Valley, CA 92570	0.3 mile
C5	Sovereign Grace Community Church Place of worship	21091 Rider Street, Perris, CA 92570	0.5 mile
C6	Columbia Elementary School Public school; includes a 3.9-acre recreation space with two baseball fields and blacktop with children's games.	21350 Rider Street, Perris, CA 92570	0.2 mile
C7	Manuel L. Real Elementary School Public school; includes large multiple-use area, two baseball backstops, and multiple-use turf area.	19150 Clark Street, Perris, CA 92570	0.1 mile
C8	Mead Valley Library Public library	21580 Oakwood Street, Perris, CA 92570	0.2 mile
C9	Tomas Rivera Middle School Public school; includes 13.5-acre recreation space with track, open play field, three baseball fields, and blacktop with children's game areas.	21675 Martin Street, Perris, CA 92570	0.3 mile
C10	Perris Spanish Seventh-day Adventist Church Place of worship	22905 Alviso Drive, Perris, CA 92750	0.2 mile
C11	Huong Sen Buddhist Temple Place of worship	19865 Seaton Avenue, Perris, CA 92570	0.3 mile
C12	National Archives at Riverside Public archive and research facility	23123 Cajalco Road, Perris, CA 92570	0.2 mile
C13	Val Verde High School Public school; includes 4.5-acre recreation space with one baseball field, open play field, and blacktop with children's games	972 Morgan Street, Perris, CA 92571	0.3 mile
C14	Val Verde Regional Learning Center Public school with shared outdoor facilities with Val Verde High School	3710 Webster Avenue, Perris, CA 92571	0.3 mile

Community Facilities and Emergency Facilities- Study Area and Service Areas
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

Mead Valley

The majority of community facilities listed in Table 3.4-9 (C3 through C14) serve the Mead Valley community. In addition to multiple places of worship, Mead Valley is served by the Mead Valley Community Center, Mead Valley Library, Columbia Elementary School, Manuel L. Real Elementary School, Tomas Rivera Middle School, Val Verde High School, and Val Verde Regional Learning Center. Due to the proximity of these facilities to residences within the community, many are accessed via bicycle and walking. Those residing at farther distances can access the facilities via public transportation and automobile. Bicycle use is accommodated along the roadway shoulders, though there are no formally designated/marked bicycle lanes within the community. Sidewalks within Mead Valley are limited, as most roadside and shoulder areas are unpaved; sidewalks are available at the following locations within the project limits:

- North side of Cajalco Road west of Brown Street to Florence Street, west of Clark Street to Clark Street, east of Carroll Street to Carroll Street, and west of Robinson Street to Robinson Street
- South side of Cajalco Road from Brown Street to east of Brown Street, west of Clark Street to east of Clark Street, Day Street to east of Day Street
- East side of Clark Street north of Cajalco Road, east and west sides of Clark Street south of Cajalco Road
- East side of Seaton Avenue north of Cajalco Road
- North side of Cajalco Road/Cajalco Expressway between west of Harvill Avenue and I-215 northbound on-ramp
- South side of Cajalco Road/Cajalco Expressway, between west of Harvill Avenue and east of Harvill Avenue

Designated crosswalks are currently at the following intersections within the project limits of Mead Valley (refer to Sheet 6 of Figure 2.2-2 and Sheets 1A through 4 of Figure 2.2-3):

- Cajalco Road and Alexander Street
- Cajalco Road and Brown Street
- Cajalco Road and Clark Street
- Cajalco Road and Day Street
- Cajalco Road and Harvill Avenue
- Cajalco Road and I-215 southbound off-ramp

Riverside Transit Agency (RTA) provides public commuter and transportation services for the Mead Valley community with bus routes that serve Metrolink users, regional commuters, and nearby cities (RTA 2019). RTA bus stops are at designated locations along Cajalco Road, and at certain intersecting roads, within Mead Valley, but do not currently include roadway pull-out spaces away from mainline traffic.

Lake Mathews/Gavilan Hills

Facilities that serve the Lake Mathews community are generally located outside of the community and require transportation to access them. The nearest facilities are the Charles Meigs (Mead Valley) Community Center in Mead Valley, Lake Mathews Elementary School in Victoria Grove, and County Community Center in Woodcrest/Mockingbird Canyon. Designated crosswalks within the project limits are currently available at the following intersections only: Cajalco Road and La Sierra Avenue, Cajalco Road and El Sobrante Road, and Cajalco Road and Harley John Road/Smith Road (refer to Sheets 2A and 5 of Figure 2.2-2).

Woodcrest/Mockingbird Canyon

The nearest facilities listed in Table 3.4-9 for the Woodcrest/Mockingbird Canyon community are the Charles Meigs (Mead Valley) Community Center in Mead Valley, Lake Mathews Elementary School in Victoria Grove, and County Community Center. Residents east of El Sobrante Road may access the County Community Center via walking or bicycle; however, no direct routes are available and use of vehicular transportation to this location and most other facilities identified with the study area would be anticipated. The Woodcrest Library at 16625 Krameria Avenue also serves this community and is greater than 2 miles from the project. RTA provides public commuter and transportation services for the Woodcrest/Mockingbird Canyon community with bus routes that serve Metrolink users, regional commuters, and nearby cities; however, no designated facilities are within the project limits of the community (RTA 2019).

Sidewalks are limited, as most roadside and shoulder areas are unpaved; sidewalks are available at the following locations within the project limits:

- East side of Wood Road north of Cajalco Road
- West side of Carpinus Drive north of Cajalco Road

Designated crosswalks within the project limits of Woodcrest/Mockingbird Canyon are currently at the following intersections only (refer to Sheet 5B of Figure 2.2-5):

- El Sobrante Road and Fire Station intersection
- Cajalco Road and Harley John Road/Smith Road
- Cajalco Road and Wood Road

Victoria Grove and Lake Hills/Home Gardens

The nearest facility listed in Table 3.4-9 for the Victoria Grove and Lake Hills communities is Lake Mathews Elementary School on Blackburn Road. Victoria Grove Park is a private park for the community of Victoria Grove adjacent to Lake Mathews Elementary School. Residents north of El Sobrante Road and Schoolhouse Road, and east of Victoria Grove Parkway, may access the school via walking or bicycle due to close proximity. Residents within the Lake Hills community may access the school from Lake Crest Drive via La Sierra Avenue to Blackburn Road. Designated crosswalks within the project limits of the Victoria Grove and Lake Hills/Home Gardens communities are currently at the following intersection only: Cajalco Road and El Sobrante Road.

Sidewalks within the project limits of the Victoria Grove and Lake Hills/Home Gardens communities are limited, as most roadside and shoulder areas are unpaved; a sidewalk is available along the north side of El Sobrante Road between east of La Sierra Avenue and McAllister Street (refer to Sheet 3B of Figure 2.2-5).

Temescal Canyon

The nearest facility listed in Table 3.4-9 for the Temescal Canyon community is the Lake Mathews Elementary School on Blackburn Road. However, El Cerrito Middle School, at 7610 El Cerrito Road, is outside of the project area but is the closest community facility for the portion of the Temescal Canyon community within the project limits, at approximately 1.8 miles distance. El Cerrito Sports Park is adjacent to El Cerrito Middle School and includes a basketball court, covered shelter, picnic area, playground, soccer field, softball field, and tennis court. The Dos Lagos Golf Course, at 4507 Cabot Drive, is an approximately 115-acre public golf course within the Dos Lagos mixed-use development, approximately 1.5 miles (via roadways) from the portion of the Temescal Canyon community within the project limits.

No direct routes to these facilities, or to other community facilities, are available and the use of vehicular transportation would be anticipated. RTA provides public commuter and transportation services for the Temescal Canyon community with bus routes that serve Metrolink users, regional commuters, and nearby cities (RTA 2019); however, no designated facilities are within the project limits of the community. Designated crosswalks within the project limits of Temescal Canyon are currently at the following intersection only: Cajalco Road and Temescal Canyon Road (refer to Sheet 1A of Figure 2.2-2). Sidewalks are limited, as most roadside and shoulder areas are unpaved; sidewalks are available at the following locations within the project limits:

- Temescal Canyon Road and Cajalco Road intersection
- North side of Cajalco Road between Temescal Canyon Road and west of Temescal Creek Bridge

Community Character and Cohesion

Mead Valley

Within the study area, Mead Valley primarily contains single-family homes interspersed with undeveloped lots, limited commercial stores along Cajalco Road, and industrial parks near I-215. This is reflected by the existing land uses and land use designations, which are primarily Residential and Undeveloped, and primarily designated for Rural Community and Industrial land uses. Refer to Sheet 2 of Figure 3.1-1 and Sheet 2 of Figure 3.1-2 in Section 3.1, *Land Use*, for existing land uses and designations within the study area. Local housing characteristics for Mead Valley provided in Tables 3.4-2 and 3.4-3 indicate that 93.5 percent of the 8,243 housing units are occupied with average household sizes of 4.11 persons per household (owner-occupied) and 4.51 persons per household (renter-occupied). A total of 64.4 percent of the occupied units are occupied by their owners, and the majority of homeowners have lived in their homes for more than 5 years (67.2 percent).

The average median household income for Mead Valley is $54,871. Population characteristics of Mead Valley provided in Tables 3.4-7 and 3.4-8 indicate the majority of the total community

population of 22,381 is Hispanic or Latino (71.1 percent), and 52.7 percent of the community is under 18 years of age while 10 percent is 65 years of age and over.

Residents along Cajalco Road experience views of the heavily traveled roadway and traffic-related noise levels that range between 48 and 71 A-weighted decibels (dBA). Limited vegetation along the project corridor includes nonnative grasses, sage scrub, and ruderal vegetation. There is a limited amount of naturally growing trees; however, there are some mature trees and shrubs associated with residential landscaping and commercial landscaping at the eastern end of the community. Refer to Figures 3.7-4 through 3.7-6 in Section 3.7, *Visual/Aesthetics*, for photographic representations, and Sheets 20 through 30 of Figure 3.15-2 in Section 3.15, *Noise and Vibration*, for measured noise receptor locations within the Mead Valley community.

Local concerns expressed from members of the Mead Valley community include excessive speeds, accidents, and increased traffic including trucks along Cajalco Road; flooding; traffic-related noise; air quality; business access and impacts; property impacts; emergency access; safety; equestrian use; trails; and growth.

Given the large amount of owner-occupied housing units, high occupancy rate of housing units, extended average length of occupancy per housing unit, density of the community, and amount of input received from members of the community, it is reasonable to assume a high degree of social cohesion exists within the Mead Valley community.

Lake Mathews/Gavilan Hills

Within the study area, the Lake Mathews/Gavilan Hills community primarily contains single-family homes interspersed with open space. This is reflected by the existing land uses and land use designations, which are primarily Conservation/Open Space, Undeveloped, and Residential, and primarily designated for Conservation and Rural Community land uses. Refer to Sheet 1 of Figure 3.1-1 and Sheet 1 of Figure 3.1-2 in Section 3.1, *Land Use*, for existing land uses and designations within the study area. Local housing characteristics for Lake Mathews/Gavilan Hills provided in Tables 3.4-2 and 3.4-3 indicate 93.7 percent of the 10,451 housing units are occupied with average household sizes of 3.55 persons per household (owner-occupied) and 3.97 persons per household (renter-occupied). A total of 77.5 percent of the occupied units are occupied by their owners, and the majority of homeowners have lived in their homes for more than 5 years (57 percent).

The median household income for Lake Mathews/Gavilan Hills is $67,725. Population characteristics of Lake Mathews/Gavilan Hills provided in Tables 3.4-7 and 3.4-8 indicate the majority of the total community population of 5,730 is White (54.9 percent), and 20.7 percent of the community is under 18 years of age while 15.7 percent is 65 years of age and over.

Most residents within the study area portion of the Lake Mathews/Gavilan Hills community are approximately 680 to 1,500 feet from Cajalco Road; a cluster of homes fronts Cajalco Road between east of Dirt Road to west of Hollis Lane. Residents that front Cajalco Road experience views of the heavily traveled roadway and traffic-related noise levels that range between 55 and 64 dBA. Many of the residents with views of Lake Mathews also have partial views of Cajalco Road and do not directly experience the traffic passing through the community or the traffic noise experienced by homes that front Cajalco Road. The open space lands, rolling terrain, and

lack of tall vegetation associated with the Lake Mathews Reserve and other area conservation lands allow for scenic vista views to the surrounding mountains and Lake Mathews. Within the community itself, vegetation is mostly nonnative grasslands, sage scrub, and ruderal vegetation. There is a limited amount of naturally growing trees; however, residences often have mature trees and shrubs with their associated landscaping.

Noise levels for the homes located farther from Cajalco Road range between 40 and 42 dBA. Refer to Figures 3.7-7 through 3.7-9, 3.7-13, and 3.7-14 in Section 3.7, *Visual/Aesthetics*, for photographic representations, and Sheets 5 through 18 of Figure 3.15-2 in Section 3.15, *Noise and Vibration*, for measured noise receptor locations within the Lake Mathews/Gavilan Hills community.

According to input received from the community, including Amazonia Wildlife Foundation and members of Residents of Greater Lake Mathews and Greater Lake Mathews Rural Trails Association, community concerns include traffic-related impacts such as noise, increased traffic and trucks, property impacts, emergency access, and equestrian trail options.

The nearest community facility serving the Lake Mathews community is the County Community Center on El Sobrante Road within the Woodcrest community; private and/or public transportation would be the primary means of accessing this facility from Lake Mathews.

Given the large amount of owner-occupied housing units, high occupancy rate of housing units, extended average length of occupancy per housing unit, and density of the community, it is reasonable to assume a high degree of social cohesion exists within the Lake Mathews community.

Woodcrest/Mockingbird Canyon

Within the study area, single-family homes and open space are the primary land uses within the Woodcrest/Mockingbird community. Other land uses include agricultural, commercial, and industrial developments. Many of the homes are on rural residential sized lots. This is reflected by the existing land uses and land use designations, which are primarily Residential and Undeveloped, and primarily designated for Rural Community and Rural Residential land uses. Refer to Figures 3.1-1 and 3.1-2 in Section 3.1, *Land Use*, for existing land uses and designations within the study area. Local housing characteristics for Woodcrest provided in Tables 3.4-2 and 3.4-3 indicate 92.9 percent of the 2,368 housing units are occupied with average household sizes of 3.41 persons per household (owner-occupied) and 4.35 persons per household (renter-occupied). A total of 84.3 percent of the occupied units are occupied by their owners, and the majority of homeowners have lived in their homes for more than 5 years (60.8 percent).

The median household income for Woodcrest/Mockingbird is $103,344. Population characteristics of Woodcrest/Mockingbird provided in Tables 3.4-7 and 3.4-8 indicate the majority of the total community population of 7,744 is White (51.8 percent), and 22.7 percent of the community is under 18 years of age while 12.2 percent is 65 years of age and over.

Residents along Cajalco Road experience views of the heavily traveled roadway and traffic-related noise levels that range between 48 and 71 dBA. The open space lands, rolling terrain, and lack of tall vegetation associated with the LMR and other conservation areas allow for scenic vista views to the surrounding mountains and Lake Mathews. Vegetation along the project

corridor is mostly nonnative grasslands, sage scrub, and ruderal vegetation. There is a limited amount of naturally growing trees; however, some residences have mature trees and shrubs with their associated landscaping, and nursery-based businesses along Cajalco Road and El Sobrante Road include rows of mature pine and fruit trees. Refer to Figures 3.7-4 through 3.7-6 in Section 3.7, *Visual/Aesthetics*, for photographic representations, and Sheets 20 through 30 of Figure 3.15-2 in Section 3.15, *Noise and Vibration*, for measured noise receptor locations within Woodcrest/Mockingbird Canyon. Existing noise levels for residences that front Cajalco Road at Extravaganza Lane and one residence that fronts Cajalco Road at Cowan Road currently approach or exceed the FHWA/California Department of Transportation (Caltrans) Noise Abatement Criteria (NAC) of 67 dBA.

Local concerns expressed from members of the community include excessive speeds, accidents, and increased traffic along Cajalco Road; flooding; traffic-related noise; air quality; business access and impacts; property impacts; emergency access; and safety.

The nearest facilities serving the Woodcrest community within the study area are described above. Residents east and north of El Sobrante Road may access the nearest facilities via walking, bicycle, and horse; however, vehicles are anticipated to be the primary mode of transportation for the community due to the distances between residents and facilities.

Given the large amount of owner-occupied housing units, high occupancy rate of housing units, extended average length of occupancy per housing unit, and density of the community, it is reasonable to assume a high degree of social cohesion exists within the Woodcrest Community.

Victoria Grove

The community of Victoria Grove, which contains 1,120 homes, is immediately northwest of McAllister Street. This is reflected by the existing land uses and land use designations, which are Residential. Refer to Sheet 1 of Figure 3.1-1 and Sheet 1 of Figure 3.1-2 in Section 3.1, *Land Use*, for existing land uses and designations within the study area. Because the Victoria Grove and Lake Hills communities share the same census tract and have similar characteristics of planned housing developments, their housing characteristics are described collectively. Local housing characteristics provided in Tables 3.4-2 and 3.4-3 indicate approximately 97.4 percent of the housing units within Victoria Grove are occupied, with average household sizes of 3.79 persons per household (owner-occupied) and 4.28 persons per household (renter-occupied). Approximately 86.4 percent of the occupied units are occupied by their owners, and the majority of homeowners have lived in their homes for more than 5 years (approximately 71.9 percent).

The median household income for Victoria Grove is $99,048. Population characteristics of Victoria Grove provided in Tables 3.4-7 and 3.4-8 indicate the majority of the total community population of 8,174 is White (47.7 percent), and 29.5 percent of the community is under 18 years of age while 9.1 percent is 65 years of age and over.

Residents along El Sobrante Road experience traffic-related noise levels that range between 53 and 59 dBA. Refer to Sheets 20 through 30 of Figure 3.15-2 in Section 3.15, *Noise and Vibration*, for measured noise receptor locations within the Victoria Grove community. Most residential views of El Sobrante Road and La Sierra Avenue are obstructed by vegetation and sound walls, with limited views via second story windows. Landscaped vegetation that fronts

Cajalco Road includes short shrubs and mature palm trees. Refer to Figure 3.7-16 in Section 3.7, *Visual/Aesthetics*, for photographic representation of the Victoria Grove community.

According to input received from members of the Victoria Grove community, there is interest in widening El Sobrante Road and support for the project.

Community facilities within the Victoria Grove community include Lake Mathews Elementary School and Victoria Grove Park; these facilities can be accessed by local residents via walking, bicycle, and vehicular transportation.

Given the large amount of owner-occupied housing units, high occupancy rate of housing units, extended average length of occupancy per housing unit, and density of the community, it is reasonable to assume a high degree of social cohesion exists within the Victoria Grove community.

Lake Hills/Home Gardens

Land uses west and southwest of the intersection of La Sierra Avenue and El Sobrante Road include single-family residences within the Lake Hills/Home Gardens community and open space. This is reflected by the existing land uses and land use designations, which are primarily Residential and Conservation/Open Space, and primarily designated for Residential and Conservation land uses. Refer to Sheet 1 of Figure 3.1-1 and Sheet 1 of Figure 3.1-2 in Section 3.1, *Land Use*, for existing land uses and designations within the study area. Because the communities of Victoria Grove and Lake Hills/Home Gardens share the same census tract and have similar characteristics of planned housing developments, their housing characteristics are described collectively. Housing characteristics provided in Tables 3.4-2 and 3.4-3 indicate approximately 97.4 percent of the 3,797 housing units within Lake Hills are occupied with average household sizes of 3.79 persons per household (owner-occupied) and 4.28 persons per household (renter-occupied). Approximately 86.4 percent of the occupied units are occupied by their owners, and the majority of homeowners have lived in their homes for more than 5 years (approximately 71.9 percent).

The median household income for Lake Hills is $95,205. Population characteristics of Lake Hills/Home Gardens provided in Tables 3.4-7 and 3.4-8 indicate the majority of the total community population of 9,191 is Hispanic or Latino (40.7 percent), and 29.2 percent of the community is under 18 years of age while 4.1 percent is 65 years of age and over.

Most residential views of El Sobrante Road and La Sierra Avenue are obstructed by vegetation and sound walls, with limited views via second-story windows. According to input received from members of the Lake Hills community, concerns include protected areas and support for Build Alternative 1.

No community facilities are within the study area limits of Lake Hills/Home Gardens; however, residents of the communities can access Lake Mathews Elementary School within the adjacent Victoria Grove community via vehicular transportation using Lake Crest Drive via La Sierra Avenue to Blackburn Road. Lake Hills residents may also access the Victoria Grove facilities via walking or bicycle, but would need to travel longer distances.

Given the large amount of owner-occupied housing units, high occupancy rate of housing units, extended average length of occupancy per housing unit, and density of the community, it is reasonable to assume a high degree of social cohesion exists within the Lake Hills community.

Temescal Canyon

Temescal Canyon is at the western end of the project and contains a mix of single-family homes, industrial uses, commercial stores, and open space. This is reflected by the land use designations, which are primarily Undeveloped, Mineral Resources, Conservation/Open Space, Commercial, and Industrial, and primarily designated for Rural Community, Conservation, Mineral Resources, Industrial, and Commercial land uses. Refer to Sheet 1 of Figure 3.1-1 and Sheet 1 of Figure 3.1-2 in Section 3.1, *Land Use*, for existing land uses and designations within the study area. Local housing characteristics of the Temescal Canyon community are indicated in Tables 3.4-2 and 3.4-3, which show regional and local housing characteristics in the study area and study area jurisdictions. Of the 10,550 housing units, 92.9 percent are occupied with average household sizes of 3.44 persons per household (owner-occupied) and 3.51 persons per household (renter-occupied). A total of 78.2 percent of the occupied units are occupied by their owners, and the majority of homeowners have lived in their homes for more than 5 years (65.2 percent).

The median household income for Temescal Canyon is $60,014. Population characteristics of Temescal Canyon provided in Tables 3.4-7 and 3.4-8 indicate the majority of the total community population of 9,472 is Hispanic or Latino (49 percent), and 26.5 percent of the community is under 18 years of age while 10.5 percent is 65 years of age and over.

Residents within the Temescal Canyon community along Cajalco Road experience views of the heavily traveled roadway and traffic-related noise levels that range between 48 and 59 dBA. Vegetation along the project corridor between west of La Sierra Avenue and east of Temescal Creek includes nonnative grasses, sage scrub, and ruderal vegetation. Vegetation is more dense at the Temescal Creek Bridge and residences east of the bridge where naturally growing mature trees and shrubs line Cajalco Road. Refer to Figures 3.7-11 and 3.7-12 in Section 3.7, *Visual/ Aesthetics*, for photographic representations, and Sheets 1 through 4 of Figure 3.15-2 in Section 3.15, *Noise and Vibration*, for measured noise receptor locations within the Temescal Canyon community.

Local concerns expressed from members of the Temescal Canyon community include traffic accidents, traffic-related noise, air quality, property impacts, business access (mining), and wildlife preserve.

The nearest community facilities serving Temescal Canyon within the study area limits are Lake Mathews Elementary School within the Victoria Grove community; private and/or public transportation would be the primary means of accessing these facilities from Temescal Canyon. Additional facilities are also available beyond the study area and range between 1.5 and 1.8 miles distance from the project limits; these include El Cerrito Middle School, El Cerrito Sports Park, and Dos Lagos Golf Course.

Given the large amount of owner-occupied housing units, high occupancy rate of housing units, extended average length of occupancy per housing unit, and density of the community, it is reasonable to assume a high degree of social cohesion exists within the Temescal Canyon community.

3.4.1.3 Environmental Consequences (Community Character and Cohesion)

Population, Housing, and Community Facilities

Permanent Impacts

Build Alternatives 1 and 2C—Cajalco and Modified Cajalco Alignments

Build Alternatives 1 and 2C would widen Cajalco Road between the I-215 southbound ramps and Temescal Canyon Road to improve east-west mobility and to provide increased capacity and improved traffic flow and safety. Communities primarily affected by the changes proposed under Build Alternatives 1 and 2C would be Mead Valley, Lake Mathews/Gavilan Hills, and Temescal Canyon. The purpose of the realignment of Cajalco Road west of Lake Mathews Drive is to reduce the curves required along Cajalco Road, which would improve the safety of the roadway and allow for increased speeds.

Construction of Build Alternative 1 or 2C would require partial acquisition of land from 67 residential parcels (not requiring relocation) and full acquisition and relocation of 19 residential units. The affected properties consist of rural-residential, single-family houses. As discussed in Section 3.4.2.3, there is adequate replacement housing within the replacement area for those displaced, and the relocation of residents would not pose a substantial impact on the community. In addition, as discussed in Section 3.3, *Growth*, growth resulting from Build Alternatives 1 and 2C is not reasonably foreseeable and no development is anticipated to result from the build alternatives, although projected growth in accordance with the Riverside County General Plan is expected and is considered acceptable and desirable (County of Riverside 2015). Consequently, no change to the local housing market would occur.

Long term, Build Alternative 1 or 2C would be expected to improve roadway efficiency and would likely result in a reduction in travel times to community facilities. Therefore, operations and permanent impacts of either Build Alternative 1 or 2C are not anticipated to result in adverse impacts on community facilities. A discussion of the anticipated impacts and benefits for each community within the study area is provided below.

Mead Valley

Build Alternatives 1 and 2C would require full acquisition of 17 residential units and one business within the community of Mead Valley. All residential units are single-family residences, eight of which are owner-occupied and nine of which are tenant-occupied. An estimated 52 residents would be displaced from their current residences within Mead Valley. An estimated nine employees would be displaced. Of the total population of 22,381 within the study area portion of Mead Valley, the displacement of 52 residents would represent 0.2 percent of the community population. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act), as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. The County will also assist eligible nonresidential displacees, such as businesses, in locating suitable replacement property and with reimbursement for certain costs involved in relocation. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. All eligible displacees would be entitled to moving expenses per the Uniform Act.

According to the DRIR, adequate residential and commercial replacement properties are available within the replacement area, which is defined as the local area where residential and business displacees would likely secure replacement sites. The replacement area was determined by the availability of replacement single-family residences and comparable business sites for displacees. The replacement area is the most similar to the displacement area in character and socioeconomic status. It has the highest likelihood of receiving displaced residents and businesses because of the availability of replacement properties with similar average purchase prices as in the displacement area. The communities within the replacement area are also within 10 miles of the displacement area; therefore, the commute distance to jobs and schools would be reasonable and would not result in substantial hardships for the displacees. In addition, residential displacees would have access to schools within the same school district in the replacement area as they had in the displacement area. The following standard condition would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

- **PF COM-1:** As part of project implementation, relocation assistance payments and counseling would be provided by the County of Riverside to persons and businesses in accordance with the Federal Uniform Relocation Assistance and Real Properties Acquisition Policies Act of 1970, as amended (42 United States Code Sections 4601–4655), to ensure adequate relocation and a decent, safe, and sanitary home for displaced residents. The County of Riverside will provide compensation to eligible recipients for property acquisitions. All eligible displacees would be entitled to moving expenses. All benefits and services would be provided equitably to all residential and business displacees without regard to race, color, religion, age, national origins, and disability, as specified under Title VI of the Civil Rights Act of 1964. All relocation activities would be conducted by the implementing agencies in accordance with the Federal Uniform Relocation Assistance and Real Properties Acquisition Policies Act of 1970, as amended. Relocation resources would be available to all displacees without discrimination.

  In addition, the Nonresidential Relocation Assistance Program (RAP) provides assistance to businesses, farms, and nonprofit organizations in locating suitable replacement properties and reimbursement for certain costs involved in relocation. The RAP will provide current lists of properties offered for sale or rent, suitable for a particular business's specific relocation needs. The types of payments available to eligible businesses, farms, and nonprofit organizations are instead of any moving, searching, and reestablishment expenses.

Construction of Build Alternative 1 or 2C would require partial acquisition of land from 67 residential parcels (not requiring relocation). The affected properties consist of rural-residential, single-family houses. Community facilities would not be substantially affected but may receive some benefit from improved access through the proposed roadway improvements and additional sidewalks and crosswalks within the Mead Valley community along Cajalco Road.

Lake Mathews/Gavilan Hills

Build Alternatives 1 and 2C would require full acquisition of one residential unit within the community of Lake Mathews/Gavilan Hills. The residential unit is a single-family residence, assumed owner-occupied. An estimated five residents would be displaced from the residence. Of the total population of 9,912 within the study area portion of Lake Mathews/Gavilan Hills, the displacement of five residents would represent 0.1 percent of the community population.

Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. Standard Project Measure **PF COM-1** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

Under Build Alternative 2C, the alignment of Cajalco Road would deviate from its existing alignment between La Sierra Avenue and a point west of Lake Mathews, and it would include the construction of a new segment of roadway south of Lake Mathews and the existing Cajalco Road. This new segment of Cajalco Road would extend through an area of conservation land that is currently inaccessible. However, Build Alternative 2C would not provide any right or left turns into this conservation area. In addition, the area would remain inaccessible because development is not permitted in the conservation area. No intensification of land uses or removal of residential communities would occur. Cajalco Road is a major transportation corridor and would continue to function as such with the implementation of Build Alternative 1 or 2C. This realignment would benefit the neighborhood by moving the roadway farther from the homes in the neighborhood, which would ultimately improve safety. Build Alternatives 1 and 2C would also include a new connection between Dirt Road and Richey Way south of Lake Mathews to accommodate emergency access. New access to areas that were previously inaccessible is not proposed, except for a short realignment of a section of Cajalco Road west of Lake Mathews Drive.

Woodcrest/Mockingbird Canyon

Build Alternatives 1 and 2C would require full acquisition of one government business, which is anticipated to result in the displacement of 16 employees. According to the DRIR, adequate commercial replacement properties are available within the replacement area, which is defined as the local area where business displacees would likely secure replacement sites. The replacement area was determined by the availability of comparable business sites for displacees. The replacement area is the most similar to the displacement area in character and socioeconomic status. The communities within the replacement area are also within 10 miles of the displacement area; therefore, the commute distance to jobs and schools would be reasonable and would not result in substantial hardships for the displacees. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. Refer to Appendix C, *Summary of Relocation Benefit*, of this EIR/EIS for details regarding available resources and assistance. Standard Project Measure **PF COM-1** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

Under Build Alternatives 1 and 2C, the widening of Cajalco Road within the community of Woodcrest/Mockingbird Canyon would occur predominantly along the existing alignment of the road between Harley John Road and Barton Street. No community facilities are within this section of the community; the nearest facilities within Mead Valley and on El Sobrante Road would not be affected under Build Alternatives 1 and 2C.

Temescal Canyon

Build Alternatives 1 and 2C would require full acquisition of one single-family residential property within the community of Temescal Canyon. An estimated five residents would be displaced from

their current residences within Temescal Canyon. Of the total population of 9,472 within the study area portion of Temescal Canyon, the displacement of five residents would represent less than 0.1 percent of the community population. According to the DRIR, adequate residential replacement properties are available within the replacement area, which is defined as the local area where residential displacees would likely secure replacement sites. The replacement area was determined by the availability of replacement single-family residences for displacees. The communities within the replacement area are also within 10 miles of the displacement area; therefore, the commute distance to jobs and schools would be reasonable and would not result in substantial hardships for the displacees. In addition, residential displacees would have access to schools within the same school district in the replacement area as they had in the displacement area. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. Standard Project Measure **PF COM-1** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

No community facilities are within this section of the community; the nearest facilities would not be affected under Build Alternatives 1 and 2C.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operational impacts would be less than those described for Build Alternatives 1 and 2C because no additional property displacements or relocations would be required. The future six-lane facility would add lanes between Temescal Canyon Road and Harley John Road, and is anticipated to further improve east-west mobility, and to provide increased capacity, improved traffic flow, and safety. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and, therefore, any additional property acquisitions.

The future six-lane facility would not provide access to areas that were previously inaccessible; as such, intensification of land uses or removal of residential communities would not result. Cajalco Road is major transportation corridor and would continue to function as such with the implementation of the future six-lane facility under Build Alternative 1 or 2C.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

The LM MSHCP is a conservation area that does not contain any population, housing, or community facilities; therefore, there would be no impacts. Employees associated with management of the LMR would not be substantially affected by operations because no relocations would occur within the conservation area, although site access would change slightly. Long term, Build Alternatives 1 and 2C are expected to improve roadway efficiency and would likely result in a reduction in travel times within the conservation area. Therefore, operation of Build Alternatives 1 or 2C would have no adverse impact on employees in the conservation area.

Build Alternative 4—El Sobrante Alignment

Build Alternative 4 would widen Cajalco Road between the I-215 southbound ramps and Harley John Road, and between La Sierra Avenue and Temescal Canyon Road, as well as widen El Sobrante Road between Harley John Road and La Sierra Avenue, and widen La Sierra Avenue between El Sobrante Road and Cajalco Road, to improve east-west mobility and to provide increased capacity and improved traffic flow and safety. Communities that would primarily be affected by the changes proposed under Build Alternative 4 would be Mead Valley, Woodcrest/ Mockingbird Canyon, Victoria Grove, Lake Hills/Home Gardens, and Temescal Canyon.

Permanent impacts on the Mead Valley and Temescal Canyon communities under Build Alternative 4 would be the same as those identified under Build Alternatives 1 and 2C, above. Please refer to Build Alternatives 1 and 2C for a discussion of impacts on these communities under Build Alternative 4.

Lake Mathews/Gavilan Hills

Similar to Build Alternatives 1 and 2C, under Build Alternative 4, full acquisition of one residential unit within the community of Lake Mathews/Gavilan Hills is proposed. The residential unit is a single-family residence, assumed owner-occupied. An estimated five residents would be displaced from the residence. Of the total population of 9,912 within the study area portion of Lake Mathews/Gavilan Hills, the displacement of five residents would represent 0.1 percent of the community population. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act of 1970, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. Standard Project Measure **PF COM-1** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

Build Alternative 4 would not provide access to areas that were previously inaccessible within the Lake Mathews/Gavilan Hills area, and intensification of land uses or removal of residential communities would not occur. The shift in the alignment of La Sierra Avenue would not provide new access to previously inaccessible areas because the new alignment of La Sierra Avenue would still mostly be in an area where roads and access currently exist, not in a new, inaccessible area. However, segments of Build Alternative 4 would extend through an area of conservation land that is currently inaccessible. This area would remain inaccessible to vehicles, because Build Alternative 4 would not provide any right or left turns into this conservation area. In addition, the area would remain inaccessible because development is not permitted in the conservation area. Cajalco Road and El Sobrante Road are major transportation corridors and would continue to function as such with the implementation of Build Alternative 4.

No community facilities are within this section of the community and would therefore not be affected under Build Alternative 4.

Woodcrest/Mockingbird Canyon

Between Cowan Road and Barton Street, impacts and benefits of Build Alternative 4 would be the same as those identified under Build Alternatives 1 and 2C, above. Under Build Alternative 4, two residential units along El Sobrante Road are proposed for acquisition in addition to the

business on Cajalco Road, for an anticipated total 10 residential and 16 employee displacees within this community. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. Standard Project Measure **PF COM-1** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

Additional new traffic signals with designated crosswalks would be constructed within the community under Build Alternative 4 at the intersections of El Sobrante Road with McAllister Street, Mockingbird Canyon Road, and Harley John Road. Long term, Build Alternative 4 is expected to improve roadway efficiency and would likely result in a reduction in travel times to community facilities. Therefore, operations and permanent impacts of Build Alternative 4 is not anticipated to result in adverse impacts on community facilities.

Victoria Grove

Under Build Alternative 4, no residential or business displacements are anticipated to occur that would affect Victoria Grove. Partial acquisitions of the landscaped portion of the roadway along the north side of El Sobrante Road would be necessary to accommodate the widened roadway. New traffic signals with designated crosswalks would be constructed at the intersections of El Sobrante Road with La Sierra Avenue and McAllister Street. No impacts on population, housing, or community facilities within this community are anticipated.

Lake Hills/Home Gardens

Under Build Alternative 4, no residential or business displacements are anticipated to occur that would affect Lake Hills/Home Gardens. A new traffic signal with designated crosswalks would be constructed at the intersection of El Sobrante Road and La Sierra Avenue; however, this change is not anticipated to affect population, housing, or community facilities within this community.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operational impacts would be less than those described for Build Alternative 4 because no additional property displacements or relocations would be required. The future six-lane facility would add lanes between Temescal Canyon Road and El Sobrante Road, and it is anticipated to further improve east-west mobility, and to provide increased capacity, improved traffic flow, and safety. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and, therefore, any additional property acquisitions.

The future six-lane facility would not provide access to areas that were previously inaccessible; as such, intensification of land uses or removal of residential communities would not result. Cajalco Road and El Sobrante Road are major transportation corridors and would continue to function as such with the implementation of the future six-lane facility under Build Alternative 4.

Lake Mathews MSHCP (Build Alternative 4)

The LM MSHCP is a conservation area that does not contain any population, housing, or community facilities; therefore, there would be no impacts. Employees associated with management of the LMR would not be substantially affected by operations because no relocations would occur within the conservation area, although access to their workplace would change slightly. Long term, Build Alternative 4 would be expected to improve roadway efficiency and would likely result in a modest reduction in travel times within the conservation area. Therefore, operation of Build Alternative 4 would have no adverse impact on employees in the conservation area.

Temporary Impacts

Build Alternatives 1 and 2C—Cajalco and Modified Cajalco Alignments

Because of the highly specialized nature of most construction projects, workers are likely to be employed on the job site only for as long as their skills are needed to complete a particular phase of the construction process. For that reason, it is reasonable to assume that most construction workers would not relocate their households to work on the proposed project. Thus, the construction of the build alternatives would not induce population growth.

Construction of the project may temporarily hinder traffic flow in the area, resulting in increased travel time to community facilities. Mead Valley would be anticipated to be affected the greatest, as that is where most community facilities within the project area are located. Temporary construction easements along Cajalco Road and short-term, temporary road closures would affect access to community facilities in Mead Valley. During the bridge construction near Barton Street in Mead Valley, Cajalco Road would continue to be used, but delays and access changes would result, which would also affect access and use of community facilities. However, all community facilities would remain operational because access would be maintained through implementation of a Traffic Management Plan (TMP). Refer to Standard Project Measure **PF LU-1** in Section 3.1.1.2 (*Land Use*). The TMP would ensure continued operation of Cajalco Road. Any required closures or detours would be noticed in advance. Standard Project Measure **PF UT-1** (utility relocations) is also proposed to minimize disruptions of service. Please refer to Section 3.5, *Utilities/Emergency Services*, for **PF UT-1**. The County will coordinate all utility relocation Therefore, construction activities would have a minimal effect on community facilities.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, temporary impacts associated with construction would be less than those described for Build Alternatives 1 and 2C, and would not result in adverse effects on population, housing, or community facilities because all work would be done within the existing median.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

The LM MSHCP is a conservation area that does not contain any population, housing, or community facilities; therefore, there would be no impacts. Employees associated with

management of the LMR may experience some temporary construction impacts as described above for Build Alternatives 1 and 2C, including temporary changes in access, lane closures, and traffic delays. However, Standard Project Measure **PF LU-1** (TMP) would ensure continued operation of Cajalco Road and any required closures or detours would be noticed in advance; refer to Section 3.1.1.2 (*Land Use*) for the TMP. Therefore, construction activities would have a minimal effect on employees in the conservation area.

Build Alternative 4—El Sobrante Alignment

Because of the highly specialized nature of most construction projects, workers are likely to be employed on the job site only for as long as their skills are needed to complete a particular phase of the construction process. For that reason, it is reasonable to assume that most construction workers would not relocate their households to work on the proposed project. Thus, the construction of Build Alternative 4 would not induce population growth.

Construction of the project may temporarily hinder traffic flow in the area, resulting in increased travel time to community facilities. The impacts on Mead Valley would be the same as those described above for Build Alternatives 1 and 2C. There are also some community facilities near Victoria Grove that would be temporarily affected during construction by temporary construction easements, short-term, temporary road closures and detours of La Sierra Avenue and El Sobrante Road, and access changes. However, all community facilities would remain operational because access would be ensured through Standard Project Measure **PF LU-1** (TMP); refer to Section 3.1.1.2 (*Land Use*) for the TMP. The TMP would ensure continued operation of Cajalco Road. Any required closures or detours would be noticed in advance. Standard Project Measure **PF UT-1** (utility relocations) is also proposed to minimize disruptions of service. Please refer to Section 3.5, *Utilities/Emergency Services*, for **PF UT-1**. Therefore, construction activities would have a minimal effect on community facilities.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, temporary impacts associated with construction would be less than those described for Build Alternative 4, and would not result in adverse effects on population, housing, or community facilities because all work would be done within the existing median.

Lake Mathews MSHCP (Build Alternative 4)

The LM MSHCP is a conservation area that does not contain any population, housing, or community facilities; therefore, there would be no impacts. Employees associated with management of the LMR may experience some temporary construction impacts as described above for Build Alternative 4, including temporary changes in access, lane closures, and traffic delays. However, Standard Project Measure **PF LU-1** (TMP) would ensure continued operation of Cajalco Road, and any required closures or detours would be noticed in advance; refer to 3.1.1.2 (*Land Use*) for the TMP. Therefore, construction activities would have a minimal effect on employees in the conservation area.

No-Build Alternative

Under the No-Build Alternative, no construction activity would occur that could result in changes to the population characteristics, housing, or community facilities. The No-Build Alternative would not introduce any changes to existing roadways. Thus, it would not provide access to areas that were previously inaccessible or result in intensification of land uses or removal of residential communities that could result in changes to population characteristics.

Economy

Permanent Impacts

Build Alternatives 1 and 2C—Cajalco and Modified Cajalco Alignments

Build Alternatives 1 and 2C would permanently alter access to some businesses along the alignment. For example, access for K-9 Companions (13703 J J Lane, Perris), Quilt Crafts (13770 Richey Way, Perris), and Lake Mathews Market and Feed Store on the south side of Cajalco Road, west of Gustin Road, would be slightly modified with the realignment of Cajalco Road, but ultimately egress and access would be maintained. A new intersection proposed at Eagle Canyon Road and Cajalco Road would also alter access to the mining businesses north and south of Cajalco Road; however, the modified access would improve safety and better accommodate the trucks used at the businesses. Permanent access for most businesses along the alignment would remain the same.

Full acquisition of two properties containing businesses and partial acquisitions of properties containing businesses would result in economic impacts on the affected businesses. The Mead Valley Market (El Mercado de Mead Valley) at the intersection of Cajalco Road and Florence Street and Riverside County Code Enforcement would be fully acquired, resulting in the displacement of 25 employees. Partial acquisitions would affect portions of businesses along Cajalco Road, including the Sand Haven Pines tree farm at the intersection of Cajalco Road and Wood Road.

The implementation of Build Alternatives 1 or 2C would increase the efficiency of the movement of people and goods along Cajalco Road, which is expected to provide regional economic benefits. Implementation of Build Alternatives 1 and 2C would reduce a lack-of-capacity bottleneck currently faced by passenger vehicles and trucks carrying goods through the study area along Cajalco Road. Although Build Alternatives 1 and 2C would result in the displacement of one commercial business and one government facility, with 25 employees, these businesses are expected to relocate within the region because there is expected to be a sufficient number of commercial replacement properties in the replacement area. See Section 3.4.2 for further details regarding acquisitions and relocations.

In addition, the effect of the project on the fiscal health of Riverside County would be negligible. The project has the potential to displace residents and businesses along Cajalco Road or El Sobrante Road, which would result in a loss of property tax and sales tax generated from these properties. Although Build Alternatives 1 and 2C would result in an estimated loss of $22,342 of property tax revenue, this loss represents less than 0.01 percent of Riverside County's estimated $351 million property tax revenue for the 2017–2018 Fiscal Year. The amount of sales tax lost under Build Alternatives 1 and 2C is unknown, but sales tax generated from the properties is minimal in relation to revenues of Riverside County as a whole. Also, if the businesses and

residents are relocated within the county, there would be little change for Riverside County. The project would be funded with state, federal, and local funds dedicated to road improvements, so no local revenues other than those specifically dedicated to roadway projects would be expended. Therefore, Build Alternatives 1 and 2C would result in minimal impacts on regional fiscal conditions. Standard Project Measure **PF COM-1** as well as Measure **COM-3** are proposed to lessen permanent economic impacts on individual businesses affected by acquisition and relocation. Therefore, impacts on the local economy would be minimal.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

If two additional travel lanes are constructed in the future, within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, it is anticipated that operational impacts would include improvements to east-west mobility, increased capacity, and improved traffic flow and safety, which would provide a benefit to businesses and the economy of the area. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and, therefore, any additional property acquisitions or changes to the tax base.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

The LM MSHCP is a conservation area that does not contain any businesses or other goods or services that would affect economic conditions; therefore, there would be no impacts.

Build Alternative 4—El Sobrante Alignment

Build Alternative 4 would permanently alter access to some businesses along the alignment. Metropolitan Water District of Southern California (MWD) access at 18250 La Sierra Avenue would change slightly from the realignment of La Sierra Avenue and El Sobrante Road, but egress and access would be maintained. At Better K9 and Wholesale Nursery, at 19410 Harley John Road, and at Rainbow Forest Nursery at 19300 Harley John Road, new access would be provided to Cajalco Road via a realigned segment of Harley John Road, although egress from the business would remain the same. At Lake Mathews Feed & Pet Supply, 17679 Cajalco Road, access to Cajalco Road would change due to the new alignment of Cajalco Road, but access to the businesses would be ensured. Permanent access for most businesses along the alignment would remain the same.

Full acquisition of two properties containing businesses and partial acquisitions of properties containing businesses would result in economic impacts on the affected businesses. The Mead Valley Market (El Mercado de Mead Valley) at the intersection of Cajalco Road and Florence Street and Riverside County Code Enforcement would be fully acquired, resulting in the displacement of 25 employees. Partial acquisitions would affect portions of businesses along Cajalco Road, including the Sand Haven Pines tree farm at the intersection of Cajalco Road and Wood Road.

The implementation of Build Alternative 4 would increase the efficiency of the movement of people and goods along the improved portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue, which is expected to provide regional economic benefits. Implementation of Build Alternative 4 would reduce a lack-of-capacity bottleneck currently faced by passenger vehicles and trucks carrying goods through the study area along Cajalco Road, east of Harley John Road. Although Build Alternative 4 would result in the displacement of two businesses (one

commercial business and one government facility) and 25 employees, these businesses are expected to relocate within the region because there is expected to be a sufficient number of commercial replacement properties in the replacement area. See Section 3.4.2 for further details regarding acquisitions and relocations. Therefore, impacts on the economy would be minimal.

In addition, the effect of the project on the fiscal health of Riverside County would be negligible. The project has the potential to displace residents and businesses along Cajalco Road or El Sobrante Road, which would result in a loss of property tax and sales tax generated from these properties. Although Build Alternative 4 would result in a property tax revenue loss of $30,253, this loss represents less than 0.01 percent of Riverside County's estimated $351 million property tax revenue for the 2017–2018 Fiscal Year. The amount of sales tax lost under Build Alternative 4 is unknown, but sales tax generated from the properties is minimal in relation to revenues of Riverside County as a whole. Also, if the businesses and residents are relocated within the county, there would be little change for Riverside County. The project would be funded with State, federal, and local funds dedicated to road improvements, so no local revenues would be expended other than those specifically dedicated to roadway projects. Therefore, Build Alternative 4 would result in minimal impacts on regional fiscal conditions. Standard Project Measures **PF COM-1**, **PF FA-1** (farmland access), and **PF FA-2** (farmland temporarily affected), as well as Measure **COM-3**, are proposed to lessen permanent economic impacts on individual businesses affected by acquisition and relocation. Therefore, impacts on the local economy would be minimal.

Future Six-Lane Facility (Build Alternative 4)

If two additional travel lanes are constructed in the future, within the median of Cajalco Road between Temescal Canyon Road and La Sierra Avenue, for a total of six travel lanes along this segment of Cajalco Road, it is anticipated that operational impacts would include improvements to east-west mobility, increased capacity, and improved traffic flow and safety, which would provide a benefit to businesses and the economy of the area. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and, therefore, any additional property acquisitions or changes to the tax base.

Lake Mathews HCP (Build Alternative 4)

The LM MSHCP is a conservation area that does not contain any businesses or other economic characteristics; therefore, there would be no impacts.

Temporary Impacts

Build Alternatives 1 and 2C—Cajalco and Modified Cajalco Alignments

Temporary impacts on circulation and access would result from construction activities that require detours and partial closures of Cajalco Road, which could temporarily affect businesses along the project corridor. Some of the businesses that could be affected by temporary detours and partial closures of Cajalco Road include businesses in the shopping center northwest of the Cajalco Road/Temescal Canyon Road intersection (Jerome's Furniture, Tilley's, restaurants, etc.); businesses between Temescal Canyon road and La Sierra Avenue, such as Cajalco Temescal Storage & RV Center, Robertson's Corona Quarry, Eagle Valley Quarry, and 3M Company FST Main Quarry; businesses between La Sierra Avenue and Cowan Road, such as K-

9 Companions, Quilt Crafts, GHZ Motorsports, Sun Shy Airbrush Tanning, Better K9 and Wholesale Nursery, Lake Mathews Feed & Pet Supply, and Jag Ranch Services; businesses between Cowan Road and Harvill Avenue, such as Wee Tole-U-Sew Embroidery & Designs, Goshen Ranch Animal Rescue, Sand Haven Pines, Best Carpet Cleaners | Upholstery Cleaning, Rug Cleaning, Epic Motorsports, Beltran Truck Sales, Tacos Jimenez, Ms Right Music, Mead Valley Market, 76 Gas Station, Breed's Market & Liquor, Mead Valley Feed, Tonaya Feed and Grain, Boris Tires, Towing Solutions, Peraza Concrete Transport, Tacos Lucaz, and XL Equipment Sales; and businesses in the shopping center at Cajalco Road and Harvill Avenue (Arco Travel Zone Center, U-Haul, Ecology Recycling, and restaurants).

Standard Project Measure **PF LU-1** (TMP) would address roadway connectivity and travel patterns during construction and provide for communication and notices to businesses and communities in advance of construction; refer to Section 3.1.1.2 (*Land Use*) for the TMP. Standard Project Measure **PF UT-1** (utility relocations) is also proposed to minimize disruptions of service. Standard Project Measure **PF COM-2** (signage provisions) would ensure that continued visibility of businesses affected during construction:

- **PF COM-2:** Signage provisions shall be made available to businesses whose temporary or permanent visibility and vehicular access changes as a result of the project. Temporary sign relocations will conform with Title 17 of County of Riverside Code 17.254.030(A) (Standards for all Temporary Signs), and permanent sign relocations will conform with County Code 17.252.030 (Outdoor advertising displays), 17.252.040 (On-site advertising structures and signs), 17.252.070 (Relocated outdoor advertising displays), and placed within the project limits. Relocated signs will be placed at heights that do not exceed surrounding structures or obstruct views.

Therefore, the temporary detours and closures would have a negligible effect on the mobility of roadway users because the roads would be restored once the proposed project is completed. In addition, temporary impacts on businesses along the corridor would have a negligible impact on the overall economy because access to all of the businesses would be maintained, and the revenues generated by the affected businesses constitute a very minor percentage of the overall economy of Riverside County. Therefore, impacts on the economy would be minimal.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

If two additional travel lanes are constructed in the future, within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, it is anticipated that temporary impacts would be limited to the future median, and would not affect businesses or economic conditions in the area. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and, therefore, any additional property acquisitions or changes to the tax base.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

The LM MSHCP is a conservation area that does not contain any businesses or other economic characteristics; therefore, there would be no impacts.

Build Alternative 4—El Sobrante Alignment

Temporary impacts on circulation and access would result from construction activities that require detours and partial closures of Cajalco Road, La Sierra Avenue, or El Sobrante Road and La Sierra Avenue, which could temporarily affect businesses along the project corridor. Some of the businesses that could be affected by temporary detours and partial closures of Cajalco Road, La Sierra Avenue, and El Sobrante Road include businesses in the shopping center northwest of the Cajalco Road/Temescal Canyon Road intersection (Jerome's Furniture, Tilley's, restaurants, etc.); businesses between Temescal Canyon road and La Sierra Avenue, such as Cajalco Temescal Storage & RV Center, Robertson's Corona Quarry, Eagle Valley Quarry, and 3M Company FST Main Quarry; businesses between La Sierra Avenue and Cowan Road, such as MWD, Abode Realty, Bronzed by Nikki, Bianca's Home Care, A & S Senior Quality Care, GoneStraw Farms, Dos Pinos Ranch & Nursery, Greensource Nursery, Gonestraw Farms, Harvest Growers, Inc., Y C Chen Nursery Inc., Dwight H Holcomb Orchard Services, The Hill, Sunny Nursery, Wholesale Nursery, Lake Mathews Feed & Pet Supply, and Jag Ranch Services; businesses between Cowan Road and Harvill Avenue, such as Wee Tole-U-Sew Embroidery & Designs, Goshen Ranch Animal Rescue, Sand Haven Pines, Best Carpet Cleaners | Upholstery Cleaning, Rug Cleaning, Epic Motorsports, Beltran Truck Sales, Tacos Jimenez, Ms Right Music, Mead Valley Market, 76 Gas Station, Breed's Market & Liquor, Mead Valley Feed, Tonaya Feed and Grain, Boris Tires, Towing Solutions, Peraza Concrete Transport, Tacos Lucaz, and XL Equipment Sales; and businesses in the shopping center at Cajalco Road and Harvill Avenue (Arco Travel Zone Center, U-Haul, Ecology Recycling, and restaurants).

However, Standard Project Measure **PF LU-1** (TMP) would address roadway connectivity and travel patterns during construction and provide for communication and notices to businesses and communities in advance of construction. Standard Project Measure **PF COM-2** would ensure that continued visibility of businesses affected during construction. Therefore, the temporary detours and closures would have a negligible effect on the mobility of roadway users because the roads would be restored once the proposed project is completed. In addition, temporary impacts on businesses along the corridor would have a negligible impact on the overall economy because access to all of the businesses would be maintained, and the revenues generated by the affected businesses constitute a very minor percentage of the overall economy of Riverside County. Standard Project Measure **PF UT-1** (utility relocations) is also proposed to minimize disruptions of service. Therefore, impacts on the economy would be minimal.

Future Six-Lane Facility (Build Alternative 4)

If two additional travel lanes are constructed in the future, within the median of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, it is anticipated that operational impacts would be limited to the future median, and would not affect businesses or economic conditions in the area. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and, therefore, any additional property acquisitions or changes to the tax base.

Lake Mathews MSHCP (Build Alternative 4)

The LM MSHCP is a conservation area that does not contain any businesses or other economic characteristics; therefore, there would be no impacts.

No-Build Alternative

There would no changes to the economy under the No-Build Alternative because existing businesses in the study area would not be affected.

Communities/Community Character and Cohesion

Permanent Impacts

Build Alternatives 1 and 2C—Cajalco Alignment and Modified Cajalco Alignment

Build Alternatives 1 and 2C would widen Cajalco Road between the I-215 southbound ramps and Temescal Canyon Road to improve east-west mobility and to provide increased capacity and improved traffic flow and safety. Communities primarily affected by the changes proposed under Build Alternatives 1 and 2C would be Mead Valley, Woodcrest/Mockingbird Canyon, Lake Mathews/Gavilan Hills, and Temescal Canyon.

Mead Valley

The widening of Cajalco Road within the community of Mead Valley would occur predominantly along the existing alignment of the road, creating a more urban visual setting than existing conditions with the introduction of additional paving, sidewalks, traffic lights, crosswalks, and drainage facilities. The existing roadbed would be widened by approximately 45 feet and include paved medians, turn pockets, and striping for two additional through lanes and turn lanes. Medians of various widths and types are proposed to provide for the separation of opposing traffic, control of cross traffic, a recovery area for out-of-control vehicles, space for speed changes, and left and U-turns. Left-turn lanes and right-turn pocket lanes are also proposed to be constructed along the roadway at selected intersections to accommodate through traffic and control cross-traffic movement. These left- and right-turn lanes would be designed to accommodate vehicles with trailers and provide alternate access options for local residents and business owners. These changes would affect current local access patterns for residents and businesses that directly front Cajalco Road.

Americans with Disabilities Act–compliant sidewalks would be constructed along one side of Cajalco Road in some locations through the Mead Valley community where residential and commercial properties are present to improve local pedestrian movement and safety. There are currently limited sidewalks and crosswalks available for pedestrians to cross Cajalco Road within Mead Valley; therefore, pedestrians and cyclists may currently share the roadway with vehicles along limited segments of Cajalco Road where sidewalks and/or roadway shoulder areas may not be available. Pedestrians may also cross Cajalco Road without using crosswalks due to the distances between crosswalk facilities. Traffic signal and crosswalk improvements are proposed to assist with crossing Cajalco Road, which would benefit community members and students that walk or ride bicycles to school.

The current narrow and limited roadway shoulders are shared by cyclists and vehicles and, in limited sections, pedestrians. The project would add curb and gutter and 8-foot-wide shoulders to serve as a combined shoulder/bike lane and provide more room for bicycles.

As indicated in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, roadway volumes for the section of Cajalco Road between Barton Street and I-215 are projected

to increase by approximately 27 percent by Year 2044 under the proposed project. The existing percentage of truck traffic within this area, approximately 3.4 percent, is projected to remain at 3.4 percent under future project conditions and would represent the same percentage of the added vehicles. However, roadway speeds within the community would be controlled with existing and proposed additional intersection traffic controls; therefore, projected future speeds would average 37 miles per hour and decrease by approximately 5–10 miles per hour during peak hours.

According to the *Noise Study Report* prepared for the project (Caltrans 2019), under Build Alternatives 1 and 2C, operational traffic-related noise is not anticipated to result in a substantial change in the noise environment when compared with existing and future no-project conditions. Although the widening of Cajalco Road would result in an increased level of noise and vibration, the increase would not reduce social interaction of residents along the roadways. Residents and community members who use Cajalco Road and businesses along Cajalco Road currently experience noise and vibration from Cajalco Road and other roadways in the vicinity; therefore, social interactions have developed around, and regardless of, this condition.

Vegetation associated with residential landscaping along Cajalco Road and commercial landscaping at the eastern end of the community would require removal to accommodate the widened roadway, flood control facilities, and pedestrian facilities.

As described under *Population, Housing and Community Facilities*, above, Build Alternatives 1 and 2C would require full acquisition of 17 residential units and one business within the community of Mead Valley. Partial acquisition of land from 67 residential parcels (not requiring relocation) would also occur. The residential and business acquisitions are anticipated to result in the displacement of 52 residents and nine employees. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. All eligible displacees would be entitled to moving expenses per the Uniform Act. In addition to the benefits of increased pedestrian, vehicular, and cyclist safety, improved pedestrian facilities for access to community facilities, and flood control improvements, the following standard project measures and mitigation measures will minimize and compensate for permanent impacts that would affect community character and cohesion within the Mead Valley community under Build Alternatives 1 and 2C:

- **PF COM-1** (Relocation Assistance)
- **COM-3** (Relocation Plan)
- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)
- **PF VIS-7** (New Bridge Architectural Treatments)
- **VIS-8** (Replace Disturbed Vegetation along Landscaped Freeways)
- **HAZ-4:** (Detailed Site Investigation [DSI]; Riverside County Department of Environmental Health Notification and Soil Remediation; Health and Safety Plan [HASP]; and Soil

Management Plan [SMP] for 21020 Cajalco Road [Assessor's Parcel Numbers (APNs) 318-061-027 and -030])

Please refer to the following sections of this EIR/EIS for the measures listed above: Section 3.7, *Visual/Aesthetics* (**PF VIS-1**, **VIS-2**, **PF VIS-4**, **PF VIS-5**, **PF VIS-7**, and **VIS-8**), and Section 3.13, *Hazardous Waste/Materials* (**HAZ-4**).

Lake Mathews/Gavilan Hills

The widening of Cajalco Road within the community of Lake Mathews/Gavilan Hills under Build Alternatives 1 and 2C would occur predominantly along the existing roadway alignment between Lake Mathews Drive and Barton Street, and include realignments to reduce roadway curves between west of La Sierra Avenue and Lake Mathews Drive. Between Lake Mathews Drive and Barton Street, the widened roadway would create a more urban visual setting than existing conditions with the introduction of additional paving, traffic lights, crosswalks, and drainage facilities. The existing roadbed would be widened by approximately 45 feet and include paved medians, turn pockets, and striping for two additional through lanes and turn lanes. Medians of various widths and types are proposed to provide for the separation of opposing traffic, control of cross traffic, a recovery area for out-of-control vehicles, space for speed changes, and left and U-turns. Left-turn lanes and right-turn pocket lanes are also proposed to be constructed along the roadway at selected intersections to accommodate through traffic and control cross-traffic movement. These left- and right-turn lanes would be designed to accommodate vehicles with trailers and provide alternate access options for local residents and business owners. These changes would affect current local access patterns for residents and businesses that directly front Cajalco Road.

The intersection of Gustin Road with Cajalco Road would be shifted west to align with Cowan Road and create a new four-way intersection. A cul-de-sac would be placed at the northern terminus of existing Gustin Road and Gustin Road would be realigned through undeveloped parcels to intersect with Cajalco Road west of the cul-de-sac. The change would redirect traffic away from residences east of Gustin Road and closer to the Lake Mathews Market. Access to the undeveloped parcels exists under current conditions and would not be increased or decreased as a result of the Gustin Road realignment. Because the Lake Mathews Market is currently accessible via Gustin Road and Cowan Road, the realignment of Gustin Road would not introduce new access to the market.

The current narrow and limited roadway shoulders are shared by cyclists and vehicles and, in limited sections, pedestrians. The project would add curb and gutter and 8-foot-wide shoulders to serve as a combined shoulder/bike lane and provide more room for bicycles.

Between west of La Sierra Avenue and Lake Mathews Drive, Build Alternatives 1 and 2C would also include a new connection between Dirt Road and Richey Way south of the existing segment of Cajalco Road and west of Lake Mathews Drive. The new road connection would connect Dirt Road to Richey Way. The eastern terminus of Richey Way at Lake Mathews Drive would also be widened slightly and graded. This new road connection would provide emergency access for residences and businesses west of Lake Mathews Drive as well as improved connectivity and accessibility within the Lake Mathews community. Because Dirt Road and Richey Way are existing roadways that are accessible by the public, the new connection would not create new access to previously inaccessible areas; it would enhance access and circulation within the Lake Mathews community.

These changes may create a sense of visual encroachment for properties with structures close to the new right of way or where landscaping would be removed so that views of and from the roadway and traffic would be available where views are presently more screened. The following standard project measures and mitigation measures will minimize permanent impacts that would affect the community character and cohesion within the Lake Mathews/Gavilan Hills community under Build Alternatives 1 and 2C:

- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)
- **PF VIS-7** (New Bridge Architectural Treatments)

Please refer to Section 3.7, *Visual/Aesthetics*, of this EIR/EIS for the measures listed above.

Woodcrest/Mockingbird Canyon

The widening of Cajalco Road within the community of Woodcrest/Mockingbird Canyon under Build Alternatives 1 and 2C between Harley John Road and Barton Street would result in the same impacts and benefits identified for this section of roadway within the Lake Mathews/ Gavilan Hills community, with the exception of anticipated noise and property impacts.

According to the *Noise Study Report* prepared for the project (Caltrans 2019), under Build Alternatives 1 and 2C, traffic noise analysis indicates that existing noise levels for residences that front Cajalco Road at Extravaganza Lane, and one residence that fronts Cajalco Road at Cowan Road, currently approach or exceed the FHWA/Caltrans NAC of 67 dBA. Predicted noise levels at these locations under the build alternatives indicate an increase between 2 and 5 dBA. For the three receivers that would experience traffic levels that would approach or exceed NAC, noise abatement in the form of noise barriers was considered and evaluated to determine feasibility of meeting the design goal of 7 decibels of noise reduction. Further analysis of cost and reasonableness of each barrier was also conducted to determine if the barriers would be constructed. Preliminary results indicate that the noise barriers are recommended for construction and are identified as Mitigation Measures **NOI-2** and **NOI-3** in Section 3.15, *Noise and Vibration*, of this EIR/EIS. Assuming these noise barriers are constructed, operational noise impacts would be reduced where they were determined to exceed the NAC. Therefore, with the recommended measures to mitigate the adverse effects identified related to operational noise of the build alternatives, remaining operational noise effects would be minor.

Access to undeveloped lands north and south of Cajalco Road would not increase because design elements that would promote access such as roadway turnoffs or parking areas would not be included, and the roadway would be fenced on the north side between Carpinus Drive and Alexander Street and fenced on the south side between Carpinus Drive and Barton Street.

Standard project measures and additional mitigation measures will minimize and compensate for impacts on the Woodcrest/Mockingbird Canyon community under Build Alternatives 1 and 2C; these are described in the *Summary*, below.

- **PF VIS-1** (Contouring and Replanting Disturbed Areas)

- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-3** (Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)
- **PF VIS-7** (New Bridge Architectural Treatments)
- **HAZ-7 Yellow Paint.** Due to the possible presence of elevated lead concentrations within the yellow thermoplastic and yellow-painted traffic stripes along the existing highway, a yellow paint and thermoplastic striping survey will be conducted along the project alignment for striping that will be removed.

Please refer to the following sections of this EIR/EIS for the measures listed above: Section 3.7, *Visual/Aesthetics* (**PF VIS-1**, **VIS-2**, **PF VIS-3** through **PF VIS-5**, and **PF VIS-7**), and Section 3.13, *Hazardous Waste/Materials* (**HAZ-7**).

Victoria Grove and Lake Hills/Home Gardens

Under Build Alternatives 1 and 2C, impacts on the community character and cohesion of the Victoria Grove and Lake Hills communities would not occur, as the project alignments would be located at a far enough distance that community composition, features, and primary community facilities would not be affected.

- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **HAZ-7** (Yellow Thermoplastic and Yellow-Painted Traffic Stripes)

Please refer to the following sections of this EIR/EIS for the measures listed above: Section 3.7, *Visual/Aesthetics* (**PF VIS-1**, **VIS-2**, and **PF VIS-4**), and Section 3.13, *Hazardous Waste/Materials* (**HAZ-7**).

Temescal Canyon

Under Build Alternatives 1 and 2C, the widening of Cajalco Road within the community of Temescal Canyon would occur predominantly along the existing alignment of the road between Temescal Canyon Road and Eagle Valley Road, and include realignments to reduce roadway curves between east of Eagle Valley Road and west of La Sierra Avenue.

The Temescal Creek Bridge would be replaced with a widened bridge, and a large detention basin would be added south of Cajalco Road. These changes in addition to the widened road and new four-way intersection at Eagle Valley Road would affect the character of the community by introducing more urban elements. The realignment would also result in the displacement of one residential unit on the north side of Cajalco Road. The affected property consists of a rural-residential, single-family house. An estimated five residents would be displaced from their current residence within Temescal Canyon. Of the total population of 9,472 within the study area

portion of Temescal Canyon, the displacement of five residents would represent less than 0.1 percent of the community population.

As discussed in Section 3.4.2, adequate residential replacement properties are available within a 10-mile radius of the project, and most displaced residents would be expected to relocate to residences within the same region. The replacement area is the most similar to the displacement area in character and socioeconomic status. It has the highest likelihood of receiving displaced residents and businesses because of the availability of replacement properties with similar average purchase prices as in the displacement area. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. All eligible displacees would be entitled to moving expenses per the Uniform Act.

- **PF COM-1** (Relocation Assistance)
- **COM-3** (Relocation Plan)
- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-3** (Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)
- **PF VIS-6** (Temescal Creek Bridge Design)
- **PF VIS-7** (New Bridge Architectural Treatments)
- **HAZ-1** (DSI; Riverside County Department of Environmental Health Notification and Soil Remediation; HASP; and SMP for 9001 Cajalco Road [APNs 279-231-004, -006, -011, and 281-140-021])
- **HAZ-7** (Yellow Thermoplastic and Yellow-Painted Traffic Stripes)
- **HAZ-8** (Asbestos-Containing Material [ACM] and Lead-Based Paint [LBP])

Please refer to the following sections of this EIR/EIS for the measures listed above: Section 3.7, *Visual/Aesthetics* (**PF VIS-1**, **VIS-2**, and **PF VIS-3** through **PF VIS-7**), and Section 3.13, *Hazardous Waste/Materials* (**HAZ-1**, **HAZ-7**, and **HAZ-8**).

Future Six-Lane Facility (Build Alternatives 1 and 2C)

Construction of the Future Six-Lane Cajalco Road facility is not currently proposed as part of the project. However, if the two additional travel lanes along Cajalco Road between Temescal Canyon Road and Harley John Road are constructed in the future, it is anticipated that impacts during operation would be similar to those described for Build Alternative 1.

The additional lanes would be added within the median and the width of the roadway would not change, avoiding any additional physical expansion of the roadway and therefore any additional property acquisitions or changes to community cohesion or character. In addition, crosswalks and access under four-lane conditions would remain the same under the six-lane facility. Because

the width of the roadway would not change, even though the facility would change from four lanes to six lanes, community cohesion would not change further.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

The LM MSHCP is a conservation area that does not contain any neighborhoods or communities; therefore, there would be no impacts.

Summary (Build Alternatives 1 and 2C)

Community character would be impacted by the widened road and approximately 84 acres of added hardscape such as extra lanes and pavement, intersection lights, light standards, and concrete drainages. The widened roads would also remove vegetation, approximately 380 to 390 small trees and shrubs, and 105 large mature trees. There would be a general change from semi-rural/suburban character to a more urbanized community character. Traffic would increase, including truck traffic. Adding lanes and reducing curves to meet Surface Transportation Assistance Act (STAA) standards to allow for larger trucks may impact the community, and some vehicles may increase speeds with the improved road, although speed limits are expected to remain unchanged.

The proposed widening of Cajalco Road would not introduce a new barrier that would divide any existing communities, separate residences from community facilities, result in substantial growth, or impede connectivity between neighborhoods because Cajalco Road is an existing roadway that currently traverses communities and neighborhoods. Widening of an existing roadway would not separate residences from community facilities or impede connectivity; the community members may currently need to cross a roadway to reach their destination, and widening the roadway would not change that. In addition, Build Alternative 1 includes the addition of sidewalks on one side of the roadway in some locations where residential and commercial properties are present to improve pedestrian movement and improvements to traffic signals to assist with crossing Cajalco Road, which would benefit community members and schools.

The widening of Cajalco Road would change the aesthetic character of the land adjacent to Cajalco Road by making the roadway wider and more suburban-like in undeveloped areas and more urban-like in populated areas. The feel of the roadway would change for travelers and business patrons along the roadway. Apart from the widening of Cajalco Road, changes to the aesthetic environment within the study area would include the removal of vegetation within the widened area, the addition of drainage facilities and wildlife crossings, and intersection improvements. The widening of Cajalco Road would occur predominantly along the existing alignment of the road, which would support compatibility with the existing land uses and aesthetics.

The alignment of Cajalco Road under Build Alternatives 1 and 2C would be modified near the homes accessed via Eagle Canyon Road, Silverton Court, and Hollis Lane. The alignment shift near the homes accessed via Silverton Court would be minor when compared to the existing roadway. The alignment shift for the homes accessed via Eagle Canyon Road and Hollis Lane would be greater. Residences on Hollis Lane, Dirt Road, and Lynette Lane, which currently connect directly to Cajalco Road, would have new access via a cul-de-sac road. Dirt Road would also connect to Lake Mathews Drive via Richey Way, which would be a new connection for this area. These realignments would serve to improve the function and geometrics of Cajalco Road, which would be an improvement for homes in these areas, particularly for the homes accessed via Hollis Lane, as

through-traffic on Cajalco Road would no longer travel directly through the neighborhood. These changes near the homes at Eagle Canyon Road and Silverton Court could make these portions of the study area seem more urban-like, but they would also improve the roadway function of the homes near Hollis Lane by removing through-traffic. Overall, even though Cajalco Road would be widened and would be more urban-like, these neighborhoods would benefit from Build Alternative 1 due to improved neighborhood connections and roadway function and safety.

Build Alternative 1 is anticipated to require the displacement of 19 residential units and two nonresidential units. For more information on the effects of the project related to relocations, refer to Section 3.4.2, *Relocations and Real Property Acquisition*. Vegetation associated with residential landscaping along Cajalco Road, commercial landscaping at the eastern end of the community, trees associated with nursery businesses, and nonnative grasses, sage scrub, and ruderal vegetation associated with habitat conservation areas would require removal to accommodate the widened roadway and associated facilities. While Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible, this measure would not be able to reverse the adverse effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor.

Beyond the effects that would occur on properties adjacent to Cajalco Road, the portions of the study area that are rural in character would be minimally affected by the operation of Cajalco Road under Build Alternatives 1 and 2C.

Although the widening of roadways under Build Alternatives 1 and 2C would result in an increased level of noise and vibration, the increase would not reduce social interaction of residents along the roadways because existing noise levels are not integral to existing social interaction along the roadways. Noise effects are currently experienced by communities adjacent to Cajalco Road. According to the *Cajalco Road Widening and Safety Enhancement Project Noise Study Report* prepared for the proposed project, permanent traffic noise impacts are predicted to occur at three modeled receivers under Build Alternative 1 (Caltrans 2019). For receivers that would experience traffic noise levels within the Woodcrest/Mockingbird Canyon community that would approach or exceed the NAC, noise abatement in the form of barriers would be considered (refer to Mitigation Measures **NOI-2** and **NOI-3** in Section 3.15, *Noise and Vibration*). With implementation of the barriers, noise impacts would be sufficiently reduced to avoid permanent noise impacts. In addition, the noise impacts would be minor given the degree to which communities in the area are currently affected by traffic noise associated with Cajalco Road. The impacts are not anticipated to be substantial enough such that communities would be incompatible with the proposed improvements.

Residents and community members who use Cajalco Road or businesses along Cajalco Road currently experience noise and vibration from Cajalco Road and other roadways in the vicinity, and social interactions have developed around, and regardless of, this condition. Therefore, additional noise and vibration are unlikely to change social interactions. Nevertheless, there would be increased noise and this would impact community character.

The following standard project measures and additional mitigation measures will minimize and compensate for impacts under Build Alternatives 1 and 2C.

- **PF COM-1** (Relocation Assistance)
- **COM-3** (Relocation Plan)

- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-3** (Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)
- **PF VIS-6** (Temescal Creek Bridge Design)
- **PF VIS-7** (New Bridge Architectural Treatments)
- **VIS-8** (Replace Disturbed Vegetation along Landscaped Freeways)
- **HAZ-1** (DSI; Riverside County Department of Environmental Health Notification and Soil Remediation; HASP; and SMP for 9001 Cajalco Road [APNs 279-231-004, -006, -011, and 281-140-021])
- **HAZ-4** (DSI; Riverside County Department of Environmental Health Notification and Soil Remediation; HASP; and, SMP for 21020 Cajalco Road [APNs 318-061-027 and -030])
- **HAZ-7** (Yellow Thermoplastic and Yellow-Painted Traffic Stripes)
- **HAZ-8** (ACM and LBP)
- **NOI-2** (Noise Barrier S-624)
- **NOI-3** (Noise Barriers S-650 [Property Line] and S-652 [Property Line])

Build Alternative 4—El Sobrante Alignment

Under Build Alternative 4, between Temescal Canyon Road and west of La Sierra Avenue, and between Gustin Road and I-215, improvements would be identical to Build Alternatives 1 and 2C. However, between Gustin Road and La Sierra Avenue, and La Sierra Avenue between El Sobrante Road and Cajalco Road, El Sobrante Road and La Sierra Avenue would be improved from the existing two-lane road to a four-lane road, which would result in different community impacts. The widening of El Sobrante Road and La Sierra Avenue from a two-lane roadway to a four-lane roadway would change the aesthetic character of the land adjacent to El Sobrante Road and La Sierra Avenue by making a roadway wider and more urban-like. In addition, realigning La Sierra Avenue could make the roadway feel more urban-like as well. The feel of the roadway would change for travelers and residents along the roadway, specifically the residents of the community north of Lake Mathews.

However, implementation of Build Alternative 4 would not cut off connected neighborhoods from each other. No development features are proposed that would divide an established community or limit movement, travel, or social interaction between established communities. Widening of an existing roadway would not separate residences from community facilities or impede connectivity; the community members currently need to cross a roadway to reach their destination, and widening the roadway would not change that. In addition, Build Alternative 4 includes the addition of sidewalks in a few sections of Cajalco Road on the eastern end in Mead

Valley to improve pedestrian movement and improvements to traffic signals to assist with crossing El Sobrante Road, which would benefit the community.

Build Alternative 4 would require the displacement of 21 residential units and 2 nonresidential units. Beyond the effects that would occur on properties adjacent to Cajalco Road, Build Alternative 4 would not substantially affect the rural character of portions of the study area.

Under Build Alternative 4, permanent traffic noise impacts are predicted to occur at seven modeled receivers, and noise abatement in the form of barriers would be considered (refer to Section 3.15, *Noise and Vibration*) (Caltrans 2019). Although the change in the noise environment would be perceptible even after implementation of the barriers, the impacts would be minor given the degree to which communities in the area are currently affected by traffic noise associated with Cajalco Road and El Sobrante Road.

Mead Valley

Under Build Alternative 4, impacts on community character and cohesion would be similar to those identified under Build Alternatives 1 and 2C for the portion of the Mead Valley community between I-215 and Cowan Road.

Lake Mathews/Gavilan Hills

Under Build Alternative 4, impacts anticipated on areas of the community west of La Sierra Avenue and east of Cabletina Circle are discussed under Build Alternatives 1 and 2C, above. Areas specific to Build Alternative 4 only within the community of Lake Mathews/Gavilan Hills with potential to experience change include residences south of Cajalco Road on Silverton Court, Farley Way, and east of Gustin Road. Residences along Silverton Court and Farley Way would experience a minor change in access related to the realignment of the La Sierra Avenue intersection with Cajalco Road farther west. La Sierra Avenue at the current intersection of La Sierra Avenue and Cajalco Road would be closed to the public, and the traffic associated with La Sierra Avenue would be redirected west of Silverton Court and Farley Way. Residences immediately east of Gustin Road are predicted to experience traffic noise levels of 66 dBA that would approach or exceed the NAC of 67 dBA. Noise abatement was not considered for this location because any noise abatement would restrict access to the property by cutting off the driveway.

Woodcrest/Mockingbird Canyon

Between Cowan Road and Barton Street, impacts and benefits of Build Alternative 4 would be the same as those identified under Build Alternatives 1 and 2C, above. Under Build Alternative 4, two residential units along El Sobrante Road are proposed for acquisition in addition to the business on Cajalco Road, for an anticipated total 10 residential and 16 employee displacees within this community. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. Standard Project Measure **PF COM-1** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

Additional new traffic signals with designated crosswalks would be constructed within the community under Build Alternative 4 at the intersections of El Sobrante Road with McAllister

Street, Mockingbird Canyon Road, and Harley John Road. Long term, Build Alternative 4 is expected to improve roadway efficiency and would likely result in a reduction in travel times to community facilities.

Victoria Grove

Under Build Alternative 4, no residential or business displacements are anticipated to occur that would affect Victoria Grove. Partial acquisitions of the landscaped portion of the roadway along the north side of El Sobrante Road would be necessary to accommodate the widened roadway. New traffic signals with designated crosswalks would be constructed at the intersections of El Sobrante Road with La Sierra Avenue and McAllister Street.

Lake Hills/Home Gardens

Under Build Alternative 4, no residential or business displacements are anticipated to occur that would affect Lake Hills/Home Gardens. A new traffic signal with designated crosswalks would be constructed at the intersection of El Sobrante Road and La Sierra Avenue; however, this change is not anticipated to affect population, housing, or community facilities within this community.

Temescal Canyon

Under Build Alternative 4, impacts on community character and cohesion would be the same as those identified under Build Alternatives 1 and 2C for the portion of the Temescal Canyon community between Temescal Canyon Road and west of La Sierra Avenue. Just west of La Sierra Avenue, residences south of Cajalco Road, on Silverton Court and Farley Way, would experience a minor change in access related to the realignment of the La Sierra Avenue intersection with Cajalco Road farther west. La Sierra Avenue at the current intersection of La Sierra Avenue and Cajalco Road would be closed to the public, and the traffic associated with La Sierra Avenue would be redirected west of Silverton Court and Farley Way.

Future Six-Lane Facility (Build Alternative 4)

For the future six-lane facility, if constructed in the future, impacts during operation would be same as described for Build Alternative 4. The additional lanes would be added within the medians and the width of the roadways would not change, avoiding any additional physical expansion of the roadways and, therefore, any additional property acquisitions or changes to community cohesion or character.

Lake Mathews MSHCP (Build Alternative 4)

The LM MSHCP is a conservation area that does not contain any neighborhoods or communities; therefore, there would be no impacts.

Summary (Build Alternative 4)

Community character would be impacted by the widened road and approximately 105 acres of added hardscape such as extra lanes and pavement, intersection lights, light standards, and concrete drainages. The widened roads would also remove vegetation, approximately 400 small trees and shrubs, and 195 large mature trees. There would be a general change from semi-rural/ suburban character to a more urbanized community character. Traffic would increase, including

truck traffic. Adding lanes and reducing curves to meet STAA standards to allow for larger trucks may impact the community, and some vehicles may increase speeds with the improved road, although speed limits are expected to remain unchanged.

The proposed widening of portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road would not introduce a new barrier that would divide any existing communities, separate residences from community facilities, result in substantial growth, or impede connectivity between neighborhoods because Cajalco Road, La Sierra Avenue, and El Sobrante Road are existing roadways that currently traverse communities and neighborhoods. Widening of an existing roadway would not separate residences from community facilities or impede connectivity; the community members may currently need to cross a roadway to reach their destination, and widening the roadway would not change that. Furthermore, Build Alternative 4 includes the addition of sidewalks on one side of the roadway in some locations where residential and commercial properties are present to improve pedestrian movement, and improvements to traffic signals to assist with crossing Cajalco Road and El Sobrante Road, which would benefit community members and schools.

The widening of Cajalco Road, La Sierra Avenue, and El Sobrante Road would change the aesthetic character of the land adjacent to the roadways by making the roadway wider and more suburban-like in undeveloped areas and more urban-like in populated areas. The feel of the roadways would change for travelers and business patrons along the roadway. Apart from the widening of the roadways, changes to the aesthetic environment within the study area would include the removal of vegetation within the widened area, the addition of drainage facilities and wildlife crossings, large bridge structure, and intersection improvements. The widening of Cajalco Road and El Sobrante Road would occur predominantly along the existing roadway alignments, which would support compatibility with the existing land uses and aesthetics. The widening of La Sierra Avenue would occur along portions of the existing roadway alignment, which would support compatibility with the existing land uses and aesthetics; however, the segments of La Sierra Avenue proposed for realignment, while still within an open space setting, would include the addition of a large bridge structure.

Build Alternative 4 would require the displacement of 21 residential units and two nonresidential units. For more information on the effects of the project related to relocations, refer to Section 3.4.2, *Relocations and Real Property Acquisition*. Vegetation associated with residential landscaping along Cajalco Road and El Sobrante Road, commercial landscaping at the eastern end of the community, trees associated with nursery businesses, and nonnative grasses, sage scrub, and ruderal vegetation associated with habitat conservation areas would require removal to accommodate the widened roadways and associated facilities. While Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible, this measure would not be able to reverse the adverse effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor.

Although the widening of roadways under Build Alternative 4 would result in an increased level of noise and vibration, the increase would not reduce social interaction of residents along the roadways because existing noise levels are not integral to existing social interaction along the roadways. Noise effects are currently experienced by communities adjacent to Cajalco Road, La Sierra Avenue, and El Sobrante Road. According to the *Cajalco Road Widening and Safety Enhancement Project Noise Study Report* prepared for the proposed project, permanent traffic

noise impacts are predicted to occur at four modeled receivers under Build Alternative 4 (Caltrans 2019). At three locations where receivers would experience traffic noise levels that would approach or exceed NAC within the Woodcrest/Mockingbird Canyon community, noise abatement in the form of barriers would be considered (refer to Mitigation Measures **NOI-2** and **NOI-3** in Section 3.15, *Noise and Vibration*). With implementation of the barriers, noise impacts would be sufficiently reduced to avoid permanent noise impacts for receivers at these three locations. One additional receiver location within the Lake Mathews/Gavilan Hills community would experience traffic noise levels that would approach or exceed the NAC under Build Alternative 4. Noise abatement was not considered for this location because any noise abatement would restrict access to the property by cutting off the driveway.

Residents and community members who use Cajalco Road, La Sierra Avenue, and El Sobrante Road, or businesses along Cajalco Road and El Sobrante Road, currently experience noise and vibration from these and other roadways in the vicinity, and social interactions have developed around, and regardless of, this condition. Therefore, additional noise and vibration are unlikely to change social interactions. Nevertheless, there would be increased noise and this would impact community character.

The following standard project measures and additional mitigation measures will minimize and compensate for impacts under Build Alternative 4.

- **PF COM-1** (Relocation Assistance)
- **COM-3** (Relocation Plan)
- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-3** (Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)
- **PF VIS-6** (Temescal Creek Bridge Design)
- **PF VIS-7** (New Bridge Architectural Treatments)
- **VIS-8** (Replace Disturbed Vegetation along Landscaped Freeways)
- **HAZ-1** (DSI; Riverside County Department of Environmental Health Notification and Soil Remediation; HASP; and, SMP for 9001 Cajalco Road [APNs 279-231-004, -006, -011, and 281-140-021])
- **HAZ-4** (DSI; Riverside County Department of Environmental Health Notification and Soil Remediation; HASP; and, SMP for 21020 Cajalco Road [APNs 318-061-027 and -030])
- **HAZ-7** (Yellow Thermoplastic and Yellow-Painted Traffic Stripes)
- **HAZ-8** (ACM and LBP)
- **NOI-2** (Noise Barrier S-624)

- **NOI-3** (Noise Barriers S-650 [Property Line] and S-652 [Property Line])

Temporary Impacts

Build Alternatives 1, 2C, and 4

Build Alternatives 1 or 2C are anticipated to take approximately 4 years to construct, and would be phased so that construction activities would not occur within a project area community for an extended period of time. Build Alternative 4 is anticipated to take approximately 4.5 years to construct, and would also be phased so that construction activities would not occur within a project area community for an extended period of time. Temporary, minor impacts on community character and cohesion during construction would be expected under Build Alternatives 1, 2C, and 4. Properties adjacent to Cajalco Road under Build Alternatives 1, 2C, and 4; Dirt Road and Richey Way under Build Alternatives 1 and 2C; and El Sobrante Road under Build Alternative 4 may require temporary driveway modifications and detours during construction. Large equipment operating during construction and periodic dust during grading activities would be visible to those traveling along these roadways, and visible and audible to properties fronting the roadways. With the incorporation of Standard Project Measures **PF FA-2**, **PF LU-1**, **PF AQ-1**, **PF AQ-2**, and **PF NOI-1**, these temporary impacts would not substantially affect the rural character of the study area. The temporary detour routes also would not provide new access to currently undeveloped areas, as described in Section 3.3, *Growth*. Only temporary signage during construction and potential restriping along the freeway overpass would occur within the City of Perris. In the City of Corona, which includes approximately 0.4 mile of the alignment at the western end of the project, construction activities would be limited to construction of medians, paving, turn pockets, signage, and bridge placement of Temescal Creek Bridge over Temescal Creek. All other construction activities would occur in unincorporated Riverside County.

Temporary partial closure of Cajalco Road, sidewalks, and crosswalks, and driveway access modifications would be required intermittently throughout the construction period. However, these closures would be short term, and alternate routes and advance notice would be provided. Temporary impacts on community character would be reduced with Standard Project Measure **PF COM-2** and Standard Project Measure **PF LU-1** (TMP); refer to Section 3.1.1.2 (*Land Use*) for the TMP.

According to the *Cajalco Road Widening and Safety Enhancement Project Noise Study Report*, noise from construction activities would intermittently dominate the noise environment in the immediate area of construction (Caltrans 2019). Conventional construction equipment is expected to generate maximum noise levels ranging from 75 to 99 dBA at a distance of 50 feet, while noise from pile driving would generate maximum noise levels of approximately 96 dBA at a distance of 50 feet. Noise produced by construction equipment would diminish over distance at a rate of about 6 dBA per doubling of distance. Temporary noise impacts from construction are anticipated; however, construction would be conducted in accordance with Caltrans provisions in Section 14-8.02, Noise Control, of the 2010 Standard Specifications and Special Provisions (SSP 14-8.02) and applicable local noise standards, and resulting noise impacts would be minor. Therefore, community character and cohesion would not be substantially affected by noise produced during construction.

According to the *Air Quality Study Report*, construction of this build alternative would result in minor air quality impacts and would not expose sensitive receptors to adverse concentration of

carbon monoxide, particulate matter, or toxic air contaminants (Caltrans 2017). In addition, Mobile Source Air Toxics (MSAT) emissions in horizon year 2044 are anticipated to be considerably less than Baseline Year 2014 levels, even though vehicle miles traveled (VMT) is anticipated to increase. MSAT emissions would be lower than present levels at Horizon Year 2044 as a result of the U.S. Environmental Protection Agency's (EPA's) national control programs, which are projected to reduce annual MSAT emissions by over 90 percent from 2010 to 2050. Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the magnitude of the EPA-projected reductions is so great (even after accounting for VMT growth) that MSAT emissions in the study area are likely to be lower in the future in virtually all locations. Under the build alternatives there would be localized areas where VMT would increase, and other areas where VMT would decrease. Therefore, it is possible that localized increases and decreases in MSAT emissions may occur. However, even if these increases do occur, they too would be substantially reduced in the future as a result of implementation of EPA's vehicle and fuel regulations. Therefore, community character and cohesion would not be substantially affected by air quality during construction.

Therefore, community character and cohesion would not be substantially affected during construction due to the minor construction impacts that would occur from temporary partial closures of Cajalco Road, noise impacts, and air quality impacts.

Mead Valley

Temporary impacts on community character and cohesion of the Mead Valley community between I-215 and Cowan Road would be the same under Build Alternatives 1, 2C, and 4. The following standard project measures and mitigation measures will minimize and compensate for temporary impacts that would affect community character and cohesion within the Mead Valley community under all build alternatives:

- **PF COM-2** (Signage Provisions)
- **PF LU-1** (TMP)
- **PF UT-1** (Utility Relocations)
- **PF NOI-1** (Construction Noise)
- **PF HAZ-2** (HASP)
- **PF HAZ-3** (Handling, Transport, and Disposal of Wastes)
- **PF HAZ-5** (Creosote-Treated Wood Waste)
- **HAZ-7** (Yellow Paint Thermoplastic and Yellow-Painted Traffic Stripes)
- **HAZ-8** (ACM and LBP)
- **PF AQ-1** (Air Pollution Control)

Please refer to the following sections of this EIR/EIS for the measures listed above: Section 3.5, *Utilities/Emergency Services*; Section 3.13, *Hazardous Waste/Materials*; Section 3.14, *Air Quality*; Section 3.15, *Noise and Vibration*; and Section 4.2.19, *Utilities and Service Systems*.

Lake Mathews/Gavilan Hills

Temporary impacts on community character and cohesion of the Lake Mathews/Gavilan Hills community between I-215 and Cowan Road would be the same under Build Alternatives 1, 2C, and 4. The following standard project measures and mitigation measure are proposed to minimize impacts during construction under all build alternatives:

- **PF COM-2** (Signage Provisions)
- **PF LU-1** (TMP)
- **PF UT-1** (Utility Relocations)
- **PF NOI-1** (Construction Noise)
- **PF HAZ-2** (HASP)
- **PF HAZ-3** (Handling, Transport, and Disposal of Wastes)
- **PF HAZ-5** (Creosote-Treated Wood Waste)
- **HAZ-6** (Agricultural Land Uses)
- **HAZ-7** (Yellow Paint Thermoplastic and Yellow-Painted Traffic Stripes)
- **PF AQ-1** (Air Pollution Control)

Woodcrest/Mockingbird Canyon

Temporary impacts on community character and cohesion of Woodcrest/Mockingbird Canyon between I-215 and Cowan Road would be the same under Build Alternatives 1, 2C, and 4. The following standard project measures and mitigation measure are proposed to minimize impacts during construction under all build alternatives:

- **PF COM-2** (Signage Provisions)
- **PF LU-1** (TMP)
- **PF FA-2** (Farmland Temporarily Affected)
- **PF UT-1** (Utility Relocations)
- **PF NOI-1** (Construction Noise)
- **PF HAZ-2** (HASP)
- **PF HAZ-3** (Handling, Transport, and Disposal of Wastes)
- **PF HAZ-5** (Creosote-Treated Wood Waste)
- **HAZ-6** (Agricultural Land Uses)
- **HAZ-7** (Yellow Paint Thermoplastic and Yellow-Painted Traffic Stripes)
- **PF AQ-1** (Air Pollution Control)

Victoria Grove and Lake Hills/Home Gardens

Under Build Alternatives 1 and 2C, impacts on the community character and cohesion of the Victoria Grove and Lake Hills/Home Gardens communities would not occur, as the project alignments would be located at a far enough distance that community composition, features, and primary community facilities would not be affected. The following standard project measures and mitigation measure are proposed to minimize impacts during construction under Build Alternative 4:

- **PF LU-1** (TMP)
- **PF NOI-1** (Construction Noise)
- **PF HAZ-2** (HASP)
- **PF HAZ-3** (Handling, Transport, and Disposal of Wastes)
- **PF HAZ-5** (Creosote-Treated Wood Waste)
- **HAZ-7** (Yellow Paint Thermoplastic and Yellow-Painted Traffic Stripes)
- **PF AQ-1** (Air Pollution Control)

Temescal Canyon

Temporary impacts on community character and cohesion of the Temescal Canyon community between Temescal Canyon Road and west of La Sierra Avenue would be the same under Build Alternatives 1, 2C, and 4. The following standard project measures and mitigation measure are proposed to minimize impacts during construction:

- **PF COM-2** (Signage Provisions)
- **PF LU-1** (TMP)
- **PF UT-1** (Utility Relocations)
- **PF NOI-1** (Construction Noise)
- **PF HAZ-2** (HASP)
- **PF HAZ-3** (Handling, Transport, and Disposal of Wastes)
- **PF HAZ-5** (Creosote-Treated Wood Waste)
- **HAZ-7** (Yellow Paint Thermoplastic and Yellow-Painted Traffic Stripes)
- **PF AQ-1** (Air Pollution Control)

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Construction of the future six-lane facility is not currently proposed as part of the project. However, if constructed in the future, it is anticipated that temporary impacts associated with the construction of two additional travel lanes along Cajalco Road between Temescal Canyon Road and Harley John Road under Build Alternatives 1 and 2C, and two additional travel lanes along Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, would be limited to the future medians, and would not substantially affect community character and cohesion. Because the additional lanes would be added within

the median, any additional physical expansion of the roadway would be avoided as would any additional property acquisitions or changes to community cohesion or character.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

The LM MSHCP is a conservation area that does not contain any neighborhoods or communities; therefore, there would be no impacts.

No-Build Alternative

There would be no changes to neighborhoods or community character under the No-Build Alternative during construction or operation because no improvements would be implemented that could affect the character of the study area.

3.4.1.4 Avoidance, Minimization, and/or Mitigation Measures (Community Character and Cohesion)

See individual community discussions above for standard project measures and proposed mitigation measures that would address permanent and temporary community character and cohesion impacts specific to each community. Additionally, Measure **COM-3** is proposed under each build alternative and would minimize changes to community character and cohesion.

- **COM-3:** Prior to any partial or full property acquisitions that would result in residential or business relocations and/or loss of business revenue, a Relocation and Reimbursement Mitigation Plan will be prepared by the County of Riverside in accordance with Federal Relocation Assistance and Real Properties Acquisition Policies Act of 1970, as amended (42 United States Code Sections 4601–4655) requirements, and in conjunction with the Relocation Assistance Program. The purpose of the Relocation and Reimbursement Mitigation Plan is to minimize economic disruptions related to relocation and loss of property. The plan will include consultation with affected property owners to ensure full consideration of information related to property valuation, and disclosure of information regarding property rights, the relocation and reimbursement process, and available resources. The following components will be included in the plan, and provided to affected property and business owners and tenants in alternative language and/or communication formats upon request:
  - Within the limits established by law and regulation, minimize the economic disruption caused to property owners by relocation and loss of property.
  - Provide regulatory compliance assistance to business owners who may require complex permitting for relocation.
  - A description of the appraisal, acquisition, and relocation process as well as a description of the activities of the appraisal and relocation specialists.
  - A means of assigning appraisal and relocation staff to affected property owners, tenants, or other residents on an individual basis.
  - Individualized assistance to affected property owners, tenants, or other residents in applying for funding, including research to summarize loans, grants, and federal aid available, and research areas for relocation.
  - Provide interpretation services, upon request, during the consultation process and during relocation coordination.

3.4.2 Relocations and Real Property Acquisition

3.4.2.1 Regulatory Setting

The Department's Relocation Assistance Program (RAP) is based on the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Act), and Title 49 Code of Federal Regulations (CFR) Part 24. The purpose of the RAP is to ensure that persons displaced as a result of a transportation project are treated fairly, consistently, and equitably so that such persons will not suffer disproportionate injuries as a result of projects designed for the benefit of the public as a whole. Please see Appendix C for a summary of the RAP.

All relocation services and benefits are administered without regard to race, color, national origin, persons with disabilities, religion, age, or sex. Please see Appendix B for a copy of the Department's Title VI Policy Statement.

3.4.2.2 Affected Environment

The CIA and *Errata* (Caltrans 2018a, 2021) and DRIR (Caltrans 2018b) were used in the preparation of this section of the document.

The proposed project is within Riverside County and a small portion in the cities of Corona and Perris. The project area consists of undeveloped land, light-industrial facilities, rural residences, residential developments, commercial retail facilities, vacant lots, agricultural land, and an interstate highway. The project area adjoining El Sobrante Road and the proposed re-alignments of El Sobrante Road consist of undeveloped land, rural residences, utility agencies, light-industrial facilities, and agricultural structures and crops. Four communities are within the study area: Mead Valley, Lake Mathews, Woodcrest, and Victoria Grove. Mead Valley and Lake Mathews are semi-rural communities. The primary type of housing in the study area is the single-family home.

Minority populations within the study area average between 64.3 percent and 70.0 percent, with the higher concentration along the alignments of Build Alternatives 1 and 2C (refer to Table 3.4-12). This is comparable to the minority populations present within Riverside County and the City of Corona (62.2 percent). With respect to poverty status in the study area, the median household income in all study area census tract and block groups is higher than the U.S. Department of Health and Human Services poverty guidelines ($26,200 for a family of four in 2020) (DHHS 2020).[1] No properties were identified as meeting Housing Act of 1937 (42 U.S.C. § 1437f), Section 8 criteria; however, any special relocation needs will be further identified during relocation surveys (Caltrans 2018b). Please refer to Sections 3.4.1, *Community Character and Cohesion*, and 3.4.3, *Environmental Justice*, for a complete population profile and description of community characteristics within the study area.

[1] For direct reference to 2016 U.S. Census data provided in Tables 3.4-5, 3.4-6, and 3.4-14, the DHHS poverty guideline for a family of four in 2015 was $24,250 (DHHS).

3.4.2.3 Environmental Consequences (Relocations and Real Property Acquisition)

Anticipated property acquisitions and potential displacees within the displacement area are summarized in Tables 3.4-10 and 3.4-11. According to the DRIR, all proposed build alternatives would result in full acquisitions of both residential and nonresidential parcels as shown below. All affected residential parcels contain single-family residences. In addition, each build alternative would result in partial acquisitions, which are detailed in Table 3.4-11.

Table 3.4-10. Summary of Proposed Property Acquisitions

Build Alternative	Residential Properties		Nonresidential Properties		Vacant Properties		Total Properties	
	Full	Partial	Full	Partial	Full	Partial	Full	Partial
Build Alternative 1	17	67	2	5	41	149	61	221
Build Alternative 2C	17	67	2	5	41	153	61	225
Build Alternative 4	18	69	2	12	50	186	70	267
Source: Caltrans 2018b.								

Table 3.4-11. Summary of Residential and Business Displacements

Build Alternative	Residential Units			Business and Government Use		
	Full	Partial	Residential Displacements (residents)	Full	Partial	Nonresidential Displacements (employees)
Build Alternative 1	19	NA	62	2	5	25
Build Alternative 2C	19	NA	62	2	5	25
Build Alternative 4	21	NA	69	2	12	25
Source: Caltrans 2018b.						

The displacement area consists of the communities of Mead Valley, Woodcrest/Mockingbird, and Temescal Canyon, located within unincorporated Riverside County. In general, minority populations within the displacement area are comparable with minority populations in adjacent area populations, with the higher concentration of minority populations located along the eastern portion of the build alternatives (refer to Table 3.4-8). At 79.2 percent, the minority population for the community of Mead Valley is less than but somewhat comparable to the minority population for the adjacent City of Perris (87.9 percent). The minority population of Woodcrest/ Mockingbird (46.9 percent) is also less than but somewhat comparable to that of Riverside County (59.6 percent). The minority population of Temescal Canyon (53.6 percent) is less than but somewhat comparable to that of the City of Corona (65.6 percent). No properties within the displacement area were identified as meeting Housing Act of 1937 (42 U.S.C. § 1437f), Section 8 criteria; however, any special relocation needs will be further identified during relocation surveys (Caltrans 2018b). It is unknown whether homeless individuals would be present within the limits of the proposed project at the time of constriction. Please refer to Sections 3.4.1, *Community Character and Cohesion*, and 3.4.3, *Environmental Justice*, for a complete discussion of population characteristics and community impacts within the study area. Descriptions of displacees affected under each build alternative are provided in their respective environmental consequences sections for each alternative, below.

The replacement area is defined as the local area where residential and business displacees would likely secure replacement sites. It extends up to a 10-mile radius. Generally, if there are services and resources available in the immediate area, businesses prefer to relocate as close as possible to their existing location, and residential displacees prefer to remain in existing school systems and their immediate familial and cultural settings. The replacement area was determined by the availability of replacement single-family residences and comparable business sites for displacees. The replacement area is the most similar to the displacement area in character and socioeconomic status, and it has the highest likelihood of receiving displaced residents and businesses because of the availability of replacement properties with similar average purchase prices as in the displacement area.

Communities within the replacement area are also within 10 miles of the displacement area; therefore, the commute distance to jobs and schools would be reasonable and would not result in substantial hardships for the displacees. In addition, residential displacees would have access to schools within the same school district in the replacement area as they had in the displacement area.

In accordance with the Uniform Act, as amended, the County will assist eligible displacees in obtaining comparable replacement housing by providing current and continuing information on the availability and prices of both houses for sale and rental units that are "decent, safe, and sanitary." The County will also assist eligible nonresidential displacees, such as businesses, in locating suitable replacement property, and with reimbursement for certain costs involved in relocation. Please refer to Appendix C, *Summary of Relocation Benefits*, for further information regarding the RAP. If homeless individuals are present within the limits of the proposed project at the time of construction, County of Riverside Continuum of Care would be contacted and the needs of the individuals assessed for resources to aid in safe relocation and additional assistance if needed.[2]

Tables 3.4-12 and 3.4-13 identify the number of single-family residences and multi-family residences for sale or lease and the number of available businesses and mixed-use replacement sites for sale or lease within the replacement area, separated by jurisdiction. As shown, there are ample replacement residences and business sites within the replacement area.

Table 3.4-12. Available Residential Replacement Resources

	City of Perris	Riverside County	City of Corona
Properties for Sale			
Number of single-family residences	136	486	331
Number of multi-family units & condos	1	21	28
Total Housing Units	137	507	359
Properties for Lease			
Number of single-family residences	31	101	101
Number of multi-family units & condos	5	62	78
Total Housing Units	36	163	179
Source: Caltrans 2018b			

[2] County of Riverside Continuum of Care is a network of private and public sector homeless service providers, designed to promote community-wide planning and the strategic use of resources addressing homelessness. http://dpss.co.riverside.ca.us/homeless-programs.

Build Alternative 1—Cajalco Alignment

In total, Build Alternative 1 would permanently acquire 218 acres of property and temporarily acquire 61 acres of property. The majority of these permanent and temporary acquisitions would be from vacant properties adjacent to the alignment. From the non-vacant properties, the majority of the acquisitions would be from semi-rural residential parcels adjacent to the alignment.

As identified in Tables 3.4-11 and 3.4-12, Build Alternative 1 would require full acquisition of 19 residential units, of which 17 are within the community of Mead Valley, one is in Lake Mathews/ Gavilan Hills, and the remaining one is within the community of Temescal Canyon. Build Alternative 1 would also require full acquisition of two nonresidential units, one within the Mead Valley community and the other within Woodcrest/Mockingbird Canyon. Each residential unit is a single-family residence. An estimated 62 residents in total would be displaced. According to the DRIR, from preliminary market research it can be concluded that there are a sufficient number of residential replacement properties for both owner-occupied single-family residences and tenant-occupied single-family residences. The housing stock available in the replacement area as well as neighboring communities would be sufficient for finding comparable replacement residential dwellings. A sufficient number of "comparable replacement dwellings" meeting decent, safe, and sanitary standards currently exists within the affected communities. It is anticipated that finding replacement housing for owner- or tenant-occupied residences would not present any unusual problems. Any special relocation challenges would be further identified once relocation surveys are completed.

Of the two nonresidential units that would be fully acquired, one is retail and one is government. The retail business, Mead Valley Market (El Mercado de Mead Valley), is a local corner market serving the residents and motorists in the area at the corner of Florence Street and Cajalco Road. The market advertises the sale of general food items, beverages, and prepared foods among other convenience products. The parcel is approximately 33,000 square feet in size, and property improvements appear to occupy approximately 40 percent of the parcel. The business employs nine people, who would be displaced as a result of the acquisition. The property has not transferred ownership since 1988, when the current owners purchased it; however, it is unclear how long the current business tenant has been operating at this location. The store's main customer base is anticipated to be composed of surrounding residents, and the store appears to have an established stream of business.

The second nonresidential relocation is the Riverside County Code Enforcement on Cajalco Road. The business employs 16 people. According to the DRIR, from preliminary market research, it can be concluded that there are a sufficient number of commercial replacement properties at this time. Should a sufficient number of commercial replacement properties not be available and adequate replacement sites cannot be located, the research area may need to be expanded not to exceed the legally mandated 50-mile radius. This situation is, however, not ideal due to the potential loss of existing clientele and may result in the payment of additional business goodwill.

The acquired residences and businesses that require relocation represent a small percentage (0.002 percent of all residences and 0.005 percent of all businesses) of the existing residences and business within Riverside County, as there are approximately 831,400 housing units and 36,500 businesses within the County (U.S. Census Bureau 2015).

Although there would be 221 partial acquisitions, none of the partial acquisitions would require the relocation of any residents or closure of any businesses.

Standard Project Measure **PF COM-1** and Measure **COM-3** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. The County will also assist eligible nonresidential displacees, such as businesses, in locating suitable replacement property, and with reimbursement for certain costs involved in relocation. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. All eligible displacees would be entitled to moving expenses per the Uniform Act. The County of Riverside will also provide compensation to eligible recipients for property acquisitions.

Future Six-Lane Facility (Build Alternative 1)

For the future six-lane Cajalco Road facility, construction is not currently proposed as part of the project. However, if the two additional travel lanes along Cajalco Road between Temescal Canyon Road and Harley John Road are constructed in the future, it is anticipated that there would be no additional impacts during operation. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and therefore any additional property acquisitions.

Lake Mathews MSHCP (Build Alternative 1)

No relocations would occur within the LM MSHCP because there are no residents or businesses present within the area.

Build Alternative 2C—Modified Cajalco Alignment

Impacts under Build Alternative 2C would be similar to those described under Build Alternative 1; the difference being that partial acquisitions would be required from 225 parcels with permanent acquisition of 239 acres of property and temporarily acquisition of 66 acres of property. Standard Project Measure **PF COM-2** and Measure **COM-3** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation.

Future Six-Lane Facility (Build Alternative 2C)

For the future six-lane facility, construction is not currently proposed as part of the project. However, if the two additional travel lanes along Cajalco Road between Temescal Canyon Road and Harley John Road are constructed in the future, it is anticipated that there would be no additional impacts during operation. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and therefore any additional property acquisitions.

Lake Mathews MSHCP (Build Alternative 2C)

No relocations would occur within the LM MSHCP because there are no residents or businesses present within the area.

Build Alternative 4—El Sobrante Alignment

Effects under Build Alternative 4 would be the similar to those described under Build Alternative 1, except Build Alternative 4 would permanently acquire 240 acres of property and temporarily acquire 63 acres of property. Build Alternative 4 would also require full acquisition of 21 residential units and two nonresidential units, and partial acquisitions would be required from 267 parcels. An estimated 69 residents would be displaced. Build Alternative 4 would also require the full acquisition of both nonresidential units detailed in Build Alternative 1. Compliance with Standard Project Measure **PF COM-2** and Measure **COM-3** would occur for all build alternatives to reduce impacts from property acquisition and relocation.

Future Six-Lane Facility (Build Alternative 4)

For the future six-lane facility, construction is not currently proposed as part of the project. However, if the two additional travel lanes along Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, are constructed in the future, it is anticipated that there would be no additional impacts during operation. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and therefore any additional property acquisitions.

Lake Mathews MSHCP (Build Alternative 4)

No relocations would occur within the LM MSHCP because there are no residents or businesses present within the area.

No-Build Alternative

No property acquisitions or relocations would occur under the No-Build Alternative because no improvements would be implemented.

3.4.2.4 Avoidance, Minimization, and/or Mitigation Measures (Relocations and Real Property Acquisition)

Standard Project Measure **PF COM-1** and Measure **COM-3** described under Section 3.4.2.3, above, would be included for all build alternatives to reduce impacts from property acquisition and relocation.

3.4.3 Environmental Justice

3.4.3.1 Regulatory Setting

All projects involving a federal action (funding, permit, or land) must comply with Executive Order (EO) 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,* signed by President William J. Clinton on February 11, 1994. This EO directs federal agencies to take the appropriate and necessary steps to identify and address disproportionately high and adverse effects of federal projects on the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law. Low income is defined based on the U.S. Department of Health and Human Services poverty guidelines. For 2020, this was $26,200 for a family of four.[3]

All considerations under Title VI of the Civil Rights Act of 1964 and related statutes have also been included in this project. The Department's commitment to upholding the mandates of Title VI is evidenced by its Title VI Policy Statement, signed by the Director, which can be found in Appendix B of this document.

3.4.3.2 Affected Environment

Analysis of environmental justice impacts is a two-step process; the first is determining the presence of protected populations (minority or low-income populations), and the second is determining if the project has a disproportionate adverse impact on those protected populations. According to the guidance provided in Caltrans Standard Environmental Reference, Chapter 4, Community Impact Assessment, environmental justice and equity is determined based on the comparison of impacts on minority and low-income groups and impacts on non-minority or higher income populations. Impacts are considered disproportionate if they are more severe or greater in magnitude for minority and low-income populations. Impacts can include noise, air quality, water quality, hazardous waste, community cohesion, aesthetics, economic vitality, accessibility, safety, and construction impacts.

The study area for the environmental justice analysis is the census block groups within 0.5 mile of the proposed right of way. Block groups were used instead of census tracts to provide a more detailed look at the area to determine if minority and low-income populations are present. To determine if minority and low-income populations exist within the study area, a demographic profile of the study area block groups was developed. For the purposes of this analysis, a block group was considered to contain minority and low-income populations if:

- The total minority population of the block group is more than 50 percent of the total population or is substantially higher than the city or county where it is located; or
- The block group is below the Federal Poverty level defined based on the U.S. Department of Health and Human Services poverty guidelines ($26,200 for a family of four in 2020[4]).

Minority individuals are members of American Indian, Asian or Pacific Islander, Black, and Hispanic population groups. Table 3.4-8 in Section 3.4.1.2 presents the full ethnicity

[3] For direct reference to U.S. Census data provided in Tables 3.4-5, 3.4-6, and 3.4-14, the DHHS poverty guideline for a family of four in 2015 was $24,250 (DHHS).
[4] $24,250 for a family of four in 2015 (DHHS).

characteristics for the study area and within each community. Figure 3.4-4 shows the distribution of minority populations within the study area. Table 3.4-14 provides the percentage of minority individuals within the county, cities, census block groups, and communities within the study area, as well as their median household incomes.

Table 3.4-14. Minority Populations and Median Household Income in the Study Area

Jurisdiction/Census Tract	Alternative	Total Population	Median Household Income	Minority Population
Riverside County	1, 2C, 4	2,298,032	$56,603	59.6%
City of Corona	1, 2C, 4	159,595	$74,149	65.6%
City of Perris	1, 2C, 4	72,547	$49,325	87.9%
Study Area[1]	1, 2C, 4	65,988	$69,623	64.3%
Mead Valley	1, 2C, 4	22,381	$54,871	79.2%
Census Tract 420.08 (Block Group 1)[2]	1, 2C, 4	4,032	$112,105	46.9%
1, 2C, 4		2,328	$39,583	95.9%
Census Tract 420.10	1, 2C, 4	6,587	$35,856	85.4%
Census Tract 429.04	1, 2C, 4	9,434	$31,942	88.7%
Lake Mathews/Gavilan Hills	1, 2C, 4	9,912	$67,725	52.5%
Census Tract 414.09 (Block Group 4)[2]	1, 2C, 4	1,092	$42,944	58.7%
Census Tract 420.07 (Block Group 2)[2]	1, 2C, 4	1,698	$69,028	28.3%
Census Tract 420.08 (Block Group 1)[2]	1, 2C, 4	4,032	$112,105	46.9%
1, 2C, 4		3,090	$46,821	72.0%
Woodcrest/Mockingbird Canyon Census Tract 420.08 (Block Groups 1 and 2)	1, 2C, 4	7,744	$103,344	46.9%
Victoria Grove Community Census Tract 414.09 (Block Group 1)	4	8,174	$99,048	46.6%
Lake Hills/Home Gardens	4	9,191	$95,205	61.9%
Census Tract 414.09 (Block Group 2)	4	5,077	$85,018	39.2%
Census Tract 414.09 (Block Group 3)	4	4,114	$105,391	84.6%
Temescal Canyon	1, 2C, 4	9,472	$60,014	53.6%
1, 2C, 4		1,092	$42,944	58.7%
Census Tract 419.09 (Block Group 1)	1, 2C, 4	1,355	$51,033	82.4%
Census Tract 419.09 (Block Group 3)	1, 2C, 4	1,261	$58,750	35.9%
Census Tract 419.10 (Block Group 1)	1, 2C, 4	4,066	$78,313	62.5%
1, 2C, 4		1,698	$69,028	28.3%
1, 2C, 4		2,948	$60,160	88.5%
City of Corona Census Tract 481.00[3]	1, 2C, 4	7,020	$103,388	47.1%

[1] The study area, for the purposes of this chapter, comprises the census tract block groups in which the proposed project would be located plus two additional block groups to capture populations at the eastern and western ends of the project (see Figure 3.4-1).
[2] Census Tracts 414.09, 420.07, and 420.08 (Block Group 1) encompass more than one community.
[3] Census tracts located within study area but outside of project limits.
Sources: U.S. Census Bureau 2016a, 2016b.

According to Table 3.4-12, the study area contains 64.3 percent minority populations. This is comparable to the minority populations present within Riverside County (59.6 percent) and the City of Corona (65.6 percent), but lower than the minority populations present within the City of Perris (87.9 percent). At the block group level, seven of the 13 census block groups within the Build Alternatives 1 and 2C study area have higher proportions of minority individuals than Riverside County, while eight of the 16 census block groups within the study area for Build

Alternative 4 have higher proportions of minority individuals than Riverside County. With respect to poverty status in the study area, the median household income in all study area census tract and block groups is higher than the U.S. Department of Health and Human Services poverty guidelines ($26,200 for a family of four in 2020).[5] Therefore, low-income populations as defined by DHHS guidelines are not present in the study area for Build Alternatives 1 and 2C or Build Alternative 4.

Of the six distinct communities within the study area, the percentage of minority populations within four of the communities, Mead Valley, Lake Mathews/Gavilan Hills, Lake Hills/Home Gardens, and Temescal Canyon, are greater than 50 percent, at 79.2 percent, 52.5 percent, 61.9 percent, and 53.6 percent, respectively. Compared to the County minority population of 59.6 percent, the Mead Valley minority population is 19.6 percent higher, and is thus considered substantially higher than that of the County. However, the Mead Valley minority population is 9.3 percent lower than the adjacent Census Tract 426.20 (Block Group 1), which is 88.5 percent minority, and 8.7 percent lower than the City of Perris overall at 87.9 percent minority.

The minority population of Lake Hills/Home Gardens (61.9 percent) is 2.3 percent higher than the County minority population (59.6 percent). The minority populations of Lake Mathews/ Gavilan Hills (52.5 percent) and Temescal Canyon (53.6 percent) are 7.1 percent and 6 percent lower than the County minority population, respectively. The minority populations for these three community areas are also lower than the minority populations identified for the overall study area (64.3 percent), and the Cities of Perris (87.9 percent) and Corona (65.6 percent). Because the minority populations of the communities of Mead Valley, Lake Mathews/Gavilan Hills, Lake Hills/Home Gardens, and Temescal Canyon exceed 50 percent, minority populations are present in the study area.

Lake Mathews MSHCP

The LM MSHCP area contains water and resource management facilities and offices for MWD and LMR employees; because no population resides in the area, there are no minority or low-income populations within the LM MSHCP.

[5] Median household income also exceeds the 2015 DHHS poverty guideline for a family of four ($24,250) (DHHS).

3.4.3.3 Environmental Consequences (Environmental Justice)

Given the higher percentage of minority populations found in the communities of Mead Valley, Lake Mathews/Gavilan Hills, Lake Hills/Home Gardens, and Temescal Canyon, analysis of effects related to minority populations is warranted. The project is subject to the provisions of EO 12898. Environmental topics that have the potential to impact minority populations are discussed below. Permanent and temporary impacts are discussed together under each subheading. Anticipated impacts within the communities of Mead Valley, Lake Mathews/ Gavilan Hills, Lake Hills/Home Gardens, and Temescal Canyon only are discussed below.

Build Alternatives 1 and 2C—Cajalco Alignment and Modified Cajalco Alignment

Three of the four communities identified with minority populations within the project study area are along the alignments of Build Alternatives 1 and 2C, Mead Valley, Lake Mathews/Gavilan Hills, and Temescal Canyon. Potential impacts on these communities are discussed below.

Hazardous Materials and Waste

Mead Valley

An Initial Site Assessment (ISA) was conducted to review, evaluate, and document present and past land uses and practices, and visually examine site conditions in order to identify Recognized Environmental Conditions (RECs) (Caltrans 2020). The ISA identified two RECs and five Areas of Environmental Concern (AOCs) within the project limits. One of the two RECs, former Mobil Baldwin gas station at 21020 Cajalco Road, is within the Mead Valley community. One of the five AOCs, pesticide use on agricultural lands, also occurs within the Mead Valley community, and three of the AOCs are not location-specific and occur throughout the entire proposed alignment, including Mead Valley: yellow striping containing lead and chromium, overhead transformers containing polychlorinated biphenyls (PCBs), and utility poles containing creosote-treated wood.

A Preliminary Site Investigation (PSI) was conducted for the two REC sites in September 2020 to further characterize site conditions and identify recommendations to minimize risk, including further study and/or coordination to confirm remediation, health and safety, and appropriate soil management, as needed (Caltrans 2020). The REC at 21020 Cajalco Road (Mead Valley) is currently undergoing remediation for soil and groundwater contamination from a gasoline release.

The ISA and PSI provide recommendations designed to minimize the potential impact related to these hazards, which include but are not limited to the following measures in Section 3.13, *Hazardous Waste/Materials*: proper handling and disposal of any hazardous material, if encountered (**PF HAZ-3**); oversight agency coordination, proper abandonment of existing monitoring structures, optional soil and groundwater investigation, HASP, SMP, compliance with South Coast Air Quality Management District (SCAQMD) Rule 1166, and groundwater disposal for 21020 Cajalco Road (**PF HAZ-2** [Health and Safety Plan], **HAZ-4**); creosote-treated wood waste handling (**PF HAZ-5**); PSI, corrective action (if required), and SMP for agricultural land uses (**PF HAZ-2** [HASP], **HAZ-6**); yellow paint and thermoplastic striping survey and disposal (**HAZ-7**); and hazardous building material surveys and proper handling and disposal of any hazardous material, if encountered (**PF HAZ-2** [HASP], **PF HAZ-3** [hazardous material disposal], and **HAZ-8**).

While these recommendations minimize the potential for adverse effects related to operation of the build alternatives, impacts could still occur, although they would be low risk due to the nature of the sites. However, because the AOCs are located throughout the study area, not only in communities with predominantly minority populations, impacts from a hazardous materials release would not be borne predominantly by minority populations. Therefore, the build alternatives would not result in disproportionately high and adverse effects on minority populations.

Lake Mathews/Gavilan Hills

The ISA identified two RECs and five AOCs within the project limits. One of the five AOCs, pesticide use on agricultural lands, occurs within the community, and three of the AOCs are not location-specific and occur throughout the entire proposed alignment, including Lake Mathews/ Gavilan Hills: yellow striping containing lead and chromium, overhead transformers containing PCBs, and utility poles containing creosote-treated wood.

The ISA and PSI provide recommendations designed to minimize the potential impact related to these hazards, which include but are not limited to the following measures in Section 3.13, *Hazardous Waste/Materials*: creosote-treated wood waste handling (**PF HAZ-5**); PSI, corrective action (if required), and SMP for agricultural land uses (**PF HAZ-2** [HASP], **HAZ-6**); yellow paint and thermoplastic striping survey and disposal (**HAZ-7**); and hazardous building material surveys and proper handling and disposal of any hazardous material, if encountered (**PF HAZ-2** [HASP], **PF HAZ-3** [hazardous material disposal], and **HAZ-8**).

While these recommendations minimize the potential for adverse effects related to operation of the build alternatives, impacts could still occur, although they would be low risk due to the nature of the sites. However, because the AOCs are located throughout the study area, not only in communities with predominantly minority populations, impacts from a hazardous materials release would not be borne predominantly by minority populations. Therefore, the build alternatives would not result in disproportionately high and adverse effects on minority populations.

Temescal Canyon

The ISA identified two RECs and five AOCs within the project limits. One of the two RECs, a former clay mine at 9001 Cajalco Road, and one of the AOCs, Temescal Creek Bridge, are within the Temescal Canyon community. The following three AOCs are not location-specific and occur throughout the entire proposed alignment: yellow striping containing lead and chromium, overhead transformers containing PCBs, and utility poles containing creosote-treated wood.

A PSI was conducted for the two REC sites in September 2020 to further characterize site conditions and identify recommendations to minimize risk, including further study and/or coordination to confirm remediation, health and safety, and appropriate soil management, as needed (Caltrans 2020). The REC at 9001 Cajalco Road (Temescal Canyon) is associated with elevated concentrations of arsenic in soils.

The ISA and PSI provide recommendations designed to minimize the potential impact related to these hazards, which include but are not limited to the following measures in Section 3.13, *Hazardous Waste/Materials*: DSI, soil remediation (if required), HASP, and SMP for 9001 Cajalco Road (**HAZ-1** and **PF HAZ-2** [HASP]); creosote-treated wood waste handling (**PF HAZ-5**); PSI, corrective action (if required), (**PF HAZ-2** [HASP], **HAZ-6**); yellow paint and

thermoplastic striping survey and disposal (**HAZ-7**); and hazardous building material surveys and proper handling and disposal of any hazardous material, if encountered (**PF HAZ-2** [HASP], **PF HAZ-3** [hazardous material disposal], and **HAZ-8**).

While these recommendations minimize the potential for adverse effects related to operation of the build alternatives, impacts could still occur, although they would be low risk due to the nature of the sites. However, because the AOCs are located throughout the study area, not only in communities with predominantly minority populations, impacts from a hazardous materials release would not be borne predominantly by minority populations. Therefore, the build alternatives would not result in disproportionately high and adverse effects on minority populations.

Aesthetics

Mead Valley

As described in Section 3.7, *Visual/Aesthetics*, existing visual quality within Mead Valley is moderate, with a visual impact rating of moderate-high to high. The build alternatives would change the aesthetic character of the land adjacent to Cajalco Road by making the roadway wider and more urban-like. The elements that would result in the greatest visual impacts would be the widening of existing roadways, removal of residential and commercial properties, sliver acquisitions that would affect residential site features and landscaping, new bridge construction, vegetation removal, and stormwater facilities. These changes may create a sense of visual encroachment for properties with structures close to the new right of way or where landscaping would be removed so that views of and from the roadway and traffic would be available where views are presently more screened. Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible.

Although changes to visual resources within the Rural Residential Visual Assessment Unit of Mead Valley would range from low to moderate, viewer response to these changes would range from moderate-high to high, and the resulting visual impacts would range from moderate to moderate-high. However, the widening of Cajalco Road under all build alternatives would occur predominantly along the existing alignment of the road, which would result in conditions similar to the existing land use and aesthetic. The most prominent visual changes would be on the less populated western end of the project, where there are fewer minority populations present as compared to the eastern end of the project.

Therefore, operation of the build alternatives would not result in disproportionately high and adverse effects related to aesthetics on minority populations.

Lake Mathews/Gavilan Hills

The proposed expansion and realignment of Cajalco Road may create a sense of visual encroachment for properties with structures close to the new right of way or where landscaping would be removed so that views of and from the roadway and traffic would be available where views are presently more screened. While Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible, this measure would not be able to reverse the adverse effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor.

Temescal Canyon

As described in Section 3.7, *Visual/Aesthetics*, existing visual quality within the Temescal Canyon community ranges from moderate-low to moderate, with a visual impact rating of moderate-high. The build alternatives would change the aesthetic character of the land adjacent to Cajalco Road by making the roadway wider and more urban-like. The elements that would result in the greatest visual impacts would be the widening of existing roadways, removal of residential properties, sliver acquisitions that would affect residential site features and landscaping, the cut and fill slopes associated with widening and realignments in hilly terrain, realigned curves, new bridge construction, vegetation removal, and stormwater facilities. These changes may create a sense of visual encroachment for properties with structures close to the new right of way or where landscaping would be removed so that views of and from the roadway and traffic would be available where views are presently more screened. Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible.

The widening of Cajalco Road under all build alternatives would occur predominantly along the existing alignment of the road, which would result in conditions similar to the existing land use and aesthetic.

Community Cohesion

Mead Valley

As described in Section 3.4.1.3, *Environmental Consequences (Community Character and Cohesion)*, the widening of Cajalco Road within the community of Mead Valley would occur predominantly along the existing alignment of the road, creating a more urban visual setting than existing conditions with the introduction of additional paving, sidewalks, traffic lights, crosswalks, and drainage facilities. These changes would affect current local access patterns for residents and businesses that directly front Cajalco Road. Sidewalks would also be constructed along one side of Cajalco Road in some locations through the Mead Valley community where residential and commercial properties are present, and would benefit local pedestrian movement and safety. Traffic signal and crosswalk improvements are proposed to assist with crossing Cajalco Road, which would further benefit community members and students that walk or ride bicycles to school. While the build alternatives would affect community cohesion with the widened roadway and more urban character, the proposed project would not introduce a new barrier that would divide the community, separate residences from community facilities, or result in substantial growth. Standard project measures and mitigation measures identified below are proposed to lessen impacts that would permanently occur within the community.

- **PF COM-1** (Relocation Assistance)
- **COM-3** (Relocation Plan)
- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)

- **PF VIS-7** (New Bridge Architectural Treatments)
- **VIS-8** (Replace Disturbed Vegetation along Landscaped Freeways)
- **HAZ-4:** (DSI; Riverside County Department of Environmental Health Notification and Soil Remediation; HASP; and SMP for 21020 Cajalco Road [APNs 318-061-027 and -030])

Please refer to the following sections of this EIR/EIS for the measures listed above: Section 3.7, *Visual/Aesthetics* (**PF VIS-1, VIS-2, PF VIS-4, PF VIS-5, PF VIS-7,** and **VIS-8**), and Section 3.13, *Hazardous Waste/Materials* (**HAZ-4**).

Therefore, with the incorporation and implementation of the measures listed above, operation of the build alternatives is not anticipated to result in disproportionately high and adverse effects related to community character or community cohesion on minority populations within the community of Mead Valley.

Temescal Canyon

As described in Section 3.4.1.3, *Environmental Consequences (Community Character and Cohesion)*, the widening of Cajalco Road within the community of Temescal Canyon would occur predominantly along the existing alignment of the road, creating a more urban visual setting than existing conditions with the introduction of additional paving, traffic lights, crosswalks, and drainage facilities.

The realignment would also result in the displacement of one residential unit on the north side of Cajalco Road. The affected property consists of a rural-residential, single-family house. An estimated five residents would be displaced from their current residence within Temescal Canyon. Of the total population of 9,472 within the study area portion of Temescal Canyon, the displacement of five residents would represent less than 0.1 percent of the community population.

As discussed in Section 3.4.2, adequate residential replacement properties are available within a 10-mile radius of the project, and most displaced residents would be expected to relocate to residences within the same region. The replacement area is the most similar to the displacement area in character and socioeconomic status. It has the highest likelihood of receiving displaced residents and businesses because of the availability of replacement properties with similar average purchase prices as in the displacement area. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. All eligible displacees would be entitled to moving expenses per the Uniform Act. Therefore, there would be no effects on population characteristics. The relocation of residents would not pose a substantial impact on the community.

- **PF COM-1** (Relocation Assistance)
- **COM-3** (Relocation Plan)
- **PF VIS-1** (Contouring and Replanting Disturbed Areas)
- **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project)

- **PF VIS-3** (Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity)
- **PF VIS-4** (Apply Minimum Lighting Standards)
- **PF VIS-5** (Basin and Flood Control Drainage Facility Treatments)
- **PF VIS-6** (Temescal Creek Bridge Design)
- **PF VIS-7** (New Bridge Architectural Treatments)
- **HAZ-1** (DSI; Riverside County Department of Environmental Health Notification and Soil Remediation; HASP; and SMP for 9001 Cajalco Road [APNs 279-231-004, -006, -011, and 281-140-021])
- **HAZ-7** (Yellow Thermoplastic and Yellow-Painted Traffic Stripes)
- **HAZ-8** (ACM and LBP)

Please refer to the following sections of this EIR/EIS for the measures listed above: Section 3.7, *Visual/Aesthetics* (**PF VIS-1** through **PF VIS-7**), and Section 3.13, *Hazardous Waste/Materials* (**HAZ-1**, **HAZ-7**, and **HAZ-8**).

Displacements/Relocations

Mead Valley

As described in Section 3.4.2, *Relocations and Real Property Acquisitions*, Build Alternatives 1 and 2C would require full acquisition of 17 residential units and one business within the community of Mead Valley. Partial acquisition of land from 67 residential parcels (not requiring relocation) would also occur. A portion of the acquisitions and relocations would be necessary because of the proximity of the residences and business to the existing roadway and necessary flood control facilities. All residential units are single-family residences, 11 of which are owner-occupied and six of which are tenant-occupied. An estimated 52 residents would be displaced from their current residences within Mead Valley, along with an estimated nine employees. Of the total population of 22,381 within the study area portion of Mead Valley, the displacement of 52 residents would represent 0.2 percent of the community population. Given the higher percentage of minorities present within the study area portion of Mead Valley, it is likely that at least some of the occupants of the residences to be acquired, and employees of the business, are minorities.

As described above, the majority of proposed residential acquisitions and displacements would occur within a community that has minority population greater than 50 percent; a portion of the acquisitions and relocations would be necessary because of the proximity of the residences and business to the existing roadway and necessary drainage facilities. Nevertheless, because the proposed property acquisitions and displacements would be predominantly borne by a minority population, impacts related to property acquisitions and displacements have potential to be disproportionately high and adverse for the affected population.

In addition to the benefits of increased pedestrian, vehicular, and cyclist safety; improved pedestrian facilities for access to community facilities; and flood control improvements, Standard Project Measure **PF COM-1** and Measure **COM-3** are proposed to minimize and mitigate for impacts involving property acquisitions and displacements for residents, employees, and property

owners within the Mead Valley community under Build Alternatives 1 and 2C. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. The County will also assist eligible nonresidential displacees, such as businesses, in locating suitable replacement property, and with reimbursement for certain costs involved in relocation. Refer to Section 3.4.1, *Community Character and Cohesion,* for Measure **COM-3** (Relocation and Reimbursement Mitigation Plan), and to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. All eligible displacees would be entitled to moving expenses per the Uniform Act. The County of Riverside will also provide compensation to eligible recipients for property acquisitions.

Based on the above discussion and analysis, and with the inclusion of the measures to address property displacements in areas with high minority populations, Build Alternatives 1 and 2C would not cause disproportionately high and adverse effects on any minority or low-income populations as per Executive Order 12898 regarding environmental justice.

Lake Mathews/Gavilan Hills

Build Alternatives 1 and 2C would require full acquisition of one residential unit within the community of Lake Mathews/Gavilan Hills. The residential unit is a single-family residence, assumed owner-occupied. An estimated five residents would be displaced from the residence. Of the total population of 9,912 within the study area portion of Lake Mathews/Gavilan Hills, the displacement of five residents would represent 0.1 percent of the community population. Given the higher percentage of minorities present within the study area portion of Lake Mathews/ Gavilan Hills, it is likely that at least some of the occupants of the residences to be acquired, and employees of the government business, are minorities.

Standard Project Measure **PF COM-1** and Measure **COM-3** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. The County will also assist eligible nonresidential displacees, such as businesses, in locating suitable replacement property, and with reimbursement for certain costs involved in relocation. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. All eligible displacees would be entitled to moving expenses per the Uniform Act. The County of Riverside will also provide compensation to eligible recipients for property acquisitions.

Temescal Canyon

As described in Section 3.4.2, *Relocations and Real Property Acquisitions*, Build Alternatives 1, 2C, and 4 would require full acquisition of one residential property within the community of Temescal Canyon. An estimated five residents would be displaced from the residence. Of the total population of 9,472 within the study area portion of Temescal Canyon, the displacement of five residents would represent 0.1 percent of the community population.

Given the higher percentage of minorities present within the study area portion of Temescal Canyon, it is likely that at least some of the occupants of the residences to be acquired, and employees of the business, are minorities.

Standard Project Measure **PF COM-1** and Measure **COM-3** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Act, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. The County will also assist eligible nonresidential displacees, such as businesses, in locating suitable replacement property, and with reimbursement for certain costs involved in relocation. Refer to Appendix C, *Summary of Relocation Benefits*, of this EIR/EIS for details regarding available resources and assistance. All eligible displacees would be entitled to moving expenses per the Uniform Act. The County of Riverside will also provide compensation to eligible recipients for property acquisitions.

Summary

According to the DRIR, adequate residential and commercial replacement properties are available within the replacement area, which is defined as the local area where residential and business displacees would likely secure replacement sites. The housing stock available in the proposed replacement area as well as neighboring communities would be sufficient for finding comparable replacement residential dwellings. A sufficient number of "comparable replacement dwellings" meeting decent, safe, and sanitary standards currently exists within the affected communities. It is anticipated that finding replacement housing for owner or tenant-occupied residences would not present any unusual problems. Any special relocation challenges would be further identified once relocation surveys are completed.

In addition, as part of project implementation, relocation assistance payments and counseling will be provided by the transportation agencies to persons and businesses in accordance with the Uniform Act, as amended, to ensure adequate relocation and a decent, safe, and sanitary home for displaced residents, as noted in Standard Project Measure **PF COM-1** and supplemented with Measure **COM-3**. All eligible displacees would be entitled to moving expenses. All benefits and services would be provided equitably to all residential and business displacees without regard to race, color, religion, age, national origins, and disability, as specified under Title VI of the Civil Rights Act of 1964. All relocation activities would be conducted by the implementing agencies in accordance with the Uniform Act, as amended. Relocation resources will be available to all displacees without discrimination.

Based on the above discussion and analysis, and with the inclusion of the measures to address property displacements in areas with high minority populations, Build Alternatives 1 and 2C would not cause proportionately high and adverse effects on any minority or low-income populations as per Executive Order 12898 regarding environmental justice.

Accessibility/Traffic/Transportation

Mead Valley

The widening of Cajalco Road under all build alternatives would not substantially alter the existing vehicular, pedestrian, bicycle, and equestrian accessibility and circulation patterns within the Mead Valley community. With the exception of the intersection of Cajalco Road with Gustin Road, existing roadways would remain in their current locations. The intersection of Cajalco Road and Gustin Road would be realigned to a four-way, signalized intersection with

Cowan Road. Access to community facilities would remain. Sidewalks would be added to one side of the roadway in some locations where residential and commercial properties are present to improve pedestrian movement, and improvements would be made to traffic signals to assist with crossing Cajalco Road, which would benefit community members, including students that walk or ride bicycles to school. Designated bus pull-outs would also be placed at select locations along Cajalco Road. The project would benefit a large and diverse population, including motorists, residents, and businesses by improving circulation along Cajalco Road. Implementation of the build alternatives would improve the connectivity of the roadway network for all users of the transportation system, including minority populations. Therefore, neither construction nor operation of the build alternatives would result in a disproportionately high and adverse traffic/transportation effects on minority populations.

Lake Mathews/Gavilan Hills

Build Alternatives 1 and 2C would include a new connection between Dirt Road and Richey Way south of the existing segment of Cajalco Road and west of Lake Mathews Drive. The new road connection would connect Dirt Road to Richey Way. The eastern terminus of Richey Way at Lake Mathews Drive would also be widened slightly and graded. This new road connection would provide emergency access for residences and businesses west of Lake Mathews Drive as well as improved connectivity and accessibility within the Lake Mathews community. Because Dirt Road and Richey Way are existing roadways that are accessible by the public, the new connection would not create new access to previously inaccessible areas; it would enhance access and circulation within the Lake Mathews community.

Temescal Canyon

Access to residents north and south of Cajalco Road just east of Temescal Creek Bridge would be affected by the roadway widening and realignment of Cajalco Road. New access connections would be provided to the residences where existing driveways connect to Cajalco Road. A new intersection is also proposed at the intersection of Eagle Canyon Road and Cajalco Road, and would alter access to the mining businesses north and south of Cajalco Road; however, the modified access would improve safety and better accommodate the trucks used at the businesses.

Safety

Mead Valley

The ISA prepared for the project identified two RECs and five AOCs within the project limits. One of the two RECs, former Mobil Baldwin gas station at 21020 Cajalco Road, is within the Mead Valley community. One of the five AOCs, pesticide use on agricultural lands, also occurs within the Mead Valley community, and three of the AOCs are not location-specific and occur throughout the entire proposed alignment, including Mead Valley: yellow striping containing lead and chromium, overhead transformers containing PCBs, and utility poles containing creosote-treated wood. Standard Project Measures **PF HAZ-2**, **PF HAZ-3**, and **PF HAZ-5** and Measures **HAZ-1** and **HAZ-6** through **HAZ-8** are identified to address impacts related to hazards.

There are currently limited sidewalks and crosswalks available for pedestrians to cross Cajalco Road within Mead Valley; therefore, pedestrians and cyclists may currently share the roadway

with vehicles along limited segments of Cajalco Road where sidewalks and/or roadway shoulder areas may not be available. Pedestrians may also cross Cajalco Road without using crosswalks due to the distances between crosswalk facilities. Traffic signal and crosswalk improvements are proposed to assist with crossing Cajalco Road, which would benefit community members and students that walk or ride bicycles to school. Sidewalks would also be constructed along one side of Cajalco Road in some locations through the Mead Valley community where residential and commercial properties are present to improve local pedestrian movement and safety. The current narrow and limited roadway shoulders are shared by cyclists and vehicles and, in limited sections, pedestrians. The project would add curb and gutter and 8-foot-wide shoulders to serve as a combined shoulder/bike lane and provide more room for bicycles. With these new safety measures, operation of the build alternatives would have a beneficial effect on safety for all groups in the study area, including minority populations.

According to the *Noise Study Report* prepared for the project (Caltrans 2019), operational traffic-related noise is not anticipated to result in a substantial change in the noise environment when compared with existing and future no-project conditions. Although the widening of Cajalco Road would result in an increased level of noise and vibration, the increase would not reduce social interaction of residents along the roadways.

Temescal Canyon

The ISA identified two RECs and five AOCs within the project limits. One of the two RECs, a former clay mine at 9001 Cajalco Road, and one of the AOCs, Temescal Creek Bridge, are within the Temescal Canyon community. The following three AOCs are not location-specific and occur throughout the entire proposed alignment: yellow striping containing lead and chromium, overhead transformers containing PCBs, and utility poles containing creosote-treated wood. A new intersection is also proposed at the intersection of Eagle Canyon Road and Cajalco Road and would alter access to the mining businesses north and south of Cajalco Road; however, the modified access would improve safety and better accommodate the trucks used at the businesses.

The ISA and PSI provide recommendations designed to minimize the potential impact related to these hazards, which include but are not limited to the following measures in Section 3.13, *Hazardous Waste/Materials*: DSI, soil remediation (if required), HASP, and SMP for 9001 Cajalco Road (**HAZ-1** and **PF HAZ-2** [HASP]); creosote-treated wood waste handling (**PF HAZ-5**); PSI, corrective action (if required), (**PF HAZ-2** [HASP], **HAZ-6**); yellow paint and thermoplastic striping survey and disposal (**HAZ-7**); and hazardous building material surveys and proper handling and disposal of any hazardous material, if encountered (**PF HAZ-2** [HASP], **PF HAZ-3** [hazardous material disposal], and **HAZ-8**).

While these recommendations minimize the potential for adverse effects related to operation of the build alternatives, impacts could still occur, although they would be low risk due to the nature of the sites. However, because the AOCs are located throughout the study area, not only in communities with predominantly minority populations, impacts from a hazardous materials release would not be borne predominantly by minority populations. Therefore, the build alternatives would not result in disproportionately high and adverse effects on minority populations.

Construction Impacts

Noise from project construction activities may intermittently dominate the noise environment in the immediate area of construction. While the impacts would be experienced by the minority populations adjacent to the project, these temporary construction impacts would affect all populations equally along proposed alignment, not solely or disproportionately minority populations. In addition, the report determined that no substantially adverse noise impacts from construction are anticipated because construction would be conducted in accordance with Standard Project Measure **PF NOI-1**, which includes compliance with applicable local noise standards and Caltrans Standard Specifications Section 14-8.02 (Caltrans 2019). Therefore, with the proposed measure to minimize the adverse effects identified related to construction noise of the build alternatives, remaining construction noise effects on minority populations within Mead Valley would not be disproportionately high and adverse.

The ISA and PSI provide construction recommendations designed to minimize the potential for adverse effects related to hazards identified in the project limits. These recommendations include the following measures in Section 3.13, *Hazardous Waste/Materials*: HASP and SMP for 9001 Cajalco Road (**HAZ-1** and **PF HAZ-2** [HASP]); proper handling and disposal of any hazardous material, if encountered (**PF HAZ-3**); optional soil and groundwater investigation, compliance with SCAQMD Rule 1166, and groundwater disposal for 21020 Cajalco Road (**PF HAZ-2** [HASP], **HAZ-4**); creosote-treated wood waste handling (**PF HAZ-5**); SMP for agricultural land uses (**PF HAZ-2** [HASP], **PF HAZ-3** [hazardous material disposal], **HAZ-6**); yellow paint and thermoplastic striping survey and disposal (**HAZ-7**); and hazardous building material surveys and proper handling and disposal of any hazardous material, if encountered (**PF HAZ-2** [HASP], **PF HAZ-3** [hazardous material disposal], and **HAZ-8**).

While these recommendations minimize the potential for an impact to occur during construction, impacts could still occur, although they would be low risk due to the nature of the sites. However, because the AOCs are located throughout the study area, not only in communities with predominantly minority populations, impacts from a hazardous materials release would not be borne predominantly by minority populations. Therefore, the build alternatives would not result in disproportionately high and adverse effects on minority populations.

Construction of all build alternatives would introduce construction equipment and staging areas that would not be compatible with the existing aesthetic character in the study area; however, the effects would be short term and limited to the construction period.

Construction would only result in temporary, short-term, partial closures of Cajalco Road under all build alternatives.

Temporary impacts on circulation and access would result from construction activities. Work that requires partial roadway closures would occur mostly during non-peak commute hours, at night, or on weekends. While the impacts would be experienced by the minority populations adjacent to the project, these temporary construction impacts would affect all populations equally along proposed alignment, not solely or disproportionately minority populations. In addition, Standard Project Measure **PF LU-1** (TMP) would be implemented to address impacts related to traffic and transportation, reducing potential impacts; please refer to Section 3.1.1.2 (*Land Use*). Construction of the build alternatives would comply with all appropriate, necessary, and required construction safety measures.

Future Six-Lane (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project, but is a future option for the project. For all build alternatives, there is one minority population group in the area where the Future Six Lane Alternative would be implemented, in Census Tract 419.09 Block Group 1. If the additional lanes are constructed in the future, it is anticipated that construction impacts would be similar to those previously described for the build alternatives. Operational impacts under all build alternatives would be less than those described for Build Alternatives 1, 2C, and 4 because no additional right of way, property displacements, or relocations would be required. The future six-lane facility would add lanes between Temescal Canyon Road and Harley John Road under Build Alternatives 1 and 2C, and between Temescal Canyon Road and El Sobrante Road under Build Alternative 4. It is anticipated to further improve east-west mobility, and to provide increased capacity, improved traffic flow and safety. The additional lanes would be added within the median, avoiding any additional physical expansion of the roadway and therefore any additional property acquisitions.

Lake Mathews HCP (Build Alternatives 1, 2C, and 4)

No minority or low-income populations reside within the LM MSHCP; therefore, impacts on these populations would not occur.

Build Alternative 4—El Sobrante Alignment

Under Build Alternative 4, between Temescal Canyon Road and west of La Sierra Avenue, and between Gustin Road and I-215, improvements would be identical to those under Build Alternatives 1 and 2C; therefore, the effects described for the communities of Mead Valley, portions of Lake Mathews/Gavilan Hills within the limits of Build Alternatives 1 and 2C, and Temescal Canyon, above, would occur under Build Alternative 4 as well. Please refer to the *Build Alternatives 1 and 2C—Cajalco Alignment and Modified Cajalco Alignment* discussion above for potential impacts on the communities of Mead Valley and Temescal Canyon under Build Alternative 4.

Project effects specific to Lake Mathews/Gavilan Hills and the Lake Hills/Home Gardens communities under Build Alternative 4 are described below.

Community Cohesion

Lake Mathews/Gavilan Hills

Under Build Alternative 4, residences on Silverton Court and Farley Way, south of Cajalco Road, would experience a minor change in access related to the realignment of the La Sierra Avenue intersection with Cajalco Road farther west. La Sierra Avenue at the current intersection of La Sierra Avenue and Cajalco Road would be closed to the public, and the traffic associated with La Sierra Avenue would be redirected west of Silverton Court and Farley Way.

Lake Hills/Home Gardens

As described in Section 3.4.1.3, *Environmental Consequences (Community Character and Cohesion)*, the build alternatives would have a minimal effect on community cohesion because they would not introduce a new barrier that would divide the community, separate residences from community facilities, or result in substantial growth. Construction would only result in temporary, short-term, partial closures of Cajalco Road under all build alternatives or El Sobrante Road and La Sierra Avenue under Build Alternative 4. Therefore, neither construction nor operation of the build alternatives would result in disproportionately high and adverse effects related to community cohesion on minority populations.

Accessibility/Traffic/Transportation

Residents of the Lake Hills community would not experience substantial changes in traffic and circulation along La Sierra Avenue or within the community. Some increase in traffic may occur along La Sierra Avenue; however, existing traffic signals at the Lake Crest Drive and La Sierra intersection would continue to control traffic flow and not impede access or traffic flow between La Sierra Avenue and Lake Crest Drive. Residents of the community would also be able to continue to access Lake Mathews Elementary School within the adjacent Victoria Grove community via vehicular transportation using Lake Crest Drive via La Sierra Avenue to Blackburn Road.

Most residential views of El Sobrante Road and La Sierra Avenue are obstructed by vegetation and sound walls, with limited views via second story windows.

According to input received from members of the Lake Hills community, concerns include protected areas and support for Build Alternative 1.

Construction Impacts

Construction of all build alternatives would introduce construction equipment and staging areas that would not be compatible with the existing aesthetic character in the study area; however, the effects would be short term and limited to the construction period.

Construction would only result in temporary, short-term, partial closures of Cajalco Road, El Sobrante Road, and La Sierra Avenue under Build Alternative 4. Temporary impacts on circulation and access would result from construction activities. Work that requires partial roadway closures would occur mostly during non-peak commute hours, at night, or on weekends. While the impacts would be experienced by the minority populations adjacent to the project, these temporary construction impacts would affect all populations equally along proposed alignment, not solely or disproportionately minority populations. In addition, Standard Project Measure **PF LU-1** (TMP) would be implemented to address impacts related to traffic and transportation, reducing potential impacts; please refer to Section 3.1.1.2 (*Land Use*). Construction of the build alternatives would comply with all appropriate, necessary, and required construction safety measures.

No-Build Alternative

No improvements would be undertaken as part of the No-Build Alternative. Therefore, there would be no impacts on minority or low-income populations.

3.4.3.4 Avoidance, Minimization, and/or Mitigation Measures (Environmental Justice)

Based on the above discussion and analysis, the build alternatives would not cause disproportionately high and adverse effects on any minority populations in accordance with the provisions of EO 12898. No further environmental justice analysis is required. The following avoidance and minimization measures included as standard project measures in Sections 3.1, *Land Use*, 3.2, *Farmlands,* 3.5, *Utilities/Emergency Services*, 3.7, *Visual/Aesthetics*, 3.13, *Hazardous Waste/Materials*, 3.14, *Air Quality*, and 3.15, *Noise and Vibration*, of this EIR/EIS would be implemented to avoid or minimize impacts involving temporary traffic, noise, land use, and hazardous materials conditions during construction, and visual changes to the environment: **PF LU-1**, **PF COM-1** and **PF COM-2**, **PF FA-1** and **PF FA-2**, **PF UT-1**, **PF VIS-1** and **PF VIS-3** through **PF VIS-7, PF HAZ-2**, **PF HAZ-3** and **PF HAZ-5**, **PF AQ-1**, and **PF NOI-1**. The following mitigation measures would also be applied to further reduce impacts: **COM-3**, **VIS-2**, **VIS-8**, **HAZ-1**, **HAZ-4**, **HAZ-6**, **HAZ-7** and **HAZ-8**, and **NOI-2** and **NOI-3**.

3.5 Utilities/Emergency Services

Unless otherwise noted, information in this section is based on the July 2018 Community Impact Assessment and February 2017 Initial Site Assessment prepared for the project.

3.5.1 Affected Environment

3.5.1.1 Utilities

Water Supply Facilities and Service

Water services for the project area are provided by the Western Municipal Water District (WMWD). The City of Corona Department of Water and Power provides water services to the City of Corona. In the City of Perris, water and sewer services are provided by City of Perris Finance & Water and the Eastern Municipal Water District (EMWD).

The following pipelines in the project area are maintained by WMWD (WMWD 2012):

- 8-inch pipelines – Cajalco Road and Hollis Lane; Cajalco Road and Gustin Road; Cajalco Road and Mockingbird Canyon Lane; Cajalco Road and Extravaganza Lane; Cajalco Road between Sewer Lift Station and Extravaganza Lane
- 10-inch pipelines – Cajalco Road and Cowan Road; Cajalco Road and Alder Street
- 12-inch pipeline – Cajalco Road and Wood Road
- 16-inch pipeline – Cajalco Road and Carpinus Drive

WMWD is a partnering agency with Metropolitan Water District of Southern California (MWD). Within the project area, MWD-managed Lake Mathews is a reservoir that receives water from the Colorado River Aqueduct, and is part of MWD's water supply system. The reservoir is fenced and closed to all public access. Lake Mathews captures the natural stormwater flows from Cajalco Creek upstream of the reservoir and the project area. The following facilities associated with the Lake Mathews reservoir in the project area are maintained by MWD (MWD 2011; AECOM 2012):

- Lake Mathews Dam – north of Cajalco Road, east of La Sierra Avenue
- Northern Lake Mathews Dike – south of El Sobrante Road, east of La Sierra
- Cajalco Creek Dam, Detention Basin, Sedimentation Basin, and Inlet Channel (connecting the two basins) – north of Cajalco Road, east of El Sobrante Road
- 140-inch Upper Feeder pipeline – north and south of El Sobrante Road, west of La Sierra Avenue (south of El Sobrante)
- 54-inch Woodcrest pipeline – north and south of El Sobrante Road, west of La Sierra Avenue (south of El Sobrante)
- 120-inch Lower Feeder pipeline – north of Cajalco Road, east and west of El Sobrante Road
- Ten-million-gallon reservoir – north of Cajalco Road, west of La Sierra Avenue

- Four additional sediment basins – south of Cajalco Road, west of Harley John Road
- Piezometers – various locations west and north of Lake Mathews

Wastewater Facilities and Service

WMWD provides wastewater service from the western boundary of the project area through to the unincorporated community of Mead Valley. The Western Riverside County Wastewater Treatment Plant in the City of Corona currently can treat up to 14 million gallons a day of wastewater and is designed to clean up to eight million gallons of wastewater per day with the capacity for future expansion (WMWD 2018).

Eastern Municipal Water District (EMWD) provides wastewater service from Mead Valley to the eastern boundary of the project area. EMWD currently treats approximately 46 million gallons per day of wastewater at five regional water reclamation facilities. The San Jacinto Valley, Moreno Valley, Perris Valley, Sun City, and Temescal Valley regional water reclamation facilities have a combined capacity of 199 million gallons of wastewater per day (EMWD 2018).

Natural Gas Service

Southern California Gas Company (SoCalGas) provides natural gas to the study area. Pipelines in the project area include a transmission line along Temescal Canyon Road, a high-pressure distribution line along El Sobrante Road, and a high-pressure distribution line running east along Cajalco Road from Clark Street (SoCalGas 2018).

Solid Waste

Riverside County Department of Waste Resources (RCDWR) manages the County's solid waste disposal system, which consists of seven regional landfills, eight transfer stations, and one bark beetle wood grinding facility (RCDWR 2018a). With the exception of the El Sobrante Landfill, all landfills in Riverside County are operated by RCDWR. The El Sobrante Landfill operates in accordance with agreements between Western Waste Industries and Riverside County, which collects the user fees for the site. Riverside County continues to have disposal capacity available for solid waste generated but not diverted in excess of 20 years (RCDWR 2018b). Permitted disposal capacity is available at the Badlands, Blythe, Desert Center, Lamb Canyon, Mecca II, Oasis, and El Sobrante landfills (CalRecycle 2018). Construction refuse/debris from the project could be hauled to the nearest landfill, the El Sobrante Landfill site, 2.5 miles away from the project area.

Electrical Facilities and Service

Southern California Edison (SCE) provides electricity to the project study area. SCE maintains utility lines in the project area and two electrical production facilities: El Sobrante Landfill Gas Generation and the Cajalco Substation.

Existing electrical poles/lines along Cajalco Road would be relocated as needed to accommodate the widening. Under Build Alternative 1, existing electrical poles/lines along Cajalco Road would be relocated as needed to accommodate the roadway widening from Temescal Canyon Road at the west to Interstate 215 (I-215) at the east. Under Build Alternative 2C, relocations of existing electrical poles along Cajalco Road would occur from Temescal Canyon Road at the

west to La Sierra Avenue, and from just west of Lake Mathews Drive to I-215. Under Build Alternative 4, relocations of existing electrical poles along Cajalco Road would occur from Temescal Canyon Road at the west to La Sierra Avenue, and from Gustin Road east to I-215. Electrical poles/lines would also be relocated as needed to accommodate the widening of El Sobrante Road between Gustin Road and La Sierra Avenue under Build Alternative 4.

Additional utilities within the project limits may also be relocated as necessary. At bridge locations within the project limits, utilities would be relocated either into the bridge or outside of the new bridge/roadway, as needed, to accommodate the proposed improvements.

MWD maintains the Temescal small conduit and Lake Mathews hydroelectric power plant in the project area, and contracts electricity produced to the City of Corona Department of Water and SCE, respectively. The City of Corona and SCE in turn provide electric services to the project area.

Telephone and Cable Facilities and Service

A number of companies provide cable and internet services for the project study area, including AT&T, Verizon, Spectrum, Direct TV, Frontier, and Century Link. HughesNet is an additional satellite internet provider serving the City of Perris and vicinity.

Lake Mathews MSHCP

Because the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. The LM MSHCP area is a conservation area that does not contain any population, housing, or community facilities. Much of the area is also part of the unincorporated Lake Mathews Community Planning Area identified in the Riverside County General Plan. The communities of Lake Mathews, Woodcrest, and Victoria Grove border the northern boundary of the conservation area, and unincorporated Riverside County borders the southern boundary.

3.5.1.2 Emergency Services

Fire protection and emergency services are provided by the Riverside County Fire Department (RCFD) and City of Corona Fire Department. The City of Perris has a contract with RCFD for fire and emergency services; there are two fire stations and 14 firefighters assigned to the City of Perris (City of Perris 2018). Police protection services in the study area are provided by the Riverside County Sheriff's Department (RCSD) and the City of Corona Police Department. The City of Perris contracts with RCSD to provide police services for the city.

Table 3.5-1 lists the locations of emergency service providers and stations within the project area. Figure 3.4-3 in Section 3.4, *Community Impacts*, shows the locations of each.

Table 3.5-1. Emergency Service Providers

Map ID*	Facility	Address	Direction from Project Area	Distance from Project (miles)
Fire				
E1	City of Corona Fire Department Station #7	3777 Bedford Canyon, Corona, CA 92882	East on Cajalco Road	0.5
E3	Riverside County Fire Station #82	17452 Lake Pointe Drive, Riverside, CA 92503	North on La Sierra Avenue	0.6
E4	Riverside County Fire Station #4	16453 El Sobrante Road, Riverside, CA 92503	N/A (adjacent to project on El Sobrante Road)	<0.1
E5	Riverside County Fire Station #59	21510 Pinewood Street, Perris, 92570	South on Clark Street	0.4
E6	Perris Fire Department Station #2	333 Placentia Avenue, Perris, CA 92570	South and east of I-215	2.3
Police				
E2	Corona Police Department	730 Public Safety Way, Corona, CA 92880	North on I-15	5.6
E7	City of Perris Police Station	137 North Perris Boulevard, Perris, CA 92570	South on I-215	3.6
Hospitals				
E8	Corona Regional Medical Center	800 South Main Street, Corona, CA 92882	North on I-15	4.7
* as shown on Figure 3.4-3.				

Fire

Riverside County Fire Department

RCFD serves the project area and has a staff of 175 employees, supplemented with an additional 1,077 employees through contract with the State of California Department of Forestry and Fire Protection.

The nearest fire station is the Lake Mathews Station No. 4, at 16453 El Sobrante Road in unincorporated County of Riverside. The next closest fire station to the project site is the Mead Valley Station No. 59, at 21510 Pinewood Street in the City of Perris (Table 3.5-1).

City of Corona Fire Department

The City of Corona Fire Department provides fire protection, prevention, and emergency medical services utilizing seven fire stations in the city. The City of Corona currently employs 132 people in fire services: 105 employees throughout the area's seven fire stations and 27 at its headquarters located in the Civic Center, and other strategic facilities for additional fire services support (City of Corona 2004). The nearest fire station is at 3777 Bedford Canyon (Table 3.5-1).

Police

Riverside County Sheriff's Department

RCSD provides much of the region's law enforcement via ten Sheriff's Stations spread across the region. RCSD's Perris Station, approximately 4 miles southeast of the project, provides law enforcement in the City of Perris and surrounding region. The Perris Station is commanded by a

captain and is in the same facility on North Perris Boulevard as the Perris Police Department. This station also contracts services for the City of Canyon Lake, as well as the unincorporated communities of Glen Valley, Mead Valley, Woodcrest, Romoland, and Sun City.

City of Corona Police Department

The Corona Police Department has a staff of over 220 employees, including sworn officers and civilians. Together, they serve the City of Corona's population of over 165,000 residents. The nearest City police station is 5.7 miles northwest of the project area (see Table 3.5-1).

Hospitals

Corona Regional Medical Center is at 800 South Main Street in the City of Corona and is the closest hospital to the project study area (Table 3.5-1). The hospital has 238 beds, with 160 beds in the acute care hospital and 78 beds in the rehabilitation campus. It employs more than 1,000 trained healthcare workers and has a medical staff of approximately 300 physicians (Corona Regional Medical Center 2018).

Lake Mathews MSHCP

Fire protection service in the Lake Mathews area is provided by RCFD; the nearest station is Fire Station No. 4. Police services are provided by RCSD, with Perris Station serving as the nearest station. The Corona Regional Medical Center is closest to the Lake Mathews area.

3.5.2 Environmental Consequences

3.5.2.1 Permanent Impacts

Build Alternatives 1 and 2C—Cajalco Alignment and Modified Cajalco Alignment

Under Build Alternatives 1 and 2C, several utility types would require relocation, including overhead and underground electrical, underground gas, overhead and underground telephone, overhead cable telephone, water, septic tank, petroleum pipeline, and underground fiber optic. The project would add a new curb and gutter with sidewalk between Harley John Road and Harvill Avenue, where existing SCE and Frontier power and communication poles are proposed to be relocated. Other potential utility conflicts identified through initial coordination with local providers include the following:

- AT&T – cable lines near the intersections of Cajalco Road/Seaton Avenue and Seaton Avenue/Marquez Road
- WMWD – water pipelines near where Cajalco Road intersects Cowan Road, Carpinus Drive, Hollis Lane, Gustin Road, Extravaganza Lane, and Silverton Court, as well as sewage pipelines where Cajalco Road intersects Wood Road and Carpinus Drive
- MWD – water pipelines where Cajalco Road intersects Smith Road, Gavilan Road, Extravaganza Lane, and Lake Mathews Drive
- Century Link – fiber optic cables near the intersection of Wood Road and Clark Street

- U.S. Postal Service (USPS) – mailboxes along Cajalco Road between Temescal Creek Bridge and Harvill Avenue

Under Build Alternative 1, approximately 202 existing electrical poles are within the project's limits of disturbance. Existing electrical poles/lines along Cajalco Road would be relocated within the project limits as needed to accommodate the roadway widening between Temescal Canyon Road and Harvill Avenue. From Harley John Road to the east along Cajalco Road, curb and gutter and 8-foot shoulders that would serve as a combined shoulder/bike lane would be constructed. A large culvert would be constructed at Cajalco Road and Harley John Road, and a new bridge would be constructed along the westbound lanes of Cajalco Road over Cajalco Creek west of Barton Street. At bridge locations within the project limits, utilities would be relocated either into the bridge or outside of the new bridge/roadway, as needed, to accommodate the proposed improvements.

Retaining walls would be constructed where feasible to avoid acquisition of additional right of way and utility impacts, as well as to accommodate construction staging. Geotechnical borings would be conducted within the project's limits of disturbance as needed for design of the project.

Build Alternative 2C would include the same improvements as Build Alternative 1 with the exception that a new four-lane segment of Cajalco Road would be constructed from La Sierra Avenue to just west of Lake Mathews Drive. Approximately 198 electrical poles are within the project's limits of disturbance under Build Alternative 2C. Relocations of existing electrical poles along Cajalco Road would occur primarily from Harley John Road east to Harvill Avenue. In addition to the wildlife crossings of various widths beneath Cajalco Road between Temescal Creek Bridge and Harley John Road, a large undercrossing may be included within the newly constructed segment of Cajalco Road west of Hollis Lane. Close coordination with WMWD during the Plans, Specifications, and Estimates (PS&E)/final design and construction phases would avoid permanent effects on an 8-inch water pipeline at the intersection of Cajalco Road and Hollis Lane. Additional utilities within the project limits may also be relocated as necessary under both alternatives.

Through close coordination with MWD, the build alternatives have been designed to avoid some MWD facilities; however, other facilities remain within the project footprint, and would thus be affected. MWD facilities that would be affected by all build alternatives include Cajalco Creek Dam and Detention Basin, Cajalco Creek Sedimentation Basin, and the Inlet Channel separating the two basins. These facilities are located along the north side of Cajalco Road between El Sobrante Road and Harley John Road. Under Build Alternatives 1 and 2C, approximately 4.95 acres of the Cajalco Creek Dam and Detention Basin and 3.69 acres of the Cajalco Creek Sedimentation Basin would be converted to roadway right of way. While continuity between the two basins and Inlet Channel function would be maintained and the basins are anticipated to retain function, Mitigation Measure **HYD-1** is proposed to ensure continued function of these facilities (please refer to Section 3.9 of this EIR/EIS for the full text of the measure).

The build alternatives are not anticipated to result in permanent impacts on water supply pipelines identified in Section 3.5.1.1, *Utilities*. Impacts on water supply pipelines would be avoided with implementation of Standard Project Measure **PF UT-1**, which requires that utility coordination with all affected agencies be conducted. Once specific information about excavation locations and depth is available, and prior to completion of the PS&E/final design

phases, coordination with the affected utility providers in the vicinity of the improvements would be completed to verify that the project would not disrupt services. For any utilities affected, all required coordination would be completed during the PS&E/final design and construction phases to establish exact procedures and specifications for addressing facilities affected by the project.

While changes in the placement of some utilities would be considered permanent, any effects during their relocation would be temporary and would be rectified once relocations and project construction are complete. Relocated utilities would be relocated on site within the environmentally evaluated footprint of this project. Standard Project Measure **PF UT-1**, below, is identified to avoid or otherwise minimize impacts.

- **PF UT-1:** The County of Riverside will coordinate all utility relocation work with the affected utility companies to ensure minimum disruption to customers in the service areas during construction. All public utility lines, pipes, and cables that are disturbed or removed to accommodate the proposed project will be replaced or relocated within the project limits to continue to meet the needs of residents and businesses in the community.

California Public Utilities Commission General Order 131-D, Section XIV.B, states that "local jurisdictions acting pursuant to local authority are preempted from regulating electric power line projects, distribution lines, substations, or electric facilities constructed by public utilities subject to the Commission's jurisdiction. However, in locating such projects, the public utilities shall consult with local agencies regarding land use matters." General Order 131-D.B.1c also states that a permit to construct is not required for "the minor relocation of existing power line facilities up to 2,000 feet in length, or the intersetting of additional support structures between existing support structures." Because the relocation of existing power line facilities is anticipated to be within 2,000 feet in length, and/or includes the intersetting of additional support structures between existing support structures, the proposed project would be exempt from local regulation and discretionary permits.

USPS mailbox receptacles within the limits of proposed roadway improvements would be relocated and replaced with grouped mailboxes placed in accordance with Sections 631.441 (Delivery Requirements), 632.524 (Location), and 632.525 (Grouping) of the USPS Postal Operations Manual. Mailboxes would be designed in accordance with USPS requirements as well as County of Riverside Standard No. 812 (Multiple Mailbox Installation for New Sidewalk).

Build Alternatives 1 and 2C would not involve construction of any habitable structures, nor would they induce population growth (see Section 3.3, *Growth*, of this document) in the project area. Therefore, no impacts would occur as there would be no demand for new or expanded emergency facilities or services. Additionally, implementation of Build Alternatives 1 or 2C are anticipated to result in a positive effect on emergency services by improving the levels of service (LOS) within the project limits, thereby potentially reducing emergency response times.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that permanent impacts associated with the addition of two additional travel lanes along Cajalco Road between Temescal Canyon Road and Harley John

Road would be limited to the existing median, and would not result in the need for new or expanded utilities or emergency services. Because the roadway medians would be disturbed as part of the proposed project, additional utility relocations within the median are not anticipated. No habitable structures would be constructed and the future six-lane facility would not permanently affect utilities or public services.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Potential utility conflicts in the Lake Mathews MSHCP area include WMWD-operated water pipelines where Cajalco Road intersects Cowan Road and MWD-operated water pipelines, and where Cajalco Road intersects Gavilan Road and Lake Mathews Drive. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to allow for construction of the project within the LM MSHCP boundary. All effects on utilities would be temporary and would be rectified when relocations and project construction are complete. Relocated utilities would be relocated on site within the environmentally evaluated limits of disturbance of these build alternatives and, as a result, there would be no permanent impacts on utilities in the project area. Standard Project Measure **PF UT-1** is included to avoid and further reduce impacts. No impacts on public services would occur, as there would be no demand for new or expanded emergency facilities or services.

Build Alternative 4—El Sobrante Alignment

Under Build Alternative 4, several utility types would require relocation, including overhead and underground electrical, underground gas, overhead and underground telephone, overhead cable telephone, water, septic tank, petroleum pipeline, and underground fiber optic. Approximately 281 existing electrical poles are within the project's limits of disturbance under Build Alternative 4. Potential utility conflicts identified through initial coordination with local providers include the following:

- AT&T – cable lines near the intersections of Cajalco Road/Seaton Avenue and Seaton Avenue/Marquez Road
- WMWD – water pipelines near where Cajalco Road intersects Alder Street, Cowan Road, Carpinus Drive, Gustin Road, Extravaganza Lane, where El Sobrante Road intersects Mockingbird Canyon Road, as well as sewage pipelines where Cajalco Road intersects Wood Road and Carpinus Drive
- MWD – water pipelines where Cajalco Road intersects Smith Road and Extravaganza Lane
- Century Link – fiber optic cables near the intersection of Wood Road and Clark Street
- USPS – mailboxes along Harley John Road to Seaton Avenue, and along Cajalco Road

All effects on utilities would be temporary and would be rectified when relocations of certain utilities and project construction are complete. Relocated utilities would be relocated on site within the environmentally evaluated footprint of this project. As a result, permanent effects on utilities would be less than significant. Standard Project Measure **PF UT-1** is included to avoid and further reduce impacts.

Under Build Alternative 4, approximately 0.12 acre of the Cajalco Creek Dam and Detention Basin and 3.55 acres of the Cajalco Creek Sedimentation Basin would be converted to right of

way. The Inlet Channel would be replaced with a bridge and wildlife crossing but is not anticipated to adversely affect inlet operation.

The Northern Lake Mathews Dike, south of El Sobrante Road and east of La Sierra Avenue, includes a 1,000-foot restricted zone in which MWD prefers avoidance of excavation activity for the protection of the dike and related facilities (AECOM 2012). Within this zone are a number of piezometers and segments of the Upper and Lower Feeder Pipelines (Callanan pers. comms.). Piezometers within the project limits would require relocation and additional engineering would be required to ensure continued protection and stability of the pipeline and dike facilities.

The proposed project would not permanently affect water supply pipelines identified in Section 3.5.1.1, *Utilities*. Impacts on water supply pipelines would be avoided with implementation of Standard Project Measure **PF UT-1**. Once specific information about excavation locations and depth is available, and prior to completion of PS&E/final design phases, coordination with the affected utility providers in the vicinity of the improvements would be completed to verify that the project would not disrupt services. For any utilities affected, all required coordination would be completed during the PS&E/final design and construction phases to establish exact procedures and specifications for addressing facilities affected by the project.

USPS mailbox receptacles within the limits of proposed roadway improvements would be relocated and replaced with grouped mailboxes placed in accordance with Sections 631.441 (Delivery Requirements), 632.524 (Location), and 632.525 (Grouping) of the USPS Postal Operations Manual. Mailboxes would be designed in accordance with USPS requirements as well as County of Riverside Standard No. 812 (Multiple Mailbox Installation for New Sidewalk).

Build Alternative 4 would not involve construction of any habitable structures, nor would it induce population growth (see Section 3.3, *Growth*) in the project area. Therefore, no impacts would occur, as there would be no demand for new or expanded emergency facilities or services. Additionally, implementation of Build Alternative 4 is anticipated to result in a positive effect on emergency services by improving the LOS within the project limits, thereby potentially reducing emergency response times.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the median of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that permanent impacts associated with the addition of two additional travel lanes along Cajalco Road between Temescal Canyon Road and La Sierra Avenue would be limited to the existing median. Once utility relocations are complete and effects rectified, there would be no permanent impacts. No habitable structures would be constructed and the future six-lane facility would not permanently affect utilities or public services.

Lake Mathews MSHCP (Build Alternative 4)

Potential utility conflict in the Lake Mathews MSHCP area includes WMWD-operated water pipelines where Cajalco Road intersects Cowan Road. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Road would be expanded and realigned within the LM MSHCP

area and Lake Mathews Multiple Species Reserve. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to allow for construction of the project within the LM MSHCP boundary. Once utility relocations are complete and effects rectified, there would be no permanent impacts. Relocated utilities would be relocated on site within the environmentally evaluated footprint of this project and, as a result, there would be no permanent effects on utilities. Standard Project Measure **PF UT-1** is included to avoid and further reduce impacts.

No impacts on public services would occur, as there would be no demand for new or expanded emergency facilities or services. Permanently improved LOS within the project limits would in turn decrease response times to the project area. The LM MSHCP, as it pertains to utilities and public services, would remain unchanged as a result of the proposed project under Build Alternative 4.

No-Build Alternative

The No-Build Alternative would not involve any modifications to the current highway or surrounding roadways. Due to the absence of improvements to Cajalco Road, congestion would not be decreased nor traffic safety improved in the project vicinity; therefore, potential benefits to emergency response services associated with access and circulation improvements would not occur. No long-term impacts on utilities are anticipated under the No-Build Alternative.

3.5.2.2 Temporary Impacts

Build Alternatives 1, 2C, and 4

Several utility types would require relocation, including overhead and underground electrical, underground gas, overhead and underground telephone, overhead cable telephone, water, septic tank, petroleum pipeline, and underground fiber optic. Potential utility conflicts identified through initial coordination with local providers include the following:

- AT&T – cable lines near the intersections of Cajalco Road/Seaton Avenue and Seaton Avenue/Marquez Road
- WMWD – water pipelines near where Cajalco Road intersects Alder Street, Cowan Road, Carpinus Drive, Hollis Lane, Gustin Road, Extravaganza Lane, and Silverton Court, where El Sobrante Road intersects Mockingbird Canyon Road, as well as sewage pipelines where Cajalco Road intersects Wood Road and Carpinus Drive
- MWD – water pipelines where Cajalco Road intersects Smith Road, Gavilan Road, Extravaganza Lane and Lake Mathews Drive
- Century Link – fiber optic cables near the intersection of Wood Road and Clark Street
- USPS – mailboxes along Harley John Road to Seaton Avenue and on proposed sidewalks

A detailed study of utility relocations would be conducted during the final design. Depending on the level of impacts, these facilities would need to be protected, adjusted/modified, or relocated. The affected utilities would be relocated in accordance with state law and regulations and County policies. There would be ongoing coordination between the County, affected agencies, and utility companies in order to minimize potential disruption of utility service; therefore, no adverse

effects on public services would occur. Due to the coordination and adherence to regulations and policies, it is not anticipated that any residential utility services would be affected.

Designated staging areas would be utilized during construction of the project. Temporary advanced signage during construction would be required, which would involve portable changeable message signs or other temporary signage that would not require any ground disturbance.

Construction activities associated with the build alternatives would result in temporary, localized, site-specific disruptions to the utilities and emergency services in the project area, primarily related to construction-related traffic changes from trucks and equipment and partial and/or complete street and lane closures, some requiring detours. Only a few locations would require temporary, localized detours; most areas would maintain two-way traffic throughout construction. In addition, non-fire-related medical emergencies could temporarily increase with the presence of construction workers and heavy machinery during construction of the project. Localized, temporary detours are proposed during replacement of the Temescal Canyon Bridge just east of Temescal Canyon Road, at the intersection of Cajalco Road and Harley John Road to accommodate replacement of a large reinforced concrete box within the roadway, and during construction of the new bridge proposed for westbound lanes west of Barton Street.

A Traffic Management Plan (TMP), as described in Standard Project Measure **PF LU-1** (see Section 3.1*, Land Use*), would be prepared for the project and include measures to minimize construction-period traffic and access/circulation impacts, and coordination of detour routes with County sheriff and fire departments and emergency providers. As part of the TMP, temporary detour plans would be prepared for alternative access and route options for local and regional travelers during construction of the project. Final detour routing would be identified during the PS&E/final design phases of the project. Standard Project Measure **PF UT-1** would also be included to avoid and minimize the potential for impacts.

Because the project construction activities would be temporary and would be implemented in a manner that minimizes the effects on utilities and emergency services, no adverse effect is expected to result.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

For the future six-lane Cajalco Road facility (Build Alternatives 1, 2C, and 4), construction is not currently proposed as part of the project. However, if constructed in the future, it is anticipated that temporary impacts associated with the addition of two additional travel lanes along Cajalco Road between Temescal Canyon Road and Harley John Road (Build Alternatives 1 and 2C) and along Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road (Build Alternative 4) would be limited to the existing median. As part of the TMP, a public awareness campaign, options for lane closures, and alternate route strategies would be included. Appropriate signage and advanced warning would be implemented to direct pedestrian, bicycle, and vehicular traffic to alternate routes as deemed necessary. As all effects on utilities would be temporary and would be implemented in a manner that minimizes the effects on utilities and emergency services, the future six-lane facility would not affect utilities and public services.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Potential utility conflicts in the Lake Mathews MSHCP area include WMWD-operated water pipelines where Cajalco Road intersects Cowan Road and MWD-operated water pipelines where Cajalco Road intersects Gavilan Road and Lake Mathews Drive. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to allow for construction of the project within the conservation area. Approval would need to be obtained prior to any construction. As discussed under Build Alternatives 1 and 2C, above, with the implementation of Mitigation Measure **HYD-1** and Standard Project Measures **PF UT-1** and **PF LU-1**, impacts on utilities and services would not be anticipated.

No-Build Alternative

Because this alternative would not involve any construction activities, this alternative would not have any adverse impacts on utilities and emergency services.

3.5.3 Avoidance, Minimization, and/or Mitigation Measures

Implementation of Mitigation Measure **HYD-1** and Standard Project Measures **PF LU-1** and **PF UT-1** are proposed to ensure continued function of MWD facilities, prevent unreasonable traffic delays and impacts on emergency access and utilities, and minimize impacts during proposed utility relocations.

3.6 Traffic and Transportation/Pedestrian and Bicycle Facilities

3.6.1 Regulatory Setting

The Department, as assigned by the Federal Highway Administration (FHWA), directs that full consideration should be given to the safe accommodation of pedestrians and bicyclists during the development of federal-aid highway projects (see 23 Code of Federal Regulations 652). It further directs that the special needs of the elderly and the disabled must be considered in all Federal-aid projects that include pedestrian facilities. When current or anticipated pedestrian and/or bicycle traffic presents a potential conflict with motor vehicle traffic, every effort must be made to minimize the detrimental effects on all highway users who share the facility.

In July 1999, the U.S. Department of Transportation issued an Accessibility Policy Statement pledging a fully accessible multimodal transportation system. Accessibility in federally assisted programs is governed by the U.S. Department of Transportation regulations (49 Code of Federal Regulations part 27) implementing Section 504 of the Rehabilitation Act (29 United States Code 794). The FHWA has enacted regulations for the implementation of the 1990 Americans with Disabilities Act (ADA), including a commitment to build transportation facilities that provide equal access for all persons. These regulations require application of the ADA requirements to Federal-aid projects, including Transportation Enhancement Activities.

In 2013, Governor Brown signed Senate Bill (SB) 743 (Steinberg 2013), which creates a process to change the way transportation impacts are analyzed under the California Environmental Quality Act (CEQA). In December 2018, the California Natural Resources Agency certified and adopted the State CEQA Guidelines updates, including the State CEQA Guidelines section implementing SB 743 (i.e., § 15064.3). SB 743 required the California Governor's Office of Planning and Research to amend the State CEQA Guidelines to provide an alternative to LOS for evaluating transportation impacts; auto delay (e.g., level of service [LOS]) is no longer considered a significant impact under CEQA. The requirements under SB 743 support the State's legislated goals pertaining to climate change (e.g., SB 32 and SB 375).

3.6.2 Affected Environment

The information in this section is based on the following documents:

- *Cajalco Road Widening and Safety Enhancement Project Draft Traffic Operations Analysis Report* (Caltrans 2017)
- *Cajalco Road Widening Project LOS Standards Memorandum* (County 2015)
- *Cajalco Road Widening Project Study Area and Traffic Analysis Methodology* (Caltrans 2015)
- *Cajalco Road Improvement Project Comparison of 2014 (Project) vs. 2018 (New) Counts Memorandum* (County 2019)

3.6.2.1 Transportation Study Area

The transportation study area includes all freeway segments, interchange ramps, and ramp terminus intersections along Interstate 15 (I-15) from Weirick Road to State Route 91 (SR-91) and along Interstate 215 (I-215) from Nuevo Road to State Route 60 (SR-60). It also includes intersections along Cajalco Road, Markham Street, and Rider Street. Refer to Figure 3.6-1.

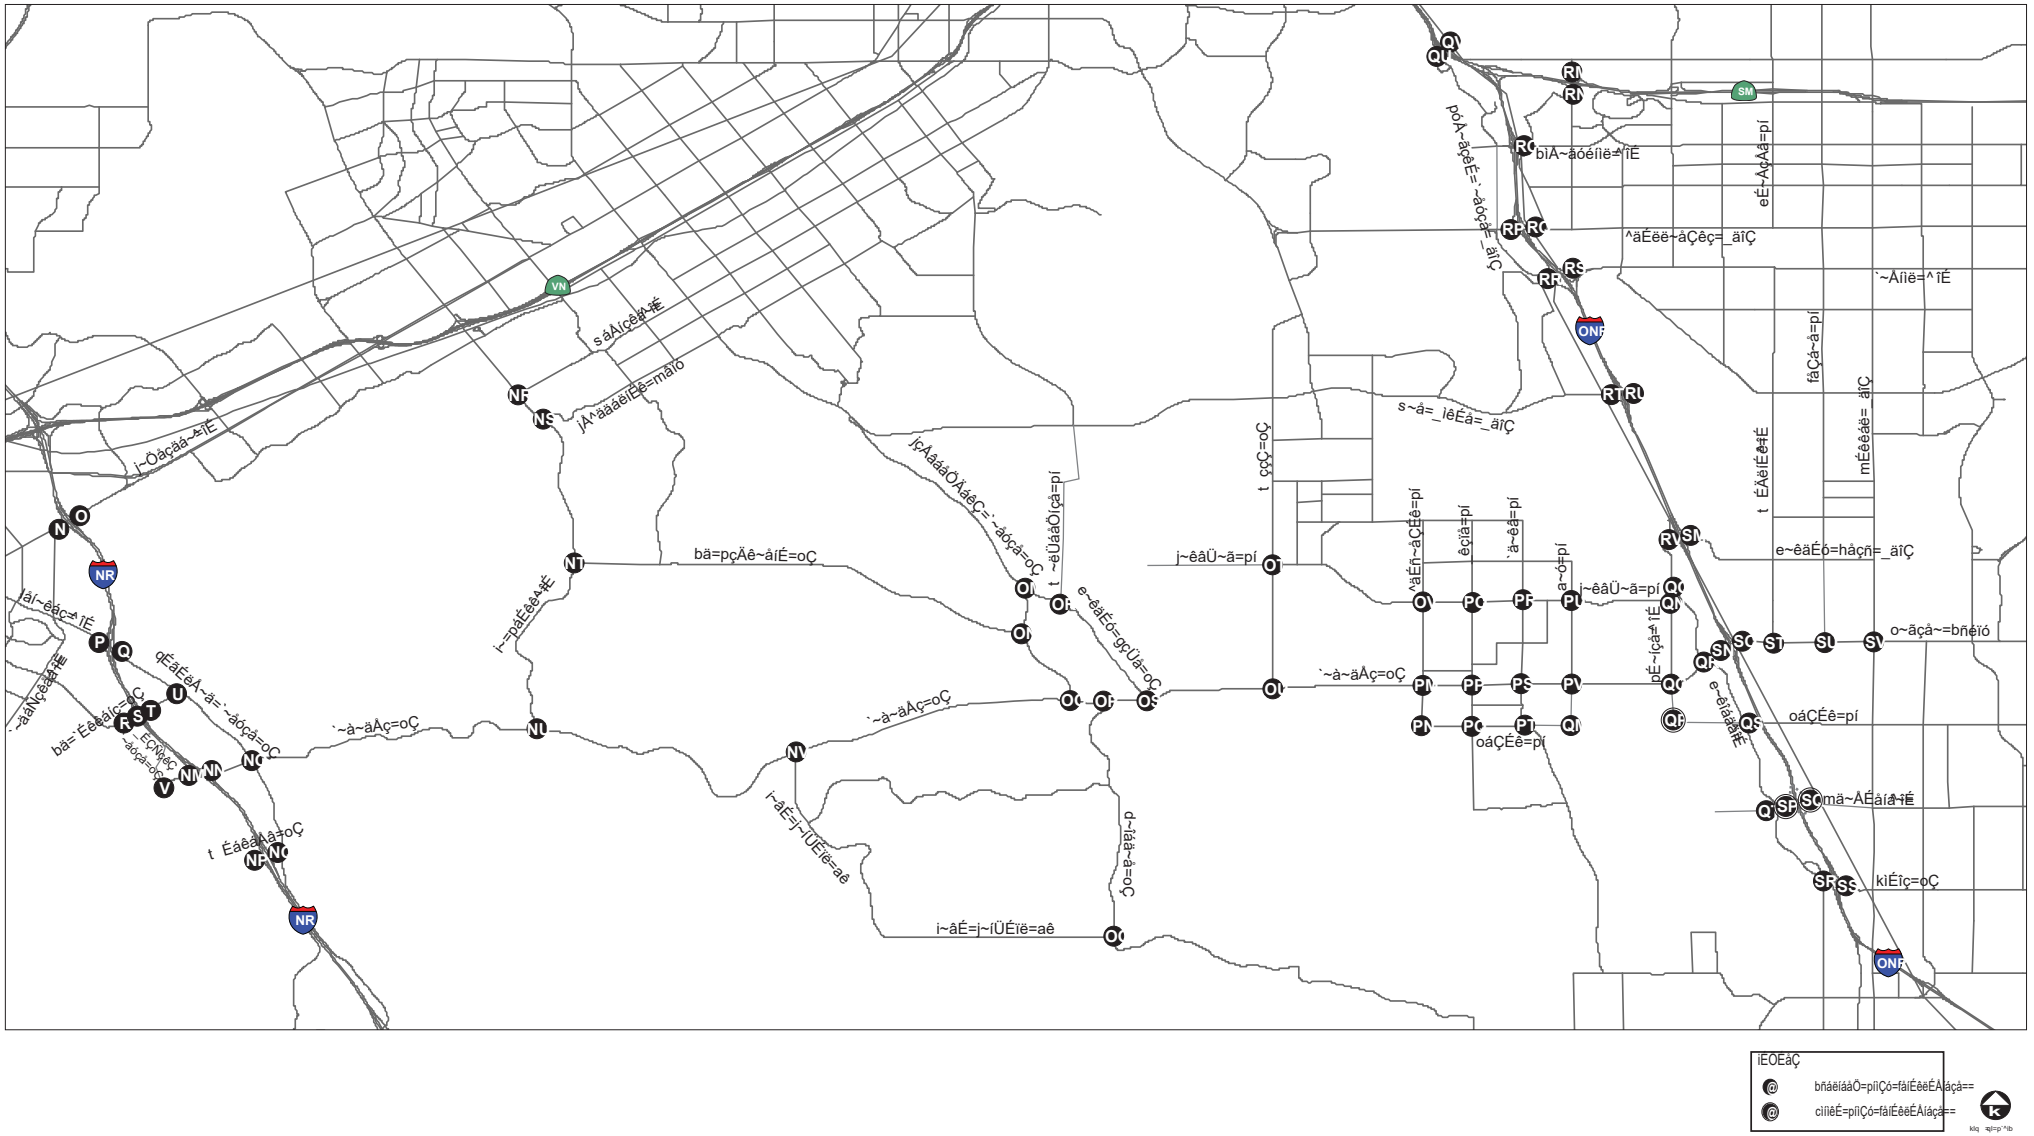

Figure 3.6-1
Transportation Study Area
Cajalco Road Widening and Safety Enhancement Project

Level-of-Service Standards

The traffic analysis study area is part of three County General Plan area plans: the Temescal Canyon Area Plan, Lake Mathews/Woodcrest Area Plan, and Mead Valley Area Plan. According to County General Plan Policy C 2.1, which applies to the study area, LOS D is the acceptable LOS for roadway (arterial) capacity analyses. The County has determined that the proposed project would be designed to LOS D. For the purposes of the proposed project, and to maintain consistency with County standards, LOS D has also been established as the design standard for intersections. According to the latest Transportation Concept Reports for I-15 and I-215 within California Department of Transportation (Caltrans) District 8, the LOS standard for basic freeway segments, freeway ramp segments, and freeway weaving segments is also LOS D.

Arterial Level-of-Service Analysis

An arterial (roadway segment) LOS analysis was performed for the project corridor using average daily traffic (ADT) volumes. Table 3.6-1 presents the established link volume capacity and associated LOS standards for county roadways.

Table 3.6-1. Arterial Level of Service

Number of Lanes	Maximum Two-Way Traffic Volume (ADT)				
	LOS A	LOS B	LOS C	LOS D	LOS E
2	10,800	12,600	14,400	16,200	18,000
4	21,540	25,130	28,700	32,300	35,900
6	32,340	37,730	43,100	48,500	53,900
Source: Caltrans 2017.					

Intersection Level-of-Service Analysis

For all study intersections, an LOS analysis was performed using the 2010 *Highway Capacity Manual* (HCM) operations methodology. The LOS parameters and criteria specified in the *Traffic Impact Analysis Preparation Guide*, as outlined by the Riverside County Transportation Department, were used. The 2010 HCM analysis methodology describes intersection operations by using a range of LOS, from LOS A (free-flow conditions) to LOS F (severely congested conditions), based on corresponding ranges for stop delay per vehicle at signalized and unsignalized intersections, as shown in Figures 3.6-2 and 3.6-3, respectively.

Freeway Level-of-Service Analysis

Freeway mainline LOS is determined through application of the HCM analysis methodology for basic freeway segments. LOS is determined by the density of vehicles within each roadway segment, or how many passenger cars per mile per lane are within the segment (the higher the density value, the more congestion occurs within a specific highway segment). There are six grades of LOS, ranging from LOS A (representing free-flow traffic conditions with low volumes and high speeds, resulting in low densities) to LOS F (representing conditions in which traffic volumes exceed capacity and cause forced-flow operations at low speeds, resulting in high densities and delays). The defined LOS for a basic freeway segment are shown graphically in

Figure 3.6-4, whereas the corresponding density (passenger cars/mile/lane) value for each respective LOS grade is shown in Table 3.6-2.

Table 3.6-2. Freeway Level of Service and Density Ranges

LOS	Density (passenger cars/mile/lane)		
	Basic Freeway Segment	**Freeway Ramp Segment**	**Freeway Weaving Segment**
A	0.0–11.0	≤ 10	≤ 10
B	11.1–18.0	> 10–20	> 10–20
C	18.1–26.0	> 20–28	> 20–28
D	26.1–35.0	> 28–35	> 28–35
E	35.1–45.0	> 35	> 35
F	Demand Exceeds Capacity > 45.0	Demand Exceeds Capacity	Demand Exceeds Capacity

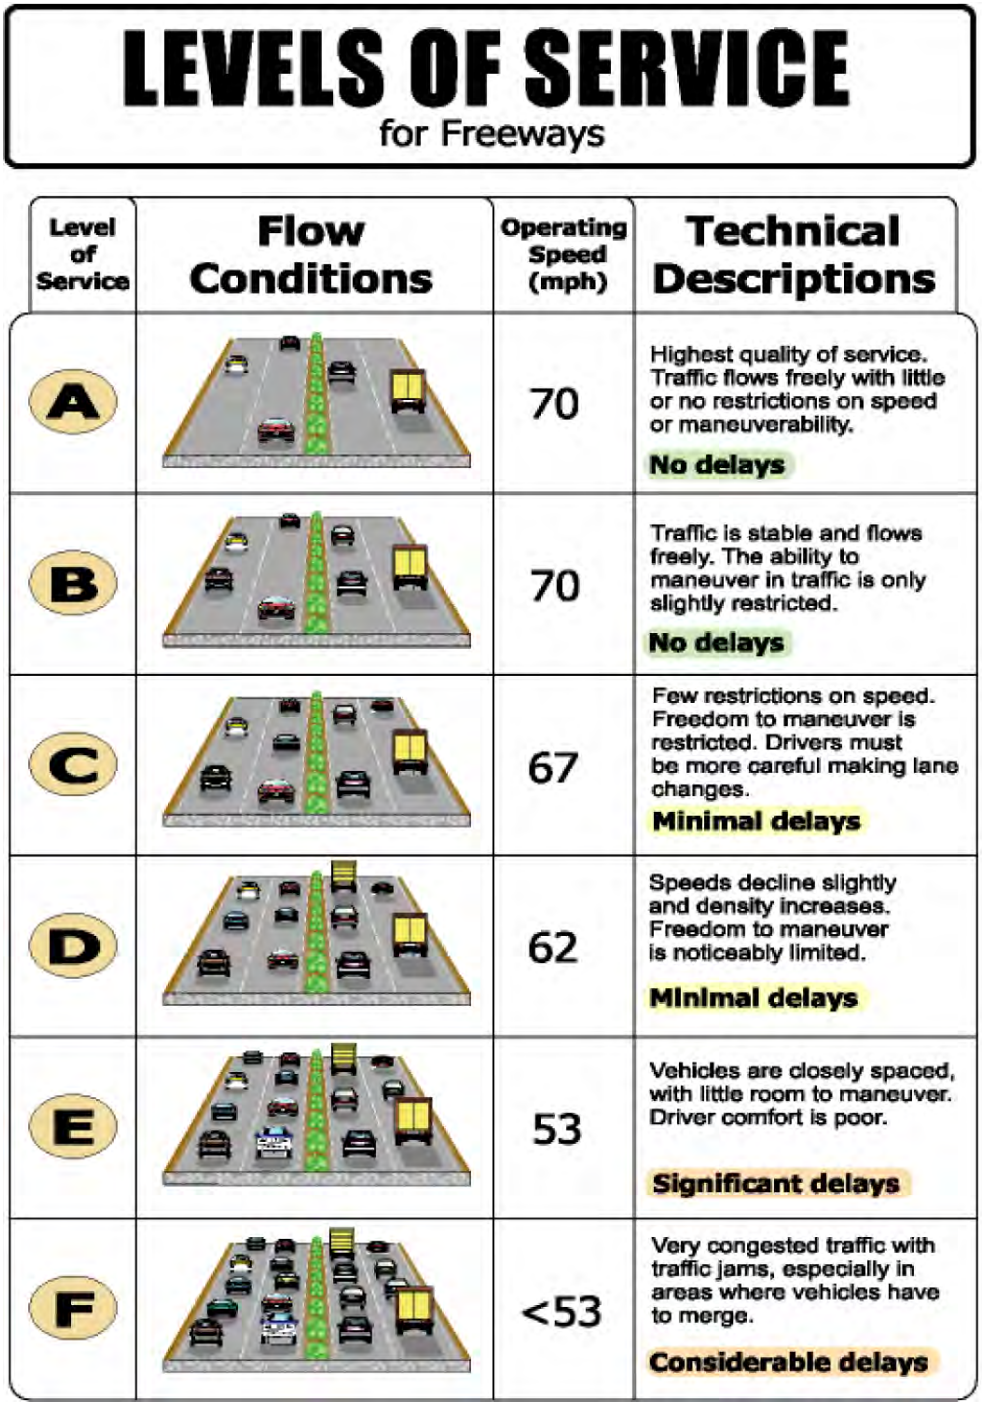
Figure 3.6-4. Level of Service for Basic Freeway Segment



3.6.2.2 Existing Year 2014 Traffic Conditions

Existing traffic volumes in the study area were based on counts conducted in December 2014 in support of the *Cajalco Road Widening Project Traffic Operations Analysis Report* (Caltrans 2017). As detailed in that report, the assessment focused on traffic operations at intersections, arterial roadway segments, freeway segments, and freeway interchange ramps within the study area exhibiting potential to be affected by project-related improvements. The existing (2014) traffic volumes were examined and compared to 2018 volumes per the *Cajalco Road Improvement Project Comparison of 2014 (Project) vs. 2018 (New) Counts Memorandum*, dated February 15, 2019. Overall, and as further detailed in the referenced memorandum, it was concluded that the volume growth trends observed in the year 2018 are consistent with the growth trends projected in the Cajalco Study based on 2014 counts.

Arterial (Roadway Segment) Level of Service

Table 3.6-3 indicates the existing ADT and LOS for traffic along mainline Cajalco Road and El Sobrante Road within the project limits.

Table 3.6-3. Average Daily Traffic and Level of Service – Existing-Year (2014) Conditions

Roadway Segment	Baseline Conditions		
	Number of Lanes	ADT	LOS
Cajalco Road east of Temescal Canyon Road	2	13,340	C
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	2	8,740	A
Cajalco Road between Lake Mathews Drive to El Sobrante Road	2	7,540	A
El Sobrante Road east of La Sierra Avenue	2	11,591	B
Cajalco Road between El Sobrante Road to Gavilan Road	2	18,280	F
Cajalco Road between Gavilan Road to Harley John Road	2	18,670	F
Cajalco Road between Harley John Road and Day Street	2	19,890	F
Cajalco Road east of Day Street	2	26,390	F
Source: Caltrans 2017. Shaded cells represent unacceptable LOS (LOS standard exceeded)			

As indicated in Table 3.6-3, baseline ADT conditions along four segments of Cajalco Road analyzed within the project limits currently exceed the maximum two-way traffic volumes for arterial roadways, as shown in Table 3.6-1. More specifically, these segments of Cajalco Road operate at LOS F.

Intersection Level of Service

The LOS and vehicle delay for existing-year (2014) conditions at study area intersections is presented in Table 3.6-4 on the following page. Refer to Figure 3.6-1 for study area intersection locations.

Table 3.6-4. Intersection Level of Service – Existing-Year (2014) Conditions

AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
-- = Freeway segment does not exist in the year 2014.
Density = passenger cars/mile/lane
CETAP = Community Environmental Transportation Acceptability Process

As shown above in Table 3.6-5, the following six freeway mainline segments currently operate at an unacceptable LOS E during the PM peak hour:

I-15 Southbound (2014):

- El Cerrito Road on-ramp to Cajalco Road off-ramp
- Cajalco Road off-ramp to Cajalco Road on-ramp
- Cajalco Road on-ramp to Weirick Road off-ramp

I-215 Southbound (2014):

- Van Buren Boulevard on-ramp to Harley Knox Boulevard off-ramp
- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp
- Harley Knox Boulevard on-ramp to Cajalco Expressway off-ramp

In addition to the six freeway mainline segments that currently operate at an unacceptable LOS E during the PM peak hour, the segment of northbound I-215 between Harley Knox Boulevard on-ramp and Van Buren Boulevard off-ramp operates at an unacceptable LOS E during the AM peak hour.

Freeway Ramp Level of Service

Existing conditions for the study area freeway ramps are presented in Table 3.6-6.

EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
"--" = Freeway ramp has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown in Table 3.6-6, 17 freeway ramps within the study area currently operate at an unacceptable LOS in the existing year (2014). The following four I-15 southbound freeway ramps operate at LOS E during the PM peak hour:

- El Cerrito Road on-ramp
- Cajalco Road off-ramp
- Cajalco Road on-ramp
- Weirick Road off-ramp

Three northbound I-15 freeway ramps operate at LOS E during the AM peak hour:

- El Cerrito Road off-ramp
- El Cerrito Road on-ramp
- Ontario Avenue off-ramp

Seven southbound I-215 freeway ramps operate at LOS E during the PM peak hour:

- Eucalyptus Avenue on-ramp
- Alessandro Boulevard off-ramp
- Van Buren Boulevard off-ramp
- Van Buren Boulevard on-ramp
- Harley Knox Boulevard off-ramp
- Cajalco Expressway off-ramp
- West Nuevo Road off-ramp

Three northbound I-215 freeway ramps operate at LOS E during the AM peak hour:

- Harley Knox Boulevard off-ramp
- Van Buren Boulevard off-ramp
- Cactus Avenue off-ramp

In addition to the 17 freeway ramps that currently operate at an unacceptable LOS within the study area, 20 freeway ramps currently operate at LOS D during the AM or PM peak hour, indicating conditions that may be subject to becoming unacceptable LOS in the future.

Freeway Weaving Segment Level of Service

Existing conditions for the study area freeway weaving segments are presented in Table 3.6-7.

Table 3.6-7. Freeway Weaving Segment Level of Service – Existing-Year (2014) Conditions

Freeway Weaving Segment	Existing Year (2014)			
	AM Peak Hour		PM Peak Hour	
	Density	LOS	Density	LOS
I-15 Southbound				
WB SR-91 on-ramp to Magnolia Avenue off-ramp	--	F	--	F
Ontario Avenue on-ramp to El Cerrito Road off-ramp	15.1	B	31.0	D

I-215 Northbound				
WB Cactus Avenue on-ramp to East Alessandro Boulevard off-ramp	25.2	C	22.7	C

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
"--" = Freeway weaving segment has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown above in Table 3.6-7, the following two freeway weaving segments currently operate at an unacceptable LOS during the AM and PM peak hours in the existing year (2014):

- **I-15 Southbound:** Westbound SR-91 on-ramp to Magnolia Avenue off-ramp
- **I-15 Northbound:** Westbound Magnolia Avenue on-ramp to SR-91 off-ramp

All of the study area freeway weaving segments on I-215 (southbound and northbound) operate an acceptable LOS in the existing year (2014).

Vehicles Miles Traveled / Vehicle Hours Traveled / Vehicle Hours Delay

In Riverside County, the circulation system is intended to accommodate a pattern of concentrated growth, providing both a regional and local linkage system between unique communities. Travel, including freight movement, extends past the Riverside County boundary. As a result, the transportation system must be capable of adequately meeting a wide range of needs. Not only does the county need to accommodate the traffic that it generates, it also must accommodate pass-through traffic.

Vehicle miles traveled (VMT) is a key transportation indicator, representing the total miles traveled by all vehicles throughout a particular study area or a region. Vehicle hours traveled (VHT) represents total hours traveled by vehicles, considering system-wide traffic congestion in a given study area. Vehicle hours delay (VHD) represents total hours of delay for vehicles across a particular study or a region. Table 3.6-8 presents summaries of daily VMT, VHT, and average

speed within the study area under existing conditions. The transportation study area includes all freeway segments, interchange ramps, and ramp terminus intersections along I-15 from Weirick Road to SR-91 and along I-215 from Nuevo Road to SR-60. It also includes intersections along Cajalco Road, Markham Street, and Rider Street.

Table 3.6-8. Baseline Year 2014 VMT, VHT, VHD and Average Speed Summary

Indicator	AM Peak Hour	PM Peak Hour	Daily
VMT	1,681,352	2,795,721	8,585,374
VHT	50,618	91,554	234,475
VHD	17,166	35,000	66,516
Average Speed	33.2	30.5	36.6
Source: Caltrans 2017. VMT = vehicle miles traveled VHT = vehicle hours traveled VHD = vehicle hours delay			

Please refer to Chapter 4, Section 4.2.17, *Transportation* (CEQA), for a discussion of Senate Bill 743 and State CEQA Guidelines updates (i.e., State CEQA Guidelines Section 15064.3) related to using VMT as a measure in the determination of transportation impacts.

Existing posted speed limits within the proposed project corridor range from 45 miles per hour to 55 miles per hour (see Table 3.6-9 below). As indicated in Table 3.6-8, above, average speeds in the study area range between 30.5 and 33.2 miles per hour (mph) during peak hours and 36.6 mph overall.

Table 3.6-9. Existing Posted Speed Limits

Roadway Segment	Posted Speed Limits
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	45
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	55
Cajalco Road between Lake Mathews Drive and El Sobrante Road	55
Cajalco Road between El Sobrante Road and Gavlin Road	55
Cajalco Road between Gavlin Road and Harley John Road	50
Cajalco Road between Harley John Road and Wood Road	50
Cajalco Road between Wood Road and Alexander Street	50
Cajalco Road between Alexander Street and Brown Street	45
Cajalco Road between Brown Street and Clark Street	45
Cajalco Road between Clark Street and Day Street	45
Cajalco Road between Day Street and Seaton Avenue	45
Cajalco Road between Seaton Avenue and Harvill Avenue	50
Cajalco Road East of Harvill Avenue	50
Cajalco Road West of Temescal Canyon Road	45

Peak Hour Truck Traffic

Existing peak hour truck traffic volume percentages of the total traffic volumes along segments along Cajalco Road, La Sierra Avenue, and El Sobrante Road within the project limits are presented in Table 3.6-10, below. The percentages of truck traffic are based on the detailed vehicle classification counts (passenger vehicles, buses, two-axle trucks, three-axle trucks, and trucks with four or more axles) conducted for intersections within the study area.

Table 3.6-10. Existing Peak Hour Truck Volumes (Percentage)

Roadway Segment	Existing (2014) Conditions	
	Eastbound	Westbound
Cajalco Road West of Temescal Canyon Road	11.9%	11.97%
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	11.9%	12.02%
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	3.36%	3.55%
La Sierra Avenue between Cajalco Road and El Sobrante Road	4.14%	4.17%
El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road	6.74%	6.85%
El Sobrante Road East of Mockingbird Canyon Road	3.07%	2.75%
Cajalco Road between Lake Mathews Drive and El Sobrante Road	3.13%	2.88%
Cajalco Road between El Sobrante Road and Gavlin Road	4.02%	3.99%
Cajalco Road between Gavlin Road and Harley John Road	3.38%	3.33%
Cajalco Road between Harley John Road and Wood Road	2.65%	2.69%
Cajalco Road between Wood Road and Alexander Street	2.35%	2.4%
Cajalco Road between Alexander Street and Brown Street	3.14%	3.24%
Cajalco Road between Brown Street and Clark Street	2.64%	2.66%
Cajalco Road between Clark Street and Day Street	4.3%	4.26%
Cajalco Road between Day Street and Seaton Avenue	3.36%	3.40%
Cajalco Road between Seaton Avenue and Harvill Avenue	3.6%	3.56%
Cajalco Road East of Harvill Avenue	3.31%	3.3%
Source: Caltrans 2019.		

As indicated in Table 3.6-10, truck traffic volumes within the project corridor range from 2.35 percent to 12.02 percent of the total vehicles, with the highest percentage of trucks occurring between Temescal Canyon Road and La Sierra Avenue. The lowest percentage of trucks occur between Wood Road and Alexander Street.

3.6.2.3 Future Year 2044 Projected Traffic Conditions

Based on FHWA and Caltrans requirements, traffic forecasts need to address a horizon year 20 years beyond the project's opening year; this required development of 2044 traffic projections because the project's opening year is assumed to be 2024. As such, the traffic assessment included herein is focused on the following traffic analysis scenarios (detailed discussion regarding the Opening-Year analysis is included in the project's *Traffic Operations Analysis Report* [Caltrans 2017]):

- Existing Year (2014)
- Future-Year (2044) No-Build Alternative

- Future-Year (2044) Build Alternative 1
- Future-Year (2044) Build Alternative 2C
- Future-Year (2044) Build Alternative 4

In an effort to minimize future impacts on areas protected under the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP), the median of Cajalco Road between Temescal Canyon Road and La Sierra Avenue under Build Alternatives 1 and 2C and the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Avenue under Build Alternative 4 would be designed wide enough to accommodate two additional travel lanes (one in each direction). Construction of the two additional lanes is not proposed or an option that is being considered for inclusion as part of the proposed project. Because the widened median area may be used for additional lanes, if constructed under a separate project in the future, an assessment of the additional lanes under the following scenarios is included in this EIR/EIS:

- Future-Year (2044) Build Alternative 1 (Future Six-Lane Facility)
- Future-Year (2044) Build Alternative 2C (Future Six-Lane Facility)
- Future-Year (2044) Build Alternative 4 (Future Six-Lane Facility)

Traffic forecasts were prepared through use of the Riverside Traffic Analysis Model, which is the official travel demand model for Riverside County. All projects on the Southern California Association of Governments (SCAG) Modeling List, which is consistent with the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) 2016–2040 list, and included in the Western Riverside Council of Governments' Transportation Uniform Mitigation Fee, Measure A, and City of Riverside or County of Riverside (County) Capital Improvement Programs were included for the relevant analysis years. Improvements that were shown only in City or County General Plans but not on the financially constrained RTP/SCS list or included in the Transportation Uniform Mitigation Fee, Measure A, or Capital Improvement Programs were not included.

It should be noted that the western end of the project area is adjacent to the eastern limits of the I-15/Cajalco Road Interchange Improvement Project (EA0J6100, RIV010208); therefore, for consistency purposes, the geometric improvements recommended by the I-15/Cajalco Road Interchange Improvement Project were reviewed and considered in developing the traffic forecasts and subsequent traffic analyses for this project.

All modeled network changes from the RTP/SCS have been included in the Volume Development Report. It should be noted that these projects are listed in the new RTP/SCS 2016–2040 list.

Socioeconomic data for 2035 were used to develop design-year volumes. The socioeconomic data for 2020 prepared for the Mid-County Parkway Project, as approved by all stakeholder parties, were used to develop opening-year (2024) volumes. Existing- and future-year daily and peak-hour volumes were obtained from the models for all roadway segments and intersections in the study area.

3.6.2.4 Regional Transportation and Transit Facilities

In addition to local and regional roadways, airports and rail facilities in the project area serve public and commercial transportation needs. Regional airports include Corona Municipal Airport, March Inland Port Airport, San Bernardino International Airport, and Ontario International Airport, and rely on roadway and rail networks that pass through or near the proposed project, in order to transport and transfer cargo and provide commuter air travel services (Caltrans 2014). Burlington Northern Santa Fe (BNSF) railroad Intermodal Yard (18 miles north) and San Diego BNSF (78 miles south) transport goods along BNSF railroad facilities that pass through the east end of the project. Union Pacific Railroad facilities north of the project area are also used for the transportation of goods. Figure 3.6-5 indicates the locations of regional transportation facilities in the project area.

The Metrolink 91/Perris Valley Line (91/PVL), a north-south public commuter and rail service using BNSF railroad facilities between 4th Street in Perris and Central Avenue in Riverside, provides local and interregional commuter services between south Perris and Downtown Riverside Station, and to connecting rail stations for interregional travel. The 91/PVL is one of seven regional Metrolink routes in Southern California, and provides access to stations with connecting trains to Los Angeles, Ontario, San Bernardino, Santa Ana, and Carlsbad. Ridership on 91/PVL averages 3,034 riders per day during weekdays and 610 on weekends (Southern California Regional Rail Authority 2019). Metrolink stations that serve the project area are listed in Table 3.6-12. Refer to Figure 3.6-5 for their locations.

In addition to intercity rail, interregional bus services—such as Amtrak Thruway, Greyhound, and Megabus—offer an important interregional mass transit mode using the existing interregional system. Interregional bus services use the existing interregional system—not only freeways and highways, but also local streets and roads, which are generally used for the first and last miles of trips. Riverside Transit Agency (RTA) also provides public commuter and transportation services in the project area with bus routes that serve Metrolink users, regional commuters, and the local communities of Mead Valley and Woodcrest and nearby cities of Corona, Riverside, Moreno Valley, and Perris (RTA 2019).

RTA provides five tiers of transit services, each with specific geographical, destination, and use characteristics, and one with an "express" feature (RTA 2015). The characteristics of each service tier are listed below.

- Frequent key corridor routes are the core spine of the network and have highest ridership and performance; they operate every 15 minutes or better in high-density areas. They have potential to support Bus Rapid Transit services in the future.
- Supporting local routes are the majority of the route network, providing connections to key employment centers, activity centers, and transfer hubs. They provide "lifeline" service for those dependent on transit and connections to services. Frequencies are 30 or 60 minutes.
- Regional connectors are longer-distance routes that connect urban centers separated by geographic gaps in density. They tend to have lower performance due to longer distances and lower densities between the urban centers. Frequencies are 60 minutes, with exceptions.
- Community feeders are shorter-distance routes that connect key destinations within a community. They connect residents with local shopping centers, educational facilities, medical facilities, or transit stations. Short distances allow them to operate at high frequency with few resources.
- CommuterLink routes are long-distance, peak-hour express services that provide both inter- and intra-county connections. They connect commuters directly with major employment centers or indirectly through connections at major multi-modal bus and rail hubs.

3.6.2.5 Pedestrian and Bicycle Facilities

Sidewalks are currently at the following locations within the project limits:

- North side of Cajalco Road between Temescal Canyon Road and west of Temescal Creek Bridge
- North side of El Sobrante Road between east of La Sierra Avenue and McAllister Street
- East side of Wood Road north of Cajalco Road
- West side of Carpinus Drive north of Cajalco Road
- East side of Clark Street north of Cajalco Road
- East side of Seaton Avenue north of Cajalco Road
- North side of Cajalco Road / Cajalco Expressway between west of Harvill Avenue and I-215 northbound on-ramp
- South side of Cajalco Road / Cajalco Expressway, between Valvoline Express Service Carwash / diesel fuel station and east of 76 Gas Station

Designated crosswalks are currently at the following intersections within the project limits:

- Cajalco Road and Temescal Canyon Road
- Cajalco Road and La Sierra Avenue
- Cajalco Road and El Sobrante Road
- El Sobrante Road and Fire Station
- Cajalco Road and Harley John Road/Smith Road
- Cajalco Road and Wood Road
- Cajalco Road and Alexander Street
- Cajalco Road and Brown Street
- Cajalco Road and Clark Street
- Cajalco Road and Harvill Avenue
- Cajalco Road and I-215 southbound off-ramp

No formally designated bicycle routes or facilities, such as marked bicycle lanes, are currently located along Cajalco Road, La Sierra Avenue or El Sobrante Road, within the project limits. Cyclists that utilize these roadways currently use roadway shoulders where available.

3.6.2.6 Traffic and Pedestrian Safety

Traffic collision data obtained from the County for the 3-year period from January 2015 to December 2017 were reviewed for Cajalco Road between Temescal Canyon Road and Harvill Avenue (a distance of approximately 15.7 miles) and also for the segment of La Sierra Avenue between Cajalco Road and El Sobrante Road and El Sobrante Road between La Sierra Avenue and Cajalco Road (a combined distance of approximately 8 miles) (County 2018). Table 3.6-13

on the following page compares the actual collision rate to the statewide average collision rate for the roadway segments identified above.

Table 3.6-13. January 2015 to December 2017 Collision Data – Roadway Segments

Road Segment	Collision Type								
	Fatal			Fatal plus Injury			Total		
	Number	Actual Rates (MVM)	Statewide Average[1] (MVM)	Number	Actual Rates (MVM)	Statewide Average[1] (MVM)	Number	Actual Rates (MVM)	Statewide Average[1] (MVM)

Sources: County 2018; Iteris 2019.
MVM = Million vehicle miles
Shaded cells represent exceedance of statewide average.
[1] Statewide average based on averages for similar facility type:
Comparative facility used for roadways between Temescal Canyon Road and Harley John Road is a two-lane mountainous rural highway with a design speed less than or equal to 55 mph.
Comparative facility used for roadways between La Sierra Avenue and Harley John Road is a two-lane rolling rural highway with a design speed less than or equal to 55 mph.
Comparative facility used for roadways east of Harley John Road is a two-lane flat rural highway with a design speed less than or equal to 55 mph.

During the 3-year period from January 2015 to December 2017, there were 355 collisions on Cajalco Road between Temescal Canyon Road and I-215, including seven fatal accidents. The majority of collisions occurred along the approximately 6-mile stretch of Cajalco Road between Alexander Street and Harvill Avenue, with 145 collisions over the 3-year period. Compared with the statewide average accident rate for similar facilities, the collision rate of 1.673 per million vehicle miles (MVM) of travel was higher than the statewide average of 1.163 per MVM. The next-highest number of recorded collisions for Cajalco Road, 82, occurred along the approximately 3.2-mile-long section of Cajalco Road between Temescal Canyon Road and La Sierra Avenue. Compared with the statewide average accident rate of 1.680 per MVM, the actual collision rate, 1.765 per MVM, was higher than the statewide average. Statewide average accident rates were also exceeded along Cajalco Road between Harvill Avenue and I-215.

Collision data for the La Sierra Avenue and El Sobrante Road sections combined showed a total of 60 collisions, including six fatal accidents. The majority of collisions occurred along the approximately 5.8-mile-long stretch of El Sobrante Road, with 39 collisions over the 3-year period. However, the statewide average accident rate of 1.230 per MVM for the approximately

2.4-mile-long section of La Sierra Avenue between Cajalco Road and El Sobrante Road was exceeded, coming in at 1.856 per MVM.

Table 3.6-14 indicates the total number and types of collisions at, or in the vicinity of, individual intersections along Cajalco Road within the project area during the 3-year period. As indicated in the table, the majority of accidents (49) occurred in the area of the La Sierra Avenue intersection; 16 of the collisions involved hit objects and nine were head-on. A total of 44 persons were injured. The next highest volumes of collisions occurred at or near Clark Street and Temescal Canyon Road, respectively, with 35 collisions at Clark Street and 32 at Temescal Canyon Road. Of the 35 collisions at or near Clark Street, 22 were rear-end and six were broadside; 23 persons were injured. Of the 32 collisions at or near Temescal Canyon Road, one person was fatally injured and 22 others were injured; the majority of collisions involved hit objects (10) and overturns (8). Additional intersection areas that had high collision volumes are Alexander Street (25), Haines Street (22), Wood Road (21), Lake Mathews Drive and Brown Street (20), and Day Street (19).

Table 3.6-14. January 2015 to December 2017 Collision Data – Intersection Areas

Location (Cajalco Road)	Existing Traffic Control	Total Collisions	Collision Detail			
			Primary Collision Types[1]	Fatal (total)	Injury (total)[2]	Property Damage Only (occurrence)

Sources: County 2018; Iteris 2019.
2WSC = 2 Way Stop Control
[1] Two most common collision types listed.
[2] Total number of persons injured.
[3] Additional collision type included for this intersection only due to high occurrence (8).

As shown in Table 3.6-14 above, the types of collisions occurring at intersection areas within the project limits during the 3-year period varies; the majority of collisions were rear-end, hit object, and broadside. For additional details regarding collision types and occurrences at each intersection, please refer to Table 1-11 in Chapter 1, *Proposed Project*.

The existing roadway along Cajalco Road is generally a two-lane undivided facility between Temescal Canyon Road east of I-15 and Harvill Avenue west of I-215, with left-turn lanes primarily limited to signalized intersections. The only divided segment of Cajalco Road is between Wood Road and Carpinus Drive where an unpaved median exists. Within the project limits, 11 intersections along Cajalco Road, and two along El Sobrante Road, are currently signalized. The remaining 26 intersections along Cajalco Road, and 10 intersections along El Sobrante Road, are unsignalized, some with "STOP" sign controls, and others lacking any stop controls. The proposed project would include safety enhancements, including new signals, medians, and controlled turn lanes, to address existing safety improvement needs. See Table 1-12 in Chapter 1, *Proposed Project*, and Section 2.2.1.1, *Common Features of the Build Alternatives*, in Chapter 2, *Project Alternatives*, for more detailed discussion regarding proposed safety enhancements.

Unpopulated, conserved areas associated with the Lake Mathews-Estelle Mountain Core Reserve and Lake Mathews Multiple Species Reserve along the project corridor do not include pedestrian uses, with the exception of limited roadway shoulders and intersections near residences. These conserved areas occur along Cajalco Road between west of La Sierra Avenue and west of Dirt Road, between Lake Mathews Drive and Gavilan Hills Road, and between Cowan Road and Alexander Road; along La Sierra Avenue between Cajalco Road and El Sobrante Road; and along El Sobrante Road between McAllister Street and Cajalco Road. As described under Section 3.6.2.5, *Pedestrian and Bicycle Facilities*, above, these areas have limited sidewalks and crosswalks for pedestrians, as well as limited roadway shoulder areas for cyclists.

3.6.2.7 Lake Mathews MSHCP

Because portions of the project are located within the LM MSHCP area, and the LM MSHCP does not currently accommodate the proposed roadway improvements or include a prescribed

process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. For this reason, an evaluation of the potential impacts associated with the proposed LM MSHCP discretionary action are included in this EIR/EIS.

Key transportation facilities within the LM MSHCP area, namely, those that would be improved as part of the build alternatives considered for the proposed project, include the following:

- Cajalco Road – Two-lane east/west-oriented roadway located south of Lake Mathews in the southern portion of the LM MSHCP area.
- El Sobrante Road – Two-lane northwest-oriented and east/west-oriented roadway located north and northeast of Lake Mathews in the northern and eastern portions of the LM MSHCP area.
- Gavilan Road – Two-lane north/south-oriented roadway located southeast of Lake Mathews in the southeastern-most portion of the LM MSHCP area (note that only the connections to Gavilan Road, Harley John Road, and Lake Mathews Road are improved with implementation of Build Alternative 1 or 2C).
- Harley John Road – Two-lane northwest/southeast-oriented roadway located east of Lake Mathews in the southeastern-most portion of the LM MSHCP area.
- Lake Mathews Drive – Two-lane north/south-oriented roadway located south of Lake Mathews in the southern portion of the LM MSHCP area.
- La Sierra Avenue – Two-lane north/south-oriented roadway located west of Lake Mathews in the western portion of the LM MSHCP area.

3.6.3 Environmental Consequences

3.6.3.1 Permanent Impacts

This section discusses operation of study area transportation facilities under the No-Build Alternative and the build alternatives.

Build Alternative 1—Cajalco Alignment

Arterial (Roadway Segment) Analysis

Under Build Alternative 1, two additional through lanes—one eastbound and one westbound—would be added to Cajalco Road between east of Temescal Creek Bridge and Harvill Avenue, for a total of four through lanes along this segment of Cajalco Road. Between Temescal Canyon Road and Temescal Creek Bridge, two eastbound lanes would be added, and between Harvill Avenue and I-215 southbound ramps, two additional through lanes (one in each direction) would be added, for a total of six through lanes along these segments of Cajalco Road. Roadway realignments would also occur between the Temescal Creek Bridge and Lake Mathews Drive to reduce existing curves. Median areas, turn lanes, and turn pockets would be placed at designated locations to accommodate through traffic and control cross-traffic movement. Refer to Figures 2.2-1 through 2.2-3, and 2.2-6, in Chapter 2, *Project Alternatives*.

Forecast-year (2044) no-build and build conditions under Build Alternative 1 (ADT and LOS) for the arterial segments within the study area are presented in Table 3.6-15, on the following page. As a reference, Table 3.6-3 provides the existing-year (2014) LOS results for comparison.

Table 3.6-15. Traffic Volumes and Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 1 Conditions

Roadway Segment	No-Build Alternative (2044)		Build Alternative 1 (2044)	
	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road east of Temescal Canyon Road	13,530	C	20,340	A
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	13,460	C	18,530	A
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	4,310	A	8,950	A
El Sobrante Road east of La Sierra Avenue	19,410	F	20,100	F
Cajalco Road between Lake Mathews Drive and El Sobrante Road	5,770	A	12,200	A
Cajalco Road between El Sobrante Road and Gavilan Road	23,800	F	33,100	E
Cajalco Road between Gavilan Road and Harley John Road	27,330	F	39,280	F
Cajalco Road between Harley John Road and Day Street	26,420	F	39,710	F
Cajalco Road east of Day Street	28,800	F	35,950	F

Source: Caltrans 2017.
Note: Shaded cells represent unacceptable LOS (LOS standard exceeded).

As shown in the above table, the following arterial segments would operate at an acceptable LOS in the forecast year (2044) under the No-Build Alternative and with implementation of Build Alternative 1:

- Cajalco Road east of Temescal Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive
- Cajalco Road between Lake Mathews Drive and El Sobrante Road

As shown in Table 3.6-15, the following arterial segments would operate at an unacceptable LOS in the forecast year (2044) under the No-Build condition and with implementation of Build Alternative 1:

- El Sobrante Road east of La Sierra Avenue
- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road
- Cajalco Road between Harley John Road and Day Street
- Cajalco Road east of Day Street

With and Without CETAP Corridor Analysis – Build Alternative 1

The traffic analyses performed for the proposed Cajalco Road Widening and Safety Enhancement Project include the construction of a separate future east-west transportation

corridor between I-15 and I-215 that would be constructed under the Community Environmental Transportation Acceptability Process (CETAP). Without the separate east-west CETAP transportation corridor between I-15 and I-215, future No-Build traffic conditions are projected to worsen along more study area roadway segments than with the referenced separate CETAP transportation corridor. More specifically, and based on a comparative analysis conducted specifically for Build Alternative 1 (see Table 3.6-16, below), the following roadway segments would be expected to operate at unacceptable LOS in the year 2044 without implementation of the separate CETAP transportation corridor as compared to with-implementation of CETAP corridor conditions under Build Alternative 1:

- Cajalco Road between Temescal Canyon Road and La Sierra Avenue (LOS F)
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive (LOS E)

Table 3.6-16. Traffic Volumes and Level of Service – Forecast Year (2044) No-Build Alternative and Build Alternative 1 Conditions without CETAP

Roadway Segment	No-Build Alternative (2044) w/o CETAP		Build Alternative 1 (2044) w/o CETAP	
	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	21,050	F	41,990	F
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	11,340	B	33,630	E
Cajalco Road between Lake Mathews Drive and El Sobrante Road	11,440	B	31,590	D
El Sobrante Road east of La Sierra Avenue	-	-	21,300	F
Cajalco Road between El Sobrante Road and Gavilan Road	29,800	F	52,560	F
Cajalco Road between Gavilan Road and Harley John Road	32,540	F	58,550	F
Cajalco Road between Harley John Road and Day Street	31,430	F	54,970	F
Cajalco Road east of Day Street	33,230	F	49,890	F

Sources: Caltrans 2017; Iteris 2018.
Note: Shaded cells represent unacceptable LOS (LOS standard exceeded).

As indicated in a comparison of Tables 3.6-16 and 3.6-16, above, Cajalco Road is projected to carry higher volumes under the 2044 without-CETAP conditions than under with-CETAP conditions. The difference in daily volumes is expected to range between a low of about 15,000 ADT near I-215 to a high of over 24,000, near I-15. In the absence of the separate CETAP corridor, regional traffic volumes connecting between I-215 and I-15 are expected to use Cajalco Road. For an illustration of the differences in future with-CETAP and without-CETAP conditions under No-Build conditions, refer to Figure 1-4 in Chapter 1, *Proposed Project*.

Comparing the effects of regional traffic growth on Cajalco Road, without the influence of the CETAP Corridor, it is expected that by Year 2044, Cajalco Road will experience an increase in daily traffic volumes generally ranging from 10,000 to 14,000, representing an estimated 22 to 47 percent increase depending on the segment. Under future year (2044) without-CETAP conditions, traffic conditions are projected to worsen along study area segments, and Cajalco Road would require a total of eight lanes between El Sobrante Road and east of Day Street in order to achieve an acceptable daily LOS.

Intersection Analysis

Improvements to existing intersections are proposed and would vary from minor widening and turn pocket additions to complete reconstruction and installation of new signals. Under Build Alternative 1, new signals are proposed at the following intersections with Cajalco Road: Eagle Canyon Road, Cajalco Road west of Lake Mathews Drive (new intersection), Lake Mathews Drive, Archer Road, Kirkpatrick Road, Cowan Road/Gustin Road, Carpinus Drive, and Seaton Avenue. The signals would replace the "STOP" signs currently used to control traffic entering Cajalco Road at these intersections. They would allow for improved control of cross-traffic and traffic flow, as well as adding pedestrian crossing, intersection safety lighting, signing, and striping. Refer to Figures 2.2-2 and 2.2-3, and Section 2.2.1.2, *Unique Features of the Build Alternatives*, in Chapter 2, *Project Alternatives*, for additional details regarding intersection improvements.

The LOS analysis of forecast-year (2044) No-Build Alternative and Build Alternative 1 conditions at study area intersections is presented in Table 3.6-17, below.

Table 3.6-17. Intersection Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 1 Conditions

EB = eastbound
NB = northbound
SB = southbound
WB = westbound
AM peak hour = 6 a.m. to 9 a.m.
PM peak hour = 3 p.m. to 7 p.m.
TWSC = two-way stop control
AWSC = all-way stop control
*Replaced with Signal under Build Alternative 1
Delay = average control delay in seconds
Shaded cells represent unacceptable LOS (LOS standard exceeded)

As presented above in Table 3.6-17, a total of 33 intersections operate at an unacceptable LOS in the forecast year (2044) under Build Alternative 1 conditions. The following intersections would operate at an unacceptable LOS F during both AM and PM peak hours:

- I-15 southbound ramps and Ontario Avenue
- I-15 northbound ramps and Ontario Avenue
- Cajalco Road and Bedford Canyon Road
- Cajalco Road and Temescal Canyon Road
- La Sierra Avenue and Victoria Avenue
- Cajalco Road and Harley John Road
- SR-60/I-215 northbound ramps and Fair Isle Drive/ Box Springs Road
- I-215 northbound ramps/Old I-215 Frontage Road and Cactus Avenue
- Indian Street and Ramona Expressway

The following intersections would operate at an unacceptable LOS E or F during both AM and PM peak hours:

- La Sierra Avenue and El Sobrante Road – LOS E in the AM peak hour and LOS F in the PM peak hour

- Alexander Street and Markham Street – LOS E in the AM peak hour and LOS F in the PM peak hour
- Sycamore Canyon Road and SR-60/I-215 southbound ramps – LOS F in the AM and PM peak hours
- Webster Avenue and Ramona Expressway – LOS E in the AM peak hour and LOS F in the PM peak hour

The following intersections would operate at an unacceptable LOS E or F during the AM peak hour:

- I-15 northbound ramps and Weirick Road – LOS F
- I-215 northbound ramps and Alessandro Boulevard – LOS E
- I-215 southbound ramps and Cajalco Expressway/Ramona Expressway – LOS F
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway – LOS E
- I-215 northbound ramps and Nuevo Road – LOS E

The following intersections would operate at an unacceptable LOS E or F during the PM peak hour:

- Bedford Canyon Road and El Cerrito Road – LOS F
- Cajalco Road and I-15 southbound ramps – LOS F
- Cajalco Road and La Sierra Avenue – LOS F
- Gavilan Road and Lake Mathews Drive – LOS F
- Harley John Road and Washington Road – LOS E
- Clark Street and Cajalco Road – LOS F
- Seaton Avenue and Markham Street – LOS E
- Harvill Avenue and Markham Street – LOS E
- Harvill Avenue and Placentia Avenue – LOS E
- Day Street and SR-60 eastbound ramps – LOS F
- I-215 ramps and Eucalyptus Avenue – LOS F
- I-215 southbound ramps and Van Buren Boulevard – LOS E
- I-215 northbound ramps and Harley Knox Boulevard – LOS F
- I-215 northbound Frontage Road and Placentia Avenue – LOS E
- I-215 southbound ramps and Nuevo Road – LOS F

As also shown in Table 3.6-17, the following study intersections are projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044), but projected to operate at an unacceptable LOS under Build Alternative 1 in the same year:

- Cajalco Road and La Sierra Avenue in the PM peak hour

- Seaton Avenue and Markham Street in the PM peak hour
- Harvill Avenue and Markham Street in the PM peak hour
- Harvill Avenue and Placentia Avenue in the PM peak hour
- I-215 southbound ramps and Van Buren Boulevard in the PM peak hour
- I-215 northbound Frontage Road and Placentia Avenue in the PM peak hour
- Webster Avenue and Ramona Expressway in the AM peak hour

As shown in Table 3.6-17, the study intersections that are projected to operate at unacceptable LOS under the No-Build Alternative in the forecast year (2044), but projected to operate at acceptable LOS under Build Alternative 1 are as follows:

- Cajalco Road and Gavilan Road in the PM peak hour
- Seaton Avenue and Cajalco Road in the AM peak hour
- Day Street and SR-60 westbound ramps in the PM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway in the PM peak hour

Finally, and as also shown in Table 3.6-17, LOS is expected to improve for the following study intersections under Build Alternative 1 in the future year (2044) as compared to the No-Build Alternative in the same year:

- Bedford Canyon Road and El Cerrito Road in the AM peak hour
- I-15 southbound ramps and El Cerrito Road in the AM peak hour
- I-15 northbound ramps and Cajalco Road in the AM peak hour
- Cajalco Road and El Sobrante Road in the AM peak hour
- Wood Road and Markham Street in the PM peak hour
- Day Street and Cajalco Road in the PM peak hour
- Day Street and SR-60 westbound ramps in the PM peak hour
- I-215 northbound ramps and Alessandro Boulevard in the PM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway in the PM peak hour
- I-215 northbound Frontage Road and Placentia Avenue in the AM peak hour

Freeway Analysis

The LOS analysis of forecast-year (2044) No-Build Alternative and Build Alternative 1 conditions at study area freeway segments (basic, ramps, and weaving segments) is presented on the following page.

Freeway Mainline Level of Service

Forecast-year (2044) No-Build Alternative and Build Alternative 1 AM and PM peak-hour conditions for study area freeway mainline segments is presented in Table 3.6-18 on the following page.

Table 3.6-18. Freeway Mainline Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 1 Conditions

EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown in Table 3.6-18, the following segments along I-15 and I-215 operate at an unacceptable LOS in the forecast year (2044) under Build Alternative 1 conditions:

I-15 Southbound (2044):

- Westbound SR-91 off-ramp to eastbound SR-91 off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Eastbound SR-91 off-ramp to eastbound SR-91 on-ramp – LOS E in the AM peak hour
- Lane drop to westbound SR-91 on-ramp – LOS E in the AM peak hour
- Magnolia Avenue on-ramp to Ontario Avenue off-ramp – LOS E in the AM and PM peak hours
- Lane addition to CETAP off-ramp – LOS E in the PM peak hour
- Lane drop to Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp to Weirick Road off-ramp – LOS F in the PM peak hour

I-15 Northbound (2044):

- Cajalco Road on-ramp to CETAP on-ramp – LOS E in the AM peak hour
- CETAP on-ramp to El Cerrito Road on-ramp – LOS F in the AM and PM peak hours
- El Cerrito Road on-ramp to Ontario Avenue off-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue off-ramp to lane addition – LOS F in the AM peak hour and LOS E in the PM peak hour
- Ontario Avenue on-ramp to Magnolia Avenue off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Magnolia Avenue off-ramp to eastbound Magnolia Avenue on-ramp – LOS F in the AM and PM peak hours
- Eastbound Magnolia Avenue on-ramp to westbound Magnolia Avenue on-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- SR-91 off-ramp to westbound SR-91 on-ramp – LOS F in the AM peak hour
- Westbound SR-91 on-ramp to eastbound SR-91 on-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Eastbound SR-91 on-ramp to lane drop – LOS F in the AM peak hour

I-215 Southbound (2044):

- Eastbound SR-60 on-ramp to westbound SR-60 on-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Lane drop to Eucalyptus Avenue on-ramp – LOS E in the AM and PM peak hours

- Eucalyptus Avenue on-ramp to Alessandro Boulevard off-ramp – LOS E in the AM and PM peak hours
- Westbound Alessandro Boulevard on-ramp to eastbound Alessandro Boulevard on-ramp – LOS E in the AM and PM peak hours
- Cactus Avenue on-ramp to Van Buren Boulevard off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Van Buren Boulevard on-ramp to Harley Knox Boulevard off-ramp – LOS E in the AM and PM peak hours
- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp – LOS E in the AM and PM peak hours
- Harley Knox Boulevard on-ramp to Cajalco Expressway off-ramp – LOS E in the AM and PM peak hours
- Cajalco Expressway off-ramp to Cajalco Expressway on-ramp – LOS E in the AM and PM peak hours
- Cajalco Expressway on-ramp to Mid-County Parkway off-ramp – LOS F in the AM and PM peak hours
- West Nuevo Road off-ramp to West Nuevo Road on-ramp – LOS E in the PM peak hour

I-215 Northbound (2044):

- Mid-County Parkway WB on-ramp to Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp to Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard on-ramp to Van Buren Boulevard off-ramp – LOS E in the PM peak hour
- Eastbound Van Buren Boulevard on-ramp to westbound Van Buren Boulevard on-ramp – LOS E in the PM peak hour
- Westbound Van Buren Boulevard on-ramp to Cactus Avenue off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Cactus Avenue off-ramp to eastbound Cactus Avenue on-ramp – LOS E in the PM peak hour
- Eastbound Cactus Avenue on-ramp to westbound Cactus Avenue on-ramp – LOS E in the PM peak hour
- East Alessandro Boulevard off-ramp to East Alessandro Boulevard on-ramp – LOS E in the PM peak hour
- East Alessandro Boulevard on-ramp to Eucalyptus Avenue off-ramp – LOS F in the PM peak hour

- Eucalyptus Avenue off-ramp to Eucalyptus Avenue on-ramp – LOS E in the PM peak hour
- Eucalyptus Avenue on-ramp to SR-60 – LOS F in the PM peak hour

As also shown in Table 3.6-18, the following segments along I-215 are projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternative 1 in the same year (there are no such instances along I-15):

I-215 Southbound (2044):

- West Nuevo Road off-ramp to West Nuevo Road on-ramp in the PM peak hour

I-215 Northbound (2044):

- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp in the PM peak hour

In addition, as shown in Table 3.6-18, the segments along I-215 that are projected to operate at an unacceptable LOS under the No-Build Alternative but projected to operate at an acceptable LOS under Build Alternative 1 are as follows (there are no such instances along I-15):

I-215 Southbound (2044):

- Alessandro Boulevard off-ramp to westbound Alessandro Boulevard on-ramp in the PM peak hour
- Eastbound Cactus Avenue off-ramp to Cactus Avenue on-ramp in the PM peak hour

I-215 Northbound (2044):

- Eastbound Van Buren Boulevard on-ramp to westbound Van Buren Boulevard on-ramp in the AM peak hour

Freeway Ramp Level of Service

Forecast-year 2044 No-Build Alternative and Build Alternative 1 conditions for study area freeway ramps are presented in Table 3.6-19, below.

Table 3.6-19. Freeway Ramp Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 1 Conditions

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
"--" = Freeway ramp has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown above in Table 3.6-19, the following freeway ramps along I-15 and I-215 operate at an unacceptable LOS in the forecast year (2044) under Build Alternative 1 conditions:

I-15 Southbound (2044):

- Eastbound SR-91 off-ramp - LOS F in the AM peak hour and LOS E in the PM peak hour
- Ontario Avenue off-ramp – LOS E in the AM and PM peak hours
- CETAP off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp – LOS F in the PM peak hour
- Weirick Road off-ramp – LOS F in the PM peak hour

I-15 Northbound (2044):

- CETAP on-ramp – LOS F in the AM and PM peak hours

- El Cerrito Road on-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue off-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue on-ramp – LOS F in the AM peak hour
- WB SR-91 on-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour

I-215 Southbound (2044):

- Eucalyptus Avenue on-ramp – LOS E in the AM and PM peak hours
- Alessandro Boulevard off-ramp – LOS E in the AM and PM peak hours
- Cactus Avenue on-ramp – LOS F in the PM peak hour
- Van Buren Boulevard off-ramp – LOS E in the AM and PM peak hours
- Van Buren Boulevard on-ramp – LOS F in the PM peak hour
- Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp – LOS E in the AM and PM peak hours
- Cajalco Expressway on-ramp – LOS F in the PM peak hour
- Mid-County Parkway off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Placentia Avenue off-ramp – LOS E in the PM peak hour
- Mid-County Parkway westbound on-ramp – LOS E in the AM and PM peak hours
- West Nuevo Road off-ramp – LOS E in the AM and PM peak hours
- West Nuevo Road on-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour

I-215 Northbound (2044):

- West Nuevo Road off-ramp – LOS E in the AM and PM peak hours
- Mid-County Parkway off-ramp – LOS E in the AM and PM peak hours
- Mid-County Parkway westbound on-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp – LOS E in the AM and PM peak hours
- Harley Knox Boulevard on-ramp – LOS F in the PM peak hour
- Van Buren Boulevard off-ramp – LOS E in the AM and PM peak hours
- Eastbound Van Buren Boulevard on-ramp LOS E in the PM peak hour
- Cactus Avenue off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Eastbound Cactus Avenue on-ramp – LOS E in the PM peak hour
- East Alessandro Boulevard on-ramp – LOS F in the AM and PM peak hours

- Eucalyptus Avenue off-ramp – LOS F in the AM and PM peak hours
- Eucalyptus Avenue on-ramp – LOS F in the AM and PM peak hours

As also shown in Table 3.6-19, the following ramp along southbound I-215 is projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternative 1 in the same year (there are no such instances along northbound I-215):

- Placentia off-ramp in the PM peak hour

In addition, as shown in Table 3.6-19, the ramps along I-15 and I-215 that are projected to operate at unacceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at acceptable LOS under Build Alternative 1 in the same year are as follows (there are no such instances along southbound I-15 and northbound I-215):

I-15 Northbound (2044):

- Weirick Road off-ramp in the AM peak hour
- Ontario Avenue on-ramp in the PM peak hour

I-215 Southbound (2044):

- Westbound Alessandro Boulevard on-ramp in the PM peak hour

An examination of the data in Table 3.6-19 indicates that, during the AM peak hour, 17 freeway ramp segments are forecast to operate at an unsatisfactory LOS under 2044 Build Alternative 1 traffic conditions; during the PM peak hour, 37 freeway ramp segments are forecast to operate at an unsatisfactory LOS under 2044 Build Alternative 1 traffic conditions.

Freeway Weaving Segment Level of Service

Forecast-year (2044) No-Build Alternative and Build Alternative 1 conditions for study area freeway weaving segments are presented in Table 3.6-20 on the following page.

Table 3.6-20. Freeway Weaving Segment Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 1 Conditions

Freeway Weaving Segment	No-Build Alternative (2044)				Build Alternative 1 (2044)			
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
	Density	LOS	Density	LOS	Density	LOS	Density	LOS

I-215 Northbound								
WB Cactus Avenue on-ramp to East Alessandro Boulevard off-ramp	36.1	E	41.3	E	36.1	E	40.8	E

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
"--" = Freeway weaving segment has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

Table 3.6-20 indicates that, during both the AM and PM peak hours, four freeway weaving segments are forecast to operate at unsatisfactory levels of service under 2044 Build Alternative 1 conditions.

Vehicle Miles Traveled/Vehicle Hours Traveled/Vehicle Hours Delay/Average Speed – Build Alternative 1

Table 3.6-21, on the following page, presents summaries of daily VMT, VHT, and average speed within the study area under 2044 No-Build Alternative and Build Alternative 1 conditions.

Table 3.6-21. 2044 VMT, VHT, VHD and Average Speed – No-Build Alternative and Build Alternative 1

Indicator	AM Peak Hour		PM Peak Hour		Daily	
	No-Build (2044)	Build Alternative 1	No-Build (2044)	Build Alternative 1	No-Build (2044)	Build Alternative 1
VMT	2,861,258	2,885,200	4,859,804	4,908,555	14,659,917	14,779,906
VHT	80,884	81,467	162,260	163,270	396,569	399,326
VHD	27,460	27,563	69,595	69,725	125,131	125,471
Average Speed	35.4	35.4	30.0	30.1	37.0	37.0

Source: Caltrans 2017.
VMT = vehicle miles traveled
VHT = vehicle hours traveled
VHD = vehicle hours delay

As indicated in Table 3.6-21, VMT, VHT, and VHD are forecast to increase by less than 1 percent each under Build Alternative 1 compared with No-Build Alternative conditions in the future year (2044). Under the Build Alternative 1 conditions, the average speed is projected to increase by 0.4 mph, as compared to the existing conditions. In comparison to 2044 No-Build Alternative conditions, average speed in the study area under Build Alternative 1 is forecast to stay the same. Design speeds for the project corridor are anticipated to range between 45 and 55 mph, similar to existing speed limits, and would be confirmed during final design in accordance with County of Riverside Roadway Design Requirements Standard No. 114.

Please refer to Chapter 4, Section 4.2.17, *Transportation*, for a discussion of Senate Bill 743 and State CEQA Guidelines updates (i.e., State CEQA Guidelines Section 15064.3) related to using VMT as a measure for transportation impacts.

Peak Hour Truck Traffic

Projected future No-Build and Build Alternative 1 peak hour truck traffic volume percentages of the total traffic volumes along segments along Cajalco Road, La Sierra Avenue, and El Sobrante Road within the project limits are presented in Table 3.6-22, below.

Table 3.6-22. Truck Traffic Volumes (Percentage) – Forecast-Year (2044) No-Build Alternative and Build Alternative 1 Conditions

Roadway Segment	Forecast-Year (2044) No-Build Conditions		Forecast-Year (2044) Build Alternative 1 Conditions	
	Eastbound	Westbound	Eastbound	Westbound
Cajalco Road West of Temescal Canyon Road	12.01%	11.98%	12.05%	12.0%
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	11.99%	12.01%	12.01%	11.99%
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	3.18%	3.36%	3.43%	3.50%
Cajalco Road between Lake Mathews Drive and El Sobrante Road	1.64%	1.76%	2.93%	3.02%
Cajalco Road between El Sobrante Road and Gavlin Road	2.44%	2.37%	3.98%	3.99%
Cajalco Road between Gavlin Road and Harley John Road	2.07%	2.04%	3.35%	3.36%
Cajalco Road between Harley John Road and Wood Road	1.66%	1.63%	2.66%	2.66%
Cajalco Road between Wood Road and Alexander Street	2.30%	2.37%	2.41%	2.42%

Roadway Segment	Forecast-Year (2044) No-Build Conditions		Forecast-Year (2044) Build Alternative 1 Conditions	
	Eastbound	Westbound	Eastbound	Westbound
Cajalco Road between Alexander Street and Brown Street	3.27%	3.19%	3.19%	3.15%
Cajalco Road between Brown Street and Clark Street	2.65%	2.75%	2.69%	2.73%
Cajalco Road between Clark Street and Day Street	4.24%	4.18%	4.15%	4.19%
Cajalco Road between Day Street and Seaton Avenue	3.36%	3.44%	3.41%	3.39%
Cajalco Road between Seaton Avenue and Harvill Avenue	3.64%	3.56%	3.62%	3.59%
Cajalco Road East of Harvill Avenue	3.29%	3.56%	3.31%	3.34%
Source: Caltrans 2019.				

As shown in Table 3.6-22, truck traffic percentages in 2044 Build Alternative 1 are forecast to increase up to 1.62 percent in comparison to 2044 no-build conditions. Under the Build Alternative 1 conditions, the truck percentages are projected to increase up to 0.14 percent as compared to the existing conditions, see Table 3.6-10 in Section 3.6.2.2. Currently, Cajalco Road does not meet Surface Transportation Assistance Act (STAA) roadway design standards for large trucks. The STAA requires specific lengths and width limits for travel lanes for large trucks to operate on the Interstate system, the non-Interstate Federal-aid Primary System, and certain primary routes (collectively referred to as the National Network). While Cajalco Road is not identified as a National Network facility, the project is proposing to incorporate STAA standards to better accommodate trucks that currently use Cajalco Road to safely pass through the project area.

Future Six-Lane Facility (Build Alternative 1)

Forecast-year (2044) No-Build Alternative and Build Alternative 1 future six-lane conditions for the arterial segments within the study area are presented in Table 3.6-23, below.

Table 3.6-23. Traffic Volumes and Level of Service – Forecast Year (2044) No-Build Alternative and Build Alternative 1 (Future Six-Lane Facility) Conditions

Roadway Segment	No-Build Alternative (2044)		Build Alternative 1 (Six-Lane Facility)	
	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road east of Temescal Canyon Road	13,530	C	20,640	A
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	13,460	C	19,760	A
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	4,310	A	11,430	A
El Sobrante Road east of La Sierra Avenue	19,410	F	20,100	F
Cajalco Road between Lake Mathews Drive and El Sobrante Road	5,770	A	14,420	A
Cajalco Road between El Sobrante Road and Gavilan Road	23,800	F	34,940	B
Cajalco Road between Gavilan Road and Harley John Road	27,330	F	40,720	C
Cajalco Road between Harley John Road and Day Street	26,420	F	40,620	F
Cajalco Road east of Day Street	28,800	F	36,260	F
Source: Caltrans 2017. Note: Shaded cells represent unacceptable LOS (LOS standard exceeded).				

As shown in Table 3.6-23, the following arterial segments operate at an acceptable LOS in the forecast year (2044) with implementation of Build Alternative 1 (Future Six-Lane Facility):

- Cajalco Road east of Temescal Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive
- Cajalco Road between Lake Mathews Drive and El Sobrante Road
- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road

As also shown in Table 3.6-23, the following arterial segments operate at an unacceptable LOS F in the forecast year (2044) with implementation of Build Alternative 1 (Future Six-Lane Facility):

- Cajalco Road between Harley John Road and Day Street
- Cajalco Road east of Day Street

As also shown in Table 3.6-23, the study arterial segments that are projected to operate at an unacceptable LOS under the No-Build Alternative but projected to operate at an acceptable LOS under the build alternatives are as follows:

- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road

Lake Mathews MSHCP (Build Alternative 1)

Between Temescal Canyon Road and Harley John Road, the alignment of Build Alternative 1 travels through the boundaries of the LM MSHCP. As detailed above in Table 3.6-15, the segment of Build Alternative 1 within the LM MSHCP between Temescal Canyon Road and El Sobrante Road would operate an acceptable LOS in the forecast year (2044), whereas the segment of Build Alternative 1 between El Sobrante Road and Harley John Road within the LM MSHCP would operate at an unacceptable LOS in the forecast year (2044). In addition, and as presented above in Table 3.6-23, all arterial study segments for the future six-lane facility associated with Build Alternative 1 would operate at an acceptable LOS within the LM MSHCP in the forecast year (2044).

Regional Transportation and Transit Facilities

Build Alternative 1 would replace existing bus stops utilized by RTA along Cajalco Road with improved bus pull-outs that would allow for buses to fully exit travel lanes and through traffic at designated stops. Opportunity for a new or modified RTA Express Route that would significantly reduce transit travel time between the project termini was considered, but the addition of an express route along Cajalco Road is constrained as the facility (Cajalco Road) would not meet RTA criteria as a CommuterLink route. RTA currently engages the community, and considers ridership, population, and travel statistics, in short- and long-term planning to identify system needs and modifications (RTA n.d., 2017). However, improved mobility along Cajalco Road between Corona

and Perris would be expected to benefit both local and regional commuters that use Cajalco Road and RTA to connect with Metrolink's 91/PVL in Perris and Corona Transit Center in Corona.

Vehicular and Pedestrian Safety

As indicated in Table 3.6-14, a number of Cajalco Road intersection areas experience a high volume of collisions and related injuries. Build Alternative 1 would alter the existing Cajalco Road roadway from a two-lane, undivided facility between Temescal Canyon Creek and Harvill Avenue, to a four-lane, generally divided roadway with medians, widened paved shoulders, additional signalized intersections with safety lighting, and additional designated left-turn lanes and right turn pockets. Safety enhancements proposed include:

- Construct medians;
- Pave roadway shoulders;
- Add left- and right-turn pockets in select locations;
- Restrict left turns from Cajalco Road onto local streets except in locations where traffic signals are present;
- Improve curves between Temescal Canyon Road and El Sobrante Road;
- Add roadway signage;
- Improve existing intersections varying from minor widening and turn pockets;
- Install new traffic signals at the following intersections with Cajalco Road: Eagle Canyon Road, Cowan Road/Gustin Road, Carpinus Drive, and Seaton Avenue, Cajalco Road west of Lake Mathews Drive (new intersection), Lake Mathews Drive, Archer Road, Kirkpatrick Road, and Gavilan Road;
- Install object markers and safety lighting at intersections; and
- Construct designated bus pull outs at select locations along Cajalco Road.

The effectiveness of the above-listed enhancements was evaluated using methods developed by Caltrans and FHWA to aid in the review of projects under consideration for funding under the Highway Safety Improvement Program.[1] Using this approach, locations and safety issues within the transportation study area were identified, and a corresponding set of proposed safety improvements, or countermeasures, identified to reduce the likelihood of future crashes was applied for each location. Each countermeasure is assigned a Crash Reduction Factor (CRF) to indicate the effectiveness of the countermeasure, measured by the percentage of the types of crashes it is expected to reduce. Caltrans worked closely with FHWA to establish CRFs based on the best available research.[2] It is important to note that the effectiveness of each CRF is related to specific types of collisions or crashes, and not overall percentage reduction in collision occurrence.

[1] Caltrans' Division of Local Assistance developed the first version of the *Local Roadway Safety Manual* (Version 1.0) in 2012 to support the Cycle 5 Highway Safety Improvement Program call-for-projects (Caltrans 2018). Last updated April 2018.

[2] FHWA is leading a concerted effort to develop information on Crash Modification Factors and makes it available to State and local agencies to assist with highway safety planning. The Crash Modification Factors Clearinghouse, a

The countermeasures listed in Table 3.6-24 have been assigned to each Cajalco Road intersection area based on the safety enhancements proposed under Build Alternative 1, and are categorized by signalized intersections (S), non-signalized intersection (N), and roadway segments (R). Pedestrian- and bicycle-related countermeasures are included as applicable, as the consideration of the safety of non-motorized travel is important.

Table 3.6-24. Cajalco Road Safety Countermeasures – Build Alternative 1

Location (Cajalco Road)	Traffic Control	Countermeasure		
		Name	Type	CRF
Temescal Canyon Road	Signal	S1. Add intersection lighting	Lighting	40%
		S8. Install raised pavement markers and striping (through Intersection)	Operation/Warning	10%
		S12. Install raised median on approaches	Geometric Modification	25%
La Sierra Avenue	Signal	S1. Add intersection lighting	Lighting	40%
		S8. Install raised pavement markers and striping (through Intersection)	Operation/Warning	10%
		S12. Install raised median on approaches	Geometric Modification	25%
		S20. Install pedestrian crossing	Pedestrian and Bike	25%
		R16. Widen shoulder (paved)	Geometric Modification	30%

2WSC = Two-Way Stop Control
CRF = Crash Reduction Factor; based on percentage reduction of specific collision or crash types, not reduction in overall in collision occurrence.
[1] Existing two-way stop control replaced with new signal.
[2] Applies to intersecting roadway only (does not cross Cajalco Road).

A comparison of Table 3.6-14 and Table 3.6-24, above, indicates countermeasures would be incorporated at intersection areas experiencing high volumes of collisions and injuries, as well as intersection areas that would benefit from countermeasures.

Pedestrian and Bicycle Facilities

As indicated above, new traffic signals with designated crosswalks would be added to the following intersections with Cajalco Road: Eagle Canyon Road, Cowan Road/Gustin Road, Carpinus Drive, Seaton Avenue, Cajalco Road west of Lake Mathews Drive (new intersection), Lake Mathews Drive, Archer Road, Kirkpatrick Road, and Gavilan Road. The crosswalks would offer more opportunities for pedestrians to cross Cajalco Road safely. In addition, to improve local pedestrian movement, ADA-compliant sidewalks would be constructed along one side of Cajalco Road in some locations where residential and commercial properties are present. Improvements that would support cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue would include curb and gutter and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane.

While design and posted speed limits within the project limits would be similar or equal to those identified in Table 3.6-9, actual average speeds for traffic traveling along Cajalco Road are projected to average 37 mph and decrease by approximately 5–10 mph during peak hours (see Table 3.6-21). Projected truck traffic is also not anticipated to result in an increased risk to pedestrian or cyclist safety as the projected minor increases would be consistent with the overall projected traffic volumes through most of the project limits. Roadway speeds within residential and commercial areas would further be controlled with existing and proposed additional intersection traffic controls.

Build Alternative 2C—Modified Cajalco Alignment

As described in the Build Alternative 2C description in Section 2.2.1 of Chapter 2, *Project Alternatives*, of this EIR/EIS, the project-related improvements proposed under Build Alternative 2C are similar to those proposed as part of Build Alternative 1, with the exception of the new four-lane segment of Cajalco Road that would be constructed from La Sierra Avenue to just west of Lake Mathews Drive. All study intersections have similar configurations under Build Alternatives 1 and 2C. Also, Cajalco Road would have the same number of lanes under both Build Alternatives 1 and 2C. Refer to Figures 2.2-1 through 2.2-3, and 2.2-6, in Chapter 2, *Project Alternatives*. Therefore, peak-hour traffic operations under Build Alternative 2C conditions would be similar to peak-hour traffic operations at study area arterial segments, intersections, freeway mainline segments, freeway ramps, and freeway weaving segments under Build Alternative 1, as detailed in the preceding section.

Please refer to Tables 3.6-15 through 3.6-20 and 3.6-22 for comparisons of projected roadway segment traffic volumes under with-CETAP and without-CETAP conditions, intersection LOS conditions, freeway mainline, ramp and weaving segment LOS conditions, and truck volume percentages for future Year 2044 No-Build and Build Alternative 1 scenarios.

Vehicle Miles Traveled/Vehicle Hours Traveled/Vehicle Hours Delay/Average Speed – Build Alternative 2C

Table 3.6-25, below, presents summaries of daily VMT, VHT, and average speed within the study area under 2044 No-Build Alternative and Build Alternative 2C conditions.

Table 3.6-25. 2044 VMT, VHT, VHD and Average Speed – No-Build and Build Alternative 2C

	AM Peak Hour		PM Peak Hour		Daily	
Indicator	No-Build Alternative	Build Alternative 2C	No-Build Alternative	Build Alternative 2C	No-Build Alternative	Build Alternative 2C
VMT	2,861,258	2,873,908	4,859,804	4,894,605	14,659,917	14,721,152
VHT	80,884	80,885	162,260	162,013	396,569	396,160
VHD	27,460	27,277	69,595	68,866	125,131	123,851
Average Speed	35.4	35.5	30.0	30.2	37.0	37.2

Source: Caltrans 2017.
VMT = vehicle miles traveled
VHT = vehicle hours traveled
VHD = vehicle hours delay

As indicated in Table 3.6-25, VMT is projected to increase less than 1 percent, and VHT is forecast to decrease less than 1 percent each under Build Alternative 2C compared with no-build conditions in the future year (2044). VHD is forecast to decrease by approximately 1 percent under Build Alternative 2C compared with no-build conditions in the future year (2044). In comparison to the existing conditions, the average speed is projected to increase by 0.6 mph as compared to the existing conditions. In comparison to year 2044 no-build conditions, the average speed in the study area is forecast to increase by 0.2 mph. Build Alternative 2C is expected to provide higher average speeds and reducing the overall delay in the project vicinity. Design speeds for the project corridor are anticipated to range between 45 and 55 mph, similar to existing speed limits, and would be confirmed during final design in accordance with County of Riverside Roadway Design Requirements Standard No. 114.

Build Alternative 2C is expected to produce higher average speed than the No Build Alternative. It should be noted that since this statistic is calculated over a relatively large area, it represents a sizeable improvement in overall mobility compared to the 2044 no-build conditions.

Please refer to Chapter 4, Section 4.2.17, *Transportation* (CEQA), for a discussion of Senate Bill 743 and State CEQA Guidelines updates (i.e., State CEQA Guidelines Section 15064.3) related to using VMT as a measure for transportation impacts.

Future Six-Lane Facility (Build Alternative 2C)

As identified under the Build Alternative 2C description in Section 2.2.1 of Chapter 2, *Project Alternatives*, of this EIR/EIS, the median between Temescal Canyon Road and Harley John Road would be wide enough to accommodate two additional travel lanes (one in each direction) in the future. The intent of including the additional median area is to ensure that future impacts on the LM MSHCP areas would be minimized to the extent feasible if the roadway is widened to six lanes. Although this is not an alternative that is being considered as part of the proposed project, impacts associated with the potential future construction of these two additional travel lanes are being disclosed in this EIR/EIS.

Because the study intersections have similar configurations, and Cajalco Road would have the same number of lanes compared with future (six-lane facility) configurations for Build Alternatives 1 and 2C, peak-hour traffic operations under the future (six-lane facility) Build Alternative 2C condition would be similar to peak-hour traffic operations at study area arterial segments, intersections, freeway mainline segments, freeway ramps, and freeway weaving segments under the future (six-lane facility) Build Alternative 1, as detailed above.

Lake Mathews MSHCP (Build Alternative 2C)

As noted above, the median between Temescal Canyon Road and Harley John Road would be wide enough to accommodate two additional travel lanes (one in each direction) in the future under Build Alternative 2C. The intent of including the additional median area is to ensure that future impacts on the LM MSHCP areas would be minimized to the extent feasible if the roadway is widened to six lanes. Although this is not an alternative that is being considered as part of the proposed project, impacts associated with the potential future construction of these two additional travel lanes are being disclosed in this EIR/EIS.

Because the study intersections have similar configurations, and Cajalco Road would have the same number of lanes compared with the configurations for Build Alternatives 1 and 2C, peak-hour traffic operations under the Build Alternative 2C condition within the area of the LM MSHCP would be similar to peak-hour the traffic operations at study area arterial segments, intersections, freeway mainline segments, freeway ramps, and freeway weaving segments under Build Alternative 1, as detailed above.

Regional Transportation and Transit Facilities

As described in the Build Alternative 2C description in Section 2.2.1 of Chapter 2, *Project Alternatives*, of this EIR/EIS, the project-related improvements proposed under Build Alternative 2C are similar to those proposed as part of Build Alternative 1, with the exception of the new four-lane segment of Cajalco Road that would be constructed from La Sierra Avenue to just west of Lake Mathews Drive. Build Alternative 2C would replace the same bus stops along Cajalco Road as Build Alternative 1 and result in the improved mobility identified under Build Alternative 1 for Cajalco Road between Corona and Perris; therefore, Build Alternative 2C would be expected to benefit both local and regional commuters that use Cajalco Road and RTA to connect with Metrolink's 91/PVL in Perris and Corona Transit Center in Corona.

Vehicular and Pedestrian Safety

As described in the Build Alternative 2C description in Section 2.2.1 of Chapter 2, *Project Alternatives*, of this EIR/EIS, the project-related improvements proposed under Build Alternative 2C are similar to those proposed as part of Build Alternative 1, with the exception of the new four-lane segment of Cajalco Road that would be constructed from La Sierra Avenue to just west of Lake Mathews Drive. All study intersections have similar configurations under Build Alternatives 1 and 2C. Therefore, the safety enhancements and countermeasures proposed under Build Alternative 2C, and their anticipated benefits, would be the same as those described for Build Alternative 1.

Pedestrian and Bicycle Facilities

As indicated above, new traffic signals with designated crosswalks would be added to the following intersections with Cajalco Road: Eagle Canyon Road, Cowan Road/Gustin Road, Carpinus Drive, Day Street, Seaton Avenue, Cajalco Road west of Lake Mathews Drive (new intersection), Lake Mathews Drive, Archer Road, Kirkpatrick Road, and Gavilan Road. The crosswalks would offer more opportunities for pedestrians to cross Cajalco Road safely. In addition, to improve local pedestrian movement, ADA-compliant sidewalks would be constructed along one side of Cajalco Road in some locations where residential and commercial properties are present. Improvements that would support cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue would include curb and gutter and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane.

While design and posted speed limits within the project limits would be similar or equal to those identified in Table 3.6-9, actual average speeds for traffic traveling along Cajalco Road are projected to average 37 mph and decrease by approximately 5–10 mph during peak hours (see Table 3.6-21). Projected truck traffic is also not anticipated to result in an increase risk to

pedestrian or cyclist safety as the projected minor increases would be consistent with the overall projected traffic volumes through most of the project limits.

Build Alternative 4—El Sobrante Alignment

Arterial (Roadway Segment) Analysis

Under Build Alternative 4, two additional through lanes, one in each direction, would be added to Cajalco Road between east of Temescal Creek Bridge and realigned La Sierra Avenue, and between realigned Harley John Road and Harvill Avenue, for a total of four through lanes along these segments of Cajalco Road. Similar to Build Alternatives 1 and 2C, two eastbound lanes would be added between Temescal Canyon Road and Temescal Creek Bridge, and two additional through lanes, one in each direction, would be added, between Harvill Avenue and I-215 southbound ramps, for a total of six through lanes along these segments of Cajalco Road. The primary difference of Build Alternative 4 from Build Alternatives 1 and 2C would be widening and realignment of La Sierra Avenue between Cajalco Road and El Sobrante Road, and of El Sobrante Road between La Sierra Avenue and Cowan Road. Roadway realignments along Cajalco Road would also occur between the Temescal Creek Bridge and west of the realigned La Sierra Avenue to reduce existing curves. Median areas, turn lanes, and turn pockets would be placed at designated locations to accommodate through traffic and control cross-traffic movement. Refer to Figures 2.2-1, 2.2-3, 2.2-5, and 2.2-6, in Chapter 2, *Project Alternatives*.

Forecast-year (2044) No-Build Alternative and Build Alternative 4 conditions for the arterial segments within the study area are presented below in Table 3.6-26. As a reference, Table 3.6-3 provides the existing-year (2014) LOS results for comparison.

Table 3.6-26. Traffic Volumes and Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 4 Conditions

Roadway Segment	No-Build Alternative (2044)		Build Alternative 4	
	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road east of Temescal Canyon Road	13,530	C	32,820	E
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	13,460	C	30,810	D
El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road	19,410	F	21,400	A
El Sobrante Road between Mockingbird Canyon Road and Harley John Road	--	--	21,280	B

Cajalco Road between Lake Mathews Drive and El Sobrante Road	5,770	A	6,050	A
Cajalco Road between Lake Mathews Drive and Gavilan Road	--	--	6,810	A
Cajalco Road east of El Sobrante Road	--	--	43,860	F
Cajalco Road between El Sobrante Road and Gavilan Road	23,800	F	--	--
Cajalco Road between Gavilan Road and Harley John Road	27,330	F	21,980	F
Cajalco Road between Harley John Road and Day Street	26,420	F	44,030	F
Cajalco Road east of Day Street	28,800	F	37,780	F

Source: Caltrans 2017
Shaded cells represent unacceptable LOS (LOS standard exceeded)
ADT volumes not provided for segments not applicable to the No-Build and Build condition

As shown in Table 3.6-26, the following arterial segments operate at an unacceptable LOS in the forecast year (2044) under the no-build condition:

- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road
- Cajalco Road between Harley John Road and Day Street
- Cajalco Road east of Day Street

As also shown in Table 3.6-26, the following arterial segments operate at an acceptable LOS in the forecast year (2044) with implementation of Build Alternative 4:

- El Sobrante Road between Cajalco Road and Harley John Road
- El Sobrante Road between Harley John Road and Mockingbird Canyon Road
- El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between Gavilan Road and Lake Mathews Drive
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive

In addition, Table 3.6-26 indicates that the following arterial segments operate at an unacceptable LOS in the forecast year (2044) with implementation of Build Alternative 4:

- Cajalco Road east of El Sobrante Road
- Cajalco Road east of Day Street

With and Without CETAP Corridor Analysis – Build Alternative 4

As indicated under Build Alternative 1, the traffic analyses performed for the proposed project include the construction of a separate future east-west transportation corridor between I-15 and I-215 that would be constructed under CETAP. Without the separate east-west CETAP transportation corridor between I-15 and I-215, future No-Build traffic conditions are projected to worsen along more study area roadway segments than with the referenced separate CETAP transportation corridor. More specifically, and based on a comparative analysis conducted for Build Alternative 4 (see Table 3.6-27 on the following page), the following roadway segments would be expected to operate at unacceptable LOS in the year 2044 without implementation of the separate CETAP transportation corridor as compared to with-implementation of CETAP corridor conditions under Build Alternative 4:

- Cajalco Road between Temescal Canyon Road and La Sierra Avenue (LOS F)
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive (LOS E)

Table 3.6-27. Traffic Volumes and Level of Service – Forecast Year (2044) No-Build Alternative and Build Alternative 4 Conditions without CETAP

Roadway Segment	No-Build Alternative (2044) w/o CETAP		Build Alternative 4 (2044) w/o CETAP	
	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	21,050	F	48,150	F
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	11,340	B	17,500	E
Cajalco Road between Lake Mathews Drive and El Sobrante Road	11,440	B	NA	-
El Sobrante Road east of La Sierra Avenue	-	-	29,990	D
Cajalco Road between El Sobrante Road and Gavilan Road	29,800	F	NA	-
Cajalco Road between Gavilan Road and Harley John Road	32,540	F	28,330	F
Cajalco Road between Harley John Road and Day Street	31,430	F	55,870	F
Cajalco Road east of Day Street	33,230	F	NA	-

Sources: Caltrans 2017, Iteris 2018
Note: Shaded cells represent unacceptable LOS (LOS standard exceeded).

As indicated in a comparison of Tables 3.6-26 and 3.6-27, above, Cajalco Road is projected to carry higher volumes under the 2044 without-CETAP conditions than under with-CETAP conditions. For an illustration of the differences in future with-CETAP and without-CETAP conditions under No-Build conditions, refer to Figure 1-4 in Chapter 1, *Proposed Project*.

Under future year (2044) without-CETAP conditions, traffic conditions are projected to worsen along study area segments than under with-CETAP conditions under Build Alternative 4.

Intersection Analysis

Under Build Alternative 4, improvements to existing intersections are proposed and would vary from minor widening and turn pocket additions to complete reconstruction and installation of new signals. New signals are proposed at the following intersections with Cajalco Road: Eagle Canyon Road, Cowan Road/Gustin Road, Carpinus Drive, Day Street, and Seaton Avenue. New signals are proposed at the following intersections with El Sobrante Road: La Sierra Avenue, McAllister Street, and Mockingbird Canyon Road. The signals would replace the "STOP" signs currently used to control traffic entering Cajalco Road at these intersections. They would allow for improved control of cross-traffic and traffic flow, and would add pedestrian crossing, intersection safety lighting, signing, and striping. Refer to Figures 2.2-3 and 2.2-4, and Section 2.2.1.2, *Unique Features of the Build Alternatives*, in Chapter 2, *Project Alternatives*, for additional details regarding intersection improvements.

The LOS analysis for forecast-year (2044) No-Build Alternative and Build Alternative 4 conditions at study area intersections is presented in Table 3.6-28 on the following page.

Table 3.6-28. Intersection Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 4 Conditions

	Intersection	Control Type	No-Build Alternative (2044)				Build Alternative 4			
			AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
TWSC = two-way stop control
AWSC = all-way stop control
*Replaced with Signal under Build Alternative 4
Delay = average control delay in seconds
Shaded cells represent unacceptable LOS (LOS standard exceeded)

As detailed above in Table 3.6-28, a total of 24 intersections operate at an unacceptable LOS in the forecast year (2044) with implementation of Build Alternative 4, as follows:

- I-15 southbound ramps and Ontario Avenue – LOS F in the AM and PM peak hours

- I-15 northbound ramps and Ontario Avenue – LOS F in the AM and PM peak hours
- Bedford Canyon Road and El Cerrito Road – LOS F in the PM peak hour
- Cajalco Road and Bedford Canyon Road – LOS E in the AM peak hour and LOS F in the PM peak hour
- Cajalco Road and I-15 southbound ramps – LOS F in the PM peak hour
- Cajalco Road and Temescal Canyon Road – LOS F in the AM and PM peak hours
- I-15 northbound ramps and Weirick Road – LOS F in the PM peak hour
- La Sierra Avenue and Victoria Avenue – LOS F in the AM and PM peak hours
- Gavilan Road and Lake Mathews Drive – LOS F in the PM peak hour
- Alexander Street and Markham Street – LOS E in the PM peak hour
- Clark Street and Cajalco Road – LOS E in the AM peak hour and LOS F in the PM peak hour
- Sycamore Canyon Road and SR-60/I-215 SB ramps – LOS F in the AM and PM peak hours
- SR-60/I-215 northbound ramps and Fair Isle Drive/Box Springs Road – LOS F in the AM peak hour and LOS E in the PM peak hour
- Day Street and SR-60 eastbound ramps – LOS F in the PM peak hour
- I-215 ramps and Eucalyptus Avenue – LOS F in the PM peak hour
- I-215 NB ramps and Alessandro Boulevard – LOS E in the AM peak hour
- I-215 northbound ramps/Old 215 Frontage Road and Cactus Avenue – LOS F in the AM and PM peak hours
- I-215 northbound ramps and Harley Knox Boulevard – LOS F in the PM peak hour
- I-215 SB ramps and Cajalco Expressway/Ramona Expressway – LOS F in the AM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway – LOS E in the AM and PM peak hours
- I-215 southbound ramps and Nuevo Road – LOS F in the PM peak hour
- I-215 northbound ramps and Nuevo Road – LOS E in the AM peak hour
- Webster Avenue and Ramona Expressway – LOS F in the PM peak hour
- Indian Street and Ramona Expressway – LOS E in the AM peak hour and LOS F in the PM peak hour

In addition, as shown in Table 3.6-28, the following study intersection is projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternative 4 in the same year:

- Clark Street and Cajalco Road in the AM peak hour

Furthermore, as shown in Table 3.6-28, the study intersections that are projected to operate at an unacceptable LOS under the No-Build Alternative but projected to operate at an acceptable LOS under Build Alternative 4 are as follows:

- La Sierra Avenue and El Sobrante Road in the AM and PM peak hours
- Cajalco Road and Gavilan Road in the PM peak hour
- Harley John Road and Washington Road in the PM peak hour
- Cajalco Road and Harley John Road in the AM and PM peak hours
- Alexander Street and Markham Street in the AM peak hour
- Clark Street and Cajalco Road in the AM peak hour
- Seaton Avenue and Cajalco Road in the AM peak hour
- Day Street and SR-60 westbound ramps in the PM peak hour

Finally, and as also shown in Table 3.6-28, LOS is expected to improve for the following study intersections under Build Alternative 4 in the future year (2044) as compared to the No-Build Alternative in the same year:

- Bedford Canyon Road and El Cerrito Road in the AM peak hour
- I-15 southbound ramps and El Cerrito Road in the AM peak hour
- Cajalco Road and Bedford Canyon Road in the AM peak hour
- I-15 northbound ramps and Cajalco Road in the AM and PM peak hour
- La Sierra Avenue and El Sobrante Road in the AM and PM peak hour
- Cajalco Road and La Sierra Avenue in the PM peak hour
- Cajalco Road and Gavilan Road in the AM and PM peak hour
- Harley John Road and Washington Road in the PM peak hour
- Cajalco Road and Harley John Road in the AM and PM peak hour
- Wood Road and Markham Street in the AM and PM peak hour
- Alexander Street and Markham Street in the AM peak hour
- Alexander Street and Cajalco Road in the AM peak hour
- Brown Street and Cajalco Road in the PM peak hour
- Day Street and Markham Street in the AM peak hour
- Day Street and Cajalco Road in the PM peak hour
- Seaton Avenue and Markham Street in the PM peak hour
- Day Street and SR-60 westbound ramps in the PM peak hour
- Alessandro Boulevard and I-215 southbound ramp in the PM peak hour

- I-215 southbound ramps and Van Buren Boulevard in the PM peak hour
- I-215 southbound ramps and Harley Knox Boulevard in the PM peak hour
- I-215 southbound ramps and Cajalco Expressway/ Ramona Expressway in the PM peak hour

Freeway Analysis

The LOS analysis of forecast-year (2044) No-Build Alternative and Build Alternative 4 conditions at study area freeway segments (basic, ramps, and weaving segments) is presented below.

Freeway Mainline Level of Service

Forecast-year (2044) No-Build Alternative and Build Alternative 4 AM and PM peak-hour conditions at study area freeway mainline segments is presented below in Table 3.6-29.

Table 3.6-29. Freeway Mainline Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 4 Conditions

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
"--" = Freeway ramp has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown above in Table 3.6-30, the following freeway ramps along I-15 and I-215 operate at an unacceptable LOS in the forecast year (2044) under Build Alternative 4 conditions:

I-15 Southbound (2044):

- Eastbound SR-91 off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Ontario Avenue off-ramp – LOS E in the AM and PM peak hours
- CETAP off-ramp –LOS F in the AM and PM peak hours
- Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp – LOS F in the PM peak hour
- Weirick Road off-ramp – LOS F in the PM peak hour

I-15 Northbound (2044):

- Weirick Road off-ramp – LOS E in the AM peak hour
- CETAP on-ramp – LOS F in the AM and PM peak hours
- El Cerrito Road on-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue off-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue on-ramp – LOS F in the AM peak hour
- Westbound SR-91 on-ramp – LOS F in the AM and PM peak hours

I-215 Southbound (2044):

- Eucalyptus Avenue on-ramp – LOS E in the AM and PM peak hours
- Alessandro Boulevard off-ramp – LOS E in the AM and PM peak hours
- Cactus Avenue on-ramp – LOS F in the PM peak hour
- Van Buren Boulevard off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Van Buren Boulevard on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp – LOS F in the PM peak hour
- Mid-County Parkway off-ramp – LOS E in the AM and PM peak hours
- Placentia off-ramp – LOS E in the PM peak hour
- Placentia on-ramp – LOS E in the PM peak hour
- West Nuevo Road off-ramp – LOS E in the PM peak hour
- West Nuevo Road on-ramp – LOS E in the PM peak hour

I-215 Northbound (2044):

- West Nuevo Road off-ramp – LOS E in the PM peak hour
- Mid-County Parkway off-ramp – LOS E in the AM and PM peak hours
- Mid-County Parkway westbound on-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp – LOS E in the AM and PM peak hours
- Harley Knox Boulevard on-ramp – LOS F in the PM peak hour
- Van Buren Boulevard off-ramp – LOS E in the AM and PM peak hours
- Eastbound Van Buren Boulevard on-ramp – LOS E in the PM peak hour
- Cactus Avenue off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- East Alessandro Boulevard on-ramp – LOS F in the PM peak hour
- Eucalyptus Avenue off-ramp – LOS F in the PM peak hour
- Eucalyptus Avenue on-ramp – LOS F in the PM peak hour

As also shown in Table 3.6-30, the following ramps along southbound I-215 are projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternative 4 in the same year (there are no such instances along I-15):

I-215 Southbound (2044):

- Placentia off-ramp in the PM peak hour
- Placentia on-ramp in the PM peak hour

I-215 Northbound (2044):

- Mid-County Parkway westbound on-ramp in the PM peak hour

In addition, as shown in Table 3.6-31, the ramps along I-15 and I-215 that are projected to operate at an unacceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an acceptable LOS under Build Alternative 4 in the same year are as follows (there are no such instances along southbound I-15):

I-15 Northbound (2044):

- Ontario Avenue on-ramp in the PM peak hour

I-215 Southbound (2044):

- Westbound Alessandro Boulevard on-ramp in the PM peak hour
- Mid-County Parkway westbound on-ramp in the PM peak hour

I-215 Northbound (2044):

- Cajalco Expressway on-ramp in the AM peak hour
- Harley Knox Boulevard on-ramp in the AM peak hour
- Eastbound Van Buren Boulevard on-ramp in the AM peak hour
- Westbound Van Buren Boulevard on-ramp in the AM and PM peak hours

In summary, the data in Table 3.6-30 reveal that, during the AM peak hour, 17 freeway ramp segments and, during PM peak hour, 36 freeway ramp segments are forecast to operate at unsatisfactory levels of service under 2044 Build Alternative 4 traffic conditions.

Freeway Weaving Segment Level of Service

Forecast-year (2044) No-Build Alternative and Build Alternative 4 conditions at study area freeway weaving segments is presented in Table 3.6-31.

Table 3.6-31. Freeway Weaving Segment Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 4 Conditions

Freeway Weaving Segment	No-Build Alternative (2044)				Build Alternative 4 (2044)			
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour

I-215 Northbound								
WB Cactus Avenue on-ramp to East Alessandro Boulevard off-ramp	36.1	E	41.3	E	36.2	E	40.3	E

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
"--" = Freeway weaving segment has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

Table 3.6-31 indicates that, during both AM and PM peak hours, four freeway segments are forecast to operate at unsatisfactory levels of service under 2044 Build Alternative 4 conditions.

Vehicle Miles Traveled/Vehicle Hours Traveled/Vehicle Hours Delay/Average Speed – Build Alternative 4

Table 3.6-32 presents summaries of daily VMT, VHT, and average speed within the study area under 2044 No-Build Alternative and Build Alternative 4 conditions. The VMT is forecast to increase approximately 1 percent under Build Alternative 4 compared with no-build conditions in the future year (2044). The VHT is forecast to increase less than 1 percent under Build Alternative 4 compared with no-build conditions in the future year (2044), whereas VHD is forecast to decrease by approximately 1 percent under Build Alternative 4 compared with no-build conditions in the future year (2044). In comparison to the existing conditions, the average speed is projected to increase by 0.6 mph. Average speed in the study area under Build Alternative 4 is forecast to increase by 0.2 mile per hour compared with 2044 No-Build conditions. Build Alternative 4 is expected to provide higher average speeds and reduce the overall delay in the project vicinity. Design speeds for the project corridor are anticipated to range between 45 and 55 mph, similar to existing speed limits, and would be confirmed during final design in accordance with County of Riverside Roadway Design Requirements Standard No. 114.

Build Alternative 4 is expected to produce higher average speed than the No Build Alternative. It should be noted that since this statistic is calculated over a relatively large area, it represents a sizeable improvement in overall mobility compared to the 2044 no-build conditions.

Table 3.6-32. 2044 VMT, VHT, VHD and Average Speed – No-Build Alternative and Build Alternative 4

Indicator	AM Peak Hour		PM Peak Hour		Daily	
	No-Build Alternative (2044)	Build Alternative 4	No-Build Alternative (2044)	Build Alternative 4	No-Build Alternative (2044)	Build Alternative 4
VMT	2,861,258	2,891,390	4,859,804	4,914,059	14,659,917	14,811,302
VHT	80,884	81,509	162,260	162,393	396,569	398,527
VHD	27,460	27,534	69,595	68,817	125,131	124,228
Average Speed	35.4	35.5	30.0	30.3	37.0	37.2

Source: Caltrans 2017
VMT = vehicle miles traveled
VHT = vehicle hours traveled
VHD = vehicle hours delay

Please refer to Chapter 4, Section 4.2.17, *Transportation* (CEQA), for a discussion of Senate Bill 743 and State CEQA Guidelines updates (i.e., State CEQA Guidelines Section 15064.3) related to using VMT as a measure for transportation impacts.

Peak Hour Truck Traffic

Table 3.6-33, truck traffic percentages in 2044 Build Alternative 4 are forecast to increase up to 1.07 percent in comparison to 2044 no-build conditions. Under the Build Alternative 4 conditions, the truck percentages are projected to increase up to 0.59 percent as compared to the existing conditions.

Table 3.6-33. Truck Traffic Volumes (Percentage) – Forecast-Year (2044) No-Build Alternative and Build Alternative 4 Conditions

Roadway Segment	Forecast-Year (2044) No-Build Conditions		Forecast-Year (2044) Build Alternative 4 Conditions

Future Six-Lane Facility (Build Alternative 4)

As discussed in Section 2.2.1 of Chapter 2, *Project Alternatives*, of this EIR/EIS, under the Build Alternative 4 project description, the median along Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road would be wide enough to accommodate two additional travel lanes (one in each direction in the future). Actual construction of these lanes is not proposed under Build Alternative 4 and is not an option that is being considered for inclusion as part of the proposed project. The intent of including the additional median area is to ensure that future impacts on the LM MSHCP would be minimized to the extent feasible if the roadway is widened to six lanes. Although this is not an alternative that is being considered as part of the proposed project, impacts associated with potential future construction of these two additional travel lanes are being disclosed.

Forecast-year (2044) No-Build and build conditions for Build Alternative 4 (ADT and LOS) at arterial segments within the study area are presented in Table 3.6-34 on the following page.

Table 3.6-34. Traffic Volumes and Level of Service – Forecast-Year (2044) No-Build Alternative and Build Alternative 4 (Future Six-Lane Facility) Conditions

Roadway Segment	No-Build Alternative (2044)		Build Alternative 4 (2044)	
	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	13,460	C	32,820	B
El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road	19,410	F	22,660	B
El Sobrante Road between Mockingbird Canyon Road and Harley John Road	--	--	21,400	A
El Sobrante Road between Harley John Road and Cajalco Road	--	--	39,660	C
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	4,310	A	6,360	A
Cajalco Road between Lake Mathews Drive and Gavilan Road	5,770	A	7,140	A
Cajalco Road east of El Sobrante Road	23,800	F	44,030	F
Cajalco Road east of Day Street	28,800	F	37,780	F

Source: Caltrans 2017.
Note: Shaded cells represent unacceptable LOS (LOS standard exceeded).

As shown in the above table, the following arterial segments operate at an acceptable LOS in the forecast year (2044) with implementation of Build Alternative 4 (Future Six-Lane Facility):

- El Sobrante Road between Cajalco Road and Harley John Road
- El Sobrante Road between Harley John Road and Mockingbird Canyon Road
- El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between Gavilan Road and Lake Mathews Drive
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive

As also shown in Table 3.6-34, the following arterial segments operate at an unacceptable LOS F in the forecast year (2044) with implementation of Build Alternative 4 (Future Six-Lane Facility):

- Cajalco Road east of El Sobrante Road
- Cajalco Road East of Day Street

Lake Mathews MSHCP (Build Alternative 4)

Between Temescal Canyon Road and Harley John Road, the alignment of Build Alternative 4 travels through the boundaries of the LM MSHCP. As detailed above in Table 3.6-26 and Table 3.6-32, the segment of Build Alternative 4, both the four-lane and future (six-lane facility) cross sections, within the LM MSHCP would operate at an acceptable LOS in the forecast year (2044), with exception of the study segment along Cajalco Road east of El Sobrante Road.

Regional Transportation and Transit Facilities

Build Alternative 4 would replace existing bus stops utilized by RTA along Cajalco Road with improved bus pull-outs that would allow for buses to fully exit travel lanes and through traffic at designated stops. Opportunity for a new or modified RTA Express Route that would significantly reduce transit travel time between the project termini was considered, but the addition of an express route along Cajalco Road is constrained as the combination of Cajalco Road, La Sierra Avenue, and El Sobrante Road would not meet RTA criteria as a CommuterLink route. As indicated under Build Alternative 1, RTA currently engages the community and considers ridership, population, and travel statistics in short- and long-term planning to identify system needs and modifications (RTA n.d., 2017). However, improved mobility along Cajalco Road, La Sierra Avenue, and El Sobrante Road would be expected to benefit both local and regional commuters that use these roadways and RTA to connect with Metrolink's 91/PVL in Perris, Corona Transit Center in Corona, and La Sierra Metrolink Station in Riverside.

Vehicular and Pedestrian Safety

As indicated in Table 3.6-14, a number of Cajalco Road intersection areas experience a high volume of collisions and related injuries. Build Alternative 4 would alter the existing Cajalco Road roadway from a two-lane, undivided facility between Temescal Canyon Creek and La Sierra Avenue, and between Cowan Road and Harvill Avenue, to a four-lane, generally divided roadway with medians, additional signalized intersections with safety lighting, and additional designated left-turn lanes and right turn pockets. Safety enhancements proposed include:

- Construct medians;
- Pave roadway shoulders;
- Add left- and right-turn pockets in select locations;
- Restrict left turns from Cajalco Road onto local streets except in locations where traffic signals are present;
- Improve curves between Temescal Canyon Road and El Sobrante Road;
- Add roadway signage;

- Improve existing intersections varying from minor widening and turn pockets;
- Install new traffic signals at the following intersections with Cajalco Road: Eagle Canyon Road, Harley John Road, Cowan Road/Gustin Road, Carpinus Drive, and Seaton Avenue;
- Install object markers and safety lighting at intersections; and
- Construct designated bus pull-outs at select locations along Cajalco Road.

As indicated for Build Alternative 1, the effectiveness of the above-listed enhancements was evaluated using methods developed by Caltrans and FHWA to aid in the review of projects under consideration for funding under the Highway Safety Improvement Program (Caltrans 2018). Between Harley John Road and Harvill Avenue, the countermeasures listed in Table 3.6-24 for Build Alternative 1 would be the same as those proposed under Build Alternative 4 and are thus not included in the table of countermeasures specific to Build Alternative 4, below.

The countermeasures listed in Table 3.6-35 were assigned to each Cajalco Road intersection area between Temescal Canyon Road and Harley John Road based on the safety enhancements proposed under Build Alternative 4. Please refer to Table 3.6-24 for proposed countermeasures located at Cajalco Road intersection areas between Harley John Road and Harvill Avenue.

Table 3.6-35. Cajalco Road Safety Countermeasures – Build Alternative 4

Location (Cajalco Road)	Traffic Control	Countermeasure		
		Name	Type	CRF
Temescal Canyon Road	Signal	S1. Add intersection lighting	Lighting	40%
		S8. Install raised pavement markers and striping (through Intersection)	Operation/Warning	10%
		S12. Install raised median on approaches	Geometric Modification	25%
La Sierra Avenue	Signal	S1. Add intersection lighting	Lighting	40%
		S8. Install raised pavement markers and striping (through Intersection)	Operation/Warning	10%
		S12. Install raised median on approaches	Geometric Modification	25%
		S20. Install pedestrian crossing	Pedestrian and Bike	25%
		R16. Widen shoulder (paved)	Geometric Modification	30%
		R21. Improve horizontal and vertical alignments	Geometric Modification	60%
		R31. Install delineators, reflectors and/or object markers	Operation/ Warning	15%
		R35. Install edgeline rumble strips/stripes	Operation/Warning	15%
		R40. Install animal fencing	Animal	80%
Eagle Canyon Road	Signal[1]	N53. Install signals	Lighting	25%
		S1. Add intersection lighting	Lighting	40%
		S12. Install raised median on approaches	Geometric Modification	25%
		S13. Create directional median openings to allow (and restrict) left-turns and u-turns	Geometric Modification	50%
		S20. Install pedestrian crossing	Pedestrian and Bike	25%

Location (Cajalco Road)	Traffic Control	Countermeasure		
		Name	Type	CRF
Harley John Road	Signal	S1. Add intersection lighting	Lighting	40%
		S8. Install raised pavement markers and striping (through Intersection)	Operation/Warning	10%
		S12. Install raised median on approaches	Geometric Modification	25%
		R16. Widen shoulder (paved)	Geometric Modification	30%
		R40. Install animal fencing	Animal	80%

2WSC = Two-Way Stop Control
CRF = Crash Reduction Factor; based on percentage reduction of specific collision or crash types, not reduction in overall in collision occurrence.
[1] Existing two-way stop control replaced with new signal

A comparison of Table 3.6-13 with Tables 3.6-24 and Table 3.6-35, above, indicates countermeasures would be incorporated at intersection areas experiencing high volumes of collisions and injuries, as well as intersection areas that would benefit from countermeasures. However, Build Alternative 4 would not include countermeasures or safety benefits for Cajalco Road intersection areas of Lake Mathews Drive, Archer Road, and Gavilan Road.

Pedestrian and Bicycle Facilities

New traffic signals with designated crosswalks would be added to the following intersections with Cajalco Road: Eagle Canyon Road, La Sierra Avenue, Cowan Road/Gustin Road, Carpinus Drive, Day Street, and Seaton Avenue. New traffic signals with designated crosswalks would also be added to the to the following intersections with El Sobrante Road: La Sierra Avenue, McAllister Street, Mockingbird Canyon Road, and Harley John Road. To improve local pedestrian movement, ADA-compliant sidewalks would be constructed along one side Cajalco Road in some locations where residential and commercial properties are present. Improvements that would support cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue would include curb and gutter and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane.

While design and posted speed limits within the project limits would be similar or equal to those identified in Table 3.6-9, actual average speeds for traffic traveling along Cajalco Road are projected to average 37 mph and decrease by approximately 3–7 mph during peak hours (see Table 3.6-21). Projected truck traffic is also not anticipated to result in an increase risk to pedestrian or cyclist safety as the projected minor increases would be consistent with the overall projected traffic volumes through most of the project limits.

No-Build Alternative—No Project

Traffic conditions under existing-year (2014) as well as future-year (2044) No-Build conditions were evaluated to determine LOS without the proposed project.

Arterial (Roadway Segment) Analysis

Existing-year (2014) and forecast-year (2044) No-Build conditions (ADT and LOS) at arterial segments within the study area are presented in Table 3.6-36, below.

Table 3.6-36. Traffic Volumes and Level of Service – Existing-Year (2014) and Forecast-Year (2044) No-Build Conditions

Roadway Segment	Existing-Year (2014) Conditions		Forecast-Year (2044) No-Build Conditions	
	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road east of Temescal Canyon Road	13,340	C	13,530	C
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	8,740	A	4,310	A
Cajalco Road between Lake Mathews Drive and El Sobrante Road	7,540	A	5,770	A
El Sobrante Road east of La Sierra Avenue	11,591	B	19,410	F
Cajalco Road between El Sobrante Road and Gavilan Road	18,280	F	23,800	F
Cajalco Road between Gavilan Road and Harley John Road	18,670	F	27,330	F
Cajalco Road between Harley John Road and Day Street	19,890	F	26,420	F
Cajalco Road east of Day Street	26,390	F	28,800	F

Source: Caltrans 2017
Shaded cells represent unacceptable LOS (LOS standard exceeded).

As shown in the above table, the following arterial segments operate at the same acceptable LOS under both existing-year (2014) and forecast-year (2044) No-Build conditions:

- Cajalco Road east of Temescal Canyon Road
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive
- Cajalco Road between Lake Mathews Drive and El Sobrante Road

As also shown in Table 3.6-36, the following arterial segments operate at LOS F under both existing-year (2014) and forecast-year (2044) no-build conditions:

- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road
- Cajalco Road between Harley John Road and Day Street
- Cajalco Road east of Day Street

With and Without CETAP Corridor Analysis – No-Build Alternative

As indicated for Build Alternatives 1, 2C, and 4, the traffic analyses performed for the proposed project include the construction of a separate future east-west transportation corridor between I-15 and I-215 under CETAP. Without the separate east-west CETAP transportation corridor between I-15 and I-215, future No-Build traffic conditions are projected to worsen along more study area roadway segments than with the referenced separate CETAP transportation corridor. More specifically, and based on a comparative analysis conducted for No-Build Alternative conditions (see Table 3.6-37, below), the following roadway segment would be expected to operate at unacceptable LOS in the year 2044 without implementation of the separate CETAP transportation corridor as compared to with-implementation of CETAP corridor conditions under the No-Build Alternative:

- Cajalco Road between Temescal Canyon Road and La Sierra Avenue (LOS F)

Table 3.6-37. Traffic Volumes and Level of Service – Forecast Conditions with and without CETAP

Baseline 2014 and Year 2044 Forecast Conditions with and without CETAP – No-Build						
	Existing-Year (2014) Conditions		Forecast-Year (2044) No-Build Conditions with CETAP[1]		Forecast-Year (2044) No-Build Conditions without CETAP[2]	
Roadway Segment	Volume (ADT)	LOS	Volume (ADT)	LOS	Volume (ADT)	LOS
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	9,321	A	13,460	C	21,050	F
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	8,740	A	4,310	A	11,340	B
Cajalco Road between Lake Mathews Drive and El Sobrante Road	7,540	A	5,770	A	11,440	B
Cajalco Road between El Sobrante Road and Gavilan Road	18,280	F	23,800	F	29,800	F
Cajalco Road between Gavilan Road and Harley John Road	18,670	F	27,330	F	32,540	F
Cajalco Road between Harley John Road and Day Street	19,890	F	26,420	F	31,430	F
Cajalco Road East of Day Street	26,390	F	28,800	F	33,230	F

Source: Caltrans 2017a.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
[1] Traffic volumes and LOS projections with CETAP included per Riverside Traffic Analysis Model (Caltrans 2017).
[2] Traffic volumes and LOS projections without CETAP based on screening-level traffic analysis (Iteris 2018).

As indicated in the comparison in 3.6-37, above, Cajalco Road is projected to experience higher volumes under the 2044 without-CETAP conditions than under with-CETAP conditions included in the traffic analysis because regional, east-west traffic between I-215 and I-15 would be expected to continue to use Cajalco Road in the absence of a CETAP corridor.

The differences in projected volumes between with-CETAP and without-CETAP conditions along Cajalco Road are projected to range between 5,210 and 7,590 ADT west of Harley John Road, and between 4,430 and 5,010 ADT east of Harley John Road. These differences would result in a projected lower LOS F (instead of LOS C) for the segment of Cajalco Road between Temescal Canyon Road and La Sierra Avenue, and LOS B (instead of LOS A) between La Sierra Avenue and El Sobrante Road. Without additional capacity or other planned improvements to accommodate increased volumes under without-CETAP conditions, segments of Cajalco Road would be expected to operate at a lower capacity than the traffic volumes modeled with CETAP conditions. For an illustration of the differences in future with-CETAP and without-CETAP conditions under No-Build conditions, refer to Figure 1-4 in Chapter 1, *Proposed Project*.

Intersection Analysis

The LOS analysis of existing-year (2014) and forecast-year (2044) No-Build conditions at study area intersections is presented in Table 3.6-38 on the following page.

Table 3.6-38. Intersection Level of Service – Existing-Year (2014) and Forecast-Year (2044) No-Build Conditions

EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
TWSC = two-way stop control
AWSC = all-way stop control
Delay = average control delay in seconds
Shaded cells represent unacceptable LOS (LOS standard exceeded)

As presented above in Table 3.6-38, a total of five intersections operate at an unacceptable LOS in the existing year (2014), as follows:

- I-15 southbound ramps and Ontario Avenue – LOS E in the AM peak hour

- La Sierra Avenue and El Sobrante Road – LOS E in the PM peak hour
- Alexander Street and Markham Street – LOS F in the AM peak hour
- I-215 southbound ramps and Cajalco Expressway/Ramona Expressway – LOS F in the AM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway – LOS E in the AM peak hour

In addition, as also presented in Table 3.6-38, the following 30 intersections will operate at an unacceptable LOS under the forecast-year (2044) No-Build condition, as follows:

- I-15 southbound ramps and Ontario Avenue – LOS F in the AM and PM peak hours
- I-15 northbound ramps and Ontario Avenue – LOS F in the AM and PM peak hours
- Bedford Canyon Road and El Cerrito Road – LOS F in the PM peak hour
- Cajalco Road and Bedford Canyon Road – LOS in the AM and PM peak hours
- Cajalco Road and I-15 Southbound ramps – LOS F in the PM peak hour
- Cajalco Road and Temescal Canyon Road – LOS in the AM and PM peak hours
- I-15 northbound ramps and Weirick Road – LOS F in the AM peak hour
- La Sierra Avenue and Victoria Avenue – LOS F in the AM and PM peak hours
- La Sierra Avenue and El Sobrante Road – LOS E in the AM peak hour and LOS F in the PM peak hour
- Cajalco Road and Gavilan Road – LOS F in the PM peak hour
- Gavilan Road and Lake Mathews Drive – LOS in the PM peak hour
- Harley John Road and Washington Road – LOS in the PM peak hour
- Cajalco Road and Harley John Road – LOS F in the AM and PM peak hours
- Alexander Street and Markham Street – LOS E in the AM peak hour and LOS F in the PM peak hour
- Clark Street and Cajalco Road – LOS F in the PM peak hour
- Seaton Avenue and Cajalco Road – LOS F in the AM peak hour
- Sycamore Canyon Road and SR-60/I-215 southbound ramps – LOS F in the AM and PM peak hours
- SR-60/I-215 northbound ramps and Fair Isle Drive/Box Springs Road – LOS F in the AM peak hour and LOS E in the PM peak hour
- Day Street and SR-60 westbound ramps – LOS F in the PM peak hour
- Day Street and SR-60 eastbound ramps – LOS E in the PM peak hour
- I-215 ramps and Eucalyptus Avenue – LOS F in the PM peak hour

- I-215 northbound ramps and Alessandro Boulevard – LOS E in the AM peak hour
- I-215 northbound ramps/Old 215 Frontage Road and Cactus Avenue – LOS F in the AM peak hour and LOS E in the PM peak hour
- I-215 northbound ramps and Harley Knox Boulevard – LOS F in the PM peak hour
- I-215 southbound ramps and Cajalco Expressway/Ramona Expressway – LOS F in the AM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway – LOS E in the AM and PM peak hours
- I-215 southbound ramps and Nuevo Road – LOS F in the PM peak hour
- I-215 northbound ramps and Nuevo Road – LOS E in the AM peak hour
- Webster Avenue and Ramona Expressway – LOS F in the PM peak hour
- Indian Street and Ramona Expressway – LOS E in the AM peak hour and LOS F in the PM peak hour

Freeway Analysis

The LOS analysis for existing-year (2014) and forecast-year (2044) No-Build conditions at study area freeway segments (basic, ramps, and weaving segments) is presented below.

Freeway Mainline Level of Service

Existing-year (2014) and forecast-year (2044) No-Build AM and PM peak-hour conditions at study area freeway mainline segments is presented in Table 3.6-39.

Table 3.6-39. Freeway Mainline Level of Service – Existing-Year (2014) and Future-Year (2044) No-Build Conditions

Freeway Segment	Existing-Year (2014) Conditions				Forecast-Year (2044) No-Build Conditions			
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
	Density	LOS	Density	LOS	Density	LOS	Density	LOS
I-15 Southbound								
Lane addition to WB SR-91 off-ramp	15.3	B	19.4	C	27.8	D	28.4	D
WB SR-91 off-ramp to EB SR-91 off-ramp	20.5	C	22.9	C	57.7	F	44.5	E
EB SR-91 off-ramp to EB SR-91 on-ramp	14.6	B	16.8	B	37.4	E	31.9	D

Source: Caltrans 2017
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown above in Tables 3.6-5 and 3.6-39, the following seven freeway mainline segments operate at an unacceptable LOS in the existing year (2014):

I-15 Southbound (2014):

- El Cerrito Road on-ramp to Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road off-ramp to Cajalco Road on-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp to Weirick Road off-ramp – LOS E in the PM peak hour

I-215 Southbound (2014):

- Van Buren Boulevard on-ramp to Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard on-ramp to Cajalco Expressway off-ramp – LOS E in the PM peak hour

I-215 Northbound (2014):

- Harley Knox Boulevard on-ramp to Van Buren Boulevard off-ramp – LOS E in the AM peak hour

In addition, as also shown above in Table 3.6-32, the following 41 freeway mainline segments will operate at an unacceptable LOS under the forecast-year (2044) No-Build condition:

I-15 Southbound (2044):

- Westbound SR-91 off-ramp to eastbound SR-91 off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Eastbound SR-91 off-ramp to eastbound SR-91 on-ramp – LOS E in the AM peak hour
- Lane drop to westbound SR-91 on-ramp – LOS E in the AM peak hour
- Magnolia Avenue on-ramp to Ontario Avenue off-ramp – LOS E in the AM and PM peak hours
- El Cerrito Road off-ramp to lane addition – LOS E in the AM peak hour and LOS F in the PM peak hour
- Lane addition to CETAP off-ramp – LOS E in the PM peak hour
- Lane drop to Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp to Weirick Road off-ramp – LOS F in the PM peak hour

I-15 Northbound (2044):

- Cajalco Road on-ramp to CETAP on-ramp – LOS E in the AM peak hour
- CETAP on-ramp to El Cerrito Road on-ramp – LOS F in the AM and PM peak hours
- El Cerrito Road on-ramp to Ontario Avenue off-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue off-ramp to lane addition – LOS F in the AM peak hour and LOS E in the PM peak hour
- Ontario Avenue on-ramp to Magnolia Avenue off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Magnolia Avenue off-ramp to eastbound Magnolia Avenue on-ramp – LOS F in the AM and PM peak hours
- Eastbound Magnolia Avenue on-ramp to westbound Magnolia Avenue on-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- SR-91 off-ramp to westbound SR-91 on-ramp – LOS F in the AM peak hour
- Westbound SR-91 on-ramp to eastbound SR-91 on-ramp – LOS F in the AM and PM peak hours
- Eastbound SR-91 on-ramp to lane drop – LOS F in the AM peak hour

I-215 Southbound (2044):

- Eastbound SR-60 on-ramp to westbound SR-60 on-ramp – LOS F in the AM and PM peak hours
- Lane drop to Eucalyptus Avenue on-ramp – LOS E in the AM and PM peak hours
- Eucalyptus Avenue on-ramp to Alessandro Boulevard off-ramp – LOS E in the AM and PM peak hours

- Alessandro Boulevard off-ramp to westbound Alessandro Boulevard on-ramp – LOS E in the PM peak hour
- Westbound Alessandro Boulevard on-ramp to eastbound Alessandro Boulevard on-ramp – LOS E in the AM and PM peak hours
- Eastbound Cactus Avenue off-ramp to Cactus Avenue on-ramp – LOS E in the PM peak hour
- Cactus Avenue on-ramp to Van Buren Boulevard off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Van Buren Boulevard on-ramp to Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard on-ramp to Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp to Cajalco Expressway on-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp to Mid-County Parkway off-ramp – LOS F in the PM peak hour

I-215 Northbound (2044):

- Mid-County Parkway westbound on-ramp to Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp to Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard on-ramp to Van Buren Boulevard off-ramp – LOS E in the PM peak hour
- Eastbound Van Buren Boulevard on-ramp to westbound Van Buren Boulevard on-ramp – LOS E in the AM and PM peak hours
- Westbound Van Buren Boulevard on-ramp to Cactus Avenue off-ramp – LOS F in the AM and PM peak hours
- Cactus Avenue off-ramp to eastbound Cactus Avenue on-ramp – LOS E in the PM peak hour
- Eastbound Cactus Avenue on-ramp to westbound Cactus Avenue on-ramp – LOS E in the PM peak hour
- East Alessandro Boulevard off-ramp to East Alessandro Boulevard on-ramp – LOS E in the PM peak hour
- East Alessandro Boulevard on-ramp to Eucalyptus Avenue off-ramp – LOS F in the PM peak hour
- Eucalyptus Avenue off-ramp to Eucalyptus Avenue on-ramp – LOS E in the PM peak hour
- Eucalyptus Avenue on-ramp to SR-60 – LOS F in the PM peak hour

Freeway Ramp Level of Service

A comparison of existing-year (2014) and forecast-year (2044) No-Build AM and PM peak-hour conditions at study area freeway ramps is presented below in Table 3.6-40.

Table 3.6-40. Freeway Ramp Level of Service – Existing-Year (2014) and Future-Year (2044) No-Build Conditions

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 p.m.
"--" = Freeway ramp has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown above in Tables 3.6-6 and 3.6-40, the following 17 freeway ramps operate at an unacceptable LOS in the existing year (2014):

I-15 Southbound (2014):

- El Cerrito Road on-ramp – LOS E in the PM peak hour
- Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp – LOS E in the PM peak hour
- Weirick Road off-ramp – LOS E in the PM peak hour

I-15 Northbound (2014):

- El Cerrito Road off-ramp – LOS E in the AM peak hour
- El Cerrito Road on-ramp – LOS E in the AM peak hour
- Ontario Avenue off-ramp – LOS E in the AM peak hour

I-215 Southbound (2014):

- Eucalyptus Avenue on-ramp – LOS E in the PM peak hour
- Alessandro Boulevard off-ramp – LOS E in the PM peak hour
- Van Buren Boulevard off-ramp – LOS E in the PM peak hour
- Van Buren Boulevard on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp – LOS E in the PM peak hour
- West Nuevo Road off-ramp – LOS E in the PM peak hour

I-215 Northbound (2014):

- Harley Knox Boulevard off-ramp – LOS E in the AM peak hour
- Van Buren Boulevard off-ramp – LOS E in the AM peak hour
- Cactus Avenue off-ramp – LOS E in the AM peak hour

Also, as shown above in Table 3.6-36, the following 38 freeway ramps will operate at an unacceptable LOS under the forecast-year (2044) No-Build condition:

I-15 Southbound (2044):

- EB SR-91 off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Ontario Avenue off-ramp – LOS E Roads
- CETAP off-ramp – LOS F Roads
- Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp – LOS F in the PM peak hour

- Weirick Road off-ramp – LOS F in the PM peak hour

I-15 Northbound (2044):

- Weirick Road off-ramp – LOS E in the AM peak hour

Source: Caltrans 2017.
EB = eastbound NB = northbound
WB = westbound SB = southbound
AM peak hour = 6 a.m. to 9 a.m.; PM peak hour = 3 p.m. to 7 pm.
"--" = Freeway weaving segment has volume-to-capacity ratio greater than 1. Weaving segment is expected to fail, and the HCM does not assign a density value to it.
Shaded cells represent unacceptable LOS (LOS standard exceeded)
Density = passenger cars/mile/lane

As shown above in Tables 3.6-7 and 3.6-41, the following two freeway weaving segments operate at an unacceptable LOS in the existing year (2014):

I-15 Southbound (2014):

- Westbound SR-91 on-ramp to Magnolia Avenue off-ramp – LOS F in the AM and PM peak hours

I-15 Northbound (2014):

- Westbound Magnolia Avenue on-ramp to SR-91 off-ramp

All of the study area freeway weaving segments on I-215 (southbound and northbound) operate an acceptable LOS in the existing year (2014).

Also, as shown above in Table 3.6-41, the following four freeway weaving segments will operate at an unacceptable LOS under the forecast-year (2044) no-build condition:

I-15 Southbound (2044):

- Westbound SR-91 on-ramp to Magnolia Avenue off-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue on-ramp to El Cerrito Road off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour

I-15 Northbound (2044):

- Westbound Magnolia Avenue on-ramp to SR-91 off-ramp – LOS F in the AM and PM peak hours

I-215 Northbound (2044):

- Westbound Cactus Avenue on-ramp to East Alessandro Boulevard off-ramp – LOS E in the AM and PM peak hours

Vehicles Miles Traveled/Vehicle Hours Traveled/Vehicle Hours Delay/Average Speed

Table 3.6-42 presents summaries of daily VMT, VHT, and average speed within the study area under existing conditions as well as projected daily VMT, VHT, and average speeds under 2044 No-Build conditions.

Table 3.6-42. Baseline and 2044 VMT, VHT, VHD and Average Speed Summary – No-Build Alternative

Indicator	AM Peak Hour		PM Peak Hour		Daily	
	Existing (2014) Conditions	2044 No-Build Conditions	Existing (2014) Conditions	2044 No-Build Conditions	Existing (2014) Conditions	2044 No-Build Conditions
VMT	1,681,352	2,861,258	2,795,721	4,859,804	8,585,374	14,659,917
VHT	50,618	80,884	91,554	162,260	234,475	396,569
VHD	17,166	27,460	35,000	69,595	66,516	125,131
Average Speed	33.2	35.4	30.5	30.0	36.6	37.0

Source: Caltrans 2017.
VMT = vehicle miles traveled
VHT = vehicle hours traveled
VHD = vehicle hours delay

VMT is forecast to increase nearly 71 percent compared with existing conditions, and VHT is forecast to increase by more than 69 percent compared with existing conditions. VHD is forecast

to increase by more than 88 percent compared with existing conditions, and average speed is projected to increase by 0.4 mph compared with existing conditions.

Peak Hour Truck Traffic

As shown in Table 3.6-43, truck traffic percentages in 2044 No-Build Alternative conditions are forecast to increase up to 0.54 percent in comparison to existing conditions.

Table 3.6-43. Truck Traffic Volumes (Percentage) – Existing (2014) and Forecast-Year (2044) No-Build Alternative Conditions

Roadway Segment	Existing (2044) Conditions		2044 No-Build Conditions	
	Eastbound	Westbound	Eastbound	Westbound
Cajalco Road West of Temescal Canyon Road	11.90%	11.97%	12.01%	11.98%
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	11.90%	12.02%	11.99%	12.01%
La Sierra Avenue between Cajalco Road and El Sobrante Road	4.14%	4.17%	3.92%	3.89%
El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road	6.74%	6.85%	6.78%	6.73%
El Sobrante Road East of Mockingbird Canyon Road	3.07%	2.75%	3.22%	3.30%
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	3.36%	3.55%	3.18%	3.36%
Cajalco Road between Lake Mathews Drive and El Sobrante Road	3.13%	2.88%	1.64%	1.76%
Cajalco Road between El Sobrante Road and Gavlin Road	4.02%	3.99%	2.44%	2.37%
Cajalco Road between Gavlin Road and Harley John Road	3.38%	3.33%	2.07%	2.04%
Cajalco Road between Harley John Road and Wood Road	2.65%	2.69%	1.66%	1.63%
Cajalco Road between Wood Road and Alexander Street	2.35%	2.40%	2.30%	2.37%
Cajalco Road between Alexander Street and Brown Street	3.14%	3.24%	3.27%	3.19%
Cajalco Road between Brown Street and Clark Street	2.64%	2.66%	2.65%	2.75%
Cajalco Road between Clark Street and Day Street	4.30%	4.26%	4.24%	4.18%
Cajalco Road between Day Street and Seaton Avenue	3.36%	3.40%	3.36%	3.44%
Cajalco Road between Seaton Avenue and Harvill Avenue	3.60%	3.56%	3.64%	3.56%
Cajalco Road East of Harvill Avenue	3.31%	3.30%	3.29%	3.39%

3.6.3.2 Temporary Impacts

Future-Year (2044) Build Condition – Build Alternatives 1, 2C, and 4

Construction of any of the build alternatives would result in temporary impacts on traffic and transportation as well as pedestrian and bicycle facilities. A description of these temporary impacts, which apply to Build Alternatives 1, 2C, and 4, is provided below.

Access, Circulation, and Parking

Temporary traffic delays would occur during construction of the proposed improvements. Construction activities would occur in stages; however, the details have not been determined because the scope of such activities would depend on the characteristics and elements of the preferred alternative. Regardless of which build alternative is implemented, construction activities would affect local access and circulation. Temporary lane closures and lane narrowing

could divert traffic to alternate roadways; however, access to residences and businesses would be maintained during project construction. Furthermore, emergency access would be accommodated during all phases of construction and the project would implement a traffic control plan as part of Standard Project Measure **PF LU-1**, which would include, but not be limited to, a public awareness campaign, that would involve coordination with emergency service providers, schools, business owners, and residents along the project corridor. A construction traffic management plan would also be developed and implemented as part of Standard Project Measure **PF AQ-1** that would include, but not be limited to, consolidating truck deliveries, providing a rideshare or shuttle service for construction workers, and providing dedicated turn lanes for movement of construction trucks and equipment on and off site. Please refer to Sections 3.1, *Land Use*, and 3.14, *Air Quality*, for Standard Project Measures **PF LU-1** and **PF AQ-1**.

Public Transportation

Design and construction of the project would take into consideration public transit use and potential disruptions to transit services. During construction, the project may result in increased service times for buses that operate on the existing transportation network. Because construction would be staged, these impacts would not globally affect all public transportation that serves the project area. Instead, impacts would be shifted from segment to segment as construction work proceeds and, being temporary in nature, would cease after completion of construction. These impacts would be addressed with implementation of Standard Project Measure **PF LU-1**, which includes a Traffic Management Plan (TMP) and public awareness campaign that would inform and coordinate with motorists, business owners/operators, residents, elected officials and government agencies, and emergency service providers regarding construction activities and associated impacts. Please refer to Section 3.1, *Land Use*, for Standard Project Measure **PF LU-1.**

Pedestrian and Bicycle Facilities

Temporary disruptions to pedestrian facilities (e.g., sidewalks) and bicycle facilities would occur during project construction. However, these impacts would be temporary and would cease after completion of project construction. If needed, alternative routes would be provided through the TMP developed for the project under Standard Project Measure **PF LU-1**, to maintain access and connectivity. The TMP would be developed in advance of construction-related activities and updated as necessary to accommodate project construction phasing.

Future-Year (2044) No-Build Condition

Under the future-year (2044) No-Build condition, no improvements would be made to the existing roadway system. Therefore, no temporary impacts on traffic and transportation as well as pedestrian and bicycle facilities would occur under the future-year (2044) No-Build condition.

3.6.4 Avoidance, Minimization, and/or Mitigation Measures

Temporary impacts on traffic and transportation, as well as pedestrian and bicycle facilities during construction, would be addressed through the preparation and use of a TMP, public awareness campaign, and construction traffic management plan. Please refer to Sections 3.1, *Land Use*, and 3.14, *Air Quality*, for Standard Project Measures **PF LU-1** (TMP) and **PF AQ-1** (construction traffic management plan).

3.7 Visual/Aesthetics

3.7.1 Regulatory Setting

The National Environmental Policy Act (NEPA) of 1969, as amended, establishes that the federal government use all practicable means to ensure all Americans safe, healthful, productive, and *aesthetically* (emphasis added) and culturally pleasing surroundings (42 United States Code [USC] 4331[b][2]). To further emphasize this point, the Federal Highway Administration (FHWA), in its implementation of NEPA (23 USC 109[h]), directs that final decisions on projects are to be made in the best overall public interest taking into account adverse environmental impacts, including among others, the destruction or disruption of aesthetic values.

The California Environmental Quality Act (CEQA) establishes that it is the policy of the state to take all action necessary to provide the people of the state "with…enjoyment of *aesthetic*, natural, scenic and historic environmental qualities" (CA Public Resources Code [PRC] Section 21001[b]).

California Streets and Highways Code Section 92.3 directs Caltrans to use drought resistant landscaping and recycled water when feasible, and incorporate native wildflowers and native and climate-appropriate vegetation into the planting design when appropriate.

3.7.2 Affected Environment

This section was prepared using information from the *Visual Impact Assessment* (VIA) technical report prepared for the project (Caltrans 2018a). The VIA assesses potential visual impacts of the proposed project based on guidance outlined in the *Visual Impact Assessment for Highway Projects* published by the FHWA (1981). The following key terms describe visual resources in a project area, which are used as descriptors and as part of a rating system to assess a landscape's visual quality.

- *Visual character* includes attributes such as form, line, color, and texture and is used to describe, not evaluate, visual resources.
- *Visual quality* is evaluated by identifying the vividness, intactness, and unity present in the project area.
- *Vividness* is the extent to which the landscape is memorable and is associated with distinctive, contrasting, and diverse visual elements.
- *Intactness* is the integrity of visual features in the landscape and the extent to which the existing landscape is free from non-typical visual intrusions.
- *Unity* is the extent to which all visual elements combine to form a coherent, harmonious visual pattern.

Resource change is one of the two major variables that determine visual impacts. *Resource change* refers to the evaluation of the visual character and the visual quality of the visual resources that comprise the project corridor before and after construction of a proposed project. The other major variable is *viewer response*, the response of viewers to changes in their visual environment.

3.7.2.1 Project Location and Setting

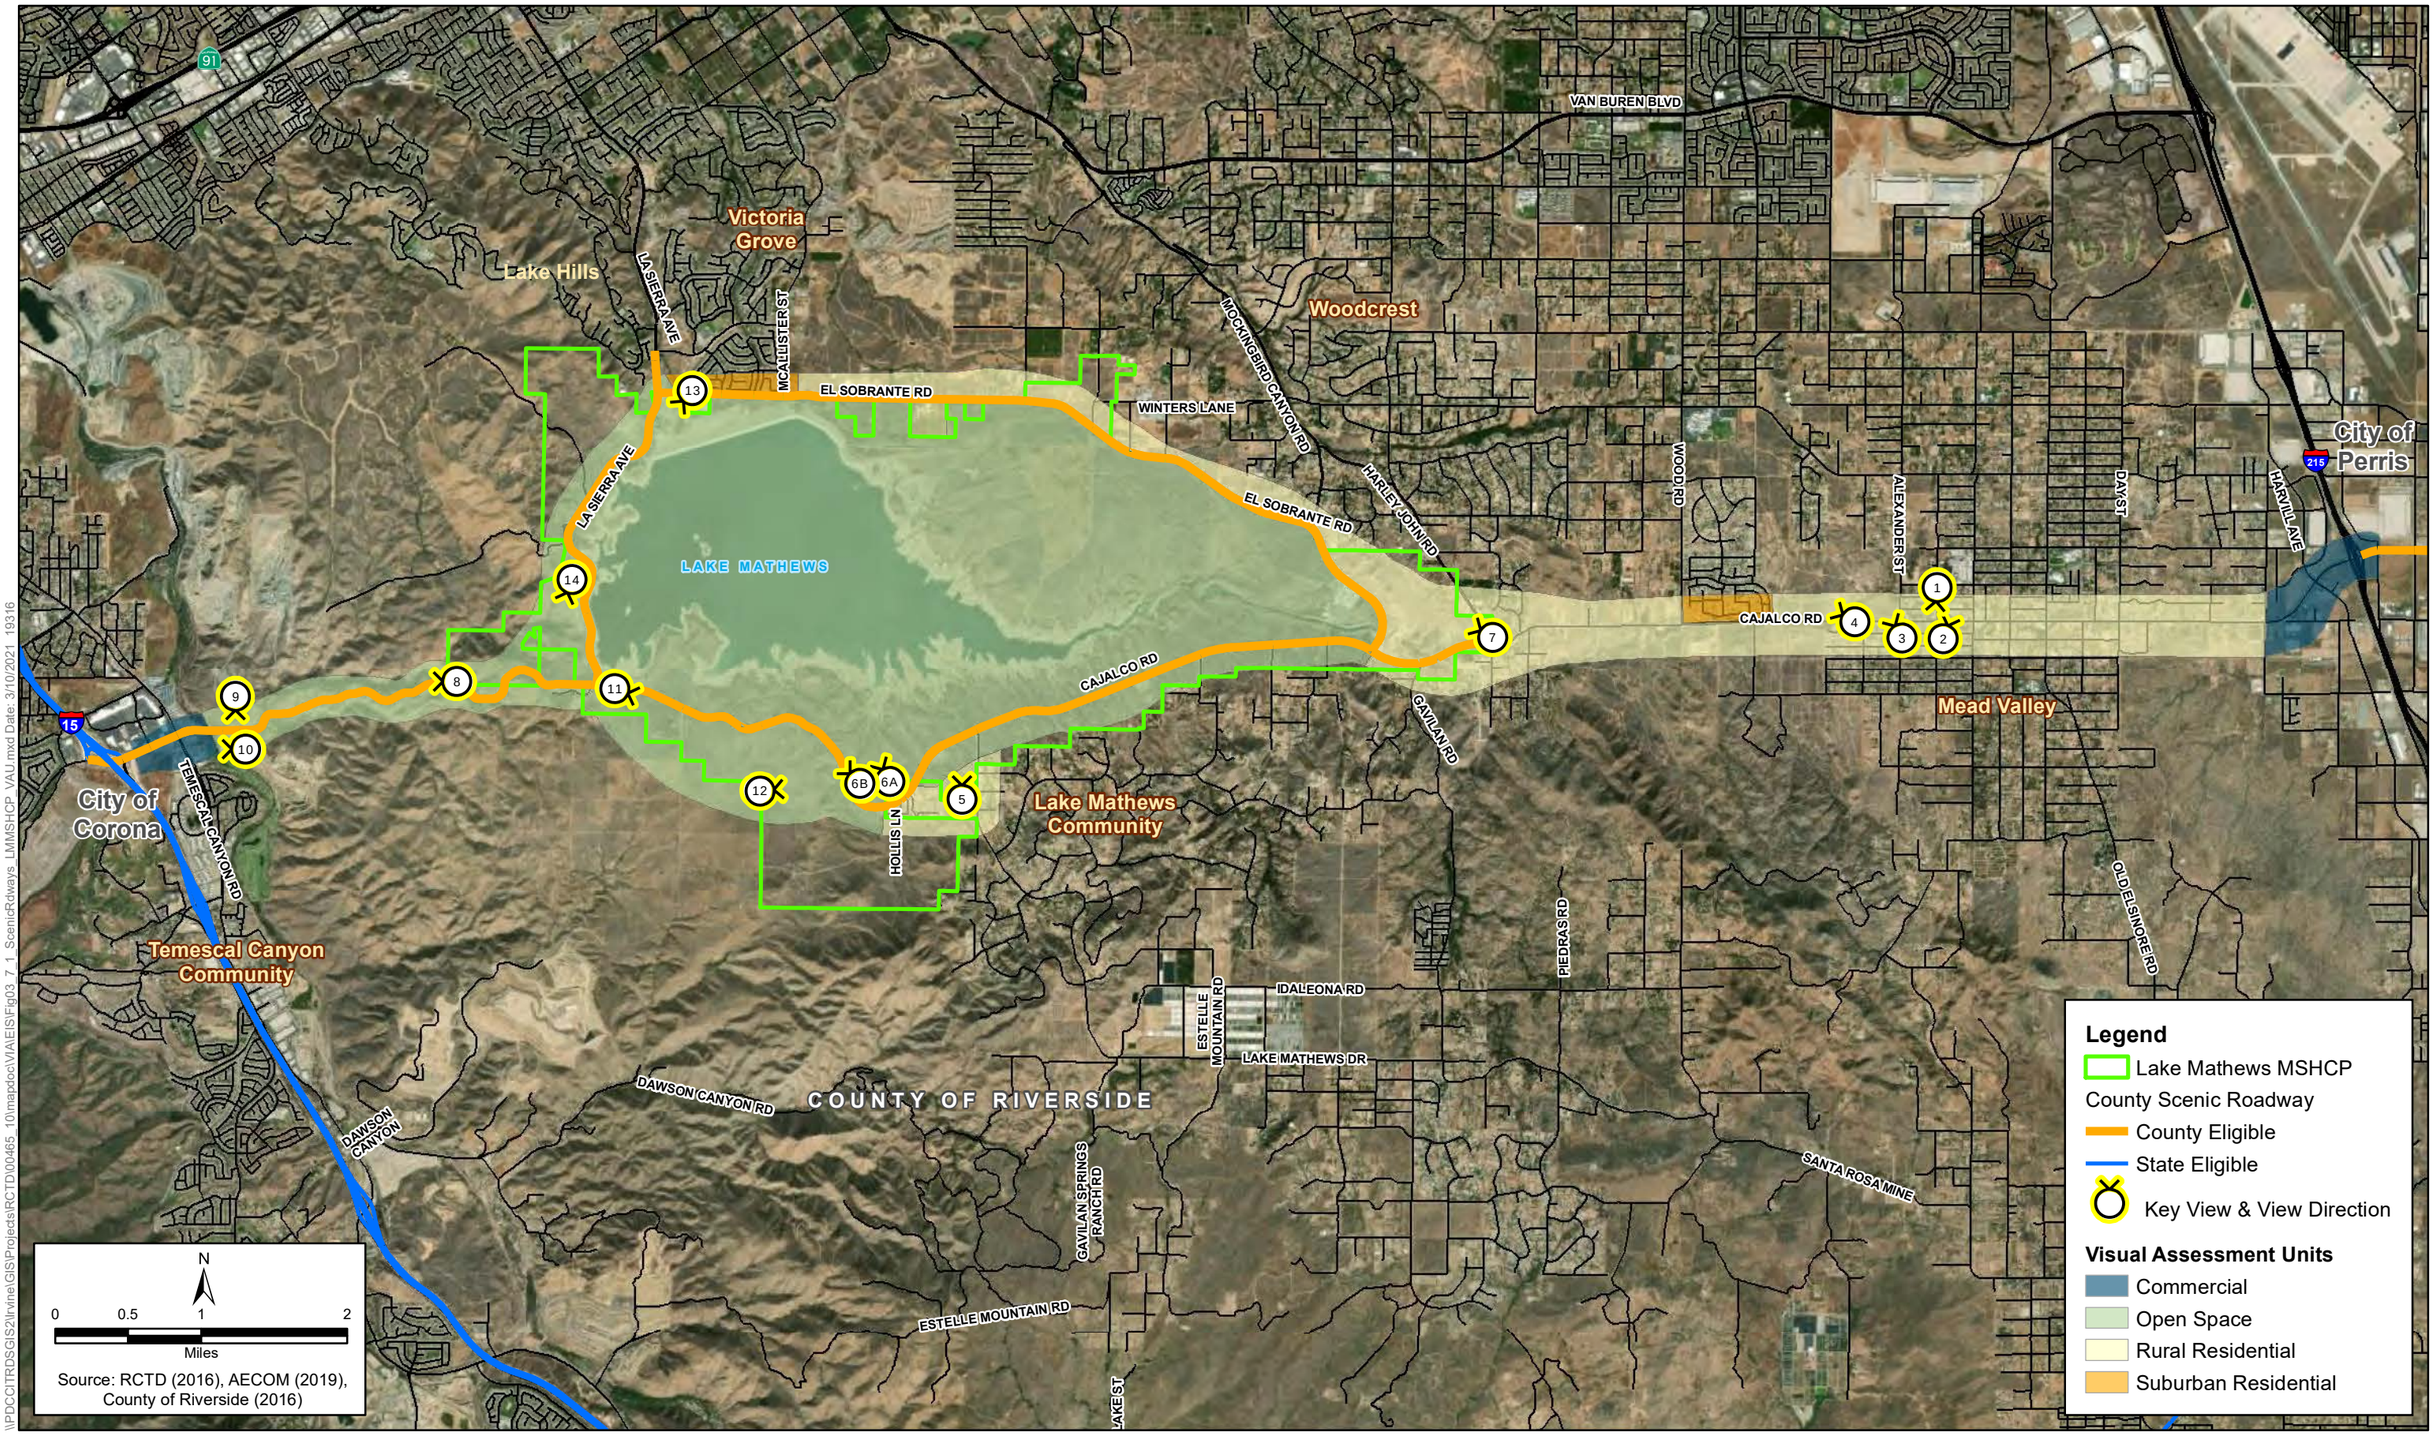
The proposed project is located on Cajalco and El Sobrante Roads, and La Sierra Avenue, between Temescal Canyon Road and Interstate 215 (I-215), in the northwestern portion of Riverside County, within unincorporated Riverside County and a portion of the City of Corona, California (refer to Figure 1-2). The project corridor falls within the South Coast California Floristic Province and is just east of the Santa Ana Mountains and north of the Temescal Mountains. The landscape pattern of the project region is influenced by development centralized along major roadways, such as Interstate 15 (I-15), State Route 91, and I-215.

The landscape of the project vicinity is characterized by predominantly rolling to gently rolling terrain. The land uses within the corridor are primarily open space lands surrounding Lake Mathews and rural residential land uses northeast, east, and southeast of the lake. There are two suburban residential developments that abut the project corridor—one to the north and one to the east of the lake. The majority of commercial land uses are at the eastern and western termini of the corridor. Vegetation along the project corridor is mostly nonnative grasslands, sage scrub, and ruderal vegetation. There is a limited amount of naturally growing trees; however, residences often have mature trees and shrubs with their associated landscaping. The open space lands, rolling terrain, and lack of tall vegetation allow for scenic vista views to the surrounding mountains and Lake Mathews.

There are no roadways in or near the project area that are designated in federal or state plans as an officially designated scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). I-15 is an eligible state scenic highway; however, the project's western terminus is approximately 0.3 mile away from the freeway, and views of the project corridor from the freeway are blocked by the interchange berms. I-215 is a classified Landscaped Freeway between Post Miles 30.81 and 31.31; the project's eastern terminus connects to the I-215 southbound ramps (Caltrans 2018b). The Riverside County General Plan Circulation Element also indicates that Cajalco Road from I-15 to approximately Harley John/Smith Roads, El Sobrante Road, and La Sierra Avenue from El Sobrante Road to Cajalco Road are County-eligible scenic corridors, which are to be managed in a manner so as to maintain their aesthetic value (County of Riverside 2016). County-eligible roadway segments located within the project vicinity are depicted on Figure 3.7-1.

Lake Mathews Habitat Conservation Plan Area

The project corridor travels through the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area, Lake Mathews Multiple Species Reserve (LMR), and land owned by Metropolitan Water District of Southern California (MWD) and Riverside County Habitat Conservation Agency (RCHCA) (RCHCA 2007). Refer to Figure 3.7-1 for LM MSHCP boundaries. Much of the land surrounding Lake Mathews is undeveloped because these lands are protected by the LMR and the Lake Mathews-Estelle Mountain Core Reserve (LM-EM Reserve) of the Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP). The landscape of the LM MSHCP area is characterized by predominantly rolling to gently rolling terrain associated with the open space lands surrounding Lake Mathews. The open space lands, rolling terrain, and lack of tall vegetation allow for scenic vista views to the surrounding mountains and Lake Mathews.



\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\VIA\EIS\Fig03_7_1_ScenicRdways_LMMSHCP_VAU.mxd Date: 3/10/2021 19316

Figure 3.7-1
County Scenic Roadways, Lake Mathews MSHCP, and Visual Assessment Units
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

3.7.2.2 Visual Assessment Units

For this analysis, the area surrounding the project area has been subdivided into four visual assessment units (VAUs) based on specific vantage points and differing sensitivities of those affected by the proposed project. The four VAUs include Rural Residential, Open Space Suburban Residential, and Commercial VAUs, which are described below. The VAUs are shown on Figures 3.7-1 and 3.7-2. Note that the LM MSHCP area falls within the Open Space VAU. Key views within each VAU were selected for their representation of the VAU within which they are located and the viewer groups affected. Refer to Figure 3.7-2 for key view locations.

Rural Residential Visual Assessment Unit

The Rural Residential VAU consists of rural land uses that are north of the project corridor along El Sobrante Road and along both sides of the project corridor, east of the lake and mostly within Mead Valley, along Cajalco Road. Along the north side of El Sobrante Road between Harley John Road and McAllister Street, the VAU includes a portion of the Woodcrest community. In addition, there is a small area of this VAU that lies within the western boundaries of the Lake Mathews community, within Lake Mathews Estates, south of Lake Mathews and west of Lake Mathews Drive, and on either side of Cajalco Road (refer to Figure 3.7-2 and Sheet 3 of Figure 2.2-2). Development along the project corridor ranges from being fairly well-kept to being slightly unkempt. Vegetation in this VAU is mostly ruderal vegetation, riparian trees and shrubs growing along small drainage ways, and trees and shrubs associated with rural residential, commercial landscaping, and a few orchards and plant nurseries. Views from the project corridor in this VAU tend to be confined by rural development, except along El Sobrante Road where views of open space areas to the south are available. In addition, the Cajalco Road corridor provides a narrow view corridor to the east of the Russell Mountains and Bernasconi Hills within the Lake Perris State Recreation Area. Views from El Sobrante Road are considered to be scenic vista views; however, the view corridor provided by Cajalco Road is not, because of the confined nature of the views and intervening visual elements that detract from views.

This VAU is somewhat well-lit by interior and exterior lighting associated with rural residences and interspersed commercial businesses, landscape lighting, vehicle headlights, limited parking lot lighting, street lighting at intersections, and traffic lights at the Cajalco Road intersections with Smith and Wood Roads and Alexander, Brown, and Clark Streets (refer to Sheets 1A through 3 of Figure 2.2-3).

Table 3.7-1 on the following page summarizes the visual quality identified for each VAU. For the Rural Residential VAU, the vividness is moderate-low, intactness and unity are moderate, and the resulting visual quality of the Rural Residential VAU is moderate.

Table 3.7-1. Visual Assessment Units – Existing Visual Quality

Visual Assessment Unit	Visual Resource Rating		Visual Quality
	Vividness	Intactness and Unity	
Rural Residential	ML	M	M
Open Space	MH	MH	MH
Suburban Residential	M	M	M
Commercial	MH	M	M
Low (L); Moderate-Low (ML); Moderate (M); Moderate-High (MH); High (H)			

Open Space Visual Assessment Unit

The Open Space VAU consists of mostly undeveloped, rolling open space lands and low-growing grasslands and scrublands associated with Lake Mathews and the LMR (refer to Figure 3.7-1). The roadways mostly conform to the terrain, but there are small areas where roadside cuts and fill exist to accommodate the roadways in this VAU. La Sierra Avenue is not as winding as, and is flatter than, Cajalco Road, and the southern segment of La Sierra Avenue is located on fill that is the Lake Mathews Dam (refer to Sheets 2 and 3A of Figure 2.2-5). El Sobrante Road is predominantly flat and straight, mostly lacking cuts and fills, with roadside shoulders scraped of vegetation and some gentle bends toward the eastern end of the lake (refer to Sheets 3B through 5B of Figure 2.2-5). Views from Cajalco Road, and looking south from El Sobrante Road, range from being limited by terrain to offering scenic vista views out and over the lake and surrounding landscape. This VAU is not well lit and has minimal lighting from vehicle headlights, nearby residences, the traffic and safety lighting at the Cajalco Road/La Sierra Avenue intersection (see Sheet 2A of Figure 2.2-2), and the safety lighting along El Sobrante Road, where the suburban developments of Victoria Grove and Lake Hills are located to the north of this VAU (see Sheet 3B of Figure 2.2-5). A cluster of residences associated with the Temescal Canyon community are also located off Cajalco Road, east of Eagle Valley Road.

The vividness, intactness, unity, and resulting visual quality of the Open Space VAU are all moderate-high (refer to Table 3.7-1).

Suburban Residential Visual Assessment Unit

The Suburban Residential VAU consists of two suburban residential developments that are located along the project corridor and are separated from the roadways by noise barriers and landscape buffers. The development of Victoria Grove is a gated community located to the north of the lake and north of El Sobrante Road, between La Sierra Avenue and McAllister Street (see Sheet 3B of Figure 2.2-5). The development of Boulder Springs is located east of the lake and north of Cajalco Road between Wood Road and Carpinus Drive (see Sheet 1B of Figure 2.2-3). First-story views of the roadways are not available from the residences because views are limited by residential structures, landscaping, and noise barriers. However, some residences that border the roadway corridors have second-story views of adjacent development and Open Space and Rural Residential VAUs, the project roadways, landscape buffers, and noise barriers.

\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\VIA\EIS\Fig03_7-2_Visual_Assessment.mxd Date: 3/9/2021 19316

Figure 3.7-2
Visual Assessment Units - Build Alternatives 1, 2C and 4
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

The Suburban Residential VAU is well lit and is associated with interior and exterior house lighting, landscape lighting, vehicle headlights, street and parking lot lighting, traffic and safety lights at the El Sobrante Road/La Sierra Avenue intersection, and safety lighting along El Sobrante Road, where the suburban development of Victoria Grove is located to the north of this VAU.

The vividness, intactness, unity, and resulting visual quality of the Suburban Residential VAU are all moderate (refer to Table 3.7-1).

Commercial Visual Assessment Unit

The Commercial VAU is located at the project termini, from Temescal Creek to the western end of the project and from Seaton Avenue to the eastern end of the project (refer to Figure 3.7-2, Sheet 1A of Figure 2.2-2, and Sheet 4 of Figure 2.2-3). The Crossings at Corona shopping center is located at the western terminus (Sheet 1A of Figure 2.2-2). Businesses face inward, toward parking lots and away from the roads. Views from the project corridor west of Temescal Canyon Road include divided travel ways that are separated by landscaped medians near the shopping center. From the western terminus, views of the Santa Ana and Temescal Mountains are available from the corridor at this end of the project.

Freeway commercial and vacant and industrial land uses land uses are near the Cajalco Expressway at the eastern terminus at I-215. From the eastern terminus, views of the Santa Ana and Temescal Mountains can be seen to the west and views to the Russell, San Bernardino, and San Jacinto Mountains and Bernasconi Hills can be seen to the east, which contribute to higher quality views from this segment of the project corridor because utility lines do not clutter views (Sheet 4 of Figure 2.2-3). However, the elevated freeway interchange is built on fill, which partially obstructs sightlines to these mountains and hills to the east, and the commercial development slightly detracts from views, so these views are not considered to be scenic vistas. This VAU is well lit with interior and exterior lighting associated with commercial and industrial businesses, landscape lighting, vehicle headlights, parking lot lighting, street lighting at intersections, and traffic lights.

The vividness of this VAU is moderate-high, intactness and unity are moderate, and the resulting visual quality of the Commercial VAU is moderate (refer to Table 3.7-1).

3.7.2.3 Viewers and Viewer Response

Two major types of viewer groups are of primary concern for highway projects: roadway neighbors (people who have views to the road) and roadway users (people who have views from the road). Each viewer group has its own particular level of viewer exposure and viewer sensitivity, resulting in distinct and predictable visual concerns for each group that help to evaluate their responses to visual changes. This analysis considers residents within the Rural Residential and Suburban Residential VAUs; workers and patrons within the Rural Residential and Commercial VAUs; recreationists within the Rural Residential, Suburban Residential, and Commercial VAUs; and roadway users within the Open Space, Rural Residential, Suburban Residential, and Commercial VAUs.

Roadway neighbors constitute viewers who would have longer-term, stationary views (residents and businesses) and viewers who would have shorter-term, transient views (recreationists and

roadway travelers on nearby local roadways) as they pass by the proposed project. Roadway neighbors would have moderate-high to high sensitivity to visual changes resulting from the project because the neighbors that are adjacent to or in proximity to the project site have short- to long-term stationary and transient views of the project corridor and lands adjacent to the right of way.

Roadway users include recreational travelers including drivers and cyclists using Cajalco and El Sobrante Roads, and La Sierra Avenue; local and regional commuters; and transporters of goods. Roadway users represent the largest number of viewers who would come into direct visual contact with the proposed project. Roadway users would have moderate to moderate-high sensitivity to visual changes resulting from the project. Although viewers would have direct visual contact with the project only while traveling through the area and views would be intermittent, many roadway users travel this route on a daily basis for work commutes and are familiar with the existing visual conditions. However, views range from being more scenic to slightly degraded.

Composite Viewer Group

For analytical purposes, a composite viewer group was created for this project. A composite viewer group is made up of all roadway neighbors and roadway users affected by the project. The roadway neighbors viewer group has a range in exposure. Residents would have high exposure, businesses would have moderate-high exposure, and transient roadway neighbors would have moderate exposure. Roadway neighbor viewers have a moderate-high to high visual sensitivity. The response of roadway neighbors to the project would be moderate-high to high. These responses would result from project features that would alter the visual character of the roadway, alter terrain, remove vegetation, affect residential dwellings and commercial parking lots and buildings, and be visually inconsistent with other nearby rural roadways combined with viewer familiarity with the project site. The roadway users viewer group has high exposure to the project site and moderate to moderate-high visual sensitivity. The response of roadway users to the project would be moderate-high to high. Because the response of both roadway neighbors and roadway users to the project would be moderate-high to high, the group viewer response would also be moderate-high to high.

3.7.3 Environmental Consequences

Visual impacts are determined by assessing changes to the visual resources and predicting viewer response to those changes. These impacts can be beneficial or detrimental. Table 3.7-2 on the following page provides a reference for determining levels of visual impact by combining resource change and viewer response.

Table 3.7-2. Visual Impact Ratings Using Viewer Response and Resource Change

		Viewer Response (VR)				
Resource Change (RC)		Low (L)	Moderate-Low (ML)	Moderate (M)	Moderate-High (MH)	High (H)
	Low (L)	L	ML	ML	M	M
	Moderate-Low (ML)	ML	ML	M	M	MH
	Moderate (M)	ML	M	M	MH	MH
	Moderate-High (MH)	M	M	MH	MH	H
	High (H)	M	MH	MH	H	H

3.7.3.1 Permanent Impacts

Build Alternatives 1 and 2C

Rural Residential Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Permanent impacts for Build Alternatives 1 and 2C, and each key view within the viewshed of the alternatives evaluated, are described below. Table 3.7-3 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts between alternatives for the Rural Residential VAU and associated key views.

Table 3.7-3. Summary of Key View Narrative Ratings for the Rural Residential VAU – Build Alternatives 1 and 2C

Key View	Alternative	Resource Change	Viewer Response	Visual Impact
1	1, 2C, and 4	H	H	**H**
2	1, 2C, and 4	MH	H	**H**

*No changes anticipated under Build Alternatives 1 and 2C.				

All Project Roadways

Build Alternatives 1 and 2C within the Rural Residential VAU would include modifications such as culvert additions, culvert widening, and utility relocations that would appear similar under all build alternatives. The changes would result in new features that are below the road profile and would not stand out in the landscape, slight culvert widenings, and shifted locations of existing features that would all be consistent with the existing visual character of the project corridor. Abandoned portions of Cajalco Road would be restored consistent with Standard Project Measure **PF VIS-1** (contouring and replanting), creating a more natural look where these roadway segments once were so that these segments of abandoned roadway would blend with and recede into the natural landscape.

- **PF VIS-1: Contouring and Replanting Disturbed Areas.** Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory.

Additional changes that would affect specific roadway segments within the Rural Residential VAU are described below.

Cajalco Road between Cowan Road and Seaton Avenue

Permanent impacts would be the same along the portion of Cajalco Road located within Mead Valley, between Cowan Road and Seaton Avenue, for all build alternatives (refer to Figure 2.2-3). The primary visual changes to this portion of the VAU would result from widening the roadway and installing medians and turn lanes, curbs and gutters, sidewalks along portions of the roadway, stormwater facilities, a bridge over Cajalco Creek, noise barriers, and new traffic signals and associated street lights that are being added for safety purposes and are not proposed for the length of the alignment. The roadway would be widened into vacant lands or residential properties along Cajalco Road between Cowan Road and Seaton Avenue. This would require the partial acquisitions of land to increase the roadway surface area from a two-lane rural roadway to a four-lane roadway with associated turn lanes that is more suburban in nature (refer to Figure 2.2-1).

The roadway widening would bring roadway facilities and traffic closer to roadway neighbors; remove formal and informal landscaping, including fencing, mailboxes, and approximately 56 mature trees, 160 small trees and shrubs, and 160 trees associated with a tree farm; and alter entry driveways at the affected properties, resulting in permanent impacts. The project would be constructed consistent with County General Plan Land Use Element Policy LU 31.5, which requires public facilities to be designed to consider their surroundings and visually enhance, not degrade, the character of the surrounding area. Furthermore, Mitigation Measure **VIS-2** is identified to lessen impacts on affected properties by replacing landscape features to the degree possible, minimize visual impacts associated with roadside grading and slopes, and reduce impacts of vegetation removal, under all build alternatives.

Implementation of this measure would not result in additional substantially adverse visual effects. In addition, as described in Section 3.17, *Natural Communities*, construction would require the removal of riparian-riverine trees and shrubs to accommodate roadside grading and a new bridge over Cajalco Creek. Compensatory mitigation identified in Measure **NC-15 (NES BIO-14)**, summarized in Measure **VIS-2**, includes enhancement, restoration, and/or creation on

site, and specifies proposed replacement planting ratios pending the Determination of Biologically Equivalent or Superior Preservation.

Stormwater facilities proposed in coordination with the Riverside County Flood Control and Water Conservation District would result in the most notable visual change along Cajalco Road between Cowan Road and Seaton Avenue because it would result in the full acquisitions, vegetation removal, and replacement of these features with a large stormwater facility under all build alternatives. Full and partial acquisitions would result in the permanent removal of several residential properties and a business between Alexander Street and east of Haines Street, to build the large stormwater facility and to accommodate new turn lanes and storm drains that would connect to existing stormwater facilities (see Sheet 3 of Figure 2.2-3). The large stormwater facility would replace residences, a business, and vegetation with underground culverts with rocked inlets and outlets, a 30-foot-wide concrete-lined channel from Haines to Brown Streets, and a 110-foot-wide earthen channel between Brown and Alexander Streets (see Sheet 2 of Figure 2.2-3).

As shown in the simulation for Key View 1 (Figure 3.7-3) and Key View 2 (Figure 3.7-4), removal of development and vegetation on affected parcels would permanently alter the existing visual character of this residential portion of Cajalco Road and would replace it with a large-scale, anthropogenic, geometric stormwater facility that would contrast with the surrounding developed areas to remain. However, the widened roadway corridor would not greatly detract from the quality of views from the vantage of Key View 3 (Figure 3.7-5), as shown in the simulation, and the changes would allow more direct views toward the hills located south of Three Sisters mountain range.

Security fencing separating Cajalco Road from the open channel, and from residences north of the open channel, would also be added. In addition, iron fencing, a block wall, or a similar type of ornamental fencing is proposed under all build alternatives and would be more aesthetically pleasing compared to chain link fencing.

Between Carpinus Drive and Alexander Street, Cajalco Road would diverge and split into two separate travel ways to cross over Cajalco Creek under all build alternatives (see Sheets 1B and 2 of Figure 2.2-3). The westbound lanes would use a bridge structure, while the eastbound lanes would use a widened replacement culvert, to cross the creek. As shown in the simulation for Key View 4 (Figure 3.7-6), the culvert is not visible and the low-profile bridge would not obstruct or degrade the quality of views from this vantage under all build alternatives. The widened roadway corridor, sidewalk, and curbs and gutters contribute to a view that appears more intact and unified than existing conditions and riparian vegetation removed during construction would be replaced and would naturally recolonize the site within a few years as described in Section 3.17, *Natural Communities*.

Figure 3.7-6
Key View 4, Existing View and Alternatives 1, 2C, and 4 Simulated Conditions
Cajalco Road Widening and Safety Enhancement Project

To alleviate noise impacts on adjacent residences, noise barriers are proposed on the northwest corner of Cajalco and Cowan Roads, and north of Cajalco Road on either side of Extravaganza Lane under all build alternatives (see Sheets 1B and 2 of Figure 2.2-3) (Caltrans 2019). One residence at the northeast corner of Cajalco Road and Extravaganza Lane has an existing cinderblock wall that is between 4 and 5 feet tall. However, the recommended noise barrier height is 8 feet tall at this location (Caltrans 2019). This would introduce a much taller, vertical surface close to residences near where a much shorter, similar structure currently exists. If the noise barriers are designed without aesthetic consideration, the quality of views from residences and local roadways would be degraded by installing a visual barrier under all build alternatives.

Standard Project Measure **PF VIS-3** is identified below to ensure that new noise barriers are visually consistent with existing noise barriers in the project vicinity.

- **PF VIS-3: Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity.** Existing noise barriers in the project vicinity utilize a combination of solid barriers and landscaping to improve site aesthetics. Any noise barriers constructed as a result of the proposed project will be designed and constructed in a manner that complements and blends with nearby existing noise barriers. Aesthetic treatments such as color and/or texture will be considered for the walls, and their compatibility with existing conditions, and with applicable goals and policies of the County, will be considered prior to final design. The County's Resident Engineer, or Project Engineer under contract to the County, will ensure that the aesthetic treatments included in the final Plans, Specifications, and Estimates (PS&E) are implemented by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

Cajalco Road near Lake Mathews Drive

In addition to the changes described above, Build Alternatives 1 and 2C would realign Cajalco Road to the north and move traffic away from the rural residential area within Lake Mathew Estates that is west of Lake Mathews Drive (Sheet 3 of Figure 2.2-2 and Sheet 4 of Figure 2.2-4). At a distance, the relocated, widened roadway corridor under Build Alternatives 1 and 2C would not result in a drastic change to the visual landscape from nearby residences even though areas of cut and fill would be slightly visible, as shown in the simulation for Key View 5 (Figure 3.7-7). However, in closer proximity, the realigned roadway corridor under Build Alternative 1 would be much more prominent in views from nearby residences, as shown in the simulation for Key View 6A (Figure 3.7-8), because large areas of fill would be created, the roadway corridor would stand out in the natural landscape, and it would look like a major highway imposed upon the landscape rather than a small rural roadway that blends with the landscape.

Build Alternative 2C would not create as much of a visual contrast as Build Alternative 1, as shown in the simulation for Key View 6B (Figure 3.7-9), even though new roadside cuts would be larger than existing conditions. The wildlife exclusion fencing does not stand out in views. Views from the new, realigned segment of Cajalco Road are likely to be scenic. Both alternatives would also create a cul-de-sac on Cajalco Road, west of Hollis Lane, and a new roadway connection between this portion of Cajalco Road and Lake Mathews Drive. Creating a cul-de-sac along the existing Cajalco Road would not affect visual resources but is likely to improve views for residences by greatly reducing the amount of traffic they can see. The new roadway connection to Lake Mathews Drive would not affect any residences and would result in minimal vegetation removal.

Scenic Roadways

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. The portions of these County-eligible scenic corridor roadways that fall within the Rural Residential VAU under Build Alternatives 1 and 2C are limited to the segments of Cajalco Road between Hollis Lane and Dirt Road, and between El Sobrante Road and Harley John/Smith Roads, and to residential streets located south of Cajalco Road between Hollis Lane and northwest of Lakeridge Drive.

A small segment of Cajalco Road would be relocated from the Rural Residential VAU to the Open Space VAU, near Lake Mathews Estates, and a cul-de-sac would be created on the old segment of Cajalco Road, retaining the old segment for local traffic, under Build Alternatives 1 and 2C. This minor impact is likely to be perceived as beneficial because large amounts of traffic would be removed from the residential area, allowing for longer views from the roadway of the surrounding scenic views. Widening El Sobrante Road within the Rural Residential VAU would not alter the scenic views for which the roadway is noted. Therefore, these minor, permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU under any of the build alternatives with implementation of the recommended standard measures. Views of scenic roadways from this VAU would not be altered by the permanent visual changes associated with the build alternatives.

Light and Glare

Effects related to light and glare would be the same or very similar within all VAUs under all build alternatives. County staff, working with contractors prior to and during project construction, would make sure that no lighting is aimed toward homes and businesses within the Rural Residential, Suburban Residential, and Commercial VAUs. Please refer to Standard Project Measure **PF VIS-4** below for additional details regarding lighting standards and coordination.

Build Alternatives 1 and 2C would result in a nominal increase in daytime glare by increasing the paved area and by removing some of the roadside vegetation that provides shade within all VAUs. However, the pavement would be dark and greatly reduce glare. Within the Rural Residential VAU, roadside trees associated with residences would still be present along the right of way to provide some shade. In addition, Standard Project Measure **PF VIS-1** and **Measure VIS-2** would replace vegetation on affected properties and reduce glare. Therefore, the proposed project would not create a new substantial glare impact for daytime or nighttime views in the area.

Substantial changes to lighting are not proposed along County-eligible scenic roadway segments within this VAU. However, existing traffic signals would be improved or new traffic signals would be installed at Cowan Road/Gustin Road and other intersections in the Rural Residential VAU, along portions of Cajalco Road that are not a County-eligible scenic roadway. Improving existing traffic signals along Cajalco Road and installing new traffic signals at Cowan Road/Gustin Road in Mead Valley, within the Rural Residential VAU, would add an inconsequential amount of light to the project area. If not properly designed, new and relocated street lighting proposed along the project corridor at intersections could substantially affect

nearby roadway neighbors. In particular, light-emitting diode (LED) lighting can negatively affect humans by increasing nuisance light and glare, in addition to increasing ambient light glow, if proper shielding is not provided and blue-rich white light lamps (BRWL) are used (American Medical Association 2016; International Dark-Sky Association 2010a, 2010b, 2015). Studies indicate that a 4000 Kelvin (K) white LED light causes approximately 2.5 times more light pollution than high pressure sodium lighting with the same lumen output, which would affect sensitive receptors, and more than double the perceived brightness of the night sky (Aubé et al. 2013; Falchi et al. 2011, 2016). This would result in a notable source of nighttime light and glare that would substantially affect nighttime views in the area if lighting is not properly designed and shielding is not employed. Implementation of Standard Project Measure **PF VIS-4** is identified below to address the effects associated with street lighting and ensure that changes from project light and glare would be minor and would not result in substantial adverse visual effects under all build alternatives.

- **PF VIS-4: Apply Minimum Lighting Standards.** All artificial outdoor lighting and overhead street lighting will be limited to only those locations where it is absolutely necessary for safety and security requirements, such as intersections. In most cases, lighting will consist of County lighting standards that are up to 35 feet in height, and the minimum required for driver safety. Lighting will be designed using the Illuminating Engineering Society's design guidelines and in compliance with International Dark-Sky Association–approved fixtures. All lighting will be designed to have minimum impact on the surrounding environment and will use downcast, cut-off type fixtures that are shielded and direct the light only toward objects requiring illumination. Therefore, lights will be installed at the lowest allowable height and cast low-angle illumination while minimizing incidental light spill onto adjacent properties or open spaces, or backscatter into the nighttime sky. The lowest allowable wattage will be used for all lighted areas, and the number of nighttime lights needed to light an area will be minimized. Light fixtures will have non-glare finishes that will not cause reflective daytime glare.

  Lighting will be designed for energy efficiency, with daylight sensors or timers with an on/off program. Lights will provide good color rendering with natural light qualities, with the minimum intensity needed for security, safety, and personnel access. Lighting, including light color rendering and fixture types, will be designed to be aesthetically pleasing. Light-emitting diode (LED) lighting will avoid the use of blue-rich white light lamps (BRWL) lamps and use a correlated color temperature that is no higher than 3,000 Kelvin, consistent with the International Dark-Sky Association's Fixture Seal of Approval Program (International Dark-Sky Association 2010a, 2010b, 2015). In addition, LED lights will use shielding to ensure that nuisance glare and light spill does not affect sensitive residential viewers. Technologies to reduce light pollution evolve over time; design measures that are currently available may help but may not be the most effective means of controlling light pollution once the project is designed. Therefore, all design measures used to reduce light pollution will use the technologies available at the time of project design to allow for the highest potential reduction in light pollution.

  The County's Resident Engineer, or Project Engineer under contract to the County, will ensure that the Lighting Plan included in the final Plans, Specifications, and Estimates (PS&E) is implemented by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

Implementation of this measure would not result in additional substantially adverse visual effects.

Summary (Rural Residential VAU)

As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high. The primary changes to the landscape in the Rural Residential VAU that would affect viewer groups and viewer response would be (1) A wider roadway and additional pavement; (2) new bridge structures and drainage features (some concrete-lined); (3) removal of vegetation and trees; (4) increased traffic and truck volumes; and (5) additional hardscape features such as sidewalks, signage, fencing and improved intersection lighting. The roadway widening would result in the permanent conversion of a two-lane rural roadway to a four-lane suburban roadway. The proposed project would utilize Context Sensitive Solutions so that slopes would be gentle, smooth, and well transitioned into the existing adjacent roadside and landforms, avoiding obvious cuts and fills, and improving project aesthetics associated with roadside slopes. Portions of the alignment would widen into vacant lands; however, the most noticeable visual changes would be where the alignment widens into private properties. Impacts on private properties would occur because residential and commercial properties would lose frontage along the roadway, affecting landscape features such as structures, vegetation, fencing, and mailboxes. All build alternatives would have the similar permanent impacts.

Except where Build Alternatives 1 and 2C would realign Cajalco Road away from residences that are south of Lake Mathews, the widening would bring the right of way and traffic closer to residences and businesses under all build alternatives. Build Alternatives 1 and 2C would also include a new connection between Dirt Road and Richey Way south of Lake Mathews. These changes may create a sense of visual encroachment for properties with structures located close to the new right of way or where landscaping would be removed so that views of and from the roadway and traffic would be available where views are presently more screened. While Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible, this measure would not be able to reverse the substantial adverse effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor. This measure would also not reduce the effects associated with structures that would be permanently displaced through implementation of the stormwater facilities under the alternatives. However, many properties within the developed portions of the corridor that are along and just outside the right of way would not be affected or would only be slightly affected by the project.

Widening under all build alternatives would not substantially alter the visual character of lands beyond the right of way because these areas' rights of way would retain their visual character, new roadside slopes would appear compatible with the existing visual character, and views from the expanded roadway corridor that are seen by roadway users would be consistent with existing conditions. However, there would be locations where there would be greater permanent visual impacts, such as where full acquisitions would occur during construction to implement the stormwater facility (refer to Key View 1 on Figures 3.7-2 and 3.7-3).

In addition to Key View 1, areas and user groups associated with Key Views 2, 6A, and 6B are also anticipated to result in high visual impacts; Key Views 3, 4, and 7 are anticipated to result in moderate-high visual impacts; and Key View 5 is anticipated to result in a moderate impact

(refer to Table 3.7-3). As indicated above and in Table 3.7-3, the resulting visual impacts on the existing visual character would range between moderate and high, even with implementation of standard measures. Therefore, these permanent visual changes would result in substantial adverse visual effects under all build alternatives even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**.

Open Space Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Permanent impacts for Alternatives 1 and 2C and each key view are described below. Table 3.7-4 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts between alternatives for the Open Space VAU and associated key views.

Table 3.7-4. Open Space VAU Summary of Key View Narrative Ratings – Build Alternatives 1 and 2C

Key View	Alternative	Resource Change	Viewer Response	Visual Impact
6A	1	H	H	**H**
6B	2C	MH	H	**H**
8	1, 2C, and 4	MH	MH	**MH**
9	1, 2C, and 4	MH	MH	**MH**
10	1, 2C, and 4	M	MH	**MH**
11	1	M	MH	**MH**
12	2C	MH	H	**H**
13*	4	None	L	**None**
14*	4	None	L	**None**
*No changes anticipated under Build Alternatives 1 and 2C.				

The most notable permanent visual change in this VAU would be the widening, realignments of the roadway, and creation of a large stormwater basin southeast of Eagle Canyon Road. Under all build alternatives, the roadway widening would require large areas of cut and fill to accommodate the widening; traverse the undeveloped, hilly terrain; stand out more in the natural landscape; and resemble a highway rather than a rural roadway, as shown in the simulation for Key View 8 (Figure 3.7-10). These changes would alter the existing visual character and degrade the quality of views from the roadway even though the project would be designed so that slopes appear more natural. The proposed project would include Standard Project Measure **PF VIS-5** for proposed basins and larger drainages to ensure the most natural appearance feasible for the introduced features.

- **PF VIS-5: Basin and Flood Control Drainage Facility Treatments**. New or expanded basins and the new flood control drainage facility would be soft-bottom where hydraulically feasible; however, some would need to be concrete-lined. The soft-bottomed basins would further be vegetated where vegetation would not interfere with the intended use of the facilities (i.e., conveyance of water). Seeding with appropriate species would be determined in coordination with a County-approved biologist, and consistent with the requirements of the WRC MSHCP, LM MSHCP, and/or SKR HCP, where applicable.

A vehicular bridge that would follow the existing roadway contours would be built at STA #110, but the bridge would be low-profile and would not result in notable visual changes for roadway travelers or nearby sensitive viewers. The widened bridge at Temescal Creek would also be low-profile, but would be constructed partially within the City of Corona El Cerrito Specific Plan area, which includes Scenic Corridor Design Standards for changes within 500 feet of the Cajalco Road right of way (within the specific plan boundary). The proposed project would include Standard Project Measure **PF VIS-6** for the proposed widened Temescal Creek Bridge to ensure consistency with applicable design guidelines specified in Section 14.7.1 of the City of Corona El Cerrito Specific Plan, and minimize impacts on the County-eligible scenic corridor within the City of Corona.

- **PF VIS-6: Temescal Creek Bridge Design**. Section 14.7.1 of the City of Corona El Cerrito Specific Plan Scenic Corridor Design Standards will be applied in the design and construction of the widened Temescal Creek Bridge:

    1. Outstanding scenic vistas and visual features will be preserved and protected for the enjoyment of the traveling public as viewed from the roadway.

    2. The design and appearance of new structures and/or equipment within scenic corridors will be compatible with the setting or environment.

    6. Trees and other roadside planting will be utilized to protect and enhance the view from the roadway.

    7. Earthmoving operations that expose soil surfaces that would be visible from the scenic corridors will be required to reestablish vegetation to bind the soil, prevent water or wind erosion, and reestablish a natural vegetative appearance.

Roadway widening east of Temescal Creek and Eagle Canyon Creek Road would result in the full acquisition and removal of a residential property north of the roadway and removal of its associated landscaping. Several small stormwater detention basins would also be created along the north and south sides of the roadway under all alternatives. Some of the smaller basins would not affect views but some would require a larger area and vegetation removal to construct the basin, which would slightly degrade views. However, visual changes associated with the project are not likely to affect the quality of views and scenic vistas available from this portion of County-eligible scenic roadway because views from the roadway would not be greatly altered as there are no structures proposed that would interfere with vista views and the changes would not degrade the quality of views available from the roadway under all build alternatives.

In addition, as shown in the simulations for Key View 9 (Figure 3.7-11) and Key View 10 (Figure 3.7-12), the proposed detention basin that would be built southeast of Eagle Canyon Road would introduce a large, inorganic-looking, geometrically shaped basin into views from adjacent sensitive residential receptors where flat land currently exists. Existing views transition smoothly from the foreground to background, with little visual distraction. However, proposed views would bring the roadway closer to the nearby remaining residences, which is likely to be perceived negatively, and make the widened roadway corridor and stormwater facility much more of a focal point in foreground views under all build alternatives. The wildlife exclusion fencing would distract from views even with the color treatment. Partial acquisitions would also likely be required elsewhere in the Open Space VAU and would remove formal and informal

landscaping, fencing, and mailboxes and alter entry drives at the affected properties that would remain under all build alternatives. However, Measure **VIS-2** would lessen impacts on affected properties to the degree possible.

The LM MSHCP area falls within the Open Space VAU. All alternatives would follow a portion of the current alignment for Cajalco Road and widen to either side of the roadway onto vacant reserve lands. Several of the existing curves would be slightly realigned, abandoning small segments of roadway that would be restored, creating a more natural look where these roadway segments once were, as shown in the simulations for Key View 2, Key View 3, and Key View 4 (Figures 3.7-3, 3.7-4, and 3.7-5). Culvert widening and utility relocations would appear similar under all build alternatives and would only result in minor visual changes as the modifications are occurring. In addition, an approximately 10-foot-tall chain link fence with barbed wire rows at the top would be required along Cajalco Road through the LMR to prevent wildlife from crossing the roadway under all build alternatives. The fencing would be powder-coated a darker color to ensure that it is more transparent and recedes into views, instead of being more pronounced as with untreated chain link fencing.

Once the roadway is built and in operation, visual changes would occur intermittently during regular maintenance activities similar to those currently taking place and that are a common visual element. Traffic would increase over time, but the proposed project would aid in alleviating backups on the roadway, reducing the visible presence of traffic congestion.

Build Alternatives 1 and 2C would both follow the current alignment for Cajalco Road and widen to the north onto vacant reserve lands between Lake Mathews Drive and Harley John Road. Between the realigned connection of La Sierra Avenue with Cajalco Road and Lake Mathews Drive, Alternative 1 would follow the current alignment for Cajalco Road and widen to the north onto vacant reserve lands. Both alternatives would require the removal of native shrubs and approximately 32 small trees and shrubs and 16 large mature trees to be removed on either side of Cajalco Road. However, as described in Section 3.17, *Natural Communities*, compensatory mitigation specifies that enhancement, restoration, and/or creation may occur on site, which would replace this vegetation. As shown in the simulation for Key View 11 (Figure 3.7-13), this portion of the project corridor is flatter so Build Alternative 1 would generally follow the natural terrain, without major cut and fill areas. However, the widening would increase the prominence of transportation facilities in this view. Furthermore, as shown in the simulation for Key View 12 (Figure 3.7-14), the realigned segment of Cajalco Road would alter natural terrain, create large areas of cut on vacant reserve lands to the south of the existing corridor, stand out in the natural landscape, and resemble a major highway imposed upon the landscape under Build Alternative 2C. The color-treated wildlife exclusion fencing would recede into views under both build alternatives. Relocating Cajalco Road would not affect views from the existing Cajalco Road, but would create new views that are likely to be scenic from the realigned segments.

Figure 3.7-14
Key View 12, Existing View and Alternative 2C Simulated Conditions
Cajalco Road Widening and Safety Enhancement Project

Widening Cajalco Road under Build Alternatives 1 and 2C would likely still offer scenic vista views and have views that are consistent with the scenic qualities associated with existing views from Cajalco Road, including after realigning portions of the roadway under Alternative 2C. With the addition of new turn lanes and intersections, the widened roadway corridor would be more suburban, rather than rural, in nature under both build alternatives, and Build Alternative 2C would affect undeveloped natural lands and transform them into a transportation corridor with the realignment. Measure **VIS-2** would replace landscape features to the degree possible to reduce the effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor.

Scenic Roadways

Within the Open Space VAU under Build Alternatives 1 and 2C, Cajalco Road between Eagle Canyon Road and Hollis Lane, and between Dirt Road and El Sobrante Road, is a County-eligible scenic corridor that is to be managed in a manner so as to maintain its aesthetic value. The segments of La Sierra Avenue and El Sobrante Road located within the limits of Build Alternatives 1 and 2C are also County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value.

Under Build Alternatives 1 and 2C, roadway widening would require large areas of cut and fill to accommodate the widening and traverse the undeveloped, hilly terrain. A 10-foot-tall chain link fence that would be powder-coated a darker color and topped with barbed wire would be required along Cajalco Road through the Lake Mathews Reserve area to prevent wildlife from crossing the roadway. The fence coloring would ensure that the fencing is relatively transparent and recedes into views. This would help to minimize the impacts of views from the scenic corridor.

As shown in the simulation for Key View 8 (Figure 3.7-10), Build Alternatives 1 and 2C would be more prominent in views because the widened and realigned roadway corridor would look like a highway, rather than a small rural roadway, which stands out more in the natural landscape. The wildlife exclusion fencing would be visible but would recede into views due to its color treatment. The project would alter the existing visual character by making landform alterations and pronounced roadside cuts that degrade the quality of views from the roadway even though slopes would be designed to appear more natural. Widening the roadway surface area from a two-lane rural roadway to a four-lane roadway with associated turn lanes and new intersections would appear more suburban in nature. However, these changes are not likely to affect the quality of scenic views available from this portion of County-eligible scenic roadways because views from the roadway would not be greatly altered, there are no structures proposed that would interfere with vista views, and changes would not degrade the quality of views available from the roadway.

Build Alternative 1 would result in the least amount of change to the existing visual character of Cajalco Road. Realignment under Alternative 2C would result in a similar visual experience as the existing alignment and have high-quality views to the surrounding landscape, but it would shift the locations of where views are experienced.

Overall, Build Alternatives 1 and 2C would offer scenic vista views and have views that are consistent with the scenic qualities for which Cajalco Road, La Sierra Avenue, and El Sobrante Road qualified when considered by the County as scenic-eligible roadways. Therefore,

permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU under all build alternatives with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measure **VIS-2**.

Light and Glare

Effects related to light and glare would be the same or very similar within all VAUs under all build alternatives. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses within the Rural Residential, Suburban Residential, and Commercial VAUs, consistent with Standard Project Measure **PF VIS-4**. Vegetation on affected properties would also be replaced under Standard Project Measure **PF VIS-1** and Measure **VIS-2** and reduce glare. Therefore, the proposed project would not create a new substantial glare impact for daytime or nighttime views in the area.

Under Build Alternatives 1 and 2C, existing traffic signals would be improved or new traffic signals would be installed at Eagle Canyon Road, La Sierra Avenue, Lake Mathews Drive, and other intersections in the Open Space VAU, along portions of Cajalco Road that are County-eligible scenic roadway. Improving existing traffic signals along Cajalco Road at La Sierra Avenue and El Sobrante Road, and installing new traffic signals at a new intersection west of Lake Mathews Drive, at Lake Mathews Drive, Archer Road, and Kirkpatrick Road, within the Open Space VAU would add an inconsequential amount of light to the project area. If not properly designed, new and relocated street lighting proposed along the project corridor at intersections could substantially affect nearby roadway neighbors. In particular, LED lighting can negatively affect humans by increasing nuisance light and glare, in addition to increasing ambient light glow, if proper shielding is not provided and BRWL are used (American Medical Association 2016; International Dark-Sky Association 2010a, 2010b, 2015). Studies indicate that a 4000 K white LED light causes approximately 2.5 times more light pollution than high pressure sodium lighting with the same lumen output, which would affect sensitive receptors, and more than double the perceived brightness of the night sky (Aubé et al. 2013; Falchi et al. 2011, 2016). This would result in a notable source of nighttime light and glare that would substantially affect nighttime views in the area if lighting is not properly designed and shielding is not employed. Such impacts would also occur within the Open Space VAU from relocating the traffic signals and lights at the Cajalco Road intersection with La Sierra Avenue if BRWL LED is used. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that project light and glare would not result in substantial adverse visual effects under all build alternatives.

Summary (Open Space VAU)

As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high. The primary changes to the landscape in the Open Space VAU that would affect viewer groups and viewer response would be (1) a wider roadway and additional pavement; (2) new bridge structures and drainage features (some concrete-lined); (3) removal of vegetation, including approximately 32 small trees and shrubs and 16 large mature trees; (4) increased traffic and truck volumes; and (5) additional hardscape features such as sidewalks, signage, fencing, and improved intersection lighting. Relocated utilities, culvert widening and new bridges, and modified driveways would not alter the visual character of views

of and from the project corridor, because the visual changes would not be very noticeable when seen in conjunction with the widened roadway corridor.

The roadway widening would permanently increase the roadway surface area from a two-lane rural roadway to a four-lane roadway with suburban features such as turn lanes and additional intersections. The widening would bring the right of way closer to residents and create a sense of visual encroachment for properties located close to the new right of way or where vegetation removal would open up views of and from the roadway. While Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible, this measure would not be able to reverse the substantial adverse effects experienced by some roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor. This measure would also not reduce the effects associated with structures that would be permanently displaced through widening under the build alternatives. However, the removal of structures on affected properties and changes to landscaping, fencing, and other landscape features would not substantially alter the existing visual character of lands adjacent to the project corridor or views of these areas from the project corridor, except for where the stormwater basin is located.

Views from the expanded roadway corridor, as seen by roadway users, would be consistent with existing conditions because lands outside the right of way would retain their visual character and new roadside slopes would appear mostly compatible with the existing visual character. Widening would not substantially alter visual resources along El Sobrante Road within the Open Space VAU. In addition, widening would not substantially affect visual resources along the segment of Cajalco Road within the Open Space VAU where it would generally follow the current alignment under Build Alternative 1 and portions of Build Alternative 2C. However, new areas of cut and fill would alter the visual character of Cajalco Road because they would be larger and more pronounced than existing conditions. Under Build Alternative 2C, realignment of a portion of Cajalco Road would affect natural lands that are undeveloped and transform them into a transportation corridor roadway, having a greater impact on visual resources within this VAU and the LM MSHCP area than under Build Alternative 1; Build Alternative 2C would further alter the viewer experience for roadway users. Build Alternative 4 would result in the greatest visual change because the proposed relocation of La Sierra Avenue is within an area of greater topographical variation, which would result in the need for larger landform alterations and areas of cut and fill that would create landscape scarring and require the use of artificial retaining features. This would alter the existing visual character of the project area and may degrade the quality of views in some areas, as seen from La Sierra Avenue.

Permanent visual changes would result in a resource change to this VAU that is moderate-high to high. The resulting visual impacts on scenic views and existing visual character would be moderate-high to high even with Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measure **VIS-2**. Therefore, these permanent visual changes would result in substantial adverse visual effects on visual character and quality. In addition, Build Alternative 2C may also result in substantial adverse visual effects on scenic vistas because roadway realignment would alter the availability of existing scenic vistas. However, the realignments may introduce new scenic vista views that may be of value. No scenic vistas would be affected under Build Alternative 1.

Suburban Residential Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Permanent impacts for Build Alternatives 1 and 2C within the Suburban Residential VAU are described below. Table 3.7-5 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts for the Suburban Residential VAU and its associated view.

Table 3.7-5. Suburban Residential VAU Summary of Key View Narrative Ratings – Build Alternatives 1 and 2C

Key View	Alternative	Resource Change	Viewer Response	Visual Impact
N/A	1, 2C, and 4	L	MH	M
13*	4	None	L	None
*No changes anticipated under Build Alternatives 1 and 2C.				

Under Build Alternatives 1 and 2C, the proposed project would widen the existing corridor near Wood Road to accommodate a widened median and a new turn lane for westbound traffic onto Wood Road. Slight widening would also occur near Carpinus Drive to accommodate a turn lane for eastbound traffic onto Carpinus Drive. A new sidewalk would also be added to the north side of Cajalco Road. No vegetation or structures would be affected by construction at this location. The primary views of the roadway are from second-story windows of residences bordering Cajalco Road, and existing noise barriers surrounding residential areas, residential landscaping, and landscaping along Cajalco Road would block views of visual changes from ground levels and from residences north of Rocky Summit Drive. Also, much of the affected segments of Cajalco Road were previously widened to four lanes. Therefore, visible changes during construction would be very minor and the overall visual impact would be moderate.

Standard Project Measure **PF VIS-1** and Measure **VIS-2** would lessen potential visual impacts associated with vegetation loss to the extent possible. In this area, available sightlines to the mountains and foothills would remain largely unobstructed. The roadway would become a more prominent visual element, but, generally, the introduction of the proposed project's built elements would not substantially reduce the overall visual quality at this view or within similar viewsheds, nor would it compromise the visual character therein. Proposed project changes would be somewhat compatible with the existing visual setting and land uses. There are no scenic vista views within this VAU, so scenic vistas would not be affected.

Once the widened roadway is built and in operation, intermittent visual changes would occur during regular maintenance activities similar to those currently in use and are a common visual element. Traffic would increase over time, but the proposed project would aid in alleviating backups on the roadway, reducing the visible presence of traffic congestion.

Scenic Roadways

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El

Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. No County-eligible scenic corridors within the Suburban Residential VAU are within or would be affected by Build Alternatives 1 and 2C. Therefore, no permanent visual changes as a result of Build Alternatives 1 and 2C would affect scenic roadways or views of scenic roadways from this VAU.

Light and Glare

Effects related to light and glare would be the same or very similar within all VAUs under all build alternatives. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses within the Rural Residential, Suburban Residential, and Commercial VAUs. The proposed project would result in a nominal increase in daytime glare by increasing the paved area and by removing some of the roadside vegetation that provides shade within all VAUs. However, the pavement would be dark and greatly reduce glare. Within the Suburban Residential VAU, roadside trees associated with residences would still be present along the right of way to provide some shade. In addition, Standard Project Measure **PF VIS-1** and Measure **VIS-2** would replace vegetation on affected properties and reduce glare within this VAU.

Within the Suburban Residential VAU, existing traffic signals at the intersection of Cajalco Road and Wood Road would be improved, and new traffic signals would be installed at the intersection of Cajalco Road and Carpinus Street, which are not County-eligible scenic roadways. The lighting changes would add an inconsequential amount of light within the VAU. If not properly designed, new and relocated street lighting could substantially affect nearby roadway neighbors. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that changes from project light and glare would be minor and would not result in substantial adverse visual effects under all build alternatives.

Therefore, the proposed project would not create a new substantial glare impact for daytime or nighttime views in the area.

Summary (Suburban Residential VAU)

As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high. Viewers within the project area are familiar with the segment of Cajalco Road and El Sobrante Road within this VAU that is the same width as the proposed widening, and the proposed alternatives are consistent with the existing visual environment. In addition, the proposed widening would not substantially alter visual resources along this segment of Cajalco Road and El Sobrante Road. Therefore, the proposed widening would not be an eyesore and would not substantially alter the existing visual character of the project area, as seen from the Suburban Residential VAU.

Permanent visual changes would result in a resource change to this VAU that is low under Build Alternatives 1 and 2C. The resulting visual impacts on the existing visual character and quality would be moderate under Build Alternatives 1 and 2C with Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**. Therefore, permanent visual changes would not result in substantial adverse visual effects under Build Alternatives 1 and 2C. There are no scenic vista views within this VAU; therefore, no scenic vistas would be affected.

Commercial Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Permanent impacts for Build Alternatives 1 and 2C are described below. Table 3.7-6 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts for all build alternatives for the Commercial VAU.

Table 3.7-6. Commercial VAU Summary of Key View Narrative Ratings – Build Alternatives 1, 2C, and 4

Key View	Alternative	Resource Change	Viewer Response	Visual Impact
N/A	1, 2C, and 4	L	MH	M

Widening under all build alternatives would not substantially alter the visual character of views seen from this VAU because the lands outside the right of way would retain their visual character, new roadside slopes would appear compatible with the existing visual character, and views from the modified roadway corridors would be consistent with existing conditions. However, widening at the eastern terminus would require reconstruction and widening of the Ramona Expressway Overhead Bridge (Bridge No. 56-C196) over Burlington Northern Santa Fe Railroad, removal of approximately 15 small trees/shrubs along the south side of Cajalco Expressway near Seaton Avenue that are associated with residential land uses, and 12 mature trees would need to be removed east of Harvill Avenue, along vacant lands, to accommodate the slight widening and new sidewalks.

Widening at the western terminus between Temescal Canyon Road and Temescal Creek would occur on vacant land along the roadway corridor and would be consistent with existing conditions and the widened roadway corridor west of Temescal Canyon Road. Widening would not affect or disrupt the quality of scenic vista views associated with this VAU. Approximately 15 small trees and large shrubs and 8 mature trees would be removed. Views of traffic using Cajalco Road from this VAU would not differ compared to current conditions under all build alternatives.

Therefore, permanent visual changes would result in a resource change to this VAU that is low. As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high. The resulting visual impacts on scenic vista views and the existing visual character and quality would be moderate with Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**. Measure **VIS-2** would lessen impacts on affected properties to the degree possible by replacing landscaping and site features. Removal of two or three trees adjacent to the freeway overpass may affect the landscaped freeway designation because vegetation in this area is already sparse and removal may be deemed negative under all build alternatives. Mitigation Measure **VIS-8** would ensure that vegetation removed along this portion of landscaped freeways is replanted.

Scenic Roadways

As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a

manner so as to maintain their aesthetic value. The portions of these roadways that are County-eligible scenic corridors within the Commercial VAU under Build Alternatives 1 and 2C include the section of Cajalco Road between I-15 and Eagle Canyon Road. Widening Cajalco Road and the Temescal Creek Bridge within the Commercial VAU would not alter the scenic views for which the roadway is noted. Therefore, permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU, and views of scenic roadways from this VAU would not be altered by the permanent visual changes, under Build Alternatives 1 and 2C.

Light and Glare

Effects related to light and glare within the Commercial VAU would be the same or very similar to existing conditions under Build Alternatives 1 and 2C. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses. Standard Project Measure **PF VIS-1** and Measure **VIS-2** would replace vegetation on affected properties and reduce glare. Existing traffic signals at the intersections of Cajalco Road with Harvill Avenue and Temescal Canyon Road would be improved, and new traffic signals would be installed at the intersections of Cajalco Road with Seaton Avenue and Eagle Valley Road. The lighting changes would add an inconsequential amount of light within the VAU. If not properly designed, new and relocated street lighting could substantially affect nearby roadway neighbors. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that changes from project light and glare would be minor and would not result in substantial adverse visual effects under all build alternatives.

Therefore, the proposed project would not create a new substantial glare impact for daytime or nighttime views in the area.

Summary (Commercial VAU)

Viewers within the project area are familiar with widened segments of Cajalco Road within this VAU, and the proposed alternatives are consistent with the existing visual environment. In addition, the widening would not substantially alter visual resources in the project area. Therefore, the proposed widening would not be an eyesore and would not substantially alter the existing visual character of the project area, as seen from the Commercial VAU. As a result, permanent visual changes would not result in substantial adverse visual effects on scenic vista views or existing visual character and quality under all build alternatives with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Mitigation Measures **VIS-2** and **VIS-8**.

Build Alternative 4 – El Sobrante Alignment

Rural Residential Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Permanent impacts for Build Alternative 4, and each key view within the viewshed of the alternative evaluated, are described below. Table 3.7-7 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts between alternatives for the Rural Residential VAU and associated key views.

Table 3.7-7. Summary of Key View Narrative Ratings for the Rural Residential VAU – Build Alternative 4

Key View	Alternative	Resource Change	Viewer Response	Visual Impact
1	1, 2C, and 4	H	H	H
2	1, 2C, and 4	MH	H	H
3	1, 2C, and 4	M	H	MH
4	1, 2C, and 4	M	MH	MH
5	1 and 2C	None	L	None
6A*	1	None	L	None
6B*	2C	None	L	None
7	4	MH	MH	MH
*No changes anticipated under Build Alternative 4.				

All Project Roadways

Build Alternative 4 within the Rural Residential VAU would include modifications such as culvert additions, culvert widening, and utility relocations that would appear similar under all build alternatives. With the exception of roadway segments discussed separately below, most of the changes associated with new features would occur below the road profile and would not stand out in the landscape, and would involve slight culvert widenings and shifted locations of existing features that would all be consistent with the existing visual character of the project corridor. Abandoned portions of Cajalco Road and El Sobrante Road would be restored consistent with Standard Project Measure **PF VIS-1** (contouring and replanting), creating a more natural look where these roadway segments once were so that these segments of abandoned roadway would blend with and recede into the natural landscape.

Additional changes that would affect specific roadway segments within the Rural Residential VAU are described below.

Cajalco Road between Cowan Road and Seaton Avenue

Permanent impacts under Build Alternative 4 for the portion of Cajalco Road located within Mead Valley, between Cowan Road and Seaton Avenue, would be the same as what is described for Build Alternatives 1 and 2C (refer to Figure 2.2-3). The project would be constructed consistent with County General Plan Land Use Element Policy LU 31.5, which requires public facilities to be designed to consider their surroundings and visually enhance, not degrade, the character of the surrounding area. Furthermore, Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-3**, and Measure **VIS-2,** are identified to lessen impacts on affected properties by replacing landscape features to the degree possible, minimize visual impacts associated with roadside grading and slopes under all build alternatives, and ensure that new noise barriers are visually consistent with existing noise barriers in the project vicinity.

El Sobrante Road between McAllister Street and Cajalco Road

Under Build Alternative 4, widening would mostly occur to the north of the existing roadway, into vacant lands along the length of El Sobrante Road or residential or commercial properties between McAllister Street and Vista Del Lago Drive, to avoid reserve lands and a large

underground MWD pipe under El Sobrante Road (refer to Sheets 3B and 4B of Figure 2.2-5). Roadside grading would have small areas of cut and fill that would transition naturally to the existing terrain and would require erosion control measures to vegetate exposed soils, which would minimize visual impacts from earthwork. Therefore, the primary visual changes to this portion of the VAU would result from widening the roadway and installing medians and turn lanes, and new traffic signals and associated safety lighting at intersections.

Construction would require partial acquisition of lands; removal of formal and informal landscaping, vegetation, fencing, mailboxes, approximately 400 small trees/shrubs (of which 306 are trees associated with orchards and nurseries), and approximately 114 mature trees; and alteration of entry drives at the affected properties to accommodate the widened roadway and right of way along the segment of El Sobrante Road between McAllister Street and Vista Del Lago Drive. These visual features contribute to providing an attractive appearance along the roadway. In addition, Measure **VIS-2** would lessen impacts on affected properties to the degree possible. Two residential structures along the north side of El Sobrante Road are also present; an expanded roadway corridor and roadside slopes would take the place of the residential structures and associated vegetation.

Removal of development and vegetation on affected parcels would alter the existing visual character of these residential properties, but would not contribute to substantially altering the overall visual character and quality of views from this portion of El Sobrante Road under Build Alternative 4. The most notable visual change would be from the conversion of a two-lane rural roadway to a four-lane roadway with more suburban features such as turn lanes and additional intersections. However, most roadway neighbors are not directly adjacent to the roadway and most viewers are oriented away from El Sobrante Road, so widening would not affect their views. In addition, scenic vista views available from El Sobrante Road would not be affected by these changes because there are no structures proposed that would interfere with vista views, and the changes would not degrade the quality of views available from the roadway.

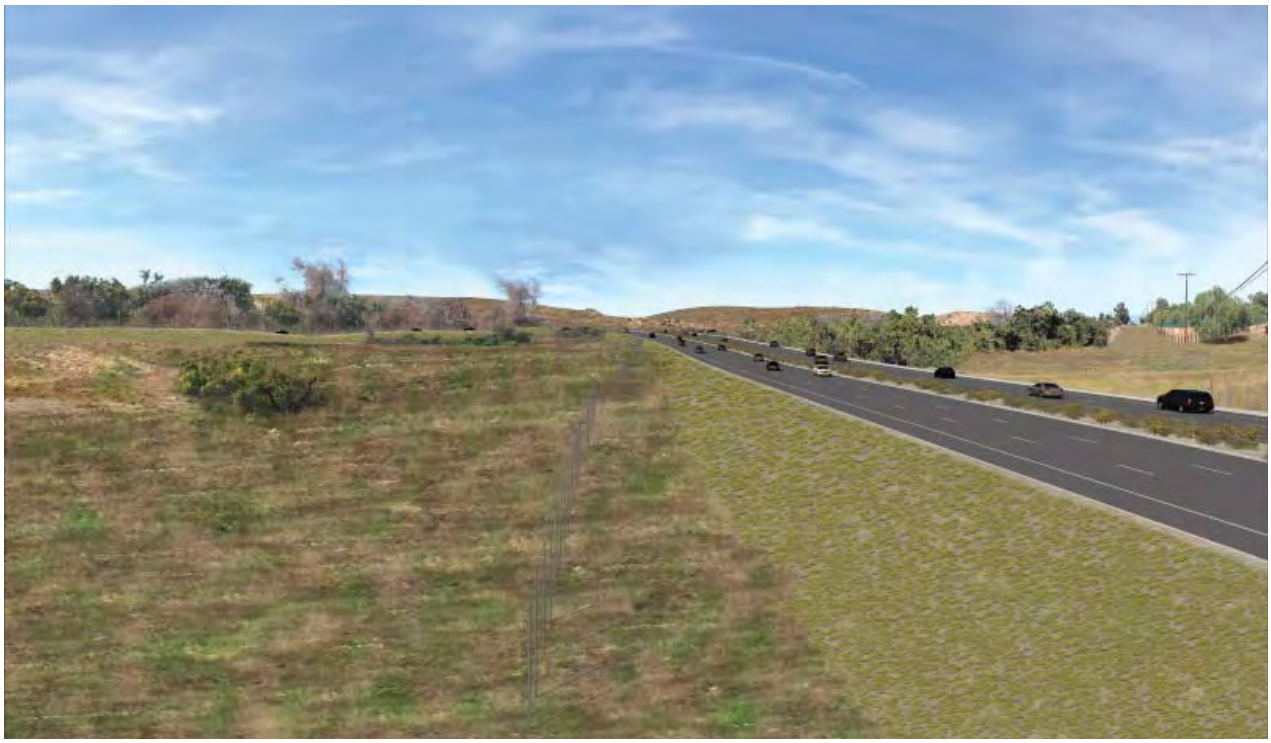
El Sobrante Road between Cajalco Road and Harley John Road

The connection of El Sobrante Road to Cajalco Road would be realigned, the intersection of Harley John and Cajalco Roads would also be realigned, and a cul-de-sac would be installed at Harley John Road under Build Alternative 4 (see Sheet 6 of Figure 2.2-5). As shown in the simulation for Key View 7 (Figure 3.7-15), the realigned El Sobrante Road would provide expanded views of the adjacent foothills for motorists. Creating a cul-de-sac along the existing Harley John Road would not affect visual resources but may improve views (for some residences that front on Harley John Road) slightly by reducing the amount of traffic the residents can see. The realigned connection of Harley John Road to Cajalco Road would go behind the existing residences along Harley John Road, would not affect any residential structures, and would result in minimal vegetation removal.

Visual changes along El Sobrante Road would not result in substantial adverse visual effects on most scenic resources under Build Alternative 4 with Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**.

Existing View

Simulation



\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\VIA\EIS

Figure 3.7-15
Key View 7, Existing View and Alternative 4 Simulated Conditions
Cajalco Road Widening and Safety Enhancement Project

Scenic Roadways

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. The portions of these roadways that are County-eligible scenic corridors within the Rural Residential VAU under Build Alternative 4 include Cajalco Road between El Sobrante Road and Harley John/Smith Roads, and El Sobrante Road between McAllister Street and Cajalco Road. Due to the existing topography and land uses, the south side of this segment of County-eligible scenic El Sobrante Road also falls within the Open Space VAU. Under Build Alternative 4, the east end of El Sobrante Road would be relocated out of the Open Space VAU into the Rural Residential VAU at its east end, and intersect with Harley John Road.

A cul-de-sac would be created on the old segment of Harley John Road, north of Cajalco Road. This may improve visual character at this location because large amounts of traffic would be removed from the residential area, allowing for longer views from the roadway of the surrounding scenic views. Widening El Sobrante Road within the Rural Residential VAU would not alter the scenic views for which the roadway is noted. Therefore, permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU under Build Alternative 4 with Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**. Views of scenic roadways from this VAU would also not be substantially altered by the permanent visual changes associated with Build Alternative 4.

Light and Glare

Effects related to light and glare would be the same or very similar within all VAUs under all build alternatives. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses within the Rural Residential, Suburban Residential, and Commercial VAUs. Build Alternative 4 would result in a nominal increase in daytime glare by increasing the paved area and by removing some of the roadside vegetation that provides shade within all VAUs. However, the pavement would be dark and greatly reduce glare. Within the Rural Residential VAU, roadside trees associated with residences would still be present along the right of way to provide some shade. In addition, Standard Project Measure **PF VIS-1** and Measure **VIS-2** would replace vegetation on affected properties and reduce glare.

New traffic signals would be constructed along portions of County-eligible scenic roadways at the following intersections: El Sobrante Road and McAllister Street, El Sobrante Road and Mockingbird Canyon Road, new intersection of El Sobrante Road with Harley John Road, and new intersection of Cajalco Road with Cowan/Gustin Roads. The new traffic lights would add an inconsequential amount of light to the project area. If not properly designed, new and relocated street lighting proposed along the project corridor at intersections could substantially affect nearby roadway neighbors. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that changes from project light and glare would be minor and would not result in substantial adverse visual effects. Therefore, the proposed project would not create a new substantial glare impact for daytime or nighttime views in the area.

Open Space Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Permanent impacts for Alternative 4 and each key view are described below. Table 3.7-8 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts between alternatives for the Open Space VAU and associated key views.

Table 3.7-8. Open Space VAU Summary of Key View Narrative Ratings – Build Alternative 4

Key View	Alternative	Resource Change	Viewer Response	Visual Impact
6A*	1	None	L	None
6B*	2C	None	L	None
8	1, 2C, and 4	MH	MH	MH
9	1, 2C, and 4	MH	MH	MH
10	1, 2C, and 4	M	MH	MH
11*	1	None	MH	None
12**	2C	None	None	None
13	4	MH	MH	MH
14	4	MH	MH	MH

*No changes anticipated under Build Alternative 4.
**No viewer group under Build Alternative 4.

Under Build Alternative 4, widening along El Sobrante Road would result in the same impacts as described under the Rural Residential VAU for between McAllister Street and Cajalco Road. The primary visual changes to this VAU would result from widening the roadway and installing medians and turn lanes, and new traffic signals and associated street lights. However, there are no recreational viewers associated with the Open Space VAU and the minor roadside changes would not affect views for MWD employees in this VAU. Therefore, the most notable visual change would be that roadway widening would increase the roadway surface area from a two-lane rural roadway to a four-lane roadway with suburban features such as turn lanes and additional intersections, and the realignment of La Sierra Avenue. However, scenic vista views available from El Sobrante Road would not be affected by these changes because there are no structures proposed that would interfere with vista views and the changes would not degrade the quality of views available from the roadway.

West of McAllister Street, widening would also mostly occur to the north, but the realigned intersection of El Sobrante Road and La Sierra Avenue would affect the MWD Lake Mathews facility entrances and associated vegetation under Alternative 4. However, Standard Project Measure **PF VIS-1** and Measure **VIS-2** would lessen impacts on the entrance to the degree possible. As shown in the simulation for Key View 13 (Figure 3.7-16), the realigned intersection of El Sobrante Road and La Sierra Avenue would also result in the introduction of the widened roadway, shoulder, and unpaved median into the viewshed, where existing utility poles and light roadside vegetation would be removed to accommodate the proposed project changes. Standard Project Measure **PF VIS-1** and Measure **VIS-2** would lessen potential visual impacts associated with vegetation loss to the extent possible.

Figure 3.7-16 Key View 13, Existing View and Alternative 4 Simulated Conditions

Existing View

Simulation

\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\VIA\EIS

Figure 3.7-16
Key View 13, Existing View and Alternative 4 Simulated Conditions
Cajalco Road Widening and Safety Enhancement Project

In this area, available sightlines to the mountains and foothills would remain largely unobstructed. The roadway would become a more prominent visual element, but, generally, the introduction of the proposed project's built elements would not substantially reduce the overall visual quality at this view or within similar viewsheds.

The greatest visual change in this VAU would be the widening and realignment of La Sierra Avenue under Build Alternative 4, which would require large areas of cut and fill to accommodate the widening and traverse the undeveloped, hilly terrain. In addition, an approximately 1,800-foot-long arch bridge would be constructed along the realigned section of La Sierra Avenue, introducing new bridge infrastructure where none presently exists. As shown in the simulation for Key View 14 (Figure 3.7-17), the realignment would introduce several permanent elements that do not currently exist within that viewshed, including the bridge, paved and widened roadway and shoulder, unpaved median, wildlife corridor fencing, graded roadway shoulders and slopes, and vehicular traffic. This would also remove existing scenic vista views that are available along the current roadway alignment. The realignment would contain more human-made features than the existing alignment and would be more suburban in nature with the addition of turn lanes and intersections.

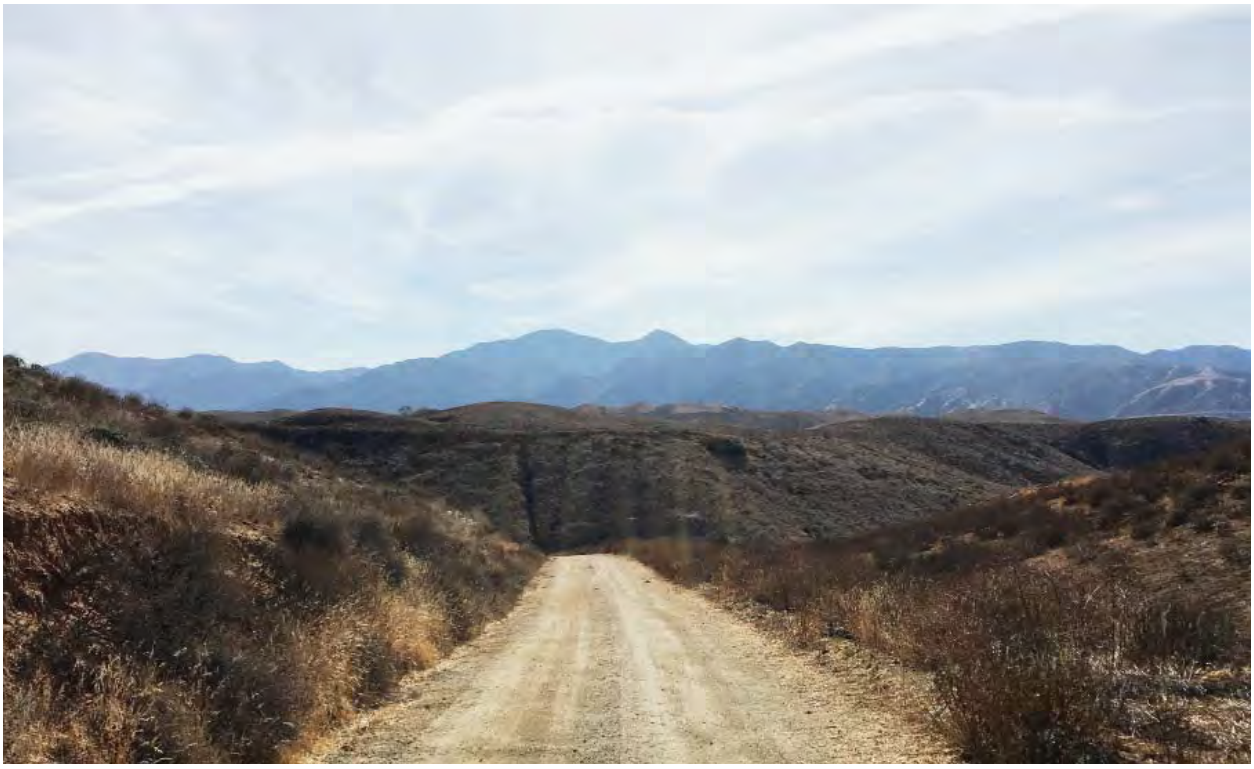
Scenic Roadways

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. The portions of these roadways that are County-eligible scenic corridors within the Open Space VAU under Build Alternative 4 include: Cajalco Road between Eagle Canyon Road and La Sierra Avenue; La Sierra Avenue between Cajalco Road and Blackburn Road; and El Sobrante Road between La Sierra Avenue and Cajalco Road. Due to the existing topography and land uses (setting), the north side of the segment of County-eligible scenic El Sobrante Road between Mc Allister Street and Cajalco Road also falls within the Rural Residential VAU.

A portion of La Sierra Avenue would also be relocated under Build Alternative 4, removing views from a portion of the existing roadway, but new views would be created from the realigned segments that are likely to be scenic. However, this realignment would require large cuts and fills and structures because of the hillier terrain. Also, the east end of El Sobrante Road would be relocated out of the Open Space VAU, and intersect with Harley John Road within the Rural Residential VAU.

Overall, Build Alternative 4 would still offer scenic vista views and have views that are consistent with the scenic qualities for which Cajalco Road, La Sierra Avenue, and El Sobrante Road qualified when considered by the County as scenic-eligible roadways. Widening El Sobrante Road within the Rural Residential/Open Space VAUs would not substantially alter the scenic views for which the roadway is noted. Therefore, permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU under Build Alternative 4 with implementation of the recommended standard measures. Views of scenic roadways from this VAU would not be substantially altered by the permanent visual changes associated with the build alternatives.

Existing View



Simulation

\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\VIA\EIS

Figure 3.7-17
Key View 14, Existing View and Alternative 4 Simulated Conditions
Cajalco Road Widening and Safety Enhancement Project

Light and Glare

Effects related to light and glare would be the same or very similar within all VAUs under all build alternatives. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses. Standard Project Measure **PF VIS-1** and Measure **VIS-2** would replace vegetation on affected properties and reduce glare. Therefore, the proposed project would not create a new substantial glare impact for daytime or nighttime views in the area.

Within the Open Space VAU under Build Alternative 4, new traffic signals would be constructed along portions of County-eligible scenic roadways at the following intersections: Cajalco Road and Eagle Canyon Roa, and new intersection of Cajalco Road and realigned La Sierra Avenue; La Sierra Avenue and El Sobrante Road; El Sobrante Road and McAllister Street; and El Sobrante Road and Mockingbird Canyon Road. The new traffic lights would add an inconsequential amount of light to the project area. If not properly designed, new and relocated street lighting proposed along the project corridor at intersections could substantially affect nearby roadway neighbors. In particular, LED lighting can negatively affect humans by increasing nuisance light and glare, in addition to increasing ambient light glow, if proper shielding is not provided and BRWL are used (American Medical Association 2016; International Dark-Sky Association 2010a, 2010b, 2015). Studies indicate that a 4000 K white LED light causes approximately 2.5 times more light pollution than high pressure sodium lighting with the same lumen output, which would affect sensitive receptors, and more than double the perceived brightness of the night sky (Aubé et al. 2013; Falchi et al. 2011, 2016). This would result in a notable source of nighttime light and glare that would substantially affect nighttime views in the area if lighting is not properly designed and shielding is not employed. Such impacts would also occur within the Open Space VAU from relocating the traffic signals and lights at the Cajalco Road intersection with La Sierra Avenue if BRWL LED is used. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that changes from project light and glare would be minor and would not result in substantial adverse visual effects.

Summary (Open Space VAU)

As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high. Relocated utilities, culvert widening and new bridges, and modified driveways would not alter the visual character of views of and from the project corridor because modifications would only result in visual changes that would not be very noticeable when seen in conjunction with the widened roadway corridor.

The roadway widening would permanently increase the roadway surface area from a two-lane rural roadway to a four-lane roadway with suburban features such as turn lanes and additional intersections. The widening would bring the right of way closer to residents and create a sense of visual encroachment for properties located close to the new right of way or where vegetation removal would open up views of and from the roadway. While Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible, this measure would not be able to reverse the substantial adverse effects experienced by some roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor. This measure would also not reduce the effects associated with structures that would be permanently displaced through widening under the build alternatives. However, the removal of

structures on affected properties and changes to landscaping, fencing, and other landscape features would not substantially alter the existing visual character of lands adjacent to the project corridor or views of these areas from the project corridor, except for where the stormwater basin is located.

Views from the expanded roadway corridor, as seen by roadway users, would be consistent with existing conditions because lands outside the right of way would retain their visual character and new roadside slopes would appear mostly compatible with the existing visual character. Widening would alter visual resources along El Sobrante Road within the Open Space VAU. In addition, widening would affect visual resources along the segment of Cajalco Road within the Open Space VAU where it would generally follow the current alignment of Cajalco Road. However, new areas of cut and fill would alter the visual character of Cajalco Road because they are likely to be larger and more pronounced than existing conditions. Build Alternative 4 would result in a greater visual change than Build Alternatives 1 and 2C because the proposed relocation of La Sierra Avenue is within an area of greater topographical variation, which would result in the need for larger landform alterations and areas of cut and fill that would create landscape scarring and require the use of artificial retaining features. This would alter the existing visual character of the project area and may degrade the quality of views in some areas, as seen from La Sierra Avenue.

Permanent visual changes would result in a resource change to this VAU that is moderate-high to high. The resulting visual impacts on scenic views and existing visual character would be moderate-high to high even with implementation of the Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measure **VIS-2**. Therefore, these permanent visual changes would result in substantial adverse visual effects on visual character and quality under Build Alternative 4.

As in Key View 13, despite the introduction of these changes under Build Alternative 4, available sightlines to the mountains and foothills would be maintained, preserving the most important visual resources at this viewpoint location. The introduction of these human-made elements at Key View 14 would reduce the view's visual quality. While these changes would alter the existing visual character by making roadside cuts more pronounced, degrading the quality of views from the roadway, the changes would not constitute a substantial visual effect because most views would be transitory (roadway users/motorists); the visible features would lack substantial vertical profile and would not obstruct sightlines to visual resources; and the new bridge, roadway, and support structures would replace an existing graveled roadway. The arch bridge and smaller roadway bridges proposed west of Lake Mathews would further include architectural treatments consistent with County design standards that would lessen potential visual impacts associated with the introduction of the new structures, to the extent possible. These architectural treatments would be applied under Standard Project Measure **PF VIS-7**, below:

- **PF VIS-7: New Bridge Architectural Treatments.** Aesthetic treatments, such as color and/or texture, that are consistent with County design and engineering standards, and complement area conditions, will be applied to new bridge structures.

Under Build Alternative 4, scenic vista views would not be substantially affected because the proposed project would not introduce features that would block or alter such views. Although

views from El Sobrante Road would not be substantially altered, there would be substantial landform alterations along La Sierra Avenue. The large cut slopes and suburban feel of the widened roadway with increased traffic controls would result in alterations to the visual character and would increase the prominence of roadway infrastructure, which would degrade views associated with the corridor. In addition, under Build Alternative 4, impacts on the MWD Lake Mathews facility would occur because the entrances would be affected by the intersection realignment, as described above, affecting vegetation and fencing. Measure **VIS-2** would replace landscape features to the degree possible to reduce the effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor.

Suburban Residential Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Permanent impacts for Build Alternative 4, and each key view within the viewshed of the alternative evaluated, are described below. Table 3.7-9 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts between alternatives for the Suburban Residential VAU and associated key views.

Table 3.7-9. Suburban Residential VAU Summary of Key View Narrative Ratings – Build Alternative 4

Key View	Alternative	Resource Change	Viewer Response	Visual Impact
N/A	1, 2C, and 4	L	MH	M
13	4	MH	MH	MH

Under Build Alternative 4, permanent visual changes would affect suburban residences north of El Sobrante Road between La Sierra Avenue and McAllister Street. Much of this segment of El Sobrante Road is already four lanes. Therefore, the proposed project would widen the existing corridor near the eastern and western ends of the development to accommodate slight realignments of the corridor and to replace existing sidewalks affected by the realignment. No structures would be affected by construction, but grass, small shrubs, and approximately 35 palm trees within the sidewalk median and vegetation within the landscape buffer would be removed between the sidewalk and existing noise barriers. Standard Project Measure **PF VIS-1** and Measure **VIS-2** would ensure that vegetation affected by the project is replaced. The primary views of the roadway are from second-story windows of residences bordering El Sobrante Road, and existing noise barriers surrounding residential areas, residential landscaping, and landscaping along El Sobrante Road would block views of visual changes from ground levels and from residences north of the homes backing El Sobrante Road. From the upper stories of these homes, views of the realigned intersection of El Sobrante Road and La Sierra Avenue would be visible. As shown in the simulation for Key View 13 (Figure 3.7-15), the realigned El Sobrante Road would also result in the introduction of the widened roadway, shoulder, and unpaved median into the viewshed depicted in Key View 13 where existing utility poles and light roadside vegetation would be removed to accommodate the proposed project changes.

Scenic Roadways

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. The portions of these roadways that are County-eligible scenic corridors within the Suburban Residential VAU under Build Alternative 4 include El Sobrante Road between east of La Sierra Avenue and McAllister Street. Due to the existing topography and land uses (setting), the south side of this segment also falls within the Open Space VAU. Widening El Sobrante Road within the Suburban Residential/Open Space VAUs would not substantially alter the scenic views for which the roadway is noted. Therefore, permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU, and views of scenic roadways from this VAU would not be substantially altered by the permanent visual changes, under Build Alternative 4.

Light and Glare

Effects related to light and glare would be the same or very similar within all VAUs under all build alternatives. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses within the Rural Residential, Suburban Residential, and Commercial VAUs. Standard Project Measure **PF VIS-1** and Measure **VIS-2** would replace vegetation on affected properties and reduce glare. Within the Suburban Residential VAU for Build Alternative 4, new traffic signals would be installed at the intersection of El Sobrante Road and McAllister Street. The lighting changes would add an inconsequential amount of light within the VAU overall. However, if not properly designed, new and relocated street lighting could substantially affect residents near the new and relocated street lighting. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that changes from project light and glare would be minor and would not result in substantial adverse visual effects under all build alternatives.

Therefore, the proposed project would not create a new substantial glare impact for affect daytime or nighttime views in the area.

Summary (Suburban Residential VAU)

Table 3.7-9 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts of Build Alternative 4 for the Suburban Residential VAU and its associated key view.

Permanent visual changes would result in a resource change to this VAU that is moderate-high under Build Alternative 4. Under Build Alternative 4, views toward La Sierra Avenue would be substantially affected by the realigned intersection of La Sierra Avenue and El Sobrante Road. The resulting visual impacts on the existing visual character and quality would be moderate-high under Build Alternative 4. These permanent visual changes would result in substantial adverse visual effects under Build Alternative 4 even with implementation of the recommended standard measures. There are no scenic vista views within this VAU. Therefore, no scenic vistas would be affected.

Commercial Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Table 3.7-6 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts for all build alternatives for the Commercial VAU.

Scenic Roadways

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. The portions of these roadways that are a County-eligible scenic corridor within the Commercial VAU under Build Alternative 4 include the section of Cajalco Road between I-15 and Eagle Canyon Road. Widening Cajalco Road and the Temescal Creek Bridge within the Commercial VAU would not alter the scenic views for which the roadway is noted. Therefore, permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU, and views of scenic roadways from this VAU would not be substantially altered by the permanent visual changes, under Build Alternative 4.

Light and Glare

Effects related to light and glare within the Commercial VAU would be the same or very similar to existing conditions under Build Alternative 4, and would be the same effects that would be expected under Build Alternatives 1 and 2C. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses. Standard Project Measure **PF VIS-1** and Measure **VIS-2** would replace vegetation on affected properties and reduce glare. Existing traffic signals at the intersections of Cajalco Road with Harvill Avenue and Temescal Canyon Road would be improved, and new traffic signals would be installed at the intersections of Cajalco Road with Seaton Avenue and Eagle Valley Road. The lighting changes would add an inconsequential amount of light within the VAU. If not properly designed, new and relocated street lighting could substantially affect nearby roadway neighbors. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that changes from project light and glare would be minor and would not result in substantial adverse visual effects under all build alternatives.

Therefore, the proposed project would not create a new substantial glare impact for daytime or nighttime views in the area.

Summary (Commercial VAU)

Table 3.7-6 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts between alternatives for the Commercial VAU. The effects of Build Alternative 4 for this VAU would be the same as those identified for Build Alternatives 1 and 2C. Resource change within this VAU would be anticipated to be low, and viewer response and visual impact would be anticipated to be moderate-high and moderate, respectively.

Future Six-Lane Facility

Build Alternatives 1 and 2C

Under Build Alternatives 1 and 2C, the addition of two travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, permanent impacts on viewer groups and visual quality associated with converting the median area to travel lanes would be similar to those described for Build Alternatives 1 and 2C within the Rural Residential, Open Space, and Commercial VAUs. The addition of two lanes would not substantially alter the existing visual character and quality of views or affect scenic corridors, scenic vistas, and light and glare beyond what has been analyzed for the VAUs. Paving the median to create two new lanes would occur within the already modified roadway corridor and would not affect visual resources beyond paving the median and installing a safety barrier to separate the directional travel ways. Visual changes would be minimal.

Build Alternative 4

Under Build Alternative 4, the addition of two travel lanes within the median of Cajalco Road between Temescal Canyon Road and La Sierra Avenue, and within the median of La Sierra Avenue between Cajalco Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, permanent impacts on viewer groups and visual quality associated with converting the median area to travel lanes would be similar to those described for Build Alternative 4 within the Open Space and Commercial VAUs. The addition of two lanes would not substantially alter the existing visual character and quality of views or affect scenic corridors, scenic vistas, and light and glare beyond what has been analyzed for the VAUs. Paving the median to create two new lanes would occur within the already modified roadway corridor and would not affect visual resources beyond paving the median and installing a safety barrier to separate the directional travel ways. Visual changes would be minimal.

No-Build Alternative

Under the No-Build Alternative, the project would not be constructed and there would be no visual impacts associated with light and glare or on the existing visual character, visual quality, scenic vistas, scenic roadways, or affected viewer groups.

3.7.3.2 Temporary Impacts

Build Alternatives 1, 2C, and 4

All Project Roadways

The proposed project would take approximately 4 years to construct; however, construction activities would be sporadic, transitory, and short term in nature. In addition, construction would proceed in segments so that localized impacts would not be concentrated in a given area for a substantial amount of time. Construction activities would remove formal and informal

landscaping, and introduce staging areas, signaling and signage to direct traffic, and considerable heavy equipment and associated vehicles into the viewshed of roadway neighbors and users that would affect views of and from the project site during the construction period. Although construction would be temporary, the proposed project and its alternatives constitute a major roadway construction project that would permanently affect the visual character views of roadway, portions of which are County-eligible scenic corridors. The proposed project would result in temporary construction impacts on visual quality that would not affect the existing visual quality for an extended period of time, except in some locations where construction would require partial to full acquisitions and where residential and commercial landscaping and native trees and vegetation located along the project corridor are affected.

Scenic Roadways

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds (Caltrans 2017). As described in Section 3.7.2, *Affected Environment*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. The portions of these roadways that are County-eligible scenic corridors within the limits of Build Alternative 4 include: Cajalco Road between I-15 and La Sierra Avenue, and between El Sobrante Road and Harley John/Smith Roads; La Sierra Avenue between Cajalco Road and Blackburn Road; and El Sobrante Road between La Sierra Avenue and Cajalco Road. The visual effects resulting from construction are similar to those described above under Visual Character and Visual Quality, including Scenic Vistas for the Rural Residential VAU. Also, the east end of El Sobrante Road would be relocated out of the Open Space VAU into the Rural Residential VAU at its east end, and intersect with Harley John Road. A cul-de-sac would be created on the old segment of Harley John Road, north of Cajalco Road. Widening El Sobrante Road within the Rural Residential VAU would not alter the scenic views for which the roadway is noted. Therefore, permanent visual changes would not result in substantial adverse visual effects on scenic roadways in this VAU under any of the build alternatives with Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**. Views of scenic roadways from this VAU would not be altered by the permanent visual changes associated with the build alternatives.

The visual effects resulting from construction are the same as described under Visual Character and Visual Quality, including Scenic Vistas for the Open Space VAU, and would affect the LM MSHCP area.

Light and Glare

Effects related to light and glare would be the same or very similar within all VAUs under all build alternatives. Evening and nighttime construction activities would require the use of extremely bright lights. However, Section 7-1.04 of Caltrans standard specifications require that temporary illumination be installed so that illumination and illumination equipment do not interfere with public safety (Caltrans 2015). Therefore, County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses within the Rural Residential, Suburban Residential, and Commercial VAUs.

Rural Residential Visual Assessment Unit

Cajalco Road between Cowan Road and Seaton Avenue

Temporary impacts would be the same along the portion of Cajalco Road located within Mead Valley, between Cowan Road and Seaton Avenue, for Build Alternatives 1, 2C, and 4 (refer to Figure 2.2-3). As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high. The proposed project would result in temporary construction impacts on visual quality that would not affect the existing visual quality for an extended period of time.

Open Space Visual Assessment Unit

As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high. The proposed project would result in temporary impacts on visual quality from construction activities that would not affect the existing visual quality for an extended period of time.

Suburban Residential Visual Assessment Unit

Visual Character and Visual Quality, including Scenic Vistas

Construction in the Suburban Residential VAU would occur in the same manner as described under Build Alternatives 1, 2C, and 4 for the Rural Residential VAU. Under Build Alternatives 1 and 2C, the proposed project would widen the existing corridor near Wood Road to accommodate a widened median and a new turn lane for westbound traffic onto Wood Road. Slight widening would also occur near Carpinus Drive to accommodate a turn lane for eastbound traffic onto Carpinus Drive. A new sidewalk would also be added to the north side of Cajalco Road. No vegetation or structures would be affected by construction at this location. The primary views of the roadway are from second-story windows of residences bordering Cajalco Road, and existing noise barriers surrounding residential areas, residential landscaping, and landscaping along Cajalco Road would block views of visual changes from ground levels and from residences north of Rocky Summit Drive. Also, much of the affected segments of Cajalco Road were previously widened to four lanes. Therefore, visible changes during construction would be very minor.

Summary (Suburban Residential VAU)

The proposed project would result in temporary construction impacts on visual quality that would not affect the existing visual quality for an extended period of time and changes would not be substantial. As described in Section 3.7.2.3, *Viewers and Viewer Response*, the composite viewer response would be moderate-high to high.

Commercial Visual Assessment Unit

Table 3.7-6 summarizes and compares the narrative ratings for visual resource change, viewer response, and visual impacts between alternatives for the Commercial VAU. Construction in the Commercial VAU would occur in the same manner as described under Build Alternatives 1, 2C, and 4 for the Rural Residential VAU. The proposed project would result in temporary

construction impacts on visual quality that would not affect the existing visual quality for an extended period of time, and changes would not be substantial.

Riparian vegetation along Temescal Creek removed during construction of the widened bridge would be addressed in part by Measure **VIS-2** as well as measures identified specifically for riparian vegetation replacement described in Section 3.17, *Natural Communities*; therefore, impacts would be temporary.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Build Alternatives 1 and 2C

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, temporary impacts associated with construction would be less than those described for Build Alternatives 1 and 2C within the Rural Residential, Open Space, and Commercial VAUs, as work would primarily occur within the existing median area and require much less time to complete.

Build Alternative 4

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and La Sierra Avenue, and within the median of La Sierra Avenue between Cajalco Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, temporary impacts associated with construction would be less than those described for Build Alternative 4 within the Open Space and Commercial VAUs, as work would primarily occur within the existing median area and require much less time to complete.

No-Build Alternative

Under the No-Build Alternative, the project would not be constructed and there would be no visual impacts associated with light and glare or on the existing visual character, visual quality, scenic vistas, scenic roadways, or affected viewer groups.

3.7.3.3 Impacts Summary

Build Alternative 1 (Impacts Summary)

Permanent

Visual impacts in response to viewer response and resource change rated high for Key Views 1, 2, and 6A; moderate-high for Key Views 3 and 4; and moderate for Key View 5.

Build Alternative 1 would add approximately 83 acres of pavement and hardscape (such as pavement and roadway shoulders, structures, concrete drainages, and intersection and street light standards). The widened roads would also remove vegetation, approximately 380 small trees and shrubs, and 105 large mature trees.

Within the Rural Residential VAU, impacts on the existing visual character and quality would range between moderate and high, even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**, and therefore would result in substantial adverse visual effects.

Within the Open Space VAU, impacts on scenic views and existing visual character and quality would be moderate-high to high even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measure **VIS-2**, and therefore would result in substantial adverse visual effects. No scenic vistas would be affected under Build Alternative 1.

Within the Suburban Residential VAU, impacts on the existing visual character and quality would be moderate with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**. There are no scenic vista views within the Suburban Residential VAU; therefore, no scenic vistas would be affected.

Within the Commercial VAU, impacts on the existing visual character and quality would be moderate with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measures **VIS-2** and **VIS-8**. There are no scenic vista views within the Commercial VAU; therefore, no scenic vistas would be affected.

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds. However, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors. The proposed project would not result in substantial adverse visual effects on County-eligible scenic roadways with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**. Views of scenic roadways would not be substantially altered by the permanent visual changes associated with the project.

Implementation of Standard Project Measure **PF VIS-4** would ensure that project light and glare would not result in substantial adverse visual effects.

Temporary

Construction activities and equipment would affect views of and from the project site during the construction period. Construction would proceed in segments so that localized impacts would not be concentrated in a given area for a substantial amount of time. However, visible changes would occur during construction. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses during construction, consistent with Section 7-1.04 of Caltrans standard specifications (Caltrans 2015).

Build Alternative 2C (Impacts Summary)

Permanent

Visual impacts in response to viewer response and resource change rated high for Key Views 1, 2, and 6B; moderate-high for Key Views 3 and 4; and moderate for Key View 5.

Build Alternative 2C would add approximately 84 acres of pavement and hardscape (such as pavement and roadway shoulders, structures, concrete drainages, and intersection and street light

standards). The widened roads would also remove vegetation and approximately 390 small trees and shrubs, and 105 large mature trees.

Within the Rural Residential VAU, impacts on the existing visual character and quality would range between moderate and high, even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**, and therefore would result in substantial adverse visual effects.

Within the Open Space VAU, impacts on scenic views and existing visual character and quality would be moderate-high to high even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measure **VIS-2**, and therefore would result in substantial adverse visual effects.

Within the Suburban Residential VAU, impacts on the existing visual character and quality would be moderate with implementation of project measures. There are no scenic vista views within the Suburban Residential VAU; therefore, no scenic vistas would be affected.

Within the Commercial VAU, impacts on the existing visual character and quality would be moderate with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measures **VIS-2** and **VIS-8**. There are no scenic vista views within the Commercial VAU; therefore, no scenic vistas would be affected.

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds. However, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors. The proposed project would not result in substantial adverse visual effects on County-eligible scenic roadways with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**. Views of scenic roadways would not be substantially altered by the permanent visual changes associated with the project.

Implementation of Standard Project Measure **PF VIS-4** would ensure that project light and glare would not result in substantial adverse visual effects.

Temporary

Construction activities and equipment would affect views of and from the project site during the construction period. Construction would proceed in segments so that localized impacts would not be concentrated in a given area for a substantial amount of time. However, visible changes would occur during construction. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses during construction, consistent with Section 7-1.04 of Caltrans standard specifications (Caltrans 2015).

Build Alternative 4 (Impacts Summary)

Permanent

Visual impacts in response to viewer response and resource change rated high for Key Views 1 and 2, and moderate-high for Key Views 3, 4, and 7.

Build Alternative 4 would add approximately 105 additional acres of pavement and hardscape (such as pavement and roadway shoulders, structures, concrete drainages, and intersection and street light standards). The widened roads would also remove vegetation, approximately 400 small trees and shrubs, and 195 large mature trees.

Within the Rural Residential VAU, impacts on the existing visual character and quality would range between moderate and high, even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**, and therefore would result in substantial adverse visual effects.

Within the Open Space VAU, impacts on scenic views and existing visual character and quality would be moderate-high to high even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measure **VIS-2**, and therefore would result in substantial adverse visual effects.

Within the Suburban Residential VAU, impacts on the existing visual character and quality would be moderate with implementation of project measures. There are no scenic vista views within the Suburban Residential VAU; therefore, no scenic vistas would be affected.

Within the Commercial VAU, impacts on the existing visual character and quality would be moderate with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-4** through **PF VIS-7**, and Measures **VIS-2** and **VIS-8**. There are no scenic vista views within the Commercial VAU; therefore, no scenic vistas would be affected.

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds. However, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors. The proposed project would not result in substantial adverse visual effects on County-eligible scenic roadways with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Measure **VIS-2**. Views of scenic roadways would not be substantially altered by the permanent visual changes associated with the project.

Implementation of Standard Project Measure **PF VIS-4** would ensure that project light and glare would not result in substantial adverse visual effects.

Temporary

Construction activities and equipment would affect views of and from the project site during the construction period. Construction would proceed in segments so that localized impacts would not be concentrated in a given area for a substantial amount of time. However, visible changes would occur during construction. County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses during construction, consistent with Section 7-1.04 of Caltrans standard specifications (Caltrans 2015).

3.7.4 Avoidance, Minimization, and/or Mitigation Measures

Implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7** is proposed to reduce visual impacts associated with the build alternatives. In addition, Mitigation Measures **VIS-2** and **VIS-8** are proposed to lessen impacts on affected properties by replacing landscape features to the degree possible, minimize visual impacts associated with roadside

grading and slopes, and reduce impacts of vegetation removal within the project limits, including on Landscaped Freeway segments.

- **VIS-2: Replace or Relocate Site Features and Landscaping Affected by the Project.** Where appropriate and to the degree possible, landscaping and related appurtenances, such as fencing, privacy walls, and other similar features, removed from private properties as a result of construction will be relocated, replaced, or restored in place and in kind to address visual impacts. Slopes will (1) be graded to 4:1 or flatter; (2) be gentle, smooth, and well transitioned with slope rounding, and topsoil and duff salvaged and reused; and (3) have contours naturally formed that tie gracefully into the existing adjacent roadside and landforms. Rock cut slopes will be irregular for a natural appearance, with rounding of the tops and ends of cut slopes. Steep, obvious cuts and fills will be avoided to improve project aesthetics associated with roadside slopes.

  Standard fence types (chain link, barbed wire, and/or wire mesh) will be used unless fences of special design need to be used in certain cases, such as for wild animal control. In special cases, alternative options such as powder-coating, the use of iron, and other enhancements will be considered.

  Replacement vegetation will reflect adjacent communities and natural surroundings, serve as a visual buffer for objectionable views of the roadway facility for adjacent land uses, soften visual impacts associated with graded slopes and large structures, and act to frame or enhance good views.

  For specific plant species within the limits of habitat conservation plan areas, replacement vegetation will be reestablished in the ratios identified in Measure **NC-15 (NES BIO-14)**: no less than 3:1 mitigation ratio for riparian, 1:1 for riverine resources, and 2:1 for permanent shading of riparian vegetation and wetlands. Temporary impacts on riparian-riverine vegetation may be replaced through restoration at their current locations at a not-less-than 1:1 ratio or through the purchase of In-lieu Fee Program or other permittee-responsible mitigation bank credits, or through another approved mitigation program.

  A Tree Avoidance, Minimization, and Replacement Plan will be developed in consultation with a certified arborist for trees removed during project construction. Landscaping and planting will not be deferred, and will commence prior to the end of roadway construction. The plan will contain the following provisions and be included in the final Plans, Specifications, and Estimates (PS&E):

  - Before ground-disturbing activities begin, an International Society of Arboriculture or American Society of Consulting Arborists–certified arborist will conduct a tree inventory to identify trees subject to pruning, removal, or potential damage from the project.
  - Trees consisting of a diameter at breast height greater than 12 inches will be replaced on a 1:1 basis using 15-gallon replacement trees (i.e., one 15-gallon tree would be planted for every tree removed), where feasible.
  - The replacement plan for tree replacement will specifically identify the locations where replacement/transplanted trees are to be planted; replacements will occur on site if possible.

  - During construction, trees greater than 12 inches diameter at breast height not proposed for removal will be protected using temporary barrier fencing.

- **VIS-8: Replace Disturbed Vegetation along Landscaped Freeways.** The County of Riverside will work with the appropriate California Department of Transportation (Caltrans) district landscape architect to determine which disturbed portions of landscaped freeways within the project limits require replanting and to what extent. At a minimum, replanting will follow the guidance in Section 92.3 of the Streets and Highways Code. Landscaping will be drought resistant whenever feasible. Recycled water will be used for irrigation when practicable. When appropriate and consistent with integrated pest management strategies as defined in subdivision (d) of Section 14717 of the Government Code, landscaping will include California native wildflowers and native and climate-appropriate vegetation as an integral and permanent part of the planting design, with priority given to those species of wildflowers and native and climate-appropriate vegetation that will help rebuild pollinator populations. Trees and shrubs will be replaced at a minimum 1:1 ratio. Container sizes and species will be determined in coordination with the appropriate Caltrans district landscape architect. Disturbed groundcovers will be replanted to match existing groundcovers, unless the Caltrans district landscape architect specifies otherwise. Irrigation of replacement plants will also be coordinated with the appropriate Caltrans district landscape architect as watering may occur with existing irrigation systems or irrigation may need to be installed. Any irrigation lines that are damaged within the state right of way as a result of project construction will also be replaced per Caltrans standards and in coordination with the appropriate Caltrans district landscape architect. No invasive plant species will be planted under any circumstances.

[This page left blank intentionally.]

3.8 Cultural Resources

3.8.1 Regulatory Setting

The term "cultural resources" as used in this document refers to the "built environment" (e.g., structures, bridges, railroads, water conveyance systems, etc.), places of traditional or cultural importance, and archaeological sites (both prehistoric and historic), regardless of significance. Under federal and state laws, cultural resources that meet certain criteria of significance are referred to by various terms including "historic properties," "historic sites," "historical resources," and "tribal cultural resources." Laws and regulations dealing with cultural resources include:

The National Historic Preservation Act (NHPA) of 1966, as amended, sets forth national policy and procedures for historic properties, defined as districts, sites, buildings, structures, and objects included in or eligible for listing in the National Register of Historic Places (NRHP). Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties and to allow the Advisory Council on Historic Preservation (ACHP) the opportunity to comment on those undertakings, following regulations issued by the ACHP (36 Code of Federal Regulations [CFR] 800). On January 1, 2014, the First Amended Section 106 Programmatic Agreement (PA) among the Federal Highway Administration, (FHWA), the ACHP, the California State Historic Preservation Officer (SHPO), and the Department went into effect for Department projects, both state and local, with FHWA involvement. The PA implements the AHCP's regulations, 36 CFR 800, streamlining the Section 106 process and delegating certain responsibilities to the Department. The FHWA's responsibilities under the PA have been assigned to the Department as part of the Surface Transportation Project Delivery Program (23 United States Code [USC] 327).

The California Environmental Quality Act (CEQA) requires the consideration of cultural resources that are historical resources and tribal cultural resources, as well as "unique" archaeological resources. California Public Resources Code (PRC) Section 5024.1 established the California Register of Historical Resources (CRHR) and outlined the necessary criteria for a cultural resource to be considered eligible for listing in the CRHR and, therefore, a historical resource. Historical resources are defined in PRC Section 5020.1(j). In 2014, Assembly Bill 52 (AB 52) added the term "tribal cultural resources" to CEQA, and AB 52 is commonly referenced instead of CEQA when discussing the process to identify tribal cultural resources (as well as identifying measures to avoid, preserve, or mitigate effects to them). Defined in PRC Section 21074(a), a tribal cultural resource is a CRHR or local register eligible site, feature, place, cultural landscape, or object which has a cultural value to a California Native American tribe. Tribal cultural resources must also meet the definition of a historical resource. Unique archaeological resources are referenced in PRC Section 21083.2.

PRC Section 5024 requires state agencies to identify and protect state-owned historical resources that meet the NRHP listing criteria. It further requires the Department to inventory state-owned structures in its rights-of-way.

Section 4(f) of the Department of Transportation Act specifically protects public park and recreation lands, wildlife and waterfowl refuges, and historic sites. Under its provisions, a federally assisted highway project cannot adversely take properties of these types unless it can be shown that there is no prudent and feasible alternative to doing so. Section 4(f), as specifically

related to cultural resources, applies when there is an actual taking of land from, or constructive use of, a historic property. Section 4(f) evaluation requires documentation of completion of the Section 106 process. Section 4(f) regulations are found at 23 CFR 774.

3.8.2 Affected Environment

The information for this section comes from the *Historic Property Survey Report* (HPSR) (Caltrans 2020a). The HPSR includes as appendices the *Archaeological Survey Report* (ASR) (Caltrans 2020b), *Extended Phase I Report* (XPI) (Caltrans 2020c), *Historical Resources Evaluation Report* (HRER) (Caltrans 2020d), *Archaeological Evaluation Report* (AER) (Caltrans 2020e), and *Finding of Adverse Effect* (FOE) (Caltrans 2020f) that were prepared for this project.

3.8.2.1 Area of Potential Effects

The Area of Potential Effects (APE) for the project was established in consultation with Gary Jones, Professionally Qualified Staff (PQS) Principal Investigator, Prehistoric Archaeology, and Albert Vergel de Dios, District Local Assistance Engineer, on October 5, 2020.

The APE was established as the limits of proposed construction, including the limits of the current and proposed right of way, temporary construction easements (TCEs), a sufficient buffer to allow heavy equipment to maneuver, potential staging areas, and built environment resource parcel boundaries. The entire APE is 1,273.7 acres. The APE further encompasses the full boundaries of previously recorded or newly identified archaeological sites that are partially within the project limits, within reason, to consider direct and indirect effects on entire sites. Given that P-33-13791/CA-RIV-7843 is over 700 acres, only the pertinent portions of the site have been included that may be either directly or indirectly affected by the project (Locus 816 and Locus 817). The study area for archaeological resources is considered the Area of Direct Impacts (ADI), located within the bounds of the APE. The total area of the ADI is 820.4 acres.

The vertical APE within the project limits east of Lake Mathews Drive is anticipated to range from 2 to 12 feet in depth, depending on construction activity. Limited locations may require excavating to depths of up to approximately 50 feet for the installation of utility poles and bridge pilings, as well as associated drilling activities; proposed locations for these deeper activities are indicated where these project features are shown in the project exhibit maps (Figures 2.2-1 through 2.2-6). West of Lake Mathews Drive, topographical conditions are more varied and would require deeper excavation for road leveling and other construction activities. Within these areas, the vertical APE is anticipated to average greater than 12 feet deep and may require depths up to 100 feet in limited locations for utility poles, bridge pilings, and associated drilling activities. Given the amount of cultural material located in the APE and demonstrated potential for subsurface resources, the APE as a whole can be characterized as sensitive for subsurface cultural resources. The confidential APE map is included in Attachment A of the HPSR.

The project area is predominantly rural with large ranch and agricultural parcels. For larger parcels where the ADI traverses only minor, ubiquitous, or fragmentary infrastructure elements, whole parcels containing these elements were not introduced into the APE. In instances where a property upon a bluff or hill is immediately adjacent to the ADI below it, that property was not introduced into the APE. Non-archaeological objects such as aqueducts were not introduced into the APE if the ADI's depths did not touch such resources or, based on available project information, otherwise presented no reasonable expectation of an effect upon them.

3.8.2.2 Summary of Identification Efforts

Cultural resources records searches were obtained from the Eastern Information Center of the California Historical Resources Information System, located at the University of California, Riverside, on February 27 and 28, 2006; April 14, 2011; and April 18, 2016. The records searches included a review of all available cultural resources surveys, excavation reports, and site records within the current APE and within a 1-mile radius of the APE. Additional research included a review of the NRHP, CRHR, California Inventory of Historic Resources, California Historical Landmarks, California Points of Historical Interest, and Caltrans Historic Highway Bridge Inventory. Additional sources consulted included TRW/Experian, Google Earth Pro, Proquest, Historical Los Angeles Times Database, HistoricAerials.com, U.S. Geological Survey historic topographic maps, Riverside Public Library California History Room, Perris Public Library, California Digital newspaper collection, and the Riverside County Tax Assessor.

A total of 308 resources exist within the APE and the 1-mile study area buffer around the APE. Of the resources in the 1-mile radius of the study area, 245 are prehistoric sites, four are combined prehistoric and historic sites, 32 are historic sites, and 27 are undifferentiated/undated. Thirteen of the previously recorded cultural resources exist within the project APE.

An intensive pedestrian archaeological field survey of the ADI was undertaken from June 20 to August 2, 2016; August 17, November 30, and December 1, 2016; March 1 and 15, 2017; and February 20 and August 15, 2018. Fieldwork for the XPI study took place from August 15 to September 6, 2018, with one additional field day on October 18, 2018. Native American monitors accompanied the survey personnel during all archaeological fieldwork. Architectural field surveys of the APE were conducted in December 2012, April 2012, May 2016, and March 2019.

3.8.2.3 Native American Consultation

A records search of the Sacred Lands File maintained by the California Native American Heritage Commission (NAHC) was obtained in April 2011. According to the NAHC, no Native American cultural resources within their Sacred Lands Files are located within the direct APE, but there are Native American cultural resources in the project vicinity. The NAHC also provided a list of 13 Native American representatives to contact for further information. Letters and maps were sent to these contacts to inform the individuals and organizations about the project, to inquire if they knew of any unrecorded Native American cultural resources or other areas of concern within or adjacent to the direct APE, and to solicit comments in regard to the project. Between May 2011 and October 2016, initial consultation letters and consultation update letters were sent to contacts representing 13 Native American tribes identified by the NAHC. Follow-up phone calls and emails were made after each consultation letter was sent.

As a result of outreach efforts, Caltrans has entered into consultation with four Native American tribes: Pechanga Band of Luiseño Mission Indians, Soboba Band of Luiseño Indians, Morongo Band of Mission Indians, and Cahuilla Band of Indians. Native American consultation is ongoing for the proposed project and is documented in Attachment E of the HPSR.

In October 2019, Caltrans circulated the draft HPSR package to the four consulting tribes for review and comment. Following circulation of the draft HPSR package, in 2020 Caltrans attended meetings with representatives from each of the four consulting tribes. The purpose of the meetings was to provide an opportunity for each tribe to discuss their comments on the document.

Continuing consultation with the Pechanga Band of Luiseño Mission Indians resulted in the identification of three Traditional Cultural Properties (TCPs), *Túu'uv*, *Qax alku Pay mik*, and *Qax lku Kw imik*, which encompass the APE and APE vicinity. Further consultation discussions focused on the cultural and religious significance of the TCPs and the undertaking's potential to adversely affect the TCPs during construction and operation. The HPSR package was subsequently updated with information on the TCPs. Native American consultation is ongoing for the proposed project and is documented in Attachment E of the HPSR.

Separate coordination with Native American tribal representatives—including letters, phone calls, emails, and meetings—occurred concurrently during the Section 106 consultation process through circulation of the project Notice of Preparation in September 2011 and invitation to become a participating agency in the project, sent in October 2012 per 23 USC 139 (Efficient Environmental Review). Refer to Chapter 5, *Comments and Coordination*, for additional information regarding Native American coordination.

A Section 106 Memorandum of Agreement (MOA) will be developed for all historic properties that will be affected by the project, and it will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including the Metropolitan Water District of Southern California (MWD), will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS.

3.8.2.4 Public Participation and Consultation

On July 11, 2012, and February 15, 2019, letters were sent to 21 government agencies and consulting and interested parties who may have knowledge or concerns about historic properties in the area. In the letters, information was requested regarding historic buildings, districts, sites, objects, and archaeological sites of significance within the project area. Two responses were received. On March 5, 2019, a letter from the March Joint Powers Authority stated that staff have no comments and that the lead agency consider coordinating with the City of Perris, as the project may affect the Ramona Expressway. Additionally, the letter requested that the lead agency consider coordinating with the Agua Caliente, Morongo, Soboba, and Pechanga Tribes.

On April 12, 2019, Sean Berry of Santa Rosa Mining District & Preservation Society spoke with an ICF project architectural historian. Mr. Berry complimented the direction that the project was going and discussed potential historic sites outside of the APE. The ICF historian requested that Berry provide any historic information within or outside the APE. No further information has been received. Outreach efforts are documented in Attachment F of the HPSR.

3.8.2.5 Archaeological Resources

An intensive pedestrian field survey of the ADI was undertaken from June 20 to August 2, 2016. Follow-up surveys were conducted on August 17, November 30, and December 1, 2016; March 1 and 15, 2017; and February 20 and August 15, 2018. Native American monitors accompanied the survey personnel. Native American monitors included a representative from the Soboba Band

of Luiseño Indians (Ronald Dominguez) and representatives from the Pechanga Band of Luiseño Mission Indians (Tony Foussat, John Jackson, Augie Ortiz, Todd Perry, and Cody Schlater).

Archaeological surveys occurred within the portion of the right of way and proposed right of way that encompasses the project work limits and on adjacent parcels. Approximately 803.1 acres have been surveyed utilizing intensive pedestrian survey methods. The total area within the APE not intensively pedestrian surveyed is approximately 17.3 acres and was surveyed using reconnaissance methods. The areas of reconnaissance survey were generally developed and contained modern structures and ancillary structures, including driveways, pools, and outbuildings. The criteria used to define sites and isolated resources followed the guidelines set by the Office of Historic Preservation (OHP) (1995:2). A new site was defined as any three or more artifacts found in association with one another or a single feature recorded more than 131 feet (40 meters) from an existing site. One or two artifacts found in close proximity to each other were treated as an isolated resource.

As a result of the records search and surveys, 17 archaeological sites and ten isolated artifacts were identified (refer to Table 3.8-1). Isolated artifacts identified in the APE include isolated prehistoric and historic artifacts. According to the Caltrans Section 106 PA Attachment 4, "Isolated prehistoric finds consisting of fewer than three items per 100 square meters" are exempt from evaluation and are not discussed in this document.

Five historic-period sites are located partially or completely within the APE and include one historic-period railroad grade (CA-RIV-3832H), three historic-period refuse scatters (historic component of CA-RIV-6623/H, CA-RIV-012618, and CA-RIV-012621), and one cairn (CA-RIV-012622). Historic-period sites were evaluated in the HRER (Attachment C of the HPSR). All of the evaluated historic-period sites were found to be ineligible for the NRHP and are not considered historical resources for the purposes of CEQA.

Nine prehistoric archaeological resources and one potential archaeological district are located within the APE: Combined site of CA-RIV-2263, -2264, and -4444 (subsumed as CA-RIV-2263); CA-RIV-4403; CA-RIV-4407; CA-RIV-4408; CA-RIV-4409; CA-RIV-4454; CA-RIV-7843, Loci 816 and 817; CA-RIV-012623, and the Mead Valley Potential Prehistoric Archaeological District (PPAD).

Subsequent to the archaeological surveys conducted for the project, an XPI study (Attachment D of the HPSR, Appendix D) was completed and an AER (Attachment G of the HPSR) was prepared for all prehistoric sites in the study area. Caltrans made an assumption of eligibility of the Mead Valley PPAD for the NRHP under Criteria A, B, C, and D for the purposes of this project only because of the large size of the property, which is beyond the scope of this project to evaluate. It was also assumed that the nine prehistoric sites are eligible for the NRHP as contributing elements of the PPAD. Additionally, the combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444 (CA-RIV-2263) is confirmed individually eligible for the NRHP under Criterion D. Site CA-RIV-7843, Locus 816 is confirmed individually eligible for listing in the NRHP under Criteria A, C, and D. Site CA-RIV-7843, Locus 817 is confirmed as not individually eligible for listing in the NRHP but is eligible as a locus of CA-RIV-7843 under Criterion D. Sites CA-RIV-4403, -4407, -4408, -4409, and -4454, were all found ineligible for individual listing in the NRHP or CRHR individually. Site CA-RIV-012623 is eligible for listing in the NRHP under Criterion D. All ten of the aforementioned historic properties are considered

historical resources for the purposes of CEQA. SHPO provided concurrence on the assumptions of eligibility for the sites discussed above in a letter dated February 10, 2021.

Table 3.8-1. Archaeological Resources within the APE

Site Trinomial	Description	OHP Status Code	Eligibility Status
CA-RIV-3832H	Atchison, Topeka, and Santa Fe railroad grade (archaeological component)	6Z	Not eligible for the NRHP/CRHR under any criteria. SHPO concurrence received 2/10/2021.
Mead Valley PPAD, including contributing elements: CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444 (combined site CA-RIV-2263); CA-RIV-4403; CA-RIV-4407; CA-RIV-4408; CA-RIV-4409; CA-RIV-4454; 33-13791/ CA-RIV-7843, Locus 816; 33-13791/CA-RIV-7843, Locus 817; and CA-RIV-012623	Prehistoric milling slicks/stations, lithic scatters, habitation sites, pictographs, *Nahachish* rocks within an as-yet undefined larger boundary inclusive of additional likely similar sites outside of the APE	3S (for the purposes of this project only)	Multiple individual sites may not eligible individually, but assumed eligible as contributing elements of PPAD. PPAD as a whole assumed eligible for the purposes of this project only under Criteria A/1, B/2, C/3, and D/4. Caltrans' Cultural Studies Office (CSO) approved assumption of eligibility 7/7/2020.
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Prehistoric bedrock milling station, lithic scatter, reported petroglyph	3D	Eligible for listing in the NRHP/CRHR under Criteria D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/7/2020).
CA-RIV-4403	Bedrock milling station	3D	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021) but assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/7/2020).
CA-RIV-4407	Bedrock milling station; lithic scatter	3D	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021), but assumed eligible as a contributing element to PPAD under Criterion D/4.
CA-RIV-4408	Bedrock milling station; lithic scatter	3D	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021), but eligible as a contributing element to PPAD under Criterion D/4.
CA-RIV-4409	Bedrock milling station	3D	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021), but eligible as a contributing element to PPAD under Criterion D/4.
CA-RIV-4454	Prehistoric artifact scatter	3D	Not eligible for the NRHP/CRHR under any criteria individually but assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/7/2020).
CA-RIV-6623/H	Historic period refuse scatter; imported manos	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021.)

Site Trinomial	Description	OHP Status Code	Eligibility Status
CA-RIV-7843, Locus 816 (formerly CA-RIV-816)	Prehistoric cupule rock, milling features, lithic scatter	3D	Eligible for listing in the NRHP/CRHR under Criteria A/1, C/3, and D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/7/2020).
CA-RIV-7843, Locus 817 (Formerly CA-RIV-817)	Prehistoric milling station and artifact scatter	3D	Not eligible for listing in the NRHP or CRHR individually (SHPO concurrence received 2/10/2021). Assumed eligible for listing as a locus of CA-RIV-7843 under Criteria D/4 (CSO approval 7/7/2020).
CA-RIV-012618	Historic period refuse scatter	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
CA-RIV-012621	Historic period refuse scatter	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
CA-RIV-012622	Historic period refuse scatter	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
CA-RIV-012623	Prehistoric artifact scatter	3S	Eligible for listing in the NRHP/CRHR under Criteria D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/72020).

Source: Caltrans 2020b
3B – Appears eligible for NRHP both individually and as a contributor to an NRHP-eligible district through survey evaluation.
3D – Appears eligible for NRHP as a contributor to an NRHP-eligible district through survey evaluation.
3S – Appears eligible for NRHP as an individual property through survey evaluation.
6Z – Found ineligible for NRHP, CRHR, or local designation through survey evaluation.

Mead Valley Potential Prehistoric Archaeological District

The Mead Valley PPAD includes nine prehistoric sites and their previously recorded features and boundaries within the project APE, as well as a yet-undefined boundary and larger number of sites not within the project APE. The boundary for the Mead Valley PPAD is potentially much larger and inclusive of many other sites that are geographically and morphologically similar. The Mead Valley PPAD would likely encompass several thousand acres and more than 100 archaeological sites that are outside of the current project APE. Therefore, for the purposes of the project and the evaluation of effects, the acreage approximation for the PPAD relative to the project APE is 29,229 acres; areas of the project APE included within the PPAD are indicated on Confidential Figure B-1 in Appendix A, *Draft Section 4(f)*, of this EIR/EIS. The PPAD would include numerous additional sites not within the APE for this project, and would include multiple site types such as individual milling slicks and milling stations (multiple slicks and mortars), large and small lithic and ground stone scatters, and habitation sites that include groups of thermal features, lithics and ground stone artifacts, ceremonial objects, faunal materials, midden, and inhumations.

The PPAD (and the sites described herein) was assumed eligible for inclusion in the NRHP and CRHR under Criteria A, B, C, and D, and has been confirmed by the Caltrans Cultural Studies Office (Price 2020) pursuant to Stipulation VIII.C.4 of the Caltrans Section 106 PA. Eligibility

for this PPAD was assumed due to the large size of the PPAD (that precludes its complete evaluation) and eligibility under all four Criteria (A, B, C, and D).

Nine PPAD components are identified with the project APE, all of which are considered contributing elements of the PPAD: the combined site of CA-RIV-2263 (composed of what was previously CA-RIV-2263, -2264, and -4444); CA-RIV-4403, -4407, -4408, -4409, -4454; Loci 816 and 817 of CA-RIV-7843; and CA-RIV-012623. Individually, sites CA-RIV-2263, Locus 816 of CA-RIV-7843, and CA-RIV-012623 are considered individually eligible for listing in the NRHP. None of the remaining sites (CA-RIV-4403, -4407, -4408, -4409, -4454, and Locus 817 of CA-RIV-7843) are considered eligible individually, and eligible as contributing elements of the PPAD under Criterion D.

Combined Site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444

Based on the studies prepared for this project, these three sites are combined into one site because a surface lithic scatter is present over the whole area. This area encompasses the milling features at these sites, demonstrating the sites are functionally related, and it appears that the sites were recorded separately in error. The new P-number (forthcoming) subsumes the three sites, but the three sites also retain individual designations. The combined sites are considered to be a contributing element to the combined TCPs and to the Mead Valley PPAD because they fall within the boundary of each TCP and the Mead Valley PPAD and exhibit evidence of resource extraction consistent with a character-defining feature of the TCPs and Mead Valley PPAD. Limited subsurface investigations have identified a buried archaeological component at this site with the potential to contain materials and/or features that can address important research questions for the region. Given the available information and potential for additional subsurface cultural material, the combined site of CA-RIV-2263, -2264, and -4444 (CA-RIV-2263), is eligible for listing in the NRHP under Criterion D. The site is also considered to be a contributing element to the combined TCPs and to the Mead Valley PPAD.

CA-RIV-4403, -4407, -4408, and -4409

Due to the proximity of sites CA-RIV-4403, -4407, -4408, and -4409 within the project APE, site context and setting are discussed collectively. Limited Extended Phase I Investigation (XPI) excavations conducted at these sites did not yield any cultural materials or identify subsurface components for sites CA-RIV-4403, -4408, and -4409; the limited XPI excavation at site CA-RIV-4407 did yield debitage evidence. No disturbance was noted at the sites either during excavations or by review of historic aerial photographs. Nearby roads and residences do not appear to have affected the sites in any significant way. As such, the sites retain integrity of location and slightly impaired integrity of setting through loss of the traditional viewshed with the introduction of paved roads and the construction of houses nearby.

Considered individually, CA-RIV-4403, -4407, -4408, and -4409 are recommended as ineligible for inclusion in the NRHP for all four criteria (A, B, C, and D). As contributing elements to the PPAD, CA-RIV-4403, -4407, -4408, and -4409 are considered eligible for the purposes of this project for their presumed ability to contribute to the significance of the PPAD under Criterion D for their potential to yield important information.

CA-RIV-4454

CA-RIV-4454 retains integrity of location and slightly impaired integrity of setting through loss of the traditional viewshed with the introduction of paved roads and the construction of houses nearby. Individually, CA-RIV-4454 is recommended as ineligible for inclusion in the NRHP or CRHR for all four criteria (A, B, C, and D). Surface surveys and documentation have failed to yield information beyond what has already been collected to address important research questions and have likely exhausted the research potential for this site. As a contributing element to the PPAD, CA-RIV-4454 is recommended eligible for its ability to contribute to the significance of the Mead Valley PPAD under Criterion D.

CA-RIV-7843, Locus 816

First recorded in 1972, CA-RIV-816 was initially described as a low-density lithic scatter and milling site. The site was updated in 1982, 1991, 1999, and 2005, and these subsequent records identified milling features and a cupule boulder. The site was later subsumed within the boundaries of the larger site CA-RIV-7843/P-33-13791 as Locus 816.

As part of the current project, the site was evaluated by ICF using known documentation and based on current conditions. Individually, Locus 816 (CA-RIV-816) is eligible for inclusion in the NRHP under Criteria A, C, and D. As a locus of the larger site CA-RIV-7843, a site that is considered eligible, Locus 816 is considered a contributing element. The 50 loci of CA-RIV-7843 are collectively presumed to contribute to the site's significance and, as such, are considered eligible for inclusion in the NRHP under Criteria D for their potential to yield information important to prehistory or history. CA-RIV-7843 Locus 816 is also considered to be a contributing element to the combined TCPs and to the Mead Valley PPAD.

CA-RIV-7843, Locus 817

CA-RIV-817 was first recorded in 1972 and updated in 1982, 1991, and 2000, at which time CA-RIV-817 was subsumed within the boundaries of the larger site CA-RIV-7843/P-33-13791 as Locus 817.

This locus has been altered since it was last recorded and does contribute to the overall eligibility of -7843 as a whole. Subsurface potential exists given the locus' proximity to a creek and location in the creek floodplain. Individually, Locus 817 (CA-RIV-817) is ineligible for inclusion in the NRHP under all four criteria (A, B, C, and D). Surface surveys and documentation have failed to yield information to address important research questions and have likely exhausted the research potential for this site. However, as a locus of the larger site CA-RIV-7843, Locus 817 is considered a contributing element. The 50 loci of CA-RIV-7843 are collectively presumed to contribute to the site's significance and, as such, are considered eligible for inclusion in the NRHP under Criteria D for their potential to yield information important to prehistory or history. CA-RIV-7843 Locus 817 is also considered to be a contributing element to the combined TCPs and to the Mead Valley PPAD.

CA-RIV-012623

CA-RIV-012623 was discovered during ICF's 2016 survey of the APE. This site is a sparse prehistoric artifact scatter. No features are present on the site's surface, and it is unknown

whether a subsurface component exists. The condition of the site is good; that is, no disturbances to the site were apparent.

No temporally diagnostic artifacts were observed, and the age of the site could not be determined, other than that it is from the prehistoric era. However, the presence of dateable exotic artifacts provides the opportunity for the site to address important research questions for the region, making CA-RIV-012623 eligible for inclusion in the NRHP under Criterion D. The site is also considered to be a contributing element to the combined TCPs and to the Mead Valley PPAD.

3.8.2.6 Historic Built Environment Resources

As part of the HRER, historic archaeological and built environment resources were identified and evaluated for the NRHP as required by 36 CFR Part 800 and the regulations implementing Section 106 of the NHPA, as amended (Section 106).

Architectural field surveys of the proposed project's APE were conducted in December 2012, April 2016, May 2016, and March 2019, in accordance with standard Caltrans guidelines and procedures. Ten properties within the APE were evaluated by PQS (see Table 3.8-2). Caltrans determined that these 10 properties are not eligible for the NRHP and consulted with SHPO on December 1, 2020. SHPO concurred with Caltrans determination of ineligibility for the 10 properties in a letter dated February 10, 2021 (Polanco 2021a). All other properties within the APE meet the criteria for Section 106 PA Attachment 4 (Properties Exempt from Evaluation). None of the evaluated properties are historical resources for CEQA purposes.

Table 3.8-2. Built Environment Resources within the APE

Name	Address/Location	Community	OHP Status Code	Eligibility Status
CA-RIV-3832H (Atchison, Topeka, and Santa Fe Railroad Grade)	N/A	Corona, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
N/A	12667 El Sobrante Road	Riverside, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
N/A	12697 El Sobrante Road	Riverside, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
N/A	13456 El Sobrante Road	Riverside, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
N/A	14870 El Sobrante Road	Riverside, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
N/A	15016 El Sobrante Road	Riverside, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
Lake Mathews General Store and Feed Store	17679 Cajalco Road	Perris, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
Great Miracle Valley Church	21415 Cajalco Road	Perris, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).

Name	Address/Location	Community	OHP Status Code	Eligibility Status
N/A	19391 Clark Street	Perris, CA	6L	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
Mead Valley Feed	21623 Cajalco Road	Perris, CA	6Z	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).
6Z – Found ineligible for NRHP, CRHR, or local designation through survey evaluation. 6L – Determined ineligible for local listing or designation through local government review process; may warrant special consideration in local planning.				

Traditional Cultural Properties

As a result of consultation between Caltrans on behalf of FHWA and the Pechanga Band of Luiseño Mission Indians, the tribe provided a confidential Ethnographic Report (Woodward et al. 2019) and a non-confidential letter (Dubois 2020) summarizing the location, description, and evaluation of three TCPs—*Túu'uv, Qax alku Pay mik, and Qax lku Kw imik*—encompassing the APE and APE vicinity. The nonconfidential letter detailing the context, location, and description of the TCPs (Dubois 2020) is provided in Attachment E of the HPSR. The three TCPs encompass a vast, undefined geographic area that includes the APE and all the project alternatives. The confidential ethnographic report prepared by the Pechanga Tribe (Woodward et al. 2019) and submitted to Caltrans evaluated the TCPs and considers them eligible for the NRHP under Criteria A through D (CSO approval on 5/7/2021). For the purposes of the project, Caltrans assumed NRHP eligibility for the three TCPs and has demarcated a 500-foot buffer around the project APE as the focal point for the analysis of project effects on the TCPs (Attachment A of the HPSR, APE Index, and Confidential Figure B-3 in Appendix A, *Draft Section 4(f)*, of this EIR/EIS). The three TCPs listed in Table 3.8-3 are also considered historical resources for the purposes of CEQA.

Table 3.8-3. Traditional Cultural Properties within the APE

Name	Description	OHP Status Code	Eligibility Status
Túu'uv	TCP encompassing a vast geographical area. Associated with a village and large ceremonial center, including more than 30 petroglyphs, and ancient trail.	3S (for the purposes of this project only)	Caltrans assumption of eligibility (NRHP Criteria A, B, C, D) for the purposes of this project only (CSO approval 5/7/2021).
Qax alku Pay mik	TCP encompassing a vast geographical area. Village complex associated with resource gathering and the Luiseño Creation account.	3S (for the purposes of this project only)	Caltrans assumption of eligibility (NRHP Criteria A, B, C, D) for the purposes of this project only (CSO approval 5/7/2021).
Qax alku Kw imik	TCP encompassing a vast geographical area. Associated with a village complex and large ceremonial center.	3S (for the purposes of this project only)	Caltrans assumption of eligibility (NRHP Criteria A, B, C, D) for the purposes of this project only (CSO approval 5/7/2021).
3S – Appears eligible for NRHP as an individual property through survey evaluation.			

Together, these TCPs encompass an expansive, unbounded, and overlapping geographic area that includes the APE and all the project alternatives. The TCPs share common uses and locations of religious and cultural importance, embodied by their position as a regional resource-gathering

area, a regional hub along a travel and trade route, and an expression of tribal values concerning the tribe's present-day religious and cultural values as expressed in the Creation account. The following descriptions of the three TCPs is summarized from the non-confidential letter provided by the tribe (Dubois 2020).

Túu'uv

Túu'uv is associated with a village and large ceremonial center, including more than 30 petroglyphs, and ancient trail extending from the coast to the San Jacinto Plain, connecting *Túu'uv* with the large village sites in the Lake Matthews/*Qax alku* region and the villages farther east. It is mentioned in traditional songs, is named in a long list of places located within ancestral Luiseño territory, and is generally considered to be more ancient than the surrounding areas.

Qax alku Pay mik

Qax alku Pay mik is a village complex associated with the Luiseño Creation account. This TCP is significant because of its use for both ceremonial purposes, indicated by the presence of petroglyphs and pictographs, and resource-gathering purposes in and near the project area.

Qax lku Kw imik

Qax lku Kw imik is a dense village complex and ceremonial center. It includes quartz quarries, resource processing areas, and seven vertical wave-shaped cupule boulders. Because quartz projectile points were important for ceremonial purposes, the presence of quartz quarries in this TCP is directly connected to the religious and cultural practices of the Luiseño.

3.8.3 Environmental Consequences

Results of the records searches, surveys, evaluations, and Caltrans assumptions of eligibility resulted in the identification of 13 historic properties within the APE that may be affected, depending on the build alternative. Refer to Table 3.8-4 on the following page. Assumptions of eligibility for the purposes of the project were made for six properties by Caltrans per Stipulation VIII.C.4 of the Section 106 PA: Mead Valley PPAD (including assumed contributing elements: combined site CA-RIV-2263, -2264, and -4444; CA-RIV-4403; CA-RIV-4407; CA-RIV-4408; CA-RIV-4409; and CA-RIV-012623) and approved by the CSO on July 7, 2020. TCPs *Túu'uv*, *Qaxáalku Payómik*, and *Qaxáalku Kwiimik* were all also assumed eligible for the purposes of the project by Caltrans and approved by the CSO on May 7, 2020. Determinations of eligibility for the sites were made by Caltrans and concurred upon by SHPO on February 10, 2021.

Table 3.8-4. Historic Properties within the APE – Build Alternatives 1, 2C, and 4

Site Name/Number	NRHP Status	Site Located within APE (Alternative)		
		1	2C	4
Mead Valley PPAD, including contributing elements	PPAD assumed eligible under Criteria A/1, B/2, C/3, and D/4 (CSO approval 7/7/2020). NRHP status for contributing elements described below for each qualifying site.	✓	✓	✓
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Individually assumed eligible under Criterion D/4; eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	✓	✓	
CA-RIV-4403	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓
CA-RIV-4407	Not individually eligible (SHPO concurrence on 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓
CA-RIV-4408	Not individually eligible (SHPO concurrence on 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓
CA-RIV-4409	Not individually eligible (SHPO concurrence on 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓
CA-RIV-4454	Not individually eligible (SHPO concurrence on 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (approved by CSO July 7, 2020).	✓	✓	
33-13791/CA-RIV-7843, Locus 816	Individually eligible under Criteria A/1, C/3, and D/4 (SHPO concurrence on 2/10/2021). Eligible as an assumed contributing element to the PPAD, and as a locus of CA-RIV-7843, under Criterion D/4 (CSO approval 7/7/2020).	✓	✓	✓
33-13791/CA-RIV-7843, Locus 817	Not individually eligible (SHPO concurrence on 2/10/2021); assumed eligible as a contributing element to the PPAD, and as a locus of CA-RIV-7843, under Criterion D/4 (CSO approval 7/7/2020).	✓	✓	✓
CA-RIV-012623	Individually eligible (SHPO concurrence on 2/10/2021), and as an assumed contributing element to the PPAD, under Criterion D/4 (CSO approval 7/7/2020).	✓	✓	✓
Traditional Cultural Property: *Túu'uv*	Assumed eligible under Criteria A/1, B/2, C/3, and D/4 (CSO approval 5/7/2020).	✓	✓	✓
Traditional Cultural Property: *Qax alku Pay mik*	Assumed eligible under Criteria A/1, B/2, C/3, and D/4 (CSO approval 5/7/2020).	✓	✓	✓
Traditional Cultural Property: *Qax alku Kw imik*	Assumed eligible under Criteria A/1, B/2, C/3, and D/4 (CSO approval 5/7/2020).	✓	✓	✓

Caltrans proposed a Finding of Adverse Effect and SHPO concurred on February 17, 2021. Caltrans also proposed that the effects of the three build alternatives would not cause an adverse effect on the three TCPs. SHPO stated on February 17, 2021 that they did not object to this finding (Polanco 2021b).

A Section 106 MOA will be developed for all historic properties that will be affected by the project, and will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS.

Of the 13 resources listed in Table 3.8-4, the concurrence on the determination of eligibility provided by SHPO February 10, 2021, indicates the following five NRHP-eligible resources qualify as individual properties subject to Section 4(f): Mead Valley PPAD, 33-13791/CA-RIV-7843, Locus 816, *Túu'uv* TCP*, Qax alku Pay mik* TCP*,* and *Qax alku Kw imik* TCP*.* See Appendix A, *Draft Section 4(f)*, of this EIR/EIS for a more detailed discussion of the evaluation of impacts involving Section 4(f) properties.

Regarding the evaluation of potential temporary impacts on cultural resources, any impact on cultural resources would be considered permanent; therefore, separate analysis of temporary impacts is not included in the EIR/EIS.

The effects of the project alternatives on these historic properties are discussed in Section 3.8.3.1, below.

3.8.3.1 Potential Effects on Historic Properties

Mead Valley Potential Prehistoric Archaeological District

Build Alternatives 1 and 2C—Adverse Effect

Under Build Alternatives 1 and 2C, construction activities would occur within the Mead Valley PPAD, resulting in impacts on the PPAD and contributing elements. The following contributing elements of the Mead Valley PPAD within the APE and limits of Build Alternatives 1 and 2C would be adversely affected: combined site CA-RIV-2263; CA-RIV-4454; Loci 816 and 817 of CA-RIV-7843; and CA-RIV-012623.

The PPAD boundary used for the purposes of this project encompasses the majority of the project limits and extends out enough to allow for determining the effects of the project. Actual boundaries, however, are not spatially defined, and are anticipated to contain an undefined number of archaeological resources outside the project limits. The majority of Build Alternatives 1 and 2C are fully encompassed by the Mead Valley PPAD, and may be fully encompassed for the reasons stated above. For the purposes of the project and the evaluation of impacts related to the project, the acreage approximation for the PPAD is 29,229 acres (see Index Overview and Index Map Sheets 1–6 of HPSR Attachment A), which is not the full extent of the PPAD.

Under Build Alternative 1,399 acres of permanent and 78 acres of temporary impacts are anticipated, resulting in impacts on 1.63 percent of the PPAD (29,229 acres) delineated in the vicinity of the project. The limited percentage of permanent and temporary impacts within the overall PPAD would be minimal. However, the removal of contributing elements of the PPAD from their historic location, which is what qualifies the site as NRHP eligible, would be

considered an adverse effect. In addition, the change in character of the physical features within the site's setting that contribute to its historical significance would be compromised and considered an adverse impact. Therefore, a finding of Adverse Effect is provided for the PPAD under Build Alternative 1.

Under Build Alternative 2C, 415 acres of permanent and 86 acres of temporary impacts are anticipated, resulting in impacts on 1.71 percent of the PPAD (29,229 acres) delineated in the vicinity of the project. The limited percentage of permanent and temporary impacts within the overall PPAD would be minimal. However, the removal of contributing elements of the PPAD from their historic location, which is what qualifies the site as NRHP eligible, would be considered an adverse effect. In addition, the change in character of the physical features within the site's setting that contribute to its historical significance would be compromised and considered an adverse impact. Therefore, a finding of Adverse Effect is provided for the PPAD under Build Alternative 2C.

Build Alternative 4—Adverse Effect

Under Build Alternative 4, 254 acres of permanent and 55 acres of temporary impacts are anticipated, resulting in impacts on 1.1 percent of the PPAD (29,229 acres) delineated in the vicinity of the project. The following contributing elements of the Mead Valley PPAD located within the APE and limits of Build Alternative 4 would be adversely affected: CA-RIV-4403, -4407, -4408, -4409, and -4454; Loci 816 and 817 of CA-RIV-7843; and CA-RIV-012623.

Contributing elements within the PPAD and APE would be permanently destroyed through the removal of features, subsurface deposits, and artifacts. The removal of contributing elements of the PPAD from their historic location, which is what qualifies the site as NRHP eligible, would be considered an adverse effect. In addition, the change in character of the physical features within the site's setting that contribute to its historical significance would be compromised and considered an adverse impact. Therefore, a finding of Adverse Effect is provided for the PPAD under Build Alternative 4.

Combined Site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444

Build Alternatives 1 and 2C—Adverse Effect

The combined site is eligible for inclusion in the NRHP under Criterion D due to the presence of a buried cultural deposit with the potential to provide data considered important to the prehistory of the area and larger region. Under Build Alternatives 1 and 2C, construction activities would physically remove portions of these three sites, resulting in a finding of Adverse Effect on a historic property. Components of CA-RIV-2263, sites CA-RIV-4444 and -2263, would be partially destroyed by Build Alternative 1, while CA-RIV-2264 would be avoided under this alternative. Conversely, under Build Alternative 2C, CA-RIV-4444 would be avoided and portions of CA-RIV-2263 and -2264 would be destroyed. Considering the three sites as a whole with the revised site boundary, Build Alternative 1 would permanently destroy approximately 2.09 acres, whereas Build Alternative 2C would permanently destroy 5.36 acres of the combined site. Additionally, a subsurface component of this site was identified and would also be partially destroyed.

Under Build Alternative 1, three bedrock milling stations would be physically removed during construction. Based on the findings from three shovel test pits, there could be additional subsurface deposits in the project footprint on this site.

Under Build Alternative 2C, CA-RIV-4444 would be avoided, whereas portions of CA-RIV-2263 and -2264 and areas in between them would be destroyed. Based on the findings from ten shovel test pits in the areas identified for permanent impacts, and three test units, there is potential for subsurface artifacts within the site boundary for this alternative that would be physically destroyed through direct ground-disturbing construction activities.

Under both alternatives, adverse effects on this resource would be anticipated because both alternatives would physically destroy parts of the site, including milling features, surface artifacts, and an undetermined amount of buried cultural deposits; remove resources from their context; and change the character of the site's physical features. The site as a whole would be adversely affected.

Build Alternative 4—No Adverse Effect

Under Build Alternative 4, there would be no anticipated construction in the location of this resource. As such, there would be no physical impact on the resource that would damage or destroy a part of the site. In addition, temporary indirect impacts from construction of this alternative, such as visual, noise, or air quality impacts, would be situated too far from the resource to have substantial impacts.

CA-RIV-4403, -4407, -4408, and -4409

Due to the proximity of sites CA-RIV-4403, -4407, -4408, and -4409 within the project APE, the potential for adverse effects on the four contributing elements of the PPAD is addressed collectively.

Build Alternatives 1 and 2C—No Adverse Effect

Under Build Alternatives 1 and 2C, no construction activities or other disturbance would occur; therefore, no impacts would be anticipated.

Build Alternative 4—Adverse Effect

Under Build Alternative 4, construction activities would physically destroy parts of sites CA-RIV-4403, -4407, -4408, -4409, resulting in the removal of resources from their context. While the sites are not individually NRHP eligible, as contributing elements of the Mead Valley PPAD, CA-RIV-4403, -4407, -4408, -4409, would be adversely affected. Therefore, a finding of Adverse Effect is provided for CA-RIV-4403, -4407, -4408, -4409 under Build Alternative 4.

CA-RIV-4454

Build Alternatives 1 and 2C—Adverse Effect

Under Build Alternatives 1 and 2C, construction activities would result in the physical removal of the majority of the artifact scatter at CA-RIV-4454. While the site is not individually NRHP eligible, as a contributing element of the Mead Valley PPAD, site CA-RIV-4454 would be

adversely affected. Therefore, a finding of Adverse Effect is provided for CA-RIV-4454 under Build Alternatives 1 and 2C.

Build Alternative 4—No Adverse Effect

Under Build Alternative 4, no construction activities or other disturbance would occur; therefore, no impacts would be anticipated.

CA-RIV-7843, Locus 816

Build Alternatives 1, 2C, and 4—Adverse Effect

All three build alternatives would physically damage Locus 816 of site CA-RIV-7843. Because the locus is a component of the larger CA-RIV-7843 site, impacts on the locus are considered as impacts on the larger site overall.

At Locus 816, 2.16 acres of permanent impacts and an adverse effect are anticipated under all three build alternatives. Individually, Locus 816 (CA-RIV-816) is eligible for inclusion in the NRHP under Criteria A, C, and D. Previous research at this locus, subsurface investigations, and consultation with Native American tribes have identified elements of this site that can address important research questions for the region. The majority of Locus 816 is within the direct impact area under all three build alternatives and would be adversely affected. One bedrock milling feature, a portion of a midden deposit, and six areas of subsurface recovery (TU-8, TU-9, TU-10, SP-42, SP-52, and SP-54) would be physically displaced, removed, or buried as part of the project, resulting in an adverse effect. The resources, especially the couple rock and bedrock milling features, would be exposed to vibration associated with construction equipment and bridge construction. The cupule rock and one bedrock milling feature and associated bedrock outcrop would be left in place, but it would still be adversely affected due to the change in setting and being located in proximity to the proposed bridge deck.

CA-RIV-7843, Locus 817

Build Alternatives 1, 2C, and 4—Adverse Effect

All three build alternatives would physically damage Locus 817 of site CA-RIV-7843. Because the locus is a component of the larger CA-RIV-7843 site, impacts on the locus are considered as impacts on the larger site overall.

Individually, Locus 817 does not appear to meet any of the criteria that would make it eligible for inclusion in the NRHP and, as such, is not eligible. As a locus of the site CA-RIV-7843, it should be considered a contributing element of the larger site. The larger site CA-RIV-7843 is presumed eligible for listing in the NRHP, and the individual loci of this site collectively contribute to its significance. A total of 0.65 acre of permanent impacts is anticipated for Locus 817 under all three build alternatives and would be adversely affected. Surface resources associated with the site could not be relocated as part of the project; however, the majority of Locus 817 would be adversely affected through construction grading, bridge construction, and sediment removal. It is unknown whether a subsurface component exists on the site. Midden deposits and a rock shelter were identified when the site was first recorded, but these components were not identified during the present survey.

Under all build alternatives, adverse effects on this resource would be anticipated because the alternatives would physically destroy parts of the site and remove resources from their context, and because construction of each of the alternatives would change the character of the site's physical features within its setting.

CA-RIV-012623

Build Alternatives 1, 2C and 4—Adverse Effect

CA-RIV-012623 is eligible for inclusion in the NRHP under Criterion D. The presence of dateable exotic artifacts (marine shell) provides the opportunity for the site to address important research questions for the region. It is unknown whether the site contains a subsurface deposit because archaeological testing activities have not been conducted; however, the stratigraphic soil profile indicates potential for buried deposits to exist at the site. All three build alternatives would adversely affect this site. Under Build Alternative 1, 0.17 acre of permanent impacts are anticipated. Two surface artifacts consisting of one chalcedony core (two pieces) and one chalcedony flake would be physically displaced or removed as part of the project.

Under Build Alternative 2C, 0.17 acre of permanent impacts are anticipated. Two surface artifacts consisting of one chalcedony core (two pieces) and one chalcedony flake would be physically displaced or removed as part of the project.

Under Build Alternative 4, 0.00008 acre of permanent impacts are anticipated. There are no recorded artifacts that would be adversely affected by the project; however, a small portion of the resource is proposed to be removed, resulting in an adverse effect.

Under all build alternatives, adverse effects on this resource would be anticipated because the alternatives would physically destroy parts of the site and remove resources from their original context. The site would also be adversely affected because construction impacts could destroy potentially buried resources and, as such, change the character of the site's physical features within its setting.

Traditional Cultural Properties: Túu'uv, Qax alku Pay mik, and Qax alku Kw imik

Build Alternatives 1, 2C, and 4—No Adverse Effect

The project would affect the NRHP-eligible TCPs consisting of *Túu'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*, but the effect would not be adverse. None of the three build alternatives would physically alter the TCPs such that the overall setting and integrity of the TCPs' character-defining features would be adversely affected. While some sites that occur within the APE would be individually adversely affected, the effects on these sites would not cause an adverse effect on the overall TCPs because those sites compose such a small physical part of the overall TCPs.

All three build alternatives are encompassed by the large, unbounded, geographic area included in the TCPs. Caltrans and the Pechanga Band participated in the development of the TCP boundary approach for the project. The Pechanga Band agreed with the Caltrans District 8 approach for developing fluid, undetermined TCP boundaries that are wide enough to allow for determining the effects of the project, but that may be expanded in the future if needed. The

boundaries fully include the project limits and extend out enough to allow for determining the effects of the project. However, actual boundaries are vast, and the tribe has not yet fully determined their limits (see Index Map Sheets 1–6 of HPSR Attachment A). For the purposes of this project, the acreage approximation for the combined TCPs is 28,531 acres, which is not the full extent of the TCPs.

Under Build Alternative 1, 390.2 acres of permanent impacts are anticipated, resulting in impacts on 1.37 percent of the combined TCPs delineated in the vicinity of the project. Three sites, which have been discussed earlier in this chapter, are contributing elements of the TCPs and individually would be adversely affected under Alternative 1. The sites are listed below with their proposed permanent impact acreages.

- Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444: 2.09 acres
- 33-13791/CA-RIV-7843, Loci 816 and 817: 2.81 acres
- CA-RIV-012623: 0.17 acre

The limited percentage of permanent impacts on the overall TCP and contributing site(s) impact acreages would be minimal; therefore, a finding of No Adverse Effect is provided for the TCPs under Build Alternative 1.

Under Build Alternative 2C, 399.2 acres of permanent impacts are anticipated, which would result in impacts on 1.40 percent of the combined TCPs delineated in the vicinity of the project. Three sites, which have been discussed earlier in this chapter, are contributing elements of the TCPs and individually would be adversely affected under Build Alternative 2C. The sites are listed below with their proposed permanent impact acreages.

- Combined Site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444: 5.36 acres
- 33-13791/CA-RIV-7843, Loci 816 and 817: 2.81 acres
- CA-RIV-012623: 0.17 acre

The limited percentage of permanent impacts on the overall TCP and contributing site(s) impact acreages would be minimal; therefore, a finding of No Adverse Effect is provided for the TCPs under Build Alternative 2C.

Under Build Alternative 4, 395.9 acres of permanent impacts are anticipated, which would result in impacts on 1.39 percent of the combined TCPs delineated in the vicinity of the project. Two sites and one PPAD, which have been discussed earlier in this chapter, are contributing elements of the TCPs and individually would be adversely affected under Build Alternative 4. The sites are listed below with their proposed permanent impact acreages.

- 33-13791/CA-RIV-7843, Loci 816 and 817: 2.81 acres
- CA-RIV-012623: 0.00008 acre
- PPAD (CA-RIV-4403, CA-RIV-4407, CA-RIV-4408, and CA-RIV-4409): 0.30 acre

The limited percentage of permanent impacts on the individual and combined TCPs and contributing site(s) impact acreages would be minimal; therefore, a finding of No Adverse Effect is provided for the TCPs under Build Alternative 4.

Under all build alternatives, less-than-adverse effects on the TCPs would be anticipated. Each of the roadway alternatives would physically destroy portions of the four sites listed above, remove them from their original context, and change the use of the physical elements of the individual sites; however, their damage, destruction, or removal would not change the characteristics of the TCP landscapes such that they do not retain integrity of setting, feeling, and location. Within the APE, which is a very small fraction of the total area of the TCPs, change in character of the sites' physical features within the TCPs' setting would not be to an extent great enough to adversely affect the greater TCPs because their extent comprises multiple similar resources over a vast area. These physical changes would not affect the TCPs' functions within the contemporary Luiseño beliefs and culture because, in the words of the Pechanga Band, "the traditional cultural significance of these TCPs is derived from the role the properties play in [our] community's historically rooted beliefs, customs and practices." Additionally, the Pechanga Band feels that "…the intangible ties to the area are so interwoven into the Tribe's identity as a People that the ability to freely access the area has not resulted in the destruction of the Tribe's religious and cultural practices associated with the region, which have been passed down through oral tradition since time immemorial" (Dubois 2020). It is concluded that the physical changes to these archaeological contributors are so minor, relative to the physical and intangible components of the TCPs, that they do not constitute an adverse effect.

The project is not expected to introduce visual, atmospheric, or audible elements that diminish the integrity of the TCPs' setting, feeling, or location. While the project would alter the alignment of Cajalco Road, the changes would largely use the existing road alignment, which would cause minimal change within the APE and relative to the full extent of the TCPs; this effect would be very minor.

The primary significance of the TCPs is the important role they play in the Luiseño community's historically and traditionally based customs, beliefs, and practices. None of the three alternatives would affect the intangible spiritual and religious qualities of the TCPs or the ability of the Luiseño to recognize or maintain their relationship to their history, religion, customs, or the landscape. The sacred and spiritual components of the TCPs exist independent from the physical characteristics of the landscape and would not be diminished or adversely affected through direct or indirect construction impacts. Therefore, a finding of No Adverse Effect is provided for the TCPs under all alternatives concerning direct and indirect impacts.

3.8.3.2 Build Alternative 1—Cajalco Alignment

As noted in Table 3.8-5 on the following page, nine historic properties (consisting of five archaeological properties, one PPAD, and three TCPs) would potentially be affected by Build Alternative 1. The portion of site CA-RIV-7843 outside Loci 816 and 817 was not evaluated as part of this project.

Table 3.8-5. Effect Finding – Build Alternative 1

Property	Effect Finding for Alternative 1	Measures
Mead Valley PPAD, including contributing elements: CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444 (combined site CA-RIV-2263); CA-RIV-4454; CA-RIV-7843, Locus 816; CA-RIV-7843, Locus 817; and CA-RIV-012623	Adverse Effect on PPAD; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-4454	No Adverse Effect on individually ineligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-7843 (Locus 816)	Adverse Effect on individually eligible site; Adverse Effect as a contributor to site CA-RIV-7843; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-7843 (Locus 817)	Adverse Effect as a contributor to site CA-RIV-7843; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-012623	Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Túu'uv*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Qax alku Pay mik*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Qax alku Kw imik*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2

Based on the application of the Criteria of Effect, as defined in the revised Section 106 guidelines (36 CFR 800.5(1)), Caltrans proposes that Build Alternative 1 would cause an Adverse Effect on the Mead Valley PPAD, combined site of CA-RIV-2263, Loci 816 and 817 of CA-RIV-7843, CA-RIV-4454, and CA-RIV-012623. The project would have No Adverse Effect on the TCPs *Túu'uv, Qax alku Pay mik,* and *Qax alku Kw imik.* Build Alternative 1 would also have no effect on sites CA-RIV-4403, -4407, -4408, and -4409.

Because no historic built environment properties are present within the APE, historic built environment properties would not be affected.

There are historic properties protected by Section 4(f) of the Department of Transportation Act of 1966 within the project APE and vicinity. The proposed project would result in a "use" of those properties as defined by Section 4(f). Please see additional details in Appendix A, *Draft Section 4(f)*, of this EIR/EIS.

Caltrans, pursuant to Section 106 PA Stipulation IX.A, has determined a Finding of Adverse Effect is appropriate for this undertaking.

Caltrans and the County have been working with participating Native American tribes in the identification and understanding of resources relative to each tribe involved. A number of meetings have been held to discuss tribal concerns and consider mitigation, and Native American tribes have been actively engaged with Caltrans during cultural resources surveys and site testing. Native American input and information have been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternative 1. In addition to design options, the following Standard Project Measures would be implemented:

Standard Project Measures

If cultural materials or human remains are discovered during construction, all earthmoving activity within and around the immediate discovery area would be diverted until a qualified archaeologist or the Riverside County Coroner can assess the nature of the find. Standard Project Measure PF-CR-1 addresses the possibility of discovery of cultural material during construction. Standard Project Measure PF-CR-2 addresses the possibility of discovery of human remains during construction.

PF-CR-1: Unanticipated Discoveries. If cultural materials are discovered during construction, all earth-moving activity within and around the immediate discovery area will be diverted until a qualified archaeologist can assess the nature and significance of the find. Unanticipated discoveries will be treated according to the Project Discovery and Monitoring Plan.

PF-CR-2: Discovery of Human Remains. If human remains are discovered during construction, California Health and Safety Code Section 7050.5 states that further disturbances and activities shall stop in any area or nearby area suspected to overlie remains, and the County Coroner contacted. If the remains are thought by the County Coroner to be Native American, the coroner will notify the Native American Heritage Commission (NAHC) who, pursuant to Public Resources Code (PRC) Section 5097.98, will then notify the Most Likely Descendant (MLD). At this time, the person who discovered the remains will contact Gary Jones, District Native American Coordinator, at (909) 383-7505 so that they may work with the MLD on the respectful treatment and disposition of the remains. Further provisions of PRC 5097.98 are to be followed as applicable.

3.8.3.3 Build Alternative 2C—Modified Cajalco Alignment

As noted in Table 3.8-6 on the following page, nine historic properties (consisting of five archaeological properties, one PPAD, and three TCPs) would potentially be affected by Build Alternative 2C. The portion of site CA-RIV-7843 outside Loci 816 and 817 was not evaluated as part of this project.

Table 3.8-6. Effect Finding – Build Alternative 2C

Property	Effect Finding for Alternative 2C	Measures
Mead Valley PPAD, including contributing elements: CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444 (combined site CA-RIV-2263); CA-RIV-4454; 33-13791/ CA-RIV-7843, Loci 816 and 817; and CA-RIV-012623	Adverse Effect on PPAD; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-4454	No Adverse Effect on individually ineligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-7843 (Locus 816)	Adverse Effect on individually eligible site; Adverse Effect as a contributor to site CA-RIV-7843; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-7843 (Locus 817)	Adverse Effect as a contributor to site CA-RIV-7843; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-012623	Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Túu'uv*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Qax alku Pay mik*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Qax alku Kw imik*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2

Based on the application of the Criteria of Effect, as defined in the revised Section 106 guidelines (36 CFR 800.5(1)), Caltrans proposes that Build Alternative 2C would cause an Adverse Effect on the Mead Valley PPAD, combined site of CA-RIV-2263, Loci 816 and 817 of CA-RIV-7843, CA-RIV-4454, and CA-RIV-012623. The project would have No Adverse Effect on the TCPs *Túu'uv, Qax alku Pay mik,* and *Qax alku Kw imik.* Build Alternative 2C would also have no effect on sites CA-RIV-4403, -4407, -4408, and -4409.

Because no historic built environment properties are present within the APE, historic built environment properties would not be affected.

Caltrans, pursuant to Section 106 PA Stipulation IX.A, has determined a Finding of Adverse Effect is appropriate for this undertaking.

Caltrans and the County have been working with participating Native American tribes in the identification and understanding of resources relative to each tribe involved. A number of meetings have been held to discuss tribal concerns and consider mitigation, and Native American tribes have been actively engaged with Caltrans during site testing. Native American input and information have been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternative 2C.

If cultural materials or human remains are discovered during construction, all earthmoving activity within and around the immediate discovery area would be diverted until a qualified archaeologist or the Riverside County Coroner can assess the nature of the find. Standard Project Measure **PF CR-1** addresses the possibility of discovery of cultural material during construction. Standard Project Measure **PF CR-2** addresses the possibility of discovery of human remains during construction (see Section 3.8.3.2). There are historic properties protected by Section 4(f) of the Department of Transportation Act of 1966 within the project APE and vicinity. The proposed project would result in a "use" of those properties as defined by Section 4(f). Please see additional details in Appendix A, *Draft Section 4(f)*, of this EIR/EIS.

3.8.3.4 Build Alternative 4—El Sobrante Alignment

As noted in Table 3.8-7, eleven historic properties (consisting of seven archaeological properties, one PPAD, and three TCPs) would potentially be affected by construction of Build Alternative 4. The portion of site CA-RIV-7843 outside Loci 816 and 817 was not evaluated as part of this project.

Table 3.8-7. Effect Finding – Build Alternative 4

Property	Effect Finding for Alternative 4	Measures
Mead Valley PPAD, including contributing elements: CA-RIV-4403, -4407, -4408, -4409; 33-13791/CA-RIV-7843, Loci 816 and 817; and CA-RIV-012623	Adverse Effect on individually eligible PPAD; Adverse Effect as a contributor to the PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-4403	No Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-4407	No Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-4408	No Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-4409	No Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-7843 (Locus 816)	Adverse Effect on individually eligible site; Adverse Effect as a contributor to site CA-RIV-7843; No Adverse Effect as a contributor to a TCP (SHPO concurrence2/17/2021).	PF CR-1, PF CR-2
CA-RIV-7843 (Locus 817)	Adverse Effect as a contributor to site CA-RIV-7843; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
CA-RIV-012623	Adverse Effect on individually eligible site; Adverse Effect as a contributor to PPAD; No Adverse Effect as a contributor to a TCP (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Túu'uv*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Qax alku Pay mik*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2
Traditional cultural property: *Qax alku Kw imik*	No Adverse Effect on TCP; Adverse Effect on contributing sites (SHPO concurrence 2/17/2021).	PF CR-1, PF CR-2

Based on the application of the Criteria of Adverse Effect, as defined in the revised Section 106 guidelines (36 CFR 800.5(1)), Caltrans proposes that Build Alternative 4 would cause an Adverse Effect on the Mead Valley PPAD, CA-RIV-4403, CA-RIV-4407, CA-RIV-4408, CA-RIV-4409, Loci 816 and 817 of CA-RIV-7843, and CA-RIV-012623. The project would have no adverse effect on the *Túu'uv, Qax alku Pay mik,* and *Qax alku Kw imik* TCPs. Build Alternative 4 would also have no effect on combined sites CA-RIV-2263 and CA-RIV-4454.

Because no historic built environment properties are present within the APE, historic built environment properties would not be affected.

Caltrans, pursuant to Section 106 PA Stipulation IX.A, has determined a Finding of Adverse Effect is appropriate for this undertaking.

Caltrans and the County have been working with participating Native American tribes in the identification and understanding of resources relative to each tribe involved. A number of meetings have been held to discuss tribal concerns and consider mitigation, and Native American tribes have been actively engaged with Caltrans during site testing. Native American input and information have been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternative 4.

If cultural materials or human remains are discovered during construction, all earthmoving activity within and around the immediate discovery area would be diverted until a qualified archaeologist or the Riverside County Coroner can assess the nature of the find. Standard Project Measure **PF CR-1** addresses the possibility of discovery of cultural material during construction. Standard Project Measure **PF CR-2** addresses the possibility of discovery of human remains during construction (see Section 3.8.3.1). There are historic properties protected by Section 4(f) of the Department of Transportation Act of 1966 within the project APE and vicinity. The proposed project would result in a "use" of those properties as defined by Section 4(f). Please see additional details in Appendix A, *Draft Section 4(f)*, of this EIR/EIS.

3.8.3.5 Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road or Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if constructed in the future, additional impacts on cultural resources would not be anticipated because the median areas where the additional lanes would occur would have already been disturbed under the proposed project.

3.8.3.6 Lake Mathews MSHCP (Build Alternatives 1, 2C and 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the Lake Mathews Multiple Species Habitat Conservation Plan (LM MSHCP) area and Lake Mathews Multiple Species Reserve (LMR); appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. These roadway improvements would also include the areas of La Sierra Avenue and El Sobrante Road under Build Alternative 4. The proposed project would also result in the excavation, grading, and cut

and fill of soils and rock within the LM MSHCP area. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to accommodate the proposed project. Potential impacts on archaeological resources eligible for the NRHP and CRHR within the LM MSHCP area and LMR may occur.

A number of meetings have been held to discuss tribal concerns and consider mitigation, and Native American tribes have been actively engaged with Caltrans during site testing. Native American input and information has been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternatives 1, 2C, and 4.

If cultural materials or human remains are discovered during construction, all earthmoving activity within and around the immediate discovery area would be diverted until a qualified archaeologist or the Riverside County Coroner can assess the nature of the find. Standard Project Measure **PF CR-1** addresses the possibility of discovery of cultural material during construction. Standard Project Measure **PF CR-2** addresses the possibility of discovery of human remains during construction (see Section 3.8.3.1).

3.8.3.7 No-Build Alternative

The No-Build Alternative would not adversely affect cultural resources.

3.8.4 Avoidance, Minimization, and/or Mitigation Measures

In addition to the Standard Project Measures **PF CR-1** and **PF CR-2** identified in Section 3.8.3.2, a Section 106 MOA will be developed for all historic properties that will be affected by the project, and will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS.

3.9 Hydrology and Floodplain

3.9.1 Regulatory Setting

Executive Order (EO) 11988 (Floodplain Management) directs all federal agencies to refrain from conducting, supporting, or allowing actions in floodplains unless it is the only practicable alternative. The Federal Highway Administration (FHWA) requirements for compliance are outlined in 23 Code of Federal Regulations (CFR) 650 Subpart A.

To comply, the following must be analyzed:

- The practicability of alternatives to any longitudinal encroachments.
- Risks of the action.
- Impacts on natural and beneficial floodplain values.
- Support of incompatible floodplain development.
- Measures to minimize floodplain impacts and to preserve/restore any beneficial floodplain values affected by the project.

The base floodplain is defined as "the area subject to flooding by the flood or tide having a one percent chance of being exceeded in any given year." An encroachment is defined as "an action within the limits of the base floodplain."

3.9.2 Affected Environment

The following discussion is based on information contained in the *Location Hydraulic Study Form and Floodplain Encroachment Report – Cajalco Road Widening Project* (County 2017) and the *Lake Mathews Watershed Water Quality Improvement Study* (MWD 2012).

3.9.2.1 Surface Water Hydrology

The proposed project is located in the Santa Ana River and San Jacinto Valley Hydrologic Units, within the Lake Mathews, Middle Santa Ana River, and Perris Hydrologic Areas (HAs). The westerly end of the project is located within the Bedford Hydrologic Subarea (HSA) within the Lake Mathews HA. The middle section of the project, located within the Cajalco HSA, is also within the Lake Mathews HA. Portions of Build Alternative 4 are within the Arlington HSA, within the Middle Santa Ana River HA. The easterly end of the project is located within the Perris Valley HSA within the Perris HA. The westerly end of the project crosses Temescal Wash (or Creek) as well as several unnamed tributaries to and Temescal Wash. The proposed project's alternative routes then run adjacent to Lake Mathews before crossing Cajalco Creek toward the easterly project limits. The proposed project also crosses several unnamed tributaries to Lake Mathews, and Cajalco Creek.

Temescal Wash is 29 miles long, connecting Lake Elsinore to the Santa Ana River. It has a drainage basin of 1,000 square miles including the 720 square miles of the San Jacinto River and Lake Elsinore watersheds. It is considered ephemeral for most of its length, except for non-stormwater runoff from development and agricultural return flows. It has an average flow of 30 cubic feet per second (cfs). The 100-year discharge is 24,400 cfs.

Lake Mathews is a reservoir with a capacity of 182,000 acre-feet that receives water from the Colorado River Aqueduct, and is part of Metropolitan Water District of Southern California's (MWD) water supply system. The reservoir is fenced and closed to all public access. Lake Mathews captures the natural stormwater flows from Cajalco Creek upstream of the reservoir and the project area.

Cajalco Creek, an ephemeral stream, flows westerly to Lake Mathews. Downstream of Lake Mathews, the lower reach of Cajalco Creek continues westerly joining Temescal Creek, which flows northerly to the Santa Ana River at Prado Basin. The Santa Ana River continues westerly to the Pacific Ocean. The eastern end of the project is within the Perris Valley hydrologic subarea. Upstream of Lake Mathews, Cajalco Creek begins on the northeast face of the Gavilan Hills of the Temescal Mountains. It is an ephemeral stream that flows westerly through Mead Valley and Cajalco Valley before flowing into Lake Mathews. Cajalco Creek has a 100-year discharge of 8,220 cfs.

The following facilities associated with the Lake Mathews reservoir in the project area are maintained by MWD (MWD 2011; AECOM 2012):

- Lake Mathews Dam: north of Cajalco Road, east of La Sierra Avenue
- Northern Lake Mathews Dike: south of El Sobrante Road, east of La Sierra Avenue
- Cajalco Creek Dam, Detention Basin, Sedimentation Basin, and Inlet Channel (connecting the two basins): north of Cajalco Road, east of El Sobrante Road
- 140-inch Upper Feeder pipeline: north and south of El Sobrante Road, west of La Sierra Avenue (south of El Sobrante Road)
- 54-inch Woodcrest pipeline: north and south of El Sobrante Road, west of La Sierra Avenue (south of El Sobrante)
- 120-inch Lower Feeder pipeline: north of Cajalco Road, east and west of El Sobrante Road
- Ten-million gallon reservoir: north of Cajalco Road, west of La Sierra Avenue
- Four additional sediment basins: south of Cajalco Road, west of Harley John Road.
- Piezometers: various locations west and north of Lake Mathews

The *Lake Mathews Watershed Water Quality Improvement Study* (MWD 2012) identified a series of best management practices (BMPs) that could be constructed and maintained either by public agencies, or in conjunction with larger development projects, to protect Lake Mathews' water quality from the potentially adverse effects of development in the watershed (MWD 2012). Recommended BMPs included a combination of detention basins, sediment basins, and water quality ponds. The majority of the BMPs have been constructed and one remains in the conceptual planning stage. Within the project site is the existing Cajalco Creek Dam and Detention Basin and Cajalco Creek Sediment Basin (MWD 2012), also identified above. The *Lake Mathews Watershed Water Quality Improvement Study* identified one potential scenario for protecting future lake water quality, construction of the Lake Mathews Estates Water Quality Pond as the major, additional regional stormwater BMP (MWD 2012). However, the timeline for implementing the proposed BMP is currently unknown.

The Cajalco Creek Dam and Detention Basin is the primary BMP constructed in the watershed. Its purpose is to provide extended detention to reduce pollutant loading immediately upstream of Lake Mathews. The dam is formed by a 46-foot-high embankment and a 30-foot-wide crest. A spillway on the north abutment allows flood waters to safely pass without overtopping the embankment. A gated outlet allows water to be released into Lake Mathews and is manually operated. The Cajalco Creek Sediment Basin is on the largest tributary to Lake Mathews. It is 31 acres, sited immediately upstream of the 70-acre Cajalco Creek Dam and Detention Basin (MWD 2012). According to the *Lake Mathews Watershed Water Quality Improvement Study Task 3* (Appendix C to MWD 2012), the runoff control basin dimensions for Cajalco Creek Dam and Detention basin is 131 acres and provides 2,010 acre-feet of capacity and the Cajalco Creek Sedimentation Basin runoff control basin dimensions is 19.9 acres and provides 134 acre-feet of capacity.

Topography

To the west of Lake Mathews, Cajalco Road winds through Cajalco Canyon with steep grades generally sloping westerly toward Temescal Creek. Along the south side of Lake Mathews, slopes are generally to the north toward Lake Mathews. On the north side of Lake Mathews, slopes are also generally to the north, but in this area away from Lake Mathews and toward Arlington Valley Channel.

The highest elevation along the project occurs at the drainage divide between Mead Valley and Perris Valley along the existing Cajalco Road, approximately 1.7 miles west of Interstate 215 (I-215), near Day Street. Cajalco Road ranges in elevation from 1,704 feet at the Mead Valley/Perris Valley drainage divide, to 1,510 feet at the eastern end of the project (I-215), to 800 feet at the westerly end of the project (Temescal Canyon Road).

Within the Cajalco HSA, elevations reach as high as 2,557 feet in the Gavilan Hills to the south of Cajalco Road. Northwest of El Sobrante Road, elevations reach as high as 1,857 feet at the peak of Arlington Mountain. El Sobrante Road generally follows the drainage divide between Lake Mathews and Mockingbird Canyon within the Arlington HSA. The area north of Cajalco Road slopes generally to the southwest at a grade of about 1.4 percent. Within Mead Valley, the area south of Cajalco Road slopes generally to the north at a grade of about 1.2 percent.

3.9.2.2 Groundwater Hydrology

A small portion of the western end of the project site is within the Temescal Subbasin of the Upper Santa Ana Valley Groundwater Basin, based on 2016 data. A limited section of the eastern end of the project is within the San Jacinto Groundwater Basin.

The California Department of Water Resources Groundwater Bulletin 118[1] indicates the Temescal Subbasin of the Upper Santa Ana Valley Groundwater Basin underlies the southwestern part of upper Santa Ana Valley. The subbasin has a surface area of 37 square miles and is bounded on the west by the Santa Ana Mountains and the south by the Elsinore

[1] Bulletin 118 is California's official publication on the occurrence and nature of groundwater statewide. Bulletin 118 defines the boundaries and describes the hydrologic characteristics of California's groundwater basins and provides information on groundwater management and recommendations for the future.

Groundwater Basin at a constriction in the alluvium of Temescal Wash. Groundwater flows toward the center of the subbasin and then northeast toward the Santa Ana River.

Bulletin 118 indicates the San Jacinto Groundwater Basin underlies San Jacinto, Perris, Moreno, and Menifee Valleys in western Riverside County. The basin has a surface area of 293 square miles.

The Initial Site Assessment for the proposed project indicates that, according to published groundwater monitoring reports, groundwater in the vicinity of the project site ranges between approximately 10 feet and 45 feet below ground surface.

3.9.2.3 Floodplain Characteristics

The Federal Emergency Management Agency (FEMA) identifies designated zones to indicate flood hazard potential and provides information on flood hazard and frequency for cities and counties on its Flood Insurance Rate Maps (FIRMs). FIRMs were consulted in order to identify flood hazard areas in the vicinity of the project (see Figure 3.9-1). FEMA creates FIRMs that delineate special flooding hazard areas and risk premium zones. The proposed project site is located in FIRM panels 06065C1360G, 06065C1380G, 06065C1385G, 06065C1405G, and 06065C1410G for Riverside County, California, and incorporated areas, dated August 28, 2008. Flooding hazard areas are designated as zones, with the proposed project in FEMA Zone A and un-shaded Zone X. Zone A is an area subject to inundation by the 1-percent annual chance (100-year) flood. Zone X is an area of minimum flood hazard outside the 0.2-percent annual chance (500-year) flood limits.

Temescal Creek is located within the Zone A floodplain on the western portion of the project site (refer to Location 1 on Figure 3.9-1). The Temescal Creek floodplain at Cajalco Road is approximately 1,705 feet wide. The Cajalco Road Bridge crossing at this location is a significant constriction in the Temescal Creek and causes the water surface to rise approximately four feet across the width of the bridge (RCTC 2008).

Cajalco Creek is within a mapped Zone A floodplain. Improvements at Cajalco Road and El Sobrante Road include a dam and detention basin. From approximately 605 feet west to 310 feet east of Harley John Road, the Cajalco Creek floodplain straddles Cajalco Road (refer to Location 2 on Figure 3.9-1). Cajalco Road and Cajalco Creek diverge east of Harley John Road. Approximately one mile farther east, the creek and road converge again. At Wood Road, and easterly for one mile, the creek lies on the south side of the road, adjacent to the toe of the existing slope. The creek crosses to the north side of Cajalco Road just west of Barton Road. The floodplain is approximately 870 feet wide at this point (refer to Location 3 on Figure 3.9-1). Roughly 560 feet east of Alexander Street, Cajalco Creek returns to flow against the north side of Cajalco Road (refer to Location 4 on Figure 3.9-1). At Brown Street, the floodplain crosses to the south side of Cajalco Road and then lies on both sides of the road to a point 660 feet east of Clark Street (RCTC 2008).

3.9.2.4 Natural and Beneficial Uses

The Santa Ana Region Basin Plan (Santa Ana RWQCB 2016) establishes water quality standards for the ground and surface waters of the region. The Santa Ana Regional Water Quality Control Board (RWQCB) uses planning, permitting, and enforcement authorities to meet this responsibility and has adopted the Basin Plan to implement plans, policies, and provisions for water quality management. Beneficial uses are described in the Basin Plan and designated for major surface waters and their tributaries as well as groundwater. Each RWQCB sets water quality objectives that will ensure reasonable protection of beneficial uses and prevent nuisance.[2]

Natural and beneficial floodplain values include, but are not limited to, fish, wildlife, plants, open space, natural beauty, scientific study, outdoor recreation, agriculture, forestry, natural moderation of floods, water quality maintenance, and groundwater recharge. Beneficial uses for surface waters are defined in the Santa Ana Region Basin Plan as various ways that water can be used for the benefit of people and/or wildlife. Lake Mathews has been designated with existing or potential Beneficial Uses including municipal uses (MUN), Agricultural Supply (AGR), Industrial Service Supply (IND), Industrial Process Supply (PROC), Groundwater Recharge (GWR), Water Contact Recreation (REC1) although access is prohibited, Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Wildlife Habitat (WILD), and Rare Threatened or Endangered Species (RARE) waters. Reach 2 of Temescal Wash (Creek), 1,400 feet upstream of Magnolia Avenue to Lee Lake, has been designated with existing or potential Beneficial Uses including AGR, IND, GWR, REC1, REC2, WARM, WILD, and RARE. Other Tributaries to these creeks (Cajalco Creek) have intermittent Beneficial Uses including MUN, GWR, REC1, REC2, WARM, and WILD.

3.9.2.5 Lake Mathews MSHCP

The Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) is a joint conservation effort initiated by MWD and the Riverside County Habitat Conservation Agency in cooperation with the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife that spans 5,994 acres of open land around Lake Mathews, and includes the 5,110-acre Lake Mathews Multiple Species Reserve (LMR). Within the LM MSHCP area, major hydrological features include Lake Mathews and the Colorado River Aqueduct. Lake Mathews is a 182,000-acre-foot reservoir at the western terminus of the Colorado River Aqueduct, and provides much of the water used by the member public agencies of MWD. The reservoir is fenced and closed to all public access. Lake Mathews captures the natural stormwater flows from Cajalco Creek upstream of the reservoir and the project area. A series of water quality wetlands and basins are located on Cajalco Creek. Lake Mathews and the water quality wetlands and basins are operated by MWD solely for the purpose of water supply, not for flood control purposes. Releases from Lake Mathews would only occur if the water elevation was to reach the spillway crest.

[2] "Nuisance" is defined as "anything which meets all of the following requirements:
1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property so as to interfere with the comfortable enjoyment of life or property, and
2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal, and
3) occurs during or as the result of the treatment or disposal of wastes." (SWRCB 2016)

3.9.3 Environmental Consequences

3.9.3.1 Permanent Impacts

Build Alternatives 1 and 2C – Cajalco Alignment and Modified Cajalco Alignment

Build Alternative 1 would increase the amount of impervious surface by approximately 83 acres and Build Alternative 2C by approximately 84 acres. For the entire project area, runoff volume would increase about 2.6 acre-feet for Build Alternative 1 and 2.62 acre-feet for Build Alternative 2C. Flow rates would increase about 11.4 cfs for Build Alternative 1 and 11.5 cfs for Build Alternative 2C. Under Build Alternatives 1 and 2C, new on-site drainage facilities would be included as part of the realignment and roadway improvements. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These detention basins would provide peak flow attenuation to reduce the discharge of stormwater into the creeks consistent with the existing conditions.

Build Alternatives 1 and 2C would encroach into the floodplains at four creek crossing locations: one at Temescal Creek and three along Cajalco Creek. The Temescal Creek floodplain encroachment (Location 1) would occur on the western end of the alignment at Temescal Creek, as shown on Figure 3.9-1. The three Cajalco Creek encroachments (Locations 2, 3, and 4), shown on Figure 3.9-1, would occur along Cajalco Road between Kirkpatrick Street and east of Harley John Road, west of Una Street, and west of Alexander Street and east of Clark Street. Floodplain encroachments at Temescal Creek (Location 1) and at two of the three Cajalco Creek crossings (Locations 3 and 4) would share the same alignment for Alternatives 1 and 2C, resulting in the same impacts. Under Build Alternatives 1 and 2C, the widened roadway, new drainage facilities, and proposed bridge improvements would have permanent impacts on approximately 1.52 acres of the floodplain at Location 1, 8.71 acres of the floodplain at Location 2, 3.72 acres of the floodplain at Location 3, and 17.01 acres of the floodplain at Location 4.

The replacement bridge structure within the floodplain at Temescal Creek under Build Alternatives 1 and 2C would be supported by piers that would be replaced in the floodplain. The culvert replacements and new bridge along Cajalco Creek would extend existing structures and add new piers in the floodplain. Through the use of project design features such as detention basins and culverts, 100-year storm flows would be conveyed, and would not result in any new flooding. Groundwater hydrology is not expected to be adversely affected or to adversely affect the project. The Cajalco Road crossing of Temescal Creek under the Build Alternatives 1 and 2C would involve replacement of the existing bridge (four 36-foot-long spans and one 27-foot-long span; 171 feet total length and 40.67 feet wide) with a new, larger bridge (four 110-foot-long spans; 440 feet total length and 120.33 feet wide) that provides a larger opening, lowering the upstream water surface elevation and reducing velocities through the bridge and potential scour. The bridge structure proposed for this location would be larger than the existing crossing and would be expected to accommodate the predicted storm events.

Under Build Alternative 1, west of Lake Mathews Drive, Cajalco Road would be realigned, bypassing the Hollis Lane residential area to the south, and would include the construction of a bridge south of Lake Mathews. No floodplain is mapped by FEMA at this location; therefore, no encroachment would be associated with this bridge. Under Build Alternative 2C, a large

undercrossing would be included within the newly constructed segment of Cajalco Road west of Hollis Lane. No floodplain is mapped by FEMA at this location; therefore, no encroachment would be associated with this bridge.

The Cajalco Road crossing of Cajalco Creek at Harley John Road, on the east side of Lake Mathews as shown on Figure 3.9-1 (Location 2), would involve replacing three 48-inch culverts with a four-cell, 20-foot-wide by 10-foot-high reinforced concrete box (RCB) culvert under Build Alternatives 1 and 2C. In addition, where Cajalco Creek crosses Cajalco Road, the double 9-foot-wide by 5-foot-high RCB culvert would be replaced with a larger four-cell, 20-foot-wide by 10-foot-high RCB culvert. The two proposed RCB culverts would provide a larger opening, which is expected to lower the upstream water surface, reduce velocities through the culverts, and eliminate flow over the roadway during a 100-year flood. MWD Lake Mathews facilities within this floodplain encroachment area that would be affected by Build Alternatives 1 and 2C include Cajalco Creek Dam and Detention Basin, Cajalco Creek Sedimentation Basin, and the Inlet Channel separating the two basins. These facilities are located along the north side of Cajalco Road between El Sobrante Road and Harley John Road. A description of these facilities and their anticipated impacts under Build Alternatives 1 and 2C is provided below.

The Cajalco Creek Sedimentation Basin is approximately 31 acres and provides 134 acre-feet of capacity as a runoff control basin; it is sited immediately upstream of the Cajalco Creek Dam and Detention Basin. The 70-acre Cajalco Creek Dam and Detention Basin provides 2,010 acre-feet of capacity. Under Alternatives 1 and 2C, approximately 3.69 acres of the Cajalco Creek Sedimentation Basin (approximately 12 percent) and 4.95 acres of the Cajalco Creek Dam and Detention Basin (approximately 7 percent) would be converted to right of way. Continuity between the two basins and Inlet Channel would not be affected. The removal of 3.69 acres and 4.95 acres, respectively, however, may reduce the capacities of the basins to 118 acre-feet and 1,869 acre-feet. An additional BMP identified in the *Lake Mathews Watershed Water Quality Improvement Study* may be implemented in the future, separately from the proposed project, that would slightly reduce volumes entering the Cajalco Creek Sedimentation Basin and Cajalco Creek Dam and Detention Basin, providing a small increase in available capacity that may offset a portion of the capacities affected under the proposed project. Nonetheless, because the proposed project would convert a portion of the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin to right of way, this could affect the capacity and operation of the basins, particularly during high-flow months and high rainy seasons.

Mitigation Measure **HYD-1** (see Section 3.9.4) is proposed for the coordination of right of way acquisition involving the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin. Mitigation Measure **HYD-1** includes coordination with MWD and requires the preparation of a Drainage Study to confirm that implementation of the proposed project would not conflict with operations of the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin. As needed, the Drainage Study would provide engineering recommendations to ensure the operation of the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin are maintained to accommodate existing stormwater discharges along with the increased project stormwater discharges. Recommendations could include regular maintenance of the dam and basins to remove sediment buildup, excavation to offset capacities of the dam and basins, or expansion of the dam and basins to the north or south depending on the build alternative selected. With implementation of Mitigation Measure **HYD-1**,

impacts that would affect continued operation of the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin under Build Alternatives 1 and 2C would be minimized.

The Cajalco Road crossing of Cajalco Creek west of Alexander Street would involve replacement of the 102-inch and 48-inch culverts with an RCB culvert within the existing roadway and a new bridge (refer to Sheet 2 of Figure 2.2-3, and Figure 3.9-1, Location 4). The proposed eastbound Cajalco Road culvert would be replaced by a four-cell, 20-foot-wide by 14-foot-high RCB culvert. The proposed westbound Cajalco Road would cross Cajalco Creek upstream of the existing culvert with a new bridge (two 150.75-foot-long spans; 301.50 feet total length, 57.61 feet wide). The new bridge would have three new 6-foot-diameter columns in Cajalco Creek. The proposed RCB culvert and bridge would provide a larger opening than the existing culverts, and would be expected to lower the upstream water surface, reduce velocities through the existing culverts, and eliminate flow over the roadway during a 100-year flood.

The Cajalco Road crossings of Cajalco Creek from Alexander Street to Clark Street would involve replacement of a series of asphalt-paved "low water crossings" and small culverts with several RCB culverts, a trapezoidal channel, and an open rectangular concrete channel with an overflow inlet structure under Build Alternatives 1 and 2C (refer to Sheets 2 and 3 of Figure 2.2-3, and Figure 3.9-1, Location 4). Build Alternatives 1 and 2C would provide a new three-cell, 14-foot-wide by 8-foot-high RCB culvert at Alexander Street; grade a trapezoidal channel 80-foot bottom along the north side of Cajalco Road to a three-cell 10-foot-wide by 5-foot-high RCB culvert under Brown Street and Florence Street along the north side of Cajalco Road; and provide an open rectangular concrete channel with a 30-foot bottom width, 6 feet deep with an overflow inlet to accommodate tributary flow, which then would cross under Cajalco Road and Haines Street in a three-cell, 10-foot-wide by 5-foot-high RCB. An inlet structure would be constructed immediately upstream of Haines Street along the south side of Cajalco Road to collect flow from the upper portion of Cajalco Creek. The proposed culverts and channels would provide a larger conveyance through this area, which is predicted to lower the water surface, reduce velocities, and eliminate flow over the roadway during a 100-year flood.

The proposed project's encroachment in the floodplain would not reduce the storage volume of the creeks. The proposed project would provide larger openings to more efficiently convey flows, which is expected to result in lowering of the upstream water surface; therefore, the proposed project would not have an adverse effect on the base floodplain elevation.

Potential Risks to Life and Property

Build Alternatives 1 and 2C would not result in flood-related interruption of emergency services or routes. Build Alternatives 1 and 2C would provide a more reliable highway. Operation of Build Alternatives 1 and 2C would not result in interruption of emergency services or routes and would improve access throughout the region. In addition, Build Alternatives 1 and 2C would not increase the risk of flooding because they would lower the base flood elevations. Therefore, there would be no substantial flood-related risks to life or property associated with implementation of Build Alternatives 1 and 2C.

Potential Risks for Support of Incompatible Floodplain Development

Build Alternatives 1 and 2C include improvements to an existing transportation facility to improve traffic safety, address projected traffic volumes, and address projected growth in

population. Build Alternatives 1 and 2C would modify an existing facility and would not promote incompatible floodplain development.

Potential Risks to Natural and Beneficial Floodplain Values

Several of the affected waterbodies are natural-bottom waterways; as such, the creeks provide open space, natural beauty, and outdoor recreation value and also have value to support wildlife and plant habitat, as detailed in Sections 3.19, *Plants*, and 3.20, *Animals*. The build alternatives have the potential to affect natural and beneficial water resource values by affecting natural-bottom channels, which could affect water quality and jurisdictional waters. As described above, the build alternatives would result in a net increase in impervious surfaces and, therefore, an increase in runoff. The runoff from the proposed roadway improvements would have the potential to affect water quality in receiving waters. However, the build alternatives would comply with the County's Municipal Separate Storm Sewer System Permit and implement BMPs to the maximum extent practicable under Standard Project Measures **PF WQ-1** through **PF WQ-3** (post-construction BMPs). The build alternatives would also implement proposed Measures **NC-13 (NES BIO-9)** through **NC-15 (NES BIO-14)**, and **WET-1** (hydroseeding and compensation for riparian-riverine and wetland impacts) to reduce impacts on water quality. Refer to Section 3.10, *Water Quality and Stormwater Runoff*, for Standard Project Measure **PF WQ-3**; Section 3.17, *Natural Communities*, for Measures **NC-13 (NES BIO-9)** through **NC-15 (NES BIO-14)**; and Section 3.18, *Wetlands and Other Waters*, for Measure **WET-1**.

Improvements within the 100-year floodplain proposed under the build alternatives would result in direct, permanent impacts on Temescal and Cajalco Creeks, which are considered potentially jurisdictional to the United States Army Corps of Engineers, the California Department of Fish and Wildlife, and the RWQCB. As discussed in Section 3.18, *Wetlands and Other Waters*, compensatory mitigation is proposed as part of the build alternatives to reduce potential impacts on jurisdictional waters. Therefore, with the measures proposed in Sections 3.10, 3.17, and 3.18, operation of Build Alternatives 1 and 2C would not result in long-term adverse impacts on natural and beneficial floodplain values.

Significant Encroachment

"Significant encroachment" as defined at 23 CFR 650.105 is a highway encroachment and any direct support of likely base floodplain development that would involve one or more of the following construction or flood-related impacts:

- A significant potential for interruption or termination of a transportation facility that is needed for emergency vehicles or provides a community's only evacuation route
- A significant risk (to life or property)
- A significant adverse impact on natural and beneficial floodplain values

As indicated above, Build Alternatives 1 and 2C would result in permanent encroachment within approximately 1.52 acres of the floodplain at Location 1, 8.71 acres at Location 2, 3.72 acres at Location 3, and 17.01 acres at Location 4. However, the proposed project does not constitute a significant floodplain encroachment as defined in 23 CFR Section 650.105(q). Based on the floodplain modeling performed for the proposed project, implementation of the proposed project

would result in lowering the upstream water surface elevation and reducing velocities through the new bridge crossings at Temescal and Cajalco Creeks. The proposed project would not result in any significant change in flood risks or damage, does not have significant potential for interruption or termination of emergency service or emergency routes, and would not have a significant adverse impact on natural or beneficial floodplain values. Therefore, the proposed encroachment at Temescal and Cajalco Creeks is not a significant encroachment as defined under 23 CFR 650.105. Build Alternatives 1 and 2C would not involve a significant encroachment on a regulatory floodway or substantially increase the base flood elevation.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, no additional development within a floodplain would be anticipated. Under Build Alternatives 1 and 2C, the widened roadway and bridge structure proposed at Temescal Creek (Location 1) would be fully paved to accommodate six lanes, and the widened roadway at Location 2 would be fully paved within the existing floodplain. The construction of two additional travel lanes east of Harley John Road associated with a Future Six-Lane Facility is not anticipated; therefore, Cajalco Creek floodplain Locations 3 or 4 would not be affected. The proposed project would also construct proper drainage facilities to avoid flooding associated with roadway runoff. No additional impacts on floodplains would occur.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Under Build Alternatives 1 and 2C, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR (refer to Figure 1-2); appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Build Alternative 1 would increase the amount of impervious surface by approximately 45 acres and Build Alternative 2C by approximately 35 acres within the LM MSHCP area. However, the project is outside the LM MSHCP area on the western and eastern ends of Cajalco Road; the middle section is within the LM MSHCP. Therefore, three of the four floodplain encroachments would not occur within the LM MSHCP area. Under Build Alternatives 1 and 2C, the proposed project would result in an encroachment of Cajalco Creek at Harley John Road and would involve replacing three culverts with an RCB culvert. A portion of these improvements would be located within the LM MSHCP area, and impacts are detailed above under Build Alternatives 1 and 2C. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to allow for the proposed project, which would result in an increase of flood flows from increased impervious surfaces and development in the floodplain; however, the proposed project would construct proper drainage facilities so that runoff would not result in additional flooding as discussed under Build Alternatives 1 and 2C.

Build Alternative 4 – El Sobrante Alignment

Build Alternative 4 would increase the amount of impervious surface by approximately 105 acres. For the entire project area, runoff volume would increase about 3.22 acre-feet for Build Alternative 4. Flow rates would increase about 14.0 cfs for Build Alternative 4. Under Build Alternative 4, new on-site drainage facilities would be included as part of the realignment and

roadway improvements. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These detention basins would provide peak flow attenuation to reduce the discharge of stormwater into the creeks consistent with the existing conditions.

Similar to Build Alternatives 1 and 2C, Build Alternative 4 would encroach into the floodplains at four creek crossing locations and would share the same impacts as Build Alternatives 1 and 2C for Locations 1, 3, and 4 (see Figure 3.9-1). The Cajalco Creek floodplain encroachment at Location 2 would differ under Build Alternative 4 due to the realignment of Cajalco Road and Harley John Road at this location. Under Build Alternative 4, the widened and realigned roadway, new drainage facilities, and proposed bridge improvements would have permanent impacts on approximately 1.52 acres of the floodplain at Location 1, 7.09 acres of the floodplain at Location 2, 3.72 acres of the floodplain at Location 3, and 17.01 acres of the floodplain at Location 4.

As mentioned above, Build Alternative 4 would result in a new alignment for Cajalco Road along the north side of the existing Cajalco Creek Detention Basin and Cajalco Creek Sediment Basin located just upstream of Lake Mathews (refer to Sheet 6 of Figure 2.2-5, and Figure 3.9-1, Location 2). As such, these MWD Lake Mathews facilities would be affected by the proposed project. Under Alternative 4, approximately 0.12 acre of the Cajalco Creek Dam and Detention Basin (less than 1 percent of the basin size) and 3.55 acres of the Cajalco Creek Sedimentation Basin (approximately 11.5 percent of the basin size) would be converted to right of way. The Inlet Channel would be replaced with a wildlife crossing and may affect inlet operation. As with Build Alternatives 1 and 2C, Mitigation Measure **HYD-1** (see Section 3.9.4) would be implemented to reduce potential impacts associated with operation of the Cajalco Creek Dam and Detention Basin, Cajalco Creek Sedimentation Basin, and the Inlet Channel separating the two basins.

Several cross culverts would convey stormwater runoff from areas north of the proposed roadway, under the roadway, and into the existing basins. The existing Cajalco Creek double 9-foot-wide by 5-foot-high RCB culvert would remain in place. The existing three 48-inch-diameter culvert under Harley John Road would be removed and Harley John Road would be realigned to the crest of the Cajalco Creek Sediment Basin embankment. At the existing Cajalco Creek Sediment Basin spillway, a new bridge would be constructed for the realigned Harley John Road. The proposed encroachments would be in areas considered ineffective in conveying flow through the basins and therefore would not adversely affect water surface elevation or velocity of the existing Cajalco Creek floodplain. With implementation of Mitigation Measure **HYD-1**, impacts that would affect continued operation of the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin under Build Alternative 4 would be minimized.

Potential Risks to Life and Property

Build Alternative 4 would not result in flood-related interruption of emergency services or routes, and would be expected to provide a more reliable highway. Operation of Build Alternative 4 would not result in interruption of emergency services or routes and would improve access throughout the region. In addition, Build Alternative 4 would not increase the risk of flooding because it would lower the base flood elevations. Therefore, there would be no

substantial flood-related risks to life or property associated with implementation of Build Alternative 4.

Potential Risks for Support of Incompatible Floodplain Development

Build Alternative 4 would include improvements to an existing transportation facility to improve traffic safety, address projected traffic volumes, and address projected growth in population. Build Alternative 4 would modify an existing facility and would not promote incompatible floodplain development.

Potential Risks to Natural and Beneficial Floodplain Values

The potential risks to natural and beneficial floodplain values as a result of Build Alternative 4 would be the same as those identified for Build Alternatives 1 and 2C. With compliance with Standard Project Measures **PF WQ-1** through **PF WQ-3** (post-construction BMPs) and the implementation of proposed Measures **NC-13 (NES BIO-9)** through **NC-15 (NES BIO-14)** and **WET-1**, long-term adverse impacts on natural and beneficial floodplain values would not occur as a result of Build Alternative 4 operations. Refer to Section 3.10, *Water Quality and Stormwater Runoff*, for Standard Project Measure **PF WQ-3**; Section 3.17, *Natural Communities*, for Measures **NC-13 (NES BIO-9)** through **NC-15 (NES BIO-14)**; and Section 3.18, *Wetlands and Other Waters*, for Measure **WET-1**.

Significant Encroachment

As indicated above, Build Alternative 4 would result in permanent encroachment within approximately 1.52 acres of the floodplain at Location 1, 7.09 acres of the floodplain at Location 2, 3.72 acres of the floodplain at Location 3, and 17.01 acres of the floodplain at Location 4. However, the proposed project does not constitute a significant floodplain encroachment as defined in 23 CFR Section 650.105(q). Based on the floodplain modeling performed for the proposed project, implementation of the proposed project would result in lowering the upstream water surface elevation and reducing velocities through the new bridge crossings at Temescal and Cajalco Creeks. The proposed project would not result in any significant change in flood risks or damage, does not have significant potential for interruption or termination of emergency service or emergency routes, and would not have a significant adverse impact on natural or beneficial floodplain values. Therefore, the proposed encroachment at Temescal and Cajalco Creeks is not a significant encroachment as defined under 23 CFR 650.105. Build Alternative 4 would not involve a significant encroachment on a regulatory floodway or substantially increase the base flood elevation.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the median of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, no additional development within a floodplain would be anticipated. The widened roadway and bridge structure at Temescal Creek (Location 1) would be fully paved under Build Alternative 4 to accommodate six lanes. The construction of two additional travel lanes east of the intersection of

La Sierra Avenue and El Sobrante Road, associated with a Future Six-Lane Facility, is not anticipated; therefore, Cajalco Creek floodplain Locations 2, 3, or 4 would not be affected. The proposed project would also construct proper drainage facilities to avoid flooding associated with roadway runoff. No additional impacts on floodplains would occur.

Lake Mathews MSHCP (Build Alternative 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the Lake Mathews MSHCP area and LMR (refer to Figure 1-2); appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Build Alternative 4 would increase the amount of impervious surface by approximately 35 acres within the LM MSHCP area. However, the project is outside the LM MSHCP area on the western and eastern ends of Cajalco Road; the middle section is within the LM MSHCP. Therefore, three of the four floodplain encroachments would not occur within the LM MSHCP area.

Under Build Alternative 4, the proposed project would result in an encroachment of Cajalco Creek at Harley John Road and would result in a new roadway alignment within this floodplain area. A portion of these improvements would be located within the LM MSHCP area, and impacts are detailed above under Build Alternative 4. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to allow for the proposed project, which would result in an increase of flood flows from increased impervious surfaces and development in the floodplain; however, the proposed project includes the construction of proper drainage facilities so that runoff would not result in additional flooding as discussed previously.

No-Build Alternative

Under the No-Build Alternative, there would be no changes made to Cajalco Road. Consequently, there would be no adverse impacts on hydrology and floodplains in the project area. The existing surface and groundwater hydrology and floodplains would remain the same. The No-Build Alternative would have no indirect adverse impacts on downstream hydrology and flooding because there would be no construction associated with the project.

3.9.3.2 Temporary Impacts

Build Alternatives 1, 2C, and 4

Temporary hydrologic impacts associated with construction activities could occur as a result of stormwater runoff. Potential temporary impacts could occur during the widening of the road, construction of the bridge structure, and excavation under the new bridge structure. Land and vegetation would be cleared, exposing soil to the potential for erosion and downstream transport of sediments to occur. Under the Construction General Permit, the build alternatives would be required to prepare a Storm Water Pollution Prevention Plan (SWPPP) and implement construction BMPs aimed at reducing pollutants of concern in stormwater runoff. The construction BMPs would include Erosion Control, Sediment Control, and Good Housekeeping BMPs designed to minimize erosion, retain sediment on site, and prevent spills. Therefore, the build alternatives would not result in temporary water quality–related impacts related to the floodplains. Compliance with Standard Project Measures **PF WQ-1** through **PF WQ-4**, which

include BMPs required as part of the Section 401 certification and 404 and municipal separate storm sewer system permit processes and construction BMPs identified in the SWPPP, and implementation of proposed Measures **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-12 (NES BIO-12)**, which include BMPs required as part of the Western Riverside County MSHCP, would minimize the potential for erosion and water pollution during construction; therefore, the build alternatives would not result in short-term adverse impacts on natural and beneficial floodplain values.

Refer to Section 3.10.3 in Section 3.10, *Water Quality and Stormwater Runoff*, for Standard Project Measures **PF WQ-1** through **PF WQ-4**; and Section 3.17.4 in Section 3.17, *Natural Communities*, for Measures **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-12 (NES BIO-12)**.

During project construction, Build Alternatives 1, 2C, and 4 would have temporary impacts on approximately 0.88 acre of the floodplain at Location 1, 1.23 acres of floodplain at Location 3, and 0.81 acre of floodplain at Location 4. Build Alternatives 1 and 2C would have temporary impacts on approximately 7.23 acres of floodplain at Location 2, and Build Alternative 4 would have temporary impacts on approximately 2.39 acres of floodplain at Location 2. However, the temporary floodplain impacts would not constitute a significant floodplain encroachment as defined in 23 CFR Section 650.105(q).

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, no additional development within a floodplain would be anticipated. Under Build Alternatives 1 and 2C, the widened roadway and bridge structure proposed at Temescal Creek (Location 1) would be fully paved to accommodate six lanes, and the widened roadway at Location 2 would be fully paved within the existing floodplain. The construction of two additional travel lanes east of Harley John Road associated with a Future Six-Lane Facility is not anticipated; therefore, Cajalco Creek floodplain Locations 3 or 4 would not be affected. No additional construction impacts that would affect floodplains would occur.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to allow for the proposed project, which would result in restriping of the median; however, no additional construction impacts would occur.

No-Build Alternative

The No-Build Alternative would not involve any construction, and no direct or indirect adverse hydrology and floodplain impacts would occur. However, several sections of Cajalco Road experience flooding in the existing condition. The proposed project would include improved flood control facilities to convey flood waters more effectively and reduce flooding at some of the creek crossings that would not be improved under the No-Build Alternative.

3.9.4 Avoidance, Minimization, and/or Mitigation Measures

The build alternatives may result in adverse permanent or temporary impacts on floodplain values. Therefore, in addition to compliance with Standard Project Measures **PF WQ-1** through **PF WQ-4** and the implementation of Measures **NC-6 (NES BIO-6)**, **NC-10 (NES BIO-10)** through **NC-15 (NES BIO-14)**, and **WET-1**, Mitigation Measure **HYD-1** is proposed to ensure that construction and operation of the build alternatives would not result in long-term adverse impacts on natural and beneficial floodplain values. Refer to Section 3.10, *Water Quality and Stormwater Runoff*, for Standard Project Measures **PF WQ-1** through **PF WQ-4**; Section 3.17, *Natural Communities*, for Measures **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-15 (NES BIO-14)**; and Section 3.18, *Wetlands and Other Waters*, for Measure **WET-1**.

- **HYD-1:** The County of Riverside (County) will coordinate directly with Metropolitan Water District of Southern California (MWD) to obtain approval for right of way acquisition involving the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin. The County will coordinate directly with MWD in the preparation of a site-specific Drainage Study to evaluate the changes in runoff and floodplain encroachment into the Cajalco Creek Dam and Detention Basin and the Cajalco Creek Sedimentation Basin, and determine whether the conversion of right of way would affect operation of the dam and basins. If operation of the basins is affected by the project, engineering recommendations will be provided, and implemented as necessary, to ensure continued operation of the dam and basins. Recommendations could include regular maintenance of the dam and basins to remove sediment buildup, excavation to offset capacities of the dam and basins, or expansion of the dam and basins to the north or south depending on the build alternative selected. The County will be responsible for implementation of the engineering recommendations as part of the proposed project.

[this page left blank intentionally.]

3.10 Water Quality and Stormwater Runoff

This section describes the environmental and regulatory setting associated with water quality and stormwater runoff in the project area. This section also describes the impacts of project implementation on water resources.

3.10.1 Regulatory Setting

3.10.1.1 Federal Regulations: Clean Water Act

In 1972 Congress amended the Federal Water Pollution Control Act, making the addition of pollutants to the waters of the United States (U.S.) from any point source[1] unlawful unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. This act and its amendments are known today as the Clean Water Act (CWA). Congress has amended the act several times. In the 1987 amendments, Congress directed dischargers of storm water from municipal and industrial/construction point sources to comply with the NPDES permit scheme. The following are important CWA sections:

- Sections 303 and 304 require states to promulgate water quality standards, criteria, and guidelines.
- Section 401 requires an applicant for a federal license or permit to conduct any activity, which may result in a discharge to waters of the U.S., to obtain certification from the state that the discharge will comply with other provisions of the act. This is most frequently required in tandem with a Section 404 permit request (see below).
- Section 402 establishes the NPDES, a permitting system for the discharges (except for dredge or fill material) of any pollutant into waters of the U.S. Regional Water Quality Control Boards (RWQCBs) administer this permitting program in California. Section 402(p) requires permits for discharges of storm water from industrial/construction and municipal separate storm sewer systems (MS4s).
- Section 404 establishes a permit program for the discharge of dredge or fill material into waters of the U.S. This permit program is administered by the U.S. Army Corps of Engineers (USACE).

The goal of the CWA is "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters."

The USACE issues two types of 404 permits: General and Individual. There are two types of General permits: Regional and Nationwide. Regional permits are issued for a general category of activities when they are similar in nature and cause minimal environmental effect. Nationwide permits are issued to allow a variety of minor project activities with no more than minimal effects.

Ordinarily, projects that do not meet the criteria for a Regional or Nationwide Permit may be permitted under one of USACE's Individual permits. There are two types of Individual permits: Standard permits and Letters of Permission. For Individual permits, the USACE decision to

[1] A point source is any discrete conveyance such as a pipe or a man-made ditch.

approve is based on compliance with U.S. Environmental Protection Agency's (U.S. EPA) Section 404 (b)(1) Guidelines (40 Code of Federal Regulations [CFR] Part 230), and whether the permit approval is in the public interest. The Section 404(b)(1) Guidelines (Guidelines) were developed by the U.S. EPA in conjunction with the USACE, and allow the discharge of dredged or fill material into the aquatic system (waters of the U.S.) only if there is no practicable alternative which would have less adverse effects. The Guidelines state that the USACE may not issue a permit if there is a least environmentally damaging practicable alternative (LEDPA) to the proposed discharge that would have lesser effects on waters of the U.S. and not have any other significant adverse environmental consequences. According to the Guidelines, documentation is needed that a sequence of avoidance, minimization, and compensation measures has been followed, in that order. The Guidelines also restrict permitting activities that violate water quality or toxic effluent[2] standards, jeopardize the continued existence of listed species, violate marine sanctuary protections, or cause "significant degradation" to waters of the U.S. In addition, every permit from the USACE, even if not subject to the Section 404(b)(1) Guidelines, must meet general requirements. See 33 CFR 320.4. A discussion of the LEDPA determination, if any, for the document is included in the Wetlands and Other Waters section.

3.10.1.2 State Requirements: Porter-Cologne Water Quality Control Act

California's Porter-Cologne Act, enacted in 1969, provides the legal basis for water quality regulation within California. This act requires a "Report of Waste Discharge" for any discharge of waste (liquid, solid, or gaseous) to land or surface waters that may impair beneficial uses for surface and/or groundwater of the state. It predates the CWA and regulates discharges to waters of the state. Waters of the state include more than just waters of the U.S., like groundwater and surface waters not considered waters of the U.S. Additionally, it prohibits discharges of "waste" as defined, and this definition is broader than the CWA definition of "pollutant." Discharges under the Porter-Cologne Act are permitted by Waste Discharge Requirements (WDRs) and may be required even when the discharge is already permitted or exempt under the CWA.

The State Water Resources Control Board (SWRCB) and RWQCBs are responsible for establishing the water quality standards (objectives and beneficial uses) required by the CWA and regulating discharges to ensure compliance with the water quality standards. Details about water quality standards in a project area are included in the applicable RWQCB Basin Plan. In California, RWQCBs designate beneficial uses for all water body segments in their jurisdictions and then set criteria necessary to protect those uses. As a result, the water quality standards developed for particular water segments are based on the designated use and vary depending on that use. In addition, the SWRCB identifies waters failing to meet standards for specific pollutants. These waters are then state-listed in accordance with CWA Section 303(d). If a state determines that waters are impaired for one or more constituents and the standards cannot be met through point source or non-point source controls (NPDES permits or WDRs), the CWA requires the establishment of Total Maximum Daily Loads (TMDLs). TMDLs specify allowable pollutant loads from all sources (point, non-point, and natural) for a given watershed.

[2] The U.S. EPA defines "effluent" as "wastewater, treated or untreated, that flows out of a treatment plant, sewer, or industrial outfall."

State Water Resources Control Board and Regional Water Quality Control Boards

The SWRCB administers water rights, sets water pollution control policy, and issues water board orders on matters of statewide application, and oversees water quality functions throughout the state by approving Basin Plans, TMDLs, and NPDES permits. RWQCBs are responsible for protecting beneficial uses of water resources within their regional jurisdiction using planning, permitting, and enforcement authorities to meet this responsibility.

National Pollution Discharge Elimination System (NPDES) Program

Municipal Separate Storm Sewer Systems (MS4)

Section 402(p) of the CWA requires the issuance of NPDES permits for five categories of storm water discharges, including Municipal Separate Storm Sewer Systems (MS4s). An MS4 is defined as "any conveyance or system of conveyances (roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, human-made channels, and storm drains) owned or operated by a state, city, town, county, or other public body having jurisdiction over storm water, that is designed or used for collecting or conveying storm water." The SWRCB has identified the Department as an owner/operator of an MS4 under federal regulations. The Department's MS4 Permit covers all Department rights-of-way, properties, facilities, and activities in the state. The SWRCB or the RWQCB issues NPDES permits for five years, and permit requirements remain active until a new permit has been adopted.

The Department's MS4 Permit, Order No. 2012-0011-DWQ (adopted on September 19, 2012 and effective on July 1, 2013), as amended by Order No. 2014-0006-EXEC (effective January 17, 2014), Order No. 2014-0077-DWQ (effective May 20, 2014) and Order No. 2015-0036-EXEC (conformed and effective April 7, 2015) has three basic requirements:

1. The Department must comply with the requirements of the Construction General Permit (see below);
2. The Department must implement a year-round program in all parts of the State to effectively control storm water and non-storm water discharges; and
3. The Department storm water discharges must meet water quality standards through implementation of permanent and temporary (construction) Best Management Practices (BMPs), to the maximum extent practicable, and other measures as the SWRCB determines to be necessary to meet the water quality standards.

To comply with the permit, the Department developed the Statewide Storm Water Management Plan (SWMP) to address storm water pollution controls related to highway planning, design, construction, and maintenance activities throughout California. The SWMP assigns responsibilities within the Department for implementing storm water management procedures and practices as well as training, public education and participation, monitoring and research, program evaluation, and reporting activities. The SWMP describes the minimum procedures and practices the Department uses to reduce pollutants in storm water and non-storm water discharges. It outlines procedures and responsibilities for protecting water quality, including the selection and implementation of BMPs.

The proposed project is not a Caltrans highway facility and is not required to comply with the guidelines and procedures outlined in the latest Caltrans SWMP to address storm water runoff.

The proposed project is a local highway project owned and maintained by the Riverside County Transportation Department. The proposed project would follow the County's MS4 Permit, Order No. R8-2010-0033 (adopted on and effective January 29, 2010), which requires implementation of the Guidance and Standards for Transportation Projects, as described further below.

Construction General Permit

Construction General Permit, Order No. 2009-0009-DWQ (adopted on September 2, 2009 and effective on July 1, 2010), as amended by Order No. 2010-0014-DWQ (effective February 14, 2011) and Order No. 2012-0006-DWQ (effective on July 17, 2012). The permit regulates storm water discharges from construction sites that result in a Disturbed Soil Area (DSA) of one acre or greater, and/or are smaller sites that are part of a larger common plan of development. By law, all storm water discharges associated with construction activity where clearing, grading, and excavation result in soil disturbance of at least one acre must comply with the provisions of the General Construction Permit. Construction activity that results in soil disturbances of less than one acre is subject to this Construction General Permit if there is potential for significant water quality impairment resulting from the activity as determined by the RWQCB. Operators of regulated construction sites are required to develop Storm Water Pollution Prevention Plans (SWPPPs); to implement sediment, erosion, and pollution prevention control measures; and to obtain coverage under the Construction General Permit.

The Construction General Permit separates projects into Risk Levels 1, 2, or 3. Risk levels are determined during the planning and design phases, and are based on potential erosion and transport to receiving waters. Requirements apply according to the Risk Level determined. For example, a Risk Level 3 (highest risk) project would require compulsory storm water runoff pH and turbidity monitoring, and before construction and after construction aquatic biological assessments during specified seasonal windows. For all projects subject to the permit, applicants are required to develop and implement an effective SWPPP. In accordance with the Department's SWMP and Standard Specifications, a Water Pollution Control Program (WPCP) is necessary for projects with DSA less than one acre.

Section 401 Permitting

Under Section 401 of the CWA, any project requiring a federal license or permit that may result in a discharge to a water of the U.S. must obtain a 401 Certification, which certifies that the project will be in compliance with state water quality standards. The most common federal permits triggering 401 Certification are CWA Section 404 permits issued by the USACE. The 401 permit certifications are obtained from the appropriate RWQCB, dependent on the project location, and are required before the USACE issues a 404 permit.

In some cases, the RWQCB may have specific concerns with discharges associated with a project. As a result, the RWQCB may issue a set of requirements known as WDRs under the State Water Code (Porter-Cologne Act) that define activities, such as the inclusion of specific features, effluent limitations, monitoring, and plan submittals that are to be implemented for protecting or benefiting water quality. WDRs can be issued to address both permanent and temporary discharges of a project.

3.10.1.3 Regional and Local Requirements

Riverside County Area-Wide Municipal MS4 NPDES Storm Water Permit

The project would comply with the Santa Ana Region MS4 Permit, Order No. R8-2010-0033 (adopted on and effective January 29, 2010). The current MS4 Permit requires "standard design and post-development BMP guidance to be incorporated into projects for streets, roads, highways, and freeway improvements, under the jurisdiction of the Co-Permittees to reduce the discharge of pollutants from the projects to the Maximum Extent Practicable (MEP)." The guidance is provided by *Low Impact Development: Guidance and Standards for Transportation Projects for the Santa Ana Region Riverside County Co-Permittees* (Cities and County of Riverside 2012). The guidance applies to public transportation projects in the area covered by the Santa Ana Region MS4 Permit, which involve the construction of new transportation surfaces or the improvement of existing transportation surfaces (including Class I Bikeways and sidewalks). The project is considered a Category 3 – Existing Transportation Project (Roadway Capacity Improvement Project) for Build Alternative 1. Build Alternatives 2C and 4 are considered a combination of Category 3 and Category 4 – New Transportation Project (New Road or Bridge Project).

Drainage Water Quality Management Plan for the Lake Mathews Watershed

In May 1991, a Memorandum of Understanding was entered into by the Metropolitan Water District of Southern California (MWD), Riverside County Flood Control and Water Conservation District (RCFCWCD), the County, and Paragon Homes and C.A.P. Partnership (Landowners) leading to a cooperative effort to develop the *Drainage Water Quality Management Plan for the Lake Mathews Watershed* (DWQMP). The RCFCWCD acts as technical advisor to the County on flood control, drainage, and drainage water quality issues; administers Area Drainage Plans; and is lead agency and co-permittee with the County and various cities in the NPDES permit issued by the Santa Ana RWQCB regulating municipal stormwater runoff. The RCFCWCD is responsible for implementation of the plan by imposing the plan requirements on new land development projects in the watershed; administering the Area Drainage Plan and benefit assessments for the watershed; applying for State Loan funds; and constructing, operating, and maintaining the DWQMP facilities.

The DWQMP identifies a series of BMPs that could be constructed and maintained—either by public agencies or in conjunction with larger development projects—to protect Lake Mathews' water quality from the potentially adverse effects of development in the watershed (John M. Tettemer and Associates, Ltd. 1992). Recommended BMPs in the DWQMP include a combination of detention basins, sediment basins, in-stream treatment wetlands, and water quality ponds.

Lake Mathews Watershed Water Quality Improvement Study

The *Lake Mathews Watershed Water Quality Improvement Study* (WQIS) was prepared in 2012 to update recommendations of the DWQMP given development of the Low-Impact Development (LID) requirements. The overarching goal of the study was to identify water quality improvement strategies that mitigate impacts of future development and existing development to maintain lake water quality. The WQIS identified one potential scenario for MWD, the

RCFCWCD, and the County to consider for protecting future lake water quality, which was to plan to construct the Lake Mathews Estates Water Quality Pond as the major, additional regional stormwater BMP to supplement LID implementation on individual development/redevelopment sites, and effective management of onsite wastewater treatment systems (MWD 2012).

The proposed project would implement individual LID and post-construction BMPs to the maximum extent practicable in compliance with the County's *Low Impact Development: Guidance and Standards for Transportation Projects for the Santa Ana Region Riverside County Co-Permittees* (Cities and County of Riverside 2012).

Water Quality Control Plan for Santa Ana Region

Water quality standards and control measures for surface and groundwaters of the Santa Ana Region are contained in the *Water Quality Control Plan for the Santa Ana River Basin* (Basin Plan). The plan designates beneficial uses for water bodies and establishes water quality objectives, waste discharge prohibitions, and other implementation measures to protect those beneficial uses. State water quality standards also include a Nondegradation Objective adopted in 1968 (Resolution 68-16) and is a "Statement of Policy with Respect to Maintaining High Quality Waters in California." Water quality control measures include TMDLs, which are often, but not always, adopted as Basin Plan amendments. The project is located within the within the Santa Ana River (801.00) and San Jacinto Valley (802.00) Hydrologic Units (Santa Ana RWQCB 2019). The project must comply with all applicable water quality standards and prohibitions, including provisions of the Basin Plan.

3.10.2 Affected Environment

The following discussion is based on information contained in the *Water Quality Assessment Report—Cajalco Road Widening and Safety Enhancement Project* (Caltrans 2018) and the *Santa Ana Region MS4 Permit Program Low Impact Development: Guidance and Standards for Transportation Projects, Cajalco Road Widening Project* (County 2017).

3.10.2.1 Climate

The Basin Plan indicates the climate of the Santa Ana Region is classified as Mediterranean: generally dry in the summer with mild, wet winter. The average annual rainfall in the region is about 12 inches, most of it occurring between November and March. The three types of storms that can occur over the project area are general winter storms, general summer storms, and high intensity thunderstorms. Most precipitation results from the general winter storms that normally occur in the late fall or winter months and may have durations of several days. General winter storms occur when—as the result of extratropical cyclones—warm, moisture-laden Pacific air masses move inland over Southern California. Although most precipitation over the project results from general winter storms, thunderstorms can occur at any time of the year, causing extremely high rates of precipitation for relatively short durations. Thunderstorms can occur either during general storms or as isolated phenomena, but they are most common from July through September when moist unstable air subject to convective lifting may cover the Southern California area. General summer storms, although rare, occur normally in the months from July through September and result from an influx of tropical, moisture-laden air originating over the

Gulf of Mexico or the South Pacific Ocean. Although these types of storms are uncommon, they can result in heavy precipitation and have durations of several days.

3.10.2.2 Watersheds

The proposed project is located in the Santa Ana River and San Jacinto Valley Hydrologic Units, within the Lake Mathews, Middle Santa Ana River, and Perris hydrologic areas. The Santa Ana River and San Jacinto Valley Hydrologic Units are within the hydrological boundary of the South Coast Hydrologic Region, which is an arid region. The San Jacinto Valley Hydrologic Unit is hydrologically isolated from the Santa Ana River.

The Santa Ana River Watershed is approximately 7,252 square kilometers (2,800 square miles) (including the San Jacinto River Watershed) and extends about 155 kilometers (96 miles) from its headwaters to where it drains into the Pacific Ocean. The San Jacinto River is considered a tributary of the Santa Ana River, although it usually terminates at Lake Elsinore. On rare occasions, during high rainfall years, Lake Elsinore overflows into Temescal Creek, which ultimately flows to the Santa Ana River. The San Jacinto River has a drainage area of approximately 1,857 square kilometers (717 square miles), and it extends about 95 kilometers (59 miles) from its headwaters in the San Jacinto Mountains to where it drains into Canyon Lake and then into Lake Elsinore.

Surface Waters

The project is adjacent to Lake Mathews and crossed by Cajalco Creek and Temescal Wash, as well as several tributaries to Lake Mathews, Cajalco Creek, and Temescal Wash (Figure 3.10-1, Watersheds and Surface Waters).

Cajalco Creek, an ephemeral stream, flows westerly to Lake Mathews. Downstream of Lake Mathews, the lower reach of Cajalco Creek continues westerly and joins Temescal Wash, which flows northerly to the Santa Ana River at Prado Basin. The Santa Ana River continues westerly to the Pacific Ocean. The easterly end of the project is within the Perris Valley hydrologic subarea. Upstream of Lake Mathews, Cajalco Creek begins on the northeast face of the Gavilan Hills of the Temescal Mountains. It is an ephemeral stream that flows westerly through the Mead Valley and Cajalco Valley before flowing into Lake Mathews. Cajalco Creek has a 100-year discharge of 8,220 cubic feet per second.

Temescal Wash (or Creek) is 29 miles long, connecting Lake Elsinore to the Santa Ana River. It has a drainage basin of 1,000 square miles, including the 720 square miles of the San Jacinto River and Lake Elsinore watersheds. It is considered ephemeral for most of its length, except for non-stormwater runoff from development and agricultural return flows. It has an average flow of 30 cubic feet per second. The 100-year discharge is 24,400 cubic feet per second.

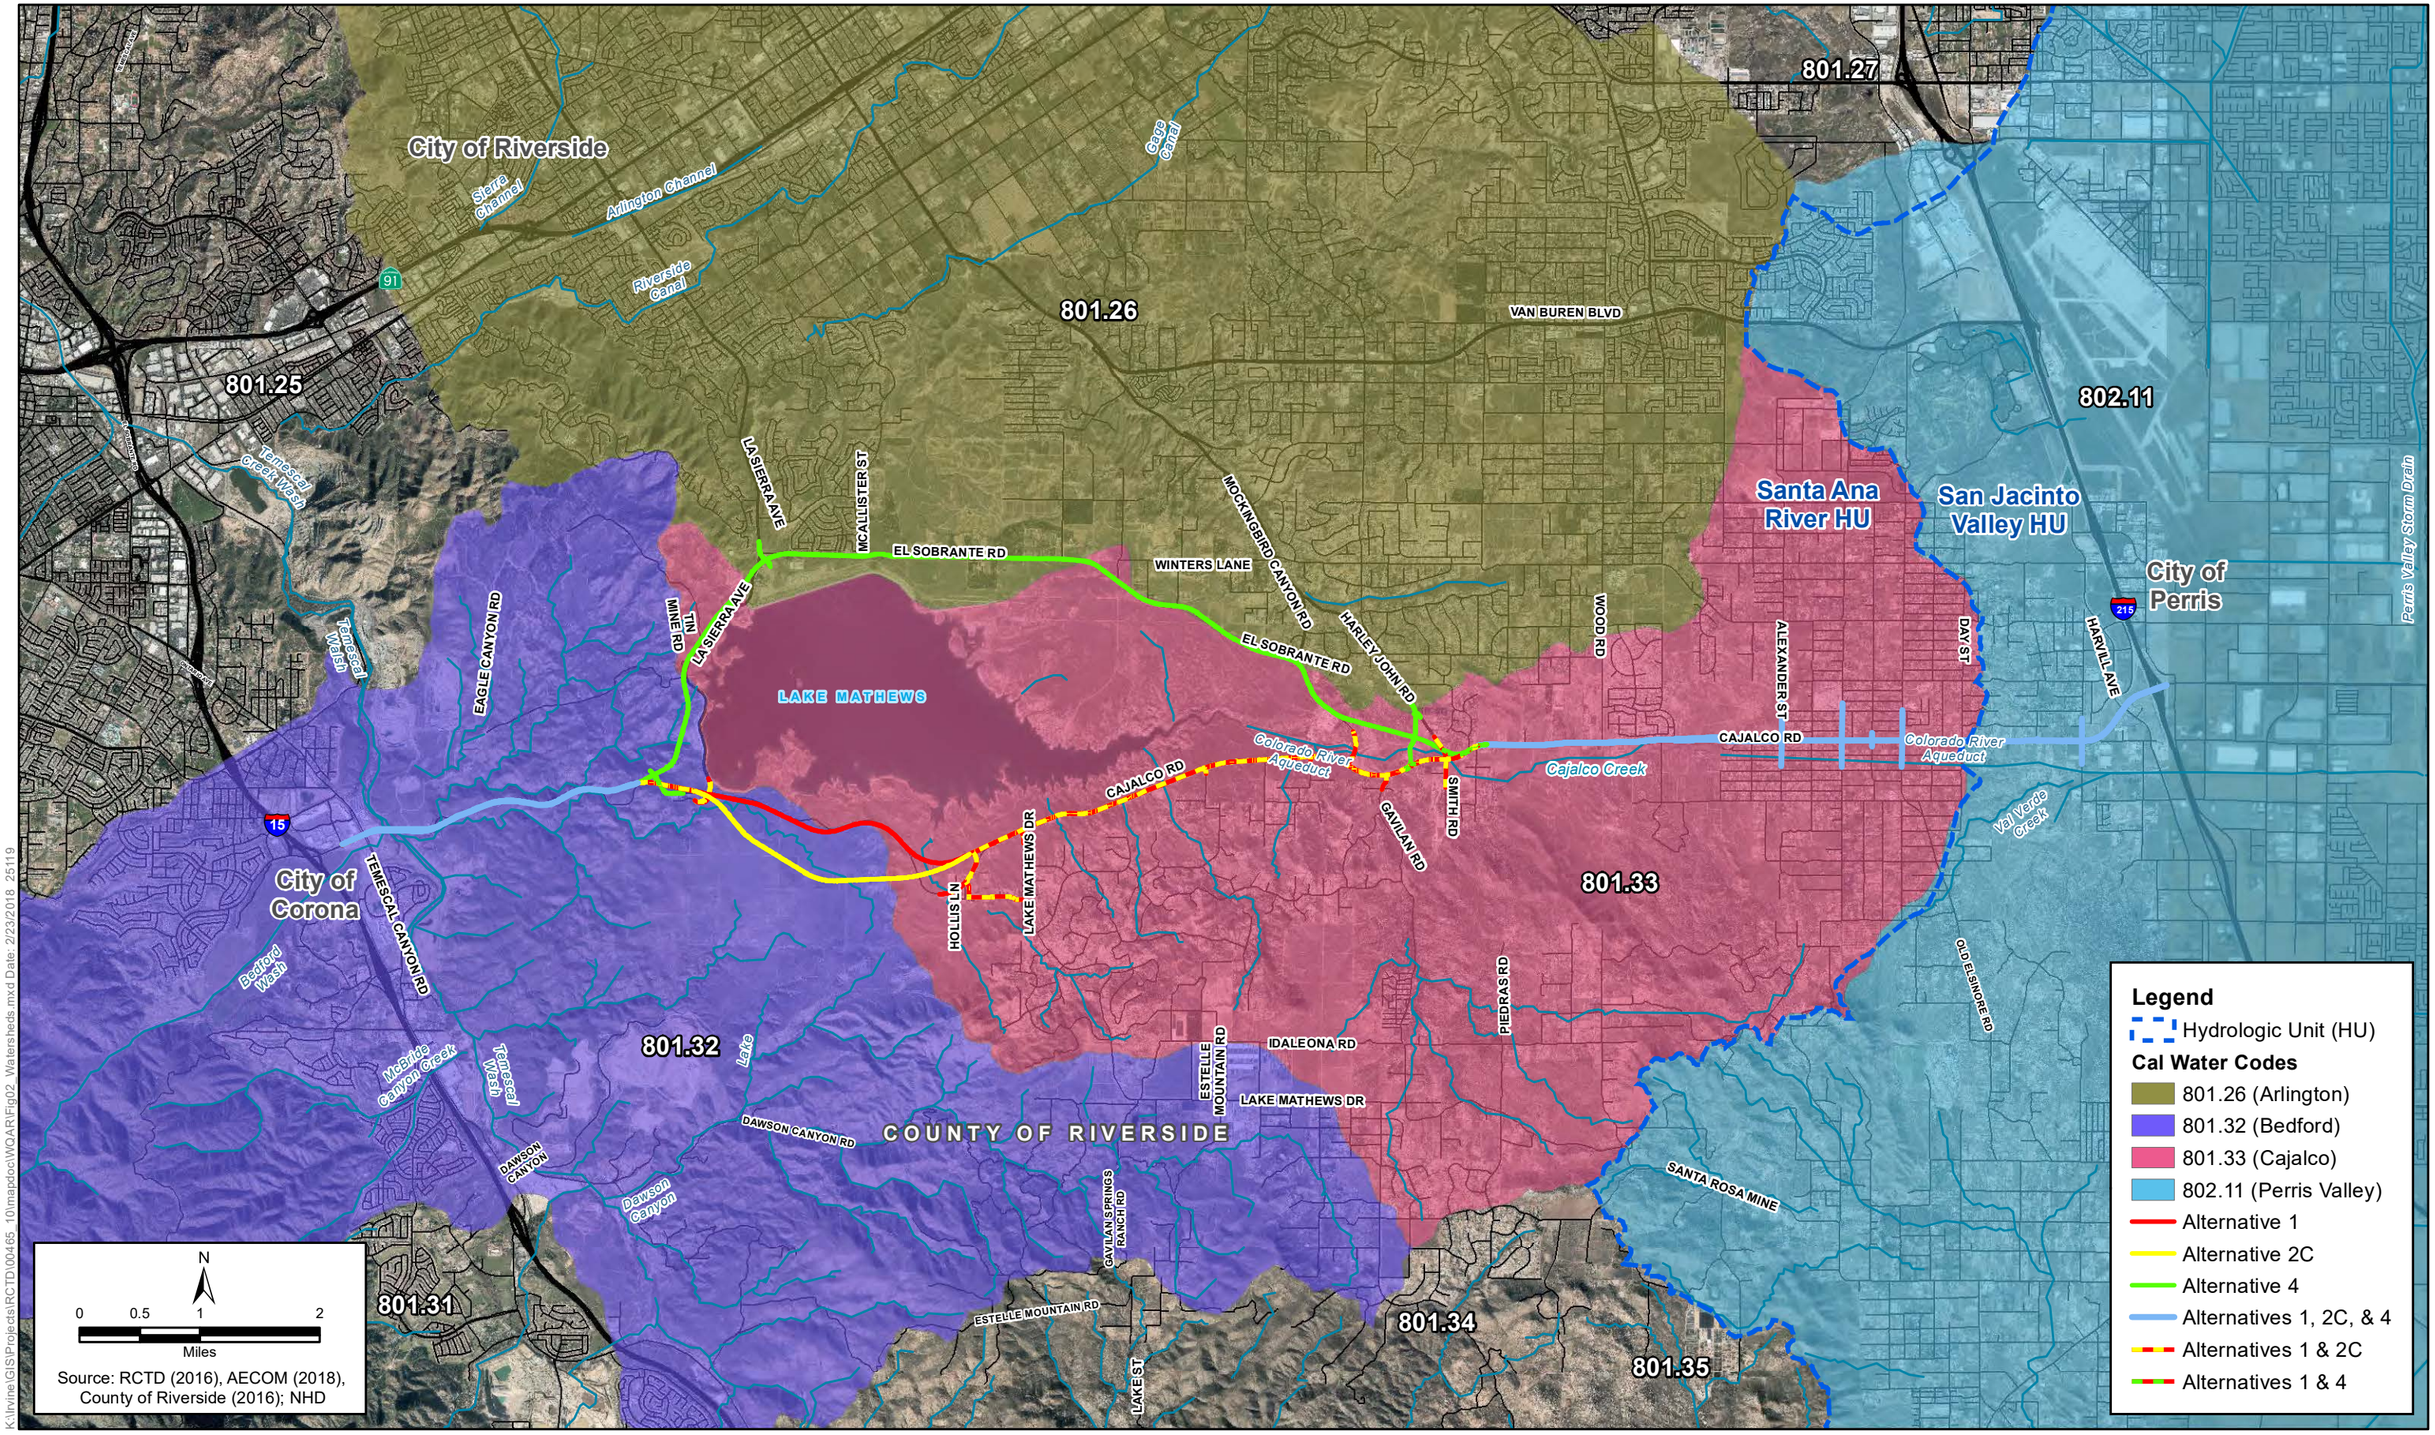
The east end of the project site drains easterly to the Perris Valley Storm Drain about 2 miles east of the project. The Perris Valley Storm Drain has a drainage basin of 82.5 square miles and drains southerly from the March Air Force Base/Sunnymead area in the north to the San Jacinto River. The 100-year discharge in the Perris Valley Storm Drain is 11,300 cubic feet per second where it crosses Rider Street in the City of Perris. The San Jacinto River then flows southwesterly through Railroad Canyon and Railroad Canyon Reservoir (Canyon Lake), then to Lake Elsinore, which occasionally overflows into Temescal Wash.

Lake Mathews is a reservoir that receives water from the Colorado River Aqueduct and is part of MWD's water supply system. The reservoir is fenced and closed to all public access. Lake Mathews captures the natural stormwater flows from Cajalco Creek upstream of the reservoir and the project area. The Cajalco Creek Dam, Detention Basin, Sedimentation Basin, and Inlet Channel (connecting the two basins) were built to provide extended detention to reduce pollutant loading immediately upstream of Lake Mathews. Four additional sediment basins were also constructed in the Lake Mathews watershed to reduce sediment discharges to the Lake.

Beneficial Uses

The Basin Plan (Santa Ana RWQCB 2019) does not identify surface water beneficial uses specifically for Cajalco Creek; however, Lake Mathews has been designated with existing or potential beneficial uses, including Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Service Supply (IND), Industrial Process Supply (PROC), Groundwater Recharge (GWR), Water Contact Recreation (REC1) (although access is prohibited per agency/company with jurisdiction), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Wildlife Habitat (WILD), and Rare Threatened or Endangered Species (RARE) waters.

Reach 2 of Temescal Wash (Creek), 1,400 feet upstream of Magnolia Avenue to Lee Lake (Hydrologic Unit 801.32), has been designated with existing or potential Beneficial Uses including AGR, IND, GWR, REC1, REC2, WARM, WILD, and RARE. Other Tributaries to these creeks (Cajalco Creek) have intermittent Beneficial Uses, including MUN, GWR, REC1, REC2, WARM, and WILD.



K:\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\WQAR\Fig02_Watersheds.mxd Date: 2/23/2018 25119

[This page left blank intentionally.]

Water Quality Impairments

Temescal Wash (Reach 2), Lake Mathews, and Cajalco Creek and its tributaries are not CWA 303(d) listed as impaired water bodies for any pollutant within the Santa Ana Region. Because the proposed project area discharges directly to Temescal Wash, Lake Mathews, and Cajalco Creek, no TMDLs are in place that relate to the project.

Based on the highway stormwater runoff data collected by the Caltrans Stormwater Research and Monitoring Program, pollutants that are expected to be found in roadway runoff include conventional constituents (biochemical oxygen demand, calcium carbonate, chemical oxygen demand, total dissolved solids, total organic carbon, total suspended solids, total volatile suspended solids, etc.), hydrocarbons, metals, microbial agents, nutrients, volatile and semi-volatile organics, pesticides, and herbicides. Pollutants are usually deposited on the roadway as a result of fuel combustion processes, lubrication system losses, tire and brake wear, transportation load losses, paint from infrastructure, and atmospheric fallout. Sources of specific pollutants are outlined in Table 3.10-1.

Table 3.10-1. Known Roadway Pollutants

Constituents	Primary Sources
Particulates	Pavement wear, vehicles, atmosphere, maintenance, snow/ice abrasives, sediment disturbance
Nitrogen, Phosphorus	Atmosphere, roadside fertilizer application, sediments
Lead	Auto exhaust, tire wear, lubricating oil and grease, bearing wear, atmospheric fallout
Zinc	Tire wear, motor oil, grease
Iron	Auto body rust, steel highway structures, moving engine parts
Copper	Metal plating, bearing and bushing wear, moving engine parts, brake lining wear, fungicide and insecticide application
Cadmium	Tire wear, insecticide application
Chromium	Metal plating, moving engine parts, brake lining wear
Nickel	Diesel fuel and gasoline, lubricating oil, metal plating, bushing wear, brake lining wear, asphalt paving
Manganese	Moving engine parts
Bromide	Exhaust
Cyanide	Anticake compound used to keep deicing salt granular
Sodium, Calcium	Deicing salts, grease
Chloride	Deicing salts
Sulphate	Roadway bed, fuel, deicing salts
Petroleum	Spills, leaks, or blow-by of motor lubricants; antifreeze and hydraulic fluids; asphalt leachate
Polychlorinated Biphenyl (PCBs), Pesticides	Spraying of highway rights of way, atmospheric deposition, PCB catalyst in synthetic tires
Pathogenic Bacteria	Soil litter, bird droppings, trucks hauling livestock/stockyard waste
Rubber	Tire wear
Asbestos*	Clutch and brake lining wear

Source: Federal Highway Administration 1996.
* Runoff does not contain mineral asbestos; however, some breakdown products of asbestos have been measured.

Surface Water Quality Objectives

As required by the Porter-Cologne Water Quality Act, the Santa Ana RWQCB has developed water quality objectives for waters within its jurisdiction to protect the beneficial uses of those waters and has published them in the Basin Plan. The Basin Plan also establishes implementation programs to achieve these water quality objectives and requires monitoring to evaluate the effectiveness of these programs. Water quality objectives must comply with the state antidegradation policy (State Board Resolution No. 68-16), which is designed to maintain high-quality waters while allowing some flexibility if beneficial uses are not unreasonably affected.

Lake Mathews has been designated with water quality objectives of 700 milligrams per liter Total Dissolved Solids (TDS), 325 milligrams per liter hardness, 100 milligrams per liter sodium, 90 milligrams per liter chloride, and 290 milligrams per liter sulfate. Other tributaries to Temescal Creek (e.g., Cajalco Creek, un-named drainages) have water quality objectives of 250 milligrams per liter TDS.

3.10.2.3 Groundwater

The California Department of Water Resources Bulletin 118 presents the results of groundwater basin evaluations and defines the boundaries of California's 515 alluvial groundwater basins (California Department of Water Resources 2006). A small portion of the west end of the project site is within the Temescal Subbasin of the Upper Santa Ana Valley Groundwater Basin (8-002.09). A limited section of the east end of the project is within the San Jacinto Groundwater Basin (8-005). The project is within the Eastern Municipal Water District's West San Jacinto Groundwater Management Area and the City of Corona's Management Area.

Bulletin 118 indicates the Temescal Subbasin of the Upper Santa Ana Valley Groundwater Basin (8-002.09) underlies the southwest part of upper Santa Ana Valley. The subbasin has an area of 37 square miles and is bounded on the west by the Santa Ana Mountains and the south by the Elsinore Groundwater Basin at a constriction in the alluvium of Temescal Wash. Groundwater flows toward the center of the subbasin and then northeast toward the Santa Ana River.

Bulletin 118 indicates the San Jacinto Groundwater Basin (8-005) underlies San Jacinto, Perris, Moreno, and Menifee Valleys in western Riverside County. The basin has an area of 293 square miles. Prior to the extraction of groundwater from the basin, groundwater flow was generally toward the course of the San Jacinto River and westward out of the basin. High extraction rates have produced groundwater depressions and locally reversed the historical flow pattern.

The *Initial Site Assessment* (ISA) for the Cajalco Road Widening and Safety Enhancement Project indicates groundwater in the vicinity of the project site ranges from between approximately 10 feet below ground surface (bgs) and 45 feet bgs (Caltrans 2020).

The Basin Plan identifies the following beneficial groundwater uses for Upper Santa Ana Valley Groundwater Basin: AGR, MUN, and IND. The following beneficial groundwater uses are identified for the San Jacinto Groundwater Basin: AGR, MUN, and IND.

3.10.2.4 Lake Matthews MSHCP

The Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) spans 5,993.5 acres of open land around Lake Mathews, and includes a 5,110.4-acre Lake Mathews Multiple Species Reserve (LMR). The LM MSHCP and LMR are discussed in detail in Section 3.17, *Natural Communities*. In the early 1990s, discovery of the endangered Stephens' kangaroo rat (*Dipodomys stephensi*) in the area prompted the addition of 9,000 acres, establishing the Lake Mathews-Estelle Mountain Reserve (LM-EM Reserve). The Lake Mathews area is an important bird nesting and feeding site, particularly in the winter months. In addition to a variety of ducks, double-crested cormorants (*Phalacrocorax auritus*), western grebe (*Aechmophorus occidentalis*), eared grebe (*Podiceps caspicus*), golden eagles (*Aquila chrysaetos*), and bald eagles (*Haliaeetus leucocephalus*) are present during the winter.

Lake Mathews itself is a large, 182,000 acre-foot reservoir. It is the western terminus for the Colorado River Aqueduct that provides much of the water used by the member agencies of the MWD. The reservoir is fenced and closed to all public access. Lake Mathews captures the natural stormwater flows from Cajalco Creek upstream of the reservoir and the project area. A series of water quality wetlands and basins are located on Cajalco Creek. Lake Mathews and the water quality wetlands and basins are operated by MWD solely for the purpose of water supply, not for flood control purposes. Releases from Lake Mathews would only occur if the water elevation were to reach the spillway crest.

3.10.3 Environmental Consequences

3.10.3.1 Permanent Impacts

Build Alternatives 1, 2C, and 4

Widening and realignment of Cajalco Road under any of the build alternatives would increase the amount of impervious surface in the area, which would also increase stormwater runoff. Increases in stormwater runoff volume could accelerate soil erosion and increase the transport of pollutants to waterways. Build Alternative 1 would increase the amount of impervious surface by approximately 83 acres, Build Alternative 2C by approximately 84 acres, and Build Alternative 4 by approximately 105 acres. For the entire project area, runoff volume would increase about 2.60 acre-feet for Build Alternative 1, 2.62 acre-feet for Build Alternative 2C, and 3.22 acre-feet for Build Alternative 4. Flow rates would increase about 11.4 cubic feet per second for Build Alternative 1, 11.5 cubic feet per second for Build Alternative 2C, and 14.0 cubic feet per second for Build Alternative 4.

As traffic increases (with or without the project), the amount of a pollutant originating from cars and trucks (i.e., tire and brake lining wear, litter, and spills during vehicle accidents) is also expected to increase. The proposed project would construct proper drainage facilities so that runoff would not result in erosion or flooding. The Cajalco Road crossing of Cajalco Creek at Harley John Road would involve replacement of three culverts with a reinforced concrete box (RCB) culvert (Caltrans 2018). The Cajalco Road crossing of Cajalco Creek west of Barton Street would involve replacement of the exiting culvert with a RCB culvert. The proposed westbound Cajalco Road would cross Cajalco Creek upstream of the existing culvert with a new bridge.

The Cajalco Road crossing of Cajalco Creek from Alexander Street to Clark Street would involve replacement of a series of asphalt paved "low water crossings" and small culverts with several RCB culverts, trapezoidal channel, and an open rectangular concrete channel with an overflow inlet structure. While the project would result in improvements to the drainage system, the proposed project would not change the existing drainage patterns of the watershed subareas in the project area. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These basins would provide peak flow attenuation and some water quality treatment as highway runoff pollutants, such as sediment, would settle out.

Under Build Alternatives 1 and 2C, approximately 4.95 acres of the Cajalco Creek Dam and Detention Basin and 3.69 acres of the Cajalco Creek Sedimentation Basin would be converted to roadway right of way. Continuity between the two basins and Inlet Channel would not be affected. Under Build Alternative 4, approximately 0.12 acre of the Cajalco Creek Dam and Detention Basin and 3.55 acres of the Cajalco Creek Sedimentation Basin would be converted to roadway right of way. The Inlet Channel would be replaced with a wildlife crossing and designed to allow continued operation of the inlet. Mitigation Measure **HYD-1** (see Section 3.9, *Hydrology and Floodplain*) is proposed for the coordination of right of way acquisition involving the Cajalco Creek Dam and Detention Basin and the Cajalco Creek Sedimentation Basin.

Santa Ana Region MS4 Permit Program Low Impact Development: Guidance and Standards for Transportation Projects (County 2017) has been prepared evaluating each project build alternative. Minimum roadway widths, drainage swales, infiltration basins, bioretention, sidewalk trees and tree boxes, and permeable pavement were evaluated for implementation as LID BMPs within the project area; however, none were determined to be feasible due to soil types that do not allow for infiltration or were not feasible for this rural roadway (e.g., tree boxes). In addition, high groundwater and shallow basement rock limit feasibility for infiltration BMPs within the project area. Consistent with the County's NPDES permit, post-construction BMPs would be incorporated into the project design to reduce the discharge of pollutants during operation to the maximum extent practicable. Post-construction BMPs are selected to reduce post-construction discharges. Treatment BMPs are designated to remove certain pollutants. Implementation of post-construction BMPs would minimize the potential for surface and groundwater contamination.

Coordination with RCFCWCD, MWD, Santa Ana RWQCB, and Caltrans has occurred to evaluate potential permanent BMPs for the project (refer to Chapter 5, *Comments and Coordination*). In addition to the LID report, the RCFCWCD and MWD Lake Mathews Watershed DWQMP and WQIS were evaluated for potential post construction BMPs (John M. Tettemer and Associates, Ltd. 1992; MWD 2012). In accordance with LID Transportation Project Guidance, source control BMPs such as sweeping of transportation surfaces (on an as-needed basis), drainage facility inspection and maintenance, stenciling and signage, and protection of slopes and channels with riprap armoring would be implemented. Long-term effects on turbidity would be addressed through final stabilization of soils. Final stabilization may include, but is not limited to, hydroseeding. Hydroseeding is the method by which permanent seed is applied to the soil surface to protect exposed soils from erosion by wind and water. Measures **PF VIS-1, NC-13 (NES BIO-9)** through **NC-15 (NES BIO-14),** and **WET-1** (hydroseeding and replacement of riparian-riverine and wetland resources) are further proposed for the protection of water quality. Refer to Section 3.7, *Visual/Aesthetics*, for Measure **PF VIS-**

1; Section 3.17, *Natural Communities*, for Measures **NC-13 (NES BIO-9)** through **NC-15 (NES BIO-14)**; and Section 3.18, *Wetlands and Other Waters*, for Measure **WET-1**.

In addition to the standard project measures and mitigation measures identified above, implementation of the following standard water quality protection measures required as part of the Section 401 certification, and 404 and MS4 permit processes, would ensure the protection of water quality during operation of the proposed project.

- **PF WQ-1: 401 Certification –** The project proponent will obtain a Clean Water Act Section 401 Certification from the Santa Ana Regional Water Quality Control Board for activities that may result in impacts on State Water Quality Standards.
- **PF WQ-2: 404 Permit** – The project proponent will obtain a Clean Water Act Section 404 permit from the U.S. Army Corps of Engineers for activities that would discharge materials into waters of the U.S.
- **PF WQ-3**: **Post-Construction BMPs** – Post-construction best management practices will be implemented to the maximum extent practicable, consistent with the requirements of the National Pollutant Discharge Elimination System permit and Waste Discharge Requirements for the County of Riverside's Municipal Separate Storm Sewer System Permit in place at the time of project approval.

Because the project site is not used specifically for groundwater recharge, the project's increase in impervious surface would not result in a considerable loss of groundwater recharge and would not affect groundwater levels.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes were constructed in the future, unpaved portions of the median areas within the limits would be paved for the additional roadway lanes, resulting in an increase of approximately 30.6 acres of impervious surface along the Build Alternative 1 alignment, 31 acres along the Build Alternative 2C alignment, and 14.2 acres along the Build Alternative 4 alignment.

The increase in impervious surfaces would not result in a considerable loss of groundwater recharge and would not affect groundwater levels. The Future Six-Lane Facility, if constructed, would be required to obtain CWA Section 401 certification and Section 404 and MS4 permits, and comply with the related requirements for accommodating the additional stormwater runoff flows. Such accommodations may include upgrades to the roadside ditches, drainages, and detention basins constructed under Build Alternatives 1, 2C, or 4. Thus, through compliance with the required Section 401, Section 404, and MS4 requirements, including potential upgrades to drainage facilities constructed as part of Build Alternatives 1, 2C, and 4, if necessary, no additional impacts as a result of the Future Six-Lane Facility are anticipated.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities—including a drainage basin, culverts, bridges and wildlife crossings—would also be constructed. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to allow for construction of the proposed project, which would increase impervious surfaces and associated runoff volumes and rates. The proposed project would need to construct proper drainage facilities so that runoff would not result in erosion or flooding. Compliance with the post-construction BMPs and measures, as described under Build Alternatives 1, 2C, and 4, would be required to reduce the discharge of runoff.

No-Build Alternative

Under the No-Build Alternative, Cajalco Road and other project roadways would not be improved. There would be no increase in impermeable surfaces and therefore no anticipated potential to increase runoff or adversely affect water quality in the area.

3.10.3.2 Temporary Impacts

Build Alternatives 1, 2C, and 4

Construction of the proposed project would disturb soil. Build Alternative 1 would disturb approximately 503 acres, Build Alternative 2C would disturb approximately 526 acres, and Build Alternative 4 would disturb approximately 505 acres. Disturbed soil could cause potential erosion and sediment control issues. In general, the severity of temporary, construction-related water quality impacts depends on soil erosion potential; construction practices; the frequency, magnitude, and duration of precipitation events; and the proximity of construction to stream channels or water bodies. Disturbed or loosened soils exposed to rainfall, runoff, and wind have the potential to be transported to waterways and settle out as sediment, and to "carry" pollutants (e.g., hydrocarbons, metals, certain pesticides), via adsorption, to nearby surface waters. Sediment is considered a pollutant by the RWQCB. Standard measures would be employed to control erosion during construction, thereby minimizing or avoiding sediment-related water quality impacts. As such, there would be no substantial adverse effects under any of the build alternatives.

Construction of the project would involve the use of construction equipment and associated fuels, solvents, lubricants, and other petroleum-based pollutants. There is the potential for accidental direct or indirect release of these substances into the environment, where they may adversely affect surface and/or groundwater. In addition, concrete, soap, trash, and sanitary wastes are other common sources of potentially harmful materials on construction sites that could be accidentally introduced into a nearby waterway. The impact of toxic, construction-related materials on water quality varies depending on the duration and time of activities.

In addition to the implementation of proposed Measures **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-12 (NES BIO-12)**, which include BMPs required as part of the Western Riverside County Multiple Species Habitat Conservation Plan (see Section 3.17, *Natural Communities*), implementation of the following standard water quality protection measure, required as part of the SWRCB Construction General Permit process, would address discharges

of stormwater runoff and ensure the protection of water quality during construction of the proposed project:

- **PF WQ-4: Construction SWPPP** – The project will comply with the State Water Resources Control Board Construction General Permit in effect at the time the project goes to construction, including developing and implementing a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP is a project-specific document that includes an Erosion Control Plan and construction site best management practices (BMPs), which are implemented to minimize sediment and erosion during construction. The SWPPP would also include post-construction erosion control measures such as re-vegetation of disturbed soil areas. A Qualified SWPPP Practitioner (QSP) would be required to regularly inspect and maintain the BMPs to ensure they are in good working order, as required in the Construction General Permit. The QSP would implement appropriate hazardous material management practices, spill prevention measures, and other good housekeeping measures to reduce the potential for chemical spills or releases of contaminants, including any non-stormwater discharge off site. Construction-related impacts on water quality would be avoided or otherwise minimized with the implementation of construction BMPs identified in the SWPPP, such as fiber rolls, silt fence, stabilized construction entrance/exit, and concrete washouts.

With the BMPs properly designed, implemented, and maintained, no adverse impacts are anticipated on water quality during construction of the proposed project.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, the project would be required to obtain a Construction General Permit, which includes the preparation of a project-specific SWPPP with erosion control plan and construction BMPs, which would minimize sediment and erosion during construction. The SWPPP would also include post-construction erosion control measures such as revegetation of disturbed soil areas. Thus, through compliance with the Construction General Permit, including preparation of a SWPPP, no additional impacts as a result of the Future Six-Lane Facility are anticipated.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities—including a drainage basin, culverts, bridges and wildlife crossings—would also be constructed. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to allow for construction of the proposed project, which would result in disturbed soil areas and associated construction pollutant runoff during storm events. The proposed project would comply with the provisions of the Construction General Permit and standard project measures, as well as Measures **NC-6 (NES BIO-6)** and

NC-10 (NES BIO-10) through **NC-12 (NES BIO-12)**, as described under Build Alternatives 1, 2C, and 4.

No-Build Alternative

Under the No-Build Alternative, there would be no changes made to Cajalco Road. As such, there would be no potential for construction-associated impacts to adversely affect water quality in the area.

3.10.4 Avoidance, Minimization, and/or Mitigation Measures

Implementation of Mitigation Measure **HYD-1** and Measures **PF VIS-1**, **NC-13 (NES BIO-9)** through **NC-15 (NES BIO-14)**, and **WET-1** as well as compliance with Standard Project Measures **PF WQ-1** through **PF WQ-3** (required as part of the Section 401 certification and 404 and MS4 permit processes) would ensure the protection of water quality during operation of the proposed project. During construction of the proposed project, compliance with Standard Project Measure **PF WQ-4 (**required as part of the SWRCB Construction General Permit) in addition to Measures **NC-6 (NES BIO-6)**, **NC-10 (NES BIO-10)** through **NC-12 (NES BIO-12)** (required as part of the Western Riverside County Multiple Species Habitat Conservation Plan [see Section 3.17, *Natural Communities*]), would ensure the protection of water quality during construction of the proposed project.

For full description of the measures identified above, refer to Section 3.9, *Hydrology and Floodplain* **(HYD-1)**; Section 3.7, *Visual/Aesthetics* (**PF VIS-1**); Section 3.17, *Natural Communities* (**NC-6 [NES BIO-6]**, **NC-10 [NES BIO-10]** through **NC-15 [NES BIO-14]**); and Section 3.18, *Wetlands and Other Waters* (**WET-1).**

3.11 Geology/Soils/Seismic/Topography

3.11.1 Regulatory Setting

For geologic and topographic features, the key federal law is the Historic Sites Act of 1935, which establishes a national registry of natural landmarks and protects "outstanding examples of major geological features." Topographic and geologic features are also protected under the California Environmental Quality Act (CEQA).

This section also discusses geology, soils, and seismic concerns as they relate to public safety and project design. Earthquakes are prime considerations in the design and retrofit of structures. Structures are designed using the Department's Seismic Design Criteria (SDC). The SDC provides the minimum seismic requirements for highway bridges designed in California. A bridge's category and classification will determine its seismic performance level and which methods are used for estimating the seismic demands and structural capabilities. For more information, please see the Department's Division of Engineering Services, Office of Earthquake Engineering, Seismic Design Criteria.

3.11.1.1 State Regulations

Alquist-Priolo Earthquake Fault Zoning Act

California's Alquist-Priolo Earthquake Fault Zoning Act (Public Resources Code Section 2621 et seq.), originally enacted in 1972 as the Alquist-Priolo Special Studies Zones Act and renamed in 1994, is intended to reduce the risk to life and property from surface fault rupture during earthquakes. The Alquist-Priolo Act prohibits the location of most types of structures intended for human occupancy across the traces of active faults and strictly regulates construction in the corridors along active faults (referred to as earthquake fault zones). It defines criteria for identifying active faults, giving legal weight to terms such as active, and establishes a process for reviewing building proposals in and adjacent to earthquake fault zones. It also encourages and regulates seismic retrofits of some types of structures.

Seismic Hazards Mapping Act of 1990

The Seismic Hazards Mapping Act of 1990 (Public Resources Code Sections 2690–2699.6) is intended to avoid or reduce damage resulting from earthquakes. While the Alquist-Priolo Earthquake Fault Zoning Act addresses surface fault rupture, the Seismic Hazards Mapping Act addresses other earthquake-related hazards, including strong ground shaking, liquefaction,[1] and seismically induced landslides. Its provisions are similar in concept to those of the Alquist-Priolo Earthquake Fault Zoning Act (i.e., the state is charged with identifying and mapping areas at risk of strong ground shaking, liquefaction, landslides, and other corollary hazards, and cities and counties are required to regulate development within mapped seismic hazard zones).

Under the Seismic Hazards Mapping Act, permit review is the primary mechanism for local regulation of development. Specifically, cities and counties are prohibited from issuing

[1] *Liquefaction* is a phenomenon in which the strength and stiffness of a soil are reduced by earthquake shaking or other rapidly applied loading. Liquefaction and related types of ground failure are of greatest concern in areas where well-sorted sandy unconsolidated sediments are present in the subsurface and the water table is comparatively shallow.

development permits for sites within seismic hazard zones until appropriate site-specific geologic and/or geotechnical investigations have been carried out and measures to reduce potential damage have been incorporated into the development plans.

3.11.2 Affected Environment

Unless otherwise noted, the information from this section was synthesized from the *Structure Preliminary Geotechnical Report: Wildlife Crossing (New) (Bridge No. 110)* (County 2017a), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 268)* (County 2017b), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 242)* (County 2017c), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 267)* (County 2017d), *Structure Preliminary Geotechnical Report: Wildlife Crossing (New) (Bridge No. 145)* (County 2019a), *Structure Preliminary Geotechnical Report: Wildlife Crossing (New) (Bridge No. 179)* (County 2017e), *Structure Preliminary Geotechnical Report: Cajalco Creek Bridge (New) (Bridge No. 740)* (County 2017f), *Structure Preliminary Geotechnical Report: Temescal Wash Bridge (Replace) (Bridge No. 22)* (County 2019b), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 173)* (County 2019c), *Structure Preliminary Geotechnical Report: Bridge Over MWD Maintenance Area (New) (Bridge No. 163)* (County 2019d), *Structure Preliminary Geotechnical Report: Ramona Expressway Overhead (Widen) (Bridge No. 56C-0196)* (County 2019e), *Structure Preliminary Geotechnical Report: Bridge Over Lake Mathews Spillway Channel (New) (Bridge No.* 565*)* (County 2019f), and *Western Riverside County Multiple Species Habitat Conservation Plan* (Western Riverside County Regional Conservation Authority [RCA] 2003). References used in the preliminary geotechnical reports are not carried over into this section. These preliminary geotechnical reports are based on site reconnaissance, literature review of geotechnical reports of adjacent properties, and local geological and geotechnical information. These reports do not present final design recommendations for use during the design phase of the project. Final geotechnical investigations are typically conducted, and final recommendations made, after the completion of the Project Approval and Environmental Document (PA&ED) stage.

3.11.2.1 Regional Geology

The project site is within the Peninsular Ranges geomorphic province of Southern California. The Peninsular Ranges Province is characterized by northeast-trending mountain ranges and valleys largely influenced by active strike-slip and thrust-belt faulting. The project site is situated within a relatively stable structural platform within the province, known as the Perris Block. The structural block is bound to the east and west by active northwest-trending fault zones, including the San Jacinto and Elsinore fault zones. The Cretaceous pluton of the Peninsula Batholith is exposed internally. The pluton is largely composed of granitic, volcanic, metasedimentary, and sedimentary rocks.

Basement up-warping resulted in an undulating geomorphic surface that generally peaks along the bordering fault zones. During the Pliocene period, continental deep valley and volcanic deposition carved and filled the basement floor. Through the Pleistocene much of the Pliocene deposition was washed out by major river systems, like the San Jacinto River. However, some Miocene non-marine sediments are preserved within the western portion of the block, south of Lake Mathews.

In the valleys, the surface of the pluton is largely an expression of deep-buried erosion. Rock exposed within the valley floor typically consists of residual rock masses in the form of isolated piles of boulders, otherwise called tors. Within the bordering mountains, landforms are typically well-rounded with relatively gently sloping canyons. Old surficial deposits are preserved within old alluvial fan platforms bordering main drainages and valleys within the block. Younger surficial debris overlie slopes, drainage channels, and creeks.

3.11.2.2 Site Geology

The western end of the project site is within the El Sobrante de San Jacinto foothills of the Santa Ana Mountains, which are within the western margin of the Perris Block. Temescal Valley is to the west, and Mead Valley is to the east. The hills have a relatively low gradient and are composed of Mesozoic metasedimentary rock and Cretaceous monzogranite, granodiorite, sedimentary, and volcanics. Miocene non-marine sediments are preserved within isolated areas south of Lake Mathews, and Holocene channel deposits are deposited within active canyons and valleys throughout the foothills. Cajalco Canyon meanders southwest along the north side of the existing Cajalco Road. The hilltop narrows over a short distance, forming a saddle. Cretaceous sedimentary and volcanic rock is exposed within the cut slopes along Cajalco Road on both ends of the saddle. Moving eastward, beyond the foothills, the project is situated within the Mead Valley, which is centrally located within the Perris Block. Generally, Val Verde Tonalite is exposed within the valley floor. The geologic map of the project area is presented in Figure 3.11-1.

Soils

Surface soils within the project area include artificial fill, alluvium, colluvium, Cretaceous granitic rock, Tertiary formational material (soft sedimentary rock), and Holocene and late Pleistocene-age Young axial channel deposits.

Based on site reconnaissance and review of published materials, the soils at the western end of the project along Cajalco Road appear to be sandy/gravelly fills that go down to about 10 feet deep and are underlain by bedrock, becoming less weathered and harder with depth. Along the alignment of Build Alternative 4, surficial colluvial debris and highly weathered bedrock (decomposed granite) of up to 5 feet appear to be underlain by bedrock that becomes less weathered and harder with depth.

Previous subsurface explorations conducted for other projects in the area include a soil boring taken south of Lake Mathews indicating about 10 feet of alluvial materials overlying Tertiary formational material (Lake Mathews Formation). The alluvial material is primarily stiff to very stiff sandy silt (ML). No subsurface data was available below 26.5 feet below ground surface (bgs), but it likely consists of sedimentary rock becoming less weathered and harder with depth. The colluvial soil found between rock outcrops in this area is loose, coarse-grained, silty sand and sandy silt. Another boring taken at the eastern end of the project indicated about 20 feet of alluvial materials overlying highly weathered bedrock. The alluvial material is primarily medium dense to dense silty sand (SM) and poorly graded sand (SP). No subsurface data were available below 26.5 feet bgs, but it likely consists of bedrock becoming less weathered and harder with increasing depths. The borehole did not encounter the anticipated surface geology to a depth of about 20 feet bgs. This indicates that the depth of soil cover over the bedrock may vary significantly within this area.

Mineral Resources

According to the California Geological Survey, the proposed project is with the Temescal Valley Production Area Boundary as established by the California Department of Conservation; the majority of lands within the boundary are classified as Mineral Resource Zone (MRZ) 3, which is defined by the California Department of Conservation as "areas containing mineral occurrences of undetermined mineral resource significance" (California Geological Survey 2014). A very limited portion of the western end of the project limits travels through a narrow area identified as "Sector Q" of the Temescal Valley Production Area; the Sector Q area encompasses instream alluvial deposits of Temescal Wash from Magnolia Avenue in the City of Corona extending to Cajalco Road. Land within Sector Q is classified MRZ-2, which the California Department of Conservation defines as "areas where adequate information indicates that significant mineral deposits are present, or where it is judged that a high likelihood for their presence exists. This zone shall be applied to known mineral deposits or where well-developed lines of reasoning, based upon economic-geologic principles and adequate data, demonstrate that the likelihood for occurrence of significant mineral deposits is high." Sector Q contains an estimated 18.2 million tons of aggregate resource.

Topography and Surface Drainage

The existing topography of the project area varies from its western to eastern end. The El Sobrante de San Jacinto foothills, located west of Lake Mathews, slope toward Temescal Creek in the west and create steep grades in the area where Cajalco Road travels through canyon areas. The area surrounding the lake is an irregular plateau with gently rolling hills and tributary channels. South of Lake Mathews, the hills slope north toward the lake; north of the lake they continue to slope northward toward Arlington Valley Channel.

The area just east of Lake Mathews is characterized by moderate relief and gently rolling hills. Mead Valley is in this area, separated from the Perris Valley by the low-lying hills of the Lake Mountains along the east. The valley is relatively broad and gently grades down toward Cajalco Road from the north and south.

The elevation along Cajalco Road ranges from 800 feet at the western terminus of the project, at Temescal Canyon, to 1,510 feet at its eastern terminus at Interstate 215 (I-215). The highest elevation (1,704 feet) occurs at the drainage divide between Mead Valley and Perris Valley, located west of I-215, near Day Street.

The project area is adjacent to and crossed by Cajalco Creek and Temescal Creek (or Wash), as well as several tributaries to Cajalco Creek, Lake Mathews, Temescal Wash, and the San Jacinto River. Temescal Creek is at the west end of the project area. It is 29 miles long and connects Lake Elsinore to the Santa Ana River. It is considered ephemeral, except for runoff from housing development and agricultural return flows. Cajalco Creek, also in the west end of the project, is an ephemeral stream that flows through Cajalco Canyon downstream of Lake Mathews and its tributary to Temescal Creek. Upstream of Lake Mathews, Cajalco Creek begins on the northeast face of the Gavilan Hills of the Temescal Mountains. It is an ephemeral stream that flows westerly through the Mead Valley and Cajalco Valley before flowing into Lake Mathews. The east end of the project drains easterly to the Perris Valley Storm Drain about 2 miles east of the project (Caltrans 2018).

Groundwater

According to published groundwater monitoring reports cited in the *Initial Site Assessment for Cajalco Road Widening and Safety Enhancement Project, STPL 5956 (195)* (County 2017h), groundwater in the vicinity of the project ranges from approximately 10 and 45 feet bgs and flows in a southwesterly direction toward the Pacific Ocean.

Groundwater exploration borings were taken near the sites evaluated in the structure preliminary geotechnical reports prepared for this project. One boring explored to a maximum depth of 26.5 feet near the west end of the project area in the El Sobrante de San Jacinto foothills. No groundwater was encountered. According to the reports, an internal drainage meanders north, across the project area, eventually meeting up with Lake Mathews at approximately 1,395 feet elevation. The main drainage floor rests at about 1,400 feet elevation and is anticipated to transport water seasonally. The permanent groundwater table is not anticipated to be encountered in the upper 100 feet in this area of the project because it is underlain by Cretaceous sedimentary rock, which is considered non-water bearing rock. However, perched water may be present within fractures throughout the formation. Perched water is not anticipated within the fill materials due to the largely impermeable asphalt layer covering the existing Cajalco Road and existing surface drainage controls.

A second boring taken near Cajalco Creek and the Cajalco Road and Barton Street intersection encountered groundwater at 16 bgs, which likely coincides with perched water level conditions in the wash. The site is composed of tonalite, which is considered a non-water bearing rock. There is potential for water to be confined within fractures in the rock; however, the rock at the surface did not appear to be significantly fractured. In general, perched groundwater should be expected within the main channel of the Cajalco Creek wash and isolated areas within the wash area. Excavations into the alluvial soil within the creek are likely to encounter groundwater.

Seismicity, Ground Shaking, and Surface Rupture

The project site is in a seismically active area. The site is not in a State of California Special Studies (“Alquist-Priolo”) Zone for fault rupture, and no known active faults are mapped as crossing or projecting toward the site. The closest known active fault is the Glen Ivy Section of the Elsinore Fault Zone approximately 3.4 miles southwest of the nearest end of the project area. Therefore, potential for fault rupture is considered remote. Figure 3.11-2 shows the location of the nearest faults in relation to the project site. The site has experienced historical, regional earthquakes. The closest significant earthquake was a Magnitude 6.7 earthquake with an epicenter near Lake Elsinore in 1918.

Liquefaction and Seismic Settlement

Soil liquefaction is the sudden loss in strength of a saturated, cohesionless soil caused by the buildup of pore water pressure during cyclic loading, such as that produced by an earthquake. The effects of liquefaction can include lateral and vertical ground displacements, slope instability and lateral spreading, and bearing failure.

For liquefaction to occur, all of the following must be present:

- Liquefaction-susceptible soils (loose to medium dense cohesionless soils)
- Groundwater within 50 feet of the surface
- Strong shaking, such as that caused by an earthquake

According to the Generalized Liquefaction Map for Riverside County, liquefaction potential varies from very low to moderate in the project area (see Figure 3.11-3). The preliminary geotechnical reports prepared for the three bridge structures along the project route indicate that liquefaction potential is not an issue in the area west of Lake Mathews due to the relatively shallow bedrock and deep groundwater. The area east of Lake Mathews near Cajalco Creek has potentially liquefiable soils. These soils are thin layers of loose to medium dense sands over competent bedrock, which suggests a likely overall low to very low liquefaction potential.

Due to the presence of limited depth of fill over shallow bedrock, seismic dry sand settlement is not considered an issue in the area west of Lake Mathews that was studied in the preliminary geotechnical report for the wildlife overcrossing. Sands and axial channel deposits are located in the other two areas studied; therefore, there is a potential for settlement in these areas.

Scour

Scour is the powerful and concentrated clearing and digging action of flowing water, especially the downward erosion by stream water in sweeping away mud and silt on the outside curve of a bend, or during flooding.

Scour could be an issue where the proposed project crosses any unlined channel, wash, drainage, or area that is subject to flooding. Sedimentary soils and fills are subject to scour, whereas the intact granitic rock is generally scour resistant.

Landslides

Landslides commonly occur in connection with other natural disasters such as earthquakes, volcanoes, wildfires, and floods. Steep, bare slopes; deposits of stream or river sediment; clay-rich rock; and heavy rains can also cause landslides. Based on Riverside County Mapping, there is a potential for seismically induced landslides through the foothills along the western portion of the project area. However, historically, no seismically induced landslides have been reported in the project area.

Other Seismic Hazards

Subsidence is the sinking of the ground surface in response to geologic or human-induced causes such as the removal of water, oil, or natural gas. The project area has no known history of subsidence.

A tsunami is a large ocean wave that is caused by sudden movement on the ocean floor, such as from an earthquake, a volcanic eruption, or an underwater landslide. Due to the site elevation and distance from the coastline, there is no risk of tsunami in the project area.

A seiche is a standing wave that forms in an enclosed or partially enclosed body of water. The effect is caused by resonances in the confined water body. Most often, they are caused by wind and are imperceptible. However, in the event of an earthquake, the ground movement can be enough to create a large standing wave (seiche) that causes the "slosh" of the waterbody onto its shores at levels higher than expected. Lake Mathews, a reservoir with a capacity of 182,000 acre-feet, is within the project area. Should a seiche occur, it would most likely be imperceptible or it would be confined within the reservoir and would not impact the project area. The project is not located within a tsunami or seiche zone.

3.11.2.3 Lake Mathews MSHCP

The Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) is a joint conservation effort initiated by Metropolitan Water District of Southern California (MWD) and the Riverside County Habitat Conservation Agency (RCHCA) in cooperation with the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW) that spans 5,993.5 acres of open land around Lake Mathews. The proposed project is located within the LM MSHCP area.

According to the LM MSHCP, most of the soils in the area comprise the Monserate-Arlington-Exeter association, which ranges from well-drained, moderately deep sandy loams to loamy soils found on old alluvial terraces and washes. These are shallow to deep soils with a calcareous hardpan. The Cajalco-Temescal-Las Posas association is in the eastern part of the Plan Area. The soils in this association range from moderately deep and shallow loam to clay loam developed on gabbro (MWD and RCHCA 1995).

Nine soil series occur within the Plan Area, including Porterville cobbly clay, Bosanko clay, Cieneba rocky sandy loam, Gorgonio loamy sand, Hanford coarse sandy loam, Las Posas stony loam, Monserate sandy loam, Temescal rocky loam, and Terrace escarpments. These soil series are described below:

- Porterville cobbly clay is a well-drained clay soil found on alluvial fans. It is very hard and has a slow permeability, medium runoff, and slight erosion hazard.
- Bosanko clay is a grayish-brown upland soil that developed from igneous parent materials. It has a moderately slow permeability, medium runoff, and moderate erosion hazard.
- Cieneba rocky sandy loam is an excessively drained soil found on moderate to steep slopes.
- Gorgonio loamy sand is also an excessively drained soil. It developed in granitic alluvium and has rapid permeability with slow runoff and a slight erosion hazard.

- Hanford coarse sandy loam is a well-drained soil found on alluvial fans and is developed from granitic parent materials. It has moderately rapid permeability, slow runoff, and a slight erosion hazard.
- Las Posas stony loam is a well-drained soil that has developed on a gabbro parent material. It is moderately permeable, has medium runoff, and a moderate erosion hazard.
- Monserate sandy loam is a well-drained soil developed from granitic materials. Permeability is moderately slow, and runoff and erosion are moderate.
- Temescal rocky loam is a well-drained soil found in upland areas, where up to 10 percent of the area is covered by rock outcrops. The permeability of this soil is moderate, runoff is rapid, and the erosion hazard is high.
- Terrace escarpment consist of various alluvial material found in terraces or washes. This alluvial material may vary from sandy deposits to cobbles or boulders. Generally, at least one-quarter of these sites have eroded areas or active gullies.

3.11.3 Environmental Consequences

3.11.3.1 Permanent Impacts

Build Alternative 1 – Cajalco Alignment

Ground Shaking and Surface Rupture

Neither ground shaking nor fault rupture can be avoided in the design of roadways; however, placing the realigned roadway either at natural grade or in low cuts or on low embankments limits the potential for, and consequences of, failure in the cuts and fills. This allows the road to be restored to service with minimum maintenance or re-construction effort following a seismic event. Accordingly, the currently proposed designs are favorable for accommodating future ground shaking or surface rupture. Compliance with Standard Project Measure **PF GEO-1** is also anticipated to prevent any adverse effects related to seismic ground shaking.

- **PF GEO-1:** Implement the California Department of Transportation's (Caltrans') procedures regarding seismic design, as detailed in Section 19, "Earthwork," of the Caltrans Standard Specifications Manual. Seismic design would also meet County of Riverside (County) requirements for near-source design parameters under the Uniform Building Code (UBC).

Liquefaction and Seismic Settlement

The Generalized Liquefaction Map for Riverside County indicates liquefaction potential in the west end of the project area at Temescal Creek is considered low to moderate (refer to Figure 3.11-3). Soils in the area of the proposed replacement of Bridge No. 56C-0155 at Temescal Creek are loose to moderately packed and may have a moderate to high liquefaction potential. The proposed project includes Standard Project Measures **PF GEO-2** and **PF GEO-3** that would be employed during the Plans, Specifications, and Estimates (PS&E) phase of the project for all proposed new or replacement bridges to confirm specific excavation and stabilization techniques for each bridge location based on the results of testing.

- **PF GEO-2: Core Sample Tests.** Prior to construction, the following additional fieldwork and laboratory testing will be performed:
  - **PF GEO-2(a):** Borings will be taken in accordance with Table 10-1 of the American Association of State Highway and Transportation Officials' Load and Resistance Factor Design Bridge Design Specifications for number, spacing, and depth of borings.
  - **PF GEO-2(b):** Rock core samples will be collected to estimate rock quality designation.
  - **PF GEO-2(c):** Seismic refraction survey and refraction microtremor survey are recommended to evaluate rock rippability and shearwave velocity, respectively.
  - **PF GEO-2(d):** Test pits or other methods will be used to collect data for evaluation of the soil cover over the competent soil or bedrock and stability of the steep descending slope.
  - **PF GEO-2(e):** Sufficient field and laboratory testing will be conducted to classify the subsurface materials and define liquefaction, shear strength, compressibility, and corrosion properties of the soils and rock encountered.
- **PF GEO-3: Excavation and Stabilization Techniques.** Temporary excavations and installation of spread footing foundations at bridges will include the following techniques. If loose or otherwise unsuitable materials are present below foundation level, limited overexcavation and replacement with lean concrete slurry may be needed to transmit foundation loads to competent soils.
  - **PF GEO-3(a):** In the event that near-slope materials are not adequate to support spread footings, cast-in-drilled-hole (CIDH) piles socketing into the bedrock could be considered.
  - **PF GEO-3(b):** Subgrade conditions and need for subgrade preparation or stabilization measures, particularly in the vicinity of the slope, should be evaluated in detail in the Plans, Specifications, and Estimates (PS&E)-level investigation.
  - **PF GEO-3(c):** The need for foundation overexcavation or use of deep foundations should be addressed in the Foundation Report after performing the PS&E-level investigation.

These recommendations, which are considered preliminary, may be revised based on actual conditions encountered during earthwork and grading.

Liquefaction in the area of proposed new bridge at Station (STA) #110 along Cajalco Road west of La Sierra Avenue is unlikely (refer to Figure 3.11-3). There is limited depth of fill over shallow bedrock at the bridge proposed as STA #110; therefore, seismic dry sand settlement is not an issue.

Due to relatively shallow bedrock and deep groundwater, liquefaction potential is low to very low at the site of the proposed new bridge along a realigned segment of Cajalco Road west of Lake Mathews Drive, at STA #268 (refer to Figure 3.11-3). The proposed project includes Standard Project Measures **PF GEO-1** through **PF GEO-3** that would address seismic settlement potential.

The area along the project alignment east of Lake Mathews near Cajalco Creek has potentially liquefiable soils (refer to Figure 3.11-3). These soils are thin layers of loose to medium dense sands over competent bedrock, which suggests a likely overall low to very low liquefaction potential. During extreme flood events, water levels in the nearby creek may be 5 feet above the static channel bed, resulting in saturation of soils to flood level. Since extreme flood and earthquake are unlikely to occur simultaneously, the preliminary recommended high design groundwater level for evaluation of liquefaction should be considered at the channel bed elevation.

However, liquefaction potential—specifically in the areas of the proposed new westbound bridge over Cajalco Creek at STA #740, new drainage facilities between Alexander Street and Clark Street, and the proposed replacement of Ramona Expressway Overhead Bridge (Bridge No. 56C-0196) at STA #935—is considered low due to localized bedrock conditions.

The proposed new bridge at STA #740 is located in an area with axial channel deposits; compliance with Standard Project Measures **PF GEO-1** through **PF GEO-3** would address any seismic settlement potential. These measures would also be employed prior to work proposed in the area of Bridge No. 56C-0196 at STA #935 to minimize potential settlement risk.

Surface Drainage

Temescal Creek flows toward the north, where it flows beneath Cajalco Road. Runoff from the east and west flows into Temescal Creek by overland flow and through tributary drainages. Temescal Creek has a small year-round base flow, and higher flows and water surface elevations during flood events.

Surface flow generally drains away from the proposed site for the new bridge at STA #110. An open drainage flows southwest, along the south side of Cajalco Road and Cajalco Canyon, and another flows southwest north of Cajalco Road. Both drainages meet up with Temescal Creek west of the site. Surface water flows seasonally within the natural drainages bordering the roadway.

At the proposed site for the new bridge at STA #268, surface flow generally drains toward the center of the main stream and north away from the site. The drainage initiates locally within the Monument Peak and meanders north to Lake Mathews approximately 1,000 feet away. Flooding may occur during rainstorm events. Surface water is anticipated to flow intermittently during rainy seasons within the natural drainage.

East of Lake Mathews, at Cajalco Creek, surface water collects within the natural wash flowing southwest across the proposed site for the new bridge at STA #740 along a realigned segment of westbound Cajalco Road, at Barton Street. The drainage is channeled by a double corrugated metal pipe culvert that is constructed below the existing Cajalco Road, south of the site. Water is anticipated to flow seasonally and pond locally following a rain event. According to FEMA, the site is within an area subject to inundation by the 1-percent annual chance flood event (100-year flood). Impacts on surface waters, and related avoidance and minimization measures, are discussed in Section 3.10, *Water Quality*.

Groundwater

In the west end of the project area, groundwater is anticipated near Temescal Creek. Based on previous borings taken at the Temescal Creek Bridge, groundwater was encountered at 23 feet bgs, which approximately coincides with normal water levels in the channel (County 2012). The groundwater level should be anticipated near the channel bed, becoming deeper with distance from the channel. Due to fairly pervious sandy/gravelly alluvial soils, the groundwater levels would be expected to rise and fall in response to variable water levels in the channel (County 2012).

The permanent groundwater table is not anticipated to be encountered in the upper 100 feet of surface west of Harley John Road. The western end of Build Alternative 1 is underlain by Cretaceous sedimentary rock, which is considered non-water-bearing rock; however, perched water may be present within fractures throughout the formation. Perched water is not anticipated within the fill materials due to the largely impermeable asphalt layer covering the existing Cajalco Road at the evaluated site and the apparent surface drainage controls. Groundwater may be encountered during excavation for structure footing installation, and dewatering or other measures may be required.

A portion of the project area south of Lake Mathews is underlain by Cretaceous monzogranitic rock. Contact with the permanent groundwater table is not anticipated; however, perched water may be present locally within fractures and along the colluvial bedrock contact. Perched and/or seasonal groundwater may be present during excavation for footing installation.

The east end of the project area traversed by all the alignments is underlain by tonalite, which is considered a non-water-bearing rock. There is a potential for water to be confined within fractures in the rock; however, the rock exposed at the surface of the site did not appear to be significantly fractured. In general, perched groundwater should be expected within the main channel of the unnamed wash crossing the project alignments and within isolated areas within the wash flood area. Excavations into the alluvial soil within the creek are likely to encounter groundwater. Groundwater may also be encountered during excavation for footing installation, and dewatering or other measures may be required. The proposed project includes Standard Project Measures **PF GEO-1** through **PF GEO-3** that would specify appropriate excavation and stabilization techniques.

Soils

Surface soils within the project area include artificial fill, colluvial soils, Holocene alluvium, Pleistocene older alluvium and fan deposits, Tertiary sandstone and siltstone, Mesozoic plutonic and volcanic rocks, and Mesozoic metamorphic rocks.

Foundation

Based on site reconnaissance and published geology maps, soils in the western end of the project area at Temescal Creek are primarily sands and silty sands with variable amounts of gravel and cobbles (County 2012). Shallow bedrock is anticipated to be about 5 to 10 feet below the existing ground in the western end of the project area studied for the new bridge at STA #110. Deeper colluvial soils may be present on the slopes. Footings for the new bridge at STA #110 are proposed to be placed approximately 20 feet or more below the original roadway grade, and the north end of the footings will be some depth below the existing slope surface. Due to high

anticipated bearing capacity and low compressibility of bedrock materials, it is feasible to support the proposed new bridge structure on shallow spread footing foundations founded in bedrock materials. Due to a very steep high descending slope and unknown depth of soil cover and condition of the near surface rock, the footings may need to be deepened on the north end to reach competent soils and to provide for adequate slope stability. This option will be more economical than use of deep foundations. Use of spread footings is allowed for this structure in accordance with Caltrans Bridge Memo to Designers 5-1.

In the event that near slope materials are not adequate to support spread footings, CIDH piles socketing into the bedrock may be considered. Driven piles are not recommended due to anticipated hard driving conditions. In general, the tall mechanically stabilized earth (MSE) walls founded in competent bedrock materials are considered feasible due to high bearing capacity and low compressibility of the bedrock. However, near-surface slope stability and techniques to address any unstable near-surface materials would be addressed prior to construction through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Shallow bedrock, Tertiary-age soft rock, and Holocene- to late Pleistocene-age axial channel deposits are anticipated in the area south of Lake Mathews, specifically at the site for proposed the new bridge at STA #268. If shallow granitic rock or competent Tertiary formation or dense to very dense axial channel deposit (high anticipated bearing capacity and low compressibility) is encountered below the existing grade, it is feasible to support the proposed structure on shallow spread footing foundations. Limited removal of unsuitable soil and/or highly weathered formation may be necessary prior to placing the compacted fill. In general, spread footings are in most cases more economical than use of deep foundations. Use of spread footings is allowed for this structure in accordance with Caltrans Bridge Memo to Designers 5-1.

Depending on actual subsurface conditions explored in site-specific borings in the PS&E stage and economic considerations, CIDH piles penetrating into competent materials may be considered. Due to lack of groundwater and relatively shallow competent soils, conditions are likely to be favorable for CIDH construction in dry open holes without the need for slurry or casing. Driven piles are not recommended due to anticipated hard driving conditions.

Relatively shallow bedrock is present at the site for the new bridge at STA #740, in the eastern end of the project. Outcrops of slightly weathered to fresh rock are present above surrounding ground in much of the site, while elsewhere there is an unknown depth of soil and weathered bedrock overlying the less weathered rock. The depth of soil cover is not known, but it is expected to be relatively shallow. Weathered to fresh bedrock materials may be considered "competent" soil in accordance with Caltrans guidelines. Due to high bearing capacity and very low compressibility, it is feasible to support the proposed new bridge structure on shallow spread footing foundations founded in weathered to fresh bedrock. Provided that the competent material is at reasonably shallow depth and excavations to competent materials do not require major dewatering, the spread footing option is generally expected to be more economical than use of deep foundations. If depth to competent bearing materials is deep and/or significantly below groundwater, use of CIDH piles socketed into bedrock may be more economical. Depth to bedrock and constructability of placing spread footing foundations on bedrock would be addressed prior to construction through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-3**. Based on Caltrans Bridge Memo to Designers 5-1 (October 2016) shallow foundations in competent soil may be used for non-integral abutments up to 36 feet in height.

Foundation type and any stabilization techniques for the replacement of Bridge No. 56C-0196 at STA #935 would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-3** during the PS&E phase of the project, and foundation recommendations provided.

Cut Slope and Embankments

Permanent cut slopes are proposed on the south side of the proposed bridge STA #110. Slope stability would be evaluated during final design through Standard Project Measure **PF GEO-2**.

Shallow fill materials (generally sandy and gravelly soils) overlying bedrock were observed during site reconnaissance for the bridge proposed at STA #110 in the western portion of the project. The southern portion of the roadway approaches will be primarily in cut, while the northern portion situated over the steep descending slope will have up to about 45 feet of approach fill embankment. The approach fill embankments on the north side will be retained by MSE retaining walls up to about 50 feet in height.

Approach fill embankments up to about 20 feet high are proposed at 2:1 (horizontal:vertical) inclination near the abutments for the proposed new bridge at STA #268 in the area south of Lake Mathews.

New approach embankments would be placed at the abutments for the proposed bridge at STA #740 in the eastern end of the proposed project.

Foundation types and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5**.

- **PF GEO-4:** Appropriate backfill materials would be used in accordance with California Department of Transportation standards. Select fill materials should be used for mechanically stabilized earth wall construction, and use of oversize materials generated in cuts screened prior to use as backfill materials.
- **PF GEO-5:** Structure approach embankment is that portion of the fill material within approximately 150 feet longitudinally of the structure in accordance with Figure 208.11 of the Highway Design Manual. Structure abutment embankment fill should be compacted to not less than 95 percent relative compaction in accordance with Section 19-5.03B of the Standard Specifications (Caltrans 2018). Poor quality material, such as expansive soils, must be precluded from structure abutment embankments unless treated and placed in accordance with California Department of Transportation Geotechnical Manual Section 3.1.2. Expansive soil materials for this requirement are defined as having either an Expansion Index (ASTM D 4829) greater than 50, or a Sand Equivalent (California Test Method 217) less than 20. This requirement is exclusive of the structure backfill and pervious backfill material requirements as shown on the plans and set forth in the Standard Specifications under Sections 19-3.02B and 19-3.03E, Structure Backfill, and 19-3.02C and 19-3.03G, Pervious Backfill Material, respectively.

Mineral Resources

Under Build Alternative 1, permanent impacts associated with replacement of the Temescal Creek Bridge, including roadbed widening, bridge embankments, and fill, would affect

approximately 0.4 acre of land classified as MRZ-2. A portion of the land classified MRZ-2 is within the streambed of Temescal Creek and subject to environmental regulations that limit mineral resource extraction activities. It is also under resource protection under the Riverside-Corona Resource Conservation District. Therefore, the potential for future use of the 0.4-acre MRZ-2 land for mineral extraction is unlikely. Additionally, the amount of aggregate resource affected compared to the remaining 18.2 million tons available within Sector Q of the Temescal Valley Production Area (composed of instream alluvial deposits of Temescal Wash) would not significantly affect the availability of the resource.

Natural Landmarks and Landforms

As discussed under Section 3.7, *Visual/Aesthetics*, no designated landmarks are within the project limits. However, Build Alternative 1 would result in landform alterations, including pronounced roadside cuts, through widening of roadway surface areas from a two-lane rural roadway to a four-lane roadway. Even though slopes would be designed to appear more natural, Measure **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project) would be applied to ensure landform impacts are minimized and the resulting appearance is similar to the surrounding landscape. Refer to Section 3.7, *Visual/Aesthetics*, for the complete text of Mitigation Measure **VIS-2**.

Future Six-Lane Facility (Build Alternative 1)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is expected that the new lanes would be exposed to the same seismic hazards as the proposed project described under Build Alternative 1, above. It is also anticipated that geotechnical evaluations would be required to evaluate impacts resulting from any excavation, cuts, and fill required.

Lake Mathews MSHCP (Build Alternative 1)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and Lake Mathews Multiple Species Reserve (LMR). A discretionary action coordinated between the County and LM MSHCP responsible parties be required to allow for construction of the proposed project, and would result in exposure of transportation facilities and structures to potential seismic activity. The proposed project would also result in the excavation, grading, cut, and fill of soils and rock within the LM MSHCP area. Through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-3**, the proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology.

Build Alternative 2C – Modified Cajalco Alignment

Ground Shaking and Surface Rupture

Ground shaking and surface rupture risks and impacts would be the same as for Alternative 1, above.

Liquefaction and Seismic Settlement

The Generalized Liquefaction Map for Riverside County indicates that liquefaction potential is unlikely at the proposed new bridges at STA #173, STA #242, and STA #267 under Build Alternative 2C. Bridges are also proposed at STA #242 and #267 along a realigned segment of Cajalco Road west of Lake Mathews Drive (refer to Figure 3.11-3). Due to the presence of limited depth of colluvial and surficial debris cover (about 5 to 10 feet in thickness) over shallow bedrock and lack of a permanent groundwater table within the upper 50 feet, seismic settlement is not an issue. Under Build Alternative 2C, the potential for liquefaction and seismic settlement in the area at Temescal Creek, in the area east of Lake Mathews near Cajalco Creek, and at the proposed replacement of Bridge No. 56C-0196 at STA #935 west of I-215 would be the same as described above for Build Alternative 1. The proposed project includes Standard Project Measures **PF GEO-2** and **PF GEO-3** that would be employed during the PS&E phase of the project to confirm specific excavation and stabilization techniques for each bridge location based on the results of testing.

Surface Drainage

Surface flow generally drains toward the center of the main stream and northwest away from the proposed bridge site at STA #242. The drainage initiates locally and meanders 4.5 miles west to Temescal Creek. Surface ponding was observed after a rain event; therefore, it is believed that flooding may occur during rainstorm events. Surface water is anticipated to flow intermittently during the rainy season.

At the proposed site for the new bridge at STA #267, surface flow generally drains toward the center of the main stream and north away from the site. The drainage initiates locally within the Monument Peak and meanders north to Lake Mathews approximately 0.5 mile away. Flooding may occur during rainstorm events. Surface water is anticipated to flow intermittently during rainy seasons within the natural drainage.

Impacts on surface drainage at Temescal Creek, the area east of the proposed new bridge located at STA #740, and the location of proposed replacement of Bridge No. 56C-0196 at STA #935 west of I-215 would be the same as those described above for Build Alternative 1. Impacts on surface waters, and related avoidance and minimization measures, are discussed in Section 3.10, *Water Quality*.

Groundwater

The permanent groundwater table is not anticipated to be encountered at the site of the proposed bridge at STA 173, as this area is underlain by non-water-bearing Cretaceous monzogranite rock. However, perched water may be present in isolated fracture zones and along colluvial soils contact. Therefore, groundwater should be anticipated during excavation for structure footing installation and dewatering, or other measures may be required.

No specific groundwater data is available for the proposed new bridge at STA #242; however, Miocene age sedimentary rock underlies the site, and perched water may be present throughout the formation. Additionally, an agricultural field occupies the western portion of the site, and irrigation may affect groundwater levels in this area. Therefore, groundwater may be

encountered during excavation for structure footing installation and dewatering, or other measures may be required.

An exploratory boring taken to a depth of 26.5 feet bgs near the proposed new bridge site at STA #267 indicated no groundwater. However, there is a known internal drainage that crosses the site and transports water seasonally. The bridge site is underlain by Cretaceous monzogranitic rock. Contact with the permanent groundwater table is not anticipated; however, perched water may be present locally within fractures and along the colluvial bedrock contact. Therefore, groundwater should be anticipated during excavation for structure footing installation and dewatering, or other measures may be required.

Groundwater impacts at Temescal Creek and at the east end of the project alignment would be the same as those described above for Build Alternative 1. The proposed project includes Standard Project Measures **PF GEO-1** through **PF GEO-3** that would specify appropriate excavation and stabilization techniques.

Soils

Surface soils within the project area include artificial fill, colluvial soils, Holocene alluvium, Pleistocene older alluvium and fan deposits, Tertiary sandstone and siltstone, Mesozoic plutonic and volcanic rocks, and Mesozoic metamorphic rocks.

Foundation

Based on site reconnaissance and published geology maps for the proposed new bridge at STA #242, shallow Tertiary-age soft rock is anticipated about 5 feet below the existing ground underlying a shallow cover of alluvial and colluvial soils. Based on preliminary plans, the proposed footings will be approximately 5 to 7 feet below the existing ground. The upper part of the bedrock may be highly weathered or residual soil, which may or may not be suitable for foundation support. Due to high anticipated bearing capacity and low compressibility of the competent Tertiary formational materials, it is feasible to support the proposed new bridge structure on shallow spread footing foundations founded in these materials. Limited removal of unsuitable soil and/or highly weathered formation may be necessary below the foundations. In general, use of spread footings may be more economical than use of deep foundations. Use of spread footings is allowed for this structure in accordance with Caltrans Bridge Memo to Designers 5-1.

Shallow bedrock or Tertiary-age soft rock is anticipated about 5 to 10 feet below the existing ground at the site for proposed new bridge at STA #267. Based on preliminary plans, the proposed footing would be approximately 6 to 8 feet below the existing ground. Due to the height of the proposed retaining walls, the bearing pressures are anticipated to be high. Due to high anticipated bearing capacity and low compressibility of materials (Cretaceous granitic rock or competent Tertiary formation), it is feasible to support the proposed new bridge structure on shallow spread footing foundations in these materials. Limited removal of unsuitable soil and/or highly weathered formation may be necessary below the foundations. In general, use of spread footings is in most cases more economical than use of deep foundations. However, due to the significant height of the walls and presence of a cover of potentially unsuitable soils over shallow competent materials, spread footing may or may not be the most economical option for

tall abutments. Use of spread footings is allowed for this structure in accordance with Caltrans Bridge Memo to Designers 5-1.

Depending on actual subsurface conditions explored in site-specific borings in the PS&E stage for proposed new bridges at STA #242 and #267, as well as economic considerations, CIDH piles penetrating into competent materials may be considered. Due to lack of groundwater and relatively shallow competent soils, conditions are likely to be favorable for CIDH construction in dry open holes without the need for slurry or casing. Driven piles are not recommended due to anticipated hard driving conditions.

It is not known at this time what type of foundation would be needed for the proposed bridge near STA #173. Foundation type and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Soil impacts for the area at Temescal Creek, the east end of the alignment at the proposed new bridge at STA #740, and the location for the proposed replacement of Bridge No. 56C-0196 at STA #935 west of I-215 would be the same as those described above for Build Alternative 1.

Cut Slope

No permanent cut slopes are proposed for the new bridges at STA #242 and 267. It is not known at this time if permanent cut slopes would be needed for the proposed bridge near STA #173. Slope stability would be evaluated during final design through Standard Project Measure **PF GEO-2**.

Mineral Resources

Permanent impacts on mineral resources associated with replacement of the Temescal Creek Bridge, including roadbed widening, bridge embankments, and fill, would be the same as those described under Build Alternative 1.

Natural Landmarks and Landforms

Landform alterations as a result of Build Alternative 2C would be similar to those identified for Build Alternative 1. Even though slopes would be designed to appear more natural, Measure **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project) would be applied to ensure landform impacts are minimized and the resulting appearance is similar to the surrounding landscape. Refer to Section 3.7, *Visual/Aesthetics*, for the complete text of Mitigation Measure **VIS-2**.

Future Six-Lane Facility (Build Alternative 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is expected that the new lanes would be exposed to the same seismic hazards as the proposed project described under Build Alternative 2C, above. It is also anticipated that geotechnical evaluations would be required to evaluate impacts resulting from any excavation, cuts, and fill required.

Lake Mathews MSHCP (Build Alternative 2C)

Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR in the same manner as discussed above under Build Alternative 1. Through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-5**, the proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology.

Build Alternative 4 – El Sobrante Alignment

Ground Shaking and Surface Rupture

Ground shaking and surface rupture risks and impacts under Build Alternative 4 would be the same as those described for Build Alternative 1.

Liquefaction and Seismic Settlement

According to liquefaction mapping for Riverside County, liquefaction potential is unlikely at the west end of Build Alternative 4 due to relatively shallow bedrock and deep groundwater (Figure 3.11-3). Specifically, liquefaction is unlikely to low at the site for the proposed arch bridge at STA #163 that spans between STA #157 and #169. Additionally, seismic dry sand settlement is not anticipated due to the limited depth of colluvial and surficial debris over bedrock. The potential for liquefaction and seismic settlement in the area at Temescal Creek, in the area east of Lake Mathews near Cajalco Creek, and at the proposed replacement of Bridge No. 56C-0196 at STA #935 west of I-215 would be the same under Build Alternative 4 as those described above for Build Alternative 1. The area of MWD's Detention Basin and Sedimentation Basin west of Harley John Road, and at the proposed new bridge over the spillway between the two basins at STA #565, may be susceptible to seismic settlement and liquefaction due to loose soil conditions and shallow groundwater. The proposed project includes Standard Project Measures **PF GEO-2** and **PF GEO-3** that would be employed during the PS&E phase of the project to confirm specific excavation and stabilization techniques for each bridge location based on the results of testing.

Surface Drainage

Surface flow generally drains toward the center of the main stream and northwest away from proposed bridge at STA #145 along a realigned segment of La Sierra Avenue west of existing La Sierra Avenue (refer to Figure 3.10-1). The drainage initiates locally within the foothills and meanders northwest to Cajalco Canyon approximately 0.5 mile away. Surface water is anticipated to flow seasonally within the natural drainage.

At the proposed bridge site at STA #179, surface flow generally drains toward the center of the main stream and southwest away from the site. It is located along a realigned segment of La Sierra Avenue west of existing La Sierra Avenue (refer to Figure 3.10-1). The drainage initiates locally within the foothills and flows south to Cajalco Canyon. Surface water is anticipated to pool seasonally within the drainage, and flooding may occur during rainstorm events. Lake Mathews Spillway events would also drain across the site. Surface water is anticipated to flow intermittently during rainy seasons within the natural drainage.

Impacts on surface drainage at Temescal Creek, in the area east of Lake Mathews, at the location of the proposed new bridge at STA #740, and at the location of the proposed replacement of Bridge No. 56C-0196 at STA #935 west of I-215 would be the same as those described above for Build Alternative 1. Impacts on surface waters, and related avoidance and minimization measures, are discussed in Section 3.10, *Water Quality*.

Groundwater

The permanent groundwater table is not anticipated to be encountered at the locations of the proposed new bridge at STA #145, the proposed arch bridge at STA #163, and the proposed bridge at STA #179 because the area in the western part of the alignment is underlain by non-water-bearing Cretaceous monzogranite rock. However, perched water may be present in isolated fracture zones and along colluvial soils contact. Water is anticipated to flow and pool seasonally within the drainages. Therefore, groundwater should be anticipated during excavation for structure footing installation and dewatering, or other measures may be required.

Groundwater impacts at Temescal Creek and at the east end of the project alignment would be the same as those described above for Build Alternative 1. The proposed project includes Standard Project Measures **PF GEO-1** through **PF GEO-3** that would specify appropriate excavation and stabilization techniques.

Soils

Surface soils within the project area include artificial fill, colluvial soils, Holocene alluvium, Pleistocene older alluvium and fan deposits, Tertiary sandstone and siltstone, Mesozoic plutonic and volcanic rocks, and Mesozoic metamorphic rocks.

Foundation

Based on site reconnaissance and published geology maps of the proposed site of the new bridge at STA #145, shallow bedrock is anticipated at about 5 feet below the existing ground. It is proposed that the original grade would be raised and the footings would be placed on compacted fill materials. Due to the lack of liquefaction and settlement potential, the structure would be supported on shallow spread footing foundations, provided that the fill materials are properly compacted. In general, use of spread footings may be more economical than use of deep foundations. Use of spread footings is allowed for this structure in accordance with Caltrans Bridge Memo to Designers 5-1.

Shallow bedrock is anticipated at about 5 feet below the existing ground at the site for the proposed bridge at STA #179. The footings are proposed to be 10 to 15 feet below the existing ground surface. Due to high anticipated bearing capacity and low compressibility of bedrock materials, the bridge structure would be supported on shallow spread footing foundations founded in bedrock materials. This option would be more economical than using deep foundations. Use of spread footings is allowed for this structure in accordance with Caltrans Bridge Memo to Designers 5-1.

In the event that deep colluvial debris is present, CIDH piles socketing into the bedrock could be considered for the proposed new bridges at STA #145 and #179. Driven piles are not recommended due to anticipated hard driving conditions.

Foundation types and any stabilization techniques would be confirmed for the bridges proposed at STA #145, #163, and #179 prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5,** during the PS&E phase of the project for construction, foundation, and structure recommendations.

Soil impacts for the area at Temescal Creek, at the east end of the alignment at the proposed new bridge at STA #740, and the location of the proposed replacement of Bridge No. 56C-0196 at STA #935 west of I-215 would be the same as those described above for Build Alternative 1.

Cut Slope

Slope stability for the proposed arch bridge between STA #157 and #169 (Bridge #163) would be evaluated during final design through Standard Project Measure **PF GEO-2**, and additional recommendations applied during the PS&E phase.

Mineral Resources

Permanent impacts on mineral resources associated with replacement of the Temescal Creek Bridge, including roadbed widening, bridge embankments, and fill, would be the same as those described under Build Alternative 1.

Natural Landmarks and Landforms

Landform alterations as a result of Build Alternative 4 would be similar to those identified for Build Alternative 1. Even though slopes would be designed to appear more natural, Measure **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project) would be applied to ensure landform impacts are minimized and the resulting appearance is similar to the surrounding landscape. Refer to Section 3.7, *Visual/Aesthetics*, for the complete text of Mitigation Measure **VIS-2**.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is expected that the new lanes would be exposed to the same seismic hazards as the proposed project described under Build Alternative 4, above. It is also anticipated that geotechnical evaluations would be required to evaluate impacts resulting from any excavation, cuts, and fill required.

Lake Mathews MSHCP (Build Alternative 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to allow for construction of the proposed project, which would result in exposure of transportation facilities and structures to potential seismic activity. The proposed project would also result in the excavation, grading, cut, and fill of soils and rock within the LM

MSHCP area. The proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology. Through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-5**, the proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology.

No-Build Alternative

Under the No-Build Alternative, no permanent effects involving geology, erosion, soils, seismicity, topography, or mineral resources would occur.

3.11.3.2 Temporary Impacts

Build Alternative 1 – Cajalco Alignment

Soils and Settlement

Sandy soils found in various areas of the project can be easily erodible, and erosion could occur during construction. Development of the roadway would cause groundbreaking and vegetation removal during construction. As a result, soil could be exposed to rain and wind, potentially causing accelerated erosion and deposition from the project site. Minor settlement (up to a few inches) may be anticipated after the placement of embankment fill on sandy soils within the project area. Subgrade preparation, including removal and/or recompaction of unsuitable materials, should be performed in accordance with Caltrans Standard Specifications prior to placing fill. Settlement is expected to be primarily elastic and occur within a few weeks of placing the embankment. No long-term consolidation is expected. The proposed project includes Standard Project Measures **PF WQ-4** (Storm Water Pollution Prevention Plan) and **PF GEO-1** through **PF GEO-3** to prevent construction pollutants from contacting stormwater with the intent of keeping all products of erosion from moving off site into receiving waters, and to prevent any adverse effects related to settlement. A settlement waiting period, if needed, should be recommended at the PS&E stage. No adverse effects are anticipated.

Cut Slope and Excavation Technique

Any temporary cuts for the proposed project would be safely sloped in accordance with Occupational Safety and Health Administration (OSHA) guidelines, or properly shored.

Relatively hard rock is anticipated during construction of the bridge proposed at STA #110, and blasting may be required to facilitate excavation for footing installation.

Surficial soils should be readily excavated with conventional grading equipment for proposed Bridges Nos. 268 and 267. Tertiary Lake Mathews formation would likely be rippable but may contain cemented zones and require heavy ripping. The granitic rock may consist of relatively hard rock, and blasting may be required. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Since geologic conditions at proposed new bridge at STA #242 are Tertiary-age soft rock, they are likely rippable, but hard ripping and cemented zones may be encountered, or harder non-

rippable rock may be present at shallow depths. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Structure Foundations

Temporary excavations would be required for installation of spread footing foundations for the proposed new bridge at STA #110 in the western end of the project. Since the majority of the footings are in deep cut in rock materials, competent subgrade conditions are anticipated. However, in the vicinity of the steep descending slope, less competent soils or rock could be present below footings. If loose or otherwise unsuitable materials are present below foundation level, limited overexcavation and replacement with lean concrete slurry may be needed to transmit foundation loads to competent soils. Excavation and stabilization techniques and foundation type would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Temporary excavations would be required for installation of foundations for Bridge No. 268, south of Lake Mathews. If loose or otherwise unsuitable materials are encountered (highly unlikely if fill materials are placed properly) below foundation level, limited overexcavation and replacement with lean concrete slurry may be needed to transmit foundation loads to competent soils.

Temporary excavations and possibly limited dewatering may be required for installation of spread footing foundations for the proposed new bridge at STA #740 in the eastern end of the project area. If loose materials are present below foundation level, overexcavation to competent bearing materials and backfill with lean concrete slurry up to bottom of footing would be recommended to transfer structural loads to competent bearing materials. The need for foundation overexcavation or use of deep foundations should be addressed in the Foundation Report after performing the PS&E level investigation. Foundation type and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Mineral Resources

Temporary impacts associated with replacement of the Temescal Creek Bridge, including grading and construction easements, would affect approximately 0.5 acre of land classified as MRZ-2. A portion of the land classified MRZ-2 is within the streambed of Temescal Creek and subject to environmental regulations that limit mineral resource extraction activities. It is also under resource protection under the Riverside-Corona Resource Conservation District. Therefore, the project would not affect the viability of the area for continued or future mining extraction.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

For the future six-lane Cajalco Road facility, construction is not currently proposed as part of the project. However, if constructed in the future, it is anticipated that that there would be similar temporary impacts as for the proposed project in terms of disturbing soil through grading, excavation, and cutting and filling. It is anticipated that all earthwork and ground disturbance would be conducted in accordance with all applicable state and local regulations.

Lake Mathews MSHCP

As discussed above, a discretionary action coordinated between the County and LM MSHCP responsible parties would be required, to allow for construction of the proposed project, which would result in potential temporary impacts related to excavation, grading, cut, and fill of soils and rock within the MSHCP area. The proposed project would be constructed and developed in a manner to minimize temporary impacts from seismic hazards as well as to minimize impacts on the surrounding soils and geology due excavation, grading, cut, and fill of soils and rock within the MSHCP area. Through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-3**, the proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology.

Build Alternative 2C – Modified Cajalco Alignment

Soils and Settlement

Temporary impacts related to soils and settlement under Build Alternative 2C would be the same as those discussed under Build Alternative 1, above. Near-surface slope stability and techniques to address any unstable near-surface materials as well as foundation type selection would be addressed prior to construction through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-3**.

Cut Slope and Embankments

Any temporary cuts for the proposed project shall be safely sloped in accordance with OSHA guidelines, or properly shored.

As discussed above under Build Alternative 1, structure approach embankment is that portion of the fill material within approximately 150 feet longitudinally of the structure in accordance with Figure 208.11 of the Highway Design Manual and will be treated in accordance with the Standard Specifications discussed above. The approach fill embankments for proposed new bridges at STA #242 and 267 would be retained by retaining walls up to about 20 to 25 feet in height and 25 to 30 feet in height, respectively. Appropriate backfill materials would be used in accordance with Caltrans standards.

Loose colluvium and surficial soil cover at least several feet in thickness were observed during site reconnaissance for the proposed new bridge site at STA #242. Colluvial and surficial debris covering up to 5 to 10 feet thick overlying bedrock was observed at the site for the proposed new bridge at STA #267. Subgrade preparation, including removal and/or recompaction of unsuitable soils, shall be performed in accordance with Caltrans standards prior to placing fill. It is not known at this time what type of embankments would be needed for the proposed bridge at STA #173. Foundation type and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Temporary impacts associated with the east end of the project, including the proposed new bridge at STA #740, and the replacement of Bridge No. 56C-0196 at STA #935, west of I-215 are discussed above under Build Alternative 1.

Excavation Technique

Relatively hard rock could be encountered during construction of the proposed bridge near STA #173, and blasting may be required to facilitate excavation for footing installation. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Surficial soils should be readily excavated with conventional grading equipment for proposed Bridge No. 267. Tertiary Lake Mathews formation would likely be rippable but may contain cemented zones and require heavy ripping. The granitic rock may consist of relatively hard rock, and blasting could be required. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Because site materials at the proposed bridge site at STA #242 are Tertiary-age soft rock, they are likely rippable, but hard ripping and cemented zones may be encountered, or harder non-rippable rock may be present at shallow depths. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Structure Foundations

Temporary excavations would be required for installation of spread footing foundations for proposed new bridges at STA #242 and 267. Since the proposed footings are in bedrock or Tertiary-age soft rock materials, competent subgrade conditions are anticipated. If loose or otherwise unsuitable materials are present below foundation level, limited overexcavation and replacement with lean concrete slurry may be needed to transmit foundation loads to competent soils. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

It is not known at this time what type of structure foundations would be needed for the proposed bridge at STA #173; however, it is anticipated that, similar to the proposed new bridges at STA #242 and #267, temporary excavations would be required for installation of spread footing foundations. Foundation type and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Temporary impacts associated with the east end of the project, including proposed new bridge located at STA #740, and proposed replacement of Bridge No. 56C-0196 at STA #935, west of I-215 are discussed above, under Build Alternative 1.

Mineral Resources

Temporary impacts associated with replacement of the Temescal Creek Bridge, including grading and construction easements, would be the same as those described under Build Alternative 1.

Future Six-Lane Facility (Build Alternative 2C)

Temporary impacts associated with the future six-lane Cajalco Road facility would be the same as those discussed under Build Alternative 1.

Lake Mathews MSHCP (Build Alternative 2C)

Temporary impacts within the LM MSHCP area would be the same as those discussed under Build Alternative 1. Through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-5**, the proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology.

Build Alternative 4 – El Sobrante Alignment

Soils and Settlement

Temporary impacts related to soils and settlement under Build Alternative 4 would be the same as those discussed under Build Alternative 1. Near-surface slope stability and techniques to address any unstable near-surface materials as well as foundation type selection would be addressed prior to construction through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Cut Slope and Embankments

Any temporary cuts for the proposed project shall be safely sloped in accordance with OSHA guidelines, or properly shored.

As discussed above under Build Alternative 1, structure approach embankment is that portion of the fill material within approximately 150 feet longitudinally of the structure in accordance with Figure 208.11 of the Highway Design Manual and will be treated in accordance with the Standard Specifications discussed above. The approach fill embankments near the abutments for proposed new bridge site at STA #145 would be retained by wing walls up to about 30 feet in height. The compacted fill materials would be sloped at 2:1 (horizontal:vertical) inclination around the abutment and wing walls. The approach fill embankments for the proposed new bridge site at STA #179 would be retained by retaining walls up to about 20 feet in height. Appropriate backfill materials would be used in accordance with Caltrans standards.

Colluvial and surficial debris of about 5 feet in thickness overlying bedrock is expected. Minor settlement (up to a few inches) may occur. The settlement would be primarily elastic and would occur within a few weeks of placing the embankment. No long-term consolidation is expected.

Foundation type and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Temporary impacts associated with the east end of the project, including the proposed new bridge at STA #740, and the replacement of Bridge No. 56C-0196 at STA #935, west of I-215 are discussed above under Build Alternative 1.

Excavation Technique

Relatively hard rock is anticipated during construction of new bridges proposed at STA #145, #179, and the proposed arch bridge at STA #163; blasting may be required to facilitate excavation for footing installation. Excavation and stabilization techniques would be employed

as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Temporary impacts associated with the east end of the project, including the proposed new bridge at STA #740, and replacement of Bridge No. 56C-0196 at STA #935, west of I-215 are discussed above under Build Alternative 1. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Structure Foundations

Temporary excavations would be required for installation of spread footing foundations for new bridges proposed at STA #145 and #179. If loose or otherwise unsuitable materials are present below foundation level, limited overexcavation and replacement with lean concrete slurry may be needed to transmit foundation loads to competent soils. Excavation and stabilization techniques would be employed as appropriate based on the recommendations identified through Standard Project Measures **PF GEO-2** and **PF GEO-3**.

Temporary excavations would be required for installation of spread footing foundations. Foundation type and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-5**.

Temporary impacts associated with the east end of the project, including proposed new bridge at STA #740 and the replacement of Bridge No. 56C-0196 at STA #935, west of I-215 are discussed above under Build Alternative 1.

Mineral Resources

Temporary impacts associated with replacement of the Temescal Creek Bridge, including grading and construction easements, would be the same as those described under Build Alternative 1.

Future Six-Lane Facility (Build Alternative 4)

Temporary impacts associated with the future six-lane Cajalco Road facility would be the same as those discussed under Build Alternative 1.

Lake Mathews MSHCP (Build Alternative 4)

Temporary impacts within the LM MSHCP area would be the same as those discussed under Build Alternative 1. Through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-5**, the proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology.

No-Build Alternative

Under the No-Build Alternative, no temporary effects involving geology, erosion, soils, seismicity, topography, or mineral resources would occur.

3.11.4 Avoidance, Minimization, and/or Mitigation Measures

No additional avoidance, minimization, and/ or mitigation measures related to geology and soils are required beyond the standard measures discussed above in the Environmental Consequences section.

[This page left blank intentionally.]

3.12 Paleontology

3.12.1 Regulatory Setting

Paleontology is a natural science focused on the study of ancient animal and plant life as it is preserved in the geologic record as fossils. A number of federal statutes specifically address paleontological resources, their treatment, and funding for mitigation as a part of federally authorized projects. 16 United States Code (USC) 431-433 (the "Antiquities Act") prohibits appropriating, excavating, injuring, or destroying any object of antiquity situated on federal land without the permission of the Secretary of the Department of Government having jurisdiction over the land. Fossils are considered "objects of antiquity" by the Bureau of Land Management, the National Park Service, the Forest Service, and other federal agencies. 16 United States Code (USC) 461-467 established the National Natural Landmarks (NNL) program. Under this program property owners agree to protect biological and geological resources such as paleontological features. Federal agencies and their agents must consider the existence and location of designated NNLs, and of areas found to meet the criteria for national significance, in assessing the effects of their activities on the environment under NEPA. 16 United States Code (USC) 470aaa (the Paleontological Resources Preservation Act) prohibits the excavation, removal, or damage of any paleontological resources located on federal land under the jurisdiction of the Secretaries of the Interior or Agriculture without first obtaining an appropriate permit. The statute establishes criminal and civil penalties for fossil theft and vandalism on federal lands. 23 United States Code (USC) 1.9(a) requires that the use of Federal-aid funds must be in conformity with all federal and state laws. 23 United States Code (USC) 305 authorizes the appropriation and use of federal highway funds for paleontological salvage as necessary by the highway department of any state, in compliance with 16 USC 431-433 above and state law.

Under California law, paleontological resources are protected by the California Environmental Quality Act (CEQA).

3.12.2 Affected Environment

The information from this section was synthesized from the *Paleontological Technical Memorandum for the Cajalco Road Widening and Safety Enhancement Project* (County 2019).

The project is located within the extreme northern portion of the Peninsular Ranges Geomorphic Province, near the boundary with the Transverse Ranges Province to the north. The Peninsular Ranges Province is characterized by a series of generally northwest-trending mountain ranges and intervening valleys. Extensive folding and faulting within the province has created this northwest-trending fabric evident throughout the province. The majority of the Peninsular Ranges Province is characterized by Mesozoic to Paleozoic age granitic and metamorphic bedrock and includes the Perris Block and Elsinore Trough.

The Perris Block is located between the northwest-trending San Jacinto Fault to the east and the northwest trending Elsinore Fault Zone to the west. The surface of the block consists of granitic exposure and has been tectonically tilted eastward. This has left granitic outcrops elevated and exposed on the west side of the block, allowing Pleistocene sediments to cover the east side. This suggests that the block tilted eastward prior to middle or late Pleistocene time.

The Elsinore Trough is a zone of faulting between the Santa Ana Mountains to the west and south and the Perris Block to the east. Erosion along the fault zone created a trough or valley at low elevations. The northern end of the trough drains to the Santa Ana River and then the Pacific Ocean. The southern end drains into the internal basin of Lake Elsinore.

3.12.2.1 Stratigraphy

Research and mapping of the project area and an area within a 2-mile radius of the build alternatives' alignments was conducted to verify the location and extent of sedimentary formations. The record of sedimentary deposition in the northwestern Peninsular Range Province begins in the late Paleozoic and Mesozoic eras and continues through the Cenozoic period.

The westernmost end of the project area is located in the Elsinore Trough, which is the valley area between the Santa Ana Mountains to the west and foothills to the east, through which Interstate 15 (I-15) and Temescal Wash pass. This area contains early Tertiary deposits. These include the Paleocene Silverado Formation, the Eocene Santiago Formation, the Oligocene to early Miocene Sespe/Vaqueros Formations, the early Miocene Topanga Formation, all members of the Puente Formation, and the Pliocene Fernando Formation.

Once in and beyond the foothills, the majority of the project is located within the Perris Block. The Perris Block is underlain by lithologically diverse prebatholithic and metasedimentary rocks intruded by Cretaceous plutons of the Peninsular Ranges Batholith. Several erosion and deposition surfaces are developed on the Perris Block, and thin to relatively thick sections of Paleocene to mainly Quaternary sediments discontinuously cover the basement rocks. Typically, the broad valley areas are infilled with younger alluvial outwash derived from the surrounding mountain ranges. Quaternary sediments are underlain by Tertiary deposits, including the Paleocene Silverado Formation, Early Miocene Topanga Formation, Middle Miocene Lake Mathews Formation, Upper Miocene Puente Formation, Pliocene Fernando Formation, and Latest Pliocene to Pleistocene deposits.

Table 3.12-1 provides a listing of the sedimentary formations within the larger search area, along with their age and general location. Figure 3.11-1 in Section 3.11 (*Geology/Soils/Seismicity/ Topography*) is a map showing the location of geologic formations relative to the project alternatives.

Table 3.12-1. Sedimentary Formations within 2-Mile Radius

Age (Youngest-Oldest)	Fm	Name	General Location

Stratigraphically, the most sensitive formations within the search area are, from oldest to youngest, the Paleocene Silverado Formation, Early Miocene Topanga Formation, Middle Miocene Lake Mathews Formation, Upper Miocene Puente Formation, Pliocene Fernando Formation, and Latest Pliocene to Pleistocene deposits combined.

The Silverado Formation is located in the western end of the project near Temescal Canyon. It consists of about 1,490 feet of sediments that were deposited in marine, brackish water, and terrestrial depositional environments. This formation has been known to contain extinct significant plant fossils of fossil wood, roots, leaf, spores, and pollen.

Miocene age units of the Topanga, Lake Mathews and Puente Formations have been known to contain important paleontological resources. The Topanga Formation is located northwest of the project limits, along I-15 near El Cerrito Road. It is very fossiliferous and contains substantial important marine vertebrates, invertebrates, and terrestrial plant fossils.

The Lake Mathews Formation crops out on the northeastern side and the southern side of Lake Mathews. It contains important vertebrate fossils of the Clarendonian Land Mammal Age, such as oredonts, gophers, camels, javelinas, ground squirrels, and deer mice. This is the only known deposit on the Perris Block of the northern Peninsular Range Geologic Province to produce fossils and provide local environmental data in the period between the end of the Cretaceous (65 million years ago) and the early Pliocene (4 million years ago) (Lander and Whistler 2002). Several fossil localities are from within and near to the study area.

The Puente Formation is located north of the project, near El Cerrito and west of I-15. It is composed of marine sandstone shales and siltstone and contains marine fossil of whales, fish, marine turtles, sharks, bony fishes, pelecypods, and land plants, as well as marine algae (micro fossils). It also contains important land mammals such as rhinoceros, camel, and elephant.

The Pliocene Fernando Formation is located west of I-15 and yields significant paleontological resources. Pliocene-Pleistocene Quaternary deposits also yield important paleontological resources such as fossil reptiles, birds, and land mammals.

3.12.2.2 Paleontological Sensitivity

Paleontological resources are considered to be important if they provide new data on fossil animals, distribution, evolution, or other scientifically important information as stated previously. The California Department of Transportation (Caltrans) uses a tripartite scale to characterize paleontological sensitivity (see Table 3.12-2). Figure 3.12-1 shows the locations within the project area that have low paleontological sensitivity and high paleontological sensitivity at surface and at depth (more than 1 meter, or approximately 3.3 feet below ground surface [bgs]).

Table 3.12-2. Paleontology Sensitivity Scale

Caltrans Sensitivity Designation	Characteristics of Geologic Units in this Category
High Potential (High Sensitivity)	This category consists of rock units known to contain significant vertebrate, invertebrate, or plant fossils anywhere within their geographic extent, including sedimentary rock units that are suitable for the preservation of fossils, as well as some volcanic and low-grade metamorphic rock units. This category includes rock units with the potential to contain: • abundant vertebrate fossils; • a few significant vertebrate, invertebrate, or plant fossils that may provide new and significant taxonomic, phylogenetic, ecological, and/or stratigraphic data; • areas that may contain datable organic remains older than Recent; • areas that may contain unique new vertebrate deposits, traces, and/or trackways; and • fossiliferous deposits with very limited geographic extent or an uncommon origin (e.g., tar pits and cave deposits).
Low Potential (Low Sensitivity)	This category includes sedimentary rock units that • are potentially fossiliferous, but have not yielded significant fossils in the past; • have not yet yielded fossils, but have the potential to contain fossil remains; or • contain common and/or widespread invertebrate fossils of species whose taxonomy, phylogeny, and ecology are well understood.
No Potential (No Sensitivity)	This category includes rock units of intrusive igneous origin, most extrusive igneous rocks, and moderate- to high-grade metamorphic rocks.
Note: Sedimentary rocks expected to contain vertebrate fossils are considered highly sensitive, because vertebrates are generally rare and found in more localized strata.	

Based on the characteristics described in Table 3.12-2, the geologic units within the project study area that have high sensitivity include the Silverado Formation, Topanga Formation, Lake Mathews Formation, Puente Formation, Fernando Formation, and late Pliocene to Pleistocene deposits.

3.12.2.3 Records Search and Field Reconnaissance

Paleontological and geological records searches included the U.S. Geological Survey, Map and Earth Sciences Library, online searches via the U.C. Museum of Paleontology, Berkeley database and San Jose State University MLK library. In addition, an extensive library, literature, and map search was conducted at the University of California Berkeley Map and Earth Sciences library on August 12, 2016, and the U.S. Geological Survey on December 15, 2016.

According to the search, fossil localities have been found in the larger search area in the Silverado Formation, Topanga Formation, Puente Formation, Fernando Formation, and Late Pliocene to Pleistocene deposits. Four fossil localities were found within the Lake Mathews Formation within the project area. These sites contained the bones, teeth, and fragments of large mammals, including camel, oredont, and felid; small mammals; and a tapir dentition. One fossil locality containing a horse ulna was found in the Late Pleistocene alluvium within the project area.

A pedestrian inspection of the project limits of disturbance for evidence of paleontological resources was conducted between June 2016 and October 2018. In addition, an Extended Phase I study for cultural resources, which included approximately 66 Shovel Test Probes (STPs), was performed in three geographical areas within the project limits between August 16 and September 6, 2018, and on October 18, 2018. The STPs were excavated to a depth of 1 meter (approximately 3.3 feet) below ground surface (bgs), or until granite bedrock was encountered. Although these excavations were related to cultural resources evaluations, no evidence of fossils was observed or encountered during the pedestrian inspection or the STPs.

3.12.2.4 Lake Mathews Habitat Conservation Plan Area

The project corridor travels through the Lake Mathews Multiple Species Reserve (LMR), owned by the Metropolitan Water District of Southern California (MWD), and managed by MWD, California Department of Fish and Wildlife (CDFW), U.S. Fish and Wildlife Service (USFWS), and Riverside County Habitat Conservation Agency (RCHCA) under a Cooperative Management Agreement. The LMR was established under the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP). The project corridor specifically travels through parcels of land that are owned by the MWD and RCHCA. Much of the land surrounding Lake Mathews is undeveloped because these lands are protected by the LMR.

The Lake Mathews Formation and Late Pleistocene deposits, which are both sensitive for paleontological resources, are located within the LM MSHCP area. Several fossil localities have been found in portions of the Lake Mathews Formation and Late Pleistocene deposits located within the LM MSHCP area and within or immediately adjacent to the Build Alternative alignments, as discussed below.

3.12.3 Environmental Consequences

3.12.3.1 Build Alternatives 1 and 2C – Cajalco Alignment and Modified Cajalco Alignment

In the west end of the project limits, in the vicinity of Temescal Canyon, Build Alternatives 1 and 2C traverse an area of younger alluvial and Pleistocene deposits classified as having high paleontological sensitivity at depth (1 meter, or approximately 3.3 feet bgs), and high paleontological sensitivity at the surface, respectively (Figure 3.12-1). As they continue eastward, both alternatives traverse the Lake Mathews Formation and Pliocene-Pleistocene alluvial deposits located south of Lake Mathews, which are both considered as having high paleontological sensitivity at the surface (Figure 3.12-1). According to the results of the record search, four fossil localities were found within the Lake Mathews Formation traversed by Alternatives 1 and 2C, south of Lake Mathews. These localities could be within or are in close proximity to the two alignments. These sites were found to contain the bones, teeth, and fragments of large mammals, including camel, oredont, and felid; small mammals; and a tapir dentition. One fossil locality, located just east of the El Sobrante and Cajalco Road intersection, was found in Late Pleistocene alluvium, in an area traversed by all Build Alternatives. The site contained the ulna of a horse.

The potential to affect paleontological resources also depends on the depths of proposed earthwork and excavations, previous site disturbances, and the presence of non-fossiliferous sediment. As previously discussed, STPs up to 1 meter (approximately 3.3 feet) in depth were performed in three geographic locations related to cultural resources evaluations. One location was within the limits of disturbance of all three alignments and another was within the limits of disturbance of Build Alternatives 1 and 2C. No evidence of paleontological resources was observed or found during the 1-meter (3.3-foot) STPs.

It is anticipated that ground-disturbing activities for the project east of Lake Mathews Drive may range from 2 to 12 feet in depth, depending on construction activity. Limited locations may require excavating to a depth of up to approximately 50 feet for the installation of utility poles, bridge pilings, and associated activities. West of Lake Mathews Drive, topographical conditions are more varied, and would require deeper excavation for road grading and other construction activities. Within this area, construction depth could reach depths greater than 12 feet, and may require depths up to 100 feet in limited locations for utility poles, bridge pilings, and associated drilling activities.

Both Build Alternatives have the potential to affect sensitive paleontological areas, and areas near where fossils have been discovered. Because their alignments traverse a larger area of sensitive geologic units, Build Alternatives 1 and 2C have the potential to affect a larger sensitive paleontological area than Build Alternative 4. Due to the paleontological sensitivity of the project area, the preparation of a Paleontological Mitigation Plan (PMP) would be required during the final design phase of the project.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road under Build Alternatives 1 and 2C, is not currently proposed as part of the

project. Should the additional lanes be constructed in the future, they would traverse the same highly sensitive areas discussed above and shown on Figure 3.12-1, specifically the alluvial and Pleistocene deposits near Temescal Canyon Road, the Lake Mathews Formation, and the Pliocene-Pleistocene deposits on the east end of the project (Figure 3.11-1 in Section 3.11). However, because these future lanes would be constructed in the median of the roadway, the potential to affect paleontological resources would be reduced, as that area would have already been disturbed by the currently proposed project.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Under Build Alternatives 1 and 2C, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to allow for the proposed project to be constructed. Should either alternative be selected, the impacts on sensitive paleontological resources within the LM MSHCP area would be the same as the impacts discussed above. Protection of paleontological resources is not a listed goal or policy in the LM MSHCP; therefore, these impacts would not affect the intention of the LM MSHCP.

3.12.3.2 Build Alternative 4 – El Sobrante Alignment

Similar to the other two Build Alternatives, Build Alternative 4 crosses an area classified as having high paleontological sensitivity at depth, and an area of high paleontological sensitivity at the surface, in the western end of the project limits just east of Temescal Canyon (Figure 3.12-1). As it continues eastward, Build Alternative 4 avoids the sensitive units to the south of Lake Mathews, but does traverse two Pliocene-Pleistocene alluvial deposits north of Lake Mathews that are considered highly sensitive at the surface (Figure 3.12-1). Build Alternative 4 also traverses two areas of the Lake Mathews Formation located to the northeast of Lake Mathews that are considered highly sensitive at the surface for paleontological resources (Figure 3.12-1). Once Build Alternative 4 reaches the eastern end of Lake Mathews, it follows the same alignment as Build Alternatives 1 and 2C, where they would all affect the same Pliocene-Pleistocene alluvial deposits, which are considered highly sensitive at the surface for paleontological resources (Figure 3.12-1). In this area, one fossil locality, located just east of the El Sobrante and Cajalco Road intersection, was found in Late Pleistocene alluvium. The site contained the ulna of a horse.

The potential to affect paleontological resources also depends on the depths of proposed earthwork and excavations, previous site disturbances, and the presence of non-fossiliferous sediment. As previously discussed, STPs up to 1 meter (approximately 3.3 feet) in depth were performed in three geographic locations. One location was within the limits of disturbance of all three alignments, another was within the limits of disturbance of Alternatives 1 and 2C, and the third was in the limits of disturbance of Build Alternative 4. No evidence of paleontological resources was observed or found during the 1-meter (3.3-foot) test probes.

It is anticipated that ground-disturbing activities for the project east of Lake Mathews Drive may range from 2 to 12 feet in depth, depending on construction activity. Limited locations may require excavating to a depth of up to approximately 50 feet for the installation of utility poles, bridge pilings, and associated activities. West of Lake Mathews Drive, topographical conditions

are more varied, and would require deeper excavation for road leveling and other construction activities. Within this area, construction depth could reach depths greater than 12 feet, and may require depths up to 100 feet in limited locations for utility poles, bridge pilings, and associated drilling activities.

Similar to Build Alternatives 1 and 2C, Build Alternative 4 has the potential to affect sensitive paleontological areas, including one area where a fossil had been found. However, because Build Alternative 4 traverses a smaller area of sensitive geologic units, it has less potential to affect sensitive paleontological areas than Build Alternatives 1 and 2C. Due to the paleontological sensitivity of the project area, the preparation of a PMP would be required during the final design phase of the project.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the median of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. Should the additional lanes be constructed in the future, they would traverse the same highly sensitive areas discussed above and shown on Figure 3.12-1, specifically the alluvial and Pleistocene deposits near Temescal Canyon Road (Figure 3.11-1 in Section 3.11). However, because these future lanes would be constructed in the median of the roadway, the potential to affect paleontological resources would be reduced, as that area would have already been disturbed by the currently proposed project.

Lake Mathews MSHCP (Build Alternative 4)

Under Build Alternative 4, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Under this alternative, portions of La Sierra Avenue and El Sobrante Road would also be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to allow for the proposed project to be constructed. If Build Alternative 4 is selected, the impacts on sensitive paleontological resources within the LM MSHCP area would be the same as the impacts discussed for Build Alternative 4, above. Protection of paleontological resources is not a listed goal or policy in the LM MSHCP; therefore, these impacts would not affect the intention of the LM MSHCP.

3.12.3.3 No-Build Alternative

The No-Build Alternative would not result in impacts on paleontological resources.

3.12.4 Avoidance, Minimization, and/or Mitigation Measures

The following measure would be implemented with the project and would minimize or avoid impacts related to paleontological resources.

PAL-1: Grading, excavation, and other surface and subsurface excavation have the potential to affect nonrenewable paleontological resources. A Paleontological Mitigation Plan (PMP) shall be prepared by a qualified paleontologist in accordance with the California Department of

Transportation (Caltrans), County of Riverside Planning Department, and the Society of Vertebrate Paleontology guidelines during the final design phase of the project. The PMP will detail all the measures to be implemented in the event of paleontological discoveries. The PMP shall include, at a minimum, the following elements.

a) Required 1-hour preconstruction paleontological awareness training for earthmoving personnel, including documentation of training, such as sign-in sheets, and hardhat stickers, to establish communications protocols between construction personnel and the principal paleontologist.

b) There will be a signed repository agreement with an appropriate repository that meets Caltrans requirements and is approved by Caltrans.

c) Monitoring, by a principal paleontologist, of paleontologically sensitive areas in sedimentary deposits during initial and all ground-disturbing activities.

d) Field and laboratory methods that meet the curation requirements of the appropriate repository will be implemented for monitoring, reporting, collection, and curation of collected specimens. Curation requirements are available for public review at the appropriate repository.

e) All elements of the PMP will follow the PMP Format published in the Caltrans Standard Environmental Reference.

f) A Paleontological Mitigation Report (PMR) discussing findings and analysis will be prepared by a principal paleontologist upon completion of project earthmoving. The report will be included in the environmental project file and also submitted to the curation facility.

[This page left blank intentionally.]

3.13 Hazardous Waste/Materials

3.13.1 Regulatory Setting

Hazardous materials, including hazardous substances and wastes, are regulated by many state and federal laws. Statutes govern the generation, treatment, storage, and disposal of hazardous materials, substances, and waste, and also the investigation and mitigation of waste releases, air and water quality, human health, and land use.

The primary federal laws regulating hazardous wastes/materials are the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, and the Resource Conservation and Recovery Act (RCRA) of 1976. The purpose of CERCLA, often referred to as "Superfund," is to identify and cleanup abandoned contaminated sites so that public health and welfare are not compromised. The RCRA provides for "cradle to grave" regulation of hazardous waste generated by operating entities. Other federal laws include:

- Community Environmental Response Facilitation Act (CERFA) of 1992
- Clean Water Act
- Clean Air Act
- Safe Drinking Water Act
- Occupational Safety and Health Act (OSHA)
- Atomic Energy Act
- Toxic Substances Control Act (TSCA)
- Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)

In addition to the acts listed above, Executive Order (EO) 12088, *Federal Compliance with Pollution Control Standards*, mandates that necessary actions be taken to prevent and control environmental pollution when federal activities or federal facilities are involved.

California regulates hazardous materials, waste, and substances under the authority of the CA Health and Safety Code and is also authorized by the federal government to implement RCRA in the state. California law also addresses specific handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning of hazardous waste. The Porter-Cologne Water Quality Control Act also restricts disposal of wastes and requires cleanup of wastes that are below hazardous waste concentrations but could impact ground and surface water quality. California regulations that address waste management and prevention and cleanup of contamination include Title 22 Division 4.5 Environmental Health Standards for the Management of Hazardous Waste, Title 23 Waters, and Title 27 Environmental Protection.

Worker and public health and safety are key issues when addressing hazardous materials that may affect human health and the environment. Proper management and disposal of hazardous material is vital if it is found, disturbed, or generated during project construction.

3.13.2 Affected Environment

The proposed project covers a distance of approximately 16 miles and features the widening of Cajalco Road, or combination of Cajalco Road and El Sobrante Road, between Temescal Canyon Road and the Interstate 215 (I-215) southbound ramps and in the County of Riverside.

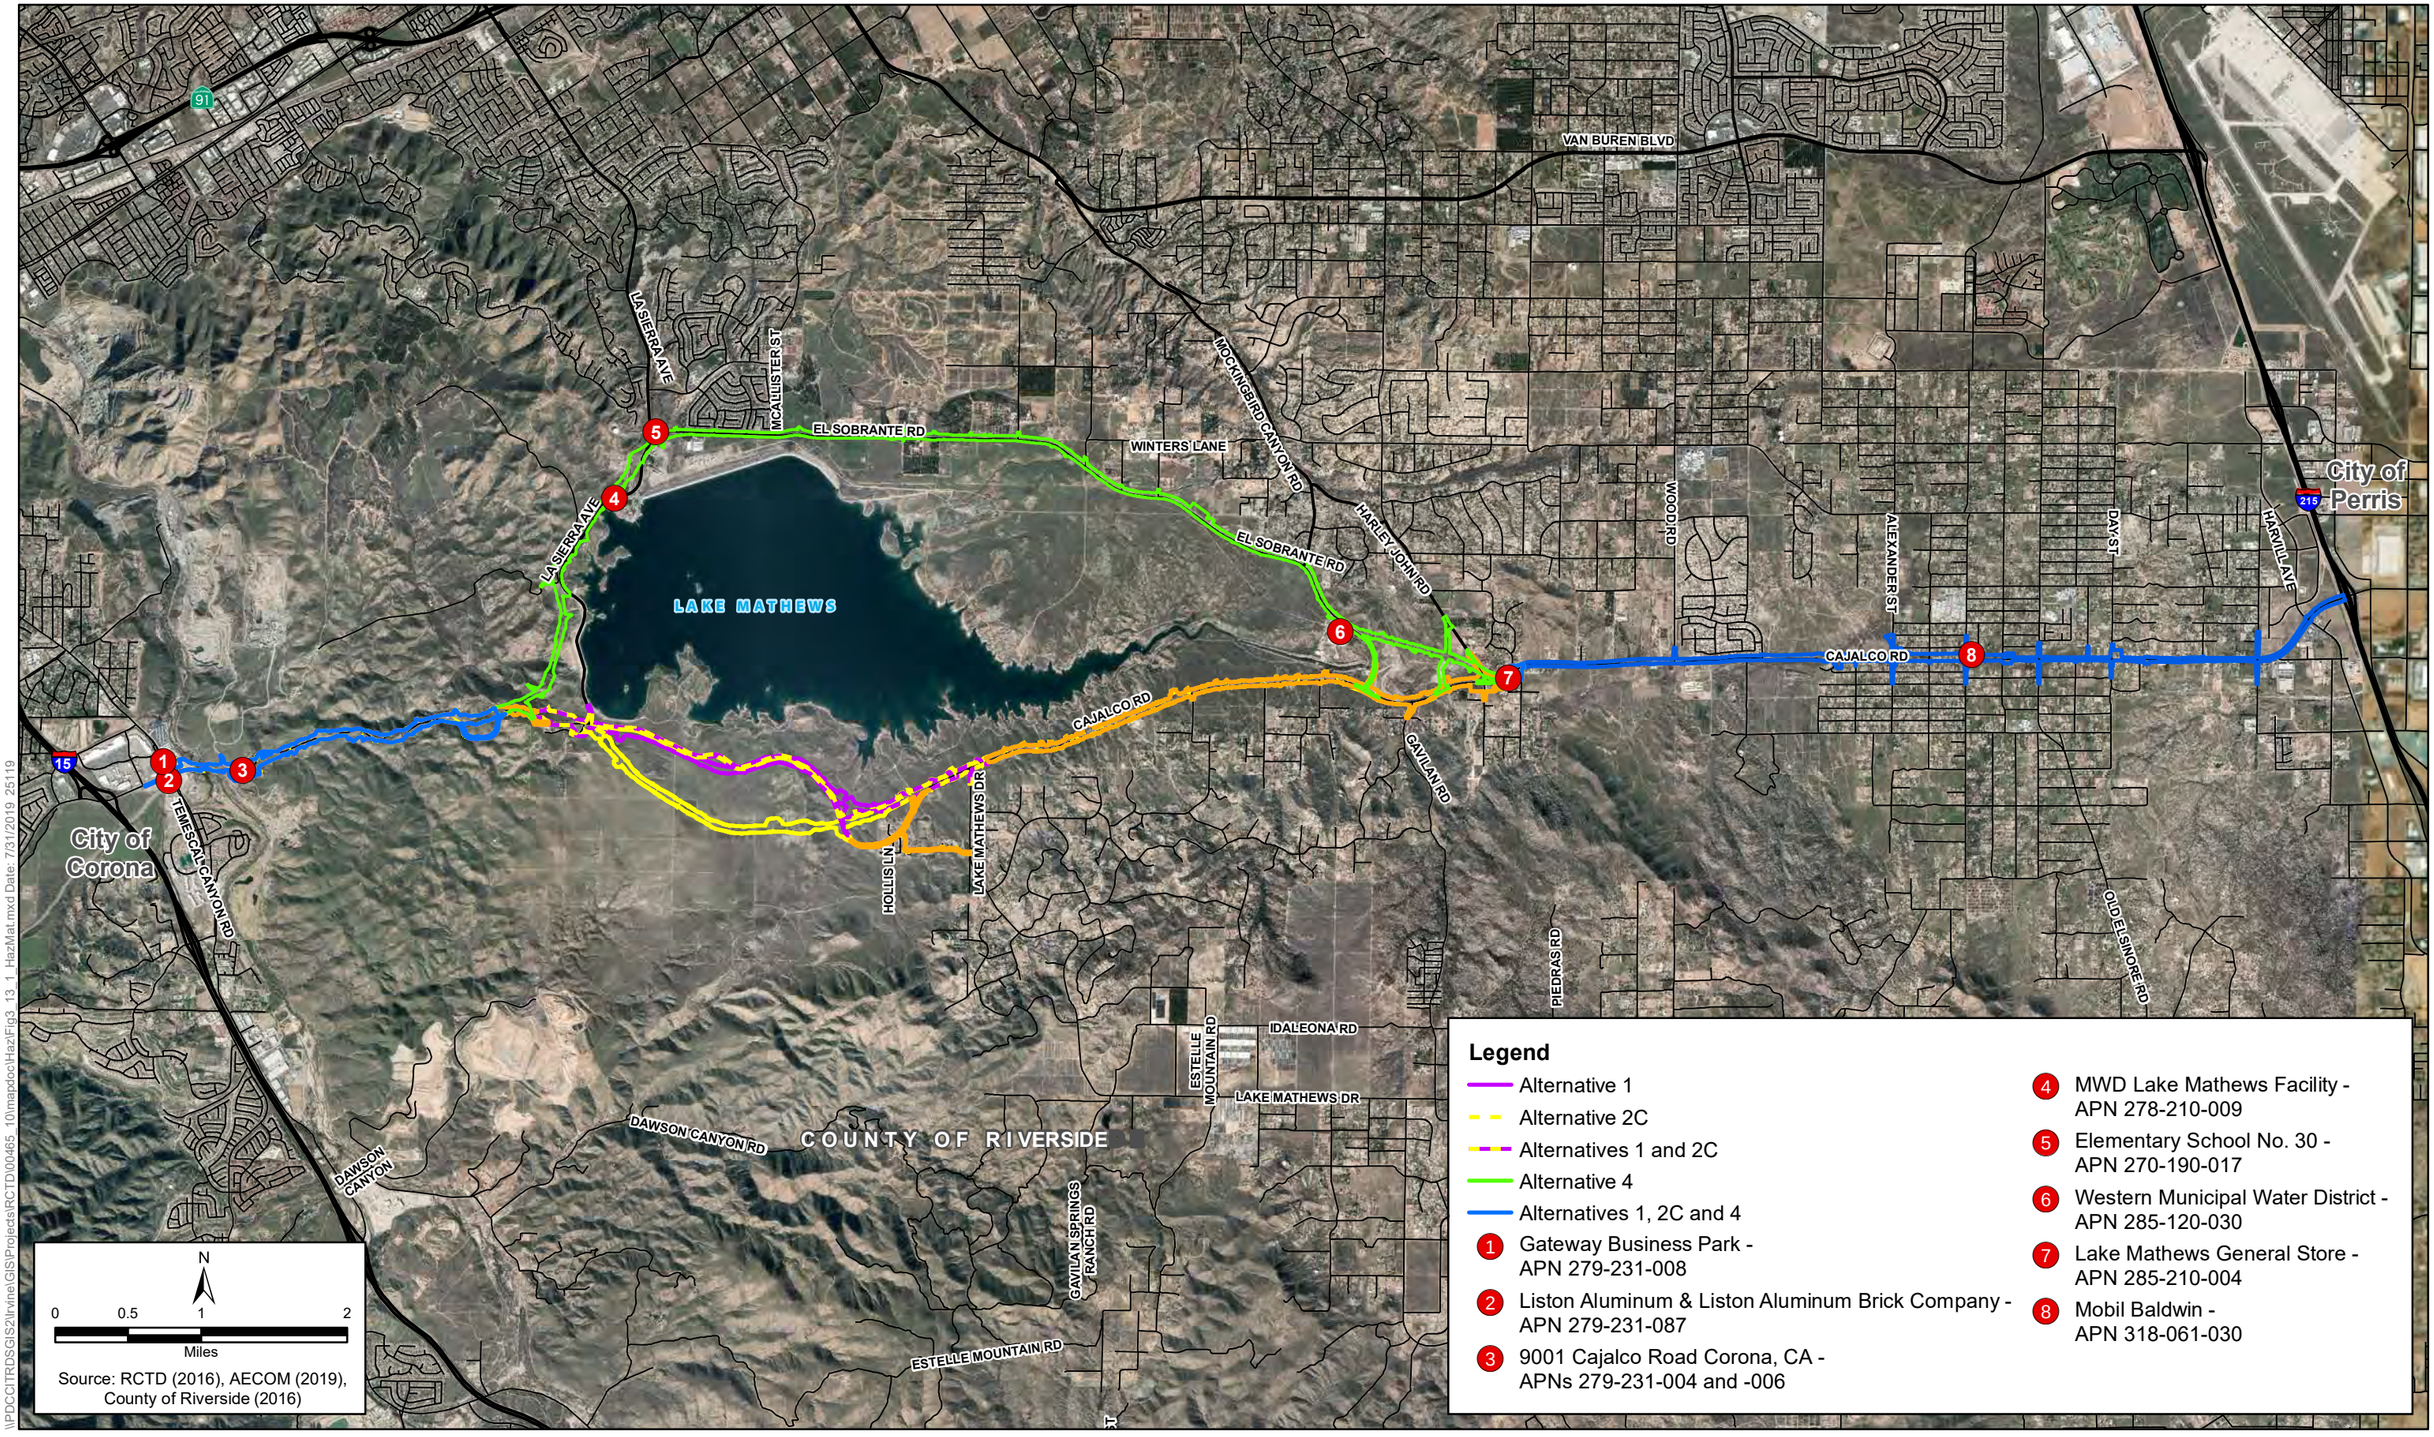
The information presented in this section is based on the project-specific *Cajalco Road Widening and Safety Enhancement Project Initial Site Assessment* (Caltrans 2020a); *Preliminary Site Investigation*, *Cajalco Road Widening and Safety Enhancement, Riverside County, California* (Caltrans 2020b); the *Aerially Deposited Lead Site Investigation Work Plan, Cajalco Road Widening and Safety Enhancement Project, Riverside County*, *California* (Caltrans 2017a); and the *Aerially Deposited Lead (ADL) Investigation, Cajalco Road Widening and Safety Enhancement Project, Riverside County, California* (Caltrans 2017b).

The purpose of the Initial Site Assessment (ISA) was to review, evaluate, and document present and past land uses and practices, and visually examine on-site conditions to identify the following:

- Recognized Environmental Conditions (RECs) – Defined as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property.
- Historical Recognized Environmental Conditions (HRECs) – Defined as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (American Standard Testing Methods Standard 1527-13).
- Areas of Concern (AOCs) – AOCs are not considered RECs, but require consideration during construction or further investigation.

The purpose of the Preliminary Site Investigation (PSI) was to further investigate site conditions of RECs identified in the ISA, provide an evaluation of their current environmental/hazardous waste conditions, and describe the potential effects of existing contamination on proposed construction activities within these properties.

The ISA identified two RECs, one HREC, and five AOCs within 500 feet of the project limits. A PSI was conducted for the two RECs located at 9001 Cajalco Road, Corona, and at 21020 Cajalco Road, Perris. Refer to Figure 3.13-1 on the following page for locations of the RECs, HREC, and AOCs.



\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\HazFig3_13_1_HazMat.mxd Date: 7/31/2019, 25119

Figure 3.13-1
Documented Hazardous Materials Sites
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

3.13.2.1 Recognized Environmental Conditions

9001 Cajalco Road, Corona (Map ID #3). This site is south of the Cajalco Road/Eagle Canyon Road intersection and consists of 104 acres of undeveloped land (see Figure 3.13-1). According to the Environmental Information Risk Services Database Report findings, it is a former red clay mine and rock quarry with associated elevated concentrations of arsenic in soils, and is therefore considered a REC. The Department of Toxic Substances Control (DTSC) identified investigative studies related to an Environmental Oversight Agreement/School Cleanup Agreement. The northern portion of the site is located within the limits of Build Alternatives 1, 2C, and 4, within Assessor's Parcel Numbers (APNs) 279-231-004 and -006.

A PSI was conducted for this property in September 2020; please refer to Section 3.13.2.8, *Preliminary Site Investigation*, for further information.

Mobil Baldwin, 21020 Cajalco Road, Perris (Map ID #8). This site is northeast of the Cajalco Road/Brown Street intersection (see Figure 3.13-1); the northern portion of the site currently operates as a gasoline station, and the southern portion that is adjacent to Cajalco Road is undeveloped. Due to previously documented, elevated contaminant concentrations and open regulatory case status, this site is considered a REC. The southern portion of this site is located within the limits of Build Alternatives 1, 2C, and 4, within APNs 318-061-027 and -030.

A PSI was conducted for this property in September 2020; please refer to Section 3.13.2.8, *Preliminary Site Investigation*, for further information.

3.13.2.2 Historical Recognized Environmental Conditions

Lake Mathews General Store, 17679 Cajalco Road (Map ID #7). This site is southwest of the Cajalco Road/Gustin Road intersection and currently operates as a local general store (see Figure 3.13-1). The site was previously associated with soil and soil vapor contamination and is therefore an HREC. While this property is an HREC, the site was granted closure by the Riverside County Local Oversight Program and the Santa Ana Regional Water Quality Control Board (RWQCB), and it is no longer considered a risk.

3.13.2.3 Environmental Areas of Concern

The following environmental conditions were identified within or adjacent to the proposed limits of disturbance and are considered AOCs:

- Creosote-treated wood utility poles along several roads within the project limits.
- Overhead transformers mounted on multiple utility poles along the project limits. Pole-mounted transformers have historically contained polychlorinated biphenyls (PCBs).
- Current and former agricultural land uses. The use of agricultural chemicals is associated with former agricultural practices. Soils within current agricultural land uses and land formerly associated with agriculture that has not undergone development potentially contain residual pesticide concentrations. Areas of (current or historic) agricultural land uses are presented on Figure 3.13-2.

- Yellow striping (paint or thermoplastic) along most of Cajalco Road, El Sobrante Road, and La Sierra Avenue within the project limits. Yellow striping coatings have historically contained hazardous concentrations of lead and chromium.
- Temescal Creek Bridge in the western portion of the project alignment. The bridge potentially could contain hazardous building materials including asbestos or lead.

3.13.2.4 Site Reconnaissance

Site reconnaissance of the project limits was conducted on November 15 and 30, 2016, and again on May 28, 2020, to observe site conditions as they relate to the potential presence of hazardous substances. In addition to the AOCs listed in Section 3.13.2.3, above, the following observations were recorded during the site reconnaissance:

- An ARCO gasoline station at 23261 Cajalco Expressway, south of the intersection of Cajalco Expressway and Harvill Avenue.
- Eleven monitoring wells associated with the former Mobil Baldwin site northeast of the Cajalco Road/Brown Street intersection. One of the wells is adjacent to the County right of way.
- Two pad-mounted transformers on the eastern and western portions of Harvill Avenue at Cajalco Road.
- No current quarries or open-pit mines were observed adjacent to the existing right of way or observed portions of the proposed realignment, except for the quarry at 9001 Cajalco Road, Corona, California.

3.13.2.5 Environmental Database Search

As part of the ISA, a search was conducted for environment-related information present in publicly accessible databases using Environmental Risk Information Services. The report was reviewed to determine if the project limits or sites in the project's vicinity are listed in any environmental databases (the regulatory database report includes information from federal, state, local, military, and tribal environmental regulatory agency databases). The information serves as an indicator whether prior land uses have had the potential to negatively affect the site. Listed sites identified in the regulatory database report were screened, taking into consideration the nature of the database listing, the physical environment, and distance and position of the listed sites relative to the project area. The sites' status and environmental history are summarized in Tables 3.13-1 and 3.13-2, and presented on Figure 3.13-1.

The following sites identified in the ISA are within the project limits of disturbance.

Table 3.13-1. Environmental Database Search Results – Sites within Project Limits

Map ID	Site Address and Location	Database(s)	Site Status
2	**Liston Aluminum Brick Company** **20401 Temescal Canyon Road, Corona** APN: 279231087 Southwest corner of Cajalco Road and Temescal Road intersection.	LUST, RESPONSE, CERCLIS NFRAP, RIVERSIDE LOP	Site formerly a scrap metal processing facility. Approximately 25 tons of hazardous waste were deposited at the site in June 1984. Cleanup was completed in October 1985. Site also associated with unauthorized release of gasoline from a leaking underground storage tank (LUST). Release reported to have affected soil only. Site identified as *Case Closed* as of July 1993.
3	**9001 Cajalco Road** APNs: 279-231-004 and -006 East of Cajalco Road and Eagle Canyon Road intersection.	ENVIROSTOR, SCH	Site is identified as a former red clay mine operating since the 1960s, with mineralization identified to contain elevated concentrations of arsenic. The site was also a former railroad easement along the property's western boundary.
6	**Western Municipal Water District** **16451 El Sobrante Road, Riverside** APN: 285120030 South side of El Sobrante Road.	FINDS/FRS, RIVERSIDE LOP, LUST	Site associated with unauthorized release of approximately 2,500 gallons of gasoline from an underground storage tank (UST) affecting underlying soil and groundwater. Release was discovered in July 1994. Over-excavation and post-remediation groundwater monitoring has been conducted. Case listed as *Completed – Case Closed* as of February 2011.
7	**Lake Mathews General Store** **17679 Cajalco Road** APN: 285210004 East of Cajalco Road and Smith Road intersection.	FINDS/FRS, RIVERSIDE HZH, RIVERSIDE LOP, LUST	Unauthorized release of gasoline in January 1992. Several methods of remediation were implemented between 2009 and 2011. Subsurface impacts are considered stable and contained, and are expected to naturally attenuate with time. Site listed in the GeoTracker site as *Completed – Case Closed* as of May of 2017.

Map ID	Site Address and Location	Database(s)	Site Status
8	**Mobil Baldwin** **21020 Cajalco Road, Perris** APNs: 318-061-027 and -030 Northeastern corner of Cajalco Road and Brown Street intersection.	UST, FINDS/ FRS, HHSS, RIVERSIDE LOP, HAZNET, LUST, RIVERSIDE UST, RESPONSE	Site currently operates as a gasoline station and is associated with an unauthorized release of gasoline that affected underlying soil and groundwater. Piping and a 1,000-gallon UST were removed in 2000. Groundwater monitoring currently ongoing. Case listed as *Open*, undergoing remediation.

CERCLIS NFRAP – No Further Remedial Action Planned
ENVIROSTOR – EnviroStor Database

RIVERSIDE LOP – Riverside County Local Oversight Program List
RIVERSIDE UST – Riverside County Underground Storage Tank List
SCH – School Property Evaluation Program Sites
UST – Permitted Underground Storage Tank in GeoTracker

The following site was identified as in the vicinity of the project limits.

Table 3.13-2. Environmental Database Search Results – Site in Project Vicinity

Map ID	Site Address and Location	Database(s)	Site Status
4	**Metropolitan Water District** **18250 La Sierra Avenue, Riverside** APN: 278210009 Approximately 450 feet east-southeast of project limits; south of El Sobrante Road and La Sierra Avenue intersection.	AST, HHSS, RIVERSIDE HWG, RIVERSIDE HZH, RIVERSIDE LOP, RCRA LQG, LUST, Cleanup Sites, UST	Site identified as a LUST Cleanup Site due to unauthorized release of waste motor oil and lubricating fluid to soils (July 1990). Remedial excavation and physical/chemical treatment were conducted. Site was issued closure in April 2009. An additional regulatory case associated with an unauthorized release of petroleum hydrocarbons from a hydraulic hoist was opened in February 2010, and it is reported to have affected soils only. Remedial excavation was conducted, and minor residual concentrations of hydrocarbons remain.

3.13.2.6 Environmental Regulatory Agency Inquiries

Regulatory agencies were contacted for reasonably ascertainable and practically reviewable documentation regarding environmental conditions present at the subject site and adjacent facilities. Some of the sites identified during the database search above were also found in the local regulatory agency documentation reviewed (where applicable, it is noted in the site descriptions below). Both sources were used to get a more complete characterization of the site's environmental history and status.

California Regional Water Quality Control Board

Gateway Business Park, 20325 Temescal Canyon Road, Corona (Map ID #1). The site is approximately 425 feet north of the Temescal Canyon Road and Cajalco Road intersection. The facility formerly operated as clay pipe manufacturing facility, silica sand mining and processing facility, and truck maintenance facility. Subsurface investigations were conducted upon planned redevelopment of the property, which resulted in remedial excavations of petroleum-affected soil at discrete locations within the property in 1999 and 2003. Excavated petroleum-affected soil

was remediated on site by employing biofarming, which achieved remediation goals. Groundwater monitoring wells were installed in June 2004 and were decommissioned after four quarterly monitoring events. The case was issued a No Further Action (NFA) letter in August 2005.

Liston Aluminum Brick Company, 20401 Temescal Canyon Road, Corona (Map ID #2). Also discussed in Section 3.13.2.6. The site formerly operated as an aluminum recycler. Various hazardous materials were stored on site, and inspections conducted by the Riverside County Department of Environmental Health (DEH) resulted in violations for improper management of waste oil and a waste oil spill. Other violations were reported by RWQCB for the disposal of materials in a dry streambed near the facility in 1984. The oil spill was cleaned up, and the disposed materials were removed from the streambed. Preliminary Assessments of the site were performed by the U.S. Environmental Protection Agency (USEPA) in June 1986 and January 1987, and a site investigation was performed in September 1989, which included soil sampling. Laboratory results indicated some heavy metal contamination above background levels; however, the extent of soil contamination was determined to be limited in quantity and depth. It was concluded the contamination had a low probability of migration. Following the site investigation, secondary containment equipment was installed around areas of concern. No further recommendations were provided by regulatory agencies. In March 1993, two USTs were removed from the facility. Samples did not identify detectable concentrations of potential contaminants. The site was issued an NFA letter from DEH in July 1993.

Western Municipal Water District Operations Center, 16451 El Sobrante Road, Riverside (Map ID #6). Also discussed in Section 3.13.2.6. The site formerly operated four USTs. During a tank tightness test, it was discovered that approximately 2,500 gallons of gasoline were missing from a 4,000-gallon UST. Several subsurface investigations were conducted and identified the presence of gasoline in on-site soil and groundwater. Groundwater monitoring wells were installed on site along with a soil vapor extraction system, which operated at the facility from April 1998 to March 2001. A High-Vacuum Soil Vapor Extraction System and Groundwater Extraction and Treatment System were installed for further remediation efforts, and operated concurrently between May 2005 and June 2008. Shutdown of the High-Vacuum Soil Vapor Extraction System and Groundwater Extraction and Treatment System was recommended in 2008, and closure requested in June 2009. Closure was granted by DEH in February 2011.

Department of Toxic Substances Control

9001 Cajalco Road, Corona (Map ID #3). Also identified in Section 3.13.2.6. A September 2004 site-specific Phase I Environmental Site Assessment (ESA) investigation and a response letter from DTSC were reviewed. Results of the Phase I ESA revealed no evidence of RECs in connection with the property, and no apparent environmental concerns relative to regulations and DTSC guidance with regard to the property. The response letter from DTSC concurred with the Phase I ESA findings. However, an Environmental Oversight Agreement/School Cleanup Agreement from 2007 identified multiple planned studies to be conducted on site. The planned studies included a Preliminary Endangerment Assessment, Supplemental Site Investigation, Site Investigation, Remedial Action Workplan, and Remedial Action Completion Report. None of these documents were available for review during the regulatory agency inquiries. As of 2017, the property was no longer under consideration for development with a school. Given the land use history associated with the property and the current case status identified as requiring additional evaluation (March 2008), this property was considered a REC for the project in the ISA.

Online Resources

In addition to the local regulatory agency review, supplemental research was conducted via online resources. The DTSC's Envirostor; the State Water Resources Control Board's GeoTracker; California Department of Conservation Division of Oil, Gas, and Geothermal Resources; and Office of California State Fire Marshal *Pipeline Mapping System* online databases were reviewed during completion of the ISA. No operational or abandoned oil or gas wells were identified in the vicinity of the project, and no oil or gas pipelines intersect or are located within 1,000 feet of the project area. Some of the sites identified in the previous sections were also found in the online resources reviewed (where applicable, it is noted in the site descriptions below). All data were used to get a more complete characterization of the site's environmental history and status.

Mobil Baldwin, 21020 Cajalco Road, Perris (Map ID #8). Site also discussed in Sections 3.13.2.6 and 3.13.2.8. The site historically has and currently operates as a gasoline station. The site was listed with five historical on-site USTs and an unauthorized release of gasoline that affected on-site soils and groundwater. Concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, and xylenes (BTEX) and methyl tertiary-butyl ether (MTBE) were detected in samples collected from the UST cavity during tank closure activities. Groundwater monitoring in 2003 indicated elevated concentrations of petroleum hydrocarbons and BTEX in on-site groundwater along with MTBE. Additional soil and groundwater analyses were conducted in February 2004 and a soil vapor extraction (SVE) feasibility study was conducted in May 2005. Due to shallow regional groundwater in the vicinity of the site (between approximately 9 and 13 feet below ground surface) and limited extent of the benzene contamination plume, soil excavation was identified as the most suitable remedial alternative, and commenced in January 2008. An abandoned UST and associated piping were discovered during excavation and handled according to regulatory requirements. Air sparging combined with SVE was implemented in 2014.

In January of 2016, a site-specific *Supplemental Remedial Action Plan* (A.C.C.E.S., Inc. Environmental Engineering 2016) proposed the expansion of the existing vapor extraction system with two additional horizontal vapor extraction lines in the northern portion of the site. As of June 2020, groundwater monitoring has continued as the corrective action for the site.

Lake Mathews General Store, 17679 Cajalco Road, Perris (Map ID #7). Site also discussed in Section 3.13.2.6. Soil samples collected during a 1992 tank removal indicated elevated concentrations of petroleum hydrocarbons and volatile organic compounds (VOCs). Remedial excavation ensued and confirmation soil samples indicated the presence of total petroleum hydrocarbons (TPH) and BTEX. Groundwater samples indicated significantly elevated concentrations of TPH, benzene, and MTBE. SVE was implemented between August 2005 and March 2006, and air sparging also installed in February 2007. SVE was not effective in treating contamination at the site; high-vacuum dual-phase extraction was installed in November 2010, and oxygen release compound socks were installed in August 2012. As a result, substantial decreases in chemical constituents in groundwater occurred.

In August 2013, the site met the criteria for the Low-Threat Underground Storage Tank Case Closure Policy. Operation of the groundwater remediation system continued until the first quarter of 2015. According to information obtained via GeoTracker, remedial efforts conducted at the site have been effective in reducing soil and groundwater impacts. Remaining

hydrocarbons are expected to further biodegrade and naturally attenuate with time and do not appear to pose a threat to human health or the environment. The status of the site is identified as Completed – Case Closed as of May 12, 2017.

Elementary School No. 30, El Sobrante Road/La Sierra Avenue, Riverside (Map ID #5). The property is approximately 200 feet east of the La Sierra Avenue and El Sobrante Road intersection and consists of 12 acres of land under consideration for development of a school. The property historically operated as a citrus orchard and egg ranch. Potential contaminants of concern were identified as arsenic, dichlorodiphenyldichloroethylene (DDE), and dichlorodiphenyldichloroethane (DDD). Remediation details were not disclosed. The site status was identified as NFA as of November 2000.

MWD Lake Mathews Facility, 18250 La Sierra Avenue, Riverside (Map ID #4). Site also discussed in Section 3.13.2.6. A waste oil UST was removed from the facility in July 1990. Soil samples collected from the tank excavation indicated the presence of petroleum hydrocarbons above regulatory thresholds. Approximately 96 cubic yards of contaminated soil were then excavated. Additional borings were taken between 1990 and 1994. Results of the March 1994 investigation indicated detectable concentrations of petroleum hydrocarbons; however, the concentrations were determined not to be substantial enough to warrant further investigations or remedial activities. Closure was issued to the facility in April 1997. In February 2010, a hydraulic hoist was observed to be compromised during hoist removal activities. Soil samples were analyzed and the results indicated the presence of petroleum hydrocarbons above regulatory thresholds. Soil excavated from the area of the former hoist and laboratory results from subsequent sampling indicated contamination was limited in mass and extent, and had not migrated beyond the area of investigation. An NFA letter was issued for the site in July 2010.

9001 Cajalco Road, Corona (Map ID #3). Site also discussed in Sections 3.13.2.6 and 3.13.2.8. Soil reported to be affected by former land use. Site listed as inactive under EnviroStor and in need of evaluation as of March 2008.

Liston Aluminum, 20401 Temescal Canyon Road, Corona (Map ID #2). Site also discussed in Section 3.13.2.6. The site was identified as being adjacent to a streambed and near drinking water wells. Approximately 25 tons of hazardous waste were deposited in a streambed behind the property in June 1984. This material was sampled, tested, and found to contain hazardous levels of zinc and lead. The hazardous waste was removed from the property, and cleanup was completed in October 1985.

3.13.2.7 Aerially Deposited Lead Investigation

An *Aerially Deposited Lead Site Investigation Work Plan, Cajalco Road Widening and Safety Enhancement Project, Riverside County*, *California* was prepared for the County in June of 2017 (Caltrans 2017a). The objective of the ADL investigation was to evaluate unpaved soil along the project alignment for the presence of ADL. Soil sampling for the ADL Investigation was conducted on October 30 and 31, 2017, following the methodology proposed in the work plan as described above. Twenty-six boring locations were tested, and 78 soil samples were collected at depths of 0.5 foot, 1 foot, and 2 feet below ground surface. Soil samples were analyzed for total lead via USEPA Method 6010B. Total lead was detected in each of the 63 samples analyzed, ranging from 1.1 milligrams per kilogram (mg/kg) to 66 mg/kg; however, no samples contained total lead concentrations exceeding the California Total Threshold Limit Concentration of 1,000 mg/kg.

Samples containing greater than or equal to 50 mg/kg total lead were analyzed for soluble lead using the California Waste Extraction Test (citric acid extraction/USEPA Method 3050A) and USEPA Method 6010B for extractable lead. Two of the 63 samples analyzed exceeded 50 mg/kg and, therefore, were subject to California Waste Extraction Test analysis. However, neither of the samples analyzed exceeded the California Soluble Threshold Limit Concentration threshold of 5 milligrams per liter and did not meet hazardous waste criteria.

Based on analytical results, the investigation report concluded that further statistical analysis of the results would not be warranted. Furthermore, excavated soil would not be restricted for on-site reuse and would be classified as non-hazardous waste if disposed off site. Soils removed as part of the project could be disposed of as nonhazardous waste at a Class III landfill.

3.13.2.8 Preliminary Site Investigation

The ISA prepared for the project identified the following two properties within the project limits as RECs, and recommended a PSI be conducted for each property: 9001 Cajalco Road and 21020 Cajalco Road. The results of the additional investigations were compared with the available data for these properties, and the combined data set evaluated to determine the need for specific protocols to be included in the site-specific Health and Safety Plan (HASP) and Soil Management Plan (SMP). In lieu of an additional intrusive investigation, a review of the historical documents and available contaminant analytical data related to these properties was conducted.

9001 Cajalco Road, Corona (Map ID #3)

The following summary regarding 9001 Cajalco Road is based on the PSI prepared for 9001 Cajalco Road and 21020 Cajalco Road. Sources of information for 9001 Cajalco Road included in the PSI are listed below, and are incorporated by reference:

- *Environmental Oversight Agreement/School Cleanup Agreement, Docket Number HAS-EOA/SCA 07/08-064, Corona Norco Unified School District, Rancho Serrano High School, Corona, Riverside County* (Site Code: 404759-11) (DTSC, October 2007)
- *Limited Phase II Soil Investigation Report for the Proposed Rancho Serrano High School Site, Located at 9001 Cajalco Road, Corona, Riverside County, California* (Leighton, August 2007)
- *Phase I Environmental Site Assessment, Corona-Norco Unified School District, Proposed Rancho Serrano High School, Lawson Drive/Temescal Canyon Road, Corona, Riverside County, California* (Kleinfelder, Inc., September 2004)

An assessment of limited existing soil analytical data previously collected in the region of the rock quarry/former red clay mine at 9001 Cajalco Road (APNs 279-231-011, 279-231-006, 279-231-004, and 281-140-021) was conducted to develop recommendations based on the proximity of at least four of the sampling locations to the property.

A Detailed Site Investigation (DSI) or Phase II ESA was completed in 2007 when the Corona Norco Unified School District considered the entire quarry site for development into a new high school. The investigation comprised collection and analyses of only surface soil samples across the entire 104-acre site. Although no samples were collected within the limits of the proposed

project, four borings (11 samples) were collected in the project vicinity at locations approximately 76 feet southwest and 215 feet south of the project limits. The highest detected arsenic concentration of the four borings was 47 mg/kg. Without the collection and analyses of soil samples within the limits of the proposed project down to depths of the proposed excavation, it is not possible to fully assess health and safety considerations for project construction workers and soil management requirements. Based on arsenic levels detected from the four borings that were located in the vicinity of the proposed acquisition property, soil generated from this area has the potential to be characterized as a California non-RCRA hazardous waste. However, because the soil samples were not further analyzed to determine their extractable arsenic concentrations, which is used to determine the soil's waste characteristic (i.e., hazardous waste), there is also potential for the soil to be characterized as RCRA hazardous waste.

The entirety of the mine and quarry activities appear to have been conducted primarily in the central and southern portions of the property and do not overlap with the planned acquisition property. The nearest feature to the project limits is an inactive clay pit approximately 300 feet to the southeast. A soil and debris stockpile of unknown origin along the northern access road at Cajalco Road and staining near the pit were noted.

Based on the 2007 DSI, there appears to have been no soil samples collected within a portion of the proposed project acquisition area (Leighton 2007). Due to the uncertainty of the stockpile location, there is potential that arsenic-impacted soil exists in the acquisition property resulting from historical stockpiling and/or spillage during soil transport. Based on a review of aerial photos taken of the property from 2007 through 2020, there appears to be significant movement/transport of the surface soils in this area. The shape and size of the inactive clay pit appear to have transformed over this same time period. Because only surface soil samples were collected across this region, there is potential for soil to be impacted with arsenic above screening levels at greater depths.

No soil remediation activities have been documented for the property up to the date of this report. No groundwater investigation or remediation has been performed at the property. Groundwater is expected below 100 feet below ground surface. Based on the type of contaminants detected in the upper 6 inches of soil and the depth to groundwater, the potential for soil contamination to affect groundwater is low. In addition, groundwater should not be encountered during construction.

Mobil Baldwin, 21020 Cajalco Road, Perris (Map ID #8)

The following summary regarding 21020 Cajalco Road is based on the PSI prepared for 9001 Cajalco Road and 21020 Cajalco Road. Sources of information for 21020 Cajalco Road included in the PSI are listed below, and are incorporated by reference:

- *Groundwater Monitoring Report First Semi-Annual 2020 (Second Quarter 2020) for Mobil Baldwin 21020 Cajalco Road, Perris, California* (A.C.C.E.S., July 2020)
- *Additional Subsurface Soil and Groundwater Investigation for Mobil Baldwin, 21020 Cajalco Road, Perris, California* (A.C.C.E.S., September 2019)
- California State Water Resources Control Board GeoTracker website (SWRCB 2020)
- Review Summary Report – Additional Work, Second Review (SWRCB, March 2019)

Mobil Baldwin, formerly located at 21020 Cajalco Road, Perris, California (APN 318-061-027 and 318-061-030), maintains an open LUST case with the RWQCB. Chemicals of concern are TPH and VOCs. Ongoing groundwater monitoring and remediation activities are being conducted to obtain case closure and a No Further Action determination by RWQCB.

An unauthorized release was reported in July 2000 when five USTs were removed. Since 2000, the site has been undergoing soil and groundwater investigation and remediation. In 2008, the former UST area was excavated, and 740 cubic yards of contaminated soil were disposed off site. Excavation activities ceased prior to reaching the contaminated soil limits due to budgetary reasons. Limited soil and groundwater remediation using a combination of air sparging and SVE was performed in December 2012, and again from March to May in 2014. The SWRCB concluded in its March 2019 Review Summary Report that a sufficient mass of contaminants had been removed during the two remediation periods such that residual contamination could not be a source of significant risk to utility workers (SWRCB 2019).

Despite not having recent soil analytical data representing residual soil contamination, there is sufficient information available regarding the site from the sources identified above to develop health and safety considerations for project construction personnel. One of the primary considerations will be the exposure of VOCs to project workers originating from both residual soil contamination and contaminated groundwater beneath the site. The affected groundwater is shallow at depths ranging from 5 to 12 feet below ground surface. Any waste generated from this area has the potential to be characterized as California non-RCRA hazardous waste or RCRA hazardous waste due to the presence of benzene.

Based upon the latest available groundwater monitoring results, it appears that case closure is not imminent for the property (A.C.C.E.S. 2020). Numerous groundwater monitoring and air sparging wells are located within the project limits, and ongoing groundwater monitoring will likely continue for the foreseeable future due to the relatively high concentrations of VOCs still present in the groundwater.

3.13.3 Environmental Consequences

3.13.3.1 Build Alternatives 1, 2C, and 4

Recognized Environmental Conditions

Two documented hazardous material sites occur within the limits of Build Alternatives 1, 2C, and 4; these include 9001 Cajalco Road and the former Mobil Baldwin located at 21020 Cajalco Road. The PSI conducted for both sites in September 2020 confirmed potential for arsenic to occur within the project limits at 9001 Cajalco Road, and the Mobil Baldwin site remained active with an open regulatory case status.

Lake Mathews General Store at 17679 Cajalco Road was identified as an HREC and was formerly associated with soil and soil vapor contamination. However, as the site was granted closure in May of 2017 by the Riverside County Local Oversight Program and the Santa Ana RWQCB, it is not considered a risk to the proposed project.

Table 3.13-3 on the following page lists the sites considered RECs for the proposed project and summarizes recommended studies performed and recommended measures.

Table 3.13-3. Recognized Environmental Conditions – Build Alternatives 1, 2C, and 4

Map ID	Site Name and Parcels	Agencies	Studies/Measures
3	**9001 Cajalco Road** APNs 279-231-004, -006, 011, and 281-140-021	DTSC	PSI conducted September 2020. HAZ-1(a): Detailed Site Investigation; to be conducted during final design. HAZ-1(b): Riverside County Department of Environmental Health Notification and soil remediation, if required, and case closure; prior to construction. HAZ-1(c) and PF HAZ-2: Health and Safety Plan; prior to construction. HAZ-1(d): Soil Management Plan, if required; prior to construction. PF HAZ-3: Handling, Transport, and Disposal of Wastes; during construction, throughout construction duration.
8	**Mobil Baldwin** **21020 Cajalco Road** APNs 318-061-027 and -030	Santa Ana RWQCB/ Riverside County LOP	PSI conducted September 2020. PF HAZ-3: Handling, Transport, and Disposal of Wastes; during and throughout construction. HAZ-4(a): Continued Coordination with Oversight Agencies; during final design through construction. HAZ-4(b): Abandonment of Existing Monitoring Structures; prior to construction. HAZ-4(c): Soil and Groundwater Investigation (Optional); during final design and prior to construction. HAZ-4(d) and PF HAZ-2: Health and Safety Plan; prior to construction. HAZ-4(e): Soil Management Plan; prior to construction. HAZ-4(f): SCAQMD Rule 1166 permitting and VOC monitoring; during construction. HAZ-4(g): Groundwater Disposal; during construction.

The 9001 Cajalco Road site is a former red clay mine and rock quarry; according to the Environmental Information Risk Services Database Report findings, it is associated with elevated concentrations of arsenic in soils. In 2007, an Environmental Oversight Agreement/ School Cleanup Agreement identified additional investigative studies to be prepared in advance of the site being considered for the construction of a new school. Partial acquisition of APNs 279-231-004 and -006 is proposed as part of the project. A 2004 Phase I ESA revealed no evidence of RECs in connection with the property, and a response letter from DTSC concurred with the Phase I ESA findings. Considering the land use history associated with the property and because the current case status identifies additional investigative studies (as of March 2008), this property is considered a REC.

Mitigation Measure **HAZ-1** is identified to minimize potential impacts related to the acquisition of APNs 279-231-004 and -006 (see Section 3.13.4); this measure, in addition to Standard Project Measures **PF HAZ-2** and **PF HAZ-3**, would ensure hazards associated with the acquisition of APNs 279-231-004 and -006, and soil disturbance activities during construction, are minimized to the greatest extent feasible:

- **PF HAZ-2. Health and Safety Plan.** The Health and Safety Plan (HASP) would provide direction for the identification, evaluation, and control of the wide variety of chemical, physical, biological, and ergonomic hazards that may be encountered during construction activities. The HASP will also address the management of potential health and safety

hazards to workers and the public, and will be prepared and implemented prior to initiation of the construction activities. Instructions, guidelines, and requirements for handling hazardous materials to ensure employee safety as provided in Chapter 16, "Hazardous Materials Communication Program," of the California Department of Transportation's Safety Manual will be included in the HASP. The HASP should be prepared and stamped by a Certified Industrial Hygienist (CIH) and will provide appropriate administrative controls, engineering controls, and personal protective equipment necessary to eliminate or reduce hazards to both project personnel and the community.

- **PF HAZ-3. Handling, Transport, and Disposal of Wastes.** Wastes and petroleum products used or encountered during construction will be collected, transported, and removed from the project site in accordance with Resource Conservation and Recovery Act regulations and federal/Occupational Health and Safety Administration standards, including Waste Management and Materials Pollution Control Best Management Practices (BMPs) – Spill Prevention and Control, Materials; and Waste Management BMPs, Hazardous Waste Management. The following California Department of Transportation (Caltrans) and other regulations will also be followed, as applicable:
  - All hazardous waste will be stored, transported, and disposed of as required in California Code of Regulations (CCR) Title 22, Division 4.5; Code of Federal Regulations (CFR) Title 49, Parts 261–263;
  - Applicable Caltrans requirements as stated in Section 7-109, Solid Waste Disposal and Recycling Reporting, of the Caltrans Construction Manual, Waste Management and Materials Pollution Control BMPs, and Standard Special Provisions (SSPs), will be implemented.
  - Handling of thermoplastic material would be conducted in accordance with Caltrans SSPs 36-4 and 14-11.12, or with 84-9.03C, as applicable. Thermoplastic waste will be disposed of in accordance with SSP 36-4. Environmental Rules and Requirements as outlined in the Caltrans Construction Manual—7-103H (1) Caltrans & Contractor Designated Disposal, Staging, and Borrow Sites—will be followed as required.
  - Handling, transport, and disposal of any contaminated media determined to exceed maximum concentration levels will be performed in accordance with all applicable state and federal regulations. If a commercial landfill will be used to dispose of soils: (1) soils will be transported to a landfill appropriately permitted to receive the material and (2) the contractor is responsible for identifying the appropriately permitted landfill to receive said soils.

The Mobil Baldwin site involved unauthorized release of gasoline that affected on-site soils and groundwater, and is currently undergoing remediation. Affected soil and groundwater may still remain at the site. Full acquisition of APNs 318-061-027 and -030, located on the southern portion of the Mobil Baldwin site, is proposed as part of the project. Due to elevated contaminant concentrations identified at the site and open regulatory case status, acquisition of the property associated with APNs 318-061-027 and -030 is considered a REC for the project. Mitigation Measure **HAZ-4** is identified to minimize potential impacts related to the acquisition of APNs 318-061-027 and -030 (see Section 3.13.4); these measures, in addition to Standard Project Measures **PF HAZ-2** and **PF HAZ-3**, would ensure hazards associated with the acquisition of

APNs 318-061-027 and -030, and soil disturbance activities during construction, are minimized to the greatest extent feasible.

Areas of Concern

In addition to the RECs, five AOCs were identified as potential issues associated with the implementation of the build alternatives and would require attention prior to construction.

Utility poles containing creosote-treated wood are located along several roads within the project limits. During construction, creosote-treated wood waste (TWW) may be generated when aforementioned poles are manipulated or removed. Pole-mounted transformers were also noted throughout the project limits (for all build alternatives). In addition, two pad-mounted transformers are located in the eastern portion of the project (at the intersection of Harvill Avenue and Cajalco Expressway). Historically, PCBs were widely used as dielectric and coolant fluids in electrical transformers. If disturbed, the materials within these electrical transformers will need to be profiled and managed appropriately. Compliance with Standard Project Measures **PF HAZ-2, PF HAZ-3**, and **PF HAZ-5** would ensure hazards would be minimized to the greatest extent feasible:

- **PF HAZ-5. Creosote-treated Wood Waste.** When handling creosote-treated wood waste (TWW), the following should be observed:
  - Proper removal and disposal of any materials or waste will be consistent with Caltrans' Standard Special Provision (SSP) 14-11.14.
  - Proper removal and disposal of all stained pole-mounted and/or pad-mounted transformers will be required for the utility company or agency operating them.
  - TWW material (being stored) should be labeled TREATED WOOD WASTE - DO NOT BURN OR SCAVENGE, and should include the handler's name and address as well as the accumulation date.
  - TWW will not be stored directly on the ground. TWW will be segregated from other wastes and stored in containers or on plastic sheeting, covered, and secured.
  - TWW will not be burned, scavenged, reused, recycled, or commingled with other waste prior to disposal.
  - TWW will be hauled by a Department of Toxic Substances Control (DTSC)-registered hazardous waste transporter.
  - All TWW will be disposed of at an approved landfill (liner-equipped/ permitted Class I landfill).
  - TWW handlers that generate more than 10,000 pounds in any calendar year will obtain a DTSC ID Number and submit the notification within 30 days of exceeding the 10,000-pound limit.

Several areas immediately adjacent to and within the construction limits of the build alternatives are either currently or have historically been used for agriculture (refer to Figure 3.13-2). As such, agricultural chemicals have likely been applied within these areas and these chemicals along with their associated metal constituents may be present in near-surface soils at residual

concentrations. The implementation of Mitigation Measure **HAZ-6** and compliance with Standard Project Measures **PF HAZ-2** and **PF HAZ-3** would ensure hazards would be minimized to the greatest extent feasible.

Yellow striping was observed along most of the proposed project. As yellow striping used prior to 2006 could contain significant levels of lead and chromium, disturbance of the paint striping could result in an exposure risk to construction personnel and the surrounding environment. The implementation of Mitigation Measure **HAZ-7** and compliance with Standard Project Measures **PF HAZ-2** and **PF HAZ-3** would ensure hazards would be minimized to the greatest extent feasible.

Based on the age (prior to 1978) of some structures, such as the Temescal Canyon Bridge, located within the project limits, there is a potential for either asbestos-containing materials (ACM) or lead-based paint (LBP) to be present in the building materials of said structures. If these structures are to be modified or removed as part of the implementation of the build alternatives, construction personnel and the surrounding environment could be exposed to these hazardous materials. In addition to the implementation of Mitigation Measure **HAZ-8**, the handling of LBP and ACM would be conducted consistent with Standard Project Measures **PF HAZ-2** and **PF HAZ-3**.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road or Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if constructed in the future, the median included as part of the Cajalco Road Widening and Safety Enhancement Project would be designed with sufficient width to accommodate the two additional travel lanes for future construction.

Construction activities associated with a Future Six-Lane Facility may include grading, and cut and fill; however, these activities would be anticipated to occur within the limits of disturbance of the widening and safety enhancement project. Because all applicable avoidance, minimization, and mitigation measures would have been applied during implementation of the widening and safety enhancement project, the construction activities associated with the future additional travel lanes would be unlikely to result in hazardous materials impacts. However, if grading, cut, and fill are proposed in areas previously undisturbed during implementation of the widening and safety enhancement project as part of a future Six-Lane Facility, then further analysis and measures described above under Build Alternatives 1, 2C, and 4 would apply.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the Lake Mathews Multiple Species Habitat Conservation Plan (LM MSHCP) area and Lake Mathews Multiple Species Reserve (LMR); if Build Alternative 4 is constructed, a combination of Cajalco Road and El Sobrante Road would be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities—including a drainage basin, culverts, bridges, and wildlife crossings—would also be constructed. An application to amend the LM MSHCP would be

required to allow for construction of the project within the conservation area. Approval would need to be obtained prior to any construction. If approved, the amendment would allow for the proposed project.

The two RECs identified within the limits of the proposed project would occur outside the LM MSHCP area and LMR, and would thus not affect the LM MSHCP area and LMR. A number of the AOCs identified within the limits of the project, however, are also within the LM MSHCP area and LMR; these include creosote-treated wood utility poles, agricultural areas, and yellow striping. With the implementation of Mitigation Measures **HAZ-1**, **HAZ-4**, and **HAZ-6** and compliance with Standard Project Measures **PF HAZ-2**, **PF HAZ-3**, and **PF HAZ-5**, hazards impacts on the LM MSHCP area and LMR would be minimized to the greatest extent feasible.

3.13.3.2 No-Build Alternative

Under the No-Build Alternative, the project site would not be disturbed and no effects involving hazardous materials would occur.

3.13.4 Avoidance, Minimization, and/or Mitigation Measures

Implementation of the following avoidance, minimization, and mitigation measures would ensure that impacts involving hazards and hazardous materials would not be adverse.

- **HAZ-1: 9001 Cajalco Road (APNs 279-231-004, -006, -011, and 281-140-021).** The County of Riverside will be responsible for implementation of the following actions regarding 9001 Cajalco Road, prior to and during construction, where applicable. The Resident Engineer, or Project Engineer under contract to the County, will ensure that the Health and Safety Plan and Soil Management Plan included in the final Plans, Specifications, and Estimates (PS&E) are implemented by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

  a). Detailed Site Investigation. A Detailed Site Investigation (DSI) for arsenic concentrations in shallow soil in proposed acquisition areas of Assessor's Parcel Numbers (APNs) 279-231-004 006, -011, and 281-140-021 will be conducted during final design and prior to project construction. The DSI report will provide recommendations for remediation, health and safety, and appropriate soil management during construction using recent site-specific data representative of areas that will be disturbed during construction.

  b). Riverside County Department of Environmental Health Notification and Soil Remediation. If site investigation concludes that contaminants are present within the project limits of disturbance that exceed regulatory thresholds, the Riverside County Department of Environmental Health (DEH) should be notified and a case opened if deemed necessary by the agency. If required, soil will be remediated to the satisfaction of the DEH or appropriate lead regulatory agency prior to commencement of construction activities. The County of Riverside will submit and file all required documentation with the appropriate regulatory agencies to formally confirm closure of the case and obtain a letter of No Further Action.

  c). Health and Safety Plan – APNs 279-231-004, -006, -011, and 281-140-021. Project special provisions will be developed directing the construction contractor to develop a

Health and Safety Plan (HASP) using data obtained during the DSI. The HASP would be prepared as outlined in Measure **PF HAZ-2**.

d). Soil Management Plan – APNs 279-231-004, -006, -011, and 281-140-021. Project special provisions will be prepared directing the contractor to develop a project-specific Soil Management Plan (SMP) summarizing contaminated soil management procedures, waste disposal requirements, and best management practices for work to be conducted at the site.

- **HAZ-4: 21020 Cajalco Road (APNs 318-061-027 and -030).** The County of Riverside will be responsible for implementation of the following actions regarding 21020 Cajalco Road prior to and during construction, where applicable. The Resident Engineer, or Project Engineer under contract to the County, will ensure that the Health and Safety Plan and Soil Management Plan included the final Plans, Specifications, and Estimates (PS&E), are implemented, and SCAQMD Rule 1166 and Groundwater provisions below met, by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

  a). Continued Coordination with Oversight Agencies. The Mobil Baldwin site at 21020 Cajalco Road (APNs 318-061-027 and -030) has undergone contaminant characterization, monitoring, and remediation beginning in June of 2000 (A.C.C.E.S., Inc., Environmental Engineering's *First Semi-Annual 2019 Groundwater Monitoring Report*). Currently, the site is undergoing groundwater monitoring and remediation focused around contaminants of concern (total petroleum hydrocarbons and benzene). As the site is well characterized and currently undergoing remediation activities, the risk of accidental exposure to the public is considered low. Coordination would continue among the County of Riverside, Regional Water Quality Control Board (RWQCB), and the responsible party (currently Mr. Fayez Sedrak) to ensure remediation achieves case closure and that relocation of any remediation equipment and/or utilities to accommodate construction activities, if necessary, is properly completed. Residual contamination will remain in soil and/or groundwater regardless of case status. Potential future obligations may include, but not necessarily be limited to, allowing encroachment access for future monitoring, sampling, and/or remediation activities.

  b). Abandonment of Existing Monitoring Structures. Prior to commencement of construction activity, any subsurface structures/conveyance systems pertaining to former contaminant monitoring (e.g., groundwater monitoring and vapor extraction wells, and associated conveyance piping) that interfere with proposed construction activities will be abandoned in accordance with the regulatory requirements of Riverside County Department of Environmental Health, RWQCB, and California Department of Water Resources. Removal of these structures and facilities should be conducted by the responsible party under the oversight of RWQCB and prior to site acquisition. Groundwater monitoring wells may need to be reinstalled and/or moved to different locations following completion of the project to enable long-term monitoring of the groundwater.

c). Soil and Groundwater Investigation (Optional). The County can consider a soil and groundwater investigation to provide current groundwater and/or soil contamination data on the parcel to support the development of health and safety and contaminated soil/groundwater management procedures/best management practices and/or estimation of contaminated soil-handling and disposal costs that would be incurred. If conducted, the additional investigation should be performed during final design and prior to construction. However, based upon the level of historical information available for the site, project specifications can be prepared directing the contractor for work proposed on this site using available data.

d). Health and Safety Plan – APNs 318-061-027 and -030. Significant historical soil, groundwater, and/or soil vapor analytical data exist for the Mobil Baldwin Site and provide an indication of potential contaminant constituents and their respective concentrations that may be encountered during construction at this location. Adequate historical data are available to develop a project-specific Health and Safety Plan (HASP). Project special provisions should be developed directing the construction contractor to develop a HASP using information from the Preliminary Site Investigation (PSI) and any other historical data deemed necessary by the preparer. The HASP would be prepared as outlined in Measure **PF HAZ-2**.

e). Soil Management Plan – APNs 318-061-027 and -030. Significant historical soil, groundwater, and/or soil vapor analytical data exist for the Mobil Baldwin site and provide an indication of potential contaminant constituents and their respective concentrations that may be encountered during construction at this location. Project special provisions should also be prepared directing the contractor to develop a project-specific Soil Management Plan (SMP) summarizing contaminated soil management procedures, waste disposal requirements, and best management practices for work to be conducted at the site.

f). South Coast Air Quality Management District (SCAQMD) Rule 1166 permitting and volatile organic compound (VOC) monitoring. Construction activities will be conducted in accordance with SCAQMD Rule 1166, *Volatile Organic Compound Emissions from Decontamination of Soil*, and permitting requirements, and include VOC monitoring during earthwork and excavation activities on parcels associated with Mobil Baldwin.

g). Groundwater Disposal. The disposition of the groundwater underlying the site must be considered for work activities that involve contact with the groundwater at this site for purposes of groundwater management (e.g., construction dewatering). In general, any excess groundwater generated during construction may be disposed of off site at a licensed facility or released under a discharge permit. Groundwater should not be discharged to the sewer or storm drain without proper permits. If sewer or storm drain permits are not obtained, groundwater should be containerized and transported to an appropriate disposal facility. The concentrations of VOCs and total petroleum hydrocarbons detected in groundwater would permit the water to be transported to and disposed of at an appropriate facility as non-hazardous wastewater. Special provisions should be prepared that provide the selected construction contractor with project requirements for groundwater management and discharge or disposal. Although

groundwater data are available, data are not sufficient for discharge permitting. If discharge is anticipated, the County should consider collection of representative groundwater samples from one or more wells prior to their abandonment; samples should be analyzed for the full suite required for National Pollutant Discharge Elimination System permitting with the RWQCB.

- **HAZ-6: Agricultural Land Uses.** The County of Riverside will be responsible for implementation of the following actions prior to and during construction, where applicable. The Resident Engineer, or Project Engineer under contract to the County, will ensure that the Agricultural Land Uses Soil Management Plan included in the final Plans, Specifications, and Estimates (PS&E), is implemented by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

  a). Preliminary Site Investigation (PSI). A PSI that includes soil investigations for residual concentrations of metals and organochlorine pesticides, if suspected areas of preparation involving metals and organochlorine pesticides are identified, will be conducted prior to commencement of construction within acquisition areas immediately adjacent to or within land historically associated with agricultural land uses that has not undergone redevelopment. The locations of these areas are identified on Figure 3.13-2. Construction activities will not commence until the site is deemed safe for disturbance by the appropriate regulatory agencies. The specifications prepared for construction of the project and/or the project's Environmental Commitments Record will be updated as needed, based on the results of sampling. If the PSI concludes that contaminants are present and at levels above regulatory threshold standards, then the following corrective actions will be employed to remediate soil and/or groundwater conditions and prevent exposure of the public to hazardous levels of contaminants.

  b). Corrective Action (if PSI concludes contaminants present at levels above regulatory threshold standards). Based upon the findings of the PSI, special provisions will be prepared providing direction for construction activities where contaminated soil may be encountered or disturbed. If site investigation concludes that contaminants are present within the project limits that exceed regulatory thresholds, Riverside County Department of Environmental Health (DEH) will be notified and a case will be opened if deemed necessary by the agency. If required, soil will be remediated to the satisfaction of the DEH or appropriate lead regulatory agency prior to commencement of construction activity. The County of Riverside will submit and file all required documentation with the appropriate regulatory agencies to formally confirm closure of any cases and obtain letters of No Further Action.

  c). Soil Management Plan – Agricultural Land Uses. If contaminated soil is involved, a Soil Management Plan (SMP) will be prepared and implemented. The SMP would provide administrative, procedural, and analytical guidance to expedite and clarify decisions and actions if contaminated soils are encountered during project implementation.

- **HAZ-7: Yellow Paint.** Due to the possible presence of elevated lead concentrations within the yellow thermoplastic and yellow-painted traffic stripes along the existing highway, a yellow paint and thermoplastic striping survey will be conducted along the project alignment

for striping that will be removed. If materials will be removed in phases, samples will be collected in each phase to ensure that all materials are assessed. The paint and thermoplastic striping survey will be conducted during final design and prior to construction, by a Certified Industrial Hygienist. Handling of this material would be consistent with the California Department of Transportation's Standard Special Provisions 36-4 and 14-11.12, or with 84-9.03C, as applicable. The County of Riverside will be responsible for implementation of the above actions prior to and during construction, where applicable. The Resident Engineer, or Project Engineer under contract to the County, will ensure the handling of yellow thermoplastic and yellow-painted traffic stripe materials consistent with Caltrans SSP 36-4 and 14-11.12, or with 84-9.03C, as applicable, by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

- **HAZ-8**: **Asbestos-Containing Material and Lead-Based Paint.** Surveys for hazardous building materials, including asbestos-containing material (ACM) and lead-based paint (LBP), will be conducted for structures that will be removed in as part of the project, including the Temescal Canyon Wash Bridge. Surveys for ACM and LBP will be conducted during final design and prior to construction. A certified contractor will be retained to abate any identified ACM or LBP in accordance with all applicable laws, including Occupational Health and Safety Administration guidelines. Handling of ACM waste would be conducted consistent with California Department of Transportation (Caltrans) Standard Special Provision (SSP) 14-11.16, while LBP would be handled according to SSP 36-4. Furthermore, demolition or renovation of a structure requires submittal of Rule 1402 Form Notification of Demolition or Asbestos Removal to the South Coast Air Quality Management District for all impending demolition and renovation projects.

  In the event that ACM not identified in the asbestos study are uncovered during demolition/ renovation activities, the contractor must stop work and have these materials tested for asbestos content by a qualified subcontractor specializing in the identification, sampling, and handling of ACM. If ACM is present, handling of the materials would be conducted consistent with Caltrans SSP 14-11.16.

  The County of Riverside will be responsible for implementation of the above actions prior to and during construction, where applicable. The Resident Engineer, or Project Engineer under contract to the County, will ensure that the handling of ACM consistent with Caltrans SSP 14-11.16, and submittal of Rule 1402 Form, are implemented by the County's Construction Contractor or Project Construction Contractor under contract to the County, during construction.

3.14 Air Quality

3.14.1 Regulatory Setting

The Federal Clean Air Act (FCAA), as amended in 1990, is the federal law that governs air quality while the California Clean Air Act of 1988 is its companion state law. These laws, and related regulations by the U.S. Environmental Protection Agency (U.S. EPA) and California Air Resources Board (ARB), set standards for the quantity of pollutants that can be in the air. At the federal level, these standards are called National Ambient Air Quality Standards (NAAQS). NAAQS and State ambient air quality standards have been established for six criteria pollutants that have been linked to potential health concerns. The criteria pollutants are: carbon monoxide (CO), nitrogen dioxide (NO_2), ozone (O_3), particulate matter (PM, broken down for regulatory purposes into particles of 10 micrometers or smaller—PM_{10} and particles of 2.5 micrometers and smaller ($PM_{2.5}$), Lead (Pb), and sulfur dioxide (SO_2). In addition, state standards exist for visibility reducing particles, sulfates, hydrogen sulfide (H_2S), and vinyl chloride. The NAAQS and state standards are set at a level that protects public health with a margin of safety, and are subject to periodic review and revision. Both state and federal regulatory schemes also cover toxic air contaminants (air toxics). Some criteria pollutants are also air toxics or may include certain air toxics within their general definition.

Federal and state air quality standards and regulations provide the basic scheme for project-level air quality analysis under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). In addition to this type of environmental analysis, a parallel "Conformity" requirement under the FCAA also applies.

Conformity

The conformity requirement is based on FCAA Section 176(c), which prohibits the U.S. Department of Transportation (USDOT) and other federal agencies from funding, authorizing, or approving plans, programs, or projects that do not conform to State Implementation Plan (SIP) for attaining the NAAQS. "Transportation Conformity" applies to highway and transit projects and takes place on two levels: the regional (or planning and programming) level and the project level. The proposed project must conform at both levels to be approved.

Conformity requirements apply only in nonattainment and "maintenance" (former nonattainment) areas for the NAAQS, and only for the specific NAAQS that are or were violated. U.S. EPA regulations at 40 Code of Federal Regulations (CFR) 93 govern the conformity process. Conformity requirements do not apply in unclassifiable/attainment areas for NAAQS and do not apply at all for state standards regardless of the status of the area.

Regional conformity is concerned with how well the regional transportation system supports plans for attaining the NAAQS for carbon monoxide (CO), nitrogen dioxide (NO_2), ozone (O_3), particulate matter (PM_{10} and $PM_{2.5}$), and in some areas (although not in California), sulfur dioxide (SO_2). California has nonattainment or maintenance areas for all of these transportation-related "criteria pollutants" except SO_2, and also has a nonattainment area for lead (Pb); however, lead is not currently required by the FCAA to be covered in transportation conformity analysis. Regional conformity is based on emission analysis of Regional Transportation Plans (RTPs) and Federal Transportation Improvement Programs (FTIPs) that include all

transportation projects planned for a region over a period of at least 20 years (for the RTP) and 4 years (for the FTIP). RTP and FTIP conformity uses travel demand and emission models to determine whether or not the implementation of those projects would conform to emission budgets or other tests at various analysis years showing that requirements of the FCAA and the SIP are met. If the conformity analysis is successful, the Metropolitan Planning Organization (MPO), Federal Highway Administration (FHWA), and Federal Transit Administration (FTA) make the determinations that the RTP and FTIP are in conformity with the SIP for achieving the goals of the FCAA. Otherwise, the projects in the RTP and/or FTIP must be modified until conformity is attained. If the design concept and scope and the "open-to-traffic" schedule of a proposed transportation project are the same as described in the RTP and FTIP, then the proposed project meets regional conformity requirements for purposes of project-level analysis.

Project-level conformity is achieved by demonstrating that the project comes from a conforming RTP and TIP; the project has a design concept and scope[1] that has not changed significantly from those in the RTP and TIP; project analyses have used the latest planning assumptions and EPA-approved emissions models; and in PM areas, the project complies with any control measures in the SIP. Furthermore, additional analyses (known as hot-spot analyses) may be required for projects located in CO and PM nonattainment or maintenance areas to examine localized air quality impacts.

3.14.2 Affected Environment

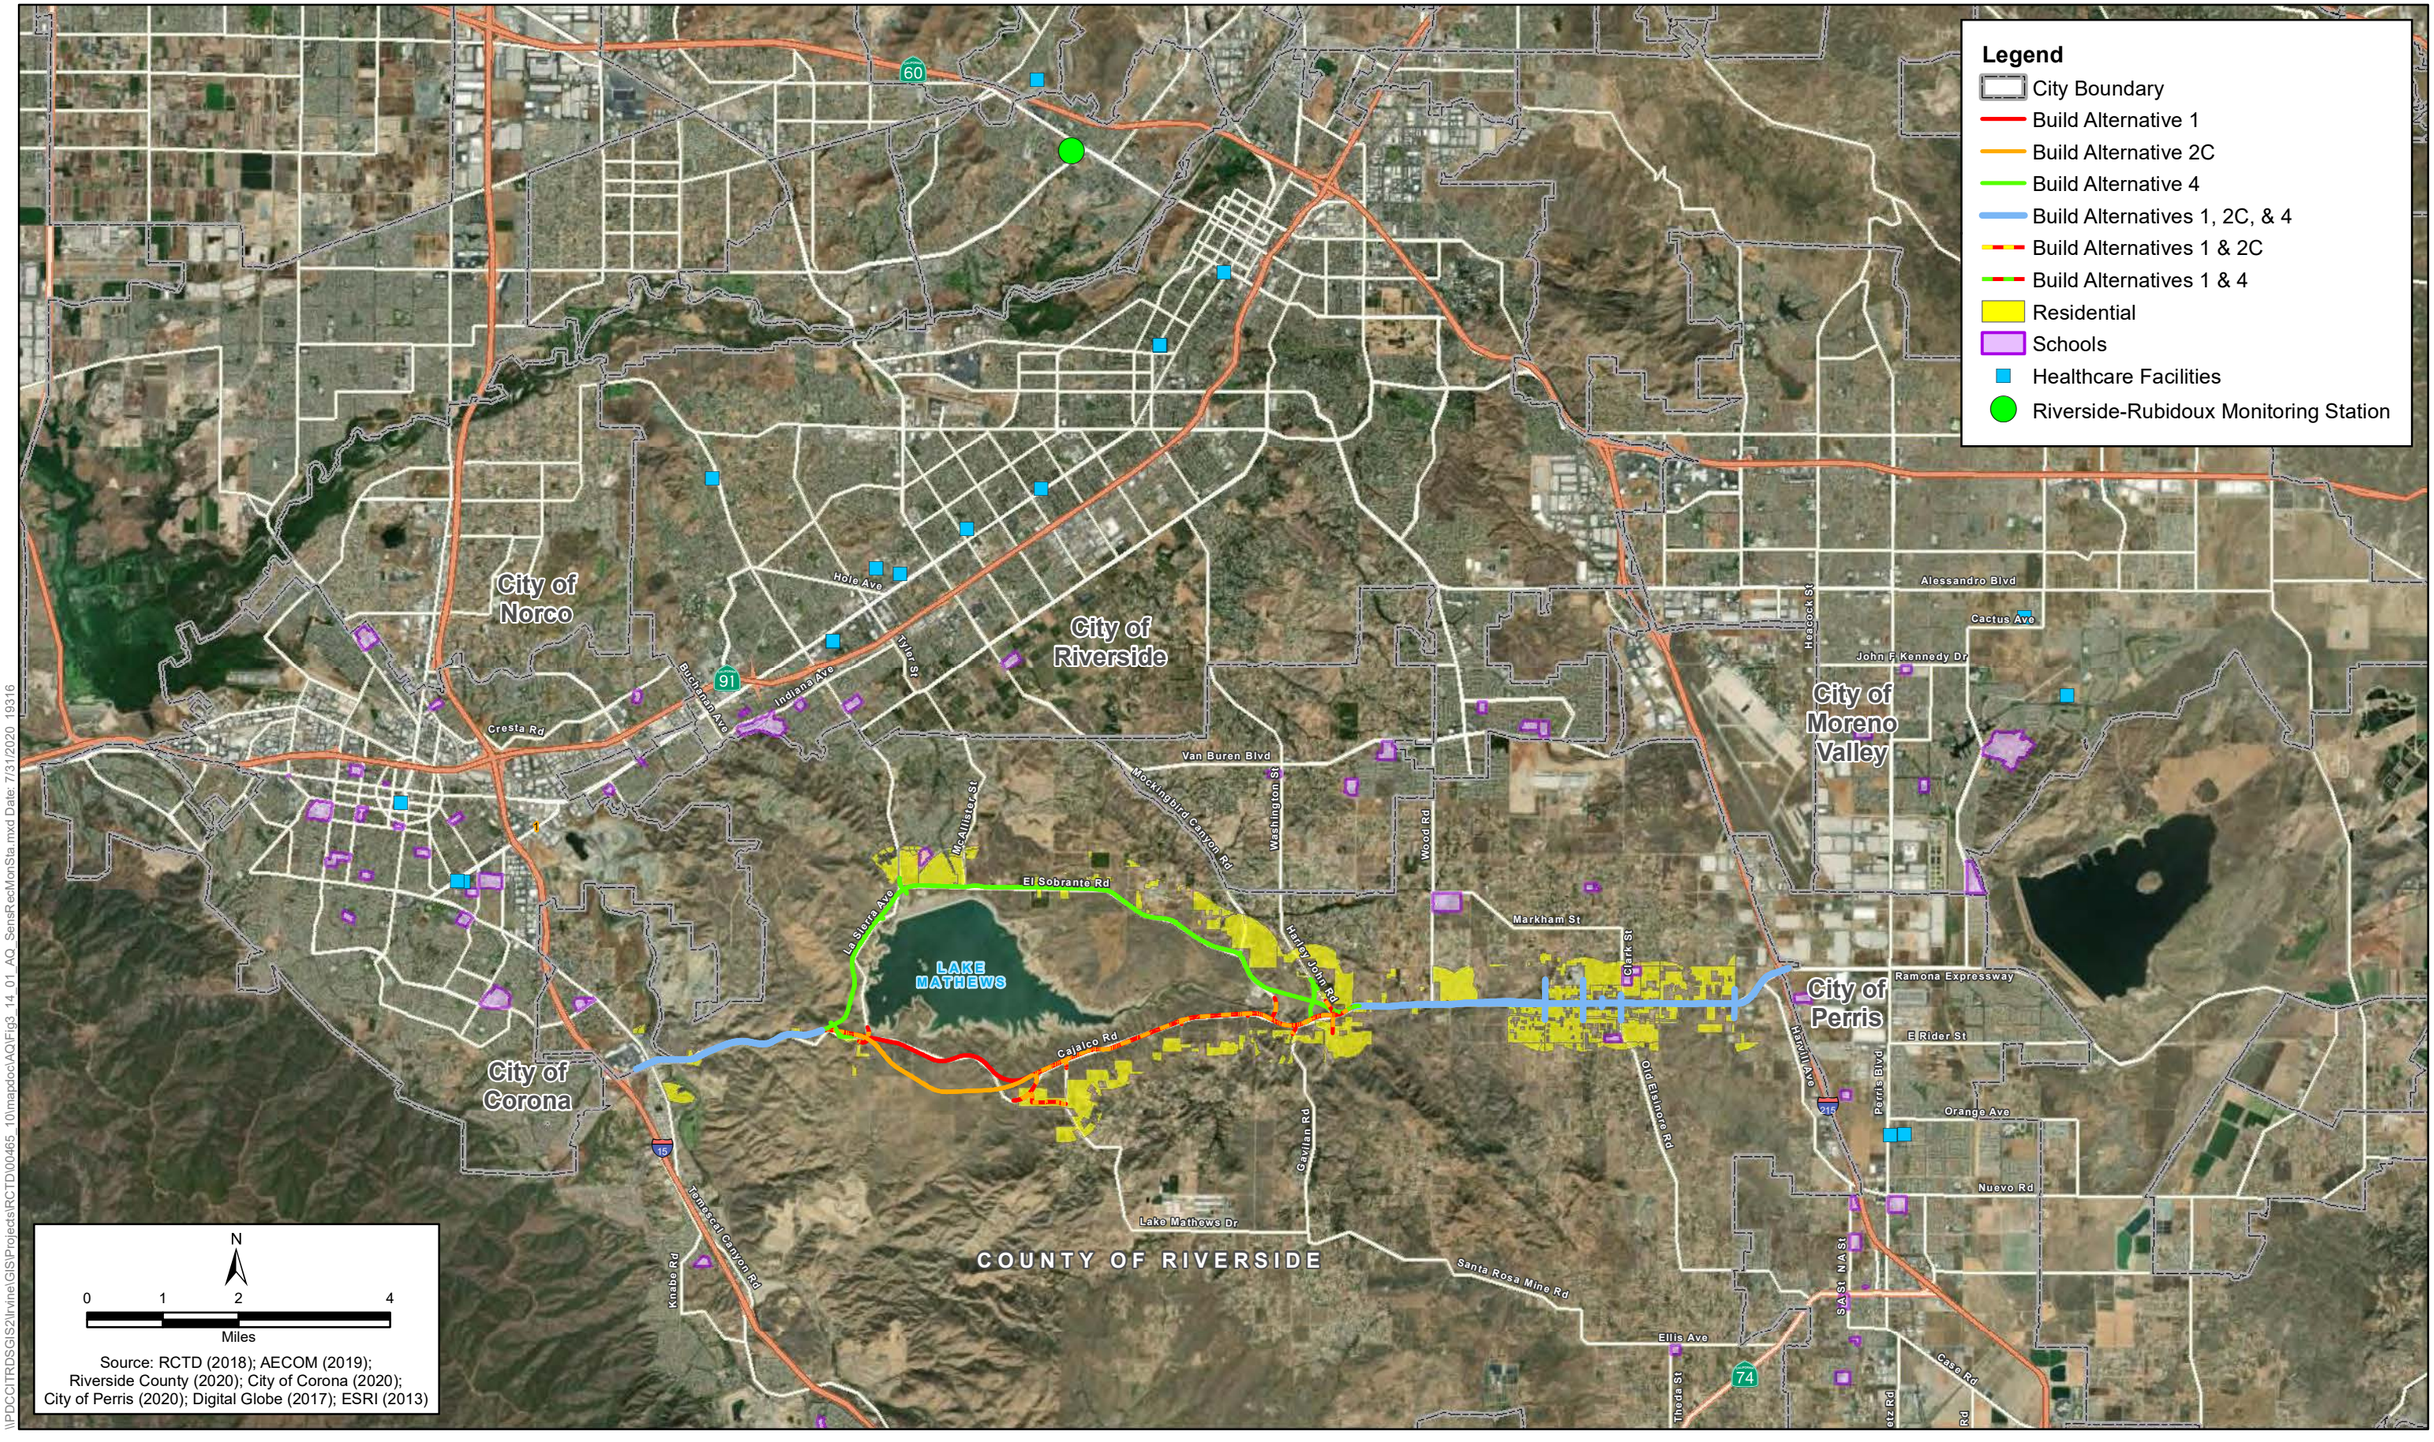
The information in this section is based on the Air Quality Study Report (AQSR) for the Cajalco Road Widening and Safety Project (Caltrans 2017a). The findings of the report are summarized in this section. The methodologies and assumptions for the air quality analysis are described in the AQSR (Caltrans 2017a).

3.14.2.1 Topography and Climate

The proposed project site is within the Riverside County portion of the South Coast Air Basin (SCAB), a 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The SCAB includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. The terrain and geographical location determine the distinctive climate of the SCAB, which is a coastal plain with connecting broad valleys and low hills. The topography and climate of Southern California combine to make the SCAB an area of high air pollution potential.

Data from the Western Regional Climate Center's Riverside-Rubidoux climate monitoring station were used to characterize project vicinity climate conditions because it is nearest to the proposed project site (Western Regional Climate Center 2016). The average project area summer (August) high and low temperatures are 94 degrees Fahrenheit (°F) and 60°F, respectively, while the average winter (January) high and low temperatures are 67°F and 39°F, respectively. The average annual rainfall is 10.2 inches. A map indicating the location of the monitoring station and potential sensitive receptors, is provided in Figure 3.14-1 on the following page.

[1] "Design concept" means the type of facility that is proposed, such as a freeway or arterial highway. "Design scope" refers to those aspects of the project that would clearly affect capacity and thus any regional emissions analysis, such as the number of lanes and the length of the project.



\\PDCCITRDSGIS2\Irvine\GIS\Projects\RCTD\00465_10\mapdoc\AQ\Fig3_14_01_AQ_SensRecMonSta.mxd Date: 7/31/2020 19316

Figure 3.14-1
Air Quality Sensitive Receptor and Monitoring Station Map
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

The wind monitoring station nearest to the proposed project site is the University of California, Riverside Station, approximately 10 miles north of the central portion of the project alignment. Wind patterns in the project vicinity are either westerly or southeasterly, with an average annual speed of 4 miles per hour.

3.14.2.2 Lake Mathews MSHCP Area

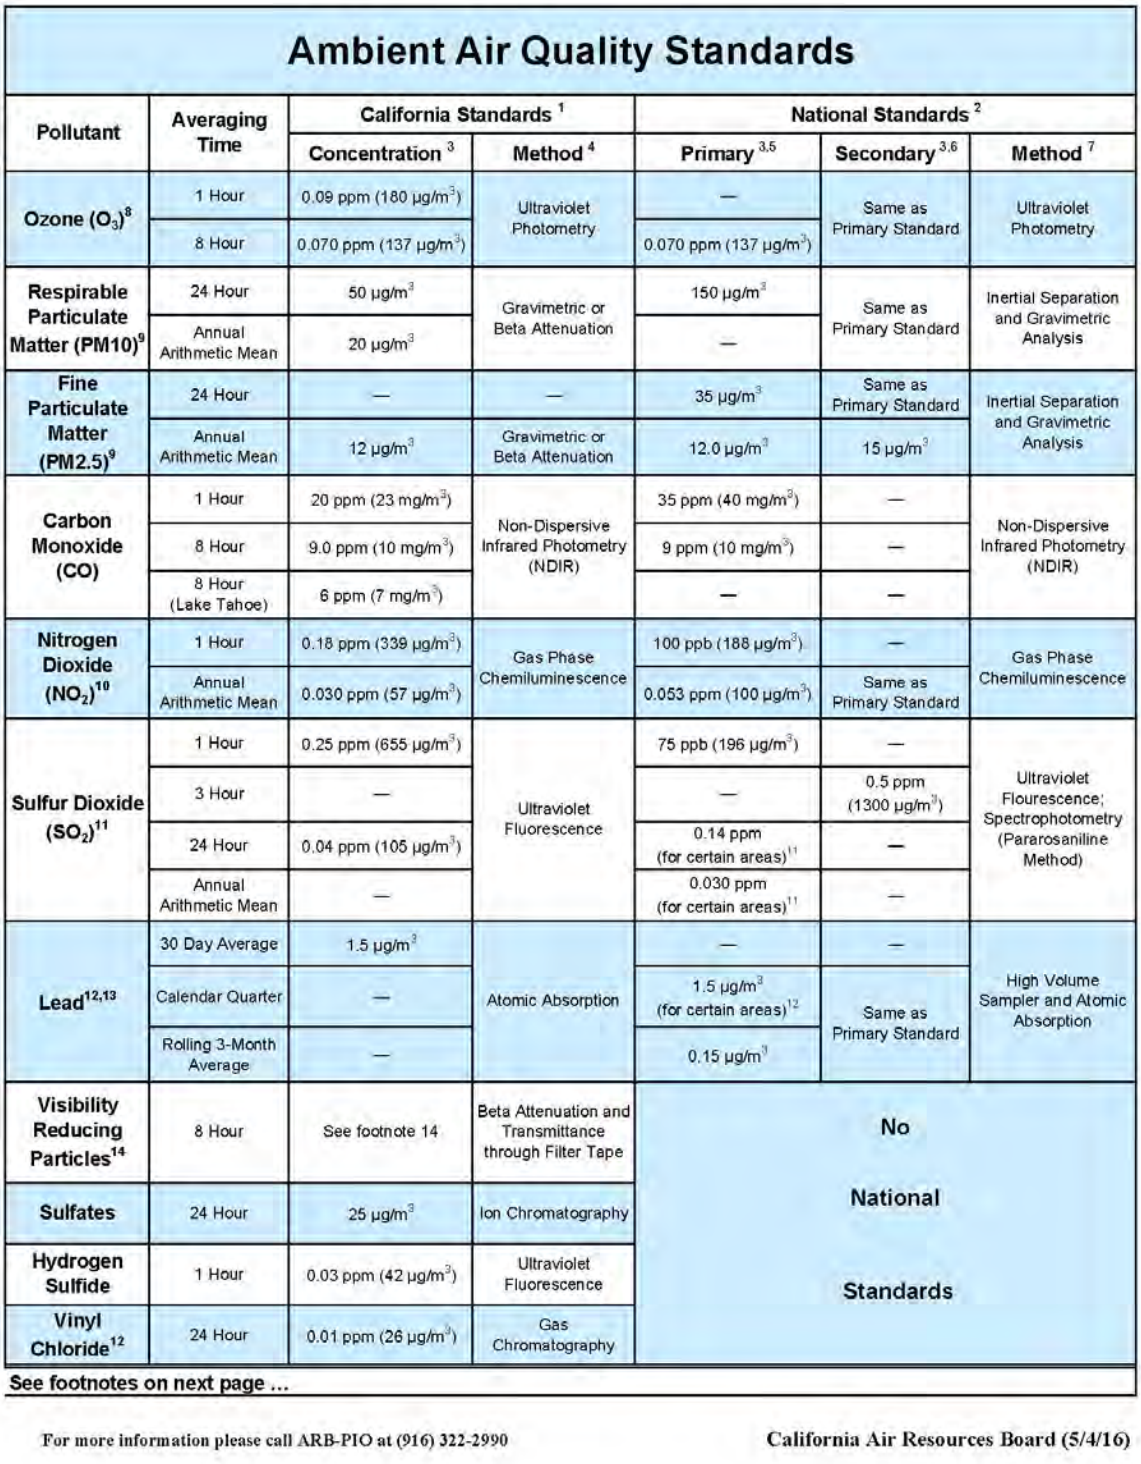
The project corridor travels through the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area and Lake Mathews Multiple Species Reserve (LMR), as well as the Lake Mathews-Estelle Mountain Reserve (LM-EM Reserve) of the Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP). The project corridor specifically travels through parcels of land that are owned by Metropolitan Water District of Southern California and Riverside County Habitat Conservation Agency (RCHCA 2007). Much of the land surrounding Lake Mathews is undeveloped because these lands are protected by the LMR and LM-EM Reserve. The LM MSHCP area is also within the Riverside County portion of the SCAB, and has a similar topography and climate to the project area as a whole.

3.14.2.3 Monitored Air Quality

Existing air quality conditions in the project area can be characterized in terms of the ambient air quality standards that the State of California and the federal government have established for several different pollutants. For some pollutants, separate standards have been set for different measurement periods. Most standards have been set to protect public health. For some pollutants, standards have been based on other values (such as protection of crops, protection of materials, or avoidance of nuisance conditions).

If a pollutant concentration is lower than the state or federal standard, the area is classified as being in attainment for that pollutant. If a pollutant violates the standard, the area is considered a nonattainment area. If data are insufficient to determine whether a pollutant is violating the standard, the area is designated unclassified. The State of California has designated the SCAB as being a nonattainment area for O_3, $PM_{2.5}$, and PM_{10}. U.S. EPA has designated this area as being an extreme nonattainment area for O_3 (eight-hour standard) and a moderate nonattainment area for $PM_{2.5}$. Figure 3.14-2 on the following page shows the state and federal standards for a variety of pollutants. Table 3.14-1 follows Figure 3.14-2 and shows the attainment status of the SCAB for criteria air pollutants.

Figure 3.14-2. State and Federal Ambient Air Quality Standards (page 1 of 2)



Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards [1]		National Standards [2]		
		Concentration [3]	Method [4]	Primary [3,5]	Secondary [3,6]	Method [7]
Ozone (O_3)[8]	1 Hour	0.09 ppm (180 µg/m³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m³)		0.070 ppm (137 µg/m³)		
Respirable Particulate Matter (PM10)[9]	24 Hour	50 µg/m³	Gravimetric or Beta Attenuation	150 µg/m³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m³		—		
Fine Particulate Matter (PM2.5)[9]	24 Hour	—	—	35 µg/m³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m³	Gravimetric or Beta Attenuation	12.0 µg/m³	15 µg/m³	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m³)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m³)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m³)		9 ppm (10 mg/m³)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m³)		—	—	
Nitrogen Dioxide (NO_2)[10]	1 Hour	0.18 ppm (339 µg/m³)	Gas Phase Chemiluminescence	100 ppb (188 µg/m³)	—	Gas Phase Chemiluminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m³)		0.053 ppm (100 µg/m³)	Same as Primary Standard	
Sulfur Dioxide (SO_2)[11]	1 Hour	0.25 ppm (655 µg/m³)	Ultraviolet Fluorescence	75 ppb (196 µg/m³)	—	Ultraviolet Flourescence; Spectrophotometry (Pararosaniline Method)
	3 Hour	—		—	0.5 ppm (1300 µg/m³)	
	24 Hour	0.04 ppm (105 µg/m³)		0.14 ppm (for certain areas)[11]	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas)[11]	—	
Lead[12,13]	30 Day Average	1.5 µg/m³	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m³ (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average	—		0.15 µg/m³		
Visibility Reducing Particles[14]	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	No National Standards		
Sulfates	24 Hour	25 µg/m³	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m³)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 µg/m³)	Gas Chromatography			

See footnotes on next page ...

For more information please call ARB-PIO at (916) 322-2990

California Air Resources Board (5/4/16)

Figure 3.14-2. State and Federal Ambient Air Quality Standards (page 2 of 2)

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.

3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

4. Any equivalent measurement method which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.

5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

7. Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.

8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

9. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 $\mu g/m^3$, as was the annual secondary standard of 15 $\mu g/m^3$. The existing 24-hour PM10 standards (primary and secondary) of 150 $\mu g/m^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

11. On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

    Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

12. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

14. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

For more information please call ARB-PIO at (916) 322-2990 **California Air Resources Board (5/4/16)**

Table 3.14-1. Attainment Status of the South Coast Air Basin

Pollutants	Federal Classification	State Classification
Ozone (O_3) (1-hour standard)	Not Applicable (Federal standard revoked)	Nonattainment
Ozone (O_3) (8-hour standard)	Nonattainment, Extreme (2015 standard)	Nonattainment
Respirable Particulate Matter (PM_{10})	Attainment/Maintenance	Nonattainment
Fine Particulate Matter ($PM_{2.5}$)	Nonattainment, Moderate (2012 standard)	Nonattainment
Carbon Monoxide (CO)	Attainment/Maintenance	Attainment
Nitrogen Dioxide (NO_2)	Attainment/Maintenance	Attainment
Sulfur Dioxide (SO_2)	Attainment	Attainment
Lead	Attainment (except for Los Angeles County portion, which is designated nonattainment)	Attainment
Source: ARB 2018.		

The project site is in the Riverside County portion of the SCAB. Because the project alignment spans approximately 15.7 miles, it is within three distinct air monitoring areas. The Riverside-Rubidoux monitoring station, which is 10 miles north of the central portion of the project alignment, was used as the representative monitoring station for the study area due to its proximity to the project as well as the number of pollutants for which data are collected. Located at 5888 Mission Boulevard, Riverside, CA 92509, the Riverside-Rubidoux monitoring station (ARB Station No. 33144/ EPA AQS No. 060658001) monitors major criteria pollutants including O_3, NO_2, CO, PM_{10}, and $PM_{2.5}$. Table 3.14-2 presents air monitoring data from the Riverside-Rubidoux monitoring station.

As shown in Table 3.14-2 on the following page, there were numerous exceedances of the federal standard for 8-hour O_3 (69 in 2016, 81 in 2017, 53 in 2018, 59 in 2019, and 82 in 2020), and the California 1-hour standard (33 in 2016, 47 in 2017, 22 in 2018, and 24 in 2019). The 2020 California 1-hour standard data is not available. In addition, PM_{10} concentrations exceeded the California standard 60 times in 2016, 98 times in 2017, 127 times in 2018, and 110 times in 2019; no exceedances of the federal PM_{10} standards were recorded. The 2020 California PM_{10} standard data is not available. $PM_{2.5}$ concentrations exceeded the federal standard five times in 2016, seven times in 2017, three times in 2018, five times in 2019, and seven times in 2020. CO and NO_2 concentrations remained below state and federal standards during the 5-year reporting period.

Table 3.14-2. Monitoring Data Collected from the Riverside-Rubidoux Monitoring Station (ARB Station No. 33144/EPA AQS Site ID 060658001)

Pollutant Standards		2016	2017	2018	2019	2020

3.14.2.4 Pollutant Overview

Air pollutants are governed by multiple federal and state standards to regulate and mitigate health impacts. At the federal level, there are six criteria pollutants for which NAAQS have been established: CO, Pb, NO_2, O_3, PM ($PM_{2.5}$ and PM_{10}), and SO_2. U.S. EPA has also identified nine priority mobile source air toxics (MSATs): 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (diesel PM), ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter (FHWA 2016). In California, sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride are also regulated.

Criteria Pollutants

The FCAA requires U.S. EPA to set NAAQS for six criteria air contaminants: O_3, PM, CO, N_2O, Pb, and SO_2. It also permits states to adopt additional or more protective air quality standards if needed. California has set standards for certain pollutants. Table 3.14-3 documents the current air quality standards while Figure 3.14-3, following Table 3.14-3, summarizes the sources and health effects of the six criteria pollutants and pollutants regulated in the state of California.

Table 3.14-3. State and Federal Criteria Air Pollutant Effects and Sources

Pollutant	Principal Health and Atmospheric Effects	Typical Sources
Ozone (O_3)	High concentrations irritate lungs. Long-term exposure may cause lung tissue damage and cancer. Long-term exposure damages plant materials and reduces crop productivity. Precursor organic compounds include many known toxic air contaminants. Biogenic VOC may also contribute.	Low-altitude ozone is almost entirely formed from reactive organic gases/volatile organic compounds (ROG or VOC) and nitrogen oxides (NO_X) in the presence of sunlight and heat. Common precursor emitters include motor vehicles and other internal combustion engines, solvent evaporation, boilers, furnaces, and industrial processes.
Respirable Particulate Matter (PM_{10})	Irritates eyes and respiratory tract. Decreases lung capacity. Associated with increased cancer and mortality. Contributes to haze and reduced visibility. Includes some toxic air contaminants. Many toxic and other aerosol and solid compounds are part of PM_{10}.	Dust- and fume-producing industrial and agricultural operations; combustion smoke & vehicle exhaust; atmospheric chemical reactions; construction and other dust-producing activities; unpaved road dust and re-entrained paved road dust; natural sources.
Fine Particulate Matter ($PM_{2.5}$)	Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and produces surface soiling. Most diesel exhaust particulate matter – a toxic air contaminant – is in the $PM_{2.5}$ size range. Many toxic and other aerosol and solid compounds are part of $PM_{2.5}$.	Combustion including motor vehicles, other mobile sources, and industrial activities; residential and agricultural burning; also formed through atmospheric chemical and photochemical reactions involving other pollutants including NO_X, sulfur oxides (SO_X), ammonia, and ROG.

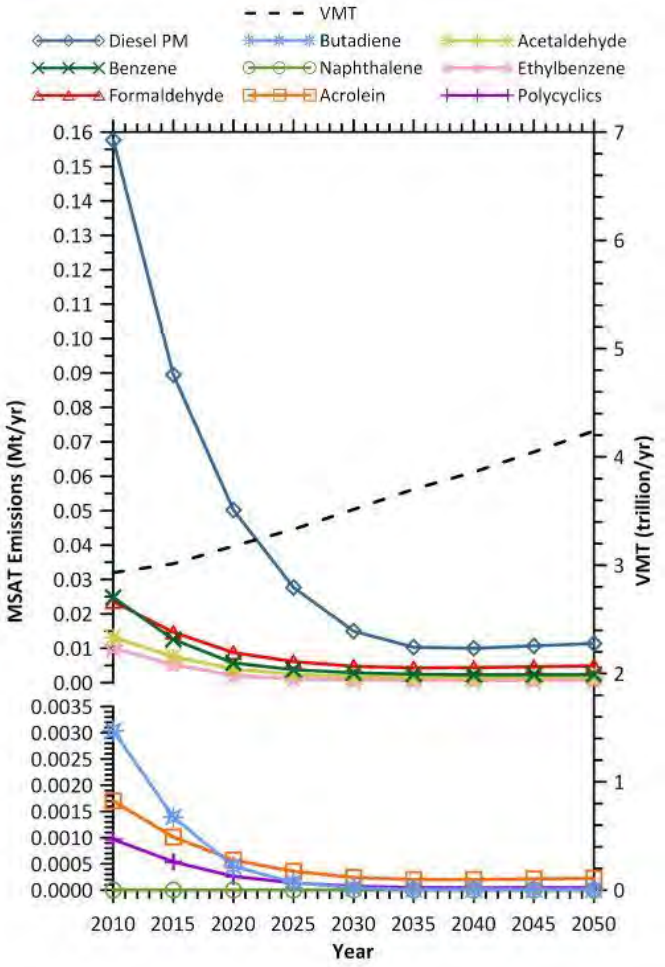
Pollutant	Principal Health and Atmospheric Effects	Typical Sources
Carbon Monoxide (CO)	CO interferes with the transfer of oxygen to the blood and deprives sensitive tissues of oxygen. CO also is a minor precursor for photochemical ozone. Colorless, odorless.	Combustion sources, especially gasoline-powered engines and motor vehicles. CO is the traditional signature pollutant for on-road mobile sources at the local and neighborhood scale.
Nitrogen Dioxide (NO_2)	Irritating to eyes and respiratory tract. Colors atmosphere reddish-brown. Contributes to acid rain & nitrate contamination of stormwater. Part of the "NO_X" group of ozone precursors.	Motor vehicles and other mobile or portable engines, especially diesel; refineries; industrial operations.
Sulfur Dioxide (SO_2)	Irritates respiratory tract; injures lung tissue. Can yellow plant leaves. Destructive to marble, iron, steel. Contributes to acid rain. Limits visibility.	Fuel combustion (especially coal and high-sulfur oil), chemical plants, sulfur recovery plants, metal processing; some natural sources like active volcanoes. Limited contribution possible from heavy-duty diesel vehicles if ultra-low sulfur fuel not used.
Lead (Pb)	Disturbs gastrointestinal system. Causes anemia, kidney disease, and neuromuscular and neurological dysfunction. Also a toxic air contaminant and water pollutant.	Lead-based industrial processes like battery production and smelters. Lead paint, leaded gasoline. Aerially deposited lead from older gasoline use may exist in soils along major roads.
Visibility-Reducing Particles (VRP)	Reduces visibility. Produces haze. NOTE: not directly related to the Regional Haze program under the Federal Clean Air Act, which is oriented primarily toward visibility issues in National Parks and other "Class I" areas. However, some issues and measurement methods are similar.	See particulate matter above. May be related more to aerosols than to solid particles.
Sulfate	Premature mortality and respiratory effects. Contributes to acid rain. Some toxic air contaminants attach to sulfate aerosol particles.	Industrial processes, refineries and oil fields, mines, natural sources like volcanic areas, salt-covered dry lakes, and large sulfide rock areas.
Hydrogen Sulfide (H_2S)	Colorless, flammable, poisonous. Respiratory irritant. Neurological damage and premature death. Headache, nausea. Strong odor.	Industrial processes such as: refineries and oil fields, asphalt plants, livestock operations, sewage treatment plants, and mines. Some natural sources like volcanic areas and hot springs.
Vinyl Chloride	Neurological effects, liver damage, cancer. Also considered a toxic air contaminant.	Industrial processes.

Mobile Source Air Toxics

Controlling air toxic emissions became a national priority with the passage of the Clean Air Act Amendments (CAAA) of 1990, whereby Congress mandated that U.S. EPA regulate 188 air toxics, also known as hazardous air pollutants. U.S. EPA has assessed this expansive list in its rule on the Control of Hazardous Air Pollutants from Mobile Sources (Federal Register, Vol. 72, No. 37, page 8430, February 26, 2007), and identified a group of 93 compounds emitted from mobile sources that are part of U.S. EPA's Integrated Risk Information System (https://www.epa.gov/iris). In addition, U.S. EPA identified nine compounds with significant contributions from mobile sources that are among the national and regional-scale cancer risk drivers or contributors and non-hazard contributors from the 2011 National Air Toxics Assessment (https://www.epa.gov/national-air-toxics-assessment). These are 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (diesel PM), ethylbenzene, formaldehyde, naphthalene, and polycyclic organic matter. While FHWA considers these the priority MSATs, the list is subject to change and may be adjusted in consideration of future U.S. EPA rules.

The 2007 U.S. EPA rule mentioned above requires controls that will dramatically decrease MSAT emissions through cleaner fuels and cleaner engines. According to an FHWA analysis using U.S. EPA's MOVES2014a model, even if vehicle activity (vehicle-miles traveled [VMT]) increases by 45 percent from 2010 to 2050 as forecast, a combined reduction of 91 percent in the total annual emission rate for the priority MSATs is projected for the same time period, as shown on Figure 3.14-3.

Figure 3.14-3. State and Federal Criteria Air Pollutant Effects and Sources



Source: https://www.fhwa.dot.gov/environment/air_quality/air_toxics/policy_and_guidance/msat/.

3.14.2.5 Asbestos

Asbestos is a term used for several types of naturally occurring fibrous minerals that are a human health hazard when airborne. The most common type of asbestos is chrysotile, but other types such as tremolite and actinolite are also found in California. Asbestos is classified as a known human carcinogen by state, federal, and international agencies and was identified as a toxic air contaminant by ARB in 1986. All types of asbestos are hazardous and may cause lung disease and cancer.

Asbestos can be released from serpentine and ultramafic rocks when the rock is broken or crushed. At the point of release, the asbestos fibers may become airborne, causing air quality and

human health hazards. These rocks have been commonly used for unpaved gravel roads, landscaping, fill projects, and other improvement projects in some localities. Asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading for development projects, and at quarry operations. All of these activities may have the effect of releasing potentially harmful asbestos into the air. Natural weathering and erosion processes can act on asbestos-bearing rock and make it easier for asbestos fibers to become airborne if such rock is disturbed.

Serpentine may contain chrysotile asbestos, especially near fault zones. Ultramafic rock, a rock closely related to serpentinite, may also contain asbestos minerals. Asbestos can also be associated with other rock types in California, though much less frequently than serpentinite and/or ultramafic rock. Serpentinite and/or ultramafic rock are known to be present in 44 of California's 58 counties. These rocks are particularly abundant in counties of the Sierra Nevada foothills, the Klamath Mountains, and Coast Ranges. The California Department of Conservation, Division of Mines and Geology has developed a map showing the general location of ultramafic rock in the state (www.conservation.ca.gov/cgs/minerals/hazardous_minerals/asbestos/Pages/index.aspx).

3.14.3 Environmental Consequences

3.14.3.1 Permanent Impacts

Build Alternatives 1, 2C, and 4

Regional Air Quality Conformity

Build Alternatives 1 and 2C are listed in the Southern California Association of Governments (SCAG) financially constrained 2020-2045 RTP/Sustainable Communities Strategy (SCS) under project number 3A04WT137A, which was adopted by SCAG on September 3, 2020; FHWA and FTA made a regional conformity determination finding on June 5, 2020. The project is also included in the SCAG financially constrained 2021 FTIP, page 9 (Riverside County – 100% Prior, project number RIV090903), which was found to conform by FHWA and FTA on April 16, 2021.[2] The design concept and scope of the proposed project is consistent with the project description in the 2020-2045 RTP/SCS, 2021 FTIP, and the "open to traffic" assumptions of SCAG's regional emissions analysis. Refer to Appendix G of this EIR/EIS for copies of the listing of the project in the 2020-2045 RTP and the 2021 FTIP.

[2] The project is currently described in the 2021 FTIP as "CAJALCO RD. WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON RD. TO HARVILL AVE AND FROM 4 TO 6 LANES FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND A BRIDGE RECONSTRUCTION OVER A WATER CROSSING." The County of Riverside has submitted an amendment that would update the description as follows: "IN RIVERSIDE COUNTY ON CAJALCO RD - WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON. BRIDGE/EAGLE CANYON ROAD TO HARVILL AVE AND FROM 4 TO 6 LANES WITH THREE LANES IN THE WESTBOUND DIRECTION FROM TEMESCAL CANYON RD TO TEMESCAL CANYON BRIDGE, THREE LANES IN THE EASTBOUND DIRECTION FROM TEMESCAL CANYON ROAD TO JUST EAST OF EAGLE CANYON ROAD, AND THREE LANES EASTBOUND AND WESTBOUND FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND THE CONSTRUCTION OF NEW, AND RECONSTRUCTION OF EXISTING, BRIDGES AS NEEDED." This amendment will be obtained prior to adoption of the Final Environmental Document.

In the event that Build Alternative 4 is identified as the Preferred Alternative, the project description in the FTIP would need to be revised to reflect the widening of La Sierra Avenue and El Sobrante Road from two to four lanes to the west and north of Lake Mathews. While Build Alternative 4 would provide a transportation facility, the design and location would differ slightly from that of Build Alternatives 1 and 2C. In addition, Build Alternative 4 would not substantially change the overall number of VMT in the project area. Therefore, the project design and scope under Build Alternative 4 would change slightly from that in the current regional analysis. As such, the FTIP description would require revision to accurately reflect Build Alternative 4 if Build Alternative 4 is identified as the Preferred Alternative.

Project-Level Conformity

Carbon Monoxide

Caltrans, in coordination with the University of California, Davis, Institute of Transportation Studies, has developed a transportation project-level CO Protocol (Garza et al. 1997). This CO Protocol details a qualitative step-by-step screening procedure to determine whether project related CO concentrations have a potential to generate new air quality violations, worsen existing violations, or delay attainment of NAAQS for CO. If the screening procedure reveals that such a potential may exist, then the CO Protocol details a quantitative method to ascertain project-related CO impacts.

The proposed project was evaluated using the CO Protocol. The CO Protocol includes two flowcharts that illustrate when a detailed CO analysis needs to be prepared. The referenced flowcharts are included in Appendix D to the December 2017 AQSR.

Based on the first flowchart in the CO Protocol, it was determined that the proposed project is not exempt from emissions analyses and that the proposed project would be defined as regionally significant. It was also determined that the proposed project is not in a federal attainment area for all criteria pollutants. The responses to the questions from the first flowchart also documented that the project is within an area with a currently conforming RTP and FTIP and that the proposed project was included in the regional emissions analysis. It was also determined that the project design concept and/or scope has not changed significantly from that in the regional analysis.

On the basis of the answers to the first flowchart, a second flowchart is used to determine the level of local CO impact analysis required for the project. Responses to the second flowchart questions identified that the project is in a CO attainment/maintenance area for the federal CO standards, and that the SCAB was reclassified to attainment/maintenance from serious nonattainment, effective June 11, 2007, when a CO Maintenance Plan was approved. Based on ambient air monitoring data collected by the South Coast Air Quality Management District (SCAQMD), the SCAB has continually met the NAAQS for CO since 2002.

The response to Level 7 of the second flowchart identified that the proposed project has the potential to worsen air quality due to the increases in traffic volumes and increases in localized delay at intersections identified under each of the build alternatives at the Opening Year 2024 and Horizon Year 2044 relative to the corresponding No-Build Alternative.

Tables 3.14-4 and 3.14-5 on the following page show roadway segment volumes under Build Alternatives 1, 2C, and 4 relative to the No-Build Alternative for Opening Year 2024. As shown, increases in volumes would result from the increases in roadway capacity. Increases in roadway segment daily traffic volumes relative to the No-Build Alternative under Build Alternatives 1 and 2C would range from 37 percent to 125 percent.

Relative to the No-Build Alternative, the percentage increases in daily traffic volumes would generally be highest in the western portion of the alignment, with lower percentage increases in the eastern portion of the alignment. Although the absolute increases in traffic volumes would be similar between all segments, the percentage increases differ due to the No-Build Alternative baseline volumes. Level of service (LOS) would be similar to No-Build conditions, with no segments deteriorating to LOS E or F as a result of implementation of Build Alternatives 1 or 2C (see Table 3.14-4). Increases in roadway segment daily traffic volumes relative to the No-Build Alternative under Build Alternative 4 would range from 7 percent to 114 percent. LOS would be similar to No-Build conditions, with one segment (Cajalco Road between Temescal Canyon and La Sierra Avenue) deteriorating to LOS E or F as a result of Build Alternative 4 implementation and improvements in LOS on El Sobrante Road (see Table 3.14-5).

Table 3.14-4. Opening Year 2024 Daily Roadway Segment Volumes (No-Build and Build Alternatives 1 and 2C)

[1] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment of El Sobrante Road between Harley John Road and Mockingbird Canyon Road is compared to the No-Build Alternative segment of El Sobrante Road between Cajalco Road and Mockingbird Canyon Road.

[2] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment of El Sobrante Road between Cajalco Road and Harley John Road is compared to the No-Build Alternative segment Cajalco Road between Harley John Road and Gavilian Road.

[3] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment of Cajalco Road between Gavilian Road and Lake Mathews Drive is compared to the No-Build Alternative segment Cajalco Road between El Sobrante Road and Lake Mathews Drive.

[4] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment Cajalco Road east of El Sobrante Road is compared to the No-Build Alternative segment of Cajalco Road east of Harley John Road.

Tables 3.14-6 and 3.14-7 on the following page show roadway segment volumes under Build Alternatives 1, 2C, and 4, relative to the No-Build Alternative for Horizon Year 2044. As shown, increases in volumes would result from the increases in roadway capacity. Increases in roadway segment daily traffic volumes relative to the No-Build Alternative under Build Alternatives 1 or 2C would range from 25 percent to 111 percent. LOS would be similar to No-Build conditions, with no segments deteriorating to LOS E or F as a result of Build Alternative 1 or 2C implementation (see Table 3.14-6). Increases in roadway segment daily traffic volumes relative to the No-Build Alternative under Build Alternative 4 would range from 10 to 129 percent. LOS would be similar to No-Build conditions, with no segments deteriorating to LOS E or F as a result of Build Alternative 4 implementation and improvements in LOS on El Sobrante Road (see Table 3.14-7).

Table 3.14-6. Horizon Year 2044 Daily Roadway Segment Volumes (No-Build and Build Alternatives 1 and 2C)

Segment	No-Build Alternative			Alternatives 1 and 2C			Percent Increase
	Lanes	2044 AADT	LOS	Lanes	2044 AADT	LOS	
Cajalco Road between Temescal Canyon Road and La Sierra Avenue	2	13,460	C	6	20,340	A	51%
Cajalco Road between La Sierra Avenue and Lake Mathews Drive	2	4,310	A	4	8,950	A	108%
Cajalco Road between Lake Mathews Drive and El Sobrante Road	2	5,770	A	4	12,200	A	111%
Cajalco Road between El Sobrante Road and Gavilian Road	2	23,800	F	4	33,100	E	39%
Cajalco Road between Gavilian Road and Harley John Road	2	27,330	F	4	39,280	F	44%

[1] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment of El Sobrante Road between Harley John Road and Mockingbird Canyon Road is compared to the No-Build Alternative segment El Sobrante Road between Cajalco Road and Mockingbird Canyon Road.

[2] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment of El Sobrante Road between Cajalco Road and Harley John Road is compared to the No-Build Alternative segment Cajalco Road between Harley John Road and Gavilian Road.

[3] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment of Cajalco Road between Gavilian Road and Lake Mathews Drive is compared to the No-Build Alternative segment Cajalco Road between El Sobrante Road and Lake Mathews Drive.

[4] Due to the change in roadway configuration under Alternative 4, the Alternative 4 segment of Cajalco Road east of El Sobrante Road is compared to the No-Build Alternative segment Cajalco Road east of Harley John Road.

The proposed project also has the potential to worsen air quality on the basis that it could worsen traffic flow at specific study area intersections under the build alternatives relative to the No-Build Alternative. The following intersections that operate at LOS D, E, or F for one or both peak hours under the Opening Year 2024 No-Build Alternative would experience an increase in delay of 5 seconds or greater under one or more of the build alternatives

Build Alternatives 1 and 2C:

- Interstate 15 (I-15) southbound ramps and Ontario Avenue
- Cajalco Road and Temescal Canyon Road

- Interstate 215 (I-215) southbound ramps and Cajalco Expressway/Ramona Expressway
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway
- Webster Avenue and Ramona Expressway

Build Alternative 4:

- I-15 northbound ramps and El Cerrito Road
- Cajalco Road and Temescal Canyon Road
- La Sierra Avenue and Victoria Avenue
- La Sierra Avenue and El Sobrante Road
- Day Street and State Route 60 (SR-60) eastbound ramps
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway
- I-215 northbound ramps and Nuevo Road
- Webster Avenue and Ramona Expressway

In addition, the following intersections that operate at LOS D, E, or F for one or both peak hours under the Horizon Year 2044 No-Build Alternative would experience an increase in delay of 5 seconds or greater under one or more of the build alternatives.

Build Alternatives 1 and 2C:

- Bedford Canyon Road and El Cerrito Road
- Cajalco Road and Bedford Canyon Road
- Cajalco Road and Temescal Canyon Road
- La Sierra Avenue and Victoria Avenue
- Cajalco Road and La Sierra Avenue
- Gavilian Road and Cajalco Road
- Cajalco Road and Harley John Road
- Alexander Street and Cajalco Road
- Clark Street and Cajalco Road
- Seaton Avenue and Markham Street
- Seaton Avenue and Cajalco Road
- Harvill Avenue and Placentia Avenue
- Sycamore Canyon Road and SR-60/I-215 southbound ramps
- SR-60/I-215 northbound ramps and Fair Isle Drive/Box Springs Road
- Day Street and SR-60 eastbound ramps
- I-215 ramps and Eucalyptus Avenue
- I-215 northbound ramps and Alessandro Boulevard
- I-215 northbound ramps/Old 215 Frontage Road and Cactus Avenue
- I-215 southbound ramps and Van Buren Boulevard
- I-215 southbound ramps and Cajalco Expressway/Ramona Expressway
- I-215 Northbound Frontage Road and Placentia Avenue
- Webster Avenue and Ramona Expressway
- Indian Street and Ramona Expressway

Build Alternative 4:

- I-15 northbound ramps and Ontario Avenue
- Bedford Canyon Road and El Cerrito Road
- Sycamore Canyon Road and SR-60/I-215 southbound ramps 49: SR-60/I-215

- Cajalco Road and Bedford Canyon Road
- Cajalco Road and Temescal Canyon Road
- I-15 northbound ramps and Weirick Road
- La Sierra Avenue and Victoria Avenue
- Cajalco Road and La Sierra Avenue
- Gavilian Road and Cajalco Road
- Cajalco Road and Harley John Road
- Alexander Street and Cajalco Road
- Clark Street and Cajalco Road
- Seaton Avenue and Markham Street
- Seaton Avenue and Cajalco Road
- Harvill Avenue and Placentia Avenue
- I-15 northbound ramps and Fair Isle Drive/Box Springs Road
- Day Street and SR-60 eastbound ramps
- I-215 ramps and Eucalyptus Avenue
- I-215 northbound ramps and Alessandro Boulevard
- I-215 northbound ramps/Old 215 Frontage Road and Cactus Avenue
- I-215 southbound ramps and Van Buren Boulevard
- I-215 Southbound Ramps and Cajalco Expressway/Ramona Expressway
- I-215 Northbound Frontage Road and Placentia Avenue
- Webster Avenue and Ramona Expressway
- Indian Street and Ramona Expressway

Because there would be increases in delay at study area intersections under the build alternatives relative to the No-Build condition, the project would worsen traffic flow.

On the basis of the CO Protocol screening criteria, the proposed project has the potential to worsen air quality; therefore, additional analysis is required (proceed to Section 4.7.2).

Level 7: Is the project suspected of resulting in higher CO concentrations than those existing within the region at the time of attainment demonstration?

Note: The Final 2016 Air Quality Management Plan (AQMP) is the most recent AQMP, but no additional regional or hot-spot CO modeling was conducted to demonstrate attainment of the 8-hour average O_3 standard, as SCAQMD submitted a request to U.S. EPA to redesignate the SCAB as an attainment area for the 8-hour federal CO standard in 2013 (SCAQMD 2013). Therefore, the 2003 AQMP is used as the basis for the following analysis. In addition, the 2003 AQMP did not provide model input assumptions. Instead, it refers to the 1992 CO Plan, where a general description of input assumptions was provided (SCAQMD 2003).

Response: No. According to Section 4.7.2 of the CO Protocol, project sponsors are encouraged to use the following criteria to determine the potential for the project to result in higher CO concentrations than those existing within the region at the time of attainment demonstration:

a. *The receptors at the location under study are at the same distance or farther from the traveled roadway than the receptors at the location where attainment has been demonstrated.*

A receptor distance of 3 meters from the traveled roadway was used in the CO attainment demonstration prepared for the 2003 AQMP. With respect to the proposed project, all sensitive receptors are located no closer than 3 meters from the traveled roadway. The closest sensitive receptors to the project site are residences adjacent to the widened roadway.

b. *The roadway geometry of the two locations is not significantly different. An example of a significant difference would be a larger number of lanes at the location under study compared with the location where attainment has been demonstrated.*

In the CO attainment demonstration prepared for the 2003 AQMP, four approach lanes in all directions were used to model the intersections at Wilshire/Veteran and La Cienega/Century, while three approach lanes in all directions were used to model the intersections at Sunset/ Highland and Long Beach/Imperial. Therefore, if the total number of intersection approach lanes associated with any of the proposed project alternatives exceeds 16 lanes, the intersection could result in a potentially adverse effect. Table 3.14-8 shows the number of approach lanes that would occur under the build alternatives. As shown therein, the maximum number of approach lanes at any intersection location under the build alternatives would be 10 (Webster Avenue at Ramona Expressway), which is fewer than the 16 lanes used in the attainment demonstration.

Table 3.14-8. Approach Lanes for the Proposed Project

Intersection	Number of Approach Lanes			
	Eastbound	Westbound	Northbound	Southbound
Opening Year 2024 Alternative 1 and 2C Intersections *				
I-15 Southbound Ramps and Ontario Avenue	2	2	-	-
Cajalco Road and Temescal Canyon Road	1	3	1	2
I-215 Southbound Ramps and Cajalco Road Expressway/Ramona Expressway	3	3	-	1
I-215 Northbound Ramps and Cajalco Expressway/Ramona Expressway	2	2	1	-
Webster Avenue and Ramona Expressway	3	3	2	2
Opening Year 2024 Alternative 4 Intersections *				
I-15 Northbound Ramps and El Cerrito Road	1	2	1	-
Cajalco Road and Temescal Canyon Road	1	2	1	2
La Sierra Avenue and Victoria Avenue	1	1	2	2
La Sierra Avenue and El Sobrante Road	-	-	2	1
Day Street and SR-60 Eastbound Ramps	-	-	2	3
I-215 Northbound Ramps and Cajalco Expressway/Ramona Expressway	2	2	1	-
I-215 Northbound Ramps and Nuevo Road	2	2	1	-
Horizon Year 2044 Alternative 1 and 2C Intersections *				
Cajalco Road and Bedford Canyon Road	2	2	-	-

La Sierra Avenue and Victoria Avenue	1	2	3	3
Cajalco Road and Harley John Road	2	2	1	1
Sycamore Canyon Road and SR-60/I-215 Southbound Ramps	-	-	3	1
SR-60/I-215 Northbound Ramps and Fair Isle Drive/Box Springs Road	2	1	1	-
I-215 Ramps and Eucalyptus Avenue	2	2	-	-
Webster Avenue and Ramona Expressway	3	3	2	2
Horizon Year 2044 Alternative 4 Intersections *				
Cajalco Road and Bedford Canyon Road	1	2	1	-
Cajalco Road and Temescal Canyon Road	2	2	-	-
La Sierra Avenue and Victoria Avenue	1	3	3	3
Sycamore Canyon Road and SR-60/I-215 Southbound Ramps	1	2	3	3
SR-60/I-215 Northbound Ramps and Fair Isle Drive/Box Springs Road	-	-	3	1

Intersection	Number of Approach Lanes			
	Eastbound	Westbound	Northbound	Southbound
I-215 Ramps and Eucalyptus Avenue	2	1	1	-

* Intersections were selected for each scenario based on the following criteria:
1. Intersection operates at LOS D, E, or F under No-Build Conditions for one or both peak hours.
2. Intersection delay increases by 5 seconds or greater during one or both peak hours under the build alternative identified.
3. Intersection delay is one of the five highest of all 69 study area intersections in either the AM or PM peak hour.

c. *Expected worse-case meteorology at the location under study is the same or better than the worst-case meteorology at the location where attainment has been demonstrated. Relevant meteorological variables include wind speed, wind direction, temperature, and stability class.*

In the CO attainment demonstration prepared for the 2003 AQMP, a wind speed of 1 meter per second, stability class D, and worst-case wind angle were used as modeling assumptions. These assumptions are considered worst case; as such, the expected worst-case meteorology at the location under study would be the same or better. In addition, there is no meaningful difference in temperature between the attainment demonstration intersection locations and the proposed project study area intersection locations.

d. Traffic lane volumes at the location under study are the same or lower than those at the location where attainment has been demonstrated.

A comparison of the traffic volumes per lane used for modeling in the attainment plan demonstration and volumes per lane projected to occur at the studied intersection locations is provided in Table 3.14-9 for Opening Year 2024 and Horizon Year 2044. As shown therein, overall per-lane approach volumes would generally be lower than the approach lane volumes of the attainment demonstration intersections for Opening Year 2024 and Horizon Year 2044, with exception of the following intersections under Build Alternatives 1, 2C, and 4 in 2044, which would have per-lane volumes from some approaches greater than the highest per-lane approach volumes for the 2003 attainment demonstration:

- Sycamore Canyon Road and SR-60/I-215 southbound ramps
- SR-60/I-215 northbound ramps and Fair Isle Drive/Box Springs Road
- I-215 ramps and Eucalyptus Avenue

However, overall approach volumes at these locations would be lower than the attainment demonstration intersections, and the existing vehicle stock emits substantially less CO compared to vehicles in operation at the time of the 2003 attainment demonstration, a trend that will continue as older vehicles are replaced with newer vehicles that release less pollutants. Furthermore, as shown in Table 3.14-2, the existing maximum 8-hour background CO concentration in the project area is no greater than 1.8 parts per million (ppm) compared to an 8-hour background concentration of 7.8 ppm used for the 2003 attainment demonstration analysis (77 percent lower). Because of the lower overall intersection volumes, lower emissions from vehicles, and the lower background concentrations, no CO hotspot is anticipated.

e. Percentage of vehicles operating in cold-start mode at the location under study is the same or lower than the percentage at the location where attainment has been demonstrated.

The proposed project would not increase the percentage of vehicles operating in cold-start mode in the project area because no parking facilities would be constructed as part of the proposed project.

f. Percentage of heavy-duty gas trucks at the location under study is the same or lower than the percentage at the location where attainment has been demonstrated.

The attainment area demonstration intersections are located along urban arterial roadways with a commercial and residential mix of land uses within the SCAB, and the project area intersections are urban arterials near primarily residential land uses. Because neither the demonstration intersection areas nor the project area have a high concentration of industrial uses or other uses responsible for a substantial number of truck trips, the project area is anticipated to have a similar percentage of heavy-duty trucks to the attainment demonstration intersections. Aggregate mining operations near the western end of the project alignment are known to generate heavy-duty truck trips in the project vicinity at present, which is expected to continue in the future. Given the location of mining operations near I-15, it is anticipated that the bulk of the trips would continue to access the regional transportation network via I-15 and a substantial change in truck traffic elsewhere along the project alignment would not occur.

Table 3.14-9. 2024 and 2044 Peak-Hour Approach Lane Volumes: Proposed Project and 2003 AQMP Attainment Demonstration

Location	Eastbound (AM/PM)	Westbound (AM/PM)	Northbound AM/PM)	Southbound (AM/PM)

Attainment Demonstration Intersections (Used in the SCAQMD 2003 AQMP CO Attainment Demonstration)				
Wilshire Boulevard and Veteran Avenue (four lanes, all directions)	1,238/517	458/829	180/350	140/233
Sunset Boulevard and Highland Avenue (three lanes, all directions)	472/588	447/513	768/611	517/746
La Cienega Boulevard and Century Boulevard (four lanes, all directions)	635/561	473/682	346/507	205/419
Long Beach Boulevard and Imperial Highway (three lanes, all directions)	406/673	587/467	160/315	252/383

Sources: Based on Caltrans 2017b; SCAQMD 2003.
* Study area intersections were selected for each scenario based on the following criteria:
1. Intersection operates at LOS D, E, or F under No-Build Conditions for one or both peak hours.
2. Intersection delay increases by 5 seconds or greater during one or both peak hours under the build alternative identified.
3. Intersection delay is one of the five highest of all 69 study area intersections in either the AM or PM peak hour.

g. *For projects involving intersections, average delay and queue length figures for each approach are the same or smaller for the intersection under study compared with those found in the intersection where attainment has been demonstrated.*

   As shown in Table 3.14-9, the overall per-lane approach volumes would generally be lower than the approach lane volumes of the attainment demonstration intersections for Opening Year 2024 and Horizon Year 2044, with exception of the following intersections under Build Alternatives 1, 2C, and 4 in 2044, which would have per-lane volumes from some approaches greater than the highest per-lane approach volumes for the 2003 attainment demonstration.

   - Sycamore Canyon Road and SR-60/I-215 southbound ramps
   - SR-60/I-215 northbound ramps and Fair Isle Drive/Box Springs Road
   - I-215 ramps and Eucalyptus Avenue

   However, overall approach volumes (when approach volumes are not divided by the number of lanes) at these locations would be lower than the volumes at attainment demonstration intersections. Overall average delay and queue length figures for the build alternatives are anticipated to be less than those for the attainment demonstration intersections.

h. *Background concentration at the location under study is the same as or lower than the background concentration at the location where attainment has been demonstrated.*

   As shown earlier in Table 3.14-2, the maximum recorded background CO concentration in the project area in the past 3 years is 1.8 ppm for the 8-hour averaging period. This value is substantially less than the 8-hour average maximum background concentration of 7.8 ppm (2005) used for the 2003 AQMP attainment demonstration.

Because the answer to the second Level 7 question is "no," per the CO Protocol, the project is satisfactory and no further analysis is needed. Because project implementation would not result in CO concentrations that exceed the 1-hour or 8-hour ambient air quality standards, on the basis of CO Protocol analysis methodology, the build alternatives are not expected to result in a new

or more severe exceedance of either the NAAQS or California Ambient Air Quality Standards (CAAQS). As previously indicated, the proposed project was evaluated using Figure 1 and Figure 3 of the CO Protocol. Through this process, it was determined the build alternatives are not expected to result in a new or more severe exceedance of either the NAAQS or CAAQS related to CO.

Particulate Matter (PM_{10} and $PM_{2.5}$)

In November 2015, U.S. EPA issued a guidance document titled *Transportation Conformity Guidance for Quantitative Hot-spot Analyses in PM2.5 and PM10 Nonattainment and Maintenance Areas* (FHWA and U.S. EPA 2015). This guidance details a step-by-step screening procedure to determine whether project-related particulate emissions have a potential to generate new air quality violations, worsen existing violations, or delay attainment of NAAQS for $PM_{2.5}$ or PM_{10}.

Although nearly all projects create particulate emissions during construction, construction activities lasting 5 years or less are considered temporary impacts under the U.S. EPA transportation conformity rule and are exempt from project-level conformity analysis. It is expected that this project would be constructed in approximately 4 years. As such, this project-level hot-spot analysis is limited to operational impacts.

U.S. EPA specifies in 40 CFR 93.123(b)(1) that only "projects of air quality concern" are required to undergo a $PM_{2.5}$ and PM_{10} hot-spot analysis. U.S. EPA defines projects of air quality concern as certain highway and transit projects that involve significant levels of diesel traffic or any other project that is identified by the $PM_{2.5}$ SIP as a localized air quality concern. A discussion of the proposed project compared to projects of air quality concern, as defined by 40 CFR 93.123(b)(1), is provided below.

1. *New or expanded highway projects that have a significant number of or significant increase in diesel vehicles.*

   The proposed project would involve the widening of existing roadways connecting I-15 and I-215, with some realignment under Build Alternatives 2C and 4. Under Opening Year 2024 conditions, medium- and heavy-duty truck traffic would increase in terms of annual average daily traffic (AADT) and percentage of total volumes. Truck volumes along improved Cajalco Road segments are expected to increase by 55 to 221 percent under Build Alternatives 1 and 2C relative to the 2024 No-Build scenario, with absolute increases of no more than 1,443 trucks per day. For Alternative 4, which includes improvements on El Sobrante Road, relative increases in truck traffic would range from 40 percent on El Sobrante Road to 127 percent on the western end of the alignment on Cajalco Road, but absolute increases in daily truck traffic would be no greater than 1,324 trucks per day. Diesel truck traffic would compose up to 8.4 percent of truck traffic under Build Alternatives 1 and 2C and up to 9.4 percent under Build Alternative 4. Overall Opening Year AADT (including passenger vehicles) would be no greater than 52,170 under each of the build alternatives.

   Under Horizon Year 2044 conditions, medium- and heavy-duty truck traffic would increase in terms of AADT and percentage of total volumes. Truck volumes along improved Cajalco Road segments are expected to increase by 25 to 79 percent under Build Alternatives 1 and 2C relative to the 2044 No-Build Scenario, with absolute increases of no more than 572

trucks per day. For Build Alternative 4, which includes improvements on El Sobrante Road, relative increases in truck traffic would be up to 72 percent on El Sobrante Road to the east of the Lake Mathews reservoir and an increase of up to 103 percent on Cajalco Road on the eastern end of the alignment, but absolute increases in daily truck traffic would be no greater than 1,449 trucks per day. Diesel truck traffic would compose up to 5.8 percent of truck traffic under Build Alternatives 1 and 2C, and up to 7.6 percent under Build Alternative 4. Overall Horizon Year AADT (including passenger vehicles) would be no greater than 43,860 under each of the build alternatives. Of note, the total AADT, truck volumes, and percentage of total AADT for most project roadway segments are lower under 2044 conditions than under 2024 conditions because the parallel Community and Environmental Transportation Acceptability Process (CETAP) Project (RTP/SCS ID: 3C01MA01) is assumed to be implemented prior to the 2044 Horizon Year. The CETAP Project would offer an additional east-west transportation corridor in the vicinity, which would reduce demand for the proposed project. Hence, the traffic volumes would be lower in 2044 than in 2024.

2. *Projects affecting intersections that are at LOS D, E, or F with a significant number of diesel vehicles or those that will change to LOS D, E, or F because of increased traffic volumes from a significant number of diesel vehicles related to the project.*

   Overall, the proposed project would reduce congestion at project vicinity intersections. Of the 69 study area intersections, some intersections that operate at LOS D, E, or F under the Opening Year 2024 No-Build Alternative would experience an increase in peak-hour delay of 5 seconds or greater under one or more of the build alternatives. For Build Alternatives 1 and 2C, five intersections operating at LOS D, E, and F would experience delays of 5 seconds or greater, all of which occur near I-15 and I-215. For Build Alternative 4, eight intersections operating at LOS D, E, and F would experience delays of 5 seconds or greater.

   Of the 69 study area intersections, some intersections that operate at LOS D, E, or F under the Horizon Year 2044 No-Build Alternative would experience an increase in peak-hour delay of 5 seconds or greater under one or more of the build alternatives. For Build Alternatives 1 and 2C, 23 intersections operating at LOS D, E, and F would experience delays of 5 seconds or greater. For Build Alternative 4, 24 intersections operating at LOS D, E, and F would experience delays of 5 seconds or greater.

3. *New bus and rail terminals and transfer points that have a significant number of diesel vehicles congregating at a single location.*

   The proposed project has no bus or rail terminal component, and it would not alter travel patterns to/from any existing bus or rail terminal.

4. *Expanded bus and rail terminals and transfer points that significantly increase the number of diesel vehicles congregating at a single location.*

   The proposed project would not expand any bus terminal, rail terminal, or related transfer point that would increase the number of diesel vehicles congregating at any single location.

5. *Projects in or affecting locations, areas, or categories of sites that are identified in the $PM_{2.5}$- or PM_{10}-applicable implementation plan or implementation plan submission, as appropriate, as sites of violation or possible violation.*

The project site is not in or affecting an area or location identified in any PM_{10} or $PM_{2.5}$ implementation plan. The immediate project area is not considered to be a site of violation or possible violation.

The discussion provided above indicates that the proposed project would not be considered a project of air quality concern, as defined by 40 CFR 93.123(b)(1), because AADT would be no greater than 52,170 and truck AADT would be no greater than 4,084 for any of the segments under the build alternatives. In addition, volumes would fall over time because of the implementation of the parallel CETAP Project. Although the truck composition of total AADT would be greater than 8 percent for certain improved segments and increased delay would be experienced at a small number of study area intersections relative to the No-Build conditions, the traffic volumes are low enough that substantial $PM_{2.5}$ and PM_{10} emissions are not anticipated and hot-spot evaluations would not be required. It is unlikely that the proposed project would generate new air quality violations, worsen existing violations, or delay attainment of NAAQS for $PM_{2.5}$ or PM_{10}. The SCAG Transportation Conformity Working Group concurred with this determination during its Tuesday, May 23, 2017, meeting (refer to Appendix G of this EIR/EIS). FCAA (40 CFR 93.116) requirements are therefore met.

Criteria Pollutant Emissions

Criteria pollutant emissions would result from project implementation from vehicles operating in the project vicinity. A summary of mobile-source emissions estimates for the Baseline Year 2014, Opening Year 2024, and Horizon Year 2044 is provided in Table 3.14-10.

Table 3.14-10. Project Area Mobile-Source Emissions

Evaluation Scenario	Criteria Pollutant Emissions in Pounds per Day				
	ROG	CO	NO_X	PM_{10}	$PM_{2.5}$
Existing Year 2014	1,356	30,327	13,189	201	191
Opening Year 2024					
No-Build Alternative	**551**	**14,814**	**4,059**	**50**	**47**
Build Alternative 1	**548**	**14,892**	**4,035**	**50**	**47**
Increase/(Decrease) Compared to Existing	(808)	(15,435)	(9,154)	(151)	(144)
Increase/(Decrease) Compared to No-Build Alternative	(3)	78	(24)	0	0

Increase/(Decrease) Compared to Existing	(805)	(15,358)	(9,126)	(150)	(144)
Increase/(Decrease) Compared to No-Build Alternative	0	155	4	1	0
Build Alternative 4	**549**	**14,945**	**4,046**	**51**	**47**
Increase/(Decrease) Compared to Existing	(807)	(15,382)	(9,143)	(150)	(144)
Increase/(Decrease) Compared to No-Build Alternative	(2)	131	(13)	(150)	(144)
Horizon Year 2044					
No-Build Alternative	**480**	**10,988**	**2,754**	**30**	**28**
Build Alternative 1	**484**	**11,074**	**2,778**	**30**	**28**
Increase/(Decrease) Compared to Existing	(872)	(19,253)	(10,411)	(171)	(163)
Increase/(Decrease) Compared to No-Build Alternative	4	86	24	0	0
Build Alternative 2C	**480**	**11,010**	**2,754**	**30**	**28**
Increase/(Decrease) Compared to Existing	(876)	(19,317)	(10,435)	(171)	(163)
Increase/(Decrease) Compared to No-Build Alternative	0	22	0	0	0

Evaluation Scenario	Criteria Pollutant Emissions in Pounds per Day				
	ROG	CO	NO_X	PM_{10}	$PM_{2.5}$
Build Alternative 4	**484**	**11,083**	**2,783**	**30**	**28**
Increase/(Decrease) Compared to Existing	(1,810)	(19,244)	(10,406)	(171)	(163)
Increase/(Decrease) Compared to No-Build Alternative	4	95	29	0	0
SCAQMD Regional Significance Threshold [a]	**55**	**550**	**55**	**150**	**55**
[a] SCAQMD thresholds are provided for informational purposes only. Caltrans has not adopted and does not recognize SCAQMD thresholds.					

Re-Entrained Road Dust Emissions

Fugitive dust emissions from vehicle travel on paved roads (i.e., re-entrained dust) can be calculated using the emission factor equation provided in the Fifth Edition of U.S. EPA's AP-42 emissions factor compilation document (U.S. EPA 2011). The specific equation can be found in Section 13.2.1 of the AP-42 document. The emissions factor equation requires the input of several site-specific variables such as particle size multiplier, roadway silt loading factor, average vehicle weight, and rainfall correlation factor. The variables used in the analysis for the proposed project were obtained based on research conducted by Midwest Research Institute while they were performing California silt-loading measurements (Muleski 1996).

Based on U.S. EPA's AP-42 emission factor equation, re-entrained roadway emissions of PM_{10} and $PM_{2.5}$ around the Cajalco Road project vicinity are predicted to increase by 2.1 percent and 2.9 percent under Build Alternatives 1 and 2C, respectively, at Opening Year 2024. At Horizon Year 2044, re-entrained roadway emissions of PM_{10} and $PM_{2.5}$ are predicted to increase by 1.3 percent and 0.8 percent under Build Alternatives 1 and 2C, respectively, when compared to the No-Build Alternative. Under Build Alternative 4, re-entrained roadway emissions of PM_{10} and $PM_{2.5}$ around the Cajalco Road project vicinity are predicted to increase by 2.9 percent under Build Alternative 4 at Opening Year 2024. At Horizon Year 2044, re-entrained roadway emissions of PM_{10} and $PM_{2.5}$ are predicted to increase by 1.7 percent under Build Alternative 4 when compared to the No-Build Alternative.

Asbestos

Although naturally occurring asbestos is common in certain counties of California, it is not likely to be found in the project vicinity of Riverside County (California Department of Conservation 2000). Because roadway operation would not involve the disturbance of soils outside the right of way and no structures containing asbestos would be affected by roadway use, no permanent effects would occur. Construction-period effects are discussed under the temporary impacts section.

Lead

Lead (Pb) is normally not an air quality issue for transportation projects unless the project involves disturbance of soils containing high levels of aerially deposited lead (ADL) or painting or modification of structures with lead-based coatings. No permanent effects associated with lead would occur, given that roadway operation would not disturb soils outside the right of way. Construction-period effects are discussed under the temporary impacts section.

Mobile Source Air Toxics

FHWA has issued interim guidance on how MSATs should be addressed in NEPA documents for highway projects and has developed a tiered approach for analyzing MSATs in NEPA documents (FHWA Memorandum, Updated Interim Guidance on Mobile Source Air Toxics Analysis in NEPA Documents, October 18, 2016). Depending on the specific project circumstances, one of the following three levels of analysis identified by FHWA should be used:

1. No analysis for exempt projects or projects with no potential for meaningful MSAT effects.
2. Qualitative analysis for projects with low-potential MSAT effects.
3. Quantitative analysis to differentiate alternatives for projects with higher potential MSAT effects.

According to FHWA's Interim Guidance, this project is classified as a Category 2 project (Projects with Low Potential MSAT Effects). This project is expected to meet this category because projected AADT volumes at Horizon Year 2044 would not exceed the 140,000 AADT criterion established by FHWA for projects considered to have higher potential for MSAT effects. Furthermore, overall MSAT emissions at Horizon Year 2044 are anticipated to be considerably less than Baseline Year 2014 levels, even though VMT is anticipated to increase.

Even though this project is classified as Category 2 (low) in terms of potential MSAT effects, a quantitative MSAT emissions analysis and estimates were prepared to allow for a comparison of the project alternatives. Using the CT-EMFAC2014 model, VMT and travel speed profile data provided were used to estimate project MSAT emissions. A summary of Horizon Year 2044 VMT and related MSAT emissions among build alternatives, in comparison to the Existing/Baseline Year 2014, is provided in Table 3.14-11.

Table 3.14-11. Comparison of Years 2014 and 2044 MSAT Emissions in Pounds per Day

MSAT Pollutant	Existing Year 2014	Horizon Year 2044			
		No-Build	Alternative 1	Alternative 2C	Alternative 4
Benzene	45	15	16	15	16
Acrolein	2	1	1	1	1
Acetaldehyde	42	17	17	17	17
Formaldehyde	96	39	39	39	39
Butadiene	9	3	3	3	3
Naphthalene	1	1	1	1	1
POM	2	1	1	1	1
Diesel PM	174	12	12	12	12
DEOG	479	205	207	205	207
Regional VMT	8,585,371	14,659,917	14,779,906	14,721,152	14,811,302

Regional VMT at Horizon Year 2044 is anticipated to increase under the build alternatives when compared to the Existing Year 2014 baseline condition and the Horizon Year No-Build Alternative, as travelers would use different routes to most efficiently reach their destinations. More importantly, overall MSAT emissions at Horizon Year 2044 are anticipated to be considerably less than Baseline Year 2014 levels, even though VMT is anticipated to increase.

To comply with Council on Environmental regulations (40 CFR 1502.22(b)) regarding incomplete or unavailable information, Appendix E to the December 2017 AQSR contains a discussion regarding how air toxics analysis is an emerging field and current scientific techniques, tools, and data are not sufficient to estimate accurately the human health effects that would result from a transportation project in a way that would be useful to decision-makers. Also in compliance with 40 CFR 1502.22(b), Appendix E to the December 2017 AQSR contains a summary of current studies regarding the health effects of MSATs.

Regardless of the alternative chosen, emissions would be lower than present levels at Horizon Year 2044 as a result of U.S. EPA's national control programs, which are projected to reduce annual MSAT emissions by over 90 percent from 2010 to 2050. Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the magnitude of the U.S. EPA-projected reductions is so great (even after accounting for VMT growth) that MSAT emissions in the study area are likely to be lower in the future in virtually all locations.

Under the build alternatives there would be localized areas where VMT would increase, and other areas where VMT would decrease. Therefore, it is possible that localized increases and decreases in MSAT emissions may occur. However, even if these increases do occur, they too would be substantially reduced in the future as a result of implementation of U.S. EPA's vehicle and fuel regulations.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. The future six-lane facility has not been planned and programmed as part of the SCAG RTP/SCS or FTIP, and would need to be included in these documents in order to comply with regional transportation conformity requirements. For project-level conformity, the future six-lane facility would require interagency consultation with the Transportation Conformity Working Group to determine whether or not the future six-lane facility would be considered a project of air quality concern. The project would also be required to demonstrate that it does not result in the creation of criteria pollutant hot-spots.

Estimated emissions of regional criteria pollutant and precursor pollutant emissions from mobile sources in the project area are shown in Table 3.14-12. Emissions estimates are based on VMT and speed profile data projected under the six-lane future facility and are compared to emissions that would occur under the build alternatives at the Horizon Year 2044. The future six-lane facility is compared to the corresponding Horizon Year 2044 build alternatives because the future six-lane facility would not be implemented until a later date and would only occur after the construction of the selected build alternative. As such, the 2044 build alternative scenarios are the appropriate baseline for comparison. As shown in the table, operational emissions are expected to be greater under the six-lane future facility when compared to the corresponding build alternatives, but the increases would not exceed any current regional standards set for bringing the region into attainment.

Table 3.14-12. Project Area Mobile-Source Emissions for Future Six-Lane Facility (2044)

Evaluation Scenario	Criteria Pollutant Emissions in Pounds per Day				
	ROG	CO	NO_X	PM_{10}	$PM_{2.5}$
Horizon Year 2044					
Future Six-Lane Facility (Build Alternative 1/2C)	**488**	**11,138**	**2,806**	**30**	**28**
Increase/(Decrease) Compared to 2044 Build Alternative 1	4	64	28	< 1	< 1
Future Six-Lane Facility (Build Alternative 4)	**488**	**11,164**	**2,822**	**31**	**29**
Increase/(Decrease) Compared to 2044 Build Alternative 4	5	81	41	< 1	< 1
SCAQMD Regional Significance Threshold [a]	**55**	**550**	**55**	**150**	**55**

[a] SCAQMD thresholds are provided for informational purposes only. Caltrans has not adopted and does not recognize SCAQMD thresholds.

Table 3.14-13 shows the comparison of estimated MSAT emissions in the project area, which are expected to be similar under the future six-lane facility and the corresponding build alternative. Any increases would be due to the projected increases in VMT. Substantial reductions in MSAT emissions are estimated to occur relative to Existing Year 2014 based on the retirement of older vehicles.

Table 3.14-13. Comparison of Years 2014 and 2044 MSAT Emissions for Future Six-Lane Facility (in Pounds per Day)

MSAT Pollutant	Existing Year 2014	Horizon Year 2044			
		Build Alternative 1	6-Lane Future Facility (Alternative 1/2C)	Build Alternative 4	6-Lane Future Facility (Alternative 4)
Benzene	45	16	16	16	16
Acrolein	2	1	1	1	1
Acetaldehyde	42	17	18	17	18
Formaldehyde	96	39	39	39	39
Butadiene	9	3	3	3	3
Naphthalene	1	1	1	1	1
POM	2	1	1	1	1
Diesel PM	174	12	12	12	12
DEOG	479	207	209	207	209
Regional VMT	8,585,371	14,779,906	14,843,301	14,811,302	14,893,944

Naturally occurring asbestos is not likely to be an issue under the future six-lane facility, as it is not commonly found in the project vicinity and roadway operation would not involve the disturbance of soils outside the right of way. Similarly, lead is normally not an air quality issue for transportation projects unless the project involves disturbance of soils containing high levels of ADL or painting or modification of structures with lead-based coatings. No permanent effects associated with lead would occur, given that roadway operation would not disturb soils outside the right of way.

As discussed for criteria and precursor pollutant emissions, the future six-lane facility would attract greater traffic volumes than the No-Build Alternative. As such, MSAT emissions would be expected to increase proportionally to the increase in VMT in the project area.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the Lake Mathews MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP boundary responsible parties is proposed as part of the project to accommodate the proposed roadway improvements. Introducing the proposed project into to the LM MSHCP area is anticipated to result in permanent impacts within the LM MSHCP area associated with the increased emissions from greater vehicle volumes. As specified in Table 3.14-10, overall emissions for some pollutants under Build Alternatives 1 and 2C would increase relative to the No-Build Alternative, and a portion of those increases would occur in the LM MSHCP area. These increases would not exceed any regional standards set for bringing the region into attainment. As shown in Table 3.14-11, overall project MSAT emissions would be nearly identical under Alternatives 1 and 2C when compared to the No-Build Alternative, and any increases would be negligible within the LM MSHCP area. In addition to everyday roadway operations within the LM MSHCP area, ongoing maintenance activities for the appurtenant facilities would also result in air pollutant emissions. Given the infrequent nature of maintenance activities and that the maintenance activities would generally be limited in scope, such emissions would be minor.

No-Build Alternative

The No-Build Alternative is the baseline for the comparison of air quality impacts. Under this alternative, emissions would be lower for some pollutants and higher for others in comparison to the build alternatives (see Table 3.14-10 for a summary of the regional emissions). The No-Build Alternative would offer less vehicular capacity than the build alternatives, which would result in greater operational emissions for some, but not all, pollutants.

3.14.3.2 Temporary Impacts

Build Alternatives 1, 2C, and 4

Construction Conformity

Construction activities will not last for more than 5 years at one general location, so construction-related emissions do not need to be included in regional and project-level conformity analysis (40 CFR 93.123(c)(5)).

Criteria Pollutant Emissions

Construction is anticipated to begin in 2023 and would last approximately 4 years. Temporary construction emissions would result from grubbing/land clearing, grading/excavation, drainage/subgrade construction, paving, and the commuting patterns of construction workers. Pollutant emissions would vary daily, depending on the level of activity, specific operations, and prevailing weather.

During construction, short-term degradation of air quality may occur because of the release of particulate emissions (airborne dust) generated by excavation, grading, hauling, and other

activities related to construction. Emissions from construction equipment also are anticipated and would include CO, nitrogen oxides (NO_X), reactive organic gases (ROG), directly emitted PM (PM_{10} and $PM_{2.5}$), and toxic air contaminants (MSATs), such as diesel exhaust PM. Ozone is a regional pollutant that is derived from NO_X and ROG in the presence of sunlight and heat.

Site preparation and roadway construction would involve clearing, site-work activities, grading, removing or improving portions of existing roadways, and paving roadway surfaces. Construction-related effects on air quality from most highway projects would be greatest during the site preparation phase because most engine emissions are associated with the excavation, handling, and transport of soils to and from the site.

Construction-period criteria pollutant emissions were quantified using the Road Construction Model, Version 8.1.0. A summary of emissions estimates is provided in Table 3.14-14. Modeling assumptions assumes compliance with SCAQMD Rule 403 (Fugitive Dust Control) are detailed in Appendix B to the December 2017 AQSR.

Table 3.14-14. Estimate of Criteria Pollutant Emissions during Construction (pounds per day)

Construction Phase	ROG	CO	NO_X	PM_{10}	$PM_{2.5}$
Grubbing and Clearing	1	13	9	11	2
Grading/Excavation	5	53	50	13	4
Drainage/Utilities/Sub-Grade	3	34	27	11	3
Paving	2	21	16	1	1
Daily Maximum Regional Emissions	5	53	50	13	4
SCAQMD Regional Emissions Daily Significance Threshold [b]	75	550	100	150	55
Daily Maximum Onsite Emissions	5	48	47	10	4
SCAQMD Localized Significance Threshold [b]	N/A [a]	1,700	270	12	8

Source: Calculated by ICF; detailed calculation assumptions are provided in Appendix B to the December 2017 AQSR.
[a] ROG emissions have no SCAQMD localized emissions threshold; SCAQMD Source Receptor Area 22, 5-acre site, 25-meter receptor distance.
[b] SCAQMD thresholds are provided for informational purposes only. Caltrans has not adopted and does not recognize SCAQMD thresholds.

The project would comply with all applicable construction requirements and standard measures for Caltrans projects related to construction emissions, as specified in Standard Project Measures **PF AQ-1** and **PF AQ-2**, below.

- **PF AQ-1**: The project would conform to California Department of Transportation (Caltrans) construction requirements, as specified in the Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). The contractor will comply with all air pollution control ordinances and statutes which apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code. Exhaust emissions control measures may include, but are not limited to, the following:

    1. General contractors shall maintain and operate construction equipment so as to minimize exhaust emissions. During construction, trucks and vehicles in loading and unloading queues would have their engines turned off when not in use to reduce vehicle emissions. Construction emissions should be phased and scheduled to avoid emissions peaks and discontinued during second-stage smog alerts.

2. All equipment shall be properly tuned and maintained in accordance with manufacturer's specifications. The equipment must be checked by an Automotive Service Excellence–certified mechanic and determined to be running in proper condition before it is operated.
3. All on-road and off-road equipment shall comply with California Air Resources Board (ARB) commercial vehicle idle regulations. California Code of Regulations Title 13, Section 2449(d)(3), which was adopted by ARB on June 15, 2008, restricts idling of construction vehicles to no longer than 5 consecutive minutes.
4. Use electricity from power poles, rather than temporary diesel- or gasoline powered generators if or where feasible.
5. Use onsite mobile equipment powered by alternative fuel sources (i.e., methanol, natural gas, propane, or butane) as feasible.
6. Use solar-powered signal boards.
7. Develop a construction traffic management plan that includes, but is not limited to: (1) consolidating truck deliveries; (2) providing a rideshare or shuttle service for construction workers; and (3) providing dedicated turn lanes for movement of construction trucks and equipment on and off site.

- **PF AQ-2**: South Coast Air Quality Management District (SCAQMD) Rule 403 (Fugitive Dust) requires that fugitive dust control measures be applied to all construction projects in the South Coast Air Basin, unless said project is specifically exempted by the rule. Construction projects that are classified as "large operations" (i.e., 20 hectares [50 acres] or larger) are required to submit a fully executed Large Operation Notification Form (Form 403 N) to the Executive Office of SCAQMD within 7 days of qualifying as a large operation and to maintain daily records to document the specific control actions taken. The control measures incorporated in the rule are available in a Rule 403 Implementation Handbook, and include:
  - Water or dust palliative will be applied to the site and equipment as frequently as necessary to control fugitive dust emissions.
  - Soil binder will be spread on any unpaved roads used for construction purposes and all project construction parking areas.
  - Trucks will be washed off as they leave the right of way as necessary to control fugitive dust emissions.
  - Equipment and materials storage sites will be located as far away from residential and park uses as practical. Construction areas will be kept clean and orderly.
  - Track-out reduction measures, such as gravel pads at project access points, will be used to minimize dust and mud deposits on roads affected by construction traffic.
  - All transported loads of soils and wet materials will be covered prior to transport or adequate freeboard (i.e., space from the top of the material to the top of the truck) will be provided to reduce PM10 and deposition of particulate during transportation.
  - Dust and mud that are deposited on paved, public roads due to construction activity and traffic will be removed to decrease PM.

- During construction, dust palliatives will be used as specified in the Department's Standard Specifications, Section 18-1.03A, General.
- Construction equipment fleets will be in compliance with Best Available Control Technology requirements.

Asbestos

As discussed in the July 2020 Initial Site Assessment (ISA) prepared for the proposed project, the Temescal Canyon Wash Bridge is considered an environmental area of concern, as it may contain hazardous building materials including asbestos or lead. As identified in the ISA, surveys for hazardous building materials, including asbestos-containing materials (ACM) and lead-based paint (LBP), shall be conducted for structures that will be removed in support of the project, including the Temescal Canyon Wash Bridge. Surveys for ACM and LBP will be conducted during final design and prior to project construction. All applicable recommendations that result from these surveys and applicable regulations related to worker safety will be followed. No adverse effects are anticipated.

Lead

ADL refers to lead deposited on highway shoulders from past leaded fuel vehicle emissions. Although leaded fuel has been prohibited in California since the 1980s, ADL may still be present in soils adjacent to highways in use prior to that time. It is Caltrans' policy to evaluate and investigate these unpaved areas when they will be affected by a project, to ensure that workers are properly protected from lead exposure through training and appropriate work practices, and to manage ADL-containing soils in compliance with all applicable laws and regulations while minimizing costs to the project and future state liability.

As discussed in the November 2017 ADL Investigation prepared for the proposed project, soil samples were collected from areas of proposed widening based on the expected depths of soil disturbance. None of the 63 samples contained total lead concentrations exceeding the California Total Threshold Limit Concentration of 1,000 milligrams per kilogram, and the ADL Investigation concluded that excavated soil is not restricted for onsite reuse.

The July 2020 ISA also identified the potential presence of lead-chromate in traffic lane striping, as it has been used historically. As discussed in the ISA, a survey of yellow paint and thermoplastic striping will be conducted along the project alignment for striping that will be removed in support of the project to determine the likelihood of workers encountering lead. All applicable recommendations that result from this survey and applicable regulations related to worker safety will be followed. No adverse effects are anticipated.

Mobile Source Air Toxics

Construction activities associated with the proposed project would be sporadic, transitory, and short term in nature, and would proceed in segments so that localized impacts would not be concentrated in a given area for a substantial amount of time. Diesel exhaust would be emitted by construction equipment near residences, sometimes in areas adjacent to residences; however, the assessment of cancer risk typically is based on a 30-year exposure period. Because exposure to diesel exhaust would be well below the 30-year exposure period, construction of the proposed

project is not anticipated to result in an elevated cancer risk to exposed persons. Consequently, the estimation of diesel risks associated with construction activities would be expected to show that such risks are trivial for humans. Construction activities would be consistent with all applicable SCAQMD rules, including those related to the permitting and proper maintenance of construction equipment.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

For the future six-lane facility, construction is not currently proposed as part of the project. However, if constructed in the future, it is anticipated that temporary impacts associated with the construction of two additional travel lanes within the median of Cajalco Road, or a combination of Cajalco Road and La Sierra Avenue, would involve air pollutant emissions resulting from construction equipment use, material movement, and worker commute trips. Construction activities anticipated for the future six-lane facility would include clearing, grading and paving, and temporary staging, for the segment of Cajalco Road between Temescal Canyon Road and La Sierra Avenue under Build Alternatives 1 or 2C, or for the segments of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4. Because the roadway areas represent less than half of the overall length and project area associated with the build alternatives, construction-period emissions would be anticipated to be less than that identified for the build alternatives shown in Table 3.14-14, above. Similarly, construction-period MSAT emissions under the future six-lane facility would be anticipated to be less than construction-period emissions under the build alternatives. The future six-lane alternative is not anticipated to change risks related to ACM and LBP from those risks identified for the build alternatives.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Temporary effects of the construction of the build alternatives in the LM MSHCP area would include air pollutant emissions associated with construction equipment use, material movement, and worker commute trips. Daily emissions for the portions of the project that would be within the LM MSHCP boundaries are expected to be similar to those emissions identified in Table 3.14-14, and would vary depending on the specific activities required on a given day. As shown in Table 3.14-14, emissions from construction activities would not exceed regional or localized emissions standards designed to bring the SCAB into attainment for criteria pollutants.

No-Build Alternative

Under the No-Build Alternative the improvements would not be implemented and there would be no construction-related air quality impacts.

3.14.4 Avoidance, Minimization, and/or Mitigation Measures

Standard Project Measures **PF AQ-1** and **PF AQ-2** would be implemented to minimize construction-period pollutant emissions. No additional avoidance, minimization, or mitigation measures are required.

3.14.5 Climate Change

Neither U.S. EPA nor FHWA has issued explicit guidance or methods to conduct project-level greenhouse gas analysis. FHWA emphasizes concepts of resilience and sustainability in highway planning, project development, design, operations, and maintenance. Because there have been requirements set forth in California legislation and executive orders on climate change, the issue is addressed in the CEQA chapter of this document. The CEQA analysis may be used to inform the NEPA determination for the project.

3.15 Noise and Vibration

3.15.1 Regulatory Setting

The National Environmental Policy Act (NEPA) of 1969 and the California Environmental Quality Act (CEQA) provide the broad basis for analyzing and abating highway traffic noise effects. The intent of these laws is to promote the general welfare and to foster a healthy environment. The requirements for noise analysis and consideration of noise abatement and/or mitigation, however, differ between NEPA and CEQA.

3.15.1.1 State Regulations

California Environmental Quality Act

CEQA requires a strictly baseline versus build analysis to assess whether a proposed project will have a noise impact. If a proposed project is determined to have a significant noise impact under CEQA, then CEQA dictates that mitigation measures must be incorporated into the project unless those measures are not feasible. The rest of this section will focus on the NEPA/Title 23 Part 772 of the Code of Federal Regulations (23 CFR 772) noise analysis; please see Chapter 4 of this document for further information on noise analysis under CEQA.

Section 216 of the California Streets and Highways Code

Section 216 of the California Streets and Highways Code concerns the noise effects of a proposed freeway project on elementary and secondary schools, both public and private. Under this code, a noise impact would occur if, as a result of a freeway project (or arterial roadway project, as it pertains to the proposed project), noise levels would exceed 52 A-weighted decibels (dBA), hourly equivalent sound level (L_{eq}[h]), in the interior of public or private elementary or secondary classrooms, libraries, multipurpose rooms, or other spaces. This requirement does not replace the noise abatement criteria (NAC) for classroom interiors and other indoor sensitive uses but is a requirement that must be addressed in addition to the requirements of 23 CFR 772. If a project results in a noise impact under this code, noise abatement must be provided to reduce classroom noise to a level that is at or below 52 dBA L_{eq}(h). If the noise levels generated from freeway and non-freeway sources exceed 52 dBA L_{eq}(h) prior to the construction of the proposed freeway project, then noise abatement must be provided to reduce the noise to the level that existed prior to construction of the project. This highway code relates directly to the interior threshold under Activity Category D in the Protocol.

3.15.1.2 Federal Regulations

National Environmental Policy Act and 23 CFR 772

For highway transportation projects with Federal Highway Administration (FHWA) involvement (and the Department, as assigned), the Federal-Aid Highway Act of 1970 and its implementing regulations (23 CFR 772) govern the analysis and abatement of traffic noise impacts. The regulations require that potential noise impacts in areas of frequent human use be identified during the planning and design of a highway project. The regulations include noise abatement

criteria (NAC) that are used to determine when a noise impact would occur. The NAC differ depending on the type of land use under analysis. For example, the NAC for residences (67 dBA) is lower than the NAC for commercial areas (72 dBA). The following table lists the noise abatement criteria for use in the NEPA/23 CFR 772 analysis.

Table 3.15-1. Noise Abatement Criteria

Activity Category	NAC, Hourly A-Weighted Noise Level, $L_{eq}(h)$	Description of activity category
A	57 (Exterior)	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B[1]	67 (Exterior)	Residential.
C[1]	67 (Exterior)	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section 4(f) sites, schools, television studios, trails, and trail crossings.
D	52 (Interior)	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios.
E	72 (Exterior)	Hotels, motels, offices, restaurants/bars, and other developed lands, properties, or activities not included in A–D or F.
F	No NAC—reporting only	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical, etc.), and warehousing.
G	No NAC—reporting only	Undeveloped lands that are not permitted.
[1] Includes undeveloped lands permitted for this activity category.		

Figure 3.15-1, on the following page, lists the noise levels of common activities to enable readers to compare the actual and predicted highway noise-levels discussed in this section with common activities.

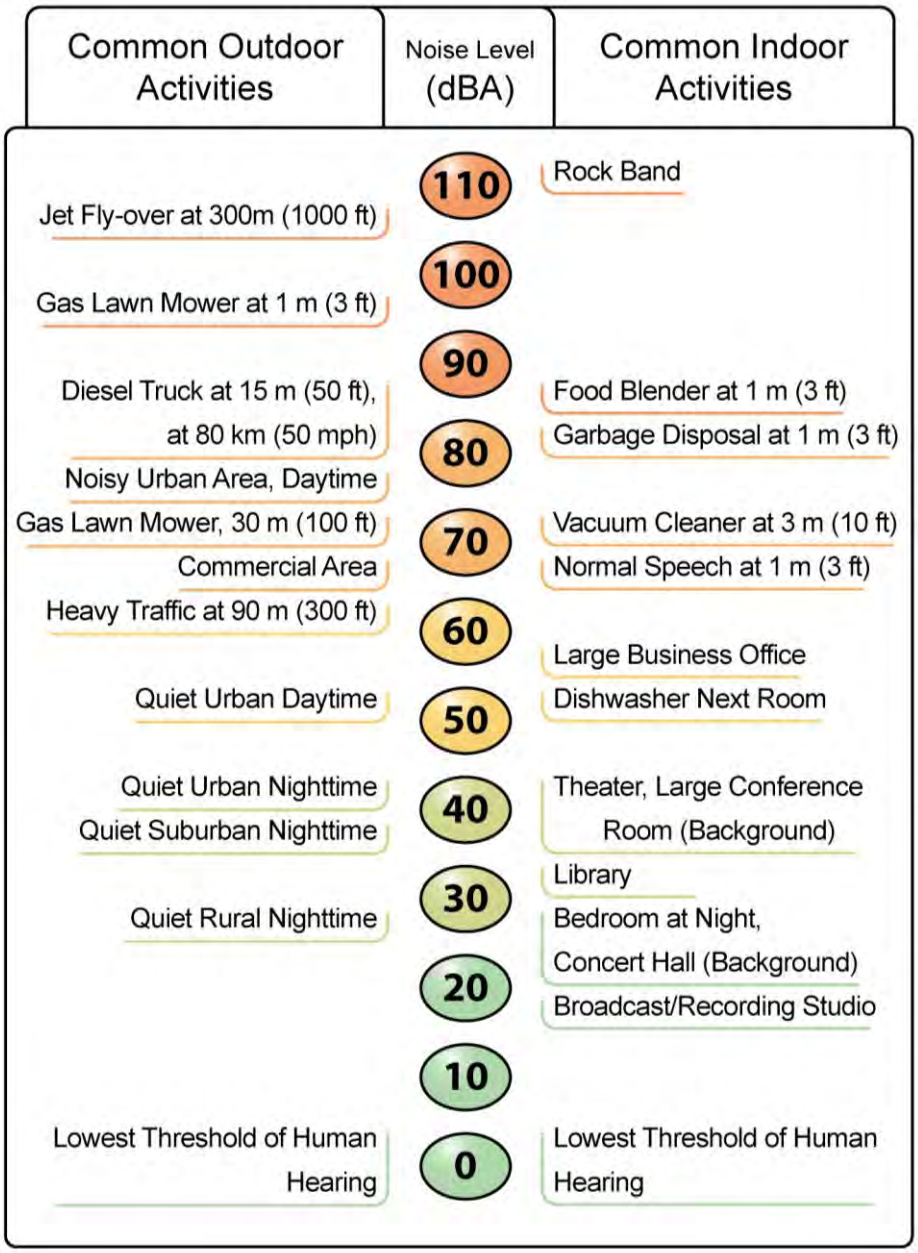

Figure 3.15-1. Noise Levels of Common Activities

According to the Department's *Traffic Noise Analysis Protocol for New Highway Construction and Reconstruction Projects, May 2011*, a noise impact occurs when the predicted future noise level with the project substantially exceeds the existing noise level (defined as a 12 dBA or more) or when the future noise level with the project approaches or exceeds the NAC. A noise level is considered to approach the NAC if it is within 1 dBA of the NAC.

If it is determined that the project will have noise impacts, then potential abatement measures must be considered. Noise abatement measures that are determined to be reasonable and feasible at the time of final design are incorporated into the project plans and specifications. This document discusses noise abatement measures that would likely be incorporated in the project.

The Department's *Traffic Noise Analysis Protocol* sets forth the criteria for determining when an abatement measure is reasonable and feasible. Feasibility of noise abatement is basically an engineering concern. Noise abatement must be predicted to reduce noise by at least 5 dBA at an impacted receptor to be considered feasible from an acoustical perspective. It must also be possible to design and construct the noise abatement measure for it to be considered feasible. Factors that affect the design and constructability of noise abatement include, but are not limited to, safety, barrier height, topography, drainage, access requirements for driveways, presence of local cross streets, underground utilities, other noise sources in the area, and maintenance of the abatement measure. The overall reasonableness of noise abatement is determined by the following three factors: 1) the noise reduction design goal of 7 dBA at one or more impacted receptors; 2) the cost of noise abatement; and 3) the viewpoints of benefited receptors (including property owners and residents of the benefited receptors).

3.15.2 Affected Environment

This section is based on the analysis and findings presented in the following technical studies:

- Noise Study Report, completed in October 2017 (Caltrans 2017)
- Noise Abatement Decision Report, completed in March 2019 (Caltrans 2019)

A field investigation was conducted to identify land uses that could be subject to traffic and construction noise impacts from the project. Land uses in the project area were categorized according to land use type, the extent of frequent human use, and activity category, as defined in Table 3.15-1. Although all land uses were evaluated in this analysis, as stated in the *Traffic Noise Analysis Protocol*, the focus of this impact analysis was on locations of frequent human use that would benefit from a lowered noise level, specifically, locations with defined outdoor activity areas.

3.15.2.1 Land Uses

Land uses along the project alignments consist primarily of a mix of undeveloped land (Activity Category G) and residences (Activity Category B [NAC = 67 dBA L_{eq}[h]). Other land uses along the project alignment include a fire station (Activity Category C [NAC = 67 dBA L_{eq}[h]), commercial uses (Activity Category E [NAC = 72 dBA L_{eq}[h]), and manufacturing and industrial facilities (Activity Category F).

Although all land uses were considered in this analysis, noise abatement was considered only for areas of frequent human use that would benefit from a lowered noise level. Accordingly, this impact analysis focuses on locations with defined outdoor activity areas, such as residences. Land uses that are considered non-noise sensitive were included for informational purposes only.

Because of the size of the project area, the existing- and design-year no-build and build alignments were divided into three analysis areas:

- Area A is located along Cajalco Road, west of Harley John Road. The western terminus of Area A is approximately 500 feet west of the Temescal Canyon Road/Cajalco Road intersection (refer to Figures 3.15-2 [Sheets 6 through 20] and 3.15-3 [Sheets 6 through 23]). Land uses in this area include industrial facilities (Activity Category F), commercial uses (Activity Category E), and residences (Activity Category B) as well as undeveloped land

(Activity Category G). West of Lake Mathews Drive, the Cajalco Road alignment and surrounding terrain are generally mountainous and undulating. East of Lake Mathews Drive, the Cajalco Road alignment and surrounding terrain flatten considerably. Surrounding land uses are at or above the grade of the Cajalco Road alignment. For the purposes of Build Alternative 4, the terminus of Area A would be from 500 feet west of the Temescal Canyon Road/Cajalco Road intersection to STA #130+00, the point where the alignment begins to turn north, along a new portion of the proposed La Sierra Avenue alignment (refer to Figure 3.15-4, Sheet 5).

- Area B is located along Cajalco Road, between Harley John Road and the Cajalco Road/ Interstate 215 (I-215) interchange (refer to Figures 3.15-2 [Sheets 20 through 31], 3.15-3 [Sheets 23 through 34], and 3.15-4 [Sheets 24 through 35]). Land uses in this area include industrial facilities (Activity Category F), residences (Activity Category B), and commercial uses (Activity Category E) as well as undeveloped land (Activity Category G). The area is generally flat and at grade with the Cajalco Road alignment.
- Area C is located along El Sobrante Road and La Sierra Avenue. The western terminus of this area is at the La Sierra Avenue/Cajalco Road intersection, between Temescal Canyon Road and Lake Mathews Drive (refer to Figure 3.15-4). The eastern terminus of Area C is at the Lake Mathews Drive/Cajalco Road intersection, between Kirkpatrick Road and Gavilan Road. Land uses in this area include industrial facilities (Activity Category F), residences (Activity Category B), commercial uses (Activity Category E), and a fire station (Activity Category C) as well as undeveloped land (Activity Category G). The La Sierra Avenue and El Sobrante Road alignment and the surrounding terrain in this area are generally hilly and occasionally undulating. Surrounding land uses are generally at or above the grade of the roadway alignment.

Lake Mathews MSHCP

Located within the western portion of the project alignments (generally in Areas A and C), the project corridor travels through the Lake Mathews Multiple Species Reserve (LMR) and Lake Mathews Multiple Species Habitat Conservation Plan (LM MSHCP) area (refer to Figure 2-1). Much of the land surrounding Lake Mathews is undeveloped because these lands are protected by the LMR and thus considered a Category G land use. The landscape of the LM MSHCP area is characterized by the predominantly rolling to gently rolling terrain associated with the open spaces surrounding Lake Mathews. The open spaces, rolling terrain, and lack of tall vegetation allow for scenic views of the surrounding mountains and Lake Mathews.

3.15.2.2 Existing Noise Environment

To establish the existing noise environment, short-term and long-term noise measurements were taken from February 14 to March 29, 2017. Short-term monitoring was conducted at 59 locations, ST-1 through ST-50 and ST-52 through ST-59,[1] which were selected to represent the various land use types within the project area. A minimum of two consecutive but separate measurements (each 20 to 30 minutes in duration) were taken at each site using a Larson Davis Type 1 (precision-grade) sound-level meter. Dominant noise sources and other relevant measurement conditions were identified and logged on field sheets, which are included as

[1] ST-51 was not included because of corrupted traffic video that affected the calibration data.

Appendix J to this environmental impact report/environmental impact statement (EIR/EIS). Traffic along Cajalco Road was generally determined to be the dominant contributor to the noise levels. Traffic on Cajalco Road and El Sobrante Road, as well as intersecting roadways, was videotaped and manually counted subsequent to the measurements. The locations of the short-term monitoring sites are shown on Figures 3.15-2 through 3.15-4. Figures 3.15-2 through 3.15-4 also show the three design-year build alternatives (Alternatives 1, 2C, and 4). It should also be noted that not all measurement locations are representative of each build alternative. Therefore, some measurement locations may not be included in every alternative.

Long-term monitoring was conducted at four locations (LT-1 through LT-4). The purpose of these measurements was to describe variations in sound levels throughout a typical 24-hour period and characterize the noise levels at the specific location being measured. The long-term sound-level data were collected over a 24-hour period, beginning April 13, 2017, and ending April 14, 2017. The long-term monitoring locations are shown on Figures 3.15-2 through 3.15-4 and described below.

- LT-1: Right of way southwest of residence at 9070 Cajalco Road. The maximum noise level measured was 78.3 dBA L_{eq}(h) during the 5:00 p.m. hour, and the minimum noise level was 66.3 dBA L_{eq}(h) during the 12:00 and 1:00 a.m. hours.
- LT-2: Right of way north of residence at 20295 Cajalco Road. The maximum noise level measured was 79.1 dBA L_{eq}(h) during the 6:00 a.m. hour, and the minimum noise level was 70.9 dBA L_{eq}(h) during the 12:00 a.m. hour.
- LT-3: Right of way east of residence at 22920 Cajalco Road. The maximum noise level measured was 82.7 dBA L_{eq}(h) during the 6:00 a.m. hour, and the minimum noise level was 74.2 dBA L_{eq}(h) during the 1:00 a.m. hour.
- LT-4: Right of way south of residence at 17990 Tangerine Way. The maximum noise level measured was 77.0 dBA L_{eq}(h) during the 6:00 a.m. hour, and the minimum noise level was 66.1 dBA L_{eq}(h) during the 1:00 a.m. hour.

To ensure that the FHWA Traffic Noise Model (TNM), version 2.5, represents actual conditions, the model was validated by comparing measured traffic noise levels to the model's estimate of existing noise levels at field measurement locations.

Lake Mathews MSHCP

Twenty field noise measurements (19 short term and one long term) were taken in Area A, and 13 field noise measurements (12 short term and one long term) were taken in Area C, all within the LM MSHCP area. Within Area A, the noise levels measured during the field measurements ranged from 39.5 dBA L_{eq} (20 min.) to 74.5 dBA L_{eq} (20 min.) at ST-42 and ST-16, respectively. Within Area C, the noise levels measured during the field measurements ranged from 42.7 dBA L_{eq} (20 min.) to 70.3 dBA L_{eq} (20 min.) at ST-43 and ST-54, respectively.
