Source: Caltrans 2017.					

The modeled noise levels show some deviation from the measured noise levels but, in general, show relatively good agreement. In general, agreement (within 0 to 5 decibels [dB])[2] was achieved between the measured and modeled results.

[2] The Caltrans TeNS generally uses a 3 dB difference between measured and modeled noise levels as the threshold for which model validation does not need to be considered and suggests that modeled differences between 3 and 4 dB may be validated by using a validation constant. For this analysis, validation constants have been included for all differences more than 2 dB. For any validation above 2 dB the model parameters, traffic inputs and speeds were reviewed for accuracy and determined to be accurate.

3.15.3 Environmental Consequences

3.15.3.1 Permanent Impacts

As defined in 23 CFR 772, a Type I project is a federal or federal-aid highway project that constructs a highway at a new location or physically alters an existing highway or facility, resulting in the addition of through lanes. All three build alternatives include the addition of a through lane in each direction; therefore, the project is considered a Type I project.

The future worst-case traffic noise impact at frequent outdoor human use areas along the project corridor was modeled for existing conditions, design-year (2044) no-build conditions, and design-year (2044) build-conditions to determine appropriate noise abatement measures. This section discusses the future noise environment and feasible noise abatement measures for affected locations.

Build Alternative 1—Cajalco Alignment

Build Alternative 1 would construct two 12-foot lanes in each direction (eastbound and westbound) along portions of Cajalco Road, from Temescal Canyon Road on the west to I-215 on the east, replacing the existing two-lane roadway segments. Between Harvill Avenue and the I-215 southbound ramps as well as between Temescal Canyon Road and Temescal Creek Bridge, three lanes would be constructed in each direction (eastbound and westbound), replacing the existing four-lane roadway segments. The bridge over Temescal Creek would be replaced with a new widened bridge. New striping is proposed along Cajalco Road, between Grand Oaks and Temescal Canyon Road; however, the limit of roadway construction at the west end of the project would be at Temescal Canyon Road. The proposed alignment would generally follow the existing roadway. In addition, because of limited opportunities for future roadway expansion within the boundaries of the LM MSHCP area, the median of Cajalco Road between Temescal Canyon Road and Harley John Road would be designed to be wide enough to accommodate two additional travel lanes (one in each direction) in the future. A discussion of this is included below and in Chapter 4 under the CEQA noise discussion.

Table 3.15-3, on page 3.15-53, lists the existing and design-year (2044) noise levels at modeled receivers, including sensitive receptors, along the Build Alternative 1 alignment.

Under Build Alternative 1, noise levels at three modeled receivers would approach or exceed the NAC of 67 dBA $L_{eq}(h)$ for residential land uses. The traffic noise modeling results in Table 3.15-4 indicate that Receivers M-93, M-105, and M-118, within Area B, would experience design-year (2044) noise levels of 74, 74, and 69 dBA $L_{eq}(h)$, respectively. Modeling results indicate that noise levels at other modeled receivers would not approach or exceed the NAC or increase substantially.

Traffic noise impacts are predicted to occur at Receivers M-93, M-105, and M-118. Therefore, noise abatement must be considered.

a. Total reasonable allowance is within 10% of the estimated construction cost.

Build Alternative 1 would not involve changes that would result in noticeable increases in ground-borne vibration or ground-borne noise levels from use or maintenance of the roadway compared with the No-Build Alternative.

Future Six-Lane Facility (Build Alternative 1)

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not change existing land uses.

Additional analysis was conducted to identify potential impacts from the addition of two travel lanes along limited segments of Cajalco Road in the future. Table 3.15-4 shows design-year noise levels at sensitive receptors along the alignment of Build Alternative 1. As shown in Table 3.15-4, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would affect traffic noise in a manner similar to that described for Build Alternative 1.

Table 3.15-4. Proposed Project vs. Future Six-Lane Design Traffic Noise – Build Alternative 1

* Traffic noise results represent uncalibrated noise levels

[1] Bolded receivers represent traffic noise results that approach or exceed the respective NAC or result in a substantial increase.

Lake Mathews MSHCP (Build Alternative 1)

The roadway modifications resulting from the conversion of conservation lands to a transportation facility along the Cajalco Road alignment would not result in any receiver approaching or exceeding the NAC for residential land uses within the LM MSHCP area, including the LMR.

Build Alternative 2C—Modified Cajalco Alignment

Build Alternative 2C would include the same improvements as Build Alternative 1, except that a new four-lane segment of Cajalco Road would be constructed from La Sierra Avenue to just west of Lake Mathews Drive. Under this alternative, Cajalco Road between La Sierra Avenue and a point just west of Lake Mathews Drive would be closed to public traffic. The pavement in this portion of existing Cajalco Road would be partially or completely removed and fenced to prevent access. The remaining dirt, gravel, or partially paved road may be used by the Metropolitan Water District of Southern California (MWD) for access to the LMR and Lake Mathews.

Table 3.15-5, on the following page, indicates existing and design-year (2044) noise levels at modeled receivers, including sensitive receptors, along the Build Alternative 2C alignment.

Under Build Alternative 2C, noise levels at three modeled receivers would approach or exceed the NAC of 67 dBA L_{eq}(h) for residential land uses. The traffic noise modeling results in Table 3.15-5 indicate that Receivers M-93, M-105, and M-118, within Area B, would experience design-year noise levels of 74, 74, and 69 dBA L_{eq}(h), respectively. Modeling results indicate that noise levels at other modeled receivers would not approach or exceed the NAC or increase substantially. Traffic noise impacts are predicted to occur at Receivers M-93, M-105, and M-118. Therefore, noise abatement must be considered.

Similar to Build Alternative 1, Build Alternative 2C would not involve changes that would result in noticeable increases in ground-borne vibration or ground-borne noise levels from use or maintenance of the roadway compared with the No-Build Alternative.

Table 3.15-5. Traffic Noise Results and Barrier Analysis – Build Alternative 2C

a. Total reasonable allowance is within 10% of the estimated construction cost.

Future Six-Lane Facility (Build Alternative 2C)

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, construction may result in intermittent traffic delays until the project is completed; however, the delays would be temporary and would not be anticipated to be substantial enough to interfere with existing land uses.

Additional analysis was conducted to identify potential impacts from the addition of two travel lanes along limited segments of Cajalco Road in the future. Table 3.15-6 shows design-year noise levels at sensitive receptors along the alignment of Build Alternative 2C. As shown in Table 3.15-6, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would affect traffic noise in a manner similar to that described for Build Alternative 2C.

* Traffic noise results represent uncalibrated noise levels
[1] Bolded receivers represent traffic noise results that approach or exceed the respective NAC or result in a substantial increase.

Lake Mathews MSHCP (Build Alternative 2C)

As mentioned above, roadway modifications as a result of the conversion of conservation lands to a transportation facility along the Cajalco Road alignment would not result in any receiver approaching or exceeding the NAC for residential land uses within the LM MSHCP area, including the LMR.

Build Alternative 4—El Sobrante Alignment

Between Temescal Canyon Road and the area west of La Sierra Avenue as well as between Gustin Road and I-215, improvements proposed under Build Alternative 4 would be identical to those of Build Alternatives 1 and 2C. Between the area west of La Sierra Avenue and Gustin Road, El Sobrante Road would be improved from the existing two-lane facility to a four-lane facility, generally following the existing El Sobrante Road alignment from La Sierra Avenue to Harley John Road (see Figure 3.15-4). The El Sobrante Road intersection with La Sierra Avenue would be improved. La Sierra Avenue would be slightly realigned from just west of Tin Mine Road eastward to the intersection with El Sobrante Road. At a point approximately one mile west of Harley John Road, El Sobrante Road would be realigned to provide a smoother transition from Cajalco Road to El Sobrante Road. In addition, existing Cajalco Road would be realigned west of Harley John Road to tie into El Sobrante Road.

Between La Sierra Avenue and Temescal Canyon Road, the western portion of Build Alternative 4 would extend south to Cajalco Road, then continue west along Cajalco Road to Temescal Canyon Road. Between El Sobrante Road and Cajalco Road, La Sierra Avenue would be realigned slightly west of the existing La Sierra Avenue alignment. Between the realigned La Sierra Avenue intersection with Cajalco Road and Temescal Canyon Road, the roadway improvements would be the same as those proposed under Build Alternative 1.

The portion of Cajalco Road between La Sierra Avenue and Gustin Road would remain in its current configuration. Between Temescal Creek Bridge and the realigned La Sierra Avenue, as well as along the realigned La Sierra Avenue south of El Sobrante Road, wildlife crossings of various widths would be constructed beneath Cajalco Road. New traffic signals would be installed at the realigned intersection of El Sobrante Road and La Sierra Avenue/the main MWD Lake Mathews facility entrance as well as the new intersection of El Sobrante Road and Harley John Road.

Table 3.15-7, on the following page, indicates existing and design-year (2044) noise levels at modeled receivers, including sensitive receptors, along the Build Alternative 4 alignment.

a. Total reasonable allowance is within 10% of the estimated construction cost.

Under Build Alternative 4, noise levels at four modeled receivers would approach or exceed the NAC of 67 dBA $L_{eq}(h)$ for residential land uses; one modeled receiver is predicted to experience a substantial increase (12 dB increase relative to the existing modeled noise level) as a result of the proposed project. The traffic noise modeling results in Table 3.15-4 indicate that Receivers M-93, M-99, M-105, and M-118, within Area B, would experience design-year noise levels of 75, 66, 75, and 70 dBA $L_{eq}(h)$, respectively. The traffic noise modeling results in Table 3.15-4 indicate that traffic noise levels at modeled Receiver M-98A would increase by 15 dB (48 dBA $L_{eq}(h)$ in the existing year and 63 dBA $L_{eq}(h)$ in the design year [build condition]). Modeling results indicate that noise levels at other modeled receivers would not approach or exceed the NAC or increase substantially. Traffic noise impacts are predicted to occur at Receivers M-93, M-99, M-105, and M-118. Therefore, noise abatement must be considered.

Build Alternative 4 would not involve changes that would result in noticeable increases in ground-borne vibration or ground-borne noise levels from use or maintenance of the roadway compared with the No-Build Alternative.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not change existing land uses.

Additional analysis was conducted to identify potential impacts from the addition of two travel lanes along limited segments of Cajalco Road and La Sierra Avenue in the future. Table 3.15-8 shows design-year noise levels at sensitive receptors along the Build Alternative 4 alignment. As shown in Table 3.15-8, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would affect traffic noise in a manner similar to that described for Build Alternative 4.

Table 3.15-8. Proposed Project vs. Future Six-Lane Design Traffic Noise – Build Alternative 4

M-21	Undeveloped / G	72.6	72.5	-0.1

* Traffic noise results represent uncalibrated noise levels
[1] Bolded receivers represent traffic noise results that approach or exceed the respective NAC or result in a substantial increase.

Lake Mathews MSHCP (Build Alternative 4)

As mentioned above, roadway alignment modifications along Cajalco Road, El Sobrante Road, and La Sierra Avenue as a result of the conversion of conservation lands to a transportation facility along the Cajalco Road alignment would not result in any receiver approaching or exceeding the NAC for residential land uses within the LM MSHCP area, including the LMR.

No-Build Alternative

The noise study results provided in Table 3.15-3 indicate that predicted traffic noise levels for design-year worst-hour noise levels would range from 37 to 71 dBA $L_{eq}(h)$ at representative land uses, meaning that noise levels would approach or exceed the NAC for Activity Category B land uses at three modeled receiver locations.

3.15.3.2 Temporary Impacts

Build Alternatives 1, 2C, and 4

During construction of the project, noise from construction activities may intermittently dominate the noise environment in the immediate area of construction. Table 3.15-9 on the following page summarizes the noise levels that would be produced by the equipment that is anticipated to be used during project construction. This conventional construction equipment is expected to generate noise levels ranging from 74 to 85 dBA maximum noise level (L_{max}) at a distance of 50 feet; pile driving would generate a noise level of approximately 101 dBA L_{max} at 50 feet. Noise produced by construction equipment would be reduced at a rate of about 6 dB per doubling of distance.

Table 3.15-9. Construction Equipment Noise

Equipment	L_{max} at 50 feet (dBA, slow)
Air compressor	78
Auger drill rig	84
Backhoe	78
Compactor	83
Concrete mixer truck	79
Concrete pump truck	81
Crane	81
Dozer	82
Dump truck	76

Jackhammer	89
Paver	77
Pneumatic tools	85
Rollers	80
Scraper	84
Welder/torch	74
Source: Federal Highway Administration. 2008. *Roadway Construction Noise Model*. Version 1.1. Available: http://www.fhwa.dot.gov/environment/noise/construction_noise/rcnm/rcnm.pdf.	

The proposed project would include compliance with Standard Project Measure **PF NOI-1**, whereby noise associated with construction is controlled by the 2018 Caltrans Standard Specifications, Section 14-8.02, Noise Control:

- **PF NOI-1**: Do not exceed 86 A-weighted decibels maximum noise level at 50 feet from job site activities between 9:00 p.m. and 6:00 a.m. (2018 California Department of Transportation Standard Specifications, Section 14-8.02, Noise Control[3]).

No adverse noise impacts from construction are anticipated because construction would be conducted in accordance with Caltrans Standard Specifications, Section 14.8-02.[4]

The project would include construction activities related to laying new pavement along the existing roadway alignment on Cajalco Road, as well as intersecting roads, under Build Alternatives 1 and 2C; the same activities would occur on Cajalco Road, La Sierra Avenue, and El Sobrante Road, as well as intersecting roads, under Build Alternative 4. According to Caltrans' *Transportation and Construction Vibration Guidance Manual*, the typical type of construction equipment involved in laying new pavement produces a peak particle velocity (PPV) of 0.21 PPV inch per second (for vibratory rollers) at a reference distance of 25 feet (Caltrans 2020). The vibration damage threshold for older residential building is 0.5 PPV.

[3] The project NSR referenced the 2015 SS 14-8.02; however, the ED has been updated to reference the 2018 SS 14-8.02 as the 2018 version was released after the NSR was completed. The time requirements of 9:00 p.m. and 6:00 a.m. remain unchanged between the 2015 and 2018 versions.
[4] Refer to Section 4.2.13, *Noise*, of Chapter 4, *California Environmental Quality Act*, for discussion on local construction noise ordinances.

Vibration-sensitive structures that are considered extremely susceptible to vibration damage would not be located within 50 feet of construction activities.

Pile driving is proposed at new bridge locations where engineering designs and geotechnical conditions indicate that pile driving is the appropriate construction method. The nearest residence to a proposed bridge location would be approximately 310 feet south of the proposed westbound Cajalco Road bridge at STA #740, which is west of Barton Street (refer to Figures 3.15-2 [Sheet 24], 3.15-3 [Sheet 27], and Figure 3.15-4 [Sheet 29]). The use of cast-in-drilled-hole (CIDH) piles, or shallow-spread footings, is recommended for bridge construction at this location; therefore, pile driving and associated vibration effects are not anticipated at the residence (County 2017). As discussed in Section 3.8, *Cultural Resources*, vibration-sensitive cultural resources have been identified at this location and therefore would be exposed to vibration associated with construction equipment used for clearing, grubbing, and bridge construction. Measures in Section 3.8 are proposed to avoid or otherwise minimize construction impacts on sensitive cultural resources to the greatest extent feasible.

The next-nearest residence to a proposed bridge location would be approximately 330 feet northwest of the proposed Cajalco Road bridge at STA #110, between Temescal Canyon Road and La Sierra Avenue (refer to Sheet 4 on Figures 3.15-2, 3.15-3, and Figure 3.15-4). The estimated vibration that the residence would experience during construction of the bridge is based on the following calculation:

Vibration PPV would dissipate at a rate of PPVref x (25/D)N x (Eequip/Eref) 0.5, where:

- PPVref = 0.65 inch/second at a reference distance of 25 feet,
- D = distance from the pile driver,
- N = 1.1 is the value related to attenuation of vibration throughout the ground,
- Eref = 36,000 foot-pound (rated energy of reference pile driver),
- Eequip = rated energy of impact pile driver in foot-pounds (assumed same as reference).

For proposed bridge locations where engineering designs and geotechnical conditions warrant pile driving, the closest habitable structure would be approximately 330 feet from the vibration sources. As such, vibration levels would be on the order of 0.04 PPV (Caltrans 2020). No impacts from vibration during construction are predicted at habitable structures. In addition, CIDH piles, or shallow-spread footings, may be used, depending on engineering designs and geotechnical conditions. These construction techniques would be considerably less vibration intensive (0.089 PPV), which would further reduce vibration levels.

No-Build Alternative

Under the No-Build Alternative, widening along Cajalco Road would not be implemented at this time. No construction-related noise or vibration impacts would occur.

3.15.4 Avoidance, Minimization, and/or Abatement Measures

Before adoption of the final environmental document, 23 CFR 772 requires noise abatement measures that are reasonable and feasible, as well as likely to be incorporated into the project, to be identified.

The preliminary reasonableness determination is made by calculating an allowance, which is considered a reasonable amount of money, per benefited residence, to spend on abatement. The overall reasonable abatement is determined by considering factors such as cost, the absolute predicted noise levels, predicted future increases in noise levels, the opinion of affected residents, input from the public and local agencies, and social, legal, and technological factors. This reasonable allowance is then compared to the engineer's cost estimate for the abatement. If the engineer's cost estimate is less than the allowance, the preliminary determination is that the abatement is reasonable. If the cost estimate is higher than the allowance, the preliminary determination is that abatement is not reasonable.

The recommended soundwall locations are shown on Figure 3.15-2 (Sheets 20 and 21) for Build Alternative 1, Figure 3.15-3 (Sheets 23 and 24) for Build Alternative 2C, and Figure 3.15-4 (Sheets 25 and 26) for Build Alternative 4; heights are listed in Tables 3.15-3, 3.15-5, and 3.15-7 for each build alternative, respectively. The results of the preliminary noise abatement decision report are based on acoustical and non-acoustical feasibility factors, the design goal, and the relationship between noise abatement allowances and the cost estimate. The final overall reasonableness decision will take these results into account, along with the results of the survey of benefited receptors conducted during the environmental review process. At the end of the public review process for this EIR/EIS, the final noise abatement decision will be made and presented in the final EIR/EIS. The preliminary noise abatement decision presented in this EIR/EIS will become the final noise abatement decision, unless compelling information received during the environmental review process, or as part of the survey of benefited receptors, indicates that it should be changed.

The following Mitigation Measures **NOI-2** and **NOI-3** have been identified based on the results of the noise abatement analysis for each build alternative.

3.15.4.1 NOI-2: Noise Barrier S-624

Build Alternative 1–Cajalco Alignment

Modeled Receiver M-93 would approach or exceed the NAC of 67 dBA $L_{eq}(h)$ under the design-year build condition. Noise Barrier S-624 was modeled and found to be acoustically feasible. Furthermore, the barrier would meet the 7 dB insertion loss at the design receiver (M-93) if constructed at heights ranging from 6 to 16 feet. Noise Barrier S-624 would be constructed on the right of way, with a length of approximately 160 feet. The location of Noise Barrier S-624 is shown on Figure 3.15-2, Sheet 20.

Under Build Alternative 1, Noise Barrier S-624 would provide benefit for one receptor (Activity Category B land use [residential]) and have a total reasonable allowance of $95,000 for all barrier heights (6 to 16 feet) versus a construction cost of $39,778 at 6 feet, $58,861 at 8 feet, $82,802 at 10 feet, $104,924 at 12 feet, $130,966 at 14 feet, and $160,740 at 16 feet. The cost at barrier heights of 12, 14, and 16 feet would exceed the reasonable allowances. However, the

reasonable allowances for barrier heights of 6, 8, and 10 feet would be below the construction costs. Therefore, this barrier is considered reasonable to construct for barrier heights of 6, 8, and 10 feet. Because a barrier height of 10 feet would provide the most noise reduction at the benefited receptor, a 10-foot height for Noise Barrier S-624 is recommended.

Based on the studies completed to date, the County intends to incorporate noise abatement in the form of Noise Barrier S-624 at the right of way between STA 624+22 and 625+37 (see Figure 3.15-2, Sheet 20), with respective lengths and average heights of 160 feet and 10 feet. Calculations based on preliminary design data show that Noise Barrier S-624 will reduce noise levels by 5 to 13 dB for one residence at a cost of $82,802. These measures may change based on input received from the public. If conditions have substantially changed during final design, noise abatement may not be constructed. The final decision on noise abatement will be made upon completion of the project design.

Build Alternative 2C–Modified Cajalco Alignment

Modeled Receiver M-93 would approach or exceed the NAC of 67 dBA L_{eq}(h) under the design-year build condition. Noise Barrier S-624 was modeled and found to be acoustically feasible. Furthermore, the barrier would meet the 7 dB insertion loss at the design receiver (M-93) if constructed at heights ranging from 6 to 16 feet. Noise Barrier S-624 would be constructed on the right of way, with a length of approximately 160 feet. The location of Noise Barrier S-624 is shown on Figure 3.15-3, Sheet 23.

Under Build Alternative 2C, Noise Barrier S-624 would provide benefit for one receptor (Activity Category B land use [residential]) and have a total reasonable allowance of $95,000 for all barrier heights (6 to 16 feet) versus a construction cost of $39,778 at 6 feet, $58,861 at 8 feet, $82,802 at 10 feet, $104,924 at 12 feet, $130,966 at 14 feet, and $160,740 at 16 feet. The cost at barrier heights of 12, 14, and 16 feet would exceed the reasonable allowances. However, the reasonable allowances for barrier heights of 6, 8, and 10 feet would be below the construction costs. Therefore, this barrier is considered reasonable to construct for barrier heights of 6, 8, and 10 feet. Because a barrier height of 10 feet would provide the most noise reduction at the benefited receptor, a 10-foot height for Noise Barrier S-624 is recommended.

Based on the studies completed to date, the County intends to incorporate noise abatement in the form of Noise Barrier S-624 at the right of way between STA 624+22 and 625+37 (see Figure 3.15-3, Sheet 23), with respective lengths and average heights of 160 feet and 10 feet. Calculations based on preliminary design data show that Noise Barrier S-624 will reduce noise levels by 5 to 13 dB for one residence at a cost of $82,802. These measures may change based on input received from the public. If conditions have substantially changed during final design, noise abatement may not be constructed. The final decision on noise abatement will be made upon completion of the project design.

Build Alternative 4–El Sobrante Alignment

Modeled Receiver M-93 would approach or exceed the NAC of 67 dBA L_{eq}(h) under the design-year build condition. Noise Barrier S-624 was modeled and found to be acoustically feasible, Furthermore, the barrier would meet the 7 dB insertion loss at the design receiver (M-93) if constructed at heights ranging from 6 to 16 feet. Noise Barrier S-624 would be constructed on

the right of way, with a length of approximately 155 feet. The location of Noise Barrier S-624 is shown on Figure 3.15-4, Sheet 25.

Under Build Alternative 4, Noise Barrier S-624 would provide benefit for one receptor (Activity Category B land use [residential]) and have a total reasonable allowance of $95,000 for all barrier heights (6 to 16 feet) versus a construction cost of $39,032 at 6 feet, $57,866 at 8 feet, $79,738 at 10 feet, $103,354 at 12 feet, $128,905 at 14 feet, and $158,347 at 16 feet. The cost at barrier heights of 14 and 16 feet would exceed the reasonable allowances. However, the reasonable allowances for barrier heights of 6, 8, and 10 feet would be below the construction costs, with a barrier height of 12 feet being within the 10 percent contingency. Therefore, this barrier is considered reasonable to construct for barrier heights of 6, 8, 10, and 12 feet. Because a barrier height of 10 feet would provide the most noise reduction at the benefited receptor, a 10-foot height for Noise Barrier S-624 is recommended.

Based on the studies completed to date, the County intends to incorporate noise abatement in the form of Noise Barrier S-624 at the right of way between STA #624+22 and 625+37 (see Figure 3.15-4, Sheet 25), with respective lengths and average heights of 155 feet and 10 feet. Calculations based on preliminary design data show that Noise Barrier S-624 will reduce noise levels by 5 to 13 dB for one residence at a cost of $79,738. These measures may change based on input received from the public. If conditions have substantially changed during final design, noise abatement may not be constructed. The final decision on noise abatement will be made upon completion of the project design.

3.15.4.2 NOI-3: Noise Barriers S-650 (Property Line) and S-652 (Property Line)

Build Alternative 1–Cajalco Alignment

Modeled Receivers M-105 and M-118 would approach or exceed the NAC of 67 dBA $L_{eq}(h)$ under the design-year build condition. Two sets of noise barriers (Noise Barriers S-650 and S-652 Right of Way [ROW] and Noise Barriers S-650 and S-652 [Property Line]) were modeled and found to be acoustically feasible. The barriers would meet the 7 dB insertion loss at the design receiver (M-105) if constructed at heights ranging from 6 to 16 feet. Noise Barrier S-650 would be constructed on the property line under both modeling scenarios; modeling this barrier along the right of way would restrict access to a dirt road on the adjacent parcel. Noise Barrier S-650 would be approximately 330 feet in length. Noise Barrier S-652 (ROW) was modeled along the right of way, with a length of approximately 450 feet. Noise Barrier S-652 (Property Line) was modeled along the property line, with a length of approximately 285 feet. The locations of Noise Barriers S-650 and 652 are shown on Figure 3.15-2, Sheet 21.

Noise Barriers S-650 and S-652 (Property Line) under Build Alternative 1 were found to be acoustically feasible. The barriers would meet the design goal of 7 dB insertion loss at the design receivers (M-105 and M-118) if constructed at heights ranging from 6 to 16 feet, with a total length of approximately 610 feet. Noise Barriers S-650 and S-652 (Property Line) would both be constructed along the property line and include a step-down design. Barrier heights of 14 and 16 feet would block the line of sight to an 11.5-foot truck stack at all the benefited receptors.

Under Build Alternative 1, Noise Barriers S-650 and S-652 (Property Line) would provide benefit for one to six receptors (representative of Activity Category B land uses [residential]) and have a total reasonable allowance of $95,000 for a barrier height of 6 feet versus a construction

cost of $398,157, a total reasonable allowance of $475,000 for a barrier height of 8 feet versus a construction cost of $442,241, a total reasonable allowance of $475,000 for a barrier height of 10 feet versus a construction cost of $484,699, a total reasonable allowance of $475,000 for a barrier height of 12 feet versus a construction cost of $522,535, a total reasonable allowance of $475,000 for a barrier height of 14 feet versus a construction cost of $557,215, and a total reasonable allowance of $570,000 for a barrier height of 16 feet versus a construction cost of $591,861. The cost at barrier heights of 6, 12, and 14 feet would exceed the reasonable allowances. However, the reasonable allowance for a barrier height of 8 feet would be below the construction costs. In addition, the reasonable allowance for a barrier height of 10 and 16 feet would be within 10 percent of the construction costs. Therefore, these barriers are considered reasonable to construct for barrier heights of 8, 10, and 16 feet. Thus, under Build Alternative 1, Noise Barriers S-650 and S-652 (Property Line) are recommended to be constructed at a barrier height of 8 feet, benefitting five receptors.

Barrier heights of 10 and 16 feet would provide additional noise reduction and benefit a maximum of six receptors (in the case of the 16-foot barrier height); however, the additional barrier height would block the line of sight from the benefited residences and the additional receptor significantly (in the case of a 16-foot barrier).

Based on the studies completed to date, the County intends to incorporate noise abatement in the form of Noise Barriers S-650 and S-652 (Property Line) at the property line between STA #649+29 and 650+51 (S-650) and between STA #652+32 and 655 (S-652) (see Figure 3.15-2, Sheet 21), with respective lengths and average heights of 330 and 285 feet, and 8 feet. Calculations based on preliminary design data show that Noise Barriers S-650 and S-652 (Property Line) will reduce noise levels by 5 to 12 dB for benefited residences at a cost of $442,241. These measures may change based on input received from the public. If conditions have substantially changed during final design, noise abatement may not be constructed. The final decision on noise abatement will be made upon completion of the project design.

Build Alternative 2C–Modified Cajalco Alignment

Modeled Receivers M-105 and M-118 would approach or exceed the NAC of 67 dBA $L_{eq}(h)$ under the design-year build condition. Two sets of noise barriers (Noise Barriers S-650 and S-652 [ROW] and Noise Barriers S-650 and S-652 [Property Line]) were modeled and found to be acoustically feasible. The barriers would meet the 7 dB insertion loss at the design receiver (M-105) if constructed at heights ranging from 6 to 16 feet. Noise Barrier S-650 would be constructed on the property line under both modeling scenarios; modeling this barrier along the right of way would restrict access to a dirt road on the adjacent parcel. Noise Barrier S-650 would be approximately 330 feet in length. Noise Barrier S-652 (ROW) was modeled along the right of way, with a length of approximately 450 feet. Noise Barrier S-652 (Property Line) was modeled along the property line, with a length of approximately 285 feet. The locations of Noise Barriers S-650 and 652 are shown on Figure 3.15-3, Sheet 24.

Under Build Alternative 2C, Noise Barriers S-650 (Property Line) and S-652 (Property Line) were found to be acoustically feasible. The barriers would meet the design goal of 7 dB insertion loss at the design receivers (M-105 and M-118) if constructed at heights ranging from 6 to 16 feet, with a total length of approximately 610 feet. Noise Barriers S-650 (Property Line) and S-652 (Property Line) would both be constructed along the property line and include a step-down

design. Barrier heights of 14 and 16 feet would block the line of sight to an 11.5-foot truck stack at all the benefited receptors.

Under Build Alternative 2C, Noise Barriers S-650 (Property Line) and S-652 (Property Line) would provide benefit for one to six receptors (representative of Activity Category B land uses [residential]) and have a total reasonable allowance of $95,000 for a barrier height of 6 feet versus a construction cost of $398,157, a total reasonable allowance of $475,000 for a barrier height of 8 feet versus a construction cost of $442,241, a total reasonable allowance of $475,000 for a barrier height of 10 feet versus a construction cost of $484,699, a total reasonable allowance of $4754,000 for a barrier height of 12 feet versus a construction cost of $522,535, a total reasonable allowance of $475,000 for a barrier height of 14 feet versus a construction cost of $557,215, and a total reasonable allowance of $570,000 for a barrier height of 16 feet versus a construction cost of $591,861. The cost at barrier heights of 6, 12, and 14 feet would exceed the reasonable allowances. However, the reasonable allowance for a barrier height of 8 feet would be below the construction costs. In addition, the reasonable allowance for a barrier height of 10 and 16 feet would be within 10 percent of the construction costs. Therefore, these barriers are considered reasonable to construct for barrier heights of 8, 10, and 16 feet. Thus, under Build Alternative 2C, Noise Barriers S-650 (Property Line) and S-652 (Property Line) are recommended to be constructed at a barrier height of 8 feet, benefitting five receptors.

Barrier heights of 10 and 16 feet would provide additional noise reduction and benefit a maximum of six receptors (in the case of the 16-foot barrier height); however, the additional barrier height would block the line of sight from the benefited residences and the additional receptor significantly (in the case of a 16-foot barrier).

Based on the studies completed to date, the County intends to incorporate noise abatement in the form of Noise Barriers S-650 and S-652 at the property line between STA #649+29 and 650+51 (S-650) and between STA #652+32 and 655 (S-652) (see Figure 3.15-3, Sheet 24), with respective lengths and average heights of 330 and 285 feet, and 8 feet. Calculations based on preliminary design data show that Noise Barriers S-650 and S-652 (Property Line) will reduce noise levels by 5 to 12 dB for residences at a cost of $442,241. These measures may change based on input received from the public. If conditions have substantially changed during final design, noise abatement may not be constructed. The final decision on noise abatement will be made upon completion of the project design.

Build Alternative 4–El Sobrante Alignment

Modeled Receivers M-105 and M-118 would approach or exceed the NAC of 67 dBA $L_{eq}(h)$ under the design-year build condition. Two sets of noise barriers (Noise Barriers S-650 [Property Line] and S-652 [ROW] and Noise Barriers S-650 [Property Line] and S-652 [Property Line]) were modeled and found to be acoustically feasible. The barriers would meet the 7 dB insertion loss at the design receiver (M-105) if constructed at heights ranging from 6 to 16 feet. Noise Barrier S-650 would be constructed on the property line under both modeling scenarios; modeling this barrier along the right of way would restrict access to a dirt road on the adjacent parcel. Noise Barrier S-650 would be approximately 330 feet in length. Noise Barrier S-652 (ROW) was modeled along the right of way, with a length of approximately 450 feet. Noise Barrier S-652 (Property Line) was modeled along the property line, with a length of

approximately 285 feet. The locations of Noise Barriers S-650 and S-652 are shown on Figure 3.15-4, Sheet 26.

Under Build Alternative 4, Noise Barriers S-650 and S-652 (Property Line) were found to be acoustically feasible. The barriers would meet the design goal of 7 dB insertion loss at the design receivers (M-105 and M-118) if constructed at heights ranging from 6 to 16 feet, with a total length of approximately 610 feet. Noise Barriers S-650 and S-652 (Property Line) would both be constructed along the property line and include a step-down design. Barrier heights of 14 and 16 feet would block the line of sight to an 11.5-foot truck stack at all the benefited receptors.

Under Build Alternative 4, Noise Barriers S-650 and S-652 (Property Line) would provide benefit for one to five receptors (representative of Activity Category B land uses [residential]) and have a total reasonable allowance of $190,000 for a barrier height of 6 feet versus a construction cost of $398,157, a total reasonable allowance of $475,000 for a barrier height of 8 feet versus a construction cost of $442,241, a total reasonable allowance of $475,000 for a barrier height of 10 feet versus a construction cost of $484,699, a total reasonable allowance of $475,000 for a barrier height of 12 feet versus a construction cost of $522,535, a total reasonable allowance of $475,000 for a barrier height of 14 feet versus a construction cost of $557,215, and a total reasonable allowance of $475,000 for a barrier height of 16 feet versus a construction cost of $591,861. The cost at barrier heights of 6, 12, 14, and 16 feet would exceed the reasonable allowances. However, the reasonable allowance for a barrier height of 8 feet would be below the construction costs. In addition, the reasonable allowance for a barrier height of 10 feet would be within 10 percent of the construction costs. Therefore, these barriers are considered reasonable to construct for barrier heights of 8 and 10 feet. Under Build Alternative 4, Noise Barriers S-650 and S-652 (Property Line) are recommended to be constructed at a barrier height of 8 feet, benefitting five receptors.

A barrier height of 10 feet would provide additional noise reduction; however a 10-foot barrier would block the line of sight from the benefited residences to a greater extent compared with an eight-foot barrier.

Based on the studies completed to date, the County intends to incorporate noise abatement in the form of Noise Barriers S-650 and S-652 (Property Line) at the property line between STA #649+29 and 650+51 (S-650) and between STA #652+32 and 655 (S-652) (see Figure 3.15-4, Sheet 26), with respective lengths and average heights of 330 and 285 feet, and 8 feet. Calculations based on preliminary design data show that Noise Barriers S-650 and S-652 (Property Line) will reduce noise levels by 5 to 12 dB for residences at a cost of $442,241. These measures may change based on input received from the public. If conditions have substantially changed during final design, noise abatement may not be constructed. The final decision on noise abatement will be made upon completion of the project design.

3.15.4.3 Additional Modeled and Evaluated Noise Abatement and Receptors

The following noise abatement and receptors were modeled and considered in this analysis. Based on Section 5 of the Protocol, the noise impact analysis presented in this EIR/EIS is based on a preliminary design. If the project design is changed in a way that could affect the acoustical performance of the barriers, the barrier design would need to be modified to achieve the same performance as that of the barriers outlined in this EIR/EIS. If conditions have substantially

changed during final design, noise abatement may not be necessary. The final decision on noise abatement will be made upon completion of the project design.

Noise Barrier S-652 (ROW)

Noise Barrier S-652 (ROW) was modeled along the right of way (see Figure 3.15-2, Sheet 21 [Build Alternative 1], Figure 3.15-3, Sheet 24 [Build Alternative 2C], and Figure 3.15-4, Sheet 26 [Build Alternative 4]), with a length of approximately 450 feet, and found to be acoustically feasible. Noise Barrier S-652 (ROW) was not recommended because the wall would extend along the right of way in front of an adjacent property.

Build Alternative 1–Cajalco Alignment

Under Build Alternative 1, Noise Barriers S-650 and S-652 (ROW) would provide benefit for one to eight receptors (representative of Activity Category B land uses [residential]) and have a total reasonable allowance of $95,000 for a barrier height of 6 feet versus a construction cost of $402,169, a total reasonable allowance of $380,000 for a barrier height of 8 feet versus a construction cost of $447,038, a total reasonable allowance of $570,000 for a barrier height of 10 feet versus a construction cost of $487,376, a total reasonable allowance of $665,000 for a barrier height of 12 feet versus a construction cost of $524,606, a total reasonable allowance of $665,000 for a barrier height of 14 feet versus a construction cost of $558,680, and a total reasonable allowance of $760,000 for a barrier height of 16 feet versus a construction cost of $592,674. The cost at barrier heights of 6 and 8 feet would exceed the reasonable allowances. However, the reasonable allowances for barrier heights of 10, 12, 14, and 16 feet would be below the construction costs. Therefore, these barriers are considered reasonable to construct for barrier heights of 10, 12, 14, and 16 feet. However, under Build Alternative 1, Noise Barriers S-650 and S-652 (ROW) are not recommended a barrier height of 16 feet because Noise Barrier S-652 (ROW) would extend along the right of way in front of the adjacent property.

Build Alternative 2C–Modified Cajalco Alignment

Under Build Alternative 2C, Noise Barriers S-650 (Property Line) and S-652 (ROW) would provide benefit for one to eight receptors (representative of Activity Category B land uses [residential]) and have a total reasonable allowance of $95,000 for a barrier height of 6 feet versus a construction cost of $402,169, a total reasonable allowance of $380,000 for a barrier height of 8 feet versus a construction cost of $447,038, a total reasonable allowance of $570,000 for a barrier height of 10 feet versus a construction cost of $487,376, a total reasonable allowance of $665,000 for a barrier height of 12 feet versus a construction cost of $524,606, a total reasonable allowance of $665,000 for a barrier height of 14 feet versus a construction cost of $558,680, and a total reasonable allowance of $760,000 for a barrier height of 16 feet versus a construction cost of $592,674. The cost at barrier heights of 6 and 8 feet would exceed the reasonable allowances. However, the reasonable allowances for barrier heights of 10, 12, 14, and 16 feet would be below the construction costs. Therefore, these barriers are considered reasonable to construct for barrier heights of 10, 12, 14, and 16 feet. However, under Build Alternative 2C, Noise Barriers S-650 (Property Line) and S-652 (ROW) are not recommended to be constructed at a barrier height of 16 feet because Noise Barrier S-652 (ROW) would extend along the right of way in front of the adjacent property.

Build Alternative 4–El Sobrante Alignment

Under Build Alternative 4, Noise Barriers S-650 (Property Line) and S-652 (ROW) 4 would provide benefit for one to seven receptors (representative of Activity Category B land uses [residential]) and have a total reasonable allowance of $95,000 for a barrier height of 6 feet versus a construction cost of $402,169, a total reasonable allowance of $475,000 for a barrier height of 8 feet versus a construction cost of $447,038, a total reasonable allowance of $570,000 for a barrier height of 10 feet versus a construction cost of $487,376, a total reasonable allowance of $570,000 for a barrier height of 12 feet versus a construction cost of $524,606, a total reasonable allowance of $665,000 for a barrier height of 14 feet versus a construction cost of $558,680, and a total reasonable allowance of $665,000 for a barrier height of 16 feet versus a construction cost of $592,674. The cost at a barrier height of 6 feet would exceed the reasonable allowances. However, the reasonable allowances for barrier heights of 8, 10, 12, 14, and 16 feet would be below the construction costs. Therefore, these barriers are considered reasonable to construct for barrier heights of 8, 10, 12, 14, and 16 feet. However, under Build Alternative 4, Noise Barriers S-650 (Property Line) and S-652 (ROW) are not recommended to be constructed at a barrier height of 16 feet because the Noise Barrier S-652 (ROW) would extend along the right of way in front of the adjacent property.

Noise Barrier S-565 (Build Alternative 4)

Noise Barrier S-565, under Build Alternative 4 (see Figure 3.15-4, Sheet 23), was found to be acoustically feasible if constructed at heights ranging from 8 to 16 feet but would meet the design goal of 7 dB insertion loss at the design receiver (M-98A) only at barrier heights of 14 to 16 feet, with a length of approximately 1,225 feet.

Noise Barrier S-565 would provide benefit for one receptor (Activity Category B land use [residential]) and have a total reasonable allowance of $95,000 at barrier heights of 14 and 16 feet versus a construction cost of $966,191 at 14 feet and a construction cost of $1,050,441 at 16 feet. Because the construction cost would exceed the reasonable allowance for both barrier heights, Noise Barrier S-565 is not recommended and will not be included as abatement.

Modeled Receptor M-99 (Build Alternative 4)

Modeled receptor M-99 (see Figure 3.15-4, Sheet 25) would approach or exceed the NAC of 67 dBA $L_{eq}(h)$ during the design year. Noise abatement was not considered for this location because any noise abatement would restrict access to the property by cutting off the driveway. Therefore, no abatement is available.

3.16 Energy

3.16.1 Regulatory Setting

3.16.1.1 Federal Regulations

The National Environmental Policy Act (NEPA) (42 United States Code [USC] Part 4332) requires the identification of all potentially significant impacts to the environment, including energy impacts.

3.16.1.2 State Regulations

The California Environmental Quality Act (CEQA) Guidelines section 15126.2(b) and Appendix F, Energy Conservation, require an analysis of a project's energy use to determine if the project may result in significant environmental effects due to wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources.

3.16.2 Affected Environment

California is the most populated state in the nation, has the largest economy, and is second only to Texas in total energy consumption. Although California has the world's fifth-largest economy, the state has one of the lowest per-capita energy consumption levels in the United States. California's extensive efforts to increase energy efficiency and implement alternative technologies have restrained growth in energy demand. California is also rich in energy resources. The state has an abundant supply of crude oil and is a top producer of conventional hydroelectric power. California also leads the nation in electricity generation from solar, geothermal, and biomass resources (U.S. Energy Information Administration 2018).

Driven by high demand from California's many motorists, major airports, and military bases, the transportation sector is the state's largest energy consumer, responsible for approximately 40 percent of the state's energy consumption in 2016 by British Thermal Units (U.S. Energy Information Administration 2016). Petroleum-based fuels account for 91 percent of California ground transportation fuel use (California Energy Commission 2018a:9). Gasoline is the most used transportation fuel in California, with 9 percent of all gasoline being consumed by light-duty cars, pickup trucks, and sport utility vehicles. In 2015, 15.1 billion gallons of gasoline were sold, according to the State Board of Equalization (California Energy Commission 2019). Diesel fuel is the second largest transportation fuel used in California, representing 17 percent of total fuel sales behind gasoline. According to the state Board of Equalization, in 2015 4.2 billion gallons of diesel, including off-road diesel, were sold (California Energy Commission 2019).

As discussed in the 2017 *Integrated Energy Policy Report*, California Energy Commission (CEC) staff projects that petroleum-based fuels will continue to represent the largest shares of transportation fuel demand through at least 2030. However, CEC staff projects that demand for gasoline is expected to wane over time, primarily due to increases in fuel efficiency and electrification. Based on a middle-case scenario, gasoline consumption in the state is predicted to fall from just under the current 15 billion gallons in 2016 to just over 12 billion gallons in 2030. During the same period, demand for jet fuel and diesel fuel is projected to remain constant at

approximately 4 billion gallons of gasoline equivalent for each fuel type (California Energy Commission 2018a:212–213).

In the Southern California Association of Governments (SCAG) region, 9.3 billion gallons of fuel were consumed in 2012, which is projected to fall to 6.8 billion gallons of fuel annually in 2040 with full implementation of the 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy. Despite a projected net increase in vehicle miles traveled (VMT) in the region, fuel consumption reductions are anticipated to result from better fuel economy, the Advanced Clean Cars Program, reduced total daily hours of delays in the regional transportation system, and more alternative fuel and zero emissions vehicles on the road (SCAG 2015:3.6-26).

3.16.2.1 Lake Mathews MSHCP Area

The project corridor travels through the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area and Lake Mathews Multiple Species Reserve (LMR). Much of the land surrounding Lake Mathews is undeveloped because these lands are protected. Much of the energy use within the LM MSHCP area and surrounding area at present results from the operation of motor vehicles and the small number of buildings present, as well as from maintenance activities within the LM MSHCP area. Such energy use is a negligible portion of the total energy use in the project region and the state.

3.16.3 Environmental Consequences

3.16.3.1 Methodology

This energy analysis is based on California Department of Transportation's (Caltrans') Standard Environmental Reference, Volume 1, Chapter 13, Energy, updated in August 2018. The energy analysis addresses two elements: direct and indirect energy consumption. Direct energy refers to the fuel consumed by vehicles using the highway facility. Indirect energy refers to the energy associated with the construction and operation of the facility.

Based on the traffic analysis prepared for the proposed project, sub-regional VMT and roadway network travel speeds were calculated using Opening Year 2024 traffic data (VMT apportioned into 5-mile-per-hour [mph] speed bins) derived from a micro-simulation model that captures regional project effects on traffic circulation (Caltrans 2017). The sub-regional VMT was used to estimate operational automobile traffic energy consumption from the No-Build Alternative and the build alternatives. The VMT-by-speed-bin data were used as inputs in CT-EMFAC2014, which is Caltrans' tool for estimating pollutant emissions from on-road vehicles. The outputs for carbon dioxide (CO_2) were converted to fuel equivalents and million British thermal units (MMBTU) using conversion factors. The estimate of operational energy use includes direct energy from vehicles using the project alignment, as well as the indirect energy use from the effects of the project on circulation patterns and speeds elsewhere in the region.

The estimate of construction-related energy use was estimated using the outputs from the Road Construction Emissions Model, which includes details on construction equipment and activity assumptions. The estimated CO_2 emissions were then converted to fuel equivalents and MMBTU using conversion factors.

3.16.3.2 Permanent Impacts

Build Alternatives 1, 2C, and 4

Local energy demand for transportation projects typically is dominated by vehicle fuel usage. The build alternatives would improve operational efficiency, providing an improvement in traffic flow. Based on the traffic analysis prepared for the proposed project, each of the build alternatives would increase the VMT in the study area at Opening Year 2024 relative to the No-Build Alternative as a result of more vehicles operating on the widened roadway. As shown in Table 3.16-1, energy consumption (in MMBTU and its equivalent in gallons of gasoline) would increase under each of the build alternatives relative to the No-Build Alternative. Under Build Alternative 1, operational energy consumption at Opening Year 2024 would be 0.67 percent higher than under the No-Build Alternative. Under Build Alternative 2C, operational energy consumption at Opening Year 2024 would be 1.25 percent higher than under the No-Build Alternative. Under Build Alternative 4, operational energy consumption at Opening Year 2024 would be 1.07 percent higher than under the No-Build Alternative.

Table 3.16-1 also shows operational energy consumption projected for Horizon Year 2044. Under Build Alternative 1, operational energy consumption at Opening Year 2044 would be 0.88 percent higher than under the No-Build Alternative. Under Build Alternative 2C, operational energy consumption at Opening Year 2044 would be 0.39 percent higher than under the No-Build Alternative. Under Build Alternative 4, operational energy consumption at Opening Year 2044 would be 1 percent higher than under the No-Build Alternative.

Table 3.16-1. Estimated Operational Energy Consumption and Vehicle Miles Traveled, by Alternative

Alternative	Annual Energy Consumption (MMBTU)	Annual Energy Consumption (Gallons of Gasoline Equivalent)	Annual Vehicle Miles Traveled[1]
Existing/Baseline 2014	19,413,114	155,304,913	2,979,123,737
Open to Traffic 2024			
No Build	18,294,593	146,356,745	3,699,198,298
Build Alternative 1	18,416,974	147,335,796	3,751,722,597
Build Alternative 2C	18,522,989	148,183,910	3,771,736,039
Build Alternative 4	18,491,106	147,928,848	3,768,515,922
Horizon Year 2044			
No Build	19,429,723	155,437,786	5,086,991,199
Build Alternative 1	19,601,538	156,812,301	5,128,627,382
Build Alternative 2C	19,504,966	156,039,730	5,108,239,744
Build Alternative 4	19,623,207	156,985,653	5,139,521,794

Source*:* EMFAC 2014. See calculations in Appendix K.
[1] Annual vehicle miles traveled (VMT) values derived from Daily VMT values multiplied by 347, per California Air Resources Board methodology (California Air Resources Board 2014).

Although there would be increases in operational energy consumption from vehicles in the project vicinity when comparing the Opening Year 2024 build alternatives to the No-Build Alternative, annual operational energy consumption would decrease by approximately 5 percent under each of the Opening Year 2024 build alternatives when compared to Year 2014

Existing/Baseline. These decreases in energy consumption are attributable to increasing fuel economy standards and the retirement of older, less fuel-efficient vehicles projected to take place by Opening Year 2024. The decrease in fuel consumption at Opening Year 2024 under each of the build alternatives would also occur despite increases in VMT of approximately 26 percent under each of the build alternatives relative to the Existing/Baseline Year 2014.

At Horizon Year 2044, energy consumption from vehicles in the project vicinity would be higher under the build alternatives when compared to the Existing/Baseline Year 2014 conditions. However, for each build alternative, the increase in energy consumption would be approximately 1 percent higher than the Existing/Baseline Year 2014 increases despite increases in VMT of at least 70 percent. Furthermore, Standard Project Measure **PF VIS-4**, which includes the use of energy efficient lighting, would be employed and would reduce energy usage related to operational lighting. Refer to Section 3.7, *Visual/Aesthetics*, for Standard Project Measure **PF VIS-4**. Thus, there would be a minor increase in operational energy consumption to fuel a substantial increase in vehicle travel in the project area, and the build alternatives would not result in the wasteful, inefficient, or unnecessary consumption of energy resources.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would involve greater energy consumption.

Estimated annual operational energy consumption from vehicles in the project area is shown in Table 3.16-2 and would occur almost entirely as fuel use. Energy consumption estimates are based on VMT and speed profile data projected under the six-lane future facility and are compared to the energy consumption estimated under the build alternatives at the Horizon Year 2044. The future six-lane facility is compared to the corresponding Horizon Year 2044 build alternatives because the future six-lane facility, if constructed, would not be implemented until a later date and occur after the construction of the selected build alternative. As such, Year 2044 build alternative scenarios are the appropriate baseline for comparison.

As shown in Table 3.16-2, operational energy consumption is expected to be greater under the six-lane future facility when compared to the corresponding build alternatives, but the increases would not be substantial. The future six-lane facility under Build Alternative 1 or 2C would result in an estimated 0.55 percent increase in operational fuel use compared to Build Alternative 1 at the 2044 Horizon Year. The future six-lane facility under Build Alternative 4 would result in a 0.69 percent increase in operational fuel use compared to Build Alternative 4 at the 2044 Horizon Year. All projected increases in fuel use in the study area are attributable to the increase in VMT projected under the future six-lane future facility.

Table 3.16-2. Estimated Annual Operational Energy Consumption and Vehicle Miles Traveled, Future Six-Lane Facility

Alternative	Annual Energy Consumption (MMBTU)	Annual Energy Consumption (Gallons of Gasoline Equivalent)	Annual Vehicle Miles Traveled[1]
Horizon Year 2044			
Future Six-Lane Facility (Build Alternative 1/2C)	19,709,768	157,678,147	5,150,625,375
Future Six-Lane Facility (Build Alternative 4)	19,758,168	158,065,342	5,168,198,490

Source: EMFAC 2014. See calculations in Appendix K.
[1] Annual vehicle miles traveled (VMT) values derived from Daily VMT values multiplied by 347, per California Air Resources Board methodology (California Air Resources Board 2014).

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under each of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements. Any of the build alternatives would result in permanent impacts within the LM MSHCP area associated with the increased emissions from greater vehicle volumes. As specified in Table 3.16-1, operational energy consumption would increase under the build alternatives relative to the No-Build Alternative, and a portion of those increases would occur in the MSHCP area. In addition to everyday roadway operations within the MSHCP area, ongoing maintenance activities for the appurtenant facilities would also result in increases in energy emissions. Given the infrequent nature of maintenance activities and that the maintenance activities would generally be limited in scope, such energy consumption would be minor.

No-Build Alternative

Under the No-Build Alternative, the capacity and condition of the roadways in the project vicinity would remain the same as current conditions. As shown in Table 3.16-1, operational energy consumption would be lower than under each of the build alternatives, but the roadway would not accommodate the additional VMT projected to occur under each of the build alternatives. Energy use in the form of fuel consumption would fall under the No-Build Alternative relative to the Existing/Baseline Year 2014.

3.16.3.3 Temporary Impacts

Build Alternatives 1, 2C, and 4

The construction of the project is expected to involve the use of diesel-powered heavy equipment, portable diesel generators, and heavy-duty trucks for material hauling and delivery and light-duty vehicles for worker commute trips, almost all of which would involve the

consumption of petroleum-based gasoline or diesel fuel. Temporary construction-period activities would require the consumption of the equivalent of 462,000 gallons of diesel fuel, or approximately 64,000 MMBTU (see Table 3.16-3 and Appendix K). Although there would be some differences in the amount of construction-period energy consumed between each of the build alternatives, the construction activities would be similar and the differences are expected to be minor.

Table 3.16-3. Estimated Construction-Period Energy Consumption

Construction Phase	Equipment Used	Gallons of Fuel	Energy Consumption (MMBTU)
Grubbing/Land Clearing	Crawler Tractors (1) Forklifts (2) Water Truck (1) Delivery and Haul Trucks Worker Commute Trips	14,962	2,075
Grading/Excavation	Crawler Tractors (1) Excavators (3) Graders (2) Rollers (2) Rubber Tired Loaders (1) Scrapers (2) Tractors/Loaders/Backhoes (4) Water Truck (1) Delivery and Haul Trucks Worker Commute Trips	244,363	33,893
Drainage/Utilities/Sub-Grade	Air Compressors (1) Generator Sets (1) Graders (1) Plate Compactors (1) Pumps (1) Rough Terrain Forklifts (1) Scrapers (1) Tractors/Loaders/Backhoes (3) Water Truck (1) Delivery and Haul Trucks Worker Commute Trips	138,126	19,158
Paving	Pavers (1) Paving Equipment (1) Rollers (2) Tractors/Loaders/Backhoes (3) Delivery and Haul Trucks Worker Commute Trips	64,656	8,968
	TOTAL	**462,106**	**64,094**
Source: Road Construction Emissions Model outputs. See Appendix K.			

In addition to direct fuel consumption, some battery-operated support equipment and electric equipment may be used during the construction period, which would rely on electricity from the existing grid. There would be an irreversible impact from the consumption of diesel fuel (and other fuels) related to these construction activities.

Although construction activities under each of the build alternatives would require energy consumption, the construction fuel requirements would be temporary in nature and would be limited to the approximately 4-year construction period. Furthermore, Standard Project Measure **PF AQ-1**, which includes restrictions on idling of construction vehicles and the use of onsite mobile equipment powered by alternative fuel sources, would be employed and reduce energy consumption during construction. Refer to Section 3.14, *Air Quality*, for Standard Project Measure **PF AQ-1**. Fuel required for construction would represent a negligible increase in regional demand and an insignificant amount relative to the more than 19 billion gallons of fuels sold in the state as of 2015 (California Energy Commission 2018a, 2018b). Given the extensive network of fueling stations throughout the project vicinity and the fact that construction would be short term, no new or expanded sources of energy or infrastructure would be required to meet the energy demands of the build alternatives. All construction activities would be in the service of constructing the build alternatives to improve existing transportation facilities, and would therefore not be a wasteful, inefficient, or unnecessary consumption of energy resources.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

For the future six-lane facility, construction is not currently proposed as part of the project. However, if constructed in the future, it is anticipated that temporary impacts associated with the construction of two additional travel lanes within the median of Cajalco Road, or within the medians of Cajalco Road and La Sierra Avenue for Build Alternative 4, would result from the use of construction equipment, material movement, and worker commute trips. Construction activities anticipated for the future six-lane facility would include clearing, grading and paving, and temporary staging, for the segment of Cajalco Road between Temescal Canyon Road and La Sierra Avenue under Build Alternatives 1 or 2C, or for the segments of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4. Because the roadway areas represent less than half of the overall length and project area associated with the build alternatives, construction-period energy consumption would be anticipated to be less than that identified for the build alternatives. Such temporary increases in energy consumption are not anticipated to be wasteful or inefficient.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Energy consumed within the LM MSHCP area would represent a portion of the energy consumed for the overall construction of the build alternatives. Because the energy consumption for the overall construction period is not considered a wasteful, inefficient, or unnecessary consumption of energy resources, the portion of the energy consumption within the LM MSHCP area would also not be considered wasteful, inefficient, or unnecessary.

No-Build Alternative

Under the No-Build Alternative, no construction activities would occur and consequently no additional energy would be consumed.

3.16.4 Avoidance, Minimization, and/or Mitigation Measures

The proposed project includes Standard Project Measure **PF AQ-1** to reduce energy consumption during construction. It also includes Standard Project Measure **PF VIS-4**, which

would reduce energy consumption used for operational lighting. No avoidance, minimization, and/or mitigation measures are required.

3.17 Natural Communities

This section of the document discusses natural communities of concern. The focus of this section is on biological communities, not individual plant or animal species. The emphasis of the section is on the ecological function of the natural communities within the area. This section also includes information on wildlife corridors and habitat fragmentation. Wildlife corridors are areas of habitat used by wildlife for seasonal or daily migration. Habitat fragmentation involves the potential for dividing sensitive habitat and thereby lessening its biological value.

Habitat areas that have been designated as critical habitat under the Federal Endangered Species Act (FESA) are discussed in Section 3.21, *Threatened and Endangered Species*. Wetlands and other waters are discussed in Section 3.18, *Wetlands and Other Waters*.

3.17.1 Regulatory Setting

The Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP), Stephens' kangaroo rat (SKR) (*Dipodomys stephensi*) Habitat Conservation Plan (HCP), and Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP), were reviewed because the plans provide specific conservation goals for natural vegetation communities that are rapidly declining throughout the region (e.g., Riversidian sage scrub [RSS] and riparian-riverine resources); these communities provide suitable habitat for the species covered under the plans.

Modifications to the LM MSHCP and associated agreements, easements, and permits, including the identification of proposed mitigation, require approvals by regulatory and responsible parties, and are subject to NEPA and CEQA where such agreements, easements, and permits apply. Therefore, analyses specific to the LM MSHCP are provided under separate headings, *Lake Mathews MSHCP,* within this section. Refer to Section 3.17.1.3, *Lake Mathews Multiple Species Habitat Conservation Plan*, below for further discussion.

3.17.1.1 Western Riverside County Multiple Species Habitat Conservation Plan

The WRC MSHCP, a comprehensive regional HCP, was adopted in June 2003. Major participants in the regional planning effort included the California Department of Transportation (Caltrans), Riverside County, California Department of Fish and Wildlife (CDFW), U.S. Fish and Wildlife Service (USFWS), Riverside County Transportation Commission, 18 cities, and interested individuals and groups. The purpose of the plan was to develop methods and procedures that provide for development while protecting environmental resources in the western Riverside County area over a 75-year period. The County signed the Implementation Agreement on December 15, 2003. This plan provides, among other things, impact mitigation for future County projects on circulation element roads in the covered area of western Riverside County.

Participation by the County is intended to streamline the environmental process for future transportation projects in western Riverside County (e.g., through pre-mitigation) and save money over the long term. The proposed project involves an existing facility and is a Covered Activity under Volume I, Section 7.2.2 (Circulation Element Roads) of the WRC MSHCP. The covered transportation routes require discretion by the County with respect to design, construction, and operational decisions to minimize adverse impacts on existing habitat that may

be affected by project activities. For covered projects, compliance with WRC MSHCP Volume I, Section 7.5.1 (Guidelines for the Siting and Design of Planned Roads within the Criteria Area and Public/Quasi-public Lands), 7.5.2 (Guidelines for Construction of Wildlife Crossings), 7.5.3 (Construction Guidelines), and Appendix C (Standard Best Management Practices) is required. Where impacts cannot be avoided, the County will make reasonable efforts to mitigate the impacts.

A consistency review by the Western Riverside County Regional Conservation Authority (RCA), USFWS, and CDFW will be performed to ensure that the project is consistent with the requirements of the plan. Because there is a federal nexus for the project, formal consultation would occur through the consistency review performed by USFWS and will result in a streamlined biological opinion from USFWS.

3.17.1.2 Stephens' Kangaroo Rat Habitat Conservation Plan

The Riverside County Habitat Conservation Authority (RCHCA) obtained incidental take permits from USFWS and CDFW for SKR within the SKR HCP area. The purpose of the SKR HCP is to streamline the permitting process for otherwise lawful activities resulting in the incidental take of SKR while also meeting FESA and California Endangered Species Act (CESA) requirements without seeking individual permits and agreements with USFWS and CDFW. Conservation goals for SKR were incorporated into the HCP to ensure full mitigation for all SKR occupied habitat that would be incidentally taken. One of these goals included the acquisition and conservation of SKR habitat within an SKR regional reserve system. The SKR HCP provides take authorization for SKR within its boundaries through the establishment of Core Reserves.

The SKR HCP occurs entirely within the WRC MSHCP area. The SKR HCP establishes conservation of 15,000 acres in Core Reserves within the plan's boundary for SKR. The proposed project would occur in one of the long-term SKR HCP Core Reserve areas, Existing Core C. This Core Reserve was established as part of the SKR HCP and is now managed under the WRC MSHCP Conservation Area, consistent with the SKR HCP and other management agreements for the reserve. Public facilities projects receive coverage under this HCP for potential take of SKR; however, because the proposed project would affect SKR Core Reserve lands, a Core Reserve Land Disturbance Report would be prepared that documents the impacts on SKR and compensatory mitigation. The report would be submitted to the RCHCA for Board approval.

3.17.1.3 Lake Mathews Multiple Species Habitat Conservation Plan

The LM MSHCP is a joint conservation effort initiated by the Metropolitan Water District of Southern California (MWD) and RCHCA in cooperation with USFWS and CDFW that spans 5,993.5 acres of open land around Lake Mathews. The LM MSHCP provides take of federally (Endangered Species Act [ESA]) and state-listed (California Endangered Species Act [CESA]) species covered under the plan and the measures necessary to minimize and mitigate for such take. The LM MSHCP also provides take of species that are candidates for federal or state listing under the ESA and CESA; bird species protected by the Migratory Bird Treaty Act or Bald and Golden Eagle Protection Act; species of special concern in California, as identified by CDFW; species on the California Rare Plant Ranking list of sensitive plants; species on the NCCP list of

sensitive coastal sage scrub species; and species of special local concern because of rarity or unique biological value. There are 65 listed and non-listed species covered under the LM MSHCP (Lake Mathews target species). Thirty-one of the LM MSHCP target species are also covered under the WRC MSHCP. The plan provides a broad-based ecosystem approach to planning for the protection and perpetuation of biological diversity. The LM MSHCP includes MWD Plan Area projects and operations areas, the existing State Ecological Reserve, and Mitigation Bank lands established for the LM MSHCP. The Lake Mathews Reserve (LMR) is composed of the State Ecological Reserve and Mitigation Bank area within the LM MSHCP area.

Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements.

The responsible parties (i.e., MWD, USFWS, CDFW, and RCHCA) will need to approve and authorize any new amendment or agreements, and implementation would be conducted by the Lake Mathews Reserve Management Committee (LMRMC).[1] Public/Quasi-public (PQP) lands replacement within the LM MSHCP lands would also require consultation with the RCA. It is anticipated that MWD, as the primary managing entity of Lake Mathews and surrounding operations, will be included in the development of procedures for the discretionary action; however, it should be noted that MWD is not a joint project lead or co-sponsor of the project. Refer to Section 3.1, *Land Use,* for details of the LM MSHCP process.

3.17.2 Affected Environment

Unless otherwise noted, the information from this section was based upon the Natural Environment Study (NES) prepared for the project (Caltrans 2018, 2021). References used in the NES are not carried over into this section. The analysis in this document focuses on those species and habitats that occur or have the potential to occur in the Biological Study Area (BSA).

Several references were used to determine what natural vegetation communities of concern are present. The California Natural Diversity Database (CNDDB) was initially reviewed because it tracks natural communities of concern by CDFW. The WRC MSHCP and LM MSHCP were also reviewed for the sensitive natural vegetation communities that are tracked in the plans.

3.17.2.1 Study Areas

The resources described in this section occur within the BSA, which is composed of the proposed project footprint for Build Alternatives 1, 2C, and 4 and up to a 500-foot buffer (Figure 3.17-1). For WRC MSHCP riparian-riverine resources, the jurisdictional delineation study area (JSA) includes the project footprint and 200-foot buffer for each of the build alternatives.

The BSA occurs in the South Coast subregion of the Southwestern California region and within the California Floristic Province. The natural vegetation of the subregion consists primarily of chaparral, sage scrub, annual grasslands, woodland, and riparian scrub and forest. Much of the natural vegetation occurs in preserved open space or scattered in fragmented patches in areas that are not developed.

[1] The LMRMC is composed of representatives from MWD, RCHCA, USFWS, and CDFW.

The BSA is located within valleys and foothills between the Santa Ana and San Jacinto Mountain ranges. Major topographic features in the vicinity of the BSA include the Gavilan Plateau, Estelle Mountain, Temescal Creek, Lake Mathews, the Gavilan Hills to the immediate south, and the Santa Ana Mountains to the southwest. Human activities and land use in the area surrounding the BSA have historically included ranching, farming, mining, and associated infrastructure; the landscape condition reflects this disturbance. The BSA currently contains a mosaic of undeveloped lands, farming lands, mining, and rural residential development, with a large amount of open lands, including preserved open space, specifically surrounding the western portion of the BSA that includes conserved lands under the ownership of the RCA, Riverside-Corona Resource Conservation District (RCRCD), RCHCA, and MWD (Figure 3.17-2), and multiple restored areas functioning as compensatory mitigation for aquatic impacts related to several public and private projects. These conserved lands include the LMR within the LM MSHCP and SKR Core Reserve within the SKR HCP. WRC MSHCP Additional Reserve Lands managed by RCA are located west of La Sierra Road. In addition, the RCRCD manages several restorations sites off of Cajalco Road; however, none of these are managed under an HCP.

A majority of the undeveloped lands, open space, and conserved lands are located on the western end of the BSA, between Temescal Canyon Road and Harley John Road. The BSA is generally undeveloped in the westernmost portion, with some residential and other land uses occurring along the BSA toward the east. The BSA from Harley John Road east to Interstate 215 (I-215) is dominated by more developed and residential lands with some interspersed open space areas.

3.17.2.2 Vegetation Communities within the Biological Study Area

Forty-three vegetation communities/land types were identified within the BSA (Figure 3.17-3). Thirty-five of the vegetation communities/land types documented within the BSA were found within the boundaries of the LM MSHCP (hereafter referred to as the LM MSHCP area) (Figure 3.17-3). Table 3.17-1 summarizes the amount of each vegetation community within the BSA and the portion of those communities that occurs within the LM MSHCP area.

Table 3.17-1. Biological Study Area Vegetation Community Acreages

Vegetation Communities/Land Types	Biological Study Area (acres)	BSA within the LM MSHCP Area only (acres)[1]

* Classified as a natural community of concern by CDFW.
[1] The BSA includes all conserved (including LM MSHCP lands) and non-conserved lands. The portion of the BSA that occurs within the LM MSHCP planning area is provided in a separate column to facilitate environmental reviews and approvals specific to LM MSHCP accommodation of the project.

A general description of each vegetation community mapped within the BSA and the dominant plant species in those communities is provided below.

Southern Cottonwood-Willow Riparian Forest

This vegetation community has a well-developed tree canopy, with the dominant species being arroyo willow (*Salix lasiolepis*), red willow (*S. laevigata*), black willow (*S. gooddingii*), and Fremont's cottonwood (*Populus fremontii*). In some areas, this community has a well-developed shrub and/or herb layer, depending especially on hydrology and disturbance. Species dominating the shrub and herb layer include mulefat (*Baccharis salicifolia*) and stinging nettle (*Urtica dioica*). This community occurs primarily within Temescal Creek and portions of Cajalco Creek. Southern cottonwood-willow riparian forest is considered a natural community of concern.

Riparian Forest

Riparian forest habitat occurs within drainages with intermittent hydrology in the BSA. Dominant species observed included Fremont's cottonwood, western sycamore, and willows. There is little to no vegetation in the herbaceous layer and the ground is composed of leaf litter. Riparian forest is considered a natural community of concern.

Southern Willow Scrub

The species dominating this community are arroyo willow, Goodding's black willow, and red willow, with a limited amount of mulefat present. This shrubby vegetation community lacks a well-developed tree canopy. The southern willow scrub occurs along perennial and intermittent streams within the BSA. Southern willow scrub is considered a natural community of concern.

Disturbed Southern Willow Scrub

The disturbed southern willow scrub community occurs within the more developed areas of the BSA. The tree canopy is composed of a few willow trees surrounded by residential properties and other human disturbances. The hydrology of the drainages where the disturbed southern willow scrub occurs has been altered due to development. There is also an increase in human disturbances, such as trash and debris, and disking in the vicinity. Southern willow scrub (including disturbed) is considered a natural community of concern.

Mulefat Scrub

This vegetation community is dominated by mulefat, including nearly monotypic stands. This community occurs primarily along ephemeral and intermittent streams.

Figure 3.17-3 - Sheet 25
Vegetation Communities Build Alternative 4
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

Willow/Mulefat Scrub

This community is composed of a transitional area between southern willow scrub and mulefat scrub and is composed of willows and mulefat. The community occurs adjacent to ephemeral and intermittent streams in the BSA.

Sandbar Willow

The sandbar willow community occurs in a low valley in a drainage area. The community is dominated by sand bar willow (*Salix exigua*) with some mulefat near the edges.

Coast and Valley Freshwater Marsh

Freshwater marsh occurs mostly in streams (i.e., Temescal Wash) and drainage features. This community is dominated by hydrophytic vegetation, such as cattails (*Typha* spp.), sedges (*Eleocharis* spp., *Cyperus* spp., *Schoenoplectus* spp.), and rushes (*Juncus* spp.). Other species observed include salt grass (*Distichlis spicata*), common duckweed (*Lemna minor*), floating water primrose (*Ludwigia peploides*), water cress (*Nasturtium officinale*), and water speedwell (*Veronica anagallis-aquatica*). This vegetation community is limited to a few small areas in the BSA. Coast and valley freshwater marsh is considered a natural community of concern.

Native/Nonnative Riparian Scrub

This community is composed of a mosaic of riparian scrub species, including mulefat, blue elderberry (*Sambucus nigra* ssp. *caerulea*), willows, tree tobacco (*Nicotiana glauca*), short-pod mustard (*Hirschfeldia incana*), and nonnative grasses. The native/nonnative riparian scrub occurs on a terrace at Temescal Wash.

Riparian Vegetated

Riparian vegetated areas are mapped where small patches of CDFW jurisdictional riparian-associated vegetation was present. The “riparian vegetated” designation does not represent a vegetation classification; however, to be consistent with WRC MSHCP riparian-riverine policies, it is included here. Riparian vegetated areas are characterized as small patches and often as individual mulefat or willow plants that, by themselves, would not function or be classified as a vegetation community; however, because of their association with CDFW streambed, they qualify as riparian-riverine.

Riparian Herbaceous

Riparian herbaceous habitat occurs within drainages in the BSA and is dominated by herbaceous plants, including curly dock (*Rumex crispus*), willow dock (*R. salicifolius*), willow smartweed (*Persicaria lapathifolia*), yerba mansa (*Anemopsis californica*), saltmarsh-fleabane (*Pluchea odorata* var. *odorata*), and fringed willowherb (*Epilobium ciliatum*).

Riparian Ruderal

The riparian ruderal classification is given to areas located along roadsides and mechanically disturbed areas within and adjacent to riparian areas. Species within this community include

mulefat saplings, short-pod mustard, salt grass, and alkali heliotrope (*Heliotropium curassavicum* var. *oculatum*).

Riparian Scrub

The riparian scrub community is composed of a mosaic of riparian and non-riparian vegetation. Species within this community include mulefat, willow, Mexican palo verde (*Parkinsonia aculeata*), and sparse nonnative grasses. Most of the riparian scrub communities are associated with a drainage feature. There is also riparian scrub mapped at culvert inlets/outlets.

Tamarisk Scrub

This community is dominated by the invasive species tamarisk (*Tamarix ramosissima*). This community contains monotypic stands of tamarisk, often associated with drainage features.

Coast Live Oak/Sycamore Riparian

This woodland community consists of mature coast live oak (*Quercus agrifolia*) and western sycamore (*Platanus racemosa*) trees. The canopy is open to continuous with a sparsely vegetated understory. This community is associated with an ephemeral earthen drainage. Coast live oak/sycamore riparian is considered a natural community of concern.

Coast Live Oak Woodland

This woodland habitat occurs on an upper terrace of Temescal Creek. The community comprises mature coast live oak. The canopy is open to continuous, with a sparsely vegetated understory comprising nonnative grasses and herbs. Coast live oak woodland is a natural community of concern.

California Sycamore Woodland

The California sycamore woodland is an open canopy community dominated by California sycamore with a shrub layer composed of mulefat.

Mexican Elderberry Scrub

This shrub community occurs in open to moderately dense stands and is dominated by blue elderberry. Other species observed in this community include nonnative Peruvian peppertree (*Schinus molle*) and mulefat. Mexican elderberry scrub typically occurs within drainages and flood terraces.

Mulefat/Mexican Elderberry Scrub

This scrub community consists of scattered mulefat and blue elderberry with an herbaceous layer of nonnative grasses.

Mexican Elderberry/Ruderal

The Mexican elderberry/ruderal vegetation community is composed of a patchy Mexican elderberry scrub habitat. Shrubs also occurring in this community include California buckwheat

(*Eriogonum fasciculatum*) and mulefat. Historically, the Mexican elderberry/ruderal habitat was part of the Cajalco Creek drainage system.

Saltbush Scrub

This upland community is dominated by saltbush including big saltbush (*A. lentiformis*) and four-wing saltbush (*A. canescens* var. *canescens*) in the shrub canopy. Other dominant species found in this community include five-hooked bassia (*Bassia hyssopifolia*) and smooth tarplant (*Centromadia pungens* ssp. *laevis*). Often this community is associated with alkaline soils.

Riversidian Sage Scrub

This vegetation community is a xeric form of coastal sage scrub and contains mostly drought-deciduous shrubs with small leaves. The dominant plants are California sagebrush (*Artemisia californica*), California buckwheat, brittlebush (*Encelia farinosa*), and short-winged deerweed (*Acmispon glaber* var. *brevialatus*). A number of nonnative plants also occur, including slender wild oat (*Avena barbata*), red brome (*B. madritensis* ssp. *rubens*), Mediterranean schismus (*Schismus barbatus*), and redstem filaree (*Erodium cicutarium*). RSS is a natural community of concern.

Disturbed Riversidian Sage Scrub

Disturbed RSS occurs in areas that have been disturbed by routine mowing or are adjacent to developed areas and subject to edge impacts, thereby minimizing vegetation community function and value. These communities are identified as disturbed RSS. This community is included with RSS as a natural community of concern because of the potential for the community to be enhanced and provide value for special-status species, and its function as a buffer between disturbed areas and RSS.

Riversidian Alluvial Fan Sage Scrub

Riversidian alluvial fan sage scrub (RAFSS) occurs on alluvial fans and drainages. Vegetation within RAFSS is composed of California buckwheat, California sagebrush, white sage (*Salvia apiana*), and California broomsage (*Lepidospartum squamatum*). RAFSS is a natural community of concern.

Nonnative Grassland

Areas mapped as nonnative grassland (NNG) in the BSA are heavily dominated by nonnative annual grasses including ripgut brome (*Bromus diandrus*), red brome, soft brome (*B. hordeaceus*), wild oat (*Avena fatua*), slender wild oat, Mediterranean schismus, and wall barley (*Hordeum murinum*). Forb species common in the NNG are short-pod mustard and Menzies' fiddleneck (*Amsinckia menziesii*). Most of the NNG areas occur within open space areas throughout the BSA with a majority of the NNG occurring on the LM MSHCP area and within the LMR. NNG within preserved lands have relatively low levels of human disturbance. NNG adjacent to Cajalco Road, El Sobrante Road, and La Sierra Avenue is heavily disturbed by routine mowing and disking for fire and weed abatement.

Riversidian Sage Scrub/Nonnative Grassland

This community is composed of a mosaic of RSS and NNG. This community occurs on the LM MSHCP area. RSS is a natural community of concern.

California Juniper Woodland

This woodland community is dominated by open to intermittent stands of California juniper (*Juniperus californica*) with scattered grasses such as Mediterranean schismus, wild oat, short-pod mustard, and doveweed occurring in the herbaceous layer. This community primarily occurs within the LM MSHCP area on ridges, slopes, and valley bottoms and, in many areas, adjacent to drainage features.

California Juniper Riparian

The California juniper riparian vegetation type occurs as dense stands of California juniper shrubs within drainages that convey flows toward Lake Mathews within the LM MSHCP area.

California Juniper Scrub/Nonnative Grassland

California juniper scrub/NNG is composed of scattered California juniper within an NNG matrix in the openings.

California Juniper Scrub/Riversidian Sage Scrub

California juniper scrub/RSS is composed of scattered California juniper within an RSS matrix in the openings. RSS is a natural community of concern.

Brittlebush Scrub

Brittlebush scrub is similar in structure and function to the RSS community, but is dominated by brittlebush with a few scattered RSS species intermixed within this community, such as California buckwheat. An herbaceous layer underneath the shrubs is primarily composed of Mediterranean schismus.

Ruderal

Ruderal areas generally lack natural topography and support only nonnative grasses and forbs, such as ripgut brome, red brome, prickly Russian thistle (*Salsola tragus*), tocalote (*Centaurea melitensis*), horseweed (*Erigeron canadensis*), telegraph weed (*Heterotheca grandiflora*), prickly lettuce (*Lactuca serriola*), bristly ox-tongue (*Helminthotheca echioides*), and common sow thistle (*Sonchus oleraceus*). Ruderal areas in the BSA are often disked routinely for weed abatement or are too heavily disturbed for native vegetation to establish. Areas with bare ground often have compacted soils, which prevent vegetation growth and often occur along the existing paved roadway.

Ruderal Herbaceous

This community occurs along roadside areas adjacent to riparian vegetation. Vegetation is composed of horseweed (*Erigeron canadensis*), tree tobacco, short-pod mustard, and mulefat saplings.

Exotic Tree(s)/Woodland

Most of this type of community support mature red gum trees (*Eucalyptus camaldulensis*) as well as other mature ornamental trees. This community occurs in small patches throughout the BSA along the road right of way and around developed areas. Mature ornamental trees do not function as a natural vegetation community and may lack some habitat function and value relative to native trees and woodlands, but may still be used by birds such as raptors and bats for roosting.

Eucalyptus/Tamarisk

This community is composed of a mix of red gum tree woodland with a shrub layer composed of tamarisk species (*Tamarix* spp.) and a mix of nonnative grasses in the herb layer.

Developed/Disturbed

The majority of developed/disturbed areas occur within residential and commercial areas, and also include paved and dirt roadways within the BSA.

Residential/Urban/Exotic

This land type occurs on private property. Dominant plants include tree tobacco and Peruvian peppertree.

Concrete Channel/Spillway/V-Ditch/Rip-Rap

Areas designated as concrete include concrete structures such as channels, spillways, v-ditches, and rip-rap.

Unvegetated

Areas categorized as unvegetated occur within BSA drainages. This land type is associated with unvegetated earthen drainage or wash bottoms. There is typically no tree, shrub, or herbaceous layer present.

Open Water/Reservoir/Pond

Open water/reservoir/pond is present in the Lake Mathews reservoir, perennial streams (e.g., Temescal Creek), and ponds that occurs within the BSA. These areas are unvegetated.

Riparian/Open Water/Reservoir/Pond

This land type occurs within an open pond on the north side of Cajalco Road. Some riparian vegetation, such as willows, are present within the pond.

Lakebed

This land type occurs within the lakebed of Lake Mathews on the LMR. It consists of the submerged portion of the lake.

Agriculture

Lands mapped as agricultural are currently used for agriculture and may be routinely plowed or disked. Some sites are also active nurseries and orchards.

Fallow Agriculture

Historically, these lands were active agricultural lands, but the lands have been converted to conservation lands within the SKR Core Reserve. These lands will remain fallow and uncultivated.

3.17.2.3 Natural Communities of Concern

Based on a review of the CNDDB (CDFW 2018), WRC MSHCP, and LM MSHCP, eight of the vegetation communities listed in Table 3.17-1 above are deemed natural communities of concern. The following natural communities of concern were identified as present within the BSA during reconnaissance surveys: RSS, RAFSS, coast live oak woodland, coastal and valley freshwater marsh, southern cottonwood-willow riparian forest, southern coast live oak riparian forest, southern riparian forest, and southern willow scrub. Of these, coast live oak woodland, southern cottonwood-willow riparian forest, and coastal and valley freshwater marsh were absent from the LM MSHCP area. Table 3.17-2 summarizes the total acreage of each natural community of concern that occurs within the BSA and the portion of those communities in the BSA which occur within the LM MSHCP area.

Table 3.17-2. Natural Communities of Concern within the BSA

Natural Community of Concern	Total within the BSA[1] (acres)	Total within the LM MSHCP[2] (acres)
Riversidian Sage Scrub (RSS, disturbed RSS, RSS/NNG, California juniper/RSS)	968.55[3]	472.32
Riversidian Alluvial Fan Sage Scrub	7.67	3.26
Coast Live Oak Woodland	0.03	-
Southern Coast Live Oak Riparian Forest (coast live oak/sycamore riparian)	0.03	0.03
Southern Cottonwood-Willow Riparian Forest	4.88	-
Southern Riparian Forest (riparian forest)	4.47	0.00
Southern Willow Scrub (southern willow scrub and disturbed southern willow scrub)	100.35	38.69
Coastal and Valley Freshwater Marsh	1.84	-
Total Natural Community of Concern	**1,087.82[2]**	**514.3[3]**

[1] Total amount of natural communities of concern present within the BSA.
[2] The portion of the BSA that occurs in within the LM MSHCP planning area is provided in a separate column to facilitate environmental reviews and approvals specific to LM MSHCP accommodation of the project.
[3] This total is composed of high-quality RSS (approximately 753 acres) and low-quality RSS (approximately 215 acres).

Riversidian Sage Scrub

RSS is a xeric form of coastal sage scrub characterized by low-growing drought-deciduous shrubs with shallow roots and an open canopy, which allows for a diverse herbaceous community of annual vegetation. RSS is a plant community of concern because its extent has been drastically reduced during recent decades, primarily because of residential development in the coastal foothills of Southern California. Portions of this vegetation community occur within

WRC MSHCP riparian-riverine resources (refer to description below). Threats to this community include habitat loss and fragmentation; competition from nonnative, invasive species; altered fire cycles; and air pollution. RSS provides habitat for a number of special-status species such as coastal California gnatcatcher (*Polioptila californica*), Quino checkerspot butterfly (*Euphydryas editha quino*), SKR, Belding's orange-throated whiptail (*Aspidoscelis hyperythra beldingi*), and cactus wren (*Campylorhynchus brunneicapillus*). Most special-status species associated with RSS are covered species under the WRC MSHCP (refer to Sections 3.20 and 3.21 for further discussion of these species).

The RSS within the BSA has been classified into the following categories based on the density of the intact sage scrub vegetation, disturbances, and function and value to wildlife: RSS, disturbed RSS, RSS/NNG, and California juniper/RSS (Figure 3.17-3). Within the BSA, there are an estimated 968.55 acres of RSS, composed of intact RSS, disturbed RSS, RSS/NNG, and California juniper/RSS (Table 3.17-1). The overall habitat value of the intact RSS (approximately 753 acres) in the BSA is judged to be moderate to high, with disturbed RSS, California juniper/RSS, and RSS/NNG (approximately 215 acres) judged to be lower in value based on increased disturbances and lower densities of native RSS vegetation compared to nonnative components. The disturbed RSS occurs in areas that have been disturbed by routine mowing or are adjacent to developed areas and subject to edge effects, thereby decreasing this disturbed vegetation community's function and value for wildlife. Within the LM MSHCP area of the BSA, RSS occurs as a mosaic of RSS/NNG and California juniper/RSS and is composed of scattered California juniper within an RSS matrix in the openings.

The RSS occurs within Extension of Existing Core 2, Proposed Linkage 3, and Existing Core C of the WRC MSHCP (see discussion in Section 3.17.2.5 below for further details).

Riversidian Alluvial Fan Sage Scrub

RAFSS is a Mediterranean shrubland type that occurs on gently sloping alluvial fans and drainages. This community occurs within recent or active alluviated drainages that experience infrequent but severe flood events. Threats to RAFSS include changes in flood regime from flood control, urban irrigation, edge effects, and disturbances from off-highway vehicles. This vegetation community is considered a WRC MSHCP riparian-riverine resource when associated with a stream. Vegetation within RAFSS is composed of California buckwheat, California sagebrush, white sage (*Salvia apiana*), and California broomsage (*Lepidospartum squamatum*). Two special-status species are endemic to RAFSS in the WRC MSHCP area: slender-horned spineflower (*Dodecahema leptoceras*) and Santa Ana River woollystar (*Eriastrum densifolium* ssp. *sanctorum*). In addition, RAFSS can provide habitat for a number of special-status wildlife species, including coastal California gnatcatcher and Quino checkerspot butterfly. Most special-status species associated with RAFSS are covered species under the WRC MSHCP (refer to Sections 3.19, 3.20, and 3.21 for further discussion of these species).

There are an estimated 9.17 acres of RAFSS within the BSA (Table 3.17-1). Approximately 3.26 acres of the RAFSS mapped within the BSA occur within the LM MSHCP area. There are no other conserved areas in the BSA with the RAFSS vegetation community.

The RAFSS occurs within Extension of Existing Core 2 and Existing Core C of the WRC MSHCP and is within the LMR (see discussion in Section 3.17.2.5 below for further details).

Coast Live Oak Woodland

Coast live oak woodland is a natural community of concern that has declined greatly over past decades. Threats to this community include land development, clearing for agriculture, use for fuelwood, soil compaction and grazing, and groundwater depletion lowering water tables in valleys. Coast live oak woodland provides suitable habitat for special-status species, such as fish's milkwort (*Polygala cornuta* var. *fishiae*), and suitable foraging habitat and shelter for a number of wildlife species.

Coast live oak woodland is relatively rare in the BSA, with only two locations mapped, both associated with terraces within Temescal Wash. An estimated 0.03 acre of coast live oak woodland is present within the BSA. There are no other conserved areas in the BSA with the coast live oak woodland vegetation community.

Southern Coast Live Oak Riparian Forest

Coast live oak/sycamore riparian habitat (which would be classified in the CNDDB Natural Community hierarchy as southern coast live oak riparian forest) was mapped near the edge of the BSA south of Cajalco Road and east of Lake Mathews Road (Sheet 8 of Figure 3.17-3). This vegetation community is considered a WRC MSHCP riparian-riverine resource. This riparian forest community consists of mature coast live oak (*Quercus agrifolia*) located on stream banks and terraces.

Approximately 0.03 acre of southern coast live oak riparian forest occurs within the BSA, entirely within the LMR. This community has the potential to provide habitat for terrestrial animal species, including use for foraging and shelter. The community occurs within WRC MSHCP Existing Core C; however, due to the small acreage present in the BSA and small extent of the southern coast live oak riparian forest adjacent to the BSA, this community is only expected to have moderate functions and values for wildlife. The southern coast live oak riparian forest occurs within Existing Core C of the WRC MSHCP (see discussion in Section 3.17.2.5 below for further details).

Southern Cottonwood-Willow Riparian Forest

Southern cottonwood-willow riparian forests occur along rivers and streams in Southern California. They are also often associated with wetland areas. Within the BSA, the southern cottonwood-willow riparian forest community has a well-developed tree canopy made up of willows and cottonwoods, and a shrub/herbaceous layer composed of mulefat, stinging nettle, and emergent species. This vegetation community is usually found within perennial streams. Within the BSA it is primarily found within Temescal Wash and has a well-developed shrub and herbaceous layer, due to sufficient hydrology and relatively low disturbances within the creek bed. This community is also found within a riparian corridor within Cajalco Creek southeast of Harley John Road and Cajalco Road. This vegetation community is also considered a WRC MSHCP riparian-riverine resource.

There are 4.88 acres of southern cottonwood-willow riparian forest within the BSA. This community provides habitat for special-status species, such as least Bell's vireo (*Vireo bellii pusillus*), yellow warbler (*Setophaga petechia*), and yellow-breasted chat (*Icteria virens*); terrestrial mammals, such as mule deer; and reptiles and amphibians. The community occurs

within WRC MSHCP Proposed Linkage 3 (Cajalco Creek) and adjacent to WRC MSHCP Proposed Extension of Existing Core 2 (Temescal Wash). Because this community occurs within and adjacent to WRC MSHCP core/linkages and provides suitable habitat for a number of special-status species and other wildlife, southern cottonwood-willow riparian forest provides high functions and values for the region. Southern cottonwood-willow riparian forest does not occur within the LM MSHCP area.

Southern Riparian Forest

Southern riparian forest habitat often occurs within streams with perennial or intermittent hydrology. The dominant plant species include box elder (*Acer negundo*), Fremont cottonwood, western sycamore, willows, California walnut (*Juglans californica*), blue elderberry, and wild grape (*Vitus girdiana*). Southern riparian forest provides important habitat for wildlife including providing shading and refugia in streams for fish and other aquatic species; food, shelter, and nesting sites for mammals and birds; and a source of cover, food, and water for wildlife movement. Threats to riparian communities include colonization by invasive plants (i.e., giant reed), changes in hydrology from surrounding land uses and development, degraded water quality, and degraded instream ecology. This vegetation community is tracked by the CNDDB and is also considered a WRC MSHCP riparian-riverine resource.

There are approximately 4.47 acres of riparian forest within the BSA. Because of the dense tree canopy, there is little to no vegetation in the herbaceous layer and the ground is composed of leaf litter. This community is found within streams adjacent to Cajalco Road and occurs within WRC MSHCP Proposed Linkage 3 (Cajalco Creek). This community provides habitat for special-status species, such as least Bell's vireo and southwestern willow flycatcher (*Empidonax traillii extimus*); cover for terrestrial mammals, such as mule deer; and shade within streams for amphibians and fish species. Because this community occurs within and adjacent to WRC MSHCP core/linkages and provides suitable habitat for a number of special-status species and other wildlife, southern riparian forest is a valuable resource within the region. Southern riparian forest does not occur within the LM MSHCP area.

Southern Willow Scrub

Southern willow scrub is a natural community of concern tracked by the CNDDB and is considered a WRC MSHCP riparian-riverine resource. This community is characterized by willow trees and shrubs, such as mulefat, and is often found associated with perennial and intermittent streams. Southern willow scrub provides habitat for special-status species, such as least Bell's vireo, yellow warbler, and yellow-breasted chat; cover and food for terrestrial mammals, including mule deer; and reptiles and amphibians. The southern willow scrub community is threatened by introduction of invasive plant species, changes in hydrology from flood control activities, and degraded water quality.

There are approximately 100.34 acres of the southern willow scrub community (including disturbed southern willow scrub) within the BSA. The community occurs within WRC MSHCP Proposed Linkage 3 (Cajalco Creek) and adjacent to WRC MSHCP Proposed Extension of Existing Core 2 (Temescal Wash). Because this community occurs within and adjacent to WRC MSHCP core/linkages and provides suitable breeding habitat, foraging, and shelter for a number of special-status species and other wildlife, southern willow scrub is a valuable resource in the

region. Approximately 38.68 acres of the southern willow scrub community occurs within the LM MSHCP area.

Coastal and Valley Freshwater Marsh

Coastal and valley freshwater marsh is an herbaceous freshwater wetland community that occurs along perennial streams but can also occur where only seasonal flows occur. This vegetation community is tracked by CNDDB and is also considered a WRC MSHCP riparian-riverine resource. This community provides food, water, cover, and reproductive opportunities for numerous resources, including habitat for mammals, birds, reptiles, and amphibians. In addition, it is a wetland community, which is also a rare and declining resource in Southern California. This wetland community is an important source of inorganic and organic nutrients (refer to Section 3.18, *Wetlands and Other Waters*, for additional details on functions and values of wetlands). Wetland resources contribute to filtration of pollutants and nutrient retention; therefore, this community has high functions and values. Freshwater marshes are threatened by pollution (e.g., from fertilizer and pesticides), grazing, introduction of invasive plants, erosion, and conversion of land uses, such as agricultural.

This vegetation community is limited to a few small areas in the BSA, totaling 1.84 acres. The coastal and valley freshwater marsh on the western end of the project is associated with WRC MSHCP Proposed Extension of Existing Core 2. There are no coastal and valley freshwater marshes within the LM MSHCP area.

3.17.2.4 WRC MSHCP Riparian-Riverine and Vernal Pool Resources

The WRC MSHCP also has specific policies and procedures regarding the evaluation and conservation of riparian-riverine resources (including riparian vegetation) because these resources support WRC MSHCP covered species (WRC MSHCP Volume I, Section 6.1.2). Similar to RSS, natural communities of concern within riparian systems and vernal pools have declined throughout Southern California during past decades. These sensitive riparian communities often occur within federal and state jurisdictional drainages and wetland areas, which are also declining and protected resources (refer to Section 3.18 for the discussion of waters and wetlands).

WRC MSHCP riparian-riverine resources are not specifically tracked by the CNDDB as natural communities of concern; however, the WRC MSHCP classification of riparian-riverine includes the sensitive riparian vegetation communities described above, as well as riparian vegetation associated with ephemeral drainages, such as mulefat scrub (not tracked by the CNDDB) and some upland vegetation, such as RSS, that occurs adjacent to ephemeral drainages. These natural communities are distributed throughout the BSA and occur within riparian and riverine areas, and adjacent uplands.

Under Section 6.1.2 of the WRC MSHCP Volume I, WRC MSHCP riparian-riverine resources are afforded special considerations under this policy. Specifically, the WRC MSHCP states that "riparian/riverine areas are natural lands which contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or which depend upon soil moisture from a nearby fresh water source; or areas with fresh water flow during all or a portion of the year." Therefore, the WRC MSHCP classification of riparian-riverine includes both riparian (natural community of concern) as well as ephemeral drainages that are natural in

origin but may lack riparian vegetation. The WRC MSHCP defines vernal pools as "seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season."

For the evaluation of WRC MSHCP riparian-riverine resources, a smaller JSA (up to a 200-foot buffer) was used (refer to Figure 3.17-1). In addition to the sensitive natural vegetation communities identified as WRC MSHCP riparian-riverine resources (described above), the following vegetation classifications were used for the remaining WRC MSHCP riparian-riverine resources within the JSA: riparian scrub, riparian ruderal, native/nonnative riparian scrub, Mexican elderberry scrub, California juniper riparian, mulefat scrub, mulefat/Mexican elderberry scrub, tamarisk scrub, riparian/open water/reservoir/pond, sandbar willow scrub, Mexican elderberry ruderal, and riparian herbaceous. Riverine resources in the JSA were composed of ephemeral drainages and unvegetated streambeds when vegetation consisted of xeric upland species (i.e., RSS, RAFSS, salt bush scrub) or was absent entirely, such as in the RSS ruderal, unvegetated, and lakebed classifications. Ephemeral riverine drainages transport water during or for a short time after rainfall events.

All WRC MSHCP riparian-riverine resources occur in state jurisdictional streambeds, and robust adjacent upland vegetation along streambeds also provides greater value to wildlife than surrounding upland vegetation that is not associated with riparian-riverine resources; therefore, robust adjacent upland vegetation was included in the WRC MSHCP riparian-riverine resources mapping. This methodology is consistent with correspondence and guidance from CDFW. The majority of the WRC MSHCP riparian-riverine resources in the jurisdictional delineation study area are located within Temescal Creek, Cajalco Creek, and Lake Mathews and its tributaries.

WRC MSHCP riparian-riverine resources support a large variety of special-status wildlife species, such as least Bell's vireo, southwestern willow flycatcher, arroyo toad (*Anaxyrus californicus*), western pond turtle (*Actinemys marmorata*), yellow-breasted chat, western yellow warbler, and coastal California gnatcatcher (refer to Sections 3.19 and 3.21 for further discussion of these sensitive species). In addition, WRC MSHCP riparian-riverine resources provide foraging, nesting, and shelter, and are used for wildlife passage by numerous other species, including small to large mammals, birds, reptiles, amphibians, and fish species.

In total, there are 120.21 acres of riparian-riverine resources within the JSA, of which 86.75 acres are riparian and 33.46 acres are riverine. Approximately 63.72 acres of WRC MSHCP riparian-riverine resources occur within conserved lands. Within these reserve lands, the LM MSHCP target species that would use riparian-riverine systems includes least Bell's vireo, coastal California gnatcatcher, and yellow warbler.

No vernal pools or vernal pool watersheds were documented within the JSA.

Lake Mathews MSHCP

In total, there are 70.73 acres of WRC MSHCP riparian-riverine resources within the LM MSHCP, of which 47.56 acres are riparian and 23.17 acres are riverine. The LM MSHCP target species that would use riparian-riverine systems include least Bell's vireo, coastal California gnatcatcher, and yellow warbler.

In addition to the sensitive natural vegetation communities identified as WRC MSHCP riparian-riverine resources (described above), the following vegetation classifications were used for the remaining WRC MSHCP riparian-riverine resources within the JSA: riparian scrub, riparian ruderal, native/nonnative riparian scrub, Mexican elderberry scrub, California juniper riparian, mulefat scrub, mulefat/Mexican elderberry scrub, tamarisk scrub, sandbar willow scrub, Mexican elderberry ruderal, and riparian herbaceous. Riverine resources in the JSA were composed of ephemeral drainages and unvegetated streambeds when vegetation consisted of xeric upland species (i.e., RSS, RAFSS, salt bush scrub) or was absent entirely, such as in the RSS ruderal, unvegetated, and lakebed classifications.

3.17.2.5 Corridors and Linkages

The BSA and surrounding area provide opportunities for movement and landscape connectivity for a wide variety of species. West of Harley John Road, the existing landscape immediately surrounding the proposed project is largely composed of open space bounded by existing roads; diverse topographical conditions, including flats and canyons; riparian corridors; and relatively low levels of human use. These conditions provide "live-in" habitat and home ranges for a number of species and also provide relatively high-quality function and value for local wildlife movement and habitat connectivity in a region largely constrained by existing highways and developments that act as barriers and are of concern for the conservation of many species in the region. The western end includes the WRC MSHCP Temescal Canyon and Lake Mathews/Woodcrest Area Plan, LM MSHCP, Lake Mathews Ecological Reserve, SKR HCP, and LMR area. East of Harley John Road, the project lies within the WRC MSHCP Mead Valley Area Plan where the density of residential development increases and the proximity to open space decreases as Cajalco Road approaches I-215.

The specific WRC MSHCP linkages and cores, from west to east, that overlap the BSA are the Proposed Extension of Existing Core 2, Existing Core C (LMR), and Proposed Linkage 3 (Figure 3.17-4). As defined by the WRC MSHCP, linkages are specific areas of connectivity delineated between core areas with adequate size, configuration, and vegetation characteristics to generally provide for "live-in" habitat and/or for genetic flow for identified planning species. Wildlife movement corridors are often linear and facilitate movement by providing adequate cover and lack of physical obstacles for movement. These movement corridors do not provide "live-in" habitat for species. Core areas are blocks of habitat of appropriate size, configuration, and vegetation characteristics to generally support the life history requirements of one or more WRC MSHCP covered species. Wildlife crossing design considerations and guidelines specified in WRC MSHCP Section 7.5.2, Guidelines for Construction of Wildlife Crossings, specify the general approach to analyzing project area connectivity and the number and frequency, design guidelines and standards, and species-specific considerations for wildlife crossings.

Existing roadways intersecting open space include Cajalco Road, La Sierra Avenue, El Sobrante Road, and Harley John Road, all of which are composed of two-lane, undivided minor arterial and major collector roads lacking wildlife fencing, dedicated wildlife crossings, median barriers, and standard shoulders.

[This page left blank intentionally.]

Local Wildlife Connectivity and Movement Conditions

The project BSA generally traverses relatively undeveloped open space habitat areas that have high potential for wildlife movement across the landscape. The BSA and surrounding area support movement of a wide variety of species, including avian species and small, medium, and large mammals, including mountain lion and mule deer, which were observed during various field studies conducted as part of the proposed project.

A variety of landscape features and habitats in the region—including draws and drainages, ridgelines, riparian and stream corridors, gentle terrain, grasslands, riparian scrub and forest, scrublands, and agricultural fields—provide structure and function that facilitate the movement of a wide variety of species. Generally, areas that have low levels of human development and connectedness to open space provide at least some function and value to wildlife movement in the region.

Several existing man-made structures within the BSA facilitate at least nominal movement between adjacent habitat areas. These include Temescal Wash Bridge and various culverts ranging in size from 24 to 60 inches in diameter throughout the BSA, including the existing sets of culverts connecting Proposed Linkage 3 to Existing Core C near the intersection of Cajalco Road and Harley John Road, which include a double-barrel 9-foot-wide by 5-foot-tall culvert and triple-barrel 48-inch-diameter culvert. Temescal Wash Bridge contains high habitat connectedness through the riparian corridor and provides the largest, most open structure with regard to wildlife movement and connectivity in the BSA.

Although these existing structures may provide some safe movement opportunities under the existing roadway, it is important to note that they were not specifically designed for wildlife movement. No dedicated wildlife crossing structures, designed specifically for facilitating wildlife movement, exist in the BSA. Some species may still be crossing over the existing roadway and avoiding such structures because they may not be suitable to facilitate movement. This may be due to their design, size, maintenance needs, or environmental or physical conditions (e.g., may be too small and narrow, may lack dry crossing, may lack suitable substratum, or may not be located in suitable habitat or conditions for some species), all of which have potential to prohibit or obstruct passage. Without dedicated wildlife structures and fencing designed to facilitate movement for a variety of species by guiding them toward dedicated crossing structures, many animals cross existing roadways, where they are subject to vehicle collisions.

WRC MSHCP Proposed Linkage 3

This linkage is generally made up of upland habitats under a combination of Public/Quasi-Public (PQP) and private land ownership. This linkage is one of two connections between the LMR and Core 1 to the south. WRC MSHCP planning species with habitat in this linkage include coastal California gnatcatcher, Quino checkerspot butterfly, SKR, thread-leaved brodiaea (*Brodiaea filifolia*), Munz's onion (*Allium munzii*), and many-stemmed dudleya (*Dudleya multicaulis*). This linkage is relatively unimpeded by existing land use but is subject to edge impacts such as fire, fire suppression, livestock grazing, and off-road vehicle activities associated with rural land uses.

The northernmost limit of Proposed Linkage 3 is located in the central portion of the BSA where it connects to the easternmost limits of Core C, near the intersection of Harley John Road and

Cajalco Road (Figure 3.17-4). Two culverts exist in this area connecting a drainage that flows under, and supports riparian scrub and forest on both sides of, Cajalco Road (refer to Figure 3.17-3 for vegetation communities).

Criteria Cells located in Proposed Linkage 3 that overlap the BSA include Criteria Cells 2324 and 2325. These cells contribute to the conservation and assembly of Proposed Linkage 3. Criteria in these cells focus on grassland and riparian habitats, including riparian scrub, woodland, and forest adjacent to the Colorado River Aqueduct to the east.

Crossing the BSA where Proposed Linkage 3 connects to Core C is an existing double-barrel culvert measuring 9 feet wide by 5 feet tall under Cajalco Road and a triple-barrel 48-inch-diameter culvert under Harley John Road. These culverts provide some opportunity for smaller wildlife species to cross safely under the existing roadways and connect Proposed Linkage 3 to Core C, but are not currently designed or retrofitted for wildlife movement.

WRC MSHCP Existing Core C

Existing Core C is composed of public lands located in the LMR area. This area was originally assembled as a Core Reserve for the SKR HCP. Existing Core C is connected to Proposed Linkage 3 to the east, Proposed Extension of Existing Core 2 to the west, and Core 1 to the south. WRC MSHCP planning species include Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*), Bell's sage sparrow (*Amphispiza belli belli*), burrowing owl (*Athene cunicularia*), cactus wren (*Campylorhynchus brunneicapillus*), northern harrier (*Circus cyaneus*), white-tailed kite (*Elanus leucurus*), loggerhead shrike (*Lanius ludovicianus*), coastal California gnatcatcher, SKR, bobcat (*Lynx rufus*), mountain lion (*Puma concolor*), western pond turtle, Munz's onion, slender-horned spineflower, and many-stemmed dudleya.

This core area encompasses the LM MSHCP area and extends southward toward Dawson Canyon and Estelle Mountain. The northern block of this core area overlaps with the western end of the BSA from Cajalco Canyon on the western side of Lake Mathews to Harley John Road (Figure 3.17-4).

Criteria Cells located in Existing Core C that overlap with the BSA include 2405, 2310, 2311, 2407, 2408, 2121, and 2323. These cells contribute to assembly of Existing Core C, and their criteria focus on coastal sage scrub, grassland, riparian scrub, woodland, and forest conservation. Criteria Cell 2323 also contributes to the assembly of Proposed Linkage 3 and also focuses on conservation of chaparral habitat.

No major structures such as culverts or bridges that may facilitate safe wildlife movement under the existing roadways exist within the area of Core C overlapping the BSA, including within the LM MSHCP area. Topographical features and habitat exist that provide function and value to wildlife movement, but animals must cross over the existing roadway.

WRC MSHCP Proposed Extension of Existing Core 2

Proposed Extension of Existing Core 2 (Lake Mathews/Estelle Mountain Extension) is an extension of Existing Core C and is located along its eastern border. This extension is also connected to Proposed Constrained Linkage 4 (North Temescal Wash) to the north and Proposed Linkage 1 and Proposed Constrained Linkages 3, 5 (Horsethief Canyon), and 6 (Temescal Wash

south) to the south. This region supports known populations of, and suitable habitat for, coastal California gnatcatcher and the same WRC MSHCP planning species as Existing Core C.

This core area extends from the western edge of Core C south toward and along Temescal Wash. The westernmost portion of the BSA overlaps with this core area along Cajalco Road (Figure 3.17-4).

Criteria Cells located in Proposed Extension of Existing Core 2 that overlap the BSA include 2400, 2402, 2403, 2404, 2310, 2311, 2214, 2120, 2121, and 2026. These cells contribute to assembly of existing Proposed Extension of Existing Core C and Core 2, and criteria focus on coastal sage scrub, grassland, riparian scrub, woodland, wetland, and forest habitat conservation.

Temescal Wash and Temescal Wash Bridge at the westernmost end of the BSA provide high-functioning wildlife movement and "live-in" habitat for a wide variety of species. There are no other major structures such as culverts or bridges that may facilitate safe wildlife movement under the existing roadways within the area of Proposed Extension of Existing Core 2 overlapping with the existing BSA, including within the LM MSHCP area. Topographical features and habitat exist in this portion of the BSA that provide function and value to wildlife movement, but animals must cross over the existing roadway.

Lake Mathews MSHCP

There are no wildlife or movement corridors identified within the LM MSHCP area. However, as mentioned above, the LM MSHCP area occurs within PQP lands and Existing Core C and Proposed Extension of Existing Core 2, and is adjacent to Proposed Linkage 3 of the WRC MSHCP. These WRC MSHCP cores and linkages would also serve to support wildlife movement and connectivity for the LM MSHCP target wildlife species, such as coastal California gnatcatcher and SKR. However, there are no existing culverts or bridges within the LM MSHCP area that would facilitate safe wildlife movement through the LMR area. There are a small number of culverts underneath the existing roadway that could potentially be used for wildlife movement; however, the culverts are for water conveyance and there are no structures within the culverts permitting dry passage for wildlife during rainfall. In addition, existing security fencing north of Cajalco Road, east of La Sierra Avenue, and south of El Sobrante Road may impede some wildlife from entering the lakeside of the LM MSHCP area.

3.17.3 Environmental Consequences

This section addresses the effects on natural communities of concern (Section 3.17.3.1), WRC MSHCP riparian-riverine resources (Section 3.17.3.2), and WRC MSHCP wildlife corridors and linkages (Section 3.17.3.3). In addition, to ensure the project would not affect conserved lands for the WRC MSHCP and the LM MSHCP, an evaluation of those impacts and requirements for consistency are provided in Section 3.17.2.5. For each resource discussed in this section, an additional evaluation of the impacts within the LMR is also provided to facilitate environmental reviews and approvals specific to LM MSHCP accommodation of the project.

The effects from permanent and temporary impacts on natural communities of concern, WRC MSHCP riparian/riverine resources, and WRC MSHCP wildlife corridors and linkages were analyzed for each build alternative and the No-Build Alternative. The permanent and temporary impacts can also be classified as direct or indirect. *Direct impacts* are those impacts that can be

expected from direct removal and disturbances to the land and resources. Examples of direct impacts include mortality of individuals and permanent loss of habitat. *Indirect impacts* are those impacts that give rise to delayed, secondary impacts. Indirect impacts are those that can be assumed to increase mortality, reduce productivity, and/or reduce the functions and values of natural open space for native species.

An additional analysis of impacts that would occur on LM MSHCP target species is also provided in Section 3.21, *Threatened and Endangered Species*.

3.17.3.1 Natural Vegetation Communities

Build Alternatives 1, 2C, and 4

Build Alternative 1 would result in widening the existing Cajalco Road roadbed from two to four lanes, with medians and paved shoulders to improve mobility and increase traffic capacity. Bridge expansions would occur at Temescal Creek (STA #20 to 25), Cajalco Creek (STA #740 to 742), and an unnamed drainage (STA #268 to 269).

Build Alternative 2C includes the same improvements as Build Alternative 1, with the exception of a new four-lane segment of Cajalco Road that would be constructed from La Sierra Avenue to just west of Lake Mathews Drive in a currently undeveloped area south of Lake Mathews. Due to the differences in terrain, land use in this area, and proposed project design of this new four-lane segment, proposed wildlife crossings in this area include an additional bridge structure compared to Build Alternative 1. This bridge underpass would be included within the newly constructed segment of Cajalco Road west of Hollis Lane. The underpass would be designed with a minimum 15-foot clearance height for mule deer passage, with a 50-foot width on each side of the bridge for sheep and wildlife passage through the area. Sheep are used for land and resource conservation management in the adjacent lands; ensuring the sheep have the ability to pass under the roadway would be important under Build Alternative 2C for facilitating ongoing management and conservation activities. The width of the bridge is also advantageous for wildlife movement because it would provide an expansive openness for wildlife under the crossing structure.

Unlike Build Alternatives 1 and 2C, Build Alternative 4 would widen La Sierra Avenue and El Sobrante Road along the north side, and La Sierra Avenue along the west side, of Lake Mathews. Under this alternative, Cajalco Road between La Sierra Avenue and Gustin Road would remain in its current configuration and no changes are proposed.

Table 3.17-3 provides the total impacts that would occur on all vegetation communities and land use types described in Section 3.17.2.2 present within the limits of disturbance (LOD). These include impacts that would occur on natural communities of concern, WRC MSHCP riparian-riverine resources, corridors and linkages, and impacts within the conserved areas such as the LM MSHCP area (described below).

Table 3.17-3. Summary of Impacts on All Vegetation Communities

Impact Type	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Permanent (acres)	386.85	395.49	388.17
Temporary (acres)	88.61	96.53	87.91
Beneficial (Roadway Removal) (acres)	23.08	28.84	18.04
Shading[1] (acres)	1.64	2.22	5.73
[1] Shading effects = permanent indirect impacts from bridge extensions and new bridges onto vegetation communities.			

Impacts on Natural Communities of Concern

Natural communities of concern would be directly and indirectly affected under each of the three build alternatives. The direct and indirect effects on natural communities of concern are described below, including a quantitative and qualitative analysis of the direct effects, shading effects, and beneficial effects. In addition, a description of the potential indirect effects and long-term operational effects for each build alternative is provided. Under Build Alternatives 1, 2C, and 4, construction activities would result in the permanent removal of natural communities of concern within the LOD. Construction activities that would permanently remove vegetation include grading and creation of slopes, addition of new lanes, bridge widening, installation of new drainages and culverts, creation of wildlife crossing features, and installation of signage. Also included in the permanent impacts are any full property acquisitions within the project impact area and roadbed removal along the existing paved roadways and adjacent right of way. Table 3.17-4 summarizes the permanent impacts for Build Alternatives 1, 2C, and 4 for each natural community of concern.

Table 3.17-4. Permanent Impacts on Natural Communities of Concern within the LOD

Natural Community of Concern	Permanent Impacts (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	69.43	78.61	75.25
Riversidian Alluvial Fan Sage Scrub	1.33	1.33	1.28
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00
Southern Cottonwood-Willow Riparian Forest	0.19	0.19	0.19
Southern Riparian Forest	0.34	0.34	0.01
Southern Willow Scrub	5.23	4.67	2.99
Coast and Valley Freshwater Marsh	0.06	0.06	0.06
Total	**76.58**	**85.20**	**79.78**

Portions of the existing roadways and the roadway right of way would be permanently removed, returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with native vegetation. Although removal of the existing roadbed would be considered permanent, this is also considered a beneficial effect because the land would generally be returned to natural topography and revegetated with native vegetation. Under the build alternatives, roadbed removal areas in the vicinity of the LM MSHCP area would be replaced with an approximately 20-foot-wide dirt, gravel, or partially paved road for MWD access. Table 3.17-5 on the following page summarizes the beneficial effects under Build Alternatives 1, 2C, and 4 for each natural community of concern.

Table 3.17-5. Beneficial Effects on Natural Communities of Concern

Natural Community of Concern	Beneficial Effects (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	2.99	3.38	4.30
Riversidian Alluvial Fan Sage Scrub	0.00	0.00	0.00
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00
Southern Cottonwood-Willow Riparian Forest	0.00	0.00	0.00
Southern Riparian Forest	0.05	0.05	0.05
Southern Willow Scrub	0.00	0.00	0.00
Coast and Valley Freshwater Marsh	0.00	0.00	0.00
Total	**3.04**	**3.43**	**4.35**

Temporary effects from project construction would occur within areas used for staging, access, and temporary construction areas (LOD). Table 3.17-6 summarizes the temporary impacts under Build Alternatives 1, 2C, and 4 for each natural community of concern.

Table 3.17-6. Temporary Impacts on Natural Communities of Concern

Natural Community of Concern	Temporary Impacts (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	7.81	8.08	8.42
Riversidian Alluvial Fan Sage Scrub	0.30	0.30	0.29
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00
Southern Cottonwood-Willow Riparian Forest	0.10	0.10	0.10
Southern Riparian Forest	0.56	0.56	0.09
Southern Willow Scrub	2.63	2.69	1.59
Coast and Valley Freshwater Marsh	0.06	0.06	0.06
Total	**11.46**	**11.79**	**10.55**

Indirect effects identified under the build alternatives may be permanent or temporary. Permanent indirect effects are those effects that would occur once construction is completed and during operation of the project. Permanent indirect effects include edge effects and habitat degradation in areas adjacent to the roadway; increased risk of fire, litter, and spread of invasive weeds due to increased human encroachment; compacted soils that could hinder re-establishment of vegetation; increased noise and light from traffic that may alter wildlife behavior or use of areas adjacent to the roadway; erosion, siltation, sedimentation, and runoff that alters the soil conditions to make the soil less suitable or no longer suitable for native plant communities; construction equipment leaks that result in soil and water contamination; habitat fragmentation that could prevent the dispersal of plant species and/or reduce survival and movement of wildlife species that are pollinators or seed dispersers; introduction of invasive plant species that could outcompete native plant communities or pathogens that could infect native plant communities; and shading effects.

Bridge expansions under all three build alternatives would result in permanent (indirect) shading effects on existing riparian vegetation. New bridges may permanently alter the amount of sunlight available for photosynthesis and vegetative growth, thereby reducing vegetation density

and functions and values. During operation of the selected build alternative, there would be ongoing maintenance of the road right of way, which would not differ appreciably from current maintenance activities within the existing right of way. Table 3.17-7 summarizes the shading effects under Build Alternatives 1, 2C, and 4 for each natural community of concern.

Table 3.17-7. Shading Effects on Natural Communities of Concern

Natural Community of Concern	Shading Effects (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	0.17	0.50	2.09
Riversidian Alluvial Fan Sage Scrub	0.05	0.05	0.05
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00
Southern Cottonwood-Willow Riparian Forest	0.17	0.17	0.17
Southern Riparian Forest	0.00	0.00	0.00
Southern Willow Scrub	0.14	0.17	0.18
Coast and Valley Freshwater Marsh	0.00	0.00	0.00
Total	**0.53**	**0.89**	**2.49**

Temporary indirect effects could occur on lands adjacent to the LOD. Temporary indirect effects are those secondary effects that would only occur during construction-related activities and could temporarily alter plant growth, survival, dispersal or germination; fragment habitat; alter hydrology; result in water or soil contamination; or increase litter and pest attractiveness. The potential temporary indirect effects include increased risk of fire, chemical spills during construction, increased dust levels, risk of introduction of invasive plant species, and increased trash, each of which can contribute to a temporary degradation of habitat and water quality. There is also a risk of encroachment from equipment operating outside of the LOD. Construction activities performed during day or night could also alter behavior of wildlife moving through the landscape. Implementation of avoidance and minimization measures (Measures **NC-1 [NES BIO-1]** through **NC-12 [NES BIO-12]** in Section 3.17.4) would ensure the potential indirect effects during project construction are reduced or eliminated.

Once construction is completed, disturbed areas or rehabilitation areas would be revegetated with a native seed mix (Measure **NC-13 [NES BIO-9]** in Section 3.17.4). Full compensatory requirements and details for riparian-riverine habitats (including impacts from shading effects) will be provided in the Determination of Biologically Equivalent or Superior Preservation (DBESP) report for the selected build alternative (Measure **NC-14 [NES BIO-13]** in Section 3.17.4). Replacement of riparian-riverine resources would occur through on-site restoration or through the purchase of RCRCD In-lieu Fee Program (ILFP) credits, Santa Ana Watershed Association ILFP, a permittee responsible mitigation bank, and/or other approved mitigation program (Measure **NC-15 [NES BIO-14]** in Section 3.17.4). Additional details for impacts on jurisdictional waters is provided in Section 3.18, *Wetlands and Other Waters*.

After construction is completed, there is a potential for long-term indirect effects during operation of the selected build alternative. Ongoing road maintenance operations would not have direct impacts on natural communities of concern that have already been removed; however, direct impacts would occur where additional habitat losses occur due to the incidental trampling or crushing of vegetation by vehicles or human activities, or exposure to accidental spills of

contaminants and pollutants. Vegetation control activities through the application of herbicides and fire breaks could contribute to runoff and pollution that would result in direct mortality of vegetation or habitat degradation. Fire risks could be greater because of the presence of maintenance and operation crews within the right of way. Operation of Build Alternatives 1, 2C, or 4 would have potential long-term indirect impacts on natural communities of concern related to fire risks, application of herbicides and pesticides, and increases in litter. These potential indirect operational impacts may reduce the function and value of natural communities of concern but would be similar to those of the No-Build Alternative.

A brief comparison of the quantity of impacts among the build alternatives, significance of impacts as it relates to the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA), and the avoidance, minimization, and mitigation measures that are directly applicable to each community are provided below.

Riversidian Sage Scrub

The direct effects on RSS for the build alternatives are summarized in Tables 3.17-2 through 3.17-4. Of the three build alternatives, Build Alternative 2C would cause the greatest permanent impact on RSS and Build Alternative 1 would cause the smallest permanent impact on RSS. Build Alternative 4 would cause the greatest temporary impact on RSS, while Build Alternative 1 would have the smallest temporary impact on RSS.

Because RSS is rapidly declining, becoming fragmented, or degrading within the region, the loss of this resource caused by Build Alternatives 1, 2C, or 4 would be considered significant under CEQA and biologically substantial under NEPA. The permanent impacts on RSS outside of conservation lands are fully covered under the WRC MSHCP through consistency with the plan. The avoidance and minimization measures (Measures **NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]** in Section 3.17.4) would ensure that potential direct and indirect impacts on RSS from construction are reduced or avoided entirely and ensure compliance with the WRC MSHCP.

RSS habitat suitable for special-status species within the RCHCA SKR Reserve and for several of the LM MSHCP target species within the LM MSHCP area would require compensatory mitigation (refer to Section 3.21, *Threatened and Endangered Species*, for further details).

Riversidian Alluvial Fan Sage Scrub

The direct effects on RAFSS for each of the build alternatives are summarized in Tables 3.17-2 through 3.17-4. This community is rapidly declining, fragmented, and degrading within the region; therefore, the permanent loss of this resource caused by Build Alternatives 1, 2C, or 4 may be significant under CEQA and biologically substantial under NEPA. The proposed project is a Covered Activity under the WRC MSHCP (Volume I, Section 7.2.2); therefore, with the exception of impacts on conserved lands and riparian-riverine resources (described below), permanent direct impacts from construction on RAFSS are expected to be addressed through consistency with the WRC MSHCP. The quantity of temporary direct impacts would be the same for Build Alternatives 1 and 2C, and slightly smaller for Build Alternative 4.

Measures **NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]** in Section 3.17.4 would be applied to avoid and minimize the potential direct and indirect effects during project construction and ensure project compliance with the WRC MSHCP.

RAFSS habitat that is suitable for LM MSHCP target species within the LM MSHCP area would require compensatory mitigation (refer to Section 3.20, *Animal Species*, and Section 3.21, *Threatened and Endangered Species*, for further details).

Coast Live Oak Woodland

There would be no temporary or permanent direct effects on coast live oak woodlands that occur within the BSA. This community occurs entirely outside of the LOD for Build Alternatives 1, 2C, and 4. No indirect effects would occur with implementation of avoidance and minimization measures identified for the project.

Southern Coast Live Oak Riparian Forest

There would be no temporary or permanent direct effects on southern coast live oak riparian forest that occur within the BSA. This community occurs entirely outside of the LOD for Build Alternatives 1, 2C, and 4. No indirect effects would occur with implementation of avoidance and minimization measures identified for the project.

Southern Cottonwood-Willow Riparian Forest

The direct effects on southern cottonwood-willow riparian forest from the build alternatives are summarized in Tables 3.17-2 through 3.17-4. The indirect effect from shading from new bridge structures would occur when the height and width of the new bridge structure reduces the light attenuation available to vegetation, thereby greatly reducing the canopy and density of vegetation or eliminating the potential for the vegetation to grow back once construction is completed.

Because this vegetation community provides suitable habitat for special-status species (refer to Section 3.20, *Animal Species,* and Section 3.21, *Threatened and Endangered Species*) and is becoming fragmented and degraded throughout the region, the impacts on southern cottonwood-willow riparian forest would be significant under CEQA and biologically substantial under NEPA. To reduce these impacts, compensatory mitigation for this vegetation community would be required. A mitigation ratio of 3:1 is currently proposed for permanent impacts on southern cottonwood-willow riparian forest as a result of the selected build alternative; a ratio of 2:1 is proposed for shading effects; and a ratio of 1:1 is proposed for temporary impacts (Measures **NC-14 [NES BIO-13]** and **NC-15 [NES BIO-14]** in Section 3.17.4). Mitigation for riparian-riverine habitats associated with Temescal Wash and Cajalco Creek may require higher compensatory mitigation and will be addressed further in the DBESP report and Clean Water Act (CWA) (Sections 401 and 404) and Lake and Streambed Alteration Program permits (refer to Section 3.18, *Wetlands and Other Waters*). Approval of the DBESP by RCA, USFWS, and CDFW, and adequate compensatory mitigation for riparian-riverine resources, would ensure full compliance with the WRC MSHCP riparian-riverine policy (see Section 3.17.3.2 below for more details). In addition, implementation of avoidance and minimization measures would address potential indirect effects on this natural community of concern.

Southern Riparian Forest

The direct effects on southern riparian forest from the build alternatives are summarized in Tables 3.17-2 through 3.17-4. Permanent shading effects from new or expanded bridge structures under all three build alternatives would be the same.

Southern riparian forest provides suitable habitat for special-status species (refer to Section 3.20, *Animal Species,* and Section 3.21, *Threatened and Endangered Species*, for further details) and is becoming fragmented and degraded throughout the region; therefore, impacts on the community would be significant under CEQA and biologically substantial under NEPA. To reduce these impacts, compensatory mitigation for this vegetation community would be required. A mitigation ratio of 3:1 is currently proposed for permanent impacts on southern riparian forest as a result of the selected build alternative; a ratio of 2:1 is proposed for shading effects; and a ratio of 1:1 is proposed for temporary impacts (Measures **NC-14 [NES BIO-13]** and **NC-15 [NES BIO-14]** in Section 3.17.4). Mitigation for riparian-riverine habitats associated with Temescal Wash and Cajalco Creek may require higher compensatory mitigation and will be addressed further in the DBESP report and CWA (Section 401 and 404) and Lake and Streambed Alteration Program permits (refer to Section 3.18, *Wetlands and Other Waters*). Approval of the DBESP by RCA, USFWS, and CDFW, and adequate compensatory mitigation for riparian-riverine resources, would ensure full compliance with the WRC MSHCP riparian-riverine policy (see Section 3.17.3.2 below for more details). In addition, implementation of avoidance and minimization measures would address potential indirect effects on this natural community of concern.

Southern Willow Scrub

The direct effects on southern willow scrub from each of the build alternatives are summarized in Tables 3.17-2 through 3.17-4. Build Alternative 1 would have the greatest permanent effect, while Build Alternative 2C would have the greatest temporary effect of the three build alternatives. Shading effects from new or expanded bridge structures under all three build alternatives would be the same.

Southern willow scrub provides suitable habitat for special-status species (refer to Section 3.20, *Animal Species*, and Section 3.21, *Threatened and Endangered Species*, for further details) and is becoming fragmented and degraded throughout the region; therefore, impacts on the community may be significant under CEQA and biologically substantial under NEPA. To reduce these impacts, compensatory mitigation for this vegetation community would be required. A mitigation ratio of 3:1 is currently proposed for permanent impacts on southern willow scrub as a result of the selected build alternative; a ratio of 2:1 is proposed for shading effects; and a ratio of 1:1 is proposed for temporary impacts (Measures **NC-14** and **NC-15** in Section 3.17.4). Mitigation for riparian-riverine habitats will be addressed further in the DBESP report and CWA (Sections 401 and 404) and Lake and Streambed Alteration Program permits (refer to Section 3.18, *Wetlands and Other Waters*). Approval of the DBESP by RCA, USFWS, and CDFW, and adequate compensatory mitigation for riparian-riverine resources, would ensure full compliance with the WRC MSHCP riparian-riverine policy (see Section 3.17.3.2 below for more details). In addition, implementation of avoidance and minimization measures would address potential indirect effects on this natural community of concern.

Coastal and Valley Freshwater Marsh

The direct effects on coastal and valley freshwater marsh from each of the build alternatives are summarized in Tables 3.17-2 through 3.17-4. There would be no shading effects on this vegetation community.

Because wetlands and marsh habitats are rare and rapidly declining in the region, impacts on coastal and valley freshwater marsh would be significant under CEQA and substantial under NEPA. To reduce these impacts, compensatory mitigation for this vegetation community would be required. A mitigation ratio of 3:1 is currently proposed for permanent impacts on coastal and valley freshwater marsh as a result of the selected build alternative; a ratio of 2:1 is proposed for shading effects; and a ratio of 1:1 is proposed for temporary impacts (Measures **NC-14** and **NC-15** in Section 3.17.4). Mitigation for riparian-riverine habitats will be addressed further in the DBESP report and CWA (Section 401 and 404) and Lake and Streambed Alteration Program permits (refer to Section 3.18, *Wetlands and Other Waters*). Approval of the DBESP by RCA, USFWS, and CDFW, and adequate compensatory mitigation for riparian-riverine resources, would ensure full compliance with the WRC MSHCP riparian-riverine policy (see Section 3.17.3.2 below for more details). In addition, implementation of avoidance and minimization measures would address potential indirect effects.

Lake Mathews MSHCP

Table 3.17-8 provides the total impacts that would occur on all vegetation communities that occur within the LOD in the LMR. This does not include areas generally considered developed (Developed/Disturbed or Concrete Channel/Spillway/V-ditch/Riprap).

Table 3.17-8. Vegetation Communities Impacts: Lake Mathews Reserve

Impact Type	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Permanent (acres)	120.50	111.39	56.52
Temporary (acres)	20.09	22.56	9.01
Beneficial (Roadway Removal) (acres)	0.14	0.07	0.70
Shading[1] (acres)	0.30	0.88	0.39
[1] Shading effects = permanent indirect impacts from bridge extensions and new bridges onto vegetation communities.			

Natural communities of concern would be directly and indirectly affected under each of the three build alternatives. The direct and indirect effects on natural communities of concern are described in the previous section that discusses impacts within the entire BSA, and includes a quantitative and qualitative analysis of the direct effects, shading effects, and beneficial effects. In addition, a description of the potential indirect effects and long-term operational effects for each build alternative is provided.

Under Build Alternatives 1, 2C, and 4, construction activities would result in the permanent removal of natural communities of concern within the LMR. Table 3.17-9 summarizes the permanent impacts by Build Alternatives 1, 2C, and 4 for each natural community of concern within the LMR.

Table 3.17-9. Permanent Impacts on Natural Communities of Concern: Lake Mathews Reserve

Natural Community of Concern	Permanent Impacts (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	25.87	35.32	21.95
Riversidian Alluvial Fan Sage Scrub	0.02	0.02	0.00
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00

Natural Community of Concern	Permanent Impacts (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Southern Cottonwood-Willow Riparian Forest	0.00	0.00	0.00
Southern Riparian Forest	0.00	0.00	0.00
Southern Willow Scrub	2.27	1.72	0.29
Coast and Valley Freshwater Marsh	0.00	0.00	0.00
Total	**28.16**	**37.06**	**22.24**

Build Alternative 4 is the only alternative that would result in beneficial effects on natural communities of concern. Table 3.17-10 summarizes the beneficial effects under Build Alternatives 1, 2C, and 4 for each natural community of concern within the LMR.

Table 3.17-10. Beneficial Effects on Natural Communities of Concern: Lake Mathews Reserve

Natural Community of Concern	Beneficial Effects (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	0.00	0.00	0.49
Riversidian Alluvial Fan Sage Scrub	0.00	0.00	0.00
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00
Southern Cottonwood-Willow Riparian Forest	0.00	0.00	0.00
Southern Riparian Forest	0.00	0.00	0.00
Southern Willow Scrub	0.00	0.00	0.00
Coast and Valley Freshwater Marsh	0.00	0.00	0.00
Total	**0.00**	**0.00**	**0.49**

Table 3.17-11 summarizes the temporary impacts under Build Alternatives 1, 2C, and 4 for each natural community of concern within the LMR.

Table 3.17-11. Temporary Impacts on Natural Communities of Concern: Lake Mathews Reserve

Natural Community of Concern	Temporary Impacts (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	3.12	3.63	2.19
Riversidian Alluvial Fan Sage Scrub	0.01	0.01	0.00
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00
Southern Cottonwood-Willow Riparian Forest	0.00	0.00	0.00
Southern Riparian Forest	0.00	0.00	0.00
Southern Willow Scrub	0.78	0.84	0.17
Coast and Valley Freshwater Marsh	0.00	0.00	0.00
Total	**3.91**	**4.48**	**2.36**

Permanent (indirect) shading effects from bridge expansions would only affect natural communities of concern in Build Alternatives 2C and 4 within the LMR. Shading effects would not affect natural communities of concern in Build Alternative 1. Table 3.17-12 summarizes the shading effects under Build Alternatives 1, 2C, and 4 for each natural community of concern.

Table 3.17-12. Shading Effects on Natural Communities of Concern: Lake Mathews Reserve

Natural Community of Concern	Shading Effects (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riversidian Sage Scrub	0.00	0.33	0.22
Riversidian Alluvial Fan Sage Scrub	0.00	0.00	0.00
Coast Live Oak Woodland	0.00	0.00	0.00
Southern Coast Live Oak Riparian Forest	0.00	0.00	0.00
Southern Cottonwood-Willow Riparian Forest	0.00	0.00	0.00
Southern Riparian Forest	0.00	0.00	0.00
Southern Willow Scrub	0.00	0.03	0.03
Coast and Valley Freshwater Marsh	0.00	0.00	0.00
Total	**0.00**	**0.36**	**0.25**

Future Six-Lane (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road, under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road, or Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that no additional impacts would occur on natural communities of concern because all development would occur in a previously graded median. In addition, operation of the proposed future six-lane facility is not expected to affect these resources.

No-Build Alternative

Under the No-Build Alternative, there would be no permanent or temporary impacts on natural communities of concern beyond those that would be expected to occur from the existing facility.

3.17.3.2 WRC MSHCP Riparian-Riverine and Vernal Pool Resources

Build Alternatives 1, 2C, and 4

Construction of Build Alternatives 1, 2C, or 4 would result in a permanent loss and temporary impact on WRC MSHCP riparian and riverine resources (WRC MSHCP Volume I, Section 6.1.2, Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools). The vegetation communities classified as WRC MSHCP riparian that would be affected by the build alternatives are riparian forest, southern cottonwood-willow riparian, southern willow scrub, disturbed southern willow scrub, coastal and valley freshwater marsh, riparian scrub, riparian ruderal, native/nonnative riparian scrub, Mexican elderberry scrub, California juniper riparian, mulefat scrub, mulefat/Mexican elderberry scrub, tamarisk scrub, riparian/open water/reservoir/pond, sandbar willow scrub, Mexican elderberry ruderal, and riparian herbaceous. Bridge expansions proposed at Temescal Creek (STA #20 to 25) and Cajalco Creek (STA #740 to 742) under all three build alternatives would result in permanent shading effects on existing riparian vegetation. Additional shading effects would occur with construction of new bridges at unnamed drainages at STA #268 to 269 under Build Alternative 1, STA #266 to 268

under Build Alternative 2C, and STA #145+50 under Build Alternative 4. The height and width of new bridge structures are expected to cause shading effects on existing riparian vegetation that would greatly reduce or eliminate the canopy of the riparian habitat at those locations.

Riverine resources, which include drainages and upland communities that depend on the soil moisture of the drainage and provide valuable upland habitat for WRC MSHCP planning species, would be affected during project construction through direct removal, temporary disturbance, or indirect effects adjacent to the LOD of the build alternatives. Upland communities classified as riverine resources when they are directly adjacent to drainages include RSS, disturbed RSS, RAFSS, brittlebush scrub, California juniper woodland, California juniper/NNG, concrete channel/spillway/V-ditch/riprap, eucalyptus/tamarisk, exotic tree(s)/woodland, fallow agriculture, NNG, open water/reservoir/pond, RSS/NNG, ruderal, saltbush scrub, unvegetated, and developed/disturbed land.

The proposed build alternatives would have permanent, temporary, and shading impacts on WRC MSHCP riparian-riverine resources (Figure 3.17-5). Table 3.17-13 summarizes the direct impacts on riparian-riverine resources by each of the build alternatives.

Table 3.17-13. Riparian-Riverine Resource Impacts

Impact Type	Build Alternative 1 (acres)	Build Alternative 2C (acres)	Build Alternative 4 (acres)
Riparian			
Permanent	11.36	9.55	6.62
Temporary	7.53	7.40	3.75
Shading[1]	0.45	0.43	0.58
Riverine			
Permanent	4.65	4.76	2.39
Temporary	1.49	1.48	1.89
Shading[1]	0.33	0.36	0.64
[1] Shading effects = permanent indirect impacts from bridge extensions and new bridges.			

Portions of the existing roadways and right of way would be permanently removed during project construction but returned to natural earthen drainage topography (rehabilitated) under the three build alternatives. Removal of the roadbed and rehabilitated areas would permanently affect some riparian-riverine resources, but because these resources would be returned to a natural state and natural drainage topography, this permanent impact is considered beneficial. The beneficial permanent impact from roadbed removal and rehabilitation of riparian-riverine resources under each build alternative is provided in Table 3.17-14. It should be noted that under Build Alternatives 1 and 2C, an approximately 20-foot-wide dirt, gravel, or partially paved road would be left in place to be used for access by MWD through the LM MSHCP area, but this is not included as a beneficial effect.

Table 3.17-14. Roadbed Removal Beneficial Impacts: Rehabilitated Riparian-Riverine Resources

Stream Type	Rehabilitation (acres)		
	Build Alternative 1	Build Alternative 2C	Build Alternative 4
Riparian	0.07	0.05	0.05
Riverine	0.09	0.10	0.21
Total	**0.16**	**0.15**	**0.26**
Note: No roadbed removal would occur within existing conserved lands.

Figure 3.17-5 - Sheet 25
Riparian/Riverine Resources Results Build Alternative 4
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

Once the selected build alternative is constructed and the project is operational, there are additional long-term effects that would occur and include maintenance (e.g., mowing along the shoulder for fire/weed abatement), more vehicles traveling on the facility, increases in noise and lighting, and other activities or changes associated with operating the new facility. Many of these operational effects would reduce the functions and values of adjacent riparian-riverine habitats due to degradation of habitat quality and edge effects, but would be similar to the existing conditions under the No-Build Alternative.

Indirect impacts on lands adjacent to the build alternatives include degradation of habitat through increased risk of fire, air pollution, litter, and noise, among other risks. Although riparian resources have high value to wildlife movement and provide "live-in" habitat, animals would still maintain safe movement patterns within riparian areas through the placement of wildlife crossings (refer to Section 3.17.3.3 below). The loss of canopy connectivity and habitat can also reduce the function and value for movement and other species uses.

Under the WRC MSHCP policy, impacts on riparian-riverine resources require the preparation of a DBESP (Measure **NC-14 [NES BIO-13]** in Section 3.17.4) report, which analyzes the functions and values of riparian-riverine resources before and after construction, including riparian-riverine associated species (i.e., least Bell's vireo), and provides the avoidance/minimization, mitigation, and compensatory measures for the loss of WRC MSHCP riparian-riverine resources. The loss of WRC MSHCP riparian-riverine resources would require mitigation; replacement at a no less than 3:1 ratio for permanent impacts, no less than 2:1 ratio for shading effects, and no less than 1:1 ratio for temporary effects is currently proposed (Measure **NC-15 [NES BIO-14]** in Section 3.17.4). A minimum 2:1 mitigation ratio is proposed for impacts on riparian-riverine resources restored from roadbed removal. Mitigation for riparian-riverine habitats associated with Temescal Wash and Cajalco Creek may require higher compensatory mitigation and will be addressed further in the DBESP report and CWA (Section 401 and 404) and Lake and Streambed Alteration Program permits (refer to Section 3.18, *Wetlands and Other Waters*). Approval of the DBESP by RCA, USFWS, and CDFW, and adequate compensatory mitigation for riparian-riverine resources, will ensure consistency with the WRC MSHCP.

Lake Mathews MSHCP

Construction of the proposed project would permanently remove WRC MSHCP riparian-riverine resources from the LMR under Build Alternatives 1, 2C, and 4. Temporary impacts would also occur on riparian-riverine resources under Build Alternatives 1, 2C, and 4. In addition, shading effects from new bridges over riparian habitat would result in permanent, indirect effects on riparian resources, potentially affecting density of the habitat or eliminating the habitat completely. All roadbed removal would occur within the existing County right of way; therefore, no roadbed removal within the LMR would occur. The impacts on WRC MSHCP riparian-riverine resources within the LM MSHCP area and LMR are shown in Figure 3.17-5.

Table 3.17-15 summarizes the direct impacts on riparian-riverine resources by each of the build alternatives within the LMR.

Table 3.17-15. Riparian-Riverine Resource Impacts: Lake Mathews Reserve

Impact Type	Build Alternative 1 (acres)	Build Alternative 2C (acres)	Build Alternative 4 (acres)
Riparian			
Permanent	5.44	3.62	0.30
Temporary	3.52	3.39	0.18
Shading[1]	0.05	0.03	0.17
Riverine			
Permanent	1.15	1.26	0.09
Temporary	0.22	0.21	0.01
Shading[1]	0.01	0.05	0.01
[1] Shading effects = permanent indirect impacts from bridge extensions and new bridges.			

Riparian vegetation within the LMR that would be affected by the build alternatives includes southern willow scrub, riparian scrub, riparian ruderal, Mexican elderberry scrub, California juniper riparian, mulefat scrub, willow/mulefat scrub, mulefat/Mexican elderberry scrub, tamarisk scrub, and riparian herbaceous. Within the LMR, upland communities classified as riverine resources when associated with drainages include RSS, disturbed RSS, RAFSS, brittlebush scrub, California juniper woodland, California juniper/NNG, concrete channel/spillway/V-ditch/riprap, eucalyptus/tamarisk, exotic tree(s)/woodland, fallow agriculture, NNG, open water/reservoir/pond, RSS/NNG, ruderal, saltbush scrub, unvegetated, and developed/disturbed land. The riparian habitat within the LMR provides valuable habitat for LM MSHCP target species, such as least Bell's vireo. In addition, riparian-riverine features within the LMR can be used for wildlife movement across the LMR and adjacent open lands. The loss of riparian-riverine resources could have a biologically considerable effect on the LM MSHCP area because this community is uncommon within the LMR.

Future Six-Lane (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road, under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road, or Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that no additional impacts would occur on WRC MSHCP riparian-riverine resources because all development would occur in a previously graded median. In addition, operation of the proposed future six-lane facility is not expected to affect these resources.

No-Build Alternative

Under the No-Build Alternative, there would be no permanent or temporary impacts on WRC MSHCP riparian-riverine resources beyond those that would be expected to occur from the existing facility.

3.17.3.3 Corridors and Linkages

Build Alternatives 1, 2C, and 4

As described in Section 3.17.2.5, there are currently no dedicated wildlife crossings within the BSA; however, there are several bridges and culverts that wildlife could opportunistically use to move through the area. There are also no existing barriers or fencing within the roadway median restricting wildlife movement across roadway surfaces. However, existing roadways could also serve as a potential deterrent or barrier for some species that avoid crossing roadways. Although the roadways currently provide some level of opportunity for connectivity, there is also an increased risk of wildlife collisions with vehicles.

The build alternatives would widen the existing roadways from two to four lanes, with medians and paved shoulders to improve traffic mobility and increase traffic capacity. Where bridges and culverts exist, road widening would result in longer bridge and culvert structures, some culverts with decreased structure openness:length ratios. Dedicated wildlife crossings (functioning as wildlife underpasses and modified culverts) have been incorporated into the project design of the build alternatives to facilitate wildlife movement per Section 7.5.2 of the WRC MSHCP, Guidelines for Construction of Wildlife Crossings. Modifications to the guidelines were further added as needed to accommodate species requirements and design specifications. Such modifications include all small and medium crossings having crossing widths that are twice the measurement as the WRC MSHCP required height (width = 2 x height) to increase openness and better facilitate small animal movement. In addition, the sizing of large and extra-large crossings, which are not specified in the WRC MSHCP, were designed to accommodate large animals and mule deer movement.

Some additional design elements have been implemented based on agency guidance and updated best management practices in road ecology. The WRC MSHCP requires small and medium crossings to be placed every 984 feet and large crossings to be placed every mile along improved roadway within criteria cells, cores, linkages, and/or PQP lands. The WRC MSHCP design guidelines are provided in Appendix J. The proposed project would include crossing structures that would meet or exceed the placement and size criteria outlined in the WRC MSHCP guidelines and would facilitate movement for a wide variety of terrestrial and aquatic species of various sizes. A summary of the crossing sizes, number of crossings under each build alternative, crossing dimensions, and the target wildlife that would be facilitated through each crossing is provided in Table 3.17-16 on the following page. Individual wildlife crossings proposed under each build alternative, and their locations, are provided in Appendix J; Table J-1 lists each proposed wildlife crossing and Figure J-1, *Proposed Wildlife Crossings – Build Alternatives 1, 2C and 4,* indicates the location of each crossing.

Table 3.17-16. Proposed Wildlife Crossings: Build Alternatives 1, 2C, and 4

Wildlife Crossing Size	Build Alternative 1 Crossings (Wet Crossings)*	Build Alternative 2C Crossings (Wet Crossings)*	Build Alternative 4 Crossings (Wet Crossings)*	Minimum Height/Width[1]	Species Facilitated
Extra Large – Bridge	3 (2)	5 (2)	6 (4)	Height 15 ft. Width 30 ft.	Large animals (e.g., mule deer, mountain lion), medium animals (e.g., coyote, raccoon), and small animals (e.g. voles, lizards)
Extra Large	4 (2)	4 (2)	2 (1)		
Large – Bridge	1(1)	1(1)	1(1)	Diameter and/or height/width 5.1–14.9 ft. (minimum 10 ft. targeted)	Large animals, medium animals, and small animals
Large	20 (15)	21 (15)	6 (4)		
Medium	35 (20)	32 (15)	22 (14)	Height 3–5 ft. Width 6–10 ft.	Medium and small animals
Small	10 (7)	8 (6)	14 (10)	Height 1.5–3 ft. Width 3–6 ft.	Small animals
Total	**73 (47)**	**71 (41)**	**51 (34)**		

* Numbers in parentheses are a subset of the total and represent the number of wet crossings such as modified culverts and bridges.
[1] Dimensions are derived from WRC MSHCP minimum size requirements and agency coordination meetings. WRC MSHCP specifies minimum sizes for small, medium, and mule deer crossings. Large crossing sizes were determined as the minimum size required to facilitate mountain lion and elements such as a dry shelf. All small and medium crossing widths will be double the crossing height.

Under all three build alternatives, the widening of the existing Temescal Creek Bridge would result in shading impacts, which would result in habitat loss and possible decreased movement function for some species. Although Temescal Creek Bridge is being widened, the bridge openness is not expected to be affected due to the bridge span being lengthened; therefore, function and value for wildlife movement from bridge openness is not expected to change at Temescal Creek Bridge. Other existing culvert structures would also be lengthened to accommodate the widened roadway, potentially decreasing their openness, which may result in reduced function and value for wildlife movement. Wildlife vehicle collisions are generally expected to decrease with the installation of wildlife fencing and escape opportunities throughout the conservation area.

Build Alternative 2C includes the same improvements to wildlife crossing as Build Alternative 1, with the exception of a new four-lane segment of Cajalco Road that would be constructed from La Sierra Avenue to just west of Lake Mathews Drive in a currently undeveloped area south of Lake Mathews. Due to the differences in terrain, land use in this area, and proposed project design of this new four-lane segment, proposed wildlife crossings in this area include an additional bridge structure. This bridge underpass would be included within the newly constructed segment of Cajalco Road west of Hollis Lane. The underpass would be designed with a minimum 15-foot clearance height for mule deer passage, with a 50-foot width on each side of the bridge footings for sheep and wildlife passage through the area. Sheep are used for land and resource conservation management in the adjacent lands. Ensuring they have ability to pass under the roadway will be important under Alternative 2C for facilitating ongoing management and conservation activities. The width of the bridge is also advantageous for wildlife movement because it provides an expansive openness for wildlife under the crossing structure.

As part of Linkage 3 improvements under Build Alternatives 1 and 2, existing culverts in Linkage 3 would be replaced with larger and longer modified culverts, which are designed to facilitate wildlife movement. The existing culverts are composed of one set of triple-barrel 48-inch pipes across Harley John Road and one set of double-barrel 5-foot-tall by 9-foot-wide box culverts across Cajalco Road. These would be replaced with a four-barrel, 80-foot-wide, 10-foot-tall, 245-foot-long box culvert, crossing diagonally through the intersection of Harley John Road and Cajalco Road. Although the loss of these lands would result in decreased live-in habitat and movement habitat for wildlife, these impacts have already been accounted for and addressed in the WRC MSHCP. Linkage 3 improvements would not occur under Build Alternative 4.

During construction, wildlife movement and habitat connectivity through the WRC MSHCP cores and linkages would be temporarily affected due to vegetation removal and increased human presence, as well as indirectly affected from increased noise, dust, light, reduced water quality, edge effects, and vibrations associated with construction activities, deterring wildlife from passing through the construction area. Wildlife avoidance of the area could result in temporary population fragmentation, habitat avoidance, increased potential for avoidance of existing crossing areas, and increased incidence of vehicular/wildlife collisions. Implementation of avoidance and minimization measures (Measures **NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]** in Section 3.17.4) would reduce these potential effects.

Compensatory mitigation for impacts on WRC MSHCP cores and linkages under Build Alternatives 1, 2C, and 4 would require the replacement of habitat of equivalent or higher value (Measure **NC-20 [NES BIO-21]** in Section 3.17.4). Table 3.17-17 summarizes the direct effects on WRC MSHCP cores and linkages under each of the build alternatives.

Table 3.17-17. Direct Impacts on WRC MSHCP Cores and Linkages

Build Alternative	Impact Type	WRC Cores and Linkages (acres)[1]		
		Core C	Extension of Existing Core 2	Linkage 3
Build Alternative 1	Permanent	210.04	52.60	2.95
	Temporary	27.33	8.37	3.54
	Shading Effects	0.30	0.27	--
Build Alternative 2C	Permanent	215.39	55.65	2.95
	Temporary	35.05	8.63	3.54
	Shading Effects[2]	0.88	0.27	--
Build Alternative 4	Permanent	82.32	93.51	0.98
	Temporary	12.99	16.68	--
	Shading Effects	1.87	2.79	--

[1] All totals are rounded to the nearest 100th.
[2] Shading impacts = indirect impacts from bridge extensions and new bridges.

The addition of vehicle lanes could increase potential mortality from vehicle strikes because the wider roadway would be more difficult to safely cross. However, the 73 dedicated wildlife crossings under Build Alternative 1, 71 dedicated wildlife crossings under Build Alternative 2C, and 51 dedicated wildlife crossings under Build Alternative 4 and associated fencing that has been incorporated into the project design would minimize the potential risk from vehicle strikes.

Temporary impacts on wildlife movement and habitat connectivity through the project area during construction activities for Build Alternative 2C are anticipated to be similar to those

detailed for Build Alternative 1, including direct habitat and vegetation removal, and increased human presence and construction traffic as well as indirect impacts such as noise, dust, light, reduced water quality, edge impacts, and vibration associated with construction. In addition, wildlife would likely avoid the construction area during work activities, resulting in temporary population fragmentation, avoidance of existing crossing areas, and increased incidence of wildlife/vehicular collisions.

In addition to the direct and indirect effects identified above for the build alternatives, roadbed removal under Build Alternative 2C east of La Sierra Avenue and west of Hollis Lane would retain an approximately 20-foot-wide dirt, gravel, or partially paved road that would be used for access by MWD through the LM MSHCP area. The remaining portions of the roadbed removal areas would be vegetated with native plants. Because Build Alternative 2C proposes a portion of newly built roadway through existing undeveloped lands, this alternative would result in additional impacts on habitat, vegetation communities, and existing wildlife movement through such areas. In addition, portions of existing Cajalco Road would be removed and replaced with an approximately 20-foot-wide dirt, gravel, or partially paved road for MWD access and would be fenced along the northern edge, which may interfere with wildlife movement. During project operation, wildlife vehicle collisions are expected to decrease with the installation of wildlife fencing and escape opportunities. A Wildlife Fencing Plan (Measure **NC-16** in Section 3.17.4) will be prepared for the selected build alternative to facilitate wildlife movement through the dedicated wildlife crossings.

Lake Mathews MSHCP

Wildlife crossings through the LMR are identified on Figure J-1 in Appendix J. A number of the wildlife crossings identified for the build alternatives would occur within the LMR. During construction, potential wildlife movement occurring across the LMR would be temporarily affected during vegetation removal and increased human presence, as well as indirectly affected from increased noise, dust, light, reduced water quality, edge effects and vibrations associated with construction activities, deterring wildlife from passing through the construction area. Wildlife avoidance of the area could result in temporary population fragmentation, habitat avoidance, increased potential for avoidance of existing crossing areas, and increased incidence of vehicular/wildlife collisions. Implementation of avoidance and minimization measures (Measures **NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]** in Section 3.17.4) would reduce these potential effects. The compensatory mitigation identified for PQP lands under the build alternatives (Measure **NC-20 [NES BIO-21]** in Section 3.17.4) would address the direct effects on WRC MSHCP cores and linkages through the LMR. Table 3.17-18 summarizes the direct effects on WRC MSHCP cores and linkages under each of the build alternatives within the LMR.

Table 3.17-18. Cores and Linkages Direct Impacts: Lake Mathews Reserve

Build Alternative	Impact Type	WRC Cores and Linkages (acres)[1]		
		Core C	Extension of Existing Core 2	Linkage 3[3]
Build Alternative 1	Permanent	121.09	0.12	0.00
	Temporary	21.59	0.00	0.00
	Shading Effects	0.30	0.00	0.00
Build Alternative 2C	Permanent	112.20	0.12	0.00
	Temporary	23.21	0.00	0.00
	Shading Effects[2]	0.88	0.00	0.00
Build Alternative 4	Permanent	55.13	0.63	0.00
	Temporary	7.32	1.45	0.00
	Shading Effects	0.39	0.00	0.00

[1] All totals are rounded to the nearest 100th.
[2] Shading impacts = indirect impacts from bridge extensions and new bridges.
[3] Linkage 3 does not occur within the LM MSHCP area; therefore, no impacts to this linkage would occur.

Future Six-Lane (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road, under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road, or Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that no additional impacts would occur on wildlife corridors or linkages because all development would occur in a previously graded median. In addition, operation of the proposed future six-lane facility is not expected to affect these resources.

No-Build Alternative

Under the No-Build Alternative, there would be no permanent or temporary impacts on WRC MSHCP corridors and linkages beyond those that would be expected to occur from the existing facility. In addition, there would be no improvements to wildlife movement.

3.17.3.4 Western Riverside County MSHCP Amendment

Build Alternatives 1, 2C, and 4 have incorporated all the WRC MSHCP requirements for the proposed project including Volume I, Sections 3.2.3, 6.1.2, 6.1.3, 6.1.4, 6.3.2, 7.3.5, 7.5.1, 7.5.2, and 7.5.3, and Appendix C of the WRC MSHCP document.

Build Alternatives 1 and 2C – Cajalco Alignment and Modified Cajalco Alignment

Build Alternatives 1 and 2C are WRC MSHCP Covered Activities that overlap with both the Criteria Area and PQP lands. The maximum area of impact allowable within the Criteria Area for Build Alternatives 1 and 2C was determined through coordination with RCA and Figure 7-1 in WRC MSHCP Volume I. Figure 7-1 identifies County General Plan Circulation Element roadway designations at the time the WRC MSHCP was developed. The proposed roadway right of way for Cajalco Road through the Criteria Area is 128 feet; however, due to the rugged and steep terrain of the proposed project through the Criteria Area, project impacts associated with

slope easements and appurtenant facilities are anticipated to extend beyond the roadway right of way in limited areas. For this reason, Build Alternatives 1 and 2C would require a minor amendment of the WRC MSHCP document as described in Volume I, Section 6.10.2 (F). The County will submit a request for a minor amendment to the RCA prior to the submittal of the Joint Project Review application for MSHCP consistency. The minor amendment analysis will review the effects of grading/slopes outside of the covered roadway on the Rough Step status of vegetation communities, future Reserve assembly, and Reserve connectivity. The approved minor amendment will be provided in the Final EIR/EIS. In addition, the County may coordinate with the RCA to adjust the right of way of another County facility to accommodate the additional right of way of Build Alternatives 1 or 2C. Any adjustments to the right of way of another County road facility would be negotiated with the RCA during the minor amendment process.

Build Alternative 4 – El Sobrante Alignment

Build Alternative 4 is a WRC MSHCP Covered Activity that overlaps with both the Criteria Area and PQP lands. The maximum area of impact allowable within the Criteria Area was determined through coordination with RCA and the designated roadway facility right of way identified in Figure 7-1 of the WRC MSHCP Volume I. As described above, this WRC MSHCP figure identified the County General Plan Circulation Element roadway designations established at the time the WRC MSHCP was developed. The proposed roadway right of way of Build Alternative 4 through the Criteria Area would not exceed the 196-foot right of way identified in the General Plan for El Sobrante Road; however, due to the rugged and steep terrain of the proposed project through the Criteria Area, project impacts may exceed 196 feet in limited areas to accommodate slope easements and appurtenant facilities. Therefore, a minor amendment of the WRC MSHCP document as described in Volume I, Section 6.10.2 (F), may be required under Build Alternative 4 to accommodate the slope easements and appurtenant facilities. The County will submit a request for a minor amendment to the RCA prior to the submittal of the Joint Project Review application. The minor amendment analysis will review the effects of grading/slopes outside of the covered roadway on the Rough Step status of vegetation communities, future Reserve assembly, and Reserve connectivity. The approved minor amendment will be provided in the Final EIR/EIS. In addition, the County may coordinate with the RCA to adjust the right of way of another County road facility accommodate the additional right of way and slope easements/appurtenant facilities necessary for Build Alternative 4. Any adjustments to the right of way of another County road facility would be negotiated with the RCA during the minor amendment process.

3.17.3.5 Lake Mathews MSHCP

Under Build Alternatives 1 and 2C, Cajalco Road would be expanded and realigned, and Build Alternative 4 would expand and realign portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road, within the LM MSHCP and LMR; appurtenant facilities including drainage basins, culverts, bridges, and wildlife crossings would also be constructed. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. All three build alternatives would also encroach into the LM MSHCP and remove habitat for LM MSHCP target

species, which is not currently permissible under the LM MSHCP. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to accommodate the proposed project and may include a new LM MSHCP amendment along with the development of procedures for the amendment. Modification of the LM MSHCP and associated agreements, easements, and permits, including the identification of proposed mitigation, requires approvals to be coordinated between the County and LM MSHCP responsible parties, and is subject to NEPA where such agreements, easements, and permits apply, and to CEQA.

Table 3.17-19 summarizes the direct impacts on all natural vegetation communities within the LMR.

Table 3.17-19. Direct Impacts on All Natural Vegetation Communities in the Lake Mathews Reserve

Build Alternative	Impact Type (acres)		
	Permanent Impact[1]	Temporary Impact	Roadbed Removal[2]
Build Alternative 1	120.31	20.79	0.14
Build Alternative 2C	111.21	22.44	0.16
Build Alternative 4	56.52	8.76	0.70

[1] Replacement and restoration acreages are only for natural lands suitable for LM MSHCP target species. These lands have been generally categorized as NNG, RSS, and riparian. No developed areas or exotic/invasive vegetated areas would require compensatory mitigation.
[2] Roadbed removal would restore native vegetation and has already been removed from the total compensatory mitigation requirements.

Under the build alternatives, proposed wildlife fencing would direct wildlife to crossing locations to facilitate wildlife access to habitat on the north and south sides of the roadway. Existing MWD security fencing within the LM MSHCP area and other fencing may impede wildlife movement through the LMR in areas that are close to proposed wildlife crossing structures and proposed wildlife fencing. However, with the implementation of a fencing design plan (Measure **NC-16** in Section 3.17.4), the proposed wildlife crossings, and WRC MSHCP Guidelines for Construction of Wildlife Crossings (Volume I, Section 7.5.2), it is expected that wildlife connectivity through the LM MSHCP area would improve for the LM MSHCP target species.

Mitigation measures for the loss of habitat include: acquisition and/or restoration of new lands contiguous with the existing LMR; improvements to security fencing that still allow for wildlife passage through wildlife crossings; installation of cameras to monitor wildlife usage at crossings and deter human trespass; and establishment of an endowment fund to be used for LMR enhancement, management, and monitoring (Measures **NC-17** and **NC-18** in Section 3.17.4). In addition, temporary impacts are proposed to be addressed through on-site restoration (Measure **NC-19** in Section 3.17.4).

3.17.4 Avoidance, Minimization, and/or Mitigation Measures

NC-1 (NES BIO-1): Clearing of natural vegetation (including sage scrub) will be performed outside of the active breeding season for birds, as defined in the Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) (March 1 through June 30) (WRC MSHCP Volume I, Section 7.5.3), except for Riversidian sage scrub habitat judged to be potentially suitable and/or occupied by coastal California gnatcatcher and located within WRC MSHCP Criteria Areas and Public/Quasi-Public (PQP) lands. For these areas, the habitat

removal restriction is extended from June 30 to August 15. In addition, for riparian-riverine vegetation occupied by least Bell's vireo, vegetation removal restrictions occur through September 15. Table 3.17-20 summarizes the clearing restrictions of sensitive vegetation communities.

Table 3.17-20. Natural, Sage Scrub, and Riparian Vegetation Clearing Restrictions

Clearing Restriction	Natural Vegetation With Clearing Restriction
March 1–June 30	All natural vegetation communities
March 1–August 15	Riversidian sage scrub (including disturbed and remnant) where it occurs within Criteria Cells 2026, 2120, 2121, 2214, 2308, 2309, 2310, 2311, 2323, 2324, 2402, 2403, 2404, 2405, 2407, and 2408 and PQP lands (Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan area and Riverside County Habitat Conservation Authority Stephens' Kangaroo Rat Core Reserve).
April 1–September 15	Southern willow scrub (including disturbed), eucalyptus/tamarisk scrub, mulefat scrub, riparian forest, riparian scrub, sandbar willow scrub, southern cottonwood-willow riparian forest, tamarisk scrub, and willow/mulefat scrub

If clearing of vegetation needs to occur within these timeframes due to construction schedule, a preconstruction nesting bird survey will need to be performed prior to any vegetation removal activities (refer to Measure **AS-5** in Section 3.20.4 for the nesting bird survey requirements).

NC-2 (NES BIO-2): Active construction areas will be watered regularly to control dust and thus minimize impacts on adjacent vegetation (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3).

NC-3 (NES BIO-3): When work is conducted during the fire season (as identified by the Riverside County Fire Department) adjacent to any natural vegetation communities, appropriate firefighting equipment (e.g., extinguishers, shovels, water tankers) will be available on the project site during all phases of project construction to help minimize the chance of human-caused wildfires. Shields, protective mats, and/or other fire preventative methods will be used during grinding, welding, and other spark-inducing activities. Personnel trained in fire hazards, preventative actions, and responses to fires will advise contractors regarding fire risk from all construction-related activities (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3).

NC-4 (NES BIO-4): A qualified biologist will prepare and present an environmental training program for project and construction personnel (Western Riverside County Multiple Species Habitat Conservation Plan [WRC MSHCP] Volume I, Section 7.5.3) prior to grading or staging. As new personnel are added to the project, they will be required to participate in the training. The training will include a description of the species of concern and their habitats, the general provisions of the federal Endangered Species Act and California Endangered Species Act and the WRC MSHCP, the need to adhere to the provisions of the acts and the WRC MSHCP, the penalties associated with violating the provisions of the acts, the general measures that are being implemented to conserve the species of concern as they relate to the proposed project, and the access routes to and project site boundaries within which the project activities must be accomplished (WRC MSHCP Volume I, Appendix C). All sensitive areas will be fenced as presented in Measure **NC-6 (NES BIO-6)**, below.

NC-5 (NES BIO-5): The qualified project biologist will monitor construction activities to ensure that practicable measures are being employed and avoid incidental disturbance of habitat and

species of concern outside the project footprint (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3). Special attention will be provided to ensure that the environmentally sensitive area fencing required in Measure **NC-6 (NES BIO-6)** is maintained. Additionally, ongoing monitoring and reporting will occur for the duration of the construction activity to ensure implementation of best management practices. This will be done in concert with Measure **NC-6**, below, which includes the fencing of sensitive areas (e.g., riparian-riverine resources and jurisdictional waters and wetlands adjacent to the limits of disturbance and conserved lands).

NC-6 (NES BIO-6): Construction personnel will strictly limit their activities, vehicles, equipment, and construction materials to the proposed project footprint and designated staging areas and routes of travel. The construction area(s) will be the minimal area necessary to complete the proposed project and will be specified in the construction plans. Construction limits adjacent to sensitive resource areas will be demarcated using environmentally sensitive area (ESA) fencing (e.g., orange snow fencing, silt fencing). The ESA fencing will be reviewed at a frequency deemed necessary by the biological monitor (as indicated in Measure **NC-5 [NES BIO-5]**) until the completion of all construction activities. For the ESA fencing installed within Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) Core Reserve (Riverside County Habitat Conservation Authority Stephens' Kangaroo Rat Reserve and Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan area), the fencing must exclude reptiles and amphibians (to greatest extent feasible) from entering the limits of disturbance. Employees will be instructed that their activities are restricted to the construction areas (WRC MSHCP Volume I, Appendix C). Access to sites will be from pre-existing access routes to the greatest extent possible (WRC MSHCP Volume I, Section 7.5.3 and Appendix C).

NC-7 (NES BIO-7): Exotic plant species removed during construction will be properly handled to prevent sprouting or regrowth (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Section 7.5.3). Vegetation removed from the project site will be covered while being carried on trucks, and vegetation materials removed from the site will be disposed of in accordance with applicable laws and regulations.

NC-8 (NES BIO-8): Construction equipment will be cleaned of mud or other debris that may contain invasive plants and/or seeds and inspected to reduce the potential of spreading noxious weeds before mobilizing to the site and before leaving the site during the course of construction. The cleaning of equipment will occur at least 300 feet from environmentally sensitive area fencing to prohibit the spread of invasive species.

NC-9 (NES BIO-24): To avoid attracting predators of special-status species, the project site will be kept as clean of debris as possible. All food-related trash items will be enclosed in sealed containers and regularly removed from the site(s) (Western Riverside County Multiple Species Habitat Conservation Plan Volume I, Appendix C).

NC-10 (NES BIO-10): Plans for water pollution and erosion control (i.e., Storm Water Pollution Prevention Plan [SWPPP]) will be prepared in accordance with project aquatics permits (refer to Section 3.10, *Water Quality*, for additional details for the SWPPP). The plans will describe sediment and hazardous materials control, dewatering or diversion structures, fueling and equipment management practices, and use of plant material for erosion control. Plans will be reviewed and approved by the County of Riverside prior to construction (Western Riverside

County Multiple Species Habitat Conservation Plan [WRC MSHCP] Volume I, Section 7.5.3). The following measures will be incorporated into the plans, as applicable, to ensure consistency with the WRC MSHCP:

- Water pollution and erosion control plans will be developed and implemented in accordance with Regional Water Quality Control Board (RWQCB) requirements (WRC MSHCP Volume I, Appendix C) and will ensure that no fluids or sediment from construction will enter into the environmentally sensitive area (ESA) fenced areas.
- Sediment and erosion control measures will be implemented until such time soils are determined to be successfully stabilized (WRC MSHCP Volume I, Section 7.5.3).
- No erodible materials will be deposited into watercourses or areas demarcated with ESA fencing. Brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks (WRC MSHCP Volume I, Section 7.5.3 and Appendix C).
- Projects that cannot be conducted without placing equipment or personnel in riparian vegetation areas should be timed to avoid the breeding season of riparian-associated species identified in WRC MSHCP Global Species Objective No. 7 (WRC MSHCP Volume I, Appendix C). Breeding season as defined by the WRC MSHCP is March 1 through June 30.
- If stream flows must be diverted, the diversions will be conducted using sandbags or other methods requiring minimal instream impacts. Silt fencing or other sediment trapping materials will be installed at the downstream end of construction activity to minimize the transport of sediments off site. Settling ponds where sediment is collected will be cleaned out in a manner that prevents the sediment from reentering the stream. Care will be exercised when removing silt fences, as feasible, to prevent debris or sediment from returning to the stream (WRC MSHCP Volume I, Section 7.5.3 and Appendix C). Short-term diversions will consider impacts on wildlife (WRC MSHCP Volume I, Section 7.5.3).
- Equipment storage, fueling, and staging areas will be located on non-sensitive upland sites with minimal risks of direct drainage into riparian areas or other sensitive habitats (WRC MSHCP Volume I, Section 7.5.3 and Appendix C). These designated areas will be located in such a manner as to prevent any runoff from entering sensitive habitat. Necessary precautions will be taken to prevent the release of cement or other toxic substances into surface waters. Project-related spills of hazardous materials will be reported to appropriate entities, including, but not limited to, the applicable jurisdictional city, U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, and the RWQCB, and will be cleaned up immediately and contaminated soils removed to approved disposal areas (WRC MSHCP Volume I, Appendix C).
- All equipment maintenance, staging, and dispensing of fuel, oil, coolant, or any other toxic substances will occur only in designated areas within the proposed grading limits of the project site. These designated areas will be clearly marked and located in such a manner as to contain runoff (WRC MSHCP Volume I, Section 7.5.3).

NC-11 (NES BIO-11): The limits of disturbance (LOD), including the upstream, downstream, and lateral extents on either side of any stream adjacent to the project impact footprint, will be clearly defined and marked in the field. Monitoring personnel (biology) will review the LOD prior to initiation of construction activities (Western Riverside County Multiple Species Habitat

Conservation Plan Volume I, Section 7.5.3 and Appendix C). This will ensure avoidance of jurisdictional areas and riparian habitat.

NC-12 (NES BIO-12): During construction, the placement of equipment within a stream or on adjacent banks or adjacent upland habitats occupied by Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) covered species that are outside of the project footprint will be avoided (WRC MSHCP Volume I, Section 7.5.3 and Appendix C).

NC-13 (NES BIO-9): Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades, decompacted to eliminate compressed soils and allow for plant establishment, and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory.

NC-14 (NES BIO-13) (Mitigation): A Determination of Biologically Equivalent or Superior Preservation (DBESP) report that provides analysis of direct and indirect impacts, avoidance, minimization, and compensatory mitigation, if necessary, along with the functions and values of the resources being affected as related to Section 6.1.2 of the Western Riverside County Multiple Species Habitat Conservation Plan Volume I will be prepared and submitted to the Western Riverside County Regional Conservation Authority, U.S. Fish and Wildlife Service, and California Department of Fish and Wildlife for review and approval prior to finalization of the environmental document. The DBESP will incorporate **NC-15 (NES BIO-14)**, **NC-19 (NES BIO-15)**, **TE-1 (NES BIO-18)**, and **TE-2 (NES BIO-23)** (in Section 3.21.4), and any other additional measures required based on coordination with the resource agencies. This measure includes implementation of measures identified in the DBESP.

NC-15 (NES BIO-14) (Mitigation): Compensation for permanent impacts on riparian-riverine resources will occur as a combination of enhancement, restoration, and/or creation, at a ratio that achieves no net loss of riparian-riverine resources. Compensation can also occur through the purchase of mitigation bank credits through the Riverside-Corona Resource Conservation District In-lieu Fee Program (ILFP), Santa Ana Watershed Association ILFP, a permittee responsible mitigation bank, and/or other approved mitigation provider and/or creation of riparian-riverine resources, including federal and state jurisdictional water resources. For riparian resources a mitigation ratio of no less than 3:1 is proposed, and for riverine resources no less than a 1:1 ratio is currently proposed. A mitigation ratio of no less than 2:1 is proposed for permanent shading of riparian vegetation and wetlands[2] to address temporal loss of these habitats. Mitigation for all aquatic resources will be biologically superior or equivalent to resources occurring on site. The temporary impacts on riparian-riverine resources may be replaced through restoration of the temporarily affected area to pre-project conditions at a ratio of no less than 1:1, or through the purchase of mitigation bank credits, a permittee responsible mitigation bank, or other approved mitigation program. Details of the compensation for riparian-riverine resources will be provided in the Determination of Biologically Equivalent or Superior Preservation (Measure **NC-14 [NES BIO-13]**). Because the federally and state-listed as endangered least Bell's vireo occupies the riparian-riverine areas at Temescal Creek, Cajalco

[2] Mitigation ratios may differ based on the location of riparian/riverine resources within the limits of disturbance. For example, riparian habitat within Temescal Wash may be mitigated at a higher ratio due to the quality of functions and values for wildlife movement, "live-in" habitat for sensitive species (i.e., least Bell's vireo), and water quality functions.

Creek, and other unnamed drainages proposed for impact, the compensation for both Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine and least Bell's vireo should also be integrated. Compensatory mitigation will be coordinated with U.S. Army Corps of Engineers (USACE) Clean Water Act (CWA) 404 authorization, Regional Water Quality Control Board (RWQCB) CWA 401 Certification, California Department of Fish and Wildlife (CDFW) Fish and Game Code 1602 Streambed Alteration Agreement acquisition (measure **WET-1** in Section 3.18), and Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine requirements to ensure efficiencies with the mitigation effort. Final mitigation ratios will be determined after consultation with the USACE, RWQCB, U.S. Fish and Wildlife Service, and CDFW.

NC-16 (NES BIO-19): A Wildlife Fencing Plan will be developed and implemented for the preferred build alternative. Prior to finalizing the wildlife fencing design, the impacts of and interaction between wildlife fencing and other fencing (e.g., Lake Mathews and other local fencing) in the project area of the preferred build alternative shall be fully assessed and analyzed. If it is determined that fencing in the project area (i.e., either project-related fencing or other fencing) will hinder or interfere with wildlife movement or the function and value of wildlife crossings, the wildlife fencing plan (and project design) shall include design considerations that will lessen these impacts.

Final Wildlife Fencing Plans will include the following considerations at a minimum:

- guidelines on fencing design;
- access gates design;
- construction requirements for fence ends; and
- facilitation of escape opportunities.

The plan will be prepared by a qualified biologist and use current resources based on the best available science and any requirements from the Western Riverside County Multiple Species Habitat Conservation Plan. The Wildlife Fencing Plan will be approved by the Western Riverside County Regional Conservation Authority, U.S. Fish and Wildlife Service, and California Department of Fish and Wildlife, and Lake Mathews Reserve Management Committee (within the Lake Mathew Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan area only).

NC-17 (NES BIO-17) (Mitigation): Compensation for permanent loss of habitat on the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area will be accomplished through the acquisition of replacement lands; a ratio no less than 1:1 is currently proposed. The County will purchase lands which will provide equivalent or greater habitat value and be located adjacent to the existing LM MSHCP area to ensure the reserve remains whole. The replacement lands will be managed by the Lake Mathews Reserve Management Committee (LMRMC) and the Metropolitan Water District of Southern California (MWD) in perpetuity as part of the larger Lake Mathews Reserve. If adequate replacement lands are not available at the time of land acquisition, the remainder of the necessary lands will be purchased from a mitigation bank (if available), and supplemental actions identified in Measure **NC-18** (**NES BIO-31**) implemented in coordination with LMRMC and MWD.

NC-18 (NES BIO-31) (Mitigation): To compensate for the loss of natural lands on the Lake Mathew Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area, the County of Riverside will coordinate with Lake Mathews Reserve Management Committee (LMRMC) to develop a suite of mitigation measures that demonstrate biological equivalency to offset the loss, including the acquisition of adequate replacement and restoration of lands (Measures **NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]**), fencing to aid in management of the Lake Mathews Multiple Species Reserve (LMR) (Measure **NC-16 [NES BIO-19]**), and funding to be used toward LMR management. The County of Riverside will develop the funding mechanism with input from the LMRMC that will be used to support management of new reserve lands acquired for the LM MSHCP area and any existing reserve lands, along with shared maintenance and security costs for the LM MSHCP area.

NC-19 (NES BIO-15) (Mitigation): Restoration of temporary impact areas on the Lake Mathew Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan area will be accomplished through on-site restoration of those temporarily affected areas. A Habitat Mitigation and Monitoring Plan will be developed in consultation with Lake Mathews Reserve Management Committee, U.S. Fish and Wildlife Service, and California Department of Fish and Wildlife.

NC-20 (NES BIO-21) (Mitigation): Public/Quasi-Public (PQP) lands in Existing Core C and Proposed Extension of Existing Core 2 and Proposed Linkage 3 that will be permanently removed are proposed to be replaced at a minimum 1:1 ratio. This will be coordinated with riparian-riverine compensation (**BIO-14**) and jurisdictional resources permitting (Measure **WET-1** in Section 3.18), as feasible. An evaluation of existing functions and value of PQP conserved lands within the project area will be performed as part of the Project Equivalency Determination, to provide accurate estimate of potential impacts (direct and indirect) and ensure the proposed replacement lands are equivalent or superior to those lands proposed for impact. Prior to land acquisition, an equivalency report will be provided that analyzes the existing biological resources being permanently removed compared to the biological resources supported by the lands proposed for acquisition. The resource mitigation values will need to be equivalent or superior to what is being removed. The Lake Mathews Reserve Management Committee (LMRMC) will be consulted regarding mitigation lands proposed within Lake Mathews Multiple Species Reserve PQP conserved lands, and provided opportunity for input on the selection of lands. Execution of this mitigation measure will include compensatory mitigation needed for least Bell's vireo (refer to Measure **TE-2 [NES BIO-23]** in Section 3.21.4) and Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine resources (Measures **NC-14 [NES BIO-13]**, **NC-15 [NES BIO-14]**, **NC-17 [NES BIO-17]**, and **NC-19 [NES BIO-15]**) as feasible. The Equivalency Determination will be reviewed by the Western Riverside County Regional Conservation Authority (RCA), U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Wildlife (CDFW), and LMRMC, and approved by RCA, USFWS, and CDFW.

3.18 Wetlands and Other Waters

3.18.1 Regulatory Setting

Wetlands and other waters are protected under a number of laws and regulations. At the federal level, the Federal Water Pollution Control Act, more commonly referred to as the Clean Water Act (CWA) (33 United States Code [USC] 1344), is the primary law regulating wetlands and surface waters. One purpose of the CWA is to regulate the discharge of dredged or fill material into waters of the U.S., including wetlands. Waters of the U.S. include navigable waters, interstate waters, territorial seas and other waters that may be used in interstate or foreign commerce. The lateral limits of jurisdiction over non-tidal water bodies extend to the ordinary high water mark (OHWM), in the absence of adjacent wetlands. When adjacent wetlands are present, CWA jurisdiction extends beyond the OHWM to the limits of the adjacent wetlands. To classify wetlands for the purposes of the CWA, a three-parameter approach is used that includes the presence of hydrophytic (water-loving) vegetation, wetland hydrology, and hydric soils (soils formed during saturation/inundation). All three parameters must be present, under normal circumstances, for an area to be designated as a jurisdictional wetland under the CWA.

Section 404 of the CWA establishes a regulatory program that provides that discharge of dredged or fill material cannot be permitted if a practicable alternative exists that is less damaging to the aquatic environment or if the nation's waters would be significantly degraded. The Section 404 permit program is run by the U.S. Army Corps of Engineers (USACE) with oversight by the U.S. Environmental Protection Agency (U.S. EPA).

The USACE issues two types of 404 permits: General and Individual. There are two types of General permits, Regional and Nationwide. Regional permits are issued for a general category of activities when they are similar in nature and cause minimal environmental effect. Nationwide permits are issued to allow a variety of minor project activities with no more than minimal effects.

Ordinarily, projects that do not meet the criteria for a Regional or Nationwide Permit may be permitted under one of USACE's Individual permits. There are two types of Individual permits: Standard permits and Letters of Permission. For Individual permits, the USACE decision to approve is based on compliance with U.S. EPA's Section 404(b)(1) Guidelines (40 Code of Federal Regulations Part 230), and whether permit approval is in the public interest. The Section 404 (b)(1) Guidelines (Guidelines) were developed by the U.S. EPA in conjunction with the USACE, and allow the discharge of dredged or fill material into the aquatic system (waters of the U.S.) only if there is no practicable alternative which would have less adverse effects. The Guidelines state that the USACE may not issue a permit if there is a "least environmentally damaging practicable alternative" (LEDPA) to the proposed discharge that would have lesser effects on waters of the U.S., and not have any other significant adverse environmental consequences.

The Executive Order for the Protection of Wetlands (EO 11990) also regulates the activities of federal agencies with regard to wetlands. Essentially, EO 11990 states that a federal agency, such as FHWA and/or the Department, as assigned, cannot undertake or provide assistance for new construction located in wetlands unless the head of the agency finds: (1) that there is no

practicable alternative to the construction and (2) the proposed project includes all practicable measures to minimize harm. A Wetlands Only Practicable Alternative Finding must be made.

At the state level, wetlands and waters are regulated primarily by the State Water Resources Control Board (SWRCB), the Regional Water Quality Control Boards (RWQCBs) and the California Department of Fish and Wildlife (CDFW). In certain circumstances, the Coastal Commission (or Bay Conservation and Development Commission or the Tahoe Regional Planning Agency) may also be involved. Sections 1600-1607 of the California Fish and Game Code require any agency that proposes a project that will substantially divert or obstruct the natural flow of or substantially change the bed or bank of a river, stream, or lake to notify CDFW before beginning construction. If CDFW determines that the project may substantially and adversely affect fish or wildlife resources, a Lake or Streambed Alteration Agreement will be required. CDFW jurisdictional limits are usually defined by the tops of the stream or lake banks, or the outer edge of riparian vegetation, whichever is wider. Wetlands under jurisdiction of the USACE may or may not be included in the area covered by a Streambed Alteration Agreement obtained from the CDFW.

The RWQCBs were established under the Porter-Cologne Water Quality Control Act to oversee water quality. Discharges under the Porter-Cologne Act are permitted by Waste Discharge Requirements (WDRs) and may be required even when the discharge is already permitted or exempt under the CWA.[1] In compliance with Section 401 of the CWA, the RWQCBs also issue water quality certifications for activities which may result in a discharge to waters of the U.S. This is most frequently required in tandem with a Section 404 permit request. Please refer to Section 3.10, *Water Quality and Stormwater Runoff*, for more details.

The Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) also has a policy regarding riparian-riverine resources.

3.18.2 Affected Environment

Unless otherwise noted, the information from this section was based upon the December 2018 Natural Environment Study (NES) prepared for the project (Caltrans 2018a, 2021), the preliminary Jurisdictional Delineation (JD) prepared for the project (Caltrans 2018b), and the jurisdictional delineation impacts memorandum (Appendix L of the NES). References used in the NES and JD are not carried over into this section.

The study area for the jurisdictional delineation was composed of the combined limits of disturbance (LOD) of Build Alternatives 1, 2C, and 4, and up to a 200-foot buffer, which defined the Jurisdictional Study Area (JSA) (refer to Figure 3.17-1 in Section 3.17, *Natural Communities*). The JSA consists of the existing County right of way, private property, Metropolitan Water District of Southern California (MWD) lands, Riverside-Corona Resource Conservation District lands, Western Riverside County Resource Conservation Authority lands, and Riverside County Habitat Conservation Agency lands, where they overlap each project alternative. Land uses in the vicinity of the JSA include undeveloped lands, conservation areas, mining operations, water treatment operations at MWD facilities, agriculture, schools, and residential, commercial, and other industrial uses. The JSA is within the boundaries of the WRC

[1] SWRCB Procedures went into effect on May 28, 2020 and details the level of alternatives analysis required to determine the LEDPA.

MSHCP, Stephens' Kangaroo Rat Habitat Conservation Plan, and Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP).

The topography of the JSA ranges from flat or gently sloping at the eastern extent to rolling and rugged hills throughout the western extent. Average precipitation in Corona, near the western end of the JSA, is approximately 12.01 inches per year. Average precipitation in Perris, near the eastern project limit, is approximately 8.07 inches per year.

The JSA is within both the Santa Ana River and San Jacinto Valley watersheds. The Santa Ana River Watershed encompasses the majority of the JSA from Temescal Canyon Road east toward Day Street. From around Day Street east to Interstate 215, the JSA overlaps with the San Jacinto Watershed. The Santa Ana River Watershed drains via the Santa Ana River into the Pacific Ocean and the San Jacinto Watershed drains into Lake Elsinore. Major water features in the JSA include Temescal Creek, Cajalco Creek, and Lake Mathews, in addition to other smaller unnamed earthen and concrete lined drainages.

Soils in the JSA are mostly loam ranging from fine sandy loam to rocky sandy loam to cobbly loam. Other soils include clay and gravelly loamy sand. Soil series mapped within the JSA include Arbuckle, Arlington, Bonsall, Bosanko, Buchenau, Buren, Cajalco, Cieneba, Cortina, Escondido, Exeter, Fallbrook, Friant, Garretson, Gaviota, Gorgonio, Grangeville, Greenfield, Hanford, Honcut, Las Posas, Lodo, Monserate, Pachappa, Placentia, Porterville, Ramona, San Emigdio, San Timoteo, Soper, Temescal, Vallecitos, Vista, Yokohl, and Ysidora. None of the soils are mapped as hydric soils with the exception of the Placentia series and the Yokohl soils (only when they occur in depressional areas).

3.18.2.1 Lake Mathews MSHCP

Within the LM MSHCP planning area, the landscape is composed of varying terrain and rolling hills. Cajalco Creek is the primary drainage that conveys flows from east to west into Lake Mathews. Tributaries located south of existing Cajalco Road drain from south to north toward the lake and tributaries from El Sobrante Road drain south toward the lake. From Lake Mathews, flows that are released from the dam under La Sierra Avenue are conveyed west outside of the LM MSHCP area. The LM MSHCP occurs within the Santa Ana River Watershed. Soils within the LM MSHCP area consist of Arlington, Bosanko, Buchenau, Buren, Cajalco, Cieneba, Fallbrook, Gorgonio, Hanford, Las Posas, Monserate, Pachappa, Porterville, Temescal, and Vista series. None of these soils are considered hydric soils.

3.18.2.2 Jurisdictional Delineation Methodology

Prior to field visits, aerial photographs of the site in various scales were obtained and compared to U.S. Geological Survey 7.5-minute Corona South, Lake Mathews, Steele Peak, and Perris topographic quadrangles to identify drainage features within the JSA as indicated by vegetation types, topographic changes, or visible drainage patterns. The National Wetlands Inventory and National Hydrography Dataset data for the JSA were referenced to identify any mapped features, such as streams and wetlands. In addition, the 100-year (1-percent annual chance) floodplain designated by the Federal Emergency Management Agency was examined. The JSA was then carefully reviewed in Google Earth in various scales and various image dates ranging from 1995 to 2017, and potentially jurisdictional features were marked on field maps. In addition, the U.S.

Department of Agriculture, Natural Resources Conservation Service's Web Soil Survey was reviewed to identify the soil series that occur in the JSA.

The entire JSA was walked and visually examined for the presence of drainage features, even when such features were not identified using the remote detection methods described above. Fieldwork was performed from April 2012 through January 2018.

Potential waters of the U.S. (WoUS) and wetlands were delineated using methods established in the Wetland Delineation Manual, the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008a), *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b), and 2007 and 2008 Rapanos Guidance, and were reviewed in November of 2013 for consistency with *Draft Guidance on Identifying Waters Protected by the Clean Water Act* (USACE and U.S. EPA 2011).[2] Non-wetland waters were delineated based on the presence of OHWM indicators. At each evaluation area, several parameters were considered to determine whether the sample point was within a wetland. Three criteria normally must be fulfilled in order to classify an area as a jurisdictional USACE wetland: (1) a predominance of hydrophytic vegetation; (2) the presence of hydric soils; and (3) the presence of wetland hydrology. Where possible, a soil pit was dug at each sample point to examine soil color and texture. If access restrictions prevented use of a soil pit, hydric soils were assumed based on the vegetation community and hydrology present. In addition, the JSA was evaluated for resources potentially regulated under the Porter-Cologne Act (i.e., excluded features) and WoUS.[3]

Areas subject to Section 1600 of the California Fish and Game Code (FGC) were considered as features that exhibited a discernable bed and bank. Areas that exhibited evidence of concentrated surface flows, but were not associated with a definable bed and bank were also considered as subject to Section 1600 of the FGC. These included areas with concentrated deposition and/or sorting or racking of sediment, concentrated drift deposits, and/or concentrated destruction of terrestrial vegetation, all resulting from a fluvial mechanism. These areas were delineated by measuring the outer width and length boundaries, consisting of the greater of either the top of bank measurement, outer extent of evidence of concentrated surface flows, or the outer extent of associated riparian or wetland vegetation. Portions of features were mapped as either riparian vegetation or unvegetated streambed. Areas were mapped as riparian vegetation based on the presence of hydrophytic emergent, annual, or perennial plant species. Areas were mapped as unvegetated streambed when vegetation consisted of xeric upland species, or was absent entirely. Width measurements were taken at approximately 50-foot intervals, or more frequently when a substantial variation in width was detected.

3.18.2.3 Agency Coordination

Coordination with multiple resource agencies regarding the proposed project, including USACE, RWQCB, and CDFW, has occurred since 2011 and is ongoing. Agency coordination meetings are summarized in Chapter 5, *Comments and Coordination*, and agency correspondence,

[2] The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting.
[3] On April 2, 2019, SWRCB adopted a wetland definition and procedures that govern permitting of dredge and fill into WoS.

including comment letters, are provided in Appendix H, *Environmental Review Coordination and Scoping*. Meetings held with resource agencies throughout the preliminary design and technical study phase included discussions concerning project design and wetland, and other resource, details. Agency questions and comments were addressed and incorporated into the project design after each meeting.

The JD Report was distributed to U.S. EPA, USACE, CDFW, and RWQCB on June 29, 2017, as part of the Efficient Environmental Review (23 USC 139) process. The comment period was extended per agency request and closed on April 3, 2018. The draft NES was also distributed to the U.S. Fish and Wildlife Service, CDFW, USACE, U.S. EPA, RWQCB, Riverside-Corona Resource Conservation District, and MWD for review and to obtain initial feedback as part of the Efficient Environmental Review (23 USC 139) process. Agency comments were reviewed by the County and addressed directly with the resource agencies, and were incorporated into the Final NES and JD (Caltrans 2018a, 2018b, 2021). Refer to Chapter 5, *Comments and Coordination*, and Appendix H, *Environmental Review Coordination and Scoping*.

It is anticipated that each build alternative would qualify for the use of the CWA Section 404 Nationwide Permit Program from USACE and a CWA Section 401 water quality certification from RWQCB. Acquisition of multiple Nationwide Permits and a CWA Section 401 water quality certification would ensure compliance with EO 11990. Permit applications will be submitted prior to the start of construction. In addition, each build alternative would require a Lake and Streambed Alteration Agreement from CDFW. A Section 1602 Notification will be submitted and agreement obtained prior to the start of construction.

3.18.2.4 Jurisdictional Delineation Results

CWA jurisdictional resources within the JSA totaled approximately 27.58 acres (102,451 linear feet) of non-wetland WoUS/WoS and 7.13 acres of wetland WoUS/WoS.[4] Approximately 33.10 acres (104,038 linear feet) of unvegetated streambed, subject to CDFW jurisdiction, and 50.96 acres of CDFW jurisdictional riparian vegetation were observed within the JSA. Additionally, approximately 0.01 acre (158 linear feet) of non-wetland WoS may be subject to regulation by the RWQCB under the Porter-Cologne Act. The location of all USACE/RWQCB and CDFW jurisdictional water resources are shown on Figure 3.18-1 and Figure 3.18-2, respectively.

Table 3.18-1 summarizes the total acreage under each regulatory jurisdiction.

[4] Aquatic resources within the project area were delineated according to the 1987 *Corps of Engineers Wetland Delineation Manual; Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region;* and *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (USACE 1987, 2008a, 2008b). The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting. On April 2, 2019, SWRCB adopted a wetland definition that required the same methods of delineation as the USACE.

Table 3.18-1. Jurisdictional Aquatic Resources within the JSA

Jurisdictional Agency	Jurisdictional Type	Total Acreage	Total Linear Feet
USACE/RWQCB[1]	Non-wetland WoUS/WoS	27.58	102,451
	Wetland WoUS/WoS	7.13	n/a
RWQCB (only)	Non-wetland WoS	0.01	158
CDFW	Unvegetated Streambed	33.10	104,038
	Associated Riparian	50.96	n/a

[1] Aquatic resources within the project area were delineated according to the 1987 *Corps of Engineers Wetland Delineation Manual; Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region;* and *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (USACE 1987, 2008a, 2008b). The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting.

All features observed within the JSA were delineated with the understanding that a request for a Preliminary Jurisdictional Determination would be submitted for the project. As such, all non-wetland water features exhibiting an OHWM and wetlands meeting the three wetland parameters (hydrophytic vegetation, hydric soils, and hydrology) were analyzed as potentially jurisdictional WoUS, which are subject to regulation by USACE under Section 404 of the CWA and the RWQCB under Section 401 of the CWA. Based on this, 141 features observed within the JSA are assumed to be potentially jurisdictional WoUS. A request for a Preliminary Jurisdictional Determination will be submitted for all features observed within the JSA and would be conducted concurrent with project permitting. All of the areas satisfying USACE jurisdiction for WoUS, including adjacent wetlands, plus any additional streambed and associated riparian habitat are also subject to CDFW jurisdiction pursuant to FGC Section 1602.

Within the LM MSHCP, the JSA contains approximately 18.88 acres of non-wetland WoUS/WoS and 0.56 acre of wetland WoUS/WoS, 18.93 acres CDFW unvegetated streambed, 4.60 acres CDFW lakebed, and 16.20 acres of CDFW-associated riparian.

Feature types observed within the total JSA are summarized following Figures 3.18-1 and 3.18-2.

[This page intentionally left blank.]

Ephemeral Channels

The large majority of features in the JSA are earthen drainages and ditches that convey precipitation and, in some cases, urban runoff. Water was observed in a small number of these features during the delineation. The majority are ephemeral and were dry during survey efforts. Blue-line earthen features include:

- Feature 1 (Temescal Creek), Feature 4 (Bedford Wash), Feature 6, Feature 7 (Cajalco Creek), Feature 42, Feature 50, Feature 61, Feature 68, Feature 72, Feature 75, Feature 91, Feature 102, Feature 107, Feature 113, Feature 131, Feature 142, and Feature ESA PCR 1.

OHWM indicators observed commonly included a break in bank slope, sediment deposition, sediment sorting, the destruction of terrestrial vegetation, an abrupt change in a plant community, flow patterns, a natural line impressed on the bank, drift deposits, and water staining. The CDFW width was measured at the top of bank or to the outer drip line of associated riparian vegetation. In addition to earthen drainages and ditches, the JSA included earthen manufactured basins.

Wetland Waters

Wetlands within the JSA can be perennial or seasonal, and maintain inundation for a period long enough to develop anaerobic conditions (typically 15 days of continuous saturation or inundation during the growing season). There are a total of 11 features within the JSA that meet, or are assumed to meet, the definition of a federally jurisdictional wetland. Wetlands were found within the following features:

- Feature 1 (Temescal Creek), Feature, Feature 7 (Cajalco Creek), Feature 37 (Lake Mathews), Feature 47, Feature 52, Feature 84, Feature 104, Feature 109, Feature 134, Feature 138.

Concrete Channels

A small number of features mapped within the JSA are maintained concrete-lined channels and ditches that convey precipitation and urban runoff. Most of these features were dry during the delineation. Many OHWM indicators associated with these features were obscured because of engineering and/or maintenance. As such, the OHWM determination was most commonly based on the presence of water staining and sediment deposition along the bottom of the bank slope or channel invert. The CDFW width was determined to be at the top of bank.

The JSA includes several types of concrete channels: v-ditches, which are relatively smaller in width (approximately 1–3 feet) than other concrete features; trapezoidal channels, which are designed to convey larger flows than v-ditches and have larger widths (approximately 4–36 feet); and box channels, which have vertical walls and are the largest concrete-lined features within the JSA. A number of asphalt concrete–lined overside drainages are also present within the JSA, originating at the edge of pavement of existing roads, and typically draining into earthen drainage features.

Swales

A large number of swales were observed within the JSA. Swales are locations where natural or human-altered topography has created low points in the landscape, such as where two or more

hills come together, but these areas do not support flows of a return interval or surface concentration that impress evidence upon the landscape.

One swale in particular was noted west of Haines (Sheet 25 of Figure 3.18-1 and 3.18-2) and is mapped on the National Hydrography Dataset maps. On close investigation of this swale feature, there was no discernible OHWM or top-of-bank observed through the entire feature. The swale is a topographical low point within a routinely disced agricultural field and it conveys local and road runoff from Haines Road southwest to where an OHWM for Feature 107 picks up at Cajalco Road. There were a few mature willows (*Salix* sp.) along the swale feature which typically occur within wetter conditions, but vegetation was mostly composed of upland-associated species including common sunflower (*Helianthus annuus*), five-horn smotherweed (*Bassia hyssopifolia*), and salt grass (*Distichlis spicata*). No culverts were present along this feature and there were no other features noted east of Haines Street.

Paleo Channels

Paleo channels are locations where flows have been concentrated in a manner that impressed evidence upon the landscape in the distant past, but evidence of contemporary flows is not present. These features may still exhibit a bed and/or bank feature but do not exhibit current indicators of an OHWM. As such, these features meet the definition of a stream under the jurisdiction of CDFW as a result of the presence of bed and/or bank, but are not classified as jurisdictional WoUS/WoS under the CWA or Porter-Cologne. Features 27, 42, 43, and 129 have been classified as paleo channels within the JSA.

Water Quality Treatment Best Management Practice Facilities

A single feature, Feature 156, that appears to have been constructed in uplands as a post-construction water quality Best Management Practice (BMP) facility was observed in association with the residential development northeast of the intersection of the existing Cajalco Road/Wood Road intersection. This feature collects runoff from the associated residential development, and appears to treat this runoff via a vegetated swale prior to discharging to Feature 102 via a culvert located beneath the existing Cajalco Road. As defined in 40 Code of Federal Regulations 423.11(m), waste treatment systems are not WoUS. In addition, this feature was determined not to be defined as a stream or lakebed, as it was apparently constructed in uplands solely for the purpose of treating waste prior to its discharge to the natural hydrologic system; therefore, this feature was determined to be subject only to jurisdiction as WoS under Porter-Cologne.

3.18.3 Environmental Consequences

Project design details by build alternative are provided in Figures 2.2-2 through 2.2-5. Field investigations were performed within all portions of the JSA established for each proposed build alternative, including areas for alternatives that are no longer under consideration (refer to Chapter 2). Project engineers and biologists reviewed all of the build alternatives to determine whether construction activities for new and widened bridges could avoid jurisdictional areas or minimize impacts on these areas. For many locations, impact areas were reduced where feasible, including decreasing project construction areas, replacing large culverts with bridges thereby reducing the work area needed for the construction of bridges, designing and placing bridge piers to reduce impacts on the greatest extent feasible, and creating full-span bridges over streams and

riparian vegetation. Full avoidance of jurisdictional WoUS/WoS, state streambeds, and riparian habitat for each build alternative discussed above, however, was not feasible.

A key component of the development of the project's avoidance and minimization of impacts on jurisdictional waters was frequent coordination with the Western Riverside County Regional Conservation Authority, U.S. Fish and Wildlife Service, CDFW, RWQCB, Riverside County Habitat Conservation Agency, and USACE since 2011. Coordination is still ongoing for the proposed project. During coordination meetings, the proposed project design alternatives were reviewed in detail throughout the preliminary design and technical study phase. Agency questions and comments were addressed and incorporated into the project design after each meeting, including discussions of mitigation expectations. Chapter 5 provides a detailed discussion of coordination and copies of correspondence with the agencies. A coordination summary is also available in Section 5.4 of the NES.

The build alternatives (1, 2C, and 4) would require acquisition of multiple CWA Section 404 Nationwide Permits for separate crossings from USACE and a CWA Section 401 Water Quality Certification from RWQCB. These permits would ensure compliance with EO 11990. A Lake and Streambed Alteration Agreement from CDFW would also be required under each build alternative.

3.18.3.1 Build Alternatives 1, 2C, and 4

Permanent impacts on jurisdictional waters within the LOD would result from proposed improvements (structures and roadway components, including bridge piers and footings, new pavement, and new or enlarged culverts), grading activities, proposed cut and fill, proposed drainage/BMPs, permanent access roads, and proposed wildlife crossings. The permanent impacts within Temescal Creek and Cajalco Creek would occur from placement of piers and supporting structures from new and replacement bridges, and bridge extensions over aquatic features.

Temporary impacts would occur within the LOD outside of the permanent impact area (Figures 3.18-1 and 3.18-2) and is the area needed to construct the project including access and staging areas, temporary construction easements, and temporary access roads. Any jurisdictional resource proposed for impact within the temporary impact area would be restored to pre-project conditions or better at its original location. For proposed culvert improvements, any portion of an existing concrete culvert proposed for replacement was classified as a temporary impact, whereas the portion of any new culvert was classified as a permanent impact. The impact footprint associated with the Temescal Creek Bridge as well as all other new bridges under each build alternative have been reduced to the greatest extent feasible.

Although the construction-related impacts under new and replacement bridges and bridge extension areas, are initially classified as temporary, once construction is completed, the area under bridges is considered a permanent indirect impact from shading. For example, an approximately 0.010-acre area under the widened Temescal Creek Bridge (refer to STA #20 to 25 in Figures 3.18-1 and 3.18-2) would be newly shaded and would result in a type conversion from wetland to non-wetland WoUS. In this scenario, the temporary impact on WoUS from bridge construction associated with bridge shading has been classified as a permanent shading effect and not a temporary effect.

The bridge deck expansion at Temescal Creek and new bridge over Cajalco Creek would cause permanent shading of USACE-regulated wetland WoUS and CDFW-regulated riparian streambeds under each build alternative. When evaluating the potential effects from bridge shading, the following parameters were considered: bridge orientation, bridge height and width, and sunlight requirements of existing riparian vegetation. Shading can eliminate or appreciably reduce the direct sunlight available to plants and permanently reduce relative cover of wetland hydrophytic vegetation. For this impact analysis, bridge shading is expected to result in a conversion of wetland WoUS to non-wetland WoUS, and CDFW riparian streambed to unvegetated streambed. The conversion from wetland to non-wetland and CDFW riparian streambed to unvegetated streambed permanently alters the functions and values of these resources but is not considered a direct loss of waters (i.e., no placement of fill). Because shading of non-wetland WoUS or CDFW unvegetated streambed would not result in a conversion of waters, there would be no shading effect on these resources.

In addition to the temporary impacts described above, under any of the three build alternatives, areas of existing roadbed and underlying culverts would be removed and returned to natural drainage conditions (i.e., rehabilitation) consistent with the conditions directly adjacent to the existing structure. These areas proposed for such rehabilitation only occur west of Harley John Road along the existing Cajalco Road under Build Alternatives 1 and 2C, and a portion of El Sobrante under Build Alternative 4. Such rehabilitation would occur at Features 7 and 31 under all build alternatives, Feature 45, and Feature 47 under Build Alternative 1. Refer to Figure 3.18-1 and Sheet 2, 4, and 9a of Figure 3.18-2 for these locations. At the rehabilitation locations, although the initial disturbance is classified as a temporary impact, this effect is being categorized as a permanent beneficial effect (rather than a permanent direct effect) through rehabilitation of a jurisdictional bed and bank at the location of the removed culvert and/or roadbed. Rehabilitation areas could potentially serve as on-site mitigation with approval from USACE, RWQCB, and CDFW.

Additional beneficial effects on jurisdictional waters would occur at Temescal Creek (Feature 7). Presently, there is a hydrological constriction at the Temescal Creek Bridge crossing and the new proposed bridge would be lengthened, potentially widening the creekbed, which would in turn improve hydrological connectivity and flows resulting in the formation of additional federal and state jurisdictional waters. As a result, the functions and values at Temescal Creek are expected to improve under Build Alternatives 1, 2C, and 4.

During construction, there is increased risk for indirect temporary impacts, such as changes in hydrology, to the adjacent jurisdictional waters and state streambeds. Indirect impacts on federal and state jurisdictional waters adjacent to the build alternatives may include degradation of habitat through increased risk of fire, water pollution, litter, decreased water quality, and increased exposure to invasive plant species, among other risks. The avoidance and minimization measures identified in Section 3.17.4 (**NC-4 [NES BIO-4]** through **NC-6 [NES BIO-6]** and **NC-10 [NES BIO-10]** through **NC-13 [NES BIO-9]**) will ensure these potential indirect effects are reduced so the effects would not be substantial under the National Environmental Policy Act.

Once the selected build alternative is constructed and the project is operational, there are additional long-term effects that would occur; these include maintenance (e.g., mowing along the shoulder for fire/weed abatement), additional vehicles traveling on the facility potentially spreading toxics or invasive species, and other activities or changes associated with roadway

operations. Many of these operational effects may reduce the functions and values of adjacent WoUS, WoS, and state streambeds due to degradation of habitat quality and edge effects, but would be similar to the existing conditions under the No-Build Alternative.

USACE/RWQCB Jurisdiction[5]

The proposed impacts on USACE jurisdictional WoUS are summarized in Table 3.18-2 and shown on Figure 3.18-1. The RWQCB impacts on WoS are the same as those identified for the USACE wetland and non-wetland WoUS.

Table 3.18-2. USACE and RWQCB Jurisdictional Wetland and Non-Wetland Waters of the U.S. Impacts

Non-wetland	1.203	1.203	--	0.053
Wetland	0.082	0.233	0.042	--
Build Alternative 4 Total	**1.436**	**1.561**	**0.042**	**0.081**

[1] Aquatic resources within the project area were delineated according to the 1987 *Corps of Engineers Wetland Delineation Manual; Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region;* and *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (USACE 1987, 2008a, 2008b). The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting.
[2] The bridge expansion area at Temescal Creek and Cajalco Creek will indirectly cause wetlands to be permanently shaded once construction is complete. Shading of USACE/RWQCB wetland areas would result in a type conversion to non-wetland and is therefore considered a permanent indirect effect.

[5] Aquatic resources within the project area were delineated according to the 1987 *Corps of Engineers Wetland Delineation Manual; Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region;* and *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (USACE 1987, 2008a, 2008b). The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting. On April 2, 2019, SWRCB adopted a wetland definition and procedures that govern permitting of dredge and fill into WoS.

Build Alternative 2C would result in the greatest amount of permanent impacts (3.938 acres) on aquatic resources compared to Build Alternative 1 (totaling 3.605 acres) and Build Alternative 4 (totaling 1.436 acre). However, Build Alternative 1 would have the greatest temporary impact (2.163 acres) compared to Build Alternative 2C (1.782 acre) and Build Alternative 4 (1.561 acre). The amount of wetlands proposed for permanent and temporary impact by Build Alternative 1 (0.076 acre and 0.236 acre, respectively) is the same as that proposed by Build Alternative 2C. Build Alternative 4, however, would result in slightly higher permanent and temporary impact on wetlands WoUS (0.082 acre and 0.233 acre, respectively). Permanent and temporary impacts within Temescal Creek and Cajalco Creek under any of the build alternatives would occur from the placement of piers and supporting structures into, or new and replacement bridges and bridge extensions over, wetland features. It is not possible to widen the facility and not affect federal wetlands. The loss of wetland WoUS will require compensatory mitigation as described in Section 3.18-4 (refer to Measure **WET-1**).

Proposed shading under Build Alternatives 1, 2C, and 4, is equivalent where shading would result in indirect impacts and the permanent conversion of 0.042 acre of wetland WoUS to non-wetland WoUS, as the mitigation ratios for this effect would occur at 2:1 rather than 3:1. Rehabilitation associated with Build Alternative 4 would restore the greatest quantity (0.081 acre) of USACE/RWQCB jurisdictional non-wetland WoUS and culverts to natural conditions compared to Build Alternative 1 (0.78 acre) and Build Alternative 2C (0.071 acre). As described in *Summary of Impacts*, above, the acreage of rehabilitation has not been included under permanent effects and could potentially be self-mitigating with approval from USACE, RWQCB, and CDFW.

CDFW Jurisdiction

Proposed impacts on CDFW streambed and associated riparian habitat are summarized in Table 3.18-3 and shown on Figure 3.18-2.

Table 3.18-3. CDFW Streambed and Associated Riparian Habitat Impacts

CDFW Jurisdictional Type	Permanent Impact (acres)	Temporary Impact (acres)	Shading Effects (Indirect)[1] (acres)	Roadbed Removal (Rehabilitation) (acres)
BUILD ALTERNATIVE 1				
Culvert	0.132	0.373	--	0.029
Lakebed	--	--	--	--
Streams (no riparian)	4.138	1.655	--	0.092
Streams (w/riparian)	4.649	1.973	0.047	0.004
Riparian (wetland)	1.283	1.671	0.136	0.065
Build Alternative 1 Total[1]	**10.203**	**5.672**	**0.183**	**0.190**
BUILD ALTERNATIVE 2C				
Culvert	0.267	0.247	--	0.019
Lakebed	--	--	--	--
Streams (no riparian)	4.246	1.682	--	0.099
Streams (w/riparian)	4.241	1.973	0.031	0.002
Riparian (wetland)	1.283	1.685	0.136	0.053
Build Alternative 2C Total[1]	**10.037**	**5.587**	**0.167**	**0.173**

CDFW Jurisdictional Type	Permanent Impact (acres)	Temporary Impact (acres)	Shading Effects (Indirect)[1] (acres)	Roadbed Removal (Rehabilitation) (acres)
BUILD ALTERNATIVE 4				
Culvert	0.152	0.111	--	0.026
Lakebed	0.127	0.141	--	--
Streams (no riparian)	1.734	2.098	--	0.10
Streams (w/riparian)	3.463	1.263	0.037	0.003
Riparian (wetland)	1.607	2.187	0.136	0.05
Build Alternative 4 Total[1]	**7.083**	**5.800**	**0.173**	**0.179**

[1] The bridge expansion area at Temescal Creek, Cajalco Creek, and several other smaller bridges will indirectly cause riparian areas and CDFW-regulated wetlands to be permanently shaded once construction is complete. Shading of riparian vegetated and CDFW-regulated wetland areas would result in a type conversion to non-riparian streambed and is therefore considered an additional permanent impact.

Build Alternative 2C would have the greatest permanent and temporary impact on CDFW jurisdictional areas (10.037 acres, and 5.587 acres, respectively), followed closely by Build Alternative 1 (10.203 acres and 5.672 acres, respectively). Build Alternative 4 would result in the least amount of permanent and temporary impacts on CDFW aquatic resources compared to Build Alternatives 1 and 2C. Build Alternative 1, however, would have the greatest permanent impact on CDFW riparian (4.649 acres) but would have the same amount of temporary effect as Build Alternative 2C (1.973 acres). Build Alternative 4 provides the greatest amount of rehabilitation acreage to CDFW streambeds and associated riparian habitat. As stated above in the *Summary of Impacts*, rehabilitation areas may be self-mitigating with agency approval.

Future Six-Lane Facility (Build Alternative 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future as a separate project, it is anticipated that no additional direct impacts would occur on jurisdictional water resources because the two additional lanes would be constructed in the median portion of the road, where impacts have already been considered as part of this analysis and where the area would already have been cleared during construction. There is a potential that jurisdictional water resources adjacent to the right of way would be temporarily affected depending on the location of staging areas or any additional work area needed for construction within the median. However, avoidance and minimization measures would be integrated into the future project to reduce these potential effects. In addition, the project would acquire the regulatory permits necessary for any additional potential effects adjacent to the right of way.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

As mentioned in Section 3.17, *Natural Communities*, the proposed build alternatives would remove lands (including jurisdictional aquatic WoUS, WoS, state streambeds and associated riparian) from the existing LM MSHCP area. Roadbed removal areas may potentially restore some of the natural drainage topography adjacent to the Lake Mathews Multiple Species Reserve (LMR), and thus be available to be added to the LMR and be preserved. There is also a potential for additional restoration of these areas in the future.

Lake Mathews MSHCP (USACE/RWQCB Impacts)

Within the LMR, the proposed build alternatives would permanently and temporarily affect USACE and RWQCB non-wetland jurisdictional waters. Table 3.18-4 summarizes the direct effects on federal WoUS and state WoS. No shading effects from new bridges would occur within the LMR. Although permanent impacts on wetlands would not occur within the LMR under the build alternatives, approximately 0.003 acre of wetland WoUS/WoS would be temporarily affected under Build Alternatives 1 and 2C; no wetlands would be affected under Build Alternative 4. All roadbed removal is associated with the existing County right of way; therefore, no roadbed removal of the LMR would occur. Compensatory mitigation (**WET-1**) would ensure full replacement of WoUS and WoS, including the resources functions and values.

Table 3.18-4. USACE and RWQCB Jurisdictional Waters and Wetlands Impacts: Lake Mathews Reserve

USACE/RWQCB Jurisdictional Type[1]	Permanent Impact (acres)[1]	Temporary Impact (acres)[1]	Shading Effects (Indirect)[2] (acres)	Roadbed Removal (Rehabilitation) (acres)

Build Alternative 4 Total	**0.057**	**0.018**	**--**	**--**

[1] Aquatic resources within the project area were delineated according to the 1987 *Corps of Engineers Wetland Delineation Manual; Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region;* and *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (USACE 1987, 2008a, 2008b). The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting.
[2] No shading from bridges would occur on USACE/RWQCB jurisdictional waters or roadbed removal would occur within the LM MSHCP.

Lake Mathews MSHCP (CDFW Impacts)

Within the LMR, the proposed build alternatives would permanently and temporarily affect CDFW jurisdictional streambeds and associated riparian habitat. Shading effects from new bridges would occur within the LMR and affect riparian habitat under each of the build alternatives. Similar to impacts on CDFW jurisdictional areas throughout the project area, Build Alternatives 1 and 2C would have the most effect on CDFW resources compared to Build Alternative 4. Compensatory mitigation (**WET-1**) would ensure full replacement of state

streambeds and associated riparian habitat, including the functions and values of the resources. Table 3.18-5 summarizes the direct effects on state streambeds and associated riparian habitat.

Table 3.18-5. CDFW Jurisdictional Streambeds, Riparian, and Wetlands Impacts: Lake Mathews Reserve

CDFW Type	Permanent Impact (acres)	Temporary Impact (acres)	Shading Effects[1] (acres)	Roadbed Removal[2] (Rehabilitation) (acres)
BUILD ALTERNATIVE 1				
Culvert	--	0.041	--	--
Streams (no riparian)	1.153	0.233	--	--
Streams (riparian)	1.792	0.467	0.047	--

Streams (no riparian)	0.085	0.027	--	
Streams (riparian)	0.047	0.061	0.032	
Wetland	--	--	--	--
Build Alternative 4 Total	**0.139**	**0.09**	**0.032**	**--**

[1] New bridges would permanently shade riparian vegetation within Feature 47 (Sheet 9a and 11b of Figure 3.18-2), and Feature 34 (Sheet 28 of Figure 3.18-2) within the LM MSHCP area. Shading of riparian vegetated areas would result in a type conversion to non-riparian streambed and is therefore considered an additional permanent impact.
[2] No roadbed removal would occur within the LM MSHCP.

The jurisdictional aquatic resources within the reserve area that are affected by the selected build alternative will be fully mitigated through compensatory Mitigation Measure **WET-1**. In addition, acquisition of lands for the LMR and funding (Measures **NC-17** through **NC-19** in Section 3.17, *Natural Communities*) would also potentially preserve jurisdictional waters.

3.18.3.2 No-Build Alternative

Under the No-Build Alternative, no impacts on USACE/RWQCB wetland and non-wetland WoUS and CDFW streambed and associated riparian habitat would occur.

3.18.4 Avoidance, Minimization, and/or Mitigation Measures

The following measures are being proposed to avoid and minimize impacts on USACE/RWQCB wetland and non-wetland WoUS and CDFW streambed and associated riparian habitat: **NC-4** through **NC-6 (NES BIO-6)**, and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in

Section 3.17, *Natural Communities*. Additional measures related to water quality and stormwater runoff are provided in Section 3.10, *Water Quality and Stormwater Runoff*.

WET-1 (Mitigation): Compensation for direct permanent impacts on U.S. Army Corps of Engineers (USACE) and Regional Water Quality Control Board (RWQCB) wetland and non-wetland waters of the U.S. (WoUS)/waters of the State (WoS) and California Department of Fish and Wildlife (CDFW) streambed and associated riparian habitat will occur as a combination of enhancement, restoration, and/or creation, at a ratio that achieves no net loss of wetland WoUS. Compensation can occur through the purchase of mitigation bank credits through the Riverside-Corona Resources Conservation District In-lieu Fee Program (ILFP), Santa Ana Watershed Association, a permittee responsible mitigation bank, and/or other agency-approved mitigation provider. No less than a 3:1 mitigation ratio is proposed for USACE/RWQCB wetlands and CDFW riparian vegetation and wetlands. A ratio of not less than 1:1 for USACE/RWQCB non-wetland WoUS/WoS and CDFW streambed is currently proposed. A mitigation ratio of no less than 2:1 is proposed for permanent shading of USACE wetlands and CDFW riparian vegetation (including CDFW-regulated wetlands)[6] to address temporal loss. Mitigation for all jurisdictional resources will be biologically superior or equivalent to resources occurring on site.

Temporary impacts on USACE/RWQCB wetland and non-wetland WoUS/WoS and CDFW streambed, and associated riparian habitat, may be replaced through restoration of the temporarily affected area to pre-project conditions at a ratio no less than 1:1 or through the purchase of ILFP or mitigation bank credits, a permittee responsible mitigation bank, or other approved mitigation program. Compensatory mitigation will be coordinated with USACE Clean Water Act (CWA) 404 authorization, Regional Water Quality Control Board (RWQCB) CWA 401 Certification, CDFW Fish and Game Code 1602 Streambed Alteration Agreement acquisition, and Western Riverside County Multiple Species Habitat Conservation Plan riparian-riverine requirements to ensure efficiencies with the mitigation effort. Final mitigation ratios will be determined after consultation with USACE, RWQCB, U.S. Fish and Wildlife Service, and CDFW.

[6] Mitigation ratios may differ based on the location of riparian/riverine resources within the limits of disturbance. For example, riparian habitat within Temescal Wash may be mitigated at a higher ratio due to the quality of functions and values for wildlife movement, "live-in" habitat for sensitive species (i.e., least Bell's vireo), and water quality functions.

3.19 Plant Species

3.19.1 Regulatory Setting

3.19.1.1 Federal and State Regulations

The U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW) have regulatory responsibility for the protection of special-status plant species. "Special-status" species are selected for protection because they are rare and/or subject to population and habitat declines. Special-status is a general term for species that are provided varying levels of regulatory protection. The highest level of protection is given to threatened and endangered species; these are species that are formally listed or proposed for listing as endangered or threatened under the Federal Endangered Species Act (FESA) and/or the California Endangered Species Act (CESA). Please see the Threatened and Endangered Species Section 3.21 in this document for detailed information about these species.

This section of the document discusses all the other special-status plant species, including CDFW species of special concern, USFWS candidate species, and California Native Plant Society (CNPS) rare and endangered plants.

The regulatory requirements for FESA can be found at 16 United States Code (USC), Section 1531, et seq. See also 50 Code of Federal Regulations (CFR) Part 402. The regulatory requirements for CESA can be found at California Fish and Game Code, Section 2050, et seq. Department projects are also subject to the Native Plant Protection Act, found at California Fish and Game Code, Section 1900-1913, and the California Environmental Quality Act (CEQA), found at California Public Resources Code, Sections 2100-21177.

3.19.1.2 Local and Regional Requirements

Western Riverside County Multiple Species Habitat Conservation Plan

The Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP), a comprehensive regional habitat conservation plan (HCP), is discussed in Section 3.17. Portions of the proposed project occur in the following WRC MSHCP survey areas:

- Narrow Endemic Plant Species Survey Areas 1 and 7 (Figure 3.19-1)
- Criteria Area Species Survey Area 1 (Figure 3.19-2)

Within these survey areas, the WRC MSHCP requires, at a minimum, onsite habitat evaluations for those survey area species that have been determined to have suitable habitat within the entire survey area. If potentially suitable habitat is present, then focused surveys must be conducted. Only those species that are non-listed special-status species are included in the list below.

WRC MSHCP Narrow Endemic Survey Areas 1 and 7:

- San Miguel savory (*Clinopodium chandleri*)
- many-stemmed dudleya (*Dudleya multicaulis*)

- Brand's phacelia (*Phacelia stellaris*)
- Hammitt's clay-cress (*Sibaropsis hammittii*)
- Wright's trichocoronis (*Trichocoronis wrightii* var. *wrightii*)

WRC MSHCP Criteria Area Survey Area 1:

- Parish's brittlescale (*Atriplex parishii*)
- Davidson's saltscale (*Atriplex serenana* var. *davidsonii*)
- smooth tarplant (Centromadia pungens ssp. laevis)
- round-leaved filaree (*California macrophylla*)
- Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*)
- little mousetail (*Myosurus minimus* ssp. *apus*)

The WRC MSHCP plant survey area maps are presented in Volume I of the WRC MSHCP (Figures 6-1 and 6-2) and also as Figures 13.9-1 and 13.9-2 in this EIR/EIS. The WRC MSHCP requires the proposed project to fulfill the requirements presented in WRC MSHCP Volume I, 6.1.3, 6.3.2, and 7.5.3, and implement the best management practices (BMPs) in Volume I, Appendix C of the WRC MSHCP.

Lake Mathews Multiple Species Habitat Conservation Plan

The project also overlaps with the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area. The LM MSHCP is a joint conservation effort initiated by the Metropolitan Water District of Southern California (MWD) and the Riverside County Habitat Conservation Agency (RCHCA) in cooperation with the USFWS and CDFW that spans 5,993.5 acres of open land around Lake Mathews, and includes the 5,110.4-acre Lake Mathews Multiple Species Reserve (LMR). The LM MSHCP and LMR are discussed in detail in Section 3.17. The non-listed target plant species under the LM MSHCP are small-flowered morning-glory (*Convolvulus simulans*; 4.2), Great Valley phacelia (*Phacelia ciliata*; no regulatory status), Palmer's grappling hook (*Harpagonella palmeri*; 4.2), Parry's spineflower (*Chorizanthe parryi* var. *parryi*; 1B.1), small-flowered microseris (*Microseris douglasii* ssp. *platycarpha*; 4.2), and Coulter's matilija poppy (*Romneya coulteri*; 4.2). Proposed project impacts within the LM MSHCP area beyond the existing right of way are not an allowable use or activity under this plan, and the LM MSHCP does not include a prescribed process to allow changes to the plan in response to public safety and/or access needs. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to accommodate the proposed project.

3.19.2 Affected Environment

Unless otherwise noted, the information from this section was based upon the December 2018 Natural Environmental Study (NES) prepared for the project (Caltrans 2018, 2021). References used in the NES are not carried over into this section. Plant species in California that have special regulatory or management status were evaluated for potential to occur within the study area. In order to comply with the provisions of various state and federal environmental statutes and executive orders, the potential impacts on natural resources of the region were investigated and documented.

A list of potential species within the project region was developed based on information compiled by the USFWS, the California Natural Diversity Database (CNDDB), the California Native Plant Society's (CNPS) Rare Plant Inventory (which lists the California Rare Plant Rank [CRPR] for all species), and the WRC MSHCP and LM MSHCP. Specifically, database searches were conducted for areas on the United States Geological Survey (USGS) 7.5-minute quadrangle maps that include the Biological Study Area (BSA) and the directly adjacent quadrangle maps (Alberhill, Corona North, Corona South, Lake Elsinore, Lake Mathews, Perris, Riverside East, Riverside West, Romoland, Santiago Peak, Steele Peak, and Sunnymead). The entire BSA was assessed for the potential presence of sensitive biological and natural resources, including habitat types, potential wetlands, special-status plants, and site disturbances.

Special-status plant surveys were conducted from 2010 to 2012, 2014 to 2016, and in 2018. No focused surveys were conducted in 2013 because of very dry and drought conditions. No focused surveys were performed in 2017 because no new study areas were identified. In 2018, special-status plant surveys were conducted in an area that was added to the Build Alternative 4 study area. All areas within a 200-foot buffer of the potential disturbance areas were surveyed and are herein referred to as the Rare Plant Study Area (RPSA).

The methods used for the surveys were consistent with the Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed, and Candidate Plants (USFWS 2000); Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities and CNPS Botanical Survey Guidelines. Linear transects were walked within all suitable habitat and spaced to ensure 100 percent visual coverage of the ground surface. In addition, reference sites were visited to verify the target species were in bloom during the focused survey. The only species recorded and mapped were Narrow Endemic Plant Species Survey Area species, Criteria Area Species Survey Area species, and non-MSHCP rare plants. Generally, the locations of fully covered WRC MSHCP special-status plant species were not mapped. However, during focused studies within the LM MSHCP area, biologists also recorded the locations of the LM MSHCP target plant species (even if the species are fully covered under the WRC MSHCP).

As described more thoroughly in Section 3.17, *Natural Communities*, the 4,994-acre BSA supports 43 distinct vegetation communities or land cover types. A little over a quarter of the total area within the BSA is developed/disturbed land (1,273 acres). The most common vegetation communities that could potentially support special-status plant species include: nonnative grasslands (1,526 acres), Riversidian sage scrub (753 acres), and disturbed Riversidian sage scrub (110 acres). A full description of the natural vegetation communities within the BSA and within the LM MSHCP is provided in Section 3.17.

3.19.2.1 Special-Status Plant Species Observed

This section discusses only non-listed special-status plant species. Listed special-status plants are discussed in Section 3.21, *Threatened and Endangered Species*. Five special-status plant species were documented in the RPSA during focused surveys conducted for the project: round-leaved filaree, long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*), small-flowered morning-glory, paniculate tarplant (*Deinandra paniculata*), and Coulter's Matilija poppy (Figure 3.19-3). In addition, a population of smooth tarplant was observed northwest of Alexander Street and Cajalco Road; however, this population was not specifically mapped because the species is fully covered under the WRC MSHCP.

Four special-status plant species, including smooth tarplant, Palmer's grapplinghook, Parry's spineflower, and small-flowered microseris, were historically documented in the LM MSHCP area, although they were not observed during the focused surveys conducted for the project and are thus considered absent from RPSA within the LM MSHCP area. Historical records of non-listed special-status species from the CNDDB and the LM MSHCP are shown on Figure 3.19-3.

Suitable habitat is present for an additional 30 species within the RPSA, but these species were not observed during any special-status plant surveys and are therefore considered absent. These species are presented in Table 3.19-1, along with all other special-status plants that were analyzed for their potential to occur within the BSA.

Four of the six species that were observed during focused special-status plant surveys are covered under the WRC MSHCP and are also LM MSHCP target species: Coulter's matilija poppy, long-spined spineflower, round-leaved filaree, and small-flowered morning-glory. Paniculate tarplant is not covered under the WRC MSHCP or the LM MSHCP. One species, Great Valley phacelia, is only covered in the LM MSHCP, but not the WRC MSHCP, and has no other special-regulatory status.

Table 3.19-1. Non-Listed Special-Status Plants with Potential to Occur in the Rare Plant Study Area

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Allen's Pentachaeta (*Pentachaeta aurea* ssp. *allenii*)	1B.1/-/-	Found in coastal scrub openings and valley and foothill grassland habitat. Elevation range is from 246 to 1,706 feet above mean sea level (amsl). Presumed extant population recorded in Santiago Peak USGS quad.	**A**	Suitable habitat is present within coastal sage scrub and nonnative grassland within the BSA. The species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Brand's Star Phacelia (*Phacelia stellaris*)	1B.1/WRC MSHCP(b) /-	Found in coastal dunes and coastal scrub habitats. Elevation range is from 3 to 1,312 feet amsl. Presumed extant population recorded in Riverside West USGS quad.	**A**	Suitable habitat within the BSA is present in sage scrub habitat. It was not detected during the rare plant focused survey in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Buxbaum's Sedge (*Carex buxbaumii*)	4.2/-/-	A perennial herb. Occurs in bogs and fens, meadows and seeps (mesic), marshes and swamps. Inflorescences present from March to August. Found at elevations from sea level to 10,827 feet.	**HP**	Suitable habitat is present within marsh habitat in the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
California Screw Moss (*Tortula californica*)	1B.2/-/-	This moss occurs in sandy soil in chenopod scrub and valley and foothill grassland. Elevation range of 33 to 4,790 feet amsl.	**A**	Although grassland habitat within the BSA may be suitable for this species, the nearest location for this species is in Lower Decker Canyon in Lake Elsinore. This species has a low potential to occur. The species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Catalina Mariposa Lily (*Calochortus catalinae*)	4.2/-/-	A perennial bulbiferous herb found in chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland. It occurs from 49 to 2,297 feet in elevation. This species blooms from February to June, and it is threatened by development.	**A**	Suitable habitat for this species is present within coastal sage scrub and grassland habitat in the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Chaparral Nolina (*Nolina cismontana*)	1B.2/-/-	Found in sandstone and gabbro substrates within chaparral and coastal scrub habitats. Elevation range is from 495 to 459 feet. Presumed extant population recorded in Corona South USGS quad.	**A**	The BSA contains suitable coastal scrub habitat for this species. The species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Chaparral Ragwort (*Senecio aphanactis*)	2B.2/-/-	Found in sometimes alkaline substrates within chaparral, cismontane woodland, and coastal scrub habitats. Elevation range is from 49 to 2625 feet amsl. Presumed extant population recorded in Riverside West USGS quad.	**A**	There is a low potential for this species to occur within coastal sage scrub habitats based on limited alkaline substrates. This species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Chaparral Rein Orchid (*Piperia cooperi*)	4.2/-/-	Found in chaparral, cismontane woodland, and valley and foothill grassland habitats. Elevation range is from 49 to 5,200 feet amsl. Presumed extant population recorded in Santiago Peak USGS quad.	**A**	Suitable habitat is present in non-native grasslands. This species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Chaparral Sand-Verbena (*Abronia villosa* var. *aurita)*	1B.1/-/-	Found in sandy soil within coastal scrub and mostly broad alluvial fans and benches. Known to occur in northern Orange County, western Riverside County, San Diego County, and southern Imperial County. It blooms from January to August at elevations from 262 to 5,248 feet amsl.	**A**	Potential habitat for this species is limited to the sandy ephemeral washes in the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Cleveland's Bush Monkeyflower (*Mimulus clevelandii)*	4.2/WRC MSHCP(f)/-	Found in gabbroic, often disturbed, openings, and rocky substrate within chaparral, cismontane woodland, and lower montane coniferous forest. Presumed extant population recorded in Alberhill USGS quad.	**HA**	The BSA lacks chaparral, cismontane woodland, and lower montane coniferous forest habitats. This species is not expected to occur and was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Coulter's Goldfields (*Lasthenia glabrata* ssp. *coulteri*)	1B.1/ WRC MSHCP(d)/-	Wide-ranging herb in southern California, with known occurrences including Los Angeles, Orange, Riverside, San Bernardino, San Diego, and other counties. This is an annual herb, blooming from February through June in saline places such as coastal saltmarsh, inland playas, and vernal pools below about 4,002 feet in elevation.	**A**	No suitable vernal pool resources are present in the BSA. Species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Coulter's Matilija Poppy (*Romneya coulteri*)	4.2/WRC MSHCP(e)/ LM MSHCP	Species is a perennial rhizomatous herb often found in burns within chaparral and sage scrub. Blooming period is March through July. Locally common along eastern margins of the Santa Ana mountains.	**P**	This species is present along the west end of the alignment near Temescal Creek and was detected during rare plant focused surveys.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
		This species will be considered adequately conserved per the WRC MSHCP when the species-specific conservation objectives have been met. These include the confirmation of at least 10 localities within the MSHCP Conservation Area (locality not less than one-quarter section) with at least 50 individuals each (unless a smaller population has been demonstrated to be self-sustaining). Per the Western Riverside County Regional Conservation Authority (RCA) MSHCP Annual Report 2014, this objective has been met, and this species can now be considered adequately conserved.		
Davidson's Saltscale (*Atriplex serenana* var. *davidsonii*)	1B.2/ WRC MSHCP(d) /-	Found in alkaline soils in coastal bluff scrub and coastal sage scrub from 10 to 820 feet amsl. Within Riverside county, uncommon on alkaline flats along the San Jacinto River, and west of Hemet (Roberts et al. 2004).	HA	There are a few locations where soils are mapped as alkaline within the BSA associated with coastal scrub habitat. However, this species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Engelmann Oak (*Quercus engelmannii*)	4.2/WRC MSHCP/-	Found in chaparral, cismontane woodland, riparian woodland, and valley and foothill grassland.	A	Suitable habitat for this species is present, but the species would have been identifiable during focused studies between 2010 and 2016, if present. Therefore, it is considered absent.
Felt-Leaved Monardella (*Monardella hypoleuca* ssp. *lanata)*	1B.2/-/-	Found in chaparral and cismontane woodland habitats. Elevation range is from 984 to 5,467 feet. Presumed extant population recorded in Alberhill USGS quad.	HA	The BSA lacks chaparral, cismontane woodland, and lower montane coniferous forest habitats. It is not expected to occur and was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Fish's Milkwort (*Polygala cornuta* var. *fishiae*)	-/-/4.3/WRC MSHCP (e)/-	This deciduous shrub blooms from May to August in oak woodland, chaparral, cismontane woodland, and riparian woodland habitats from about 328 to 3,608 feet amsl. It is known from occurrences in Los Angeles, Orange, Riverside, Santa Barbara, San Diego, and Ventura Counties and from Baja California, Mexico.	HP	Suitable habitat is present within coast live oak woodland and riparian woodland areas. This species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
		This species will be considered adequately conserved per the WRC MSHCP when the species-specific conservation objectives have been met. These include the confirmation of at least 10 localities within the MSHCP Conservation Area (locality not less than one-quarter section) with at least 50 individuals each (unless a smaller population has been demonstrated to be self-sustaining). Per the RCA MSHCP Annual Report 2014, this objective has been met and this species can now be considered adequately conserved.		
Gander's Pitcher Sage (*Lepechinia ganderi*)	1B.3/-/-	Closed-cone coniferous forest, chaparral, coastal sage scrub, valley and foothill grassland. Occurring on gabbroic or metavolcanic soils.	HA	The BSA occurs well outside of this species range, with most occurrences in southern San Diego County. This species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Great Valley Phacelia (*Phacelia ciliata*)	-/-/LM MSHCP	Species occurs within valley and foothill grasslands, oak woodland, and coastal sage scrub habitats. Within the Lake Mathews-Estelle Mountain Reserve, the species is associated with clay soils within annual grasslands. Associated with clay soils.	P	This species is present within existing conserved lands north and south of Cajalco Road. This species has also been historically documented on the Lake Mathews-Estelle Mountain Reserve.
Hall's Monardella (*Monardella macrantha* ssp. *hallii)*	-/-/1B.3/WRC MSHCP/-	Found in broad-leafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, and valley and foothill grassland. Elevation range is from 2,395 to 7,201 feet. Presumed extant population recorded in Alberhill USGS quad.	HA	The BSA lacks chaparral, cismontane woodland, and lower montane coniferous forest habitats. It is not expected to occur and was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Heart-Leaved Pitcher Sage (*Lepechinia cardiophylla*)	1B.2/ WRC MSHCP(d)/-	Species is a perennial shrub and occurs in closed- cone coniferous forest, chaparral, and cismontane woodland. Species occurs at elevations ranging from 1,280 to 4,199 feet and blooms from April to July.	HA	Generally, the BSA lacks suitable habitat for this species. In addition, the species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Intermediate Mariposa Lily (*Calochortus weedii* var. *intermedius*)	1B.2/WRC MSHCP/-	The typical blooming period extends from May to July, and the plant is a perennial. This species is known to occur in dry chaparral, valley grassland, and coastal sage scrub. It is often on sandstone outcrops in areas from 590 to 2,805 feet. Soil affinities include sandy or clay soils.	HP	Suitable habitat for this species is present within coastal sage scrub and grassland habitat in the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Intermediate Monardella (*Monardella hypoleuca* ssp. *intermedia*)	1B.3/-/-	This perennial herb can be found within the understory of chaparral, cismontane woodland, and less frequently in lower montane coniferous forests. It occurs at elevations ranging from 984 to 3,510 feet. The species is in bloom from June to August.	HA	The BSA lacks chaparral, cismontane woodland, and montane coniferous forest for this species. It is not expected to occur and was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Little Mousetail (*Myosurus minimus* ssp. *apus*)	3.1/MSHCP(d) /LM MSHCP	Occurs in association with vernal pools and within the alkali vernal pools and alkali annual grassland components of alkali vernal plains. Little mousetail is found in areas that have semiregular inundation. Within Riverside County species is locally common in the alkaline vernal pools near Hemet; otherwise scarce and local in Perris Basin and Santa Rosa Plateau (Roberts et al. 2004).	HA	Proposed project within Criteria Area Plant Species (CAPS) survey areas for this species. No suitable vernal pool habitat is present within the BSA. It is presented here because it is a covered species with potential to occur under the LM MSHCP.
Long-Spined Spineflower (*Chorizanthe polygonoides* var. *longispina*)	1B.2/WRC MSHCP/LM MSHCP	Associated primarily with heavy, often rocky, clay soils in southern needlegrass grassland, and openings in coastal sage scrub and chaparral. The species has been described as occurring on sandy and gravelly soil, but this appears to be infrequently the case.	P	This species was detected within the BSA southwest of Lake Mathews within the BSA during 2011 rare plant surveys. This species is also known to occur in the Lake Mathews-Estelle Mountain Reserve.
Many-Stemmed Dudleya (*Dudleya multicaulis*)	1B.2/WRC MSHCP(b)/ LM MSHCP	Found on the coastal slopes of southern California from Los Angeles and San Bernardino Counties south, from about 50 to 2,600 feet in elevation. It usually grows on poor soils, often on clay or at the margins of gabbroic rock outcrops in coastal sage scrub and grassland communities. This species primarily occurs on the western edge of Riverside County (Roberts et al. 2004).	A	Proposed project within the Narrow Endemic Plant Species Survey Areas for this species. Suitable habitat occurs within coastal sage scrub and nonnative grassland communities, particularly where clay soils and rocky outcrops are present. This species was not found during the 2011, 2012, 2014, 2015, 2016, or 2018 rare plant focused studies. It is presented here because it is a covered species with potential to occur under the LM MSHCP.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Mesa Horkelia (*Horkelia cuneata* ssp. *puberula*)	1B.1/-/-	This perennial herb blooms from February until September. It grows in sandy and gravelly soils in chaparral, cismontane woodland, or coastal scrub at elevations from 230 to 2,657 feet.	A	Suitable habitat is present within the coastal sage scrub. Species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Narrow-Petaled Rein Orchid (*Piperia leptopetala*)	4.3/-/-	Found in cismontane woodland, lower montane coniferous forest, and upper montane coniferous forest habitats. Elevation range is from 1,247 to 7,300 feet amsl. Presumed extant population recorded in Santiago Peak USGS quad.	HA	No suitable habitat is present in the BSA. The nearest record occurs in the Santa Ana Mountains. Thus, this species is not expected to occur and was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Ocellated Humboldt Lily (*Lilium humboldtii* ssp. *ocellatum)*	-/-/4.2/WRC MSHCP(f)/-	Found in openings within chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and riparian woodland habitats. Elevation range is from 98 to 5,906 feet. Presumed extant population recorded in Alberhill USGS quad.	HP	Suitable habitat occurs within the BSA, which is within the elevation range for the species. The species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018. Additional MSHCP species-specific conservation objectives for this species have been met (RCA 2016).
Palmer's Grapplinghook (*Harpagonella palmeri*)	-/-/4.2/ WRC MSHCP/ LM MSHCP	Found within chaparral, coastal scrub, and valley and foothill grasslands. Often associated with clay soils. Occurs at elevations of 65 to just over 3,130 feet. Blooming period begins in March and ends in May.	A	This species was documented during the rare plant focused studies. It has been known to occur within the LM MSHCP area, however it was not documented during rare plant focused surveys conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Palomar Monkeyflower (*Erythranthe diffusa*)	4.3/WRC MSHCP/-	Known to occur in chaparral and lower montane coniferous forests, in sandy or gravelly soils. Within Riverside County, only known from the Santa Ana and Agua Tibia Mountains.	HA	No suitable habitat is present in the BSA, and this species is not expected to occur. This species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Paniculate Tarplant (*Deinandra paniculata*)	4.2/-/-	This annual herb has a limited distribution, with the species known from Orange, western Riverside, southwestern San Bernardino, and southwestern San Diego Counties. It regularly grows in mesic conditions within sage scrub, valley and foothill grassland, and vernal pools but can also occur in dry nonnative grasslands. Blooming period is April through November.	P	The species was found throughout the project alignment in large populations especially along La Sierra Avenue and along Cajalco Road west of Harley John Road.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Parish's Brittlescale (*Atriplex parishii*)	1B.1/ WRC MSHCP(d) /-	Habitats where species is found include chenopod scrub, alkaline vernal pools, and playas. Blooms from June to October and ranges from 82 to 6,232 feet amsl in elevation.	HA	No suitable vernal alkaline habitat is present in the BSA, and this species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Parry's Spineflower (*Chorizanthe parryi* var. *parryi*)	1B.1/WRC MSHCP(e)/ LM MSHCP	Annual herb. Found in sandy or rocky soils in openings in chaparral, cismontane woodland, coastal scrub, and valley and foothill grassland. The blooming period is from April to June. This species is threatened by altered flood regime, development, mining, nonnative plants, and vehicles. This species will be considered adequately conserved per the WRC MSHCP when the species-specific conservation objectives have been met. These include the confirmation of at least 10 localities within the MSHCP Conservation Area (locality not less than one-quarter section) with at least 1,000 individuals each (unless a smaller population has been demonstrated to be self-sustaining). Per the RCA MSHCP Annual Report 2014, this objective has been met, and this species can now be considered adequately conserved.	HP	Suitable habitat is present within coastal sage scrub, grassland and woodland habitats that occur in the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018. This species was historically documented in the RPSA within the Lake Mathews MSHCP area.
Payson's Jewelflower (*Caulanthus simulans*)	4.2/WRC MSHCP/-	Occurs within chaparral and coastal sage scrub in sandy/granitic rock. Fairly tolerant of lands disturbed by fire. Blooms between February and June and has been recorded at elevations between 300 to 7,225 feet.	HP	Suitable habitat is present within sage scrub habitat within the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Peninsular Spineflower (*Chorizanthe leptotheca*)	4.2/WRC MSHCP(e)/-	This annual herb occurs in chaparral, coastal scrub, and lower montane coniferous forest associated with alluvial fans and granitic soils. Found at elevations from 984 to 6,234 feet. This species will be considered adequately conserved per the WRC MSHCP when the species-specific conservation objectives have been met. These include the confirmation of at	HP	Suitable habitat is present within the alluvial fan sage scrub habitat. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
		least 10 localities within the MSHCP Conservation Area (locality not less than one-quarter section) with at least 1,000 individuals each (unless a smaller population has been demonstrated to be self-sustaining). Per the RCA MSHCP Annual Report 2014, this objective has been met, and this species can now be considered adequately conserved.		
Plummer's Mariposa Lily (*Calochortus plummerae*)	4.2/WRC MSHCP(e)/-	Found on rocky and sandy areas with granitic or alluvial material in coastal sage scrub, chaparral, and valley and foothill grasslands from 295 to 5,280 feet. This species will be considered adequately conserved per the WRC MSHCP when the species specific conservation objectives have been met. These include the confirmation of at least six localities within the MSHCP Conservation Area (locality not less than one-quarter section) with at least 500 individuals each (unless a smaller population has been demonstrated to be self-sustaining). Per the RCA MSHCP Annual Report 2014, this objective has been met, and this species can now be considered adequately conserved.	HP	Suitable habitat for this species is present within coastal sage scrub and grassland habitat in the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Robinson's Pepper-Grass (*Lepidium virginicum* var. *robinsonii*)	4.3/-/-	An annual herb found in dry, exposed soils in chaparral and coastal sage scrub up to 3,100 feet in elevation. Blooming period occurs from January to July. This species is threatened by development and possibly nonnative plants.	A	Suitable habitat is present in the BSA within coastal sage scrub. The species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Round-Leaved Filaree (*California macrophylla*)	/-/ WRC MSHCP(d)/ LM MSHCP	Restricted to open cismontane woodland and valley and foothill grassland habitats on very friable deep clay soils between about 50 and 6,560 feet. Within western Riverside County, two of the mapped localities occur on Bosanko clay soils. Records reviewed for this species indicate that this species tends to be associated primarily with wild oats (Avena fatua).	P	Multiple populations of this species were detected during 2011 and 2015 rare plant focused surveys.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Salt Spring Checkerbloom (*Sidalcea neomexicana*)	2B.2/-/-	Mesic, alkaline soils in chaparral, coastal sage scrub, lower montane coniferous forest, Mojavean desert scrub, and playas.	A	Suitable habitat is present within coastal sage scrub. This species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
San Bernardino Aster (*Symphyotrichum defoliatum*)	1B.2/-/-	Found in cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, and valley and foothill grassland. Also near ditches and stream springs. Blooms from July to November at elevations from 6 to 6,700 feet amsl.	A	Suitable habitat is present near drainage areas within riparian, grassland, and sage scrub communities. The species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
San Diego County Viguiera (*Viguiera lacinata*)	4.3/-/-	Perennial shrub in chaparral and sage scrub from central San Diego County south to Baja California and Sonora, Mexico; used heavily in restoration and as an ornamental in native range and northward, with nonnatives recorded north to Santa Clara County. Elevation is range about 200 to 2,460 feet amsl.	A	Suitable habitat is present within coastal sage scrub; however, the BSA occurs outside of the species natural range. In addition, the species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
San Diego Sagewort (*Artemisia palmeri*)	4.2/-/-	Found in sandy and mesic substrate. Vegetation communities include chaparral, coastal scrub, riparian forest, riparian scrub, and riparian woodland. Elevation range is 49 to 3,002 feet amsl. Population documented in Sunnymead USGS quad.	A	Potential habitat for this species is limited to the sandy ephemeral washes in the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
San Miguel Savory (*Clinopodium chandleri*)	1B.2/ WRC MSHCP (b)/ -	Perennial shrub. Associated with rocky, gabbroic and metavolcanic substrates in coastal sage scrub, chaparral, cismontane woodland, riparian woodland, and valley and foothill grassland. The blooming period is from March to July. This species is threatened by residential development, foot traffic, agriculture, and recreational activities.	A	Suitable habitat is present within the BSA within woodland, sage scrub, and grassland communities. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
Santiago Peak Phacelia (*Phacelia keckii*)	1B.3/-/-	Found in closed-cone coniferous forest and chaparral habitats. Elevation range is from 1,788 to 5,249 feet amsl. Presumed extant population recorded in Corona South USGS quad.	HA	No suitable habitat for this species is present. The nearest record occurs in the Santa Ana Mountains. Thus, this species is not expected to occur and was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Small-Flowered Microseris (*Microseris douglasii* ssp. *platycarpha*)	/4.2/WRC MSHCP (e)/ LM MSHCP	Annual herb found in heavy clay soils in cismontane woodland, coastal scrub, valley and foothill grassland, and vernal pools. The blooming period is from March to May. This species is severely declining due to urban developments and is threatened by nonnative plants. (Roberts et al. 2004) This species will be considered adequately conserved per the WRC MSHCP when the species specific conservation objectives have been met. These include the confirmation of at least 10 localities within the MSHCP Conservation Area (locality not less than one-quarter section) with at least 1,000 individuals each (unless a smaller population has been demonstrated to be self-sustaining). Per the RCA MSHCP Annual Report 2014, this objective has been met, and this species can now be considered adequately conserved.	HP	The BSA contains Bosanko Porterville clay soils that provide suitable habitat for this species. In addition, this species has been documented on the Lake Mathews-Estelle Mountain Reserve. The species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018. This species was historically documented in the RPSA in the LM MSHCP area.
Small-Flowered Morning-Glory (*Convolvulus simulans*)	4.2-/WRC MSHCP/ LMMSHCP	Annual herb on open, friable to crumbling clay soils and serpentine seeps in openings within chaparral, sage scrub, and grasslands from Baja California, Mexico, north to central California. Vulnerable to competition from nonnative plants. Not associated with alkaline or saline conditions. Found at elevations from 100 to 2,300 feet.	P	This species was detected in in areas of clay soils west of Lynette Lane/Hollis Lane during 2016 rare plant focused surveys. This species is also known to occur in the Lake Mathews-Estelle Mountain Reserve.
Smooth Tarplant (*Centromadia pungens* ssp. *laevis*)	1B.1/WRC MSHCP(d)/ LM MSHCP	Found in fine or alkaline soils of seasonally wet chenopod scrub, meadows and seeps, playas, riparian woodland, fallow fields, drainage ditches, and moist situations within valley and foothill grasslands below about 1,575 feet. Tolerant of rural and agricultural land use. Found primarily in southwestern Riverside County, but also a few sites in the interior valleys of San Bernardino, Los Angeles, and San Diego Counties.	P	Proposed project within the Criteria Area Species Survey Area (CASSA) for this species. Suitable habitat is present within grassland habitat. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018 within the CASSA. However, a population was detected outside of the CASSA just west of Alexander Street,

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Snake Cholla (*Cylindropuntia californica* var. *parryi*)	1B.1/-/-	Perennial stem succulent found in chaparral and coastal scrub habitats. Elevation range is from 98 to 492 feet. The blooming period is from April to May. Presumed extant population recorded in Riverside East USGS quad. This species is threatened by development and vehicles.	A	Suitable habitat occurs within the BSA. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
South Coast Saltscale (*Atriplex pacifica*)	1B.2/-/-	An annual herb that occurs on coastal bluff scrub, coastal dunes, coastal scrub, and playas. It is found at elevations ranging from 0 to 459 feet amsl and blooms from March to October. Records of this species within Riverside County were misidentified and are actually Atriplex davidsonii (Roberts et al. 2004).	HA	No suitable habitat for this species is present in the BSA. This species is not expected to occur.
Southern California Black Walnut *(Juglans californica*)	4.2/WRC MSHCP/-	This deciduous tree blooms from March to May in alluvial soils of cismontane woodland, chaparral, coastal scrub, riparian scrub, and walnut-oak woodland from about 164 to 2,952 feet.	A	Suitable habitat is present within coastal sage scrub, riparian scrub and woodland habitats. Species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Southern Tarplant (*Centromadia parryi* ssp. *australis*)	1B.1/WRC MSHCP/ LM MSHCP	This annual herb most characteristically occurs along the edges of marshes and swamps, in vernal pools, and vernally mesic grasslands at elevations up to 1,600 feet amsl. It can occur in degraded conditions. Blooming period is May to November.	HA	The BSA is well outside the geographic distribution of this species. Neither the CNDDB nor the CNPS have records of this species within the BSA or the 12 USGS quads the BSA occurs on or is directly adjacent to. It is presented here because it is a covered species with potential to occur under the LM MSHCP. No potential for this species to be present.
Sticky Dudleya (*Dudleya viscida*)	-/-/1B.2/ WRC MSHCP(f)/-	Coastal bluff scrub, chaparral, coastal sage scrub. Occurring on rocky soils.	HA	This species occurs at higher elevations and is associated with more coastal influence than is present in the BSA. This species was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Summer Holly (*Comarostaphylis diversifolia* ssp. *diversifolia*)	1B.2/-/-	Perennial evergreen shrub that occurs in chaparral vegetation communities. Blooming period is from April through June.	HA	No suitable habitat for this species is present and it is not expected to occur.
Tecate Cypress (*Hesperocyparis forbesii*)	1B.1/-/-	A perennial evergreen tree found in clay, gabbroic, or metavolcanic soil within closed-cone coniferous forest and chaparral. Elevation range is 427 to 4,921 feet. This species is threatened by alteration of fire regimes, mining, and by development in Orange and Riverside Counties.	HA	There is no suitable habitat within the BSA, and it would have been detectable during the rare plant survey efforts from 2010 to 2018.
Vernal Barley (*Hordeum intercedens*)	3.2/WRC MSHCP/-	Associated with mesic grasslands, vernal pools, and large saline flats or depressions. In Riverside County, found in the Domino, Willows, and Traver soils series and is associated with alkali flats and flood plains within the alkali vernal plains community. Within this community vernal barley is primarily associated with alkali annual grasslands and vernal pools and to a lesser extent alkali scrub and alkali playa.	HA	No suitable vernal pool habitat is present in the BSA. In addition, soils with which this species is associated are absent from the BSA. It is not expected to occur and was not detected during focused surveys for rare plants conducted in 2010, 2011, 2012, 2014, 2015, 2016, and 2018.
Western Spleenwort (*Asplenium vespertinum)*	4.2/-/-	Found in rocky substrate within chaparral, cismontane woodland, and coastal scrub. Population reported in Alberhill USGS quad. Elevation range is 590 to 3,280 feet.	A	Suitable habitat occurs within the BSA, which is within the elevational range for the species. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.
White Rabbit-Tobacco (*Pseudognaphalium leucocephalum*)	2B.2/-/-	Perennial herb. Associated with sandy or gravelly soils in chaparral, cismontane woodland, coastal scrub, and riparian woodland. Blooming period is from July through December.	HP	Suitable habitat is present in the BSA within coastal sage scrub and riparian woodland habitats.
White-Bracted Spineflower (*Chorizanthe xanti* var. *leucotheca*)	1B.2/-/-	Found in sandy or gravelly substrate within coastal scrub alluvial fans, Mojavean desert scrub, and pinyon and juniper woodland habitats. Elevation range is from 984 to 3937 feet. Presumed extant population recorded in Corona South USGS quad.	A	Suitable habitat occurs within the BSA in sandy alluvial areas and juniper woodlands. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.

COMMON/SCIENTIFIC NAME	STATUS[a] CNPS / WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Woven-Spored Lichen (*Texosporium sancti-jacobi*)	3/-/-	This species is restricted to occurring on biotic crusts in arid and semi-arid habitats, such as chaparral or on decaying organic matter. Occurs at elevations from 951 to 2,165 feet amsl. Intolerant of disturbed sites.	HA	The BSA is highly disturbed and does not provide conditions suitable for this species of lichen. This species is not expected to occur.
Wright's Trichocoronis (*Trichocoronis wrightii* var. *wrightii*)	2B.1/ WRC MSHCP(b) /-	In western Riverside County, found in the alkali vernal plains and associated with alkali playa, alkali annual grassland, and alkali vernal pool habitats. This species occupies the more mesic portions of these habitats.	HA	Suitable vernal alkali habitat is absent from the BSA, and alkaline soils are limited within grassland habitats. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, 2016, and 2018.

[a] ***Status Codes***

CNPS

1B = Plants rare, threatened, or endangered in California and elsewhere

2B = Plants rare, threatened, or endangered in California, but more common elsewhere

3 = Plants about which we need more information

4 = Limited distribution (Watch List)

0.1 = Seriously threatened in California

0.2 = Moderately threatened in California

0.3 = Not very threatened in California

WRC MSHCP

WRC MSHCP = No additional action necessary

WRC MSHCP(b) = Surveys may be required within the Narrow Endemic Plant Species survey area

WRC MSHCP(d) = Surveys may be required within Criteria Area

WRC MSHCP(e) = Conservation requirements identified in species-specific conservation objectives need to be met before classified as a Covered Species

WRC MSHCP(f) = Covered species when a Memorandum of Understanding is executed with the Forest Service Land

[b] ***Habitat Presence/Absence Codes:***

P= The species is present.

HP=Habitat is or may be present. The species may be present.

HA= No habitat present and no further work needed.

A= This species is absent.

3.19.2.2 Species Covered under WRC MSHCP

WRC MSHCP Narrow Endemic Plant Species

The three non-listed narrow endemic plant species analyzed for their potential to occur include many-stemmed dudleya, San Miguel savory, and Wright's trichocoronis. It was determined that the BSA supported habitat for many-stemmed dudleya and San Miguel savory, and focused surveys were conducted for these two species in suitable habitat. Although there is a CNDDB record for many-stemmed dudleya at the west end of the RPSA, there were no narrow endemic plant species observed during focused surveys conducted for the project; therefore, these species are considered absent. There are no historical records of these narrow endemic species within the LM MSHCP area of the RPSA.

WRC MSHCP Criteria Area Species

The RPSA was evaluated for six non-listed Criteria Area Species. It was determined during the habitat evaluation that the RPSA lacked suitable habitat for Parish's brittlescale, little mousetail, Davidson's saltscale, and Coulter's goldfields. Although smooth tarplant was observed in the RPSA, the observation occurred outside of the Criteria Area; therefore, this species is fully covered and is not discussed further. The only Criteria Area Species found during focused surveys was round-leaved filaree.

Round-Leaved Filaree

Round-leaved filaree, a Criteria Area Species Survey Area species, was noted within the RPSA. Round-leaved filaree was observed during surveys in 2011 (three individuals) and 2015 (217 individuals) northeast and southwest of the existing Cajalco Road within the LM MSHCP area (Sheets 5, 6a/6b, and 7a/7b of Figure 13.9-3). There are also CNDDB records from 2018 of round-leaved filaree within the RPSA. This species has also been historically documented on the LM MSHCP area within the RPSA (Sheets 7a and 7b of Figure 13.9-3).

WRC MSHCP Fully Covered Species

Coulter's Matilija Poppy

A population of 10 Coulter's matilija poppy was found in 2012 just west of Temescal Wash. The population occurs on a mitigation site managed by the RCRCD within the RPSA (Sheet 1 of Figure 13.9-3). There are no historical records of this species within the LM MSHCP area of the RPSA.

Long-Spined Spineflower

A population of 98 individual long-spined spineflower plants was found in 2011 between Archer Road and Lake Mathews Drive on the north and south sides of Cajalco Road. A second population, comprising more than 220 individuals, was observed north of Cajalco Road in 2012 approximately 0.3 mile west of Harley John Road (Sheets 6a/6b, 8, 9, and 10a/10b of Figure 13.9-3). This species has also been historically documented within the RPSA within the LM MSHCP area (Sheets 6a and 6b of Figure 3.19-3).

Small-Flowered Morning-Glory

Small-flowered morning-glory was found in 2016 (95 individuals) southwest of Cajalco Road within the LM MSHCP area and RCHCA SKR Reserve (Sheets 5 and 7a/7b of Figure 13.9.3). This species has also been historically documented on the LM MSHCP area within the RPSA. This species has also been historically documented within the RPSA within the LM MSHCP area (Sheets 3 through 6a/6b, and 8 of Figure 3.19-3).

Non-Covered Plant Species

Paniculate Tarplant

Paniculate tarplant has a CRPR of 4.2. It is not covered under the WRC MSHCP and is not a LM MSHCP target species. Paniculate tarplant was found within the RPSA in two distinct populations composed of several thousand individuals (Sheets 8, 10a/10b, and 12 through 14 of Figure 13.9.3). A small population of about 250 individuals was observed just east of El Sobrante Road near the edge of Lake Mathews. A second, larger population of over 11,500 paniculate tarplant was observed along Cajalco Road spanning the RPSA from Hollis Lane/Lynette Lane to just west of the Harley John Road.

3.19.2.3 Lake Mathews MSHCP Target Species

The following non-listed plant species are LM MSHCP target species: Coulter's matilija poppy, long-spined spineflower, Palmer's grapplinghook, round-leaved filaree, and small-flowered morning-glory. The detailed locations of these species within the LM MSHCP area are described in Section 3.19.2.2 above.

In addition to these species, Great Valley phacelia was observed in the RPSA as one population comprising about 730 individuals southwest of Cajalco Road in the LM MSHCP area and adjacent RCHCA SKR Reserve lands (Sheets 5, 6a/6b, and 7a/7b of Figure 3.19-3). Great Valley phacelia has also historically been documented northeast and southwest of Cajalco Road to the west of Hollis Lane/Lynette Lane in the LM MSHCP area.

3.19.3 Environmental Consequences

This section addresses the effects on non-listed special-status species from the build alternatives. Specific discussions have been dedicated to round-leaved filaree, Coulter's matilija poppy, long-spined spineflower, and small-flowered morning glory because these species were recorded and mapped within the RPSA. Because Great Valley phacelia has no special regulatory status, the impacts on this species and suitable habitat are only discussed as they pertains to the LM MSHCP in Section 4.2.4. Species fully covered under the WRC MSHCP that were not specifically recorded and where no additional analysis is required (smooth tarplant, Parry's spineflower, Palmer's grapplinghook, and small-flowered microseris) are discussed in Section 3.19.3.5. A full discussion of effects on these species and/or their suitable habitat as it related to the LM MSHCP area is also provided for these species.

Paniculate tarplant is not covered under the WRC MSHCP nor is it a LM MSHCP target species; therefore, no discussion as it pertains to these HCPs is provided in Section 3.19.3.7.

For each species, direct and indirect impacts that could potentially occur during construction activities are described. Direct effects are those permanent or temporary impacts that would directly cause mortality and permanent loss of habitat. Examples of permanent impacts during construction include grading activities, construction staging, cut and fill, and the road widening. Temporary effects are those impacts that would occur within the area needed to construct the project (including staging areas), and these areas would be returned to original topographic contours, decompacted to allow for plant establishment, and revegetated with native vegetation when construction is completed. Indirect effects are those impacts that may give rise to delayed, secondary effects, including potential spread of invasive plants, increased dust generation during construction, and degradation of habitat adjacent to the work area. Operation of the proposed project may contribute to long-term indirect effects on these species and may contribute to edge effects through degradation of habitat adjacent to the new right of way, spread of invasive plants from vehicles, and increased risk of fire; however, these potential edge effects would not differ from the existing conditions along the County right of way.

3.19.3.1 Round-Leaved Filaree

Build Alternatives 1 and 4 – Cajalco Alignment and El Sobrante Alignment

No direct impacts (permanent and/or temporary) would occur on round-leaved filaree during construction of Build Alternatives 1 and 4 because this species occurs outside of the limits of disturbance (LOD). There is a potential for indirect effects on individuals to occur adjacent to the build alternatives in the form of dust generated from construction activities, edge effects and habitat degradation, increased risk of fire, and introduction of invasive species. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** (refer to Section 3.17, *Natural Communities*) are intended to avoid and/or minimize indirect impacts on round-leaved filaree that may occur adjacent to the LOD, as well as direct and indirect impacts on potentially suitable habitat for the species.

Lake Mathews MSHCP

Although no direct effects would occur on round-leaved filaree under Build Alternatives 1 or 4, suitable habitat within the LMR would be directly affected by these build alternatives (97.15 acres under Build Alternative 1 and 27.10 acres under Build Alternative 4). Measures identified above are intended to avoid and/or minimize indirect impacts on round-leaved filaree within the LMR that occur adjacent to the LOD. In addition, Build Alternative 1 would remove a portion of the existing Cajalco Road and restore portions of the area to natural topographic contours, decompacted to allow for plant establishment, and revegetated with native vegetation. Approximately 0.14 acre of natural habitat suitable for round-leaved filaree removed during roadbed removal will be added back into the LMR under Build Alternative 1. Project BMPs will ensure potential indirect impacts on round-leaved filaree would not occur. In addition, Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** (Section 3.17, *Natural Communities*) would ensure full replacement of potentially suitable habitat for round-leaved filaree associated with the LMR.

Build Alternative 2C – Modified Cajalco Alignment

Based on the mapped locations of round-leaved filaree, up to four individuals would be permanently removed during construction of Build Alternative 2C (Sheets 5 and 7b of Figure 3.19-3), and several individuals occur within the temporary impact area. There is also a potential for indirect impacts on the population that occurs adjacent to the LOD. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) are intended to avoid and/or minimize direct and indirect impacts on round-leaved filaree and its suitable habitat adjacent to the LOD. In addition, once the project is completed, the existing Cajalco Road between La Sierra Avenue and just west of Hollis Lane would retain an approximately 20-foot-wide dirt, gravel, or partially paved access road that will strictly be used for MWD access of the LMR. The restricted access will reduce future degradation of the species' habitat, including reduced spread of invasive species from vehicles and reduced future potential fire risk. This will provide an overall benefit to round-leaved filaree as the habitat that is occupied outside of the LOD is expected to improve in quality.

Operation of the proposed project may contribute to long-term, indirect effects on species, such as degradation of habitat adjacent to the new right of way, spread of invasive plants from vehicles, and increased risk of fire; however, these potential edge effects would not differ from the existing conditions along the County right of way.

Lake Mathews MSHCP

Approximately 64.99 acres of suitable habitat for round-leaved filaree within the LMR would be affected under Build Alternative 2C. There is also a potential for indirect impacts on the population that occurs adjacent to the LOD. The measures identified above are intended to avoid and/or minimize such potential indirect effects on the LMR. In addition, once construction of Build Alternative 2C is completed, there would be restricted access of the existing Cajalco Road between La Sierra to just west of Lake Mathews Drive, which will reduce future degradation of the species' habitat, including reduced spread of invasive species from vehicles and reduced future potential fire risk. This will provide an overall benefit to round-leaved filaree within the LMR as the habitat that is occupied is expected to improve in quality.

No-Build Alternative

Under the No-Build Alternative, no permanent or temporary impacts on round-leaved filaree would occur.

3.19.3.2 Coulter's Matilija Poppy

Build Alternatives 1, 2C, and 4

The build alternatives may have a temporary effect on areas currently occupied by Coulter's matilija poppy. The species-specific conservation objectives under the WRC MSHCP have been met, and this species is considered adequately conserved by the Plan. Therefore, any potential effects on Coulter's matilija poppy are fully covered under the WRC MSHCP. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) are intended to avoid and/or minimize direct and

indirect impacts on Coulter's matilija poppy and its suitable habitat adjacent to the LOD. No additional analysis is required for areas outside of the LM MSHCP.

Lake Mathews MSHCP

No direct impacts would occur on Coulter's matilija poppy within the LMR during construction of the build alternatives. However, within the LMR, potential effects would occur within potentially suitable habitat for Coulter's matilija poppy (approximately 28.99 acres under Build Alternative 1, 38.86 acres under Build Alternative 2C, and 24.14 acres under Build Alternative 4). Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** (Section 3.17, *Natural Communities*) would ensure full replacement of potentially suitable habitat for Coulter's matilija poppy associated with the LMR.

No-Build Alternative

Under the No-Build Alternative, no permanent or temporary impacts on Coulter's matilija poppy would occur.

3.19.3.3 Long-Spined Spineflower

Build Alternatives 1, 2C, and 4

Impacts on long-spined spineflower from Build Alternatives 1, 2C, and 4 are fully covered under the WRC MSHCP. No additional analysis is required for areas outside of the LM MSHCP.

Lake Mathews MSHCP

Within the LMR, potential effects would occur within potentially suitable habitat for long-spined spineflower (100.47 acres under Build Alternative 1, 82.38 acres under Build Alternative 2C, and 33.87 acres under Build Alternative 4). However, no direct impacts are expected to occur on long-spined spineflower during construction of the build alternatives because this species was absent within the LOD on the LMR. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) are intended to avoid and/or minimize direct and indirect impacts on long-spined spineflower and its suitable habitat adjacent to the LOD. In addition, Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** would ensure full replacement of potentially suitable habitat for long-spined spineflower associated with the LMR.

No-Build Alternative

Under the No-Build Alternative, no permanent or temporary impacts on long-spined spineflower would occur.

3.19.3.4 Small-Flowered Morning-Glory

Build Alternatives 1 and 4 – Cajalco Alignment and El Sobrante Alignment

Impacts on small-flowered morning-glory from Build Alternatives 1 and 4 are fully covered under the WRC MSHCP. No additional analysis is required for areas outside of the LM MSHCP.

Lake Mathews MSHCP

No direct impacts would occur on small-flowered morning glory within the LMR during construction of Build Alternatives 1 and 4 because this species occurred outside of the LOD. However, suitable habitat (up to 122.23 acres under Build Alternative 1 and 51.27 acres under Build Alternative 4) for small-flowered morning glory occurs within the LM MSHCP area and would be affected under these build alternatives. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) are intended to avoid and/or minimize direct and indirect impacts on small-flowered morning glory and its suitable habitat adjacent to the LOD. In addition, Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** would ensure full replacement of potentially suitable habitat for small-flowered morning glory associated with the LMR.

Build Alternative 2C – Modified Cajalco Alignment

Impacts on small-flowered morning-glory from Build Alternative 2C are fully covered under the WRC MSHCP. No additional analysis is required for areas outside of the LM MSHCP.

Lake Mathews MSHCP

Up to 113.96 acres of suitable habitat for small-flowered morning glory occurs within the LMR and would be affected under the Build Alternative 2C. There is a potential for direct impacts to occur on a few individuals of small-flowered morning glory within the LMR during construction of Build Alternative 2C. Because this species is fully covered under the WRC MSHCP, no replacement of individuals is proposed within the LMR. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) are intended to avoid and/or minimize direct and indirect impacts on small-flowered morning glory and its suitable habitat adjacent to the LOD. In addition, Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** would ensure full replacement of potentially suitable habitat for small-flowered morning glory associated with the LMR.

No-Build Alternative

Under the No-Build Alternative, no permanent or temporary impacts to small-flowered morning-glory would occur.

3.19.3.5 Other Fully Covered MSHCP Species

Build Alternatives 1, 2C, and 4

No impacts on Palmer's grapplinghook, Parry's spineflower, or small-flowered microseris would occur because these species are absent from the areas affected by Build Alternatives 1, 2C, and 4. There is a potential for impacts to occur on smooth tarplant located toward the east end of the build alternatives outside of the Criteria Area; therefore, any potential effects on this species is fully covered under the WRC MSHCP. No additional analysis is required for areas outside of the LM MSHCP area. The analysis for these species within the LM MSHCP area follows.

Lake Mathews MSHCP (Build Alternatives 1, 2C and 4)

Build Alternative 1 would remove up to 135.33 acres, Build Alternative 2C would remove up to 126.91 acres, and Build Alternative 4 would remove up to 63.03 acres of suitable habitat for smooth tarplant, Palmer's grapplinghook, Parry's spineflower, and small-flowered microseris from the LMR. However, no direct impacts would occur on the LM MSHCP target plant species (Palmer's grapplinghook, Parry's spineflower, smooth tarplant, and small-flowered microseris) during construction of the build alternatives because these species were either absent from the LOD during focused studies or have only been documented outside of the LOD. Measures **NC-17** and **NC-19** (Section 3.17, *Natural Communities*) would ensure full replacement of potentially suitable habitat for Palmer's grapplinghook, Parry's spineflower, smooth tarplant, and small-flowered microseris associated with the LMR.

No-Build Alternative

Under the No-Build Alternative, no permanent or temporary impacts on smooth tarplant, Palmer's grapplinghook, Parry's spineflower, or small-flowered microseris would occur.

3.19.3.6 Paniculate Tarplant

Build Alternatives 1 and 2C – Cajalco Alignment and Modified Cajalco Alignment

Direct impacts are anticipated on paniculate tarplant under Build Alternatives 1 and 2C because a few individuals of this species were documented within the LOD (Sheet 10a of Figure 3.19-3). There is also potential for indirect impacts on this species during construction activities from dust, the spread of invasive species, and increased fire potential. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)**, **NC-10 (NES BIO-10)**, and **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) are intended to avoid and/or minimize direct and indirect impacts on paniculate tarplant and its suitable habitat.

Build Alternative 4 – El Sobrante Alignment

Direct impacts are anticipated on several thousand paniculate tarplant (dispersed on approximately 6.80 acres) for Build Alternative 4 (Sheets 10b, 12, 13, and 14 of Figure 3.19-3). This alternative would bisect the population located east of Harley John Road. In addition, there is a potential for indirect impacts on paniculate tarplant during construction activities from dust, the spread of invasive species, and increased fire potential. Paniculate tarplant seeds will be collected prior to project construction (**PL-1 [NES BIO-22]**) and disseminated following construction, which will offset the number of individuals directly removed during construction of Build Alternative 4. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)**, **NC-10 (NES BIO-10)**, and **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) are intended to avoid and/or minimize direct and indirect impacts on paniculate tarplant and its suitable habitat.

No-Build Alternative

Under the No-Build Alternative, no permanent or temporary impacts on paniculate tarplant would occur.

3.19.3.7 Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road (Build Alternatives 1 and 2C), or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road (Build Alternative 4), for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. There is a less than reasonable potential for special-status plants to establish within the median due to the soil disturbances, grading within the median, and overall degradation of habitat within the median area; therefore, impacts on special-status plants from a future six-lane facility are not expected. During operation of the six-lane facility no additional effects on special-status plant species would be anticipated because the additional two lanes would be situated in the previously disturbed median. It would be unlikely for any special-status plant species to occur in this narrow strip of open land, which would be graded during construction of any of the build alternatives.

3.19.3.8 Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Within the LM MSHCP area and LMR, Build Alternatives 1 and 2C would expand and realign Cajalco Road, whereas Build Alternative 4 would expand and realign portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road. All three build alternatives would also encroach into the LM MSHCP area and remove suitable and/or occupied habitat for LM MSHCP target species, including small-flowered morning-glory, long-spined flower, Coulter's matilija poppy, round-leaved filaree, Great Valley phacelia, smooth tarplant, Palmer's grapplinghook, Parry's spineflower, and small-flowered microseris. Permanent and temporary impacts on the LM MSHCP area, which includes suitable habitat for LM MSHCP target plant species, is provided in Table 3.17-8 of Section 3.17, *Natural Communities*.

Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities,* are intended to avoid and/or minimize direct and indirect impacts on LM MSHCP target plant species and their suitable habitat within the LM MSHCP area. Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** would replace and compensate for the loss of potentially suitable habitat for LM MSHCP target plant species.

3.19.4 Avoidance, Minimization, and/or Mitigation Measures

Avoidance and minimization measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** (Section 3.17, *Natural Communities*) would be implemented to reduce potential indirect impacts on special-status plant species under Build Alternatives 1, 2C, and 4 and to ensure consistency with the WRC MSHCP (refer to Section 3.19.2.2, *Species Covered Under WRC MSHCP*). Paniculate tarplant seeds will be collected prior to project construction and disseminated following construction (**PL-1 [NES BIO-22]**), which will offset the number of individuals directly removed during construction of Build Alternative 4.

Replacement for the loss of potentially suitable habitat for LM MSHCP target plant species will be required by MWD within the LM MSHCP area at a minimum 1:1 ratio (**NC-17 [NES BIO-17]**) (Section 3.17, *Natural Communities*) to reduce potential impacts on LM MSHCP target plant species (refer to Section 3.19.2.3, *Lake Mathews MSHCP Target Species*). Temporary impacts will be addressed through preparation of a Habitat Mitigation and Monitoring Plan and onsite restoration (**NC-19 [NES BIO-15]**).

PL-1 (NES BIO-22): Paniculate Tarplant Seed Collection – Seeds for paniculate tarplant will be collected prior to construction activities. Seeds will be stored and redistributed after construction is completed.

3.20 Animal Species

3.20.1 Regulatory Setting

3.20.1.1 Federal and State Regulations

Many state and federal laws regulate impacts to wildlife. The U.S. Fish and Wildlife Service (USFWS), the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries), and the California Department of Fish and Wildlife (CDFW) are responsible for implementing these laws. This section discusses potential impacts and permit requirements associated with animals not listed or proposed for listing under the federal or state Endangered Species Act. Species listed or proposed for listing as threatened or endangered are discussed in Section 3.21, *Threatened and Endangered Species*. All other special-status animal species are discussed here, including CDFW fully protected species and species of special concern, watchlist species, and USFWS or NOAA Fisheries candidate species.

Federal laws and regulations pertaining to wildlife include the following:

- National Environmental Policy Act
- Migratory Bird Treaty Act
- Fish and Wildlife Coordination Act

State laws and regulations pertaining to wildlife include the following:

- California Environmental Quality Act
- Sections 1600 – 1603 of the California Fish and Game Code
- Section 4150 and 4152 of the California Fish and Game Code

The project is also a covered activity under the Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) (Volume I, Section 7.2.2, Circulation Element Roads). Participation in the WRC MSHCP by the County is intended to streamline the environmental process for future transportation projects in western Riverside County (e.g., through pre-mitigation) and save money over the long term. The WRC MSHCP would provide take coverage for certain special-status animal species impacted by the project. The consistency review would be performed by the Western Riverside County Regional Conservation Authority (RCA), USFWS, and CDFW.

In addition, the project overlaps a Stephens' kangaroo rat (SKR) Core Reserve, the Lake Mathews-Estelle Mountain Core Reserve, established under the SKR Habitat Conservation Plan. Although take authorization for SKR would occur under the WRC MSHCP, any loss of SKR Core Reserve would require the preparation and submittal of a Core Reserve Land Disturbance Report to the Riverside County Habitat Conservation Agency (RCHCA). This report would document the impacts on SKR and the compensatory mitigation.

The project also overlaps with the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area. The LM MSHCP is a joint conservation effort initiated by the Metropolitan Water District of Southern California (MWD)

and the RCHCA in cooperation with the USFWS and CDFW that spans 5,993.5 acres of open land around Lake Mathews. There are a total of 65 Planning species within the LM MSHCP area and the 5,110.4-acre Lake Mathews Multiple Species Reserve (LMR). Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements.

3.20.2 Affected Environment

Unless otherwise noted, the information from this section was based upon the December 2018 Natural Environmental Study (NES) prepared for the project (Caltrans 2018, 2021). References used in the NES are not carried over into this section. In order to comply with the provisions of various state and federal environmental statutes and executive orders, the potential impacts on natural resources of the region were investigated and documented. A list of species and habitats within the project region was developed based on information compiled by the USFWS, California Natural Diversity Database (CNDDB), and other current publications. The project site was field reviewed to identify animal species and their habitat.

A total of 144 species of wildlife were detected in the Biological Study Area (BSA) during field studies, the majority of which were birds, followed in species richness by mammals, reptiles, and amphibians (refer to Appendix K of the NES for a complete list of the wildlife detected during field studies).

Commonly detected birds include red-tailed hawk (*Buteo jamaicensis*), killdeer (*Charadrius vociferus*), rock pigeon (*Columba livia*), mourning dove (*Zenaida macroura*), Anna's hummingbird (*Calypte anna*), black phoebe (*Sayornis nigricans*), Say's phoebe (*Sayornis saya*), American crow (*Corvus brachyrhynchos*), common raven (*Corvus corax*), European starling (*Sturnus vulgaris*), northern mockingbird (*Mimus polyglottos*), horned lark (*Eremophila alpestris*), western meadowlark (*Sturnella neglecta*), Brewer's blackbird (*Euphagus cyanocephalus*), western kingbird (*Tyrannus verticalis*), house finch (*Haemorhous mexicanus*), and house sparrow (*Passer domesticus*). All of these species are common to the region and have adapted at least in part to human-made habitats or disturbances. The Temescal Creek portion of the BSA provides habitat for a much wider variety of birds than other portions, including some that are not common to the region, such as common ground-dove (*Columbina passerina*) and blue grosbeak (*Passerina caerulea*).

The most commonly detected mammals were desert cottontail (*Sylvilagus audubonii*), California ground squirrel (*Otospermophilus beecheyi*), Botta's pocket gopher (*Thomomys bottae*), coyote (*Canis latrans*), and domestic dog (*Canis familiaris*). These species are common in the region. In addition, larger and less common mammals such as bobcat (*Lynx rufus*), mountain lion (*Puma concolor*), and southern mule deer (*Odocoileus hemionus*) were also observed.

Amphibians and reptiles detected included western toad (*Anaxyrus boreas*), California treefrog (*Pseudacris cadaverina*), Pacific treefrog (*Pseudacris regilla*), western fence lizard (*Sceloporus occidentalis*), granite spiny lizard (*Sceloporus orcutti*), western side-blotched lizard (*Uta stansburiana elegans)*, red racer (*Coluber flagellum piceus*), California kingsnake (*Lampropeltis californiae*), gophersnake (*Pituophis catenifer*), and Southern Pacific rattlesnake (*Crotalus*

oreganus helleri). All of these species are common to the region and readily found in both natural and human-altered landscapes.

Fifteen non-listed special-status animals were detected in the BSA during field studies: coast horned lizard (*Phrynosoma blainvillii*; California species of special concern [CSC]), northern red diamond rattlesnake (*Crotalus ruber ruber*; CSC), western spadefoot (*Spea hammondii*; CSC), northern harrier (*Circus cyaneus*; CSC), golden eagle (*Aquila chrysaetos*; Bald and Golden Eagle Protection Act/California fully protected species [CFP]), burrowing owl (*Athene cunicularia*; BUOW; CSC), American peregrine falcon (*Falco peregrinus anatum*; CFP), loggerhead shrike (*Lanius ludovicianus*; CSC), yellow warbler (*Setophaga petechia*; CSC), yellow-breasted chat (*Icteria virens*; CSC), short-eared owl (*Asio flammeus*), Vaux's swift (*Chaetura vauxi*; CSC), western red bat (*Lasiurus blossevillii*; CSC), western yellow bat (*L. xanthinus*; CSC), and San Diego black-tailed jackrabbit (*Lepus californicus bennettii*; CSC). With the exception of BUOW, all of these special-status animals are WRC MSHCP fully covered species, with no survey requirements.

A literature review determined that non-listed special-status species may potentially occur within the BSA based on the regional location of the project. Table 3.20-1 identifies the non-listed special-status animals that may potentially be present and their protection status. As mentioned earlier, species listed or proposed for listing as threatened or endangered are discussed in Section 3.21, *Threatened and Endangered Species*. As displayed in Table 3.20-1, 51 non-listed special-status species have suitable habitat within the BSA: 1 fish, 2 amphibians, 10 reptiles, 27 birds, and 11 mammals. Focused studies were performed for BUOW and bats due to presence of suitable habitat within the BSA and/or survey requirement under the WRC MSHCP. No other focused studies were performed for non-listed special-status species.

Table 3.20-1. Special-Status Species Potentially Occurring or Known to Occur in the Project Area

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
FISH				
Arroyo Chub (*Gila orcuttii*)	**-**/CSC/WRC MSHCP/ LM MSHCP	Occur within warm, fluctuating streams and found within slow moving sections of stream containing sandy or muddy bottoms. Often found in intermittent streams. In Riverside County, occurs within the Santa Ana and Santa Margarita River tributaries.	HP	The BSA contains fluctuating streams with sandy or muddy bottoms and very slow to slow flows. Although the majority of the streams present within the BSA do not flow year-round, marginally suitable habitat does occur at Temescal Creek.
AMPHIBIANS				
Coast Range California Newt (*Taricha torosa*)	-/CSC/WRC MSHCP/-	Species frequent terrestrial habitats, but breed in ponds, reservoirs, and slow-moving streams. Loss of wetland habitats and introduction of nonnative predators, including crayfishes, appear to be the main causes of declines.	HP	Suitable habitat is present within Temescal Creek and Cajalco Creek. The species is fully covered under the WRC MSHCP.
Western Spadefoot (*Spea hammondii*)	-/CSC/WRC MSHCP/ LM MSHCP	Found primarily in grassland habitats, but can be found in valley-foothill hardwood woodlands. Vernal pools and seasonal ponds are essential for breeding and egg laying. It is found at sea level to 4,500 feet above mean sea level (amsl).	P	This species was observed within a detention basin on MWD lands south of Cajalco Road within the BSA. It also has a low potential to occur throughout the BSA in areas of grasslands and vernal pools primarily south of Cajalco Road. Due to ongoing human-induced disturbance such as disking and maintenance of existing flood control facilities, this species has limited potential to occur within the project alignment. The species is fully covered under the WRC MSHCP.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
REPTILES				
Western Pond Turtle (*Emys marmorata*)	-/CSC/WRC MSHCP/-	Found in association with permanent or nearly permanent water in a wide variety of habitat types. It is omnivorous, taking a wide variety of plant and animal food. The pond turtle requires basking sites such as partially submerged logs, rocks, mats of floating vegetation, or open mud banks.	HP	Although suitable habitat is present within Temescal Creek and other streams in the BSA. The species is fully covered under the WRC MSHCP.
San Diego Banded Gecko (*Coleonyx variegatus abbotti*)	-/CSC/WRC MSHCP/ LM MSHCP	Prefers rocky areas in coastal sage chaparral. Found in burrows or under surface objects during daylight.	HP	Suitable habitat is present within rock outcrops that occur in the BSA.
Coast Horned Lizard (*Phrynosoma blainvillii*)	-/CSC/WRC MSHCP/ LM MSHCP	Found in arid and semi-arid climate conditions in chaparral, coastal sage scrub, primarily below 2,000 feet amsl. Critical factors are the presence of loose soils with a high sand fraction; an abundance of native ants or other insects, especially harvester ants (*Pogonomyrmex* spp.); and the availability of both sunny basking spots and dense cover for refuge.	P	Species was documented during biological surveys in the BSA. The BSA contains loose sandy soils and harvester ants have been detected during biological surveys. There is suitable foraging and basking habitat throughout the BSA. The species is fully covered under the WRC MSHCP.
Belding's Orange-throated Whiptail (*Aspidocelis hyperythra beldingi*)	-/WL/WRC MSHCP/ LM MSHCP	Most California populations occur on or adjacent to floodplains or the terraces of streams, in or by open sage scrub and chaparral communities. The presence of perennial shrubs appears to be important, with the most strongly associated species being California buckwheat (*Eriogonum fasciculatum*), chamise (*Adenostoma fasciculatum*), white sage (*Salvia apiana*), and black sage (*S. mellifera*). Termites are reported to constitute 57–95% of the diet, and foraging microsites are primarily under shrubs in leaf litter (Brattstrom 2000).	P	Species was documented during biological surveys in the BSA. The species is fully covered under the WRC MSHCP.
Coastal Western Whiptail (*Aspidoscelis tigris stejnegeri*)	-/CSC/WRC MSHCP/ LM MSHCP	Found in a variety of ecosystems, primarily hot and dry open areas with sparse foliage – chaparral, woodland, and riparian areas	P	This species was observed within the BSA during field studies.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Southern California Legless Lizard (*Anniella stebbinsi*)	-/CSC/-/-	Occupies areas with moist, cool, friable soil with plant cover. Occurs in sparsely vegetated areas of beach dunes, pine-oak woodlands, desert scrub, sandy washes, and stream terraces with sycamores, cottonwoods, or oaks. Leaf litter under trees and bushes in sunny areas and dunes stabilized with bush lupine and mock heather often indicate suitable habitat. Often can be found under surface objects such as rocks, boards, driftwood, and logs.	HP	Suitable habitat occurs within the BSA on stream terraces where leaf litter is dense (i.e., Temescal Creek and Cajalco Creek).
California Glossy Snake (*Arizona elegans occidentalis*)	-/CSC/-/-	Inhabits arid scrub, rocky washes, grasslands, and chaparral habitats.	HP	Suitable habitat is present within grassland and coastal sage scrub communities in the BSA.
Coast Western Patch-Nosed Snake (*Salvadora hexalepis virgultea*)	-/CSC/-/-	Mostly restricted to habitats with a strong but broken shrub component, especially somewhat open chaparral and black sage (*Salvia mellifera*) or relatively mature, dense coastal sage scrub and may require ground burrows for overwintering and refuge.	HP	Suitable habitat is present within coastal sage scrub within the BSA.
Two-Striped Garter Snake (*Thamnophis hammondii*)	-/CSC/-/-	Often in water and rarely found far from it, though it is also known to inhabit intermittent streams having rocky beds bordered by willow thickets or other dense vegetation. They will also inhabit large riverbeds if riparian vegetation is available, and even occur in artificial impoundments if both aquatic vegetation and suitable prey items (small amphibians and fish) are present (Jennings and Hayes 1994).	HP	Suitable habitat is present within Temescal Creek and Cajalco Creek.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Northern Red-Diamond Rattlesnake (*Crotalus ruber ruber*)	-/CSC/WRC MSHCP/ LM MSHCP	As far north as Puente Hills in Yorba Linda and southwest San Bernardino County, and occurs south to Loreto, Baja California, Mexico. Known elevation range is sea level to just under 15,000 feet amsl, but apparently rare above about 3,940 feet amsl. Greatest frequency in areas of heavy brush, such as chamise chaparral, but also in open areas at lower densities; boulders and rocky outcrops.	P	This species has been detected during biological survey efforts throughout the BSA.
BIRDS				
Least Bittern (*Ixobrychus exilis*)	-/CSC/-/-	Found in both freshwater and brackish marshland. Prefers dense emergent vegetation near water levels up to 2 feet in depth. Preys upon small fish, amphibians, larger arthropods, small snakes, and small mammals associated with marsh ecosystems.	Foraging: HP Breeding: HP	There is a small amount of suitable breeding and foraging habitat in Temescal Creek and Cajalco Creek within BSA.
White-Faced Ibis (nesting colony) (*Plegadis chihi*)	-/WL/WRC MSHCP/-	Documented breeding sites at Prado Basin and Mystic Lake/San Jacinto Wildlife Area. Forages in shallow water near edge of shore where aquatic invertebrates, moist-soil invertebrates, amphibians, and small fish are exposed.	Foraging: HP Breeding: HA	No suitable breeding habitat is present in the BSA. There is potential for foraging within the BSA; however, this is limited due to a low amount of marsh habitat within the BSA. The species is fully covered under the WRC MSHCP.
White-Tailed Kite (nesting) (*Elanus leucurus*)	-/CFP/WRC MSHCP /LM MSHCP	Species forages in open country. This is a strongly lowland species, rare in California above 2,000 feet amsl. Nests are flimsy and are located low in trees and large shrubs near foraging areas in savannahs and at edges between open habitat and woodland or forest areas. Its diet is largely restricted to small mammals such as voles and mice.	Foraging: HP Breeding: HP	There is suitable breeding and foraging habitat throughout the BSA.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Northern Harrier (nesting) (*Circus cyaneus*)	-/CSC/WRC MSHCP/ LM MSHCP	Species forages low to the ground mostly in open country and nests on the ground. Prey diversity is high, though small mammals are most commonly taken. It remains fairly common in open country with low human disturbance during migration and in winter.	Foraging: P Breeding: HA	This species was detected within the BSA during biological surveys. Suitable foraging habitat is present, and the species will migrate through the area. No suitable breeding habitat is present.
Golden Eagle (nesting and wintering) (*Aquila chrysaetos*)	-/CFP/WRC MSHCP /LM MSHCP	Forages in grassland and open savannah of many types. It tolerates considerable variation in topography and elevation. It prefers to hunt moderate-sized prey, especially California ground squirrels (*Otospermophilus beecheyi*) and rabbits, but will occasionally take larger prey, such as mule deer (*Odocoileus hemionus*) fawns. It is very sensitive to human disturbance, especially near nest sites.	Foraging: P Breeding: A	This species was detected within the BSA during biological surveys. Suitable foraging habitat is present and poor nesting habit where there is higher topographic variety.
Cooper's Hawk (nesting) (*Accipiter cooperii*)	-/WL/WRC MSHCP/ LM MSHCP	Breeds in deciduous, mixed, and evergreen forests and deciduous stands of riparian habitat. Most proximate to wooded areas of mixed maturity for foraging.	Foraging: P Breeding: P	This species has been observed within riparian habitat within the BSA.
Sharp-Shinned Hawk (nesting) (*Accipiter striatus*)	-/WL/WRC MSHCP/ LM MSHCP	Breeds in young coniferous forests with high canopy associations. Habitats that they are documented to use include ponderosa pine, black oak, riparian deciduous, mixed conifer, and Jeffrey pine.	Foraging: P Breeding: HA	The species was observed within the BSA. No suitable breeding habitat is present, thus this individual was likely foraging.
Ferruginous Hawk (wintering) (*Buteo regalis*)	-/WL/WRC MSHCP/ LM MSHCP	Forages in open grassland and agricultural land where favored prey (e.g., rabbits, squirrels, other small rodents, birds, reptiles, and amphibians of opportunity) persists. Nests in elevated structures such as trees, buttes, and cut banks in central Canada and south through western and central U.S. into northern Texas.	Foraging: HP Breeding: HA	Suitable foraging habitat is present within open lands throughout the BSA. The BSA occurs outside of the species breeding range.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Osprey (nesting) (*Pandion haliaetus*)	-/WL/WRC MSHCP/-	Found near bodies of water including saltmarshes, rivers, ponds, reservoirs, estuaries, and even coral reefs. Nest in a wide variety of locations, from Alaska to New England, Montana to Mexico, and Carolina to California	Foraging: HA Breeding: HP	Suitable foraging habitat is present in the vicinity of Lake Mathews; however, no foraging habitat is present in the BSA. The species is fully covered under the WRC MSHCP.
American Peregrine Falcon (nesting role) (*Falco peregrinus anatum*)	D/D,CFP/ WRC MSHCP/-	Very mobile species that can be expected anywhere within Southern California. Forages on smaller and weaker birds and small mammals. Nests on cliff faces most frequently. Can also nest on trees, towers, tall buildings, and outcrops.	Foraging: P Breeding: HP	The species was observed foraging over the portion of Lake Mathews within the BSA. Although the BSA is not within the typical breeding range for the species, open landscapes and rocky cliffs occur within the BSA that may provide marginal nesting habitat for the species.
Prairie Falcon (nesting role/breeding) (*Falco mexicanus*)	-/WL/WRC MSHCP/-	Found in sagebrush, desert, prairie, agricultural fields, and alpine meadows up to about 11,000 feet elevation. They nest on ledges on sheer rocky cliffs. Breeding habitats include grasslands, shrubsteppe desert, areas of mixed shrubs and grasslands, and alpine tundra that supports abundant ground squirrel or pika populations.	Foraging: P Breeding: HA	The species was observed foraging over the BSA. No suitable breeding habitat is present. The species is fully covered under the WRC MSHCP.
Merlin (wintering role) (*Falco columbarius*)	-/WL/WRC MSHCP/-	Found in open conifer woodland and prairie groves. During migration, they are found in foothills, marshes, and open country. Breeds in semi-open terrain that has trees for nest sites and open areas for hunting. Habitat varies from coniferous forest in the north to isolated deciduous groves, suburban yards, and prairies. May winter in more open areas, such as grasslands and coastal marshes.	Foraging: HP Breeding: HA	No suitable breeding habitat is present in the BSA; however, there is a potential for this species to forage in the BSA and occur in the winter. The species is fully covered under the WRC MSHCP.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Double-Crested Cormorant (nesting colony) (*Phalacrocorax auritus*)	-/WL/WRC MSHCP/-	Inhabits coasts, bays, lakes, and rivers. Very adaptable, and may be found in almost any aquatic habitat, from rocky northern coasts to mangrove swamps to large reservoirs to small inland ponds.	Foraging: HP Breeding: HA	This species was observed flying over the BSA. No suitable habitat for nesting is present. The species is fully covered under the WRC MSHCP.
Burrowing Owl (*Athene cunicularia*)	-/CSC/ WRC MSHCP(c)/ LM MSHCP	Inhabits open, dry, grasslands, prairies, desert floors, and shrublands if shrub cover is below 30%. In coastal Southern California, a substantial fraction of birds are found in microhabitats highly altered by man, including flood control and irrigation basins, dikes, abandoned fields surrounded by agriculture, and road cuts and margins. Often associated with burrowing mammals, especially ground squirrels (*Otospermophilus* spp.).	Foraging: P Breeding: HP	Suitable habitat for nesting and foraging is present within the BSA. A single individual was detected in the winter of 2015 south of Cajalco Road in RCHCA lands.
Long-Eared Owl (nesting role) (*Asio otus*)	-/CSC/-/LM MSHCP	In Southern California, the species breeds and roosts in riparian and oak forests, and hunts small mammals at night in adjacent open habitats. Known to breed at several locales in San Diego and Orange Counties and probably do so in smaller numbers in other coastal Southern California counties as well. Species is relatively intolerant to human-made disturbances, in particular night lighting. Foraging lands need to be rodent rich and relatively close to roosting and/or nesting habitat.	Foraging: HP Breeding: HP	The BSA contains suitable nesting and foraging habitat for this species.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Short-Eared Owl (nesting role) (*Asio flammeus*)	-/CSC/-/-	Found in large, open areas with low vegetation, including prairie and coastal grasslands, meadows, shrubsteppe, savanna, tundra, marshes, dunes, and agricultural areas. Winter habitat is similar, but is more likely to include large open areas within woodlots, stubble fields, fresh and saltwater marshes, weedy fields, dumps, gravel pits, rock quarries, and shrub thickets. Nests on the ground amid grasses and low plants. They usually choose dry sites often on small knolls, ridges, or hummocks with enough vegetation to conceal the incubating female.	Foraging: P Breeding: HA	This species was observed roosting in the BSA, where there are suitable conditions for roosting and foraging; however, the BSA is outside the known breeding range for the species.
Vaux's Swift (nesting role) (*Chaetura vauxi*)	-/CSC/-/-	Found in open sky over forest, lakes, and rivers. Often feeds low over water, especially in morning and evening or during unsettled weather. Nests in coniferous and mixed, mainly old-growth forest, including redwood, Douglas-fir, and grand fir.	Foraging: P Breeding: HA	Species observed foraging over the BSA. No suitable breeding habitat occurs in the BSA.
Loggerhead Shrike (nesting role) (*Lanius ludovicianus*)	-/CSC/WRC MSHCP/ LM MSHCP	Found as a common resident and winter visitor throughout California in lowland and foothill habitats, where it frequents open areas with sparse shrubs and trees.	Foraging: P Breeding: HP	Species was documented during biological surveys in the BSA. Potentially suitable foraging and breeding habitat occurs within the BSA.
Clark's Marsh Wren (*Cistothorus palustris clarkae*)	-/CSC/-/-	Resident subspecies restricted to freshwater and brackish marshes.	Foraging: HP Breeding: HP	Foraging and breeding potential exists within the BSA; however, the quantity of this habitat is limited.
California Horned Lark (*Eremophila alpestris actia*)	-/WL/WRC MSHCP/ LM MSHCP	Occurs throughout Southern California. It prefers open grassland where trees are absent. Main sources of food are seeds and insects.	Foraging: P Breeding: P	The BSA supports the open grassland habitats that the species prefers.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Southern California Rufous-Crowned Sparrow (*Aimophila ruficeps canescens*)	-/WL/WRC MSHCP /LM MSHCP	Species found in semiarid grassy shrublands and open woodlands on moderate to steep grassy and rocky hillsides and canyons from sea level to approximately 9,800 feet amsl. Prefers coastal sage scrub where California sagebrush (*Artemisia californica*) dominates. Nests on the ground, in a natural depression, or in a hole in the ground. Forages on grass and forb seeds, fresh grass stems, and tender plant shoots.	Foraging: P Breeding: P	This species was observed within the BSA during the biological surveys.
Grasshopper Sparrow (nesting role) (*Ammodramus savannarum*)	-/CSC/ WRC MSHCP(e)/LM MSHCP	Found in grassland, hayfields, and prairies. Breeds in dry fields and prairies, especially those with fairly tall grass and weeds with low shrub cover. During migration and winter, they're found in many types of open fields. This species will be considered adequately conserved per the WRC MSHCP when the species-specific conservation objectives have been met. These objectives include occupancy requirements in three large core areas and three to four smaller core areas; the inclusion of at least 8,000 acres of habitat in seven core areas (one of which may be the Lake Mathews-Estelle Mountain Core), which contain contiguous grassland or grassland-dominated habitat. Per the RCA MSHCP Annual Report 2014 (RCA 2016), this objective has not yet been met, and this species cannot yet be considered adequately conserved.	Foraging: HP Breeding: HP	Suitable habitat for breeding and foraging is present within grasslands and agricultural lands in the BSA.
Bell's Sage Sparrow (*Artemisiospiza belli belli*)	-/WL/WRC MSHCP/ LM MSHCP	Occurs in dry chaparral and coastal sage scrub habitat throughout Southern California. Forages on the ground by gleaning insects and fruits during the breeding season and seeds during the winter.	Foraging: P Breeding: P	This species was observed within the BSA during the biological surveys.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Oregon Vesper Sparrow (wintering) (*Pooecetes gramineus affinis*)	-/CSC/-/-	Present as a non-breeding migrant during spring and fall, and overwinters in mainly open ground with little vegetation or lands with short growth grasses and forbs.	Foraging: P Breeding: HA	An unidentified subspecies of vesper sparrow was observed in the BSA during spring field work. Foraging habitat is scattered throughout the BSA.
Yellow Warbler (nesting role) (*Setophaga petechia*)	-/CSC/WRC MSHCP/ LM MSHCP	Forages in the upper canopy of deciduous trees and shrubs by gleaning insects and berries. Breeds in willows, alders, and cottonwoods.	Foraging: P Breeding: P	This species was observed within the BSA during the biological surveys and breeds in the BSA including Temescal Creek and portions of Cajalco Creek.
Yellow-Breasted Chat (nesting role) (*Icteria virens*)	-/CSC/WRC MSHCP/ LM MSHCP	Found in riparian vegetation. Forages on insects, spiders, and berries gleaned from branches. Nests in dense plant cover near streams, swampy ground, and bordering small ponds.	Foraging: P Breeding: HP	This species was observed within riparian habitats within the BSA during the biological surveys.
Yellow-Headed Blackbird (nesting role) (*Xanthocephalus xanthocephalus*)	-/CSC/-/-	Found in fresh marshes. Forages in fields and open country. Breeds in freshwater sloughs and marshy lake borders. Forages around marshes and also commonly in open pastures, plowed fields, cattle pens, and feedlots.	Foraging: HP Breeding: HA	BSA lacks suitable breeding habitat for this species; however, there is a potential for foraging over open lands (i.e., agricultural lands).
MAMMALS				
Western Yellow Bat (*Lasiurus xanthinus*)	-/CSC/-/-	Occurs from Southern California and western Arizona south into Mexico. Apparently non-colonial and non-hibernating. Roosts primarily in the untrimmed, dead fronds of fan palms (native and nonnative) but will also use other trees including cottonwoods. Possible for both seasonal movement and year-round residence. Foraging is associated with open water (also lawns, orchards, and riparian vegetation) in grassy and scrub landscapes. Feeds on varied insects. No specific threats known apart from cosmetic trimming of dead fronds on ornamentally planted palms.	P	Species was detected during focused bat emergence surveys. Suitable roost habitat occurs within fan palms and tall riparian vegetation. Potential for species to forage over Temescal Creek or Lake Mathews.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Western Mastiff Bat (*Eumops perotis californicus*)	-/CSC/-/LM MSHCP	Uncommon resident in Coastal Ranges from Monterey County southward through Southern California, from the coast eastward to the Colorado Desert. Found foraging in a variety of habitats, from dry desert washes, floodplains, chaparral, oak woodland, open ponderosa pine forest, grassland, montane meadows, and agricultural areas. Primarily a cliff-dwelling species for breeding. Often roosts in small colonies. Nursery roosts described as tight rock crevices at least 35 inches deep and 2 inches wide, or crevices in buildings.	Foraging: HP Roosting: A	Suitable habitat for roosting is present within rock outcrops on Lake Mathews-Estelle Mountain Reserve lands; however, this species was not detected during emergence/ acoustic surveys. Foraging habitat is present for this species in the BSA. It is presented here because it is a covered species with potential to occur under the LM MSHCP.
Pallid Bat (*Antrozous pallidus*)	-/CSC/-/LM MSHCP	Commonly occurs in open, dry habitats with rocky areas for roosting. Roosts in caves and mines, as well as in crevices in rocks, buildings, and trees. Roosts must protect bats from high temperatures. This is a colonial species that forages low over open ground, often picking up beetles and other species of prey off the ground. They have separate night and day roosts and hibernation roosts in the winter. The sexes segregate in summer.	Foraging: HP Roosting: A	Suitable habitat for roosting is present within rock outcrops on Lake Mathews-Estelle Mountain Reserve lands; however, this species was not detected during emergence/acoustic surveys. Suitable foraging habitat for this species occurs in the BSA. It is presented here because it is a covered species with potential to occur under the LM MSHCP.
Big Free-Tail Bat (*Nyctinomops macrotis*)	-/CSC/-/LM MSHCP	Inhabits rocky areas in a variety of arid areas including pine-juniper woodlands, desert scrub, palm oasis, desert wash, and desert riparian. Needs high cliffs or rocky outcrops for roosting sites. Feeds principally on large moths.	Foraging: HP Roosting: A	Potential foraging habitat is present throughout the BSA. Marginal roosting habitat occurs within the southern portion of the BSA; however, this species was not detected during emergence or acoustic surveys. It is presented here because it is a covered species with potential to occur under the LM MSHCP.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Pocketed Free-Tailed Bat (*Nyctinomops femorosaccus*)	-/CSC/-/LM MSHCP	Occurs in southeastern deserts of California, with portions of western Riverside County apparently on the periphery of their range. Found in pinyon-juniper and Joshua tree woodlands, desert scrub, desert succulent scrub, desert riparian areas, desert washes, alkali desert scrub, and palm oases. Roosts in high rock crevices in cliffs, bridges, roofs, and buildings. The species must drop from roost to gain flight speed. Forages primarily on large moths, especially over open water.	Foraging: HP Roosting: A	Marginally suitable roosting or foraging habitat is present within the BSA. This species was not detected during emergence/acoustic surveys. It is presented here because it is a covered species with potential to occur under the LM MSHCP.
San Diego Black-Tailed Jackrabbit (*Lepus californicus bennettii*)	-/CSC/WRC MSHCP /LM MSHCP	Common throughout state in herbaceous and desert shrub areas, sage scrub, grasslands, open chaparral, and woodland/forest areas.	P	This species was commonly detected during biological surveys.
Northwestern San Diego Pocket Mouse (*Chaetodipus fallax fallax*)	-/CSC/WRC MSHCP /LM MSHCP	Sandy herbaceous areas, usually in association with rocks and coarse gravel in southwest California; coastal and desert border areas in San Bernardino, Riverside, and San Diego Counties. Elevation ranges from sea level to 6,000 feet amsl. Vegetation community preferences include sage scrub, chamise-redshank chaparral, mixed chaparral, sage brush, desert wash, desert scrub, desert succulent scrub, pinyon-juniper, and annual grasslands.	HP	Suitable habitat is present within coastal sage scrub and annual grasslands within the BSA.
Los Angeles Pocket Mouse (*Perognathus longimembris brevinasus*)	-/CSC/ WRC MSHCP(c)/-	Inhabits areas of open ground, prefers fine sandy soils (for burrowing), but is also found commonly on gravel washes and on stony soils, within brush and woodland habitats. It is rarely found on sites with a high cover of rocks.	HP	The BSA does not occur within the WRC MSHCP survey area for this species; therefore, no additional action is required for this species.
San Diego Desert Woodrat (*Neotoma lepida intermedia*)	-/CSC/WRC MSHCP /LM MSHCP	Found in dry shrublands. Favors areas with cacti and abundant rocks and crevices. Does not require a source of drinking water. Sage scrub communities are frequently occupied.	P	Suitable habitat in the form of scrub habitats with patches of cholla and prickly pear and rocky outcrops are present within the BSA.

COMMON/SCIENTIFIC NAME	STATUS[a] FED/STATE/ WRC MSHCP/ LM MSHCP	GENERAL HABITAT DESCRIPTION	SPECIFIC HABITAT[b] PRESENT/ ABSENT	RATIONALE
Southern Grasshopper Mouse (*Onychomys torridus ramona*)	-/CSC/-/-	Occurs in a wide variety of dry scrub, grassland, and woodland habitats across southern California.	HP	Suitable habitat is present within scrub, grassland, and juniper woodland habitats in the BSA.
American Badger (*Taxidea taxus*)	-/CSC/-/LM MSHCP	Associated with large grassland and sparse sage scrub habitats. Occupies large burrows and forages on small mammals (e.g., ground squirrels, rabbits), snakes, birds, and insects.	HP	Suitable habitat is present within grasslands in the BSA. There is a low potential for this disturbance-sensitive species to occur due to continuous human disturbances.

LM MSHCP = No additional action necessary

WRC MSHCP(c) = Surveys may be required within locations shown on survey maps

WRC MSHCP(e) = Conservation requirements identified in species-specific conservation objectives need to be met before classified as a Covered Species

[b] ***Habitat Presence/Absence Codes***

P = The species is present.

HP = Habitat is or may be present. The species may be present.

HA = No habitat present and no further work needed.

A = This species is absent.

3.20.2.1 Burrowing Owl

The burrowing owl is a CSC that is a covered species under the WRC MSHCP and planning species under the LM MSHCP. This species inhabits open, dry, level or nearly level grassland, prairie, desert floor, and shrubland habitats when shrub cover is less than 30 percent. In Southern California, a substantial number of birds are found in microhabitats that have been highly altered by man, including flood control and irrigation basins, dikes, and banks; abandoned fields surrounded by agriculture; and road cuts and margins. There is a strong association between BUOWs and burrowing mammals, especially ground squirrels (*Otospermophilus* spp.); however, they also occupy human-made niches such as banks and ditches, piles of broken concrete, and abandoned structures.

Under the WRC MSHCP, a BUOW focused survey is required within the WRC MSHCP BUOW survey area (Figure 3.20-1) when suitable habitat is present. The BUOW study area included up to a 300-foot buffer with an additional 200-foot buffer that was visually assessed only (refer to Figure 3.17-1 in Section 3.17, *Natural Communities*). Within the BUOW study area, potentially suitable habitat occurs within approximately 2,601 acres. Suitable habitat for BUOW is shown in Figure 3.20-2. The quality of potential habitat within the BUOW study area ranges from low to high and varies in the level of human disturbance. In the BUOW study area, potential habitat for BUOW occurs within and outside of WRC MSHCP criteria cells. Suitable nesting and foraging habitat for BUOW occurs throughout the BUOW study area.

No BUOW were observed during focused surveys conducted for the proposed project. However, a single individual was incidentally observed occupying a burrow within a fallow agriculture field on December 16, 2015, during other field studies (Figure 3.20-2) within RCHCA reserve lands. This BUOW was likely a wintering resident based on the time of year that it was observed and may migrate outside of the BSA during the breeding season. A known population of BUOW occurs approximately 0.5 mile southwest of the BSA on the RCHCA conservation lands.

Within the BUOW study area, there are no CNDDB records of BUOW for the quadrangles that overlap the LMR; however, the species has been documented historically near the edge of Lake Mathews (MWD/RCHCA 1995).

3.20.2.2 Special-Status Bats

A total of five special-status bats have potential to occur in the BSA: pallid bat (*Antrozous pallidus*; CSC), mastiff bat (*Eumops perotis*; CSC), pocketed free-tailed bat (*Nyctinomops femorosaccus*; CSC), big free-tailed bat (*N. macrotis*; CSC), and western yellow bat. Detailed descriptions of habitat requirements are provided in Table 3.20-1. Suitable roosting habitat for pallid bat occurs throughout the BSA. Marginally suitable habitat for mastiff bat, pocketed free-tailed bat, and big free-tailed bat occurs within the larger rock outcrops, particularly north of Cajalco Road along Build Alternative 4 near STA #534 to STA #557 (see Figure 3.20-3). No suitable roosting habitat for western yellow bat occurs within the BSA. Western yellow bats may be sedentary or migratory depending on the individual but sedentary individuals are known from the region. All five bat species are CSC and none are covered under the WRC MSHCP.

Many other species of bats have potential to occur but have no special status. However, they would benefit from the protective measures identified in this section. CDFW has increased its

requirements for projects to ensure that direct mortality of bats does not occur regardless of whether the species has special status. Bat populations throughout the state of California have declined greatly in the past decade because of human development (habitat loss and degradation), increased predation pressures, and possibly disease.

Potential foraging habitat is present throughout the bat study area, with a coarse estimate of 3,720 acres of naturally vegetated and undeveloped areas. Areas within the existing right of way are not expected to be used as foraging habitat because of artificial lighting from streetlights, vehicles, businesses, and residences and because of noise from traffic and other sources.

To determine the bat species present within the BSA, acoustic and emergence surveys for bat species were performed within a bat study area. Acoustic surveys determine the species of bats that are foraging or may be roosting in the bat study area. The emergence survey detects bat species emerging from roost sites. The bat study area included up to a 300-foot buffer (Build Alternative 4 had up to a 400-foot buffer of the alternative's centerline) (refer to Figure 3.17-1 in Section 3.17, *Natural Communities*).

A total of seven bat species were detected during biological studies, including the bat acoustic and emergence surveys: western red bat, hoary bat (*Lasiurus cinereus*), western yellow bat, canyon bat (*Parastrellus hesperus*), big brown bat (*Eptesicus fuscus*), and Mexican free-tailed bat (*Tadarida brasiliensis*). Additionally, individuals in the genus Myotis were detected during the acoustic analysis. However, due to the poor quality of the call, the species could not be definitively determined, although it is possible they were Yuma myotis (*Myotis yumanensis*), which was positively identified elsewhere. Of the 26 areas evaluated during emergence surveys, 8 were positive for roosting bats, and 4 of these same areas were positive for roosting bats during both summer and fall emergence surveys. Based on the results of the acoustic analysis for calls recorded at or near the suitable roosting features during the time of emergence, no special-status species bats were observed roosting during the survey effort. Although western yellow bat (CSC) was detected on several occasions (Figure 3.20-3), this species is a solitary roosting species that almost exclusively uses fan palms with an abundance of dead fronds. Suitable roosting habitat for this species does not occur within the bat study area, and the individuals detected were foraging. There are also historical records of pocketed or big free-tailed bat and western mastiff bat (*Eumops perotis*) within the LMR area; however, these species were not documented during biological studies.

3.20.2.3 Non-listed Non-WRC MSHCP Covered Species

There is a remainder of 13 non-listed special-status species that are not covered under the WRC MSHCP (excluding bats which are addressed in Section 30.20.2.2). Habitat requirements for these 13 species are listed in Table 3.20-1. Of the 13 non-listed, non-WRC MSHCP covered species that could occur in the BSA, short-eared owl, Vaux's swift, and an unidentified subspecies of vesper sparrow (*Pooecetes gramineus*) (possibly Oregon vesper sparrow [*P. g. affinis*]) were detected within the BSA during biological surveys. Of these, short-eared owl and Oregon vesper sparrow are strictly winter residents in the BSA, and Vaux's swifts only migrate through the region between northern breeding grounds and southern wintering grounds. Although there is suitable habitat in the BSA for the remaining 10 species, they were not detected during surveys.

3.20.2.4 Non-Listed WRC MSHCP Covered Species

A total of 32 non-listed species are fully covered under the WRC MSHCP and could occur within the BSA. Habitat requirements for these species are listed in Table 3.20-1. Of the 32 non-listed, WRC MSHCP covered species that could occur in the BSA, 16 were detected during biological surveys: western spadefoot, Belding's orange-throated whiptail (*Aspidoscelis hyperythra beldingi*; CSC), coastal western whiptail (*Aspidoscelis tigris stejnegeri*; CSC), northern red-diamond rattlesnake (*Crotalus ruber*; CSC), northern harrier, golden eagle, Cooper's hawk (*Accipiter cooperi*; Watchlist [WL]), sharp-shinned hawk (*Accipiter striatus*; WL), prairie falcon (*Falco mexicanus*), California horned lark (*Eremophila alpestris actia*; WL), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*; WL), Bell's sage sparrow (*Artemisiospiza belli belli*; WL), yellow warbler, yellow-breasted chat, San Diego black-tailed jackrabbit, and San Diego desert woodrat (*Neotoma lepida intermedia*; CSC). Of the species that were found in the BSA, all reptiles and mammals are year-round residents for this region, as are northern harrier (although this species is in regional decline due to a general lack of nesting habitat), golden eagle, Cooper's hawk, prairie falcon (also rare on the coastal slope due to lack of nesting habitat), California horned lark, southern California rufous-crowned sparrow, and Bell's sage sparrow. Sharp-shinned hawk is a winter resident, and yellow warbler and yellow-breasted chat are summer residents. Although there is suitable habitat in the BSA for the remaining 16 species, they were not detected during surveys.

3.20.2.5 Lake Mathews MSHCP

The LM MSHCP area of the BSA provides suitable habitat for a number of sensitive animal species. As described in Section 3.17, *Natural Communities*, habitat within the LM MSHCP area is generally composed of nonnative grasslands, Riversidian sage scrub, and riparian habitats. Planning wildlife species historically documented within the LM MSHCP area of the BSA include the following non-listed special-status species: San Diego horned lizard (*Phrynosoma blainvillii*; CSC), coastal western whiptail, northern red diamond rattlesnake, southern California rufous-crowned sparrow, tri-colored blackbird (*Agelaius tricolor*; CSC), California horned lark, Bell's sage sparrow, golden eagle, pocketed or big free-tail bat, San Diego black-tailed jackrabbit, northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*; CSC), white-tailed kite (*Elanus leucurus*; CFP), and San Diego Desert woodrat. These species were documented during field studies performed in 1992 and 1993 for the development of the LM MSHCP document. Several of these species were also observed during biological studies performed within the BSA for the proposed project; specific locations within the LM MSHCP area were not recorded.

In addition, there are several species that have no regulatory status but are planning species under the LM MSHCP, including Ruth's cuckoo bee (*Holcopasites ruthae*), San Bernardino ring-necked snake (*Diadophis punctatus modestus*), coastal rosy boa (*Lichanura trivirgata*), red-shouldered hawk (*Buteo lineatus*), rough-legged hawk (*Buteo lagopus*), and blue grosbeak (*Passerina caerulea*), that have potential to occur in the BSA. Focused studies were not performed for these species and are not required.

3.20.3 Environmental Consequences

3.20.3.1 Build Alternatives 1, 2C, and 4

The direct and indirect effects on natural vegetation communities are described in detail in Section 3.17, *Natural Communities*. The Impacts on special-status species that occur or potentially occur from Build Alternatives 1, 2C, and 4 are discussed in this section.

Burrowing Owl

Permanent removal of suitable habitat for BUOW would occur during construction of Build Alternatives 1, 2C, and 4. In addition, the build alternatives would temporarily affect habitat within the work area necessary to complete the project. As described above, a single wintering individual was found within the BSA adjacent to the Build Alternative 2C alignment (Figure 3.20-2); however, the burrow occupied by this individual occurs outside of the limits of disturbance (LOD). Although no individuals were detected along the Build Alternative 1 and 4 alignments during focused studies, BUOW are highly mobile and there is a potential for the species to occupy the LOD in the future. Measures **AS-1 (NES BIO-25)** through **AS-3 (NES BIO-28)** (in Section 3.20.4), as well as **NC-4 (NES BIO-5)** (in Section 3.17, *Natural Communities*), are intended to reduce potential direct effects on BUOW from Build Alternatives 1, 2C, and 4. Table 3.20-2 summarizes the permanent and temporary impacts on BUOW habitat.

Table 3.20-2. Direct Impacts on Suitable BUOW Habitat

Build Alternative	Impact Type[a]			
	Permanent (acres)	Roadbed Removal (Permanent Beneficial) (acres)	Temporary (acres)	Shading Effects[b] (acres)
Build Alternative 1	211.11	8.61	42.13	0.58
Build Alternative 2C	226.96	12.26	45.28	1.18
Build Alternative 4	201.28	6.55	38.94	3.97

[a] All totals are rounded to the nearest 100th.
[b] Shading effects = indirect impacts from bridge extensions and new bridges

Portions of the existing Cajalco Road and the road right of way would be permanently removed during project construction and returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with natural vegetation under the three build alternatives. This permanent impact is considered a beneficial impact and, although not required under the WRC MSHCP, would return suitable habitat for BUOW. The beneficial permanent impact from roadbed removal and rehabilitation of BUOW habitat under each build alternative is provided in Table 3.20-2.

Under all alternatives, any BUOW or its nest, if present adjacent to the LOD, could be temporarily and indirectly affected by project construction. Construction-related noise, rumbling, or general increased human presence could cause birds to abandon burrows or cause stress. Trash and food littered in the construction area could attract predators (such as coyotes), increasing potential predation of burrowing owl that may occur within the project vicinity. If construction occurs at night, night-lighting could disturb owls adjacent to the construction area. Temporary indirect impacts on habitat adjacent to the LOD could occur as well, including degradation of

habitat and the spread of exotic plant species, which could contribute to edge effects. However, indirect impacts on BUOW would be avoided and/or minimized by Measures **AS-1 (NES BIO-25)** through **AS-3 (NES BIO-28)** (in Section 3.20.4) and **NC-1 (NES BIO-1)** through **NC-9 (NES BIO-24)** (in Section 3.17, *Natural Communities*).

Special-Status Bats

Project impacts from Build Alternatives 1, 2C, and 4 would include the permanent removal of and temporary disturbance to potentially suitable foraging habitat for bats. Potential foraging habitat occurs throughout the LOD for each build alternative and varies from low to moderate quality. Potential foraging habitat within the grasslands and mustard-dominated nonnative vegetation is judged low quality due to its low prey abundance. Several areas that were identified as suitable habitat for large colonial roosts occur within the LOD of Build Alternative 1. Emergence of one individual at Emergence Location 6 (Figure 3.20-3) was observed at one of these locations; however, the location of the roosting individual occurred outside the project limits, and direct impacts on large colonial roosts within the LOD of Build Alternative 1 are not anticipated. Two areas that were identified as suitable habitat for large colonial roosts occur within the LOD of Build Alternative 2C. Direct impacts on large colonial roosts within the LOD of Build Alternative 2C are not anticipated. There were several areas that were identified as suitable habitat for large colonial roosts within the LOD of Build Alternative 4 (Sheets 6b, 7, and 11 of Figure 3.20-3). Direct impacts on large colonial roosts within the LOD for Alternative 4 are not anticipated. Table 3.20-3 provides the impacts on special-status bat species under each build alternative.

Table 3.20-3. Impacts on Foraging Habitat for Special-Status Bats

Build Alternative	Impact Type[a]			
	Permanent Impact (acres)	Roadbed Removal (Permanent Beneficial) (acres)	Temporary Impact (acres)	Shading Effect[b] (acres)
Build Alternative 1	241.30	9.29	53.76	1.35
Build Alternative 2C	256.76	12.85	56.90	1.93
Build Alternative 4	216.37	7.39	48.04	5.16

[a] All totals are rounded to the nearest 100th.
[b] Shading effects = indirect impacts from bridge extensions and new bridges.

Portions of the existing Cajalco Road and the road right of way would be permanently removed during project construction and returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with natural vegetation under the three build alternatives. This permanent impact is considered a beneficial impact because it would return suitable foraging habitat for special-status bats. The beneficial permanent impact from roadbed removal and rehabilitation of foraging habitat under each build alternative is provided in Table 3.20-3.

During construction, there is potential for temporary indirect impacts, such as noise and dust, to occur from construction activities, which could cause degradation of potential habitat adjacent to the LOD. These indirect impacts are expected to potentially affect only a few individuals given the existing disturbance levels along Cajalco Road. Measures **AS-2 (NES BIO-16)** and **AS-4 (NES BIO-26)** (in Section 3.20.4), as well as **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)**,

NC-10 (NES BIO-10), and **NC-13 (NES BIO-9)** (in Section 3.17, *Natural Communities*), are intended to avoid and/or minimize potential indirect impacts on bats or their habitat.

Overall, project impacts from Build Alternatives 1, 2C, and 4 would occur on low- to medium-quality foraging habitat, and direct impacts on large colonial roosts within the LOD of Build Alternatives 1, 2C, and 4 are not anticipated; therefore, the project is not expected to have biologically substantial impacts on special-status bats or large colonial roosts.

Non-Listed Non-WRC MSHCP Covered Species

During construction of Build Alternatives 1, 2C, and 4, potentially suitable habitat for all 13 non-listed, non-WRC MSHCP covered species would be removed. The potential habitat proposed for removal occurs in a linear stretch along the existing roadway; thus, the number of individual animals that could be directly affected by this loss of habitat would likely be low as wildlife are generally not expected to be present in large numbers in this area. For birds, depending on the species, this may be suitable nesting, foraging, wintering, or stopover habitat used during migration. Table 3.20-4 summarizes the permanent and temporary impacts on suitable habitat for each non-listed, non-WRC MSHCP covered species for Build Alternatives 1, 2C, and 4.

Table 3.20-4. Direct Impacts on Suitable Habitat for Non-Listed, Non-WRC MSHCP Covered Species

Mammals				
Southern Grasshopper Mouse	85.91	3.16	10.02	3.56
American Badger	138.12	5.06	24.27	3.83

[a] All totals are rounded to the nearest 100th.
[b] The impacts identified for each species were generated based on the habitat suitability requirements for each independent species. There may be some overlap in the vegetation communities that can be used by each species; however, the totals shown were evaluated independently.
[c] Shading effects = indirect impacts from bridge extensions and new bridges.

Portions of the existing Cajalco Road and the road right of way would be permanently removed during project construction and returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with natural vegetation under the three build alternatives. This permanent impact is considered a beneficial impact because it would return suitable habitat for species that occur in these particular areas. The beneficial permanent impact from roadbed removal and rehabilitation of habitat under each build alternative is provided in Table 3.20-4.

Both temporary and permanent impacts on individual animals could occur during construction. Indirect temporary impacts (e.g., degradation of habitat through noise, dust, human presence, increased fire risk) on potential habitat adjacent to the project LOD during construction may occur. While it is assumed that none of the bird species in this category would actually nest on-

site, if any did then active nesting habitat and/or active nests/young could be directly disturbed or destroyed by construction activities. The potential also exists for direct mortality and injury of individuals either during vegetation clearing and grading or by predators attracted to the construction area or by pets brought onto the site by construction personnel. Measures **AS-3 (NES BIO-28)**, **AS-5 (NES BIO-27)** and **AS-7 (NES BIO-20)** (in Section 3.20.4) are intended to avoid and/or minimize potential direct and indirect impacts on animals and their suitable habitat. For reptiles, this also includes Measures **NC-2 (NES BIO-2)** through **NC-13 (NES BIO-9)** (in Section 3.17, *Natural Communities*), as well as **AS-3 (NES BIO-28)** and **AS-7 (NES BIO-20)** (in Section 3.20.4); for birds this includes **NC-1 (NES BIO-1)** through **NC-10 (NES BIO-10)** and **NC-13 (NES BIO-9)** (in Section 3.17), as well as **AS-3 (NES BIO-28)** and **AS-5 (NES BIO-27)** (in Section 3.20.4); and for mammals, this includes **NC-2 (NES BIO-2)** through **NC-10 (NES BIO-10)** and **NC-13 (NES BIO-9)** (in Section 3.17), as well as **AS-3 (NES BIO-28)** (in Section 3.20.4) and **TE-1 (NES BIO-18)** (in Section 3.21, *Threatened and Endangered Species*).

The potential also exists for direct impacts on these species from operation of Build Alternatives 1, 2C, and 4. The addition of vehicle lanes could increase potential mortality from vehicle strikes because the wider roadway would be more difficult for animals to cross, particularly reptiles. However, wildlife crossings that have been incorporated into the project design would minimize the potential risk from vehicle strikes. Individual wildlife crossings proposed under each build alternative and their locations are provided in Appendix J; Table J-1 lists each proposed wildlife crossing and Figure J-1, Proposed Wildlife Crossings – Build Alternatives 1, 2C and 4, indicates the location of each crossing. Conditions related to operation and maintenance of Build Alternatives 1, 2C, and 4 would not differ appreciably from existing operating conditions. The roadway would continue to produce noise, dust, air pollution, and fire risk. However, all of these impacts have been occurring for decades.

Non-Listed WRC MSHCP Covered Species

Permanent removal of suitable habitat for WRC MSHCP covered non-listed species would occur during construction of Build Alternatives 1, 2C, and 4. The potential habitat proposed for removal occurs in a linear stretch along the existing roadway; thus, the number of individual animals that could be directly affected by this loss of habitat would likely be low because wildlife density would be expected to be low along roadways. If these species are present, there is potential for direct mortality and loss of live-in, breeding, and foraging habitat. Indirect impacts from project construction could degrade habitat further. However, these potential impacts are fully covered under the WRC MSHCP. Measures identified in Section 3.20.4 that are intended to avoid and/or minimize potential direct and indirect impacts on WRC MSHCP covered non-listed species include **AS-2 (NES BIO-16)** through **AS-5 (NES BIO-27)** and **AS-7 (NES BIO-20)**, as well as **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** (in Section 3.17, *Natural Communities*) and **TE-3 (NES BIO-30)** (in Section 3.21, *Threatened and Endangered Species*). Table 3.20-5 on the following page summarizes the permanent and temporary impacts on suitable habitat for these species.

Table 3.20-5. Direct Impacts on Suitable Habitat for WRC MSHCP Covered Non-listed Species

Build Alternative	Impact Type[a]			
	Permanent (acres)	Roadbed Removal (Permanent Beneficial) (acres)	Temporary (acres)	Shading Effects[b] (acres)
Build Alternative 1	239.86	9.29	53.61	1.35
Build Alternative 2C	255.12	12.85	56.76	1.93
Build Alternative 4	216.16	7.28	47.57	4.99

[a] All totals are rounded to the nearest 100th.
[b] Shading effects = indirect impacts from bridge extensions and new bridges.

Potential indirect effects from operation of the proposed project may occur from vehicle strikes, fire risk, and degradation of habitat adjacent to the facility, but these impacts would not be expected to be substantially greater than existing conditions. Although the non-listed bird species and foraging habitat are covered under the WRC MSHCP, the birds and their active nests are still afforded protections under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code. The avoidance and minimization measures in Section 3.20.4 will ensure there would be no impacts on nesting birds or raptors. With implementation of these measures, all impacts on these species would be fully covered.

Nesting Birds

Project construction may additionally have adverse impacts on species that are protected by the MBTA and similar provisions of the California Fish and Game Code. This includes bird species previously addressed above as well as those that have no other protections. As stated above for other species, construction of the project would result in both temporary and permanent loss of habitat throughout the LOD. The act of removing this vegetation may result in increased stress to adult and young birds, nest abandonment, or direct take of nests that are in the construction footprint, as well as injury or mortality of birds at, in, or nearby to the nest. In addition, construction equipment and activity in the vicinity of active nests may have similar or the same results. Long-term operation may temporarily exclude species from nesting in the vicinity of the project, although over time small numbers of birds may return. It is expected that if this happened, those birds would be acclimated to the new road conditions, including noise and any visual disturbance, and that under normal circumstances no additional impacts would be expected to those particular nesting birds. Avoidance and minimization measures listed in Section 3.20.4, specifically **AS-5 (NES BIO-27)**, as well as **NC-1 (NES BIO-1)** through **NC-8 (NES BIO-8)**, **NC-10 (NES BIO-10)**, and **NC-13 (NES BIO-9)** (in Section 3.17, *Natural Communities*), would reduce the number of direct effects on individual birds, although it may not have an effect on the amount of habitat that is lost.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Burrowing Owl

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not

currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the six-lane facility would not change any effects on BUOW that are already expected as a result of the four-lane facility. Because the additional two lanes would be situated in the median, it would be unlikely for any BUOW to occur in this narrow strip of open land, which would be graded during construction of the selected build alternative. Operation of the two additional lanes could potentially result in additional traffic noise, but this is not expected to affect owls. If any staging areas are located in areas outside of the right of way, it is possible that there may be temporary impacts on BUOW in association with the use of the staging area.

Special-Status Bats

If the two additional lanes described above are constructed within the medians of Cajalco Road and La Sierra Avenue in the future, it is anticipated that operation of the six-lane facility would not change any effects on special-status bats that are already expected as a result of the four-lane facility. Because the additional two lanes would be situated in the median and would be graded during construction of the selected build alternative, a robust insect prey base would not be expected that would draw bats to forage there. If any foraging areas are located outside of the right of way, it is possible that there may be temporary impacts on special-status bats that may be roosting nearby, but staging areas could be located in areas where bat roosts do not occur so as to avoid or minimize impacts.

Non-Listed Non-WRC MSHCP Covered Species

If the two additional lanes described above are constructed within the medians of Cajalco Road and La Sierra Avenue in the future, it is anticipated that operation of the six-lane facility would not change effects on wildlife from those that are already expected as a result of the four-lane facility. Avoidance and minimization Measure **NC-16 (NES BIO-19)** (in Section 3.17, *Natural Communities*) would require wildlife exclusion fencing along the length of the road, with periodic ramps to allow any trapped wildlife out. Fencing would push wildlife to culverts that would travel below the road to allow safe crossing. Therefore, the development and use of the median as two additional travel lanes would have no effect on the exclusionary measures that would already be in effect to guide terrestrial wildlife under the road. The loss of the median may result in a minor loss of foraging habitat to species that prefer to forage in ruderal/open/grassland areas (e.g., doves), but because the project is in general surrounded by undeveloped lands it would be easy for the birds to move out of the footprint and into adjacent or nearby areas. If any staging areas are located in areas outside of the right of way, it is possible that there may be temporary impacts on wildlife in association with the use of the staging area.

Non-Listed WRC MSHCP Covered Species

If the two additional lanes described above are constructed within the medians of Cajalco Road and La Sierra Avenue in the future, it is anticipated that operation of the six-lane facility would not change effects on wildlife from those that are already expected as a result of the four-lane facility. Avoidance and minimization Measure **NC-16 (NES BIO-19)** (in Section 3.17, *Natural Communities*) would require wildlife exclusion fencing along the length of the road, with periodic ramps to allow any trapped wildlife out. Fencing would push terrestrial wildlife to culverts that would travel below the road to allow safe crossing. Therefore, the development and

use of the median as two additional travel lanes would have no effect on the exclusionary measures that would already be in effect to guide terrestrial wildlife under the road. Aquatic species would not be expected to be affected by the operation of the two additional lanes, and construction effects would be minimized or avoided through implementation of Measures **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-12 (NES BIO-12)** (in Section 3.17, *Natural Communities*). If any staging areas are located in areas outside of the ROW, it is possible that there may be temporary impacts on wildlife in association with the use of the staging area.

Nesting Birds

If the two additional lanes described above are constructed within the medians of Cajalco Road and La Sierra Avenue in the future, it is anticipated that operation of the six-lane facility would not change any effects on birds from those that are already expected as a result of the four-lane facility. Operation of the two additional lanes would perhaps result in additional traffic noise, but birds nesting, roosting, foraging, or otherwise along the side of the road would be expected to be acclimated to the noise and traffic. The two additional lanes would be in the median and would be graded during initial construction of the chosen build alternative, and thus would have little value to wildlife in general. The loss of the median may result in a minor loss of foraging habitat to species that prefer to forage in ruderal/open/grassland areas (e.g., doves), but because the project is in general surrounded by undeveloped lands it would be easy for the birds to move out of the footprint and into adjacent or nearby areas. If any staging areas are located in areas outside of the right of way, it is possible that there may be temporary impacts on wildlife in association with the use of the staging area.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Under Build Alternatives 1 and 2C, segments of Cajalco Road within the Lake Mathews MSHCP planning area and LMR would be expanded and realigned. Under Build Alternative 4, La Sierra Avenue and El Sobrante Road would be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities including drainage basins, culverts, bridges and wildlife crossings, would also be constructed within the LM MSHCP area and LMR under any of the build alternatives. Because the LM MSHCP does not currently accommodate the construction of these facilities or include a prescribed process to allow changes to the plan in response to public safety and/or accessed needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. All three build alternatives would also encroach into portions of the LMR and remove habitat for LM MSHCP target species (including the species addressed throughout this section). Modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties.

Burrowing Owl

No burrowing owl were found within the LMR. Impacts on potential habitat would affect up to 128.26 acres under Build Alternative 1, 121.69 acres under Build Alternative 2C, and 65.54 acres under Build Alternative 4. Although no impacts would occur on BUOW, as previously mentioned, this species is highly mobile and may migrate into the LOD prior to construction. The measures identified above would apply within the LM MSHCP area. In addition, the project

would be required to replace suitable habitat for this species, regardless of the species presence or absence during focused studies (**NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*).

Special-Status Bats

The LMR provides approximately 120.56 acres of suitable foraging habitat for pallid bat, mastiff bat, pocketed free-tailed bat, and big free-tailed bat that would be permanently removed under Build Alternative 1. Temporary impacts would occur on 20.91 acres of the LMR. Species discussed above were not detected within these reserve lands.

The LMR has approximately 111.46 acres of suitable foraging habitat for pallid bat, mastiff bat, pocketed free-tailed bat, and big free-tailed bat that would be permanently removed under Build Alternative 2C. Temporary impacts would occur on 22.56 acres of the LMR.

Approximately 56.52 acres of suitable foraging habitat for pallid bat, mastiff bat, pocketed free-tailed bat, and big free-tailed bat would be permanently removed under Build Alternative 4. Temporary impacts would occur on 9.01 acres of the LMR. Species discussed above were not detected within the LMR.

Avoidance and minimizations identified above would also be implemented to reduce indirect impacts on bats within the LMR. In addition, the project would be required to replace suitable habitat for these species, regardless of the species' presence or absence during focused studies (**NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*).

Non-Listed Non-WRC MSHCP Covered Species

The non-listed WRC MSHCP species described above are not LM MSHCP Planning species; therefore, no impacts analysis for these species is provided.

Non-Listed WRC MSHCP Covered Species

The build alternatives would directly affect suitable habitat for many of the LM MSHCP Planning species. As mentioned in Section 3.20.2.5, there are 14 special-status species that have been historically documented in the BSA and/or documented during biological studies. There is a potential for the species to be potentially impacted by the build alternatives based on the removal of suitable habitat for these species.

The measures identified above would apply within the LMR. In addition, the project would be required to replace suitable habitat for the Planning species, regardless of the species directly affected (**NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*).

Nesting Birds

Undeveloped lands within the LMR provide suitable habitat that could potentially be used by birds and raptors protected by the MBTA and similar provisions under the California Fish and Game Code. During construction within the LM MSHCP area, the avoidance and minimization measures identified above for each build alternative would apply within the LMR as well.

Habitat Impacts

Direct and indirect effects would occur on habitat within the LMR, which supports the LM MSHCP target species identified in Section 3.20.2.5, including species that have no special regulatory status. Table 3.20-6 summarizes the direct impacts on natural vegetation communities within the LMR.

Table 3.20-6. Vegetation Communities Direct Impacts: Lake Mathews Reserve

	Impact Type		
Build Alternative	**Permanent Impact[a,b]**	**Temporary Impact**	**Roadbed Removal[c]**
Build Alternative 1	120.31	20.79	0.14
Build Alternative 2C	111.21	22.44	0.16
Build Alternative 4	56.52	8.76	0.70

[a] All totals are rounded to the nearest 100th.
[b] Replacement and restoration acreages are only for natural lands suitable for LM MSHCP covered species. These lands have been generally categorized as nonnative grassland, Riversidian sage scrub, and riparian. No developed areas or exotic/invasive vegetated areas would require compensation; therefore, these have been deducted from the total impacts for the conservation area.
[c] Roadbed removal would restore native vegetation suitable for this species and has already been removed from the total compensation requirements.

Measure **AS-7 (NES BIO-20)** would be implemented to ensure there are no impacts on the portions of the LMR that occur outside of the LOD. Mitigation measures to compensate for the loss of habitat will include acquisition and/or restoration of lands contiguous with the existing Reserve area; improvements to security fencing that will still allow for wildlife passage through wildlife crossings; installation of cameras to monitor wildlife usage at crossings and deter human trespass; and establishment of an endowment fund to be used for Reserve enhancement, management, and monitoring (**NC-17 [NES BIO-17]** and **NC-18 [NES BIO-31]** in Section 3.17, *Natural Communities*). In addition, temporary impacts are proposed to be addressed through onsite restoration (**NC-19 [NES BIO-15]** in Section 3.17).

The details for land acquisitions and funding requirements will be coordinated with the Lake Mathews Reserve Management Committee (RMC) and final selection of mitigation would be contingent upon approval by RMC. In addition, removal of the existing roadbed will return lands to natural topographic contours, be decompacted to allow for plant establishment, and revegetated with native vegetation. Under Build Alternative 2C, areas of roadbed removal will be kept as 20-foot-wide dirt, gravel, or partially paved access roads for management of the LMR and MWD use, but the road edges would be revegetated with native species. Roadbed removed under Build Alternatives 1 and 4 would be revegetated with native vegetation. Roadbed removal areas that are returned to natural state or planned for exclusive use by MWD or management of the Reserve are included as compensatory mitigation for impacts on the Reserve.

3.20.3.2 No-Build Alternative

Under the No-Build Alternative, there would be no permanent or temporary impacts on natural communities of special concern beyond those that would be expected to occur from the existing facility.

3.20.4 Avoidance, Minimization, and/or Mitigation Measures

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **TE-3 (NES BIO-30)** in Section 3.21, *Threatened and Endangered Species*, will ensure the indirect effects on non-listed special-status species from construction activities are avoided and/or minimized.

The following avoidance and minimizations measures address the direct and indirect impacts on non-listed special-status animals:

AS-1 (NES BIO-25): BUOW Management Plan – A burrowing owl (BUOW) management plan will be developed to ensure avoidance of impacts on BUOW within Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) BUOW survey areas. In the plan, the following information, at a minimum, will be included and performed during each phase of project construction:

a) Focused Survey for BUOW – Performed following the WRC MSHCP protocol between the window of March 1 through August 31 and in the survey season prior to scheduled construction. The survey will include the limits of disturbance (LOD) of the selected build alternative and up to a 300-foot buffer if performed between February 1 and August 31.

b) Preconstruction Survey for BUOW – Performed within 30 days prior to ground disturbance regardless of whether the species is found during the focused survey. The survey area would be the LOD and at least a 300-foot buffer and required only within WRC MSHCP BUOW survey areas.

c) Protocol for Presence – Steps necessary for handling the presence of BUOW (if found during either of the two surveys), which may include full avoidance, if feasible, or passive relocation by a qualified ornithologist.

d) Agency Approval – The BUOW management plan will be submitted for review by the Western Riverside County Regional Conservation Authority, U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, and Lake Mathews Reserve Management Committee (for the Lake Mathews Multiple Species Reserve area only).

AS-2 (NES BIO-16): Light Shielding – The Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) requires that shielding be incorporated in project designs to ensure ambient lighting in WRC MSHCP conservation areas is not increased (WRC MSHCP Volume I, Section 6.1.4). Night lighting will be directed away from natural lands within existing and proposed WRC MSHCP conservation areas in order to support potential linkage and core functions during construction. This is intended to protect species within existing and proposed WRC MSHCP conservation areas from direct night lighting during construction, if activities occur at night. Table 3.20-7 provides the areas where night lighting restrictions applies for each build alternative.

Table 3.20-7. Night Lighting Avoidance Areas by Build Alternative

Build Alternative	Night Lighting Avoidance Areas Within and Adjacent to Conservation Areas
Build Alternative 1	STA #18 to 27; STA #90 to 146; STA #159 to 513
Build Alternative 2C	STA #18 to 27; STA #90 to 146; STA #159 to 518
Build Alternative 4	STA #18 to 27; STA #90 to 149; STA #149 to 182 (west side of LOD only); STA #184 to 231 (east side of LOD only); STA #270 to 318 (south side of LOD only); STA #330 to 344 (south side of LOD only); STA #356 to 385 (south side of LOD only); STA #385 to 421; STA #421 to 511 (south side of LOD only); and STA #511 to 581.

LOD = limits of disturbance

AS-3 (NES BIO-28): Preconstruction Surveys – Preconstruction clearance surveys for sensitive wildlife species will be performed within 3 days prior to construction to flush the species from the construction footprint following the installation of Environmentally Sensitive Area (ESA) fencing. ESA fencing must be sufficient to prevent the entry of animals into the limits of disturbance (LOD) as feasible. No nesting birds will be flushed during the nesting season. Bats will not be flushed but will be protected as specified in **AS-4**. Burrowing wildlife will be relocated from the site as feasible during preconstruction clearance surveys.

AS-4 (NES BIO-26): Bat Management – A bat management plan will be developed to ensure mortality to roosting bats does not occur to ensure California Environmental Quality Act compliance and consistency with the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan. The following items will be included in the plan, at a minimum:

a) For each location determined to be suitable for special-status bat species or large colonial roosts, a preconstruction survey will be conducted to determine if the location is occupied by roosting bats.

b) For each location confirmed to be occupied by bats, the plan will provide details both in text and graphically where exclusion devices will need to be placed, the timing for exclusion work, and the timeline and methodology needed to exclude the bats.

c) Monitoring activities and schedule will be included, including frequency of monitoring, which structures would need to be monitored, and reporting requirements.

d) Draft plan will be submitted for review to the U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, and Lake Mathews Reserve Management Committee.

AS-5 (NES BIO-27): Nesting Bird Management – A nesting bird management plan will be drafted to provide a comprehensive approach to addressing nesting birds prior to the commencement of construction phases. It will include, at a minimum, the following items:

a) Project biologist and monitoring biologist qualifications.

b) Methods and timing (including seasonal considerations) for preconstruction surveys for nesting birds protected under the Migratory Bird Treaty Act and California Fish and Game Code, which will be performed prior to the start of all project phases during the bird breeding season. Preconstruction nesting bird survey requirements may be superseded by the Lake and Streambed Alteration Agreement.

c) Methods for addressing nesting birds, raptors, and colonial nesting birds (i.e., swallows), including avoidance buffers, avoidance measures to reduce disturbances to active nests, and deterrent methods.

d) Reporting requirements.

This nesting bird management plan will be coordinated with and submitted for review by U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, and Lake Mathews Reserve Management Committee (as the plan pertains to the Lake Mathews Multiple Species Reserve area).

AS-6 (NE BIO-29): Pet Policy – Construction staff will not be permitted to bring their pets in, or adjacent to, the construction area.

AS-7 (NES BIO-20): Environmentally Sensitive Areas – Environmentally sensitive area (ESA) fencing must be sufficient to prevent the entry of animals into the limits of disturbance. Once the ESA fencing has been installed (**NC-6 [NES BIO-6]**), a preconstruction reptile and amphibian clearance survey will be conducted no more than 3 days prior to site grubbing and grading of lands in the area. If construction is to follow in stages, then the preconstruction clearance survey would be scheduled to follow just prior to site grubbing and grading. Clearance surveys will be conducted during the appropriate time of day when reptiles and amphibians are active. Table 3.20-8 describes where this measure is applicable for various species.

Table 3.20-8. ESA Fencing Locations for Reptiles and Amphibians

Species	Location	Refer to Section
Arroyo Toad	All Conserved Lands	3.21.3
Southern California Legless Lizard California Glossy Snake Coast Western Patch-Nosed Snake Two-Striped Garter Snake	Entire Project LOD	3.20.3
San Bernardino Ring-Necked Snake Coastal Rosy Boa	Lake Mathews Reserve	3.20.3

3.21 Threatened and Endangered Species

3.21.1 Regulatory Setting

The primary federal law protecting threatened and endangered species is the Federal Endangered Species Act (FESA): 16 United States Code (USC), Section 1531, et seq. See also 50 Code of Federal Regulations (CFR) Part 402. This act and subsequent amendments provide for the conservation of endangered and threatened species and the ecosystems upon which they depend. Under Section 7 of this act, federal agencies, such as the Federal Highway Administration (FHWA) (and the Department, as assigned), are required to consult with the U.S. Fish and Wildlife Service (USFWS) and the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries) to ensure that they are not undertaking, funding, permitting or authorizing actions likely to jeopardize the continued existence of listed species or destroy or adversely modify designated critical habitat. Critical habitat is defined as geographic locations critical to the existence of a threatened or endangered species. The outcome of consultation under Section 7 may include a Biological Opinion with an Incidental Take Statement, a Letter of Concurrence. Section 3 of FESA defines take as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect or any attempt at such conduct."

California has enacted a similar law at the state level, the California Endangered Species Act (CESA), California Fish and Game Code; Section 2050, et seq. CESA emphasizes early consultation to avoid potential impacts to rare, endangered, and threatened species and to develop appropriate planning to offset project caused losses of listed species populations and their essential habitats. The California Department of Fish and Wildlife (CDFW) is the agency responsible for implementing CESA. Section 2080 of the Fish and Game Code prohibits "take" of any species determined to be an endangered species or a threatened species. Take is defined in Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." CESA allows for take incidental to otherwise lawful development projects; for these actions an incidental take permit is issued by CDFW. For species listed under both FESA and CESA requiring a Biological Opinion under Section 7 of the FESA, CDFW may also authorize impacts to CESA species by issuing a Consistency Determination under Section 2080.1 of the Fish and Game Code.

Consistency with the Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) would provide take coverage for state-listed species affected by the project, with the consistency review performed by the Western Riverside Regional Conservation Authority (RCA), USFWS, and CDFW (see Section 3.21.2.2).

The proposed project is a covered activity under the WRC MSHCP (Volume I, Section 7.2.2); therefore, take authorization for impacts on covered federal and state endangered species would occur through consistency with the WRC MSHCP and the plan's permits. A consistency review by the RCA, USFWS, and CDFW will be performed to ensure that the project is consistent with the requirements of the WRC MSHCP. The consistency review will result in a streamlined biological opinion from USFWS. Formal consultation under Section 7 will not be necessary.

In addition, the project overlaps a Stephens' kangaroo rat (SKR) Core Reserve established under the SKR Habitat Conservation Plan (HCP). Although take authorization for SKR would occur under the WRC MSHCP, any loss of SKR Core Reserve would require the preparation and

submittal of a Core Reserve Land Disturbance Report to the Riverside County Habitat Conservation Agency (RCHCA). This report would document the impacts on SKR and the compensatory mitigation.

The proposed project also overlaps with the Lake Mathews Multiple Species Reserve (LMR) established by the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP). The LM MSHCP is a joint conservation effort initiated by the Metropolitan Water District of Southern California (MWD) and the RCHCA in cooperation with the USFWS and CDFW that spans a total of 5,993.5 acres of open land around Lake Mathews. The LM MSHCP provides take of federally (ESA) and state-listed (CESA) species covered under the plan and the measures necessary to minimize and mitigate for such take. There are a total of 65 target species within the LM MSHCP area and the 5,110.4-acre LMR, including 12 covered federally and state-listed as threatened and endangered species. Proposed project impacts within the LM MSHCP area beyond the existing right of way are not an allowable use or activity under this plan. Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements.

Another federal law, the Magnuson-Stevens Fishery Conservation and Management Act of 1976, was established to conserve and manage fishery resources found off the coast, as well as anadromous species and Continental Shelf fishery resources of the United States, by exercising (A) sovereign rights for the purposes of exploring, exploiting, conserving, and managing all fish within the exclusive economic zone established by Presidential Proclamation 5030, dated March 10, 1983, and (B) exclusive fishery management authority beyond the exclusive economic zone over such anadromous species, Continental Shelf fishery resources, and fishery resources in special areas.

3.21.2 Affected Environment

Unless otherwise noted, the information from this section was based upon the Natural Environment Study (NES) prepared for the project (Caltrans 2018, 2021). References used in the NES are not carried over into this section.

In order to comply with the provisions of various state and federal environmental statutes and executive orders, the potential impacts on natural resources of the region were investigated and documented. A list of species and habitats within the project region was developed based on information compiled from USFWS, California Natural Diversity Database (CNDDB), and other current publications. An official USFWS species list was generated March 4, 2021 (Appendix J). The Biological Study Area (BSA) was field reviewed to identify habitat types, potential to support threatened and endangered species, and potential problem areas.

A literature review determined that 32 federally and/or state-listed as threatened or endangered species may potentially occur within the BSA. Sixteen of the 32 threatened or endangered species identified in the literature review were determined to be absent due to a lack of suitable habitat. Potential habitat for the following 16 threatened or endangered species was judged present within the BSA: Munz's onion (*Allium munzii*), San Diego ambrosia (*Ambrosia pumila*), Nevin's barberry (*Berberis nevinii*), thread-leaved brodiaea (*Brodiaea filifolia*), slender-horned

spineflower (*Dodecahema leptoceras*), spreading navarretia (*Navarretia fossalis*), Riverside fairy shrimp (*Streptocephalus woottoni*), vernal pool fairy shrimp (*Branchinecta lynchi*), San Diego fairy shrimp (*Branchinecta sandiegonensis*), Quino checkerspot butterfly (*Euphydryas editha quino*), southwestern willow flycatcher (*Empidonax traillii extimus*), least Bell's vireo (LBV) (*Vireo bellii pusillus*), bald eagle (*Haliaeetus leucocephalus*) (foraging only), coastal California gnatcatcher (CAGN) (*Polioptila californica*), arroyo toad (*Anaxyrus californicus*), and SKR (*Dipodomys stephensi*). Focused surveys were performed for rare plants, fairy shrimp, LBV, southwestern willow flycatcher, and SKR based on the survey requirements identified in WRC MSHCP Volume I, Section 6.1.2, 6.1.3, and 6.3.2, and the SKR HCP within the RCHCA SKR reserve.

Study areas for these species were applied to the limits of disturbance (LOD) as follows: (1) the rare plant study area and fairy shrimp study area included up to a 200-foot LOD buffer (Build Alternative 4 had up to a 300-foot buffer from the alternative's centerline); (2) the riparian bird study area included up to a 300-foot buffer from the LOD that was applied to surveys focused on LBV and southwestern willow flycatcher; and (3) the SKR study area included up to a 500-foot buffer from the LOD. Refer to Figure 3.17-1 for the limits of each study area. All other species with potential to occur within the BSA have no survey requirements.

Threatened and endangered species evaluated for the proposed project and their habitat requirements, regulatory status, and potential for occurrence within the BSA are provided in Table 3.21-1 on the following page, and are described in more detail in the NES report prepared for the project.

Table 3.21-1. Listed Species Potentially Occurring or Known to Occur in the BSA

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Plants				
Munz's Onion (*Allium munzii*)	E/T/1B.1/WRC MSHCP (b)/ LM MSHCP	Found on mesic exposures or seasonally moist microsites in grassy openings in coastal sage scrub, chaparral, juniper woodland, and valley and foothill grasslands in clay soils. Associated with a special "clay soil flora" found in southwestern Riverside County. At least one population (Bachelor Mountain) is reported to be associated with pyroxenite outcrops instead of clay.	A	Proposed project within Narrow Endemic Plant Species (NEPS) survey areas for this species. The BSA contains areas of grasslands with clay soils. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, and 2016.
San Diego Ambrosia (*Ambrosia pumila*)	E/-/1B.1/WRC MSHCP (b)/-	Occurs in open floodplain terraces or in the watershed margins of vernal pools. This species occurs in a variety of associations that are dominated by sparse nonnative grasslands or ruderal habitat in association with river terraces, vernal pools, and alkali playas. San Diego ambrosia generally occurs at low elevations generally less than 1,600 feet above mean sea level (amsl) in the Riverside County populations and less than 600 feet amsl in San Diego County.	A	Proposed project within NEPS survey areas for this species. Potential habitat occurs in the BSA; however, this species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, and 2016.
Marsh Sandwort (*Arenaria paludicola*)	E/E/1B.1/-/-	Found in sandy substrate where there are openings. Associated with marshes and swamps. Presumed extirpated or unknown population at San Bernardino South U.S. Geological Survey (USGS) quad.	HA	No suitable marsh habitat is present within the BSA. Because focused studies for rare plants included habitat in which the species could remotely occur and took place during the appropriate blooming period, this species was determined to be absent.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Braunton's Milkvetch (*Astragalus brauntonii*)	E/-/1B.1/- / LM MSHCP	Can be found within chaparral, coastal scrub, and valley and foothill grasslands. Often found within recently burned areas. Flowers emerge between January and August. Occurs at elevations up to approximately 2,500 feet amsl.	A	The BSA is well outside the geographic distribution of this species. Neither the CNDDB nor the California Native Plant Society (CNPS) have records of this species within the BSA or the 12 USGS quads the BSA occurs on or is directly adjacent to. It is presented here because it is a covered species with potential to occur in grassland and scrub habitat under the LM MSHCP. No potential for this species to be present.
San Jacinto Valley Crownscale (*Atriplex coronata* var. *notatior*)	E/-/1B.1/WRC MSHCP (d)/-	Occurs primarily in floodplains (seasonal wetlands) dominated by alkaline scrub, playas, vernal pools, and, to a lesser extent, alkaline grasslands. Restricted to highly alkaline, silty-clay soils in association with the Traver-Domino-Willows soil association; the majority (approximately 80%) of the populations are associated with the Willows soil series.	HA	The BSA lacks the combination of suitable vegetation communities and soils. This species is not expected to occur.
Nevin's Barberry (*Berberis nevinii*)	E/E/1B.1/WRC MSHCP (d)/-	Found in coarse soils and rocky slopes in chaparral and gravelly wash margins in alluvial scrub. Elevation range from 899 feet to 2,707 feet amsl. Any chaparral and alluvial scrub within the vicinity of the San Timoteo Badlands, Vail Lake, and Agua Tibia Mountains should be considered potential habitat.	A	Suitable habitat occurs within the BSA and the BSA is located within the elevational range for the species. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, and 2016.
Thread-leaved Brodiaea (*Brodiaea filifolia*)	T/E/1B.1/WRC MSHCP (d)/-	Found in heavy soils (e.g., clay) in coastal sage scrub, chaparral, cismontane woodland, and vernal pools from 1,575 to 4,000 feet. Within western Riverside County found in southern Santa Ana Mountains, Santa Rosa Plateau, and alkali flats of the San Jacinto River flood plain and west of Hemet (Roberts et al. 2004).	A	Suitable habitat for this species is present within coastal sage scrub, particularly where clay/heavy soils are present. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, and 2016.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Salt Marsh Bird's-beak (*Chloropyron maritimum* ssp. *maritimum*)	E/E/1B.2/-/-	Found in sandy loam substrate within coastal dunes and marshes and swamps with high salt concentrations. Presumed extant population exists in San Bernardino South USGS quad. Elevation range is from 0 feet to 98 feet.	HA	Suitable habitat for this species is absent from the BSA. Because focused studies for rare plants included habitat in which the species could remotely occur and took place during the appropriate blooming period, this species was determined to be absent.
Slender-horned Spineflower (*Dodecahema leptoceras*)	E/E/1B.1/WRC MSHCP (b)/LM MSHCP	Found on flood-deposited fine sand terraces and washes in Riversidian alluvial fan sage scrub from 656 to 2,493 feet. Also associated with cismontane woodland and chaparral having suitable hydrology and fine sands.	A	Proposed project within NEPS survey areas for this species. Suitable habitat is present within the BSA in the Riversidian alluvial fan sage scrub. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, and 2016.
Santa Monica Dudleya (*Dudleya cymosa* ssp. *ovatifolia*)	T/-/1B.1/-/-	Found in volcanic or sedimentary substrate within chaparral and coastal scrub habitats. Elevation range is from 492 feet to 5,495 feet. Presumed extant population recorded in Santiago Peak USGS quad.	A	Suitable habitat occurs within the BSA in coastal sage scrub and the BSA is located within the elevation range for the species. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, and 2016.
Santa Ana River Woollystar (*Eriastrum densifolium* ssp. *sanctorum*)	E/E/1B.1/WRC MSHCP/-	Found in sandy or gravelly substrate within chaparral and coastal scrub alluvial fan habitats. Elevation range is from 299 feet to 2,001 feet. Presumed extant populations recorded in Corona North and Riverside West USGS quads.	A	Suitable habitat occurs within the BSA and the BSA is located within the elevation range for the species. This species was not detected during the rare plant focused surveys that occurred in 2011, 2012, 2014, 2015, and 2016.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Spreading Navarretia (*Navarretia fossalis*)	T/-/1B.1/-	Associated with vernal pools and depressions and ditches in areas that once supported vernal pools. In western Riverside County, spreading navarretia has been found in relatively undisturbed and moderately disturbed vernal pools, within larger vernal floodplains dominated by annual alkali grassland or alkali playa. The alkali vernal playa/pool habitat found in the Hemet area is based primarily on silty clay soils in the Willows and Travers series. These soils are usually saline-alkaline in nature and reliably pond water for long durations.	A	There are a few areas with clay soils in the BSA that could potentially support this species. It was not detected during the rare plant focused survey in 2010, 2011, 2012, 2014, 2015, and 2016.
California Orcutt Grass (*Orcuttia californica*)	E/E/1B.1/-	Restricted to the deeper portions of undisturbed vernal pools. In Riverside County, this species is found in southern basaltic claypan vernal pools at the Santa Rosa Plateau and alkaline vernal pools as at Skunk Hollow and at Salt Creek west of Hemet.	HA	No suitable vernal pool habitat is present within the BSA. It was not detected during the rare plant focused survey in 2010, 2011, 2012, 2014, 2015, and 2016.
Invertebrates				
Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)	T/-/-/ WRC MSHCP (a)/-	Restricted to seasonal vernal pools. The vernal pool fairy shrimp prefers cool-water pools that have low to moderate dissolved solids, which are unpredictable and often short-lived.	A	Up to 19 pools were identified as potentially suitable habitat for fairy shrimp (Appendix F of the NES) within the BSA. Only versatile fairy shrimp (*B. lindahli*) was found within the BSA during the 2013–2014 focused survey.
San Diego Fairy Shrimp (*Branchinecta sandiegonensis*)	E/-/-/-/-	Found within vernal pools on mesas within San Diego and Orange Counties.	A	Up to 19 pools were identified as potentially suitable habitat for fairy shrimp (Appendix F of the NES) within the BSA. Only versatile fairy shrimp (*B. lindahli*) was found within the BSA during the 2013–2014 focused survey.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Quino Checkerspot Butterfly (*Euphydryas editha quino*)	E/-/-/WRC MSHCP/ LM MSHCP	Habitat associations seem to be tied to both host plant species and topography. Larvae feed on *Plantago erecta*, *Plantago patagonica*, *Antirrhinum coulterianum*, *Cordylanthus rigidus* (and possibly other Plantago species), *Collinsia concolor*, and *Castilleja exserta*. Adults nectar mostly on small annuals; often occur on open or sparsely vegetated rounded hilltops, ridgelines, and occasionally rocky outcrops. Habitat components have been found in association with, but not restricted to, vernal pools, sage scrub, chaparral, native and nonnative grassland, and open oak and juniper woodland communities. The key component seems to be open-canopied habitats.	HP	Suitable habitat for this species is present in coastal sage scrub and grassland habitat. The species has historically been documented along Cajalco Road east of La Sierra Avenue; however, because the species has not been documented since 2002, it is believed to be extirpated from the project vicinity.
Delhi Sands Flower-loving Fly (*Rhaphiomidas terminatus abdominalis*)	E/-/-/WRC MSHCP/-	Restricted to the Colton Dunes habitat complex. The habitat is limited to 11-mile radius straddling Interstate 10 at Colton and Rialto municipal areas.	HA	BSA does not lie within or near the limited geography of the Colton Dunes complex and no suitable habitat is present. This species is not expected to occur.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Riverside Fairy Shrimp (*Streptocephalus woottoni*)	E/-/-/WRC MSHCP (a)/-	Restricted to deep seasonal vernal pools, vernal pool like ephemeral ponds, and stock ponds and other human modified depressions. Species prefers warm-water pools that have low to moderate dissolved solids, which are less predictable, and remain filled for extended periods of time. Basins that support Riverside fairy shrimp are typically dry a portion of the year, but usually are filled by late fall, winter, or spring rains, and may persist through May. All known habitat lies within annual grasslands, which may be interspersed through chaparral or coastal sage scrub vegetation. In Riverside County, found in pools formed over the following soils: Murrieta stony clay loams, Las Posas series, Wyman clay loam, and Willows soils.	A	Up to 19 pools were identified as potentially suitable habitat for fairy shrimp (Appendix F of the NES) within the BSA. Only versatile fairy shrimp (*B. lindahli*) was found within the BSA during the 2013–2014 focused survey.
Fish				
Santa Ana Sucker (*Catostomus santaanae*)	T/CSC/-/WRC MSHCP/LM MSHCP	Self-sustaining populations exist within the Santa Ana River upstream of Prado Dam where spawning beds are located near the MWD crossing and the Rapid Infiltration and Extraction facility and Sunnyslope Creek tributaries. Fish requires shallow narrow streams with heavy to sluggish current flow. Prefers substrates that are a mix of coarse gravel, rubble, and boulders covered in filamentous algae. Where water is cool, clean, and clear they thrive. Benefits from regular severe flooding, which decreases predatory fish pressure on young specimens. Santa Ana suckers and arroyo chub tend to occur in the same watersheds, with suckers found at higher-elevation, higher-gradient portions of the stream and chubs found at lower-elevation, lower-gradient stream sections.	HA	The BSA contains narrow streams with mixed substrate and very slow to slow flows. The majority of the streams present within the BSA do not flow year-round. Species not expected in Temescal Creek or the Colorado River aqueduct due to unsuitable conditions. The lower-elevation, lower-gradient nature of the streams in the BSA is not expected to support this species.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Amphibians				
Arroyo Toad (*Anaxyrus californicus*)	E/CSC/-/WRC MSHCP (c)/-	Found in slow-moving channels of rivers and streams, often with an associated riparian vegetation community component. This species requires waters with a low level of dissolved solids and a sandy/fine to medium gravelly substrate with very low levels of fine sediments for egg deposition and maturation of larvae.	HP	Although suitable habitat is present within Temescal Creek and other streams in the BSA, the project does not occur within the species-specific WRC MSHCP Survey Area. Therefore, if the species is present, mitigation would be provided under the WRC MSHCP.
California Red-legged Frog (*Rana draytonii*)	T/CSC/-/WRC MSHCP (c)/-	Occur near ponds in humid forests, woodlands, grasslands, coastal scrub, and stream sides with plant cover. It is most common in lowlands or foothills and is frequently found in woods adjacent to streams. Breeding habitat is in permanent or ephemeral water sources: lakes, ponds, reservoirs, slow streams, marshes, bogs, and swamps.	HA	The project occurs outside of this species known range; therefore, is not expected.
Birds				
Tricolored Blackbird (*Agelaius tricolor*)	T/CSC/-/WRC MSHCP/LM MSHCP	Nests in dense colonies in marshes and occasionally in moist thickets, agricultural fields, and sewage treatment plants.	Foraging: HA Breeding: HA	This species is not expected to breed or forage within the BSA due to the small amount of marsh habitat present in the BSA.
Swainson's Hawk (nesting role) (*Buteo swainsoni*)	-/T/-/WRC MSHCP/LM MSHCP	Only occurs as a migrant in Southern California and can occur in a group, foraging over recently disked agricultural fields. The species breeds on the western plains of North America and southwestern Canada from Texas to the Yukon. Preferred foraging habitats include prairies, plains, and other wide-open ranges with minimal tree cover.	Foraging: HP Breeding: HA	Suitable foraging habitat is present within open lands throughout the BSA. The BSA occurs outside of the species breeding range.
Western Snowy Plover (nesting role) (*Charadrius alexandrinus nivosus*)	T/CSC/-/-	Requires open, relatively flat areas with little or no vegetation, including undisturbed beaches, salt flats, playas, dredge spoils, levees, and river bars. Winter distribution is more coastal and may include sewage treatment ponds and agricultural wastewater sites.	Foraging: HA Breeding: HA	Human disturbances (i.e., disking) and lack of unvegetated areas within the BSA preclude this species presence; therefore, it is not expected to occur.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Western Yellow-billed Cuckoo (nesting role) (*Coccyzus americanus occidentalis*)	T/E/-/WRC MSHCP (a)/-	All breeding activity recorded in Prado Basin and adjacent Santa Ana River channel. Favors large insects like caterpillars, katydids, cicadas, grasshoppers, and crickets.	Foraging: HA Breeding: HA	No suitable breeding habitat is present within the BSA. This species is not expected to occur.
Southwestern Willow Flycatcher (nesting role) (*Empidonax traillii extimus*)	E/E/-/WRC MSHCP (a)/LM MSHCP	Species distribution associated with riparian woodlands and dense riparian shrub with surface water or heavily saturated soils. Heavily favors willows. Forages on flying insects and also gleans insects.	Foraging: HP Breeding: HP	Although potentially suitable habitat is present within riparian woodlands and riparian scrub, this species was not detected during focused studies conducted in 2011, 2012, and 2014. Therefore, this species is absent from the project site. This species has not been documented by the CNDDB or USFWS in the BSA.
Bald Eagle (nesting and wintering roles) (*Haliaeetus leucocephalus*)	D/E, CFP/-/WRC MSHCP/LM MSHCP	Primarily in or near seacoasts, rivers, swamps, and large lakes. Eats mainly fish and carrion. This species is a localized winter resident and rare migrant, with only very rare breeding efforts in coastal southern California (e.g., Lake Skinner, Riverside County).	Foraging: P Breeding: A	This species has been detected on numerous occasions during biological surveys. One incidental sighting in February 2015 included an adult and juvenile foraging near Lake Mathews. Suitable foraging habitat occurs at Lake Mathews Reservoir. However, no suitable nesting habitat is present.
Coastal California Gnatcatcher (*Polioptila californica californica*)	T/CSC/-/WRC MSHCP/LM MSHCP	Year-round obligate, permanent resident of sage scrub habitat.	Foraging: P, CH Breeding: P, CH	This species was observed during biological surveys within coastal sage scrub. Critical habitat for this species occurs within the BSA. However, the project is a covered activity, so critical habitat is excluded within the WRC MSHCP area.
Bank Swallow (nesting role) (*Riparia riparia*)	-/T/-/-/LM MSHCP	Found in low areas along rivers, streams, ocean coasts, or reservoirs. Also found along vertical cliffs or banks.	Foraging: HA Breeding: HA	No suitable breeding habitat is present in the BSA, the potential for the species to forage in the area is very low as this species is rare in Southern California, even during migration. It is presented here because it is a covered species with potential to occur under the LM MSHCP.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Least Bell's Vireo (nesting role) (*Vireo bellii pusillus*)	E/E/-/WRC MSHCP (a)/LM MSHCP	Found as a summer resident of Southern California where it inhabits low riparian growth in the vicinity of water or in dry river bottoms below 2,000 feet. Species selects dense vegetation low in riparian zones for nesting. Species most frequently located in riparian stands between 5 and 10 years old. Nests in areas with a substantial robust understory of willows as well as other plant species.	Foraging: P Breeding: P	Suitable habitat is present within Temescal Creek and riparian scrub habitat in the vicinity of Lake Mathews. This species was observed during focused studies.
Mammals				
San Bernardino Merriam's Kangaroo Rat (*Dipodomys merriami parvus*)	E/CSC/-/WRC MSHCP (c)/-	Found in Riversidian alluvial fan sage scrub and sandy loam soils, alluvial fans and floodplains, and along washes with nearby sage scrub, chaparral and nonnative grassland upland areas (at lower densities). Primarily granivores, but do consume herbaceous material and insects when available. Within western Riverside County, only found in the San Jacinto River, Bautista Creek, and possibly remnant populations in Reche Canyon and the northern portion of the Jurupa Mountains in the Bloomington area.	HA	Only small patches of Riversidian alluvial fan sage scrub are present within the BSA and these are not large enough patches to support this species. The BSA does not occur within the WRC MSHCP survey area for this species; therefore, no additional action is required for this species.

Common/Scientific Name	Status[a] Fed/State/CNPS/ WRC MSHCP/LM MSHCP	General Habitat Description	Specific Habitat[b] Present/ Absent	Rationale
Stephens' Kangaroo Rat (*Dipodomys stephensi*)	E/T/-/ WRC MSHCP/LM MSHCP	This species is found almost exclusively in open grasslands or sparse shrublands with cover of less than 50% during the summer. Species avoids dense grasses (for example, nonnative bromes [*Bromus* spp.]) and are more likely to inhabit areas where the annual forbs disarticulate in the summer and leave more open areas. The species typically is found in sandy and sandy loam soils with a low clay to gravel content, although there are exceptions where they can utilize the burrows of Botta's Pocket Gopher (*Thomomys bottae*) and California Ground Squirrel (*Otospermophilus beecheyi*). Tends to avoid rocky soils. In general, the highest abundances of species occur on gentle slopes less than 15%.	P	Suitable habitat is present in the BSA on conserved RCHCA lands south of Cajalco Road. Species was found within RCHCA lands during trapping within suitable habitat.

[a] Status Codes

Federal
E = Federally listed; Endangered
T = Federally listed; Threatened
D = Delisted

State
T = State listed; Endangered
E = State listed; Threatened
CSC = California Species of Special Concern
CFP = California Fully Protected Species

WRC MSHCP
WRC MSHCP = No additional action necessary
WRC MSHCP(a) = Surveys may be required as part of wetlands mapping
WRC MSHCP(b) = Surveys may be required within the NEPS survey area
WRC MSHCP(c) = Surveys may be required within locations shown on survey maps
WRC MSHCP(d) = Surveys may be required within Criteria Area

CNPS
1B = Plants rare, threatened, or endangered in California and elsewhere
0.1 = Seriously threatened in California
0.2 = Moderately threatened in California

[b] Habitat Presence/Absence Codes
P = The species is present.
HP = Habitat is or may be present. The species may be present.
HA = No habitat present and no further work needed.
A = This species is absent.
CH = Project footprint is within designated critical habitat unit, but does not necessarily mean that appropriate habitat is present.

Survey results for those species that were determined to have suitable habitat within the BSA are presented below. Project impacts on threatened or endangered species occurring or potentially occurring within the BSA are addressed in the subsections below.

During reconnaissance surveys and focused studies, bald eagle was incidentally observed flying over the BSA, likely foraging over Lake Mathews; no suitable nesting habitat is present for this species.

3.21.2.1 Results

During focused studies, LBV, CAGN, SKR, and bald eagle were documented within the BSA. No focused surveys were required for arroyo toad or Quino checkerspot butterfly; however, suitable habitat for these species was identified within the BSA.

Arroyo Toad

Arroyo toad is a federally listed endangered species and a California species of concern. Outside of designated survey areas, there are no conservation requirements and the species is considered fully covered under the WRC MSHCP. The proposed project does not lie within the WRC MSHCP Amphibian Survey Area for arroyo toad and therefore is considered to be fully covered for project impacts. The species is found in slow-moving channels of rivers and streams, often with an associated riparian vegetation community component dominated by mulefat and willows in light to moderate cover. Arroyo toads often utilize sage scrub, oak woodland, and areas containing sycamores and cottonwoods in surrounding uplands and terraces for dispersal, foraging, burrowing and sheltering, and aestivation. This species requires waters with a low level of dissolved solids and a sandy/fine to medium gravelly substrate with very low levels of fine sediments for egg deposition and maturation of larvae. Arroyo toad is not a target species under the LM MSHCP.

A habitat evaluation was conducted for arroyo toad during the reconnaissance surveys. Suitable arroyo toad habitat in the BSA exists within both Temescal and Cajalco Creeks and their adjacent upland areas. A focused survey was not performed for this species because the BSA is located outside of the designated mandatory evaluation/survey areas for arroyo toad within the WRC MSHCP Planning Area. Up to 41.62 acres of potentially suitable arroyo toad habitat are present within the BSA, which includes California sycamore woodland, coast live oak/sycamore riparian, coast live oak woodland, mulefat scrub, riparian scrub, Riversidian alluvial fan sage scrub (RAFSS), sandbar willow scrub, southern cottonwood-willow riparian forest, southern willow scrub, and willow/mulefat scrub. Although this encompasses the range of habitat types that arroyo toads could occur in, if present, they would most likely utilize a much smaller area than this. Areas that are most likely to be inhabited by breeding arroyo toads within these communities include those that generally have a light to moderate cover of mulefat and willows within an otherwise sparsely vegetated or unvegetated rocky/sandy streambed. Arroyo toads will forage in adjacent upland communities such as RAFSS and coast live oak woodland.

Coastal California Gnatcatcher

CAGN is federally listed as threatened and is a state species of special concern. CAGN is fully covered under the WRC MSHCP and has no survey requirement. It is also an LM MSHCP target

species. CAGN is essentially a year-round obligate inhabitant of sage scrub and normally does not utilize any other habitat types. However, this species is known to include the edges of riparian habitat as part of its foraging grounds during drought years and particularly during post-breeding dispersal and dispersal of young outside of their natal territories.

Up to 889.36 acres of nesting and foraging habitat for CAGN occurs within the BSA as brittlebush scrub, RAFSS, Riversidian sage scrub (RSS), and RSS/nonnative grassland (NNG). All of these communities function in the same manner as derivatives of coastal sage scrub. This habitat is primarily present along La Sierra Avenue and Cajalco Road. On the western side of the BSA, the habitat around Cajalco Road is more contiguous and consists primarily of large blocks of habitat, but moving farther east along Cajalco Road the suitable habitat becomes much patchier and interspersed with primarily NNG. Within the aforementioned CAGN habitat types, areas that are most likely to be inhabited by CAGN include those that are moderately dense and provide contiguous patches for individuals, pairs, and families to move through. This species is unlikely to be found in areas with trees or in areas overly dominated by NNG. Disturbed areas are less likely to be used, as are small patches of sagebrush. In inland areas such as the BSA location, CAGN breeding territories average approximately 8.4 acres.

CAGN protocol surveys were not conducted for this project because CAGN is a fully covered species under the WRC MSHCP and requires no surveys. However, suitable habitat was assessed during the reconnaissance fieldwork because FESA take consideration of this species under the WRC MSHCP is tracked through the removal of potential habitat. In addition, it is important to identify potential habitat because there are habitat removal constraints if suitable habitat occurs within a criteria cell and/or on public/quasi-public (PQP) lands. CAGN was incidentally observed in several areas west of La Sierra Avenue during other surveys for the proposed project, and there is an abundance of documented sightings of CAGN within the BSA, particularly along La Sierra Avenue between Cajalco Road and El Sobrante Road, and north of the intersection of Cajalco Road and El Sobrante Road. In addition, there are numerous records in the surrounding area outside of the BSA, particularly along the southern edge of Lake Mathews.

Federally designated critical habitat is present in the BSA. However, all final critical habitat for CAGN occurs outside of the BSA. Only excluded essential habitat occurs in the BSA. Excluded essential habitat is defined as habitat that is essential for the species but excluded from final critical habitat.

Potential habitat for CAGN in the BSA occurs in WRC MSHCP Criteria Cells 2026, 2120, 2121, 2214, 2308, 2309, 2310, 2311, 2323, 2324, 2402, 2403, 2404, 2405, 2407, and 2408. In addition, suitable habitat in the BSA occurs within WRC MSHCP cores and linkages (i.e., Proposed Linkage 3, Existing Core C, and Extension of Existing Core 2) (refer to Figure 3.17-3).

Least Bell's Vireo

LBV is federally and state-listed as an endangered species. This species is covered under the WRC MSHCP; however, focused studies for LBV are required when the species potentially occupies riparian-riverine vegetation and could be directly and/or indirectly affected (WRC MSHCP Volume I, Section 6.1.2). This species is also a target species under the LM MSHCP.

LBV is found as a summer resident of Southern California where it inhabits low riparian growth in the vicinity of water or dry river bottoms below 2,000 feet. Nests are found in dense vegetation located low in the riparian zones, most frequently in 5- to 10-year-old stands. When LBV nest in mature riparian woodlands, they nest in areas with a substantial robust understory of willows as well as other plant species.

Up to 146.58 acres of potential nesting and foraging habitat for LBV occurs within the riparian bird study area as disturbed southern willow scrub, eucalyptus/tamarisk scrub, mulefat scrub, riparian forest, riparian scrub, sandbar willow scrub, southern cottonwood-willow riparian forest, southern willow scrub, tamarisk scrub, and willow/mulefat scrub. These habitat types encompass the variety of nesting and foraging habitat that LBV could inhabit and, with some exceptions, are generally characterized under the term "riparian habitat." Suitable habitat is primarily present in drainages alongside or crossing Cajalco Road. LBV generally prefer semi-complex riparian habitats that have understory scrub and ample vertical complexity; riparian areas with no understory are less likely to be used. In California a dense shrub layer associated with riparian habitat was found to be the most critical structural component of occupied LBV habitat. In more xeric areas this species will readily utilize unconventional habitats, including mesquites and tamarisk. In riverine habitat in Southern California this species typically utilizes territory sizes of about 2 acres on average.

Under Section 6.1.2 of the WRC MSHCP, focused surveys for LBV are required in areas of riparian/riverine habitat that could support this species and that cannot be avoided by a given project. When occupied habitat will be directly affected, no more than 10 percent of the habitat that provides long-term conservation can be taken; greater than 10 percent habitat removal requires a Determination of Biologically Equivalent or Superior Preservation (DBESP). Impacts on LBV within the affected area are covered as long as the WRC MSHCP conservation area goals are adhered to. As such, focused surveys were conducted for this project during the appropriate survey periods in 2011, 2012, 2014, and 2017. Project-related focused surveys resulted in the documentation of up to 19 pairs and two individual birds (one bachelor male and one lone immature bird) within the overall project BSA. There are also known records of this species throughout the BSA and surrounding area based on data obtained from CDFW, USFWS, and the LM MSHCP. Refer to Figure 3.21-1 for recorded locations of LBV.

No federally designated critical habitat for LBV is present in the BSA.

Southwestern Willow Flycatcher

Southwestern willow flycatcher is a federally and state-listed endangered species. This species is covered under the WRC MSHCP but has survey requirements under the WRC MSHCP. Focused studies are required when potentially suitable habitat is present and a potential impact is foreseeable (WRC MSHCP Volume I, Section 6.1.2). Southwestern willow flycatcher is also a target species under the LM MSHCP. Refer to Table 3.21-1 for a summary of this species' habitat requirements.

Suitable breeding habitat for southwestern willow flycatcher occurs on approximately 106 acres of riparian vegetation communities within the BSA (Figure 3.21-1). Because of potentially affected, suitable habitat for this species in the BSA, a focused survey was necessary; however, southwestern willow flycatcher was not detected. Based on a review of the CNDDB and USFWS databases, there are no historical records of this species occurring within the BSA. Based on the results of the focused surveys and a review of historical data, this species is considered absent. No federally designated critical habitat for southwestern willow flycatcher is present in the BSA.

Stephens' Kangaroo Rat

SKR is federally listed as endangered and state-listed as threatened. The SKR HCP provides take authorization for SKR within the boundaries of the HCP and the WRC MSHCP provides for take of SKR outside of the boundaries of the SKR HCP. The SKR Core Reserves established by the SKR HCP are managed as a part of the WRC MSHCP Conservation Area. To afford take authorization for SKR within the SKR HCP and the WRC MSHCP, there are defined core areas that must be conserved. The LMR and RCHCA SKR Reserve (Existing Core 2 of the WRC MSHCP) are part of these SKR Core Reserve areas. SKR is also a target species under the LM MSHCP.

Habitat for SKR consists almost exclusively of open grasslands/sparse shrublands with 50 percent or less ground cover during the summer. SKR is more likely to be found in areas with annual forbs than in areas with thick, nonnative brome grasses. Soils within occupied habitat tend to be sandy and sandy loam soils with a low clay to gravel content (for ease of burrowing), except where Botta's pocket gopher and California ground squirrel burrows are present. SKR are usually found in flatter areas (slopes less than 30 percent) but may be found on steeper slopes at trace densities and may only use these areas for foraging.

Although SKR is a covered species under the WRC MSHCP and SKR HCP and focused surveys are not required by the WRC MSHCP, the proposed project is within and/or adjacent to the RCHCA SKR Reserve, both WRC MSHCP and LM MSHCP conserved lands, and would potentially affect PQP lands. Due to the potential loss of Core Reserve, a habitat assessment for SKR was conducted on the RCHCA SKR Reserve and data for the LMR were also reviewed. Throughout the SKR study area (LOD plus up to a 500-foot buffer), an estimated 1,682 acres of potentially suitable habitat for SKR was mapped in the form of NNG, disturbed RSS, and RSS/NNG. This estimate only considers suitable vegetation communities, but not topography or soils suitable for the species. Although SKR generally only occur on level to gently sloping terrain and within sandy to sandy loam soils, the species was documented within rugged terrain and clayey soils during focused studies within the RCHCA SKR Reserve; therefore, all areas of the RCHCA SKR Reserve with NNG, disturbed RSS, and RSS/NNG were considered suitable.

The species is assumed to be present throughout the Lake Mathews-Estelle Mountain Core Reserve. There are numerous CNDDB records for SKR within both the LOD and the BSA and from USFWS within these conserved lands. Refer to Figure 3.21-2 for the historical data records of SKR within the SKR study area.

SKR Core Reserve Areas described for conservation that would benefit SKR within the BSA include the Proposed Extension of Existing Core 2 of the WRC MSHCP and Proposed Linkage 3. Refer to Section 3.17, *Natural Communities*, for more details on these cores and linkages.

The results of the habitat suitability mapping, burrow density mapping, and trapping surveys described in the *Stephens' Kangaroo Rat Habitat Assessment and Trapping Survey Report* for the project (see Appendix G in the NES report) are summarized below.

Habitat Suitability Mapping

Within the RCHCA SKR Reserve, suitable habitat for SKR was present within open grassland and/or open RSS habitats on level to gently sloping terrain. The habitat suitability mapping performed on the RCHCA SKR Reserve rated habitat on the reserve from trace to high and was based on suitable vegetation community, topography, and presence of kangaroo rat sign (scat, tracks and burrow entrances, hind foot or trail drag marks, and characteristic small foraging divots in the soil surface). Although clay soils found on the RCHCA SKR Reserve are generally not considered suitable for kangaroo rat, it was confirmed during the burrow density mapping and trapping efforts (discussed below) that SKR were occupying areas within these denser soils.

Habitat suitability mapping data within the LMR was acquired from the Lake Mathews Reserve Management Plan and geographic information system modeling data provided by MWD. The majority of habitat on the LMR within the SKR study area had moderate to high suitability for the species within open grasslands with sandy or sandy loam soils on level terrain, or RSS habitat. Areas of low suitability were generally associated with riparian areas, steep ravines, or chaparral vegetation.

Burrow Density Mapping

Relative kangaroo rat density was assigned to occupied habitat based on the total number of burrows in each transect that was walked (relative burrow density). Mapped burrow density categories are only provided as a rough estimate of relative SKR abundance. No assumption was made regarding the number of SKR actually present at a location or in the project site in general. Table 3.21-2 provides the estimated SKR density based on relative burrow density categories.

Table 3.21-2. SKR Abundance Based on Relative Burrow Density Categories

Relative Burrow Density	Estimated SKR Density
Trace	< 1 SKR/2.47 acres*
Low	< 5 SKR/2.47 acres
Medium	5-10 SKR/2.47 acres
High	> 10 SKR/2.47 acres
*Original estimates from O'Farrell and Uptain (1989) are based on 1 hectare. For this table, 1 hectare is equivalent to 2.47 acres.	

Diagnostic field signs of SKR and the common Dulzura kangaroo rat (*Dipodomys simulans*) are very similar. It is, therefore, not possible to confirm if field sign is from Dulzura kangaroo rat or SKR. However, SKR can usually be assumed to be the primary (and often only) resident species when loose aggregations of several to many burrows in open grasslands occur within the species' range. When burrow clusters were observed in level to gently sloping terrain, SKR were assumed present. SKR had been previously mapped for some open grasslands in these parts of the study area, which increased the likelihood that these areas were being used by SKR. Areas with rugged topography or terraced slopes and kangaroo rat sign were initially assumed to not be occupied by SKR based on trace habitat suitability; however, based on the results of the trapping (described below), this assumption was invalidated.

Burrow density mapping was not possible in 2017 due to extremely heavy rainfall in Southern California producing very high grass density and grass height, thereby minimizing the viewable ground surface for the burrow mapping and detecting of kangaroo rat sign. Therefore, relative density burrow mapping within portions of the SKR study area was infeasible.

Trapping

Trapping was performed within the RCHCA SKR Reserve to confirm presence of SKR in the SKR study area (Figure 3.21-2). It was assumed that open grasslands within the RCHCA lands were occupied by SKR based on numerous scattered locations of kangaroo rat sign and previous trapping efforts conducted by RCHCA land managers who confirmed that SKR was the dominant kangaroo rat species on the RCHCA SKR Reserve.

As previously mentioned, SKR was also found on very dense clay-based soils where the SKR study area and southeastern portion of the RCHCA SKR Reserve overlap, and it is assumed to be present within all level to gently sloping terrain. Nonetheless, the two traplines placed in this area captured three SKR and no Dulzura kangaroo rat, confirming that the observed sign was that of SKR. Additional traplines set within more rugged terrain at the western end of the RCHCA SKR Reserve confirmed presence of SKR at five of six trapping locations, with a total of 27 SKR and 13 Dulzura kangaroo rat captured during two nights of trapping. The positive trap

results occurred on ridgetop roads, which would be expected, but also unexpectedly on lower canyon saddles and terraced steep hills. Based on the limited trapping effort, it is assumed that SKR occupy the majority of the RCHCA SKR Reserve. Although no trapping was performed within the LMR, this species has previously been documented within the SKR study area. Figure 3.21-2 illustrates the mapped locations of SKR.

3.21.2.2 Federal and Resource Agency Consultation

Although no formal consultation under FESA or CESA for the proposed project has occurred to date, coordination with RCA, USFWS, and CDFW has occurred since 2011 and is ongoing for the proposed project. During meetings with the resource agencies, the preliminary project design was introduced and reviewed in detail throughout the technical study phase. Agency questions and comments were addressed and incorporated into the project design as feasible after each meeting. Agency coordination meetings relating to threatened and endangered species are summarized below. A complete list of agency coordination meetings pertaining to all biological resources can be found in the NES.

- 04/21/2011: USFWS confirmed that project would be covered under the WRC MSHCP.
- 7/21/2011: USFWS stated that all SKR Core Reserve lands (i.e., RCHCA SKR Reserve and LMR) affected by the project will require a 1:1 mitigation ratio and must be adjacent to the existing SKR Core Reserves.
- 12/15/2011: USFWS discussed take allowances and impact limits and indicated that if take limits were exceeded, Section 7 consultation could be an option. Potential mitigation lands were discussed.
- 9/20/2012: USFWS and CDFW discussed conserved lands take allowances and documentation, LM MSHCP mitigation bank credit use, and mitigation acquisition, and SKR habitat and movement in the area.
- 7/24/2018: Draft NES was submitted to USFWS and CDFW for their initial review and comments, which were then integrated into the final NES report.
- 8/1/2018: A focused call was held with USFWS, CDFW, and other resource agencies to walk through the sections of the NES and allow for initial comments.
- 9/14/2018: A focused call was held with USFWS and CDFW to discuss comments regarding the NES and proposed responses and resolution.

Section 7 consultation with USFWS will be required for potential impacts on arroyo toad, CAGN, LBV, and SKR (see Section 3.21.3). Formal consultation under FESA and CESA will commence once the approved NES, and the necessary documents, including the DBESP report, are provided to RCA, USFWS, and CDFW. Because all of the listed species with potential to be affected by the build alternatives are WRC MSHCP planning species, the consultation would be a streamlined process. A Biological Opinion would be performed and take authorization would be provided under the WRC MSHCP by demonstrating project consistency with the WRC MSHCP through the Joint Project Review application process. Take authorization for arroyo

toad, CAGN, and LBV would be provided by USFWS under the WRC MSHCP. For SKR, take authorization would be provided by the WRC MSHCP where the SKR HCP does not provide coverage. For potential take of SKR within the SKR HCP boundaries, the SKR HCP would provide take authorization.

3.21.3 Environmental Consequences

3.21.3.1 Build Alternatives 1, 2C, and 4

Impacts on federally and state-listed threatened and endangered species are based on the habitat evaluations and focused studies performed per the requirements of the WRC MSHCP. Take authorization for impacts on covered species would occur through project consistency with the WRC MSHCP and project approval through the Joint Project Review process with RCA and concurrence by USFWS and CDFW. For potential take of SKR within the SKR HCP plan boundaries, the SKR HCP would provide take authorization.

Build Alternatives 1, 2C, and 4 "may affect, likely to adversely affect" LBV, SKR, and CAGN based on direct removal of occupied habitat and/or take of individuals. Due to the presence of suitable habitat for arroyo toad within the BSA and full coverage under the WRC MSHCP, a "may affect, not likely to adversely affect" finding for arroyo toad is appropriate for Build Alternatives 1, 2C, and 4. A "No Effect" determination is appropriate for Munz's onion, San Diego ambrosia, marsh sandwort, Braunton's Milkvetch, San Jacinto Valley crownscale, Nevin's barberry, thread-leaved brodiaea, salt marsh bird's-beak, slender-horned spineflower, Santa Monica dudleya, Santa Ana River woollystar, spreading navarretia, California orcutt grass, San Bernardino Merriam's kangaroo rat, southwestern willow flycatcher, yellow-billed cuckoo, western snowy plover, California red-legged frog, Santa Ana sucker, quino checkerspot butterfly, Delhi sands flower-loving fly, Riverside fairy shrimp, San Diego fairy shrimp, and vernal pool fairy shrimp because these species are absent from the BSA.

Within the BSA, critical habitat for CAGN was formerly designated; however, following approval of the WRC MSHCP, the critical habitat within the BSA was designated as *excluded*. Because of this, no additional actions, beyond demonstrating consistency with the WRC MSHCP, would be required for CAGN critical habitat impacts. Table 3.21-3 on the following page provides the FESA effects findings for each federally listed species.

Build Alternatives 1, 2C, and 4 may result in direct impacts that could harm or kill individual LBV and SKR, and thus, would result in the state CESA definition of take[1] for these state-listed species. No take would occur for state-listed Munz's onion, marsh sandwort, Nevin's barberry, thread-leaved brodiaea, salt marsh bird's-beak, slender-horned spineflower, Santa Ana River woollystar, California orcutt grass, bank swallow, tricolored blackbird, southwestern willow flycatcher, yellow-billed cuckoo, bald eagle, Swainson's hawk.

[1] CESA take is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill".

The project impacts (direct and indirect) on individual species are described below.

Arroyo Toad

Permanent removal of suitable habitat for arroyo toad would occur during construction of Build Alternatives 1, 2C, and 4. In addition, the build alternatives would temporarily affect habitat within the LOD. Temporary impacts from bridge expansion and the new bridges associated with the design of Build Alternatives 1, 2C, or 4 would also result in permanent shading effects on riparian habitat, resulting in the bridge areas no longer providing vegetative cover for arroyo toad. Refer to Table 3.21-4 for a summary of the permanent, temporary, and shading effect impacts on suitable arroyo toad habitat.

Table 3.21-4. Suitable Arroyo Toad Habitat Impacts

Build Alternative	Impact Type		
	Permanent (acres)	Temporary (acres)	Shading Effect[1] (acres)
Build Alternative 1	8.08	3.74	0.41
Build Alternative 2C	6.66	3.77	0.39
Build Alternative 4	6.24	2.38	0.40
[1] Shading effects = indirect impacts from bridge extensions and new bridges.			

Impacts on suitable habitat for arroyo toad are based on the loss of habitat types typically occupied by this species. Within the impact area, these habitat types include California sycamore woodland, mulefat scrub, riparian scrub, RAFSS, sandbar willow scrub, southern cottonwood-willow riparian forest, southern willow scrub, and willow/mulefat scrub. Permanent, temporary, and shading impacts on individual habitat types are provided in Tables 3.17-2, 3.17-4, and 3.17-5, respectively, in Section 3.17, *Natural Communities*.

If arroyo toad is present, there is the potential for direct mortality and injury of individuals during vegetation clearing and grading. Individuals could be struck by equipment or trapped and/or crushed within burrows. Indirect impacts on potential habitat adjacent to the project LOD during construction may also occur, including degradation of habitat through dust, noise, increased fire risk, and introduction of invasive plant species. Measures identified in Section 3.21.4 are intended to avoid and/or minimize such potential direct and indirect impacts on covered WRC MSHCP species, including arroyo toad. Operation of the roadway is not expected to change conditions for the species. Because the project is not within any designated survey areas, impacts on arroyo toad and its habitats are fully covered under the WRC MSHCP. Refer to Section 3.17, *Natural Communities*, for the discussion of project compliance with the WRC MSHCP.

Under Section 7 of the FESA, formal consultation with USFWS may be required due to the potential presence of the species within the BSA. However, because this species is fully covered under the WRC MSHCP, potential impacts for the covered project have been authorized.

Lake Mathews MSHCP (Arroyo Toad)

Arroyo toad are not LM MSHCP target species; therefore, no additional impact analysis for this species is provided beyond the analysis presented above.

Coastal California Gnatcatcher

Permanent removal of suitable habitat for CAGN would occur during construction of Build Alternatives 1, 2C, and 4. In addition, the build alternatives would temporarily affect habitat within the LOD. Temporary impacts from bridge expansion and new bridges associated with the design of Build Alternatives 1, 2C, or 4 would also result in permanent shading effects on scrub habitat, resulting in these bridge areas no longer providing vegetative cover for dispersing CAGN. Refer to Table 3.21-5 for a summary of the permanent, permanent beneficial, temporary, and shading effect impacts on CAGN habitat.

Table 3.21-5. Direct Impacts on Suitable CAGN Habitat and Criteria Cells

Build Alternative	Impact Type				Affected Criteria Cells
	Permanent (acres)	Roadbed Removal (Permanent Beneficial) (acres)	Temporary (acres)	Shading Effect[1] (acres)	
Build Alternative 1	67.09	2.85	7.60	0.22	2309, 2310, 2311, 2402, 2403, 2404, 2405, 2407, 2408, 2323, 2324
Build Alternative 2C	76.21	3.30	8.12	0.56	2309, 2310, 2311, 2402, 2403, 2404, 2405, 2407, 2408, 2323, 2324
Build Alternative 4	88.40	4.30	10.39	3.56	2214, 2120, 2121, 2026, 2309, 2310, 2311, 2402, 2403, 2404, 2405, 2323, 2324

[1] Shading effects = indirect impacts from bridge extensions and new bridges.

Impacts on suitable habitat for CAGN are based on the loss of habitat types typically occupied by this species. Within the BSA, these habitat types include brittlebush scrub, RAFSS, RSS, and RSS/NNG. Permanent, temporary, and shading impacts on individual habitat types are provided in Tables 3.17-2, 3.17-4, and 3.17-5, respectively. Portions of the existing Cajalco Road and the road right of way would be permanently removed during project construction and returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with native vegetation under each build alternative. This permanent impact is considered a beneficial impact and, although not required under the WRC MSHCP, would return suitable habitat for CAGN. The beneficial permanent impact from roadbed removal and rehabilitation of CAGN habitat under each build alternative is provided in Table 3.21-5.

Because CAGN is a year-round resident, there is a potential for direct impacts, including mortality or injury, to any individuals that may be occupying habitat that would be removed during construction of Build Alternatives 1, 2C, or 4. Vegetation clearing of suitable habitat for CAGN would be performed outside of the active breeding season for this species (see Measure

NC-1 [NES BIO-1] in Section 3.17, *Natural Communities*); as such, no direct impacts on eggs, nestlings, or nesting adults are anticipated.

Indirect impacts would likely be from degradation of habitat (e.g., fugitive dust, increased fire risk, or the spread of invasive plant species), disturbance from construction noise, traffic noise, or other construction-related activities that may result in disruptions to daily activities (e.g., foraging, calling). These disturbances could cause CAGN to temporarily relocate or, at the extreme, find new territories that are farther from the disturbances. Construction may result in indirect impacts on CAGN habitat from habitat degradation. These impacts would be greatly reduced with the implementation of the avoidance and minimizations measures identified in Section 3.21.4.

There is also potential for direct and indirect impacts on CAGN to occur during operation of the build alternatives. There may be an increase in the frequency of vehicle strikes of low-flying individuals traversing the widened roadway. Increased noise and maintenance could also diminish habitat quality. However, potential operational impacts most likely would not be substantially greater than existing conditions because they would generally occur in an existing fragmented corridor with many roadways rather than in an undeveloped area where birds may be unaccustomed to vehicle traffic.

Implementation of the avoidance and minimization measures in Section 3.21.4 for CAGN would ensure direct impacts on nesting individuals do not occur and effects on the species are minimized during construction within the Criteria Area, and would ensure consistency with the WRC MSHCP.

Lake Mathews MSHCP (Coastal California Gnatcatcher)

Up to 889.36 acres of nesting and foraging habitat for CAGN occurs within the BSA as brittlebush scrub, RAFSS, RSS, and RSS/NNG. CAGN surveys were not conducted and therefore were not performed in the LM MSHCP area, although the species is known to occur in the region. Impacts would occur as described in Table 3.21-5 and include impacts on the LMR, including 25.71 acres under Build Alternative 1, 35.42 acres under Build Alternative 2C, and 27.88 acres under Build Alternative 4. The measures identified above would also apply within the LMR. In addition, the proposed project would replace suitable habitat within the LMR (Measures **NC-17** [**NES BIO-17]** and **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*).

Least Bell's Vireo

Permanent removal of suitable habitat for LBV would occur during construction of Build Alternatives 1, 2C, and 4. In addition, the build alternatives would temporarily affect habitat within the LOD. Temporary impacts from bridge expansion and the new bridges associated with the design of Build Alternatives 1, 2C, or 4 would also result in permanent shading effects on riparian habitat, resulting in these bridge areas no longer providing vegetative cover for LBV. Refer to Table 3.21-6 for a summary of the permanent, temporary, and shading effect impacts on LBV habitat. Additional details for impacts occurring on riparian habitat are provided in Section 3.17, *Natural Communities*.

Table 3.21-6. Direct Impacts on Suitable LBV Habitat

Build Alternative	Impact Type			
	Permanent (acres)	Roadbed Removal (Permanent Beneficial)	Temporary (acres)	Shading Effect[1] (acres)
Build Alternative 1	7.85	0.07	4.78	0.36
Build Alternative 2C	6.43	0.05	4.81	0.34
Build Alternative 4	5.75	0.06	3.11	0.35
[1] Shading effects = indirect impacts from bridge extensions and new bridges.				

Portions of the existing Cajalco Road and the road right of way would be permanently removed during project construction but returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with natural vegetation under the three build alternatives. This permanent impact is considered a beneficial impact and, although not required under the WRC MSHCP, would return suitable habitat for LBV. The beneficial permanent impact from roadbed removal and rehabilitation of LBV habitat under each build alternative is provided in Table 3.21-6.

Within Build Alternatives 1 and 2C, the proposed project could affect up to 18 LBV pairs that were mapped during project-related focused surveys, as well as a bachelor male and three additional areas mapped by USFWS and CNDDB. Refer to Sheets 1, 2, 4a, 5a, 6, and 7 of Figure 3.21-1. Of these, five pairs observed during focused surveys were found in MWD lands. One occupied area mapped in the CNDDB was on RCA lands and seven pairs on USFWS-mapped territory were on Riverside-Corona Resource Conservation District lands.

Under Build Alternative 4, the proposed project would have the potential to affect up to 17 LBV pairs that were mapped during focused surveys as well as a bachelor male, a lone juvenile, and two additional areas that were mapped by USFWS and CDFW. Of these, one pair from project focused surveys was found in MWD lands. One occupied area mapped in the CNDDB was on RCA lands, and seven pairs were on Riverside-Corona Resource Conservation District lands. Refer to Sheets 1, 2, 5b, 6, 7, 8, and 9 of Figure 3.21-1.

Impacts on areas occupied by LBV would primarily be from construction-related disturbances (e.g., noise, night lighting, increased human presence, opportunistic predators) because most territories are outside of the LOD. However, some small areas closer to the roadways would be directly temporarily or permanently affected as a result of construction activities, most likely resulting in habitat loss and flushing birds out of territories if construction in those areas occurs during the nesting season. If LBV are present during vegetation clearing, there is the potential for direct mortality and injury of individuals that may be occupying that habitat. However, vegetation clearing of suitable habitat for LBV would be performed outside of the active breeding season for this species (see Measure **NC-1 [NES BIO-1]** in Section 3.17, *Natural Communities*); as such, no direct impacts on eggs, nestlings, or nesting adults are anticipated.

Construction activities occurring in or near riparian habitat may also result in sedimentation, degrading the on-site habitat, and potentially alterations to flow regimes if riparian areas are directly affected. In addition, project construction may result in indirect impacts on LBV habitat in the form of habitat degradation from fugitive dust, increased fire risk, or the spread of invasive plant species. Measures identified in Section 3.21.4 are intended to avoid and/or minimize such potential direct and indirect impacts.

Implementation of the avoidance and minimization measures in Section 3.21.4 for LBV would ensure direct impacts do not occur during construction within the Criteria Area and would ensure consistency with the WRC MSHCP.

Lake Mathews MSHCP (Least Bell's Vireo)

Up to 146.58 acres of suitable LBV habitat is present in the BSA within the LM MSHCP area. Within the LOD of Build Alternatives 1 and 2C, five LBV pairs were found in the LMR during project surveys, and there is one USFWS-mapped territory. Only one LBV pair was found in the LMR during project surveys within the LOD of Build Alternative 4. Impacts on suitable LBV habitat would occur as described in Table 3.21-6 and include impacts on the LMR including 4.37 acres under Build Alternative 1, 2.95 acres under Build Alternative 2C, and 0.49 acre under Build Alternative 4. The measures identified above would also apply for the LMR. The avoidance and minimization measures described for Build Alternatives 1, 2C, and 4 would ensure full avoidance of impacts on LBV and compensation/ mitigation for affected habitat in the LOD of Build Alternatives 1, 2C, and 4 that may become occupied by LBV in the future.

Stephens' Kangaroo Rat

Direct impacts from Build Alternatives 1, 2C, and 4 would occur during construction and operation. Permanent removal of suitable SKR habitat would occur during construction of each of the build alternatives. The LOD for the build alternatives includes areas outside of areas dedicated to/described for SKR conservation, areas conserved for the benefit of SKR, and areas described for conservation for the benefit of SKR. Table 3.21-7 provides the permanent and temporary impacts on SKR habitat within the LOD for each build alternative, including the permanent beneficial effect of roadbed removal and rehabilitation of habitat and permanent shading effects on suitable habitat. For illustrations of both temporary and permanent direct impacts on SKR, refer to Figure 3.21-2.

Table 3.21-7. Direct Impacts on Suitable Stephens' Kangaroo Rat Habitat

	Impact Type			
Build Alternative	**Permanent (acres)**	**Roadbed Removal (Permanent Beneficial) (acres)**	**Temporary (acres)**	**Shading Effect[1] (acres)**
Build Alternative 1	125.29	5.80	19.49	0.22
Build Alternative 2C	116.53	9.00	21.30	0.50
Build Alternative 4	63.11	3.30	15.51	1.09

Calculations are based on NNG, disturbed RSS, and RSS/NNG vegetation communities.
[1] Shading effects = indirect impacts from bridge extensions and new bridges.

Portions of the existing Cajalco Road and the road right of way would be permanently removed during project construction and returned to natural topographic contours, decompacted to allow for plant establishment, and revegetated with natural vegetation under the three build alternatives. This permanent impact is considered a beneficial impact and, although not required under the WRC MSHCP within non-conserved lands, would return suitable habitat for SKR. The beneficial permanent impact from roadbed removal and rehabilitation of SKR habitat under each build alternative is provided in Table 3.21-7.

Project construction and vegetation clearing could result in direct mortality, injury, or harassment of individual SKR as a result of construction equipment. Other direct impacts may include individuals being crushed or entombed in their burrows and injury or mortality from opportunistic predators during construction activity. Activities associated with construction, including disturbance from noise or vibrations, may result in disruption of SKR behavior. If construction occurs during the breeding season, it could disturb breeding behavior, resulting in negative impacts on reproduction. Soil compaction could decrease the availability of friable soils for burrow creation. Capturing, handling, and relocating SKR that occur within the construction area could cause injury or death if proper handling and relocation techniques are not used.

Permanent indirect impacts from construction activities on SKR may include habitat fragmentation. Habitat fragmentation is the breaking up of larger blocks of habitat into smaller blocks, leading to a reduction in the total area of habitat available to species and typically isolating habitat fragments into islands. Edge effects would reduce the quality of habitat at the edges of habitat fragments because these areas are more likely to have been disturbed by spread of invasive species, soil compaction, and adjacency to human presence and disturbances. Habitat fragmentation can result in changes in foraging patterns, shifts in territory and dispersal that could lead to increased predation, decreased reproductive success, and reduced population viability. Some aspects of the design of the project, such as wildlife-crossing structures, may reduce the impacts associated with fragmentation of occupied habitat. Individual wildlife crossings proposed under each build alternative, and their locations, are provided in Appendix J; Table J-1 lists each proposed wildlife crossing and Figure J-1, *Proposed Wildlife Crossings – Build Alternatives 1, 2C and 4,* indicates the location of each crossing.

The avoidance and minimization measures in Section 3.21.4 would ensure indirect impacts are greatly reduced or eliminated and would ensure compliance with the WRC MSHCP. The project is a planned road that traverses PQP lands (Section 7.2.2 of the WRC MSHCP). The project impacts outside of criteria areas and PQP lands would be mitigated (covered) within the WRC MSHCP plan area. The project impacts within existing PQP lands would be mitigated through the purchase and dedication of land into the WRC MSHCP Conservation Area that is in addition to the WRC MSHCP additional reserve lands. It is planned that there would be sufficient crossing opportunities for small mammals for opportunistic movement features (generally associated with undercrossings in the flatter areas of the alignment) to mitigate for edge effects.

Temporary indirect impacts from construction activities on SKR may occur from construction vehicle traffic, the temporary use of land for staging and access, noise, light, and other construction activities. Lighted construction areas could affect nocturnal activities, including foraging, decreasing reproductive success or altering territories. In addition, artificial lighting at night may increase predation risk by allowing predators, such as owls, to hunt more efficiently. Project construction would result in an increase in human activity in the area, which could result in an increase in opportunistic predators that are attracted to litter, such as coyote and American crow. Construction and mechanical soil disturbance may adversely affect SKR habitat on site by altering friability or encouraging the spread of invasive plant species, which could indirectly result in loss of quality habitat and an increase in fire risk. The avoidance and minimization measures in Section 3.21.4 would ensure these indirect impacts are greatly reduced or eliminated and would ensure compliance with the WRC MSHCP.

There is a potential for operation of the build alternatives to increase mortality of SKR through vehicle strikes of individuals attempting to cross the wider roadway. Maintenance activities along the roadway right of way are not expected to appreciably differ from existing operating conditions under the build alternatives. The existing roadway would continue to produce noise, dust, air pollution, and fire risk. However, noise, dust, and fire risk under Build Alternative 2C within the RCHCA SKR Reserve/LMR would increase and could also directly affect SKR during operations and maintenance. This impact could increase predation, decrease reproductive success, and reduce population viability in the vicinity of the roadway. The potential effects from operation and maintenance of the build alternatives would be minimized, however, with the inclusion of wildlife crossings that have been incorporated into the project design throughout SKR Core Reserve areas (refer to Section 3.17, *Natural Communities*, and Appendix J).

The proposed project is a Covered Activity under the WRC MSHCP (Volume I, Section 7.2.2). The permanent removal of 91.86 acres under Build Alternative 1, 84.16 acres under Build Alternative 2C, or 32.68 acres under Build Alternative 4 of suitable SKR habitat within the SKR Core Reserve lands would be a biologically substantial loss because the preservation of this conserved habitat was previously established under the WRC MSHCP, LM MSHCP, and SKR HCP. Direct removal of SKR Core Reserve lands would be biologically considerable and would require replacement to ensure consistency with the WRC MSHCP. Mitigation measures identified in Section 3.21.4 are intended to mitigate for the loss of conserved lands.

Lake Mathews MSHCP (Stephens' Kangaroo Rat)

SKR surveys were not conducted, although the species is known to occur in the LM MSHCP area and in the general region. Habitat assessments conducted for this project detected up to 1,682 acres of suitable habitat for SKR within the BSA as NNG, disturbed RSS, and RSS/NNG. Impacts would occur as described in Table 3.21-7 and include impacts on the LMR including 100.82 acres under Build Alternative 1, 83.47 acres under Build Alternative 2C, and 34.52 acres under Build Alternative 4. The measures identified above would also apply within the LM MSHCP area. In addition, the proposed project would replace suitable habitat within the LMR (Measures **NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*).

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road (Build Alternatives 1 and 2C) or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road (Build Alternative 4), for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the six-lane facility would not change any effects on threatened or endangered species that are already expected as a result of the four-lane facility because the additional lanes would be constructed in the median. As a result, it would be unlikely for any threatened or endangered species to occur in this narrow strip of open land, which would be graded during construction and maintained following construction. Operation of the two additional lanes may result in additional traffic noise and lights; however, threatened or endangered species would not be expected along the roadside. If any staging areas are located in areas outside of the right of way, it is possible that

there may be temporary impacts on any threatened or endangered species that may be present in the area in association with the use of the staging area.

Lake Mathews MSHCP

Within the LM MSHCP area, Build Alternatives 1 and 2C would expand and realign Cajalco Road, and Build Alternative 4 would expand and realign Cajalco Road, La Sierra Avenue, and El Sobrante Road. All three build alternatives would also encroach into the LMR and remove habitat for LM MSHCP target species, such as CAGN, LBV, and SKR, permanently removing suitable habitat for target species that is being conserved under the LM MSHCP. Permanent and temporary impacts on the LMR, which includes suitable habitat for LM MSHCP target species, are provided in Table 3.17-19 in Section 3.17, *Natural Communities*. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements (see Section 3.17, *Natural Communities*, for details regarding the LM MSHCP discretionary action). Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** and **NC-16 (NES BIO-19)** in Section 3.17, *Natural Communities*; Measures **AS-1 (NES BIO-25)**, **AS-3 (NES BIO-28)** through **AS-5 (NES BIO-27)**, and **AS-7 (NES BIO-20)** in Section 3.20, *Animal Species*; and Measures **TE-1 (NES BIO-18)** and **TE-3 (NES BIO-30)** in Section 3.21.4 are intended to avoid and/or minimize direct and indirect impacts on LM MSHCP target species, including threatened and endangered species, and their suitable habitat within the LMR. Measures **NC-17 (NES BIO-17)** through **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*, would replace and mitigate for the loss of potentially suitable habitat for LM MSHCP target species.

3.21.3.2 No-Build Alternative

Under the No-Build Alternative, there would be no permanent or temporary effects on threatened and endangered species, including arroyo toad, CAGN, LBV, and SKR, beyond those that would be expected to occur from the existing facility.

3.21.4 Avoidance, Minimization, and/or Mitigation Measures

3.21.4.1 Arroyo Toad

Measures **NC-2 (NES BIO-2)** through **NC-13 (NES BIO-9)** (in Section 3.17, *Natural Communities*) and **AS-2 (NES BIO-16)** and **AS-7 (NES BIO-20)** (in Section 3.20, Animal Species) would ensure that impacts on arroyo toad and potentially suitable habitat for arroyo toad would be avoided and minimized for Build Alternatives 1, 2C, and 4. These measures are not specific to arroyo toad but are generally required by the WRC MSHCP to avoid and minimize impacts on covered species. Because arroyo toad is considered a fully covered species under the WRC MSHCP within the project area, no mitigation is necessary under Build Alternatives 1, 2C, or 4.

3.21.4.2 Coastal California Gnatcatcher

As a fully covered species under the WRC MSHCP, potential direct and indirect impacts on CAGN would be fully addressed through consistency with the WRC MSHCP. To ensure full avoidance of CAGN within criteria cells and comply with the WRC MSHCP, construction work within the criteria area would be restricted during the breeding season (Measure **NC-1 [NES BIO-1]** in Section 3.17, *Natural Communities*). The measures generally required by the WRC MSHCP to avoid and minimize impacts on covered species (Measures **NC-2 [NES BIO-2]** through **NC-10 [NES BIO-10]** and **NC-13 [NES BIO-9]** in Section 3.17, *Natural Communities*, and Measure **AS-2 (NES BIO-16)** in Section 3.20, *Animal Species*) would also protect potential habitat for CAGN in the vicinity of the LOD for Build Alternatives 1, 2C, and 4 and ensure compliance with the WRC MSHCP. Although CAGN is a covered species under the WRC MSHCP, Measures **AS-3 (NES BIO-28)** and **AS-5 (NES BIO-27)** (in Section 3.20, Animal Species) would ensure that direct impacts on nesting CAGN are reduced because the species is protected by the Migratory Bird Treaty Act and similar provisions under the California Fish and Game Code. As CAGN is a fully covered species under the WRC MSHCP, no compensatory mitigation is necessary under Build Alternatives 1, 2C, or 4. However, the impacts on suitable habitat within the LM MSHCP area would require compensatory mitigation for permanent and temporary direct impacts on potential CAGN habitat (Measures **NC-17 [NES BIO-17]** and **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*).

3.21.4.3 Least Bell's Vireo

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** (in Section 3.17, *Natural Communities*), **AS-2 (NES BIO-16)** and **AS-3 (NES BIO-28)**, and **AS-5 (NES BIO-27)** (in Section 3.20, *Animal Species*), and **TE-1 (NES BIO-30)** below would be implemented to protect LBV and its habitat under Build Alternatives 1, 2C, and 4 and ensure consistency with the WRC MSHCP. Compensatory mitigation for direct impacts on occupied LBV habitat and adjacent potential habitat would be necessary to ensure there is no net loss of occupied LBV habitat (i.e., equivalent or superior preservation). A DBESP (Measure **NC-14 [NES BIO-13]** in Section 3.17, *Natural Communities*) will be prepared to detail mitigation requirements for LBV and ensure consistency with the WRC MSHCP. Occupied LBV habitat will be replaced at minimum 2:1 for permanent impacts and 1:1 for temporary impacts (Measure **TE-2 [NES BIO-23]** below). The mitigation for the loss of suitable habitat for LBV will be integrated with the compensatory mitigation requirements for riparian-riverine resources (Measure **NC-15 [NES BIO-14]** in Section 3.17, *Natural Communities*) and PQP lands (Measure **NC-20 [NES BIO-21]** in Section 3.17, *Natural Communities*).

Compensatory mitigation for the permanent and temporary loss of LBV habitat within the LM MSHCP lands (refer to Table 3.17-19 in Section 3.17, *Natural Communities*) under Build Alternatives 1, 2C, and 4 would be accomplished through the acquisition, at a minimum 1:1 ratio, of replacement lands of equal or greater habitat value adjacent to the existing LM MSHCP area. This would ensure no net loss of LBV habitat and that the replacement lands will be effectively managed under the LM MSHCP (Measure **NC-17 [NES BIO-17]** in Section 3.17, *Natural Communities*). Temporary impacts will be addressed through preparation of a Habitat Mitigation and Monitoring Plan and on-site restoration (Measure **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*). In addition, impacts on LBV and suitable habitat, and the mitigation proposed to address the impacts, will require an appropriate discretionary action

between the County and the LM MSHCP responsible parties to accommodate the proposed project. (Refer to Section 3.17, *Natural Communities*, for additional details regarding LM MSHCP.)

TE-1 (NES BIO-18): Between March 15 and September 15, all heavy equipment will install and maintain mufflers or other noise-reducing features will be installed when working at Temescal Creek and Cajalco Creek. Additionally, a biological monitor shall be present for activities occurring within or adjacent to riparian habitats where the potential for noise levels to exceed 60 A-weighted decibels may occur at the edge of suitable habitat. If construction noise is negatively affecting least Bell's vireo or other nesting birds, as determined by the biological monitor, work shall cease (unless authorized by the wildlife agencies) until adequate sound barriers can be constructed to reduce noise levels at the edge of the riparian corridor. It may be most effective to construct noise barriers prior to March 15 to ensure construction delays do not occur. All noise barriers will need to be placed within the limits of disturbance.

TE-2 (NES BIO-23) (Mitigation): The permanent removal of occupied least Bell's vireo (LBV) habitat will be mitigated at a minimum 2:1 ratio, with compensatory mitigation occurring as creation and/or restoration. For all LBV occupied habitat temporarily removed during construction, restoration would occur at the original location at a minimum 1:1 ratio, including meeting performance criteria. Temporal loss of riparian habitat will be addressed by mitigation for riparian-riverine resources (see Section 3.17, *Natural Communities*). Compensatory mitigation for LBV impacts should be coordinated with the riparian-riverine resources mitigation (Measure **NC-15 [NES BIO-14]** in Section 3.17, *Natural Communities*), Public/Quasi-Public lands mitigation (Measure **NC-20** [**NES BIO-21]** in Section 3.17, *Natural Communities*), and aquatics permitting mitigation (Measure **WET-1** in Section 3.18, *Wetlands and Other Waters*).

3.21.4.4 Stephens' Kangaroo Rat

Measures **NC-2 (NES BIO-2)** through **NC-9 (NES BIO-24)** and **NC-13 (NES BIO-9)** (in Section 3.17, *Natural Communities*) and **AS-2 (NES BIO-16)** (in Section 3.20, *Animal Species*) would be implemented to protect SKR and its habitat under Build Alternatives 1, 2C, and 4 and ensure consistency with the WRC MSHCP. The Wildlife Fencing Plan (Measure **NC-16 [NES BIO-19]** in Section 3.17, *Natural Communities*) would ensure there is safe movement for SKR through the RCHCA SKR Reserve and LMR. Measure **AS-3 (NES BIO-28)** (in Section 3.20, *Animal Species*) would be implemented prior to construction. Measures **AS-6 (NE BIO-29)** (in Section 3.20, *Animal Species*) and **TE-3 (NES BIO-30)** below would be implemented during construction of Build Alternatives 1, 2C, and 4 within the RCHCA SKR Reserve and LMR areas. SKR will also benefit from implementation of **TE-1 (NES BIO-18)** above.

Although SKR is a fully covered species under the WRC MSHCP, there would be a loss of SKR Core Reserve within the RCHCA SKR Reserve and LMR. Preparation of a Core Reserve Land Disturbance Report would document the impacts on SKR and the compensatory mitigation and would be submitted to the RCHCA for Board approval. Implementation of Measure **NC-20 (NES BIO-21)** (in Section 3.17, *Natural Communities*) would address any loss of these conserved lands. Mitigation for the permanent and temporary loss of SKR habitat from the LMR (refer to Table 3.17-19 in Section 3.17, *Natural Communities*) under Build Alternatives 1, 2C,

and 4 would be accomplished through the acquisition, at a minimum 1:1 ratio, of replacement lands of equal or greater habitat value adjacent to the LMR. This would ensure no net loss of SKR habitat and would mitigate for permanent and temporary direct impacts on SKR habitat (Measure **NC-17 [NES BIO-17]** in Section 3.17, *Natural Communities*). Temporary impacts would be addressed through preparation of a Habitat Mitigation and Monitoring Plan for on-site restoration (Measure **NC-19 [NES BIO-15]** in Section 3.17, *Natural Communities*). Additionally, an endowment into the LMR will be created and used for land management of any new and existing reserve lands such that the replacement lands would be effectively managed under the LM MSHCP (Measure **NC-18** [**NES BIO-31]** in Section 3.17, *Natural Communities*).

TE-3 (NES BIO-30): Prior to the start of construction activities, a Stephens' kangaroo rat (SKR) management plan will be developed for project activities occurring on the Riverside County Habitat Conservation Agency (RCHCA) SKR Reserve to minimize direct impacts on the species. At a minimum this measure will include: (1) preconstruction surveys by a qualified biologist; and (2) avoidance and minimization measures to reduce impacts on SKR.

The SKR management plan will be consistent with existing reserve management guidelines that will be coordinated with RCHCA. In addition, the management plan will submitted for review by RCHCA, U.S. Fish and Wildlife Service, California Department of Fish and Wildlife, and Lake Mathews Reserve Management Committee (as the plan pertains to the Lake Mathews Multiple Species Reserve area).

[This page left blank intentionally.]

3.22 Invasive Species

3.22.1 Regulatory Setting

3.22.1.1 Federal Regulations

On February 3, 1999, President William J. Clinton signed Executive Order (EO) 13112 requiring federal agencies to combat the introduction or spread of invasive species in the United States. The order defines invasive species as "any species, including its seeds, eggs, spores, or other biological material capable of propagating that species, that is not native to that ecosystem whose introduction does or is likely to cause economic or environmental harm or harm to human health." Federal Highway Administration (FHWA) guidance issued August 10, 1999 directs the use of the State's invasive species list, currently maintained by the Invasive Species Council of California (ISCC) to define the invasive plants that must be considered as part of the National Environmental Policy Act (NEPA) analysis for a proposed project.

3.22.2 Affected Environment

Unless otherwise noted, the information from this section is based upon the Natural Environment Study (NES) prepared for the project (Caltrans 2018). References used in the NES are not carried over into this section.

Nonnative invasive plants invade natural communities in California and can outcompete and displace native plants that many native wildlife species depend on for food and cover. Invasive plants are a leading cause of declines in native plant and animal numbers, and are a factor in Endangered Species Act listings. They also increase wildfire and flood danger and diminish productive rangeland and timberland. Nonnative invasive animal species compete with native wildlife for limited resources and have the potential to displace, remove resources for, or consume native wildlife and can lead to population declines and potentially extinction of native plants and animals, lower biodiversity, and altered habitats for considerable time periods.

There were 45 invasive plant species documented during the reconnaissance surveys and rare plant surveys. Most of the invasive plant species are associated with disturbed areas such as the edges of existing roads and farmlands, but some also occur within and adjacent to streams and waterways. Table 3.22-1 on the following page summarizes the invasive plant species present within the Biological Study Area (BSA).

Table 3.22-1. Invasive Plant Species

Scientific Name	Common Name	CAL-IPC Category
Arundo donax	Giant reed	High
Atriplex semibaccata	Australian saltbush	Moderate
Avena barbata	Slender wild oat	Moderate
Avena fatua	Wild oat	Moderate
Bromus madritensis ssp. *rubens*	Red Brome	High
Bassia hyssopifolia	Fivehorn smotherweed	Limited
Brassica tournefortii	Sahara mustard	High
Bromus diandrus	Ripgut brome	Moderate
Bromus hordeaceus	Soft brome	Limited
Carduus pycnocephalus	Italian thistle	Moderate
Centaurea melitensis	Tocalote	Moderate
Cirsium vulgare	Bull thistle	Moderate
Conium maculatum	Poison hemlock	Moderate
Cynodon dactylon	Bermuda grass	Moderate
Erodium cicutarium	Redstem filaree	Limited
Eucalyptus camaldulensis	Red gum	Limited
Festuca myuros	Rattail fescue	Moderate
Festuca perennis	Rye grass	Moderate
Helminthotheca echioides	Bristly ox-tongue	Limited
Hirschfeldia incana	Short-pod mustard	Moderate
Hordeum murinum	Wall barley	Moderate
Hypochaeris glabra	Smooth cat's-ear	Limited
Kochia scoparia ssp. *scoparia*	Mexican fireweed	Limited
Lepidium latifolium	Perennial peppergrass (perennial pepperweed)	High
Ludwigia peploides	Floating water primrose	High
Marrubium vulgare	Horehound	Limited
Medicago polymorpha	California burclover	Limited
Mesembryanthemum crystallinum	Crystalline ice plant	Moderate
Nicotiana glauca	Tree tobacco	Moderate
Olea europaea	Olive	Limited
Oncosiphon piluliferum	Globe chamomile	Watch
Oxalis pes-caprae	Bermuda buttercup	Moderate
Polypogon monspeliensis	Rabbit foot beard grass	Limited
Raphanus sativus	Radish	Limited
Ricinus communis	Castorbean	Limited
Rumex crispus	Curly dock	Limited
Salsola tragus	Prickly Russian thistle	Limited
Schinus molle	Peruvian pepper-tree	Limited
Schismus barbatus	Mediterranean schismus	Limited
Silybum marianum	Blessed milk thistle	Limited
Sisymbrium irio	London rocket	Limited
Tamarix chinensis	Chinese tamarisk (fivestamen tamarisk)	High
Tamarix ramosissima	Hairy tamarisk (saltcedar)	High
Tribulus terrestris	Puncturevine	Limited
Washingtonia robusta	Mexican fan palm	Moderate
CAL-IPC = California Invasive Plant Council		

Seven nonnative and/or invasive wildlife species were observed (not including domestic animals) and documented within the BSA during field studies. Table 3.22-2 summarizes the invasive wildlife detected within the BSA.

Table 3.22-2. Invasive Wildlife Species

Scientific Name	Common Name
Apalone spinifera emoryi	Texas spiny softshell
Columba livia	Rock pigeon
Molothrus ater	Brown-headed cowbird
Passer domesticus	House sparrow
Streptopelia decaocto	Eurasian collared-dove
Sturnus vulgaris	European starling
Trachemys scripta elegans	Red-eared slider

3.22.3 Environmental Consequences

Invasive plant and animal species are known for their propensity to invade and negatively affect natural ecosystems. Seeds of invasive plant species can be transported to natural open space areas through a variety of mechanisms such as wind, wildlife, vehicles, imported soils, and landscaping. Recurring fires can encourage the establishment of colonial invasive species, as can some forms of routine land disturbance (e.g., disking, fire breaks). Invasive plant species can have profound impacts on native vegetation communities, removing or diminishing the value of required habitat for native plants and animals. Invasive animal species may dominate habitat otherwise available to native species and may prey on native species, which can have substantial effects on native wildlife populations. Therefore, a need exists to identify and recommend measures that avoid and/or reduce further transport of invasive species into natural open space areas. Because this project has a federal nexus, EO 13112 is applicable and the project must comply with its requirements, which state that federal agencies are required to prevent the introduction and spread of invasive species, and to support efforts to eradicate and control invasive species that are established.

3.22.3.1 Build Alternatives 1, 2C, and 4

In general, roadways exacerbate the spread of invasive and exotic plants. During construction activities under any of the build alternatives, construction vehicles and equipment could transport invasive plant species from previous work sites to project limits of disturbance and adjacent buffer areas. After construction is complete, some temporary impact areas within the right of way would remain undeveloped to serve as a shoulder and/or maintenance buffer. Areas left as bare ground could create favorable conditions for invasive plants and promote the spread of these species. Invasive plant species could also spread to open space areas adjacent to the proposed project.

Activities that would result in the spread of these species will be minimized through the implementation of standard best management practices and construction guidelines required under the Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP). These measures will reduce the potential spread of invasive and exotic species. With

implementation of the minimization measures provided below, any potential indirect impacts from the introduction of invasive species is not expected to be adverse under NEPA.

The long-term operation of the proposed project under any of the build alternatives would continuously expose areas adjacent to the road right of way to invasive plant species. Seeds from invasive plant species may be transported by vehicles traveling on the roadway or in the loads they carry, resulting in the potential spread and establishment of invasive plant seeds and causing a degradation of vegetated areas adjacent to the paved roadway. Invasive plants can be moved from site to site during maintenance operations. Maintenance activities, such as routine grading and mowing along the road right of way will reduce the potential spread of invasive plant species provided the mowing occurs prior to seed set. However, the potential spread of invasive species would not differ appreciably from existing conditions along roadways.

In compliance with the Executive Order on Invasive Species, EO 13112, and guidance from FHWA, the landscaping and erosion control vegetation included in the project would not use species listed as invasive. All roadbed removal areas would be revegetated with a County-approved native seed mix and/or potted plants. All equipment and materials would be inspected for the presence of invasive species prior to mobilizing on the project site and cleaned, if necessary (refer to Measure **NC-8 [NES BIO-8]** in Section 3.17, *Natural Communities*).

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. The median areas are not proposed for drainage, habitat, or other functions under the build alternatives and would be earthen prior to construction of the future six-lane facility; therefore, the construction of the future six-lane facility would not result in additional exposure of open space areas to spread invasive species and would reduce the spread of invasive species. Regardless, the future six-lane facility would be required to comply with the WRC MSHCP, including implementation of measures in Volume I, Section 7.5.3, Construction Guidelines, and Appendix C, Standard Best Management Practices, during its construction activities.

Lake Mathews MSHCP (Build Alternatives 1, 2C and 4)

The proposed project would potentially introduce or contribute to the spread of invasive species into the Lake Mathews Multiple Species Reserve (LMR) of the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Communities Conservation Plan (LM MSHCP). As described in Section 3.17.3.3 (Table 3.17-8), the proposed project would have direct effects on lands within the LM MSHCP. As described above, seeds from invasive species can be transported to the construction area. Areas left as graded after construction is completed and increased habitat degradation within areas adjacent to the new road right of way would also create optimal conditions for invasive species to dominate. However, WRC MSHCP standard best management practices and construction guidelines (refer to Section 3.22.4) would reduce spread of invasive species within the LM MSHCP. In addition, Measure **NC-19 (NES BIO-15)** would restore temporary impact areas, reducing habitat degradation adjacent to the proposed

project. Operation of the proposed project would increase traffic within the LM MSHCP area, which could potentially increase the spread of invasive species transported by vehicles; however, this long-term effect of the LM MSHCP area is not expected to increase greatly from existing conditions within ongoing County maintenance (i.e., clearing for fire and weed abatement) of the road right of way.

As described in Sections 3.17 through 3.21, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Under the existing LM MSHCP, weed abatement within the LMR is currently monitored by the Lake Mathews Reserve Management Committee. The implementation of the selected alternative would slightly modify the location of existing monitored areas along the road right of way, including within the road removal areas that would be rehabilitated under the build alternatives and used as access roads by MWD.

3.22.3.2 No-Build Alternative

Under the No-Build Alternative, no temporary or permanent effects involving invasive species would occur.

3.22.4 Avoidance, Minimization, and/or Mitigation Measures

Measures **NC-2 (NES BIO-2)**, **NC-3 (NES BIO-3)**, **NC-5 (NES BIO-5)** through **NC-8 (NES BIO-8)**, and **NC-12 (NES BIO-12)** in Section 3.17, *Natural Communities*, will be implemented during construction to reduce the introduction and spread of invasive species to adjacent open space areas, including within streams and waterways, or off-site areas. Measure **NC-13 (NES BIO-9)** (refer to Section 3.17, *Natural Communities*) will ensure that invasive species will not be planted as part of the landscaping or revegetation of the project. Measure **NC-10 (NES BIO-10)** in Section 3.17, *Natural Communities*, will establish a Storm Water Pollution Prevention Plan and best management practices for the project to reduce or eliminate runoff containing invasive species. These measures will also ensure full compliance with the WRC MSHCP, Volume I, Section 7.5.3, Construction Guidelines, and Appendix C, Standard Best Management Practices.

Measure **NC-19 (NES BIO-15)** (refer to Section 3.17, *Natural Communities*) would ensure that temporary impact areas within the LM MSHCP are restored on site.

[This page left blank intentionally.]

3.23 Relationship between Local Short-term Uses of the Human Environment and the Maintenance and Enhancement of Long-Term Productivity

3.23.1 Introduction

Implementation of any of the build alternatives for the Cajalco Widening and Safety Enhancement Project would result in attainment of short-term and long-term transportation objectives at the expense of some long-term social, aesthetic, biological, and other land use impacts. The proposed transportation improvements are based on regional and local comprehensive planning efforts that consider the need for present and future traffic requirements within the context of present and future land use development.

3.23.2 Environmental Consequences

3.23.2.1 Build Alternatives

Short-term losses and impacts of the Cajalco Widening and Safety Enhancement Project build alternatives would include:

- Economic losses experienced by businesses from temporary displacements, relocations, or traffic detours;
- Temporary construction impacts on residents and visitors such as increased noise, impaired air quality from dust and debris, blocked viewsheds, and motorized and non-motorized traffic delays or detours;
- Temporary loss of productivity on and near sites used as temporary construction staging areas;
- Temporary increase in travel time to community facilities;
- Temporary, localized disturbance of Farmland Mapping and Monitoring Program (FMMP) important farmlands;
- Temporary disturbance of soils during construction increasing the chance of erosion and temporary water quality impacts; and
- Temporary impacts on plant resources, wildlife resources, and open space.

Short-term benefits of the build alternatives for the Cajalco Widening and Safety Enhancement Project would include:

- Increased revenue for the local region generated during construction, and possibly limited temporary employment opportunities.

Long-term losses of the build alternatives for the Cajalco Widening and Safety Enhancement Project would include:

- Permanent removal of residential and nonresidential uses and a possible permanent loss of those uses in the community along the ultimate Cajalco Road alignment if they are not relocated in the immediate project vicinity;
- Permanent conversion of FMMP important farmland and open space to roadway use;
- Permanent impacts on residents, business patrons, and travelers such as altered viewsheds, the visual presence of noise barriers, and a change in the aesthetic character of the land adjacent to the corridor due to the wider roadway;
- Permanent minor increases in noise and vibration at certain locations along the project corridor;
- Permanent loss of archaeological sites and the values associated with those sites;
- Permanent loss of paleontologically sensitive land;
- Permanent increase in impervious surfaces resulting in increased stormwater runoff and requiring new drainage facilities; and
- Permanent impacts on plant resources, wildlife resources, and open space.

Long-term gains of the build alternatives for the Cajalco Widening and Safety Enhancement Project would include:

- An improved transportation facility to address anticipated growth and mobility needs, as identified in the County of Riverside General Plan Circulation Element Policy 1.5;
- Improved interregional travel by improving east-west mobility in Riverside County;
- Increased efficiency of the movement of people and goods along Cajalco Road, which is expected to provide regional economic benefits;
- Reduction in travel times to community facilities due to roadway efficiency; and
- Improved roadway alignment and intersection design to enhance safety along Cajalco Road.

3.23.2.2 No-Build Alternative

The No-Build Alternative would not change the overall existing conditions of the Cajalco Road Widening and Safety Enhancement Project study area as described throughout Chapter 3, *Affected Environment, Environmental Consequences, and Mitigation Measures*. Therefore, the No-Build Alternative would not result in the losses/impacts described above and would not provide the benefits of the Cajalco Road Widening and Safety Enhancement Project described above.

3.23.3 Conclusions

Implementation of any of the build alternatives for the Cajalco Road Widening and Safety Enhancement Project would result in trade-offs between addressing transportation needs and goals (short and long term) and adverse environmental impacts (short and long term).

The Cajalco Road Widening and Safety Enhancement Project would serve to improve traffic conditions locally and within the region. In Riverside County, the circulation system is intended to accommodate a pattern of concentrated growth, providing both a regional and local linkage system between communities. Travel, including freight movement, extends past the Riverside County boundary and, as a result, the transportation system must be capable of adequately meeting a wide range of needs. Not only does the County need to accommodate the traffic that it generates, it also must accommodate pass-through traffic. The long-term benefits to the community (through transportation improvements) will be weighed against the short-term and long-term environmental impacts of the project as described in this Environmental Impact Report/Environmental Impact Statement.

[this page left blank intentionally]

3.24 Irreversible and Irretrievable Commitments of Resources That Would Be Involved in the Proposed Project

3.24.1 Build Alternatives

The construction of any of the build alternatives under analysis for the proposed project involve a commitment of various natural, physical, human, and fiscal resources. Land used in the construction of the project would be considered an irreversible commitment during the time period that the highway facility exists. However, if a greater need arose for use of the land or if the roadway facility was no longer needed, the land could be converted to another use. There is no reason to believe such a conversion would ever be necessary or desirable within the foreseeable future.

Considerable amounts of fossil fuels, labor, public capital, and highway construction materials such as cement, aggregate, and bituminous material would be expended and would not be retrievable following construction of the proposed project. Additionally, large amounts of labor and natural resources are used in the production of construction materials, and these are generally not retrievable. However, they are not in short supply, and their use would not have an adverse effect upon continued availability of these resources.

Lands currently committed to conservation, including those in the Lake Mathews Multiple Species Reserve, Lake Mathews-Estelle Mountain Core Reserve, and Riverside-Corona Resource Conservation District, would be converted to other uses. Efforts to avoid or otherwise minimize conversion of these lands include project alignment and design adjustments, and standard project measures, incorporated into the project. For areas that could not be avoided through the efforts described above, mitigation measures that would compensate for the loss of lands have been developed in coordination with the agencies involved in the management of the conservation areas.

Construction of the proposed project would require a substantial, one-time expenditure of both state and federal funds, which are not retrievable; savings in travel time and improved transportation system efficiency would offset the use of these materials, labor, resources, and funds. In addition to the costs of construction and right of way, there would be ongoing costs for roadway maintenance.

The commitment of these resources to the proposed project is based on the concept that residents, workers, travelers, and others in the immediate area, region, and state would benefit from the improved quality of the transportation system in Riverside County. These benefits would consist of improved accessibility, travel time, and safety, which are expected to outweigh the commitment of resources.

3.24.2 No-Build Alternative

The No-Build Alternative would not result in any irretrievable commitment of resources because it would not result in the construction of the proposed project.

[this page left blank intentionally]

3.25 Cumulative Impacts

3.25.1 Regulatory Setting

Cumulative impacts are those that result from past, present, and reasonably foreseeable future actions, combined with the potential impacts of the proposed project. A cumulative effect assessment looks at the collective impacts posed by individual land use plans and projects. Cumulative impacts can result from individually minor but collectively substantial impacts taking place over a period of time.

Cumulative impacts on resources in the project area may result from residential, commercial, industrial, and highway development, as well as from agricultural development and the conversion to more intensive agricultural cultivation. These land use activities can degrade habitat and species diversity through consequences such as displacement and fragmentation of habitats and populations, alteration of hydrology, contamination, erosion, sedimentation, disruption of migration corridors, changes in water quality, and introduction or promotion of predators. They can also contribute to potential community impacts identified for the project, such as changes in community character, traffic patterns, housing availability, and employment.

The California Environmental Quality Act (CEQA) Guidelines Section 15130 describes when a cumulative impact analysis is necessary and what elements are necessary for an adequate discussion of cumulative impacts. The definition of cumulative impacts under CEQA can be found in Section 15355 of the CEQA Guidelines. A definition of cumulative impacts under the National Environmental Policy Act (NEPA) can be found in 40 Code of Federal Regulations (CFR) Section 1508.7.

3.25.1.1 Methodology

The CEQA Guidelines Section 15130 provide two methods for an adequate analysis of cumulative impacts:

- The List Approach, which identifies all of the past, present, and probable future projects contributing to the cumulative impact, including projects that are outside of the control of the California Department of Transportation (Caltrans).
- The Projection Approach, which relies upon the cumulative impact analysis on a summary of projections of future development and impacts contained in an adopted general planning or related planning document, or in a prior environmental document that has been certified. These documents must be available to the public and describe or evaluate the regional or area-wide conditions contributing to the cumulative impact.

In 2005, Caltrans, in conjunction with the Federal Highway Administration (FHWA) and the U.S. Environmental Protection Agency (U.S. EPA), developed a guidance document: *Guidance for Preparers of Cumulative Impact Analysis*. The following analysis is based on the referenced guidance, which includes an eight-step process:

1. Identify the resources to consider in the cumulative impact analysis by gathering input from knowledgeable individuals and reliable information sources. This process is initiated during project scoping and continues throughout the NEPA/CEQA analysis.
2. Define the geographic boundary or Resource Study Area (RSA) for each resource to be addressed in the cumulative impact analysis.
3. Describe the current health and historical context of each resource.
4. Identify the direct and indirect impacts of the proposed project that might contribute to a cumulative impact on the identified resources.
5. Identify a set of other current and reasonably foreseeable future actions or projects and their associated environmental impacts to include in the cumulative impact analysis.
6. Assess cumulative impacts.
7. Report the results of the cumulative impact analysis.
8. Assess the need for mitigation and/or recommendations for actions by other agencies to address a cumulative impact.

As specified in the guidance, if a proposed project would not result in a direct or indirect impact on a resource, it would not contribute to a cumulative impact on that resource. This cumulative impact analysis includes environmental resources that are substantially affected by the project and resources that are currently in poor or declining health, or at risk even if project impacts would not be substantial.

In addition to the project, there are a number of development and transportation projects that have been identified as planned, approved, or recently constructed projects within the general project vicinity. Each project would be subject to all applicable federal and state environmental compliance requirements, as appropriate. A list of the projects considered in this analysis is provided in Table 3.25-1 on the following page, and the locations of the projects are depicted in Figure 3.25-1.

Table 3.25-1. Planned Projects within Project Vicinity

ID	Name	Jurisdiction/Location	Proposed Uses	Status
1	Magnolia Avenue Bridge Widening	City of Corona Magnolia Avenue from All American Way to El Camino Avenue	Widening Magnolia Avenue from four lanes to six lanes and widening the existing bridge over the Temescal Creek Channel.	Design phase; environmental studies in progress. PS&E anticipated to begin May 2021.
2	Ontario Avenue Widening	City of Corona Ontario Avenue from California Avenue to State Street	Widen the north side of Ontario Avenue to increase the vehicle capacity.	Planning and design in progress.
3	I-15 Express Lanes Project	County of Riverside I-15 from Cajalco Road to SR-60.	Addition of two tolled express lanes to I-15 in each direction, a distance of approximately 15 miles.	Construction initiated April 2018 and continuing through 2021.
4	Arantine Hills Specific Plan	City of Corona	A specific plan that proposes 1621 residential units on 129 acres, 38 acres of general commercial development, 40 acres of mixed-use development, 37 acres of open space, and 15 acres of park land.	Precise Plan (PP16-012) and a merchant builder map (TTM37030) approved for the first phase of development; under construction. Second phase is under plan check. City Approved 12/19/2018. General Plan Amendment (GPA2018-0001) with Specific Plan Amendment (SPA2018-0001), Parcel Map (PM 37036), and amendment to the Development Agreement (AEC724, DA15-001).
5	Cajalco Road / I-15 Interchange	City of Corona Cajalco Road and I-15, on and off ramp	Replace existing two-lane Cajalco/I-15 interchange bridge with a standard six-lane bridge and to reconfigure the on- and off-ramps to meet the projected traffic volumes for year 2035.	Construction completed.
6	Convenience store, car wash and gas station	County of Riverside North of Cajalco Road, east of Temescal Canyon Road, and west of Eagle Canyon Road	Approximately 5,881-sq. ft. convenience store, 1,262-sq. ft. car wash facility, and a 6,549-sq. ft. fuel canopy area that will house 10 fuel dispensers. In addition, 2.6 acres dedicated in accordance with MSHCP.	Constructed.
7	Two 30,000-sq. ft. industrial buildings	City of Corona East of Temescal Canyon Road and south of Cajalco Road	Parcel map to subdivide two lots. Two new 30,000–sq. ft. industrial buildings on 3.60 acres.	Construction completed.
8	McKinley Grade Separation	City of Corona McKinley Street and BNSF crossing	Build a grade separation on the McKinley railroad BNSF crossing	Design contract awarded July 2018. Construction anticipated to begin mid-2021.

ID	Name	Jurisdiction/Location	Proposed Uses	Status
9	I-15 Express Lanes Southern Extension	County of Riverside Interstate 15 between Cajalco Road in Corona and State Route 74 (Central Avenue) in Lake Elsinore	Add two Express Lanes in both directions within the I-15 median	Undergoing engineering and environmental study; initiation of construction anticipated 2025.
10	Lake Hills Specific Plan #144	County of Riverside	1,650-acre residential development; 1704 units.	Specific Plan adopted January 1998. Partially built out.
11	91,000-sq. ft. shopping center	County of Riverside North of La Sierra Avenue and El Sobrante Road intersection. APNs 270190017 and 270190022	91,000-sq. ft. shopping center	Pre-application review approved; permits are in process.
12	Victoria Grove Specific Plan #270	County of Riverside North of El Sobrante Road, east of La Sierra Avenue.	86.8-acre residential development.	Specific plan adopted 12/1999. Nearly built out. 12.55-acre residential parcel remains undeveloped. SP00270A1: Add 86.8 acres (residential); approved. TR29282: Division of 7.7 acres into 24 single family lots; approved and construction completed
13	103-acre residential subdivision	County of Riverside 13100 El Sobrante Road	103-acre residential subdivision; 271 units.	TR36730: Approved TR36730E01: Approved extension of time. IP180069: Undergoing review.
14	Greentree Ranch Specific Plan #394	County of Riverside North of El Sobrante Road between McAllister Street and Mockingbird Canyon Road	Development of 513 residential units on 327.4 acres of land.	Notice of Preparation May 2017. Undergoing review.
15	Van Buren Boulevard and Little Court	City of Riverside 18171 Van Buren Boulevard	Development of a retail commercial center on 2 contiguous parcels; 7.17 acres; 10,700-sq. ft. retail, 10,000-sq. ft. daycare, 2,500-sq. ft. drive-thru restaurant, 10,000-sq. ft. office, and 8,000-sq. ft. medical office	Revised design plans submitted September 24, 2019; undergoing review.
16	117.7-acre residential subdivision	County of Riverside South of Cajalco Road, east of Gustin Road and west of Wood Road	Subdivision of 117.7 acres into 112 single family residential lots	TR30752: Sched B Division 117 AC into 112 Res Lots W/9 Open Space Lots; Approved. TR30752E03: Third extension of time expires July 2021. TR31608: Subdivide 41 acres into 65-sq. ft. open space lot; approved. TR31608E02: Second extension for TTM31608; expires July 2021.

ID	Name	Jurisdiction/Location	Proposed Uses	Status
17	18-hole golf course with clubhouse and ancillary facilities	County of Riverside Located south of Cajalco Road and west of Wood Road	18-hole golf course with clubhouse and ancillary facilities.	Approved.
18	Boulder Springs Specific Plan #229	County of Riverside North of Cajalco Road; east of Wood Road and west of Alexander Street	981-acre specific plan that proposes 1421 dwelling units on 798 acres of land. H.B. Ranches: Subdivision of 283.3 acres into 468 residential lots.	Specific plan adopted 10/4/1988. Permits obtained or in process; some parcels constructed. Time extensions granted for H.B. Ranches Tentative Tract Maps Subdivision to January 9, 2021.
19	I-215 North Project	County of Riverside I-215 between Nuevo Road in Perris and SR-60 in Riverside	Widen 10.75-mile section of I-215 from Nuevo Road to 60/215 Interchange for one carpool lane added to I-215 in both directions.	Final design and environmental permitting, although funding is required to complete project.
20	Majestic Freeway Business Center Specific Plan #341	County of Riverside North of Cajalco Expressway, south of Nandina Avenue, west of I-215 and east of Decker Road	Construction of 6.2 million sq. ft. of light industrial buildings and 1.2 million sq. ft. of manufacturing, distribution, and warehouse facilities on 325 acres of land. Development of 1,138,800-sq. ft. industrial building.	Under construction.
21	26.73-acre industrial development	County of Riverside West and east of Harvill Avenue, south of Cajalco Expressway, and north of Cajalco Road	Subdivide 26.73 acres into 10 industrial lots. Five office buildings and light industrial.	Approved; under construction.
22	Hotel	County of Riverside Northeast of Dree Circle and Harvill Avenue	A three-story 51,994-sq. ft., 103-room hotel with 5,656-sq. ft. banquet/conference/ restaurant area on 3.2 acres	Under construction.
23	Villa Verona Apartment Community	City of Perris	Multi-family residential development on 17.33 acres; includes two and three-story buildings with one-, two-, three-, and four-bedroom units.	Project approved. Project has not been submitted for construction.
24	Duke Warehouse – Perry Street	City of Perris Southeast corner of Perry Street and Barrett Avenue	Industrial development project; 148,297 sq. ft. including 3,000 sq. ft. of office and 3,000 sq. ft. of mezzanine office space on 7.26-acre site	Approved late 2019.
25	Duke Warehouse – Perris Boulevard	City of Perris Northeast corner of Perris Boulevard and Markham Street	Industrial development project; 55 acres; 1.2 million sq. ft.	Completed.
26	Duke Warehouse – Patterson Avenue	City of Perris Southeast corner Patterson Avenue and Markham Street	Industrial development project; 37.5 acres; 811,260 sq. ft.	Completed.

ID	Name	Jurisdiction/Location	Proposed Uses	Status
27	Mid County Parkway	County of Riverside 16-mile transportation freeway between I-215 and SR-79	16-mile transportation corridor (freeway) between I-215 and SR-79	Construction of I-215/ Placentia Avenue interchange completed.
28	First Perry Logistics Project	City of Perris Adjacent to Redlands Avenue, north of Ramona Expressway	Industrial development project; 11 acres; 240,000 sq. ft.	Completed.
29	Stratford Ranch Residential Project	City of Perris West of Evans Road, north of Ramona Expressway	Residential development project; 270 lots	Partially constructed.
30	Nuevo Road and Nuevo Bridge Replacement Project	City of Perris Nuevo Road from Wilson Avenue to Perris Valley Storm Drain Channel	Widen Nuevo Road to its ultimate width (i.e., 128-foot curb-to-curb street section with a 14-foot median and 10-foot sidewalks on either side), including replacement of the Nuevo Road Bridge at the Perris Valley Storm Drain Channel.	Under construction.

Figure 3.25-1
Project Area Planned Projects
Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

3.25.2 Environmental Resources Excluded from the Cumulative Impact Analysis

If the project would not cause direct or indirect impacts on a resource, it would not contribute to a cumulative impact on that resource and would not need to be evaluated with respect to a potential cumulative impact. The project would have no effect on timberlands, coastal zone, wild and scenic rivers, sole source aquifers, or species listed by the National Marine Fisheries Service. Therefore, the project would not have the potential to contribute to a cumulative impact on these resources, and they will not be discussed within this section.

Based on the nature of the proposed project, the affected project area, and the impact analysis for each resource conducted for this Environmental Impact Report (EIR)/Environmental Impact Statement (EIS), it was determined the following resources would not require detailed cumulative impact analysis for the reason described under each resource area.

3.25.2.1 Air Quality

The proposed project is located in the South Coast Air Basin (SCAB); as such, the SCAB is the appropriate RSA for evaluation of cumulative impacts for air quality. The SCAB experiences chronic exceedances of state and federal ambient air quality standards however, the SCAB is in federal maintenance or attainment status for all criteria pollutants. The South Coast Air Quality Management District (SCAQMD) has responsibility for managing the SCAB's air resources, and is responsible for bringing the SCAB into attainment for federal and state air quality standards. The 2016 AQMP prepared by SCAQMD is part of California's State Implementation Plan (SIP), which shows how the state will attain conformity with federal ambient air quality standards, as required under the Clean Air Act.

As part of the AQMP, SCAQMD develops transportation emissions budgets based on the regional transportation planning documents prepared by the Southern California Association of Governments (SCAG). The proposed project is included in the SCAG 2020-2045 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) under Project ID 3A04WT137A. The proposed project has been incorporated into the SCAG 2021 Federal Transportation Improvement Program (FTIP) under project ID RIV090903. The 2020-2045 RTP/SCS was found by FHWA and the Federal Transportation Administration to be in conformity with the SIP on June 5, 2020. The 2021 FTIP was found to be in conformity with the SIP on April 16, 2021.[1]

[1] The project is currently described in the 2021 FTIP as "CAJALCO RD. WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON RD. TO HARVILL AVE AND FROM 4 TO 6 LANES FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND A BRIDGE RECONSTRUCTION OVER A WATER CROSSING." The County of Riverside has submitted an amendment that would update the description as follows: "IN RIVERSIDE COUNTY ON CAJALCO RD - WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON. BRIDGE/EAGLE CANYON ROAD TO HARVILL AVE AND FROM 4 TO 6 LANES WITH THREE LANES IN THE WESTBOUND DIRECTION FROM TEMESCAL CANYON RD TO TEMESCAL CANYON BRIDGE, THREE LANES IN THE EASTBOUND DIRECTION FROM TEMESCAL CANYON ROAD TO JUST EAST OF EAGLE CANYON ROAD, AND THREE LANES EASTBOUND AND WESTBOUND FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND THE CONSTRUCTION OF NEW, AND RECONSTRUCTION OF EXISTING, BRIDGES AS NEEDED." This amendment will be obtained prior to adoption of the Final Environmental Document.

Per State CEQA Guidelines Section 15130 (d), where a project is included in an approved regional transportation plan (among other land use plans) that adequately address the affected resource area, no additional analysis is required. Because the proposed project is listed, as currently proposed, in the region's currently conforming SCAG 2020-2045 RTP/SCS and 2021 FTIP regional transportation planning documents, project emissions would not be cumulatively considerable. In addition to project RTP and SIP conformance, the following standard project features are included in the project that would reduce construction-period emissions and air quality impacts: **PF AQ-1**, **PF AQ-2**, and **NC-2 (NES BIO-2)**.

3.25.2.2 Geology

The RSA is composed of the area along Cajalco Road between Interstate 15 (I-15) and Interstate 215 (I-215) within the Peninsular Ranges geomorphic province of Southern California in a relatively stable structural platform known as the Perris Block. The closest known active fault is the Glen Ivy Section of the Elsinore Fault Zone approximately 3.4 miles southwest from the nearest end of the project area. The project site is in a seismically active area; however, seismically induced impacts are localized and would not contribute to cumulative impacts.

The proposed project would include Project Standard Measures **PF GEO-1** through **PF GEO-5**, which require soil testing prior to construction, which is intended to verify that the geological conditions of the construction sites are properly characterized and to specify excavation techniques to minimize adverse effects. Moreover, hazards mapping provisions require that the location of proposed structures be evaluated for their susceptibility to catastrophic risks, including seismic and geotechnical hazards. California building standards have been developed to consider such risks. The combination of these provisions ensures that risks to these structures and their inhabitants, visitors, or users are minimized; therefore, the build alternatives and planned projects contained within Table 3.25-1 would be required to adhere to these guidelines. Based on the information and analysis above, the proposed project in combination with other projects in the RSA would not cause direct or indirect cumulative impacts related to geology, soils, or seismicity. As a result, no further analysis is necessary.

3.25.2.3 Utilities and Emergency Services

Utilities and emergency services are actively planned for and developed based on service needs of the area in which they are provided. The RSA, which is composed of utilities, emergency services, and public services, is limited to the immediate vicinity of the active construction work areas; however, various water, gas, telephone, sewer, power, and other utility lines currently cross the RSA and may require relocation or special handling during construction activities. Proposed construction activities requiring relocation of an underground fiber optic line, for example, could be scheduled to coincide with a telephone company project to underground telephone lines. In this way, a situation may be avoided where constant construction and accompanying traffic delays occur on a busy street due to poorly coordinated schedules.

The effect of other projects identified in Table 3.25-1 on utilities and emergency services would be assessed as part of the environmental review of those projects; however, for transportation and public infrastructure projects, the impacts from these projects would be beneficial because they normally improve circulation in their respective project areas. Emergency services would potentially benefit from improved access and circulation. The incorporation of Standard Project

Measures **PF LU-1** and **PF UT-1**, and the implementation of Mitigation Measure **HYD-1**, are proposed to ensure continued function of Metropolitan Water District of Southern California (MWD) facilities, prevent unreasonable traffic delays and impacts on emergency access and utilities, and minimize impacts during proposed utility relocations. Based on the information and analysis above, direct or indirect cumulative impacts on utilities and emergency services are not anticipated to result from this project, and no further analysis is necessary. Impacts from the project would not be cumulatively considerable.

3.25.3 Environmental Resources Considered in the Cumulative Impact Analysis

This section discusses potential cumulative impacts on various resources that could occur as a result of the construction and operations of the build alternatives (1, 2C, and 4) together with related projects.

3.25.3.1 Energy

Because nearly all project-related energy consumption would result from fuel use by vehicles and equipment during the construction period as well as vehicles during everyday operation of the build alternatives, for the purposes of this cumulative impacts discussion, the only form of energy use considered is gasoline and diesel fuel use. Due to the specialized requirements for fuel formulation in California (CARB 2018), the RSA for cumulative energy use is the state of California. For the purposes of fuel consumption, this cumulative impact discussion uses the list of past, present, and reasonably foreseeable projects list approach identified in CEQA Guidelines Section 15130 (b)(1).

The proposed project, in combination with the projects identified in Table 3.25-1 as well as numerous other projects and ongoing operations of transportation facilities throughout the state, requires the use of gasoline and diesel fuel for construction and long-term operations. Direct diesel and gasoline consumption would result from the use of construction vehicles and equipment as well as from employee and maintenance trips during operation. Indirect fuel consumption would result from redistribution of trips that would occur from capacity changes along the proposed alignment. Each of the build alternatives would result in increased fuel use compared to the No-Build Alternative, as shown in Table 3.16-1 (see Section 3.16, *Energy*). However, despite this project-related increase in fuel consumption and projected growth in regional population and travel demand, fuel use is expected to fall as a result of increased fuel efficiency of vehicles and adoption of vehicles powered by electricity and fuel cells, and annual fuel consumption will fall in 2040 with full implementation of the 2016–2040 RTP/SCS.

As such, additional fuel infrastructure is not anticipated to be required to meet motor vehicle fuel demands in the future. Although each of the build alternatives would result in increased fuel use in the project area relative to the No-Build Alternative, the project's contribution to energy consumption would not be substantial, as the project's gasoline and diesel fuel requirements would be small, and demand could be met by the extensive network of fueling stations found throughout the project area. Standard Project Measures **PF AQ-1**, **PF LU-1**, **PF VIS-6**, and **PF SW-1** would further be incorporated into the project and reduce energy consumption during construction. Therefore, impacts related to energy use would not be cumulatively considerable.

3.25.3.2 Farmlands

The RSA for farmlands is defined as a 0.5-mile-radius of proposed project right of way. This RSA was selected because it includes the populations and communities within those portions of unincorporated Riverside County and the Cities of Corona and Perris that are most likely to experience potential impacts from the physical improvements associated with the project. The RSA contains approximately 2,869 acres of Important Farmland[2]. Williamson Act land is intermittently within the study area of Build Alternative 4 north and south of El Sobrante Road from La Sierra Avenue to Mockingbird Canyon Road. All build alternatives include lands within the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) area that meet the California Department of Conservation's Farmland Mapping and Monitoring Program Important Farmland criteria.

All three build alternatives would require permanent acquisitions and temporary construction easements that would require conversion of important farmland. Table 3.25-1 summarizes many adopted transportation and land use plans that could potentially contribute to conversion of farmland to transportation uses along Cajalco Road or El Sobrante Road. Planned projects converting farmland to other uses would be required to address potential impacts through mitigation and as part of project approvals required by the implementing jurisdiction in which they are located.

The proposed and related projects resulting in farmland conversion would continue the regional trend of converting farmland to nonagricultural uses. With acquisition proposed by the project, the remainder of each parcel could continue to be used for agricultural purposes. While Build Alternatives 1 and 2C would not result in impacts on Williamson Act land, Build Alternative 4 would result in permanent and temporary impacts on this type of farmland. Therefore, even with inclusion of Standard Project Measures **PF LU-1**, **PF COM-1**, **PF COM-2**, and **PF FA-2**, impacts would be substantial and unavoidable, and the project's cumulative contribution would be cumulatively considerable.

3.25.3.3 Growth

The RSA for growth is regional and includes Riverside County and the Cities of Corona and Perris. The population of Riverside County has grown since 2015 and is expected to continue growing through 2040. Population growth projections developed for SCAG's 2016–2040 RTP/SCS indicate that between 2015 and 2040 the populations of Riverside County, City of Corona, and City of Perris are expected to increase by 37.4 percent, 10.5 percent, by 65 percent, respectively.

The build alternatives would not be expected to influence the amount, location, or distribution of growth in the cities, unincorporated areas, or portion of Riverside County within the project study area because the project would not encourage population density, construction of new housing, or opportunities for capital investment by the public or private sectors. In addition, under the Community and Environmental Transportation Acceptability Process Project, which would provide a western transportation corridor between I-15 and I-215 and an alternate east-west route to Cajalco Road, the anticipated traffic conditions would remain relatively similar,

[2] Excludes lands committed to urban development and water storage per 7 CFR 658.2(a).

with or without the proposed project. Therefore, the build alternatives would not induce traffic to be diverted to Cajalco Road. Consequently, the build alternatives are not anticipated to affect the rate or location of future development within the project area or region. Also, because this is a transportation project within the semi-rural, partially developed project area, the proposed project is not expected to result in direct impacts related to growth in the form of providing access to new areas that are currently inaccessible. However, it is possible that the project could make areas surrounding employment centers, where developable land is still available, more appealing for future development if peak travel commute times are reduced. The project along with development could result in indirect effects related to growth on surrounding areas that can support future growth.

The proposed project itself would not cause development to occur in the region due to land use controls such as County and local city general plan land use designations, development restrictions, lands committed to conservation, and lands currently or in the process of being developed. Future development and transportation projects in the Cities of Riverside, Corona, and Perris are anticipated to be limited to developments that are currently in progress and infill development. Infill development is not expected to result in impacts on resources of concern other than water, if water availability is constrained at the time of future development. Future infill projects would be subject to environmental review and would be required to identify adequate water supplies prior to development; therefore, implementation of the proposed project and other related projects would not have a cumulatively considerable contribution to the cumulative effects related to growth.

3.25.3.4 Parks and Recreational Facilities

The RSA for parks and recreational resources includes any park, recreational facility, open space area, recreational bikeway, or other recreational trails within 0.5 mile of the proposed project. This RSA was chosen because it includes the populations and communities that are most likely to experience potential impacts associated with the project. There are eight parks and recreational areas within 0.5 mile of the build alternatives. Of these eight resources, five are public schools with outdoor playgrounds and other recreational facilities, which are assumed to be open to the general public. Two of the remaining properties are outdoor parks, and one is a privately owned golf course. Riverside County currently has one developed trail, the Santa Ana River Trail, that is outside the RSA; however, additional future planned trail facilities are within the RSA. No formally designated bicycle routes or facilities, such as marked bicycle lanes, are currently within the project limits. Build Alternatives 1, 2C, and 4 would not require partial or full acquisition of any parks or recreational facilities.

In addition to the eight parks identified within the RSA, four agency-managed conservation areas are within the RSA; the Lake Mathews-Estelle Mountain Core Reserve (LM-EM Reserve), Lake Mathews Multiple Species Reserve (LMR), Riverside Corona Resource Conservation District (RCRCD) mitigation lands, and Western Riverside County Regional Conservation Authority (WRCRCA) conserved lands. As described in Section 3.1.5.3, land from agency-managed conservation areas would be temporarily and permanently acquired by all of the build alternatives. As shown in Table 3.1-10, the LM-EM Reserve would experience the greatest impact of the agency-managed conservation areas. Build Alternative 2C would result in the greatest amount of permanent and temporary land acquisition of the LM-EM Reserve, followed

by Build Alternative 1 and Build Alternative 4. The RCRCD Mitigation Lands and WRCRCA Conserved Lands would experience a much smaller acquisition impact under all three build alternatives.

Table 3.25-1 summarizes many development and transportation projects that could contribute to impacts on parks and recreational facilities near Cajalco Road or El Sobrante Road. Planned projects would be required to address potential impacts on parks and recreational facilities through mitigation and as part of project approvals required by the implementing jurisdiction in which they are located. For the proposed project, in addition to the avoidance and minimization measures for property acquisitions identified in Section 3.4.4, *Relocations and Real Property Acquisition*, replacement for the permanent loss of habitat within the LM MSHCP will be required at a minimum 1:1 ratio (see Measures **NC-17 [NES BIO-17]** and **NC-19** [**NES BIO-15]** in Section 3.17, *Natural Communities*). The project would not preclude future consideration of trail and bicycle facilities identified in local plans, or interfere with continued use of local, unpaved roadways for equestrian uses. Also, no conflicts would occur with any future recreational facility proposed by other development projects. Temporary impact areas would be addressed through preparation of a TMP (see Standard Project Measure **PF LU-1** in Section 3.1.1.2) and compliance with noise-reducing measures (see Standard Project Measure **PF NOI-1** in Section 3.15, *Noise and Vibration*), especially if multiple projects are being constructed at the same time. With no impacts on the eight parks and other recreational facilities, trails, bicycle facilities, or equestrian uses within the RSA, and the mitigation required as a result of impacts on the LM MSHCP, operation of the build alternatives would result in only a minor contribution to cumulative impacts on parks and recreational facilities within the RSA.

3.25.3.5 Land Use

The RSA for land use is defined as a 0.5-mile radius of proposed project right of way, and includes the populations and communities that are most likely to experience potential impacts or fragmentation from the physical improvements associated with the project. Land use within the RSA varies from mining, open space, scattered rural estates, and communities of single-family houses to commercial businesses and farmland.

All build alternatives would require right of way acquisitions, including up to 240 acres of property involving residential, nonresidential, and vacant parcels for Build Alternative 4. Acquisitions would also include lands from the LM MSHCP area, including the LMR. These acquisitions would change land uses from their current uses to that of a transportation facility. However, in addition to the reopening of the LM MSHCP and discretionary action to accommodate the project, the acquisition of lands within the LM MSHCP would require the coordination of mitigation, including replacement lands, with the managing resource agencies. The acquisitions necessary for all build alternatives represent a small percentage of total residences and businesses within Riverside County; therefore, appreciable land use change would not occur as a result of the proposed project. The future six-lane facility is not anticipated to interfere with existing land uses for all build alternatives and operation of the facility would not change existing land uses because additional property acquisitions are not anticipated. Land use impacts involving temporary changes during construction would be addressed with the incorporation of Standard Project Measures **PF LU-1** and **PF FA-2**.

Table 3.25-1 summarizes many development and transportation projects that could potentially contribute to land use impacts and increase the number of land use conversions near Cajalco Road or El Sobrante Road. Planned and approved projects would be consistent with applicable general plan and zoning requirements. Tables 3.1-5 and 3.1-6 in Section 3.1, *Land Use*, detail the temporary and permanent impacts on defined land use zoning as a result of the build alternatives.

As detailed in Table 3.1-7, Build Alternatives 1, 2C, and 4 would conflict with the current LM MSHCP. The LM MSHCP does not currently accommodate the transportation improvements of the proposed project within lands managed by MWD. Because of this inconsistency, the proposed project would require the reopening of the LM MSHCP, and discretionary action coordinated between the County and LM MSHCP responsible parties to accommodate the project. Changes in the LM MSHCP as well as changes to the lands managed by the LM MSHCP would be addressed by mitigation coordinated with MWD and other responsible agencies, and the build alternatives are not anticipated to conflict with the goals or policies of any other relevant plans and programs.

Build Alternatives 1, 2C, and 4 would conflict with three goals or policies of relevant regional and local plans and programs: the LM MSHCP, the Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP), and the Stephens' kangaroo rat (SKR) Habitat Conservation Plan (HCP). Land use changes as a result of the conversion of conservation lands to a transportation facility would require the coordination of mitigation, including replacement lands, with the managing resource agencies. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to accommodate the proposed roadway improvements within the LM MSHCP boundary. An application to amend the LM MSHCP would be pursued by the County; approval would need to be obtained prior to any construction.

To compensate for the loss of natural lands on the LM-EM Reserve and in the WRC MSHCP plan area (which includes the SKR HCP), the County will coordinate with the Riverside County Habitat Conservation Agency (RCHCA), MWD, the Lake Mathews Reserve Management Committee, WRCRCA, U.S. Fish and Wildlife Service (USFWS), and California Department of Fish and Wildlife (CDFW) to develop a suite of mitigation measures that demonstrate biological equivalency to offset the loss. Please refer to Measures **NC-17 (NES BIO-17)** through **NC-20 (NES BIO-21)** in Section 3.17, *Natural Communitie*s. Temporary impact areas would be addressed through preparation of a habitat mitigation and monitoring plan and onsite restoration to original conditions; see Measure **NC-19 (NES BIO-15)** in Section 3.17 for additional information.

Operation of the build alternatives would result in a noticeable change in land uses and a moderate contribution to cumulative land use conversion impacts in the RSA as up to 240 acres of land would be converted to transportation uses with implementation of the project. The project, when combined with other development and transportation projects, would result in an increase in land acquisitions and noticeable land use changes in the RSA and throughout Riverside County. Land use impacts involving temporary changes during construction would be addressed with the incorporation of Standard Project Measures **PF LU-1** and **PF FA-2** for the project, and other development and transportation projects would require similar measures to minimize temporary construction and operation impacts. Coordination with the managing resource agencies would also be required for the project and other development and

transportation projects to determine the extent of mitigation, including replacement lands. Therefore, implementation of the proposed project and other related projects would not have a cumulatively considerable contribution to the cumulative effects related to land use.

3.25.3.6 Community

The RSA for community impacts has been defined to include the 2015 U.S. Census Bureau census tracts within 0.5 mile of the proposed project. The primary study area for community impacts is defined by the nine Census tracts that are adjacent to or span the three build alternatives. The study area for economic conditions is Riverside County and the Cities of Corona and Perris. The study area for community facilities is the area within 0.5 mile of the project build alternatives.

There are six distinct communities in the project vicinity: Mead Valley, Lake Mathews/Gavilan Hills, Woodcrest/Mockingbird Canyon, Victoria Grove, Lake Hills/Home Gardens, and Temescal Canyon. While the proposed project would result in minor changes to the character of each community within the limits of the project, the changes would not be substantial enough to cause changes to the overall character of each community, because it would neither change the zoning within the area nor provide new access to areas that are currently undeveloped. Although transportation improvements are generally capable of having urbanizing effects in an area, the project improvements would improve the existing roadway rather than result in increased development pressure in the study area. Land use and zoning designations in the immediate and surrounding areas beyond the project limits would not change as a result of the project. Consequently, it is anticipated that the proposed project would not result in any changes to the character of the study area. Therefore, when added to the projects detailed in Table 3.25-1, which also have to comply with the city or county general plan and zoning regulations, Build Alternatives 1, 2C, and 4 would not have a cumulative impact on community character.

Depending on the project's selected alternative, the County would fully acquire 19 residential units under Build Alternatives 1 and 2C, and 21 residential units under Build Alternative 4. In addition, the project would require two nonresidential acquisitions under all build alternatives. Although displacements of residents and employees would occur, there are adequate residential and commercial replacement properties available within a 50-mile radius of the project.

Cumulative impacts may result from the replacement properties that would need to be acquired for various projects within the cumulative impact study area; however, a sufficient number of replacement properties currently exist within the city or area vicinity. In addition, many of the specific plan projects listed in Table 3.25-1 would build additional housing, thereby offsetting any housing reduction resulting from the proposed and other related roadway improvement projects. Additionally, Standard Project Measures **PF LU-1**, **PF FA-2, PF COM-1**, and **PF UT-1** would address temporary impacts on businesses during construction, and **PF FA-1**, **PF COM-2**, and Measure **COM-3** would address impacts associated with property acquisition and relocation; therefore, no substantial impacts pertaining to property acquisition and relocation on a cumulative basis are anticipated as a result of the project in combination with other development and transportation projects.

Construction of the build alternatives in combination with other development and transportation projects would not induce population growth or have an effect on population characteristics or

housing. Community character and cohesion would not be adversely affected during construction of the project due to the temporary partial closures of Cajalco Road. When combined with other development and transportation projects, the project would not cause a substantial change because construction sites and schedules would be staggered throughout Riverside County. The project would not cut off connected neighborhoods from each other. No development features are proposed that would divide an established community or limit movement, travel, or social interaction between established communities. The project would not introduce a new barrier that would divide any existing communities, separate residences from community facilities, result in substantial growth, or impede connectivity between neighborhoods because Cajalco Road is an existing roadway that currently traverses communities and neighborhoods. Also, the project proposes pedestrian and safety improvements, which would benefit community members and schools. However, the project would change the aesthetic character of the land adjacent to Cajalco Road by making the roadway wider and more urban-like, although changes to the aesthetic environment within the study area would be minimal. Standard project measures and additional mitigation measures are recommended to minimize impacts related to visual encroachment, noise, air quality, utilities, and hazards and compensate for impacts on the communities of Mead Valley, Lake Mathews/Gavilan Hills, Woodcrest/Mockingbird Canyon, Victoria Grove, Lake Hills/Home Gardens, and Temescal Canyon. The proposed project, in combination with other development and transportation projects, is not anticipated to result in permanent and temporary community character and cohesion impacts specific to any community; therefore, implementation of the proposed project and other related projects would not contribute to cumulative community impacts.

3.25.3.7 Environmental Justice

The RSA for the environmental justice analysis is the census block groups within 0.5 mile of the proposed right of way. Of the six distinct communities within the study area, the percentages of minority populations within four of the communities—Mead Valley, Lake Mathews/Gavilan Hills, Lake Hills/Home Gardens, and Temescal Canyon—are greater than 50 percent, at 79.2, 52.5, 61.9, and 53.6 percent, respectively. With respect to poverty status in the study area, the median household income in all block groups is higher than the Department of Health and Human Services poverty guidelines ($26,200 for a family of four in 2020). Therefore, low-income populations are not present in the study area for the build alternatives.

The build alternatives would have a minimal effect on community cohesion because they would not introduce a new barrier that would divide the community, separate residences from community facilities, or result in substantial growth. All build alternatives would benefit most RSA residents, including minority populations, by improving mobility and circulation throughout the RSA; however, property acquisitions for the build alternatives would affect communities that have a greater minority population than some counties and cities within the RSA. Non-minority populations would also be affected by property acquisitions; however, the build alternatives would have a disproportionately high and adverse impact on environmental justice populations because property acquisition and relocation impacts would predominantly be borne by a minority population within the Mead Valley community. In addition to the benefits of increased pedestrian, vehicular, and cyclist safety; improved pedestrian facilities for access to community facilities; and flood control improvements, Standard Project Measure **PF COM-1** and Mitigation Measure **COM-3** are proposed to minimize and mitigate for impacts involving

property acquisitions and displacements for residents, employees, and property owners within the Mead Valley community.

When added to the projects presented within Table 3.25-1, the impacts of the proposed project on minority populations, however, are not cumulatively considerable as property acquisitions and relocations associated with the other projects would be limited and occur within census areas that contain a range of minority populations.

The proposed project would result in temporary construction detours, temporary and permanent air and noise impacts, and temporary and permanent changes in travel patterns throughout the study area. Temporary construction cumulative impacts on community disruption could occur if multiple projects in the same locality are scheduled to undergo construction at the same time. Impacts related to visual encroachment and hazardous materials releases may also be borne by environmental justice populations. Along with reducing operational impacts through design and mitigation measures, the County would work closely with the cities and communities within the project area to identify such potential consequences and adjust construction schedules to avoid construction, to the extent applicable, of multiple projects to occur within the same locality simultaneously, as described in Standard Project Measure **PF LU-1**. Standard Project Measures **PF COM-1**, **PF COM-2**, **PF FA-1**, **PF FA-2**, **PF UT-1**, **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, **PF NOI-1**, **PF HAZ-2**, **PF HAZ-3**, **PF HAZ-5**, **PF AQ-1**, and **PF NOI-1**, and Mitigation Measures **COM-3**, **VIS-2**, **VIS-8**, **NOI-2**, **NOI-3**, **HAZ-1**, **HAZ-4**, **HAZ-6**, **HAZ-7**, and **HAZ-8**, would also be implemented to avoid or minimize impacts on the local communities. The projects listed in Figure 3.25-1 would not contribute to cumulative adverse effects on environmental justice populations with mitigation incorporated to reduce impacts borne by these communities. The proposed project is anticipated to benefit environmental justice communities by enhancing the operations of the project corridor; therefore, implementation of the proposed project and other related projects would not contribute to cumulative environmental justice impacts.

3.25.3.8 Noise

The RSA is the same as the study area evaluated in Section 3.15, which divided the project alignment into three noise analysis areas (Area A, Area B, and Area C). Area A is located along Cajalco Road, west of Harley John Road. The western terminus of Area A is approximately 500 feet west of the Temescal Canyon Road/Cajalco Road intersection. Area B is located along Cajalco Road, between Harley John Road and the Cajalco Road/Interstate 215 (I-215) interchange. Area C is located along El Sobrante Road and La Sierra Avenue between Temescal Canyon Road and Lake Mathews Drive and the Lake Mathews Drive/Cajalco Road intersection.

Traffic is the primary source of noise for the existing noise environment along the project alignment. Changes in traffic noise levels between design year condition for all three build alternatives (which includes the proposed project, all reasonably foreseeable projects, and all other projects included in the traffic study) and the design year No-Build Alternative condition (which includes all reasonably foreseeable projects and all other projects included in the traffic study) indicated that noise levels at noise-sensitive receptors would range from a 19-decibel (dB) decrease to an 11-dB increase under Build Alternative 1, a 19-dB decrease to a 12-dB increase under Build Alternative 2C, and no change to a 15-dB increase under Build Alternative 4.

Table 3.25-1 summarizes many adopted transportation and land use plans that could potentially contribute to noise impacts and increase the number of receptors that may be exposed to noise associated with Cajalco Road or El Sobrante Road. The traffic report for the project included all reasonably foreseeable actions in the future build and no-build condition traffic projections, and it assumed a growth factor for the project area that would be expected to increase traffic noise levels over time as additional land uses are developed and transportation facilities and improvements are implemented. As such, this growth is also incorporated into the traffic noise analysis.

Construction activities would cause short-term elevated noise levels at the surrounding residences over approximately 4 years. It is reasonable to assume that other projects could occur within this time frame in close proximity to the project alignment. Projects identified to be constructed during this time include residential developments (specific plans and subdivisions) and commercial/industrial developments (business park). Even if construction of any project listed in Table 3.25-1 were to occur within the same time frame of construction of any of the build alternatives, and in close proximity, construction noise would not be considered cumulatively considerable, as construction noise is generally exempt from the County's noise ordinance, provided that construction activities occur during the permitted hours.

NEPA

For the operation of the project, a noise impact would occur under NEPA if the project would cause traffic noise levels to approach or exceed (come within 1 dB) of the Noise Abatement Criteria (NAC) or would result in a 12 dB increase during the design year relative to the existing traffic noise level. As discussed in Section 3.15, *Noise and Vibration,* impacts would occur with all three build alternatives; three receivers would approach or exceed the NAC of 67 A-weighted decibels (dBA) hourly equivalent noise level (Leq[h]) under Build Alternatives 1 and 2C and four receivers would approach or exceed the NAC of 67 dBA Leq(h) under Build Alternative 4, and traffic noise levels are predicted to increase by 12 dB at one receiver, relative to the existing condition. The project's cumulative impact relative to the no-build condition for all three build alternatives indicates that these impacts would occur solely due to the inclusion of the project.

Abatement in the form of soundwalls was considered and incorporated (as discussed in Section 3.15, *Noise and Vibration*), which would reduce traffic noise levels at all affected receivers under Build Alternatives 1 and 2C. Noise Barriers S-624, S-650, and S-652 were considered feasible and reasonable (from a cost perspective) and are therefore intended to be incorporated as abatement as Mitigation Measure **NOI-2 (**Noise Barrier S-624) and Mitigation Measure **NOI-3** (Noise Barriers S-650, and S-652), provided that the survey process approves the noise barriers. With the inclusion of Noise Barriers S-624, S-650, and S-652, impacts would be reduced, and the project's cumulative impact would not be cumulatively considerable for affected receptors under Build Alternatives 1 and 2C. Under Build Alternative 4, one receiver would approach or exceed the NAC of 67 dBA Leq(h), where no abatement was available due to access constraints to the subject property. Therefore, even with the inclusion of Noise Barriers under Mitigation Measures **NOI-2** and **NOI-3**, the project's cumulative impact would be cumulatively considerable.

CEQA

Under CEQA, an impact would occur if, once in operation, the project would exceed an increase of 1.5 dB at any receiver that exceeded the 65 dBA Community Noise Equivalent Level (CNEL) (relative to the existing condition) threshold during the design year, if the project would result in a 3 dB increase at any receiver that during the existing condition was between 60 and 65 dBA CNEL. Additionally, an impact would occur if the project would result in an increase of 5 dB or more at any receiver below 60 dBA CNEL under the existing condition.

The noise modeling in Chapter 4 (CEQA), Section 4.2.15, *Noise*, indicates predicted traffic noise level increases relative to the existing condition by 1.5 dB at three modeled receivers, and by 3 or 5 dB (based on the existing noise level) at 48 modeled receivers under Build Alternatives 1 and 2C. Mitigation Measure **NOI-4** (rubberized asphalt) was identified to reduce impacts. With inclusion of Mitigation Measure **NOI-4**, impacts associated with Build Alternatives 1 and 2C would be reduced to less-than-significant levels and the project's cumulative contribution would not be cumulatively considerable.

The noise modeling in Section 4.2.15 further indicates that traffic noise levels would increase relative to the existing, by 1.5 dB at three modeled receivers; three modeled receivers would also increase 3 dB and 78 other modeled receivers would increase by 5 or more dB (based on the existing noise level) under Build Alternative 4. Mitigation Measure **NOI-4** was identified to reduce impacts. However, two modeled receivers would still exceed the Federal Interagency Committee on Noise 1.5 dB and County 5 dB sound levels even with Mitigation Measure **NOI-4** included. Two barriers at the two receiver locations were considered as part of the NEPA analysis; however, as one barrier (S-624) is subject to the decision of the benefited receptors and the other barrier (S-565) was not cost effective, the barriers were not considered further for impacts under CEQA. Therefore, even with inclusion of Mitigation Measure **NOI-4**, impacts would be significant, and the project's cumulative contribution would be cumulatively considerable under CEQA.

3.25.3.9 Visual Resources/Aesthetics

The RSA for cumulative impacts on visual resources would consist of a viewshed extending out 1 mile north and south along the approximately 16-mile length of the proposed alignment. As described in Section 3.7, *Visual/Aesthetics*, the landscape of the immediate project area ranges from flat to hilly to gently rolling terrain. The open space lands, rolling terrain, and lack of tall vegetation allow for scenic vista views to the surrounding mountains and Lake Mathews. The project corridor travels through the LMR and LM-EM Reserve, and through parcels of land owned by MWD and RCHCA. Much of the land surrounding Lake Mathews is undeveloped because these lands are protected by the LMR and the LM-EM Reserve of the SKR HCP.

There are no roadways in or near the project area that are designated in federal or state plans as an officially designated scenic highway or route worthy of protection for maintaining and enhancing scenic viewsheds. Interstate 15 (I-15) is an eligible state scenic highway; however, the project's western terminus is approximately 0.3 mile away from the freeway, and views of the project corridor from the freeway are blocked by the interchange berms. I-215 is a classified Landscaped Freeway between Post Miles 30.81 and 31.31. The Riverside County General Plan Circulation Element also indicates that Cajalco Road from I-15 to approximately Harley John

Road/Smith Road, El Sobrante Road, and La Sierra Avenue from El Sobrante Road to Cajalco Road are County-eligible scenic corridors, and County-eligible roadway segments located within the project vicinity.

As described in Section 3.7, and for the purpose of the cumulative analysis, the area surrounding the project area has been subdivided into four visual assessment units (VAUs) based on specific vantage points and differing sensitivities of those affected by the proposed project, including Rural Residential, Open Space, Suburban Residential, and Commercial. Refer to Section 3.7.2 for a description of each VAU. The overall visual quality of the Rural Residential, Suburban Residential, and Commercial VAUs are moderate, and the overall visual quality of the Open Space VAU is moderate-low.

Temporary and permanent impacts would be the same along the portion of Cajalco Road between Harley John Road and Seaton Avenue for Build Alternatives 1, 2C, and 4. The roadway widening would increase the roadway surface area from a two-lane rural roadway to a four-lane roadway with associated turn lanes that is more suburban in nature. Standard Project Measure **PF VIS-1** (Contouring and Replanting Disturbed Areas) and Mitigation Measure **VIS-2** (Replace or Relocate Site Features and Landscaping Affected by the Project) would lessen impacts on affected properties to the extent possible. To alleviate noise impacts on adjacent residences, noise barriers are proposed on the northwest corner of Cajalco Road and Cowan Road and north of Cajalco Road on either side of Extravaganza Lane under all build alternatives. Standard Project Measures **PF VIS-1** and **PF VIS-3** (Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity), and Mitigation Measure **VIS-2**, would ensure that new noise barriers are visually consistent with existing noise barriers in the project vicinity and that landscaping softens the appearance of the barriers. Removal of two or three trees adjacent to the freeway overpass may affect the landscaped freeway designation because vegetation in the Commercial VAU is already sparse and removal may be deemed negative under all build alternatives. Mitigation Measure **VIS-8** would ensure that vegetation removed along this portion of landscaped freeways is replaced. Lastly, implementation of Standard Project Measure **PF VIS-4** would address the effects associated with street lighting and ensure that project light and glare would not result in adverse visual effects under all build alternatives.

The combined visual effect of this proposed project and other development projects planned, recently in construction, or currently in construction would change the visual character of the region. Table 3.25-1 summarizes many adopted transportation and land use plans and projects that could potentially contribute to visual impacts associated with Cajalco Road or El Sobrante Road. The general plans for Riverside County and the City of Corona would also contribute to development within and surrounding the project area. Once implemented, these plans and smaller development projects would widen and improve existing transportation corridors, and/or create new and reconfigured transportation corridors, that may result in the development and the infill of open space areas and vacant lots within the project vicinity. These plans also allow for continued development to occur around the project area. Other transportation projects would widen segments of other local connectors and create larger roadways, and widening associated with the Cajalco Road project would contribute to cumulative visual impacts by replacing two-lane roadways with more suburban, four-lane (and in some cases, accommodate six-lane) roadways and affecting associated vegetation, private properties, and viewers.

The proposed project is driven by implementation of transportation and land use plans and the projects described above to provide access and to support future land uses in the vicinity, and all three build alternatives would result in the same cumulative visual impacts. Temporary construction impacts associated with the proposed project would result in cumulative visual impacts because even though they would be temporary, they would compound the visual presence of construction in the area, especially when combined with other larger-scale development and transportation projects.

Planned development and transportation projects would also alter the existing visual character of the area in the long term and affect the area's visual character, including the open space areas and vacant lots in the project vicinity. Development in the project vicinity would contribute to changes in the visual quality of views as seen from all VAUs. Roadway users, residents, businesses, and recreationists will be able to see open space areas and vacant lots within the landscape gradually transition and infill to industrial, mixed-use, commercial, and residential development, and this development will include the associated transportation and utility infrastructure needed to support it. However, the visual quality of the Open Space VAU would remain mostly unchanged because these lands are protected reserve lands. Future development and roadway improvements would also add to ambient atmospheric lighting and glare in the area by infilling unlit open space areas with lit buildings and roadways, using blue-rich white light lamps light-emitting diode lighting, and adding reflective surfaces to areas that are currently undeveloped or moderately developed.

The proposed project would have an incremental contribution to cumulative impacts associated with lighting, because roadway lighting would not greatly increase as a result of the project. The project would incrementally contribute to visual changes related to planned and/or proposed development in the area because it would alter the existing visual landscape, in some cases degrade the visual quality of the project area, and affect highways users and roadway neighbors. The incorporation of Standard Project Measures **PF VIS-1**, and **PF VIS-3** through **PF VIS-7**, and implementation of Mitigation Measures **VIS-2** and **VIS-8**, as detailed in Section 3.7, *Visual/Aesthetics*, would reduce the project's impact on visual resources to ensure that impacts from the proposed project would be reduced in terms of the proposed project's contribution to cumulative impacts on visual resources that are expected to occur when taking into consideration past, present, and future projects that have occurred and are anticipated in the project viewshed. Although the project and other projects, such as the Mid County Parkway, would contribute to a cumulative visual impact within the RSA, these new transportation facilities were expected and planned for in the Riverside County General Plan. Development would design or mitigate impacts through landscaping, tree preservation, apply lighting standards, wall design, and other aesthetic enhancements. Based on the discussion above, overall, the project would have moderate cumulative impacts on visual resources within the RSA.

3.25.3.10 Hydrology

The RSA for cumulative impacts associated with surface hydrology and water quality is the Middle Santa Ana River, Lake Mathews, and Perris hydrologic areas (HAs). The westerly end of the project is within the Bedford Hydrologic Subarea (HSA) 801.32 within the Lake Mathews HA 801.30. The middle section of the project, located within the Cajalco HSA 801.33, is also within the Lake Mathews HA. Portions of Build Alternative 4 are within the Arlington HSA

801.26 within the Middle Santa Ana River HA 801.20. The easterly end of the project is within the Perris Valley HSA 802.11 within the Perris HA 802.10. The westerly end of the project crosses Temescal Wash as well as several unnamed tributaries to and Temescal Wash. The proposed project also crosses several unnamed tributaries to Lake Mathews, and Cajalco Creek. Temescal Creek is within the Zone A floodplain on the western portion of the project site. Cajalco Creek is within a mapped Zone A floodplain. A small portion of the western end of the project site is within the Temescal Subbasin of the Upper Santa Ana Valley Groundwater Basin. A limited section of the eastern end of the project is within the San Jacinto Groundwater Basin.

All build alternatives would encroach into the floodplains at four creek crossing locations, and they would share the same impacts as Build Alternatives 1 and 2C for Locations 1, 3, and 4. MWD Lake Mathews facilities are within the project footprint within this floodplain encroachment area and would be affected by the proposed project. MWD facilities that would be affected by all build alternatives include Cajalco Creek Dam and Detention Basin, Cajalco Creek Sedimentation Basin, and the Inlet Channel separating the two basins. These facilities are located along the north side of Cajalco Road between El Sobrante Road and Harley John Road. Mitigation Measure **HYD-1** (see Section 3.9.4) is proposed to obtain approval from MWD regarding the right of way acquisition from Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin. Mitigation Measure **HYD-1** requires preparation of a Drainage Study to confirm implementation of the proposed project would not affect continued operation of the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin.

Under Build Alternatives 1 and 2C, the culvert replacements and new bridge along Cajalco Creek would extend existing structures and add new piers in the floodplain. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These detention basins would provide peak flow attenuation to reduce the discharge of stormwater into the creeks consistent with the existing conditions. Through the use of project design features such as detention basins and culverts, 100-year storm flows would be conveyed, and would not result in any new flooding.

Under Build Alternative 4, several cross culverts would convey stormwater runoff from areas north of the proposed roadway, under the roadway, and into the existing basins. The proposed encroachments would be in areas considered ineffective in conveying flow through the basins and therefore would not adversely affect water surface elevation or velocity of the existing Cajalco Creek floodplain.

Proposed projects within Riverside County are required to maintain sufficient drainage system capacity and convey 100-year peak flows consistent with the municipal stormwater programs from Riverside County and include Low-Impact Development features and post-construction design measures. These measures would prevent or reduce a cumulative adverse hydrology impact during operation. With the addition of the above referenced mitigation measure, the proposed project, in conjunction with those listed within Table 3.25-1, would not have a cumulatively considerable impact on hydrology within the RSA.

3.25.3.11 Hazardous Materials/Wastes

For hazardous materials and waste, the concern would not be from contamination caused by the project, but rather from materials that are currently present in the environment and materials

transported on the area-wide roadway system on a daily basis. The transportation, use, storage, and disposal of hazardous waste and associated materials are highly regulated by local, state, and federal laws; therefore, impacts associated with hazardous waste and materials would be localized. There are two Recognized Environmental Conditions, one Historical Recognized Environmental Condition, and five Environmental Areas of Concern within the RSA.

Hazardous wastes and petroleum products used during construction of development and transportation projects would be collected, transported, and removed from the project site in accordance with Resource Conservation and Recovery Act regulations and federal/Occupational Safety and Health Administration standards, including Waste Management and Materials Pollution Control BMPs – Spill Prevention and Control, Materials; and Waste Management BMP, Hazardous Waste Management. The following Riverside County active landfills are permitted as Class III landfills, and these facilities accept construction wastes such as asphalt, concrete, excess soil, and non-hazardous materials:

- El Sobrante Landfill (10910 Dawson Canyon Road, Corona) is 4 miles from the project site.
- Badlands Landfill (31125 Ironwood Avenue, Moreno Valley) is 35 miles from the project site.
- Lamb Canyon Sanitary Landfill (16411 Lambs Canyon Road, Beaumont) is 47 miles from the project site.
- Agua Mansa MRP (1830 Agua Mansa Road, Riverside) is 22 miles from the project site and is a recycling center.

Hazardous wastes would not be allowed at these disposal sites, and the project and other projects would not contribute to cumulative hazardous waste impacts on local landfills. Treated wood waste (TWW) is required to be stored and manifested as hazardous waste. Some forms of TWW are accepted at Riverside County facilities, upon approval by the facility, but they are generally transported to Class I hazardous waste landfills (e.g. Antelope Valley Recycling and Disposal Facility, 1200 West City Ranch Road, Palmdale; Calabasas Landfill, 5300 Lost Hills Road, Agoura), where TWW are accepted.

There would be an incremental increase in the generation of hazardous materials in the study area during construction; however, long-term operational impacts would not contribute to the generation of hazardous materials as the project is not a development project. With the incorporation of Standard Project Measures **PF HAZ-2**, **FP HAZ-3, PF HAZ-5**, and **PF SW-1**, and the implementation of Mitigation Measures **HAZ-1, HAZ-4**, **HAZ-6**, **HAZ-7**, and **HAZ-8**, the proposed project would not result in substantial permanent adverse impacts related to hazardous waste and materials. Future land use and transportation projects noted in Table 3.25-1 would comply with applicable city and county Hazardous Waste Management Plans, ordinances, and state regulations related to hazardous materials, which would ensure that there would be no adverse hazardous material impacts resulting from future development in the cities and the county; therefore, the proposed project would not contribute to cumulative hazardous waste and materials impacts.

3.25.3.12 Transportation

The RSA for cumulative impacts associated with transportation includes all freeway segments, interchange ramps, and ramp terminus intersections along I-15 from Weirick Road to State Route 91 and I-215 from Nuevo Road to State Route 60. It also includes intersections along Cajalco Road, Markham Street, and Rider Street.

As further detailed in Section 3.6.3.1, *Permanent Impacts*, the following study area intersections would operate at an acceptable level of service (LOS) under the No-Build Alternative in the forecast year (2044) but are projected to operate at an unacceptable LOS in the same year for the respective build alternatives:

Build Alternatives 1 and 2C

- Cajalco Road and La Sierra Avenue in the PM peak hour
- Seaton Avenue and Markham Street in the PM peak hour
- Harvill Avenue and Markham Street in the PM peak hour
- Harvill Avenue and Placentia Avenue in the PM peak hour
- I-215 southbound ramps and Van Buren Boulevard in the PM peak hour
- I-215 northbound Frontage Road and Placentia Avenue in the PM peak hour
- Webster Avenue and Ramona Expressway in the AM peak hour

Build Alternative 4

- Clark Street and Cajalco Road in the AM peak hour

With exception of the intersection at Clark Street and Cajalco Road (Build Alternative 4), none of the above-listed intersection are identified for improvement in the County's 2017/2018 Transportation Improvement Program (TIP). In the County's 2017/2018 TIP, the intersection at Clark Street and Cajalco Road is identified for "design traffic signal modifications." As development is approved (entitled) in the project area, project applicants (developers) would be responsible for paying their fair share contribution for roadway operations improvements including, but not limited to, intersection improvements. Furthermore, and as the need for such improvements is identified, pertinent intersection improvements will be accounted for in future County TIPs as a means to improve operations through the project corridor. Also, projected and cumulative truck traffic is not anticipated to result in an increased risk to pedestrian or cyclist safety as the projected minor increases would be consistent with the overall projected traffic volumes through most of the project limits.

The incremental effect of the proposed project is estimated to be considerable when taking into account the additive effects of probable future land development projects in the area; therefore, the proposed project is anticipated to result in a substantial cumulative impact on the above-listed roadway intersections that cannot be mitigated by the project addressed herein.

3.25.3.13 Water Quality

The project is adjacent to Lake Mathews and crossed by Cajalco Creek and Temescal Wash, as well as several tributaries to Lake Mathews, Cajalco Creek, and Temescal Wash. The project site is within the Perris Valley hydrologic subarea, which drains to the Perris Valley Storm Drain about 2 miles east of the project site; the Temescal Subbasin of the Upper Santa Ana Valley Groundwater Basin (8-002.09); and the San Jacinto Groundwater Basin (8-005). According to the Initial Site Assessment (2017), the groundwater in the vicinity of the project site ranges from approximately 10 to 45 feet below ground surface. The context for cumulative hydrology and water quality impacts is geographic and a function of whether impacts could affect surface water features/watersheds, municipal storm drainage systems of Riverside County, or groundwater, each of which has its own physical boundary. This analysis accounts for anticipated cumulative growth within the potentially affected geographic area, as represented by full implementation of the Riverside County General Plan.

The Santa Ana Regional Water Quality Control Board (RWQCB) has developed water quality objectives for waters within the project area and has published them in the Basin Plan. Water quality objectives for Lake Mathews and tributaries to Temescal Creek (e.g., Cajalco Creek, un-named drainages) are provided in Section 3.10, *Water Quality and Stormwater Runoff*. Existing water quality conditions in the project area are good as indicated by the fact that neither Temescal Wash (Reach 2), Lake Mathews, nor Cajalco Creek and its tributaries are listed on the Clean Water Act (CWA) 303(d) list as Impaired Water Bodies for any pollutant within the Santa Ana Region.

The proposed project does not represent a substantial departure from the existing land use of the area but would result in a substantial increase in the impervious surface area. The project, under any of the build alternatives, would permanently increase the area of paved, impermeable surfaces in the project site. This increase in impervious area would result in increased pollutant build up and wash-off and a greater volume and rate of stormwater runoff that could cause or contribute to erosion and offsite pollutant transport. For the entire project area, runoff volume would increase. The proposed bridges, culverts, and channels would provide larger conveyance through this area, lowering the water surface and reducing velocities and eliminating flow over roads during the 100-year flood. The project would be required to implement post-construction stormwater quality best management practices (BMPs) under the Caltrans and Regional Storm Water Management Plan prepared for compliance with the National Pollutant Discharge Elimination System Permits, as discussed in Section 3.10, *Water Quality and Stormwater Runoff*. These BMPs are designed to permanently control water pollution originating from the operation and maintenance of the highway. Under the Future-Six Lane, an increase of impervious surfaces and associated runoff volumes and rates would be expected, which also may require post-construction BMPs. The implementation of standard water quality protection measures **PF WQ-1** through **PF WQ-4**, required as part of the Section 401 certification and 404 and Municipal Separate Storm Sewer System (MS4) permit processes would ensure the protection of water quality during construction and operation of the proposed project. Compliance with Measures **NC-6 (NES BIO-6)**, **NC-10 (NES BIO-10)** through **NC-12 (NES BIO-12), HYD-1**, **PF VIS-1**, **NC-6 (NES BIO-6)**, **NC-13** (**NES BIO-9**) through **NC-15** (**NES BIO-14**), and **WET-1** would also ensure the protection of water quality during construction and operation of the proposed project.

Existing vegetation would be removed, thereby increasing the potential for erosion. Consistent with the Statewide construction stormwater programs, the project-specific Storm Water Pollution Prevention Plans would include construction BMPs. Stormwater runoff would be directed to existing and proposed stormwater collection systems. Stormwater conveyance capacities along Cajalco Road would be met or exceeded with the proposed improvements and new drainage facilities would be added to accommodate the proposed improvements. Because the proposed project would increase roadway capacity, the input of additional pollutants from vehicles is anticipated.

For the entire project area, runoff volume would increase with all build alternatives due to similarities in their scope and design; therefore, impacts are discussed collectively. The proposed bridges, culverts, and channels would provide larger conveyance through this area, lowering the water surface and reducing velocities and eliminating flow over roads during the 100-year flood. While the proposed project would result in the addition of impervious surfaces, the proposed project would not affect any existing groundwater recharge facilities because there are no existing groundwater recharge facilities located in the project area. Infiltration BMPs were determined to be infeasible due to soil types that do not allow for infiltration. In addition, high groundwater and shallow basement rock limit feasibility for infiltration BMPs within the project area and limit groundwater recharge. Furthermore, an indirect lowering of the local groundwater table is not likely to occur, as the proposed project would not require the use of local groundwater and, given soil and bedrock conditions, would not limit infiltration compared to existing conditions.

Construction of the proposed project as well as other planned projects within the project vicinity would result in soil area disturbances through the grading and compaction associated with typical development activities. The proposed project, collectively with projects listed in Table 3.25-1 that are over 1 acre, would be required to comply with the Construction General Permit during construction activities and would be required to implement BMPs to limit sedimentation and erosion and other construction pollutants. Therefore, the proposed project would not contribute to a cumulative water quality impact during construction.

During project operation, the proposed project could contribute to the degradation of water quality and a cumulative impact if any altered land use would result in an increase in the type and concentration of pollutants in stormwater runoff. New development projects allowed within the Riverside County General Plan would increase impervious surface areas, which would result in increased stormwater runoff. The proposed project and cumulative projects would be required to comply with the Santa Ana Region MS4 Permit during operational activities. Therefore, new development projects would need to be consistent with the municipal stormwater programs from Riverside County and include Low-Impact Development features and post-construction design measures that would promote infiltration and provide water quality treatment consistent with the MS4 Permit requirements, and would therefore not contribute to cumulative operation water quality impacts.

Cumulatively, development allowed within the Riverside County General Plan could increase the rate and volume of stormwater runoff because of the overall increase in the amount of impervious surfaces. Increases in the rate or volume of stormwater runoff can cause localized flooding if storm drain capacity is exceeded or if flows exceed channel capacities and are conveyed to overbank areas where flood storage may not be available. Proposed projects within

Riverside County, including projects like Mid County Parkway and Arantine Hills Specific Plan, are required to maintain sufficient drainage system capacity and convey 100-year peak flows. Therefore, changes in flows that could increase localized flood risk are not expected to be substantial and would not be cumulatively considerable.

All cumulative development allowed within the Riverside County General Plan would be required to include design features that would reduce flows to pre-project conditions, according to Riverside County MS4 Permit requirements and other municipal stormwater requirements. In addition, local jurisdictions review all development projects on a case-by-case basis to ensure that sufficient local and regional drainage capacity is adequate. Cumulative impacts on hydrology and water quality, as well as the proposed project's contribution to cumulative impacts, would not be cumulatively considerable.

3.25.3.14 Natural Communities

The RSA for biological resources occurs in the South Coast subregion of the Southwestern California region and within the California Floristic Province. The natural vegetation of the subregion consists primarily of chaparral, sage scrub, annual grasslands, woodland, and riparian scrub and forest. Much of the natural vegetation occurs in preserved open space or scattered in fragmented patches in areas that are not developed. The RSA is composed of the proposed project footprint for Build Alternatives 1, 2C, and 4, up to a 500-foot buffer. Additional details for the cumulative effects on natural communities of concern, riparian/riverine resources, and wildlife corridors and linkages are provided below.

Natural Communities of Concern

The RSA for the build alternatives is also composed of the boundaries of the WRC MSHCP area. The WRC MSHCP is a 1,966-square-mile area that provides a comprehensive planning program that addresses multiple species' needs by preserving native vegetation, natural communities of concern, riparian/riverine resources, and wildlife corridor/linkages within Western Riverside County. The WRC MSHCP also provides the mitigation mechanism for covered activities and addresses the cumulative effects on these resources within the RSA. The guidelines and BMPs for covered activities described in the WRC MSHCP would be implemented for the avoidance and/or minimization of impacts on sensitive biological resources from planned projects within the area. It would also allow for improvements and maintenance of the County's roadway facilities and provide long-term conservation value of preserved habitat in the region. Approximately 60 percent of western Riverside County (752,870 acres out of the 1,258,780 acres within the MSHCP Plan Area) has been identified as reasonably foreseeable for development, based on anticipated impacts projected by the MSHCP within the next 75 years. The WRC MSHCP EIR/EIS concluded that with the implementation of measures described in Section 7.5.2 and Appendix C of the WRC MSHCP, Volume I, covered activities would not have a substantial effect on natural communities.

The permanent impacts on natural communities of concern would occur on 76.58 acres under Build Alternative 1, 85.20 acres under Build Alternative 2C, and 79.78 acres under Build Alternative 4 (refer to Table 3.17-4). Details for the direct impacts on natural communities of concern are provided in Section 3.17, *Natural Communities*. The majority of the natural communities of concern that would be affected during project construction occur within open

space lands between Temescal Canyon Road and Harley John Road that occur within existing conservation lands under long-term preservation. Additional open space lands east of Harley John Road are already planned for future development, including residential development, a golf course, and business development. Refer to Table 3.25-1 for the full list of projects planned for future development in the project vicinity. Natural communities of concern temporarily affected by project construction would be restored and/or replaced through compensatory mitigation. Construction of the proposed project would contribute to an incremental loss of natural communities of concern within the RSA. Projects like the Mid County Parkway would have permanent impacts on between 117.0 and 124.6 acres of other natural communities of special concern. Cumulative impacts from any one of the build alternatives on natural communities of concern would be covered under the WRC MSHCP because the proposed project is a covered activity under the WRC MSHCP Volume I, Section 7.2.2 (Circulation Element Roads). Measures **NC-1 (NES BIO-1)** through **NC-15 (NES BIO-14)** would be implemented and ensure the project's compliance with the WRC MSHCP.

In addition to complying with the provisions of the WRC MSHCP and implementing avoidance/minimization and mitigation measures, the build alternatives would replace all natural vegetation communities that would be permanently affected within the LM MSHCP area and the RCHCA SKR Reserve. These lands would be replaced through implementation of measures **NC-17 (NES BIO-17)**, **NC-19 (NES BIO-15)**, and **NC-20 (NES BIO-21)**. Replacement of the SKR Core Reserve lands will ensure that the project is in compliance with the long-term SKR HCP. Lands acquired to replace affected areas of the LM MSHCP will be integrated into the discretionary action coordinated between the County and LM MSHCP responsible parties. The proposed project, collectively with projects listed within Table 3.25-1 that are within the LM MSHCP area and RCHCA SKR Reserve, would be required to comply with provisions established within these conserved areas. Combined with development and transportation projects, construction of the project would contribute to the incremental loss of natural communities in the region; however, the MSHCP provides a comprehensive approach to the regional conservation of natural communities for all development and, as a regional plan, serves to provide mitigation for cumulative impacts on such habitats. Therefore, with consistency with the MSHCP and through mitigation for impacts on natural communities of concern on a project-by-project basis, the proposed project would not contribute to a cumulative impact.

Riparian/Riverine Resources

For riparian/riverine resources, the jurisdictional delineation study area includes the project footprint and 200-foot buffer for each of the build alternatives. The WRC MSHCP requires covered activities to identify and map riparian/riverine resources and vernal pools. The WRC MSHCP defines riparian/riverine areas as "lands that contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens, which occur close to or which depend on soil moisture from a nearby freshwater source; or areas with freshwater flow during all or a portion of the year." In addition, streams that lack riparian vegetation but that have ephemeral or greater flows and provide biological functions and values that contribute to downstream habitat values for covered species inside the WRC MSHCP Conservation Area are also considered riparian/riverine resources. WRC MSHCP riparian/riverine resources within the limits of disturbance are mapped on Figure 3.17-5.

Permanent impacts on natural communities of concern would occur on 16.01 acres under Build Alternative 1, 14.31 acres under Build Alternative 2C, and 9.01 acres under Build Alternative 4 (refer to Table 3.17-13). Details for the direct impacts on WRC MSHCP riparian/riverine resources are provided in Section 3.17, *Natural Communities*. As described above, riparian/riverine resources between Temescal Canyon Road and Harley John Road would mostly be preserved as open space, based on a review of the projects proposed for the regional vicinity (refer to Table 3.25-1). Open space areas east of Harley John Road would be developed, but the majority of the riparian/riverine resources (included drainage features) would be preserved on site (i.e., Boulder Springs Specific Plan Area) or can be incorporated into the design of future projects. Cumulative impacts from any one of the build alternatives and other projects in the regional vicinity on MSHCP riparian/riverine resources may be cumulatively considerable due to the rapid decline of this resource in the RSA. For example, the Mid County Parkway would have permanent impacts on between 10.8 and 11.4 acres of riparian riverine areas; the Arantine Hills Specific Plan would have permanent impacts on 0.41 acre of unvegetated streambed and 0.01 acre of vegetated riparian habitat.

Because the proposed project is a covered activity under the WRC MSHCP Volume I, Section 7.2.2 (Circulation Element Roads), construction guidelines and BMPs (**NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9])** will be incorporated to ensure the project's compliance with the WRC MSHCP. Measures **NC-14 (NES BIO-13)** (Preparation of the Determination of Biologically Equivalent or Superior Preservation [DBESP]) and **NC-15 (NES BIO-14)** (Replacement of WRC MSHCP Riparian/Riverine Resources) would mitigate for the loss of these resources and also address temporal loss of riparian/riverine resources during construction. The DBESP will provide a functions and values assessment of the riparian/riverine resources, including an evaluation of hydrologic regimen, sediment trapping and transport, flood storage and flow modification, nutrient retention and transformation, toxicant trapping, public use, habitat for wildlife, and aquatic habitat. Approval of the DBESP by WRCRCA, USFWS, and CDFW and adequate compensatory mitigation for riparian/riverine resources will ensure consistency with the WRC MSHCP. The proposed project and future projects must also fulfill WRC MSHCP consistency requirements. Therefore, with consistency with the MSHCP and through mitigation for impacts on riparian/riverine resources on a project-by-project basis, cumulative effects would not be cumulatively considerable.

Wildlife Corridors and Linkages

Permanent impacts on corridors and linkages would occur on 265.59 acres under Build Alternative 1, 273.99 acres under Build Alternative 2C, and 176.81 acres under Build Alternative 4 (refer to Table 3.17-17). Details for the direct impacts on wildlife corridors and linkages are provided in Section 3.17, *Natural Communities*. Impacts from the proposed project would have a minimal cumulative effect on Existing Core C and Proposed Extension of Existing Core 2 from the widened roadway, as there are no other foreseeable projects within the conserved lands between Temescal Canyon Road and Harley John Road. Once construction of the proposed project and all future projects in the RSA are completed, the remaining preserved open space and WRC MSHCP core/linkage areas would remain undeveloped. In addition, the proposed build alternatives have incorporated wildlife corridors/dry crossings into the project design and wildlife fencing (**NC-16 [NES BIO-19]**) that would direct wildlife movement through preserved open space areas, enhancing the function and values of the core/linkage areas.

Project impacts on Proposed Linkage 3 and future planned projects in the area may contribute to cumulative effects on cores/linkages due to future projects planned within the vicinity of the Proposed Linkage 3, potentially constraining this linkage. The proposed project and future projects must also fulfill WRC MSHCP consistency requirements and mitigate impacts on a project-by-project basis. Therefore, cumulative effects would not be cumulatively considerable.

3.25.3.15 Wetlands and Other Waters

The RSA for jurisdictional waters is within the Santa Ana River and San Jacinto Valley Watersheds, as determined by the Temescal Wash and Lower San Jacinto River hydrological units (HUC 1807020306 and 1 1807020203). The RSA also occurs within the following U.S. Geological Survey 7.5-minute quadrangles: Alberhill, Corona North, Corona South, Lake Elsinore, Lake Mathews, Perris, Riverside East, Riverside West, Romoland, Santiago Peak, Steele Peak, and Sunnymead.

The direct effects on federal and state jurisdictional waters under each build alternative are provided in Table 3.18-2 and Table 3.18-4. Details for the direct impacts on federal and state jurisdictional waters are provided in Section 3.18, *Wetlands and Other Waters*. Each of the build alternatives would directly contribute to the regional loss of waters of the United States (WoUS), including wetlands, waters of the State (WoS), and state streambeds and riparian-associated habitats due to the widened road facilities, new roadway in areas, and appurtenant facilities.

The loss of jurisdictional waters by Build Alternatives 1, 2C, and 4 may be cumulatively considerable, due to the rapid decline of this resource in the region. The build alternatives bisect federal and state jurisdictional water resources along Cajalco Road and El Sobrante Road between the Temescal Canyon Wash and I-215, including federally jurisdictional wetlands and CDFW riparian habitats. Given the amount of impact proposed, the rapid decline of this habitat, and regional impact, Build Alternatives 1, 2C, and 4 could make a cumulatively considerable contribution to a regional decline of jurisdictional water resources. There are no future projects along Cajalco Road that would contribute to impacts on jurisdictional waters west of Harley John Road under Build Alternatives 1 and 2C, as most of these areas are composed of conserved and open space lands. The Mid County Parkway would have impacts on approximately 2 acres of wetlands, and the Arantine Hills Specific Plan would have permanent impacts on 0.33 acre of non-wetland waters. A residential development is proposed on the north side of El Sobrante Road, and this development in conjunction with impacts on jurisdictional waters from Build Alternative 4 may have a cumulative contribution to impacts on WoUS, WoS, and state streambeds. East of Harley John Road, the build alternatives and other developments would also contribute to cumulative effects on jurisdictional waters in the region.

Each build alternative would also require coverage under Nationwide Permits from the U.S. Army Corps of Engineers (Project Standard Feature **PF WQ-2**), a CWA Section 401 water quality certification from the RWQCB (Project Standard Feature **PF WQ-1**), and a Lake and Streambed Alteration Agreement. Implementation of the measures identified in Sections 3.17 and 3.18 would ensure that potential direct and indirect effects are reduced to the maximum extent practicable. In addition, Mitigation Measure **WET-1** would fully replace all federal and state jurisdictional waters, including addressing the temporal loss of these resources. Other projects in the region would be subject to similar permitting, avoidance, minimization, and mitigation requirements for affected jurisdictional waters, and each project would be required to

replace affected wetlands and nonwetland waters. Therefore, the effects from the proposed project are not expected to require additional mitigation for cumulative impacts.

3.25.3.16 Plant Species

The RSA for plant species consists of western Riverside County and includes the WRC MSHCP area. The WRC MSHCP is a comprehensive regional conservation plan that preserves habitat for plants and covered species and mitigates for cumulative impacts on these habitats and covered species. In addition, species not covered under the WRC MSHCP benefit greatly from the plan, as they occur within similar sensitive habitats and natural vegetation communities. Covered projects under the WRC MSHCP are required to conduct focused studies within Narrow Endemic Plant Survey Areas (WRC MSHCP Volume I, Section 6.3.2) and Criteria Area Species Survey Area (WRC MSHCP Volume I, Section 6.1.3) for specific species. No Narrow Endemic or Criteria Area species were found within their respective survey areas.

Small-flowered morning glory, Palmer's grapplinghook, Parry's spineflower, and long-spined spineflower are the fully covered WRC MSHCP species detected during focused studies. Smooth tarplant and round-leaved filaree were found outside of the Criteria Area; therefore, they are also fully covered under the WRC MSHCP. Measures **NC-2 (NES BIO-2)** through **NC-13 (NES BIO-9)** identified in Section 3.17.4 are required under the WRC MSHCP, and would avoid and minimize impacts on sensitive habitats for special-status species. Projects like Mid County Parkway would also contribute to the incremental loss of areas of long-term conservation value for species like smooth tarplant (2.73 acres). Because the WRC MSHCP provides for conservation of these fully covered species, and other projects within the region would also be required to implement WRC MSHCP conservation measures, the build alternatives would not have a cumulative impact on WRC MSHCP covered plant species.

Sensitive plant species that are not covered WRC MSHCP species, such as paniculate tarplant, will also benefit from the conservation provided by the WRC MSHCP and measures described above. Under Build Alternatives 1 and 2C, a few individuals of paniculate tarplant along the existing roadway would be affected by the project. Measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)**, **NC-10 (NES BIO-10)**, and **NC-13 (NES BIO-9)** in Section 3.17.4 and conservation of LM MSHCP lands adjacent to Build Alternatives 1 and 2C would ensure that there are no cumulative effects on paniculate tarplant. Under Build Alternative 4, the new roadway would bisect a large population of several thousand individuals west of Harley John Road. In addition to implementation of measures **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)**, **NC-10 (NES BIO-10)**, and **NC-13 (NES BIO-9)**, prior to construction, seeds would be collected (**PL-1**) for future dissemination. In addition, the population occurs within an existing conservation area, which will require full replacement under **NC-17 (NES BIO-17)** and **NC-20 (NES BIO-21)** (Section 3.17.4). Because paniculate tarplant is still relatively common in the RSA, and with implementation of the avoidance, minimization, and mitigation measures identified above, the impacts on paniculate tarplant from Build Alternative 4 would not be cumulatively considerable.

3.25.3.17 Threatened and Endangered Species

The RSA for threatened and endangered species consists of the boundaries of the WRC MSHCP. Four threatened and endangered species were evaluated fully in Section 3.21, *Threatened and*

Endangered Species: arroyo toad, coastal California gnatcatcher, least Bell's vireo, and SKR. The evaluation of cumulative effects on these species is provided below.

Arroyo Toad

The build alternatives do not occur within the WRC MSHCP Survey Area for arroyo toad; therefore, focused studies for this species are not required. However, due to the presence of suitable habitat, potential impacts on arroyo toad by the build alternatives could occur if the species is present. Because the build alternatives occur outside of the WRC MSHCP Survey Area, any potential impacts on this species are fully covered under the WRC MSHCP. The WRC MSHCP provides the mitigation mechanism for covered activities and addresses the cumulative effects on this resource. Implementation of measures **NC-2 (NES BIO-2)** through **NC-13 (NES BIO-9)**, **AS-2 (NES BIO-16)**, and **AS-7 (NES BIO-20)** would reduce potential effects on arroyo toad. No additional measures are necessary for cumulative effects.

Coastal California Gnatcatcher

The build alternatives would permanently remove suitable habitat for coastal California gnatcatcher (refer to Section 3.21, *Threatened and Endangered Species*, for a full description). This includes 67.09 acres under Build Alternative 1, 76.21 acres under Build Alternative 2C, and 88.40 acres under Build Alternative 4 (refer to Table 3.21-5). Impacts on suitable habitat may incrementally contribute to cumulative loss of habitat. The species is fully covered under the WRC MSHCP and cumulative effects on coastal California gnatcatcher have been addressed in the WRC MSHCP. The majority of suitable habitat that would be directly affected by the proposed project occurs adjacent to areas that will be conserved. Roadbed removal areas will be revegetated with native vegetation that may provide suitable habitat for coastal California gnatcatcher. Covered activities, including the proposed project, within the Criteria Area require avoidance of vegetation clearing during the breeding season (**NC-1 [NES BIO-1]**). Measures **NC-2 (NES BIO-2)** through **NC-10 (NES BIO-10)**, **NC-13 (NES BIO-9)** (Section 3.17.4), and **AS-2** (Section 3.20.4) would also protect potential habitat in the conservation area for coastal California gnatcatcher in the vicinity of the limits of disturbance for Build Alternatives 1, 2C, and 4 and ensure compliance with the WRC MSHCP. Although it is a covered species under the WRC MSHCP, Measures **AS-3 (NES BIO-28)** and **AS-5 (NES BIO-27)** would address potential direct impacts on nesting coastal California gnatcatcher. Other projects within the RSA would also need to address potential effects on coastal California gnatcatcher and mitigate impacts on a project-by-project basis. Because the cumulative effects on coastal California gnatcatcher have been addressed in the WRC MSHCP, no additional mitigation by the proposed project is required.

Least Bell's Vireo

The proposed project would permanently affect 7.85 acres of suitable habitat under Build Alternative 1, 6.43 acres under Build Alternative 2C, and 5.75 acres under Build Alternative 4. In addition, approximately 18 individuals would be directly affected under Build Alternatives 1 and 2C, and 17 individuals would be directly affected under Build Alternative 4. The majority of impacts on least Bell's vireo would occur during construction of the proposed project in the form of direct removal of habitat, lighting, noise, vibrations, and degradation of riparian habitat

adjacent to the right of way. In addition, if the species is present during vegetation clearing, there is a potential for direct mortality or injury during the nesting season. Refer to Section 3.21 for a full description of impacts on least Bell's vireo. Least Bell's vireo and suitable habitat for this species are rapidly declining within the RSA, and projects like Mid County Parkway would have impacts on an additional 3.66 acres of least Bell's vireo habitat. These impacts on least Bell's vireo, in conjunction with other projects within the region, may be cumulatively considerable.

The WRC MSHCP requires evaluation of least Bell's vireo in Section 6.1.2 of the plan, including focused studies. The proposed project would affect least Bell's vireo and riparian/riverine habitat (discussed in Section 3.17, *Natural Communities*); therefore, a DBESP would be prepared and provide the mitigation plan for the direct effects on least Bell's vireo and its habitat, including the temporal loss of habitat. Implementation of avoidance, minimization, and mitigation measures **NC-1 (NES BIO-1)** through **NC-15 (NES BIO-14)**, **NC-20 (NES BIO-21)**, **TE-1 (NES BIO-18)**, **TE-2 (NES BIO-23)**, **AS-2 (NES BIO-16)**, **AS-3 (NES BIO-28)**, and **AS-5 (NES BIO-27)** would ensure there is no direct mortality of individuals and address replacement and restoration of suitable habitat for the species within the region. Other projects within the RSA will also be required to address potential take of least Bell's vireo and mitigate for such loss, including temporal loss of suitable habitat. Therefore, the project would not substantially contribute to a cumulatively considerable impact on least Bell's vireo.

Stephens' Kangaroo Rat

Habitat that is suitable and/or occupied by SKR would be permanently affected during project construction, including 125.29 acres under Build Alternative 1, 116.53 acres under Build Alternative 2C, and 63.11 acres under Build Alternative 4. In addition, temporary impacts on suitable habitat would occur during construction of the proposed project and may also directly affect SKR. The potential direct effects on SKR from construction activities could cause direct mortality, injury, or harassment of SKR. Refer to Section 3.21 for a full description of impacts on SKR. Due to the species coverage under the WRC MSHCP, cumulative effects on the species outside of the Core Reserve were already evaluated during development of the plan, and suitable habitat outside of the Core Reserve would not require replacement. Roadbed removal areas would be revegetated with native vegetation that may provide suitable habitat for SKR in the future and provide a benefit to the species.

Each of the build alternatives would also directly affect conserved lands that have been dedicated as Core Reserves for SKR by the WRC MSHCP and SKR HCP. These SKR Core Reserves (within the Lake Mathew Reserve and RCHCA SKR Reserve) consist of conserved areas that are dedicated to/described for SKR conservation, areas conserved for the benefit of the species, and areas described for conservation for the benefit of SKR. Impacts on the SKR Core Reserve may be cumulatively considerable for SKR. However, the WRC MSHCP provides full coverage for take of SKR. As mentioned above, cumulative effects on this species were also addressed in the WRC MSHCP for covered projects, and other projects would be required to address impacts on a project-by-project basis. In addition, implementation of **NC-2 (NES BIO-2)** through **NC-9 (NES BIO-24)**, **NC-13 (NES BIO-9)**, **AS-3 (NES BIO-28)**, **AS-6 (NES BIO-29)**, and **TE-3 (NES BIO-30)** would reduce potential effects on SKR during construction. Affected SKR habitat on the Core Reserve would be required to be fully replaced (**NC-20 [NES BIO-21]**) to ensure consistency with the WRC MSHCP and SKR HCP. In addition, the proposed project will

incorporate wildlife crossings and modified culverts into the project design that with the implementation of **NC-16 (NES BIO-19)** will accommodate safer wildlife movement (including for SKR) within conservation lands. Because the SKR Core Reserve would be fully replaced, and avoidance and minimization measures would be implemented to reduce the direct effects on SKR, the proposed project is not expected to make a cumulative contribution to impacts on SKR.

3.25.3.18 Animal Species

The RSA for non-listed special-status animal species consists of the boundaries of the WRC MSHCP. These species are evaluated fully in Section 3.20, *Animal Species*, of this EIR/EIS. Cumulative effects on non-listed special-status animals may be cumulatively considerable. Further details for non-listed special-status animals are discussed below.

Burrowing Owl

The majority of proposed project occurs within the WRC MSHCP Burrowing Owl Survey Area. Covered activities, such as the proposed project, are required to perform focused studies within suitable habitat in the Survey Area in order to be in compliance with the plan. If the species is found within the Burrowing Owl Survey Area, affected lands must be evaluated to determine whether there is long-term conservation value. One wintering individual was documented during focused studies for the proposed project. No evaluation of the few areas that occur outside of the WRC MSHCP Burrowing Owl Survey Area are required under the plan. Because the proposed project is a covered activity, any potential cumulative effects outside of the WRC MSHCP Burrowing Owl Survey Area were already evaluated during development of the plan. The permanent loss of suitable habitat (211.11 acres under Build Alternative 1, 226.96 acres under Build Alternative 2C, and 201.28 acres under Build Alternative 4), in conjunction with other planned projects in the regional vicinity (i.e., Mid County Parkway would have impacts on 3.1 acres of suitable burrowing owl habitat), may make a cumulatively considerable contribution to the regional decline of the species. This is primarily due to loss of suitable habitat including lands that can be used for foraging and nesting.

Although the build alternatives would directly remove potential habitat for the species, the WRC MSHCP evaluated loss of burrowing owl habitat throughout the RSA. Conserved lands within the RSA that also contribute to the conservation of burrowing owl would be permanently affected, which also may make a cumulative contribution to decline of this species. Measures **AS-1 (NES BIO-25)** through **AS-3 (NES BIO-28)** in Section 3.20.4 and **NC-1 (NES BIO-1)** through **NC-9 (NES BIO-24)** in Section 3.17.4 would ensure there is no mortality or direct effects on burrowing owl. Measure **NC-20 (NES BIO-21)** (Section 3.14.4) is being implemented to replace conservation lands to provide suitable habitat for burrowing owl, thereby addressing this potential cumulative effect on habitat loss for the species. Implementation of the measures identified above, in conjunction with the proposed project's consistency with WRC MSHCP, and implementation of other similar measures by other development and transportation projects, would ensure the effects on burrowing owl are not cumulatively considerable.

Special-status Bat Species

The RSA provides suitable roosting and foraging habitat for both special-status and non-special-status bat species. Seven bat species were documented during biological studies. Due to the rapid

decline of bat populations within the RSA from human development, increased predation, and disease, additional potential loss of roosting or suitable habitat may be cumulatively considerable. The proposed build alternatives are not anticipated to have a direct effect on roost sites, as all potential sites occur outside of the impact area. Measures **AS-2 (NES BIO-16)** and **AS-4 (NES BIO-26)** (Section 3.20.4) as well as **NC-2 (NES BIO-2)** through **NC-8 (NES BIO-8)**, **NC-10 (NES BIO-10),** and **NC-13 (NES BIO-9)** (Section 3.17.4) would be implemented to avoid/minimize potential indirect effects. With the implementation of these and other similar measures required by other development and transportation projects, the proposed project is not expected to contribute to cumulative effects on bat species.

Non-WRC MSHCP Species

There are 13 non-listed special-status species that could potentially be affected by the proposed project (as described in Section 3.20, *Animal Species*). These species are not afforded coverage under the WRC MSHCP. The proposed project may incrementally increase the risk of mortality during construction and to individuals crossing the roadway during operation of the project.

The potential impacts on non-listed special-status species that are not already covered under the WRC MSHCP, in conjunction with other cumulative projects in the RSA, may contribute to cumulative effects on these 13 species. However, implementation of measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** (Section 3.17.4), **AS-3 (NES BIO-28)**, **AS-5 (NES BIO-27)**, and **AS-7 (NES BIO-20)** (identified in Section 3.20.4) are intended to avoid and/or minimize potential direct and indirect impacts on special-status animals and their suitable habitat. In addition, **TE-1 (NES BIO-18)** (identified in Section 3.21.4), which would be implemented for other listed species, would also reduce potential noise effects on non-listed special-status animals.

WRC MSHCP Fully Covered Species

There are 32 non-listed special status animal species that are fully covered under the WRC MSHCP and that potentially occur in the RSA. These species do not require additional study at the species level. Although all of these species are covered under the WRC MSHCP, the bird species and their active nests are protected under the Migratory Bird Treaty Act and California Fish and Game Code. Most of these species are relatively common throughout western Riverside County and the number of individuals that may be affected by the proposed project is expected to be low. The 32 fully covered WRC MSHCP species are described in Section 3.20.2.4. Therefore, implementation of the build alternatives would not make a cumulatively considerable contribution to the regional decline of any of these species. In addition, cumulative impacts on these species were evaluated for covered activities during the development of the WRC MSHCP.

In order to comply with the WRC MSHCP and ensure the proposed project does not contribute to cumulative effects on WRC MSHCP fully covered species, the County, as a permittee, is required to implement measures identified in WRC MSHCP Volume I, Section 7.5.2 and Appendix C. Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** identified in Section 3.17.4 coincide with these WRC MSHCP requirements. In addition, **AS-2 (NES BIO-16)** through **AS-5 (NES BIO-27)** and **AS-7 (NES BIO-20)** (Section 3.17.4) would ensure any construction-related effects on non-listed special-status species are avoided and/or minimized). In addition, measure **TE-3 (NES BIO-30)** (Section 3.21.4) would replace habitat for a listed

species that would also directly benefit WRC MSHCP fully covered species. With the implementation of these and other similar measures required by other development and transportation projects, the proposed project is not expected to contribute to cumulative effects on WRC MSHCP fully covered species. No additional measures to address cumulative effects on WRC MSHCP covered species are necessary.

3.25.3.19 Paleontological Resources

The RSA for paleontological resources is within the extreme northern portion of the Peninsular Ranges Geomorphic Province, near the boundary with the Transverse Ranges Province to the north. The majority of the Peninsular Ranges Province is characterized by Mesozoic- to Paleozoic-age granitic and metamorphic bedrock and includes the Perris Block and Elsinore Trough. According to the results of the record search, four fossil localities were found within the Lake Mathews Formation traversed by Alternatives 1 and 2C, south of Lake Mathews. These localities could be within or are in close proximity to the two alignments. These sites were found to contain the bones, teeth, and fragments of large mammals, including camel, oredont, and felid; small mammals; and a tapir dentition. One fossil locality, located just east of the El Sobrante Road and Cajalco Road intersection, was found in Late Pleistocene alluvium, in an area traversed by all build alternatives. The site contained the ulna of a horse. The abundance of fossils previously found in this general area and their proximity to the project suggest the high paleontological sensitivity of the region. The geologic units within the project study area that have high sensitivity include the Silverado Formation, Topanga Formation, Lake Mathews Formation, Puente Formation, Fernando Formation, and late Pliocene to Pleistocene deposits. The Lake Mathews Formation and Late Pleistocene deposits, which are both sensitive for paleontological resources, are within the LM MSHCP area. Several fossil localities have been found in portions of the Lake Mathews Formation and Late Pleistocene deposits within the LM MSHCP area and within or immediately adjacent to the build alternative alignments.

Paleontological resources are, in general, always undergoing the effects of weathering, tectonic activity, and other formation processes that put their integrity in a natural gradual state of decline over very large periods of time. Because paleontological resources are site-specific in nature, the County would implement a Paleontological Mitigation Plan that will require monitoring and collecting resources to minimize adverse impacts in the event construction activities uncover any paleontological resources, as further described in Mitigation Measure **PAL-1**. With implementation of monitoring and collection measures, the project would not substantially contribute to cumulatively adverse impacts on paleontological resources.

3.25.3.20 Cultural Resources

Under both CEQA and NEPA, cumulative impacts refer to the indirect and direct cumulative effects on cultural resources for the current project coupled with past, future, and other current projects in or near a project area. Direct effects are those caused by the project, while indirect effects on cultural resources can include noise, vibration, disturbance to setting, added foot traffic, looting, and vandalism as a result of increased accessibility to a resource by the public as a result of the project. Additionally, resources can be affected by processes such as erosion that has been exacerbated by the current project or due to the cumulative effects of other projects. Mitigation of project effects will not be fully determined until a preferred alternative is selected

and a Memorandum of Agreement has been developed and agreed upon between Caltrans and consulting parties.

As discussed in Section 3.25.1, the study area includes a number of development and transportation projects in the vicinity of the proposed project APE. The Historic Property Survey Report (HPSR) reports a total of 17 archaeological resources identified within the APE of the proposed project, either through past surveys or as part of the proposed project. As a result of field surveys and resource evaluations, three sites were combined into a single site and nine sites (including the combined site) were subsumed into a newly defined Potential Prehistoric Archaeological District (PPAD), resulting in 15 archaeological resources. Of these 15 prehistoric and historic-aged archaeological resources identified in the proposed project APE, three are "historic resources/historic properties," individually eligible for inclusion in the National Register of Historic Places (NRHP)/California Register of Historical Resources (CRHR) and one is individually eligible as a contributor to a larger archaeological site. Additionally, Caltrans has made an assumption of eligibility of inclusion in the NRHP/CRHR for one archaeological resource, the Mead Valley PPAD, with the nine prehistoric archaeological sites in the APE contributing elements of the PPAD, for the purposes of this project only. As a result of consultation between Caltrans on behalf of FHWA and the Pechanga Band of Luiseño Mission Indians, three traditional cultural properties (TCPs) were identified. For the purposes of the project, Caltrans has assumed NRHP eligibility for the three TCPs. As a result of the cultural resources study, there are 13 historic properties. These 13 resources were analyzed for the purposes of cumulative impacts analysis. Cumulative analysis was not undertaken on the five historic period archaeological resources and nine built-environment resources evaluated as not eligible for the NRHP or CRHR. The archaeological sites and TCPs identified, and the build alternatives that they are located within, are presented in Table 3.25-2.

Table 3.25-2. Historic Properties within the Project APE

Site Number	Age	Description	NRHP Status	Site Located within APE (Alternative)		
				1	2C	4
Mead Valley Potential Prehistoric Archaeological District including contributing elements: CA-RIV-2263, -2264, and -4444 (combined site CA-RIV-2263); CA-RIV-4403; CA-RIV-4407; CA-RIV-4408; CA-RIV-4409; CA-RIV-4454; 33-13791/ CA-RIV-7843, Locus 816; 33-13791/ CA-RIV-7843, Locus 817; and CA-RIV-012623	Prehistoric	Bedrock milling stations, lithic scatter within an as-yet undefined larger boundary inclusive of additional likely similar sites outside of the APE	PPAD assumed eligible under Criteria A/1, B/2, C/3, and D/4; Caltrans' Cultural Studies Office (CSO) approved assumption of eligibility 7/7/2020. NRHP status for contributing elements described for each qualifying site, below.	✓	✓	✓
Combined site of CA-RIV-2263; CA-RIV-2264; CA-RIV-4444	Prehistoric	Bedrock milling station, lithic scatter, and reported petroglyph	Eligible for listing in the NRHP/CRHR under Criteria D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 07/7/2020).	✓	✓	
CA-RIV-4403	Prehistoric	Bedrock milling station	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓
CA-RIV-4407	Prehistoric	Bedrock milling station and lithic scatter	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓

Site Number	Age	Description	NRHP Status	Site Located within APE (Alternative)		
				1	2C	4
CA-RIV-4408	Prehistoric	Bedrock milling station and lithic scatter	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓
CA-RIV-4409	Prehistoric	Bedrock milling station	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).			✓
CA-RIV-4454	Prehistoric	Artifact scatter	Not eligible for the NRHP/CRHR under any criteria individually; assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	✓	✓	
33-13791/CA-RIV-7843, Locus 816	Prehistoric	Habitation site, midden, milling features, and cupule rock	Eligible for listing in the NRHP/CRHR under Criteria A/1, C/3, and D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	✓	✓	✓
33-13791/CA-RIV-7843, Locus 817	Prehistoric	Prehistoric milling station and artifact scatter	Not eligible for listing in the NRHP or CRHR individually (SHPO concurrence 2/10/2021). Assumed eligible for listing as a locus of CA-RIV-7843 under Criteria D/4 (CSO approval 7/7/2020).	✓	✓	✓
CA-RIV-012623	Prehistoric	Artifact scatter	Eligible for listing in the NRHP/CRHR under Criteria D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/72020).	✓	✓	✓
Traditional Cultural Properties - *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik*	N/A	Traditional cultural properties encompassing a vast geographical area	Caltrans assumption of eligibility (NRHP Criteria A, B, C, D) for the purposes of this project only (CSO approval 5/7/2021).	✓	✓	✓

Past projects have resulted in cumulatively significant impacts on cultural resources throughout Riverside County because of physical demolition, destruction, relocation, or alteration of historical and archaeological resources and their setting. In order to proactively protect and consider the potential for impacts on historical and archaeological resources, federal, state, and local regulations have been created, including Public Resources Code (PRC) Section 5097; California Penal Code, Section 622; the Mills Act; California Health and Safety Code, Section 18950–18961; and the Secretary of the Interior's Standards for Rehabilitation and Standards for the Treatment of Historic Properties; future projects would be required to comply with these regulations, which would contribute to a reduction in cumulative impacts on archaeological and historical resources.

Archaeological Resources and Traditional Cultural Properties

Mead Valley Potential Prehistoric Archaeological District

The Mead Valley PPAD includes nine sites (CA-RIV-2263 [combined site MR 2]; CA-RIV-4403, -4407, -4408, and -4409; CA-RIV-4454; CA-RIV-7843 (Loci 816 and 817); and CA-RIV-012623, as contributing elements) and their previously recorded features and boundaries within the project APE, as well as a yet-undefined boundary and larger number of sites not within the project APE. The boundary for the Mead Valley PPAD is potentially much larger and inclusive of many other sites that are geographically and morphologically similar. For the purposes of this project only, Caltrans assumes the PPAD is eligible for the NRHP and CRHR under Criteria A/1, B/2, C/3, and D/4. Sites CA-RIV-4403, 4407, -4408, and -4409, and Locus 817 of CA-RIV-7843, are individually ineligible for inclusion in the NRHP or CRHR by Caltrans; however, they are eligible as contributors to the PPAD under Criterion D/4 (Vargas and Bryne 2020). Sites CA-RIV-2263, Locus 816 of CA-RIV-7843, and CA-RIV-012623 are considered eligible for listing in the NRHP both individually and as contributing elements to the PPAD. For the purposes of the project and the evaluation of effects related to the project, the acreage approximation for the PPAD is 30,263 acres.

Under any of the build alternatives, construction activities would occur within the Mead Valley PPAD, impacting the PPAD and contributing elements. Build Alternatives 1 and 2C would directly affect 336 acres (1.11 percent) and 501 acres (1.65 percent) of the Mead Valley PPAD, respectively. Build Alternative 4 would directly affect a total of 309 acres (1.02 percent) of the Mead Valley PPAD. Build Alternatives 1 and 2C would not directly affect four of contributing elements of the PPAD within the APE (CA-RIV-4403, -4407, -4408, and -4409), but they would directly affect the remaining five. Build Alternative 4 would not directly affect two of contributing elements of the PPAD within the APE (CA-RIV-2263 and CA-RIV-4454), but it would directly affect the remaining seven.

In addition to direct impacts from construction activities, remaining portions of the PPAD are likely to be affected by indirect impacts from both this project and others such as the Van Buren Boulevard and Little Court (16) and the 117.7-acre Residential Subdivision (17), which could lead to additional vehicular traffic thus creating additional indirect impacts such as those described above. Indirect impacts on the remainders of sites may include potential exposure to additional pedestrian traffic, noise and vibration from additional and new vehicular traffic, and

an overall loss of setting. As such, there will be cumulative adverse impacts on the Mead Valley PPAD as a result of Build Alternatives 1, 2C, or 4.

Combined Site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444

CA-RIV-2263, -2264, and -4444 were initially recorded as individual archaeological sites but combined into a single site after field surveys and resource evaluation. The combined site is eligible for listing in the NRHP/CRHR under Criterion D/4. Excavations at all three sites demonstrated only minor amounts of disturbance through the presence of some introduced historic and modern materials such as bullet casings and fragments of glass.

Significant portions of the combined site of CA-RIV-2263, -2264, and -4444 would be directly affected by Build Alternatives 1 and 2C. Construction of either of these alternatives could result in destruction of portions of the site, including all three loci and newly added areas. Because there is a buried component to the site that is not fully mapped, it is likely that unknown buried components of the site would be directly affected. It is also assumed that increased traffic and the addition of a new route in Build Alternative 2C could cause indirect impacts on the portions of the site that will not be directly affected. Indirect impacts would be realized through potential exposure to additional noise and vibration from additional and new vehicular traffic, and a loss of setting. None of the other regional projects identified in Table 3.25-1 appear to intersect this combined site directly, but developments such as the Arantine Hills Specific Plan (4) and the 117.7-Acre Residential Subdivision (17) could lead to additional vehicular traffic, therefore creating additional indirect impacts such as those described above. As such, there will be cumulative adverse impacts on the combined site of CA-RIV-2263, -2264, and -4444 as a result of Build Alternatives 1 and 2C, and a cumulative impact on the Mead Valley PPAD.

CA-RIV-4403, -4407, -4408, and -4409

Due to the proximity of sites CA-RIV-4403, -4407, -4408, and -4409 within the project APE, the potential for cumulative adverse impacts on the four sites is addressed collectively. Under Build Alternatives 1 and 2C, no construction activities or other disturbance would occur, including indirect effects; therefore, no impacts that would contribute to cumulative effects would be anticipated. Under Build Alternative 4, construction activities would physically destroy parts of sites CA-RIV-4403, -4407, -4408, -4409, resulting in the removal of resources from their context. As these sites are contributing elements to the Mead Valley PPAD, impacts from Build Alternative 4 would contribute to an overall cumulative impact on the PPAD.

CA-RIV-4454

Under Build Alternatives 1 and 2C, construction activities would result in the physical removal of the majority of the artifact scatter at CA-RIV-4454. The impacts would result in the removal of resources from their context. As this site is a contributing element to the Mead Valley PPAD, impacts from Build Alternatives 1 and 2C would contribute to an overall cumulative impact on the PPAD. Under Build Alternative 4, no construction activities or other disturbance would occur, including indirect effects; therefore, no impacts that would contribute to cumulative effects would be anticipated.

CA-RIV-7843 (Loci 816 and 817)

CA-RIV-7843 is a prehistoric village complex covering an approximately 3.5-square-kilometer area. As a locus of the larger site CA-RIV-7843 (presumed eligible for inclusion in the NRHP and CRHR), Locus 816 is eligible for the NRHP/CRHR individually under Criteria A/1, C/3, and D/4, and as a contributing element of CA-RIV-7843, Mead Valley PPAD, and the three TCPs. Locus 817 is individually ineligible for listing in the NRHP or CRHR, but it is eligible as a contributing element of CA-RIV-7843, Mead Valley PPAD, and the three TCPs under Criterion D/4 (Vargas and Bryne 2020).

Build Alternatives 1, 2C, and 4 would directly affect 2.16 acres of the 3.1-acre Locus 816 and 0.65 acre of Locus 817. Residential properties and Cajalco Road are immediately adjacent to the loci, and have most likely affected the site to some degree. While the loci retain integrity of location, their integrity of setting has been impaired substantially through the loss of materials and loss of the traditional viewshed with the introduction of paved roads and the construction of houses.

CA-RIV-7843 (including Loci 816 and 817) has been affected by agricultural activities for many years, and has likely been subject to impacts from pedestrian foot traffic, vandalism, and looting. Impacts related to the proposed project at CA-RIV-816 and -817 would contribute to the overall cumulative impacts on site CA-RIV-7843. Three regional projects (Van Buren Boulevard and Little Court [16], the 117.7-Acre Residential Subdivision [17], and the 18-Hole Golf Course [18]) will likely also contribute indirect impacts on the larger site. Indirect impacts from these projects could include increased vehicular traffic and increased exposure to pedestrian traffic, which in turn could lead to impacts from noise, vibration, loss of integrity to setting, vandalism, looting, and inundation with roadside refuse. Considering the indirect impacts from other proposed projects and the continued impacts of agricultural activities, the impacts from this project would contribute to an overall cumulative impact on CA-RIV-7843 and the Mead Valley PPAD.

CA-RIV-012623

Archaeological testing was not conducted at CA-RIV-012623, and, therefore, it is unknown whether a subsurface component exists, although soil conditions at the site indicate the potential for buried cultural deposits. CA-RIV-012623 is eligible for inclusion in the NRHP and CRHR under Criterion D/4. CA-RIV-012623 shows moderate signs of disturbance from the earlier construction of existing Cajalco Road and associated brush clearing and grading, and nearby residential development. The site retains integrity of location and impaired integrity of setting through likely disturbance and loss of archaeological materials and loss of the traditional viewshed with the introduction of paved roads and the construction of houses nearby. Build Alternatives 1 and 2C would directly affect 0.17 acre, and Build Alternative 4 would directly affect 0.00008 acre, of the 0.17-acre CA-RIV-012623. No regional projects would directly affect the site. The direct impacts from the proposed project coupled with the indirect impacts of nearby regional projects indicate that construction activities associated with Alternatives 1, 2C, and 4 would constitute a cumulative impact on the site as whole and the Mead Valley PPAD.

Traditional Cultural Properties of *T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*

Through consultation between Caltrans on behalf of FHWA and the Pechanga Band of Luiseño Indians, three TCPs were identified in the APE and APE vicinity. The three TCPs are *T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*. Together, these TCPs compose an expansive, overlapping geographic area that includes the APE and all the project alternatives. For the purposes of the project and the evaluation of effects related to the project, the acreage approximation for the combined TCPs is 28,531 acres. The TCPs share common uses and locations of religious and cultural importance, embodied by their position as a regional resource gathering area, a regional hub along a travel and trade route, and an expression of tribal values concerning the tribe's present-day cultural values as expressed in the Creation account. Based on the information provided by the tribe (Woodward et al. 2019; DuBois 2020) and consideration of the eligibility criteria in light of guidelines for evaluating TCPs (NPS 1997), Caltrans assumes the TCPs of *T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik* are eligible for the NRHP and CRHR under Criteria A1, B/2, C/3, and D/4 for the purposes of this project only.

Cumulative impacts of the project on the TCPs are considered in the context of the APE and vicinity, which stretches from Corona to Perris and includes the Lake Mathews area and Mead Valley. The TCPs are significant for their religious and cultural significance to the Luiseño that are associated with cultural practices, traditions, and beliefs, and embodied in the landscape. Although the outer boundaries of the TCPs are not known, changes to the location, setting, and visual character of the TCPs resulting from the project and other past and planned future projects are not expected to be significant because they affect a minute portion of the overall geographic extent of the TCPs. Build Alternative 1 would directly affect 390.2 acres (1.37 percent), Build Alternative 2C would directly affect 399.2 acres (1.40 percent), and Build Alternative 4 would directly affect 395.9 acres (1.39 percent) of the combined TCPs delineated in the vicinity of the project. Additionally, even though ground-disturbing activities associated with development would affect individual components of the TCPs, their loss would not be a cumulative impact on the landscape and intangible cultural values held by the Luiseño people caused by any project alternative and would not significantly change the integrity of setting, feeling, character, and location of *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik* to the point that they no longer contribute to the significance of the TCPs. Therefore, with respect to the TCPs, the impacts from this project would not contribute to an overall cumulative impact.

Mitigation

All 10 archaeological historic properties within the proposed project APE would be affected either directly through construction activities or indirectly because of additional vehicular and pedestrian traffic. Other regional projects will also contribute indirect impacts on the sites within the project APE, which would constitute a cumulative impact on these sites as a result of this project. It is assumed that mitigation will be necessary for sites determined (with State Historic Preservation Officer [SHPO] concurrence) to be eligible for inclusion in the NRHP and CRHR. Avoidance and preservation in place is the preferred measure for historic properties and/or historical resources; however, specific mitigation measures will be developed for all historic properties affected by the project through development of a Memorandum of Agreement (MOA). The MOA will be developed for all historic properties that will be affected by the project, and it will include mitigation measures and treatment for historic properties. The Native American

tribes that have been involved in consultation for the project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS. The MOA will stipulate the responsibilities of the FHWA, SHPO, Caltrans (as assigned by FHWA), Riverside County Transportation Department, and the Advisory Council on Historic Preservation (if it chooses to participate) on measures that will be taken to avoid, minimize, or mitigate the effects of the undertaking on historic properties.

The MOA will specify procedures for the protection, treatment, recovery, and disposition of any human remains and burial associated goods, in accordance with federal and state law. Recovery, treatment, and disposition of any artifacts found would also be provided for in the Discovery and Monitoring Plan. Unanticipated discovery of archaeological resources or human remains constitutes a cumulative impact, as construction activities could lead to their damage and/or destruction. Measures for treatment of unanticipated archaeological discoveries and/or human remains are presented as Standard Project Measures **PF CR-1** and **PF CR-2** in Section 3.8, *Cultural Resources*.

For sites that would be adversely affected, mitigation measures that might be included in the MOA include development of an archaeological treatment plan, data recovery, and development of protective measures for individual elements of sites or sites as a whole. Protective measures could also include alternative construction techniques. The archaeological treatment plan would define the elements of data recovery, including methods of investigation, a research design, and guidelines for the treatment and disposition of materials recovered during data recovery. Data recovery methods generally involve some form of excavation, recovery of artifacts, laboratory analysis, more detailed archival research, and reporting. Generally, a phased approach is enacted that includes surface collection, artifact mapping, excavation, laboratory processing, artifact/ecofact analysis, processing of special samples, consultation with interested parties, curation, reporting, and repatriation (if necessary). Alternative construction measures to assist in the lessening of such effects as vibration could include cast-in-drilled-hole piles or shallow-spread footings for bridge construction. Protective measures for individual elements of archaeological sites could include stabilization measures, burial or covering of such features, the use of protective measures such as fencing, design of alternative routes for equipment, the use of rubber tired vehicles, and other measures to be determined.

Chapter 4. California Environmental Quality Act Evaluation

4.1 Determining Significance under CEQA

The project is subject to federal, as well as County of Riverside (County) and state environmental review requirements because the County proposes the use of federal funds from the Federal Highway Administration (FHWA) and/or the project requires an approval from FHWA. Project documentation, therefore, has been prepared in compliance with both the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA). The County is the project proponent and the lead agency under CEQA. FHWA's responsibility for environmental review, consultation, and any other actions required by applicable Federal environmental laws for this project are being, or have been, carried out by Caltrans pursuant to 23 United States Code Section 327 (23 USC 327) and the Memorandum of Understanding dated December 23, 2016, and executed by FHWA and Caltrans.

One of the primary differences between NEPA and CEQA is the way significance is determined. Under NEPA, significance is used to determine whether an EIS, or a lower level of documentation, will be required. NEPA requires that an EIS be prepared when the proposed federal action (project) *as a whole* has the potential to "significantly affect the quality of the human environment." The determination of significance is based on context and intensity. Some impacts determined to be significant under CEQA may not be of sufficient magnitude to be determined significant under NEPA. Under NEPA, once a decision is made regarding the need for an EIS, it is the magnitude of the impact that is evaluated and no judgment of its individual significance is deemed important for the text. NEPA does not require that a determination of significant impacts be stated in the environmental documents.

CEQA, on the other hand, does require the County to identify each "significant effect on the environment" resulting from the project and ways to mitigate each significant effect. If the project may have a significant effect on any environmental resource, then an EIR must be prepared. Each and every significant effect on the environment must be disclosed in the EIR and mitigated if feasible. In addition, the CEQA Guidelines list a number of "mandatory findings of significance," which also require the preparation of an EIR. There are no types of actions under NEPA that parallel the findings of mandatory significance of CEQA. This chapter discusses the effects of this project and CEQA significance.

4.2 CEQA Environmental Checklist

This checklist identifies physical, biological, social, and economic factors that might be affected by the proposed project. In many cases, background studies performed in connection with the projects will indicate that there are no impacts to a particular resource. A NO IMPACT answer in the last column reflects this determination. The words "significant" and "significance" used throughout the following checklist are related to CEQA, not NEPA, impacts. The questions in this form are intended to encourage the thoughtful assessment of impacts and do not represent thresholds of significance.

Project features, which can include both design elements of the project, and standardized measures that are applied to all or most Caltrans projects such as Best Management Practices (BMPs) and measures included in the Standard Plans and Specifications or as Standard Special Provisions, are considered to be an integral part of the project and have been considered prior to any significance determinations documented below; see Chapter 2, *Project Alternatives*, and Chapter 3, *Affected Environment, Environmental Consequences, and Avoidance, Minimization, Mitigation Measures*, for a detailed discussion of these features. The annotations to this checklist are summaries of information contained in Chapter 3 in order to provide the reader with the rationale for significance determinations; for a more detailed discussion of the nature and extent of impacts, please see Chapter 3. This checklist incorporates by reference the information contained in Chapters 2 and 3.

The significance of the potential impacts of Build Alternatives 1, 2C, and 4 under CEQA has been assessed based on the 2019 CEQA Environmental Checklist and the analyses of project impacts discussed in detail in Chapter 3. The potential impacts of the build alternatives, including the identification of their levels of significance under CEQA, are summarized in the following sections. Each section includes an impact summary table that reflects the greatest level of significance, or potential impact, anticipated under the most impactful alternative. The impact summary table does not include impact determinations for all alternatives, and in many cases the preferred alternative is expected to have a lesser impact as discussed, where applicable. Potential impacts specific to each project build alternative, including their level of significance under CEQA, are discussed following each impact summary table.

Because the alignments of each build alternative extend through the boundaries of the Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP), Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP), and Stephens' Kangaroo Rat Habitat Conservation Plan (SKR HCP), and include design elements that are either inconsistent with or that exceed requirements of the current plans, actions that would allow for the LM MSHCP, WRC MSHCP, and SKR HCP to accommodate the proposed project would be required and are therefore included in the analysis of each build alternative, where applicable. The LM MSHCP does not include a prescribed amendment or process to allow changes to the plan in response to public safety and/or access needs, and it involves multiple management areas, managing documents, governing structures, and existing agreements. Therefore, an appropriate discretionary action or actions coordinated between the County and LM MSHCP responsible parties are proposed as part of the project to accommodate the proposed roadway improvements, and these actions may include a new LM MSHCP amendment along with the development of procedures for the amendment.

Modifications to the LM MSHCP and associated agreements, easements, and permits, including the identification of proposed mitigation, require approvals by regulatory and responsible parties, and they are subject to CEQA where such agreements, easements, and permits apply, and to NEPA. Therefore, analyses involving the LM MSHCP are provided under separate headings, *Lake Mathews MSHCP,* in this chapter (Chapter 4 [CEQA]) and in Chapter 3 (NEPA) for each build alternative, as applicable.

This chapter discusses the impacts of Build Alternatives 1, 2C, and 4; for a discussion of the impacts of the No-Build Alternative, refer to Chapter 3, *Affected Environment, Environmental Consequences, and Avoidance, Minimization, Mitigation Measures*.

4.2.1 Aesthetics

Except as provided in Public Resources Code Section 21099, would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect on a scenic vista?	☒	☐	☐	☐
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☒	☐	☐	☐
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☒	☐	☐

This section was prepared using information from Section 3.7, *Visual/Aesthetics*, and the *Visual Impact Assessment* technical report prepared for the project (Caltrans 2018a).

4.2.1(a) Have a substantial adverse effect on a scenic vista?

Build Alternatives 1 and 2C

Less than Significant with Mitigation

In the central area of the project, the project alignments of Build Alternatives 1 and 2C travel through open space lands and rolling terrain associated with the LM MSHCP and Lake Mathews Multiple Species Reserve (LMR) areas; the lack of tall vegetation allows for scenic vista views to the surrounding mountains and Lake Mathews. As discussed in Section 3.7, *Visual/Aesthetics*, roadway widening under Build Alternative 1 would require large areas of cut and fill to accommodate the widening and traverse the undeveloped, hilly terrain. The roadway corridor would stand out more in the natural landscape and appear more like a highway than a small rural roadway. This is due to landform alterations that would be required to widen the roadway and slightly realign the corridor. Wildlife exclusion fencing would be visible but would also recede in views due to the color treatment. Under Build Alternative 1, the existing visual character would be altered by more pronounced roadside cuts and degradation of the quality of views from the roadway even though the project would be designed so that slopes appear more natural.

Roadway widening would increase the roadway surface area from a two-lane rural roadway to a four-lane roadway and associated turn lanes that would be more suburban in nature under Build Alternative 1. However, these changes are not anticipated to affect the quality of views and scenic vistas available from Cajalco Road because views from the roadway would not be greatly altered, as there are no structures proposed that would interfere with scenic vista views and the changes would not degrade the quality of scenic vista views available from the roadway.

Under Build Alternative 2C, impacts on scenic vistas would be similar to those under Build Alternative 1. Build Alternative 2C would also include realignment of a segment of the existing Cajalco Road to vacant LMR reserve lands, south of the existing corridor alignment, resulting in large areas of cut to accommodate the new alignment. Relocating the segment of Cajalco Road would create new vista views from the realigned segment that are likely to be scenic. Furthermore, abandoned portions of Cajalco Road would be removed and restored, creating a more natural look where these roadway segments once were. Besides partial realignment of the corridor under Build Alternative 2C, the most notable change would be the widening of existing segments of Cajalco Road from two to four lanes that would create a roadway that is more suburban than rural in nature. However, these changes are not likely to affect scenic vistas available from this portion of the roadway because the quality of scenic vista views from the roadway would not be greatly altered.

Overall, Build Alternatives 1 and 2C would offer scenic vista views and have views that are consistent with the scenic qualities for which Cajalco Road, La Sierra Avenue, and El Sobrante Road qualified when considered by the County as scenic-eligible roadways. Standard Project Measure **PF VIS-1** and Mitigation Measure **VIS-2** would replace vegetation on affected properties and reduce glare. Standard Project Measure **PF VIS-3**, Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity, is designed to reduce the visual impact of adding noise barriers. Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that project light and glare would not result in adverse visual effects under all build alternatives. The proposed project would include Standard Project Measure **PF VIS-5** for proposed basins and larger drainages to ensure the most natural appearance feasible for the introduced features. **PF VIS-6**, Temescal Creek Bridge Design, specifies that the City of Corona El Cerrito Specific Plan Scenic Corridor Design Standards will be applied in the design and construction of the widened Temescal Creek Bridge. Lastly, **PF VIS-7**, New Bridge Architectural Treatments, such as color or texture, would require aesthetic treatments that are consistent with County design and engineering standards on new bridges. Therefore, permanent visual changes would not result in adverse visual effects on scenic roadways under Build Alternatives 1 and 2C with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Mitigation Measure **VIS-2** (see Section 3.7, *Visual/Aesthetics*, for the full text of these measures). Therefore, impacts would be less than significant with mitigation.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, permanent impacts on viewer groups and visual quality associated with converting the median area to travel lanes would be similar to those described for Build Alternatives 1 and 2C within the Rural Residential, Open Space, and Commercial visual assessment units (VAUs). If the additional lanes are constructed in the future, it is anticipated that impacts would be limited to paving the median to create six lanes and would occur within the already modified roadway corridor and not affect visual resources beyond changing the median area to a paved median and likely installing a safety barrier to separate directional

travelways. Visual changes would be minimal and would not result in a substantial adverse effect on a scenic vista.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Less than Significant with Mitigation

Under Build Alternatives 1 and 2C, scenic vista views along Cajalco Road occur only within the LM MSHCP plan area; the existing visual character would be altered by more pronounced roadside cuts and degradation of the quality of views from the roadway even though the project would be designed so that slopes appear more natural. The incorporation of Standard Project Measure **VIS-1** and application of Mitigation Measure **VIS-2**, Replace or Relocate Site Features and Landscaping Affected by the Project, would ensure that vegetation affected by either build alternative is replaced where appropriate and to the degree possible, helping to maintain the quality of views within the foreground of scenic vista views available from the roadway. Therefore, impacts on scenic vistas within the LMR under Build Alternatives 1 and 2C would be less than significant with mitigation.

Build Alternative 4—El Sobrante Alignment

Potentially Significant Impact

Under Build Alternative 4, scenic vista views are available from Cajalco Road, El Sobrante Road, and La Sierra Avenue. Cajalco Road and small segments of La Sierra Avenue travel through the LM MSHCP plan area and El Sobrante Road borders the LM MSHCP plan area to the north (refer to Figure 1-2). Therefore, impacts on scenic vistas seen from Cajalco Road, El Sobrante Road, and La Sierra Avenue that are discussed herein are the same as those that occur within the LMR, which are addressed below, under *Lake Mathews MSHCP (Build Alternative 4)*. Scenic vista views available from Cajalco Road and El Sobrante Road would not be affected by the proposed widening because the changes would not introduce any structures that would interfere with vista views and would not degrade the quality of views available from the roadway.

Under Build Alternative 4, scenic vista views would not be negatively affected because the proposed project would not introduce features that would block or alter such views. Although views from El Sobrante Road would not be greatly altered, there would be substantial landform alterations along La Sierra Avenue. The large cut slopes and suburban feel of the widened roadway would result in alterations to the visual character and would increase the prominence of roadway infrastructure, which would degrade views associated with the corridor. In addition, under Build Alternative 4, impacts on the MWD Lake Mathews facility would occur because the entrances would be affected by the intersection realignment, as described above, affecting vegetation and fencing. Mitigation Measure **VIS-2** would replace landscape features to the degree possible to reduce the effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor. Lastly, visual changes along El Sobrante Road would not result in adverse visual effects on most scenic vistas under Build Alternative 4 with Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Mitigation Measure **VIS-2** (see Section 3.7, *Visual/Aesthetics*, for the full text of these measures).

However, the widening and realignment of La Sierra Avenue under Build Alternative 4 would require large areas of cut and fill to accommodate the widening and to traverse the undeveloped, hilly terrain that would also require an approximately 1,800-foot-long arch bridge, introducing new bridge infrastructure where none presently exists. The realignment of La Sierra Avenue under Build Alternative 4 would introduce several permanent elements that do not currently exist within that viewshed, including the bridge, paved and widened roadway and shoulder, unpaved median, wildlife corridor fencing, graded roadway shoulders and slopes, and vehicular traffic. This would also remove existing scenic vista views that are available along the current roadway alignment. The realignment is likely to provide new scenic vista views, but they would contain more human-made features than the existing alignment and be more suburban in nature. The arch bridge and smaller roadway bridges proposed west of Lake Mathews would further include architectural treatments consistent with County design standards that would lessen potential visual impacts associated with the introduction of the new structures, to the extent possible. These architectural treatments would be applied under Standard Project Measure **PF VIS-7**, New Bridge Architectural Treatments. However, the removal of existing scenic vista views and the introduction of new structures would be an adverse effect. Therefore, even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Mitigation Measure **VIS-2**, impacts associated with Build Alternative 4 would be potentially significant.

Future Six-Lane Facility (Build Alternative 4)

Less than Significant Impact

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that paving the median to create six lanes would occur within the already modified roadway corridor and would not affect visual resources beyond changing the median area to a paved median and likely installing a safety barrier to separate directional travelways. Visual changes would be minimal and would not result in a substantial adverse effect on a scenic vista.

Lake Mathews MSHCP (Build Alternative 4)

Potentially Significant Impact

As described under Build Alternative 4, above, Cajalco Road and La Sierra Avenue travel through the LM MSHCP plan area and El Sobrante Road borders the LM MSHCP plan area to the north. Scenic vistas along Cajalco Road, El Sobrante Road, and La Sierra Avenue are only available within the LM MSHCP plan area. The application of Mitigation Measure **VIS-2**, Replace or Relocate Site Features and Landscaping Affected by the Project, would ensure that vegetation affected by the build alternative is replaced where appropriate and to the degree possible, helping to maintain the quality of views within the foreground of scenic vista views available from the roadway. Permanent visual changes would result in adverse visual effects on scenic roadways under Build Alternative 4 even with implementation of Standard Project Measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**, and Mitigation Measure **VIS-2** (see Section 3.7, *Visual/Aesthetics*, for the full text of these measures). Therefore, impacts on scenic vistas within the LMR under Build Alternative 4 would be significant and unavoidable.

4.2.1(b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

Build Alternatives 1, 2C, and 4

No Impact

No roadways within or near the project area are designated in federal or state plans as a scenic highway or route for maintaining and enhancing scenic viewsheds (Caltrans 2017a). Interstate 15 (I-15) is an eligible state scenic highway; however, the project's western terminus is approximately 0.3 mile away from the freeway, and views of the project corridor from the freeway are blocked by the interchange berms. Interstate 215 (I-215) is a classified Landscaped Freeway within the project viewshed; the project's eastern terminus connects to the I-215 southbound ramps (Caltrans 2018b). As described in Section 3.7, *Visual/Aesthetics*, portions of Cajalco Road, El Sobrante Road, and La Sierra Avenue are County-eligible scenic corridors that are to be managed in a manner so as to maintain their aesthetic value. The Riverside County General Plan Circulation Element also indicates that Cajalco Road from I-15 to approximately Harley John/Smith Roads, El Sobrante Road, and La Sierra Avenue from El Sobrante Road to Cajalco Road are County-eligible scenic corridors, which are to be managed in a manner so as to maintain their aesthetic value (County of Riverside 2016). Views of state scenic roadways would not be altered by the permanent visual changes associated with the build alternatives, as I-15, which is a state scenic highway, is too far from the build alternatives to be adversely affected. Therefore, there would be no impact and mitigation is not required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that a change from four to six lanes would not greatly affect scenic corridors beyond what has been analyzed for the build alternatives, above. Under all four-lane alternatives, paving the median to create six lanes would occur within the already modified roadway corridor and would not affect visual resources beyond changing the median area to a paved median and likely installing a safety barrier to separate directional travelways. Visual changes would be minimal and would not result in further damage to the state scenic highway, I-15.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that widening from four to six lanes would not affect the state scenic highway, I-15, as it is too far from the potential improvements.

4.2.1(c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from a publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

Build Alternatives 1 and 2C

Less than Significant with Mitigation

Under Build Alternatives 1 and 2C, Cajalco Road between I-15 and Harley John Road/Smith Road is a County-eligible scenic corridor that is protected for its aesthetic value. A segment of the existing Cajalco Road would be relocated from the Rural Residential VAU to the Open Space VAU.

As discussed in Section 3.7, *Visual/Aesthetics*, roadway widening would require large areas of cut and fill to accommodate the widening and traverse undeveloped, hilly terrain. The roadway corridor would stand out more in the natural landscape and appear more like a highway than a small rural roadway. This is due to landform alterations that would be required to widen the roadway and slightly realign the corridor. This would alter the existing visual character of the scenic corridor by making roadside cuts more pronounced and degrading the quality of views from the roadway even though the project would be designed so that slopes appear more natural. Wildlife exclusion fencing would be visible but would recede in views due to the color treatment.

Roadway widening would increase the roadway surface area from a two-lane rural roadway to a four-lane roadway and associated turn lanes that is more suburban in nature. However, these changes are not likely to affect the quality of scenic views available from this portion of County-eligible scenic roadway because views from the roadway would not be greatly altered because there are no structures proposed that would interfere with vista views and the changes would not degrade the quality of views available from the roadway. Permanent visual changes would not result in adverse visual effects on County-eligible scenic corridor with implementation of the recommended standard measures (Standard Project measures **PF VIS-1** and **PF VIS-3** through **PF VIS-7**), and Mitigation Measure **VIS-2**.

The majority of the project setting is rural and non-urbanized. As discussed in Section 3.7, *Visual/Aesthetics*, the proposed project would take approximately 4 years to construct, but construction activities would be sporadic, transitory, and short term in nature, and would proceed in segments so that localized impacts would not be concentrated in a given area for a substantial amount of time. Culvert widening and utility relocations would appear similar under all alternatives and would only result in minor visual changes as the modifications are occurring. Therefore, the primary visual changes would result from widening the roadway and installing medians and turn lanes, curbs and gutters, sidewalks along portions of the roadway, stormwater facilities, a bridge over Cajalco Creek, replacement bridge at Temescal Creek, noise barriers, and new street lights and traffic signals at intersections.

The roadway widening would increase the roadway surface area from a two-lane rural roadway to a four-lane roadway and associated turn lanes that is more suburban in nature and would bring

roadway facilities and traffic closer to roadway neighbors. The majority of the project and its alternatives would widen into vacant lands or residential properties, requiring partial acquisitions and the removal of formal and informal landscaping and site features, including mature trees, small trees, and shrubs. However, incorporation of Standard Project Measure **PF VIS-1**, Contouring and Replanting Disturbed Areas, and Mitigation Measure **VIS-2**, Replace or Relocate Site Features and Landscaping Affected by the Project, would address changes in landscaping and site features for affected properties as appropriate and to the degree possible. Roadside grading would have limited areas of cut and fill and would require erosion control measures to vegetate exposed soils. To the extent feasible rock cut slopes shall be irregular where possible for a natural appearance, with rounding of the tops and ends of cut slopes, and steep, obvious cuts and fills shall be avoided to improve project aesthetics associated with roadside slopes. To the extent feasible, replanting of vegetation shall reflect adjacent communities and natural surroundings, serve as a visual buffer for objectionable views of the highway facility for adjacent land uses, soften visual impacts associated with graded slopes and large structures, and act to frame or enhance quality views. These design approaches would minimize visual impacts associated with roadside grading and slopes.

The widened bridge at Temescal Creek under Build Alternatives 1 and 2C would be low profile, but would be constructed partially within the City of Corona El Cerrito Specific Plan area, which includes Scenic Corridor Design Standards for changes within 500 feet of the Cajalco Road right of way (within the specific plan boundary). The proposed project would include Standard Project Measure **PF VIS-6**, Temescal Creek Bridge Design, to ensure consistency with applicable design guidelines specified in Section 14.7.1 of the City of Corona El Cerrito Specific Plan. Refer to Section 3.7, *Visual/Aesthetics,* for Standard Project Measure **PF VIS-6**.

The proposed stormwater basins would result in the most notable visual change because they would result in the partial and full acquisitions, vegetation removal, and removal of residential and commercial properties immediately along the affected portion of Cajalco Road. Removal of development and vegetation on affected parcels would alter the existing visual character of this residential portion of Cajalco Road and would replace it with a large-scale, anthropogenic, geometric stormwater facility that would contrast with the surrounding developed areas to remain.

Between Carpinus Drive and Alexander Street, Cajalco Road would diverge and split into two separate travelways to cross over Cajalco Creek. The westbound lane bridge over the creek would be low profile and would not result in notable visual changes for roadway travelers or nearby sensitive viewers. Furthermore, the project would include Standard Project Measure **PF VIS-7**, New Bridge Architectural Treatments, to ensure that aesthetic treatments would be applied to new bridge structures, consistent with County design and engineering standards. Refer to Section 3.7, *Visual/Aesthetics,* for Standard Project Measure **PF VIS-7**. The eastbound lane culvert would not be very visible, like current conditions. Riparian vegetation removed during construction would be replaced under Standard Project Measure **NC-13 (NES BIO-9)** and Mitigation Measure **NC-15 (NES BIO-14)**, and would naturally recolonize the site within a few years. The widened roadway corridor would not greatly detract from the quality of views and, from this vantage, the widened roadway corridor, sidewalk, and curbs and gutters contribute to a view that appears more intact and unified than existing conditions.

The proposed noise barriers would introduce a much taller, vertical surface near residences where a much shorter, similar structure currently exists, which could degrade the quality of views from residences and local roadways by installing a visual barrier. Incorporation of Standard Project Measure **PF VIS-3**, Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers in the Project Vicinity, would ensure that new noise barriers are visually consistent with existing noise barriers in the project vicinity and that landscaping softens the appearance of the barriers. Refer to Section 3.7, *Visual/Aesthetics,* for Standard Project Measure **PF VIS-3**.

Build Alternatives 1 and 2C would also realign Cajalco Road to the north and move traffic away from the rural residential area that is west of Lake Mathews Drive. This would create a cul-de-sac on Cajalco Road, west of Hollis Lane, and create a new roadway connection between this portion of Cajalco Road and Lake Mathews Drive. Relocating Cajalco Road would not affect views from the existing Cajalco Road, but would create new views that are likely to be scenic from the realigned segments. Views of the realigned portions of Cajalco Road would be visible from nearby residences. Instead of a roadway that follows the existing topography with minimal intrusion, large areas of fill would be created to accommodate the realignment that would be most visible to the residents near the northern end of Lynette Lane, because roadway modifications would come within 390 feet under Build Alternative 1 and 220 feet under Build Alternative 2C. The roadway corridor would stand out in the natural landscape and appear like a major highway imposed upon the landscape rather than a small rural roadway that blends with the landscape. The wildlife exclusion fencing does not stand out in views. Abandoned portions of Cajalco Road would be removed and restored, creating a more natural look where these roadway segments once were. Creating a cul-de-sac along the existing Cajalco Road would not affect visual resources but is likely to improve views for residences by greatly reducing the amount of traffic they can see. The new roadway connection to Lake Mathews Drive would not affect any residences and would result in minimal vegetation removal.

Creating a cul-de-sac along the existing Harley John Road would not affect visual resources but is likely to improve views for residences by greatly reducing the amount of traffic they can see. The realigned connection of Harley John Road to Cajalco Road would go behind the existing residences along Harley John Road, would not affect any residential structures, and would result in minimal vegetation removal. However, the noise proposed barriers would introduce a tall, vertical surface near residences where no such structures currently exist. The noise barrier would also block views of the hills to the south that are likely to be valued by residences and the realigned roadway would increase the visible presence of roadway infrastructure in this immediate area. If the noise barriers are designed without aesthetic consideration, this would degrade the quality of views from residences and local roadways by installing a visual barrier. However, the incorporation of Standard Project Measure **PF VIS-3** would ensure that new noise barriers are visually consistent with existing noise barriers in the project vicinity.

The LM MSHCP area falls within the Open Space VAU, which is primarily undeveloped interspersed with infrastructure associated with the Lake Mathews dam, spillway, access roads and operational facilities, and an occasional rural residence. Build Alternative 1 would follow a portion of the current alignment for Cajalco Road and widen to either side of the roadway onto vacant reserve lands. Several of the existing curves would be realigned, abandoning segments of roadway that would be removed and restored, creating a more natural look where these roadway segments once were. Culvert widening and utility relocations would appear similar under all

alternatives and would only result in minor visual changes as the modifications are occurring. A vehicular bridge that would follow the existing roadway contours of Cajalco Road would be constructed approximately 1 mile west of La Sierra Avenue; however, the bridge would be low profile and would not result in notable visual changes for roadway travelers or nearby sensitive viewers. The widened bridge at Temescal Creek would also be low profile but would affect riparian vegetation along the creek. All riparian vegetation that would be affected and permanently removed during construction would be replaced to aid in returning the site to natural conditions. In addition, riparian vegetation would naturally recolonize the site within a few years and further aid in returning the site to natural conditions.

The proposed project would slightly widen the existing corridor in the Suburban Residential VAU because much of this segment of Cajalco Road was previously widened to four lanes. No vegetation or structures would be affected to accommodate a widened median and new sidewalk. Therefore, visible changes would be very minor.

Widening at the eastern terminus in the Commercial VAU would require the removal of some mature trees along the south side of Cajalco Road near Seaton Avenue to accommodate the slight widening and new sidewalks. Minor grading would also occur near the I-215 overcrossing and the frontage of the 76 Gas Station and Jack in the Box would be needed to accommodate these changes. The incorporation of Standard Project Measure **PF VIS-1** and Mitigation Measure **VIS-2** would address changes in landscaping and site features for affected properties as appropriate and to the degree possible, making these changes largely consistent with the existing visual character and quality of the eastern terminus. Removal of two or three trees right next to the freeway overpass may affect the landscaped freeway designation because vegetation in this area is already sparse and removal may be deemed negative. Mitigation Measure **VIS-8**, Replace Disturbed Vegetation along Landscaped Freeways*,* is proposed to ensure that vegetation removed along this portion of the landscaped freeway is replaced to maintain the existing visual quality of landscaped freeway. Refer to Section 3.7, *Visual/Aesthetics,* for Standard Project Measure **PF VIS-1,** Mitigation Measure **VIS-2**, and Mitigation Measure **VIS-8**. Striping changes west of Temescal Canyon Road would not result in a notable visual change. Widening at the western terminus between Temescal Canyon Road and Temescal Creek would occur on vacant land along the roadway corridor, adjacent to industrial land uses, and would be consistent with the existing visual character and quality of the western terminus. Views of traffic using Cajalco Road from this VAU would not differ compared to current conditions under all build alternatives.

Portions of the alignment would widen into vacant lands; however, the most noticeable visual changes would be where the alignment widens into private properties under all build alternatives. The widening would bring the right of way closer to residents and businesses under all build alternatives. This may create a sense of visual encroachment for properties with structures close to the new right of way or where landscaping would be removed so that views of and from the roadway are now available where views were once more screened. While Mitigation Measure **VIS-2** would relocate or replace landscaping, fencing, and other landscape features to the degree possible, this measure would not be able to reverse the impacts experienced by affected roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor. This measure would also not reduce the effects associated with structures that would be permanently displaced through implementation of the stormwater facilities under Build Alternatives 1 and 2C.

Many properties within the developed portions of the corridor that are along and just outside the right of way would not be affected or would only be slightly affected by the project. Therefore, the removal of structures on affected properties and changes to landscaping, fencing, and other landscape features would not be so great that they would alter the existing visual character of lands adjacent to the project corridor or views of these areas from the project corridor, except for where the stormwater facilities are located.

Build Alternative 2C would realign a segment of Cajalco Road to vacant reserve lands to the south of the existing corridor alignment between the realigned connection of La Sierra Avenue with Cajalco Road and Lake Mathews Drive, whereas Build Alternative 1 would widen the existing alignment with some minor curve reductions. Instead of natural terrain, large areas of cut would be created to accommodate the new alignment. The roadway corridor would stand out in the natural landscape and appear like a major highway imposed upon the landscape. Wildlife exclusion fencing would be visible but would recede in views due to the color treatment and would not stand out in views.

Abandoned portions of Cajalco Road would be removed and restored, creating a more natural look where these roadway segments once were. Relocating Cajalco Road would create new views that are likely to be scenic from the realigned segments. Besides realigning the corridor under Build Alternative 2C, the most notable change is that widening to four lanes would create a roadway that is more suburban than rural in nature.

Overall, roadway widening would increase the roadway surface area from a two-lane rural roadway to a four-lane roadway, with associated turn lanes and sidewalks in some locations, that is more suburban in nature. The proposed project would utilize context-sensitive solutions so that slopes would be gentle, smooth, and well transitioned into the existing adjacent roadside and landforms, avoiding obvious cuts and fills and improving project aesthetics associated with roadside slopes. Therefore, these changes are not likely to affect the quality of views and scenic vistas available from the roadway because views from the roadway would not be greatly altered because there are no structures proposed that would interfere with views and the changes would not degrade the quality of views available from the roadway. The removal of mature trees right next to the freeway overpass may affect the landscaped freeway designation because vegetation in this area is already sparse and removal may be deemed negative. Mitigation Measure **VIS-8** is proposed to address this impact with replacement planting and landscaping. Therefore, impacts would be less than significant with the incorporation of Mitigation Measures **VIS-2** and **VIS-8**.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

Less than Significant

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that the change would not greatly alter the existing visual character and quality of views beyond what has been analyzed for Build Alternatives 1 and 2C. Paving the median to create six lanes would occur within the already modified roadway corridor. Visual changes would be minimal and not substantially degrade the existing visual character or quality of public views, or conflict with zoning or other regulations governing scenic quality.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Less than Significant with Mitigation

The County-eligible scenic roadway portions of Cajalco Road occur only within the LM MSHCP plan area. Therefore, impacts on scenic roadways within the LMR would be the same as those described above for Build Alternatives 1 and 2C; impacts would be less than significant. The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that widening from four to six lanes would not greatly affect scenic corridors beyond what has been analyzed for Build Alternative 2C, above.

Within the LM MSHCP plan area, changes to the existing visual character and quality of views associated with the widening of Cajalco Road would require large areas of cut and fill to accommodate the widening and traverse the undeveloped, hilly terrain. The roadway corridor would stand out more in the natural landscape and appear like a highway rather than a small rural roadway. This is due to landform alterations that would be required to widen the roadway and slightly realign the corridor. Wildlife exclusion fencing would be visible but would recede in views due to the color treatment. This would alter the existing visual character by making roadside cuts more pronounced and degrade the quality of views from the roadway even though the project would be designed so that slopes appear more natural. Roadway widening would increase the roadway surface area from a two-lane rural roadway to a four-lane roadway and associated turn lanes that is more suburban in nature. However, these changes are not likely to affect the quality of views available from this portion of Cajalco Road because views from the roadway will not be greatly altered because there are no structures proposed that would interfere with views and the changes would not degrade the quality of views available from the roadway. In addition, the incorporation of Standard Project Measure **PF VIS-1**, Contouring and Replanting Disturbed Areas, and application of Mitigation Measure **VIS-2**, Replace or Relocate Site Features and Landscaping Affected by the Project, would ensure that vegetation is replanted to help replace some of the vegetation that is affected by the project, helping to maintain the quality of views within the foreground of views available from the roadway. Refer to Section 3.7, *Visual/Aesthetics,* for Standard Project Measure **PF VIS-1** and Mitigation Measure **VIS-2**. Therefore, impacts would be less than significant with the incorporation of Mitigation Measure **VIS-2**.

Build Alternative 4—El Sobrante Alignment

Potentially Significant Impact

Cajalco Road, between I-15 and Harley John Road/Smith Road, and La Sierra Avenue and El Sobrante Road within the limits of Build Alternative 4, are designated County-eligible scenic corridors. As discussed in Section 3.7, *Visual/Aesthetics*, scenic views available from Cajalco Road and El Sobrante Road would not be greatly affected by the proposed widening because the changes would not introduce any structures that would interfere with scenic vista views and would not degrade the quality of views available from the roadway. However, the widening and realignment of La Sierra Avenue under Build Alternative 4 would require large areas of cut and fill to accommodate the widening and to traverse undeveloped, hilly terrain. An approximately 1,800-foot-long arch bridge would also be constructed on realigned La Sierra Avenue,

introducing new bridge infrastructure where none presently exists. While the realignment would be anticipated to provide new scenic views, the views and scenic vistas would contain more human-made features than the existing alignment and be more suburban in nature.

However, these changes would not constitute a substantial visual effect because most views would be transitory (roadway users/motorists); the visible features would lack substantial vertical profile and would not obstruct sightlines to visual resources; and the new bridge, roadway, and support structures would replace an existing graveled roadway. The arch bridge and smaller roadway bridges proposed west of Lake Mathews would further include architectural treatments consistent with County design standards that would lessen potential visual impacts associated with the introduction of the new structures, to the extent possible. These architectural treatments would be applied under Standard Project Measure **PF VIS-7**, New Bridge Architectural Treatments.

Under Build Alternative 4, scenic vista views would not be negatively affected because the proposed project would not introduce features that would block or alter such views. Although views from El Sobrante Road would not be greatly altered, there would be substantial landform alterations along La Sierra Avenue. The large cut slopes and suburban feel of the widened roadway would result in alterations to the visual character and would increase the prominence of roadway infrastructure, which would degrade views associated with the corridor. In addition, under Build Alternative 4, impacts on the MWD Lake Mathews facility would occur because the entrances would be affected by the intersection realignment, as described above, affecting vegetation and fencing. Mitigation Measure **VIS-2** would replace landscape features to the degree possible to reduce the effects experienced by roadway neighbors through the loss of such landscape features and alterations in their views of the project corridor.

Under Build Alternative 4, construction and operation features would be the same as those under Build Alternative 1 along the portion of Cajalco Road between Harley John Road and I-215; Build Alternative 4 would also widen the majority of the roadway alignment within predominantly vacant lands along the length of El Sobrante Road, or residential or commercial properties west of Vista Del Lago Road. Similar to the widening of Cajalco Road for Build Alternatives 1 and 2C, construction would require partial and full acquisition of lands to accommodate the widened roadway and right of way. This would remove formal and informal landscaping and site features, including mature trees, small trees, and shrubs. The incorporation of Standard Project Measure **PF VIS-1**, Contouring and Replanting Disturbed Areas, and application of Mitigation Measure **VIS-2**, Replace or Relocate Site Features and Landscaping Affected by the Project, would address changes in landscaping and site features for affected properties as appropriate and to the degree possible (refer to Section 3.7, *Visual/Aesthetics,* for Standard Project Measure **PF VIS-1** and Mitigation Measure **VIS-2**); however, the widening and realignment of La Sierra Avenue would involve large areas of cut and fill and an approximately 1,800-foot-long arch bridge, introducing new bridge infrastructure where none presently exists. In addition to the bridge, several permanent built elements that do not currently exist within that viewshed would be added to this undeveloped location, including a wide roadway with shoulders, an unpaved median, wildlife corridor fencing, graded roadway shoulders and slopes, and vehicular traffic. This would also remove existing scenic views that are available along the existing roadway alignment of La Sierra Avenue.

Under Build Alternative 4, views toward La Sierra Avenue would be substantially affected by the realigned intersection of La Sierra Avenue and El Sobrante Road. The resulting visual impacts on the existing visual character and quality would be moderate-high under Build Alternative 4. These permanent visual changes would result in adverse visual effects under Build Alternative 4 even with implementation of the recommended standard measures.

The proposed project would include Standard Project Measures **PF VIS-6** and **PF VIS-7** to ensure consistency with applicable design guidelines for the replacement bridge at Temescal Creek, and that aesthetic treatments, such as color and texture, would be applied to new bridge structures. The realignment would be anticipated to provide new scenic views, but the views would contain more human-made features than the existing alignment and be more suburban in nature. Therefore, Build Alternative 4 would result in significant impacts on the existing visual character and quality of views even with incorporation of Standard Project Measures **PF VIS-6** and **PF VIS-7**, and application of Mitigation Measure **VIS-2**, because the measures cannot fully offset the impacts associated with Build Alternative 4, and impacts would be significant and unavoidable.

Future Six-Lane Facility (Build Alternative 4)

Less than Significant Impact

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that changing a median area to a paved median and installing a safety barrier would not greatly alter the existing visual character and quality of views beyond what has been analyzed for Build Alternative 4. Visual changes would be minimal and would not substantially degrade the existing visual character or quality of public views, or conflict with zoning or other regulations governing scenic quality.

Lake Mathews MSHCP (Build Alternative 4)

Potentially Significant Impact

Within the LM MSHCP plan area, the visual character and quality of views available from Cajalco Road and El Sobrante Road within the LMR would not be affected by the proposed widening because the changes would not introduce any structures that would interfere with views and the changes would not degrade the quality of views available from the roadway. However, the widening and realignment of La Sierra Avenue under Build Alternative 4 would require large areas of cut and fill to accommodate the widening and to traverse the undeveloped, hilly terrain that would also require an approximately 1,800-foot-long arch bridge, introducing new bridge infrastructure where none presently exists. In addition to the bridge, several permanent built elements that do not currently exist within that viewshed would be added to this undeveloped location, including a wide roadway with shoulders, an unpaved median, wildlife corridor fencing, graded roadway shoulders and slopes, and vehicular traffic. This would also remove existing scenic views that are available along the existing roadway alignment of La Sierra Avenue. The realignment is likely to provide new views that are scenic, but these views would contain more human-made features than the existing alignment and be more suburban in nature,

altering the character of the roadway. Therefore, Build Alternative 4 would result in significant impacts on the existing visual character and quality of the roadway even with incorporation of Standard Project Measures **PF VIS-6** and **PF VIS-7**, and application of Mitigation Measure **VIS-2**, because the measures cannot fully offset the impacts associated with Build Alternative 4, and impacts would be significant and unavoidable.

4.2.1(d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Build Alternatives 1, 2C, and 4

Less than Significant with Mitigation

As discussed in Section 3.7, *Visual/Aesthetics*, impacts related to light and glare would be the same or very similar under all build alternatives. Evening and nighttime construction activities would require the use of bright lights but County staff, working with contractors, would make sure that no lighting is aimed toward homes and businesses consistent with Caltrans standard specifications.

The proposed project would result in a nominal increase in daytime glare by increasing the paved area and removing some of the roadside vegetation that provides shade along the project corridor. However, the pavement would be dark and greatly reduce glare. Within the rural residential and suburban residential areas, roadside trees associated with residences would still be present along the right of way to provide some shade. In addition, implementing Mitigation Measure **VIS-2**, Replace or Relocate Site Features and Landscaping Affected by the Project, would replace vegetation on affected properties and reduce glare. Therefore, the proposed project would not create a new source of substantial glare that would negatively affect daytime or nighttime views in the area. Implementation of Standard Project Measure **PF VIS-4** is identified to address the effects associated with street lighting and ensure that project light and glare would not result in adverse visual effects.

Improving existing traffic signals along Cajalco Road and installing new traffic signals at Cowan Road/Gustin Road, within the Rural Residential VAU, would add an inconsequential amount of light to the project area. These lights are proposed for safety purposes at intersections and are not proposed for the length of the alignment. If not properly designed, new and relocated street lighting proposed along the project corridor at intersections could negatively affect nearby roadway neighbors. However, Standard Project Measure **PF VIS-4**, Apply Minimum Lighting Standards, would ensure that lighting is designed to reduce impacts. In particular, Standard Project Measure **PF VIS-4** would ensure that blue-rich white light lamps (BRWL) light-emitting diode (LED) lighting is not used and shielding is provided. The use of BRWL LED lighting can negatively affect humans by increasing nuisance light and glare, in addition to increasing ambient light glow, if proper shielding is not provided and BRWL are used (American Medical Association 2016; International Dark-Sky Association 2010a, 2010b, 2015). Studies indicate that a 4,000-Kelvin (K) white LED light causes approximately 2.5 times more light pollution than high-pressure sodium lighting with the same lumen output, which would affect sensitive receptors and more than double the perceived brightness of the night sky (Aubé et al. 2013; Falchi et al. 2011, 2016). This would result in a substantial source of nighttime light and glare that would negatively affect nighttime views in the area if lighting is not properly designed and

shielding is not employed. This would also result in a substantial source of nighttime light and glare that could negatively affect nighttime views in the area. Such impacts would also occur within the Open Space VAU from relocating the traffic signals and lights at the Cajalco Road intersection with La Sierra Avenue if BRWL LED is used. Mitigation Measure **VIS-2** and the incorporation of Standard Project Measure **PF VIS-4** would ensure that light and glare associated with street lighting would be addressed under all build alternatives. Refer to Section 3.7, *Visual/Aesthetics*, for Mitigation Measure **VIS-2** and Standard Project Measure **PF VIS-4**. Therefore, impacts would less than significant with the incorporation of Mitigation Measure **VIS-2**.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that the change from four to six lanes would not greatly alter light and glare beyond what has been analyzed for the build alternatives, above. Under all four-lane alternatives, the median would be grass and/or low-growing, non-invasive plant species and would not be paved. Paving the median to create six lanes would occur within the already modified roadway corridor and would not affect visual resources beyond changing the median area to a paved median and likely installing a safety barrier to separate directional travelways. Changes to light and glare would be minimal.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The proposed project would result in a nominal increase in daytime glare by increasing the paved area and by removing some of the roadside vegetation that provides shade along the project corridor. However, the pavement would be dark and greatly reduce glare. Improving existing traffic signals along Cajalco Road within the LM MSHCP would add an inconsequential amount of light to the project area. New traffic signals at the realigned intersection of El Sobrante Road with La Sierra Avenue/main Metropolitan Water District of Southern California (MWD) Lake Mathews facility entrance and the new intersection of El Sobrante and Harley John Road could negatively affect nearby roadway neighbors if not properly designed and LED lighting is used. The incorporation of Standard Project Measure **PF VIS-4** would ensure that light and glare associated with street lighting would be addressed under all build alternatives. Therefore, impacts would be less than significant and mitigation would not be required.

4.2.2 Agriculture and Forest Resources

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project; and the forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.				
Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☒	☐
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☒	☐
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

The information and analyses in this section are based on Sections 3.1, *Land Use*, and 3.2, *Farmland,* of this EIR/EIS, and the *Community Impact Assessment* and *Errata* (Caltrans 2018c, 2021).

4.2.2(a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

Build Alternatives 1 and 2C

Less than Significant Impact

The Department of Conservation (DOC) Farmland Mapping and Monitoring Program (FMMP), identifies approximately 2,869 acres of Important Farmland within a 0.5-mile radius of the proposed project, as indicated in Table 3.2-1 and shown on Figure 3.2-1. This includes

approximately 61 acres of Prime Farmland, 281 acres of Unique Farmland, 83 acres of Farmland of Statewide Importance, and 2,444 acres of Farmland of Local Importance.

Impacts on mapped farmland were evaluated using the United States Department of Agriculture "Farmland Conversion Impact Rating" (Form NRCS CPA 106, EIR/EIS Appendix I), which was completed in coordination with the Natural Resources Conservation Service. Consistent with 7 Code of Federal Regulations (CFR) §658.2(a), lands committed to urban development (existing and planned roadway right of way, and urban development) and water storage were not factored into the total farmland impacts of each build alternative.[1]

Build Alternatives 1 and 2C would involve temporary construction disturbance and easements, and permanent right of way and easements, affecting lands designated as Unique Farmland and Farmland of Local Importance. Build Alternative 1 would result in the permanent conversion of 7.69 acres of important farmland composed of 0.19 acre of Unique Farmland and 7.5 acres of Farmland of Local Importance, and temporary use of 10.8 acres of important farmland composed of 0.82 acre of Unique Farmland and 9.97 acres of Farmland of Local Importance, during construction. Build Alternative 2C would result in the permanent conversion of 7.85 acres of important farmland composed of 0.19 acre of Unique Farmland and 7.66 acres of Farmland of Local Importance, and temporary use of 10.8 acres composed of 0.82 acre of Unique Farmland and 9.98 acres of Farmland of Local Importance, during construction. This represents less than 0.5 percent of all the important farmland in the study area for all build alternatives. The total site assessment ratings for Build Alternatives 1 and 2C are 90, and are below the threshold score of 160.[2] Compensation to individual landowners for property impacts would be addressed and negotiated through the right of way acquisition process, as warranted (refer to Standard Project Measures **PF COM-1** in Section 3.4, *Community Impacts*).

Most temporary project activities within areas designated as farmland would occur within areas that currently front existing roadways and are not actively farmed. Standard Project Measure **PF FA-1** would ensure access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway. In addition, Standard Project Measure **PF FA-2** would ensure areas temporarily occupied during construction are returned to conditions that would allow for continued use and function as farmland following construction.

Build Alternatives 1 and 2C would result in the conversion of 0.19 acre of Unique Farmland to non-agricultural use, but would not affect FMMP Prime Farmland or Farmland of Statewide Importance.

Given the limited percentage of important farmland that would be converted within the study area, viability and quantity of the remaining farmland of affected properties for agricultural use, and total assessment rating comparative to the threshold score, impacts would be less than significant. No mitigation is required.

[1] 7 CFR 658.2(a). Lands committed to urban development for future roadway per City and County zoning and General Plans, and lands committed to urban development for water storage, utilities, and commercial and residential development, per County zoning.

[2] Projects sites receiving a total score of less than 160 need not be given further consideration for protection, and no further evaluation is required under the Farmland Protection Policy Act (CFR 658.4(c)(2)).

Future Six-Lane Facility (Build Alternatives 1 and 2C)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that no additional right of way would be required that would involve farmland resources.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

No Impact

Under Build Alternatives 1 and 2C, portions of Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. Areas identified as FMMP important farmland occur within the LM MSHCP and LMR; however, as discussed in Section 3.2, *Farmlands*, of the EIR/EIS, the LM MSHCP does not allow for land uses that are not directly associated with management of the LMR or Lake Mathews reservoir and dam facilities. As such, lands within the LM MSHCP and LMR are not currently used for farming purposes. Furthermore, much of the land within the LM MSHCP and LMR is committed to water storage and therefore not included as farmland per 7 CFR §658.2(a). Therefore, no impacts would occur and no mitigation is required.

Build Alternative 4—El Sobrante Alignment

Less than Significant Impact

Build Alternative 4 would result in the permanent conversion of 23.44 acres of important farmland composed of 0.47 acre of Prime Farmland, 3.08 acres of Unique Farmland, 0.99 acre of Farmland of Statewide Importance, and 18.89 acres of Farmland of Local Importance. During construction, 9.86 acres of important farmland composed of 0.05 acre of Prime Farmland, 2.42 acres of Unique Farmland, 0.96 acre of Farmland of Statewide Importance, and 6.43 acres of Farmland of Local Importance would be used temporarily. This represents less than 0.5 percent of all the important farmland in the study area for all build alternatives. The total site assessment rating for Build Alternative 4 is 130, below the threshold score of 160. Compensation to individual landowners for property impacts would be addressed and negotiated through the right of way acquisition process, as warranted (refer to Standard Project Measure **PF COM-2** in Section 3.4, *Community Impacts*). Standard Project Measure **PF FA-1** would further ensure access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway. In addition, Standard Project Measure **PF FA-2** would ensure farmland areas temporarily occupied during construction are returned to conditions that would allow for continued use and function as farmland following construction.

Under Build Alternative 4, 4.79 acres of Williamson Act land would be permanently acquired and incorporated into the transportation system and 2.12 acres of Williamson Act land would be temporarily acquired during construction. Section 51291 of the Williamson Act requires notification to the Director of Conservation and the local governing body responsible for the administration of agricultural preserves of the intended acquisition of lands within an agricultural preserve or property restricted by Williamson Act contract for public use. Because Build

Alternative 4 is one of three build alternatives under consideration for the proposed project, the Director of the DOC was notified of potential acquisition of lands under Williamson Act contract.[3] The notification is included in Appendix I of this EIR/EIS. If Build Alternative 4 is identified as the preferred alternative, a second notice would be provided to DOC within 10 working days following acquisition of the properties Because Build Alternative 4 would not exceed the state threshold of 100 acres of Williamson Act contract cancellations, it would not result in a significant impact on Williamson Act lands (CEQA Guidelines Section 15206).

Given the limited percentage of important farmland and Williamson Act land that would be converted within the study area, viability and quantity of the remaining farmland of affected properties for agricultural use, and total assessment rating comparative to the threshold score, impacts would be less than significant. No mitigation is required.

Future Six-Lane Facility (Build Alternative 4)

No Impact

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that no additional right of way would be required that would involve farmland resources.

Lake Mathews MSHCP (Build Alternative 4)

No Impact

Under Build Alternative 4, Cajalco Road, La Sierra Avenue, and El Sobrante Road would be expanded and realigned within the LM MSHCP area and LMR. Areas identified as FMMP important farmland occur within the LM MSHCP and LMR; however, as discussed in Section 3.2, *Farmlands*, of the EIR/EIS, the LM MSHCP does not allow for land uses that are not directly associated with management of the LMR or Lake Mathews reservoir and dam facilities. As such, lands within the LM MSHCP and LMR are not currently used for farming purposes. Furthermore, much of the land within the LM MSHCP and LMR is committed to water storage and therefore not included as farmland per 7 CFR §658.2(a). Therefore, no impacts would occur and no mitigation is required.

4.2.2(b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

Build Alternatives 1 and 2C

No Impact

Build Alternatives 1 and 2C would not affect any Williamson Act land; therefore, there would be no impact. No mitigation is required.

[3] The County of Riverside serves as the local governing body responsible for administration of the contracts listed in Table 3.2-3.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that no additional right of way would be required that would involve farmland resources.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

No Impact

Build Alternatives 1 and 2C within the LM MSHCP would not affect any Williamson Act land; therefore, there would be no impact. No mitigation is required.

Build Alternative 4—El Sobrante Alignment

Less than Significant Impact

Under Build Alternative 4, 4.79 acres of Williamson Act land would be permanently acquired and incorporated into the transportation system and 2.12 acres of Williamson Act land would be temporarily acquired during construction. Because Build Alternative 4 would not exceed the state threshold of 100 acres of Williamson Act contract cancellations, and the remaining farmland of affected properties would continue to be available for agricultural use, a significant impact on Williamson Act lands (CEQA Guidelines Section 15206) would not occur.

Given the limited percentage of important farmland and Williamson Act land that would be converted within the study area, impacts would be less than significant. No mitigation is required.

Future Six-Lane Facility (Build Alternative 4)

No Impact

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that no additional right of way would be required that would involve farmland resources.

Lake Mathews MSHCP (Build Alternative 4)

No Impact

Build Alternative 4 within LM MSHCP would not affect any Williamson Act land; therefore, there would be no impact. No mitigation is required.

4.2.2(c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

Build Alternatives 1, 2C, and 4

No Impact

The project study area is devoid of timberland, forest land, and timberland zoned Timberland Production; therefore, the proposed project would not affect timberland or forestry resources.

4.2.2(d) Result in the loss of forest land or conversion of forest land to non-forest use?

Build Alternatives 1, 2C, and 4

No Impact

The project study area is devoid of timberland, forest land, and timberland zoned Timberland Production; therefore, the proposed project would not affect timberland or forestry resources.

4.2.2(e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

Build Alternatives 1, 2C, and 4

No Impact

The proposed project would involve transportation facility improvements and include the construction of appurtenant facilities such as drainage basins, culverts, and bridges. No additional potential impacts involving farmland resources beyond those discussed under 4.2.2(a) and 4.2.2(b) would be anticipated.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that no additional right of way would be required that would involve farmland resources.

4.2.3 Air Quality

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.				
Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☐	☒
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	☐	☐	☒	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	☐	☐	☒	☐

This section is based on information from Section 3.14, *Air Quality*, and the *Air Quality Study Report* technical report prepared for the project (Caltrans 2017b).

CEQA Guidelines §15125 indicate that existing conditions at the time a Notice of Preparation is released or when environmental review begins normally constitute the baseline for environmental analysis. In 2010, the California Supreme Court issued an opinion holding that while lead agencies have some flexibility in determining what constitutes the baseline, relying on "hypothetical allowable conditions" when those conditions are not a realistic description of the conditions without the project, would be an illusory basis for a finding of no significant impact from the project and, therefore, a violation of CEQA (*Communities for a Better Environment v. South Coast Air Quality Management District* (2010) 48 Cal. 4th 310).

On August 5, 2013, the California Supreme Court decided *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (57 Cal. 4th 439). This latest decision has clarified that, under certain circumstances, a baseline may reflect future, rather than existing, conditions. The rule specifies that factual circumstances can justify an agency departing from that norm in the following circumstances, when such reasons are supported by substantial evidence.

- When necessary to prevent misinforming or misleading the public and decision-makers.
- When the use of future conditions in place of existing conditions is justified by unusual aspects of the project or surrounding conditions.

With respect to the proposed project, using existing conditions to evaluate criteria pollutant impacts would misrepresent and mislead the public and decision-makers with respect to potential air quality impacts, for the following reasons: (1) changes in on-road emission factors, and (2) net project vehicle miles traveled (VMT) reductions.

1. On-road vehicle emissions rates are anticipated to experience reductions in the future due to (a) continuing engine advancements, (b) more stringent air quality regulations, and (c) the retirement of older, more-polluting vehicles from the service population fleet. Quantifying

emissions utilizing current vehicle emissions rates would not only represent a fictitious scenario, but would also overestimate emissions reductions and potential air quality benefits achieved by the project.

2. Using the relatively higher "existing conditions" emissions factors to quantify emissions reduction benefits assorted with project-related VMT reductions in the years 2024 and 2044 would overstate the project's emissions reduction benefits.

These facts represent substantial evidence in support of using a future conditions analysis, rather than existing conditions, to evaluate air quality impacts. Accordingly, for the purposes of this analysis, the CEQA assessment evaluates project emissions under opening (2024) and design (2044) year conditions, compared to the future no project alternative. This approach reflects appropriate vehicle fleet characteristics and emission factors. Using future year conditions as the basis for the CEQA analysis avoids misinforming and misleading the public and decision-makers with respect to air quality impacts, consistent with current CEQA case law.

4.2.3(a) Conflict with or obstruct implementation of the applicable air quality plan?

Build Alternatives 1 and 2C

No Impact

The project lies within the Riverside County portion of the South Coast Air Basin (SCAB), which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). SCAQMD is required, pursuant to the federal Clean Air Act, to reduce emissions of criteria pollutants for which the SCAB is in nonattainment. SCAQMD's most recent plan to achieve air quality standards is the 2016 Air Quality Management Plan (AQMP).

The 2016 AQMP was adopted by the SCAQMD Governing Board on March 3, 2017. The 2016 AQMP outlines comprehensive control strategies to meet particulate matter (PM) 2.5 microns or less in diameter (PM2.5), ozone, and lead standards and to maintain carbon monoxide (CO), nitrogen dioxide (NO_2), and PM 10 microns or less in diameter (PM10) standards. These strategies are based, in part, on the regional population, housing, and employment projections (and related transportation-source emissions) prepared by the region's cities and counties and adopted by the Southern California Association of Governments (SCAG). Projects that propose development that is consistent with the growth anticipated in the relevant land use plans and transportation plans used in the formulation of the AQMP are therefore considered to be consistent with the AQMP. The governing transportation planning documents relevant to the project area are the SCAG 2020–2045 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) and the SCAG 2021 Federal Transportation Improvement Program (FTIP).

A project would conflict with or obstruct implementation of a regional air quality plan if it would be inconsistent with the growth assumptions of the plan. Build Alternatives 1 and 2C are included in SCAG's 2020–2045 RTP/SCS under Project ID 3A04WT137 and SCAG's 2021 FTIP under Project ID RIV090903. On June 5, 2020, FHWA found that the RTP/SCS conformed to the State Implementation Plan (SIP). The SCAG 2021 FTIP was determined to conform by

FHWA and the Federal Transit Administration on April 16, 2021.[4] Because the proposed project is included as proposed in both the SCAG 2020–2045 RTP/SCS and the 2021 FTIP, which were found to conform to the SIP responsible for attaining and maintaining compliance with air quality standards, the proposed project would not conflict with or obstruct implementation of an air quality plan. No impact would result.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

Less than Significant Impact

The future six-lane facility has not been planned and programmed as part of the SCAG RTP/SCS or FTIP, and would need to be included in these documents in order to comply with regional transportation conformity requirements.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

No Impact

The entire LM MSHCP area is within the SCAB. The SCAG RTP/SCS and FTIP and SCAQMD AQMP have been developed to ensure that the SCAB conforms with the SIP. Given that Build Alternatives 1 and 2C have been included in the 2020–2045 RTP/SCS under Project ID 3A04WT137 and SCAG's 2021 FTIP under Project ID RIV090903, the portion of Build Alternatives 1 and 2C within the LM MSHCP boundary would not conflict with or obstruct implementation of the applicable air quality plan. No impact would result.

Build Alternative 4—El Sobrante Alignment

No Impact

The project's regional conformity determination requirements have been satisfied for Build Alternatives 1 and 2C. In the event that Build Alternative 4 is identified as the preferred alternative, the FTIP description would need to be revised to accurately describe the improvements on Cajalco Road, La Sierra Avenue, and El Sobrante Road, and the SCAG regional model would need to be updated. Although the Build Alternative 4 alignment differs from the description included in the SCAG RTP/SCS and FTIP, it is anticipated that there would be no conflict with or obstruction of the applicable air quality plan. Build Alternative 4 is likely to result in greater numbers of area roadway users accessing the regional highway network via State Route 91 (SR-91) from La Sierra Avenue than under Build Alternatives 1 and 2C, which would involve more travel along Cajalco Road to I-15. However, Build Alternative 4 is not

[4] The project is currently described in the 2021 FTIP as "CAJALCO RD. WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON RD. TO HARVILL AVE AND FROM 4 TO 6 LANES FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND A BRIDGE RECONSTRUCTION OVER A WATER CROSSING." The County of Riverside has submitted an amendment that would update the description as follows: "IN RIVERSIDE COUNTY ON CAJALCO RD - WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON. BRIDGE/EAGLE CANYON ROAD TO HARVILL AVE AND FROM 4 TO 6 LANES WITH THREE LANES IN THE WESTBOUND DIRECTION FROM TEMESCAL CANYON RD TO TEMESCAL CANYON BRIDGE, THREE LANES IN THE EASTBOUND DIRECTION FROM TEMESCAL CANYON ROAD TO JUST EAST OF EAGLE CANYON ROAD, AND THREE LANES EASTBOUND AND WESTBOUND FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND THE CONSTRUCTION OF NEW, AND RECONSTRUCTION OF EXISTING, BRIDGES AS NEEDED." This amendment will be obtained prior to adoption of the Final Environmental Document.

anticipated to alter the overall regional emissions analysis substantially. Therefore, no impact is anticipated.

Future Six-Lane Facility (Build Alternative 4)

Less than Significant Impact

The future six-lane facility has not been planned and programmed as part of the SCAG RTP/SCS or FTIP, and would need to be included in these documents in order to comply with regional transportation conformity requirements.

Lake Mathews MSHCP (Build Alternative 4)

No Impact

As discussed above, the LM MSHCP area is within the SCAB, and the SCAG RTP/SCS and FTIP and SCAQMD AQMP are responsible for ensuring that SCAB conforms with the SIP. In the event that Build Alternative 4 is identified as the preferred alternative, the FTIP description would need to be revised to accurately describe the improvements on Cajalco Road, La Sierra Avenue, and El Sobrante Road, and the SCAG regional model would need to be updated. Despite the anticipated increase of area roadway users accessing the regional highway network via SR-91 from La Sierra Avenue relative to the other build alternatives, regional emissions are not expected to change substantially and the portion of Build Alternative 4 within the LM MSHCP boundary would not conflict with or obstruct implementation of the applicable air quality plan. No impact would result.

4.2.3(b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

Operation

As discussed in Chapter 3, Section 3.14, *Air Quality*, and shown in Table 4.2-1, regional increases in operational emissions would occur under Build Alternative 1 (for CO), Build Alternative 2C (for CO, nitrogen oxides [NO_X], and PM10), and Build Alternative 4 (for CO) relative to the No-Build Alternative at Opening Year 2024. At Horizon Year 2044, there would be increases in reactive organic gases (ROG), CO, and NO_X under Build Alternative 1, an increase in CO under Build Alternative 2C, and an increases in ROG, CO, and NO_X under Build Alternative 4. However, such increases would not exceed the regional thresholds developed for the purposes of bringing the SCAB into attainment.

Table 4.2-1. Project Area Mobile-Source Emissions

Evaluation Scenario	Criteria Pollutant Emissions in Pounds per Day				
	ROG	CO	NO_X	PM10	PM2.5
Existing Year 2014	1,356	30,327	13,189	201	191
Opening Year 2024

Increase/(Decrease) Compared to Existing	(1,810)	(19,244)	(10,406)	(171)	(163)
Increase/(Decrease) Compared to No-Build Alternative	4	95	29	0	0
SCAQMD Regional Significance Threshold	**55**	**550**	**55**	**150**	**55**

With respect to the potential for localized CO and PM hotspots to occur under Build Alternatives 1, 2C, and 4, Section 3.14, *Air Quality*, includes the qualitative step-by-step screening procedure identified in the CO Protocol and the U.S. Environmental Protection Agency's PM hot-spot analysis guidance. As detailed in Section 3.14, each of the build alternatives would result in increased truck traffic and additional delay at some study area intersections. However, for CO, both background CO concentrations and traffic volumes under Build Alternatives 1, 2C, and 4 would be lower than the attainment demonstration intersections included in the 2003 AQMP. For PM, the SCAG Transportation Conformity Working Group during its Tuesday, May 23, 2017, meeting concurred with the determination that the project was not a project of air quality concern and would not require a quantitative PM hot-spot analysis.

Based on the minor increases in criteria and precursor pollutants and that hot-spot screening procedures for CO and PM indicate that localized impacts would not occur, Build Alternatives 1, 2C, and 4 would not violate any air quality standard or contribute substantially to an existing or projected air quality violation. Impacts would be less than significant.

Construction

As discussed in Section 3.14, *Air Quality*, construction is anticipated to begin in 2023 and would last approximately 4 years. Temporary construction emissions would result from grubbing/land clearing, grading/excavation, drainage/subgrade construction, paving, and the commuting patterns of construction workers. Pollutant emissions would vary daily depending on the level of activity, specific operations, and prevailing weather. Daily emissions of criteria pollutants and precursor pollutants for each stage of construction are shown in Table 4.2-2. As shown therein, emissions would not exceed the SCAQMD regional and localized thresholds during any phase of construction. Maximum daily regional mass emissions would be 5 pounds of ROG, 53 pounds of CO, 50 pounds of NO_X, 13 pounds of PM10, and 4 pounds of PM2.5. Maximum daily onsite emissions during the construction period would be 5 pounds of ROG, 48 pounds of CO, 47 pounds of NO_X, 10 pounds of PM10, and 4 pounds of PM2.5. Construction-period impacts related to violating air quality standards or contributing substantially to an existing or projected air quality violation would be less than significant. The project would comply with Standard Project Measures **PF AQ-1** and **PF AQ-2** identifying Caltrans Standard Specification 14-9.02, which specifies that all air-pollution-control rules, regulations, ordinances, and statutes will be followed. One such rule, SCAQMD Rule 403 (**PF AQ-2**), requires control of fugitive dust emissions during earth-moving activities and construction/demolition activities, and for any surface area through heavy- and light-duty vehicular movement or other means. California Code of Regulations Title 13, Section 2449(d)(3), further restricts idling of construction vehicles to no longer than 5 consecutive minutes.

Table 4.2-2. Estimate of Criteria Pollutant Emissions during Construction (pounds per day)

Construction Phase	ROG	CO	NO_X	PM10	PM2.5
Grubbing and Clearing	1	13	9	11	2
Grading/Excavation	5	53	50	13	4
Drainage/Utilities/Sub-Grade	3	34	27	11	3
Paving	2	21	16	1	1
Daily Maximum Regional Emissions	5	53	50	13	4
SCAQMD Regional Emissions Daily Significance Threshold	75	550	100	150	55
Daily Maximum Onsite Emissions	5	48	47	10	4
SCAQMD Localized Significance Threshold	N/A[a]	1,700	270	12	8

Source: Calculated by ICF; detailed calculation assumptions are provided in Appendix B to the August 2017 *Air Quality Impact Report*.
[a] ROG emissions have no SCAQMD Localized Emissions Threshold; SCAQMD Source Receptor Area 22, 5-acre site, 25-meter receptor distance.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project.

The future six-lane facility has not been planned and programmed as part of the SCAG RTP/SCS or FTIP, and would need to be included in these documents in order to comply with regional transportation conformity requirements. For project-level conformity, the future six-lane facility would require interagency consultation with the Transportation Conformity Working Group to determine whether or not the future six-lane facility would be considered a project of air quality concern. The project would also be required to demonstrate that it does not result in the creation of criteria pollutant hot-spots.

Estimated emissions of regional criteria pollutant and precursor pollutant emissions from mobile sources in the project area are shown in Table 4.2-3. Emissions estimates are based on VMT and speed profile data projected under the six-lane future facility and are compared to emissions that would occur under the build alternatives at the Horizon Year 2044. The future six-lane facility is compared to the corresponding Horizon Year 2044 build alternatives because the future six-lane facility would not be implemented until a later date and would only occur after the construction of the selected build alternative. As such, the 2044 build alternative scenarios are the appropriate baseline for comparison. As shown in Table 4.2-3, operational emissions are expected to be greater under the six-lane future facility when compared to the corresponding build alternatives, but the increases would not exceed any current regional standards set for bringing the region into attainment.

Table 4.2-3. Project Area Mobile-Source Emissions for Future Six-Lane Facility (2044)

	Criteria Pollutant Emissions in Pounds per Day				
Evaluation Scenario	**ROG**	**CO**	**NO_X**	**PM10**	**PM2.5**
Horizon Year 2044					
Future Six-Lane Facility (Build Alternative 1/2C)	**488**	**11,138**	**2,806**	**30**	**28**
Increase/(Decrease) Compared to 2044 Build Alternative 1	4	64	28	< 1	< 1
Future Six-Lane Facility (Build Alternative 4)	**488**	**11,164**	**2,822**	**31**	**29**
Increase/(Decrease) Compared to 2044 Build Alternative 4	5	81	41	< 1	< 1
SCAQMD Regional Significance Threshold	**55**	**550**	**55**	**150**	**55**

Table 4.2-4 shows the comparison of estimated mobile source air toxic (MSAT) emissions in the project area, which are expected to be similar under the future six-lane facility and the corresponding build alternative. Any increases would be due to the projected increases in VMT. Substantial reductions in MSAT emissions are estimated to occur relative to Existing Year 2014 due to the retirement of older vehicles.

Table 4.2-4. Comparison of Years 2014 and 2044 MSAT Emissions for Future Six-Lane Facility (in Pounds per Day)

MSAT Pollutant	Existing Year 2014	Horizon Year 2044			
		Build Alternative 1	6-Lane Future Facility (Alternative 1/2C)	Build Alternative 4	6-Lane Future Facility (Alternative 4)
Benzene	45	16	16	16	16
Acrolein	2	1	1	1	1
Acetaldehyde	42	17	18	17	18
Formaldehyde	96	39	39	39	39
Butadiene	9	3	3	3	3
Naphthalene	1	1	1	1	1
POM	2	1	1	1	1
Diesel PM	174	12	12	12	12
DEOG	479	207	209	207	209
Regional VMT	8,585,371	14,779,906	14,843,301	14,811,302	14,893,944

The future six-lane facility would involve air pollutant emissions from construction equipment use, material movement, and worker commute trips. Construction activities anticipated for the future six-lane facility would include clearing, grading and paving, and temporary staging for the segment of Cajalco Road between Temescal Canyon Road and La Sierra Avenue under Build Alternative 1 or 2C, or for the segments of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and Harley John Road under Build Alternative 4. Because the roadway areas represent less than half of the overall length and project area associated with the build alternatives, construction-period emissions are anticipated to be less than that identified for the build alternatives shown in Table 4.2-4. Similarly, construction-period MSAT emissions under the future six-lane facility are anticipated to be less than construction-period emissions under the build alternatives.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Emissions within the LM MSHCP would be a subset of the overall construction-period and operational emissions resulting from implementation of Build Alternatives 1, 2C, and 4. Therefore, impacts related to violating air quality standards or contributing substantially to an existing or projected air quality violation would be less than significant.

4.2.3(c) Expose sensitive receptors to substantial pollutant concentrations?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

Some population groups, such as children, the elderly, and acutely and chronically ill persons, especially those with cardio-respiratory diseases, are considered more sensitive to air pollution than others. Caltrans considers schools, medical centers and similar health care facilities, child care facilities, and parks and playgrounds to be sensitive land uses. There are no sensitive land uses present within 500 feet of any of the proposed build alternatives.

Construction activities would result in the short-term generation of emissions in the immediate vicinity from the use of heavy-duty construction equipment, material movement trips, and worker commute trips. Additional indirect emissions may result from temporary delays in roadway operation during the construction period; such emissions would be minimized through compliance with Standard Project Measures **PF AQ-1**, **PF AQ-2**, and **PF LU-1**, which include Caltrans' Standard Specification 14-9.02, SCAQMD Rule 403, and the implementation of a Traffic Management Plan (TMP). The construction emissions analysis assumed a 25-meter receptor distance to assess the potential effects of construction activities on residences, which SCAQMD recommends as the receptor distance to use for uses adjacent to construction activities. As shown in Table 4.2-2, onsite emissions would not exceed localized thresholds.

Following the construction period, operational emissions associated with roadway operations would include tailpipe emissions as well as re-entrained road dust from vehicles operating in the project vicinity. The build alternatives would also result in indirect changes to traffic patterns in the area, which would change the location of a portion of emissions, with some intersections and roadway segments anticipated to see more vehicular travel than under the No-Build Alternative. Although emissions of some pollutants would increase under the build alternatives (as indicated in Table 4.2-1), these emissions increases would be throughout the project region, and emissions increases in specific locations would be a small proportion of any projected increases. Thus, the build alternatives would not expose sensitive receptors to substantial pollutant concentrations, and impacts would be less than significant.

Health-Based Effects for Project-Generated Pollutants of Human Health Concern

In December 2018, the California Supreme Court issued its decision in *Sierra Club v. County of Fresno* (226 Cal.App.4th 704) (hereafter referred to as the Friant Ranch Decision). The case reviewed the long-term, regional air quality analysis contained in the EIR for the proposed Friant Ranch development. The Friant Ranch project is a 942-acre master-plan development in unincorporated Fresno County within the San Joaquin Valley Air Basin, an air basin currently in nonattainment for the ozone and particulate matter 2.5 microns or less in diameter National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS). The Court found that the air quality analysis was inadequate because it failed to provide enough detail "for the public to translate the bare [criteria pollutant emissions] numbers provided into adverse health impacts or to understand why such a translation is not possible at this time." The Court's decision clarifies that environmental documents must connect a project's air quality impacts to specific health effects or explain why it is not technically feasible to perform such an analysis.

As discussed in Table 3.14-3, all criteria pollutants that would be generated by the proposed project are associated with some form of health risk (e.g., asthma and other respiratory tract effects). Criteria pollutants can be classified as either regional or localized pollutants. Regional pollutants can be transported over long distances and affect ambient air quality far from the emissions source. Localized pollutants affect ambient air quality near the emissions source. Ozone and nitrogen dioxide are considered regional criteria pollutants, whereas CO, sulfur dioxide, and lead are localized pollutants. PM can be both a local and a regional pollutant, depending on its composition. As discussed above, the primary criteria pollutants of concern in the study area are ozone (including ROG and NO_X), CO, and PM (including diesel particulate matter, or DPM).

Regional Project-Generated Criteria Pollutants (Ozone Precursors and Regional PM)

Adverse health effects induced by regional criteria pollutant emissions generated by the proposed project (ozone precursors and PM) are highly dependent on a multitude of interconnected variables (e.g., cumulative concentrations, local meteorology and atmospheric conditions, the number and character of exposed individuals [e.g., age, gender]). For these reasons, ozone precursors (ROG and NO_X) contribute to the formation of ground-borne ozone on a regional scale, where emissions of ROG and NO_X generated in one area may not equate to a specific ozone concentration in that same area. Similarly, some types of particulate pollutants may be transported over long distances or formed through atmospheric reactions. As such, the magnitude and locations of specific health effects from exposure to increased ozone or regional PM concentrations are the product of emissions generated by numerous sources throughout a region, as opposed to a single individual project.

Models and tools have been developed to correlate regional criteria pollutant emissions to potential community health impacts. While there are models capable of quantifying ozone and secondary PM formation and associated health effects, these tools were developed to support regional planning and policy analysis and have limited sensitivity to small changes in criteria pollutant concentrations induced by individual projects. Therefore, translating project-generated criteria pollutants to the locations where specific health effects could occur or the resultant number of additional days of nonattainment cannot be estimated with a high degree of accuracy.

Technical limitations of existing models to correlate project-level regional emissions to specific health consequences are recognized by air quality management districts throughout the state, including the San Joaquin Valley Air Pollution Control District and SCAQMD, both of which provided *amici curiae* briefs for the Friant Ranch legal proceedings. In its brief, San Joaquin Valley Air Pollution Control District (2015) acknowledges that while health risk assessments for localized air toxics, such as DPM, are commonly prepared, "it is not feasible to conduct a similar analysis for criteria air pollutants because currently available computer modeling tools are not equipped for this task." The air district further notes that emissions solely from the Friant Ranch project (which equate to less than one-tenth of 1 percent of the total NO_X and volatile organic compounds [VOC] in the Valley) is not likely to yield valid information, and that any such information should not be "accurate when applied at the local level." SCAQMD (2015) presents similar information in its brief, stating that "it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels."[5]

As discussed above, air districts develop region-specific CEQA thresholds of significance in consideration of existing air quality concentrations and attainment or nonattainment designations under the NAAQS and CAAQS. The NAAQS and CAAQS are informed from the findings of a wide range of scientific evidence that demonstrates that there are known safe concentrations of criteria pollutants. While recognizing that air quality is a cumulative problem, air districts typically consider projects that generate criteria pollutant and ozone precursor emissions below these thresholds to be minor in nature and to not adversely affect air quality such that the NAAQS or CAAQS would be exceeded. Emissions generated by the project could increase

[5] For example, SCAQMD's analysis of its 2012 Air Quality Attainment Plan showed that modeled NO_X and ROG reductions of 432 and 187 tons per day, respectively, only reduced ozone levels by 9 parts per billion. Analysis of SCAQMD's Rule 1315 showed that emissions of NO_X and ROG of 6,620 and 89,180 pounds per day, respectively, contributed to 20 premature deaths per year and 89,947 school absence (SCAQMD 2015).

photochemical reactions and the formation of tropospheric ozone and secondary PM, which at certain concentrations could lead to increased incidence of specific health consequences. Although these health effects are associated with ozone and particulate pollution, the effects are a result of cumulative and regional emissions. As such, a project's incremental contribution cannot be traced to specific health outcomes on a regional scale, and a quantitative correlation of project-generated regional criteria pollutant emissions to specific human health impacts is not included in this analysis. However, given that project-related emissions would not exceed SCAQMD regional significance thresholds, increased incidence of specific health consequences are expected to be less than significant.

Localized Project-Generated Criteria Pollutants (PM and CO)

Localized pollutants generated by a project are deposited near the emissions source. Because these pollutants are not transported over long distances and do not undergo complex photochemical or atmospheric reactions, emissions from individual projects can result in direct and material health impacts on adjacent sensitive receptors. Models and thresholds are readily available to quantify these potential health effects and evaluate their significance. Furthermore, it should be noted that the NAAQS and CAAQS are health-protective standards and define the maximum amount of ambient pollution that can be present without harming public health. SCAQMD's Localized Significance Thresholds (LSTs) represent the level of pollutant emissions from onsite sources from a project that would not exceed the most stringent applicable federal or state ambient air quality standards. As such, projects with emissions below the applicable LSTs will not be in violation of the NAAQS or CAAQS or health-protective standards developed by the California Air Resources Board (ARB) and the U.S. Environmental Protection Agency.

As shown in Table 3.14-14, construction-period emissions of pollutants would not exceed applicable SCAQMD LSTs. Following the construction period, emissions of localized pollutants would be generated throughout the project area related to the combustion of fuel from vehicles using project area roadways. Given that vehicles would generate emissions throughout the project area, no major concentrations of localized pollutants are anticipated, which is supported by the CO and PM screening procedures conducted for the project. As summarized in Section 3.14, *Air Quality*, emissions of localized pollutants were not projected to result in the generation of hot spots. Therefore, there would be no violations of the health-protective CAAQS and NAAQS, and impacts would be less than significant.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and Harley John Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project.

Estimated emissions of regional criteria pollutant and ozone precursor pollutant emissions from mobile sources in the project area are shown in Table 3.14-12. As discussed above, technical limitations prevent accurate correlation of project-related regional pollutant emissions to specific health outcomes. However, given that emissions increases would not be substantial and no

exceedances of the NAAQS or CAAQS are anticipated, impacts related to increased incidence of specific health consequences would be less than significant. Additional analysis would be required to demonstrate that implementation of the future six-lane facility would not result in the creation of localized criteria pollutant hot spots.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Emissions within the LM MSHCP would be a subset of the overall construction-period and operational emissions resulting from implementation of the build alternatives. Therefore, impacts related to violating air quality standards or contributing substantially to an existing or projected air quality violation would be less than significant.

4.2.3(d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

The project is not anticipated to result in adverse effects related to emissions, such as those leading to odors. Some phases of construction, particularly asphalt paving, would result in short-term odors in the immediate area of each paving site. Such odors would be quickly dispersed below detectable thresholds as distance from the site increases. Project operation would not create objectionable odors. Impacts from objectionable odors would be less than significant.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

It is anticipated that emissions, including those leading to odors, would be generated in minor concentrations in the construction of the future six-lane facility. However, these impacts would be temporary and would not adversely affect a substantial number of people.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Emissions, including those leading to odors, would be generated in minor concentrations in the LM MSHCP area during the construction period, particularly during the paving period. However, these impacts would be temporary and would not adversely affect a substantial number of people.

4.2.4 Biological Resources

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife, U.S. Fish and Wildlife Service, or NOAA Fisheries?	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☒	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☒	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☒	☐	☐	☐

The information and analyses in this section are based on the final Natural Environment Study (NES) prepared for the project (Caltrans 2018d), the preliminary Jurisdictional Delineation (JD) prepared for the project (Caltrans 2018e), the JD impacts memorandum (Appendix L of the NES), and the following sections of the EIR/EIS:

- Section 3.17, *Natural Communities*
- Section 3.18, *Wetlands and Other Waters*
- Section 3.19, *Plant Species*
- Section 3.20, *Animal Species*
- Section 3.21, *Threatened and Endangered Species*
- Section 3.22, *Invasive Species*

The discussion of the sensitive biological resources present in the Biological Study Area (BSA), impacts under Build Alternatives 1, 2C, and 4, and the avoidance, minimization, and mitigation measures to address the significant effects from the project on sensitive biological resources are provided in Sections 3.17 through 3.22.

Existing Conditions

The 43 vegetation communities/land types that occur within the BSA are described in detail in Section 3.17, *Natural Communities*. Eight of the vegetation communities are classified as natural communities of concern by the California Department of Fish and Wildlife (CDFW): Riversidian sage scrub (RSS), Riversidian alluvial fan sage scrub (RAFSS), coast live oak woodland, southern coast live oak riparian forest, southern cottonwood-willow riparian forest, southern riparian forest, southern willow scrub, and coast and valley freshwater marsh. Over 4,990 acres occur within the BSA, of which approximately 2,227 acres are conserved lands owned/managed by the Riverside County Habitat Conservation Authority (RCHCA), MWD, Western Riverside County Regional Conservation Authority (RCA), and Riverside-Corona Resource Conservation District.

In addition, aquatic resources that are jurisdictional under the United States Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and CDFW occur throughout the Jurisdictional Study Area (JSA). These aquatic resources are discussed in detail in Section 3.18, *Wetlands and Other Waters*, and are illustrated on Figures 3.18-1 and 3.18-2.

The proposed project also occurs within the boundaries of the WRC MSHCP and is a covered project under Section 7.2.2 (Circulation Element Roads) of the WRC MSHCP. The WRC MSHCP provides take coverage for numerous special-status (listed and non-listed) plants and wildlife species. The BSA occurs within the Narrow Endemic Plant Species Survey Area and Criteria Area Species Survey for several plant species (detailed in Section 3.19, *Plant Species*). The project is within the burrowing owl survey area and is subject to the WRC MSHCP riparian/riverine and vernal pool policy (refer to Section 6.1.2 of the WRC MSHCP Volume I). As a covered activity, compliance with WRC MSHCP Volume I, Section 7.5.1 (Guidelines for the Siting and Design of Planned Roads within the Criteria Area and Public/Quasi-public Lands), 7.5.2 (Guidelines for Construction of Wildlife Crossings), 7.5.3 (Construction Guidelines) and Appendix C (Standard Best Management Practices) is required.

As described in Section 3.17, *Natural Communities*, a large portion of the proposed project between Temescal Wash and Harley John Road is composed of open space areas that provide "live-in" habitat for numerous species across the landscape. The landscape within the areas west of Harley John Road is largely composed of open space bounded by existing roads; diverse topographical conditions, including flats and canyons; riparian corridors; and relatively low levels of human use. The density of residential development increases and the proximity to open space decreases along Cajalco Road between Harley John Road and I-215. The WRC MSHCP Cores and Linkages within the proposed project area are Existing Core C, Proposed Extension of Existing Core 2, and Proposed Linkage 3. Existing roadways and roadway features with potential to influence Cores and Linkages (i.e., habitat connectivity) include Cajalco Road, La Sierra Avenue, El Sobrante Road, and Harley John Road, all of which are composed of two-lane, undivided minor arterial and major collector roads that lack wildlife fencing, dedicated wildlife crossings, median barriers, and standard shoulders. Details for existing wildlife movement

through the BSA are provided in Section 3.17.2.5. The proposed project also occurs within the boundaries of the long-term Stephens' kangaroo rat (SKR) Habitat Conservation Plan (HCP), which occurs entirely within the WRC MSHCP area. The proposed project overlaps the SKR HCP Core Reserve. Take coverage within the SKR Core Reserve (RCHCA SKR Reserve and LMR lands) would be provided through the SKR HCP.

As described in Section 3.17, *Natural Communities*, the project also occurs within the LM MSHCP area. The project is not a covered activity under the LM MSHCP and would directly affect conserved resources within the LM MSHCP area. Specific impacts on biological resources potentially within the LM MSHCP area are also analyzed for each resource, below. Refer to the introduction to Chapter 3, *Affected Environment, Environmental Consequences, and Avoidance, Minimization, Mitigation Measures*; Section 3.1, *Land Use*; and Section 3.17, *Natural Communities*, for details of the LM MSHCP.

Special-status species documented within the BSA, or that would potentially be affected by the proposed project based on presence of suitable habitat in the BSA, include:

Plant Species (refer to Section 3.19)

- Coulter's Matilija poppy (California Rare Plant Rank [CRPR] 4.2)
- Long-spined spineflower (CRPR rank 1B.2)
- Small-flowered morning glory (CRPR rank 4.2)
- Paniculate tarplant (CRPR 4.2)

Animal Species (refer to Section 3.20)

- Burrowing owl (California Species of Concern [CSC])
- Southern California legless lizard (CSC)
- California glossy snake (CSC)
- Coast western patch-nosed snake (CSC)
- Two-striped garter snake (CSC)
- Least bittern (CSC)
- Long-eared owl (CSC)
- Short-eared owl (CSC)
- Vaux's swift (CSC)
- Clark's marsh wren (CSC)
- Oregon vesper sparrow (CSC)
- Yellow-headed blackbird (CSC)
- Southern grasshopper mouse (CSC)
- American badger (CSC)
- Western yellow bat (CSC)

- Western mastiff bat (CSC)
- Pallid bat (CSC)
- Big free-tail bat (CSC)
- Pocketed free-tailed bat (CSC)

Threatened and Endangered Species (refer to Section 3.21)

- Arroyo toad (federally listed as endangered and CSC)
- Coastal California gnatcatcher (federally listed as threatened)
- Least Bell's vireo (federally and state-listed as endangered)
- Stephens' kangaroo rat (federally listed as endangered and state-listed as threatened)

There are numerous additional plant and wildlife species which are fully covered under the WRC MSHCP that are present or potentially present within the BSA but were not specifically evaluated for impacts because they are already afforded take coverage under the WRC MSHCP. These species are fully described in Section 3.19, *Plant Species*; Section 3.20, *Animal Species*; and Section 3.21, *Threatened and Endangered Species*, of this document and Section 4.6.6 of the NES.

For each biological resource, an evaluation of the impacts within the LM MSHCP area is also provided. LM MSHCP target species that have no special regulatory status are discussed in detail in Section 4.7 and 5.10 of the NES and Section 3.17, *Natural Communities*, of this document.

Invasive species (both plant and animal) were documented throughout the BSA, particularly within disturbed areas. Refer to Table 3.22-1 and Table 3.22-2 in Section 3.22, *Invasive Species*.

4.2.4(a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife, U.S. Fish and Wildlife Service, or NOAA Fisheries?

The evaluation of impacts for all special-status species (i.e., those species protected under the federal Endangered Species Act [FESA], California Endangered Species Act [CESA], CRPR by the California Native Plant Society, or that are LM MSHCP target species and WRC MSHCP covered) are discussed below for each build alternative. Direct impacts (i.e., permanent and temporary impacts) on special-status species were based on the assumption that loss of suitable habitat would result in adverse effects on specific special-status species. Direct impacts on special-status species were therefore calculated by totaling impact acreages of natural vegetation communities that provide suitable habitat for each plant and animal species. This project is outside of National Marine Fisheries Service (NMFS) jurisdiction; therefore, an NMFS species list is not required and no effects on NMFS species are anticipated.

Build Alternative 1—Cajalco Alignment

Less than Significant with Mitigation

Build Alternative 1 would result in direct adverse impacts on the following special-status species due to loss of suitable habitat:

Non-Listed Animal Species

Refer to Section 3.20, *Animal Species*, for details on the direct effects on non-listed animal species. Suitable habitat for the following species would be affected under Build Alternative 1:

- Burrowing owl: 253.24 acres (211.11 acres permanent, 42.13 acres temporary) direct impacts; 0.58 acre indirect shading effects as described in Table 3.20-2.
- Special-status bats: 295.06 acres (241.30 acres permanent, 53.76 acres temporary) direct impacts on suitable foraging habitat; 1.35 acres indirect shading effects on foraging habitat as described in Table 3.20-3.
- Southern California legless lizard: 103.34 acres (87.45 acres permanent, 15.89 acres temporary) direct impacts; 0.70 acre indirect shading effects as described in Table 3.20-4.
- California glossy snake: 223.61 acres (194.55 acres permanent, 29.06 acres temporary) direct impacts, 0.52 acre shading effects as described in Table 3.20-4.
- Coast western patch-nosed snake: 223.61 acres (194.55 acres permanent, 29.06 acres temporary) direct impacts; 0.52 acre indirect shading effects as described in Table 3.20-4.
- Two-striped garter snake: 11.30 acres (7.18 acres permanent, 4.12 acres temporary) direct impacts; 0.40 acre indirect shading effects as described in Table 3.20-4.
- Least bittern: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) direct impacts as described in Table 3.20-4.
- Long-eared owl: 14.56 acres (9.39 acres permanent, 5.17 acres temporary) direct impacts; 0.35 acre indirect shading effects as described in Table 3.20-4.
- Short-eared owl: 134.94 acres (116.76 acres permanent, 18.18 acres temporary) direct impacts; 0.22 acre indirect shading effects as described in Table 3.20-4.
- Vaux's swift: 8.07 acres (4.99 acres permanent, 3.08 acres temporary) direct impacts; 0.31 acre indirect shading effects as described in Table 3.20-4.
- Clark's marsh wren: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) direct impacts as described in Table 3.20-4.
- Oregon vesper sparrow: 183.03 acres (147.92 acres permanent, 35.11 acres temporary) direct impacts; 0.57 acre indirect shading effects as described in Table 3.20-4.
- Yellow-headed blackbird: 1.53 acres (0.94 acre permanent, 0.59 acre temporary) direct impacts as described in Table 3.20-4.
- Southern grasshopper mouse: 76.37 acres (69.19 acres permanent, 7.18 acres temporary) direct impacts; 0.26 acre indirect shading effects as described in Table 3.20-4.

- American badger: 199.78 acres (176.41 acres permanent, 23.37 acres temporary) direct impacts; 0.45 acre indirect shading effects as described in Table 3.20-4.

Furthermore, construction of Build Alternative 1 would remove portions of the roadbed along the existing Cajalco Road and restore portions of the existing roadbed and the right of way, resulting in a beneficial effect on burrowing owl (8.61 acres), special-status bats (9.29 acres), southern California legless lizard (3.08 acres), California glossy snake (8.81 acres), coast western patch-nosed snake (8.81 acres), two-striped garter snake (0.07 acre), long-eared owl (0.38 acre), short-eared owl (5.80 acres), Vaux's swift (0.06 acre), Oregon vesper sparrow (5.89 acres), southern grasshopper mouse (3.01 acres), and American badger (8.65 acres). Refer to Section 3.20, *Animal Species*, for details on the direct effects on non-listed animal species.

In addition to direct effects, the construction and operation of Build Alternative 1 would contribute to indirect effects on special-status animals such as edge effects, degraded quality of habitat through introduction and spread of invasive species, increased risk of fire to open space lands, and spread of toxics or pollutants from construction equipment or vehicles.

In addition, the 16 non-listed special-status animals described in Section 3.20, A*nimal Species*, that would be directly affected by Build Alternative 1 are fully covered under the WRC MSHCP; therefore, no additional analysis is required under Build Alternative 1.

The following measures have been incorporated into Build Alternative 1 to address these adverse impacts:

- **NC-1 (NES BIO-1)**: Seasonal Vegetation Clearing Restrictions
- **NC-2 (NES BIO-2)**: Dust Control
- **NC-3 (NES BIO-3)**: Fire Prevention
- **NC-4 (NES BIO-4)**: Environmental Awareness Training
- **NC-5 (NES BIO-5)**: Biological Monitoring
- **NC-6 (NES BIO-6)**: ESA Fencing
- **NC-7 (NES BIO-7)**: Invasive Species Removal
- **NC-8 (NES BIO-8)**: Cleaning Construction Equipment
- **NC-9 (NES BIO-24)**: Disposal of Trash
- **NC-10 (NES BIO-10)**: Water Pollution and Erosion Control Plans
- **NC-11 (NES BIO-11)**: Defining the Limits of Disturbance
- **NC-12 (NES BIO-12)**: Placement of Construction Equipment
- **NC-13 (NES BIO-9)**: Post-construction Hydro-seeding
- **AS-1 (NES BIO-25)**: Burrowing Owl Management Plan
- **AS-2 (NES BIO-16)**: Lighting Restrictions
- **AS-3 (NES BIO-28)**: Preconstruction Wildlife Surveys
- **AS-4 (NES BIO-26)**: Bat Management Plan

- **AS-5 (NES BIO-27)**: Nesting Bird Management Plan
- **AS-6 (NES BIO-29)**: Pet Policy
- **AS-7 (NES BIO-20)**: ESA Fencing

Measures **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12)** are required to ensure full compliance with the WRC MSHCP. Measure **NC-13 (NES BIO-9)** would ensure all temporary impact areas are restored. Measures **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)** will ensure potential direct effects on special-status species are avoided and/or minimized. With the implementation of the measures identified above, potential effects on non-listed special-status animals would be reduced to a less-than-significant level under CEQA.

Non-Listed Plant Species

Three non-listed plant species would be directly removed during construction of Build Alternative 1: long-spined spineflower, small-flowered morning glory, and paniculate tarplant. The direct effects on long-spined spineflower and small-flowered morning glory are fully covered under the WRC MSHCP; therefore, no additional analysis is required under Build Alternative 1. Refer to Section 3.19, *Plant Species*, for details on the direct effects on non-listed plants.

Although Build Alternative 1 would potentially affect a few individuals of paniculate tarplant, these impacts are not considered significant under CEQA because this species is fairly common regionally. There are no other non-listed plants that would be directly affected during construction of Build Alternative 1. In addition, Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** described for non-listed animals would also address potential indirect effects on non-listed plants that may occur adjacent to the LOD. Impacts on non-listed plant species are considered less than significant under CEQA.

Threatened and Endangered Species

Suitable habitat for the following species would be affected under Build Alternative 1:

- Arroyo toad: 11.82 acres (8.08 acres permanent, 3.74 acres temporary) direct impacts; 0.41 acre indirect shading effects as described in Table 3.21-4.
- Coastal California gnatcatcher: 74.69 acres (67.09 acres permanent, 7.60 acres temporary) direct impacts; 0.22 acre indirect shading effects as described in Table 3.21-5.
- Least Bell's vireo: 12.63 acres (7.85 acres permanent, 4.78 acres temporary) direct impacts; 0.36 acre indirect shading effects as described in Table 3.21-4.
- Stephens' kangaroo rat: 144.78 acres (125.29 acres permanent, 19.49 acres temporary) direct impacts; 0.22 acre indirect shading effects as described in Table 3.21-4.

These species are all fully covered under the WRC MSHCP; however, there are species-specific survey requirements for least Bell's vireo where suitable habitat is present, and for SKR within the RCHCA-owned conserved lands (SKR Core Reserve).

Furthermore, construction of Build Alternative 1 would remove portions of the roadbed along the existing Cajalco Road and restore the removed roadbed and the right of way, resulting in a

beneficial effect on coastal California gnatcatcher (2.85 acres), least Bell's vireo (0.07 acre), and SKR (5.80 acres). Refer to Section 3.21, *Threatened and Endangered Species*, for details on the direct effects on threatened and endangered species.

In addition to direct effects, the construction and operation of Build Alternative 1 would contribute to indirect effects on special-status animals such as edge effects, degraded quality of habitat through introduction and spread of invasive species, increased risk of fire to open space lands, and spread of toxics or pollutants from construction equipment or vehicles.

The following mitigation measures have been incorporated into Build Alternative 1 to address these adverse impacts:

- **TE-1 (NES BIO-18)**: Noise Reduction for Equipment
- **TE-2 (NES BIO-23)**: Replacement of Least Bell's Vireo Habitat
- **TE-3 (NES BIO-30)**: Stephens' Kangaroo Rat Management Plan

Mitigation Measure **TE-1 (NES BIO-18)** would address avoidance of direct effects on least Bell's vireo and **TE-2 (NES BIO-23)** would address compensatory requirements for impacts on suitable habitat for the species. Measure **TE-3 (NES BIO-30)** would create a management plan for SKR within the SKR Core Reserve area. In addition to the measures above, the measures identified above for non-listed species would also be implemented. Measures **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12)** would be implemented to ensure compliance with the WRC MSHCP, **NC-13 (NES BIO-9)** would address replacement of native vegetation within temporarily affected areas, and **AS-2 (NES BIO-16)** through **AS-6 (NES BIO-29)** would avoid and/or minimize direct effects on listed species. Implementation of **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **AS-2 (NES BIO-16)** through **AS-6 (NES BIO-29)**, and **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)** would reduce any significant effects to a less-than-significant level under CEQA.

Lake Mathews MSHCP (Build Alternative 1)

Less than Significant with Mitigation

There were a total of 65 LM MSHCP target species evaluated for potential effects based on the presence of suitable habitat within the LM MSHCP boundary. The LM MSHCP target species with special regulatory status that could potentially be affected based on presence of suitable habitat within Build Alternative 1, and are discussed above, are burrowing owl, special-status bats, long-eared owl, southern grasshopper sparrow, and American badger. There are other LM MSHCP target species that are fully covered under the WRC MSHCP or species that have no special regulatory status (e.g., Great Valley phacelia) that may potentially be affected under Build Alternative 1. Refer to Chapter 4 of the NES and Sections 3.17, 3.19, 3.20, and 3.21 of this document for details pertaining to LM MSHCP target species.

The LM MSHCP tracks suitable habitat for target species in three general categories (Nonnative Grassland, Riversidian Sage Scrub, and Riparian); therefore, impacts within the LM MSHCP are

presented using these categories.[6] LM MSHCP target species utilize these vegetation community associations for feeding, breeding, shelter, or movement. Therefore, impacts on LM MSHCP target species are based on the project's effects on these broad vegetation classifications within the LM MSHCP area (refer to Table 3.17-8 for the impact details on LM MSHCP target species):

- Nonnative Grassland: 91.86 acres permanent impact and 14.24 acres temporary impact
- Riversidian Sage Scrub: 22.96 acres permanent impact and 3.08 acres temporary impact
- Riparian: 5.49 acres permanent impact and 3.47 acres temporary impact

Removal of roadbed would potentially restore 0.14 acre of habitat for LM MSHCP target species, which would be a beneficial effect. In addition to direct effects, the construction and operation of Build Alternative 1 would contribute to indirect effects on LM MSHCP target species such as edge effects, degraded quality of habitat through introduction and spread of invasive species, increased risk of fire to open space lands, and spread of toxics or pollutants from construction equipment or vehicles.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** and **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)** identified above would also be applicable within the LM MSHCP area. In addition, the impacts on natural communities within the LM MSHCP area would require the following compensatory mitigation to address the effects on suitable habitat (including natural communities of concern) for LM MSHCP target species:

- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area

The minimum compensatory requirements for LM MSHCP target species is 141.24 acres (120.31 acres replacement and 20.79 acres restoration) under Build Alternative 1 (refer to Table 3.17-19 for additional details for each vegetation community association). Full replacement/restoration of natural vegetation communities within the LM MSHCP area and funding endowment will ensure biological equivalency and offset the loss of lands within the LM MSHCP. Therefore, these effects would be reduced to a less-than-significant level under CEQA.

Build Alternative 2C

Less than Significant with Mitigation

As discussed in Chapter 3, Build Alternative 2C would result in direct adverse impacts on special-status species as follows.

Non-Listed Animal Species

Suitable habitat for the following species would be affected under Build Alternative 2C:

[6] The natural vegetation communities presented in in Section 3.17 were broadly categorized into three vegetation classifications (Nonnative Grassland, Riversidian Sage Scrub, and Riparian) to align with how the LM MSHCP tracks target species habitat for the purposes of presenting impacts on LM MSHCP resources.

- Burrowing owl: 272.24 acres (226.96 acres permanent, 45.28 acres temporary) direct impacts; 1.18 acres indirect shading effects as described in Table 3.20-2.
- Special-status bats: 313.66 acre (256.76 acres permanent, 56.90 acres temporary) direct impacts on suitable foraging habitat; 1.93 acres indirect shading effects on foraging habitat as described in Table 3.20-3.
- Southern California legless lizard: 112.50 acres (96.02 acres permanent, 16.48 acres temporary) direct impacts; 1.01 acres indirect shading effects as described in Table 3.20-4.
- California glossy snake: 227.18 acres (195.77 acres permanent, 31.41 acres temporary) direct impacts, 1.12 acres shading effects as described in Table 3.20-4.
- Coast western patch-nosed snake: 227.18 acres (195.77 acres permanent, 31.41 acres temporary) direct impacts, 1.12 acres shading effects as described in Table 3.20-4.
- Two-striped garter snake: 9.93 acres (5.77 acres permanent, 4.16 acres temporary) direct impacts; 0.39 acre indirect shading effects as described in Table 3.20-4.
- Least bittern: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) direct impacts as described in Table 3.20-4.
- Long-eared owl: 13.51 acres (8.41 acres permanent, 5.10 acres temporary) direct impacts; 0.38 acre indirect shading effects as described in Table 3.20-4.
- Short-eared owl: 144.02 acres (123.33 acres permanent, 20.69 acres temporary) direct impacts; 0.50 acre indirect shading effects as described in Table 3.20-4.
- Vaux's swift: 7.57 acres (4.43 acres permanent, 3.14 acres temporary) direct impacts; 0.34 acre indirect shading effects as described in Table 3.20-4.
- Clark's marsh wren: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) direct impacts as described in Table 3.20-4.
- Oregon vesper sparrow: 176.32 acres (139.36 acres permanent, 36.96 acres temporary) direct impacts; 0.84 acre indirect shading effects as described in Table 3.20-4.
- Yellow-headed blackbird: 17.57 acres (16.27 acres permanent, 1.30 acres temporary) direct impacts as described in Table 3.20-4.
- Southern grasshopper mouse: 87.45 acres (79.56 acres permanent, 7.89 acres temporary) direct impacts; 0.58 acre indirect shading effects as described in Table 3.20-4.
- American badger: 202.43 acres (176.75 acres permanent, 25.68 acres temporary) direct impacts; 1.06 acres indirect shading effects as described in Table 3.20-4.

Furthermore, construction of Build Alternative 1 would remove portions of the roadbed along the existing Cajalco Road, which would restore the existing roadbed and the right of way, resulting in a beneficial effect on burrowing owl (12.26 acres), special-status bats (12.85 acres), southern California legless lizard (3.44 acres), California glossy snake (12.38 acres), coast western patch-nosed snake (12.38 acres), two-striped garter snake (0.06 acre), long-eared owl (0.37 acre), short-eared owl (9.00 acres), Vaux's swift (0.05 acre), Oregon vesper sparrow (9.08 acres), southern grasshopper mouse (3.38 acres), and American badger (12.30 acres).

In addition to direct effects, the construction and operation of Build Alternative 2C would contribute to indirect effects on special-status animals such as edge effects, degraded quality of habitat through introduction and spread of invasive species, increased risk of fire to open space lands, and spread of toxics or pollutants from construction equipment or vehicles.

In addition, the 16 non-listed special-status animals described in Section 3.20, *Animal Species*, that would be directly affected by Build Alternative 2C are fully covered under the WRC MSHCP; therefore, no additional analysis for these species is required under Build Alternative 2C.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** and **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)** under Build Alternative 1 would also apply for Build Alternative 2C and would address adverse impacts. With the implementation of the measures identified above, potential effects on non-listed special-status animals would be reduced to a less-than-significant level under CEQA.

Non-Listed Plant Species

Four non-listed plant species would be directly removed during construction of Build Alternative 2C: round-leaved filaree, long-spined spineflower, small-flowered morning glory, and paniculate tarplant. The direct effects on long-spined spineflower and small-flowered morning glory are fully covered under the WRC MSHCP. The direct effects on four individuals of round-leaved filaree would occur outside of the WRC MSHCP Criteria Area and it is fully covered under the WRC MSHCP; therefore, no additional analysis is required under Build Alternative 2C for these species. Refer to Section 3.19, *Plant Species*, for details on the direct effects on non-listed plants.

Although Build Alternative 2C would potentially affect a few individual paniculate tarplants, these impacts are not considered significant under CEQA because this species is fairly common regionally. There are no other non-listed plants that would be directly affected during construction of Build Alternative 2C. In addition, Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** described for non-listed animals would also address potential indirect effects on non-listed plants that may occur adjacent to the LOD. Impacts on non-listed plant species are considered less than significant under CEQA.

Threatened and Endangered Species

Suitable habitat for the following species would be affected under Build Alternative 2C:

- Arroyo toad: 10.43 acres (6.66 acres permanent, 3.77 acres temporary) direct impacts; 0.39 acre indirect shading effects as described in Table 3.21-4.
- Coastal California gnatcatcher: 84.33 acres (76.21 acres permanent, 8.12 acres temporary) direct impacts; 0.56 acre indirect shading effects as described in Table 3.21-5.
- Least Bell's vireo: 11.24 acres (6.43 acres permanent, 4.81 acres temporary) direct impacts; 0.34 acre indirect shading effects as described in Table 3.21-4.
- Stephens' kangaroo rat: 137.83 acres (116.53 acres permanent, 21.30 acres temporary) direct impacts; 0.50 acre indirect shading effects as described in Table 3.21-4.

These species are all fully covered under the WRC MSHCP; however, there are species-specific survey requirements for least Bell's vireo where suitable habitat is present, and for SKR within the RCHCA-owned conserved lands (SKR Core Reserve).

Furthermore, construction of Build Alternative 2C would remove portions of the roadbed along the existing Cajalco Road and restore the removed roadbed and the right of way, resulting in a beneficial effect on coastal California gnatcatcher (3.30 acres), least Bell's vireo (0.05 acre), and SKR (9.00 acres). Refer to Section 3.21, *Threatened and Endangered Species*, for details on the direct effects on threatened and endangered species.

The indirect effects from construction and operation of Build Alternative 2C would be the same as those identified under Build Alternative 1.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **AS-2 (NES BIO-16)** through **AS-7 (NES BIO-20)**, and **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)** under Build Alternative 1 would also apply for Build Alternative 2C and would address adverse impacts on threatened and endangered species. Measures **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12)** would be implemented to ensure compliance with the WRC MSHCP, Measure **NC-13 (NES BIO-9)** would address replacement of native vegetation within temporarily affected areas, and Measures **AS-2 (NES BIO-16)** through **AS-6 (NES BIO-29)** would avoid and/or minimize direct effects on listed species. In addition, Mitigation Measure **TE-1 (NES BIO-18)** would address avoidance of direct effects on least Bell's vireo and **TE-2 (NES BIO-23)** would address compensatory requirements for impacts on suitable habitat for the species. Measure **TE-3 (NES BIO-30)** would create a management plan for SKR within the SKR Core Reserve area. With the implementation of **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **AS-2 (NES BIO-16)** through **AS-6 (NES BIO-29)**, and **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)** (identified under Build Alternative 1), any significant effects on threatened and endangered species would be reduced to a less-than-significant level under CEQA.

Lake Mathews MSHCP (Build Alternative 2C)

Less than Significant with Mitigation

There were a total of 65 LM MSHCP target species evaluated for potential effects based on the presence of suitable habitat within the LM MSHCP boundary. The LM MSHCP target species with special regulatory status that could potentially be affected based on presence of suitable habitat within Build Alternative 2C, and are discussed above, are burrowing owl, special-status bats, long-eared owl, southern grasshopper sparrow, and American badger. There are also numerous other LM MSHCP target species that are fully covered under the WRC MSHCP or species that have no special regulatory status (e.g., Great Valley phacelia) that may potentially be affected under Build Alternative 2C. Refer to Chapter 4 of the NES and Sections 3.17, 3.19, 3.20, and 3.21 of this document for details pertaining to LM MSHCP target species.

The LM MSHCP tracks suitable habitat for target species in three general categories (Nonnative Grassland, Riversidian Sage Scrub, and Riparian); therefore, impacts on the LM MSHCP are presented using these categories. LM MSHCP target species utilize these vegetation community associations for feeding, breeding, shelter, or movement. Therefore, impacts on LM MSHCP target species are based on the project's effects on these broad vegetation classifications within

the LM MSHCP area (refer to Table 3.17-8 for the impact details on LM MSHCP target species):

- Nonnative Grassland: 72.17 acres permanent impact and 15.44 acres temporary impact
- Riversidian Sage Scrub: 35.36 acres permanent impact and 3.68 acres temporary impact
- Riparian: 3.67 acres permanent impact and 3.33 acres temporary impact

Removal of roadbed would potentially restore 0.16 acre of habitat for LM MSHCP target species, which would be a beneficial effect. In addition to direct effects, the construction and operation of Build Alternative 2C would contribute to indirect effects on LM MSHCP target species such as edge effects, degraded quality of habitat through introduction and spread of invasive species, increased risk of fire to open space lands, and spread of toxics or pollutants from construction equipment or vehicles.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** and **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)** identified above would also be applicable within the LM MSHCP area. In addition, the impacts on natural communities within the LM MSHCP area would require the following compensatory mitigation to address the effects on suitable habitat (including natural communities of concern) for LM MSHCP target species:

- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area

The minimum compensatory requirements for LM MSHCP target species is 134.53 acres (111.21 acres replacement and 22.44 acres restoration) under Build Alternative 2C (refer to Table 3.17-8 for additional details for each vegetation community association). Full replacement/restoration of natural vegetation communities within the LM MSHCP area and funding endowment will ensure biological equivalency and offset the loss of lands within the LM MSHCP. Therefore, these effects would be reduced to a less-than-significant level under CEQA.

Build Alternative 4—El Sobrante Alignment

Less than Significant with Mitigation

Build Alternative 4 would result in direct adverse impacts on the following special-status species due to loss of suitable habitat.

Non-Listed Animal Species

Suitable habitat for the following species would be affected under Build Alternative 4:

- Burrowing owl: 240.22 acres (201.28 acres permanent, 38.94 acres temporary) direct impacts; 3.97 acres indirect shading effects as described in Table 3.20-2.
- Special-status bats: 264.41 acre (216.37 acres permanent, 48.04 acres temporary) direct impacts on suitable foraging habitat; 5.16 acres indirect shading effects on foraging habitat as described in Table 3.20-3.

- Southern California legless lizard: 117.39 acres (103.11 acres permanent, 14.28 acres temporary) direct impacts; 4.13 acres indirect shading effects as described in Table 3.20-4.
- California glossy snake: 175.77 acres (149.72 acres permanent, 26.05 acres temporary) direct impacts, 4.02 acres shading effects as described in Table 3.20-4.
- Coast western patch-nosed snake: 175.77 acres (149.72 acres permanent, 26.05 acres temporary) direct impacts, 4.02 acres shading effects as described in Table 3.20-4.
- Two-striped garter snake: 7.40 acres (5.08 acres permanent, 2.32 acres temporary) direct impacts; 0.39 acre indirect shading effects as described in Table 3.20-4.
- Least bittern: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) direct impacts as described in Table 3.20-4.
- Long-eared owl: 9.72 acres (6.36 acres permanent, 3.36 acres temporary) direct impacts; 0.38 acre indirect shading effects as described in Table 3.20-4.
- Short-eared owl: 70.18 acres (54.95 acres permanent, 15.23 acres temporary) direct impacts; 0.28 acre indirect shading effects as described in Table 3.20-4.
- Vaux's swift: 3.99 acres (2.42 acres permanent, 1.57 acres temporary) direct impacts; 0.35 acre indirect shading effects as described in Table 3.20-4.
- Clark's marsh wren: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) direct impacts as described in Table 3.20-4.
- Oregon vesper sparrow: 137.05 acres (106.62 acres permanent, 30.43 acres temporary) direct impacts; 0.78 acre indirect shading effects as described in Table 3.20-4.
- Yellow-headed blackbird: 2.96 acres (2.21 acres permanent, 0.75 acre temporary) direct impacts as described in Table 3.20-4.
- Southern grasshopper mouse: 95.93 acres (85.91 acres permanent, 10.02 acres temporary) direct impacts; 3.56 acres indirect shading effects as described in Table 3.20-4.
- American badger: 162.39 acres (138.12 acres permanent, 24.27 acres temporary) direct impacts; 3.83 acres indirect shading effects as described in Table 3.20-4.

Furthermore, construction of Build Alternative 4 would remove portions of the roadbed along the existing Cajalco Road and restore the removed roadbed and the right of way, resulting in a beneficial effect on burrowing owl (6.55 acres), special-status bats (7.39 acres), southern California legless lizard (4.36 acres), California glossy snake (6.21 acres), coast western patch-nosed snake (6.21 acres), two-striped garter snake (0.06 acre), long-eared owl (0.37 acre), short-eared owl (1.91 acres), Vaux's swift (0.05 acre), Oregon vesper sparrow (2.60), southern grasshopper mouse (3.16 acres), and American badger (5.06 acres). Refer to Section 3.20, *Animal Species*, for details on the direct effects to non-listed animal species.

In addition to direct effects, the construction and operation of Build Alternative 4 would contribute to indirect effects on special-status animals such as edge effects, degraded quality of habitat through introduction and spread of invasive species, increased risk of fire to open space lands, and spread of toxics or pollutants from construction equipment or vehicles.

In addition, the 16 non-listed special-status animals described in Section 3.20, *Animal Species,* that would be directly affected by Build Alternative 4 are fully covered under the WRC MSHCP; therefore, no additional analysis is required under Build Alternative 4.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** and **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)** under Build Alternative 1 would also apply for Build Alternative 4 and would address adverse impacts.

Measures **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12)** are required to ensure full compliance with the WRC MSHCP. Measure **NC-13 (NES BIO-9)** would ensure all temporary impact areas are restored. Measures **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)** will ensure potential direct effects on special-status species are avoided and/or minimized. With implementation of the measures identified above, potential effects on non-listed special-status animals would be reduced to a less-than-significant level under CEQA.

Non-Listed Plant Species

Three non-listed plant species would be directly removed during construction of Build Alternative 4: long-spined spineflower, small-flowered morning glory, and paniculate tarplant. The direct effects on long-spined spineflower and small-flowered morning glory are fully covered under the WRC MSHCP; therefore, no additional analysis is required under Build Alternative 4. Refer to Section 3.19, *Plant Species*, for details on the direct effects on non-listed plants.

Build Alternative 4 would affect several thousand individuals of paniculate tarplant dispersed (approximately 6.80 acres) and would bisect the population located east of Harley John Road. Paniculate tarplant seeds will be collected prior to project construction (**PL-1 [NES BIO-22]**) and disseminated following construction, which will offset the number of individuals directly removed during construction of Build Alternative 4. There are no other non-listed plants that would be directly affected during construction of Build Alternative 4. In addition, Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** described for non-listed animals would also address potential indirect effects on non-listed plants that may occur adjacent to the LOD. With implementation of these measures, these impacts are not considered significant under CEQA because this species is fairly common regionally and the measures will offset impacts and facilitate local recovery.

Threatened and Endangered Species

Suitable habitat for the following species would be affected under Build Alternative 1:

- Arroyo toad: 8.62 acres (6.24 acres permanent, 2.38 acres temporary) direct impacts; 0.40 acre indirect shading effects as described in Table 3.21-4.
- Coastal California gnatcatcher: 98.79 acres (88.40 acres permanent, 10.39 acres temporary) direct impacts; 3.56 acres indirect shading effects as described in Table 3.21-5.
- Least Bell's vireo: 8.86 acres (5.75 acres permanent, 3.11 acres temporary) direct impacts; 0.35 acre indirect shading effects as described in Table 3.21-4.
- Stephens' kangaroo rat: 78.62 acres (63.11 acres permanent, 15.51 acres temporary) direct impacts; 1.09 acres indirect shading effects as described in Table 3.21-4.

These species are all fully covered under the WRC MSHCP; however, there are species-specific survey requirements for least Bell's vireo where suitable habitat is present, and for SKR within the RCHCA-owned conserved lands (SKR Core Reserve).

Furthermore, construction of Build Alternative 4 would remove portions of the roadbed along the existing Cajalco Road and restore the removed roadbed and the right of way, resulting in a beneficial effect on coastal California gnatcatcher (4.30 acres), least Bell's vireo (0.06 acre), and SKR (3.30 acres). The indirect effects from construction and operation of Build Alternative 4 would be the same as those identified under Build Alternative 1. Refer to Section 3.21, *Threatened and Endangered Species*, for details on the direct effects on threatened and endangered species.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **AS-2 (NES BIO-16)** through **AS-7 (NES BIO-20)**, and **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)** under Build Alternative 1 would also apply for Build Alternative 4 and would address adverse impacts. Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **AS-2 (NES BIO-16)** through **AS-7 (NES BIO-20)**, and **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)** under Build Alternative 1 would also apply for Build Alternative 2C and would address adverse impacts on threatened and endangered species. Measures **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12)** would be implemented to ensure compliance with the WRC MSHCP, Measure **NC-13 (NES BIO-9)** would address replacement of native vegetation within temporarily affected areas, and Measures **AS-2 (NES BIO-16)** through **AS-6 (NES BIO-29)** would avoid and/or minimize direct effects on listed species. In addition, Mitigation Measure **TE-1 (NES BIO-18)** would address avoidance of direct effects on least Bell's vireo and **TE-2 (NES BIO-23)** would address compensatory requirements for impacts on suitable habitat for the species. Measure **TE-3 (NES BIO-30)** would create a management plan for SKR within the SKR Core Reserve area. With the implementation of **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **AS-2 (NES BIO-16)** through **AS-6 (NES BIO-29)**, and **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)** (identified under Build Alternative 1), any significant effects on threatened and endangered species would be reduced to a less-than-significant level under CEQA.

Lake Mathews MSHCP (Build Alternative 4)

Less than Significant with Mitigation

There were a total of 65 LM MSHCP target species evaluated for potential effects based on the presence of suitable habitat within the LM MSHCP boundary. The LM MSHCP target species with special regulatory status that could potentially be affected based on presence of suitable habitat within Build Alternative 4 are burrowing owl, special-status bats, long-eared owl, southern grasshopper sparrow, and American badger. There are also numerous other LM MSHCP target species that are fully covered under the WRC MSHCP or species that have no special regulatory status (e.g., Great Valley phacelia) that may potentially be affected under Build Alternative 4. Refer to Chapter 4 of the NES and Sections 3.17, 3.19, 3.20, and 3.21 of this document for details pertaining to LM MSHCP target species.

The LM MSHCP tracks suitable habitat for target species in three general categories (Nonnative Grassland, Riversidian Sage Scrub, and Riparian); therefore, impacts on the LM MSHCP are presented using these categories. LM MSHCP target species utilize these vegetation community associations for feeding, breeding, shelter, or movement. Therefore, impacts on LM MSHCP

target species are based on the project's effects on these broad vegetation classifications within the LM MSHCP area (refer to Table 3.17-8 for the impact details on LM MSHCP target species).

- Nonnative Grassland: 31.39 acres permanent impact and 6.25 acres temporary impact
- Riversidian Sage Scrub: 24.84 acres permanent impact and 2.33 acres temporary impact
- Riparian: 0.30 acre permanent impact and 0.18 acre temporary impact

Removal of roadbed would potentially restore 0.70 acre of habitat for LM MSHCP target species, which would be a beneficial effect. In addition to direct effects, the construction and operation of Build Alternative 4 would contribute to indirect effects on LM MSHCP target species such as edge effects, degraded quality of habitat through introduction and spread of invasive species, increased risk of fire to open space lands, and spread of toxics or pollutants from construction equipment or vehicles.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)** and **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)** identified above would also be applicable within the LM MSHCP area. In addition, the impacts on natural communities within the LM MSHCP area would require the following compensatory mitigation to address the effects on suitable habitat (including natural communities of concern) for LM MSHCP target species:

- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area

The minimum compensatory requirements for LM MSHCP target species is 65.99 acres (56.52 acres replacement and 8.76 acres restoration) under Build Alternative 4 (refer to Table 3.17-8 for additional details for each vegetation community association). Full replacement/restoration of natural vegetation communities within the LM MSHCP area and funding endowment will ensure biological equivalency and offset the loss of lands within the LM MSHCP. Therefore, these effects would be reduced to a less-than-significant level under CEQA.

4.2.4(b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Build Alternative 1

Less than Significant with Mitigation

Build Alternative 1 would have direct effects on natural communities of concern (as defined by CDFW), riparian/riverine resources (as defined by the WRC MSHCP, Section 6.1.2), and CDFW

jurisdictional streambeds including associated riparian habitats.[7] Wetlands are discussed in 4.2.4(c), below. The effects from Build Alternative 1 on these sensitive habitats are discussed below:

Natural Communities of Concern

There are six natural communities of concern (as defined by CDFW) that would be directly affected under Build Alternative 1 (refer to Tables 3.17-4 through 3.17-7 for the impacts). No impacts would occur on coast live oak woodland or southern coast live oak riparian forest. Impacts on natural communities of concern are as follows:

- Riversidian Sage Scrub (RSS): 72.42 acres (69.43 acres permanent, 7.81 acres temporary) would be directly affected; 0.17 acre would be indirectly affected through bridge shading.
- Riversidian Alluvial Fan Sage Scrub (RAFSS): 1.63 acre (1.33 acres permanent, 0.30 acre temporary) would be directly affected; 0.05 acre would be indirectly affected through bridge shading.
- Southern Cottonwood-Willow Riparian Forest: 0.29 acre (0.19 acre permanent, 0.10 acre temporary) would be directly affected; 0.17 acre would be indirectly affected through bridge shading.
- Southern Riparian Forest: 0.90 acre (0.34 acre permanent, 0.56 acre temporary) would be directly affected; no effects from bridge shading would occur.
- Southern Willow Scrub: 7.86 acres (5.23 acres permanent, 2.63 acres temporary) would be directly affected; 0.14 acre would be indirectly affected through bridge shading.
- Coast and Valley Freshwater Marsh: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) would be directly affected; no effects from bridge shading would occur.

In addition, construction of Build Alternative 1 would remove the roadbed along the existing Cajalco Road and restore the removed roadbed and the right of way, resulting in a beneficial effect on 2.99 acres of RSS and 0.05 acre of southern riparian forest. Refer to Section 3.17, *Natural Communities*, for details on direct effects on natural communities of concern.

In addition to these direct effects, the construction and operation of Build Alternative 1 could contribute to indirect effects on natural communities of concern that may contribute to edge effects, degrade quality of habitat through introduction and spread of invasive species, increase risk of fire to open space lands, and spread toxics or pollutants from construction equipment or vehicles.

[7] The natural communities of concern identified as riparian are not inclusive of all riparian habitat within the BSA. Some habitat (e.g., mulefat scrub) is not classified as a natural community of concern, but may be included as a WRC MSHCP riparian/riverine resource or CDFW jurisdictional riparian habitat depending on the community's location, association with a CDFW streambed, or the resource's functions and values for a sensitive WRC MSHCP species. Similarly, there are certain natural communities of concern, such as RSS, which are generally considered upland communities but, due to their location adjacent to a riverine resource and functions and values to wildlife, could also be considered WRC MSHCP riparian/riverine resource. Therefore, the impacts identified for natural communities of concern, WRC MSHCP riparian/riverine, and CDFW jurisdictional resources for the build alternatives have been quantified separately, but may overlap spatially.

Impacts on natural communities of concern would be adverse because these natural communities of concern are rapidly declining throughout the region and provide habitat for many of the special-status species discussed in 4.2.4(a), above.

The measures in Section 3.17, *Natural Communities*, and Section 3.10, *Water Quality and Stormwater Runoff*, are intended to address the potential effects on natural communities of concern.

- **NC-1 (NES BIO-1):** Seasonal Vegetation Clearing Restrictions
- **NC-2 (NES BIO-2):** Dust Control
- **NC-3 (NES BIO-3):** Fire Prevention
- **NC-4 (NES BIO-4):** Environmental Awareness Training
- **NC-5 (NES BIO-5):** Biological Monitoring
- **NC-6 (NES BIO-6):** ESA Fencing
- **NC-7 (NES BIO-7):** Invasive Species Removal
- **NC-8 (NES BIO-8):** Cleaning Construction Equipment
- **NC-9 (NES BIO-24):** Disposal of Trash
- **NC-10 (NES BIO-10):** Water Pollution and Erosion Control Plans
- **NC-11 (NES BIO-11):** Defining the Limits of Disturbance
- **NC-12 (NES BIO-12):** Placement of Construction Equipment
- **NC-13 (NES BIO-9):** Post-construction Hydro-seeding
- **PF WQ-3:** Post-Construction BMPs
- **PF WQ-4:** Construction Storm Water Pollution Prevention Plan (SWPPP)

Compensatory mitigation requirements for impacts on natural communities of concern would be addressed through mitigation required within conservation lands (i.e., lands within the LM MSHCP area, RCHCA SKR Reserve, and public/quasi-public [PQP] lands) (discussed in 4.2.4(f)) and through compensatory mitigation for impacts on WRC MSHCP riparian/riverine resources (described below). Implementation of these measures and the project's consistency with the WRC MSHCP requirements would reduce the adverse effects on natural communities of concern to less-than-significant levels.

WRC MSHCP Riparian/Riverine Resources

Build Alternative 1 would have a direct effect on the following WRC MSHCP riparian/riverine resources, which are sensitive resources under Section 6.1.2 of the WRC MSHCP Volume I:

- Riparian: 19.31 acres (11.67 acres permanent and 7.64 acres temporary) would be directly affected; 0.45 acre would be indirectly affected through bridge shading.
- Riverine: 6.14 acres (4.65 acres permanent and 1.49 acres temporary); 0.33 acre would be indirectly affected by bridge shading.

In addition, Build Alternative 1 would remove 0.16 acre of roadbed and right of way that would be restored and result in a beneficial effect. Impact details are provided in Section 3.17, *Natural Communities* (refer to Table 3.17-13).

These WRC MSHCP riparian/riverine resources would also be subject to long-term effects from operation of the proposed project, including activities that may degrade riparian/riverine habitat (e.g., maintenance of the new right of way, increased litter, increased risk of fire) and reduce the resources' functions and value for wildlife movement and other species use. The direct and indirect effects on WRC MSHCP Riparian/riverine resources would be an adverse effect under CEQA.

Implementation of Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **PF WQ-3**, and **PF WQ-4** (identified above for natural communities of concern) would also apply to WRC MSHCP riparian/riverine resources under Build Alternative 1. Impacts on riparian/riverine resources will also require mitigation and replacement of the resource. The following measures will mitigate for the impacts on WRC MSHCP riparian/riverine resources:

- **NC-14 (NES BIO-13):** Preparation of a Determination of Biologically Equivalent or Superior Preservation (DBESP)
- **NC-15 (NES BIO-14):** Replacement of Riparian/Riverine Resources

With the implementation of these mitigation measures and the project's consistency with the WRC MSHCP Section 6.1.2 policy (see 4.2.4(f) below for more details), Build Alternative 1 would have a less-than-significant effect under CEQA with mitigation incorporated.

CDFW Streambeds and Associated Riparian Habitat

The direct impacts on CDFW jurisdictional waters under Build Alternative 1 that would occur during construction activities include:

- Permanent impacts on 10.399 acres CDFW streambeds (of which 4.649 acres are CDFW riparian)
- Temporary impacts on 5.397 acres CDFW streambeds (of which 1.973 acres would occur on CDFW riparian)

Shading effects from construction of new or expanded bridges may convert 0.047 acre of CDFW riparian to state unvegetated streambed.

Roadbed removal would rehabilitate 0.161 acre of CDFW jurisdictional streambeds, of which 0.004 acre of CDFW riparian would be restored and be considered a beneficial effect of Build Alternative 1. Refer to Section 3.18, *Wetlands and Other Waters*, for details on the direct effects on CDFW streambeds and associated riparian habitat (refer to Table 3.18-4).

There is also a potential for long-term effects on CDFW unvegetated streambeds and associated riparian during operation of the proposed project. Maintenance within the road right of way and additional vehicles traveling along the project could increase toxicants and invasive species, and degrade quality of habitat, resulting in edge effects on drainage and/or wetlands adjacent to the widened roadway. However, this effect would not differ appreciably from existing conditions.

There would be a potentially significant impact on CDFW jurisdictional waters due to the regional and rapid decline of these resources, including riparian habitats. With implementation of the measures described below, the impacts on CDFW jurisdictional streambeds and associated riparian are less than significant with mitigation incorporated.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, would also be implemented to reduce construction-related effects on CDFW jurisdictional waters.

Build Alternative 1 also would require a Lake and Streambed Alteration Agreement from CDFW.

Measure **WET-1 (NES BIO-14)** (in Section 3.18, *Wetlands and Other Waters*) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1 for CDFW riparian and 1:1 for CDFW unvegetated streambeds/culverts), temporary impacts (minimum 1:1 for CDFW riparian and CDFW unvegetated streambeds/culverts), and shading effects (minimum 2:1 for CDFW riparian). Final compensatory mitigation requirements will be negotiated with CDFW during final project design and project permitting. These measures would ensure any adverse effects from Build Alternative 1 on CDFW jurisdictional streambeds will be reduced to below a level of significance under CEQA.

Lake Mathews MSHCP (Build Alternative 1)

Less than Significant with Mitigation

Natural Communities of Concern

Build Alternative 1 would have adverse effects on natural communities of concern that are present within the LM MSHCP area. Only three of the natural communities of concern that would be affected under Build Alternative 1 occur within the LM MSHCP area.

- Riversidian Sage Scrub (RSS): 28.99 acres (25.87 acres permanent, 3.12 acres temporary) would be directly affected; no impacts would occur from bridge shading.
- Riversidian Alluvial Fan Sage Scrub (RAFSS): 0.03 acre (0.02 acre permanent, 0.01 acre temporary) would be directly affected; no impacts would occur from bridge shading.
- Southern Willow Scrub: 3.05 acres (2.27 acres permanent, 0.78 acre temporary) would be directly affected; no impacts would occur from bridge shading.

As described above for Build Alternative 1, the direct effects on natural communities of concern within the LM MSHCP area would be adverse because these natural communities of concern are rapidly declining throughout the region and provide habitat for many of the special-status species discussed in 4.2.4(a), above. There would be no beneficial effects on natural communities of concern from roadbed removal within the LM MSHCP area. Refer to Tables 3.17-9 through 3.17-12 in Section 3.17, *Natural Communities*, for details on the direct effects on natural communities of concern within the LM MSHCP area.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **PF WQ-3**, and **PF WQ-4** identified above would also be applicable within the LM MSHCP area. In addition, the impacts on natural communities of concern within the LM MSHCP area would require the following compensatory mitigation to address the effects on suitable habitat (including natural communities of concern) for LM MSHCP target species:

- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area

Full replacement/restoration of natural vegetation communities within the LM MSHCP area and funding endowment will ensure biological equivalency and offset the loss of lands within the LM MSHCP.

WRC MSHCP Riparian/Riverine

Build Alternative 1 would directly affect WRC MSHCP riparian/riverine resources that occur within the LM MSHCP area as follows:

- Riparian: 8.96 acres (5.44 acres permanent and 3.52 acres temporary) would be directly affected; 0.05 acre would be indirectly affected through bridge shading.
- Riverine: 1.37 acres (1.15 acres permanent and 0.22 acre temporary); 0.01 acre would be indirectly affected by bridge shading.

No roadbed removal would occur within the LM MSHCP area that would affect WRC MSHCP riparian/riverine resources. Refer to Table 3.17-15 in Section 3.17, *Natural Communities*, for details on the direct effects on WRC MSHCP riparian/riverine resources within the LM MSHCP area.

The long-term operational effects that would occur within the LM MSHCP area are identified above for Build Alternative 1. The direct and indirect effects on WRC MSHCP riparian/riverine resources would be an adverse effect under CEQA.

Implementation of measures (**NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]**, **PF WQ-3** and **PF WQ-4**) and mitigation (**NC-14 [NES BIO-13]** and **NC-15 [NES BIO-14]**) identified above for Build Alternative 1 and compensatory mitigation for impacts on the LM MSHCP area (**NC-17 [NES BIO-17]** through **NC-19 [NES BIO-15]**) would also apply. With the implementation of these mitigation measures and the project's consistency with the WRC MSHCP Section 6.1.2 policy (see 4.2.4(f) below for more details), Build Alternative 1 would have a less-than-significant effect under CEQA with mitigation incorporated.

CDFW Streambeds and Associated Riparian

Build Alternative 1 would directly affect CDFW jurisdictional streambeds and associated riparian habitats that occur within the LM MSHCP area as follows:

- Permanent impact of 2.946 acres CDFW streambeds (of which 1.792 acres are CDFW riparian)

- Temporary impacts of 0.776 acre CDFW streambeds (of which 0.467 acre is CDFW riparian)

Shading effects from construction of new bridges within the LM MSHCP area would convert 0.047 acre of CDFW riparian to state unvegetated streambed. No roadbed removal (beneficial effect) would occur within the LM MSHCP area. Refer to Table 3.18-5 in Section 3.18, *Wetlands and Other Waters*, for details on the direct effects on CDFW jurisdictional streambeds and associated riparian habitats.

The long-term and operational effects identified above for Build Alternative 1 would also occur within the LM MSHCP area. As noted above, this effect would not differ appreciably from existing conditions. CDFW jurisdictional streambeds and associated riparian habitats are sensitive communities regionally that provide habitat for LM MSHCP target species; therefore, impacts on these CDFW resources could be significant. However, with the implementation of the avoidance, minimization, and mitigation measures for Build Alternative 1 and acquisition of a Lake and Streambed Alteration Agreement from CDFW, the impacts on state streambeds would be reduced to a less-than-significant level with mitigation incorporated.

Build Alternative 2C

Less than Significant with Mitigation

Build Alternative 2C would have direct effects on natural communities of concern (as defined by CDFW), riparian/riverine resources (as defined by the WRC MSHCP, Section 6.1.2), and CDFW jurisdictional streambeds including associated riparian habitats. Wetlands are discussed in 4.2.4(c), below. The effects from Build Alternative 2C on these sensitive habitats are discussed below.

Natural Communities of Concern

There are six natural communities of concern (as defined by CDFW) that would be directly affected under Build Alternative 2C. No impacts would occur on coast live oak woodland or southern coast live oak riparian forest. Impacts on natural communities of concern are as follows:

- Riversidian Sage Scrub (RSS): 86.69 acres (78.61 acres permanent, 8.08 acres temporary) would be directly affected; 0.50 acre would be indirectly affected through bridge shading.
- Riversidian Alluvial Fan Sage Scrub (RAFSS): 1.63 acres (1.33 acres permanent, 0.30 acre temporary) would be directly affected; 0.05 acre would be indirectly affected through bridge shading.
- Southern Cottonwood-Willow Riparian Forest: 0.29 acre (0.19 acre permanent, 0.10 acre temporary) would be directly affected; 0.17 acre would be indirectly affected through bridge shading.
- Southern Riparian Forest: 0.90 acre (0.34 acre permanent, 0.56 acre temporary) would be directly affected; no effects from bridge shading would occur.
- Southern Willow Scrub: 7.36 acres (4.67 acres permanent, 2.69 acres temporary) would be directly affected; 0.17 acre would be indirectly affected through bridge shading.

- Coast and Valley Freshwater Marsh: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) would be directly affected; no effects from bridge shading would occur.

These direct effects would be adverse because these natural communities of concern are rapidly declining throughout the region and provide habitat for many of the special-status species discussed in 4.2.4(a), above. In addition, construction of Build Alternative 2C would remove the roadbed along the existing Cajalco Road and restore the removed roadbed and the right of way, resulting in a beneficial effect on 3.38 acres of RSS and 0.05 acre of southern riparian forest. Impact details are provided in Section 3.17, *Natural Communities* (refer to Tables 3.17-4 through 3.17-7).

The indirect effects from construction and operation of Build Alternative 2C would be the same as those identified under Build Alternative 1. Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **PF WQ-3**, and **PF WQ-4** identified above under Build Alternative 1 would also be applicable under Build Alternative 2C and would address the potential indirect effects on natural communities of concern.

Compensatory mitigation requirements for impacts on natural communities of concern would be addressed through mitigation required within conservation lands (i.e., lands within the LM MSHCP area, RCHCA SKR Reserve, and PQP lands) (discussed in 4.2.4(f)) and through compensatory mitigation for impacts on WRC MSHCP riparian/riverine resources (described below). Implementation of these measures and the project's consistency with the WRC MSHCP requirements would reduce the adverse effects on natural communities of concern to less-than-significant levels.

WRC MSHCP Riparian/Riverine Resources

Build Alternative 2C would have a direct effect on the following WRC MSHCP riparian/riverine resources, which are sensitive resources under Section 6.1.2 of the WRC MSHCP Volume I:

- Riparian: 11.19 acres (9.86 acres permanent and 1.33 acres temporary) would be directly affected; 0.43 acre would be indirectly affected through bridge shading.
- Riverine: 6.24 acres (4.76 acres permanent and 1.48 acres temporary); 0.36 acre would be indirectly affected by bridge shading.

In addition, the Build Alternative would remove 0.15 acre of roadbed and right of way that would be restored and result in a beneficial effect. Impact details are provided in Section 3.17, *Natural Communities* (refer to Table 3.17-13).

The indirect effects from construction and operation of Build Alternative 2C would be the same as those identified under Build Alternative 1. The direct and indirect effects on WRC MSHCP riparian/riverine resources under Build Alternative 2C would be adverse under CEQA.

Implementation of measures (**NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]**, **PF WQ-3**, and **PF WQ-4**) identified above for natural communities of concern would also apply to WRC MSHCP riparian/riverine resources under Build Alternative 2C. Impacts on riparian/riverine resources will also require mitigation and replacement of the resource. The following measures will mitigate for the impacts from Build Alternative 2C on WRC MSHCP riparian/riverine resources:

- **NC-14 (NES BIO-13):** Preparation of a DBESP
- **NC-15 (NES BIO-14):** Replacement of Riparian/Riverine Resources

With the implementation of these mitigation measures and the project's consistency with the WRC MSHCP Section 6.1.2 policy (see 4.2.4(f) below for more details), Build Alternative 2C would have a less-than-significant effect under CEQA with mitigation incorporated.

CDFW Streambeds and Associated Riparian Habitat

Impacts on CDFW jurisdictional waters under Build Alternative 2C that would occur during construction activities include:

- Permanent impacts on 10.465 acres CDFW streambeds (of which 4.241 acres are CDFW riparian)
- Temporary impacts on 5.585 acres CDFW streambeds (of which 1.973 acres would occur on CDFW riparian)

Shading effects from construction of new or expanded bridges would convert 0.031 acre of CDFW riparian to state unvegetated streambed.

Roadbed removal would rehabilitate 0.173 acre of CDFW jurisdictional streambeds, of which 0.002 acre of CDFW riparian and 0.065 acre of CDFW wetland would be restored and be considered a beneficial effect of Build Alternative 2C. The direct effects on CDFW streambeds and associated riparian habitat are detailed in Section 3.18, *Wetlands and Other Waters* (refer to Table 3.18-4).

The long-term and operational effects under Build Alternative 2C would be the same as those identified under Build Alternative 1, above; however, this effect would not differ appreciably from existing conditions along existing roadways. The long-term effect and operation of the project through conservation lands southeast of La Sierra Avenue and Cajalco Road would be new; therefore, these additional effects may be significant. In addition, Build Alternative 2C may contribute to the regional and rapid decline of CDFW streambeds and associated riparian habitats, which would be potentially significant under CEQA.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, would be implemented to reduce construction-related effects on CDFW jurisdictional waters. In addition, Measure **WET-1 (NES BIO-14)** (in Section 3.18.4) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1 for CDFW riparian and 1:1 for CDFW unvegetated streambed/culverts), temporary impacts (minimum 1:1 for CDFW riparian and CDFW unvegetated streambeds/culverts), and shading effects (0.062 acre CDFW riparian). Build Alternative 2C also will require a Lake and Streambed Alteration Agreement from CDFW. Final compensatory mitigation requirements will be negotiated with CDFW during final project design and project permitting. These measures would ensure any adverse effects from Build Alternative 2C on CDFW jurisdictional streambeds will be reduced to below a level of significance under CEQA.

Lake Mathews MSHCP (Build Alternative 2C)

Less than Significant with Mitigation

Natural Communities of Concern

Build Alternative 2C would have adverse effects on natural communities of concern that are present within the LM MSHCP area. Only three of the natural communities of concern that would be affected under Build Alternative 2C occur within the LM MSHCP area.

- Riversidian Sage Scrub (RSS): 38.95 acres (35.32 acres permanent, 3.63 acres temporary) would be directly affected; no impacts would occur from bridge shading.
- Riversidian Alluvial Fan Sage Scrub (RAFSS): 0.03 acre (0.02 acre permanent, 0.01 acre temporary) would be directly affected; no impacts would occur from bridge shading.
- Southern Willow Scrub: 2.56 acres (1.72 acres permanent, 0.84 acre temporary) would be directly affected; no impacts would occur from bridge shading.

As described above for Build Alternative 2C, the direct effects on natural communities of concern within the LM MSHCP area would be adverse because these natural communities of concern are rapidly declining throughout the region and provide habitat for many of the special-status species discussed in 4.2.4(a), above. There would be no beneficial effects on natural communities of concern from roadbed removal within the LM MSHCP area. Refer to Tables 3.17-9 through 3.17-12 in Section 3.17, *Natural Communities*, for details on the direct effects on natural communities of concern within the LM MSHCP area.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **PF WQ-3**, and **PF WQ-4** identified above would also be applicable within the LM MSHCP area. In addition, the impacts on natural communities of concern within the LM MSHCP area would require the following compensatory mitigation to address the effects on suitable habitat (including natural communities of concern) for LM MSHCP target species:

- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area

Full replacement/restoration of natural vegetation communities within the LM MSHCP area and funding endowment will ensure biological equivalency and offset the loss of lands within the LM MSHCP. Therefore, effects on the LM MSHCP under Build Alternative 2C would be less than significant with mitigation incorporated.

WRC MSHCP Riparian/Riverine

Build Alternative 2C would directly affect WRC MSHCP riparian/riverine resources that occur within the LM MSHCP area as follows:

- Riparian: 7.61.as acres (3.62 acres permanent and 3.99 acres temporary) would be directly affected; 0.03 acre would be indirectly affected through bridge shading.

- Riverine: 1.47 acres (1.26 acres permanent and 0.21 acre temporary); 0.05 acre would be indirectly affected by bridge shading.

No roadbed removal would occur within the LM MSHCP area that would affect WRC MSHCP riparian/riverine resources. Refer to Table 3.17-15 in Section 3.17, *Natural Communities*, for details on the direct effects on WRC MSHCP riparian/riverine resources within the LM MSHCP area.

The long-term operational effects that would occur within the LM MSHCP area under Build Alternative 2C are identified above in Build Alternative 1. The direct and indirect effects on WRC MSHCP riparian/riverine resources would be an adverse effect under CEQA.

Implementation of measures (**NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]**, **PF WQ-3** and **PF WQ-4**) and mitigation (**NC-14 [NES BIO-13]** and **NC-15 [NES BIO-14]**) identified above for Build Alternative 2C and compensatory mitigation for impacts on the LM MSHCP area (**NC-17 [NES BIO-17]** through **NC-19 [NES BIO-15]**) would also apply. With the implementation of these mitigation measures and the project's consistency with the WRC MSHCP Section 6.1.2 policy (see 4.2.4(f) below for more details), Build Alternative 2C would have a less-than-significant effect under CEQA with mitigation incorporated.

CDFW Streambeds and Associated Riparian

Build Alternative 2C would directly affect CDFW jurisdictional streambeds and associated riparian habitats that occur within the LM MSHCP area as follows:

- Permanent impacts on 2.642 acres CDFW streambeds (of which 1.383 acres are CDFW riparian)
- Temporary impacts on 0.801 acre CDFW streambeds (of which 0.466 acre is CDFW riparian)

Shading effects from construction of new bridges within the LM MSHCP area would convert 0.031 acre of CDFW riparian to state unvegetated streambed. No roadbed removal (beneficial effect) would occur within the LM MSHCP area. Refer to Table 3.18-5 in Section 3.18, *Wetlands and Other Waters*, for details on the direct effects on CDFW jurisdictional streambeds and associated riparian habitats.

The long-term and operational effects identified above for Build Alternative 2C would also occur within the LM MSHCP area. As noted above, this effect would not differ appreciably from conditions along existing roadways. However, the operational and long-term effects on adjacent conservation lands southeast of La Sierra Avenue and Cajalco Road would be new. CDFW jurisdictional streambeds and associated riparian habitats are sensitive communities within the region that provide habitat for LM MSHCP target species; therefore, impacts on these CDFW resources could be significant. However, with implementation of the avoidance, minimization, and mitigation measures for Build Alternative 2C and acquisition of a Lake and Streambed Alteration Agreement from CDFW, the impacts on state streambeds would be reduced to a less-than-significant level with mitigation incorporated.

Build Alternative 4—El Sobrante Alignment

Less than Significant with Mitigation

Build Alternative 4 would have direct effects on natural communities of concern (as defined by CDFW), riparian/riverine resources (as defined by the WRC MSHCP, Section 6.1.2), and CDFW jurisdictional streambeds including associated riparian habitats. Wetlands are discussed in 4.2.4(c), below. The effects from Build Alternative 4 on these sensitive habitats are discussed below:

Natural Communities of Concern

There are six natural communities of concern (as defined by CDFW) that would be directly affected under Build Alternative 4. No impacts would occur on coast live oak woodland or southern coast live oak riparian forest. Impacts on natural communities of concern are as follows:

- Riversidian Sage Scrub (RSS): 83.94 acres (75.25 acres permanent, 8.42 acres temporary) would be directly affected; 2.09 acres would be indirectly affected through bridge shading.
- Riversidian Alluvial Fan Sage Scrub (RAFSS): 1.57 acres (1.28 acres permanent, 0.29 acre temporary) would be directly affected; 0.05 acre would be indirectly affected through bridge shading.
- Southern Cottonwood-Willow Riparian Forest: 0.29 acre (0.19 acre permanent, 0.10 acre temporary) would be directly affected; 0.17 acre would be indirectly affected through bridge shading.
- Southern Riparian Forest: 0.10 acre (0.01 acre permanent, 0.09 acre temporary) would be directly affected; no effects from bridge shading would occur.
- Southern Willow Scrub: 4.58 acres (2.99 acres permanent, 1.59 acres temporary) would be directly affected; 0.18 acre would be indirectly affected through bridge shading.
- Coast and Valley Freshwater Marsh: 0.12 acre (0.06 acre permanent, 0.06 acre temporary) would be directly affected; no effects from bridge shading would occur.

These direct effects would be adverse because these natural communities of concern are rapidly declining throughout the region and provide habitat for many of the special-status species discussed in 4.2.4(a), above. In addition, construction of Build Alternative 4 would remove portions of roadbed along existing paved roadways, and restore the removed roadbed and the right of way, resulting in a beneficial effect on 4.30 acres of RSS and 0.05 acre of southern riparian forest. Refer to Section 3.17, *Natural Communities*, for details on direct effects on natural communities of concern.

The indirect effects from construction and operation of Build Alternative 4 would be the same as those identified under Build Alternative 1. Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **PF WQ-3**, and **PF WQ-4** identified above under Build Alternative 1 would also be applicable under Build Alternative 4 and would address the potential indirect effects on natural communities of concern.

Compensatory mitigation requirements for impacts on natural communities of concern would be addressed through mitigation required within conservation lands (i.e., lands within the LM MSHCP area, SKR Reserve, and PQP lands) (discussed in 4.2.4(f)) and through compensatory mitigation for impacts on WRC MSHCP riparian/riverine resources (described below). Implementation of these measures and the project's consistency with the WRC MSHCP requirements would reduce the adverse effects on natural communities of concern to less-than-significant levels.

WRC MSHCP Riparian/Riverine Resources

Build Alternative 4 would have a direct effect on the following WRC MSHCP riparian/riverine resources, which are sensitive resources under Section 6.1.2 of the WRC MSHCP Volume I:

- Riparian: 10.37 acres (6.62 acres permanent and 3.75 acres temporary) would be directly affected; 0.58 acre would be indirectly affected through bridge shading.
- Riverine: 4.28 acres (2.39 acres permanent and 1.89 acres temporary); 0.64 acre would be indirectly affected by bridge shading.

In addition, Build Alternative 4 would remove 0.26 acre of roadbed and right of way that would be restored and result in a beneficial effect where El Sobrante Road and La Sierra Avenue intersect. Impact details are provided in Section 3.17, *Natural Communities* (refer to Table 3.17-13).

The indirect effects from construction and operation of Build Alternative 4 would be the same as those identified under Build Alternative 1. The direct and indirect effects on WRC MSHCP riparian/riverine resources under Build Alternative 4 would be an adverse effect under CEQA.

Implementation of measures (**NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]**, **PF WQ-3** and **PF WQ-4**) identified above for natural communities of concern would also apply to WRC MSHCP riparian/riverine resources affected by Build Alternative 4. The following measures will mitigate for the impacts from Build Alternative 4 on WRC MSHCP riparian/riverine resources:

- **NC-14 (NES BIO-13):** Preparation of a DBESP
- **NC-15 (NES BIO-14):** Replacement of Riparian/Riverine Resources

With the implementation of these mitigation measures and the project's consistency with the WRC MSHCP Section 6.1.2 policy (see 4.2.4(f) below for more details), Build Alternative 4 would have a less-than-significant effect under CEQA with mitigation incorporated.

CDFW Streambeds and Associated Riparian Habitat

The direct impacts on CDFW jurisdictional streambeds under Build Alternative 4 that would occur during construction activities include:

- Permanent impacts on 7.083 acres CDFW streambeds (of which 3.463 acres are CDFW riparian)
- Temporary impacts on 5.800 acres CDFW streambeds (of which 1.263 acres would occur on CDFW riparian)

Shading effects from construction of new or expanded bridges would convert 0.037 acre of CDFW riparian and 0.136 acre of CDFW wetland to state unvegetated streambed.

Roadbed removal would rehabilitate 0.179 acre of CDFW jurisdictional streambeds, of which 0.003 acre of CDFW riparian would be restored and be considered a beneficial effect of Build Alternative 4. Refer to Section 3.18, *Wetlands and Other Waters*, for details on the direct effects on CDFW streambeds and associated riparian habitat (refer to Table 3.18-4).

The long-term and operational effects under Build Alternative 4 would be the same as those identified under Build Alternative 1, above; however, this effect would not differ appreciably from existing conditions along existing roadways. In addition, Build Alternative 4 may contribute to the regional and rapid decline of CDFW streambeds and associated riparian habitats, which would be potentially significant under CEQA.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, would be implemented to reduce construction-related effects on CDFW jurisdictional streambeds. In addition, Measure **WET-1 (NES BIO-14)** (in Section 3.18.4) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1 for CDFW riparian and 1:1 for CDFW unvegetated streambed/culverts), temporary impacts (minimum 1:1 for CDFW riparian and unvegetated streambed), and shading effects (minimum 2:1 for CDFW riparian). Build Alternative 4 also will require a Lake and Streambed Alteration Agreement from CDFW. Final compensatory mitigation requirements will be negotiated with CDFW during final project design and project permitting. These measures would ensure any adverse effects from Build Alternative 4 on CDFW jurisdictional streambeds will be reduced to below a level of significance under CEQA.

Lake Mathews MSHCP (Build Alternative 4)

Less than Significant with Mitigation

Natural Communities of Concern

Build Alternative 4 would have adverse effects on natural communities of concern that are present within the LM MSHCP area. Only two of the natural communities of concern that would be affected under Build Alternative 4 occur within the LM MSHCP area.

- Riversidian Sage Scrub (RSS): 24.11 acres (21.95 acres permanent, 2.19 acres temporary) would be directly affected; no impacts would occur from bridge shading.
- Southern Willow Scrub: 0.46 acre (0.29 acre permanent, 0.17 acre temporary) would be directly affected; no impacts would occur from bridge shading.

In addition, construction of Build Alternative 4 would remove the roadbed and restore 0.49 acre of RSS, resulting in a beneficial effect. As described above for Build Alternative 4, the direct effects on natural communities of concern within the LM MSHCP area would be adverse because these natural communities of concern are rapidly declining throughout the region and provide habitat for many of the special-status species discussed in 4.2.4(a), above. Refer to

Tables 3.17-9 through 3.17-12 in Section 3.17, *Natural Communities*, for details on the direct effects on natural communities of concern within the LM MSHCP area.

Measures **NC-1 (NES BIO-1)** through **NC-13 (NES BIO-9)**, **PF WQ-3**, and **PF WQ-4** identified above would also be applicable within the LM MSHCP area. In addition, the impacts on natural communities of concern within the LM MSHCP area would require the following compensatory mitigation to address the effects on suitable habitat (including natural communities of concern) for LM MSHCP target species:

- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area

Full replacement/restoration of natural vegetation communities within the LM MSHCP area and funding endowment will ensure biological equivalency and offset the loss of lands within the LM MSHCP. Therefore, effects on the LM MSHCP under Build Alternative 4 would be less than significant with mitigation incorporated.

WRC MSHCP Riparian/Riverine

Build Alternative 4 would directly affect WRC MSHCP riparian/riverine resources that occur within the LM MSHCP area as follows:

- Riparian: 0.48 acre (0.30 acre permanent and 0.18 acre temporary) would be directly affected; 0.17 acre would be indirectly affected through bridge shading.
- Riverine: 0.10 acre (0.09 acre permanent and 0.01 acre temporary); 0.01 acre would be indirectly affected by bridge shading.

No roadbed removal would occur within the LM MSHCP area that would affect WRC MSHCP riparian/riverine resources. Refer to Table 3.17-15 in Section 3.17, *Natural Communities*, for details on the direct effects on WRC MSHCP riparian/riverine resources within the LM MSHCP area.

The long-term operational effects that would occur within the LM MSHCP area under Build Alternative 4 are identified above under Build Alternative 1. The direct and indirect effects on WRC MSHCP riparian/riverine resources would be an adverse effect under CEQA.

Implementation of measures (**NC-1 [NES BIO-1]** through **NC-13 [NES BIO-9]**, **PF WQ-3** and **PF WQ-4**) and mitigation (**NC-14 [NES BIO-13]** and **NC-15 [NES BIO-14]**) identified above for Build Alternative 4 and compensatory mitigation for impacts on the LM MSHCP area (**NC-17 [NES BIO-17]** through **NC-19 [NES BIO-15]**) would also apply. With the implementation of these mitigation measures and the project's consistency with the WRC MSHCP Section 6.1.2 policy (see 4.2.4(f) below for more details), Build Alternative 4 would have a less-than-significant effect under CEQA with mitigation incorporated.

CDFW Streambeds and Associated Riparian

Build Alternative 4 would directly affect CDFW jurisdictional streambeds and associated riparian habitats that occur within the LM MSHCP area as follows:

- Permanent impacts on 0.139 acre CDFW streambeds (of which 0.47 acre is CDFW riparian)
- Temporary impacts on 0.09 acre CDFW streambeds (of which 0.061 acre is CDFW riparian)

Shading effects from construction of new bridges within the LM MSHCP area would convert 0.032 acre of CDFW riparian to state unvegetated streambed. No roadbed removal (beneficial effect) would occur within the LM MSHCP area. Refer to Table 3.18-5 in Section 3.18, *Wetlands and Other Waters*, for details on the direct effects on CDFW jurisdictional streambeds and associated riparian habitats.

The long-term and operational effects identified above for Build Alternative 4 would also occur within the LM MSHCP area. As noted above, this effect would not differ appreciably from conditions along existing roadways. CDFW jurisdictional streambeds and associated riparian habitats are sensitive communities within the region that provide habitat for LM MSHCP target species; therefore, impacts on these CDFW resources could be significant. However, with implementation of the avoidance, minimization, and mitigation measures for Build Alternative 4 and acquisition of a Lake and Streambed Alteration Agreement from CDFW, the impacts on state streambeds would be reduced to a less-than-significant level with mitigation incorporated.

4.2.4(c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Build Alternative 1—Cajalco Alignment

Less than Significant with Mitigation

USACE/RWQCB Jurisdictional Waters

Impacts on USACE/RWQCB jurisdictional waters under Build Alternative 1 that would occur during construction activities include[8]:

- Permanent impacts on 3.605 acres, of which 0.76 acre would occur on wetland waters of the U.S. (WoUS)/waters of the State (WoS)
- Temporary impacts on 2.078 acres, of which 0.236 acre would occur on wetland WoUS/WoS
- Shading effects would convert 0.042 acre wetland WoUS/WoS to non-wetland WoUS/WoS
- Roadbed removal would rehabilitate 0.078 acre of non-wetland WoUS/WoS

[8] Aquatic resources within the project area were delineated according to the 1987 Wetland Delineation Manual, Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, and A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States. The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting.

No vernal pools or vernal pool watersheds would be affected by this build alternative. The direct impacts on USACE/RWQCB jurisdictional waters are detailed in Section 3.18, *Wetlands and Other Waters* (refer to Table 3.18-3).

There is also a potential for long-term effects on federal jurisdictional waters during operation of the proposed project. Maintenance within the road right of way and additional vehicles traveling along the project could increase toxicants and invasive species, and degrade quality of habitat, resulting in edge effects on drainage and/or wetlands adjacent to the widened roadway. However, this effect would not differ appreciably from existing conditions. There would be a potentially significant impact on federal jurisdictional waters due to the regional and rapid decline of wetlands and non-wetland waters.

The following measures would be implemented to reduce construction-related effects on federal jurisdictional waters.

- **NC-4 (NES BIO-4):** Environmental Awareness Training
- **NC-5 (NES BIO-5):** Biological Monitoring
- **NC-6 (NES BIO-6):** ESA Fencing
- **NC-10 (NES BIO-10):** Water Pollution and Erosion Control Plans
- **NC-11 (NES BIO-11):** Defining the Limits of Disturbance
- **NC-12 (NES BIO-12):** Placement of Construction Equipment
- **NC-13 (NES BIO-9):** Post-construction Hydro-seeding
- **PF WQ-3:** Post-Construction BMPs
- **PF WQ-4:** Construction SWPPP

The following permits will be necessary under Build Alternative 1 as described in **PF WQ-1** and **PF WQ-2** (in Section 3.10, *Water Quality and Stormwater Runoff*):

- Section 401 Certification from RWQCB
- Section 404 Nationwide Permit and/or Individual Permit from USACE

Measure **WET-1 (NES BIO-14)** (refer to Section 3.18.4) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1 for wetland and minimum 1:1 for non-wetland) or temporary impacts (minimum 1:1) on USACE wetlands and non-wetlands, including any effects from permanent shading of wetland WoUS/WoS (minimum 2:1). Final compensatory mitigation requirements will be negotiated with the resource agencies during final project design and project permitting. These measures would ensure any adverse impacts from Build Alternative 1 on federal wetlands and other waters will be reduced to below a level of significance under CEQA.

CDFW Wetlands

Impacts on CDFW wetlands under Build Alternative 1 that would occur on CDFW wetlands during construction activities are:

- Permanent impacts on 1.283 acres of CDFW wetlands

- Temporary impacts on 1.671 acres of CDFW wetlands

Shading effects from construction of new or expanded bridges may convert 0.136 acre of CDFW wetland to state unvegetated streambed. As identified under 4.2.4(b) above for Build Alternative 1, roadbed removal would rehabilitate 0.190 acre of CDFW jurisdictional streambeds. Of this, 0.065 acre of CDFW wetland would be restored and be considered a beneficial effect from Build Alternative 1. The impacts on CDFW wetlands are detailed in Section 3.18, *Wetlands and Other Waters* (refer to Table 3.18-4).

There is also a potential for long-term effects on CDFW wetlands during operation of the proposed project. Maintenance within the road right of way and additional vehicles traveling along the project could increase toxicants and invasive species, and degrade water quality, which could contribute to edge effects on wetlands occurring adjacent to the widened roadway. However, this effect would not differ appreciably from existing conditions.

There would be a potentially significant impact on CDFW wetlands due to the regional and rapid decline of this resource. With implementation of the measures described below, the impacts on CDFW wetlands are less than significant with mitigation incorporated.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, would also be implemented to reduce construction-related effects on CDFW wetlands. Build Alternative 1 also would require a Lake and Streambed Alteration Agreement from CDFW. Measure **WET-1 (NES BIO-14)** (in Section 3.18.4) would ensure full compensatory mitigation through and in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1 for CDFW wetlands), temporary impacts (minimum 1:1 for CDFW wetlands), and shading effects (minimum 2:1 for CDFW wetlands). Final compensatory mitigation requirements will be negotiated with CDFW during final project design and project permitting. These measures would ensure any adverse effects from Build Alternative 1 on CDFW wetlands will be reduced to below a level of significance under CEQA.

Lake Mathews MSHCP (Build Alternative 1)

Less than Significant with Mitigation

Impacts on federal and state wetlands present within the LM MSHCP area are included in the impacts described above for Build Alternative 1. Specifically, permanent impacts would occur on 1.157 acres and temporary impacts would occur on 0.339 acre on WoUS/WoS present within the LM MSHCP area. Although no permanent effects on federal wetlands would occur within the LM MSHCP area, there would be temporary effects on 0.003 acre wetland WoUS/WoS. In addition, permanent impacts would occur on less than 0.001 acre and temporary impacts would occur on 0.036 acre of CDFW wetlands.

The measures and project permits described above for Build Alternative 1 would apply within the LM MSHCP area, and reduce adverse impacts from Build Alternative 1 on federal wetlands and other waters within the LM MSHCP area to a less-than-significant level under CEQA.

Build Alternative 2C—Modified Cajalco Alignment

Less than Significant with Mitigation

USACE/RWQCB Jurisdictional Waters

Impacts on USACE/RWQCB jurisdictional waters under Build Alternative 2C that would occur during construction activities include[9]:

- Permanent impacts on 3.938 acres, of which 0.076 acre would occur on wetland WoUS/WoS
- Temporary impacts on 1.1.782 acres, of which 0.236 acre would occur on wetland WoUS/WoS
- Shading effects would convert 0.042 acre wetland WoUS/WoS to non-wetland WoUS/WoS
- Roadbed removal would rehabilitate 0.071 acre of non-wetland WoUS/WoS

No vernal pools or vernal pool watersheds would be affected by this build alternative. The impacts on USACE jurisdictional USACE/RWQCB jurisdictional waters are detailed in Section 3.18, *Wetlands and Other Waters* (refer to Table 3.18-3).

Potential long-term effects pm federal jurisdictional waters during operation of the proposed project under Build Alternative 2C are similar to those under Build Alternative 1. There would be a potentially significant impact on federal jurisdictional waters due to the regional and rapid decline of wetlands and non-wetland waters.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, described under Build Alternative 1 would also be implemented under Build Alternative 2C to reduce construction-related effects on federal jurisdictional waters.

Measure **WET-1 (NES BIO-14)** (in Section 3.18.4) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1 for wetlands and 1:1 for non-wetlands) or temporary impacts (minimum 1:1) on USACE wetlands and non-wetlands, including any effects from permanent shading of wetland WoUS/WoS (minimum 2:1). Final compensatory mitigation requirements will be negotiated with the resource agencies during final project design and project permitting. The measures and permits identified under Build Alternative 1 would also apply to Build Alternative 2C and would ensure any adverse impacts from Build Alternative 2C on federal wetlands and other waters will be reduced to below a level of significance under CEQA.

[9] Aquatic resources within the project area were delineated according to the 1987 Wetland Delineation Manual, Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, and A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States. The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting.

CDFW Wetlands

Impacts on CDFW wetlands under Build Alternative 2C that would occur on CDFW wetlands during construction activities include:

- Permanent impacts would occur on 1.283 acres of CDFW wetlands
- Temporary impacts would occur on 1.685 acres of CDFW wetlands

Shading effects from construction of new or expanded bridges may convert 0.136 acre of CDFW wetland to state unvegetated streambed. As identified under 4.2.4(b) above for Build Alternative 2C, roadbed removal would rehabilitate 0.173 acre of CDFW jurisdictional streambeds, of which 0.065 acre of CDFW wetland would be restored and be considered a beneficial effect of Build Alternative 2C. The impacts on CDFW wetlands are detailed in Section 3.18, *Wetlands and Other Waters* (refer to Table 3.18-4).

Potential long-term effects on CDFW wetlands during operation of the proposed project under Build Alternative 2C are similar to those under Build Alternative 1. There would be a potentially significant impact on CDFW wetlands due to the regional and rapid decline of this resource.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, described under Build Alternative 1 would also be implemented under Build Alternative 2C to reduce construction-related effects on CDFW wetlands. Measure **WET-1 (NES BIO-14)** (in Section 3.18.4) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1), temporary impacts (minimum 1:1), and shading effects (2:1) for CDFW wetlands. Build Alternative 2C also will require a Lake and Streambed Alteration Agreement from CDFW. Final compensatory mitigation requirements will be negotiated with CDFW during final project design and project permitting. These measures would ensure any adverse effects from Build Alternative 2C on CDFW wetlands will be reduced to below a level of significance under CEQA.

Lake Mathews MSHCP (Build Alternative 2C)

Less than Significant with Mitigation

Impacts on federal jurisdictional waters present within the LM MSHCP area are included in the impacts described above for Build Alternative 2C. Specifically, permanent impacts would occur on 1.184 acres and temporary impacts would occur on 0.336 acre on WoUS/WoS present within the LM MSHCP area. Although no permanent effects on wetland WoUS/WoS would occur within the LM MSHCP area, there would be temporary effects on 0.003 acre wetland WoUS/WoS. CDFW wetlands would have less than 0.001 acre permanent impacts and 0.037 acre temporary impacts.

The measures and project permits required for Build Alternative 2C would apply within the LM MSHCP area, and reduce adverse impacts from Build Alternative 2C on federal and state wetlands and other waters within the LM MSHCP area to a less-than-significant level under CEQA.

Build Alternative 4—El Sobrante Alignment

Less than Significant with Mitigation

USACE/RWQCB Jurisdictional Waters

Impacts on USACE/RWQCB jurisdictional waters under Build Alternative 4 that would occur during construction activities include[10]:

- Permanent impacts on 1.436 acres, of which 0.82 acre would occur on wetland WoUS/WoS
- Temporary impacts on 1.561 acres, of which 0.233 acre would occur on wetland WoUS/WoS
- Shading effects would convert 0.042 acre wetland WoUS/WoS to non-wetland WoUS/WoS
- Roadbed removal would rehabilitate 0.081 acre of non-wetland WoUS/WoS

No vernal pools or vernal pool watersheds would be affected by this build alternative. The impacts are detailed in Section 3.18, *Wetlands and Other Waters* (refer to Table 3.18-3).

Potential long-term effects on federal jurisdictional waters during operation of the proposed project under Build Alternative 4 are similar to those under Build Alternative 1. There would be a potentially significant impact on federal jurisdictional waters due to the regional and rapid decline of wetlands and non-wetland waters.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, described under Build Alternative 1 would also be implemented under Build Alternative 4 to reduce construction-related effects on federal jurisdictional waters.

Measure **WET-1 (NES BIO-14)** (in Section 3.18.4) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1 for wetlands and 1:1 for non-wetlands) or temporary impacts (minimum 1:1) on USACE wetlands and non-wetlands, including any effects from permanent shading of wetland WoUS/WoS (minimum 2:1). Final compensatory mitigation requirements will be negotiated with the resource agencies during final project design and project permitting. The measures and permits identified under Build Alternative 1 would also apply to Build Alternative 4 and would ensure any adverse impacts from Build Alternative 4 on federal wetlands and other waters will be reduced to below a level of significance under CEQA.

CDFW Wetlands

Impacts on CDFW wetlands under Build Alternative 4 that would occur on CDFW wetlands during construction activities include:

[10] Aquatic resources within the project area were delineated according to the 1987 Wetland Delineation Manual, Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, and A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States. The extent of jurisdiction was not refined based on the definition established by the Navigable Waters Protection Rule. Acreages represented are conservative and may be reduced in the future based on the regulations in place when the project is finalized and goes to permitting.

- Permanent impacts would occur on 7.083 acres of CDFW wetlands
- Temporary impacts would occur on 2.187 acres of CDFW wetlands

Shading effects from construction of new or expanded bridges would convert 0.136 acre of CDFW wetland to state unvegetated streambed. As identified under 4.2.4(b), above, roadbed removal would rehabilitate 0.179 acre of CDFW jurisdictional streambeds, of which 0.05 acre of CDFW wetland would be restored and is considered a beneficial effect of Build Alternative 4. The impacts on CDFW wetlands are detailed in Section 3.18, *Wetlands and Other Waters* (refer to Table 3.18-4).

The long-term and operational effects under Build Alternative 4 would be the same as those identified under Build Alternative 1, above; however, this effect would not differ appreciably from existing conditions along existing roadways. There would be a potentially significant impact on CDFW wetlands due to the regional and rapid decline of this resource.

Measures **NC-4 (NES BIO-4)** through **NC-6 (NES BIO-6)** and **NC-10 (NES BIO-10)** through **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*, and **PF WQ-3** and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, described under Build Alternative 1 would also be implemented under Build Alternative 4 to reduce construction-related effects on CDFW wetlands. In addition, Measure **WET-1 (NES BIO-14)** (in Section 3.18.4) would ensure full compensatory mitigation through an in-lieu fee program or mitigation bank for permanent impacts (minimum 3:1), temporary impacts (minimum 1:1), and shading effects (1:1) on CDFW wetlands. Build Alternative 4 will also require a Lake and Streambed Alteration Agreement from CDFW. Final compensatory mitigation requirements will be negotiated with CDFW during final project design and project permitting. These measures would ensure any adverse effects from Build Alternative 4 on CDFW jurisdictional streambeds will be reduced to below a level of significance under CEQA.

Lake Mathews MSHCP (Build Alternative 4)

Less than Significant with Mitigation

Impacts on federal jurisdictional waters present within the LM MSHCP area are included in the impacts described above for Build Alternative 4. Specifically, permanent impacts would occur on 0.057 acre and temporary impacts would occur on 0.018 acre on WoUS/WoS present within the LM MSHCP area. There would be no impacts on wetlands within the LM MSHCP area under Build Alternative 4.

The measures and project permits required for Build Alternative 4 would apply within the LM MSHCP area, and reduce adverse impacts from Build Alternative 4 on federal wetlands and other waters within the LM MSHCP area to a less-than-significant level under CEQA.

No CDFW wetlands are present within the LM MSHCP area; therefore, no impacts would occur.

4.2.4(d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Build Alternative 1—Cajalco Alignment

Less than Significant with Mitigation

Fish and Wildlife Movement and Migration

Build Alternative 1 would result in impacts on wildlife movement and connectivity by creating a wider roadway and removing habitat within regional wildlife connectivity areas and WRC MSHCP cores and linkages as summarized below:

- Existing Core C: 210.04 acres permanent and 27.33 acres temporary
- Proposed Extension of Existing Core 2: 52.60 acres permanent and 8.37 acres temporary
- Proposed Linkage 3: 2.95 acres permanent and 3.54 acres temporary

Such impacts may result in direct effects such as decreased habitat connectivity (i.e., increased habitat fragmentation), decreased wildlife movement, and increased wildlife-vehicle collisions. Indirect effects may include wildlife road avoidance behavior caused by increases in noise, traffic, lighting, and disturbance. Details for impacts on each of the WRC MSHCP cores/linkages are provided in Table 3.17-17 in Section 3.17.3.3.

Although the project will directly and indirectly affect these wildlife connectivity areas, there are currently no dedicated wildlife crossings in the BSA. However, there are existing structures such as bridges and culverts that may opportunistically support some wildlife movement. Lack of median barriers or existing wildlife fencing does not hinder movement across existing roadways for some species. Existing roads could also restrict movement by other species that do not cross these facilities. As discussed in Section 3.17.3.3 in *Natural Communities*, any existing movement across roadways increases risk of wildlife and vehicle collisions.

The proposed project has incorporated 73 wildlife crossings (including modified culverts designed to facilitate both hydrologic flows and wildlife movement) into the Build Alternative 1 design to facilitate wildlife movement. Wildlife fencing would also be incorporated to direct wildlife toward crossing structures and prohibit movement across the roadway. Fish movement would not be affected because all crossing structures would completely span all waterways and would not present an obstruction to fish movement. Wildlife migration would not be affected because the proposed Build Alternative 1 would facilitate movement through the project area.

Wildlife crossing structures would be designed for small (e.g., small mammals and reptiles), medium (e.g., raccoons and coyotes), and large animals (e.g., mule deer and mountain lion), and range from small crossings and culverts to large expansive bridges. The majority of the wildlife crossings and modified culverts would occur within the WRC MSHCP Core and Linkage areas and meet the minimum design guidelines in Section 7.5.2 of the WRC MSHCP, with modifications added as needed to accommodate species requirements and design specifications warranted by current science. Refer to Appendix J for the detailed analysis and mapped locations of all proposed wildlife crossings.

In addition to the incorporation of WRC MSHCP Guidelines for Construction of Wildlife Crossings throughout Build Alternative 1, the proposed project would include a wildlife fencing plan (**NC-16 [NES BIO-19]**) to ensure wildlife do not encroach on or get trapped within the roadway. Such fencing would facilitate both the use of wildlife crossings (i.e., facilitating wildlife movement and connectivity) and reductions in wildlife-vehicle collision (i.e., improved road safety). In addition, implementation of Measure **NC-20 (NES BIO-21)** would ensure that PQP lands are replaced, preserving potential core/linkages areas in the future.

- **NC-16 (NES BIO-19):** Wildlife Fencing Plan
- **NC-20 (NES BIO-21):** Replacement of PQP Lands

Because Build Alternative 1 will enhance wildlife movement through WRC MSHCP Cores and Linkages through the addition of 73 dedicated wildlife crossings serving a variety of wildlife species, and with the incorporation of **NC-16 (NES BIO-19)**, and **NC-20 (NES BIO-21)**, the impacts on WRC MSHCP Cores and Linkages and wildlife connectivity and movement through the region would be a beneficial effect. Therefore, this impact will be less than significant under CEQA.

Wildlife Nursery Sites

The habitats within the project area support native wildlife nesting and rearing (breeding) and many species of native wildlife are expected to breed in the area. Direct removal and disturbance of vegetation, other habitats, and water quality (aquatic species) could directly harm wildlife and their breeding success and/or offspring or disturb breeding activities, interfering with successful reproduction. Implementation of Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)**, **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)**, **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)**, **PF WQ-1** through **PF WQ-4**, and **WET-1 (NES BIO-14)** would reduce potential direct and indirect impacts on native wildlife breeding activities and ensure that any removed and disturbed breeding habitat is replaced and restored.

Lake Mathews MSHCP (Build Alternative 1)

Less than Significant with Mitigation

Fish and Wildlife Movement and Migration

The direct and indirect effects identified above from Build Alternative 1 would also occur adjacent to the LM MSHCP plan area. A number of the wildlife crossings identified for Build Alternative 1 would be constructed near the LM MSHCP area and therefore could improve connectivity for LM MSHCP target species throughout the LMR and adjacent lands.

With implementation of wildlife crossing structures, **NC-16 (NES BIO-19)**, **NC-20 (NES BIO-21)** (Replacement of PQP Lands), WRC MSHCP guidelines, and avoidance, minimization, and mitigation measures listed above, Build Alternative 1 is not expected to disrupt connectivity of LM MSHCP species and would likely improve connectivity through the plan area.

Wildlife Nursery Sites

The habitats within the LM MSHCP area that would be affected under Build Alternative 1 support native wildlife nesting and rearing (breeding) and many species of native wildlife are

expected to breed in the LM MSHCP area. Direct removal and disturbance of vegetation, other habitats, and water quality (aquatic species) could directly harm wildlife and their breeding success and/or offspring or disturb breeding activities, interfering with successful reproduction. Implementation of Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)**, **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)**, **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)**, **PF WQ-1** through **PF WQ-4**, and **WET-1 (NES BIO-14)** would reduce potential direct and indirect impacts on native wildlife breeding activities and ensure that any removed and disturbed breeding habitat is replaced and restored.

Build Alternative 2C—Modified Cajalco Alignment

Less than Significant with Mitigation

Fish and Wildlife Movement and Migration

The impacts on wildlife movement and connectivity under Build Alternative 2C would be similar to the direct effects described under Build Alternative 1. Build Alternative 2C would widen the existing roadway and create a new roadway through conserved lands, removing habitat within regional wildlife connectivity areas and WRC MSHCP Cores and Linkages, as summarized below:

- Existing Core C: 215.39 acres permanent and 35.05 acres temporary
- Proposed Extension of Existing Core 2: 55.65 acres permanent and 8.63 acres temporary
- Proposed Linkage 3: 2.95 acres permanent and 3.54 acres temporary

Such impacts may result in direct effects such as decreased habitat connectivity (i.e., increased habitat fragmentation), decreased wildlife movement, and increased wildlife-vehicle collisions. Indirect effects may include wildlife road avoidance behavior caused by increases in noise, traffic, lighting, and disturbance. Details for impacts on each of these cores/linkages are provided in Table 3.17-17 in Section 3.17.3.3.

Although the project will directly and indirectly affect these wildlife connectivity areas, there are no dedicated wildlife crossings currently in the BSA. However, there are existing structures such as bridges and culverts that may facilitate wildlife movement. Lack of median barriers or existing wildlife fencing does not hinder movement across existing roadways for some species. Existing roads could also restrict movement by other species that do not cross these facilities. As discussed in Section 3.17.3.3 in *Natural Communities*, any existing movement across roadways increases risk of wildlife and vehicle collisions.

The proposed project has incorporated 71 wildlife crossings (including modified culverts designed to facilitate both hydrologic flows and wildlife movement) into the Build Alternative 2C design to facilitate wildlife movement. Wildlife fencing would also be incorporated to direct wildlife toward crossing structures and prohibit movement across the roadway. Fish movement would not be affected because all crossing structures would completely span all waterways and would not present an obstruction to fish movement. Wildlife migration would not be affected because the proposed Build Alternative 2C would facilitate movement through the project area.

Similar to Build Alternative 1, wildlife crossing structures for Build Alternative 2C would be designed for small, medium, and large animals, and range from small crossings and culverts to

large expansive bridges. The majority of the wildlife crossings and modified culverts would occur within the WRC MSHCP Core and Linkage areas and meet the minimum design guidelines in Section 7.5.2 of the WRC MSHCP, with modifications added as needed to accommodate species requirements and design specifications warranted by current science. Refer to Appendix J for the detailed analysis and mapped locations of all proposed wildlife crossings.

In addition to the incorporation of WRC MSHCP Guidelines for Construction of Wildlife Crossings throughout Build Alternative 2C, the proposed project would include a wildlife fencing plan (**NC-16 [NES BIO-19]**) to ensure wildlife do not encroach on or get trapped within the roadway. Such fencing would facilitate both the use of wildlife crossings (i.e., facilitating wildlife movement and connectivity) and reductions in wildlife-vehicle collision (i.e., improved road safety). In addition, implementation of Measure **NC-20 (NES BIO-21)** would ensure that PQP lands are replaced, preserving potential core/linkages areas in the future. Because Build Alternative 2C will enhance wildlife movement through WRC MSHCP Cores and Linkages through the addition of 71 dedicated wildlife crossings serving a variety of wildlife species, and with the incorporation of **NC-16 (NES BIO-19)** and **NC-20 (NES BIO-21)**, the impacts on WRC MSHCP Cores and Linkages and wildlife connectivity and movement through the region would be a beneficial effect. Therefore, this impact will be less than significant under CEQA.

Wildlife Nursery Sites

The habitats within the Build Alternative 2C support native wildlife nesting and rearing (breeding) and many species of native wildlife are expected to breed in the area. Direct removal and disturbance of vegetation, other habitats, and water quality (aquatic species) could directly harm wildlife and their breeding success and/or offspring or disturb breeding activities, interfering with successful reproduction. Implementation of Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)**, **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)**, **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)**, **PF WQ-1** through **PF WQ-4**, and **WET-1 (NES BIO-14)** would reduce potential direct and indirect impacts on native wildlife breeding activities and ensure that any removed and disturbed breeding habitat is replaced and restored.

Lake Mathews MSHCP (Build Alternative 2C)

Less than Significant with Mitigation

Fish and Wildlife Movement and Migration

The direct and indirect effects identified above from Build Alternative 2C would also occur adjacent to the LM MSHCP plan area. A number of the wildlife crossings identified for Build Alternative 2C would be constructed near the LM MSHCP area and therefore could improve connectivity for LM MSHCP target species throughout the LMR and adjacent lands.

With implementation of wildlife crossing structures, **NC-16 (NES BIO-19)**, **NC-20 (NES BIO-21)**, WRC MSHCP guidelines, and avoidance, minimization, and mitigation measures listed above, Build Alternative 2C is not expected to disrupt connectivity of LM MSHCP species and would likely improve connectivity through the plan area.

Wildlife Nursery Sites

The habitats within the LM MSHCP area that would be affected under Build Alternative 1 support native wildlife nesting and rearing (breeding) and many species of native wildlife are expected to breed in the LM MSHCP area. Direct removal and disturbance of vegetation, other habitats, and water quality (aquatic species) could directly harm wildlife and their breeding success and/or offspring or disturb breeding activities, interfering with successful reproduction. Implementation of Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)**, **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)**, **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)**, **PF WQ-1** through **PF WQ-4**, and **WET-1 (NES BIO-14)** would reduce potential direct and indirect impacts on native wildlife breeding activities and ensure that any removed and disturbed breeding habitat is replaced and restored.

Build Alternative 4—El Sobrante Alignment

Less than Significant with Mitigation

Fish and Wildlife Movement and Migration

The impacts on wildlife movement and connectivity under Build Alternative 4 would be similar to the direct effects described under Build Alternative 1. Build Alternative 4 would widen existing roadways, removing habitat within regional wildlife connectivity areas and WRC MSHCP cores and linkages, as summarized below:

- Existing Core C: 82.32 acres permanent and 12.99 acres temporary
- Proposed Extension of Existing Core 2: 93.51 acres permanent and 16.68 acres temporary
- Proposed Linkage 3: 0.98 acre permanent

Such impacts may result in direct effects such as decreased habitat connectivity (i.e., increased habitat fragmentation), decreased wildlife movement, and increased wildlife-vehicle collisions. Indirect effects may include wildlife road avoidance behavior caused by increases in noise, traffic, lighting, and disturbance. Details for impacts on each of these cores/linkages are provided in Table 3.17-17 in Section 3.17.3.3.

Although the project will directly and indirectly affect these wildlife connectivity areas, there are no dedicated wildlife crossings currently in the BSA. However, there are existing structures such as bridges and culverts that may facilitate wildlife movement. Lack of median barriers or existing wildlife fencing does not hinder movement across existing roadways for some species. Existing roads could also restrict movement by other species that do not cross these facilities. As discussed in Section 3.17.3.3 in *Natural Communities*, any existing movement across roadways increases risk of wildlife and vehicle collisions.

The proposed project has incorporated 51 wildlife crossings (including modified culverts designed to facilitate both hydrologic flows and wildlife movement) into the Build Alternative 4 design to facilitate wildlife movement. Wildlife fencing would also be incorporated to direct wildlife toward crossing structures and prohibit movement across the roadway. Fish movement would not be affected because all crossing structures would completely span all waterways and would not present an obstruction to fish movement. Wildlife migration would not be affected because the proposed Build Alternative 4 would facilitate movement through the project area.

Similar to Build Alternative 1 described above, wildlife crossing structures for Build Alternative 4 would be designed for small, medium, and large animals, and range from small crossings and culverts to large expansive bridges. The majority of the wildlife crossings and modified culverts would occur within the WRC MSHCP Core and Linkage areas and meet the minimum design guidelines in Section 7.5.2 of the WRC MSHCP, with modifications added as needed to accommodate species requirements and design specifications warranted by current science. Refer to Appendix J for the detailed analysis and mapped locations of all proposed wildlife crossings.

In addition to the incorporation of WRC MSHCP Guidelines for Construction of Wildlife Crossings throughout Build Alternative 4, the proposed project would include a wildlife fencing plan (**NC-16 [NES BIO-19]**) to ensure wildlife do not encroach on or get trapped within the roadway. Such fencing would facilitate both the use of wildlife crossings (i.e., facilitating wildlife movement and connectivity) and reductions in wildlife-vehicle collision (i.e., improved road safety). In addition, implementation of Measure **NC-20 (NES BIO-21)** would also ensure that PQP lands are replaced, preserving potential core/linkages areas in the future. Because Build Alternative 4 will enhance wildlife movement through WRC MSHCP Cores and Linkages through the addition of 51 dedicated wildlife crossings serving a variety of wildlife species, and with the incorporation of **NC-16 (NES BIO-19)** and **NC-20 (NES BIO-21)**, the impacts on WRC MSHCP Cores and Linkages and wildlife connectivity and movement through the region would be a beneficial effect. Therefore, this impact will be less than significant under CEQA.

Wildlife Nursery Sites

The habitats within Build Alternative 4 support native wildlife nesting and rearing (breeding) and many species of native wildlife are expected to breed in the area. Direct removal and disturbance of vegetation, other habitats, and water quality (aquatic species) could directly harm wildlife and their breeding success and/or offspring or disturb breeding activities, interfering with successful reproduction. Implementation of Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)**, **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)**, **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)**, **PF WQ-1** through **PF WQ-4**, and **WET-1 (NES BIO-14)** would reduce potential direct and indirect impacts on native wildlife breeding activities and ensure that any removed and disturbed breeding habitat is replaced and restored.

Lake Mathews MSHCP (Build Alternative 2C)

Less than Significant with Mitigation

Fish and Wildlife Movement and Migration

The direct and indirect effects identified above for Build Alternative 2C would also occur adjacent to the LM MSHCP plan area. A number of the wildlife crossings identified for Build Alternative 4 would be constructed near the LM MSHCP area and therefore could improve connectivity for LM MSHCP target species throughout the LMR and adjacent lands.

With implementation of wildlife crossing structures, **NC-16 (NES BIO-19)**, **NC-20 (NES BIO-21)**, WRC MSHCP guidelines, and avoidance, minimization, and mitigation measures listed above, Build Alternative 2C would not be expected to disrupt connectivity of LM MSHCP species and would likely improve connectivity through the plan area.

Wildlife Nursery Sites

The habitats within the LM MSHCP area that would be affected under Build Alternative 2C support native wildlife nesting and rearing (breeding) and many species of native wildlife are expected to breed in the LM MSHCP area. Direct removal and disturbance of vegetation, other habitats, and water quality (aquatic species) could directly harm wildlife and their breeding success and/or offspring or disturb breeding activities, interfering with successful reproduction. Implementations of Measures **NC-1 (NES BIO-1)** through **NC-19 (NES BIO-15)**, **AS-1 (NES BIO-25)** through **AS-7 (NES BIO-20)**, **TE-1 (NES BIO-18)** through **TE-3 (NES BIO-30)**, **PF WQ-1** through **PF WQ-4**, and **WET-1 (NES BIO-14)** would reduce potential direct and indirect impacts on native wildlife breeding activities and ensure that any removed and disturbed breeding habitat is replaced and restored.

4.2.4(e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Build Alternatives 1, 2C, and 4

No Impact

The proposed project would not conflict with any local policies including tree preservation policy or ordinance; therefore, no impacts would occur. No avoidance, minimization, or mitigation measures are required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would not conflict with any local policies including tree preservation policy or ordinance within the LM MSHCP area; therefore, no impacts would occur. No avoidance, minimization, or mitigation measures are required.

4.2.4(f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Build Alternative 1—Cajalco Alignment

Less than Significant with Mitigation

Build Alternative 1 occurs within the boundaries of the WRC MSHCP, SKR HCP, and LM MSHCP.

Western Riverside County MSHCP

The proposed project is a covered activity under Section 7.2.2 (Circulation Element Roads) of the WRC MSHCP Volume I and occurs within both the Criteria Area and PQP land. As a permittee, the County is required to meet obligations described in Section 13.2 of the WRC MSHCP Implementation Agreement and conditions in the 10(a)(1)(B) take permit, including:

- Comply with the policies for the "Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools" as set forth in Section 6.1.2 of the WRC MSHCP;
- Comply with the policies for the "Protection of Narrow Endemic Plant Species" as set forth in Section 6.1.3 of the WRC MSHCP;
- Conduct surveys as set forth in Section 6.3.2 of the WRC MSHCP;
- Comply with the "Urban/Wildlands Interface Guidelines" as set forth in Section 6.1.4 of the WRC MSHCP;
- Comply with the BMPs and siting requirements and design criteria as set forth in Section 7.0 and Appendix C of the WRC MSHCP;
- Acquire and replace PQP habitat at a no less than 1:1 ratio that is biologically equivalent or superior to the disturbed habitat.

The proposed project was also designed to comply with WRC MSHCP, Section 7.5.2, "Guidelines for Construction of Wildlife Crossings." In addition, the proposed project must complete the Joint Project Review (JPR) with the RCA and demonstrate consistency with the WRC MSHCP. A full WRC MSHCP consistency analysis was performed in Section 5.12 of the NES and is also detailed in Section 3.17, *Natural Communities*.

In addition to meeting the requirements of the WRC MSHCP described above, the take allowance within the Criteria Area consists of a 128-foot right of way (approximately 96.51 acres) as identified under in the General Plan Circulation Element for Cajalco Road (Figure 7-1 in the WRC MSHCP Volume I). Because project impacts from Build Alternative 1 extend beyond the 128-foot right of way to accommodate slope easements and appurtenant facilities, Build Alternative 1 would also trigger a minor amendment of the WRC MSHCP document (in Section 6.10.2 of the WRC MSHCP). The County will submit a request for a minor amendment to the RCA prior to the submittal of the JPR. The minor amendment analysis will review the effects of grading/slopes outside of the covered roadway on the Rough Step status of vegetation communities, future Reserve assembly, and Reserve connectivity. The approved minor amendment will be provided in the Final EIR/EIS. In addition, the County will work with the RCA to reduce the maximum right of way from another County facility through the minor amendment to accommodate any additional right of way acquisition that may be needed.

The following measures will be required for WRC MSHCP compliance:

- **NC-1 (NES BIO-1):** Seasonal Vegetation Clearing Restrictions
- **NC-2 (NES BIO-2):** Dust Control
- **NC-3 (NES BIO-3):** Fire Prevention
- **NC-4 (NES BIO-4):** Environmental Awareness Training
- **NC-5 (NES BIO-5):** Biological Monitoring
- **NC-6 (NES BIO-6):** ESA Fencing
- **NC-7 (NES BIO-7):** Invasive Species Removal
- **NC-8 (NES BIO-8):** Cleaning Construction Equipment

- **NC-9 (NES BIO-24):** Disposal of Trash
- **NC-10 (NES BIO-10):** Water Pollution and Erosion Control Plans
- **NC-11 (NES BIO-11):** Defining the Limits of Disturbance
- **NC-12 (NES BIO-12):** Placement of Construction Equipment
- **NC-14 (NES BIO-13):** Preparation of the DBESP
- **NC-15 (NES BIO-14):** Replacement of Riparian/Riverine Resources
- **NC-16 (NES BIO-19):** Wildlife Fencing Plan
- **NC-20 (NES BIO-21):** Replacement of PQP Lands
- **AS-1 (NES BIO-25):** Burrowing Owl Management Plan
- **AS-2 (NES BIO-16):** Lighting Restrictions
- **AS-3 (NES BIO-28):** Preconstruction Wildlife Surveys
- **TE-2 (NES BIO-23):** Replacement of Least Bell's Vireo Habitat

These measures will ensure consistency with the WRC MSHCP and will reduce the level of significance under CEQA with mitigation incorporated.

Stephens' Kangaroo Rat HCP

A portion of Build Alternative 1 occurs within the Lake Mathews-Estelle Mountain Core Reserve (LM-EM Reserve) (part of the SKR Core Reserve system) and is subject to requirements of the long-term SKR HCP, including acquisition of replacement lands for the SKR Core Reserve system. Approximately 121.82 acres (7.00 acres of the RCHCA SKR Reserve and 114.82 acres of the LMR) would be permanently removed. Take authorization for potential impacts on SKR outside of the SKR Core Reserve would be provided through consistency with the WRC MSHCP. The direct removal of lands within the SKR Core Reserve would conflict with the SKR HCP goal of preservation of habitat for SKR, resulting in a significant effect under CEQA.

However, the WRC MSHCP and long-term SKR HCP require a minimum 1:1 replacement of SKR Core Reserve with habitat that is biologically equivalent or superior and that could be added back into the SKR Core Reserve. This will be achieved through the implementation of the following compensatory measures:

- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area
- **NC-20 (NES BIO-21):** Replacement of PQP Lands

The replacement of Core Reserve lands with **NC-17 (NES BIO-17)** and **NC-20 (NES BIO-21)**, and restoration of temporarily affected SKR Core Reserve (**NC-19 [NES BIO-15]**) will ensure the project is consistent with the long-term SKR HCP.

Lake Mathews MSHCP (Build Alternative 1)

Potentially Significant Impact

Build Alternative 1 is not a covered activity under the LM MSHCP. Build Alternative 1 would permanently remove 120.31 acres of habitat designated for LM MSHCP target species and temporarily affect 20.79 acres. Roadbed removal along Cajalco Road would restore 0.14 acre that could potentially be added back into the LMR. Because Build Alternative 1 is not a covered project under the LM MSHCP and would directly remove habitat within the LMR, this project would directly conflict with the provisions of the LM MSHCP, resulting in a significant effect under CEQA.

Discussions have occurred between the County, MWD, and the Lake Mathews Reserve Management Committee (RMC) to identify sufficient mitigation that would ensure full replacement of lost lands and feasible management of these replacement lands, including:

- **NC-16 (NES BIO-19):** Wildlife Fencing Design Plan
- **NC-17 (NES BIO-17):** Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31):** Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15):** Restoration for Temporary Impacts within the LM MSHCP Area

Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** would ensure full replacement/restoration of lands that are directly affected during construction. Measure **NC-16 (NES BIO-19)** would include strategies for integrating wildlife fencing with the MWD security fencing. Measure **NC-18 (NES BIO-31)** will establish a funding mechanism to cover costs associated with the long-term management of new conservation lands, including maintenance of new fencing and installation of security cameras near wildlife crossing areas to deter human trespass into MWD lands and facilities.

In addition to the measures described above, modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties. As described in Section 3.17.3.6, Build Alternative 1 would expand and realign Cajalco Road, and construct drainage basins, culverts, bridges, and wildlife crossings through the LM MSHCP area. Build Alternative 1 would permanently remove 120.31 acres of habitat designated for LM MSHCP target species and temporarily affect 20.79 acres. Roadbed removal along Cajalco Road would restore 0.14 acre that can be added back into the LMR. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required as part of the project to accommodate the proposed roadway improvements. Impacts would be considered significant and unavoidable.

Build Alternative 2C—Modified Cajalco Alignment

Less than Significant with Mitigation

Build Alternative 2C occurs within the boundaries of the WRC MSHCP, SKR HCP, and LM MSHCP.

Western Riverside County MSHCP

The proposed project is a covered activity under Section 7.2.2 (Circulation Element Roads) of the WRC MSHCP Volume I, and occurs within both the Criteria Area and PQP land. The County is a permittee of the WRC MSHCP and obligations are described in Section 13.2 of the WRC MSHCP Implementation Agreement and conditions in the 10(a)(1)(B) take permit, including:

- Comply with the policies for the "Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools" as set forth in Section 6.1.2 of the WRC MSHCP;
- Comply with the policies for the "Protection of Narrow Endemic Plant Species" as set forth in Section 6.1.3 of the WRC MSHCP;
- Conduct surveys as set forth in Section 6.3.2 of the WRC MSHCP;
- Comply with the "Urban/Wildlands Interface Guidelines" as set forth in Section 6.1.4 of the WRC MSHCP;
- Comply with the BMPs and the siting requirements and design criteria as set forth in Section 7.0 and Appendix C of the WRC MSHCP; and
- Acquire and replace PQP habitat at a no less than 1:1 ratio that is biologically equivalent or superior to the disturbed habitat.

Build Alternative 2C was also designed to comply with WRC MSHCP, Section 7.5.2, "Guidelines for Construction of Wildlife Crossings." In addition, the proposed project must complete the Joint Project Review with the RCA and demonstrate consistency with the WRC MSHCP. A full WRC MSHCP consistency analysis was performed in Section 5.12 of the NES and is also detailed in Section 3.17, *Natural Communities*.

In addition to meeting the requirements of the WRC MSHCP described above, the take allowance for Build Alternative 2C within the Criteria Area consists of a 128-foot right of way (approximately 96.51 acres) as identified under in the General Plan Circulation Element for Cajalco Road (Figure 7-1 in the WRC MSHCP Volume I). Because project impacts from Build Alternative 2C extend beyond the 128-foot right of way to accommodate slope easements and appurtenant facilities, Build Alternative 2C would also trigger a minor amendment of the WRC MSHCP document (in Section 6.10.2 of the WRC MSHCP). The County will submit a request for a minor amendment to the RCA prior to the submittal of the JPR. The minor amendment analysis will review the effects of grading/slopes outside of the covered roadway on the Rough Step status of vegetation communities, future Reserve assembly, and Reserve connectivity. The approved minor amendment will be provided in the Final EIR/EIS. In addition, the County will work with the RCA to reduce the maximum right of way from another County facility through the minor amendment to accommodate any additional right of way acquisition that may be needed.

The measures identified for Build Alternative 1 will also apply to Build Alternative 2C and will ensure the project's consistency with the WRC MSHCP, reducing the level of significance under CEQA with mitigation incorporated.

Stephens' Kangaroo Rat HCP

A portion of Build Alternative 2C occurs within the RCHCA SKR Reserve and is subject to requirements of the SKR HCP, including acquisition of replacement lands for the SKR Core Reserve. Approximately 140.44 acres (32.91 acres of the RCHCA SKR Reserve and 107.53 acres of the LMR) would be permanently removed. Take authorization for potential impacts on SKR outside of the SKR Core Reserve would be provided through consistency with the WRC MSHCP.

The replacement of Core Reserve lands with **NC-17 (NES BIO-17)** and **NC-20 (NES BIO-21)**, and restoration of temporarily affected Core Reserve (**NC-19 [NES BIO-15]**) (identified previously under Build Alternative 1) will ensure the project is consistent with the long-term SKR HCP.

Lake Mathews MSHCP (Build Alternative 2C)

Potentially Significant Impact

Build Alternative 2C is not a covered activity under the LM MSHCP. Build Alternative 2C would permanently remove 111.21 acres of habitat designated for LM MSHCP target species and temporarily affect 22.44 acres. Roadbed removal along Cajalco Road would restore 0.16 acre that could potentially be added back into the LMR. Because Build Alternative 2C is not a covered project under the LM MSHCP and would directly remove habitat within the LMR, this project would directly conflict with the provisions of the LM MSHCP, resulting in a significant effect under CEQA.

As described above under Build Alternative 1, the County has coordinated extensively with MWD and RMC to identify mitigation requirements and opportunities including implementation of Measures **NC-16 (NES BIO-19)** through **NC-19 (NES BIO-15)** under Build Alternative 2C.

Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** would ensure full replacement/restoration of lands that are directly affected during construction. Measure **NC-16 (NES BIO-19)** would include strategies for integrating with the MWD's security fencing. Measure **NC-18 (NES BIO-31)** will establish a funding mechanism to cover costs associated with the long-term management of new conservation lands, including maintenance of new fencing and installation of security cameras near wildlife crossing areas to deter human trespass.

In addition to the measures described above, modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties. As described in Section 3.17.3.6, Build Alternative 2C would expand and realign Cajalco Road and construct drainage basins, culverts, bridges, and wildlife crossings through the LM MSHCP area. Build Alternative 2C would permanently remove 111.21 acres of habitat designated for LM MSHCP target species and temporarily affect 22.44 acres. Roadbed removal along Cajalco Road would restore 0.16 acre that could be added back into the LMR. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow

changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required as part of the project to accommodate the proposed roadway improvements. Impacts would be considered significant and unavoidable.

Build Alternative 4—El Sobrante Alignment

Less than Significant with Mitigation

Build Alternative 4 occurs within the boundaries of the WRC MSHCP, SKR HCP, and LM MSHCP.

Western Riverside County MSHCP

The proposed project is a covered activity under Section 7.2.2 (Circulation Element Roads) of the WRC MSHCP Volume I, and occurs within both the Criteria Area and PQP lands. The County's obligations as a permittee are described in Section 13.2 of the WRC MSHCP Implementation Agreement and conditions in the 10(a)(1)(B) take permit, including:

- Comply with the policies for the "Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools" as set forth in Section 6.1.2 of the WRC MSHCP;
- Comply with the policies for the "Protection of Narrow Endemic Plant Species" as set forth in Section 6.1.3 of the WRC MSHCP;
- Conduct surveys as set forth in Section 6.3.2 of the WRC MSHCP;
- Comply with the "Urban/Wildlands Interface Guidelines" as set forth in Section 6.1.4 of the WRC MSHCP;
- Comply with the BMPs and the siting requirements and design criteria as set forth in Section 7.0 and Appendix C of the WRC MSHCP; and
- Acquire and replace PQP habitat at a no less than 1:1 ratio that is biologically equivalent or superior to the disturbed habitat.

The proposed project was also designed to comply with WRC MSHCP, Section 7.5.2, "Guidelines for Construction of Wildlife Crossings." In addition, the proposed project must complete the Joint Project Review with the RCA and demonstrate consistency with the WRC MSHCP. A full WRC MSHCP consistency analysis was performed in Section 5.12 of the NES and is also detailed in Section 3.17, *Natural Communities*.

In addition to meeting the requirements of the WRC MSHCP described above, the take allowance within the Criteria Area consists of a 196-foot right of way (approximately 96.51 acres) as identified in the General Plan Circulation Element for El Sobrante Road (Figure 7-1 in the WRC MSHCP Volume I). The proposed right of way of Build Alternative 4 will not exceed the 196-foot right of way through the Criteria Area; however, portions of the slope easements and appurtenant facilities may exceed a 196-foot right of way. Therefore, a minor amendment of the WRC MSHCP document as described in Volume I, Section 6.10.2, may be required under Build Alternative 4 to accommodate the slope easements and appurtenant facilities. The County will submit a request for a minor amendment to the RCA prior to the submittal of the JPR. The minor amendment analysis will review the effects of grading/slopes outside of the covered

roadway on the Rough Step status of vegetation communities, future Reserve assembly, and Reserve connectivity. The approved minor amendment will be provided in the Final EIR/EIS.

The measures identified for Build Alternative 1 will also apply to Build Alternative 4 and will ensure the project's consistency with the WRC MSHCP, reducing the level of significance under CEQA with mitigation incorporated.

Stephens' Kangaroo Rat HCP

A portion of Build Alternative 4 occurs within the SKR Core Reserve and is subject to requirements of the SKR HCP, including acquisition of replacement lands for the SKR Core Reserve. Approximately 63.22 acres (7.00 acres of the RCHCA SKR Reserve and 56.22 acres of the LMR) would be permanently removed. Take authorization for potential impacts on SKR outside of the SKR Core Reserve would be provided through consistency with the WRC MSHCP.

The replacement of Core Reserve lands with **NC-17 (NES BIO-17)** and **NC-20 (NES BIO-21)**, and restoration of temporarily affected Core Reserve **NC-19 (NES BIO-15)** (identified previously under Build Alternative 1) will ensure the project is consistent with the long-term SKR HCP.

Lake Mathews MSHCP (Build Alternative 4)

Potentially Significant Impact

Build Alternative 4 is not a covered activity under the LM MSHCP. Build Alternative 4 would permanently remove 56.52 acres of habitat designated for LM MSHCP target species and temporarily affect 8.76 acres. Roadbed removal along Cajalco Road would restore 0.70 acre that could potentially be added back into the LMR. Because Build Alternative 4 is not a covered project under the LM MSHCP and would directly remove habitat within the LMR, this project would directly conflict with the provisions of the LM MSHCP, resulting in a significant effect under CEQA.

As described above under Build Alternative 1, the County has coordinated extensively with MWD and RMC to identify mitigation requirements and opportunities including implementation of Measures **NC-16 (NES BIO-19)** through **NC-19 (NES BIO-15)** under Build Alternative 4. Measures **NC-17 (NES BIO-17)** and **NC-19 (NES BIO-15)** would ensure full replacement/restoration of lands that are directly affected during construction. Measure **NC-16 (NES BIO-19)** would include strategies for integrating with the MWD's security fencing. Measure **NC-18 (NES BIO-31)** will establish a funding mechanism to cover costs associated with the long-term management of new conservation lands, including maintenance of new fencing and installation of security cameras near wildlife crossing areas to deter human trespass.

In addition to the measures described above, modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties. As described in Section 3.17.3.6, Build Alternative 4 would expand and realign La Sierra Avenue and El Sobrante Road through the LM MSHCP area and construct drainage basins, culverts, bridges, and wildlife crossings through the LM MSHCP area. Build Alternative 4 would permanently remove 56.52 acres of habitat designated for LM MSHCP target species and

temporarily affect 8.76 acres. Roadbed removal along Cajalco Road would restore 0.70 acre that can be added back into the LMR. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required as part of the project to accommodate the proposed roadway improvements. Impacts would be significant and unavoidable.

4.2.5 Cultural Resources

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☒	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☒	☐	☐	☐
c) Disturb any human remains, including those interred outside of dedicated cemeteries?	☐	☐	☐	☒

The information and discussion presented in this section are based on Section 3.8, *Cultural Resources*, and 3.25.3.18, *Cumulative Impacts*, of this EIR/EIS, as well as the following reports prepared for the proposed project: *Historic Property Survey Report* (HPSR) (Caltrans 2020a), *Archaeological Survey Report* (ASR) (Caltrans 2020b), *Historical Resources Evaluation Report* (HRER) (Caltrans 2020c), *Archaeological Evaluation Report* (AER) (Caltrans 2020d), and *Finding of Adverse Effect*) (Caltrans 2020e). Caltrans submitted a Finding of Adverse Effect analysis to the State Historic Preservation Officer (SHPO) in accordance with Stipulation VIII.C.6 of the Section 106 PA seeking concurrence with their determinations. On February 17, 2021, SHPO concurred with Caltrans' determinations. Finding of Adverse Effect analysis provided by .

4.2.5(a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?

Build Alternative 1—Cajalco Alignment

Potentially Significant Impact

As discussed in Section 3.8, *Cultural Resources*, nine historical resources would potentially be affected by construction of Build Alternative 1. Build Alternative 1 would permanently affect six National Register of Historic Places (NRHP)/California Register of Historical Resources (CRHR)-eligible archaeological properties:

1. The Mead Valley Potential Prehistoric Archaeological District (PPAD), for which Caltrans has assumed eligibility for listing in the NRHP under Criteria A, B, C, and D for the purposes of this project only, and are assumed eligible for the CRHR under Criteria 1, 2, 3, and 4 (Caltrans' Cultural Studies Office [CSO] Approval on July 7, 2020);
2. Combined site of CA-RIV-2263, 2264, and 4444, which are individually assumed eligible for the NRHP and CRHR under Criterion D/4 and assumed eligible as a contributing element to the PPAD under criterion D/4 (CSO Approval on July 7, 2020);
3. CA-RIV-4454, which is not individually eligible (SHPO concurrence on February 10, 2021), assumed eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of a PPAD (CSO approval on July 7, 2020);

4. CA-RIV-7843 Locus 816, which is individually eligible for listing in the NRHP/CRHR under Criteria A/1, C/3, and D/4 (SHPO Concurrence on February 10, 2021), assumed eligible as a locus of the larger CA-RIV-7843 site that is eligible under Criterion D/4, and eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of a PPAD (CSO approval July 7, 2020);
5. CA-RIV-7843 Locus 817, which is not individually eligible (SHPO concurrence on February 10, 2021), assumed eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of CA-RIV-7843, and for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of a PPAD; and
6. CA-RIV-012623, which is eligible for the NRHP and CRHR under Criterion D/4 (SHPO concurrence on February 10, 2021)(Polanco 2021a).

Build Alternative 1 would also potentially affect three Traditional Cultural Properties (TCPs), *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik,* for which Caltrans has assumed eligibility for listing in the NRHP under Criteria A, B, C, and D for the purposes of this project only (CSO approval on May 7, 2020). Therefore, under CEQA, there would be a potentially significant impact. Standard Project Measures **PF CR-1** and **PF CR-2**, listed in Table 4.2-5, are proposed to avoid or otherwise minimize impacts on historical resources under Build Alternative 1 (refer to Section 3.8, *Cultural Resources*, for **PF CR-1** and **PF CR-2**).

Table 4.2-5. Historical Resources Impact Assessment—Build Alternative 1

Property	Impact Assessment	Standard Project Measures and Mitigation
Mead Valley PPAD	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4454	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-7843, Locus 816	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-7843, Locus 817	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-012623	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
Three traditional cultural properties - *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik*	Less than Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

For the six archaeological resources (Mead Valley PPAD; combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444; CA-RIV-4454; Loci 816 and 817 of CA-RIV-7843; and CA-RIV-012623), while the proposed measures would reduce impacts associated with the proposed project, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on archaeological historical resources would remain significant and unavoidable.

A Section 106 Memorandum of Agreement (MOA) will be developed for all historic properties that will be affected by the project, and will include mitigation measures and treatment for

historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS.

The *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik* TCPs compose an expansive, unbounded, and overlapping geographic area that includes the Area of Potential Effects (APE) and all the project alternatives (refer to Confidential Figures B-2 and B-3 in Appendix A, *Section 4(f)*, of this EIR/EIS). Although the outer boundaries of the TCPs are not known, impacts on the TCPs from the project, including ground-disturbing activities associated with development that would affect individual physical components of the TCPs, are not expected to be significant because they affect a minute portion of the overall geographic extent of the TCPs. Additionally, even though ground-disturbing activities associated with development would affect individual physical components of the TCPs, their loss would not cause a significant impact on the intangible cultural values held by the Luiseño people and would not significantly change the integrity of setting, feeling, character, and location of *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik* to the point that they no longer contribute to the significance of the TCPs.

A number of meetings have been held to discuss tribal concerns and consider mitigation, and Native American tribes have been actively engaged with Caltrans during site testing. Native American input and information has been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternatives 1, 2C, and 4.

An MOA among participating Native American tribes, Caltrans, and the County that would include additional measures for mitigating any adverse effect and would reflect input from the participating Native American tribes will be prepared before the Final EIR/EIS.

Future Six-Lane Facility (Build Alternative 1)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternative 1. If grading, cut, and fill as part of the future six-lane facility are conducted in areas previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and measures described above for Build Alternative 1 would apply, measures and treatment stipulated in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 1, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant. However, with the implementation of measures and treatments developed in the MOA and Standard Project Measures **PF CR-1** and

PF CR-2, the proposed project's impact on the three TCPs, *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik,* would be less than significant.

Lake Mathews MSHCP (Build Alternative 1)

Potentially Significant Impact

The LM MSHCP, as it pertains to cultural resources, would remain unchanged. However, under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed project, which may result in potential impacts on buried archaeological resources within the LM MSHCP area and LMR. As discussed under Build Alternative 1, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant. However, with the implementation of measures and treatments developed in the MOA and Standard Project Measures **PF CR-1** and **PF CR-2**, the proposed project's impact on the three TCPs, *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik,* would be less than significant.

Build Alternative 2C—Modified Cajalco Alignment

Potentially Significant Impact

As discussed in Section 3.8, *Cultural Resources*, nine historical resources would potentially be affected by construction of Build Alternative 2C. Build Alternative 2C would permanently affect the same six NRHP/CRHR-eligible archaeological properties and three TCPs identified under Build Alternative 1, above. Therefore, under CEQA, there would be a potentially significant impact. In an effort to mitigate the significant impacts, measures and treatments developed in the MOA will be implemented. Additionally, Standard Project Measures **PF CR-1** and **PF CR-2**, listed in Table 4.2-6, below, are proposed to avoid or otherwise minimize impacts on historical resources under Build Alternative 2C (refer to Section 3.8, *Cultural Resources*, for **PF CR-1** and **PF CR-2**).

Table 4.2-6. Historical Resources Impact Assessment—Build Alternative 2C

Property	Impact Assessment	Standard Project Measures and Mitigation
Mead Valley PPAD	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4454	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-7843, Locus 816	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-7843, Locus 817	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

Property	Impact Assessment	Standard Project Measures and Mitigation
CA-RIV-012623	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
Three traditional cultural properties - *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik*	Less than Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

For the six archaeological resources (Mead Valley PPAD; combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444; CA-RIV-4454; Loci 816 and 817 of CA-RIV-7843: and CA-RIV-012623), while the proposed measures would reduce impacts associated with the proposed project, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on archaeological historical resources would remain significant and unavoidable. Standard Project Measures **PF CR-1** and **PF CR-2** have been identified to further reduce impacts on cultural resources (see Section 3.8, *Cultural Resources*).

A Section 106 MOA will be developed for all historic properties that will be affected by the project, and will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS.

The *T u'uv, Qax alku Pay mik*, and *Qax alku Kw imik* TCPs compose an expansive, unbounded, and overlapping geographic area that includes the APE and all the project alternatives (refer to Confidential Figures B-2 and B-3 in Appendix A, *Section 4(f)*, of this EIR/EIS). Although the outer boundaries of the TCPs are not known, impacts on the TCPs from the project, including ground-disturbing activities associated with development that would affect individual physical components of the TCPs, are not expected to be significant because they affect a minute portion of the overall geographic extent of the TCPs. Additionally, even though ground-disturbing activities associated with development would affect individual physical components of the TCPs, their loss would not cause a significant impact on the intangible cultural values held by the Luiseño people and would not significantly change the integrity of setting, feeling, character, and location of *T u'uv, Qax alku Pay mik*, and *Qax alku Kw imik* to the point that they no longer contribute to the significance of the TCPs.

A number of meetings have been held to discuss tribal concerns and consider mitigation, and Native American tribes have been actively engaged with Caltrans during site testing. Native American input and information has been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternatives 1, 2C, and 4.

An MOA among participating Native American tribes, Caltrans, and the County that would include additional measures for mitigating any adverse effect and would reflect input from the participating Native American tribes will be prepared before the Final EIR.

Future Six-Lane Facility (Build Alternative 2C)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternative 2C. If grading, cut, and fill as part of the future six-lane facility are conducted in areas previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and measures described above for Build Alternative 2C would apply and measures and treatment developed in the MOA would be implemented; Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 2C, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant. However, with the implementation of the MOA and Standard Project Measures **PF CR-1** and **PF CR-2**, the proposed project's impact on the three TCPs, *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik,* would be less than significant.

Lake Mathews MSHCP (Build Alternative 2C)

Potentially Significant Impact

The LM MSHCP, as it pertains to cultural resources, would remain unchanged. However, under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to accommodate the proposed project, which may result in potential impacts on archaeological resources within the LM MSHCP area and LMR. An MOA will be developed to reduce impacts, and Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 2C, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant. However, with the measures and treatments developed in the MOA and implementation of Standard Project Measures **PF CR-1** and **PF CR-2**, the proposed project's impact on the three TCPs, *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik,* would be less than significant with mitigation.

Build Alternative 4—El Sobrante Alignment

Potentially Significant Impact

As discussed in Section 3.8, *Cultural Resources*, eleven historical resources would potentially be affected by construction of Build Alternative 4. Build Alternative 4 would permanently affect the following eight NRHP/CRHR-eligible archaeological properties:

1. Mead Valley PPAD, which is assumed eligible for listing in the NRHP/CRHR under Criteria A/1, B/2, C/3, and D/4 for the purposes of this project only (CSO approval on July 7, 2020);

2. CA-RIV-4403, -4407, -4408, and -4409, which are not eligible individually (SHPO concurrence on February 10, 2010) and assumed eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing elements of the Mead Valley PPAD (CSO approval on July 7, 2020);
3. CA-RIV-7843 Locus 816, which is eligible for listing in the NRHP/CRHR individually under Criteria A/1, C/3, and D/4 (SHPO concurrence on February 10, 2021), assumed eligible as a locus of the larger CA-RIV-7843 site that is eligible under Criterion D/4, and eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of the Mead Valley PPAD (CSO approval on July 7, 2020);
4. CA-RIV-7843 Locus 817, which is not individually eligible (SHPO concurrence on February 10, 2021), assumed eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of CA-RIV-7843, and eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of the Mead Valley PPAD (CSO approval on July 7, 2020); and
5. CA-RIV-012623, individually eligible for the NRHP and CRHR under Criterion D (SHPO concurrence on February 10, 2021).

Build Alternative 4 would also potentially affect three TCPs for which Caltrans has assumed eligibility for listing in the NRHP under Criteria A, B, C, and D for the purposes of this project only (CSO approval on May 7, 2020). Therefore, under CEQA, there would be a potentially significant impact. Measures and treatments to reduce impacts on significant resources will be developed in an MOA. Additionally, Standard Project Measures **PF CR-1** and **PF CR-2**, listed in Table 4.2-7, below, are proposed to avoid or otherwise minimize impacts on historical resources under Build Alternative 4 (refer to Section 3.8, *Cultural Resources*, for **PF CR-1** and **PF CR-2**).

Table 4.2-7. Historical Resources Impact Assessment—Build Alternative 4

Property	Impact Assessment	Standard Project Measures and Mitigation
Mead Valley PPAD	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4403	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4407	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4408	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4409	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-7843, Locus 816	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-7843, Locus 817	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-012623	Potentially Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
Three traditional cultural properties - *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik*	Less Than Significant Impact	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

For the eight archaeological resources (Mead Valley PPAD; CA-RIV-4403, -4407, -4408, and -4409; Loci 816 and 817 of CA-RIV-7843; and CA-RIV-012623), while the proposed measures would reduce impacts associated with the proposed project, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on archaeological historical resources would be significant and unavoidable.

A Section 106 MOA will be developed for all historic properties that will be affected by the project, and will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with the SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS.

The *T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik* TCPs compose an expansive, unbounded, and overlapping geographic area that includes the APE and all the project alternatives (refer to Confidential Figures B-2 and B-3 in Appendix A, *Section 4(f)*, of this EIR/EIS). Although the outer boundaries of the TCPs are not known, impacts on the TCPs from the project, including ground-disturbing activities associated with development that would affect individual physical components of the TCPs, are not expected to be significant because they affect a minute portion of the overall geographic extent of the TCPs. Additionally, even though ground-disturbing activities associated with development would affect individual physical components of the TCPs, their loss would not cause a significant impact on the intangible cultural values held by the Luiseño people and would not significantly change the integrity of setting, feeling, character, and location of *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik* to the point that they no longer contribute to the significance of the TCPs.

A number of meetings have been held to discuss tribal concerns and consider mitigation, and Native American tribes have been actively engaged with Caltrans during site testing. Native American input and information have been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternatives 1, 2C, and 4.

An MOA among participating Native American tribes, Caltrans, and the County that would include additional measures for mitigating any adverse effect and would reflect input from the participating Native American tribes will be prepared before the Final EIR/EIS.

Future Six-Lane Facility (Build Alternative 4)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternative 4. If grading, cut, and fill as part of the future six-lane facility are

conducted in areas previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and measures described above for Build Alternative 4 would apply and measures and treatment developed in the MOA would be implemented; Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 4, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant. However, with the implementation of the MOA and Standard Project Measures **PF CR-1** and **PF CR-2**, the proposed project's impact on the three TCPs, *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik,* would be less than significant.

Lake Mathews MSHCP (Build Alternative 4)

Potentially Significant Impact

The LM MSHCP, as it pertains to cultural resources, would remain unchanged. However, under Build Alternative 4, portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed project, which may result in potential impacts on undiscovered, buried archaeological resources within the LM MSHCP area and LMR. Impacts would be the same for the *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik* TCPs. Measures to reduce impacts and treatments in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable.

4.2.5(b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?

Build Alternative 1—Cajalco Alignment

Potentially Significant Impact

There are eight archaeological resources that would be affected by Build Alternative 1. Of the eight resources, six are eligible for listing in the NRHP and are therefore considered historical resources for the purposes of CEQA. Build Alternative 1 would permanently affect all six archaeological historical resources: Mead Valley PPAD; combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444; CA-RIV-4454; CA-RIV-7843 Locus 816; CA-RIV-7843 Locus 817; and CA-RIV-012623, as indicated in Table 4.2-8, below.

Table 4.2-8. Archaeological Resources Affected and Eligibility—Build Alternative 1

Site Number	Description	NRHP/CRHR Status	Standard Project Measures and Mitigation
Mead Valley PPAD	Bedrock milling stations and lithic scatter within an as-yet undefined larger boundary inclusive of additional likely similar sites outside of the APE	PPAD as a whole assumed eligible for the purposes of this project only under Criteria A/1, B/2, C/3, and D/4 (approved by CSO 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

Site Number	Description	NRHP/CRHR Status	Standard Project Measures and Mitigation
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Prehistoric bedrock milling station, lithic scatter, and reported petroglyph	Evaluated. Individually assumed eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element to the PPAD; CSO approval 7/7/2020.	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4454	Prehistoric artifact scatter	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (approved by CSO July 7, 2020).	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-6623/H	Historic period refuse scatter and imported manos	Not eligible for listing in the NRHP/CRHR under any criteria; SHPO concurrence 2/10/2021.	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
33-13791/CA-RIV-7843, Locus 816	Prehistoric cupule rock, milling features, and lithic	Previously recommended as eligible for the NRHP. See Garcia et al. (2005). No formal evaluation and no SHPO concurrence. Evaluated. Individually eligible under Criteria A/1, C/3, and D/4 (SHPO concurrence 2/10/2021). Eligible as an assumed contributing element to the PPAD, and as a locus of CA RIV-7843, under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1:** Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
33-13791/CA-RIV-7843, Locus 817	Prehistoric milling station and artifact scatter	Evaluated. Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD, and as a locus of CA RIV-7843, under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-012623	Prehistoric artifact scatter	Evaluated. Individually eligible (SHPO concurrence 2/10/2021), and as an assumed contributing element to the PPAD, under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-3832H	AT&SF Railroad alignment	Evaluated. Not eligible for listing in the NRHP and CRHR under any criteria (SHPO concurrence 2/10/2021).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

While implementation of measures and treatments developed in the MOA and **PF CR-1** and **PF CR-2** would reduce impacts associated with the proposed project, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on archaeological historical resources would be significant and unavoidable.

Future Six-Lane Facility (Build Alternative 1)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternative 1. Measures to reduce impacts and treatments in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **PF CR-2** would be employed if applicable. As discussed under Build Alternative 1, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant.

Lake Mathews MSHCP (Build Alternative 1)

Potentially Significant Impact

The LM MSHCP, as it pertains to archaeological resources, would remain unchanged. However, under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges and wildlife crossings would also be constructed. The proposed project would also result in the excavation, grading, cut, and fill of soils and rock within the MSHCP area. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to accommodate the proposed project, which could result in potential impacts on archaeological resources that are eligible for the CRHR within the LM MSHCP area and LMR. The proposed project would be constructed and developed in a manner to minimize effects on archaeological resources during construction. Measures to reduce impacts and treatments in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **PF CR-2** would be employed if applicable.

Build Alternative 2C—Modified Cajalco Alignment

Potentially Significant Impact

There are nine archaeological resources that would be affected by Build Alternative 2C. Of the nine resources, six are eligible for listing in the NRHP and are therefore considered historical resources for the purposes of CEQA. Build Alternative 2C would permanently affect all six historical resources: the Mead Valley PPAD; combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444; CA-RIV-4454; CA-RIV-7843 Locus 816; CA-RIV-7843 Locus 817; and CA-RIV-012623, as indicated in Table 4.2-9 on the following page.

Table 4.2-9. Archaeological Resources Affected and Eligibility—Build Alternative 2C

Site Number	Description	NRHP/CRHR Status	Standard Project Measures and Mitigation
Mead Valley PPAD	Bedrock milling stations and lithic scatter within an as-yet undefined larger boundary inclusive of additional likely similar sites outside of the APE	PPAD as a whole assumed eligible for the purposes of this project only under Criteria A/1, B/2, C/3, and D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Prehistoric bedrock milling station; lithic scatter; reported petroglyph	Individually assumed eligible under Criterion D/4; eligible as an assumed contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4454	Prehistoric artifact scatter	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-6623/H	Historic period refuse scatter; imported manos	Not eligible for the NRHP/CRHR under any criteria; SHPO concurrence 2/10/2021.	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
33-13791/CA-RIV-7843, Locus 816	Prehistoric cupule rock, milling features, lithic scatter	Individually eligible under Criteria A/1, C/3, and D/4 (SHPO concurrence 2/10/2021). Eligible as an assumed contributing element to the PPAD, and as a locus of CA RIV-7843, under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
33-13791/CA-RIV-7843, Locus 817	Prehistoric milling station and artifact scatter	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD, and as a locus of CA RIV-7843, under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-012618	Historic period refuse scatter	Evaluated. Not eligible for the NRHP/CRHR under any criteria; SHPO concurrence 2/10/2021.	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-012623	Artifact scatter	Individually eligible (SHPO concurrence 2/10/2021), and as an assumed contributing element to the PPAD, under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

Site Number	Description	NRHP/CRHR Status	Standard Project Measures and Mitigation
CA-RIV-3832H	AT&SF Railroad alignment	Evaluated. Not eligible for listing in the NRHP and CRHR under any criteria; SHPO concurrence 2/10/2021.	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

While implementation of measures and treatments developed in the MOA and Standard Project Measures **PF CR-1** and **PF CR-2** would reduce impacts associated with the proposed project on the four archaeological historical resources, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on historical resources would potentially be significant and unavoidable.

Future Six-Lane Facility (Build Alternative 2C)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternative 2C. If grading, cut, and fill as part of the future six-lane facility are conducted in areas previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and measures described above for Build Alternative 2C would apply and measures and treatment developed in the MOA would be implemented; Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 2C, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant.

Lake Mathews MSHCP (Build Alternative 2C)

Potentially Significant Impact

The LM MSHCP, as it pertains to archaeological resources, would remain unchanged. However, under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. The proposed project would also result in the excavation, grading, cut, and fill of soils and rock within the MSHCP area. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required in order to accommodate the proposed project, which could result in potential impacts on archaeological resources that are eligible for the CRHR within the LM MSHCP area and LMR. The proposed project would be constructed and developed in a manner to minimize effects on archaeological resources during construction. Measures to reduce impacts and treatments in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **PF CR-2** would be employed if applicable. As discussed under Build Alternative 2C, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant.

Build Alternative 4—El Sobrante Alignment

Potentially Significant Impact

There are eleven archaeological resources that would be affected by Build Alternative 4. Of the eleven resources, eight are eligible for listing in the NRHP and CRHR and are therefore considered historical resources for the purposes of CEQA, as indicated in Table 4.2-10.

Table 4.2-10. Archaeological Resources Affected and Eligibility—Build Alternative 4

Site Number	Description	NRHP/CRHR Status	Standard Project Measures and Mitigation
Mead Valley PPAD	Prehistoric bedrock milling station	PPAD assumed eligible under Criteria A/1, B/2, C/3, and D/4 (CSO approval 7/7/2020). NRHP status for contributing elements described below for each qualifying site.	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4403	Bedrock milling station	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4407	Bedrock milling station and lithic scatter	Not individually eligible (SHPO concurrence on 2/10/2021; assumed eligible as an assumed contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4408	Bedrock milling station and lithic scatter	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-4409	Bedrock milling station	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
33-13791/CA-RIV-7843, Locus 816	Prehistoric cupule rock, milling features, and lithic scatter	Individually eligible under Criteria A/1, C/3, and D/4 (SHPO concurrence 2/10/2021). Eligible as an assumed contributing element to the PPAD, and as a locus of CA RIV-7843, under Criterion D/4 (approved by CSO 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
33-13791/CA-RIV-7843, Locus 817	Prehistoric milling station and artifact scatter	Not individually eligible (SHPO concurrence 2/10/2021); assumed eligible as a contributing element to the PPAD, and as a locus of CA RIV-7843, under Criterion D/4 CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-012621	Historic period refuse scatter	Evaluated. Not eligible for the NRHP/CRHR under any criteria; SHPO concurrence 2/10/2021.	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

Site Number	Description	NRHP/CRHR Status	Standard Project Measures and Mitigation
CA-RIV-012622	Indeterminate period rock cairn	Evaluated. Not eligible for the NRHP/CRHR under any criteria; SHPO concurrence 2/10/2021.	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-012623	Prehistoric artifact scatter	Individually eligible (SHPO concurrence 2/10/2021), and as an assumed contributing element to the PPAD under Criterion D/4 (CSO approval 7/7/2020).	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains
CA-RIV-3832H	AT&SF Railroad alignment	Evaluated. Not eligible for the NRHP/CRHR under any criteria; SHPO concurrence 2/10/2021.	• **PF CR-1**: Unanticipated Discoveries • **PF CR-2:** Discovery of Human Remains

While implementation of measures and treatments developed in the MOA and Standard Project Measures **PF CR-1** and **PF CR-2** would reduce impacts associated with the proposed project, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on historical resources would be significant and unavoidable.

Future Six-Lane Facility (Build Alternative 4)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternative 4. If grading, cut, and fill as part of the future six-lane facility are conducted in areas previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and measures described above for Build Alternative 4 would apply and measures and treatment developed in the MOA would be implemented; Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 4, above, even with the incorporation of Standard Project Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant.

Lake Mathews MSHCP (Build Alternative 4)

Potentially Significant Impact

The LM MSHCP, as it pertains to archaeological resources, would remain unchanged. However, under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. The proposed project would also result in the excavation, grading, cut, and fill of soils and rock within the MSHCP area. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required

to accommodate the proposed project, which could result in potential impacts on archaeological resources that are eligible for the CRHR within the LM MSHCP area and LMR. The proposed project would be constructed and developed in a manner to minimize effects on archaeological resources during construction. Measures to reduce impacts and treatments in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **CR-2** would be employed if applicable.

4.2.5(c) 4.2.5(c) Disturb any human remains, including those interred outside of dedicated cemeteries?

Build Alternatives 1, 2C, and 4

No Impact

No human remains have been previously identified in the project APE either through the records search or through the pedestrian archaeological survey conducted for the project. However, given the sensitivity of the project area for archaeological resources, the presence of unknown, previously undiscovered human remains cannot be discounted, however unlikely their presence. If human remains are discovered, Standard Project Measure **PF CR-1** would be employed.

State Health and Safety Code Section 7050.5 states that further disturbances and activities shall stop in any area or nearby area that is suspected to overlie remains, and the County Coroner contacted. If the remains are thought to be Native American, the coroner will notify the Native American Heritage Commission (NAHC) who, pursuant to Public Resources Code (PRC) Section 5097.98, will then notify the Most Likely Descendant (MLD). At this time, the person who discovered the remains will contact Gary Jones, District Native American Coordinator, at (909) 383-7505 so that they can work with the MLD regarding the respectful treatment and disposition of the remains. Further provisions of PRC 5097.98 are to be followed as applicable.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

If additional travel lanes are constructed within the median of Cajalco Road between Temescal Canyon Road and La Sierra Avenue, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, in the future, it is anticipated that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternatives 1, 2C, and 4.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed project, which would result in potential impacts on undiscovered human remains, should they exist. The proposed project would be constructed and developed in a manner to minimize effects on cultural resources during construction. Standard Project Measure **PF CR-1** would be employed if human remains are discovered.

4.2.6 Energy

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	☐	☐	☐	☒

This section is based on information from Section 3.16, *Energy*, and the *Air Quality Study Report* technical report prepared for the project (Caltrans 2017b).

4.2.6(a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

As discussed in Section 3.16, *Energy*, energy would be consumed during both temporary construction activities as well long-term operational use of the project area roadways. Temporary energy consumption would result from use of diesel-powered heavy equipment, portable diesel generators, and heavy-duty trucks for material hauling and delivery and light-duty vehicles for worker commute trips, almost all of which would involve the consumption of petroleum-based gasoline or diesel fuel. Temporary construction-period activities would require the consumption of the equivalent of 462,000 gallons of diesel fuel, or approximately 64,000 million British thermal units (MMBTU). Long-term operational use of the facility under Build Alternatives 1, 2C, and 4 would result in energy consumption primarily in the form of vehicle fuel use. As shown in Table 3.16-1, operational energy use would vary by build alternative and analysis year based on the differing vehicle speed and operations.

Energy reduction technology incorporated into the proposed project, such as the use of LED bulbs in place of incandescent bulbs, would consume 10 percent of the electricity of traditional lights. Refer to Standard Project Measure **PF VIS-4** in Section 3.7, *Visual/Aesthetics*.

Construction activities would be implemented to provide additional east-west vehicular capacity in the project area and long-term operations would serve local and regional transportation needs. Furthermore, through innovations such as longer pavement lives, improved TMPs, and changes in materials, the energy used during construction would be offset to some degree by longer intervals between maintenance and rehabilitation activities. Therefore, the build alternatives would not result in potentially significant impacts due to wasteful, inefficient, or unnecessary consumption of energy resources. Standard Project Measures **PF AQ-1**, which includes restrictions on idling of construction vehicles and the use of onsite mobile equipment powered by alternative fuel sources, and **PF SW-1**, which includes recycling of non-hazardous construction

waste, would be employed and reduce energy consumption during construction. Refer to Standard Project Measure **PF AQ-1** in Section 3.14, *Air Quality*, and **PF SW-1** in Section 4.2.8, *Greenhouse Gas Emissions*.

Based on the consumption of energy resources during temporary construction activities and the minor increases in long-term operational vehicle fuel use in the project area associated with Build Alternatives 1, 2C, and 4, impacts would be less than significant.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

As discussed in Section 3.16, *Energy*, energy would be consumed for the future six-lane facility during both temporary construction activities as well as long-term operational use of the project area roadways. Temporary energy consumption would result from use of diesel-powered heavy equipment, portable diesel generators, and heavy-duty trucks for material hauling and delivery and light-duty vehicles for worker commute trips, almost all of which would involve the consumption of petroleum-based gasoline or diesel fuel. Because the roadway areas represent less than half of the overall length and project area associated with the build alternatives, construction-period energy consumption is anticipated to be less than that identified for the build alternatives. Such temporary increases in energy consumption are not anticipated to be wasteful or inefficient.

Long-term operational use of the future six-lane facility would result in energy consumption primarily in the form of vehicle fuel use. As shown in Table 3.16-2, operational energy use would vary by build alternative and analysis year based on the differing vehicle speed and operations. The future six-lane facility would be implemented to provide additional east-west vehicular capacity in the project area and long-term operations would serve local and regional transportation needs. Therefore, the future six-lane facility would not result in wasteful, inefficient, or unnecessary consumption of energy resources. Based on the consumption of energy resources during temporary construction activities and the minor increases in long-term operational vehicle fuel use in the project area associated with the future six-lane facility, impacts would be less than significant.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

A portion of the construction and operational energy consumption would occur within the limits of the LM MSHCP. As specified in Table 3.16-1, operational energy consumption would increase under the build alternatives relative to the No-Build Alternative, and a portion of those increases would occur in the LM MSHCP area. In addition to everyday roadway operations within the LM MSHCP area, ongoing maintenance activities for the appurtenant facilities would also result in increases in energy emissions. Given the infrequent nature of maintenance activities and that the maintenance activities would generally be limited in scope, such energy consumption would be minor. Therefore, impacts related to energy in the LM MSHCP area would not be wasteful, inefficient, or unnecessary. As such, impacts related to the consumption of energy resources during project construction or operation in the LM MSHCP area would be less than significant.

4.2.6(b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Build Alternatives 1, 2C, and 4

No Impact

The 2017 Climate Change Scoping Plan prepared by ARB calls for prioritizing transportation sustainability as part of the statewide goals to achieve greenhouse gas (GHG) reductions. Analyses by ARB show fossil fuel demand will decrease by more than 45 percent by 2030 through the implementation of a range of transportation programs related to efficient land use, affordable housing, infrastructure for cyclists and pedestrians, public transit, new vehicle technologies, fuels, and freight (ARB 2017). The California Energy Commission adopts an Integrated Energy Policy Report every 2 years and an update every other year. The most recently adopted report update, titled *Toward A Clean Energy Future, 2018 Integrated Energy Policy Report Update, Volume II,* was adopted February 20, 2019 (CEC 2019). Among the state policies summarized in the report, the 2018 Integrated Energy Policy Report discusses the effort to move the transportation sector's diverse vehicle segments away from petroleum to near-zero emission vehicles operating with low-carbon fuels and zero-emission vehicles that run on electricity from batteries or hydrogen fuel cells (CEC 2019:120). Each of these programs would contribute to reductions in energy use, or increases in energy efficiency.

The build alternatives would implement local and regional transportation improvements that would not conflict with or obstruct such statewide energy and energy efficiency efforts. Implementation of the build alternatives would involve short-term increases in energy consumption from construction activities. Long-term operations would involve increased energy consumption from vehicles on the roadway relative to the No-Build Alternative, but energy consumption per vehicle mile traveled would be substantially lower than under existing conditions. More efficient vehicle technologies using improved fuels would be able to use the alignment under the build alternatives. Standard project measures incorporated into the project would meet or exceed the measures recommended in the SCAG 2016–2040 Programmatic EIR that incorporate Best Available Control Technology to be employed during project design, construction, and operation. These measures include Standard Project Measures **PF LU-1**, **PF VIS-4**, and **PF AQ-1**. Based on the lack of conflict with state and local plans for renewable energy and energy efficiency, no impacts would occur as a result of implementation of Build Alternative 1, 2C, or 4.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

The future six-lane facility would not conflict with or obstruct state or local plans for renewable energy or energy efficiency because it would not affect the implementation of ongoing transportation programs to improve vehicle technologies and improve fuel efficiency. As such, no impacts related to the potential for the future six-lane facility to conflict with or obstruct a state or local plan for renewable energy or energy efficiency would occur.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The portion of the project within the LM MSHCP area would not conflict with or obstruct state or local plans or renewable energy or energy efficiency because it would not affect the implementation of ongoing transportation programs to improve vehicle technologies and improve fuel efficiency. As such, no impacts related to the potential for the project to conflict with or obstruct a state or local plan for renewable energy or energy efficiency in the LM MSHCP area would occur.

4.2.7 Geology and Soils

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42?	☐	☐	☐	☒
ii) Strong seismic ground shaking?	☐	☐	☒	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv) Landslides?	☐	☐	☒	☐
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☒	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

The information presented in this section is based on Chapter 3, Section 3.11, *Geology/Soils/Seismic/Topography*, of this EIR/EIS, the project-specific *Structure Preliminary Geotechnical Report: Wildlife Crossing (New) (Bridge No. 110)* (County 2017a), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 268)* (County 2017b), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 242)* (County 2017c), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 267)* (County 2017d), *Structure Preliminary Geotechnical Report: Wildlife Crossing (New) (Bridge No. 145)* (County 2019a), *Structure Preliminary Geotechnical Report: Wildlife Crossing (New) (Bridge No. 179)* (County 2017e), *Structure Preliminary Geotechnical Report: Cajalco Creek Bridge (New) (Bridge No. 740)* (County 2017f), *Structure Preliminary Geotechnical Report: Temescal Wash Bridge (Replace) (Bridge No. 22)* (County 2019b), *Structure Preliminary Geotechnical Report: Bridge Over Creek (New) (Bridge No. 173)* (County 2019c), *Structure*

Preliminary Geotechnical Report: Bridge Over MWD Maintenance Area (New) (Bridge No. 163) (County 2019d)*, Structure Preliminary Geotechnical Report: Ramona Expressway Overhead (Widen) (Bridge No. 56C-0196)* (County 2019e), *Structure Preliminary Geotechnical Report: Bridge Over Lake Mathews Spillway Channel (New) (Bridge No.* 565*)* (County 2019f), and WRC MSHCP (Western Riverside County Regional Conservation Authority 2003).

4.2.7(a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?

Build Alternatives 1, 2C, and 4

No Impact

The project area is not in a State of California Special Studies ("Alquist-Priolo") Zone for fault rupture, and no known active faults are mapped as crossing or projecting toward the site. The closest known active fault is the Glen Ivy Section of the Elsinore Fault Zone approximately 3.4 miles southwest of the nearest end of the project area. Therefore, potential for fault rupture is considered remote and no impact is anticipated. Seismic design would also meet County of Riverside requirements for near-source design parameters under the Uniform Building Code.

4.2.7(a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

ii) Strong seismic ground shaking?

iii) Seismic-related ground failure, including liquefaction?

iv) Landslides?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

The proposed project is situated within the Perris Block province, bound to the east and west by active northwest-trending fault zones, including the San Jacinto and Elsinore fault zones. Neither ground shaking nor fault rupture can be avoided in the design of roadways; however, placing the realigned roadway either at natural grade or in low cuts or on low embankments limits the potential for, and consequences of, failure in the cuts and fills. Accordingly, the currently proposed designs are generally favorable for accommodating future ground shaking or surface rupture. Compliance with Caltrans' procedures regarding seismic design, as detailed in Section 19, "Earthwork," of the Caltrans Standard Specifications Manual, is also anticipated to prevent any adverse effects related to seismic ground shaking. Seismic design would also meet County of Riverside requirements for near-source design parameters under the Uniform Building Code). The proposed project further includes Standard Project Measures **PF GEO-1** through **PF GEO-5**

to confirm soil conditions and bridge footing design; design recommendations based on the results of the testing would be incorporated into the final design.

The Generalized Liquefaction Map for Riverside County indicates that liquefaction potential in the western end of the project alignment at Temescal Creek is considered low to moderate (refer to Figure 3.11-3 in Section 3.11, *Geology/Soils/Seismicity/Topography*). However, based on site reconnaissance, soils in the area of the proposed replacement of Bridge No. 56C-0155 at Temescal Creek may have a moderate to high liquefaction potential. The proposed project includes Standard Project Measures **PF GEO-1** through **PF GEO-3** that would specify appropriate excavation and stabilization techniques.

Due to relatively shallow bedrock and deep groundwater, liquefaction potential is low to very low west of Lake Mathews Drive. Liquefaction potential along much of the eastern end of the project is also considered low due to localized bedrock conditions. The proposed project includes Standard Project Measures **PF GEO-1** through **PF GEO-5** that would address seismic settlement potential.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is expected that the new lanes would be exposed to the same seismic hazards as the proposed project described under Build Alternatives 1, 2C, and 4, above. It is also anticipated that geotechnical evaluations would be required to evaluate impacts resulting from any excavation, cuts, and fill required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed project, which would result in exposure of transportation facilities and structures to potential seismic activity. The proposed project would also result in the excavation, grading, cut, and fill of soils and rock within the LM MSHCP area. Through compliance with Standard Project Measures **PF GEO-1** through **PF GEO-3**, the proposed project would be constructed and developed in a manner to minimize effects from seismic hazards as well as to minimize impacts on the surrounding soils and geology.

4.2.7(b) Result in substantial soil erosion or the loss of topsoil?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

Sandy soils found in various areas of the project can be easily erodible, and erosion could occur during construction. Development of the roadway would cause groundbreaking and vegetation removal during construction. As a result, soil could be exposed to rain and wind, potentially causing accelerated erosion and deposition from the project site. Federal and state jurisdictions require that an approved SWPPP be prepared for projects that involve greater than 1 acre of disturbance. The preparation and implementation of the SWPPP is included as Standard Project Measure **PF WQ-4** (see Section 3.10, *Water Quality and Stormwater Runoff*). The SWPPP will specify BMPs (**PF WQ-3**) that would prevent construction pollutants from contacting stormwater, with the intent of keeping all products of erosion from moving off site into receiving waters. Earthwork in the project area would be performed in accordance with Section 19, "Earthwork," of the Caltrans Standard Specifications Manual, the requirements of applicable government agencies, and recommendations from the preliminary geotechnical reports.

4.2.7(c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

Soils in the project area are varied and include the following types west of Harley John Road: Young and very old alluvial deposits and alluvial fan deposits, boulder gravel and gravel, mesozoic metasedimentary rocks, granodiorite and gabbro, monzogranite, and Lake Mathews Formation. Soils at the proposed location of Bridge 110 in the western end of the project along Cajalco Road and within Cajalco Canyon appear to be sandy/gravelly fills that go down to about 10 feet deep and are underlain by bedrock, becoming less weathered and harder with depth. A soil boring taken south of Lake Mathews indicated approximately 10 feet of alluvial materials overlying Tertiary formational material (Lake Mathews Formation). The alluvial material is primarily stiff to very stiff sandy silt (ML). No subsurface data were available below 26.5 feet below ground surface, but it likely consists of sedimentary rock becoming less weathered and harder with depth. The colluvial soil found between rock outcrops in this area is loose, coarse-grained, silty sand and sandy silt. The following soil types are present east of Harley John Road: tonalite of Val Verde pluton, artificial fill, very old axial channel deposits, young alluvial wash deposits, very old alluvial fan deposits, and tonalite, undifferentiated.

The proposed project includes Standard Project Measures **PF GEO-1** through **PF GEO-5** that would be employed during the Plans, Specifications, and Estimates (PS&E) phase of the project to confirm soils and slope stability conditions, and specific excavation and stabilization techniques for each location based on the results of testing. Impacts would therefore be less than significant and mitigation would not be required.

4.2.7(d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

As described under 4.2.7(c), soils within the project area include artificial fill, alluvium, colluvium, Cretaceous granitic rock, Tertiary formational material (soft sedimentary rock), and Holocene and late Pleistocene-age Young axial channel deposits. The large variety of soils throughout the project site includes pockets of expansive soils. Foundation type and any stabilization techniques would be identified prior to construction through Standard Project Measures **PF GEO-1** through **PF GEO-3**. Impacts would be less than significant and mitigation would not be required.

4.2.7(e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Build Alternatives 1, 2C, and 4

No Impact

The proposed project would not include septic tanks, sewer, or alternative wastewater disposal systems, or other facilities where such facilities would be required. There would be no impact.

4.2.7(f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Build Alternatives 1 and 2C—Cajalco Alignment and Modified Cajalco Alignment

Less than Significant with Mitigation

As discussed in Chapter 3, Build Alternatives 1 and 2C would cross the Silverado Formation along the western end of the project limits, east of Temescal Canyon. As the alignment continues eastward, the alternatives would traverse the Lake Mathews Formation and the Plio-Pliestocene deposits south of Lake Mathews. It is anticipated that ground-disturbing activities east of Lake Mathews Drive may range from 2 to 12 feet in depth, depending on construction activity. Limited locations may require excavating to a depth of up to approximately 50 feet for the installation of utility poles, bridge pilings, and associated activities. West of Lake Mathews Drive, construction depth could reach depths greater than 12 feet, and may require depths up to 100 feet in limited locations for utility poles, bridge pilings, and associated drilling activities.

All three build alternatives have the potential to affect sensitive paleontological areas. However, because their alignments traverse a larger area of sensitive geologic units, Build Alternatives 1 and 2C have the potential to affect a larger sensitive paleontological area than Build Alternative 4. With implementation of the Mitigation Measure **PAL-1**, impacts would be mitigated to less-than-significant levels. Refer to Chapter 3, Section 3.12, *Paleontology*, for Mitigation Measure **PAL-1.**

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Less than Significant with Mitigation

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed highway widening, which would result in potential impacts on sensitive paleontological areas.

Build Alternative 4—El Sobrante Alignment

Less than Significant with Mitigation

As discussed in Chapter 3, Build Alternative 4 would cross the Silverado Formation in the western end of the project limits just east of Temescal Canyon. Build Alternative 4 would avoid sensitive units to the south, but would traverse two limited areas of the Lake Mathews Formation to the northeast of Lake Mathews. It is anticipated that ground-disturbing activities east of Lake Mathews Drive may range from 2 to 12 feet in depth, depending on construction activity. Limited locations may require excavating to a depth of up to approximately 50 feet for the installation of utility poles, bridge pilings, and associated activities. West of Lake Mathews Drive, construction depth could reach depths greater than 12 feet, and may require depths up to 100 feet in limited locations for utility poles, bridge pilings, and associated drilling activities.

All three build alternatives have the potential to affect sensitive paleontological areas. However, because their alignments traverse a larger area of sensitive geologic units, Alternative 1 and Alternative 2C have the potential to affect a larger sensitive paleontological area than Build Alternative 4. With implementation of Mitigation Measure **PAL-1**, impacts would be mitigated to less-than-significant levels. Refer to Section 3.12, *Paleontology*, for Mitigation Measure **PAL-1.**

Lake Mathews MSHCP (Build Alternative 4)

Less than Significant with Mitigation

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed highway widening, which would result in potential impacts on sensitive paleontological areas.

4.2.8 Greenhouse Gas Emissions

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☐	☒

4.2.8(a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Build Alternatives 1, 2C, and 4

Potentially Significant Impact

GHG emissions for transportation projects can be divided into those produced during construction and those produced during operations. Construction GHG emissions include emissions produced as a result of material processing, emissions produced by onsite construction equipment, and emissions arising from traffic delays due to construction. These emissions would be produced at different levels throughout the construction phase; their frequency and occurrence can be reduced through innovations in plans and specifications and by implementing better traffic management during construction phases. In addition, with innovations such as longer pavement lives, improved TMPs, and changes in materials, the GHG emissions produced during construction can be mitigated to some degree by longer intervals between maintenance and rehabilitation events. As discussed in Section 4.2.3, *Air Quality,* construction of the project would be in compliance with applicable air quality rules. As the CEQA lead agency, this evaluation is based on the County of Riverside's significance thresholds, and reflects the determinations of the County. Caltrans' methods have been applied to this evaluation due to its statewide role in funding and delivering transportation projects; however, the County is responsible for CEQA determinations herein.

Construction Emissions

Construction GHG emissions would result from material processing, onsite construction equipment, and traffic delays due to construction. These emissions would be produced at different levels throughout the construction phase; their frequency and occurrence can be reduced through innovations in plans and specifications and by implementing better traffic management during construction phases.

In addition, with innovations such as longer pavement lives, improved TMPs, and changes in materials, the GHG emissions produced during construction can be offset to some degree by longer intervals between maintenance and rehabilitation activities. Construction-period GHG emissions were calculated using the Sacramento Metropolitan Air Quality Management District

Roadway Construction Emissions Model, and were estimated to total 4,718 metric tons of carbon dioxide equivalent (CO_2e) over the course of the 4-year construction period.[11]

Construction activities anticipated for the future six-lane facility would involve additional GHG emissions, but because the roadway areas represent less than half of the overall length and project area associated with the build alternatives, construction-period emissions are anticipated to be less than that identified for the build alternatives.

The project would comply with all requirements of SCAQMD (which has jurisdiction over the SCAB in which the project site is located). In addition, the County will include as part of the construction contract Caltrans Standard Specifications Section 14-9, Air Quality, which requires contractors to comply with all federal, state, regional, and local rules, regulations, and ordinances related to air quality; compliance with this specification is included in the project as Standard Project Measure **PF AQ-1**. Additional measures, such as idling time restrictions and keeping equipment engines properly tuned and maintained, which reduce vehicle emissions and energy use, also reduce GHG emissions. A TMP (Standard Project Measure **PF LU-1**), which would include a public awareness campaign, would be also implemented to minimize traffic delays during construction.

Operational Emissions

The proposed build alternatives would improve traffic conditions during peak travel periods and increase capacity within the project limits. The VMT data shown in Table 4.2-11, along with EMFAC2014 emission rates (within the CT EMFAC model), were used to calculate the CO_2e emissions under the Baseline/Existing Year 2014, Opening Year 2024, and Horizon Year 2044 conditions. For purposes of this analysis, CO_2e comprises CO_2 and methane (CH_4).

Table 4.2-11. Modeled Annual CO_2 Emissions and Vehicle Miles Traveled – Alternatives 1, 2C, and 4

Year / Alternative	CO_2 Emissions (Metric Tons/Year)	Annual Vehicle Miles Traveled[1]
Existing/Baseline 2014	1,364,951	2,979,123,737
Open to Traffic 2024		
No Build	1,285,751	3,699,198,298
Build Alternative 1	1,294,347	3,751,722,597
Build Alternative 2C	1,301,794	3,771,736,039
Build Alternative 4	1,299,554	3,768,515,922
20-Year Horizon/Design-Year 2044		
No Build	1,365,350	5,086,991,199
Build Alternative 1	1,377,419	5,128,627,382
Build Alternative 2C	1,370,635	5,108,239,744
Build Alternative 4	1,378,941	5,139,521,794
Future Six-Lane Facility (Build Alternative 1/2C)	1,385,029	5,150,625,375
Future Six-Lane Facility (Build Alternative 4)	1,388,430	5,168,198,490

CO_2 = carbon dioxide
Source: EMFAC 2014
[1] Annual vehicle miles traveled (VMT) values derived from Daily VMT values multiplied by 347, per ARB methodology (ARB 2008). Differences in VMT and CO_2 emissions between Alternatives 1 and 2C based on results of traffic modeling conducted for each alternative.

[11] CO_2e is a standard unit for measuring carbon footprints. The idea is to express the impact of each different GHG in terms of the amount of CO_2 that would create the same amount of warming.

As shown in Table 4.2-11, the modeled CO_2e emissions in the project area under 2014 Existing/Baseline conditions would be approximately 1.36 million metric tons CO_2e per year. In Opening Year 2024, annual emissions from mobile sources operating in the project area[12] would be approximately 1.29 million metric tons CO_2e under the No-Build Alternative, 1.29 million metric tons CO_2e under Build Alternative 1, 1.30 million metric tons CO_2e under Build Alternative 2C, and 1.30 million metric tons CO_2e under Build Alternative 4.

Table 4.2-11 also shows emissions at the 2044 Horizon Year, which are estimated to be 1.37 million metric tons CO_2e under the No-Build Alternative, 1.38 million metric tons CO_2e under Build Alternative 1, 1.37 million metric tons CO_2e under Build Alternative 2C, and 1.38 million metric tons CO_2e under Build Alternative 4. When compared to the 2014 Existing/Baseline, GHG emissions at the Horizon Year 2044 would be 0.03 percent higher under the No-Build Alternative, 0.91 percent higher under the Build Alternative 1, 0.42 percent high under Build Alternative 2C, and 1.02 percent higher under Build Alternative 4. Although there would be increases in emissions, the increases would not be substantial relative to the greater than 70 percent increases in VMT, which is attributed to the projected improvements in vehicle fuel efficiency.

At the 2044 Horizon Year, emissions would increase under the build alternatives when compared with the No-Build Alternative, with annual GHG emissions estimated to increase 0.88 percent under Build Alternative 1, 0.38 percent under Build Alternative 2C, and 0.99 percent under Alternative 4. Such increases are attributable to the greater VMT and changes in the speed profile projected in the project area under each of the build alternatives.

While EMFAC has a rigorous scientific foundation and has been vetted through multiple stakeholder reviews, its emission rates are based on tailpipe emission test data. The numbers are estimates of CO_2 emissions and not necessarily the actual CO_2 emissions. The model does not account for factors such as the rate of acceleration and the vehicles' aerodynamics, which would influence CO_2 emissions. To account for CO_2 emissions, ARB's GHG Inventory follows the IPCC guideline by assuming complete fuel combustion, while still using EMFAC data to calculate CH_4 and N_2O emissions. Though EMFAC is currently the best available tool for use in calculating GHG emissions, it is important to note that the CO_2 numbers provided are only useful for a comparison of alternatives.

The County of Riverside adopted a Climate Action Plan Update in November 2019, which set goals for Riverside County to reduce GHG emissions to 15 percent below 2008 levels by the year 2020, 49 percent below 2008 levels by 2030, and 83 percent below 2008 levels by 2050, which are consistent with the statewide goal identified in Assembly Bill (AB 32), Senate Bill 32 (SB 32), and Executive Order S-3-05. A number of the transportation-related policies are applicable to the proposed project. Many of the policies are statewide policies that would result in GHG reductions in Riverside County, such as the Pavley standards for passenger and light-duty vehicles, the low carbon fuel standard, and electrification of the vehicle fleet. Among the local policies that will be implemented in the study area that would coincide with project implementation are the use of LED bulbs in traffic signals identified in Measure R2-EE10, reduction of waste diverted to landfills identified in Measure R2-S1, reduction of water use

[12] For the purposes of this GHG analysis, the project area is defined as the study region defined in the Traffic Operations Analysis Report, which includes roadway segments generally bounded by I-15 on the west, SR-91 to the north, I-215 to the north and west, and the area immediately south of Cajalco Road on the south.

identified in Measure R2-W2, and signal synchronization and transportation flow management identified as Reduction Measure T1.C (County 2019g). In addition, the project would be consistent with many of the policies identified in the Riverside County General Plan that have a GHG reduction co-benefit, including those related to improving circulation and relieving congestion, those related to the use of building materials/methods and waste reduction, and those related to reduced water use (County 2018a).

The increases during the construction period would be short term and the increases during long-term operations would not be substantial relative to the improvements in mobility provided by the project. Nevertheless, due to the increases in GHG emissions, impacts would be significant. Given that there would be increases in emissions, standard project measures and mitigation measures identified below have been considered and evaluated for the reduction of GHG emissions. Although increases in GHG emissions would be reduced through implementation of standard project measures and mitigation measures, impacts would remain significant.

Greenhouse Gas Emissions Reduction Strategies and Project Measures

Given that the finished project is a roadway improvement project, there is a lack of available avenues to fully offset project GHG emission increases. Standard project measures incorporated into the proposed project, such as the use of LED bulbs in place of incandescent bulbs, would consume 10 percent of the electricity of traditional lights, which will also help reduce CO_2 emissions and, subsequently, GHG emissions. Furthermore, the use and maintenance of construction equipment in accordance with Caltrans' Standard Specifications, Section 14-9.02, ARB commercial vehicle idle regulations, and manufacturers' specifications would reduce GHG emissions from diesel-powered construction vehicles. These standard project measures, as well as Mitigation Measure **GHG-1**, align with the measures and strategies outlined in the County of Riverside's November 2019 Climate Action Plan Update and SCAG 2016–2040 Programmatic EIR, and would reduce GHG emissions associated with the proposed project.

The following standard project measures have been incorporated into the project, and would reduce GHG emissions and potential climate change impacts from the project. The measures below include measures that meet or exceed measures recommended in the SCAG 2016–2040 Programmatic EIR that incorporate Best Available Control Technology to be employed during project design, construction, and operation as avoidance and minimization measures to minimize GHG emissions, and measures recommended in the SCAG 2016–2040 Programmatic EIR similarly identified to avoid or reduce GHG emissions. These measures include Standard Project Measures **PF LU-1** in Section 3.1, *Land Use*; **PF VIS-1** and **PF VIS-4** in Section 3.7, *Visual/Aesthetics*; and **PF AQ-1** in Section 3.14, *Air Quality*:

- **PF LU-1: Traffic Management Plan (summarized)**. Prior to construction, the County of Riverside will develop a Traffic Management Plan that will include the following elements: construction staging plans, public awareness campaign, analysis of impacts on traffic, options for lane closures, and alternate route strategies. The County will coordinate with local agencies, emergency services, and law enforcement to minimize disruptions to access, circulation, and parking. The County will coordinate with local jurisdictions to adjust signal timing on arterial streets during construction to minimize traffic congestion. If short-term full roadway closure is necessary, it will be scheduled for nighttime to minimize impacts on motorists.

- **PF VIS-1: Contouring and Replanting Disturbed Areas (summarized).** Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades and hydro-seeded with a County of Riverside–approved native plant seed mix.
- **PF VIS-4: Apply Minimum Lighting Standards (summarized)**. All artificial outdoor lighting and overhead street lighting will be limited to only those locations where it is absolutely necessary for safety and security requirements such as intersections. In most cases, lighting will consist of County lighting standards that are up to 35 feet in height, and the minimum required for driver safety. Lighting will be designed using the Illuminating Engineering Society's design guidelines and in compliance with International Dark-Sky Association–approved fixtures. The lowest allowable wattage will be used for all lighted areas, and the number of nighttime lights needed to light an area will be minimized. Lighting will be designed for energy efficiency, with daylight sensors or timers with an on/off program. Lights will provide good color rendering with natural light qualities, with the minimum intensity needed for security, safety, and personnel access. Lighting, including light color rendering and fixture types, will be designed to be aesthetically pleasing. Light-emitting diode (LED) lighting will avoid the use of blue-rich white light lamps (BRWL) lamps and use a correlated color temperature that is no higher than 3,000 Kelvin, consistent with the International Dark-Sky Association's Fixture Seal of Approval Program (International Dark-Sky Association 2010a, 2010b, 2015).
- **PF AQ-1 (summarized)**: The project would conform to California Department of Transportation (Caltrans) construction requirements, as specified in the Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). The contractor will comply with all air pollution control ordinances and statutes which apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code. Exhaust emissions control measures may include, but are not limited to: idling restrictions, proper equipment maintenance, solar power use, and the preparation and implementation of a construction traffic plan.
- **PF SW-1:** Consistent with Caltrans Standard Specification 14-10, non-hazardous construction-period waste shall be recycled.
- **NC-13 (NES BIO-9):** Post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades, decompacted to eliminate compressed soils and allow for plant establishment, and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory.

In addition to the standard project measures above, Mitigation Measures **GHG-1**, **VIS-2**, and **VIS-8**, described below, would also be implemented:

- **GHG-1:** The project will incorporate the use of energy efficient lighting, such as light-emitting diode (LED) traffic signals. LED bulbs—or balls, in the stoplight vernacular—consume less electricity than traditional lights, which will also help reduce the project's carbon dioxide emissions.
- **VIS-2: Replace or Relocate Site Features and Landscaping Affected by the Project (summarized)**. Where appropriate and to the degree possible, landscaping and related

appurtenances, such as fencing, privacy walls, and other similar features, removed from private properties as a result of construction will be relocated, replaced, or restored in place and in kind to address visual impacts.

- **VIS-8:** Replace Disturbed Vegetation along Landscaped Freeways. The County of Riverside will work with the appropriate California Department of Transportation (Caltrans) district landscape architect to determine which disturbed portions of landscaped freeways within the project limits require replanting and to what extent. At a minimum, replanting will follow the guidance in Section 92.3 of the Streets and Highways Code.

Summary

Standard project measures incorporated into the project, and identified mitigation measures, would meet or exceed the measures identified in the Climate Action Plan and, therefore, the build alternatives would not conflict with the County's Climate Action Plan. Because the proposed project is identified in the SCAG 2020–2045 RTP/SCS (project number 3A04WT137), project emissions would not conflict with any plan, policy, or regulation adopted for the purpose of reducing GHG emissions. However, there would be increases in emissions even with the incorporation of standard project measures and addition of mitigation measures, and GHG emissions generated by the project may not be reduced to an extent that would avoid a significant impact on the environment.

For these reasons identified above:

1. The proposed project may generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment, and
2. The proposed project would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

As such, the proposed project would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, but the contribution to global GHG emissions and climate change would be potentially significant.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Potentially Significant Impact

Although the future six-lane facility is not currently proposed as part of the project, Table 4.2-11 shows the estimated operational emissions associated with its implementation if constructed in the future. Given that the future six-lane facility would not be implemented until a later date and only after construction of the selected build alternative, emissions from the future six-lane facility are compared to the corresponding Horizon Year 2044 build alternatives. The future six-lane facility under the Build Alternative 1/2C scenario would result in estimated emissions of 1.39 million metric tons per year, a 0.55 percent increase in GHG emissions relative to the Horizon Year 2044 Build Alternative 1 scenario. The future six-lane facility under the Alternative 4 scenario would result in estimated emissions of 1.39 million metric tons CO_2e per year, a 0.69 percent increase in GHG emissions relative to the Horizon Year 2044 Build Alternative 4 scenario. The future six-lane facility, if constructed, would include the measures identified for Build Alternatives 1, 2C, and 4, that would minimize GHG emissions of the

project; however, even with the incorporation of standard project measures and addition of mitigation measures, GHG emissions generated by the project may not be reduced to an extent that would avoid a significant impact on the environment.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant with Mitigation

Localized GHG emissions within the LM MSHCP area would be less than those identified for the proposed project. Build Alternatives 1, 2C, and 4 further include measures incorporated into the project, and mitigation measures, that would minimize GHG emissions during construction and operation of the proposed project.

4.2.8(b) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Build Alternatives 1, 2C, and 4

No Impact

Following the State's adopted AB 32 GHG reduction target, Riverside County has set a goal to reduce emissions back to 1990 levels by the year 2020. This target was calculated as a 15 percent decrease from 2008 levels, as recommended in the AB 32 Scoping Plan. The estimated community-wide emissions for the year 2020, based on population and housing growth projections associated with the assumptions used in the proposed General Plan Update, are 12,129,497 metric tons of CO_2e. In order to reach the reduction target, Riverside County must offset this growth in emissions and reduce community-wide emissions to 5,960,998 metric tons of CO_2e by the year 2020 (County 2018a).

The onsite construction equipment for the proposed project is anticipated to emit a total of 3,570 metric tons of GHGs during construction. With innovations such as longer pavement lives, improved TMPs, and changes in materials, the GHG emissions produced during construction can be mitigated to some degree by longer intervals between maintenance and rehabilitation events. Compliance with the 2015 Caltrans Standard Specifications, the SCAQMD Rules and Regulations, in addition to Standard Project Measures **PF LU-1** and **PF AQ-1** during construction would minimize construction-related GHG impacts. Please refer to Section 3.1, *Land Use*, for **PF LU-1**; and Section 3.14, *Air Quality*, for **PF AQ-1**.

The proposed project would address growth and mobility needs as identified in the Riverside County General Plan Circulation Element. The proposed project would not generate new vehicular traffic trips because new homes or businesses would not be constructed as part of the project, and the proposed project is not considered a traffic generator.

The proposed project would result in a slight increase in GHG emissions during construction; however, these emissions are at levels not considered significant for an individual project. In addition, because the proposed project would not generate new traffic, it is anticipated that the proposed project would not result in any increase in operational GHG emissions that would have a significant impact on the environment.

In addition to the application of Standard Project Measures **PF LU-1** and **PF AQ-1** during construction, the proposed project would also include Standard Project Measures **PF VIS-1**, **PF VIS-4**, **NC-13 (NES BIO-9),** and **PF SW-1**, which would minimize GHG emissions consistent with the measures and goals identified in the Riverside County Climate Action Plan and would therefore be consistent with the plan. As described Section 4.2.3, *Air Quality*, the project is also consistent with the SCAG RTP/SCS. Therefore, the proposed project would not conflict with the applicable plan adopted for the purpose of reducing GHG emissions. Please refer to Section 3.7, *Visual/Aesthetics*, for **PF VIS-1** and **PF VIS-4**; and Section 3.17, *Natural Communities*, for **NC-13 (NES BIO-9)**.

The proposed project is consistent with, and does not conflict with, any applicable plans, policies, or regulations adopted for the purposes of reducing the emissions of GHGs. No impacts would result.

4.2.9 Hazards and Hazardous Materials

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☒	☐	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☒	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☒
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☒	☐	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☒	☐
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	☐	☐	☒	☐

The information presented in this section is based on Chapter 3, Section 3.13, *Hazardous Waste/Materials*, of this EIR/EIS, the project-specific *Initial Site Assessment* (ISA) *Cajalco Road Widening and Safety Enhancement Project Riverside County, California* (Caltrans 2020f), *Preliminary Site Investigation* (PSI) *Cajalco Road Widening and Safety Enhancement Project Riverside County, California* (Caltrans 2020g), and the *Aerially Deposited Lead (ADL) Investigation, Cajalco Road Widening and Safety Enhancement Project Riverside County, California* (Caltrans 2017c).

4.2.9(a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? and

4.2.9(b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Build Alternatives 1, 2C, and 4

Less than Significant Impact with Mitigation

During construction, there is the potential to encounter hazardous materials in soils and existing road and structures materials. Construction of any of the build alternatives would disturb soils, demolish existing buildings and structures, and remove pavement markings. As discussed in Section 3.13, *Hazardous Waste/Materials*, there are two Recognized Environmental Conditions (RECs), one Historical Recognized Environmental Condition (HREC), and five Environmental Areas of Concern (AOCs) associated with the proposed project. As a result, contaminants such as polychlorinated biphenyls (PCBs), lead chromate, lead-based paint (LBP), creosote treated wood, and asbestos-containing material (ACM), may be encountered during construction. Typical hazardous materials anticipated to be used during construction of any of the build alternatives (e.g., solvents, paints, fuels) and hazardous wastes generated during construction would be handled in accordance with Standard Project Measure **PF HAZ-3** (waste handling, transport and disposal), which identifies the applicable federal and state regulations and Caltrans policies regarding the use, storage, handling, disposal, and transport of these materials.

The identified RECs within the limits of Build Alternatives 1, 2C, and 4 are Mobil Baldwin at 21020 Cajalco Road and 9001 Cajalco Road. Full acquisition of Assessor's Parcel Numbers (APNs) 318-061-027 and -030, associated with the Mobil Baldwin site, and partial acquisition of APNs 279-231-004, -006, -011, and 281-140-021, associated with 9001 Cajalco Road, are proposed as part of the project.

The Mobil Baldwin site involved unauthorized release of gasoline that affected onsite soils and groundwater, and is currently undergoing remediation. Site contaminant characterization and remediation activities have been ongoing at the Mobil Baldwin site since 2005, and remediation may be concluded by the time project construction begins. Due to elevated contaminant concentrations identified at the site and open regulatory case status, however, Mitigation Measure **HAZ-4** (coordination, health and safety plan, soil management plan, VOC monitoring, groundwater disposal) is proposed to confirm safe conditions and minimize potential impacts related to the acquisition of APNs 318-061-027 and -030 (see Section 3.13, *Hazardous Waste/Materials*); these measures, in addition to Standard Project Measures **PF HAZ-2** (health and safety plan) and **PF HAZ-3** (waste handling, transport. and disposal), would ensure hazards associated with the acquisition of APNs 318-061-027 and -030, and soil disturbance activities during construction, are minimized to the greatest extent feasible and potential impacts would be less than significant.

The 9001 Cajalco Road site is a former red clay mine and rock quarry; according to the Environmental Information Risk Services Database Report findings, it is associated with elevated concentrations of arsenic in soils. A 2004 Phase I Environmental Site Assessment

(ESA) revealed no evidence of RECs in connection with the property, and a response letter from Department of Toxic Substances Control concurred with the Phase I ESA findings. In 2007, an Environmental Oversight Agreement/School Cleanup Agreement identified additional investigative studies to be prepared in advance of the site being considered for the construction of a new school. While no further investigative studies were prepared related to the school, a PSI of 9001 Cajalco Road and 21020 Cajalco Road (Mobil Baldwin site) was conducted in September 2020 for the proposed project. The PSI included review of the site history and prior site testing, and confirmed potential for arsenic to occur within the project limits at 9001 Cajalco Road. Mitigation Measure **HAZ-1** (detailed site investigation and remediation, if appropriate) is identified to minimize potential impacts related to the acquisition of APNs 279-231-004, -006, -011, and 281-140-021 (see Section 3.13, *Hazardous Waste/Materials*); this measures, in addition to Standard Project Measures **PF HAZ-2** and **PF HAZ-3**, would ensure hazards associated with the acquisition of APNs 279-231-004, -006, -011, and 281-140-021, and soil disturbance activities during construction, are minimized to the greatest extent feasible and potential impacts would be less than significant.

The Lake Mathews General Store site, located at 17679 Cajalco Road was identified as an HREC and formerly associated with soil and soil vapor contamination. However, the site was granted closure in May of 2017 by the Riverside County Local Oversight Program and the Santa Ana RWQCB. Partial acquisition and of the property and temporary construction activities are proposed. Standard Project Measures **PF HAZ-2** and **PF HAZ-3** would ensure hazards involving soil disturbance activities during construction are minimized to the greatest extent feasible and potential impacts would be less than significant.

The five identified AOCs would require attention prior to construction and are listed below:

1, 2) Utility poles containing creosote-treated wood are located along several roads within the project limits. During construction, creosote-treated wood waste may be generated when aforementioned poles are manipulated or removed. Pole-mounted transformers were also noted throughout the project footprint for all build alternatives. Two pad-mounted transformers are located at the eastern portion of the project (at the intersection of Harvill Avenue and Cajalco Expressway). The transformers may contain PCBs. Compliance with Standard Project Measures **PF HAZ-2**, **PF HAZ-3**, and **PF HAZ-5** (creosote-treated wood waste) would ensure hazards would be minimized to the greatest extent feasible and potential impacts would be less than significant.

3) Areas immediately adjacent to and within the limits of Build Alternatives 1, 2C, and 4 are either currently or have historically been used for agriculture. According to the ISA prepared for the proposed project, agricultural activities were noted along limited sections of the proposed project alignments as early as 1938. Refer to Figure 3.13-2 in Section 3.13, *Hazardous Waste/Materials*, for the locations of current and historic agricultural land uses along the project alignments. Agricultural chemicals, including organochlorine pesticides (OCPs) and arsenic, may have previously been applied within these areas along with their associated metal constituents, and may be present in near-surface soils at residual concentrations. Soil disturbance during construction may potentially expose the public and environment to unsafe levels of OCPs and arsenic if these constituents are present at levels above regulatory thresholds. Therefore, additional investigation of land formerly associated with agriculture that has not undergone development is warranted to ensure residual concentrations are below hazardous thresholds. The

implementation of Mitigation Measure **HAZ-6** and compliance with Standard Project Measures **PF HAZ-2**, **PF HAZ-3**, and **PF AQ-2** (Fugitive Dust Control) would ensure hazards related to the release and exposure of unsafe OCPs or arsenic would be avoided.

4) Yellow striping was observed within the construction limits of Build Alternatives 1, 2C, and 4. Yellow striping used prior to 2006 may contain significant levels of lead and chromium; therefore, disturbance of the paint striping could result in an exposure risk to construction personnel and surrounding environment. Handling of this material would be consistent with Caltrans Standard Special Provision (SSP) 84-9.03C. In addition to the implementation of Measure **HAZ-7** (yellow paint), compliance with Standard Project Measures **PF HAZ-2** and **PF HAZ-3** would ensure hazards would be minimized to the greatest extent feasible.

5) Based on the age (prior to 1978) of some structures within the project footprint, such as the Temescal Canyon Bridge, there is potential for ACM or LBP to be present in the building materials of these structures. If these structures are to be modified or removed as part of the implementation of any of the build alternatives, construction personnel and the surrounding environment could be exposed to hazardous materials. In addition to the implementation of Mitigation Measure **HAZ-8** (LBP and ACM), the handling of LBP and ACM would be conducted consistent with Standard Project Measures **PF HAZ-2** and **PF HAZ-3**.

After implementation of the measures as described above, Build Alternatives 1, 2C, and 4 would have less-than-significant impacts related to the routine transport, use, or disposal of hazardous materials, as well as less-than-significant impacts related to the accidental release of hazardous materials.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Construction activities associated with the future six-lane facility would include grading, cut, and fill; however, these activities would occur within the limits of the widening and safety enhancement project. Because all applicable avoidance, minimization, and mitigation measures would have been applied during implementation of the widening and safety enhancement project, the construction activities associated with adding the future additional travel lanes is unlikely to result in significant hazardous materials impacts. However, if grading, cut, and fill as part of the Future Six-Lane Facility would be conducted in areas that were previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and standard measures described above for 9001 Cajalco Road under Build Alternatives 1, 2C, and 4 would apply. Therefore, impacts would be less than significant.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed to allow for the proposed project. Significant hazardous waste/materials impacts (as discussed above) under Build Alternatives 1, 2C, and 4 are not anticipated.

4.2.9(c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Build Alternatives 1 and 2C

No Impact

There are no existing or proposed schools within one-quarter mile of the project alignments of Build Alternatives 1 or 2C. Therefore, there would be no impact on schools related to hazardous materials.

Build Alternative 4—El Sobrante Alignment

Less than Significant with Mitigation

Lake Mathews Elementary School at 12252 Blackburn Road, Riverside, CA 92503, is approximately one-quarter mile north of the project alignment on El Sobrante Road. No schools are known to be planned within 0.25 mile of the alignment of Build Alternative 4. As discussed in 4.2.9(a) and 4.2.9(b) above, there is the potential to encounter hazardous materials in soils and existing road and structure materials. The implementation of Mitigation Measures **HAZ-1**, **HAZ-4**, **HAZ-6**, **HAZ-7**, and **HAZ-8** (ACM and LBP), as well as compliance with Standard Project Measures **PF HAZ-2**, **PF HAZ-3**, and **PF HAZ-5**, would reduce impacts to less-than-significant levels. Therefore, the construction and operation of Build Alternative 4 would result in less-than-significant impacts related to the emissions or handling of hazardous waste or materials near existing or proposed schools.

Lake Mathews MSHCP (Build Alternative 4)

Less than Significant with Mitigation

A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed highway widening. As discussed above, significant hazardous waste/materials impacts would not occur with the implementation of avoidance, minimization, and mitigation measures, as applicable to Build Alternative 4.

4.2.9(d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Build Alternatives 1, 2C, and 4

Less than Significant with Mitigation

As described in 4.2.9(a) and 4.2.9(b) above, there are known hazardous material sites within the limits of Build Alternatives 1, 2C, and 4: Mobil Baldwin at 21020 Cajalco Road and 9001 Cajalco Road. The Mobil Baldwin site involved unauthorized release of gasoline that affected onsite soils and groundwater. Elevated concentrations of petroleum hydrocarbons; benzene, toluene, ethylbenzene, and xylene (BTEX); and methyl tert-butyl ether (MTBE) were identified

at this site. At the time of completion of the PSI, the site is undergoing remediation and remains active with an open regulatory case status. Mitigation Measure **HAZ-4** (coordination, health and safety plan, soil management plan, VOC monitoring, groundwater disposal) is proposed to confirm safe conditions and minimize potential impacts related to the acquisition of APNs 318-061-027 and -030 (see Section 3.13, *Hazardous Waste/Materials*); these measures, in addition to Standard Project Measures **PF HAZ-2** (health and safety plan) and **PF HAZ-3**, would ensure hazards associated with the acquisition of APNs 318-061-027 and -030, and soil disturbance activities during construction, are minimized to the greatest extent feasible and potential impacts would be less than significant.

The 9001 Cajalco Road site is a former red clay mine and rock quarry with elevated concentrations of arsenic in soils and is listed as requiring additional evaluation. A 2004 Phase I ESA revealed no evidence of RECs in connection with the property. However, considering the land use history associated with the property and because the current case status is open, Mitigation Measure **HAZ-1** (detailed site investigations and remediation, if appropriate) is identified to minimize potential impacts related to the acquisition of APNs 279-231-004, -006, -011, and 281-140-021 (see Section 3.13, *Hazardous Waste/Materials*); this measure, in addition to Standard Project Measures **PF HAZ-2** and **PF HAZ-3**, would ensure hazards associated with the acquisition of APNs 279-231-004, -006, -011, and 281-140-021, and soil disturbance activities during construction, are minimized to the greatest extent feasible and potential impacts would be less than significant.

The Lake Mathews General Store site at 17679 Cajalco Road was identified as an HREC and formerly associated with soil and soil vapor contamination. However, as the site was granted closure in May of 2017 by the Riverside County Local Oversight Program and the Santa Ana RWQCB. Compliance with Standard Project Measures **PF HAZ-2** and **PF HAZ-3** would reduce impacts related to the RECs and HREC within the project site to less-than-significant levels.

Additionally, several areas immediately adjacent to and within the construction footprint of Build Alternatives 1, 2C, and 4 are either currently or have historically been used for agriculture (refer to Figure 3.13-2). As such, agricultural chemicals have likely been applied within these areas and these chemicals, along with their associated metal constituents, may be present in near-surface soils at residual concentrations. The implementation of Mitigation Measure **HAZ-6**, as well as compliance with Standard Project Measures **PF HAZ-2**, **PF HAZ-3**, and **PF AQ-2**, would reduce impacts to less-than-significant levels.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant with Mitigation

A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed highway widening. As discussed above, significant hazardous waste/materials impacts would not occur with the implementation of avoidance, minimization, and mitigation measures as applicable to Build Alternatives 1, 2C, and 4.

4.2.9(e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

The proposed project is within an Airport Influence Area for March Air Reserve Base. Build Alternatives 1, 2C, and 4 are designated as Safety Zone Area D and Area E, with a portion of the eastern part of Cajalco Road designated as a High Terrain Zone overlay. Construction personnel working on the project would temporarily be within these Safety Zones. However, they would not be subject to areas of high hazard related to direct approach or take-off (Zone B1). Risk levels associated with Zones D and E are low and the risk level for the High Terrain Zone is medium. However, the medium risk is associated with tall single objects, such as antennas. Therefore, impacts would be less than significant because the project would not include the construction of any air traffic hazards.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed to accommodate the proposed project, which would not result in impacts related to airport safety hazards.

4.2.9(f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Build Alternatives 1, 2C, and 4

No Impact

Build Alternatives 1, 2C, and 4 would improve the operational performance and the local street system by accommodating anticipated increased traffic demand and associated potential congestion from planned development in the area, thereby improving the delivery of public services (police and fire protection and emergency medical response) in the area that would otherwise would not occur under the No-Build Alternative.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed to accommodate the proposed project, which would not affect an adopted emergency response plan or emergency evacuation plan.

4.2.9(g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

According to the Temescal Canyon Area Plan and Lake Mathews/Woodcrest Area Plan, and California Department of Forestry and Fire Protection (CAL FIRE) Very High Hazard Severity Zones (VHFHSZ) in Local Responsibility Area (LRA), Western Riverside County, Build Alternatives 1, 2C, and 4 are within State Responsibility Area/Federal Responsibility Area High/Very High/Moderate Fire Hazard Severity Zones between just east of Temescal Creek and Carpinus Drive, as related to wildfire susceptibility (CAL FIRE 2009; County 2016, 2018a, 2018b). At Temescal Creek, the project alignment passes through a limited area designated LRA VHFHSZ; the alignment of Build Alternative 4 only also passes through a limited area of local VHFHSZ just east of La Sierra Avenue (County 2018a). The proposed project would involve improvements to existing roadways, with some realignments, and related facilities such as bridges, sidewalks, and drainage and would not include any habitable structures. The proposed project would also add an alternate access route for residents between Lake Mathews Drive and Dirt Road, increase the capacity of improved roadways, and improve connections with intersecting roadways throughout the project limits. Therefore, impacts related to hazards involving wildland fires would be less than significant and mitigation would not be required.

Lake Mathews HCP (Build Alternatives 1, 2C, and 4)

No Impact

A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed to accommodate the proposed project, which would not result in impacts related to increased hazards associated with wildfires.

4.2.10 Hydrology and Water Quality

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Violate any water quality standards or waste discharge requirements, or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:				
(i) result in substantial erosion or siltation on- or off-site;	☐	☐	☒	☐
(ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;	☐	☐	☒	☐
(iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
(iv) impede or redirect flood flows?	☐	☒	☐	☐
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☒	☐

The potential for the proposed project to affect hydrology and water quality was assessed in Section 3.9, *Hydrology and Floodplain*, and Section 3.10, *Water Quality and Stormwater Runoff*, of this EIR/EIS. The following discussion is also based on information contained in the *Location Hydraulic Study Form and Floodplain Encroachment Report – Cajalco Road Widening Project* (County 2017h), *Water Quality Assessment Report—Cajalco Road Widening and Safety Enhancement Project* (Caltrans 2018f), and the *Santa Ana Region Municipal Separate Storm Sewer System (MS4) Permit Program, Low Impact Development: Guidance and Standards for Transportation Projects – Cajalco Road Widening and Safety Enhancement Project* (County 2017i).

4.2.10(a) Violate any water quality standards or waste discharge requirements, or otherwise substantially degrade surface or ground water quality?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

The proposed project is located in the Santa Ana River and San Jacinto Valley Hydrologic Units, within the Lake Mathews, Middle Santa Ana River, and Perris Hydrologic Areas. The alignments of each build alternative occur adjacent to Lake Mathews in the western half of the project area and cross Cajalco Creek toward the easterly project limits. The build alternatives also cross several unnamed tributaries to Lake Mathews and Cajalco Creek.

During construction activities associated with demolition, grubbing/land clearing, grading/excavation, drainage/subgrade construction, and paving, sediment, metals, trash, petroleum products, concrete waste (dry and wet), sanitary waste, and chemicals could be spilled or leaked with potential for those pollutants of concern to be transported directly or indirectly via storm runoff into receiving waters. Standard BMPs would be employed to control erosion, sediment, and other pollutants during construction, thereby minimizing or avoiding water quality impacts on receiving waters and nearby Lake Mathews. Because the proposed project disturbs over 1 acre, compliance with the Construction General Permit compliance is required. The Construction General Permit requires implementation of a SWPPP. The BMPs used during construction to protect water quality would be documented in the SWPPP in compliance with the Construction General Permit.

The preparation and implementation of the SWPPP is included as Standard Project Measures **PF WQ-4** (see Section 3.10, *Water Quality and Stormwater Runoff*) and **NC-10 (NES BIO-10)** (see Section 3.17, *Natural Communities*). The SWPPP would identify appropriate hazardous material management practices, spill prevention measures, and other good housekeeping measures to implement during construction in order to reduce the potential for chemical spills or releases of contaminants, including any non-stormwater discharge, off site. Any construction-related impacts on water quality would be avoided or otherwise minimized with the implementation of construction BMPs such as fiber rolls, silt fencing, stabilized construction entrances/exits, and concrete washouts. The SWPPP would also identify post-construction erosion control measures such as revegetation of disturbed soil areas to limit the potential for erosion following construction activities. The project would further include Standard Project Measures **NC-11 (NES BIO-11)** and **NC-12 (NES BIO-12)**, which require the demarcation of the LOD in stream areas and avoidance of construction equipment placed within a stream or on adjacent banks. Short-term water quality impacts are anticipated to be reduced to the maximum extent practicable during construction of the proposed project.

The proposed project would result in a permanent increase in impervious surface due to the addition of the roadway and median widening. Build Alternative 1 would increase the amount of impervious surface by approximately 83 acres, Build Alternative 2C by approximately 84 acres, and Build Alternative 4 by approximately 105 acres. For the entire project area, runoff volume would increase about 2.60 acre-feet for Build Alternative 1, 2.62 acre-feet for Build Alternative 2C, and 3.22 acre-feet for Build Alternative 4. Flow rates would increase about 11.4 cubic feet per second (cfs) for Build Alternative 1, 11.5 cfs for Build Alternative 2C, and 14.0 cfs for Build Alternative 4. This increase in the amount of runoff, resulting from the increased

impervious surface within the proposed project limits, would more effectively transport pollutants on the roadway to receiving waters. Pollutants in runoff from the widened roadway would include sediment, oils and grease, and metals, similar to the contaminants from the existing roadway operations. Without post-construction BMPs, the introduction of substantial amounts of additional pollutants in stormwater runoff could result in or contribute to a violation of water quality standards.

The project would comply with the Santa Ana Region MS4 Permit, Order No. R8-2010-0033 (adopted on and effective January 29, 2010). The current MS4 Permit requires standard design and post-development BMP guidance to be incorporated into projects for streets, roads, highways, and freeway improvements to reduce the discharge of pollutants from the project to the maximum extent practicable. As such, the proposed project would include post-construction BMPs as part of Standard Project Measure **PF WQ-3** and would be consistent with County MS4 Permit requirements. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These roadside ditches, drainages, and basins would provide some water quality treatment as highway runoff pollutants, such as sediment, would settle out. Long-term effects on turbidity would be addressed through final stabilization of soils. Based on compliance with the County MS4 Permit requirements under Standard Project Measure **PF WQ-3**, no adverse water quality impacts are anticipated during operation of the proposed project.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes were constructed in the future, an increase of impervious surfaces and associated runoff volumes and rates would not be expected because the median would be paved or otherwise treated for roadway facility use as part of the proposed project. Post-construction BMPs would be constructed as part of the proposed project, as described under Build Alternatives 1, 2C, and 4. No additional impacts would occur.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities—including a drainage basin, culverts, bridges and wildlife crossings—would also be constructed. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed project, which would increase impervious surfaces and associated runoff volumes and rates. The proposed project would need to construct proper drainage facilities so that runoff would not result in erosion or flooding. Through the use of project design features such as detention basins

and culverts, 100-year storm flows would be conveyed, and would not result in any new flooding. Post-construction BMPs would be required to reduce the discharge of runoff and pollutants, as detailed in Standard Project Measure **PF WQ-3**. Based on compliance with the County MS4 Permit requirements in Standard Project Measure **PF WQ-3**, no adverse water quality impacts are anticipated during operation of the proposed project.

4.2.10(b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such the project may impede sustainable groundwater management of the basin?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

The proposed project would not result in the need for groundwater supplies and would not substantially decrease groundwater supplies. Because the project site is not used specifically for groundwater recharge, the project's increase in impervious surface would not interfere substantially with groundwater recharge and would not affect groundwater levels. Groundwater hydrology is not expected to be adversely affected or to adversely affect the project.

Dewatering may be required in the surface waters where new bridge footings would be installed. In the event that groundwater and any other non-stormwater dewatering activities are necessary, these activities are subject to the requirements of the Regional Board Dewatering Permit (Order No. R8-2015-0004 [NPDES No. CAG998001]). A separate permit would be required if dewatering is necessary. The Dewatering Permit requires implementation of a Monitoring and Reporting Program to ensure discharges meet permit standards. Therefore, it is not anticipated that surface water would be affected during construction activities as a result of site dewatering, as long as any potential groundwater discharged meets the RWQCB dewatering permit. Impacts are considered less than significant, and no mitigation is required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The proposed project would not result in the need for groundwater supplies and would not substantially decrease groundwater supplies. Because the project site is not used specifically for groundwater recharge, the project's increase in impervious surface would not interfere substantially with groundwater recharge and would not affect groundwater levels. Groundwater hydrology is not expected to be adversely affected or to adversely affect the project. If the additional lanes were constructed in the future, an increase of impervious surfaces and associated runoff volumes and rates would not be expected because the median would be paved or otherwise treated for roadway facility use as part of the proposed project and would not affect groundwater further.

Lake Mathews HCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities—including a drainage basin, culverts, bridges

and wildlife crossings—would also be constructed. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would allow for the proposed project, which would not result in groundwater impacts beyond those identified for the proposed project. Impacts are considered less than significant, and no mitigation is required.

4.2.10(c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces, in a manner which would:

(i) result in substantial erosion or siltation on- or off-site;

ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;

(iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

(iv) impede or redirect flood flows?

Build Alternatives 1, 2C, and 4

Less than Significant with Mitigation

Because the general topography would be similar to existing conditions, the proposed project would not significantly change the drainage patterns but would result in an increase in the total impervious surface area. The addition of new impervious area from the additional roadway is anticipated to increase runoff. Build Alternative 1 would increase the amount of impervious surface by approximately 83 acres, Build Alternative 2C by approximately 84 acres, and Build Alternative 4 by approximately 105 acres. For the entire project area, runoff volume would increase about 2.60 acre-feet for Build Alternative 1, 2.62 acre-feet for Build Alternative 2C, and 3.22 acre-feet for Build Alternative 4. Flow rates would increase about 11.4 cfs for Build Alternative 1, 11.5 cfs for Build Alternative 2C, and 14.0 cfs for Build Alternative 4. Because the proposed project would increase runoff volumes and flow rates, there is a potential for the proposed project to increase erosion, flooding, and pollutant discharges and exceed the capacity of existing drainage systems.

Under Build Alternatives 1, 2C, and 4, new facilities for onsite drainage would be constructed as part of the realignment and roadway improvements. The proposed project would be designed so that the stormwater runoff flows into newly constructed roadside ditches, drainages, and several detention basins. These detention basins would provide peak flow attenuation to reduce the discharge of stormwater into the creeks, consistent with the existing conditions. Build Alternatives 1, 2C, and 4 would encroach into the floodplains at four creek crossing locations: one at Temescal Creek and three along Cajalco Creek. Refer to Figure 3.9-1, FEMA Floodplains, in Section 3.9, *Hydrology and Floodplain*, for the location of these encroachments. The proposed bridge structure would be supported by piers that would be placed in the floodplains. Through the use of project design features such as roadside ditches, detention basins, and culverts, 100-year storm flows would be conveyed, and would not result in flooding. The proposed project's

encroachment to the floodplain would not reduce the storage volume of the creeks because the proposed project would provide larger openings than currently exist to more efficiently convey flows, resulting in lowering of the upstream water surface elevation; therefore, the proposed project would not have an adverse effect on the base floodplain elevation and would limit the potential for flooding and exceeding capacities of drainage facilities. Refer to Section 3.9, *Hydrology and Floodplain*, for additional details.

MWD Lake Mathews facilities are located within the project footprint within this floodplain encroachment area and would be affected by the proposed project. MWD facilities that would be affected by Build Alternatives 1 and 2C include Cajalco Creek Dam and Detention Basin, Cajalco Creek Sedimentation Basin, and the Inlet Channel separating the two basins. These facilities are located along the north side of Cajalco Road between El Sobrante Road and Harley John Road. The Cajalco Creek Sedimentation Basin is approximately 31 acres, sited immediately upstream of the 70-acre Cajalco Creek Dam and Detention Basin.

Under Build Alternatives 1 and 2C, approximately 3.69 acres of the Cajalco Creek Sedimentation Basin (approximately 12 percent of the basin size) and 4.95 acres of the Cajalco Creek Dam and Detention Basin (approximately 7 percent of the basin size) would be converted to right of way. Under Build Alternative 4, approximately 0.12 acre of the Cajalco Creek Dam and Detention Basin (less than 1 percent of the basin size) and 3.55 acres of the Cajalco Creek Sedimentation Basin (approximately 11.5 percent of the basin size) would be converted to right of way. The Inlet Channel would be replaced with a wildlife crossing and may affect inlet operation. Because the proposed project would reduce the capacity of the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin, this could affect the operations of the basins. However, the proposed encroachments would be in areas considered ineffective in conveying flow through the basins and therefore would not adversely affect water surface elevation or velocity of the existing Cajalco Creek floodplain.

The County of Riverside will coordinate directly with MWD to obtain approval for right of way acquisition involving the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin. The County will coordinate directly with MWD in the preparation of a site-specific Drainage Study to evaluate the changes in runoff and floodplain encroachment into the Cajalco Creek Dam and Detention Basin and the Cajalco Creek Sedimentation Basin, and determine whether the conversion of right of way would affect operation of the dam and basins. Mitigation Measure **HYD-1** requires that if operation of the basins is affected by the project, engineering recommendations will be provided, and implemented as necessary, to ensure continued operation of the dam and basins. Impacts would be less than significant with implementation of Mitigation Measure **HYD-1.** Refer to Section 3.9, *Hydrology and Floodplain*, for additional details.

Erosion during project construction and operation would be addressed through compliance with the applicable National Pollutant Discharge Elimination System construction and municipal permits. Standard BMPs would be employed to control erosion, sediment, and other pollutants during construction, thereby minimizing or avoiding erosion. The BMPs used during construction would be documented in the SWPPP in compliance with the Construction General Permit, as detailed in Standard Project Measures **PF WQ-4** and **NC-10 (NES BIO-10)**. Long-term effects on erosion would be addressed through final stabilization of soils. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages,

and several detention basins, in compliance with the County's MS4 Permit, as detailed in Standard Project Measure **PF WQ-3**. Therefore, the proposed project would not include drainage modifications that would result in substantial erosion, siltation, or flooding on or off the project site. Impacts are considered less than significant.

The increase in the amount of impervious surface would increase peak storm flows such that they could affect downstream drainage facilities. However, through compliance with the requirements of the County's MS4 permit, the proposed project would minimize any incremental pollutant loading associated with the increased impervious surface areas. Impacts would be considered less than significant.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and/or La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that there would not be an increase in impervious surfaces and associated runoff volumes and rates, because the median would be paved as part of the proposed project. No additional development in the floodplain would occur. No substantial additional sources of polluted runoff or exceeding the capacity of storm drainage infrastructure would occur as a result of the proposed project. The proposed project roadway lanes would also construct proper drainage facilities so that runoff would not result in flooding. No additional impacts would occur.

Lake Mathews HCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Under Build Alternatives 1, 2C, and 4, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Build Alternative 1 would increase the amount of impervious surface within the LM MSHCP area by approximately 45 acres, Build Alternative 2C by approximately 35 acres, and Build Alternative 4 by approximately 35 acres. However, the project is outside the LM MSHCP area on the western and eastern ends of Cajalco Road; the middle section is within the LM MSHCP. Therefore, three of the four floodplain encroachments would not occur within the LM MSHCP area. Under Build Alternatives 1 and 2C, the proposed project would result in an encroachment of Cajalco Creek at Harley John Road and would involve replacement of three culverts with a reinforced concrete box culvert. A portion of these improvements are located within the LM MSHCP area, the impacts of which are detailed above under the build alternatives.

Under Build Alternative 4, the proposed project would result in an encroachment of Cajalco Creek at Harley John Road and would result in a new roadway alignment within this floodplain area. A portion of these improvements are within the LM MSHCP area, the impacts of which are detailed above under Build Alternative 4. Under Build Alternative 4, portions of La Sierra

Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. A discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to allow for the proposed highway widening, which would result in an increase of flood flows from increased impervious surfaces and development in the floodplain; however, the proposed project would construct proper drainage facilities so that runoff would not result in additional flooding, as discussed previously. Impacts are considered less than significant.

Runoff associated with the proposed project would be treated to remove pollutants of concern. The proposed project includes construction of several basins to reduce the runoff flows from the impervious surfaces so that the capacity of existing or planned stormwater drainage facilities would not be exceeded. In addition, the proposed project would include upgrades to the drainage system as needed to accommodate existing and proposed flows. No substantial additional sources of polluted runoff or exceeding the capacity of storm drainage infrastructure would occur as a result of the proposed project. Impacts would be considered less than significant.

4.2.10(d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Build Alternatives 1, 2C, and 4

No Impact

Flood hazard areas are designated as zones, with the proposed project in Federal Emergency Management Agency (FEMA) Zone A and un-shaded Zone X. Zone A is an area subject to inundation by the 100-year flood. Zone X is an area of minimum flood hazard outside the 500-year flood limits. Build Alternatives 1, 2C, and 4 would encroach into the floodplains at Temescal Creek and at Cajalco Creek west of Alexander Street and between Alexander Street and Clark Street. The proposed project would not increase risk of release of pollutants due to project inundation beyond that identified in 4.2.10(a) associated with stormwater runoff. The project would not otherwise store pollutant materials that could be released in the event of inundation. The project site is adjacent to the Cajalco Creek Dam, Lake Mathews Dam, and Lake Mathews Reservoir. The proposed project would not affect the Lake Mathews Dam or Reservoir or increase the potential for dam failure. The proposed project would not be located in an area at risk for tsunami inundation due to distance to the Pacific Ocean.

Under Build Alternatives 1, 2C, and 4, new facilities for onsite drainage would be included as part of the realignment and roadway improvements. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These detention basins would provide peak flow attenuation to reduce the discharge of stormwater into the creeks, consistent with the existing conditions. These roadside ditches, drainages, and basins would provide some water quality treatment as highway runoff pollutants, such as sediment, would settle out. Impacts would be considered less than significant.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and/or La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that there would not be an increase in impervious surfaces and associated runoff volumes and rates, because the median would be paved as part of the proposed project. No additional development in the floodplain would occur. The proposed project roadway lanes would also construct proper drainage facilities so that runoff would not result in flooding. No additional impacts would occur.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These detention basins would provide peak flow attenuation to reduce the discharge of stormwater into the creeks, consistent with the existing conditions. The incorporation of standard water quality protection measures required as part of the Section 401 certification and 404 and MS4 permit processes would ensure the protection of water quality during construction and operation of the proposed project.

4.2.10(e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

The proposed project is within the boundaries of the Drainage Water Quality Management Plan for the Lake Mathews Watershed (DWQMP) and Water Quality Control Plan for the Santa Ana Region (Basin Plan). The project must comply with all applicable water quality standards and prohibitions, including provisions of the Basin Plan.

The incorporation of standard water quality protection measures required as part of the Section 401 certification, Section 404 and MS4 permit, and Construction General Permit and SWPPP during construction would ensure the protection of water quality during construction of the proposed project. These permits, and the steps required to obtain them, are included as Standard Project Measures **PF WQ-1**, **PF WQ-2**, and **PF WQ-4** in Section 3.10, *Water Quality and Stormwater Runoff*, and Standard Project Measure **NC-10 (NES BIO-10)** in Section 3.17, *Natural Communities*. As discussed in 4.2.10(a), runoff associated with the proposed project would be treated to remove pollutants of concern. The project would comply with the Santa Ana Region MS4 Permit and include post-construction BMPs, as detailed in Standard Project Measure **PF WQ-3**. The proposed project would be designed so that the stormwater runoff flows into roadside ditches, drainages, and several detention basins. These roadside ditches, drainages, and basins would provide some water quality treatment as highway runoff pollutants, such as

sediment, would settle out. With implementation of these measures, the proposed project is not expected to conflict with implementation of a water quality control plan. No substantial degradation to water quality would occur as a result of the proposed project. Impacts would be considered less than significant with implementation of Standard Project Measures **NC-10 (NES BIO-10)**, **PF WQ-1**, **PF WQ-2**, **PF WQ-3**, and **PF WQ-4**.

As discussed in 4.2.10(b), the proposed project would not result in the need for groundwater supplies and would not substantially decrease groundwater supplies. Because the project site is not used specifically for groundwater recharge, the project's increase in impervious surface would not interfere substantially with groundwater recharge and would not affect groundwater levels. Implementation of the project is not expected to conflict with or obstruct implementation of a sustainable groundwater management plan.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and/or La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that there would not be an increase in impervious surfaces and associated runoff volumes and rates, because the median would be paved as part of the proposed project. No additional degradation to water quality would occur as the proposed project would include post-construction BMPs to be consistent with County MS4 Permit requirements. Based on compliance with the County MS4 Permit requirements, no adverse water quality impacts are anticipated during operation of the proposed project. No additional impacts would occur.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Avenue would also be expanded and realigned within the LM MSHCP area and LMR. An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed highway widening, which would increase impervious surfaces and associated runoff volumes and rates. Runoff associated with the proposed project would be treated to remove pollutants of concern. No substantial degradation to water quality would occur as a result of the proposed project. Impacts would be considered less than significant**.**

4.2.11 Land Use and Planning

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☒	☐	☐

The potential for the proposed project to affect land use and planning was assessed in Sections 3.1, *Land Use*, and 3.4.1, *Community Character and Cohesion*, of this EIR/EIS. The following discussion is also based on information in the *Community Impact Assessment* and *Errata*, *Draft Relocation Impact Report – Cajalco Road Widening Project* (Caltrans 2018c, 2018g, 2021).

4.2.11(a) Physically divide an established community?

Build Alternatives 1, 2C, and 4

No Impact

The proposed widening of Cajalco Road or El Sobrante Road would not introduce a barrier that would divide any existing communities, separate residences from community facilities, result in substantial growth, or impede connectivity between neighborhoods. The widening of Cajalco Road or El Sobrante Road would occur predominantly along the existing alignment of the road, which would make it compatible with the existing land uses and aesthetics. No development features are proposed that would divide an established community or limit movement, travel, or social interaction between established communities. Therefore, there would be no impact. No mitigation is required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

If constructed in the future, the limits of two additional travel lanes placed within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, would not introduce a barrier that would divide any existing communities, separate residences from community facilities, result in substantial growth, or impede connectivity between neighborhoods. There would be no impact; no mitigation would be required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

As indicated under Build Alternatives 1, 2C, and 4 above, there would be no impact. No mitigation would be required.

4.2.11(b) Cause a significant environmental impact due to conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Build Alternatives 1, 2C, and 4

Less than Significant with Mitigation

As discussed in the *Consistency with State, Regional, and Local Plans and Programs* section in Chapter 3, Section 3.1.4, Table 3.1-3 analyzes the consistency of the build alternatives with the relevant plans and programs. As detailed in Table 3.1-3, the proposed project would be consistent with most applicable goals and policies of relevant plans and programs.

Build Alternatives 1, 2C, and 4 would result in the acquisition of DOC FMMP important farmlands, and Build Alternative 4 would require the acquisition of 4.79 acres currently under Williamson Act contract. The assessment scores for each build alternative do not exceed the threshold standard under CFR 658.4(c)(2)), and would not result in a significant impact. Because Build Alternative 4 would not exceed the state threshold of 100 acres of Williamson Act contract cancellations, and the remaining farmland of affected properties would continue to be available for agricultural use, a significant impact on Williamson Act lands (CEQA Guidelines Section 15206) would not occur. Standard Project Measure **PF FA-1** would ensure access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway. In addition, Standard Project Measure **PF FA-2** would ensure areas temporarily occupied during construction are returned to conditions that would allow for continued use and function as farmland following construction.

Because the proposed project is included as proposed in both the SCAG 2020–2045 RTP/SCS and the 2021 FTIP, which were found to conform to the SIP responsible for attaining and maintaining compliance with air quality standards, the proposed project would not conflict with or obstruct implementation of an air quality plan. The proposed project further includes Standard Project Measures **PF LU-1**, **PF VIS-1**, **PF VIS-4**, **PF AQ-1**, **NC-13 (NES BIO-9),** and **PF SW-1**, and proposes Mitigation Measure **VIS-2**, which would minimize GHG emissions consistent with the measures and goals identified in the Riverside County Climate Action Plan and would therefore be consistent with the plan.

Build Alternatives 1, 2C, and 4 would directly affect PQP lands in the WRC MSHCP, and one of the long-term SKR HCP Core Reserve Areas (Existing Core C). The conversion of land to transportation uses is covered/allowed under Section 7.2.2 of the WRC MSHCP. Compliance with WRC MSHCP Volume I, Sections 7.5.1 (Guidelines for the Siting and Design of Planned Roads within the Criteria Area and Public/Quasi-public Lands), 7.5.2 (Guidelines for Construction of Wildlife Crossings), and 7.5.3 (Construction Guidelines), and Appendix C (Standard Best Management Practices) is required. Impacts associated with the proposed roadway improvements that would include slope easements and appurtenant facilities are anticipated to extend beyond the 128-foot right of way in limited areas under Build Alternatives 1 and 2C, and beyond the 196-foot right of way in limited areas under Build Alternative 4, and would require a minor amendment to the WRC MSHCP to accommodate the additional right of way needed. Mitigation Measure **NC-20 (NES BIO-21)** listed in Section 3.17, *Natural Communities*, is proposed to compensate for the loss of land and habitat in WRC MSHCP PQP

lands and SKR HCP Core Reserve Area. With implementation of the above mitigation measures, impacts would be less than significant with mitigation incorporated.

Under Build Alternatives 1, 2C, and 4, Cajalco Road would be expanded and realigned within the LM MSHCP and LMR; refer to *Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)*.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

The limits of two additional travel lanes placed within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, are not included in the currently proposed project. If constructed in the future, the additional lanes would be within the limits of the currently proposed project and consistency with the WRC MSHCP and LM MSHCP would have been addressed through the WRC MSHCP minor amendment and LM MSHCP discretionary action processes. No related impacts would be anticipated and mitigation would not be required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant with Mitigation

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities including a drainage basin, culverts, bridges, and wildlife crossings would also be constructed. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Road would also be expanded and realigned within the LM MSHCP area and LMR. Build Alternatives 1, 2C, and 4 would conflict with the current LM MSHCP. The LM MSHCP does not currently accommodate planned transportation improvements of the proposed project within lands managed by MWD. Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required. Build Alternatives 1, 2C, and 4 would also encroach into the LM MSHCP and remove habitat for LM MSHCP target species, which is not currently permissible under the LM MSHCP. Modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by the build alternatives will be coordinated between the County and LM MSHCP responsible parties.

Following selection of the preferred alternative, any adjustments to the right of way or another County road facility would be negotiated with RCA during the minor amendment process to accommodate the project alternative. Any amendment would occur prior to the RCA Joint Project Review with the associated wildlife agencies' approval, and is anticipated prior to the Final EIR/EIS. Additionally, there has been extensive, ongoing coordination between the County and MWD, and the Lake Mathews Reserve Management Committee, to develop a mitigation plan to compensate for the loss of lands within the LMR and to address the goals of the LM MSHCP. Refer to Mitigation Measures **NC-17 (NES BIO-17)** through **NC-19 (NES BIO-15)** in Section 3.17, *Natural Communities*. With implementation of the above mitigation measures, impacts would be less than significant.

4.2.12 Mineral Resources

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☒	☐
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

This section was prepared using information from Section 3.1, *Land Use*, the *Community Impact Assessment* technical report and *Errata* prepared for the project (Caltrans 2018c, 2021), DOC, and County of Riverside General Plan.

4.2.12(a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

According to the California State Geological Survey, the proposed project is located with the Temescal Valley Production Area Boundary as established by DOC; the majority of lands within the boundary are classified as Mineral Resource Zone (MRZ) 3, which is defined by DOC as "areas containing mineral occurrences of undetermined mineral resource significance" (DOC 2014). A very limited portion of the western end of the project limits travels through a narrow area identified as "Sector Q" of the Temescal Valley Production Area; the Sector Q area encompasses instream alluvial deposits of Temescal Wash from Magnolia Avenue in the City of Corona extending to Cajalco Road. Land within Sector Q is classified MRZ-2, which DOC defines as "areas where adequate information indicates that significant mineral deposits are present, or where it is judged that a high likelihood for their presence exists. This zone shall be applied to known mineral deposits or where well-developed lines of reasoning, based upon economic-geologic principles and adequate data, demonstrate that the likelihood for occurrence of significant mineral deposits is high." Sector Q contains an estimated 18.2 million tons of aggregate resource.

Within areas defined as MRZ-2, Build Alternatives 1, 2C, and 4 propose to replace the existing Temescal Creek Bridge with a widened bridge structure. Permanent impacts associated with the bridge replacement, including roadbed widening, bridge embankments, and fill, would affect approximately 0.4 acre of land classified as MRZ-2. Temporary impacts associated with the bridge replacement, including grading and construction easements, would affect approximately 0.5 acre of land classified as MRZ-2.

The proposed project would involve the acquisition of lands classified as MRZ-2; however, the amount of aggregate resource affected compared to the remaining 18.2 million tons available within Sector Q (composed of instream alluvial deposits of Temescal Wash) would not

significantly affect the availability of the resource. Furthermore, mining activities within the streambed of Temecula Creek would be subject to strict environmental regulations, and mining activities immediately upstream of the creek bed that is protected as part of the Riverside-Corona Resource Conservation District are unlikely. Therefore, impacts affecting the availability of a known mineral resource would be less than significant and mitigation is not required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would not include any use that would increase demand for mineral resources. The portion of the project that traverses areas of the LM MSHCP and LMR would not affect existing mineral resources. Therefore, mineral resources, as they relate to the proposed LM MSHCP discretionary action to accommodate the project, would remain unchanged.

4.2.12(b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Build Alternatives 1, 2C, and 4

No Impact

Sector Q of the Temescal Valley Production Area within the project area is also zoned Open Space-Mineral Resource (MR) (County 2018b); a very limited area within the project limits is also designated MR in the Temescal Canyon Area Plan (County 2016).

Within areas zoned MR, Build Alternatives 1, 2C, and 4 propose to replace the existing Temescal Creek Bridge with a widened bridge structure. Permanent impacts associated with the bridge replacement, including roadbed widening, bridge embankments, and fill, would affect approximately 1.2 acres of land zoned MR; temporary impacts associated with the bridge replacement, including grading and construction easements, would affect approximately 2.5 acres of MR-zoned land. The proposed project would involve permanent and temporary impacts on lands zoned MR; however, the lands are not part of a mineral resource recovery site and the County General Plan includes the planned widening of Cajalco Road through the affected area. Therefore, the project would be not result in the loss of availability of an important local mineral resources recovery site, and would be consistent with the planned widening of a transportation facility through MR-zoned lands. There would be no impact and mitigation is not required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would not include any use that would increase demand for mineral resources. The portion of the project that traverses areas of the LM MSHCP and LMR would not affect existing mineral resources. Therefore, mineral resources, as they relate to the proposed LM MSHCP discretionary action to accommodate the project, would remain unchanged.

4.2.13 Noise

Would the project result in:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

This section was prepared using information from Section 3.15, *Noise and Vibration*, the *Noise Study Report* (Caltrans 2019a), and the *Noise Abatement Decision Report* prepared for the project (Caltrans 2019b).

4.2.13(a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Permanent Impacts

Build Alternatives 1 and 2C

Less than Significant with Mitigation

Potential impacts from the proposed project were evaluated using modeling results from the Traffic Noise Model ® Version 2.5 (TNM). Existing and Design-Year 2044 peak-hour traffic volumes were converted to the Community Noise Equivalent Level (CNEL) values using a typical 24-hour diurnal traffic pattern. Operational traffic noise for the proposed project was analyzed by comparing the Design-Year CNEL noise levels to the Existing CNEL levels and the 65 CNEL sound level included in the County's General Plan (Policy N 1.3). Policy N 1.3 identifies noise levels in excess of 65 A-weighted decibels (dBA) CNEL as the level at which "any land use that is exposed to levels higher than 65 CNEL" would require noise attenuation measures.

For the purposes of this analysis, the Federal Interagency Committee on Noise (FICON) methodology was used to determine impacts. This methodology was blended with the County's

65 dBA CNEL (County General Plan Policy N 1.3) exterior sound level.[13] An impact would occur if the project would cause an increase of 1.5 decibels (dB) at any receiver that exceeded the 65 dBA CNEL (relative to the existing condition) during the design year, if the project would result in a 3 dB increase at any receiver that during the existing condition was between 60 and 65 dBA CNEL. One final consideration was included to determine level of significance: if the project would result in an increase of 5 dB or more at any receiver below 60 dBA CNEL under the existing condition. The 5 dB increase represents the increase in noise that is considered readily perceptible. Additionally, the County's interior noise level of 45 dBA CNEL (General Plan Policy N 14.1) was considered in tandem.

An analysis of the existing noise levels and the Design-Year noise levels at receiver locations, compared with the FICON and County General Plan Policy N 1.3 standards, is included in Table 4.2-12 on the following page. Receivers listed in Table 4.2-12 are the same for Build Alternatives 1 and 2C, as the two alternatives were similar in design and therefore have a similar geographic extent.

[13] The FICON methodology and thresholds are based on a day/night level, which divides a typical day into two distinct time frames: day and night (10 dB penalty from 10 p.m. to 7 a.m.). The County uses CNEL, which divides a typical day into three distinct time frames: day, evening (5 dB penalty from 7 p.m. to 10 p.m.), and night (10 dB penalty 10 p.m. to 7 a.m.).

Table 4.2-12. Modeled Exterior Traffic Noise Levels - Build Alternatives 1 and 2C

Receiver	dBA CNEL			Change in Noise Level Compared to Existing (dB)		Does Existing Condition Exceed 65/45 dBA (Exterior/Interior) CNEL standard?	Would the project result in an increase that would exceed 1.5 dB over the 65/45 dBA (Exterior/Interior) CNEL standard, 3 dB between 60 to 65 CNEL, or 5 dB at any noise level?

Note: **Bold** noise level indicates that County of Riverside's 65 dBA CNEL planning standard for residential land use is exceeded by 1.5 dB or that an increase of 3 dB or 5 dB was expected due to the project.

As indicated in Table 4.2-12, traffic noise levels are projected to increase by 1.5 dB or more at three noise-sensitive receivers (M-93, M-105, and M-118) that currently exceed the County's 65 dBA CNEL noise level under the existing condition. These three modeled receivers (M-93, M-105, and M-118) along with M-106 (66 dBA CNEL under the design condition) are predicted to exceed the 65 dBA CNEL noise level; therefore, it is assumed that the 45 dBA CNEL (interior) level would also be exceeded. Based on the Caltrans Technical Noise Supplement, a light frame building with windows closed would result in a 20-dB exterior to interior transmission loss from the building shell; while this reduction would be substantial, it is assumed that the 45 dBA CNEL (interior) level would still be exceeded for these receivers. Additionally, 48 other modeled receivers are predicted to experience increases of 3 dB (between the existing levels of 60 to 65 dBA CNEL) or 5 dB during the design year (relative to the existing noise level). Figures 4.2-1 and 4.2-2 show the locations of modeled noise sensitive receivers throughout Build Alternatives 1 and 2C. Without mitigation, future noise levels in the project area are predicted to exceed the County 65 dBA and 45 dBA CNEL exterior and interior noise levels and the FICON noise level increases (3 and 5 dB) under Build Alternatives 1 and 2C.

In response to the future predicted noise level increases and potential for significant impact, rubberized asphalt was considered as a mitigation measure (**NOI-4**) to decrease predicted noise levels to less-than-significant levels. Rubberized asphalt allows air to escape from between the tire/pavement surface in multiple pathways, thereby reducing the pressure and soundwaves and reducing overall traffic noise; the inclusion of rubberized asphalt shows a wide range of noise reduction. A mid-range of noise reduction associated with inclusion of rubberized asphalt would be 5 dB noise reduction (Mavridoua and Kehagia 2017).

Table 4.2-13 indicates the predicted noise levels with the use of rubberized asphalt as a mitigation measure for Build Alternatives 1 and 2C. Because the rubberized asphalt would result in a reduction of noise levels at multiple modeled receivers, the use of rubberized asphalt is proposed to be implemented under Build Alternatives 1 and 2C to mitigate traffic noise along the project alignment.

Table 4.2-13. Traffic Noise Results after Mitigation (Build Alternatives 1 and 2C)

M-224	55	60	60	5	5	5	55 [0]	55 [0]	No	No

Note: **Bold** noise level indicates that County of Riverside's 65 dBA CNEL planning standard for residential land use is exceeded by 1.5 dB or that an increase of 3 dB or 5 dB was expected due to the project after mitigation.

As shown in Table 4.2-13, traffic noise increases associated with the proposed project at the four modeled receivers that would exceed the County's 65 CNEL sound level (modeled receivers M-93, M-105, M-106, and M-118) would change relative to the existing noise level by 1, -2, -1, and -3 dB, respectively. At these locations, the implementation of rubberized asphalt (**NOI-4**) would reduce traffic noise increases associated with the proposed project to less than the 1.5- and 3-dB increase thresholds.

All other modeled receivers predicted to have a 3- or 5-dB or greater increase associated with the project design relative to the use of **NOI-4** would experience no more than a 4-dB increase.

Therefore, with implementation of Mitigation Measure **NOI-4**, increases in traffic noise as a result of the project would be reduced to less-than-significant levels under Build Alternatives 1 and 2C.

- **NOI-4: Inclusion of Quiet Pavement**. The County of Riverside will require the construction contractor to provide an asphalt mix that provides 5-decibel minimum tire pavement noise reduction, and will include this mix during construction and paving of the proposed project.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

No Impact

The roadway modifications as a result of the conversion of conservation lands to a transportation facility along the Cajalco Road alignment would not result in any receivers approaching or exceeding the noise abatement criteria for residential land uses within the LM MSHCP area, including the LMR.

Build Alternative 4—El Sobrante Alignment

Potentially Significant Impact

The results of TNM traffic noise modeling were used to determine potential traffic impacts from Build Alternative 4 of the proposed project. The same methodology outlined for Build Alternatives 1 and 2C was used to identify impacts on noise-sensitive receptors within Build Alternative 4. Table 4.2-14 below shows CNEL traffic noise results and changes relative to the existing condition at noise-sensitive land uses for existing and design year for Build Alternative 4.

Table 4.2-14. Modeled Exterior Traffic Noise Levels – Build Alternative 4

	dBA CNEL		Change in the Noise level compared to existing (dB)	Would the project result in an increase that would exceed 1.5 dB over the 65/45 dBA (Exterior/Interior) CNEL standard, 3 dB between 60 to 65 CNEL, or 5 dB at any noise level?

Note: **Bold** noise level indicates that County of Riverside's 65 dBA CNEL planning standard for residential land use is exceeded by 1.5 dB or that an increase of 3 dB or 5 dB was expected due to the project.

Table 4.2-14 indicates that traffic noise levels would increase by 1.5 dB or more at three noise-sensitive receivers (M-93, M-105, and M-118) that exceed the County's 65-dBA CNEL level under the existing condition. As these three receivers exceed the 65-dBA CNEL level under the existing condition, it is assumed that the 45-dBA CNEL (interior) level would also be exceeded. Based on the Caltrans Technical Noise Supplement, a light frame building with windows closed would result in a 20-dB exterior to interior transmission loss from the building shell; while this reduction would be substantial, it is assumed that the 45-dBA CNEL (interior) level would still be exceeded for these receivers.

Additionally, three modeled receivers (M-99, M-106, and M-117, with existing noise levels of 61, 62, and 62 dBA CNEL under the existing condition, respectively) are predicted to increase by 3 dB or more. A total of 78 other modeled receivers are predicted to experience increases of 5 dB during the design year (relative to the existing noise level). Figure 4.2-3 shows the location of modeled noise-sensitive receivers throughout Build Alternative 4. Without mitigation, future noise levels in the project area are predicted to exceed the County 65-dBA and 45-dBA CNEL exterior and interior sound levels and the FICON noise level increases (3 and 5 dB) under Build Alternative 4.

Table 4.2-15. Traffic Noise Results after Mitigation (Build Alternative 4)

Cajalco Road Widening and Safety Enhancement Project

[This page left blank intentionally.]

As shown in Table 4.2-15, traffic noise increases associated with the proposed project at the six modeled receivers that would exceed the County's 65 CNEL sound level (modeled receivers M-93, M-99, M-105, M-106, M-117, and M-118) would change relative to the existing noise level by 2, 1, 0, 1, -1, and -2 dB, respectively. At these locations, the implementation of rubberized asphalt (**NOI-4**) would reduce traffic noise increases associated with the proposed project to less than the 1.5- and 3-dB increase thresholds.

Mitigation Measure **NOI-4** (rubberized asphalt) would result in a 5-dB decrease in sound level at receiver M-93. Even with the inclusion of rubberized asphalt, project-related noise increases would result in an overall 2-dB increase, which exceeds the 1.5-dB threshold based on the FICON methodology at modeled receiver M-93. In accordance with Caltrans' *Traffic Noise Analysis Protocol*, noise abatement in the form of a soundwall 10 feet in height (Soundwall S-624) was considered to address noise impacts identified under NEPA at Receiver M-93 (refer to Section 3.15, *Noise and Vibration*, and Sheet 25 of Figure 4.2-3). If included as abatement, Soundwall S-624 would further reduce the noise level at receiver M-93 by 12 dB and result in less-than-significant noise impacts under CEQA. However, because the soundwall would be subject to a survey process (as outlined by the Caltrans Protocol and discussed in Section 3.15, *Noise and Vibration*), it may not be approved for implementation and its construction cannot thus be guaranteed. Furthermore, as discussed above, Mitigation Measure **NOI-4** (rubberized asphalt) would result in a 5-dB reduction without the soundwall; therefore, in consideration of the unknown outcome of the survey process, anticipated cost of the soundwall ($57,866), limited receptor benefit, and the potential for visual impacts associated with soundwalls (see Section 3.7, *Visual/Aesthetics*), Soundwall S-624 is not recommended for addressing impacts identified under CEQA. Therefore, a significant noise impact is identified at Receiver M-93.

Additionally, Mitigation Measure **NOI-4** (rubberized asphalt) would result in a 5-dB decrease in sound level at receiver M-98A. Even with the inclusion of rubberized asphalt, project-related noise increases would result in an overall 9-dB increase, which exceeds the 5-dB threshold based on the FICON methodology at modeled receiver M-98A. In accordance with Caltrans' *Traffic Noise Analysis Protocol*, noise abatement in the form of a soundwall 14 or 16 feet in height (Soundwall S-565) was considered to address noise impacts identified under NEPA at Receiver M-98A (refer to Section 3.15, *Noise and Vibration*, and Sheet 23 of Figure 4.2-3). Soundwall S-565 at height of 14 or 16 feet would further reduce the noise level at receiver M-98A by 7 dB and result in less-than-significant noise impacts under CEQA. However, this soundwall was found not to be reasonable from a cost perspective (costs of $966,191 and $1,050,441, respectively). Therefore, this barrier was not found to be cost effective for one single receiver. Furthermore, as discussed above, Mitigation **NOI-4** (rubberized asphalt) would result in a 5-dB reduction without the soundwall; therefore, in consideration with the anticipated cost of the soundwall ($966,191 and $1,050,441), limited receptor benefit, and the potential for visual impacts associated with soundwalls (see Section 3.7, *Visual/Aesthetics*), Soundwall S-565 is not recommended for addressing impacts identified under CEQA. Therefore, a significant noise impact is identified at Receiver M-98A.

The inclusion of Mitigation Measure **NOI-4** would reduce impacts from operational traffic noise to below the 1.5-, 3-, and 5-dB CNEL thresholds at all locations except two (M-98A and M-93) under Build Alternative 4. Therefore, impacts related to increased noise levels at these two locations would be considered significant under CEQA.

Lake Mathews MSHCP (Build Alternative 4)

No Impact

The roadway modifications as a result of the conversion of conservation lands to a transportation facility along the Cajalco Road alignment would not result in any receiver approaching or exceeding the noise abatement criteria for residential land uses within the LM MSHCP area, including the LMR.

Temporary Impacts

Build Alternatives 1, 2C, and 4

Less than Significant with Mitigation

Construction activities related to development of the project would occur over approximately 4 years. Construction activities would cause short-term elevated noise levels at the surrounding residences. Construction-related noise would occur with the inclusion and use of construction equipment such as concrete mixers, bulldozers, backhoes, and heavy trucks. Table 3.15-10 in Section 3.15, *Noise and Vibration*, shows construction equipment noise levels associated with the project, and these equipment noise levels are also shown below in Table 4.2-16. The noise levels in the table below are the maximum noise levels for construction equipment that would be representative of equipment used on the project site.

Table 4.2-16. Typical Construction Noise Levels

Equipment	L_{max} at 50 feet (dBA, slow)
Air compressor	78
Auger drill rig	84
Backhoe	78
Compactor	83
Concrete mixer truck	79
Concrete pump truck	81
Crane	81
Dozer	82
Dump truck	76
Excavator	81
Front-end loader	79
Generator	81
Grader	85
Impact pile driver	101
Jackhammer	89
Paver	77
Pneumatic tools	85
Rollers	80
Scraper	84
Welder/torch	74

Source: Federal Highway Administration. 2008. *Roadway Construction Noise Model*. Software Version 1.1. See also http://www.fhwa.dot.gov/environment/noise/construction_noise/rcnm/rcnm.pdf.

Based on the types of construction activities and equipment required for the proposed project, noise levels at 15 meters (50 feet) from the center of construction activities would generally range from 80 to 85 dBA during peak periods. However, during times when the pile driver is required, maximum noise would be substantially louder, resulting in noise levels up to 101 dBA. Because not all of the equipment would be operating at the same time or for the entire day, the hourly equivalent noise level (Leq[h]) from project construction would be substantially lower than the peak period and the maximum noise levels reflected in Table 4.2-16. In addition, any increase in the background noise level due to project construction would be temporary.

Construction noise would not be in excess of the limits of any applicable noise standards, because construction noise is generally exempt from the County's noise ordinance, provided that construction activities occur during the permitted hours. For construction activities located more than 0.25 mile from an occupied residence, construction noise would be exempt from the noise ordinance at any time of the day. When construction of the project occurs within 0.25 mile of an occupied residence, significant noise impacts would be avoided by the limitation of noise-generating construction activity to within the hours permitted by County of Riverside code (i.e., between the hours of 6:00 p.m. and 6:00 a.m. June through September and 6:00 p.m. and 7:00 a.m. October through May). Additionally, the incorporation of noise control measures as part of Standard Project Measure **PF NOI-5** would be implemented as appropriate to reduce increases in noise during construction, as discussed below. While this measure is not required to mitigate this impact, it would further reduce the effects of noise on nearby residences if included during construction.

- **PF NOI-5:** Construction noise would be temporary and limited to the duration of the construction. The following noise control measures will also be incorporated into the project contract specifications in order to minimize construction noise effects:
  - Whenever a construction site is within one-quarter of a mile of an occupied residence or residences, no construction activities shall be undertaken between the hours of 6 p.m. and 6 a.m. during the months of June through September and between the hours of 6 p.m. and 7 a.m. during the months of October through May. Exceptions to these standards shall be allowed only with the written consent of the building official (County of Riverside Code).
  - All noise-producing project equipment and vehicles using internal combustion engines will be equipped with mufflers, air-inlet silencers where appropriate, and any other shrouds, shields, or other noise-reducing features in good operating condition that meet or exceed original factory specifications. Mobile or fixed "package" equipment (e.g., arc-welders, air compressors) will be equipped with shrouds and noise-control features that are readily available for that type of equipment.
  - To the extent feasible, sound control blankets shall be placed such that the line of sight from ground-level construction equipment and sensitive receptors would be blocked. For example, an 8-foot-high sound control blanket that has a minimum Sound Transmission Class rating of 28 would provide a noise level reduction of 11 A-weighted decibels when the construction equipment is approximately 50 feet from the sound control blanket while the receptor is approximately 10 feet on the other side.

- All mobile or fixed noise-producing equipment used on the project that is regulated for noise output by a local, state, or federal agency will comply with such regulation while in the course of project activity.
- Electrically powered equipment will be used instead of pneumatic or internal combustion–powered equipment, where feasible.
- Material stockpiles and mobile equipment staging, parking, and maintenance areas will be located as far as practicable from noise-sensitive receptors.
- Construction site and access road speed limits will be established and enforced during the construction period.
- The hours of construction, including noisy maintenance activities and all spoils and material transport, will be restricted to the periods and days permitted by the local noise or other applicable ordinance. Noise-producing project activity will comply with local noise control regulations affecting construction activity or obtain exemptions therefrom.
- The use of noise-producing signals, including horns, whistles, alarms, and bells, will be for safety warning purposes only.
- No project-related public address or music system will be audible at any adjacent receptor.
- All residential units located within 500 feet of the construction site shall be sent a notice regarding the construction schedule. A sign, legible at a distance of 50 feet, shall also be posted at the construction site. All notices and the signs shall indicate the dates and duration of construction activities.
- The onsite construction supervisor will have the responsibility and authority to receive and resolve noise complaints. A clear appeal process to the owner will be established prior to construction commencement that will allow for resolution of noise problems that cannot be immediately solved by the site supervisor.

4.2.13(b) Generation of excessive groundborne vibration or groundborne noise levels?

Build Alternatives 1 and 2C

Less than Significant

Any groundborne noise or vibration would be limited to the construction period and would be short in duration. The project would include pavement-breaking construction activities along the existing roadway alignment on Cajalco Road where new pavement would be laid for Alternatives 1 and 2C. Caltrans' *Transportation and Construction Vibration Guidance Manual* states that the typical type of construction equipment involved in laying new pavement produces a peak particle velocity (PPV) of 0.21 PPV inch per second (in/sec) (for vibratory rollers) at a reference distance of 25 feet (Caltrans 2020h). The vibration damage threshold for older residential building is 0.5 PPV. Vibration-sensitive structures that are considered extremely susceptible to vibration damage would not be located within 50 feet of construction activities. Pile driving is proposed at new bridge locations where engineering designs and geotechnical conditions indicate that pile driving is the appropriate construction method. For proposed bridge

locations where engineering designs and geotechnical conditions warrant pile driving, the closest habitable structure would be approximately 310–330 feet from the vibration sources. As such, vibration levels would be on the order of 0.04 PPV in/sec (Caltrans 2020h). No impacts from vibration during construction are predicted at habitable structures. In addition, cast-in-drilled-hole piles, or shallow-spread footings, may be used, depending on engineering designs and geotechnical conditions. These construction techniques would be considerably less vibration intensive (0.089 PPV in/sec), which would further reduce vibration levels.

Significant temporary noise impacts and vibration would be avoided by the limitation of noise-generating construction activity to within the hours permitted by County of Riverside's code (i.e., 6 p.m. and 6 a.m. [when within 0.25 mile of an occupied residence]) (**PF NOI-5**). In addition, Standard Project Measure **PF NOI-5** requires implementation of noise control measures, would be implemented in order to minimize construction noise impacts. This measure, although not required to mitigate vibration impacts, would further reduce the effects of groundborne noise and vibration.

With respect to operations, the proposed project does not involve changes that would result in noticeable increases in groundborne vibration or groundborne noise levels from use or maintenance of the roadway when compared to the No-Build Alternative. Once the project is completed, long-term increases in noise levels from use or maintenance of the roadway would be less than significant.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Less than Significant

The roadway modifications as a result of the conversion of conservation lands to a transportation facility along the Cajalco Road alignment could result in groundborne noise and vibration sources being located closer to noise- and vibration-sensitive receptors within the LM MSHCP area, including the LMR. However, as discussed above, vibration and groundborne noise levels would be well below the threshold of damage. Vibration would also likely be reduced with the incorporation of Standard Project Measure **PF NOI-5**; however, this measure is not required to mitigate vibration impacts.

Build Alternative 4—El Sobrante Alignment

Less than Significant

Any groundborne noise or vibration would be limited to the construction period and would be short in duration. The project would include pavement-breaking construction activities along the existing roadway alignments on Cajalco Road, La Sierra Avenue, and El Sobrante Road, where new pavement would be laid for Build Alternative 4. Caltrans' *Transportation and Construction Vibration Guidance Manual* states that the typical type of construction equipment involved in laying new pavement produces a PPV of 0.21 PPV in/sec (for vibratory rollers) at a reference distance of 25 feet (Caltrans 2020h). The vibration damage threshold for older residential building is 0.5 PPV. Vibration-sensitive structures that are considered extremely susceptible to vibration damage would not be located within 50 feet of construction activities. Pile driving is proposed at new bridge locations where engineering designs and geotechnical conditions indicate that pile driving is the appropriate construction method. For proposed bridge locations where

engineering designs and geotechnical conditions warrant pile driving, the closest habitable structure would be approximately 310–330 feet from the vibration sources. As such, vibration levels would be on the order of 0.04 PPV in/sect (Caltrans 2020h). No impacts from vibration during construction are predicted at habitable structures. In addition, cast-in-drilled-hole piles, or shallow-spread footings, may be used, depending on engineering designs and geotechnical conditions. These construction techniques would be considerably less vibration intensive (0.089 PPV in/sec), which would further reduce vibration levels.

Significant temporary noise impacts and vibration would be avoided by the limitation of noise-generating construction activity to within the hours permitted by County of Riverside's code (i.e., 6 p.m. and 6 a.m. [when within 0.25 mile of an occupied residence]) (**PF NOI-5**). In addition, Standard Project Measure **PF NOI-5** also includes the implementation of noise control measures, would be implemented in order to minimize construction noise impacts. This measure, although not required to mitigate vibration impacts, would further reduce the effects of groundborne noise and vibration.

With respect to operations, the proposed project does not involve changes that would result in noticeable increases in groundborne vibration or groundborne noise levels from use or maintenance of the roadway when compared to the No-Build Alternative. Once the project is completed, long-term increases in noise levels from use or maintenance of the roadway would be less than significant.

Lake Mathews MSHCP (Build Alternative 4)

Less than Significant

The roadway modifications as a result of the conversion of conservation lands to a transportation facility along the Cajalco Road alignment could result in groundborne noise and vibration sources being located closer to noise- and vibration-sensitive receptors within the LM MSHCP area, including the LMR. However, as discussed above, vibration levels would be well below the threshold of damage and groundborne noise levels would be mitigated by including Standard Project Measure **PF NOI-5**.

4.2.13(c) For a project located within the vicinity of a private airstrip or airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Build Alternatives 1, 2C, and 4

No Impact

The eastern end of the proposed project is within the March Air Reserve Base Airport Land Use Compatibility Plan area. However, the proposed project would not result in the exposure of people residing or working in the project area to excessive noise levels associated with the March Air Reserve Base. There would be no impact and no mitigation would be required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

If constructed in the future, the limits of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, or within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, would be outside any airport influence area. There would be no impact and no mitigation would be required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The LM MSHCP and LMR are outside of the boundaries of any airport influence area. There would be no impact and no mitigation would be required.

4.2.14 Population and Housing

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☒
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☒	☐

The potential for the proposed project to affect population and housing was assessed in Sections 3.1, *Land Use*, 3.3, *Growth*, and 3.4, *Community Impacts*, of this EIR/EIS. The following discussion is also based on information in the *Community Impact Assessment* and *Errata* (Caltrans 2018c, 2021).

4.2.14(a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Build Alternatives 1 and 2C

No Impact

The growth-inducing potential of a project could be considered significant if it influences growth in excess of what is projected in general plans (land use elements) or in forecasts made by regional planning agencies. As detailed in Section 3.3, *Growth*, of this EIR/EIS, Build Alternatives 1 and 2C would include infrastructure improvements to an existing transportation facility, Cajalco Road; improvements would include additional travel lanes that would increase roadway capacity, as well as the addition of traffic flow controls such as center medians and turn lanes, and realignment of sections of the existing Cajalco Road. The proposed project, however, is located in a largely semi-rural, undeveloped part of Riverside County with limited remaining land permitted for development; designated land uses severely limit the amount of development per acre and open space and conservation areas prohibit development. Within the project study area, thousands of acres are committed to conservation under the WRC MSHCP, LM MSHCP, and SKR HCP and would not accommodate development or potential growth-inducing facilities.

Areas of potential growth in the general vicinity of the project were identified using local general plans and County of Riverside land use designations and zoning for Vacant/Undeveloped lands zoned W-2, W-2-10, and W-2-M-1/2, Controlled Development Areas and Controlled Development Areas with Mobile Homes, within a half mile of the project alternatives. The local general plans have identified approximately 3,908.46 acres where growth is anticipated within this half-mile radius of the project (see Table 3.3-2, Areas of Potential Future Growth). Growth that is projected to occur within the project vicinity is anticipated to occur primarily through infill development in designated parts of the county and cities per local land use plans and zoning. In addition, projects that have been planned within the project vicinity have been

identified as well. The areas where projects are planned are consistent with the County's plan for infill and development to occur in undeveloped/vacant lands, and in residential and business/industrial areas (see Figure 3.3-2 in Section 3.3, *Growth*). This indicates that the planned development of the project area would occur regardless of implementation or operation of any of the build alternatives.

Build Alternatives 1 and 2C are intended to alleviate existing patterns of congestion rather than create a new route to an area not currently served by major transportation routes. While the proposed improvements would increase the capacity of Cajalco Road, Build Alternatives 1 and 2C are not expected to substantially influence growth within the region because it is identified in the SCAG RTP/SCS regional projections and would not subject new areas to development that are not currently accessible.

The build alternatives would not be expected to influence the amount, location, and/or distribution of growth in the cities, unincorporated areas, or the portion of Riverside County within the project study area because the project would not encourage population density, construction of new housing, or opportunities for capital investment by the public or private sectors. There would be no impact and no mitigation is required.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not result in additional growth because accessibility would not change and new roadways would not be constructed in currently undeveloped areas. There would be no impact and no mitigation is required.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements within the LM MSHCP boundary. However, the implementation of roadway improvements within the LM MSHCP boundary would not facilitate or otherwise influence growth, as the LM MSHCP restricts development within its boundaries and lands would continue to be committed to conservation. Therefore, growth is not planned for, nor would it occur within, its boundaries. There would be no impact and no mitigation would be required.

Build Alternative 4—El Sobrante Alignment

No Impact

Build Alternative 4 would result in modifications to accessibility by increasing the capacity of portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road and adding traffic flow controls such as center medians and turn lanes.

Build Alternative 4 has limited potential to influence growth because it is located in an area with limited potential for development due to land use and zoning controls such as county and local city general plan land use designations, development restrictions, lands committed to

conservation, and lands currently or in the process of being developed. Similar to Build Alternatives 1 and 2C, planned development of the project area would occur regardless of implementation or operation of Build Alternative 4. Build Alternative 4 would also not create a new route to an area not currently served by a major transportation route. Similar to Build Alternatives 1 and 2C, Build Alternative 4 is intended to alleviate existing patterns of congestion rather than create a new route to an area not currently served by major transportation routes. While the proposed improvements would increase the capacity of portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road, Build Alternative 4 would not be expected to substantially influence growth within the region because it is identified in the SCAG RTP/SCS regional projections and would not subject new areas to development that are not currently accessible.

Build Alternative 4 would not be expected to influence the amount, location, and/or distribution of growth in the cities, unincorporated areas, or the portion of Riverside County within the project study area because the project would not encourage population density, construction of new housing, or opportunities for capital investment by the public or private sectors. There would be no impact and no mitigation is required.

Future Six-Lane Facility (Build Alternative 4)

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, it is anticipated that operation of the facility would not result in additional growth because accessibility would not change and new roadways would not be constructed in currently undeveloped areas. There would be no impact and no mitigation is required.

Lake Mathews MSHCP (Build Alternative 4)

An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements within the LM MSHCP boundary. However, the implementation of roadway improvements within the LM MSHCP boundary would not facilitate or otherwise influence growth, as the LM MSHCP restricts development within its boundaries and lands would continue to be committed to conservation. Therefore, growth is not planned for, nor would it occur within, its boundaries. There would be no impact and no mitigation is required.

4.2.14(b) Displace substantial numbers of people or housing, necessitating the construction of replacement housing elsewhere?

Build Alternatives 1 and 2C

Less than Significant Impact

As detailed in Section 3.4.2, *Relocations and Real Property Acquisitions*, of Section 3.4, *Community Impacts*, Build Alternatives 1 and 2C would require full acquisition of 18 residential properties and partial acquisition of one residential property with a residential unit, resulting in the displacement and relocation of 62 residents. According to the Draft Relocation Impact Report prepared for the project, a sufficient number of residential replacement properties for both

owner-occupied single-family residences and tenant-occupied single-family residences exists within the affected communities (Caltrans 2018g). Standard Project Measure **PF COM-1**, below, would be implemented for all build alternatives to reduce impacts from property acquisition and relocation. Relocation assistance payments and counseling would be provided to persons in accordance with the Uniform Relocation Act and Real Property Acquisition Policies Act of 1970, as amended, to ensure adequate relocation and decent, safe, and sanitary housing for displaced residents. The County will also assist eligible nonresidential displaces, such as businesses, in locating suitable replacement property, and reimbursement for certain costs involved in relocation. Construction of replacement housing would not be required; therefore, impacts would be less than significant. No mitigation is required.

- **PF COM-1:** As part of project implementation, relocation assistance payments and counseling would be provided by the County of Riverside to persons and businesses in accordance with the Federal Uniform Relocation Assistance and Real Properties Acquisition Policies Act of 1970, as amended (42 United States Code Sections 4601–4655), to ensure adequate relocation and a decent, safe, and sanitary home for displaced residents. The County of Riverside will provide compensation to eligible recipients for property acquisitions. All eligible displacees would be entitled to moving expenses. All benefits and services would be provided equitably to all residential and business displacees without regard to race, color, religion, age, national origins, and disability, as specified under Title VI of the Civil Rights Act of 1964. All relocation activities would be conducted by the implementing agencies in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended. Relocation resources would be available to all displacees without discrimination.

  In addition, the Nonresidential Relocation Assistance Program provides assistance to businesses, farms, and nonprofit organizations in locating suitable replacement properties and reimbursement for certain costs involved in relocation. The Relocation Assistance Program will provide current lists of properties offered for sale or rent, suitable for a particular business's specific relocation needs. The types of payments available to eligible businesses, farms, and nonprofit organizations are instead of any moving, searching, and reestablishment expenses.

Build Alternative 4—El Sobrante Alignment

Less than Significant Impact

Build Alternative 4 would require the same full acquisition of 18 residential properties as would occur under Build Alternatives 1 and 2C; additional partial acquisition of three residential properties with residential units, however, would result in the displacement and relocation of 69 residents under Build Alternative 4. According to the Draft Relocation Impact Report prepared for the project, a sufficient number of residential replacement properties for both owner-occupied single-family residences and tenant-occupied single-family residences exists within the affected communities. Standard Project Measure **PF COM-1** would be implemented for all build alternatives to reduce impacts from property acquisition and relocation. Construction of replacement housing would not be required; therefore, impacts would be less than significant. No mitigation is required.

4.2.15 Public Services

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
Fire protection?	☐	☐	☒	☐
Police protection?	☐	☐	☒	☐
Schools?	☐	☐	☒	☐
Parks?	☐	☐	☐	☒
Other public facilities?	☐	☐	☐	☒

The potential for the proposed project to affect public services was assessed in Sections 3.1, *Land Use*, 3.3, *Growth*, 3.5, *Utilities/Emergency Services*, and 3.4, *Community Impacts*, of this EIR/EIS. The following discussion is also based on information in the *Community Impact Assessment* and *Errata* (Caltrans 2018c, 2021).

4.2.15(a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

Fire protection and/or police protection, schools?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

Build Alternatives 1, 2C, and 4 would include infrastructure improvements to existing transportation facilities: Cajalco Road, or a combination of Cajalco Road, La Sierra Avenue, and El Sobrante Road. Improvements would include additional travel lanes that would increase roadway capacity, as well as the addition of traffic flow controls such as center medians and turn lanes, and realignment of sections of existing Cajalco Road. The proposed project includes design measures and other BMPs incorporated into the project to minimize physical impacts (refer to Chapter 2, Section 2.2.1.1, *Common Design Features of the Build Alternatives*).

The nearest recreational facilities to the project are Dos Lagos Golf Course and Manuel L. Real Elementary School, which are approximately 0.1 mile from the project limits. According to the traffic analysis prepared for the project, the proposed project would not result in a substantial

change in traffic or traffic patterns that would affect the primary roadways used for access to the golf course, Temescal Canyon Road, or Manuel L. Real Elementary School (Cajalco Road and Clark Street).

Build Alternatives 1, 2C, and 4 would not involve the construction of any habitable structures, nor would the alternatives induce population growth (see Section 3.3, *Growth*) in the project area. Therefore, additional demand for new or expanded emergency facilities or services, or the need for new or physically altered school facilities, fire protection, police protection, park, or other public facilities, would not occur. As discussed in Section 3.5, *Utilities/Emergency Services*, during construction of the proposed project, temporary detours may be required and could result in delays affecting fire and/or police protection, and school access. However, pedestrian safety and access to Manuel L. Real Elementary School may improve with additional sidewalks and designated bus turnouts proposed along Cajalco Road. The proposed project would include Standard Project Measure **PF LU-1**, which includes a TMP and public awareness campaign that would serve to inform and coordinate with motorists, business owners/operators, residents, elected officials and government agencies, and emergency service providers, regarding construction activities and associated impacts. Refer to Section 3.1, *Land Use*, for Standard Project Measure **PF LU-1**. Impacts would be less than significant; mitigation would not be required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that the change from four to six lanes would enhance emergency response times and would not interfere with school operations. During construction, temporary access impacts may occur and would be addressed with Standard Project Measure **PF LU-1**. Impacts would be less than significant; mitigation would not be required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

As indicated under Build Alternatives 1, 2C, and 4 above, the proposed project would include Standard Project Measure **PF LU-1**, which includes a TMP and public awareness campaign that would serve to inform and coordinate with motorists, business owners/operators, residents, elected officials and government agencies, and emergency service providers regarding construction activities and associated impacts. Refer to Section 3.1, *Land Use*, for Standard Project Measure **PF LU-1**. Impacts would be less than significant; mitigation would not be required.

Parks and/or other public facilities?

Build Alternatives 1, 2C, and 4

No Impact

The nearest parks and community facilities to the proposed project are Charles Meigs (Mead Valley) Community Center and Victoria Grove Park. Build Alternatives 1, 2C, and 4 would not require temporary construction easements within any parks or recreational facilities. While trails or Class I bike paths are not proposed as part of the project, improvements that would support pedestrian, equestrian, and cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue include curb, gutter, and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane. The project would not preclude future consideration of trail and bicycle facilities identified in local plans or interfere with continued use of local, unpaved roadways for equestrian uses.

Construction would also result in intermittent traffic delays under all build alternatives until the project is completed; however, the delays would be temporary and are not anticipated to be substantial enough to affect parks and recreational facilities.

Build Alternatives 1, 2C, and 4 would not involve the construction of any habitable structures, nor would the alternatives induce population growth (see Section 3.3, *Growth*) in the project area. Therefore, additional demand for new or expanded emergency facilities or services, or the need for new or physically altered school facilities, fire protection, police protection, park, or other public facilities, would not occur. Therefore, there would be no impact and mitigation is not required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, demand for new or expanded emergency facilities or services, or the need for new or physically altered school facilities, fire protection, police protection, park, or other public facilities, would not be anticipated. Therefore, there would be no impact and mitigation is not required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

As indicated under Build Alternatives 1, 2C, and 4 above, the proposed project would not result in the need for new or physically altered school facilities, fire protection, police protection, park, or other public facilities. Therefore, there would be no impact and mitigation is not required.

4.2.16 Recreation

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

The potential for the proposed project to affect recreation was assessed in Sections 3.1, *Land Use*, 3.3, *Growth*, and 3.4, *Community Impacts*, of this EIR/EIS. The following discussion is also based on information in the *Community Impact Assessment* and *Errata* (Caltrans 2018c, 2021).

4.2.16(a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Build Alternatives 1, 2C, and 4

No Impact

As discussed in Section 3.3, *Growth*, the proposed project would not be growth inducing, directly increase the number of people in the area, or cause an increase in the use of existing parks or recreational facilities or accelerated deterioration of existing facilities. Therefore, there would be no impact and mitigation is not required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, an increase the use of existing parks or recreational facilities or accelerated deterioration to existing facilities would not be anticipated. Therefore, there would be no impact and mitigation is not required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

As indicated under Build Alternatives 1, 2C, and 4 above, the proposed project would not cause an increase the use of existing parks or recreational facilities or accelerated deterioration to existing facilities. Therefore, there would be no impact and mitigation is not required.

4.2.16(b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Build Alternatives 1, 2C, and 4

No Impact

While trails or Class I bike paths are not proposed as part of the project, improvements that would support pedestrian, equestrian, and cyclist safety along Cajalco Road from Harley John Road to Harvill Avenue include curb, gutter, and 8-foot-wide shoulders that would serve as a combined shoulder/bike lane, consistent with County Class II and III Bikeway designations.[14] The project would not preclude future consideration of trail and bicycle facilities identified in local plans or interfere with continued use of local, unpaved roadways for equestrian uses. As no recreation-designated resources are being constructed as part of this project, there would be no impact and mitigation is not required.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, the construction of recreational facilities would not be included. Therefore, there would be no impact and mitigation is not required.

[14] The County of Riverside defines Class II and Class III Bikeways as follows:
Class II Bikeways, or bike lanes, are intended for preferential use by bicycles, and are provided for within the paved areas of roadways. Bike lane pavement striping and other markings, and bikeway signs are intended to promote an orderly flow of traffic by establishing demarcations between lanes designated for bicycles and lanes designated for motor vehicles. Bike lanes are one-way facilities that follow the flow of motor vehicle movement.
Class III Bikeways, or bike routes, are intended to provide continuity within the bikeways system, usually by connecting discontiguous segments of Class I and Class II Bikeways. Bike routes are shared facilities, either with motor vehicles on roads or with pedestrians on sidewalks, and bicycle usage of the facilities is considered secondary. Bike routes are not marked on pavement but are supported by signs. (County of Riverside 2020.)

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

As indicated under Build Alternatives 1, 2C, and 4 above, the proposed project would not include the construction of recreational facilities. Therefore, there would be no impact and mitigation is not required.

4.2.17 Transportation

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	☐	☐	☒	☐
b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?[15]	☒	☐	☐	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☐	☒
d) Result in inadequate emergency access?	☐	☐	☒	☐

The information presented in this section is based on Sections 3.1 and 3.6 of this EIR/EIS, and the Traffic Operations Analysis Report (Caltrans 2017d).

4.2.17(a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Build Alternatives 1 and 2C

Less than Significant Impact

Americans with Disabilities Act

The proposed project would provide facilities for bicycles and pedestrians in locations where local streets are affected by the construction of the build alternatives. These facilities would be designed consistent with the local general plan Circulation Element and comply with Americans with Disabilities Act (ADA) requirements.

The project would improve pedestrian facilities (sidewalks) by replacing existing facilities that would be removed as part of the project. Bike travel would also be improved by providing bicycle facilities per the local general plan Circulation Element. Bicycle travel is accommodated in the project area through the use of designated bikeways (Class II and Class III) on existing roadways.

[15] NOTE: While public agencies may immediately apply Section 15064.3 of the updated CEQA Guidelines, statewide application is not required until July 1, 2020. In addition, uniform statewide guidance for Caltrans projects is still under development. The project development team may determine the appropriate metric to use to analyze traffic impacts pursuant to Section 15064.3(b).

SCAG 2021 FTIP and 2020 RTP/SCS

Build Alternatives 1 and 2C are consistent with the scope included in the 2021 FTIP under ID RIV090903 (SCAG 2021).[16] In addition, Build Alternatives 1 and 2C would be generally consistent with the project description provided in the 2020–2045 SCAG RTP/SCS as project ID 3A04WT137, because both alternatives include widening Cajalco Road from Temescal Canyon Road to I-215. Build Alternatives 1 and 2C would also be consistent with the goals of the SCAG RTP/SCS because both alternatives would increase the capacity of Cajalco Road, which would improve mobility and accessibility for people and goods in the region. This would increase the roadway's ability to accommodate traffic, which would result in improved travel safety and reliability for all people and goods in the region. These improvements would also help preserve and ensure a sustainable regional transportation system and maximize the productivity of the transportation system.

County of Riverside General Plan

Build Alternatives 1 and 2C would increase the capacity of Cajalco Road, which would accommodate increased concentrations of population and employment activities, improving the efficiency of transportation within Riverside County; however, portions of the build alternatives would be inconsistent with the planned transportation facilities outlined in the Circulation Plan. The General Plan Circulation Element, Figure C-1, classifies Cajalco Road as an Expressway, with a minimum right of way varying in width from 184 feet to 220 feet. The proposed right of way for Cajalco Road varies throughout the project limits.

Between Carpinus Drive and Alexander Street, a new bridge over Cajalco Creek is proposed just west of Barton Street, for Cajalco Road westbound traffic; due to the spacing between the eastbound and westbound lanes at the proposed bridge, the maximum right of way width at this location is anticipated to be approximately 230 feet. While the total roadway right of way width exceeds the width identified for Cajalco Road in the General Plan (220 feet), the wider section of right of way would be necessary to accommodate the proposed bridge while avoiding sensitive resources between the east- and westbound lanes.

Between Temescal Canyon Bridge and Harley John Road, project impacts would extend beyond the proposed 128-foot roadway right of way to accommodate slope easements and appurtenant facilities. This would be consistent with the general plan designation and would not preclude future widening up to 220 feet.

[16] The project is currently described in the 2021 FTIP as "CAJALCO RD. WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON RD. TO HARVILL AVE AND FROM 4 TO 6 LANES FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND A BRIDGE RECONSTRUCTION OVER A WATER CROSSING." The County of Riverside has submitted an amendment that would update the description as follows: "IN RIVERSIDE COUNTY ON CAJALCO RD - WIDENING FROM 2 TO 4 THRU LNS (2 IN EA DIR) FROM TEMESCAL CANYON. BRIDGE/EAGLE CANYON ROAD TO HARVILL AVE AND FROM 4 TO 6 LANES WITH THREE LANES IN THE WESTBOUND DIRECTION FROM TEMESCAL CANYON RD TO TEMESCAL CANYON BRIDGE, THREE LANES IN THE EASTBOUND DIRECTION FROM TEMESCAL CANYON ROAD TO JUST EAST OF EAGLE CANYON ROAD, AND THREE LANES EASTBOUND AND WESTBOUND FROM HARVILL AVE TO I-215, INCLUDING TURN POCKETS AND THE CONSTRUCTION OF NEW, AND RECONSTRUCTION OF EXISTING, BRIDGES AS NEEDED." This amendment will be obtained prior to adoption of the Final Environmental Document.

Both build alternatives also provide for the expansion of the existing transportation network and the development of alternative travel modes, including additional bus turnouts for bus routes.

The proposed project alignment traverses areas where Regional and Community Trails are currently planned as future improvements in the vicinity (Circulation Element Figure C-6) of Build Alternatives 1 and 2C. Development of these trails is not included as part of the defined project right of way; however, these alternatives would not impede implementation of the Comprehensive Trails Plan because neither includes any components that would prevent development of or access to future trails.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

Build Alternatives 1 and 2C would be consistent with the Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans. Only very small portions of the project would be included in the Temescal Canyon Area Plan. Both build alternatives would increase the capacity of Cajalco Road, which would improve level of service (LOS) standards for people and goods in the region over no-project conditions. For example, the number of deficient intersections and freeway segments would be greatest under the No-Build Alternative and decrease under all build alternatives (Caltrans 2017d). In the Temescal Canyon Area Plan, neither build alternative would preclude future construction of a six-lane roadway within this area plan, which would be consistent with Temescal Canyon Area Plan Figure 7 and the functional classifications and standards specified. In the Mead Valley Area Plan, the current design of the build alternatives would not preclude the functional classifications and standards specified in the Mead Valley Area Plan in Figure 8, which specifies Cajalco Road as a 220-foot-wide expressway. Because of this, Build Alternatives 1 and 2C would not interfere with, nor impede, implementation of this area plan.

Cities of Corona and Perris General Plans

Build Alternatives 1 and 2C would be consistent with the Cities of Corona and Perris General Plans. Only very small portions of the project would be included in or adjacent to either the City of Corona or Perris. Even though the build alternatives would be only partially within or adjacent to the cities, the build alternatives would still improve existing transportation infrastructure and increase the capacity of Cajalco Road in or adjacent to both cities, which would enhance both cities' fiscal viability by improving the efficiency of the transportation of goods and services and improve mobility and accessibility and reduce congestion and travel times for people and goods in the region. Both build alternatives would require partial lane closures of Cajalco Road during construction, which could result in delays for emergency service providers who use these roadways. However, the implementation of the TMP (see Standard project Measure **PF LU-1**) would provide construction project information to emergency service providers to ensure adequate service. During operations, conditions along Cajalco Road, including delay and LOS, would improve, which would benefit emergency service providers because Cajalco Road is the most direct route between the Cities of Corona and Perris and the communities in between. Because of this, Build Alternatives 1 and 2C would not interfere with, nor impede, implementation of either city's policies.

Western Riverside County MSHCP

WRC MSHCP Volume I, Figure 7-1, identifies that Riverside County General Plan Circulation Element roadway for Build Alternatives 1 and 2C allow for a 128-foot-wide roadway right of way. While the proposed roadway right of way width for Build Alternatives 1 and 2C within the Criteria Area is 128 feet, project impacts associated with related roadway improvements and/or slope easements and appurtenant facilities are anticipated to extend beyond the 128-foot right of way in limited areas. For this reason, a minor amendment of the WRC MSHCP, as described in Volume I, Section 6.10.2, would be required for Build Alternatives 1 and 2C. As part of the amendment, the County may coordinate with RCA to negotiate an adjustment of right of way for another County facility to accommodate the additional right of way needed for Build Alternatives 1 and 2C.

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan (ALUCP) contains no relevant policies; Build Alternatives 1 and 2C would not involve the construction of structures that would have any effect on airport land use or operations.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Under Build Alternatives 1 and 2C, Cajalco Road would be expanded and realigned within the LM MSHCP and LMR; appurtenant facilities including drainage basins, culverts, bridges, and wildlife crossings would also be constructed. Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

Less than Significant Impact

SCAG 2021 FTIP and 2020 RTP/SCS

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, the future expansion would not be fully consistent with the scope in the SCAG RTP/SCS because the SCAG RTP/SCS only includes construction of four lanes. However, the Future Six-Lane Facility would be consistent with the goals of the SCAG RTP/SCS for the reasons described above for Build Alternatives 1 and 2C.

County of Riverside General Plan and Comprehensive Trails Plan

The addition of two lanes, if constructed in the future, would also be consistent with the County of Riverside General Plan and Comprehensive Trails Plan for the same reasons as described for Build Alternatives 1 and 2C. No additional right of way would be anticipated; therefore, the widths of Cajalco Road would be consistent with the General Plan.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

The addition of two lanes, if constructed in the future, would be consistent with the Temescal Canyon Area Plan and Lake Mathews/Woodcrest Area Plan for the same reasons as described for Build Alternatives 1 and 2C. Within the Temescal Canyon Area Plan, two additional lanes within the median of Cajalco Road, if constructed in the future, would be consistent with Temescal Canyon Area Plan Figure 7 and the functional classifications and standards specified, which include construction of a six-lane roadway within this area plan. Median design that would potentially accommodate additional lanes in the future would not extend east of Harley John Road under Build Alternatives 1 and 2C and is thus not anticipated to affect the Mead Valley Area Plan area.

Cities of Corona and Perris General Plans

The addition of two lanes, if constructed in the future, would be consistent with the Corona General Plan for the same reasons as described for Build Alternatives 1 and 2C. The limits of the median design that would accommodate two additional lanes would not be within the Perris General Plan area.

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The Future Six-Lane Facility, if constructed, would not occur within the March Air Reserve Base/Inland Port ALUCP area.

Lake Mathews MSHCP

The addition of two lanes, if constructed in the future, would be expected to be constructed within the median areas of existing roadway right of way and no additional right of way within the LM MSHCP area would be acquired; thus, the two additional travel lanes would be consistent with the LM MSHCP.

Build Alternative 4—El Sobrante Alignment

Less than Significant Impact

Americans with Disabilities Act

The proposed project would provide facilities for bicycles and pedestrians in locations where local streets are affected by the construction of the build alternatives. These facilities would be designed consistent with the local general plan Circulation Element and comply with ADA requirements.

The project would improve pedestrian facilities (sidewalks) by replacing existing facilities that would be removed as part of the project. Bike travel would also be improved by providing bicycle facilities per the local general plan Circulation Element. Bicycle travel is accommodated in the project area through the use of designated bikeways (Class II and Class III) on existing roadways.

SCAG 2021 FTIP and 2020 RTP/SCS

Build Alternative 4 would be partially but not fully consistent with the FTIP. In addition, Build Alternative 4 would be partially but not fully consistent with the scope in the SCAG RTP/SCS. The project description in the SCAG RTP/SCS does not match Build Alternative 4, because the RTP only describes the project as an expansion of Cajalco Road, not La Sierra Avenue or El Sobrante Road. If Build Alternative 4 is selected as the preferred alternative, an amendment to the SCAG RTP/SCS would be required to modify the project description. However, Build Alternative 4 would be consistent with the goals of the SCAG RTP/SCS for the reasons described above for Build Alternatives 1 and 2C.

County of Riverside General Plan and Comprehensive Trails Plan

Build Alternative 4 would be consistent with the Riverside County Regional Park and Open-Space District Comprehensive Trails Plan for the same reasons as described for Build Alternatives 1 and 2C. Build Alternative 4 would also include modifications to the alignments and roadway widths of La Sierra Avenue and El Sobrante Road. The County General Plan Circulation Element, Figure C-1, classifies La Sierra Avenue and El Sobrante Road as Mountain Arterial (110-foot right of way) and Arterial (128-foot right of way), respectively. The proposed roadway right of way for La Sierra Avenue under Build Alternative 4 would vary between 135 and 145 feet, and the proposed roadway right of way for El Sobrante Road would vary between 120 and 150 feet. Both roadways would also involve project impacts extending beyond the roadway right of way to accommodate slope easements and appurtenant facilities. While the proposed modifications to La Sierra Avenue and El Sobrante Road would be consistent with the number of lanes identified in the County of Riverside General Plan for each type of roadway facility (two to four lanes for Mountain Arterial, and four to six lanes for Arterial), the proposed roadway right of way widths would not be consistent with those identified for their respective facility types.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

Build Alternative 4 would be consistent with the Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans for the same reasons as described for Build Alternatives 1 and 2C. However, under Build Alternative 4, areas between El Sobrante Road and La Sierra Avenue would experience a minor decrease in LOS.

Cities of Corona and Perris General Plans

Build Alternative 4 would be consistent with the Cities of Corona and Perris General Plans for the same reasons as described for Build Alternatives 1 and 2C. This is because the portions of Build Alternative 4 that fall within the Cities of Corona and Perris have the same design as the design for Build Alternatives 1 and 2C.

Western Riverside County MSHCP

WRC MSHCP Volume I, Figure 7-1 identifies the Riverside County General Plan Circulation Element roadway right of way for El Sobrante Road as 196 feet. While the proposed roadway right of way width for Build Alternative 4 is not anticipated to exceed the 196-foot right of way through the Criteria Area, related roadway improvements and/or slope easements and

appurtenant facilities may exceed the 196-foot roadway width in limited areas. Therefore, a minor amendment of the WRC MSHCP, as described in Volume I, Section 6.10.2, may be required for Build Alternative 4. As part of the amendment, the County may coordinate with RCA to negotiate an adjustment of right of way for another County facility to accommodate the additional right of way needed.

Lake Mathews HCP (Build Alternative 4)

Build Alternative 4 would expand and realign La Sierra Avenue and El Sobrante Road within the LM MSHCP and LMR; appurtenant facilities including drainage basins, culverts, bridges, and wildlife crossings would also be constructed. Because the LM MSHCP does not currently accommodate roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements. Build Alternative 4 would also encroach into the LM MSHCP and remove habitat for LM MSHCP target species, which is not currently permissible under the LM MSHCP. Modification of the LM MSHCP and LMR to allow for the proposed project and address areas removed or otherwise affected by Build Alternative 4 will be coordinated between the County and LM MSHCP responsible parties.

Future Six-Lane Facility (Build Alternative 4)

SCAG 2021 FTIP and 2020 RTP/SCS

The construction of two additional travel lanes within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and Harley John Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. However, if the additional lanes are constructed in the future, the future expansion would not be fully consistent with the scope in the SCAG RTP/SCS because the SCAG RTP/SCS only includes construction of four lanes. However, the Future Six-Lane Facility under Build Alternative 4 would be consistent with the goals of the SCAG RTP/SCS for the reasons described above for Build Alternative 4.

County of Riverside General Plan and Comprehensive Trails Plan

The addition of two lanes, if constructed in the future, would be consistent with the County of Riverside General Plan and Comprehensive Trails Plan for the same reasons as described for Build Alternative 4. No new right of way would be anticipated and the widths of Cajalco Road and La Sierra Avenue would be consistent with the general plan.

Temescal Canyon, Lake Mathews/Woodcrest, and Mead Valley Area Plans

The addition of two lanes, if constructed in the future, would be consistent with the Temescal Canyon and Lake Mathews/Woodcrest Area Plan for the same reasons as described for Build Alternative 4. No new right of way would be required, avoiding any additional impacts on farmland.

In the Temescal Canyon Area Plan, two additional lanes within the median of Cajalco Road and La Sierra Avenue, if constructed in the future, would be consistent with Temescal Canyon Area

Plan Figure 7 and the functional classifications and standards specified, which include construction of a six-lane roadway within this area plan.

Median design that would potentially accommodate additional lanes in the future would not extend east of Cowan Road under Build Alternative 4 and is thus not anticipated to affect the Mead Valley Area Plan area.

Cities of Corona and Perris General Plans

The addition of two lanes, if constructed in the future, would be consistent with the Corona General Plan for the same reasons as described for Build Alternative 4. The limits of the median design that would accommodate two additional lanes would not be within the Perris General Plan area.

Western Riverside County MSHCP

The addition of two lanes, if constructed in the future, would be expected to be constructed within the median areas of existing roadway right of way and no additional right of way within the WRC MSHCP areas would be acquired; thus, the two additional travel lanes would be consistent with Volume I, Figure 7-1, of the WRC MSHCP.

Lake Mathews MSHCP

The addition of two lanes, if constructed in the future, would be expected to be constructed within the median areas of existing roadway right of way and no additional right of way within the LM MSHCP area would be acquired; thus, the two additional travel lanes would be consistent with the LM MSHCP.

March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan

The Future Six-Lane Facility, if constructed, would not occur within the March Air Reserve Base/Inland Port ALUCP area.

4.2.17(b) Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?

Build Alternatives 1, 2C, and 4

Potentially Significant Impact

The "Potentially Significant Impact" finding pertains specifically to the proposed project's VMT analysis, as addressed in this section. Findings related to LOS for the forecast year (2044) associated with the build alternatives and No-Build Alternative are also presented following the *Vehicle Miles Traveled Analysis* section, below. Detailed discussion regarding existing year (2014) LOS conditions compared to forecast year (2044) conditions associated with the build alternatives and No-Build Alternative are included in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*.

Vehicle Miles Traveled Analysis

In 2013, Governor Brown signed Senate Bill (SB) 743 (Steinberg 2013), which creates a process to change the way transportation impacts are analyzed under CEQA. In December 2018, the California Natural Resources Agency certified and adopted the State CEQA Guidelines updates, including the State CEQA Guidelines section implementing SB 743 (i.e., § 15064.3). SB 743 required the California Governor's Office of Planning and Research to amend the State CEQA Guidelines to provide an alternative to LOS for evaluating transportation impacts; auto delay (e.g., LOS) is no longer considered a significant impact under CEQA.[17] The requirements under SB 743 support the State's legislated goals pertaining to climate change (e.g., SB 32 and SB 375).[18]

Pursuant to State CEQA Guidelines Section 15064.3, transportation projects that reduce, or have no impact on, VMT should be presumed to cause a less-than-significant transportation impact. For roadway capacity projects, lead agencies have discretion to determine the appropriate measure of transportation impact consistent with CEQA and other applicable requirements. In the absence of specific criteria for determining the significance of transportation impacts under CEQA Section 15064.3(b) for County of Riverside roadway capacity projects, the County has elected to apply the VMT metric as a conservative measure for this project only. The application of VMT as a metric in the determination of level of significance for transportation impacts involving County roadway capacity projects will be considered on a project-by-project basis.

As detailed in Table 4.2-17, below, VMT is forecast to increase by less than 1 percent under Build Alternatives 1, 2C, and 4, as compared to No-Build Alternative conditions in the future year (2044).

Table 4.2-17. Vehicles Miles Traveled – Forecast Year (2044) No-Build Alternative and Build Alternatives 1, 2C, and 4 Conditions

Alternative	AM Peak Hour	PM Peak Hour	Daily
No-Build Alternative	2,861,258	4,859,804	14,659,917
Alternative 1	2,885,200	4,908,555	14,779,906
Alternative 2C	2,873,908	4,894,605	14,721,152
Alternative 4	2,891,390	4,914,059	14,811,302
Source: Caltrans 2017d			

While the build alternatives are forecast to increase VMT by less than 1 percent in the year 2040 as compared to the No-Build Alternative, the VMT analysis includes an assumed future CETAP transportation corridor between I-15 and I-215, separate from the proposed project, that may influence projected future No-Build VMT. As indicated in Tables 3.6-14 and 3.6-24 in Section

[17] SB 743, Chapter 386 (2013): Changes the metric of consideration for transportation impacts pursuant to CEQA from a focus on automobile delay to alternative methods focused on vehicle miles travelled, to promote the state's goals of reducing greenhouse gas emissions and traffic related air pollution and promoting multimodal transportation while balancing the needs of congestion management and safety.

[18] SB 32, 2016: Chapter 249 (2016), codifies the GHG reduction targets established in EO B-30-15 to achieve a mid-range goal of 40 percent below 1990 levels by 2030.
SB 375, Chapter 728 (2008), Sustainable Communities and Climate Protection: 2008: Current targets for the State's largest MPOs call for a 19 percent reduction in GHG emissions from cars and light trucks from 2005 emissions levels by 2035.

3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, future No-Build traffic conditions are projected to worsen without the separate east-west Community Environmental Transportation Acceptability Process (CETAP) transportation corridor between I-15 and I-215. Please refer to Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, for additional CETAP conditions discussion. Because the VMT estimates developed for the proposed project include the separate CETAP corridor, the VMT data presented in Table 4.2-17 above have been used for the evaluation of project consistency with State CEQA Guidelines Section 15064.3(b).

There are currently no options in place to mitigate the estimated increase in VMT for the build alternatives to a level equal to or lower than estimated No-Build VMT; however, the proposed project includes standard project measures to reduce GHG emissions and climate change impacts from the project, thereby supporting the GHG emissions reduction goals of SB 32, SB 375, and SB 743, that which State CEQA Guidelines Section 15064.3 is intended to achieve.[19] The following standard project measures incorporated into the project meet or exceed measures recommended in the SCAG 2016–2040 Programmatic EIR, and incorporate Best Available Control Technology to minimize GHG emissions: Standard Project Measures **PF LU-1** (TMP), **PF VIS-1** (replanting disturbed areas), **PF VIS-4** (lighting standards), **PF AQ-1** (emissions control), **NC-13 (NES BIO-9)** (reseeding), and **PF SW-1** (waste recycle). In addition to the standard project measures above, Mitigation Measures **GHG-1** (energy-efficient lighting) and **VIS-2** (replace landscaping) would be implemented. Please refer to Sections 3.1, *Land Use*, 3.7, *Visual/Aesthetics*, 3.14, *Air Quality,* 3.17, *Natural Communities*, and 4.2.8, *Greenhouse Gas Emissions*, of this EIR/EIS for the complete measures listed above.

However, even with the incorporation of the standard project measures and mitigation measure listed above, an increase in GHG emissions is projected to occur and the proposed project may not meet the GHG emissions reduction goals that may be achieved through a reduction or absence of VMT increase per State CEQA Guidelines Section 15064.3(b)(2). In the absence of a defined measure of transportation impact other than VMT, the lead agency has determined that the increase in project-related VMT would result in an impact that cannot be mitigated to a level of insignificance.

Level of Service Analysis

Arterial (Roadway Segment) Analysis

As indicated in Table 3.6-32 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, the following study area arterial segments would operate at unacceptable LOS for the No-Build Alternative in the forecast year (2044):

- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road

[19] The Office of Planning and Research shall prepare, develop, and transmit to the Secretary of the Natural Resources Agency for certification and adoption proposed revisions to the guidelines adopted pursuant to Section 21083 establishing criteria for determining the significance of transportation impacts of projects within transit priority areas. Those criteria shall promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses. (California Public Resources Code § 21099(b)(1))

- Cajalco Road between Harley John Road and Day Street
- Cajalco Road east of Day Street

As indicated in Table 3.6-13 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, the following arterial segments would operate at an acceptable LOS in the forecast year (2044) under Build Alternatives 1 and 2C (unless otherwise stated):

- Cajalco Road east of Temescal Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive (Build Alternative 1)
- Cajalco Road between Lake Mathews Drive and El Sobrante Road

The following arterial segments would operate at an unacceptable LOS in the forecast year (2044) under Build Alternatives 1 and 2C

- El Sobrante Road east of La Sierra Avenue
- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road
- Cajalco Road between Harley John Road and Day Street
- Cajalco Road east of Day Street

As indicated in Table 3.6-23 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, the following arterial segments would operate at an acceptable LOS in the forecast year (2044) with implementation of Build Alternative 4:

- El Sobrante Road between Cajalco Road and Harley John Road
- El Sobrante Road between Harley John Road and Mockingbird Canyon Road
- El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between Gavilan Road and Lake Mathews Drive
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive

The following arterial segments would operate at an unacceptable LOS in the forecast year (2044) under Build Alternative 4:

- Cajalco Road east of El Sobrante Road
- Cajalco Road east of Day Street

Intersection Analysis

Tables 3.6-15 and 3.6-25 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, indicate a total of 24 intersections would operate at an unacceptable LOS in the forecast year (2044) under all build alternatives (unless otherwise stated), as follows:

- I-15 southbound ramps and Ontario Avenue – LOS F in the AM and PM peak hours
- I-15 northbound ramps and Ontario Avenue – LOS F in the AM and PM peak hours
- Bedford Canyon Road and El Cerrito Road – LOS F in the PM peak hour
- Cajalco Road and Bedford Canyon Road – LOS F in the AM peak hour under Build Alternatives 1 and 2C, LOS E in the AM peak hour under Build Alternative 4, and LOS F in the PM peak hour under all Build Alternatives
- Cajalco Road and I-15 southbound ramps – LOS F in the PM peak hour
- Cajalco Road and Temescal Canyon Road – LOS F in the AM and PM peak hours
- I-15 northbound ramps and Weirick Road – LOS F in the AM peak hour under Build Alternatives 1 and 2C, and LOS F in the PM peak hour under Build Alternative 4
- La Sierra Avenue and Victoria Avenue – LOS F in the AM and PM peak hours
- Gavilan Road and Lake Mathews Drive – LOS F in the PM peak hour
- Alexander Street and Markham Street – LOS E in the AM peak hour and LOS F in the PM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under Build Alternative 4
- Clark Street and Cajalco Road – LOS F in the PM peak hour under Build Alternatives 1 and 2C, and LOS E in the AM peak hour and LOS F in the PM peak hour under Build Alternative 4
- Sycamore Canyon Road and SR-60/I-215 southbound ramps – LOS F in the AM and PM peak hours
- SR-60/I-215 northbound ramps and Fair Isle Drive/Box Springs Road – LOS F in the AM and PM peak hours under Build Alternatives 1 and 2C, and LOS F in the AM peak hour and LOS E in the PM peak hour under Build Alternative 4
- Day Street and SR-60 eastbound ramps – LOS F in the PM peak hour
- I-215 ramps and Eucalyptus Avenue – LOS F in the PM peak hour
- I-215 northbound ramps and Alessandro Boulevard – LOS E in the AM peak hour
- I-215 northbound ramps/Old I-215 Frontage Road and Cactus Avenue – LOS F in the AM and PM peak hours
- I-215 northbound ramps and Harley Knox Boulevard – LOS F in the PM peak hour
- I-215 southbound ramps and Cajalco Expressway/Ramona Expressway – LOS F in the AM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway – LOS E in the AM peak hour under all build alternatives, and LOS E in the PM peak hour under Build Alternative 4
- I-215 southbound ramps and Nuevo Road – LOS F in the PM peak hour
- I-215 northbound ramps and Nuevo Road – LOS E in the AM peak hour

- Webster Avenue and Ramona Expressway – LOS E in the AM peak hour under Build Alternatives 1 and 2C and LOS F in the PM peak hour under all build alternatives
- Indian Street and Ramona Expressway – LOS F in the AM peak hour under Build Alternatives 1 and 2C, LOS E in the AM peak hour under Build Alternative 4, and LOS F in the PM peak hour under all build alternatives

An additional nine intersections would operate at an unacceptable LOS in the forecast year (2044) under Build Alternatives 1 and 2C, as follows:

- La Sierra Avenue and El Sobrante Road – LOS E in the AM peak hour and LOS F in the PM peak hour
- Cajalco Road and La Sierra Avenue – LOS F in the PM peak hour
- Harley John Road and Washington Road – LOS E in the PM peak hour
- Cajalco Road and Harley John Road – LOS F in the AM and PM peak hours
- Seaton Avenue and Markham Street – LOS E in the PM peak hour
- Harvill Avenue and Markham Street – LOS E in the PM peak hour
- Harvill Avenue and Placentia Avenue – LOS E in the PM peak hour
- I-215 southbound ramps and Van Buren Boulevard – LOS E in the PM peak hour
- I-215 northbound Frontage Road and Placentia Avenue – LOS E in the PM peak hour

As also shown in Table 3.6-13 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, the following study intersections are projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternatives 1 or 2C in the same year:

- Cajalco Road and La Sierra Avenue in the PM peak hour
- Seaton Avenue and Markham Street in the PM peak hour
- Harvill Avenue and Markham Street in the PM peak hour
- Harvill Avenue and Placentia Avenue in the PM peak hour
- I-215 southbound ramps and Van Buren Boulevard in the PM peak hour
- I-215 northbound Frontage Road and Placentia Avenue in the PM peak hour
- Webster Avenue and Ramona Expressway in the AM peak hour

The following study intersection is projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternative 4 in the same year:

- Clark Street and Cajalco Road in the AM peak hour

The study intersections that are projected to operate at unacceptable LOS under the No-Build Alternative but projected to operate at acceptable LOS under Build Alternatives 1 or 2C are as follows:

- Cajalco Road and Gavilan Road in the PM peak hour
- Seaton Avenue and Cajalco Road in the AM peak hour
- Day Street and SR-60 westbound ramps in the PM peak hour
- I-215 northbound ramps and Cajalco Expressway/Ramona Expressway in the PM peak hour

The study intersections that are projected to operate at an unacceptable LOS under the No-Build Alternative but projected to operate at an acceptable LOS under Build Alternative 4 are as follows:

- La Sierra Avenue and El Sobrante Road in the AM and PM peak hours
- Cajalco Road and Gavilan Road in the PM peak hour
- Harley John Road and Washington Road in the PM peak hour
- Cajalco Road and Harley John Road in the AM and PM peak hours
- Alexander Street and Markham Street in the AM peak hour
- Clark Street and Cajalco Road in the AM peak hour
- Seaton Avenue and Cajalco Road in the AM peak hour
- Day Street and SR-60 westbound ramps in the PM peak hour

Freeway Analysis

Tables 3.6-16 and 3.6-28 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, indicate the following segments along I-15 and I-215 would operate at an unacceptable LOS in the forecast year (2044) under all build alternative conditions (unless otherwise stated).

I-15 Southbound (2044):

- Westbound SR-91 off-ramp to eastbound SR-91 off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Eastbound SR-91 off-ramp to eastbound SR-91 on-ramp – LOS E in the AM peak hour
- Lane drop to westbound SR-91 on-ramp – LOS E in the AM peak hour
- Magnolia Avenue on-ramp to Ontario Avenue off-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, LOS E in the PM peak hour under all Build Alternatives
- Lane addition to CETAP off-ramp – LOS E in the PM peak hour
- Lane drop to Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp to Weirick Road off-ramp – LOS F in the PM peak hour

I-15 Northbound (2044):

- Cajalco Road on-ramp to CETAP on-ramp – LOS E in the AM peak hour
- CETAP on-ramp to El Cerrito Road on-ramp – LOS F in the AM and PM peak hours

- El Cerrito Road on-ramp to Ontario Avenue off-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue off-ramp to lane addition – LOS F in the AM peak hour and LOS E in the PM peak hour
- Ontario Avenue on-ramp to Magnolia Avenue off-ramp – LOS F in the AM peak hour under all build alternatives and LOS E in the PM peak hour under Build Alternatives 1 and 2C
- Magnolia Avenue off-ramp to eastbound Magnolia Avenue on-ramp – LOS F in the AM and PM peak hours
- Eastbound Magnolia Avenue on-ramp to westbound Magnolia Avenue on-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- SR-91 off-ramp to westbound SR-91 on-ramp – LOS F in the AM peak hour
- Westbound SR-91 on-ramp to eastbound SR-91 on-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Eastbound SR-91 on-ramp to lane drop – LOS F in the AM peak hour under Build Alternatives 1 and 2C, and LOS E in the AM peak hour under Build Alternative 4

I-215 Southbound (2044):

- Eastbound SR-60 on-ramp to westbound SR-60 on-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Lane drop to Eucalyptus Avenue on-ramp – LOS E in the AM and PM peak hours
- Eucalyptus Avenue on-ramp to Alessandro Boulevard off-ramp – LOS E in the AM peak hour under all build alternatives, LOS E in the PM peak hour under Build Alternatives 1 and 2C, and LOS F in the PM peak hour under Build Alternative 4
- Westbound Alessandro Boulevard on-ramp to eastbound Alessandro Boulevard on-ramp – LOS E in the AM and PM peak hours
- Eastbound Cactus Avenue off-ramp to Cactus Avenue on-ramp – LOS E in the PM peak hour under Build Alternative 4
- Cactus Avenue on-ramp to Van Buren Boulevard off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Van Buren Boulevard on-ramp to Harley Knox Boulevard off-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under all build alternatives
- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under Build Alternative 4
- Harley Knox Boulevard on-ramp to Cajalco Expressway off-ramp – LOS E in the AM and PM peak hours

- Cajalco Expressway off-ramp to Cajalco Expressway on-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under all build alternatives
- Cajalco Expressway on-ramp to Mid-County Parkway off-ramp – LOS F in the AM and PM peak hours under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under Build Alternative 4
- West Nuevo Road off-ramp to West Nuevo Road on-ramp – LOS E in the PM peak hour under Build Alternatives 1 and 2C

I-215 Northbound (2044):

- Mid-County Parkway westbound on-ramp to Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp to Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard on-ramp to Van Buren Boulevard off-ramp – LOS E in the PM peak hour
- Eastbound Van Buren Boulevard on-ramp to westbound Van Buren Boulevard on-ramp – LOS E in the AM peak hour under Build Alternative 4, and LOS E in the PM peak hour under all build alternatives
- Westbound Van Buren Boulevard on-ramp to Cactus Avenue off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Cactus Avenue off-ramp to eastbound Cactus Avenue on-ramp – LOS E in the PM peak hour
- Eastbound Cactus Avenue on-ramp to westbound Cactus Avenue on-ramp – LOS E in the PM peak hour
- Eastbound Alessandro Boulevard off-ramp to eastbound Alessandro Boulevard on-ramp – LOS E in the PM peak hour
- Eastbound Alessandro Boulevard on-ramp to Eucalyptus Avenue off-ramp – LOS F in the PM peak hour
- Eucalyptus Avenue off-ramp to Eucalyptus Avenue on-ramp – LOS E in the PM peak hour
- Eucalyptus Avenue on-ramp to SR-60 – LOS F in the PM peak hour

The following segment along I-215 is projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternatives 1 and 2C in the same year (there are no such instances along I-15).

I-215 Southbound (2044):

- West Nuevo Road off-ramp to West Nuevo Road on-ramp in the PM peak hour

The following segment along I-215 is projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternatives 1, 2C, and 4 in the same year (there are no such instances along I-15).

I-215 Northbound (2044):

- Harley Knox Boulevard off-ramp to Harley Knox Boulevard on-ramp in the PM peak hour

In addition, the segments along I-215 that are projected to operate at an unacceptable LOS under the No-Build Alternative but projected to operate at an acceptable LOS under Build Alternatives 1 and 2C are as follows (there are no such instances along I-15).

I-215 Southbound (2044):

- Alessandro Boulevard off-ramp to westbound Alessandro Boulevard on-ramp in the PM peak hour
- Eastbound Cactus Avenue off-ramp to Cactus Avenue on-ramp in the PM peak hour

I-215 Northbound (2044):

- Eastbound Van Buren Boulevard on-ramp to westbound Van Buren Boulevard on-ramp in the AM peak hour

The following segments along I-15 are projected to operate at unacceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at acceptable LOS under Build Alternative 4 in the same year (there are no such instances along I-15).

I-215 Southbound (2044):

- Magnolia Avenue on-ramp to Ontario Avenue off-ramp in the AM peak hour

I-215 Northbound (2044):

- Ontario Avenue on-ramp to Magnolia Avenue off-ramp in the PM peak hour

Freeway Ramp Level of Service

Tables 3.6-15 and 3.6-25 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, indicate the following freeway ramps along I-15 and I-215 would operate at an unacceptable LOS in the forecast year (2044) under Build Alternatives 1, 2C, or 4 conditions.

I-15 Southbound (2044):

- Eastbound SR-91 off-ramp – LOS F in the AM peak hour and LOS E in the PM peak hour
- Ontario Avenue off-ramp – LOS E in the AM and PM peak hours
- CETAP off-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, LOS F in the AM peak hour under Build Alternative 4, and LOS F in the PM peak hour under all build alternatives
- Cajalco Road off-ramp – LOS E in the PM peak hour
- Cajalco Road on-ramp – LOS F in the PM peak hour
- Weirick Road off-ramp – LOS F in the PM peak hour

I-15 Northbound (2044):

- Weirick Road off-ramp – LOS E in the AM peak hour under Build Alternative 4
- CETAP on-ramp – LOS F in the AM and PM peak hours
- El Cerrito Road on-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue off-ramp – LOS F in the AM and PM peak hours
- Ontario Avenue on-ramp – LOS F in the AM peak hour
- Westbound SR-91 on-ramp – LOS F in the AM peak hour under all build alternatives, LOS F in the PM peak hour under Build Alternative 4, and LOS E in the PM peak hour under Build Alternatives 1 and 2C

I-215 Southbound (2044):

- Eucalyptus Avenue on-ramp – LOS E in the AM and PM peak hours
- Alessandro Boulevard off-ramp – LOS E in the AM and PM peak hours
- Cactus Avenue on-ramp – LOS F in the PM peak hour
- Van Buren Boulevard off-ramp – LOS E in the AM peak hour under all build alternatives, LOS E in the PM peak hour under Build Alternatives 1 and 2C, and LOS F in the PM peak hour under Build Alternative 4
- Van Buren Boulevard on-ramp – LOS F in the PM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under Build Alternative 4
- Harley Knox Boulevard off-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under Build Alternative 4
- Cajalco Expressway on-ramp – LOS F in the PM peak hour
- Mid-County Parkway off-ramp – LOS E in the AM peak hour under all build alternatives, LOS F in the PM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under Build Alternative 4
- Placentia Avenue off-ramp – LOS E in the PM peak hour
- Mid-County Parkway westbound on-ramp – LOS E in the AM and PM peak hours
- Placentia off-ramp – LOS E in the PM peak hour under Build Alternative 4
- Placentia on-ramp – LOS E in the PM peak hour under Build Alternative 4
- West Nuevo Road off-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under all build alternatives
- West Nuevo Road on-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under Build Alternative 4

I-215 Northbound (2044):

- West Nuevo Road off-ramp – LOS E in the AM peak hour under Build Alternatives 1 and 2C, and LOS E in the PM peak hour under all build alternatives
- Mid-County Parkway off-ramp – LOS E in the AM and PM peak hours
- Mid-County Parkway westbound on-ramp – LOS E in the PM peak hour
- Cajalco Expressway off-ramp – LOS E in the PM peak hour
- Cajalco Expressway on-ramp – LOS E in the PM peak hour
- Harley Knox Boulevard off-ramp – LOS E in the AM and PM peak hours
- Harley Knox Boulevard on-ramp – LOS F in the PM peak hour
- Van Buren Boulevard off-ramp – LOS E in the AM and PM peak hours
- Eastbound Van Buren Boulevard on-ramp – LOS E in the PM peak hour
- Cactus Avenue off-ramp – LOS E in the AM peak hour and LOS F in the PM peak hour
- Eastbound Cactus Avenue on-ramp – LOS E in the PM peak hour under Build Alternatives 1 and 2C
- East Alessandro Boulevard on-ramp – LOS F in the AM peak hour under Build Alternatives 1 and 2C, and LOS F in the PM peak hour under all build alternatives
- Eucalyptus Avenue off-ramp – LOS F in the AM peak hour under Build Alternatives 1 and 2C, and LOS F in the PM peak hour under all build alternatives
- Eucalyptus Avenue on-ramp – LOS F in the AM peak hour under Build Alternatives 1 and 2C, and LOS F in the PM peak hour under all build alternatives

The following ramp along southbound I-215 is projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternatives 1, 2C, and 4 in the same year (there are no such instances along I-15).

I-215 Southbound (2044):

- Placentia off-ramp in the PM peak hour

The following ramps along southbound I-215 are projected to operate at an acceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an unacceptable LOS under Build Alternative 4 in the same year (there are no such instances along I-15).

I-215 Southbound (2044):

- Placentia on-ramp in the PM peak hour

I-215 Northbound (2044):

- Mid-County Parkway westbound on-ramp in the PM peak hour

In addition, the ramps along I-15 and I-215 that are projected to operate at unacceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at acceptable

LOS under Build Alternatives 1, 2C, and 4 in the same year are as follows (there are no such instances along southbound I-15).

I-15 Northbound (2044):

- Ontario Avenue on-ramp in the PM peak hour

I-215 Southbound (2044):

- Westbound Alessandro Boulevard on-ramp in the PM peak hour

The ramp along I-215 that is projected to operate at unacceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at acceptable LOS under Build Alternatives 1 and 2C in the same year is as follows (there are no such instances along southbound I-15).

I-15 Northbound (2044):

- Weirick Road off-ramp in the AM peak hour

The ramps along I-15 and I-215 that are projected to operate at an unacceptable LOS under the No-Build Alternative in the forecast year (2044) but projected to operate at an acceptable LOS under Build Alternative 4 in the same year are as follows (there are no such instances along southbound I-15).

I-15 Northbound (2044):

- Ontario Avenue on-ramp in the PM peak hour

I-215 Southbound (2044):

- Westbound Alessandro Boulevard on-ramp in the PM peak hour
- Mid-County Parkway westbound on-ramp in the PM peak hour

I-215 Northbound (2044):

- Cajalco Expressway on-ramp in the AM peak hour
- Harley Knox Boulevard on-ramp in the AM peak hour
- Eastbound Van Buren Boulevard on-ramp in the AM peak hour
- Westbound Van Buren Boulevard on-ramp in the AM and PM peak hours

During the AM peak hour, 17 freeway ramp segments are forecast to operate at an unsatisfactory LOS under 2044 Build Alternatives 1, 2C, and 4 traffic conditions. During the PM peak hour, 37 freeway ramp segments are forecast to operate at an unsatisfactory LOS under 2044 Build Alternatives 1 and 2C traffic conditions and 36 freeway ramp segments are forecast to operate at unsatisfactory LOS under 2044 Build Alternative 4 traffic conditions.

Freeway Weaving Segment Level of Service

Tables 3.6-18 and 3.6-28 in Section 3.6, *Traffic and Transportation/Pedestrian and Bicycle Facilities*, indicate four freeway weaving segments are forecast to operate at unsatisfactory LOS under 2044 Build Alternatives 1, 2C, and 4 conditions during both the AM and PM peak hours.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Between Temescal Canyon Road and Harley John Road, the alignment of Build Alternatives 1, 2C, and 4 travel through the boundaries of the LM MSHCP. The segment of Build Alternatives 1 and 2C within the LM MSHCP between Temescal Canyon Road and El Sobrante Road would operate an acceptable LOS in the forecast year (2044), whereas the segment of Build Alternatives 1 and 2C between El Sobrante Road and Harley John Road within the LM MSHCP would operate at an unacceptable LOS in the forecast year (2044). The segment of Build Alternative 4 within the LM MSHCP would operate at an acceptable LOS in the forecast year (2044), except the segment along Cajalco Road east of El Sobrante Road. In addition, arterial study segments for the future six-lane facility associated with Build Alternatives 1, 2C, and 4 would operate at an acceptable LOS within the LM MSHCP in the forecast year (2044), with exception of the study segment along Cajalco Road east of El Sobrante Road under Build Alternative 4.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

The following arterial segments would operate at an acceptable LOS in the forecast year (2044) with implementation of Build Alternatives 1 or 2C (Future Six-Lane Facility):

- Cajalco Road east of Temescal Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive
- Cajalco Road between Lake Mathews Drive and El Sobrante Road
- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road

The following arterial segments would operate at an unacceptable LOS F in the forecast year (2044) with implementation of Build Alternative 1 (Future Six-Lane Facility):

- Cajalco Road between Harley John Road and Day Street
- Cajalco Road east of Day Street

The study arterial segments that are projected to operate at an unacceptable LOS under the No-Build Alternative but projected to operate at an acceptable LOS under the build alternatives are as follows:

- Cajalco Road between El Sobrante Road and Gavilan Road
- Cajalco Road between Gavilan Road and Harley John Road

Future Six-Lane Facility (Build Alternative 4)

The following arterial segments would operate at an acceptable LOS in the forecast year (2044) with implementation of Build Alternative 4 (Future Six-Lane Facility):

- El Sobrante Road between Cajalco Road and Harley John Road
- El Sobrante Road between Harley John Road and Mockingbird Canyon Road

- El Sobrante Road between La Sierra Avenue and Mockingbird Canyon Road
- Cajalco Road between Temescal Canyon Road and La Sierra Avenue
- Cajalco Road between Gavilan Road and Lake Mathews Drive
- Cajalco Road between La Sierra Avenue and Lake Mathews Drive

The following arterial segments would operate at an unacceptable LOS F in the forecast year (2044) with implementation of Build Alternative 4 (Future Six-Lane Facility):

- Cajalco Road east of El Sobrante Road
- Cajalco Road East of Day Street

4.2.17(c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Build Alternatives 1, 2C, and 4

No Impact

Numerous driveways and intersecting cross-streets currently present conflict points that affect safe and efficient operation of Cajalco Road. Between January 2015 and December 2017, 355 collisions occurred on Cajalco Road between Temescal Canyon Road and I-215; of the 355 collisions, seven were fatal and 150 resulted in injury. The majority of collisions occurred along the approximately 6-mile stretch of Cajalco Road between Alexander Street and Harvill Avenue, with 145 collisions over the 3-year period. Compared with the statewide average accident rate for similar facilities, the collision rate of 1.673 per million vehicle miles is higher than the statewide average of 1.163 per million vehicle miles.

The proposed project would improve traffic safety along Cajalco Road (Build Alternatives 1 and 2C), or a combination of Cajalco Road and El Sobrante Road (Build Alternative 4), within the project limits, as it would improve roadway alignment and intersection design. Under any of the build alternatives, the proposed project would not increase hazards because of a design feature or incompatible uses, and instead would reduce hazards. Therefore, there would be no impact.

Lake Mathews HCP (Build Alternatives 1, 2C, and 4)

As discussed above under Build Alternatives 1, 2C, and 4, the proposed project would improve traffic safety through roadway alignment and intersection design improvements. Therefore, there would be no impact related to hazards from a geometric design feature or incompatible uses.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

No Impact

For the future six-lane Cajalco Road facility (Build Alternatives 1, 2C, and 4), construction is not currently proposed as part of the project. However, if constructed in the future, the addition of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road (Build Alternatives 1 and 2C) and within the medians of Cajalco Road

and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road (Build Alternative 4) would be limited to the existing median. Therefore, the future six-lane facility would not result in increased hazards because of a design feature or incompatible uses. Impacts would be less than significant.

Section 2.2.1.1, *Common Features of the Build Alternatives,* of Chapter 2 discusses in detail the safety improvements that would be constructed as part of the proposed project (e.g., traffic signal improvements, installation of medians, realignment of existing roadway curves).

4.2.17(d) d) Result in inadequate emergency access?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

Build Alternatives 1 and 2C would add an alternate access route for residents between Lake Mathews Drive and Dirt Road, increase the capacity of improved roadways, and improve connections with intersecting roadways throughout the project limits, thereby improving emergency access through the project corridor.

Construction activities associated with the build alternatives would result in temporary, localized, site-specific disruptions to the utilities and emergency services in the project area, primarily related to construction-related traffic changes from trucks and equipment and partial and/or complete street and lane closures, some requiring detours. Only a few locations would require temporary, localized detours; most areas would maintain two-way traffic throughout construction. In addition, non-fire-related medical emergencies could temporarily increase with the presence of construction workers and heavy machinery during construction of the project. Localized, temporary detours are proposed during replacement of the Temescal Canyon Bridge just east of Temescal Canyon Road, at the intersection of Cajalco Road and Harley John Road to accommodate replacement of a large reinforced concrete box within the roadway, and during construction of the new bridge proposed for westbound lanes west of Barton Street.

A TMP, as described in Standard Project Measure **PF LU-1** (see Section 3.1, *Land Use*), would be prepared for the project and include measures to minimize construction-period traffic and access/circulation impacts, and coordination of detour routes with County sheriff and fire departments and emergency providers. As part of the TMP, temporary detour plans would be prepared for alternative access and route options for local and regional travelers during construction of the project. Final detour routing would be identified during the PS&E/final design phases of the project.

Temporary impacts on traffic and transportation as well as pedestrian and bicycle facilities during construction would be addressed through preparation and use of a TMP and public awareness campaign. Please refer to Section 3.1, *Land Use*, for Standard Project Measure **PF LU-1** (TMP).

Because the project construction activities would be temporary and would be implemented in a manner that minimizes the effects on emergency access, impacts would be less than significant.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to allow for construction of the project within the conservation area. Approval would need to be obtained prior to any construction. As discussed under Build Alternatives 1, 2C, and 4 above, Standard Project Measure **PF LU-1** would be included in the project and impacts on emergency access would not be anticipated.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Less than Significant Impact

For the future six-lane Cajalco Road facility (Build Alternatives 1, 2C, and 4), construction is not currently proposed as part of the project. However, if constructed in the future, it is anticipated that temporary impacts associated with the addition of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road (Build Alternatives 1 and 2C) and within the medians of Cajalco Road and La Sierra Avenue between Temescal Canyon Road and El Sobrante Road (Build Alternative 4) would be limited to the existing median. As part of the TMP, a public awareness campaign, options for lane closures, and alternate route strategies would be included. Emergency access would be accommodated during construction. Therefore, the future six-lane facility would not result in inadequate emergency access, and impacts would be less than significant.

4.2.18 Tribal Cultural Resources

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☒	☐	☐	☐
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☒	☐	☐	☐

The information and discussion presented in this section on the identification and evaluation of cultural resources, including resources that meet Public Resources Code (PRC) Section 5020.1(k) (local register of historical resources) and/or PRC Section 5024.1 (CRHR) eligibility criteria and their potential for impact, are based on information presented in Sections 3.8, *Cultural Resources* (NEPA), and 4.2.5, *Cultural Resources* (CEQA), of this EIR/EIS. The information is further based on the following studies prepared for the proposed project: *Historic Property Survey Report* (HPSR) (Caltrans 2020a), *Archaeological Survey Report* (ASR) (Caltrans 2020b), *Historical Resources Evaluation Report* (HRER) (Caltrans 2020c), *Archaeological Evaluation Report* (AER) (Caltrans 2020d), and *Finding of Adverse Effect* (Caltrans 2020e).

Effective January 1, 2015, PRC Sections 21074 and 21080.3.1 were established in response to Assembly Bill 52 (Gatto 2014), which added requirements for local agencies to consider and include tribal cultural resources (TCRs) early in the CEQA process with the intent to ensure that local and tribal governments, public agencies, and project proponents would have information available, early in the project planning process, to identify and address potential adverse impacts on TCRs. TCRs are defined by PRC Section 21074(a) as either:

(1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:

  (A) Included or determined to be eligible for inclusion in the California Register of Historical Resources.

  (B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.

(2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1

for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

(b) A cultural landscape that meets the criteria of subdivision (a) is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape.

(c) A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a "nonunique archaeological resource" as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Assembly Bill 52 and PRC Sections 21074 (TCRs) and 21080.3.1 (consultation) apply to projects that have a notice of preparation for an EIR or negative declaration or mitigated negative declaration filed on or after July 1, 2015. Because the notice of preparation for the proposed project was filed on September 6, 2011, compliance with Assembly Bill 52 and related PRC Sections 21074 and 21080.3.1 is not required. However, because the proposed project includes federal funding and the preparation of an EIS, coordination with tribal governments, public agencies, and project proponents has been ongoing for the project since 2011 per the requirements established under Section 106 of the National Historic Preservation Act of 1966 and Title 23 USC Section 139 (Efficient environmental reviews for project decisionmaking). This long-term coordination and consultation between the County and tribal governments, public agencies, and project proponents has included opportunities for participating California Native American tribes to provide information concerning the value and significance of resources that may occur within the project area, and is considered sufficient in meeting the requirements of PRC Sections 21074 and 21080.3.1.

Because the project involves resources that would meet "tribal cultural resource" criteria under PRC Section 21074, an evaluation of such resources that also meet PRC Section 5020.1(k) (local register of historical resources) and/or PRC Section 5024.1 (CRHR) eligibility criteria, and their potential for impact, is provided below for the purposes of this project only. Please refer to Sections 3.8, *Cultural Resources* (NEPA), and 4.2.5, *Cultural Resources* (CEQA), and Chapter 5, *Comments and Coordination*, for full discussion of cultural resources, including resources identified, potential impacts, consultation and coordination with participating Native American tribes, and measures to avoid or minimize effects on sensitive cultural resources.

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, that is:

4.2.18(a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

4.2.18(b) b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

As discussed in Section 4.2.5, *Cultural Resources*, and listed in Table 4.2-18, the following TCPs within the project APE were evaluated for listing in the CRHR, or assumed eligible for listing in the CRHR for the purposes of this project only, and would potentially be affected: Mead Valley PPAD; combined site of CA-RIV-2263, 2264, and 4444; CA-RIV-4403, -4407, -4408, -4409, and -4454; CA-RIV-7843, Loci 816 and Locus 817; CA-RIV-012623; *T u'uv* TCP; *Qax alku Pay mik* TCP; and *Qax alku Kwiimik* TCP, all of which received SHPO concurrence on February 10, 2021. Overall, per its February 17, 2021 Finding of Adverse Effect letter, SHPO determined that while the undertaking will result in effects on the three TCPs, the effects will not be adverse (Polanco 2021b).

Table 4.2-18. Archaeological Resources and Traditional Cultural Properties within the APE

Site	Description	Established Tribal Cultural Value[1]	CRHR / Local Register Eligibility	Tribal Cultural Resource[2]
CA-RIV-3832H	Atchison, Topeka, and Santa Fe railroad grade (archaeological component)	No	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).	No
Mead Valley PPAD	Prehistoric bedrock milling stations within an as-yet undefined larger boundary inclusive of additional likely similar sites outside of the APE	Yes	PPAD assumed eligible under Criteria A/1, B/2, C/3, and D/4 (approved by CSO 7/7/2020). NRHP status for contributing elements described below for each qualifying site.	**Yes**
Combined site of CA-RIV-2263, CA-RIV-2264, and CA-RIV-4444	Prehistoric bedrock milling station, lithic scatter, and reported petroglyph	Yes	Eligible for listing in the NRHP/CRHR under Criteria D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/7/2021).	**Yes**
CA-RIV-4403	Bedrock milling station	Yes	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021) but assumed	**Yes**

Site	Description	Established Tribal Cultural Value[1]	CRHR / Local Register Eligibility	Tribal Cultural Resource[2]
			eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/7/2020).	
CA-RIV-4407	Bedrock milling station and lithic scatter	Yes	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021), but assumed eligible as an assumed contributing element to the PPAD under Criterion D/4.	**Yes**
CA-RIV-4408	Bedrock milling station and lithic scatter	Yes	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021), but eligible as a contributing element to the PPAD under Criterion D/4.	**Yes**
CA-RIV-4409	Bedrock milling station	Yes	Not eligible for listing in the NRHP or CRHR under Criteria A/1, B/2, C/3, and D/4 individually (SHPO concurrence received 2/10/2021), but eligible as a contributing element to the PPAD under Criterion D/4.	**Yes**
CA-RIV-4454	Prehistoric artifact scatter	No	Not eligible for the NRHP/CRHR under any criteria individually but assumed eligible as a contributing element to the PPAD under Criterion D/4 (CSO (CSO approval 7/7/2020).	No
CA-RIV-6623/H	Historic period refuse scatter and imported manos	No	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).	No
CA-RIV-7843, Locus 816	Prehistoric cupule rock, milling features, and lithic scatter	Yes	Eligible for listing in the NRHP/CRHR under Criteria A/1, C/3, and D/4 SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/7/2020).	**Yes**
CA-RIV-7843, Locus 817	Prehistoric milling station and artifact scatter	Yes	Not eligible for listing in the NRHP or CRHR individually (SHPO concurrence received 2/10/2021). Assumed	**Yes**

Site	Description	Established Tribal Cultural Value[1]	CRHR / Local Register Eligibility	Tribal Cultural Resource[2]
			eligible for listing as a locus of CA-RIV-7843 under Criteria D/4 (CSO approval 7/7/2020).	
CA-RIV-012618	Historic period refuse scatter	No	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).	No
CA-RIV-012621	Historic period refuse scatter	No	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).	No
CA-RIV-012622	Historic period refuse scatter	No	Not eligible for the NRHP/CRHR under any criteria (SHPO concurrence received 2/10/2021).	No
CA-RIV-012623	Prehistoric artifact scatter	No	Eligible for listing in the NRHP/CRHR under Criteria D/4 (SHPO concurrence received 2/10/2021); assumed eligible as a contributing element to PPAD under Criterion D/4 (CSO approval 7/72020).	No
'uv Traditional Cultural Property	TCP encompassing vast geographical area. Associated with village and large ceremonial center including more than 30 petroglyphs, and ancient trail.	Yes	Caltrans assumption of eligibility (NRHP Criteria A, B, C, D) for the purposes of this project only (CSO approval 5/7/2020).	**Yes**
Qaxáalku Payómik Traditional Cultural Property	TCP encompassing vast geographical area. Village complex associated with resource gathering and Luiseño Creation account.	Yes	Caltrans assumption of eligibility (NRHP Criteria A, B, C, D) for the purposes of this project only (CSO approval 5/7/2020).	**Yes**
Qax alku Kw imik Traditional Cultural Property	TCP encompassing vast geographical area. Associated with village complex and large ceremonial center.	Yes	Caltrans assumption of eligibility (NRHP Criteria A, B, C, D) for the purposes of this project only (CSO approval 5/7/2020).	**Yes**

[1] Based on tribal coordination and consultation conducted for the project per Section 106 and USC Section 139. Refer to Section 3.8, *Cultural Resources*, and Chapter 5, *Comments and Coordination*, of this EIR/EIS for further information and details.
[2] Considered TCR for the purposes of this project only.

Build Alternatives 1 and 2C

Potentially Significant Impact

As indicated in Tables 4.2-5 and 4.2-6 in Section 4.2.5, *Cultural Resources*, potentially significant impacts would be anticipated on the Mead Valley PPAD; the combined site of CA-RIV-2263, 2264, and 4444; and on Loci 816 and Locus 817 of CA-RIV-7843, under Build Alternatives 1 and 2C. Less-than-significant impacts with mitigation would be anticipated on the three TCPs (*T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*).

A number of meetings have been held to discuss tribal concerns and consider mitigation. Native American input and information has been used in the development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternatives 1 and 2C. Standard Project Measures **PF CR-1** and **PF CR-2** have also been identified to further reduce impacts on cultural resources (see Section 3.8, *Cultural Resources*). A Section 106 MOA will be developed for all historic properties that will be affected by the project, and will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS. For the three archaeological resources, while the proposed measures would reduce impacts associated with the proposed project, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on archaeological historical resources that are considered TCRs and/or significant resources pursuant to PRC Section 5024.1(c) would be significant and unavoidable.

Although the outer boundaries of the TCPs are not known, impacts on the TCPs from the project, including ground-disturbing activities associated with development that would affect individual physical components of the TCPs, are not expected to be significant because they affect a minute portion of the overall geographic extent of the TCPs. Additionally, even though ground-disturbing activities associated with development would affect individual physical components of the TCPs, their loss would not cause a significant impact on the intangible cultural values held by the Luiseño people and would not significantly change the integrity of setting, feeling, character, and location of *T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik* to the point that they no longer contribute to the significance of the TCPs. With the implementation of measures developed in the MOA and Standard Project Measures **PF CR-1** and **PF CR-2**, the proposed project's impact on the three TCP TCRs, *T u'uv, Qax alku Pay mik,* and *Qax alku Kw imik,* would be less than significant.

Please refer to Section 3.8, *Cultural Resources*, for full description of Standard Project Measures **PF CR-1** and **PF CR-2**.

Future Six-Lane Facility (Build Alternatives 1 and 2C)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road between Temescal Canyon Road and Harley John Road under Build Alternatives 1 and 2C, for a total of six travel lanes along this segment of Cajalco Road, is not currently proposed as part of the project. If the additional lanes are constructed in the future, it is anticipated that changing the median to travel lanes and installation of a safety barrier would not greatly alter the post-construction conditions of the proposed project beyond what has been analyzed for Build Alternatives 1 and 2C. Measures described above for Build Alternatives 1 and 2C would ensure any impacts on resources considered TCRs and/or significant resources pursuant to PRC Section 5024.1(c) would be less than significant. However**,** if grading, cut, and fill as part of the future six-lane facility are conducted in areas previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and measures described above for Build Alternatives 1 and 2C would apply and measures and treatment developed in the MOA would be implemented; Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 2C, above, even with the incorporation of Measures **PF CR-1** and **PF CR-2**, impacts on archaeological resources that are considered TCRs and/or significant resources would be potentially significant.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Less than Significant with Mitigation

The LM MSHCP, as it pertains to cultural resources, would remain unchanged. However, under Build Alternatives 1 and 2C, a portion of Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed project, which may result in potential impacts on undiscovered, buried resources considered TCRs and/or significant resources pursuant to PRC Section 5024.1(c) within the LM MSHCP area and LMR. As discussed under Build Alternatives 1 and 2C, above, even with the incorporation of Measures **PF CR-1** and **PF CR-2**, impacts on archaeological resources that are considered TCRs and/or significant resources would be potentially significant. Impacts would be the same for the three TCP TCRs*, T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*. Measures to reduce impacts and treatments in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable.

Build Alternative 4

Potentially Significant Impact

As indicated in Table 4.2-7 in Section 4.2.5, *Cultural Resources*, potentially significant impacts would be anticipated on the Mead Valley PPAD; CA-RIV-4403, -4407, -4408, and -4409; Loci 816 and 817 of CA-RIV-7843; and CA-RIV-012623, under Build Alternative 4. Less-than-significant impacts with mitigation would be anticipated on the three TCPs (*T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*). A number of meetings have been held to discuss tribal concerns and consider mitigation. Native American input and information have been used in the

development of project design options that would minimize impacts on resources, and these design options have been incorporated into Build Alternative 4. Standard Project Measures **PF CR-1** and **PF CR-2** have also been identified to further reduce impacts on cultural resources (see Section 3.8, *Cultural Resources*). A Section 106 MOA will be developed for all historic properties that will be affected by the project, and will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS. For the three archaeological resources, while the proposed measures would reduce impacts associated with the proposed project, the measures would not fully avoid impacts or reduce impacts to a less-than-significant level. Therefore, the proposed project's impact on the archaeological historical resources that are considered TCRs and/or significant resources pursuant to PRC Section 5024.1(c) would be significant and unavoidable.

Although the outer boundaries of the TCPs are not known, impacts on the TCPs from the project, including ground-disturbing activities associated with development that would affect individual physical components of the TCPs, are not expected to be significant because they affect a minute portion of the overall geographic extent of the TCPs. Additionally, even though ground-disturbing activities associated with development would affect individual physical components of the TCPs, their loss would not cause a significant impact on the intangible cultural values held by the Luiseño people and would not significantly change the integrity of setting, feeling, character, and location of *T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik* to the point that they no longer contribute to the significance of the TCPs. With the implementation of the measures in the MOA and Standard Project Measures **PF CR-1** and **PF CR-2**, the proposed project's impact on the three TCP TCRs*, T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*, would be less than significant. Please refer to Section 3.8, *Cultural Resources*, for full description of Standard Project Measures **PF CR-1** and **CR-2**.

Future Six-Lane Facility (Build Alternative 4)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road under Build Alternative 4, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If grading, cut, and fill as part of the future six-lane facility are conducted in areas previously undisturbed during implementation of the widening and safety enhancement project, then the analysis and measures described above for Build Alternative 4 would apply and measures and treatment developed in the MOA would be implemented; Standard Project Measures **PF CR-1** and **PF CR-2** would further be employed if applicable. As discussed under Build Alternative 4, above, even with the incorporation of Measures **PF CR-1** and **PF CR-2**, impacts on archaeological resources considered TCRs and/or significant resources would be potentially significant.

Lake Mathews MSHCP (Build Alternative 4)

Potentially Significant Impact

The LM MSHCP, as it pertains to cultural resources, would remain unchanged. However, under Build Alternative 4, portions of Cajalco Road, La Sierra Avenue, and El Sobrante Road would be expanded and realigned within the LM MSHCP area and LMR; appurtenant facilities including a drainage basin, culverts, bridges and wildlife crossings would also be constructed. A discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed project, which may result in potential impacts on undiscovered, buried resources considered TCRs and/or significant resources pursuant to PRC Section 5024.1(c) within the LM MSHCP area and LMR. Measures to reduce impacts and treatments in the MOA would be implemented if applicable, and Standard Project Measures **PF CR-1** and **CR-2** would be employed if applicable. As discussed under Build Alternative 4, above, even with the incorporation of Measures **PF CR-1** and **PF CR-2**, impacts on archaeological historical resources would be potentially significant. Impacts would be the same for the three TCP TCRs*, T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*.

4.2.19 Utilities and Service Systems

Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electrical power, natural gas, or telecommunications facilities, the construction of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	☐	☐	☐	☒
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☐	☒
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste disposal goals?	☐	☐	☐	☒
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☐	☒

The information and analyses in this section are based on Sections 3.3, *Growth*, and 3.5, *Utilities/Emergency Services*, of this EIR/EIS, and the *Community Impact Assessment* and *Errata* (Caltrans 2018c, 2021) and Initial Site Assessment (Caltrans 2020f) prepared for the project.

4.2.19(a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electrical power, natural gas, or telecommunications facilities, the construction of which could cause significant environmental effects?

Build Alternatives 1 and 2C

Less than Significant Impact

Under Build Alternatives 1 and 2C, new facilities for onsite drainage would be included as part of the realignment and roadway improvements. However, there would be no impact on any regional facilities. Several utility types would also require relocation, including overhead and underground electrical, underground gas, overhead and underground telephone, overhead cable telephone, water, septic tank, petroleum pipeline, and underground fiber optic. While changes in the placement of some utilities would be considered permanent, any effects during their relocation would be temporary and would be rectified once relocations and project construction are complete. Relocated utilities would be relocated on site within the environmentally evaluated footprint of the project. The incorporation of Standard Project Measure **PF UT-1**, which requires coordination of utilities with all affected agencies, would minimize impacts and avoid significant environmental effects.

Neither of the build alternatives would increase the demand for wastewater treatment, as the project is not growth inducing. Therefore, the project would not exceed wastewater treatment requirements of the RWQCB.

Lake Mathews MSHCP (Build Alternatives 1 and 2C)

Less than Significant Impact

Build Alternatives 1 and 2C include drainage components such as culverts, curb, and gutters that would accommodate drainage and runoff and would not result in additional flooding. Potential utility conflicts in the LM MSHCP area include Western Municipal Water District–operated water pipelines where Cajalco Road intersects Cowan Road and MWD-operated water pipelines where Cajalco Road intersects Gavilan Road and Lake Mathews Drive. All effects on utilities would be temporary and would be rectified when relocations and project construction are complete. Relocated utilities would be relocated on site within the environmentally evaluated limits of disturbance of these build alternatives and, as a result, there would be no permanent impacts on utilities in the project area. Standard Project Measure **PF UT-1** would minimize impacts and avoid significant environmental effects. Additionally, the proposed project would not include any use that would increase demand for wastewater treatment. Therefore, the project, including discretionary action to accommodate the proposed project within the LM MSHCP area, would not exceed wastewater treatment requirements of the RWQCB. Impacts on utilities and public services would be less than significant.

Build Alternative 4—El Sobrante Alignment

Less than Significant Impact

Under Build Alternative 4, several utility types would require relocation, including overhead and underground electrical, underground gas, overhead and underground telephone, overhead cable telephone, water, septic tank, petroleum pipeline, and underground fiber optic. Potential utility conflicts and relocations identified through initial coordination with local providers are discussed in Section 3.5, *Utilities/Emergency Services*. Similar to Build Alternatives 1 and 2C, relocated utilities would be relocated on site within the environmentally evaluated limits of disturbance of these build alternatives and, as a result, there would be no permanent impacts on utilities in the project area. The incorporation of Standard Project Measure **PF UT-1**, which requires coordination of utilities with all affected agencies, would minimize impacts and avoid significant environmental effects.

Under Build Alternative 4, new facilities for onsite drainage would be included as part of the realignment and roadway improvements. The existing Cajalco Creek double 9-foot-wide by 5-foot-high reinforced concrete box culvert would remain in place. The existing three 48-inch-diameter culverts under Harley John Road would be removed and Harley John Road would be realigned to the crest of the Cajalco Creek Sediment Basin embankment. There would be no impact on any regional facilities.

Build Alternative 4 would not include any use that would increase demand for wastewater treatment. Therefore, the project would not exceed wastewater treatment requirements of the RWQCB.

Lake Mathews MSHCP (Build Alternative 4)

Less than Significant Impact

Build Alternative 4 would include drainage components such as culverts, curb, and gutters that would accommodate drainage and runoff and would not result in additional flooding. Under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Road would be expanded and realigned within the LM MSHCP area and LMR. Once utility relocations are complete and effects rectified, there would be no permanent impacts. Relocated utilities would be relocated on site within the environmentally evaluated footprint of this project and, as a result, there would be no permanent effects on utilities. Standard Project Measure **PF UT-1** would be included to avoid and further reduce impacts to less-than-significant levels.

Additionally, the project would not include any use that would increase demand for wastewater treatment. Therefore, the project, including discretionary action to accommodate the proposed project within the LM MSHCP area, would not exceed wastewater treatment requirements of the RWQCB. Impacts on utilities and public services would be less than significant.

4.2.19(b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Build Alternatives 1, 2C, and 4

No Impact

Build Alternatives 1, 2C, and 4 would not result in substantial demand for water supplies. Some water would be used during project construction for potable use, dust control, and revegetation, as described in project measures. However, the demand for water during construction and operation of the build alternatives would represent only a very small percentage of total demand for water in the area and would not exceed existing entitlements. The proposed project would not require additional water supply entitlements and resources, as the project is a road improvement project and not a development project. Therefore, existing services would be sufficient and impacts would not occur. No mitigation is required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

As described above, the proposed project would not result in substantial demand for water supplies. Some water may be needed during project construction within the LM MSHCP area and LMR for potable use, dust control, and as described in project measures. However, the demand for water during construction and operation of the build alternatives would represent only a very small percentage of total demand for water in the area and would not exceed existing entitlements. Therefore, water supply demand as it relates to the proposed project, including discretionary action to accommodate the proposed project within the LM MSHCP area, would remain unchanged.

4.2.19(c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Build Alternatives 1, 2C, and 4

No Impact

As discussed in a) above, the proposed project would require new drainage facilities so that runoff would not result in additional flooding. Therefore, the project would not cause significant environmental effects and impacts would not occur. No mitigation is required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

As discussed in above under Build Alternatives 1, 2C, and 4, the proposed project would require new drainage facilities so that runoff would not result in additional flooding. The proposed project would not include any use that would increase demand for wastewater treatment. Therefore, the project would not require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities that would affect the LM MSHCP.

4.2.19(d) 4.2.19(d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste disposal goals?

Build Alternatives 1, 2C, and 4

No Impact

During construction of the proposed project, roadway contouring would involve the removal and replacement of soil, most of which would be reused on site. The amount of exported waste anticipated to be generated for each build alternative is shown in Table 4.2-19, below.

Table 4.2-19. Estimated Exported Waste by Alternative

Build Alternative	Quantity and Type of Earthwork (cubic yards)			
	Excavation	Fill	Imported Borrow	Export Disposal
1	1,859,300 CY	1,859,100 CY		200 CY
2C	2,511,200 CY	2,587,000 CY	75,800 CY	
4	2,855,400 CY	1,243,300 CY		1,612,100 CY

Build Alternative 4 would generate the greatest amount of waste after onsite soils have been replaced. Additional wastes generated during construction would include removed asphalt and limited structures. All wastes would be handled and transported in accordance with Standard Project Measure **PF HAZ-3** (waste handling, transport and disposal), which identifies the applicable federal and state regulations and Caltrans policies regarding the use, storage, handling, disposal, and transport of materials. Furthermore, Standard Project Measure **PF SW-1** would be applied to reduce construction waste:

- **PF SW-1**: Consistent with Caltrans Standard Specification 14-10, non-hazardous construction-period waste shall be recycled.

The excess soils anticipated for Build Alternatives 2C and 4 would be transported to the nearby El Sobrante Landfill, and removed asphalt would be transported to All American Asphalt Quarry. The amount of waste materials generated during construction and operation of Build Alternatives 1, 2C, and 4 that would be disposed of in landfills would represent only a very small percentage of the total amount of waste generated in the region and disposed of at the landfills. As a result, the waste generated during construction and operation of the build alternatives would not exceed the permitted capacity at landfills in Riverside County. Therefore, the proposed build alternatives would not result in a change in demand for waste disposal services or resources and no impacts would occur. No mitigation is required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would not result in a change in demand for waste disposal services or resources, as the project is a road improvement project and not a development project. Therefore, solid waste associated with the project would not affect the LM MSHCP.

4.2.19(e) Comply with federal, state, and local statutes and regulations related to solid waste?

Build Alternatives 1, 2C, and 4

No Impact

The proposed project is a road improvement project and not a development project; therefore, the project would not result in a change in demand for services or resources, as the project is not growth inducing. Therefore, existing landfill services would be sufficient.

The proposed project would comply with federal, state, and local statutes and regulations related to solid waste. Wastes and petroleum products used during construction would be collected, transported, and removed from the project site in accordance with Resource Conservation and Recovery Act regulations and federal/Occupational Safety and Health Administration standards, including Waste Management and Materials Pollution Control BMPs – Spill Prevention and Control, Materials; and Waste Management BMP, Hazardous Waste Management. All hazardous waste will be stored, transported, and disposed of as required in California Code of Regulations Title 22, Division 4.5; CFR Title 49, Parts 261–263; and Caltrans' SSP 14-11.14 and requirements as stated in Section 7-109, Solid Waste Disposal and Recycling Reporting, of the Caltrans Construction Manual. Impacts would not occur and mitigation would not be required.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would not result in a change in demand for waste disposal services or resources, as the project is a road improvement project and not a development project. Therefore, solid waste associated with the project would not affect the LM MSHCP.

4.2.20 Wildfire

If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☒	☐
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

This section was prepared using information from Section 3.4, *Community Impacts*, Section 3.9, *Hydrology and Floodplain*, the *Community Impact Assessment* technical report and *Errata* prepared for the project (Caltrans 2018c, 2021), and the County of Riverside General Plan.

4.2.20(a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

Build Alternatives 1, 2C, and 4

No Impact

Build Alternatives 1, 2C, and 4 would improve operational performance of primary roadways and the local street system by accommodating anticipated increased traffic demand and associated potential congestion from planned development in the area, thereby improving local access and the delivery of public services (police and fire protection, and emergency medical response). Therefore, the project would not result in the substantial impairment of an emergency response plan or evacuation plan; there would be no impact.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would improve the operational performance of local roadways including access and emergency services within the portion of the project that traverses areas of the LM MSHCP and LMR. Therefore, emergency response or evacuation as it relates to the proposed LM MSHCP discretionary action to accommodate the project would not be substantially impaired.

4.2.20(b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Build Alternatives 1, 2C, and 4

No Impact

According to the Temescal Canyon Area Plan and Lake Mathews/Woodcrest Area Plan, Build Alternatives 1, 2C, and 4 are within a State Responsibility Area/Federal Responsibility Area VHFHSZ between just east of Temescal Creek and Carpinus Drive, as related to wildfire susceptibility (County 2016, 2018a, 2018b). At Temescal Creek, the project alignment passes through a limited area zoned LRA VHFHSZ; the alignment of Build Alternative 4 also passes through a limited area of LRA VHFHSZ along the north side of El Sobrante Road, just east of La Sierra Avenue. The proposed project would involve improvements to existing roadways, with some realignments, and related facilities such as bridges, sidewalks, and drainage, and would not include any habitable structures. The proposed project would also increase the capacity of improved roadways and improve connections with intersecting roadways throughout the project limits. Therefore, the proposed project would not be anticipated to exacerbate risk of wildfire and there would be no impact.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would increase the capacity of improved roadways and improve connections with intersecting roadways within the portion of the project that traverses areas of the LM MSHCP and LMR. Therefore, wildfire risk as it relates to the proposed LM MSHCP discretionary action to accommodate the project would not be exacerbated by the project.

4.2.20(c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Build Alternatives 1, 2C, and 4

Less than Significant

The proposed project would involve improvements to existing roadways, with some realignments, and related infrastructure such as bridges, sidewalks, drainage, and utility relocations. Construction or operation of the roadway facilities, including maintenance, would not be anticipated to exacerbate risk of wildfire.

Temporary and permanent impacts on the environment as a result of improvements to existing roadways, with some realignments, and related facilities such as bridges, sidewalks, drainage, and utility relocations associated with the proposed project are addressed under their related sections of this chapter. Standard project measures and features incorporated into the project, including **PF UT-1**, **PF GEO-1** through **PF GEO-5**, **PF HAZ-3** and **PF HAZ-5**, **PF AQ-1**, and **NC-3 (NES BIO-3)**, **NC-5 (NES BIO-5)**, **NC-6 (NES BIO-6)**, **NC-10 (NES BIO-10)**, would

reduce impacts to less-than-significant levels. Please refer to Sections 3.5, *Utilities/Emergency Services*; 3.11, *Geology/ Soils/Seismic/Topography*; 3.13, *Hazardous Waste/Materials*; 3.14, *Air Quality*; and 3.17, *Natural Communities*, for the standard project measures and further discussion.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Less than Significant

The proposed project would involve improvements to existing roadways, with some realignments, and related infrastructure such as bridges, sidewalks, drainage, and utility relocations within the portion of the project that traverses areas of the LM MSHCP and LMR. Construction or operation of the roadway facilities, including maintenance, would not be anticipated to exacerbate risk of wildfire. Temporary and permanent impacts on the environment within areas of the LM MSHCP and LMR as a result of the proposed roadway-related infrastructure improvements would be addressed with the incorporation of standard project measures and features incorporated into the project, specifically **PF UT-1**, **PF GEO-1** through **PF GEO-5**, **PF HAZ-3** and **PF HAZ-5**, **PF AQ-1**, and **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12)**, which would reduce impacts to less-than-significant levels. Please refer to Sections 3.5, *Utilities/Emergency Services*; 3.11, *Geology/ Soils/Seismic/Topography*; 3.13, *Hazardous Waste/Materials*; 3.14, *Air Quality*; and 3.17, *Natural Communities*, for the standard project measures and further discussion.

4.2.20(d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Build Alternatives 1, 2C, and 4

No Impact

The majority of the proposed project is situated within FEMA-designated un-shaded Zone X, which indicates minimum flood hazard outside the 500-year flood limits. Portions of the project are also within Zone A, an area subject to inundation by the 100-year flood. The proposed project would not significantly change the existing drainage patterns, affect the Lake Mathews Dam, or increase the potential for dam failure. Through the use of project design features such as detention basins and culverts, 100-year-level storm flows would be conveyed, and would not be expected to result in flooding.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

No Impact

The proposed project would not significantly change existing drainage patterns within areas of the LM MSHCP and LMR, nor would it affect the Lake Mathews Dam or result in increased potential for dam failure. Therefore, exposure of people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes, as they relate to the proposed LM MSHCP discretionary action to accommodate the project, is not anticipated.

4.2.21 Mandatory Findings of Significance

	Potentially Significant Impact	Less Than Significant with Mitigation	Less Than Significant Impact	No Impact
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☒	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

4.2.21(a) Have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Build Alternatives 1, 2C, and 4

Potentially Significant Impact

As described in Section 4.2.4, *Biological Resources*, Build Alternatives 1, 2C, and 4 have the potential to result in adverse impacts on habitats and natural communities, threatened and endangered species, protected waters, and wildlife movement. With implementation of the avoidance, minimization, and mitigation measures described in Section 4.2.4 and in detail in Sections 3.17 through 3.22, these potential adverse impacts would be mitigated to below a level of significance under CEQA.

As described in Section 4.2.5, *Cultural Resources*, Build Alternatives 1 and 2C would permanently affect four NRHP/CRHR-eligible archaeological properties: combined site of CA-RIV-2263, 2264, and 4444, eligible for the NRHP and CRHR under Criterion D/4; CA-RIV-7843, Locus 816, eligible for listing in the NRHP/CRHR individually under Criteria A/1, C/3,

and D/4 and as a locus of the larger CA-RIV-7843 site that is eligible under Criterion D/4; CA-RIV-7843 Locus 817, eligible for listing in the NRHP/CRHR under Criterion D/4 as a contributing element of CA-RIV-7843; and CA-RIV-012623, eligible for the NRHP and CRHR under Criterion D/4. Build Alternative 4 would also permanently affect four NRHP/CRHR-eligible archaeological properties: the Mead Valley PPAD, assumed eligible for listing in the NRHP/CRHR under Criteria A/1, B/2, C/3, and D/4 for the purposes of this project only; CA-RIV-7843, Locus 816; CA-RIV-7843 Locus 817; and CA-RIV-012623.

All three build alternatives would potentially affect three TCPs, *T u'uv*, *Qax alku Pay mik*, and *Qax alku Kw imik*, for which Caltrans has assumed eligibility for listing in the NRHP under Criteria A, B, C, and D for the purposes of this project only, and are assumed eligible for the CRHR under Criteria 1, 2, 3, and 4. SHPO provided concurrence on the assumptions of eligibility for the sites discussed above in a letter dated February 10, 2021. While measures developed in the MOA and Standard Project Measures **PF CR-1** and **PF CR-2** would reduce impacts associated with the proposed project on the TCPs to a less-than-significant level, the measures would not fully avoid or reduce impacts to a less-than-significant level on the combined site of CA-RIV-2263, 2264, and 4444; to Mead Valley PPAD; to CA-RIV-7843, Locus 816; to CA-RIV-7843, Locus 817; or to CA-RIV-012623. These findings are consistent with the effect determinations of SHPO in its February 17, 2021, Finding of Adverse Effect letter, whereby the undertaking will not result in adverse effects on the three TCPs, but will result in adverse effects on the other resources listed above.

As discussed in Section 3.12, *Paleontology*, and Section 4.2.7, *Geology and Soils*, Build Alternatives 1, 2C, and 4 may directly or indirectly affect unique paleontological resources during construction. Areas along the alignments of the build alternatives have a high level of sensitivity for the presence of paleontological resources. As a result, grading and excavation could adversely affect unknown paleontological resources within sedimentary units that may contain fossils. To reduce impacts on paleontological resources that may be present in the areas proposed for grading and excavation, Mitigation Measure **PAL-1** in Section 3.12, *Paleontology*, requires the preparation during final design and implementation during construction of a detailed Paleontological Mitigation Plan. The actions required in Mitigation Measure **PAL-1** to monitor during construction, collect fossils, document/record those fossils, and curate the fossils in a permanent repository would reduce the adverse impacts of the build alternatives to paleontological resources to below a level of significance under CEQA.

Because the impacts discussed above would potentially result in the permanent loss of biological resources, cultural resources, and paleontological resources, the impacts above would result in irreversible environmental changes to these resources in the project area.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, significant impacts on habitats and natural communities, threatened and endangered

species, protected waters, wildlife movement, and paleontological resources would not be anticipated, as the impacts would occur within areas disturbed and mitigated under the currently proposed project.

Potential impacts involving unanticipated discovery of human remains and/or cultural resources are unlikely, as the additional lanes would occur within areas previously disturbed and mitigated under the currently proposed project.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Potentially Significant Impact

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; under Build Alternative 4, La Sierra Avenue and El Sobrante Road would also be expanded and realigned within the LM MSHCP area and LMR. Appurtenant facilities including a drainage basin, culverts, bridges and wildlife crossings associated with the roadway improvements would also be constructed. An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements.

As described for Build Alternatives 1, 2C, and 4 above, impacts on habitats and natural communities, threatened and endangered species, protected waters, wildlife movement, and paleontological resources within the LM MSHCP area and LMR would be mitigated to below a level of significance under CEQA.

4.2.21(b) Have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Build Alternatives 1, 2C, and 4

Less than Significant Impact

As detailed in Section 3.25, *Cumulative Impacts*, and Sections 4.2.1 through 4.2.20, the incorporation of standard project measures into the project would not result in cumulatively considerable effects involving the following resources when combined with past, present, and reasonably foreseeable future projects:

- Air Quality
- Energy
- Mineral Resources
- Population and Housing
- Public Services
- Recreation
- Utilities and Emergency Services

- Wildfire

Less than Significant with Mitigation

As detailed in Section 3.25, *Cumulative Impacts*, and Sections 4.2.1 through 4.2.20, with implementation of mitigation measures, the project would not result in cumulatively considerable effects involving the following resources when combined with past, present, and reasonably foreseeable future projects:

- Biological Resources (Natural Communities, Wildlife Corridors and Linkages, Plants, Threatened and Endangered Species, Animal Species)
- Geology and Soils (Paleontological Resources)
- Hazards and Hazardous Materials
- Hydrology and Water Quality (flood flows)
- Land Use and Planning

Potentially Significant Impact

As discussed in Section 3.25, *Cumulative Impacts*, and Sections 4.2.2, 4.2.4, 4.2.8, and 4.2.13, the proposed project may contribute to adverse impacts that are not fully mitigated or offset and that were determined to potentially contribute to significant cumulative adverse impacts involving:

- Aesthetics
- Agriculture and Forest Resources (Farmlands)
- Cultural Resources
- Greenhouse Gas Emissions
- Noise
- Biological Resources (Riparian/Riverine, Wetlands and Other Waters)
- Tribal Cultural Resources
- Transportation

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. If the additional lanes are constructed in the future, cumulative impacts on habitats and natural communities, threatened and endangered species, protected waters, wildlife movement, farmland, and noise would not be anticipated, as the impacts would occur within areas disturbed and mitigated under the currently proposed project.

Potential impacts involving unanticipated discovery of human remains and/or cultural resources are unlikely, as the additional lanes would occur within areas previously disturbed and mitigated under the currently proposed project. Additional excavation at deeper depths may occur for construction of the additional lanes within the median areas; therefore, the potential for unanticipated discovery of human remains or cultural resources exists and may contribute to a cumulatively considerable impact if not fully mitigated.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Potentially Significant Impact

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Road would also be expanded and realigned within the LM MSHCP area and LMR. An appropriate discretionary action coordinated between the County and LM MSHCP responsible parties is proposed as part of the project to accommodate the proposed roadway improvements. Impacts identified for Build Alternatives 1, 2C, and 4, above, would be the same within the portions of the LM MSHCP area and LMR that each build alternative travels through.

4.2.21(c) Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Build Alternatives 1, 2C, and 4

Potentially Significant Impact

As described in Sections 4.2.1, 4.2.5, and 4.2.23, Build Alternatives 1, 2C, and 4 have the potential to result in substantial adverse effects on human beings, particularly as a result of the significant unavoidable adverse impacts related to aesthetics, cultural resources, greenhouse gases, and noise described earlier. Mitigation measures identified in Sections 3.7, 3.8, 3.15, and 4.2.8 would reduce impacts but not to a less-than-significant level under CEQA.

Future Six-Lane Facility (Build Alternatives 1, 2C, and 4)

Potentially Significant Impact

The construction of two additional travel lanes within the median of Cajalco Road, between Temescal Canyon Road and Harley John Road, under Build Alternatives 1 and 2C, or within the medians of Cajalco Road and La Sierra Avenue, between Temescal Canyon Road and El Sobrante Road, for a total of six travel lanes along these segments of Cajalco Road and La Sierra Avenue, is not currently proposed as part of the project. Potential impacts involving unanticipated discovery of human remains and/or cultural resources are unlikely, as the additional lanes would occur within areas previously disturbed and mitigated under the currently proposed project. If the additional lanes are constructed in the future, environmental effects involving aesthetic resources and cultural resources, and subsequent substantial adverse effects on human beings, may not be fully avoided with the incorporation of mitigation.

Lake Mathews MSHCP (Build Alternatives 1, 2C, and 4)

Potentially Significant Impact

Under any of the build alternatives, Cajalco Road would be expanded and realigned within the LM MSHCP area and LMR; under Build Alternative 4, portions of La Sierra Avenue and El Sobrante Road would also be expanded and realigned within the LM MSHCP area and LMR. Because the LM MSHCP does not currently accommodate the roadway improvements or include a prescribed process to allow changes to the plan in response to public safety and/or access needs, an appropriate discretionary action coordinated between the County and LM MSHCP responsible parties would be required to accommodate the proposed roadway improvements. Significant unavoidable adverse impacts related to aesthetics and cultural resources identified for Build Alternatives 1, 2C, and 4, above, would be the same within the portions of the LM MSHCP area and LMR that each build alternative travels through.

4.3 Wildfire

4.3.1 Regulatory Setting

Senate Bill 1241 required the Office of Planning and Research, the Natural Resources Agency, and the California Department of Forestry and Fire Protection to develop amendments to the "CEQA Checklist" for the inclusion of questions related to fire hazard impacts for projects located on lands classified as very high fire hazard severity zones. The 2018 updates to the CEQA Guidelines expanded this to include projects "near" these very high fire hazard severity zones.

4.3.2 Affected Environment

Topographical conditions within the project study area vary, with more substantial changes in elevations occurring along the western half of the project. Highest elevations reach 2,557 feet in the Gavilan Hills area south of Cajalco Road and 1,857 feet at Arlington Mountain northwest of El Sobrante Road. Along the eastern half of the project, slopes are approximately 1.4 percent and generally in a southwest direction along the north side of Cajalco Road, and approximately 1.2 percent in a northern direction south of Cajalco Road.

According to the County of Riverside Temescal Canyon Area Plan and Lake Mathews/ Woodcrest Area Plan, and CAL FIRE VHFHSZ in LRA, Western Riverside County map, Build Alternatives 1, 2C, and 4 are within State Responsibility Area/Federal Responsibility Area High/Very High/Moderate Fire Hazard Severity Zones between just east of Temescal Creek and Carpinus Drive, as related to wildfire susceptibility (CAL FIRE 2009; County 2016, 2018a, 2018b). At Temescal Creek, the project alignment passes through a limited area designated LRA VHFHSZ; the alignment of Build Alternative 4 also passes through a limited LRA VHFHSZ along the north side of El Sobrante Road, just east of La Sierra Avenue (County 2018a).

Fire protection and emergency services are provided by the Riverside County Fire Department (RCFD) and City of Corona Fire Department. The City of Perris has a contract with RCFD for fire and emergency services; there are two fire stations and 14 firefighters assigned to the City of Perris (City of Perris 2018).

Flood hazard areas within the project area include Temescal Creek at the western end of the project, and Cajalco Creek, between Kirkpatrick Road and Clark Street, which are within a Zone A floodplain per FEMA Flood Insurance Rate Maps (FIRMs). Zone A is an area subject to inundation by the 1-percent annual chance (100-year) flood. Refer to Figure 3.9-1 in Section 3.9, *Hydrology and Floodplain*, for mapped floodplain areas.

4.3.3 Environmental Consequences

4.3.3.1 Emergency Access and Response

Build Alternatives 1, 2C, and 4 would improve the operational performance and the local street system by accommodating anticipated increased traffic demand and associated potential congestion from planned development in the area, thereby improving the delivery of public services (police and fire protection and emergency medical response) in the area.

Construction activities associated with the build alternatives would result in temporary, localized, site-specific disruptions to the utilities and emergency services in the project area, primarily related to construction-related traffic changes from trucks and equipment and partial and/or complete street and lane closures, some requiring detours. Only a few locations would require temporary, localized detours; most areas would maintain two-way traffic throughout construction. In addition, non-fire-related medical emergencies could temporarily increase with the presence of construction workers and heavy machinery during construction of the project. Localized, temporary detours are proposed during replacement of the Temescal Canyon Bridge just east of Temescal Canyon Road, at the intersection of Cajalco Road and Harley John Road to accommodate replacement of a large reinforced concrete box within the roadway, and during construction of the new bridge proposed for westbound lanes west of Barton Street.

A TMP, as described in Standard Project Measure PF **LU-1** (see Section 3.1*, Land Use*), would be prepared for the project and include measures to minimize construction-period traffic and access/circulation impacts, and coordination of detour routes with County sheriff and fire departments, and emergency providers. As part of the TMP, temporary detour plans would be prepared for alternative access and route options for local and regional travelers during construction of the project. Final detour routing would be identified during the PS&E/final design phases of the project. Therefore, impacts would be less than significant and mitigation would not be required.

4.3.3.2 Wildfire Risk

Build Alternatives 1, 2C, and 4 would include infrastructure improvements to existing transportation facilities located within mapped fire hazard severity zone areas. Improvements include widened roadway and roadway shoulders, additional travel lanes, center medians, turn lanes, curbs and gutters, and sidewalks, which would increase paved surfaces as well as the capacity of improved roadways, and improve connections with intersecting roadways throughout the project limits. Build Alternatives 1, 2C, and 4 would increase the capacity of improved roadways and improve connections with intersecting roadways throughout the project limits, thereby improving local access and the delivery of public services, including emergency response and fire protection.

An alternate access route for residents between Lake Mathews Drive and Dirt Road is also proposed under Build Alternatives 1 and 2C; no new habitable structures or access to previously inaccessible lands would occur as a result. A section of Cajalco Road would also be realigned east of Lake Mathews Drive through conserved lands managed by MWD under Build Alternatives 1 and 2C. While the realigned roadway would introduce a paved roadway structure through a previously unpaved area, public access to MWD-managed lands would continue to be restricted, limiting risk of undeveloped lands to fire exposure. Furthermore, the widened roadway areas would include wider shoulders and median areas, reducing roadside vegetation, serve as a firebreak, and provide additional areas for emergency response vehicle staging.

Build Alternatives 1, 2C, and 4 would require the relocation of several utilities, including overhead and underground electrical, underground gas, overhead and underground telephone, overhead cable telephone, water, septic tank, petroleum pipeline, and underground fiber optic. Under Build Alternatives 1 and 2C, existing electrical poles/lines along Cajalco Road would be relocated within the project limits as needed to accommodate the roadway widening between

Temescal Canyon Road and Harvill Avenue, with the majority of relocations occurring between Harley John Road and Harvill Avenue. Under Build Alternative 4, electrical poles/lines along Cajalco Road would also be relocated, but only between Temescal Canyon Road and La Sierra Avenue, and Harley John Road and Harvill Avenue, within the project limits as needed. Remaining utility relocations under Build Alternative 4 would occur along La Sierra Avenue and El Sobrante Road within the project limits. At bridge locations under all build alternatives, utilities would be relocated either within the bridge or outside of the new bridge/roadway, as needed, to accommodate the proposed improvements. Utility relocation plans will be prepared in consultation with the affected utility providers/owners for those utilities that will need to be relocated, removed, or protected in place. Utilities would be relocated within the environmentally evaluated footprint of this project in accordance with State law and regulations and County policies. The utility relocation plans will be included in the project specifications. The relocation of utilities would be coordinated between the County, affected agencies, and utility companies. This commitment is included in the project as Standard Project Measure **PF UT-1**; please refer to Section 3.5, *Utilities/Emergency Services*, for **PF UT-1**.

Therefore, for the reasons stated above, potential impacts caused by exacerbated wildfire risk related to emergency access, evacuations, or infrastructure would not occur and there would be no impact.

4.3.3.3 Post-Fire Slope Failure and Flood Risk

Topographical and slope conditions throughout the project vicinity vary, with more prominent slopes located along the western portion of the project, specifically along Cajalco Road between Temescal Creek Bridge and La Sierra Avenue, along La Sierra Avenue between Cajalco Road and El Sobrante Road, and south of El Sobrante Road (Lake Mathews Northern Dam) between La Sierra Avenue and east of McAllister Street. Moderately sloped areas occur along Cajalco Road between La Sierra Avenue and Kirkpatrick Road, decreasing as topographical conditions transition to more rolling and flat areas toward the eastern end of the project.

Build Alternatives 1, 2C, and 4 would require slope cuts and the addition of fill to accommodate a wider roadway profile through steep and moderately steep slope areas, and through undeveloped slope areas. Retaining walls are proposed for steeper areas where embankments are not feasible due to steep slopes. Refer to Figures 2.2-2, 2.2-4, and 2.2-5 in Chapter 2, *Project Alternatives*, for proposed retaining wall locations. Retaining walls and embankments would be constructed in accordance with County and/or Caltrans specifications. Final slope design would be confirmed during final design through Standard Project Measures **PF GEO-1** through **PF GEO-5**, and additional recommendations applied during the PS&E phase.

Build Alternatives 1, 2C, and 4 would encroach into the floodplains at four creek crossing locations: one at Temescal Creek and three along Cajalco Creek. The Temescal Creek floodplain encroachment would occur on the western end of the alignment near Temescal Canyon Road, as shown on Figure 3.9-1, and the three Cajalco Creek encroachments would occur at John Harley Road, west of Alexander Street, and between Alexander Street and Clark Street. Refer to Section 3.9, *Hydrology and Floodplain*, for Figure 3.9-1. Through the use of project design features such as detention basins, culverts, and channels, 100-year storm flows would be conveyed and would not result in any new flooding. Refer to Figures 2.2-2 through 2.2-5 in Chapter 2, *Project Alternatives*, for the locations of proposed basins, culverts, and channels. The culverts and

channels would provide a larger conveyance through this area, which is predicted to lower the water surface, reduce velocities, and eliminate flow over the roadway during a 100-year flood.

Build Alternatives 1, 2C, and 4 would not result in flood-related interruption of emergency services or routes and would improve access throughout the region. In addition, Build Alternatives 1, 2C, and 4 would not increase the risk of flooding. Standard project measures have been incorporated into the project that address slope stability and flood risk hazards. These standard project measures include **PF UT-1** that requires the coordination of utility modifications, including relocations, with providers; **PF GEO-1** through **PF GEO-5** for soil testing and confirmation of excavation and stabilization techniques, and foundation and embankment design, that meet Caltrans and/or County requirements, to avoid risk of post-fire slope failure; **PF HAZ-3** and **PF HAZ-5** for handling and disposal of petroleum, creosote-treated wood, and other flammable waste products; **PF AQ-1** for compliance with vehicle idle regulations and a construction traffic management plan to avoid impeding emergency access; and **NC-3 (NES BIO-3)**, **NC-5 (NES BIO-5)**, **NC-6 (NES BIO-6)**, **NC-10 (NES BIO-10)**, and **NC-13 (NES BIO-9)** for prevention of soil or other disturbance outside the project limits, an erosion control plan, and the return of temporarily disturbed, bare areas to natural contour grades, and hydro-seeded, post-construction. Therefore, with the incorporation of the above standard project measures, the risk of project-related slope or flood-related risks to life or property associated with post-fire conditions would be less than significant. Please refer to Sections 3.5, *Utilities/Emergency Services*; 3.11, *Geology/ Soils/Seismic/Topography*; 3.13, *Hazardous Waste/Materials*; 3.14, *Air Quality*; and 3.17, *Natural Communities*, for the standard project measures and further discussion.

4.3.4 Avoidance, Minimization, and/or Mitigation Measures

Standard project measures and features incorporated into the project, including **PF UT-1**, **PF GEO-1** through **PF GEO-5**, **PF HAZ-3** and **PF HAZ-5**, **PF AQ-1**, and **NC-1 (NES BIO-1)** through **NC-12 (NES BIO-12)**, would reduce impacts to less-than-significant levels. Please refer to Sections 3.5, *Utilities/Emergency Services*; 3.11, *Geology/ Soils/Seismic/Topography*; 3.13, *Hazardous Waste/Materials*; 3.14, *Air Quality*; and 3.17, *Natural Communities*, for the standard project measures and further discussion.

4.4 Climate Change

Climate change refers to long-term changes in temperature, precipitation, wind patterns, and other elements of the earth's climate system. An ever-increasing body of scientific research attributes these climatological changes to greenhouse gas (GHG) emissions, particularly those generated from the production and use of fossil fuels.

While climate change has been a concern for several decades, the establishment of the Intergovernmental Panel on Climate Change (IPCC) by the United Nations and World Meteorological Organization in 1988 led to increased efforts devoted to GHG emissions reduction and climate change research and policy. These efforts are primarily concerned with the emissions of GHGs generated by human activity, including carbon dioxide (CO_2), methane (CH4), nitrous oxide (N_2O), tetrafluoromethane, hexafluoroethane, sulfur hexafluoride (SF6), and various hydrofluorocarbons (HFCs). CO_2 is the most abundant GHG; while it is a naturally occurring component of Earth's atmosphere, fossil-fuel combustion is the main source of additional, human-generated CO_2.

Two terms are typically used when discussing how we address the impacts of climate change: "greenhouse gas mitigation" and "adaptation." Greenhouse gas mitigation covers the activities and policies aimed at reducing GHG emissions to limit or "mitigate" the impacts of climate change. Adaptation, on the other hand, is concerned with planning for and responding to impacts resulting from climate change (such as adjusting transportation design standards to withstand more intense storms and higher sea levels). This analysis will include a discussion of both.

4.4.1 Regulatory Setting

This section outlines federal and state efforts to comprehensively reduce GHG emissions from transportation sources.

4.4.1.1 Federal

To date, no national standards have been established for nationwide mobile-source GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions reduction at the project level.

The National Environmental Policy Act (NEPA) (42 United States Code [USC] Part 4332) requires federal agencies to assess the environmental effects of their proposed actions prior to making a decision on the action or project.

The Federal Highway Administration (FHWA) recognizes the threats that extreme weather, sea-level change, and other changes in environmental conditions pose to valuable transportation infrastructure and those who depend on it. FHWA therefore supports a sustainability approach that assesses vulnerability to climate risks and incorporates resilience into planning, asset management, project development and design, and operations and maintenance practices (FHWA 2019). This approach encourages planning for sustainable highways by addressing climate risks while balancing environmental, economic, and social values—"the triple bottom line of sustainability" (FHWA n.d.). Program and project elements that foster sustainability and resilience also support economic vitality and global efficiency, increase safety and mobility, enhance the environment, promote energy conservation, and improve the quality of life.

Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects. The most important of these was the Energy Policy and Conservation Act of 1975 (42 USC Section 6201) and Corporate Average Fuel Economy (CAFE) Standards. This act establishes fuel economy standards for on-road motor vehicles sold in the United States. Compliance with federal fuel economy standards is determined through the CAFE program based on each manufacturer's average fuel economy for the portion of its vehicles produced for sale in the United States.

Energy Policy Act of 2005, 109th Congress H.R.6 (2005–2006): This act sets forth an energy research and development program covering: (1) energy efficiency; (2) renewable energy; (3) oil and gas; (4) coal; (5) the establishment of the Office of Indian Energy Policy and Programs within the Department of Energy; (6) nuclear matters and security; (7) vehicles and motor fuels, including ethanol; (8) hydrogen; (9) electricity; (10) energy tax incentives; (11) hydropower and geothermal energy; and (12) climate change technology.

The U.S. EPA in conjunction with the National Highway Traffic Safety Administration (NHTSA) is responsible for setting GHG emission standards for new cars and light-duty vehicles to significantly increase the fuel economy of all new passenger cars and light trucks sold in the United States. Fuel efficiency standards directly influence GHG emissions.

4.4.1.2 State

California has been innovative and proactive in addressing GHG emissions and climate change by passing multiple Senate and Assembly bills and executive orders (EOs) including, but not limited to, the following:

EO S-3-05 (June 1, 2005): The goal of this EO is to reduce California's GHG emissions to: (1) year 2000 levels by 2010, (2) year 1990 levels by 2020, and (3) 80 percent below year 1990 levels by 2050. This goal was further reinforced with the passage of Assembly Bill (AB) 32 in 2006 and Senate Bill (SB) 32 in 2016.

Assembly Bill (AB) 32, Chapter 488, 2006, Núñez and Pavley, The Global Warming Solutions Act of 2006: AB 32 codified the 2020 GHG emissions reduction goals outlined in EO S-3-05, while further mandating that the California Air Resources Board (ARB) create a scoping plan and implement rules to achieve "real, quantifiable, cost-effective reductions of greenhouse gases." The Legislature also intended that the statewide GHG emissions limit continue in existence and be used to maintain and continue reductions in emissions of GHGs beyond 2020 (Health and Safety Code [H&SC] Section 38551(b)). The law requires ARB to adopt rules and regulations in an open public process to achieve the maximum technologically feasible and cost-effective GHG reductions.

EO S-01-07 (January 18, 2007): This order sets forth the low carbon fuel standard (LCFS) for California. Under this EO, the carbon intensity of California's transportation fuels is to be reduced by at least 10 percent by the year 2020. ARB re-adopted the LCFS regulation in September 2015, and the changes went into effect on January 1, 2016. The program establishes a strong framework to promote the low-carbon fuel adoption necessary to achieve the Governor's 2030 and 2050 GHG reduction goals.

Senate Bill (SB) 375, Chapter 728, 2008, Sustainable Communities and Climate Protection: This bill requires ARB to set regional emissions reduction targets for passenger vehicles. The

Metropolitan Planning Organization (MPO) for each region must then develop a "Sustainable Communities Strategy" (SCS) that integrates transportation, land-use, and housing policies to plan how it will achieve the emissions target for its region.

SB 391, Chapter 585, 2009, California Transportation Plan: This bill requires the State's long-range transportation plan to identify strategies to address California's climate change goals under AB 32.

EO B-16-12 (March 2012) orders State entities under the direction of the Governor, including ARB, the California Energy Commission, and the Public Utilities Commission, to support the rapid commercialization of zero-emission vehicles. It directs these entities to achieve various benchmarks related to zero-emission vehicles.

EO B-30-15 (April 2015) establishes an interim statewide GHG emission reduction target of 40 percent below 1990 levels by 2030 to ensure California meets its target of reducing GHG emissions to 80 percent below 1990 levels by 2050. It further orders all state agencies with jurisdiction over sources of GHG emissions to implement measures, pursuant to statutory authority, to achieve reductions of GHG emissions to meet the 2030 and 2050 GHG emissions reductions targets. It also directs ARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent ($MMTCO_2e$).[20] Finally, it requires the Natural Resources Agency to update the state's climate adaptation strategy, Safeguarding California, every 3 years, and to ensure that its provisions are fully implemented.

SB 32, Chapter 249, 2016, codifies the GHG reduction targets established in EO B-30-15 to achieve a mid-range goal of 40 percent below 1990 levels by 2030.

SB 1386, Chapter 545, 2016, declared "it to be the policy of the state that the protection and management of natural and working lands … is an important strategy in meeting the state's greenhouse gas reduction goals, and would require all state agencies, departments, boards, and commissions to consider this policy when revising, adopting, or establishing policies, regulations, expenditures, or grant criteria relating to the protection and management of natural and working lands."

AB 134, Chapter 254, 2017, allocates Greenhouse Gas Reduction Funds and other sources to various clean vehicle programs, demonstration/pilot projects, clean vehicle rebates and projects, and other emissions-reduction programs statewide.

SB 743, Chapter 386 (September 2013): This bill changes the metric of consideration for transportation impacts pursuant to CEQA from a focus on automobile delay to alternative methods focused on vehicle miles travelled, to promote the state's goals of reducing greenhouse gas emissions and traffic related air pollution and promoting multimodal transportation while balancing the needs of congestion management and safety.

SB 150, Chapter 150, 2017, Regional Transportation Plans: This bill requires ARB to prepare a report that assesses progress made by each metropolitan planning organization in meeting their established regional greenhouse gas emission reduction targets.

[20] GHGs differ in how much heat each trap in the atmosphere (global warming potential, or GWP). CO_2 is the most important GHG, so amounts of other gases are expressed relative to CO_2, using a metric called "carbon dioxide equivalent" (CO_2e). The global warming potential of CO_2 is assigned a value of 1, and the GWP of other gases is assessed as multiples of CO_2.

EO B-55-18 (September 2018) sets a new statewide goal to achieve and maintain carbon neutrality no later than 2045. This goal is in addition to existing statewide targets of reducing GHG emissions.

EO N-19-19 (September 2019) advances California's climate goals in part by directing the California State Transportation Agency to leverage annual transportation spending to reverse the trend of increased fuel consumption and reduce GHG emissions from the transportation sector. It orders a focus on transportation investments near housing, managing congestion, and encouraging alternatives to driving. This EO also directs ARB to encourage automakers to produce more clean vehicles, formulate ways to help Californians purchase them, and propose strategies to increase demand for zero-emission vehicles.

4.4.2 Environmental Setting

The proposed project is in a rural area of Riverside County with a sparsely developed road and street network. The project vicinity include commercial and residential developments as well as an aggregate operation near I-15. In the central portion of the alignment, vacant, undeveloped land predominates, with an occasional residence or cluster of residences. In the eastern third of the alignment, Cajalco Road is surrounded by low-density residences. The Riverside County Climate Action Plan (CAP), originally adopted in 2015 and revised in November 2019, provides information on Riverside County GHG Inventory reduction goals, thresholds, policies, guidelines, and implementation programs. In particular, the CAP elaborates on the General Plan goals and policies relative to GHG emissions and provides a specific implementation tool to guide future County decisions.

A GHG emissions inventory estimates the amount of GHGs discharged into the atmosphere by specific sources over a period of time, such as a calendar year. Tracking annual GHG emissions allows countries, states, and smaller jurisdictions to understand how emissions are changing and what actions may be needed to attain emission reduction goals. U.S. EPA is responsible for documenting GHG emissions nationwide, and the ARB does so for the state, as required by H&SC Section 39607.4.

4.4.2.1 National GHG Inventory

The U.S. EPA prepares a national GHG inventory every year and submits it to the United Nations in accordance with the Framework Convention on Climate Change. The inventory provides a comprehensive accounting of all human-produced sources of GHGs in the United States, reporting emissions of CO_2, CH_4, N_2O, HFCs, perfluorocarbons, SF6, and nitrogen trifluoride. It also accounts for emissions of CO_2 that are removed from the atmosphere by "sinks" such as forests, vegetation, and soils that uptake and store CO_2 (carbon sequestration). The 1990–2016 inventory found that of 6,511 MMTCO2e GHG emissions in 2016, 81% consist of CO_2, 10% are CH_4, and 6% are N_2O; the balance consists of fluorinated gases (EPA 2018a). In 2016, GHG emissions from the transportation sector accounted for nearly 28.5% of U.S. GHG emissions.

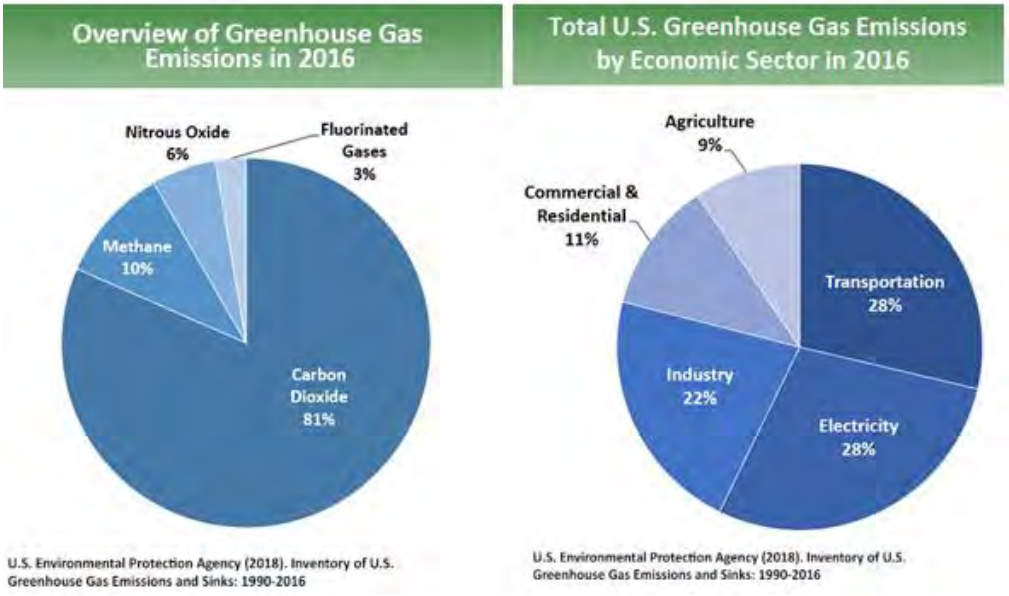

Figure 4.4-1. U.S. 2016 Greenhouse Gas Emissions

4.4.2.2 State GHG Inventory

ARB collects GHG emissions data for transportation, electricity, commercial/residential, industrial, agricultural, and waste management sectors each year. It then summarizes and highlights major annual changes and trends to demonstrate the state's progress in meeting its GHG reduction goals. The 2019 edition of the GHG emissions inventory found total California emissions of 424.1 MMTCO2e for 2017, with the transportation sector responsible for 41% of total GHGs. It also found that overall statewide GHG emissions declined from 2000 to 2017 despite growth in population and state economic output (ARB 2019a).

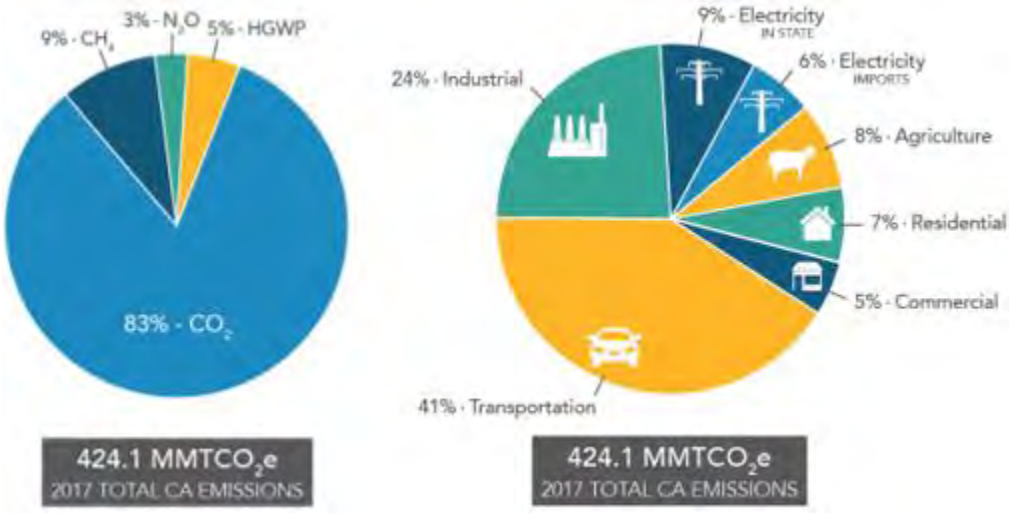

Figure 4.4-2. California 2017 Greenhouse Gas Emissions

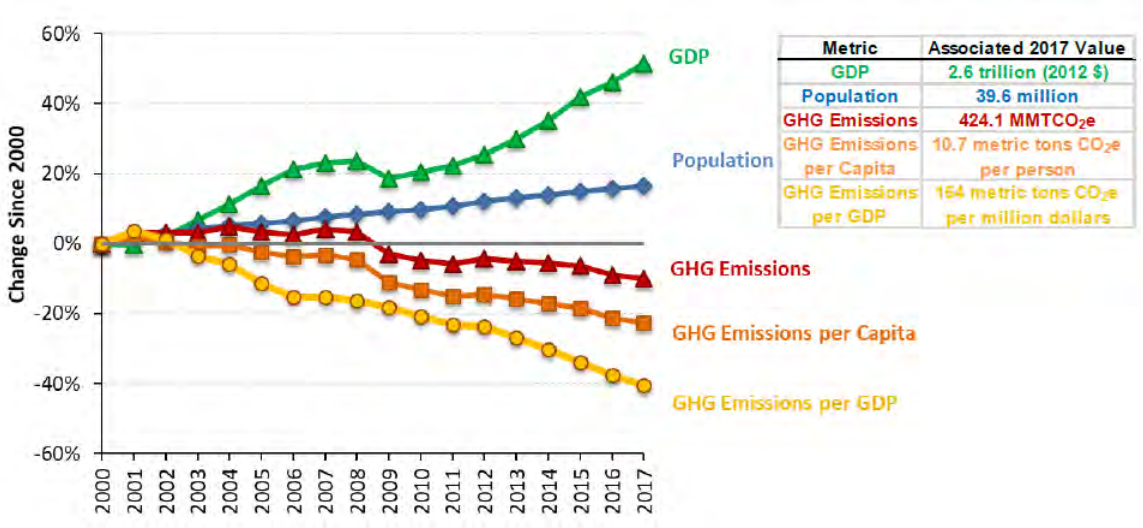

Figure 4.4-3. Change in California GDP, Population, and GHG Emissions since 2000 (*Source*: ARB 2019b)

AB 32 required ARB to develop a Scoping Plan that describes the approach California will take to achieve the goal of reducing GHG emissions to 1990 levels by 2020, and to update it every 5 years. ARB adopted the first scoping plan in 2008. The second updated plan, California's 2017 Climate Change Scoping Plan, adopted on December 14, 2017, reflects the 2030 target established in EO B-30-15 and SB 32. The AB 32 Scoping Plan and the subsequent updates contain the main strategies California will use to reduce GHG emissions.

4.4.2.3 Regional Plans

ARB sets regional targets for California's 18 MPOs to use in their Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) to plan future projects that will cumulatively achieve GHG reduction goals. Targets are set at a percent reduction of passenger vehicle GHG emissions per person from 2005 levels. The proposed project is included within the Southern California Association of Governments (SCAG) MPO. The regional reduction target for the SCAG region is 8 percent and 19 percent for the years 2020 and 2035, respectively (ARB 2019c). Shown below in Table 4.4-1, SCAG and Riverside County policies directed at, or resulting in, the reduction of GHG emissions include the following, among other measures.

Table 4.4-1. Regional and Local Greenhouse Gas Reduction Plans

Title	GHG Reduction Policies or Strategies
Southern California Association of Governments *2016-2040 Regional Transportation Plan/Sustainable Communities Strategy* (adopted April 2016)	• Encourage bicycle and pedestrian improvements and efficient transportation infrastructure. • Invest in adding capacity and improving critical road conditions. • Invest in long-term emission-reduction investments for trucks and rail. • Implement technology and mobility innovations • Expand regional express lanes.

Title	GHG Reduction Policies or Strategies
County of Riverside Climate Action Plan Update (revised November 2019)	• **Reduction measure R2-T1**: Alternative Transportation Options - provide a comprehensive system of facilities for non-motorized transportation. • **Reduction measure R2-W2**: Exceed water efficiency standards – promote use of recycled water or grey water. • **Reduction measure R2-T4**: Electrify the Fleet – promotion of electric vehicle use. • **Reduction measure R2-S1**: Reduce waste to landfills. • **Reduction measure R2-EE10**: Energy Efficiency Enhancement of Existing and New Infrastructure – use high-efficiency light-emitting diodes (LEDs) for new and retrofitted traffic signals. • **Project feature T1.C**: Roadway improvements including signal synchronization and transportation flow management.
County of Riverside General Plan (July 2018)	**Circulation Element** • **Policy C 1.5**: Evaluate the planned circulation system as needed to enhance the arterial highway network to respond to anticipated growth and mobility needs. • **Policy C 3.12**: Improve highways serving as arterials through mountainous and rural areas to adequately meet travel demands and safety requirements while minimizing the need for excessive cut and fill. • **Policy C 3.13**: Design street intersections, where appropriate, to assure the safe, efficient passage of through traffic and the negotiation of turning movements. • **Policy C 5.2:** Encourage the use of drought-tolerant native plants and the use of recycled water for roadway landscaping. • **Policy C 21.5**: Consider roadway expansion at public expense to relieve congestion only after the determination has been made that TSM measures will not be effective. • **Policy C 21.6**: Install special turning lanes whenever necessary to relieve congestion and improve safety. **Air Quality Element** • **Policy AQ 4.1:** Require the use of all feasible building materials/methods which reduce emissions. • **Policy AQ 5.1**: Utilize source reduction, recycling and other appropriate measures to reduce the amount of solid waste disposed of in landfills. • **Policy AQ 12.1**: Manage traffic flow through signal synchronization, while coordinating with and permitting the free flow of mass transit vehicles, when possible. • **Policy AQ 14.3**: Monitor traffic and congestion to determine when and where the County needs new transportation facilities to achieve increased mobility efficiency. • **Policy AQ 14.4**: Preserve transportation corridors with high demand potential or regional significance for future expansion to meet project demand. • **Policy AQ 17.6**: Reduce emissions from building materials and methods that generate excessive pollutants, through incentives and/or regulations. • **Policy AQ 20.14:** Reduce the amount of water used for landscaping irrigation through implementation of County Ordinance 859 and increase use of non-potable water. • **Policy AQ 20.20:** Reduce the amount of solid waste generation by increasing solid waste recycle, maximizing waste diversion, and composting for residential and commercial generators. Reduction in decomposable organic solid waste will reduce the methane emissions at County landfills.

4.4.3 Project Analysis

Because the County is the CEQA lead agency, this evaluation is based on the County's significance thresholds and reflects the County determinations. Caltrans' methods have been applied to this evaluation due to its statewide role in funding and delivering transportation projects, but the County is responsible for CEQA determinations herein.

GHG emissions from transportation projects can be divided into those produced during operation of the SHS and those produced during construction. The primary GHGs produced by the transportation sector are CO_2, CH_4, N_2O, and HFCs. CO_2 emissions are a product of the combustion of petroleum-based products, like gasoline, in internal combustion engines. Relatively small amounts of CH_4 and N_2O are emitted during fuel combustion. In addition, a small amount of HFC emissions are included in the transportation sector.

The CEQA Guidelines generally address greenhouse gas emissions as a cumulative impact due to the global nature of climate change (Pub. Resources Code, § 21083(b)(2)). As the California Supreme Court explained, "because of the global scale of climate change, any one project's contribution is unlikely to be significant by itself." (Cleveland National Forest Foundation v. San Diego Assn. of Governments (2017) 3 Cal.5th 497, 512.) In assessing cumulative impacts, it must be determined if a project's incremental effect is "cumulatively considerable" (CEQA Guidelines Sections 15064(h)(1) and 15130).

To make this determination, the incremental impacts of the project must be compared with the effects of past, current, and probable future projects. Although climate change is ultimately a cumulative impact, not every individual project that emits greenhouse gases must necessarily be found to contribute to a significant cumulative impact on the environment.

4.4.3.1 Operational Emissions

CO_2 accounts for 95 percent of transportation GHG emissions in the U.S. The largest sources of transportation-related GHG emissions are passenger cars and light-duty trucks, including sport utility vehicles, pickup trucks, and minivans. These sources account for over half of the emissions from the sector. The remainder of GHG emissions comes from other modes of transportation, including freight trucks, commercial aircraft, ships, boats, and trains, as well as pipelines and lubricants. Because CO_2 emissions represent the greatest percentage of GHG emissions it has been selected as a proxy within the following analysis for potential climate change impacts generally expected to occur.

The highest levels of CO_2 from mobile sources such as automobiles occur at stop-and-go speeds (0–25 miles per hour) and speeds over 55 miles per hour; the most severe emissions occur from 0–25 miles per hour (see Figure 4.4-4). To the extent that a project relieves congestion by enhancing operations and improving travel times in high-congestion travel corridors, GHG emissions, particularly CO_2, may be reduced.

Four primary strategies can reduce GHG emissions from transportation sources: (1) improving the transportation system and operational efficiencies, (2) reducing travel activity, (3) transitioning to lower GHG-emitting fuels, and (4) improving vehicle technologies/efficiency. To be most effective, all four strategies should be pursued concurrently.

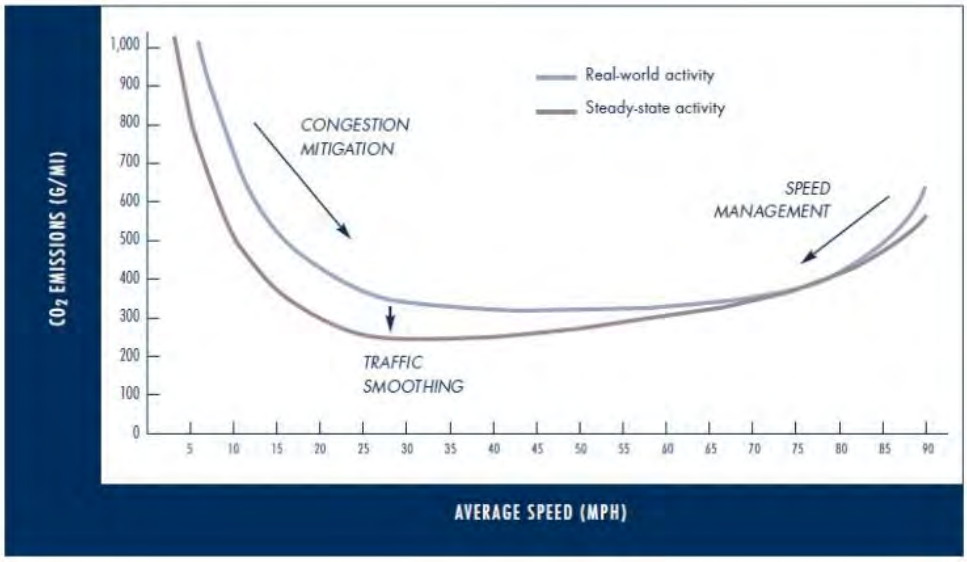

Figure 4.4-4. Possible Use of Traffic Operation Strategies in Reducing On-road CO_2 Emissions (*Source:* Barth and Boriboonsomsin 2010)

The project purpose is to (1) improve the transportation facility to address anticipated growth and mobility needs, (2) improve interregional travel by improving east-west mobility in Riverside County, and (3) improve roadway alignment and intersection design to enhance safety. These capacity enhancements would have some effect on project vicinity VMT, and related GHG emissions, due to trip redistributions. Project vicinity congestion or travel delay would also be affected. The project is identified in the SCAG 2016–2040 and more recent 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and, as such, would assist in meeting the region's SB 375 goals to reduce mobile-source GHG emissions.

4.4.3.2 Quantitative Analysis

The proposed build alternatives would improve traffic conditions during peak travel periods and increase capacity within the project limits. The VMT data shown in Table 4.4-2, along with EMFAC2014 emission rates (within the CT EMFAC model), were used to calculate the CO_2 equivalent (CO_2e)[21] emissions under the Baseline/Existing Year 2014, Opening Year 2024, and Horizon Year 2044 conditions. For purposes of this analysis, CO_2e comprises CO_2 and CH_4.

[21] Carbon dioxide equivalent is a measure used to compare the emissions from various greenhouse gases based upon their global warming potential. For example, the global warming potential for methane over 100 years is 28.

Table 4.4-2. Modeled Annual CO_2 Emissions and Vehicle Miles Traveled – Alternatives 1, 2C, and 4

Year / Alternative	CO_2 Emissions (Metric Tons/Year)	Annual Vehicle Miles Traveled[1]
Existing/Baseline 2014	1,364,951	2,979,123,737
Open to Traffic 2024		
No Build	1,285,751	3,699,198,298
Build Alternative 1	1,294,347	3,751,722,597
Build Alternative 2C	1,301,794	3,771,736,039
Build Alternative 4	1,299,554	3,768,515,922
20-Year Horizon/Design-Year 2044		
No Build	1,365,350	5,086,991,199
Build Alternative 1	1,377,419	5,128,627,382
Build Alternative 2C	1,370,635	5,108,239,744
Build Alternative 4	1,378,941	5,139,521,794
Future Six-Lane Facility (Build Alternative 1/2C)	1,385,029	5,150,625,375
Future Six-Lane Facility (Build Alternative 4)	1,388,430	5,168,198,490

CO_2 = carbon dioxide
Source: EMFAC 2014
[1] Annual vehicle miles traveled (VMT) values derived from Daily VMT values multiplied by 347, per ARB methodology (ARB 2008).

As shown in Table 4.4-2, the modeled CO_2e emissions in the project area under 2014 Existing/Baseline conditions would be approximately 1.36 million metric tons CO_2e per year. In Opening Year 2024, annual emissions from mobile sources operating in the project area[22] would be 1.29 million metric tons CO_2e under the No-Build Alternative, 1.29 million metric tons CO_2e under Build Alternative 1, 1.30 million metric tons CO_2e under Build Alternative 2C, and 1.30 million metric tons CO_2e under Build Alternative 4.

Table 4.4-2 also shows emissions at the 2044 Horizon Year, which are estimated to be 1.37 million metric tons CO2e under the No-Build Alternative, 1.38 million metric tons CO2e under Build Alternative 1, 1.37 million metric tons CO2e under Build Alternative 2C, and 1.38 million metric tons CO2e under Build Alternative 4. When compared to the 2014 Existing/Baseline, GHG emissions at the Horizon Year 2044 would be 0.03 percent higher under the No-Build Alternative, 0.91 percent higher under the Build Alternative 1, 0.42 percent high under Build Alternative 2C, and 1.02 percent higher under Build Alternative 4. Although there would be increases in emissions, the increases would be minimal relative to the greater than 70 percent increases in VMT. The relatively small increases in CO2e over time compared to the percentage increase in VMT is attributable to the projected improvements in vehicle fuel efficiency.

At the 2044 Horizon Year, emissions would increase under the build alternatives when compared with the No-Build Alternative, with annual GHG emissions estimated to increase 0.88 percent under Build Alternative 1, 0.38 percent under Build Alternative 2C, and 0.99 percent under Alternative 4. Such increases are attributable to the greater VMT and changes in the speed profile projected in the project area under each of the build alternatives.

[22] For the purposes of this GHG analysis, the project area is defined as the study region defined in the Traffic Operations Analysis Report, which includes roadway segments generally bounded by I-15 on the west, SR-91 to the north, I-215 to the north and west, and the area immediately south of Cajalco Road on the south.

While CT-EMFAC has a rigorous scientific foundation and has been vetted through multiple stakeholder reviews, its GHG emission rates are based on tailpipe emission test data.[23] Moreover, the model does not account for factors such as the rate of acceleration and vehicle aerodynamics, which influence the amount of emissions generated by a vehicle. GHG emissions quantified using CT-EMFAC are therefore estimates and may not reflect actual physical emissions. Though CT-EMFAC is currently the best available tool for calculating GHG emissions from mobile sources, it is important to note that the GHG results are only useful for a comparison among alternatives.

The County adopted a Climate Action Plan Update in November 2019, which set the goal for Riverside County to reduce GHG emissions to 15 percent below 2008 levels by the year 2020, 49 percent below 2008 levels by 2030, and 83 percent below 2008 levels by 2050. This goal is consistent with the statewide goal identified in AB 32, SB 32, and EO S-3-05. A number of the transportation-related policies are applicable to the proposed project. Many of the policies are statewide policies that would result in GHG reductions in Riverside County, such as the Pavley standards for passenger and light-duty vehicles, the low carbon fuel standard, and electrification of the vehicle fleet. Among the local policies that will be implemented in the study area that would coincide with project implementation are the use of LED bulbs in traffic signals identified in Measure R2-EE10, reduction of waste diverted to landfills identified in Measure R2-S1, reduction of water use identified in Measure R2-W2, and signal synchronization and transportation flow management identified as Reduction Measure T1.C (County 2019g). In addition, the project would be consistent with many of the policies identified in the Riverside County General Plan that have a GHG reduction co-benefit, including those related to improving circulation and relieving congestion, those related to the use of building materials/methods and waste reduction, and those related to reduced water use (County 2018a).

4.4.3.3 Construction Emissions

Construction GHG emissions would result from material processing, on-site construction equipment, and traffic delays due to construction. These emissions will be produced at different levels throughout the construction phase; their frequency and occurrence can be reduced through innovations in plans and specifications and by implementing better traffic management during construction phases. In addition, with innovations such as longer pavement lives, improved traffic management plans, and changes in materials, the GHG emissions produced during construction can be offset to some degree by longer intervals between maintenance and rehabilitation activities.

All construction contracts to be issued by the County will include Caltrans Standard Specifications Section 7-1.02A and 7 1.02C, Emissions Reduction, which require contractors to

[23] This analysis does not currently account for the effects of the US National Highway Traffic Safety Administration and Environmental Protection Agency SAFE (Safer Affordable Fuel-Efficient) Vehicles Rule. Part One revoking California's authority to set its own greenhouse gas emissions standards was published on September 27, 2019 and effective November 26, 2019. The SAFE Vehicles Rule Part 2 would amend existing Corporate Average Fuel Economy (CAFE) and tailpipe carbon dioxide emissions standards for passenger cars and light trucks and establish new standards covering model years 2021 through 2026. The proposal would retain the model year 2020 standards for both programs through model year 2026. Although CARB has not yet provided adjustment factors for greenhouse gas emissions to be utilized in light of the SAFE Rule, modeling these estimates with EMFAC2017 or CT-EMFAC2017 remains the most precise means of estimating future greenhouse gas emissions.

comply with all laws applicable to the project and to certify they are aware of and will comply with all ARB emission reduction regulations; and Section 14-9.02, Air Pollution Control, which requires contractors to comply with all air pollution control rules, regulations, ordinances, and statutes. Certain common regulations, such as equipment idling restrictions, that reduce construction vehicle emissions also help reduce GHG emissions.

4.4.4 CEQA Conclusion

4.4.4.1 Would the Project: Generate Greenhouse Gas Emissions, Either Directly or Indirectly, That May Have a Significant Impact on the Environment?

Build Alternative 1

Shown above in Table 4.4-2, Build Alternative 1 emissions would not exceed Baseline emissions at Opening Year 2024, but they would exceed Baseline emissions during the Horizon Year 2044. As such, project GHG emissions under Build Alternative 1 would be significant.

Build Alternative 2C

Shown above in Table 4.4-2, Build Alternative 2C emissions would not exceed Baseline emissions at Opening Year 2024, but they would exceed Baseline emissions during the Horizon Year 2044. As such, project GHG emissions under Build Alternative 2C would be significant.

Build Alternative 4

Shown above in Table 4.4-2, Build Alternative 4 emissions would not exceed Baseline emissions at Opening Year 2024, but they would exceed Baseline emissions during the Horizon Year 2044. As such, project GHG emissions under Build Alternative 4 would be significant.

Future Six-Lane Facility (Build Alternative 1/2C)

Shown above in Table 4.4-2, Future Six-lane Facility Build Alternative 1/2C emissions would exceed Baseline emissions during the Horizon Year 2044. As such, project GHG emissions under Future Six-lane Facility Build Alternative 1/2C would be significant.

Future Six-Lane Facility (Build Alternative 4)

Shown above in Table 4.4-2, Future Six-lane Facility Build Alternative 4 emissions would exceed Baseline emissions during the Horizon Year 2044. As such, project GHG emissions under Future Six-lane Facility Build Alternative 4 would be significant.

4.4.4.2 Would the Project Conflict with an Applicable Plan, Policy, or Regulation Adopted for the Purpose of Reducing the Emissions of Greenhouse Gas?

Build Alternatives 1, 2C, and 4

Following California's adopted AB 32 GHG reduction target, Riverside County has set a goal to reduce emissions back to 1990 levels by the year 2020. This target was calculated as a

15-percent decrease from 2008 levels, as recommended in the AB 32 Scoping Plan. The estimated community-wide emissions for the year 2020, based on population and housing growth projections associated with the assumptions used in the proposed General Plan Update, are 12,129,497 metric tons of CO_2e. In order to reach the reduction target, Riverside County must offset this growth in emissions and reduce community-wide emissions to 5,960,998 metric tons of CO_2e by the year 2020 (County 2018a).

The onsite construction equipment for the proposed project is anticipated to emit a total of 3,570 metric tons of GHGs during construction. With innovations such as longer pavement lives, improved TMPs, and changes in materials, the GHG emissions produced during construction can be mitigated to some degree by longer intervals between maintenance and rehabilitation events. Compliance with Caltrans Standard Specifications, the SCAQMD Rules and Regulations, and Standard Project Measures **PF LU-1**, **PF VIS-4**, and **PF AQ-1** during construction will minimize construction-related GHG impacts. Please refer to Section 3.1, *Land Use*, for **PF LU-1**; Section 3.7, *Visual/Aesthetics*, for **PF VIS-4**; and Section 3.14, *Air Quality*, for **PF AQ-1**.

The proposed project would address growth and mobility needs as identified in the Riverside County General Plan Circulation Element, Policy C 1.5. The proposed project would not generate new vehicular traffic trips because new homes or businesses will not be constructed as part of the project, and the proposed project is not considered a traffic generator.

The proposed project would result in a slight increase in GHG emissions during construction; however, these emissions are at levels not considered significant for an individual project. In addition, because the proposed project would not generate new traffic, it is anticipated that the proposed project would not result in any increase in operational GHG emissions that would have a significant impact on the environment.

In addition to the application of Standard Project Measures **PF LU-1**, **PF VIS-4**, and **PF AQ-1** during construction, the proposed project would also include Standard Project Measures **PF VIS-1**, **NC-13 (NES BIO-9),** and **PF SW-1**, which would minimize GHG emissions consistent with the measures and goals identified in the Riverside County Climate Action Plan Update, and would therefore be consistent with the plan. As described Section 4.2.3, *Air Quality*, the project is also consistent with the SCAG RTP/SCS. Therefore, the proposed project would not conflict with the applicable plan adopted for the purpose of reducing GHG emissions. Please refer to Section 3.7, *Visual/Aesthetics*, for **PF VIS-1** and **PF VIS-4**; Section 3.14, *Air Quality*, for **PF AQ-1**; Section 3.17, *Natural Communities*, for **NC-13 (NES BIO-9)**; and Section 4.2.8, *Greenhouse Gas Emissions*, for **PF SW-1**.

The proposed project is consistent with, and does not conflict with, any applicable plans, policies, or regulations adopted for the purposes of reducing the emissions of GHGs. No impacts would result.

4.4.5 Greenhouse Gas Reduction Strategies

4.4.5.1 Statewide Efforts

Major sectors of the California economy, including transportation, will need to reduce emissions to meet the 2030 and 2050 GHG emissions targets. Former Governor Edmund G. Brown

promoted GHG reduction goals that involved (1) reducing today's petroleum use in cars and trucks by up to 50 percent; (2) increasing from one-third to 50 percent our electricity derived from renewable sources; (3) doubling the energy efficiency savings achieved at existing buildings and making heating fuels cleaner; (4) reducing the release of methane, black carbon, and other short-lived climate pollutants; (5) managing farms and rangelands, forests, and wetlands so they can store carbon; and (6) periodically updating the state's climate adaptation strategy, Safeguarding California.

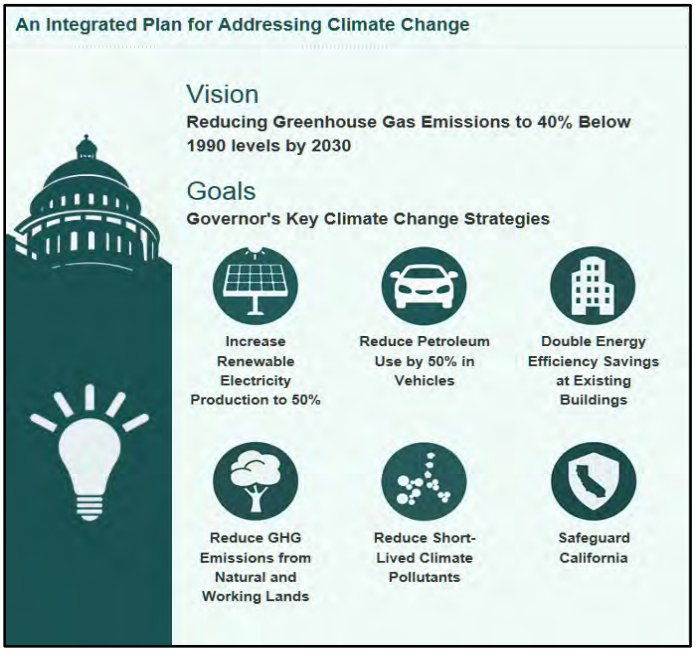

Figure 4.4-5. California Climate Strategy

The transportation sector is integral to the people and economy of California. To achieve GHG emission reduction goals, it is vital that the state build on past successes in reducing criteria and toxic air pollutants from transportation and goods movement. GHG emission reductions will come from cleaner vehicle technologies, lower-carbon fuels, and reduction of vehicle miles traveled (VMT). A key state goal for reducing greenhouse gas emissions is to reduce today's petroleum use in cars and trucks by up to 50 percent by 2030 (State of California 2019).

In addition, SB 1386 (Wolk 2016) established as state policy the protection and management of natural and working lands and requires state agencies to consider that policy in their own decision making. Trees and vegetation on forests, rangelands, farms, and wetlands remove carbon dioxide from the atmosphere through biological processes and sequester the carbon in above- and below-ground matter.

4.4.5.2 Project-Level GHG Reduction Strategies

Given that the finished project is a roadway improvement project, there is a lack of available avenues to fully offset project GHG emission increases. Standard project measures incorporated into the proposed project, such as the use of LED bulbs in place of incandescent bulbs, would consume 10 percent of the electricity of traditional lights, which will also help reduce CO_2 emissions and, subsequently, GHG emissions. Furthermore, the use and maintenance of

construction equipment in accordance with Caltrans' Standard Specifications, Section 14-9.02, ARB commercial vehicle idle regulations, and manufacturers' specifications would reduce GHG emissions from diesel-powered construction vehicles. These standard project measures, as well as Mitigation Measures **GHG-1**, **VIS-2**, and **VIS-8**, align with the measures and strategies outlined in the County of Riverside Climate Action Plan Update (County 2019g) and the SCAG 2016–2040 Programmatic EIR, and they would reduce GHG emissions associated with the proposed project.

The following standard project measures have been incorporated into the project and would reduce GHG emissions and potential climate change impacts from the project. The measures below include measures that meet or exceed measures recommended in the SCAG 2016–2040 Programmatic EIR that incorporate Best Available Control Technology to be employed during project design, construction, and operation as avoidance and minimization measures to minimize GHG emissions, and measures recommended in the SCAG 2016–2040 Programmatic EIR similarly identified to avoid or reduce GHG emissions. These measures include Standard Project Measures **PF LU-1** in Section 3.1, *Land Use*; **PF VIS-1** and **PF VIS-4** in Section 3.7, *Visual/Aesthetics*; **PF AQ-1** in Section 3.14, *Air Quality*; and **NC-13 (NES BIO-9)** in Section 3.17, *Natural Communities*:

- **PF LU-1: Traffic Management Plan,** involves the development of a Traffic Management Plan that will include the following elements: construction staging plans, public awareness campaign, analysis of impacts on traffic, options for lane closures, and alternate route strategies. By reducing delays to motorists in the project vicinity during the construction period, this measure would reduce emissions associated with vehicle idling and congestion.
- **PF VIS-1: Contouring and Replanting Disturbed Areas,** states that, post-construction, any disturbed areas remaining as bare ground will be returned to natural contour grades and hydro-seeded with a County of Riverside–approved native plant seed mix. This seed mix shall not contain any species listed on the California Integrated Pest Council Inventory. Planting will reduce GHG emissions by absorbing greenhouse gases.
- **PF VIS-4: Apply Minimum Lighting Standards,** identifies guidelines for project lighting, including the wattage, amount of lights, and energy efficiency, which would reduce energy use and thereby reduce GHG emissions during long-term operations.
- **PF AQ-1:** The construction contract issued by the County will include California Department of Transportation (Caltrans) construction requirements, as specified in the Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control). The contractor will comply with all air pollution control ordinances and statutes which apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code. Exhaust emissions control measures may include, but are not limited to, the following:

    1. General contractors shall maintain and operate construction equipment so as to minimize exhaust emissions. During construction, trucks and vehicles in loading and unloading queues would have their engines turned off when not in use to reduce vehicle emissions. Construction emissions should be phased and scheduled to avoid emissions peaks and discontinued during second-stage smog alerts.

2. All equipment shall be properly tuned and maintained in accordance with manufacturer's specifications. The equipment must be checked by an Automotive Service Excellence–certified mechanic and determined to be running in proper condition before it is operated.
3. All on-road and off-road equipment shall comply with California Air Resources Board (ARB) commercial vehicle idle regulations. California Code of Regulations Title 13, Section 2449(d)(3), which was adopted by ARB on June 15, 2008, restricts idling of construction vehicles to no longer than 5 consecutive minutes.
4. Use electricity from power poles, rather than temporary diesel- or gasoline-powered generators, if or where feasible.
5. Use onsite mobile equipment powered by alternative fuel sources (i.e., methanol, natural gas, propane, or butane) as feasible.
6. Use solar-powered signal boards.
7. Develop a construction traffic management plan that includes, but is not limited to: (1) consolidating truck deliveries; (2) providing a rideshare or shuttle service for construction workers; and (3) providing dedicated turn lanes for movement of construction trucks and equipment on and off site.

- **NC-13 (NES BIO-9):** specifies that native plant seed mix will be used following construction, which reduces the water requirements of vegetation. As such, GHG emissions associated with energy needed to transport water would not be required.
- **PF SW-1:** Consistent with Caltrans Standard Specification 14-10, non-hazardous construction-period waste shall be recycled.

In addition to the standard project measures above, Mitigation Measures **GHG-1, VIS-2**, **VIS-8**, **NC-15 (NES BIO-14)** and **WET-1 (NES BIO-14)**, described below, would also be implemented:

- **GHG-1:** The project will incorporate the use of energy efficient lighting, such as light-emitting diode (LED) traffic signals. LED bulbs—or balls, in the stoplight vernacular—consume less electricity than traditional lights, which will also help reduce the project's carbon dioxide emissions.
- **VIS-2: Replace or Relocate Site Features and Landscaping Affected by the Project,** provides that, where appropriate and to the degree possible, landscaping and related appurtenances, such as fencing, privacy walls, and other similar features, removed from private properties as a result of construction will be relocated, replaced, or restored in place and in kind to address visual impacts. Replacement landscaping will provide plants which absorb greenhouse gases.
- **VIS-8: Replace Disturbed Vegetation along Landscaped Freeways**, provides roadside planting, which would reduce GHG by absorbing emissions.
- **NC-15 (NES BIO-14):** Compensation for permanent impacts on riparian-riverine resources will occur as a combination of enhancement, restoration, and/or creation, as long as there is

no net loss of riparian-riverine resources, which will help preserve floral life to help reduce the project's greenhouse gas emissions.

- **WET-1 (NES BIO-14):** Compensation for direct permanent impacts on U.S. Army Corps of Engineers (USACE) wetland and non-wetland waters of the U.S. (WoUS) and California Department of Fish and Wildlife (CDFW) streambed and associated riparian habitat will occur as a combination of enhancement, restoration, and/or creation, at a ratio that achieves no net loss of wetland WoUS, which will help preserve floral life to help reduce the project's greenhouse gas emissions.

4.4.5.3 Adaptation

Reducing GHG emissions is only one part of an approach to address climate change. Caltrans must plan for the effects of climate change on the state's transportation infrastructure and strengthen or protect the facilities from damage. Climate change is expected to produce increased variability in precipitation, rising temperatures, rising sea levels, variability in storm surges and their intensity, and the frequency and intensity of wildfires. Flooding and erosion can damage or wash out roads; longer periods of intense heat can buckle pavement and railroad tracks; storm surges combined with a rising sea level can inundate highways. Wildfire can directly burn facilities and indirectly cause damage when rain falls on denuded slopes that landslide after a fire. Effects will vary by location and may, in the most extreme cases, require that a facility be relocated or redesigned. Accordingly, Caltrans must consider these types of climate stressors in how highways are planned, designed, built, operated, and maintained.

Federal Efforts

Under NEPA assignment, Caltrans is obligated to comply with all applicable federal environmental laws and FHWA NEPA regulations, policies, and guidance.

The U.S. Global Change Research Program (USGCRP) delivers a report to Congress and the president every 4 years, in accordance with the Global Change Research Act of 1990 (15 U.S.C. ch. 56A § 2921 et seq). The Fourth National Climate Assessment, published in 2018, presents the foundational science and the "human welfare, societal, and environmental elements of climate change and variability for 10 regions and 18 national topics, with particular attention paid to observed and projected risks, impacts, consideration of risk reduction, and implications under different mitigation pathways." Chapter 12, "Transportation," presents a key discussion of vulnerability assessments. It notes that "asset owners and operators have increasingly conducted more focused studies of particular assets that consider multiple climate hazards and scenarios in the context of asset-specific information, such as design lifetime" (USGCRP 2018).

The U.S. DOT Policy Statement on Climate Adaptation in June 2011 committed the federal Department of Transportation to "integrate consideration of climate change impacts and adaptation into the planning, operations, policies, and programs of DOT in order to ensure that taxpayer resources are invested wisely, and that transportation infrastructure, services and operations remain effective in current and future climate conditions" (U.S. DOT 2011).

FHWA order 5520 (Transportation System Preparedness and Resilience to Climate Change and Extreme Weather Events, December 15, 2014) established FHWA policy to strive to identify the risks of climate change and extreme weather events to current and planned transportation

systems. FHWA has developed guidance and tools for transportation planning that foster resilience to climate effects and sustainability at the federal, state, and local levels (FHWA 2019).

State Efforts

Climate change adaptation for transportation infrastructure involves long-term planning and risk management to address vulnerabilities in the transportation system. California's Fourth Climate Change Assessment (2018) is the state's effort to "translate the state of climate science into useful information for action" in a variety of sectors at both statewide and local scales. It adopts the following key terms used widely in climate change analysis and policy documents:

- *Adaptation* to climate change refers to adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities.
- *Adaptive capacity* is the "combination of the strengths, attributes, and resources available to an individual, community, society, or organization that can be used to prepare for and undertake actions to reduce adverse impacts, moderate harm, or exploit beneficial opportunities."
- *Exposure* is the presence of people, infrastructure, natural systems, and economic, cultural, and social resources in areas that are subject to harm.
- *Resilience* is the "capacity of any entity – an individual, a community, an organization, or a natural system – to prepare for disruptions, to recover from shocks and stresses, and to adapt and grow from a disruptive experience." Adaptation actions contribute to increasing resilience, which is a desired outcome or state of being.
- *Sensitivity* is the level to which a species, natural system, or community, government, etc., would be affected by changing climate conditions.
- *Vulnerability* is the "susceptibility to harm from exposure to stresses associated with environmental and social change and from the absence of capacity to adapt." Vulnerability can increase because of physical (built and environmental), social, political, and/or economic factor(s). These factors include, but are not limited to: ethnicity, class, sexual orientation and identification, national origin, and income inequality. Vulnerability is often defined as the combination of sensitivity and adaptive capacity as affected by the level of exposure to changing climate.

Several key state policies have guided climate change adaptation efforts to date. Recent state publications produced in response to these policies draw on these definitions.

EO S-13-08, issued by then-governor Arnold Schwarzenegger in November 2008, focused on sea-level rise and resulted in the *California Climate Adaptation Strategy* (2009), updated in 2014 as *Safeguarding California: Reducing Climate Risk* (Safeguarding California Plan). The Safeguarding California Plan offers policy principles and recommendations and continues to be revised and augmented with sector-specific adaptation strategies, ongoing actions, and next steps for agencies.

EO S-13-08 also led to the publication of a series of sea-level rise assessment reports and associated guidance and policies. These reports formed the foundation of an interim *State of California Sea-Level Rise Interim Guidance Document* (SLR Guidance) in 2010, with instructions for how state agencies could incorporate "sea-level rise (SLR) projections into planning and decision making for projects in California" in a consistent way across agencies. The guidance was revised and augmented in 2013. *Rising Seas in California – An Update on Sea-Level Rise Science* was published in 2017 and its updated projections of sea-level rise and new understanding of processes and potential impacts in California were incorporated into the *State of California Sea-Level Rise Guidance Update* in 2018.

EO B-30-15, signed in April 2015, requires state agencies to factor climate change into all planning and investment decisions. This EO recognizes that effects of climate change other than sea-level rise also threaten California's infrastructure. At the direction of EO B-30-15, the Office of Planning and Research published *Planning and Investing for a Resilient California: A Guidebook for State Agencies* in 2017, to encourage a uniform and systematic approach. Representatives of Caltrans participated in the multi-agency, multidisciplinary technical advisory group that developed this guidance on how to integrate climate change into planning and investment.

AB 2800 (Quirk 2016) created the multidisciplinary Climate-Safe Infrastructure Working Group, which in 2018 released its report, *Paying it Forward: The Path Toward Climate-Safe Infrastructure in California*. The report provides guidance to agencies on how to address the challenges of assessing risk in the face of inherent uncertainties still posed by the best available science on climate change. It also examines how state agencies can use infrastructure planning, design, and implementation processes to address the observed and anticipated climate change impacts.

County of Riverside Adaptation Efforts

County Vulnerability Assessments and Resiliency Strategies

Regional transportation planning agencies, such as the Western Riverside Council of Governments (WRCOG), are developing guidance and tools to support regional efforts to prepare for and mitigate risks associated with climate adaptation and transportation infrastructure. Efforts include conducting vulnerability assessments through collaboration with stakeholders and governmental agencies at the state, regional, and local levels. The guidance and analyses are intended to provide local and regional jurisdictions with tools, methods, and resources to incorporate asset risk into planning processes for sound transportation project prioritization and investment. Provided in the below table is a summary of key guidance documents pertinent to the proposed project in the context of adaptation and resiliency.

Table 4.4-3. Summary of County Adaptation Efforts and Guidance Documents

Guidance Document / Initiative	Summary of Adaptation Approach
Regional Climate Adaptation Toolkit for Transportation Infrastructure ("Resilient IE") https://ca-wrcog.civicplus.com/285/Resilient-IE	Developed collaboratively between WRCOG and the San Bernardino County Transportation Authority (SBCTA) with funding from Caltrans, Resilient IE works to support regional and local efforts to prepare for and mitigate risks associated with climate adaptation on the region's transportation infrastructure, with five primary project components:

Guidance Document / Initiative	Summary of Adaptation Approach
	1. A newly established regional climate collaborative, the Inland Southern California Climate Collaborative (ISC3); 2. Subregional vulnerability assessments and adaptation strategies; 3. City-level, climate-related transportation hazards and evacuation maps; 4. A regionally tailored climate resilient transportation infrastructure guidebook; and 5. A template regional climate adaptation and resiliency element.
Western Riverside Adaptation and Resiliency Strategy https://wrcog.us/DocumentCenter/View/7478/Western-Riverside-Adaptation-and-Resiliency-Strategy_Vulnerability-Assessment	WRCOG's Adaptation and Resiliency Strategy provides a brief overview of expected climate change effects, assets in the subregion that are vulnerable to climate change effects, and adaptation strategies intended to reduce vulnerability and increase resilience. WRCOG identified the following nine priority issues through the vulnerability assessment process: 1. Planning and Emergency Response Frameworks 2. Disadvantaged Communities 3. Public Health 4. Transportation Infrastructure and Operations 5. Resilient Development 6. Water and Energy Resources and Reliability 7. Agriculture 8. Biological Resources 9. Plan Maintenance Key strategies pertinent to the proposed project include the following: • Strategy 4.1: Use the Climate Resilient Transportation Infrastructure Guidebook strategies and design features in transportation infrastructure to improve resiliency to extreme events; • Strategy 4.2: Facilitate coordination of traffic signal systems between adjacent communities; • Strategy 4.6: Ensure redundancy of critical transportation routes to allow for continued access and movement in the event of an emergency; and • Strategy 5.4: Restore riparian corridors, soft-bottomed streambeds, and seasonal flood basins that reduce flood hazards.
Climate Resilient Transportation Infrastructure Guidebook https://wrcog.us/DocumentCenter/View/7230/Climate-Resilient-Transportation-Infrastructure-Guidebook	This guidebook, developed collaboratively between WRCOG and SBCTA as part of the larger Resilient IE effort, provides insights on current policy, procedures, local and regional challenges and solutions, and resilient infrastructure strategies. The guidebook also includes case studies, design examples, and implementation guidance.

Sea Level Rise

The proposed project is outside the coastal zone and not in an area subject to sea-level rise. Accordingly, direct impacts on transportation facilities from projected sea-level rise are not expected.

Floodplains

As further detailed in Section 3.9, *Hydrology and Floodplain*, the proposed project would encroach upon FEMA-designated floodplains. Through the use of project design features such as roadside ditches, detention basins, and culverts, 100-year storm flows would be conveyed, and would not result in flooding. In addition, the Caltrans District 8 *Climate Change Vulnerability Assessment* Technical Report (Caltrans 2019c) indicated that the project study area is projected

to have a minor (0–5 percent) change in precipitation. Therefore, and with incorporation of pertinent project measures (e.g., Mitigation Measure **HYD-1**), the proposed project would not exacerbate or contribute to increased flood magnitude or frequency in combination with climate change.

Wildfire

As further detailed in Section 4.3, *Wildfire*, the proposed project would include infrastructure improvements to existing transportation facilities located within mapped fire hazard severity zone areas. Improvements include widened roadway and roadway shoulders, additional travel lanes, center medians, turn lanes, curbs and gutters, and sidewalks, which would increase paved surfaces as well as the capacity of improved roadways. The proposed project also would increase the capacity of improved roadways and improve connections with intersecting roadways throughout the project limits, thereby improving local access emergency response and fire protection. Furthermore, the widened roadway areas would include wider shoulders and median areas, reducing roadside vegetation, serve as a firebreak, and provide additional areas for emergency response vehicle staging. Finally, incorporation of Standard Project Measure **NC-3 (NES BIO-3)** would help minimize the risk of human-caused wildfires. Therefore, for the reasons stated above, the proposed project would not exacerbate wildfire risk in conjunction with climate change.

4.5 Energy Conservation

The CEQA Guidelines, Appendix F, Energy Conservation, state that EIRs are required to include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy.

The following items required for an energy analysis per the CEQA Guidelines are summarized below, with references to where information may be found in this EIR/EIS:

a) Project Description: Chapter 2, *Project Alternatives*, provides a detailed description of the proposed project and project alternatives. The energy analysis in Sections 3.16 and 4.2.6, *Energy*, includes an analysis of the energy consumed by each build alternative and a discussion of temporary energy needs for construction.

b) Environmental Setting: Section 3.16.2 includes a description of the fuel and natural gas currently consumed within the SCAG region.

c) Environmental Impacts: Sections 3.16.3 and 4.2.6 evaluate potential impacts associated with short-term construction and long-term operational energy consumption.

d) Mitigation Measures: The proposed project would result in a nominal (maximum of 0.36 percent) annual increase in regional energy consumption compared to the No-Build Alternative due to project operation as a result of increased VMT. Standard Project Measures **PF LU-1**, discussed in Section 3.1, *Land Use*; **PF VIS-4** in Section 3.7, *Visual/Aesthetics*; **PF AQ-1** in Section 3.14, *Air Quality*; and **PF SW-1**, discussed in Section 4.2.8, *Greenhouse Gas Emissions,* would reduce impacts related to energy consumption.

e) Alternatives: Sections 3.16.3 and 4.2.6, *Energy*, evaluate the projected long-term energy consumption of each of the build alternatives.

f) Unavoidable Adverse Effects: Implementation of the proposed project would result in a minor increase in operational energy consumption; however, with the implementation of Standard Project Measures **PF LU-1**, **PF VIS-4**, **PF AQ-1**, and **PF SW-1**, the minor adverse effects would not be significant.

g) Irreversible Commitment of Resources: While considerable amounts of fossil fuels would be expended and would not be retrievable, implementation of the proposed project would not commit any future resources that would preempt future energy development or future energy conservation.

h) Short-term Gains versus Long-term Impacts: As discussed in Section 3.16, *Energy*, the proposed project would result in a minor increase in operational energy consumption.

i) Growth-Inducing Effects: The purpose of the proposed project is to address anticipated growth and mobility needs projected for Riverside County; future development in the project area would further be constrained by protected lands with development restrictions.

4.6 Summary of Measures for Impacts under CEQA

The following avoidance, minimization, mitigation, and compensation measures are included in the proposed project to address significant adverse impacts identified for the resources listed in Sections 4.2 through 4.4 of this chapter. The complete text of each measure is provided in the appropriate sections of Chapter 3, *Affected Environment, Environmental Consequences, and Avoidance, Minimization, and/or Mitigation Measures*.

4.6.1 Aesthetics Measures

Standard Project Measures **PF VIS-1**, **PF VIS-3**, **PF VIS-4**, **PF VIS-5, PF VIS-6**, and **PF VIS-7** listed below, have been incorporated into the project. The incorporation of these measures, in addition to Mitigation Measures **VIS-2** and **VIS-8**, would reduce impacts involving aesthetics to a less-than-significant level for Build Alternatives 1, 2C, and 4. These measures, however, would not fully mitigate significant aesthetics impacts on scenic vistas and public views of nonurbanized areas under Build Alternative 4.

- **PF VIS-1:** Contouring and Replanting Disturbed Areas
- **VIS-2:** Replace or Relocate Site Features and Landscaping Affected by the Project
- **PF VIS-3**: Design Proposed Noise Barriers to Be Visually Consistent with Existing Noise Barriers
- **PF VIS-4:** Apply Minimum Lighting Standards
- **PF VIS-5:** Basin and Flood Control Drainage Facility Treatments
- **PF VIS-6**: Temescal Creek Bridge Design
- **PF VIS-7**: New Bridge Architectural Treatments
- **VIS-8**: Replace Disturbed Vegetation along Landscaped Freeways

4.6.2 Agriculture and Forest Resources Measures

Significant impacts involving the conversion of Prime, Unique, or Statewide Important Farmland, or impacts on forest or timberland resources, have not been identified under CEQA; mitigation would not be required. The proposed project may result in a cumulatively considerable contribution to impacts affecting lands under Williamson Act Contract. The following standard project measure related to farmland and agriculture has been incorporated into the project but would not fully mitigate significant impacts under Build Alternative 4.

- **PF FA-1:** Access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway.
- **PF FA-2:** Farmland temporarily affected during construction activities returned to conditions that allow for continued use and function.
- **PF COM-1**: Provide compensation to eligible recipients for property acquisitions
- **PF LU-1**: Traffic Management Plan

4.6.3 Air Quality Measures

Significant impacts have not been identified under CEQA; mitigation would not be required. The following standard project measure related to air quality would be incorporated into the project.

- **PF AQ-1**: Caltrans construction requirements, as specified in Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control), and all air pollution control ordinances and statutes that apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code.
- **PF AQ-2**: South Coast Air Quality Management District (SCAQMD) Rule 403

4.6.4 Biological Resources Measures

With the implementation of the following avoidance, minimization, and mitigation measures, potential adverse impacts on habitats and natural communities, threatened and endangered species, protected waters, and wildlife movement would be reduced to a less-than-significant level under CEQA. The implementation of these measures would reduce impacts related to conflict with the SKR HCP and LM MSHCP, but impacts would remain significant and unavoidable.

- **NC-1 (NES BIO-1)**: Seasonal Vegetation Clearing Restrictions
- **NC-2 (NES BIO-2)**: Dust Control
- **NC-3 (NES BIO-3)**: Fire Prevention
- **NC-4 (NES BIO-4)**: Environmental Awareness Training
- **NC-5 (NES BIO-5)**: Biological Monitoring
- **NC-6 (NES BIO-6)**: ESA Fencing
- **NC-7 (NES BIO-7)**: Invasive Species Removal

- **NC-8 (NES BIO-8)**: Cleaning Construction Equipment
- **NC-9 (NES BIO-24)**: Disposal of Trash
- **NC-10 (NES BIO-10)**: Water Pollution and Erosion Control Plans
- **NC-11 (NES BIO-11)**: Defining the Limits of Disturbance
- **NC-12 (NES BIO-12)**: Placement of Construction Equipment
- **NC-13 (NES BIO-9)**: Post-construction Hydro-seeding
- **NC-14 (NES BIO-13)**: Preparation of DBESP
- **NC-15 (NES BIO-14)**: Replacement of Riparian/Riverine Resources
- **NC-16 (NES BIO-19)**: Wildlife Fencing Plan
- **NC-17 (NES BIO-17)**: Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31)**: Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15)**: Restoration for Temporary Impacts within the LM MSHCP Area
- **NC-20 (NES BIO-21)**: Replacement of PQP Lands
- **AS-1 (NES BIO-25)**: Burrowing Owl Management Plan
- **AS-2 (NES BIO-16)**: Lighting Restrictions
- **AS-3 (NES BIO-28)**: Preconstruction Wildlife Surveys
- **AS-4 (NES BIO-26)**: Bat Management Plan
- **AS-5 (NES BIO-27)**: Nesting Bird Management Plan
- **AS-6 (NES BIO-29)**: Pet Policy
- **AS-7 (NES BIO-20)**: ESA Fencing
- **TE-1 (NES BIO-18)**: Noise Reduction for Equipment
- **TE-2 (NES BIO-23)**: Replacement of Least Bell's Vireo Habitat
- **TE-3 (NES BIO-30)**: Stephens' Kangaroo Rat Management Plan
- **PF WQ-1:** 401 Certification
- **PF WQ-2:** 404 Permit
- **PF WQ-3**: Post-Construction BMPs
- **PF WQ-4:** Construction SWPPP

4.6.5 Cultural Resources Measures

Significant impacts involving substantial adverse changes in the significance of historical and archaeological resources are anticipated under any of the build alternatives. A Section 106 MOA will be developed for all historic properties that will be affected by the project, and will include

mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. In addition, agencies that are owners of properties that would be affected by the project and that contain historic properties, including MWD, will also be invited to participate in the development of the MOA. Consultation with SHPO, consulting tribes, and other consulting parties will continue through development and finalization of the MOA, which will be completed prior to the Final EIR/EIS. Measures in the MOA and Standard Project Measures **PF CR-1** and **PF CR-2**, listed below, would reduce impacts on TCPs to a less-than-significant level. These measures, however, would not fully mitigate significant impacts identified for other resources eligible for listing in NRHP/CRHR.

- **PF CR-1:** Unanticipated Discoveries
- **PF CR-2:** Discovery of Human Remains

4.6.6 Energy Measures

Significant impacts have not been identified under CEQA; mitigation would not be required. The following measures would decrease energy consumption related to the proposed project:

- **PF LU-1**: Traffic Management Plan
- **PF AQ-1**: Grid-based electricity and/or onsite renewable electricity and/or practical powered generators, construction idle restrictions, and alternative fuels
- **PF VIS-4**: Apply Minimum Lighting Standards
- **PF SW-1**: Recycle non-hazardous construction-period waste

4.6.7 Geology and Soils Measures

Significant impacts involving soils have not been identified under CEQA; mitigation would not be required. Standard Project Measures **PF GEO-1** through **PF GEO-5** listed below have been incorporated into the project. Potentially significant impacts on paleontological resources were identified for all build alternatives; the incorporation of Mitigation Measure **PAL-1** would reduce impacts to a less-than-significant level.

- **PF GEO-1:** Caltrans Standard Specifications Manual, Section 19, "Earthwork."
- **PF GEO-2:** Core Sample Tests
- **PF GEO-3:** Excavation and Stabilization Techniques
- **PF GEO-4:** Backfill Materials
- **PF GEO-5:** Structure Embankment
- **PAL-1:** Paleontological Mitigation Plan

4.6.8 Greenhouse Gas Emissions Measures

The project would result in a slight increase in GHG emissions during construction and it is anticipated that the project would result in minor increases in operational GHG emissions. While it is the County's determination that in the absence of further regulatory or scientific information

related to GHG emissions and CEQA significance, it is too speculative to make a significance determination regarding the project's direct impact and its contribution on the cumulative scale to climate change, Caltrans and the County are firmly committed to implementing measures to help reduce GHG emissions. These measures are outlined in the following section.

- **PF LU-1:** Traffic Management Plan
- **PF AQ-1**: Grid-based electricity and/or onsite renewable electricity and/or practical powered generators, construction idle restrictions, and alternative fuels
- **PF VIS-1**: Contouring and Replanting Disturbed Areas
- **VIS-2**: Replace or Relocate Site Features and Landscaping Affected by the Project
- **PF VIS-4**: Energy-efficient Lighting
- **PF VIS-8**: Replace Disturbed Vegetation along Landscaped Freeways
- **NC-13 (NES BIO-9):** Post-construction Hydroseeding
- **NC-15 (NES BIO-14):** Compensation for permanent impacts on riparian-riverine resources
- **WET-1 (NES BIO-14):** Compensation for direct permanent impacts on wetland and non-wetland waters of the U.S.
- **PF SW-1**: Recycle Non-hazardous Construction-period Waste
- **GHG-1:** Energy-efficient Lighting for Traffic Signals

4.6.9 Hazards and Hazardous Materials Measures

In addition to the incorporation of Standard Project Measures **PF HAZ-2**, **PF HAZ-3**, and **PF HAZ-5**, Mitigation Measures **HAZ-1**, **HAZ-4**, **HAZ-6**, **HAZ-7**, and **HAZ-8** would be applied, reducing potentially significant impacts involving hazardous emissions and/or materials to a less-than-significant level.

- **HAZ-1:** APNs 279-231-004, -006, -011, and 281-140-021 Detailed Site Investigation and Remediation, if appropriate
- **PF HAZ-2:** Health and Safety Plan
- **PF HAZ-3:** Waste Handling, Transport, and Disposal
- **HAZ-4**: APNs 318-061-027 and -030 Coordination, Health and Safety Plan, Soil Management Plan, VOC Monitoring, Groundwater Disposal
- **PF HAZ-5**: Creosote-treated Wood Waste
- **HAZ-6**: Agricultural Land Uses
- **HAZ-7:** Yellow Paint
- **HAZ-8:** Asbestos-Containing Material and Lead-Based Paint

4.6.10 Hydrology and Water Quality Measures and Conditions

Standard Project Measures **PF WQ-1** through **PF WQ-4** listed below have been incorporated into the project. The incorporation of these measures, in addition to Mitigation Measure **HYD-1**, would reduce impacts involving the redirection of flood flows to a less-than-significant level for Build Alternatives 1, 2C, and 4.

- **PF WQ-1:** 401 Certification
- **PF WQ-2:** 404 Permit
- **PF WQ-3**: Post-Construction BMPs
- **PF WQ-4:** Construction SWPPP
- **HYD-1:** Coordination of right of way involving the Cajalco Creek Dam and Detention Basin and Cajalco Creek Sedimentation Basin

4.6.11 Land Use and Planning Measures

Standard Project Measures **PF VIS-4**, **PF FA-1**, **PF AQ-1**, and **PF LU-1** listed below would be incorporated into the project. The incorporation of these measures, in addition to the mitigation measures below, would reduce environmental impacts related to the WRC MSHCP, SKR HCP, and LM MSHCP to a less-than-significant level.

- **PF VIS-4:** Apply Minimum Lighting Standards
- **PF FA-1:** Access to all farmland will be maintained once construction is complete, including to any field remnants that may be cut off by the new roadway.
- **PF FA-2:** Farmland temporarily affected during construction activities returned to conditions that allow for continued use and function.
- **PF AQ-1:** Caltrans construction requirements, as specified in Caltrans' Standard Specifications, Section 14-9.02 (Air Pollution Control), and all air pollution control ordinances and statutes that apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code.
- **PF LU-1:** Traffic Management Plan
- **NC-17 (NES BIO-17)**: Replacement Lands for Permanent Impacts within the LM MSHCP Area
- **NC-18 (NES BIO-31)**: Funding Endowment for the LM MSHCP
- **NC-19 (NES BIO-15)**: Restoration for Temporary Impacts within the LM MSHCP Area
- **NC-20 (NES BIO-21)**: Replacement of PQP Lands

4.6.12 Mineral Resources Measures

Significant impacts have not been identified under CEQA; mitigation would not be required.

4.6.13 Noise Measures

Compliance with Standard Project Measure **PF NOI-5**, listed below, would occur under all build alternatives to reduce temporary increases in noise levels associated with construction to a less-than-significant level. Mitigation Measure **NOI-4** would also be implemented, reducing the potential for project-related noise increases in ambient noise levels to a less-than-significant level under CEQA for Build Alternatives 1 and 2C. The implementation of this measure would reduce impacts related to ambient noise levels under Build Alternative 4; however, the reduction in noise levels would not be reduced to below the threshold of significance at Receivers M-93 and M-98A to a less-than-significant level.

- **NOI-4:** Inclusion of Quiet Pavement
- **PF NOI-5:** Construction Noise Control Measures

4.6.14 Population and Housing Measures

Significant impacts have not been identified under CEQA; mitigation would not be required. Standard Project Measures **PF COM-1** related to population and housing would be incorporated into the project.

- **PF COM-1:** Provide compensation to eligible recipients for property acquisitions

4.6.15 Public Services Measures

Significant impacts have not been identified under CEQA; mitigation would not be required. The following standard measures related to public services would be incorporated into the project.

- **PF LU-1:** Traffic Management Plan
- **PF UT-1:** Coordination of utility relocation work with utility companies to ensure minimum disruption to customers in the service areas during construction

4.6.16 Recreation Measures

Significant impacts have not been identified under CEQA; mitigation would not be required.

4.6.17 Transportation/Traffic Measures

Standard Project Measure **LU-1** (Traffic Management Plan) would minimize impacts during construction to less-than-significant levels. A potentially significant impact is identified for increased VMT under all build alternatives for future 2044 traffic operations. There are currently no options in place to mitigate the increase in VMT associated with the proposed project; however, the following standard project measures and Mitigation Measure **GHG-1** would reduce GHG emissions and climate change impacts of the project, and support GHG emissions reduction goals of SB 32, SB 375, and SB 743.

- **PF LU-1:** Traffic Management Plan
- **PF AQ-1**: Grid-based electricity and/or onsite renewable electricity and/or practical powered generators, construction idle restrictions, and alternative fuels

- **PF VIS-4**: Apply Minimum Lighting Standards
- **NC-13 (NES BIO-9):** Post-construction Hydroseeding
- **PF SW-1**: Recycle Non-hazardous Construction-period Waste
- **GHG-1:** Energy-efficient Lighting for Traffic Signals

4.6.18 Tribal Cultural Properties Measures

Refer to Section 4.6.5, *Cultural Resources*, for related measures.

4.6.19 Utilities and Service Systems Measures

Significant impacts have not been identified under CEQA; mitigation would not be required. The following standard measures related to utilities and service systems would be incorporated into the project.

- **PF UT-1:** Coordination of utility relocation work with utility companies to ensure minimum disruption to customers in the service areas during construction
- **PF LU-1:** Traffic Management Plan

4.6.20 Wildfire Measures

Construction or operation of the proposed project, including maintenance, would not be anticipated to exacerbate risk of wildfire. However, temporary and permanent impacts on the environment as a result of the installation of roads and utility relocations associated with the proposed project may occur. With implementation of the following avoidance, minimization, and mitigation measures and standard project measures, potential adverse impacts on habitats and natural communities, threatened and endangered species, and hazardous emissions and/or materials would be reduced to a less-than-significant level under CEQA.

- **PF UT-1:** Coordination of utility relocation work with utility companies
- **PF GEO-1:** Caltrans Standard Specifications Manual, Section 19, “Earthwork”
- **PF GEO-2:** Core Sample Tests
- **PF GEO-3:** Excavation and Stabilization Techniques
- **PF GEO-4:** Backfill Materials
- **PF GEO-5:** Structure Embankment
- **PF HAZ-3:** Waste Handling, Transport, and Disposal
- **PF HAZ-5:** Creosote-treated Wood Waste
- **PF AQ-1:** Caltrans construction requirements, as specified in Caltrans’ Standard Specifications, Section 14-9.02 (Air Pollution Control), and all air pollution control ordinances and statutes that apply to any work performed pursuant to the contract, including any air pollution control rules, regulations, ordinances, and statutes specified in Section 11017 of the Government Code.

- **NC-3 (NES BIO-3)**: Fire Prevention
- **NC-5 (NES BIO-5)**: Biological Monitoring
- **NC-6 (NES BIO-6)**: ESA Fencing
- **NC-10 (NES BIO-10)**: Storm Water Pollution Prevention Plan

Chapter 5. Comments and Coordination

Early and continuing coordination with the general public and appropriate public agencies is an essential part of the environmental process. It helps planners determine the necessary scope of environmental documentation and the level of analysis required, and to identify potential impacts and mitigation measures and related environmental requirements. Agency consultation and public participation for this project have been accomplished through a variety of formal and informal methods, including project development team (PDT) meetings, interagency coordination meetings, interagency consultation, scoping meetings, and public outreach meetings. This chapter summarizes the results of the California Department of Transportation's (Caltrans') efforts to fully identify, address, and resolve project-related issues through early and continuing coordination.

At the beginning of the project approval and environmental document process in 2011, a PDT was established to facilitate the course, development, and completion of preliminary engineering and environmental studies for the project in accordance with all applicable requirements through implementation of a systematic, interdisciplinary approach throughout the project development process. Over the course of project development and environmental study, PDT participation has consistently included environmental and planning staff from Caltrans and the County of Riverside (County), and engineering, traffic, environmental and outreach consultants. Caltrans and County traffic, design, and right of way specialists, Caltrans cultural specialists, and County survey and utilities specialists also engaged in the PDT at different points during the project development process for the Cajalco Road Widening and Safety Enhancement Project. Local district representatives from Riverside County Flood Control and Water Conservation District, Eastern Municipal Water District, and Riverside County Regional Park and Open-Space District also participated in PDT meetings where topics included subjects of interest. The PDT meetings covered a wide range of topics related to the proposed project, including development and evaluation of design alternatives, engineering considerations, environmental considerations, public outreach, the environmental document, and the documentation process.

Coordination among the County, Caltrans, and representatives of applicable regulatory agencies has been ongoing since 2011. As the project has developed, input from the public and various agencies has been critical to the identification of alternatives that County and Caltrans have been able to create in order to construct the least environmentally damaging project and still accomplish the goals of the purpose and need outlined in this document. There have been many personnel at the County, Caltrans, and various agencies who have commented on stages of the development of the project.

5.1 23 USC 139 Efficient Environmental Review

23 United States Code (USC) Section 139, as amended by the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users in 2005, Moving Ahead for Progress in the 21st Century in 2012, and Fixing America's Surface Transportation (FAST) Act in 2015, includes a number of provisions designed to make the environmental review process more efficient. The provisions of 23 USC 139 apply to any U.S. Department of Transportation Environmental Impact Statement (EIS) for which the Notice of Intent (NOI) was published in the Federal Register after August 10, 2005, and have been included in the proposed project.

Some provisions of 23 USC 139 established with the passage of the FAST Act, however, apply only to those projects with an NOI published after December 4, 2015. These additional provisions, such as establishment of the coordination plan no later than 90 days after the NOI has been published, and required inclusion of a schedule in the coordination plan that must be concurred upon by the participating agencies, do not apply to the proposed project. The NOI for the proposed project was published in the Federal Register on September 26, 2012.

5.1.1 Coordination Plan

The environmental provisions in 23 USC §139 require that lead agencies establish a plan for coordinating public and agency participation and comment during the environmental review process. A Coordination Plan for the proposed project was developed in July 2012 and included a list of possible agencies, roles and responsibilities, contact information, and milestone schedule. The Coordination Plan has been updated over time in response to agency feedback, changes in contact information, and environmental schedule updates. Updated versions of the Coordination Plan were further redistributed to cooperating and participating agencies for review and input. A copy of the current Coordination Plan is located in Appendix H, *Environmental Review Coordination and Scoping*.

5.1.2 Notice of Initiation

The first step in the 23 USC 139 efficient environmental review process is the notification to the Secretary of Transportation (via the Federal Highway Administration [FHWA]) by the lead agency of the initiation of the review process. 23 USC 139 requires that the project sponsor notify the Secretary of the type of work, termini, length, general location of the proposed project, and anticipated federal approvals/permits. An NOI may be used as this notification as long as it contains the information required pursuant to 23 USC 139 for streamlining purposes. The notification of the initiation of the review process precedes or occurs simultaneously with the publication of the NOI in the Federal Register.

In September 2012, following receipt of comments and agency feedback in response to the Notice of Preparation (NOP) of an Environmental Impact Report (EIR) for the proposed project, an NOI to prepare an EIS was advertised to the public and mailed to elected officials and local, state, and federal agencies having jurisdiction or discretionary approval within the project corridor. The NOI was published in the Federal Register on September 26, 2012; a copy is included on the following page.

Responses to the NOI, including comments submitted during the public scoping meetings, are discussed in Section 5.2.3 of this EIR/EIS. Copies of responses to the NOI from organizations, environmental stakeholder groups, and agencies are included in Appendix H.

59244 Federal Register / Vol. 77, No. 187 / Wednesday, September 26, 2012 / Notices

in the **FOR FURTHER INFORMATION CONTACT** section no later than October 12, 2011. Please provide the following information: Full legal name, country of citizenship, and name of your industry association, or applicable affiliation. If you are attending as a public citizen, please indicate so.

The FAA will arrange for teleconference service for individuals wishing to join in by teleconference if we receive notice by October 12, 2011. For persons participating by telephone, please contact Ralen Gao by email or phone for the teleconference call-in number and passcode. Anyone calling from outside the Arlington, VA, metropolitan area will be responsible for paying long-distance charges.

The public must make arrangements by October 12, 2011, to present oral statements at the meeting. Written statements may be presented to the ARAC at any time by providing 25 copies to the person listed in the **FOR FURTHER INFORMATION CONTACT** section or by providing copies at the meeting. Copies of the documents to be presented to ARAC may be made available by contacting the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

If you need assistance or require a reasonable accommodation for the meeting or meeting documents, please contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section. Sign and oral interpretation, as well as a listening device, can be made available if requested 10 calendar days before the meeting.

Issued in Washington, DC on September 20, 2011.

Julie Ann Lynch,

Acting Director, Office of Rulemaking.

[FR Doc. 2012–23709 Filed 9–25–12; 8:45 am]

BILLING CODE 4910–13–P

DEPARTMENT OF TRANSPORTATION

Federal Highway Administration

Environmental Impact Statement: Riverside County, CA; Notice of Intent

AGENCY: Federal Highway Administration (FHWA), DOT.

ACTION: Notice of Intent.

SUMMARY: The FHWA, on behalf of the California Department of Transportation (Caltrans), is issuing this notice to advise the public that an Environmental Impact Statement (EIS) will be prepared for a proposed highway project in Riverside County, California. Caltrans will be responsible for production of the EIS in accordance with assignment of National Environmental Policy Act (NEPA) responsibilities from DOT to Caltrans pursuant to Section 6005 of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA–LU, Pub. L. 109–59).

DATES: Comments regarding the proposed action should be provided to Caltrans at the address listed below by no later than October 28, 2012.

FOR FURTHER INFORMATION CONTACT: Aaron Burton, Senior Environmental Planner, Environmental Studies ''B,'' California Department of Transportation, Division of Environmental Planning, 464 West 4th Street, 6th Floor, MS 829, San Bernardino, California 92401–1400; or call (909) 383–2841.

SUPPLEMENTARY INFORMATION: Effective July 1, 2007, the Federal Highway Administration (FHWA) assigned, and the California Department of Transportation (Caltrans) assumed, environmental responsibilities for this project pursuant to 23 U.S.C. 327. Caltrans, as the assignee for NEPA compliance, will prepare an EIS on a proposal for a roadway widening project in Riverside County, California. The proposed project would widen Cajalco Road from two to four lanes between Harvill Avenue at the east end and Temescal Canyon Road at the west end, from four to five lanes between Temescal Wash and Temescal Canyon Road, and from four to six lanes between Interstate 215 (I–215) southbound ramps and Harvill Avenue. The purpose of the proposed project is to: (1) To improve the transportation facility to address anticipated growth and mobility needs, as identified in the County of Riverside General Plan Circulation Element Policy 1.5; (2) provide improved interregional travel by improving east-west mobility in Riverside County; and (3) to improve roadway alignment and intersection design to enhance safety along Cajalco Road. Alternatives under consideration include: (1) Widening existing Cajalco Road with minor alignment changes between I–215 and Temescal Canyon Road; (2) widening existing Cajalco Road between I–215 and Hollis Lane and between east of Eagle Canyon Road and Temescal Canyon Road, along with constructing a new segment of Cajalco Road between Hollis Lane and east of Eagle Canyon Road; and (3) taking no action. The project covers a length of approximately 16 miles. Anticipated federal approvals for the project include Air Quality Conformity, Section 7,Endangered Species Act, consultation for threatened and endangered species, and a Section 404, Clean Water Act individual permit.

Letters describing the proposed action and soliciting comments will be sent to appropriate Federal, State, Participating Agencies, Tribal governments (as determined by the Native American Heritage Commission consultation), and local agencies, and to private organizations and citizens who have previously expressed or are known to have interest in this proposal. The environmental review process is anticipated to be started in late 2012. Public scoping meetings will be held to discuss the alternatives and the potential impacts of the proposed project. In addition, a public hearing will be held. Public notice will be given of the time and place of the meetings and hearing. The EIS will be available for public and agency review and comment prior to the public hearing.

To ensure that the full range of issues related to this proposed action are addressed and all significant issues identified, comments and suggestions are invited from all interested parties. Comments or questions concerning this proposed action and the EIS should be directed to Caltrans at the address provided above.

(Catalog of Federal Domestic Assistance Program Number 20.205, Highway Planning and Construction. The regulations implementing Executive Order 12372 regarding intergovernmental consultation on Federal programs and activities apply to this program.)

Issued on: September 17, 2012.

Rebecca Bennett,

Director, Local Programs, Federal Highway Administration, Sacramento, California.

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA–2012–0048]

Agency Information Collection Activities; Extension of Currently-Approved Information Collection Request: Annual and Quarterly Report of Class I Motor Carriers of Passengers

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice and request for comments.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995, FMCSA announces its plan to submit the Information Collection Request (ICR) described below to the Office of Management and Budget (OMB) for its

5.1.3 Lead, Cooperating and Participating Agencies

On October 1, 2012, Caltrans entered into a Memorandum of Understanding (MOU) pursuant to 23 USC 327 (NEPA Assignment MOU) with FHWA, assuming FHWA responsibilities under the National Environmental Policy Act (NEPA) and other federal environmental laws. The NEPA Assignment MOU was renewed on December 23, 2016, for a term of 5 years, and Caltrans continues to assume FHWA responsibilities, including NEPA oversight for Local Assistance Projects off of the State Highway System within the State of California.[1] As such, Caltrans is serving as NEPA lead agency for the proposed County project. The County is serving as the California Environmental Quality Act (CEQA) lead agency.

Council on Environmental Quality regulations define cooperating agency status (40 Code of Federal Regulations [CFR] § 1501.6 and 40 CFR § 1508.5) and how that agency should implement the NEPA mandate. Participating agencies are defined in surface transportation law at 23 USC 139. Federal agencies that are responsible for preparing NEPA documents will do so "in cooperation with state and local governments" and other agencies with jurisdiction by law or special areas of expertise (42 USC § 4331(a), and 42 USC § 4332(2)).

A cooperating agency is any federal agency, other than a lead agency, that has jurisdiction by law or special expertise with respect to any environmental impact involved in a proposed project or project alternative (see Section 1508.5, 40 CFR). Any other federal agency with special expertise regarding any environmental issue may be a cooperating agency, and an agency may request to be designated as a cooperating agency. All cooperating agencies are also participating agencies under 23 USC 139.

A participating agency is any federal or non-federal agency (state, federally recognized tribe, regional, and local government agency) that may have an interest in the project. Federal agencies are also required to be participating agencies unless they declare in writing that they have no jurisdiction, expertise, or information, and do not intend to comment on the project. The lead agencies collectively decide which other agencies, in addition to the agencies identified above, to invite to become participating agencies into the 23 USC 139 efficient environmental review process.

Per responses to the Letters of Invitation and consideration of agency involvement in the proposed project, interagency review roles have been established and are identified in Table 5-1 on the following page. All agencies on the list have been requested to comment on key components of the environmental document prior to public circulation.

[1] Exceptions are certain categorical exclusions that FHWA assigned to Caltrans under the 23 USC 326 Categorical Exemption Assignment MOU, projects excluded by definition, and specific project exclusions.

Table 5-1. Cajalco Road Widening Project Agencies and Roles

Agency	Role
California Department of Transportation (Caltrans)	Lead Agency (NEPA)
County of Riverside Transportation Department (County)	Lead Agency (CEQA) / Sponsoring Agency
Regional Water Quality Control Board, Santa Ana Region (RWQCB)	Participating Agency
U.S. Army Corps of Engineers (USACE)	Cooperating Agency Participating Agency
U.S. Environmental Protection Agency (EPA)	Cooperating Agency Participating Agency
Advisory Council on Historic Preservation (ACHP)	Participating Agency
Bureau of Indian Affairs (BIA)	Participating Agency
Bureau of Land Management (BLM)	Participating Agency
Cahuilla Band of Indians[1]	Participating Agency
California Department of Fish and Wildlife (CDFW) [1]	Participating Agency
California Office of Historic Preservation/State Historic Preservation Officer (SHPO) [1]	Participating Agency
California Highway Patrol (CHP) [1]	Participating Agency
City of Riverside[1]	Participating Agency
City of San Jacinto	Participating Agency
Metropolitan Water District of Southern California (MWD)	Participating Agency
Morongo Band of Mission Indians (Morongo) [1]	Participating Agency
Native American Heritage Commission (NAHC)	Participating Agency
Natural Resources Conservation Service (NRCS) [1]	Participating Agency
Office of Environmental Policy and Compliance	Participating Agency
Pechanga Band of Luiseño Mission Indians[1]	Participating Agency
Riverside County Habitat Conservation Agency (RCHCA)	Participating Agency
Riverside County Transportation Commission (RCTC)	Participating Agency
Riverside County Fire Department [1]	Participating Agency
Riverside County Waste Management	Participating Agency
Soboba Band of Luiseño Indians[1]	Participating Agency
U.S. Fish and Wildlife Service (USFWS)	Participating Agency
Western Municipal Water District (WMWD) [1]	Participating Agency
Western Riverside County Regional Conservation Authority (RCA) [1]	Participating Agency

[1] Unclear invitation response or nonresponse; status based on type of response and/or involvement in project.

5.1.3.1 Invitation Process

As early as practicable, the lead agency requests other agencies to be cooperating agencies. The invitation to become a cooperating agency may occur before, or shortly after, the publication of the NOI in the Federal Register. Upon request of the lead agency, any federal agency with jurisdiction by law shall be a cooperating agency. Cooperating agencies are invited to participate in early meetings to discuss issues and alternatives, and to determine the scope of issues that may be involved in the project. Where appropriate, the lead agency should also seek the cooperation of state or local agencies with jurisdiction by law or special expertise.

On October 1, 2012, Letters of Invitation were distributed to the agencies listed in Table 5-2, requesting involvement as cooperating and/or participating agencies. The invitation letters explained the applicability of the efficient environmental review process, provided reason as to why the particular agency may have interest in the project, included a brief description of the

project, summarized the potential responsibilities of the agency, and explained the results of a response or nonresponse by the invited agency. An example copy of the letters distributed to cooperating and/or participating agencies is provided in Appendix H.

Table 5-2. Invited Participating and Cooperating Agencies

Agency	Response	Invitation Type
U.S. Army Corps of Engineers (USACE)	Accept	Cooperating Agency Participating Agency
U.S. Environmental Protection Agency (EPA)	Accept	Cooperating Agency Participating Agency
U.S. Fish and Wildlife Service (USFWS)	Accept	Participating Agency
Regional Water Quality Control Board, Santa Ana Region (RWQCB)	Accept	Participating Agency
California Department of Fish and Wildlife (CDFW)	None	Cooperating Agency Participating Agency
California Office of Historic Preservation/State Historic Preservation Officer (SHPO)	None	Cooperating Agency Participating Agency
Advisory Council on Historic Preservation (ACHP)	Accept	Cooperating Agency Participating Agency
Bureau of Indian Affairs (BIA)	None	Cooperating Agency Participating Agency
Bureau of Land Management (BLM)	Accept	Cooperating Agency Participating Agency
Federal Emergency Management Agency (FEMA)	Decline	Cooperating Agency Participating Agency
Natural Resources Conservation Service (NRCS)	None	Cooperating Agency Participating Agency
Office of Environmental Policy and Compliance	Accept	Cooperating Agency Participating Agency
Cahuilla Band of Indians	None	Participating Agency
California Highway Patrol (CHP)	Unclear[1]	Participating Agency
California Resources Agency (CRA)	None	Participating Agency
City of Corona	None	Participating Agency
City of Perris	None	Participating Agency
City of Riverside	Unclear[1]	Participating Agency
Eastern Municipal Water District (EMWD)	None	Participating Agency
Los Coyotes Band of Mission Indians	None	Participating Agency
March Joint Powers Authority (March JPA)	None	Participating Agency
Metropolitan Water District of Southern California (MWD)	Unclear[1]	Participating Agency
Morongo Band of Mission Indians (Morongo)	None	Participating Agency
Native American Heritage Commission (NAHC)	Accept	Participating Agency
Pala Band of Mission Indians	Decline	Participating Agency
Pauma & Yuma Reservation	None	Participating Agency
Pauma Valley Band of Luiseño Indians	None	Participating Agency
Pechanga Band of Luiseño Mission Indians	Unclear[1]	Participating Agency
Ramona Band of Cahuilla Mission Indians	None	Participating Agency
Riverside County Fire Department	Unclear	Participating Agency
Riverside County Flood Control and Water Conservation District (RCFCWCD)	None	Participating Agency
Riverside County Habitat Conservation Agency (RCHCA)	Accept	Participating Agency
Riverside County Sheriff's Department	Decline	Participating Agency

Agency	Response	Invitation Type
Riverside County Transportation Commission (RCTC)	Accept	Participating Agency
Riverside Transit Agency (RTA)	None	Participating Agency
Riverside County Waste Management	Accept	Participating Agency
Santa Ana Watershed Project Authority (SAWPA)	None	Participating Agency
Santa Rosa Band of Mission Indians	None	Participating Agency
Soboba Band of Luiseño Indians	None	Participating Agency
Southern California Association of Governments (SCAG)	None	Participating Agency
South Coast Air Quality Management District (SCAQMD)	None	Participating Agency
Western Riverside County Regional Conservation Authority (RCA)	None	Participating Agency
Western Municipal Water District (WMWD)	Unclear[1]	Participating Agency
City of San Jacinto	Accept	Participating Agency

[1] Acceptance of role not clearly defined in response.

5.1.3.2 Involvement Opportunities

Agencies that were confirmed as a participating or/and cooperating agency were also sent letters requesting review and comment on the purpose and need, range of alternatives, and methodology for the project. Letters inviting cooperating and participating agencies to comment on the project description and purpose and need for the project were distributed on February 26, 2013. An example copy of the letters and responses received is provided in Appendix H. Letters inviting cooperating and participating agencies to provide input on range of alternatives and methodology were sent on March 19, 2015, and April 3, 2015. An example copy of the letters distributed and copies of the responses received are provided in Appendix H.

A meeting with conference call option was held November 17, 2015, to introduce participating and cooperating agencies to the project team and to one another; confirm feedback received from agencies on the project purpose and need, range of alternatives, and methodologies; and provide project updates. In April 2016, bi-monthly conference calls were established between the lead agencies and participating and cooperating agencies to inform agencies of the status of environmental review, share project updates, and discuss information and related to environmental technical studies and/or specific project topics of interest. Between June 2017 and September 2018, project environmental studies were provided to cooperating and participating agencies per request, for review and comment regarding information related to their areas of expertise or jurisdiction. A summary of this coordination is included in Appendix H. Feedback received on the studies was discussed with the commenting agencies and considered in the environmental studies. Summaries of the coordination involving each environmental study reviewed are provided in Table 5-3, and comments received on the studies are included in Appendix H. Participating and cooperating agency coordination calls continued until mid-2018, when they were placed on hold during preparation of the Draft EIR/EIS.

Beginning on May 7, 2021, the Draft EIR/EIS was provided to cooperating and participating agencies per request, for review and comment regarding information related to their areas of expertise or jurisdiction. On May 24, 2021, the Final NES was provided to cooperating and participating agencies per request. Feedback received on the Draft EIS and Final NES was discussed with the commenting agencies and considered in this Draft EIS. Summaries of the coordination involving the Draft EIS and Final NES are provided in Table 5-3, and comments received on the studies and Draft EIS are included in Appendix H.

Coordination calls are planned to resume following release of the Draft EIR/EIS. A summary of the coordination calls is provided in Table 5-3, below.

Table 5-3. Coordination Calls and Meetings – Participating and Cooperating Agencies

Meeting Date	Meeting Summary
11/17/2015	Meeting/Call: ICF provided an overview of the proposed project and a description of the alternatives. Input was solicited from cooperating and participating agencies on the project description, range of alternatives, and methodologies. ICF provided a description of the alignment and features of Build Alternative 2C. Attendees: Russell Williams, Mary Zambon, and Scott Staley (County of Riverside); Eduardo Moreno-Castaneda (Caltrans); Heather Pert (CDFW); Kevin Porter and Bill Betancur (CHP); Brian Calvert and Keturah Anderson (ICF); Wendy Picht (MWD); Anna Hoover, Ebru T. Ozdil, Paul Macarro, Brenda L. Tomaras, and Shannon (Pechanga Band of Luiseño Mission Indians); Arlee Montalvo (Riverside-Corona Resource Conservation District [RCRCD]); Joe Ontiveros (Soboba Band of Luiseño Indians); Susan A. Meyer Gayagas (USACE); Clifton Meek (EPA); John M. Taylor (USFWS); Tim Hults (City of San Jacinto); Gil Hernandez (City of Riverside); Glenn Robertson (Santa Ana RWQCB); Sergio Felix (WMWD); Princess Hester and Brian Shomo (RCHCA).
4/7/2016	Meeting/Call: ICF provided project overview and a description of the alternatives. Information regarding the project alignments and project description, as well as the current Efficient Environmental Review Coordination Plan, were distributed prior to call. ICF provided a description of the alignment and features of Build Alternative 2C. Attendees: Eduardo (Eddie) Moreno-Castaneda (Caltrans); Heather Pert (CDFW); Kevin Porter (CHP); Brian Calvert and Keturah Anderson (ICF); Wendy Picht (MWD); Anna Hoover, Ebru T. Ozdil, Paul Macarro, Brenda L. Tomaras, and Shannon (Pechanga Band of Luiseño Mission Indians); Arlee Montalvo (RCRCD); Russell Williams, Mary Zambon, and Scott Staley (County of Riverside); Tim Hults (City of San Jacinto); Joe Ontiveros (Soboba Band of Luiseño Indians); Susan A. Meyer Gayagas (USACE); Clifton Meek (EPA); John M. Taylor (USFWS).
6/2/2016	Meeting: ICF provided status updates for the proposed project. There was a discussion on environmental review coordination and the County was to confer with Caltrans to confirm strategies for early involvement in reviews. Attendees: Aaron P. Burton (Caltrans); Heather Pert (CDFW); Kevin Porter (CHP); Brian Calvert and Keturah Anderson (ICF); Heriberto Diaz, Wendy Picht, Diane Doesserich, Paul Norlen, and Lilly Shraibati (MWD); Ebru T. Ozdil and Paul Macarro (Pechanga Band of Luiseño Mission Indians); Arlee Montalvo (RCRCD); Scott Staley and Mary Zambon (County of Riverside); Glenn Robertson (Santa Ana RWQCB); Clifton Meek (EPA).
8/4/2016	Meeting: ICF provided status updates for the proposed project and an overview of the milestone schedule added to the Efficient Environmental Review Coordination Plan. Attendees: Eduardo (Eddie) Moreno-Castaneda (Caltrans); Heather Pert (CDFW); Brian Calvert and Keturah Anderson (ICF); Heriberto Diaz, Wendy Picht, Diane Doesserich, Paul Norlen, Shohreh Zareh, and Minu Sink (MWD); Arlee Montalvo (RCRCD); Scott Staley and Mary Zambon (County of Riverside); Susan A. Meyer Gayagas (USACE); Clifton Meek (EPA).
10/6/2016	Meeting/Call: ICF provided status updates for the proposed project, including the progress of technical studies. In regard to agencies' potential early involvement in reviews, Caltrans indicated a preference for technical studies and the environmental document to undergo a minimum of two reviews by Caltrans prior to dissemination to other agencies. Attendees: Eduardo (Eddie) Moreno-Castaneda (Caltrans); Brian Calvert and Keturah Anderson (ICF); Wendy Picht, Diane Doesserich, Paul Norlen, and Shohreh Zareh (MWD); Arlee Montalvo (RCRCD); Gilbert (Gil) Hernandez (City of Riverside); Mary Zambon (County of Riverside); Susan A. Meyer Gayagas (USACE); Glenn Robertson (Santa Ana RWQCB).

Meeting Date	Meeting Summary
2/02/2017	Meeting/Call: ICF provided status updates for the proposed project, including the progress of technical studies. In regard to agencies' potential early involvement in reviews, ICF prepared an Input Opportunities Matrix to be distributed to all participating/cooperating agencies to document which technical studies or environmental document sections they desire to review. Attendees: Aaron P. Burton (Caltrans), Kevin Porter (CHP); Brian Calvert and Keturah Anderson (ICF); Wendy Picht and Diane Doesserich (MWD); Ebru T. Ozdil and Paul Macarro (Pechanga Band of Luiseño Mission Indians); Mary Zambon and Scott Staley (County of Riverside); Susan A. Meyer Gayagas (USACE); Glenn Robertson (Santa Ana RWQCB); Clifton Meek (EPA); John M. Taylor (USFWS).
6/01/2017	Meeting/Call: ICF provided status updates for the proposed project, including the progress of technical studies. In regard to agencies' potential early involvement in reviews, ICF distributed an Input Opportunities Matrix on 3/23/2017 to all participating/cooperating agencies. The California Rapid Assessment Method was discussed. Attendees: Aaron P. Burton (Caltrans); Heather Pert and Carly Beck (CDFW); Kevin Porter (CHP); Brian Calvert and Keturah Anderson (ICF); Wendy Picht and Diane Doesserich (MWD); Ebru T. Ozdil, Paul Macarro, Brenda L. Tomaras, and Nicole Corey (Pechanga Band of Luiseño Mission Indians); Arlee Montalvo (RCRCD); Gilbert (Gil) Hernandez (City of Riverside); Scott Staley and Mary Zambon (County of Riverside); Glenn Robertson (Santa Ana RWQCB); Clifton Meek (EPA), John M. Taylor (USFWS); Sergio Felix (WMWD).
9/19/2017	Meeting/Call: Discussed comments received on the Jurisdictional Delineation and Traffic Operations Analysis Report for the Cajalco Road Widening and Safety Enhancement Project from EPA on July 31, 2017. Attendees: Clifton Meek (EPA); Mary Zambon (County of Riverside); Viggen Davidian and Rajat Parashar (Iteris); Brian Calvert and Keturah Anderson (ICF).
9/20/2017	Meeting/Call: Discussed comments received on the Jurisdictional Delineation and Traffic Operations Analysis Report for the Cajalco Road Widening and Safety Enhancement Project from Santa Ana RWQCB on July 31, 2017. Attendees: Glenn Robertson and Jason Bill (Santa Ana RWQCB); Mary Zambon (County of Riverside); Brian Calvert and Keturah Anderson (ICF).
10/5/2017	Meeting/Call: ICF provided status updates for the proposed project, including the progress of technical studies. Revisions to the Input Opportunities Matrix were reviewed. Attendees: Heather Pert (CDFW); Brian Calvert and Keturah Anderson (ICF); Wendy Picht (MWD); Arlee Montalvo (RCRCD); Gilbert (Gil) Hernandez (City of Riverside); Scott Staley and Mary Zambon (County of Riverside); Glenn Robertson (Santa Ana RWQCB); Susan A. Meyer Gayagas (USACE); Clifton Meek (EPA); Sergio Felix (WMWD).
2/1/2018	Meeting/Call: ICF provided status updates for the proposed project, including the progress of technical studies and a description of changes made to Build Alternative 4. Attendees: Aaron P. Burton (Caltrans); Heather Pert (CDFW); Brian Calvert, Keturah Anderson, and Marisa Flores (ICF); Wendy Picht, Kieran M. Callanan, Diane Doesserich, Ken Chung, and Maria Lopez (MWD); Raymond Huaute (Morongo); Ebru T. Ozdil, Paul Macarro, and Molly Earp-Escobar (Pechanga Band of Luiseño Mission Indians); Shelli Lamb (RCRCD); Gilbert (Gil) Hernandez (City of Riverside); Mary Zambon (County of Riverside); Glenn Robertson (Santa Ana RWQCB); Susan A. Meyer Gayagas (USACE); Clifton Meek (EPA); John M. Taylor and Karin Cleary-Rose (USFWS); Sergio Felix (WMWD).
4/5/2018	Meeting/Call: ICF provided status updates for the proposed project, including the progress of technical studies and a description of alternatives. There was a discussion about technical studies undergoing review and the timeline for submittal. Attendees: Aaron P. Burton (Caltrans); Heather Pert (CDFW); Brian Calvert, Keturah Anderson, and Marisa Flores (ICF); Wendy Picht and Diane Doesserich (MWD); Paul Macarro (Pechanga Band of Luiseño Mission Indians); Arlee Montalvo (RCRCD); Gilbert (Gil) Hernandez (City of Riverside), Scott Staley and Mary Zambon (County of Riverside); Glenn Robertson (Santa Ana RWQCB); Clifton Meek (EPA).

Meeting Date	Meeting Summary
8/1/2018	Meeting/Call: Discussed and reviewed the Natural Environment Study (NES). ICF provided an overview of the document format, focused studies, surveys and habitat assessments, modeling, and methods. Agencies present during call provided feedback and recommendations. Attendees: Kieran M. Callanan, Tanya Asef, Alex Marks, and Sean Carlson (MWD); Scott Staley and Mary Zambon (County of Riverside); Clifton Meeks (EPA), Susan Gayagas (USACE); Brian Calvert, Keturah Anderson, Marisa Flores, and Greg Hoisington (ICF); Heather Pert (CDFW); Glenn Robertson (Santa Ana RWQCB); John Taylor (USFWS); Arlee Montalvo (RCRCD).
5/18/2021	Meeting/Call: ICF provided status updates for the proposed project, including the progress of environmental schedule. ICF provided an overview of the document format and responded to inquiries. Agencies present during call provided feedback and recommendations. Attendees: Diane Doesserich, Alex Marks, and Sean Carlson (MWD); Sergio Felix (WMWD); Sarah Stokely (ACHP); Clifton Meeks (EPA); Heather Pert (CDFW); Susan Mayer-Gayagas (USACE); Maher Zaher and Chuck Griffin (Santa Ana RWQCB); Kylie Gallup (RCFCWCD); John Taylor (USFWS); Juan Ochoa (Pechanga); Gilbert Hernandez and Vital Patel (City of Riverside); Shani Pynn (RCRCD); Ryan Ross (County WR); Aaron Burton, Andrew Walters, and Gary Jones (Caltrans); Mary Zambon (County of Riverside); Brian Calvert, Keturah Anderson, Marisa Flores, and Greg Hoisington (ICF); Greg Hefter and Dat Nguyen (AECOM).
5/26/2021	Meeting/Call: ICF provided status updates for the proposed project, including the progress of environmental schedule and updates to the Final NES. ICF responded to inquiries regarding the Final NES and Draft EIS. Agencies present during call provided feedback and recommendations. Attendees: Alex Marks and Sean Carlson (MWD); John Taylor (USFWS); Adam Fischer and Chuck Griffin (Santa Ana RWQCB); Aaron Burton (Caltrans); Mary Zambon and Mohammed Eissa (County of Riverside); Brian Calvert, Keturah Anderson, Marisa Flores, and Greg Hoisington (ICF).
5/27/2021	Meeting/Call: ICF provided status updates for the proposed project, including the progress of environmental schedule and updates to the Final NES. ICF responded to inquiries regarding the Final NES and Draft EIS. Agencies present during call provided feedback and recommendations. Attendees: Diane Doesserich, Alex Marks, and Sean Carlson (MWD); John Taylor (USFWS); Heather Pert and Carly Beck (CDFW); Chuck Griffin (Santa Ana RWQCB); Aaron Burton (Caltrans); Mary Zambon (County of Riverside); Brian Calvert, Keturah Anderson, Marisa Flores, and Greg Hoisington (ICF).
6/8/2021	Meeting/Call: ICF provided an overview of the project, status of environmental review, and responded to inquiries. Agencies present during call provided feedback and recommendations. Attendees: Shani Pynn, Kerwin Russell, and Shelli Lamb (RCRCD); Mary Zambon and Mohammed Eissa (County of Riverside); Brian Calvert, Keturah Anderson, Marisa Flores, and Greg Hoisington (ICF).
6/9/2021	Meeting/Call: The Draft EIS and Section 4(f) were discussed. Agencies present during call provided feedback and recommendations. Attendees: John Taylor and Karin Cleary-Rose (USFWS); Carly Beck (CDFW); Mary Zambon (County of Riverside); Brian Calvert, Keturah Anderson, Marisa Flores, and Greg Hoisington (ICF).

5.1.3.3 Early Identification of Issues

A Preliminary Environmental Study was prepared for the proposed project in 2012, and an Initial Study Checklist (IS) was prepared in 2011. The Preliminary Environmental Study and IS included screening checklists and preliminary assessment of potential environmental issues for the proposed project, including natural, community, cultural, and historic resources in the project area. Based on the Preliminary Environmental Study and IS and agency and community feedback, preparation of an EIS-level environmental document was identified, and the provisions of 23 USC 139 efficient environmental review process initiated.

The IS for the proposed project was also distributed along with the NOP to numerous agencies, organizations, interested groups, and individuals and made available on a website and at local offices for comment during the scoping period. Refer to Section 5.2.1, below, for details.

5.1.4 Permits and Approvals Status

Coordination for the following permits, reviews, and approvals are anticipated prior to project construction unless otherwise indicated.

Table 5-4. Permits and Approvals Needed

Agency	Permit/Approval	Status
U.S. Fish and Wildlife Service (USFWS)	• Section 7 consultation for Threatened and Endangered Species • Section 7 consultation with USACE on Section 404 permit • Joint Project Review (JPR) • Concurrence with County Western Riverside County Multiple Species Habitat Conservation Plan (WRC MSHCP) Consistency Determination • Approval of WRC MSHCP minor amendment • Concurrence with Determination of Biologically Equivalent or Superior Preservation (DBESP) • Equivalency Analysis of Public/Quasi-Public Lands Replacement • Approval of replacement lands pursuant to the Habitat Conservation Plan (HCP) for the Stephens' kangaroo rat (SKR) • Lake Mathews Multiple Species Habitat Conservation Plan and Natural Community Conservation Plan (LM MSHCP) discretionary action • Approval of SKR HCP Minor Amendment	1. Section 7 consultations are to be conducted following identification of a Preferred Alternative and preparation of the WRC MSHCP Consistency Determination, which will serve as the Biological Assessment. 2. MSHCP Consistency Determination and DBESP to be prepared and submitted for concurrence following identification of a Locally Preferred Alternative and prior to approval of the Final EIS. 3. The JPR application will be submitted following preparation of the MSHCP Consistency Determination and DBESP. 4. Minor amendment to the WRC MSHCP will be requested by the County EIS Record of Decision (ROD). 5. JPR finding following approval of Minor Amendment, and after EIS ROD. 6. Approval of replacement lands pursuant to the SKR HCP, WRC MSHCP minor amendment, and LM MSHCP discretionary action, will be requested by the County after the EIS ROD is approved.
United States Army Corps of Engineers (USACE)	Section 404 Permit for fill or dredging waters of the United States	Application to be submitted prior to construction.
California Department of Fish and Wildlife (CDFW)	• Section 1602 Lake and Streambed Alteration Agreement • JPR • Concurrence with County MSHCP Consistency Determination • WRC MSHCP Minor Amendment approval • Approval of replacement lands pursuant to the SKR HCP • DBESP Concurrence • LM MSHCP discretionary action • SKR HCP Minor Amendment approval	1. Section 1602 Notification is to be submitted and agreement obtained prior to the start of construction. 2. MSHCP Consistency Determination and DBESP to be prepared and submitted for concurrence following identification of a Preferred Alternative and prior to certification of the Final EIR. 3. Amendment to the WRC MSHCP to be requested by the County after the Final EIR is certified. 4. Approval of replacement lands pursuant to the SKR HCP, WRC MSHCP minor amendment, and LM MSHCP discretionary action, will be requested by the County after certification of the Final EIR.

Agency	Permit/Approval	Status
California State Water Resources Control Board	• Coverage under the General Permit for Discharges of Stormwater Associated with Construction Activity (Construction General Permit, Order No. 2009-0009-DWQ) • Water Discharge Permit, approval of NOI to comply with General Construction Activity • National Pollutant Discharge Elimination System (NPDES) Permit	• Following completion of the Final Design phase of the project. • NOI to be submitted prior to construction. • Application to be submitted prior to construction.
Western Riverside County Regional Conservation Authority (RCA)	• Minor Amendment under Section 7.2.2 • Concurrence with County MSHCP Consistency Determination and JPR finding	• Minor amendment to the WRC MSHCP will be requested by the County following approval of a Preferred Alternative. • JPR finding and concurrence with County MSHCP Consistency Determination following approval of Minor Amendment, and prior to EIS ROD.
County of Riverside, Riverside County Habitat Conservation Agency (RCHCA)	• Approval of replacement lands pursuant to the SKR HCP • Section 4(f) consultation • LM MSHCP discretionary action	• Approval of replacement lands pursuant to the SKR HCP will be requested by the County after certification of the Final EIR. • Section 4(f) consultation will be completed prior to completion of the Final EIR/EIS.
Regional Water Quality Control Board 8 (RWQCB)	Section 401 Water Quality certification	Application to be submitted prior to construction.
County of Riverside	Temporary construction permits and relinquishment of County right of way to MWD	To be coordinated during Final Design phase of the project.
City of Corona	Approval of encroachment permits and street construction permits, and improvements within public right of way	Actions/permits would be issued prior to start of construction.
Riverside County Flood Control and Water Conservation District (RCFCWCD)	Encroachment permits for improvements affecting RCFCWCD facilities	Application(s) to be submitted prior to construction.
Caltrans, District 8	Encroachment Permit for work within I-215 right of way.	Application to be submitted prior to construction.
Metropolitan Water District of Southern California (MWD)	• LM MSHCP discretionary action • Section 4(f) consultation • Land transfers between MWD and County	• Discretionary action and consultation following approval of Preferred Alternative; land transfers following Final EIR/EIS. • Section 4(f) consultation will be completed prior to completion of the Final EIR/EIS.
Burlington Northern Santa Fe (BNSF)	• Encroachment permit • Required for work performed within railroad right of way	To be acquired prior to any construction activity occurring within BNSF right of way.
California Public Utilities Commission	Compliance with Public Utilities Code Sections 1201 through 1205, for grade separated structure over BNSF rail line	Application to the California Public Utilities Commission to occur during Final Design phase of the project

Agency	Permit/Approval	Status
State Historic Preservation Officer (SHPO)	• Concurrence with agencies' determinations of eligibility and findings of effect • Memorandum of Agreement	• SHPO concurrence with determinations of eligibility and findings of effect confirmed. • Memorandum of Agreement consultation will be completed prior to completion of the Final EIR/EIS.
Participating Native American Tribes	Required consultation under National Historic Preservation Act, Section 106, including (but not limited to): determinations of eligibility, findings of effect, and future work that includes involvement with the Memorandum of Agreement, Archaeological Monitoring Plan, and Data Recovery Plan	Native American consultation for the project is ongoing.

5.2 Scoping Process

5.2.1 Initiation of Scoping

As part of the CEQA and NEPA process, a scoping meeting is required as part of the preparation of an EIR and EIS. An NOP for the EIR and a NOI to prepare an EIS were advertised to the public and mailed to elected officials and local, state, and federal agencies having jurisdiction or discretionary approval within the project corridor in September 2011 and September 2012, respectively. The NOP was received and accepted by the State Clearinghouse on September 6, 2011, and the NOI was published in the Federal Register on September 26, 2012. A copy of the NOP is included on the following page.

The NOP comment period initiated September 6, 2011, and went through to October 21, 2011; the NOI comment period initiated September 26, 2012, and went through to October 28, 2012. Responses to the NOP received from the public, organizations, environmental stakeholder groups, and agencies, including comments submitted during public scoping meetings, are summarized in Table 5-5. Copies of the original responses to the NOP and NOI received from organizations, environmental stakeholder groups, and agencies, are included in Appendix H.

Notice of Preparation

September 6, 2011

To: Reviewing Agencies

Re: Cajalco Road Widening and Safety Enhancement Project
SCH# 2011091015

Attached for your review and comment is the Notice of Preparation (NOP) for the Cajalco Road Widening and Safety Enhancement Project draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Mary Zambon
Riverside County Transportation Department
3525 14th Street
Riverside, CA 92501

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

SCH# 2011091015
Project Title Cajalco Road Widening and Safety Enhancement Project
Lead Agency Riverside County

Type NOP Notice of Preparation

Description The County of Riverside (County) is proposing to widen Cajalco Road from two to four lanes between Harvill Avenue to the east and Temescal Canyon Road to the west, and from four to six lanes between Interstate 215 (I-215) southbound ramps and Harvill Avenue. Related proposed improvements include traffic signals, bus turnouts, additional turn lanes, and watercourse crossing and drainage improvements.

5.2.2 September 2011 CEQA Public Scoping Meetings

Two public scoping meetings were held in September 2011, in conjunction with the CEQA NOP comment period. Meeting locations were selected based on their proximity to the project and local communities, accessibility, room capacity, and availability. The first meeting was held at 6:30 p.m. on Monday, September 26, 2011, at Lake Mathews Elementary School (12252 Blackburn Road, Riverside, CA 92503), and the second was held at 6:30 p.m. on Thursday, September 29, 2011, at Tomas Rivera Middle School (21675 Martin Street, Perris, CA 92570). Notices for the meetings were distributed to agencies, organizations, interested groups, individuals, and residents within 500 feet of the proposed project and were made available on a website and at the County office and local libraries.

Attendees of each scoping meeting had the opportunity to learn about the project and ask questions of representatives from the County involved with the planning process. Attendees were also able to provide input on the proposed alternative alignments and issues to be addressed in the EIR through comment cards made available in English and Spanish at the meetings. A court reporter and Spanish interpreter were present at the public meetings. Verbal comments and comment cards received during the meeting and calls, emails, and comment cards submitted during the public scoping period are summarized in Table 5-5. Transcripts for each meeting are included in Appendix H

Comments received from the public, environmental stakeholder groups, and agencies during the public scoping period included following topics: environmental impacts involving biological resources, cultural resources, air quality, and noise; community impacts involving safety, traffic, property access, and property acquisition; and general project inquiries and comments involving project phasing, project as an economic catalyst, funding equity, information requests, and statements in support of or against project. All comments have been considered and incorporated, as appropriate, into the preliminary engineering and EIR/EIS.

Table 5-5. CEQA Scoping Summary – September 6 through October 21, 2011

Date	Name / Affiliation	Comment Topics and Summary
9/7/11	Debbie & Carl Winzen	*Comment topic:* Traffic, Air Quality, Noise Opposes the project. Concerned with traffic, noise levels, and additional traffic in community using Cajalco Road as a route from Interstate 215 (I-215) to Interstate 15 (I-15).
9/7/11	Kimberlie Gurule, Southern California Edison Mapping Services	*Comment topic:* General/Other Incorrect contact.
9/8/11	Sean Berry, Santa Rosa Historical Mining District & Preservation Society	*Comment topic:* Biological Resources, Cultural Resources Supports Cajalco improvements over Mid-County Parkway (MCP) Project; concerned with biological resources and cultural resources in the area.
9/10/11	Carlene Brown	*Comment topic:* Design/Configuration, Traffic Cajalco Road needs widening and only route would be to stay on Cajalco Road. Should become a major freeway, as the traffic is non-stop. Add shopping center at Harvill Road/Cajalco Road or Alexander Street/Cajalco Road. This is sound reasoning and also would give jobs to hundreds of people.

Date	Name / Affiliation	Comment Topics and Summary
9/12/11	JoAnn McAnlis	*Comment topic:* Property Impacts, Traffic, Safety, Air Quality Flooding/drainage between Seaton & Decker, north side of Cajalco Road. How much property acquisition? Add frontage road to address safety concerns with turning movements and median that stops cars from crossing the road. Truck traffic relative to noise and air quality impacts from diesel emissions.
9/12/11	Margarita Gonzalez	*Comment topic:* Property Impacts, General/Other Property impacts and acquisitions? When is project going to begin? What is available to understand project better? Can information be mailed?
9/13/11	Dan Silver, Executive Director, Endangered Habitats League	*Comment topic:* Environmental Impacts, General/Other In agreement with addressing biological impacts via conformance with the County's WRC MSHCP. County should coordinate with RCTC's MCP Project. Concerns with WRC MSHCP conformance presented in 2009 letter to RCTC regarding the MCP Project apply equally to proposed project. 2010 letter from state and federal wildlife agencies included. Retain Endangered Habitats League on all mailing and distribution lists for project.
9/13/11	Lorraine & Michael Girod	*Comment topic:* General/Other Requests information regarding the public scoping meeting.
9/16/11	Tina McCauslin, Assistant Vice President, David L. Bonuccelli & Associates, Inc.	*Comment topic:* General/Other Represents a property owner; interested in receiving information.
9/20/11	Lauren Millsap	*Comment topic:* Traffic, Noise, Air Quality Traffic study results for proposed project and traffic volume patterns for segments around Lake Mathews. Necessary to widen Cajalco between El Sobrante and Temescal Road? Concerned widening will encourage higher traffic volumes (especially trucks) and increase noise and pollution. It's one thing to widen a road to relieve existing, and mitigate future traffic loads, but this project seems designed to actually encourage more traffic through this remote area.
9/21/11	Nathan Westphal, Board Member, Residents Association of Greater Lake Mathews (RAGLM)	*Comment topic*: Noise Consider rubberized asphalt for the proposed expansion to keep the noise level down. This will help limit the impact on wildlife as well as the community residents.
9/22/11	Joseph Ontiveros, Soboba Band of Luiseño Indians, Soboba Cultural Resources Department	*Comment topic*: Environmental Impacts, Cultural Resources The project area falls within the boundaries of Soboba's Tribal Traditional Use Areas. The land is regarded as highly sensitive to the people of Soboba. Soboba Band of Luiseño Indians is requesting the following: 1. To initiate a consultation with the project developer and land owner. 2. The transfer of information to Soboba regarding the progress of this project should be done as soon as new development occurs. 3. Soboba continues to act as a consulting tribal entity for this project. 4. Requests that Native American monitor(s) from Soboba's Cultural Resources Department to be present during any ground-disturbing proceedings. 5. Requests that proper procedures are taken and requests of the tribe be honored for cultural items, treatment and disposition of remains, coordination with county coroner's office, and non-disclosure of location reburials.
9/25/11	Jane Gustafson	*Comment topic:* General/Other, Traffic, Noise, Air Quality Route has been studied many times at taxpayers' expense; status of eight prior proposed routes? Property impacts and traffic during construction. Property acquisition and displacement concern.

Date	Name / Affiliation	Comment Topics and Summary
9/26/11	Harold Gotts	*Comment topic:* Property Impacts Property impacts including loss of water well/water source, access.
9/26/11	Mrs. Hunt	*Comment topic:* Design/Configuration, Traffic, Noise, Air Quality Semi-truck traffic and associated noise and air quality. Circulation and access for Harley John Road, Cowan Road, and Dustin Road.
9/26/11	David Eakin	*Comment topic:* Design/Configuration, General/Other, Safety, Project Support Project needed for safety. Cajalco Road too dangerous to leave the way it is. Recommends Alternative 2: 1. If Alternative 2 is used, that would divert most of the heavy traffic. Diesel exhaust and auto exhaust would be farther away from the lake and would be better for water purity, water quality. There would be no exhaust running into the lake that way. 2. Most of that land, even though it is pristine and not being used, should be used for an improvement like this. Believes the land that is required for Alternative 2 is not in a wildlife preserve, which means that the existing Cajalco Road would be removed and that land could go back to being part of the immediate preserve surrounding the lake or on the south side of the lake. Only problem is that at the intersection of the existing Cajalco Road and La Sierra an extension of La Sierra Avenue needs to be put in north from the existing intersection to wherever Alternative 2 is so that those by the intersection of Lake Mathews Drive and Cajalco Road would have an easier way of getting into the La Sierra Avenue part of town and back, because Alternative 1 has an intersection at Cajalco Road and La Sierra Avenue but there is no extension of La Sierra Avenue south of the Alternative 2 route.
9/26/11	Debra Smith	*Comment topic:* Design/Configuration Maintain access to La Sierra Avenue.
9/26/11	Tuan and Arlene Van	*Comment topic:* Design/Configuration, Project Support Supports Alternative 1; widen existing road.
9/26/11	Mohammad Ali	*Comment topic:* General/Other, Project Support Supports proposed project; needed and helps commuters.
9/26/11	Teri Bruce	*Comment topic:* Design/Configuration, Project Support Supports Alternative 1: 1. Safer for many children in the neighborhood, including handicapped children. 2. Would like the access to La Sierra Avenue to remain as it is now. 3. Access to homes and neighborhoods would be farther away from the noise of a four-lane highway.
9/26/11	Dyan Pass	*Comment topic:* Property Impacts Concerned about egress and ingress into commercial center. Already have been affected by prior road improvements and hopes that the County will connect and communicate to help keep the business center accessible and not block it off. Has been accessible to community for over 30 years.
9/26/11	Kirk Ramsey	*Comment topic:* Design/Configuration 23570 Cajalco Property is drawn wrong on “Preliminary 9/26/11 Riverside Co Trans Dept – Alternates 1 & 2 – Cajalco Rd Widening & Safety Enhancement Project east end from Harley John Rd. to I-215” map, which makes “proposed right of way” wrong – advise.
9/26/11	Don Hunt	*Comment topic:* Noise and Air Quality A large number of semi-trucks currently rumble down Cajalco Road and that does not fit in a neighborhood environment. Noise and air quality?

Date	Name / Affiliation	Comment Topics and Summary
9/26/11	Leann Kluck	*Comment topic:* Property Impacts, General/Other 1. This project is unnecessary. Use State Route 74 and widen downtown Perris. The Metrolink is being put in there anyway. 2. How many people will lose their homes? 3. How much eminent domain? Current egress safety issues, don't see any way it can be safer with four lanes and 60–65 mile per hour speed.
9/26/11	Lyle Falls	*Comment topic:* Design/Configuration Need 90-degree intersection at Lake Mathews Drive. Prefer Alternative 1
9/26/11	Paula Vice	*Comment topic:* General/Other, Project Support Project needed. Almost been in two head-on collisions due to unsafe passing.
9/26/11	Charles Bruce	*Comment topic:* Design/Configuration, Safety Would like to see Alternative #1. 1. Still have access to La Sierra. 2. Turn existing part of Cajalco Road into private road toward homes. 3. It would be safer for the many children in neighborhood.
9/26/11	Denise Jones	*Comment topic:* Design/Configuration, Noise No light pollution. View of the lake and the city beyond will be greatly affected. How will light pollution be minimized? Supports Alternative 1. 1. Use the contractor from the last road improvement. 2. Provide a map or diagram to scale showing the homes on Descanso that are west of Lake Mathews Drive and the proposed and alternate routes of the widening project. It's difficult to view this on the existing maps at the meeting. What will be the ambient noise levels at this location during peak and nonpeak travel times? Compare that with existing zero noise level and provide that info with Alternatives 1 & 2.
9/26/11	Lanette Bodiford	*Comment topic:* Safety/Noise, Project Support Believes that the widening of Cajalco Road has been needed for some time. The safety measures are also greatly needed. May also be a need for soundwalls in the area due to additional traffic noise. Homes are already subject to substantial noise during high traffic times.
9/26/11	Steve T Adams & Maurice Adams	*Comment topic:* General/Other Keep on Cajalco Project mailing list.
9/26/11	Lanette Bodiford	*Comment topic:* Noise There may be a need for soundwalls in the area due to additional traffic noise. Homes are already subject to substantial noise during high traffic times.
9/27/11	Rick Simmons	*Comment topic:* Traffic, Noise, Property Impacts Lives very close to where the proposed widening is to take place and concerned about the noise pollution, air pollution, safety, and increased traffic it will bring near his house.
9/27/11	Carolyn Schmidt	*Comment topic:* General/Other, Project Support Supports Alternative 1.
9/27/11	Kris Flanigan, Senior Civil Engineer, RCFCWCD	*Comment topic*: General/Other 1. Portions of the proposed project may be within the 100-year Zone A floodplain limits. If the proposed project will affect watercourses that may have floodplain associated with them, the Draft EIR should address potential direct and indirect floodplain impacts. 2. The proposed project is within the Mead Valley and Perris Valley Master Drainage Plans and the Lake Mathews Area Drainage Plan. The Draft EIR should address impacts on these drainage plan facilities within the proposed project area. 3. Any work that involves RCFCWCD right of way, easements, or facilities will require an encroachment and should be coordinated with RCFCWCD.

Date	Name / Affiliation	Comment Topics and Summary
9/28/11	Ian MacMillan, Program Supervisor, CEQA Inter-Governmental Review, SCAQMD	*Comment topic:* Air Quality, General/Other Recommendations regarding the analysis of potential air quality impacts from the proposed project that should be included in the draft CEQA document. Send SCAQMD a copy of the Draft EIR upon its completion, including all appendices or technical documents related to the air quality and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files. These include original emission calculation spreadsheets and modeling files (not Adobe PDF files). Without all files and supporting air quality documentation, SCAQMD will be unable to complete its review of the air quality analysis in a timely manner. Any delays in providing all supporting air quality documentation will require additional time for review beyond the end of the comment period. SCAQMD recommends that the lead agency use the CEQA Air Quality Handbook as guidance when preparing its air quality analysis. The lead agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips, should be included in the analysis. The SCAQMD requests that the lead agency quantify particulate matter 2.5 microns or less in diameter (PM2.5) emissions and compare the results to the recommended PM2.5 significance thresholds. SCAQMD recommends calculating localized air quality impacts and comparing the results to localized significance thresholds. In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment. In the event that the project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate significant adverse air quality impacts. Please forward with Draft EIR and all appendices or technical documents related to the air quality and greenhouse gas analysis and electronic versions of all air quality modeling and health risk assessment file permits to SCAQMD directly.
9/28/11	Tim Armstrong, Technical Services-Biologist, Southern California Gas Company	*Comment topic:* General/Other Requests that the County include Southern California Gas Company in the environmental permitting process for the project, if the analysis requires relocation of Southern California Gas Company facilities within the footprint of the project site.
9/28/11	Thomas Molter	*Comment topic:* Design/Configuration, Project Support Supports Options 1 and 2, but prefers Option 1 providing that the existing portion of Cajalco Road from the Forestry Substation include the homes served by Lynette Lane, Hollis Lane, and Dirt Road becomes a private access only roadway for those homes.
9/28/11	Jeff Radway	*Comment topic:* Design/Configuration, Project Support Supports Options 1 and 2, but prefers Option 1 realignments providing that the existing portion of Cajalco Road from the Forestry Substation include the homes served by Lynette Lane, Hollis Lane, and Dirt Road becomes a private access only roadway for those homes. Would like Cajalco Road to go through instead of being a dead end road, which would be better for the Forestry Substation and emergency access and improve access to the new Cajalco Road.
9/29/11	Lee Cussins	*Comment topic: General/Other* Wondering how soon the guidelines will be disseminated? Understood construction would start if project goes in through about 2017. When will it be completed?

Date	Name / Affiliation	Comment Topics and Summary
9/29/11	Efren Arias	*Comment topic:* Safety/Noise Lives just at the corner of Una Street and has seen a lot of accidents. Greatly concerned about traffic accidents, has witnessed fatalities. Will a retaining wall be built for the noise or prevent from cars going inside the houses that are just on the side of the road?
9/29/11	Rose Rico	*Comment topic:* Air Quality, Property Acquisition How will air quality impacts affect health of residents in the years to come once this roadway is built? How will property acquisition work? Will property be purchased or taken away?
9/29/11	Efren Arias	*Comment topic:* Noise Concerned that existing traffic noise with only two lanes will be worse with four or six lanes. Will soundwalls be built to reduce noise?
9/29/11	Edward Avila	*Comment topic*: Utilities Recommends constructing a sewer along Cajalco Road.
9/29/11	Carlotta Fuerstenberg	*Comment topic*: Construction, General/Other Recommends not installing a signal light on Seaton Avenue. Was told that they are doing a bridge to widen it over I-215. Does that mean that they will expedite it, like night work? Were they going to employ night work to rush it?
9/29/11	Rose Rico	*Comment topic*: Flooding, General/Other Wants more information about a box that will divert the flooding in the corner empty vacant area, plus the house across the street. Is there a flood box at the corner of Ramona and Perris Boulevard? Will crosswalks be installed? Will there be detours for the construction coming down? And if there are any, which streets will you use?
9/29/11	Nick Luick	*Comment topic*: General/Other What are the speed limits on comparable roads?
9/29/11	Rose Rico	*Comment topic*: General/Other Requests information on comments opposing the project, the reasons given, and documentation. Are there comparisons to other areas where similar projects have taken place?
9/29/11	Abel Maldonado	*Comment topic*: General/Other Will there be a signal light on Cajalco Road and Alexander?
9/29/11	Abel Maldonado	*Comment topic*: Flooding, General/Other Lives right on the flooding center point on Alexander and Wells. Will something crossing along this property on both sides be installed?
9/29/11	Tim Holmes	*Comment topic:* Design/Configuration Will fencing be put up along areas open where game can cross over, like the Lake Mathews areas, or is that going to be still wide open? The way the road is now, traffic dies down substantially about 10 or 11 p.m., so a lot of game crosses at that time. When you open this up, there is going to be 24-hour traffic.
9/29/11	Unidentified speaker	*Comment topic:* Design/Configuration Will a walkway or sidewalk be installed all the way up to Cajalco Road?
9/29/11	Jennifer (last name unknown)	*Comment topic:* Design/Configuration, Noise What will the speed limit be? Based on some of the area east of Harley John Road, will traffic lights be the same, or will speed limits or number of traffic lights be modified? The speed limit is currently 50 miles per hour (mph), which seems high for a residential area, but widening of the road will cause people to exceed the speed limit, so the speed limit should be reduced. How will traffic noise be reduced? Lives on Cajalco Road, where there is currently a lot of traffic, and the four-lane road is going to increase the amount of traffic noise. A soundwall may add an echo to the valley, which would not reduce the amount of noise.
9/29/11	Unidentified speaker	*Comment topic:* Design/Configuration Will bike lanes and horse trails continue past Mead Valley or are there certain parts of the Cajalco project that will have bike lanes and lanes for horses?

Date	Name / Affiliation	Comment Topics and Summary
9/29/11	Unidentified speaker	*Comment topic:* Air Quality Cars running at freeway speed burn much cleaner than they do at slower speeds. Is a retired mechanic.
9/29/11	Charles Duane Romero	*Comment topic:* General/Other, Project Support Please start construction as soon as possible, as the four lanes will help prevent traffic accidents. Also supports the proposed Shell gas station and 7-Eleven.
9/29/11	Rose Rico	*Comment topic:* General/Other, Design/Configuration Median in certain areas to change to double lines. When will residents be informed of how their properties will be affected?
9/29/11	Joy De Fries	*Comment topic:* General/Other, Project Support Supports the project.
9/29/11	Mike Margis	*Comment topic:* Construction After they widen Cajalco Road, will there be a right of way, an area for cars to pull off the road as needed, and if so how will it be?
9/29/11	Maria Cervantes	*Comment topic:* Design/Configuration Dislikes the raised median; prefers a yellow safety line. Does not want to drive on a back street to get to her property. Likes the four lanes.
9/29/11	Conrado & Santos Martinez	*Comment topic:* General/Other, Project Support Supports project. How it will be constructed and what will happen to those living near the freeway?
9/29/11	Edward Mercado	*Comment topic:* Design/Configuration Suggests putting in a signal at the intersection of Cajalco Road and Seaton Avenue to avoid future accidents.
9/29/11	Ramon Vasquez	*Comment topic:* Property Impacts Prefers the plan that minimizes taking some of his property on Cajalco Road. Proposal 1 would be more efficient on Cajalco Road. His business will be affected if his property is shortened and taken away.
9/30/11	Kerwin Russell, Natural Resources Manager, RCRCD	*Comment topic:* Environmental Impacts, General/Other The project has the potential to affect plants and wildlife under the management of RCRCD. Some of the lands also occur in areas with lands that have been required as mitigation under previous permits and under control of RCRCD. RCRCD is concerned about the loss of mitigated lands and replacement or protection of those lands. The CEQA document should include an alternative analysis that focuses on special survey areas, biological resources, and mitigation measures.
9/30/11	Al Shami, Project Manager, Brownfields and Environmental Restoration Program Department of Toxic Substances Control	*Comment topic:* Hazards, General/Other 1. The EIR should evaluate whether conditions within the project area may pose a threat to human health or the environment. 2. The EIR should identify the mechanism to initiate any required investigation and/or remediation for any site that may be contaminated, and the government agency to provide appropriate regulatory oversight. 3. Any environmental investigations sampling and/or remediation for a site should be conducted under a work plan approved and overseen by a regulatory agency that has jurisdiction to oversee hazardous substance cleanup. 4. If buildings, other structures, or asphalt- or concrete-paved surface areas are planned to be demolished, an investigation should be conducted for the presence of other hazardous chemicals, mercury, and asbestos-containing materials. 5. Future project construction may require soil excavation or filling in certain areas. 6. Human health and the environment of sensitive receptors should be protected during any construction or demolition activities. 7. If it is determined that hazardous wastes are, or will be, generated by the proposed operations, the waste must be managed in accordance with the

Date	Name / Affiliation	Comment Topics and Summary
		California Hazardous Waste Control Law and Hazardous Waste Control Regulations. 8. The Department of Toxic Substances Control can provide cleanup oversight through an Environmental Oversight Agreement for government agencies that are not responsible parties, or a Voluntary Cleanup Agreement for private parties.
10/3/11	James Dailey, Level 3, OSP Engineer So Cal	*Comment topic:* Property Impacts Level 3 has a fiber optic facility on Cajalco Road between Wood and Clark. Level 3 also has a second fiber optic facility crossing Cajalco Road at Temescal Canyon Road. Review As-Builts for potential conflicts. Also, please send a plan set when available.
10/4/11	Jeff Brandt, Senior Environmental Scientist, California Natural Resources Agency, CDFW Inland Desert Region	*Comment topic:* Environmental Impacts The proposed project occurs within the WRC MSHCP and is subject to the provisions and policies of the WRC MSHCP. The County is signatory to the Implementing Agreement and is a Permittee of the WRC MSHCP. Participants in the WRC MSHCP are issued take authorization for covered species. The Draft EIR should include a discussion of the impact of the project on the proposed extension of Core 2 for the WRC MSHCP. The Draft EIR should discuss potential impacts from Alternative 2 on the El Sobrante Landfill HCP and any conserved lands associated with it. The Draft EIR should also discuss any potential impacts on and mitigation for lands already in conservation, or lands serving as mitigation sites for CDFW streambed alteration agreements, RWQCB 401 certification, or USACE 404 permits, as well as lands managed by RCRCD. The project has the potential to affect southern riparian forest, southern willow scrub, mule fat scrub, and Riverside sage scrub. The Draft EIR should focus on the potential adverse impacts of roadways on wildlife, particularly existing wildlife crossings, and measures to mitigate those impacts. CDFW is concerned about the continuing loss of jurisdictional waters of the state and the encroachment of development into areas with native habitat values. The Draft EIR should contain sufficient, specific, and current biological information on the existing habitat and species at the project site; measures to minimize and avoid sensitive biological resources; and mitigation measures to offset the loss of native flora and fauna and state waters. If the project site contains federally or state-listed species, the Draft EIR should include measures to avoid and minimize impacts on these species as well as mitigation measures to compensate for the loss of biological resources. The Draft EIR should not defer impact analysis and mitigation measures to future regulatory discretion actions, such as a Lake or Streambed Alteration Agreement. This project has the potential to have significant environmental impacts on sensitive flora and fauna resources. Therefore, the Draft EIR should include an alternatives analysis that focuses on environmental resources and ways to avoid or minimize impacts on those resources. To enable CDFW staff to adequately review and comment on the proposed project, CDFW suggests that updated biological studies be conducted prior to any environmental or discretionary approvals. The Draft EIR should include any actions or approvals taken by the WRC MSHCP. The following information should be included in any focused biological report: 1. A summary of the structure, purpose, and obligations of the lead agency under the WRC MSHCP and an analysis of the project in relation to the Area Plan and Criteria Cell biological goals and objectives. 2. A complete assessment of the flora and fauna within and adjacent to the project area, with emphasis on identifying endangered, threatened, and locally unique species and sensitive habitats. 3. A thorough discussion of direct, indirect, and cumulative impacts expected to adversely affect biological resources, with specific measures to offset such impacts. 4. A range of alternatives analyzed to ensure that alternatives to the proposed project are fully considered and evaluated.

Date	Name / Affiliation	Comment Topics and Summary
		Although the proposed project is within the WRC MSHCP and could be subject to Section 6.1.2, Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools, a Lake and Streambed Alteration Agreement Notification is still required by CDFW should the site contain jurisdictional waters. CDFW's criteria for determining the presence of jurisdictional waters are generally more comprehensive than the WRC MSHCP criteria in Section 6.1.2. The Draft EIR should include a jurisdictional delineation if there are impacts on riparian vegetation or state waters. CDFW opposes the elimination of watercourses and/or their channelization or conversion to subsurface drains. All wetlands and watercourses, whether intermittent or perennial, must be retained or mitigated for and provided with substantial setbacks, which preserve the riparian and aquatic values and maintain their value to on-site and off-site wildlife populations.
10/4/11	J. Hill, CA Boulder Springs Holdings, LLC c/o TriMont Real Estate Advisors	*Comment topic:* Property Impacts Both alternatives show a "Staging Area" on the Boulder Springs property at Carpinus and Cajalco Road; opposed to that usage as the owner of the property. Usage could affect development of the larger parcel it is a part of as well as have an environmental impact on the site.
10/5/11	Carolyn Schmidt	*Comment topic:* General/Other, Project Support Supports Option 1.
10/5/11	Lawrence Savedra	*Comment topic:* General/Other Requests to be on the project mailing list.
10/6/11	Sid Woods	*Comment topic:* General/Other, Project Support Wants to see improvements occur and inquired as to the timeframe for construction.
10/7/11	Claudia Naber Amazonia Wildlife	*Comment topic:* Property Impacts, Noise Property will be directly affected. Important that the project team studies noise levels at various times of the day and at various heights of the road. Requests that the road not be raised because it increases the noise level. Supports the no-build option.
10/11/11	Robert Pring	*Comment topic:* Traffic, Project Support Supports Option 1. Access for Hollis Lane area should include turn pockets and traffic signal for safety. Access to La Sierra Avenue must be maintained. Turn pockets should be provided for the businesses at Lake Mathews Store.
10/11/11	Linda Riley	*Comment topic:* Property Impacts The prevailing winds will carry the noise and air pollution directly to the residences of Lake Mathews. Large, growing distribution centers at the eastern end of Cajalco Road and the Moreno Valley area will likely cause Cajalco Road to become a trucking route. Is the County ignoring this problem like it has in Mira Loma? Even though this type of project has been planned for years, it didn't take into consideration the future effects of distribution center development and the thousands of trucks that will be using this route. Distribution centers are not the answer and will only continue the degrading image and path toward low-paying jobs in Riverside. Is this a false fix to the lack of jobs in the area? Until big rigs can run without emissions and noise we need to stop the distribution centers immediately.
10/12/11	Aurora Fong EMWD	*Comment topic:* General/Other Requested information regarding potential impacts on EMWD's aboveground facility at the intersection of Cajalco Road/Clark.
10/13/11	Debbie Duran	*Comment topic:* General/Other Interested in getting more information on the project. Wants to know if there is a website or place to receive more information. Lives right off Cajalco Road, and wants to know how this will be affecting her.

Date	Name / Affiliation	Comment Topics and Summary
10/13/11	Ryan Ross, Planner, Riverside County Waste Management Department	*Comment topic:* Property Impacts Alternative 2 will encroach on land conserved for the El Sobrante Landfill HCP. Any encroachment into HCP lands will require an amendment to the HCP and its Implementing Agreement. The Draft EIR must address potential impacts on El Sobrante Landfill HCP lands as a result of the encroachment of Alternative 2. Recommends Alternative 1 because it avoids the physical impacts on HCP lands.
10/14/11	Ken Gutierrez, AICP, Planning Director, City of Riverside Community Development Department, Planning Division	*Comment topic:* Traffic Although not an active annexation area, the project area is within the City's Southern Sphere of Influence. As such, City staff offers the following comment related to traffic impacts: As indicated in the IS, a traffic analysis using Riverside County Congestion Management Program guidelines will be conducted in conjunction with this project. City staff requests that the City be provided the opportunity to review and comment on the traffic model and trip distribution during the preliminary stages, prior to completion of the traffic analysis and Draft EIR. Furthermore, City staff requests that a copy of the traffic analysis along with the Draft EIR be forwarded to the City as soon as these documents are available so that staff can review them and provide any necessary feedback during the review period.
10/15/11	Mike Record	*Comment topic:* Design/Configuration, Other Opposes the four-lane proposal. Should be six lanes. The San Jacinto Valley will be economically affected for decades. There also should be off-ramps at intersections.
10/15/11	John C. Walter Sr.	*Comment topic:* General/Other Add to Cajalco Project mailing list.
10/16/11	Nancy Urtado	*Comment topic:* Design/Configuration Please consider that in order for the corridor to meet the needs of the Riverside County Integrated Plan (RCIP) and Community and Environmental Transportation Acceptability Process (CETAP), a number of features must be incorporated into the project. These include the following: 1. Design and construct the project in a manner that is complementary to and an extension of the MCP Project per Riverside County Policy SJVAP 13.1 Hemet to Corona/Lake Elsinore CETAP corridor in accordance with the CETAP Corridors section of the County General Plan Circulation Element. 2. Develop phasing for the proposed project and MCP Project in such a way that ensures equity in the funding and capacity on each project. 3. Design and construct the project so that it can be expanded to accommodate not less than six lanes of traffic per the County General Plan and in conformance with Caltrans Highway Design Manual standards. 4. Design and construct the project in recognition that the facility is regional in nature. 5. Design and construct the project to ensure that traffic can flow without significant impediments and in the most expeditious manner per the 2008 County Regional Transportation Improvement Program (RTIP). If the project is developed without these considerations, it will not meet the RCIP and the CETAP goals. Furthermore, it would likely not function as a true regional corridor capable of alleviating the traffic pressures experienced by other east-west corridors. Finally, without these design and construction considerations, economic development opportunities in the San Jacinto Valley, Winchester, Homeland, Romoland, Nuevo, East Lake, Perris, Moreno Valley, and Menifee will be severely affected.
10/17/11	Gus Gonzalez, Associate Planner, City of Riverside Department of Community Development	*Comment topic:* Traffic Impacts City staff requests that the City be provided the opportunity to review and comment on the traffic model and trip distribution during preliminary stages, prior to completion of the traffic analysis and Draft EIR. City staff requests that copies of the traffic analysis and Draft EIR be forwarded to the City so that staff can review them and provide feedback.

Date	Name / Affiliation	Comment Topics and Summary
10/17/11	Anne Absey	*Comment topic*: General/Other Founding director and general manager of Animazonia Wildlife Foundation, a permanent sanctuary for exotic cats and reptiles. The 5-acre facility borders the south side of Cajalco Road, three lots east of the Harley John Road/Cajalco Road intersection. Has some concerns about how this project will affect the sanctuary and the animals and people who live, visit, and work there. Concerns are based on expected effects of the construction and the new road and also past experience from the construction of the flood control channel and the subsequent raising of the Cajalco Road roadbed in the area bordering sanctuary land. Believes the resulting noise, fumes, contamination of the water table, and loss of privacy will be exacerbated by the proposed project. Asks that the following be included in the Draft EIR: 1. Prove that the no-build option will result in more problems than those that will occur if the project continues. 2. Prove that the new road is necessary, taking into account not the development plan that is in place, but a revised development scenario considering the economic meltdown and failure to recover. 3. Prove that the continued housing and development that this road is supposed to facilitate along Cajalco Road is necessary and answer the following questions: • For the housing or development projects that do and would use Cajalco Road as a major ingress/egress, what traffic plan was in place to handle projects that have already been approved and/or started? Why is this not adequate to handle the traffic, especially because there is not full occupancy? • What are the numbers of unimproved lots in the area for which development plans are already in place? How many homes have been started but not finished? • How many homes are for sale but unsold? • How many boarded-up homes in the area? • All this points to the possibility that we really don't need continued expansion and development along Cajalco. 4. Prove that any additional lighting on the project (construction lighting, street lights, and intersection lights) will not negatively affect people, their homes, or animals, especially birds. 5. Prove that traffic patterns will be significantly improved with the new road considering that expansion will not continue as projected in the plans that originally indicated the new road was necessary. 6. Prove that there will be no degradation of the existing water table due to construction-related activities or to the future increase in traffic. MWD indicates that the increase in toxic chemicals in the water table due to the construction of the flood control channel and flood basin is measurable and cannot be cleaned up or mitigated. MWD advised Animazonia not to swim in, irrigate with, or drink the water pumped up from its well into the small pond on the property. What are the expected effects of the project, how will water table pollution be affected, and what will be done to mitigate it? 7. Prove that the land set aside for the SKR HCP in the local area will not be negatively affected by the project and what will be done to mitigate any impact. 8. Prove that existing wild animal and plant species will not be negatively affected by the construction itself or the finished project and what will be done to mitigate it. 9. Prove that the proposed animal corridors will be effective to preserve the quantity and diversity of the wild animal populations in the area. Animal corridors have been proven to be highly unsuccessful in other areas, because predators quickly learn to stalk prey when they emerge from the corridors. 10. Prove that there will be no increase in wildfire danger from the increased traffic, construction vehicles, or any other aspects of the project.

Date	Name / Affiliation	Comment Topics and Summary
		11. Prove that there will be no decrease in air quality along the road and address the air quality for all properties within 0.5 mile of the road both north and south, especially for those who will get the most direct pollution from the vehicles due to prevailing wind direction. Address what will be done to mitigate this. 12. Prove that the increase in air pollution from both the construction and the increased traffic will not harm the health or decrease the quality of life of the people and animals along the road and what steps will be taken to mitigate the harm. Vehicle emissions are a health hazard for people within a certain distance of a roadway. Especially concerned because Animazonia is within 100 feet. 13. Prove that the noise and vibration from both the construction and the final project will not diminish the quality of life or health for those along the project and what steps will be taken to mitigate this. 14. Prove that any soundwalls will not negatively affect the ambiance and rural nature of the area. Address the timing of building soundwalls because they are usually not built until after construction is done and therefore will not provide any protection during construction. 15. Prove that there will not be any reduction in the value of the land or houses along the corridor and address what will be done to mitigate any loss should it occur. 16. Prove that the loss of visual privacy to the residents along the project resulting from higher roadbeds and less protective screening from vegetation will not negatively affect the health, well-being, or property values of those living along the project and what will be done to mitigate this.
10/20/11	Cindy Jones Daverin, Habitat Manager, El Sobrante Landfill	*Comment topic:* Design/Configuration The IS does not mention that Alternative 2 proposes to take land that is part of the El Sobrante Landfill Preserve and does not address this impact. The El Sobrante Landfill has an HCP that was finalized in 2001. A portion of the land proposed to be affected under Alternative 2 is in the El Sobrante Preserve. The El Sobrante Preserve provides habitat for the benefit of 31 sensitive species that are HCP Covered Species. The direct and indirect impacts on the 31 Covered Species, the replacement of El Sobrante HCP mitigation lands, and the costs for amending the El Sobrante HCP would need to be addressed. The costs associated with this would need to be addressed and provided by the project proponent.
10/20/11	Jim Rossi, President, San Jacinto Chamber of Commerce	*Comment topic*: Design/Configuration The San Jacinto Chamber of Commerce feels that the need still exists for a regional transportation corridor between the Corona area and the San Jacinto Valley. However, in order to meet the needs of the RCIP and CETAP and to be a true catalyst of economic development, a number of features must be incorporated into the project. These include the following: 1. Design and construct the project in a manner that is complementary to and an extension of the MCP Project per County Policy SJVAP 13.1 Hemet to Corona/Lake Elsinore CETAP corridor in accordance with the CETAP Corridors section of the County General Plan Circulation Element. 2. Develop phasing for the proposed project and MCP Project in such a way that ensures equity in the funding and capacity on each project. 3. Design and construct the project so that it can be expanded to accommodate not less than six lanes of traffic per the County General Plan and in conformance with Caltrans Highway Design Manual standards. 4. Design and construct the project in recognition that the facility is regional in nature. 5. Design and construct the project to ensure that traffic can flow without significant impediments and in the most expeditious manner per the County RTIP. If the project is developed without these considerations, it will not meet the RCIP and the CETAP goals. Furthermore, it would likely not function as a true

		regional corridor capable of alleviating the traffic pressures experienced by other east-west corridors. Finally, without these design and construction considerations, economic development opportunities in the San Jacinto Valley, Winchester, Homeland, Romoland, Nuevo, East Lake, Perris, Moreno Valley, and Menifee will be severely affected.
10/20/11	City of San Jacinto	Comment topic: Design/Configuration The San Jacinto City Council supports the project subject to the following conditions: 1. Design and construct the project in a manner that is complementary to and an extension of the MCP Project. 2. Develop phasing that ensures equity in the funding and capacity on the proposed project and MCP project. 3. Design and construct the project so that it can be expanded to accommodate no less than six lanes of traffic. 4. Design and construct the project in recognition that the facility is regional in nature. 5. Design and construct the project to ensure traffic can flow without significant impediments and in the most expeditious manner.
10/20/11	Richard Miller, City Clerk, City of San Jacinto	*Comment topic*: General/Other The CETAP as part of the RCIP indicates that there will be such extensive regional traffic that an internal transportation corridor linking the Corona area to the San Jacinto Valley will be necessary. The City Council of the City of San Jacinto supports the proposed project subject to the following conditions: 1. Design and construct the project in a manner that is complementary to and an extension of the MCP Project per Riverside County Policy SJVAP 13.1 Hemet to Corona/Lake Elsinore CETAP corridor in accordance with the CETAP Corridors section of the County General Plan Circulation Element. 2. Develop phasing for the proposed project and MCP Project in such a way that ensures equity in the funding and capacity on each project. 3. Design and construct the project so that it can be expanded to accommodate no less than six lanes of traffic per the County General Plan and in conformance with the Caltrans Highway Design Manual standards. 4. Design and construct the project in recognition that the facility is regional in nature. 5. Design and construct the project to ensure that traffic can flow without significant impediments and in the most expeditious manner per the County RTIP.
10/20/11	Susan Nash, President, Friends of the Northern San Jacinto Valley	*Comment topic:* General/Other Concerned Caltrans is incorrectly implementing the delegated NEPA responsibilities by proceeding with an Environmental Assessment initially for this project instead of the NEPA-mandated EIS. NEPA clearly requires federal agencies to prepare an EIS for actions “significantly affecting the quality of the human environment.” The County and Caltrans have already made a “significant affect” determination via the CEQA IS that this project will significantly affect the environment, requiring a state-mandated EIR. (CEQA IS is equivalent to the NEPA Environmental Assessment.) Consequently, believes the public will be better served by the actual consultation and cooperation of County, state, and federal agencies implementing these environmental protection laws concurrently rather than consecutively; both CEQA and NEPA recommend and encourage this approach to project environmental review. Final concern is that the Draft EIR/EIS give required consideration to global warming. Climate change and its adverse environmental impacts are accelerating. In what ways will the Cajalco project directly, indirectly, and cumulatively contribute to this adverse environmental impact? How will this project mitigate for this adverse environmental impact?

Date	Name / Affiliation	Comment Topics and Summary
10/20/11	Friends of the Northern San Jacinto Valley	*Comment topic:* Environmental Impacts Concerned about the significant adverse impacts of the Cajalco project's noise and light on sensitive wildlife habitats. Noise and light pollution generated from the new or improved roadway will render WRC MSHCP lands unsuitable for many species, particularly the nocturnal SKR. Complete avoidance of noise and light intrusion onto WRC MSHCP conservation lands is the preferred mitigation for these impacts. Should the new roadway intrude into or be situated adjacent to WRC MSHCP lands, recommend consideration of earthen berms of sufficient stature to prevent unwanted noise and light intrusion into these sensitive wildlife conservation lands.
10/20/11	Ileene Anderson, Biologist/Public Lands Desert Director, Center for Biological Diversity	*Comment topic:* Environmental Impacts A majority of this site falls within the Lake Mathews-Estelle Mountain Reserve. This area is designated as an Important Bird Area, a reserve area for the federally and state-listed as endangered SKR, a reserve established under the LM MSHCP, and is a Core Reserve for the WRC MSHCP. The expansion of Cajalco Road must be carefully designed to avoid sensitive resources, minimize impacts, and substantially mitigate any impacts. In light of the sensitive nature of the proposed project area, not only should an EIR be produced under CEQA, but also an EIS not an Environmental Assessment should be produced under NEPA. Also the lead NEPA agency is unclear and should be clearly stated in the EIS. The conservation organizations request that thorough, seasonal surveys be performed for sensitive plant species and vegetation communities and animal species under the direction and supervision of the land management and resource agencies such as USFWS and CDFW. The conservation organizations request that the vegetation maps be at a large enough scale to be useful for evaluating the impacts. Adequate surveys covering all likely seasons in likely conditions must be implemented. The EIR/EIS must evaluate all direct, indirect, and cumulative impacts on sensitive habitats, including impacts associated with permitted and unpermitted recreational activities, introduction of nonnative plants, introduction of lighting and noise, creation of potential barriers to wildlife connectivity, and loss and disruption of essential habitat due to edge effects.
10/20/11	J. Marconi	*Comment topic:* Design/Configuration 1. Design and construct the project in a manner that is complementary to and an extension of the MCP Project per County Policy SJVAP 13.1 Hemet to Corona/Lake Elsinore CETAP corridor in accordance with the CETAP Corridors section of the County General Plan Circulation Element. 2. Develop phasing for the proposed project and MCP Project in such a way that ensures equity in the funding and capacity on each project. 3. Design and construct the project so that it can be expanded to accommodate not less than six lanes of traffic per the County General Plan and in conformance with Caltrans Highway Design Manual standards. 4. Design and construct the project in recognition that the facility is regional in nature. 5. Design and construct the project to ensure that traffic can flow without significant impediments and in the most expeditious manner per the County RTIP.
10/20/11	Robert and Candelaria Chandler	*Comment topic:* Property Impacts, Safety, General/Other House is about 100 feet away from the road and up on a hill; building is on permanent foundation about 50 feet from the road. Driveway is very steep; the 1.1-acre property is multi-level. Concern is driveway approach and ingress. Also concerned that a block/retaining wall will be needed to keep the land from sliding into the new road, especially during heavy rain. Current water lines run parallel with the road and water meter is two lots to the west. Will the water meter be relocated to the front of the property? There is a telephone pole located in the driveway; understand this will be relocated and adjusted. Will street lights be placed along the road as well?

Date	Name / Affiliation	Comment Topics and Summary
		Detailed sketches of the center median and possible turn-outs in the road indicate there will be an opening at Anderson; why not Decker? Have seen more accidents at the Decker intersection. Because there will be a center median in front of the driveway, how will we turn into the driveway going eastbound? The nearest turn-out would be Decker. Informed at the public meeting on September 29 that the speed limit may be raised. Even though the limit is currently posted at 50 mph on Cajalco Road, cars and big rigs drive 60 to 70 mph. Raising the limit would allow them to drive even faster. Property is 1.1 acre. Would the property size be considered? Would property taxes and property value be adjusted or affected? Can and will digital speed limit monitors be placed to inform drivers of their speed? Getting in and out of the driveway is biggest concern. Prevented from turning left toward I-215 by the center median. Inconvenient to always turn right and find another way to turn around to go back to I-215, not to mention the extra gas to always go around the block, which isn't a short or small area. Own two trailers and doing a U-turn at the next intersection (Clark) isn't possible. Will other side roads be paved to allow for this? To turn right and get to I-215, would have to turn right at Clark, then again at Markham, then to Harvill, and go all the way around to get to I-215. Constant back-tracking. Wants to be notified as changes are made to this project.
10/20/11	David L. Kepke	*Comment topic:* Design/Configuration, Project Support Supports option 1, the one that closely follows the existing path and has the bridge that eliminates one of the big curves around the lake. Supports the divided median. Advocates for a horse trail/bike path separate from the highway on the lake side of the highway.
10/20/11	Leslie Dale	*Comment topic:* General/Other, Project Support Supports proposal 1 because it will be the least expensive and best option for stakeholders' tax money.
10/20/11	Nathan	*Comment topic:* General/Other, Environmental Impacts Supports proposal 1 because it has the least impact on the area in the existing spot. Proposal 2 has some big curves that could potentially cause more collisions on an already dangerous road. Also supports a two-lane median, as future expansion would be less intrusive. Would like to see a trail separate from the expressway. Has a concern with potential lighting and would like to see a fully proposed design of potential lighting and the impact it may have on the environment, sensitive habitats, and the community as a whole. What would the zoning be for signage?
10/20/11	Paula Vice	*Comment topic:* General/Other, Project Support Supports the project, mostly for safety reasons. Has had two close calls of being hit head-on due to vehicles passing in unsafe conditions.
10/20/11	Michael Fred Allen	*Comment topic:* General/Other Thinks project team should develop the project with all the considerations necessary to meet the goals of the RCIP and the CETAP.
10/20/11	Matt Davis, Geographic Information Systems (GIS) Specialist, BLM Palm Springs - South Coast Field Office	*Comment topic:* General/Other Requesting GIS files used to create the PDF maps on the project's webpage.

Date	Name / Affiliation	Comment Topics and Summary
10/20/11	Harold Gotts	*Comment topic:* Property Impacts Property will be affected by the present configuration of the roadway. Property owner's water well will be in the area that is required. The driveway to the property will be rendered unusable if entering property from the west. Will have to drive east a quarter of a mile and make a U-turn on this high-speed four-lane highway. Property owner has a 34-foot trailer. This widening would also affect the resident to the west, as the water wells are in the same area. Thinks an alignment to the north of these lots would be a better route.
10/20/11	Susan Sturges, Life Scientist, Region 9, EPA Environmental Review Office	*Comment topic:* General/Other Add to Cajalco Project mailing list.
10/21/11	Linda Riley	*Comment topic:* Property Impacts Supporters of the project are disregarding impacts that would be experienced by those that live facing Cajalco Road. The County has previously referred to Cajalco Road as the future trucking route; the growing numbers of warehouses/ distribution centers going in on the eastern end of Cajalco Road will destroy the clean air and quiet existence. The prevailing winds will carry the traffic fumes and sound straight to homes. Was not aware expansion of Cajalco Road would provide a trucking route to distribution centers. Riverside County planners do not understand or care about how much permanent damage this business will do to Riverside's future and are paving the way to Riverside being viewed as a permanent low wage, polluted area like Mira Loma. Will there ever be a time when the planners will make a decision that will actually benefit existing tax-paying residents over big corporate money?
10/21/11	Anna M. Hoover, Cultural Analysis, Pechanga Band of Luiseño Mission Indians	*Comment topic:* Environmental Impacts, Cultural Resources The Pechanga Band of Luiseño Indians, "the Tribe," requests to be directly notified of all public hearings and scheduled approvals concerning this project. The County, Caltrans, and FHWA must include involvement of and consultation with the Tribe in its environmental review process. The project passes through at least one known Luiseño village complex/archaeological district and potentially several other activity areas. Because the Tribe retains cultural information that archaeologists do not necessarily have access to, it is imperative that the County continues consultation with the Tribe. In order to comply with CEQA, NEPA, and other applicable federal and California laws, it is imperative that the County, Caltrans, and FHWA consult with the Tribe in order to guarantee an adequate basis of knowledge for an appropriate evaluation of the project effects, as well as generating adequate mitigation measures. The Tribe asserts that the project Area of Potential Effects (APE) is part of Luiseño, and therefore the Tribe's, aboriginal territory. The Tribe welcomes the opportunity to meet with the County, Caltrans, and FHWA to further explain and provide documentation concerning its specific cultural affiliation to lands within your jurisdiction. The proposed project and the alternatives are in a highly sensitive region of Luiseño territory and the Tribe knows that subsurface resources will be recovered during ground-disturbing activities. The Tribe has much more information than can be provided in this letter and requests to continue consultation with the County, Caltrans, and FHWA to provide these sensitive and important data. Given the sensitivity of the area, inadvertent discoveries are foreseeable impacts and should be appropriately mitigated for within the confines of the project. The Tribe is not opposed to this project and, in fact, appreciates the improvements that are proposed for Cajalco Road, so long as they do not subvert County conditions of approval and mitigation measures already in place for the protection of certain cultural sites in perpetuity. The Tribe's primary concerns stem from the project's proposed impacts on Native American cultural resources. The Tribe is concerned about both the protection of unique and

Date	Name / Affiliation	Comment Topics and Summary
		irreplaceable cultural resources, such as Luiseño village sites, sacred sites, and archaeological items that would be displaced by ground-disturbing work on the project, and about the proper and lawful treatment of cultural items, Native American human remains, and sacred items likely to be discovered in the course of the work. The Tribe requests to continue to be involved and participate with the County, Caltrans, and FHWA in ensuring that an adequate environmental assessment is completed, and in developing all monitoring and mitigation plans and measures for the duration of the project. In addition, given the sensitivity of the project area, it is the position of the Tribe that Pechanga tribal monitors be required to be present during all ground-disturbing activities conducted in connection with the project, including any archaeological surveys and excavations performed. The Tribe believes that adequate cultural resources assessments and management must always include a component that addresses inadvertent discoveries. The Tribe believes that if human remains are discovered, state law would apply and the mitigation measures for the permit must account for this. The Tribe is requesting further meetings and consultations to develop appropriate mitigation to specifically address impacts on any sites or resources found during the archaeological site assessments. The Tribe asks that, at a minimum, the County include all mitigation from the Boulder Springs Specific Plan and Gavilan Hills Specific Plan regarding the protection and preservation of cultural sites that have the potential to be affected by the project, as well as the following mitigation measures in its environmental assessment documents: MM 1: Prior to beginning project construction, the project applicant shall retain a Riverside County qualified archaeologist. Any newly discovered cultural resource deposits shall be subject to a cultural resources evaluation. MM 2: At least 30 days prior to beginning construction, the project applicant shall contact the Pechanga Tribe to notify the Tribe of grading, excavation, and the monitoring program, and to coordinate between the County and the Tribe to develop a Cultural Resource Treatment and Monitoring Agreement. MM 3: Prior to beginning project construction, the project archaeologist shall file a pre-grading report with the County (if required) to document the proposed methodology for grading activity observation. Tribal monitors shall be allowed to monitor all grading, excavation, and groundbreaking activities, and shall also have the authority to stop and redirect grading activities in consultation with the project archaeologist. MM 4: If human remains are encountered, California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the Riverside County Coroner has made the necessary findings as to origin. If the Riverside County Coroner determines the remains to be Native American, the NAHC must be contacted within 24 hours. MM 5: The landowner shall relinquish ownership of all cultural resources, including sacred items, burial goods, and all archaeological artifacts that are found on the project site to the appropriate tribe for proper treatment and disposition. MM 6: All sacred sites, should they be encountered within the project area, shall be avoided and preserved as the preferred mitigation, if feasible. MM 7: If inadvertent discoveries of subsurface archaeological/cultural resources are discovered during grading, the developer, the project archaeologist, and the Tribe shall assess the significance of such resources and shall meet and confer regarding the mitigation for such resources. If the developer, the project archaeologist, and the Tribe cannot agree on the significance or the mitigation for such resources, these issues will be presented to the planning director for decision. Notwithstanding any other rights available under the law, the decision of the planning director shall be appealable to the Planning Commission and/or Board of Supervisors. The Tribe reserves the right to fully participate in the environmental review process, as well as to provide further comment of the project's impacts on cultural resources and potential mitigation for such impacts. Furthermore, the

Date	Name / Affiliation	Comment Topics and Summary
		Tribe reserves the right to participate in the regulatory process and provide comment on issues pertaining to the regulatory process and project approval.
10/21/11	Andrew F. Kotyuk	*Comment topic:* Design/Configuration The need still exists for a regional transportation corridor between the Corona area and the San Jacinto Valley. As such, the County has initiated the process to widen Cajalco Road to serve as that facility. In order for that facility to meet the needs of the RCIP and CETAP, and to be a true catalyst of economic development, a number of features must be incorporated into the project. These include the following: 1. Design and construct the project in a manner that is complementary to and an extension of the MCP Project per Riverside County Policy SJVAP 13.1 Hemet to Corona/Lake Elsinore CETAP corridor in accordance with the CETAP Corridors section of the County General Plan Circulation Element. 2. Develop phasing for the proposed project and MCP Project in such a way that ensures equity in the funding and capacity on each project. 3. Design and construct the project so that it can be expanded to accommodate not less than six lanes of traffic per the County General Plan and in conformance with Caltrans Highway Design Manual standards. 4. Design and construct the project in recognition that the facility is regional in nature. 5. Design and construct the project to ensure that traffic can flow without significant impediments and in the most expeditious manner per the County RTIP. If the project is developed without these considerations, it will not meet the RCIP and the CETAP goals. Furthermore, it would likely not function as a true regional corridor capable of alleviating the traffic pressures experienced by other east-west corridors. Finally, without these design and construction considerations, economic development opportunities in the San Jacinto Valley, Winchester, Homeland, Romoland, Nuevo, East Lake, Perris, Moreno Valley, and Menifee will be severely affected.
10/21/11	Muriel Dufresne	*Comment topic:* Design/Configuration The need still exists for a regional transportation corridor between the Corona area and the San Jacinto Valley. As such, the County has initiated the process to widen Cajalco Road to serve as that facility. If the project is developed without these considerations, it will not meet the RCIP and the CETAP goals. Furthermore, it would likely not function as a true regional corridor capable of alleviating the traffic pressures experienced by other east-west corridors. Finally, without these design and construction considerations, economic development opportunities in the San Jacinto Valley, Winchester, Homeland, Romoland, Nuevo, East Lake, Perris, Moreno Valley, and Menifee will be severely affected.

Date	Name / Affiliation	Comment Topics and Summary
10/21/11	Lori M. Stone Executive Director March JPS	*Comment topic:* Design/Configuration The March JPA, in partnership with its member agencies, believes that this project is a key economic catalyst for the future of the San Jacinto Valley and Perris Valley corridors. The widening of Cajalco Road to connect these two valleys will serve to alleviate traffic congestion, increase economic development opportunities, and meet the goals of the RCIP and CETAP. In order to achieve the objectives of the RCIP and CETAP, the March JPA recommends the following features be incorporated into the project: 1. Design and construct the project in a manner that is complementary to and an extension of the MCP Project per County Policy SJVAP 13.1 Hemet to Corona/Lake Elsinore CETAP corridor in accordance with the CETAP Corridors section of the County General Plan Circulation Element. 2. Develop phasing for the proposed project and MCP in such a way that ensures equity in the funding and capacity on each project. 3. Design and construct the project so that it can be expanded to accommodate no less than six lanes of traffic per the County General Plan, and in conformance with Caltrans Highway Design Manual standards. 4. Design and construct the project in recognition that the facility is regional in nature. 5. Design and construct the project to ensure that traffic can flow without significant impediments and in the most expeditious manner per the County RTIP. With inclusion of the above features, the March JPA is confident that this project will be a significant benefit to Perris and San Jacinto Valley, and fully supports the County in its efforts.
10/21/11	Linda Riely	*Comment topic:* Noise, Air Quality The prevailing winds will carry the traffic fumes and sound straight to homes.
10/21/11	John Roth	*Comment topic:* General/Other, Environmental Impacts, Design/Configuration Provided a cover letter and three disks containing comments related to the MCP Project. Believes that some of the alignments are either the same or very similar to the alignments proposed for the expansion of Cajalco Road and many of the comments should be considered for the expansion. General comments: 1. Right of way is expensive and becomes more so over time. Every effort should be made to acquire as much right of way as possible for later expansions as new projects are approved in the Hemet/San Jacinto, Lakeview/Nuevo, and Perris areas. 2. To the maximum extent possible, use the existing Cajalco Road right of way. Repeatedly stressed this point in comments relative to the MCP Project; it makes sense to reduce the economic costs of procuring additional right of way. Alternative 1 of the proposed project is the best because it uses existing right of way and is the shortest distance between I-215 and I-15. A trail adjacent to the road is a dangerous idea and could create additional liability for the County. Recommends working with MWD to secure trail right of way separate from the actual roadbed. Presume that MWD would not want the liability and maintenance of the trail, so the County would have to offer something that showed MWD as a major player in the ongoing development of Riverside County. Any publicity that would be positive for MWD might sway it but negotiations will be very difficult. Recommends four lanes with a two-lane expansion median the entire length of Cajalco Road. The expansion median would serve the purpose of providing additional lanes in the future. It would also provide rationale to change the name of the road from “Cajalco Expressway,” which connotes a sterile strip of asphalt or concrete, to the “Cajalco Parkway.” Naming the three segments of the project could have some value, such as naming the second (middle) section the Metropolitan Parkway to acknowledge MWD’s contribution to the project.

Date	Name / Affiliation	Comment Topics and Summary
10/21/11	Lynn K. & Nancy L. Higbee	*Comment topic:* Environmental Impacts Little concern or attention is paid in the recent NOP for the proposed project to the severe effects this project will have on commenters' rural community. Voluntary lack of street lights currently provides quiet nights and skies dark enough to enjoy the stars. Commenters' quality of life will be destroyed by this project by substantially raising noise levels and adding a tremendous amount of light pollution, adding more stress. Will substantially damage the two reserves it will cut through. This project has nothing to do with traffic or safety on Cajalco Road. It has everything to do with promoting growth in Hemet, Moreno Valley, and San Jacinto and with traffic in the City of Riverside. Cajalco Road was not mentioned in the recent article in the Press-Enterprise listing the most congested roads in Riverside County in need of improvement. State Route 76 in San Diego County and Los Osos Valley Road in San Luis Obispo County have much more traffic than Cajalco Road. When Cajalco Road approaches the traffic load of either of these examples it might warrant consideration for more improvements. There are no traffic jams on Cajalco Road except those caused by semi-trucks, which should be restricted from using it. This project has nothing to do with Cajalco Road and everything to do with State Route 91 because of previous poor planning decisions and the lack of mass transit in this area.
10/21/11	George Hague, Conservation Chair, Sierra Club, Moreno Valley Group	*Comment topic:* Environmental Impacts, Air Quality, Design/Configuration, Other What is the alternative to have a trail for horses near Cajalco Road? Will there be any staging areas provided for horses? How will these proposed trails affect biological resources? The Draft EIR needs to show the best places for trails to help the area remain rural. There needs to be viable over- and undercrossings for both the largest of predators and the smallest of prey. Because most experts believe you cannot have human activity near or intersecting these animal crossings, how can you have trails for humans/horses next to this planned expansion? The Draft EIR needs to show the design of these animal crossings as well as each location for the different designs along the entire Cajalco Road. These same diagrams need to include where the trail system for humans would be located. The document needs to fully analyze the impacts of k-rails, medians, and fencing on the animal populations in the area as well as those who just occasionally move through. The Draft EIR needs to have clear representation of where these k-rails, medians, and fences will be located at different phases of the project along the entire length of Cajalco Road. How will you mitigate for the "dead zones" caused by the expansion of Cajalco Road? These are places that animals try to avoid because of the noise, pollution, vibration, and lights. Some may call these indirect impacts, but the Sierra Club calls them direct impacts caused by the road. How far will these dead zones reach beyond the Cajalco Road expansion right of way and also pavement? Will animals nest in and repopulate these zones? The Draft EIR needs to show the locations of staging areas for construction equipment, supplies, temporary buildings, and building materials and the biological impacts from these staging areas. How will you eliminate light pollution from both overhead lights and traffic? The document needs to explain how this will cause predation of different species such as the SKR. How will the project make up for the increase of predation of this endangered animal by the decades of increased light pollution? Please look into International Dark Sky Standards and try to apply many of those ideas. How and where will you supply viable lands that mitigate for the loss of habitat? Will it be nearby or many miles away? How will the Draft EIR be able to show replacement habitat and will it be at least a two-for-one mitigation? What happens if MWD doesn't open the LM MSHCP? The Sierra Club expects to be notified when they do open the LM MSHCP. The Draft EIR needs to fully explain how the air quality degradation caused by this widening will affect plan and animal life—especially but not limited to those that are threatened/endangered—or it will be inadequate.

Date	Name / Affiliation	Comment Topics and Summary
		The Draft EIR must show where, as well as how, Cajalco Road and the MCP will meet to make for a continuous road. How will I-215 and the Ramona Expressway work with these other two roadways? The analysis of all impacts must be done with the maximum traffic expected on these four roads mentioned above along with those that feed into them. The Irvine-Corona Expressway needs to be factored into the Draft EIR's analysis, because it is in the present Riverside County General Plan and is a logical extension to this expansion. Does this Draft EIR deal with any roadway on the west side of I-15 and if so, why? How will I-15 handle the ultimate widening/improvements of Cajalco Road? The Draft EIR needs to compare the present traffic on I-15 with what will happen between the Cajalco Road connection and State Route 91. How will this project accommodate mass transit and public transportation? Will this be something that is built into the first phases of the project or must we wait many years? How will bicycle lanes be provided and again will they be provided in the first phases? Which roads will be downgraded? Are there any near Lake Mathews that will have fewer lanes and when? What changes to roads that are/will connect to Cajalco Road are being proposed for the General Plan Update that are different than the current Riverside County General Plan? The area in which this widening would take place is mainly rural, but it appears the only way pedestrians will be accommodated is by future development. This will mean much higher density. Is your traffic analysis based on current land zoning or what always happens to rural zoning when roadways like this are built? This rural area has a significant number of horse riders. How will a horse trail next to a six-lane road be viable? Will the horses be able to handle all the noise, lights, vibration, and pollution of this goods movement corridor? How can you prove they will? What is your alternative to having a trail for horses near Cajalco Road? Will there be any staging areas provided for horses? How will these proposed trails affect biological resources? The Draft EIR needs to show the best places for trails to help the area remain rural.
10/21/11	Joseph B. Lewis, Director of Engineering Services, EMWD	*Comment topic:* Design/Configuration EMWD has existing facilities in the area of the proposed project including potable water appurtenances along Cajalco Road west of I-215 to Alexander Street; Clark Street Sewer Lift Station at the intersection of Clark Street and Cajalco Road; Cajalco Tank at 23337 Cajalco Road; and Mead Valley Pump Station at 22555 Cajalco Road. In order to avoid potential conflicts with EMWD's facilities and rights of way EMWD requests that any preliminary engineering design drawings or improvement plans for any activity in the area of EMWD's facilities, pipelines, and rights of way be submitted for EMWD review and written approval. All submitted designs or plans must clearly identify EMWD's existing and planned facilities and rights of way. Contact EMWD to obtain further information regarding EMWD's facilities.
10/21/11	Deirdre West, Manager, Environmental Planning Team, MWD	*Comment topic:* Design/Configuration MWD currently owns and operates several facilities within or in the vicinity of the area described in the NOP-EIR, including Lake Mathews, Cajalco Creek Dam and Detention Basin, Lake Mathews Sediment Basins, Colorado River Aqueduct Val Verde Tunnel, Upper Feeder pipeline, Lower Feeder pipeline, and Lake Perris Bypass pipeline and pump-back facilities. In addition, MWD's approved but not-yet constructed Central Pool Augmentation pipeline and treatment plant are within or adjacent to the boundaries of the proposed area. Furthermore, MWD maintains ownership of and jointly manages the Lake Mathews Multiple Species Reserve and mitigation bank, established and managed under the terms of the LM MSHCP and Cooperative Management Agreement among MWD, CDFW, USFWS, and RCHCA; a Conservation Easement recorded by the County and held by RCHCA; and an underlying MOU among MWD, the California Department of Water Resources, and CDFW. The use of MWD-owned property for the proposed project requires the approval of MWD. For that reason, MWD must be included in the EIR as a Responsible Agency for purposes of CEQA.

Date	Name / Affiliation	Comment Topics and Summary
		MWD recognizes that the proposed project is a distinctly different project than RCTC's MCP Project; however, many of the same issues that were identified for that project would also apply to the proposed project. Similar issues of concern to MWD regarding this project pertain to alignment, design, construction, and operation of a major transportation facility within or adjacent to MWD's property outside the existing Cajalco Road right of way. These issues include but are not limited to: 1. Impacts on LM MSHCP Reserve lands, including direct and indirect impacts on covered species and habitats. 2. Consistency of the project with existing Reserve-related agreements for mitigation banking and long-term protection of sensitive threatened and endangered species. 3. Impacts on the Lake Mathews watershed, specifically impacts on the quality of water entering Lake Mathews. 4. Inclusion of the requirements stated in the Lake Mathews Drainage Water Quality Management Plan, a joint agreement among MWD, the County, and RCFCWCD. 5. Security of MWD land and facilities. 6. Impacts on MWD operational facilities and rights of way. Any proposed use of MWD's Lake Mathews fee property outside the existing Cajalco Road right of way to accommodate the proposed road realignment and widening project will need a formal request for the proposed project. This request should be submitted to Mr. Sherman Hom of our Real Property Development and Management Group, As previously stated, MWD has particular concerns with any project that would adversely affect or encroach upon the LM MSHCP Reserve lands, as these Reserve lands provide the basis for MWD's compliance with the federal and state Endangered Species Acts. MWD advises the County to review and assess the proposed project and legal ramifications associated with modifications to the LM MSHCP and related agreements to fully understand and consider the importance of maintaining the integrity of the Reserve lands and agreements in compliance with federal and state law. The County should note that existing agreements allow only for the addition of species or lands to the LM MSHCP for protection, not for removing or exchanging species or lands. Any changes to the LM MSHCP and related agreements would require the approval of all signatories to those agreements; as such, the County would need to address the plausibility of modifying the LM MSHCP given the constraints outlined in the legal documents that established the Reserve and provide for its current and future management. As a signatory agency and trustee agency for wildlife purposes, CDFW must be included as a Responsible Agency for CEQA purposes, as well as for ensuring compliance with the California Endangered Species Act. MWD also has critical engineering issues related to the protection of its existing facilities and to the operation and maintenance of its water distribution system. MWD has particular concerns over the potential impact from the widening of Cajalco Road on the Cajalco Dam and Detention Basin and Lake Mathews Sediment Basin along Cajalco Road. Changes to the existing Cajalco Road elevation or width can affect the operational requirements of the Cajalco Dam and Detention Basin (including water impound capacity and access for sediment removal and general maintenance), which would be unacceptable. Portions of the Cajalco Dam and Detention Basin are under the jurisdiction of the Division of Safety of Dams. Modifications required by the Division of Safety of Dams may affect the operational requirements of the facility and could be unacceptable. Changes to the drainage system along Cajalco Road could result in flooding on MWD properties, potentially affecting facility operations. Please be advised that extensive engineering and geotechnical work will need to be undertaken to ensure that the location and operation system will not restrict or constrain MWD's ability to maintain, operate, replace, or add facilities along its right of way. Where mitigation of potential impacts on facilities would not be possible, realignment of the project might be required. MWD requests

Date	Name / Affiliation	Comment Topics and Summary
		that its facilities and rights of way be fully shown and identified as MWD's in the EIR and on project plans and that prints of the plans and pertinent environmental documentation be submitted for review and written approval as they pertain to MWD rights of way.
10/24/11	Glenn Robertson, CEQA Coordinator, California RWQCB, Santa Ana Region (8)	*Comment topic:* General/Other RWQCB and staff reviewed and generated some notes on this anticipated highway project and route alternatives (Temescal Canyon, Gavilan Plateau) but will apply them to the next phase of CEQA, the EIR. RWQCB was unable to provide comments during the NOP comment phase that ended October 5. However, RWQCB looks forward to working with the County in the near future on the Cajalco Road EIR, 401 Certification (as stated for the route, including Bridge at Temescal Wash), stormwater runoff permitting, and any other issues.

5.2.3 October 2012 NEPA Public Scoping Meetings

Two NEPA public scoping meetings were held in October 2012 in conjunction with the NEPA NOI scoping period, September 26, 2012, through October 28, 2012. The first meeting was held at 6:00 p.m. on Wednesday, October 24, 2012, at Lake Mathews Elementary School in Riverside, and the second was held at 6:00 p.m. on Thursday, October 25, 2012, at Tomas Rivera Middle School in Perris. In addition to the two NEPA public scoping meetings, Caltrans distributed letters to all cooperating and participating agencies inviting them to attend a meeting on October 24, 2012. The agency scoping meeting was held at 1:00 p.m. on Wednesday, October 24, 2012, at Lake Mathews Fire Station #4 (16453 El Sobrante Road, Riverside, CA 92503). The purpose of the meeting was to discuss the purpose and need and range of alternatives for the project and solicit agency comments. Representatives from the Cities of Perris and San Jacinto, Riverside County Waste Management Department, March JPA, and WMWD were in attendance.

Responses to the NOI, including comments submitted during the public scoping meetings, are summarized in Table 5-6.

Table 5-6. NEPA Scoping Summary – September 26 through October 28, 2012

Date	Name / Affiliation	Comment Topics and Summary
9/26/12	Brett Cochrane	*Comment topic:* General/Other Add to Cajalco Project mailing list.
9/26/12	Nancy Higbee San Bernardino Audubon Society 21230 Onaknoll Drive Perris, CA 92570	*Comment topic:* General/Other Add to Cajalco Project mailing list.
9/26/12	Susan Nash, President Friends of the Northern San Jacinto Valley P.O. Box 4036 Idyllwild, CA	*Comment topic:* General/Other Add to Cajalco Project mailing list.
10/4/12	John H. Semcken, III Vice President Majestic Realty Co. 13191 Crossroads Parkway North, 6th Floor City of Industry, CA 91746	*Comment topic:* General/Other Requested plans for the widening of Cajalco Road leading up to the bridge along the business property; requested information on these improvements.

Date	Name / Affiliation	Comment Topics and Summary
10/5/12	John H. Semcken, III Vice President Majestic Realty Co. 13191 Crossroads Parkway North, 6th Floor City of Industry, CA 91746	*Comment topic:* General/Other Requested current information.
10/5/12	Deirdre West Manager, Environmental Planning Team MWD	*Comment topic:* Environmental Impacts Request that EIS include detailed assessment of direct and indirect impacts on MWD's facilities as a result of the project.
10/6/12	Linda Riley	*Comment topic:* Property Impacts, Environmental Impacts, Noise Concerned about the Cajalco Road trucking route and diesel fumes, particle pollution, and nonstop noise from the big rigs occurring as a result of growth of warehouses and approval of mega warehouses. Feels the public meetings are ineffective, referencing meetings held for the DHL project even though the forms for the warehouse were already poured and public input was disregarded. Feels the County bows to developers and disregards residents.
10/9/12	Robert Howard	*Comment topic:* General/Other Add to Cajalco Project mailing list.
10/12/12	Joseph Forkert for Rosemary Hamill AT&T (Long Distance) Forkert Engineering & Surveying, Inc. 22311 Brookhurst Street, #203 Huntington Beach, CA 92646	*Comment topic:* General/Other, Design/Configuration Possible conflict with the project and Transcontinental Fiber Optic Cable.
10/15/12	John R Burroughs, LEED AP President Majestic Realty Co. 13191 Crossroads Parkway North, 6th Floor City of Industry, CA 91746	*Comment topic:* General/Other Follow-up email regarding John Semcken's request from 10/5/12.
10/24/12	Judy Heilman	*Comment topic:* General/Other Would like to know about the 10/24/12 meeting. Does not want to attend if it is a repeat of information.
10/24/12	Tom Bartels	*Comment topic:* Property Impacts, Traffic Concerned about traffic. What do you do about Dirt Road? There's not enough width.
10/24/12	Grace Ruga	*Comment topic:* Design/Configuration, Noise 1. Green – "Slope Varies" – Please clarify this ambiguous number? How wide and where are these measurements? 2. How is the hugely increased semi-truck traffic being addressed? Witnesses several (six to eight in a row) from 11 p.m. to 4 a.m. any weeknight on El Sobrante Road, La Sierra Avenue, and Cajalco Was told this project was needed to accommodate the increased truck traffic (projected to be second heaviest in the state, next to Harbor Freeway/Long Beach) because of March Air Force Base being turned into an air cargo facility. 3. Sound issues – semi brakes and down-shifting engine noise throw against the hillsides (El Sobrante/Cajalco/Gavilan Road areas).

Date	Name / Affiliation	Comment Topics and Summary
10/24/12	Winsley Hector	*Comment topic:* General/Other, Project Support Supports the project and Alternative 1 and hopes the project will proceed expeditiously. Would appreciate additional widening of El Sobrante Road.
10/24/12	Karla Downing	*Comment topic:* Design/Configuration Please send/email a more detailed map of the section between Temescal Canyon and where Alternatives 1 & 2 split at the west. Owns property near Eagle Canyon Road on Cajalco Road.
10/24/12	Gary Schultz	*Comment topic:* Design/Configuration Please send/email a more detailed map of the section between Temescal Canyon and where Alternatives 1 & 2 split at the west. Owns property near Eagle Canyon Road on Cajalco Road.
10/24/12	Josue M. Anguiano-Vega	*Comment topic:* Property Impacts Feels Alternative 1 makes more sense because it would create the least impact on the protected areas the project crosses. Disappointed the project won't start until 2015.
10/24/12	Serena Burnett Animazonia WildLife Foundation 173250 Kraemer Way Perris, CA 92570	*Comment topic:* Property Impacts, Environmental Impacts, Noise Proposes that the section between Smith Road and Gavilan Hills Road be widened to only 80 feet instead of 120 feet, as this area runs near the wildlife foundation. Any widening should be to the north, away from Animazonia property. Noise is the main issue to be addressed in the EIR. Address wildlife corridors in planning.
10/24/12	Myung Soo Lee	*Comment topic:* Noise, Environmental Impacts, Traffic, Property Impacts Supports Alternative 2 for the following reasons. 1. Alternative 1 would result in loss of part of property 2. Too many collisions 3. Noise 4. Air pollution
10/24/12	Annette Sapiano RAGLM	*Comment topic:* General/Other, Traffic Widening Cajalco Road to facilitate traffic between Orange County & Hemet/San Jacinto, Moreno Valley, etc., would not accomplish anything except more traffic on I-15 regardless of an extra lane or two between Cajalco Road and Ontario Avenue. Having a freeway every few miles parallel to each other is redundant; State Route 74 is better. However, Alternative 1 is less intrusive than Alternative 2.
10/24/12	Bob Pring	*Comment topic:* General/Other Prefers Alternative 1. Appreciates the connection between Dirt Road and Lake Mathews Drive, as it provides an important alternative exit route in case of fire.
10/24/12	John C. Davis	*Comment topic:* General/Other, Traffic, Design/Configuration Has concerns about the newly proposed connection at Lake Mathews Drive. This is a private small driveway that serves four large homes. Does not support making this into a legal size street for fire trucks and more traffic. Suggests moving up the hill and crossing over the vacant land area.

Date	Name / Affiliation	Comment Topics and Summary
10/24/12	Sandra Lee	*Comment topic:* Environmental Impacts, Noise, Traffic, Property Impacts Prefers Alternative 2 for the following reasons: 1. Needs good air due to stage 4 lung cancer 2. Less noise 3. No more car accidents in front of house 4. Property will remain as is
10/24/12	Roberta Reed	*Comment topic:* Traffic, Design/Configuration Traffic study: please consider truck traffic and ingress/egress from mining facilities just north of Temescal Canyon Road (south of Eagle Canyon Road). Please note that Eagle Canyon Road is a private road/private property with access to mine facilities only.
10/24/12	Vern Freeman	*Comment topic:* Design/Configuration Dirt Road is only 30 feet wide vs. 60-foot County standard. Northern area of 13703 Cajalco (JJ Lane) and adjacent 13735 (Schmidt) is a driveway, not a road. There are better options for this fire road with no impact on the local residents.
10/24/12	C. Thorne	*Comment topic:* Design/Configuration, Traffic Eastbound Cajalco Road will be able to turn left on Cowan (to commenter's house) or have to drive down Harley John Road to Scottsdale. Also, would fire trucks be impeded?
10/24/12	Travis Duet K-9 Companies 13703 J.J. Lane Perris, CA 92570	*Comment topic:* Design/Configuration, Property Impacts Dirt Road should not be used in either alternative. It affects pre-existing business that has maintained this road for 20 years.
10/24/12	Abigail Duet K-9 Companies 13703 J.J. Lane Perris, CA 92570	*Comment topic:* Property Impacts It creates a great deal of handicap using Dirt Road because of the business and residents involved. The project would hurt state revenue.
10/24/12	Jeffrey Radway	*Comment topic:* Property Impacts, Design/Configuration Lives on the corner of Cajalco Road & Dirt Road. Having Dirt Road as a second alternate road for the fire department is not good, because after going down the first road they will have to go through the K-9 business facility to continue on. The K-9 facility keeps the road gated and locked outside of business hours. It would be wise to have a second access road on the property east of Dirt Road down through the center, to allow a left turn before approaching the K-9 property. This would make more sense because there is more room to build.
10/24/12	Jerry Grell	*Comment topic:* Design/Configuration Requests extension of the bike path from Smith Road to Wood Road. Many bike races include going up La Sierra Avenue to Cajalco Road and then follow all the way to Wood Road.
10/24/12	Thomas & Pamela Molter	*Comment topic:* Project Support Supports Alternative 1, but does not support the "Design Option" shown in Alternative 1.
10/24/12	Susan Nash, President Friends of the Northern San Jacinto Valley P.O. Box 4036 Idyllwild, CA	*Comment topic:* General/Other, Traffic El Sobrante Road alternative must be discussed in detail; most traffic goes to State Route 91 rather than to I-15.

Date	Name / Affiliation	Comment Topics and Summary
10/25/12	Jane Gustafson	*Comment topic:* General/Other, Traffic Only "study" participants have benefited from development while the residents, commuters, or taxpayers have not over these past 20 years. Deaths, accidents, and 14,000 vehicles daily are supposed to impress the taxpayers but not the decision-makers?
10/25/12	Agapito Ortiz	*Comment topic:* Traffic, Safety, Project Support Supports the project because two-lane roads are needed due to the high number of accidents.
10/25/12	Eulalia Patino	*Comment topic:* Traffic Consider there have been a lot of accidents in the area of Cajalco Road and problems with accumulation of water that sinks on the major part of the streets of Cajalco. Would support the project if it is going to benefit residents.
10/25/12	Martin Alvarado	*Comment topic:* Project Support Supports the improvements to the area.
10/25/12	Raymundo Caballero	*Comment topic:* Traffic, Safety, Project Support Believes that it is a great idea to widen the road, considering that there have been a few accidents from the tight space. Understands that from Extravaganza in to Barton there will be no bike lanes available; recommends bike lanes for children to ride to school, for example, to Citrus Hill High School.
10/25/12	Miriam Cardenas	*Comment topic:* Design/Configuration Would like to know the proximity of the Alternative 2 highway to the El Sobrante wildlife preserve.
10/25/12	Michael Duval	*Comment topic:* Project Support In favor of moving forward. Either alternative is fine.
10/25/12	Maria G. Jimenez	*Comment topic:* General/Other, Traffic Need a signal light or stop sign on Cajalco Road/Alexander due to the high number of accidents.
10/25/12	Soila Trejo	*Comment topic:* Property Impacts, Design/Configuration, Traffic Placing a median on Cajalco Road will limit access to and egress from the commenter's property. Suggests that Marquez Road be paved so commenter can use that alternate route to access property. If Marquez Road cannot be paved, please do not place median.
10/25/12	Steven Trejo	*Comment topic:* Property Impacts, Design/Configuration, Traffic Placing a median will make it very hard to access commenter's property. Has large equipment and it will make it very hard to turn into property heading west; would have to park, block traffic, and open the entrance, which cause a huge problem with traffic. Please do not place median.
10/25/12	Warren Webb	*Comment topic:* Design/Configuration, Traffic Continue bike path (available for horse riders, too) east to Harvill. This is a rural area and still has horse traffic.
10/25/12	Dalton and Dulce Lyons	*Comment topic:* Property Impacts, Traffic Concerned that barber shop business on commenter's property would be affected due to access changes with a center divider.

Date	Name / Affiliation	Comment Topics and Summary
10/25/12	Jo Ann McAnlin	*Comment topic:* Air Quality, Environmental Impacts, Safety 1. Between Seaton and Decker, water backs up on the south side of Cajalco in a field and runs under the road across the front of commenter's property to Seaton. Needs to be addressed 2. Storage of equipment at Seaton/Cajalco is a health hazard for residents already flooded with diesel fumes every morning form the truck stop at Harvill/Cajalco. This is an air pollution problem.
10/25/12	Michelle Randall	*Comment topic:* General/Other Only one alternative is environmentally acceptable. No project alternative is not good. Alternative 2 is not a widening project; re-routing; environmental groups will oppose Alternative 2. Recommends Alternative 1.
10/25/12	Steve Trout	*Comment topic:* Noise, Air Quality, Project Support Looking forward to a safer road, less dust in the air. Hopefully quieter road. Wondering about masonry soundwalls for houses right on the main path. The semi-trucks run well into the night and howl with road noise.
10/25/12	Lee Cussins	*Comment topic:* Property Impacts, Noise, Traffic, Safety, Project Support Long-time resident of home about 0.5 mile north that overlooks Cajalco Road from Alexander to Wood Road. On this stretch there are no street lights and few control signs. Beginning about 3 a.m. hears cars, trucks, and motorcycles speeding to Orange County along with accidents and attendant emergency vehicles. The now-discarded freeway proposal was disliked by everyone, but the accident rate would have been better. Supports the project because of: 1. Improved lighting, road and berm widening, and control signage (speed limit signs and stop lights) 2. The flooding at Brown and Cajalco Road would be eliminated 3. Checkpoints could be legally built in to reduce DUI 4. Businesses would want to locate along a well-lighted and well-policed modern road (as opposed to now when people say "don't go to Mead Valley after dark")
10/25/12	Ralph Hoyte	*Comment topic*: General/Other, Project Support Supports Alternative 2. Requests to be placed on mailing list.
10/25/12	Gabrielle Restivo-Draim Also known as Gabrielle Restivo-DeGange	*Comment topic*: Property Impacts, Design/Configuration, Noise, Traffic, Safety, Environmental Impacts Refer to Section H.2.2.2 of Appendix H, *Environmental Review Coordination and Scoping*, for comment letter submitted at 10/25/12 scoping meeting.
10/26/12	Gabrielle Restivo-Draim Also known as Gabrielle Restivo-DeGange	*Comment topic*: General/Other Correction to earlier reference to 200-foot radius notification; 500 feet.
10/28/12	Judith Murdock	*Comment topic*: Design/Configuration Questioned necessity of project and secondary access between Dirt Road and Lake Mathews Drive for residences in the Hollis Lane/Lynette Lane area.
Comments received outside of NOI scoping period		
7/5/12	Adam Miller	*Comment topic:* General/Other Request to be placed on mailing list.
7/30/12	Gary J Hirdler	*Comment topic:* General/Other Request to be placed on mailing list.

Date	Name / Affiliation	Comment Topics and Summary
9/12/12	Alana Preston	*Comment topic:* General/Other Request to be placed on mailing list.
9/12/12	Keith Osborn, P.E. Principal	*Comment topic:* Design/Configuration Request for horizontal and vertical alignments along with related proposed roadway cross-sections for the portion of this roadway between Wood Road and Alexander Street.
9/20/12	John H. Semcken, III Vice President Majestic Realty Co. 13191 Crossroads Parkway North, 6th Floor City of Industry, CA 91746	*Comment topic:* Design/Configuration Requests copy of plans for the new Cajalco bridge.
10/29/12	Karly Payne, Administrative Assistant, Engineering Dept. Kinder Morgan	*Comment topic:* General/Other Letter stating no conflict. Refer to Section H.2.2.2 of Appendix H, *Environmental Review Coordination and Scoping*.
10/29/12	Debra Smith	*Comment topic:* Property Impacts, Design/Configuration New road should go below (south) of houses at Hollis Lane/Cajalco. Do not put new road between the houses and the lake or it will destroy the little lakeside community. Extend La Sierra Avenue to the new Cajalco Road.
10/30/12	James Dailey, Level 3, OSP Engineer So Cal	*Comment topic:* Design/Configuration Level 3 Communications has underground fiber optic structure on Cajalco Road running from Wood to Clark. Second structure running on Temescal Canyon Road at the Cajalco Road intersection. Once engineering progresses, please re-engage to ensure utility identified on the plans as protected in place.
10/30/12	Kathy Tegeler	*Comment topic:* General/Other Request to be added to mailing list.
10/30/12	Everett Price	*Comment topic:* General/Other Inquired about the Brown Street crossing construction.
10/30/12	Edward Araiza	*Comment topic:* General/Other Request to be added to mailing list.
10/30/12	Edward Cooper, Director, Riverside County Airport Land Use Commission	*Comment topic:* General/Other Riverside County Integrated Project General Plan was consistent with the 1984 Riverside County Airport Land Use Plan in 2003; if the proposed project does not require amendments to the General Plan or Specific Plans, then review by Airport Land Use Commission is not required.
11/1/12	Gail Barton, Principal Planner Brian Shomo, Natural Resources Manager, RCHCA 4080 Lemon Street, 12th Floor, Riverside, CA 92501	*Comment topic*: General/Other Requested that RCHCA become a participating agency on the proposed project. Also indicated that Brian Shomo will be the designated point of contact. He has also provided some broad comments that are consistent with comments that the RCHCA has provided to the County with regard to the project.
11/4/12	Mary Hunt	*Comment topic:* Property Impacts Letter to A. Burton with concerns regarding her property. Refer to Section H.2.2.2 of Appendix H, *Environmental Review Coordination and Scoping*, for full comments.
11/5/12	Dan Silver, Executive Director, Endangered Habitats League	*Comment topic:* Property Impacts, Environmental Impacts, Project Support Comments on the extension of La Sierra Avenue to Alternative 2, which would damage the reserve land, and requests removal of the extension of La Sierra Avenue.

Date	Name / Affiliation	Comment Topics and Summary
11/6/12	Rosalyn Squires, Transmission Pipeline Planning Assistant, Southern California Gas Company	*Comment topic:* General/Other Southern California Gas Company does not operate facilities within the proposed improvement; however, the Northern Distribution Region may have distribution facilities within the construction area.
11/6/12	Susan Nash, President, Friends of the Northern San Jacinto Valley P.O. Box 4036 Idyllwild, CA	*Comment topic:* Environmental Impacts Requests environmental compliance with Section 4(f).
11/7/12	Jane Gustafson	*Comment topic:* General/Other, Property Impacts 1. Maintain current roadbed, as eastbound lanes have fewer homes on north side through Clark to Wood improvement 2. Wood improvement rated 50 mph; reality = 70 mph. How are residents not bought out to cope? Eight-foot berm not sufficient protection for open car door – UPS, FedEx, Dial-A-Ride 3. Mailbox on north side – hazardous crossing 4. Will water meter, gas, fencing, plantings, and property elevation accessibility be adjusted at whose expense?
11/8/12	Ryan Ross, Principal Planner, Riverside County Waste Management Department	*Comment topic:* General/Other Mr. Ross sent letter to D. Bricker comments from Riverside County Waste Management Department. Refer to Section H.3.2 of Appendix H, *Environmental Review Coordination and Scoping*, for letter.
11/8/12	Drew Feldmann San Bernardino Valley Audubon Society P.O. Box 22054 San Bernardino, CA 92423	*Comment topic:* General/Other Request to be added to the mailing list.
11/8/12	Tammy Martin, Engineering Technician, WMWD	*Comment topic:* General/Other Letter explaining appurtenances with water and sewer on Cajalco Road. Included CD of as-built drawings, spreadsheet with numbers of water and sewer pipeline.
11/9/12	Nancy Higbee San Bernardino Audubon Society 21230 Onaknoll Drive Perris, CA 92570	*Comment topic:* Property Impacts, Environmental Impacts, Air Quality, Noise Unacceptable impact on air quality, noise level, darkness of night sky, and two preserves. Prefers the no build alternative or a substantially smaller project with wider shoulders, some passing lanes, right- and left-turn lanes, and widening El Sobrante Road where the traffic really is.
11/9/12	Kyle Smith, MURP, Associate Planner, City of Riverside Community Development Department / Planning Division	*Comment topic:* Environmental Impacts, Traffic City of Riverside has identified issues that need to be addressed in the EIS phase relating to traffic assessment.
11/9/12	Susan Sturges EPA Region 9 Environmental Review Office, Transportation Team 75 Hawthorne Street (CED-2) San Francisco, CA 94105	*Comment topic:* Environmental Impacts Comments on the project. Refer to Section H.3.2 of Appendix H, *Environmental Review Coordination and Scoping*, for full comments.

Date	Name / Affiliation	Comment Topics and Summary
11/9/12	Anna M. Hoover Cultural Analyst Pechanga Band of Luiseno Mission Indians P.O. Box 2183 Temecula, CA 92593	*Comment topic:* Environmental Impacts Tribe is requesting to be involved in the whole NEPA process and must be notified of any public hearings, workshops, and scheduled approvals on project.
11/10/12	Kerry Wheeler	*Comment topic:* General/Other, Design/Configuration, Noise, Traffic, Safety El Sobrante Road should be an alternative. The large expense for a small part of the day only benefits large warehouses. Safety: ban large, heavy trucks except during certain times like 11 p.m.–4 a.m. on all freeways and roads
11/12/12	Aruna Prabhala Staff Attorney Center for Biological Diversity 351 California Street, Suite 600 San Francisco, CA 94104	*Comment topic:* Environmental Impacts, Biological Resources, Air Quality Draft EIS/EIR should fully address and analyze the project's impacts on sensitive species, regional HCPs, greenhouse gas emissions, potential for growth-inducing impacts, cumulative impacts, and all reasonable alternatives.
11/12/12	Miriam Cardenas, Community Relations Specialist Mike Williams, Senior District Manager Waste Management	*Comment topic:* General/Other Refer to Section H.3.2 of Appendix H, *Environmental Review Coordination and Scoping*, for full letter with project comments.
11/13/12	Cecil D. Green	Comment topic: General/Other Request to be added to project mailing list.
11/13/12	George Hague Sierra Club Moreno Valley Group Conservation Chair 26711 Ironwood Avenue Moreno Valley, CA 92555	*Comment topic:* General/Other, Environmental Impacts Draft EIS/EIR for the project needs to answer and address concerns such as to where Cajalco Road and the MCP will meet to make for a continuous road, How will I-215 and the Ramona Expressway work with these other two roadways?
12/4/12	Melissa Arellano	Comment topic: General/Other Request to be added to project mailing list.
12/10/12	Vaughn Jones	*Comment topic:* General/Other, Safety Request to be added to project mailing list. Experienced a serious accident resulting in injuries and persistent pain, and one fatality, due to unsafe speed, wet roadway, and blind curve on Cajalco Road. The accident would not have occurred if Cajalco Road had been widened and straighter, providing more visibility to oncoming traffic.

5.3 Additional Resource Agency Consultation and Coordination

In addition to 23 USC 139 related coordination with participating and cooperation agencies, the County and Caltrans also performed the following consultation and coordination in conjunction with project development.

5.3.1 Western Riverside County Regional Conservation Authority

Coordination with RCA, which includes staff of USFWS, CDFW, and USACE, has been ongoing since project inception in 2011. Because the proposed project involves proposed improvements within Criteria areas and Core Reserves and is seeking coverage under Section 7.2.2 of the WRC MSHCP, the County and Caltrans have sought to consult and coordinate with

RCA to confirm mutual understanding of the plan requirements, solicit input on approaches for meeting plan requirements, and share proposed project alternatives and design options throughout project development. During meetings, the proposed project design and wildlife crossing approach were introduced and reviewed in detail throughout the preliminary design and technical study phase. Agency questions and comments were addressed and incorporated into the project design following each meeting.

A consistency review by RCA, USFWS, and CDFW would be performed to ensure that the project is consistent with the requirements of the plan. Because there is a federal nexus for the project, the consistency review will result in a streamlined biological opinion from USFWS. Formal consultation under Section 7 will not be necessary. There have been numerous agency coordination meetings where USFWS was present.

Table 5-7 below summarizes the coordination meetings with RCA and other agencies regarding the WRC MSHCP.

Table 5-7. WRC MSHCP Coordination Meetings Summary

Meeting Date	Meeting Summary
4/21/2011	Meeting: ICF presented basic elements of proposed project and status of biological surveys. Coverage of the project under the WRC MSHCP was discussed and confirmed by USFWS and all parties agreed that further meetings and coordination would be advantageous. Further review of the LM MSHCP and specific requirements to be anticipated were also discussed as being needed in the future. Attendees: Russell Williams, Scott Staley, and Mary Zambon (County of Riverside); Charles Landry and Laurie Dobson-Correa (RCA); Stephanie Standerfer and Joe Monaco (Dudek); Ken Corey and Karin Cleary-Rose (USFWS); Leslie MacNair (CDFW), Tricia Campbell and Brian Calvert (ICF); Edward Ng, Heng Chow, and Paul Lau (AECOM).
7/21/2011	Meeting: USFWS provided updates on LM MSHCP status and indicated that encroachment into the reserve may require more coordination and may affect the LM MSHCP. USFWS stated that all reserve lands affected by the project will require a 1:1 mitigation ratio and must be adjacent to the existing reserves, and MWD will track all bank credits for LM MSHCP. Group reviewed potential mitigation lands. Attendees: Scott Staley and Mary Zambon (County of Riverside); Charles Landry and Laurie Dobson-Correa (RCA); Stephanie Standerfer and Joe Monaco (Dudek); Karin Cleary-Rose (USFWS); Leslie MacNair (CDFW); Tricia Campbell and Brian Calvert (ICF); Edward Ng and Heng Chow (AECOM).
12/15/2011	Meeting: ICF provided project overview and design options. USFWS discussed take allowances and impact limits and indicated that if take limits were exceeded, Section 7 consultation could be an option. Discussed need for agencies to review impact calculations on Public/Quasi-Public (PQP) and conserved lands. La Sierra Avenue extension option was discussed and USFWS stated that this would not be a Covered Activity under the WRC MSHCP without a major plan amendment. Clarification was also requested regarding the proposed project's inclusion as a Covered Activity under the WRC MSHCP. The Lake Mathews mitigation bank mapping was discussed and requested and it was stated that MWD was aware of the proposed project development and had not indicated an issue with the project. Potential mitigation lands in the area were also discussed and it was indicated that a potential list of mitigation parcels was submitted as part of the MCP review, which the project team confirmed they had on file. Attendees: Scott Staley and Mary Zambon (County of Riverside); Charles Landry and Laurie Dobson-Correa (RCA); Stephanie Standerfer (Dudek); Karin Cleary-Rose (USFWS); David Elms and Heather Pert (CDFW); Keturah Anderson, Tricia Campbell, and Brian Calvert (ICF); Edward Ng and Heng Chow (AECOM).

Meeting Date	Meeting Summary
9/20/2012	Meeting: ICF presented overview of preliminary wildlife crossings, including sizes and dimensions. Discussed need for dual-use culverts that provide a dry crossing to support wildlife movement, that culvert and crossing placement was based on landscape factors such as topography and vegetation, and that WRC MSHCP crossing frequencies/distances would not be exactly met due to topography and habitat suitability conditions determining locations rather than spacing requirements. Also discussed conserved lands impact allowances and documentation, LM MSHCP mitigation bank credit use, and mitigation acquisition, and SKR habitat and movement in the area. The proposed box culvert at Linkage 3 was discussed and the agencies conveyed that a soft bottom was preferred. The engineer stated that this was feasible. All agreed that a field meeting would be needed to review locations of proposed crossings in the field. Discussed proposed WRC MSHCP take allowance methodology, which included the deduction of existing developed lands (e.g., existing Cajalco Road and right of way) from the total permanent impact acreages. Also discussed approaches for restoring areas where roadbed and right of way would be removed so that these impacts would be considered temporary. It was agreed that more discussion on these topics was required at a later date. Discussed LM MSHCP and how to document take and how to acquire mitigation on those lands. All agreed that affected conserved lands will be mitigated at 1:1 to ensure total PQP remains constant and that all impacts on RCHCA and MWD lands had to be mitigated adjacent to existing reserves and that it would be possible to allow adding these lands to the WRC MSHCP conserved lands. It was confirmed that the use of Core/Criteria Refinement would result in a 2:1 replacement for PQP lands and that the County would provide that documentation. Attendees: Scott Staley and Mary Zambon (County of Riverside); Charles Landry and Laurie Dobson-Correa (RCA); Stephanie Standerfer (Dudek); Karin Cleary-Rose (USFWS); Heather Pert (CDFW); Tricia Campbell, Brian Calvert, and Keturah Anderson (ICF); Edward Ng and Heng Chow (AECOM).
11/7/2012	Multi-Agency Field Meeting: Group drove along the existing alignment to review the general area and existing conditions. Discussed preliminary wildlife crossings and project design, crossing placement methodology, movement of deer through the project area including Temescal Wash, and design considering for crossings and culverts, including visibility, maintaining natural drainage flows, and maintaining connectivity of Linkage 3 and a natural bottom at this location. CDFW stated that shading effects from bridge widening would need to be addressed. CDFW also stated that bats would need to be addressed at Temescal Wash Bridge and wondered if bat housing structures would be installed as mitigation. ICF stated that this could be accommodated if bats are present; if not, the bridge would be designed without the structures so as not to encourage bats to use the bridge. RCHCA provided information for SKR habitat quality along Cajalco Road. Attendees: Mary Zambon and Brian Shomo (County of Riverside); Stephanie Standerfer (Dudek); Laurie Dobson-Correa (RCA); Heather Pert and Kim Freeburn (CDFW); Tricia Campbell, Brian Calvert, Keturah Anderson, and Mikael Romich (ICF); Heng Chow (AECOM); John Taylor (USFWS).
2/21/2013	Meeting: Group discussed USFWS email dated 02/19/2013 from Karin Cleary-Rose indicating that the proposed project would be covered under Volume I, Section 7.2.2, of the WRC MSHCP as a non-Community and Environmental Transportation Acceptability Process. County requested this confirmation in a letter dated January 8, 2013. ICF presented concepts of Build Alternatives 1 and 2 and stated that further alternative development was planned. Discussions were held on what aspects of the alternatives would be covered under the WRC MSHCP and what guidelines would be applicable. CDFW requested that the area south of the lake contain larger culvert and movement opportunities for wildlife with earthen bottoms. Discussions also included the survey methods for rare plants and the drought conditions. The agencies confirmed that they would accept surveys for that year but that reference sites needed to be visited and the conditions of those sites disclosed. Attendees: Mary Zambon (County of Riverside); Stephanie Standerfer (Dudek); Laurie Dobson-Correa and Charles Landry (RCA); Karin Cleary-Rose (USFWS); Heather Pert (CDFW); Brian Calvert and Tricia Campbell (ICF); Edward Ng and Heng Chow (AECOM).

Meeting Date	Meeting Summary
3/21/2013	Meeting: ICF confirmed that the team received the USFWS opinion letter from RCA regarding coverage of an El Sobrante Alternative under Volume I, Section 7.2.2, of the WRC MSHCP. Discussed detail of El Sobrante Alternative and coverage under WRC MSHCP, including design and right of way dimensions, incorporation of wildlife crossings, and implications of this alternative on Cajalco Road. ICF requested biological resource documents related to the Eagle Valley project and the team indicated that they did not have any such documents available. Attendees: Mary Zambon and Scott Staley (County of Riverside); Stephanie Standerfer (Dudek/RCA), Laurie Dobson-Correa and Charles Landry (RCA); Karin Cleary-Rose (USFWS); Heather Pert (CDFW); Brian Calvert and Tricia Campbell (ICF).
12/18/2014	Meeting: GLA, ICF, and AECOM discussed conceptual engineering design of project alignments and wildlife crossings, as well as RCHCA management activities and needs. Attendees: M. Zambon (County of Riverside); B. Shomo and Princess Hester (RCHCA); H. Chow and Bill Hagmaier (AECOM); Mike Romich (ICF); Tricia Campbell (GLA).
12/17/2015	Meeting: Discussed proposed project alignment overview, preliminary GIS resistance surface modeling results, MWD fencing issues, Southern California mountain lion status, anticipated conflicts with potential mule deer and mountain lion movement into MWD lands and residential areas (additional depredation permits), proposed crossings for large mammals (Build Alternatives 1 and 2C only), including discussion of minimum structure height and width. Also discussed potential overpass options and the group agreed that an overpass was likely not feasible on either Build Alternative 1 or 2C. Attendees: Mary Zambon and Scott Staley (County of Riverside); Laurie Dobson-Correa, Charles Landry, Noelle Ronan, and Wendy Worthey (RCA), John Taylor and Karin Cleary-Rose (USFWS); Heather Pert (CDFW); Brian Calvert and Shannon Crossen (ICF); Tricia Campbell (Glenn Lukos Associates [GLA]).
1/15/2016	Overpass and Large Crossing Field Meeting: Reviewed potential overpass and large crossing locations on Build Alternatives 1 and 2C at the Lake Mathews Fire Station Community Room. Discussed potential for mule deer and mountain lion movement in project area and reviewed resistance surface modeling results and data layers used, discussed large mammal crossing design standards. After discussion, the group reviewed proposed overpass and large crossing locations in the field. Comments and recommendations were noted and incorporated into crossing design where practicable. Attendees: Mary Zambon (County of Riverside); Laurie Dobson-Correa (RCA); John Taylor (USFWS); Heather Pert, Kevin Brennan, and Chanelle Davis (CDFW); Brian Calvert and Shannon Crossen (ICF), Tricia Campbell (GLA).
2/11/2016	Wildlife Overpass Consideration Meetings: RCHCA, CDFW, and project consultant discussed the potential for a wildlife overpass on the western end of the proposed project. Both agency representatives agreed that an overpass was not suitable at this location and that a larger bridge underpass would be more suitable and feasible. This information was presented to RCA and resource agencies at a meeting on 02/18/16. Attendees: Brian Shomo (RCHCA), Kevin Brennan (CDFW), Tricia Campbell (GLA)
2/18/2016	Meeting: Information from the 2/11/2016 meeting was presented. Discussed project and wildlife crossing design progress to date, mule deer crossing size requirements, reference materials used to date for development of wildlife crossings. Following discussion, an agreement was reached regarding the proposed larger bridge underpass. Attendees: Mary Zambon (County of Riverside), Charles Landry, Noelle Ronan, Laurie Dobson-Correa, and Wendy Worthey (RCA); Karin Cleary-Rose and John Taylor (USFWS); Heather Pert (CDFW), Brian Calvert, Keturah Anderson, and Shannon Crossen (ICF); Tricia Campbell (GLA).
5/19/2016	Meeting: Discussed proposed alignment designs for Build Alternatives 3 and 4 and reviewed proposed wildlife crossing analysis, design, and approach. Presented proposed extra-large and large undercrossings for Build Alternatives 3 and 4. Discussed the WRC MSHCP crossing maximum distance requirements and difficulties in meeting those in some areas due to topography and land use and that a best fit approach with the same total number of crossings was a more feasible and effective approach. Attendees: Mary Zambon (County of Riverside); Noelle Ronan and Laurie Dobson-Correa (RCA); Karin Cleary-Rose and John Taylor (USFWS); Heather Pert (CDFW), Brian Calvert, Shannon Crossen, and Keturah Anderson (ICF); Tricia Campbell (GLA).

Meeting Date	Meeting Summary
6/16/2016	Meeting: Discussed proposed project alternative alignments (Build Alternatives 1, 2C, 3 and 4) and wildlife crossing design progress to date for each project alternative. Reviewed crossing terminology, placement, and design methodology. Attendees: Mary Zambon and Scott Staley (County of Riverside); Charlie Landry (CDFW); Noelle Ronan and Wendy Worth (Dudek/RCA); Laurie Dobson-Correa (RCA); Karin Cleary-Rose and John Taylor (USFWS); Heather Pert (CDFW); Brian Calvert, Shannon Crossen, and Keturah Anderson (ICF); Tricia Campbell (GLA).
7/6/2016	Mule Deer Crossing Field Meeting: Met with CDFW wildlife biologists Kevin Brennan (CDFW) and Dr. Jeff Villepique (mule deer specialist) in the field to review potential locations for mule deer crossings on the western end of the proposed project. Reviewed several sites that had potential for a large underpass to be placed and discussed which location was most viable with respect to biology, land use, and engineering. This information was taken back to the RCA and Agency team and a final extra-large underpass location was determined. Attendees: Dat Nguyen (AECOM); Kevin Brennan and Jeff Villepique (CDFW); Shannon Crossen (ICF); Tricia Campbell (GLA).
7/21/2016	Meeting: Discussed details of proposed project alternative alignments and wildlife crossing design for each project alternative to date. Reviewed crossing placement and design of each crossing for each alternative in detail. Attendees: Heather Pert (CDFW); Mary Zambon and Scott Staley (County of Riverside); Karin Cleary-Rose (USFWS); Tricia Campbell (GLA); Charlie Landry and Laurie Dobson-Correa (RCA); Wendy Worthy and Noelle Ronan (Dudek/RCA); Brian Calvert, Keturah Anderson, and Shannon Crossen (ICF); Dat Nguyen (AECOM).
8/18/2016	Meeting: The County presented the approach and method taken for determining areas subject to Section 1600 of the Fish and Game Code and WRC MSHCP riparian/riverine jurisdiction. Based on this meeting it was agreed by all parties to hold a field meeting. Attendees: Heather Pert (CDFW), Mary Zambon and Scott Staley (County of Riverside); Karin Cleary-Rose (USFWS); Tricia Campbell and Zack West (GLA); Charlie Landry and Laurie Dobson-Correa (RCA); Wendy Worthy and Noelle Ronan (Dudek/RCA); Brian Calvert and Keturah Anderson (ICF).
9/08/2016	Field Meeting: Staff from USFWS, CDFW, RCA, the County, and GLA reviewed a selection of jurisdictional features in the field. Attendees: Heather Pert (CDFW), Mary Zambon and Scott Staley (County of Riverside); Karin Cleary-Rose (USFWS); Tricia Campbell and Zack West (GLA); Charlie Landry and Laurie Dobson-Correa (RCA); Wendy Worthy and Noelle Ronan (Dudek/RCA); Brian Calvert and Keturah Anderson (ICF).
10/20/2016	Meeting: Discussed the results of the field meeting held on 9/8/2016 as well as the methodology for delineation areas subject to Section 1600 of the California Fish and Game Code and WRC MSHCP riparian/riverine resources. Attendees: Heather Pert (CDFW); Mary Zambon (County of Riverside); Karin Cleary-Rose (USFWS); Tricia Campbell (GLA); Charlie Landry and Laurie Dobson-Correa (RCA); Wendy Worthy and Noelle Ronan (Dudek/RCA).
1/29/2018	Field Meeting: Drove the entire project area of all three build alternatives, stopping at select areas of interest to the resource agencies. The focus of the meeting was on jurisdictional water resources. Attendees: Dee Bradshaw and Alexander Marks (MWD); Glenn Robertson (RWQCB); Harry Sandoval and Brian Shomo (RCHCA); Raymond Huaute and Travis Armstrong (Morongo); Heather Pert (CDFW); Clifton Meek (EPA); Paul Macarro, Tony Foussat, and Molly Earp Escobar (Pechanga); Mary Zambon (County of Riverside); Brian Calvert, Keturah Anderson, and Marisa Flores (ICF).
3/15/2018	Meeting: Discussed revisions to the build alternatives and presented the most current locations of the wildlife crossings, including their types and sizes for agency input. General wildlife movement documentation and approaches used, project wildlife crossing design update, and riparian/riverine methodology. It was agreed that to be sure that the species could utilize small and medium-sized crossings, all small and medium crossings would be doubled in width to increase the openness and potential suitability for SKR movement. Also discussed increasing the size of Crossing #87 to an arch culvert or bridge to span riparian resources. All agreed that RCA would review details of

Meeting Date	Meeting Summary
	provided wildlife crossing data and that we would address any questions at the next meeting in April 2018. Attendees: Heather Pert (CDFW); Mary Zambon (County of Riverside); Karin Cleary-Rose (USFWS); Charlie Landry and Laurie Dobson-Correa (RCA); Wendy Worthy and Noelle Ronan (Dudek/RCA); Brian Calvert, Keturah Anderson, Marisa Flores, and Shannon Crossen (ICF).
4/19/2018	Meeting: Discussed feedback regarding the wildlife crossings design and locations presented to RCA 3/15/2018, as well as minor revisions to Build Alternative 2C, and wildlife fencing design. Discussed recommended bridge design at Crossing #87, east of La Sierra; the definition and treatment of riparian vegetation was also discussed. RCA and Wildlife Agencies provided feedback and confirmed the proposed locations and sizes of all wildlife crossings and agreed with the approach for the identification and treatment of riparian vegetation that will be applied for the project. Attendees: Laurie Dobson-Correa and Charlie Landry (RCA); Wendy Worthy (Dudek/RCA); Karin Cleary-Rose and John Taylor (USFWS); Mary Zambon (County of Riverside); Marisa Flores, Greg Hoisington, Brian Calvert, and Keturah Anderson (ICF).
4/16/2020	Conference Call: The purpose of the meeting was to determine the timing of the Minor Amendment and JPR/Consistency Determination, and verify the WRC MSHCP's relationship to the LM MSHCP. The County provided an update on the status of the environmental document to the RCA and Wildlife Agencies and a timeline for circulation of the draft EIR/EIS. Based on input from the RCA, the Minor Amendment would need to be requested prior to the final environmental document and would need to be completed prior to approval of the JPR. The County also wanted to verify whether the Minor Amendment would require evaluation of all three build alternatives or just the Locally Preferred Alternative. The agencies stated that the County would need to ensure that the alternative selected is included in the evaluation, whether or not it is the Locally Preferred Alternative. The evaluation would have to determine the relationship between impacts and ensuring that measures are incorporated to offset the effects and a strategy under each alternative based on the objectives for each cell and alternative. Attendees: Tricia Campbell (RCA); Wendy Worthy (Dudek/RCA); Karin Cleary-Rose and John Taylor (USFWS); Joanna Gibson (CDFW); Mary Zambon (County of Riverside); Marisa Flores, Brian Calvert, and Keturah Anderson (ICF).

5.3.2 Riverside County Habitat Conservation Authority

RCHCA obtained incidental take permits from USFWS and CDFW for SKR within the SKR HCP area. The purpose of the SKR HCP is to streamline the permitting process for otherwise lawful activities resulting in the incidental take of SKR while also meeting federal Endangered Species Act and California Endangered Species Act requirements without seeking individual permits and agreements with USFWS and CDFW. Conservation goals for SKR were incorporated into the HCP to ensure full mitigation for all SKR-occupied habitat that would be incidentally taken. One of these goals included the acquisition and conservation of SKR habitat within an SKR regional reserve system. The SKR HCP provides take authorization for SKR within its boundaries through the establishment of Core Reserves.

The SKR HCP occurs entirely within the WRC MSHCP area. The SKR HCP establishes conservation of 15,000 acres in Core Reserves within the plan's boundary for SKR. The proposed project would occur in one of the long-term SKR HCP Core Reserve areas, Existing Core C. This Core Reserve was established as part of the SKR HCP and is now managed under the WRC MSHCP Conservation Area, consistent with the SKR HCP and other management agreements for the reserve. Public works projects receive coverage under this HCP for potential take of SKR; however, because the proposed project would affect SKR Core Reserve lands, incidental take of SKR is subject to approval by RCHCA, USFWS, and CDFW, and compensatory mitigation is required that would be reviewed and agreed to with RCHCA,

USFWS, and CDFW. Email correspondence with RCHCA in May 2020 confirmed the need for a Core Reserve Land Disturbance Report, which would be submitted to RCHCA for Board approval. This report would document the impacts on SKR and compensatory mitigation and would ensure consistency with the SKR HCP.

RCHCA also manages the portions of the SKR Core Reserve under MWD ownership (refer to Section 5.3.3.1 for coordination involving MWD reserve lands). Numerous meetings occurred with both RCA and RCHCA to discuss the options for replacement lands and land management criteria that would serve both the WRC MSHCP and SKR HCP requirements. Coordination meetings with RCA regarding replacement lands requirements are described in Table 5-7 in Section 5.3.1. Meetings held specifically with RCHCA for the SKR Core Reserve under its management focused on project design and feasibility of reserve management, as summarized in Table 5-8.

Table 5-8. SKR HCP Coordination Meetings Summary

Meeting Date	Meeting Summary
8/10/2011	Meeting: ICF provided an overview of the proposed project, including project alternatives and where SKR areas would be involved. SKR HCP goals and requirements were discussed as well as RCHCA management needs and project expectations. Next steps for mitigation options and coordination between the County and resources agencies were identified. Attendees: Scott Staley and Mary Zambon (County of Riverside); Brian Calvert, Keturah Anderson, and Tricia Campbell (ICF); Heng Chow (AECOM); Gail Barton and Brian Shomo (RCHCA).
6/21/2012	Meeting: ICF provided an overview of the proposed project including biological resource studies to date. Also discussed were the survey needs and documentation requirements for the SKR within the Core Reserve lands. Existing information was discussed along with the potential for a trapping study along the entire alignment. It was determined that a 1:1 mitigation ratio would be required regardless of species occupation. Replacement lands for the SKR Core Reserve Area owned by RCHCA could occur adjacent to any of the SKR Core Reserves. Attendees: Gail Barton and Brian Shomo (RCHCA), Brian Calvert, Keturah Anderson, and Tricia Campbell (ICF); Mary Zambon, Juan Perez, Scott Staley, Russell Williams, John Ashlock, Carolyn Syms Luna, Karin Watts-Bazan, and Tiffany North (County of Riverside).
12/18/2014	Meeting: GLA, ICF, and AECOM discussed conceptual engineering design of project alignments and wildlife crossings, as well as RCHCA management activities and needs. Attendees: Mary Zambon (County of Riverside); Brian Shomo and Princess Hester (RCHCA); Heng Chow and Bill Hagmaier (AECOM); Mike Romich (ICF); Tricia Campbell (GLA).
2/11/2016	Wildlife Overpass Consideration Meeting: RCHCA, CDFW, and project consultant had a meeting and discussed the potential for a wildlife overpass on the western end of the proposed project. Both agency representatives agreed that an overpass was not suitable at this location and that a larger bridge underpass would be more suitable and feasible. This information was presented to the RCA and resource agencies at a meeting on 02/18/16. Attendees: Brian Shomo (RCHCA), Kevin Brennan (CDFW), Tricia Campbell (GLA).
2/27/2018	Meeting: Based on feedback from resource agencies and environmental stakeholders, ICF and RCHCA discussed feasibility of various movement studies for SKR. It was determined that a roadkill and camera study would not be cost effective or provide any substantial benefits or insight into the project design because there are already substantial and evenly dispersed wildlife crossings throughout the critical permeability areas. Also discussed potential SKR wildlife crossing simulation study and RCHCA did not feel that this was necessarily warranted. RCHCA suggested small/medium crossings be widened, which may improve usability but all noted that we still do not know what attributes are necessary for crossings designed for this species. All agreed that some level of research would be helpful and that possibly finding an existing culvert in occupied habitat could be more cost effective than conducting a larger controlled experiment. Attendees: Brian Shomo (RCHCA); Shannon Crossen, Marisa Flores, Keturah Anderson, and Brian Calvert (ICF); Mary Zambon (County of Riverside).

5.3.3 Metropolitan Water District of Southern California

5.3.3.1 Lake Mathews MSHCP

The LM MSHCP is a joint conservation effort initiated by MWD and RCHCA in cooperation with USFWS and CDFW. Proposed project impacts on the LMR beyond the existing right of way are not an allowable use or activity under this plan. While the LM MSHCP includes procedures for four types of amendments that facilitate course corrections and other amendments to the LM MSHCP and accompanying agreements, the LM MSHCP does not include a prescribed amendment or process to allow changes to the plan in response to public safety and/or access needs. Thus, an appropriate discretionary action or actions coordinated between the County and LM MSHCP responsible parties are proposed as part of the project to accommodate the proposed roadway improvements, and may include a new LM MSHCP amendment along with the development of procedures for the amendment. Any changes to the LM MSHCP would require consideration and accommodation of the associated federal Endangered Species Act, California Endangered Species Act, and natural community conservation plan permits and agreements. Refer to the introductory discussions in Chapter 3, *Affected Environment, Environmental Consequences, and Avoidance, Minimization, Mitigation Measures*, and Chapter 4, *California Environmental Quality Act Evaluation*, and to discussion of the LM MSHCP and associated plans and agreements in Section 3.1, *Land Use,* of this Draft EIR/EIS.

Coordination efforts involving the proposed project and accommodation of the project by the LM MSHCP and associated agreements have been ongoing since 2011. The discretionary action or actions necessary for accommodation of the project would be pursued by the County; approvals would need to be obtained prior to any construction. It is anticipated that MWD, as the primary managing entity of Lake Mathews and surrounding operations, will be included in the development of procedures for the discretionary action; however, it should be noted that MWD is not a joint project lead or co-sponsor of the project.

A summary of meetings and calls with MWD is provided in Table 5-9. Additional calls involving MWD as a participating agency in the 23 USC 139 (Efficient Environmental Review) process are described in Table 5-3.

Table 5-9. MWD Coordination Meetings Summary

Meeting Date	Meeting Summary
7/14/2011	Meeting: ICF provided an overview of the proposed project, including project alternatives and where MWD areas would be involved. MWD management objectives were discussed, as well as next steps for coordination among the County, resources agencies, and MWD. Attendees: Scott Staley and Mary Zambon (County of Riverside); Brian Calvert and Tricia Campbell (ICF); Edward Ng, Heng Chow, and Mauro Mawawa (AECOM); Jill T. Wicke, Morris Duncan, and John Osornia (MWD).
8/10/2011	Meeting: ICF provided an overview of the proposed project, including project alternatives and where SKR areas would be involved. SKR HCP goals and requirements were discussed as well as RCHCA management needs and project expectations. Next steps for mitigation options and coordination between the County and resources agencies were identified. Attendees: S. Staley and M. Zambon (County of Riverside); B. Calvert, Keturah Anderson, and T. Campbell (ICF); H. Chow (AECOM); Gail Barton and Brian Shomo (RCHCA).

Meeting Date	Meeting Summary
8/30/2012	Meeting: The County provided an overview of the proposed project, including project alternatives, where MWD areas would be involved, and County interest in minimizing adverse effects on the LMR and MWD facilities while seeking opportunities to aid with management improving LMR conditions. The LM MSHCP and associated resource agency interests were discussed, as well as coordination among the County, resources agencies, and MWD. Attendees: Juan C. Perez, M. Zambon, Karin Watts-Bazan, Tiffany North, and G. Barton (County of Riverside); B. Calvert and T. Campbell (ICF); John C. Clairday, Wendy Picht, Kieran Callanan, Joe Vanderhorst, Paul Norlen, Patty Fowler, Lilly Shraibatia, Peter Wiseman, and Clen Boyd (MWD).
2/26/2013	Meeting: ICF provided an overview of the El Sobrante project description. There was a discussion regarding MWD facilities and the LM MSHCP. Action items from the August 2012 meeting were reviewed. Attendees: S. Staley and M. Zambon (County of Riverside); B. Calvert and T. Campbell (ICF); J. C. Clairday, W. Picht, K. Callanan, P. Norlen, Bryan Otake, and Brad Eaton (MWD).
4/4/2013	Call: ICF reviewed the LM MSHCP amendment process and facilitated a discussion between MWD and the County. BBK summarized findings from the Audubon Society Settlement Agreement. ICF then discussed the County's preferred CEQA/NEPA approach to the project. Attendees: S. Staley, M. Zambon, and K. Watts-Bazan (County of Riverside); Michelle Ouellette (BBK); B. Calvert and T. Campbell (ICF); J. C. Clairday, W. Picht, K. Callanan, P. Norlen, P. Wiseman, and B. Otake (MWD).
4/25/2013	Meeting: ICF reviewed the roadbed removal required as part of the proposed project. The Audubon Society Settlement Agreement and the CEQA/NEPA document were both determined to require further discussion. The draft MOU was discussed, and it was stated by BBK that more information from MWD was needed. Attendees: M. Zambon and K. Watts-Bazan (County of Riverside); M. Ouellette (BBK); B. Calvert, K. Anderson, and T. Campbell (ICF); J. C. Clairday, K. Callanan, B. Otake, and B. Eaton (MWD).
5/23/2013	Meeting: An update on the proposed coordination approach was provided, with MWD to review and edit the draft document. An update was also provided on the CEQA/NEPA environmental document. BBK discussed future resource agency coordination on behalf of MWD. The County stated that the RCHCA amendment role and process would be discussed at a later date. Attendees: M. Zambon and K. Watts-Bazan (County of Riverside); M. Ouellette (BBK); B. Calvert, K. Anderson, and T. Campbell (ICF); J. C. Clairday, K. Callanan, B. Otake, and P. Norlen (MWD).
6/26/2013	Meeting: ICF provided overview of the proposed project and discussed La Sierra Avenue and El Sobrante intersections under Build Alternatives 3 and 4. MWD described a proposed Central Pool Augmentation facility that would be constructed by 2040. MWD stated that since it has property ownership, it wanted early involvement with project development and approval of mitigation options. Attendees: W. Picht, K. Callanan, B. Otake (MWD); B. Calvert, K. Anderson, and T. Campbell (ICF).
4/7/2015	Meeting: ICF provided an overview of the proposed project, including project alternatives. AECOM provided details regarding the alignment of each alternative. ICF summarized the environmental documents that are forthcoming including technical studies. Attendees: T. Campbell (GLA); B. Hagmaier and Dat Nguyen (AECOM); J. Clairday, Heriberto "Eddie" Diaz, and P. Norlen (MWD); S. Staley (County of Riverside); W. Picht (MWD); J. Wicke (Jill Wicke Consulting); B. Calvert (ICF).
7/13/2015	Meeting: ICF provided an overview of the proposed project, including coordination history. The County, ICF, and AECOM presented and discussed each of the project alternatives. The County and ICF provided an overview of stakeholder outreach efforts to date. GLA and ICF provided a status summary of the environmental studies in progress and agency coordination efforts. Attendees: S. Staley and M. Zambon (County of Riverside); W. Picht, K. Callanan, H. Diaz, and P. Norlen (MWD); B. Calvert and K. Anderson (ICF); B. Hagmaier (AECOM); J. Wicke (Jill Wicke Consulting).

Meeting Date	Meeting Summary
3/7/2016	Meeting: ICF provided an overview of the project, including a summary of the current alternatives for the project. GLA reviewed biology and the delineation data that had been collected thus far. Attendees: M. Zambon (County of Riverside); Brock Ortega (Dudek/MWD); B. Calvert and K. Anderson (ICF); T. Campbell (GLA).
9/1/2016	Meeting: GLA provided an overview of the level of evaluation performed to date on potential mitigation lands for proposed impacts on reserve lands and presented information on replacement land requirements. Attendees: W. Picht (MWD); B. Calvert and K. Anderson (ICF); T. Campbell (GLA).
1/12/2017	Call: ICF provided an overview of the proposed project, including a current update. The Drainage Water Quality Management Plan was discussed in terms of protection of Lake Mathews water quality, existing and proposed facilities, and project opportunities and constraints. Future MWD facilities planning was discussed with a focus on Alternative 3 and mitigation lands. Engineering, safety, and access plans were reviewed with an emphasis on Alternatives 3 and 4. Lastly, non-governmental organization feedback concerning Lake Mathews was discussed. Attendees: S. Staley and M. Zambon (County of Riverside); W. Picht, Diane Doesserich, K. Callanan, and Rob Bell (MWD); B. Calvert and K. Anderson (ICF); B. Hagmaier and Gary Sjelin (AECOM).
2/22/2017	Meeting: ICF provided an overview of the proposed project. Project opportunities and constraints related to protection of Lake Mathews water quality were discussed. MWD water quality planning and facilities were reviewed, which included a discussion on existing and proposed facilities and the Drainage Water Quality Management Plan. Attendees: S. Staley, M. Zambon, and Claudia Steiding (County of Riverside); Mickey Chadhuri, Ken Chung, K. Callanan, and Maria Lopez (MWD); B. Calvert and K. Anderson (ICF); B. Hagmaier and G. Sjelin (AECOM).
3/1/2017	Field Meeting: The purpose of this meeting was to locate and identify MWD equipment and facilities possibly affected by the Alternative 4 alignment near Lake Mathews Dam. Attendees: K. Chung, K. Callanan, and three other MWD personnel (MWD); Dave McMillan and Tim Rayburn (County of Riverside); D. Nguyen (AECOM).
8/16/2018	Meeting: ICF provided an overview of the proposed project. The requirements and goals of existing MWD/Reserve fencing and proposed wildlife fencing placement were discussed, including challenging locations/options and opportunities for wildlife fencing to supplement or replacement MWD/Reserve fencing. Lastly, MWD access and wildlife fencing was discussed in terms of access gates, fencing/crossing tie-ins, and MWD security. Attendees: M. Zambon (County of Riverside); K. Callanan, Sean Carlson, John Osornia, Tania Asef, and Isaac Fernandez (MWD); B. Calvert, K. Anderson, Shannon Crossen, and Marisa Flores (ICF); Greg Hefter (AECOM).
3/27/2019	Call: Update, EIR/EIS status, timing, entry permits, keep in touch. Attendees: K. Callanan and Lily Shiribati (MWD); B. Calvert, K. Anderson, and M. Flores (ICF).
10/30/2019	Call: Update, EIR/EIS status, LMR Management Plan status/timing, LM MSHCP coordination. Attendees: K. Callanan, S. Carlson, and L. Shiribati (MWD); M. Zambon (County); B. Calvert and M. Flores (ICF).
2/3/2020	Meeting: ICF provided an overview of the proposed project and current updates. Coordination opportunities and constraints involving the LM MSHCP and proposed project were discussed. Attendees: S. Staley, M. Zambon, and Aaron Gettis (County of Riverside); K. Callanan, Sean Carlson, B. Otake, and Alexander Marks (MWD); B. Calvert, K. Anderson, and M. Flores (ICF).

5.3.3.2 Project Design and Lake Mathews Facilities

Because the proposed project would travel through areas managed by MWD, the County has coordinated closely with MWD throughout the project planning and design phase to understand and address MWD's needs involving management and operation of Lake Mathews facilities. Since 2011, information concerning Lake Mathews facility management and operations and the

proposed project has been exchanged between the County and MWD, and discussed throughout the 23 USC 139 coordination process, NOP scoping, and LM MSHCP coordination. In addition to these coordination efforts, the County and MWD have discussed and considered specific design options that may better accommodate facility and operations, including security, dam facilities, maintenance roads, and entrance access and circulation.

In July 2015, MWD presented a letter to the County that outlined engineering and operational concerns regarding specific segments of the proposed project and the accommodation of existing and future, planned MWD facilities. In response to the concerns identified in the letter, project engineers prepared recommended design modifications to accommodate operations and maintenance access needs for the Lake Mathews Dam and other Lake Mathews facilities, including maintenance road access, and redesign of the main MWD entrance at the intersection of El Sobrante Road and La Sierra Avenue. The letter also addressed variations of the segment of Build Alternative 3 within MWD-managed lands west of La Sierra Avenue previously developed in an effort to avoid or otherwise minimize impacts on sensitive conservation areas and MWD facilities discussed with MWD and resource agencies prior to 2015 (refer to Table 5-9). The 2015 letter confirmed that the variations would not fully avoid future facilities planned by MWD and, in November 2016, Build Alternative 3 was eliminated from further consideration.

In November 2016, MWD presented a letter to the County that outlined engineering and operational concerns regarding the alignment of Build Alternative 4 west of Lake Mathews and existing MWD facilities east of Lake Mathews. In response to the concerns identified in the letter, project engineers adjusted the alignment of Alternative 4 east and west of Lake Mathews and added a large, arched bridge to span the Lake Mathews Dam spillway area.

Please refer to Tables 5-3 and 5-9 for meetings with MWD and Appendix H for copies of letters and meeting minutes.

5.3.4 United States Army Corps of Engineers

Coordination with USACE regarding the project has included the sharing of information, methodologies, and draft technical studies under the 23 USC 139 process, as well as the discussion of project details concerning Clean Water Act (CWA) 404 and jurisdictional wetlands.

On November 4, 2015, a meeting was held among USACE and the County, Caltrans, ICF, and GLA. ICF discussed delineation methodology and clarification of aerials and the conditions they showed and from what years they are from. Attendees discussed that some of the project alignment was delineated during the MCP Project but that the data were found insufficient for the current project (prior Arid West delineation method [U.S. Army Corps of Engineers 2008]). All lands were re-delineated and 2010 Ordinary High Water Mark and Arid West data sheets were used. ICF indicated the project would permanently affect fewer than 2 acres of USACE jurisdiction. The draft delineation report was pending, but the schedule was to have the draft jurisdictional delineation submitted to Caltrans District 8 in early to mid-2016 and to USACE mid- to late 2016. USACE stated the new Clean Water Rule would not go into effect for quite some time.

The draft jurisdictional delineation report was distributed to USACE, EPA, CDFW, and RWQCB on June 29, 2017, for review as part of the 23 USC 139 process. Initial comments from

USACE were received on July 31, 2017. The comment period was extended per agency request and closed on April 3, 2018. All comments received were incorporated into the final Jurisdictional Delineation report (Caltrans 2018). The draft NES was also distributed to USACE, USFWS, CDFW, EPA, RWQCB, RCRCD, and MWD for review and to provide initial feedback as part of the 23 USC 139 process. Agency comments were reviewed by the County and addressed directly with the resource agencies, and were incorporated into the Final NES.

The project would encroach into federal waters of the U.S. under all the build alternatives. All features were delineated with the understanding that a request for a Preliminary Jurisdictional Determination would be submitted for the project. As such, all non-wetland water features exhibiting an ordinary high water mark and wetlands meeting the three wetland parameters (hydrophytic vegetation, hydric soils, and hydrology) were analyzed as jurisdictional waters of the U.S. subject to regulation by USACE under Section 404 of the CWA. The project would require acquisition of a CWA Section 404 Nationwide Permits from USACE.

5.3.5 Regional Water Quality Control Board

Coordination with RWQCB regarding the project has included the sharing of information, methodologies, and draft technical studies under the 23 USC 139 process, as well as the discussion of project details concerning water quality and CWA 401 certification. A summary of meetings and correspondence specifically with RWQCB is presented in Table 5-10, below. All other coordination and communications involving RWQCB and the 23 USC 139 process are summarized in Section 5.1 and included in Appendix H.

Table 5-10. RWQCB Coordination Summary

Meeting Date	Meeting Summary
5/25/2017	Meeting: Included RWQCB, the County, ICF, and AECOM. An overview of the proposed project and alternatives and the locations of existing drainage features within the project area were presented to RWQCB. Proposed design features that would accommodate storm flows and support water quality objectives under the County Municipal Separate Storm Sewer System (MS4) Permit and Low-Impact Development (LID) guidance (Cities and County of Riverside 2012) and Transportation Project Guidance (TPG) were discussed. Attendees: Scott Staley, Mary Zambon, and Claudia Steiding (County of Riverside); Adam Fischer and Ray Akhtarshad (RWQCB); Brian Calvert and Keturah Anderson (ICF); Bill Hagmaier and Gary Sjelin (AECOM).
9/20/2017	Call: A call was held among RWQCB, the County, and ICF regarding RWQCB comments on the Jurisdictional Delineation under the 23 USC 139 review process. Proposed Best Management Practices (BMPs) in support of the protection of water quality, as well as the consideration of existing RCRCD mitigation areas north and south of Cajalco Road in the areas of Wood Road and Carpinus Drive, and Temescal Creek, were discussed. Consistency with MWD's Lake Mathews Watershed Drainage Water Quality Management Plan (DWQMP) (John M. Tettemer & Associates, Ltd. 1992), Lake Mathews Watershed Water Quality Improvement Study (WQIS) (Tetra Tech, Inc. 2012), and the RCA WRC MSHCP was also discussed. Recommendations were made to consider the 401 certification application relative to the Cajalco Road Bridge crossing of Temescal Creek and any agreements regarding road bridge impacts in the Temescal Creek/Bedford Canyon Wash confluence made among RCRCD, Caltrans, RCTC, and any other agencies. Attendees: Scott Staley (County of Riverside); Glenn Robertson and Jason Bill (RWQCB) Brian Calvert and Keturah Anderson (ICF).

Meeting Date	Meeting Summary
7/30/2018	Meeting: The results of additional research regarding proposed BMPs, as well as refinements made to the project alignment and design in effort to avoid or otherwise reduce impacts on RCRCD mitigation areas, were discussed. The consideration of alternative BMPs, including integration with BMPs identified in the MWD Lake Mathews Watershed DWQMP and WQIS, and their status and feasibility, were also discussed. Due to low infiltration rates throughout the project alignments, findings of the WQIS, and unknown timing of implementation of remaining facilities identified in the DWQMP, the integration of BMPs beyond those recommended for the project may not be feasible. Attendees: Scott Staley (County of Riverside); Glenn Robertson and Muhammad Bashir (RWQCB); Brian Calvert, Keturah Anderson, and Laura Rocha (ICF); Greg Hefter (AECOM).
8/28/2018	Meeting: Comments presented by RWQCB on the LID, Water Quality Assessment Report, and NES, and proposed responses for addressing comments as part of the 23 USC 139 review process were discussed. The consideration of additional BMP options was revisited and discussed, along with the LID and TPG, and project considerations of the BMPs. The timing of the MS4 permit and 401 certification and benefits of early preparation of the certification application were also discussed. Attendees: Scott Staley, Mary Zambon, and Benji Cho (County of Riverside); Adam Fischer and Glenn Robertson (RWQCB); Brian Calvert, Keturah Anderson, and Laura Rocha (ICF); Greg Hefter (AECOM).

5.3.6 Riverside County Flood Control and Water Conservation District

RCFCWCD acts as technical advisor to the County on flood control, drainage, and drainage water quality issues; administers Area Drainage Plans; and is lead agency and co-permittee with the County and various cities in the NPDES permit issued by the RWQCB regulating municipal stormwater runoff. As a signatory for the Lake Mathews Watershed DWQMP MOU, RCFCWCD is also responsible for constructing, operating, and maintaining DWQMP facilities, and thus has interest in the proposed project and related drainage and/or water quality components.

Coordination with RCFCWCD regarding the project has included the sharing of information, methodologies, and draft technical studies under the 23 USC 139 process, as well as the discussion of project details concerning drainage design and water quality. A summary of meetings and correspondence specifically with RCFCWCD is presented in Table 5-11, below. All other coordination and communications involving RCFCWCD and the 23 USC 139 process are summarized in Section 5.1 and included in Appendix H.

Table 5-11. RCFCWCD Coordination Summary

Meeting Date	Meeting Summary
7/14/2015	Meeting: An overview of the proposed project and alternatives was presented to RCFCWCD along with the locations of existing and proposed drainage features within the project area. Proposed design features that would accommodate storm flows and support water quality objectives under the County MS4 Permit and LID guidance and TPG were discussed. Consistency with MWD's Lake Mathews Watershed DWQMP (John M. Tettemer & Associates, Ltd. 1992) and Lake Mathews Watershed WQIS (Tetra Tech, Inc. 2012) was also discussed. Attendees: Scott Staley (County of Riverside); Edwin Quinonez, Kris Flanigan, Ruben Duran, Juliana Adams, and Joan Valle (RCFCWCD); Brian Calvert and Keturah Anderson (ICF); Dat Nguyen (AECOM).

Meeting Date	Meeting Summary
2/16/2017	Meeting: Project updates were provided to RCFCWCD and drainage design options for the eastern section of the project were discussed. Attendees: Scott Staley and Mary Zambon (County of Riverside); Edwin Quinonez, Kris Flanigan, Ruben Duran, Juliana Adams, and Joan Valle (RCFCWCD); Brian Calvert and Keturah Anderson (ICF); Bill Hagmaier and Gary Sjelin (AECOM).

5.3.7 Riverside-Corona Resource Conservation District

Coordination with RCRCD regarding the project has included the sharing of information, methodologies, and draft technical studies under the 23 USC 139 process, as well as the discussion of project details concerning water quality and CWA 401 certification. A summary of meetings and correspondence specifically with RCRCD is presented in Table 5-12, below. All other coordination and communications involving RCRCD and the 23 USC 139 process are summarized in Section 5.1 and included in Appendix H.

Table 5-12. RCRCD Coordination Summary

Meeting Date	Meeting Summary
12/3/2015	Meeting: An overview of the project was provided to RCRCD and existing mitigation lands under management of RCRCD were discussed. Attendees: Mary Zambon (County of Riverside); Arlee Montalvo (RCRCD), Brian Calvert, Keturah Anderson, and Marisa Flores (ICF).
9/26/2016	Meeting: Existing mitigation lands under management of RCRCD at Temescal Creek and Cajalco Creek were discussed. Design options that would avoid or otherwise minimize impacts were presented for consideration. Attendees: Mary Zambon (County of Riverside); Shelli Lamb and Arlee Montalvo (RCRCD); Brian Calvert and Keturah Anderson (ICF); Tricia Campbell (GLA).
10/3/2018	Meeting: RCRCD comments regarding the NES submitted as part of the 23 USC 139 process. Attendees: Mary Zambon (County of Riverside); Arlee Montalvo (RCRCD); Brian Calvert, Keturah Anderson, and Marisa Flores (ICF).

5.3.8 Native American and Section 106 Coordination

NAHC was contacted by letter on March 29, 2011, requesting information regarding sacred lands and a list of Native American organizations/individuals to contact. The NAHC response received on April 1, 2011, stated that a record search of the Sacred Land Files failed to indicate the presence of Native American cultural resources within 0.5 mile of the project APE, but noted that there are Native American cultural resources in adjacent sections of the Lake Mathews and Steele Peak U.S. Geological Survey 7.5-minute quadrangles. A list of 13 individuals with knowledge of the project area was provided and it was recommended they be contacted. In April 2011, Gary Jones, Caltrans' District 8 Native American Coordinator, reviewed the NAHC list and recommended that changes be made to four contact persons.

Between May 19 and May 27, 2011, letters were sent to representatives of various Native American tribes in accordance with the list of organizations/individuals received from NAHC and recommendations from Gary Jones, Caltrans District 8 Native American Coordinator. Due to

the passage of time and changes to the project description, letters were re-sent to the Native American contacts on May 18, 2016, as well as to additional new contacts identified by the tribes previously contacted. Follow-up emails were sent and phone calls made on June 29, 2016; additional follow-up emails and phone calls for tribes that did not respond to the June 29, 2016, contact attempts were made October 10 and 11, 2016 (refer to Appendix H). Table 5-13 provides a summary of applicable Native American organization contacts and subsequent consultation.

On December 1, 2020, Caltrans consulted with SHPO regarding the determination of National Register of Historic Places (NRHP) eligibility for resources within the project APE. SHPO provided concurrence with Caltrans's determination on February 10, 2021. On February 17, 2021, SHPO concurred with a Finding of Adverse Effect for the proposed project. A Section 106 Memorandum of Agreement (MOA) will be developed for all sites that will be affected by the project, and it will include mitigation measures and treatment for historic properties. The Native American tribes that have been involved in consultation for the Cajalco Road Widening Project will be invited to participate in the development of the MOA. Consultation with the SHPO and consulting tribes will continue through consultation on the MOA, which will be completed prior to the Final EIR/EIS.

In addition to the Section 106 consultation process, the project team met with and discussed the proposed project and area cultural information with local Native American organizations through the 23 USC 139 coordination process and NOI/NOP scoping coordination. This separate coordination is summarized in Table 5-14, *Summary of Additional Native American Coordination*, following Table 5-13.

Table 5-13. Native American Consultation Summary

Native American Group/Individual	Summary of Communications
Agua Caliente Tribe of Cupeño Indians William J. Pink	**5/18/2011:** Initial contact letter sent to William J. Pink via certified mail. No response to the letter was received. **5/18/2016:** New letter sent due to passage of time and introduction of additional project alternatives. **6/29/20016:** Follow-up phone call made and email sent to W. Pink regarding questions or comments about the project. W. Pink replied via email, stating there are significant religious sites and quarries along the current route that should be avoided. He expects burials and cremations to be encountered and if they are they should be avoided if possible, and if not possible to be treated in accordance with the law. **7/27/2016:** Email sent to W. Pink requesting clarification of tribal affiliation. **7/31/2016:** Email received from W. Pink confirming tribal affiliation as Cupeño/Luiseño Indian and a member of the Agua Caliente Tribe of Cupeño Indians. No further responses have been received from Agua Caliente Tribe of Cupeño Indians.
Cahuilla Band of Indians Yvonne Markel Luther Salgado Sr., Chairperson Andreas Heredia, Cultural Director Bobby Ray Esparza, Cultural Coordinator	**5/23/2011:** Initial contact letter sent to Yvonne Markel via certified mail. No response to the letter was received. **5/18/2016:** New letter sent to Chairperson Luther Salgado, Senior, due to passage of time and introduction of additional project alternatives. No response to the letter was received. **6/29/2016:** Follow-up phone call made and email sent to L. Salgado Sr. requesting a response if the tribe has information related to the project. **6/30/2016**: Email response received from Cultural Director Andreas Heredia requesting a copy of the letter. Follow up email sent to L. Salgado Sr.

Native American Group/Individual	Summary of Communications
Anthony Madrigal, Senior, Vice President / Tribal Historic Preservation Officer (THPO)	**6/30/2016:** Letter received from A. Heredia, stating that the tribe requests a cultural monitor(s) on site for all ground disturbances. **12/6/2017:** Email sent to A. Heredia regarding review of the Extended Phase I (XPI) Survey proposal and involvement in the survey. An electronic copy of XPI proposal was provided via FTP. An email response was received from Bobby Ray Esparza (Cahuilla) stating that A. Heredia was no longer there, that B. Esparza would be the new Cultural Coordinator/Director for Cahuilla, and Anthony Madrigal, Sr. is the Tribal Historic Preservation Officer. **12/8/2017:** A CD containing the XPI proposal for the project was mailed to B. Esparza. **12/13/2017:** Telephone call made by S. Bryne (ICF) to B. Esparza to discuss meeting to gather the tribe's input on the XPI proposal. B. Esparza suggested a meeting at the tribal office on 12/20/2017. **12/20/2017:** M. Zambon (County) and consultants met at the Cahuilla Tribal office with A. Madrigal and B. Esparza to gather input on the XPI proposal. A. Madrigal and B. Esparza stated that they would like to monitor and that they would have a tribal monitor available. **1/5/2018:** A CD containing the HPSR for the project was mailed to B. Esparza. **3/1/2018:** Email received from B. Esparza inquiring about project updates. Project update provided. **8/15–9/6/2018, 10/18/2018:** Rose Ann Hamilton (Cahuilla) participated as a monitor during XPI survey. **9/10/2018:** Email to B. Esparza from S. Bryne (ICF) inquiring as to positive or negative feedback regarding the monitoring during the XPI. Mr. Esparza responded, stating no negative feedback but inquired as to an update when the project would proceed. **10/9/2018:** Email exchange between B. Esparza and S. Bryne (ICF) regarding coordination of monitoring for one additional day of XPI survey. **10/21/2019:** Caltrans submitted revised Draft HPSR to Cahuilla (attention of A. Madrigal, Sr.) for review. **11/18/2019:** Meeting held at County office regarding comments on HPSR. Attendees: A. Madrigal, Sr., B. Esparza (Cahuilla); Gary Jones (Caltrans); M. Zambon (County of Riverside); and County consultants. Information provided by Cahuilla was considered and addressed in revised cultural reports. **11/19/2020:** A CD containing the HPSR was delivered via mail to the attention of A. Madrigal, Sr. **12/11/2019:** Email to G. Jones (Caltrans) and M. Zambon (County) from B. Esparza regarding comments on HPSR and concern that some destruction to cultural resources would occur under any of the project alternatives. The email further indicated recommendation by THPO for Build Alternative 2C. No further comments have been received from Cahuilla Band of Indians.
Los Coyotes Band of Mission Indians Francine Kupsch, Spokesperson Janice Elzenga	**5/21/2011:** Initial contact letter sent to Francine Kupsch via certified mail. No response to the letter was received. **5/18/2016:** New letter sent due to passage of time and introduction of additional project alternatives. No response to the letter was received. **6/29/2016:** Follow-up phone call made and email sent to J. Elzenga requesting a response if the tribe has information related to the project. **10/11/2016:** Follow-up phone call made and email sent to J. Elzenga requesting a response if the tribe has information related to the project. No responses have been received from Los Coyotes Band of Mission Indians.
Morongo Band of Mission Indians Michael Contreras	**5/19/2011:** Initial contact letter sent to M. Contreras via certified mail. No response to the letter was received. **5/18/2016:** New letter sent due to passage of time and introduction of additional project alternatives. No response to the letter was received.

Native American Group/Individual	Summary of Communications
Raymond Huaute, Cultural Resource Specialist Travis Armstrong, Tribal Historic Preservation Officer (THPO)	**6/29/2016**: Follow-up phone call made and email sent to M. Contreras requesting a response if the tribe has information related to the project. **10/11/2016:** Follow-up phone call made and email sent to M. Contreras requesting a response if the tribe has information related to the project. **3/9/2017:** Email sent to Raymond Huaute, Cultural Resource Specialist, regarding interest in Section 106 consultation and requesting a response if the tribe has information related to the project. A summary of prior contact efforts with Morongo was provided. R. Huaute responded in an email the same day, requesting copies of cultural reports. He was thusly informed of the status of cultural reports, and that they would be provided when available. **1/6/2018:** Draft HPSR provided to R. Huaute. No comments received. **1/29/2018:** Field meeting with resource agencies, County, and ICF to view drainage features throughout project site. R. Huaute and Travis Armstrong (Morongo) attended. Mr. Huaute and T. Armstrong shared concerns regarding communications with Morongo about the project. It was agreed that Morongo would be involved in monitoring and informed of any changes in project status. **2/5, 2/27/2018:** Follow up email sent to R. Huaute regarding the Morongo monitoring agreement and to review the XPI proposal. A signed monitoring contract was provided by R. Huaute on 2/27/2018. **2/15/2018:** M. Zambon (County) sent R. Huaute a letter and CD containing the XPI proposal for the project. **4/10/2018:** Monitoring agreement for the XPI survey was sent to R. Huaute. No comments received. **6/29/2018:** S. Bryne (ICF) received a voicemail message from T. Armstrong asking to be informed as the project schedule for the XPI survey was developed. **7/2/2018:** S. Bryne left a voicemail for T. Armstrong informing him that he would be apprised of the project schedule when it was available. **7/13/2018:** Executed monitoring agreement received from Alicia Benally (Morongo) via email. **8/15–9/6/2018, 10/18/2018:** D. Hough, A. Lerma, and R. Mathews, Jr. (Morongo) participated as a monitors during XPI survey. **9/10/2018:** Email to A. Benally from S. Bryne (ICF) inquiring as to positive or negative feedback regarding the monitoring during the XPI. No response to the inquiry was received. An additional email inquired if a monitor from the tribe would be available to monitor one additional day for the XPI survey. **10/09 and 10/16/2018**: Email from A. Benally sent to S. Bryne (ICF) indicating that R. Mathews, Jr. may not be available for monitoring. Email from A. Benally to S. Bryne (ICF) indicating monitor would be D. Hough. **10/21/2019:** Caltrans submitted revised Draft HPSR to Morongo (attention of T. Armstrong, THPO) for review. **11/21/2019:** Meeting held at County office regarding comments on HPSR. Attendees: T. Armstrong (Morongo); G. Jones (Caltrans); M. Zambon (County of Riverside); and B. Calvert, Karen Crawford, and K. Anderson (ICF). Mr. Armstrong conveyed appreciation of the County's outreach and inclusion of the tribe in the planning process, and interest in protecting tribal resources without obstructing the project. Additional information discussed was considered and addressed in revised cultural reports. **12/18/2019:** Email received by G. Jones (Caltrans) and M. Zambon (County) from T. Armstrong (Morongo) indicating no further comments on HPSR. No further responses have been received from Morongo Band of Mission Indians.
Pala Band of Mission Indians	**5/19/2011**: Initial contact letter sent to Shasta Gaughen via certified mail. A response to the letter was received in 2012 (below). **10/10/2012:** Letter from S. Gaughen to Deputy District Director David Bricker (Caltrans), indicating deferral to tribes in closer proximity to the project.

Native American Group/Individual	Summary of Communications
Shasta C. Gaughen, PhD, Tribal Historic Preservation Officer	**5/18/2016:** New letter sent due to passage of time and introduction of additional project alternatives. No response to the letter was received. No further responses have been received from Pala Band of Mission Indians.
Pauma and Yuima Reservation Randall Majel, Chairperson	**5/19/2011:** Initial contact letter sent to Chairman Randall Majel via certified mail. No response to the letter was received. **5/18/2016:** New letter sent due to passage of time and introduction of additional project alternatives. No response to the letter was received. **6/29/2016:** Follow-up call made and email sent to R. Majel requesting a response if the tribe has information related to the project. **10/11/2016:** Follow-up phone call made and email sent to R. Majel requesting a response if the tribe has information related to the project. No responses have been received from Pauma and Yuima Reservation.
Pauma Valley Band of Luiseño Indians Bennae Calac, Tribal Council Member Chris Devers, Vice Chairman	**5/19/2011:** Initial contact letter sent to Bennae Calac via certified mail. No response to the letter was received. **5/18/2016:** New letter sent due to passage of time and introduction of additional project alternatives. **6/2/2016:** Email received from Chris Devers stating Pauma Band is unaware of specific cultural resources within proposed project area; their concern is the protection and avoidance of cultural sites. Requested to be updated as project progresses. **10/11/2016:** Follow up phone call made and email sent to B. Calac requesting a response if the tribe has information related to the project. No further responses have been received from Pauma Valley Band of Luiseño Indians.
Pechanga Band of Luiseño Mission Indians Anna Hoover, Cultural Analyst Mark Macarro, Chairperson Paul Macarro, Chairperson, Cultural Resource Coordinator Raymond Basquez, Senior, Chairperson Gary Dubois, Tribal Historic Preservation Officer Ebru Ozdil, Cultural Analyst Molly Earp-Escobar, Cultural Resource and Planning Specialist	**5/27/2011:** Initial contact letters sent to M. Macarro, P. Macarro and A. Hoover via certified mail. **6/13/2011:** Letter response received from A. Hoover (Pechanga) addressed to M. Robinson (ICF) requesting government-to-government consultation, and stating that the project is not within reservation lands, but within ancestral territory. The letter further describes prior coordination with the County and interest in protection of sensitive resources. **2/10/2012:** Brenda Tomaras (Tomaras & Ogas) sent an email on behalf of tribe to Mary Zambon (County) requesting project status update. M. Zambon responded to the inquiry with a status update. **10/2/2012:** Email to A. Hoover from K. Anderson (ICF) regarding the proposed project; addressed CEQA and NEPA delegated lead agencies, the County and Caltrans, respectively, seeking to continue consultation with Pechanga regarding the proposed project. **10/3/2012:** Email sent to A. Hoover from K. Anderson (ICF) regarding coordination of October 29, 2012, meeting at Pechanga Cultural Resources facility in Temecula. **10/29/2012:** Russell Williams, Scott Staley and M. Zambon (County), Gary Jones (Caltrans), and County consultants (ICF), met with P. Macarro, A. Hoover, Raymond Basquez, Senior, and Ebru Ozdil (Pechanga), and B. Tomaras (Tomaras & Ogas) at the Pechanga Cultural Resources facility to discuss resources in the project area and bridge design in the Cajalco Creek area. **3/7/2013–3/21/2013:** Email exchange with A. Hoover (Pechanga) regarding coordination of April 16, 2013 meeting. **4/16/2013:** Meeting held at Pechanga Cultural Resources facility with A. Hoover, P. Macarro and E. Ozdil (Pechanga); B. Tomaras (Tomaras & Ogas); G. Jones (Caltrans); M. Zambon, S. Staley, and R. Williams (County); and County consultants (AECOM and ICF). Revised bridge designs for the Cajalco Creek area in response to earlier input from Pechanga were shared and discussed.

Native American Group/Individual	Summary of Communications
	4/25/2013: Email to A. Hoover, P. Macarro, E. Ozdil, B. Tomaras, G. Jones, M. Zambon, S. Staley, R. Williams, and County consultants regarding field meeting on April 29, 2013. **4/29/3013:** Field meeting held with R. Basquez, Sr., A. Hoover, P. Macarro, and E. Ozdil (Pechanga); G. Jones (Caltrans); B. Tomaras (Tomaras & Ogas); M. Zambon (County); and County consultants (AECOM and ICF). Pechanga shared Cajalco Creek area information and indicated interest in specific features; the County and consultants described what would be proposed by the project for the area, and possible methods for avoiding and minimizing impacts. **5/6/2013:** Field meeting summary distributed to A. Hoover, P. Macarro, E. Ozdil, B. Tomaras, G. Jones, M. Zambon, S. Staley, R. Williams, E. Ng, B. Calvert, and M. Long. **12/18/2013:** Email sent to A. Hoover from M. Zambon regarding additional engineering work to revise the Cajalco Creek bridge conceptual layout. **1/29/2015**: M. Zambon emailed A. Hoover, R. Williams, A. Cannon, P. Macarro, E. Ozdil, G. Jones, and J. Marcinek, and agenda for the February 3, 2015, meeting. **2/3/2015**: M. Zambon (County) met with R. Basquez, Sr., A. Hoover, and E. Ozdil (Pechanga) at the County office to discuss County projects and concerns involving sensitive resources. County consultants (AECOM and ICF) attended. **3/19/2015:** M. Zambon (County) sent a CD containing project information to Pechanga Band of Luiseño Mission Indians containing project information. **5/14/2015:** Email sent to A. Hoover containing Cajalco Creek Bridge design details. **5/28/2015:** M. Zambon (County), G. Jones (Caltrans), K. Anderson and M. Robinson (ICF) met with P. Macarro, A. Hoover, and E. Ozdil (Pechanga) at the Pechanga Cultural Resources facility to discuss resources in the project area and bridge design in the Cajalco Creek area. **6/7/2015:** Email sent to E. Ozdil regarding KMZ and DGN files depicting the Cajalco Creek bridge options. **7/27/2015:** Letter sent to A. Hoover from M. Zambon regarding follow-up information for meeting held 5/28/2015. **5/3/2016:** M. Zambon (County), G. Jones (Caltrans), and County consultants (ICF) met with A. Hoover, E. Ozdil, and P. Macarro (Pechanga) at Pechanga Cultural Resources facility to discuss the project and bridge design in the Cajalco Creek area. **5/17/2016:** Ms. Zambon (County) sent a letter containing a CD with project information to A. Hoover. **5/18/2016:** New letter sent to A. Hoover and P. Macarro (Pechanga) regarding introduction of additional project alternatives. **5/31/2016–11/15/2016:** Email exchanges and phone calls among S. Bryne, A. Hoover, and Tony Foussat (Pechanga) regarding coordination and scheduling of monitoring during field surveys. **6/29/2016:** Follow-up phone call made and email sent requesting a response if the Tribe has additional information related to the project. **6/30/2016:** Email from S. Bryne to A. Hoover confirming letters sent in May to the Native American contacts on the original NAHC list. **10/11/2016:** Follow-up phone calls made and emails sent to P. Macarro and A. Hoover (Pechanga) requesting a response if the tribe has information related to the project. **3/9–3/10/2017:** Email exchange between S. Bryne and T. Foussat regarding coordination and scheduling of monitoring during survey. **3/24/2017:** Email received from E. Ozdil requesting that A. Hoover's email be removed from project correspondence list, as she is no longer with the Pechanga Tribe. **9/15/2017:** M. Zambon (County) sent E. Ozdil a letter with APE map, site information for the Cajalco Creek site area, a map set for each project alternative, and Google Earth files of the project area.

Native American Group/Individual	Summary of Communications
	12/6/2017: Email sent to E. Ozdil regarding review of the XPI proposal and involvement in survey. An electronic copy of the XPI proposal was made available via FTP. The email also requested a meeting with Caltrans, the County, and consultants to discuss details of the proposal and go over questions or concerns. **12/18/2017:** M. Zambon (County) and County consultants (ICF) called E. Ozdil to go through the details of the XPI proposal and to discuss any questions or concerns. E. Ozdil stated that the tribe would like to monitor the excavations and that they would provide a tribal monitor. P. Macarro stated that Cajalco means "Quail Place," and that the Boulder Springs Development had affected the prehistoric sites. P. Macarro stated that ICF should coordinate the monitoring with T. Foussat. **1/5/2018:** Draft HPSR provided to E. Ozdil per request. **1/23/2018:** Email received from M. Earp-Escobar regarding request of complete cultural (XPI) report. In response, clarification was provided clarifying that the full report for archaeological resources was included as an attachment to the draft HPSR provided 1/6/2018. **1/29/2018:** Field meeting with resource agencies, County, and ICF to view drainage features throughout project site. P. Macarro, T. Foussat, and M. Earp-Escobar (Pechanga) attended. **2/14/2018:** Meeting held between Pechanga members, County, Caltrans, and County consultants at Pechanga Cultural Resources facility to discuss the XPI locations, testing approach, coordination and monitoring, and comments on the HPSR. **2/15/2018:** Email follow-up sent to P. Macarro, E. Ozdil, M. Earp-Escobar, and M. Hannah by K. Anderson. M. Earp-Escobar responded with a letter containing comments on HPSR. **3/22/2018:** Email sent to P. Macarro, E. Ozdil, M. Earp-Escobar, M. Hannah, and B. Tomaras regarding follow up on additional resources information discussed at February 14 meeting. **4/12/2018:** Letter received from M. Earp-Escobar regarding Pechanga comments on XPI proposal. **8/15–9/6/2018, 10/18/2018:** C. Schlater and C. Yearyean (Pechanga) participated as a monitors during XPI survey. **9/10/2018:** Email sent to Tina Mendoza inquiring as to positive or negative feedback regarding the monitoring during the XPI. A response to the inquiry was not received. **10/9, 10/16/2018:** Email exchange between County consultants and T. Mendoza regarding availability of a monitor for one additional XPI survey day. **10/21/2019:** Caltrans submitted revised Draft HPSR to Pechanga (attention of E. Ozdil) for review. **10/24/2019:** Additional electronic transmission of Draft HPSR provided to Pechanga per request. **11/7/2019:** Meeting held at Pechanga Cultural Resources facility regarding comments on HPSR and Traditional Cultural Properties (TCPs). Attendees: P. Macarro, E. Ozdil, Michele Fahley, and M. Earp-Escobar (Pechanga Band of Luiseño Mission Indians); G. Jones (Caltrans – via telephone); M. Zambon (County of Riverside); and County consultants (ICF). **11/25/2019:** Letter sent to Pechanga (attention of E. Ozdil) by G. Jones (Caltrans) requesting TCP information for consideration in HPSR. **12/20/2019:** Confidential letter submitted to Caltrans by Pechanga regarding TCPs. **1/23/2020:** Meeting held at Pechanga Cultural Resources facility regarding TCPs. Attendees: P. Macarro, E. Ozdil, and M. Earp-Escobar (Pechanga); G. Jones (Caltrans). Mapping approach for the three newly identified TCPs was discussed and developed. During this meeting it was established that because the TCPs are so large, and due to their sacred aspects, the project would have no adverse effects overall on the TCPs because the project would not affect the region's sacred qualities. It was made clear that the adverse effect of the project was on the archaeological sites only

Native American Group/Individual	Summary of Communications
	and that these effects were dependent on which alternative was chosen to move forward. **2/27–3/2/2020:** Email exchange between G. Jones and E. Ozdil confirming that next review for Pechanga will be to develop mitigation measures during the Memorandum of Agreement process. **2/28/2020:** TCP information letter submitted to Caltrans by Pechanga for consideration and inclusion in HPSR. Information provided in letter was considered and addressed in revised cultural reports.
Ramona Band of Cahuilla Mission Indians John Gomez Jr., Cultural Resources Coordinator Joseph Hamilton, Chairperson	**5/19/2011:** Initial contact letter sent to John Gomez, Junior, via certified mail. **5/18/2016:** New letter sent due to passage of time and introduction of additional project alternatives. **6/29/2016:** Follow-up phone call made to N. Jonnkhoff requesting a response if the tribe has information related to the project. **10/11/2016:** Follow-up phone call made and email sent to J. Hamilton requesting a response if the tribe has information related to the project. **2/9/2017:** Follow-up phone call made to J. Gomez, Jr., requesting a response if the tribe has information related to the project. No further responses have been received from Ramona Band of Cahuilla Mission Indians.
Santa Rosa Band of Cahuilla Indians Steven Estrada, Chairman, Environmental Director Mayme Estrada, Chairperson John Marcus, Vice Chairman	**5/19/2011:** Initial contact letter sent to S. Estrada via certified mail. **5/26/2011:** S. Estrada responded to the letter in an email, stating the Santa Rosa Band of Cahuilla Indians did not have any specific concerns in regard to cultural resources at this time. He further stated, “However, there is potential for unknown cultural resources to be discovered.” He concluded that, “With this said, the Santa Rosa Band of Cahuilla Indians will defer further consultation efforts to the Soboba Band of Luiseno Indians and their Cultural Resources Department. If you have any other questions please contact Mr. Joseph Ontiveros.” **5/18/2016**: New letter sent to M. Estrada due to passage of time and introduction of additional project alternatives. No response to the letter was received. **6/29/2016:** Phone call made and follow-up email sent to M. Estrada requesting a response if the tribe has information related to the project. **6/30/2016:** Letter sent to J. Marcus regarding new project alternatives. **10/11/2016:** Follow-up phone call made and email sent to M. Estrada requesting a response if the tribe has information related to the project. No further responses have been received from Santa Rosa Band of Cahuilla Indians.
Soboba Band of Luiseño Indians Joseph Ontiveros, Director Jessica Valdez	**5/23/2011:** Initial contact letter sent to Joseph Ontiveros via certified mail. No response to the letter was received. **3/19/2015:** M. Zambon (County) sent CD to Soboba Band of Luiseño Indians containing project information. **4/20/2015:** Letter from J. Ontiveros to M. Zambon (County), stating the project is within the Tribal Traditional Use Area and requesting tribal monitoring and a meeting with the County regarding the project. **5/6/2015:** G. Jones (Caltrans), M. Zambon (County), and County consultants (ICF) met with J. Ontiveros (Soboba) to discuss the proposed Cajalco Creek bridge. **5/13/2015:** Email received from J. Ontiveros regarding follow-up to the information requested at May 6, 2015, consultation meeting held at County, concerning the Cajalco Creek Bridge structure for design options. **6/18/2015:** Email from J. Ontiveros to K. Anderson regarding scheduling of field meeting with County and Caltrans July 16, 2015. **7/15/2015:** Email received from J. Ontiveros to M. Zambon confirming change of meeting location to County office.

Native American Group/Individual	Summary of Communications
	7/16/2015: G. Jones (Caltrans), S. Staley (County), B. Calvert and County consultants (AECOM and ICF) met with J. Ontiveros (Soboba) at County offices to discuss the proposed Cajalco Creek bridge. **7/27/2015:** Ms. Zambon (County) emailed a letter with CD containing bridge design information to J. Ontiveros. **11/19/2015:** Email sent to J. Ontiveros confirming field meeting with County and Caltrans on December 3, 2015. **12/3/2015:** G. Jones (Caltrans), M. Zambon (County), County consultants (AECOM and ICF), and Nick Biro (Blue Mtn. Development), met with J. Ontiveros (Soboba) to discuss proposed bridge options in Cajalco Creek area. **5/17/2016**: M. Zambon (County) sent a letter containing a CD with project information to Mr. Ontiveros. **5/18/2016:** New letter sent to J. Ontiveros regarding introduction of additional project alternatives. **5/31, 6/1/2016–11/29/2016:** Telephone and email exchanges between S. Bryne (ICF) and J. Ontiveros regarding coordination and scheduling of monitoring during survey of Cajalco Creek area and various areas of the project. **10/11/2016:** Phone conversation with J. Ontiveros soliciting questions or concerns Soboba may have concerning the project. J. Ontiveros referred ICF to J. Valdez (Soboba) to set up a disclosed consultation as he was out of the country at the time. Email sent to J. Valdez following phone call with J. Ontiveros to set up consultation. J. Valdez stated J. Ontiveros had already been corresponding with S. Bryne (ICF). **10/19/2016:** Email received from J. Valdez stating the project area is considered sensitive and existing sites are in the surrounding area. An in-house database search identified multiple areas of potential impact to be discussed in direct consultation with lead agency. **10/19/2016:** Letter received from J. Ontiveros stating the project is within the Tribal Traditional Use Area, and requests consultation with lead agency, transfer of information to Soboba, and monitor to be present during ground disturbance activities. **11/29/2016:** G. Jones (Caltrans) and M. Zambon (County) met with J. Ontiveros (Soboba) at County offices to discuss the proposed project and Cajalco Road Interim Safety Improvement Project, and documentation of earlier correspondence. **3/9–3/10/2017:** Email exchange between S. Bryne and J. Ontiveros regarding coordination and scheduling of monitoring during survey. **9/15/2017:** M. Zambon (County) sent J. Ontiveros a letter, draft APE map, site information for the Cajalco Creek site area, a map set of each project alternative, and Google Earth files of the project area. **12/6/2017:** Email sent to J. Ontiveros regarding review of the XPI proposal and involvement in the survey. An electronic copy of the XPI document was made available via FTP. The email also requested a meeting with Caltrans, the County, and consultants to discuss details of the proposal and go over any questions or concerns. **12/8/2017:** A CD containing the XPI proposal for the project was mailed to J. Ontiveros. **1/4/2018:** M. Zambon (County) and County consultants (ICF) met with J. Ontiveros at County office to discuss the XPI survey. J. Ontiveros indicated that the tribe would provide a Native American Monitor and would send a monitoring agreement. **1/6/2018:** Draft HPSR sent to J. Ontiveros. No comments received. **1/8/2018:** J. Ontiveros provided draft Cultural Resource Monitoring Agreement. **1/29/2018:** Field meeting with resource agencies, County, and ICF to view drainage features throughout project site. **8/6/2018:** Executed monitoring agreement received via email from J. Valdez (Soboba). **8/15–9/6/2018, 10/18/2018:** T. Arceo and J. Sigler (Soboba) participated as monitors during XPI survey.

Native American Group/Individual	Summary of Communications
	9/10/2018: Email to J. Valdez from S. Bryne (ICF) inquiring as to positive or negative feedback regarding the monitoring during the XPI. A response to the inquiry was not received. **10/9, 10/15/2018:** Email exchange between J. Valdez and S. Bryne (ICF) regarding availability of a monitor for one additional day for the XPI survey. J. Valdez responded that T. Arceo would not be available to monitor but that J. Sigler would be the monitor. **10/21/2019:** Caltrans submitted revised Draft HPSR to Soboba (attention of J. Ontiveros) for review. **11/14/2019:** Meeting held at County office regarding comments on HPSR. Attendees: J. Ontiveros (Soboba); G. Jones (Caltrans); M. Zambon (County); and County consultants (ICF). Information provided by Soboba was considered and addressed in revised cultural reports. **12/16/2019 and 1/9/2020:** Follow up emails sent to J. Ontiveros (Soboba) from M. Zambon (County) regarding comments on HPSR. No further comments provided.

Table 5-14. Summary of Additional Native American Coordination

Native American Group/Individual	Summary of Communications
Agua Caliente Tribe of *Cupeño* Indians William J. Pink	**9/7/2011**: NOP sent to Willie J. Pink; NOP included notice of public scoping meeting and copy of IS.
Cahuilla Band of Indians Yvonne Markel Anthony Madrigal, Sr, Tribal Historic Preservation Officer BobbyRay Esparza, Cultural Coordinator	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe by Deputy District Director D. Bricker (Caltrans), per 23 USC 139 (Efficient Environmental Review). **2/26/2013**: Letter of opportunity to comment on project description and purpose and need sent to tribe per 23 USC 139 (Efficient Environmental Review). **2/6/2019:** Email regarding status of 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF). **8/6/2019:** Email with status update regarding 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF). **5/3/2021:** Solicitation of interest to review Draft EIS per 23 USC 139 (Efficient Environmental Review) sent to Cahuilla by K. Anderson (ICF). **5/17/2021**: Request to hold a focused call received from BobbyRay Esparza (Cahuilla). Email containing SharePoint link for Draft EIS and download instructions sent to Anthony Madrigal Senior and BobbyRay Esparza (Cahuilla) by K. Anderson (ICF). Email reminder to submit comments on the Draft EIS by 6/9/2021 sent to A. Madrigal Sr and B. Esparza (Cahuilla) by K. Anderson (ICF). Email invitation to participate in 5/18/2021 focused call regarding Draft EIS sent to A. Madrigal Sr. and B. Esparza by K. Anderson. **5/21/2021**: Email containing SharePoint link for Final HPSR and download instructions sent to A. Madrigal Sr. and B. Esparza by K. Anderson (ICF). **6/2/2021**: Email with meeting date and time options sent to A. Madrigal Sr. and B. Esparza by K. Anderson (ICF). Email reminder sent to B. Esparza requesting receipt of comments on Draft EIS by 6/92021 by K. Anderson (ICF). **6/3/2021**: Email with additional meeting date and time options sent to A. Madrigal Sr. and B. Esparza by K. Anderson (ICF).

Native American Group/Individual	Summary of Communications
Los Coyotes Band of Mission Indians Francine Kupsch, Spokesperson	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review).
Morongo Band of Mission Indians Michael Contreras, Cultural Heritage Programs Raymond Huaute, Cultural Resource Specialist Ann Brierty	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review). **3/23/2017:** Email from K. Anderson (ICF) canceling the 4/6/2017 bi-monthly conference call (Efficient Environmental Review) due to minimal changes and requesting response to input opportunities matrix. **1/29/2018**: Email with meeting minutes for 10/5/2017 bi-monthly conference call held regarding the proposed project and participating agencies coordination per 23 USC 139 (Efficient Environmental Review), and agenda for 2/1/2018 bi-monthly conference call, sent to Raymond Huaute (Morongo) by K. Anderson (ICF). **2/1/2018**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **2/27/2018**: Email with meeting minutes for bi-monthly conference call held 2/2/2018 regarding the proposed project and participating agencies coordination per 23 USC 139 (Efficient Environmental Review), and agenda for the 4/5/2018 Bi-monthly conference call, sent to R. Huaute (Morongo) by K. Anderson (ICF). **2/6/2019:** Email regarding status of 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF). **8/6/2019:** Email with status update regarding 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF). **5/3/2021:** Solicitation of interest to review Draft EIS per 23 USC 139 (Efficient Environmental Review) sent to Morongo by K. Anderson (ICF). **5/20/2021:** Email reminder for submittal of comments on Draft EIS by 6/9/2021 sent to Ann Brierty and THPO email address by K. Anderson (ICF). **5/21/2021:** Email containing SharePoint link for Final HPSR and download instructions sent to A. Brierty and THPO email address by K. Anderson (ICF).
Pala Band of Mission Indians Shasta C. Gaughen, PhD, Tribal Historic Preservation Officer	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **9/16/2011**: S. Gaughen responded to S. Staley (County) re: NOP—deferred to local tribes. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review). **10/10/2012**: Letter from S. Gaughen (Pala) to Deputy District Director D. Bricker (Caltrans) indicating deferral to tribes in closer proximity to the project.
Pauma and Yuima Reservation Randall Majel, Chairperson	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review). **6/29/2016**: Follow-up email sent regarding questions or comments about the project.
Pauma Valley Band of Luiseño Indians Bennae Calac, Tribal Council Member	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review).
Pechanga Band of Luiseño Mission Indians	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP.

Native American Group/Individual	Summary of Communications
Anna Hoover, Cultural Analyst Mark Macarro, Chairperson Paul Macarro, Chairperson, Cultural Coordinator Ebru Ozdil, Cultural Analyst Juan Ochoa, Asst Tribal Historic Preservation Officer	**10/21/2011**: Letter from A. Hoover (Pechanga) to M. Zambon (County) with comments concerning project area and requesting government-to-government consultation. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review). **11/9/2012**: Letter from A. Hoover (Pechanga) to A. Burton (Caltrans) regarding invitation to become participating agency and response to NOP. **2/26/2013**: Letter of opportunity to comment on project description and purpose and need sent to tribe per 23 USC 139 (Efficient Environmental Review). **3/27/2013**: Letter from A. Hoover (Pechanga) to A. Burton (Caltrans) regarding comments on project purpose and need, and request for detailed project maps. **3/11/2014**: County quarterly project coordination meeting held at County office. Active County projects, including Cajalco Road Widening Project, were discussed. **3/12/2015**: Letter of opportunity to provide input on range of alternatives and methodology sent to tribe per 23 USC 139 (Efficient Environmental Review). **5/5/2015**: County quarterly project coordination meeting held at County office. Active County projects, including Cajalco Road Widening Project, were discussed. **8/4/2015**: County quarterly project coordination meeting held at County office. Active County projects, including Cajalco Road Widening Project, were discussed. **4/7/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **6/2/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **6/16/2016**: Email exchange between T. Foussat (Pechanga) and S. Bryne (ICF) stating that T. Foussat will be the contact person for monitor scheduling and serve as the tribal representative for the project. **8/4/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **10/6/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **2/2/2017**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **6/1/2017**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **1/29/2018**: Email with meeting minutes for 10/5/2017 bi-monthly conference call held regarding the proposed project and participating agencies coordination per 23 USC 139 (Efficient Environmental Review), and agenda for 2/1/2018 Bi-monthly conference call, sent to E. Ozdil, P. Macarro, and T. Foussat (Pechanga) by K. Anderson (ICF). **2/1/2018**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **2/27/2018**: Email with meeting minutes for bi-monthly conference call held 2/2/2018 regarding the proposed project and participating agencies coordination per 23 USC 139 (Efficient Environmental Review), and agenda for the 4/5/2018 Bi-monthly conference call, sent to E. Ozdil, P. Macarro, and T. Foussat (Pechanga) by K. Anderson (ICF). **4/5/2018**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **2/6/2019:** Email regarding status of 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF). **8/6/2019:** Email with status update regarding 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF). **5/3/2021**: Solicitation of interest to review Draft EIS per 23 USC 139 (Efficient Environmental Review) sent to P. Macarro, E. Ozdil, Tina Thompson Mendoza, and Tony Foussat (Pechanga) by K. Anderson (ICF).

Native American Group/Individual	Summary of Communications
	5/4/2021: Email confirming interest in reviewing Draft EIS received by K. Anderson (ICF) from E. Ozdil (Pechanga). **5/6/2021:** Email containing SharePoint link for Draft EIS and download instructions sent to E. Ozdil and Michele Fahley (Pechanga) by K. Anderson (ICF). **5/10/2021:** Second email containing SharePoint link for Draft EIS and download instructions sent to E. Ozdil and Michele Fahley (Pechanga) by K. Anderson (ICF). **5/12/2021**: Invitation to participate in 5/18/2021 focused call regarding Draft EIS sent to E. Ozdil, T. Mendoza, and M. Fahley (Pechanga) by K. Anderson (ICF). **5/17/2021**: Second invitation to participate in focused call regarding Draft EIS sent to E. Ozdil, T. Mendoza, and Michele Fahley (Pechanga) by K. Anderson (ICF). **5/21/2021:** Email containing SharePoint link for Final HPSR and download instructions sent to Pechanga by K. Anderson (ICF). **6/2/2021**: Email reminder sent to Pechanga requesting receipt of comments on Draft EIS by 6/9/2021 by K. Anderson (ICF).
Ramona Band of Cahuilla Mission Indians John Gomez Jr., Cultural Resources Coordinator	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review).
Santa Rosa Band of Cahuilla Indians Steven Estrada, Chairman, Environmental Director	**9/7/2011**: NOP sent to Tribe; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent to tribe per 23 USC 139 (Efficient Environmental Review).
Soboba Band of Luiseño Indians Joseph Ontiveros, Director	**9/7/2011**: NOP sent to tribe; notice of public scoping meeting and copy of IS included with NOP. **9/22/2011**: Letter from J. Ontiveros (Soboba) to M. Zambon (County) responding to NOP—government-to-government consultation requested. **10/1/2012**: Letter of invitation to become a participating agency sent to J. Ontiveros (Soboba) by Deputy District Director D. Bricker (Caltrans). **4/23/2015**: Email from J. Ontiveros to M. Zambon regarding meeting scheduled 5/6/2016. **4/7/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **6/2/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **8/4/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **10/6/2016**: Bi-monthly conference call held regarding proposed project with participating agencies per 23 USC 139 (Efficient Environmental Review). **1/29/2018**: Email with meeting minutes for 10/5/2017 bi-monthly conference call held regarding the proposed project and participating agencies coordination per 23 USC 139 (Efficient Environmental Review), and agenda for 2/1/2018 bi-monthly conference call, sent to J. Ontiveros (Soboba) by K. Anderson (ICF). **2/27/2018**: Email with meeting minutes for bi-monthly conference call held 2/2/2018 regarding the proposed project and participating agencies coordination per 23 USC 139 (Efficient Environmental Review), and agenda for the 4/5/2018 bi-monthly conference call, sent to J. Ontiveros (Soboba) by K. Anderson (ICF). **2/6/2019:** Email regarding status of 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF). **8/6/2019:** Email with status update regarding 23 USC 139 (Efficient Environmental Review) coordination distributed to all participating agencies by K. Anderson (ICF).

Native American Group/Individual	Summary of Communications
	5/3/2021: Solicitation of interest to review Draft EIS per 23 USC 139 (Efficient Environmental Review) sent to J. Ontiveros (Soboba) by K. Anderson (ICF). **5/21/2021:** Email containing SharePoint link for Final HPSR and download instructions sent to J. Ontiveros by K. Anderson (ICF).
NAHC Dave Singleton	**3/29/2011**: Contacted NAHC for file search. **4/1/2011**: NAHC responded. **9/7/2011**: NOP sent; notice of public scoping meeting and copy of IS included with NOP. **10/1/2012**: Letter of Invitation to become a participating agency on the project sent from Deputy District Director D. Bricker, per 23 USC 139 (Efficient Environmental Review). **10/8/2012**: Letter from D. Singleton (NAHC) to Deputy District Director D. Bricker (Caltrans) accepting participating agency status on the project.

The following coordination has also occurred to address cultural resources pursuant to Section 106 of the National Historic Preservation Act:

- On July 11, 2012, and February 15, 2019, letters were sent to the following government agencies and consulting and interested parties who may have knowledge about historic properties in the area. In the letters, information was requested regarding historic buildings, districts, sites, objects, and archaeological sites of significance within the project area. Updated letters were sent on February 15, 2019, due to passage of time and introduction of additional project alternatives; the letter included project information updates and solicitation of information concerning cultural resources and interest in consultation.
  - City of Corona Planning Department
  - City of Perris Planning Department
  - City of Riverside Cultural Heritage Board
  - Corona Historic Preservation Society
  - March JPA
  - Hemet-San Jacinto Genealogical Society
  - Jurupa Mountain Cultural Center
  - Lake Elsinore Historical Society
  - Mission Inn Museum and Foundation
  - Norco Historical Society
  - Orange Empire Railway Museum
  - Perris Valley Historical Museum Association, Perris Valley Museum
  - Riverside County Planning Department
  - Riverside County Historical Commission
  - Riverside County Transportation and Land Management Agency

- Riverside County Mexican American Historical Society
- Riverside Genealogical Society
- Riverside Historical Society
- Riverside Land Conservancy
- Santa Rosa Mining District & Preservation Society
- Sherman Indian Museum
- Winchester Historical Society of Pleasant Valley

On April 12, 2019, Sean Berry of Santa Rosa Mining District & Preservation Society spoke with a project architectural historian. Berry discussed potential historic sites outside of the APE, including the location of Mulholland Tunnel (outside of the APE), and potential locations of the Butterfield Stage Route.

On July 15, 2019, telephone calls were made and/or emails were sent to the remaining 15 local preservation consulting parties. As of February 10, 2020, five responses were received: an email dated July 15, 2019, from Wes Speake from the Corona Historic Preservation Society; a phone call on July 16, 2019, from Ruth Atkins from the Lake Elsinore Historical Society; an email dated July 16, 2019, from Nicole Padron from the Rivers & Lands Conservancy; an email dated July 18, 2019, from Lina Salinas Thompson from the Riverside Country Mexican American Historical Society; and an email dated July 21, 2019, from Lisa Baker from the Hemet San Jacinto Genealogical Society. None of these responses identified resources in or near the APE.

5.3.9 Transportation Conformity Working Group

At the May 23, 2017, meeting with SCAG's Transportation Conformity Working Group (TCWG), it was determined that the proposed project is not a project of air quality concern (POAQC). TCWG meeting information is included in Appendix G of the EIR/EIS.

PM Hot Spot Analysis Project Lists

Review of PM Hot Spot Interagency Review Forms

May, 2017	Determination
LATP17M014 May 2017	Not a POAQC – Hot Spot Analysis Not Required
SCAG015 May 2017	Not a POAQC – Hot Spot Analysis Not Required
RIV071388 May 2017	Not a POAQC – Hot Spot Analysis Not Required
[illegible]	Not a POAQC – Hot Spot Analysis Not Required
RIV111203 May 2017	Not a POAQC – Hot Spot Analysis Not Required

5.4 Additional Public Participation

5.4.1 Public Outreach

Public meetings have been held over the course of the project from 2011 to 2018, including the public scoping meetings discussed in Sections 5.2.2 and 5.2.3. Table 5-15, below, lists all the public meetings held to date.

Table 5-15. Public Outreach Meetings

Date	Meeting	Location
9/26/2011	Public Scoping Meeting #1	Lake Mathews Elementary School 12252 Blackburn Road, Riverside, CA 92503
9/29/2011	Public Scoping Meeting #2	Tomas Rivera Middle School 21675 Martin Street, Perris, CA 92570
10/19/2011	RAGLM	Lake Mathews Fire Station #4 16453 El Sobrante Road, Riverside, CA 92503
1/12/2012	Greater Lake Mathews Rural Trails Association	Kountry Folks Homestyle Restaurant 3653 La Sierra Avenue, Riverside, CA 92505
1/26/2012	Greater Lake Mathews Rural Trails Association	Lake Mathews Fire Station #4 16453 El Sobrante Road, Riverside, CA 92503
7/18/2012	RAGLM	Lake Mathews Fire Station #4 16453 El Sobrante Road, Riverside, CA 92517
9/12/2012	Mead Valley Municipal Advisory Council Meeting	Tomas Rivera Middle School 21675 Martin Street, Perris, CA 92570
10/11/2012	Woodcrest Municipal Advisory Council Meeting	Woodcrest Library 16625 Krameria Avenue, Perris, CA 92504
10/17/2012	Mead Valley Municipal Advisory Council Meeting	Mead Valley Library 21580 Oakwood Street, Riverside, CA 92570
10/24/2012	NEPA Public Scoping Meeting #1	Lake Mathews Elementary School 12252 Blackburn Road, Riverside, CA 92503
10/25/2012	NEPA Public Scoping Meeting #2	Tomas Rivera Middle School 21675 Martin Street, Perris, CA 92570
10/13/2013	Mead Valley Town Hall Meeting	Mead Valley Community Center 16453 El Sobrante Road, Riverside, CA
10/16/2013	RAGLM	Lake Mathews Fire Station #4 16453 El Sobrante Road, Riverside, CA 92503
11/14/2013	Woodcrest Town Hall Meeting	Woodcrest Elementary School 16940 Krameria Avenue, Riverside, CA 92504
3/12/2014	Temescal Valley Town Hall Meeting	Temescal Valley Elementary School 22950 Claystone Avenue, Corona, CA 92504
7/14/2015	La Sierra/Lake Mathews Town Hall Meeting	Lake Mathews Elementary School 12252 Blackburn Road, Riverside, CA 92503
8/5/2015	Mead Valley Town Hall Meeting	Mead Valley Community Center 21091 Rider Street, Perris, CA 92570
11/12/2015	Woodcrest Town Hall Meeting	Woodcrest Elementary School 16940 Krameria Avenue, Riverside, CA 92504
1/20/2016	RAGLM	Lake Mathews Fire Station #4 16453 El Sobrante Road, Riverside, CA 92517
8/3/2016	Mead Valley Municipal Advisory Council Meeting	Mead Valley Community Center 21091 Rider Street, Perris, CA 92570
11/10/2016	Woodcrest Town Hall Meeting	Woodcrest Elementary School 16940 Krameria Avenue, Riverside, CA 92504
4/19/2017	RAGLM	Lake Mathews Fire Station #4 16453 El Sobrante Road, Riverside, CA 92503

Meetings were held with six community-based organizations, which provided members the opportunity to express concerns and provide input about the proposed project. Project information was also available at multiple Riverside County Town Hall meetings held in the area.

Information regarding the project was also made available to the public outside of meetings. The County created a webpage (http://rcprojects.org/cajalco/), which is currently active, that contains details about the Cajalco Road Widening and Safety Enhancement Project. The following information was made available on the webpage: the IS, the NOP, the project alternatives, figures of the proposed alignment, a project overview, presentations provided at public meetings, project contacts, and comment submission form.

5.4.2 Environmental Stakeholder Groups

Based on responses to the NOI and NOP received from environmental stakeholder groups, focused meetings were held in 2011, 2017, and 2018 to discuss environmental concerns noted in the responses involving wildlife movement, species protection, and consistency with transportation planning. A summary of the meetings held is provided in Table 5-16, below. Complete meeting summaries are included in Appendix H.

Table 5-16. Environmental Stakeholder Coordination Meetings Summary

Meeting Date	Meeting Summary
9/22/2011	Meeting: An overview of the proposed project was presented and project background and need were discussed. Environmental concerns regarding the proposed project, project area, and prior projects were shared by participants and discussed. Next steps in the development and environmental assessment of the proposed project and continuing opportunities for input and coordination with stakeholder groups were identified. Attendees: Susan Nash and Tom Paulek (Friends of the Northern San Jacinto Valley); George Hague (Sierra Club); Len Nunney (Friends of the Riverside Hills); Drew Feldman; Arlee Montalvo (RCRCD); Michael Fitts; Gaston Roucg; Juan Perez, Scott Staley, and Mary Zambon (County of Riverside); Brian Calvert, Keturah Anderson, and Tricia Campbell (ICF); Ed Ng (AECOM).
9/27/2012	Meeting: An overview of the proposed project and updates since the stakeholders meeting in 2011 was presented. Follow-up information regarding wildlife movement, crossing opportunities, and group input on project components to facilitate safe crossings, including roadway design, fencing, and crossing design, were discussed. Concerns regarding impacts on existing conservation lands and proposed mitigation were also discussed. Next steps in the environmental assessment of the proposed project and continuing opportunities for input and coordination with stakeholder groups were identified. Attendees: Susan Nash and Tom Paulek (Friends of the Northern San Jacinto Valley); George Hague (Sierra Club); Len Nunney (Friends of the Riverside Hills); Arlee Montalvo (RCRCD); Dan Silver (Endangered Habitats League); Juan Perez, Scott Staley, and Mary Zambon (County of Riverside); Brian Calvert, Keturah Anderson, and Tricia Campbell (ICF); Ed Ng (AECOM).
5/10/2017	Meeting: An overview of the proposed project, including project alternatives, was presented and project components were discussed. Biological research and studies conducted to date concerning wildlife movement and crossing design were also discussed. Reopening of the LM MSHCP and the steps involved were discussed, as well as next steps for the consideration of input and continuing coordination with stakeholder groups, resources agencies, and MWD. Attendees: Kate Kramer (California Native Plant Society-Riverside San Bernardino Chapter [CNPS]); Ilene Anderson (Center for Biological Diversity); Susan Nash and Tom Paulek (Friends of the Northern San Jacinto Valley); Nancy Higbee (San Bernardino Valley Audubon Society); George Hague (Sierra Club); Len Nunney (Friends of the Riverside Hills); Aaron Burton (Caltrans); Juan Perez, Patty Romo, Russell Williams, Scott Staley, Mary Zambon, and Michael

Meeting Date	Meeting Summary
	Maldonado (County of Riverside); Diane Doesserich and Wendy Picht (MWD); Brian Calvert and Keturah Anderson (ICF); Tricia Campbell (GLA).
4/30/2018	Meeting: The County provided updates regarding the status of project development and environmental assessment, as well as the consideration of prior input in the design and placement of wildlife crossings. Next steps in the availability of the Draft EIR/EIS and opportunities for input were identified. Attendees: Dan Silver (Endangered Habitats League); Kate Kramer (CNPS); Ilene Anderson (Center for Biological Diversity); Susan Nash and Tom Paulek (Friends of the Northern San Jacinto Valley); Nancy Higbee (San Bernardino Valley Audubon Society); George Hague (Sierra Club); Len Nunney (Friends of the Riverside Hills); Kathleen Dale; Aaron Burton (Caltrans); Juan Perez, Patty Romo, Russell Williams, Scott Staley, and Mary Zambon (County of Riverside); Sean Carlson and Alex Marks (MWD); Brian Calvert, Keturah Anderson, Marisa Flores, Shannon Crossen, and Greg Hoisington (ICF).
6/7/2021	Meeting: The County provided updates regarding the status of project development and environmental reviews, as well as the consideration of prior input in the design and placement of wildlife crossings. Next steps in the availability of the Draft EIR/EIS and opportunities for input were identified. Attendees: Kate Kramer (CNPS); Ilene Anderson (Center for Biological Diversity); Susan Nash and Tom Paulek (Friends of the Northern San Jacinto Valley); Nancy Higbee (San Bernardino Valley Audubon Society); George Hague (Sierra Club); Len Nunney (Friends of the Riverside Hills); Dan Silver (Endangered Habitats League); Arlee Montalvo (CNPS); Aaron Burton (Caltrans); Juan Perez, Mark Lancaster, Russell Williams, Mary Zambon, and Mojahed Salama (County of Riverside); Diane Doesserich, Sean Carlson, and Alex Marks (MWD); Brian Calvert, Keturah Anderson, Marisa Flores, Shannon Crossen, and Greg Hoisington (ICF); Greg Hefter and Dat Nguyen (AECOM).

Chapter 6 List of Preparers

This EIR/EIS was prepared by the County in cooperation with Caltrans, District 8. The following staff prepared this report:

6.1 California Department of Transportation (Caltrans)

Aaron Burton	Senior Environmental Planner	Local Assistance, Environmental Support
Sean Yeung	Senior Transportation Engineer	Office Chief – Caltrans Environmental Engineering
Donald Cheng	Caltrans Environmental Engineering	Hazardous Waste, Hazardous Waste Coordinator, Hazmat Review
Olufemi Odufalu	Senior Transportation Engineer	Caltrans Environmental Engineering Oversight
Maria Aranguiz	Branch Chief	System Planning, Traffic Forecasting, Traffic Study Review
Alberto Vergel De Dios	Transportation Engineer,	Caltrans Environmental Engineering, Traffic Study Review
Alan Bisi	Acting Office Chief – Hydraulics	Hydraulic Studies Review
Eduardo Moreno-Castaneda, MPA	Associate Environmental Planner	Local Assistance
Gabrielle Duff	Senior Environmental Planner	Cultural Review Lead
Gary Jones	Environmental Planner, Archaeologist	District Native American Coordinator
Andrew Walters	Senior Environmental Planner	Branch Chief – Environmental Support / Cultural Studies
Rebecca Guirado	Deputy District Director	Right of Way
Evita Premdas	Transportation Engineer	Local Assistance
Miriam Bishop	District Landscape Architect	Caltrans Engineering Services, Landscape Architecture

6.2 County of Riverside

Mary Zambon	Senior Transportation Planner	Environmental Project Manager/Oversight
Scott Staley	Engineering Project Manager	Engineering Project Manager/Oversight
John Ashlock	Senior Civil Engineer	Oversight/Cumulative Projects

Claudia Steiding, CPSWQ, QSD/P	Senior Transportation Planner/NPDES Coordinator	Water Quality Assessment Report/Location Hydraulic Study and Summary Floodplain Evaluation Report Reviews
Jan Bulinski	Senior Transportation Planner/NPDES Coordinator	Oversight/Water Quality
Kevin Tsang	Senior Civil Engineer	Engineering/Traffic Study Report Review
Lawrence Tai	Traffic Engineer	Engineering/Traffic Study Report Review
Don Copeland	Biologist	Natural Environment Study and Jurisdictional Delineation Review
Stan Dery	Principal Engineering Technician	Survey/Right of Way
Joan George, Applied Earthworks	Cultural Resources	Historic Property Survey Report Review
Tiffany Clark, Applied Earthworks	Cultural Resources	Historic Property Survey Report Review

6.3 Consultants

6.3.1 ICF

Brian Calvert	Project Director	EIR/EIS QA/QC
Keturah Anderson	Project Manager/Coordinator	Environmental and EIR/EIS Coordinator
Marisa Flores	Lead Biologist	EIR/EIS Biological Resources, Natural Environment Study, and Field Surveys
Greg Hoisington	Senior Biologist	EIR/EIS Biological Resources and Natural Environment Study
Peter Hardie	Senior Noise Analyst	EIR/EIS Noise, Noise Study Report, and Noise Abatement Decision Report
David Buehler, PE	Senior Acoustical Engineer	Noise Study Report
Eric Moskus	Noise Analyst	Noise Study Report and Noise Abatement Decision Report
Jennifer Ban, PLA	Project Landscape Architect	EIR/EIS and Visual Impact Assessment
Keith Cooper	Senior Technical Analyst	EIR/EIS Air Quality and Air Quality Report

Keith Lay	Senior Air Quality, Climate Change Specialist	EIR/EIS Air Quality
Rusty Whisman	Environmental Planner/Air Quality Specialist	EIR/EIS Air Quality and Energy, Air Quality Report
Jennifer Andersen	Environmental Planner	EIR/EIS and Community Impact Assessment
Benjamin Vargas	Archaeologist	Archaeological Study Report and Archaeological Evaluation Record
Daniel Paul	Architectural Historian	Field Surveys and Historic Resources Evaluation Report
Stephen Bryne	Principal Archaeologist	Field Surveys and Archaeological Survey Report
Shane Sparks	Archaeologist	Field Surveys and Archaeological Survey Report
Elizabeth Hilton	Architectural Historian	Field Surveys and Historic Resources Evaluation Report
Daniela Sanaryan	Senior Environmental Planner	EIR/EIS Preparation and Paleontological Memorandum
Shelleena Pernot	Specialist- CPESC, QSD	EIR/EIS Hydrology and Water Quality
Vincent Tong	Environmental Planner	Section 4(f) Evaluation
Monica Corpuz	Environmental Planner	Section 4(f) Evaluation
Court Morgan	Transportation Lead	EIR/EIS Traffic
Liane Chen	Environmental Planner	EIR/EIS Utilities
Meagan Flacy	Environmental Planner	EIR/EIS Preparation
Sarah Baker	Environmental Planner	EIR/EIS Cumulative Impacts
Mario Barrera	Environmental Planner	EIR/EIS Hazards
Ryan Winkleman	Senior Biologist	EIR/EIS Biological Resources and Natural Environment Study
Colleen Martin	Biologist	EIR/EIS Biological Resources and Natural Environment Study
Shelly Dayman	Senior Biologist	Natural Environment Study
Elizabeth Irvin	Senior Editor	Technical Editing
Kenneth Cherry	Senior Editor	Technical Editing
Saadia Byram	Senior Editor	Technical Editing
John Mathias	Senior Editor	Technical Editing

Jenelle Mountain-Castro	Publications Specialist	Formatting
Soraya Swiontek	GIS Lead	GIS/Graphics
Brittney Buscombe	GIS	GIS/Graphics
Tricia Campbell	Senior Biologist	Agency and HCP Coordination
Shannon Crossen	Biologist	EIR/EIS Biological Resources, Natural Environment Study, and Wildlife Crossings
Paul Schwartz	Biologist	Field Surveys/Jurisdictional Delineation
Phil Richards	Biologist	Field Surveys/Jurisdictional Delineation
Zack West	Biologist	Field Surveys/Jurisdictional Delineation
Ryan Gilmore	Biologist	Field Surveys/Jurisdictional Delineation
Dennis Miller	Biologist	Field Surveys/Jurisdictional Delineation
Amanda Parra	Biologist	Field Surveys/Jurisdictional Delineation
Kolby Olson	Biologist	Field Surveys/Jurisdictional Delineation
Daniel Cardoza	Biologist	Jurisdictional Delineation
Brett Bowen	Biologist	Jurisdictional Delineation
Kamber McAllister	Biologist	Jurisdictional Delineation
Kristen Klinefelter	Biologist	EIR/EIS Biological Resources and Jurisdictional Delineation
Erica Eidson	Biologist	Field Surveys
James Hickman	Biologist	Field Surveys
Cindy Dunn	Biologist	Field Surveys
Glen Kinoshita	Biologist	Field Surveys
Jennifer Cogswell	Biologist	Field Surveys
Karen Carter	Biologist	Field Surveys
Dale Ritenour	Biologist	Field Surveys
Ian Cain	Biologist	Field Surveys
Marissa Maggio	Biologist	Field Surveys
Makela Mangrich	Biologist	Field Surveys
Marty Lewis	Biologist	Field Surveys
Monica Alfaro	Biologist	Field Surveys
Rari Marks	Biologist	Field Surveys

Robin Kinmont	Biologist	Field Surveys
Will Kohn	Biologist	Field Surveys
Kimberly Davis	Biologist	Field Surveys
Korey Klutz	Biologist	Field Surveys
Lindsey Willrick	Biologist	Field Surveys
Lisa Allen (Franklin)	Biologist	Field Surveys
Renee Richardson	Biologist	Field Surveys
Cheryl Rustin	Biologist	Field Surveys
Camilla Estes	Biologist	Field Surveys
Rachel Henry	Biologist	Field Surveys
Mark Robinson	Archaeologist	Field Surveys/Archaeological Study
Jesse Shelmire	Archaeologist	Field Surveys/Archaeological Study
Sydni Kitchel	Archaeologist	Field Surveys/Archaeological Study
Michael Richards	Archaeologist	Historic Property Survey
Katherine Crosmer	Archaeologist	Historic Property Survey

6.3.2 AECOM

Greg Hefter, PE	Project Engineer	Project Design and Engineering
Dat Nguyen, PE	Lead Civil Engineer	Noise Abatement Decision Report
William Hagmeier, PE	Project Engineer	Project Design and Engineering
Ed Ng, PE	Project Engineer	Project Design and Engineering
Heng Chow, PE	Project Engineer	Project Design and Engineering
Gary W. Sjelin, PE	Hydraulic Engineer	Location Hydraulic Study and Summary Floodplain Evaluation Report

6.3.3 Iteris

Viggen Davidian, PE	Transportation Engineer	Traffic Operations Analysis Report
Vamshi K. Akkinepally, PTP	Transportation Engineer	Traffic Operations Analysis Report
Shaumik Pal, PTP	Senior Transportation Planner	Traffic Modeling, Traffic Operations Analysis Report
Rajat Parashar	Senior Transportation Planner	Traffic Modeling, Traffic Operations Analysis Report

Sowmya Chandrasekhar, PE, TE, PTOE	Transportation Planner	Traffic Modeling

6.3.4 Group Delta

Jack Packwood, CIH	Senior Engineer	Aerially Deposited Lead Investigation
Curt Scheyhing, PE, GE	Associate Geotechnical Engineer	Structure Preliminary Geotechnical Reports
Aapris Frisbie	Geologist	Initial Site Assessment
Sathis Kumar, PE, GE	Engineer	Structure Preliminary Geotechnical Reports

6.3.5 Glenn Lukos Associates

Tony Bomkamp	Biologist	Field Surveys
Tricia Campbell	Senior Biologist	Agency and HCP Coordination/Mitigation Lands Assessment, Estimates
Zackry West	Biologist	Jurisdictional Delineation
Kevin Livergood	Biologist	Field Surveys/Vernal Pool Assessment
Jason Kurnow	Biologist	Fairy Shrimp Focused Studies

6.3.6 Epic Land Solutions

Lynette Overcamp, SR/WA	Relocation Impact Report
Kari Anvick, RWP	Relocation Impact Report
Karen Starr	Relocation Impact Report

6.3.7 SJM Biological Consultants

Tony Bomkamp	Biologist	Field Surveys/SKR Study
Stephen J. Montgomery	Biologist	Field Surveys/SKR Study

Chapter 7. Distribution List

This Draft Environmental Impact Report (EIR)/Environmental Impact Statement (EIS) will be distributed to the State, regional, and local agencies listed in this section. Distribution of the Draft EIR/EIS may be by hard copy, electronic media, reference to the Web site in which the document is available, or a combination of these. In addition, a Notice of Availability of the Draft EIR/EIS will be published in local English and Spanish newspapers on December 3, 2021. The document will also be available for public view at: www.rcprojects.org/cajalco-road-widening.

7.1 Federal Agencies

Dianne Feinstein US Senator	880 Front Street, #4236 San Diego, CA 92101
Mark Takano Congressman 41st District	3403 10th Street, Suite 610 Riverside, CA 92501
