Reference: Northlake Specific Plan Transportation Analysis for CEQA

Stantec Consulting Services Inc. (Stantec) performed a transportation analysis for the proposed Northlake Specific Plan Development (Project). The Project is located east of the Interstate 5 (I-5) freeway and north of Lake Hughes Road in unincorporated Los Angeles County. This analysis was prepared in accordance with the California Environmental Quality Act (CEQA) and the Los Angeles County Department of Public Works Transportation Impact Analysis Guidelines for CEQA analysis (July 2020, Version 1.1, updated September 2020; "TIA Guidelines"). The purpose of this study is to identify potential significant impacts related to transportation due to the implementation of the proposed Project (as defined below). This analysis evaluates the Project's impact on vehicle miles traveled (VMT), potential conflicts with current transportation planning programs (plans, ordinances, and policies), increased hazards due to the Project's geometric design features, and emergency access.

The previously approved Northlake Traffic Impact Analysis (TIA)¹ is appended to this memorandum for information purposes only, as the approved TIA evaluated project impacts using the level of service (LOS) metric which is no longer the applicable metric for identifying significant impacts under CEQA. The approved TIA represents a conservative, worst-case analysis of the project's effect on LOS and therefore an update is not required.

Project Description

The Northlake Specific Plan (NLSP) was adopted by the Board of Supervisors on June 1, 1992 and includes the development of 2,337 single family residential units, 1,286 multi-family units (for a total of 3,623 units), 169,884 square feet of commercial uses, 545,589 square feet of light industrial uses, an 18-hole golf course, school, parks and open space. In 2019², changes to the land use plan were approved (referred to herein as the previously approved Project) and include the development of 1,143 single family residential units, 1,341 multifamily residential units, 345 age qualified single family residential units,

¹ Stantec, 2016

² In 2019 the Project was approved by the Los Angeles County Board of Supervisors. Subsequently, due to a superior court ruling, the County rescinded the Project approvals. The Project applicant is currently proposing to recirculate portions of the NLSP SEIR. At the time the previously approved Project traffic analysis was prepared, LOS was the metric used to evaluate transportation impacts. VMT is now the metric used to evaluate a transportation impact per Senate Bill 743. Los Angeles County has updated their Transportation Impact Analysis Guidelines to utilize the VMT metric.

Reference: Northlake Specific Plan Transportation Analysis for CEQA

315 affordable mixed-use housing units and 6 market-rate live-work units³, for a total of 3,150 residential units. The previously approved Project would also construct highway commercial (e.g., retail near the highway), a middle school (as an option), private and public recreational parks, and a fire station.

Table 1 summarizes the NLSP land uses and the previously approved Project land uses. **Figure 1** shows the previously approved Project site plan.

Table 1 Northlake Specific Plan Project Land Use Summary

Category	NLSP			Previously Approved Project			Difference		
	(AC)	(DU)	(SQ. FT.)	(AC)	(DU)	(SQ. FT.)	(AC)	(DU)	(SQ. FT.)
Residential	600.3	3,623	--	362	3,150	--	-238.3	-794	--
Single Family	504.8	2,337	--	235	1,488	--	-269.8	-593	--
Multi-Family	95.5	1,286	--	107	1,341	--	11.5	-201	--
Affordable Mixed-Use / Live-Work***	0	0	--	20	321*	--	10.8	321	--
General Commercial	9.2	--	100,188		--	38,700**		--	-61,488
Highway Commercial	4	--	69,696	2	--	32,175**	2	--	-37,521
Industrial	50.1	--	545,589	0	--	0	-50.1	--	-545,589
School	23.1	--	--	44	--	--	20.9	--	--
Recreation/Park	167	--	--	167	--	--	0	--	--
* For the purposes of the VMT analysis, the affordable mixed-use housing / market-rate live-work units are treated as multi-family units. ** Square footage per Northlake Design Guidebook *** 315 affordable mixed-use units and 6 market-rate live-work units.									

VMT Analysis Methodology

Signed by the Governor in 2013, SB 743 requires the Governor's Office of Planning and Research (OPR) to identify new metrics for the identification of transportation related impacts within CEQA. Regulatory changes to CEQA guidelines that implement SB 743 were approved on December 28, 2018, establishing VMT as a new metric to replace level of service (LOS) for transportation analysis. Within CEQA, a project's effect on vehicle delay shall not constitute a significant transportation impact (Section 15064.3(a)).

Thresholds for determining a project's significant transportation impact shall be pursuant to section 15064.3 of the CEQA Guidelines. OPR released a Technical Advisory that contains recommendations for assessing

³ For the purposes of the VMT analysis, the affordable mixed-use housing units and 6 market-rate live-work units are treated as multi-family units to provide a worst-case conservative assessment of Project-generated VMT. Since the County's VMT tool does not estimate VMT per capita for affordable mixed-use housing units or market-rate live-work units, the VMT per capita for multi-family units was used for the affordable mixed-use housing units and the market-rate live-work units.

Reference: Northlake Specific Plan Transportation Analysis for CEQA

VMT, thresholds of significance, and mitigation measures. OPR and the California Natural Resources Agency (CNRA) have concluded that VMT is the most appropriate metric to evaluate a project's transportation impacts. On July 1, 2020, statewide implementation occurred.

The Los Angeles County Public Works (LACPW) Department published the TIA Guidelines that provides recommendations for assessing VMT for development in unincorporated Los Angeles County. As such, this VMT analysis has been prepared in accordance with the County's guidelines and guidance from County Public Works staff. The previously Approved Project is evaluated as a land use plan and VMT per service population⁴ is the metric used for the VMT impact analysis. An increase in the NLSP VMT on a per capita basis would result in a significant impact. This methodology is used because the NLSP was approved prior to SB 743 adoption and Project modifications are being made after SB 743 adoption.

Project-Level VMT Analysis

The County's VMT Tool uses data from the Southern California Association of Government's Regional Transportation Plan/Sustainable Communities Strategy (SCAG RTP/SCS) travel demand forecasting model and was specifically designed to be used to develop project-specific daily residential VMT per capita and daily employment VMT per employee metrics for residential, office, and industrial land use development projects in the unincorporated areas of the County of Los Angeles⁵.

The estimated VMT for the NLSP establishes the baseline for the currently proposed Project to be evaluated against for determining a potential significant CEQA transportation impact. This is due to the approval occurring before SB 743 and modifications happening after SB 743. Unlike a brand new project, the previously approved Project does not need to be evaluated against the County baseline, as determined from the County's VMT Tool.

Table 2 summarizes the Project's VMT, service population, and the VMT per service population estimated for the NLSP and for the previously approved Project (VMT calculations are attached). The VMT estimates presented here are intended to compare the allowed uses of the NLSP and the previously approved Project, using VMT per service population as the basis of comparison. Therefore, the same assumptions to calculate the VMT per service population are applied to both the NLSP and the previously approved Project to provide an equal point of comparison. In regard to the on-site commercial, parks, and school, these uses are assumed to primarily serve the Project residents, therefore the VMT associated with these uses is primarily captured in the residential VMT totals, with any additional visitor VMT being generally equivalent between the NLSP and for the previously approved Project. As shown in **Table 2**, the previously approved Project would generate less VMT and have a VMT per service population rate lower than the NLSP. Due to the VMT reduction, the previously approved Project's impacts would be less and the Project would not result in any new or increased significant transportation impacts.

⁴ Service population is the sum of the number of residents and the number of employees.

⁵ County of Los Angeles VMT Tool User Guide, Los Angeles County Public Works. December 2020.

Table 2 NLSP and Previously Approved Project VMT Summary

Category	NLSP VMT	Previously Approved Project VMT
Single Family Residential	260,013	165,568
Multi-Family Residential	77,860	100,623
Commercial Retail	8,765	3,670
Light Industrial	13,869	--
Recreation/Park	1,320	2,640
School	2,640	2,640
Project VMT	364,467	275,141
Service Population	13,485	10,705
VMT per Service Population	27.0	25.7
See attached VMT and Service Population Calculation Worksheet.		

The VMT estimates presented above use data from a travel demand model and are based on location and land use types only. The travel demand mode data does not consider the unique features of a specific project. For the previously approved Project, there are a number of features that tend to reduce VMT such as constructing a pedestrian network, integrating affordable housing, constructing bicycle trails, and expanding the transit network. VMT reduction ranges from the California Air Pollution Control Officers Association's (CAPCOA) Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity⁶ (GHG Handbook) are noted below.

Pedestrian Network: The previously approved Project would promote a high level of walkability by providing access to recreational destinations. Pedestrian facilities in the neighborhood would include multi-use trails, enhanced parkways, and neighborhood pedestrian trails. Neighborhood trails connect homes to the larger network, bringing all community amenities within pedestrian, bicycle, or equestrian access and reducing the need for automobiles⁷. The GHG Handbook's T-18 Provide Pedestrian Network Improvement measure cites up to a 6.4% potential reduction in VMT, however, the previously approved Project is not taking any quantitative credit for this project feature.

Affordable Housing: The previously approved Project includes affordable mixed-use housing units, which represent approximately 10% of the total number of residential units. The GHG Handbook's T-4 Integrate Affordable and Below Market Rate Housing measure cites up to a 28.6% potential reduction in VMT, however, the previously approved Project is not taking any quantitative credit for this project feature.

⁶ Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity, California Air Pollution Control Officers Association, December 2021.

⁷ Northlake Design Guidebook, April 2018.

Reference: Northlake Specific Plan Transportation Analysis for CEQA

Bicycle Trails: The previously approved Project would construct a Class I Bike Path, Class II Bike Lanes, and Class III Bike Route. Per the Northlake Design Guidebook, a Class I Bike Path is planned along Northlake Boulevard and Ridge Route Road south of Northlake Boulevard. Class II bike lanes are planned for Local Collectors “A” and “B” and Fire Access Road. Class III Bike Route is planned along Ridge Route Road north of Northlake Boulevard. The GHG Handbook’s T-19A Construct or Improve Bike Facility measure cites up to a 0.08% potential reduction in VMT, however, the previously approved Project is not taking any quantitative credit for this project feature.

Expand Transit Network: The Project would provide a community shuttle and service (“tram”) for the Project residents and guests. The tram would service local destinations within the Project Site as well as regional destinations outside the site. The Northlake Design Guidebook provides a conceptual diagram of a well-connected public transit route within the Project site, providing access to local destinations. The GHG Handbook’s T-25 Extend Transit Network Coverage or Hours measure cites up to a 4.6% potential reduction in VMT, however, the previously approved Project is not taking any quantitative credit for this project feature.

Cumulative VMT Impact Analysis

The previously approved Project would have a less than significant VMT impact at the Project-level and would, therefore, also have a less-than-significant cumulative VMT impact⁸.

Plan Consistency

The previously approved Project does not conflict with the General Plan, any program plan, ordinance, or policy addressing the circulation system. The previously approved Project does not propose to amend or adjust roadway classifications, roadway network, transit routes, or bicycle network under existing conditions and future conditions as identified in the General Plan.

The previously approved Project would enhance the pedestrian experience by constructing multi-use trails, enhanced parkways, and neighborhood pedestrian trails. Neighborhood trails connect homes to the larger network, bringing all community amenities within pedestrian, bicycle, or equestrian access and reducing the need for automobiles. The previously approved Project would also construct a Class I Bike Path, Class II Bike Lanes, and Class III Bike Route. Per the Northlake Design Guidebook, a Class I Bike Path is planned along Northlake Boulevard and Ridge Route Road south of Northlake Boulevard. Class II bike lanes are planned for Local Collectors “A” and “B” and Fire Access Road. Class III Bike Route is planned along Ridge Route Road north of Northlake Boulevard. Lastly, the Project would expand the transit network by creating a route alignment and bus stop locations within the Project site. Therefore, the Project does not conflict with the General Plan, any program plan, ordinance, or policy addressing the circulation system.

⁸ “A project that falls below an efficiency-based threshold that is aligned with long-term goals and relevant plans has no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than significant project impact would imply a less than significant cumulative impact, and vice versa.” Technical Advisory on Evaluating Transportation Impacts in CEQA, Governors’ Office of Planning and Research, December 2018, page 6.

Reference: Northlake Specific Plan Transportation Analysis for CEQA

On-site Access

The previously approved Project would involve construction of a new internal circulation system. According to the Santa Clarita Valley Area Plan 2012 EIR, hazards due to roadway design would be evaluated on a project-by-project basis. The previously approved Project would include implementation of the Access and Circulation Plan that provides circulation and design standards for the layout of arterial highways and local collector streets in support of the Northlake land use plan. Because the Northlake Specific Plan, including the Access and Circulation Plan, was evaluated as part of the Northlake 1992 EIR and approved as part of the Specific Plan, no significant impacts are anticipated. Further, all roadway design would comply with applicable design standards and requirements set forth in the Northlake Specific Plan and would be subject to review and approval by the County of Los Angeles Department of Public Works. Therefore, impacts would be less than significant.

Emergency Access

Development of the Project site will not alter or impede emergency response routes or plans set in place by the County. Access during construction will be addressed in the Project's construction traffic management plan.

Emergency vehicles would access the Project site using Ridge Route Road and use the internal street network. North of the Project site, existing Ridge Route Road can be accessed from Templin Highway. Vehicular circulation within the Project site would be accommodated by public and private roadways, which would be constructed consistent with applicable Los Angeles County Department of Public Works design standards for local roads. According to the California Fire Code (2016), fire apparatus access roads need to be no less than 20 feet wide and shall always be unobstructed, which the internal Project streets will meet. Based on the previously approved Project site plan, the internal streets and intersections, including the Project cul-de-sacs, would accommodate a fire truck.

The Project driveways are designed to comply with turning radius requirements for emergency vehicles and will not cause hazardous driving conditions. The Project's detailed design will be completed in compliance with California Fire Code requirements and not impair emergency vehicle access in the vicinity of the Project during construction and in ongoing operation. Compliance with the California Fire and Building Codes will be mandated through the plan check and approval process. This process will also ensure that adequate access for emergency services is provided, and the County's emergency response plan will be upheld during construction. Therefore, the Project's impact on emergency access would be less than significant.

Reference: Northlake Specific Plan Transportation Analysis for CEQA

Construction VMT Analysis

Construction of the proposed project would generate temporary VMT associated with construction activities. It is anticipated that construction of the proposed project would be phased based on market demand.

Construction-related VMT would primarily be associated with mass grading including movement of soils within the Project site, delivery of building materials and construction equipment, removal of construction debris, and construction workers commuting to/from the project site. The amount of construction VMT would vary daily depending on the nature of the activity. In general, phased construction of the proposed uses is not anticipated to result in substantial construction related VMT, except possibly for the initial demolition and clearing stages, which would generate the highest number of heavy truck VMT. All grading materials are anticipated to be balanced on the Project site; therefore, the primary source of construction related VMT would occur during the building phases of the Project. Construction traffic is expected to access the Project site from I-5 at Lake Hughes Road, which leads to Ridge Route Road, and which is the most direct and shortest route from the site to the regional freeway system. Construction workers would primarily be from the southern California region. In some cases, specialized workers will be housed temporarily in the local area for the duration of their work activity. The distance construction workers travel to jobsites is a function of the worker's home location and the jobsite location, which is continually changing due to the short-term nature of construction work. Construction related VMT is variable, short-term, and is substantially lower than the project's operational VMT. As such, construction related VMT would be less than significant.

As described in Mitigation Measure 5.11-3, to minimize traffic impacts during construction, a Construction Traffic Management Plan will be prepared and submitted to the County; this plan will describe safe detours, provide temporary traffic-control measures during construction activities, and identify requirements to be met when one or more travel lanes are obstructed during construction. To reduce traffic congestion, the plan would also include, as necessary, appropriate, and practicable, the following activities: implementing temporary traffic controls (e.g., a flag person) during all phases of construction to maintain smooth traffic flow; implementing signage for detours, if needed; assigning dedicated turn lanes for movement of construction trucks and equipment on and off the site; scheduling construction activities that affect traffic flow on the arterial system to off-peak hours; consolidating truck deliveries; rerouting construction trucks away from congested streets or sensitive receptors; and synchronizing signals to improve traffic flow. Conducting construction activities in compliance with the Traffic Management Plan would reduce potential impacts related to construction traffic to less than significant levels.

Conclusion

The purpose of this study is to identify potential significant impacts related to transportation due to the implementation of the proposed Project. The previously approved Project would generate less VMT and a lower VMT per service population rate than the NLSP. Due to the VMT reduction, the previously approved Project's impacts would be less and the previously approved Project would not result in any new or increased significant transportation impacts.

Reference: Northlake Specific Plan Transportation Analysis for CEQA

The previously approved Project's consistency with existing plans was evaluated and the previously approved Project does not conflict with the General Plan, any program plan, ordinance, or policy addressing the circulation system.

The previously approved Project's roadway design would comply with applicable design standards and requirements set forth in the Northlake Specific Plan and subject to review and approval by the County of Los Angeles Department of Public Works, therefore the Project would not increase hazards or incompatible uses.

Emergency access during construction would be maintained through the previously approved Project's construction management plan and on-site roadways would be designed per Fire Code requirements. Therefore, the previously approved Project would not impact emergency access.

Lastly, construction related VMT is variable, short-term, and is substantially lower than the Project's operational VMT. As such, construction related VMT would be less than significant. A construction Traffic Management Plan will be prepared and submitted to the County. Conducting construction activities in compliance with the Traffic Management Plan would reduce potential impacts related to construction traffic to less than significant levels.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Introduction
September 2016

1.0 INTRODUCTION

This report presents the results of a traffic study carried out to evaluate a proposed development (hereby referred to as Northlake) within the Northlake Specific Plan area in unincorporated Los Angeles County. VTTM 73336 represents a portion of the Northlake development. The purpose of the study is to identify potential significant impacts of the project and will serve as a technical resource for the project's Environmental Impact Report (EIR).

1.1 PROPOSED PROJECT

Figure 1-1 illustrates the general location of the project. The project is located in the Castaic community, east of Interstate (I-5) and northeast of the Lake Hughes Road interchange. A Specific Plan was approved in 1991 for a development consisting of nearly 4,000 residential dwelling units. The buildout of the project as currently proposed, consists of 1,414 single family residential units, 1,341 condominium and townhouse units, 345 senior adult residential units with a combined total of 3,100 residential units. The project also includes non-residential uses estimated to consist of approximately 67,100 square feet of neighborhood commercial, a 304,900 square feet industrial park, a junior high school (approximately 1,200 students), 15 acre Sports Park and a 10 acre developed park.

The site is currently undeveloped, except for the existing Northlake Hills Elementary school just north of the intersection of Ridge Route Road and Pine Crest Place.

The project site plan is shown in Figure 1-2. Access to the project site is via an extension of the existing Ridge Route Road.

Based on established trip rates published by the Institute of Transportation Engineers (ITE) and the County of Los Angeles, at buildout the development will result in approximately 32,600 average daily trips (35,500 daily tripends) given the proposed land uses for the project site. Detailed trip generation and trip distribution data is provided in Chapter 3.0, Project Description. The project is expected to be fully built out over a 10 to 15 year period.

1.2 STUDY AREA

This traffic report addresses the local study area in the nearby Castaic community where project generated traffic could potentially cause a significant impact and the I-5 freeway segments near the project site. The local study area and the freeway segments addressed in this report are presented in Figure 1-3. As shown, the local study area extends south to the Ridge Route Road/Parker Road interchange and westerly to Sloan Canyon Road.

The study area was derived by utilizing a traffic model to distribute project trips to the area's roadways (see Section 1.3.1 for additional discussion of the traffic model used for this analysis)

DRAFT

Legend

--- Project Boundary

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Introduction
September 2016

and each major intersection with a discernible volume of project traffic (i.e., daily traffic volumes > 500 ADT) was included in the study area.

1.3 METHODOLOGY

The traffic analysis evaluates the project utilizing the established guidelines of the Los Angeles County Department of Public Works (See Reference 3 in Section 1.6) and current methodologies as direct by County staff. A special plan-to-ground analysis (i.e., existing plus project analysis) is provided as well as cumulative conditions (i.e., Related Projects) analysis. The project is expected to buildout over a 10 to 15 year period, therefore a horizon year of 2028 is utilized for the cumulative setting. The scenarios analyzed are as follows:

1. Existing Conditions
2. Existing Conditions plus Project
3. 2028 Cumulative Conditions/Related Projects with Project
4. 2028 Cumulative Conditions/Related Projects without Project

1.3.1 Project Impact Analysis

The County's traffic study guidelines specify the analysis of the scenarios shown above. The future forecasts were derived using three primary sources. The first is the Santa Clarita Valley Consolidated Traffic Model (SCVCTM), a model has the capability of forecasting the complex interaction of vehicle trips between existing and future land uses. The second is the Northlake Traffic Model (NTM), a fine-grained site-specific traffic model prepared for this traffic study. The third set of data is from the Los Angeles County Department of Regional GIS-NET-3 database, referred to here as "related projects". All three sources are discussed in detail in Section 2.2.

1.4 PERFORMANCE CRITERIA

In traffic impact studies, impact criteria are based on two primary measures. The first is "capacity," which establishes the vehicle carrying ability of a road segment, and the second is "volume". The volume measures is either a traffic count (in the case of existing volumes) or a traffic forecast for a future point in time. The ratio between the volume and the capacity gives a volume/capacity (V/C) ratio, and based on that V/C ratio, a corresponding level of service (LOS) is defined. Traffic LOS is designated "A" through "F" with LOS "A" representing free flow conditions and LOS "F" representing severe traffic congestion. Traffic flow quality for each LOS is described in Table 1-1 for arterial roadways and intersections and Table 1-2 for freeways, these descriptions being taken from the Highway Capacity Manual (HCM).

Table 1-3 summarizes the V/C ranges listed for arterial roads, intersections and freeway segments and are those used by the County of Los Angeles. The V/C ranges listed for freeway segments are based on the V/C and LOS relationships specified in the 2010 Highway Capacity Manual (see Reference 2 in Section 1.6 and referred to as "HCM 2010" in this report) for basic freeway sections with free-flow speeds of 65 miles per hour, and the V/C methodology is specified by the

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Introduction
September 2016

County's Congestion Management Program (CMP) for the evaluation of CMP freeway monitoring stations.

The V/C is the methodology used in this analysis for the CEQA determination of impacts since it is the methodology specified by the Los Angeles County CMPs.

Both the V/C ratio and the LOS are used in identifying significant impacts. Certain LOS values are deemed unacceptable, and increases in the V/C ratio that cause or contribute to the LOS being unacceptable are defined as a significant impact. Note that while the Caltrans guidelines for the preparation of traffic studies (see Reference 4 in Section 1.6) recommend the HCM 2010 method for the evaluation of State highway facilities, those guidelines do not include a threshold of significance criteria for the determination of a significant project impact that is based on the HCM 2010 methodologies. While the Caltrans guidelines do not identify specific impact criteria due to differences between rural and urban areas of the State, as well as differences between the northern, central, and southern regions, the local Caltrans Districts will determine the impact criteria based on the appropriate requirements of that District. As such, the thresholds of significance criteria specified by the local agencies (i.e., Caltrans District 7, County of Los Angeles, and the LA County CMP) are utilized for this analysis.

In establishing V/C based performance criteria, there are certain items that need to be addressed to obtain suitable V/C estimates and relate them to LOS. For instance, while average daily traffic (ADT) is a useful measure to show general levels of traffic on a facility and to provide data for other related aspects such as noise and air quality, highway congestion is largely a peak hour or peak period occurrence and ADT does not reflect peak period conditions very effectively. Because of this, ADT is not used here as the basis for capacity evaluation but instead this evaluation focuses on those parts of the day when such congestion can occur, specifically the AM and PM peak hours.

For the arterial system and freeway system, the peak hour is the accepted time period used for impact evaluation. The analysis of the arterial road system is based on intersection capacity since this is the defining capacity limitation on an arterial highway system. The analysis of the freeway system is based on peak hour volumes by direction.

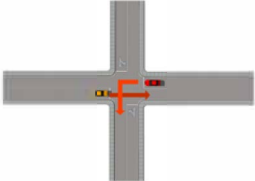

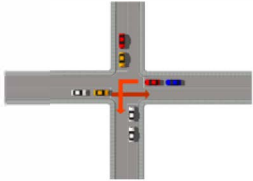

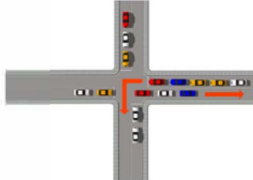

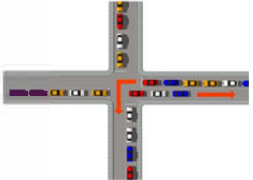

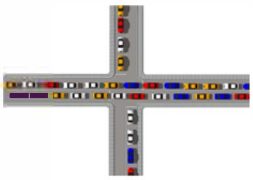

Levels of service for arterial roadway intersections and for freeway mainline segments are determined based on operating conditions during the AM and PM peak hours. For intersections, the intersection capacity utilization (ICU) methodology is applied, providing a planning level basis for determining V/C and LOS. This methodology sums the V/C ratios for the critical movements of an intersection and is the preferred procedure for intersection analysis by the County of Los Angeles. The ICU methodology is generally compatible with the intersection capacity analysis methodology outlined in the HCM 2010. For freeway segments, the V/C methodology is applied, which also provides a planning level basis for determining capacity utilization and LOS, and which is the methodology specified by the County CMP. The HCM 2010 equates V/C ratios to other performance measures such as speed and density shown in Table 1-4.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Introduction

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Introduction
September 2016

Table 1-2 Level of Service Descriptions – Freeways

LOS		Traffic Flow Description	Density (pc/mi/ln)
A		Free-flow conditions. Free-flow speed prevails and vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream. The effects of incidents or point breakdowns are easily absorbed.	≤ 1
B		Reasonably free-flow operations, and free-flow speed on the freeway is maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high. The effects of minor incidents and point breakdowns are still easily absorbed.	$>11 - 18$
C		Traffic flow and speeds near the free-flow speed of the freeway. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more care and vigilance on the part of the driver. Minor incidents may still be absorbed, but the local deterioration in service quality will be significant. Queues may be expected to form behind any significant blockages.	$>18 - 26$
D		Speeds begin to decline with increasing flows, with density increasing more quickly. Freedom to maneuver within the traffic stream is seriously limited and drivers experience reduced physical and psychological comfort levels. Even minor incidents can be expected to create queuing, because the traffic stream has little space to absorb disruptions.	$>26 - 35$
E		Operation at capacity. Operations on the freeway at this level are highly volatile because there are virtually no usable gaps within the traffic stream, leaving little room to maneuver within the traffic stream. Any disruption to the traffic stream can establish a disruption wave that propagates throughout the upstream traffic flow. The physical and psychological comfort afforded to drivers is poor.	$>35 - 45$
F		Breakdown, or unstable flow. Breakdown occurs when the ratio of demand to capacity exceeds 1.00. Whenever queues due to a breakdown exist, they have the potential to extend upstream for considerable distances.	>45
<p>Source: HCM 2010 pc/mi/ln = passenger cars per mile per lane</p>

Maximum service flow rate (pc/h/ln)	710	1,170	1,680	2,090	2,350

Notes:

The exact mathematical relationship between density and V/C has not always been maintained at LOS boundaries because of the use of rounded values. Density is the primary determinant of LOS. The speed criterion is the speed at maximum density for a given LOS.

Values based on a free flow speed of 65 mph.

Source: HCM 2010

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Introduction
September 2016

The ICU calculation methodology and associated impact criteria for the study area arterial system are summarized in Table 1-5. The County utilizes a variable scale of ICU impact amounts that are based on the pre-project LOS.

The County CMP specifies that LOS E is the acceptable threshold for arterial intersections. Therefore, the CMP analysis presented in Section 4.3 utilizes LOS E as the acceptable threshold for CMP purposes.

The freeway V/C calculation methodology and associated impact criteria for the study area freeway system are summarized in Table 1-6. The County CMP specifies that LOS E or existing LOS, whichever is worse, represents the performance standard for freeway segments, and Caltrans goal is to maintain no worse than LOS E in urban areas.

1.5 DEFINITIONS

Certain terms used throughout this report are defined below to clarify their intended meaning:

ADT	Average Daily Traffic. Generally used to measure the total two-directional traffic volumes passing a given point on a roadway.
CMP	Congestion Management Program. A state mandated program administered by the Los Angeles County Metropolitan Transportation Authority (MTA) that provides a mechanism for coordinating land use and development decisions.
ICU	Intersection Capacity Utilization. A measure of the volume to capacity ratio for an intersection. Typically used to determine the peak hour level of service for a given set of intersection volumes.
LOS	Level of Service. A scale used to evaluate circulation system performance based on intersection ICU values or volume/capacity ratios of arterial segments.
Peak Hour	This refers to the hour during the AM peak period (typically 7 AM - 9 AM) or the PM peak period (typically 3 PM - 6 PM) in which the greatest number of vehicle trips are generated by a given land use or are traveling on a given roadway.
Tripend	A trip generation measure which represents the beginning or endpoint of a trip.
V/C	Volume to Capacity Ratio. This is typically used to describe the percentage of capacity utilized by existing or projected traffic on a segment of an arterial or intersection.
VPH	Vehicles per Hour. Used for roadway volumes (counts or forecasts) and trip generation estimates. Measures the number of vehicles in a one-hour period, typically the AM and PM peak hour.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Introduction
September 2016

Table 1-5 Arterial Intersection Performance Criteria

V/C Calculation Methodology									
Level of service to be based on peak hour intersection capacity utilization (ICU) values calculated using the following assumptions:									
Saturation Flow Rates:									
County Methodology:	1,600 vehicles/hour/lane for through lanes, right-turn lanes, and single left-turn lanes 2,880 vehicles/hour/lane for dual left-turn lanes (total of both lanes)								
Clearance Interval:	0.10								
Significant Impact Thresholds¹									
An intersection is considered to be significantly impacted if the project increases the ICU by an amount equal to or greater than the amounts set forth below:									
County Thresholds:	<table><tr><th>Pre-Project ICU</th><th>Project Increment</th></tr><tr><td>0.71 - 0.80 (LOS C)²</td><td>greater than or equal to 0.04</td></tr><tr><td>0.81 - 0.90 (LOS D)</td><td>greater than or equal to 0.02</td></tr><tr><td>0.91 or more (LOS E & F)</td><td>greater than or equal to 0.01</td></tr></table>	Pre-Project ICU	Project Increment	0.71 - 0.80 (LOS C) ²	greater than or equal to 0.04	0.81 - 0.90 (LOS D)	greater than or equal to 0.02	0.91 or more (LOS E & F)	greater than or equal to 0.01
Pre-Project ICU	Project Increment								
0.71 - 0.80 (LOS C) ²	greater than or equal to 0.04								
0.81 - 0.90 (LOS D)	greater than or equal to 0.02								
0.91 or more (LOS E & F)	greater than or equal to 0.01								
¹ Note: For intersections under joint jurisdiction of the County and Caltrans or Caltrans, the analysis utilizes the corresponding threshold of the lead agency (County) or local agency.									
² Note: The County guidelines do not address situations where pre-project conditions are less than 0.71. In that situation, County staff has interpreted the guidelines to mean that an increase resulting in a with-project condition of 0.75 or more is considered significant. The interpretation is based on the following scenario, which is addressed by the guidelines: 0.71 (pre-project) + 0.04 (project increment) = 0.75 and is a significant impact.									
Abbreviations:									
V/C – Volume/Capacity Ratio									
LOS – Level of Service									
ICU – Intersection Capacity Utilization

2.0 TRANSPORTATION SETTING

This chapter describes the transportation setting for the project. Existing conditions are first summarized, followed by the future background setting against which project impacts are evaluated.

2.1 EXISTING CONDITIONS

The following section describes the transportation system serving the local study area. It includes a description of the local study area roadway system, existing traffic volumes and the results of an intersection capacity utilization (ICU) level of service (LOS) analysis, thereby providing a point of reference for describing anticipated future traffic conditions.

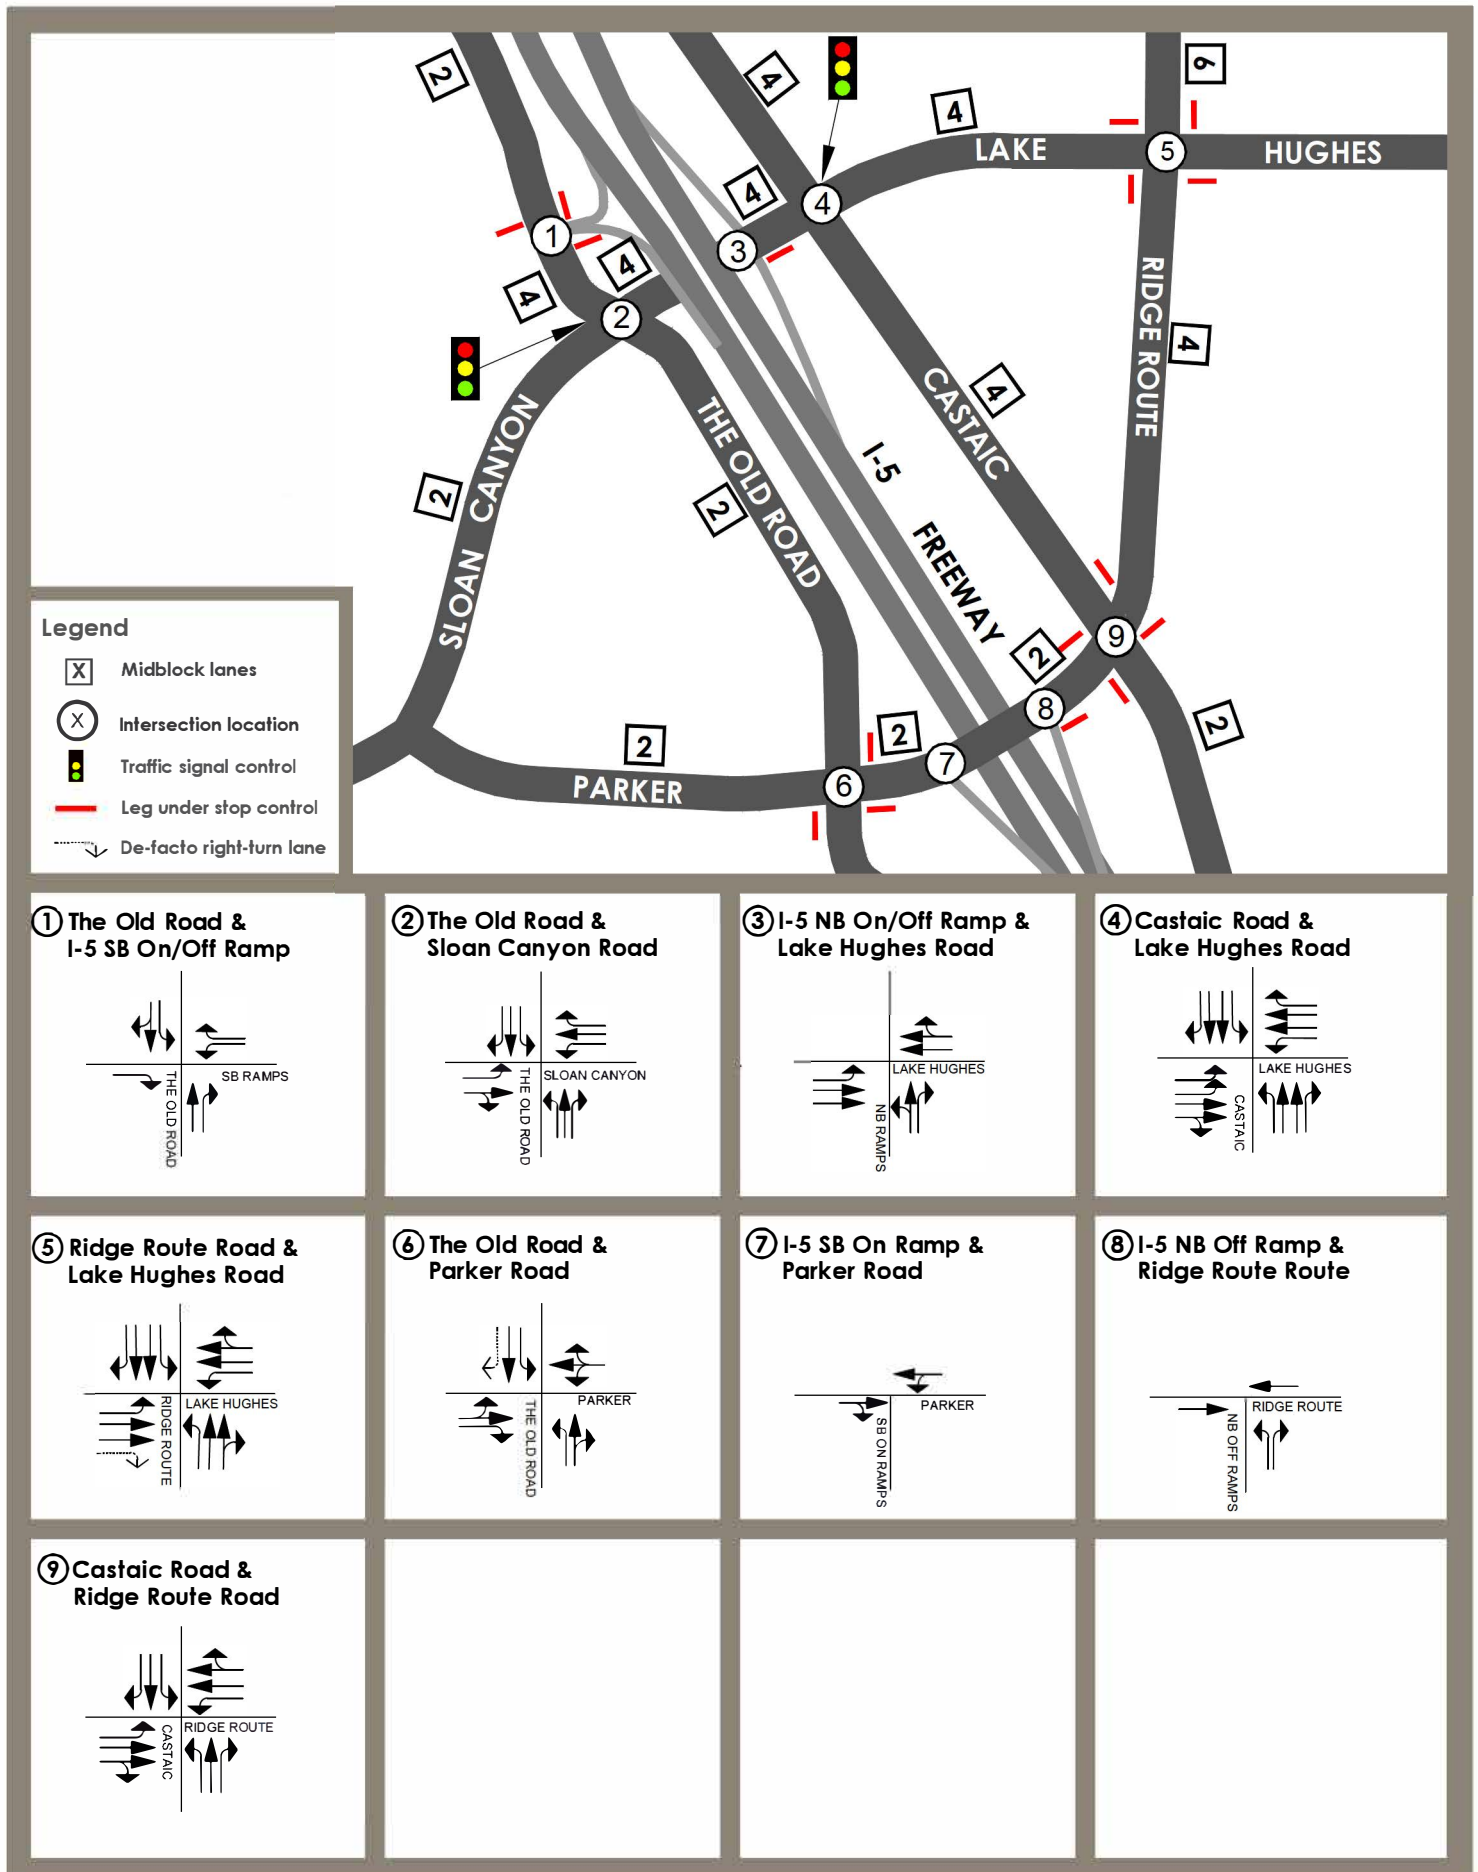

2.1.1 Existing Local Roadway System

The existing local roadway system in the nearby Castaic community is illustrated in Figure 2-1 in the form of mid-block lanes, intersection lane configurations and intersection control types for the intersections being studied.

Immediately south of the project site, Ridge Route Road has been constructed with a 64 foot roadway width within 80 feet of right-of-way to just north of Castaic Lake Drive. From just north of Castaic Lake Drive to just south of the park entrance, Ridge Route Road has been constructed with a 94 foot roadway width within 110 feet of right-of-way. From just south of the park entrance to Lake Hughes Road, Ridge Route Road has been constructed with an 84 foot roadway within 100 feet of right-of-way, with a raised median ranging from 4 feet to 14 feet in width. South of Lake Hughes Road, Ridge Route Road consists of two lanes in each direction, with parking, within a 64 foot roadway width.

Lake Hughes Road is a major highway currently configured with two lanes in each direction between Ridge Route Road and the I-5 freeway. West of Ridge Route Road, Lake Hughes Road has been constructed with a 90 foot roadway width.

The I-5 freeway provides regional access to the Los Angeles area to the south and to Kern County to the north. It currently consists of four lanes in each direction. In the Castaic area, interchanges exist at Lake Hughes Road and at Parker Road/Ridge Route Road. At the Lake Hughes Road interchange, direct ramps exist for the northbound direction, and hook ramps to and from The Old Road for the southbound direction. At the Parker Road/Ridge Route interchange, ramps exist for movement to and from the south only.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Transportation Setting
September 2016

2.1.2 Existing Traffic Volumes and Levels of Service

An illustration of existing average daily traffic (ADT) volumes is provided in Figure 2-2. Peak hour turning movement volumes for each intersection can be found in Figure 2-3 and Figure 2-4 for the AM peak hour and PM peak hour, respectively. The traffic counts were collected in January of 2015 (count data is provided in Appendix C).

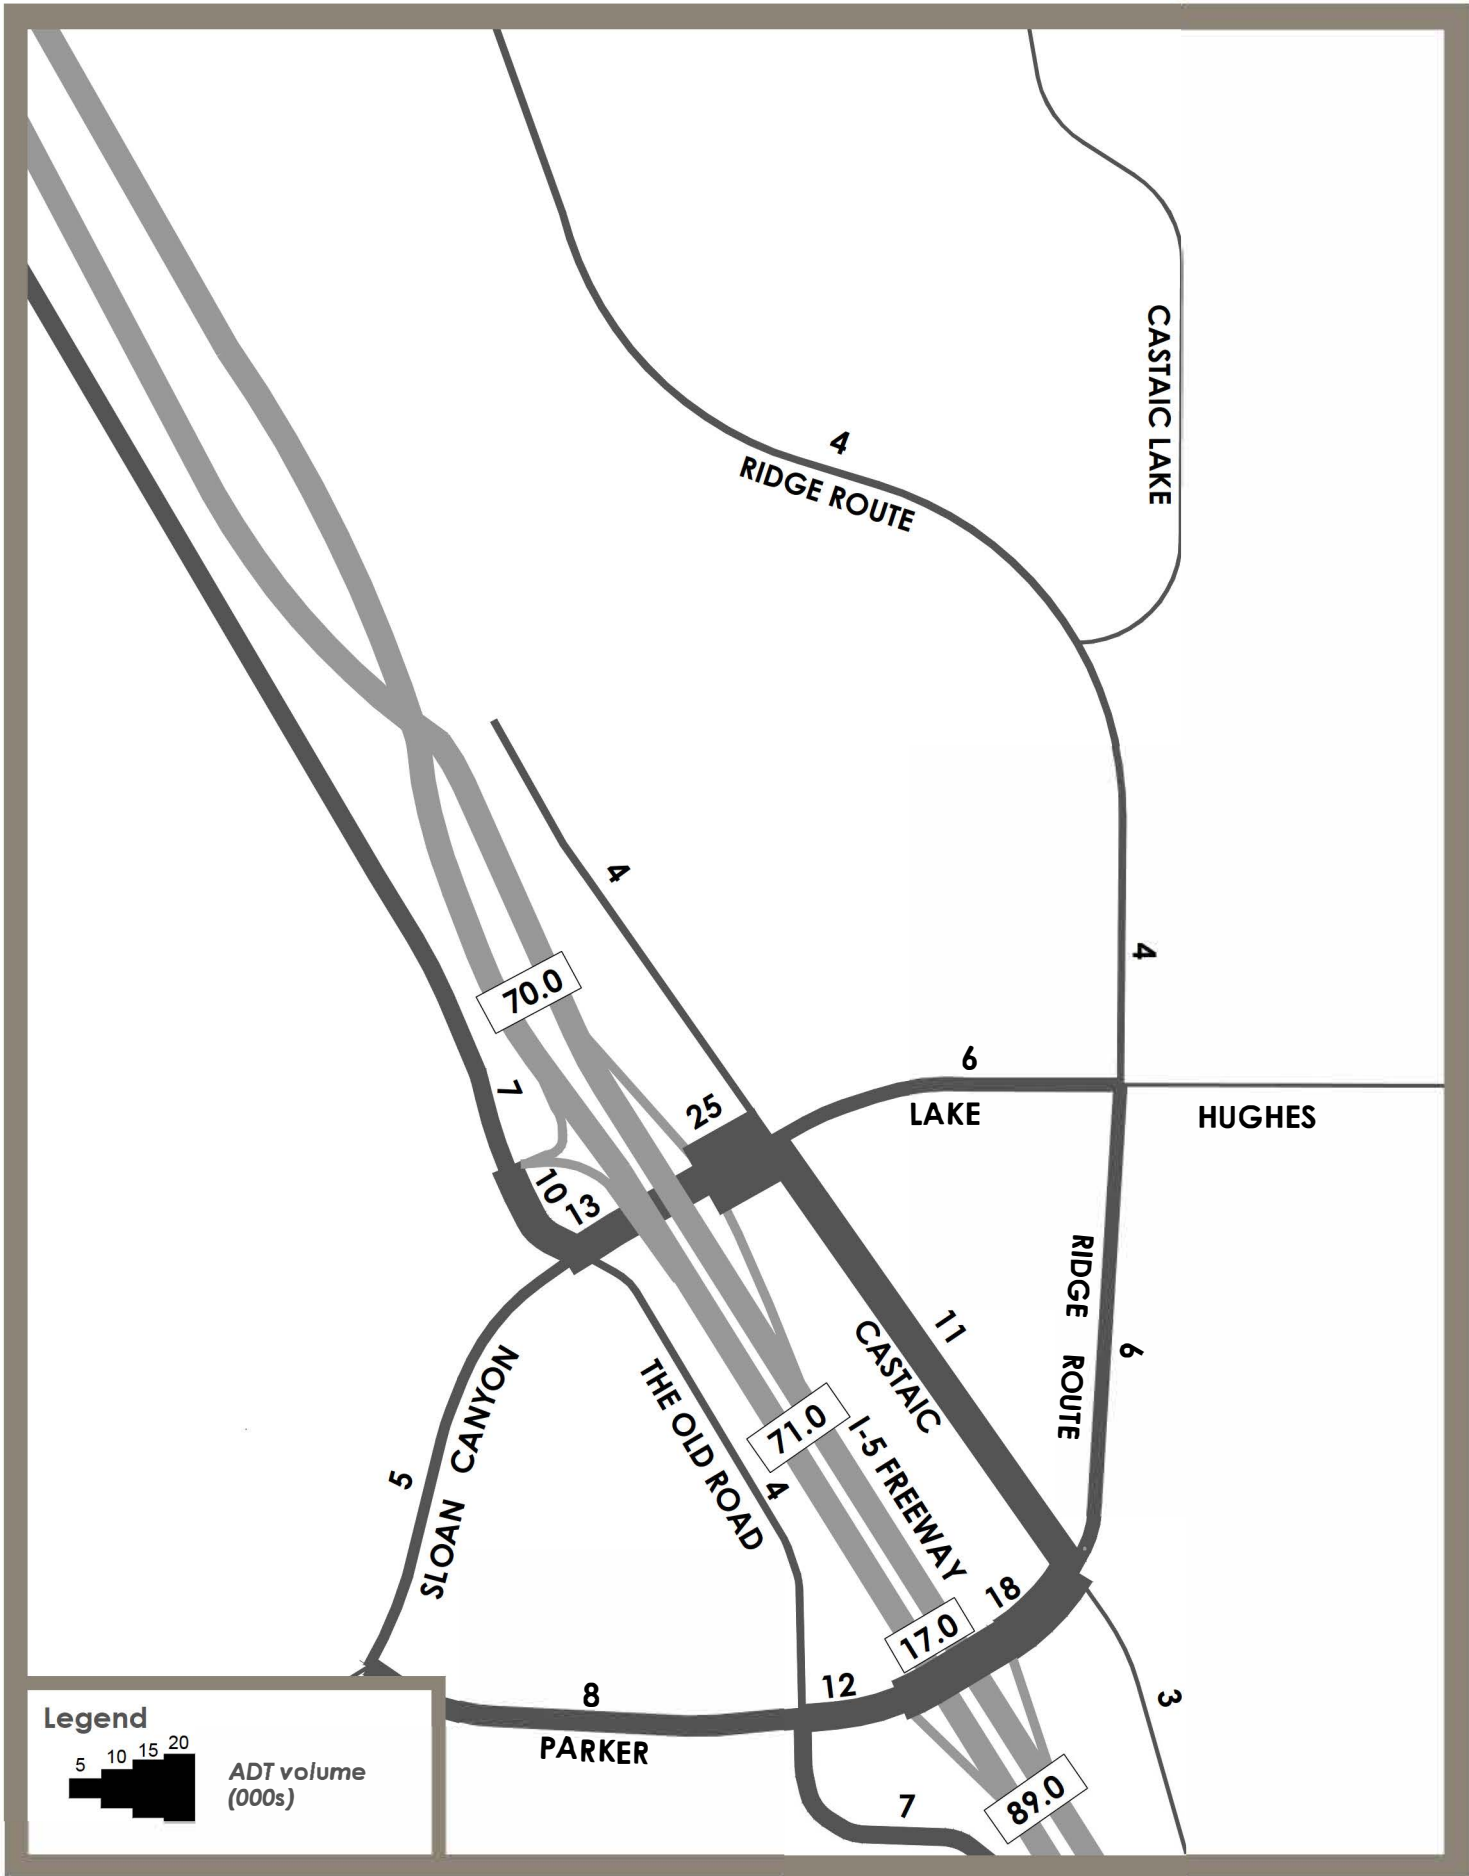

As discussed in the section on performance criteria in Section 1.4, LOS is a concept developed to quantify the degree of comfort afforded to drivers as they travel on a given roadway. The degree of comfort includes such elements as travel time, number of stops, total amount of stopped delay, etc. As defined in the HCM 2010, six grades are used to denote the various LOS. The six are denoted "A" through "F" and a discussion on these was given in Section 1.4.

The results of the ICU and LOS analysis for the intersections near the project site are shown in Table 2-1 (detailed LOS calculation worksheets are provided in Appendix A). As noted in Figure 2-1, most intersections in the study area are not currently controlled by a traffic signal. For those locations, the ICU provides an indication of the level of service based on traffic signal control and provides a benchmark for comparison of future condition with the project.

Table 2-1 ICU and LOS Summary – Existing Conditions

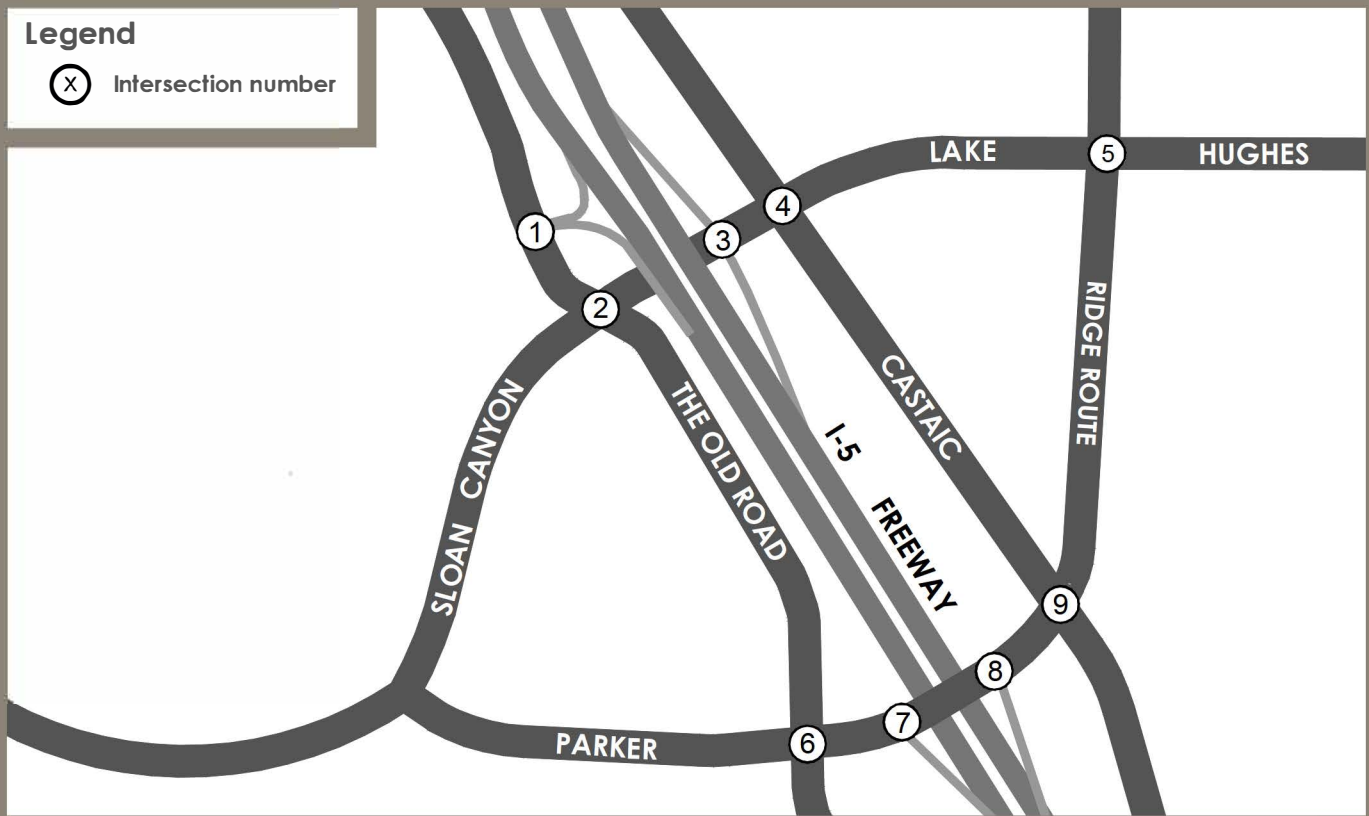

Intersection	Jurisdiction	Signal Control	AM Peak Hour		PM Peak Hour		Count Date
			ICU	LOS	ICU	LOS	
1. The Old Road & I-5 SB Ramps	County/ Caltrans	Stop	0.41	A	0.39	A	1/27/2015
2. The Old Road & Sloan/Lake Hughes	County	Signal	0.34	A	0.36	A	1/22/2015
3. I-5 NB Ramps & Lake Hughes	County/ Caltrans	Stop (South Leg)	0.31	A	0.41	A	1/27/2015
4. Castaic & Lake Hughes	County	Signal	0.31	A	0.37	A	1/27/2015
5. Ridge Route and Lake Hughes	County	Stop	0.31	A	0.19	A	1/27/2015
6. The Old Road & Parker	County	Stop	0.45	A	0.42	A	1/28/2015
7. I-5 SB On Ramp & Parker	County/ Caltrans	None	0.60	A	0.52	A	1/22/2015
8. I-5 NB Off Ramp & Ridge Route	County/ Caltrans	Stop (South Leg)	0.46	A	0.55	A	1/22/2015
9. Castaic & Ridge Route	County	Stop	0.33	A	0.41	A	1/22/2015
See Table 1-1 for level of service descriptions.							

As can be seen in Table 2-1, all intersections currently operate better than LOS D.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Transportation Setting
September 2016

2.1.3 Existing Freeway Traffic Volumes and Levels of Service

The I-5 freeway provides the regional travel in the project area. Freeway traffic volumes for existing (2013) conditions as reported by Caltrans are provided in Table 2-2 for average annual daily traffic (AADT).

Table 2-2 Freeway AADT Volumes – Existing Conditions

No.	Segment	2013 AADT
1	I-5 Between Templin Hwy & Lake Hughes	70,000
2	I-5 Between Lake Hughes & Parker	71,000
3	I-5 Between Parker & Hasley Canyon	89,000
4	I-5 Between Hasley Canyon & SR-126	109,000
5	I-5 Between Calgrove & SR-14	193,000
AADT – Annual Average Daily Traffic		

Peak hour volumes were obtained from the Caltrans Performance Measurement System (PeMS) at select representative locations over the period of one month for 2013 weekday conditions. These peak hour volumes represent the mean (average) weekday volume plus one standard deviation for the weekdays for the month of October, 2013. Peak hour data for several key segments on the I-5 was used to calculate representative K (peak hour volume factor) and D (directional factor) values in the AM and PM peak periods for each segment in order to calculate peak hour volumes by direction. The calculated K and D factors were then applied to 2013 AADT volumes to determine the peak hour volumes.

Table 2-3 Freeway Peak Hour K & D Factors (Sample Locations)

Location	AM Period			PM Period		
	K	D	KD	K	D	KD
I-5 at Templin Highway	3.80%	50.87% (NB)	1.93%	6.57%	51.34% (NB)	3.37%
I-5 at Magic Mountain Parkway	4.61%	55.25% (SB)	2.54%	6.12%	56.34% (SB)	3.45%
Source: PeMS – October 2013 weekday volumes (mean plus one standard deviation)						

Table 2-4 presents the freeway peak hour volumes and corresponding V/C ratios for the study area. As can be seen, no freeway segments are operating over capacity under existing conditions.

M = Mixed Flow Lane Cap = Capacity Vol = Volumes See Table 1-6 for lane capacities.							

2.1.4 Public Transportation

City of Santa Clarita Transit (SCT) is the primary bus service operator in the Castaic community. SCT provides two fixed route transit lines within close proximity to the project site; Routes 1 and 636.

SCT Route 1 provides service between Castaic and Val Verde to the McBean Regional Transit Center with 11 stops near the project site. Route 1 also stops through the Valencia Commerce Center and Valencia Industrial Center. Route 636 is a supplemental school day service route between West Ranch High School and the Castaic area with 13 stops within the project site.

Future bus transit routes are anticipated to be introduced in the project area in order to provide services for the new Castaic Middle School.

2.1.5 Active Transportation

The County of Los Angeles has a Bicycle Master Plan (BMP). At this time, the BMP does not address facilities in the Castaic community. Consultations with County have indicated that the

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Transportation Setting
September 2016

existing portion of Ridge Route Road south of Lake Hughes Road has been designated as a proposed Class II facility.

2.2 FUTURE CONDITIONS

The following section describes the long-range buildout conditions. It includes a description of the planned roadway system in the vicinity of the project site and a summary of the anticipated increases in land use.

2.2.1 Future Local Roadway System

Figure 2-5 illustrates the Los Angeles County Highway Master Plan for the Castaic community. On the Highway Master Plan, Ridge Route Road is classified as a secondary highway from Castaic Road to approximately 1.40 miles north of the Lake Hughes Road intersection where Ridge Route Road transitions to a limited secondary highway. Development of the project includes reconstruction of Ridge Route Road from north of Pine Crest Place to Northlake Boulevard to current standards and to the established IEC alignment within the project site. Ridge Route Road north of Northlake Boulevard would remain as a two-lane roadway. Ridge Route Road is classified as a major highway from Castaic Road to The Old Road where it becomes Parker Road, which is classified as a limited secondary highway.

Lake Hughes Road is classified as a major highway from The Old Road to east of Ridge Route Road. Castaic Road from Lake Hughes Road to Ridge Route Road is classified as a major highway. The Old Road is classified as a secondary highway. Most of the roadways are built out.

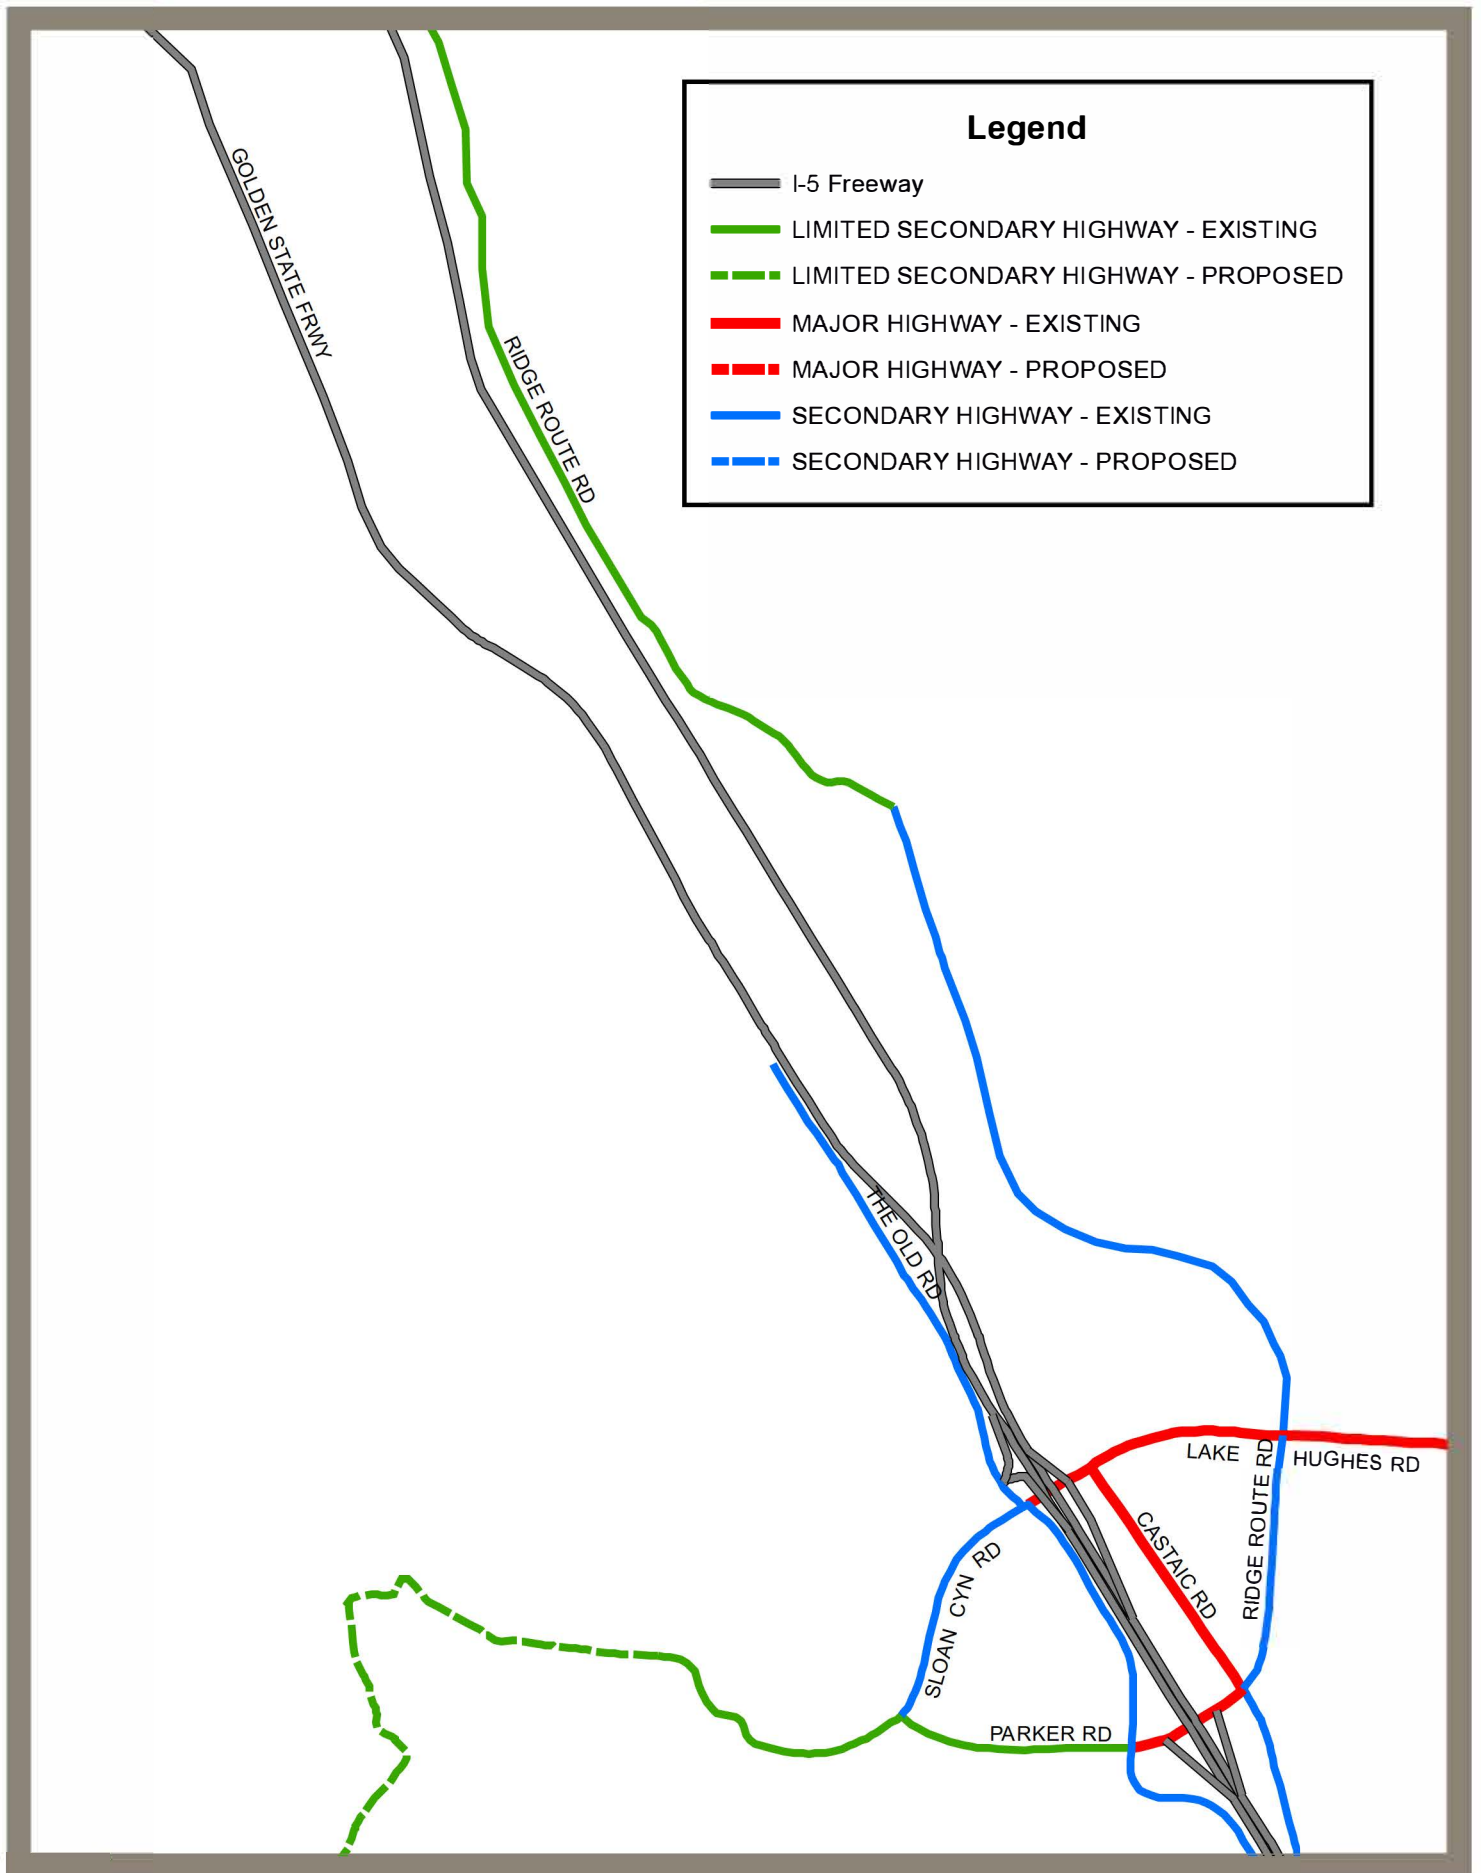

Also, a complete network of roadways will be constructed within the project site to serve the needs of the project generated traffic.

As part of the project, the extension of Ridge Route Road to Northlake Boulevard would be built to full County standards, which would include the construction of sidewalks on both sides of the roadway, as well as a Class I bike lane/multi-use trail along Ridge Route Road that would continue onto Northlake Boulevard and terminate at E Street. Within the project site, a complete network of streets with sidewalks, multi-use (10 feet) trails and neighborhood pedestrian (6 feet) trails would be constructed and would facilitate movement between the various areas of the site.

2.2.2 Future Land Use

Future forecasts were derived using three primary sources. The first is the Santa Clarita Valley Consolidated Traffic Model (SCVCTM), a model has the capability of forecasting the complex interaction of vehicle trips between existing and future land uses. The SCVCTM has the ability to provide traffic volume forecasts for a long-range setting, which represents buildout conditions, as well as Interim Year forecasts that are based on a defined list of planned, approved, and pending projects (i.e., "related projects"). An Interim Year version of SCVCTM was used to derive

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Transportation Setting
September 2016

2028 cumulative conditions forecasts. The SCVCTM was developed jointly by the County of Los Angeles Department of Public Works and the City of Santa Clarita

The second source of forecast data is the Northlake Traffic Model (NTM) prepared as part of this traffic study. The NTM is based on traffic modeling techniques used for fine-grained site-specific traffic forecasting. The arterial and freeway access network in the NTM defines the on-site circulation system used in the on-site impact analysis. The traffic forecasts results give traffic volumes on individual links and intersections.

The third set of data used in this report is from the Los Angeles County Department of Regional Planning GIS-NET3 database. The online database tool was used to access information regarding subdivision activity around the project site. A list was compiled, referred to in this report as the "related project" list. Table 2-5 defines a list of planned, approved, pending and inactive projects in and around the Castaic community (Figure 2-6 shows the general location of the projects). The list was incorporated into the interim year of the SCVCTM discussed above.

2.2.3 Future Traffic Volumes

As part of this study effort, the SCVCTM was updated to reflect the specific characteristics of the proposed project. An interim year version of the SCVCTM was used to derive 2028 cumulative conditions. Related projects discussed in the previous section were included in the model's land use database, along with additional growth derived by interpolating between existing and General Plan buildout conditions. 2028 model runs were prepared for conditions with and without the project. These traffic forecasts are presented in the subsequent chapters.

The SCVCTM forecasts the complex interaction of vehicle trips between existing and future land uses. As such, the future condition forecasts reflect the changes in existing travel patterns that occur due to changes in land use (e.g., the introduction of new development). The SCVCTM employs a process in which modeled future volumes are compared to modeled existing condition volumes, and the net change from existing to future is then applied to the actual observed traffic count in a post-processing procedure. Post-processing is applied to each of the intersection's 12 possible turning movements while controlling to the net change at each of the intersection's four legs (both entering and departure volumes). In that regard, the traffic forecasts presented here utilize existing traffic conditions as the foundation and build upon that foundation with the forecast change in volume (both increases and decreases) as derived by the model. As a result of changing traffic patterns, there are instances where specific turning movement volumes may decrease in the future relative to existing volumes.

Similar to the modeled changes between existing and future conditions, the SCVCTM is also used to derive the traffic volume differences between no project and with project conditions. A change in traffic patterns occurs with the introduction of the project's land uses; and the larger the project the more pronounced the changes will be. The effect of new land uses results in modified travel patterns that, in some instances, cause a reduction to specific turning movement volumes under conditions with the project.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Transportation Setting
September 2016

2.2.4 Future Freeway Volumes

Freeway volumes for future year cumulative conditions were derived from two sources; the Supplemental EIR/ER for the HOT lanes prepared by Caltrans (See Reference 6 in Section 1.6) and the Southern California Association of Government's (SCAG) Regional Transportation Model (RTM).

The Supplemental EIR/ER for the HOT lanes study is for an improvement project that replaces the planned HOV lanes with HOT lanes. I-5 traffic volumes from this study were considered and average annual growth rates were derived from those volumes. The Supplemental EIR/ER addressed segments on the I-5 within the Santa Clarita Valley and it presents traffic forecasts for the year 2035.

The second source for deriving future freeway volumes is the SCAG RTM (See Reference 8 in Section 1.6). SCAG is the primary agency responsible for the development and maintenance of the regional travel demand forecasting models for the SCAG region that includes six counties – Los Angeles, Orange, Ventura, Riverside, San Bernardino and Imperial. Traffic model data, such as an average annual growth rate for the freeway section on the I-5 north of Lake Hughes Road (this segment was not addressed in the Caltrans HOT lanes study) was as obtained from SCAG. The growth rate was then applied to 2013 existing conditions traffic volumes previously discussed in Section 2.1.3.

Table 2-6 summarizes the average annual growth rates assumed in this analysis for 2028 Cumulative Conditions.

Table 2-6 Average Annual Growth Rates for the I-5

Segment	Description	Average Annual Growth Rate 2028	Source:
I-5			
1	Between Templin Hwy & Lake Hughes	3.06%	SCAG
2	Between Lake Hughes & Parker	4.44%	HOT Lane SEIR
3	Between Parker & Hasley Canyon	3.54%	HOT Lane SEIR
4	I-5 Between Hasley Canyon & SR-126	2.45%	HOT Lane SEIR
5	I-5 Between Calgrove & SR-14	1.22%	HOT Lane SEIR

3.0 PROJECT DESCRIPTION

This section describes the project in terms of its transportation characteristics. Trip generation is summarized and the distribution of project trips on the adjoining roadway network is presented.

3.1 PROJECT OVERVIEW

The Northlake Specific Plan was approved in 1992 for a development consisting of approximately 4,000 residential dwelling units. The project as currently proposed consists of approximately 1,414 single family detached dwelling units, 1,341 condominium dwelling units and 345 senior adult attached housing (total of 3,100 dwelling units). In addition to residential dwelling units, the project also includes non-residential uses estimated to consist of approximately 67,100 square feet of neighborhood commercial, approximately 304,900 square feet industrial park, a middle school (approximately 1,200 students), a 15-acre sports park, a 10-acre developed park and a fire station. VTTM 73336 represents a portion of the Northlake Project. The project site plan was presented in Section 1.1 (see Figure 1-2).

The project site would be accessed via an extension of the existing Ridge Route Road. Since the project area is currently vacant, a complete network of roadways will be constructed within the site to serve the needs of the project generated traffic.

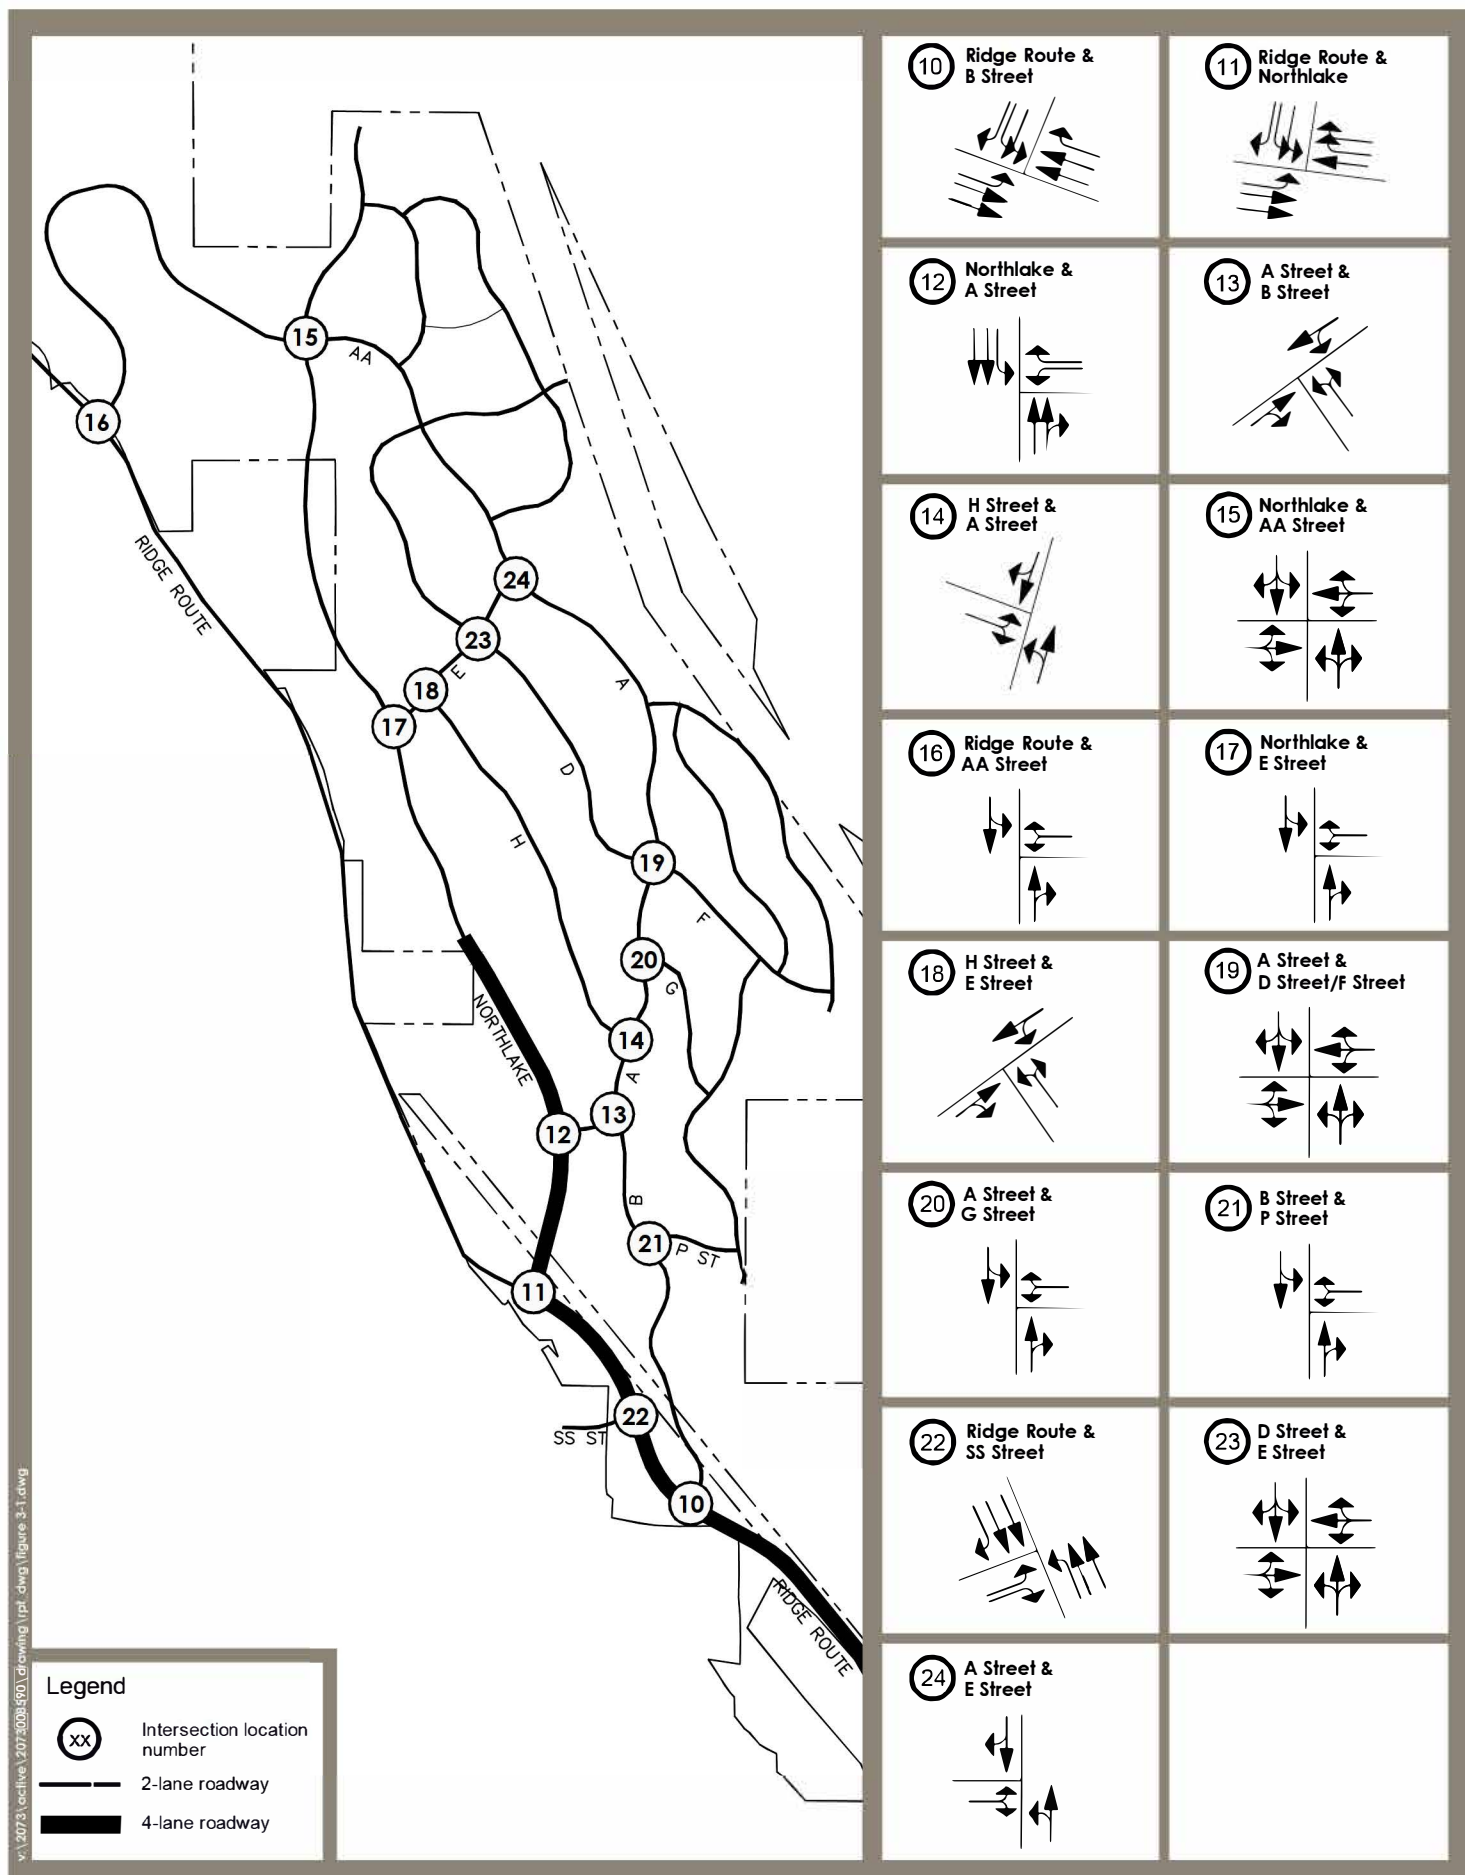

Intersection lane geometry for the project site has been developed based on peak hour turning movement forecasts presented in the subsequent sections, and is illustrated in Figure 3-1.

3.2 PROJECT TRIP GENERATION

The project consists of a variety of land uses as described in the preceding section. For the purpose of the traffic study, these land uses have been categorized based on the land use categories used by the Santa Clarita Valley Consolidated Traffic Model (SCVCTM), the County of Los Angeles Department of Public Works Traffic Impact Analysis Guidelines (see Reference 3 in Section 1.6), and industry standards such as the Institute of Transportation Engineers (ITE) Trip Generation Manual (see Reference 1 in Section 1.6). The specific trip rates used for this analysis are listed in Table 3-1. Note that for the Sports Park land use category, a comparison was made between the Brea Sports Park Traffic Study (see Reference 12 in Section 1.6) and the City of San Diego Trip Generation Manual (see Reference 14 in Section 1.6), Developed Park land use category. It was determined that using the trip rate from the Brea Sports Park Traffic Study would be more conservative than using the trip rate from City of San Diego Trip Generation Manual.

Detailed trip generation estimates based on the trip generation rates referenced above are provided in Table 3-2. As shown, the project is estimated to generate approximately 35,500 average daily tripends, with approximately 2,900 tripends during the AM peak hour, and approximately 3,500 tripends during the PM peak hour.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Project Description
September 2016

The residential units of the project are forecast to generate approximately 25,400 ADT with approximately 1,850 tripends in the AM peak hour (1,480 outbound) and approximately 2,480 tripends in the PM peak hour (1,570 inbound). The non-residential uses (i.e., neighborhood commercial and industrial) are forecast to generate approximately 8,200 ADT with approximately 370 tripends in the AM peak hour (280 inbound) and 830 tripends in the PM peak hour (500 outbound).

The middle school site will serve students from the Northlake development and from outside the Specific Plan area. The middle school (approximately 1,200 students) is projected to generate approximately 1,940 ADT with approximately 650 tripends in the AM peak hour and approximately 190 tripends in the PM peak hour.

The location of the project and the on-site commercial and institutional uses (i.e., retail, existing Northlake Elementary School and proposed middle school) encourages a degree of local trip making. Table 3-3 shows the estimated ADT and peak hour trips separated by land use and both internal and external trip components.

Overall, around 19 percent of the daily trips generated (as measured by tripends) are estimated to be internal and 81 percent are external trips. The net volume of trips generated by the project is derived by combining the amount of internal trips (two on-site project tripends) with the amount of external trips (one on-site project tripend). As shown in Table 3-4, the project generates a net total of 33,241 trips when taking into account the project's 19 percent internal capture rate.

The internal capture rate was derived by first determining the amount of school traffic that would be captured by the residential uses on-site. A nominal amount of internal capture was assumed during the AM peak hour for the commercial and industrial uses. After deducting these on-site trips from residential uses, the remainder represents the net volume of external (off-site) trips. The same was done for the PM peak hour, but with opposite directionality. This approach produced a conservative estimate of external trips for the model to distribute to the off-site study area.

3.3 PROJECT TRIP DISTRIBUTION

The project is anticipated to buildout in over a period of 10 to 15 years. Traffic patterns for the project in relation the surrounding region were estimated for a year 2028 time frame to understand the relationship between the project and the surrounding region in this long-range buildout context. The distribution of project-generated trips was derived by the SCVCTM.

The SCVCTM is a computerized travel demand model that utilizes a sophisticated trip distribution function to derive the distribution of vehicle trips, and which has previously been calibrated to the existing conditions of the Santa Clarita Valley. Production and attraction trip data is generated by the model based on five separate trip purposes, and trip distribution patterns are then derived by the model. As a final step, the model assigns these trips to the roadway network based on the derived distribution patterns.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Project Description
September 2016

Table 3-4 Project Trip Summary

Total Tripends	External Trips ¹	Internal Trips ²	Total Trips
35,477	28,768	3,839	32,607
¹ One tripend on-site			
² Two tripends on-site			

Illustrations of the project's trip distribution patterns are provided in Figure 3-2. 19 percent of the project's trip generation remains internal to the project site and the remaining 81 percent are distributed along Ridge Route Road south of the project site. Of those, 3 percent are generated by the adjacent neighborhood (north of the Lake Hughes Road intersection) and the remaining 78 percent are distributed to the Castaic area roadway system. 47 percent are distributed to Lake Hughes Road west of Ridge Route Road, and 31 percent remain on Ridge Route Road south of Lake Hughes Road.

3.4 PROJECT TRAFFIC FORECASTS

The following section presents project only traffic data, first for the on-site roadway system, followed by the local roadway system and then the freeway system. As noted in the previous section, the SCVCTM was used to calculate the distribution of trips to and from the project site. For on-site intersections, the site-specific Northlake Traffic Model was used to forecast future traffic volumes within the project.

3.4.1 On-Site Roadway System

Forecast ADT volumes based on the project for buildout within the project site are illustrated in Figure 3-3. Forecast peak hour turning movement volumes for buildout conditions are illustrated in Figure 3-4 and Figure 3-5 for the AM peak hour and PM peak hour, respectively.

The peak hour traffic volumes referenced above were utilized to derive the intersection lane configurations for the on-site intersections referenced in Figure 3-1. Intersection capacity analysis based on these lanes and the forecast peak hour volumes is summarized in Table 3-5. As shown, each of the on-site project intersections is anticipated to operate at LOS D or better for buildout conditions, with the majority of intersections operating at no worse than LOS B. Detailed LOS calculation worksheets for each intersection are provided in Appendix B.

The Northlake Specific Plan, approved in 1991, showed a need to either widen Ridge Route Road to a 6-lane Major Arterial, or build a secondary access. Due to the decreased dwelling unit total, in comparison to the Specific Plan, the findings of this analysis show that neither the widening of Ridge Route Road to a 6-lane Major Arterial, or build a secondary access is needed.

A traffic signal warrant analysis for on-site intersections is provided in Section 5.1.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Project Description
September 2016

3.4.2 Off-Site Local Roadway System & Freeway System

Project generated ADT volumes are provided in Figure 3-6 for the local roadway system and freeway system. This distribution of project trips corresponds to the project's buildout horizon year of 2028 (see previously discussed Figure 3-2 for distribution percentages).

The corresponding project generated peak hour turning movement volumes are provided in Figure 3-7 and Figure 3-8 for the AM peak hour and PM peak hour, respectively.

3.5 ON-SITE BICYCLE FACILITIES

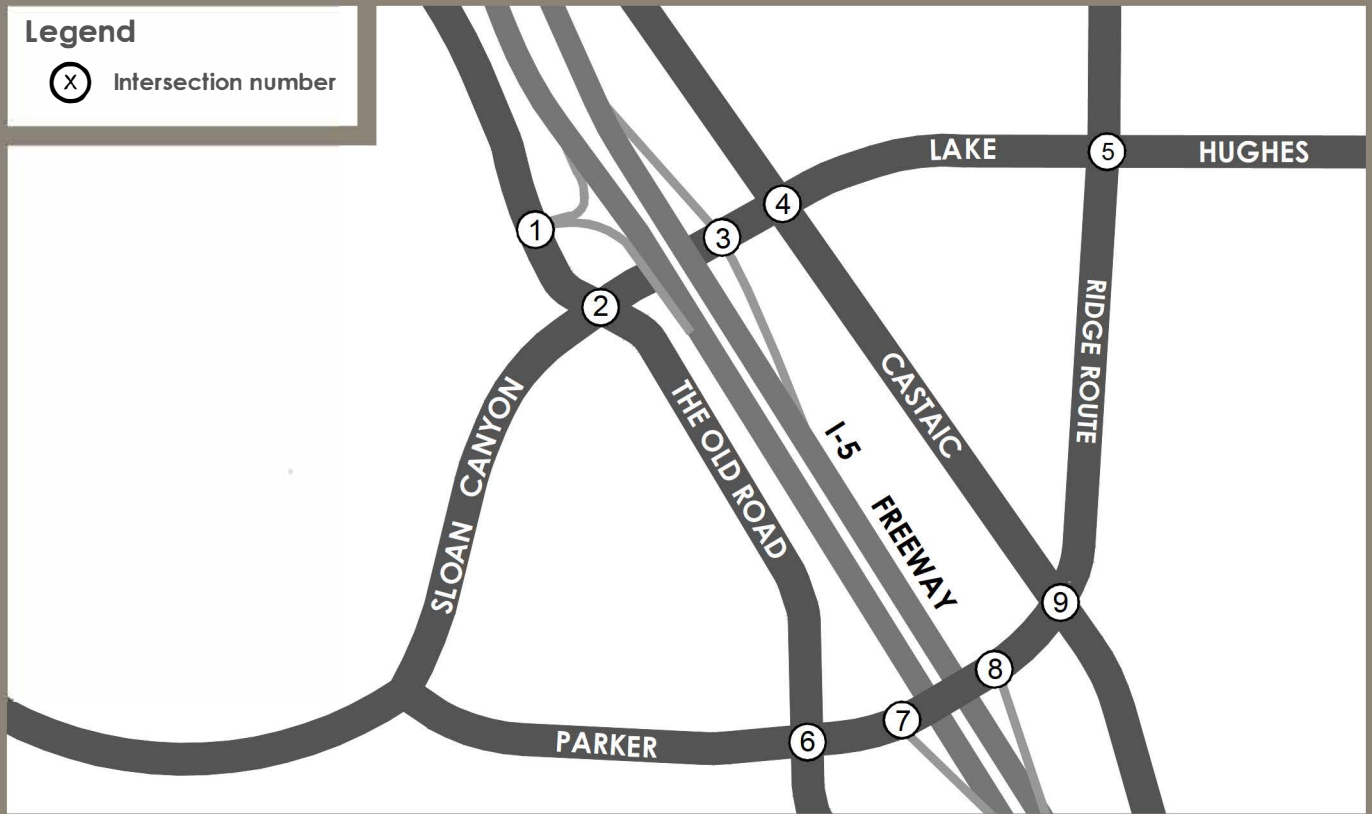

The project would include a network of bicycle facilities, trails and sidewalks to accommodate pedestrians and encourage non-motorized active transportation.

Bicycle facilities would be made available along Ridge Route Road, Northlake Boulevard, A Street and B Street. A Class 1 bike lane is proposed along the west side of Ridge Route Road from Northlake Hills Elementary School to the Ridge Route Road and Northlake Boulevard intersection, where it would continue along Northlake Boulevard. Class II bike lanes are proposed along B Street and A Street. The proposed bicycle facilities are illustrated in Figure 3-9.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Impact Analysis
September 2016

4.0 IMPACT ANALYSIS

This chapter addresses the traffic impacts of the proposed project on the surrounding circulation system. Future conditions with project traffic and with traffic from cumulative projects are described in the following sections. Project impacts and cumulative impacts are identified using the criteria outlined in Chapter 1.0.

4.1 EXISTING PLUS PROJECT ANALYSIS

The existing plus project scenario depicts the addition of project generated traffic to existing traffic conditions. ADT forecasts for existing plus project conditions are shown in Figure 4-1. In all cases, the existing roadway system has been used for this analysis as a baseline to determine project impacts.

4.1.1 Existing plus Project Impact Analysis – Local Roadway System

The peak hour intersection data can be found in Figure 4-2 and Figure 4-3 for the AM peak hour and PM peak hour, respectively. Table 4-1 gives the corresponding ICU values and LOS results, which provides a comparison between the existing and with project conditions.

Table 4-1 Existing plus Project ICU and LOS Summary

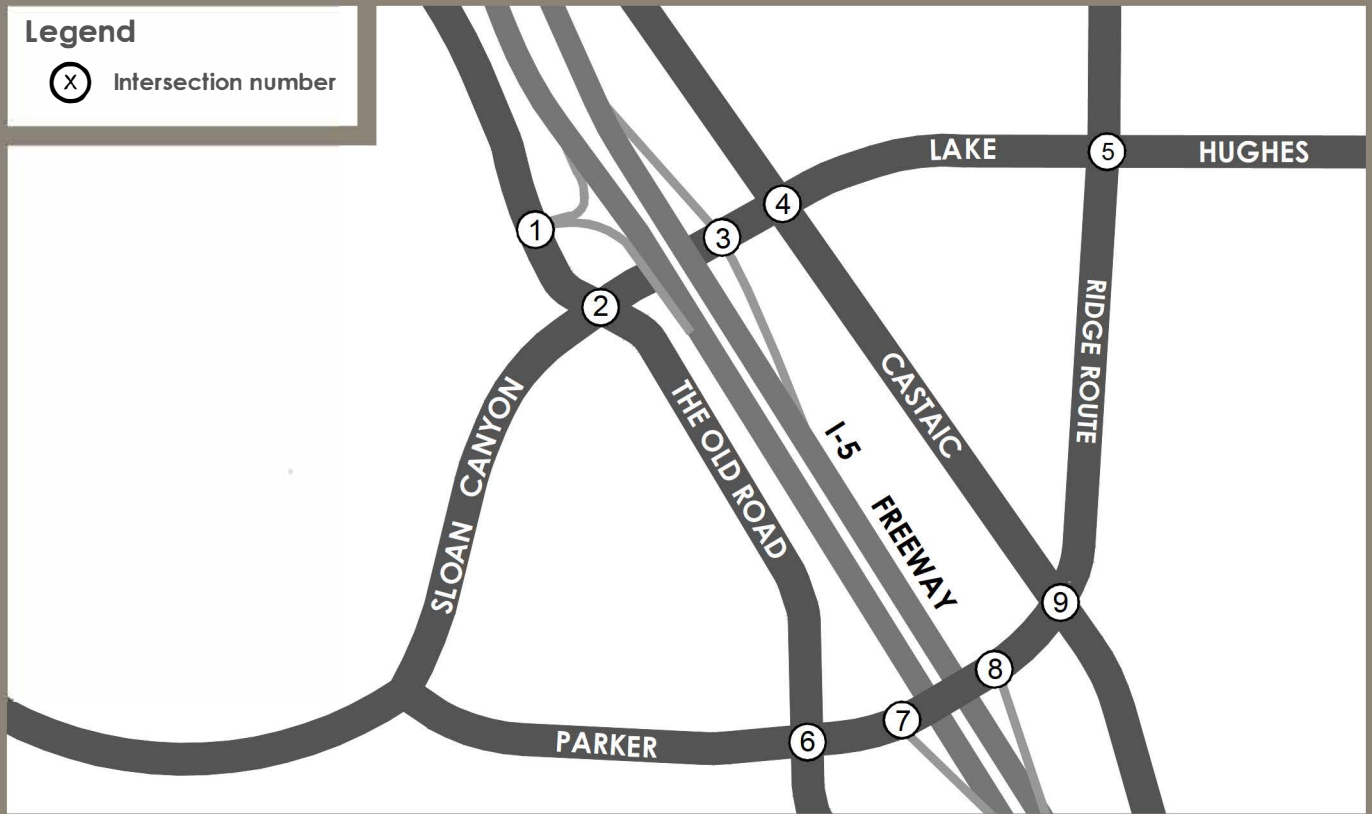

4.9Location	Existing				Existing plus Project				Difference

Intersection Turning Lane Movement Volumes
AM Peak Hour - Existing Plus Project

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Impact Analysis
September 2016

Table 4-1 shows that under existing plus project conditions, three intersections are shown to be significantly impacted by the project in either the AM or PM peak hour:

5. Ridge Route Road & Lake Hughes Road (County)
7. I-5 SB On Ramp & Parker Road (County/Caltrans)
8. I-5 NB Off Ramp & Ridge Route Road (County/Caltrans)

4.1.2 Existing plus Project Mitigation – Local Roadway System

The results of the ICU and LOS analysis show that 3 intersections are significantly impacted by the proposed project under existing plus project conditions. Table 4-2 summarizes the potential improvements that mitigate the impacts at these locations and Table 4-3 summarizes the resulting ICUs and LOS with this mitigation.

Table 4-2 Existing plus Project Mitigation Measures for Project Impacts

Location	Jurisdiction	Mitigation
5. Ridge Route and Lake Hughes	County	Install traffic signal and include a southbound right-turn overlap phase. Restripe eastbound approach to include two left-turn lanes, one through lane and one right-turn lane. In the northbound direction, add one right-turn lane. In the westbound direction, add a dedicated right-turn lane.
7. I-5 SB On Ramp & Parker	County/Caltrans	Reconstruct bridge to 4 lanes. Install Traffic Signal. At intersection add one eastbound right-turn lane and two westbound left-turn lanes.
8. I-5 NB Off Ramp & Ridge Route	County/Caltrans	Reconstruct bridge to 4 lanes. Install Traffic Signal. At intersection add a second northbound right-turn lane and add a second westbound through lane.

Table 4-3 Existing plus Project ICU and LOS Summary – With Mitigation

8. I-5 NB Off Ramp & Ridge Route	0.46	A	0.55	A	0.50	A	0.61	B	0.04	0.06

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Impact Analysis
September 2016

With the improvements described above, the Ridge Route at Lake Hughes intersection would be mitigated to a desirable LOS D, consistent with the threshold established in the Los Angeles County General Plan and the Santa Clarita Valley Area Plan, One Valley One Vision. However, the intersection would not be fully mitigated to the LOS C threshold utilized in the County's Traffic Impact Analysis Guidelines. Improvements to fully mitigate the intersection to the LOS C threshold were considered, such as a southbound free-right turn lane, however was determined to not be geometrically feasible. Another improvement that was considered to achieve the LOS C threshold was to convert an existing southbound through lane to a shared through/right turn lane. However, the lane conversion would not be desirable when considering the crosswalks and pedestrians.

Mitigation measures for existing plus project conditions would require that the Parker Road interchange be reconstructed in order to accommodate the volume of traffic with the project. The ultimate buildout of the bridge is anticipated to have six lanes, four in the westbound direction and two in the eastbound direction. The ultimate configuration is not needed to mitigate the impacts under existing plus project conditions. Therefore, a phased improvement to the bridge consisting of 4-lanes, three lanes in the westbound direction and one lane in the eastbound direction, would be adequate to mitigate the project's impacts.

4.2 CUMULATIVE CONDITIONS ANALYSIS

Year 2028 cumulative conditions (i.e., with approved, planned, and pending projects reasonably anticipated to be in place within this horizon) have been derived as previously discussed in Section 2.2.3. The 2028 horizon year includes the future roadway system described in Section 2.2.1.

4.2.1 Cumulative Conditions – Local Roadway System

Year 2028 cumulative conditions ADT volumes with the project are provided in Figure 4-4. The corresponding cumulative conditions with project peak hour turning movement volumes are provided in Figure 4-5 and Figure 4-6 for the AM peak hour and PM peak hour, respectively.

4.2.2 Cumulative Conditions Impact Analysis – Local Roadway System

Peak hour ICU values and LOS that correspond with the cumulative conditions with project referenced above can be found in Table 4-4 which provides a comparison between the with project conditions and existing conditions. The criteria used to identify significant impacts are discussed in Section 1.4.

8. I-5 NB Off Ramp & Ridge Route	0.46	A	0.55	A	1.09	F	1.44	F	0.63	0.89
9. Castaic & Ridge Route	0.33	A	0.41	A	0.69	B	0.84	D	0.36	0.43
Bold – denotes significant impact (See Table 1-5 for impact criteria)										

The table indicates that under cumulative conditions with the project, the following intersections are forecast to be significantly impacted by the project:

1. The Old Road & I-5 SB Ramps (County/Caltrans)
3. I-5 NB Ramps & Lake Hughes Road (County/Caltrans)
5. Ridge Route Road & Lake Hughes Road (County)
7. I-5 SB On Ramp & Parker Road (County/Caltrans)
8. I-5 SB Off Ramps & Ridge Route Road (County/Caltrans)
9. Castaic Road & Ridge Route Road (County)

4.2.3 Cumulative Conditions Mitigation – Local Roadway System

Roadway improvements have been identified to mitigate the project impacts identified in the previous section. Table 4-5 lists the identified mitigation measures to address project impacts in the cumulative conditions with project setting.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Impact Analysis
September 2016

Table 4-5 Off-Site Mitigation Measures for Project Impacts – Cumulative Conditions (With Project)

Location	Jurisdiction	Mitigation
1. The Old Road & I-5 SB Ramps	County/ Caltrans	Install traffic signal with a northbound right-turn overlap phasing.
3. I-5 NB Ramps & Lake Hughes	County/ Caltrans	Install traffic signal. Widen off ramp to add one left-turn lane and restripe center lane to a shared left/through/right turn lane.
5. Ridge Route and Lake Hughes	County	Install traffic signal and include southbound right-turn overlap phasing. Restripe eastbound approach to include two left-turn lanes, one through lane and one right-turn lane. In the northbound direction, add one right-turn lane. In the westbound direction, add a dedicated right-turn lane.
7. I-5 SB On Ramp & Parker	County/ Caltrans	Reconstruct bridge to 4 lanes. Install traffic signal. At intersection add one eastbound right-turn lane and two westbound left-turn lanes.
8. I-5 NB Off Ramp & Ridge Route	County/ Caltrans	Reconstruct bridge to 4 lanes. Install traffic signal. At intersection add a second northbound right-turn lane and add a second and third westbound through lane.
9. Castaic & Ridge Route	County	Install traffic signal. Restripe northbound approach to include two left-turn lanes, one through lane and one right-turn lane. In the eastbound direction, stripe a right-turn lane. Signal modification to include southbound right-turn overlap phasing.

The identified impacts are cumulative impacts and, therefore, the project is responsible for its fair-share of the costs of the identified mitigation measures. Participation in the Castaic Bridge and Major Thoroughfare District will satisfy the project's fair share obligations. Each of the identified improvements would fully mitigate the project's significant impact, as shown in Table 4-6, with the exception of the Ridge Route at Lake Hughes intersection. With the improvements described above, the Ridge Route at Lake Hughes intersection would be mitigated to a desirable LOS C (0.78), better than the LOS D threshold established in the Los Angeles County General Plan and the Santa Clarita Valley Area Plan, One Valley One Vision. However, the intersection would not be fully mitigated to the LOS C (0.74) threshold utilized in the County's Traffic Impact Analysis Guidelines. Improvements to fully mitigate the intersection to the LOS C threshold were considered, such as a southbound free-right turn lane, however was determined to not be geometrically feasible.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Impact Analysis
September 2016

As can be seen in the previously referenced Table 4-6 and Table 4-7, the I-5 NB Ramp Off Ramp at Ridge Route Road intersection would operate at a LOS D under cumulative conditions with the project and mitigation using the ICU methodology, but would operate at a low LOS C using the HCM methodology. The acceptable LOS for a Caltrans intersection is LOS D, therefore the intersection would be fully mitigated.

The Ridge Route at Lake Hughes intersection would be mitigated to a desirable LOS C (0.78), better than the LOS D threshold established in the Los Angeles County General Plan and the Santa Clarita Valley Area Plan, One Valley One Vision. However, the intersection would not be fully mitigated to the LOS C (0.74) threshold utilized in the County's Traffic Impact Analysis Guidelines. Improvements to fully mitigate the intersection to the LOS C threshold were considered, such as a southbound free-right turn lane, however was determined to not be geometrically feasible.

4.2.4 Cumulative Conditions (No Project) Impact Analysis – Local Roadway System

To derive cumulative conditions no project ADT volumes, the SCVCTM was run with no land uses in the project traffic zone (except for related projects that fall inside the zone). In this process, trips from non-project zones that would otherwise interact with the project are redistributed to other zones (both internal and cordon zones).

ADT volumes for the local Castaic community for the cumulative condition no project scenario is provided in Figure 4-7. The corresponding no project peak hour turning movement volumes are provided in Figure 4-8 and Figure 4-9 for the AM peak hour and PM peak hour, respectively. Peak hour ICU values and LOS that correspond with the cumulative conditions traffic forecasts referenced above can be found in Table 4-8 which provides a comparison between no project condition and with project conditions.

Table 4-8 ICU Summary – Cumulative Conditions No Project and With Project

Location	Cumulative No Project				Cumulative with Project				Increase	
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour		AM	PM
	ICU	LOS	ICU	LOS	ICU	LOS	ICU	LOS		
1. The Old Road & I-5 SB Ramps	0.50	A	0.58	A	0.78	C	0.62	B	0.28	0.04
2. The Old Road & Sloan/Lake Hughes	0.43	A	0.52	A	0.73	C	0.73	C	0.30	0.21
3. I-5 NB Ramps & Lake Hughes	0.49	A	0.65	B	0.66	B	0.77	C	0.17	0.12
4. Castaic & Lake Hughes	0.36	A	0.40	A	0.53	A	0.53	A	0.17	0.13
5. Ridge Route and Lake Hughes	0.40	A	0.25	A	0.92	E	1.03	F	0.52	0.78

4.3 FREEWAY IMPACT ANALYSIS

The following section discusses an impact analysis conducted for the I-5 freeway that provides the regional travel to and from the project area

4.3.1 Existing plus Project Impact Analysis – Freeway System

Project generated traffic was added onto the existing freeway system. Existing AADT freeway volumes with the project trips are shown in Table 4-11.

Table 4-11 Freeway AADT Summary – Existing Plus Project

No.	Segment	Without Project	With Project
1	I-5 Between Templin Hwy & Lake Hughes	70,000	71,000
2	I-5 Between Lake Hughes & Parker	71,000	80,000
3	I-5 Between Parker & Hasley Canyon	89,000	108,000
4	I-5 Between Hasley Canyon & SR-126	109,000	124,000
5	I-5 Between Calgrove & SR-14	193,000	197,000
AADT – Annual Average Daily Traffic			

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Impact Analysis
September 2016

The AM and PM peak hour freeway volumes for existing plus project conditions are shown in Table 4-13. As can be seen in Table 4-13, the project increment exceeds the 0.02 CMP threshold at the following freeway segments:

- I-5 NB Between Lake Hughes Road & Parker Road (AM & PM)
- I-5 NB Between Parker Road & Hasley Canyon (AM & PM)
- I-5 SB Between Lake Hughes Road & Parker Road (AM & PM)
- I-5 SB Between Parker Road & Hasley Canyon (AM & PM)

However, although the project increment exceeds the 0.02 threshold at the above referenced freeway segments, the other criteria for the project to cause a significant impact is for the freeway segment to operate deficiently (i.e., worse than LOS E). All segments with the project operate at LOS C or better (V/C less than or equal to 0.71). Hence, the project does not cause a significant impact.

4.3.2 Cumulative Conditions Impact Analysis – Freeway System

As previously discussed in Section 2.2.4., future freeway forecasts were derived from multiple sources. Year 2028 cumulative conditions AADT volumes with and without the project are shown in Table 4-12.

Table 4-12 Freeway AADT Summary – 2028 Cumulative Conditions

No.	Segment	Without Project	With Project
1	I-5 Between Templin Hwy & Lake Hughes	95,000	96,000
2	I-5 Between Lake Hughes & Parker Road	103,000	109,000
3	I-5 Between Parker Road & Hasley Canyon	115,000	128,000
4	I-5 Between Hasley Canyon & SR-126	143,000	153,000
5	I-5 Between Calgrove & SR-14	224,000	226,000
AADT – Annual Average Daily Traffic			

Freeway lanes and capacities are shown in Table 4-14, along with directional peak hour volumes and the resulting V/C ratios and project increments.

As can be seen in Table 4-14 while segments on the I-5 freeway from the Lake Hughes interchange to south of Parker Road interchange contain a project increment exceeding 0.02, the freeway segments operate better than an LOS E (V/C less than or equal to 1.00). Therefore, these segments are not considered to be significantly impacted by the project.

4.4 CONGESTION MANAGEMENT PROGRAM ANALYSIS

The Los Angeles County Congestion Management Program (CMP) requires that a proposed development address two major subject areas with respect to traffic impacts. These are the project's impacts on the CMP highway system and the project's impacts on the local and regional transit systems.

4.4.1 CMP Highway System

According to the CMP guidelines, the geographical area to be examined in a CMP traffic impact analysis (TIA) consists of the CMP monitoring locations that meet the following criteria:

- CMP intersections where the proposed project will add 50 or more trips during either the AM or PM weekday peak hours (determined based on adjacent street traffic).
- Mainline freeway locations where the project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.

There are no CMP intersections located within the Castaic community, with the nearest two locations being Chiquito Canyon Road/SR-126 (8.5 miles south), Valencia Boulevard/Magic Mountain Parkway (9 miles south) and Railroad Avenue/Lyons Avenue (12 miles south).

The number of trips to and from the proposed Project is forecast to include more than 50 peak hour trips at the Chiquito Canyon Road/SR-126 intersection (70 peak hour trips). The Valencia Boulevard/Magic Mountain Parkway intersection and the Railroad Avenue and Lyons Avenue intersection have less than 50 peak hour trips. Therefore, a CMP analysis of Chiquito Canyon Road/SR-126 intersection is required since the peak hour volume of the project trips exceeds 50.

The intersection LOS methodology specified by the CMP is identical to the methodology utilized by the County of Los Angeles Department of Public Works and this traffic study for County intersections. Table 4-15 summarizes the results of the intersection LOS analysis for the CMP intersection. As shown, the intersection would operate at an unacceptable LOS F before the addition of project traffic. The table shows that the project would not result in a significant impact the intersection and therefore would not require mitigation measures. While the project does not require mitigation measures at this intersection, the "Westside Bridge and Major Thoroughfare Construction Fee District Report" include improvements of the Chiquito Canyon and SR-126 intersection that would improve the intersection LOS from an LOS F to a LOS C in the AM peak hour and LOS D in the PM peak hour.

Table 4-15 ICU Summary - CMP Methodology

Location	AM Peak Hour		PM Peak Hour	
	ICU	LOS	ICU	LOS
110. Chiquito Canyon & SR-126				
- Existing Conditions	0.35	A	0.39	A
- Cumulative Conditions (2028) without Project	1.78	F	1.70	F
- Cumulative Conditions (2028) with Project	1.78	F	1.70	F
- Cumulative Conditions with Phased Plan Improvements ¹	0.78	C	0.82	D
¹ – "Westside Bridge and Major Thoroughfare Construction Fee District Report," Los Angeles County Department of Public Works, February 2011.				

With respect to the mainline freeway, the CMP monitoring locations nearest to the project site are the following:

- I-5 north of SR-126
- I-5 north of SR-14

As shown in Table 4-16, the proposed project is forecast to add 150 or more peak hour trips to both of these monitoring locations. At the segment of I-5 north of the SR-126 the project contributes a maximum of 772 vehicles per hour in the northbound direction and a maximum of 756 vehicles per hour in the southbound direction. At the I-5 segment north of SR-14, the project contributes a maximum of 182 vehicles per hour in the northbound direction and a maximum of 178 vehicles per hour in the southbound direction. The next two closest CMP freeway monitoring locations do not meet the CMP analysis criteria since the maximum number of project trips at those locations is less than 150 vehicles per hour during the peak hour. Freeway segment V/C at these CMP freeway segments are shown in the previously referenced Table 2-10 in Section 4.2.4.

Table 4-16 Freeway Volume Summary – CMP Monitoring Locations

Segment	Peak Hour Project Volumes			
	Northbound		Southbound	
	AM	PM	AM	PM
I-5 between Hasley Cyn & SR-126	390	772	756	553
I-5 between Calgrove & SR-14	92	182	178	130
Bold – exceeds CMP impact analysis criteria of 150 veh/hour				

4.4.2 Local and Regional Transit Systems

Another component of the CMP transportation impact analysis is a review of transit impacts; public transit in the Santa Clarita Valley includes both bus and commuter rail service. The CMP review is to include evidence that transit operators received the Notice of Preparation, identification of existing transit services near the project, estimation of the number of project trips assigned to transit, information on facilities and/or programs that will encourage public transit use, and an analysis of project impacts on transit service.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Impact Analysis
September 2016

With respect to the Notice of Preparation, the project's environmental documentation will include evidence that the applicable transit operators (i.e., City of Santa Clarita Transit, Metro, and Metrolink) received the Notice of Preparation. Section 2.1.3 provides a summary of the existing transit services in the vicinity of the Project Site.

As to the estimated number of project transit trips, buildout of the project is forecast to generate approximately 35,477 ADT. To estimate the number of project trips that would use public transit, the number of project vehicle trips is multiplied by an occupancy factor (1.4), which is provided in the CMP, to determine total person trips. The number of person trips is then multiplied by the applicable MTA factor (3.5%), which is also provided in the CMP, to determine the number of transit trips generated by the project (presuming that SCT extends the existing transit routes into the site). Based on this calculation, the project would generate approximately 1,700 daily transit trips, as shown in Table 4-17.

Table 4-17 Transit Trip Summary

	Time Period		
	Daily	AM Peak Hour	PM Peak Hour
Vehicle Trips	35,477	2,870	3,500
Person Trips ¹	49,668	4,018	4,900
Factor to Transit Trips	3.5%	3.5%	3.5%
Total Transit Trips	1,738	141	172
¹ Person Trips = Vehicle Trips x 1.4			
Sources: Congestion Management Program for Los Angeles County, 2002, 2004, and 2010.			

With respect to the project's impacts on transit service, while the County does not have LOS standards applicable to future development such as the proposed project, the demand for transit service that would result from the project (approximately 140 to 170 peak hour trips as shown in the previously referenced (Table 4-17), has the potential to impact transit services.

The project would facilitate the use of public transit by providing areas designated for bus stops in accordance with County standards and transit provider requirements. It is anticipated that, over time, the local bus service will expand as additional development occurs within the valley. Meanwhile, the current transit arrangement is anticipated to continue to serve local residents of the area, connecting residential areas with employment and commercial centers.

With respect to commuter rail, Metrolink, governed by the Southern California Regional Rail Authority (SCRAA), provides commuter rail service between the Antelope Valley and Downtown Los Angeles, and also links Ventura, Los Angeles, San Bernardino, Riverside, Orange, and San Diego counties with transfer service between the bus and rail systems. The Metrolink station closest to the project site is located along Soledad Canyon Road east of Bouquet Canyon Road in the City of Santa Clarita. A second Metrolink station is located along Railroad Avenue just south of Lyons Canyon Road. Long-range plans include a potential Metrolink extension along the SR-126 corridor

Impact Analysis
September 2016

4.5 PHASING ANALYSIS

This section presents the findings of a phasing analysis conducted for the project. The project is anticipated to be constructed in phases; the first phase includes VTTM 73336 and the second phase would be full buildout.

For purposes of the phasing analysis, various amounts of project development were tested. One scenario analyzed the following amounts of project development:

- 325 Single Family Residential Units
- 1,300 Multi-Family Residential Units
- 400 Multi-Family Residential Units

Note that the amount of project development listed above would accommodate VTTM 73336 as currently proposed. The following table summarizes the LOS based on the aforementioned amount of development:

Table 4-18 ICU and LOS Summary – Existing plus Project Phase I

Location	Existing				Existing plus Phase 1				Difference	
	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour		AM	PM
	ICU	LOS	ICU	LOS	ICU	LOS	ICU	LOS		
1. The Old Road & I-5 SB Ramps	0.41	A	0.39	A	0.64	B	0.42	A	0.23	0.03
2. The Old Rd & Sloan/Lake Hughes	0.34	A	0.36	A	0.57	A	0.45	A	0.23	0.09
3. I-5 NB Ramps & Lake Hughes	0.31	A	0.41	A	0.47	A	0.62	B	0.16	0.21
4. Castaic & Lake Hughes	0.31	A	0.37	A	0.47	A	0.55	A	0.16	0.18
5. Ridge Route and Lake Hughes	0.32	A	0.19	A	0.66	B	0.62	B	0.34	0.43
6. The Old Road & Parker	0.45	A	0.42	A	0.47	A	0.47	A	0.03	0.05
7. I-5 SB On Ramp & Parker	0.60	A	0.52	A	0.72	C	0.64	B	0.12	0.12
8. I-5 NB Off Ramp & Ridge Route	0.46	A	0.55	A	0.59	A	0.72	C	0.13	0.17
9. Castaic & Ridge Route	0.33	A	0.41	A	0.42	A	0.50	A	0.09	0.09

As shown in the above table, with this first phase of development, most intersections within the study area continue to operate at LOS B or better. The locations closest to being impacted are the on and off-ramp intersections at Ridge Route/Parker Road, which are forecast to operate at LOS C with a peak hour ICU of 0.72, but would not be significantly impacted by the first phase of development based on the County's significant impact criteria.

5.0 TRAFFIC SIGNAL WARRANT ANALYSIS

The following sections presents the results of traffic signal warrant analyses conducted for intersections within the project site (referred to here as on-site) as well as intersections in the local study area (referred to here as off-site).

5.1 ON-SITE TRAFFIC SIGNAL WARRANT ANALYSIS

A traffic signal warrant analysis was conducted for on-site intersections.

Traffic signal warrants are based on peak hour volumes as adopted by the Federal Highway Administration and Caltrans. For purposes of this analysis, on-site intersections along Ridge Route Road would have a speed limit greater than 40 mph. Therefore, the signal warrant analysis for intersections along Ridge Route Road would be based on the plotted data contained in the graph shown in Figure 5-1, which are for intersections where the posted speed on the major street is greater than 40 mph. Additionally, the southerly portion of Northlake Boulevard from Ridge Route Road to south of "E" Street would have a speed limit greater than 40 mph and therefore would also use the plotted data contained in the graph shown in Figure 5-1.

The remaining on-site roadways (not addressed above) would have speeds lower than 40 mph; therefore, the signal warrant analysis for the remaining on-site intersections is based on the plotted data contained in the graph shown in Figure 5-2, which are for intersections where the posted speed on the major street is lower than 40 mph.

The results of the traffic signal warrant analysis for the on-site intersections are shown in Table 5-1.

As shown in Table 5-1 the following intersections warrant signalization:

- 10. Ridge Route Road at B Street
- 11. Ridge Route Road at Northlake Boulevard
- 12. Northlake Boulevard at A Street
- 17. Northlake Boulevard at E Street
- 22. Ridge Route at SS Street

5.2 OFF-SITE TRAFFIC SIGNAL WARRANT ANALYSIS

A traffic signal warrant analysis was conducted for intersections within the local study area for Existing Conditions plus Phase I of the Project and for 2028 Cumulative Conditions that includes full buildout of the Project.

- AM peak hour Major Street Volume, Minor Street Volume
- PM peak hour Major Street Volume, Minor Street Volume

- ▲ Note: These curves are recommended for use in community less than 10,000 population or above 40 MPH on Major Street.
- ★ Note: 100 VPH applies as the lower threshold volume for a minor-street approach with two or more lanes, and 75 VPH applies as the lower threshold volume for a minor-street approach with one lane.

Source: MUTCD - Figure 4C-4

★ Note: 150 VPH applies as the lower threshold volume for a minor-street approach with two or more lanes, and 100 VPH applies as the lower threshold volume for a minor-street approach with one lane.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Traffic Signal Warrant Analysis
September 2016

For purposes of this traffic signal warrant analysis, Table 5-2 lists the speed limits assumed. The results of the traffic signal warrant analysis for 2028 Cumulative Conditions are summarized in Table 5-3 and the traffic signal warrant analysis for Existing plus Phase I of the Project are summarized in Table 5-4.

Per the request of the County, three additional off-site intersections were included in the signal warrant analysis; Ridge Route at Shadow Lake intersection, Ridge Route at Elk Ridge intersection, and Ridge Route at Castaic Lake intersection (labeled intersection 10 – 12 in Table 5-3, respectively).

Table 5-2 Speed Limits – Local Study Area

Roadway Description	Speed (mph)
Ridge Route Road north of Lake Hughes Road	40
Ridge Route Road south of Lake Hughes Road to I-5 Freeway	35
Lake Hughes Road	35
Castaic Road	35
Sloan Canyon Road	40
The Old Road north of I-5 SB Ramps	55
The Old Road from I-5 SB Ramps to Parker Road	45
Parker Road	40
Based on current posted speed limits	

Based on the results of the signal warrant analysis, 9 intersections would warrant a signal for 2028 Cumulative Conditions and 5 intersections would warrant a signal for Existing plus Phase I of the Project (see Table 5-5 for list of intersections). The traffic signals should be installed only when warranted by actual traffic counts.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Appendix A ICU Worksheet Off Site
September 2016

Appendix A ICU WORKSHEET OFF SITE

Peak hour intersection volume/capacity ratios are calculated by means of intersection capacity utilization (ICU) values. ICU calculations were performed for the intersections shown in Figure A-1.

The procedure is based on the critical movement methodology, and shows the amount of capacity utilized by each critical move. A "de-facto" right-turn lane is used in the ICU calculation for cases where a curb lane is wide enough to separately serve both through and right-turn traffic (typically with a width of 19 feet from curb to outside of through-lane with parking prohibited during peak periods). Such lanes are treated the same as striped right-turn lanes during the ICU calculations, but they are denoted on the ICU calculation worksheets using the letter "d" in place of a numerical entry for right-turn lanes.

The methodology also incorporates a check for right-turn capacity utilization. Both right-turn-on-green (RTOG) and right-turn-on-red (RTOR) capacity availability are calculated and checked against the total right-turn capacity need. If insufficient capacity is available, then an adjustment is made to the total capacity utilization value. The following example shows how this adjustment is made.

Example of Right-Turn Capacity Utilization For Northbound Right

1. Right-Turn-On-Green (RTOG)

If NBT is critical move, then:

$$\text{RTOG} = \text{V/C (NBT)}$$

Otherwise,

$$\text{RTOG} = \text{V/C (NBL)} + \text{V/C (SBT)} - \text{V/C (SBL)}$$

2. Right-Turn-On-Red (RTOR)

If WBL is critical move, then:

$$\text{RTOR} = \text{V/C (WBL)}$$

Otherwise,

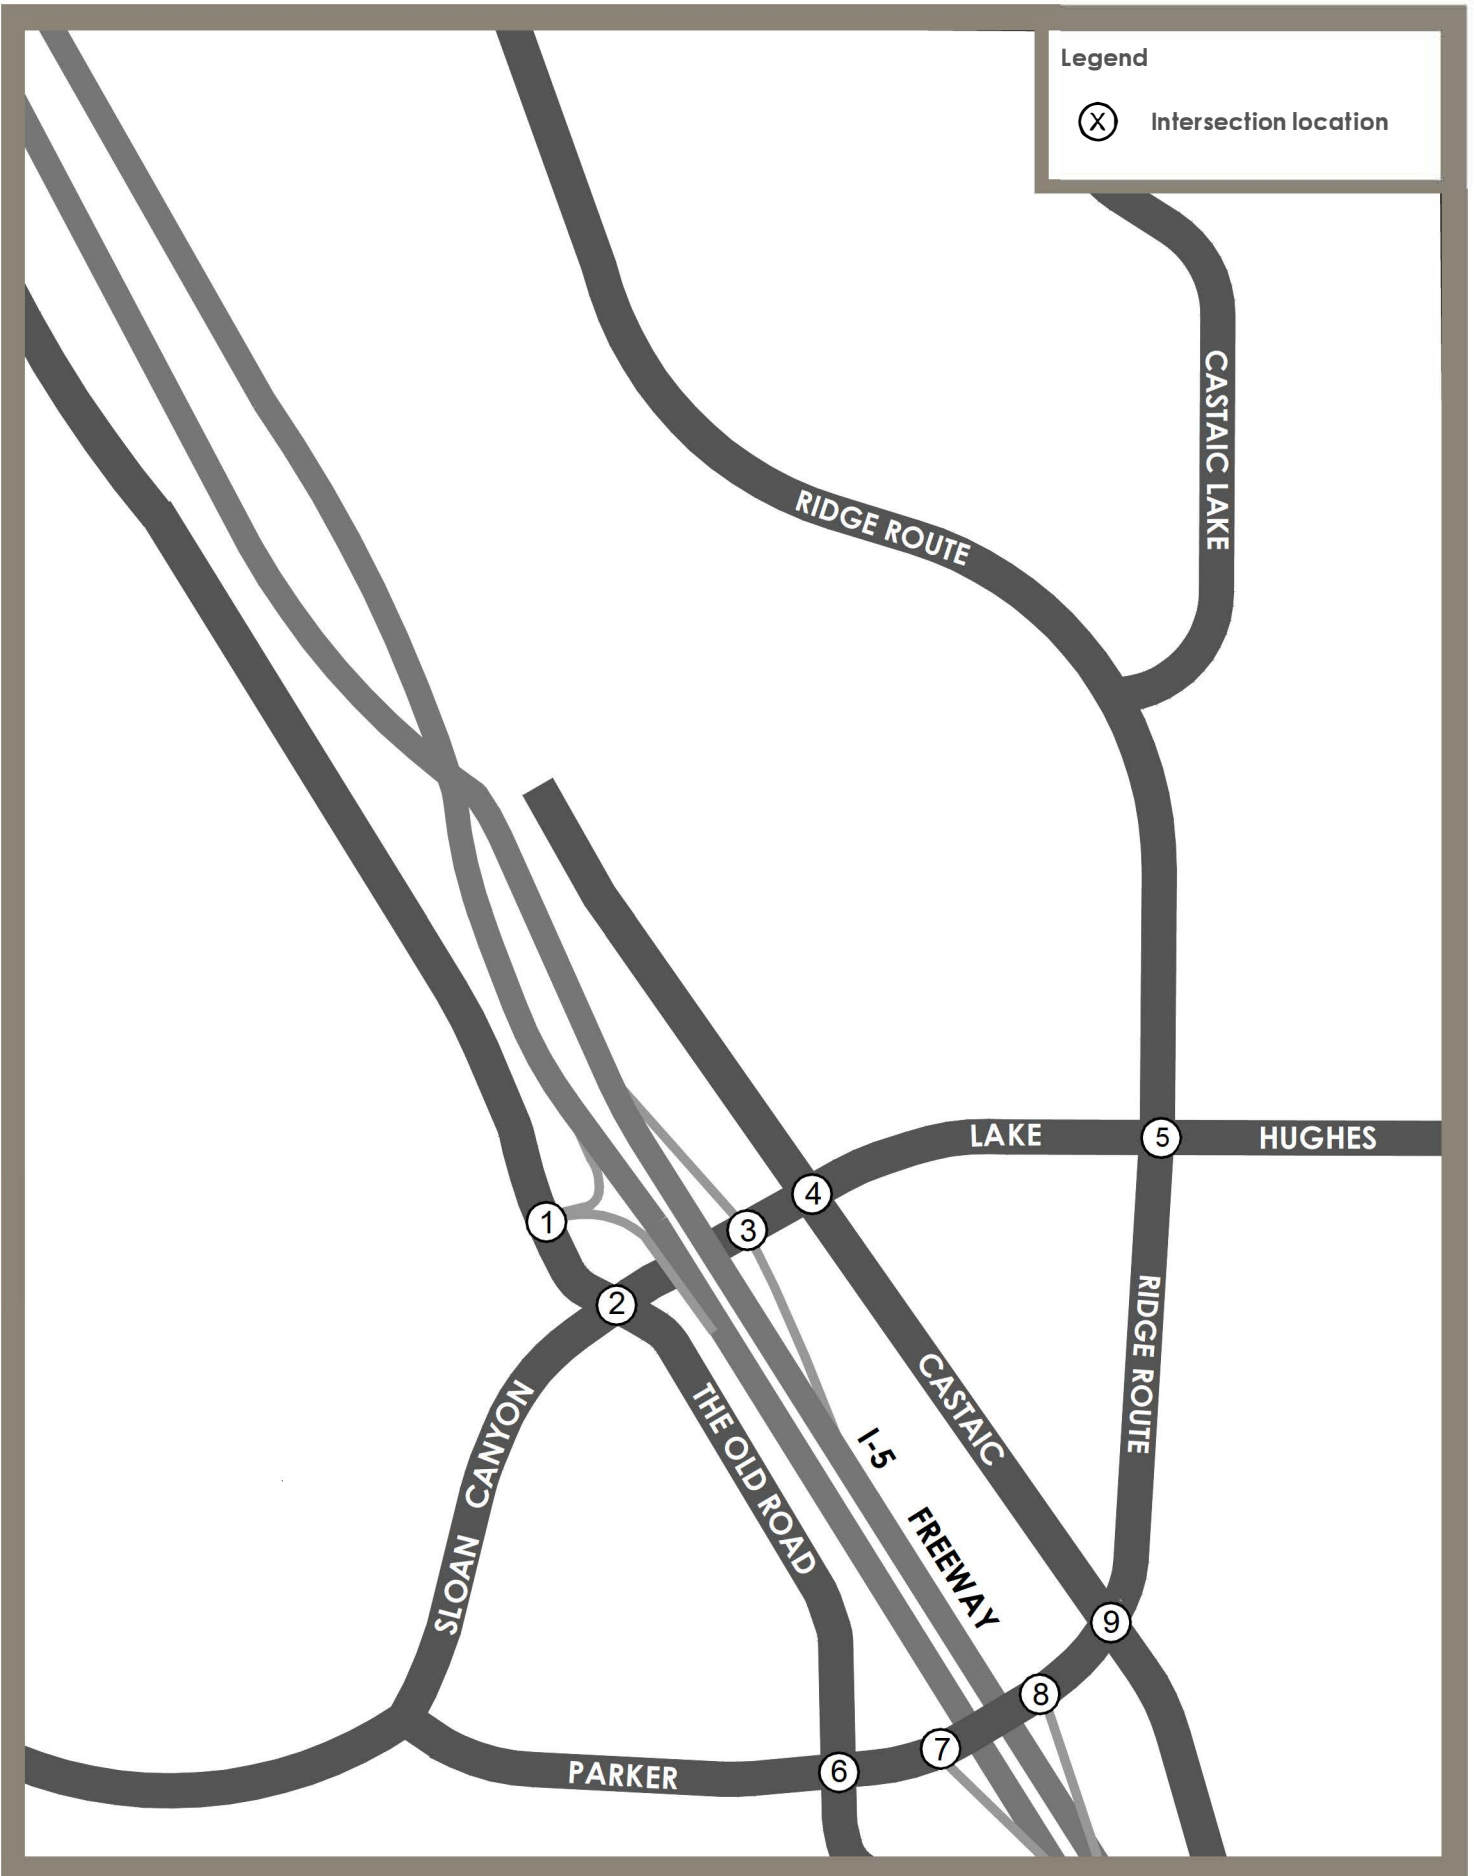

$$\text{RTOR} = \text{V/C (EBL)} + \text{V/C (WBT)} - \text{V/C (EBT)}$$

3. Right-Turn Overlap Adjustment

If the northbound right is assumed to overlap with the adjacent westbound left, adjustments to the RTOG and RTOR values are made as follows:

$$\text{RTOG} = \text{RTOG} + \text{V/C (WBL)}$$

$$\text{RTOR} = \text{RTOR} - \text{V/C (WBL)}$$

NORTHLAKE TRAFFIC IMPACT ANALYSIS

September 2016

4. Total Right-Turn Capacity (RTC) Availability For NBR

$$\text{RTC} = \text{RTOG} + \text{factor} \times \text{RTOR}$$

Where factor = RTOR saturation flow factor (typically 75%)

5. Right-turn Adjustment for ICU Calculation

Right-turn adjustment is then as follows: Additional ICU = V/C (NBR) - RTC

A zero or negative value indicates that adequate capacity is available and no adjustment is necessary. A positive value indicates that the available RTOR and RTOG capacity does not adequately accommodate the right-turn V/C, therefore the right-turn is essentially considered to be a critical movement. In such cases, the right-turn adjustment is noted on the ICU worksheet and it is included in the total capacity utilization value. When it is determined that a right-turn adjustment is required for more than one right-turn movement, the word "multi" is printed on the worksheet instead of an actual right-turn movement reference, and the right-turn adjustments are cumulatively added to the total capacity utilization value. In such cases, further operational evaluation is typically carried out to determine if under actual operational conditions, the critical right-turns would operate simultaneously, and therefore a right-turn adjustment credit should be applied.

Shared Lane V/C Methodology

For intersection approaches where shared usage of a lane is permitted by more than one turn movement (e.g., left/through, through/right, left/through/right), the individual turn volumes are evaluated to determine whether dedication of the shared lane is warranted to any one given turn movement. The following example demonstrates how this evaluation is carried out:

Example of Shared Lane Utilization for Shared Left/Through Lane

1. Average Lane Volume (ALV)

$$\text{ALV} = \frac{\text{Left-Turn Volume} + \text{Through Volume}}{\text{Total Left + Through Approach Lanes (including shared lane)}}$$

2. ALV for Each Approach

$$\text{ALV (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Lanes (including shared lane)}}$$

$$\text{ALV (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Lanes (including shared lane)}}$$

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Appendix A ICU Worksheet Off Site
September 2016

3. Lane Dedication is Warranted

If ALV (Left) is greater than ALV then full dedication of the shared lane to the left-turn approach is warranted. Left-turn and through V/C ratios for this case are calculated as follows:

$$V/C \text{ (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (including shared lane)}}$$

$$V/C \text{ (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Capacity (excluding shared lane)}}$$

Similarly, if ALV (Through) is greater than ALV then full dedication to the through approach is warranted, and left-turn and through V/C ratios are calculated as follows:

$$V/C \text{ (Left)} = \frac{\text{Left-Turn Volume}}{\text{Left Approach Capacity (excluding shared lane)}}$$

$$V/C \text{ (Through)} = \frac{\text{Through Volume}}{\text{Through Approach Capacity (including shared lane)}}$$

4. Lane Dedication is Not Warranted

If ALV (Left) and ALV (Through) are both less than ALV, the left/through lane is assumed to be truly shared and each left, left/through or through approach lane carries an evenly distributed volume of traffic equal to ALV. A combined left/through V/C ratio is calculated as follows:

$$V/C \text{ (Left/Through)} = \frac{\text{Left-Turn Volume} + \text{Through Volume}}{\text{Total Left + Through Approach Capacity (including shared lane)}}$$

This V/C (Left/Through) ratio is assigned as the V/C (Through) ratio for the critical movement analysis and ICU summary listing.

If split phasing has not been designated for this approach, the relative proportion of V/C (Through) that is attributed to the left-turn volume is estimated as follows:

If approach has more than one left-turn (including shared lane), then:

$$V/C \text{ (Left)} = V/C \text{ (Through)}$$

If approach has only one left-turn lane (shared lane), then:

$$V/C \text{ (Left)} = \frac{\text{Left-Turn Volume}}{\text{Single Approach Lane Capacity}}$$

If this left-turn movement is determined to be a critical movement, the V/C (Left) value is posted in brackets on the ICU summary printout.

NORTHLAKE TRAFFIC IMPACT ANALYSIS

Appendix A ICU Worksheet Off Site
September 2016

These same steps are carried out for shared through/right lanes. If full dedication of a shared through/right lane to the right-turn movement is warranted, the right-turn V/C value calculated in step three is checked against the RTOR and RTOG capacity availability if the option to include right-turns in the V/C ratio calculations is selected. If the V/C value that is determined using the shared lane methodology described here is reduced due to RTOR and RTOG capacity availability, the V/C value for the through/right lanes is posted in brackets.

When an approach contains more than one shared lane (e.g., left/through and through/right), steps one and two listed above are carried out for the three turn movements combined. Step four is carried out if dedication is not warranted for either of the shared lanes. If dedication of one of the shared lanes is warranted to one movement or another, step three is carried out for the two movements involved, and then steps one through four are repeated for the two movements involved in the other shared lane.
