Executive Summary

SCS Engineers was contracted by LSA Associates, Inc. to prepare a quantitative odor analysis (QOA) for the County of Orange, OC Waste & Recycling (OCWR) Department's proposed Increase in Maximum Daily Operations at the Prima Deshecha Landfill (proposed Project). The Prima Deshecha Landfill (Landfill) proposed Project would increase the maximum daily tonnage receipt capacity from 4,000 tons per day (TPD) to 8,000 TPD [18]. This increase is expected to take place gradually, reaching the proposed limit by the year 2030. The Project also includes construction and operation of a third flare for backup purposes.

The goal of this study was to analyze two Landfill operating scenarios for significant nuisance odor impacts at nearby sensitive receptors (e.g., residential areas):

1. Existing baseline; and
2. Post project.

To achieve this goal, representative odor concentrations and associated flow rates were used to estimate the potential emissions of odor from Landfill operations. The AERMOD atmospheric dispersion model was then used to predict odor concentrations at sensitive receptor locations surrounding the Landfill for comparison to a significant risk threshold for nuisance odor.

Odor concentration is defined as the dilution of an odor sample with odor-free air, at which point only 50% of an odor panel (or population) will detect or recognize the odor (e.g., per ASTM 679-04 – Standard Practice for Determination of Odor and Taste Thresholds by a Forced-Choice Ascending Concentration Series Method of Limits). This point is expressed in units of "dilutions-to-threshold" or "D/T". By definition, the odor threshold is equal to 1 D/T (i.e., volume of odorous air after dilution divided by volume before dilution equals one). Typically, odors become a nuisance at or above 7 D/T above background [1]. For this study, 4 D/T was selected as the significant risk threshold for sensitive receptor nuisance odor [3].

Based upon the dispersion modeling analysis of representative odors, the peak 3-minute odor concentration at a sensitive receptor was 2.4 D/T for the post-project scenario (well below the significant risk threshold of 4 D/T). Therefore, it was concluded that the proposed Project will not cause significant off-site nuisance odor impacts at nearby sensitive receptors.

1.0 INTRODUCTION

SCS Engineers was contracted by LSA Associates, Inc. to prepare a quantitative odor analysis (QOA) for the County of Orange, OC Waste & Recycling (OCWR) Department's proposed Increase in Maximum Daily Operations at the Prima Deshecha Landfill (proposed Project). The Prima Deshecha Landfill (Landfill) proposed Project would increase the maximum daily tonnage receipt capacity from 4,000 tons per day (TPD) to 8,000 TPD [18]. This increase is expected to take place gradually, reaching the proposed limit by the year 2030.

The goal of this study was to analyze two Landfill operating scenarios for significant nuisance odor impacts at nearby sensitive receptors (e.g., residential areas):

1. Existing baseline; and
2. Post project.

To achieve this goal, representative odor concentrations and associated flow rates were used to estimate the potential emissions of odor from Landfill operations. The AERMOD atmospheric dispersion model was then used to predict odor concentrations at sensitive receptor locations surrounding the Landfill for comparison to a significant risk threshold for nuisance odor.

The remainder of Section 1 describes the existing facility and the proposed project. Section 2 then discusses the methodology used in this study while Section 3 presents the results. Finally, Section 4 provides a discussion of this study's conclusions while the appendices provide supporting documentation.

1.1 EXISTING SETTING [14, 18]

1.1.1 Location and Local Land Use

The Landfill is located at 32250 Avenida La Pata, San Juan Capistrano, CA 92675 (see Figure 1). The Landfill occupies 1,530 acres (570 acres in San Juan Capistrano, 133 acres in San Clemente, and 827 acres in unincorporated Orange County) in the western foothills of the Santa Ana Mountains. Ground elevations range from 230 feet above mean sea level (MSL) at the Landfill's southwestern boundary to a maximum elevation of 1,125 feet above MSL at the Landfill's northeastern boundary.

Land use surrounding the Landfill can be characterized as follows:

- Open Space areas of unincorporated Orange County to the northeast.
- Suburban Residential areas of unincorporated Orange County to the east.
- Planned Community areas of the City of San Juan Capistrano to the northwest.
- Natural Open Space areas of the City of San Juan Capistrano to the west.
- Public Open Space, Private, Open Space and residential development ranging from Very Low Density to Medium Density Residential in the City of San Clemente to the south.

Figure 1. Prima Deshecha Landfill Location [4]

1.1.2 Landfill and Composting Operations

The Landfill is a Class III solid waste landfill that began operations in 1976. The Landfill is divided into Zones 1 through 5. Zone 1 is the current landfilling area (west of Avenida La Pata). The future Zone 4 (east of Avenida La Pata) is planned to start construction by the end of 2024. Two major utility easements extend through the central portion of the Landfill, separating Zone 1 and Zone 4. Zones 2 and 3 are open space and habitat mitigation areas, and Zone 5 is Avenida La Pata. There are existing uses (i.e., administrative offices/operations building, storage building, a household hazardous waste collection center (HHWCC), equipment maintenance facility, and a former gas-to-energy facility) near the Landfill entrance that do not fall within a designated zone. In addition, the Capistrano Greenery Composting Operation is co-located at the Landfill (see Figure 2). Composting is a natural biological process that biodegrades organic waste and turns it into a valuable organic fertilizer.

Figure 2. Capistrano Greenery Composting Operation Location [4]

1.1.3 Landfilling and Potential Odor Activities

The Landfill accepts public and commercial solid waste. The waste is placed in layers at the working faces, compacted by heavy equipment, and then covered daily. Once an area of the Landfill is completed, it is capped with final cover to control the incursion of precipitation and the release of gases from the Landfill [19]. Landfill related odors may come from sources such as:

- potentially two working faces operating simultaneously (Zone 1 and Zone 4);
- leachate (i.e., water that has passed through the landfill layers);
- landfill gas (LFG) which is a natural byproduct of decomposing organic material;
- flares which burn any excess LFG collected by the Landfill; and
- Capistrano Greenery Composting Operation.

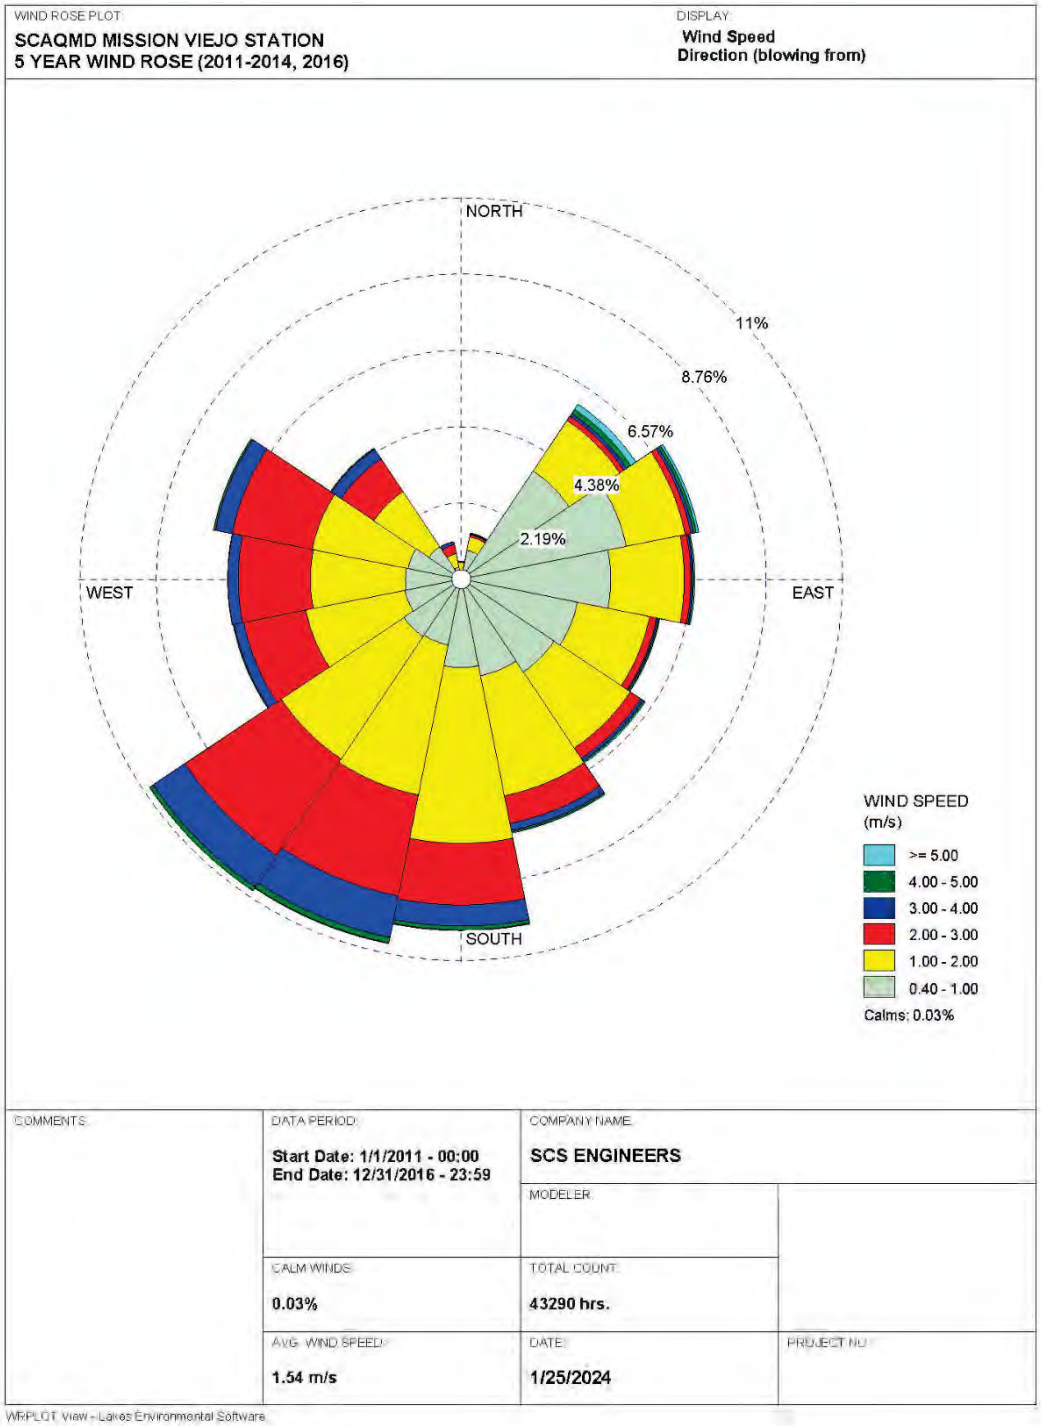
1.1.4 Odor Control Measures at the Landfill

The Landfill has developed and implemented an Odor Control Management Plan that includes measures such as:

- Application of daily cover.
- LFG collection and control system.
- Odor neutralizing misting system located on the ridge separating Zone 1 from the Rancho San Juan residential area.
- Various portable misting systems.
- Biosolids and green waste are deposited when not raining on weekdays prior to 11 am.

- Berm between Landfill and Rancho San Juan/Whispering Hills community provides a buffer.
- Limit the width of the open working faces to the extent possible during odorous conditions.
- Reject odorous loads, or apply odor neutralizer and cover immediately.
- Monitoring weather reports and site conditions on an ongoing basis.
- Neighbor Support Portal (NSP) that allows Landfill neighbors the ability to submit comments, questions, and concerns by using an online form.
- Routing received complaints directly to all site staff for immediate response:
    - observe the area of concern for smell and neighborhood conditions;
    - inspect the active landfill and compost operations for any unusual activities or conditions
    - identify possible sources of odor;
    - confirm implementation of applicable minimization measures;
    - review working face sizes, weather conditions, biosolids, and importation status; and
    - when possible, implement changes or remedial actions on the same day, such as covering certain parts of the working faces with tarps, increasing the use of deodorizer sprays, or pausing biosolids receipt and disposal.

In addition, OCWR is currently planning to expand into Zone 4 of the Landfill property. Zone 4 is located east of Avenida La Pata which gives OCWR the ability to conduct waste operations further away from the closest homes in Rancho San Juan during weather conditions that exacerbate odors. For example, the availability of Zone 4 makes it possible to operate split lifts putting public loads in Zone 1 while putting commercial loads, which are generally more odorous, in Zone 4. The development and use of Zone 4 will coincide approximately with the implementation of the Proposed Project to increase the daily maximum tonnage of waste accepted at the Landfill.



1.1.5 Odor Complaint History

Residential areas are located north, northwest, west, southwest, and south of the Landfill's boundary (see Figure 3). OCWR hasn't received any complaints directly related to the Capistrano Greenery Composting Operation. However, OCWR received odor complaints regarding the Landfill between January 1, 2022 and October 4, 2023 primarily from two addresses within the Rancho San Juan (RSJ) residential neighborhood (see Figure 3). Based upon representative regional meteorological data measured off-site in Mission Viejo, the most likely wind directions are from the southwest and south-southwest. Such winds occurring on-site would transport and disperse odors from the Landfill to the northeast and north-northeast, away from several nearby residential areas. See Figure 4 for the Mission Viejo wind rose which graphically represents wind speed and wind direction data over a five-year period.

Figure 3. Residential Areas Closest to the Landfill [4]

Figure 4. Mission Viejo Wind Rose

1.2 PROPOSED PROJECT

The Landfill is owned by the County and operated by OCWR. The proposed Project would increase the maximum daily tonnage receipt capacity of the Landfill from 4,000 tons per day (TPD) to 8,000 TPD. This increase in daily tonnage is anticipated to take place gradually, reaching the 8,000 TPD limit by 2030, and would be reflected in proposed Amendment No. 5 to the 2001 Prima Deshecha General Development Plan (GDP). The Project also includes construction of a third flare for backup purposes (to provide redundancy when maintenance is required on one of the two existing flares), with a permit limitation allowing for only two flares to operate at one time. Since the volume of landfill gas being flared would not change, no additional odor analysis is required for the third flare.

2.0 METHODOLOGY

2.1 MODEL SELECTION

The American Meteorological Society/Environmental Protection Agency Regulatory Model (USEPA AERMOD Version 23132 (May 12, 2023) incorporated into Lakes Environmental AERMOD View 12.0 software suite) [5] was used to model representative emissions of odor from the landfill. AERMOD was selected for this study since:

- AERMOD is preferred/recommended by the USEPA for near-field dispersion of emissions for distances less than 50 kilometers in both simple and complex terrain.
- AERMOD is acceptable to the SCAQMD for dispersion modeling studies [6].
- AERMOD has undergone numerous validation studies.
- AERMOD is in the public domain and is readily available.
- AERMOD can model multiple sources and multiple receptors.
- AERMOD can use representative meteorological data to simulate the atmospheric conditions that affect the transport and dispersion of air pollution from sources.
- AERMOD can use local terrain data to model receptors in complex terrain.
- AERMOD can be used to model impacts of odor causing pollutants.

Input data for AERMOD included the following which are described below:

- source parameters (locations, dimensions, emission rates, etc.);
- receptor locations;
- meteorological data;
- terrain data; and
- model options.

2.2 SOURCE PARAMETERS

Source parameters were used to model the release of odor from various release points into the atmosphere. Source locations and dimensions were obtained from site maps and aerial imagery. Odor emission rates in units of (D/T)*(m^3/s) were estimated by multiplying each source's representative odor concentration (D/T) times its representative volumetric flow rate (m^3/s). Representative odor concentrations and flow rates were based on prior odor studies [7, 8, 9, 10, 17].

Odor concentration is defined as the dilution of an odor sample with odor-free air, at which point only 50% of an odor panel (or population) will detect or recognize the odor (e.g., per ASTM 679-04 – Standard Practice for Determination of Odor and Taste Thresholds by a Forced-Choice Ascending Concentration Series Method of Limits). This point is expressed in units of "dilutions-to-threshold" or "D/T". By definition, the odor threshold is equal to 1 D/T (i.e., volume of odorous air after dilution divided by volume before dilution equals one). Typically, odors become a nuisance at or above 7 D/T above background [1]. For this study, 4 D/T was selected as the significant risk threshold for sensitive receptor nuisance odor [3].

Sources such as active composting piles, curing piles, receiving areas, processing areas, screening/ storage/loadout areas, ponds, working faces, and covered area fugitives were modeled as area sources. Transport of garbage and compost were modeled as line sources using representative truck

routes between the Landfill's property boundary and on-site operations. For area and line sources, AERMOD required odor emission rates be entered per area in units of (D/T)*(m/s) along with each source's dimensions in order to account for surface area.

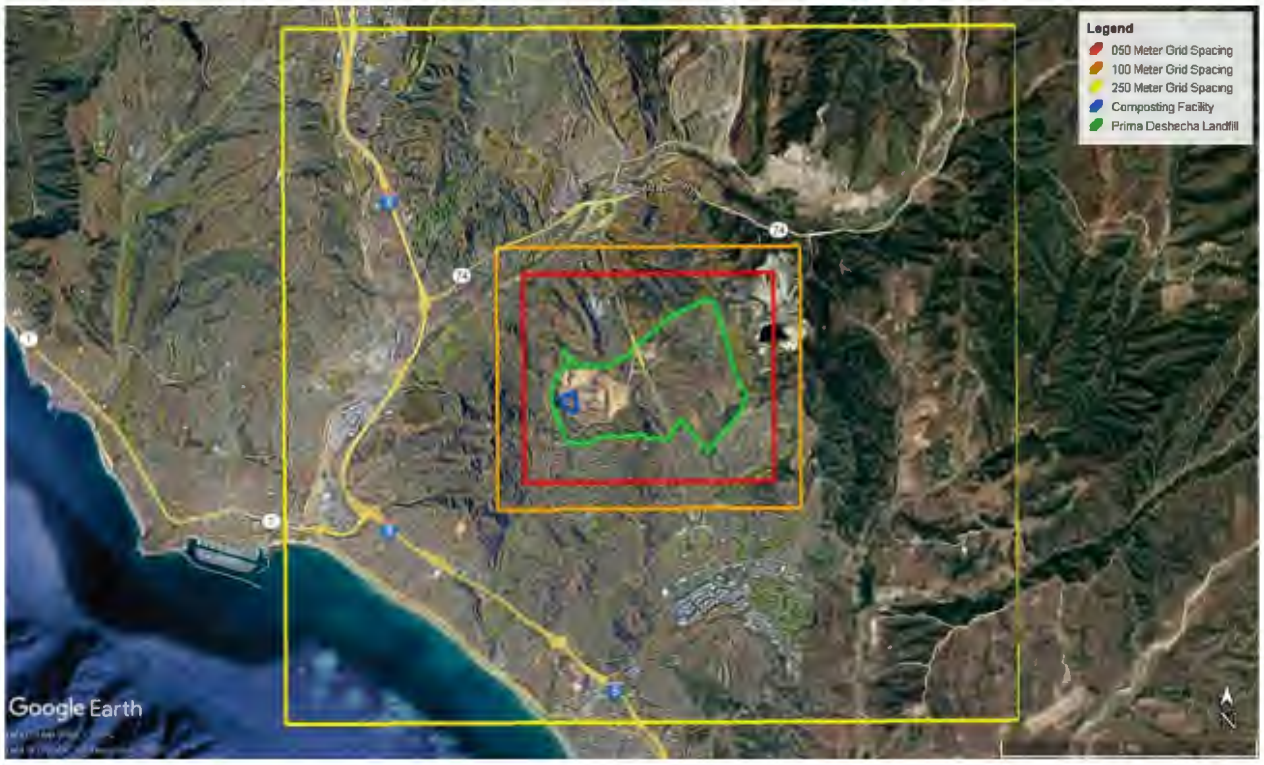
2.3 BUILDING DOWNWASH

Building downwash occurs when wind flowing over/around buildings impacts the dispersion of pollution from nearby stacks (point sources). In accordance with SCAQMD modeling guidelines, building downwash parameters were estimated using BPIP-PRIME and then imported into AERMOD.

2.4 RECEPTORS

AERMOD was used to generate nested 50-meter, 100-meter, and 250-meter spaced receptor grids over the landfill and surrounding area. Additional receptors were placed along the landfill's property boundary at 10-meter intervals. Finally, discrete receptors were placed at nearby sensitive receptor locations (e.g., residential areas) to supplement the grid receptors. Receptor flag pole heights were set to zero meters (ground level). On-site receptors within the landfill's property boundary were removed from the analysis. See Figure 13 for the layout of the nested grids. See Figure 14 and Appendix C for details of the sensitive receptors modeled in this study.

Figure 13. Nested Grid Layout [4]



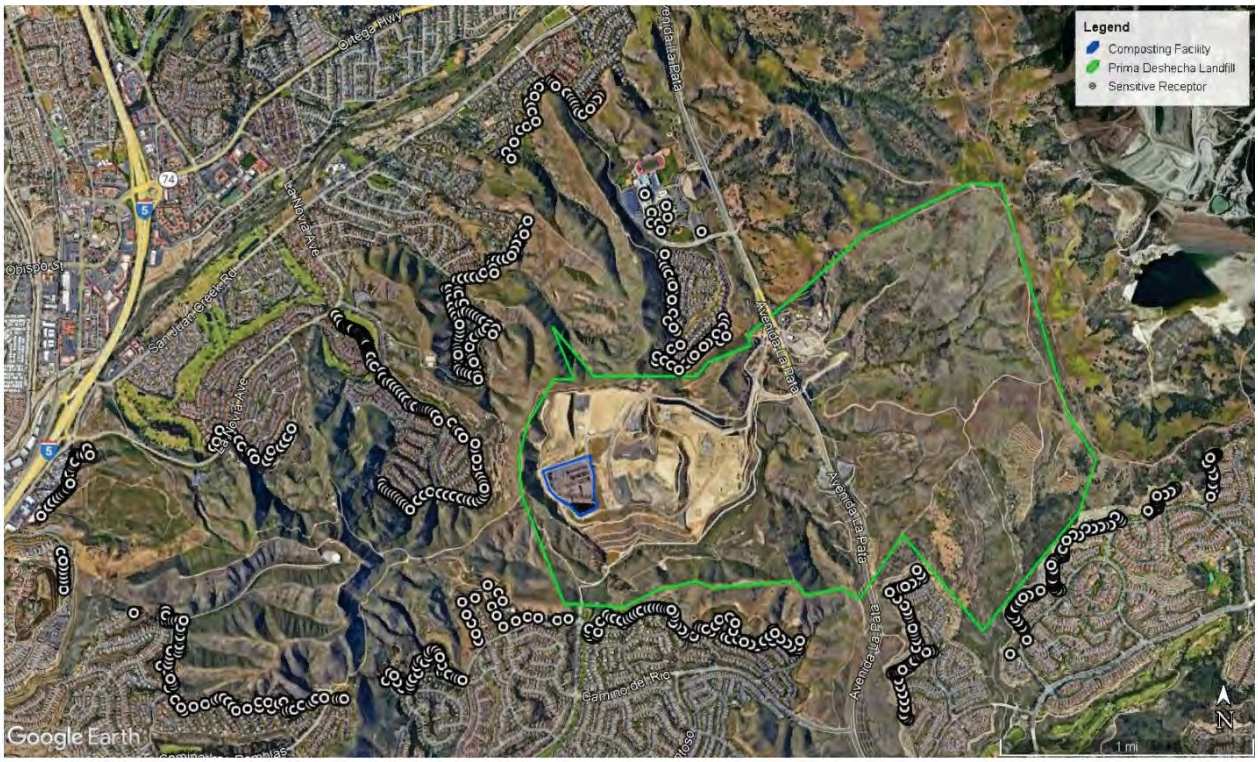


Figure 14. Nearby Sensitive Receptors [4]

2.5 METEOROLOGICAL DATA

The SCAQMD provides pre-processed meteorological data from various locations throughout the region for use with AERMOD. Selection of an appropriate meteorological station for dispersion modeling purposes is based upon many factors such as the source's meteorological conditions (e.g., prevailing winds, mixing heights, etc.), terrain, surrounding land use and surface characteristics, and proximity. Based on site-specific conditions, five years of meteorological data from the SCAQMD's Mission Viejo station [11] were selected for this study (see Table 2 for details). See Appendix E for wind roses which graphically represent the wind speeds and wind directions for various historical time periods (i.e., five years, seasonal, and hour of the day). In general, the dominant wind direction at the Mission Viejo station is from the southwest (closely followed by winds from the south-southwest and then from the south). However, as seen in Appendix E, dominant wind directions can vary over the course of a 24-hour day.

2.6 TERRAIN DATA

Modeling guidelines from the SCAQMD and USEPA [6, 12] indicate that AERMOD can under predict concentrations at receptor elevations lower than the base elevation of a source. Therefore, modeling scenarios were conducted with and without terrain elevation data since the sensitive receptors were lower in elevation than the landfill. Local terrain data was obtained from the United States Geological Survey (USGS) 1/3 arc-second National Elevation Dataset (NED).

2.7 MODEL OPTIONS

Table 1 summarizes the four modeling runs that were evaluated using the model options in Table 2.

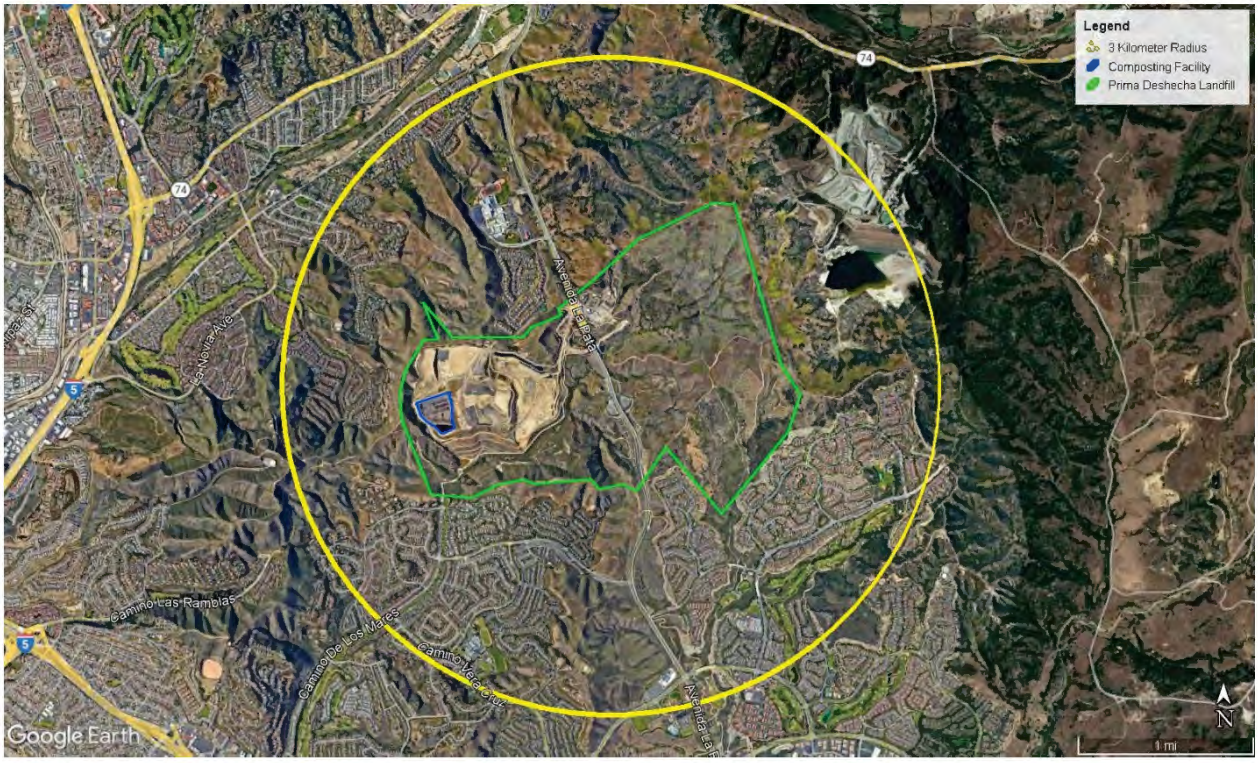
1	#1 (Existing baseline)	Rural	Elevated
2	#1 (Existing baseline)	Rural	Flat
3	#2 (Post project)	Rural	Elevated
4	#2 (Post project)	Rural	Flat

Modeling was conducted based upon SCAQMD guidelines [6] and the following assumptions:



- All sources were modeled as one source group operating continuously.
- Modeling runs were conducted using the rural dispersion mode based upon local land use and the amount of undeveloped areas within three kilometers of the landfill (see Figure 15).
- Peak one-hour odor concentrations predicted by AERMOD were multiplied by a factor of 1.82 to estimate the peak three-minute odor concentrations [13].

2.8 SIGNIFICANT RISK THRESHOLD

SCAQMD is the local agency that regulates air quality in the region where the landfill is located. The SCAQMD has adopted Rule 402 Nuisance [2] which states:

> *"A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property."*

Since SCAQMD Rule 402 Nuisance is subjective (i.e., qualitative), the Bay Area Air Quality Management District's (BAAQMD's) Regulation 7 [3] nuisance odor standard of 4 D/T was selected as the significant risk threshold for sensitive receptors since Regulation 7 is one of the most restrictive odor regulations in the country using an objective (quantitative) odor concentration threshold.

3.0 RESULTS

AERMOD was used to screen for the peak 1-hour and peak 3-minute odor concentrations at receptor locations surrounding the Landfill based upon the two scenarios modeled. Table 3 presents the peak modeling results for the sensitive receptors (e.g., nearby residential areas). Peak sensitive receptor odor impacts were compared to the surrogate nuisance odor standard of 4 D/T from the BAAQMD's Regulation 7 since the SCAQMD's Rule 402 did not provide a numeric nuisance odor standard. Peak sensitive receptor odor impacts were all below the 4 D/T significant risk threshold.

Table 3. Peak Sensitive Receptor Odor Impacts

Run No.	Scenario	Mode	Terrain	Receptor No.	Peak 1-Hour Odor Concentration (D/T)	Peak 3-Minute Odor Concentration (D/T) *	Odor Significant Risk Threshold (D/T)	Odor Significant Risk Threshold Exceeded?

* 1-hour concentrations were multiplied by a factor of 1.82 to estimate the 3-minute concentrations.

See Figure 16 through Figure 30 for contours of odor concentration in units of D/T. These figures also display the peak impact at a sensitive receptor and along the facility boundary. As seen in Figure 17, the peak 3-minute odor impact at the facility boundary was 8.4 D/T for Scenario #1 using elevated terrain. This boundary receptor is not populated and is approximately 680 feet from the nearest residential property (4 D/T only reached 80 feet from the facility boundary). As seen in Figure 24, the peak 3-minute odor impact at the facility boundary was 8.7 D/T for Scenario #2 using elevated terrain. This boundary receptor is not populated and is approximately 680 feet from the nearest residential property (4 D/T only reached 90 feet from the facility boundary).

See Appendix D for the modeling results by receptor. See Appendix F for the AERMOD output files from Run #1 (Baseline) and Run #3 (Post Project) which had the highest impacts for each scenario modeled.

4.0 CONCLUSIONS

Peak, 3-minute odor concentrations at nearby sensitive receptors were estimated to be 2.1 D/T (using elevated terrain) and 2.4 D/T (using flat terrain) for the existing baseline scenario. For comparison, the peak, 3-minute odor concentrations at nearby sensitive receptors were estimated to be 2.1 D/T (using elevated terrain) and 2.4 D/T (using flat terrain) for the post project scenario. Therefore, the worst case sensitive receptor odor impact was estimated to increase by 3.4% (2.35 to 2.43 D/T). The 2.4 D/T sensitive receptor odor impact was driven by the following sources:

- Landfill Zone 4 Fugitives 4 (25.0%)
- Landfill Zone 1 Working Face (24.4%)
- Landfill Zone 1 Fugitives (18.1%)
- Landfill Zone 4 Working Face (14.9%)
- All Other Sources (Less than 1% individually)

Smelling an odor doesn't tell how much chemical exposure you have or whether the odor will cause health effects. Health effects from odors can range from none, to mild, to more severe symptions. In most cases, people will notice an odor well below the exposure level that would cause health effects [15].

The worst case sensitive receptor odor impact modeled in this study (2.4 D/T) was well below the significant risk threshold (4 D/T). Therefore, this study concluded that the proposed modifications to the Prima Deshecha Landfill are expected to be in compliance with SCAQMD Rule 402 and will not cause significant sensitive receptor nuisance odor impacts based upon dispersion modeling analysis of representative odors and existing odor mitigation measures in place.
