Parking Calculations

1 Introduction and Project Description

Transportation Demand Management (TDM) is the incorporation of a variety of incentives, services, and actions that influence the reduction of single-occupant automobile trips to provide additional relief from congestion, parking, and air quality impacts[1].

This TDM plan has been completed in accordance with the City of Sunnyvale TDM Tool Kit, the City of Sunnyvale Draft TDM Program Guidelines and is also consistent with the Lawrence Station Area Plan (LSAP) Trip Reduction guidelines and incorporates comments received from the City of Sunnyvale.

1.1 Project Description

The project includes 364,000 sq ft of corporate office on 945 and 955 Kifer Road (the north site) and 847,000 sq ft of manufacturing and research and development (R&D) on 932 and 950 Kifer Road (the south site). The north site is bounded to the north and south by Central Expressway and Kifer Road respectively with access from Kifer Road only. The south site is bounded to the north and south by Kifer Road and the Caltrain right-of-way respectively with access from Kifer Road only.

Parking will be provided to meet City requirements. In total, 2,550 parking spaces will be provided – 822 on the north site and 1,728 on the south site. For the north site, parking will be provided in a two-level basement underneath the office building with 31 surface parking spaces also provided in the southwest corner of the site. For the south site, parking will be provided in a five-level parking structure with 57 surface parking spaces also provided in the northwest corner of the site. Of the 2,550 parking spaces, 50 will be ADA accessible, including 11 van ADA accessible spaces, 128 for carpool and 78 for electric vehicles.

Figure 1 presents a map of the site location and Figure 2 presents the proposed site plan.

Long-term (Class I) and short-term (Class II) bicycle parking will be provided in line with City requirements. In total, 148 Class I bicycle parking spaces will be provided in the amenity building on the north site and in the parking structure on the south site. Class II bicycle parking will be provided for 50 bicycles and will be conveniently located near building entrances.

Pedestrian and bicycle facilities are provided in and around the site to connect the external pedestrian and bicycle paths to internal entrances and parking.

[1] City of Sunnyvale Draft TDM Program Guidelines, November 2015

1.2 Trip Reduction Goals

The trip reduction mitigation measures in the TDM plan are essential to achieve the trip reduction goals for the project, defined as follows in the TDM Policies of the LSAP:

TDM-P2 *Achieve a daily trip reduction target of 20 percent and a peak hour trip reduction target of 30 percent for new Office/R&D development.*

Table 1 shows the estimated weekday AM and PM peak hour vehicle trips for the project using Institute of Transportation Engineers (ITE) vehicle trip generation rates. The table also shows the trip generation allowance after applying the prescribed TDM trip reductions given above.

Table 1: Trip Allowance Calculation for Intuitive Campus

Site	Land Use	ITE Code	Area (sf)	Daily		AM Peak Hour		PM Peak Hour	
				Rate	Trips	Rate	Trips	Rate	Trips
North Site	General Office Building	710	364,000	9.74	3,545	1.16	422	1.15	419
	Maximum Allowable Trips with 20%/30% Trip Reduction			**20%**	**2,836**	**30%**	**296**	**30%**	**293**
South Site	Manufacturing and R&D	760	847,000	11.26	9,537	0.42	356	0.49	415
	Maximum Allowable Trips with 20%/30% Trip Reduction			**20%**	**7,630**	**30%**	**249**	**30%**	**291**
Total Maximum Allowable Trips				**10,466**		**545**		**584**	

Source: ITE Trip Generation Manual 10th Edition; average rate per 1,000 square feet of gross floor area; peak hour of adjacent street traffic (one hour between 7-9AM and between 4-6PM)

Note: Trip generation is based on current development program at time of submittal. A Traffic Impact Analysis (TIA) is being conducting separately from the TDM plan. Trip generation numbers should match for both the TIA and TDM. If necessary, TDM will be updated to match approved TIA trip generation.

The maximum allowable daily trips for both the north site and the south site of the Intuitive Campus, after the 20 percent reduction, is 10,466. The maximum allowable peak hour trips for both the north site and the south site, after the 30 percent reduction, are 545 and 584 in the AM peak hour and PM peak hour respectively.

1.3 Area Map

See Figure 1 for a map showing the location of the Intuitive Campus. The office building will be located on the site to the north of Kifer Road comprised of parcels 945 and 955 Kifer Road. The manufacturing and R&D building will be located on the site to the south of Kifer Road comprised of parcels 932 and 950 Kifer Road.

1.4 Site Plan

See Figure 2 for a proposed site plan of the Intuitive Campus.

Figure 1: Location of Intuitive Campus

Figure 2: Intuitive Campus Site Plan

2 Trip Reduction Program and Mitigation Measures

Intuitive will offer the following programs to achieve the trip reduction goals. The programs are organized into two categories: baseline measures, which Intuitive will include in their TDM plan, and optional measures that may be included to help meet the trip reduction goals.

2.1 Baseline TDM Programs

The baseline TDM programs that the project will implement are described below.

2.1.1 On-Site TDM Coordinator

Intuitive has a dedicated on-site TDM coordinator whose role is to proactively plan for changes in travel demand, adjust and implement new services, and monitor the impacts of changes, all while responding to a host of day-to-day operational challenges. The TDM Plan proposed for the Intuitive Campus will be administered and managed through the on-site TDM coordinator.

2.1.2 Membership in Transportation Management Association (TMA)

A Transportation Management Association (TMA) is an organized group (typically non-profit) that works to support TDM and related commuter transportation strategies for both private and public employers and their employees. A TMA typically provides:

- Commuter resources
- Carpool and vanpool matching
- Transportation consulting
- Employee commute surveys
- Guaranteed Ride Home
- Enhanced bicycle facilities
- Car and vanpool incentives
- Transit advocacy
- Information on local issues
- Training
- Marketing programs
- Promotional assistance
- Newsletters

Carpool Parking Photo © Arup

Intuitive participates in and is a part of the SVBC Sunnyvale team and remains connected about alternative commute programs, incentives, and transportation projects affecting LSAP businesses.

2.1.3 Priority Parking for Carpools, Vanpools, and Clean-Fuel Vehicles

Priority parking for ADA, carpools and vanpools as well as personal electric vehicles is provided close to the main building entrances. The number and type of parking spaces provided is summarized in Table 2.

Table 2: Intuitive Vehicle Parking Provision

Type of Parking	Parking Spaces Provided		
	North Site	South Site	Total
Total shared and commercial parking spaces	822	1,728	2,550
ADA spaces	20 (5 of which are ADA van accessible)	30 (6 of which are ADA van accessible)	50 (11 of which are ADA van accessible)
Carpool (and vanpool) spaces	47	81	128
Electric vehicle parking spaces	29	49	78

2.1.4 Bicycle Parking, Sharing and Facilities

To facilitate cycling as a major mode of transportation, secure and ample bicycle parking is required. This includes providing both long-term and short-term bicycle parking. Long-term or Class I secured bicycle parking is defined as lockable facilities such as individual lockers or enclosed, locked, limited-access areas for parking of bicycles. Short-term or Class II bike racks are defined as stationary objects to which a bicycle can be locked such as “inverted U” racks or “ribbon wave” racks. As shown in Table 3, 148 long-term bicycle parking spaces and 50 short-term bicycle racks will be provided.

In addition, Intuitive has its own inter-campus bicycle program, Zagster, and currently provides 36 bikes, with dedicated racks and locks, for employees to use between their various campuses in Sunnyvale. This program will be extended to serve the new Intuitive Campus.

Also, to complement a worksite’s bicycle and active transportation, showers and changing facilities are important for employees who walk or bike to work or for those who wish to change after commuting via alternative modes of transportation. Showers with changing facilities and lockers will be provided in the amenity building on the north site and on level 1 of the manufacturing and R&D building on the south site.

Table 3: Bicycle Parking Provision

Type of Parking	Parking Spaces Provided		
	North Site	South Site	Total
Short-term/Class II bicycle parking (racks lockable in two points on a bike)	15	35	50
Long-term/Class I bicycle parking (covered, lockable enclosure protected from weather)	44	104	148

2.1.5 Rideshare Matching Services

Intuitive employees have access to an internal commuter/transportation webpage which allows them to search for individuals who they could carpool/vanpool with. Carpoolers and vanpoolers can use the designated carpool parking spaces.

2.1.6 Pre-tax Commuter Benefits

Pre-tax commuter benefits are provided through payroll. Consistent with the provisions in the federal tax code, employees can pay for transit passes and/or bicycle tune ups using pre-tax dollars.

2.1.7 Marketing and Information

Intuitive will lead the marketing and promotion of the TDM programs, which is critical to the success of the TDM measures. In addition to providing information on transit and bike maps, rideshare matching services, and pre-tax commuter benefits, Intuitive will promote special events and recurring TDM programs to employees. This may include active transportation events such as Bike to Work Day, monthly or quarterly bike repair and commute workshops, fitness competitions, and other incentive programs.

Additional ways to promote the TDM programs include:

- Embedded materials within new hire packets and orientation
- Transportation fairs; combined with benefits/health fairs to increase attendance
- Regularly published electronic newsletters
- Informational email blasts
- Commuter information boards/kiosks located in prominent, central locations like the building lobby
- Employer/TMA website with information and links to local relevant agencies, forms, and services

2.2 Optional TDM Programs

This section provides additional TDM programs which may be implemented at the Intuitive Campus.

2.2.1 Employer Commuter Shuttle Services

Intuitive currently provides free daily shuttles to/from its existing campuses in Sunnyvale and may extend these services to the Intuitive Campus. Existing shuttle routes include:

- Intercampus shuttles which operate as a loop between the Intuitive buildings and Lawrence Caltrain Station from 7:15AM to 6:00PM
- Shuttles to/from Santa Clara Great America Station and Intuitive buildings between 5:15AM and 8:10AM and also between 3:00PM and 6:35PM
- Commuter shuttles to/from the East Bay with pick-up/drop-off at Fremont Civic Center Park and Ride and Fremont BART station between 5:15AM and 8:10AM and also between 3:00PM and 6:35PM

Shuttle users are guaranteed a ride home (Uber voucher, taxi reimbursement, etc) should shuttle service go down for any reason.

2.2.2 Flexible Work Schedule Program

Flexible work schedules provide versatility to employees and can reduce the number of commuters during typical peak work hours. Intuitive currently offers the following options which they may extent to employees at Intuitive Campus:

- Working from other offices or remote locations, including the Intuitive satellite office in San Francisco
- Flexible work program (for certain groups)

2.2.3 Subsidized or Free Transit Passes

Intuitive currently provides a free Caltrain Go Pass to its employees who commute by Caltrain. The Caltrain Go Pass provides unlimited Caltrain rides seven days a week. In 2018, 765 employees signed up for this benefit which may also be extended to employees at the Intuitive Campus.

3 Planning and Design Measures

The project's location and physical context provides access to public transit and bicycle routes, which will complement the TDM program measures listed in Section 2.

3.1 Transit Service

Figure 3 shows the public transit that operates within Sunnyvale near the site including Caltrain and a number of VTA bus routes. Not shown on the map but given in Figure 4 is the Altamont Corridor Express (ACE) Gray Shuttle which runs along Kifer Road in front of the development site.

Caltrain

Caltrain provides a commuter rail service along the San Francisco Peninsula, through the South Bay to San Jose and Gilroy. The service operates seven days a week with various frequencies during the peak morning and evening hours. Intuitive operates a shuttle between its Sunnyvale campuses and the Lawrence Caltrain Station.

Altamont Corridor Express (ACE)

ACE provides a shuttle for commuters from the east (as far east as Stockton, passing through Lathrop, Tracy, Livermore, Pleasanton, and Fremont). The ACE Gray Shuttle (Figure 4) connects the Great America Station and the Intuitive Campus and Intuitive also operates a shuttle to/from its campuses and the Great America Station.

Figure 3: VTA Bus and Rail Map

Figure 4: ACE Gray Shuttle 822 (source: VTA)

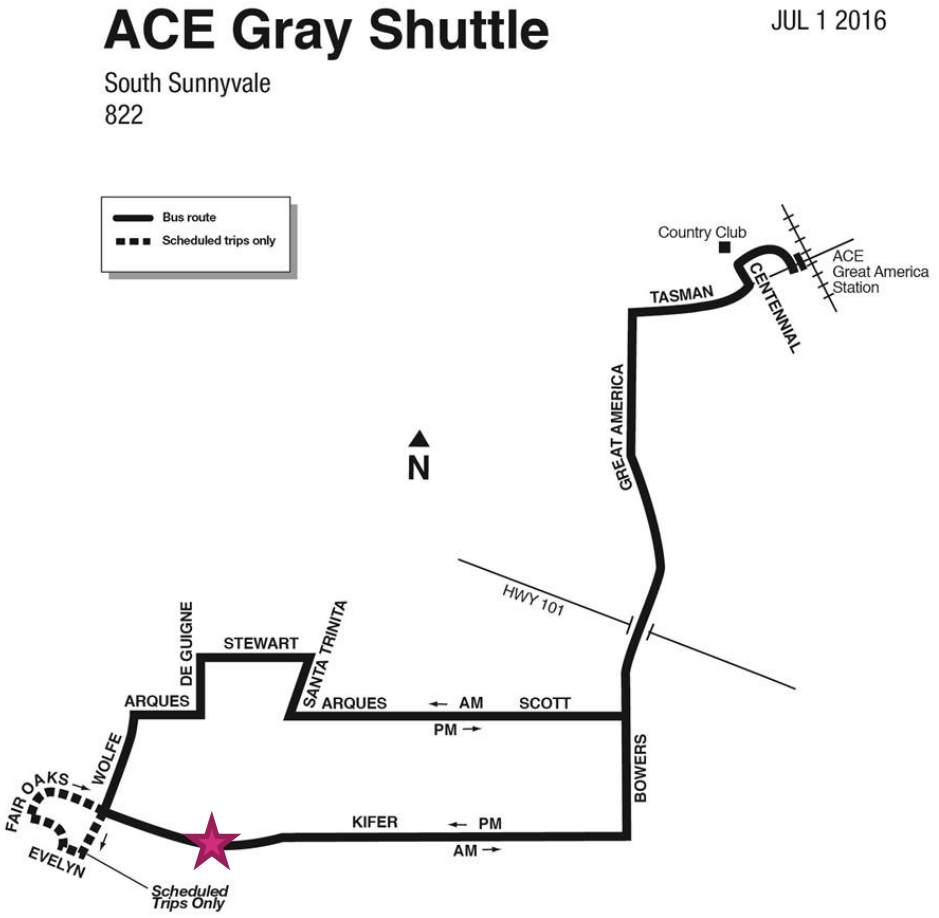

Table 4 shows a summary of the existing transit services near the Intuitive Campus. The VTA bus routes are given in Figure 5 to Figure 9. It is understood that these routes may change when the VTA Next Network project is implemented and the anticipated changes are also noted in Table 4.

Table 4: Transit Services Serving Intuitive Campus

Service	Description	Nearby Stops	Service Hours	VTA Next Network
Caltrain	Caltrain Service to Lawrence Caltrain Station	Lawrence Caltrain Station (0.8 mi)	Northbound: 4:39AM-10:40PM Southbound: 6:15AM-1:29AM	

Service	Description	Nearby Stops	Service Hours	VTA Next Network
ACE Gray Shuttle 822	ACE Gray Shuttle (South Sunnyvale)	Kifer & Commercial (<0.1 mi)	Southbound: 6:16AM-9.36AM Northbound: 3:09PM-6:39PM	
VTA Bus 304	South San Jose - Sunnyvale Transit Center	Arques & Wolfe (0.8 mi)	Northbound: 5:52AM-8:49AM Southbound: 3:33PM-7:07PM	Route 304 would be discontinued
VTA Bus 26	Lockheed Martin Transit Center - Eastridge via Westgate	Fair Oaks & Kifer (0.7 mi)	5:13AM-11:50PM (weekdays)	Route 26 would be broken into two routes: Route 26 and Route 56 Route 56 would serve the site
VTA Bus 55	De Anza College - Great America	Fair Oaks & Kifer (0.7 mi)	5:38AM-10:54PM (weekdays)	Route 55 would stay on Sunnyvale Avenue rather than serve Fair Oaks. Weekday frequency would decrease during commute periods from 15 minutes to 30 minutes
VTA Bus 328	Almaden Expressway & Camden - Lockheed Martin	Lawrence Expressway & Kifer (0.7 miles)	Northbound: 5:57AM-8:43AM Southbound: 4:53PM-7:14PM	Route 328 would be discontinued
VTA Bus 32	San Antonio Shopping Center - Santa Clara Transit Center	Evelyn & Wolfe (0.8 mi)	5:45AM-8:35PM (weekdays)	Route 32 would merge with route 35 and be renamed route 21

Figure 5: VTA Bus Route 304 (source: VTA)

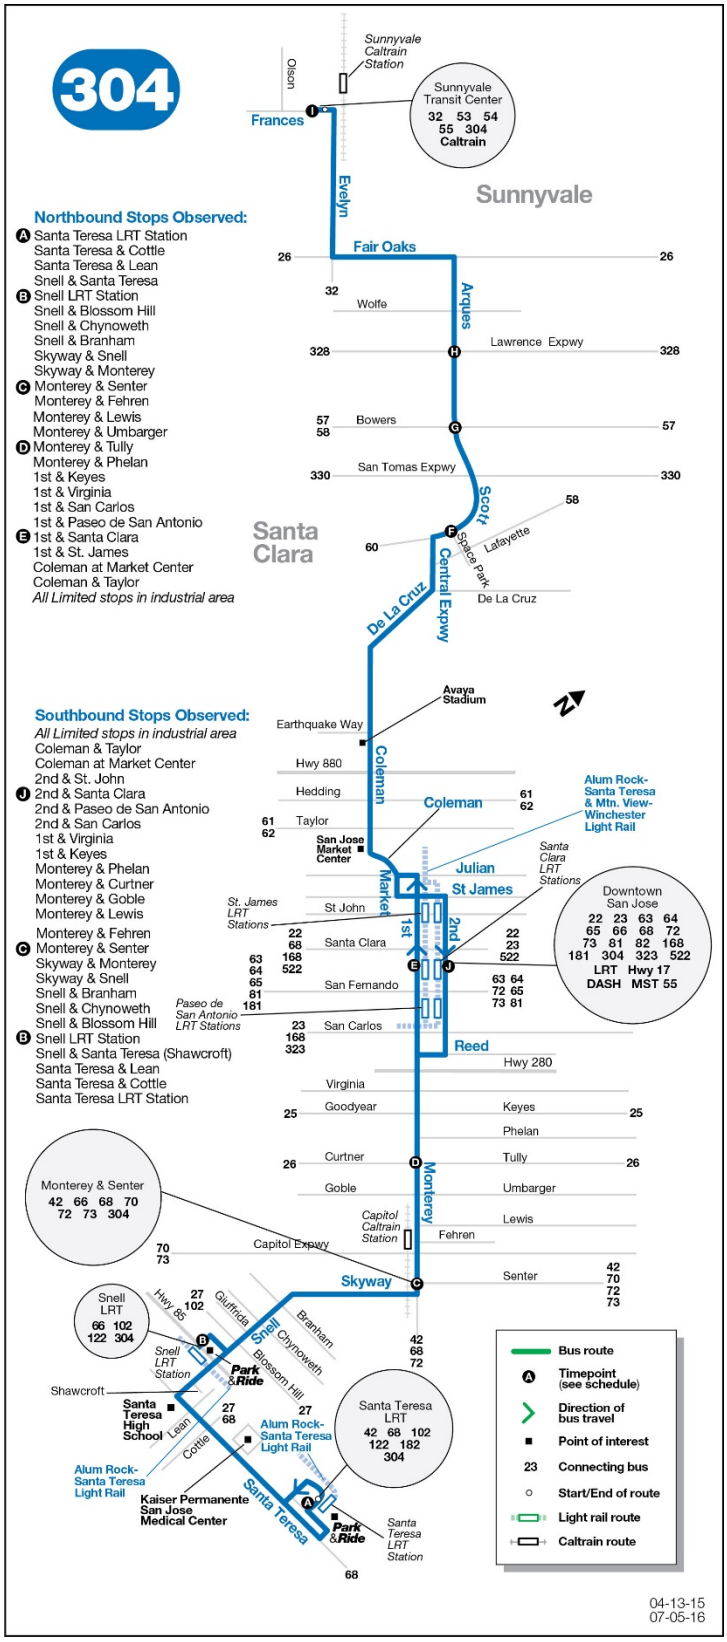

Figure 6: VTA Bus Route 26 (source: VTA)

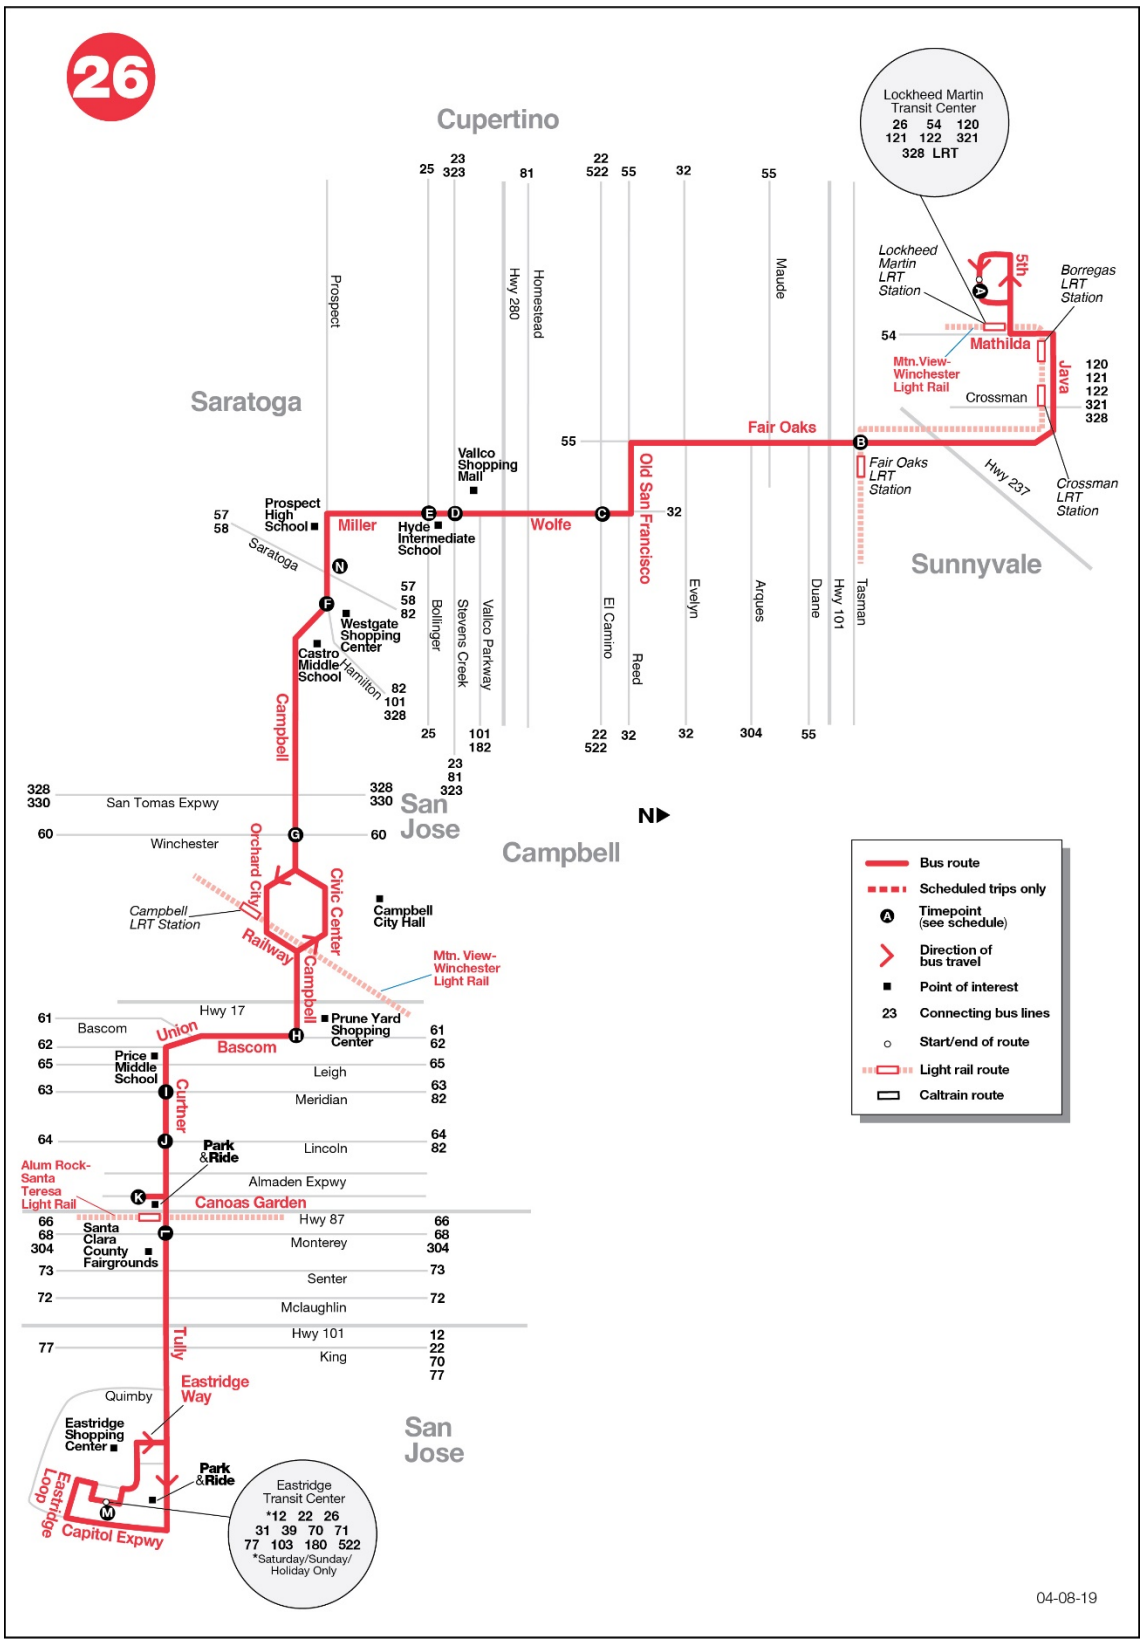

Figure 7: VTA Bus Route 55 (source: VTA)

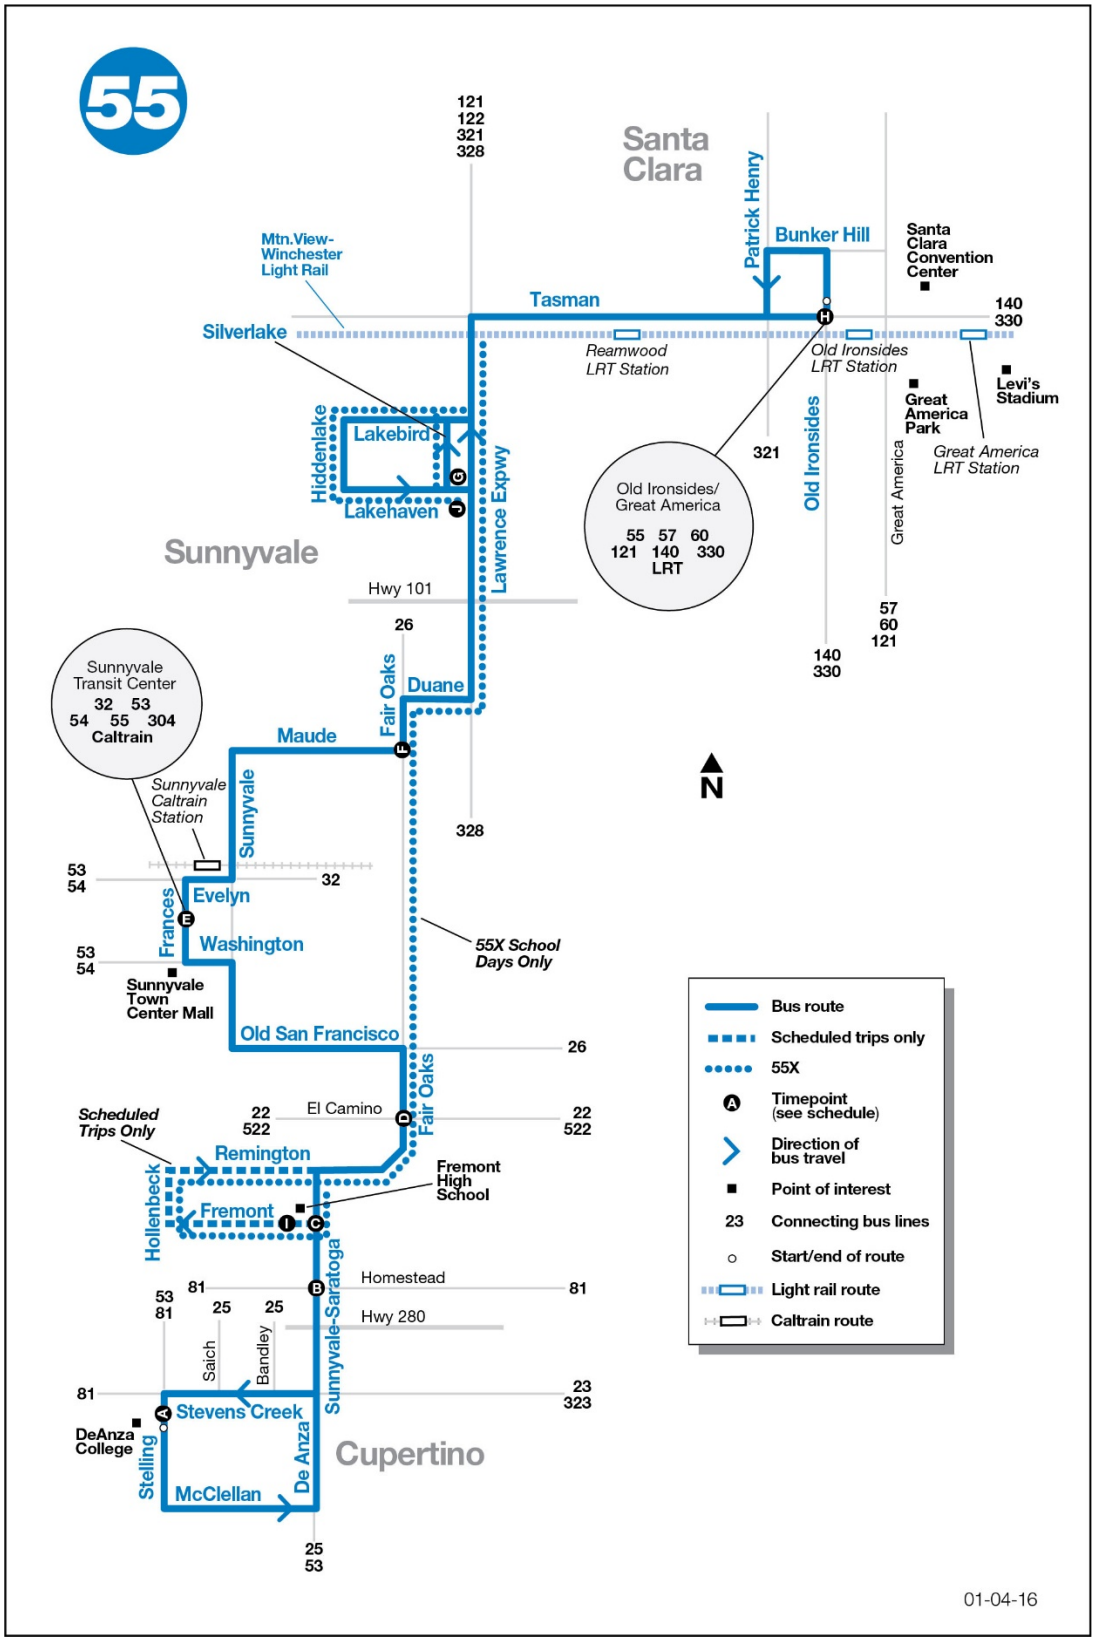

Figure 8: VTA Bus Route 328 (source: VTA)

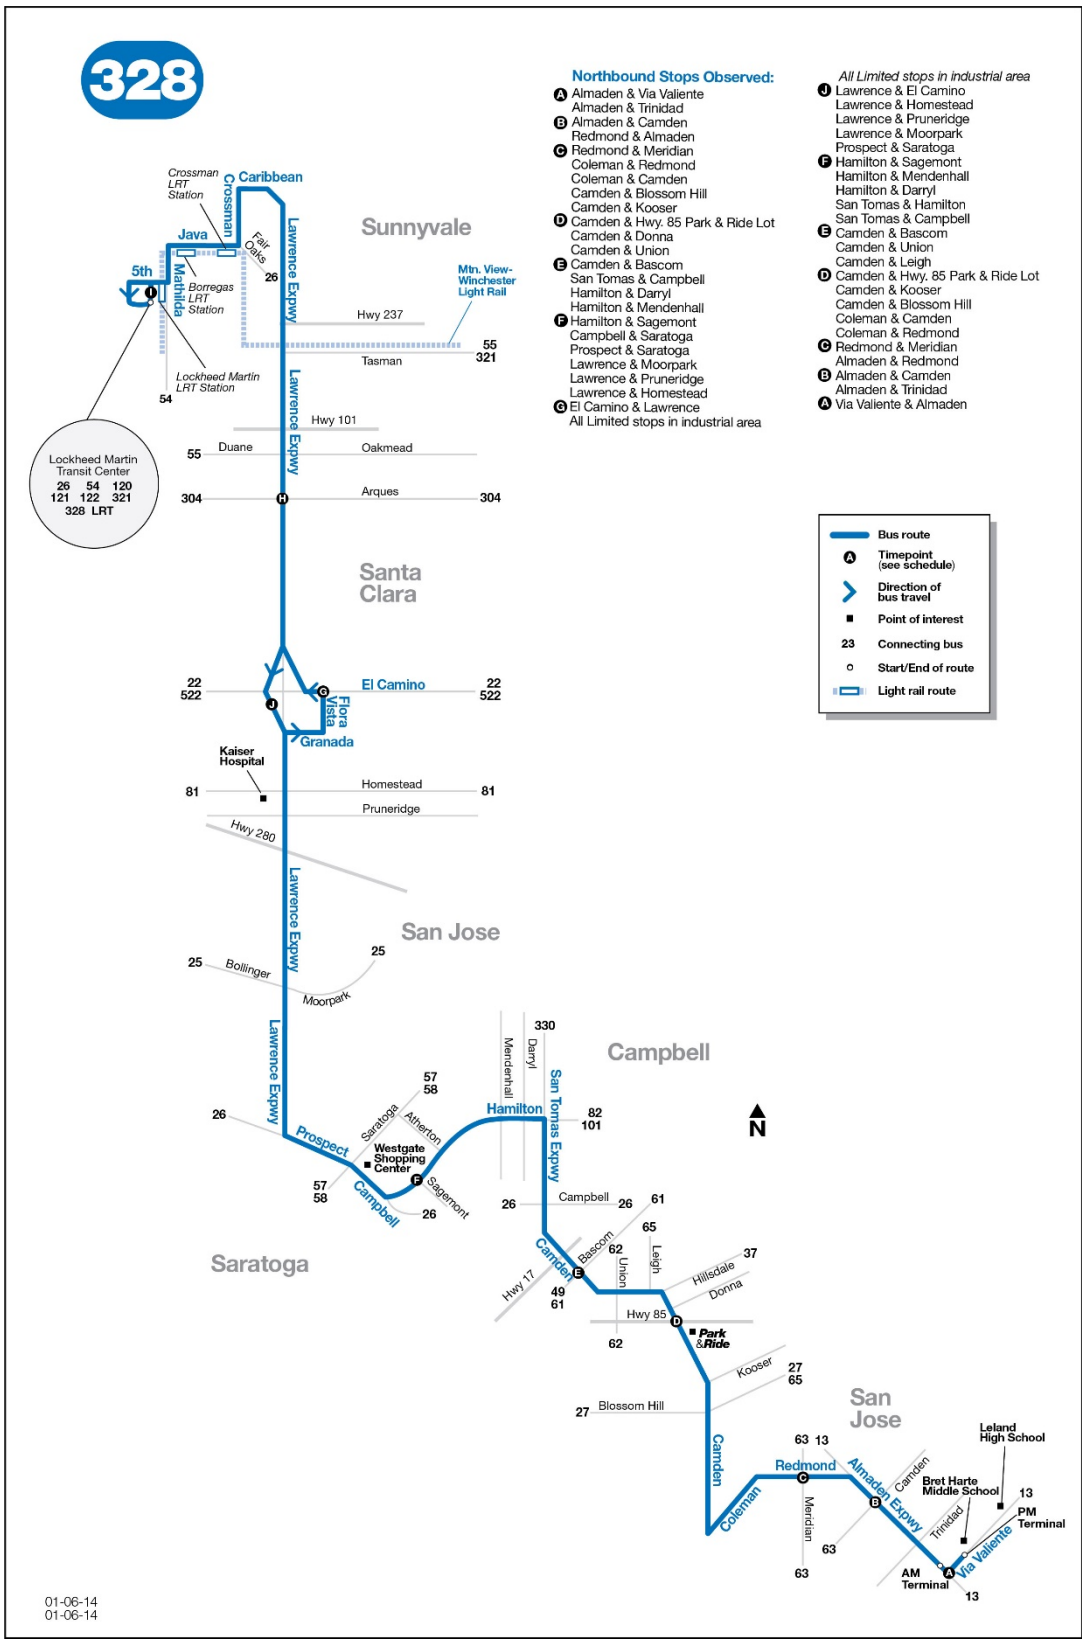

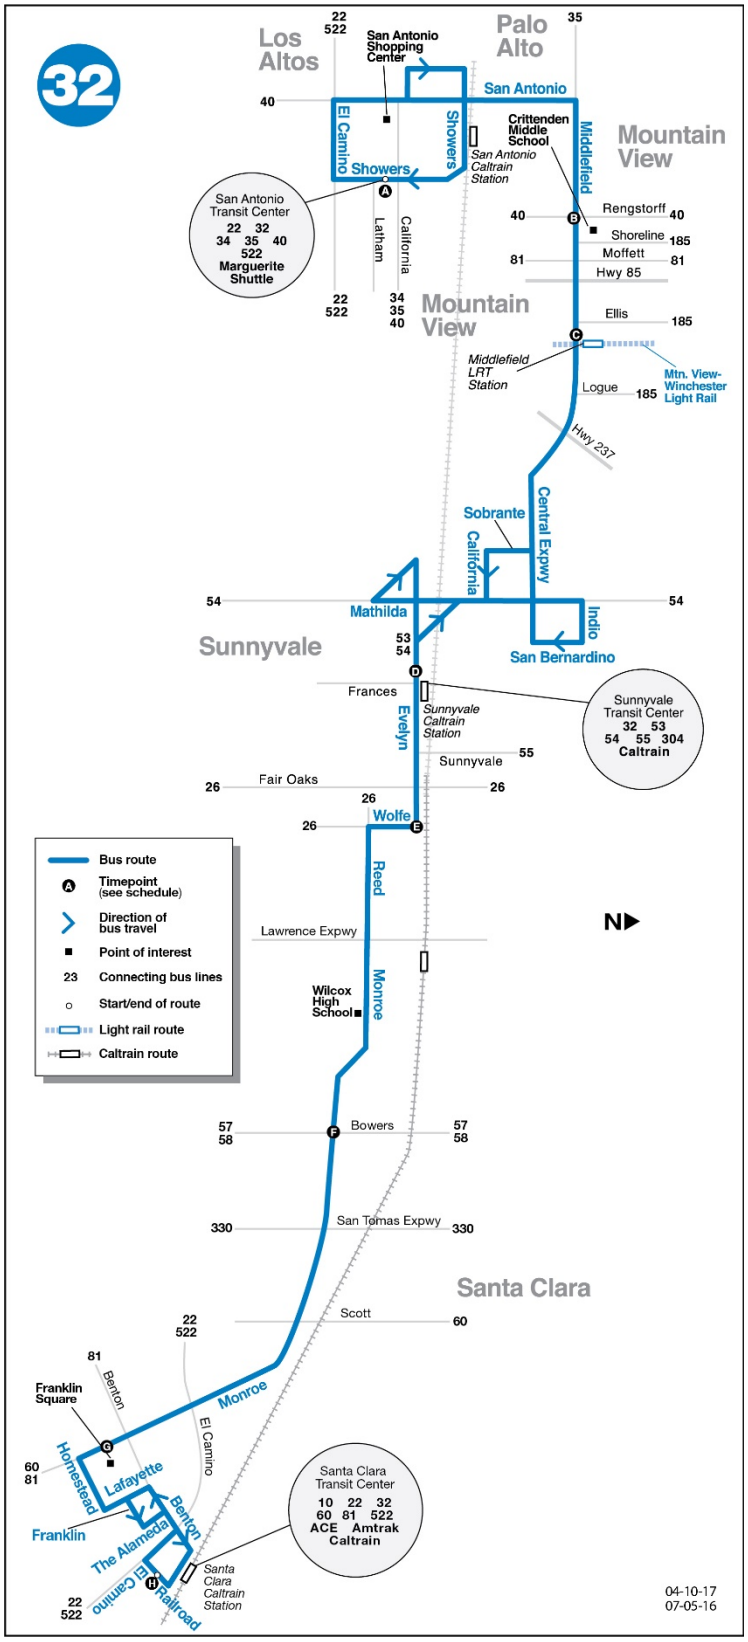

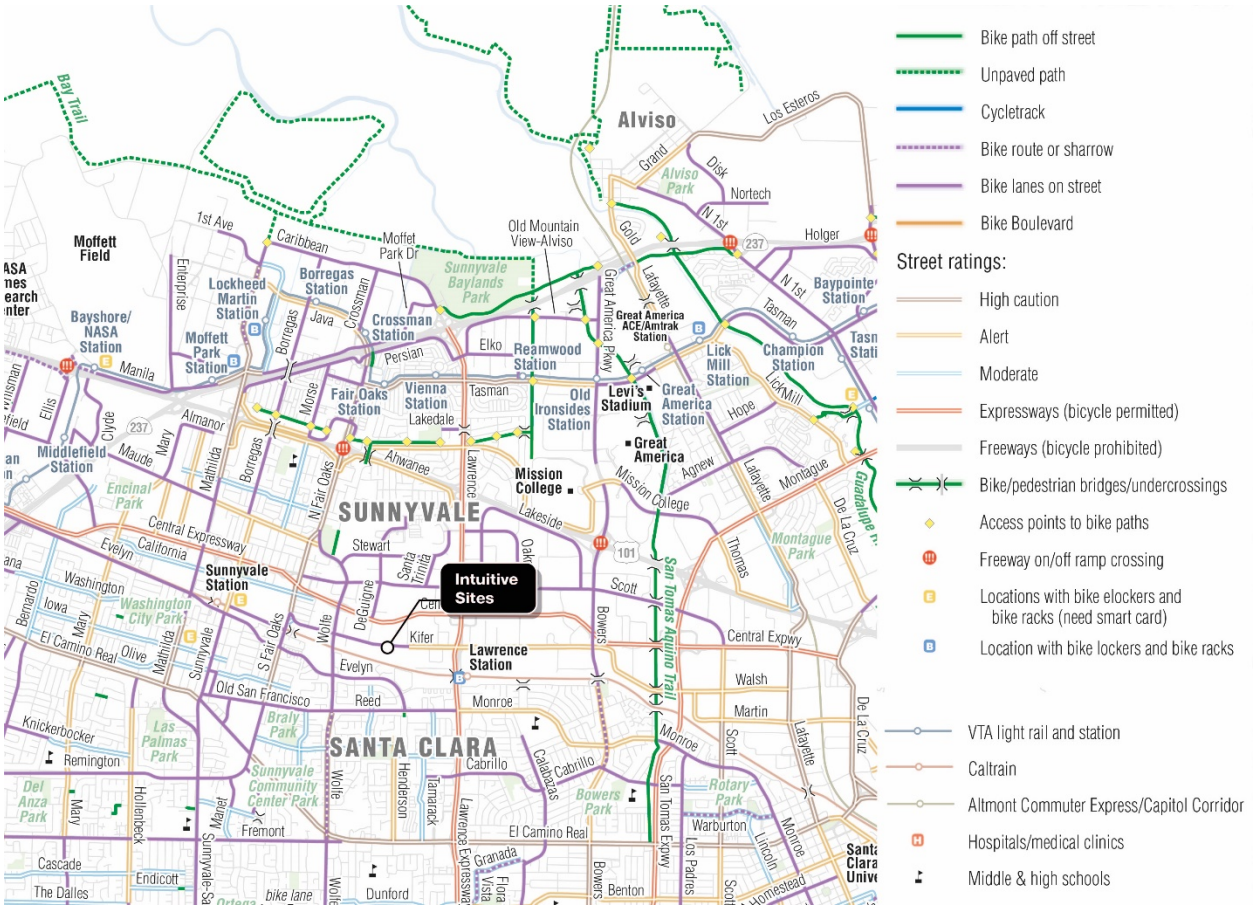

Figure 9: VTA Bus Route 32 (source: VTA)

3.2 Bicycle and Pedestrian Access

Figure 10 shows the existing bicycle paths within the vicinity of the site. Sidewalks also exist on either side of Kifer Road and crosswalks are provided at signalized intersections. The site includes a network of pedestrian and bicycle pathways to connect external facilities with internal bike parking and access. A pedestrian bridge is proposed over Kifer Road to facilitate pedestrian movement between the buildings on the north and south sites.

Figure 10: Sunnyvale Bikeways (source: Santa Clara Valley Transportation Authority)

3.3 Parking Management

The supply of parking can directly affect the behavior of commuters. As such, managing the supply and use of parking should enhance and encourage the TDM measures.

In line with City standards, to facilitate compliance with the City's TDM requirements and to encourage the use of alternative modes of travel, this project proposes to reduce required parking by 3%. Therefore 2,550 parking spaces will be provided – 822 on the north site and 1,728 on the south site.

For the north site, parking will be provided in a two-level basement underneath the office building with 31 surface parking spaces also provided in the southwest corner of the site. For the south site, parking will be provided in a five-level parking structure with 57 surface parking spaces also provided in the northwest corner of the site. Of the 2,550 parking spaces, 50 will be ADA accessible, including 11 van ADA accessible spaces, 128 for carpool and 78 for electric vehicles. Preferential parking will be made available for alternative commute modes, including carpools and electric vehicles.

Access to all of the parking will be via Kifer Road. A signalized intersection at Commercial Avenue will provide access to the south site parking. The surface parking on the north site will be accessed via a side street stop controlled intersection to the east of Commercial Avenue. Access to the main parking at the north site will be from a signalized intersection, approximately 1,200ft east of the Kifer Road / Commercial Avenue intersection.

3.4 Passenger Loading

Some employees and visitors to Intuitive Campus are expected to be dropped off at the campus or use shared ride services such as Lyft and Uber. Although convenience is important for maintaining a high-quality user experience, the campus prioritizes active mobility and safety over vehicle mobility, so dedicated drop-off areas will be provided on both the north and south site. On the north site, the drop off area will be located at the turn around in front of the building which is accessible from the side street stop controlled intersection on Kifer Road. On the south site, passenger loading will take place to the east of the building, also accessible from a side street stop controlled intersection. The drop-off areas are located adjacent to the buildings, in a location that avoids the need for passengers to cross the roadway after drop-off.

3.5 Project Amenities

The on-site amenities and services provided at Intuitive Campus reduce the number of trips that employees need to take during the day and increase the feasibility of using an alternative to driving alone. The project has plans for many on-site amenities, which include:

- Onsite showers and changing facilities
- Bicycle storage
- Onsite towel service
- Onsite dry-cleaning
- Onsite yoga
- Cafés

- Public plazas with greenery and seating
- Pedestrian and bike pathways throughout and around the site

4 Implementation Mechanism

Intuitive will be responsible for implementing the TDM programs. TDM programs shall be complete, active, and in place upon 75% building occupancy.

Upon implementation of the program, as per requirements outlined in the TDM Program Guidelines, Intuitive shall contact the City in writing to identify the designated TDM Coordinator, their contact information, occupancy date, and implementation date of the TDM plan. Such notification shall be sent to the City TDM Program.

5 Monitoring and Evaluation

Intuitive will be responsible for annual monitoring and evaluating the TDM programs. Intuitive's TDM Coordinator(s) shall produce annual reports to the City.

5.1 Preliminary Schedule

First day of business of Intuitive Campus is expected to be in the third quarter of 2022.

5.2 Acknowledgment of Annual Monitoring

Intuitive acknowledges that the City will administer monitoring beginning at 75% occupancy and agrees to pay all costs for monitoring. Monitoring could include driveway counts, intercept counts and/or employee surveys. Intuitive will agree an appropriate means of monitoring with the City before annual monitoring begins. Intuitive acknowledges that non-compliance fees will apply and recognizes that the fees are subject to change.

5.3 City TDM Program Contact Information

Mailing Address: City of Sunnyvale

Transportation Demand Program Manager

456 W. Olive Avenue

Sunnyvale, CA 94086

Phone Number: (408) 730-7415

5.4 TDM Coordinator Contact Information

The TDM Coordinator for Intuitive Campus is as follows:

Name: Cynthia Arteaga

Firm: Intuitive

Mailing Address: 1020 Kifer Road

Sunnyvale, CA 94086-5304

Email: cynthia.arteaga@intusurg.com

Phone Number: +1 408 523 2100

CITY OF SUNNYVALE
DIVISION OF TRANSPORTATION AND TRAFFIC

TRANSPORTATION DEMAND MANAGEMENT (TDM) FORM

A Transportation Demand Management (TDM) program is the incorporation of a variety of incentives, services, and actions that influence the reduction of automobile trips in order to provide additional relief from congestion, parking and air quality impacts. Projects within the City of Sunnyvale that require the implementation of a TDM program must have a TDM Form approved by the City prior to issuance of building permits. The site and TDM coordinator contact information must be kept up to date with the City at all times; this information can be updated at any time by submitting an updated TDM Form. One TDM Form must be submitted and approved per site. Parcels sharing driveway access are to be considered a single site and single parcels with two or more separate access points are also considered a single site.

Executive Summary

This report presents the results of the transportation impact analysis conducted for the proposed Lawrence Station Area Plan (LSAP) Update in Sunnyvale, California. The LSAP was adopted by the Sunnyvale City Council on December 6, 2016. The City of Sunnyvale now proposes to increase housing in the LSAP area. As selected by City Council in June 2018, the preferred land use alternative would allow for a housing increase of 3,612 dwelling units within the LSAP area, increasing the total allowable housing units within the LSAP area to 5,935 units. In addition, the LSAP boundary is proposed to be expanded to include adjacent parcels owned by Intuitive Surgical (932 Kifer, 950 Kifer, 945-955 Kifer). These parcels are proposed to allow for a total of 1,280,000 gross square feet (s.f.) of commercial development (including 23,245 s.f. of amenity space and 62,000 s.f. of unoccupied storage area), resulting in 1,194,755 net s.f. of office/R&D area. The proposed gross floor area represents an increase of 1,089,444 s.f. over existing occupied conditions and 700,708 s.f. of office/R&D area over the maximum allowed office/R&D square footage under the current land use regulations for the Intuitive Surgical sites. It should be noted that the LSAP inclusion of the increased commercial development on these Intuitive Surgical parcels would not increase the overall LSAP development capacity.

This study was conducted for the purpose of determining whether the traffic impacts of the proposed LSAP-Update would create any new or substantially more adverse traffic impacts than disclosed in the certified 2016 LSAP EIR on the key intersections and freeway segments in the study area during the weekday AM (7-10 AM) and PM (4-7 PM) peak commute hours. The potential impacts of the proposed LSAP-Update were evaluated in accordance with the standards set forth by the California Environmental Quality Act (CEQA), City of Sunnyvale, and the Santa Clara Valley Transportation Authority (VTA) Congestion Management Program (CMP). The traffic analysis is based on the AM and PM peak hour levels of service for two unsignalized intersections and 61 signalized intersections. Two of the study intersections are within the City of Cupertino, one is within the City of San Jose, and 23 are within the City of Santa Clara. 25 of the study intersections are CMP intersections. The study intersections were selected to include locations where the proposed LSAP-Update is expected to generate 10 or more peak-hour trips per lane.

Intersection Levels of Service under Year 2035 Cumulative Conditions

To determine potential impacts generated by the LSAP-Update, a separate model run was conducted assuming no growth in the LSAP area beyond the current general plan and the adopted LSAP, named the cumulative no LSAP-Update scenario. The cumulative scenario was compared to the cumulative no LSAP-update scenario to disclose impacts. Therefore, all impacted intersections identified in the cumulative scenario are generated by the update portion of the LSAP. If an impacted intersection was also identified with an impact in the original LSAP traffic analysis, the LSAP-Update is said to generate

a greater adverse impact at this intersection. The Sunnyvale Travel Demand Forecasting Model (STFM) for year 2035 was used to forecast the year 2035 cumulative traffic volumes.

The intersection levels of service results for the year 2035 cumulative conditions were compared to the Cumulative no LSAP-Update conditions to determine potential adverse intersection impacts (see Table ES-1). Some of the adversely impacted intersections were previously identified with a significant impact in the certified 2016 LSAP EIR. The LSAP-Update generated adverse impacts at these intersections would be considered substantially more severe than identified in the certified 2016 LSAP EIR.

County of Santa Clara Intersections:

- Lawrence Expressway & Cabrillo Avenue
- Lawrence Expressway & Benton Street
- Lawrence Expressway & Pruneridge Avenue

The certified 2016 LSAP EIR did not identify any significant impact at the intersections listed below, however, the LSAP-Update identifies adverse impacts at these locations. The LSAP-Update generated adverse impacts at these intersections would be considered new impacts.

City of Sunnyvale Intersections:

- Wolfe Road & Arques Avenue
- Wolfe Road & Central Expressway Ramps
- Wolfe Road & Kifer Road

Caltrans Intersections:

- Wolfe Road & El Camino Real
- San Tomas Expressway & El Camino Real

County of Santa Clara Intersections:

- Lawrence Expressway & Oakmead Parkway
- Lawrence Expressway & Arques Avenue
- Lawrence Expressway & Kifer Road
- Lawrence Expressway & Monroe Street
- Oakmead Parkway & Central Expressway
- Bowers Avenue & Central Expressway
- San Tomas Expressway & Scott Boulevard
- San Tomas Expressway & Walsh Avenue
- San Tomas Expressway & Monroe Street

City of Santa Clara Intersections:

- Bowers Avenue & Scott Boulevard
- Bowers Avenue & Kifer Road

Notes:
** = CMP, SC = Santa Clara, County = County of Santa Clara, SJ = San Jose*
">120" indicates this signalized intersection experiences lengthy delay that is beyond the reasonable calculation range of the HCM 2000 methodology.
BOLD indicates unacceptable level of service
BOLD and boxed indicates an adverse cumulative impact

Potential Improvement Strategies for Intersection Impacts

Improvement options were studied for each intersection experiencing impacts under the year 2035 cumulative conditions when compared to cumulative no LSAP-Update conditions. An intersection impact can be satisfactorily addressed by implementing measures that would restore intersection conditions to Cumulative no LSAP-Update conditions. Potential improvement strategies are shown in Table ES-2.

Table ES- 2
Potential Improvement Strategies for Intersection Impacts

#	Intersection	Potential Improvement	Notes
17	Wolfe Road & Arques Avenue	Restripe the northbound approach to include 2 left-turn lanes, 2 through lanes and 1 dedicated right-turn lane. Restripe the westbound approach to include 2 left-turn lanes, 1 shared left-through lane and 1 shared through-right lane. Operate eastbound and westbound approaches with split phasing.	Improvement would require moving the northbound bike lane to the west side of the proposed right-turn lane. This improvement conflicts with the Sunnyvale Active Transportation Plan and therefore is not feasible.
18	Wolfe Road & Central Expressway Ramps	Widen both eastbound and westbound Central Expressway off-ramps to include one left-turn lane, one shared through-left lane and one right-turn lane.	Improvement would require lengthening the respective crosswalks by up to 12 feet. The off-ramps are in County's jurisdiction, so the City cannot ensure the implementation of the potential improvement.
19	Wolfe Road & Kifer Road	The improvement at this intersection is to widen all approaches up to 12 feet to include a second left-turn lane.	Right-of-way acquisition would be required. The LSAP shall require projects within the plan area to contribute a fair share contribution towards the identified improvements.
22	Wolfe Road & El Camino Real	The Sunnyvale City Council approved a concept on June 21, 2016 for a project to improve the Wolfe Road intersections with El Camino Real and with Fremont Avenue, as well as signalizing the intersection at Fremont Avenue and El Camino Real. Bicycle improvements include the extension of bike lanes and installation of bike boxes, and they are detailed in the *Wolfe Road Corridor Traffic Improvement Study* , prepared by Kimley-Horn dated February 2016.	Right-of-way acquisition would be required. This improvement (Triangle – Refined Alternative 3) would require signal coordination between the two Wolfe Road intersections and the new signalized Fremont Avenue and El Camino Real intersection. Modification to this intersection will trigger modifications at the Wolfe Road and Fremont Avenue intersection and the Fremont Avenue and El Camino Real intersection as well. Therefore, the LSAP shall require projects within the plan area to contribute a fair share contribution towards the identified improvements at all three intersections.
33	Lawrence Expressway & Oakmead Parkway	The County of Santa Clara has identified a future project to provide a grade separation at this intersection.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of this grade separation. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection.
34, 35, 36	Lawrence Expressway at Arques Avenue, at Kifer Road, and at Monroe Street	The County of Santa Clara has identified a future project to provide a grade separation at this intersection.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of this grade separation. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection.
37, 39, 41	Lawrence Expressway at Cabrillo Avenue, at Benton Street, and at Pruneridge Avenue	The County of Santa Clara has identified a future project to provide a grade separation at all these intersections.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of these grade separations. These intersections are under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection.

Table ES-2 (continued)
Potential Improvement Strategies for Intersection Impacts

#	Intersection	Potential Improvement	Notes
47	Oakmead Parkway & Central Expressway	Widen westbound Central Expressway to include two left-turn lanes.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the identified improvement. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection.
53	Bowers Avenue & Scott Boulevard	Widen southbound Bowers Avenue to include a second southbound left-turn lane.	This intersection is in City of Santa Clara's jurisdiction, so the City cannot ensure the implementation of the potential improvement.
54	Bowers Avenue & Central Expressway	The County of Santa Clara has identified a future project to provide a grade separation at this intersection.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the grade separation. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection.
55	Bowers Avenue & Kifer Road	Widen eastbound Kifer Road to include a second eastbound left-turn lane.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the identified improvement. However, the intersection is in City of Santa Clara's jurisdiction, so the City cannot ensure the implementation of the potential improvement.
58, 60, 61	San Tomas Expressway at Scott Boulevard, at Monroe Street and at El Camino Real	The County of Santa Clara has identified a future project to provide a grade separation at all these intersections.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of these grade separations. These intersections are under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection.
59	San Tomas Expressway at Walsh Avenue	A grade separation would be required at this intersection.	The LSAP shall require projects within the plan area to contribute their fair share towards the cost of this grade separation. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection.

LSAP-Update Freeway Impact Analysis

VTA CMP guidelines define that a project would cause a freeway impact if the project deteriorates freeway levels of service from an acceptable level to an unacceptable level, or if the freeway already operates at an unacceptable level under existing conditions, the project would add traffic exceeding 1% of the freeway capacity. The LSAP-Update would have an adverse impact on the following freeway segments.

Mixed Flow Lanes – AM Peak Hour

- US 101, northbound from Lawrence Expressway to Embarcadero Road
- US 101, southbound from Oregon Expressway to San Antonio Road
- US 101, southbound from Moffett Boulevard to Ellis Street
- SR 237, eastbound from Great America Parkway to North First Street
- SR 237, westbound from I-880 to Lawrence Expressway
- I-880, northbound from SR 237 to Dixon Landing Road

- I-880, southbound from Dixon Landing Road to SR 237
- I-880, southbound from Tasman Drive to Montague Expressway

HOV Lanes – AM Peak Hour

- US 101, northbound from Lawrence Expressway to Mathilda Avenue
- US 101, northbound from Ellis Street to SR 85

Mixed-Flow Lanes – PM Peak Hour

- US 101, southbound from San Antonio Road to Lawrence Expressway

HOV Lanes – PM Peak Hour

- US 101, southbound from SR 85 to Lawrence Expressway
- US 101, southbound from Montague Expressway to SR 87
- SR 237, westbound from North First Street to Lawrence Expressway

The VTA's Valley Transportation Plan (VTP) 2040 identifies freeway express lane projects along US 101 between Cochrane Road and Whipple Avenue, along SR 237 between N. First Street and SR 85, and along I-880 between the Alameda County Line and US 101. On all identified freeway segments, the existing HOV lanes are proposed to be converted to express lanes. On US 101 along the identified segments, a second express lane is proposed to be implemented for a total of two express lanes in each direction.

On SR 237 and I-880, the existing HOV lanes would be operating over capacity under the year 2035 cumulative conditions. Converting the HOV lanes to express lanes would not mitigate LSAP-Update's impact. On US 101, converting the existing HOV lane to an express lane and adding an express lane in each direction would increase the capacity of the freeway and would adequately address the freeway impacts. The LSAP shall require future projects within the proposed plan area to participate in VTA's Volunteer Freeway Contribution Program and contribute their fair share towards the US 101 Express Lane Project to fund improvements along US 101.

However, capacity improvements on freeways are beyond the capabilities of the City of Sunnyvale. Furthermore, freeways are under Caltrans jurisdiction. It should be noted that both US 101 and SR 237 were identified with impacts under the *Lawrence Station Area-Wide Transportation Plan and Near-Term Final TIA,* dated December 2015, while I-880 was not studied in that report. Therefore, freeway impacts generated by the LSAP-Update on US 101 and SR 237 constitute a substantially more severe freeway impact compared to the original LSAP plan.

Freeway Ramp Capacity Analysis

For the purpose of this study, the LSAP-Update is said to create an adverse impact on a freeway ramp if its implementation:

- Would cause the volume-to-capacity (V/C) ratio of the freeway ramp to exceed 1.0; or
- Would increase the amount of traffic on a freeway ramp that is already exceeding its capacity by more than one percent (1%) of the ramp's capacity.

The freeway ramp volumes under year 2035 cumulative conditions were estimated using the Sunnyvale Travel Demand Forecast Model. All study freeway ramps would continue to operate below capacity.

LSAP Impacts to Transit Facilities

It is expected that the LSAP-Update would increase the number of Caltrain riders. Several trains currently operate at or near capacity. The Caltrain electrification project would enable Caltrain to provide more frequent train service at the Lawrence Caltrain station. Caltrain predicts an initial capacity increase of over 30%. It is expected that the Caltrain electrification project would accommodate the potential increase in transit ridership generated by the LSAP-Update. It is assumed that if the free shuttle service becomes full, employers would increase their funding for the service as required by their TDM requirements or as a part of their commuter benefits and additional shuttles would be provided to meet the demand.

The adopted LSAP plan established five policies to support public transit within the plan area. The implementation of these policies would enhance the travel experience for transit riders within the LSAP plan area, and potentially enhance and/or increase transit services to the plan area.

Transit Travel Times

The results show that all studied transit routes under year 2035 cumulative conditions are expected to experience increased route travel times ranging from 1 minute to 3 minutes compared to existing conditions. The City of Sunnyvale and the VTA do not have adopted standards related to transit corridor performance associated with congestion resulting from new development projects. Per the VTA TIA Guidelines (dated October 2014), *if increased transit vehicle delay is found, the Lead Agency [City of Sunnyvale] should work with VTA to identify feasible transit priority measures near the affected facility and include contributions to any applicable projects that improve transit speed and reliability in the TIA.* Projects within the LSAP study area would be required to pay a fair share contribution to any feasible priority measures near the affected facility.

LSAP Impacts to Pedestrian Facilities

The adopted LSAP plan established 12 policies to provide safe, inviting, and attractive pedestrian connections to Lawrence Station and other key destinations in the Plan area. Along with the implementation of all 12 pedestrian policies, the LSAP would close existing sidewalk gaps, build new pedestrian connections, enhance pedestrian intersection crossings, enhance pedestrian comfort-level on sidewalks, improve pedestrian connections to the Lawrence Caltrain Station, and enhance pedestrian facilities to be functional for all types of users. The conceptual LSAP Sense of Place Plan shows implementation of these policies, which will require new development in the area to implement improvements to the existing pedestrian facilities, and build a new loop road and Class I multi-use trail with direct pedestrian access to the Lawrence Caltrain Station.

LSAP Impacts to Bicycle Facilities

The adopted LSAP plan identifies various bicycle facility improvements to close the gaps in the existing and planned bicycle network. The conceptual LSAP Sense of Place Plan shows implementation of these improvements and will require new development in the area to implement improvements to existing bicycle facilities and construct new facilities as described below. The LSAP-Update also includes additional bicycle facility improvements. The entire list of proposed bicycle improvements is provided in the Sense of Place Plan.

- Calabazas Creek Trail: New Class I multi-use trail in the City of Santa Clara in alignment with Calabazas Creek.
- New Class I multi-use trail from Aster Avenue and extending across the railroad tracks to Sonora Court with a grade-separated pedestrian/bicycle track crossing.

- New Class II bicycle lanes on Kifer Road east of Lawrence Expressway.

In addition to the proposed bicycle facilities within the LSAP plan area, the adopted LSAP plan also identified seven bicycle policies to encourage the use of bicycles for local and inter-neighborhood access. Along with the implementation of all seven bicycle policies, the LSAP-Update plan would build new bicycle connections east-west across Lawrence Expressway and north-south across the rail tracks and improve bicycle connections to the Lawrence Caltrain Station. The LSAP-Update also proposes a new east-west Class I multi-use trail from either end of the LSAP boundaries, north of the tracks. The trail would be located on private property, as properties redevelop. The adopted LSAP includes a new loop road to connect Corvin Drive (east of Lawrence Expressway) and Semiconductor Drive (west of Lawrence Expressway) to the Caltrain station. The loop road would include Class II bike lanes and would be built on private property, as properties redevelop.

Projects within the LSAP study area would be required to pay their fair share contribution towards bicycle improvements or construct, as applicable.

1. Introduction

This report presents the results of the transportation impact analysis conducted for the proposed Lawrence Station Area Plan (LSAP)-Update in Sunnyvale, California (see Figure 1). The LSAP was adopted by the Sunnyvale City Council on December 6, 2016. The City of Sunnyvale now proposes to increase housing in the LSAP area. As selected by the City Council in June 2018, the preferred land use alternative would allow for a housing increase of 3,612 dwelling units within the LSAP area, increasing the total allowable housing units within the LSAP area to 5,935 units. In addition, the LSAP boundary is proposed to be expanded to include adjacent parcels owned by Intuitive Surgical (932 Kifer, 950 Kifer, 945-955 Kifer). These parcels are proposed to allow for a total of 1,280,000 gross square feet (s.f.) of commercial development (including 23,245 s.f. of amenity space and 62,000 s.f. of unoccupied storage area), resulting in 1,194,755 net s.f. of office/R&D area. The proposed gross floor area represents an increase of 1,089,444 s.f. over existing occupied conditions and 700,708 s.f. of office/R&D area over the maximum allowed office/R&D square footage under the current land use regulations for the Intuitive Surgical sites. It should be noted that the LSAP inclusion of the increased commercial development on these Intuitive Surgical parcels would not increase the overall LSAP development capacity.

Scope of Study

This study was conducted for the purpose of determining whether the traffic impacts of the proposed LSAP-Update would create any new or substantially more adverse traffic impacts than disclosed in the certified 2016 LSAP EIR on the key intersections and freeway segments in the study area during the weekday AM (7-10 AM) and PM (4-7 PM) peak commute hours. The potential impacts of the proposed LSAP-Update were evaluated in accordance with the standards set forth by the California Environmental Quality Act (CEQA), City of Sunnyvale, and the Santa Clara Valley Transportation Authority (VTA) Congestion Management Program (CMP). The traffic analysis is based on the AM and PM peak hour levels of service for two unsignalized intersections and 61 signalized intersections. Two of the study intersections are within the City of Cupertino, one is within the City of San Jose, and 23 are within the City of Santa Clara. Twenty-five of the study intersections are CMP intersections. The study intersections were selected to include locations where the LSAP-Update is expected to generate 10 or more peak-hour trips per lane.

The Santa Clara County VTA CMP guidelines require that the CMP freeway segments be evaluated to determine the impact of added traffic for projects that generate trips equal to or greater than one percent of the freeway segment's capacity. The proposed LSAP-Update is expected to generate added traffic volume on multiple freeway segments along US 101, SR 237 and I-880. The traffic analysis also includes a capacity analysis for ten freeway ramps.

8. Southbound Off-Ramp to Lawrence Expressway

SR 237 and Lawrence Expressway Interchange

9. Eastbound On-Ramp from Northbound Lawrence Expressway
10. Westbound Off-Ramp to Southbound Lawrence Expressway

Traffic conditions at the study intersections were analyzed for both the weekday AM and PM peak hours of adjacent street traffic. The AM peak hour is expected to occur between 7:00 AM and 10:00 AM and the PM peak hour is expected to occur between 4:00 PM and 7:00 PM on a regular weekday. These are the peak commute hours during which most traffic congestion occurs on the roadways.

Traffic conditions were evaluated for the following scenarios:

Scenario 1: ***Existing Conditions.*** Existing traffic volumes at study intersections were based on traffic counts conducted in 2017 through 2019, as well as the 2018 CMP TRAFFIX database. The study intersections were evaluated with a level of service analysis using TRAFFIX software in accordance with the *2000 Highway Capacity Manual* methodology. Study freeway segments were analyzed in accordance with the VTA CMP method, and study freeway ramps were analyzed using demand to capacity ratios.

Scenario 2: ***2035 Cumulative Conditions.*** The 2035 cumulative conditions traffic volumes were estimated using the Sunnyvale Traffic Demand Forecast Model for year 2035. In addition to land uses assumed under the current General Plan, the cumulative conditions include the proposed LSAP-Update, the proposed El Camino Real Specific Plan, the proposed Fortinet Master Plan, and the proposed Downtown Specific Plan Update. To determine potential impacts generated by the update portion of the LSAP, a separate model run was conducted assuming no growth in the LSAP study area beyond the current general plan and adopted LSAP. The cumulative scenario was compared to the cumulative no-LSAP-Update scenario to disclose impacts. If an impact was identified in the original LSAP traffic study, the LSAP-Update is said to generate a greater adverse impact.

Methodology

This section presents the methods used to determine the traffic conditions for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from previous traffic counts, the City of Sunnyvale, the VTA CMP TRAFFIX database, and field observations. The following data were collected from these sources:

- existing traffic volumes,
- existing lane configurations, and
- signal timing and phasing.

Level of Service Standards and Analysis Methodologies

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The various analysis methods are described below.

Signalized Study Intersections

All City of Sunnyvale, San Jose, Cupertino, and Santa Clara level of service analysis methodologies for signalized intersections are the *Highway Capacity Manual* (HCM) 2000 operations method. This method is applied using the TRAFFIX software. The HCM 2000 operations method evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. Since TRAFFIX is also the CMP-designated traffic impact analysis tool, the City of Sunnyvale employs the CMP default values for the analysis parameters within the software.

The Cities of Sunnyvale, San Jose, Cupertino, and Santa Clara level of service standards for signalized intersections are all LOS D or better. Within the City of Sunnyvale, intersections on roadways considered to be "regionally significant" have a standard of LOS E. In the study area, signalized intersections within Sunnyvale along El Camino Real, Sunnyvale-Saratoga Road, Central Expressway and Lawrence Expressway are considered regionally significant. The correlation between average control delay and level of service is shown in Table 1.

CMP Intersections

The designated level of service analysis methodology for the CMP is also the HCM 2000 operations method for signalized intersections, using TRAFFIX. The CMP level of service standard for signalized intersections within the City of Sunnyvale, San Jose, Cupertino and Santa Clara is LOS E or better.

Table 1
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B+ B B-	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 12.0 12.1 to 18.0 18.1 to 20.0
C+ C C-	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though many still pass through the	20.1 to 23.0 23.1 to 32.0 32.1 to 35.0
D+ D D-	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and	35.1 to 39.0 39.1 to 51.0 51.1 to 55.0
E+ E E-	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 60.0 60.1 to 75.0 75.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major-contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *Highway Capacity Manual 2000* (Washington, D.C., 2000) p10-16.

Unsignalized Study Intersections

The level of service for the unsignalized intersections was evaluated using the 2000 HCM methodology. Level of service for unsignalized (stop-controlled and yield controlled) intersections is evaluated based on the delay experienced by vehicles on the controlled approaches. For two-way or T-intersections, operations are defined by the average control delay experienced by the worst approach. For all-way stop controlled intersections, the level of service is reported based on the average delay for all approaches. The City of Sunnyvale General Plan level of service standard for unsignalized intersections is LOS D or better.

The correlation between delay and level of service for unsignalized intersections is shown in Table 2.

Table 2
Unsignalized Intersection Level of Service Based on Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Little or no traffic delay	10.0 or less
B	Short Traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, *Highway Capacity Manual 2000* (Washington, D.C., 2000) p17-2.

Traffic Signal Warrant Analysis

An assessment of the need for signalization was conducted for unsignalized study intersections. For this study, the need for signalization was assessed on the basis of the peak hour volume signal warrant (Warrant #3) described in the 2014 California Manual on Uniform Traffic Control Devices (CA MUTCD). This method provides an indication of whether traffic conditions and peak-hour traffic levels are, or would be, sufficient to justify the installation of a traffic signal. It should be noted that it is just one of the factors/warrants used to indicate whether installation of a traffic control signal is justified.

Freeway Segments

Within Santa Clara County, freeway segments are analyzed as prescribed in the Santa Clara County CMP technical guideline. The level of service for freeway segments is estimated based on vehicle density. Density is calculated by the following formula:

$$D = V / (N*S)$$

Where:

D = density, in vehicles per mile per lane (vpmpl)
V = peak hour volume, in vehicle per hour (vph)
N = number of travel lanes
S = average travel speed, in miles per hour (mph)

The vehicle density on a segment is correlated to level of service as shown in Table 3. The CMP requires that mixed-flow lanes and auxiliary lanes be analyzed separately from high-occupancy vehicle (HOV) lanes (otherwise known as carpool lanes). The CMP specifies that a capacity of 2,300 vehicles per hour per lane (vphpl) be used for segments three lanes or wider in one direction, and a capacity of 2,200 vphpl be used for segments two lanes wide in one direction. HOV lanes are specified as having a capacity of 1,650 vphpl.

Table 3
Freeway Segment Level of Service Definition

Level of Service	Description	Density (vehicles/mile/lane)
A	Average operating speeds at the free-flow speed generally prevail. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream.	11.0 or less
B	Speeds at the free-flow speed are generally maintained. The ability to maneuver within the traffic stream is only slightly restricted, and the general level of physical and psychological comfort provided to drivers is still high.	11.0 to 18.0
C	Speeds at or near the free-flow speed of the freeway prevail. Freedom to maneuver within the traffic stream is noticeably restricted, and lane changes require more vigilance on the part of the driver.	18.0 to 26.0
D	Speeds begin to decline slightly with increased flows at this level. Freedom to maneuver within the traffic stream is more noticeably limited, and the driver experiences reduced physical and psychological comfort levels.	26.0 to 46.0
E	At this level, the freeway operates at or near capacity. Operations in this level are volatile, because there are virtually no usable gaps in the traffic stream, leaving little room to maneuver within the traffic stream.	46.0 to 58.0
F	Vehicular flow breakdowns occurs. Large queues form behind breakdown points.	greater than 58.0

Source: Santa Clara County Valley Transportation Authority, Transportation Impact Analysis Guidelines, Updated March 2009 (Based on the *Highway Capacity Manual (2000), Washington, D.C.)*

Freeway Ramps

A freeway ramp analysis was performed in order to verify that the freeway ramps would have sufficient capacity to serve the expected traffic volumes with and without the project. This analysis consisted of a volume-to-capacity ratio evaluation of the freeway ramps at the study interchanges. The ramp capacities were obtained from the *Highway Capacity Manual 2000*, and considered the free-flow speed, number of lanes on the ramp, and ramp metering.

Report Organization

The remainder of this report is divided into two chapters. Chapter 2 describes the existing roadway network, transit services, and pedestrian facilities. Chapter 3 presents the traffic conditions in the LSAP study area under the year 2035 cumulative conditions, the project impacts on the transportation system, and any recommended improvement measures.

2. Existing Conditions

This chapter describes the existing conditions for transportation facilities in the vicinity of the LSAP study area, including the roadway network, transit service, pedestrian and bicycle facilities.

Existing Roadway Network

The proposed Lawrence Station Area Plan (LSAP) study area comprises approximately 319 acres adjacent to the Lawrence Caltrain Station, with properties within ½ mile radius of the station generally included in the study area. Regional access to the study area is provided by US 101 to the north, I-280 to the south and SR 85 and SR 237 to the west. These facilities are described below.

US 101 is an eight-lane freeway (three mixed-flow lanes and one HOV lane in each direction) within the vicinity of Sunnyvale. LSAP study area access to and from US 101 is provided via its interchanges at Fair Oaks Avenue, Lawrence Expressway, and Bowers Avenue.

I-280 is an eight-lane freeway (three mixed-flow lanes and one HOV lane in each direction) within the vicinity of Sunnyvale. I-280 provides regional freeway access between the cities of San Francisco and San Jose. LSAP study area access to and from I-280 is provided via its interchanges at Wolfe Road, Stevens Creek Boulevard, and Lawrence Expressway.

SR 237 is a four-lane to six-lane freeway within the vicinity of Sunnyvale that extends west to El Camino Real and east to I-880 in Milpitas. East of Mathilda Avenue, SR 237 has two mixed-flow lanes and one HOV lane in each direction. West of Mathilda Avenue, SR 237 has two mixed-flow lanes in each direction. LSAP study area access to and from SR 237 is provided via its interchanges at Fair Oaks Avenue and Lawrence Expressway.

SR 85 is a six-lane freeway (two mixed-flow lanes and one HOV lane in each direction) that begins at the US 101 interchange east of Shoreline Boulevard, extends south towards San Jose and terminates at the US 101 interchange south of Silicon Valley Boulevard/Bernal Road. LSAP study area access to and from SR 85 is provided via interchanges with Fremont Avenue and El Camino Real.

Major roadways within or near the LSAP study area include El Camino Real, Lawrence Expressway, Central Expressway, San Tomas Expressway, Mary Avenue, Mathilda Avenue, Sunnyvale Avenue, Fair Oaks Avenue, Wolfe Road, Bowers Avenue, Evelyn Avenue, Remington Drive, Fremont Avenue, Reed Avenue and Monroe Street, Kifer Road, Arques Avenue, and Tasman Drive.

El Camino Real is a six-lane divided arterial that extends from Mission Street in Colma to The Alameda in Santa Clara. Within the vicinity of Sunnyvale, El Camino Real has a posted speed limit of 40 miles per hour (mph). Sidewalks are present along both sides of the roadway, and all major signalized intersections have crosswalks and pedestrian push buttons and signal heads across all legs. Bike lanes are present between Fair Oaks Avenue and Sunnyvale Avenue. On-street parking is permitted along certain segments of the roadway. El Camino Real provides regional access to the LSAP study area via its interchange with Lawrence Expressway, as well as its intersections with Wolfe Road and Bowers Avenue.

Lawrence Expressway is a north-south, eight-lane expressway with a raised median and a posted speed limit of 50 mph. It begins at Saratoga Avenue in the south, crosses through Sunnyvale, and extends northward and transitions into Caribbean Drive. HOV lanes are present between Stevens Creek Boulevard and Oakmead Parkway. Lawrence Expressway connects with US 101 via full-access freeway interchanges. Lawrence Expressway includes sidewalks along both sides on most segments and crosswalks at signalized intersections. There are no bike lanes on Lawrence Expressway, but bikes are allowed to ride on the shoulders. On-street parking is not permitted on this roadway. Lawrence Expressway provides regional access to the LSAP study area via its interchanges with SR 237, US 101, Central Expressway and I-280.

Central Expressway is an east-west, four-lane to six-lane expressway. It begins at Trimble Road in the east, crosses Sunnyvale, extends westward and transitions into Alma Street. In the study area, Central Expressway has two eastbound lanes and two westbound lanes and a posted speed limit of 50 mph. Central Expressway is mostly grade-separated within Sunnyvale except at Mary Avenue. The Mary Avenue intersection has crosswalks with pedestrian push buttons and signal heads across all legs. There are no sidewalks or bike lanes along Central Expressway, but bikes are allowed to ride on the shoulders. On-street parking is not permitted on this roadway. Central Expressway has intersections at Mary Avenue, Oakmead Parkway, and Bowers Avenue, and interchanges at Mathilda Avenue, Fair Oaks Avenue, Wolfe Road and Lawrence Expressway.

San Tomas Expressway is a north-south, six-lane to eight-lane expressway with a raised median and a posted speed limit of 45 mph. It begins at Camden Avenue in the south, crosses through Santa Clara, and extends northward and transitions into Montague Expressway. HOV lanes are present between Winchester Boulevard and Central Expressway. San Tomas Expressway connects with US 101 via full-access freeway interchanges. There are sidewalks on both sides of the roadway along certain segments and crosswalks at signalized intersections. There are no bike lanes on San Tomas Expressway, but bikes are allowed to ride on the shoulders. The San Tomas Aquino Creek Trail is a shared bicycle and pedestrian trail located along the west side of San Tomas Expressway. It extends from Homestead Road to Monroe Street, where it diverts to follow the San Tomas Aquino Creek. On-street parking is not permitted on this roadway. San Tomas Expressway provides regional access to the LSAP study area via its interchanges with US 101 and Central Expressway.

Mary Avenue is a north-south, two-lane to six-lane roadway with a posted speed limit of 35 to 40 mph. It extends from Almanor Avenue south to Homestead Road. Mary Avenue has sidewalks and bike lanes along both sides throughout Sunnyvale. Intersections with major roadways have crosswalks, pedestrian push buttons, and signal heads. On-street parking is generally permitted along the roadway segments within the residential neighborhood. Mary Avenue provides regional access to the study area via its intersection with Central Expressway.

Mathilda Avenue/Sunnyvale-Saratoga Road is a north-south, six-lane roadway with a posted speed limit of 35 to 45 mph. It extends from E. Caribbean Drive (north of US 237) south past El Camino Real, transitions to Sunnyvale-Saratoga Road and extends south into Cupertino and Saratoga. There are sidewalks on both sides of the street for the whole length of the roadway with crosswalks, pedestrian push buttons, and signal heads at all major intersections. Bike lanes are generally present along Mathilda Avenue north of Iowa Avenue. Bike lanes are present along Mathilda Avenue/Sunnyvale-Saratoga Road south of El Camino Real. On-street parking is permitted along certain segments of the roadway. Mathilda Avenue provides regional access to the LSAP study area via its interchanges with US 101 and Central Expressway and its intersections with Remington Drive and El Camino Real.

Sunnyvale Avenue is a north-south, two-lane roadway with a posted speed limit of 30 mph. It extends from E. Maude Avenue south to El Camino Real. Sunnyvale Road has sidewalks on both sides of the roadway through all segments with crosswalks, pedestrian push buttons, and signal heads at all major intersections. Bike lanes are present along Sunnyvale Avenue south of Evelyn Avenue. On-street parking is permitted along certain segments of the roadway

Fair Oaks Avenue is a north-south, four-lane to six-lane roadway with a posted speed limit of 30 mph. It extends from SR 237 to El Camino Real and transitions into Remington Drive. Sidewalks exist on both sides for most of the segments along with crosswalks, pedestrian push buttons, and signal heads at all major intersections. Bike lanes are present along Fair Oaks Avenue between Evelyn Avenue and Kifer Road, as well as south of Old San Francisco Road. On-street parking is generally permitted north of Old San Francisco Road. Fair Oaks Avenue provides regional access to the LSAP study area via its interchanges with SR 237, US 101 and Central Expressway.

Wolfe Road is a four-lane to six-lane, north-south arterial that begins north at N. Fair Oaks Avenue, and extends south into the City of Cupertino, ending at Stevens Creek Boulevard (its transition point into Miller Avenue). Wolfe Road has a posted speed limit of 35 mph in the study area. Wolfe Road includes sidewalks along most segments on both directions of travel and crosswalks at signalized intersections. Bike routes or lanes are present along Wolfe Road for its entirety. On-street parking is permitted along only certain segments of the roadway. Wolfe Road provides regional access to the LSAP study area via its interchanges with Central Expressway and I-280.

Bowers Avenue is a four-lane to six-lane, north-south arterial with a posted speed limit of 35 to 40 mph. It begins as Kiely Boulevard south of El Camino Real and transitions into Great America Parkway at US 101. Bowers Avenue includes sidewalks along both directions of travel and crosswalks at signalized intersections. Bike routes or lanes are present along both directions of Bowers Avenue as well. On-street parking is permitted between Chromite Drive and Donovan Avenue. Bowers Avenue provides regional access to the LSAP study area via its interchange with US 101 and intersection with Central Expressway.

Tasman Drive is a two-lane to four-lane roadway with a posted speed limit of 40 mph in the project vicinity. Tasman Drive begins at Morse Avenue in the west and extends east past I-880 and transitions into Great Mall Parkway. The VTA Light Rail tracks are present in the middle of Tasman Drive east of Fair Oaks Avenue. Tasman Drive includes sidewalks along some segments on both directions of travel and crosswalks at signalized intersections. Bike routes or lanes are provided within the project vicinity. Tasman Drive provides regional access to the LSAP study area via its intersections with Fair Oaks Avenue and Lawrence Expressway.

Arques Avenue is a two-lane to four-lane roadway with a posted speed limit of 35 mph in the project vicinity. Arques Avenue begins at Stowell Avenue in the west and extends east past San Tomas Expressway and transitions into Scott Boulevard. Arques Avenue connects with Central Expressway via a westbound on-ramp and an eastbound off-ramp. Arques Avenue connects with Lawrence Expressway via a traffic signal. Sidewalks are present along both sides of the street between Wolfe Road and Lawrence Expressway and along the north side between Fair Oaks Avenue and Wolfe Road. Bike lanes are provided east of Fair Oaks Avenue.

Kifer Road is a four-lane roadway within the project vicinity with a posted speed limit of 40 miles per hour (mph). Kifer Road begins at Fair Oaks Avenue in the west and extends east towards Bowers Avenue, where it transitions into Walsh Avenue. Kifer Road has a center two-way left-turn median along the entirety of the roadway. On-street parking is prohibited on both sides of Kifer Road within the project vicinity. In the study area, Kifer Road includes sidewalks along some segments of the roadway and crosswalks at the nearby signalized intersections. Bike lanes are provided on both sides of Kifer Road between Fair Oaks Avenue and Lawrence Expressway and between Corvin Drive and Uranium Drive. Bike lanes are present on the south side of Kifer Road between the Costco Driveway and Corvin Drive, mainly due to construction on the north side. Kifer Road provides direct access to the project site.

Reed Avenue/Monroe Street is a two-lane to four-lane roadway with a posted speed limit of 35 mph in the project vicinity. Reed Avenue/Monroe Street begins west at Wolfe Road as Reed Avenue and extends southeast towards its terminus at Tisch Way in the City of San Jose. Reed Avenue is within the City of Sunnyvale, and transitions to Monroe Street in the City of Santa Clara at its intersection with Lawrence Expressway (Sunnyvale-Santa Clara city boundary). Reed Avenue/Monroe Street has a center two-way left-turn lane that runs along the entirety of the roadway. In the study area, on-street parking is permitted on the north side of Reed Avenue between Wolfe Road and Sitka Terrace, along portions of both sides between Evelyn Avenue and Timberpine Avenue, and along the south side between Timberpine Avenue and Willow Avenue. On Monroe Street, on-street parking is permitted on both sides east of Nobili Avenue. Sidewalks are present along both sides of the street. Bike lanes are provided on both sides of Reed Avenue between Sunnyvale Avenue and Lawrence Expressway and on the north side of Monroe Street between Lawrence Expressway and Nobili Avenue.

Evelyn Avenue is a two-lane to four-lane roadway that begins west at Castro Street in the City of Mountain View and extends east to its terminal at Reed Avenue in the City of Sunnyvale. Within Sunnyvale, Evelyn Avenue generally includes two travel lanes and a center two-way left-turn lane and has a posted speed limit of 30 mph in the study area. Evelyn Avenue includes sidewalks and bicycle lanes on both directions of travel and crosswalks at signalized intersections. On-street parking is permitted along most segments of this roadway.

Remington Drive is an east-west, two-lane to four-lane roadway with a posted speed limit of 35 mph that begins west at S Bernardo Avenue and ends at El Camino Real before transitioning into Fair Oaks Avenue. It has bike lanes and sidewalks along both directions of the roadway on all segments and has crosswalks, pedestrian push buttons, and signal heads at major intersections. On-street parking is permitted west of Sunnyvale-Saratoga Road.

Fremont Avenue is an east-west, two-lane to six-lane roadway with a posted speed limit of 30 mph that begins west along Foothill Expressway in Los Altos and ends as it joins El Camino Real. It has bike lanes along the full length of the roadway. There are sidewalks on both sides of the roadway along some segments and there are crosswalks, pedestrian push buttons, and signal heads at major intersections. On-street parking is not permitted on this roadway. Fremont Avenue provides regional access to the LSAP study area via its interchange with SR 85.

Existing Bicycle Facilities

Bicycle facilities in the vicinity of the LSAP study area include bike lanes and bike routes. Bike lanes are lanes on roadways designated for use by bicycles with special lane markings, pavement legends, and signage. Bike routes are streets that accommodate bicycles with pavement markings and signage but are not separate from the travel lanes.

The existing bicycle facilities in the study area are shown on Figure 2. The following bicycle facilities exist within the immediate vicinity of the LSAP study area:

Bike Lanes:

- Kifer Road between Fair Oaks Avenue and Lawrence Expressway, and between the Costco Driveway and Uranium Drive
- Fair Oaks Avenue between Evelyn Avenue and Kifer Road
- Evelyn Avenue
- Reed Avenue/Old San Francisco Road between Sunnyvale Avenue and Lawrence Expressway
- Wolfe Road between Reed Avenue and Fair Oaks Avenue
- Arques Avenue/Scott Boulevard between Central Expressway and Fair Oaks Avenue
- Oakmead Parkway between Lawrence Expressway and Central Expressway
- Stewart Drive between Duane Avenue and Wolfe Road
- Duane Avenue between Fair Oaks Boulevard and AMD Place
- DeGuigne Drive/Commercial Street between Duane Avenue and Central Expressway
- Bowers Avenue between Great America Parkway and Chromite Drive
- Aster Avenue between E. Evelyn Avenue and Willow Avenue

Bike routes are present along Wolfe Road between Fremont Avenue and Reed Avenue, on Fair Oaks Avenue between Tasman Drive and Weddell Drive, between Ahwanee Avenue to Kifer Road, and between Evelyn Avenue to Old San Francisco Road, and on Bowers Avenue between El Camino Real and Chromite Drive. According to the *City of Sunnyvale Bike Map, 2018 Edition*, there are three guided bike routes within the City. Each guided route is briefly described below and shown on Figure 2:

- Bike Route 352: This is a generally north-south bike route that extends north from the southern City limits into the Moffett Park area. North of El Camino Real, this route travels along Sunnyvale Avenue until Evelyn Avenue and transitions into Bike Route 353 (described below). South of El Camino Real, this bike route zigzags along local roadways west of Sunnyvale-Saratoga Road, providing access to Fremont High School and Nimitz Elementary School.

- Bike Route 353: This is a generally north-south bike route that extends north from the southern City limits into the Moffett Park area. South of Evelyn Avenue, this route transitions into Bike Route 352 (described above). North of Evelyn Avenue, this route travels mostly along Morse Avenue south of US 101 and along Borregas Avenue north of US 101. Bike Route 353 provides access to Bishop Elementary School and Columbia Middle School.

- Bike Route 600: This is a generally east-west bike route that extends east from the intersection at Bernardo Avenue and El Camino Real and ending east at Poinciana Drive. This route travels parallel and north of El Camino Real along residential roadways (mainly Olive Avenue, Gail Avenue, Iris Avenue and Lily Avenue). This route provides access to the Civic Center, Ellis Elementary School, Braly Elementary School and Ponderosa Elementary School.

Overall, the existing bicycle facilities in the LSAP study area provide adequate connections for bicycles. However, certain segments of Kifer Road east Lawrence Expressway are missing bicycle facilities. Additionally, San Zeno Way, Lawrence Station Road, and Willow Avenue do not provide bicycle facilities, which would otherwise connect the Lawrence Caltrain Station to the surrounding areas.

Existing Pedestrian Facilities

Within the immediate vicinity of the LSAP study area, sidewalks and crosswalks are present along most sections of roadways. As shown on Figure 3, sidewalks and crosswalks are missing along only selected sections of the roadways. Along Kifer Road, which is the roadway fronting the majority of the LSAP study area, sidewalk is mostly missing on both sides of the street west of the LSAP boundary and on the north side near Corvin Drive. Sidewalk is also missing along certain segments of Corvin Drive, Oakmead Parkway, Arques Avenue, north side on Aster Avenue, and fronting the Greystar (1120 Kifer Road) construction site, the Lawrence Station Development construction site, and the Nuevo construction site. Pedestrian crosswalks and signal heads are present at the nearby signalized intersections. Currently, sidewalks along Kifer Road are generally six feet wide. According to the City's current General Plan Land Use and Transportation Element, Kifer Road, which is a Commercial/Industrial Corridor, should have sidewalks with a width of 11 feet. The current sidewalk widths along Kifer Road do not comply with General Plan standards.

Existing Transit Service

Existing transit services in the vicinity of the Lawrence Station Area Plan (LSAP) study area are provided by Caltrain, VTA, and ACE. Bus routes that are serving the LSAP study area are described in Table 4 and shown on Figure 4.

Table 4
Existing Transit Services

Bus Route	Route Description	Nearest Bus Stops	Weekday Hours of Operation	Headway
Local Route 21	Sunnyvale Transit Center to Milpitas Transit Center	Lawrence Expressway & Reed Avenue	5:30 AM - 10:00 PM	30 min
Frequent Route 57	Old Ironsides Station to West Valley Community College	Bowers Avenue & Kifer Road	5:30 AM - 11:00 PM	15 min
ACE Gray Line	Kifer/Oakmead Village to Great America ACE Amtrak Station	Commercial Street & Kifer Road, 1050 Kifer Road, San Ysidro Way & Kifer Road, Copper Road & Kifer Road, 1450 Kifer Road	6:15 AM - 9:45 AM 3:20 PM - 6:40 PM	60 min
Mission College Shuttle	Lawrence Caltrain Station to Mission area office buildings	Lawrence Caltrain Station	6:20 AM - 9:45 AM 3:20 PM - 6:40 PM	30 - 75 min
Bowers/Walsh Shuttle	Lawrence Caltrain Station to Bowers area office buildings	Lawrence Caltrain Station	7:15 AM - 9:55 AM 3:15 PM - 6:45 PM	35 - 80 min

Caltrain Service

Commuter rail service between San Francisco and Gilroy is provided by Caltrain. There are two Caltrain stations within the City of Sunnyvale: the Sunnyvale Caltrain Station and the Lawrence Caltrain Station.

Sunnyvale Caltrain Station

The Sunnyvale Caltrain Station, located near the intersection of Frances Street and Evelyn Avenue, provides Caltrain service with approximately 15- to 30-minute headways during the weekday AM and PM commute hours and 60-minute headways during weekday midday and night hours as well as on weekends. The Sunnyvale Caltrain Station provides service for all Local, Limited-Stop, and Baby-Bullet trains. VTA bus routes 20, 21, 53, 55, and 523 all stop at the Sunnyvale Transit Center, which is across the street from the Sunnyvale Caltrain Station. The Sunnyvale Caltrain Station is located approximately 1.6 miles from the project site (routed from the Commercial Street/Kifer Road intersection), which is approximately a 9-minute bike ride. There are continuous pedestrian facilities between the Sunnyvale Caltrain station and the project site. Bicycle lanes are present on Kifer Road, but the ends of Hendy Avenue between Kifer Road and the Sunnyvale Caltrain station do not provide bicycle facilities.

Lawrence Caltrain Station

The Lawrence Caltrain Station, located beneath the Lawrence Expressway overcrossing between Reed Avenue and Kifer Road, provides Caltrain service with approximately 20- to 30-minute headways during the weekday AM and PM commute hours and 60-minute headways during weekday midday and night hours as well as on weekends. The Lawrence Caltrain Station provides service for only Local and Limited-Stop trains. Services are provided between 4:30 AM and 1:45 AM (next day). The Baby-Bullet train does not stop at the Lawrence Caltrain Station. VTA bus route 21 stops at the intersection at Lawrence Expressway and Reed Avenue, approximately 0.3 mile from the station. The Lawrence Caltrain Station is located within the Lawrence Station Area Plan boundary.

Two free public Caltrain shuttles provide service at the Lawrence Caltrain Station: the Bowers/Walsh shuttle and the Mission shuttle. The shuttle routes are shown on Figure 4. These shuttles are funded jointly by the Bay Area Air Quality Management District, the Peninsula Corridor Joint Powers Board and private employers.

Existing Intersection Lane Configurations

The existing lane configurations at the study intersections were determined by observations in the field and are shown on Figure 5.

Existing Traffic Volumes

The existing traffic volumes were obtained from peak hour traffic counts collected in 2017 through 2019. The existing PM traffic counts for the CMP intersections were collected in 2018. The existing AM and PM peak hour traffic volumes are shown graphically on Figure 6. Traffic count data are included in Appendix A. Traffic volumes at the study intersections for all scenarios of the traffic study are included in Appendix B.

Existing Intersection Levels of Service

Intersection levels of service were evaluated against the respective city and CMP standards. The results of the intersection level of service analysis under existing conditions are summarized in Tables 5 and 6 and shown on Figure 7. The results of the analysis show that the following intersections currently operate at unacceptable levels:

City of Sunnyvale Intersections:

- Wolfe Road & Maude Avenue (#15) – PM Peak Hour (LOS F)
- Wolfe Road & Central Expressway Ramps (#18) – PM Peak Hour (LOS E)

County of Santa Clara Intersections:

- Lawrence Expressway & Lakehaven Drive (#30) – AM & PM Peak Hours (LOS F)
- Lawrence Expressway & Kifer Road (#35) – PM Peak Hour (LOS F)
- Lawrence Expressway & Monroe Street (#36) – AM Peak Hour (LOS F)

The intersection levels of service calculation sheets are included in Appendix B.

Existing Freeway Levels of Service

Existing weekday AM and PM peak-hour traffic volumes on the study freeway segments were obtained from the 2018 CMP Annual Monitoring Report. The existing freeway levels of service during the weekday peak hours of traffic are summarized in Figures 8 to 11 and shown on Table 7.

Table 5
Existing Intersection Levels of Service – Signalized Intersections

#	Intersection	Peak Hour	Count Date	LOS Std.	Existing Conditions Avg. Delay (sec)	Existing Conditions LOS
1	Mary Avenue & Central Expressway (County*)	AM	11/14/17	E	51.5	D-

Existing Freeway Ramp Capacity Analysis

This analysis consists of a volume-to-capacity ratio evaluation of the study freeway ramps. The ramp capacities were obtained from the *Highway Capacity Manual 2000* (Chapter 25), which considers both the free-flow speed and the number of lanes on the study ramps. As a conservative approach, on-ramps that currently have ramp meter equipment are analyzed with a capacity of 900 vehicles per hour for the mixed-flow lanes. The peak-hour freeway ramp volumes were obtained from recent traffic counts and Caltrans (see Table 7).

The ramp analysis shows that the freeway ramps currently have sufficient capacity to serve the existing traffic volumes. The study ramps have a volume-to-capacity (V/C) ratio that is well below 1.0, which means that the existing traffic demand is lower than the ramp capacity.

Table 7
Existing Freeway Ramp Capacity Analysis

Interchange	Ramp	Type	Peak Hour	Lanes				Existing Conditions

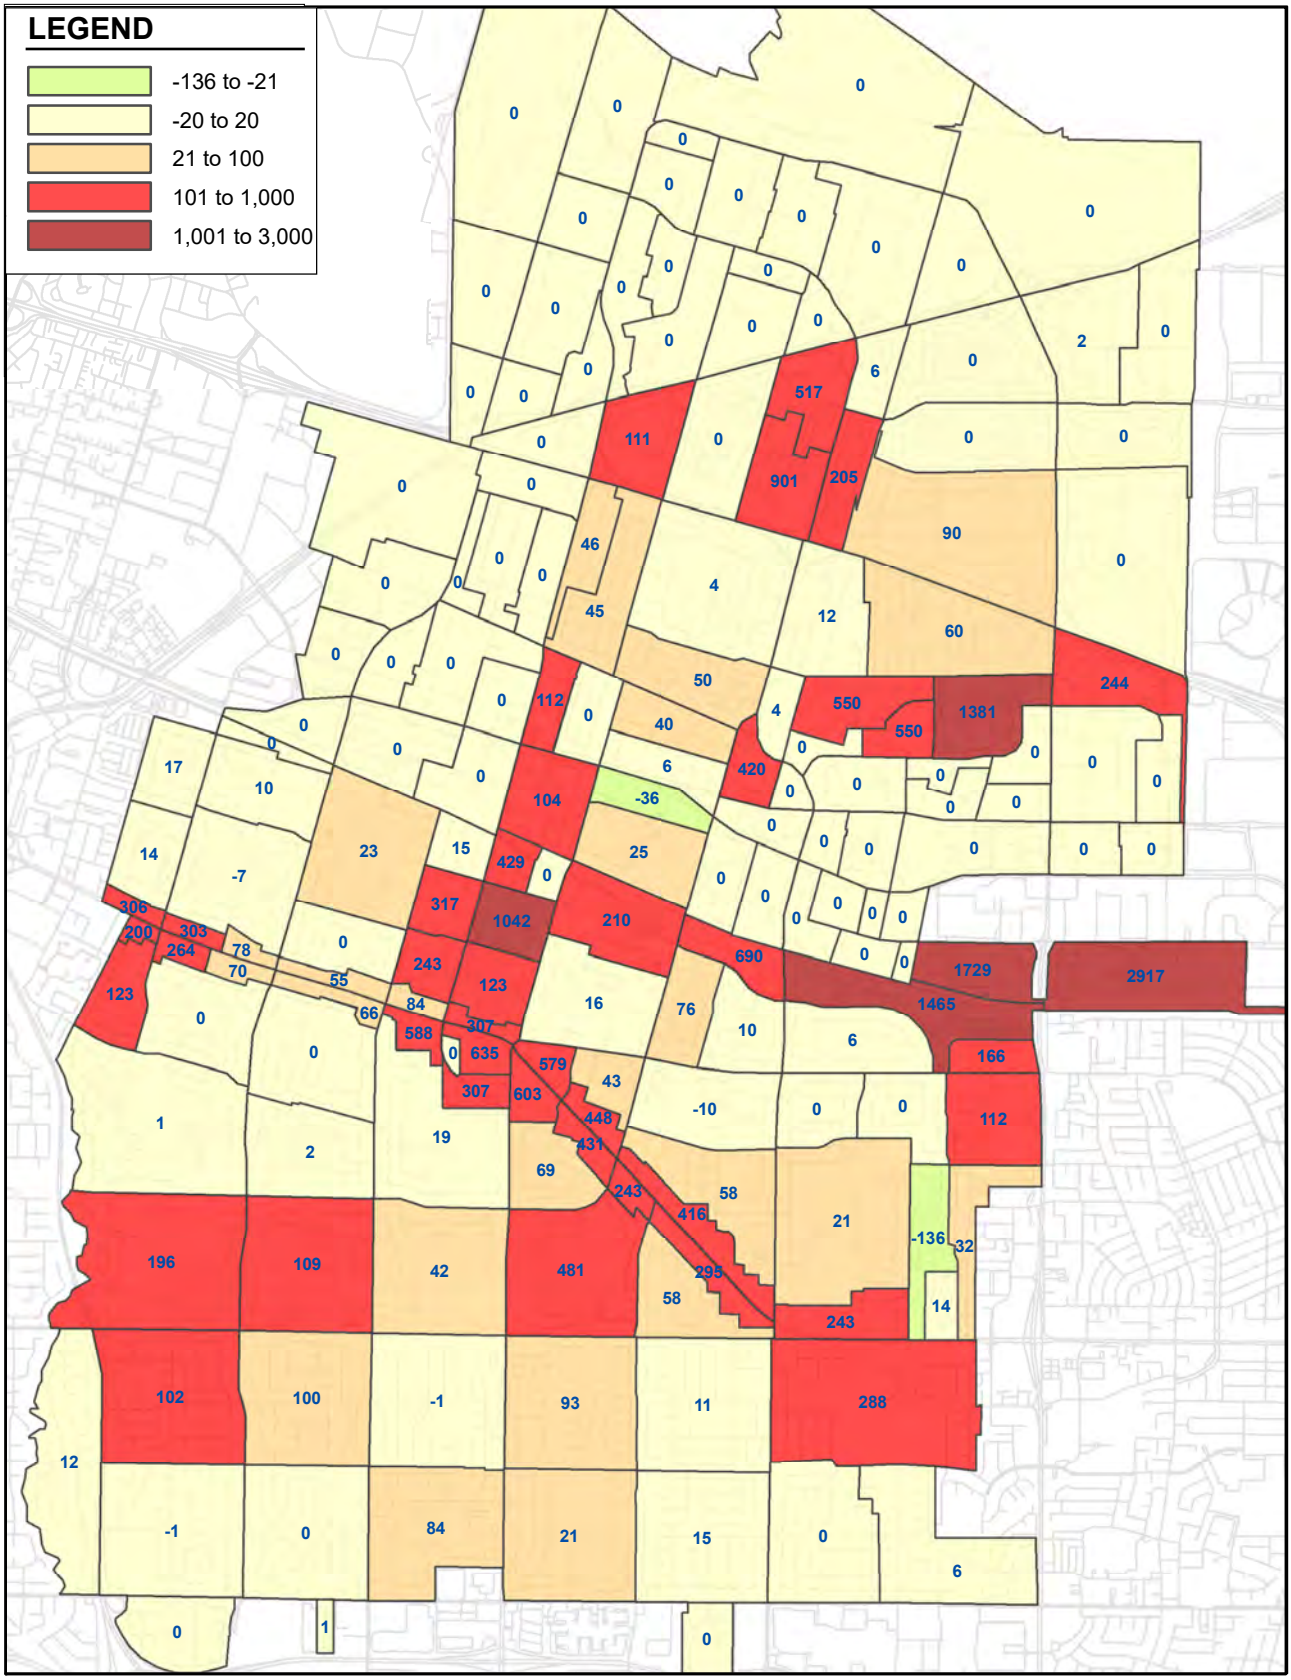
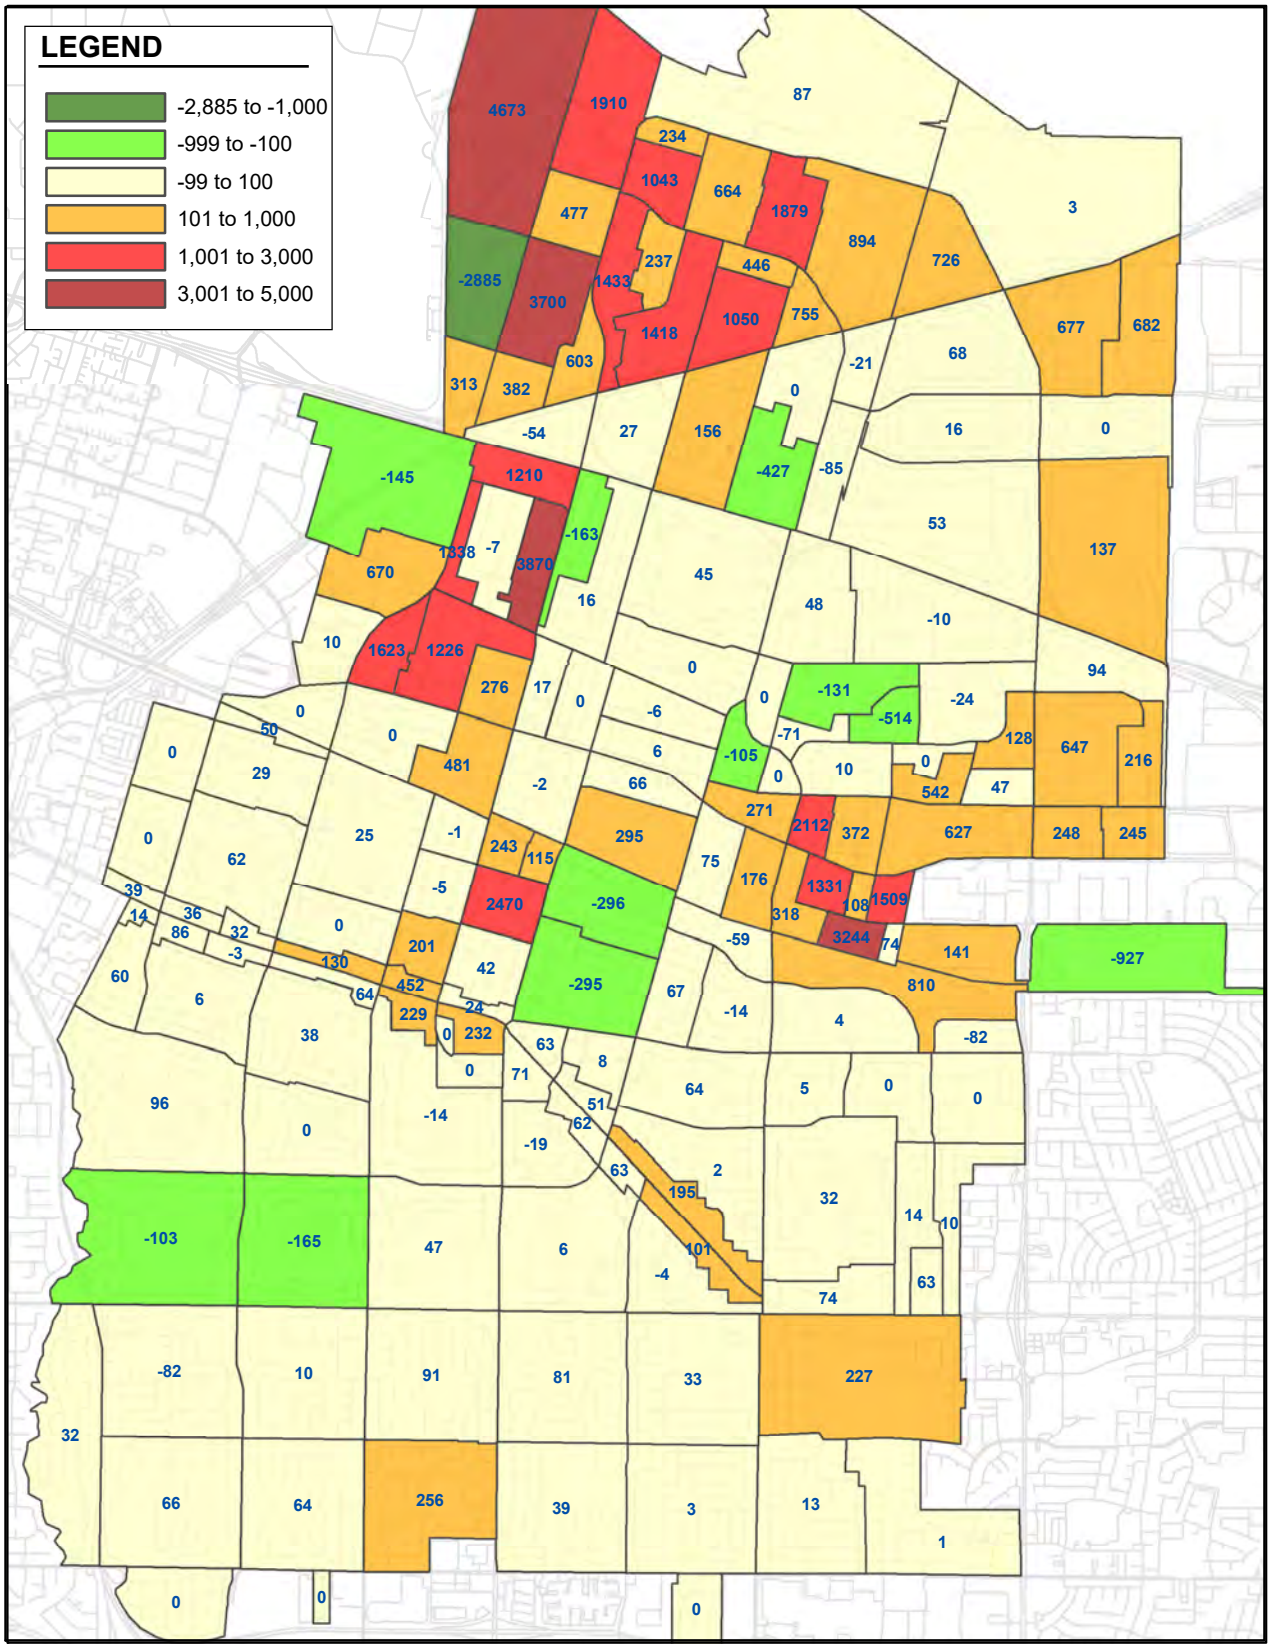
Notes:
NB = Northbound, SB = Southbound, EB = Eastbound, WB = Westbound, fr. = from
1. As a conservative approach, if an on-ramp has meter equipment present , the ramp is analyzed assuming it is metered.
2. Ramp capacities were obtained from *Highway Capacity Manual, 2000* , and considered the free-flow speed, the number of lanes on the ramp, and
3. Existing peak hour volumes are obtained through intersection counts and Caltrans.



3.
Year 2035 Cumulative Conditions

This chapter presents a summary of the cumulative traffic conditions that would occur in year 2035 with the proposed Lawrence Station Area Plan (LSAP) update. The year 2035 cumulative scenario assumes buildout of the current general plan, the proposed LSAP-Update, the proposed El Camino Real Corridor Specific Plan, the proposed Fortinet Master Plan, the proposed update to the Downtown Specific Plan, as well as regional growth. To determine potential impacts generated by the LSAP-Update, a separate model run was conducted assuming no growth in the LSAP area beyond the current general plan and adopted LSAP. The cumulative scenario was compared to the cumulative no LSAP-Update scenario to disclose impacts generated by the update portion of the LSAP. The LSAP-Update is said to generate a greater adverse impact if the impact was previously identified under the original LSAP traffic study. The Sunnyvale Travel Demand Forecasting Model (STFM) for year 2035 was used to forecast the year 2035 cumulative traffic volumes. Model assumptions and inputs are described in this chapter as well.

Traffic Volumes and Roadway Network



The year 2035 forecasts of intersection turning movements, freeway traffic, ramp volumes, and vehicle miles traveled were completed using the Sunnyvale Travel Demand Forecast Model (STFM). The STFM is a mathematical representation of travel within the nine counties in the San Francisco Bay Area and is calibrated to represent travel within the City of Sunnyvale. The model uses socioeconomic data, such as number of jobs and households, for different geographic areas (transportation analysis zones) to predict the travel from place to place in the future. There are 172 transportation analysis zones within the model to represent the City of Sunnyvale.

The year 2035 socioeconomic data are generated by the Association of Bay Area Governments and refined by VTA. For the year 2035 cumulative conditions model forecasts, socioeconomic data within the City of Sunnyvale were supplied by city staff. Socioeconomic data within the City of Sunnyvale assumed the buildout of the current general plan, the proposed LSAP-Update, the proposed El Camino Real Corridor Specific Plan, the proposed Fortinet Master Plan, and the proposed update to the Downtown Specific Plan (see Figures 12 and 13 for the housing and jobs growth by TAZ). The existing and year 2035 cumulative conditions jobs and housing data (by TAZ) are provided in the Appendix. Table 8 shows the model inputs for the entire bay area separated by counties.

NOTE:
Year 2035 land use includes the adopted LUTE, proposed ECRCSP, LSAP update, Fortinet Precise Plan, and Downtown Specific Plan.

Figure 12
Sunnyvale Land Use Growth - Households Year 2035 Compared to Year 2013

NOTE:
Year 2035 land use includes the adopted LUTE, proposed ECRCSP, LSAP update, Fortinet Precise Plan, and Downtown Specific Plan.

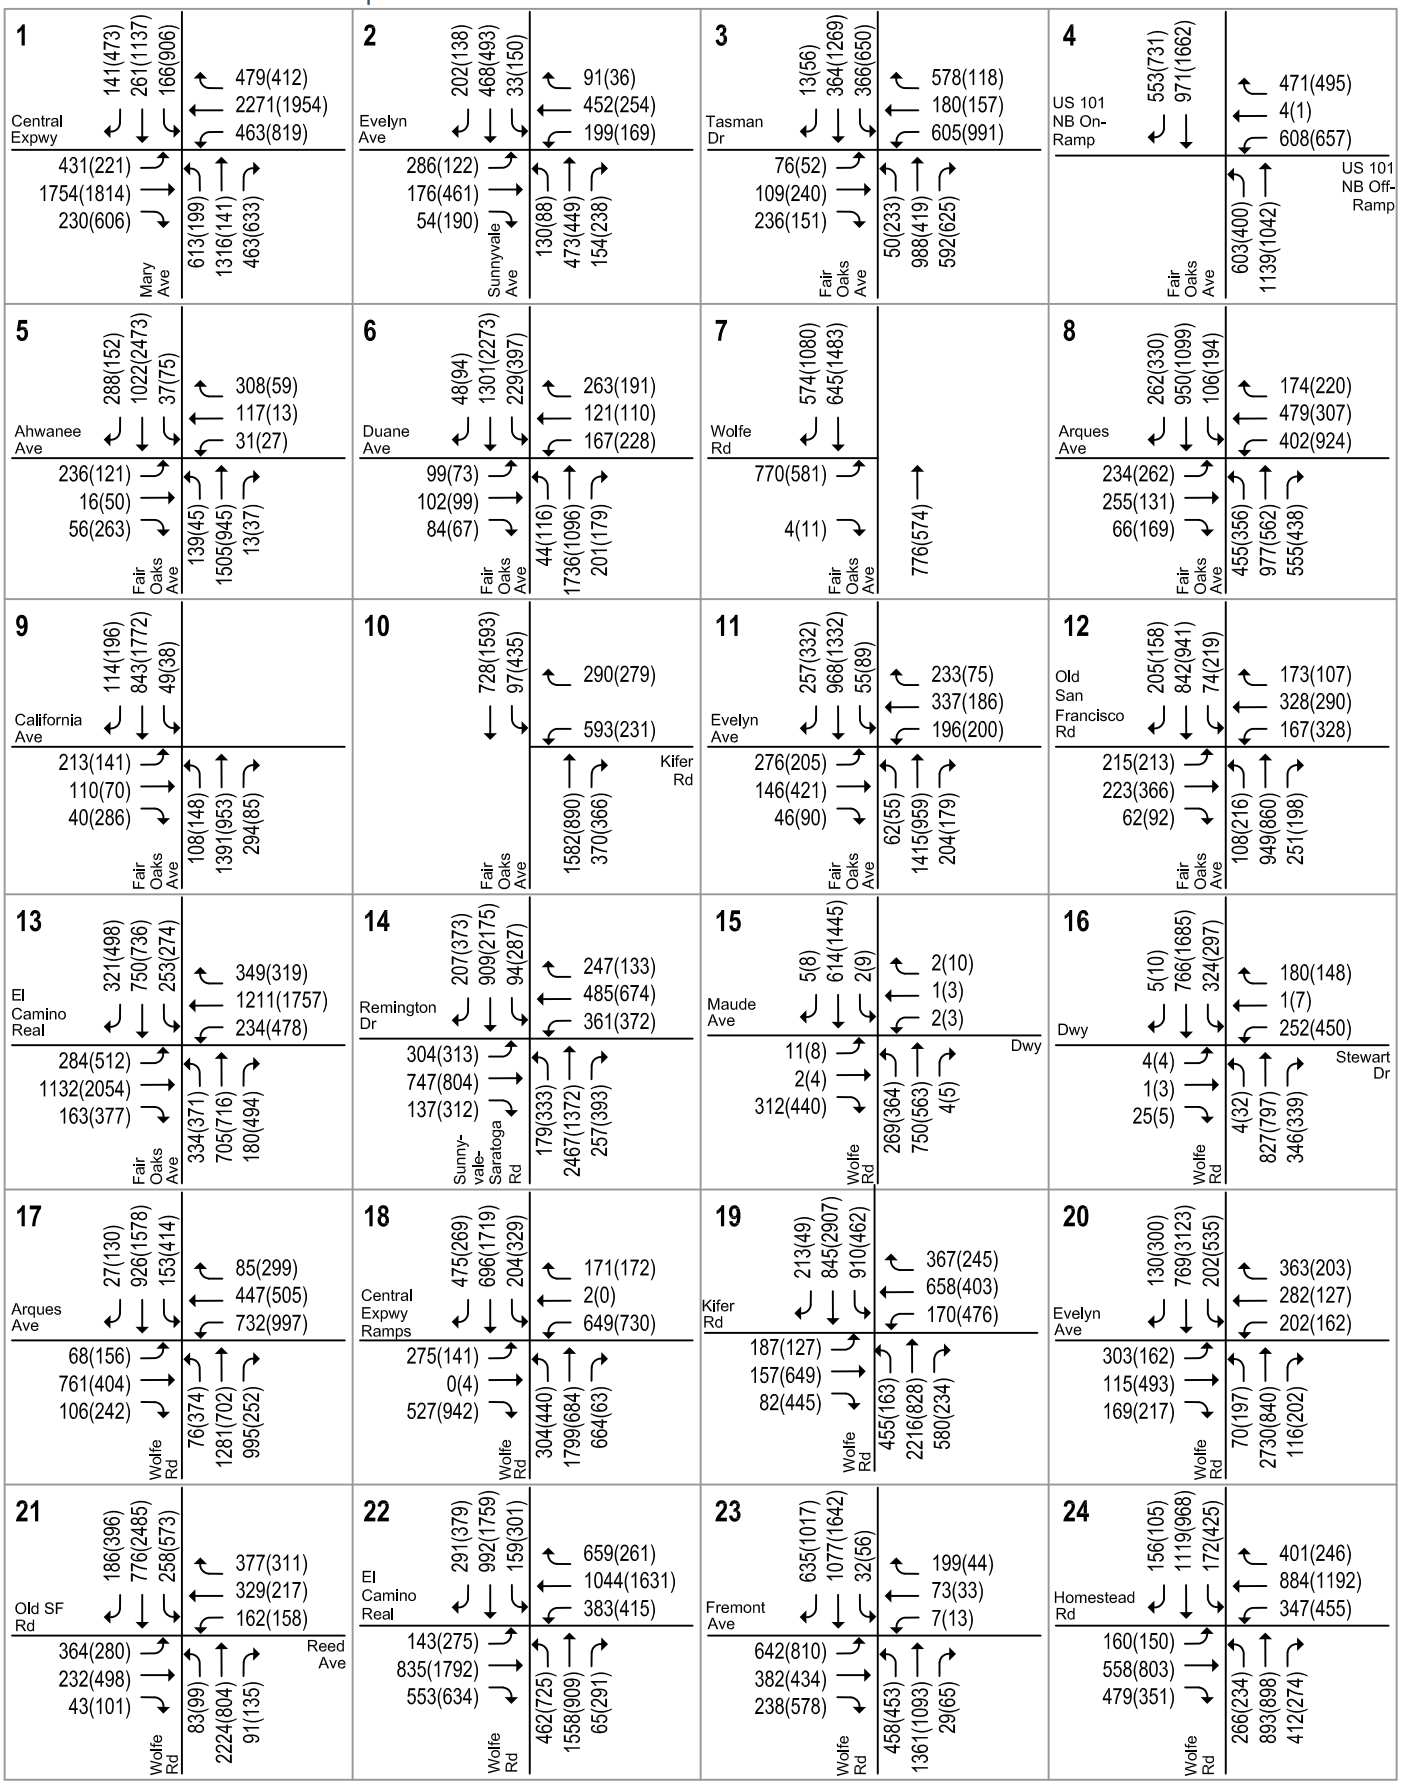
San Mateo	305,826	+ 45,546	864,870	+ 142,670	433,295	+ 97,840
Santa Clara [2]	819,224	+ 192,678	2,356,670	+ 529,157	1,296,139	+ 321,970
Alameda	677,886	+ 135,346	1,877,079	+ 360,980	910,613	+ 163,95
Contra Costa	447,099	+ 78,329	1,269,299	+ 253,999	448,001	+ 75,0
Solano	164,049	+ 23,949	476,887	+ 57,507	172,676	+ 24,39
Napa	55,018	+ 6,728	153,791	+ 20,691	86,887	+ 15,740
Sonoma	214,729	+ 32,229	570,296	+ 93,596	248,147	+ 24,179
Marin	110,513	+ 7,263	268,668	+ 17,268	125,569	-10,038

Notes:
1. Year 2035 land uses referenced the ABAG Projections 2013.
2. Sunnyvale land uses included the adopted LUTE, propoesd ECRCSP, LUTE update, Fortinet Master Plan and Downtown Specific Plan.

The SFTM includes improvements to the roadway network as part of the 2040 Valley Transportation Plan (VTP) and the Sunnyvale Transportation Impact Fee (TIF). Significant roadway improvements that are funded or planned to be funded within or near Sunnyvale are shown on Figure 14.

A separate model run was conducted for the Cumulative no LSAP-Update scenario assuming no growth in the LSAP area beyond the current general plan levels. The same roadway improvements shown on Figure 14 were assumed in the Cumulative no LSAP-Update model run. The forecast intersection turning movement volumes were adjusted based on intersection counts to generate the year 2035 cumulative conditions and Cumulative no LSAP-Update traffic volumes (see Figures 15 and 16).



Improvements

1. Construct auxiliary lanes on eastbound SR 237 between Mathilda Avenue and Fair Oaks Avenue.
2. Extend express lanes on SR 237 to SR 85.
3. Construct auxiliary lanes on southbound US 101 between Lawrence Expressway and Great America Parkway, and between Ellis Street and SR 237.
4. Construct auxiliary lanes on southbound SR 85 between SR 237 and El Camino Real.
5. Reconstruct the US 101/Mathilda and SR 237/Mathilda interchanges.
6. Widen the ramp from northbound SR 85 to eastbound SR 237 to two lanes. Construct an auxiliary lane on eastbound SR 237 from SR 85 to Middlefield Road.
7. Extend Mary Avenue north over the SR 237/US 101 interchange via a flyover and connect with Enterprise Way.
8. Construct auxiliary lane on southbound Lawrence Expressway between the SR 237 loop ramps.
9. Construct auxiliary lanes on Central Expressway between Mary Avenue and Lawrence Expressway.
10. Widen Central Expressway between Lawrence Expressway and San Tomas Expressway to six lanes.

Intersection Lane Configurations

Intersection lane configurations under year 2035 cumulative conditions are shown on Figure 17. The following intersection improvements were assumed under the year 2035 cumulative conditions:

- As part of the approved Butcher's Corner project, the project will be providing the right-of-way necessary along the project frontage on Wolfe Road to allow south Wolfe Road to be widened to include a southbound right-turn lane at the intersection of Wolfe Road and Fremont Avenue.

- As documented in the *Valley Transportation Plan 2040,* Central Expressway is planned to be widened to six through lanes between Lawrence Expressway and San Tomas Expressway. At the intersection at Central Expressway and Oakmead Parkway, the eastbound and westbound approaches will be widened to include three through lanes in each direction.

- As documented in the City of Santa Clara *Multimodal Improvement Plan*, adopted by the City Council in September 2018, the City Place project will be fully responsible for implementing the following intersection improvements at the following study intersections within the City of Santa Clara:

    - Lawrence Expressway & Benton Street: Add a second southbound left-turn lane and a second eastbound left-turn lane.

    - Lawrence Expressway & Homestead Road: Add a third eastbound through lane and a third westbound through lane.

    - Great America Parkway & Tasman Drive: Add a southbound right-turn lane and a third westbound left-turn lane.

    - Bowers Avenue & Central Expressway: Add a third southbound left-turn lane and a third eastbound left-turn lane.

    - Bowers Avenue & Monroe Street: Add a northbound and a southbound left-turn lane. Change northbound and southbound to protected left-turn phasing.

    - San Tomas Expressway & Walsh Avenue: Add a second eastbound left-turn lane.

In addition, the currently unsignalized intersection at Wolfe Road and Maude Avenue is being signalized by Intuitive Surgical as a part of the 1050 Kifer Road project. The unsignalized intersection at Commercial Street and Kifer Road will be signalized by Intuitive Surgical as part of the 932 Kifer Road project and by Fortinet as part of the 901 Kifer Road project. Therefore, both unsignalized intersections are assumed to be signalized under future conditions.

Definition of Intersection Impacts at Signalized Intersections

The LSAP-Update is said to create an adverse impact on traffic conditions at a signalized intersection if for the study peak hour:

1. The level of service at the intersection drops below its respective level of service standard when project traffic is added; or
2. An intersection that operates below its level of service standard under no project conditions experiences an increase in critical-movement delay of four (4) or more seconds, *and* the critical volume-to-capacity ratio (v/c) is increased by 0.01 or more when project traffic is added.

The exception to this threshold is when the addition of project traffic reduces the amount of average control delay for critical movements, i.e., the change in average control delay for critical movements are negative. In this case, the threshold is when the project increases the critical V/C value by 0.01 or more.

An impact by the City of Sunnyvale, City of Santa Clara and CMP standards is said to be satisfactorily addressed when measures are implemented that would restore intersection conditions to its LOS standard *or* to an average delay equal to without-project conditions or better.

Intersection Levels of Service Under Year 2035 Cumulative Conditions

The intersection levels of service results for the year 2035 cumulative conditions were compared to the Cumulative no LSAP-Update conditions to determine potential adverse intersection impacts (see Table 9 and Figure 18). Some of the adversely impacted intersections were previously identified with a significant impact in the certified 2016 LSAP EIR. The LSAP-Update generated adverse impacts at these intersections would be considered substantially more severe than identified in the certified 2016 LSAP EIR.

County of Santa Clara Intersections:

- Lawrence Expressway & Cabrillo Avenue
- Lawrence Expressway & Benton Street
- Lawrence Expressway & Pruneridge Avenue

The LSAP-Update identifies new adverse impacts not previously identified with a significant impact in the certified 2016 LSAP EIR at the intersections listed below. The LSAP-Update generated adverse impacts at these intersections would be considered new impacts from the certified 2016 LSAP EIR.

City of Sunnyvale Intersections:

- Wolfe Road & Arques Avenue
- Wolfe Road & Central Expressway Ramps
- Wolfe Road & Kifer Road

Caltrans Intersections:

- Wolfe Road & El Camino Real
- San Tomas Expressway & El Camino Real

County of Santa Clara Intersections:

- Lawrence Expressway & Oakmead Parkway
- Lawrence Expressway & Arques Avenue
- Lawrence Expressway & Kifer Road
- Lawrence Expressway & Monroe Street

- Oakmead Parkway & Central Expressway
- Bowers Avenue & Central Expressway
- San Tomas Expressway & Scott Boulevard
- San Tomas Expressway & Walsh Avenue
- San Tomas Expressway & Monroe Street

City of Santa Clara Intersections:

- Bowers Avenue & Scott Boulevard
- Bowers Avenue & Kifer Road

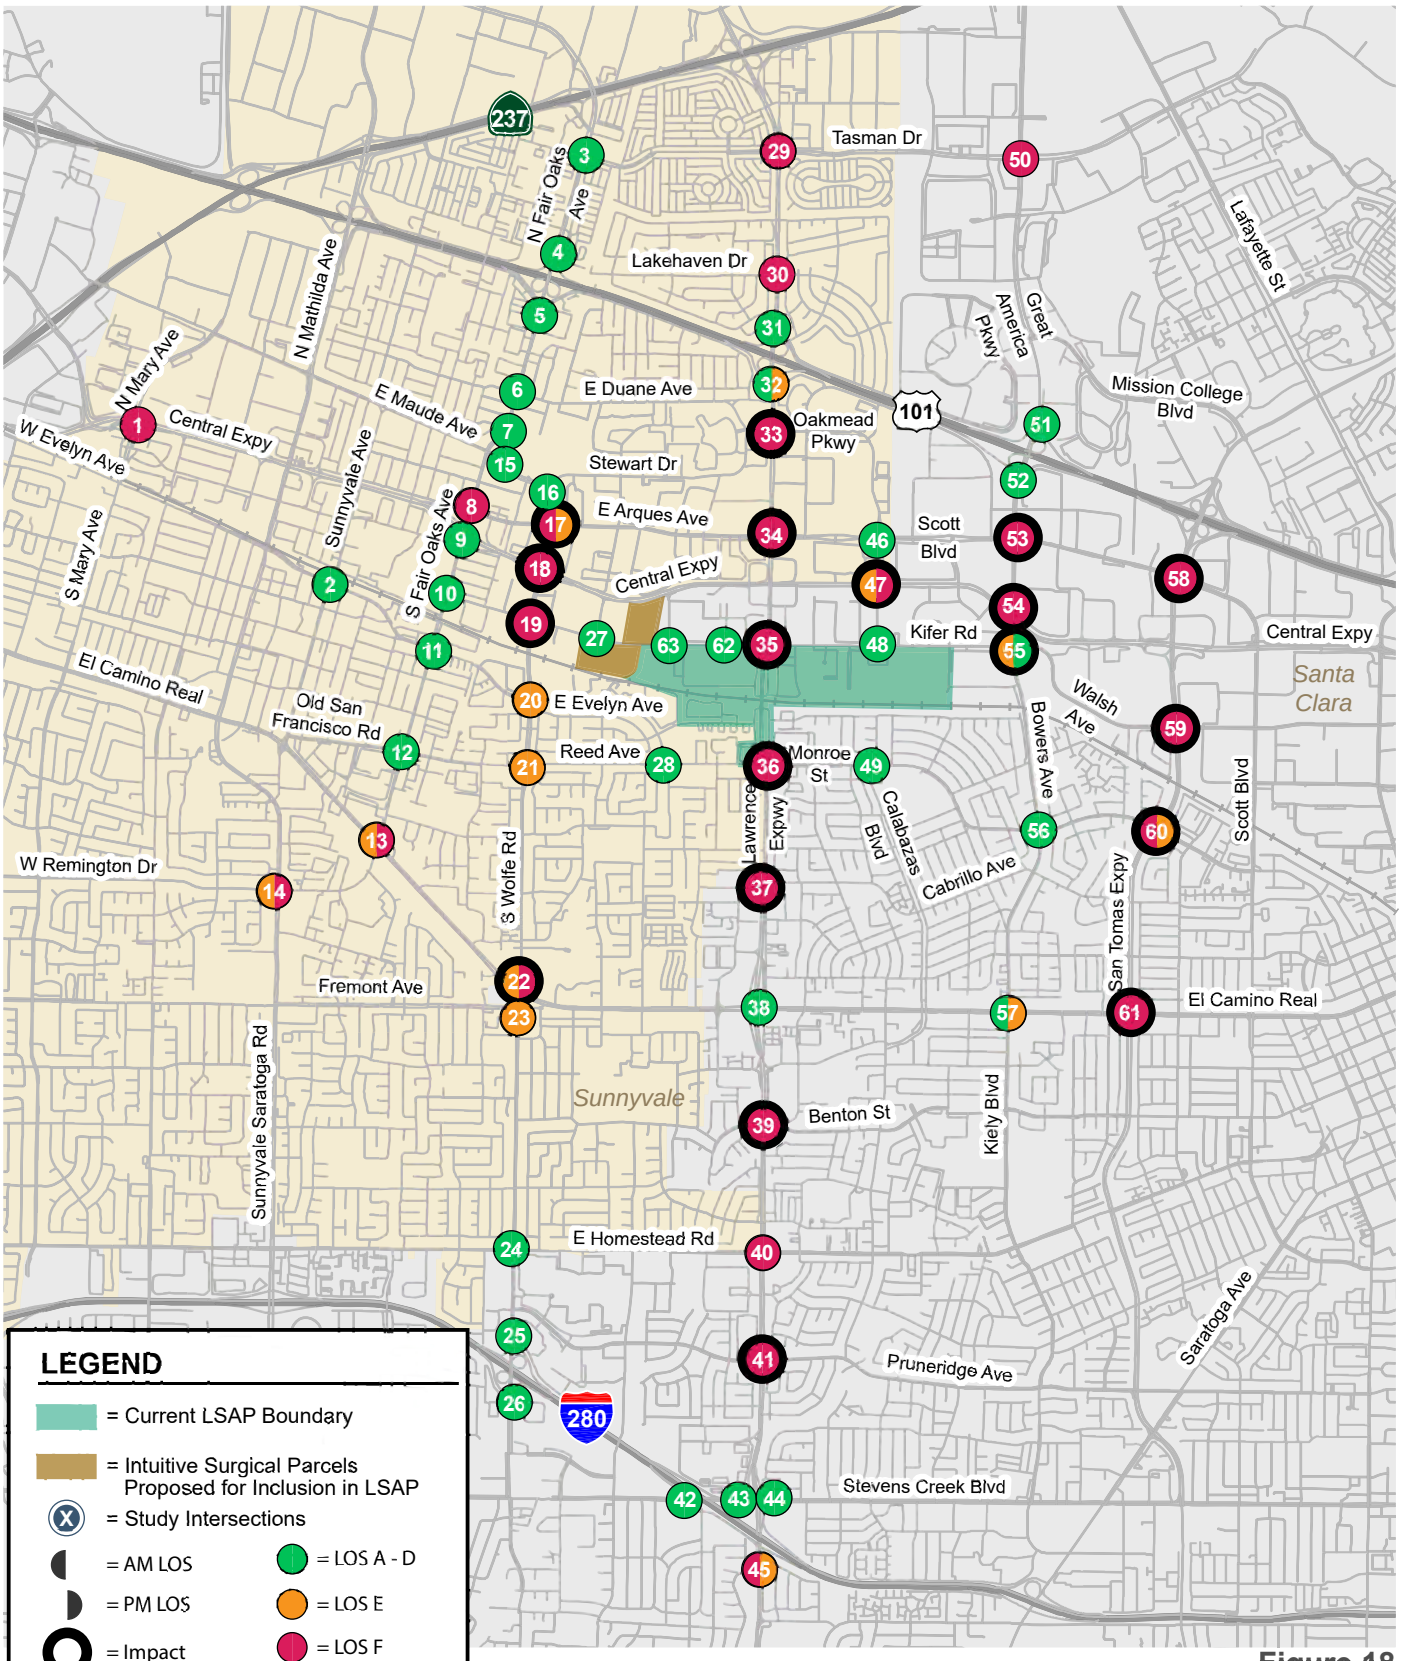

Figure 18
Year 2035 Cumulative Conditions Intersection Levels of Service Summary

The LSAP shall require projects within the plan area to make a fair share contribution toward the cost of the identified improvements.

The three intersections on Lawrence Expressway at Cabrillo Avenue, Benton Street, and at Pruneridge Avenue were impacted under the adopted LSAP. They continue to be impacted under the LSAP - Update. Other intersections impacted by the LSAP-Update were not identified with impacts under the adopted LSAP.

Potential improvement strategies are discussed below.

Potential Improvement Strategies for Intersection Impacts

Improvement options were studied for each intersection experiencing impacts under the year 2035 cumulative conditions when compared to cumulative no LSAP-Update conditions. An intersection impact can be satisfactorily addressed by implementing measures that would restore intersection conditions to Cumulative no LSAP-Update conditions. The LOS results under the improved year 2035 cumulative conditions are summarized in Table 10.

Table 10
Intersection Impact Improvement Summary

">120" indicates this signalized intersection experiences lengthy delay that is beyond the reasonable calculation range of the HCM 2000 methodology.
BOLD indicates unacceptable level of service
BOLD and boxed indicates an adverse cumulative impact

Wolfe Road & Arques Avenue (#17)

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS E during both the AM and PM peak hours. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Sunnyvale's adverse intersection impact criteria.

Potential Improvement: Improvement would require restriping the northbound approach to include 2 left-turn lanes, 2 through lanes, and 1 dedicated right-turn lane. The northbound bike lane would need to be moved to the west side of the proposed right-turn lane. The westbound approach would require restriping to include 2 left-turn lanes, 1 shared left-through lane, and 1 shared through-right lane. Eastbound and westbound approaches would need to operate with split phasing. This improvement would not increase the pedestrian and bicycle exposure time to traffic at the intersection. No right-of-way acquisition would be required. It should be noted that split phasing operates favorably to protected phasing only under certain circumstances.

With the proposed improvement, the intersection would remain operating at LOS E under cumulative conditions during both the AM and PM peak hours, but the intersection operations would improve in comparison to the Cumulative no LSAP-Update conditions. However, this improvement conflicts with the road diet proposed on Wolfe Road in the Sunnyvale Active Transportation Plan and therefore is considered infeasible.

Wolfe Road & Central Expressway Ramps (#18)

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during both the AM and PM peak hours. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Sunnyvale's adverse intersection impact criteria.

> **Potential Improvement:** Improvement would require widening both the eastbound and westbound Central Expressway off-ramps to include one left-turn lane, one shared through-left lane and one right-turn lane. There appears to be sufficient right-of-way to accommodate the potential improvements. The improvements would lengthen the respective crosswalks by up to 12 feet. The widened approaches would increase traffic exposure time for pedestrians by 3 to 5 seconds and 1 to 3 seconds for bicyclists crossing the intersection.

With the proposed improvement, the intersection would remain operating at LOS F under cumulative conditions during both the AM and PM peak hours, but the intersection operations would improve in comparison to the Cumulative no LSAP-Update conditions. However, the improvement requires widening the Central Expressway off-ramps, which are in the County's jurisdiction, so the City cannot ensure the implementation of the potential improvement. All projects within the plan area shall contribute their fair share towards the identified improvement.

Wolfe Road & Kifer Road (#19)

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during both the AM and PM peak hours. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Sunnyvale's adverse intersection impact criteria.

> **Potential Improvement:** The improvement at this intersection to widen all approaches to include a second left-turn lane. All legs of the intersection could require widening by up to 12 feet. The widened approaches would increase traffic exposure time for pedestrians by 3 to 5 seconds and 1 to 3 seconds for bicyclists crossing the intersection.

With the proposed improvement, the intersection would remain operating at LOS F under cumulative conditions during both the AM and PM peak hours, but the intersection operations would improve in comparison to the Cumulative no LSAP-Update conditions. All projects within the plan area shall contribute their fair share towards the identified improvement.

Wolfe Road and El Camino Real (#22) [CMP]

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during the PM peak hour. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet VTA's CMP adverse intersection impact criteria.

> **Potential Improvement:** The Sunnyvale City Council approved a concept on June 21, 2016 for a project to improve the Wolfe Road intersections with El Camino Real and with Fremont Avenue, as well as signalizing the intersection at Fremont Avenue and El Camino Real (see Figure 19). Right-of-way acquisition would be required. Bicycle improvements include the

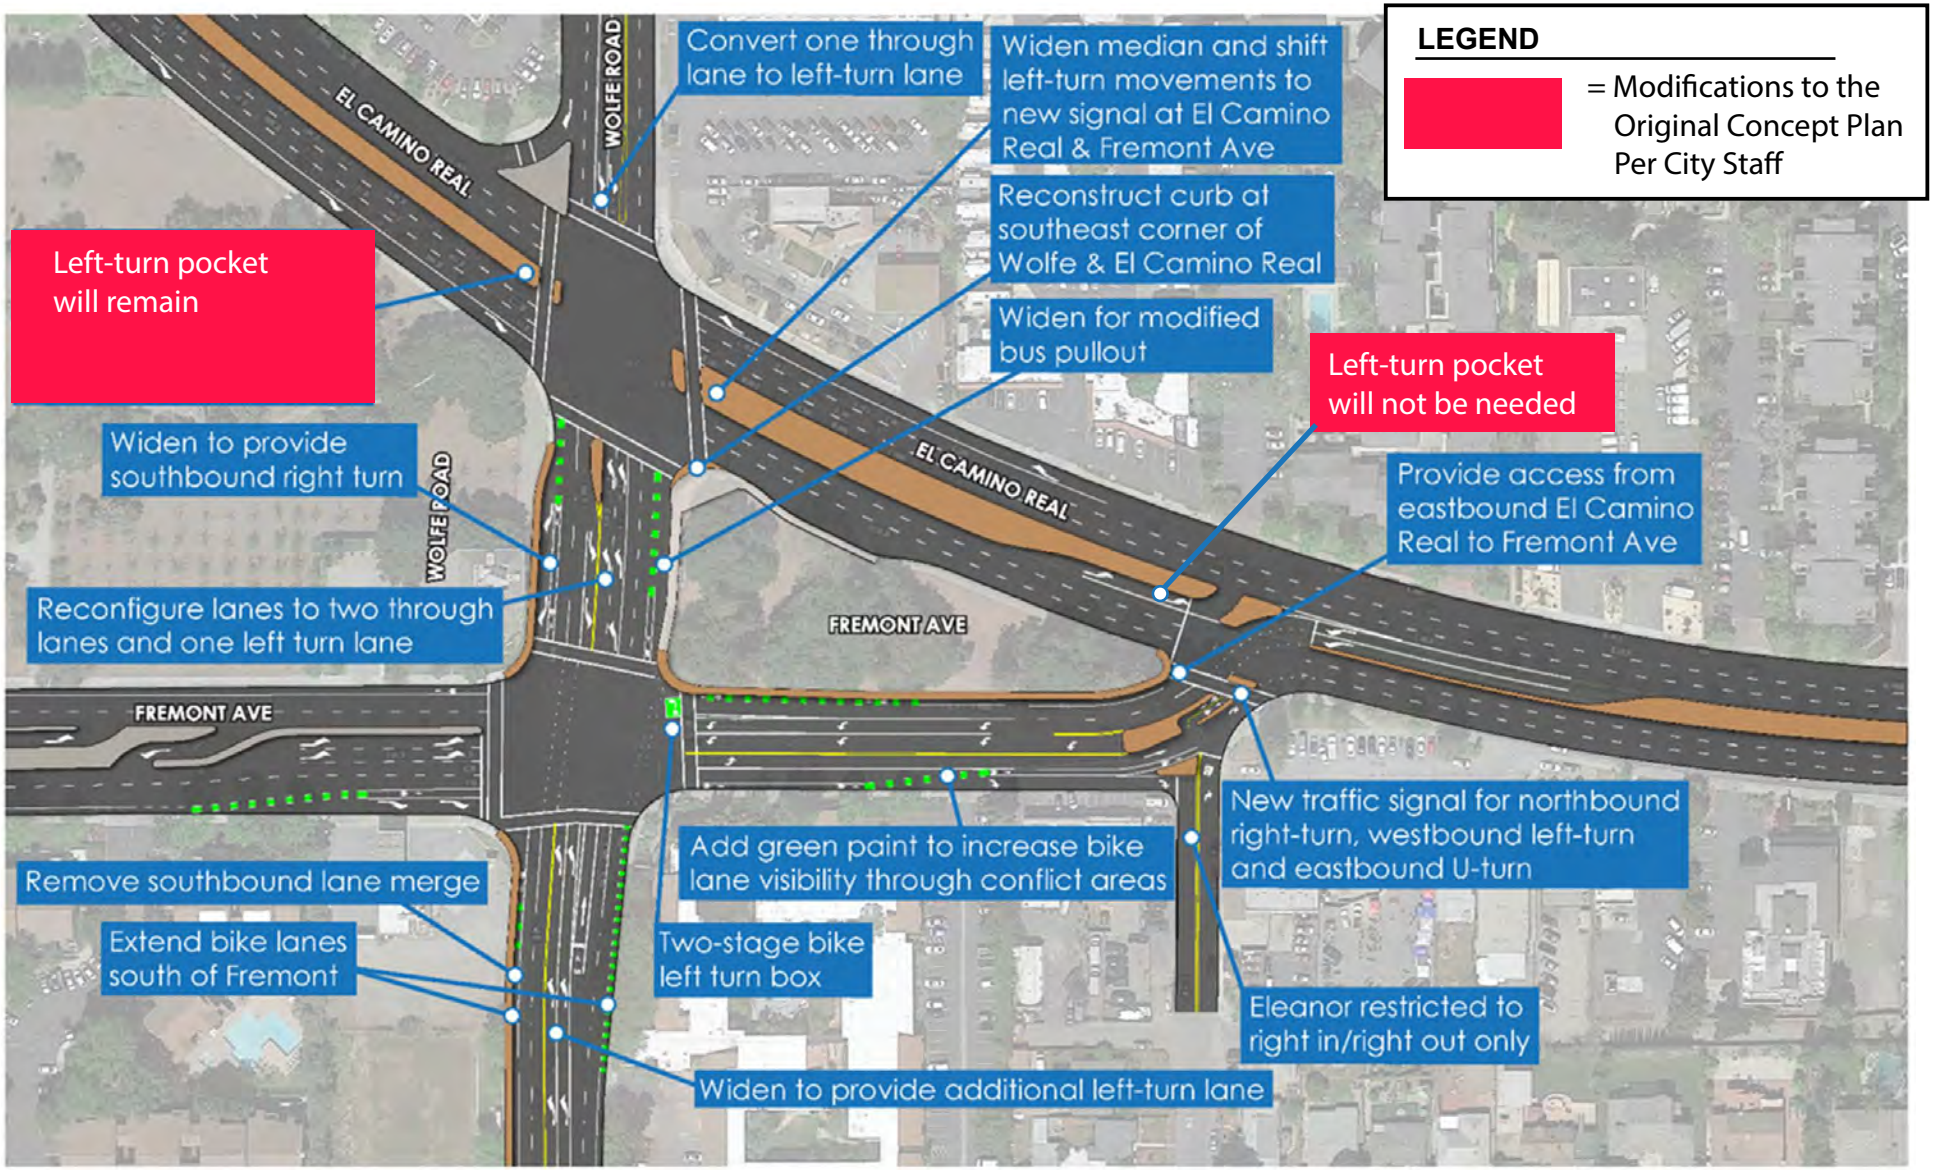
extension of bike lanes and installation of bike boxes, and they are detailed in the *Wolfe Road Corridor Traffic Improvement Study*, prepared by Kimley-Horn dated February 2016. This improvement (Triangle – Refined Alternative 3) would require signal coordination between the two Wolfe Road intersections and the new signalized Fremont Avenue and El Camino Real intersection.

With the proposed improvement, the intersection would operate at an acceptable LOS E under cumulative conditions during the PM peak hour. Modification to this intersection will trigger modifications at the Wolfe Road and Fremont Avenue intersection and the Fremont Avenue and El Camino Real intersection as well. Therefore, the LSAP shall require projects within the plan area to contribute a fair share contribution towards the identified improvements at all three intersections.

Lawrence Expressway & Oakmead Parkway (#33)

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during the AM peak hour. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Sunnyvale's adverse intersection impact criteria.

> **Potential Improvement:** The County of Santa Clara has identified a future project to provide a grade separation at this intersection. This would improve the north-south flow of traffic and potentially address the project's impact.



The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the grade separation at Lawrence Expressway and Oakmead Parkway/Duane Avenue. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection. Future project applicants within the LSAP area and City shall coordinate with the County on this improvement.

Lawrence Expressway with Arques Avenue and Monroe Street (#34, #36) [CMP]

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during the AM peak hour for the intersection of Lawrence Expressway and Arques Avenue and PM peak hour for the intersection of Lawrence Expressway and Monroe Street. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet VTA's CMP adverse intersection impact criteria.

> **Potential Improvement:** The County of Santa Clara has identified a future project to provide a grade separation at these intersections. This would improve the north-south flow of traffic and potentially address the project's impact.

The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the grade separation on Lawrence Expressway at Arques Avenue and at Monroe Street. These intersections are under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at these intersections. Future project applicants within the LSAP area and City shall coordinate with the County on this improvement.

SOURCE: Wolfe Road Corridor Traffic Improvement Study, February, 2016.

Figure 19
Potential Improvement at Wolfe Road and Fremont Avenue

Lawrence Expressway and Kifer Road (#35)

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during the AM and PM peak hours at this intersection. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Sunnyvale's adverse intersection impact criteria.

> **Potential Improvement:** The County of Santa Clara has identified a future project to provide a grade separation at this intersection. This would improve the north-south flow of traffic and potentially address the project's impacts.

The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the grade separation at Lawrence Expressway and Kifer Road. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection. Future project applicants within the LSAP area and City shall coordinate with the County on this improvement.

Lawrence Expressway at Cabrillo Avenue, at Benton Street and at Pruneridge Avenue (#37, 39, 41)

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F at all three intersections. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Santa Clara's adverse intersection impact criteria.

> **Potential Improvement:** The County of Santa Clara has identified a future project to provide a grade separation at all these intersections. This would improve the north-south flow of traffic and potentially address the project's impacts.

The LSAP shall require projects within the plan area to contribute their fair share towards the cost of these grade separations. These intersections are under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection. Future project applicants within the LSAP area shall coordinate with the County on these improvements.

Oakmead Parkway & Central Expressway (#47) [CMP]

Under Cumulative no LSAP-Update conditions, the LOS would be an acceptable LOS E during the PM peak hour. The addition of LSAP-Update traffic would deteriorate traffic operations to an unacceptable LOS F, which meets the City of Sunnyvale's adverse intersection impact criteria.

> **Potential Improvement: I**mprovement at this intersection would require further widening of westbound Central Expressway to include two left-turn lanes. This improvement can be accommodated within the existing right-of-way.

With the proposed improvement, the intersection would operate at an acceptable LOS E under cumulative conditions during the PM peak. The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the identified improvement. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection. Future project applicants within the LSAP area and City shall coordinate with the County on this improvement.

Bowers Avenue & Scott Boulevard (#53) [CMP]

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during the PM peak hour. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio, which meets the City of Santa Clara's adverse intersection impact criteria.

> **Potential Improvement:** Improvement would require widening southbound Bowers Avenue to include a second southbound left-turn lane. This improvement could potentially be accommodated within the existing right-of-way by removing the existing median.

With the proposed improvement, the intersection would remain operating at LOS F under cumulative conditions during the PM peak, but the intersection operations would improve in comparison to the Cumulative no LSAP-Update conditions. However, the intersection is in the City of Santa Clara's jurisdiction, so Sunnyvale cannot ensure the implementation of the potential improvement.

Bowers Avenue & Central Expressway (#54) [CMP]

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during both the AM and PM peak hours at this intersection. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio to meet the County of Santa Clara's adverse intersection impact criteria.

> **Potential Improvement:** The County of Santa Clara has identified a future project to provide a grade separation at this intersection. This would improve the east-west flow of traffic and potentially address the project's impacts.

The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the grade separation. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection. Future project applicants within the LSAP area and the City shall coordinate with the County on this improvement.

Bowers Avenue & Kifer Road (#55)

Under Cumulative no LSAP-Update conditions, the LOS would be an acceptable LOS D during the AM peak hour. The addition of LSAP-Update traffic would deteriorate traffic operations to an unacceptable LOS E, which meets the City of Santa Clara's adverse intersection impact criteria.

> **Potential Improvement:** Improvement would require widening eastbound Kifer Road to include a second eastbound left-turn lane. This improvement could potentially be accommodated within the existing right-of-way.

With the proposed improvement, the intersection would operate at an acceptable LOS D under cumulative conditions during the AM peak. The LSAP shall require projects within the plan area to contribute their fair share towards the cost of the identified improvement. However, the intersection is in City of Santa Clara's jurisdiction, so Sunnyvale cannot ensure the implementation of the potential improvement.

San Tomas Expressway at Scott Boulevard, at Monroe Street, and at El Camino Real (#58, 60, 61) [CMP]

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F at all three intersections. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Santa Clara's adverse intersection impact criteria.

> **Potential Improvement:** The County of Santa Clara has identified a future project to provide a grade separation at all these intersections. These would improve the north-south flow of traffic and potentially address the project's impacts.

The LSAP shall require projects within the plan area to contribute their fair share towards the cost of these grade separations. These intersections are under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersections. Future project applicants within the LSAP area shall coordinate with the County on these improvements.

San Tomas Expressway at Walsh Avenue (#59)

Under Cumulative no LSAP-Update conditions, the LOS would be an unacceptable LOS F during the AM peak. The addition of LSAP-Update traffic would increase both the critical-movement delay and V/C ratio sufficient to meet the City of Santa Clara's adverse intersection impact criteria.

> **Potential Improvement:** A grade separation would be required at this intersection to alleviate the LSAP-Update intersection impact. This improvement could improve the north-south flow of traffic and potentially address the project's impacts. However, the County of Santa Clara currently has no plans to construct a grade separation at this intersection.

The LSAP shall require projects within the plan area to contribute their fair share towards the cost of this grade separation. This intersection is under Santa Clara County's jurisdiction; therefore, it is up to the County to approve and advance the proposed improvement at the intersection. Future project applicants within the LSAP area shall coordinate with the County on these improvements.

Freeway Levels of Service

In analyzing the freeway segments, the Sunnyvale Travel Demand Forecast Model (STFM) was used to project the increase in traffic volumes between existing and the year 2035 cumulative conditions. VTA CMP guidelines require freeway levels of service to be calculated based on density. However, congested freeway speed (used to measure density) cannot be accurately modeled. For the purpose of this study, freeway levels of service under the year 2035 cumulative conditions are instead calculated based on volume to capacity (V/C) ratio. A freeway segment is assumed to operate at LOS F under the year 2035 cumulative conditions if,

- The freeway segment already operates at LOS F under existing conditions, or
- The STFM forecasts the freeway segment to operate at a V/C ratio above one under the year 2035 cumulative conditions.

LSAP-Update Freeway Impact Analysis

VTA CMP guidelines define that a project would cause a freeway impact if the project would deteriorate freeway levels of service from an acceptable level to an unacceptable level, or if the freeway already operates at an unacceptable level under existing conditions, the project would add traffic exceeding 1% of the freeway capacity. To determine the LSAP-Update potential freeway impacts, a select zone analysis within the Sunnyvale Travel Demand Forecast Model was performed to estimate the increase in LSAP traffic volume between the Cumulative no LSAP-Update and cumulative conditions. Freeway segments that would experience a freeway impact are shown on Figures 20 to 23 and are identified below:

Mixed Flow Lanes – AM Peak Hour

- US 101, northbound from Lawrence Expressway to Embarcadero Road
- US 101, southbound from Oregon Expressway to San Antonio Road
- US 101, southbound from Moffett Boulevard to Ellis Street
- SR 237, eastbound from Great America Parkway to North First Street
- SR 237, westbound from I-880 to Lawrence Expressway
- I-880, northbound from SR 237 to Dixon Landing Road
- I-880, southbound from Dixon Landing Road to SR 237
- I-880, southbound from Tasman Drive to Montague Expressway

HOV Lanes – AM Peak Hour

- US 101, northbound from Lawrence Expressway to Mathilda Avenue
- US 101, northbound from Ellis Street to SR 85

Mixed-Flow Lanes – PM Peak Hour

- US 101, southbound from San Antonio Road to Lawrence Expressway

HOV Lanes – PM Peak Hour

- US 101, southbound from SR 85 to Lawrence Expressway
- US 101, southbound from Montague Expressway to SR 87
- SR 237, westbound from North First Street to Lawrence Expressway

The VTA's Valley Transportation Plan (VTP) 2040 identifies freeway express lane projects along US 101 between Cochrane Road and Whipple Avenue, along SR 237 between N. First Street and SR 85, and along I-880 between the Alameda County Line and US 101. On all identified freeway segments, the existing HOV lanes are proposed to be converted to express lanes. On US 101 along the identified segments, a second express lane is proposed to be implemented for a total of two express lanes in each direction.

On SR 237 and I-880, the existing HOV lanes would be operating over capacity under the year 2035 cumulative conditions. Converting the HOV lanes to express lanes would not mitigate the project impact. On US 101, converting the existing HOV lane to an express lane and adding an express lane in each direction would increase the capacity of the freeway and would adequately address the freeway impacts. The LSAP shall require future projects within the proposed plan area to participate in VTA's Voluntary Freeway Contribution Program and contribute their fair share towards the US 101 Express Lane Project for improvements along US 101.

However, capacity improvements on freeways are beyond the capabilities of the City of Sunnyvale. Furthermore, freeways are under Caltrans jurisdiction. It should be noted that both US 101 and SR 237 were also identified with impacts under the adopted LSAP while I-880 was not studied in that report. Therefore, the impacts identified are greater than the impacts identified in the adopted LSAP.

Freeway Ramp Capacity Analysis

Definition of Adverse Freeway Ramp Impacts

For the purpose of this study, the LSAP-Update is said to create an adverse impact on a freeway ramp if its implementation:

- Would cause the volume-to-capacity (V/C) ratio of the freeway ramp to exceed 1.0; or
- Would increase the amount of traffic on a freeway ramp that is already exceeding its capacity by more than one percent (1%) of the ramp's capacity.

The freeway ramp volumes under year 2035 cumulative conditions were estimated using the Sunnyvale Travel Demand Forecast Model. As shown on Table 11, all study freeway ramps would continue to operate below capacity.

Table 11
Year 2035 Cumulative Conditions Ramp Capacity Analysis

Interchange	Ramp	Type	Peak Hour	Existing Conditions Volume [3]	Existing Conditions V/C	Year 2035 Cumulative Conditions Volume	Year 2035 Cumulative Conditions Capacity	Year 2035 Cumulative Conditions V/C

Notes:
NB = Northbound, SB = Southbound, EB = Eastbound, WB = Westbound, fr. = from
1. As a conservative approach, if an on-ramp has meter equipment present , the ramp is analyzed assuming it is metered.
2. Ramp capacities were obtained from *Highway Capacity Manual, 2000* , and considered the free-flow speed, the number of lanes on the ramp, and ramp metering.
3. Existing peak hour volumes are obtained through intersection counts and Caltrans.

LSAP Impact to Transit Facilities

The VTA CMP's *Transportation Impact Analysis Guidelines* require an evaluation of transit vehicle delay, transit access and transit facilities. However, there are no established impact criteria by either VTA or the City of Sunnyvale. For the purpose of this study, the LSAP-Update is said to create a potentially adverse transit impact if:

1. A study intersection along a transit service route is found to have an adverse motor vehicle LOS intersection impact, or
2. The project is expected to generate increased transit demand that may not be accommodated by the existing transit services; or
3. The project is expected to reduce transit availability or access to transit facilities.

Within the immediate vicinity of the Lawrence Caltrain Station, bus route 21 has stops located within walking distance of the Lawrence Station. The Altamont Commuter Express (ACE) Gray Shuttle (Route 822) also serves the project area. Two public Caltrain shuttles, which are funded through public-private partnerships, provide service at the Lawrence Caltrain Station:

- Bowers-Walsh: This shuttle provides service between the Lawrence Caltrain Station and the Bowers/Walsh area office buildings during weekday commute periods.
- Mission: This shuttle provides service between the Lawrence Caltrain Station and Mission Area office buildings during weekday commute periods.

It is expected that the LSAP-Update would increase the number of Caltrain riders, as the developments are near the train station, and residents/employees would take Caltrain to/from work. The Caltrain electrification project would enable Caltrain to provide more frequent train service at the Lawrence Caltrain station. Caltrain predicts an initial capacity increase of over 30%. It is expected that the Caltrain electrification project would accommodate the potential increase in transit ridership generated by the LSAP-Update. It is assumed that if the free shuttle service becomes full, employers would increase their funding for the service as required by their TDM requirements or as a part of their commuter benefits, and additional shuttles would be provided to meet the demand.

The adopted LSAP plan established five policies to support public transit within the plan area. The implementation of these policies would enhance the travel experience for transit riders within the LSAP plan area, and potentially enhance and/or increase transit services to the plan area.

Transit Travel Times

To assess the transit travel time impacts, the bus route travel times in the study area under year 2035 cumulative conditions were compared to existing conditions. Bus route travel times are estimated using published schedules and adjusted based on delays experienced at study intersections. VTA does not have established criteria to determine impact to transit services. Therefore, this analysis is presented for information purposes only.

As shown on Table 12, The results show that all studied transit routes under year 2035 cumulative conditions are expected to experience increased route travel times ranging from 1 minute to 3 minutes compared to existing conditions. The City of Sunnyvale and the VTA do not have adopted standards related to transit corridor performance associated with congestion resulting from new development projects. Per the VTA TIA Guidelines (dated October 2014), *if increased transit vehicle delay is found, the Lead Agency [City of Sunnyvale] should work with VTA to identify feasible transit priority measures*

near the affected facility and include contributions to any applicable projects that improve transit speed and reliability in the TIA. Projects within the LSAP study area would be required to contribute their fair share towards any feasible priority measures near the affected facility.

Table 12
Transit Travel Time Analysis

LSAP Cumulative Impacts to Pedestrian and Bicycle Facilities

The VTA CMP's Transportation Impact Analysis Guidelines requires evaluation of pedestrian and bicycle facilities. However, there are no established impact criteria by either VTA or the City of Sunnyvale. For the purpose of this study, the project is said to create a potentially adverse pedestrian or bicycle impact if:

1. The project proposes modifications to the existing pedestrian or bicycle facilities that are not in conformance with adopted plans (i.e. Sunnyvale's Bicycle Master Plan, General Plan, Countywide Bicycle Plan); or

2. The project reduces, severs, or eliminates existing or planned pedestrian or bicycle facilities; or

3. The project creates demand for pedestrian or bicycle facilities that do not currently exist.

Pedestrian Facilities

Sidewalks are present along both sides of all major roadways within the LSAP plan area except along both sides of Kifer Road generally west of 950 Kifer Road. Signalized crosswalks with pedestrian push buttons are present at all study intersections. The roadways connecting Kifer Road and Reed Avenue/Monroe Street to the Lawrence Caltrain Station also have sidewalks but are missing crosswalks at their respective intersections with minor residential streets. North-south connectivity for pedestrians across the railroad tracks is provided by an underpass at the Caltrain Station and on Lawrence Expressway.

The adopted LSAP plan established 12 policies to provide safe, inviting, and attractive pedestrian connections to Lawrence Station and other key destinations in the Plan area. Along with the implementation of all 12 pedestrian policies, the LSAP would close existing sidewalk gaps, build new pedestrian connections, enhance pedestrian intersection crossings, enhance pedestrian comfort-level on sidewalks, improve pedestrian connections to the Lawrence Caltrain Station, and enhance pedestrian facilities to be functional for all types of users. The conceptual LSAP Sense of Place Plan shows implementation of these policies, which will require new development in the area to implement improvements to existing pedestrian facilities, and build a new loop road and Class I multi-use trail with direct pedestrian access to the Lawrence Caltrain Station. Projects within the LSAP study area would be required to construct pedestrian improvements in accordance with the Sense of Place Plan.

Bicycle Facilities

The adopted LSAP plan identifies various bicycle facility improvements to close the gaps in the existing and planned bicycle network. The conceptual LSAP Sense of Place Plan shows implementation of these improvements and will require new development in the area to implement improvements to existing bicycle facilities and construct new facilities as described below. The LSAP-Update also includes additional bicycle facility improvements. The entire list of proposed bicycle improvements is provided in the Sense of Place Plan.

- Calabazas Creek Trail: New Class I multi-use trail in the City of Santa Clara in alignment with Calabazas Creek.
- New Class I multi-use trail from Aster Avenue and extending across the railroad tracks to Sonora Court with a grade-separated pedestrian/bicycle track crossing.
- New Class II bicycle lanes on Kifer Road east of Lawrence Expressway.

In addition to the proposed bicycle facilities within the LSAP plan area, the adopted LSAP plan also identified seven bicycle policies to encourage the use of bicycles for local and inter-neighborhood access. With the implementation of all seven bicycle policies the LSAP would build new bicycle connections east-west across Lawrence Expressway and north-south across the rail tracks and improve bicycle connections to the Lawrence Caltrain Station. The LSAP-Update also proposes a new east-west Class I multi-use trail from either end of the LSAP boundaries, north of the tracks. The trail would be located on private property, as properties redevelop. The adopted LSAP includes a new loop road to connect Corvin Drive (east of Lawrence Expressway) and Semiconductor Drive (west of Lawrence Expressway) to the Caltrain station. The loop road would include Class II bike lanes and would be built on private property, as properties redevelop.

Projects within the LSAP study area would be required to pay their fair share contribution towards bicycle improvements or construct, as applicable.

Peak Hour Delay Signal Warrant Report

****

Intersection #93 Wolfe Rd & Maude Ave

****

Future Volume Alternative: Peak Hour Warrant NOT Met

Copyright (c) 2008 Dowling Associates, Inc.

Approach:	North Bound			South Bound			East Bound			West Bound		
Movement:	L	T	R	L	T	R	L	T	R	L	T	R
Control:	Uncontrolled			Uncontrolled			Stop Sign			Stop Sign		
Lanes:	1 0 1	1 0		1 0 2	0 1		0 1 0	0 1		0 0 1!	0 0	
Initial Vol:	185	541	4	2	299	5	11	2	76	2	1	2
ApproachDel:	xxxxxx			xxxxxx			11.9			22.0		

Approach[eastbound][lanes=2][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.3]
FAIL - Vehicle-hours less than 5 for two or more lane approach.
Signal Warrant Rule #2: [approach volume=89]
FAIL - Approach volume less than 150 for two or more lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=1130]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

Approach[westbound][lanes=1][control=Stop Sign]
Signal Warrant Rule #1: [vehicle-hours=0.0]
FAIL - Vehicle-hours less than 4 for one lane approach.
Signal Warrant Rule #2: [approach volume=5]
FAIL - Approach volume less than 100 for one lane approach.
Signal Warrant Rule #3: [approach count=4][total volume=1130]
SUCCEED - Total volume greater than or equal to 800 for intersection with four or more approaches.

SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

   SUCCEED - Total volume greater than or equal to 650 for intersection
             with less than four approaches.
--------------------------------------------------------------------------------
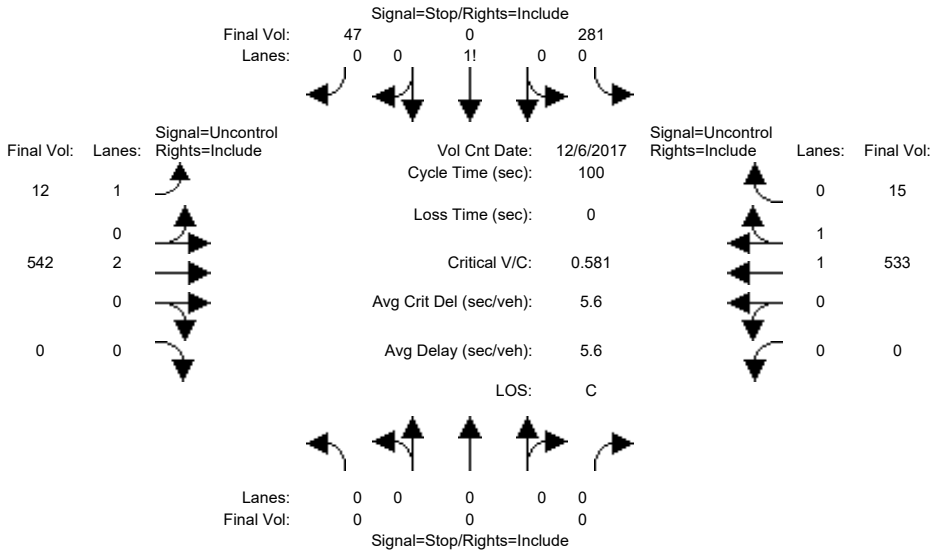
SIGNAL WARRANT DISCLAIMER
This peak hour signal warrant analysis should be considered solely as an
"indicator" of the likelihood of an unsignalized intersection warranting
a traffic signal in the future.  Intersections that exceed this warrant
are probably more likely to meet one or more of the other volume based
signal warrant (such as the 4-hour or 8-hour warrants).



The peak hour warrant analysis in this report is not intended to replace
a rigorous and complete traffic signal warrant analysis by the responsible
jurisdiction.  Consideration of the other signal warrants, which is beyond
the scope of this software, may yield different results.

LIST OF ABBREVIATED TERMS

ADT	average daily traffic
APN	Assessor's Parcel Number
ASTM	American Society for Testing and Materials
CEQA	California Environmental Quality Act
CSMA	California Subdivision Map Act
CNEL	community equivalent noise level
dB	decibel
dBA	A-weighted sound level
du/ac	dwelling units per acre
FHWA	Federal Highway Administration
FTA	Federal Transit Administration
HVAC	heating ventilation and air conditioning
Hz	hertz
in/sec	inches per second
L_{dn}	day-night noise level
L_{eq}	equivalent noise level
L_{max}	maximum noise level
L_{min}	minimum noise level
LUD	Land Use Designation
µPa	micropascals
PPV	peak particle velocity
RMS	root mean square
SEL	Sound Exposure Level
sf	square feet
STC	Sound Transmission Class
TNM	Traffic Noise Model
VdB	vibration velocity level

1 INTRODUCTION

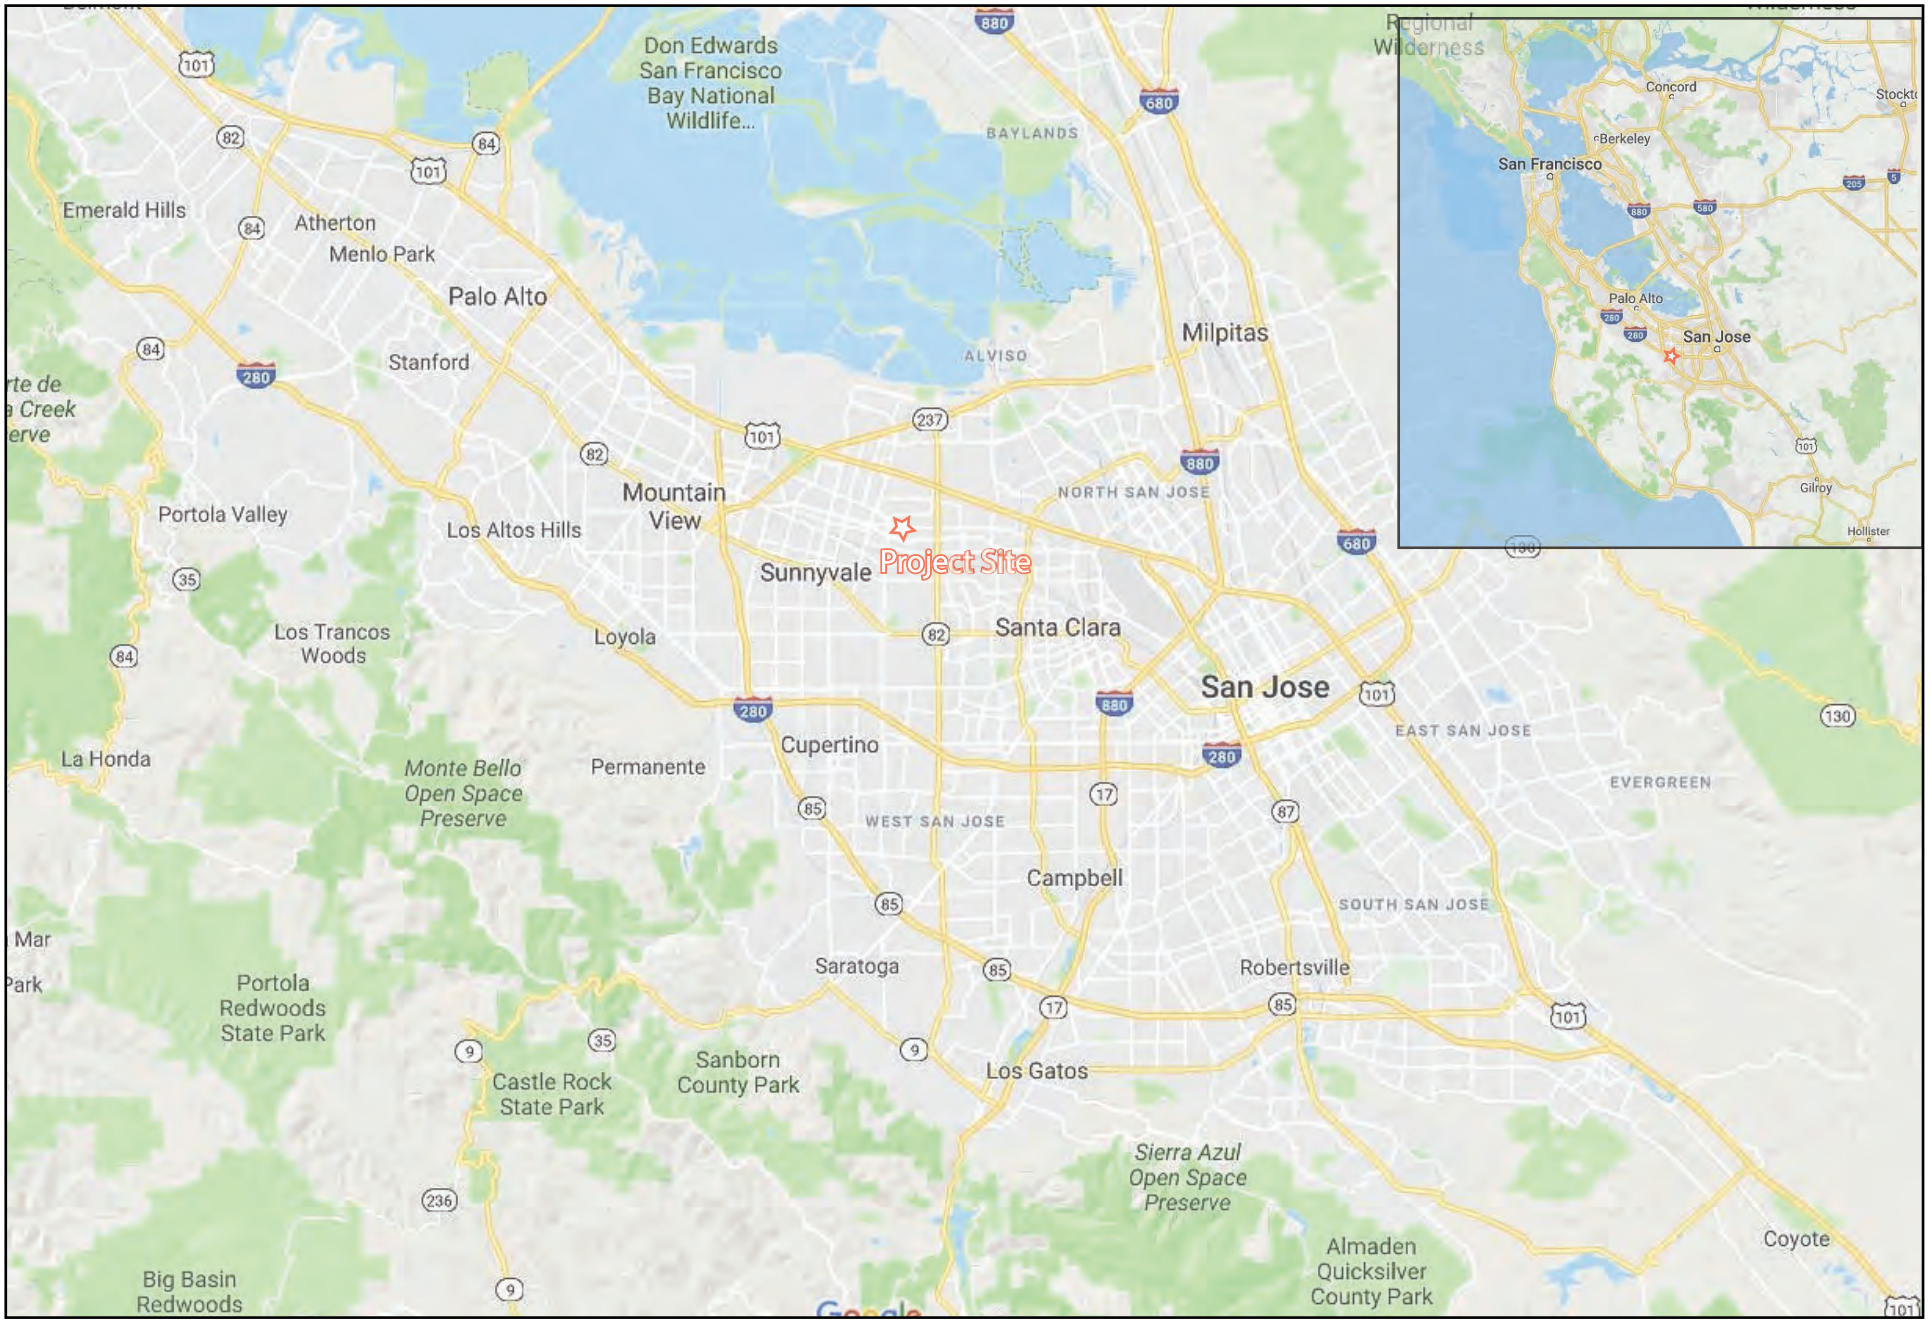
This report documents the results of an Acoustical Assessment completed for the Intuitive Surgical Project. The purpose of this Acoustical Assessment is to evaluate the potential construction and operational noise and vibration levels associated with the Project and determine the level of impact the Project would have on the environment.

1.1 Project Location

The Project would be constructed on a site bisected by Kifer Road, creating a north Project area and south Project area in the City of Sunnyvale, Santa Clara County, California. The north area is located at 945–955 Kifer Road, while the south area is located at 932 and 950 Kifer Road. *Figure 1: Regional Location* and *Figure 2: Project Site Vicinity*, depict the Project site in a regional and local context, respectively. The north area is approximately 15.6 acres while the south area is approximately 16.8 acres. Combined, the Project site is approximately 32.4-acres. The Project includes four parcels, described as Assessor Parcel Numbers (APNs) 205-40-001; 205-40-002; 205-49-17; and 205-49-18. The sites are relatively flat, at an approximate elevation of 59 to 71 feet above mean sea level.

Regional access to the site is from U.S. Route 101, which is located approximately 1.1 miles north of the Project site. Local vehicular access to the site is provided from Lawrence Expressway and Central Expressway. The north area is bordered by Central Expressway to the north and Kifer Road to the south and commercial uses to the east and west. The south area is bordered by Kifer Road to the north and Caltrain right-of-way to the south and commercial uses to the east and west. The new facilities on the south area would be connected to the north area across Kifer Road by a new private pedestrian bridge, helping to connect the areas and to reduce pedestrian traffic congestion at street level. The Project proposes four driveways along Kifer Road.

1.2 Project Description



The proposed Project would expand Intuitive's presence in Sunnyvale along Kifer Road with the development of a unified corporate campus and state of the art manufacturing and research and development (R&D) facility on four parcels near the existing Intuitive facilities. The proposed Project is located on approximately 32.4 acres and would accommodate approximately 3,500 employees in approximately 1.2 million square feet of development. The Project would allow Intuitive to integrate manufacturing, engineering and corporate offices in two connected buildings, supported by open space, recreation areas, an amenity building, dining venues and parking garages.

The new facility would replace an existing commercial building, and other smaller structures that were once part of an industrial facility on the two sites. The north area was previously used as a private recreation space for employees. The existing shade structure and amphitheater on the north area would remain. Refer to *Figure 3: Site Plan*.

The north area would include an approximately 363,000 square foot three-story office building with a new multi-purpose amenity building, outdoor sports fields and courts, and outdoor dining area. The north site would have a diesel emergency backup generator in the basement that would be permitted by the Bay Area Air Quality Management District (BAAQMD). The north area would include two floors of underground parking and small surface visitor parking lot with approximately 825 stalls.

The south area would be home to an approximately 850,000 square foot, three-story manufacturing and research and development facility. There also would be a basement level, with a covered loading dock, manufacturing, storage and service space. The south area would include a five-story parking garage and visitor parking for a total of approximately 1,726 parking stalls. A utility plant would be constructed on the south west portion of the site adjacent to the parking structure. The Project Site (both the north and south Project areas) include bicycle parking, fire lanes, waste management areas, and security guard stations.

Project construction is anticipated to last up to three years and would disturb a total of approximately 28-acres. The existing buildings (approximately 172,806 square feet) would be demolished.

2 ACOUSTIC FUNDAMENTALS

2.1 Sound and Environmental Noise

Acoustics is the science of sound. Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a medium (e.g., air) to human (or animal) ear. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound and is expressed as cycles per second, or hertz (Hz).

Noise is defined as loud, unexpected, or annoying sound. The fundamental acoustics model consists of a noise source, receptor, and the propagation path between the two. The loudness of the noise source, obstructions, or atmospheric factors affecting the propagation path, determine the perceived sound level and noise characteristics at the receptor. Acoustics deal primarily with the propagation and control of sound. A typical noise environment consists of ambient noise that is the sum of many distant and indistinguishable noise sources. Superimposed on this ambient noise is the sound from individual local sources. These sources can vary from an occasional aircraft or train passing by to continuous noise from traffic on a major highway. Perceptions of sound and noise are highly subjective from person to person.

Measuring sound directly in terms of pressure would require a large range of numbers. To avoid this, the decibel (dB) scale was devised. The dB scale uses the hearing threshold of 20 micropascals (µPa) as a point of reference, defined as 0 dB. Other sound pressures are then compared to this reference pressure, and the logarithm is taken to keep the numbers in a practical range. The dB scale allows a million-fold increase in pressure to be expressed as 120 dB, and changes in levels correspond closely to human perception of relative loudness. *Table 1: Typical Noise Levels* provides typical noise levels.

Table 1: Typical Noise Levels

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	– 110 –	Rock Band
Jet fly-over at 1,000 feet		
	– 100 –	
Gas lawnmower at 3 feet		
	– 90 –	
Diesel truck at 50 feet at 50 miles per hour		Food blender at 3 feet
	– 80 –	Garbage disposal at 3 feet
Noisy urban area, daytime		
Gas lawnmower, 100 feet	**– 70 –**	Vacuum cleaner at 10 feet
Commercial area		Normal Speech at 3 feet
Heavy traffic at 300 feet	**– 60 –**

Noise Descriptors

The dB scale alone does not adequately characterize how humans perceive noise. The dominant frequencies of a sound have a substantial effect on the human response to that sound. Several rating scales have been developed to analyze the adverse effect of community noise on people. Because environmental noise fluctuates over time, these scales consider that the effect of noise on people is largely dependent on the total acoustical energy content of the noise, as well as the time of day when the noise occurs. The equivalent noise level (L_{eq}) is the average noise level averaged over the measurement period, while the day-night noise level (L_{dn}) and Community Equivalent Noise Level (CNEL) are measures of energy average during a 24-hour period, with dB weighted sound levels from 7:00 p.m. to 7:00 a.m. Most commonly, environmental sounds are described in terms of L_{eq} that has the same acoustical energy as the summation of all the time-varying events. Each is applicable to this analysis and defined in *Table 2: Definitions of Acoustical Terms.*

Table 2: Definitions of Acoustical Terms

Term	Definitions
Decibel (dB)	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure. The reference pressure for air is 20.
Sound Pressure Level	Sound pressure is the sound force per unit area, usually expressed in µPa (or 20 micronewtons per square meter), where 1 pascal is the pressure resulting from a force of 1 newton exerted over an area of 1 square meter. The sound pressure level is expressed in dB as 20 times the logarithm to the base 10 of the ratio between the pressures exerted by the sound to a reference sound pressure (e.g., 20 µPa). Sound pressure level is the quantity that is directly measured by a sound level meter.
Frequency (Hz)	The number of complete pressure fluctuations per second above and below atmospheric pressure. Normal human hearing is between 20 Hz and 20,000 Hz. Infrasonic sound are below 20 Hz and ultrasonic sounds are above 20,000 Hz.
A-Weighted Sound Level (dBA)	The sound pressure level in dB as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise.
Equivalent Noise Level (L_{eq})	The average acoustic energy content of noise for a stated period of time. Thus, the L_{eq} of a time-varying noise and that of a steady noise are the same if they deliver the same acoustic energy to the ear during exposure. For evaluating community impacts, this rating scale does not vary, regardless of whether the noise occurs during the day or the night.
Maximum Noise Level (L_{max}) Minimum Noise Level (L_{min})	The maximum and minimum dBA during the measurement period.
Exceeded Noise Levels (L_{01}, L_{10}, L_{50}, L_{90})	The dBA values that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Day-Night Noise Level (L_{dn})	A 24-hour average L_{eq} with a 10-dBA weighting added to noise during the hours of 10:00 PM to 7:00 AM to account for noise sensitivity at nighttime. The logarithmic effect of these additions is that a 60 dBA 24-hour L_{eq} would result in a measurement of 66.4 dBA L_{dn}.
Community Noise Equivalent Level (CNEL)	A 24-hour average L_{eq} with a 5-dBA weighting during the hours of 7:00 AM to 10:00 AM and a 10-dBA weighting added to noise during the hours of 10:00 PM to 7:00 AM to account for noise sensitivity in the evening and nighttime, respectively. The logarithmic effect of these additions is that a 60 dBA 24-hour L_{eq} would result in a measurement of 66.7 dBA CNEL.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends on its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

The A-weighted decibel (dBA) sound level scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be used. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The accuracy of the predicted models depends on the distance between the receptor and the noise source.

A-Weighted Decibels

The perceived loudness of sounds is dependent on many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable and can be approximated by dBA values. There is a strong correlation between dBA and the way the human ear perceives sound. For this reason, the dBA has become the standard tool of environmental noise assessment. All noise levels reported in this document are in terms of dBA, but are expressed as dB, unless otherwise noted.

Addition of Decibels

The dB scale is logarithmic, not linear, and therefore sound levels cannot be added or subtracted through ordinary arithmetic. Two sound levels 10 dB apart differ in acoustic energy by a factor of 10. When the standard logarithmic dB is A-weighted, an increase of 10 dBA is generally perceived as a doubling in loudness. For example, a 70-dBA sound is half as loud as an 80-dBA sound and twice as loud as a 60-dBA sound. When two identical sources are each producing sound of the same loudness, the resulting sound level at a given distance would be 3 dBA higher than one source under the same conditions. Under the dB scale, three sources of equal loudness together would produce an increase of 5 dBA.

Sound Propagation and Attenuation

Sound spreads (propagates) uniformly outward in a spherical pattern, and the sound level decreases (attenuates) at a rate of approximately 6 dB for each doubling of distance from a stationary or point source. Sound from a line source, such as a highway, propagates outward in a cylindrical pattern. Sound levels attenuate at a rate of approximately 3 dB for each doubling of distance from a line source, such as a roadway, depending on ground surface characteristics. No excess attenuation is assumed for hard surfaces like a parking lot or a body of water. Soft surfaces, such as soft dirt or grass, can absorb sound, so an excess ground-attenuation value of 1.5 dB per doubling of distance is normally assumed. For line sources, an overall attenuation rate of 3 dB per doubling of distance is assumed.

Noise levels may also be reduced by intervening structures; generally, a single row of buildings between the receptor and the noise source reduces the noise level by about 5 dBA, while a solid wall or berm reduces noise levels by 5 to 10 dBA. The way older homes in California were constructed generally provides a reduction of exterior-to-interior noise levels of about 20 to 25 dBA with closed windows. The exterior-to-interior reduction of newer residential units is generally 30 dBA or more.

Human Response to Noise

The human response to environmental noise is subjective and varies considerably from individual to individual. Noise in the community has often been cited as a health problem, not in terms of actual physiological damage, such as hearing impairment, but in terms of inhibiting general well-being and contributing to undue stress and annoyance. The health effects of noise in the community arise from interference with human activities, including sleep, speech, recreation, and tasks that demand concentration or coordination. Hearing loss can occur at the highest noise intensity levels.

Noise environments, including noise from human activities, are usually well represented by median noise levels during the day or night or over a 24-hour period. Environmental noise levels are generally considered low when the CNEL is below 60 dBA, moderate in the 60 to 70 dBA range, and high above 70 dBA. Examples of low daytime levels are isolated, natural settings with noise levels as low as 20 dBA and quiet, suburban, residential streets with noise levels around 40 dBA. Noise levels above 45 dBA at night can disrupt sleep. Examples of moderate-level noise environments are urban residential or semi-commercial areas (typically 55 to 60 dBA) and commercial locations (typically 60 dBA). People may consider louder environments adverse, but most will accept the higher levels associated with noisier urban residential or residential-commercial areas (60 to 75 dBA) or dense urban or industrial areas (65 to 80 dBA). Regarding increases in dBA, the following relationships should be noted:

- Except in carefully controlled laboratory experiments, a 1-dBA change cannot be perceived by humans.
- Outside of the laboratory, a 3-dBA change is considered a just-perceivable difference.
- A minimum 5-dBA change is required before any noticeable change in community response would be expected. A 5-dBA increase is typically considered substantial.
- A 10-dBA change is subjectively heard as an approximate doubling in loudness and would almost certainly cause an adverse change in community response.

Effects of Noise on People

Hearing Loss. While physical damage to the ear from an intense noise impulse is rare, a degradation of auditory acuity can occur even within a community noise environment. Hearing loss occurs mainly due to chronic exposure to excessive noise but may be due to a single event such as an explosion. Natural hearing loss associated with aging may also be accelerated from chronic exposure to loud noise. The Occupational Safety and Health Administration has a noise exposure standard that is set at the noise threshold where hearing loss may occur from long-term exposures. The maximum allowable level is 90 dBA averaged over 8 hours. If the noise is above 90 dBA, the allowable exposure time is correspondingly shorter.

Annoyance. Attitude surveys are used for measuring the annoyance felt in a community for noises intruding into homes or affecting outdoor activity areas. In these surveys, it was determined that causes for annoyance include interference with speech, radio and television, house vibrations, and interference with sleep and rest. The L_{dn} as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise and ground transportation noise. There continues to be disagreement about the relative

annoyance of these different sources. A noise level of about 55 dBA L_{dn} is the threshold at which a substantial percentage of people begin to report annoyance[1].

2.2 Groundborne Vibration

Sources of groundborne vibrations include natural phenomena (earthquakes, volcanic eruptions, sea waves, landslides, etc.) or man-made causes (explosions, machinery, traffic, trains, construction equipment, etc.). Vibration sources may be continuous (e.g., factory machinery) or transient (e.g., explosions). Ground vibration consists of rapidly fluctuating motions or waves with an average motion of zero. Several different methods are typically used to quantify vibration amplitude. One is the peak particle velocity (PPV); another is the root mean square (RMS) velocity. The PPV is defined as the maximum instantaneous positive or negative peak of the vibration wave. The RMS velocity is defined as the average of the squared amplitude of the signal. The PPV and RMS vibration velocity amplitudes are used to evaluate human response to vibration.

Table 3: Human Reaction and Damage to Buildings from Vibrations, displays the reactions of people and the effects on buildings produced by continuous vibration levels. The annoyance levels shown in the table should be interpreted with care since vibration may be found to be annoying at much lower levels than those listed, depending on the level of activity or the sensitivity of the individual. To sensitive individuals, vibrations approaching the threshold of perception can be annoying. Low-level vibrations frequently cause irritating secondary vibration, such as a slight rattling of windows, doors, or stacked dishes. The rattling sound can give rise to exaggerated vibration complaints, even though there is very little risk of actual structural damage. In high noise environments, which are more prevalent where groundborne vibration approaches perceptible levels, this rattling phenomenon may also be produced by loud airborne environmental noise causing induced vibration in exterior doors and windows.

Table 3: Human Reaction and Damage to Buildings from Vibrations

Peak Particle Velocity (in/sec)	Approximate Vibration Velocity Level (VdB)	Human Reaction	Effect on Buildings
0.006-0.019	64-74	Range of threshold of perception	Vibrations unlikely to cause damage of any type
0.08	87	Vibrations readily perceptible	Recommended upper level to which ruins and ancient monuments should be subjected
0.1	92	Level at which continuous vibrations may begin to annoy people, particularly those involved in vibration sensitive activities	Virtually no risk of architectural damage to normal buildings
0.2	94	Vibrations may begin to annoy people in buildings	Threshold at which there is a risk of architectural damage to normal dwellings
0.4-0.6	98-104	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges	Architectural damage and possibly minor structural damage

Source: California Department of Transportation, Transportation and Construction-Induced Vibration Guidance Manual, September 2013.

[1] Federal Interagency Committee on Noise, *Federal Agency Review of Selected Airport Noise Analysis Issues*, August 1992.

Ground vibration can be a concern in instances where buildings shake, and substantial rumblings occur. However, it is unusual for vibration from typical urban sources such as buses and heavy trucks to be perceptible. Common sources for groundborne vibration are planes, trains, and construction activities such as earth-moving which requires the use of heavy-duty earth moving equipment. For the purposes of this analysis, a PPV descriptor with units of inches per second (in/sec) is used to evaluate construction-generated vibration for building damage and human complaints.

3 REGULATORY SETTING

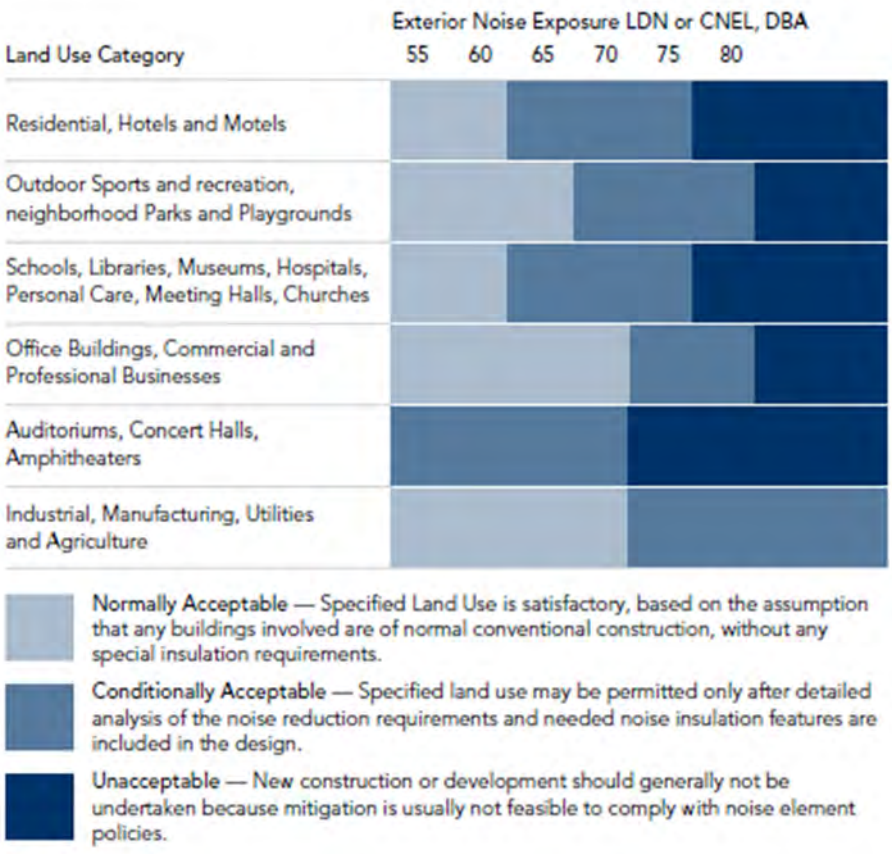
To limit population exposure to physically or psychologically damaging as well as intrusive noise levels, the Federal government, the State of California, various county governments, and most municipalities in the State have established standards and ordinances to control noise.

3.1 State of California

California Government Code

California Government Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines established by the State Department of Health Services. The guidelines rank noise land use compatibility in terms of "normally acceptable", "conditionally acceptable", "normally unacceptable", and "clearly unacceptable" noise levels for various land use types. Single-family homes are "normally acceptable" in exterior noise environments up to 60 CNEL and "conditionally acceptable" up to 70 CNEL. Multiple-family residential uses are "normally acceptable" up to 65 CNEL and "conditionally acceptable" up to 70 CNEL. Schools, libraries, and churches are "normally acceptable" up to 70 CNEL, as are office buildings and business, commercial, and professional uses.

Title 24 – Building Code



The State's noise insulation standards are codified in the California Code of Regulations, Title 24: Part 1, Building Standards Administrative Code, and Part 2, California Building Code. These noise standards are applied to new construction in California for interior noise compatibility from exterior noise sources. The regulations specify that acoustical studies must be prepared when noise-sensitive structures, such as residential buildings, schools, or hospitals, are located near major transportation noise sources, and where such noise sources create an exterior noise level of 65 dBA CNEL or higher. Acoustical studies that accompany building plans must demonstrate that the structure has been designed to limit interior noise in habitable rooms to acceptable noise levels. For new multi-family residential buildings, the acceptable interior noise limit for new construction is 45 dBA CNEL.

3.2 Local

City of Sunnyvale General Plan

The City has established noise standards and policies in its General Plan intended to protect community residents from harmful and annoying noise levels. These policies identify permissible maximum average-daily noise standards for determination of land use compatibility. The City's General Plan noise standards are summarized in *Figure 4: City of Sunnyvale Noise Guidelines for Land Use Compatibility*. For instance, the land use compatibility noise standard for office/R&D land uses is 70 dBA L_{dn}, though noise levels up to 80 dBA are conditionally acceptable. These noise criteria apply to newly proposed land uses and are based on average-daily noise levels at the property line. The land use compatibility standards mean that the proposed new land use cannot be sited in a location where it would be exposed to exterior and interior noise above the normally acceptable levels specified unless adequate noise reduction measures have been incorporated to reduce noise to acceptable levels.

Figure 4: City of Sunnyvale Noise Guidelines for Land Use Compatibility

Source: City of Sunnyvale General Plan Safety and Noise Element, 2011.

The General Plan Safety and Noise Element discusses the significant noise impacts from new development on existing land use. The General Plan includes standards for evaluating whether a project's contribution to ambient noise levels is significant. Under these standards, if ambient noise conditions are in the "normally acceptable" category, then a noise increase is significant if it would increase noise by more than 3 dBA and cause the total Ldn to exceed the "normally acceptable" category or increase noise by more than 5 dBA. If ambient noise conditions are in the conditionally acceptable or unacceptable categories, then a noise increase of more than 3 dBA is significant.

The following policies and action items from the Safety and Noise Element and the Land Use and Transportation Element (LUTE) would reduce exposure of noise-sensitive land uses to excessive noise levels:

Policy SN-8.4: Prevent significant noise impacts from new development by applying state noise guidelines and Sunnyvale Municipal Code noise regulations in the evaluation of land use issues and proposals.

Policy SN -8.5: Comply with “State of California Noise Guidelines for Land Use Planning” (Figure 6-5 [refer to Figure 4]) for the compatibility of land uses with their noise environments,

except where the City determines that there are prevailing circumstances of a unique or special nature.

Policy SN-8.6: Use Figure 6-6 (refer to Figure 5: Significant Noise Impacts from New Development on Existing Land Use), "Significant Noise Impacts from new Development on Existing Land Use" to determine if proposed development results in a "significant noise impact" on existing development.

Figure 5: Significant Noise Impacts from New Development on Existing Land Use

Ldn Category of Existing Development Per Figure 6-4	Noise Increase Considered "Significant" over Existing Noise Levels
Normally Acceptable	An increase of more than 3 dBA and the total Ldn exceeds the "normally acceptable" category
Normally Acceptable	An increase of more than 5 dBA
Conditionally Acceptable	An increase of more than 3 dBA
Unacceptable	An increase of more than 3 dBA

Source: City of Sunnyvale General Plan Safety and Noise Element, 2011.

Policy SN-8.7: Supplement Figure 6-5, "State of California Noise guidelines for Land Use Planning" for residential uses by attempting to achieve an outdoor day-night level (L_{dn}) of no greater than 60 dBA for common recreational areas, backyards, patios and medium and large-size balconies. These guidelines should not apply where the noise source is a railroad or an airport. If the noise source is a railroad, then an L_{dn} of no greater than 70 dBA should be achieved in common areas, backyards, patios and medium and large balconies. If the noise source is from aircraft, then preventing new residential uses within areas of high L_{dn} from aircraft noise is recommended.

Policy SN-8.9: Consider techniques which block the path of noise and insulate people from noise.

Policy SN-10.1: Refrain from increasing or reduce the noise impacts of major roadways.

Policy LT-6.2: Limit the intrusion of incompatible uses and inappropriate development in and near residential neighborhoods, but allow transition areas at the edges of neighborhoods.

LT-6.2b: Require appropriate noise attenuation, visual screening, landscape buffers, or setbacks between residential areas and dissimilar land uses.

Policy LT-13.3: Use density and design principles, such as physical transitions, between different land uses and to buffer between sensitive uses and less compatible uses.

Policy LT-13.8: Require high design standards for office, industrial, and research and development (R&D) buildings in all business districts.

LT-13.8c: Carefully review the impacts, such as noise, odors, and facility operations, of commercial, office, and industrial uses and development adjacent to residential areas.

Policy LT-14.5: Use the Industrial-to-Residential (ITR) combining district to help meet the community's housing needs for all ages and economic sectors and balance its use with maintaining a healthy economy and employment base. ITR zoning allows industrial/commercial/office uses to continue as conforming uses while an area transitions to residential uses. ITR areas include Tasman Crossing, East Sunnyvale, Futures 4a, Futures 4b, and Futures 6a.

LT-14.5b: During the transition from industrial to residential uses, anticipate and monitor compatibility issues between residential and industrial uses (e.g., noise, odors, hazardous materials).

Policy LT-14.12: Recognize child care and places of assembly as essential services and land uses that support the diverse needs of the community. Avoid locating these sensitive uses near hazardous materials, noise, dust, etc.

The LUTE EIR also includes Mitigation Measure 3.6.3 to minimize noise during construction:

New development and public projects shall employ site-specific noise attenuation measures during construction to reduce the generation of construction noise and vibration. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by the City. Measures specified in the Noise Control Plan and implemented during construction shall include, at a minimum, the following noise control strategies:

- Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds;
- Impact tools (e.g., jackhammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools; and
- Stationary noise sources shall be located as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures.

City of Sunnyvale Municipal Code

Construction

All construction activities are regulated by the City of Sunnyvale Municipal code regarding allowable activities and the times and days in which construction can occur. The City of Sunnyvale Municipal Code Section 16.08.030 (Hours of Construction-Time and Noise Limitations) specifies construction activity shall be permitted between 7:00 a.m. and 6:00 p.m. Monday to Friday, 8:00 a.m. to 5:00 p.m. on Saturday, and prohibited on Sunday or federal holidays when City offices are closed, except that a waiver to the hours

limit can be granted where additional construction activity will not be a nuisance to surrounding properties, based on location and type of construction. Section 16.08.030 also provides that construction noises should not include loud, environmentally disruptive noises, such as air compressors without mufflers, continuously running motors or generators, loud playing musical instruments, and radios, where such noises could be a nuisance to adjacent properties.

Operations

The City of Sunnyvale Municipal Code Chapter 19.42.030(a) and (b) (Noise or Sound Level) identifies the acceptable noise levels. The City of Sunnyvale operational noise shall not exceed 75 dBA L_{eq} at any point on the property line of the premises where the noise is generated.[2] Properties adjacent to residential uses shall not exceed 50 dBA L_{eq} during nighttime and 60 dBA L_{eq} during the daytime at any point on adjacent residentially zoned property. However, if during the nighttime the enforcing officer determines the noise involves a steady, audible tone such as a whine, screech or hum, or is a staccato or intermittent noise (e.g. hammering) or includes music or speech, the allowable noise or sound level at the property line should not exceed 45 dBA.

Section 19.42.030 also limits the use of powered equipment used on a temporary, occasional or infrequent basis that produces a noise greater than the applicable operational noise limit set by Section 19.42.030 to daytime hours when used adjacent to a property with a residential zoning district.[3] Powered equipment used on other than a temporary, occasional or infrequent basis must comply with the operational noise requirements in Section 19.42.030. Powered equipment does not include leaf blowers. In addition, construction activity is not regulated by Section 19.42.030.

Table 4: City Noise Level, shows the maximum noise levels according to the Municipal Code. It should be noted that the standards in *Table 4* apply to stationary noise levels that are generated on a property. The land use compatibility standards in *Figure 4* are guidelines and are generally used to evaluate land use and transportation noise compatibility.

Table 4: City Noise Level Standards

Time	Maximum Noise Level (dBA L_{eq})	Notes
Anytime	75 dBA	At any point on the property line of the property from which the noise emanates
Nighttime	50 dBA	On adjacent residentially zoned property
Daytime	60 dBA	On adjacent residentially zoned property

Source: City of Sunnyvale Municipal Code Ch. 19.42.030

[2] Sunnyvale Municipal Code Section 19.12.160(6) defines "operational noise" as continuous or frequent noise related to the basic use of a property. Operational noise includes, but is not limited to, noise produced by air conditioners, equipment for swimming pools or spas, industrial machinery, air compressors, or forklifts. Powered equipment or deliveries shall not be considered operational noise.

[3] Sunnyvale Municipal Code Section 19.12.170(8) defines "powered equipment" as a motorized device powered by electricity or fuel used for construction, demolition, property or landscape maintenance, and repairs. Powered equipment includes, but is not limited to lawn mowers, edgers, leaf blowers, parking lot sweepers, saws, sanders, motors, pumps, generators, blowers, fans, wood chippers, vacuums.

Deliveries

The City of Sunnyvale Municipal Code (Section 19.42.030[c]) prohibits nighttime deliveries to commercial or industrial establishments when the loading/unloading area is adjacent to a residential zoning district.

Landscaping

The City of Sunnyvale Municipal Code (Section 19.42.030[d]) limits the noise level of leaf blowers operated in or adjacent to a residential area at or below 65 dBA at a distance of 50 feet. Leaf blowers are prohibited from operating on private property in or adjacent to a residential area between 8:00 p.m. and 8:00 a.m.

Stationary Noise

Section 19.48.100 of the Municipal Code requires mechanical equipment to be located within side or rear yards, screened from view, which would provide some noise shielding as these areas are typically within property line fences/walls. In addition, the code requires all mechanical equipment to comply with City of Sunnyvale noise limits, as defined by Section 19.42.030 of the code.

4 EXISTING CONDITIONS

4.1 Existing Noise Sources

The City is impacted by various noise sources. Mobile sources of noise, especially cars, trucks, and trains are the most common and significant sources of noise. Other noise sources are the various land uses (i.e., residential, commercial, institutional, and recreational and parks activities) throughout the City that generate stationary-source noise.

Mobile Sources

Existing roadway noise levels were calculated for the roadway segments in the project vicinity. This task was accomplished using the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model (FHWA-RD-77-108) and existing traffic volumes from the project traffic impact analysis (Kimley-Horn 2018). The noise prediction model calculates the average noise level at specific locations based on traffic volumes, average speeds, roadway geometry, and site environmental conditions. The average vehicle noise rates (also referred to as energy rates) used in the FHWA model have been modified to reflect average vehicle noise rates identified for California by the California Department of Transportation (Caltrans). The Caltrans data indicates that California automobile noise is 0.8 to 1.0 dBA higher than national levels and that medium and heavy truck noise is 0.3 to 3.0 dBA lower than national levels. The average daily noise levels along roadway segments in proximity to the Project site are included in *Table 5: Traffic Noise Levels.*

Table 5: Traffic Noise Levels

Roadway Segment	Existing Conditions	
	ADT	dBA L_{dn} 100 feet from Roadway Centerline
Kifer Road		
Wolfe Road and Commercial Street	10,885	61.9
Commercial Street and Semiconductor Drive	13,970	62.9
Semiconductor Drive and Lawrence Expressway	16,465	63.7
Lawrence Expressway and Corvin Drive	17,455	63.9
Lawrence Expressway		
Oakmead Parkway and Arques Avenue	49,005	71.2
Arques Avenue and Kifer Road	57,980	71.9
Kifer Road and Monroe Street	61,440	72.1
Wolfe Road		
Arques Avenue and Kifer Road	28,245	65.1
Kifer Road and Evelyn Avenue	30,270	65.3
Evelyn Avenue and Reed Avenue	25,370	64.6
Central Expressway		
Corvin Drive and Bowers Avenue	42,275	70.3
Notes: ADT = average daily trips; dBA = A-weighted decibels; CNEL = community noise equivalent level		
Source: Based on traffic data provided by Hexagon 2019.		

Caltrain trains currently include diesel locomotive-hauled, bi-level passenger cars. As of 2018, Caltrain operates 46 northbound and 46 southbound (total of 92) trains per weekday between San Jose and San Francisco.[4] After completion of electrification, Caltrain plans to expand its service to 114 weekday trains using a mix of diesel locomotive-hauled rolling stock and new Electric Multiple Units (EMU) trains.

Stationary Sources

The primary sources of stationary noise in the project vicinity are those associated with the operations of adjacent office and industrial uses to the north, east, and west of the site. The noise associated with these sources may represent a single-event noise occurrence, short-term, or long-term/continuous noise.

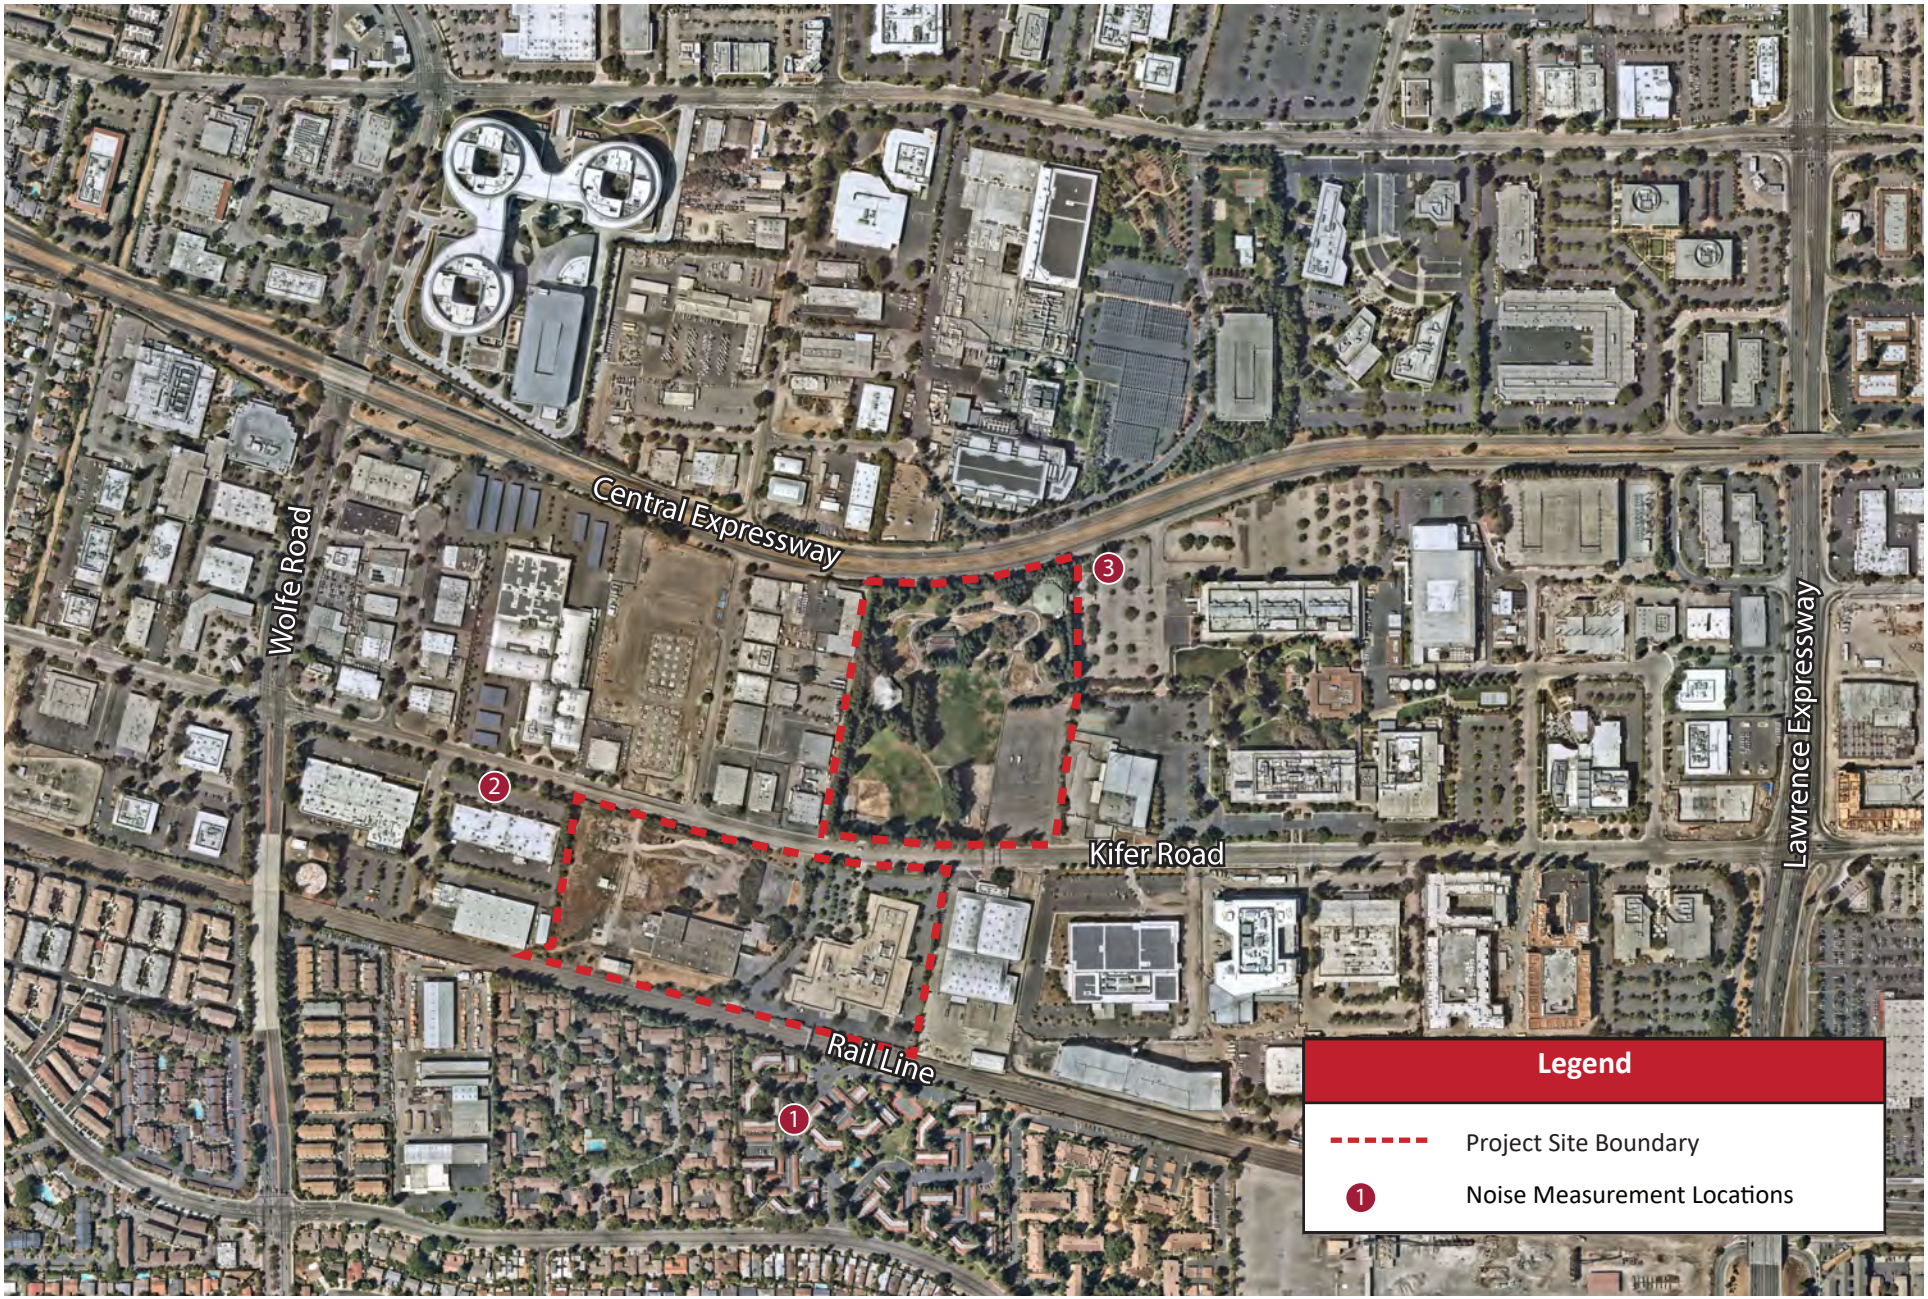
4.2 Noise Measurements

To determine ambient noise levels in the project area, three 10-minute (short-term) noise measurements were taken using a 3M SoundPro DL-1 Type I integrating sound level meter between 2:37 p.m. and 3:14 p.m. on October 10, 2019; refer to Appendix A for existing noise measurement data and Figure 6: Noise Measurement Locations. Noise Measurement one was taken to represent the ambient noise level south of the Project site across the railroad tracks; Noise Measurement two was taken to represent the ambient noise level west of the Project site adjacent to Kifer Road; and Noise Measurement three was taken to represent the ambient noise level east of the Project site. The primary noise sources that resulted in higher L_{max} values was traffic on Central Expressway, Kifer Road, passing trains, and parking lot noises. *Table 6: Existing Noise Measurements*, provides the ambient noise levels measured at these locations.

Table 6: Existing Noise Measurements

Site	Location	L_{eq} (dBA)	L_{min} (dBA)	L_{max} (dBA)	Time
1	Courtyard of apartment complex along Evelyn Terrace West	60.0	59.6	60.5	2:37 p.m.
2	Along Kifer Road west of South area	57.9	50.1	68.6	2:57 p.m.
3	Parking lot east of North area	54.4	50.3	65.4	3:14 p.m.

Source: Noise measurements taken by Kimley-Horn and Associates, October 10, 2019. See Appendix A for noise measurement results.



4.3 Sensitive Receptors

Noise exposure standards and guidelines for various types of land uses reflect the varying noise sensitivities associated with each of these uses. Residences, hospitals, schools, guest lodging, libraries, and churches are treated as the most sensitive to noise intrusion and therefore have more stringent noise exposure targets than do other uses, such as manufacturing or agricultural uses that are not subject to impacts such as sleep disturbance. Sensitive receptors near the Project site include an existing single-family and multi-family communities. *Table 7: Sensitive Receptors*, lists the distances and locations of sensitive receptors within the Project vicinity.

[4] Peninsula Corridor Joint Powers Board (PCJPB), *Caltrain Comprehensive Annual Financial Report*, 2018.

Table 7: Sensitive Receptors

Receptor Description	Distance and Direction from the Project Site
Multi-Family residences	120 feet south
Single-Family residences	1,990 feet west
Multi-Family residences	2,725 feet north
5 Star School for Music	0.3 miles north
Ellis Elementary School	0.7 miles southwest
Ponderosa Park	0.7 miles south
Murphy Park	1-mile northwest

5 SIGNIFICANCE CRITERIA AND METHODOLOGY

5.1 CEQA Thresholds

Appendix G of the California Environmental Quality Act (CEQA) Guidelines contains analysis guidelines related to noise impacts. These guidelines have been used by the City to develop thresholds of significance for this analysis. A project would create a significant environmental impact if it would:

- Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Generate excessive groundborne vibration or groundborne noise levels; and
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels.

5.2 Methodology

Construction

Construction noise estimates are based upon noise levels from the Federal Highway Administration (FHWA) Roadway Construction Noise Model (FHWA-HEP-05-054) as well as the distance to nearby receptors. Reference noise levels from the FTA document are used to estimate noise levels at nearby sensitive receptors based on a standard noise attenuation rate of 6 dB per doubling of distance (line-of-sight method of sound attenuation for point sources of noise). Construction noise level estimates do not account for the presence of intervening structures or topography, which may reduce noise levels at receptor locations. Therefore, the noise levels presented herein represent a conservative, reasonable worst-case estimate of actual temporary construction noise.

Operations

This analysis of the existing and future noise environments is based on noise prediction modeling and empirical observations. Operational noise evaluated in this section include vehicle traffic noise and stationary source noise (e.g., mechanical equipment, on-site trucks/loading docks, parking lot activities etc.). Operational noise is evaluated to determine whether noises are consistent with the City's Compatibility Guidelines. As noted above in Section 3.2, the City of Sunnyvale Municipal Code Chapter 19.42.030(a) and (b) (Noise or Sound Level) identifies the acceptable noise levels. The City of Sunnyvale operational noise shall not exceed 75 dBA L_{eq} at any point on the property line of the premises where the noise is generated. Properties adjacent to residential uses shall not exceed 50 dBA L_{eq} during nighttime and 60 dBA L_{eq} during the daytime at any point on adjacent residentially zoned property. Additionally, Section 19.42.030(c) of the City of Sunnyvale Municipal Code prohibits nighttime deliveries to commercial or industrial establishments when the loading/unloading area is adjacent to a residential zoning district. It should be noted that the Project site is not immediately adjacent to a residentially zoned neighborhood. The residential community is across the railroad tracks to the south of the southern site. Therefore, nighttime deliveries are permitted at both the north and south buildings.

The traffic noise levels in the Project vicinity were calculated using the FHWA Highway Noise Prediction Model (FHWA-RD-77-108). Traffic noise level significance is determined by comparing the increase in noise levels (traffic contribution only) to increments recognized by Caltrans as representing a perceptible increase in noise levels.

Operational noise is evaluated based on the standards within the City's Noise Ordinance (Ch. 19.42.030: Noise or Sound Level) and the City's General Plan. A significant noise impact would occur if a project exceeds the applicable noise standard (75 dBA) or increases ambient conditions as follows: if ambient noise conditions are in the "normally acceptable" category (70 CNEL in this case), then a noise increase is significant if it would increase noise by more than 3 dBA *and* cause the total Ldn to exceed the "normally acceptable" category *or* increase noise by more than 5 dBA; or if ambient noise conditions are in the conditionally acceptable or unacceptable categories (greater than 70 CNEL in this case), then a noise increase of more than 3 dBA is significant.

Vibration

Groundborne vibration levels associated with construction-related activities for the Project were evaluated utilizing typical groundborne vibration levels associated with construction equipment, obtained from Federal Transit Administration (FTA) published data for construction equipment. Potential groundborne vibration impacts related to structural damage and human annoyance were evaluated, considering the distance from construction activities to nearby land uses and typically applied criteria for structural damage and human annoyance.

6 POTENTIAL IMPACTS AND MITIGATION

6.1 Acoustical Impacts

Threshold 6.1 Would the Project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Construction

There are two types of short-term noise impacts associated with construction: noise generated from construction equipment operating at the Project site and noise generated from an increase in traffic flow on local streets.

Equipment Noise

Construction noise typically occurs intermittently and varies depending on the nature or phase of construction (e.g., land clearing, grading, excavation, paving). Noise generated by construction equipment, including earth movers, material handlers, and portable generators, can reach high levels. Noise levels typically attenuate (or drop off) at a rate of 6 dB per doubling of distance from noise source.

Construction activities would include site preparation, grading, building construction, paving, and architectural coating. Such activities would require graders, scrapers, and tractors during site preparation; graders, dozers, and tractors during grading; cranes, forklifts, generators, tractors, and welders during building construction; pavers, rollers, mixers, tractors, and paving equipment during paving; and air compressors during architectural coating. Typical operating cycles for these types of construction equipment may involve 1 or 2 minutes of full power operation followed by 3 to 4 minutes at lower power settings. Other primary sources of acoustical disturbance would be random incidents, which would last less than one minute (such as from impact equipment or the hydraulic movement of machinery lifts). Typical noise levels associated with individual construction equipment are listed in *Table 8: Typical Construction Noise Levels.*

Sensitive receptors near the Project site include the following: multi-family residences approximately 120 feet south of the site, across the train tracks and single-family residences approximately 0.40 miles (1,990 feet) west of the site. A six-foot masonry wall separates the residences on the south side and the train tracks. As shown in *Table 8*, noise levels at the sensitive receptors are below 80 dBA, except for pile-driving which could reach levels of 93 dBA. The Project does not require the use of pile drivers, and therefore noise levels at the nearest sensitive receptor would be no higher than 80 dBA. Additionally, the six-foot wall would further attenuate noise levels an additional 5 dBA to a maximum noise level of 75 dBA at the nearest sensitive receptor.

The City does not establish quantitative noise limits for construction activities, including demolition, in the City. The City of Sunnyvale Municipal Code Section 16.08.030 (Hours of Construction-Time and Noise Limitations) specifies construction activity shall be permitted between 7:00 a.m. and 6:00 p.m. Monday to Friday, 8:00 a.m. to 5:00 p.m. on Saturday, and prohibited on Sunday or federal holidays when City offices are closed. These hours are intended to mitigate temporary noise impacts by avoiding construction during noise-sensitive periods that would disturb noise-sensitive land uses, primarily residential, or create noise disturbances when the City is unavailable to respond to a noise complaint. The City does have a

qualitative noise limit for construction activities, however, which is an increase in daytime noise levels that would cause substantial annoyance to residents during daytime hours.

Table 8: Typical Construction Noise Levels

Equipment	Typical Noise Level (dBA) at 50 feet from Source	Typical Noise Level (dBA) at 120 feet from Source[1]
Air Compressor	80	72
Backhoe	80	72
Compactor	82	74
Concrete Batch Plant	83	75
Concrete Mixer	85	77
Concrete Pump	82	74
Concrete Vibrator	76	68
Crane, Derrick[2]	88	80
Crane, Mobile	83	75
Dozer	85	77
Generator	82	74
Grader	85	77
Impact Wrench	85	77
Jack Hammer	88	80
Loader	80	72
Paver	85	77
Pile-driver (Impact)[2]	101	93
Pile-driver (Sonic)[2]	95	87

Truck	84	76

[1] Calculated using the inverse square law formula for sound attenuation: $dBA_2 = dBA_1+20Log(d_1/d_2)$
Where: dBA_2 = estimated noise level at receptor; dBA_1 = reference noise level; d_1 = reference distance; d_2 = receptor location distance
[2] Equipment not required for Project construction.

Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018.

Project construction would include a temporary concrete batch plant which would be located on the northern portion of the south site along Kifer Road. Typical concrete batch plant equipment includes conveyors, elevators, elevated storage bins and silos, weight hoppers, and mixers. The concrete batch plant would operate during the construction phase and would be decommissioned once construction of the basement is completed. The plant would operate during typical construction hours and generate noise levels of typical construction as identified in *Table 8* above. Concrete batch plants generate noise levels of 83 dBA at 50 feet. The nearest sensitive receptor to the concrete batch plant would be approximately 400 feet south. At 400 feet, the concrete batch plant would generate noise levels of approximately 64.9 dBA. With the 6-foot wall at the south site property, noise levels would further attenuate to 59.9 dBA.

As noted above, the City's Municipal Code does not establish quantitative construction noise standards, but instead establishes allowable hours of construction, of which the proposed Project would adhere. In addition, the Project would comply with LUTE EIR Mitigation Measure 3.6.3 (incorporated as a standard condition of approval), which reduces the risk that construction noise would cause substantial annoyance to residents to a less-than-significant level. The standard conditions require projects to implement best management practices during construction and ensure that all construction equipment uses proper mufflers and noise attenuation devices and that construction occurs during the City's allowable hours, consistent with the assumptions in this analysis.

Construction Traffic Noise

Construction noise may be generated by large trucks moving materials to and from the Project site. Large trucks would be necessary to deliver materials for the new approximately 363,000 square-foot building on the north area and 850,000 square-foot building on the south area. The Project would include demolition of 172,806 square feet of existing buildings. Grading would be approximately 3.5 months and require approximately 570,000 cubic yards of export, which would result in approximately 71,250 roundtrip truck hauling trips. Building Construction would result in approximately 1,003 roundtrip construction trips per day (687 worker trips and 316 vendor trips per day) over approximately 14 months. Noise generated from construction traffic would increase short-term noise, however these noise levels are temporary and would cease once construction is complete. The trucks associated with construction would occur during the allowable hours for construction specified in the Municipal Code (7:00 a.m. to 6:00 p.m. on weekdays and 7:00 a.m. to 5:00 p.m. on Saturdays). Delivery trucks, haul trucks, and worker vehicles associated with the construction of the proposed Project would vary from day to day, with the highest volumes generally occurring during construction initiation.

The Project's off-site construction noise impact from haul trucks was analyzed by using the FHWA RD-77-108 model to quantify noise from the Project's maximum estimated haul truck usage with existing traffic and roadway noise levels along the potential haul routes. The location of roadside sensitive receptors was also considered. As the Project would require haul trucks over the course of the construction period to accommodate the soil off haul necessary for construction. The addition of haul trucks would alter the fleet mix of haul route roadways. This effect was accounted for by adjusting the fleet mix (i.e., increasing the truck percentages) in the FHWA RD-77-108 model.

Table 9: Construction Traffic Noise Levels provides the predicted noise levels at nearby roadway segments near the Project site. As shown in *Table 9*, roadway noise levels would range from 61.9 dBA to 72.1 dBA under existing conditions and from 64.7 dBA to 72.4 dBA under existing conditions plus Project construction. The greatest change in noise levels would occur along Kifer Road. Construction traffic would result in an increase in ambient noise levels of up to 2.8 dBA. This increase in ambient noise levels is below the perceptible range (3.0 dBA). Additionally, this increase would occur within a commercial area (i.e., not along residences) where the existing traffic noise level is 61.9 dBA and would not exceed the City's 70 dBA normally acceptable land use compatibility noise standard. Therefore, a less than significant impact would occur. The traffic noise along Wolfe also would remain below 70 dBA with the addition of the Project's construction traffic. Traffic noise on Lawrence Expressway already exceeds 70 dBA under existing conditions and the Project's construction traffic would not perceptibly alter those noise levels.

Table 9: Construction Traffic Noise Levels						
Roadway Segment	**Existing Without Project**		**Existing Plus Project Construction Truck Trips**		**Change**	**Significant Impact?**

Operations

Stationary Noise Sources

Project implementation would create new noise sources near the Project. Typical noise in office and R&D campuses includes mechanical equipment, parking area, loading area, and landscaping activities. Noise from office stationary sources would primarily occur during the daytime activity hours of 7:00 a.m. to 8:00 p.m. Further, the campus would be required to comply with the General Plan and Municipal Code noise standards.

Mechanical Equipment. Municipal Code Section 19.42.030 notes that operational noise may not exceed 75 dBA at any point on the property line of the premises upon which the noise or sound is generated or produced. Additionally, Municipal Code Section 19.42.030 states that the noise or sound level may not exceed 50 dBA during nighttime or 60 dBA during daytime hours at any point on adjacent residentially zoned property. Section 19.48.100 of the City's Municipal Code stipulates that mechanical equipment, including HVAC units, cannot be located between the face of the building and the street, and must be screened from view.

The north area mechanical equipment would include an emergency generator which would be located approximately 0.23 miles (approximately 1,200 feet) north of the closest sensitive receptor. The north area generator would be located underground in the basement of the building. As the generator would be fully enclosed underground, it would not be heard at the property lines. Therefore, noise levels in the north area would not exceed City's standard of 75 dBA at the property line. Additionally, it should be

noted that the emergency backup generator would be considered powered equipment under the Sunnyvale Municipal Code and is subject to Section 19.420.030(b), which allows such equipment to be used on a temporary, occasional, or infrequent basis during daytime hours.

The south area Central Utility Plant would be located in rooms on the south side of the proposed parking structure, and would be adjacent to the existing railway line. The south area Central Utility Plant would be located approximately 140 feet north of the nearest sensitive receptors and would house chillers, heat pumps, cooling towers and the emergency generator. Based on equipment manufacturer specifications, the chillers, heat pumps, and cooling towers at the south area would have a combined noise level of 66 dBA at 50 feet, assuming all equipment is operating simultaneously, and there was no enclosure around the equipment. The solid wall enclosure surrounding the equipment would reduce these noise levels to 56 dBA or less at 50 feet. The emergency generator would be fully enclosed on the first level of the parking garage.

The south area Central Utility Plant would be approximately 33 feet from the closest property line. Based on the combined noise level of 56 dBA at 50 feet, the chillers, heat pumps, and cooling towers at 33 feet would have a noise level of 60 dBA. Therefore, noise levels would not exceed City's standard of 75 dBA at the property line. Based upon the 140-foot distance for the south area Central Utility Plant to the closest sensitive receptors, noise levels would attenuate to approximately 47 dBA. Additionally, the 6-foot masonry wall separating the railway line and the residences south of the Project site would further reduce noise levels 5 dBA. Therefore, the Central Utility Plant would generate noise levels of approximately 42 dBA at the nearest sensitive receptors across the train tracks. The Central Utility Plant would not exceed the City's 60 dBA daytime standard and 50 dBA nighttime for residential uses. Exhaust fans would also be at various locations on the roof and would be approximately 120 feet from the closest property line. The exhaust fans typically generate 50 dBA at 50 feet. At 120 feet noise levels would be 42 dBA (37 dBA when accounting for the existing wall), which is below the City's daytime and nighttime standards. Therefore, the stationary noise sources associated with the Project would not exceed the standards set forth in the City's noise ordinance. Potential stationary source noise impacts would be less than significant.

Parking Areas. Surface parking lots currently exist on the Project site. Parking noise also occurs at the adjacent properties under existing conditions. Parking for the proposed Project would be accommodated with small guest surface parking lots and two parking garages. Traffic associated with parking areas is typically not of sufficient volume to exceed community noise standards, which are based on a time-averaged scale such as the CNEL scale. The instantaneous maximum sound levels generated by a car door slamming, engine starting up, and car pass-bys range from 53 to 61.2 dBA L_{max} at a distance of 50 feet and may be an annoyance to adjacent noise-sensitive receptors.[5] Conversations in parking areas may also be an annoyance to adjacent sensitive receptors. Sound levels of speech typically range from 33 dBA at 50 feet for normal speech to 50 dBA at 50 feet for very loud speech. It should be noted that parking area noises are instantaneous noise levels compared to noise standards in the hourly L_{eq} metric, which are averaged over the entire duration of a time period.

Parking noise would be partially masked by background noise from traffic along Kifer Road, Central Expressway, Lawrence Expressway, and Wolfe Road and the existing railroad operations. Noise from the parking garages is anticipated to be lower than the reference levels identified above, as parking would occur in structures that would be predominantly enclosed. Additionally, the parking garage on the north

[5] Kariel, H. G., Noise in Rural Recreational Environments, Canadian Acoustics 19(5), 3-10, 1991.

area offers only underground parking, and thus is totally enclosed. The south area parking structure would be located between Kifer Road and the existing railroad tracks. The nearest sensitive receptors would be located across the railroad tracks approximately 160 feet south of the proposed garage.

For the purpose of providing a conservative, quantitative estimate of the noise levels that would be generated from the vehicles entering and exiting the Project's parking structure, the methodology recommended by FTA for the general assessment of stationary transit noise sources is used. Using the methodology, the Project's peak hourly noise level that would be generated by the on-site parking levels was estimated using the following FTA equation for a parking area:

$$L_{eq(h)} = SEL_{ref} + 10\log(NA/1{,}000) - 35.6$$

Where:

$L_{eq(h)}$ = hourly L_{eq} noise level at 50 feet
SEL_{ref} = reference noise level for stationary noise source represented in sound exposure level (SEL) at 50 feet
NA = number of automobiles per hour
35.6 is a constant in the formula, calculated as 10 times the logarithm of the number of seconds in an hour

Based on the peak hour trip generation rates in the Traffic Impact Study, the Project would generate a maximum of 808 peak hour trips (approximately 242 peak hour trips to the north building and 566 peak hour trips to the south building). Parking activities (including typical vehicle arrival and departure) generate a SEL[6] of 92 dBA[7] at a distance of 50 feet. Using the formula above, the Project's highest peak hour vehicle trips would generate noise levels of approximately 50.2 dBA L_{eq} at 50 feet from the parking area associated with the north building and 53.9 dBA L_{eq} at 50 feet from the parking area associated with the south building. The closest sensitive receptors located approximately 890 feet from the north building parking area and 170 feet from the south building parking area (south of the railroad). At these distances, parking noise levels from the north and south building would attenuate to 25.2 dBA and 43.3 dBA, respectively. Therefore, parking noise would not exceed the City's 60 dBA daytime or the 50 dBA nighttime noise standards. It should be noted that these noise levels would occur during the peak hour. During other hours of the day when less overall vehicles arrive and depart from the parking areas, the noise levels would be even lower. It should be noted that an existing concrete masonry unit (CMU) wall is located along the northern property line of the sensitive receptors to the south and would further reduce noise levels by approximately 5 dBA[8] beyond what has been identified above.

Additionally, as noted above, the north area parking structure would be located under the proposed building on that site, in an underground garage, and approximately 900 feet from the nearest sensitive receptor. Based on this distance and the acoustic shielding provided by the garage, noise levels would be imperceptible at the nearest sensitive receptor. Noise impacts would less than significant in this regard.

[6] The sound exposure level (SEL) was used to quantify the noise levels from typical parking lot noise. SEL is the cumulative noise exposure from a single noise event, normalized to one second. SEL contains the same overall sound energy as the actual varying sound energy during the event. It is the primary metric for the measurement of transit vehicle noise emissions and is an intermediate metric in the measurement and calculation of both Leq(t) and Ldn.

[8] Federal Highway Administration, *FHWA Roadway Construction Noise Model User's Guide*, January 2006.

Loading Area. The proposed Project includes office/R&D and manufacturing that would necessitate occasional truck delivery operations. The deliveries would occur at each of the buildings, a maximum of 43 deliveries per day are expected at the north building and a maximum of 160 deliveries per day are expected at the south building. The occasional delivery trucks associated with the Project would not significantly increase noise within the Project area. It should be noted that truck deliveries/operations (including trash pickup trucks) currently occur at the Project site and are not anticipated to increase to a point where additional noise would be perceptible. The primary noise associated with deliveries is the arrival and departure of trucks. Normal deliveries typically occur during daytime hours, but some deliveries may occur during nighttime or early morning hours. As noted above, the Project site is not immediately adjacent to a residentially zoned neighborhood (both the north and south buildings). The closest residential community is across the railroad tracks to the south of the southern site. Therefore, nighttime deliveries are permitted at both the north and south buildings. During loading and unloading activities, noise would be generated by the trucks' diesel engines, exhaust systems, and brakes during low gear shifting' braking activities; backing up toward the docks/loading areas; dropping down the dock ramps; and maneuvering away from the docks.

The Project site is not immediately adjacent to a residentially zoned neighborhood, but the residential community is across the railroad tracks to the south of the southern site. The loading area for the north area would be more than 2,000 feet from the closest sensitive receptors and would be shielded by intervening structures. Therefore, nighttime deliveries are permitted at the northern site. As the southern site is adjacent to the railroad and not adjacent to residential uses, nighttime deliveries are also permitted at the south building. The drive aisle and loading area for the south building would be approximately 170 feet and 185 feet north of the closest sensitive receptors to the south, respectively. A second loading area would be located in the subterranean level of the south building. Loading in the south building subterranean level would be acoustically shielded by the basement and would not generate audible noise on the exterior of the building. See Figure 3 for callout of loading areas.

Delivery truck and loading dock noise is typically 64.4 dBA at a distance of 50 feet.[10] At 170 feet, truck noise would attenuate to 53.8 dBA. As noted above, the existing CMU wall located along the northern property line of the sensitive receptors to the south would further reduce noise levels by approximately 5 dBA[11] or more resulting in truck noise levels of at least 48.8 dBA at the closest sensitive receptors. Therefore, loading area noise would not exceed the City's 60 dBA daytime noise standard or the 50 dBA nighttime standard. It should be noted that these standards are applicable to properties adjacent to residential uses and the Project site is not immediately adjacent to a residentially zoned neighborhood. The closest residential community is across the railroad tracks to the south of the southern site.

Furthermore, loading dock doors would also be surrounded with protective aprons, gaskets, or similar improvements that, when a trailer is docked, would serve as a noise barrier between the interior warehouse activities and the exterior loading area. This would attenuate noise emanating from interior activities, and as such, interior loading and associated activities would be permissible during all hours of the day. Loading area noise would not be an intrusive or significant noise source compared to existing conditions. Impacts resulting from truck delivery and loading activities would be less than significant.

Landscape Maintenance Activities. The proposed Project includes new landscaping that would require periodic maintenance. Noise generated by a gasoline-powered lawnmower is estimated to be

[10] Loading dock reference noise level measurements conducted by Kimley-Horn on December 18, 2018.
[11] Federal Highway Administration, *FHWA Roadway Construction Noise Model User's Guide*, January 2006.

approximately 70 dBA at 5 feet. However, maintenance activities would operate during daytime hours for brief periods of time as allowed by the City Municipal Code and would not permanently increase ambient noise levels in the Project vicinity and would be consistent with activities that currently occur at the surrounding uses. Therefore, with adherence to the City's Municipal Code, impacts associated with landscape maintenance would be less than significant.

Traffic Noise

The Project proposes office/R&D and manufacturing uses. *Table 10: Projected Traffic Noise Levels* provides the predicted noise levels at nearby roadway segments near the Project site. As shown in *Table 10*, roadway noise levels at standard distance of 100 feet from the centerline would range from 61.9 dBA to 72.1 dBA under existing conditions and from 62.9 dBA to 72.2 dBA under existing conditions plus Project. Noise levels at 100 feet from the roadway centerline represent a typical receptor distance from the roadway and also provides a standards distance to compare noise levels from various road segments.

Table 10: Projected Traffic Noise Levels

Roadway Segment	Existing Without Project		Existing Plus Project		Change	Significant Impact?
	ADT	dBA CNEL at 100 feet from Roadway Centerline	ADT	dBA CNEL at 100 feet from Roadway Centerline		
Kifer Road						
Wolfe Road and Commercial Street	10,885	61.9	13,670	62.9	1.0	No
Commercial Street and Semiconductor Drive	13,970	62.9	17,190	63.8	0.9	No
Semiconductor Drive and Lawrence Expressway	16,465	63.7	19,685	64.5	0.8	No
Lawrence Expressway and Corvin Drive	17,455	63.9	17,585	63.9	0.0	No
Lawrence Expressway						
Oakmead Parkway and Arques Avenue	49,005	71.2	50,695	71.3	0.1	No
Arques Avenue and Kifer Road	57,980	71.9	60,030	72.0	0.1	No
Kifer Road and Monroe Street	61,440	72.1	62,480	72.2	0.1	No
Wolfe Road						
Arques Avenue and Kifer Road	28,245	65.1	29,875	65.3	0.2	No

Evelyn Avenue and Reed Avenue	25,370	64.6	26,430	64.8	0.2	No
Central Expressway						
Corvin Drive and Bowers Avenue	42,275	70.3	42,915	70.3	0.0	No

Notes: ADT = average daily trips; dBA = A-weighted decibels; CNEL = community noise equivalent level

Source: Based on traffic data provided by Hexagon 2019.

The Kifer Road and Central Expressway road segments are surrounded by office and industrial uses. With Project traffic, Kifer Road noise levels would not exceed the City's Land Use Compatibility Standard of 70 dBA. Although Central Expressway noise levels exceed 70 dBA, the Project would not increase traffic noise along this segment. Both Lawrence Expressway and Wolfe Road include residential uses and the applicable Land Use Compatibility Standards is 60 dBA. Although traffic noise levels along these roadways exceed the land use compatibility standard, the maximum Project increase along these roads would be 0.2 dBA, which would not be perceptible. The greatest change in noise levels would occur along Kifer Road

between Wolfe Road and Commercial Street. Project-generated traffic would result in an increase in future ambient noise levels of 1.0 dBA. This increase in ambient noise levels is below the perceptible range (3.0 dBA), and a less than significant impact would occur.

Standard Conditions:

SC-1 New development and public projects shall employ site-specific noise attenuation measures during construction to reduce the generation of construction noise and vibration. These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by the City. Measures specified in the Noise Control Plan and implemented during construction shall include, at a minimum, the following noise control strategies:

- Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds;
- Impact tools (e.g., jackhammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools; and
- Stationary noise sources shall be located as far from adjacent receptors as possible, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

Threshold 6.2 Would the Project generate excessive groundborne vibration or groundborne noise levels?

Construction

Project construction has the potential to result in varying degrees of temporary groundborne vibration, depending on the equipment used and operations involved. The FTA has published standard vibration velocities for construction equipment operations. In general, the FTA architectural damage criterion for continuous vibrations (i.e., 0.2 in/sec) appears to be conservative. The types of construction vibration impacts include human annoyance and building damage. Human annoyance occurs when construction vibration rises significantly above the threshold of human perception for extended periods of time. Building damage can be cosmetic or structural. Ordinary buildings that are not particularly fragile would not experience cosmetic damage (e.g., plaster cracks) at distances beyond 30 feet from the source of the vibration. This distance can vary substantially depending on soil composition and underground geological layer between vibration source and receiver. According to the geotechnical reports for the Project, the site consists of stiff soils. These soil types would be considered Class III hard soils according to the Caltrans Transportation and Construction Vibration Guidance Manual (September 2013), which increases vibration levels compared to soft soils.

In addition, not all buildings respond similarly to vibration generated by construction equipment. For example, for a building that is constructed with reinforced concrete with no plaster, the FTA guidelines

show that a vibration level of up to 0.5 in/sec is considered safe and would not result in any construction vibration damage.

Table 11: Typical Construction Equipment Vibration Levels, lists vibration levels at 25 feet for typical construction equipment in a wide range of soil conditions. Groundborne vibration generated by construction equipment spreads through the ground and diminishes in magnitude with increases in distance. Project construction would not require piles to be driven (i.e., the use of pile drivers would not be required). Soldier beams (i.e., steel beams placed into a drilled hole) would be installed as part of a shoring system. As indicated in *Table 11*, based on FTA data, vibration velocities from typical heavy construction equipment operations that would be used during Project construction range from 0.003 to 0.089 in/sec PPV at 25 feet from the source of activity. The nearest sensitive receptors are the multi-family residences 120 feet south of the Project site. At the nearest sensitive receptors, the Project construction PPV would reach up to 0.016 in/sec, which is in the range of threshold of perception, but would not cause any building damage, even to very fragile buildings. The vibrations would be temporary and short term, however, and are not anticipated to create a nuisance.

Table 11: Typical Construction Equipment Vibration Levels

Equipment	Peak Particle Velocity at 25 Feet (in/sec)	Peak Particle Velocity at 50 Feet (in/sec) [1, 2]	Peak Particle Velocity at 120 Feet (in/sec) [1, 2]
Large Bulldozer	0.089	0.042	0.016
Caisson Drilling	0.089	0.0342	0.016
Loaded Trucks	0.076	0.036	0.014
Rock Breaker	0.059	0.028	0.011
Jackhammer	0.035	0.016	0.006
Small Bulldozer/Tractors	0.003	0.001	0.000

1. Calculated using the following formula: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$, where: PPV_{equip} = the peak particle velocity in in/sec of the equipment adjusted for the distance; PPV_{ref} = the reference vibration level in in/sec from Table 7-4 of the Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, 2018; D = the distance from the equipment to the receiver.
2. PPV levels have been adjusted based on the site's soil type per the Caltrans *Transportation and Construction Vibration Guidance Manual,* September 2013.

Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018.

The closest structures to the construction area would be a mix of office and industrial developments, which would be approximately 50 feet from the closest construction/demolition area. At this distance, maximum construction vibration levels would range from 0.001 to 0.042 inch/second PPV and would not exceed the 0.2 inch/second PPV threshold for damage to buildings like the ones closest to the Project site. Therefore, vibration impacts from Project construction would be less than significant and no mitigation would be required.

Operational

The Project involves office/R&D and manufacturing uses that would not have any groundborne vibration associated with operational activities. The Project would not involve railroads or substantial heavy truck operations or increase the frequency or number of cars per train that Caltrain runs. However, the Project would involve delivery vehicles that would come to the Project site once facilities are operational. The project site is not adjacent to a residential zoning district, and therefore nighttime deliveries are permitted per section 19.42.030(c) of the City of Sunnyvale Municipal Code. Operation of delivery vehicles would be consistent with existing operations and operations on the surrounding uses and roadways and would not

generate perceptible groundborne vibrations. As a result, impacts from vibration associated with Project operation would be less than significant.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

Threshold 6.3 For a Project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the Project area to excessive noise levels?

The nearest public airport is the Moffett Federal Airfield, approximately 2.5 miles northwest of the site. The Norman Y. Mineta San Jose International Airport is located approximately 3.4 miles east of the site and Palo Alto Airport approximately 8.1 miles northwest of the site. As such, the Project is not located within an airport land use plan nor is it located within two miles of a public airport. Therefore, no impacts would occur. Additionally, there are no private airstrips or airports near the City of Sunnyvale and the Project site. Therefore, no impacts would occur.

Mitigation Measures: No mitigation is required.

Level of Significance: Less than significant impact.

6.2 Cumulative Noise Impacts

As discussed above, all Project construction and operational noise impacts would be less than significant. Construction noise impacts are by nature localized. Based on the fact that noise dissipates as it travels away from its source, noise impacts would be limited to the Project site and vicinity.

Construction activities at other planned and approved projects near the Project site would be required to comply with City rules related to noise and would take place during daytime hours on the days permitted by the Municipal Code, and projects requiring discretionary City approvals would be required to evaluate construction noise impacts, comply with the City's standard conditions of approval, and implement mitigation, if necessary, to minimize noise impacts. The timing of construction activities associated with this or other development projects would overlap minimally, if at all with the Project. The Project would be required to implement SC-1 to minimize construction noise and impacts are considered less than significant. Furthermore, because construction noise is a highly localized, even if construction activities did overlap in time with the Project, the intervening distance between projects would diminish any additive effects. Given these distances, topography, and the intervening structures, the Project, together with other nearby projects that may be under construction at the same time, would not create a significant cumulative impact from construction noise. In addition, Project construction would not make a cumulatively considerable contribution to significant cumulative impacts, assuming such a cumulative impact existed, and impacts in this regard are not cumulatively considerable.

The Project's construction vibration levels would not exceed annoyance thresholds therefore, the Project's incremental contribution is not cumulatively considerable. Given that vibration propagates in waves through the soil, multiple pieces of equipment operating simultaneously would each produce vibration waves in different phases that typically would not increase the magnitude of the vibration. Furthermore, vibration is a localized phenomenon, and tends to dissipate to insignificant levels within dozens of feet, as discussed in Threshold 6.2. Thus, there would be no possibility for vibration associated

with the Project to combine with vibration from other projects because of their distances from the Project site. Therefore, the cumulative vibration impacts would be cumulatively less than significant.

As discussed above, operational noise caused by the proposed Project would be less than significant. Stationary noise sources of the proposed Project would result in an incremental increase in non-transportation noise sources in the Project vicinity. However, stationary sources of noise were analyzed and would comply with City noise standards. Additionally, due to site distance to sensitive receptors and intervening railroad tracks to the south (which increase existing ambient noise levels), cumulative stationary noise impacts would not occur. Similar to the proposed Project, other planned and approved projects would be required to mitigate for stationary noise impacts at nearby sensitive receptors, if necessary. As stationary noise sources are generally localized, there is a limited potential for other projects to contribute to cumulative noise impacts.

The Project would generate a maximum of approximately 11,528 vehicle trips per day (round trips). The surrounding roadways analyzed above include Kifer Road, Lawrence Expressway, Wolfe Road, and Central Expressway. Kifer Road and Central Expressway near the Project site are both surrounded by office and industrial uses and therefore the City's Land Use Compatibility Standard of 70 dBA would apply. Kifer Road has an existing noise level between 61.9 dBA and 63.9 dBA that would increase to 62.9 dBA to 63.9 dBA with the Project. These resulting noise levels would increase by 1.0 dBA or less and noise levels would remain under the 70 dBA standard. Central Expressway existing noise levels are 70.3 dBA and would remain unchanged with the Project.

Both Lawrence Expressway and Wolfe Road near the Project site include residential uses meaning the Land Use Compatibility Standards is 60 dBA. Lawrence Expressway noise levels without the Project ranges from 71.2 dBA to 72.1 dBA. The Project would increase noise levels to 71.3 dBA and 72.2 dBA. While these noise levels are above the 60 dBA Land Use Compatibility Standard, the change due to the Project is 0.1 dBA and therefore less than the perceptible 3.0 dBA noise level. Wolfe Road has an existing noise level between 64.7 dBA and 65.3 dBA and with the Project the noise levels increase to 64.8 dBA and 65.5 dBA. While these noise levels are above the standard for residential areas, the change due to the Project is 0.2 dBA and less than the perceptible level of 3 dBA. Although traffic noise levels along several roadway segments exceed the Land Use Compatibility Standard, the maximum increase caused by the Project would be imperceptible. Therefore, the Project would make a cumulatively considerable contribution to existing significant cumulative traffic noise levels on Lawrence, Wolfe, and Central and would not create a significant cumulative impact along Kifer when the Project's noise is added to existing and reasonably foreseeable future noise. It should be noted that cumulative traffic in future years would increase and the Project's trip generation would not change. The increase of the background cumulative projects would further diminish the Project's traffic noise contribution.

No known past, present, or reasonably foreseeable projects would combine with the operational noise levels generated by the Project to increase noise levels above levels acceptable by the City because each project must comply with City regulations that limit operational noises to no more than 75 dBA at the property line, and 60 dBA at residential areas during daytime and 50 dBA at residential areas during nighttime. Therefore, the Project, together with other projects, would not create a significant cumulative impact relative to temporary and permanent noise generation, and even if there was such a significant cumulative impact, the Project would not make a cumulatively considerable contribution to significant cumulative operational noises.

EXECUTIVE SUMMARY

ES.1 INTRODUCTION

Division 6, Part 2.10 (1995) of the California Water Code (Water Code), requires coordination between land use lead agencies and public water purveyors. The purpose of this coordination is to ensure that prudent water supply planning has been conducted, and that planned water supplies are adequate to meet both existing demands and demands of planned development.

Water Code Sections 10910 – 10915 (inclusive) require land use lead agencies: 1) to identify the responsible public water purveyor for a proposed development project, and 2) to request a "Water Supply Assessment" (WSA) from the responsible purveyor. The objective of a WSA is to demonstrate the sufficiency of a purveyor's water supplies to satisfy the water demands of a proposed development project while still meeting the current and projected water demands of existing customers. Water Code Sections 10910 – 10915 delineate specific information that must be included in a WSA. This WSA was prepared consistent with Water Code Sections 10910 – 10915.

ES.2 SUMMARY DESCRIPTION OF THE PROJECT

The project consists of two primary components: (1) modifications to the adopted Lawrence Station Area Plan (LSAP Update) (i.e., an increase in housing potential within the LSAP, expansion of the western LSAP boundary by approximately 32.4 acres, and a Sense of Place Plan that would function as a policy document for LSAP area circulation, open space, and streetscape improvements) and (2) an office/research and development (R&D) and manufacturing development project in the western LSAP boundary expansion area for the Intuitive Surgical Corporate Campus Project (ISI project).

ES.3 SUMMARY OF WATER SUPPLY ASSESSMENT CONCLUSIONS

Pursuant to Section 10910 of the Water Code and based on the analysis detailed in this report, the City of Sunnyvale has determined that its currently projected water supplies will be sufficient to meet the projected annual water demands of existing and previously approved uses, and the implementation of the LSAP Update and ISI project during normal, single dry, and multiple dry years. The project will increase water demand within the City by approximately 688 acre-feet per year (AFY). For this WSA, project demand is compared to demands associated with development levels in the currently adopted LSAP as documented in the 2015 WSA for the City of Sunnyvale Land Use and Transportation Element (LUTE) Update (the LSAP is a component of the LUTE) (LUTE WSA). The analysis also accounts an increase in water demand as part of the Downtown Specific Plan Amendments Update.

As shown in Tables 4-1 and 4-2, the City's existing water supply contracts would meet the combined increase demand of the project and the Downtown Specific Plan Amendments Project under normal and single dry year conditions. During multiple dry year conditions, the City would use groundwater that would be within its safe yield of 8,000 AFY. During extended droughts, the City would implement its Water Shortage Plan which would include voluntary and mandatory water conservation measures to address water supply shortfalls of up to 50 percent.

This page intentionally left blank.

1 INTRODUCTION

1.1 PURPOSE OF WATER SUPPLY ASSESSMENT

The Water Code (Section 10910 et. seq.), based on Senate Bill 610 of 2001 (SB 610), requires a project proponent to prepare a water supply assessment (WSA) to evaluate the reliability of a project's water supply as part of the California Environmental Quality Act (CEQA) process. If the City of Sunnyvale's (City's) potable water supply does not have sufficient existing water supply to meet the project demands of the project, the development of additional water supplies must be addressed in the WSA and in the project Environmental Impact Report (EIR).

Under the Government Code (Section 66473.7), based on SB 221 of 2001, proposed subdivisions adding 500 dwelling units are also required to receive written verification of the available water supply from the project's water supplier. The LSAP Update/ ISI project (project) does not include the creation of a subdivision or a subdivision tract map, so a written verification of supply is not required.

This report is meant to serve as the WSA for the project to meet the Water Code and Government Code requirements. This WSA documents the City's existing and future water supplies for the LSAP area and compares them to the City's total projected water demands for the next twenty (20) years.

SB 610 requires the following steps be taken to identify the need and scope of a project's WSA:

1. Determine whether the project is subject to CEQA.
2. Determine whether the project meets the definition of a "project" per SB 610.
3. Determine the public water agency that will serve the project.
4. Determine whether any current Urban Water Management Plan considers the projected water demand for the project area.
5. Determine whether groundwater is used by the public water agency to serve the project area.

1.2 PROJECT OVERVIEW

The City's LSAP is located in the east-central part of the City, adjacent to the City of Santa Clara. The Caltrain Lawrence Station (Station) is located at 137 San Zeno Way, directly below the Lawrence Expressway overpass. U.S. 101 to the north and Interstate 280 to the south provide regional access to the plan area, and a network of major streets provides local access (i.e., Kifer Road, E. Evelyn Avenue, and Reed Avenue/Monroe Street). In December 2016, the City Council adopted the LSAP and its associated General Plan Amendment and Rezoning. The City also prepared an EIR (State Clearinghouse No. 2013082030) for the LSAP that was certified by City Council in 2016. In 2015, a WSA prepared for the City's LUTE Update assessed buildout of the LSAP (City of Sunnyvale 2015) (LUTE WSA). The City is reviewing the potential impacts of the project. The project consists of two primary components: (1) modifications to the adopted LSAP (i.e., an increase in housing potential within the LSAP, expansion of the western LSAP boundary by approximately 32.4 acres, and the proposed Lawrence Station Sense of Place Plan that would function as a policy document for LSAP area circulation, open space, and streetscape improvements) and (2) an office/research and development (R&D) and manufacturing development project in the western LSAP boundary expansion area for the ISI project.

This WSA assesses the LSAP update component of the project as it relates to the addition of 3,612 net new residential units that would be allowable within the LSAP area with modifications to the adopted LSAP. The land uses proposed as part of the ISI project are consistent with the land uses of the adopted LSAP and have been factored in the 2015 WSA and the City's 2015 Urban Water Management Plan (UWMP).

The proposed increase of 3,612 residential units triggers the need for the preparation of a WSA pursuant to Water Code Section 1092(a). The City municipal water system that serves the LSAP uses groundwater and water purchased from the Santa Clara Valley Water District (Valley Water) and the San Francisco Public Utilities Commission (SFPUC). The LSAP is located within City service Zone I.

This WSA is being prepared in accordance with SB 610 for the City's CEQA work in connection with the project.

1.3 PREVIOUS WATER SUPPLY ASSESSMENT

The LUTE WSA was prepared for the City's LUTE Update. In accordance with SB 610, a WSA is to be prepared to document the sufficiency of available water supply for the proposed project. Typically, WSA's are prepared for specific development projects. The LUTE Update established the development potential of the City at buildout. This buildout potential was included in the 2016 adopted LSAP. Full buildout of the LSAP analyzed under the LUTE WSA included: approximately 3,500 residential units; 3.6 million square feet of office/R&D development; approximately 217,000 square feet of retail space, and 26,500 square feet of industrial space. The values included existing residential units that were to be protected under the LSAP. Total expected water demand for the adopted LSAP was estimated at approximately 814 acre-feet per year (AFY). The LUTE WSA concluded that the City of Sunnyvale has a sufficient program of water supply for the current and future use, including sufficient water supply for buildout under the LUTE update (City of Sunnyvale 2015).

1.4 RELATIONSHIP OF THE WATER SUPPLY ASSESSMENT TO THE CITY URBAN WATER MANAGEMENT PLAN

Urban water management plans are considered by the California Department of Water Resources as a fundamental document for compliance with both SB 610 and SB 221. Thorough and complete UWMPs allow water suppliers to use UWMPs as a foundation to fulfill the specific requirements of these two statutes. The UWMP provides information detailing water supplies available during normal, single dry, and multiple dry water years during a 20-year projection, and the existing and projected future water demand during a 20-year projection. The UWMP presents projected supplies and demands in 5-year increments for the 20-year projection. Supplies from all sources, including wholesaler supplies, are documented in the UWMP. This documentation includes identifying and quantifying water rights, contracts, and/or entitlements to the supply; associated capital outlay programs; federal, state and local permits for constructing infrastructure for conveying the supply; and any necessary regulatory approvals required for conveyance.

Data from the City's 2010 UWMP was utilized to complete the LUTE WSA. The most recent UWMP for the City of Sunnyvale was adopted in June 2016 for the 2015 water year (2015 UWMP). The 2015 UWMP shows projected water supplies available during normal, single dry, and multiple dry water years in 5-year increments through the year 2035. Although not required, the 2015 UWMP provided water use projections for the year 2040. Water demand for the adopted LSAP was considered under the 2015 UWMP; therefore, whenever possible data from the 2015 UWMP was used to complete this WSA.

1.5 WATER SUPPLY ASSESSMENT ORGANIZATION

This WSA is organized into chapters, as identified and briefly described below. Chapters are further divided into sections (e.g., Chapter 3, "City Water Supply" and Section 3.1, "Current Water Supply Sources"):

- The "Executive Summary": This chapter introduces the LSAP project; provides a summary of the of the project, and a summary of the WSA conclusions.
- Chapter 1, "Introduction": This chapter provides a description of the purposed of the WSA, a project overview, a review of the previous WSA and its relationship the City's UWMP, and the WSA organization.

- Chapter 2, "Project Description": This chapter describes the location, background, and project water demands for the LSAP project, City water demands, and describes the project elements in detail.
- Chapter 3, "City Water Supply": The sections within this chapter describe the City's current and future water supply and reliability from the following existing sources: SFPUC, Valley Water, groundwater, and recycled water.
- Chapter 4, "Water Supply Sufficiency Analysis": This chapter evaluates the water supply reliability and the anticipated project water demands to determine if the future water supply can adequately meet the project water demands.
- Chapter 5, "Conclusions": This chapter summarizes the conclusions of the WSA.
- Chapter 6, "Report Preparers": This chapter identifies the preparers of the document.
- Chapter 7, "References": This chapter identifies the organizations and persons consulted during preparation of this WSA and the documents and individuals used as sources for the analysis.

1.6 STANDARD TERMINOLOGY

This WSA uses the following standard terminology:

"acre-feet per year" refers to the measurement of annual water supply demand. One acre-foot equals about 326,000 gallons, or enough water to cover an acre of land one foot deep.

"CEQA" means the California Environmental Quality Act.

"LUTE WSA" refers to the 2015 WSA that was prepared for the LUTE Update.

"project" means proposed LSAP Update and ISI project.

This page intentionally left blank.

2 PROJECT DESCRIPTION AND WATER DEMANDS

2.1 PROJECT DESCRIPTION

On December 6, 2016, the City of Sunnyvale adopted the Lawrence Station Area Plan (LSAP) and certified the LSAP EIR. The City's LSAP is located in the east-central part of the City of Sunnyvale in Santa Clara County, adjacent to the City of Santa Clara. The Caltrain Lawrence Station (Station) is located at 137 San Zeno Way, directly below the Lawrence Expressway overpass. U.S. 101 to the north and Interstate 280 to the south provide regional access to the plan area, and a network of major streets provides local access (i.e., Kifer Road, E. Evelyn Avenue, and Reed Avenue/Monroe Street). The LSAP area of focus consists of approximately 199 acres (without roads) of already urbanized lands within the City and is part of a larger 319 acres. The intent of the LSAP is to increase ridership at Caltrain's Lawrence Station and promote a mix of uses at the station through the development of a diverse neighborhood of employment, residential, retail, other support services and open space. With a plan horizon of 2035, the adopted LSAP includes goals, policies and guidelines to guide public and private investment in the area.

The LSAP Update/ISI project consists of two primary components: (1) modifications to the adopted LSAP (i.e., an increase in housing potential within the LSAP, expansion of the western LSAP boundary by approximately 32.4 acres, and the proposed Lawrence Station Sense of Place Plan that would function as a policy document for LSAP area circulation, open space, and streetscape improvements) and (2) an office/research and development (R&D) and manufacturing development project in the western LSAP boundary expansion area for the ISI project.

Residential development capacity under the adopted LSAP allows for a maximum of 2,323 net new dwelling units and water supply for the LSAP development was assessed in the City's 2015 LUTE WSA. With implementation of the proposed LSAP Update, the addition of 3,612 net new residential units would be allowable within the plan area. This WSA assesses the LSAP Update component of the project as it relates to the addition of 3,612 net new residential units that would be allowable within the LSAP area with modifications to the adopted LSAP.

The ISI project would consist of the redevelopment of 32.4-acres located within the proposed LSAP boundary expansion area and construction of a corporate campus and state of the art manufacturing and R&D facility. The ISI project would include demolition of 172,706 square feet of existing on-site office/R&D buildings (105,000 square feet of occupied area), associated structures, and infrastructure for redevelopment of the site as a unified corporate campus owned and operated by ISI. The campus would include approximately 1.211 million gross square feet of floor area (GFA) (and approximately 1.038 million gross square feet of net new floor area, including existing vacant floor area) of office/R&D development and manufacturing uses, and would serve up to 3,500 employees. This development would be within the office/R&D development allocations established in the 2016 LSAP and evaluated in the LUTE WSA. Therefore, water demand associated with redevelopment the ISI campus was assumed in the LUTE WSA and is not further evaluated in this WSA.

2.2 PROJECT WATER DEMANDS IN COMPARISON TO PREVIOUS WATER SUPPLY ASSESSMENT

The LUTE WSA analyzed projected water demands for the adopted 2016 LSAP project and did not consider the LSAP boundary expansion area and the additional 3,612 net new residential units. There would be no change to the total commercial, industrial, or institutional development under the proposed LSAP update and changes to increased water demand would be attributed only to the additional 3,612 net new residential units. Table 2-1 identifies changes in water demand between the adopted 2016 LSAP and the project for proposed new land uses. As shown in Table 2-1, the additional residential units would increase the water demand from the approved 2016 LSAP by 688 AFY.

Table 2-1 Comparison of Adopted Lawrence Station Area Plan to the Proposed Project Water Demands

Project	Land Use Type		Water Demand Factors[1]		Water Demands AFY[2]		Total
	New Residential Dwelling units	New I/O/C[3] Square feet	Residential (gpd/du)[4]	I/O/C (gpd/ksf)[5]	Residential	I/O/C	
2016 Adopted LSAP	2,323	1,225,600	170	270	442	371	813
LSAP Update[6]	5,935	1,225,600	170	270	1,130	371	1,501
Increase	3,612	-	-	-	688	-	688

1. Water demand factors from Table 3-2 of the LUTE WSA (City of Sunnyvale 2015)

2. Acre-feet per year

3. Industrial, office and R&D, and commercial uses

4. Gallons per day per dwelling unit

5. Gallons per day per thousand square feet of use

6. ISI project water demands are factored in the allocated square footage under the adopted LSAP.

2.3 CITY WATER DEMANDS

2.3.1 Historic and Current Water Demands

Table 2-2 summarizes the past and current water use in the City divided by sector.

Table 2-2 Estimated Past and Current Water Use Demand by Customer Type (AFY)

Customer Type	Year				
	2015	2016	2017	2018	2019
Single Family Residential	5,449	-	-	-	-
Multi-Family Residential	4,452	-	-	-	-
Commercial, Industrial, and Institutional	3,806	-	-	-	-
Irrigation (Potable)	1,374	-	-	-	-
Other (Firelines)	9	-	-	-	-
Total Potable	**15,090**	**16,503**	**18,639**	**18,582**	**18,778**

Note: 2016 through 2019 water demands were estimated using annual growth of water demands projected between 2015 and 2020 in the 2015 Sunnyvale UWMP. Water demands by customer were not available at the time of the preparation of this WSA.

Source: 2015 Sunnyvale UWMP, Table 4-1 (City of Sunnyvale 2016)

2.3.2 Future Water Demands

Table 2-3 summarizes the projected water demand for the City divided by 5-year increments provided in the 2015 UWMP as well as projection of 2040 water demands using UWMP growth rates. This includes anticipated water demands from buildout under the City LUTE that was assumed to occur by 2035. Water demand growth is assumed to occur under normal water year conditions. In the case of drought year conditions, it is expected that projected water use demand would be less than the value presented in Table 2-3 due to implementation of water conservation measures, for example reduced irrigation of landscaping.

Table 2-3 2015 UWMP Projected Water Demand Projections by Customer Type (AFY)

Customer Type	Year				
	2020	2025	2030	2035	2040
Single Family Residential	7,619	7,796	7,563	7,351	7,123
Multi-Family Residential	5,575	5,705	5,534	5,379	5,212
Commercial, Industrial, and Institutional	6,722	7,952	8,986	10,268	11,500
Irrigation (Potable)	2,288	2,341	2,271	2,208	2,142
Other (Firelines)	10	10	10	10	10
Total Potable	**22,214**	**23,804**	**24,364**	**25,216**	**25,987**

Source: 2015 Sunnyvale UWMP Table 4-1 (City of Sunnyvale 2016)

Notes: 2040 water demands were estimated using changes water demands projected between 2030 and 2035 by customer type in the 2015 Sunnyvale UWMP Table 4-1.

This page intentionally left blank.

3 CITY WATER SUPPLY

The following provides an overview of City water supply sources based on the 2015 UWMP and other technical materials from the City.

3.1 CURRENT WATER SUPPLY SOURCES

The City obtains its potable water supply from three sources: purchased surface water from the San Francisco Public Utility Commission (SFPUC), purchased treated surface water from Valley Water, and groundwater from six City-owned and operated wells. The City maintains one additional well on stand-by for emergency use. Most of the City's potable water supply is obtained from SFPUC and Valley Water, approximately 54 percent and 40 percent from each respectively. Approximately 1 percent of the City's water supply is obtained from groundwater wells and the remaining 5 percent comes from non-potable recycled water provided by the City's Water Pollution Control Plant (WPCP or Plant) (City of Sunnyvale 2016).

3.1.1 San Francisco Public Utility Commission

The City receives imported water from the City and County of San Francisco's Regional Water System (RWS), operated by SFPUC. This supply is predominantly from the Sierra Nevada, delivered through the Hetch Hetchy aqueducts, but also includes treated water produced by the SFPUC from its local watersheds and facilities in Alameda and San Mateo Counties.

The amount of imported water available to the SFPUC's retail and wholesale customers is constrained by hydrology, physical facilities, and the institutional parameters that allocate the water supply of the Tuolumne River. Due to these constraints, the SFPUC is very dependent on reservoir storage to ensure ongoing reliability of its water supplies.

The SFPUC serves its retail and wholesale water demands with an integrated operation of local Bay Area water production and imported water from Hetch Hetchy. The local watershed facilities are operated to capture local runoff. The business relationship between the SFPUC and its wholesale customers is largely defined by the "Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County and Santa Clara County" (WSA) entered into in July 2009 (WSA) and set to expire in 2034. This 25-year WSA replaced the Settlement Agreement and Master Water Sales Contract that expired in June 2009. The WSA addresses the rate-making methodology used by the SFPUC in setting wholesale water rates for its customers in addition to addressing water supply and water shortages for the RWS.

The WSA is supplemented by an individual Water Supply Contract between SFPUC and each individual retailer, also entered into in July 2009. These contracts also expire in 25 years. The City has an Individual Supply Guarantee (ISG) of 12.58 million gallons per day (MGD) (or approximately 14,100-acre feet per year [AFY]). Although the WSA and accompanying Water Supply Contract expire in 2034, the ISG (which quantifies San Francisco's obligation to supply water to its individual wholesale customers) survives their expiration and continues indefinitely. The City contract also includes a minimum purchase amount of 8.93 MGD (10,003 AFY), which Sunnyvale agrees to buy, regardless of whether sales drop below this level.

As previously stated, the WSA provides for a 184-MGD (expressed on an annual average basis) Supply Assurance to the SFPUC's wholesale customers. This Supply Assurance is subject to reduction, to the extent and for the period made necessary by reason of water shortage, because of drought, emergencies, or by malfunctioning or rehabilitation of the regional water system. The WSA does not guarantee that San Francisco will meet peak daily or hourly customer demands when their annual usage exceeds the Supply Assurance. The SFPUC's wholesale customers have agreed to the allocation of the 184 MGD Supply Assurance among themselves, with each entity's share of the Supply Assurance set forth on Attachment C to the WSA.

The Water Shortage Allocation Plan between the SFPUC and its wholesale customers, adopted as part of the WSA in July 2009, addresses shortages of up to 20 percent of system-wide use. The Tier 1 Shortage Plan allocates water from the RWS between San Francisco retail and the wholesale customers during system-wide shortages of 20 percent or less. The WSA also anticipated a Tier 2 Shortage Plan adopted by the wholesale customers which would allocate the available water from the RWS among the wholesale customers. The Tier 2 agreement was completed and approved by all the wholesale customers in March 2011.

SFPUC deliveries to the City reached a maximum of 12,675 AFY in 2008. The 2014 deliveries were 8,454 AFY, and the 2015 deliveries were 8,883 AFY (2015 UWMP Table 7-3).

3.1.2 Valley Water

Valley Water, previously known as SCVWD, supplies the City of Sunnyvale treated surface water through an entitlement of the imported Central Valley Project (CVP) water and the State Water Project (SWP) water, in combination with water from local reservoirs. Valley Water has a contract for 152,500 AFY from the CVP and 100,000 AFY from the SWP. The City receives water for Valley Water under an existing agreement that expires in 2051. The actual amount of water delivered to the City is typically significantly less than the contractual amounts and depends on hydrology, conveyance limitations, and environmental regulations. Valley Water operates 10 local reservoirs with a total storage capacity of approximately 170,000 AF. (City of Sunnyvale 2016).

3.1.3 Groundwater

The City owns, operates, and maintains six wells for regular use and one well on stand-by for emergencies. The wells supplement imported water supplies from SFPUC and Valley Water during peak demand periods (e.g., summer months) and as needed for emergencies. Valley Water manages two groundwater subbasins, the Santa Clara Subbasin and the Llagas Subbasin. The basins are subject to conjunctive use management and are pumped more in drier years and then replenished (or recharged) during wet years and average years. Conjunctive use methods prevent overdraft, land subsidence, and saltwater intrusions of the subbasins. The groundwater subbasins are managed under guidance from Valley Water and in accordance with the 2016 Groundwater Management Plan (GWMP). The 2016 GWMP was submitted to the California Department of Water Resources (DWR) in December 2016 for approval as an Alternative to a Groundwater Sustainability Plan, as required under the Sustainable Groundwater Management Act (SGMA). On July 17, 2019, DWR determined that the Alternative (i.e., the 2016 GWMP) satisfies the objectives of SGMA and was approved (DWR 2019).

The 2015 Sunnyvale UWMP identifies the City's safe yield for groundwater extraction is 8,000 AFY. Table 3-1 shows the historical groundwater volume pumped from 2011-2019.

Table 3-1 Historical Groundwater Pumped Volume

Year	Volume Pumped (AFY)
2011[1]	467
2012[1]	142
2013[1]	123
2014[1]	2,064
2015[1]	148
2016[2]	152
2017[2]	119
2018[2]	106
2019[3]	92

3.1.4 Recycled Water

The City has developed a recycled water program which today serves parks, golf courses and the landscaping needs of diverse industries. A wastewater reclamation program was developed in 1991 when the City first identified short-term goals of recycling wastewater of 20 percent to 30 percent of high-quality effluent from the Sunnyvale Water Pollution Control Plant (Plant). The long- term goal of the City is to reuse 1.5 MGD generated from the Plant to reduce all flows to the bay, as stated in the 2015 UWMP. Plant has a design flow capacity of 10 MGD for treatment of wastewater from the City.

The City has completed Phases I and II of the 2000 Recycled Water Master Plan, which now serves Baylands Park, Lockheed/Martin Area, the Sunnyvale Municipal Golf Course, and other parks and industrial areas in the northern part of the City. A storage tank was built in the Year 2000 to allow for more recycled water to be developed and stored in order to keep up with demand on the system once the area is built out. In September 2013, the City Council approved the Recycled Water Feasibility Study that identifies possible extensions of the recycled water system. Possible extensions to serve the south end of Sunnyvale along Wolfe road are currently under way. Possible extensions to serve the south end of the City and also Cupertino and Los Altos may be evaluated in the future. Table 3-2 projects recycled water use:

Table 3-2 Historical and Projected Recycled Water Use Within the City (AFY)

Supply Source	Year				
	2015	2020	2025	2030	2035
Recycled Water	717[1]	1,456	1,568	1,680	1,680

3.2 FUTURE WATER SUPPLY SOURCES AND RELIABILITY

Table 3-3 shows the projected water supplies for the City through the year 2040.

Table 3-3 City Water Supplies (AFY)

Supply Source	Year				
	2020	2025	2030	2035	2040
SFPUC Purchased Water	11,124	12,266	12,266	12,266	12,266
Valley Water Purchased Water	10,642	11,202	11,762	12,614	12,726
Local Groundwater Wells	448	336	336	336	336
Recycled Water	1,456	1,568	1,680	1,680	1,680
Total	**23,670**	**25,372**	**26,044**	**26,896**	**27,008**

Source: 2015 Sunnyvale UWMP Table 6-2 and Table 7-4

3.2.1 San Francisco Public Utility Commission

The extent of imported water is dependent on water supply of the Tuolumne River which is constrained by hydrology, physical facilities, and the institutional parameters. In October 2008, the SFPUC adopted the Water System Improvement Program (WSIP) to improve the water delivery and water supply reliability of the RWS. Relevant goals of the WSIP related to water supply are: meet average annual water demand of 265 MGD from the SFPUC watersheds for retail and wholesale customers during non-drought years for system demands, meet dry-year delivery needs through 2018 while limiting rationing to a maximum 20 percent system-wide reduction in water service during extended droughts; diversify water supply options during non-drought and drought periods; and improve use of new water sources and drought management, including groundwater, recycled water, conservation, and transfers.

As part of the adoption of the WSIP, the SFPUC adopted the Interim Supply Limitation (ISL). The ISL limits water sales from the RWS to an annual average of 265 MGD through 2018.

The SFPUC has analyzed past system yields to identify periods with single and multiple dry-years. The SFPUC has translated these dry-year projections into reductions to the total 184 MGD water supply available to the Bay Area Water Supply and Conservation Agency (BAWSCA). The City is a member of BAWSCA (City of Sunnyvale 2016).

3.2.2 Valley Water

The 2015 Santa Clara Valley Water District UWMP recognized climate change, droughts, local fisheries operations, invasive species damage, earthquake, environmental regulations, and reduced groundwater production as threats to water supply reliability. Valley Water supplies have previously been affected by changes in regulatory requirements, and additional requirements are anticipated in the future. Locally, the greatest impact of regulations has been on instream recharge operations. However, future droughts represent the primary threat to Valley Water's water supply (Valley Water 2016).

Modeling conducted for the Water Supply Master Plan 2040 (Master Plan) indicates shortages during droughts in all demand years, with shortages increasing in severity and frequency as demands increase and Delta-conveyed supplies decrease. By 2040, without new supplies or conservation savings, shortages could occur in about 40 percent of years. The Master Plan identifies that 2040 available water supplies would range from 250,000 AFY to 399,000 AFY depending on the water year that could result in water supply shortfalls as high as 140,000 AFY during extended drought conditions (Valley Water 2019).

To improve the reliability of water supplies, the Master Plan includes the Valley Water's Ensure Sustainability water supply strategy that consists of securing existing supplies and infrastructure; increasing water conservation and water reuse; and optimizing the use of existing supplies and infrastructure. The following projects would be implemented as part of this strategy:

- Delta Conveyance Project
- Additional Conservation and Stormwater Projects and Programs
- Potable Reuse Program
- Pacheco Reservoir Expansion
- Transfer-Bethany Pipeline
- South County Recharge

Implementation of these projects would provide a reliable water supply that would meet 2040 demands during a non-drought year. During drought conditions, water supplies would be sufficient to meet 100 percent of demand during the first five years of drought and more than 90 percent in the last year. (Valley Water 2019)

3.2.3 Groundwater

Groundwater is managed under guidance from Valley Water and in accordance with the 2016 GWMP. DWR has determined that the GWMP satisfies the objectives of the SGMA (California Department of Water Resources 2019).The goals are the 2016 GWMP area to manage and optimize groundwater supply reliability and minimalize land subsidence and to protect groundwater from contamination and saltwater intrusion. Groundwater well pumping may be adjusted slightly in the future to meet future water demands during drought years and emergencies. Countywide water supplies are generally sufficient to meet demands in normal years through 2040, but significant shortages may occur during multiple dry years without additional investments. Total natural groundwater recharge assumed for total Valley Water supplies consists of 61,000 AFY long term average and 47,000 AFY during a crucial drought (Valley Water 2019).

3.2.4 Recycled Water

The City has experienced a slight decrease in WPCP influent from 2010-2015, but anticipates a conservative level of 15 MGD for plant influent over the next 25 years. The 2013 Feasibility Study identified four recycled water system pipeline alignments. Four alignment/connection types were developed and include: Wolfe Road main, main loop, potential recycled water alignments, and infill connections. The City plans to build the alignments in four Phases as part of their Capital Improvement Program. Completion of the pipeline improvements would provide additional recycled water to the City of Sunnyvale (City of Sunnyvale 2016).

4 WATER SUPPLY SUFFICIENCY ANALYSIS

4.1 PROJECT WATER DEMANDS AND FUTURE WATER SUPPLY

Tables 4-1, 4-2, and 4-3 identify project water demands as well as the proposed Downtown Specific Plan Amendments Project water demands on City water supplies under normal, single dry, multiple dry year conditions between 2020 and 2040.

Table 4-1 City Water Supplies vs. Water Demands With Project – Normal Year (AFY)

Supply Source	Year				
	2020	2025	2030	2035	2040
SFPUC Purchased Water[1]	12,141	13,283	13,283	13,283	13,283
Valley Water Purchased Water[2]	10,642	11,202	11,762	12,614	12,726
Local Groundwater Wells[2]	448	336	336	336	336
Recycled Water[2]	1,456	1,568	1,680	1,680	1,680
Supply Total	**24,687**	**26,389**	**27,061**	**27,913**	**28,025**
City Water Demands[3]	23,670	25,372	26,044	26,896	27,008
Downtown Specific Plan Amendments Water Demand[4]	329	329	329	329	329
Project Water Demand	688	688	688	688	688
Water Demand Total	**24,687**	**26,389**	**27,061**	**27,913**	**28,025**
Difference	**0**	**0**	**0**	**0**	**0**

1. SFPUC supply increases as necessary to meet City demands up to the City total right of 14,100 AFY.

2. Water supplies based on 2015 Sunnyvale UWMP Table 6-2 and Table 7-4 and does not reflect the maximum supply available.

3. Water demands based on 2015 Sunnyvale UWMP and projected water demand for 2040 based on UWMP rate of annual water demand increase between 2030 and 2035.

4. Downtown Specific Plan Amendments Project Water Supply Assessment (Schaaf & Wheeler 2019)

Source: 2015 Sunnyvale UWMP Table 6-2 and Table 7-4 (City of Sunnyvale 2016)

Table 4-2 City Water Supplies vs. Water Demands With Project – Single Dry Year (AFY)

Supply Source	Year				
	2020	2025	2030	2035	2040
SFPUC Purchased Water[1]	12,141	13,283	13,283	13,283	13,395
Valley Water Purchased Water[2]	10,642	11,202	11,762	12,614	12,614
Local Groundwater Wells[2]	448	336	336	336	336
Recycled Water[2]	1,456	1,568	1,680	1,680	1,680
Supply Total	**24,687**	**26,389**	**27,061**	**27,913**	**28,025**
City Water Demands[3]	23,670	25,372	26,044	26,896	27,008
Downtown Specific Plan Amendments Water Demand[4]	329	329	329	329	329
Project Water Demand	688	688	688	688	688
Water Demand Total	**24,687**	**26,389**	**27,061**	**27,913**	**28,025**
Difference	**0**	**0**	**0**	**0**	**0**

1. SFPUC supply increases as necessary to meet City demands up to the City total right of 14,100 AFY.

2. Water supplies based on 2015 Sunnyvale UWMP Table 6-2 and Table 7-5 and does not reflect the maximum supply available. Water supplies from Valley Water for 2040 were assumed to not change from 2035 supplies.

3. Water demands based on 2015 Sunnyvale UWMP and projected water demand for 2040 based on UWMP rate of annual water demand increase between 2030 and 2035.

4. Downtown Specific Plan Amendments Project Water Supply Assessment (Schaaf & Wheeler 2019)

Source: 2015 Sunnyvale UWMP Table 7-5 (City of Sunnyvale 2016)

4.2 WATER SUPPLY RELIABILITY

As shown in Tables 4-1 and 4-2, City's existing water supply contracts would meet the combined increase demand of the project and the Downtown Specific Plan Amendments Project under normal and single dry year conditions. During multiple dry year conditions the City would use groundwater that would be within its safe yield of 8,000 AFY. During extended droughts, the City would implement its Water Shortage Plan that consists of voluntary and mandatory water conservation measures that would address water supply shortfalls of up to 50 percent.

Table 4-3 City Water Supplies vs. Water Demands With Project – Multiple Dry Year (AFY)

Supply Source	Year

SECTION 1: INTRODUCTION AND PROJECT DESCRIPTION

1.1 Project Overview

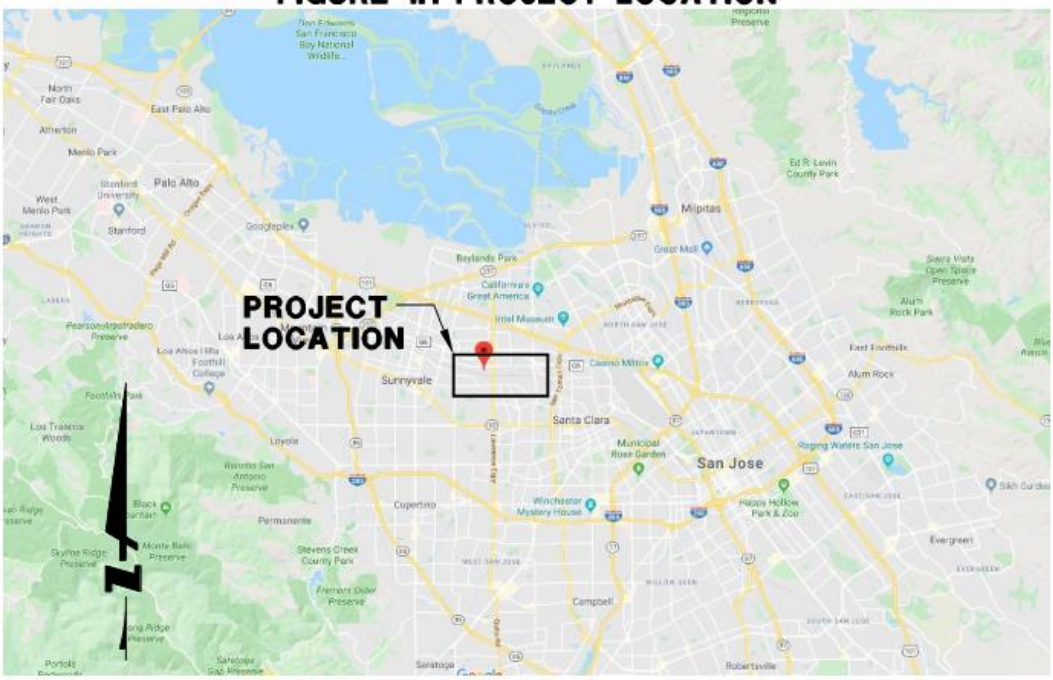
The proposed Lawrence Station Area Plan (LSAP) Amendment Project (Project) is generally centered around a ½ mile radius of the existing Lawrence Caltrain Station at 137 San Zeno Way in Sunnyvale, California and is approximately 252.09 acres. For the purposes of the infrastructure studies, the LSAP Update project is divided into two study areas: the Housing Expansion Study Area and the Proposed Intuitive Surgical Corporate Campus Project at 932, 945, 950, and 955 Kifer Road (herein referred to as the Office Expansion) Study Area. This Infrastructure Study will address the Office Expansion Study Area which composes of two parcels south of Kifer Road and one parcel north of Kifer Road. The north parcel is bounded by Central Expressway to the north, Texas Instruments campus to the east, Kifer Road to the south, and numerous commercial offices to the west. The south parcel is bounded by Kifer Road to the north, the proposed LSAP Housing Expansion to the east, railroad right of way (ROW) to the south, and two large commercial offices to the west. The project site is located in the far eastern area of the City of Sunnyvale northwest of the Lawrence Caltrain station.

The Office Expansion Study Area site is approximately 32.39 acres of industrial land owned by Intuitive Surgical, Inc. (ISI) that is proposed for redevelopment as office/research and development.

The Housing Expansion Study Area is approximately 219.70 acres encompassing existing developments, railroad ROW, and public ROW. The residential LSAP is bounded by the City of Santa Clara to the north and east, Reed Avenue, Aster Avenue, and the railroad ROW to the south, and the Intuitive Surgical offices to the west. Please refer to the Housing Expansion Buildout Infrastructure Impact Study for the infrastructure analysis associated with the proposed increase of allowable housing potential within the LSAP.

Figure 1.1 - Project Location - illustrates the regional location of the Project.

FIGURE 1.1 PROJECT LOCATION



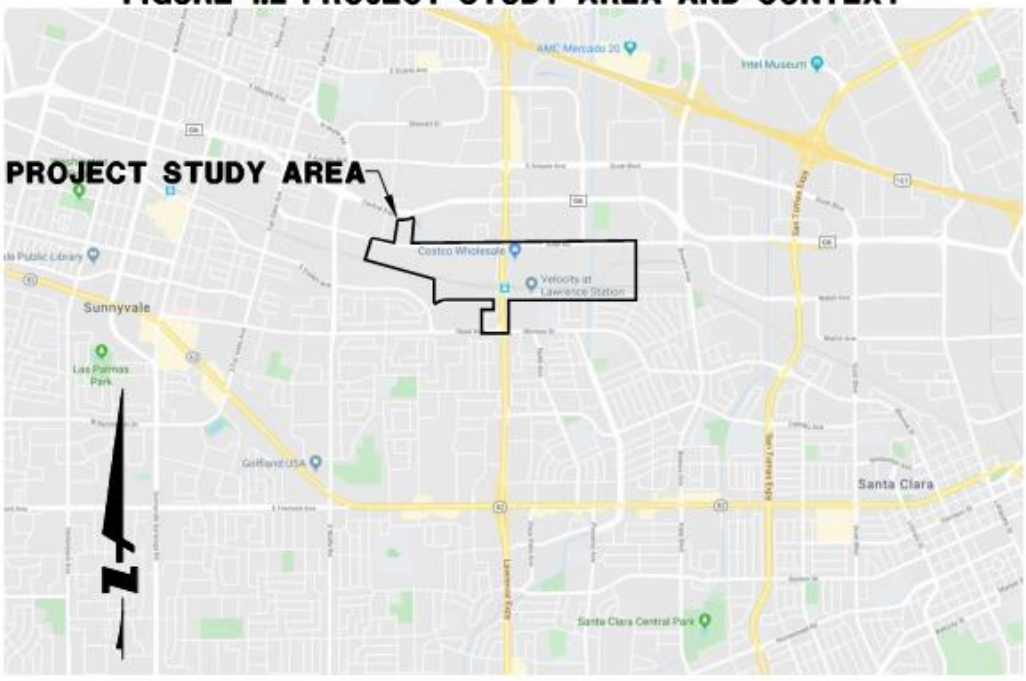


Figure 1.2 - Project Site and Context - illustrates the Study Area Boundaries and the location of the Project within the City.

FIGURE 1.2 PROJECT STUDY AREA AND CONTEXT

This study will discuss the office expansion located across three parcels. The Project includes two office/R&D buildings, a parking structure, an amenities building, and two central utility plants. Existing utility infrastructure requiring upgrades to serve the Project will be identified in this study.

1.2 Lawrence Station

1.2.1 Existing Conditions and Land Use

Existing conditions and Land Uses within the 32.39 acre office expansion LSAP includes an office/research building, an industrial building, a fitness center, an equipment enclosure, and a recreational park for employees. The ISI project site is currently designated for industrial uses in the City's General Plan.

1.2.2 Proposed ISI Project Component of the LSAP Update

The LSAP Update consists of two primary components: (1) modifications to the adopted LSAP (i.e. an increase in housing potential within the LSAP, expansion of the western LSAP boundary, and a Sense of Place Plan that would function as a policy document for LSAP area circulation, open space, and streetscape improvements) and (2) an office/research development (R&D) and manufacturing redevelopment project in the western LSAP boundary expansion area for the ISI project. This infrastructure study analyzes the second component of the LSAP update: the ISI project. A detailed breakdown of the land uses are shown in Table 2.4 – Office Expansion Study LSAP Potable Water Demand Summary (ADD). The proposed LSAP layout is shown in Figure 1.3 – Proposed Site Layout.

1.3 Project Datum

All elevations referenced herein are based on the following:

- Vertical datum used in the City of Sunnyvale's Utility and GIS Maps.

- Record drawings provided by the City for Aster Avenue and Willow Avenue
- Manhole survey data provided by the City for Lawrence Expressway

SECTION 2: POTABLE WATER SYSTEM

2.1 Potable Water System Design Criteria

The design criteria used for the office expansion development of the potable water model is based upon established industry operations standards and regulatory agency requirements. The potable water system will be designed in accordance to the City of Sunnyvale's Standard Plans and Specifications and to applicable City, State, and Federal water and fire codes and standards unless otherwise permitted. Since the City of Sunnyvale does not have written standards for water generation, this report will use Redwood City's Design Standards to estimate project water demands. The intent of this study is to identify which existing City water mains will need to be upgraded in order to provide adequate water supply to the LSAP. All existing water mains are located within the City Right-of-Way.

The design criteria are dependent on the demand scenario. Table 2.1 – Potable Water System Demand and Peaking Factor presents the potable water system demand and peaking factor for the demand scenario. Assumed peaking factors for max day demand and peak hour demand scenarios are based on correspondence between BKF and the City of Sunnyvale.

Table 2.1
Potable Water System Demand and Peaking Factor

Parameter	Value
Average Day Demand (ADD)	262,812 gpd
Fire Flow Demands (FF)	4,500 gpm
Maximum Day Demand (MDD)	MDD = 2.0 ADD
Peak Hour Demand (PHD)	PHD = 3.0 ADD

Notes:
1. Fire flow demand based on an assumed R-2 Occupancy type building and construction Type III-A, assuming 25% fire flow reduction for sprinkling.
2. gpd = gallons per day
3. gpm = gallons per minute

Table 2.2 – Potable Water System Design Criteria presents the potable water system design criteria.

Table 2.2
Potable Water System Design Criteria

Parameter	Value
Pipe size	Pipe diameters of 8, 10, 12, and 16 inches shall be used for all distribution and feeder mains.
Pipe Material	For water mains 12-inches and smaller shall be C900 DR14 PVC pipe or AWWA C-151/A21.51 ductile iron pipe (DIP). Water mains larger than 12-inches shall be C905 DR14 PVC or AWWA C-151/A21.51 DIP.
Hazen Williams C-value for recommended pipes	140 for DIP, 150 for PVC
Maximum static pressure	120 psi
Maximum velocity during PHD	7 fps
Maximum velocity during MDD+FF	15 fps
Minimum system pressure during MDD+FF	20 psi

Notes:
fps = feet per second
psi = pounds per square inch

2.2 Potable Water System Layout

Potable water is supplied to the LSAP by the City of Sunnyvale through an existing 12-inch diameter cast iron pipe (CIP) in Kifer Road. Commercial Street also contains an existing 8-inch diameter CIP. Existing potable water system layout is shown on Figure 2.1 – LSAP Existing Potable Water System.

2.3 Upgraded Potable Water System

2.3.1 Proposed Water Demand Factors

The potable water demand factors used for the Project's various land uses are shown in Table 2.3 – LSAP Potable Water Demand Factors (ADD). The total estimated water

demands for the Project land uses are shown on Table 2.4 – Office Expansion Study LSAP Potable Water Demand Summary (ADD). Water demands are derived from Redwood City's Design Standards.

Table 2.3
LSAP Potable Water Demand Factors (ADD)

Land Use	Indoor Potable Water Demand Factors (ADD)	Outdoor Potable Water Demand Factors (ADD)	Total Water Demand (ADD)
Office/R&D	0.13 gpd/sf	0.072 gpd/sf	0.202 gpd/sf
Industrial	0.21 gpd/sf	0 gpd/sf	0.21 gpd/sf
Restaurant	30 gpd/seat	0 gpd/seat	30 gpd/seat

Note:
sf = square feet

2.3.2 Model Results Discussion

The existing potable water system is sufficient to supply the potable water demands as well as provide fire flow to the site. Under the scenario of max day demand and fire flow, the water model analysis determined that the flow demand would be at its highest of any scenario at 4,820 gpm as seen in Appendix C-3 – Model Scenario 3: Max Day Demand + Fire Flow. However, the existing potable water system is able to provide a flow of 6,000 gpm, which is well above the necessary flow to meet the demands in this scenario. Refer to Appendix C-3 – Model Scenario 3: Max Day Demand + Fire Flow for water model results. The overall proposed ISI development indicates that no improvements are required for the City's potable water system.

2.4 Potable Water System Model Water Demands

2.4.1 Sources of Land Use Water Demand Data

Potable water demand factors for the model analyses are shown in Table 2.3 – LSAP Potable Water Demand Factors (ADD) and were applied to the project program to develop the project potable water demand total. Table 2.4 – Office Expansion Study LSAP Potable Water Demand Summary (ADD) provides water demands by land use.

See Appendix E – Potable Water System Demand Calculations, for model demand calculations on a block by block basis. Total project development will not exceed the demands presented in Table 2.4 – Office Expansion Study LSAP Potable Water Demand Summary (ADD).

2.4.2 Average Day Demand

The demand factors presented in Table 2.3 – LSAP Potable Water Demand Factors (ADD) and the demand summaries presented in Table 2.4 – Office Expansion Study LSAP Potable Water Demand Summary (ADD) reflect average day demand (ADD) for the Office Expansion Study.

Table 2.4
Office Expansion Study LSAP Potable Water Demand Summary (ADD)

Land Use	Number	Unit	Demand/Unit (gpd)	Total (gpd)
Office/R&D	351,000	sf	0.202	70,902
Industrial	831,000	sf	0.21	174,510
Restaurant[1,3]	580	seat	30	17,400
			Total	262,812

Notes:

1. Total restaurant seating is assumed to be 580 seats. This is based on the assumption that 50% of restaurant space (29,000 sf total) is for patrons and one 10'x10' table has seating for 4 people. The calculation is as follows:
$$(29{,}000\ sf \times 0.5) \times (\frac{4\ seats}{100\ sf}) = 580\ seats$$
2. Block by block water demand calculations shown in Appendix E – Potable Water System Demand Calculations.
3. Restaurant is defined as employee amenity space.

2.4.3 Maximum Day Demand

Maximum Day Demand (MDD) represents the maximum volume of water used in a 24-hour period for the entire year. A water system is typically evaluated under a maximum day plus fire flow demand condition as this condition allows the system to be stressed at a higher demand rate to ascertain if pipeline carrying capacities are adequate in a fire emergency. As identified in Table 2.1 – Potable Water System Demand and Peaking Factor, a peaking factor of 2 was applied to ADD.

2.4.4 Peak Hour Demand

Peak Hour Demand (PHD) represents the highest hourly demand for the entire system, and simulates the highest flow rate expected. To determine the PHD, a peaking factor was applied to increase the ADD. Peaking factors represent the increase above ADD and are a statistical concept typically obtained from historical data. As identified in Table 2.1 – Potable Water System Demand and Peaking Factor, a peaking factor of 3 was applied to ADD.

2.4.5 Fire Flow Demand

The fire flow (FF) demand is assumed to be 4,500 gallons per minute (gpm) as noted in correspondence between the City of Sunnyvale, Ascent Environmental, and BKF Engineers.

2.5 Potable Water System Model Boundary Conditions

The recommended potable water system is modeled based on calibrated boundary conditions and fire hydrant flow data received from the City completed for the LSAP Project. Since the LSAP Project is redeveloping existing lots, the recommended water model is analyzing existing City water mains and identifying which water mains will need to be upgraded in order to provide adequate water supply for the redevelopment.

2.6 Potable Water System Model Scenario

The LSAP water model was created in Bentley Water CAD V8i SELECT series 1. A series of model scenarios were created to reflect the range of demand usage patterns and confirm conformance to the Potable Water System Design Criteria outline in Table 2.2 – Potable Water System Design Criteria. Three model runs are prepared for the ISI Project and are shown in Table 2.5 – LSAP Project Model Runs – Office Expansion Study.

Table 2.5
LSAP Project Model Runs – Office Expansion Study

Run	Description
1	Static Pressures
2	Peak Hour Demand
3	Maximum Day Demand + Fire Flow

See Appendix C – LSAP Potable Water Model Reports for model run results.

2.7 Potable Water System Recommendations

The existing potable water system, as shown in Appendix C – LSAP Potable Water Model Reports, is designed to meet the design criteria outlined in Table 2.2 – Potable Water System Design Criteria. Table 2.6 – Potable Water System Results for Office Expansion Study summarizes the pressure and velocity results for the referenced model scenarios listed in Table 2.5 – LSAP Project Model Runs – Office Expansion Study. Refer to Appendix C – LSAP Potable Water Demand Results for detailed results of model scenarios. In conclusion, no upgrades to the existing potable water system are required since the water model reflects the system being adequately supplied during maximum daily demand plus fire flow. A water supply analysis memorandum prepared by Ascent Environmental will follow this report and will similarly state that the existing potable water system is sufficient to meet proposed water and fire flow demands.

Table 2.6
Potable Water System Results for Office Expansion Study

Parameter	Requirement	Minimum	Maximum
Static ADD Pressure (psi)	120 max	75	77
PHD Velocity (fps)	7 max	-	1.73
MDD+FF Pressure (calculated system lower limit at total flow available) (psi)	20 min	73	-
MDD+FF Velocity (fps)	15 max	-	10.40

LSAP OFFICE EXPANSION BUILDOUT INFRASTRUCTURE REPORT

FIGURE 2.1 – EXISTING POTABLE WATER SYSTEM

SECTION 3: SANITARY SEWER SYSTEM

3.1 Sanitary Sewer System Design Criteria

The design criteria used for the office expansion development of the sanitary sewer model is based upon established industry operations standards and regulatory agency requirements. The sanitary sewer system will be designed in accordance to the City of Sunnyvale's Standard Plans and Specifications and to applicable City, State, and Federal water and fire codes and standards unless otherwise permitted. At certain locations within the project area, City design guidelines were supplemented with updated pipe slope and invert information provided by the City. Sanitary sewer generation is assumed to be 95% of indoor potable water demands. This infrastructure study will identify which existing City sewer mains will need to be upgraded in order to support the anticipated sewer flows from the development within Office Expansion Study Area. All existing sewer mains are located within the City ROW. The pipe material of existing sewer mains is vitrified clay pipe (VCP). The design criteria are dependent on the demand scenario. Table 3.1 – Sanitary Sewer System Design Criteria presents the sanitary sewer system design criteria based on the supplemental information from the City.

Table 3.1
Sanitary Sewer System Design Criteria

Parameter	Value
Minimum pipe size	8-inch inside diameter
Pipe Material	PVC SDR-26 or better
Manning's coefficient, n, for recommended PVC pipes	0.01
Minimum Slope	0.5% (0.005 feet/feet) for sewer diameters 8-inches and smaller, 0.4% (0.004 feet/feet) for sewer diameters 10-inches and larger.
Maximum Slope	14.0% (0.14 feet/feet)
PWWF Maximum Pipe Flow Depth Ratio, *d/D*	0.5 for sewer diameters 10-inches and smaller, 0.75 for sewer diameters 12-inches and larger
Minimum Depth of Cover	5 feet below finished grade
Sewer Generation	95% of indoor potable water demand

Notes:
ADWF = Average Dry Weather Flow
PDWF = Peak Dry Weather Flow
PDWF = Peak Wet Weather Flow
d/D = ratio of depth of flow (*d*) to the pipe inside diameter (*D*)
fps = feet per second
PWWF = Peak Wet Weather Flow

Four flow conditions were analyzed:

1. ADWF in Existing City Sewer System
2. ADWF in Recommended City Sewer System
3. PWWF in Existing City Sewer System
4. PWWF in Recommended City Sewer System

The ADWF is based on the potable water average daily demand described in Section 2.4.2. To account for existing flows entering the project area from other areas of the City, existing sewer flows collected from flow monitoring sites at Lawrence Road north of Warburton Avenue, Kifer Road west of Lawrence Expressway, and Aster Avenue west of Willow Avenue were incorporated into the sanitary sewer model analysis. Existing sewer flow data collected from the flow monitoring cites were received from the City on February 6, 2020. According to the City of

Sunnyvale's Sanitary Sewer Systems Design Standards, the PDWF peaking factor is dependent upon ADWF. We have assumed a PDWF peaking factor that varies between 2.5 and 2.75 which is based on individual parcel demands. PWWF is based on PDWF and a design inflow and infiltration rate based on a 10-year storm event that is 65% of the ADWF. Table 3.2 – Sanitary Sewer System Peaking Factor summarizes the peaking factor to achieve PWWF based on the supplemental information from the City.

Table 3.2
Sanitary Sewer System Peaking Factor

Parameter	Value
Average Dry Weather Flow	225,663 gpd
PDWF[1]	PDWF = (varies between 2.5 and 2.75) * ADWF
PWWF	PWWF = ADWF * (PDWF peaking factor + 0.65)

Note:
PDWF peaking factor is dependent upon ADWF for each parcel.

3.2 Sanitary Sewer Collection System

3.2.1 Existing Sanitary Sewer Collection System

The existing sanitary sewer collection system within the vicinity of the LSAP consists of sewer mains that vary in size between 8-inches to 18-inches. Pipe material of the existing sewer mains is VCP. The existing sanitary sewer system within the LSAP boundary consists of a single drainage area. Sanitary sewer flows generally drain by gravity and ultimately drain to the existing 27-inch sanitary sewer main in Lawrence Expressway. All existing sewer mains are assumed to have adequate slope and that the pipe velocity can meet the minimum 2 fps. For 8-inch pipes, pipe slope was assumed to be 0.4%. Additional record drawings, manhole survey data, and construction documents were provided by the City to update pipe invert and slope information used in this sewer analysis model. Existing sanitary sewer system layout is shown on Figure 3.1 – LSAP Existing Sanitary Sewer System and existing manholes shown on Figure 3.2 – LSAP Existing Sanitary Sewer Manholes.

3.3 Sanitary Sewer System Model Sewer Flows

3.3.1 Land Use Sewer Generation Data

The sanitary sewer flows used are based on the indoor potable water for each land use. Outdoor water demands are not included in sanitary sewer flows because outdoor drains connect to the storm drain system.

3.3.2 Average Dry Weather Flow

The sanitary sewer ADWF is intended to be representative of the average day sanitary sewer generation. The sanitary sewer ADWF is a function of the indoor water use ADD. Table 3.3 – Office Expansion Study LSAP Sanitary Sewer Demand Summary represents indoor water use ADD for each land use shown in Table 2.4 – Office Expansion Study LSAP Potable Water Demand Summary (ADD). The sanitary sewer ADWF is based on 95% of the indoor potable water ADD. Total sewer demand use for each development is detailed in Appendix F – Sanitary Sewer System Demand Calculations. Sewer generation (gpm) that was calculated for each parcel was applied to each sewer line in the street that was adjacent to that particular parcel. This allows an even distribution of sewer generated for a particular parcel to account for existing sanitary sewer lines in the street.

Table 3.3
Office Expansion Study LSAP Sanitary Sewer Demand Summary

Land Use	Number	Unit	Indoor Domestic Water Demand (gpd)	Sanitary Sewer Demand (gpd)
Office/R&D	351,000	sf	45,630	43,349
Industrial	831,000	sf	174,510	165,784
Restaurant[1,2]	580	seat	17,400	16,530
Total	-	-	237,540	225,663

Notes:

1. Total restaurant seating is assumed to be 580 seats. This is based on the assumption that 50% of restaurant (29,000 sf total) is for patrons and one 10'x10' table has seating for 4 people. The calculation is as follows:
$$(29{,}000\ sf \times 0.5) \times (\frac{4\ seats}{100\ sf}) = 580\ seats$$
2. Restaurant is defined as employee amenity space.

3.3.3 Peak Dry Weather Flow (PDWF)

The sanitary sewer PDWF is the highest sanitary sewer generation during the day due to diurnal peaks associated with higher water usage in the morning and early evening hours. PDWF is determined by applying a peaking factor to ADWF. City of Sunnyvale has varying peaking factors for PDWF which is dependent upon ADWF for each parcel. Peaking factors for the LSAP vary between 2.5 and 2.75.

3.3.4 Peak Wet Weather Flow (PWWF)

The sanitary sewer PWWF incorporates infiltration and inflow rate at 65% of the ADWF. This rate is added to the PDWF peaking factor.

Inflow is surface water that enters the wastewater system from yards, roof drains, downspouts, storm drain cross connections, or through manhole covers due to overland flow runoff. Similar to infiltration, inflow is a result of storm events, and peak inflow typically occurs during heavy storm events or prolonged periods of precipitation.

Infiltration is groundwater that enters sewer facilities such as pipelines, laterals, and manholes through holes, breaks, joint/connection failures, and other openings. Infiltration is directly correlated to the total amount of piping and appurtenances in the ground. Infiltration quantities vary due to seasonal variation in the groundwater levels influenced by storm events, surface and soil conditions, condition of sanitary sewer systems, and type of pipe joints. The highest infiltration flows are typically observed following significant storm events and during the winter or peak precipitation months, when groundwater levels are high.

3.4 Sanitary Sewer Flow Distribution

Each parcel's total sanitary sewer generation was determined by reviewing the planned parcel land use and applying applicable land use sanitary sewer generation rate to it. The parcel land use summary is included in Appendix F – Sanitary Sewer System Demand Calculations for

reference.

Each parcel's total sanitary sewer flow was divided equally amongst the sanitary sewer manholes bordering the parcel as shown in Figure 3.2 – Existing Sanitary Sewer Manholes. The parcel flow entering a manhole represents a sanitary sewer lateral point of connection.

3.5 Hydraulic Grade Line Considerations

The analysis of the sanitary sewer system is assumed to be a free outfall condition.

3.6 Sanitary Sewer Boundary Conditions

In addition to the flow monitoring survey data provided by the City, the recommended sanitary sewer system is modeled based on boundary conditions taken from Technical Memorandum 7 attached to the City of Sunnyvale's 2015 Wastewater Collection System Master Plan. Since the LSAP Project is redeveloping existing lots, the recommended sewer model is analyzing existing City sewer mains and identifying which sewer mains will need to be upgraded in order to abide by City sanitary sewer standards.

3.7 Model Scenario Results and Analysis

The LSAP sanitary sewer model was created in Bentley StormCAD V8i SELECT series 5. The following sanitary sewer model flow conditions were developed:

1. Average Dry Weather Flow (ADWF) in Existing City Sewer System
2. ADWF in Recommended City Sewer System
3. Peak Wet Weather Flow (PWWF) in Existing City Sewer System
4. PWWF in Recommended City Sewer System

Sanitary sewer model inside diameters were based on JM Eagle PVC Pipe Size for SDR 26 (160 psi).

3.7.1 Pipe Diameter

The sewer systems were modelled with the inside pipe diameters. Pipe diameters were reviewed based on the d/D exceeding the allowable depth of flow of 0.50 for pipe sizes 10-inches and smaller, and 0.75 for pipe sizes greater than 12-inches per the supplemental information from the City.

3.7.2 Flow Velocity

The flow velocities through the pipes were calculated using the Manning's equation. The Manning's equation calculates the flow velocities using the pipe's roughness coefficient, the hydraulic radius, and the slope of the pipe.

3.7.2.1 Average Dry Weather Flow (ADWF)

Figure 3.3 – LSAP Average Dry Weather Flow Pipe Velocity illustrates the ADWF pipe velocities for the sanitary sewer system. The sanitary sewer system ADWF pipe velocity results are detailed in Appendix D – LSAP Sewer Model Reports. The results shown in this appendix account for flows from the overall LSAP area including the office and housing expansion areas. The recommended system described falls under the housing expansion infrastructure impact study. The results of the analysis show LSAP ADWF velocities ranging from approximately 2.39 fps to 5.67 fps in the City's existing sewer system. ADWF velocities in the recommended City sewer system range from approximately 2.39 fps to 6.24 fps.

3.7.2.2 Peak Wet Weather Flow (PWWF)

Figure 3.4 – LSAP Peak Wet Weather Flow Pipe Velocity illustrates the PWWF pipe velocities for the sanitary sewer system. The sanitary sewer system PWWF pipe velocity results are detailed in Appendix D – LSAP Sewer Model Reports. The results shown in this appendix account for flows from the overall LSAP area including the office and housing expansion areas. The recommended system described falls under the housing expansion infrastructure impact study. The

results of the analysis show LSAP PWWF velocities ranging from approximately fps 3.21 to 7.84 fps in the City's existing sewer system. PWWF velocities in the recommended City sewer system range from approximately 3.21 fps to 8.20 fps.

3.8 Sanitary Sewer System Recommendations

The existing sanitary sewer system, as shown in Appendix D – LSAP Sewer Model Reports, is designed to meet the design criteria outlined in Table 3.1 – Sanitary Sewer System Design Criteria. Refer to Appendix D – LSAP Sewer Model Reports for detailed results of model scenarios. In conclusion, no upgrades to the existing sanitary sewer system are required since the model results display no issues with pipe capacity and flow under various demand scenarios and the existing pipe system abides by City design standards.

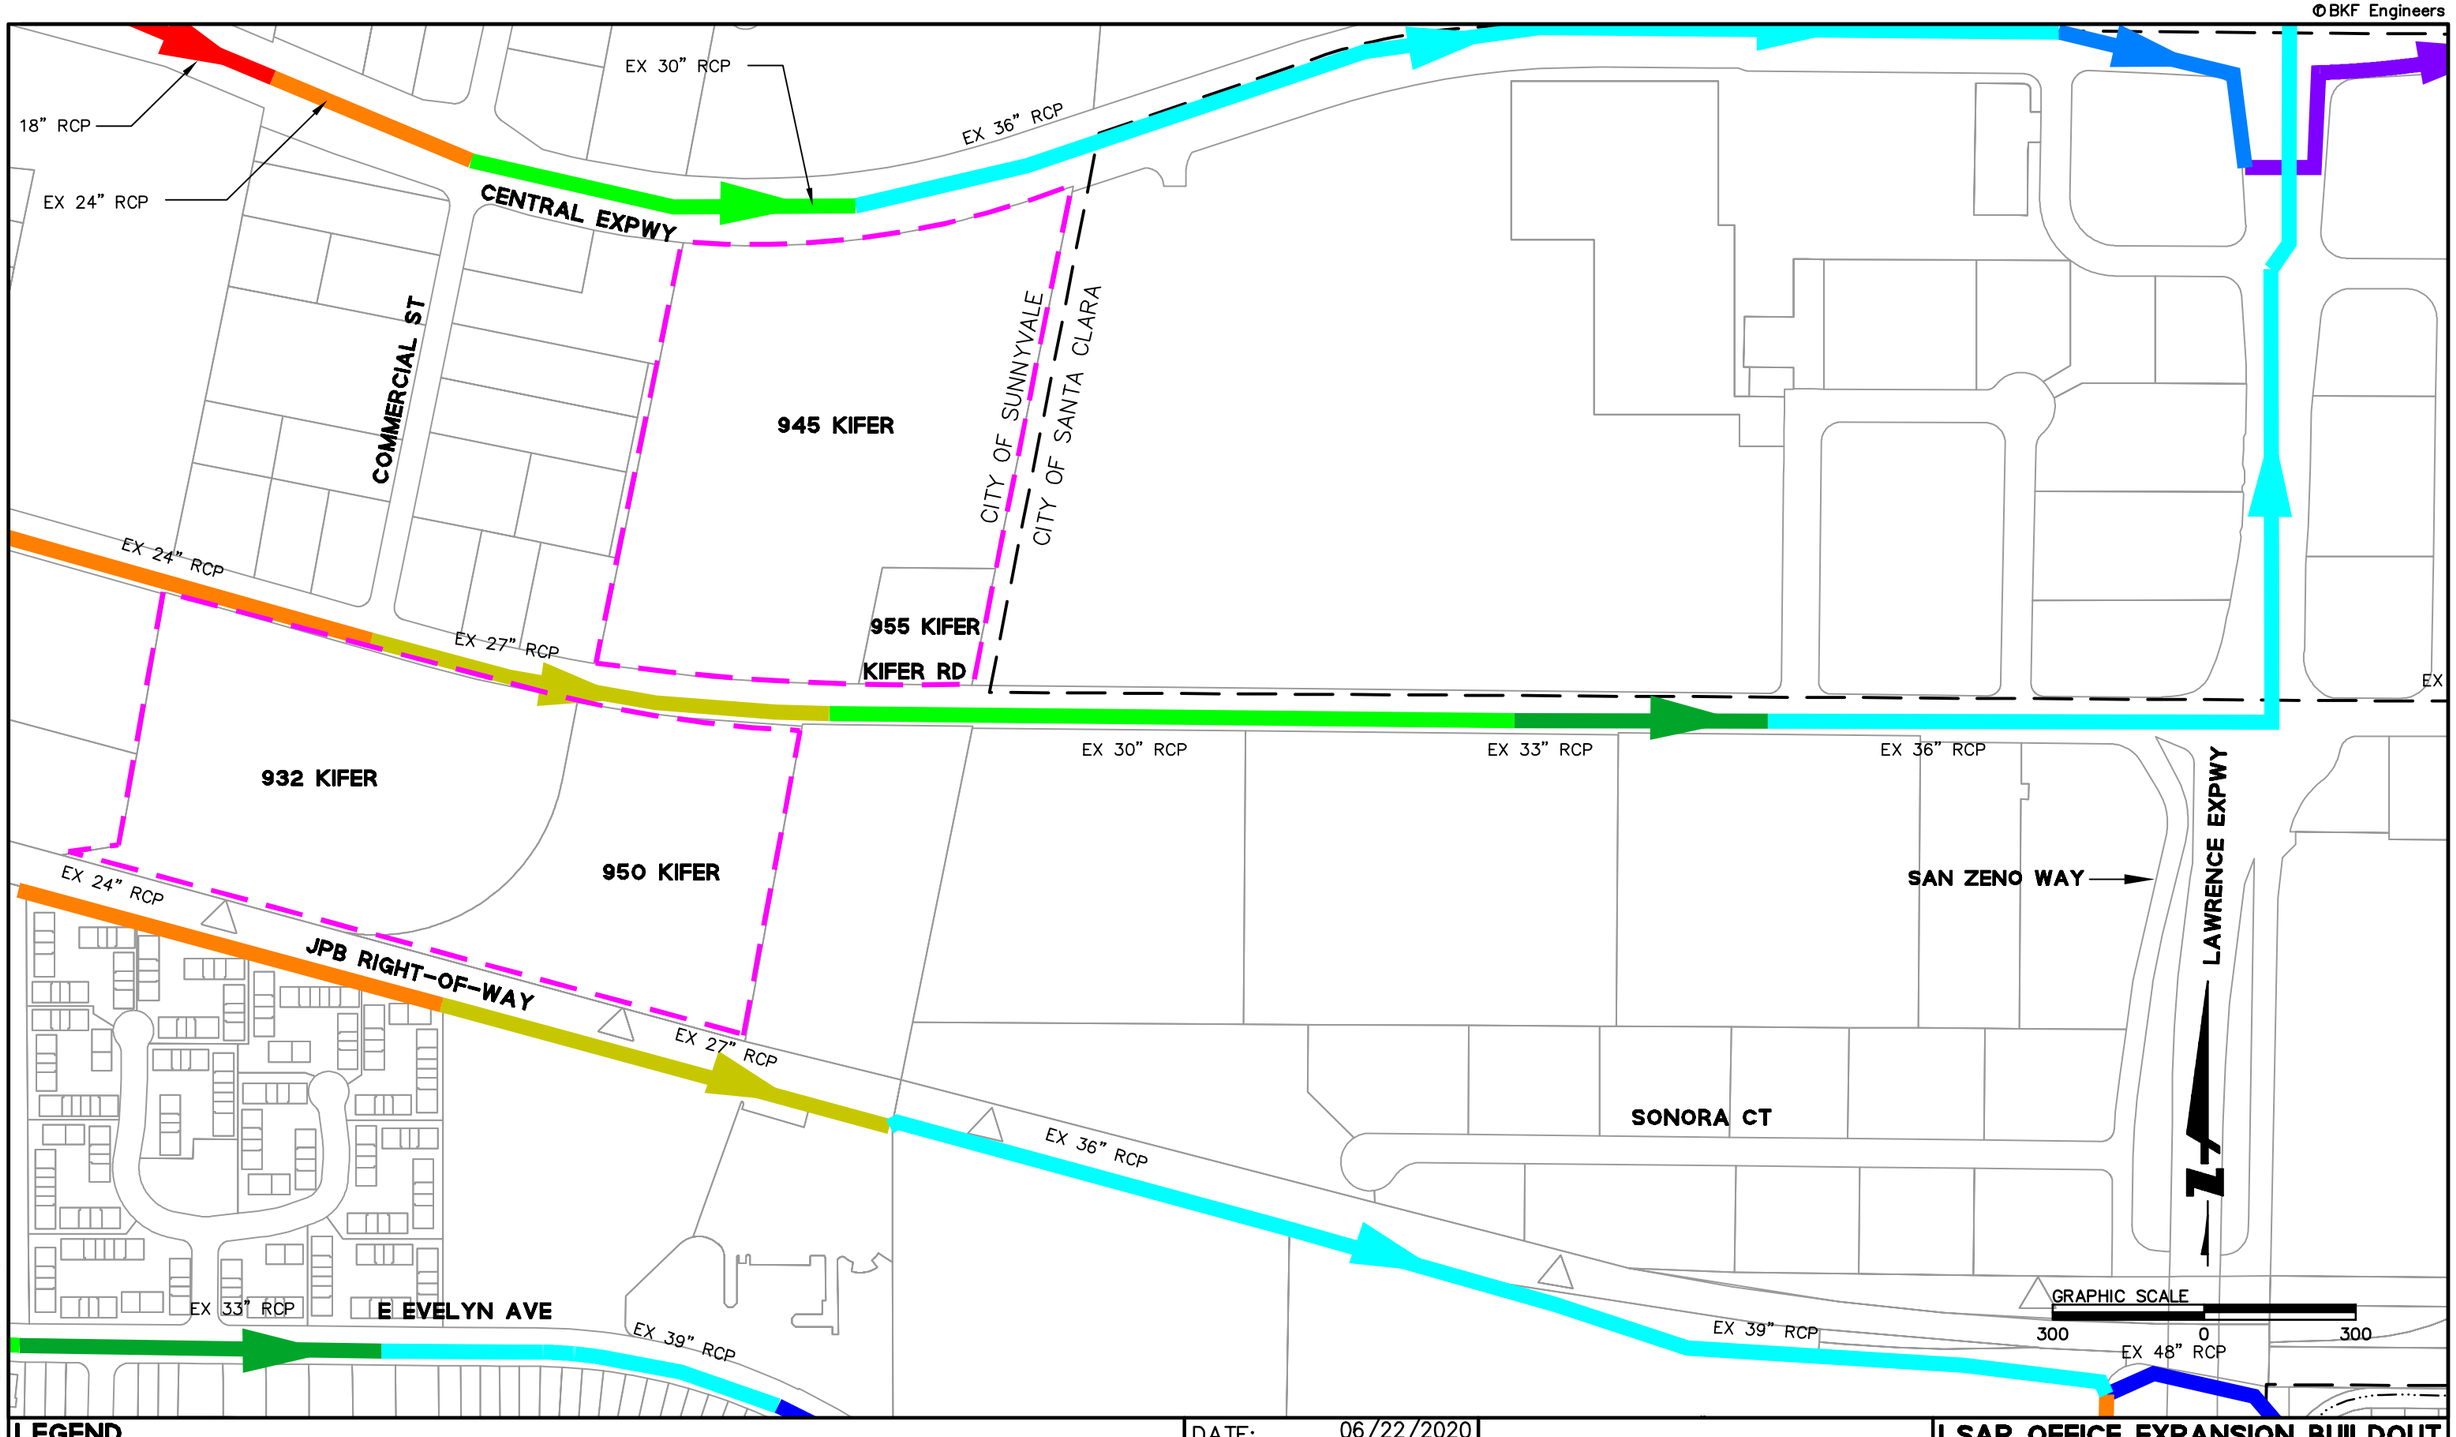
SECTION 4: STORM DRAIN SYSTEM

4.1 Existing Storm Drain Layout

The existing storm drain for LSAP is shown on Figure 4.1 – LSAP Existing Storm Drain System. Existing storm drain mains are maintained by the City of Sunnyvale. The LSAP area is currently served by existing storm drain mains that vary in size between 18-inches to 30-inches.

4.2 Storm Drain System for Developed Projects



The existing site is approximately 719,000 sf (51%) of impervious surfaces and 692,100 sf (49%) of pervious surfaces. The north site, located at 945/955 Kifer Road, composes of 447,500 sf (66%) of pervious surfaces and 230,600 sf (34%) of impervious surface. The south site, located at 932/950 Kifer Road, composes of 244,600 sf (33%) of pervious surfaces and 488,400 sf (67%) of impervious surface.

The office expansion LSAP is proposed to have approximately 862,900 sf (61%) of impervious surfaces and 548,100 sf (39%) of pervious surface. The north site proposes 371,600 sf (55%) of pervious surfaces and 306,400 sf (45%) of impervious surface. The south site proposes 176,500 sf (24%) of pervious surfaces and 556,500 sf (76%) of impervious surface. The proposed developments abide by the City of Sunnyvale's Municipal Code requirements for a minimum of 20% landscaped surfaces for each development parcel. The north and south sites proposes bio-treatment areas on-site to treat impervious surfaces. The remainder of the pervious surfaces are assumed to be self-treating and infiltrate within their own development site.

4.3 Storm Drain System Recommendations

With on-site treatment areas for impervious surfaces and self-treating pervious surfaces elsewhere throughout the site, the proposed developments would abide by the City of Sunnyvale's Municipal Code requirements for a minimum of 20% landscaped surfaces for each parcel. Therefore, the proposed Office Expansion Study Area project assumes no increase in stormwater runoff to the existing storm drain system.

* Available flow reported is based on system-wide constraint of 20 psi and 15 fps applied every where in the system. During simulation, if the pressure were to drop below 20 psi or velocity exceed 15 fps at any location system-wide due to demand placed at that specific node in question, then the simulation ends and the resulting flow calculated at the end of that simulation is reported for that node in question.

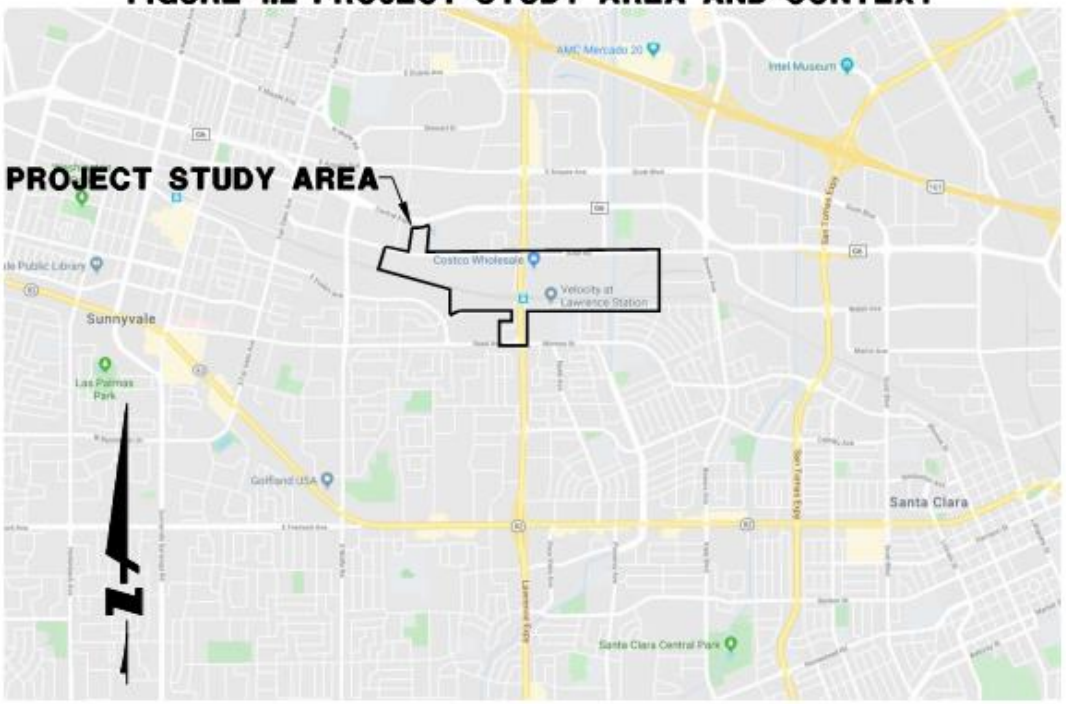
SECTION 1: INTRODUCTION AND PROJECT DESCRIPTION

1.1 Project Overview

The proposed Lawrence Station Area Plan (LSAP) Amendment Project (Project) is generally centered around a ½ mile radius of the existing Lawrence Caltrain Station at 137 San Zeno Way in Sunnyvale, California and is approximately 252.09 acres. The overall LSAP project is divided into two study areas: the Housing Expansion Study Area (i.e. proposed modifications to the adopted LSAP would allow for an addition of 3,612 net new units within portions of the adopted LSAP) and the Office Expansions Study Area. This Infrastructure Study will address the Housing Expansion Study Area which is bounded by the City of Santa Clara to the north and east, Reed Avenue, Aster Avenue, and the railroad right of way (ROW) to the south, and the Intuitive Surgical (ISI) offices to the west. The project site is located in the far eastern area of the City of Sunnyvale around the Lawrence Caltrain station. Figure 1.1 - Project Location - illustrates the regional location of the Project.



The Housing Expansion Study Area is approximately 219.70 acres that include 25.27 acres of public ROW, 17.94 acres of railroad ROW, and 176.49 acres of existing developments.

The Office Expansion Study Area is approximately 32.39 acres industrial land owned by ISI that is proposed for redevelopment as office/R&D that encompasses existing developments for ISI and an industrial site. The office LSAP is bounded by Central Expressway and Kifer Road to the north, City of Santa Clara and the Housing Expansion Study Area to the east, railroad ROW to the south, and commercial developments east of Commercial Street and San Lucar Court. Figure 1.2 - Project Study Area and Context - illustrates the Study Area Boundaries and the location of the Project within the City. Please refer to the Office Expansion Buildout Infrastructure Impact Study for analysis within the Office Expansion Study Area.

FIGURE 1.1 PROJECT LOCATION

FIGURE 1.2 PROJECT STUDY AREA AND CONTEXT

The housing expansion study area includes a mixed-use community with a wide range of residential, retail, and office. Existing utility infrastructure requiring upgrades to serve the

proposed increase in allowable housing potential within the adopted LSAP (i.e. the addition of 3,612 net new units within the LSAP) will be identified in this study.

1.2 Lawrence Station

1.2.1 Existing Conditions and Land Use

The LSAP area is approximately 252.09 acres. The study area includes portions of the Lawrence Caltrain station as well as existing commercial, industrial, and residential properties. Existing conditions and Land Uses within the LSAP include several development projects under construction, including new office buildings, mixed-use residential and retail, and self-storage.

1.2.2 Adopted LSAP Conditions

In December 2016, the Sunnyvale City Council approved the LSAP and its associated General Plan Amendment and Rezoning. The LSAP consisted of primarily residential redevelopment with office and research and development (R&D) developments interspersed. The adopted LSAP includes 2,323 residential units and 1,200,000 square feet (sf) of net new office/R&D development.

1.2.3 Proposed Conditions

At the time of the City's LSAP adoption (December 2016), the Sunnyvale City Council directed staff to return with a plan to study additional housing opportunities within the LSAP area. There are no planned increases to office/R&D development potential. The City Council subsequently selected a preferred land use alternative on June 26, 2018, which studies an increase in the residential density allowance for both MXD-I (Flexible Mixed-Use I) and MXD-II (Flexible Mixed-Use II) zoned areas, and expands the area where housing may be considered to the M-S/LSAP (Industrial and Service, LSAP Combining District) and O-R (Office/Retail) zoning districts.

Residential development capacity under the adopted LSAP allows for a maximum of 2,323 net new dwelling units under the plan's 'Estimated Likely Development Scenario'. A

total of 1,261 net new housing units have been approved by the City since the LSAP was adopted in December 2016; therefore, a balance of 1,062 net new housing units currently remains for buildout within the adopted LSAP. With implementation of the proposed LSAP Update, the addition of 3,612 net new units would be allowable within the plan area. In addition, the maximum density allowance (with incentives) for MXD-I and MXD-II zoned areas within the LSAP would increase from 68 dwelling units per acre (du/ac) to 100 du/ac. The project would also expand where new housing may be considered to the M-S/LSAP zoning district with a maximum density allowance (with incentives) of 100 du/ac and O-R zoning district with a maximum density allowance (with incentives) of 54 du/ac. The housing expansion study area for the LSAP update is shown in Figure 1.3 – Proposed LSAP Study Area Layout.

1.3 Project Datum

All elevations referenced herein are based on the following:

- Vertical datum used in the City of Sunnyvale's Utility and GIS Maps
- Record drawings provided by the City for Aster Avenue and Willow Avenue
- Manhole survey data provided by the City for Lawrence Expressway

SECTION 2: POTABLE WATER SYSTEM

2.1 Potable Water System Design Criteria

The design criteria used for the development of the potable water model is based upon established industry operations standards and regulatory agency requirements. The potable water system will be designed in accordance to the City of Sunnyvale's Standard Plans and Specifications and to applicable City, State, and Federal water and fire codes and standards unless otherwise permitted. Since the City of Sunnyvale does not have written standards for water generation, this report will use Redwood City's Design Standards to estimate project water demands based on correspondence between the City and BKF. The one exception is that this analysis will calculate residential demand using 55 gallons per day per capita based on correspondence between BKF and the City of Sunnyvale. The intent of this study is to identify which existing City water mains will need to be upgraded in order to provide adequate water supply to the LSAP. All existing water mains are located within the City Right-of-Way except for an existing 12-inch main running between Kifer Road and Sonora Court located in a public utility easement.

The design criteria are dependent on the demand scenario. Table 2.1 – Potable Water System Demand and Peaking Factor presents the potable water system demand and peaking factor for the demand scenario. Assumed peaking factors for max day demand and peak hour demand scenarios are based on correspondence between BKF and the City of Sunnyvale.

Table 2.1
Potable Water System Demand and Peaking Factor

Parameter	Value
Average Day Demand (ADD)	1,319,228 gpd
Fire Flow Demand (FF)	4,500 gpm
Maximum Day Demand (MDD)	MDD = 2.0 ADD
Peak Hour Demand (PHD)	PHD = 3.0 ADD

Notes:
1. Fire flow demand based on an assumed R-2 Occupancy type building and construction Type III-A,

assuming 25% fire flow reduction for sprinkling.
2. gpd = gallons per day
3. gpm = gallons per minute

Table 2.2 – Potable Water System Design Criteria presents the potable water system design criteria.

Table 2.2
Potable Water System Design Criteria

Parameter	Value
Pipe size	Pipe diameters of 8, 10, 12, and 16 inches shall be used for all distribution and feeder mains.
Pipe Material	For water mains 12-inches and smaller shall be C900 DR14 PVC pipe or AWWA C-151/A21.51 ductile iron pipe (DIP). Water mains larger than 12-inches shall be C905 DR14 PVC or AWWA C-151/A21.51 DIP.
Hazen Williams C-value for recommended pipes	140 for DIP, 150 for PVC
Maximum static pressure	120 psi
Maximum velocity during PHD	7 fps
Maximum velocity during MDD+FF	15 fps
Minimum system pressure during MDD+FF	20 psi

Notes:
fps = feet per second
psi = pounds per square inch

2.2 Potable Water System Layout

Potable water is supplied to the LSAP by the City of Sunnyvale through an existing 12-inch diameter cast iron pipe (CIP) in Lawrence Expressway from the north and a 12-inch diameter asbestos-concrete pipe from the south. Additionally, there is an existing 12-inch diameter CIP in Kifer Road. Aster Avenue and Reed Avenue both contain existing 10-inch diameter CIPs. Existing potable water system layout is shown on Figure 2.1 – Existing Potable Water System.

2.3 Upgraded Potable Water System

2.3.1 Proposed Water Demand Factors

The potable water demand factors used for the Project's various land uses are shown in Table 2.3 – LSAP Potable Water Demand Factors (ADD). The total estimated water demands for the Project land uses are shown on Table 2.4 – Total Buildout Potable Water Demand Summary (ADD). Water demands are derived from Redwood City's Design Standards with the exception of indoor water demands. Per capita demands for indoor residential demand was determined based on input from the City of Sunnyvale.

Table 2.3
LSAP Potable Water Demand Factors (ADD)

Land Use	Indoor Potable Water Demand Factors (ADD)	Outdoor Potable Water Demand Factors (ADD)	Total Water Demand (ADD)
Residential[1]	121 gpd/unit	37.4 gpd/unit	158.4 gpd/unit
Office/R&D	0.13 gpd/sf	0.072 gpd/sf	0.202 gpd/sf
Industrial	0.21 gpd/sf	0 gpd/sf	0.21 gpd/sf
Restaurant	30 gpd/seat	0 gpd/seat	30 gpd/seat
Storage Facility	0.003 gpd/sf	0 gpd/sf	0.003 gpd/sf

Notes:
1. Indoor potable water demand based on 55 gpd/person * 2.2 persons/unit. Outdoor potable water demand based on 17 gpd * 2.2 persons/unit. 55 gpd/person was determined after a phone conversation between BKF and Eric Evans with the City of Sunnyvale.
2. sf = square feet

2.3.2 Model Results Discussion

The existing potable water system is sufficient to supply the potable water demands as well as provide fire flow to the study area. Under the scenario of max day demand and fire flow, the water model analysis determined that the flow demand would be at its highest of any scenario at 4,820 gpm as seen in Appendix C-3 – Model Demand Scenario 3: Max Day Demand + Fire Flow. However, the existing potable water system is able to provide a flow between 5,000 and 6,000 gpm, which sufficiently meets the max day and fire flow demands. The impact of the proposed LSAP indicates that no improvements are required for the City's potable water system.

2.4 Potable Water System Model Water Demands

2.4.1 Sources of Land Use Water Demand Data

Potable water demand factors for the model analyses are shown in Table 2.3 – LSAP Potable Water Demand Factors (ADD) and were applied to the project program to develop the project potable water demand total. Table 2.4 – Total Buildout Potable Water Demand Summary (ADD) provides water demands by land use including proposed sites associated with the LSAP and existing parcels expected to remain within the LSAP area.

See Appendix E – Potable Water System Demand Calculations, for model demand calculations on a block by block basis. Total project development will not exceed the demands presented in Table 2.4 – Total Buildout Potable Water Demand Summary.

2.4.2 Average Day Demand (ADD)

The demand factors are presented in Table 2.3 – LSAP Project Potable Water Demand Factors (ADD). The demand summary for the overall LSAP Housing Expansion including proposed sites associated with the LSAP and existing parcels to remain is presented in Table 2.4 – Total Buildout Potable Water Demand Summary (ADD). Table 2.5 – Office Expansion Study LSAP Potable Water Demand Summary (ADD) reflects the average day demand for the Office Expansion Study.

Table 2.4
Total Buildout Potable Water Demand Summary (ADD)

Land Use	Number	Unit	Demand/Unit (gpd)	Total (gpd)
Residential	5,935	Units	158.4	940,104
Office/R&D	1,212,374	sf	0.202	244,900
Industrial	614,598	sf	0.21	129,065
Restaurant[1,2]	156	seat	30	4,680
Storage Facility	159,637	sf	0.003	532
			Total	1,319,281

Notes:

1. Existing restaurant located at 1210 Kifer Road is assumed to have 156 seats. This is based on the assumption that 50% of restaurant space (7,800 sf total) is for patrons and one 10'x10' table has seating for 4 people. The calculation is as follows:

$$(7{,}800\ sf \times 0.5) \times \left(\frac{4\ seats}{100\ sf}\right) = 156\ seats$$

2. Restaurant is defined as employee amenity space.
3. The square footage numbers provided in this table present the project buildout numbers and the existing parcels expected to remain.

Table 2.5
Office Expansion Study LSAP Potable Water Demand Summary (ADD)

Land Use	Number	Unit	Demand/Unit (gpd)	Total (gpd)
Office/R&D	351,000	sf	0.202	70,902
Industrial	831,000	sf	0.21	174,510
Restaurant[1,3]	580	seat	30	17,400
			Total	262,812

Notes:

1. Total restaurant seating is assumed to be 580 seats. This is based on the assumption that 50% of restaurant space (29,000 sf total) is for patrons and one 10'x10' table has seating for 4 people. The calculation is as follows:

$$(29{,}000\ sf \times 0.5) \times \left(\frac{4\ seats}{100\ sf}\right) = 580\ seats$$

2. Block by block water demand calculations shown in Appendix E.
3. Restaurant is defined as employee amenity space.

2.4.3 Maximum Day Demand

Maximum Day Demand (MDD) represents the maximum volume of water used in a 24-hour period for the entire year. A water system is typically evaluated under a maximum day plus fire flow demand condition as this condition allows the system to be stressed at a higher demand rate to ascertain if pipeline carrying capacities are adequate in a fire emergency. As identified in Table 2.1 – Potable Water System Demand and Peaking Factor, a peaking factor of 2 was applied to ADD.

2.4.4 Peak Hour Demand

Peak Hour Demand (PHD) represents the highest hourly demand for the entire system, and simulates the highest flow rate expected. To determine the PHD, a peaking factor was applied to increase the ADD. Peaking factors represent the increase above ADD and are a statistical concept typically obtained from historical data. As identified in Table 2.1 – Potable Water System Demand and Peaking Factor, a peaking factor of 3 was applied to ADD.

2.4.5 Fire Flow Demand

The fire flow (FF) demand is assumed to be 4,500 gallons per minute (gpm) based on correspondence between the City of Sunnyvale, Ascent Environmental, and BKF Engineers.

2.5 Potable Water System Model Boundary Conditions

The recommended potable water system is modeled based on calibrated boundary conditions and fire hydrant flow data received from the city completed for the LSAP Project. Since the LSAP Project is redeveloping existing lots, the recommended water model is analyzing existing City water mains and identifying which water mains will need to be upgraded in order to provide adequate water supply for the redevelopment.

2.6 Potable Water System Model Scenario

The LSAP water model was created in Bentley Water CAD V8i SELECT series 1. A series of model scenarios were created to reflect the range of demand usage patterns and confirm conformance to the Potable Water System Design Criteria outline in Table 2.2 – Potable Water System Design Criteria. Three model runs are prepared for the Housing Expansion Study Area and are shown in Table 2.6 – LSAP Project Model Runs – Housing Expansion Study.

Table 2.6
LSAP Project Model Runs – Housing Expansion Study

Run	Description
1	Static Pressures
2	Peak Hour Demand
3	Maximum Day Demand + Fire Flow

See Appendix C – LSAP Potable Water Model Reports for model run results.

2.7 Recommended Potable Water System Model Results

The existing potable water system, as shown in Appendix C – LSAP Potable Water Model Reports, is designed to meet the design criteria outlined in Table 2.2 – Potable Water System Design Criteria. Table 2.7 – Potable Water System Results for Housing Expansion Study summarizes the pressure and velocity results for the referenced model scenarios listed in Table 2.6 – LSAP Project Model Runs – Housing Expansion Study. Refer to Appendix C – LSAP Potable Water Model Reports for detailed results of model scenarios.

Table 2.7
Potable Water System Results for Housing Expansion Study

Parameter	Requirement	Minimum	Maximum
Static ADD Pressure (psi)	120 max	68	85
PHD Velocity (fps)	7 max	-	2.96
MDD+FF Pressure (calculated system lower limit at total flow available) (psi)	20 min	33	-
MDD+FF Velocity (fps)	15 max	-	< 15

Note:
MDD+FF pressure was 4,820 gpm, however the model was allowed to run with flows higher than 5,000 gpm, which resulted in it stopping at 15 fps.

2.8 Potable Water System Conclusion

Based on the results shown in Appendix C-2 – Model Demand Scenario: Peak Hour Demand and C-3 – Model Demand Scenario: Max Day Demand + Fire Flow, the existing potable water system is sufficient to meet proposed potable water and fire flow (FF) demands during average day demand (ADD), max day demand (MDD), and peak hour demand (PHD). No new upgrades to the potable water system were determined to be needed at this time. A water supply analysis will be prepared by Ascent Environmental.

SECTION 3: SANITARY SEWER SYSTEM

3.1 Sanitary Sewer System Design Criteria

The design criteria used for the development of the sanitary sewer model is based upon established industry operations standards and regulatory agency requirements. The sanitary sewer system will be designed in accordance to the City of Sunnyvale's Standard Plans and Specifications and to applicable City, State, and Federal water codes and standards unless otherwise permitted. At certain locations within the project area, City design guidelines were supplemented with manhole survey data and record drawings provided by the City. Sanitary sewer generation is assumed to be 95% of indoor potable water demands. This infrastructure study will identify which existing City sewer mains will need to be upgraded in order to support the anticipated sewer flows from the development within Housing Expansion Study Area. All existing sewer mains are located within the City right-of-way. The pipe material of existing sewer mains is vitrified clay pipe (VCP). The design criteria are dependent on the demand scenario. Table 3.1 – Sanitary Sewer System Design Criteria presents the sanitary sewer system design criteria based on the supplemental information received from the City.

Table 3.1
Sanitary Sewer System Design Criteria

Parameter	Value
Minimum pipe size	8-inch inside diameter
Pipe Material	PVC SDR-26 or better
Manning's coefficient, n, for recommended PVC pipes	0.01
Minimum Slope	0.5% (0.005 feet/feet) for sewer diameters 8-inches and smaller, 0.4% (0.004 feet/feet) for sewer diameters 10-inches and larger.
Maximum Slope	14.0% (0.14 feet/feet)
PWWF Maximum Pipe Flow Depth Ratio, *d/D*	0.5 for sewer diameters 10-inches and smaller, 0.75 for sewer diameters 12-inches and larger
Minimum Depth of Cover	5 feet below finished grade
Sewer Generation	95% of indoor potable water demand

Notes
ADWF = Average Dry Weather Flow
d/D = ratio of depth of flow (*d*) to the pipe inside diameter (*D*)
fps = feet per second
PWWF = Peak Wet Weather Flow

Four flow conditions were analyzed:

1. Average Dry Weather Flow (ADWF) in Existing City Sewer System
2. ADWF in Recommended City Sewer System
3. Peak Wet Weather Flow (PWWF) in Existing City Sewer System
4. PWWF in Recommended City Sewer System

The ADWF is 95% of the indoor potable water demand. To account for existing flows entering the project area from other areas of the city, existing sewer flows collected from flow monitoring sites at Lawrence Road north of Warburton Avenue, Kifer Road west of Lawrence Expressway, and Aster Avenue west of Willow Avenue were incorporated into the sanitary sewer model analysis. Existing sewer flow data collected from the flow monitoring sites were received

from the City on February 6, 2020. According to the City of Sunnyvale's Sanitary Sewer Systems Design Standards, the PDWF peaking factor is dependent upon ADWF. We have assumed a Peak Dry Weather Flow (PDWF) peaking factor that varies between 2.5 and 3.5 which is based on individual parcel demands. PWWF is based on PDWF and a design inflow and infiltration rate based on a 10-year storm event that is 65% of the ADWF. Table 3.2 – Sanitary Sewer System Peaking Factor summarizes the peaking factor to achieve PWWF based on the supplemental information received from the City.

Table 3.2
Sanitary Sewer System Peaking Factor

Parameter	Value
Indoor Potable Water Demand	1,010,021 gpd
Average Dry Weather Flow (95% of Indoor Water Demand)	959,520 gpd
PDWF[1]	PDWF = (varies between 2.5 and 3.5) * ADWF
PWWF	PWWF = ADWF * (PDWF peaking factor + 0.65)

Notes:
PDWF peaking factor is dependent upon ADWF for each parcel.
PDWF = Peak Dry Weather Flow
PWWF = Peak Wet Weather Flow
ADWF = Average Dry Weather Flow

3.2 Sanitary Sewer Collection System

3.2.1 Existing Sanitary Sewer Collection System

The existing sanitary sewer collection system within the vicinity of the LSAP consists of sewer mains that vary in size between 6-inches to 27-inches and a single lift station on Kifer Road located at the crossing over Calabazas Creek. Pipe material of the existing sewer mains is VCP. The lift station consists of a wet well system.

The existing sanitary sewer system within the LSAP boundary consists of a single drainage area. Sanitary sewer flows generally drain by gravity and ultimately drain to the existing 27-inch sanitary sewer main in Lawrence Expressway. The City provided BKF with record drawings, sewer manhole survey data and construction documents for sanitary

sewer mains in Lawrence Expressway, Willow Avenue, and Aster Avenue. A layout of the existing sanitary sewer system is shown on Figure 3.1 – Existing Sanitary Sewer System and existing sanitary sewer manholes are represented on Figure 3.2 – Existing Sanitary Sewer Manholes.

3.3 Recommended Sanitary Sewer System Layout

Figure 3.3 – Recommended Sanitary Sewer Pipe Sizing and Figure 3.4 – Recommended Sanitary Sewer Model Pipe Labels shows the sanitary sewer system collection system with recommended sewer main upgrades required for the LSAP. Figure 3.3 – Recommended Sanitary Sewer Pipe Sizing shows which existing sanitary sewer mains will require upgrades in order to handle the increased sanitary sewer demands from the proposed LSAP.

3.3.1 Kifer Road Lift Station

The analysis of the existing Kifer Lift Station involved reviewing the existing and proposed sanitary sewer ADWF flows into the lift station. The existing sanitary sewer flow during ADWF was determined to be 83 gpm as derived from the building square footages from the M-S/LSAP zone adjacent to Uranium Drive as shown on Figure 3.2 – Existing Sanitary Sewer Manholes. The proposed sanitary sewer ADWF flow into the lift station was determined to be 160 gpm based on the sewer analysis model used throughout this report. BKF provided the existing and proposed sewer flows to the city. The City reviewed the information provided and confirmed the existing Kifer Road Lift Station has enough capacity to serve the LSAP buildout condition.

3.4 Sanitary Sewer System Model Sewer Flows

3.4.1 Land Use Sewer Generation Data

The sanitary sewer flows used are based on the indoor potable water for each land use. Outdoor water demands are not included in sanitary sewer flows because outdoor drains connect to the storm drain system.

3.4.2 Average Dry Weather Flow

The sanitary sewer ADWF is intended to be representative of the average day sanitary sewer generation. The sanitary sewer ADWF is a function of the indoor water use ADD. Table 3.3 – Total Buildout Sanitary Sewer Demand Summary represents the indoor water use ADD and sanitary sewer demands generated for each land use shown in Table 2.4 – Total Buildout Potable Water Demand Summary (ADD) including proposed sites associated with the LSAP and existing parcels to remain. The sanitary sewer ADWF is based on 95% of the indoor potable water ADD. Total sewer demand use for each development is detailed in Appendix F - Sanitary Sewer Demand Calculations. Sewer generation (gpm) that was calculated for each parcel was applied to each sewer line in the street that was adjacent to that particular parcel. This allows an even distribution of sewer generated for a particular parcel to account for existing sanitary sewer lines in the street. Table 3.6 – Office Expansion Study LSAP Sanitary Sewer Demand Summary represents the indoor water use and sanitary sewer demands generated from the office expansion.

Table 3.3
Total Buildout Sanitary Sewer Demand Summary

Land Use[1]	Number	Unit	Indoor Domestic Water Demand (gpd)	Sanitary Sewer Demand (gpd)
Residential	5,935	sf	718,135	682,228
Office/R&D	1,212,374	sf	157,609	149,728
Industrial	614,598	sf	129,065	122,612
Restaurant[2]	156	seat	4,680	4,446
Storage Facility	159,637	sf	532	506
		Total	1,010,021	959,520

Notes:

1. Existing restaurant located at 1210 Kifer Road is assumed to have 156 seats. This is based on the assumption that 50% of restaurant space (7,800 sf total) is for patrons and one 10'x10' table has seating for 4 people. The calculation is as follows:

$$(7{,}800\ sf \times 0.5) \times \left(\frac{4\ seats}{100\ sf}\right) = 156\ seats$$

2. Restaurant is defined as employee amenity space.
3. The square footage numbers provided in this table represent project buildout numbers including nonresidential buildings expected to remain.

3.4.3 Peak Dry Weather Flow (PDWF)

The sanitary sewer PDWF is the highest sanitary sewer generation during the day due to diurnal peaks associated with higher water usage in the morning and early evening hours. PDWF is determined by applying a peaking factor to ADWF. City of Sunnyvale has varying peaking factors for PDWF which is dependent upon ADWF for each parcel. Peaking factors for the LSAP vary between 2.5 and 3.5.

3.3.3 Peak Wet Weather Flow (PWWF)

The sanitary sewer PWWF incorporates infiltration and inflow rate at 65% of the ADWF. This rate is added to the PDWF peaking factor.

Inflow is surface water that enters the wastewater system from yards, roof drains, downspouts, storm drain cross connections, or through manhole covers due to overland flow runoff. Similar to infiltration, inflow is a result of storm events, and peak inflow

flow runoff. Similar to infiltration, inflow is a result of storm events, and peak inflow typically occurs during heavy storm events or prolonged periods of precipitation.

Infiltration is groundwater that enters sewer facilities such as pipelines, laterals, and manholes through holes, breaks, joint/connection failures, and other openings. Infiltration is directly correlated to the total amount of piping and appurtenances in the ground. Infiltration quantities vary due to seasonal variation in the groundwater levels influenced by storm events, surface and soil conditions, condition of sanitary sewer systems, and type of pipe joints. The highest infiltration flows are typically observed following significant storm events and during the winter or peak precipitation months, when groundwater levels are high.

3.5 Sanitary Sewer Flow Distribution

Each parcel's total sanitary sewer generation was determined by reviewing the planned parcel land use and applying applicable land use sanitary sewer generation. The parcel land use summary is included in Appendix F – Sanitary Sewer System Demand Calculations for reference. Sanitary sewer flows from the proposed LSAP Office Expansion (i.e. ISI project) was included in the model results due to the LSAP Office Expansion located within the LSAP Housing Expansion Buildout Infrastructure on Kifer Road. Refer to the Lawrence Station Area Plan Office Expansion Buildout Infrastructure Impact Study for a detailed analysis with the expanded office use.

Each parcel's total sanitary sewer flow was divided equally amongst the sanitary sewer manholes bordering the parcel as shown in Figures 3.2 – Existing Sanitary Sewer Manholes and 3.4 – Recommended Sanitary Sewer Model Pipe Labels. The parcel flow entering a manhole represents a sanitary sewer lateral point of connection.

3.6 Hydraulic Grade Line Considerations

The analysis of the sanitary sewer system is assumed to be a free outfall condition.

3.7 Sanitary Sewer Boundary Conditions

In addition to the flow monitoring survey data provided by the City, the recommended sanitary sewer system is modeled based on boundary conditions taken from Technical Memorandum 7 attached to the City of Sunnyvale's 2015 Wastewater Collection System Master Plan. Since the LSAP Project is redeveloping existing lots, the proposed sewer model is analyzing existing City sewer mains and identifying the sewer mains that will need to be upgraded in order to abide by supplemental information provided by the City.

3.8 Model Scenario Results and Analysis

The LSAP sanitary sewer model was created using a Bentley StormCAD V8i SELECT series 5.

The following sanitary sewer model flow conditions were developed:

1. Average Dry Weather Flow (ADWF) in Existing City Sewer System
2. ADWF in Recommended City Sewer System
3. Peak Wet Weather Flow (PWWF) in Existing City Sewer System
4. PWWF in Recommended City Sewer System

Sanitary sewer model inside diameters were based on JM Eagle PVC Pipe Size for SDR 26 (160 psi). Installation of the sewer system should be based on the modeling of the product.

3.8.1 Pipe Diameter

The recommended sanitary sewer pipe sizes are shown on Figure 3.3 – Recommended Sanitary Sewer Pipe Sizing. The recommended sanitary sewer system consists of 12-inch to 30-inch diameter pipes. Exhibits show nominal pipe diameters. The sewer systems were modelled with the inside pipe diameters. Pipe upgrades for portions of the sanitary sewer system were based on the d/D exceeding the allowable depth of flow of 0.50 for pipe sizes 10-inches and smaller, and 0.75 for pipe sizes greater than 12-inches per the supplemental information the City provided.

3.8.2 Flow Velocity

The flow velocities through the pipes were calculated using the Manning's equation. The Manning's equation calculates the flow velocities using the pipe's roughness coefficient, the hydraulic radius, and the slope of the pipe.

While most of the existing sewer mains are able to provide 2 fps during PWWF conditions, this was not achievable for all existing sewer mains. For sewer mains that flowed under 2 fps during PWWF conditions, these sewer mains are flowing at less than half pipe capacity. Therefore, these existing sewer mains will not be upgraded as it has sufficient capacity for future sewer demands and will achieve minimum 2 fps flow velocity requirements when flowing half-full. The existing sewer mains are upsized if found to be flowing greater than the d/D at PWWF requirements (0.5 or 0.75).

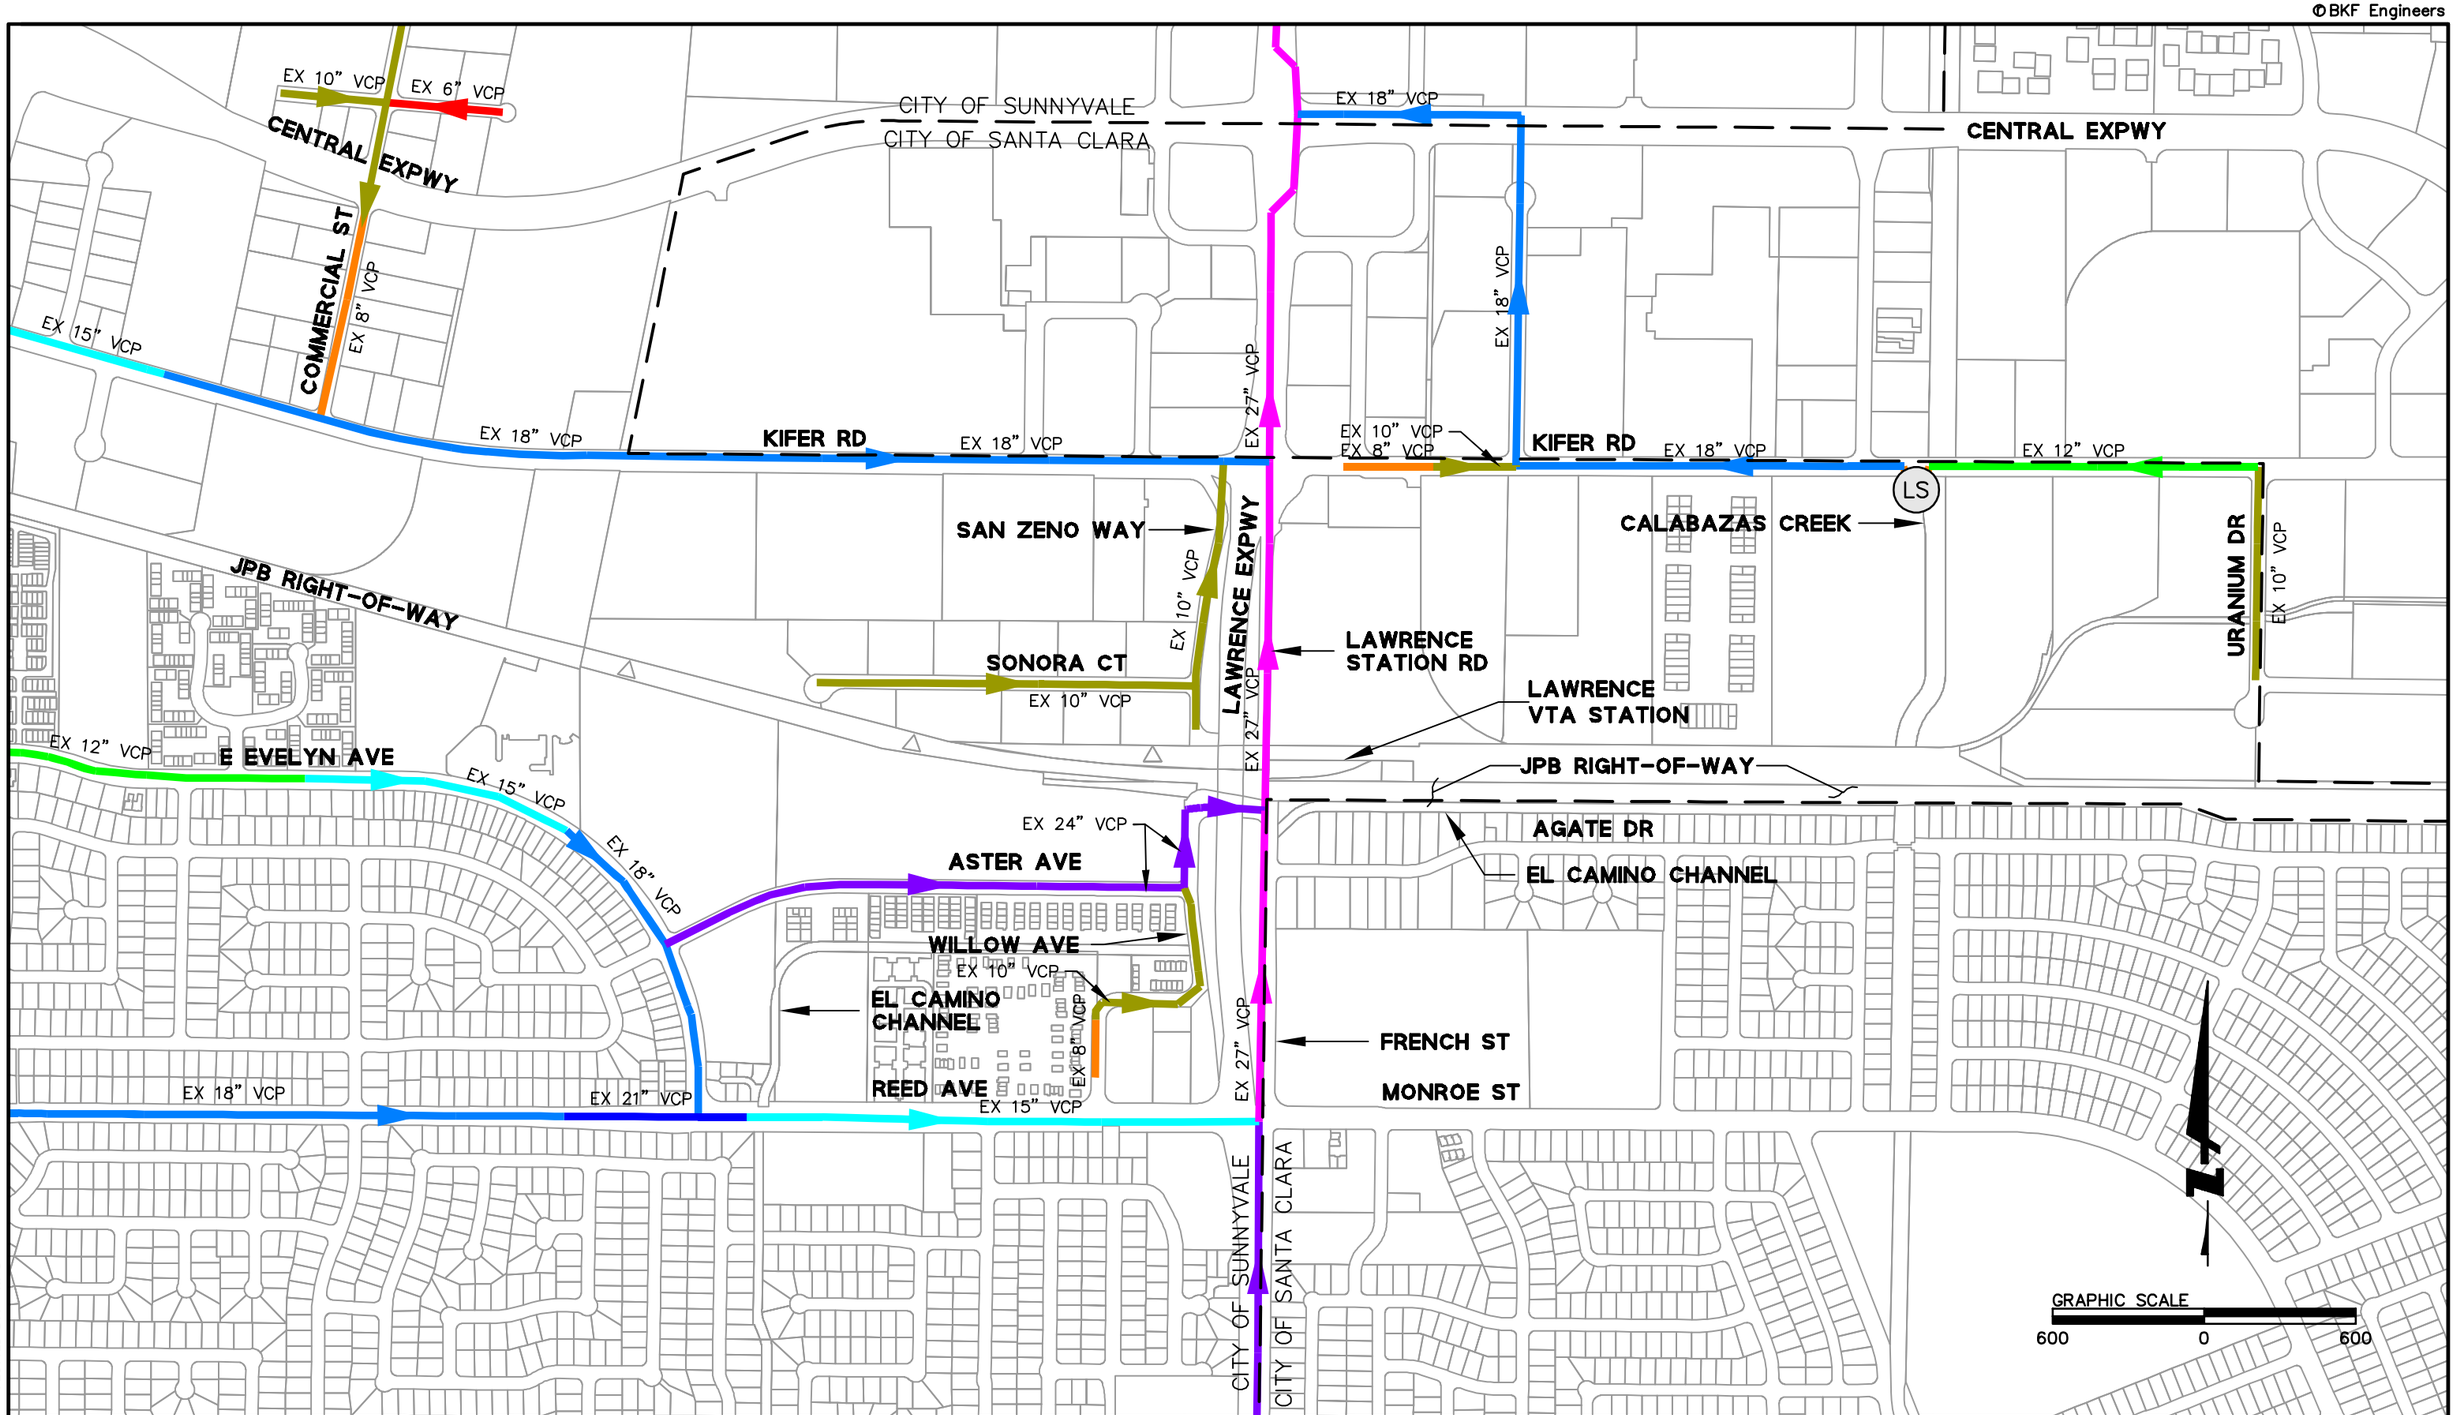
3.8.2.1 Average Dry Weather Flow (ADWF)

Figure 3.5 – Average Dry Weather Flow Pipe Velocity illustrates the ADWF pipe velocities for the sanitary sewer system. The sanitary sewer system ADWF pipe velocity results are detailed in Appendix D – LSAP Sewer Model Reports. The results shown in this appendix account for flows from the overall LSAP area including the office and housing expansion areas. The results of the analysis show LSAP ADWF velocities ranging from approximately 0.61 fps to 7.36 fps in the City's existing sewer system. ADWF velocities in the recommended City sewer system range from approximately 0.84 fps to 7.28 fps.

3.8.2.2 Peak Wet Weather Flow (PWWF)

Figure 3.6 – Peak Wet Weather Flow Pipe Velocity illustrates the PWWF pipe velocities for the sanitary sewer system. The sanitary sewer system PWWF pipe velocity results are detailed in Appendix D – LSAP Sewer Model Reports. The results shown in this appendix account for flows from the overall LSAP area including the office and housing expansion areas. The results of the analysis

show LSAP PWWF velocities ranging from approximately 0.25 fps to 11.04 fps in the City's existing sewer system. PWWF velocities in the recommended City sewer system range from approximately 1.27 fps to 10.94 fps.



3.9 Sanitary Sewer System Conclusion

The existing Sanitary Sewer system had three pipes that did not meet design criteria based on the supplemental information provided by the City for maximum pipe flow depth (*d/D*). These pipes were the following:

- Existing 10-inch VCP sewer main located in San Zeno Way connecting into Kifer Road between manholes 305-201 and 336-201 has an existing pipe flow depth of 0.53 during PWWF conditions as seen in Appendix D – LSAP Sewer Model Reports. Per supplemental information provided by the City, maximum depth for pipes 10-inches and smaller is 0.5. BKF recommends upsizing to 12-inch PVC sewer main to provide sufficient capacity.

- Existing 10-inch VCP sewer main located at the intersection of Willow Avenue and Aster Avenue between manholes 296-208 and 296-209 has an existing pipe flow depth of 1.06 during PWWF conditions as seen in Appendix D – LSAP Sewer Model Reports. Per supplemental information provided by the City, maximum depth for pipes 10-inches and smaller is 0.5. BKF recommends upsizing to a 18-inch PVC sewer main to provide sufficient capacity.
- Existing 27-inch VCP sewer main is in Santa Clara, but the City of Sunnyvale has jurisdiction over the pipe segment. It is located in Lawrence Expressway north of Kifer Road between manholes 336-202 and 336-207. It has an existing pipe flow depth of 0.80 during PWWF conditions as seen in Appendix A – LSAP Sewer Model Reports. Per supplemental information provided by the City, maximum depth for pipes 12-inches and larger is 0.75. BKF recommends upsizing the existing 27-inch VCP to a 30-inch PVC sewer main to provide sufficient capacity.

SECTION 4: CONSTRUCTION COSTS

4.1 Sanitary Sewer System Construction Costs

The associated construction costs to complete the recommended pipe upsizing upgrades are based off of the cost estimates prepared by Schaaf & Wheeler for the Downtown Specific Study prepared in September 2019. The anticipated construction cost based on linear footage has been prepared in Table 4.1 – Anticipated Construction Cost. The unit cost provided includes the costs associated with mobilization, demobilization, traffic control, shoring, trenching, manholes, laterals, bypass pumping, offhaul and disposal.

Table 4.1
Anticipated Construction Cost

Pipe Diameter	Recommended Costs ($/LF)[2]
12" PVC pipe	$700
18" PVC pipe	$900
30" PVC pipe[1]	$2000

Note:
1. The 30" PVC pipe recommended unit cost has been adjusted to account increased costs for construction work required on Lawrence Expressway including sewer bypass pumping, expressway traffic control, and pavement thickness.
2. Unit cost values are derived from 2019 Downtown Specific Plan Amendments Utility Impact Study.

Total project construction was estimated by factoring expected additional costs related to construction contingency, design, inspection, miscellaneous costs, and city administration. These additional project costs have been provided in Table 4.2 – Additional Project Costs shown below.

Table 4.2
Additional Project Costs

Project Item	Percentage of Total Cost
Construction Contingency	25%
Design	20%
Inspection	10%
Miscellaneous Costs	10%
City Administration	5%

The sewer analysis model finds that a total of 671 linear feet of 27-inch VCP sewer pipe in Lawrence Expressway must be upsized to a 30-inch PVC sewer pipe, which creates an estimated cost of $1,342,000. With additional costs, the total cost for upsizing sewer pipe in Lawrence Expressway amounts to $2,214,300. The model concludes that a total of 324 linear feet of 10-inch VCP sewer pipe in San Zeno Way must be upsized to a 12-inch PVC sewer pipe, which creates an estimated cost of $226,800. With additional costs, the total cost for upsizing the sewer pipe in San Zeno Way amounts to $374, 220. For Willow Avenue, a total of 69 linear feet of 10-inch VCP sewer pipe must be upsized to 18-inch PVC sewer pipe, which creates an estimated cost of $62,100. With additional costs, the total cost for upsizing the sewer pipe in Willow Avenue amounts to $102,465. The total cost associated with the recommended sewer upgrades for the LSAP Housing Expansion is $2,690,985. A detailed breakdown of the project's cost estimate can be seen in Appendix G – Cost Estimate for City Sanitary Sewer System Upgrades.

SECTION 5: STORM DRAIN SYSTEM

5.1 Existing Storm Drain Layout

The existing storm drain for LSAP is shown on Figure 4.1 – Existing Storm Drain System. Existing storm drain mains are maintained by the City of Sunnyvale. The LSAP area is currently served by existing storm drain mains that vary in size between 12-inches to 60-inches. Within the vicinity of the LSAP, there are four points where the existing storm drain system discharges into a City flood easement (El Camino Channel) listed below.

- Discharge point #1 located near Reed Avenue and East Evelyn Avenue
- Discharge point #2 located at Aster Avenue east of East Evelyn Avenue
- Discharge point #3 located at French Street south of Agate Drive
- Discharge point #4 located at the intersection of French Street and Willow Avenue.

There are also two points where the existing storm drain system discharges into Calabazas Creek at Kifer Road coming from the West and East (Discharge points #5 and #6 respectively). Discharge points are shown in Figure 4.1 – Existing Storm Drain System.

5.2 Storm Drain System Conclusion

While the project does not have pervious/impervious areas of the existing developments, it is assumed that the pervious areas in the existing development are below 20% pervious. The existing LSAP site, using Google Earth aerial images, show significant impervious surfaces throughout the project area consisting primarily of existing buildings and surface parking for each lot. While the project does not have a pervious/impervious area breakdown for the proposed development, the City of Sunnyvale's Municipal Code requires a minimum of 20% landscaping for each development parcel. It is also assumed that stormwater flows from the proposed developments within the LSAP will be designed to infiltrate within their own development site. Therefore, the proposed Housing Expansion Study Area project assumes no increase in stormwater runoff to the existing storm drain system.

APPENDIX B

LSAP Parcels with Development Assumptions

Appendix B
Lawrence Station Area Plan
LSAP Parcels with Devleopment Assumptions
Received from George Schroeder of the City of Sunnyvale on March 16, 2019

Residential development cap under the adopted LSAP (net new dwelling units)	**2,323**		
Net new housing units approved by the City since LSAP adoption in 2016	**1261**	**Addition of net new units proposed within the adopted LSAP**	**Total net new housing unit cap proposed with implementation of LSAP update**
Balance of net new housing units that currently remain for buildout within the adopted LSAP	**1,062**	**3,612**	**5,935**

Existing — Parcels highlighted in green will be analyzed as the existing condition.
Proposed — Parcels highlighted in blue will be analyzed as the proposed condition.

Parcels not expected to redevelop to residential or change (Caltrain properties also excluded)

APPENDIX C

LSAP Potable Water Model Reports

NOTE:

1. THE PRESENTED MODEL LAYOUT IS A FUNCTIONAL APPROXIMATION OF THE DOMESTIC WATER SYSTEM, BASED ON THE EXISTING PLANS. THIS EXHIBIT IS PROVIDED SOLELY FOR THE PURPOSE OF DOCUMENTATION FOR THIS HYDRAULIC MODELING STUDY.
2. SERVICE LATERALS ARE NOT SHOWN. LOSSES DUE TO METERS AND BACKFLOW PREVENTION DEVICES WILL OCCUR IN SERVICE LATERALS AND ARE NOT INCLUDED IN THE MODELING OF DOMESTIC WATER MAINS.

* Available flow reported is based on system-wide constraint of 20 psi and 15 fps applied every where in the system. During simulation, if the pressure were to drop below 20 psi or velocity exceed 15 fps at any location system-wide due to demand placed at that specific node in question, then the simulation ends and the resulting flow calculated at the end of that simulation is reported for that node in question.

Note:
The system accounts for flows from the overall LSAP area including the existing areas to remain for the proposed housing expansion scenario.

Note:
The system accounts for flows from the overall LSAP area including the existing areas to remain for the proposed housing expansion scenario.

Note:
The system accounts for flows from the overall LSAP area including the existing areas to remain for the proposed housing expansion scenario.

APPENDIX G

Cost Estimate for City Sanitary Sewer System Recommendations

BKF Engineers
255 Shoreline Drive, Suite 200
Redwood City, California 94065

APPENDIX G
ESTIMATE OF CONSTRUCTION
COSTS FOR CITY SANITARY SEWER UPGRADES

LAWRENCE EXPRESSWAY SANITARY SEWER IMPROVEMENTS					
ITEM	**DESCRIPTION**	**QUANTITY**	**UNIT**	**UNIT COST[5]**	**TOTAL COST**
1	Replace existing 27" VCP main with proposed 30" PVC SS main	671	LF	$2,000.00	$1,342,000
				LAWRENCE EXPRESSWAY SUBTOTAL	**$1,342,000**

ADDITIONAL PROJECT COSTS (PERCENTAGE OF LAWRENCE EXPRESSWAY SUBTOTAL)			
ITEM	**DESCRIPTION**	**QUANTITY**	**TOTAL COST**
1	Construction Fees	25%	$335,500
2	Design Fees	20%	$268,400
3	Inspection Fees	10%	$134,200
4	Miscellaneous Costs	5%	$67,100
5	City Administration Fees	5%	$67,100
		ADDITIONAL COSTS SUBTOTAL	**$872,300**
		LAWRENCE EXPRESSWAY TOTAL	**$2,214,300**

SAN ZENO WAY SANITARY SEWER IMPROVEMENTS					
ITEM	**DESCRIPTION**	**QUANTITY**	**UNIT**	**UNIT COST**	**TOTAL COST**
1	Replace existing 10" VCP main with proposed 12" PVC SS main	324	LF	$700.00	$226,800
				SAN ZENO WAY SUBTOTAL	**$226,800**

ADDITIONAL PROJECT COSTS (PERCENTAGE OF SAN ZENO WAY SUBTOTAL)			
ITEM	**DESCRIPTION**	**QUANTITY**	**TOTAL COST**
1	Construction Fees	25%	$56,700
2	Design Fees	20%	$45,360
3	Inspection Fees	10%	$22,680
4	Miscellaneous Costs	5%	$11,340
5	City Administration Fees	5%	$11,340
		ADDITIONAL COSTS SUBTOTAL	**$147,420**
		SAN ZENO WAY TOTAL	**$374,220**

WILLOW AVENUE SANITARY SEWER IMPROVEMENTS					
ITEM	**DESCRIPTION**	**QUANTITY**	**UNIT**	**UNIT COST**	**TOTAL COST**
1	Replace existing 10" VCP main with proposed 18" PVC SS main	69	LF	$900.00	$62,100
				WILLOW AVENUE SUBTOTAL	**$62,100**

ADDITIONAL PROJECT COSTS (PERCENTAGE OF WILLOW AVENUE SUBTOTAL)			
ITEM	**DESCRIPTION**	**QUANTITY**	**TOTAL COST**
1	Construction Fees	25%	$15,525
2	Design Fees	20%	$12,420
3	Inspection Fees	10%	$6,210
4	Miscellaneous Costs	5%	$3,105
5	City Administration Fees	5%	$3,105
		ADDITIONAL COSTS SUBTOTAL	**$40,365**
		WILLOW AVENUE TOTAL	**$102,465**

LSAP HOUSING TOTAL	**$2,690,985**

Abbreviations:

Symbol	Description
PVC	polyvinyl chloride
VCP	vitrified clay pipe

Notes:

1. For location of Sanitary Sewer improvements, refer to Figure 3.3 - LSAP Proposed Sanitary Sewer Pipe Sizing.
2. This cost estimate does not include the costs associated with the installation of intermediary manholes for segments of sanitary sewer main that violate City requirements for running length of sewer mains between manholes.
3. Unit cost values are derived from 2019 Downtown Specific Plan Amendments Utility Impact Study.
4. Unit cost for the sewer main upgrades includes cost for mobilization, demobilization, traffic control, shoring, trenching, manholes, laterals, bypass pumping, offhaul, and disposal.
5. Unit cost for sewer main upgrade within Lawrence Expressway has been adjusted to account higher anticipated costs for increased pavement thickness, expressway traffic control, bypass pumping, and tunneling in addition to the costs listed in Note 4.
6. This cost estimate is approximate and may not be representative of actual construction costs.

BKF Job No.: 20180080
Estimate Date: 05/19/2020
