- GO 75-D, Warning devices for at-grade railroad crossings (if any),
- GO 95, Overhead electric line construction (if catenary is used),
- GO 128, Construction of Underground and Electrical Supply and Communication,
- GO 143-B, Design, Construction and Operation Safety Rules and Regulations Governing Light-Rail Transit, and
- GO 164-E. Rules and Regulations Governing State Safety Oversight of Rail Fixed Guideway Systems

2-3

The project must ensure compliance with the American Society of Civil Engineers Automated People Mover Standards (APM Standards).

The following link provides resources on the Commission's rules and regulations in regard to rail safety:

http://www.cpuc.ca.gov/PUC/safety/Rail/

The proposed project would disrupt the heavily used roadway network in the surrounding community. The potential impacts should be identified, discussed and evaluated for necessary safety improvements and mitigations at each proposed construction stage. This includes considering traffic circulation and queuing, level of service, emergency service response, and compliance with the Americans with Disabilities Act.

2-4

The Commission appreciates the opportunity to provide comments on the project described in the NOP. Please feel free to contact me at (916) 928-6858 or daren.gilbert@cpuc.ca.gov or contact our lead staff on this project: Ainsley Kung at (213) 576-7056 or ainsley.kung@cpuc.ca.gov for transit safety matters and Jose Pereyra at (213) 576-7083 or jose.pereyra@cpuc.ca.gov for crossing matters.

2-5

Sincerely,

Daren Gilbert, Manager
Rail Transit Safety Branch
Safety and Enforcement Division

RE: Inglewood Transit Connector
Notice of Preparation of Environmental Impact Report (NOP)
SCH # 2018071034
GTS # 07-LA-2018-01760-FL
Vic. LA/ 105/ PM 3.123
LA/ 405/ PM 22.482

Dear Ms. Wilcox:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project. The project includes an automatic people mover(APM)/transit connector that would be built primarily in existing public Right-of-Way (ROW) in the city. 3-1

The project would connect the under construction Metro Crenshaw/LAX Line with Downtown Inglewood, the Forum, the LA Sports and Entertainment District, and the proposed Inglewood Basketball and Entertainment Center. Up to five passenger stations would be included on the automatic people mover alignment.

The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. Senate Bill 743 (2013) mandated that CEQA review of transportation impacts of proposed development be modified by using Vehicle Miles Traveled (VMT) as the primary metric in identifying transportation impacts for all future development projects. You may reference to The Governor's Office of Planning and Research (OPR) for more information. 3-2

http://opr.ca.gov/ceqa/updates/guidelines/

Caltrans is aware of challenges that the region faces in identifying viable solutions to alleviating congestion on State and Local facilities. With limited room to expand vehicular capacity, this 3-3

development should incorporate multi-modal and complete streets transportation elements that will actively promote alternatives to car use and better manage existing parking assets. Prioritizing and allocating space to efficient modes of travel such as bicycling and public transit can allow streets to transport more people in a fixed amount of right-of-way. 3-3

Caltrans supports the implementation of complete streets and pedestrian safety measures such as road diets and other traffic calming measures. Please note the Federal Highway Administration (FHWA) recognizes the road diet treatment as a proven safety countermeasure, and the cost of a road diet can be significantly reduced if implemented in tandem with routine street resurfacing. 3-4

We encourage the Lead Agency to integrate transportation and land use in a way that reduces Vehicle Miles Traveled (VMT) and Greenhouse Gas (GHG) emissions by facilitating the provision of more proximate goods and services to shorten trip lengths, and achieve a high level of non-motorized travel and transit use. We also encourage the Lead Agency to evaluate the potential of Transportation Demand Management (TDM) strategies and Intelligent Transportation System (ITS) applications in order to better manage the transportation network, as well as transit service and bicycle or pedestrian connectivity improvements. 3-5

The Department also seeks to provide equitable mobility options for people who are economically, socially, or physically disadvantaged. Therefore, we ask the Lead Agency to evaluate the project site for access problem, VMT and service needs that may need to be addressed. 3-6

This project boundary is near I-405 and I-105. Please provide trip generation, trip distribution, and trip assignment estimates for this project with regards to the local and regional road system. To ensure that queue formation does not create traffic conflicts, project-generated trips should be added to the existing and future scenario traffic volumes for the NB/SB I-405 on/off-ramps at Century Blvd., La Cienega Blvd., Manchester Blvd., and Florence Ave., and EB/WB I-105 on/off-ramps at Prairie Ave., Imperial Hwy., Hawthorne Blvd., and Crenshaw Blvd.. To avoid traffic conflicts such as inadequate weaving distances, queue spilling back onto the freeway, and uneven lane utilization, please analyze the adequacy of the operations of freeway segments in the vicinity of the project. 3-7

Analysis should include existing traffic, traffic generated by the project assigning to the State facilities, cumulative traffic generated from all specific planning developments in the area, and traffic growth other than from the project and developments.

A discussion of mitigation measures appropriate to alleviate anticipated traffic impacts. Any mitigation involving transit or Transportation Demand Management (TDM) is encouraged and should be justified to reduce VMT and greenhouse gas emissions. Such measures are critical to facilitating efficient site access. 3-8

For additional TDM options, please refer to the Federal Highway Administration's *Integrating Demand Management into the Transportation Planning Process: A Desk Reference* (Chapter 8). The reference is available online at: http://www.ops.fhwa.dot.gov/publications/fhwahop12035/fhwahop12035.pdf. 3-9

If you have any questions, please feel free to contact me, the project coordinator at (213) 897-0673 and refer to GTS #07-LA-2018-01760-FL. 3-10

Sincerely,

MIYA EDMONSON
IGR/CEQA Branch Chief

Subject: Inglewood Transit Connector EIR Notice of Preparation

Dear Ms Wilcox:

West Basin Municipal Water District (West Basin) appreciates the opportunity to respond to the City of Inglewood's Notice of Preparation and Notice of Public Scoping Meeting for an Environmental Impact Report for the Inglewood Transit Connector Project. 4-1

For your reference, a map of West Basin's facilities in the vicinity of the City's project is attached to this letter. These facilities consist primarily of recycled water distribution pipelines in the public right-of-way. In most instances West Basin's pipelines are located at least 3.5' below grade. If the City's project necessitates pipeline relocation(s), please provide a specific utilities relocation request to West Basin. In order to allow West Basin staff adequate time to plan and execute a pipeline relocation project, please provide such requests a minimum 6 months in advance.

Additionally, among West Basin's capital improvement projects that is of particular significance to the City's Project is the Kenneth Hahn Lateral. West Basin in conjunction with California American Water, Golden State Water Company, and other stakeholders is investigating opportunities to provide recycled water from the existing 36-in pipeline that ends at the intersection of the Prairie Avenue and E. Florence Avenue, in the City of Inglewood, to the Kenneth Hahn State Park, the Baldwin Hills area generally, and into Culver City. This project was considered by West Basin in the 2009 Recycled Water Master Plan. This expansion of West Basin's recycled water system comprises approximately 22,000 LFT of 4-inch pipe; 11,000 LFT of 6-inch pipe; 20,000 LFT of 16-inch pipe; two booster pump stations; and potentially a reservoir. A map of preliminary pipeline alignment options and potential sites for connections and pump stations is attached to this letter. The complete Kenneth Hahn Lateral Feasibility Study is available upon request at West Basin's administrative office in Carson, CA. 4-2

Thank you again for the Notice of Preparation and providing the opportunity for West Basin to contribute to the planning process. If you or your staff have any questions about West Basin's projects or facilities, please contact me at runc@westbasin.org or (310) 660-6219. 4-3

Sincerely,

Run Chen
Engineering Supervisor
West Basin Municipal Water District

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Inglewood Transit Connector [SCAG NO. IGR9664]

Dear Ms. Wilcox,

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the Inglewood Transit Connector ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines. 5-1

SCAG is also the designated Regional Transportation Planning Agency under state law, and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS) pursuant to Senate Bill (SB) 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.[1] SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Community Strategies (RTP/SCS) goals and align with RTP/SCS policies.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Inglewood Transit Connector in Los Angeles County. The proposed project includes an approximately 1.8-mile automated people mover system with 5 total stops connecting to the Metro Crenshaw Line at Market Street. 5-2

When available, please send environmental documentation to *SCAG's Los Angeles office in Los Angeles (900 Wilshire Boulevard, Ste. 1700, Los Angeles, California 90017) or by email to au@scag.ca.gov* providing, at a minimum, the full public comment period for review. 5-3

If you have any questions regarding the attached comments, please contact the Inter-Governmental Review (IGR) Program, attn.: Anita Au, Associate Regional Planner, at (213) 236-1874 or au@scag.ca.gov. Thank you.

Sincerely,

Ping Chang

Ping Chang
Acting Manager, Compliance and Performance Monitoring

[1] Lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS for the purpose of determining consistency for CEQA. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a determination of consistency with the 2016 RTP/SCS for CEQA.

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE INGLEWOOD TRANSIT CONNECTOR [SCAG NO. IGR9664]

CONSISTENCY WITH RTP/SCS

SCAG reviews environmental documents for regionally significant projects for their consistency with the adopted RTP/SCS. For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the RTP/SCS. 5-4

The Inglewood Transit Connector project (proposed project) is currently not listed in the Project List of the 2016 RTP/SCS which may prevent the project from accessing state or federal funding and receiving federal environmental approval. In order for a project to be included in the Project List of the RTP/SCS, it must prove that it is financially constrained. Please consult with the Los Angeles Metropolitan Transportation Authority (Metro) to request for SCAG to include the proposed project in the 2020 RTP/SCS Project List. SCAG will initiate the 2020 RTP/SCS Call for Projects beginning September 4, 2018 through November 1, 2018. We would advise the City to coordinate with Metro during this time if the City intends to include the project as part of the 2020 RTP/SCS Project List. 5-5

2016 RTP/SCS GOALS

The SCAG Regional Council adopted the 2016 RTP/SCS in April 2016. The 2016 RTP/SCS seeks to improve mobility, promote sustainability, facilitate economic development and preserve the quality of life for the residents in the region. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health (see http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx). The goals included in the 2016 RTP/SCS may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project within the context of regional goals and policies. Among the relevant goals of the 2016 RTP/SCS are the following:

SCAG 2016 RTP/SCS GOALS	
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*
RTP/SCS G3:	*Ensure travel safety and reliability for all people and goods in the region*
RTP/SCS G4:	*Preserve and ensure a sustainable regional transportation system*
RTP/SCS G5:	*Maximize the productivity of our transportation system*
RTP/SCS G6:	*Protect the environment and health for our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking)*
RTP/SCS G7:	*Actively encourage and create incentives for energy efficiency, where possible*
RTP/SCS G8:	*Encourage land use and growth patterns that facilitate transit and active transportation*
RTP/SCS G9:	*Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies**
	**SCAG does not yet have an agreed-upon security performance measure.*

5-6

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

SCAG 2016 RTP/SCS GOALS		
	Goal	Analysis
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
etc.		etc.

5-7

2016 RTP/SCS STRATEGIES

To achieve the goals of the 2016 RTP/SCS, a wide range of land use and transportation strategies are included in the 2016 RTP/SCS. Technical appendances of the 2016 RTP/SCS provide additional supporting information in detail. To view the 2016 RTP/SCS, please visit: http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx. The 2016 RTP/SCS builds upon the progress from the 2012 RTP/SCS and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that the SCAG region strives toward a more sustainable region, while the region meets and exceeds in meeting all of applicable statutory requirements pertinent to the 2016 RTP/SCS. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

5-8

DEMOGRAPHICS AND GROWTH FORECASTS

Local input plays an important role in developing a reasonable growth forecast for the 2016 RTP/SCS. SCAG used a bottom-up local review and input process and engaged local jurisdictions in establishing the base geographic and socioeconomic projections including population, household and employment. At the time of this letter, the most recently adopted SCAG jurisdictional-level growth forecasts that were developed in accordance with the bottom-up local review and input process consist of the 2020, 2035, and 2040 population, households and employment forecasts. To view them, please visit http://www.scag.ca.gov/Documents/2016GrowthForecastByJurisdiction.pdf. The growth forecasts for the region and applicable jurisdictions are below.

5-9

	Adopted SCAG Region Wide Forecasts			Adopted City of Inglewood Forecasts		
	Year 2020	Year 2035	Year 2040	Year 2020	Year 2035	Year 2040
Population	19,663,000	22,091,000	22,138,800	120,800	126,500	129,000
Households	6,458,000	7,325,000	7,412,300	40,400	42,400	43,300
Employment	8,414,000	9,441,000	9,871,500	34,800	36,400	37,400

MITIGATION MEASURES

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for the 2016 RTP/SCS for guidance, as appropriate. SCAG's Regional Council certified the Final PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on April 7, 2016 (please see:

5-10

http://scagrtpscs.net/Pages/FINAL2016PEIR.aspx). The Final PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories. 5-10

Subject: Inglewood Transit Connector EIR Notice of Preparation

Dear Ms Wilcox:

West Basin Municipal Water District (West Basin) appreciates the opportunity to respond to the City of Inglewood's Notice of Preparation and Notice of Public Scoping Meeting for an Environmental Impact Report for the Inglewood Transit Connector Project. 6-1

For your reference, a map of West Basin's facilities in City of Inglewood is enclosed. These facilities consist primarily of recycled water distribution pipelines in the public right-of-way. In most instances West Basin's pipelines are located at least 3.5' below grade. If the City's project necessitates pipeline relocation(s), please provide a utilities relocation request to West Basin. In order to allow adequate time to conduct a pipeline relocation project, please provide requests at least 6 months in advance.

Among West Basin's capital improvement projects that is of particular significance to the City's Project is the Kenneth Hahn Lateral. West Basin is investigating opportunities to provide recycled water from the existing 36-in pipeline at the intersection of the Prairie Avenue and E. Florence Avenue in the City of Inglewood, to the Kenneth Hahn State Park, the Baldwin Hills area generally, and into Culver City. This project was considered by West Basin in the 2009 Recycled Water Master Plan. This expansion of West Basin's recycled water system comprises approximately 22,000 LFT of 4-inch pipe; 11,000 LFT of 6-inch pipe; 20,000 LFT of 16-inch pipe; two booster pump stations; and a reservoir. A map of preliminary pipeline alignment options and potential sites for connections and pump stations is enclosed. The complete Kenneth Hahn Lateral Feasibility Study is available upon request at West Basin's administrative office in Carson, CA. 6-2

Thank you again for the Notice of Preparation and providing the opportunity for West Basin to contribute to the planning process. If you have any questions about West Basin's projects or facilities, please contact me at runc@westbasin.org or (310) 660-6219. 6-3

Notice of Preparation of a Draft Environmental Impact Report for the Proposed Inglewood Transit Connector Project

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. SCAQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Draft Environmental Impact Report (DEIR). Please send SCAQMD a copy of the DEIR upon its completion. Note that copies of the DEIR that are submitted to the State Clearinghouse are not forwarded to SCAQMD. Please forward a copy of the DEIR directly to SCAQMD at the address shown in the letterhead. **In addition, please send with the DEIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, SCAQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.** 7-1

Air Quality Analysis

The SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. The SCAQMD staff recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analyses. Copies of the Handbook are available from the SCAQMD's Subscription Services Department by calling (909) 396-3720. More recent guidance developed since this Handbook was published is also available on SCAQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). The SCAQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com. 7-2

On March 3, 2017, the SCAQMD's Governing Board adopted the 2016 Air Quality Management Plan (2016 AQMP), which was later approved by the California Air Resources Board on March 23, 2017. Built upon the progress in implementing the 2007 and 2012 AQMPs, the 2016 AQMP provides a regional

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

perspective on air quality and the challenges facing the South Coast Air Basin. The most significant air quality challenge in the Basin is to achieve an additional 45 percent reduction in nitrogen oxide (NOx) emissions in 2023 and an additional 55 percent NOx reduction beyond 2031 levels for ozone attainment. The 2016 AQMP is available on SCAQMD's website at: http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan.

SCAQMD staff recognizes that there are many factors Lead Agencies must consider when making local planning and land use decisions. To facilitate stronger collaboration between Lead Agencies and the SCAQMD to reduce community exposure to source-specific and cumulative air pollution impacts, the SCAQMD adopted the Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning in 2005. This Guidance Document provides suggested policies that local governments can use in their General Plans or through local planning to prevent or reduce potential air pollution impacts and protect public health. SCAQMD staff recommends that the Lead Agency review this Guidance Document as a tool when making local planning and land use decisions. This Guidance Document is available on SCAQMD's website at: http://www.aqmd.gov/docs/default-source/planning/air-quality-guidance/complete-guidance-document.pdf. Additional guidance on siting incompatible land uses (such as placing homes near freeways or other polluting sources) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. Guidance[2] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF. 7-2

The SCAQMD has also developed both regional and localized significance thresholds. SCAQMD staff requests that the Lead Agency compare the emission results to the recommended regional significance thresholds found here: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In addition to analyzing regional air quality impacts, SCAQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

When specific development is reasonably foreseeable as result of the goals, policies, and guidelines in the Proposed Project, the Lead Agency should identify any potential adverse air quality impacts and sources pf air pollution that could occur using its best efforts to find out and a good-faith effort at full disclosure in the DEIR. The degree of specificity will correspond to the degree of specificity involved in the underlying activity which is described in the DEIR (CEQA Guidelines Section 15146). When quantifying air quality emissions, emissions from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and

[2] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis. Furthermore, for phased projects where there will be an overlap between construction and operation, the air quality impacts from the overlap should be combined and compared to SCAQMD's regional air quality CEQA operational thresholds to determine significance. 7-2

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying possible mitigation measures for the Proposed Project, including:

- Chapter 11- Mitigating the Impact of a Project, of the SCAQMD *CEQA Air Quality Handbook*
- SCAQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities 7-3
- SCAG's MMRP for the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy available here: http://scagrtpscs.net/Documents/2016/pEIR/final/2016fPEIR_ExhibitB_MMRP.pdf
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the DEIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project. 7-4

Permits

In the event that the Proposed Project requires a permit from SCAQMD, SCAQMD should be identified as a responsible agency for the Proposed Project. For more information on permits, please visit SCAQMD webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to SCAQMD's Engineering and Permitting staff at (909) 396-3385. 7-5

SCAQMD rules and relevant air quality reports and data are available by calling the SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available via the SCAQMD's webpage (http://www.aqmd.gov). 7-6

The SCAQMD staff is available to work with the Lead Agency to ensure that project air quality and health risk impacts are accurately evaluated and mitigated where feasible. Please contact Robert Dalbeck, Assistant Air Quality Specialist, at rdalbeck@aqmd.gov, if you have any questions regarding these comments. 7-7

Sincerely,

Daniel Garcia

Dear Ms. Wilcox:

NOP Response for the Inglewood Transit Connector Project

The Sanitation Districts of Los Angeles County (Districts) received a Notice of Preparation of a Draft Environmental Impact Report (NOP) for the subject project on July 17, 2018. The proposed project is located within the jurisdictional boundaries of District No. 5. We offer the following comment: 8-1

- The proposed project may impact existing and/or proposed Districts' facilities (e.g. trunk sewers, recycled waterlines, etc.) over which it will be constructed. Districts' facilities are located directly under and/or cross directly beneath the proposed project alignment. The Districts cannot issue a detailed response to or permit construction of, the proposed project until project plans and specification that incorporate Districts' facilities are submitted for our review. To obtain copies of as-built drawings of the Districts' facilities within the project limits, please contact the Districts' Engineering Counter at engineeringcounter@lacsd.org or (562) 908-4288, extension 1205. When project plans that incorporate our facilities have been prepared, please submit copies of the same to the Engineering Counter for our review and comment. 8-2

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2717. 8-3

Very truly yours,

Adriana Raza

Mindy Wilcox, Planning Manager
City of Inglewood
Planning Division
One W. Manchester Boulevard
Inglewood, CA 90301

Dear Ms. Wilcox:

NOTICE OF PREPARATION FOR AN ENVIRONMENTAL IMPACT REPORT, "INGLEWOOD TRANSIT CONNECTOR," WOULD INCLUDE AN AUTOMATED PEOPLE MOVER SYSTEM TO TRANSPORT RIDERS TO AND FROM THE REGIONAL METRO RAIL SYSTEM TO DOWNTOWN INGLEWOOD, INGLEWOOD, FFER 201800080 9-1

The Notice of Preparation for an Environmental Impact Report has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department.

The following are their comments:

PLANNING DIVISION:

Under 2.14, Public Services, a.1. Fire Protection, sentence six is incorrect and misleading, therefore it should be deleted. 9-2

Sentence seven should be corrected to state that "An Assistant Fire Chief oversees the three Battalions that are within Division 6." 9-3

LAND DEVELOPMENT UNIT:

1. The proposed development may necessitate multiple ingress/egress access for the circulation of traffic and emergency response issues. 9-4

2. The development of this project must comply with all applicable code and ordinance requirements for construction, access, water mains, fire flows, and fire hydrants. 9-5

3. All proposals for traffic calming measures (speed humps/bumps/cushions, traffic circles, roundabouts, etc.) shall be submitted to the Fire Department for review prior to implementation. 9-6

4. Provide three sets of alternate route (detour) plans with a tentative schedule of planned closures prior to the beginning of construction. Complete architectural/ structural plans are not necessary. 9-7

5. Disruptions to water service shall be coordinated with the County of Los Angeles Fire Department and alternate water sources shall be provided for fire protection during such disruptions. 9-8

The County of Los Angeles Fire Department's Land Development Unit appreciates the opportunity to comment on this project. 9-9

For any questions regarding the report, please contact Inspector Joseph Youman at (323) 890-4125 or Joseph.Youman@fire.lacounty.gov.

FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:

The statutory responsibilities of the County of Los Angeles Fire Department's Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones or Fire Zone 4, archeological and cultural resources, and the County Oak Tree Ordinance. 9-10

The County of Los Angeles Fire Department's Forestry Division has no further comments regarding this project. 9-11

HEALTH HAZARDOUS MATERIALS DIVISION:

The Health Hazardous Materials Division of the Los Angeles County Fire Department has no comments or requirements for the project at this time. 9-12

If you have any additional questions, please contact this office at (323) 890-4330. 9-13

Very truly yours,

MICHAEL Y. TAKESHITA, ACTING CHIEF, FORESTRY DIVISION

Re: Inglewood Transit Connector Project - Comments on the July 2018 Initial Study and Notice of Preparation of an Environmental Impact Report

Dear Ms. Wilcox:

We represent the Inglewood Unified School District (the "School District"), and submit the following comments on its behalf in response to the City of Inglewood's (the "City") July 2018 Initial Study and Notice of Preparation of an Environmental Impact Report for the Inglewood Transit Connector Project (the "Project"), a 1.8 mile elevated automated people mover ("APM") system to transport riders to and from the regional Metro Rail system and five stations in Inglewood, including a planned station at the Madison Square Garden Forum (the "Forum"). We write to express serious concerns regarding the City's potential displacement of the William H. Kelso TK-6 Elementary School ("Kelso School") to build support facilities for the Project, and urge you to reconsider the potential location of those facilities at the school. We also urge you to reconsider the alignment of the Project directly adjacent to Kelso School.

10-1

10-2

10-3

Kelso School is an elementary school centrally located in Inglewood, across the street from the Forum. Originally built in 1925 with ten classrooms, a library, and a cafeteria, Kelso School has grown to 33 classrooms. Its campus serves a population of 523 students from kindergarten to sixth grade. There are no other elementary schools in the vicinity, and the School District considers Kelso School essential for the education of children in the Inglewood community. Kelso School was the first school in the School District to earn an Academic Performance Index score of greater than 800, and has received recognition as a California Distinguished School in 2006 and 2012. Educators from urban schools across the country have visited Kelso School and used the school as a model for best practices in urban education.

10-4

Impacts from the Placement of Project Support Facilities at Kelso School

The City is considering placing a maintenance and storage facility ("MSF") and/or an intermodal transportation facility ("ITF") across from the Forum at the location of Kelso School's campus. According to the Initial Study, MSF is a facility for the maintenance and storage of train cars and equipment. An MSF "consist[s] of a multi-level building on an approximately 4- to 6-acre site with sufficient space for maintenance facilities, administration facilities, an automatic car wash for exterior vehicle cleaning, equipment and materials storage area, shipping/receiving areas, and sufficient parking for staff." An ITF is a 3- to 5-acre site that will serve as a pick-up and drop-off area for passengers to transfer to the APM system from other modes of travel, and will include information kiosks, wayfinding, waiting areas, and other amenities. An MSF and an ITF may be co-located or individually located. In addition to the Kelso School campus, four other sites are proposed as potential locations for support facilities, and each of these four sites consist of commercial property or vacant lots -- far better options for the location of the Project's support facilities, than a thriving community elementary school. 10-5 10-6

The California Environmental Quality Act ("CEQA") requires the City to consider the impacts of the Project on public services, including schools. The critical question is whether the Project would "result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services." Cal. Code Reg tit. 14, Appendix G. Significant environmental impacts result where, as here, the project would require physical changes in the environment through construction of new school facilities. *Fullerton Joint Union High School Dist. v. State Bd. of Education*, 32 Cal. 3d 779, 794 (1982) (significant impact requiring further study where agency's action "will likely require the construction of a new high school . . . and may result in the abandonment of some facilities"), *abrogated on other grounds by Board of Supervisors v. Local Agency Formation Com.*, 32 Cal. 4th 903 (1992); *El Dorado Union High School Dist. v. City of Placerville*, 144 Cal. App. 3d 123, 131-32 (1983) (requiring EIR to address impact of a project on a school district where construction of the project may necessitate the construction of at least one new high school). 10-7

The Initial Study wrongly concludes, based on inadequate analysis, that the Project will have "no impact" on public schools in vicinity of the Project. It summarily states that the Project, which "will primarily serve to accommodate persons attending one-day events at adjacent sports and entertainment venues," "would not result in an increase in the number of residents; thus, there would be no increase in demand for school facilities" and "the construction or expansion of schools would not be required." In total, the section discussing impacts on public schools consists of four sentences. This scant analysis wholly ignores the potential displacement of Kelso School if the City proceeds with locating the support facilities at the campus. So long as the Kelso School campus remains a candidate for the location of these facilities, the Project poses a significant threat to the continued viability of the school. As such, the Initial Study's determination that "[n]o impacts would occur, and no further evaluation is 10-8

required" is incomplete, premature, and without foundation. Yet, the Notice of Preparation of the EIR relies on this flawed analysis to exclude as a topic to be evaluated in the EIR the Project's impacts on schools.

The impacts of the Project on the Kelso School must be fully evaluated in the EIR. The Initial Study itself acknowledges that "[s]ignificant impacts would occur if the Project were to necessitate the construction or expansion of schools in the proposed Project's area." The location of support facilities at Kelso School would necessitate construction of a new elementary school in the area. As the Initial Study makes clear, the Project's support facilities require 4 to 6 acres of space for an MSF and an additional 3 to 5 acres for an ITF. Such a use of the Kelso School campus would be utterly incompatible with the continued existence of Kelso School at its current location. In fact, at approximately 3.4 acres, the Kelso School campus is *undersized* for purposes of an MSF, and just barely sufficient for a smaller-sized ITF. If the City elects to proceed with building the support facilities at Kelso School, the taking would necessarily shut down the school at its current location and require construction of a new school for 523 displaced students. Additionally, if the shutdown occurs before a new school is constructed and incorporated, Kelso School's 523 students will need to be transported to other elementary schools within the School District, none of which are in the immediate vicinity, increasing traffic, requiring new bus schedules, and otherwise negatively impacting the environment. The temporary enrollment of 523 students at other elementary schools in the School District also will result in overcrowding at the other schools. Most importantly, the shutdown would disrupt the education of 523 young children, 88.9% of whom are socioeconomically disadvantaged. These are significant impacts that must be evaluated in the EIR. 10-8

Finally, the City must consider the intensive, lengthy, and expensive regulatory approval process for opening a new elementary school. The California Education Code governs the acquisition and selection of real property for a new school site. The process involves consulting with a complex web of California state regulators that govern school facilities. These agencies include the California Department of Education ("CDE"), the Department of State Architects ("DSA"), and the Department of Toxic Substance Control ("DTSC"). As part of the acquisition process, the School District may be required to prepare an EIR to evaluate environmental impacts associated with the school site. Cal. Educ. Code § 17213. 10-9

Impacts from the Construction and Operation of the Project Adjacent To Kelso School

Even if the City does not proceed with locating the support facilities at Kelso School, the EIR must thoroughly consider impacts of the construction and operation of the Project on the School. The Initial Study proposes that the Project will run directly adjacent to Kelso School, with a station at the Forum. This alignment is incompatible with the educational purpose of Kelso School. Indeed, the Initial Study expressly acknowledges the air quality, noise, vibration, and safety risks associated with the construction and operation of transit system near Kelso School. The EIR must fully evaluate whether, in light of these significant impacts, the City should proceed with the present alignment directly adjacent to Kelso School. 10-10

As the Initial Study acknowledges, the Project's "construction and operational activities would potentially generate pollutant emissions that could contribute to an existing or projected air quality violation." Moreover, "construction of the APM system and associated stations . . . would lead to emissions from construction equipment that could contribute to a violation of air quality standards." The risks arise as a result of "typical construction practices such as grading and excavation." Moreover, "[a] significant impact would occur if construction or operation of the proposed Project were to result in exposure of sensitive receptors to concentrations of air pollutants" above the California Ambient Air Quality Standards. The Initial Study acknowledges that Kelso School is a sensitive receptor. 10-10

Toxic emissions from the construction and operation of the Project directly adjacent to Kelso School could severely impact the health of its students, faculty, and staff. Airborne toxic emissions can cause or contribute to severe health problems, ranging from short-term effects such as coughing, dizziness, nausea, and headaches, to long-term effects, such as cancer, chronic asthma, and other respiratory illness. Children and pregnant staff are sensitive receptors because they are more sensitive to toxins than the general adult population, and have a higher risk of suffering these effects, including cancer. In preparing the EIR, the City must fully address the health risk of toxic air contaminants on the Kelso School community.

The Initial Study likewise acknowledges that noise and vibration impacts from the construction and operation of the Project are potentially significant. Construction of the Project "would require the use of heavy equipment for demolition and site clearing; grading, excavation, and foundation preparation; the installation of utilities; paving; and building." As the Initial Study recognizes, the "noise associated with the proposed Project's construction activities may have potential impacts" on Kelso School. Operation of the Project similarly "ha[s] the potential to increase noise levels" near the Project "due to noise emitted by the APM." Similarly, "ground-borne vibration and ground-borne noise could occur during construction" of the Project, "especially during paving, demolition, earth movement activities, pile driving, and other activities associated with the construction of an elevated APM line." 10-11

These noise and vibration impacts are incompatible with the education of children. Noise interference in the classroom can impair children's speech and listening comprehension, as well as their concentration, understanding of verbal information, reading comprehension, and learning. At levels greater than 35 A-weighted decibels, speech is less intelligible to children, and they have lower comprehension. The EIR must fully analyze the impacts of noise and vibration on the education of students at Kelso School.

* * *

The School District requests that the City reconsider the potential placement of support facilities at Kelso School, as well as the alignment of the Project directly adjacent to Kelso School. If the City intends to proceed with the placing the support facilities at the School, the City must include in the EIR a complete analysis of the Project's impact on Kelso School, including impacts from the displacement of its 523 students. The EIR must also include a 10-12

complete analysis of the air quality, noise, vibration, and safety impacts of aligning the Project directly adjacent to the School. 10-12

Sincerely,

Jennifer Recine /TLH

Scoping Meeting
Inglewood Transit Connector
July 26, 2018

Please use this form to provide written comments this evening on what you believe should be addressed in the Environmental Impact Report for the proposed Inglewood Transit Connector Project. You may submit your comments at this scoping meeting or to the City of Inglewood address listed below. Written comments on the Notice of Preparation (NOP) and Initial Study (IS) for the Environmental Impact Report will be accepted until **August 15, 2018, at 5:00 p.m.**

Comments:

PW-1-1 Thank you for this informative meeting. Having the experts per area was helpful. My comment pertains to the location of the APM facility & maintenance station as well as Intermodal location for buses, ubers, drop-offs, etc. It seems like the proposed Inglewood Basketball and Entertainment center would be the Ideal location... no interference with North end of market Street and metro traffic... open space and optimal access for drop offs, buses, etc. Perhaps it could be incorporated into the proposed center if the clippers come. If they don't that area would still be extremely useful in providing support for the required infrastructure of the APM

Comments:

PW-3

In regards to the APM storage Facility, I think it may be efficient to utilize a dedicated Section of Edward Vincent Jr. Park. Utilize some under ~~used~~ used space to build the facility. I think that serves a better purpose than displacing businesses and or residences. Vons is the one source of healthy and organic produce, removing it, will impact the comm. negatively.

Comments:

more alternatives should be considered to provide more economic development to all of Inglewood, including Market street as it is being revitalized. Traffic should be addressed NOW!! provide a street car throughout the City that would be utilized more often & easier & cost effective.

Comments: We don't need another metro train, people mover or any other type rail system. The streets of Inglewood is one big mess already. Florence has been reduced to 2 lanes. Century Blvd is a disaster. They keep tearing the St. up (over)

Comments:

PW-9

To place a station for the new Transit Connector at Market & Florence Would be a huge benefit for people to be able to connect to other locations near by. As well as our Shopping Centers Customers. Should be Free for Seniors & lower income passes It should also connect all the way to the 105 Fwy

Comments: I'd love to see the connection of the revitalization / construction connected to the city's schools. It's a perfect opportunity to create STEM focused curricalun programs, internships/externships/early career awarness for IUSD. lets create a world class school system rooted in growing STEM careers NOW It's too late once construction is Complete

CIUDAD DE INGLEWOOD
DEPARTAMENTO DE DESARROLLO ECONÓMICO Y COMUNITARIO
División de Planificación

10 de septiembre de 2020
AVISO DE PREPARACIÓN REVISADO Y ESTUDIO INICIAL REVISADO

NOMBRE DEL PROYECTO: Proyecto Conector de Tránsito de Inglewood

RECIRCULACIÓN: El Proyecto Conector de Tránsito de Inglewood (Proyecto propuesto) es una línea de transporte masivo de APM propuesta que conecta a la Ciudad de Inglewood con la región del sur de California. El Proyecto propuesto incluirá un carril guía de tránsito de 1.6 millas revisado, tres estaciones, trenes de APM, e instalaciones de apoyo que incluyen una instalación de almacenamiento de mantenimiento (MSF, por sus siglas en inglés) y dos subestaciones eléctricas de tracción (TPSS). La Ciudad de Inglewood (Ciudad o Inglewood) como la Agencia Líder preparó un Estudio Inicial (IS Original) que fue publicado en julio de 2018 (SCH 2018071034). El IS Original determinó que un Informe de Impacto Ambiental (EIR, por sus siglas en inglés) sería preparado de conformidad con CEQA para evaluar los impactos potencialmente significativos que pueden resultar del Proyecto propuesto. Un Aviso de Preparación (NOP Original) fue circulado y se recibieron comentarios del público y las agencias después de un periodo de comentarios de 30 días que finalizó el 15 de agosto de 2018.

Como resultado de los comentarios recibidos y perfeccionamientos y modificaciones al Proyecto propuesto identificado en el NOP Original y el IS Original, este NOP e IS Originales están siendo recirculados. Posteriormente a la circulación del IS Original, la Oficina de Planificación e Investigación del Estado de California (OPR, por sus siglas en inglés) actualizó y revisó los límites en el Apéndice G de las Directrices de CEQ Estatales. El IS Revisado se ha actualizado para abordar la lista de verificación del Apéndice G actualizado que está vigente desde el 28 de diciembre de 2018.

UBICACIÓN DEL PROYECTO REVISADO: El Proyecto propuesto incluye mejoras de tránsito que serían construidas en la Ciudad de Inglewood a lo largo de la misma ruta y alineación como puede verse en el NOP Original y el IS Original. La alineación APM propuesta ha sido modificada ligeramente de una alineación aproximada de 1.8 millas de largo con 5 estaciones para una alineación de aproximadamente 1.6 millas de largo con 3 estaciones. Las alineaciones APM revisadas siguen la misma ruta que la alineación original desde Market Street y Florence Avenue a Manchester Boulevard hasta Prairie Avenue que termina en la intersección de Prairie Avenue y Hardy Street.

FECHA LÍMITE PARA COMENTARIOS PÚBLICOS: 12 de octubre de 2020 antes del cierre de actividades Por medio de la presente se notifica que la Ciudad prepara un EIR para el Proyecto propuesto según lo revisado y descrito en el NOP Revisado y el IS Revisado. El EIR que será preparado por la Ciudad evaluará los posibles efectos ambientales significativos del Proyecto propuesto. La Ciudad está solicitando comentarios relacionados al Proyecto propuesto revisado.

Una copia del Estudio Inicial Revisado para el Proyecto propuesto está disponible para su revisión en el sitio web de la Ciudad de Inglewood en: www.cityofinglewood.org y en las ubicaciones enumeradas a continuación:

- Inglewood City Hall, Lobby Primer Piso, One W. Manchester Blvd., Inglewood, CA 90301

DESCRIPCIÓN DEL PROYECTO: La Ciudad propone construir un APM de 1.6 millas e infraestructura de apoyo que iría desde la intersección de Market Street y Florence Avenue adyacente a la Línea de Metro Crenshaw/LAX en el Centro de Inglewood, hacia el sur por Market Street, luego hacia el este sobre Manchester Boulevard, girando al sur en Prairie Avenue hasta su intersección con Hardy Street. El sistema APM brindaría servicio desde el Centro de Inglewood a el Forum, Distrito de Deportes y Entretenimiento de Los Ángeles (LASED, por sus siglas en inglés), y el Centro de Básquetbol y Entretenimiento de Inglewood (IBEC, por sus siglas en inglés) propuesto. El Proyecto propuesto sería ubicado mayormente dentro del derecho de paso público e incluiría infraestructura de apoyo y parcelas adyacentes.

Todos los comentarios serán considerados en la preparación del EIR. Los comentarios por escrito deben ser enviados por correo electrónico a https://www.cityofinglewood.org/1016/Environmental-Documents o enviarse a la siguiente dirección de correo en Ciudad de Inglewood, División de Planificación, One W. Manchester Boulevard 4° Piso, Inglewood, CA 90301 antes del 12 de octubre de 2020.

Tutor Perini
Over a century of excellence

INVITATION FOR BIDS

Tutor Perini Corp. (TPC) is seeking qualified bidders including, but not limited to, certified **SBEs & DVBEs,** for the following scope of work on IFB No. C1197 Airport Metro Connector Transit Station/ 96th Street Station

Drawings / Specifications / Insurance Requirements (Contractors Controlled Insurance Program) as well as Scope (Bid Package) are available upon request.

TPC is requesting bids for the following trades including but not limited to: Survey, Demolition, Reinforcing Steel, Concrete, Masonry, Structural Steel, Miscellaneous Metals, Ornamental Metals, Waterproofing & Damproofing, Insulation, Roofing, Exterior Metal Wall Panels, Fireproofing, Firestopping, Expansion Joints, Doors, Frames & Hardware, Glass & Glazing, Louvers & Vents, Metal Studs & Drywall, Tile & Stone, Acoustical Treatment, Resilient Flooring, Terrazzo, Painting & Coatings, Signage, Elevators & Escalators, Fire Suppression, Plumbing, Mechanical & HVAC, Clear & Grub, Earthwork, Piling & Caissons, Asphalt Paving, Pavement Markings, Concrete Flatwork, Hardscape, Landscaping & Irrigation, Utilities, Trackwork

REVISED NOTICE OF PREPARATION
AND REVISED INITIAL STUDY

PROJECT NAME: Inglewood Transit Connector Project

RECIRCULATION: The Inglewood Transit Connector Project (proposed Project) is a proposed APM mass-transit line connecting the City of Inglewood to the greater southern California region. The proposed Project will include a revised 1.6-mile transit guideway, three stations, APM trains, and support facilities including a maintenance storage facility (MSF) and two traction power substations (TPSSs). The City of Inglewood (City or Inglewood) as the Lead Agency prepared an Initial Study (Original IS) which was published in July 2018 (SCH 2018071034). The Original IS determined that an Environmental Impact Report (EIR) would be prepared in compliance with CEQA to assess for potentially significant impacts that may result from the proposed Project. A Notice of Preparation (Original NOP) was circulated, and comments were received from the public and agencies following a 30-day comment period that ended on August 15, 2018.

As a result of the comments received and refinements and modifications to the proposed Project identified in the Original NOP and Original IS, this Revised NOP and IS are being re-circulated. Subsequent to the circulation of the Original IS, the State of California Office of Planning and Research (OPR) updated and revised the thresholds contained in the State CEQ Guidelines Appendix G. The Revised IS has been updated to address the updated Appendix G checklist that became effective on December 28, 2018.

REVISED PROJECT LOCATION: The proposed Project includes transit improvements that would be constructed in the City of Inglewood along the same route and alignment as noted in the Original NOP and Original IS. The proposed APM alignment has been modified slightly from an approximately 1.8-mile long alignment with 5 stations to an approximately 1.6-mile long alignment with 3 stations. The revised APM alignment follows the same route as the original alignment from Market Street and Florence Avenue to Manchester Boulevard to Prairie Avenue terminating at the intersection of Prairie Avenue and Hardy Street.

DUE DATE FOR PUBLIC COMMENTS: October 12, 2020 by close of business
Notice is hereby given that the City will prepare an EIR for the proposed Project as revised and described in this Revised NOP and the Revised IS. The EIR to be prepared by the City will evaluate the potential significant environmental effects of the proposed Project. The City is requesting comments related to the proposed Project as revised.

A copy of the Revised Initial Study prepared for the proposed Project is available for review at the City of Inglewood website at: www.cityofinglewood.org and at the locations listed below:

- Inglewood City Hall, First Floor Lobby, One W. Manchester Blvd., Inglewood, CA 90301

PROJECT DESCRIPTION: The City proposes to construct a 1.6-mile APM and supporting infrastructure that would run from the Market Street and Florence Avenue intersection adjacent to the Metro Crenshaw/LAX Line in Downtown Inglewood, south through Market Street, then east on Manchester Boulevard, turning south on Prairie Avenue until its intersection with Hardy Street. The APM system would provide service from Downtown Inglewood to the Forum, the Los Angeles Sports and Entertainment District (LASED), and the proposed Inglewood Basketball and Entertainment Center (IBEC). The proposed Project would be located mostly within the public right-of-way and would include supporting infrastructure on adjacent parcels.

All comments will be considered in the preparation of the EIR. Written comments must be submitted through email at https://www.cityof-inglewood.org/1016/Environmental-Documents or sent to the following address through mail at City of Inglewood, Planning Division, One W. Manchester Boulevard 4th Floor, Inglewood, CA 90301 by October 12, 2020.

Inglewood Today & The Serving Spoon Teams-up

It News Wire

Inglewood Today and The Serving Spoon, the iconic Urban Eatery that has served Presidents Barack Obama and Bill Clinton in addition to a legion of other celebrities and community patrons, are teaming up to sponsor breakfast or lunch for a family of four each month.

The program, sponsored by The Serving Spoon in conjunction with Inglewood Today, will begin with the family in October and continue each month.

Interested families are required to send a 300 word essay to kmiller@inglewoodtoday explaining how they have been impacted by COVID-19 and or racism. The chose family will be contacted and presented with a gift for the family of four to eat at The Serving Spoon.

"This is just another measure of the philanthropy of JC Johnson and his lovely wife Angela demonstrating how much they care for others. I am elated that our readers can share their story with us and then enjoy a wholesome family meal," said Inglewood Today Publisher Kenneth Miller.

SoFi Stadium to Host Vote Center

Center to open Friday, Oct. 30 – Tuesday, Nov. 3

For More Information or to Register to Vote, Visit lavote.net

Inglewood Today News

To commemorate National Voter Registration Day, SoFi Stadium and Hollywood Park, Los Angeles Chargers and Los Angeles Rams today announced that a Vote Center location will be established on the grounds of SoFi Stadium in Inglewood, CA. The announcement was made jointly with the Los Angeles County Registrar-Recorder/County Clerk and the California Secretary of State'

SoFi Stadium and Hollywood Park's Vote Center will be located adjacent to the stadium and open for a day period from Friday, October 30 – Monday, November 2 from 10 a.m. to 7 p.m. and on Tuesday, November 3 from 7 a.m. to 8 p.m. All LA County registered voters are eligible to vote at SoFi Stadium and Hollywood Park's Vote Center.

"This is a touchdown for democracy! Partnering with SoFi Stadium and Hollywood Park, the Los Angeles Chargers, and the Los Angeles Rams to host a vote center in such a large, visible location demonstrates the spirit of community and a shared commitment to make sure all voters have access to cast a ballot in 2020," said Dean C. Logan, Registrar-Recorder/County Clerk Los Angeles County.

The deadline to register to vote is Monday, October 19. For more information or to register, visit www.lavote.net.

"We are proud to work with the Los Angeles Chargers, Los Angeles Rams and the Los Angeles County Registrar-Recorder/County Clerk to turn SoFi Stadium and Hollywood Park into a Vote Center," said Jason Gannon, managing director, SoFi Stadium and Hollywood Park. "Our goal is to help expand polling access for our local

COMMENTARY: Justice Ginsburg's Death Could Prove Fatal to American Democracy

By Stacy M. Brown, NNPA Newswire Senior National Correspondent

Ruth Bader Ginsburg –
known as The Notorious R.B.G. (after the famous moniker of the late hip-hop star, The Notorious B.I.G.) – held on as long as she could while battling metastatic pancreatic cancer.

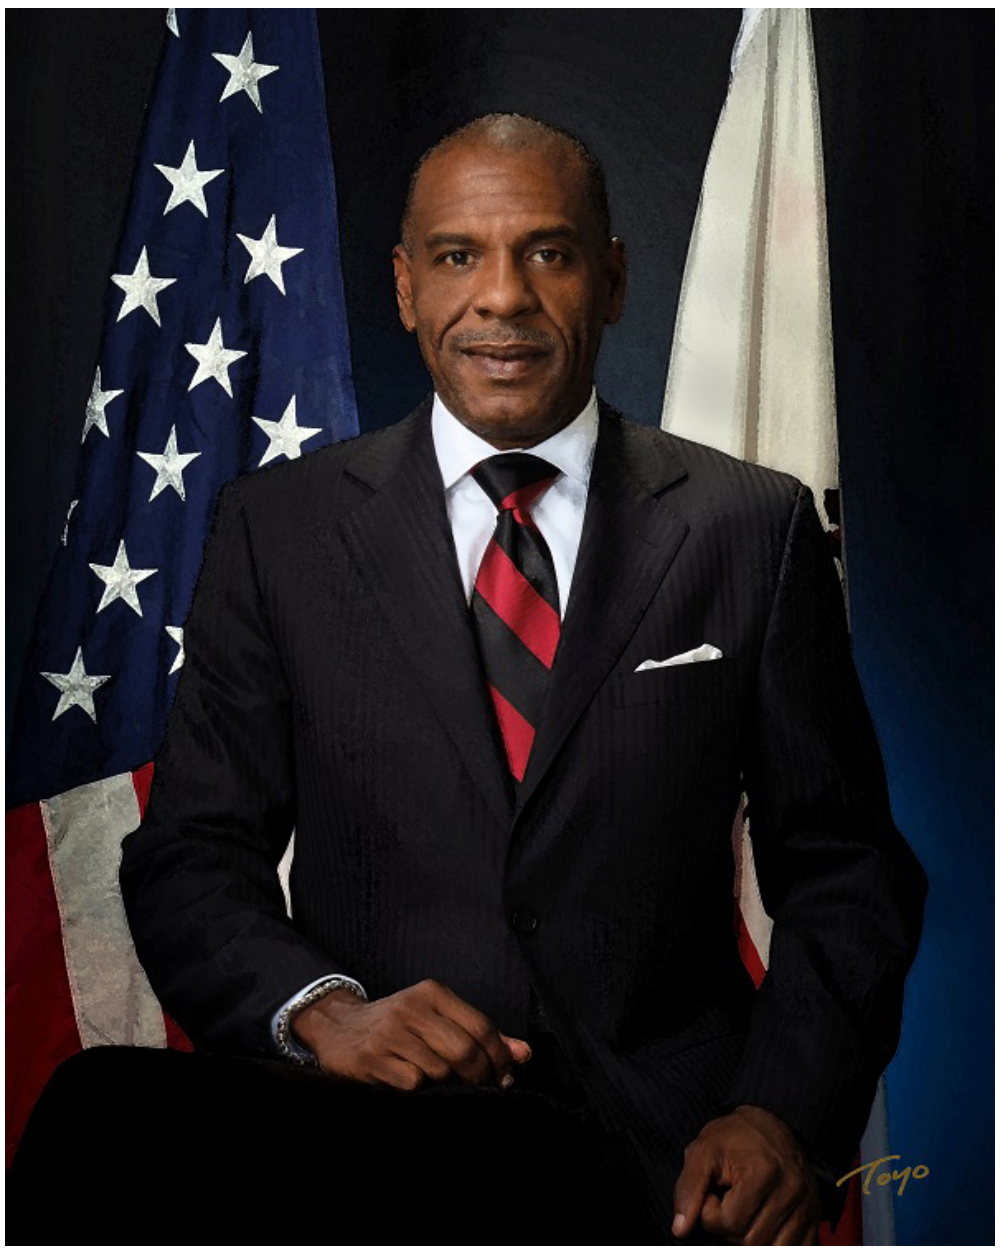
At 87, the popular Supreme Court Justice had battled cancer and several other maladies, for some time. Just days before her death, as her strength waned, Ginsburg dictated this statement to her granddaughter Clara Spera: "My most fervent wish is that I will not be replaced until a new president is installed."

Echoing the sentiments of many, both inside and outside of the political spectrum acclaimed novelist Terry McMillan stated, "I was praying she could hold on."

The author and many others realized that, in sphere of today's of American politics, where one of the two dominant parties is essentially wholly controlled by President Donald Trump and the hard-hearted Sen. Majority Leader Mitch McConnell, if they choose to ignore the Justice's dying wishes, the Republicans, who control the Senate, have the votes to quickly Ginsburg's replacement.

This is the case even as the president – and possibly McConnell – head toward lame-duck status.

In spite of the an result from the impending process and it's connectivity to an election that will occur in less than 45 days, the life and achievements of Ruth Bader Ginsburg are to be celebrated. America's loss of one of its notable and most courageous jurists is palpable.



"We have lost a champion of justice,

Bradford Act Delivers Nearly $1 million to Nonprofits

IT News Wire

SACRAMENTO – California Department of Business Oversight (DBO) announced the inaugural award of nearly $1 million in CalMoneySmart grants to 12 organizations throughout California. The $4 million CalMoneySmart grant program was created by SB 455 (Chapter 478, Statutes of 2019), authored by Senator Steven Bradford (D-Gardena). This bill established the California Financial Empowerment Fund (FEF) to provide low- and moderate-income Californians with greater access to tools and education they can use to improve

The $4 million CalMoneySmart grant program was created by SB 455 (Chapter 478, Statutes of 2019), authored by Senator Steven Bradford (D-Gardena).

"COVID-19 has made it even more important that we be creative in delivering services to those lacking access to them," said Senator Bradford. "I authored SB 455 last year to help provide people with access to the types of resources they need to protect themselves. I am thrilled to see those dollars going to organizations that will carry on that mission and look forward to seeing the next round of funding awarded next year."

According to the most recent Federal Deposit Insurance Corporation (FDIC) Survey of Unbanked and Underbanked Households, approximately 7% of California households are unbanked, and another 18% are underbanked. The FDIC "unbanked" individuals as someone without a checking or savings account, and "underbanked" individuals as those with checking or savings accounts but who also use nonbank services. Although two-thirds of California's households are fully banked, only half of households save for unexpected expenses or emergencies, and many of those who save still lack the money necessary to cover a $400 emergency expense.

The funds directed toward organizations are awarded by DBO through a competitive application process that drew 95 applicants in the program's year. Grants are awarded in amounts of up to $100,000 to organizations that education, coaching, products, and/or services to unbanked and underbanked individuals free of charge. The 12 grantees for 2020 serve communities across 17 counties and include, Juma Ventures, JVS SoCal, Mission Asset Fund, Dreams for Change, the Coalition for Humane Immigrant Rights, Peninsula Family Services, Folsom Cordove Community Parnetship, the Delhi Center, Housing and Economic Rights Advocates, Children's Network of Solano County, and El Sol of San Bernadino.

The next CalMoneySmart application period, for year 2021-22, will be open in January.

Continued from page 1: COMMENTARY...

an icon and patriot, a woman who lived the concept of building a more perfect union," D.C. Mayor Muriel Bowser

"Justice Ruth Bader Ginsburg fought for us until the very end, and it is that spirit – that we were fortunate as a nation to from time and time again – that made us love, respect, and admire her. We are heartbroken."

Hillary Shelton, the Chief Lobbyist of the NAACP, called Ginsburg's death a sad day for America. "We are losing a real champion for Civil Rights, Voting Rights, Women's Rights and Human Rights on our Supreme Court," Shelton posited.

Shelton honored Ginsburg for breaking through many barriers to the full participation of all Americans and demanded that Republicans wait until after the election to a successor.

"It is our hope that whoever her position would have her same values. We also urge that the president withhold the nomination to that position until after the election," Shelton exclaimed.

"It was Mitch McConnel who insisted not to allow President Obama to a position in his last year in We urge that there not be a nomination or consideration by the U.S. Senate until after the November election."

Through her cancer, Ruth Bader Ginsburg fought to the end with unwavering faith in our democracy and its ideals, and that's how she'll be remembered, Obama expressed in a written statement. "But she also left instructions for how she wanted her legacy to be honored," the popular former president observed.

Obama recalled when Republicans refused to hold a hearing or an up-or-down vote on his Supreme Court nominee, Merrick Garland, and they invented the principle that the Senate shouldn't an open seat on the Supreme Court before a new president was sworn in.

"A basic principle of the law – and of everyday fairness – is that we apply rules with consistency, and not based on what's convenient or advantageous in the moment," Obama demanded.

"The rule of law, the legitimacy of our courts, the fundamental workings of our democracy all depend on that basic principle. As votes are already being cast in this election, Republican Senators are now called to apply that standard.

"The questions before the Court now and in the coming years – with decisions that will determine whether or not our economy is fair, our society is just, women are treated equally, our planet survives, and our democracy endures – are too consequential to future generations for courts to be through anything less than an unimpeachable process."

Sixty years ago, the Brooklyn born Ginsburg applied to be a Supreme Court clerk. She'd studied at two of the country's law schools and had ringing recommendations. But because she was a woman, she was rejected, Obama recalled.

Ten years later, she sent her brief to the Supreme Court – which led it to strike down a state law based on gender discrimination for the time. And then, for nearly three decades, as the second woman ever to sit on the highest court in the land, she proved a warrior for gender equality – someone who believed that equal justice under the law only had meaning if it applied to every single American.

"Over a long career on both sides of the bench – as a relentless litigator and an incisive jurist – Justice Ginsburg helped us see that discrimination on the basis of sex isn't about an abstract ideal of equality; that it doesn't only harm women; that it has real consequences for all of us. It's about who we are – and who we can be," Obama remarked, noting that Ginsburg inspired the generations who followed her.

Justice Ginsberg always voiced strong and principled demands for justice and equality for all, and she was a lifelong champion of women's and civil rights, declared Marcela Howell, the founder, and president of "In Our Own Voice: National Black Women's Reproductive Justice Agenda."

"We are putting the U.S. Senate on notice; we demand that no nominee be voted on until a new president is elected. We will take to the streets in protest if McConnell and his cohorts do not abide by their own precedent," Howell avowed.

"We promise to continue Ruth Bader Ginsburg's for freedom. As we mourn, we will honor her life and legacy by hard to demand a worthy successor. And we will even harder to ensure that all votes are counted on Election Day."

Voter Registration Critical for Communities of Color

IT News Wire

2020 Voter Registration coverage must include the voices and perspectives of communities of color, informed by data and practical GOTV information, the following are resources and story threads to be used to increase awareness of Voter Registration in LA County.

Communities of color comprise over 60% of Los Angeles County's 10 million residents, and Latinos are the fastest-growing group in the County and the state. With over 15 million Latino residents in California and nearly 5 million in Los Angeles County alone, Latinos are projected to have a tremendous impact on the November 3rd election. However, nearly 58% of unregistered eligible voters in California are Latino, compared to 22% being white, 15% Asian Americans, and 3% African Americans. Across the country, voter suppression tactics and intentional barriers have been increasingly threatening to communities of color, in Los Angeles the registrar and community based organizations have been working to combat misinformation and increase voter turnout.

According to the July 3rd report from the of the Secretary of State, Alex Padilla, over a half million eligible voters in LA County have not yet registered to vote. The November 3, 2020 election is not only a crucial presidential election with the potential to reshape the U.S. Supreme Court and other federal courts, but includes all local candidates and dozens of critical ballot measures that will impact our communities. With so much at stake, it is urgent that all eligible voters register and cast their ballot in this important election.

Given the importance of this election, and the largely negative role many social media platforms played in the 2016 election, some social media platforms have stepped up their civic engagement The popular social media platforms Instagram, Facebook, and Snapchat have made it easy to register to vote online. Snapchat is popular with people under the age of 30 which could mean that primarily young people are likely to register to vote in the coming weeks. Facebook began pinning voter information at the top of users' news feeds in July to register 4 million eligible voters this year between Facebook, Instagram, and Messenger.

Naomi Gleit, VP Product and Social Impact at Facebook wrote about their Voting Information Center which launched in August:

"People can access the Voting Information Center directly from the menu on Facebook and Instagram. They can use it to check if they're registered to vote – and if they're not, easily register through a link that takes them directly to their state website or our nonpartisan partner. They can see if their state has expanded vote-by-mail options and request absentee or mail-in ballots from their state if it's available. And we'll help people know if a deadline is approaching so they don't miss it."

The Voting Information Resource boasts an array of resources, such as registering online to vote, accessing the information on voting by mail, checking registration status, and applying to serve as a poll worker. They also easily link to the Secretary of State's and the myriad of resources in languages, including Spanish, Chinese, Korean, and Japanese.

community and the greater Los Angeles region, providing Angelenos with more locations and greater ease of access to exercise their right to vote."

SoFi Stadium and Hollywood Park released the following guidelines for anyone wishing to vote at this Vote Center.

To access the Vote Center:

·The address is 1000 S. Prairie Avenue, Inglewood, CA 90301

·Voters will enter Prairie and Arbor Vitae and make a right onto District Drive

·Parking is available in Lot N, with ADA parking in Lot adjacent to construction trailers

·The Vote Center will be in the NFL Trailer

SoFi Stadium's Vote Center will follow State and County public health and safety guidelines:

·All election workers at the Vote Center will wear facial coverings, gloves, and wipe down surfaces and devices on a regular basis

· Voting stations will be wiped down after each voter

·Voters who vote in-person will be required to wear a facial covering, and if needed, facial coverings and gloves will be provided

·Vote Center will practice social distancing

· Vote Center will be cleaned and sanitized nightly

·LA County residents who are not registered to vote, can go to the Vote Center to register to vote and cast a ballot via a conditional voter registration .

September 10, 2020
REVISED NOTICE OF PREPARATION
AND REVISED INITIAL STUDY

PROJECT NAME: Inglewood Transit Connector Project

RECIRCULATION: The Inglewood Transit Connector Project (proposed Project) is a proposed APM mass-transit line connecting the City of Inglewood to the greater southern California region. The proposed Project will include a revised 1.6-mile transit guideway, three stations, APM trains, and support facilities including a maintenance storage facility (MSF) and two traction power substations (TPSSs). The City of Inglewood (City or Inglewood) as the Lead Agency prepared an Initial Study (Original IS) which was published in July 2018 (SCH 2018071034). The Original IS determined that an Environmental Impact Report (EIR) would be prepared in compliance with CEQA to assess for potentially significant impacts that may result from the proposed Project. A Notice of Preparation (Original NOP) was circulated, and comments were received from the public and agencies following a 30-day comment period that ended on August 15, 2018.

As a result of the comments received and refinements and modifications to the proposed Project identified in the Original NOP and Original IS, this Revised NOP and IS are being re-circulated. Subsequent to the circulation of the Original IS, the State of California Office of Planning and Research (OPR) updated and revised the thresholds contained in the State CEQ Guidelines Appendix G. The Revised IS has been updated to address the updated Appendix G checklist that became effective on December 28, 2018.

REVISED PROJECT LOCATION: The proposed Project includes transit improvements that would be constructed in the City of Inglewood along the same route and alignment as noted in the Original NOP and Original IS. The proposed APM alignment has been modified slightly from an approximately 1.8-mile long alignment with 5 stations to an approximately 1.6-mile long alignment with 3 stations. The revised APM alignment follows the same route as the original alignment from Market Street and Florence Avenue to Manchester Boulevard to Prairie Avenue terminating at the intersection of Prairie Avenue and Hardy Street.

DUE DATE FOR PUBLIC COMMENTS: October 12, 2020 by close of business
Notice is hereby given that the City will prepare an EIR for the proposed Project as revised and described in this Revised NOP and the Revised IS. The EIR to be prepared by the City will evaluate the potential significant environmental effects of the proposed Project. The City is requesting comments related to the proposed Project as revised.

A copy of the Revised Initial Study prepared for the proposed Project is available for review at the City of Inglewood website at: www.cityofinglewood.org and at the locations listed below:

- Inglewood City Hall, First Floor Lobby, One W. Manchester Blvd., Inglewood, CA 90301

PROJECT DESCRIPTION: The City proposes to construct a 1.6-mile APM and supporting infrastructure that would run from the Market Street and Florence Avenue intersection adjacent to the Metro Crenshaw/LAX Line in Downtown Inglewood, south through Market Street, then east on Manchester Boulevard, turning south on Prairie Avenue until its intersection with Hardy Street. The APM system would provide service from Downtown Inglewood to the Forum, the Los Angeles Sports and Entertainment District (LASED), and the proposed Inglewood Basketball and Entertainment Center (IBEC). The proposed Project would be located mostly within the public right-of-way and would include supporting infrastructure on adjacent parcels.

All comments will be considered in the preparation of the EIR. Written comments must be submitted through email at https://www.cityofinglewood.org/1016/Environmental-Documents or sent to the following address through mail at City of Inglewood, Planning Division, One W. Manchester Boulevard 4th Floor, Inglewood, CA 90301 by October 12, 2020.

Local Army Veteran Demetrius Mallory Succumbs

Demetrius (Meechie) S. Mallory

Inglewood Today News

Army veteran, longtime trucker and adoring community member Demetrius (Meechie) S. Mallory has died of cancer. He was 61.

Mallory was born on January 19, 1959 in Oklahoma City, Oklahoma, but was raised in Los Angeles after his family moved in 1960. He attended Washington High School.

In addition to his duty in the United States Reserved Armed Forces, Mallory held the position of Loss and Prevention at May Company, Truck Driver, served as a Real-Estate Broker and was also a small business owner.

Mallory was fourth oldest of 14 children born to Joyce and Herbert Mallory who along with a sister Sheiva L. Mallory preceded him in death.

An avid story teller and generous man, he was respected in the community as a caring man and committed family member.

"WORDS CAN'T EXPRESS MY ENDURING LOVE FOR YOU. MR BROTHER LOST HIS BITTER BATTLE WITH CANCER AND IM MESSED UP. MY LIFE WILL NEVER BE THE SAME FROM TALKING AND JOKING EVERYDAY OR READING A POST OF YOU NOT BEING HERE. YOUR BAGS WAS PACKED AND I ASKED, "WHERE YOU GOING BRO?" AND YOU ANSWERED, "IM TAKING A TRIP". I ASKED WHERE AND YOU SAID HOME. I THOUGHT IT WAS JUST UP THE STREET BUT WHEN I HEARD

Weeks Before Early Voting in California

Young Activists Target Black and Brown Millennials, Generation Z-ers

Quinci LeGardye | California Black Media

Early voting in California will begin Monday, October 5. Registered voters will be able to either mail in or drop their ballots from that day until the day before Election Day, Monday, Nov. 2.

In a deeply divided American electorate, both Democrats and Republicans have been pushing to motivate their respective party bases to get out and vote. And in an election year when a few votes in a handful of swing states will likely determine who will win the U.S. presidency, poll watchers are predicting that young people could be the deciding vote in several places.

"Don't let anyone keep you from exercising your sacred vote. Make your plan to vote. Grab your vote and head to the polls the day they are open," said California Attorney General Xavier Becerra, calling out young people in his speech at the Democratic National Convention in August.

Across California, young voters are speaking out about the issues that concern them this election, and decisions that will their future. On Sept. 11, Power California, a civic engagement organization that encourages young people of color to participate in government, hosted their "Fight For Our Future Campaign Kick-

Young activists from all corners of California spoke about issues coming up in the November election to launch he campaign, which aims to reach more than 150,000 California voters between the ages of 18 and 35 through virtual phone banking and texting.

Annie Gonzalez, the actress known for her role as Lidia Solis on s comedy-drama series hosted the virtual event. She addressed the struggles that young people of color are facing in the lead up to the election.

According to Power California's 2020 Youth Poll, 46 % of young people surveyed had buying food, household supplies or medicine during the COVID-19 pandemic, and 67 % said their state government is not doing enough to address the impact of COVID-19.

"Young people of color have been hit hard by these crises, and their needs and futures must be centered in this election, and always during the recovery, from young essential workers risking everything to take care of us to college students unsure about their future to everyday young people struggling to

Kendrick Sampson, activist and actor known for his role as Nathan Campbell on HBO's popular comedy-drama series "Insecure," addressed the young people watching the event as well. He stressed the importance of activism and participation.

"I'm inspired by all the young people. It's what keeps me going and motivated, because y'all are leading the movement across the country. Young people like yourselves are rising up and fueling movements for justice, from Black Lives Matter and calls to defund the police to climate change and immigrant rights. You are the leaders and the moral compass of our nation in every major movement for justice that has been true in our past, and it is still true today."

Tyler Okeke, a 19-year-old organizer with Power California, asked young people to sign a letter asking Gov. Newsom to endorse Proposition 15. The ballot measure would require commercial and industrial properties to be taxed at their market value. According to Ballotpedia, 40 % of the revenue generated will fund school districts and community colleges.

"It will require decisive action from our elected leaders, especially leaders like Governor Newsom," he said. "We need leaders who will put people over corporations and take steps to meet California's most essential human needs while recognizing that young people are the central force of this future that we want for this state."

Ixchel Arista, a 15-year-old youth organizer with Oakland Kids First, advocated for Measure QQ, a ballot initiative in Oakland which will allow 16 and 17-year-olds to vote in school board elections.

"Students feel the most impact as we spend most of our lives at school, yet have no say in decisions being made for our education. We need to be able to decide who is making these impactful decisions," said Arista.

Te'Ausha Garcia, a civic engagement organizer with Californians for Justice in Fresno, said, "It's important that we for the solutions that we need, because who else will for us? We have to be willing to stand up and for what we want. Otherwise the change we desperately need will not be showcased. We must stand up for our rights and really name what it is that we need."

"We must continue to for our right to the future that we deserve. The right to have our most basic human needs met: Clean and fresh air and water, housing, healthcare and education. The right to be free and to live with dignity and without discrimination, the right to determine the future of our democracy and our economy, and we will not stop until we secure these rights. We will not stop until we secure these rights," said Eugene Vang, a 19-year-old activist from Merced, who organizes with 99 Routes and Power California.

Groups for and Against Prop 22 Take Aim Point Messages to Black Voters as Election Day Nears

Quinci LeGardye | California Black Media

With less than two months left before Election Day, campaigns both defending and opposing Proposition 22 — the ballot initiative that aims to keep gig company drivers cla as independent contractors — are revving up their to reach out to Black voters.

Earlier this month, Uber, Lyft, DoorDash and Instacart pumped another $70 million into their campaign to pass Prop 22. The total funds those app-based companies and others have spent on the Yes on Prop 22 public information is now $181 million, making it one of the most expensive California initiative information campaigns ever.

The opposition, made up of mostly labor organizing groups, has raised about $4.8 million so far, with funding coming mostly from labor organizing groups.

On Sept 3, the Yes on 22 campaign hosted a press conference for ethnic communities in the state. At the event, community leaders spoke up about why they support the ballot initiative. They emphasized that gig companies provide an easy stream of income for their drivers, and that Prop 22 would keep those jobs in California — and in Black and Brown communities in particular.

"Driving has been a source of relief for these people. It's easy to sign up, start driving and earning right away, without a lot of the normal barriers that block Black and Latino Americans from working," said Dr. Tecoy Porter Sr., President of the National Action Network Sacramento Chapter.

Jay King, President and CEO of California Black Chamber of Commerce, said the Black community can not massive job losses in the wake of the pandemic.

Sports & Entertainment

The time is right to go forward with Justin Herbert

JUSTIN HERBERT (Photo/Ty Nowell/Los Angeles Chargers)

By Kenneth Miller, Publisher

Mere moments before the Chargers made their SoFi Stadium debut against the Super Bowl champion Kansas City Chiefs, the team plugged in No. 6 draft pick and rookie quarterback Justin Herbert as the starter over incumbent Tyrod Taylor.

Rumors swirled rampant as the gunslinger from Oregon led the Bolts to two touchdown drives and fueled a 14-6 Chargers lead into the third quarter, but they eventually lost 23-20 in overtime.

Taylor reportedly a chest injury during warm-ups. Sure and the UFOs was responsible for the bullet that killed John F. Kennedy.

"I found out right after the coin toss to be honest with you and so [QB Justin Herbert], he had to go in and play and it might have been good that he had to go in and play, I had been thinking about it all night. [Tyrod's injury] was something that developed late and kind of caught us all but it is what is," said head coach Anthony Lynn. "I don't know right now, as soon as I leave here - he was at the hospital, I don't know if he is still at the hospital or not,

I don't [have an idea on what caused the injury]. I am telling you I didn't out anything until right after the coin toss. "

I do not doubt that all of that is true, but it turns out to be a blessing in disguise.

Laughably Lynn referred to Herbert as his back after a brilliant performance against the world champs.

"He is our backup quarterback so whatever we put in for Tyrod, we felt he could do the same thing. He understood, but he didn't get the same reps that Tyrod got, especially down in the red zone. So, some of those play calls got a little bit tricky down there with him, but it's all part of the experience there for him. I thought he handled it well, to be honest with you. A couple of throws I know he would like to have back but that's just the way it was. I thought he handled the situation well, but we lost the game last time I checked, so those grades are not too high right now."

Regardless of whether Taylor an injury during warm-up or perhaps in practice, his lackluster performance during week one in Cincinnati did not boost any in his ability to win games with this team.

He has never possessed the tools that would make him a game changer, instead more of player that will not lose a game for you, but probably can't win one for you either.

The dilemma that coach Lynn had was to sit Herbert for the season and allow for his NFL adjustment or to simply play him and be willing to live with the growing pains.

With a team moving into a new stadium during COVID-19 pandemic, Taylor's nod relieved any pressure on Herbert to replace the legendary Philip Rivers although retrospectively that is precisely why he was drafted.

Herbert replaced Taylor instead, a name that few barely knew and most care to forget.

No one remembers Taylor in Cleveland, except that he played too many games in front of Baker

It was an injury that led to the transition in Clevelandand it will be just a matter of time before Herbert takes over the helm. His debut at home in an empty stadium against the best team in the league served ample notice that he can handle it.

Taylor's one-year salary is $5 million, while Herbert is fully guaranteed $26 million over four seasons.

Which car do you drive the used Dodge Datsun or the fresh Mercedes Benz?

One could have only hoped better for Taylor and perhaps he does start another game this season for the Chargers.

"If Tyrod is 100 percent, he's our quarterback," Lynn said.

The reality is he's good guy to have in your locker room. He is real high character man that you can always rely on.

And you can also bet on him getting hurt, whether he right now or not, he is more likely to get injured than he is to help advance your team to any meaningful victories throughout the season.

As for next week when the Chargers host the Carolina Panthers?

"I am going to wait and check on my starting Quarterback right now and see how he is doing."

AL righty coach!

The Rams are rolling can they keep it up?

11-5 week two in Pigskins Pickem

By Kenneth Miller, Publisher

The Rams are absolutely killing it, after a 37-19 shellacking of the

Eagles in week 2, Jared has appeared to regain his golden touch and the high octane of the Super Bowl run is back.

Former Serra High star Robert Woods just received a nice extension deservedly so and he has proven to be the key to the Rams as

It's not just his ability to catch and run after the catch, but he is arguably the best blocking receiver in football.

Last week I went an impressive 11-5, so lets cash in again in week 3.

EQUAL HOUSING OPPORTUNITY

THE 9th SCOTUS

By Michelle Lyons, Columnist

On Saturday, September 26th, 2020 our lives may change forever. Literally, moments after Ruth Bader Ginsberg, the 9th SCOTUS and deciding vote, died, President Trump announced he would replace her with a conservative woman. The front-runners are Amy Coney Barrett and Barbara Lagoa, who are both against abortion and have other conservative ideologies.

The black community is more conservative than liberal so we are more focused on Black Lives Matter than this issue at the present, but this issue is Life Changing. If you are a black conservative know that making abortions illegal without a plan for education and responsibility will create an even higher poverty rate in the black community, especially in this WAP era.

Secondly, Trump has stated that he is against gay marriage being a federal law. He believes the issue should be up to The State. Which does not sound like a bad idea for a conservative or a liberal person, but the next three things are frightening. The Republicans have not renewed The Voting Rights Act of 1965. What happens if these women do not believe black people should have the right to vote? Trump recently gave a speech on Eugenics in Minnesota, what if the SCOTUS does not believe in interracial dating? And lastly, Trump has been known to give a lot of money to HBCU's, what if these women do not believe in desegregation? This may sound far-fetched, but this is what can potentially happen. Making America Great Again can begin us back into the 50's instead of into The Future. And the worst part is that whether Trump is elected or not this person will be a SCOTUS for life.

Local family aims to grow beauty store

By Kenneth Miller, Publisher

Bernadette Prado, 32, is one of four children born to Penny Miller and also one of the three girl siblings who are inspired to make it big in the billion-dollar beauty sector.

According to statistics revealed in 2017, the beauty services sector employs over 670,000 people nationwide and jobs growth was estimated at 13 percent. In just 2017 alone the industry was pulling in $532.43 billion in 2017 and is expected to reach a market value of $805.61 billion by 2023.

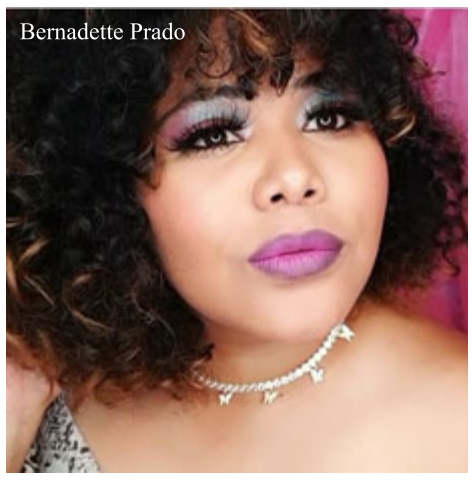
So when Bernadette founded SBS Beauty Parlor (SlAy BEE SlAy) about eight months ago she was in the right business to reach her dream of someday purchasing a house for her mother.

A graduate of Morningside High School, Crozier and Highland, she is an Inglewood native through and through.

The second oldest of the siblings, Kesha is the oldest at 33, then there is Magen at 30 and brother Jeddy at 28.

Each of the girls plays a prominent role in SBS, a beauty parlor specializes in eyelashes.

"We grew up not have most things that we wanted, but our family is close, loving and caring," Bernadette told Inglewood Today.



However, with 700 Instagram followers and growing she is proving that believing and hard work pay dividends.

She holds a bachelor degree from California State University Dominguez Hills, but her focus is on SBS.

"We are huge believers in Christ and we know that we can absolutely achieve anything."

SBS motto is "where we are more than

Bernadette Prado

products" has a mission is to empower and give back to the community, which speaks to their prices that are "catered to our community with 100% quality!"

SBS authentic vegan lashes and lip-gloss, which can be shipped 3-5 business days. Also Classic Eyelash Extensions and Beauty Parlor rentals to artists seeking a private suite.

Their three signature Lash Collections: Ambitious, Visionary, are designed to uplift and manifest a positive slay experience for your day.

SBS welcomes any talented artist for example; Lash artist, hair braiders, and barbers, massage therapist, etc. to join the team.

Supreme Court Decision Jeopardizes CFPB's Future and its Independence

By Charlene Crowell, NNPA Newswire Contributor

A June 29 U.S. Supreme Court split decision represents a major setback to both the Consumer Financial Protection Bureau (CFPB) and the consumers who have come to rely upon the agency. Since 2010, more than 25 million consumers were helped by the agency's that returned over $11 billion.

Although the case known as Seila Law v. Consumer Financial Protection Bureau, was argued on March 3 of this year, its origins date back to 2017 when Seila Law, a California-based debt relief asked the CFPB to set aside a civil investigative demand (CID) that sought information to determine whether it was engaged in illegal debt relief practices.

CFPB declined to set aside the CID and turned to a California federal court to pursue its interests. In response, Seila Law restated its challenge of the independence of the agency's Director who could only be removed by a President for cause, seeking to have the entire agency abolished as unconstitutional."

The Supreme Court's 5-4 decision refuted CFPB's hallmark: its independent Director. By allowing for an agency Director to be removed for any reason, it now becomes possible for partisan interests to whether or not a full, 5-year term of enshrined in the law will occur, or that powerful corporations will be held accountable.

The Court majority argued that CFPB is "unique." "The CFPB Director has no boss, peers, or voters to report to," wrote Justice Roberts in the majority opinion and was joined by Associate Justices Sam Alito, Neil Gorsuch, Brett Kavanaugh and Clarence Thomas.

"Yet the Director wields vast rulemaking, enforcement, and adjudicatory authority over a portion of the U. S. economy. The question before us is whether this arrangement violates the Constitution's separation of powers… "We therefore hold that the structure of the CFPB violates the separation of powers," continued the Chief Justice …The agency may therefore continue to operate, but its Director, in light of our decision, must be removable by the President at will."

PUBLIC NOTICE

COVID-19 PUBLIC PARTICIPATION OPTIONS

Due to the existing COVID-19 health emergency and the social distancing measures currently in effect, and pursuant to the Governor's Executive Order N-29-20 ((https://www.gov.ca.gov/wp-content/uploads/2020/03/3.17.20-N-29-20-EO.pdf)), please note that members of the public will only be allowed to observe and address the City Council Meeting of October 6, 2020 at 2:00 P.M. by telephone, video and other electronic means, as follows:

Viewing and Listening to the Meeting without Making Public Comments:

- On Spectrum Cable Local Channel 35 with audio and limited video. Please check with your cable provider for details.
- Live on-line through Facebook Live, with audio and limited video, at https://www.facebook.com/cityofinglewood/
- The above access options provide the public with the opportunity to both observe and listen to the meeting.
- However, members of the public who wish to orally address the Planning Commission must use the public access options noted below:

Listening to Meeting and Oral Public Comments: The meeting's telephone number and access code access number will be provided no later than 72 hours before the meeting on the meeting agenda published at https://www.cityofinglewood.org/AgendaCenter/City-Council-3 and/or by contacting the Office of the City Clerk via email at yhorton@cityofinglewood.org.

Please observe the following tips when phoning in:

- When you call-in, the operator will provide further instructions on how you can make public comments via phone.
- If you are calling from a cell phone, please call from an area with good reception.
- If you are watching the meeting on Facebook or Channel 35 while also accessing the phone line, it is requested that you mute the sound of your video feed as it is offset by 3 seconds from the phone transmission. Additionally, when you are making public comments on the phone line you will be inaudible due to feedback.

Written Public Comments: Members of the public can submit comments electronically for consideration by the Inglewood City Council/Successor Agency/Housing Authority/Finance Authority/Parking Authority/Joint Powers Authority (Legislative Body) by sending them to the City Clerk/Secretary at yhorton@cityofinglewood.org, and Deputy City Clerk at aphillips@cityofinglewood.org. To ensure distribution to the members of the Legislative Body prior to consideration of the agenda, please submit comments prior to 8:00 A.M. on the day of the meeting, and in the body of the email, please identify meeting date and subject matter. Comments received after 8:00 A.M. on day of the meeting will be made part of the official public record of the meeting. Contact the Office of the City Clerk at 310-412-5280 with any questions.

Accessibility: If you will require special accommodations due to a disability, please contact the City Clerk's Office at (310) 412-5280, One Manchester Boulevard, 1st Floor, Inglewood, California 90301. All requests for accommodations must be received 24 hours prior to the day of the hearing.

The City Council of the City of Inglewood, California, will hold a public hearing on October 6, 2020 at the hour of 2:00 p.m., to consider the following:

1. **Appeal of Planning Commission Denial of Special Use Permit No. 2019-014 to Allow the Sale of Beer and Wine for Off-Site Consumption from an Existing Convenience Market at 400 West Manchester Boulevard.**
   A Notice of Exemption (EA-CE-2019-127) has been prepared stating that the proposed project is categorically exempt from the California Environmental Quality Act, a copy of which is available for public review in the first floor lobby, of City Hall. An electronic copy can be obtained by emailing mfewell@cityofinglewood.org.
2. **A public hearing to consider Amendments to Inglewood Municipal Code Chapters 8 and 12 including Zoning Code Amendment 2018-01 (ZCA-2018-01) to establish Short Term Rental Regulations.**
   A Notice of Exemption (EA-CE-2018-061) has been prepared stating that the proposed project is exempt from the California Environmental Quality Act (CEQA), a copy of which is available for public review in the Planning Division office of City Hall and via email to fljackson@cityofinglewood.org.

This notice is given by the order of the City Council of the City of Inglewood and is dated this 22nd day of September 2020.

Yvonne Horton, City Clerk
City of Inglewood, California

Pursuant to Government Code Section 65009, if you challenge the proposed project in court, you may be limited to raising only those issues you or someone else raised at the public hearing described in this notice, or in written correspondence delivered to the City Council at, or prior to, the public hearing.

In the event that the City Council meeting of October 6, 2020 is not held, or is concluded prior to this public hearing agenda item being considered, the public hearing will automatically be continued to the next regularly scheduled City Council meeting.

"Si no entiende esta noticia o si necesita mas informacion, favor de llamar a este numero (310) 412-5280."

COVID-19 PUBLIC PARTICIPATION OPTIONS

Due to the existing COVID-19 health emergency and the social distancing measures currently in effect, and pursuant to the Governor's Executive Order N-29-20 ((https://www.gov.ca.gov/wp-content/uploads/2020/03/3.17.20-N-29-20-EO.pdf)), please note that members of the public will only be allowed to observe and address the City Council Meeting of October 6, 2020 at 2:00 P.M. by telephone, video and other electronic means, as follows:

Viewing and Listening to the Meeting without Making Public Comments:

- On Spectrum Cable Local Channel 35 with audio and limited video. Please check with your cable provider for details.
- Live on-line through Facebook Live, with audio and limited video, at https://www.facebook.com/cityofinglewood/
- The above access options provide the public with the opportunity to both observe and listen to the meeting.
- However, members of the public who wish to orally address the Planning Commission must use the public access options noted below:

Listening to Meeting and Oral Public Comments: The meeting's telephone number and access code access number will be provided no later than 72 hours before the meeting on the meeting agenda published at https://www.cityofinglewood.org/AgendaCenter/City-Council-3 **and/or by contacting the Office of the City Clerk via email at yhorton@cityofinglewood.org.**

Please observe the following tips when phoning in:

- When you call-in, the operator will provide further instructions on how you can make public comments via phone.
- If you are calling from a cell phone, please call from an area with good reception.
- If you are watching the meeting on Facebook or Channel 35 while also accessing the phone line, it is requested that you mute the sound of your video feed as it is offset by 3 seconds from the phone transmission. Additionally, when you are making public comments on the phone line you will be inaudible due to feedback.

Written Public Comments: Members of the public can submit comments electronically for consideration by the Inglewood City Council/Successor Agency/Housing Authority/Finance Authority/Parking Authority/Joint Powers Authority (Legislative Body) by sending them to the City Clerk/Secretary at yhorton@cityofinglewood.org, and Deputy City Clerk at aphillips@cityofinglewood.org. To ensure distribution to the members of the Legislative Body prior to consideration of the agenda, please submit comments prior to 8:00 A.M. on the day of the meeting, and in the body of the email, please identify meeting date and subject matter. Comments received after 8:00 A.M. on day of the meeting will be made part of the official public record of the meeting. Contact the Office of the City Clerk at 310-412-5280 with any questions.

Accessibility: If you will require special accommodations due to a disability, please contact the City Clerk's Office at (310) 412-5280, One Manchester Boulevard, 1st Floor, Inglewood, California 90301. All requests for accommodations must be received 24 hours prior to the day of the hearing.

The City Council of the City of Inglewood, California, will hold a public hearing on **October 6, 2020 at the hour of 2:00 p.m.,** to consider the following:

1. Appeal of Planning Commission Denial of Special Use Permit No. 2019-014 to Allow the Sale of Beer and Wine for Off-Site Consumption from an Existing Convenience Market at 400 West Manchester Boulevard.

   A Notice of Exemption (EA-CE-2019-127) has been prepared stating that the proposed project is categorically exempt from the California Environmental Quality Act, a copy of which is available for public review in the Planning Division office, fourth floor of City Hall. An electronic copy can be obtained by emailing mfewell@cityofinglewood.org.

This notice is given by the order of the City Council of the City of Inglewood and is dated this 22nd day of September 2020.

Yvonne Horton, City Clerk
City of Inglewood, California

Pursuant to Government Code Section 65009, if you challenge the proposed project in court, you may be limited to raising only those issues you or someone else raised at the public hearing described in this notice, or in written correspondence delivered to the City Council at, or prior to, the public hearing.

In the event that the City Council meeting of October 6, 2020 is not held, or is concluded prior to this public hearing agenda item being considered, the public hearing will automatically be continued to the next regularly scheduled City Council meeting.

COVID-19 PUBLIC PARTICIPATION OPTIONS

Due to the existing COVID-19 health emergency and the social distancing measures currently in effect, and pursuant to the Governor's Executive Order N-29-20((https://www.gov.ca.gov/wp-content/uploads/2020/03/3.17.20-N-29-20-EO.pdf)), please note that members of the public will only be allowed to observe and address the Planning Commission Meeting of October 7, 2020 at 7:00 P.M. by telephone, video and other electronic means, as follows:

Viewing and Listening to the Meeting without Making Public Comments:

- On Spectrum Cable Local Channel 35 with audio and limited video. Please check with your cable provider for details.
- Live on-line through Facebook Live, with audio and limited video, at https://www.facebook.com/cityofinglewood/
- The above access options provide the public with the opportunity to both observe and listen to the meeting.
- However, members of the public who wish to orally address the Planning Commission must use the public access options noted below:

Listening to Meeting and Oral Public Comments: The meeting's telephone number and access code access number will be provided no later than 72 hours before the meeting on the meeting agenda published at https://www.cityofinglewood.org/AgendaCenter/Planning-Commission-4

Please observe the following tips when phoning in:

- When you call-in, the operator will provide further instructions on how you can make public comments via phone.
- If you are calling from a cell phone, please call from an area with good reception.
- If you are watching the meeting on Facebook or Channel 35 while also accessing the phone line, it is requested that you mute the sound of your video feed as it is offset by 3 seconds from the phone transmission. Additionally, when you are making public comments on the phone line you will be inaudible due to feedback.

Written Public Comments: Members of the public can submit comments electronically for consideration by the Inglewood Planning Commission by sending them to the Case Planner indicated below. To ensure distribution to the Commissioners prior to consideration of the agenda, please submit comments prior to 12:00 P.M. the day of the meeting, and in the body of the email, please identify meeting date and subject matter. Comments received after 12:00 P.M. on day of meeting will be made part of the official public record of the meeting. Contact the Planning Division at 310-412-5230 with any questions.

Accessibility: If you will require special accommodations due to a disability, please contact the Planning Division Office at (310) 412-5230, One Manchester Boulevard, 4th Floor, Inglewood, California 90301. All requests for accommodations must be received 48 hours prior to the day of the hearing.

Spanish: "Si no entiende esta noticia o si necesita más información, favor de llamar a este número (310) 412-5230."

The Planning Commission of the City of Inglewood, California, will hold public hearings on **October 7, 2020 at the hour of 7:00 p.m.,** to consider the following:

. A public hearing to consider a Special Use Permit No. 2019-013 (SP-2019-013) for a Final Planned Assembly Development (PAD) to allow a five-story, 65-unit senior housing mixed-use development on an approximately 26,250 square-foot C-2 (General Commercial) zoned property at 3320 West 85th Street. An Initial Study and Mitigated Negative Declaration (EA-MND-2019-120) was previously prepared stating that with the recommended mitigation measures the proposed project will have no significant adverse impact upon the environment, a copy of which is available for public review in the Planning Division office of City Hall, fourth floor, www.cityofinglewood.org/1016/Environmental-Documents or via email to bmccrumby@cityofinglewood.org. The MND was adopted by the Planning Commission on April 13, 2020.
Case Planner: Bernard McCrumby, Planner (bmccrumby@cityofinglewood.org)

. A public hearing to consider an application by Frank Martini, representing Adventurer Hotel, for Special Use Permit No. 2020-002 (SP-2020-002) to allow an approximately 192 square-foot poolside bar selling 1) Beer and Wine and 2) Distilled Spirits for on-site consumption within an existing 80-room motel on an approximately 72,758 square-foot, C-2A (Airport Commercial) zoned property at 4200 West Century Boulevard.

A Notice of Exemption (EA-CE-2020-008) has been prepared stating that the proposed project is exempt from the California Environmental Quality Act (CEQA), a copy of which is available for public review in the Planning Division office of City Hall and via email at bmccrumby@cityofinglewood.org.
Case Planner: Bernard McCrumby, Planner (bmccrumby@cityofinglewood.org.)

Pursuant to Government Code Section 65009, if you challenge any of the proposed public hearing items in court, you may be limited to raising only those issues you or someone else raised at the public hearing described in this notice, or in written correspondence delivered to the Planning Commission at, or prior to, the public hearing.
In the event that the Planning Commission meeting of October 7, 2020 is not held, or is concluded prior to a public hearing agenda item being considered, the public hearing will automatically be continued to the next regularly scheduled Planning Commission meeting.

Continued from page 5: Groups for...

Jay King, President and CEO of California Black Chamber of Commerce

"One in 10 app-based drivers are Black. Many of them would lose their jobs if Prop 22 is not passed this November. When so much of our community is we need to encourage and promote new and innovative ways to make income. I encourage everyone to vote yes to save app-based jobs and services," he said.

On Sept. 9, protesters from Rideshare Drivers United (RDU), an organizing group that has come out against Prop 22, gathered under an Uber billboard in Oakland that read, "If you tolerate racism, delete Uber. Black people have the right to move without fear." Uber has launched a microsite that promotes that slogan and shares how the company plans to rid its platform of racism and investments it has made in the Black community.

"We are condemning them on their hypocritical ballot measure that would relegate drivers to a permanent underclass without basic rights or voices or privileges. We condemn major companies like Uber and Lyft who are claiming support of a protest movement that has galvanized America, in the middle of a pandemic that has disproportionately Black and Brown people in their lives," Cherri Murphy, an RDU organizer, told California Black Media.

Murphy says there are multiple instances when Uber and Lyft exploit Black drivers and customers, alleging that those companies increase ride prices in Black and Brown neighborhoods. That claim has been supported by a June preprint study by George Washington University.

"If you want to know whether or not Lyft and Uber are doing the right thing, you need to look at their historical measures and tactics. The most recent one is around the preliminary injunction. As opposed to following the rules, what they want to do is invoke fear and have people make a decision based on fear. So their method on threatening people to shut down wasn't because they're in a bind. Not a million dollar — a billion dollar — company. Compare that to those who live check to check," said Murphy.

As they wait to see how Californians will vote on Prop 22, Uber and Lyft are also currently in an appeals process against the preliminary injunction that ordered them to classify their drivers as employees last August.

Comments Received on the ITC Revised NOP and Revised Initial Study

Governor's Office of Planning & Research

Sep 18 2020

STATE CLEARINGHOUSE

September 14, 2020

Mindy Wilcox, Planning Manager
City of Inglewood
One W. Manchester Boulevard, 4th Floor
Inglewood, CA 90301

Re: 2018071034, Inglewood Transit Connector Project, Los Angeles County

Dear Ms. Wilcox:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

1-1

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

a. A brief description of the project.

b. The lead agency contact information.

c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).

d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)). 1-2

a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

a. Alternatives to the project.

b. Recommended mitigation measures.

c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

a. Type of environmental review necessary.

b. Significance of the tribal cultural resources.

c. Significance of the project's impacts on tribal cultural resources.

d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

a. Whether the proposed project has a significant impact on an identified tribal cultural resource.

b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).

2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.

3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).

4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:

- **a.** The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
- **b.** Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:

- **a.** If part or all of the APE has been previously surveyed for cultural resources.
- **b.** If any known cultural resources have already been recorded on or adjacent to the APE.
- **c.** If the probability is low, moderate, or high that cultural resources are located in the APE.
- **d.** If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.

- **a.** The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
- **b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

RE: Inglewood Transit Connector Project –
Recirculated Notice of Preparation (NOP)
SCH # 2018071034
GTS # 07-LA-2018-03366
Vic. LA-405/PM: 23.331

Dear Mindy Wilcox:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced NOP. The project is an automated people mover (APM) to transport riders between the regional Metro Rail system (Crenshaw Line), Downtown Inglewood, the Forum, the Los Angeles Sports and Entertainment District, and the future Inglewood Basketball and Entertainment Center. The project would consist of elevated dual guideways to allow for continuous APM trains to travel in each direction. It would also include support facilities, such as an approximately 78,000 square feet maintenance and storage facility, and two traction power substations facilities to provide the system's electrical power. Ultimately the project is planned to have a ridership capacity of 11,500 passengers per hour. The City of Inglewood is the Lead Agency under the California Environmental Quality Act (CEQA). 2-1

The project is located approximately 1.5 miles away from the Interstate 405 (I-405) and Manchester Boulevard interchange, and approximately 2 miles away from the Interstate 105 (I-105) ramps at Prairie Avenue in Inglewood.

From reviewing the NOP, Caltrans has the following comments:

- Caltrans wrote a letter in response to the original NOP for this project in 2018. Since then, the project scope has changed and the implementation deadline for Senate Bill (SB) 743 has passed. SB 743 (2013) mandates that Vehicle Miles Traveled (VMT) rather than Level of Service be used as the primary metric for determining the transportation impacts of projects under CEQA. Thus, Caltrans has reviewed the recirculated NOP from a VMT perspective. 2-2
- For information on determining transportation impacts in terms of VMT on the State Highway System, see the *Technical Advisory on Evaluating Transportation Impacts in CEQA* by the California Governor's Office of Planning and Research (OPR), dated December 2018: http://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf.
- The City can also refer to Caltrans' updated *Vehicle Miles Traveled-Focused Transportation Impact Study Guide* (TISG), dated May 2020 and released on Caltrans' website in July 2020: https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-05-20-approved-vmt-focused-tisg-a11y.pdf. Caltrans' new TISG is largely based on the OPR 2018

Technical Advisory.

- The updated TISG states, "Additional future guidance will include the basis for requesting transportation impact analysis that is not based on VMT. This guidance will include a simplified safety analysis approach that reduces risks to all road users and that focuses on multi-modal conflict analysis as well as access management issues." Since releasing the TISG, Caltrans has released interim safety analysis guidance, dated July 2020 and found here, for the City's reference: https://dot.ca.gov/-/media/dot-media/programs/transportation-planning/documents/sb-743/2020-07-01-interim-ldigr-safety-guidance-a11y.pdf. 2-4
- Caltrans looks forward to reviewing the VMT analysis for this project in the forthcoming DEIR. As discussed in Caltrans' new TISG, Caltrans strongly recommends undertaking project VMT analysis, significance determination, and potential mitigation in a manner consistent with OPR's Technical Advisory. 2-5

2-3

The following information is included for your consideration.

The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. Furthermore, Caltrans encourages Lead Agencies to implement Transportation Demand Management (TDM) strategies that reduce VMT and Greenhouse Gas emissions. For examples of TDM options to further reduce this project's VMT, please refer to:

- The 2010 *Quantifying Greenhouse Gas Mitigation Measures* report by the California Air Pollution Control Officers Association (CAPCOA), available at http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf, or
- *Integrating Demand Management into the Transportation Planning Process: A Desk Reference* (Chapter 8) by the Federal Highway Administration (FHWA), available at https://ops.fhwa.dot.gov/publications/fhwahop12035/index.htm.

2-6

Also, any transportation of heavy construction equipment and/or materials which requires use of oversized-transport vehicles on State highways will need a Caltrans transportation permit. Caltrans recommends that the project limit construction traffic to off-peak periods to minimize the potential impact on State facilities. If construction traffic is expected to cause delays on any State facilities, please submit a construction traffic control plan detailing these delays for Caltrans' review.

If you have any questions about these comments, please contact Emily Gibson, the project coordinator, at Emily.Gibson@dot.ca.gov, and refer to GTS # 07-LA-2018-03366.

Sincerely,

Miya Edmonson

RE: Inglewood Transit Connector Project
Revised Notice of Preparation (NOP) of Environmental Impact Report (EIR)

Dear Ms. Wilcox:

Thank you for coordinating with the Los Angeles County Metropolitan Transportation Authority (Metro) regarding the proposed Inglewood Transit Connector Project (Project) located in the City of Inglewood (City). Metro's aim is to create and maintain a world-class transportation system that focuses on providing an excellent customer experience and enhancing the quality of life for those who live, work, and play within Los Angeles County. As the public mass transportation planner , builder and operator, Metro is constantly working to deliver a regional system that supports increased transportation options and associated benefits, such as improved mobility options, air quality, health and safety, and access to opportunities.

The purpose of this letter is twofold: firstly, to provide the City with specific detail on the scope and content of environmental information that should be included in the EIR for the Project per Metro's area of statutory responsibility pursuant to the California Environmental Quality Act (CEQA)[1], and secondly, to encourage close coordination on Project design and development to ensure a quality interface between the Project and Metro's Downtown Inglewood Station along the Crenshaw/LAX Line (K Line). Effects of a project on transit systems and infrastructure are within the scope of transportation impacts to be evaluated under CEQA.[2]

3-1

Metro recognizes the Project's significance to the City and the greater Los Angeles County region. Metro and the City have been collaborating closely on several efforts, including the K (Crenshaw/LAX) Line, Metro-funded transit-oriented development (TOD) Specific Plans, the Inglewood First/Last Mile Plan, the Centinela/Florence Grade Separation, and event transportation demand management for SoFi Stadium and the Inglewood Basketball and Entertainment Center. We are committed to a collaborative approach with respect to this Project. In particular, we appreciate the NOP consultation meeting held between our respective staffs on September 28, 2020. Metro will follow up with the Project Team to assemble an interdisciplinary working group to address future technical and operational issues as the Project design advances.

Project Description
The Project would include an automated people mover (APM) system to transport riders from the regional Metro Rail system (K Line) to Downtown Inglewood, the Forum, and the Los Angeles Sports and Entertainment District (LASED) which includes the new SoFi stadium (recently opened in the Fall of 2020), the proposed Inglewood Basketball and Entertainment Center (IBEC) and new retail, housing, and employment centers. The

[1] See Sections 15082(b) and 15086(a) of the Guidelines for Implementation of CEQA (Cal. Code of Regulations, Title 14, Ch. 3).

[2] See CEQA Guidelines section 15064.3(a); Governor's Office of Planning and Research Technical Advisory on Evaluating Transportation Impacts In CEQA, December 2018, p. 19.

Project will consist of elevated dual guideways to allow for continuous APM trains to travel in each direction. There will likely be several trains operating at any time, depending upon ridership needs. As currently envisioned, the proposed Project will have up to three stations, as follows: 1) Market Street/Florence Avenue Station; 2) Prairie Avenue/Pincay Drive Station, and 3) Prairie Avenue/Hardy Street Station.

Station design will be established by passenger demand volumes under typical peak conditions, in addition to increased demands during special events. Station design will also take into account the potential for service disruptions and emergency evacuation requirements. Stations would provide for pedestrian access to the elevated guideway from street level via existing sidewalk and pedestrian travel areas adjacent to the station locations. Final station locations and configurations will be determined during the design process. A pedestrian bridge linkage will connect the Market Street/Florence Avenue Station with the K Line on the north side of Florence Avenue.

The proposed Project will include support facilities to provide for a maintenance and storage facility (MSF), and traction power substations (TPSS) that would be located adjacent to the elevated guideway alignment but outside the street rights-of-way. The MSF would be an approximately 78,000 square feet structure to provide for maintenance activities and train storage. Two TPSS facilities would provide electrical power for system operation. The MSF location south of the intersection of Hillcrest Boulevard and Manchester Boulevard would include a TPSS. A second TPSS would be located on the Civic Center site located east of Prairie Avenue and south of Arbor Vitae Street.

Recommendations for EIR Scope and Content

To address potential impacts to Metro's transit system and infrastructure, the EIR for the Project should analyze and discuss the following topics, without limitation. Impacts should be described and mitigated to the maximum extent feasible:

1. Rail Transit Service Capacity: Coordination on passenger flows between the Project and the K Line will be critical to the success of the Project. Projected service headways and passenger throughput under different scenarios for the Project should be discussed. As currently designed and constructed, the K Line will provide 6-minute headways using two-car trains. Due to physical constraints on station and systems design, it is not possible to run more frequent service or longer trains. The EIR should incorporate this information into the Project's design and EIR analysis. 3-2

2. Interface between Metro Downtown Inglewood Station and APM Station: Additional information and discussion is needed on the interface between the Market/Florence APM Station and Metro's Downtown Inglewood Station. Key interface issues that need further information include: pedestrian volumes, circulation patterns, security, and queuing accommodations for patrons transferring from the APM to the Metro Station, as well as the proposed pedestrian bridge that will link the two stations and any touchdown points for the bridge on Metro's property. To help ensure a seamless connection between the two systems, Metro would like to be review performance standards proposed as part of the City's proposed P3 delivery method. 3-3

3. Bus Service and Intermodal Connections: The EIR should discuss current and projected Metro bus service and whether changes to bus service and bus stop locations are proposed by the Project. The Project design should consider and accommodate transfer activity between bus and rail lines that will occur along sidewalks and public spaces. Metro has completed the Metro Transfers Design Guide, a best practices document on transit improvements. This can be accessed online at https://www.metro.net/projects/systemwidedesign. 3-4

4. Centinela/Florence Avenues Grade Separation Project: The EIR should take into account construction activities for the Centinela/Florence Avenues Grade Separation Project, which are projected to occur between Summer 2022 and Summer 2025, and will likely overlap with construction of the APM Project. Issues to be coordinated and considered may include without limitation: construction schedule; need for right-of-way (ROW) construction staging areas and construction staging plan; construction site

safety and clearance from adjacent Metro properties, rail ROW and train operations (e.g., OCS poles and wires); construction traffic management (roadway closure, traffic detour, relocation of bus stops); shared utilities (if any), etc.

3-5

Metro looks forward to further discussions and coordination with the City on this Project. If you have any questions regarding this letter, please contact me at lings@metro.net.

Revised Notice of Preparation of an Environmental Impact Report for the Inglewood Transit Connector Project (Proposed Project) (SCH No.: 2018071034)

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. Our comments are recommendations on the analysis of potential air quality impacts from the Proposed Project that should be included in the Environmental Impact Report (EIR). Please send a copy of the EIR upon its completion and public release directly to South Coast AQMD as copies of the EIR submitted to the State Clearinghouse are not forwarded. **In addition, please send all appendices and technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all emission calculation spreadsheets, and air quality modeling and health risk assessment input and output files (not PDF files). Any delays in providing all supporting documentation for our review will require additional review time beyond the end of the comment period.** 4-1

CEQA Air Quality Analysis

Staff recommends that the Lead Agency use South Coast AQMD's CEQA Air Quality Handbook and website[1] as guidance when preparing the air quality and greenhouse gas analyses. It is also recommended that the Lead Agency use the CalEEMod[2] land use emissions software, which can estimate pollutant emissions from typical land use development and is the only software model maintained by the California Air Pollution Control Officers Association. 4-2

South Coast AQMD has developed both regional and localized significance thresholds. South Coast AQMD staff recommends that the Lead Agency quantify criteria pollutant emissions and compare the emissions to South Coast AQMD's CEQA regional pollutant emissions significance thresholds[3] and localized significance thresholds (LSTs)[4] to determine the Proposed Project's air quality impacts. The localized analysis can be conducted by either using the LST screening tables or performing dispersion modeling. 4-3

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of

[1] South Coast AQMD's CEQA Handbook and other resources for preparing air quality analyses can be found at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook.
[2] CalEEMod is available free of charge at: www.caleemod.com.
[3] South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.
[4] South Coast AQMD's guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips, and hauling trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers and air pollution control devices), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis. Furthermore, emissions from the overlapping construction and operational activities should be combined and compared to South Coast AQMD's regional air quality CEQA *operational* thresholds to determine the level of significance. 4-4

If the Proposed Project generates diesel emissions from long-term construction or attracts diesel-fueled vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment[5]. 4-5

In the event that implementation of the Proposed Project requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. The assumptions in the air quality analysis in the EIR will be the basis for evaluating the permit under CEQA and imposing permit conditions and limits. Questions on permits should be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385. 4-6

Mitigation Measures

In the event that the Proposed Project results in significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize these impacts. Any impacts resulting from mitigation measures must also be analyzed. Several resources to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project include South Coast AQMD's CEQA Air Quality Handbook[1], South Coast AQMD's Mitigation Monitoring and Reporting Plan for the 2016 Air Quality Management Plan[6], and Southern California Association of Government's Mitigation Monitoring and Reporting Plan for the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy[7]. 4-7

South Coast AQMD staff is available to work with the Lead Agency to ensure that air quality, greenhouse gas, and health risk impacts from the Proposed Project are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

INGLEWOOD TRANSIT CONNECTOR PROJECT
REVISED NOTICE OF PREPARATION AND INITIAL STUDY
ENVIRONMENTAL PLAN (RPPL2020006654)

Thank you for the opportunity to review the Initial Study and Notice of Preparation (IS/NOP) for the Inglewood Transit connector project. The project proposes an automated people mover (APM) transporting riders to and from the regional Metro Rail system (Crenshaw Line) to Downtown Inglewood, the Forum, the new NFL stadium scheduled to open in the Fall of 2020, and the future Inglewood Basketball and Entertainment Center. The proposed Project consists of elevated dual guideways to allow for continuous APM trains to travel in each direction with a ridership capacity of 11,500 passengers per hour. 5-1

The Los Angeles County Flood Control District (LACFCD) has reviewed the IS/NOP and has no objection to the proposed project. The LACFCD has the following comments for your consideration:

1. Section 2.10, Hydrology and Water Quality, Page 22

Clarify if or how the proposed project improvements will impact any LACFCD facilities, including but not limited to the existing Drainage District Improvements (DDI) No. 008 and Project No. 4402-Unit 1, Line C. 5-2

2. Section 2.19, Utilities and Service Systems, Page 102

There is an existing LACFCD maintained storm drain along Prairie Avenue within the project site. It is not clear if the proposed guideway will be located over the LACFCD's drain. Clarify if or how the guideway will interfere with the LACFCD's operation and maintenance activities of the storm drain. 5-3

3. General Comment – LACFCD Permit

If any project components affects the LACFCD facilities or right of way, a permit from LACFCD will be required.

For questions regarding comments 1-3, please contact Miguel Garibay of Public Works, Stormwater Planning Division at (626) 458-4333 or migaribay@pw.lacounty.gov.

5-4

We request the opportunity to review all future environmental documents regarding this project. Please email related documents to Jose Suarez of Public Works, Land Development Division at jsuarez@pw.lacounty.gov.

Sincerely,

Mindy Wilcox, Planning Manager
City of Inglewood
Planning Division
One West Manchester Boulevard
Inglewood, CA 90301

Dear Ms. Wilcox:

REVISED NOTICE OF PREPARATION, "INGLEWOOD TRANSIT CONNECTOR PROJECT," IS A PROPOSED AUTOMATED PEOPLE MOVER MASS-TRANSIT LINE CONNECTING THE CITY OF INGLEWOOD TO THE GREATER SOUTHERN CALIFORNIA REGION, THE PROJECT WILL INCLUDE A REVISED 1.6-MILE TRANSIT GUIDEWAY, THREE STATION, APM TRAINS, AND SUPPORT FACILITIES INCLUDING A MAINTENANCE STORAGE FACILITY AND TWO TRACTION POWER SUBSTATIONS, INGLEWOOD, FFER 2020006727

6-1

The Revised Notice of Preparation has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department.

The following are their comments:

PLANNING DIVISION:

Under 2.15 **Public Services,** a.1. Fire Protection, paragraph two, sentence six is incorrect. If the author was indicating the number of personnel on-duty daily within the City of Inglewood, that number is 21 firefighting staff on-duty daily at fire stations located within Inglewood's boundaries.

6-2

Sentence seven of paragraph two should be corrected to state that, "An Assistant Fire Chief oversees the three battalions that are within Division 6."

For any questions regarding this response, please contact Loretta Bagwell, Planning Analyst, at (323) 881-2404 or Loretta.Bagwell@fire.lacounty.gov.

LAND DEVELOPMENT UNIT:

1. The development of this project must comply with all applicable code and ordinance requirements for construction, access, water mains, fire flows, and fire hydrants.

2. The proposed Automated People Mover shall comply with NFPA 130: Standard for Fixed Guideway Transit and Passenger Rail Systems.

3. Changes to the existing public water system such as fire hydrants, and water mains, for firefighting purposes shall be submitted to the County of Los Angeles Fire Department's Fire Prevention, Land Development Unit for review and approval.

Should any questions arise regarding subdivision, water systems, or access, please contact the County of Los Angeles Fire Department Land Development Unit's, Inspector Nancy Rodeheffer at (323) 890-4243.

6-3

FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:

The statutory responsibilities of the County of Los Angeles Fire Department's Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones, archeological and cultural resources, and the County Oak Tree Ordinance. Potential impacts in these areas should be addressed.

Under the Los Angeles County Oak tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage or encroach into the protected zone of any tree of the Oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured 4 1/2 feet above mean natural grade.

If Oak trees are known to exist in the proposed project area further field studies should be conducted to determine the presence of this species on the project site.

The County of Los Angeles Fire Department's Forestry Division has no further comments regarding this project.

For any questions regarding this response, please contact Forestry Assistant, Joseph Brunet at (818) 890-5719.

6-4

HEALTH HAZARDOUS MATERIALS DIVISION:

The Health Hazardous Materials Division of the Los Angeles County Fire Department has no comments or requirements for the project at this time.

6-5

Please contact HHMD senior typist-clerk, Perla Garcia at (323) 890-4035 or Perla.garcia@fire.lacounty.gov if you have any questions.

If you have any additional questions, please contact this office at (323) 890-4330.

Very truly yours,

RONALD M. DURBIN, CHIEF, FORESTRY DIVISION

RE: Inglewood Transit Connector Project Initial Study - State Clearinghouse No. 2018071034

Dear Ms. Wilcox:

The Inglewood Unified School District ("District") thanks the City of Inglewood ("City") for providing the Notice of Preparation for the September 2020 Revised Initial Study ("RIS") on the proposed Inglewood Transit Connector Project ("Project"). I would also like to personally thank Mayor James Butts and his staff for providing thorough and transparent information about the RIS to the District and for coordinating a meeting at the senior administrative and staff levels to better understand the Project and its impacts.

The District very much supports the Project, which will play an important role in ongoing revitalization efforts by providing convenient, reliable, and efficient public transportation to major activity centers within the City, to the benefit of the Inglewood community, and reduce extra vehicular traffic. 7-1

The District has reviewed the RIS and would like the City to consider in the upcoming Draft Environmental Impact Report ("EIR") the Project's potentially significant impacts on the following four District schools: (1) Crozier Middle School & City Honors High School (cumulatively, "Crozier") which is within 1,300 feet from the Project's Market Street/Florence Ave Station and within 996 feet from the Project's railroad alignment; (2) Inglewood High School ("Inglewood") which is within 1,000 feet from the Project's railroad alignment; (3) Kelso Elementary School ("Kelso") which is directly adjacent to the Project's Prairie Ave/Pincay Drive Station; and (4) Inglewood Adult School, which is within 800 feet of the Project's railroad alignment.

Children are much more susceptible than adults to impacts caused by development. Given the large population of children at public school sites, special consideration of a project's potential impacts on a school site is necessary. Understanding this, the California Department of Education ("CDE") has established specific regulations for public school sites to protect students from undue development hazards. These regulations set forth in Title 5 California Code of Regulations section 14010 et seq. set forth specific setbacks and required studies of recognized hazards to the safety and learning environment of students. The encroachment of these hazards can render a public school site unusable for educational purposes. Thus, the specifics of these regulations must be evaluated for Crozier, Inglewood, and Kelso. Additionally, the Project's potential impacts on any other District facility needs to be included, as required by the State's environmental review process. As such, we reference "three" schools (Crozier, Inglewood, and Kelso) when discussing CDE specific requirements and "four" schools (the three schools plus Inglewood Adult School) when discussing general California Environmental Quality Act ("CEQA") considerations. We have identified the following six types of Project impacts to our four schools to be considered and analyzed**:** (1) aesthetics, (2) air quality, (3) hazards and hazardous materials, (4) noise, (5) traffic, and (6) utilities.

7-2

The District wishes to emphasize that its comments are meant to assist the City in evaluating the Project's potential impacts to the District's four schools, and to ensure that District students' safety and education are not significantly impacted by the Project.

1. AESTHETICS.

The RIS notes that the Project would run trains on elevated tracks and have elevated stations. The District is concerned that Kelso's adjacency to the Prairie Ave/Pincay Drive Station could be a visual distraction to Kelso's students by the frequent movement of trains into and out of the station. Students are immediately drawn to movement and accompanying sounds, so the Project's trains could draw student's attention away from their lessons whether they are held in indoor classrooms or outside. The Project should include a mitigation measure to screen the elevated Prairie Ave/Pincay Drive Station and adjacent elevated railroad tracks from the view of Kelso's students.

7-3

Additionally, at ground level, the influx of patrons walking to and from the station or other persons loitering in the vicinity of the station could provide an opportunity for these people to observe Kelso's students. A mitigation measure should be included to visually shield potential onlookers from observing Kelso's students.

2. AIR QUALITY.

Per Education Code section 17213, a school shall only be located where, "The health risks from the facilities or other pollution sources do not and will not constitute an actual or potential endangerment of public health to persons who would attend or be employed at the school." (*Id*. § 17213(c)(2)(B).) For health risks from air pollution, Education Code section 17213(b) instructs that sources of Toxic Air Contaminants ("TACs") within ¼ mile of a school requires direct analysis. "'Hazardous air emissions' means emissions into the ambient air of air contaminants that have been identified as a TAC by the State Air Resources Board or by the air pollution control officer for the jurisdiction in which the project is located." (*Id*. § 17213(d)(1).) Particulate emissions from diesel-fueled engines ("DPM") is identified as a TAC. (https://ww2.arb.ca.gov/resources/documents/carb-identified-toxic-air-contaminants)

7-4

Per the RIS, the Project is a hazardous air emitter. It obliquely identifies Kelso as a sensitive air quality receptor and explains that a Health Risk Assessment ("HRA") will be conducted "to consider impacts associated with exposure to TACs on nearby receptors during both construction and operation." (RIS, p. IS-52.) Since the three schools are all within ¼ mile of the Project, the HRA needs to analyze the Project's potential hazardous air emissions that include TACs on all three schools and include those results in the Draft EIR along with any necessary mitigation measures. The HRA should specifically analyze DPM, Reactive Organic Gases ("ROGs"), Nitrogen Oxides, and dust impacts on the schools during Project construction. If mitigation measures are required, temporary HVAC systems with appropriate MERV-rated filters might be appropriate for significant air quality impacts.

If construction of the Project would cause lane and/or street closures, the air quality impact of longer Vehicle Miles Traveled ("VMT") due to vehicles navigating around such closures and idling at congested street segments would need to also be analyzed in the Draft EIR.

3. HAZARDS AND HAZARDOUS MATERIALS.

As stated above, the RIS identifies the three schools being within ¼ mile of the Project. (RIS, p. IS-78.) It also notes that the Project could involve the use and transportation of hazardous materials, which their impact will be analyzed in the Draft EIR. (*Id*. p. IS-29.) As discussed above, the Draft EIR also needs to analyze the Project's potential hazardous air emission impacts on the three schools in the HRA and provide appropriate mitigation measures for those potentially significant impacts.

Per Title 5 California Code of Regulations section 14010(d), a school cannot be sited within 1,500 feet of a railroad track easement unless a railroad safety study is conducted that demonstrates that students and staff will be adequately protected. Thus, an "unsafe" railroad in proximity to the District's schools would be a significant hazard impact. This is especially important considering a potential derailment of a train that is elevated from 22 to 45 feet above ground. Given that the three schools are within 1,500 feet of the Project's railroad tracks, the Draft EIR needs to include a railroad safety study at each school, and if the safety study reveals unsafe conditions, mitigation measures should be developed and proposed to remedy the unsafe conditions in order for the Project's impact on the school be reduced to less than significant.

7-5

Per Title 5, California Code of Regulations section 14010(c), a school site must have the following setbacks to power line easements:

100 feet from 50-133 kV line;
150 feet from a 220-230 kV line; and
350 feet from a 500-550 kV line.

If any of the Project's power lines exceed these voltages or any existing power line needs to be relocated, the resultant impact on Kelso needs to be evaluated because Kelso is within 350 feet of the Project. If a potentially significant electrical hazard impact is revealed by the study, appropriate mitigation measure(s) need to be identified and adopted.

4. NOISE.

Noise monitoring sites used to analyze the ambient noise along the alignment should include the District's three schools and the Draft EIR needs to include analyses of noise impacts at each school. CDE's School Site Selection and Approval Guide ("CDE's Guide") states that background noise in a classroom should not exceed 30 decibels. (https://www.cde.ca.gov/ls/fa/sf/schoolsiteguide.asp#Noise.) CDE's Guide explains that the California Department of Transportation considers noise at 50 decibels in the vicinity of schools to be at the point at which it will take corrective action for noise generated by freeways. (*Ibid.*) The Streets and Highways Code also address traffic noise impacts in section 216(c):

> "If the noise level produced from the freeway traffic, or the construction of the freeway, exceeds 55dBA, L10, or 52dBA, Leq., the department shall undertake a noise abatement program in any classroom, library, multipurpose room, or space used for pupil personnel services to reduce the freeway traffic noise level therein to 55dBA, L10, or 52dBA, Leq., or less, by, measures including, but not limited to, installing acoustical materials, eliminating windows, installing air–conditioning, or constructing sound baffle structures."

7-6

CDE's Guide moreover recognizes that the American Speech-Language-Hearing Association guidelines recommend that in classrooms, sounds dissipate in 0.4 seconds or less (and not reverberate) and that background noise not rise above 30 decibels. Further, the World Health Organization's Guidelines for Community Noise set maximum background classroom noise at 35 dBA. (https://www.who.int/docstore/peh/noise/Comnoise-1.pdf, p. xi.) Typical classroom attenuation is approximately 25 dBA. Therefore, the significant noise threshold at the schools' boundaries should be 60 dBA.

The Draft EIR should also consider the startle effect of the Project from train horns and other Project noises on the three schools. This is especially important given the noise and vibration sensitivity of special education students being taught at these three schools.

If the Draft EIR concludes that there would be a potentially significant impact on any of these schools, appropriate mitigation measures, such as sound walls, noise-attenuating windows, and other sound insulation should be utilized.

5. TRAFFIC.

The RIS states there will be a less than significant transportation impact from the Project, but transportation will still be studied in the Draft EIR. (RIS, p. IS-98.)

Although CEQA no longer considers vehicle delay as a significant transportation impact, analyses of traffic safety and educational impact by Project traffic are still necessary. The District is concerned with safety of, and delays to, drop-off and pick-up activities. The added delay can disrupt the educational day and could contribute to more frequent absences. Such disruptions would detract from the most effective educational program.

7-7

Further, drop-off (7:45 a.m. to 8:15 a.m.) and pick-up (2:30 p.m. to 3:20 p.m.) traffic at the three schools are very congested and will likely be made worse by Project construction. Additional delays and added traffic resulting from construction of the Project could exacerbate the congestion

and potentially threaten the safety of students exiting and entering vehicles. The queue of vehicles creates temporary restrictions to sight lines that exacerbate the safety of the three schools. The Draft EIR should identify appropriate mitigation measures to reduce any discovered potential safety or educational impacts to less than significant.

As discussed above, it is anticipated that the construction of the Project would result in lane and street closures. Additionally, it is anticipated that certain pedestrian and bicycle thoroughfares would be closed during construction. The Draft EIR needs to analyze the impact of such closures on students walking or biking to and from the four schools and include appropriate mitigation measures to ensure that the students can safely navigate their ways to and from school.

6. UTILITIES.

The RIS states that there are several utilities within 15 feet of the alignment along Prairie Avenue and a 60-inch LADWP main pipe located on the east side of Prairie Avenue. (RIS, p. IS-102.) Per Title 5, California Code of Regulations section 14010(h), any high-pressure or hazardous material pipeline within 1,500 feet of a school site could constitute a potential hazard to students and staff and that a pipeline safety study is necessary. Since the three schools are within 1,500 feet of the Project, any relocation or addition of such pipelines needs to be analyzed and appropriately mitigated in the Draft EIR.

7-8

CONCLUSION.

The District desires that the Project's potentially significant and cumulative impacts to the students, parents, faculty, and staff of the District's schools are appropriately analyzed and mitigated while this important mass transit project becomes a reality. Accordingly, the District respectfully requests that the Draft EIR include those analyses and mitigation measures pertaining to the four schools as set forth herein.

Thank you for the opportunity to participate in this review process and for your consideration of the above. We look forward to continuing to work collaboratively with the City on this and many other projects to benefit the students and communities of Inglewood. If you have any questions or wish to meet, please contact me at Erika.Torres@inglewoodusd.com or call me at (323) 459-9291.

7-9

Sincerely,

Erika F. Torres

RE: Revised Notice of Preparation (NOP) and Initial Study (IS) for the Inglewood Transit Connector Project

Dear Ms. Wilcox:

On behalf of the Los Angeles Conservancy, I am writing to comment on the Inglewood Transit Connector Project Notice of Preparation (NOP) and Initial Study (IS). The project proposes to build an automated people mover (APM) to transport pedestrians between Metro's Crenshaw Line station, downtown Inglewood, the Forum, and SoFi Stadium. The proposed 1.6 mile long above ground APM will be constructed along Market Street, Manchester Boulevard, and Prairie Avenue with a total of three stations. Construction will occur within the public right of way.

I. Nine historic resources within the Project Area will be adversely impacted by the proposed project

The Project Area for the Inglewood Transit Connector Project contains ten identified historic resources. Of the ten, nine are located between East Regent Street and Manchester Boulevard and the Forum located on Prairie Avenue. Between Regent and Manchester, eight historic resources are identified as eligible for listing in the California Register of Historical Resources and National Register of Historic Places. One property, the Fox Theater located at 115 N Market Street, is listed on the National Register.

9-1

As Historic Resources Group (HRG) stated in their Preliminary Historic Resources Investigation (Appendix B) of the Initial Study, the project will have significant and unavoidable indirect impacts to historic resources if constructed.

II. Alternatives to the proposed route must be explored

As stated above, the proposed project will have significant and unavoidable adverse impacts. The Conservancy urges the City of Inglewood to review and consider all available alternatives to this plan. Is it essential for the APM to travel along Market Street or is there an environmentally superior project route? Can the APM be designed in a manner that may reduce impacts on historic resources to less than significant levels? Such alternatives should be fully explored and seriously considered to avoid impacts to historic resources. 9-2

III. Conclusion

As proposed, Inglewood Transit Connector Project will have significant and unavoidable impacts to historic resources. The current APM route, which moves south along Market Street and East along Manchester Boulevard contains a collection of historic resources that date from 1920 to 1950. To avoid impacts to these resources, the Conservancy strongly encourages the City of Inglewood to explore alternative routes as well as APM designs whereby the impacts may be reduced to less than significant levels. 9-3

About the Los Angeles Conservancy:

The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 5,000 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Please do not hesitate to contact me at (213) 430-4203 or afine@laconservancy.org should you have any questions or concerns.

Sincerely,

Adrian Scott Fine
Director of Advocacy

mwilcox@cityofinglewood.org

Re: Inglewood Transit Connector Project Initial Study

Dear Ms. Wilcox:

I am writing on behalf of Thomas Safran & Associates (TSA), a local stakeholder in the Inglewood Community, to provide comment on the Revised Initial Study the City of Inglewood ("City") recently released for the Inglewood Transit Connector project (ITC). TSA owns four properties on Market Street in close proximity to the proposed northern terminus of the ITC. In the collaborative spirit in which TSA and the City have partnered to bring over three hundred residential units to this area, TSA is looking forward to working with the City to help ensure that the ITC matches the long-planned vibrancy for the neighborhood surrounding the Downtown Inglewood Metro station.

10-1

Given the proximity of TSA's properties to the alignment, especially the northern terminus, TSA would like to review more detailed information about the project, including plans, renderings, and other available project concepts and anticipated specifications. Evaluating plans for the proposed northern terminus of the ITC, its design (including anticipated finishing materials) and connection to the Downtown Inglewood Metro station would equip TSA to offer meaningful feedback that will benefit the ITC, TSA's neighboring residential projects, and other nearby structures. TSA would prefer to review such materials prior to the commencement of EIR analysis. However, if such materials are not available, TSA is willing to work with the City on their development.

As the City proceeds with environmental analysis, TSA requests that the EIR treat TSA's properties as sensitive receptors for all noise, air quality, and GHG analysis. The Revised Initial study acknowledges the property identified by the City as *D-3* is currently under construction with residential uses; as such, it will be evaluated as a sensitive receptor. TSA requests that the EIR also treat properties located at 139 North Market Street and 158 North Market Street as sensitive receptors. Though these lots are currently vacant, TSA purchased them from the City with the understanding that they would be developed with residential units. Similarly, TSA has been analyzing renovating the Fox Theater as a residential structure. As TSA continues working towards the goal of establishing residential uses at these locations, it is important that the EIR simultaneously analyze that eventuality.

10-2

In addition to analyzing these properties as sensitive receptors, TSA has identified issues specific to these properties that we want to bring to the City's attention prior to commencement of EIR analysis. Light, glare, shade, and shadow could potentially create aesthetic impacts to residential units located at D-3, 139 North Market Street, and 158 North Market Street. Further, project design analyzed by the

10-3

11811 SAN VICENTE BLVD. LOS ANGELES, CA 90049-5063 TEL (310) 820-4888 FAX (310) 207-6986

THOMAS SAFRAN & ASSOCIATES

EIR should account for posts and other equipment at street level to ensure that development of residential or mixed-use projects at 139 North Market Street and 158 North Market Street is not precluded by the ITC. The EIR should memorialize that the ITC will specifically be designed to allow for these projects' development. TSA would appreciate analysis of engineering solutions the EIR could include to mitigate and/or avoid these potential impacts. 10-4

The Revised Initial Study acknowledges that the Fox Theater is listed on the National Register of Historic Places but suggests that impacts to the Fox Theater as a historic resource would be limited since the ITC would not be taller than the structure. As the building is characterized by its architectural significance, it is important that the EIR analyze how the ITC may impact the Fox Theater, a historic resource, pursuant to Public Resources Code § 21084.1. 10-5

Finally, TSA is requesting more information regarding the anticipated Overlay Zone described in the Revised Initial Study. TSA believes that, consistent with state policy prioritizing transit-oriented development, any overlay zone implemented associated with the ITC should include zoning refinements to expedite the entitlement process for mixed-use and residential development. TSA is willing to work with the City to help ensure that the anticipated Overlay Zone is consistent with the City's intentions. 10-6

TSA is excited to be a part of the emerging Inglewood. Major changes in Inglewood are underway, with the renovation of the Forum, the opening of Sofi Stadium, and the Basketball and Entertainment Center. The City continues to implement its vision for the future of Inglewood, connecting these exciting venues to the County's mass transit system. TSA considers itself a proud stakeholder in the reimagining of Inglewood, developing much needed housing in the heart of the City which will allow the community to live and thrive around these new facilities. We look forward to our continued, enduring partnership with the City. 10-7

Sincerely,

Jordan Pynes

RE: Inglewood Transit Connector Revised Notice of Preparation

Dear Ms. Wilcox,

BYD has reviewed the *Revised Notice of Preparation for an Environmental Impact Report* dated September 10th 2020 and we appreciate the opportunity to do so at this critical juncture for the project.

11-1

Please note that BYD does not have comments on the *Revised Notice of Preparation*. We and our partners remain in full support of this truly transformative project for improved mobility in the City of Inglewood and Los Angeles County. We look forward to the positive social and economic benefits transportation systems like these can bring to the communities in which we serve.

Sincerely,

Patrick Duan
Senior Vice President of Operations
BYD Transit Solutions

CL 12

Mindy Wilcox, AICP
Planning Manager
City of Inglewood
Planning Division
One W. Manchester Boulevard, 4th Floor
Inglewood, Ca. 90301

Comments regarding: Revised notice of preparation for the Inglewood Transit Connector Project

In the original Notice of Preparation (NOP), four potential sites were identified for the support facilities. In the revised NOP, it appears that one of the sites has been selected as the Maintenance Support Facility (MSF). This selected site is currently occupied by a VONS supermarket, Planet Fitness, and gas station. Based on the information provided in the NOP, the businesses within this commercial plaza would be demolished. 12-1

In general, I am supportive of the transit project, but strongly opposed to an eminent domain acquisition and demolishment of the VONS supermarket. The VONS at this location serves thousands of Inglewood residents in the surrounding geographical area. It is the only one of two supermarkets located between the western border and eastern border in the city of Inglewood, that is South of Florence Blvd. and North of Century Blvd. 12-2

This VONS serves a large swath of Inglewood residents and is largely walkable from a good portion of the area. This VONS also serves many senior citizens who live in the area such as myself, a resident of the area for the last 20 years. In my opinion, the loss of VONS would be a huge impact as it would be a sacrifice that would become a permanent inconvenience to the surrounding community.

The Automated People Mover would minimize automotive traffic through the city between certain hours of the weekday and weekends. However, the loss of the VONS supermarket that is available to residents 18 hours a day and 7 days a week is not an acceptable tradeoff. 12-3

Personally, I do not think there has been sufficient outreach to let the community know what will be impacted in this proposal. There was one outreach meeting sponsored by Trifiletti Consulting in late 2019, but no other information in the last 9 months prior to the revised NOP. 12-4

I would request that the consultants look again at the potential site that sits near the north west corner of Prairie and Century as an alternate MSF location. It was identified as a gas station and auto shop in the initial study. It seems to me that this location would have less of an impact to the residents of the city that reside in or near the project area. 12-5

Also, the description of the potential station location at Prairie Ave/Pincay Drive does not indicate if there would be a street closure involved going west on Kelso street, or going east on Pincay street. If so, this would also be a huge inconvenience for the area residents. I hope to see more information and have input regarding the ongoing plans for this intersection and the transit project as a whole. 12-6

Regards,
William Harris, Inglewood Resident

Appendix A: ITC Alignment Plan and Profile
Appendix B: Prairie Ave. Utility Review Summary
Appendix C: Five Station Alignment
Appendix D: Potential Locations for Traction Power Substations
Appendix E: Correspondence with Southern California Edison

1. Introduction

1.1. Project Background

The City of Inglewood is currently developing an Environmental Impact Report to evaluate the environmental effects of the proposed Inglewood Transit Connector (ITC) Project.

The ITC Project was developed to address the anticipated increase in mobility needs due to the City's projected population and employment growth and the new sports and entertainment venues. The City recognized that in order to provide quality and high level of service for residents, commuters, and event attendees, a transit system providing the “last mile” connection between the future Metro Crenshaw/LAX Station and the event venues is needed. The transit system would also improve economic activity along the alignment, providing opportunities for integration with transit-oriented development and other initiatives in the area.

In June 2018, the City of Inglewood released their Envision Inglewood report which established the City’s locally preferred alternative for providing automated transit service to the City’s growth centers. Named the Inglewood Transit Connector (ITC), this system would provide high-frequency service between the future Downtown Inglewood Metro Crenshaw/LAX Station and the Forum; the Los Angeles Stadium and Entertainment District at Hollywood Park (LASED), which is the home of the LA Rams and LA Chargers NFL teams; and the Inglewood Basketball and Entertainment Center (IBEC), which is the future home of the LA Clippers NBA team. The ITC system will provide service to residents and commuters on non-event days, and special event service on event days.

1.2. Report Purpose

The scope of this report is to present the results of the conceptual planning performed in support of the development of the EIR project definition.

The analysis includes:

- Description of the Automated People Mover (APM) configuration, including guideway geometry
- Overview of the APM demand
- Basis for the APM project
- Description of APM system operations and operating modes
- Normal and event-based operations
- Round trip times, fleet, and system capacity
- Maintenance and Storage Facility conceptual requirements
- Power Distribution Substation conceptual requirements
- Conceptual cost estimates for the APM operating system

These Conceptual Plans identify the proposed Alignment for the APM, which will be in the public right of way, with supporting facilities on property located adjacent to the public right of way as described further below. These Conceptual Plans will be refined as design of the facility progresses. However, in order to evaluate potential impacts of the project, the size of the APM guideway, columns and other components of the Project as identified in the Conceptual Plans illustrate the likely maximum potential

size of these elements. The location, layout, and size of the proposed stations, traction power substations, and maintenance and storage facility as illustrated in the Conceptual Plans also represent the likely maximum potential size of these facilities for the purpose of analyzing the potential impacts of the Project. The description of the proposed changes to streets identified in the alignment plans are also illustrative and identify the likely maximum potential extent of changes to existing streets proposed as part of the Project. Engineering and design-level details of the Project will be refined as the Project moves through the environmental review, approval, procurement, and design processes

1.3. Basic Assumptions

Initial planning for the ITC project was conducted under the Envision Inglewood effort, which included an alignment alternatives review, ridership development, operational analysis, and identification of the preferred alignment.

For this project, assumptions and parameters established under the Envision Inglewood effort were reviewed to determine their continued applicability for the ITC project. The following assumptions for the operations of the ITC system were identified as being relevant and are continued to be used as basic assumptions for the ITC Project.

- The ITC alignment would further refine Alignment A of Envision Inglewood: Market-Manchester Alignment, which was selected as the preferred alignment for further study. This alignment is also included in the City of Inglewood Notice of Preparation and Notice of Public Scoping Meeting for an Environmental Impact Report, July 16, 2018.
- The five-station alignment developed for the Envision Inglewood project was further refined for cost and operational efficiencies. The proposed dual lane system serves three (3) stations:
    - Market Street / Florence Avenue Station (Market St. Station), located at Market St. and Florence Ave., which provides connection to the future Downtown Inglewood Metro Crenshaw/LAX Station;
    - Prairie Avenue / Pincay Drive Station (Forum Station), located at Prairie Ave. and Pincay Dr., which provides connection to The Forum and LASED; and
    - Prairie Avenue / Hardy Street Station (Hollywood Park Station), located at Prairie Ave. and Hardy St. which provides connections to LASED and the IBEC Project.
- The ridership developed for the Envision Inglewood Appendix B: Ridership Memo was refined based on the assumptions used in the IBEC EIR effort to ensure the basis for both projects are consistent.
- Capacity per car is based on a passenger space allocation of 2.7 square feet per passenger identified in Envision Inglewood, Section 4.5 Operations Analysis, which this evaluation confirms is consistent with the FTA Transit Cooperative Report Program 57's definition of AW2 design load (seated plus 4 standing passengers per square meter).
- Technology will be automated people mover (APM) systems, which include the three potential self-propelled technologies identified in the Envision Inglewood report: rubber-tire, large monorail, and steel wheel/steel rail were identified to be maintained for consideration. These three technologies were further assessed as part of the ITC Project. See Section 3. The

assessment found that while the application of steel wheel/steel rail technology is considered challenging due to the physical constraints, they are not precluded from proposing on the project to provide industry an opportunity to evaluate and determine its applicability to the project.

- The system operates daily from 6am to 11:59pm and shuts down from 12am to 5:59am. Extended hours may be operated for special event days.

2. System Layout

The ITC systems is a fully elevated, APM system, spanning a total length of approximately 8,500 ft. (dual lane) and connecting a total of three, center platform stations, as shown in Figure 2-1.

On the north end of the alignment, the system begins with the Market St. Station located on Market St. just south of Florence Ave., serving the future Metro/LAX Crenshaw LRT Station located on Florence Ave and the historic Market St. district. The ITC Project will operate as an extension of existing transit facilities by providing a station and passenger walkway connecting the ITC Project to the Downtown Inglewood Station on the Metro Crenshaw/LAX Line. The ITC Project is necessary to close the last-mile gap between the Crenshaw/LAX line and the City's new activity centers, allowing passengers to transfer to or from the Crenshaw/LAX Line to the City's activity centers. The alignment runs southwest for approximately 0.35 miles, turning east at Manchester for another 0.5 miles until turning south on Prairie Ave.

The alignment continues south on Prairie Ave. for approximately .75 miles, ending north of Hardy St. The two event-serving stations, Forum Station and Hollywood Park Station, are located along Prairie Ave. Further information on stations is provided in Section 6.

The stations are located over the roadways to minimize impacts to existing developments and to remain within the public right of way to the extent possible; this approach minimized impacts on private properties and the potential acquisition requirements. Where possible, the dual tracks are narrowed and designed to allow for a single column to support the structure, thus minimizing the infrastructure needs.

Trains will be maintained and stored at an off-line Maintenance and Storage Facility (MSF), which is planned to be located at 500 E Manchester Blvd, Inglewood, CA 90301 at Manchester Blvd. and S Hillcrest Blvd. Further information on the MSF is provided in Section 8.

The system is planned to be powered by two power distribution substations. The final locations of the substations are yet to be confirmed with the local utility and City as of the time of the writing of this report. However, tentative locations have been identified and are discussed in Section 9.

The alignment profile was developed assuming a minimum clearance of 16 ft. – 6 in. is required above all roadways. The alignment elevation is dictated by the elevation at the stations. The alignment elevation between stations is then adjusted to ensure the minimum roadway clearance is maintained.

The full alignment plan and profile is provided in Appendix A.

Figure 2-1: Map of Proposed System Alignment
(Preliminary conceptual draft: subject to change)

2.1. Utilities Review

During the development of the ITC alignment, the City of Inglewood advised that the large water and sewer pipes along Prairie Ave. are to be avoided. Relocation of these utilities would be a major effort.

Based on the review of the City-provided utility information, the large water and sewer pipes are concentrated either in the center or eastern edge of Prairie Ave. The location of these pipes is provided in Appendix B.

The location of these utilities guided the development of the alignment along Prairie Ave. Where the alignment is pinched together to be as narrow as possible, the alignment is located on the western edge of Prairie Ave., thus allowing for future columns to avoid the large water and sewer utilities.

2.2. Alternatives

The five-station alignment developed for the Envision Inglewood project was further refined as part of the ITC Project. This effort included the refinement of the alignment and station locations, including review of a station south of Century Blvd. As part of an optimization effort, station locations and their connectivity to the City's growth centers were assessed against various parameters, including passenger demand, operations, and cost. Through this effort, the alignment was refined to three stations, optimizing the level of service for its passengers while providing cost benefits. The Market St. Station was refined to allow for a more seamless connection to the Metro station, minimizes infrastructure over Market St., and provides residential and commercial development opportunities to further enhance the Market Street commercial district. Manchester Station was removed as a non-event serving station. The Forum Station and Hollywood Park Station locations were refined to optimize service to the future growth centers, The Forum, the LASED development, and the IBEC development.

3. Technology

The ITC Project's transit technology is a form of light rail technology that can be steel-wheel/steel rail, rubber tired, or magnetically levitated. The technology can also be supported on dual rails (that may be steel rail or concrete plinths), straddling or suspended from a single beam/rail such as in a monorail type technology, and operate within a dedicated trainway. Power distribution will be through a third rail instead of overhead catenary to avoid additional visual impacts due to the overhead catenary system wires and support structures. It will be fully automated (i.e. driverless) which is necessary to operate at the tight headways to meet the projected ridership needs. The vehicles are smaller than traditional heavy rail technology so as to successfully maneuver the tight curves driven by the site-specific conditions. This type of technology is often times also referred to as automated guideway transit, automated people movers or simply monorails; regardless of the terminology used it is a form of a light rail technology.

3.1. Technology Assessment

As part of this ITC project, the Envision Inglewood technology conclusions were further assessed against the ITC project's alignment and station refinement efforts. These refinement efforts focused on ensuring that the physical requirements for the project (i.e. alignment including turn radii, guideway widths, station sizes, traction power substations and Maintenance and Storage Facility) were developed based on maximizing the number and types of automated transit system technologies that may be viable for the project – this encourages a robust competitive procurement environment. A key driver of potential technology viability was the ridership capacity, ability to fit within the physical project requirements, operational flexibility, and noise during operations.

The Envision Inglewood technology evaluation identified Large Monorail and Rubber-tire APMs as the technology to be maintained for consideration for the ITC project, and identified large automated steel-wheel/steel rail technology as a "maybe" for further consideration.

As part of this ITC project, the technical requirements for large automated monorail, rubber-tire, and automated steel-wheel/steel-rail, also known as automated light rail transit (ALRT), were reviewed against the public right of way and property availability to determine the technologies best applicable for the project. The results of the review, also summarized in Table 3-1, are as follows:

- It was confirmed that large, automated monorail and rubber-tire APM technologies are still applicable and appropriate for the project. The requirements for rubber-tire and large monorail APM technologies were used in the project design.
- The review concluded that the typical automated steel-wheel/steel-rail requirements of technologies currently available should not continue to be used in alignment planning due to the resulting need for additional property acquisitions requirements and potential higher noise levels.
- **Although steel-wheel/steel rail design requirements were not applied to the design of the project, they are not precluded to propose on the project if they can fit within the identified right of way and meet all other specified requirements.** This provides industry the opportunity

to offer the best possible solution for application of steel-wheel/steel rail technology to the project, within the constraints that are defined.

While rubber tired APM systems, including monorail systems, can be readily applied to the project requirements as defined, steel wheel/steel rail technologies may also be applied to the project provided they sufficiently demonstrate the ability to comply with the established project requirements including maximum limits on noise and fitting within the defined physical space of the project. Certain suppliers offer or are in the process of updating their steel wheel/steel rail technologies to meet these requirements, and it is therefore prudent to allow the market to determine the best solution in terms of the proposed technology as part of the procurement process.

TECHNOLOGY	MEETS CAPACITY	STAYS WITHIN ALIGNMENT SPECIFIC CONSTRAINTS/ GEOMETRY	AVOID MSF PROPERTY IMPACTS	LOW NOISE POLLUTION	SUMMARY OF VIABILITY
Rubber-tire APM	Yes	Yes	Yes (Fits within proposed site)	Yes	Yes
Monorail	Yes	Yes	Yes (Fits within proposed site- requires two trains to be stored at stations)	Yes	Yes
ALRT*	Yes	No	No	No	Not recommended

*Steel wheel/steel rail are not precluded from proposing.

Table 3-1: Summary of comparison between possible rail technologies

The following sections provide further information on the rubber-tire, large monorail, and automated steel-wheel/steel-rail technologies and suppliers.

3.2. Self-Propelled Rubber-Tire APMs

Large rubber-tire APM systems are in widespread use at airports around the world, as well as in urban areas. These systems feature one-car to six-car trains operating in a shuttle or pinched loop configuration. Typical characteristics include:

- Train speeds of up to 50 mph;
- Urban system car capacity of approximately 90 to 100 passengers per car;
- Minimum turning radius of 180 ft.;
- Vehicle dimensions of approximately 40 to 42 ft. long by approximately 9 ft. wide;
- Maximum recommended grade of 6%.

Currently available self-propelled rubber-tire APM technologies are:

- Bombardier INNOVIA APM 300
- Mitsubishi Heavy Industries (MHI) Crystal Mover
- Siemens CityVAL and AirVAL: Currently implementing first AirVAL system at Bangkok Suvarnabhumi International Airport and CityVAL is anticipated to begin service in Rennes, France in December 2020.
- IHI/Niigata I-Max: IHI / Niigata has developed a new, larger vehicle, the "I-Max", and tested it extensively on a test track in Korea. This vehicle has yet to be implemented on a project.
- Woojin Industrial Systems Rubber-tire APM

These are generally proprietary technologies that preclude interoperability as they each have different physical dimensions, power/signaling requirements, guidance mechanisms, and other features. MHI and IHI are potential exceptions to this rule, though interoperability requirements significantly limit the range of vehicle design, performance and other factors.

While rubber-tire APMs are most common at airports, they are also operated as urban transit systems. Urban Systems where this technology is operating, and the suppliers of the systems include:

- Europe
  - France Rennes Metro: Siemens CityVAL
- United States
  - Miami, Florida Metromover: Bombardier
- Asia
  - Shanghai Metro Line 8: Bombardier INNOVIA APM 300
  - Guangzhou Zhujiang New Town: INNOVIA APM 100
  - Singapore Bukit Panjang LRT: Bombardier INNOVIA APM APM 100
  - Singapore Sengkang and Punggol LRT: MHI Crystal Mover
  - Macau Taipa LRT: MHI Crystal Mover (opening 2019)

Bombardier INNOVIA APM 300

Bombardier has provided by far the most airport and urban APM systems. In addition to 20 worldwide airport projects, they have also implemented six urban systems in China, Singapore, and the United States. Their current vehicle is the INNOVIA APM 300, operated at Dubai International Airport and being implemented at Frankfurt International Airport. The INNOVIA APM 300 is a center-guided vehicle, with all guidance, power rails, and equipment located between the vehicle tires.

Figure 3-1: Bombardier INNOVIA APM 300, Shanghai (Source: chinanews.com)

MHI Crystal Mover

MHI (Mitsubishi Heavy Industries) has several urban APMs in Japan and Singapore and is nearing the completion of the Macau Taipa line, which will operate 11 stations and 55 vehicles. It is also a strong player for airport APM systems, with 12 total urban and airport projects worldwide. The Crystal Mover is a side-guided vehicle, with all guidance and power rails and equipment located on the sides of the vehicle.

Figure 3-2: MHI Crystal Mover, MIA Mover, Miami International Airport (Source: Lea+Elliott)

Siemens AirVAL

Siemens Transportation's latest generation of their VAL system are the AirVAL and CityVAL transportation systems. The AirVAL and CityVAL systems differ in vehicle width only; all other systems (train control, guidance, etc.) are the same. In 2018, Siemens began operation of their first CityVAL system on the Rennes Metro in France and they are implementing their AirVAL system at Bankok's Suvarnabhumi International Airport. The AirVAL and CityVAL are center-guided vehicles, with all guidance and power rails and equipment located between the vehicle tires.

Figure 3-3: Siemens CityVAL, Rennes, France (Source: Siemens)

IHI/Niigata I-MAX

IHI/Nigata has developed a new Japanese standard vehicle, the "I-Max", and tested it extensively on a test track in Korea as shown in the figure. However, this vehicle has yet to be implemented on a project, the I-Max is larger than the vehicles that IHI provided to Hong Kong International Airport. The I-MAX is a side-guided vehicle, with all guidance and power rails and equipment located on the sides of the vehicle.

Figure 3-4: IHI I-Max

Woojin Industrial Systems

Woojin is a newer APM supplier with only two airport APM systems in operation. The Seoul Incheon airsideTerminal 2 shuttle APM system began operations in January 2018, and the Jakarta Soekarno-Hatta Airport landside systems began operations in 2018. In addition, Woojin implemented the Busan metro line No. 4 (South Korea) which operates their automated guideway transit (AGT) technology, a similar automated, rubber-tire technology. The Busan system started revenue service in 2011.

Figure 3-5: Woojin APM, Soekarno-Hatta Airport, Indonesia (Source: Gunawan Kartapranata)

3.2.1. Applicability to ITC Project

Rubber-tire APMs are feasible and applicable for the ITC project.

- Capacity: With a vehicle capacity of approximately 97 passengers per car, this technology can meet the demand requirements for the ITC project.
- Alignment Specific Constraints / Geometry: The minimum turning radii for operating and maintenance tracks are well suited for the urban environment and geometric constraints of the Manchester MSF location. This technology has the least impacts to existing properties.
- MSF: The site slated for the ITC MSF can fit an MSF facility capable of performing all required maintenance and can store the full 8-train fleet.
- Noise: Rubber-tire systems have much lower noise impacts compared to rail system.

3.3. Monorails

Monorails are in widespread use in urban environments around the world, as well as some systems at airports. The unique feature of monorails is that they are either supported by or suspended by a single beam, which generally provides a minimized visual impact. Monorails feature connected vehicles operating in a shuttle or pinched loop configuration. Typical characteristics include:

- Train speeds of up to 50 mph;
- Urban system car capacity of approximately 90 to 110 passengers per car;
- Minimum turning radius of 200 ft.;
- Vehicle dimensions large monorails of approximately 55 to 65 ft. long by approximately 9.5 ft. to 10.3 ft wide; and
- Maximum recommended grade of 6%.

Example large monorail systems are:

- Bombardier INNOVIA Monorail 300;
- Hitachi; and
- Scomi Rail.

These are generally proprietary technologies that preclude interoperability as they each have different physical dimensions, power/signaling requirements, guidance mechanisms, and other features.

Urban monorail systems and the suppliers of the systems include:

- South America
  - Sao Paulo Monorail, Brazil: Bombardier
- United States
  - Las Vegas Monorail: Bombardier
- Asia
  - Daegu, South Korea: Hitachi
  - Chongqing, China: Hitachi
  - Riyadh, Saudi Arabia: Bombardier
  - KL Line, Kuala Lumpur Malaysia: Scomi

Bombardier Innovia 300

Bombardier has implemented their Innovia monorail technology in multiple locations worldwide, including in China, Korea, Japan, and the United States. Their current vehicle is the Innovia 300, implemented most recently in Brazil. The technology is a straddle-beam technology.

Figure 3-6: Las Vegas Monorail Four-Car Vehicle

Hitachi

Hitachi has a range of monorail vehicle sizes, ranging from small systems, such as the monorail on Sentosa island in Singapore, to large technologies implemented in Daegu, South Korea. The technology is a straddle-beam technology.

Figure 3-7 Hitachi Monorail, Daegu Metro Line 3 (Image source: IMKSv)

Scomi Rail

Scomi Rail is a rolling stock supplier in Malaysia, implementing multiple projects in Asia including in Kuala Lumpur and Munbai. The technology is a straddle-beam technology.

Figure 3-8: Scomi Rail Monorail, Kuala Lumpur (Image Source: Howard Pulling)

BYD Skyrail

Build Your Dreams (BYD) is currently actively marketing their Skyrail monorail technology worldwide. Skyrail currently has projects in implementation; however, no projects are currently in operation. The technology is a straddle-beam technology.

Figure 3-9 BYD Skyrail Monorail, Shenzhen (Image source: BYD)

3.3.1. Applicability to the ITC Project

Large monorails are feasible and applicable for the ITC project.

- Capacity: With a vehicle capacity of approximately 100 passengers per car, this technology can meet the demand requirements for the ITC project.
- Alignment Specific Constraints / Geometry: The minimum turning radii for operating and maintenance tracks are well suited for the urban environment and geometric constraints of the Manchester MSF location. However, it does have larger property impacts at tight turns at Market St./Manchester and Manchester/Prairie where tight turns are needed.
- MSF: The site slated for the ITC MSF can fit an MSF facility capable of performing all required maintenance and can store the six-train fleet.
- Noise: Rubber-tire systems have the much lower noise impacts compared to rail system.

3.4. Automated Light Rail Transit (ALRT)

Large steel-wheel APM systems operate in numerous urban settings and two landside airport applications: New York Kennedy (JFK) and the Beijing Capital (PEK) International Airports. Urban applications of this technology include Vancouver, Toronto, Detroit, Dubai, Riyadh, Copenhagen, Breccia, Kuala Lumpur, and Honolulu (under construction). Train length ranges from two to six vehicles. Train speeds range between 50 and 60 mph. Suppliers of this type of technology include Alstom, Ansaldo-Breda, Bombardier, MHI, and Rotan.

Three examples of automated light rail transit (ALRT) technologies and associated systems are:

- The Mark II system manufactured by the Bombardier and installed at New York JFK (Air Train), Beijing Capital International Airport (Airport Express of the Beijing Subway), and Vancouver (SkyTrain)
- Breda Metro driverless light rail system for Copenhagen, Denmark
- The Kinki Sharyo/Mitsubishi system for the Dubai Metro.

The greater capacity and speed of this technology makes it more suitable for systems with relatively straight alignment on dedicated transportation right of way for the system.

Figure 3-10: Bombardier MKII Sky Train Vancouver, British Columbia

Figure 3-11: KinkiSharyo/Mitsubishi, Dubai Metro, UAE

3.4.1. Applicability to the ITC Project

ALRT technology is not recommended for the ITC project. However, the technology is not precluded from proposing on the project if they can fit within the identified right of way and meet all other specified requirements.

- Capacity: With a vehicle capacity of approximately 140 passengers per car, this technology can meet the demand requirements for the ITC project.
- Alignment Specific Constraints / Geometry: The minimum turning radius (300 ft. operating) is larger than what can be easily accommodated in Inglewood's urban environment and geometric constraints of the Manchester MSF location. It results in much larger property impacts at tight turns at Market St./Manchester and Manchester/Prairie where tight turns are needed.
- MSF: It was found that the site slated for the ITC MSF resulted in space constraints for an ALRT MSF; further property acquisitions are likely to be required if an ALRT MSF is located at the ITC MSF site. However, an ALRT supplier is not precluded from proposing on the project if they can fit the ALRT technology into the identified MSF site without requiring additional property acquisitions.
- Noise: Generally, steel wheel/steel rail systems have higher noise levels than rubber-tire systems, and the tighter the turning radius, the higher the noise levels. As minimum turning radii will be required at Market St./Manchester and Manchester/Prairie, higher noise levels may

occur. However, there are certain suppliers and technologies that, if applied, can mitigate and limit the noise.

4. Projected Ridership

The basis for the normal weekday/weekend and event service projected ridership for the ITC project was first established in the Envision Inglewood report, detailed in the report's Appendix B: Ridership Memo. In the Envision Inglewood report, weekday and weekend demand was estimated on an hourly basis. For event ridership, pre-and post-event demand for small, medium, and large events at each The Forum, IBEC, LASED were estimated. Ridership was projected for all alignment alternatives.

As part of this project, the basis and methodology for the development of the Envision Inglewood ridership was reviewed. It was determined that the ridership projected for the Envision Inglewood Alignment A is applicable for the project definition effort of the ITC project.

The ridership projections were also re-calibrated against the IBEC EIR to ensure that the assumptions for the development of the projected ridership were consistent between the ITC and IBEC projects.

In addition, further assumptions were established that were necessary to solidify the projected ridership. Those assumptions are:

- While it cannot be confirmed that there will be no conflicting events at The Forum, LASED, and the IBEC, it is confirmed by the City of Inglewood that it can be assumed that if there are overlapping events, they will not be NFL and NBA games.
- No surge factor is applied to the ridership presented in Envision Inglewood. As the riders travel from events to the ITC station, they are metered and distributed at various points, including funneling through designated exists, walking the distance to the station, buying tickets at the ITC station, and passing through the fare gates. The riders can therefore be assumed to arrive in a fairly consistent rate throughout the hour.

Based on these assumptions, the following are the final projected ridership numbers for the ITC project:

PEAK PERIOD	PROJECTED RIDERSHIP	PROJECTED FREQUENCY
Normal Weekday/Weekend	441 peak hour passengers	Daily
Single Large Event: NFL Game	8,910 passengers departing the Los Angeles Stadium within the one hour after the end of event	20 events per year
Three-Event Scenario: NFL Midsized Game + IBEC Concert + Forum Concert	9,600 passengers departing Market St. Station post events	Rare

Table 4-1: Projected ridership numbers during peak periods

5. System Operations

5.1. Typical Operations

The ITC will be a "pinched loop" system, whereby trains operate back and forth from the Market St. Station to the Hollywood Park Station, stopping at each station along the way and reversing at "turnbacks" at each end of the system. Trains will crossover to the adjacent guideway prior to entering the Market St. Station and reverse direction when leaving the station. At the Hollywood Park Station end of the line, trains will also crossover prior to entering the station and reverse direction when leaving the station.

The system is planned to operate from 6am to 12am for normal weekday/weekend service, with the possibility to add trains and extend hours, as needed, to serve special events. Generally, additional service will be provided before the start of an event to bring passengers to the venue, and again at the end of the event to bring passengers back to the LA Metro system.

At the start of service, the Central Control Operator (CCO) will issue a command to initiate the required operations. The Automated Train Control (ATC) system will then automatically dispatch the necessary number of trains to the mainline from the MSF. The ATC system should be designed so that the station dwell times are adjusted until the trains are equally spaced at the required headway. To adjust the operating fleet for special event service, the CCO will issue commands to inject trains onto the mainline guideway. For removal of trains from the system, maintenance personnel will be staged at one or more stations to ensure that all passengers have deboarded the trains prior to the trains going out of service.

5.2. Simulation and Performance

The Lea+Elliott Train Performance Simulation Model (TPSim©) was run for the ITC alignment and the results were used to calculate the optimal number of trains and cars per train to provide the capacity required to meet the normal weekday/weekend and event ridership projections. An analysis of the minimum operating headway and other operating constraints were included in this analysis.

The simulation results are subject to change based upon refinements to the ridership demand forecasts and changes to the alignment, crossovers locations, station configuration, and other aspects of the system.

The following are the operational parameters assumed for the TPSim© simulation:

- Conventional self-propelled large APM technology
- Pinched loop operations, serving all three stations
- Maximum potential vehicle speed of up to 50 mph but operating at a maximum of 45 mph for passenger comfort
- Station dwell of 40 seconds to accommodate larger numbers of passengers needing to board or deboard at once, as would occur for events. The dwell times for normal weekday/weekend service is anticipated to be shorter due to low demand. The longer dwell time for event service is therefore assumed for the operational analysis.
- Simulation inputs included:

- Lateral acceleration: 0.075 g
- Jerk rate: 0.06 g/s
- Brake rate: 0.08 g/s
- Super elevation through curves: 3%
- Speed limits were applied in specific sections of the route to prevent speed surges (spikes) that would impact passenger ride comfort.

Based on the simulation, the estimated round trip time for the pinched loop is 12.5 minutes (750 seconds). Trip times, dwell times and round trip times for the pinched loop are shown in Table 5-1. Graphs of train velocity and trip distance versus time are provided in Figure 5-1.

TO / FROM	MARKET STREET	THE FORUM	HOLLYWOOD PARK
Market Street	N/A	4.7	6.8
Forum	3.7	N/A	2.1
Hollywood Park	5.7	2.0	N/A

Table 5-1: Forecasted Northbound Station-to-Station In-Vehicle APM Travel Times (minutes)

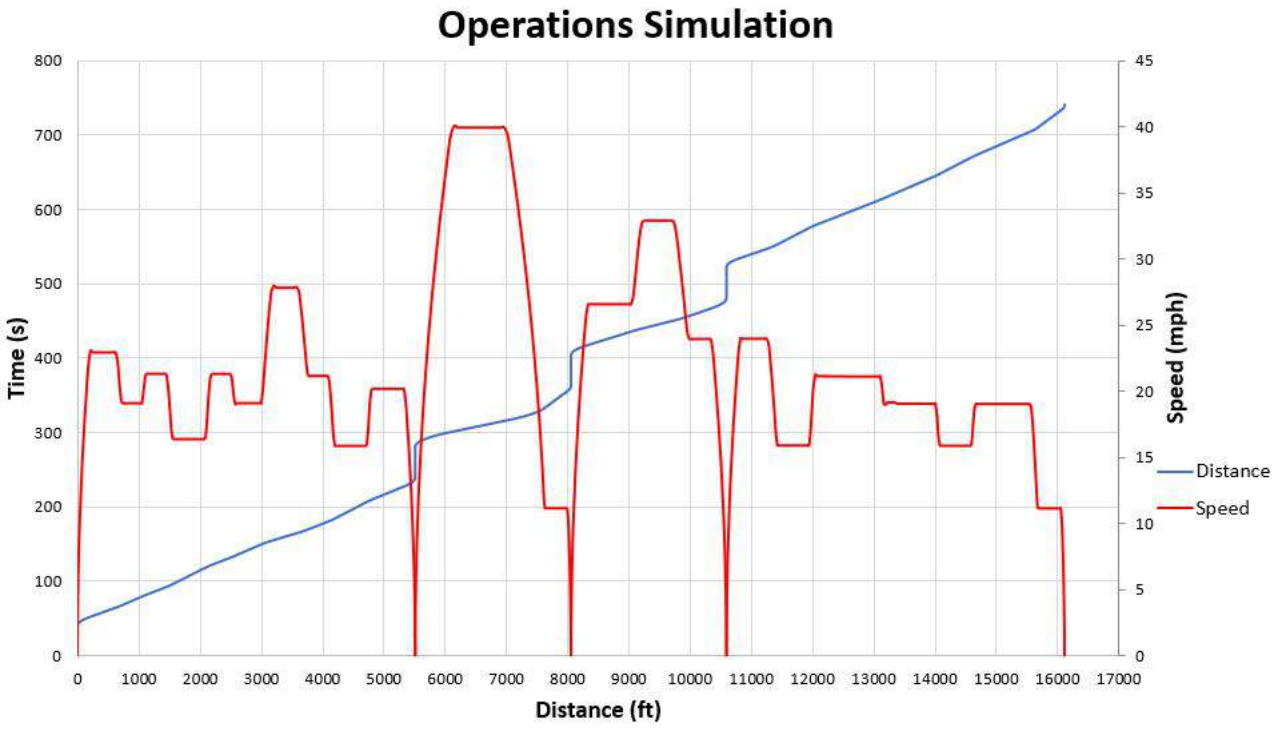

Figure 5-1: Train Velocity (mph) and Trip Distance (ft.) versus Time (minutes)

5.3. Minimum Operating Headway

To minimize the overall footprint of the ITC system, and therefore its impact on the neighborhoods, the crossovers at the end stations, Market St. and Hollywood Park Stations, are location in front of the

stations. However, locating the crossovers in front of the stations limits trains from entering the end stations before the train ahead has departed. Thus, this time between trains being able to occupy the stations is the minimum operating headway.

In a pinched loop operation, the minimum operating headway is the time separation between two consecutive trains at the same end-of-line platform. It also defines the frequency of the operation of the System. In practical terms, this is the time for a given train to approach and enter a switch, traverse the switch, enter the station, dwell, depart the station and clear the switch zone before another train can be permitted to enter the switch zone to enter the station vacated by the prior train.

The headway is affected by:

- Station geometry as related to guideway separation (station width), switch location (optimally switch must be located just outside the station), and the station length relative to the train berthing position.
- Station dwell time.

To minimize the operating headway, the crossovers in front of each of the end stations, Market St. and Hollywood Park Stations, are located as close to the platform as possible. In addition, the station dwell was analyzed as being the minimum dwell required to deboard a full train; as event ridership is directional, the additional time to board a train would be negligible. With this configuration and a minimize dwell to deboard passengers, the minimum operating headway was calculated at approximately 95 sec.

5.4. Fleet Size and Line Capacity Analysis

Line capacity is defined as the number of passengers per hour per direction (pphpd) that the System can carry past any particular point. The estimated fleet size considers the operating fleet, which is the number of vehicles required to provide the necessary line capacity to meet the projected demand, as well as the spare fleet, comprised of the hot standby and maintenance trains to ensure that the number of trains required for operations is always available. The TPSim-developed round trip time is the foundation of the fleet size and APM system capacity.

- Operating Fleet: The ITC system must serve the most frequent, largest event, which is an NFL game at LASED. The fleet size and line capacity analysis therefore sized the operating fleet so that the system can fully serve the 8,910 pphpd demand for NFL events. To serve the 8,910 pphpd ridership demand, a fleet of 5 trains, operating at a 2.5 min. headway is required. For rubber-tire, self-propelled technology, a 4-car train is required. For large monorails, a 4-car train provides the necessary capacity and is of an equivalent length to a 4-car self-propelled APM train.

- Spare Fleet: For the ITC system only one train is assumed to be used for hot standby or maintenance for the ITC system. For typical automated systems that operate the full fleet for normal daily operations, the spare vehicle fleet calculation considers a hot standby train in addition to a minimum of 10 to 15 percent of the operational fleet. This larger spare fleet is

needed to ensure that at all times, including during maintenance rotations, the required number of operating trains is always available for normal service.

However, the ITC system is not a typical automated system. As normal weekday/weekend projected demand is so much lower than event demand, there is added flexibility to perform maintenance during normal weekday/weekend service; maintenance is not limited to only non-operating or off-peak hours. In addition, the full five-train operating fleet is only projected for approximately 20 NFL events, concentrated into 18 weeks of the year, and the occurrence of the three-event scenario is projected to be rare.

For normal weekday and weekend service, the 4-car self-propelled APM trains may be de-coupled into smaller 1- or 2-car trains to provide service that is more optimized to the time -specific, low projected demands. Splitting one 4-car train into two 2-car trains and operating a headway of 6.3 min provides a reasonably good level of service for commuter and daily service and optimizes the utilization of the fleet with respect to the lower demand. Large monorails are more difficult to de-couple so would likely operate the full 4-car train length for normal weekday/weekend operations. The headways of the operating fleet to serve the projected number of passengers are shown in the following table. The APM system also offers the flexibility to provide additional higher capacity if needed in the future to accommodate changes in demand levels, event sizes, event schedules, etc. Operating the full six-train fleet by activating the hot standby train into operation can cover some unique and infrequent situations where the additional capacity is required. This increases the system capacity to approximately 11,100 to 11,500 at a headway of approximately 2.1 min.

PEAK PERIOD	PROJECTED RIDERSHIP (pphpd)	HEADWAY	FLEET	CAPACITY
Normal Weekday	441	6.3 min.	2 x 2-car trains or 1 x 4-car trains	1,850 to 1,950
NFL Event	8,910	2.5 min	5 x 4-car trains	9,300 to 9,700
Three-Event	9,600	2.1 min	6 x 4-car trains	11,100 to 11,500

Table 5-2: Analysis of Project Ridership Numbers Against System Fleet and Capacity

In addition, the stations and system are also capable of adding capacity through the addition of more trains. The ultimate capacity of the system is driven by the tightest headway achievable, considering the safe separation and operational requirements of the turnback. It is estimated that the system capacity can reach about 15,000 pphpd through the addition of up to three additional trains. However, further detailed analysis is required to determine the exact final expandable capacity and associated system and infrastructure design considerations to allow for this level of expandability.

6. Stations

The primary function of the passenger station is to accommodate the boarding and alighting of passengers to and from the APM vehicles. This section discusses the conceptual planning performed for the APM stations, including vertical circulation, platform configurations, and overall station area requirements.

6.1. Basic Functions

Passenger station locations and designs must provide for the efficient and convenient movement of passengers. The functional spaces within APM stations typically include boarding/ deboarding platforms, access or vertical cores for circulation, and system equipment rooms. Features of each functional spaces are as follow:

- Station platforms provide for passenger deboarding/boarding, circulation and queuing at platform doors and are typically sized per the following criteria:
  - Projected peak passenger demands.
  - Space per passenger.
  - Accessibility and associated life safety requirements.
  - Dimensional requirements of candidate APM technologies.
  - Projected maximum trains length.
- Automatic station platform doors, integrated into a platform edge barrier wall separate passenger on the platform from the guideway. The barrier wall and station platform doors can be half- or full-height.
- A refuge area under and along the entire station platform length is required for a person who is on the guideway to escape the path of an oncoming train. This refuge area is required for all platform edges that are along the guideway. A minimum clear cross-sectional area of 2 ft. by 2 ft. is recommended.
- Access and vertical circulation elements include stairs, escalators, elevators, and/or ramps. Requirements are typically determined based on:
  - Capacity to facilitate life-safety platform passenger clearing and exiting requirements.
  - Level of service provided to deboarding passengers in terms of wait time for escalators and elevators.
  - Areas that do not conflict with passenger horizontal circulation and queuing areas on the platforms.
- Station communication and surveillance equipment, including public announcement (PA) speakers, closed circuit television (CCTV) cameras, and static and dynamic signage.
- Equipment rooms are required in each station to house ATC equipment, interface equipment for station doors, dynamic graphics, station CCTV, and public address systems and Uninterruptible Power Supply (UPS) equipment. Station equipment rooms are approximately 1,000 sq. ft. and are to be located within 200 ft. of the station.
- In order to provide access to the Equipment Rooms for equipment delivery, replacement, and maintenance, a freight elevator with the following minimum requirement is recommended, if the room is not located on the ground level:

  - Min door clear width: 6 ft. – 4 in.
  - Min door clear height: 8 ft.
  - Interior dimensions: No smaller than 4,000 lb. interior dimensions
- A janitor's closet of approximately 110 sq. ft. is recommended.

Figure 6-1: Singapore Sengkang LRT Station with Half-height Barrier Wall/Platform Doors, MHI Crystal Mover APM (Image Credit: Peter Velthoen)

6.2. Station Configuration

Based on station size along with ridership and circulation parameters, the platform configuration can take three basic forms, visually presented in Figure 6-2.

- The first configuration is the center platform with cross flow movements, where there is a single center platform with boarding and alighting occurring through the same set of APM train doors. In this configuration, passengers are encouraged to allow the arriving passengers to alight before boarding begins, this option is the least costly and physical space demanding option.
- The second configuration is two side platforms with cross flow movements. By providing two side platforms, the level of service for the station can be greatly increased, and board/deboard times reduced. However, providing two side platforms is more costly, demands more physical space, and requires double the vertical circulation equipment than the center platform configuration. The additional physical requirements may outweigh the benefits of better passenger service.
- The third configuration is flow through, where the station has a center platform for boarding passengers located between the two APM guideway lanes that are in turn flanked by two exterior or side platforms for alighting passengers. This configuration removes cross flow movements by having the doors on the alighting (side) platform open first and then several seconds later having the doors on the boarding platform open. This separates conflicting passenger flows and allows the arriving passengers to begin to clear the vehicle before

departing passengers begin to board the vehicle. However it is the most costly and physical space demanding option.

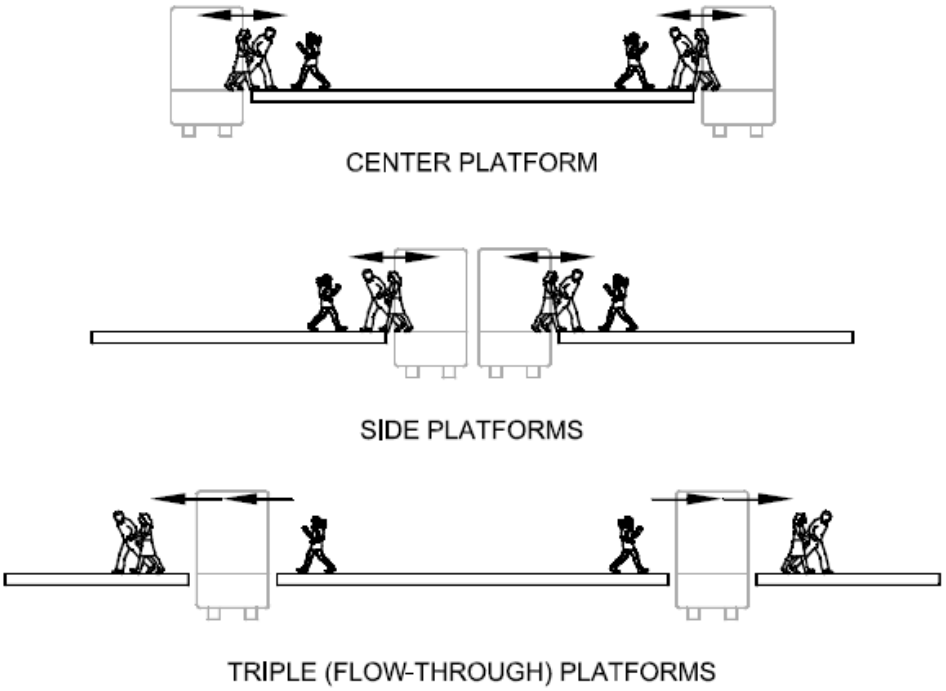

Figure 6-2: Profile views of Platform Configurations

6.2.1. Applicability to the ITC Project

The center platform configuration is the preferred option for the ITC System. The single center platform allows for optimized use of the station while minimizing the total width required for the station.

- Spatial constraints: The ITC right of way is limited in physical space due to the existing developments. The center platform configuration requires the least total width.
- Optimized platform utilization: Due to the event-driven service, the instances of high ridership are typically boarding or alighting, and not both occurring simultaneously. Therefore, the need to provide improved cross-traffic flow in both direction is not critical for the ITC system.
- Optimized vertical circulation: Center platforms allow for a single set of vertical circulation that can serve either platform edge, even if one is rendered out of service. To provide full redundancy in case one platform is rendered out of service, side platform configurations require that the two platforms be designed to accommodate all levels of service, and therefore require duplicated vertical circulation.

6.3. Station Dimensions

The purpose of the APM station sizing analysis is to ensure that the conceptual station design provides the platform queue area/width and length needed to accommodate the forecasted passenger ridership.

Train simulations and operational analyses determined the system requirements such as train lengths, headways, and other parameters. These requirements, along with the forecasted ridership, were used as input for queuing, vertical circulation, and emergency evacuation analyses which define circulation and other spatial, fire and life safety considerations required to determine minimum platform sizes. The resulting conceptual platform sizes will be further analyzed by the project architects as inputs into their fire and life safety/code compliance assessment for the station design as a whole.

6.3.1. Station Length

Minimum platform length estimates are based solely on maximum train length and do not account for vertical circulation elements added to either platform end. An additional 10 to 15 ft. beyond the end of the full length of a train is advised to be provided at the platform level for passenger circulation and vertical circulation queuing.

From the fleet size and line capacity analysis, it was determined that a four-car rubber-tire APM vehicle, approximately 170 ft. long, or four-car large monorail, approximately 200 ft. long is required to meet the projected demand. Because it is expensive and potentially disruptive to APM operations to expand APM station platforms after completion and initiation of passenger service, stations should be designed and constructed to accommodate either technology's maximum length train. Thus, the four-car large monorail becomes the basis for determining the platform length. In addition, at this conceptual stage of the project, an additional 15 ft. is included at each end of the platform, resulting in a minimum platform length of 230 ft.

Pending the project's infrastructure and systems design schedules, the station length may be refined and reduced should a self-propelled APM supplier and technology be selected early enough in the infrastructure design schedule.

6.3.2. Station Width

The purpose of the station sizing analysis is to ensure that the conceptual station designs provide the platform queue area/width needed to accommodate the forecasted passenger demands. The findings presented herein should be revisited accordingly should forecast data and/or APM operations be updated.

This analysis provides the methodology and results for passenger queuing analysis and the resulting minimum platform widths for passenger queuing and circulation. This analysis is not to replace the NFPA 130 platform evacuation analysis; this analysis is anticipated in a future phase of the project.

6.3.2.1. Assumptions

The following are the assumptions for the platform queuing analysis:

- Passenger space allocations: An average of 8.5 sq. ft. per passenger is assumed for this analysis. Based on the level of service descriptions for queuing in Pedestrian Planning and Design by John J. Fruin, Ph.D., 7 to 10 sq. ft. per passenger provides for a level of service C for passenger queuing.
- Circulation lane: To provide free flow of passengers, three feet per circulation lane is assumed. For all stations except Hollywood Park, one circulation lane in each direction is assumed. Due to the large number of passengers anticipated at Hollywood Park, three circulation lanes are assumed.
- Buffer: As passengers do not queue or walk directly against walls, an additional 18 in. of space for each side of the platform is assumed.
- Queue depth in off-peak direction: The passenger flows for the ITC system are inherently single-directional; for event service, passengers will be travelling toward the venue before an event and away from the venue towards the Market St. Station after the event. However, as there may be passengers traveling on the ITC system who are not attending events, a width of three feet is allocated for queuing for those off-peak passengers.
- Train length: The train length assumptions are based on the example operations characteristics provided in Section 5.4.
    - Market St. and Hollywood Park Stations: Four-car rubber-tire APM vehicle is used.
    - Forum Stations: Two-car rubber-tire APM train is used.
- Station width: A generic and common station platform width capable of supporting the maximum demand anticipated will be used as the basis for the station designs for all stations in the system for EIR purposes. The platform width is anticipated to be refined during a future phase of the project.
- Station demand:
    - Peak Direction: As the demand for each station differs due to their specific purposes, queuing analysis was performed for the highest boarding demand anticipated to be seen at any station.
    - Off-Peak Direction: The demand in the off-peak direction for event service is unknown. Off-peak demand is applicable for only the Forum Station. As Market St. and Hollywood Park Stations are end-of-line stations, there is no queuing in the off-peak direction.

Based on the assumptions above, and a review of the ridership demand per station for large NFL games and the Three-Event Scenario, the peak direction ridership demand value used for the queuing analysis is 8,910 passengers in an hour seen at Hollywood Park Station one hour after the end of a large NFL event.

6.3.2.2. Platform Queuing Analysis

A vehicle boarding queue model was used to determine the queue depth associated with each side of the APM station platform. The maximum demand scenario of two trains, travelling in opposite

directions, stopping at the same station and simultaneously boarding on opposite sides of the platform was modelled for this analysis. If the station platforms are too narrow and do not have sufficient circulation space, passenger freedom of movement will be compromised, passengers will not be able to disperse evenly among all the train doors, and a poor level of service and reduced capacity will result.

The vehicle boarding queues represent the number of passengers consolidated at each vehicle door. The vehicle queue model assumes that the passengers form a wedge-shaped queue in front of each vehicle door. The sum of the two opposite boarding queue depths and a circulation space in between comprise the minimum platform width requirement without accounting for columns and other obstructions that might be located on the platform.

It is important to note that the resulting minimum platform width requirement corresponds to a generic rubber-tire APM technology. Different technologies may produce different boarding queues depths due to variation in maximum speeds, headways, vehicle capacities, and door configurations. The final design of the stations should consider the potential for greater minimum platform width requirements depending on the selected automated technology.

The following table summarizes the queuing analysis results, as well as the minimum width required. Due to the large number of passengers, an additional circulation lane is assumed.

PEAK DEMAND (pphpd)	QUEUE DEPTH (FT)		CIRCULATION LANES (3 FT / LANE)	BUFFER (FT)	TOTAL MINIMUM WIDTH (FT)
	PEAK DIRECTION	OFF-PEAK DIRECTION			
8,910	22.5	0	3	3	34.5

Table 6-1: Queuing Analysis Results Summary

Based on these queuing results, a generic 40 ft. width was assumed for all stations. At this conceptual stage of the project, all stations are designed with the same layout (width, length, vertical circulation, etc.). This conservative approach a) allows for further tailoring of the station widths during future design efforts by reducing the widths to better meet the station-specific needs; and b) allows for the largest possible physical envelope for the project to be cleared as part of the EIR process.

6.4. Vertical Circulation

Vertical circulation requirements are based primarily on the time required to clear station platforms of passengers that are deboarding trains. Deboarding passengers arrive in relatively large numbers over a relatively short time period and vertical circulation elements must clear this load from the platform before the next train arrives for passenger safety reasons. Level of service considerations, specifically the time required for deboarding passengers to access escalators and elevators, usually dictate that the platform be cleared well before the next train arrives at the station platform.

Where vertical circulation elements provide emergency egress from station platforms, escalators and stairs must satisfy code-prescribed emergency egress requirements. Among other requirements, codes will require adequate vertical circulation for passengers to clear the platform and reach a point of safety

within specified time periods, and may require a secondary means of egress remote from the major egress route.

Lea+Elliott analyzed the vertical circulation requirements from an operational requirement perspective and established the minimum required vertical circulation to meet the normal boarding and deboarding needs for each station.

6.4.1. Operational Requirements Analysis

The purpose of the Operational Requirements analysis is to ensure that during normal operations, the station has the ability to:

- Bring the anticipated number of passengers onto the platform that are anticipated to be coming into the station based on post-event projected demand, and
- Clear the platform within one headway based on the projected pre-event demand estimates, i.e. the number of passengers that will be on the trains.

To assess the vertical circulation, the maximum anticipated number of people to be at a station for boarding and deboarding was determined. The maximum boarding demand reflect the maximum number of passengers anticipated to be at a station, while the maximum deboarding demand is reflected as a full, four-car train deboarding at a station.

DEMAND (pphpd)		NOTES
BOARDING	DEBOARDING	
8,910*	13,200**	*Boarding: Maximum station peak demand seen at Hollywood Park Station **Deboarding: Full train deboarding post event at Market St. Station

Table 6-2: Summary of Station Demand for Operational Requirements Analysis

Assumptions for the analyses were taken from industry-accepted planning resources and compared against the LA Metro Rail Design Criteria to determine the best fit for this unique special event-based system. Documents referenced for the station analysis are:

- Pedestrian Planning and Design, John J. Fruin, Ph.D
- TCRP Transit Capacity Quality of Service Manual
- LA Metro Rail Design Criteria, Section 6 Architectural
- Other APM application benchmarks

These reference documents resulted in the following key assumptions:

- Escalator width: 40 in.
- Escalator capacity: 55 people per minute (ppm) per 40 in. tread
- Stair capacity: 10 pedestrians per minute per foot of width (ppmpf)
- Minimum Stair Width: 5.5 ft.
- Elevator quantity: 2

- Elevator capacity: 3 sq. ft. / passenger
- Elevator Size: ~ 42 sq. ft.
- Elevator Speed: 150 feet per minute (fpm)
- Elevator travel distance: 25 ft.
- Elevator deboard/board speed: 1 sec. / passenger

In addition, the quantities of each type of vertical circulation must accommodate the number of people who likely want to or need to use each type of vertical circulation. Escalators are more popular than stairs, and there will always be a number of passengers who ride elevators. For this project, the goal for the distribution of passengers on vertical circulation is as follows:

- Escalators: 60%
- Stairs: 30%
- Elevators: 10%

The vertical circulation analysis also assumed that due to the event-based nature of the project, the demand would be single-direction. The boarding maximum occurs pre-event, while the deboarding occurs post-event. Therefore, the direction of the escalators would change to reflect the demand.

Based on all of the above assumptions, the vertical circulation required to meet the operational requirements and projected demand are summarized for each station in the following tables.

VERTICAL CIRCULATION ELEMENT	BOARDING	DEBOARDING
Escalator	2	3
Stairs (total width, ft)	6 ft.	6 ft.
Elevator	2	2

Table 6-3: Vertical Circulation Per Operational Requirements Analysis

The assumed 40 feet platform width identified in Section 6.3.2.2 is sufficient to accommodate all the vertical circulation elements.

7. Guideway

The term guideway structure refers to the structure providing support for running and guidance surfaces and other System equipment.

Guideway structures should be designed to provide a generally rectangular clearance envelope that accommodates:

- Clearance envelope for the vehicles, including additional width at curves for vehicle nosing and chording effects
- A continuous walkway along the entire guideway length to provide emergency egress for evacuating passengers and safe access to guideways and wayside equipment by operations and maintenance personnel
- Guidance and/or power equipment
- Cable trays, conduits, and/or wireway for power and communications needs

Guideway structures differ not only between rubber-tire APM and monorail technologies, but between the various suppliers for each technology type. Therefore, for this project and for the EIR, the guideway structure requirements are based on a combination of requirements for the candidate rubber-tire APM and monorail technologies.

7.1. Guideways and Guideway Equipment

7.1.1. Clearances

Guideway structures should be designed to provide the necessary clearances to accommodate vehicles, power and guideway equipment, and emergency walkways. The clearance requirements vary as a function of alignment geometry to account for nosing and chording effects through horizontal curves. Required clearances, taking into account nosing and chording effects, are included in the figures below. As all APM and monorail technologies have different vehicle designs, and therefore different dynamic envelope requirements, the dimensional data used for this project are based on worst-case dynamic parameters of the representative technologies of APMs and monorails.

Horizontal and vertical clearances between APM guideways and other existing and proposed infrastructure should be in accordance with the local, State, or Federal requirements specified by the governing authorities. For the EIR Project Definition, clearances between guideway structures and adjacent infrastructure was coordinated by the team architect.

Clearance requirements for dual track and at stations are provided for APM and monorail technology in Figure 7-1 to Figure 7-10.

Other station-guideway interface requirements are discussed in the Stations Section 6.1.

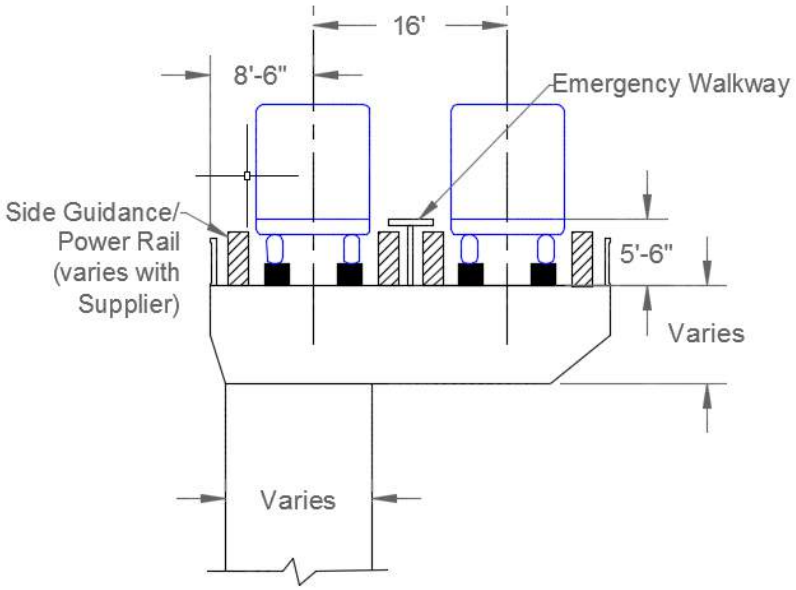

Figure 7-1: APM Guideway Clearances - Dual Track

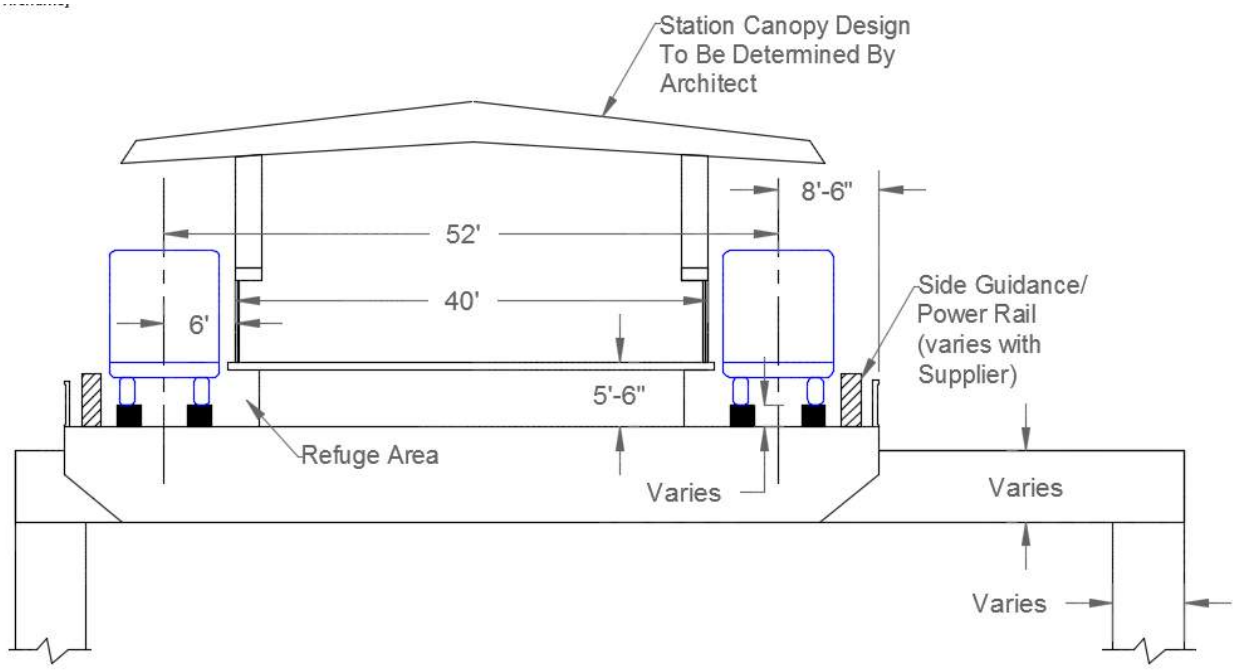

Figure 7-2: APM Guideway Clearances – In Stations

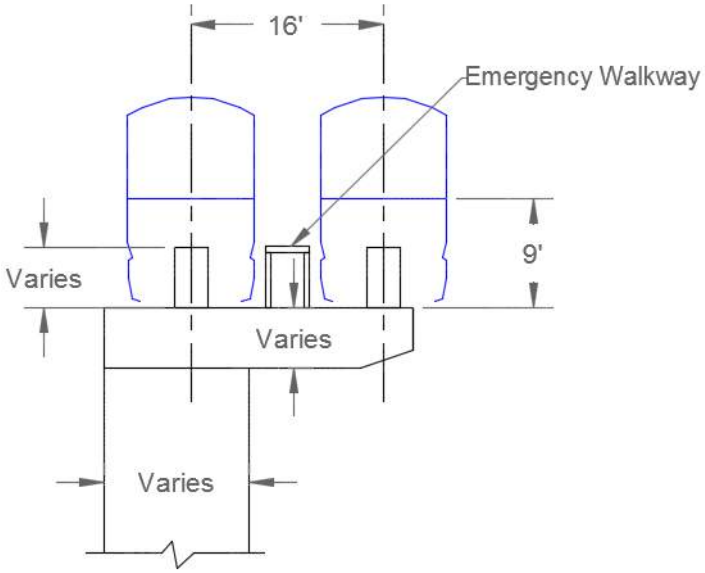

Figure 7-3: Monorail Guideway Clearances – Dual Track

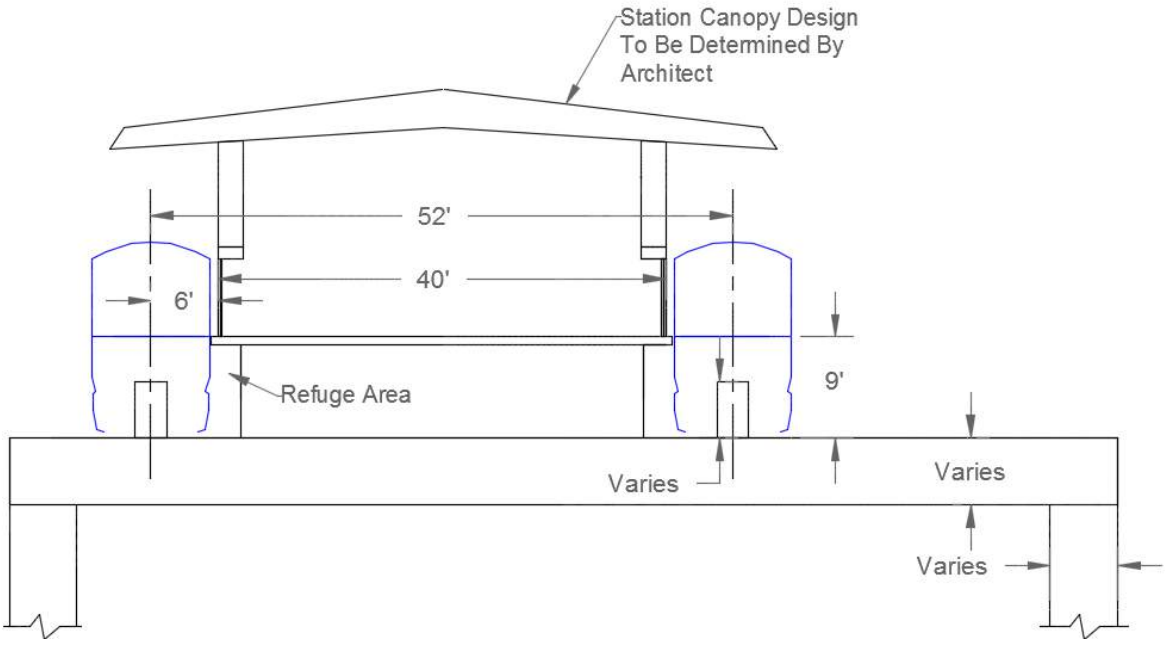

Figure 7-4: Monorail Guideway Clearances - At Stations

7.1.2. Maintenance/Emergency Walkway

A continuous walkway is required along the entire guideway length to provide emergency egress for evacuating passengers and safe access to guideways and wayside equipment by operations and maintenance personnel. For the ITC project, the walkway is assumed to be between the tracks, providing access into the center platform stations.

Maintenance/emergency walkway considerations and requirements include:

- The walkway must be continuous through crossovers/switches or other elements that may act as barriers.
- The walkway should be located at or below the vehicle floor level under both normal and worst-case vehicle suspension failure conditions. It is desirable to locate the emergency walkway not more than 12 inches below the vehicle floor level. The walkway must not be more than 40 inches below the vehicle floor level under any circumstances.
- Walkways without a railing should be at least 44-inches wide and walkways with a railing should be at least 30-inches wide.
- The walkway should provide a clear cross-sectional envelope at least 30 inches wide to a height of 6 feet-8 inches above the walkway surface.
- The APM System Supplier may desire to locate cable trays, wireways, and other System elements below the walkway.
- Emergency walkway lighting is required along the entire walkway and egress route and will normally be turned on only when passengers are required to evacuate a train or during maintenance activities.

Images of emergency walkway examples for APM and monorail systems are provided in Figure 7-5 and Figure 7-6, respectively.

Figure 7-5: APM Emergency Walkway Example, TPA SkyConnect APM (Image source: L+E)

Figure 7-6: Monorail Emergency Walkway Example, Las Vegas Monorail (Image source: LAmag)

7.1.3. Crossovers and Switches

Crossovers provide the means for trains to move between guideway lanes and are required for pinched-loop operations and failure management purposes. A crossover is generally composed of two switches (one on each guideway lane) connected by a short length of special trackwork. Crossovers and switches must be located in constant-grade, tangent guideway sections. Approximately 50 feet of tangent, constant-grade alignment should be provided before and after switches. Expansion joints are not allowed in crossover zones.

Crossover requirements vary significantly among APM System and monorail suppliers and each supplier's switch and crossover requirements are "discrete" in that their geometric and other requirements are largely inflexible. Unique requirements exist for:

- Switch curve radius
- Turn (or throw) angle
- Need for spiral and/or tangent lengths before and/or after a switch
- Widened and/or depressed slab sections required for switch machine support
- Widened slab sections to accommodate movement of guidance devices
- Spacing between consecutive switches on a single guideway
- Transverse spacing between parallel guideways

The guideway length required to accommodate a crossover is dependent on the required switch/crossover geometry, crossover configuration, and the spacing between parallel guideways. For the ITC system, crossovers are located adjacent to stations where the guideway widths are dictated by the station platform width of 40 ft., resulting in a separation of guideway centerlines of approximately 52 ft.

The crossover configurations for the ITC project are assumed to be a "double crossover" for APM systems and an X-crossover for monorail systems. The total length required for these two types of configurations for the two technologies is similar.

- For APM systems, "double crossovers" include two consecutive, but symmetrically oriented, crossovers. The orientation of double crossovers is dictated by operational considerations. Crossovers configured to create an "X" between guideways should not be planned, as this configuration is not possible for most APM system suppliers. See Figure 7-7 for an example double crossover.
- For monorail systems, X-crossovers are typical for all suppliers. Crossovers consist of a moveable guide beam that shifts positions depending on the required travel path. See Figure 7-8 for an example monorail X-crossover.

Figure 7-7: APM Double Crossover Example at IAH (Image Source: L+E)

Figure 7-8: Monorail X-Crossover Example, Las Vegas Monorail System (Image Source: LRN Library)

For the ITC project, the guideway structure must allow for both the APM and monorail crossover clearance requirements. As switches require additional space for switch equipment and/or switch movement, as well as emergency walkway access from both sides of the train, the guideway structure at crossovers is wider than in areas with track only. Cross sections through the guideway structure for APMs and monorail at the crossover areas are provided in Figure 7-9 and Figure 7-10.

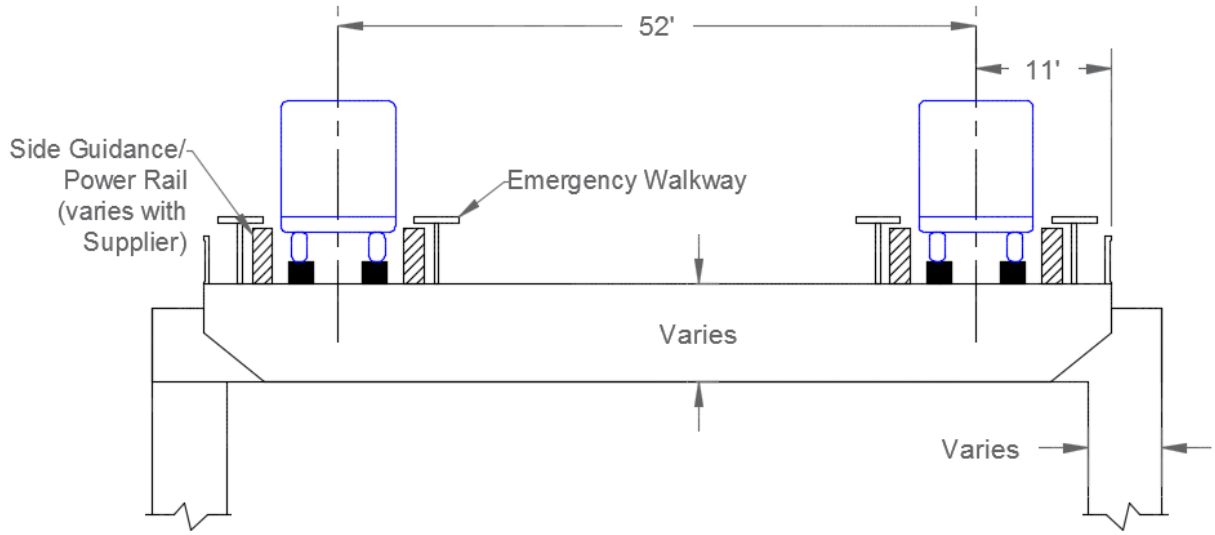

Figure 7-9: APM Guideway Clearances – At Crossovers

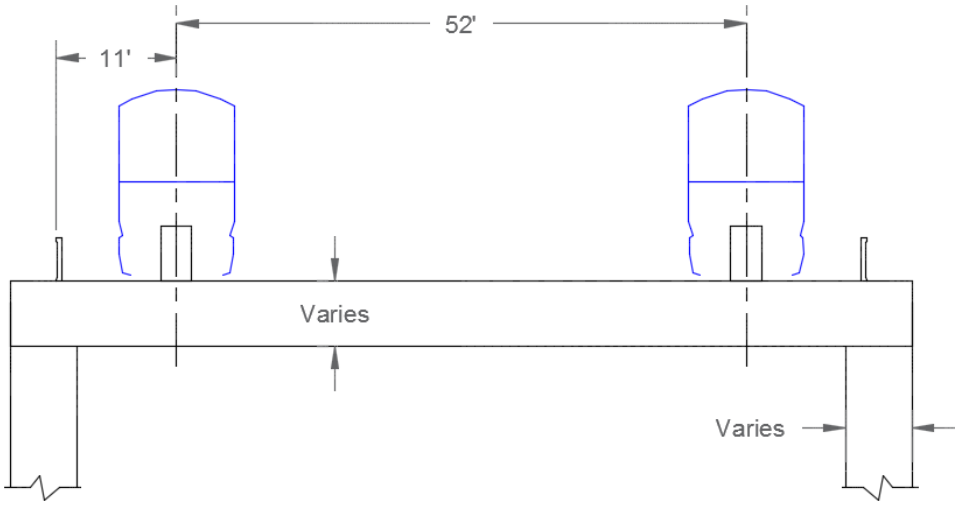

Figure 7-10: Monorail Guideway Clearances – At Crossovers

7.2. Alignment

The goal in defining the guideway alignment is to develop an alignment that allows APM and monorail systems suppliers to competitively bid on the project, and to optimize the alignment to their unique technology requirements. Optimizing the alignment also allows for optimized system performance and potentially reduced the facility and structure sizes.

The alignment options developed for the ITC project assumed generic and reasonably conservative parameters given the early planning stage of the project. The following sections provide a summary of the parameters used for the horizontal and vertical alignment development. The plan view of the alignment options, as well as the plan and profile for the final ITC alignment, are provided in Appendix A.

7.2.1. Plan

The horizontal alignment consists of tangents joined to circular curves by spiral transition curves. Tangent alignment is required through and about 50 ft. beyond the ends of station platforms.

Horizontal curves should use the largest practical radii. Large curve radii reduce required superelevation values and nosing and chording effects through horizontal curves; allow higher speeds to be maintained, which decreases trip times and potentially reduces the required fleet size and implementation costs; improve ride comfort. Minimum radii should only be considered in extreme cases when the cost or other adverse effects of using larger radii are prohibitive. The following minimum radii for APM and monorail technology were used for the ITC alignment (these do not apply to switches and crossovers):

- Minimum radius for operating track:
  - APM: 180 ft.
  - Monorail: 200 ft.
- Minimum radius for maintenance yard track:
  - APM: 100 ft.
  - Monorail: 180 ft.

7.2.2. Profile

The vertical alignment should consist of tangents joined by parabolic curves having a constant rate of change of grade. Guideway profile grades should be kept as level as possible and the number of grade changes minimized.

A constant grade, at least 50 feet in length between two adjoining parabolic vertical curves should be provided. Grade must be zero percent through stations. On the mainline, desired maximum grade is 6%. Although some technologies allow for a maximum grade of up to 10%, grades higher than 6% are not assumed for the ITC project due to the very early planning nature of this project. Steeper grades restrict the design and should only be used when absolutely necessary. Grades through switch and crossover locations are assumed to be 0% as not all technologies support switches on a grade.

7.3. Other Guideway Considerations

The following are further considerations for guideway and trackwork design as the project moves into more detailed design phases.

- Trackwork and the associated interface requirements vary significantly among APM system suppliers. Guideway structure designs must accommodate the variable trackwork load and connection and other interface requirements of the different APM system suppliers.
- Horizontal curves should be superelevated to limit sustained lateral accelerations parallel to the vehicle floor. Desirable maximum superelevation is 6%, but in some cases, the APM system supplier will be allowed to provide up to 10% superelevation.
- Access to the guideways is required at stations and desirable near abutments at ends of elevated guideway sections. Access and egress points must not permit unauthorized access to the guideway, and all guideway access and egress points must be alarmed at the CCF.

- Cable trays, conduits and/or wireways are required along the guideways to accommodate system cabling. These are typically located adjacent to longitudinal trackwork elements on the guideway structure, below emergency walkways, and are supported by elements such as walkways or parapet walls.
- Guideways must be designed and constructed to effectively drain water from their surfaces. Guideway drainage provisions should allow for reasonable and expected interaction with trackwork and other guideway equipment.
- Structure-borne, vehicle-induced vibrations and noise should be evaluated to mitigate passenger and facility occupant discomfort.
- Elevated and at-grade guideways should have parapet walls to screen guideway equipment and running surfaces so that trains have the appearance of gliding between stations.

8. Maintenance and Storage Facility

The MSF houses functional spaces required for the operation and maintenance of the APM Systems, including the Central Control Room (CCR), administrative offices, spare parts and consumable storage, and space for regular maintenance, inspection, service, testing, repair, and replacement of parts for vehicles and other system equipment.

Maintenance facility functions include vehicle maintenance, cleaning, and washing; shipping, receiving, and storage of parts, tools, and spare equipment; fabrication of parts; and repair of vehicle spares. Supervisory offices, rest rooms, locker rooms, and break/training rooms are also provided for staff use.

Maintenance performed on System equipment includes:

- Service - Replacement of consumables and expendables, adjustment of parts
- Cleaning - Interior and exterior
- Inspection - Periodic inspection of parts, appurtenances and subsystems subject to deterioration and failure.
- Repair - The repair or replacement of a part that has been damaged, has failed, or is nearing the end of its service life.
- Departure Test - The MSF and adjacent non-passenger carrying guideway will contain departure test equipment and a dedicated section of track for the departure test.
- Maintenance Information Management and Scheduling - The processing of maintenance information, work reports, failure reports, and System performance data needed to manage the System maintenance program effectively and efficiently.

8.1. Layout

The primary functions of the MSF include support of APM System operations, vehicle storage, and APM System maintenance.

Area is be provided for service and inspection shops, major repairs, vehicle storage, inspection and service (including under-vehicle bays), equipment and materials storage, offices, lunch/break rooms, restrooms, locker areas, personnel wash facilities, loading platforms, and other areas based on design information to be provided by the APM System Supplier. The design of the facility should also include roadway access, signage, and means of controlling access into and out of the MSF.

The MSF is currently sized for both, rubber-tire and monorail technology six-train fleet and also for larger fleet to allow for the addition of trains to support storage and maintenance for larger demands, if needed. This will still maintain flexibility to define the exact needs in the future phases of the project based on on-going coordination with the stakeholders. A reduction of the MSF size could occur in the next phases of the project as the design is refined and finalized.

8.1.1. Vehicle Storage

The MSF needs to be sized to accommodate the maximum number of vehicles to be in maintenance or stored during off-peak periods. Vehicles are planned to be accommodated in dedicated storage tracks and in maintenance bays.

Dedicated storage tracks at the MSF will have traction power guide rails with automated train control into and out of storage. This fully automated vehicles storage area allows trains to be stored during off-service, off-peak, and non-event time while remaining ready for immediate dispatch. The storage tracks are therefore protected from hazards, including moving vehicles and propulsion power. These automated areas are to be designed to control access in order to ensure the safety of maintenance personnel.

Locations of the vehicle storage tracks are identified in Figure 8-1.

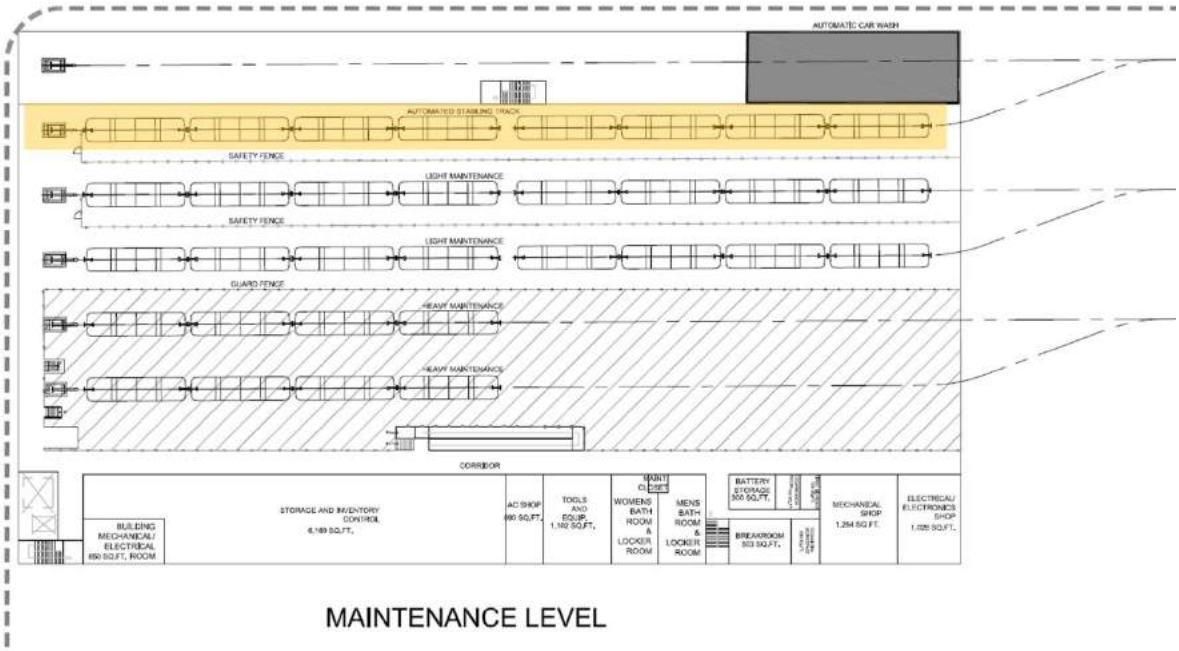

Figure 8-1: MSF Vehicle Storage

8.1.2. Maintenance Bays

Heavy and light maintenance bays are required to perform maintenance on trains at the MSF. The MSF design must include the space and related necessary infrastructure to inspect and maintain the APM vehicles. Shops, parts storage, and other maintenance-related functions should be situated at the same level as the maintenance floor. Trains are manually driven and moved to, from, and within the heavy and light maintenance bays. Power in the manual areas is provided to the vehicles via stingers, a festooning system with power plugs affixed to ceiling to allow for vehicle movements while connected to wayside power.

There are two types of maintenance bays, each with their own specific uses and requirements. The locations of the light and heavy maintenance bays are identified in Figure 8-2.

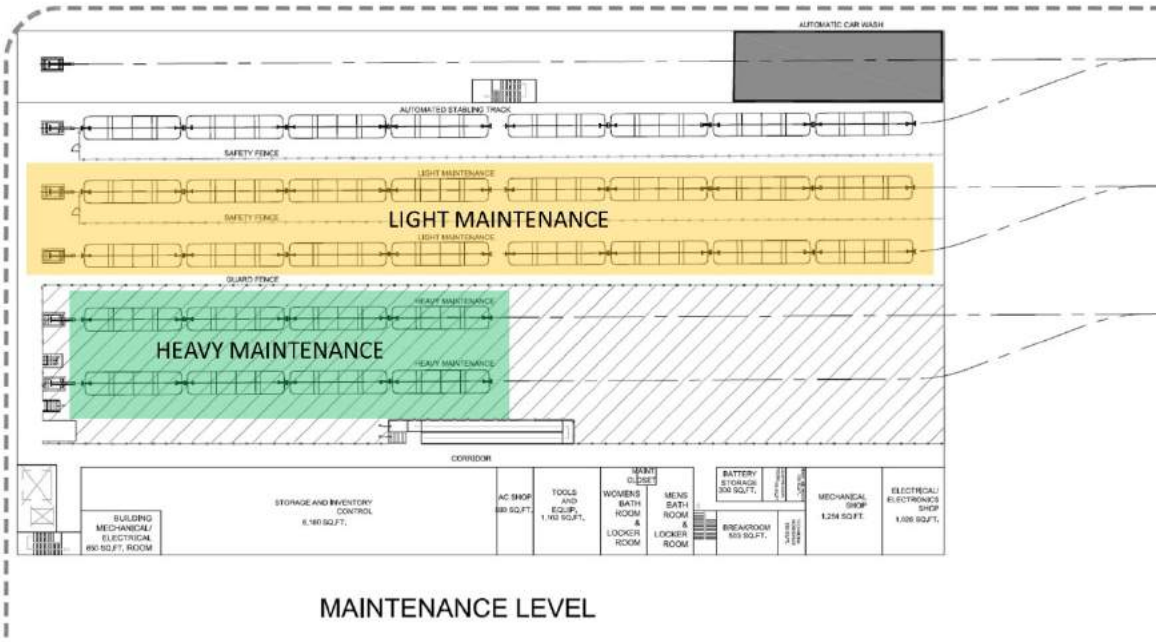

Figure 8-2: MSF Light and Heavy Maintenance

Light Maintenance Bays: Each train is required to undergo nightly light maintenance if it was in operation that day. Light maintenance is typically comprised of inspection and replacement of readily accessible parts and expendables and a general confirmation that the vehicle is available for the next day's service. Underbody access is required; light maintenance bays are over pits or on elevated structures such that staff can readily walk underneath them. Examples of access to the vehicle underbody are provided in Figure 8-3.

Typical light maintenance tasks include cleaning as needed, vehicle underbody inspection, checking and replacing brake pads, component inspection, dimensional verifications, contact/collector shoe replacements, inspection of running tires for wear/cuts, and other similar tasks that can be performed in relative short duration. Exact tasks and inspections performed are determined by the APM supplier per their maintenance practices.

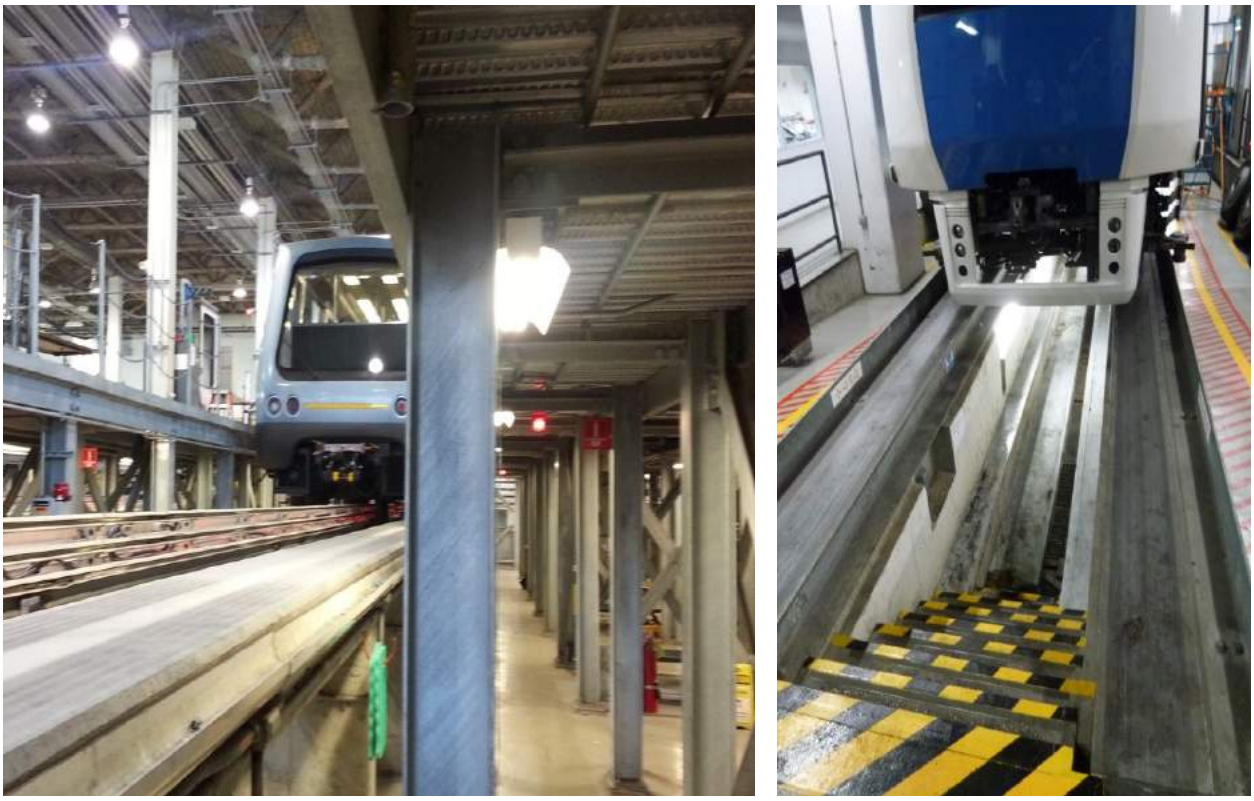

Figure 8-3: Example Light Maintenance Access

Heavy Maintenance Bays: Heavy maintenance, required on periodic and scheduled frequencies, includes a more thorough inspection of the vehicle and replacement of parts showing excessive wear and/or approaching their scheduled replacement time. Heavy maintenance tasks generally include major repairs/refurbishments of vehicle subsystems such as bogies and air conditioning units, replacement of brake calipers, replacement of brake discs, draining and refilling of axle oil, flushing of hydraulic systems, replacement of shocks, replacement of air bags, dropping the bogie, hydraulic fluid decontamination, and other similar tasks that take a number of hours to perform. Exact tasks and schedules of the heavy maintenance rotation are determined by the APM supplier per their maintenance practices.

Maintenance is performed on flat floors, with vehicles elevated on jacks, as needed. Four jacks per car are assumed, with the depot floor supporting loading up to 250 psf and a concentrated load of about 4 ton for the wheel load or load from lifting jacks. Guide rails in the heavy maintenance bays are removable to allow for unobstructed access below raised cars. An example of vehicles in heavy maintenance is provided in Figure 8-4.

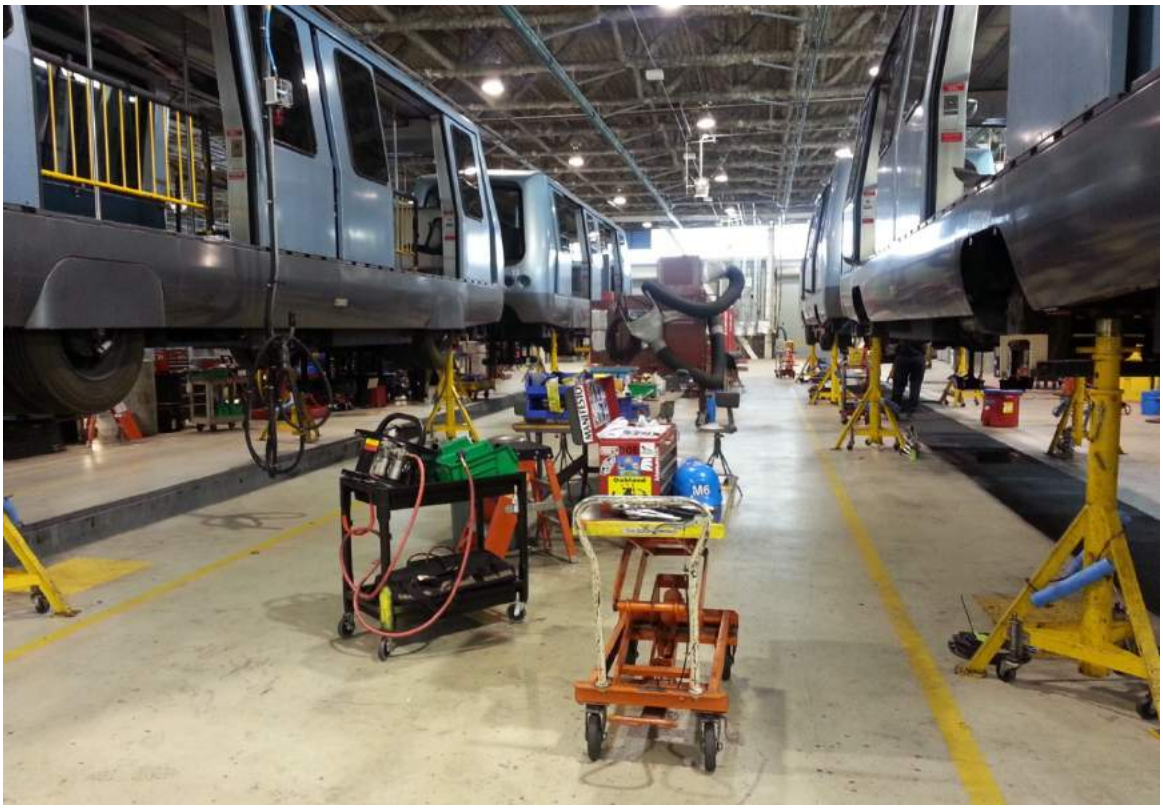

Figure 8-4: Example Heavy Maintenance

8.1.3. Vehicle Wash:

Automatic washing of the vehicle exteriors should be accomplished at a Vehicle Wash Facility. The vehicle wash is typically a stationary system located in/near/adjacent to the MSF building where trains can be either manually or automatically moved through the wash facility. Various required provisions, including sanitary sewer, power, and infrastructure provisions, will be needed. The location of the vehicle wash facility is identified in Figure 8-5.

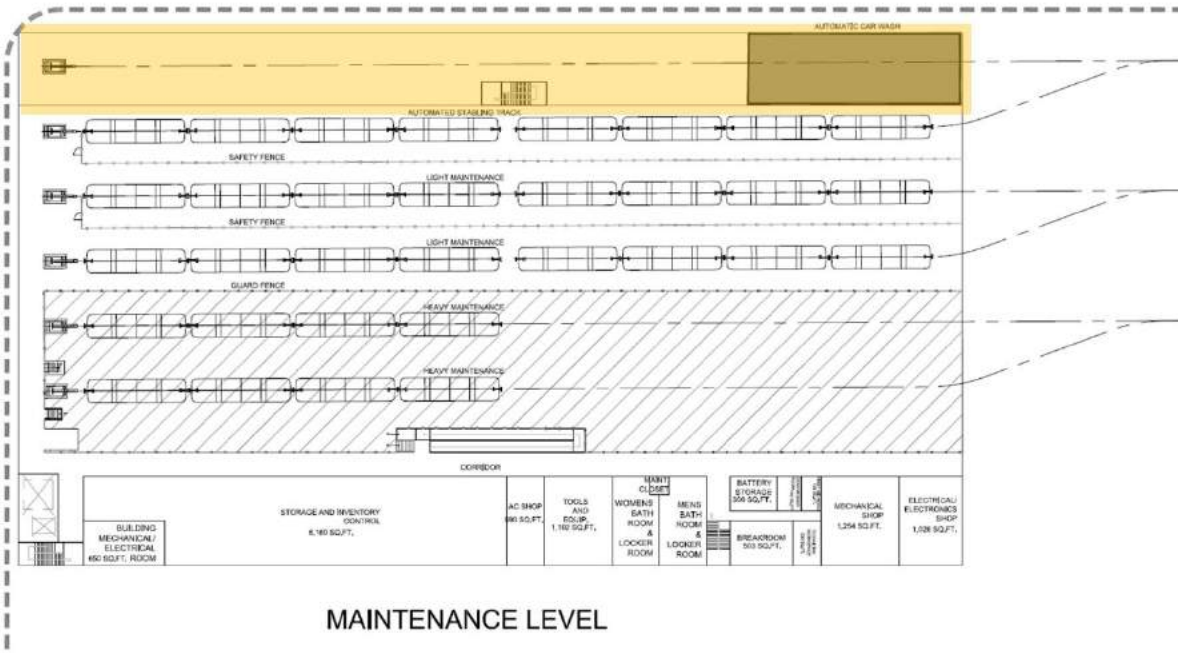

Figure 8-5: MSF Vehicle Wash

8.1.4. Maintenance Support Facilities

The following are the main support facilities needed for the APM MSF needs:

- Repair shops and inventory: For the maintenance of the APM equipment and storage of spare parts and inventory to support the maintenance needs, and located on the maintenance level
- Administrative: The APM operations and maintenance staff require space to support normal administrative functions. These are planned to be located on the mezzanine level.
- Command, Control, and Communications: The Command, Control, and Communications (CCC) facilities, which include the Central Control Room (CCR) and the CCC Equipment Room are planned to be located at the MSF on the mezzanine level.
- Roadway and Ground Floor Access: For personnel and visitor access, as well as deliveries and removal of inventory and equipment. These requirements are located on the ground floor.
- Power Distribution: The traction power substation is planned to be located at the MSF on the ground level. See Section 9 for further information on traction power substations.

These areas are identified in Figure 8-6, Figure 8-7, and Figure 8-8 and are further described in the following sections.

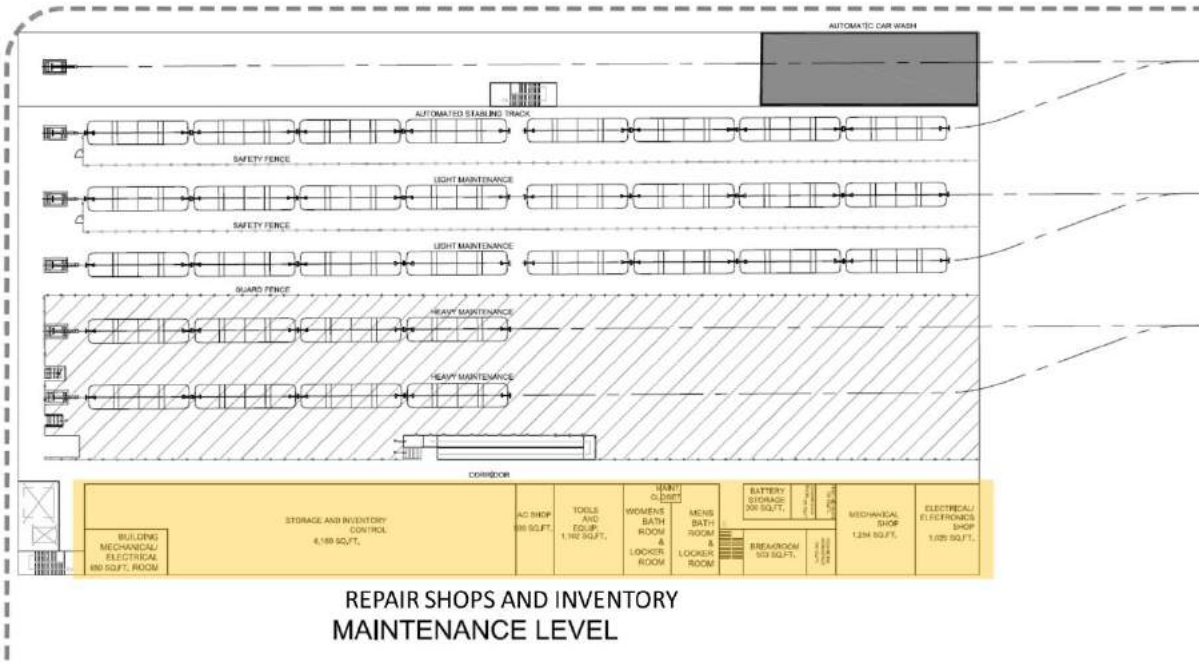

Figure 8-6: MSF Maintenance Level Support Facilities

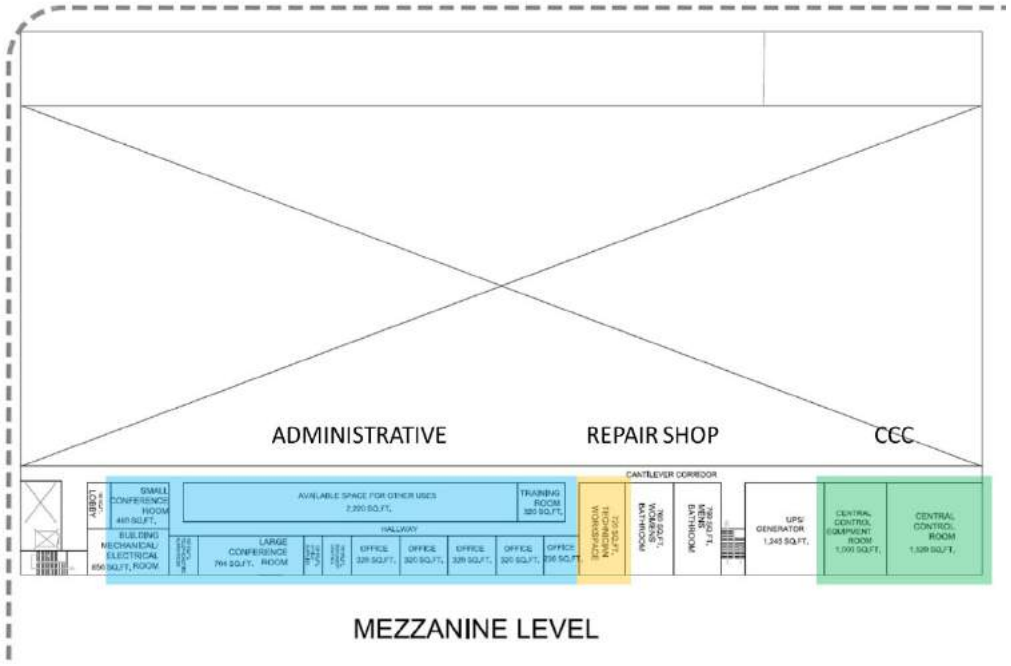

Figure 8-7: MSF Mezzanine Level Support Facilities

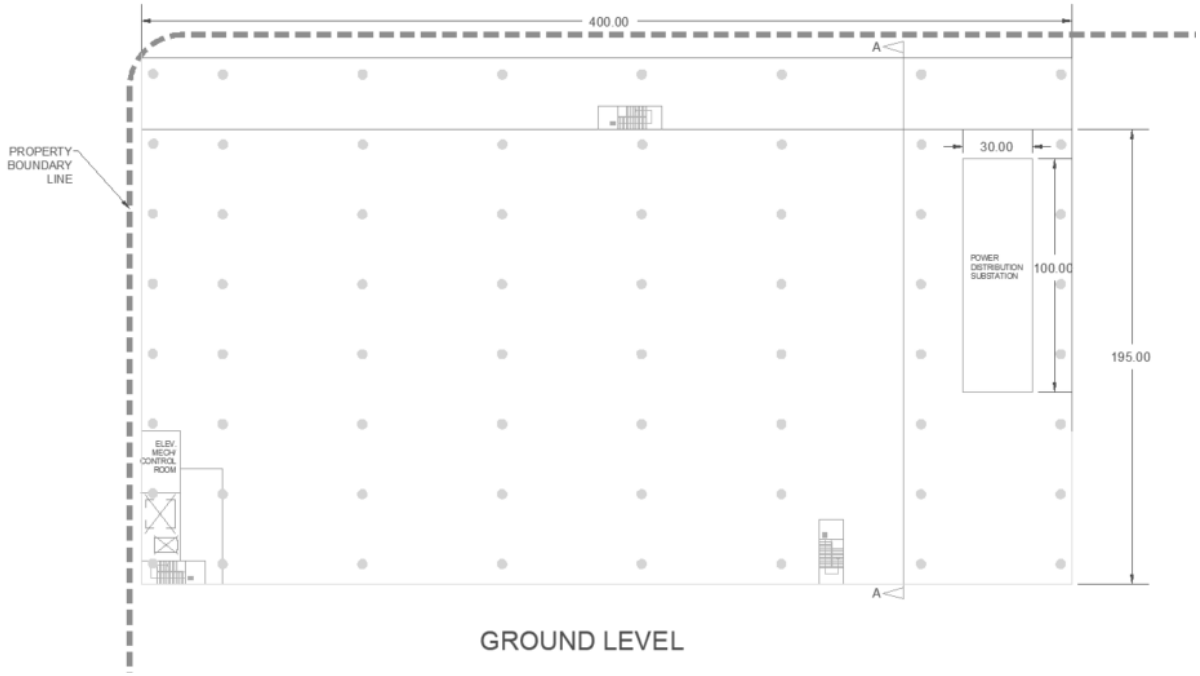

Figure 8-8: MSF Ground Level Support Facilities

In addition to the APM-specific functional areas, building HVAC, plumbing, electrical, and communications rooms will be required to serve the facility, and are anticipated to be located on the maintenance and mezzanine levels.

8.1.4.1. Repair Shops and Inventory

The maintenance support facilities provide for the maintenance of the APM system and vehicles. The shops and stores (i.e. inventory) allow for the maintenance of all but the most major repairs for all on-board and wayside systems. Major work includes the repair and replacement of bogies; traction motors; and heating, ventilation, and air conditioning (HVAC) units. All mechanical and electrical components are also repaired at the MSF. The shops include workbenches and storage areas, and specialty tools for each shop type. The electrical and electronics shops repair smaller components and units so access direction from the maintenance floor is less critical. Machine, HVAC, and mechanical shops are located with direct access to the maintenance areas.

The MSF must also house all inventory, including spares, tools, and consumables. All items must first be screened before being brought into the MSF facility. A sizable inventory area is therefore located in close proximity to the loading docks for easy access from the goods screening area. To maintain inventory control, this area is to be secured with protocol for parts/consumables removal and use.

A layout of the maintenance support facilities is provided in Figure 8-6 and Figure 8-7.

8.1.4.2. Administrative

The requirements for administrative offices are typical of any professional office environment. Besides office space for administrators and support staff, functional spaces for reception, records keeping, meeting, training, document receipt and transmission, copying, etc. are representative of those required in the APM administrative offices. The administrative offices should comply with the all relevant accessibility requirements.

Separation between administrative and maintenance staff uses is assumed, with the exception of shared conference and training rooms. Offices for maintenance managers are also assumed to be located with the administrative offices.

The location of the administrative offices is provided in Figure 8-7.

8.1.4.3. Command, Control, and Communications.

The command, control, and communications facilities, including the Central Control Room (CCR) and the CCC Equipment Room, are planned to be co-located at the MSF. Additional CCC equipment is located at stations and along the wayside. CCC equipment is required for train control and supervision, power control and supervision, station doors, dynamic graphics, closed-circuit television (CCTV), public address, radio, fire detection, and other System-related elements.

The CCR provides for the supervision of the overall APM operation. It houses all display, safety, and communications equipment required to monitor and control the APM system. Typical equipment includes large work consoles and monitor banks (for system overview, CCTV, etc.).

The CCC equipment room adjacent to the CCR houses all servers and equipment for the control of the APM system. The equipment room is also sized to house the uninterruptible power supplies (UPS) required for the operation of the System equipment. The UPS powers low voltage System equipment at the CCR and CCC equipment rooms.

The locations of the CCR and CCC Equipment Room are provided in Figure 8-7.

8.1.4.4. Roadway and Ground Floor Access

Road access to the MSF is required for employees, visitors, suppliers, and emergency vehicles. It is anticipated that all ground floor requirements can be accommodated below the building footprint.

- Employees and visitors require ample parking.
- Suppliers require a delivery entrance to load and unload equipment, materials and parts. A loading dock and adequate roadways and clearances must be provided for flat-bed trucks to deliver equipment and supplies into the MSF. The APM vehicles will be lifted onto the guideway, most likely at/near the MSF. Provisions must be made for these movements.
- Emergency Vehicles (fire trucks) require designated stopping positions for firefighting equipment adjacent to the MSF.

Appropriate space should be provided to allow adequate maneuvering by these ground vehicles. The number of employee parking spaces and assumed maneuvering for large delivery vehicles, as well as an area for APM vehicle delivery, have been identified in the conceptual MSF design. In addition to roadway access, vertical circulation (normal and emergency purposes) must also be provided, including a freight elevator for inventory/equipment delivery and removal.

An initial layout of the ground floor is provided in Figure 8-8.

8.1.5. Spatial Requirements

A summary of the estimated spatial requirements for all support facilities is provided in Table 8-1. These spatial requirements will be further refined during future phases of the project.

CONCEPTUAL MSF SPACE PLANNING REQUIREMENTS			
MAINTENANCE AND STORAGE FACILITY	**CITY OF INGLEWOOD APM**		
ROOM DESCRIPTION	**AREA (FT^2)**	**LEVEL**	**HVAC**
Central Control Room	1,500	mezzanine	Y
Central Control Equipment Room	1,000	mezzanine	Y
Telephone/Fire Alarm Room	200	mezzanine	Y
Management and Administrative Offices	1,350	mezzanine	Y
Lobby Reception	200	mezzanine	Y
Conference Room	500	mezzanine	Y
Restrooms (M/W)	350	mezzanine	Y
Training Room	350	mezzanine	Y
Technician Workspaces	950	maintenance	N
Break Room	500	maintenance	Y
Locker/Restrooms (M/W)	1,000	maintenance	Y
First Aid Room	100	maintenance	N
Storage/Inventory Control	6,150	maintenance	N
Electrical/Electronics Shop	1,250	maintenance	Y
Mechanical Shop	1,250	maintenance	N
AC Shop	600	maintenance	N
Welding Room	400	maintenance	N
Paint Shop	400	maintenance	N
UPS/Generator Room	1,000	maintenance	Y
Tools & Equipment	1,100	maintenance	N
Compressor	150	maintenance	N
Battery Storage and Charging	300	maintenance	Y
Vehicle Maintenance Area/Storage	60,800	maintenance	N
Car Wash & Equipment	13,800	maintenance	N
Elevators/Stairs/Hallways/Miscellaneous	2,200	mezzanine / maintenance	N
Loading Dock	400	ground	N
Power Substation	3,000	ground	Y
Total Maintenance Level (approx)	**91,950**	Approx 400 ft x 230 ft	
Total Mezzanine Level (approx)	**5,450**	Approx 400 ft x 43 ft	
Total Ground Level (approx)	**3,400**		
Total Area	**97,400**		

Table 8-1: Conceptual MSF Space Planning Requirements

8.2. Elevations

The guideway elevation in the MSF is dictated by the elevation of the mainline guideways outside of the MSF. The top of building measured from existing grade is approximately 75'. A cross section of the MSF is provided in Figure 8-9.

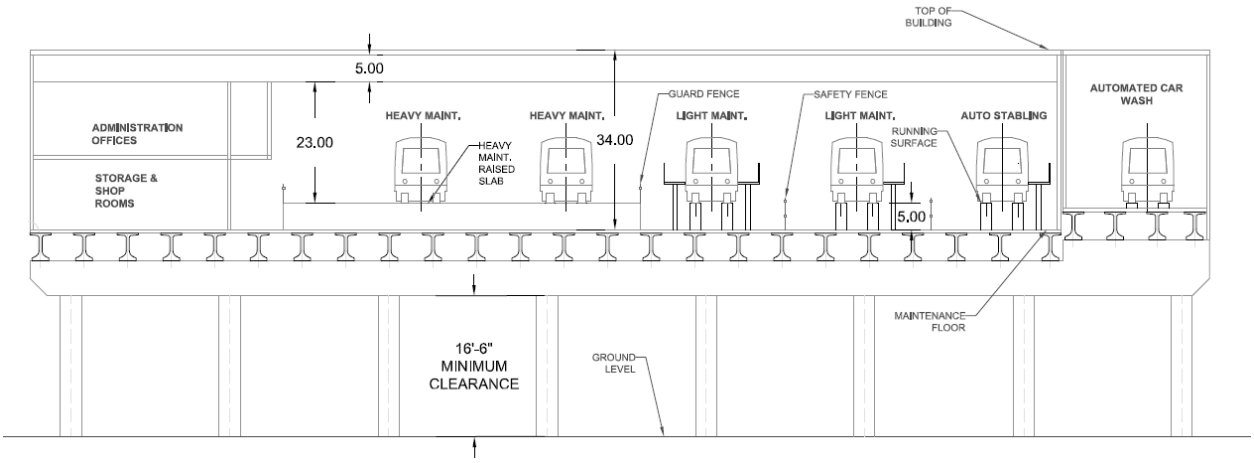

Figure 8-9: MSF Cross Section

9. Traction Power Substations

This section summarizes the preliminary power requirements analyses and results for the mainline operations and MSF operations for the ITC system. In order to obtain the power requirements for the ITC System, detailed load-flow analyses were performed for the rubber-tire APM technology for multiple traction power substation (TPSS) location combinations. These load-flow analyses results were then combined with estimated power requirements for the MSF to determine the transformer ratings for each of the TPSS locations.

This report identifies the key assumptions used as the basis for the analysis, provides some basic information about traction power systems and substations for informational purposes only, and summarizes the analysis results and considerations.

9.1. Introduction

The analysis for the propulsion power needs for the ITC system and therefore took into account the operations for normal and special event service.

Propulsion power (i.e. the power to run the train on a guideway) is provided via traction power substations (TPSS) located along the alignment. Each TPSS includes equipment to transform the medium- to high-voltage power feed provided from the power companies to the required 750-volt direct current (VDC) needed to power the vehicles and other ancillary equipment.

A key element in a TPSS is the transformer/rectifier unit, which needs to be sized to accommodate the power requirements for operating multiple trains simultaneously on the system. Load flow analyses were therefore performed to assess the potential locations for the TPSS to determine the required locations for the substations and required transformer sizes to provide the necessary service for the ITC system.

The load flow analyses were performed using two Lea+Elliott simulation and calculation models, the Legends© Train Performance Simulator (TPSim) and the Power Demand Analysis Model. The train performance simulator calculates individual train performance and power demand characteristics on a per second and guideway location basis throughout a single round-trip. The power demand analysis model accumulates the total simultaneous (also on a per second basis) power demand for all trains operating at a defined headway using the output of the train performance simulator. The power demand analysis model then calculates the power demand for each substation as a function of the positional and time Kilo-Volt Ampere (KVA) requirements of each train consist that is receiving power from that particular substation. The substation load calculation output provides both per second and root mean squared (RMS) KVA loads for each substation.

Predicted train performance from the Train Performance Simulator is obtained using a typical large capacity APM vehicle and train model, operating on the proposed ITC System alignment shown in Figure 2-1. To determine PDS substation requirements, simulations were conducted using 4-car trains loaded at the design load (AW1).

The operational train performance data was then applied to the Power Demand Analysis model to establish the peak and RMS capacity requirements for the minimum number of fully redundant substations. The configuration of substations was analyzed using the power analysis model and using this information, the Power Demand Analysis model generates the time and location distributed electrical load data.

9.2. Assumptions

The following are the key assumptions for the power load flow analyses:

1. The system must be able to operate at a minimum, 6 x 4-car trains at approximately 125-second headways.
2. The system operates for 18 hours per day and is closed with no trains operating for 6 hours per day.
3. The system alignment is approximately 8,500 feet of dual lane guideway and includes three stations and an MSF as shown in Figure 2-1 above.
4. Various potential locations for the PDS were identified along the alignment, including locations near all stations. Based on discussions to date with the City on the possible use of various properties along the alignment, those locations were refined to the following two locations, as shown in Figure 9-1. Further details on the parcels tentatively identified as possible locations for the PDS are provided in Appendix D.
    1. MSF site at 500 E Manchester Blvd, Inglewood, CA 90301 adjacent to E. Spruce Ave.; and
    2. City of Inglewood Intermodal Transit/Park and Ride Facility (ITF) site, or similarly located site, on the east side of Prairie Ave.

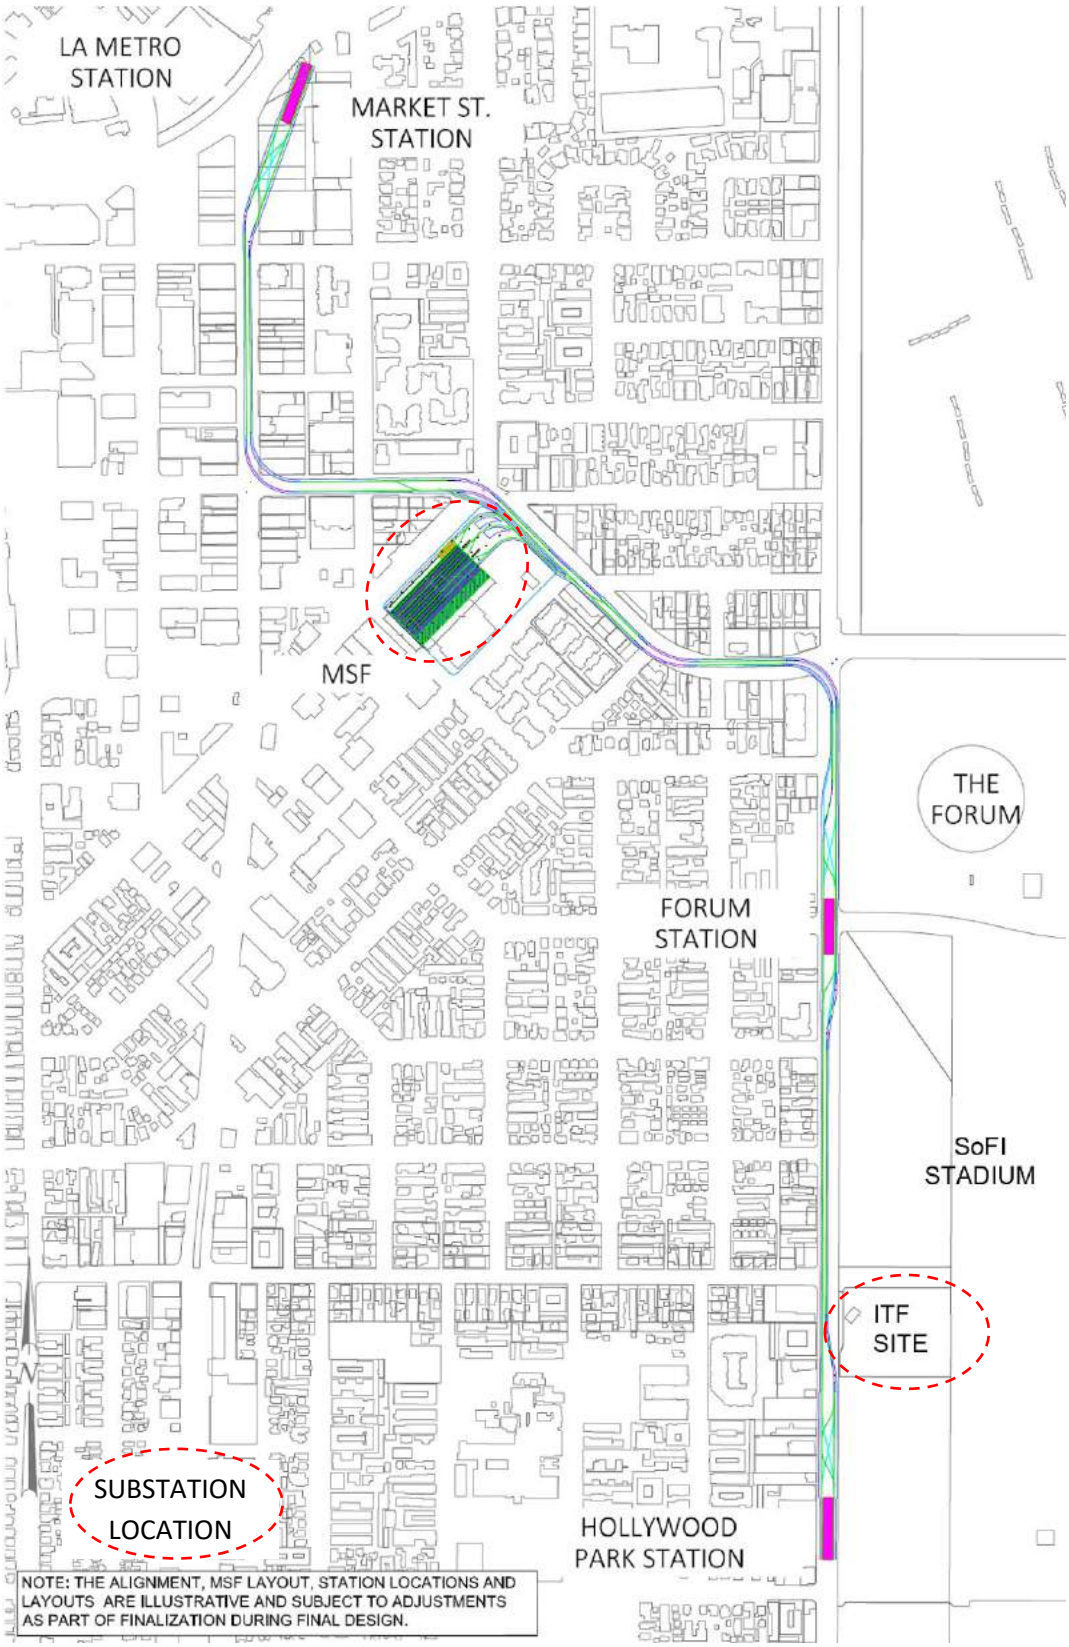

Figure 9-1: Potential Locations for ITC PDS Substations

5. The TPSS system will be fully redundant, meaning that there is not a single point of failure within the substations. Having a fully redundant substation requires the following:

    a. Primary power is expected to be provided by two separate primary power feeders such that the loss of a single feeder would not affect train operations. While future coordination with Southern California Edison will be required, the provision for, at a minimum, two separate feeders will continue as a base requirement for the system.

    b. Each TPSS will include two sets of equipment such that the loss of any single element within the TPSS (e.g. feeder, transformer, breaker, etc.) would not affect train operations.

6. Other non-vehicle propulsion loads included the APM equipment located in the APM equipment rooms in each station and the MSF.

7. 750 V DC distribution and rail resistance for a typical 750 V DC distribution APM system.

8. The MSF will be sized to store the full 6 train fleet and includes 4 maintenance berths and 4 automated storage berths.

9. The MSF must be able to perform maintenance on the maximum anticipated occupied berth based on the anticipated operations. This occurs during normal, non-event operations where 1 x 4-car train or 2 x 2-car trains are in operation.

9.3. Typical Substation Information

Prior experience indicates that when using DC power distribution, optimum performance of the PDS is obtained when the spacing between substations is kept under 5,000 feet due to power rail voltage drop and substations are located optimally between 100 feet and 500 feet from the guideway.

Actual substation locations may be changed as the result of a design process by the final selected supplier who will utilize more complex dynamic load flow comparative analysis techniques that are based on their specific system design criteria. Such a load flow examination is a design process beyond the scope of this programming level analysis effort since generic vehicle characteristics were assumed for the analysis. Nevertheless, the location selections made here may be considered appropriate to satisfy efficient system performance and for prediction of power consumption and substation capacity requirements.

9.3.1. Substation Single Line Diagram

A typical single line diagram for a DC distribution system is provided in Figure 9-2 below. As mentioned previously, each substation will typically be designed to utilize two sets (redundant) of transformer/rectifiers such that either transformer/rectifier set is capable of supplying the entire substation load indefinitely.

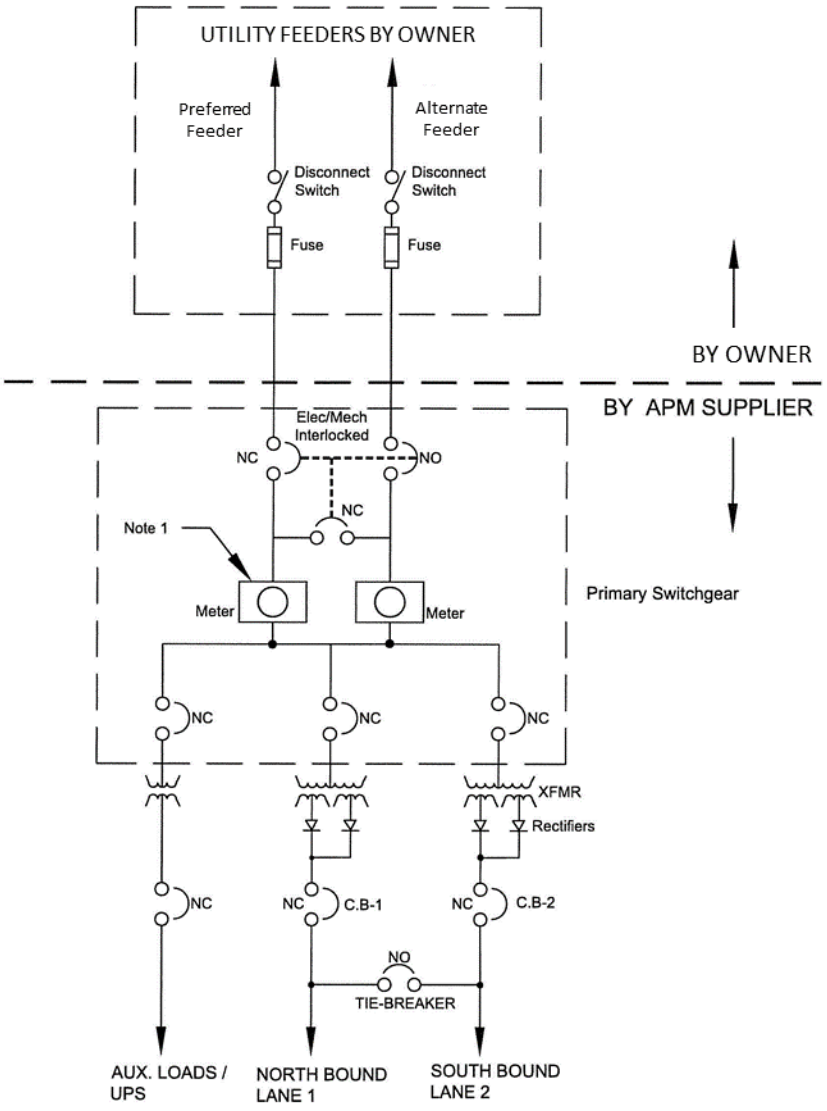

Figure 9-2: Typical Single Line Diagram

9.3.2. Estimated PDS Substation Space Allocations

The estimated minimum room space allocation for a fully redundant PDS substation is approximately 3,000 square feet and with 14 feet of clearance above the finished floor. Substations should be generally rectangular for power equipment placement. However, different aspect ratios can be considered provided that equipment spacing meets all applicable local codes and the National Electrical Code. The PDS substation houses transformers, DC rectifiers, primary and secondary switchgear, APM System auxiliary power and other propulsion related equipment required to provide power to the APM System for vehicle propulsion and other System equipment.

The PDS substation requires access for truck loading and adequate space for the passage for installation/replacement of PDS equipment. A typical DC propulsion power substation layout is illustrated in Figure 9-3 below.

Access to substations is also required for personnel to perform maintenance and testing activities. The PDS substation design should consider parking for approximately four APM ground maintenance vehicles and a loading/unloading zone to maneuver equipment, tools, and materials for maintenance activities. Ramps providing smooth transition over curbs, as applicable, should be provided to enable efficient movement of equipment.

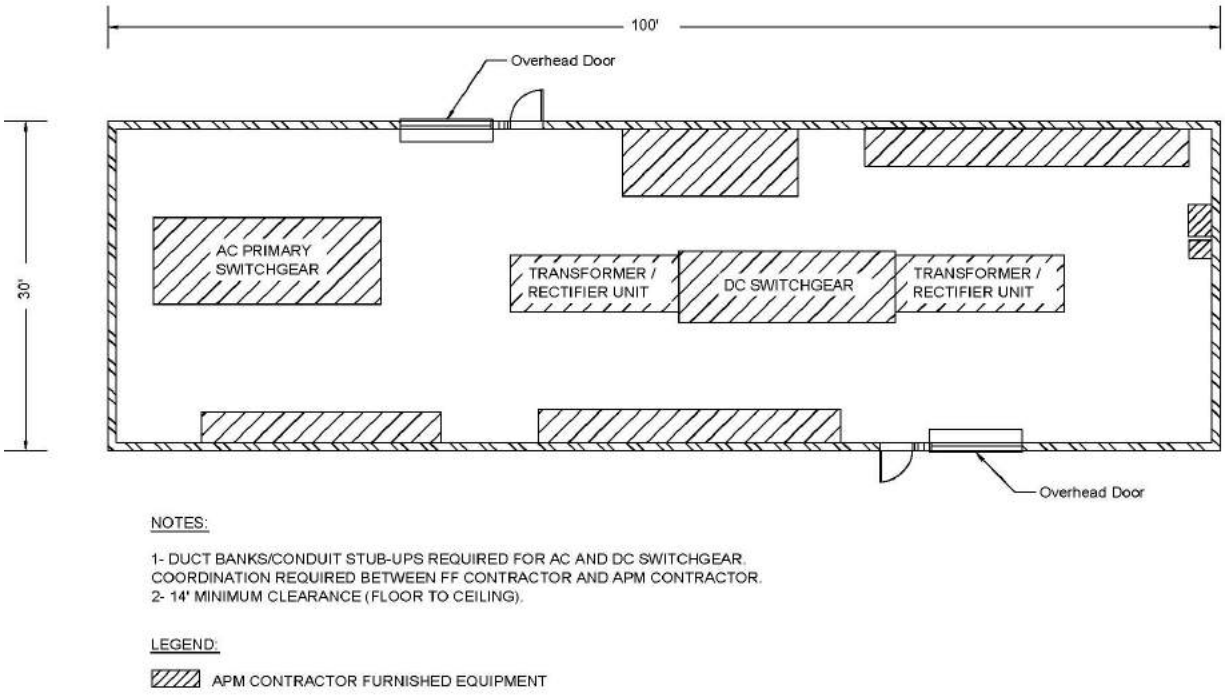

Figure 9-3: Typical Substation Layout

9.3.2.1. Underground PDS Substation

Typically, PDS substations are located at-grade due to local codes and regulations or at the direction of the local authorities having jurisdiction (AHJ). However, the possibility of an underground substation is also being preserved for as part of the ITC project. Further review of applicable codes and regulations and discussions with the AHJ are required for final determination on the acceptability of an underground substation.

For underground substations, the above requirements for an approximately 30 ft x 100 ft room is still applicable. Access for personnel and installation/replacement of smaller equipment can occur via freight elevators, and at a minimum, two staircases (one for normal access, and another for emergency egress). It is estimated that in addition to the 30 ft x 100 ft room, an additional space of approximately 30 ft x 30 ft should be adequate to fit the required vertical circulation. Access for large equipment

installation/replacement, which is expected to occur infrequently, can occur via an access hatch located over the substation room in lieu of a ramp for truck access. The use of an access hatch minimizes the amount of underground excavation and construction. With the access hatch, equipment would be lowered down into or lifted u out of the substation via a temporary crane.

Note that, in addition to code/regulatory and local authority having jurisdiction requirements, the following may also be considerations for underground PDS substations:

- Water table and flooding;
- Water proofing design requirements;
- Air circulation equipment to ensure the necessary conditions are maintained within the substation; and
- Other safety and environmental mitigations.

9.4. Analysis Results

The following are the results of the load-flow analysis performed for mainline operations, as well as the estimated power load for the MSF.

9.4.1. Mainline Operations

The objective of the analysis was to determine the following:

A. Normal Operation: The service that could be operated with TPSSs located at the MSF and at the ITF site with both TPSS in operation;
B. Failure Operations: The service that could be operated with one full TPSS out of service and the other in service; and
C. The resulting transformer size for each TPSS location.

The results indicated that the two TPSS provide adequate redundancy with the ability to operate the 6 x 4-train fleet, even with either TPSS out of service.

9.4.2. Normal Operation

The following tables present the results of the load flow analysis based on Normal Operation with both TPSS in operation for the 6 x 4-car fleet. Normal Operations can be operated with the MSF and ITF site substation locations.

Normal	Peak Power (KW)	RMS Power (KW)	Average Power (KW)	RMS Current (A)
MSF Site TPSS 1	2008	834	755	1067
ITF Site TPSS 2	2119	777	639	996

Table 9-1: Normal Operations Load Flow Analysis

9.4.3. Failure Operations

The following presents the results of the load flow analysis used to determine the operations that are capable when one full TPSS is out of service. The analysis determined that with one TPSS out of service, the system can continue to operate the 6 x 4-car trains.

Based on the results provided in Table 9-2, the minimum transformer sizing is 2.0 MW.

Loss of TPSS 1	Peak Power (KW)	RMS Power (KW)	Average Power (KW)	RMS Current (A)
MSF Site TPSS 1	0	0	0	0
ITF Site TPSS 2	4152	1671	1447	2200
Loss of TPSS 2	**Peak Power (KW)**	**RMS Power (KW)**	**Average Power (KW)**	**RMS Current (A)**
MSF Site TPSS 1	4353	1668	1436	2197
ITF Site TPSS 2	0	0	0	0

Table 9-2: Failure Operations (6 x 4-car Train) Load Flow Analysis

9.4.4. MSF Operations

The power requirements for the MSF were developed assuming a worst-case scenario where during operating hours, 1 x 4-car or 2 x 2-car trains are operating on the mainline and maintenance is simultaneously being performed on the remaining trains at the MSF. During non-operating hours, all four maintenance berths are simultaneously performing maintenance. This worst-case scenario provides a conservative estimate for the power requirements for the MSF.

Based on the above assumptions and the operating hours noted in Section 9.2 Assumptions, it is estimated that the transformers at the MSF TPSS location will need 0.5 MVA of additional capacity.

The power usage for the automated stabling tracks can be accommodated by the power requirements for the mainline operations. There is no situation where trains are being moved into/out of the automated stabling area while the mainline is operating 6 x 4-car trains. Trains can only be moved into/out of automated stabling when the number of trains operating on the mainline is reduced. Therefore, it is not required to increase the size of the MSF or the mainline transformer sizes to power the automated stabling tracks.

9.5. Conclusions and Recommendations

The following table identifies the estimated transformer sizes for the analyzed MSF site and ITF site TPSS locations, along with Lea+Elliott's recommendations and comments.

These sizes and recommendations are based on an assumed high reliability robust level of service that is reasonable for this early level of planning. As the project progresses, the transformer sizes can be further optimized. In addition, if the peak hour demand assumptions are updated in a future phases due to updates to the number of trains in the system, additional load flow analysis will be required to determine the resulting estimated transformer sizes and TPSS facility size.

TPSS Locations	Transformer Size	Comments
MSF Site	2.5 MVA (2.0 MVA + 0.5 MVA)	• Strongly recommend providing two TPSS. • Provides Normal Operations and Failure Operations of 6 x 4-car trains with one full TPSS out of service. • Further optimizing of transformer sizes can occur in a future phase of the project.
ITF Site	2.0 MVA	

Table 9-3: Summary of Estimated Transformer Sizes

Two TPSS is strongly recommended. Although one TPSS appears sufficient to support the Normal Operation, no redundancy during failure operation can be provided with one TPSS. Although reduction from two to one TPSS would result in a capital cost savings of upwards of $3 Million, this savings does not outweigh the potential risks of failure scenarios and reduced future operational flexibility.

9.6. Coordination with Southern California Edison

In 2019, the EIR team reached out to Southern California Edison (SCE) to begin coordination related to the power demand requirements for the ITC system. The goal was to identify whether there were any major shortfalls or major issues at this time from a power capacity perspective.

The ITC Team provided the following requirements and assumptions to SCE regarding the ITC Project:

- The project would require approximately 10 MVA to power the System (trains, traction power, etc.) and infrastructure (Station lighting and vertical circulation, guideway lighting, etc.).
- Fully redundant power feeds are requested.
- Feeds to be provided at single location. The ITC Project would distribute power as needed.

Using these assumptions, SCE's Distribution Engineering department completed a high-level Distribution Study to determine the amount of load that SCE could accommodate and required infrastructure upgrades in order to meet the ITC Project's recommended full redundancy design. SCE's analysis assumed the use of the existing single (non-redundant) 16kVA circuit currently available along Market St. as it may be the most likely used circuit for the ITC Project.

The results of SCE's Distribution Study found that:

- The maximum load that can be accommodated at the present time is 10 MVA.
- To accommodate the 10MVA with full redundancy, the following upgrades would be required:
  - 1,500' of new civil work/duct banks
  - 1,860' of new 1000 JCN cable
  - 1,700' of upgrading/re-cabling existing SCE Primary cable to 1000 JCN
  - Two new Gas Switches

These values and upgrades are based on the current projected loads for 2026. SCE's also noted that their distribution system is dynamic and is subject to change as we approach the 2026 date. As the project details develop, SCE can effectively plan for this new load. The ITC project will need to be reevaluated by the SCE Distribution Engineering in a future phase of the project as the details are finalized.

Email correspondence from SCE are provided in Appendix E for reference.

10. Conceptual Cost Estimates

The total cost for an APM project is comprised of the cost for the infrastructure and the Operating System. The following sections provide a summary of the conceptual capital and Operations and Maintenance (O&M) cost estimates for the APM Operating System only. The APM infrastructure capital and O&M cost estimates were prepared separately by the EIR team's structural cost estimation consultant.

An APM project, including this ITC project, can be separated into the following two distinct elements:

- APM Operating System: The APM operating system includes the rolling stock (vehicles) and associated equipment (such as automatic train control and communications equipment, traction power distribution system, guidance and power rails, running surface/trackwork, public address and CCTV systems, maintenance equipment etc.) required for the integrated safe and reliable operations of the APM operating system. The APM operating system equipment is installed within APM Fixed Facilities; the requirements are driven by the APM operating system.
- APM Infrastructure (also called Fixed Facilities (FF)): APM Infrastructure is generally comprised of the passenger stations, guideway structures, maintenance and storage facility (MSF), central control facilities, power substations and equipment rooms, as well as establishing appropriate interfaces for life-safety systems such as lightning protection, grounding, NFPA 130, etc. The APM Infrastructure requirements are driven by the APM operating system.

APM Operating Systems are proprietary designs that must be procured as complete packages, whether in standalone contracts for Operating System or as part of a larger Design Build Operate Maintain contract with the design and construction of the infrastructure. In some cases, large infrastructure investments are also procured with the financing of the project integrated into the project delivery, such as Design Build Finance Operate Maintain (DBFOM). The procurement approach for the ITC project has not yet been determined.

10.1. Systems Capital Cost Estimate

10.1.1. Overview

APM Operating Systems are proprietary designs that must be procured as complete packages. The major subsystems (e.g., vehicles, tracks, switches, control systems, station equipment, etc.) from different suppliers cannot be mixed to form a system. Therefore, the APM Operating System must be procured under a turnkey design, supply and installation contract. The APM Operating System equipment designs are proprietary and are different for each of the suppliers. Due to the highly specialized nature of this work, there are a limited number of qualified, responsible suppliers for the APM Operating System. As a result, the costs within the APM industry vary on a project by project basis often driven by market conditions (i.e. how many APM procurements are ongoing, economic conditions, as well as a potential supplier's strategic considerations in gaining market share, among other things), degree and level of competitive interest in the procurement, and the project specific requirements. Some of the key project

specific requirements for an APM System include the fleet size, capacity requirements, operational modes and more significantly, the general terms and conditions of the contract, including but not limited to caps on damages.

The ITC project has been programmed for a "generic" class of large APM technology, including large monorails, to facilitate a competitive procurement environment.

The generic APM Operating System includes characteristics common to the available proprietary technologies such that these technologies could be "easily adapted" to site specific requirements. The aim of this approach is to ensure that the project is compatible with the various APM technologies and thus increase the competitive environment.

For cost estimating purposes, Lea+Elliott has developed a proprietary cost model using cost data from historical projects that can be programmed to create a theoretical composite APM Operating System most like the APM Operating System planned for the subject project. The cost model considers prices from an extensive database, including costs of APM systems with similar characteristics to the system being estimated.

10.1.2. Capital Cost Estimate Breakdown

Table 10-1 provides a breakdown of the estimated capital cost for the APM Operating System by subsystem and/or major activity. The following items are taken into consideration in the estimate:

- This estimate is provided in 2018 dollars; additional escalation to mid-point of construction or bid dates is to be added should they be needed.
- Overhead and Bond costs are included in the contractor's project management and administration, as they are typically assigned to this line item by the bidder/supplier.
- A 15% contingency is applied, which is applicable due to:
    - Level of unknowns at this early planning level of this project.
    - The proprietary nature of the technologies, as suppliers' competitiveness, and therefore prices, vary depending on different economic factors.
- Fare collection costs are identified in a separate line item as further analysis and discussions are required to determine whether fare collection will be applied to this project.
- This estimate does not include the APM infrastructure cost, or the Owner's costs for project management, technical assistance and administration of the contract, and any legal fees.

APM OPERATING SYSTEM CAPITAL COST ESTIMATE (DOES NOT INCLUDE INFRASTURCTURE)			
ITEM DESCRIPTIONS	**MAJOR QUANTITY AND UNIT**		**ESTIMATED COST**
GUIDEWAY EQUIPMENT	16,880	LINEAR FT. GUIDEWAY	$32,500,000
STATION EQUIPMENT	3	STATIONS	$3,500,000
MAINTENANCE AND STORAGE FACILITY EQUIPMENT	1	LUMP SUM	$12,800,000
POWER DISTRIBUTION SYSTEM EQUIPMENT	2	PDS	$8,800,000
AUTOMATIC TRAIN CONTROL EQUIPMENT	1	LUMP SUM	$14,400,000
COMMUNICATIONS EQUIPMENT	1	LUMP SUM	$3,500,000
CARS	24	EACH	$65,100,000
OTHER OPERATING SYSTEM EQUIPMENT OR FACILITIES	16,880	LINEAR FT. GUIDEWAY	$9,100,000
OPERATING SYSTEM VERIFICATION AND ACCEPTANCE	4%	% of subtotal	$6,600,000
OPERATING SYSTEM CONTRACTOR'S PROJECT MANAGEMENT AND ADMINISTRATION	32%	% of subtotal	$50,200,000
SYSTEM TOTAL			$206,500,000
CONTINGENCY FACTOR		15%	$31,000,000
TOTAL (ESTIMATE YEAR= 2018$)			**$237,500,000**

FARE COLLECTION	3	Sta	$2,500,000
CONTINGENCY FACTOR		15%	$400,000
TOTAL (ESTIMATE YEAR -2018$)			**$2,900,000**

Table 10-1: Conceptual APM Operating System Capital Cost Estimate

10.2. Operations & Maintenance Cost Estimate

10.2.1. Overview

The Systems O&M is typically performed by the Contractor as part of their delivery of the initial system. The annual O&M cost estimate addresses labor, power and material (i.e., parts and consumables) costs for the system operations and estimated fleet size. O&M costs include vehicle and guideway maintenance, system controls, fare collection, roving staff that can respond to mechanical problems and emergencies, and management and administration support. As an automated system, APM O&M labor costs can be relatively low compared to regular transit and allow more frequent service to be operated.

10.2.2. O&M Cost Estimate Breakdown

Table 10-2 provides a breakdown of the O&M estimate for the APM system equipment. The following items have also been taken into consideration in the estimate:

- Estimate is provided in 2018 dollars.
- A 20% contingency is applied, which is applicable due to:
    - Increased level of unknowns at this very early planning level of this project
    - The proprietary nature of the technologies, as suppliers' competitiveness, and therefore prices, vary depending on different economic factors.
- A 10% profit is assumed for the Contractor.
- Fare collection costs are identified in a separate line item as further analysis and discussions are required to determine whether fare collection will be applied to this project.
- This estimate does not include the infrastructure O&M costs or the Owner's costs for project management, technical assistance and administration of the contract, and any legal fees.

APM OPERATING SYSTEM O&M COST ESTIMATE (DOES NOT INCLUDE INFRASTRUCTURE)		
ITEM DESCRIPTION		**ESTIMATED COST**
LABOR		$5,240,000
MATERIALS		$1,810,000
	SUBTOTAL	**$7,050,000**
PROFIT AND G&A	10%	$710,000
	ANNUAL O&M CONTRACT	**$7,760,000**
UTILITIES		$1,320,000
TECHNICAL ASSISTANCE		$100,000
OTHER APM ADMINISTRATIVE REQUIREMENTS		$100,000
	SUBTOTAL	**$9,280,000**
CONTINGENCY	20%	$1,860,000
	TOTAL ANNUAL O&M COST	**$11,140,000**

Appendix B: Prairie Ave. Utility Review Summary

LEA ELLIOTT

MEMORANDUM

Date: May 31, 2019

To: Louis Atwell, City of Inglewood
Peter Puglese, City of Inglewood

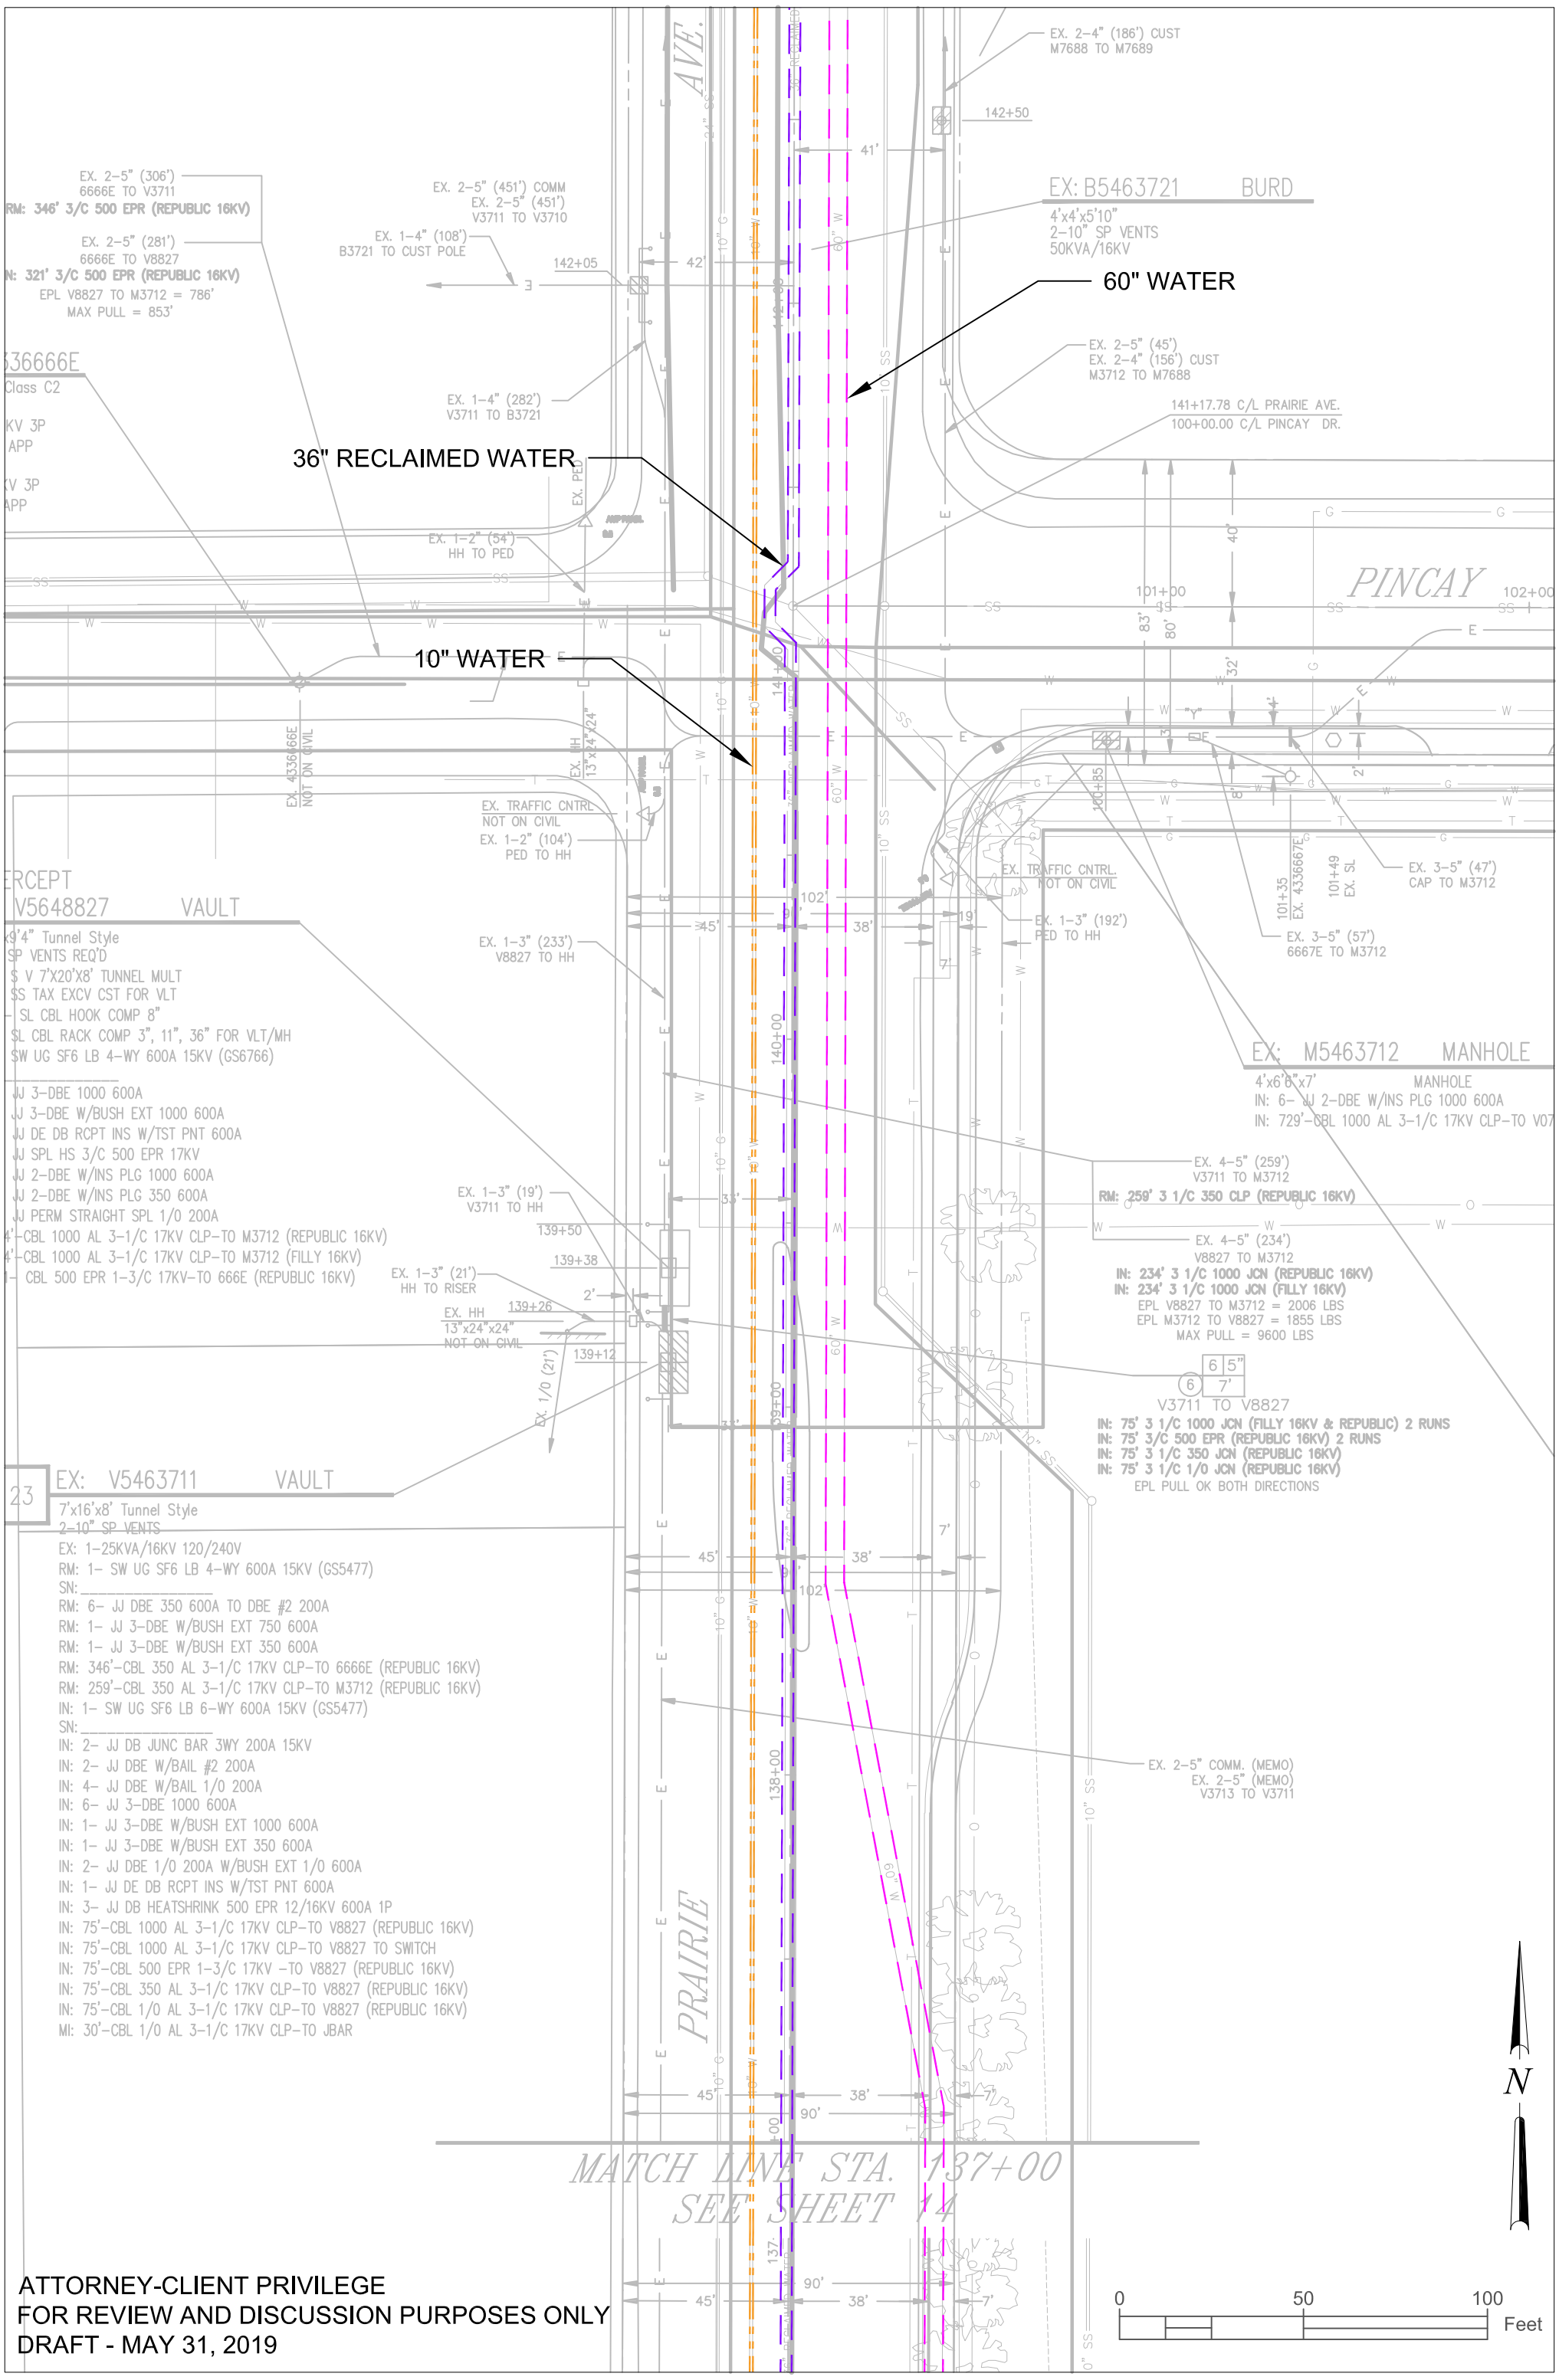
From: Iris Yuan, Lea+Elliott, Inc.

CC: Lisa Trifiletti, Omar Pulido – Trifiletti Consulting
Sanjeev Shah, Sambit Bhattarcharjee, Eduardo Cuadra – Lea+Elliott, Inc.
Desiree Gonzales – Pacifica Services, Inc.

Subject: Inglewood Transit Connector
Utility Analysis Summary

This memo summarizes the review of the utilities along Prairie Ave. for the Inglewood Transit Connector and the identification of those utilities to be avoided during the planning for the column locations.

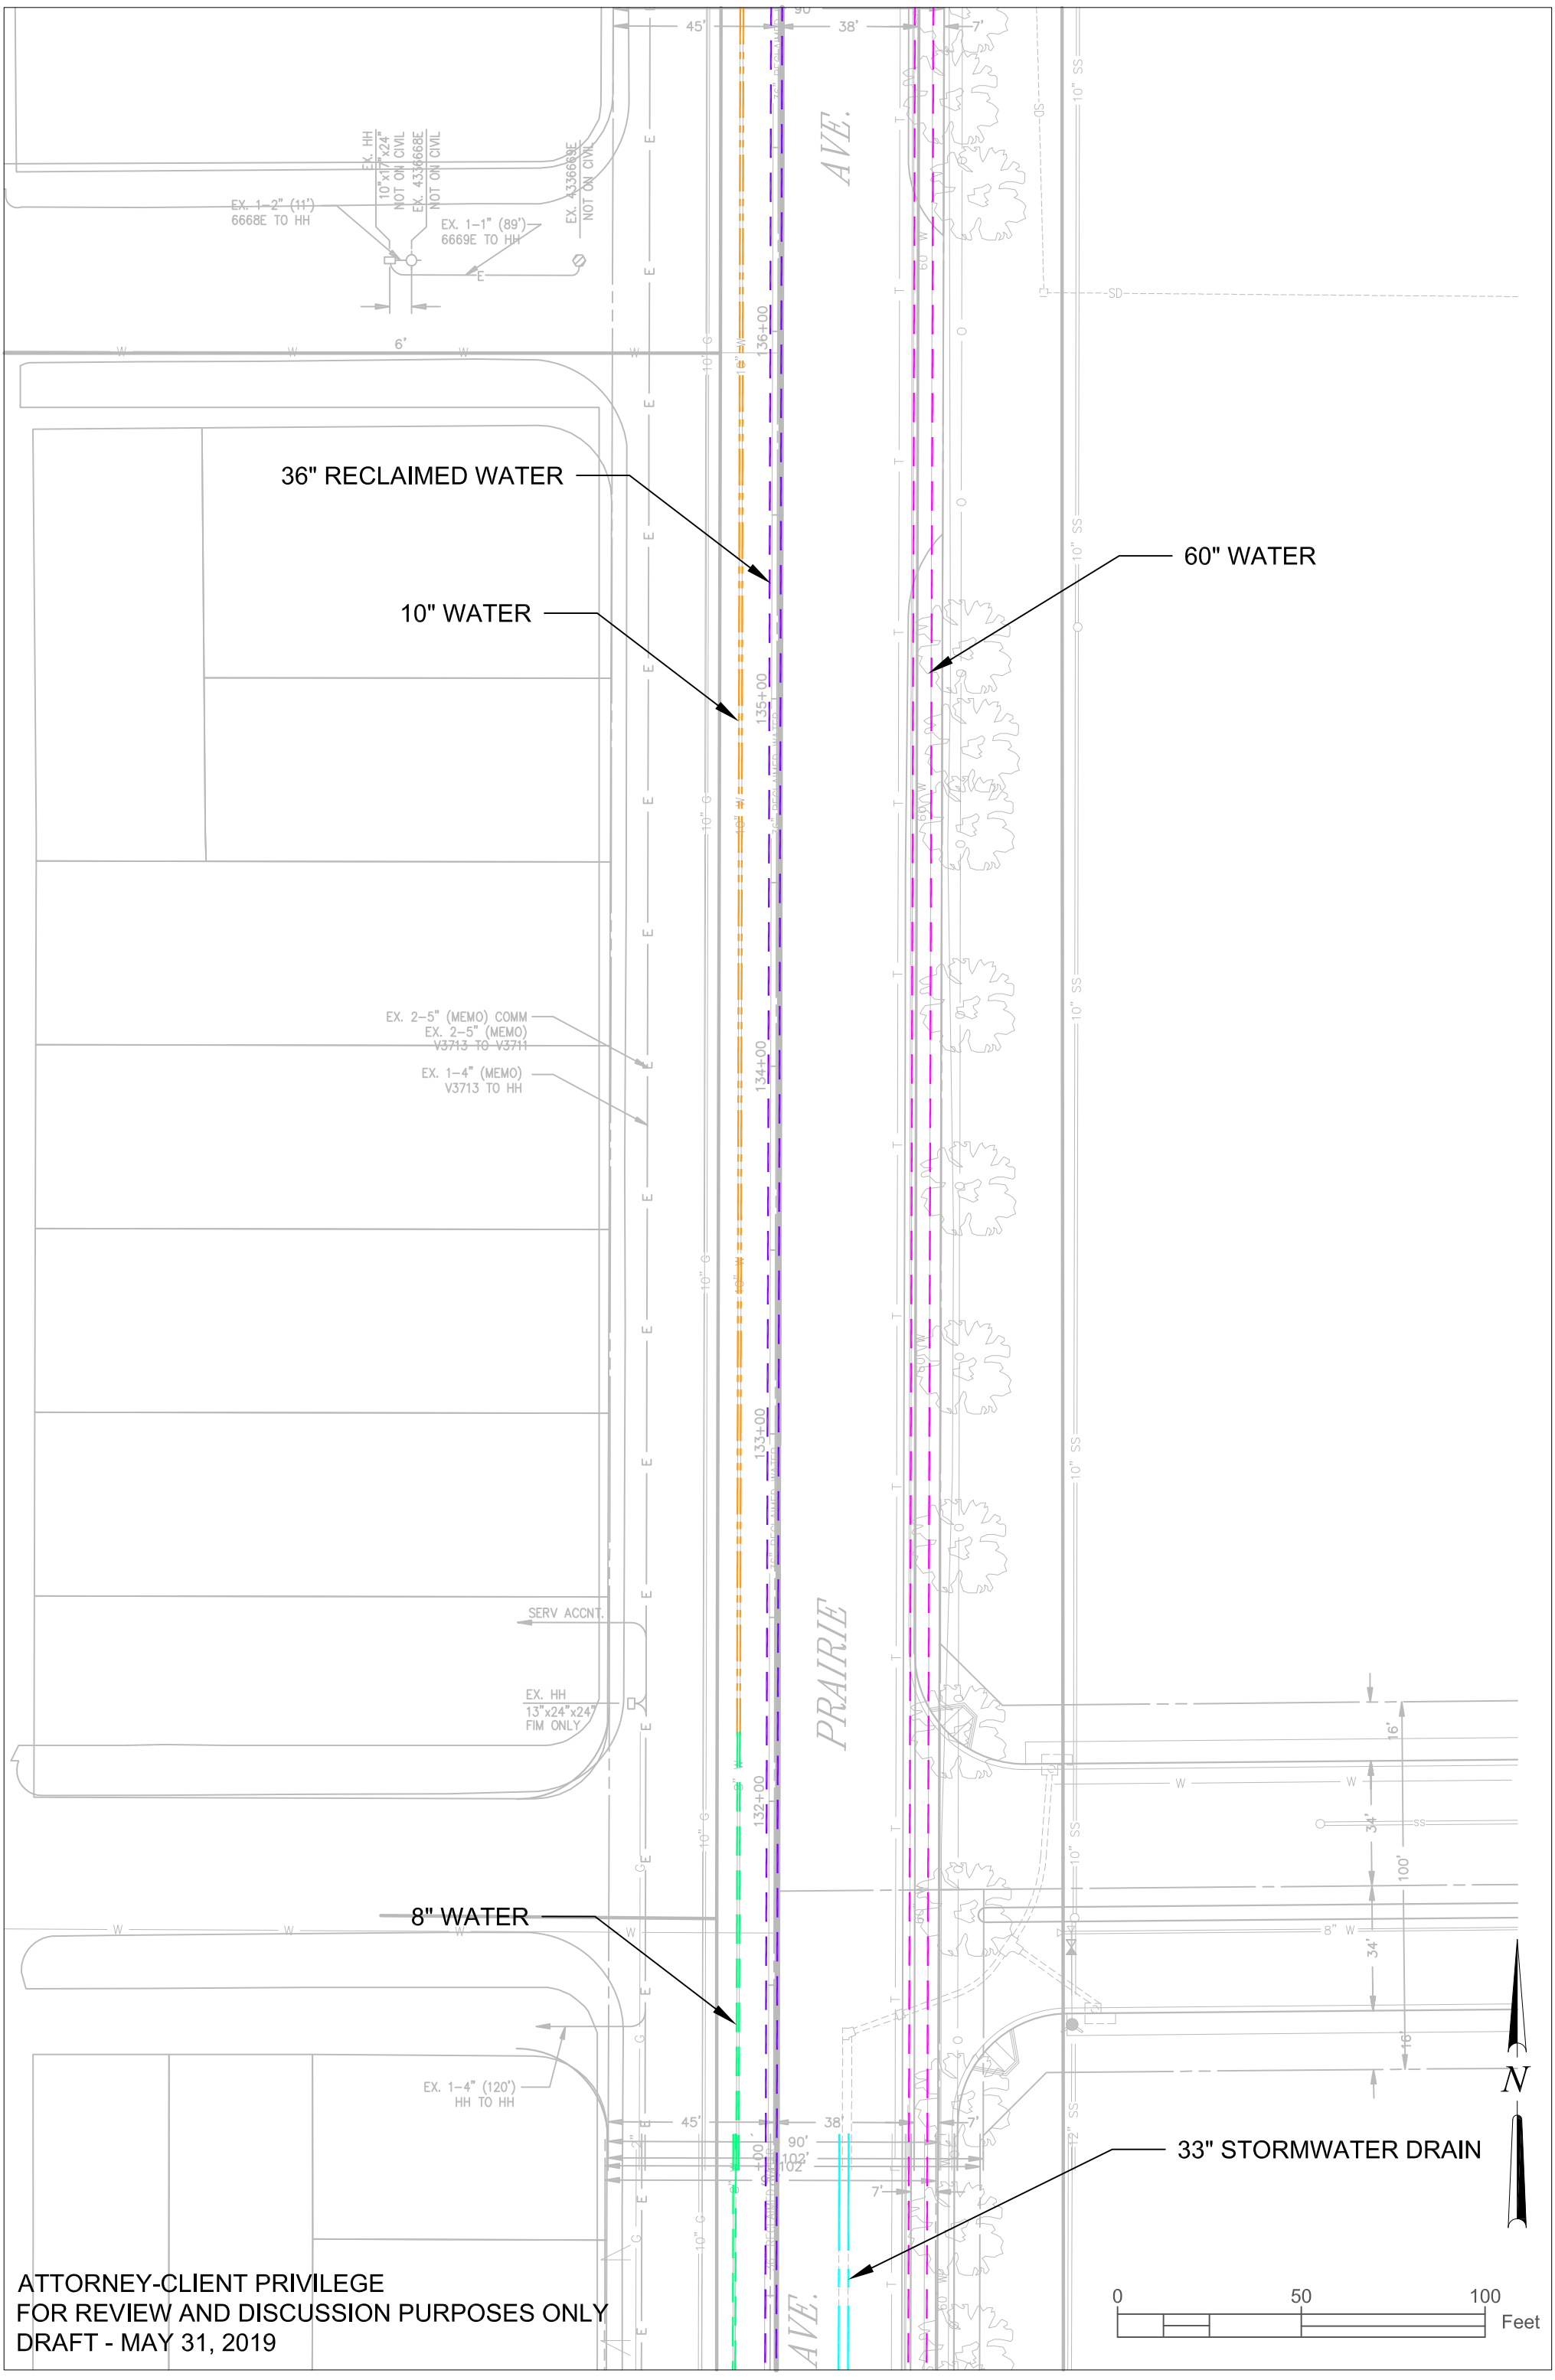
During the September 13, 2018 meeting between the ITC team and the City of Inglewood, the City noted that any utilities along Prairie Ave. could be relocated with the exception of the large water and sewer pipes.



The City provided the utilities along Prairie Ave. for review (file name: Inglewood-Utilities.dwg).

In reviewing this drawing, the following large water and sewer pipes were identified as those to be avoided:

- 60” Water
- 36” Reclaimed Water
- 33” SD (Stormwater Drain)
- 39” SD (Stormwater Drain)
- 60” SD (Stormwater Drain)
- 8” Water
- Connections to the stormwater drains



These water, reclaimed water, and stormwater drain pipes, along with the connections to the sewer drain, are shown in Attachment A: Prairie Ave Utility Review Drawings.

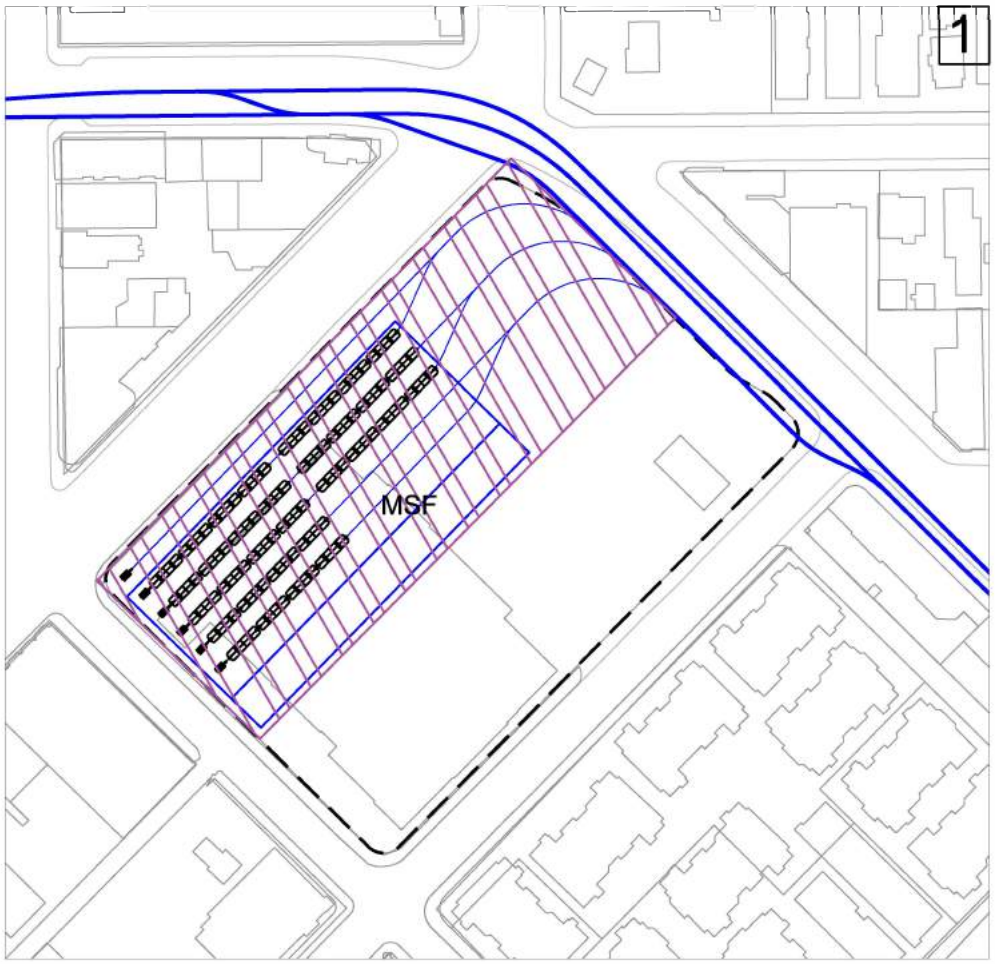
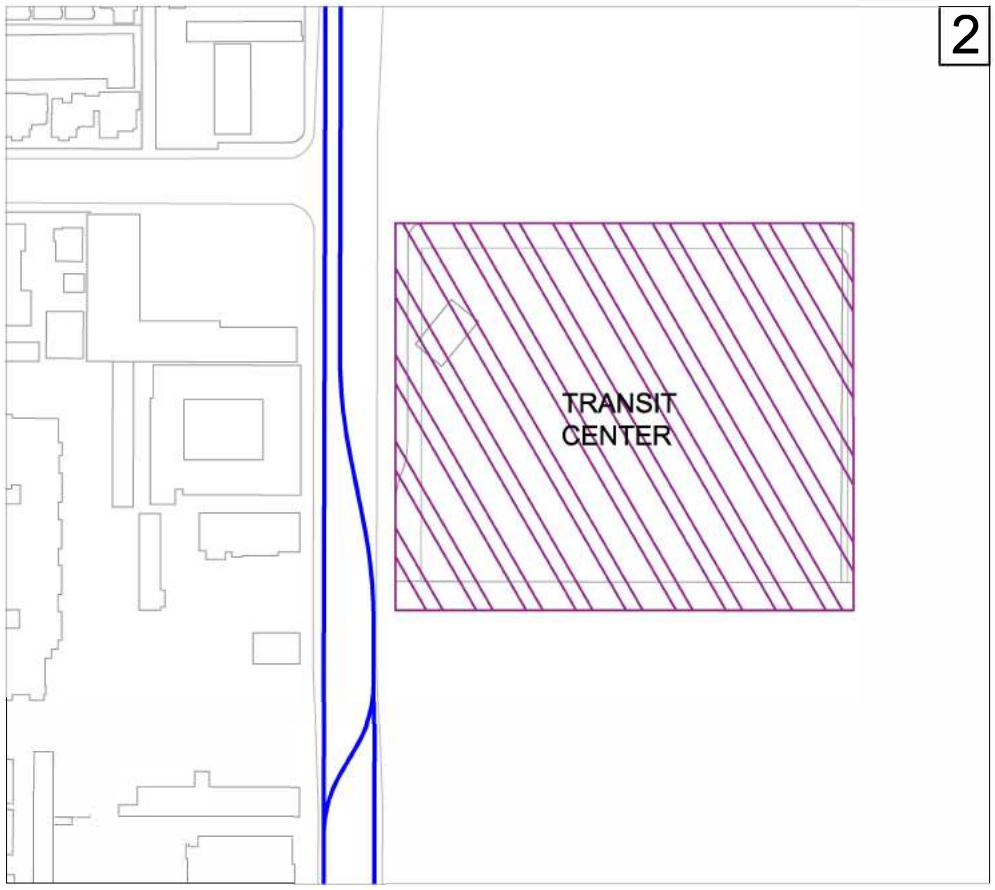
Appendix D: Potential Locations for Traction Power Substations

Inglewood Transit Connector
Operating System Conceptual Planning for EIR Project Definition
Appendix D: Potential Locations for Traction Power Substations

- Approximate locations for the traction power substations are identified. The exact size of the available properties is to be determined.
- The location of the substation within each of the identified areas is to be determined.
- Each substation is approximately 3000 sq ft with a building height of approximately 15 to 20 ft.

TPSS size (to scale with drawings)





- Parking and any additional area for fencing (if deemed necessary) is in addition to the 3000 sq ft.
- Alignment is representative only. Further refinements may occur.

Drawing Scale: 1" = 200'

Subject: RE: (External):RE: Inglewood Hollywood Park Rail

Hello Omar,

We have completed the requested study for the Inglewood Transit Connector project. There is only one existing 16kV circuit along Market Street. This circuit can accommodate the proposed 10MVA of load. For the requested redundancy, new infrastructure will be required. A further study is needed to determine the scope of work for the new infrastructure.

Moving forward, Dylan Kasten will be the Field Engineer for this project.

Please let us know if there are any questions or concerns.

Thanks.

Danielle Chanes
Field Engineer

Subject: RE: (External):RE: (External):RE: Inglewood Hollywood Park Rail

Hi Omar,

Distribution Engineering has completed a high level Distribution Study to determine the amount of load we can accommodate, as well as the required upgrades. With full redundancy proposed for the Inglewood Transit system, it is critical that the results are based on accurate projected loading values for the future service year of 2026. The project will need to be reevaluated by SCE Distribution Engineering once the project develops and as details are finalized. The results are as follows:

Maximum Allowable Load:
Distribution Engineering has determined that the maximum load (at the present time) that can be accommodated is 10 MVA.

Infrastructure Upgrades / Work Required:
To accommodate the requested 10 MVA of load with full redundancy, the following upgrades would be needed:

- 1500' of new civil work/duct banks
- 1860' of new 1000 JCN cable
- 1700' of upgrading/re-cabling existing SCE Primary cable to 1000 JCN
- Two new Gas Switches

These values and upgrades are based on the current projected loads for 2026. SCE's distribution system is dynamic and is subject to change as we approach the 2026 date. As the project details develop, SCE can effectively plan for this new load.

Thanks,

Dylan Kasten

1. INTRODUCTION

1.1 BACKGROUND

An exciting transformation for the City of Inglewood is underway as it becomes "The City of Champions" and is redefined as a world-class sports and entertainment center in the greater Los Angeles region. As of August 2017, sales tax revenue in the City of Inglewood increases have outpaced the Los Angeles County average, and property values are up more than 100% since 2012. These accomplishments have been driven by a number of completed and on-going projects in the City. The Metro Crenshaw/LAX Line is set to open in 2019, which will enhance transit access to the City. The Forum's revitalization now actively hosts the largest entertainment acts in the country. The redevelopment of approximately 298 acres at Hollywood Park includes new residential, commercial, and recreational uses, and at the centerpiece is the construction of the Los Angeles Rams and Los Angeles Chargers new National Football League (NFL) stadium.

Additionally, in 2018, the Los Angeles Clippers of the National Basketball Association (NBA) announced a proposal to relocate their headquarters, training facilities and new arena to the City, and a new Los Angeles Philharmonic state-of-the-art music and cultural campus for the Youth Orchestra Los Angeles (YOLA) designed by renowned architect Frank Gehry, will also be headquartered in Inglewood. All of these new venues are bringing new energy and opportunity to the City and are contributing to its social and economic well-being.

As investment in Inglewood has burgeoned in the last several years, it has injected the local economy with new jobs, retail, entertainment and residential opportunities. As Inglewood is transformed into a major regional activity center, it also means that the number of trips in and around the City are anticipated to increase. Based on historic traffic counts, traffic volumes have been increasing at the rate of 1.5% per year and many key intersections and key highway corridors are already experiencing congestion. According to the traffic study for the Hollywood Park Stadium Alternative Project performed by Linscott Law & Greenspan in 2015, while roughly 85% of patrons are anticipated to use privately-owned vehicles and 15% will rely on transit or charter buses for stadium events and games, these modes will still compete to utilize the same traffic corridors within the City that may be physically constrained or congested. Moreover, Southern California Association of Government's (SCAG) 2016 RTP/SCS Regional Travel Demand Forecasting Model projects substantial socioeconomic and demographic growth throughout the six-county southern California region. According to SCAG, population, housing and employment growth are expected throughout the cities of Los Angeles, Inglewood, Culver City, unincorporated areas of Los Angeles County and portions of the South Bay Cities consisting of El Segundo, Hawthorne and others. The City is working to manage this growth in a sustainable and responsible way, ensuring that residents, businesses and visitors have convenient and efficient access to new destinations and resources.

Figure 1.1-1: Youth Orchestra of Los Angeles (YOLA)

Source: LA Phil/YOLA

Building on the tremendous progress the Los Angeles County Metropolitan Transportation Authority (Metro) has made to develop the County's regional rail network and to create more transportation options associated with the opening of the Crenshaw/LAX Line, Inglewood's existing transportation infrastructure and circulation system should be updated, capacity should be increased on major arterial streets where possible, Metro and municipal bus operations and service should be enhanced, and most importantly, the Metro Rail system should connect directly to the City's major activity centers.

To address these critical mobility issues, Inglewood has

partnered with Metro to perform a focused analysis of viable transit connection options from the Metro Crenshaw/LAX light rail line to the Los Angeles Stadium and Entertainment District at Hollywod Park development (LASED). With the City's input, Metro explored how best to connect Inglewood's future LASED to Metro's rail system via a high-capacity transit connection. The Metro study analyzed 1) an Interlined Operability connection from the Crenshaw/LAX Line in a subway under Prairie Avenue, which also would jointly operate on a portion of the Crenshaw/LAX Line, and 2) Independent Operability options for independent services that could provide a connection from the Metro Rail system at nearby Metro stations along the Crenshaw line to the NFL Stadium. At the conclusion of the study, the City and Metro agreed that the Interlined Operability Scenario is infeasible due to its cost and complexity that would be created on the Metro Rail system.

Consistent with Metro's recommendations, Inglewood has continued to analyze several Independent Operability transit connections to the City's activity centers. The City has assembled an experienced consultant team to continue to define the transit connection concepts, initiate the environmental analysis and clearance process, launch a stakeholder engagement process, and develop an overall project implementation and delivery strategy, which will include the pursuit of an Enhanced Infrastructure Financing District. This report describes the City's further examination and comparative analysis of alternative transit connection concepts, a more detailed analysis of transit ridership potential, rough-order-of-magnitude project cost estimates, and a brief discussion of a project implementation strategy. Based on a deeper understanding of The City's mobility goals and objectives, this report includes a recommendation for the City's preferred conceptual alignment for the Inglewood

Figure 1.1-2: Los Angeles Stadium and Entertainment District at Hollywood Park (LASED)
City of Inglewood Revitalization Rendering

Source: LASED Website, 2018

Transit Connector Project. The Inglewood Transit Connector Project will be further defined as part of the environmental review process, and develop project delivery and implementation strategies.

1.2 INGLEWOOD TRANSIT CONNECTOR GOALS AND OBJECTIVES

The City of Inglewood provides a compeling example of what communities can accomplish when leaders, local organizations and citizens join forces to change the status quo and improve the quality of life. In recent years, the City has made great strides to improve the quality and delivery of essential public services and update its transportation infrastructure. Today, Metro is working to complete the construction of the Crenshaw/LAX Line into Inglewood by 2019, increasing access to public transportation for local residents. Stations at Aviation/Century, Westchester/Veterans, Downtown Inglewood, Fairview Heights, Hyde Park, Leimert Park, MLK Jr., and Expo/Crenshaw are currently under construction. The Metro Crenshaw/LAX will extend light rail transit from the existing Metro Expo Line Station at Crenshaw/Exposition Boulevards to the Metro Green Line station at Aviation/Century Boulevards, and will provide a transit connection to Los Angeles International Airport (LAX) via the City of Los Angeles' Automated People Mover (APM) system at the Airport Metro Connector 96th Street Transit Station. The approximately 8.5 mile light rail transit line will include two stations in Inglewood including the Fairview Heights station and the Downtown Inglewood station. As the City experiences a historic revitalization and benefits from Metro's major transit investment, it is important to synergize and build upon the new development occurring within City boundaries.

The City is now also working diligently to prepare for the LASED opening and is developing a comprehensive Inglewood Sports and Entertainment Center Transportation Management and Operations Plan (TMOP). Preliminary analysis indicates that Stadium events could generate over 10,000 additional trips in the AM peak hours, and over 15,000 additional trips during the PM peak hours. The Stadium will provide more than 9,000 parking spaces, consistent with the Hollywood Park Specific Plan requirements, and will also rely on off-site satellite parking with event shuttle service. Yet, while buses, Transportation Network Companies, taxis, shuttles, and other modes will be critical transportation options to access the City's event centers, these modes will still compete with existing roadway traffic and may not provide a convenient time-certain connectivity compared to an elevated rail connection. The physical capacity of the exisiting local and regional roadway network may challenge the ability of visitors to conveniently access the City's amenities. While a comprehensive satellite parking and shuttle program is being developed for operation on the Stadium's opening day, requisite staging areas will still entail drop-off and pick-up facilities at each end, potentially diverting valuable real estate from its hightest and best use. Additionally, even if patrons elect to use transit to Inglewood, the City's new sports and entertainment centers are located approximately 1.5 to 2 miles away from regional transit, leaving a critical last-mile gap.

Accordingly, the City is wholly committed to providing world-class transportation connections to its new state-of-the-art sports and entertainment center and is working diligently to define and propose a last-mile fixed guideway transit connector, referred to as the Inglewood Transit Connector Project. Mobility and direct transit access to the City's new activity centers are critical top priorities, especially given local and regional goals to increase transportation choices, reduce greenhouse gas emissions, improve air quality and human health, and encourage sustainable development patterns. Specifically, the City's goals and objectives for the Inglewood Transit Connector Project are to:

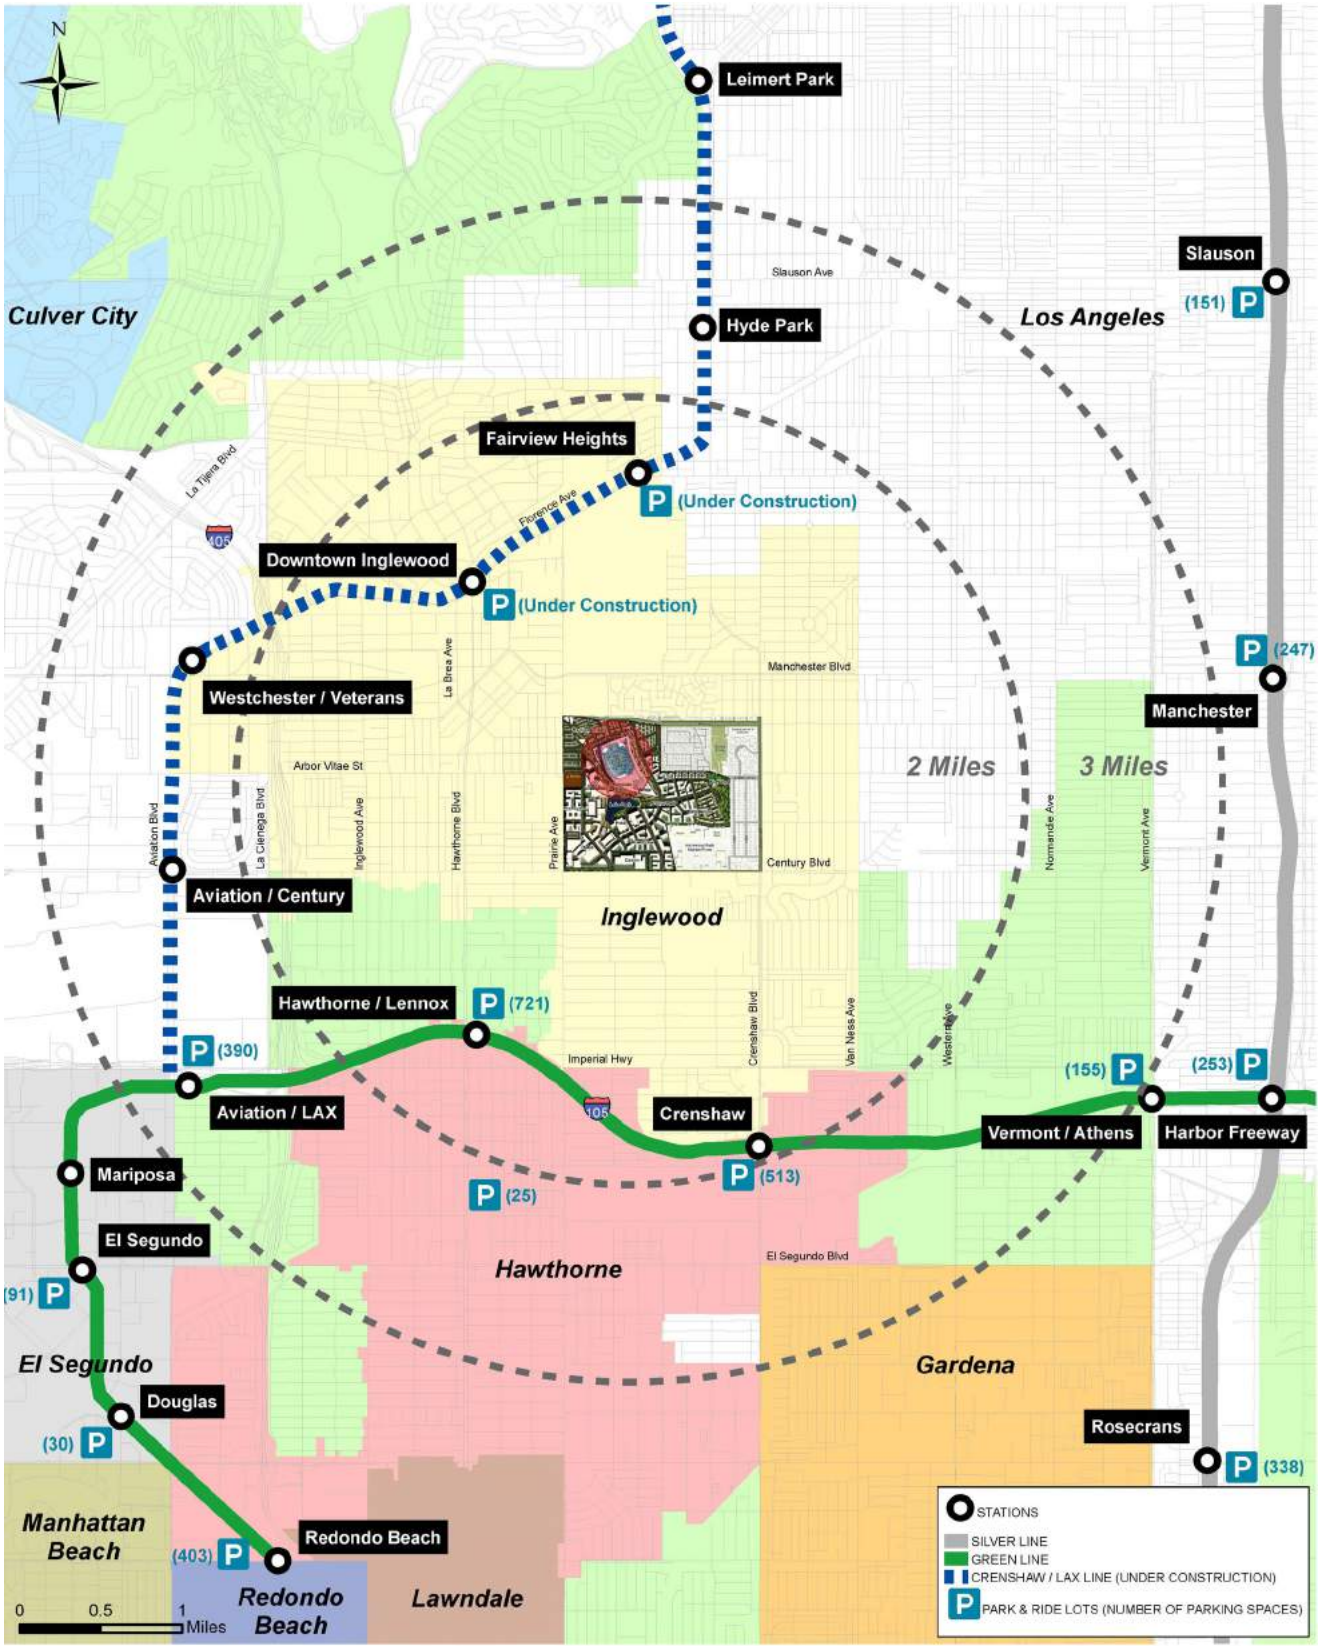
- Encourage intermodal transportation systems by providing convenient, reliable, time-certain transit service and direct transit accessibility and connectivity to the City's major activity centers.
- Reduce the City's traffic congestion and alleviate growing

Figure 1.2-1: Existing Metro Connections to the City of Inglewood

Source: Trifiletti Consulting, 2018

demand on the existing roadway network for both event and non-event days.

- Increase transit mode split and reduce trips and overall vehicle miles traveled to the City's major activity centers, which will improve overall air quality, public health, environmental outcomes and reduce greenhouse gas emissions.
- Activate and synergize with development and redevelopment within the City and enhance the City's economic development, social cohesion, equity and community resilience.
- Connect its community and citizens to jobs, education, services, destinations within the City and within the region, and support regional efforts to become more efficient, economically strong, equitable and sustainable.



The City has evaluated several independent last-mile fixed guideway transit connector options, comparing these options against key screening criteria and evaluating each option against the City's stated goals and objectives. The City recognizes that an efficient and effective transportation network is essential to achieving the full benefits of this ongoing and widespread investment.

Table 1.2-1: Metro Rail Stations Near City of Inglewood

METRO RAIL STATIONS NEAR CITY OF INGLEWOOD	APPROXIMATE WALKING DISTANCE TO HOLLYWOOD PARK NFL STADIUM

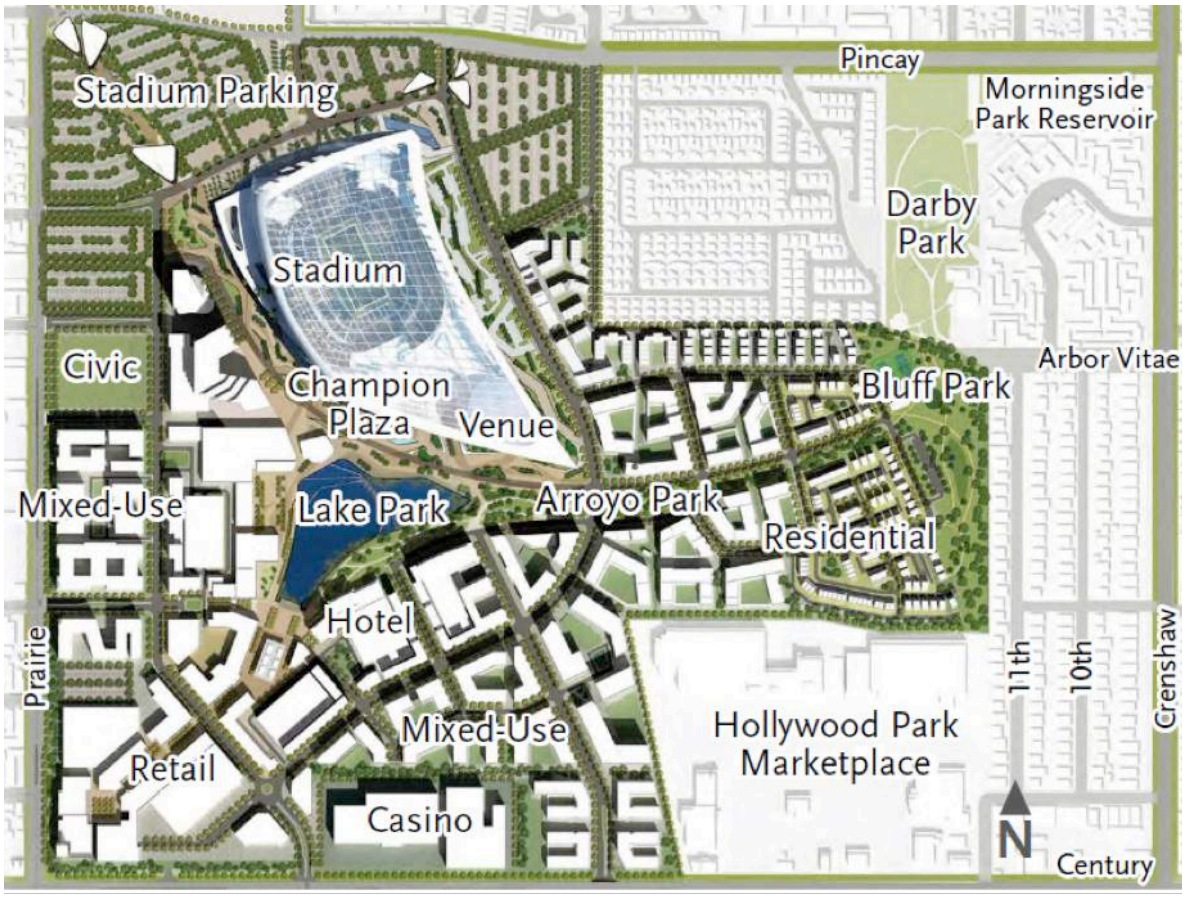
1.3 INGLEWOOD MOBILITY PLAN

Working in collaboration with the Southern California Association of Governments (SCAG), Metro, Caltrans, and surrounding transportation agencies and municipalities, the City has launched several parallel and coordinated transportation planning and programming efforts. The City of Inglewood's Circulation Element from the City's General Plan, which was adopted in 1992, will also be updated to reflect the City's long-range infrastructure needs and updated transportation goals, objectives, plans and projects. The Mobility Plan will include performance measures aligned with the City's vision, goals, and objectives, and will include short-term and long-term transportation improvements and policy recommendations designed to improve and enhance the City's local and regional transportation networks. The Inglewood Transit Connector Project will be proposed as the centerpiece and backbone of the Inglewood Mobility Plan.

Figure 1.3-1: Envision Inglewood Website - Mobility Plan Illustration

1.4 EXISTING AND FUTURE LAND USE AND TRANSPORTATION CONDITIONS



Located a few miles from downtown Los Angeles, the Silicon Beach tech corridor in West Los Angeles and just east of the Los Angeles International Airport and Gateway to Los Angeles hotel and business district, the City of Inglewood is a centrally located area that is seeing new construction and renewed economic development.

The following important projects under construction or proposed within the City are highlighted below.

1.4.1 Los Angeles Stadium and Entertainment District at Hollywood Park (LASED)

The LASED project, a new mixed-use, master planned community on the site of the former Hollywood Park racetrack and equestrian training facility, started construction in 2014 and is slated for completion by 2023. The project will transform underutilized asphalt lots and the former racetrack into a vibrant mixed-use community. The project includes a number of new uses including 2,500 residential units, 890,000 square feet of retail, 780,000 square feet of office and a 300-room hotel, as well as 25 acres of new recreational and park amenities for the City. The signature component of the project is new 75,000-seat NFL stadium, which includes a 6,000-seat performance venue that will be home to both the NFL Los Angeles Rams and Los Angeles Chargers teams. The stadium is set to open in 2020.

Figure 1.4-1: Los Angeles Stadium and Entertainment District at Hollywood Park (LASED) Site Plan

Source: City of Inglewood

According to Moody's Analytics, the LASED project is expected to generate nearly $1 billion in tourist expenditures for the City, pump $3.8 billion per year into the local economy, and add $18.7 to $28 million annually to the City's general fund. The LASED project includes roadway infrastructure upgrades, to modernize traffic systems with intelligent traffic signal systems (ITS) and a state-of-the-art traffic management command center, and implement physical mitigation measures at various intersections along Prairie Avenue and Century Boulevard.

1.4.2 The Forum

Constructed in 1967, The Forum, a multi-purpose indoor arena, has served for decades as one of the region's premier sports and entertainment venues. In 2014, The Forum completed a multi-million-dollar renovation and was added to the National Register of Historic Places. The Forum now actively hosts the largest entertainment acts in the country and is scheduled to host events during the 2028 Summer Olympic games.

1.4.3 The Proposed Inglewood Basketball and Entertainment Center

In June 2017, the NBA's Los Angeles Clippers team announced a proposal to construct a new arena and sports facility in Inglewood designed to host the team and other non-sporting events. In February 2018, the City initiated the environmental clearance process for the proposed project by releasing the Notice of Preparation (NOP) for a Draft Environmental Impact Report (EIR). The proposed project is located on approximately 27 acres and includes an 18,000 fixed seat arena, an approximately 85,000-square foot team practice and athletic training facility, approximately 55,000 square feet of LA Clippers team office space, approximately 25,000-square foot sports medicine clinic for team and potential general public use, approximately 40,000 square feet of retail and other ancillary uses that would include community and youth-oriented space, an outdoor plaza with an approximate area of 260,000 square feet including landscaping, outdoor basketball courts, outdoor community gathering space, and parking facilities sufficient to meet the needs of the proposed uses.

Figure 1.4-3: The Forum

Source: City of Inglewood, 2018

Figure 1.4-4: Proposed Inglewood Basketball and Entertainment Center Preliminary Site Plan

Source: City of Inglewood, Notice of Preparation, 2018

1.4.4 Market Street

The City of Inglewood is also working to revitalize downtown Inglewood in time to synergize with the future Metro Crenshaw/LAX station. The City is encouraging the design and development of new residential, mixed-use and retail oriented projects along Inglewood's Market street along with signage, marketing, landscaping and traffic calming improvements. Situated in the heart of Inglewood's Historic Core, The Miracle Theater was once connected to greater Los Angeles by the Red Car system. Today's Metro Crenshaw/LAX line will stop in downtown Inglewood just three blocks from The Miracle on Market Street. Classic theaters throughout Los Angeles are currently being re-energized as vital cultural venues. In the late 1940s through the early 1960s, Inglewood's Market Street hosted Hollywood film premieres at several movie houses including The Fox Theater, The United Artist's Theater, and The Ritz Theater. Built in 1937, The Ritz (now revived as The Miracle) is once again home to local and international entertainment. Featuring music, movies, comedy, and community events, The Miracle Theater provides a venue for arts and culture on Market Street.

Figure 1.4-5: Screening of HBO Series, *Insecure: Season 2,* Miracle Theater on Market Street, Fall 2017

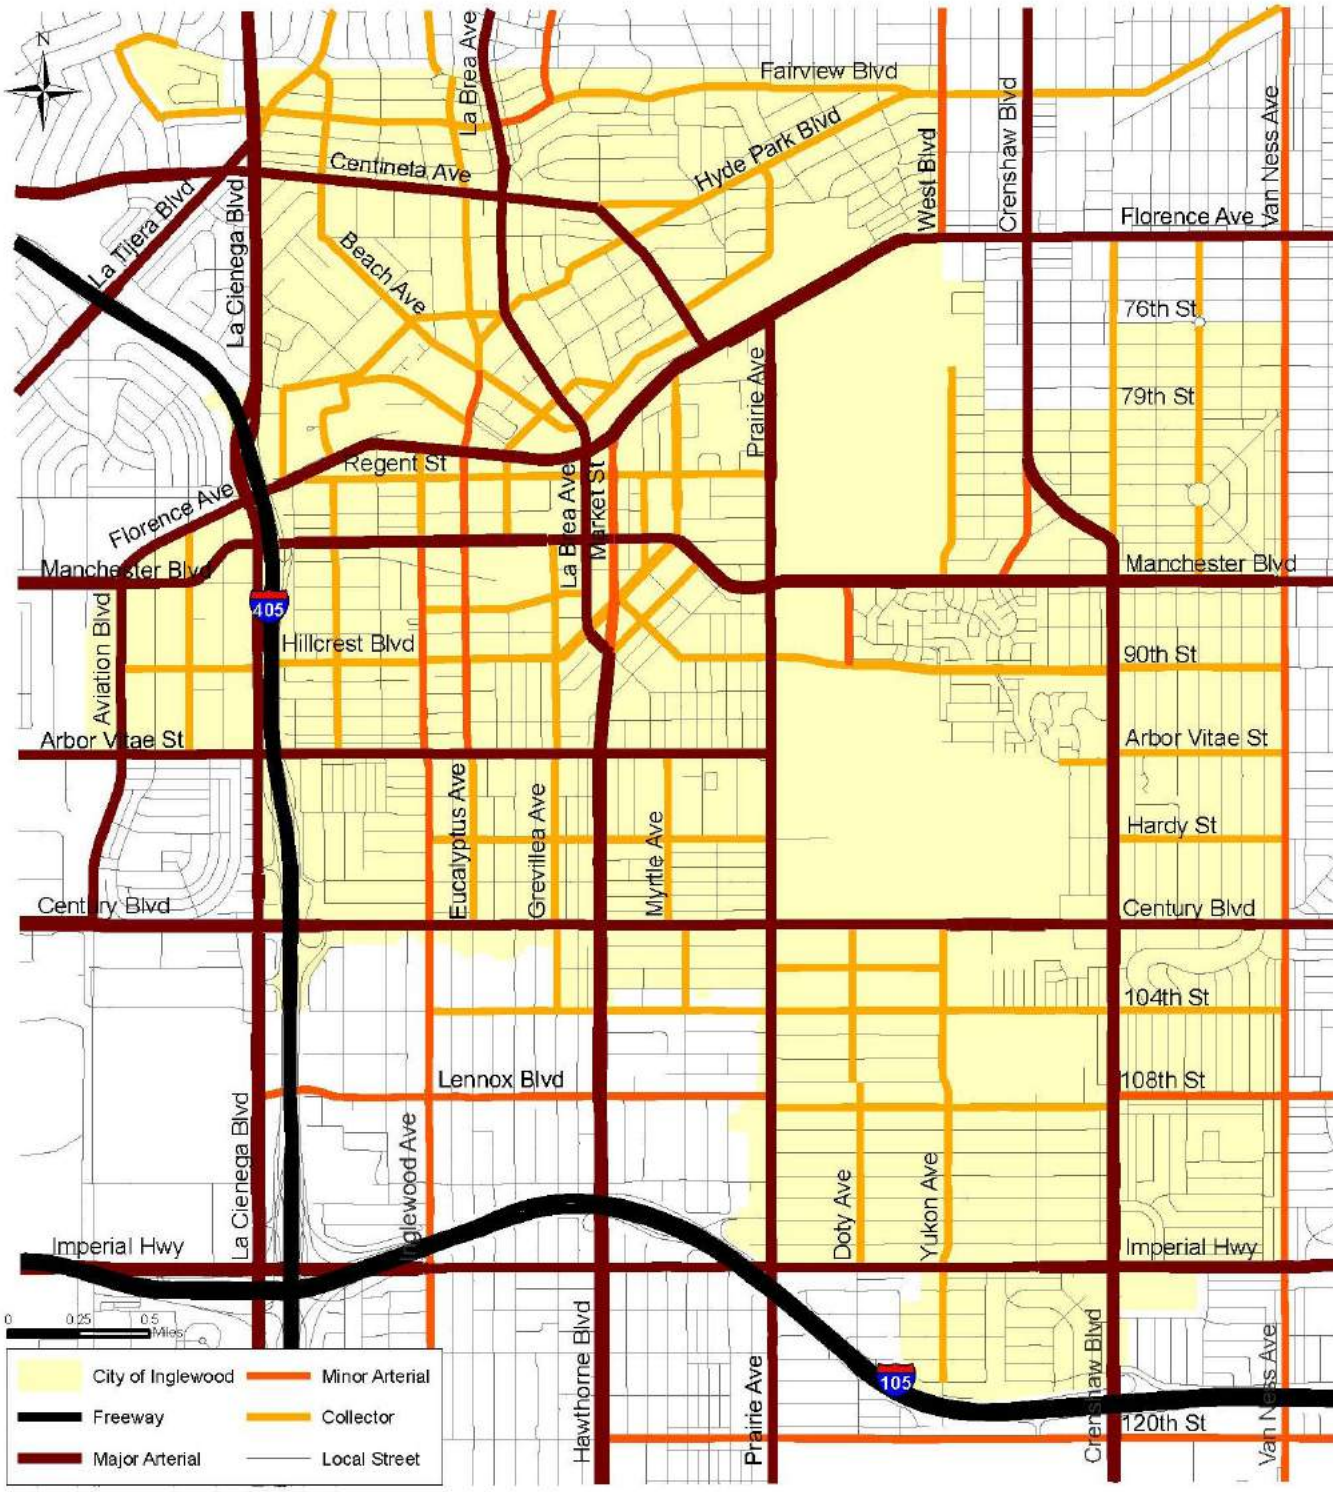
Source: Miracle Theater Website, 2018

1.5 EXISTING FREEWAY/ ARTERIAL ROADWAYS

Four major interstate highways serve the Inglewood area, including the Santa Monica Freeway (I-10) and Glenn Anderson Freeway (I-105), running east/west, the San Diego Freeway (I-405) running north/south and the Harbor Freeway (I-110) running north/south just east of the Study Area. The I-10, I-105, I-110 and the I-405 experience high levels of congestion, particularly during peak commute periods. I-105 and I-405 experience heavy traffic throughout the day as they provide regional access to West Los Angeles and Los Angeles International Airport.

The roadway system in the City is primarily a grid that includes arterials, collectors, and local roads. A major arterial thoroughfare is a high-capacity urban road with the primary function of delivering traffic from collector roads to freeways or expressways, and between urban centers at the highest level of service possible.

According to the City of Inglewood 1992 Circulation Element, the following streets within in the City are classified as major arterials:



1. Arbor Vitae Street
2. Centinela Avenue
3. Century Boulevard
4. Crenshaw Boulevard
5. Florence Avenue
6 Hawthorne Boulevard
7. Imperial Highway
8. La Brea Avenue
9. La Cienega Boulevard
10. Manchester Boulevard
11. Prairie Avenue

Minor or secondary arterials are similar to major arterials except that they may be discontinuous within the city, may carry less traffic volume and/or may serve as extensions of other major arterials. According to the City of Inglewood 1992 Circulation Element, the following streets within the Study Area is classified as a minor arterial:

1. Crenshaw Drive
2. Eucalyptus Avenue (Beach to Arbor Vitae)
3. Fairview Boulevard (La Brea to Overhill)
4. Kareem Court (Forum Road)
5. Inglewood Avenue (south of Manchester)
6. Lennox Boulevard
7. Market Street (Florence to La Brea)
8. Overhill Drive
9. Van Ness Avenue
10. West Boulevard (north of Florence)
11. 108th Street (east of Crenshaw)

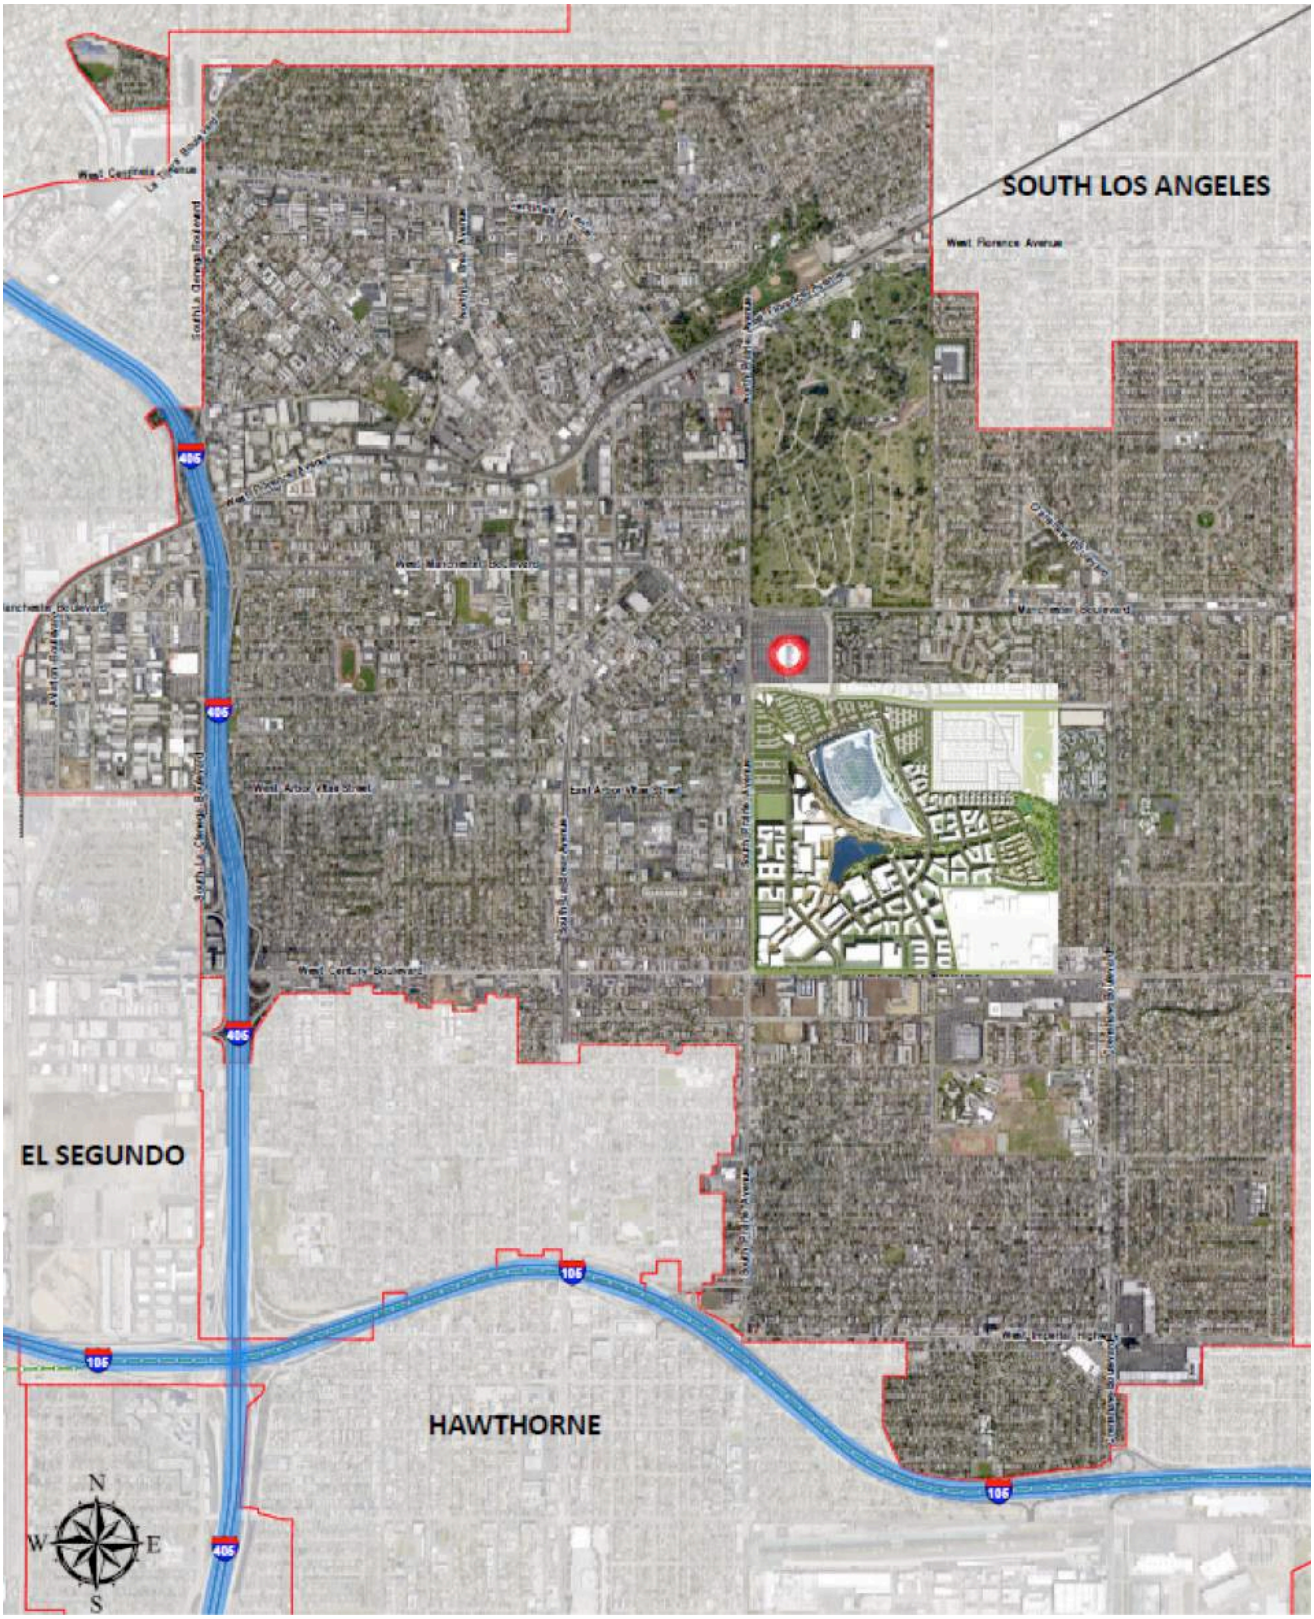


Figure 1.5-1 illustrates Inglewood's freeway and roadway system (arterial, collector, and local streets).

Figure 1.5-1: City of Inglewood General Plan: Circulation Element, 1992

Source: City of Inglewood, 1992

Figure 1.5-2: City of Inglewood, 2018

Source: Trifiletti Consulting, 2018

1.6 FUTURE FREEWAY/ ARTERIAL ROADWAYS

Several roadway improvements within the City of Inglewood are either programmed or under construction. They include:

- Century Boulevard Corridor Improvements.
- Prairie Avenue Corridor Improvements.
- Florence Avenue and Centinela Avenue Roadway Segment Improvements.
- Citywide Intelligent Transportation System (ITS) Improvements.
- Other intersection improvements.

Several regional improvements outside the City's jurisdiction that would have a positive impact on traffic flow, network connectivity and circulation are either proposed as mitigations or are being planned as part of the SCAG's RTP/ SCS and Metro's Long Range Transportation Plan (LRTP). They include:

- I-405 Improvements.
- La Cienega Boulevard Corridor Improvements.
- I-105 Fast-Track Implementation Improvements
- Other improvements.

Additionally, several specific intersection improvements are anticipated as project design features or traffic mitigations required as part of the Hollywood Park Development Project, including but not limiting to, at the following intersections:

- Re-stripe eastbound Arbor Vitae approach.
- Modifications of traffic signal improvements at Arbor Vitae/Prairie, Hardy/Prairie, Prairie/Century, Doty/ Century and Yukon/Century.
- Upgrade seven intersections with ITS traffic signal improvements per the EIR including Crenshaw/Century, Prairie/Century, Doty/Century, Yukon/Century, Club Drive/Century, 11th Ave/Century and Van Ness/Century
- Install southbound right-turn lane at Crenshaw and Century Boulevards.
- New private access road to the Hollywood Park Casino.

1.7 INGLEWOOD EXISTING TRANSIT

Transit service in Inglewood is provided by Metro and the City of Inglewood. The characteristics of bus services in the City of Inglewood are summarized in Table 1.7-1and Table1.7-2, while Figures 1.7-2 and 1.7-3 illustrate existing transit routes for all bus and rail lines within the City.

A combination of Metro Local and Rapid buses provide service to the City of Inglewood, with limited service during weekends and evenings. Inglewood is currently serviced by City-operated I-Line and Metro transportation agencies. The Metro lines serving Inglewood include: Lines 40, 102, 110, 111, 115, 117, 120, 126, 209, 210, 211, 212/312, 217, 442, 607, 625, 710, and 740. These lines connect the City of Inglewood to the greater Los Angeles region. Metro's new LAX/Crenshaw is currently under construction and will provide service to Inglewood at the Downtown Inglewood Station at Florence Avenue and Market Street. An additional Crenshaw/LAX will be built immediately adjacent to the City of Inglewood at Westchester/Veteran at the southwest border of the City.

As part of the City's Mobility Plan and Event Transportation Management and Operations Plan, the City is working with Metro and other municipal bus operators to increase and enhance transit service to City of Inglewood destinations.

Table 1.7-1: Metro Bus Service in the City of Inglewood

OPERATOR	ROUTE	SERVICE AREA		ANNUAL ROUTE RIDERSHIP
		FROM/TO	TO/FROM	
Metro	40	Downtown Los Angeles	South Bay Galleria	8,649
	102	LAX City Bus Center	South Gate	33
	110	Playa Vista	Bell Gardens	2,840
	111	LAX	Norwalk Station	4,305
	115	Playa Del Rey	Norwalk Station	8,734
	117	City Bus Center	Downey	9,359

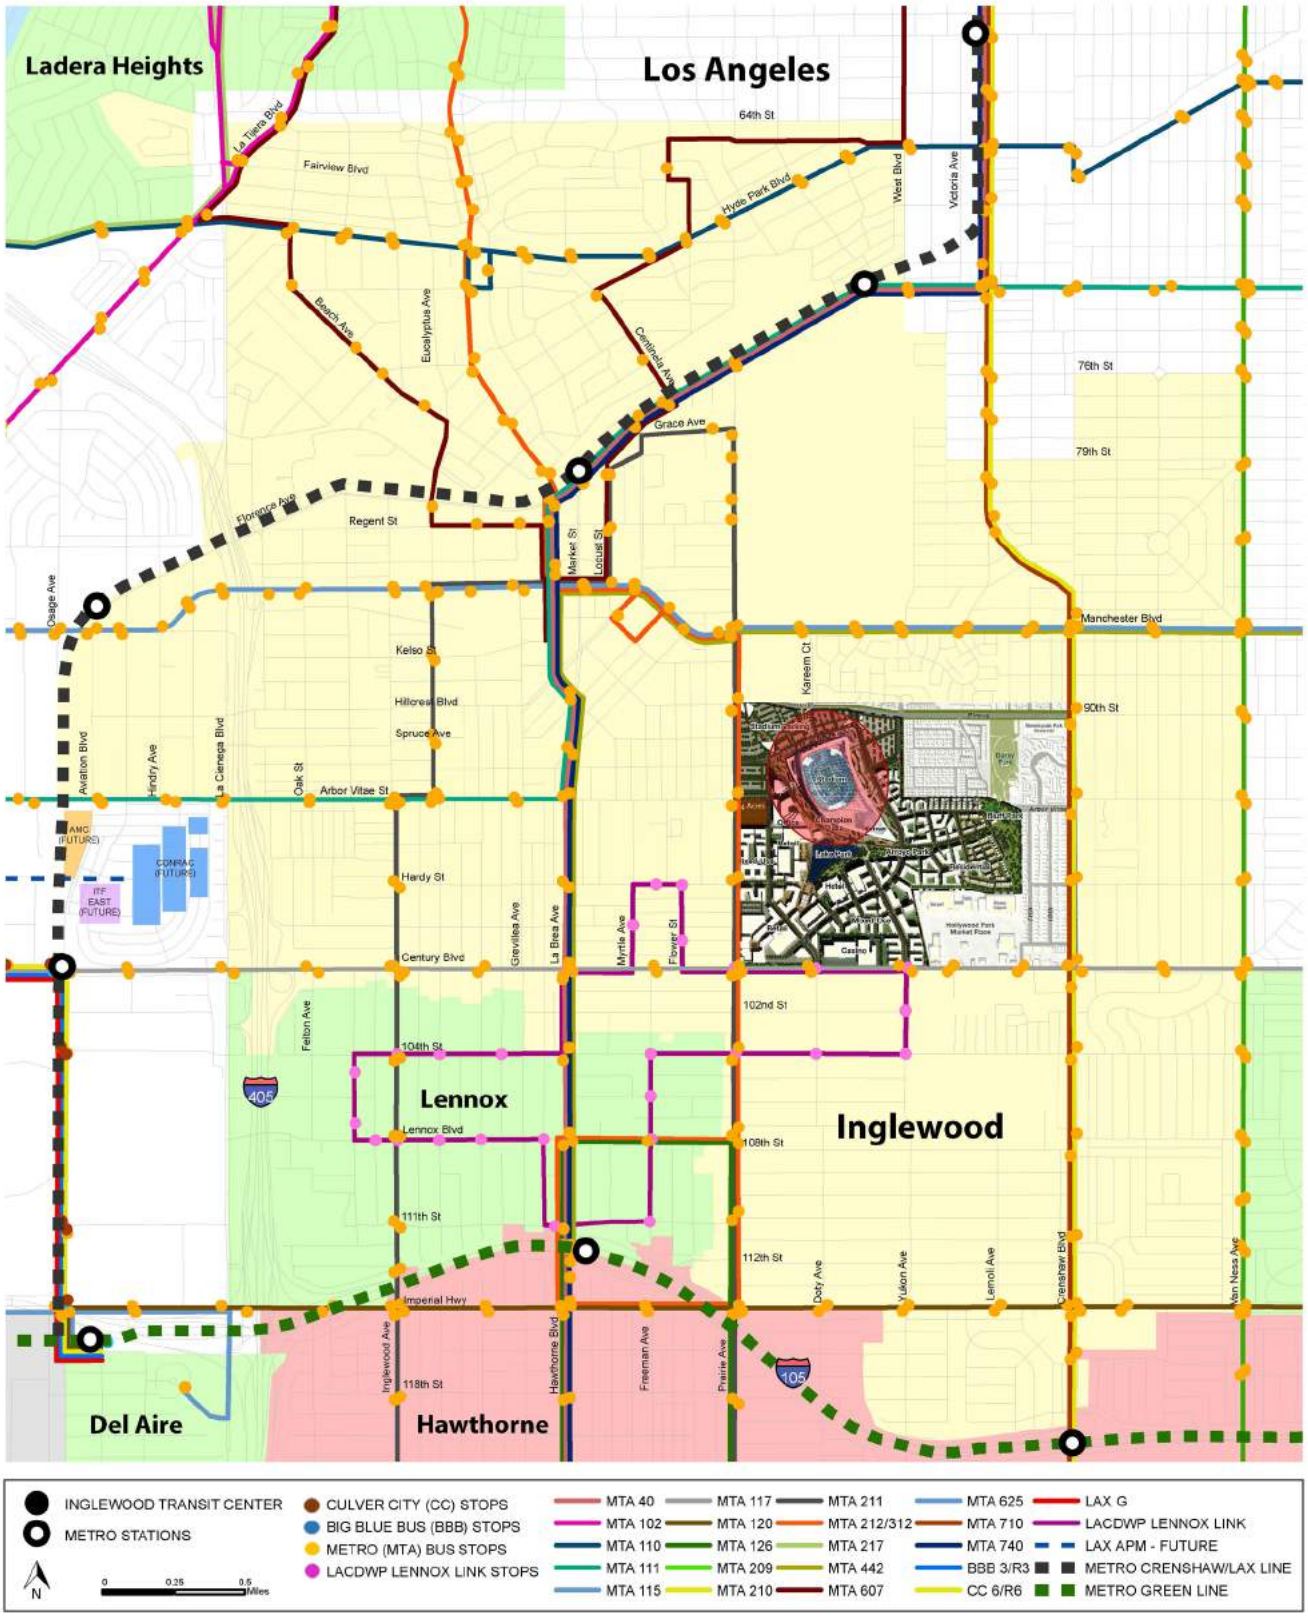
Source: Metro, 2018

Note: This data is for all Metro bus routes that pass through the City of Inglewood, is limited to activity that occurs within City boundaries, and includes boarding and alighting on weekdays and weekends.

Table 1.7-2: Exisiting and Future Rail Service in the City of Inglewood



METRO RAIL LINE	DESCRIPTION
Metro Crenshaw/LAX Line	The Crenshaw/LAX transit line, currently under construction, has two stations located in the City of Inglewood – the Downtown Inglewood Station at the intersection of Florence Avenue and La Brea Avenue and the Fairview Heights Station at Florence Avenue and West Boulevard.
Metro Green Line	The Metro Green Line currently terminates at the Redondo Beach Station to the south and Norwalk Station to the east. It provides transfer service to the Blue Line, Silver Line and several Metro bus lines traveling north – south. Metro's Expenditure Plan identifies the extension of the Green Line to Torrance at Crenshaw Boulevard. The project is anticipated to be completed by 2030.

1.8 METRO CITY OF CHAMPIONS/ INGLEWOOD (NFL) PROJECT STUDY

Metro completed the City of Champions/Inglewood (NFL) Project Focused Analysis of Transit Connection Study in July 2017. Metro's study analyzed a potential underground rail transit connection from the under-construction Metro Crenshaw/LAX Fairview Heights at-grade light rail station at Florence south Prairie Avenue to the NFL Stadium/ Hollywood Park mixed-use development. The study evaluated the feasibility of using high-capacity transit technology to serve the Los Angeles Stadium and Entertainment District at Hollywood Park under an Interlined Operability Scenario and Independent Operability Scenarios. The Metro study concluded the following, summarized below and in Figure 1.8-1:

- Alignment 1 Fairview Heights: The Interlined Operability Scenario looked at a branch from the Crenshaw/LAX Line in a subway under Prairie Avenue.
- Alignment 2A Market-Manchester: An independent urban rail transit connection to Downtown Inglewood to leverage Market Street in In glewood's historic core and to promote economic development opportunities in the City.
- Alignment 2B Arbor Vitae: An independent automated people mover transit connection to the Airport Metro Connector 96th Street Transit Station via Arbor Vitae Street to provide connections to LAX and Metro's major multi-modal hub at the AMC 96th Street Transit Station.
- Alignment 2C Century Boulevard: An independent automated people mover transit connection to the Airport Metro Connector 96th Street Transit Station via Century Boulevard to provide connections to LAX and Metro's major multi-modal hub at the AMC 96th Street Transit Station.

Regarding the Independent Operability Scenario, other alternatives, which could be considerably less costly, were not studied, because of the City's concern that congestion during peak periods at the entertainment/stadium district could create conflicts with at-grade, fixed – guideway transit service, degrading transit service. Future "Long term" connections to the Green Line and Hawthorne were identified but not recommended for further study at this phase and were not included in Metro's analysis.

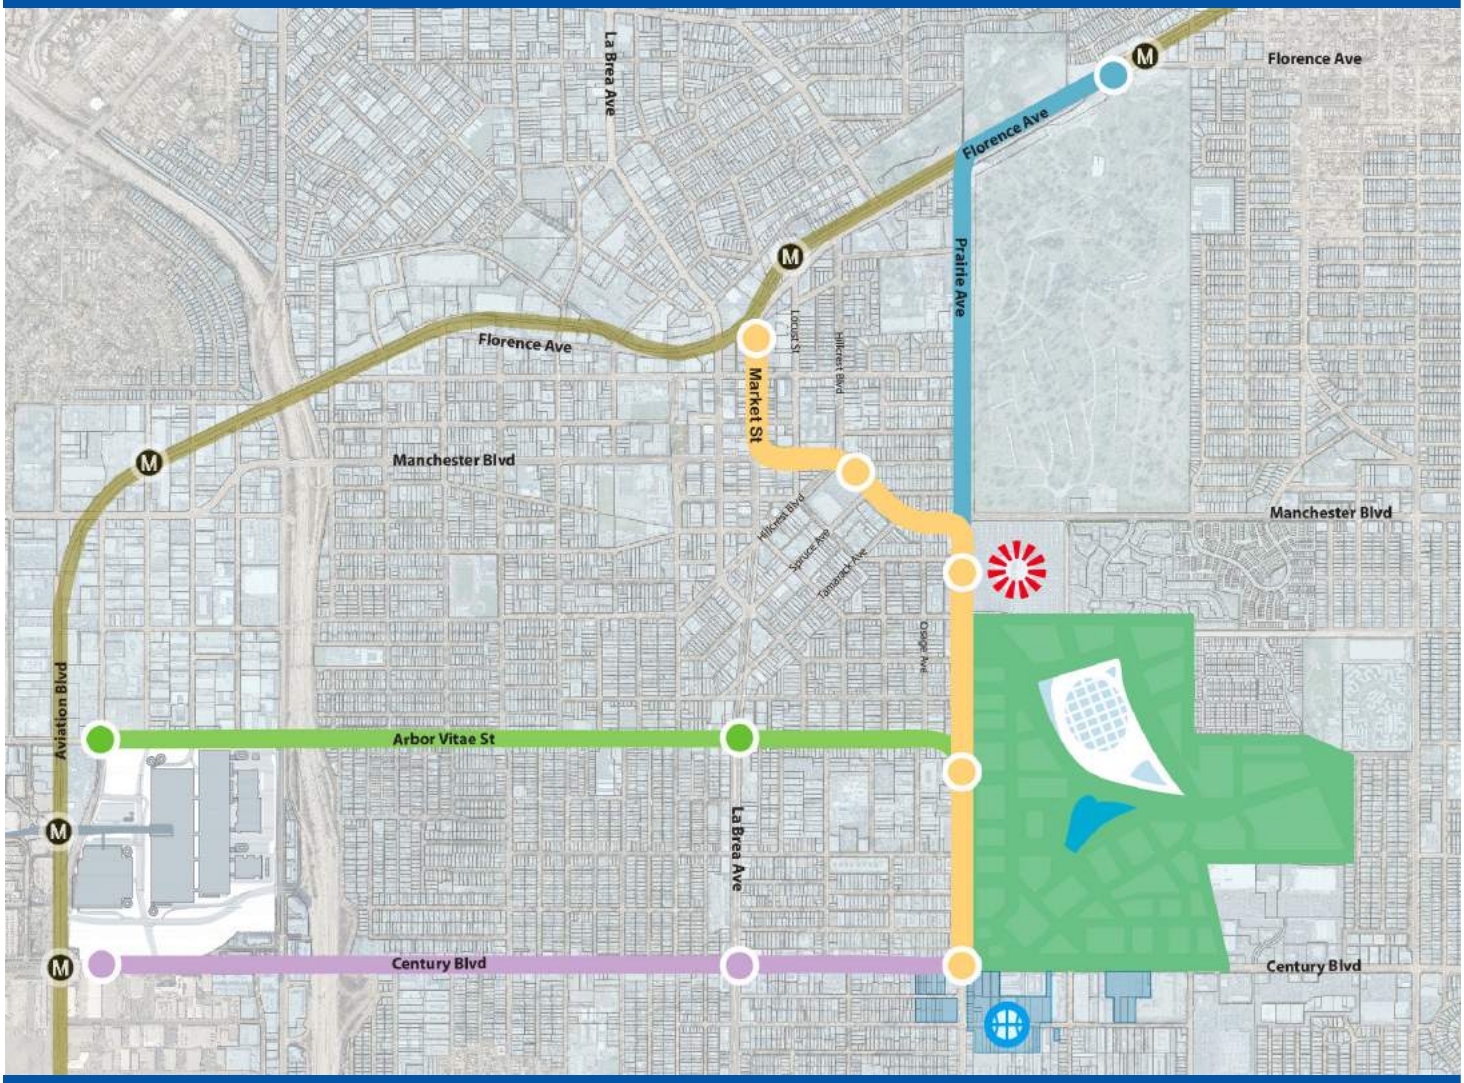
1. Range reflects differences in attendance between teams, varying mode splits, and parking utilization (for Independent Option 2 & 3)
2. Range reflects a low and high capacity operating plan as well as uncertainty and contingency due to current stage of design
3. Range reflects a low and high capacity operating plan
4. Based on the new branch from Fairview Heights Station to the Development

Source: Metro/AECOM

The Metro study concluded that interlined operations with the Crenshaw/LAX line offered some advantages associated with a one-seat ride (thus avoiding passenger transfers) inter-operability and maintenance of fleet. However, the Metro study found a one-seat ride would introduce complexities to Metro regional network operations due to the introduction of an additional route to Los Angeles Stadium and Entertainment District at Hollywood Park. The operational headways for the overlapping routes must account for the route demands, which differ. For example, the special events/ game-day ridership demands on the Inglewood Transit Connector are exponentially higher than the peak hour demands of the other Metro rail routes. Metro deemed the Interlined Operability alternative not feasible due to the costs and operational impacts on the regional system.

The Metro study concluded the following:



- The existing and planned venues within the City of Inglewood are major traffic generators with a high event driven transit mode share.
- Independent APM operations would better serve the event driven ridership.
- The single seat interlined operation would introduce complexities and added costs to the mainline rail operations.
- While Metro deemed the Interlined Option not viable, it recommended that the City further develop independent automated people mover options to serve major development sites.
- A public-private-partnership strategy and an Enhanced Infrastructure Financing District is recommended, especially since Measure M and the Metro Long Range Transportation Plan do not earmark funding for such a project.

2. INGLEWOOD TRANSIT CONNECTOR ALTERNATIVES

2.1 INGLEWOOD TRANSIT CONNECTOR ALTERNATIVES

To build upon the work initiated by Metro, the City refined the Inglewood Transit Connector Alternatives to achieve the City's goals and objectives. Accordingly, this Study evaluates the following four conceptual transit alternatives, all consisting of elevated APM Systems:

- Alternative A: Market-Manchester Alignment
- Alternative B: Fairview Heights Alignment
- Alternative C: Arbor Vitae Alignment
- Alternative D: Century Boulevard Alignment

This Study is evaluating for overall project feasibility, and therefore it should be stressed that each alternative is based on a conceptual, preliminary design. Engineering would undoubtedly result in shifts and modifications to the overall project design, including stations, platforms and support facilities. Yet, preliminary conceptual designs are provided so that various alternative concepts can be compared with one another and feasibility issues can be identified.

Each of the alternatives described in Sections 2.2 through 2.5 provide an assessment of APM technologies with key findings on the candidate technologies that would be viable for the Inglewood Transit Connector Project. The specific technology is expected to be selected through a competitive procurement process and is not dependent on the selection of the preferred alignment. A number of alternative features and project characteristics are expected to be comparable to each other. These non-differing characteristics are 1) station size, configuration and locations/distances serving the key traffic generators; 2) guideway right-of-way and elevations; 3) maintenance and storage facilities; and 4 passenger convenience/amenities. It is assumed for purposes of this analysis that each station and station access will be comparable across the Alternatives. This Report also includes specific details associated with each of these non-differentiating characteristics.

Los Angeles Clippers

2.2 ALTERNATIVE A: MARKET-MANCHESTER ALIGNMENT

The Market-Manchester Alignment (Alternative A) is an aerial alignment that runs approximately one-quarter of a mile along Market Street between Florence Avenue and Manchester Boulevard, where it transitions east along Manchester Boulevard for approximately half a mile to Prairie Avenue. The alignment continues for approximately one mile south of Manchester Boulevard along Prairie to Century Boulevard. This Alternative provides service to downtown Inglewood, The Forum, Los Angeles Stadium and Entertainment District at Hollywood Park, and the proposed Inglewood Basketball and Entertainment Center. This is the shortest alignment concept in comparison to other options. The mainline length of this alternative is approximately 1.8 miles, dual-lane, and includes an anticipated five stations as illustrated in Figure 2.2-1. The station locations and number were identified to provide connections to the traffic generators/development, and potential opportunities for further development/investment.

Alternative A (see Figure 2.2-1) is designed to connect major development sites to Metro LAX/Crenshaw line station at downtown Inglewood and presents an opportunity for integration with local economic activity, current and future transit-oriented development, and other initiatives in the downtown/commercial district of Inglewood. Unlike the 2017 Metro study's urban rail technology and at-grade segment at Market Street, the City's option is proposed to be elevated so that the Inglewood Transit Connector would not compete for the same roadway network as other road-based vehicles.

Possible intermodal facility locations to capture road-based traffic such as buses, transportation network comapnies (TNCs), taxis, and private vehicles, and facilitate a convenient transfer to the Internet Transit Connector have been identified (see Figure 2.2-1). These potential intermodal facilities provide an opportunity to limit the amount and type of road-based traffic into the area especially during special events. Such limits may be voluntary, based on convenience, and/or controlled through regulatory policies such as possible congestion pricing for access.

Figure 2.2-5: Alternative A: Market-Manchester Alignment
Market Street Looking North at Station

Source: Raju Associates, 2018

2.3 ALTERNATIVE B: FAIRVIEW HEIGHTS ALIGNMENT

The City identified an independent elevated APM System as a refined alternative connecting directly to the Fairview Heights Station along Prairie Avenue. The Fairview Heights Alignment (see Figure 2.3-1) is an aerial alignment that runs approximately one-half mile along Florence Avenue between Prairie Avenue and West Boulevard. The alignment then transitions south along Prairie Avenue for approximately one and three-quarter miles between Florence Avenue to Century Boulevard. This Alternative provides service to downtown Inglewood, The Forum, LASED, and the proposed Inglewood Basketball and Entertainment Center. The mainline length of this alternative is approximately 2.2 miles, dual lane, and includes an anticipated four stations as illustrated in Figure 2.3-1. The number of stations and their locations were identified based on providing connections to traffic generators/development. Further development opportunities are limited by Edward Vincent Jr. Park, Inglewood Cemetery, and residential areas; furthermore, Alternative B would not service the downtown Inglewood area.

A possible intermodal facility location to capture road-based traffic such as buses, TNCs, taxis, and private vehicles, and facilitate a convenient transfer to the ITC has been identified. This potential intermodal facility provides an opportunity to limit the amount and type of road-based traffic into the area especially during special events. Such limits may be voluntary based on convenience, and/or regulatory through policies including possible congestion pricing for access.

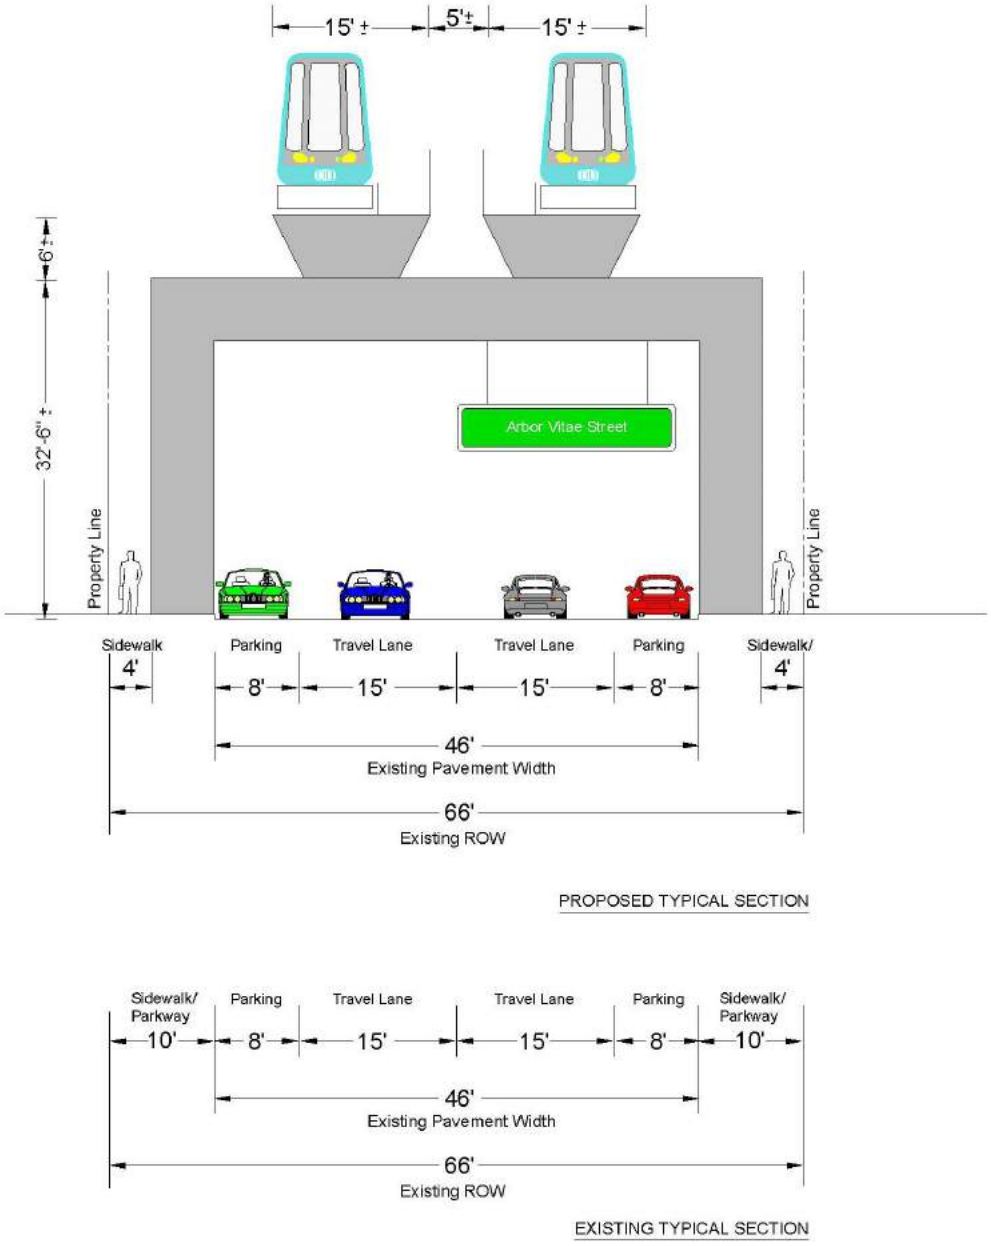
2.4 ALTERNATIVE C: ARBOR VITAE ALIGNMENT

The Arbor Vitae Alignment (Alternative C) is an aerial alignment concept that runs approximately two miles along Arbor Vitae Street from Aviation Boulevard to Prairie Avenue, where it transitions south, and potentially north, along Prairie Avenue for approximately one half mile to Century Boulevard. This Alternative provides service to The Forum, LASED, and the proposed Inglewood Basketball and Entertainment Center. Alternative C presents the opportunity to directly connect to the Los Angeles International Airport (LAX) and its Landside Access Modernization Program (LAMP) that includes substantial parking opportunities, a consolidated rental car center, planned regional multi-modal hub served by both Metro's Crenshaw/LAX and Green Lines, various Metro and municipal bus lines, and the LAX Automated People Mover system. Although this alternative connects to a planned multi-modal hub, development opportunities are limited in downtown Inglewood since it will not serve the area.

Crossing over the I-405 and a narrow right-of-way along Arbor Vitae Street poses significant obstacles for Alternative C. Crossing over the I-405 requires coordination with Caltrans, Los Angeles Department of Transportation and Los Angeles World Airports. However, since Arbor Vitae Street crosses over the I-405, the complexity of the coordination is expected to be less than the Century Boulevard Alignment (Alternative D). East of La Brea Avenue, the roadway section only includes one through-lane in each direction and one parallel parking lane. This section would require significant modifications to accommodate the alignment and create potential major impacts to existing small businesses as well as possible neighborhood displacement.



Possible intermodal facility locations to capture road-based traffic such as buses, TNCs, taxis, and private vehicles and facilitate a convenient transfer to the ITC have been identified. These potential intermodal facilities provide an opportunity to limit the amount and type of road-based traffic into the area especially during special events; such limits may be voluntary based on convenience, and/or controlled through regulatory policies including possible congestion pricing for access.

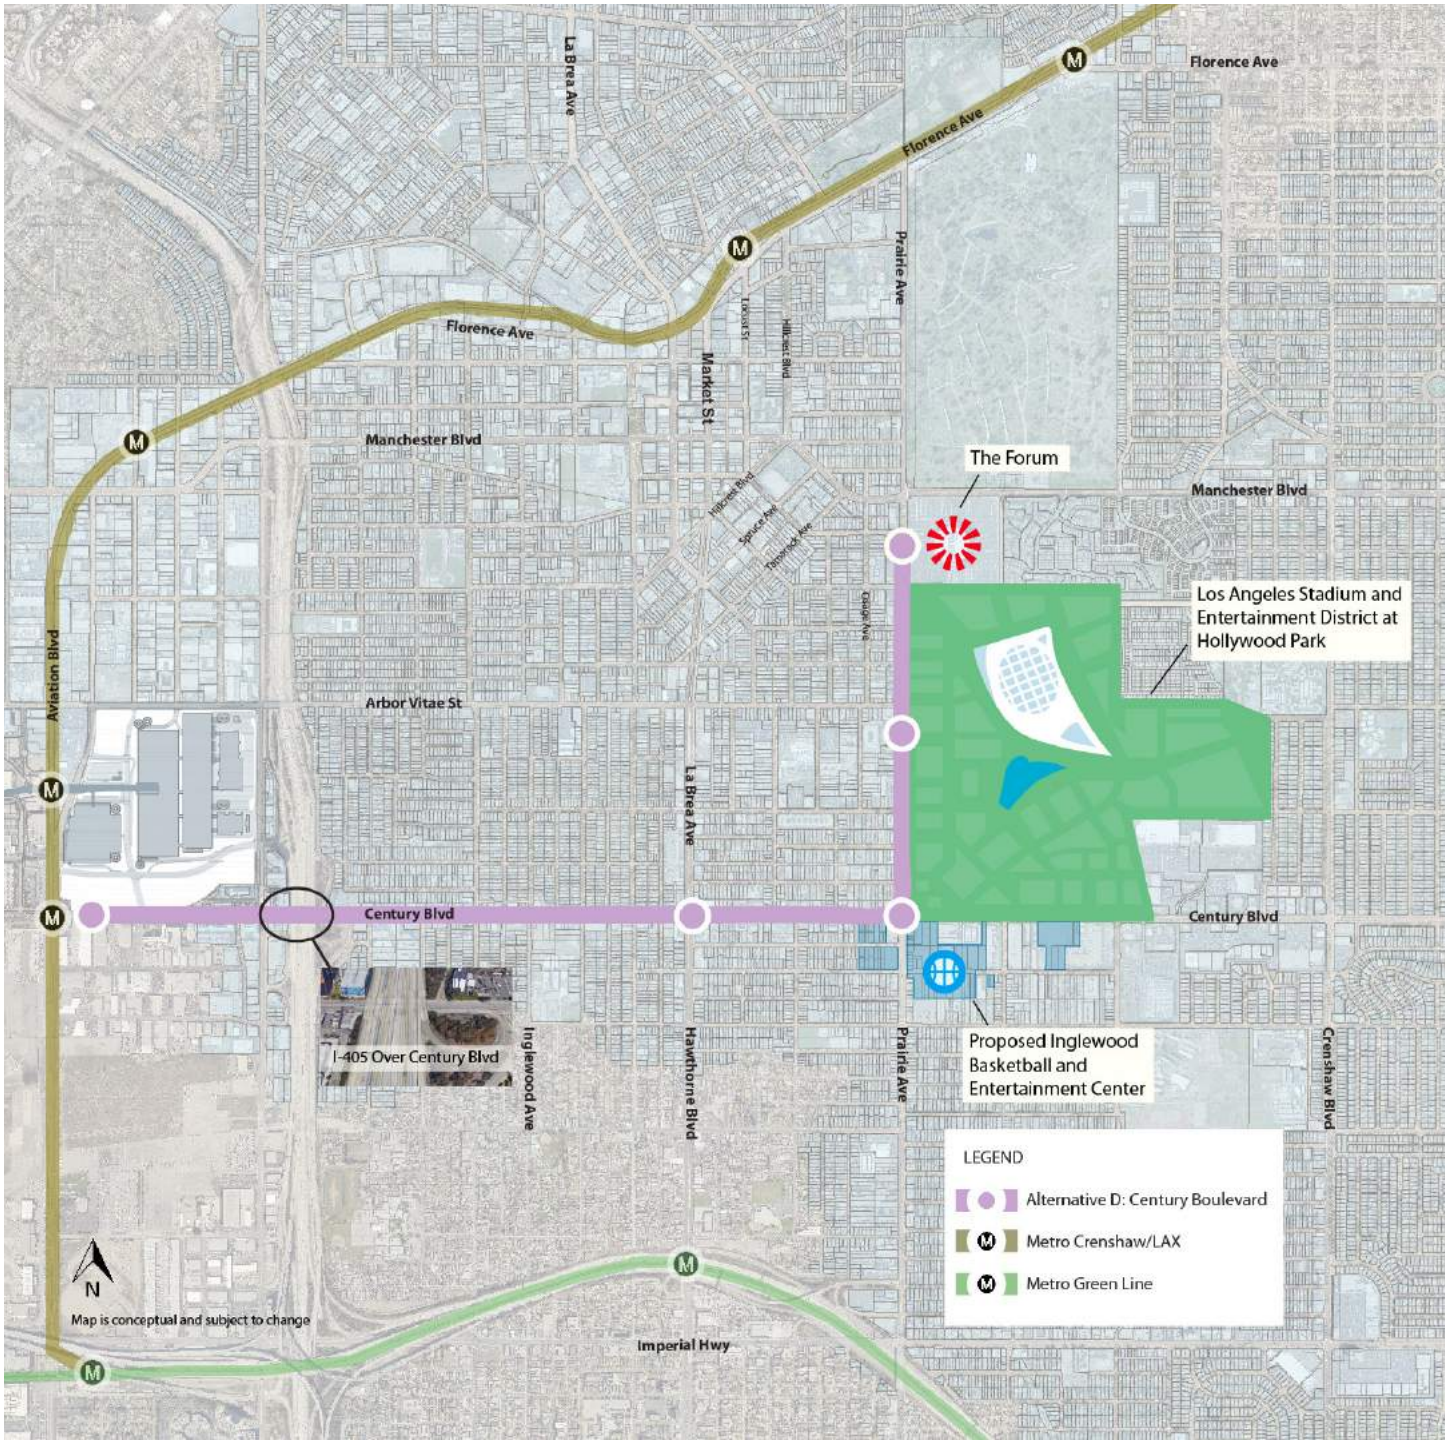
2.5 ALTERNATIVE D: CENTURY BOULEVARD ALIGNMENT



The Century Boulevard Alignment (Alternative D) is an aerial alignment concept that runs approximately two miles along Century Boulevard from Aviation Boulevard to Prairie Avenue, where it transitions north along Prairie Avenue for approximately one mile to south of Manchester Boulevard. This Alternative provides service to The Forum, LASED, and the proposed Inglewood Basketball and Entertainment Center. Alternative D provides the opportunity to directly connect to a regional multimodal facility served by Metro's Crenshaw/ LAX and Green Lines, various Metro and municipal bus lines, and the LAX automated people mover (APM) system.

To connect to the multimodal facility, Alternative D would be required to cross the I-405 on the south side of the LAX LAMP development near Manchester Square. A preliminary review indicates that the transition from an elevated segment to a level sufficient under the I-405 may not be feasible due to the short distance available and the real estate constraint between Century Boulevard and the LAX LAMP development at Manchester Square. Crossing over and under the I-405 would require coordination with Caltrans, Los Angeles Department of Transportation and Los Angeles World Airports. This alignment does not present the opportunity for integration with local economic activity, current and future transit-oriented development, and other initiatives in downtown Inglewood.

Possible intermodal facitlity locations to capture road-based traffic such as buses, TNCs, taxis, and private vehicles and facilitate a convenient transfer to the ITC have been identified (see Figure 2.5-1). These potential intermodal facilities provide an opportunity to limit the amount and type of road-based traffic into the area especially during special events. Such limits may be voluntary based on convenience and/or controlled by regulatory policies including possible congestion pricing for access.

2.6 TRANSIT TECHNOLOGY ASSESSMENT

The City also evaluated a range of transit technologies to determine the viable classes of technologies that can potentially meet the anticipated requirements for the Inglewood Transit Connector. Driverless technologies have been presumed as these are similar to manually operated technologies except that with an automated train control system, the driverless technologies can be operated at shorter (more frequent) headways. The system performance requirements will be established after the selection of the locally preferred alternative and further project development. Such system requirements will drive the ultimate selection of the optimal technology. Manually operated technologies have been removed from consideration as they will not be able to meet the operational requirements (i.e. short headways) to meet the anticipated line capacity demands, nor fit within the geometric constraints given the short system route and the high peak ridership demands from special events and game days at the key ridership generators.

The range of such technologies are considered to be a class of Automated Guideway Transit or APM Systems. Differentiation is primarily based on the size of the vehicles, guideway mounting, propulsion and guidance systems. The candidate transit technologies are:

- Personal Rapid Transit (PRT)
- Large and Small Monorails
- Cable-propelled APMs
- Self-propelled Rubber-Tired APMs
- Large Steel Wheel-Rail APMs

Table 2.6-1 provides a summary of the typical characteristics of the different potential technologies.

Table 2.6-1: Summary of Technology Specifications of Modes Considered

MODES	TYPICAL APPLICATION AND OPERATIONS	TYPICAL CAR LENGTH (ft)	TYPICAL CAR CAPACITY (Pax/car at 2.7 to 3.5 sf/pax)	TYICAL OPERATING SPEEDS (mph)	GUIDEWAY/ ALIGNMENT ROW CHARACTERISTICS
Personal Rapid Transit (PRT)	Designed to provide nonstop, origin-to-destination service to individuals or small groups of passengers with multiple cars operating in a network. To date, network size has been very limited.	10 to 15 feet	Small (max four to six passengers seated)	Typical low operating speed (less than 25mph) but some suppliers claim up to 40 mph	Five to seven feet per guideway (excluding emergency walkway) Min. turning radius capability of 16 feet, but preferable 20-25 feet or higher.
Small Monorails	Provides line haul type service connecting multiple stations. May be operated as a shuttle or pinched loop with multiple trains following each other stopping at every station before turning back at the end of line stations. Applied when geographically compact area. May operate on top of the guideway, or be suspended from the guideway.	15-20 feet (typical trains can be six to eight cars long)	12 to 20	20 to 30 mph	Seven to eight feet per guideway (excluding emergency walkway) includes vehicle overhang. Min. turning radius capability of 50 feet, but preferable 150 feet or higher. At turnback – requires guideway structure movement to switch tracks.
Large Monorails	Provides line haul type service connecting multiple stations. May be operated as a shuttle or pinched loop with multiple trains following each other stopping at every station before turning back at the end of line stations. Applied when geographically compact area. May operate on top of the guideway, or be suspended from the guideway.	40 feet (typical trains can be four to five cars long)	55 to 70	30 to 55 mph	12 feet per guideway
Cable Propelled APMs	Provides line haul service connecting multiple stations. Applied when geographically compact area. Typically operated as a shuttle where trains operate on their track shuttling back and forth between the end-of-line stations. Trains are "pulled" by cables with "cars" attached to the cable with grips. Cable drives between station pairs. Detachable grips available with some technology suppliers – to facilitate multiple trains operating behind each other with trains turning back at end of line stations. Requires that station pair distances be roughly uniform to maintain synchronized operations.	25-30 feet (typical trains can be up to five to seven cars long)	35 to 55	25 to 30 mph	10 to 12 feet per guideway (excluding emergency walkway) Min. turning radius capability of 75 feet, but preferable 150 feet or higher.
Self Propelled Rubber-Tired APMs	Provides line haul type service connecting multiple stations. Typically operated in a pinched loop with multiple trains following each other stopping at every station before turning back at the end of line stations; can also be operated in shuttle operations where a train shuttles back and forth on same track between the stations. Applied when geographically compact area. Typically applied when operational flexibility is required, and when system is implemented in phases – as future expansion is more easily accommodated compared to monorails or cable propelled technologies. Applied at airports (landside and airside), as well as downtown circulators.	40-42 feet (typical two to four car trains, but up to six car trains)	50 to 75	30 to 50 mph	12 feet per guideway (excluding emergency walkway) Min. turning radius capability of 75 feet, but preferable 150 feet or higher.

Source: Trifiletti Consulting, 2018

Figure 2.6-1: Personal Rapid Transit Examples - Heathrow Airport, Morgantown, WV and Masdar, UAE

Source: Heathrow Airport

Source: Morgantown, WV

Personal Rapid Transit - Key Considerations:

- Small, limited operating systems with limited capacities.
- Small cars with limited interior capacity, maximum of 4 to 6 passengers, and low headroom.
- Low operating speed, less than 25 mph.
- Only three small starter systems with very limited complexity and capacity, though this technology has been developed for over 30 years.
- Operating headway and resulting system capacity remains controversial. PRT suppliers claim that the operating headways can be as close as 0.5 seconds to get higher capacities. However, this has not been service proven, even on a test track, with a representative operating fleet and guideway configuration. To accommodate such a high vehicle volume, the infrastructure at the stations and bypass lanes would be substantially larger than for larger vehicle APM systems.

Source: Masdar, UAE

Figure 2.6-2: Small Monorail Guideway and Switch Examples

Source: Bombardier Monorail at Newark Airport

Source: Bombardier Monorail at Newark Airport

Small Monorails - Key Considerations

- Small vehicles/cabins with single doors.
- Longer, narrower vehicles for same number of passengers.
- Fixed vehicle length.
- Limited flexibility to extend train length by coupling due to front and tail car nose.
- Relatively small guideway but large guideway replacement switches.

Figure 2.6-3: Large Monorail Guideway and Switch Examples

Source: Bombardier Monorail in Las Vegas

Large Monorails - Key Considerations

- Larger cabins with one or two bi-parting door sets.
- Fixed vehicle length.
- Limited flexibility to extend train length by coupling due to front and tail car nose.
- Inefficient vehicle floor use due to bogies – longer vehicle per number of passengers.
- Relatively small guideway but massive guideway replacement switches.
- Ability to support competitive procurement with the number of active suppliers with technically mature and/or ready for deployment technologies.

Source: Bombardier Innovia 200, Phoenix Sky Harbor International Airport

Figure 2.6-6: Large Steel Wheel-Rail APM Examples

Source: Bombardier Innovia ART 300 APM System at JFK

Self Propelled Large Steel Wheel Rail APM - Key Considerations:

- Vehicles typically longer than rubber-tired vehicles, 55 feet compared to 40 feet.
- Flexible train length: one to six cars.
- Shuttle, loop, and pinched loop operating modes.
- Higher operating speeds, typically 50 to 60 mph.
- Generally applied to urban/metro systems that are longer and have more stations.
- Steel wheel-rail noise, particularly in curves.

2.7 TECHNOLOGY EVALUATION

Technologies were evaluated against a set of defined criteria to provide a preliminary assessment of viable systems that are suitable for further evaluation and consideration.

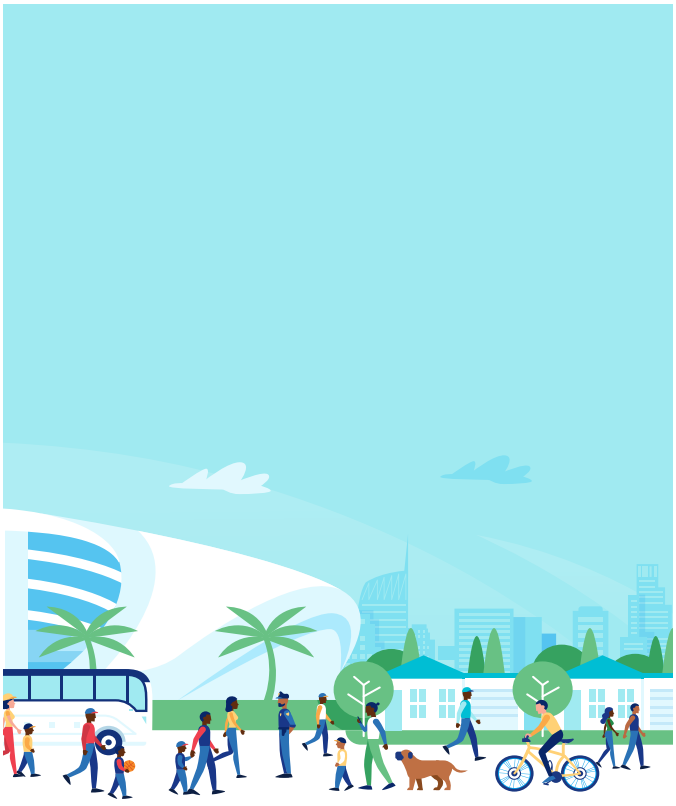
- Ability to fit within the site-specific constraints.
- Ability to fit the scope and scale of the project.
- Ability to meet anticipated ridership demand, in terms of peak hour demand or line capacity.
- Flexibility of operations in terms of different train lengths
    - Train lengths would be longer during peak periods and shorter during off-peak periods to maintain the same frequency and service levels.
- Ability to expand the fleet size with minimal or no disruption to ongoing normal passenger service during peak operational hours.
- Ability to extend the system with minimal or no disruption to ongoing passenger service.
- Viability/availability of technology suppliers as measured by 1) longevity of business providing new systems and continued operations and maintenance; 2) at least one technology application proven in passenger service; and 3) applications of comparable size/scale to the Inglewood Transit Connector proposed project.

Table 2.7-1 Summary of How Each Technology is Evaluated According to the Criteria

CRITERIA	PRT	SMALL MONORAIL	LARGE MONORAIL	CABLE-PROPELLED	RUBBER-TIRED APM	LARGE STEEL-WHEEL RAIL APM
Ability to fit within site specific constraints/ geometry	Yes	Yes	Yes	Yes	Yes	Maybe
Fits the project scope and scale	No	No	Maybe/Yes	No	Yes	Maybe
Ability to meet peak hour ridership (line capacity)	No	No	Maybe/Yes	No	Yes	Yes
Flexible train length operations	No	No	No	No	Yes	Yes
Expand fleet size with minimal to no disruption	Yes	Yes	Yes	No	Yes	Yes
Extend system with minimal to no disruption	Yes	Yes	Yes	No	Yes	Yes
Viability/availability of suppliers	Yes	Yes/Limited	Yes	Yes	Yes	Yes
Maintain consideration for the Inglewood Transit Connector Project	No	No	Yes	No	Yes	Maybe

Source: Trifiletti Consulting, 2018

The analysis concluded that PRT, small monorails, and cable-propelled APMs are not appropriate for the Inglewood Transit Connector project. To determine the viability of steel wheel-rail APMs, further analysis is required. Although steel wheel-rail APMs could provide the passenger capacity necessary to meet the demand generated by the activity centers and have been successfully applied to larger systems in the US such as the JFK Air Train, which is more than ten miles long with eight stations, the technology cannot accommodate the tight right-of-way, and curves, including a minimum turning radius of 120 feet, which is anticipated for the proposed project alternatives. Therefore, it is highly unlikely that steel wheel-rail APMs will be suitable for the Inglewood Transit Connector Project.



Large monorail systems can provide the necessary passenger capacity for both event and non-event days to newly constructed, under construction, and proposed activity centers. However, train lengths are not readily adjustable, and technology suppliers may not have the ability to fit their technology within the project's constraints, such as the line capacity/demand requirement, the tight right-of-way, and curves anticipated for the proposed alternatives. These are not technical flaws, but they may have an impact on the commercial competitiveness, as a total cost of ownership, of the monorail technology. This is not definitively known and further evaluation, including technology maturity and readiness for deployment is recommended as part of the further project definition process for the locally preferred alternative.

2.8 STATIONS

APM stations accommodate passengers boarding/de-boarding to and from the APM vehicles. Station platforms also provide the required space for passengers to circulate between the station platform and the adjacent facilities. Stations are required to be fully accessible to passengers with disabilities.

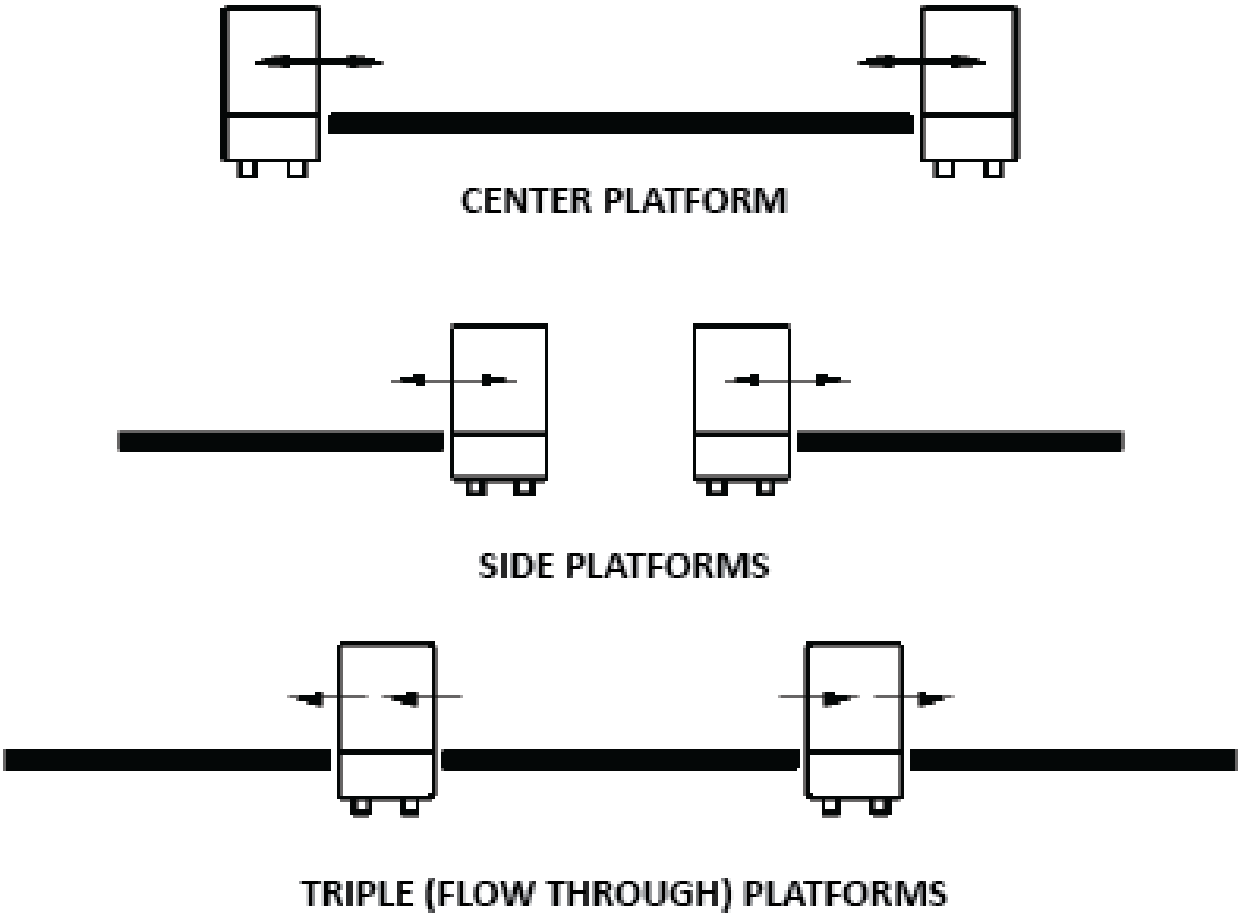
Each of the alternatives are described in Sections 2.2 through 2.5. Section 2.6 provides details of the technology assessment of APM technologies with key findings on the candidate technologies applicable to the project; the specific technology is expected to be selected through a competitive procurement process that is not alternative dependent.

Since all the alternatives consist of elevated APM systems, typical station configurations and requirements will be similar and are not differentiators between the different alternatives. Any adjustments to station locations and configurations at this stage would apply equally to each of the alternatives. Station location and configurations will be refined and adjusted for the selected preferred alternative as the project is further developed, in coordination with the activity generator facility designs, site specific passenger access/egress concepts, and to address utility and right-of-way constraints for the preferred alternative.

At this time, the anticipated locations of stations have been established for each of the alternatives and illustrated in Figures 2.2-1, 2.3-1, 2.4-1, 2.5-1. The station locations were primarily designed to serve the key event and activity generators in the City.

Because ridership projections for the alternatives are comparable, as described in Section 3, the station occupant load at the key stations can be expected to be similar. The worst case loading for any station is governed by life safety constraints to address a scenario where two fully loaded trains are brought to the same station under an emergency or failure mode. NFPA-130 establishes life safety requirements for fixed guideway transit systems. It requires that all passengers must be evacuated to a point of safety within a set amount of time. For normal operational conditions, the station must be designed in a manner to ensure that all de-boarding passengers are able to get off the station platform before the arrival of the next train. Specific station designs will be site-specific and will be defined as the project development progresses for the preferred alternative.

Typical station descriptions provided below are based on accommodating a large class of automated guideway transit vehicles; the transit technology most likely to be applied to the project. Due to the variation that may occur between technologies within this class, the station configuration can be expected to be adjusted as part of the design development phase once the transit system technology has been selected.



2.8.1 Platform Configurations

Many different platform configurations are possible. Some configurations are more appropriate than others dependent upon the location within the system and the type of facility or area served by the station, security and passenger flow considerations, level of service, cost, and other factors. As described below, and illustrated in Figure 2.8-1 platform configurations may be:

1. Center Platforms - are located between relatively widely spaced guideways and serve as both boarding and de-boarding platforms for passengers traveling in either direction on the System.
2. Side Platforms - are located outside guideways. Each side platform generally serves as a boarding and de-boarding platform for passengers traveling in one direction only on a pinched-loop system, and in either direction on shuttle systems.
3. Triple (flow through) Platforms - combine a center platform with side platforms. Side platforms usually serve de-boarding passengers and the center platform serves as a boarding platform. Triple platforms are sometimes referred to as flow through platforms because the flow of boarding and de-boarding passengers is through APM vehicles.

Center platforms can be more compact in size and less expensive than comparable side or triple platforms because center platforms generally require less infrastructure. Additionally, they provide a consistent and easier wayfinding scheme for passengers, where the decision on direction of travel is made once the passenger is on the platform. The specific platform configuration is expected to be defined in coordination with the activity generators and site specific requirements related to ability to fit the station. Since all alternatives serve the same activity centers within the City's business district, it is reasonable to expect that the station configurations will remain consistent across each of the different alternatives. For the purpose of this, center platform configuration is assumed since it is the most compact in size and thus expected to have the least physical impact compared to the other platform configurations.

Figure 2.8-1: Typical Platform Configurations

Source: Trifiletti Consulting, 2018

Vertical circulation can be provided at one end (single end-loaded) or both ends (double end-loaded) of station platforms, or within the length of the platform (center loaded) for any of these platform configurations:

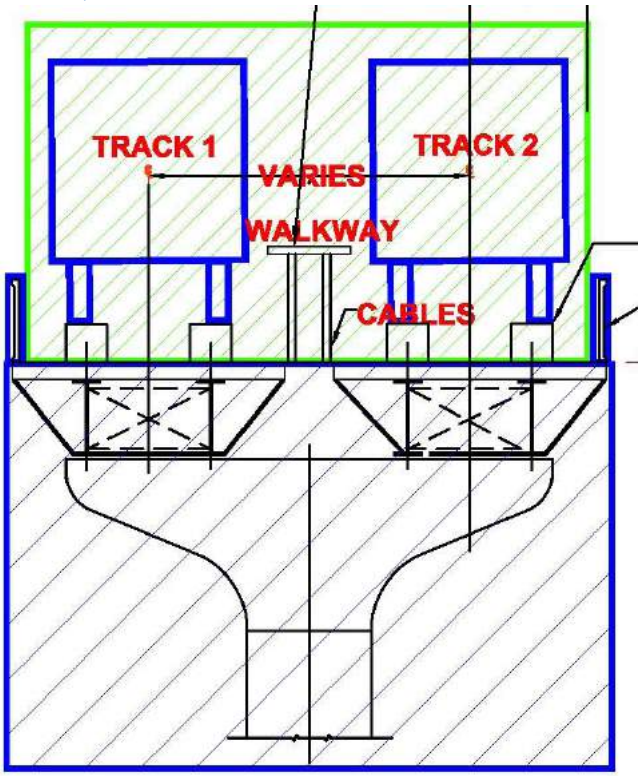
- Single end-loaded platforms only provide this circulation from one end of the station platform.
- Double end-loaded platforms permit passengers to move from the platform to adjacent facilities, and vice versa, from both ends of the station platform.
- Center loaded platforms require additional platform width since the vertical circulation cores disrupts the circulation within the platform.

For the purpose of this study, platforms are assumed to be either single or double end-loaded to provide the most compact, in size, station platform to minimize the physical impact of the stations.

A mezzanine level is anticipated under the station platform. This mezzanine will provide connectivity to the adjacent facilities through pedestrian walkways.

2.8.2 Station Equipment /Amenities

All stations will be equipped with Public Address systems, static and dynamic signage to provide information to passengers, CCTV to enable central control operators to surveil the operations of each station and make announcements, adjustments and/or take other action as appropriate, as well as emergency telephones and blue light stations in case of emergencies. Since the station platforms are transitory spaces, amenities such as seating and concessions will not be provided at the platform level, but may be provided at the mezzanine level.



2.8.3 Platform Dimensions

Station platforms are anticipated to be approximately two hundred feet long, excluding vertical circulation, to accommodate the anticipated longest train, and thirty feet wide to accommodate passenger queuing and circulation. A minimum ceiling height of twelve feet would be provided in APM stations to accommodate CCTV cameras and dynamic graphics above the automated platform doors.

2.8.4 Vertical Circulation

Vertical circulation consists of fixed stairs, escalators and elevators. Sufficient vertical circulation elements will be provided to assure that under normal circumstances all de-boarding passengers can clear the platform before the next train arrives. Additionally, all code prescribed emergency egress requirements must be satisfied.

Figure 2.8-2 – Example of Emergency Walkway Along Trainway Between Stations

2.9 MAINTENANCE AND STORAGE FACILITY REQUIREMENTS

All of the alternatives are aerial APM Systems. The selected technology will be applicable equally to each of the alternatives and is not a differentiator between them. Each of the alternatives will require a Maintenance and Storage Facility (M&SF) to perform regular and preventive maintenance of the transit operating system, for storage of the vehicle fleet, as well as for the operations control center where automated train operations are monitored and controlled. The specific design of the M&SF will be driven by the selected M&SF site, which will depend on the alternative selected.

Road access to the M&SF is required for employees, visitors, suppliers, and emergency vehicles. Accommodations must be made for a delivery entrance to load and unload equipment, materials and parts from tractor-trailer trucks. Roadway access is also required near the M&SF to allow APM vehicles to be delivered. In addition, stopping positions for firefighting equipment must be provided adjacent to the Maintenance Facility.

Appropriate space should be provided to allow adequate maneuvering by these ground vehicles. Anticipated M&SF requirements are noted below to define the project requirements. Depending on the available site, the M&SF may be split to fit onto the available site(s); however, a consolidated M&SF is more efficient and preferable.

The M&SF is expected to be an elevated structure that will accommodate the following functions: 1) support of system operations, 2) vehicle storage, and 3) APM system maintenance. Additionally, the transit system operations and maintenance administrative facilities would be co-located within the M&SF.

The following functional areas are required at the M&SF:

- Service and inspection shops.
- Major repair area.
- Vehicle storage areas.
- Inspection and service bays, including under vehicle bays.
- Equipment and materials storage areas.
- Offices, lunch/break areas, restrooms, locker areas, personnel wash facilities.
- Loading platforms, paint booth, and other areas based on design information to be provided by the selected System Supplier.

Design of the facility would also include access roadways, landscaping, exterior lighting, parking, signage, and means of controlling access into and out of the M&SF such as secure fencing. The M&SF design would include the guideway and an access platform at the vehicle floor level with stairs to grade to allow Operations and Maintenance (O&M) personnel access into APM vehicles and other facilities infrastructure, such as lighting required to accommodate the train receiving and departure tracks and its operation.

2.9.1 Operations

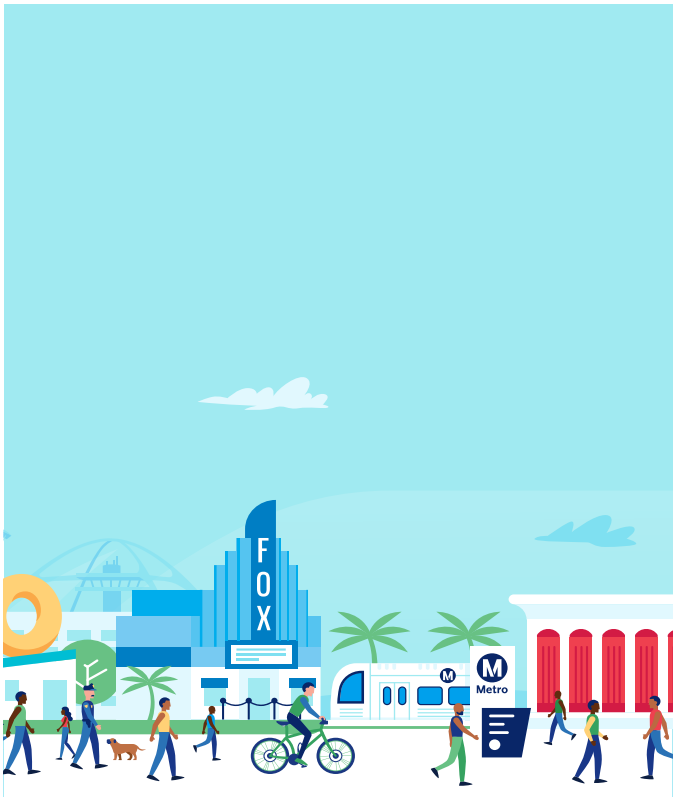
Automated system operations will be monitored and controlled from a Central Control Facility within the M&SF. Central Control Operators monitor the system operations aided by CCTV coverage, and alarms that will identify and notify any issues within the system. Depending on the type of issue and/or alarm, the Central Control Operators remotely implement corrective actions to return the system to normal operations as quickly as possible. Additionally, Central Control Operators are the key interface with emergency response. All responses and actions are procedurally defined in the System Operations Plan, the System Safety Program Plan and other documents that are jointly developed by the System Supplier and the Owner's Safety and Security Committee during project implementation.

All equipment for communications, train control, power distribution, SCADA, CCTV, whether along the system train-way, at stations or other locations is connected to equipment at the Central Control Facility.

2.9.2 Maintenance

Maintenance performed on system equipment includes:

- Service: the periodic replacement of consumables and expendables and adjustment of parts to their nominal position, required tolerance, setting, and output.
- Cleaning: interior and exterior cleaning of accumulated trash, dirt, and grime, including graffiti.
- Inspection: periodic inspection of parts, appurtenances and subsystems subject to deterioration and failure.
- Repair: the repair or replacement of a part that has been damaged, has failed, or is nearing the end of its service life.
- Maintenance Information Management and Scheduling: the processing of maintenance information, work reports, failure reports, and system performance data needed to manage the system maintenance program effectively and efficiently.



Maintenance facilities include an automatic car wash for vehicle exterior cleaning, maintenance pits with under vehicle access, electronics and mechanical and lubrication workshops, tool and equipment storage, spare parts and consumables storage, shipping/receiving areas, freight elevator, hoists, administrative offices, employee locker rooms/facilities, and sufficient parking.

2.9.3 Spatial Requirements

Approximately four to six acres is estimated to accommodate the M&SF functions as described. Access and egress tracks to and from the M&SF to the mainline would be developed for the preferred alternative. Based on available sites, the M&SF may be functionally split; however, consolidating functions into a fully functional M&SF provides the most efficient and cost-effective solution.

The following overhead clearances are required for the M&SF:

- A minimum vertical clearance of ten feet is required in the shop and shipping/receiving areas.
- A minimum vertical clearance of eight feet is required in office areas.
- A minimum vertical clearance of twenty feet is required in the vehicle heavy maintenance area and designated highbay areas.
- A minimum vertical clearance of fourteen feet is required in the propulsion power substation.

3. PRELIMINARY RIDERSHIP PROJECTIONS

3.1 RIDERSHIP METHODOLOGY

For the purposes of selecting a Locally Preferred Alternative Project, preliminary transit ridership was developed to provide a basis of comparison between alternative concepts for the Inglewood Transit Connector. Further ridership analysis will be completed and refined as part of the future environmental analysis and project definition work.

While the City utilized the early ridership analysis performed by Metro, it updated the ridership analysis with more current available information. The analysis also recognized that the Inglewood Transit Connector Project would be different from a traditional urban/metro regional transit system:

- Compared to a traditional urban/metro transit system which provides regional connectivity, the Inglewood Transit Connector would provide the last-mile connectivity, with relatively small route lengths of approximately one to three miles, between the Metro system to key facilities and trip generators within the City of Inglewood.
- Key trip generators are the various venues within the Inglewood Sports and Entertainment District including the NFL Stadium, The Forum, and the Los Angeles Stadium and Entertainment District at Hollywood Park. The travel demands and ridership are largely driven by scheduled events with peak demands expected to be multiple times higher than those for normal work days and weekends.

To better understand potential future ridership, the City sought to establish the anticipated demands over the course of a year to account for fluctuation over months, weeks and days of the week, and to provide a foundation for developing the anticipated operational scenarios and the appropriate technology, and to provide data in support of the estimation of rough order of magnitude costs.

The typical regional planning models used for estimating ridership on a typical urban/metro transit system were supplemented with additional analysis and models. This study adopted the horizon year of 2040 to maintain consistency with the Southern California Association of Government's (SCAG) Regional Transportation Plan 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy RTP/SCS. SCAG'S RTP utilizes the horizon year of 2040 and provides policy direction for specific improvements, sets forth a transportation plan and sustainable communities strategy for 2040 conditions. This study and related plans need to be consistent with the regional transportation plan and forecasting. Given preliminary available information and data, this Report provides a concept planning level estimate of the anticipated users of the Inglewood Transit Connector system for:

1. Non-event normal day anticipated users based on a calibrated and validated regional travel demand model for the typical work weekday and weekend days. The estimates address the hourly distribution over the day, per direction, with origin and destination to estimate non-event normal day peak ridership.
2. Event day anticipated users, which was informed by preliminary data regarding anticipated events, distribution of the events over the year, days of week, time of day, as well as anticipated attendees, anticipated transportation modes and arrival and departure profiles to and from the events.
    - Event based information was tabulated based on event venue, size and type of event, day and time, and anticipated transportation mode.
    - For event based anticipated transit system users, the City developed estimates of peak hour demand and direction, the duration and time of the peak hour, and the anticipated duration of the event-based demand. This should be established for each event.

A preliminary total anticipated user demand was identified by overlapping the non-event normal day ridership with preliminary event-based ridership estimates. The overall ridership estimation is based on initial assumptions that will be refined and researched as the Inglewood Transit Connector Project moves into the project definition and environmental clearance phase, and as other proposed projects are more fully defined.

The preliminary ITC transit ridership analysis included the following scenarios:

1. Weekday non-event conditions.
2. Weekend non-event conditions.
3. Weekday/weekend event conditions individually at the The Forum, NFL Stadium, the 6,000-seat Performance Arena, and the proposed Inglewood Basketball and Entertainment Center.
4. Estimation of overall yearly non-event and event conditions ridership using information on low and high estimates during events and the number of such events over an entire year. Additionally, average event conditions along with non-event conditions ridership estimates for each of the alignment alternatives under consideration were also developed.

The weekday non-event conditions were simulated using the latest SCAG 2016 RTP/SCS Model, the SCAG 2012 Regional Model including updates to SED databases and transit networks to reflect the various Inglewood Transit Connector alternatives, as well as operational scenarios and associated transit base-network changes. The weekend day non-event conditions were estimated by normalizing weekday ridership estimates using specific weekday and weekend day transit utilization in the study area, provided by Metro.

The event-day conditions were simulated using a spreadsheet-based model based on Metro's mode-split model and actual data related to the event attendees' zip-code information. The NFL game attendees included information on ticket sales data while all other attendees at events at all venues included information on distribution of population by zip-code derived from the SCAG 2012 Regional Model.

3.2 TRANSIT RIDERSHIP RESULTS

Model simulations were performed, and transit ridership estimate results were compiled for each of the alignment alternatives.

3.2.1 Non-Event Normal Conditions

Table 3.2-1 presents the ridership estimates for each alternative on a non-event normal commuter weekday. alternatives A and D have the highest non-event, normal commuter weekday ridership with roughly about 2,000 more riders than Alternatives B and C.

Travel demand models are not available for weekend days. However, transit service characteristics and demand data are available for all days of the week. Transit ridership and service characteristics in 2017 available on weekdays, Saturdays and Sundays were utilized to compute the related utilization of the transit system. Table 3.2-2 and Table 3.2-3 present weekend non-event day estimates for Saturday and Sunday per each alternative.

3.2.2 Event Day Conditions Forecast

Tables 3.2-4, 3.2-5, 3.2-6, and 3.2-7 provide a summary of event ridership profiles for each of the four proposed alternatives. These tables include ridership profiles for both low and high estimates, broken down by types of events at each of the venues.

Based on preliminary ridership analysis, the following key observations can be made:

1. The peak ridership estimate is projected for an LA Rams NFL game high-estimate departure period for all Inglewood Transit Connector alignment alternatives. The variation in peak ridership estimates during that peak timeframe between these alignment alternatives is less than +/- 5%.
2. The ridership projections for the Market-Manchester and Century Boulevard alignments indicate that the maximum ridership estimate occurs on an NFL game event day and is equivalent to 8,985 riders occurring in the one-hour period after the game.

Detailed ridership estimates for each of the Inglewood Transit Connector alignment alternatives by venue and type of event including profiles of arrivals and departures are provided in Appendix B.

Table 3.2-1: Year 2040 Line Level Ridership (Non-Event, Normal Commuter Weekday) Estimates

	RIDERSHIP (ON LINE)		
	PEAK TOTAL	OFF-PEAK TOTAL	TOTAL
Alternative A: Market-Manchester Alignment	3,717	1,252	4,969
Alternative B: Fairview Heights Alignment	2,118	938	3,057
Alternative C: Arbor Vitae Alignment	2,340	1,056	3,396
Alternative D: Century Blvd Alignment	4,194	1,789	5,982

Table 3.2-2: Year 2040 Line Level Ridership (Normal Commuter Weekend – Saturday)

	2040 RIDERSHIP TOTAL	AM 6am – 9am	BASE 9am – 3pm	PM 3pm – 7pm	NT 7pm – end
Alternative A: Market-Manchester Alignment	3,228	412	1,397	918	501
Alternative B: Fairview Heights Alignment	1,986	253	859	565	308
Alternative C: Arbor Vitae Alignment	2,206	281	955	627	343
Alternative D: Century Blvd Alignment	3,886	495	1,682	1,105	604

Table 3.2-3: Year 2040 Line Level Ridership (Normal Commuter Weekend – Sunday)

	2040 RIDERSHIP TOTAL	AM 6am – 9am	BASE 9am – 3pm	PM 3pm – 7pm	NT 7pm – end
Alternative A: Market-Manchester Alignment	2,773	348	1,183	777	424
Alternative B: Fairview Heights Alignment	1,681	214	728	478	261
Alternative C: Arbor Vitae Alignment	1,868	238	808	531	290
Alternative D: Century Blvd Alignment	3,290	420	1,424	936	511

Source: Raju Associates, 2018

This study is consistent with the SCAG Regional Transportation Plan, and automated people mover system will be designed to accommodate future ridership consistent with the regional transportation plan forecasting.

3.2.3 Average Annual Ridership Estimates

The average annual ridership estimates were developed for each of the four Inglewood Transit Connector alignment alternatives as follows:

1. Average weekday and weekend day, Saturday and Sunday, non-event-based ridership estimates were expanded by the number of days of their respective occurrences.
2. Average event-day ridership estimates for each of the types of events at each of the venues were expanded by the number of instances that they occur in a given year.
3. Combination of the above two ridership estimates.

Table 3.7-8 through Table 3.7-10 summarizes the average annual ridership for each of the four alternatives.

Table 3.2-8: Event Day Annual Ridership by Alignment

	EVENT ANNUAL RIDERSHIP				
	LASED	THE FORUM	IBEC	PERFORMANCE ARENA	TOTAL
Alternative A: Market-Manchester Alignment	409,230	184,538	353,992	78,148	1,025,908

4. COMPARISON ANALYSIS OF ALTERNATIVES

To identify the the City of Inglewood's locally preferred alternative project, the following screening criteria were established:

- Connection between Metro and key City venues
- Passenger convenience
- Cost and feasibility
- Total costs – Capital and Operations & Maintenance
- Ability to fit within the public right of way constraints and ability to resolve conflicts with utilities
- Ridership potential
- Synergistic Economic Development within the City
- Required Major Coordination Efforts

4.1 PASSENGER CONVENIENCE

Passenger convenience is measured by the criteria defined below:

1. Reliable Connection to Inglewood Activity Centers: convenient service with minimum delay, wait, and travel times to LASED, The Forum, and the proposed Inglewood Basketball and Entertainment Center.
2. Regional Connectivity: ease of transferring to and from the Metro Rail system and potential intermodal facilities that would be served by various Metro and municipal bus lines
3. Safety and Security: all the alternatives are elevated APM systems that will operate within a defined right-of-way. All Fixed Guideway Transit Systems, such as the APM, are subject to oversight by the California Public Utilities Commission (CPUC) which will determine whether the system is safe to carry passengers and issue the operating certificate.

Each of the alternatives are described in Section 2.2 through 2.5. Section 2.6 provides details of the technology assessment of APM technologies with key findings on the candidate technologies applicable to the project. The specific technology is expected to be selected through a competitive procurement process, which is not alternative dependent. Multiple characteristics of the alternatives are expected to be comparable to each other across the alternatives, and will not provide any differentiation between them.

For the selection of the Locally Preferred Alternative (LPA), passenger convenience is expected to be similar among all alternatives, and therefore, is a non-differentiating characteristic because:

- All alternatives will provide a time-certain travel experience, i.e. reliable connection to the key traffic generators.
- All alternatives will provide a transfer connection to Metro and each alternative will be designed to include an intermodal facility that would serve various Metro and municipal bus lines.
- Station locations, configurations, access and amenities will be comparable across all alternatives.
- All alternatives will be subject to CPUC requirements.

4.2 COST AND FINANCIAL FEASIBILITY

As the Inglewood Transit Connector Project is refined, cost estimates will be updated and developed. Nonetheless, to assist the comparative analysis of alternative concepts, in project evaluation, the City developed preliminary cost estimates based on a conceptual level project definition for each of the alternatives. System cost estimates considered demand, capacity, and technology needs.

APM systems are comprised of two major elements, the Operating System and Fixed Facilities, which are integrated into a fully functional total system. The Operating System consists of vehicles, running track, guideway equipment, propulsion power, automatic train control and communications subsystems, station and wayside equipment, maintenance equipment and other elements. Fixed Facilities include guideway infrastructure, stations, buildings for the Maintenance and Storage Facilities (M&SF), Command and Control Facilities, propulsion power substations and other facilities upon which Operating System elements are installed by the APM system supplier.

Estimates of probable costs for the APM Operating System and the Fixed Facilities were prepared for each of the Alternatives, based on a concept level definition and are presented herein.

4.3 CAPITAL COSTS

4.3.1 APM Operating System Capital Cost

APM Operating Systems are proprietary designs that are typically procured as complete packages. The major subsystems, such as vehicles, tracks, switches and control systems, station equipment, from different suppliers cannot be mixed to form a system. Operating Systems are typically procured under a turnkey design, supply and installation contract. The Operating System of an APM application is specially configured using supplier developed equipment designs that are applied to satisfy site-specific requirements. As a result, costs within the APM industry vary widely on a project by project basis as APM suppliers implement their unique proprietary technology for a particular system. Costs for different projects by the same supplier may also vary significantly because of differences in fleet size, capacity requirements, and performance requirements. Probable capital costs for the APM Operating System were developed and estimated based on historical cost information and applied to this project considering factors such as guideway length, configuration and number of passenger stations, size of the M&SF, number of propulsion power substations and fleet size.

Globally, there are likely only a handful APM Operating System suppliers with technically mature technologies capable of providing a system that will meet the anticipated performance requirements of this project within the site specific constraints. A competitive procurement environment is essential and inherently assumed in developing the estimate of probable costs.

4.3.2 Fixed Facility Cost Estimates

In contrast with the Operating System, there are a substantially larger number of potential entities capable of designing and building the fixed facilities elements. The estimated probable cost of the fixed facility elements was developed based on a concept level definition of the different fixed facility elements including similar transit projects within the Los Angeles Metropolitan area. Estimated unit costs for the different elements are noted below:

- Aerial guideway, per linear feet of dual lane: $7,000 per linear foot.
- Stations, including pedestrian bridge to sidewalks, and excluding Operating System elements: $20 M per station.
- Maintenance and Storage Facility, excluding Operating System elements: $40 M.
- Utility infrastructure: $2,000 per linear foot of dual lane.

Table 4.3-1: Capital Cost Estimate (Conceptual) - 2018$

	Alternative A: Market-Manchester Alignment	Alternative B: Fairview Heights Alignment	Alternative C: Arbor Vitae Alignment	Alternative D: Century Blvd Alignment
System Length	1.8 route miles	2.2 route miles	3.0 route miles	3.1 route miles
Number of Stations	5	4	5	5
Traction Power Substations	2	2	3	3
Number of Cars ("Generic") Operating Fleet/Total Fleet	28/32	28/32	28/32	28/32
APM OPERATING SYSTEM CAPITAL COST ESTIMATE				
Guideway, Wayside, ATC, Power and Communication Systems and Maintenance Equipment	$62 M	$70 M	$90 M	$93 M
Rolling Stock/Fleet	$75 M	$75 M	$75 M	$75 M
Other Costs not included above including but not limited to other equipment, System Supplier's PM/Engineering/T&C, bonds, insurance, etc. (at 30%)	$42 M	$43.5 M	$49.5 M	$50.4 M
Subtotal Estimate of Operating System Probable cost	$179M	$188.5 M	$214.5 M	$218.4
FIXED FACILITY COST ESTIMATE (CONCEPTUAL) – 2018$				
Stations and Ped bridges structure and Building systems	$100 M	$80 M	$ 100 M	$ 100 M
Aerial Guideway (incl. columns, foundations)	$66.6 M	$ 81.3 M	$110.9 M	$ 114.6 M
Maintenance and Storage Facility Structure and Building Systems	$40 M	$ 40 M	$ 40 M	$ 40 M
Utility Infrastructure, Traction and building power substations, housekeeping power equipment and distribution (downstream from utility connection points)	$19 M	$23 M	$31.7 M	$ 32.7 M
Other Costs not included above such as and including DB Contractor's engineering/CM/etc, bonds, insurance etc. (est. 30%)	$68 M	$ 68 M	$ 85 M	$ 86 M
SubTotal – Estimate of Fixed Facility Probable cost	$293.6 M	$ 292.3 M	$ 367.6 M	$ 373.3 M
Subtotal (Operating System + Fixed Facilities)	$472.6 M	$480.8 M	$582.1 M	$591.7 M
Contingency (30%)	$141.8 M	$144.3 M	$174.6 M	$177.5 M
TOTAL ESTIMATED PROBABLE CAPITAL COST (2018$) [1, 2]				
TOTAL COST [1, 2]	$614.4 M	$625.1 M	$756.7 M	$ 769.2 M

1. Right of way acquisition, environmental and physical mitigations, parking/intermodal center costs and costs of other infrastructure are not included since these are not defined and subject to future analysis and input from other city and regional transportation plans/studies.
2. Owner soft costs not included – Owner soft costs cover Owner's management costs including Owner retained consultants etc.

Source: Pacifica Services, Trifiletti Consulting, 2018

4.3.3 Operations and Maintenance Cost Estimates

Operations and maintenance cost estimates are provided for each of the alternatives below.

There are two components: 1) APM Operating System operations and maintenance, and 2) Fixed Facility/ infrastructure operations and maintenance.

The APM Operating System operations and maintenance cost estimates address the operations and maintenance of the Operating System components including the vehicles, the automatic train control system, the traction and auxiliary power distribution systems and communication systems, all of which are the components that when fully integrated, provide the reliable and safe transportation service that is desired. Staffing consists of central control operators, supervisors, mechanical and electrical shop technicians, as well as management, administrative and janitorial staff necessary for the APM Operating System. Costs for regular preventive maintenance, as well as spare parts and consumables are included, however, costs for major overhauls and capital asset replacement are not included. The typical design service life of an APM Operating System is approximately 25 to 30 years. Major overhauls and capital asset replacement can be expected to occur at year fifteen of service. Considering that the Operating System characteristics are similar for all the alternatives, the major overhaul and capital asset replacement costs are considered to be approximately comparable and not expected to change the comparative costs between the alternatives. Since the project is at a conceptual definition phase, the estimate of probable cost is based on a concept level operations plan considering the fleet and anticipated annual fleet miles.

Fixed Facility operations and maintenance cost estimates address the following scope of work: regular inspections and routine repairs to the infrastructure, ncluding guideway structure, station structure, maintenance and storage facility structure, power substation structure, and the electro-mechanical systems within that are not part of the APM Operating System. These electro-mechanical systems include housekeeping power systems, building heating-ventilation-air-conditioning systems, escalators and elevators, fire management systems, and other similar building management systems. An estimate of probable annual O&M costs for the Fixed Facilities is approximately 1.5% of the total Fixed Facility capital cost.

Estimates of probable annual operations and maintenance costs are shown in Table 4.3-2.

Table 4.3-2: Annual Operations and Maintenance Cost Estimate (Conceptual) – 2018$

	Alternative A: Market-Manchester Alignment	Alternative B: Fairview Heights Alignment	Alternative C: Arbor Vitae Alignment	Alternative D: Century Boulevard Alignment
System Length	1.8 route miles	2.2 route miles	3.0 route miles	3.1 route miles
Number of Stations	5	4	5	5
Traction Power Substations	2	2	3	3
#Number of Cars ("Generic") Operating Fleet/Total Fleet	28/32	28/32	28/32	28/32
ESTIMATE OF FIXED FACILITY ANNUAL O&M COSTS (EXCLUDING UTILITIES)				
Estimate of Fixed Facility Annual O&M Costs (excluding Utilities)	$5 M	$5 M	$6 M	$6 M
ESTIMATE OF OPERATING SYSTEM ANNUAL O&M COSTS				
Operating System Annual O&M Cost Estimate (excl Utilities, mid-life overhauls and capital asset replacement/ rejuvenation)	$6 M			
Estimates annual reserve for mid life overhaul, capital asset rejuvenation etc.	$3 M			
Sub Total – Estimate of Annual O&M Costs including reserves for Operating System capital asset rejuvenation	$14 – $15 M			
Contingency (30%)	$ 4.2 - $ 4.5 M			
Total Estimate of Annual O&M Costs including reserves for Operating System capital asset rejuvenation [1]	$18.2 - $19.5 M			

1. Assumes a Design-Build-Operate-Maintain delivery strategy with a 25 to 30-year term with Contractor responsible for all operations/maintenance of contractor delivered assets. Does not include cost of utilities or Owner soft costs.

Source: Pacifica Services, Trifiletti Consulting, 2018

4.4 ENGINEERING AND PHYSICAL FEASIBILITY

Physical constraints and engineering feasibility are key factors to selecting the Locally Preferred Alternative for the Inglewood Transit Connector Project. Because all alternatives are elevated APM systems with similar design and constructability aspects, this section focuses on areas where the alignment characteristics differ, specifically the available right-of-way and location of underground utilities.

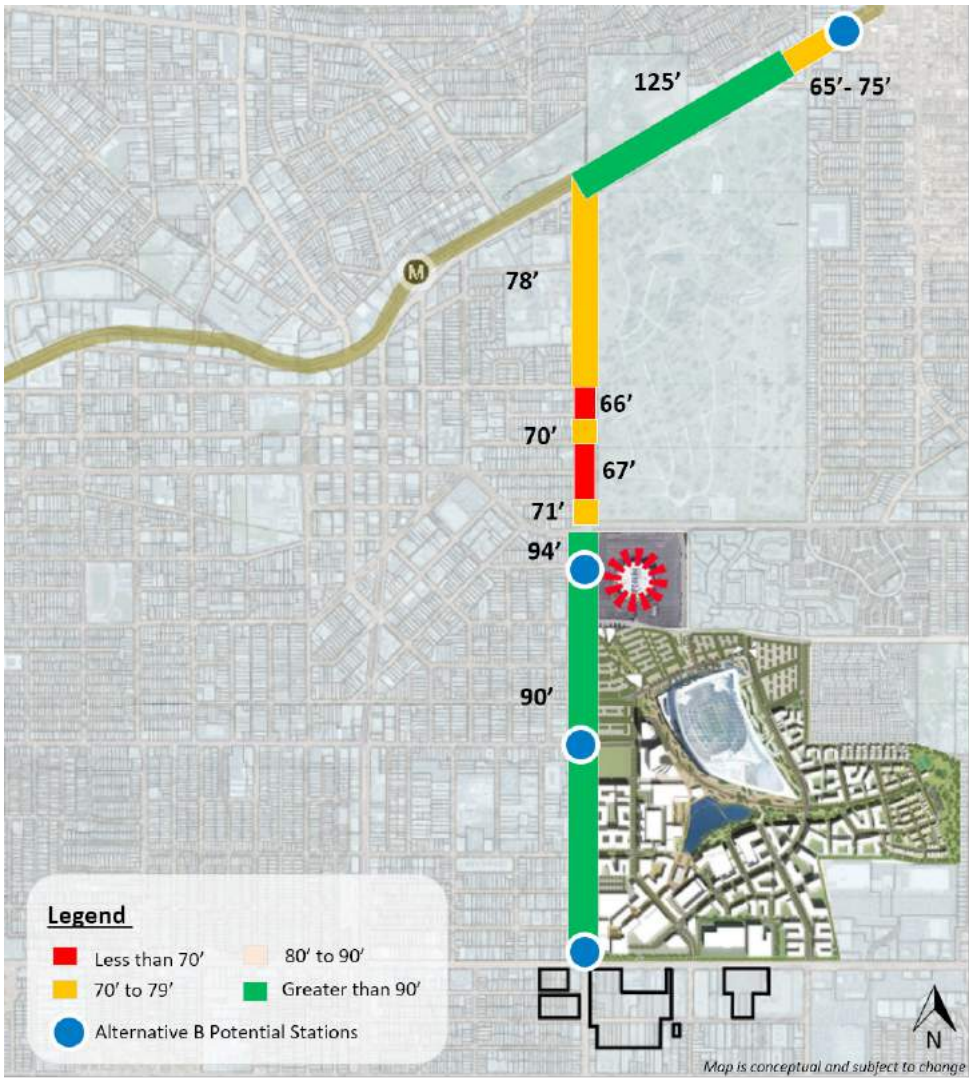
4.4.1 Ability to Fit Within the Right-of-Way

This section summarizes a preliminary analysis on the right-of-way acquisitions that may be required for the Project alternatives. The four alternatives have stations along their respective alignments that may involve redevelopment in the areas adjacent to the stations. In addition to station areas, additional property acquisitions may be required for Maintenance Storage Facilities and traction power stations. As part of the detailed design and environmental review analysis of the preferred alternative, specific property acquisition requirements will be established for the preferred alternative as part of the next stage of the project development during the EIR phase.

Alternative A: Market-Manchester Alignment:

The right-of-way along Alternative A ranges from approximately 93 feet to 112 feet, thus minimal property acquisitions due to utilities are anticipated. The alignment would be located primarily on the street right-of-way with the exception of a segment on the northeast quadrant of Market Street and Manchester Boulevard where the alignment transitions east onto Manchester Boulevard from Market Street. Potential acquisition or right-of-way easement requirements at the southwest quadrant of Prairie Avenue and Arbor Vitae Street are projected.

Figure 4.4-1 Alternative A: Right-of-Way Analysis

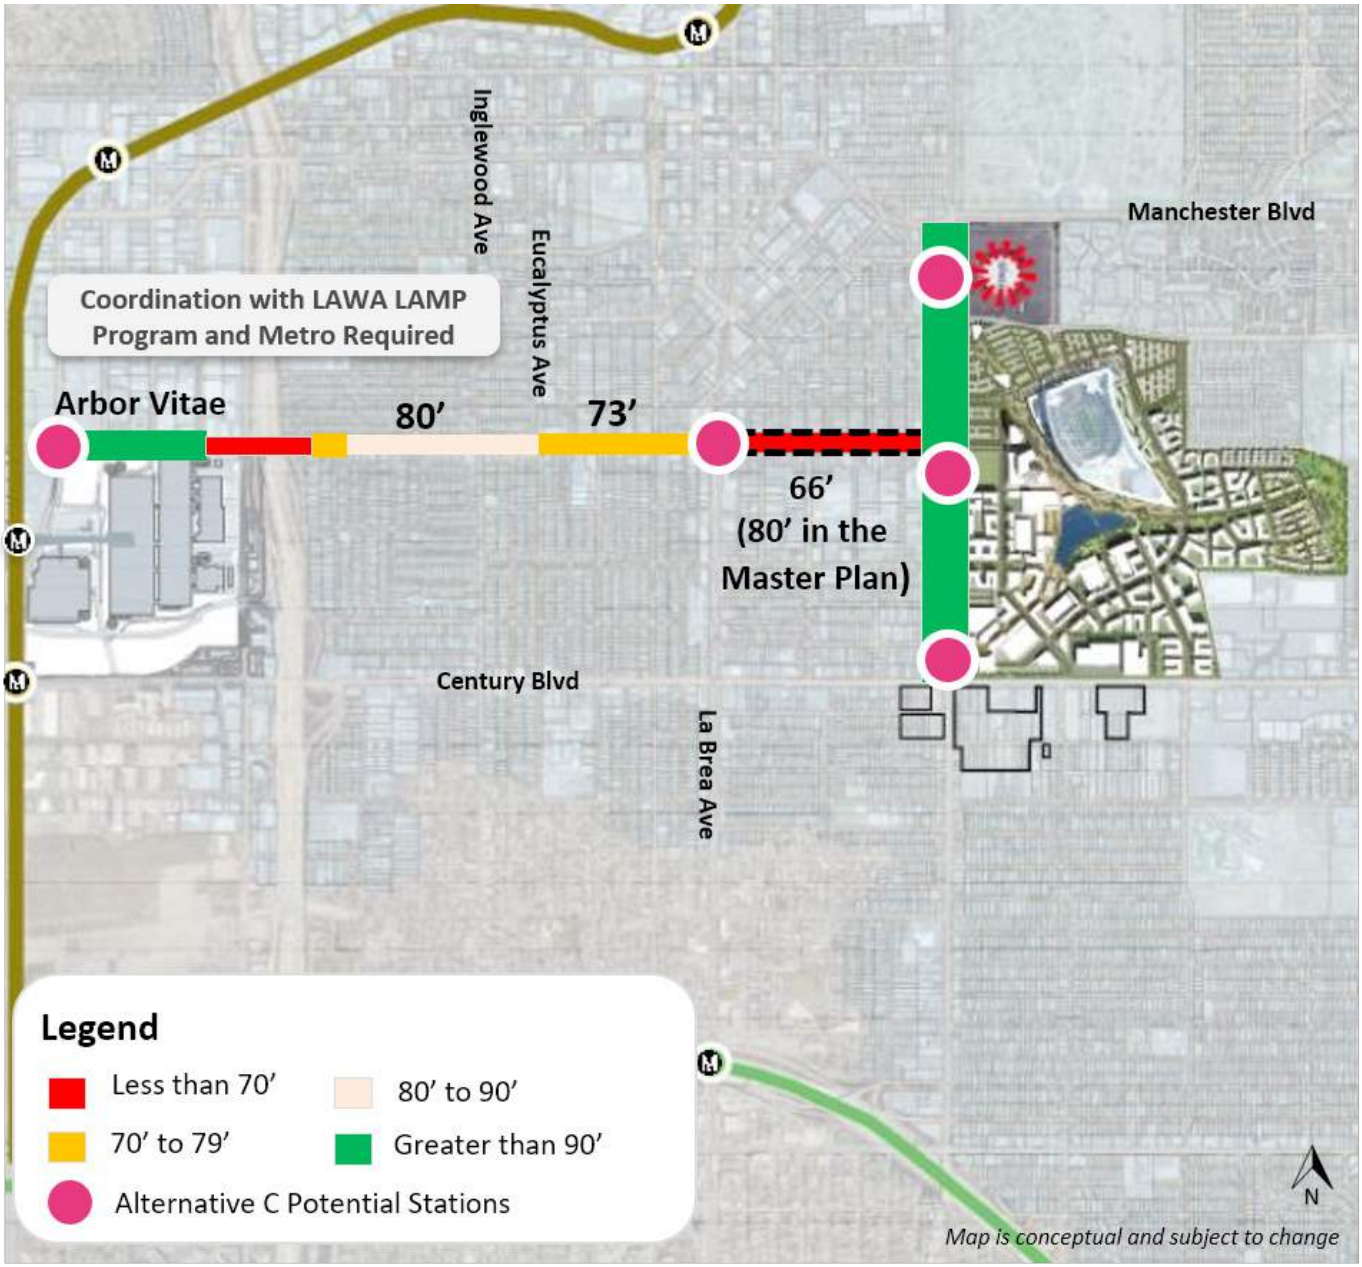


Source: Trifiletti Consulting, Raju Associates, 2018

Alternative B: Fairview Heights Alignment:

Although Alternative B is located primarily within the street right-of-way, there is limited roadway width between Florence Avenue and Manchester Boulevard (Figure 4.4-2). Potentially significant property impacts to the Inglewood Cemetery are anticipated because the alignment transitions from Florence Avenue which has a wide right-of-way of 125 feet, to Prairie Avenue, which has a right-of-way of 78 feet. Furthermore, the right-of-way of Prairie Avenue decreases to less than 70 feet south of Regent Street. This would potentially further impact the Inglewood Cemetery and would potentially conflict with utility infrastructure.

Figure 4.4-2: Alternative B: Right-of-Way Analysis

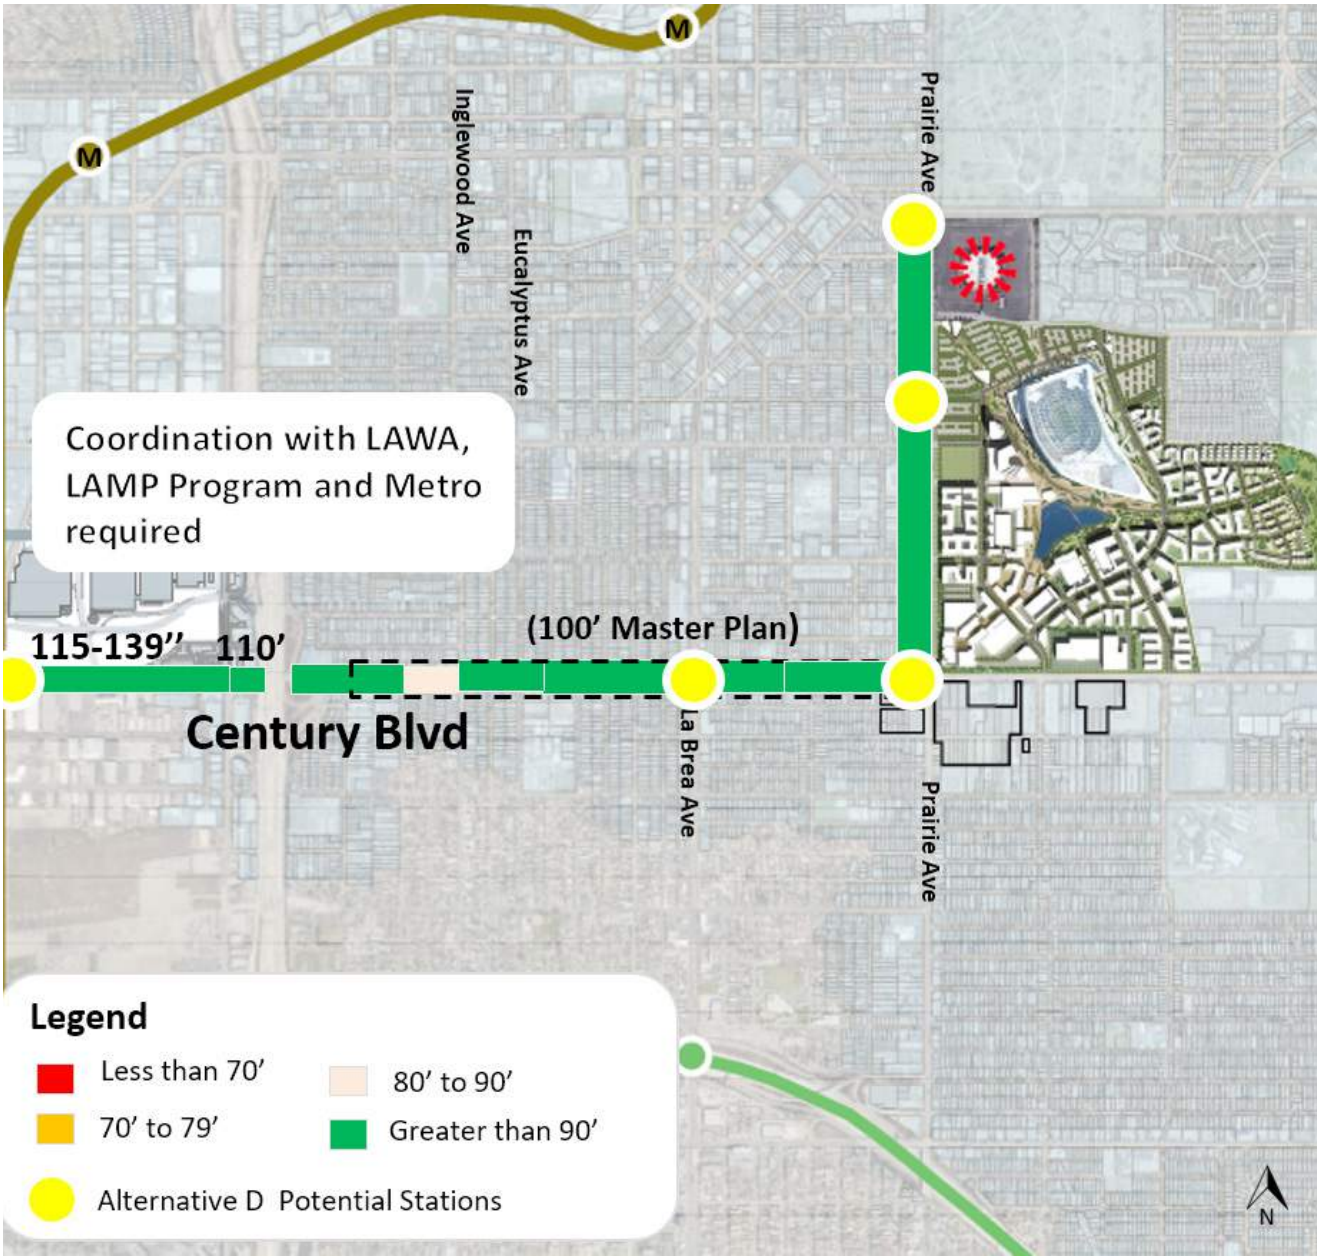


Source: Trifiletti Consulting, Raju Associates, 2018

Alternative C: Arbor Vitae Alignment:

Alternative C: Arbor Vitae Alignment right-of-way ranges from 100 feet to 66 feet, narrowing of the right-of-way east of Eucalyptus Avenue (Figure 4.4-3). Given the narrow right-of-way, this concept would potentially require acquisition of existing small business and possible neighborhood displacement. It would also potentially have adverse economic and fiscal impacts to local businesses along Arbor Vitae due to potentially reduced visibility, potential loss of on-street parking during construction and potential permanent removal of on-street parking spaces to accommodate the alignment.

Figure 4.4-3: Alternative C: Right-of-Way Analysis



Source: Trifiletti Consulting, Raju Associates, 2018

Alternative D: Century Boulevard Alignment:

Alternative D has a wide right-of-way of at least 100 feet (Figure 4.4-4) and a continuous center median. Major utilities are located along Century Boulevard and may pose significant conflicts. Major property acquisitions or a major utility relocation effort are required if Alternative D is the selected alternative. Although Century Boulevard has a wide right-of-way of at least 100 feet and a continuous medium, major utilities are located along Century Boulevard and pose significant conflicts that may require a major utility relocation effort or property acquisitions to avoid utilities. Additionally, the I-405 crosses Century Boulevard with a single 100-foot bridge span impeding over or under clearance.

Figure 4.4-4: Alternative D: Right-of-Way Analysis

Source: Trifiletti Consulting, Raju Associates, 2018

4.4.2 Ability to Address/Resolve Underground Utility Conflicts

Utility information has been provided from the following agencies and utility purveyors:

- City of Inglewood
- Southern California Gas Company, Transmission Department
- Southern California Gas Company, Northwest Distribution Region
- Los Angeles Department of Water and Power
- Los Angeles Department of Public Works
- West Basin Municipal Water District

For the purpose of selecting a Locally Preferred Alternative, the available utility information was examined by overlaying the transit alignment alternatives to determine whether there were any fatal flaws. For this analysis, a fatal flaw is deemed to be a utility conflict that could not be resolved through design to avoid the conflict or by providing for a technically viable utility relocation. A conflict resolution that requires the relocation of a major utility, i.e. a utility that serves a regional base, is considered technically non-viable. The utility identification and assessment process consisted of requests for information from various agencies and utility purveyors. Data obtained included existing and planned major utilities within the project limits. Data and utility maps were prepared for major identified utilities. These maps have been incorporated into preliminary project concept plans for each alternative concept and included in Appendix A.

Available data did not provide exact utility locations in terms of plan and profile; rather, exact utility locations will be determined during project implementation by utilizing ground penetrating radar and/or other methods. During the environmental review of the locally preferred alternative, the City will perform a more comprehensive utility analysis, including depths, width of utilities, material makeup, condition of utility, and clearance requirements to address potential significant impacts and mitigation measures.

Alternative A: Market–Manchester Alignment:

Potential obstacles along the Alternative A alignment include a 36-inch West Basin Water District recycled water line at street centerline and several utilities within fifteen feet along Prairie Avenue. A large 60-inch Department of Water and Power (DWP) main pipe and a 33-inch storm drain line are located on the east side of Prairie Avenue, approximately 20 to 40 feet from centerline. Underground electrical lines, including vaults, are primarily concentrated along or adjacent to easterly and westerly sidewalks and do not pose a major impediment to the Alternative A alignment.

Existing utilities along the northern portion of the alignment pose minimal obstacles for placement of guideway columns. However, due to the span of utilities tie-ins and crossings along Manchester Boulevard at Hillcrest Boulevard, Spruce Avenue, Manchester Drive and Manchester Terrace, placement of guideway columns in this alignment should avoid relocation of gravity flow utilities including sewer and storm drains.

Utilities along the Alternative A route do not pose as major conflicts, and these conflicts could be resolved as there is sufficient roadway width along Market Street, Manchester Boulevard and Prairie Avenue (see Figure 4.4-5). As part of the detailed design of the preferred alternative, the City will conduct site investigations to determine exact utility locations and coordinate column placements to avoid or resolve conflicts, or relocate based on costs versus benefits.

Figure 4.4-5: Utilities Along Alternative A: Market-Manchester

Source: Trifiletti Consulting, Raju Associates, 2018

Alternative B: Fairview Heights Utility Analysis:

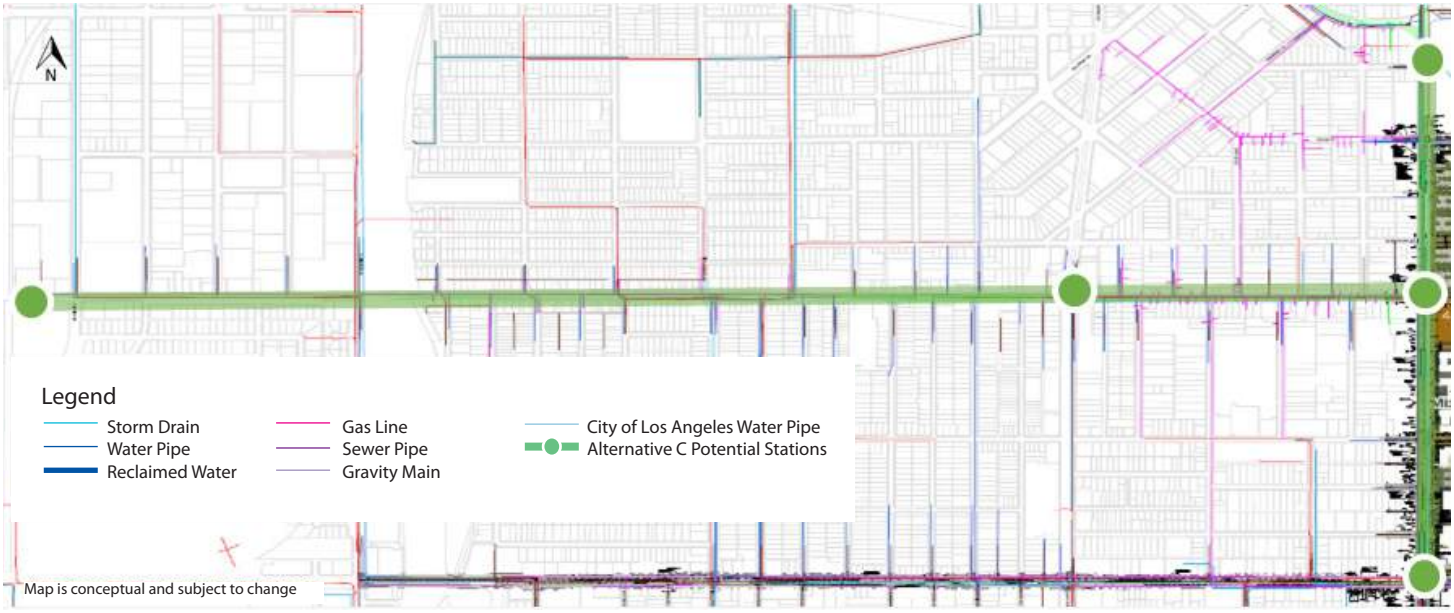
Based on preliminary research, minor utility pipes, as well as lateral connections to these pipes, from adjacent properties, have been identified along Florence Avenue. Existing utilities, including sewer, gas and water mains along these streets pose minimal obstacles for placement of guideway columns; however, various utility crossings at the curve alignment transition at Florence Avenue and Prairie Avenue should be avoided.

Several utilities along Prairie Avenue have been identified within close proximity, approximately fifteen feet, to this preliminary project alignment alternative. A 36-inch recycled water line travels along the easterly side of Prairie Avenue and transitions to the centerline of the street at Grace Avenue. A large 60-inch LADWP water main and a 33-inch storm drain line are located toward the southerly end of the alignment on the east side of Prairie Avenue, approximately twenty to forty feet from centerline. These utilities may pose significant obstacles but would not be considered to render the alignment infeasible at this stage.

Underground electrical lines, including vaults, are primarily concentrated along or adjacent to easterly and westerly sidewalks and do not pose a concern. Non-gravity flow utilities, including water service lines, may be relocated vertically, i.e. lowered, in lieu of horizontal relocation. Utility crossings including electrical and relatively large sized storm drain lines are primarily found at street intersections. Extensive utility crossings have been identified south of Manchester Boulevard, at Kelso Street/Pincay Drive, and north of Arbor Vitae Street. Guideway column placements should be avoided near these utility crossings and street intersections.

Utilities along alternative B pose a significant obstacle but relocations are not considered infeasible at this stage. As part of the detailed design of the preferred alternative, the City will conduct site investigations to determine exact utility locations and coordinate column placements to avoid or resolve conflicts.

Figure 4.4-6: Utilities along Alternative B: Fairview Heights Alignment



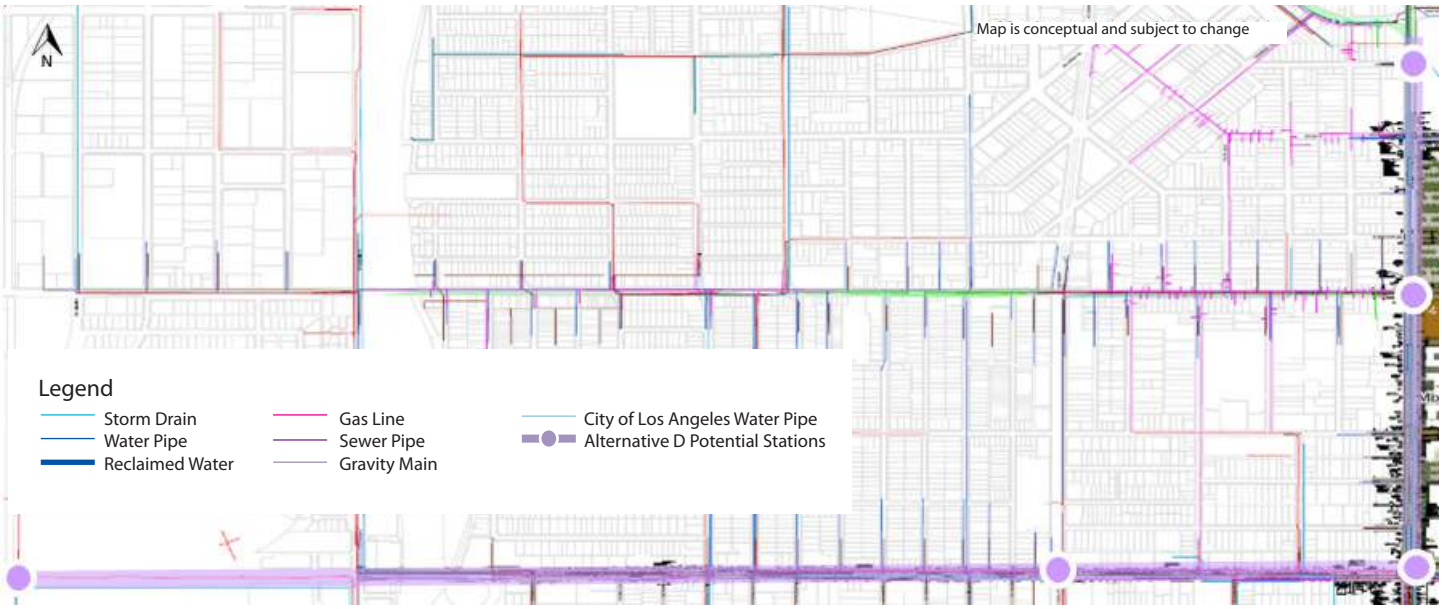
Source: Trifiletti Consulting, Raju Associates, 2018

Alternative C: Arbor Vitae Utility Analysis:

The most significant utilities identified as part of preliminary research for this alignment alternative includes an eight to ten inch sewer pipe along the centerline of Arbor Vitae Street between Eucalyptus Avenue and La Brea Avenue, a 36-inch recycled water line along Prairie Avenue centerline within fifteen feet of the preliminary alignment. A large 60-inch DWP water main and a 33-inch storm drain line are located at the east side of Prairie, approximately twenty to forty feet from centerline. Together, these utilities may pose significant obstacles but relocation would not be considered infeasible at this stage. Underground electrical lines, including vaults, are primarily concentrated along or adjacent to sidewalks and do not pose a major impediment. Non-gravity flow utilities, including water service lines, may be relocated vertically, i.e. lowered, in lieu of horizontal relocation.

Due to narrowing of the right-of-way east of Eucalyptus Avenue (Figure 4.4-7), there are potential major impacts to existing small businesses and possible neighborhood displacement. During detailed design of the preferred alternative, the City will conduct site investigations for exact utility locations and coordinate column placements to avoid or resolve conflicts or relocate utilities based on cost versus benefit to the project.

Figure 4.4-7: Utilities Along Alternative C: Arbor Vitae Alignment



Source: Trifiletti Consulting, Raju Associates, 2018

Alternative D: Utilities Along Century Boulevard:

Overhead power lines are located along and crossing Century Boulevard from east of Felton Avenue to Condon Avenue. Clearance requirements for these power lines should be considered when evaluating this alignment. Additional underground electrical lines are located along Alternative D including crossings between Grevillea and Burn Avenue and at the intersection of Prairie Avenue and Century Boulevard. Figure 4.4-8 illustrates utilities located along alternative D at a high level.

Although Century Boulevard has a wide right-of-way of at least 100 feet (Figure 4.4-8) and a continuous center median, major utilities are located along Century Boulevard and pose significant conflicts that may require a major utility relocation effort or property acquisitions to avoid utilities. Major property acquisitions or a major utility relocation effort are required if Alternative D is the selected alternative. Additionally, the I-405 crosses Century Boulevard with a single 100-foot bridge span impeding over or under clearance. As part of the detailed design of the preferred alternative, the City will conduct site investigations to determine exact utility locations and coordinate column placements to avoid or resolve conflicts or relocate utilities based on cost versus benefit to the project.

Figure 4.4- 8: Utilities along Alternative D: Century Boulevard Alignment

4.5 OPERATIONAL ANALYSIS

Ridership analysis supports the following assumptions for the development of sufficient information for a conceptual definition of probable costs, and preliminary conceptual APM system performance, (i.e., travel times and operations):

- Because ridership projections between the different alternatives vary only marginally, the highest projections were assumed for fleet sizing and operations.
- Normal day service: approximately sixteen hours a day from 5 AM to 9 PM.
- Highest per direction ridership projection is approximately 400 passengers-per-hour-per-direction. Over a year, this equates to 5,840 service hours.
- When special events service hours are considered, the net annual service hours for normal day service is 3,940 hours.
- Special event ridership estimates range between low and high, and reflect the anticipated arrival and departure profile for attendees. The required service hours are a maximum of eight hours for NFL Game Day, and six hours for the other events.
- For the purposes of this study, service requirements were assumed based on no overlap between special events. While some overlap may occur, it is expected that this would be addressed as part of service scheduling once events calendars are better defined as part of regular service coordination between the ITC and the venues.

4.5.1 Car Capacity and Travel Times

The estimated APM peak hour ridership is used as an initial basis to determine operational capacity needs and fleet requirements. One other variable in estimating system capacity is the estimated space that passengers will occupy while riding the APM system. Because the Inglewood Transit Connector is the last mile urban transit connector, a passenger space allocation of 2.7 square feet per passenger has been assumed; this is consistent with urban metro systems.

Different technologies have different size cars, and therefore different passenger capacity per car. For the purpose of this analysis, an average APM car has been assumed to provide a capacity of between 75 and 90 passengers per car. This assessment is subject to update based on further project development for the preferred alternative.

The dwell time at each station depends on the number of boarders and de-boarders at each station. An average dwell time of 30 seconds has been assumed for each station. While this is sufficient for the average APM car with dual door sets on each side of the car, this assumption also provides for some operational flexibility wherein station dwell times can be adjusted based on the actual boarding and de-boarding at the stations.

Operation of a train over the system for the different alternatives was estimated based on preliminary track geometry and limits on velocity, acceleration and jerk, which is the rate of acceleration. A maximum cruise speed of 50 mph was assumed with speed limits applied in sections of the route to prevent speed surges, or spikes, that would be uncomfortable for passengers. Dwell times of 30 seconds were assumed for each station stop, and then adjusted to achieve round trip times that are equally divisible by the desired minimum operating headway capability. The resulting estimated round-trip times for each of the alternatives are:

- Alternative A: Market-Manchester:
    - Round Trip Time: 770 seconds
- Alternative B: Fairview Heights:
    - Round Trip Time: 710 seconds
- Alternative C: Arbor Vitae (T-alignment to equitably serve all sites):
    - Round Trip Time: 750 seconds
- Alternative D: Century Boulevard:
    - Round Trip Time: 760 seconds

The round-trip time is driven not only by the route length but also the geometry, which places speed limits, and the number of stations.

4.5.2 Fleet Estimate

Line capacity is normally defined as the number of passengers-per-hour-per-direction (PPHPD) that the system can carry past any particular point. Determining factors are the operating headway capability and the passenger capacity per train, which is the number of cars per train, or the train length. Preliminary train simulations indicate that the round-trip times between the different alternatives are within 10% of each other. The number of operating trains must be a whole number. For the purpose of this study, the longest round-trip time of 770 seconds has been used to establish the line capacities based on different operating fleet and headway scenarios. Assuming that a generic train car can carry 75 passengers, the line capacities for varying headways and train lengths are provided below:

Table 4.5-1 Estimated Line Capacities

NUMBER OF TRAINS	HEADWAY (SECONDS)	LINE CAPACITY 4-CAR TRAIN (PPHPD)	LINE CAPACITY 2-CAR TRAIN (PPHPD)	LINE CAPACITY 1-CAR TRAIN (PPHPD)
8	96.3	11,221	5,610	2,805
7	110.0	9,818	4,909	2,455
6	128.3	8,416	4,208	2,104
5	154.0	7,013	3,506	1,753
4	192.5	5,610	2,805	1,403
3	256.7	4,208	2,104	1,052
2	385.0	2,805	1,403	701
1	770.0	1,403	701	351

Source: Trifiletti Consulting, Raju Associates, 2018

Operating Fleet Scenario to Meet Anticipated Demands: The high ridership projections are used as the basis to determine the operating fleet; variation in the ridership over the day and/or special event duration is not considered at this stage of concept planning. This approach provides for robust concept planning, sufficient flexibility to respond to ridership refinement as better data and information is available, and establishes a conservative estimate for the fleet size, and capital and operations/maintenance costs. It establishes a conservative business case for evaluation in making appropriate project related policy decisions.

Table 4.5-2 Estimated Line Capacities

SERVICE	DEMAND (PPHPD)	NORMAL PLUS SPECIAL EVENT DEMAND (PPHPD)	OPERATING FLEET	CAPACITY PROVIDED (PPHPD)	NUMBER OF ANNUAL SERVICE HOURS
Normal Day	400	400	Operate 2-1 car trains at 385 s headways (total 2 cars operating)	701	3940
Small Events	870	1270	Operate 4-1 car trains at 192.5 s headways (total 4 cars operating)	1403	648
Medium and Large Events incl. Clipper Games	2012	2412	Operate 4-2 car trains at 192.5 s headways (total 8 cars operating)	2805	924
NFL Stadium Small Event	2735	3135	5-2 car trains operating at 154 s headways	3506	120
NFL Stadium Medium Event	6525	6925	5-4 car trains operating at 154 s headways	7013	48
NFL Stadium Game Day	8985	9385	7-4 car trains operating at 110 s headways (total 28 car operating fleet)	9818	160

Source: Trifiletti Consulting, Raju Associates, 2018

Based on the above analysis, the following assumptions are being used to develop rough order of magnitude costs and will support the next level of planning and project definition work:

- Fleet Size: 32 generic cars (28 operating fleet cars, plus 4 spare cars).
- Maximum Cruise Speed: At least 50 mph.
- Minimum Operating Headway: Not greater than 110 seconds.
- Maximum Round Trip Time: 770 seconds (12 minutes 50 seconds).
- Station Dwell Times: 30 seconds.
- Train Operations: Ability to operate different length trains from 1-car (approx. 45 feet long) to up to a 4-car train (approx. 175 feet long train).
- Operating Headways:
  - Normal Day and Weekend – no less frequently than 6 – 6 ½ minutes.
  - Special Events – no less frequently than between 1 ½ to 3 ½ minutes depending the special event.

5. INGLEWOOD TRANSIT CONNECTOR RECOMMENDED ALIGNMENT

The Market–Manchester Alignment (Alternative A) is recommended for further study, as the alternative would provide a direct connection between downtown Inglewood and the major activity centers. Alternative A presents the opportunity for integration with local economic activity, current and future transit-oriented development and other initiatives in the downtown/commercial district of Inglewood. This alternative would also minimize utility relocations, and construction impacts to the adjacent commercial and residential uses along the alignment.

The alignment is approximately 1.8 miles of dual-lane guideway with five anticipated stations. The anticipated stations were identified with the objective of serving traffic generators, current, proposed or potential, with an intuitive and convenient connection. The exact station locations and number of stations will be refined as part of the future environmental impact report (EIR) phase in coordination with the City, stakeholders and through the continuing public outreach process. At this time, the anticipated station locations are:

- Market Street/Downtown Inglewood Crenshaw/LAX Metro Station.
- Manchester Boulevard at or near Market Street.
- The Forum.
- Los Angeles Stadium and Entertainment District at Hollywood Park.
- Proposed Inglewood Basketball and Entertainment Center.

The other alternatives were not recommended for future consideration as they are fundamentally inconsistent with community goals. Alternative B would require one major transition from Florence Avenue onto Prairie Avenue that would potentially impact the Inglewood Cemetery and does not generate economic development opportunities within the City. Alternative C is located primarily on Arbor Vitae Street whose right-of-way ranges from 100 feet to 66 feet. This would potentially require acquisition of existing small businesses and possible neighborhood displacement. It would have adverse economic and fiscal impacts to local businesses along Arbor Vitae Street due to potentially reduced visibility, potential loss of on-street parking during construction and potential permanent removal of on-street parking spaces to accommodate the alignment. In addition to design challenges, Alternative D is located along a corridor that contains major utilities which may potentially pose significant conflicts that may require a major utility relocation effort or property acquisitions along Century Boulevard to avoid utilities.

Alternative D presents the opportunity to directly connect to a regional multimodal facility served by Metro's Crenshaw/LAX and Green Lines, various Metro and municipal bus lines, and the LAX APM system. However, to connect to the multimodal facility, the alignment would have to cross the I-405 on the south side of the LAX APM system. Crossing over the I-405 would require coordination with Caltrans, the Los Angeles Department of Transportation and Los Angeles World Airport and would pose design challenges as the transition from an elevated segment to a level sufficient under the I-405 may not be feasible due to the short distance available and the real estate constraint between Century Boulevard and the LAX LAMP Manchester Square development.

Table 5.0-1 presents key characteristics for each alternative. Summary of the key findings and conclusions of the screening analysis are listed below:

- For the Fixed Guideway Transit Alternatives, the preferred technology is an Automated People Mover technology, which could be rubber tired, steel wheel or monorail technology.
- All alternative alignments provide a comparable level of passenger service and convenience, including connectivity to Metro and the key traffic generators within the City.
- While alternatives A and D demonstrate the greatest ridership potential for "normal" non-event days, the degree to which each of the alternatives is able to relieve road-based congestion and improve overall air quality is generally comparable. The potential ridership for alternatives A and D have heavier ridership than the Alternatives B and C, however, challenges associated with Alternative D, including the utility relocation challenges, challenges with crossing the I-405 freeway, project costs,

- The total cost of ownership for Alternatives A and B is lowest, and is comparable. Because ridership potential is comparable, these two Alternatives offer the lowest cost per rider.

While each of the alternatives can be constructed, the impacts during construction, and the duration of construction varies. This relative measure of construction impacts is, in the context of this report, termed constructability. The impacts during construction are driven by 1) length of alignment, 2) extent of underground utility (which introduce conflicts to be resolved) and 3) traffic impacts due to construction work affecting roadways.

All alternatives traverse Prairie Avenue, as such it is the remaining segments of the alignment that are the differentiators. Alternative A has little or no major utility within the corridor, has a sufficiently wide right of way and the shortest alignment. Thus, it is best in terms of constructability. Alternative D (Century Boulevard) and Alternative C (Arbor Vitae Street) are the least attractive. While Century Boulevard is wide, there are major utilities along the corridor and a narrow sidewalk - this will likely impact the roadway travel lanes and possibly impact properties to place foundations and columns. Arbor Vitae Street is a narrow right-of-way, and will impact properties during construction and also traffic along a narrow right of way. Additionally, both alternatives cross the I-405 introducing construction logistical and traffic mitigation challenges. Alternative B, north of Prairie Avenue is a narrow right-of-way - during construction, impacts to the cemetery and the residences are expected. While Alternative B is more attractive than C or D, it is less attractive than Alternative A.

Underground options were preliminarily reviewed and discarded due to the significantly higher costs, but more importantly due to conflicts with the major underground utilities along Prairie Avenue - which is common to all alternatives. Transitioning from an underground to an elevated option along Prairie would cutoff major roadways at the transition - a fatal flaw to traffic circulation and capacity.

The Market–Manchester Alternative (Alternative A) performs well on a number of key measures including projected high annual ridership (2,578,120), minimal conflicts related to utility and construction impacts, and provides economic opportunities for downtown Inglewood.

Furthermore, based on outreach efforts conducted during the phase of study, stakeholders and representatives from local jurisdictions indicated their support for Alternative A. Initial stakeholder meetings were conducted, includiing meetings with the Inglewood City Council, block clubs, neighborhood watch groups, Inglewood Rotary, businesses, merchant groups, and early feedback has indicated support for Alternative A. As part of the environmental clearance process robust stakeholder outreach will be continued and conducted to help define the Inglewood Transit Connector Project, including project design, stakeholder locations, intermodal facilities, and over all interface with the City's major activity centers and pedestrian realm.

Therefore, it is recommended that the Alternative A: Market-Manchester, be advanced as the preferred alternative for further review as part of the environmental review process.

Table 5.0-1: Screening Results of the Inglewood Transit Connector Alternatives

	Alternative A: Market-Manchester Alignment	Alternative B: Fairview Heights Alignment	Alternative C: Arbor Vitae Alignment	Alternative D: Century Blvd Alignment
Length of System (approximately)	1.8 miles	2.2 miles	3 miles	3.1 miles
Connection to Metro	Yes at Downtown Inglewood Station	Yes at Fairview	Yes	Yes
Service to Key Venues	Comparable	Comparable	Comparable	Comparable
Right-of-way impacts/ability to resolve	Minimal	Potential impact to Inglewood Cemetery	Potential impacts to small businesses and residences	Property acquisitions likely due to major utility relocations
Potential impacts, based on available roadway width	Minimal	Potential impact to Inglewood Cemetery	Potential impacts to small businesses and residences	Property acquisitions likely due to major utility relocations
Utility Conflicts/ability to resolve with relocations	Minimal/Good	Minimal/Good (with potential impacts to Inglewood Cemetery)	Minimal/Good (with potential impacts to small businesses and residences)	Major/Limited (major utilities with impacts driving property acquisitions)
Annual Ridership	2,578,120	1,894,826	2,047,055	2,933,147
Passenger Convenience	Comparable	Comparable	Comparable	Comparable
Synergistic Economic Development within City	Good	Limited	Limited	Limited
Required Major Coordination Efforts	Coordinate with Metro	Coordinate with Metro	Coordinate with Metro, LAWA and Caltrans (I-405)	Coordinate with Metro, LAWA and Caltrans (I-405)
Estimate of Probable Capital Cost (2018 $) [1, 2]	$614.4M	$625.1M	$756.7M	$ 769.2M
Estimate of Probable Annual O&M Cost (2018 $) [3]	$18.2 - $19.5 M			

1. Right of way acquisition, environmental and physical mitigations, parking/intermodal center costs and costs of other infrastructure are not included since these are not defined and subject to impacts/influence from other city and regional transportation plans/studies.
2. Owner soft costs not included – Owner soft costs cover Owner's management costs including Owner retained consultants etc.
3. Assumes a Design-Build-Operate-Maintain delivery strategy with a 25-30 year term with Contractor responsible for all operations/maintenance of contractor delivered assets. Does not include cost of utilities or Owner soft costs.

Figure 5.0-3: Alternative A: Market-Manchester Alignment
Market Street, Looking West at Station

Source: Raju Associates, 2018

Intermodal facilities are preliminarily located at each end of the alignment, at Market Street and near the Prairie/Century intersection. The objective is to provide an opportunity for passengers on buses, shared ride vehicles, TNCs, and taxis to conveniently transfer to the APM system for the final journey into the City. This strategy is consistent with the objective of relieving traffic demands within the City's commercial district by providing a convenient transfer to the final destination. This also alleviates additional demand on real estate currently used for parking that can now be utilized for its highest and best use. The intermodal facilities will be appropriately sized to accommodate traffic projections that will vary based on special events and is likely to consist of a surface lot with convenient vehicle access and egress and curb cuts to facilitate short-term stopping to pick up or discharge passengers to and from the APM system. Specifics will be developed as part of the environmental impact report (ERI) phase of the Project and in coordination with the City, stakeholders and input from public outreach programs.

6. NEXT STEPS
7. FUNDING/FINANCING STRATEGY
8. PROCUREMENT STRATEGY

6. NEXT STEPS

The City will further define the Market-Manchester Alignment as the locally preferred alternative, and will now launch the environmental review process pursuant to the California Environmental Quality Act (CEQA). The specific configurations and station locations, intermodal facilities and other various technical and design characteristics will be identified and developed in coordination with the key City departments and stakeholders, including the community, residential, civic organizations, business groups and potentially impacted property owners. The project definition work and the environmental analysis will also include coordination with third-party agencies including but not limited to Metro, Los Angeles County Regional Planning and Public Works, Caltrans, SCAG, and the City of Los Angeles. Public engagement will continue throughout the environmental and public process.

To support the environmental and project delivery process, the City will conduct and include engineering and other technical studies and will continue to assess and identify potential project designs, environmental impacts, operational profiles, cost estimates, ridership and overall environmental benefits. This further analysis will supplement this report and produce more detailed project benefits and description designed to be fully integrated into the transit network and transportation system. Next steps include launching the environmental process pursuant to CEQA, which includes releasing the Notice of Preparation and commencing the preparation of a Draft Environmental Impact Report.

7. FUNDING/FINANCING STRATEGY

The Project shall seek funding as a special district and form an Enhanced Infrastructure Finance District (EIFD). The project shall seek the EIFD formation concurrently with the environmental process through CEQA and fulfill subsequent requirements of the EIFD along with the requirements of the environmental process. The City will also explore and seek all available public funds at the local, state and federal level, and will also develop innovative project delivery strategies to establish public-private partnerships and/or joint funding and development tools.

8. PROCUREMENT STRATEGY

The Metro study concluded and recommended a public-private-partnership/concessionaire strategy to deliver the project, primarily due to Metro's inability to fund the project, which is not included in either the Measure M Expenditure Plan or the Metro Long Range PTransportation Plan. It is critical to understand that such a strategy still requires the Owner to have sufficient debt capacity/revenue generation capacity/strategy to provide the back stop on the contract. Additionally, the City must consider its own strategy for entering into such a transaction, including but not limited to establishing a special purpose entity, or identifying policies to assure financing to support the back-stop on the contract. To that end, consultation with stakeholders, the City's legal counsel and policy makers is essential as the strategy is developed further for the City's locally preferred alternative for the Inglewood Transit Connector Project.

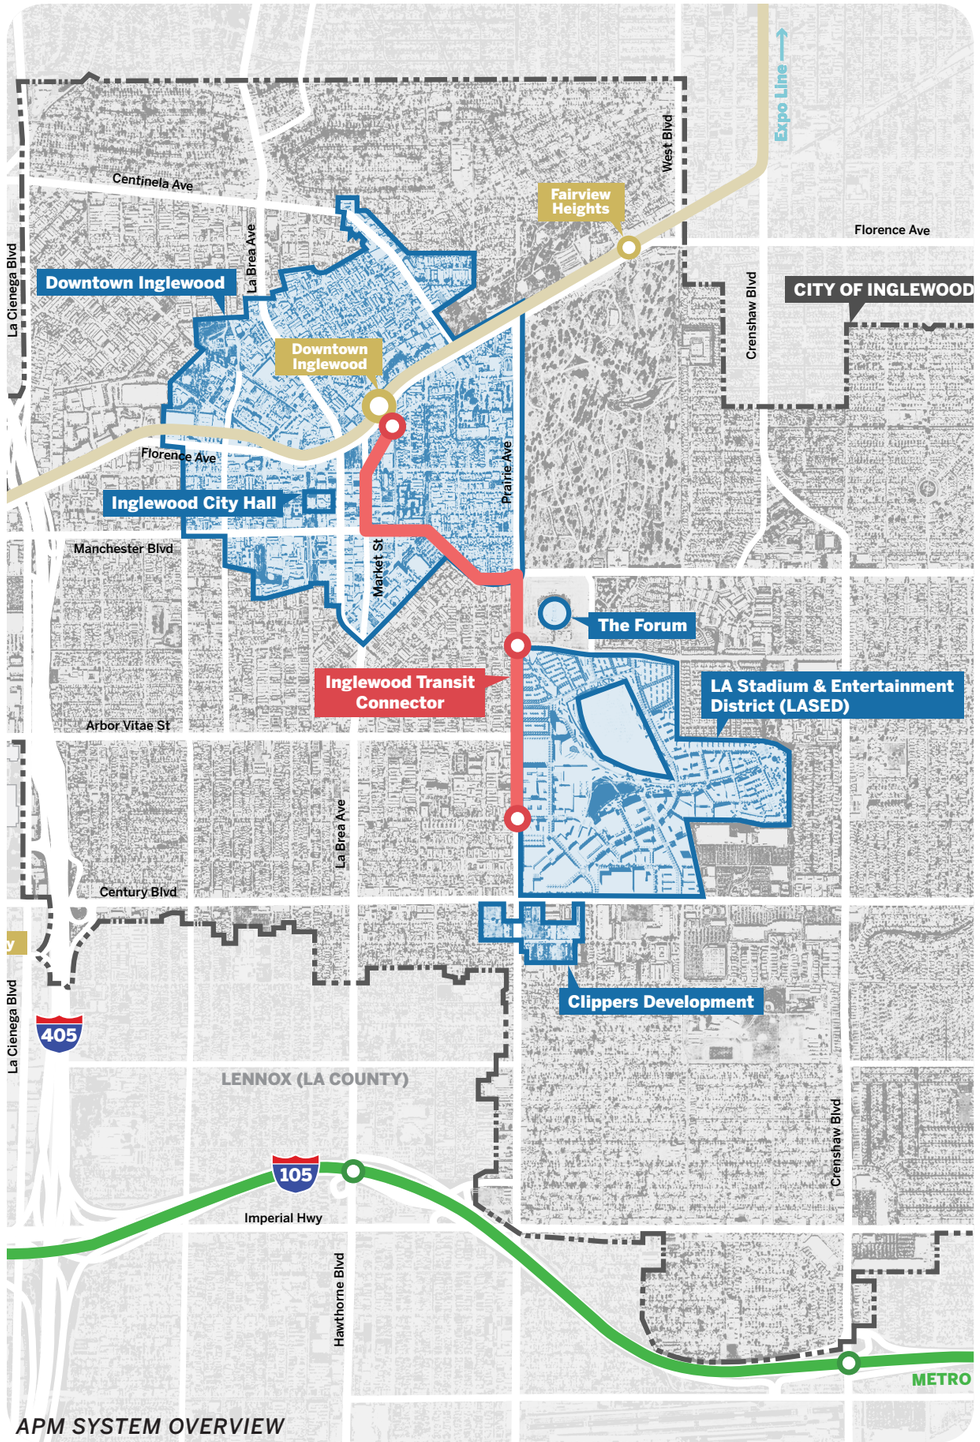
INTRODUCTION



INTRODUCTION

1.1 OVERVIEW AND PURPOSE

The Inglewood Transit Connector (ITC) Design Guidelines (Design Guidelines) establish the City of Inglewood's comprehensive vision for the transit experience to bring patrons to downtown Inglewood and the surrounding entertainment and business venues. These guidelines are intended to integrate the design of new and existing facilities and to create a passenger experience that reflects the City's history and architecture, while providing design guidance for the proposed ITC project. The Design Guidelines apply to all components of the ITC project which is comprised of, among other things, the Automated People Mover (APM) guideways, stations, support facilities, and parking areas. These guidelines also apply to areas of the public realm affected by the ITC project including streetscapes, roadways, landscape and hardscape areas.

The overall purpose of the Design Guidelines is to provide a framework for enhancing the experience in and around downtown Inglewood in a way that is consistent with both the existing urban context and future development vision. These guidelines encourage the development of sustainable and user-friendly spaces with a focus on unified high quality architecture and urban design. They will also shape a seamless interaction between a variety of users including pedestrians, cyclists, transit riders, and automobile drivers with an emphasis on the public experience. All guidelines listed are to be implemented to the extent feasible for the ITC project.

Design guidelines for the public realm govern streetscapes and other affected areas at the grade level. They establish the overall vision for public streets and spaces along the ITC project alignment right-of-way. They also establish aspirational goals for the look and feel of the development of existing and future projects on properties along the alignment. These guidelines are to be applied in conjunction with existing land use plans, specific plans and the City's urban design guidelines. In the event of any conflict or inconsistency, it is the City's intent that the ITC Design Guidelines shall control and supersede any such land use plans, specific plans, and/or urban design guidelines. In the absence of any conflict or inconsistency, design-related elements of such plans and guidelines will be considered and may be implemented to the extent feasible and in keeping with the overall project vision set forth in the ITC Design Guidelines.

APM SYSTEM OVERVIEW

INTRODUCTION
1.2 VISION AND GOALS

VISION

As the City of Inglewood continues to define itself as a world-class sports and entertainment center with both existing and new developments within the greater Los Angeles region, there are growing opportunities for the City to optimize the public experience by implementing smart transportation strategies.

By providing transit access from the LA Metro LAX/Crenshaw line to Inglewood's entertainment centers, the proposed Inglewood Transit Connector (ITC) will integrate the City of Inglewood with the greater Los Angeles region. The ITC is an elevated Automated People Mover system comprised of three stations that will serve as a distinctive and unified system befitting "The City of Champions."

GOALS

- Integrate with existing local communities, and harmonize new developments within the city.
- Optimize Inglewood's vehicular network by reducing future traffic congestion and alleviating growing demand on existing roadways.
- Enhance the public experience by facilitating ease of movement in and around Inglewood.
- Provide a distinct gateway that represents the spirit of Inglewood.
- Create attractive and functional streetscapes, roadways and pedestrian connections.
- Create a hierarchy of street level spaces that provide a rich and diverse variety of experiences.
- Deliver a project in accordance with the City of Inglewood's overall sustainability goals and objectives.

SIGNAGE | CITY OF INGLEWOOD

OLD HOLLYWOOD PARK

FOX THEATER

INTRODUCTION
1.3 AREA CONTEXT

Located near downtown Los Angeles, the Silicon Beach tech corridor, the Los Angeles International Airport and a substantial hotel, retail and business district, the City of Inglewood is well positioned at the center of renewed economic development in Southern California. The following are important projects recently completed, under construction or proposed within the City:

1.3.1 LOS ANGELES STADIUM AND ENTERTAINMENT DISTRICT (LASED) AT HOLLYWOOD PARK

The Los Angeles Stadium and Entertainment District (LASED) project, a new mixed-use, master planned community on the site of the former Hollywood Park Racetrack and Equestrian Center started construction in 2014 and is slated for completion by 2023. The project will transform underutilized asphalt lots and the former racetrack into a vibrant mixed-use community. The project includes a number of new uses including 2,500 residential units, 890,000 square feet of retail, 780,000 square feet of office and a 300-room hotel, as well as 25 acres of new recreational and park amenities for the City. At the centerpiece of Hollywood Park is the new $5 billion-dollar, 70,240 seat National Football League (NFL) SoFi Stadium to be shared by both the Los Angeles Rams and Los Angeles Chargers. The SoFi Stadium will host Super Bowl LVI in Winter 2022, the 2026 FIFA World Cup, and the 2028 Summer Olympic Games. The LASED project includes roadway infrastructure upgrades, modernized traffic systems with intelligent traffic signals(ITS), a state-of-the-art traffic management command center, and improvements at various intersections along Prairie Avenue and Century Boulevard.

1.3.2 THE FORUM

Constructed in 1967, the Forum is a multi-purpose indoor arena which for decades has served as one of the region's premier sports and entertainment venues. In 2014 the Forum completed a multi-million-dollar renovation and was added to the National Register of Historic Places. The Forum now actively hosts some of the largest entertainment programs in the country and is scheduled to host events during the 2028 Summer Olympic games.

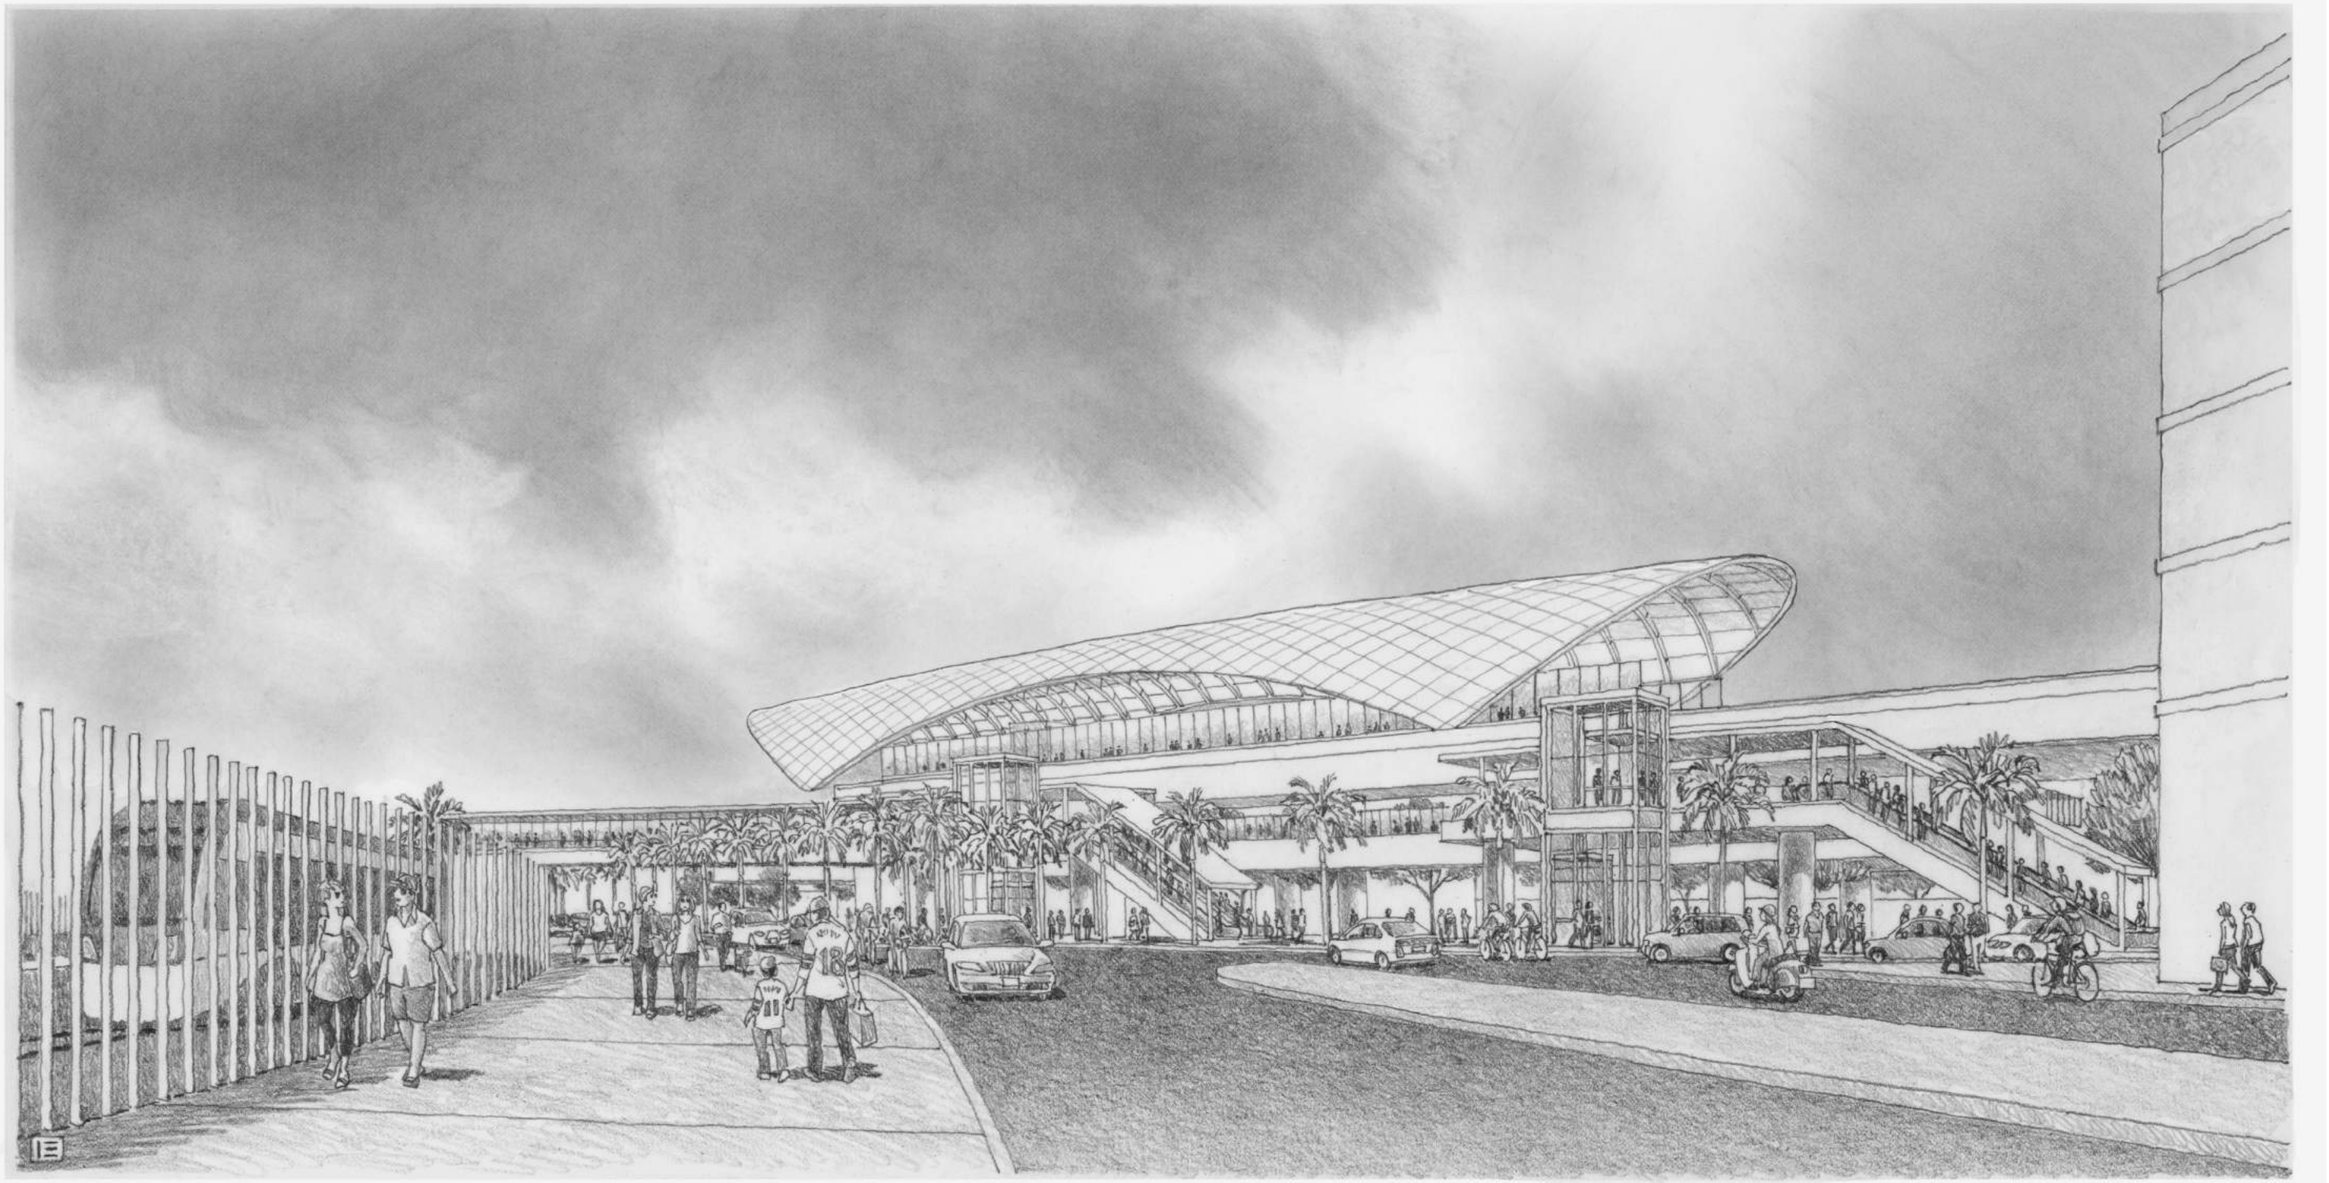
SOFI STADIUM

THE FORUM

1.3.3 INGLEWOOD BASKETBALL AND ENTERTAINMENT CENTER (IBEC)

In June 2017 the National Basketball Association's Los Angeles Clippers announced a proposal to construct a new arena and sports facilities in Inglewood designed to host the team's events and other non-sporting programs. In August 2020, the City approved the final environmental impact report for the Inglewood Basketball and Entertainment Center (IBEC). The IBEC project is located on approximately 27 acres and includes an 18,000 fixed seat arena, an approximately 85,000 square foot team practice and athletic training facility, approximately 55,000 square feet of LA Clippers team office space, approximately 25,000 square foot sports medicine clinic for team and potential general public use, approximately 40,000 square feet of retail and other ancillary uses that would include community and youth-oriented space, an outdoor plaza with an approximate area of 260,000 square feet including landscaping, outdoor basketball courts, outdoor community gathering space, and parking facilities sufficient to meet the needs of the proposed uses.

INGLEWOOD BASKETBALL AND ENTERTAINMENT CENTER



1.3.4 MARKET STREET

Inglewood is also working to revitalize its downtown in order to integrate with the future LA Metro Crenshaw/LAX station. The City is encouraging the design and development of new residential, mixed-use and retail projects on Market Street. In the late 1940s through the early 1960s, Inglewood's Market Street hosted Hollywood film premieres at several movie houses including The Fox Theater, The United Artist's Theater, and The Ritz Theater. Today's LA Metro Crenshaw/LAX line will stop in downtown Inglewood just blocks away from these historic structures. Classic theaters throughout Los Angeles are currently being re-energized as vital cultural venues and the same opportunity will now exist in Inglewood.

MARKET STREET

INTRODUCTION
1.3 AREA CONTEXT

PRAIRIE AVENUE AND PINCAY DRIVE

2.0
STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.1 STATION DESIGN

OBJECTIVE:

Stations will be strong architectural focal points and prominent design elements of the ITC Project. The stations will be:

- Identifiable
- Iconic
- Elegant

Station designs will be consistent in both form and function with adjustments as necessary to fit within each specific site. They will also be designed to accommodate adjacent existing local businesses and future developments along the APM guideway. In addition, designs will also accommodate a variety of passenger flows and demands within the stations themselves. The three station designs will enable ease of pedestrian movement both to and from the public realm:

- Market Street/Florence Avenue Station will include a connection from the LA Metro LAX/Crenshaw station.
- Prairie Avenue/Pincay Drive Station will provide service to both the Forum and LASED.
- Prairie Avenue/Hardy Street Station will provide service to LASED and the IBEC.

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.1 STATION DESIGN

GUIDELINES:

Massing

1. The form will be sleek and monolithic.

2. The design will be modern in style.

3. The station canopy will be the dominant architectural feature.

4. The station canopy will provide shade and protection from inclement weather while allowing for natural ventilation and daylight.

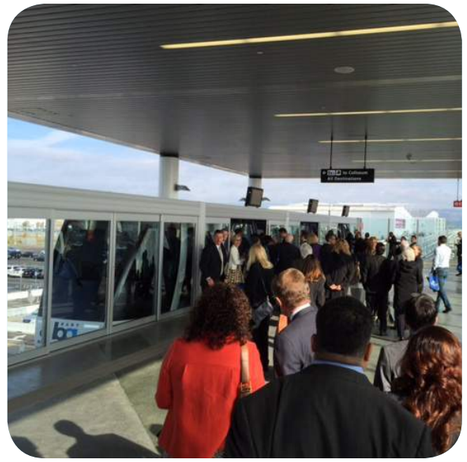
STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.1 STATION DESIGN

Platform and Mezzanine

1. Platform and mezzanine will include the following key areas:
   a. Fare collection
   b. Queuing space
   c. Places for respite
   d. Appropriately sized passenger horizontal and vertical circulation
   e. Operations spaces

2. Space layout will be intuitive, efficient, and ensure passenger safety.

3. Areas will be designated to accommodate graphics, wayfinding signage and/or advertising in a consistent and integrated manner.



4. The platform edge barrier will be transparent or partially open to protect passengers and the roadway below.

Passenger Circulation

1. Escalators will be transit grade and shielded from inclement weather.

2. Stairs will be provided and sized to meet passenger demand.

3. Elevators enclosures and cabs will be transparent, to the extent feasible, and will allow for clear and unobstructed views.

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.1 STATION DESIGN

Materials and Color Palette

1. Station superstructure may be constructed of exposed concrete or other attractive materials.

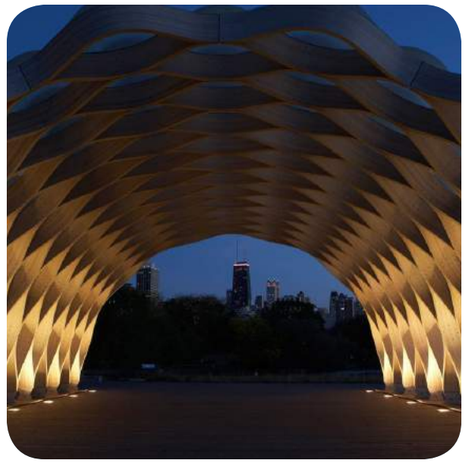
2. Canopy materials will be light in color to reduce the urban heat island effect.

3. The color palette will be neutral in tone with color accents as appropriate

4. Material surfaces will be low glare.

5. Materials that are accessible to the public.

6. Materials will be selected that require minimal maintenance and are resistant to graffiti and vandalism.



Lighting

1. Station canopies will have indirect accent lighting.

2. Lighting will clearly highlight pedestrian paths including those to stairs, escalators and elevators.

3. Accent and functional lighting will be strategically placed to minimize impacts on adjacent properties.

4. Accent and functional lighting controls will be programmable and sensor controlled to allow for various settings such as daytime, nighttime, and event lighting.

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.2 GUIDEWAY AND SUPPORT STRUCTURE DESIGN

OBJECTIVE:

The APM guideway is intended to be simple, elegant, and will be a unifying feature between stations. The guideway architecture will create a sense of movement that connects the stations.

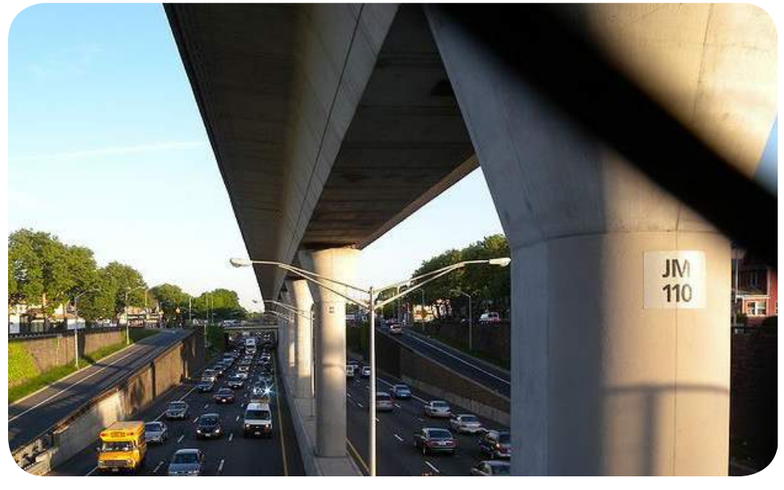
GUIDELINES:

Superstructure

1. Guideway superstructure, including bents and column supports will be designed to read as one family.
2. Guideway profiles will be streamlined and with a horizontal expression.
3. Edges will be minimal in thickness to reduce perceived mass.
4. Transitions at crossovers will be smooth and rounded, rather than angular and sharp (in plan view).
5. Guideway superstructure soffit will be smooth.
6. Conduits, guideway equipment, walkways, drainage systems, and other utilities will be concealed from public view to the extent feasible.

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.2 GUIDEWAY AND SUPPORT STRUCTURE DESIGN

Supports



1. Column form will be consistent, integrated with the guideway superstructure, and designed to read as one a family.

2. Column superstructure configuration is listed in order of preference.
   a. Center column superstructure
   b. Cantilevered superstructure
   c. Straddle bents

3. Column size, space, and span will be balanced and optimized such that:
   a. Minimal column size with consistent spacing is preferred .
   b. Maximum distance between columns is preferred in balance with the proportion of the depth of the beam.
   c. Eccentrically loaded columns will need to be oblong in shape.
   d. Column locations and sizes will accommodate traffic and pedestrian safety.

Materials and Color Palette

1. Guideway superstructure may be exposed structural concrete.

2. Color palette will be neutral in tone and complement the station palette.

3. Materials will be resistant to graffiti and vandalism in areas accessible to the public.

Lighting

1. Where provided, guideway indirect accent lighting will complement station lighting design.

2. Light fixtures will be concealed or minimally visible to the extent feasible.

3. Accent and functional lighting will be strategically placed to minimize spillover to adjacent properties.

4. Code required lighting along the guideway will be designed to minimize visibility from the ground level.

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.3 MAINTENANCE AND STORAGE FACILITY

OBJECTIVE:

The Maintenance and Storage Facility (MSF) will be easily-accessible by employees who serve and maintain APM trains.

GUIDELINES:

Massing

1. Massing and height will be minimized to the extent feasible and the minimum height will be derived from the function and program of the facility.

2. Rooftop equipment will be fully screened.

Materials and Color Palette

1. Transparent glazing shall be provided, maximizing daylight to the extent feasible.

2. Color palette to be uniform and neutral in tone with accent colors where appropriate

3. Material surfaces to be low glare.

4. Materials will be selected that require minimal maintenance and are resistant to graffiti and vandalism.

5. Roof surface will be light in color to reduce the urban heat island effect.

Lighting

1. Where provided, functional lighting will be placed to minimize spillover to adjacent properties.

2. Building entrances will be well lit.

3. Lighting will clearly highlight pedestrian paths including those to ramps, stairs, escalators and elevators.

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.4 PASSENGER WALKWAY

OBJECTIVE:

Passenger walkways, where required, will be designed to provide clear and direct access from neighboring developments to the APM station(s).

GUIDELINES:

Massing

1. Walkways will be:
   a. Functional and simple in form.
   b. Complementary to the overall APM system design and visually integrated with the stations.
   c. Naturally ventilated while providing protection from wind driven rain, and sun.
   d. Transparent, providing natural daylight and views for pedestrians moving to and from the stations.
   e. Designed to include transparent or partially open screen walls of appropriate height to ensure the safety of pedestrians and the roadway below.

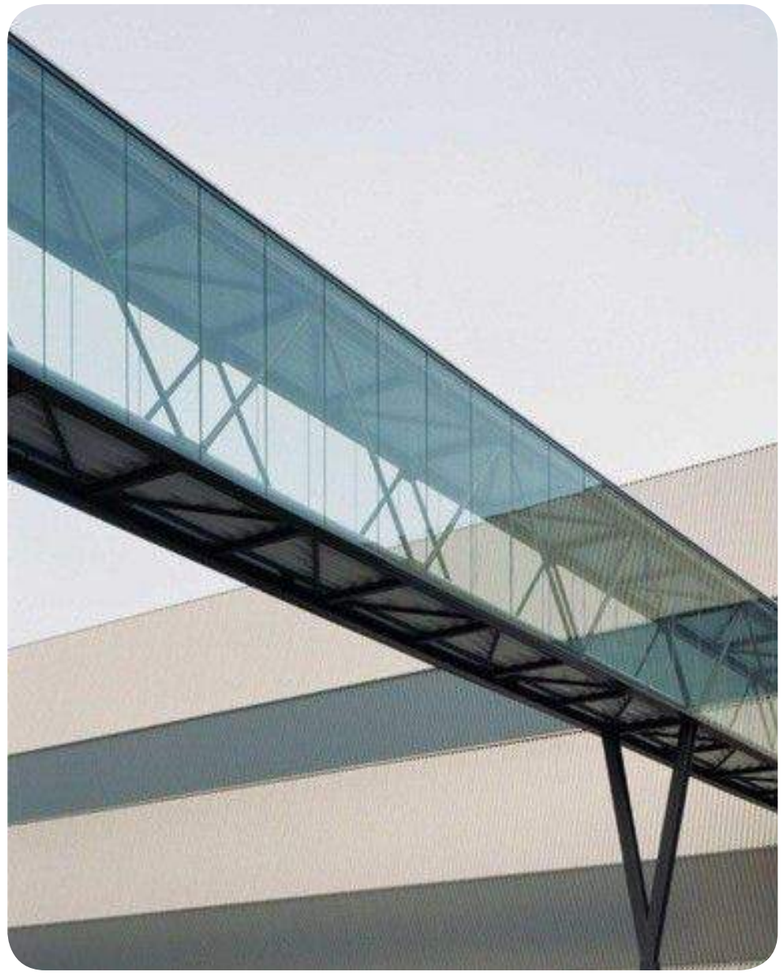
STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.4 PASSENGER WALKWAY

Materials and Color Palette

1. Walkways will be able to accommodate graphics, wayfinding signage and/or advertising within designated areas.

2. Color palette to be uniform and neutral in tone with color accents where appropriate.

3. Material surfaces will be low glare.



4. Materials that are accessible to the public will be resistant to graffiti and vandalism.

Lighting

1. Overall Lighting design will not interfere with roadway traffic below.

2. Accent lighting will complement station lighting design.

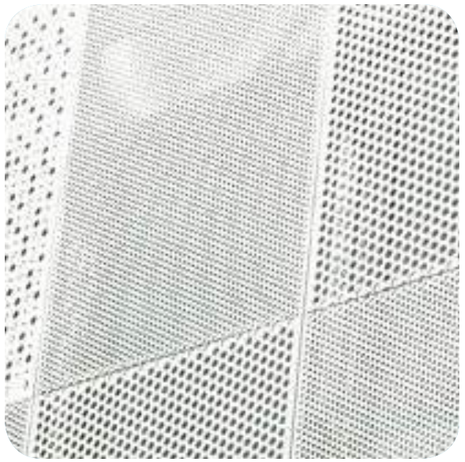
3. Accent and general lighting controls will be programmable and sensor controlled to allow for daytime, nighttime, and event settings.

STATIONS, GUIDEWAYS AND RELATED BUILDING ELEMENTS
2.5 OTHER ARCHITECTURAL ELEMENTS

WALLS AND FENCES
OBJECTIVE:

Walls and fences for security and screening purposes as required will balance functionality with aesthetics to create an attractive environment.

GUIDELINES:



1. Decorative security walls and fences will be selected to screen and protect elements as required and will:
   a. Enclose equipment to minimize visual exposure to the public.
   b. Allow for space around equipment required for operations.

2. Screening and Security Fencing to be chosen from a set of options previously approved by the City of Inglewood.

3. Long expanses of walls and fences will be broken up with textural or recessed elements, landscape pockets, or changes in material.

4. Landscape elements are to be used in combination with walls and fences, but not in lieu of, where appropriate.

3.0 PUBLIC REALM AND STREETSCAPE GUIDELINES

PUBLIC REALM AND STREETSCAPE

3.1 General Public Realm and Streetscape Guidelines

OBJECTIVE:

Implement complete street design on areas that are adjacent to APM Guideway alignment. Accommodate all modes of transportation on streets, with particular attention to public transit vehicles and pedestrians. Provide places where people can gather and opportunities for activation of local businesses on adjacent parcels.

GUIDELINES:

1. Streetscape adjacent to APM stations will support significant pedestrian flows and provide easy access to local businesses.

2. Urban amenity areas will be designed to allow for places to sit and gather, and encourage social interaction.

3. Sidewalks will be lined with trees, where possible, to provide shade and create a comfortable, walkable pathway.

4. Future developments that are adjacent to APM stations will be easy to access and have attractive pedestrian connections.

PUBLIC REALM AND STREETSCAPE
3.2 STREETSCAPE

OBJECTIVE:

Streetscapes include roads, sidewalks, furnishings, lighting, landscapes and other open space amenities which combine to define the character of the street. At Market Street, Manchester Boulevard and Prairie Avenue, the ITC project will create a spacious public realm with wide sidewalks, planting areas and amenity zones that can accommodate large volumes of pedestrian traffic.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.1 SIDEWALKS

OBJECTIVE:

The sidewalk is a fundamentally important space within a neighborhood. The sidewalk represents the pedestrian realm and is located between the street curb and the property line. The primary function of the sidewalk is to provide a safe and accessible means of travel for pedestrians. The secondary function is to provide a vibrant place where people can enjoy the urban environment.

GUIDELINES:

1. Sidewalks will be sized to accommodate a wide variety of pedestrian traffic.

2. Pavement material and finish to be consistent with City of Inglewood's Public Works standards.

3. Beyond the typical standard, alternate paving typologies may be considered as follows:
   a. Unique paving patterns at areas of interests.
   b. Variations in paving material to help to define separation of spaces.
   c. Simple variations in concrete surfacing and textures.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.2 PLAZA AND OTHER URBAN AMENITY AREAS

OBJECTIVE:

The project should encourage the development of plazas and other urban amenity areas to the extent feasible. A plaza is an open area located in an urban context that encourages public gathering. Smaller underutilized spaces, contiguous to the sidewalk, provide additional opportunities for seating and other amenities.

GUIDELINES:

1. Plazas will feature landscape and seating elements.

2. Plazas will accommodate flexible opportunities for retail and other local businesses.

3. Urban amenity areas which are smaller than plazas have the same programmatic options but will not include as wide a range of uses.

4. Urban amenity areas will respond to their particular context and maximize available space in order to have the most beneficial impact on the streetscape and public realm.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.3 LIGHTING

OBJECTIVE:

Street lights are essential for creating a lively and safe nighttime environment. Street lights should be dual-purpose and provide lighting for the roadway and pedestrian-scale lighting for sidewalks as applicable.

Pedestrian lighting creates a more comfortable level of light for pedestrians and contributes to the overall experience and identity of the street. It also improves security and safety by properly illuminating sidewalks, curb ramps, barriers and informational signage for users.

GUIDELINES:

1. City of Inglewood's requirements for street and pedestrian lighting will be followed.

2. Along primary pedestrian circulation routes, light fixtures and incidental light sources will provide a continuous light level of 3-foot candles to help pedestrians better distinguish color, size, and shape.

3. Any unique lighting effects created by guideways and stations must be considered and street and pedestrian lighting will be designed to consistently meet the standard of lighting established by City of Inglewood requirements.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.4 STREET TREES

OBJECTIVE:

Street trees and integrated landscaping foster an attractive, comfortable, and walkable environment. Trees add value by cooling down streets and sidewalks on hot days, providing zones for respite, improving air quality, and assisting with reduction of embodied carbon and stormwater runoff.

GUIDELINES:

1. Trees will be planted on both sides of the roadway where possible to create an allee.

2. Trees will be positioned at regular intervals relative to APM guideway column supports to create a consistent rhythm.

3. Within each median, below the APM guideway at Market Street, a combination of street trees and plantings will be provided. They will be composed in a manner that responds to the guideway support and any other streetscape elements.

4. City of Inglewood's approved street tree list will be used as a basis for all sections.

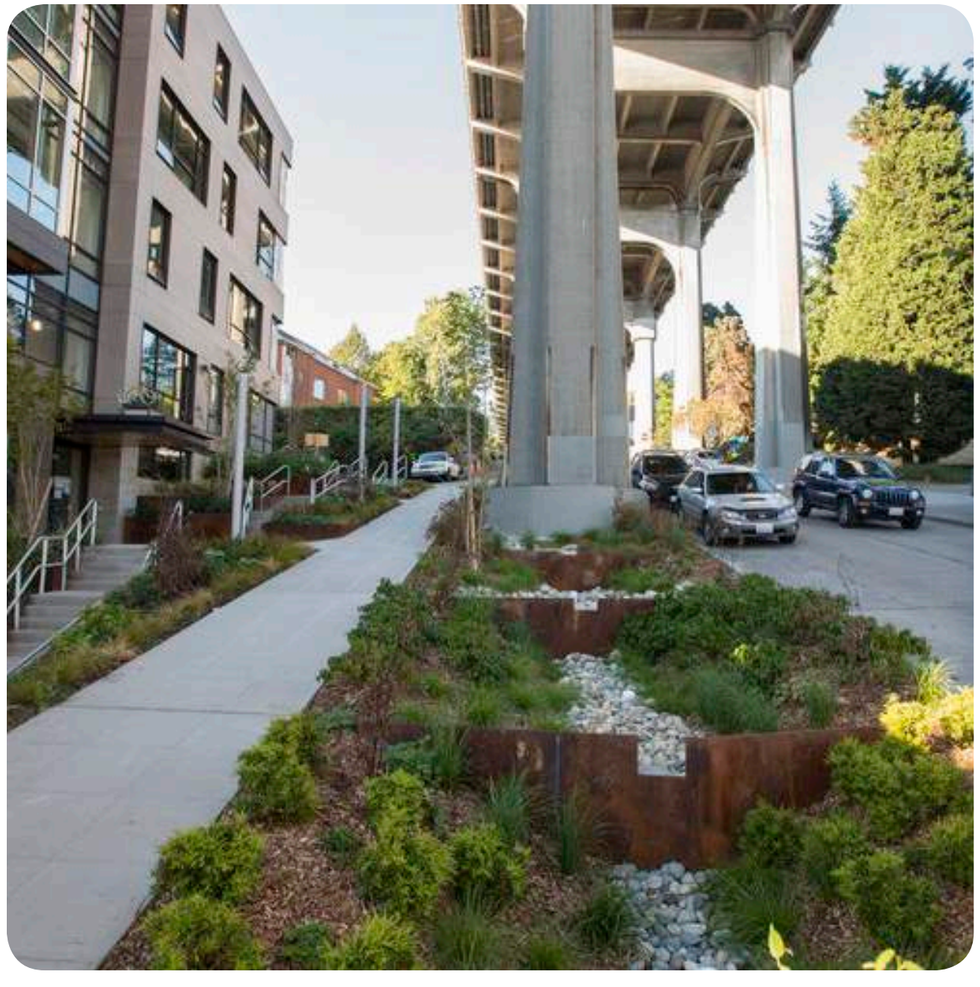
5. Trees that can flourish in areas of heavy shade created by the APM guideway will be prioritized.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.4 STREET TREES (CONTINUED)

6. Trees that allow for visibility to the other side of the street will be part of the selection criteria.



7. An arborist report surveying the health of all existing trees along the length of the APM Guideway will be required.

8. Where feasible, existing trees will remain.

9. The quantity and species of existing trees removed by the ITC Project will be replaced in accordance with the City's current landscape guidelines.

10. Protected species in the Inglewood Municipal Code, Tree Preservation will remain.

11. City of Inglewood guidelines for tree spacing will be followed, considering species of trees and the desired canopy coverage.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.5 PLANTINGS

OBJECTIVE:

Install small scale landscape adjacent to streets in planting zones to help soften the street corridor and provide clear separation between pedestrians and vehicular traffic.

GUIDELINES:

1. A combination of plants will be used to create seasonal horticultural “events”, visual interest and texture on the ground plane.

2. Planting zones will capture stormwater runoff where feasible, and allow for infiltration into the ground.

3. Pass-through and step out areas between planting zones should be paved with permeable pavers to allow for water infiltration where feasible.

4. At planting zones within or adjacent to publicly occupied spaces, plants that are potentially hazardous to pedestrians and pets will not be utilized.

5. Selected plants will tolerate radiant heat from the sidewalk or street surface.

6. Low maintenance and drought tolerant plants will be prioritized, particularly those that do not require irrigation upon maturity.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.6 IRRIGATION

OBJECTIVE:

The design and installation of supplemental irrigation systems will be necessary for the establishment of new trees and plantings.

GUIDELINES:

1. Irrigation will conform to the City of Inglewood water conservation requirements.

2. Irrigation will be installed at all trees and planting zones.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.7 SITE FURNISHING

OBJECTIVE:

Street furnishings along Market Street, Manchester Boulevard, and Prairie Avenue contribute to an improved street life, providing places for respite, interaction, and comfort. They also encourage socialization and increase enjoyment of the urban environment. The aesthetic qualities of furnishings will complement each other and visually reinforce the overall design of the streetscape.

GUIDELINES:

1. Seating may be provided in areas with high concentrations of pedestrian activity.

2. Seating will be integrated with raised planter beds where appropriate.

3. Seating will be designed to accommodate transit users and will be provided at transit stops.

4. Seating will be designed and configured to discourage loitering.

5. Waste and recycling receptacles will be located at pedestrian walkways, seating areas, transit stops, public plazas, and other pedestrian gathering areas.

3.2 STREETSCAPE

3.2.7 SITE FURNISHING (CONTINUED)

6. Waste and recycling receptacles will be placed close to the street on the sidewalk, ideally in immediate proximity to each intersection with at least one receptacle per intersection provided.

7. Additional receptacles in pass-through zones are encouraged on high-traffic and retail streets.

8. All trash receptacles must be covered.

9. Bike racks must be durable and sturdy and designed to enable both wheels of a bicycle to be safely secured.

10. Bike racks will be located along walkways, near building entrances, intersections, transit stations, bus shelters, and any other pedestrian gathering areas, to the extent feasible.

PUBLIC REALM AND STREETSCAPE

3.2 STREETSCAPE

3.2.8 PARKING LOTS

OBJECTIVE:

Surface parking lots located on Market Street and Manchester Boulevard will be attractive and well-lit. Plants will be incorporated to provide shade and decorative separation of spaces, to the extent feasible. Trees and plantings cool the parking lot surface during warm days, reduce stormwater runoff, and beautify the parking lot area.

GUIDELINES:

1. Distinctive markings and wayfinding elements that ensure clear separation between pedestrians and vehicles will be provided where feasible.

2. Emergency call boxes will be incorporated.

3. Permeable concrete or permeable pavers will be used at parking stalls at surface parking lots. Asphalt will be used at drive aisles.

4. Planting zones will be provided to separate parking stalls from sidewalks,

5. Trees will be planted at a minimum ratio of one tree per 10 parking spaces, not including the trees along the street edge of the parking lot.

6. Landscaping should be spaced so as not to obstruct traffic or obscure visibility.

4.0 SUSTAINABILITY

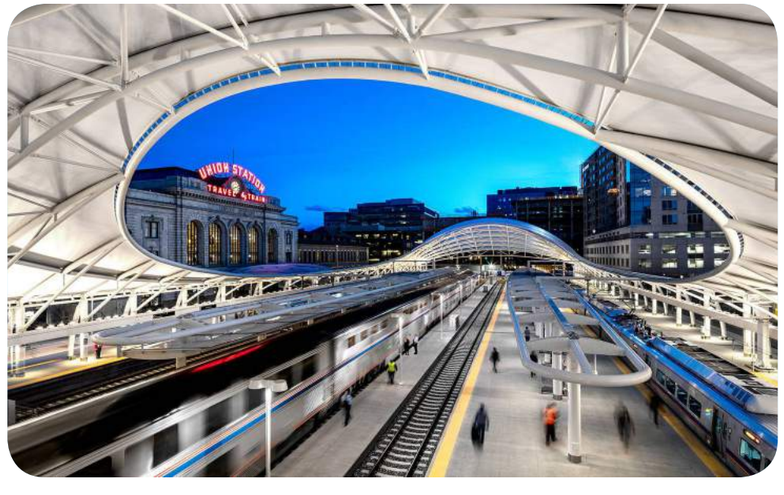
SUSTAINABILITY

4.1 PURPOSE AND APPLICABILITY

The sustainability guidelines establish a list of green measures to be incorporated into the design, construction, and operation of facilities of the ITC. The ITC project will be designed and constructed to achieve Silver Award Certification under the Envision™ Sustainable Infrastructure Rating System.

In addition, the guidelines below identify the City's applicable sustainability priorities for the ITC project. These priorities should be incorporated as much possible into the project design while achieving the required Envision Silver Award certification.

These guidelines apply to all components of the ITC project including the APM guideway and stations, passenger walkways and the MSF. A life cycle assessment (LCA) may be conducted to compare various design alternatives to identify the lowest impact approach.



SUSTAINABILITY
4.2 GENERAL GUIDELINES
4.2.1 INTEGRATED DESIGN

GUIDELINES:

The ITC project should use an integrated design approach to arrive at design decisions. Integrated design brings together all major design disciplines including architecture, planning, structural, landscape, mechanical, electrical and plumbing and other specialties in order to collaborate in the most effective way to meet programmatic goals with lowest feasible lifecycle environmental impacts. Design teams should also consider including representatives from facilities maintenance and future users to make informed decisions about how projects will be used and maintained.

SUSTAINABILITY
4.2 GENERAL GUIDELINES
4.2.2 SITE DESIGN

The following is provided for reference only. Please keep the components of this section in mind during the development of the project. The designer shall report on which of the components can be achieved in accordance with, or in addition to, the required Envision Silver Award certification.

OBJECTIVE:

While the core of the ITC project is anchored in public transportation, the project should also facilitate the use of other low impact forms of transportation such as walking, bicycling, carpooling, and the use of electric and alternative fuel vehicles.

To facilitate this objective, stairways and pedestrian pathways should be designed to be easily identified, accessible, comfortable and visually appealing. Similarly, bike parking, carpool parking, electric vehicle charging stations and public transportation connections should be convenient and easy to locate.

The ITC project should also incorporate landscaped outdoor spaces and to reduce heat island impacts. Reductions could be achieved by reducing hardscape areas and increasing landscape. Landscaped areas can serve to reduce heat island effects while also functioning as stormwater detention and treatment. Other strategies for heat island reductions include the use of cool roof materials and light colored construction materials.

SUSTAINABILITY

4.2 GENERAL GUIDELINES

4.2.2 SITE DESIGN

SITE PLANNING TABLE

	GUIDELINES	APM GUIDEWAY & STATIONS	MSF	TRANSIT CENTER
01	Provide vegetated open space equal to 30% of the total project site area (including building footprint), with a minimum of 25% of that outdoor space being vegetated or having overhead vegetated canopy.	M	M	M
02	Implement strategies to reduce impact from storm water runoff for at least the 85th percentile of regional or local rainfall events using low-impact development (LID) and green infrastructure. Project must conform with City of Inglewood LID standards	F	M	M
03	Drainage systems designs must manage and capture Stormwater runoff to the maximum extent feasible through, in order of priority: infiltration, evapotranspiration, capture and use, and treatment with a high removal efficiency biofiltration/biotreatment system.	M	M	M
04	Provide secure bicycle parking for 5% of tenant-occupied motorized vehicle parking capacity, with a minimum of one space, and locate bicycle storage within 200 yards from a bicycle network that connects to services that are within a 3-mile bicycling distance of the project boundary.	F	F	F
05	Provide changing/shower facilities to support bicycle commuting. Provide at least one on-site shower with changing facility for the first 100 regular building occupants and one additional shower for every 150 regular building occupants thereafter.	N/A	F	N/A
06	Designate 5% of all parking spaces used by the project as preferred parking for green vehicles, including low-emitting, fuel-efficient and carpool/van pool vehicles.	M	M	M
07	Provide infrastructure including electrical system capacity and raceways for future electric charging stations for 10% of total parking spaces.	M	M	M
08	Provide vegetative or man-made shading devices for all fenestration on east-, south-and west-facing walls.	M	M	M
09	For opaque wall areas use wall surfacing with solar reflectance index (SRI) 25 (aged), for 75% of opaque wall areas	M	M	M
10	Reduce heat island effect- Hardscape per City of Inglewood EECAP. Use one or a combination of strategies 1 through 4 for 75% of site hardscape: Provide shade trees (mature within 5 years of occupancy). Use light-colored materials with an initial solar reflectance value of at least 0.30. Use open-grid pavement system or a pervious or permeable pavement system. Use solar panel arrays to create a canopy shade system.	M	M	M
11	Reduce heat island effect per City of Inglewood EECAP. Use roofing materials having a minimum 3-year aged solar reflectance and thermal emittance or install a roof with a thermal mass over the roof membrane, including areas of vegetated (green) roofs	M	M	M
12	Energy systems will be monitored through a Building Management System (BMS) and submetering, resulting in an integrated energy management system.	M	M	M

M= Mandatory, F= If Feasible, N/A= Not Applicable, Y= Yes, N= No

SUSTAINABILITY
4.2 GENERAL GUIDELINES
4.2.3 ENERGY EFFICIENCY

The following is provided for reference only. Please keep the components of this section in mind during the development of the project. The designer shall report on which of the components can be achieved in accordance with, or in addition to, the required Envision Silver Award certification.

OBJECTIVE:

The purpose of this section is to achieve energy efficiency and maximize the use of renewable energy in the project above and beyond minimum code requirements.

GUIDELINES:

Where California Energy Efficiency Standards apply, the project should be 15% more energy efficient than allowed. For energy-using equipment not governed by California Energy Efficiency Standards, best available energy efficient technologies should be used. Advanced commissioning of building systems should be conducted to ensure systems are operating as designed.

To achieve energy use reduction, passive strategies taking advantage of the favorable local climate should be considered where feasible. The use of solar canopies as shade structures in addition to roof-mounted solar is another energy saving strategy.

SUSTAINABILITY

4.2.5 MATERIAL CONSERVATION AND RESOURCE EFFICIENCY

The following is provided for reference only. Please keep the components of this section in mind during the development of the project. The designer shall report on which of the components can be achieved in accordance with, or in addition to, the required Envision Silver Award certification.

OBJECTIVE:

In order to reduce the environmental impact from the use of construction materials, the project should minimize the use of virgin materials. This can be accomplished by increasing the use of materials that are: reused, recycled, rapidly renewable, locally sourced, and durable. In order to determine the best approach to reducing the overall environmental impact from use of materials, a life cycle assessment (LCA) could be used.

SUSTAINABILITY

4.2 GENERAL GUIDELINES

4.2.5 MATERIAL CONSERVATION AND RESOURCE EFFICIENCY

MATERIAL CONSERVATION AND RESOURCE EFFICIENCY TABLE

	GUIDELINES	APM GUIDEWAY & STATIONS	MSF	TRANSIT CENTER
01	Select building materials or products for permanent installation on the project that have been harvested or manufactured in California or within 500 miles of the project site. Select building materials or products for permanent installation on the project that have been harvested or manufactured in California or within 500 miles of the project site.	F	F	F
02	Divert construction and demolition debris from the landfill. All projects must divert at least 75% of construction and demolition debris and 100% of uncontaminated land clearing debris (green waste, soil, rocks).	M	M	M
03	An end-of-life plan, including deconstruction & reusability/recyclability of materials, will be developed.	M	M	M
04	At least 50%, with a goal of 95% , of operational waste will be diverted from landfill through robust recycling and e-waste infrastructure.	M	M	M
05	Use rapidly renewable materials made from plants harvested within a ten-year cycle.	F	F	F
06	Use salvaged, refurbished, refinished or reused materials.	M	M	M
07	Use materials, equivalent in performance to virgin materials, with a total (combined) recycled content value (RCV) of not be less than 15% of the total material cost of the project.	F	F	F
08	Use concrete made with recycled content such as fly ash or slag.	M	M	M
09	Use concrete made with recycled aggregate.	M	M	M
10	Conduct a whole building life cycle assessment, including operating energy, showing at least 10% improvement above baseline building.	F	M	F

M= Mandatory, F= If Feasible, N/A= Not Applicable, Y= Yes, N= No

SUSTAINABILITY
4.2 GENERAL GUIDELINES
4.2.6 ENVIRONMENTAL QUALITY

The following is provided for reference only. Please keep the components of this section in mind during the development of the project. The designer shall report on which of the components can be achieved in accordance with, or in addition to, the required Envision Silver Award certification.

OBJECTIVE:

The project will provide a high quality, sustainable indoor environment that protects and enhances the health and comfort of occupants.

GUIDELINES:

Regularly occupied spaces should be designed to maximize natural daylighting and views of the outdoors. Individual occupant comfort should be considered by maximizing the use of individual controls in thermal and lighting systems. Indoor spaces should use high efficiency air filtration and should create a comfortable indoor acoustical environment. Materials and systems should be selected that will provide for a healthy indoor environment including considerations of off-gassing.

SUSTAINABILITY

4.2 GENERAL GUIDELINES

4.2.6 ENVIRONMENTAL QUALITY

ENVIRONMENTAL QUALITY TABLE

	GUIDELINES	APM GUIDEWAY & STATIONS	MSF	TRANSIT CENTER
01	Provide temporary ventilation during construction in accordance with Section 121 of the California Energy Code, CCR, Title 24, Part 6 and Chapter 4 of CCR, Title 8.	M	M	M
02	If the HVAC system is used during construction, use return air filters with a MERV of 8.	M	M	M
03	Flush out the building with outside air prior to occupancy or perform Indoor Air Quality (IAQ) testing prior to occupancy.	M	M	M
04	Cover duct openings and protect of mechanical equipment during construction.	M	M	M
05	Select adhesives, adhesive bonding primers, adhesive primers, sealants, sealant primers and caulks that comply with local or regional air pollution control or air quality management district rules where applicable or SCAQMD Rule 1168 VOC limits.	M	M	M
06	Install low emitting carpet, carpet cushion and carpet adhesive in the building interior to meet the requirements of the Carpet and Rug Institute's Green Label program.	M	M	M
07	Use materials with no added urea formaldehyde including insulation, wood products, particle board, fiberboard, and adhesives.	M	M	M
08	Install entryway systems to prevent contaminants from entering buildings.	F	M	M
09	In mechanically ventilated buildings, provide regularly occupied areas of the building with air filtration media for outside and return air prior to occupancy that provides at least a MERV of 13.	M	M	M
10	Install CO2 monitors in regularly occupied areas.	M	M	M
11	Design for thermal and lighting comfort by providing for individual work spaces to control their own environment and for the majority of shared spaces to have independent lighting and thermal controls.	N/A	M	N/A
12	Provide daylit spaces for building occupants.	N/A	M	M
13	Design exterior wall and roof-ceiling assemblies for buildings exposed to a noise level of 65 dB Leq-1Hr during any hour of operation shall have exposed to the noise source meeting a composite STC rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30).	M	F	M
14	Wall and floor-ceiling assemblies separating tenant spaces and tenant spaces and public places shall have an STC of at least 40.	N/A	F	M
15	Install HVAC and refrigeration equipment that does not contain HCFCs.	M	M	M

M= Mandatory, F= If Feasible, N/A= Not Applicable, Y= Yes, N= No

5.0 IMPLEMENTATION PROCESS FOR SPECIFIC PROJECT DESIGN AND REVIEW

IMPLEMENTATION PROCESS FOR SPECIFIC PROJECT DESIGN AND REVIEW

5.1 APPLICABILITY

APPLICABILITY:

The ITC Design Guidelines shall only apply to the ITC system (as defined in Chapter 1 of the ITC Design Guidelines). Additionally, the ITC Design Guidelines shall be taken into the consideration by the City (including, without limitation, its Public Works Department and Planning and Building Safety Divisions) when reviewing other, non-ITC projects located within or adjacent to the Transit Corridor Overlay Zone areas to the maximum extent feasible as part of the review process(es) applicable to such project pursuant to the City's Municipal Code.

5.2 AUTHORITY AND IMPLEMENTATION

AUTHORITY AND IMPLEMENTATION:

The Public Works Director or his/her designee shall, in consultation with the Planning Division Manager or his/her designee, have the authority to review each ITC system project for compliance with all applicable provisions of (i) the ITC Design Guidelines, (ii) all additional technical, aesthetic, and other specifications contained in the procurement document(s) for the applicable ITC system component(s), and (iii) all requirements of the Mitigation Monitoring and Reporting Program set forth in the ITC's Final Environmental Impact Report.

[Note: Additional details regarding review timelines and other submittal requirements are in the process of being developed by the Department of Public Works, in consultation with other City departments and its consultant team. Chapter 5 will be supplemented with these additional details when available.]

ATTACHMENT: Construction Phasing 20

2.6.1. CONSTRUCTION SCENARIOS

2.6.1.0 Construction Phases:

Construction of the proposed Project would occur in four phases throughout a five-year period between 2022 and 2026. The first phase of construction would be the demolition of the commercial property for the Market Street Station, for the Vons and gas station on Manchester, and for the commercial building on the southeast corner of Manchester and Market Street. The phase will also include the start of the MSF structure; this construction would begin at the end of 2023 and finish by the end of 2023. The second phase of construction would occur along Prairie Avenue from Hardy Street to Manchester Boulevard; this construction would begin early 2023 and finish early 2025. The third phase of construction would occur along Manchester Boulevard from Prairie Avenue to Market Street, and Market Street from Manchester Boulevard to Florence Avenue; this construction would begin early 2024 and finish early 2026. The fourth phase of construction would occur along the entire length of the alignment and primarily incudes installation of the Automated People Mover (APM) System's operations, and testing and commissioning; this work would begin mid- 2023 and finish by approximately mid-2026; the initial activities for phase four (The manufacturing of the APM Operating System) would occur off-site with on-site activities beginning to occur towards the end of the phase one construction when sufficient aerial structure is available for the installation of the equipment.

In order to meet schedule constraints, multiple project phases mentioned above may be under design and construction concurrently to meet the requirements of a design-build delivery strategy. Construction of the proposed Project is contingent on Project approvals, which are projected to be obtained in 2021. The general sequence of construction developed for analysis in this environmental impact report (EIR) represents the best available information.

Due to site constraints, primarily along Prairie Avenue and Manchester Boulevard, just-in-time deliveries of construction materials would be required during off-peak hours and / or night hours. Additionally, construction of the APM guideway, columns and station components that could impact Prairie Avenue and Manchester Boulevard would be primarily constructed during the off-peak hours and night hours in order to minimize impacts to daily commuter traffic and potential event traffic. Where certain construction activities (such as foundations) may require partial roadway/lane closures, it is expected that the maintenance of traffic strategy will include potential lane reversals (or contra-flow) during the peak hours in the peak hour direction – which would be different between the a.m. and p.m. peak hours. Assumptions for construction shifts are as follows:

- APM guideway, columns and station components located along Prairie Avenue and Manchester Boulevard would be constructed over a 16 hour / day schedule with two shifts. The night shift would occur from approximately 11:00 p.m. to 7:00 a.m., the day shift would occur from approximately 7:00 a.m. to 3:00 p.m. Other minimal construction work could occur between 3:00 p.m. to 11:00 p.m. Delivery of construction materials would occur during the night shift, as would most lane closures. Construction activities during the day shift would primarily consist of work that could proceed without requiring lane closures or significant disruption to daily commuter traffic and potential event traffic along Prairie Avenue and Manchester Boulevard.

- APM guideway, columns and station components located along Market Street between Manchester Avenue and Florence Avenue, and other remaining construction activity would occur over a 16 hour / day schedule with two shifts. The morning shift would occur from

approximately 7:00 a.m. to 3:00 p.m., and the evening shift from approximately 3:00 p.m. to 11:00 p.m.

Phase 1: Demolition of commercial property for Market Street Station, for Vons and the gas station on Manchester, and the commercial building on the southeast corner of Manchester and Market Street. The phase will also include the start of construction for the (MSF) Maintenance and Storage Facility Structure.

The first phase would include the demolition of property acquisitions, building demolitions, utility relocations, cast-in-place (CIP) columns and slabs, foundations for the initial construction of the Maintenance and Storage Facility (MSF). Additional work in the area will commence in Phase 4 for the completion of the aerial construction of the APM and the Hollywood Park Station. After the demolition, the remaining asphalt flatwork area within the lot will provide suitable space for construction staging including but not limited to space for equipment storage, material staging and storage, temporary concrete batch plants, if needed, contractor jobsite trailers, and on-site parking for construction staff throughout the entire project duration. As previously discussed, the first phase of construction would occur between the end of 2022 and the end of 2023. Major elements include the following:

- This stage of construction would focus on the demolition of property/parcel acquisitions, as needed. Some of the areas to be demolished will be used for construction staging.

- Utility locations for protection in place, possible utility relocations, and new utility installation for utilities such as: electrical, water lines, gas lines, storm drains, sewer lines, temporary traffic signals and streetlights.

- Removal and disposal of existing sidewalks, roadways, landscape, medians, and demolition as needed, including the new or temporary pavement and asphalt for road work and sidewalks.

The installation of the traction power substation will occur at TPSS and at the Maintenance Storage Facility (MSF) for the electrical equipment and subsystems.

Maintenance and Storage Facility (MSF)

The demolition of the existing Vons building, gas station, and other building structures will allow the construction of the building structure and traction power substation. Remediation of the underground storage tanks at the gas station will be required as part of the demolition. The remaining asphalt flatwork area within the lot will provide suitable space for construction staging including but not limited to space for equipment storage, material staging and storage, temporary concrete batch plants, if needed, contractor jobsite trailers, and on-site parking for construction staff throughout the entire project duration.

Phase 2: Prairie Avenue from Arbor Vitae Street to Manchester Boulevard

The second phase would include enabling the construction sequence of the APM along Prairie Avenue from the Hardy Street intersection to Manchester Boulevard. This phase includes demolition, utility relocations, foundations, CIP columns, straddle bents and the precast trapezoidal troughs and girders, and the construction of the MSF. Additional work in the area will commence in Phase 4 for the APM system installation, testing and commissioning, and the Forum Station. As

previously discussed, the second phase of construction would occur between early 2023 and early 2025.

- Removal of existing sidewalks, roadways, landscaping, and demolition as needed. This work includes new or temporary pavement and asphalt for road work and sidewalks.

- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer lines, temporary traffic signals and streetlights.

- Completion of the MSF building shell, roofing structure, and second level platform for the storage and testing of trains.

- The installation of a K-Rail system to delineate the construction area, which includes approximately twenty-two feet of public ROW from the westerly face of curb, excluding sidewalks, along Prairie Avenue from Hardy Street to Manchester Boulevard. This area will include the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and cantilevered bents for the aerial construction. The twenty-two feet would span several foundations and columns to minimize the construction area into phased construction staging sections along Prairie Avenue. To minimize traffic impacts, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra-flow) will be implemented to facilitate the peak hour traffic direction.

- The contractor would then switch to the east side of Prairie Avenue and install the K-rail system again to delineate the construction area and utilize approximately fifteen-feet of public ROW starting from the easterly face of curb, excluding sidewalk, from Hardy Street to Manchester Boulevard. If needed, contractor may also utilize an easement or utility setback to secure staging areas. These areas would include the installation of foundations, CIP columns, single and double concrete columns, beam girders and cantilevered bents for the aerial construction. The fifteen-foot staging area would span several foundations and columns to minimize the construction area into phased construction staging sections along Prairie Avenue. To minimize traffic impacts, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra-flow) will be implemented to facilitate the peak hour traffic direction.

- Installation of the traction power substations prefabricated building for the electrical equipment and subsystems at the MSF and Civic Center ITF sites. The station at the Civic Center ITF may be below grade.

- Aerial construction of the railway formwork with precast trapezoidal troughs and steel girders, and completion of stations and mezzanines with vertical circulation elements. This work would include temporary closures during the following activities for safety measures:

    - During the formwork phase, traffic would not be allowed to pass underneath the structure.
    - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. temporary lane closures would be necessary.

- The staging and holding area for the delivery of girders and beams will be located in the MSF staging area; delivery to the construction area will occur when required

Phase 3: Manchester Boulevard from Prairie Avenue to Market Street, and Market Street from Manchester Boulevard to Florence Avenue

The third phase would include enabling the construction sequence of the APM along Manchester Boulevard from Prairie Avenue to Market Street, and Market Street from Manchester Boulevard to Florence Avenue. The work will include an above-ground pedestrian access walkway to the Metro Crenshaw/LAX Line's Downtown Inglewood Station, property acquisitions, building demolition, utility relocation, foundations, CIP columns, straddle bents and the precast trapezoidal troughs and girders. This phase includes sitework completion to the MSF. Additional work in the area will commence in Phase 4 for the APM system installation, testing and commissioning, for the three (3) stations. As previously discussed, the third phase of construction would occur between late 2025 and early 2026.

- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer lines, temporary traffic signals and streetlights.

- Removal of existing sidewalks, roadways, landscaping, and demolition as needed. This work includes new or temporary pavement and asphalt for road work and sidewalks.

- The installation of a K-Rail system to delineate the construction area, which includes approximately twenty-two feet of public ROW from southerly face of curb, excluding sidewalks, along Manchester Boulevard from Prairie Avenue to Market Street. This area will include the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and cantilevered bents for the aerial construction. The twenty-two feet would span several foundations and columns to minimize the construction area into phased construction staging areas along Manchester Boulevard. To minimize traffic impacts, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra flow) will be implemented to facilitate the peak hour traffic direction.

- The contractor would then switch to the north side of Manchester Boulevard and install the K-rail system again to delineate the construction area and utilize approximately twenty-two feet of public ROW starting from the northerly face of curb, excluding sidewalks, from Prairie Avenue to Market Street. This area will include the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and cantilevered bents for the aerial construction. The twenty-two-foot staging area would span several foundations and columns to minimize the construction area into phased construction staging sections along Manchester Boulevard. To minimize traffic impacts, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra-flow) will be implemented to facilitate the peak hour traffic direction.

- The installation of the traction power substation prefabricated building for the electrical equipment and subsystems.

- The completion of the MSF.

- Aerial construction of the railway formwork with precast trapezoidal troughs and girders, and completion of stations and mezzanines with vertical circulation elements. This work would include temporary closures during the following activities for safety measures:

    - During the formwork phase, traffic would not be allowed to pass underneath the structure.
    - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. temporary lane closures would be necessary.
    - The staging and holding area for the delivery of girders and beams will be located in the MSF staging area; delivery to the construction area will occur when required

Market Street from Manchester Boulevard to Florence Avenue

This sub-phase will include the mobilization of equipment, demolition, utility relocations, excavation and installation of piles for the foundations and single and double columns, CIP columns, straddle bents and the precast trapezoidal troughs and girders.

- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer lines, temporary traffic signals and streetlights.

- Removal of existing sidewalks, roadways, landscaping, medians, demolition of buildings, as needed, and a contractor staging area. This work includes new or temporary pavement and asphalt for road work and sidewalks.

- The installation of two rows of K-Rail systems along Market Street to delineate the rectangular perimeter of the construction area, which includes approximately twenty-five feet of public ROW in the center of Market Street, starting from Manchester Boulevard to Florence Avenue. This area will include the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and for supports directly under the guideway. To minimize traffic impacts, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra-flow) lanes may be implemented to facilitate the peak hour traffic direction.

- Aerial construction of the railway formwork with precast trapezoidal troughs and steel girders, and completion of stations and mezzanines with vertical circulation elements. This work would include temporary closures during the following activities for safety measures:

    - During the formwork phase, traffic would not be allowed to pass underneath the structure.
    - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. temporary lane closures would be necessary.
    - The staging and holding area for the delivery of girders and beams will be located in the MSF staging area and at the Market/Florence CVC shopping center that will be demolished; delivery to the construction areas will occur when required.

Phase 4: APM Operation Systems Manufacturing and Installation, Testing and Commissioning

The fourth phase would include enabling the completion of the aerial construction elements including the installation of the APM system's operations, track work, station platform equipment and systems, completion of the traction power substations, testing and commissioning of the full APM system, completion of all surface construction activities including but not limited to all electrical, mechanical and utilities energizations. As previously discussed, the fourth phase of construction would occur between late-2025 and mid-2026.

- These components will have temporary lane closures and/or a K-rail system as needed, for accessing the aerial construction platforms, installation of equipment, completion of platforms, stations and electrical systems. To minimize traffic impacts, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra-flow) will be implemented to facilitate the peak hour traffic direction.

2.6.1.1 Construction Hours

Construction activity would primarily occur over a 16 hour / day schedule with two shifts, either a morning shift from approximately 7:00 a.m. to 3:00 p.m. and an evening shift from approx. 3:00 p.m. to 11:00 p.m., or a morning shift from approximately 7:00 a.m. to 3:00 p.m. and a night shift from approximately 11:00 p.m. to 7:00 a.m.

Due to site constraints, primarily along Prairie Avenue and Manchester Boulevard, just-in-time deliveries of construction materials would be required during off-peak hours and / or night hours. Additionally, construction of the APM guideway, columns and station components that could impact Prairie Avenue and Manchester Boulevard would be primarily constructed during the off-peak hours and night hours in order to minimize impacts to daily commuter traffic and potential event traffic. Delivery of construction materials would occur during the night shift, as would most lane closures. Construction activities during the day shift would primarily consist of work that could proceed without requiring lane closures or significant disruption to daily commuter traffic and potential event traffic along Prairie Avenue and Manchester Boulevard. Additionally, it can be anticipated that some minor activity would occur during periods in between construction shifts for logistics, moving equipment, etc. An adjusted workload intensity is assumed for these periods of minor activity, as shown in red in the ITC Construction Intensity Assumptions table below.

Pursuant to Section 5-41 of the Inglewood Municipal Code, construction between the hours of 8:00 p.m. and 7:00 a.m. of the next day will require a permit from the Permits and License Committee of the City. The proposed Project will secure a permit(s) from the Permits and License Committee to allow for construction work activities to occur between the hours of 8:00 p.m. and 7:00 a.m. Due to safety and/or noise concerns, evening and nighttime activities may be less than daytime activities. The anticipated hourly construction intensity has therefore been adjusted across the evening and nighttime hours, as indicated below.

ITC Construction Intensity Assumptions

Morning/Evening Shift (7am-3pm, 3pm-11pm)		
	Hour	Hourly Work
Nighttime	12:00 AM – 1:00 AM	25%
	1:00 AM – 2:00 AM	25%
	2:00 AM – 3:00 AM	25%
	3:00 AM – 4:00 AM	25%
	4:00 AM – 5:00 AM	25%
	5:00 AM – 6:00 AM	25%
	6:00 AM – 6:59 AM	25%
Daytime	7:00 AM – 8:00 AM	100%
	8:00 AM – 9:00 AM	100%
	9:00 AM – 10:00 AM	100%
	10:00 AM – 11:00 AM	100%
	11:00 AM – 12:00 PM	100%
	12:00 PM – 1:00 PM	100%
	1:00 PM – 2:00 PM	100%
	2:00 PM – 3:00 PM	100%
	3:00 PM – 4:00 PM	100%
	4:00 PM – 5:00 PM	100%
	5:00 PM – 6:00 PM	100%
	6:00 PM – 6:59 PM	100%
Evening	7:00 PM – 8:00 PM	75%
	8:00 PM – 9:00 PM	75%

DRAFT

Construction Sequence

The construction sequence are subsections to the construction phases mentioned above and consist of the tasks to occur in the pre-construction, surface construction, aerial construction and light construction for the APM. Listed below are activity and tasks.

Subsection / Activity	Tasks
2.6.1.2 Pre-Construction	Assemble/draw design drawings packages, commence off site manufacturing, commence acquisitions, locate utilities, permits and sequence, commence surveying requirements, establish traffic control plan, establish detours and haul routes, erect safety devices and noise barriers, select staging areas, mobilize construction equipment in staging area.
2.6.1.3 Surface Construction	Commence demolition of existing sidewalk and road surfaces; clear and grub landscape, as needed for each phase, construct foundations, cast-in-place columns, straddle bents and preparation for aerial construction. Utilities improvements and or installation of new utilities, streetlights and traffic signals, building demolition, MSF construction, traction power substations, roadway construction and adjoining guideways for each phase.
2.6.1.4 Aerial Construction	Construct aerial structure guideways with precast trapezoidal troughs and girders, compete stations and mezzanines with vertical circulation elements (elevators, escalators etc.).
2.6.1.5 Light Construction	Architectural interior and exterior features for the Maintenance and Storage Facility and passenger stations, systems installation and testing, train control systems, communication systems for all phases.

The subsections below describe in detail, the characteristics of each construction category: surface construction, aerial construction, MSF construction, traction power substations and light construction.

2.6.1.2 Pre-Construction

During the final design the contractor will conduct a number of pre-construction activities to determine the most optimal actual construction activities that should be designated into each phase. These activities include the following:

- Prior to beginning construction, it would be necessary to the extent possible, to relocate, modify or protect in place all utilities which would conflict with excavations for cast-in-place columns and traction power substations. Shallow utilities, such as maintenance manholes or pull boxes, which would interfere with excavation work, would require relocation.

- Initiating and identifying utility lines for possible relocation during construction, where the contractor and the utility companies are to protect in place, including high risk utilities such

as overhead tension wires, fiber optics, and pressurized transmission mains. Utilities would be modified, protected, and or relocated. Temporary interruptions in services (several hours) may be experienced during relocation or rerouting of utilities.

- Identifying traffic lights and traffic signals for relocation during construction where the contractor can prepare temporary signals and street lighting.

- Geotechnical investigations, which focus on geology, groundwater, seismic, and environmental conditions. The results of this work would guide final design and construction methods for foundations, CIP columns, trapezoidal troughs, aerial construction, building concrete foundations and substations.

- Develop a traffic control plan, to implement temporary road closures or detour traffic away from construction activities and to implement safety protection with handrails, fences, walkways and detour signs for pedestrian and traffic access. Traffic control plans could include strategies such as lane reversals (or contra flow) operations along Prairie Avenue and Manchester Boulevard, or other strategies.

- Identify other potential staging areas for each phase of work for onsite equipment, employee parking, storage and preparation of precast segments. Field offices and/or temporary jobsite trailers would also be located at a designated staging area.

- Location of temporary batch plants within the MSF staging area, which would be required to prepare concrete materials needed for the cast-in-place concrete columns, architectural columns, building concrete pads and replacement of sidewalks and roadways. The facility would consist of silos containing fly ash, lime and cement, heated tanks of asphalt, sand and gravel material storage areas, mixing equipment, above-ground storage tanks, concrete truck loading, and concrete truck washout.

2.6.1.3 Surface Construction

During the surface construction the contractor starts the demolition activities, utilities construction, installation of foundations, CIP concrete columns, MSF construction, traction power substations, and ITF construction. Below are construction activities to occur:

Demolition:

Assumptions for construction demolitions including the following:

- Removal of existing asphalt surface and concrete sidewalks, center medians, utility removal and/or relocation.

- Investigation to determine the type of demolition required for existing building structures, facilities and utilities including open hardscapes and landscapes impacted by surface and aerial construction.

- The demolishing of existing commercial property at the northeast corner of Market Street and Manchester, for the Market Street Station, and for the MSF yields approximately 40,308 cubic yards for debris, for an estimated amount of 1343 trucks to be used. Inclusive with demolition, the contractor will need to address the removal of underground storage tanks from the gas station, and potential removal of contaminated soil.

Utilities

Assumptions for utilities include the following:

- Locate, analyze, and develop utility sequencing plans each utility company and agency
- Develop utility construction plans for protection in place and/or schedule removal, relocation, and installation of new utilities with each agency – temporary shutdowns may occur.

Foundations and Cast-In-Place Columns

Assumptions for foundations and cast-in-place columns (CIP) consist of the following exported soils, daily trucks, and cubic yards:

- The guideway construction sequence would take place with the construction of the foundations, poured-in-place columns, straddle bent plate columns, with the lift and connection of horizontal guideway section into place atop the cast-in-place pile cap columns, and form and pour the top deck.
- Each vertical support column would be supported by the reinforced concrete shaft pile caps approximately 6x12 or 6x9 feet in diameter and vary from 60 to 100 feet deep and will be based on geotechnical conditions and guideway characteristic.
- Each foundation and pile cap would yield spoils to be trucked away and disposed of according to the geotechnical and environmental services report. The estimated volume to be excavated would total approximately **124,474 cubic yards.**
- For acquisitions and easements, including Vons and the existing gas station, we assume a total volume of dirt to be approximately **7,884 cubic yards** and to add approximately **328** trucks more trucks.
- Assuming the use of bottom dump trucks with 24 CY capacity for exporting soils, **5515 trucks** would be needed. Staging of the trucks on the north side of Manchester east of Prairie would occur with spaced interval scheduling for in-time loading. Approximately **260 trucks on any given day** would enter the construction zone areas inside the K-rails and exit the areas per the noted truck haul routes. The majority of the hauling will occur during the night shift to ease traffic congestion. To minimize traffic impacts, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra-flow) will be implemented to facilitate the peak hour traffic direction.
- Street sweepers would be employed for controlling dust and for keeping the streets clean. Flag men would also be present controlling the flow of traffic during the exporting activity. Contaminated soils would be separated as soon as they are identified before excavation and would also be separated into temporary stockpiles. The soils would be handled, transported, and disposed of in accordance with all applicable regulations.

Resurfacing and Signaling

Perform the repair and/or construction of the following elements, as needed: concrete sidewalks, gutter, curbs, driveways, asphalt improvements, striping, replacement of traffic and pedestrian signage, parking meters, placement of traffic and pedestrian signals, street lighting, hardscape and landscape.

Maintenance and Storage Facility (MSF)

The MSF building would consist of a cast-in-place slab on-grade and concrete cast-in-place columns including a structural concrete cast-in-place elevated slab and seismic joint assembly with a structural steel building with metal deck roof and structure.

Traction Power Substations

The traction power substations would consist of prefabricated buildings on a concrete pad to house the electrical equipment, with concrete masonry unit (CMU) walls, electrical and subsystem connections to the APM guideway. One will be located on the MSF site and another will be at the Civic Center ITF site, which may be above or below ground.

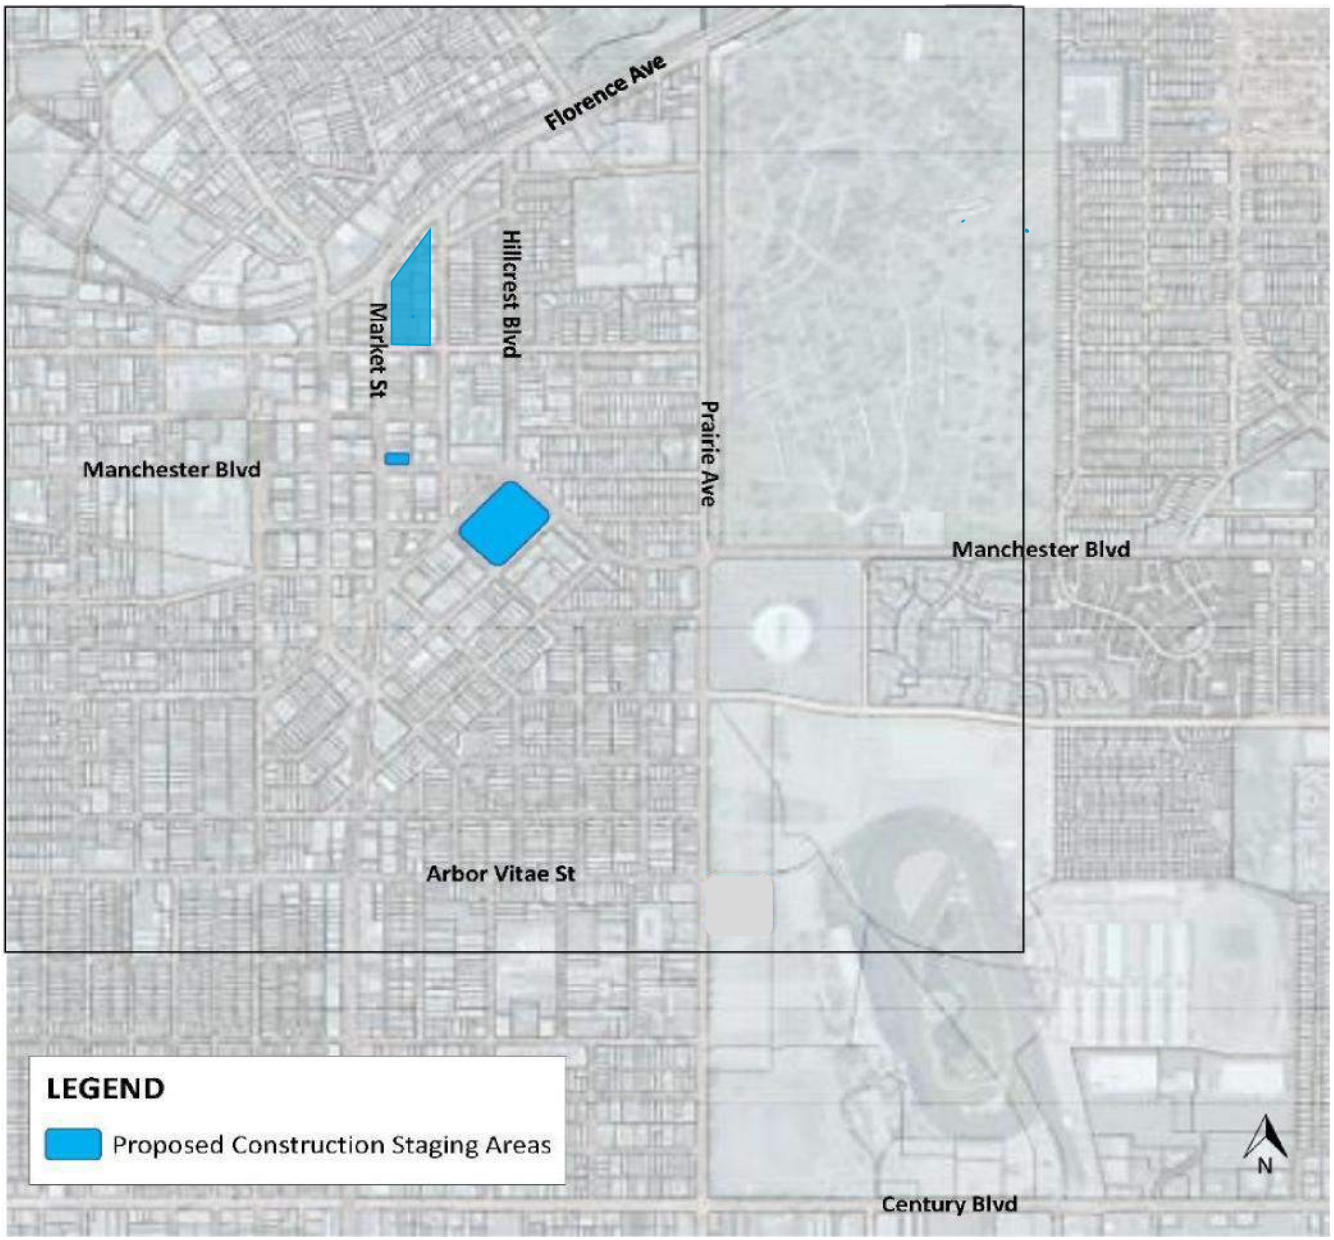
2.6.1.4 Aerial Construction

Aerial construction consists of the above-grade concrete structures and support for the APM and the three (3) above-grade station platforms. Assumptions include that the aerial segments will be constructed as precast trapezoidal troughs and/or using the alternative of precast prestressed concrete "I" Girder placed on cast-in-place concrete columns, with post-tensioning strand for the guideway. The station platforms consist of three levels from ground access to a mezzanine level and a platform level. The station will consist of structural concrete slabs with edge girders and post tension concrete, steel roof structure, and elevators/escalators to APM stations.

2.6.1.5 Light Construction

Light construction will consist of interior and exterior finishes for the MSF building, APM stations, APM train system installation and testing, train control systems, communication systems, completion of electrical and mechanical systems, and minor road work improvements.

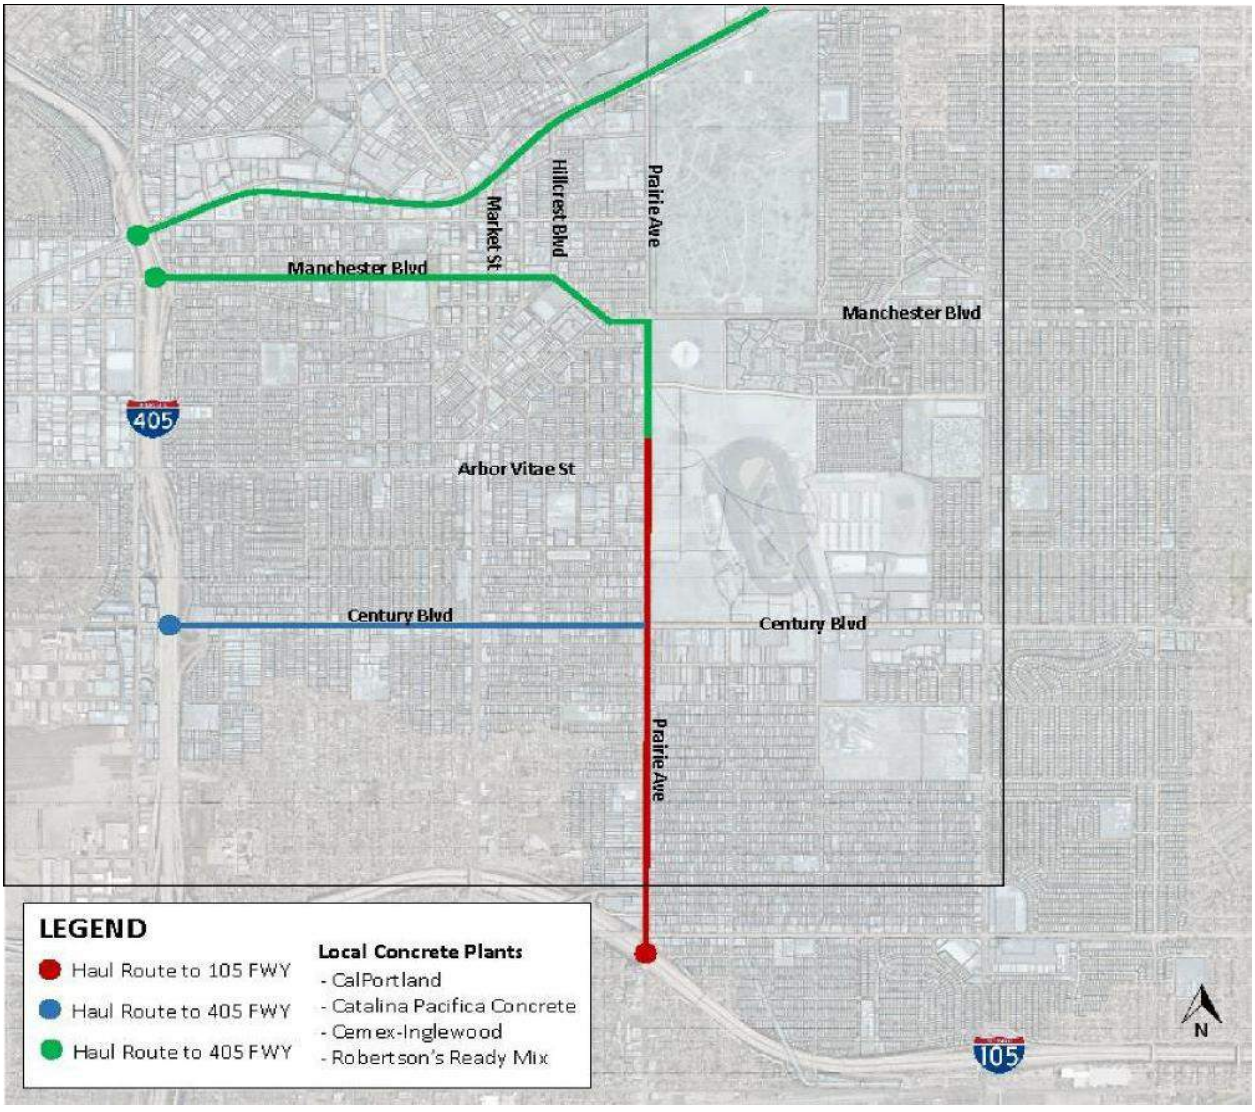
2.6.2 Construction Employee Parking and Staging Locations



Construction employee parking would be provided within the construction areas and may also serve as temporary parking for construction personnel. Construction employees would be shuttled between construction sites and construction employee parking areas. The contractor also has the option to rent additional parking spaces as needed. In addition, contractor parking could occur at City designated parking lots, included but not limited to the lots listed below, which total approximately 756 parking spaces.

City Owned Parking Lots	# of Spaces
Manchester @ 7th (2901 W. Manchester Blvd.)	12
Manchester @ 12th (3363 W. Manchester Blvd.)	86
Redondo Blvd. @ West Blvd. (west of West Blvd.)	101
Civic Center Library (101 West Manchester Blvd.)	189
Kelso Street between La Brea & Market	34
Nutwood B/O Market (268 Market Street)	25
La Brea @ Kelso	73

Eucalyptus @ Oak	40
Market St. N/O Manchester	6
119 E. Arbor Vitae (Lot G)	30
101 W. Arbor Vitae (Lot F)	0
180 W. Arbor Vitae (Lot E)	36
155 W. Arbor Vitae (Lot D)	21
300 W. Arbor Vitae (Lot C)	41
327 W. Arbor Vitae (Lot K)	13
439 W. Arbor Vitae (Lot H)	22
500 W. Arbor Vitae (Lot I)	17
569-571 W. Arbor Vitae (Lot J)	10



Staging Locations

The constructing staging areas will provide locations for material storage, equipment storage, and construction parking. At each construction staging area, the contractor would implement, as necessary, security and screen fencing, security personnel, and the locking and securing of equipment. Additionally, the proposed Project would incorporate various temporary construction fencing features and sound walls to screen much of the construction activities along major public streets and perimeter roadways. These areas are shown in the Construction Staging Map below:

2.6.3 Construction Haul Routes

As shown, the primary delivery routes include Florence Avenue, Manchester Boulevard, Prairie Avenue and Century Boulevard. For materials delivered to and stored at designated construction staging areas, the contractor's haul routes to and from the Project area would be generally located on public streets. To minimize traffic impacts to streets in and around the proposed Project site, excavated dirt materials/spoils will be hauled during off-peak and night hours. The contractor would develop an excavation plan that further defines the haul routes, dust control, and sweeping and disposal operations at the sites. The map below delineates the delivery and haul routes proposed to be used during construction of the proposed Project:

2.6.4 Construction Equipment

The equipment that would be used during construction may include rail-mounted equipment, drilling rigs, specialized water jet excavators, earth moving equipment, cranes, concrete mixers, flatbed trucks, sand and gravel delivery trucks, dump trucks, compactors, air compressors, generators sets, tractor trailer rigs, loaders, welders. The types of equipment by activity can be found in the chart below:

Off-Road On-Site Equipment: Off-road construction equipment includes dozers, loaders, sweepers and other heavy-duty construction equipment that is not licensed for travel on public highways.

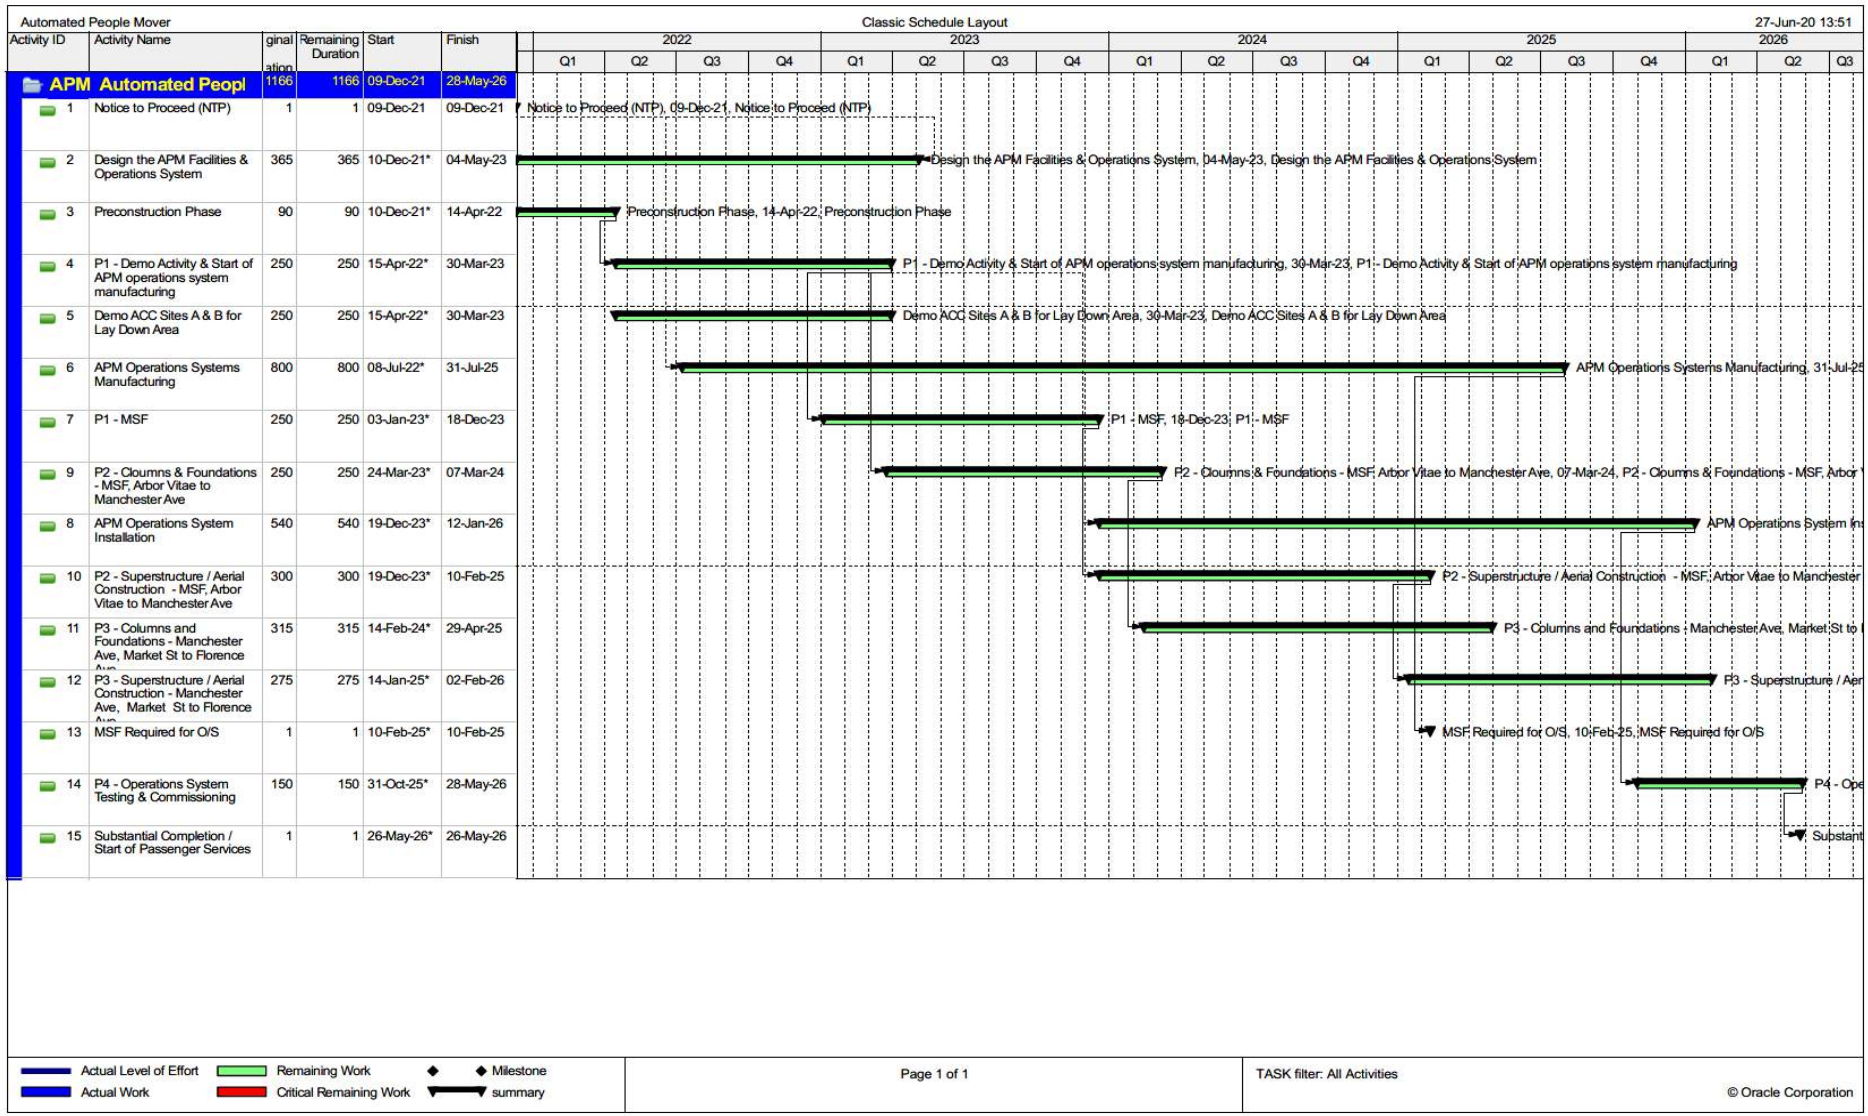
Equipment	HP	Impact Device	Noise Level (dba)	Exposure Limit	Phase 1	Phase 2	Phase 3	Phase 4	Total
Impact Pile Driver	700	Yes	101	8 hr.	1	1	1	0	3
Crane	270	No	85	8 hr.	1	2	2	1	6
Backhoe	127	No	80	8 hr.	5	5	5	0	13
Loader	164	No	80	8 hr.	5	3	2	0	8
Auger Drill Rig	600	Yes	85	8 hr.	1	1	1	0	3
Compressor (air)	150	No	80	8 hr.	6	6	6	3	18
Excavator	396	Yes	85	8 hr.	3	2	2	0	6
Bobcat	72.9	No	85	8 hr.	3	3	4	1	11
Impact Hammer	N/A	Yes	90	8 hr.	6	3	3	2	11
Jackhammer	N/A	Yes	89	8 hr.	7	4	4	2	13
Pneumatic Tools	N/A	Yes	85	8 hr.	15	20	20	8	58
Generator	15plus	No	82	8 hr.	3	3	3	1	10
Warning Horn	N/A	No	85	6 hr.	2	2	2	1	7
Drum Mixer	1.5-5.5	No	80	8 hr.	0	3	3	0	6
Drill Rig Truck	600	Yes	84	8 hr.	1	1	1	0	3

Concrete Saw	24	No	90	8 hr.	4	2	2	1	7
Compactor (ground)	80	Yes	83	8 hr.	3	3	4	0	10
Portable Light Towers for night work	12.2	No	55	8 hr.	4	4	6	3	17
MKN Lifts	49.9	No	75	9 hr.	9	9	10	5	33

On-Road On-Site Equipment: On-road on-site equipment includes shuttle vans transporting construction employees to and from the site(s), on-site pick-up trucks, crew vans, water trucks, dump trucks, haul trucks and other on road-road vehicles licensed to travel on public roadways.

Equipment	HP	Impact Device	Noise Level	Exposure Limit	Phase 1	Phase 2	Phase 3	Phase 4	Total
Demo Dump Trucks	335-475	No	76	8 hr.	1343	0	0	0	1343
Asphalt Removal Trucks	335-475	No	76	8 hr.	172	0	0	0	172
Asphalt Placement Trucks	335-475	No	76	8 hr.	209	0	0	0	209
Soil Spoils Dump Trucks	335-475	No	76	8 hr.	1607	1503	2395	10	5515
Utility Trucks	375-600	No	75	4 hr.	28	39	35	39	123
Welder/Torch	23	No	73	8 hr.	5	5	6	4	20
Water Truck	650	No	74	8 hr.	2	2	2	0	6
Street Sweeper	240	No	74	8 hr.	1	2	2	1	6
Flat Bed Trucks	650	No	74	5 hr.	48	61	65	10	184
Pneumatic Tools	N/A	Yes	85	8 hr.	10	20	20	8	58
Concrete Trucks	430	No	85	8 hr.	10,284	9477	3516	50	21,866
Conc. Pump Trucks	600	No	84	8 hr.	2	2	2	2	8

On-Road Off-Site Equipment: On-road off-site vehicles include personal vehicles for construction employees to travel to and from work, per vehicle, and delivery vehicles for materials and equipment.



Equipment	HP	Impact Device	Noise Level (dba)	Exposure Limit	Phase 1	Phase 2	Phase 3	Phase 4	Total
Pickup Trucks	350	No	75	3 hr.	60	73	80	52	265
Delivery Trucks	650	No	80	4 hr.	52	65	65	35	217

Workforce Estimates / Manpower

The proposed manpower workforce estimate is based on the phases of construction, which overlap in any calendar year due to the schedule phasing. The workforce estimates include all contractor staff and specialty on-site professionals, and is shown in the table below:

Phase	Approximate Manpower Required
Phase 1	105-140 persons
Phase 2	165-189 persons
Phase 3	210-238 persons
Phase 4	88-123 persons

ITC Construction Scenarios or the EIR, June 2020

INGLEWOOD TRANSIT CONNECTOR PROJECT
CONSTRUCTION COMMITMENT PROGRAM

INTRODUCTION

The Inglewood Transit Connector (ITC) Project includes this construction commitment program to proactively address the potential effects of the construction of the Project on the community. This Program addresses:

- Construction staging and traffic control requirements
- Maintaining access to parking, businesses, and pedestrian facilities
- Noise and vibration measures
- Air quality measures
- Tree removal and replacement procedures
- Visual measures during construction

For purposes of this Construction Commitment Program (CCP), the following terms are defined:

- "Construction" means the work of removal, demolition, replacement, alteration, realignment, building, fabricating, landscaping of all Project facilities and new fixed facilities to be built and systems and equipment to be procured and installed that are necessary to complete the Project.
- "Construction Staging Plans" means construction phasing/sequencing plans, which may include Traffic Management Plans.
- "Days" means calendar days including Saturdays, Sundays, and legal holidays. See also definition of Working Days.
- "Design" means engineering, architectural and other design work and the resulting maps, plans, specifications, special provisions, drawings, calculations, computer software and estimates which are needed to construct the Project.
- "Design Review" means the process of critical evaluation of plans and specifications by the City and others as necessarily required to verify compliance and to complete the Project.
- "Facility" means real or personal property now or in the future to be located within the City Rights-of-Way, including but not limited to, roadways, pipes, mains, services, meters, regulators and any equipment, apparatus, columns, footings, guideways, station structures, maintenance and storage facility, power substations and/or structure appurtenant thereto or associated therewith.
- "Project" means Inglewood Transit Connector Project within the City of Inglewood.

- "Traffic Management Plan" means the various Worksite Traffic Control Plans and any other measures intended to mitigate impacts on traffic circulation during Construction, which may be included in Construction Staging Plans, for the various stages of Construction.
- "Working Days" or "Workdays' means those days that Inglewood City Hall is open for business.
- "Worksite Traffic Control Plan(s)" means the plans depicting the stages of traffic control for each stage of Construction for the Project.

CONSTRUCTION STAGING & TRAFFIC CONTROL PROGRAM

1. The **City of Inglewood** will establish a **Project Task Force** specifically for the ITC Project. This **Project Task Force** will provide input into worksite traffic control plans and other traffic management plans that are developed for the Project. The Project Task Force will review traffic management plans to ensure the following topics are addressed:

- Coordination with other public infrastructure projects within the City's boundaries
- Detour impact analysis for pedestrian, business, bicycle, and traffic flow
- Coordinate closures and restricted access with all special events
- Notification of the public with use of signage and web-based media
- Coordinate with City of Inglewood and LA County police and fire personnel regarding maintenance of emergency access and response times
- Monitor and coordinate deliveries
- Establish detour routes
- Work with residential and commercial neighbors regarding upcoming construction activities
- Analyze traffic conditions to determine the need for additional traffic signals, signs, lane restriping, signal modifications, etc.

2. The Contractor and its consultants and contractors shall develop and submit **Worksite Traffic Control Plans** to the City of Inglewood that address the following:

- Worksite Traffic Control Plans shall be designed to minimize traffic impacts on residential streets.
- Except as provided in the work hours permit issued by the City, the minimum traffic lane requirements for arterial streets impacted by Construction shall maintain at least the full number of traffic lanes in the peak direction, and if feasible one traffic lane in the off-peak direction, with additional capacity provided through appropriate detour routes. The directional traffic lanes shall be reversible to maintain the peak directional capacity in either direction.
- The minimum traffic requirements for all other commercial and residential streets impacted by construction activities shall be one lane in each direction, unless varied by a City-approved Worksite

Traffic Control Plan that protects the surrounding residential and business neighborhoods and promotes the free flow of traffic along the arterial streets.

- Access shall be maintained to and from all alleys at one or both ends of the alley. If an alley is obstructed at one end such that a turnaround by any vehicle is not feasible, then at its sole expense the Contractor will provide flaggers to control the alley.
- Worksite Traffic Plans shall demonstrate public safety vehicles (such as police, fire, and emergency response), and pedestrian access within the Project area or approved detours at all times.
- Worksite Traffic Plans shall provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- All existing bus stops must be maintained or if necessary, relocated nearby with appropriate signage working in close coordination with the affected transit providers.
- Sidewalk closures in accordance with an approved Construction Staging Plan or Worksite Traffic Control Plan are permitted only when necessary to facilitate the Contractor's Contract work and when approved by the City.
- To ensure that continued vehicular access to all businesses and community facilities is maintained, including parking needs, the contractor shall provide at least one lane of traffic in each direction on access cross streets that are not going to be dead ended during construction.

3. Roadway Closures

- The City and Contractor shall meet and confer ninety (90) days prior to the planned date of any temporary full street closure to coordinate community outreach for the closure. Such community outreach will include at least one meeting with businesses and residents to discuss and receive comments for each temporary full street closure.
- Temporary directional street closures for ground improvement activities on residential streets may be permitted with prior approval from the City, provided that the Contractor gives thirty (30) days' notice.
- Temporary full street closures are permitted upon thirty (30) days' advance notice to the City only for work activities including but not limited to:
  - Installation of piles,
  - Underground utility work,
  - Installation of columns/substructure and superstructure
  - Installation of decking, and
  - Removal of decking

- If the City determines that traffic impacts have not been sufficiently addressed, then, at any time, the City's traffic engineer may revise the Worksite Traffic Control Plans to incorporate additional measures or to modify traffic control.

- The Contractor shall reimburse the City for the cost of Traffic Control Officers (TCOs) to assist in cut-through traffic on residential streets. The Contractor shall also reimburse the City for the Cost of TCOs for all City-approved special events affected by construction.

- Detour routes during temporary street closures shall be subject to review and approval by the City, provided that the Contractor gives thirty (30) days' notice. Detour routes must not use residential streets unless authorized by the City. Advance public notification of street closures in accordance with the notification process required by the City will be provided.

- Temporary directional street closures for ground improvement activities on residential streets may be permitted with prior approval from the City, provided that the Contractor gives thirty (30) days' notice. The minimum traffic lane requirements at all other times shall be one lane in each direction.

- Construction staging and traffic control requirements (including lane closures, street closures and hauling restrictions) shall be in accordance with the standards set forth in this Article; all Construction Staging Plans, Traffic Management Plans, and any conditions of approval included in a City-issued permit.

4. Preliminary Haul and Overload routes

    - Haul routes and overload/oversized vehicle routes must be reviewed and approved by the City.

    - To the extent possible, truck deliveries of bulk materials such as aggregate, bulk cement, dirt, etc. to the project site, and hauling of material from the project site, shall be scheduled during off-peak hours to avoid the peak commuter traffic periods on designated haul routes. For dirt, aggregate, bulk cement, and all other materials and equipment, truck deliveries would be on designated routes only (freeways and non-residential streets).

    - The City may restrict one or more of the approved haul routes during special events within the City or when lane restrictions affect a haul route, except that the City must leave open at least one haul route at all times.

5. Allowable Work Hours and Workdays

- Allowable work hours and workdays, including after-hours construction, holiday moratorium exceptions and peak hour exemptions shall be in accordance with the standards set forth in Construction Permit issued by the City to the Contractor; and any conditions of approval included in the City-issued permit. Conditions of other City-issued permits shall control over the Contract. Notwithstanding the foregoing, a more restrictive standard in a later-issued permit or plan shall control over a conflicting standard in an earlier issued permit or plan.

- For those activities when construction is permitted to begin at 7:00 AM, traffic control for those activities may begin at 6:30 AM. No other construction is permitted during this one- half hour time.
- No work shall occur when the City has identified a special event permit for Market Street, Manchester Boulevard, or Prairie Avenue.

PEDESTRIAN

1. The Construction Staging Plans and Worksite Traffic Control Plans shall include Pedestrian Access Plans which shall be approved by the City unless deemed unnecessary by the City. Pedestrian Access Plans shall meet the following minimum criteria:

- Pedestrian access to buildings shall be maintained during all times.
- The Contractor shall maintain all crosswalks, unless infeasible to do so. Whenever the Contractor removes a crosswalk from service, the Contractor shall establish and maintain temporary replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- The Pedestrian Access Plans shall include a program of wayfinding signage.
- The sidewalk shall be used exclusively for pedestrian use and shall not be used for Construction activities or staging unless Construction is taking place within the sidewalk.
- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards and meet the following criteria:
  - Sidewalks in a temporary condition in excess of one month shall be constructed of pre-cast concrete panels or cast in place concrete; unless precast or cast in place concrete is infeasible and the City grants approval to use metal replacement panels, asphalt, or other satisfactory material;
  - Sidewalks in a temporary condition of up to one month shall be covered on a temporary basis by materials satisfactory to the City; and
  - Asphalt shall not be used as a temporary sidewalk material unless approved in advance by the City
    - Sidewalks that are being maintained in a temporary condition shall meet then current standards required by the Federal Americans with Disabilities Act and similar California laws for sidewalks being maintained in a temporary condition.
  - Sidewalk closures in accordance with an approved Construction Staging Plan or Worksite Traffic Control Plan are permitted only when necessary to facilitate Contract work and when approved by the City.

- At all times, the Contractor shall protect pedestrians from Construction-related dust and noise, and such protection may include the use of dedicated pedestrian barriers.
- Temporary streetlight and traffic signal foundations outside of the construction work zones shall be wrapped in an aesthetically pleasing material satisfactory to the City and changed out periodically. Overhead electrical wiring shall be maintained in a neatly bundled condition.
- The Contractor will provide crossing guards at hazardous locations requested by the City when crosswalks or sidewalks are closed.
- Unless subject to an approved closure or an approved width-reduction, the minimum sidewalk width shall be five (5) feet and additional width shall be required as necessary to protect the public safety and the operational needs of affected properties within the Project area, when requested by the City. The Contractor shall endeavor to maintain the maximum width of sidewalk possible.

PARKING

1. Parking, staging, or queuing of Project-related vehicles, including workers' vehicles, trucks, and heavy vehicles, shall be prohibited on City streets at all times, including for miscellaneous trips, outside of a permitted workspace identified in a City-approved Worksite Traffic Control Plan or if otherwise approved by the City. The Contractor shall notify the City thirty (30) Days in advance of any agreement for off-street parking with any owner of a private parking facility within the City. In an effort to assist the Contractor meet its obligations hereunder, the City will permit the Contractor parking in assigned staging areas during Construction.
2. The Construction Staging Plans or Worksite Traffic Control Plans developed by the Contractor shall include a parking management plan that observes the conditions set forth in this parking management program.
3. On-street parking may not be used by the Contractor for their vehicles or equipment unless the City agrees that such use is necessary. If the Parties agree that such use is necessary, then a parking management plan satisfactory to the City shall provide for equivalent overnight replacement parking for removed residential permit parking spots at the nearest possible location to the location where parking has been removed. In the event that any on-street metered parking spaces are removed because the work is directly within the subject parking space or a Worksite Traffic Control Plan or other form of traffic control requires the removal of the parking space, including spaces removed by the City to provide loading or valet zones for impacted businesses, the Contractor shall reimburse the City for the City's lost parking meter revenue due to the removal of the metered parking space(s).
4. The Contractor shall mitigate the loss of metered parking spaces by making available an equivalent number of parking spaces in an off-street parking facility located near the lost parking. The parking spaces shall be provided for public use at a rate no greater than the metered parking rate. The Contractor shall provide public notice of the availability of the alternative parking spaces through consultation with businesses and the use of signage. The Contractor shall further post appropriate signage on on-street metered parking spaces when Construction activities may restrict the use of a metered parking space.

5. Parking, staging, or queuing of Project-related vehicles, including workers' vehicles, trucks, and heavy vehicles, shall be prohibited on City streets at all times, including for miscellaneous trips, outside of a permitted workspace identified in a City-approved Worksite Traffic Control Plan or if otherwise approved by the City.
6. Provide public notice of the availability of the alternative parking spaces through consultation with businesses and the use of signage.

TRANSIT, ACCESS, AND CIRCULATION

1. The Contractor shall coordinate with Metro and any other transit service provider to ensure that access and circulation to the bus transit routes are maintained at all times, unless infeasible.
2. The Contractor shall coordinate with Metro and any other service provider to relocate bus stop(s) and provide appropriate wayfinding signage information the users of the system at its own expense. The relocated bus stop shall be at a location closest to the bus stop being temporarily relocated.
3. The Contractor shall coordinate with Metro and any other service provider to facilitate rerouting of the transit bus line. Required wayfinding signage and information dissemination shall be provided by the contractor, at its own expense, to the satisfaction of the City of Inglewood and the transit provider.

NOISE AND VIBRATION CONTROL

1. Construction Noise Control Plan.

   Prior to the issuance of any demolition or construction permit for each phase of project development, the Construction Manager shall develop a Construction Noise Control Plan demonstrating how to ensure increases in ambient noise levels are less than 5 dBA Leq over existing conditions. The Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and the Construction Manager and shall be approved by the City's Director of Public Works prior to construction. The Plan shall include the following elements:

   - Measurements of existing one-hour Leq noise levels at sensitive receptors prior to construction activities.
   - Construction noise measures necessary to ensure increase in noise are less than 5 dBA Leq over existing conditions. This plan could include, but would not be limited to, the following strategies:
     - Install temporary noise barriers that block line-of-sight to sensitive receptors.
     - Reduce the simultaneous use of heavy-duty construction equipment.
     - Operate equipment at the lowest possible power levels.
     - Use solar, battery powered, or hybrid equipment whenever practical.
     - Locate staging areas as far away from sensitive receptors as feasible.

- Work on elevated guideways and stations areas shall use temporary noise barriers where possible.
- Enclose stationary noise sources with acoustical barriers where possible.
  - Stationary noise sources (e.g., generators) shall be muffled and enclosed within sheds, incorporate insulation barriers, or other measures to the extent feasible. Pole power shall be utilized at the earliest feasible point in time, and to the maximum extent feasible in lieu of generators. If stationary equipment such as diesel- or gasoline-powered generators are not enclosed within a shed or barrier, such equipment must be located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Limiting the use impact pile drivers and impact hammers operating simultaneously to reduce Lmax noise levels by approximately 7 dBA. Additionally, use of "quiet" pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.
- Contractors shall coordinate with Kelso Elementary School administrators to avoid disruptive activities during school hours.

2. Designate Community Affairs Liaison. Designate a Community Affairs Liaison Officer.

   This person's contact information shall be posted around the Project area, in adjacent public spaces, and in construction notifications. The Community Affairs Liaison shall be responsible for responding within 24 hours to any local complaints about construction activities. This Community Affairs Liaison shall receive all public complaints about construction noise and vibration disturbances and be responsible for determining the cause of the complaint and implementation of feasible measures to be taken to alleviate the problem.

   The Community Affairs Liaison shall have the authority to coordinate with a designated construction contractor representative for the purpose of investigating the noise disturbance and undertaking all feasible measures to protect public health and safety and shall ensure that steps be taken to reduce construction vibration levels as deemed appropriate and safe by the designated construction contractor representative. Such steps could include the application of noise and vibration absorbing barriers, substitution of lower noise and vibration generating equipment or activity, rescheduling of noise and vibration-generating construction activity, or other potential adjustments to the construction program to reduce noise and vibration impacts at the adjacent noise and vibration-sensitive receptors.

3. Construction Vibration Reduction Plan. Prior to the issuance of any demolition or construction permit for each phase of project development, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and the Construction Manager and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from groundborne vibration are less than significant:

   - A Pre-Demolition and Construction Plan that includes but not limited to:
     - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.
     - Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
     - Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the project.
     - Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and their locations shall take into account proposed demolition and construction activities so that adequate measurements can be taken illustrating vibration levels during the course of the project, and if/when levels exceed the established threshold.
     - A line and grade pre-construction survey at the affected buildings shall be conducted.

   - A Vibration Plan During Demolition and Construction:
     - The Construction Manager shall regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.
     - The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.
     - In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.

- In the event the regulatory level (PPV) is triggered, the Construction Manager shall halt the construction activities in the vicinity of the Project area and visually inspect the building for any damage. Results of the inspection must be logged. The Construction Manager shall identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction activities may then restart.
- In the event damage occurs to historic finish materials due to construction vibration, such materials shall be repaired in consultation with a qualified preservation consultant.
- The Construction Manager shall collect vibration data from receptors and report vibration levels to the City Chief Building Official on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.

- Post-Construction:
  - The Construction Manager shall provide a report to the City Chief Building Official regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the project and/or show how the project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.
  - The Construction Manager shall be responsible for repairs and damage to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.

4. Construction Equipment Locations (Building Damage). To address potential structural and building damage, the following measures are proposed to reduce vibration impacts:
   - Limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively.
   - Limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors.

- In the event impact pile driving is required, equipment shall only be used from the hours of 7:00 AM to 7:00 PM. If feasible, pile driving should use alternative technology such as vibration or hydraulic insertion.

5. Construction Equipment Locations (Human Annoyance). To reduce construction vibration impacts related to human annoyance, the following measures are proposed:

    - Limit the location of pile driving to 310 feet of off-site vibration sensitive receptors.
    - Limit the location of vibratory roller to 150 feet of off-site vibration sensitive receptors.
    - Limit the location of large bulldozer to 85 feet of off-site vibration sensitive receptors.
    - Limit the location of caisson drilling to 85 feet of off-site vibration sensitive receptors.
    - Limit the location of loaded trucks to 75 feet of off-site vibration sensitive receptors.
    - Limit the location of jackhammers to 45 feet of off-site vibration sensitive receptors.
    - Limit the location of small bulldozer to 25 feet of off-site vibration sensitive receptors.

AIR QUALITY

1. Construction contractors shall, at a minimum, use equipment that meets the USEPA's Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City of Inglewood Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the City of Inglewood shall include this requirement in applicable bid documents, purchase orders, and contracts. The City of Inglewood shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

    Such equipment will be outfitted with Best Available Control Technology devices including a CARB certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and SCAQMD a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.

If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an alternative compliance plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.

- The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project alignment, and the Contractor has submitted documentation to the City of Inglewood showing that the requirements of this exception provision apply.
- The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project alignment, and the Contractor has submitted documentation to the City of Inglewood showing that the requirements of this exception provision apply.
- Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the project site, and the Contractor has submitted documentation to the City of Inglewood showing that the requirements of this exception provision apply.
- Construction-related diesel equipment or vehicle will be used on the Project alignment for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.
- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City of Inglewood will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120 mile radius of the project site, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.

2. Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., non-diesel). Pole power shall be utilized at the

earliest feasible point in time and shall be used to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.

3. At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances identified in MM AQ-1 exist and the Contractor submits an alternative compliance plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City of Inglewood shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.
4. Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.
5. A publicly visible sign shall be posted with the telephone number and person to contact at the City of Inglewood regarding dust complaints. This person shall respond and take corrective action with 24 hours. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.
6. All roadways, driveways, sidewalks, etc., being installed as part of the project should be completed as soon as practical; in addition, building pads should be laid as soon as practical after grading.
7. To the extent feasible, allow construction employees to commute during off-peak hours.
8. Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.
9. Every effort shall be made to utilize grid-based electric power at any construction site, where feasible. Grid-based power can be from a direct hookup or a tie into electricity from power poles.
10. Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.
11. Enter into applicable bid documents, purchase orders, and contracts to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors,

contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project alignment. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

VISUAL

Construction activities during evening and nighttime hours may require the use of temporary lighting. To minimize the impact of temporary lighting on adjacent properties. To minimize the impact of temporary lighting on adjacent properties, the following measures shall be implemented:

1. Light plans and measures shall be in accordance with the standards for the City issued Construction Permit and submittals for the Project work at issue; and any conditions of approval included in a City-issued permit. The conditions included in the Construction Permit shall control over other City-issued permits.
2. Temporary lighting will be limited to the amount necessary to safely perform the required work and will be directed downwards and shielded. Care shall be taken in the placement and orientation of portable lighting fixtures to avoid directing lights toward sensitive receptors, including automobile drivers.
3. In addition to minimizing light spill, sensitive receptors and motorists on public streets will not have direct views of the light source (glare) from construction lighting. Light sensitive receptors include but are not limited to residential areas and transient occupancy uses.
4. Light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties.
5. Temporary sidewalks and any sidewalk adjacent to Construction activities shall be illuminated to City Standards to protect public safety.
6. Visually obtrusive erosion control devices, such as silt fences, plastic ground cover, and straw bales should be removed as soon as the area is stabilized.
7. Stockpile areas should be located in less visibly sensitive areas and pre-approved by the City. Stockpile locations/laydown/staging areas shall be accessed by construction vehicles with minimal disruption near residential neighborhoods.

TREE REMOVAL AND REPLACEMENT

1. Tree removal will be avoided wherever possible. The Contractor shall strictly comply with a tree removal and replacement plan that will ensure that any landscaping removed as a result of Contract Construction is eventually returned to its condition prior to removal. The tree removal and replacement plan shall be approved in writing by the City before any trees are removed and shall substantially conform to the following requirements:

- New permanent replacement trees shall be a 36-inch box of the same species and planted in the same location as the removed tree when not in conflict with new infrastructure, in which case the City's Public Works Department shall designate an alternative location, type and/or size;
- New permanent replacement palm trees shall be a minimum 20 feet in height

2. The Contractor shall permanently replace trees within six (6) months of restoration and completion of that portion of streets that may impact the tree. To the extent feasible, the Contractor shall permanently replace trees on an ongoing basis so long as doing so does not conflict with future construction.
3. If construction of the project requires pruning of native tree species, the pruning shall be performed in a manner that does not cause permanent damage or adversely affect the health of the trees.
4. The Contractor shall coordinate with the City's Public Works Department to ensure that the tree removal and replacement plan is executed to the satisfaction of Public Works. The Contractor shall maintain all permanent trees and other landscaping installed by the Contractor for a period of three (3) years from the date of planting and shall warranty the trees and landscaping for one (1) year after planting. Prior to the end of the one-year warranty period, the City and the Contractor will conduct an inspection of all permanent replacement trees and landscaping for general health as a condition of final acceptance by the City. If, in the City's determination, a permanent replacement tree or landscaping does not meet the health requirements of the City, then the Contractor shall replace that tree within thirty (30) days. For any permanent trees or landscaping that must then be removed, the original warranty shall be deemed renewed commencing from when the tree or landscaping is replaced.

HAZARDOUS MATERIALS

1. **Building Demolition Plan**- Prior to any demolition occurring, the Contractor shall conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.
2. **Hazardous Materials Contingency Plan** – Prior to construction, the Contractor shall prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs), hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes encountered during construction. This plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.
3. **Soil Management Plan** – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared the Contractor shall prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials,

describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.

4. **Health and Safety Plan** – Prior to construction, the Contractor shall prepare a Health and Safety Plan to address the potential for exposure to the constituents of concern identified in the limited Phase II ESA.

BUSINESS AND COMMUNITY SUPPORT PROGRAMS

1. The Contractor and its consultants and contractors shall develop and submit **Business and Community Support Plans** to the City of Inglewood for the purpose of assisting those businesses financially affected by the construction performed. Business Support Plans shall address the following:

   - Advertising support in a local or regional newspaper, social media
   - Notice plans of the schedule for specific planned construction activities, changes in traffic flow, and required short-term modifications to property access
   - Notice plans to all affected property owners if utilities would be disrupted for short periods of time and scheduled major utility shut-offs during low-use periods of the day.
   - Methods by which business owners can convey their concerns about construction activities and the effectiveness of measures during the construction period so activities can be modified to reduce adverse effects.
   - Access plans that ensure that all businesses and service providers are provided with adequate access during construction. Where there is a significant LEP population, signage shall be provided in various languages (as appropriate).
   - Funding for temporary signage and advertising during construction to help businesses that are partially blocked or that have inconvenient access due to construction activity.

Establishment of Project Public Liaison Phone Line: The Contractor shall establish and fund a toll-free phone line that is available twenty-four (24) hours a Day to respond to concerns related to construction disturbances within the City. This phone line shall incorporate a construction relations phone line prompt for immediate live response. Contact information for the public liaison person and phone line shall be included in all Construction notices.

AIR QUALITY AND HEALTH RISK ASSESSMENT TECHNICAL REPORT

1.0 INTRODUCTION

This document presents the Air Quality and Health Risk Assessment Technical Report associated with the proposed Inglewood Transit Connector (proposed Project) in Inglewood, California.

To support the Inglewood Transit Connector Environmental Impact Report (EIR), three analyses were conducted: construction emissions inventories, dispersion modeling to support an ambient air quality standards analysis, and a health risk assessment (HRA). The ambient air quality standards analysis and HRA results are presented for both the Morning/Evening and Morning/Night construction scenarios (as described in the ITC Construction Scenario, June 2020). The analyses provide an estimate of the air emissions associated with the construction (off-road equipment along the proposed Project's alignment including the guideway, stations, and support facility sites, and off-site truck travel for the removal of debris and soils excavated during demolition and construction along nearby roadways) of the proposed Project. The potential air quality and health impacts that would result construction of the proposed Project have also been identified.

The supporting information, methodology, and assumptions used in the construction air emissions inventory, air quality dispersion modeling, HRA, and operational air emissions inventory are provided in:

- **Attachment A: Air Quality Dispersion Modeling Methodology and Assumptions,**
- **Attachment B: Health Risk Assessment Methodology and Assumptions,**
- **Attachment C: Supplemental Health Impact Information,**
- **Attachment D: TIRCP GHG Benefits Calculator Tool Memo, and**
- **Attachment E: Operational Air Emissions Inventory.**

Air quality impacts were determined for United States Environmental Protection Agency (USEPA) criteria pollutants such as carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter less than 10 micrometers (coarse particulate or PM_{10}), and particulate matter less than 2.5 micrometers (fine particulate or $PM_{2.5}$). The air quality analysis was developed based on the South Coast Air Quality Management District (SCAQMD) Modeling Guidance for AERMOD,[1] the USEPA *Guideline on Air Quality*

1 South Coast Air Quality Management District, SCAQMD Modeling Guidance for AERMOD, Accessed July 7, 2020 at: https://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance.

Models,[2] and the SCAQMD *Air Quality Handbook.*[3] The air quality analyses were conducted to determine the air quality impacts, in terms of ambient pollutant concentrations, using the significance levels identified by SCAQMD.[4]

The HRA focuses on impacts on existing residences and other sensitive populations from emissions of toxic air contaminants (TAC)[5] such as diesel particulate matter (DPM)[6] emissions from construction equipment and haul trucks associated with the proposed Project construction activities. The HRA was conducted to determine the health impacts, in terms of excess cancer risk and noncancer hazards, using the significance levels identified by the SCAQMD.[7] The HRA was prepared based on the California Office of Environmental Health Hazard Assessment (OEHHA)'s *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[8] and SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1* and *212.*[9]

2.0 PROJECT OVERVIEW

The proposed Project would provide a transit connection from the Metro Crenshaw/LAX Line in Downtown Inglewood to the Los Angeles Stadium and Entertainment District (LASED) area and would be designed to integrate with local economic activity, transit-oriented development, and other initiatives in the area. Up to three stations are proposed at the following locations: (1) Market Street near Florence Avenue in the vicinity of the Metro Crenshaw/LAX Line Downtown Inglewood Station; (2) near The Forum at Prairie Avenue and Pincay Street; and (3) near the LASED at Hollywood Park at Prairie Avenue and Hardy Street

2 United States Environmental Protection Agency, Guideline on Air Quality Models (Revised), 40 Code of Federal Regulations, Part 51, Appendix W, November 2005, Accessed July 6, 2020 at: https://www3.epa.gov/scram001/guidance/guide/appw_05.pdf.

3 South Coast Air Quality Management District, CEQA Air Quality Handbook, Accessed July 6, 2020 at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook.

4 South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, Accessed July 6, 2020 at: http://www.aqmd.gov/ceqa/hdbk.html.

5 Toxic air contaminants (TAC) are a broad class of compounds known to cause morbidity or mortality. TAC are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., gasoline service stations, dry cleaners). TAC are typically found in low concentrations, even near their source (e.g., diesel particulate matter near a freeway). Because chronic exposure can result in adverse health effects, TAC are regulated at the regional, state, and Federal level.

6 In 1998, the California Air Resources Board classified diesel particulate matter as a toxic air contaminant, citing its potential to cause cancer and other health problems. The United States Environmental Protection Agency concluded that long-term exposure to diesel engine exhaust is likely to pose a lung cancer hazard to humans and can also contribute to other acute and chronic health effects.

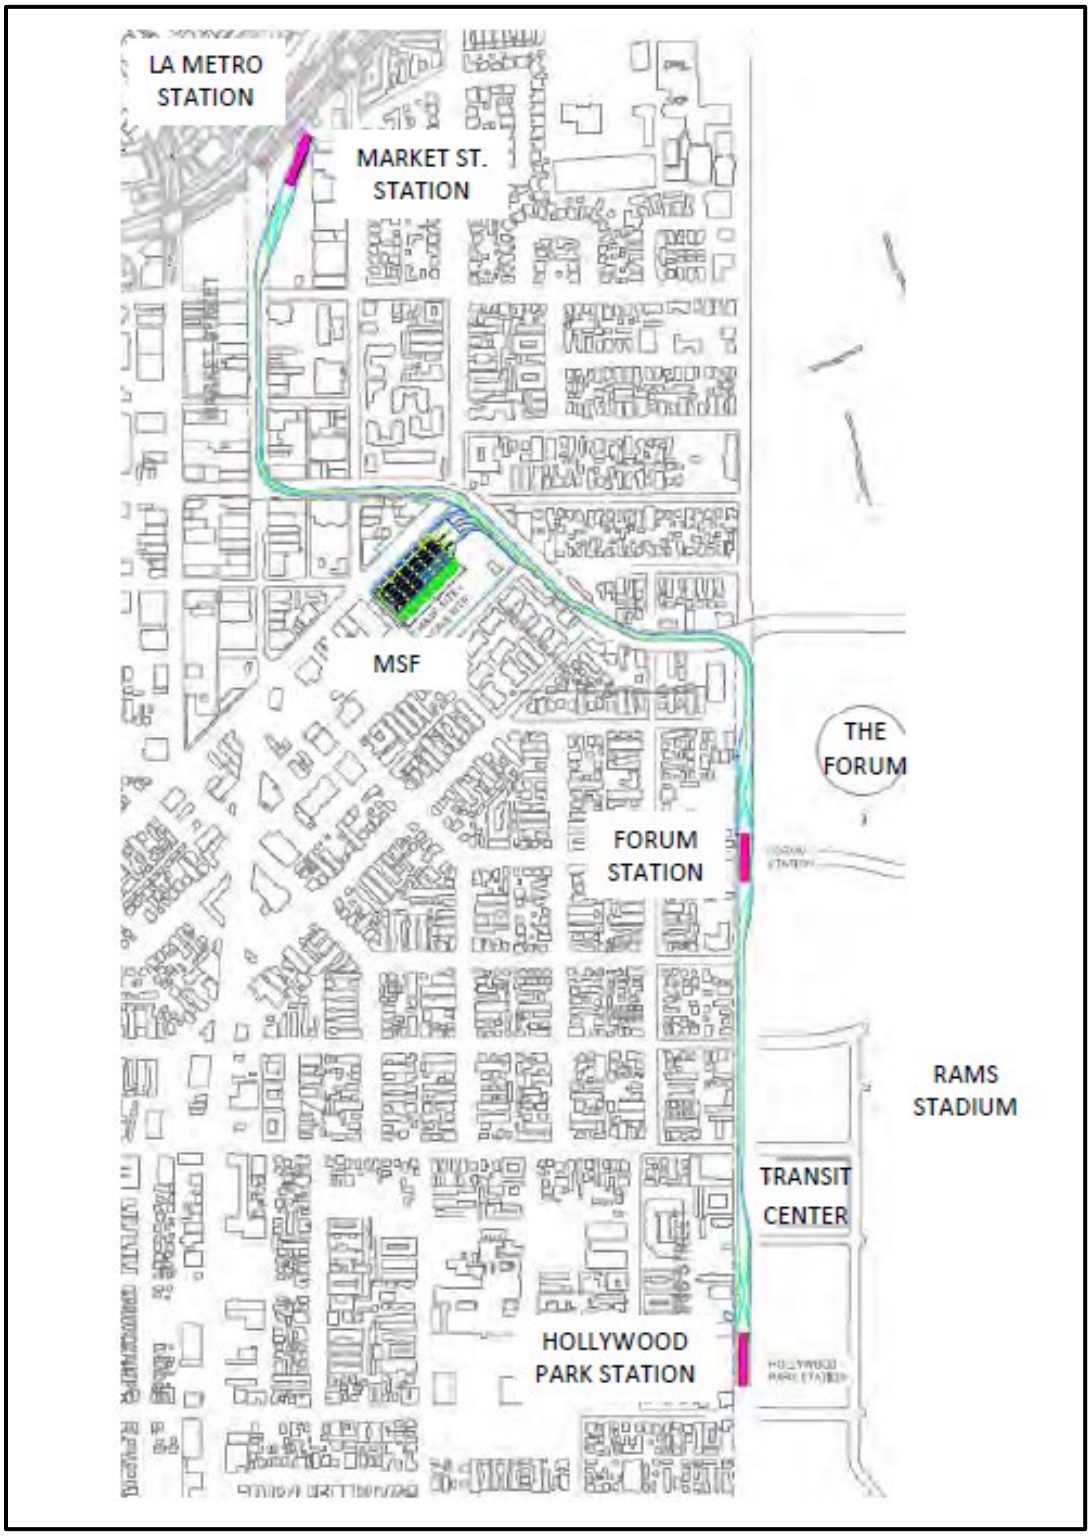
9 South Coast Air Quality Management District, Risk Assessment Procedures for Rule 1401, 1401.1 and 212, September 1, 2017, Accessed July 6, 2020 at: http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12.



The proposed Project would consist of an elevated, automated people mover (APM) system with dual guideways to allow for continuous trains to travel in each direction. The Project extends from the intersection with the Metro Crenshaw/LAX Line north of downtown Inglewood, southwest for approximately a quarter of a mile to the intersection of Market Street and Regent Street, continue south on Market Street, then east on Manchester Boulevard, turning south on Prairie Avenue until its intersection with Hardy Street. Potential sites for Project support facilities are adjacent to the APM alignment. **Figure 1: Project Location Map** shows the Project location and surrounding area. Construction activities are expected to commence in the early 2022 and be completed in mid-2026.

The first phase would include the demolition of property acquisitions, building demolitions, utility relocations, cast-in-place (CIP) columns and slabs, and foundations for the initial construction of the Maintenance and Storage Facility (MSF). The first phase of construction would be the demolition of the commercial property for the Market Street/Florence Avenue Station at the existing commercial center at on the southeast corner of Market Street and Florence Avenue (approximately 137,525 SF), the existing commercial plaza at 500 and 510 Manchester Boulevard (the Vons store and gas station; approximately 76,604 SF), and the commercial building at 150 South Market Street on the southeast corner of Manchester and Market Street (approximately SF). Additional work in the area will commence in Phases 2 and 3 4for the completion of the aerial guideway construction of the APM and the three stations.

After the demolition, the remaining asphalt flatwork area within the lot will provide suitable space for construction staging including but not limited to space for equipment storage, material staging and storage, temporary concrete batch plants, if needed, contractor jobsite trailers, and on-site parking for construction staff throughout the entire project duration. The first phase of construction would occur between the early 2022 and the end of 2023 (including site preparation, staging, and cleanup).

The second phase would include enabling the construction sequence of the APM guideway along Prairie Avenue from the Hardy Street intersection to Manchester Boulevard. This phase includes demolition, utility relocations, foundations, CIP columns, straddle bents and the precast trapezoidal troughs and girders, and the construction of the MSF. The second phase of construction would occur between early 2023 and early 2025 (including site preparation, staging, and cleanup).

Figure 1 Project Location Map

The third phase would include enabling the construction sequence of the APM guideway along Manchester Boulevard from Prairie Avenue to Market Street, and Market Street from Manchester Boulevard to Florence Avenue. The work will include an above-ground pedestrian access walkway to the Metro Crenshaw/LAX Line's Downtown Inglewood Station, property acquisitions, building demolition, utility relocation, foundations, CIP columns, straddle bents and the precast trapezoidal troughs and girders. This phase includes site work completion to the MSF. The third phase of construction would occur between early 2024 and early 2026 (including site preparation, staging, and cleanup).

The fourth phase would include enabling the completion of the aerial construction elements including the installation of the APM system's operations, track work, station platform equipment and systems, completion of the traction power substations, testing and commissioning of the full APM system, completion of all surface construction activities including but not limited to all electrical, mechanical and utilities energizations. Additional work in the area will commence in Phase 4 for the APM system installation, testing and commissioning of the system. The fourth phase of construction would occur between late 2025 and mid-2026 (including site preparation, staging, and cleanup).

The following presents the schedule under which use of construction equipment and haul trucks would occur:

- **Phase 1 (Demolition):** April 15, 2022 – March 15, 2023
- **Phase 1 (MSF Construction):** February 2, 2023 – December 18, 2023
- **Phase 2:** March 24, 2023 – February 10, 2025
- **Phase 3:** February 14, 2024 – February 2, 2026
- **Phase 4:** October 31, 2025 – May 28, 2026

Construction activity would primarily occur over a 16 hour / day schedule with two shifts, both a morning shift from approximately 7:00 AM to 3:00 PM and an evening shift from approximately 3:00 PM to 11:00 PM, or a morning shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM. Other minimal construction work could occur during other hours at a reduced intensity. Delivery of construction materials would occur during the night shift, as would most lane closures. These shifts are intended to minimize impacts to daily commuter traffic and potential event traffic. Delivery of construction materials would occur during the night shift, as would most lane closures.

Pursuant to Section 5-41 of the Inglewood Municipal Code, construction between the hours of 8:00 PM. and 7:00 AM of the next day will require a permit from the Permits and License Committee of the City. The proposed Project would secure a permit(s) from the Permits and License Committee to allow for

construction work activities to occur between the hours of 8:00 PM and 7:00 AM. The ambient air quality standards analysis and HRA results are presented for both the Morning/Evening and Morning/Night construction scenarios.

3.0 ANALYSIS METHODOLGY

Intermittent, short-term construction emissions that occur from activities such as demolition, site-grading, and concrete construction were evaluated. Regulatory models used to estimate air quality and health impacts include:

- California Air Resources Board's (CARB) EMFAC2017[10] emissions inventory model. EMFAC2017 is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC2017 can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.
- CARB OFFROAD2017[11] emissions inventory model. OFFROAD is the latest emission inventory model that calculates emission inventories and emission rates for off-road equipment such as loaders, excavators, and off-road haul trucks operating in California. This model reflects CARB's current understanding of how equipment operates and how much they emit. OFFROAD can be used to show how California off-road equipment emissions have changed over time and are projected to change in the future.
- American Meteorological Society/USEPA Regulatory Model (AERMOD). AERMOD (Version 19191) is an atmospheric dispersion model which can simulate point, area, volume, and line emissions sources and has the capability to include simple, intermediate, and complex terrain along with meteorological conditions and multiple receptor locations.[12,13] AERMOD is commonly executed to yield 1-hour maximum and annual average concentrations (in parts per million or ppm and micrograms per cubic meter or µg/m3) at each receptor. AERMOD is used to estimate air concentrations at nearby receptors resulting from the activities associated with an air emission source (such as construction equipment).

4.0 EXISTING CONDITIONS

The proposed Project is located in Los Angeles County (County) within the South Coast Air Basin (SCAB or Basin). The Basin is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties.

Regional Meteorology

Air quality is affected by the rate, amount, and location of pollutant emissions and the associated meteorological conditions that influence pollutant movement and dispersal. Atmospheric conditions, including wind speed, wind direction, stability, and air temperature, in combination with local surface topography (i.e., geographic features such as mountains, valleys, and Pacific Ocean), determine the effect of air pollutant emissions on local air quality.

In general, Southern California has a warm, dry Mediterranean climate; hot in the summer and mild in the winter. Temperatures are cooler near the coast and hotter near inland areas. Most of the precipitation occurs as rain during the winter months, although rain showers are common during the summer in higher-elevation desert areas. Average annual precipitation is approximately 19 inches and temperatures reach 90 degrees Fahrenheit 100 days of the year on average. August daily highs average 95 degrees while daily lows average 64 degrees Fahrenheit. January typically exhibits average daily highs of 68 degrees and average daily lows of 43 degrees Fahrenheit. The predominant wind directions are either out of the northwest or southeast. Gusts greater than 15 miles per hour occur infrequently, less than two percent of the time.

Basin climate increases the potential to create air pollution problems. Air quality within the Basin generally rates from fair to poor. Sinking or subsiding air from the Pacific High-Pressure System creates a temperature inversion (known as a subsidence inversion), which acts as a lid to vertical movement of air masses and dispersion of pollutants. The lower bound of this inversion at any given time is known as the "mixing height." Restricted maximum mixing heights are 3,500 feet above sea level or less. Weak summertime pressure gradients suppress winds and further limit horizontal dispersion of pollutants in the mixed layer below the subsidence inversion. Poorly dispersed anthropogenic (human-made) emissions, combined with strong sunshine, lead to photochemical reactions that create ozone (O_3) in this surface layer. Daytime onshore air flow (i.e., sea breeze) and nighttime offshore flow (i.e., land breeze) are quite common in Southern California. The sea breeze helps to moderate daytime temperatures and leads to air pollutants being blown out to sea at night and returning to land the following day.

Nearby Sensitive Receptors

Land uses such as schools, children's daycare centers, hospitals, and convalescent homes are considered to be more sensitive than the general public to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress. Persons engaged in strenuous work or exercise also have increased sensitivity to poor air quality. The CARB and SCAQMD has identified the following people as most likely to be affected by air pollution: children less than 14 years of age, the elderly over 65 years of age, athletes, and those with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive population groups.

Residential areas are considered more sensitive to air quality conditions than commercial and industrial areas because people generally spend longer periods of time at their residences, resulting in greater exposure to ambient air quality conditions. Recreational uses are also considered sensitive, due to the greater exposure to ambient air quality conditions and because the presence of pollution detracts from the recreational experience. Off-site workers are also considered sensitive receptors by the SCAQMD.

Local Air Quality

The SCAQMD maintains a network of monitoring stations within the Air Basin that monitor air quality and compliance with applicable ambient standards. The nearest air monitoring station which measures CO, NO_2, SO_2, and PM_{10} is located near Los Angeles International Airport (7201 West Westchester Parkway, Southwest Coastal LA County, Station 820), four miles to the west of the Project alignment. The nearest air monitoring station which measures $PM_{2.5}$ is located in central Los Angeles (1630 North Main Street, Central LA, Station 087), ten miles to the northeast of the Project alignment.

Table 1: **Air Quality Data Summary** summarizes the most recent three years of data (2017 through 2019) from the nearby air monitoring stations. The ozone standard was not exceeded. The State annual PM_{10} standard was exceeded in 2018 and the State 24-hour PM_{10} standard was exceeded in 2019. The State annual $PM_{2.5}$ standard was exceeded in 2018 and the State 24-hour $PM_{2.5}$ standard was exceeded in 2019. No other exceedances were observed at the nearby air monitoring stations in 2017 through 2019.

Table 1
Air Quality Data Summary (2017 - 2019)

Pollutant	Monitoring Data by Year			
	Standard[s]	***2017***	***2018***	***2019***
Ozone				
Highest 1 Hour Average (ppm)	0.09	0.086	0.074	0.082
Days over State Standard	—	0	0	0
Highest 8 Hour Average (ppm)	0.070	0.070	0.065	0.067
Days over National Standard	—	0	0	0
Days over State Standard	—	0	0	0
Nitrogen Dioxide				
Highest 1 Hour Average (ppm)	0.180/0.100	0.072	0.060	0.057
Days over State Standard	—	0	0	0
Annual Average (ppm)	0.030/0.053	0.009	0.009	0.010
Carbon Monoxide				
Highest 1 Hour Average (ppm)	20.0	2.1	1.8	1.8
Days over State Standard	—	0	0	0
Highest 8 Hour Average (ppm)	9.0	1.6	1.5	1.3
Days over State Standard	—	0	0	0
Particulate Matter (PM10)				
Highest 24 Hour Average ($\mu g/m^3$)	50	46	45	**62**
Days over State Standard	—	0	0	2
State Annual Average ($\mu g/m^3$)	20	19.8	**20.5**	19.2
Particulate Matter (PM2.5)				
Highest 24 Hour Average ($\mu g/m^3$)	35	27.8	30.5	**43.5**
Days over National Standard	—	0	0	1
State Annual Average ($\mu g/m^3$)	12	11.9	**12.6**	10.9

*Notes: Values in **bold** are in excess of at least one applicable standard.*
Generally, State and national standards are not to be exceeded more than once per year.
ppm = parts per million; $\mu g/m^3$ = micrograms per cubic meter.
PM_{10} is not measured every day of the year. Number of estimated days over the standard is based on 365 days per year.
Source: South Coast Air Quality Management District, Annual Air Quality Summaries, Accessed July 7, 2020 at: http://www.aqmd.gov/home/air-quality/air-quality-data-studies/historical-data-by-year.

Adjusted Baseline

The Hollywood Park Specific Plan (HPSP) project is located adjacent to the project site. Related to air quality, the changes associated with the HPSP Adjusted Baseline, currently under development and/or operational, include operational air emissions associated with new uses in the HPSP area. The HPSP Adjusted Baseline would emit air pollutants associated with vehicle trips, maintenance operations, energy consumption from all of its operational land uses. Specifically, vehicle trips associated with activities at the HPSP began taking place during 2020 when the NFL Stadium began operations and uses are operating on the site and have an impact on local and regional air quality. Accordingly, the air pollutant emissions associated with the HPSP area were considered as part of an Adjusted Baseline.

Regional air emissions from the Proposed Project were assessed based on the incremental increase in emissions compared to existing conditions (that is, project-related), consistent with SCAQMD methodology. This methodology measures the incremental project contributions only and compares to project-level significance thresholds and so the Adjusted Baseline conditions are not relevant to the mass emissions threshold (**Section 8**).

The localized air quality analysis includes the Proposed Project impacts on local air quality concentrations of PM_{10} and $PM_{2.5}$. However, given the regional nonattainment status, the significance threshold is also only a project-related impact analysis. Thus, the Adjusted Baseline is not relevant to the PM_{10} and $PM_{2.5}$ localized air quality analysis for the Proposed Project (**Section 9**).

However, the localized air quality analysis includes the Proposed Project impacts on local air quality concentrations of CO, SO_2, and NO_2. The project-related concentrations would be added to the existing concentration from a nearby monitoring station. The Adjusted Baseline would emit air pollutants associated with vehicle trips, maintenance operations, energy consumption from all of its operational land uses concurrently during Proposed Project construction. Specifically, Adjusted Baseline activities would begin taking place during 2020 when the NFL Stadium begins operations and uses are operating on the site and would have an impact on local and regional air quality (which would not be accounted for in the existing monitoring data). Therefore, the project-related concentrations would be added to the existing concentration from a nearby monitoring station plus the concentrations associated with the Adjusted Baseline and the total would be compared to the CO, SO_2, and NO_2 NAAQS and CAAQS (**Section 9**).

The health impacts are also based on the maximum project-level incremental impact compared to a project-level significance thresholds (that is, does the project itself contributed significantly to the local health of nearby receptors). For this reason, the Adjusted Baseline is not relevant to the health impact analysis for the Proposed Project (**Section 10**).

Similarly, although the Adjusted Baseline has been constructed and in operation prior to start of construction of the Proposed Project, its potential impact on global emissions would not affect the threshold of significance or the impact analysis regarding GHG emissions from the Proposed Project (which is also based on project-level incremental contribution). For this reason, the Adjusted Baseline is not relevant to the GHG impact analysis for the Proposed Project (**Section 11**).

5.0 REGULATORY CONTEXT

USEPA has established the National Ambient Air Quality Standards (NAAQS) under the Clean Air Act (CAA) for six common air pollutants known as "criteria pollutants."[14] These air pollutants consist of CO, NO_2, ozone (O_3), particulate matter (PM_{10} and $PM_{2.5}$), SO_2, and lead (Pb). An ambient air quality standard establishes the concentration above which the pollutant is known to cause adverse health effects to sensitive groups within the population such as children and the elderly. Ambient air quality standards are classified as either "primary" or "secondary" standards. Primary standards define levels of air quality, including an adequate margin of safety, necessary to protect the public health. Secondary ambient air quality standards define levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant. The ambient air quality standards are shown in **Table 2: State and National Criteria Air Pollutant Standards, Effects, and Sources**.

Under the federal CAA, USEPA designate air basins where NAAQS are exceeded as "nonattainment" areas. If standards are met, the area is designated as an "attainment" area. If there are inadequate or inconclusive data to make a definitive attainment designation, they are considered "unclassified." Areas where air pollution levels persistently exceed the State or national ambient air quality standards are designated "nonattainment." Federal nonattainment areas are further designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards. The South Coast Air Basin portion of the County is in nonattainment status for the federal ozone, lead, and $PM_{2.5}$; and in attainment for the federal CO, NO_2, SO_2, and PM_{10}.[15]

CARB manages air quality, regulates mobile emissions sources, and oversees the activities of county and regional Air Pollution Control Districts and Air Quality Management Districts. CARB regulates local air quality indirectly by establishing State ambient air quality standards and vehicle emissions and fuel standards; and by conducting research, planning and coordinating activities. California has adopted ambient standards (known as California Ambient Air Quality Standards or CAAQS) that are more stringent

14 United States Environmental Protection Agency, Six Common Air Pollutants, Accessed July 6, 2020 at: https://www.epa.gov/criteria-air-pollutants.

15 United States Environmental Protection Agency, The Green Book Nonattainment Areas for Criteria Pollutants, Accessed July 6, 2020 at: https://www.epa.gov/green-book.

than the federal standards for some criteria air pollutants. Under the California Clean Air Act patterned after the CAA, areas have been designated as attainment or nonattainment with respect to the State standards. The South Coast Air Basin portion of the County is in nonattainment status for the State ozone, PM_{10}, and $PM_{2.5}$; and is in attainment status for CO, NO_2, and SO_2.[16, 17]

The SCAQMD has jurisdiction over an area of approximately 10,743 square miles. The South Coast Air Basin is a sub-region of the SCAQMD jurisdiction. While air quality in this area has improved, the Basin requires continued diligence to meet air quality standards. The SCAQMD has adopted a series of Air Quality Management Plans to meet the CAAQS and NAAQS. These plans require control technology for existing sources, control programs for area sources and indirect sources, a SCAQMD permitting system designed to allow no net increase in emissions from any new or modified permitted emission sources and transportation control measures.

On March 3, 2017, the SCAQMD adopted the 2016 Air Quality Management Plan (AQMP) which includes strategies and measures needed to meet the NAAQS. The AQMP demonstrates attainment of the ozone NAAQS as well as the latest $PM_{2.5}$ standards.[18] The SCAQMD also adopts rules and regulations to implement portions of the AQMP. On October 1, 2015, the USEPA strengthened the NAAQS for ground-level ozone, lowering the primary and secondary ozone standard levels to 70 ppb. The South Coast Air Basin is classified as an "extreme" nonattainment area and the Coachella Valley is classified as a "severe-15" nonattainment area for the 2015 Ozone NAAQS. The upcoming 2022 AQMP will be developed to address the requirements for meeting this standard. For the proposed Project, the relevant SCAQMD rules and regulations include:

- **Rules 201 and 203 (Permits to Construct and Operate**): These rules require that owners of applicable construction or operation equipment obtain written permits from the SCAQMD prior to construction and operation.

18 South Coast Air Quality Management District, 2016 Air Quality Management Plan, March 1, 2017, Accessed July 6, 2020 at: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan.

Table 2
State and National Criteria Air Pollutant Standards, Effects, and Sources

Pollutant	Averaging Time	State Standard	National Standard	Pollutant Health and Atmospheric Effects	Major Pollutant Sources
Ozone	1 Hour 8 Hour	0.09 ppm 0.07 ppm	– 0.070 ppm	High concentrations can directly affect lungs, causing irritation. Long–term exposure may cause damage to lung tissue.	Formed when reactive organic gases and nitrogen oxides react in the presence of sunlight. Major sources include on–road motor vehicles, solvent evaporation, and commercial / industrial mobile equipment.
Carbon Monoxide (CO)	1 Hour 8 Hour	20 ppm 9.0 ppm	35 ppm 9.0 ppm	Classified as a chemical asphyxiant, carbon monoxide interferes with the transfer of fresh oxygen to the blood and deprives sensitive tissues of oxygen.	Internal combustion engines, primarily gasoline–powered motor vehicles.
Nitrogen Dioxide (NO_2)	1 Hour Annual	0.18 ppm 0.03 ppm	0.10 ppm 0.053 ppm	Irritating to eyes and respiratory tract. Colors atmosphere reddish–brown.	Motor vehicles, petroleum–refining operations, industrial sources, aircraft, ships, and railroads.
Sulfur Dioxide (SO_2)	1 Hour 3 Hour 24 Hour Annual	0.25 ppm – 0.04 ppm –	0.075 ppm 0.5 ppm 0.14 ppm 0.030 ppm	Irritates upper respiratory tract; injurious to lung tissue. Can yellow the leaves of plants, destructive to marble, iron, and steel. Limits visibility and reduces sunlight.	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
Respirable Particulate Matter (PM_{10})	24 Hour Annual	50 µg/m^3 20 µg/m^3	150 µg/m^3 –	May irritate eyes and respiratory tract, decreases in lung capacity, cancer and increased mortality. Produces haze and limits visibility.	Dust and fume–producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind–raised dust and ocean sprays).
Fine Particulate Matter ($PM_{2.5}$)	24 Hour Annual	– 12 µg/m^3	35.0 µg/m^3 12.0 µg/m^3	Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and results in surface soiling.	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning; Also, formed from photochemical reactions of other pollutants, including nitrogen oxides, sulfur oxides, and organics.
Lead (Pb)	Month Rolling 3 Month	1.5 µg/m^3 –	– 0.15 µg/m^3	Disturbs gastrointestinal system, and causes anemia, kidney disease, and neuromuscular and neurological dysfunction.	Present sources: lead smelters, battery manufacturing & recycling facilities. Past source: combustion of leaded gasoline.

Source: Air Quality Standards, https://ww2.arb.ca.gov/resources/background-air-quality-standards.

- **Rule 402 (Nuisance):** This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.
- **Rule 403 (Fugitive Dust):** This rule requires fugitive dust sources to implement Best Available Control Measures for all sources, and all forms of visible particulate matter are prohibited from crossing any property line. SCAQMD Rule 403 is intended to reduce PM10 emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust.
- **Rule 1113 (Architectural Coatings):** This rule requires manufacturers, distributors, and end-users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.
- **Rule 2202 (Employee Commute Reduction Program Guidelines)**: This rule is designed to assist employers in understanding the development and implementation requirements of the Employee Commute Reduction Program (ECRP) at their worksites. The ECRP focuses on reducing work related vehicle trips and vehicle miles traveled to a worksite with the purpose of achieving and maintaining the employers' designated average vehicle ridership targets.

A fugitive dust control program pursuant to the provisions of SCAQMD Rules 402 and 403 shall be implemented. This program shall include, but not be limited to the following:

- Prior to start of the initial on-site construction, the City Engineer shall confirm that the proposed construction plan is in compliance with SCAQMD Rule 403, fugitive dust shall be controlled by the applicable best available control measures listed in Table 1 of Rule 403.
- Water or a stabilizing agent shall be applied at least three times daily, preferably in the mid-morning, afternoon, and after work is done for the day, to exposed surfaces including graded and disturbed areas in sufficient quantity to prevent generation of dust plumes.
- Track-out shall not extend 25 feet or more from an active operation and track-out shall be removed at the conclusion of each workday. The contractor shall use a gravel apron, 25 feet long by road width, or a pipe-grid track-out control device to reduce mud/dirt track-out from active operations and unpaved truck exit routes.
- A wheel washing system shall be installed and used to remove bulk material from tires and vehicle undercarriages before vehicles exit the Project alignment.
- All trucks hauling dirt, sand, soil, or other loose materials are to be covered (e.g., with fabric tarps or other enclosures that would reduce fugitive dust emissions) and maintain a freeboard height of 12 inches, in accordance with California Vehicle Code Section 23114 (freeboard means vertical space between the top of the load and top of the trailer).
- Traffic speeds on unpaved roads shall be limited to 15 miles per hour.

- Operations on unpaved surfaces shall be suspended when winds exceed 25 miles per hour.
- On-site stockpiles shall be covered or watered at least twice per day.

Criteria Air Pollutants

The following provides a brief summary of the potential health and welfare effects and typical sources of each of the criteria air pollutants and air toxics.

Ozone

Ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and that can cause substantial damage to vegetation and other materials. O_3 is not emitted directly into the atmosphere but is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving volatile organic compounds (VOC) and NO_x. VOC and NO_x are known as precursor compounds for O_3. Substantial ozone production generally requires O_3 precursors to be present in a stable atmosphere with strong sunlight for approximately three hours. O_3 is a regional air pollutant because it is not emitted directly by sources but is formed downwind of sources of VOC and NO_x under the influence of wind and sunlight. O_3 concentrations tend to be higher in the late spring, summer, and fall, when long sunny days combine with regional air subsidence inversions to create conditions conducive to the formation and accumulation of secondary photochemical compounds.

Carbon Monoxide

CO is a nonreactive pollutant that is a product of incomplete combustion of organic material, and is mostly associated with motor vehicle traffic, and in wintertime, with wood–burning stoves and fireplaces. High CO concentrations develop primarily during winter when periods of light winds combine with the formation of ground–level temperature inversions (typically from the evening through early morning). These conditions result in reduced dispersion of vehicle emissions. Motor vehicles also exhibit increased CO emission rates at low air temperatures.

When inhaled at high concentrations, CO combines with hemoglobin in the blood and reduces its oxygen-carrying capacity, resulting in reduced levels of oxygen reaching the brain, heart, and other body tissues. This condition is especially critical for people with cardiovascular diseases, chronic lung disease, or anemia. CO measurements and modeling were important in the early 1980s when CO levels were regularly exceeded throughout California, but in more recent years, CO measurements and modeling are not a priority in most California air districts due to the retirement of older vehicles, fewer emissions from new vehicles, and improvements to fuels.

Nitrogen Oxides

When combustion temperatures are extremely high, as in aircraft, truck and automobile engines, atmospheric nitrogen combines with oxygen to form various oxides of nitrogen. Nitric oxide (NO) and NO_2 are the most significant air pollutants generally referred to as NO_x. Nitric oxide is a colorless and odorless gas that is relatively harmless to humans, quickly converts to NO_2 and can be measured. Nitrogen dioxide has been found to be a lung irritant capable of producing pulmonary edema. Inhaling NO_2 can lead to respiratory illnesses such as bronchitis and pneumonia.

Volatile Organic Compounds

VOC means any compound of carbon, excluding carbon monoxide, carbon dioxide (CO_2), carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions and thus, a precursor of ozone formation. VOC are any reactive compounds of carbon, excluding methane, CO, CO_2, carbonic acid, metallic carbides or carbonates, ammonium carbonate, and other exempt compounds.

VOC include a variety of chemicals, some of which may have short- and long-term adverse health effects. VOC are emitted by a wide array of products numbering in the thousands. Examples include paints and lacquers, paint strippers, cleaning supplies, building materials and furnishings, as well as fuel storage and use.

VOC can cause eye, nose, and throat irritation; headaches, loss of coordination, nausea; and damage to liver, kidney, and central nervous system. Some organics can cause cancer in animals; some are suspected or known to cause cancer in humans. The ability of organic chemicals to cause health effects varies greatly from those that are highly toxic, to those with no known health effect. As with other pollutants, the extent and nature of the health effect will depend on many factors including level of exposure and length of time exposed. Eye and respiratory tract irritation, headaches, dizziness, visual disorders, and memory impairment are among the immediate symptoms that some people have experienced soon after exposure to some organics.

Particulate Matter

PM_{10} and $PM_{2.5}$ consist of airborne particles that measure 10 micrometers or less in diameter and 2.5 micrometers or less in diameter, respectively. PM_{10} and $PM_{2.5}$ represent fractions of particulate matter that can be inhaled into the air passages and the lungs, causing adverse health effects. Particulate matter in the atmosphere results from many kinds of dust- and fume-producing industrial and agricultural operations, fuel combustion, wood burning stoves and fireplaces, and atmospheric photochemical reactions. Some sources of particulate matter, such as demolition, construction activities and mining, are

more local in nature, while others such as vehicular traffic and wood burning stoves and fireplaces, have a more regional effect.

Very small particles of certain substances (e.g., sulfates and nitrates) can cause lung damage directly, or can contain adsorbed gases (e.g., chlorides or ammonium) that may be injurious to health. Particulates can also damage materials and reduce visibility. Dust comprised of large particles (diameter greater than 10 micrometers) settles out rapidly and is easily filtered by human breathing passages. This dust is of concern more as a soiling nuisance rather than a health hazard. The remaining fractions, PM_{10} and $PM_{2.5}$, are a health concern particularly at levels above the federal and California ambient air quality standards. $PM_{2.5}$ (including diesel exhaust particles) is thought to have greater effects on health, because these particles are so small and thus penetrate to the deepest parts of the lungs.

Acute and chronic health effects associated with high particulate levels include the aggravation of chronic respiratory diseases, heart and lung disease, coughing, bronchitis, and respiratory illnesses in children. Mortality studies since the 1990s have shown a statistically significant direct association between mortality (premature deaths) and daily concentrations of particulate matter in the air. Despite important gaps in scientific knowledge and continued reasons for some skepticism, a comprehensive evaluation of the research findings provides persuasive evidence that exposure to fine particulate air pollution has adverse effects on cardiopulmonary health. The CARB has estimated that achieving the ambient air quality standards for PM_{10} could reduce premature mortality rates by 6,500 cases per year.

Sulfur Dioxide

SO_2 is a combustion product of sulfur or sulfur–containing fuels such as coal and diesel. SO_2 is also a precursor to the formation of atmospheric sulfate and particulate matter and contributes to potential atmospheric sulfuric acid formation that could precipitate downwind as acid rain.

Lead

Ambient lead concentrations meet both the federal and State standards in the Project area. Lead has a range of adverse neurotoxin health effects and was released into the atmosphere via leaded gasoline products. The phase-out of leaded gasoline in California has resulted in dramatically decreased levels of atmospheric lead. Metal processing is currently the primary source of lead emissions in the SCAB. The highest concentrations of lead in air are generally found near lead smelters and general aviation airports; where piston aircraft use leaded fuel. Other stationary sources that generate lead emissions include waste incinerators, utilities, and lead-acid battery manufacturers. The maximum lead concentrations recorded in the Project area is below federal and California standards. Notably, diesel fuel does not contain lead emissions and gasoline fuel is unleaded.

Toxic Air Contaminants

Non-criteria air pollutants or toxic air contaminants (TAC) are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TAC include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TAC includes approximately 240 compounds, including particulate emissions from diesel-fueled engines and asbestos.

In August of 1998, CARB identified particulate emissions from diesel-fueled engines as TAC. CARB developed the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*[19] and *Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines.*[20] The document represents a proposal to reduce diesel particulate emissions, with the goal to reduce emissions and the associated health risk by 75 percent in 2010 and 85 percent in 2020.[21] The program aims to require the use of state-of-the-art catalyzed diesel particulate filters and ultra-low sulfur diesel fuel on diesel-fueled engines.

Diesel particulate matter (DPM) is the most complex of diesel emissions. Diesel particulates, as defined by most emission standards, are sampled from diluted and cooled exhaust gases. This definition includes both solid and liquid material that condenses during the dilution process. The basic fractions of DPM are elemental carbon; heavy hydrocarbons derived from the fuel and lubricating oil and hydrated sulfuric acid derived from the fuel sulfur. DPM contains a large portion of the polycyclic aromatic hydrocarbons (PAH) found in diesel exhaust. Diesel particulates include small nuclei particles of diameters below 0.04 micrometers (µm) and their agglomerates of diameters up to 1 µm. DPM is a major factor in total TAC exposure in California.

California State law defines TAC as air pollutants having carcinogenic effects. A total of 243 substances have been designated as TAC under California law; they include the 187 (federal) hazardous air pollutants (HAP) adopted in accordance with AB 2728. The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) seeks to identify and evaluate risk from air toxics sources but AB 2588 does not regulate air toxics emissions. TAC emissions from individual facilities are quantified and prioritized. Depending on the risk levels, emitting facilities are required to implement varying levels of risk reduction measures.

20 California Air Resources Board, Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines, October 2000. Accessed July 6, 2020 at https://www.arb.ca.gov/diesel/documents/rmgFinal.pdf.

21 Generally, there was a 60 percent reduction in health risks from 2005 through 2015, based on the SCAQMD Multiple Air Toxics Exposure Study.

In 2005, the SCAQMD conducted a comprehensive study on air toxics in the SCAB called the Multiple Air Toxics Exposure Study (MATES-III). The monitoring program measured more than 30 air pollutants, including both gas and particulates. The monitoring study was accompanied by a computer modeling study in which SCAQMD estimated the risk of cancer from breathing toxic air pollution throughout the region based on emissions and weather data. MATES-III found that the average cancer risk in the region from carcinogenic air pollutants ranges from approximately 870 in a million to 1,400 in a million, with an average regional risk of approximately 1,200 in a million.[22]

In 2015, the Multiple Air Toxics Exposure Study IV (MATES IV) is a follow up to previous air toxics studies in the Basin. The MATES IV Study includes an updated emissions inventory of toxic air contaminants and a modeling effort to characterize risk across the SCAB. The study focuses on the carcinogenic risk from exposure to air toxics but does not estimate mortality or other health effects from particulate exposures. An additional focus of MATES IV is the inclusion of measurements of ultrafine particle concentrations. Results for MATES-IV show that trends in monitored levels air toxics continue to decline, modeled exposures and risks were substantially lower compared to MATES III (approximately 60 percent decrease), and DPM remains the largest component of air toxics estimated risk, at approximately 68 percent of the South Coast Air Basin wide cancer risk of 418 per million persons, ranging from 320 to 480 per million persons. Based on data within MATES-IV, the proposed Project is within an area with an estimated cancer risk of 1,001 to 1,200 per million persons.[23]

6.0 THRESHOLDS OF SIGNIFICANCE

Because of the SCAQMD's regulatory role in the Basin, the significance thresholds and analysis methodologies in the SCAQMD's *CEQA Air Quality Handbook* are used in evaluating project impacts for construction, operations, and air toxics.[24] These significance thresholds, under which the proposed Project was evaluated, are described within the following section. The proposed Project would result in a significant construction air quality impact if the Project exceeds the concentration significance thresholds set forth in **Table 3: Ambient Air Quality Significance Thresholds for Criteria Pollutants**. Per SCAQMD guidance, the evaluated concentrations of CO, NO_2, and SO_2 included both the Project contribution plus background concentrations. The total concentration is then compared to the significance thresholds. For CO, NO_2, and SO_2, these significance thresholds are reflective of the CAAQS and NAAQS. Background

22 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-III) in the South Coast Air Basin, September 2008, Accessed July 6, 2020 at: https://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iii.

23 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-IV) in the South Coast Air Basin, May 1, 2015, Accessed July 6, 2020 at: http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iv.

24 South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, Accessed July 6, 2020 at: http://www.aqmd.gov/ceqa/hdbk.html.

concentration were based on existing air monitoring stations near the Project alignment and represent existing air emissions sources within the Air Basin. Further information on the background concentrations is provided in **Attachment A: Air Quality Dispersion Modeling Methodology and Assumptions**. Per SCAQMD guidance, the Project contribution of PM_{10} and $PM_{2.5}$ is compared to the significance thresholds without adding background concentrations.

The proposed Project would also result in a significant health impact if the carcinogenic or toxic air contaminants individually or cumulatively are equal to or exceed the maximum individual cancer risk of ten in one million persons or an chronic and acute hazard index of 1.0 or the cancer burden of 0.5 excess cancer cases (in areas greater than or equal to one in one million).[25]

Table 3
Ambient Air Quality Significance Thresholds for Criteria Pollutants

Pollutant	Averaging Period	Pollutant Concentration Threshold
CO	1-hour /8-hour	SCAQMD is in attainment (federal and State); project is significant if it causes or contributes to an exceedance of the attainment standards of 20 ppm (1-hour) and 9 ppm (8-hour)
NO_2	1-hour	SCAQMD is in attainment (federal and State); project is significant if it causes or contributes to an exceedance of the following attainment standard 0.18 ppm (State) and 0.10 ppm (federal)
	Annual	0.03 ppm (state) and 0.0534 ppm (federal)
PM_{10}	24-hour	10.4 µg/m^3 (construction) and 2.5 µg/m^3 (operation)
	Annual	1.0 µg/m^3 (construction and operation)
$PM_{2.5}$	24-hour	10.4 µg/m^3 (construction) and 2.5 µg/m^3 (operation)
SO_2	1-hour	0.25 ppm (State) and 0.075 ppm (federal)
	24-hour	0.04 ppm (State)
Lead	30-day Average	1.5 µg/m^3 (State)
	Rolling 3-month Average	0.15 µg/m^3 (federal)

25 Cancer burden is the total cancer risk for all receptors divided by the estimated population within the modeling domain.

7.0 MITIGATION MEASURES

The following mitigation measures describe a number of specific actions to reduce construction NOx emissions from on-road vehicles and off-road equipment used in construction activities. **MM AQ-1** through **MM AQ-4** were incorporated into the post-mitigation modeling (see **Sections 8, 9, and 10** for unmitigated and mitigated air quality and health risk assessment results). However, the extent to which the remaining measures would reduce air quality impacts is not quantifiable. Nevertheless, the following mitigation measures are required to reduce the air quality and health impacts for cumulatively considerable construction emissions of ozone precursor of NOx:

MM AQ-1: Construction contractors shall, at a minimum, use equipment that meets the USEPA's Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City of Inglewood Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the City of Inglewood shall include this requirement in applicable bid documents, purchase orders, and contracts. The City of Inglewood shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

Such equipment will be outfitted with Best Available Control Technology devices including a CARB certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and SCAQMD a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.

If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an alternative compliance plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.

- The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project alignment, and the Contractor has submitted documentation to the City of Inglewood showing that the requirements of this exception provision apply.
- The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project alignment, and the Contractor has submitted documentation to the City of Inglewood showing that the requirements of this exception provision apply.
- Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the project site, and the Contractor has submitted documentation to the City of Inglewood showing that the requirements of this exception provision apply.
- Construction-related diesel equipment or vehicle will be used on the Project alignment for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a

substantially similar function in an attempt to use this exception to circumvent the intent of this mitigation measure.

- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City of Inglewood will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120 mile radius of the project site, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.

MM AQ-2: Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., non-diesel). Pole power shall be utilized at the earliest feasible point in time, and shall be used to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.

MM AQ-3: At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances identified in MM AQ-1 exist and the Contractor submits an alternative compliance plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City of Inglewood shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.

MM AQ-4: Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with HEPA filters.

MM AQ-5: A publicly visible sign shall be posted with the telephone number and person to contact at the City of Inglewood regarding dust complaints. This person shall respond and take corrective action with 24 hours. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.

MM AQ-6: All roadways, driveways, sidewalks, etc., being installed as part of the project should be completed as soon as practical; in addition, building pads should be laid as soon as practical after grading.

MM AQ-7: To the extent feasible, allow construction employees to commute during off-peak hours.

MM AQ-8: Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.

MM AQ-9: Every effort shall be made to utilize grid-based electric power at any construction site, where feasible. Grid-based power can be from a direct hookup or a tie into electricity from power poles.

MM AQ-10: Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.

MM AQ-11: Enter into applicable bid documents, purchase orders, and contracts to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project alignment. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

In addition to these mitigation measures, the following recommendations are provided for certain school/daycare centers:

- Indoor air filtration systems should meet or exceed an efficiency standard of Minimum Efficiency Reporting Value (MERV) 13 or higher (i.e., a filter efficiency of approximately 80 percent of fine particulates in the range of 1.0 to 3.0 micrometers) to limit DPM exposure at school/daycare sensitive receptors in which the health impacts using **MM AQ-1** through **MM AQ-11** potentially exceed the significance thresholds. MERV-13 air filters may reduce concentrations of DPM from mobile sources by approximately 53 percent and cancer risk by 42 percent. An ongoing maintenance plan for building air filtration systems would be implemented. Ventilation systems should meet the following minimal design standards:
  - A MERV-13, or higher, rating that represents a minimum of 80 percent efficiency to capture fine particulates;
  - At least one air exchange(s) per hour of fresh outside filtered air;
  - At least four air exchange(s) / hour recirculation; and
  - At least 0.25 air exchange(s) per hour in unfiltered infiltration; and[26]
  - Where appropriate, install passive electrostatic filtering systems, especially those with low air velocities (i.e., one mph).

The presence of a noise barrier often leads to pollutant concentration reductions behind the barrier during meteorological conditions with winds directionally from the project site. $PM_{2.5}$ concentrations generally decrease between 15 and 50 percent behind a noise barrier. However, conditions may also occur when pollutant concentrations are greater behind the barrier than when no barrier is present. These results imply that the presence of a noise barrier can lead to higher pollutant concentrations during certain wind conditions.[27]

8.0 CONSTRUCTION EMISSIONS INVENTORY

The proposed Project would consist of an elevated APM system with dual guideways to allow for continuous trains to travel in each direction. The proposed Project is designed as an aerial APM system that runs approximately 1.8 miles along Market Street between Florence Avenue and Manchester Boulevard, where it transitions east along Manchester Boulevard for approximately half a mile to Prairie Avenue for approximately one mile.

---

27 Atmospheric Environment. *Impacts of Noise Barriers on Near-road Air Quality,* May 2008, Accessed August 25, 2020 at: https://escholarship.org/content/qt1ch1q6wx/qt1ch1q6wx.pdf.

Construction activities are expected to commence in early 2022 and be completed in mid-2026. Construction activity would primarily occur over a 24 hour per day schedule with three shifts as follows:

- a morning shift from approximately 7:00 AM to 3:00 PM (Morning Shift), and
- an evening shift from approximately 3:00 PM to 11:00 PM (Evening Shift), or
- a night shift from approximately 11:00 PM to 7:00 AM (Night Shift).

Combinations of these shifts would be referred to "Moring/Night" or "Night/ Morning." **Section 2** provides additional Project information. The AAQS analysis and HRA results are presented for both the Morning/Evening and Morning/Night construction scenarios.

Intermittent (short-term) construction emissions that occur from activities related to the proposed Project were evaluated. The air quality analysis focuses on daily emissions from construction (mobile, area, stationary, and fugitive sources) activities and compares the emission estimates to thresholds of significance. The air quality analysis was developed based on the SCAQMD *Air Quality Handbook.*[28] The air quality analysis was conducted to determine the air quality impacts, using the significance levels identified by the SCAQMD.[29] Assumption for the air construction emission estimates were based on the Inglewood Transit Connector: Construction Scenarios for the Environmental Impact Report by Pacifica Services (dated June 27, 2020).

Table 4: Daily Unmitigated Construction Emissions for Proposed Project shows the estimated daily unmitigated emissions for construction related emissions (including combustion engine and fugitive dust emissions) for the proposed Project. The grand total construction emissions as well as the contribution from employee vehicle trips, pickup/delivery trucks, haul trucks, and off-road equipment are presented. The off-road equipment represents the largest contribution to the total construction emissions. The daily unmitigated NO_x construction emissions would potentially exceed the SCAQMD thresholds of significance during 2022 through 2025. Therefore, appropriate mitigation measures (such as requiring USEPA Tier 4 emissions standards for off-road diesel-powered construction equipment with more than 50 horsepower) was evaluated in conjunction with the ambient air quality analysis (**Section 9**) and the health risk assessment (**Section 10**).

The off-road equipment represents the largest contribution to the total construction emissions; approximately 91 percent of the VOC emissions, approximately 85 percent of the CO emissions, approximately 73 percent of the NO_x emissions, approximately 46 percent of the PM_{10} emissions, approximately 64 percent of the $PM_{2.5}$ emissions, and approximately 56 percent of the SO_2 emissions. Cranes, backhoes/loaders, air compressors, and compactors contribute the greatest amounts to the daily total NO_x emissions.

Table 5: Daily Mitigated Construction Emissions for Proposed Project shows the estimated daily mitigated emissions for construction related emissions (including combustion engine and fugitive dust emissions) for the proposed Project.

Table 5
Daily Mitigated Construction Emissions (pounds) for Proposed Project

The total construction emissions including the contribution from employee vehicle trips, pickup/delivery trucks, haul trucks, and off-road equipment are presented. The daily mitigated NO_x construction emissions would potentially exceed the SCAQMD thresholds of significance during 2023 through 2025. However, as presented in **Section 9**, the ambient air concentration impacts due to Project construction would be less than significant at all nearby receptors for all pollutants. Therefore, although the daily emissions for NO_x would potentially exceed the SCAQMD significance thresholds, the resultant air concentrations would not likely exceed the SCAQMD significance thresholds.

The mitigation measures represent a reduction of approximately 23 percent of the NO_x emissions, approximately 36 percent of the PM_{10} emissions, and approximately 48 percent of the $PM_{2.5}$ emissions.

Air Emission Calculation Methodology

Air emission sources include combustion exhaust from on-road vehicles such as construction worker vehicles, pickup/delivery trucks, haul trucks, and construction equipment such as backhoes, loaders, and graders.

On-Road Vehicles

Vehicular emissions were computed using the CARB's emission factor model, EMFAC, to estimate on-road emissions. Construction worker trips were modeled using the light-duty auto/truck classification. Construction worker trips are a composite of gasoline and diesel vehicles. Foreman trucks used on-site were modeled as gasoline and diesel light heavy-duty trucks. Haul trucks were modeled using the diesel combination long-haul truck classification, which is a heavy-heavy duty truck emission factor for public vehicles. Construction worker vehicles usage were assumed to be 12 miles per one way trip per day.[30] Distance traveled is assumed to be 20 miles per one way trip per day for dump trucks, delivery trucks, and concrete trucks.[31] Distance traveled is assumed to be 29 miles per one way trip per day for asphalt removal trucks, asphalt pavement trucks, and soil spoils dump trucks.[32] A conservative estimate of 10 percent of the total truck trips within each phase were assumed to occur on any given day. The usage factor for haul trucks is approximately 25 percent. Paved road dust, brake wear, and tire wear particulate emissions were also accounted for and included in the analysis using EMFAC emission factors and methodologies. For haul trucks, exhaust particulate emissions is approximately 14 percent of the total particulate emissions.

Criteria pollutant emissions associated with on-road vehicles were calculated by combining the activity information with emissions factors, in grams per mile, derived using the EMFAC emissions model. Emissions calculations were based on **Equation 1**. The EMFAC emissions factors are summarized on **Table 6: Emissions Factors (g/mile) for On-Road Vehicles** for employee vehicles, pickup trucks, delivery trucks, and haul trucks for 2022 through 2026.

Equation 1

*Emission Rate (tons/year) = Emission Factor (gram/mile) * trips per day * miles per trip * days/year * (453.59/2000 tons/gram)*

30 California Emissions Estimator Model (CalEEMod) Version 2016.3.2

Off-Road Equipment

Construction of the proposed Project would require the use of heavy-duty equipment, such as excavators, loaders, forklifts, and off-road haul trucks. This equipment would be used to load and unload material and otherwise sort and handle material. Composite emission factors from the OFFROAD emissions model were used. Emissions from construction activities were estimated based on the projected construction activity schedule, the number of vehicles/pieces of equipment, the types of equipment/type of fuel used, vehicle/equipment utilization rates, equipment horsepower, and the construction year. This data were based on the Inglewood Transit Connector: Construction Scenarios for the Environmental Impact Report

by Pacifica Services (dated June 27, 2020). Emissions from construction activities were also estimated based on load factor (throttle setting)[33] and usage factor.[34] For the daily emission estimates and short-term ambient concentration analysis (1-hour to 24-hour averaging periods), the usage factor of 100 percent was applied (i.e., full-time operation). For the long-term ambient concentration analyses and the health risk assessment, the usage factor of less than 100 percent was applied by equipment type, as not all of the equipment can be used every hour of the day and every day of the year due to safety issues and manpower constraints. That is, the short-term impacts are based on worst-case construction activity but the long-term impacts are based on average construction activity.

This information was applied to criteria pollutant emissions factors, in grams per horsepower-hour, primarily derived using the OFFROAD emissions model. **Equation 2** outlines how off-road construction equipment emissions were computed, and the emissions factors used in this assessment are summarized, by equipment type within **Table 7** through **Table 11: Emissions Factors (g/hp-hour) for Off-Road Equipment** for 2022 through 2026, respectively**.**

Equation 2

*Emission Rate (tons/year) = Emission Factor (gram/hp-hour) * size (hp) * hours of operation * Load Factor * usage factor * (453.59/2000 tons/gram)*

*Emission Rate (pounds/day) = Emission Factor (gram/hp-hour) * size (hp) * hours of operation * Load Factor * (1/453.59 pounds/gram)*

33 Load factor (or throttle setting) are the engine performance demands, as a percent of maximum power; based on values within OFFROAD and typically ranging from 30 to 80 percent depending on equipment type.

34 Activity level (or usage factor) are defined as the percent of operation for a piece of equipment over a given time.

Fugitive Dust from Project Alignment Activities

Fugitive dust emissions from site preparation, grading equipment passes, soil movement, unloading/loading of materials, and other construction related activities is based on work performed by Midwest Research Institute (MRI).[35] Generally, the emission factor used is 0.11 tons PM_{10} per acre-month of activity. This emission factor is based on MRI's observation of the types, quantity, and duration of operations at eight construction sites (three in Las Vegas and five in California). The bulk of the operations observed were site preparation-related activities. The observed activity data were then combined with operation-specific emission factors provided in USEPA's AP-42 to produce emissions estimates.[36]

The construction emission factor is assumed to include the effects of typical control measures such as routine watering. A dust control effectiveness of 75 percent is assumed from these measures, which is based on the estimated control effectiveness of watering. The MRI also includes an emission factor for worst-case emissions of 0.42 tons PM_{10} per acre-month.[37] This emission factor is appropriate for large-scale construction operations, which involve substantial earthmoving operations. The ratio of $PM_{2.5}$ to PM_{10} was assumed to be 21 percent.

The MRI also includes an emission factor for typical conditions of 0.22-ton PM_{10} per acre-month without control measures. This emission factor is based on MRI's observation of the types, quantity, and duration of operations at eight construction sites (three in Las Vegas and five in California). The bulk of the operations observed were site preparation-related activities. The observed activity data were then combined with operation-specific emission factors provided in USEPA's AP-42 to produce emissions estimates.

The SCAQMD estimated that 25 percent of their construction projects under the jurisdiction of the District involve substantial earthmoving operations (worst case conditions) and applied recommended application of the larger emission factor of 0.42-ton PM_{10} per acre-month for those types of construction projects. For the remainder of the construction projects, the average emission factor of 0.22-ton PM_{10} per acre-month was recommended.

Therefore, given the larger size of the proposed Project, the 0.42 ton PM_{10} per acre-month emission factor was used along with the dust control effectiveness of 75 percent, which is based on the estimated control

35 Midwest Research Institute, Inventory of Agricultural Tilling, Unpaved Roads and Airstrips and Construction Sites, November 1974.

9.0 AMBIENT AIR CONCENTRATION IMPACTS

A dispersion modeling analysis was also conducted to assess Project-related impacts to air concentrations of CO, NO_2, PM_{10}, $PM_{2.5}$, and SO_2. Concentrations were compared to SCAQMD's significance thresholds and California/federal ambient air quality standards. The proposed Project would result in a significant construction air quality impact if concentration impacts from the proposed Project exceed the significance

38 SCAQMD Air Quality Management Handbook Mitigation Measures Fugitive Dust, Accessed July 6, 2020 at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies/fugitive-dust.

concentration thresholds set forth in **Table 2: Ambient Air Quality Standards for Criteria Pollutants (see Attachment C: Supplemental Health Impact Information** for further information.[39]

Table 15: Estimated Unmitigated Concentration Impacts from Construction Activities provides the unmitigated proposed Project air concentrations from construction activities for nearby receptors.

Table 16: Estimated Mitigated Concentration Impacts from Construction Activities provides the mitigated proposed Project air concentrations from construction activities for nearby receptors.

Ambient Air Quality Concentrations Due To Construction Activities

Attachment A: Air Quality Dispersion Modeling Methodology and Assumptions provides detailed information about the location of air quality receptors used in the dispersion modeling analysis of criteria pollutants (NO_2, CO, SO_2, PM_{10}, and $PM_{2.5}$). There are a total of 1,954 air quality receptors.[40] These

39 The recent Sierra Club v. County of Fresno California Supreme Court case held, in part, that the Friant Ranch Specific Plan EIR (Friant Ranch EIR) was deficient in the informational discussion of air quality impacts as they connect to adverse human health effects. The Supreme Court concluded that an EIR's discussion must "make [ ] a reasonable effort to substantively connect a project's air quality impacts to likely health consequences."
For the proposed Project, daily construction emissions of NOx (a precursor to the formation of ozone) would exceed significance thresholds resulting in a significant and unavoidable impact even with mitigation. The proposed Project would contribute to regional ozone contributions but determining potential health impacts caused directly by the construction activities is not feasible.
According to the San Joaquin Valley Air Pollution Control District, it is not possible to determine ozone concentrations or make a direct correlation to human health impacts, because project-focused modeling cannot feasibly predict ozone formation and resulting regional ozone concentrations. SCAQMD has indicated that applicable methods do exist but are not applicable or feasible in most cases. The Court did not rule on whether health impacts of the named pollutants were scientifically feasible to predict, but it did state that: "if it is not scientifically possible to do more than has already been done to connect air quality effects with potential human health impacts, the Friant Ranch EIR itself must explain why, in a manner reasonably calculated to inform the public of the scope of what is and is not yet known about the project's impacts."
The current modeling tools are not equipped to provide meaningful analysis of the correlation between a project's criteria pollutant or pollutant precursor emissions and specific health impacts. Air dispersion modeling is available, such as the American Meteorological Society/ Environmental Protection Agency Regulatory Model (AERMOD), but these models cannot accurately estimate dispersion of ozone. Ozone concentrations are dependent upon a variety of complex factors, including the presence of sunlight and precursor pollutants, natural topography, atmospheric stability, and wind patterns. Because of the dynamic nature of ozone formation and the complexities of predicting ground-level ozone concentrations in relation to ambient standards, air districts instead generally develop mass emissions thresholds for NOx that are used to make significance determinations.
In summary, modeling of the proposed Project's ozone emissions is not feasible and would not provide meaningful information given the number of variables that affect ozone formation (e.g., location of activity and weather on that day that results in conversion of precursor emissions into ozone). However, as shown in **Section 9**, the resultant air concentrations for the proposed Project would be below the significance thresholds and thus, the air quality health impacts due to the construction criteria air pollutant emissions would be expected to be less than significant. Nevertheless, the health impacts due to diesel particulate emissions would be potentially above the significance thresholds and would potentially be significant. Lastly, daily operational emissions would potentially exceed the SCAQMD significance thresholds during an NFL event. However, once operational in 2026, the proposed Project will increase transit ridership throughout the region, reduce vehicle miles traveled and criteria air pollutants, GHG emissions, and improve air quality throughout the South Coast Air Basin (see **Section 12**). Therefore, short-term construction-related and operational–related air quality impacts would occur but long-term operational-related air quality benefits would follow.

40 There are a total of 669 air quality criteria pollutant receptors plus the 1,285 sensitive receptors.

receptors are designed to represent off-site locations where a person has access and can be situated for an hour or longer at a time (which is different from the HRA receptors which are designed to represent specific residences, schools, daycares, off-site worker locations). The ambient air quality standards analysis results are presented for both the Morning/Evening and Morning/Night construction scenarios.

Morning/Evening Construction Activities

As shown in **Table 13: Estimated Unmitigated Concentration Impacts from Construction Activities for Morning/Evening Scenario**, for the air quality receptors during Project construction, the incremental 1-hour NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be a maximum of 0.16 ppm (see **Attachment A: Air Quality Dispersion Modeling Methodology and Assumptions**), which is below the State threshold of 0.18 ppm. The maximum incremental 98th percentile 1-hour NO_2 impacts to a sensitive receptor, including background concentrations, would be 0.12 ppm, which is potentially above the federal threshold of 0.10 ppm. The maximum Project construction incremental annual NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.01 ppm, which is below the thresholds of 0.03 ppm (State) and below the threshold of 0.0534 ppm (federal). Therefore, unmitigated construction activities would potentially exceed the 1-hour and would result in a *potentially significant air quality impact of 1-hour NO_2 on nearby receptors due to construction activities* but would not exceed the annual NO_2 thresholds and would result in a *less than significant air quality impact of annual NO_2 on nearby receptors due to construction activities.*

As shown in **Table 13: Estimated Unmitigated Concentration Impacts from Construction Activities for Morning/Evening Scenario**, for the air quality receptors during Project construction, the maximum incremental 24-hour and annual PM_{10} impacts to a sensitive receptor would be 3.02 µg/m^3 and 0.23 µg/m^3, respectively; impacts would be below the 24-hour PM_{10} threshold of 10.4 µg/m^3 and below the annual PM_{10} threshold of 1.0 µg/m^3. The Project construction maximum incremental 24-hour $PM_{2.5}$ impacts to a sensitive receptor would be 2.78 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 10.4 µg/m^3. Therefore, unmitigated construction activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ on nearby receptors due to construction activities*.

As shown in **Table 14: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Evening Scenario**, for the air quality receptors during Project construction, the maximum incremental 1-hour NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.14 ppm, which is below the State threshold of 0.18 ppm. The maximum incremental 98th percentile 1-hour NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.10 ppm, which is within the federal threshold of 0.10 ppm. The maximum Project construction incremental annual NO_2 impacts including background

concentrations would be 0.01 ppm, which is below the thresholds of 0.03 ppm (state) and below the threshold of 0.0534 ppm (federal). Therefore, mitigated construction activities would not exceed the 1-hour and annual NO_2 thresholds and would be a *less than significant air quality impact of NO_2 on nearby receptors due to construction activities*.

As shown in **Table 14: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Evening Scenario**, for the air quality receptors during Project construction, the maximum incremental 24-hour and annual PM_{10} impacts would be 0.65 µg/m^3 and 0.06 µg/m^3, respectively. Impacts would be below the 24-hour PM_{10} threshold of 10.4 µg/m^3 and the annual PM_{10} threshold of 1.0 µg/m^3. The Project construction maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.65 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 10.4 µg/m^3. Therefore, mitigated construction activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ on nearby receptors due to construction activities*.

Additionally, as shown in **Table 14: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Evening Scenario**, for the air quality receptors during Project construction, the maximum incremental SO_2 and CO impacts including background concentrations and Adjusted Baseline would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO on all nearby receptors due to construction activities*.

Total concentrations reflect rounding of values (Project Increment plus background concentration plus Adjusted Baseline). Per SCAQMD guidance, PM_{10} and $PM_{2.5}$ impacts do not include background concentrations.

As previously noted, construction activities are expected to commence in the end of 2021 and be completed in mid-2026. Construction activity would primarily occur over a 24 hour per day schedule with three shifts as follows:

- a morning shift from approximately 7:00 AM to 3:00 PM (Morning Shift), and
- an evening shift from approximately 3:00 PM to 11:00 PM (Evening Shift), or
- a night shift from approximately 11:00 PM to 7:00 AM (Night Shift).

Combinations of these shifts would be referred to "Morning/Night" or "Night/Morning."

Morning/Night Construction Activities

As shown in **Table 15: Estimated Unmitigated Concentration Impacts from Construction Activities for Morning/Night Scenario**, for the air quality receptors, the maximum Project construction incremental 1-hour NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.16 ppm (see **Attachment A: Air Quality Dispersion Modeling Methodology and Assumptions**), which is below the State threshold of 0.18 ppm. The maximum incremental 98th percentile 1-hour NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.12 ppm, which is potentially above the federal threshold of 0.10 ppm. The maximum Project construction incremental annual NO_2 impacts including background concentrations and Adjusted Baseline would be 0.01 ppm, which is below the thresholds of 0.03 ppm (State) and 0.0534 ppm (federal). Therefore, unmitigated construction activities would potentially exceed the 1-hour and would result in a *potentially significant air quality impact of 1-hour NO_2 on nearby receptors due to construction activities* but would not exceed the annual NO_2 thresholds and would result in a *less than significant air quality impact of annual NO_2 on nearby receptors due to construction activities.*

As shown in **Table 15: Estimated Unmitigated Concentration Impacts from Construction Activities for Morning/Night Scenario**, for the air quality receptors, the Project construction maximum incremental 24-hour and annual PM_{10} impacts to a sensitive receptor would be 2.79 µg/m^3 and 0.22 µg/m^3, respectively. Impacts would be below the 24-hour PM_{10} threshold of 10.4 µg/m^3 and below the annual PM_{10} threshold of 1.0 µg/m^3. The Project construction maximum incremental 24-hour $PM_{2.5}$ impacts would be 2.56 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 10.4 µg/m^3. Therefore, unmitigated construction activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ on nearby receptors due to construction activities*.

As shown in **Table 16: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Night Scenario**, for the air quality receptors, the maximum Project construction incremental 1-hour NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.13 ppm, which is below the State threshold of 0.18 ppm. The maximum incremental 98th

percentile 1-hour NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.10 ppm, which is within the federal threshold of 0.10 ppm. The maximum Project construction incremental annual NO_2 impacts to a sensitive receptor, including background concentrations and Adjusted Baseline, would be 0.01 ppm, which is below the thresholds of 0.03 ppm (State) and 0.0534 ppm (federal). Therefore, mitigated construction activities would not the 1-hour and annual NO_2 thresholds and would be a *less than significant air quality impact of NO_2 on nearby receptors due to construction activities*.

As shown in **Table 16: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Night Scenario**, for the air quality receptors, the Project construction maximum incremental 24-hour and annual PM_{10} impacts to a sensitive receptor would be 0.62 µg/m^3 and 0.06 µg/m^3, respectively. Impacts would be below the 24-hour PM_{10} threshold of 10.4 µg/m^3 and the annual PM_{10} threshold of 1.0 µg/m^3. The Project construction maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.60 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 10.4 µg/m^3. Therefore, mitigated construction activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ on nearby receptors due to construction activities*.

Additionally, as shown in **Table 16: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Night Scenario**, for the air quality receptors, the proposed Project construction incremental SO_2 and CO impacts, including background concentrations and Adjusted Baseline, would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO on all nearby receptors due to construction activities*.

Summary of Air Quality Concentration Assessment Results

The following concluding statements can be made about the ambient air quality analysis results:

- The maximum concentrations of the 1-hour NO_2 impacts would not exceed the significance threshold and would be a *less than significant impact for all off-site receptors due to construction activities with mitigation*.
- The maximum concentrations of the annual NO_2 impacts would not exceed the significance threshold for the CAAQS and the NAAQS and would be a *less than significant impact for all off-site receptors due to construction activities*.
- The maximum concentrations of 24-hour and annual PM_{10} and 24-hour $PM_{2.5}$ would not exceed the significance threshold and would be *less than significant impact for all off-site receptors due to construction activities with mitigation*.
- The maximum concentrations of SO_2 and CO including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO on all nearby receptors due to construction activities*.
- Generally (it depends on receptor location and averaging period), the concentrations due to construction activities would be potentially greater for the morning/evening scenario compared to the morning/night scenario. This may have something to do with the morning/evening scenario having a greater intensity than the morning/night especially during overnight hours which tend to exhibit calm, stagnant air flow conditions and thus, higher pollutant concentrations.

10.0 HEALTH RISK ASSESSMENT

The HRA was conducted following methodologies in OEHHA's Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments[41] and SCAQMD's Risk Assessment Procedures for Rule 1401, 1401.1 and 212.[42] This was accomplished by applying the estimated concentrations at the receptors analyzed to the established cancer risk estimates and acceptable reference concentrations for noncancer health effects.

Recent OEHHA's revisions to its Guidance Manual were primarily designed to ensure that the greater sensitivity of children to cancer and other health risks is reflected in the HRA. For example, OEHHA now recommends that risks be analyzed separately for multiple age groups, focusing especially on young children and teenagers, rather than the past practice of analyzing risks to the general population, without

41 Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015, Accessed July 6, 2020 at: http://oehha.ca.gov/air/hot_spots/hotspots2015.html.

42 South Coast Air Quality Management District, Risk Assessment Procedures for Rule 1401, 1401.1 and 212, September 1, 2017, Accessed July 6, 2020 at: http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12.

distinction by age. OEHHA also now recommends that statistical "age sensitivity factors" be incorporated into an HRA, and that children's relatively high breathing rates be accounted for. On the other hand, the Guidance Manual revisions also include some changes that would reduce calculated health risks. For example, under the former guidance, OEHHA recommended that residential cancer risks be assessed by assuming 70 years of exposure at a residential receptor; under the Guidance Manual, this assumption is lessened to 30 years.

Attachment B: Health Risk Assessment Methodology and Assumptions provides additional methodologies and assumptions used within the health risk assessment. **Attachment C: Supplemental Health Impact Information** provides additional information on health impacts.

Health Impacts

The proposed Project would constitute a new emission source of DPM due to its construction activities. Studies have demonstrated that DPM from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to DPM poses a chronic health impact. Health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. Individual cancer risk is the likelihood that a person exposed to air toxic concentrations over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology and a 30-year exposure duration. The maximally exposed individual (MEI) represents the worst–case risk estimate, based on a theoretical person exposed for a period of 30 years at the highest concentration. This is a highly conservative assumption since most people do not remain in place all day and on average residents change residences every 11 to 12 years and do not stay in the same place of work for 25 years. In addition, this assumes that individuals are experiencing outdoor concentrations for the entire exposure period (even when indoors). A school child exposure duration is between ages 2 and 16 years old, which again, is conservative because the elementary, middle, and high school are not often located at the same location.

This HRA analyzes the incremental cancer risks to sensitive receptors in the vicinity of the proposed Project, using emission rates (in pounds per hour) derived from CARB's OFFROAD emission model. A further description of the sensitive receptors included in the dispersion modeling analysis and HRA is provided in **Attachment A: Air Quality Dispersion Modeling Methodology and Assumptions**.

Notably, peak daily emission estimates were used to estimate short-term air concentrations (1-hour, 8-hour, and 24-hour) while annual emission estimates were used to estimate annual air concentrations. DPM (reported as exhaust emissions of $PM_{2.5}$) and other air toxics emission rates were utilized along with derived concentrations from USEPA's AERMOD atmospheric dispersion model (using a unit emission rate of 1) to calculate air concentrations at receptors in the Project vicinity. This HRA is intended to provide a

worst–case estimate of the increased exposure by employing a standard emission estimation program, an accepted pollutant dispersion model, approved toxicity factors, and conservative exposure parameters.

In accordance with OEHHA *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments,* this HRA was accomplished by applying the highest estimated concentrations of specific air toxics at the receptors analyzed to the established cancer potency factors and acceptable reference concentrations for noncancer health effects. Increased cancer risks were calculated using the modeled concentrations and OEHHA-recommended methodologies for both a child exposure (3rd trimester through two years of age and ages two through 16 years) and adult exposure (16 to 30 years). The cancer risk calculations were based on applying the OEHHA-recommended age sensitivity factors and breathing rates, as well as the fraction of time at home (100 percent for child and 73 percent for adult), and an exposure duration of 30 years, to the concentration exposures; over a 70-year lifetime. As a conservative assumption, children are assumed to attend a daycare or school in close proximity to their home and no discount should be taken for time spent outside of the area (i.e., 100 percent fraction of time) affected by the Project's emissions. For worker exposures, it is assumed that the working age begins at 16 years, and that exposures to Project emissions occur during the work shift which is typically up to eight hours per day during workdays. Age-sensitivity factors reflect the greater sensitivity of infants and small children to cancer causing air pollutants.

Per Education Code Section 17213 (School Site Selection And Approval Guide), a school shall only be located where, "the health risks from the facilities or other pollution sources do not and will not constitute an actual or potential endangerment of public health to persons who would attend or be employed at the school." Proposed projects located within ¼ mile of a school that involve the construction or alteration of a facility that might reasonably be anticipated to emit hazardous air emissions, or the handling of an extremely hazardous substance or mixture containing extremely hazardous substances in a quantity equal to or greater than the state threshold quantity specified in subdivision (j) of HSC Section §25532, and that may impose a health or safety hazard to persons who would attend or would be employed at the school, must meet all requirements per CEQA Guidelines §15186 (b)(1)(2). Therefore, the HRA included nearby schools as sensitive receptors. **Section 7.0** of this document describes recommendations (such as Indoor air filtration systems with MERV 13 or higher and **MM AQ-1** through **MM AQ-11**) to reduce the health impacts at certain schools/daycare centers.

These conservative methodologies overestimate both noncarcinogenic and carcinogenic health risk, possibly by an order of magnitude or more. Therefore, for carcinogenic risks, the actual probabilities of cancer formation in the populations of concern due to exposure to carcinogenic pollutants are likely to be lower than the risks derived using the HRA methodology. The extrapolation of toxicity data in animals to humans, the estimation of concentration prediction methods within dispersion models; and the variability

in lifestyles, fitness and other confounding factors of the human population also contribute to the overestimation of health impacts. Therefore, the results of this HRA, although conducted in accordance with all regulatory agency protocols, are highly overstated.

SCAQMD currently does not require the evaluation of long-term cancer risk or chronic health impacts for a short-term project.[43] The proposed Project's construction activities would occur over a six-year period (2022 into 2026). The relatively short duration when compared to the 30-year exposure duration would limit exposures to off-site receptors. Secondly, exhaust emissions associated with the construction activities would not exceed the air concentrations significance thresholds (see **Section 9**) and thus, it is anticipated that construction emissions would not pose a threat to health impacts at nearby receptors.

The SCAQMD thresholds of significance applied to assess project-level health impacts are the exposure of persons to substantial levels of air toxics resulting in (a) a cancer risk level greater than 10 per one million persons or (b) a noncancerous risk (chronic or acute) hazard index greater than 1 or (c) a cancer burden of greater than 0.5 excess cancer cases.[44] For this threshold, sensitive receptors include residential uses, schools, daycare centers, nursing homes, medical centers, and off-site workers. A total of 1,285 sensitive receptors were analyzed.

Construction Activities

Morning/Evening Construction Activities

Table 17: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Evening Scenario provides the proposed Project's unmitigated health impacts from construction activities for existing residences, schools, daycares, and off-site workers receptors. A large majority of the health impacts are due to off-road construction equipment operating within the Project alignment with a minimal contribution from off-site construction truck travel along nearby roadways.

Table 18: Estimated Mitigated Health Impacts from Construction Activities for Morning/Evening Scenario provides the mitigated proposed Project health impacts from construction activities for existing residences, schools, daycares, and off-site workers receptors. A large majority of the health impacts are due to off-road construction equipment operating within the Project alignment with a minimal contribution from off-site construction truck travel along nearby roadways.

43 SCAQMD is currently reviewing and developing guidance for the health risk assessment of construction activities.
44 Cancer burden is the total cancer risk for all receptors divided by the estimated population within the modeling domain.

Health Impacts at Existing Residences Due To Construction Activities

As shown in **Table 17: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Evening Scenario**, the maximum cancer risk from unmitigated proposed Project construction emissions for a residential receptor would be 27.6 per one million persons. The maximum cancer risks

would occur at a residential receptor (also known as the maximum exposed individual or MEI). Thus, the cancer risk for residential receptors due to construction activities would be potentially above the SCAQMD threshold of 10 per one million persons and would be *potentially significant for residential receptors due to construction activities*. The cancer burden due to construction activities would be 0.03 and below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be *less than significant for all residential receptors due to construction activities*.

The unmitigated chronic health impact would be 0.02, based on a proposed Project-related maximum annual diesel concentration of 0.08 $\mu g/m^3$ (per dispersion modeling analysis) or 0.08 $\mu g/m^3$/5.0 μ g/m^3, which is 0.02. The chronic health impact due to construction activities would be below the Project-level threshold of 1 and would therefore be *less than significant for all residential receptors due to construction activities*.

As shown in **Table 18: Estimated Mitigated Health Impacts from Construction Activities for Morning/Evening Scenario**, the maximum cancer risk from mitigated proposed Project construction emissions (see **Section 7**) for a residential receptor would be 7.6 per one million persons. The maximum cancer risks would occur at a residential receptor. Thus, the cancer risk for residential receptors due to construction activities would be *less than significant for all residential receptors due to construction activities*. The cancer burden due to construction activities would be 0.01 and below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be *less than significant for all residential receptors due to construction activities*.

The mitigated chronic health impact would be less than 0.01, based on a proposed Project-related maximum annual diesel concentration of 0.02 $\mu g/m^3$ (per dispersion modeling analysis) or 0.02 $\mu g/m^3$/5.0 μ g/m^3, which is 0.01. The chronic health impact due to construction activities would be below the Project-level threshold of 1 and would therefore be *less than significant for all residential receptors due to construction activities*.

Health Impacts at Off-site School/Daycare Due To Construction Activities

As shown in **Table 17: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Evening Scenario**, the maximum cancer risk from unmitigated proposed Project construction emissions for a school/daycare receptor would be 2.2 per one million persons. Thus, the cancer risk for school/daycare receptors due to construction activities would be potentially above the SCAQMD threshold of 10 per one million persons and would be *less than significant for all off-site school/daycare receptors due to construction activities*.

The maximum unmitigated chronic health impact for an off-site school/daycare receptors would be 0.02 Thus, the chronic health impact due to construction activities for all off-site school/daycare receptors would be below the Project-level threshold of 1 and the chronic health impact would be *less than significant for all off-site school/daycare receptors due to construction activities*.

As shown in **Table 18: Estimated Mitigated Health Impacts from Construction Activities for Morning/Evening Scenario**, the maximum cancer risk from mitigated proposed Project construction emissions (see **Section 7**) for a school/daycare receptor would be 0.6 per one million persons (using **Mitigation Measures AQ-1 through AQ-12**).[45] In addition to the identified off-road equipment mitigation measures, additional measures for ventilation systems at certain schools and daycare facilities is provided to assist in maintaining adequate air quality. Thus, the cancer risk for school/daycare receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all school/daycare receptors due to construction activities*.

The maximum mitigated chronic health impact for a school/daycare receptor would be 0.01. Thus, the chronic health impact due to construction activities for all school/daycare receptors would be below the Project-level threshold of 1 and the chronic health impact would be *less than significant for all school/daycare receptors due to construction activities*.

Health Impacts at Off-site Workers Due To Construction Activities

As shown in **Table 17: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Evening Scenario**, the maximum cancer risk from unmitigated proposed Project construction emissions for an off-site worker receptor (such as office buildings, retail centers, hotels, hospitals) would be 0.8 per one million persons. Thus, the cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all off-site worker receptors due to construction activities*.

The maximum unmitigated chronic health impact modeled to occur at an off-site worker receptor would be 0.03. Thus, the chronic health impact due to construction activities at all off-site worker receptors would be below the Project-level threshold of 1 and would be *less than significant for all off-site worker receptors due to construction activities*.

As shown **in Table 18: Estimated Mitigated Health Impacts from Construction Activities for Morning/Evening Scenario**, the maximum cancer risk from mitigated proposed Project construction emissions (see **Section 7**) for an off-site worker receptor would be 0.2 per one million persons. Thus, the

45 Primarily due to construction activities during year 3 and 4 associated with Phase 2 and 3.

cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all off-site worker receptors due to construction activities*.

The maximum mitigated chronic health impact modeled to occur at an off-site worker receptor would be 0.01. Thus, the chronic health impact due to construction activities at all off-site worker receptors would be below the Project-level threshold of 1 and would be *less than significant for all off-site worker receptors due to construction activities*.

Morning/Night Construction Activities

Table 19: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Night Scenario provides the proposed Project's unmitigated health impacts from construction activities for existing residences, schools, daycares, and off-site workers receptors. A large majority of the health impacts are due to off-road construction equipment operating within the Project alignment with a minimal contribution from off-site construction truck travel along nearby roadways.

Table 20: Estimated Mitigated Health Impacts from Construction Activities for Morning/Night Scenario provides the mitigated proposed Project health impacts (see **Section 7**) from construction activities for existing residences, schools, daycares, and off-site workers receptors. A large majority of the health impacts are due to off-road construction equipment operating within the Project alignment with a minimal contribution from off-site construction truck travel along nearby roadways.

Health Impacts at Existing Residences Due To Construction Activities

As shown in **Table 19: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Night Scenario**, the maximum cancer risk from unmitigated proposed Project construction emissions for a residential receptor would be 33.8 per one million persons. Thus, the cancer risk for residential receptors due to construction activities would be potentially above the SCAQMD threshold of 10 per one million persons and would be *potentially significant for residential receptors due to construction activities*. The cancer burden due to construction activities would be 0.03 and below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be *less than significant for all residential receptors due to construction activities*.

The unmitigated chronic health impact would be 0.02, based on a proposed Project-related maximum annual diesel concentration of 0.10 $\mu g/m^3$ (per dispersion modeling analysis) or 0.10 $\mu g/m^3$/5.0 μ g/m^3, which is 0.02. The chronic health impact due to construction activities would be below the Project-level threshold of 1 and would therefore be *less than significant for all residential receptors due to construction activities*.

Table 19
Estimated Unmitigated Health Impacts from Construction Activities for Morning/Night Scenario (Approximately 7:00 AM to 3:00 PM and 11:00 PM to 7:00 AM)

Criteria	Cancer Risk	Chronic Impact

Significance Threshold	10	1.0
Potentially Significant (Yes or No)?	No	No

*Note: Values in **bold** are in excess of applicable standard.*
Source: RCH Group, 2020

As shown in **Table 20: Estimated Mitigated Health Impacts from Construction Activities for Morning/Night Scenario**, the maximum cancer risk from mitigated proposed Project construction emissions for a residential receptor would be 9.4 per one million persons. Thus, the cancer risk for residential receptors due to construction activities would be *less than significant for all residential receptors due to construction activities*. The cancer burden due to construction activities would be 0.01 and below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be *less than significant for all residential receptors due to construction activities*.

The mitigated chronic health impact would be 0.01, based on a proposed Project-related maximum annual diesel concentration of 0.03 µg/m^3 (per dispersion modeling analysis) or 0.03 µg/m^3/5.0 µ g/m^3, which is 0.01. The chronic health impact due to construction activities would be below the Project-level threshold of 1 and would therefore be *less than significant for all residential receptors due to construction activities*.

Health Impacts at Off-site School/Daycare Due To Construction Activities

As shown in **Table 19: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Night Scenario**, the maximum cancer risk from unmitigated proposed Project construction emissions for a school/daycare receptor would be 2.5 per one million persons. Thus, the cancer risk for school/daycare receptors due to construction activities would be potentially above the SCAQMD threshold of 10 per one million persons and would be *less than significant for all off-site school/daycare receptors due to construction activities*.

The maximum unmitigated chronic health impact for an off-site school/daycare receptors would be 0.01. Thus, the chronic health impact due to construction activities for all off-site school/daycare receptors would be below the Project-level threshold of 1 and the chronic health impact would be *less than significant for all off-site school/daycare receptors due to construction activities*.

As shown in **Table 20: Estimated Mitigated Health Impacts from Construction Activities for Morning/Night Scenario**, the maximum cancer risk from mitigated proposed Project construction emissions (see **Section 7**) for a school/daycare receptor would be 0.7 per one million persons (using **Mitigation Measures AQ-1 through AQ-13**).[46] In addition to the identified off-road equipment mitigation measures, additional measures for ventilation systems at certain schools and daycare facilities is provided to assist in maintaining adequate air quality. Thus, the cancer risk for school/daycare receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all school/daycare receptors due to construction activities*.

The maximum mitigated chronic health impact for all school/daycare receptors would be 0.01. Thus, the chronic health impact due to construction activities for all school/daycare receptors would be below the Project-level threshold of 1 and the chronic health impact would be *less than significant for all school/daycare receptors due to construction activities*.

46 Primarily due to construction activities during year 3 and 4 associated with Phase 2 and 3.

Health Impacts at Off-site Workers Due To Construction Activities

As shown in **Table 19: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Night Scenario**, the maximum cancer risk from unmitigated proposed Project construction emissions for an off-site worker receptor (such as office buildings, retail centers, hotels, hospitals) would be 0.6 per one million persons. Thus, the cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all off-site worker receptors due to construction activities*.

The maximum unmitigated chronic health impact modeled to occur at an off-site worker receptor would be 0.01. Thus, the chronic health impact due to construction activities at all off-site worker receptors would be below the Project-level threshold of 1 and would be *less than significant for all off-site worker receptors due to construction activities*.

As shown in **Table 20: Estimated Mitigated Health Impacts from Construction Activities for Morning/Night Scenario**, the maximum cancer risk from mitigated proposed Project construction emissions for an off-site worker receptor would be 0.2 per one million persons. Thus, the cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all off-site worker receptors due to construction activities*.

The maximum mitigated chronic health impact modeled to occur at an off-site worker receptor would be 0.01. Thus, the chronic health impact due to construction activities at all off-site worker receptors would be below the Project-level threshold of 1 and would be *less than significant for all off-site worker receptors due to construction activities*.

Summary of Health Risk Assessment Results

The following concluding statements can be made about the health risk assessment results:

- The cancer risk for residential receptors due to construction activities would be potentially above the SCAQMD threshold of 10 per one million persons and would be *less than significant for residential receptors due to construction activities with mitigation*.
- The cancer risk for all school/daycare receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant for school/daycare receptors due to construction activities*.
- The cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be l*ess than significant health impacts for all off-site worker receptors due to construction activities*.

- Generally (it depends on receptor location), the cancer risk due to construction activities would be potentially greater for the morning/night scenario compared to the morning/evening scenario and those adverse impacts would extend over a larger area near the Project alignment. This may have something to do with the morning/night scenario having a greater intensity than the morning/evening especially during overnight hours which tend to exhibit calm, stagnant air flow conditions and thus, higher pollutant concentrations.

11.0 GREENHOUSE GAS EMISSIONS

"Global warming" and "global climate change" are the terms used to describe the increase in the average temperature of the earth's near-surface air and oceans since the mid-20th century and its projected continuation. Warming of the climate system is now considered to be unequivocal (IPCC, 2007), with global surface temperature increasing approximately 1.33 degrees Fahrenheit (°F) over the last 100 years. Continued warming is projected to increase global average temperature between 2 and 11°F over the next 100 years.

Natural processes and human actions have been identified as the causes of this warming. The International Panel on Climate Change (IPCC) concludes that variations in natural phenomena such as solar radiation and volcanoes produced most of the warming from pre-industrial times to 1950 and had a small cooling effect afterward. After 1950, however, increasing GHG concentrations resulting from human activity such as fossil fuel burning and deforestation have been responsible for most of the observed temperature increase. These basic conclusions have been endorsed by more than 45 scientific societies and academies of science, including all of the national academies of science of the major industrialized countries. Since 2007, no scientific body of national or international standing has maintained a dissenting opinion.

Increases in GHG concentrations in the earth's atmosphere are thought to be the main cause of human-induced climate change. GHG naturally trap heat by impeding the exit of solar radiation that has hit the earth and is reflected back into space. Some GHG occur naturally and are necessary for keeping the earth's surface inhabitable. However, increases in the concentrations of these gases in the atmosphere during the last 100 years have decreased the amount of solar radiation that is reflected back into space, intensifying the natural greenhouse effect and resulting in the increase of global average temperature.

Gases that trap heat in the atmosphere are referred to as GHG because they capture heat radiated from the sun as it is reflected back into the atmosphere, much like a greenhouse does. The accumulation of GHG has been implicated as the driving force for global climate change. The primary GHG are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), ozone, and water vapor.

While the presence of the primary GHG in the atmosphere are naturally occurring, CO_2, CH_4, and N_2O are also emitted from human activities, accelerating the rate at which these compounds occur within earth's

atmosphere. Emissions of CO_2 are largely by-products of fossil fuel combustion, whereas methane results from off-gassing associated with agricultural practices and landfills. Other GHG include hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride, and are generated in certain industrial processes. Greenhouse gases are typically reported in "carbon dioxide-equivalent" measures (CO_2e).[47]

There is international scientific consensus that human-caused increases in GHG have and will continue to contribute to global warming. Potential global warming impacts may include, but are not limited to, loss in snowpack, sea level rise, more extreme heat days per year, more high ozone days, more large forest fires, and more drought years. Secondary effects are likely to include a global rise in sea level, impacts to agriculture, changes in disease vectors, and changes in habitat and biodiversity.

Transit and Intercity Rail Capital Program (TIRCP)

The Transit and Intercity Rail Capital Program (TIRCP) was created by Senate Bill (SB) 862 (Chapter 36, Statutes of 2014) and modified by Senate Bill 9 (Chapter 710, Statutes of 2015) to provide grants from the Greenhouse Gas Reduction Fund to fund transformative capital improvements that will modernize California's intercity, commuter, and urban rail systems, and bus and ferry transit systems to reduce emissions of greenhouse gases by reducing congestion and vehicle miles traveled throughout California. The goal of the TIRCP is to provide monies to fund transformative capital improvements that modernize California's intercity rail, bus, ferry and rail transit systems to achieve the following objectives:

- Reduction in greenhouse gas emissions;
- Expand and improve rail service to increase ridership;
- Integrate the rail service of the State's various rail operations, including integration with the high-speed rail system; and
- Improve safety

City of Inglewood Energy Efficiency Climate Action Plan

An Energy Efficiency Climate Action Plan (EECAP) has been developed by the City of Inglewood (City).[48] The Inglewood EECAP serves as the roadmap for the City to reduce GHG emissions, create jobs, and prepare for the impacts of climate change on public health, infrastructure, the economy, ecosystems, and public spaces in the City. The EECAP builds on the goals and policies in the City's General Plan to further

47 Because of the differential heat absorption potential of various GHG, GHG emissions are frequently measured in "carbon dioxide-equivalents," which present a weighted average based on each gas's heat absorption (or "global warming") potential.

48 City of Inglewood, Climate Action Plan, December 2015, Accessed July 6, 2020 at: http://www.southbaycities.org/sites/default/files/EECAP_Inglewood_Final_20151218.pdf and https://www.cityofinglewood.org/225/Sustainability.

the City's efforts to build health equity through the reduction of local GHG emissions, and to simultaneously ensure that the community is well prepared for the impacts of climate change.

The EECAP includes an inventory of the City's emissions, establish an emissions reduction target, and identifies City and community actions to reduce emissions. The City revised its existing 2005 GHG emissions inventory (baseline) with better transportation and solid waste data and compiled a 2012 inventory updates that allows the City to start assessing emissions trends over time while the interim years (2007 and 2010) provide context and may help identify trends or anomalies.

From 2005 to 2010, emissions decreased by over 2 percent. This reduction trend continued into the most recent 2012 inventory update year, with total emissions having decreased an additional 2 percent between 2010 and 2012. The Transportation sector was the largest contributor to emissions in both 2005 (48 percent) and 2012 (52 percent) by producing 287,372 MT CO_2e in 2005 and 294,376 MT CO_2e in 2012. This change represents a 2.4 percent increase in emissions from 2005 to 2012. Commercial/Industrial energy is the second-largest contributor to emissions, adding 23 percent in 2005 and 20 percent in 2012. While the proportion of emissions did not change significantly over time, the total emissions decreased by about 14 percent from 2005 to 2012, from 133,521 MT CO_2e to 114,719 MT CO_2e. The proportion of emissions from the Residential sector was also steady, at 21 percent in 2005 and 22 percent in 2012, with total emissions increased by less than 1 percent, from 124,844 MT CO_2e in 2005 to 125,250 MT CO_2e in 2012. Solid waste comprised 4 percent of the total (26,385 MT CO_2e) in 2005, but was reduced to 3 percent of the total (17,889 MT CO_2e) in 2012. Water, Wastewater, and Off-road sources made up the remaining emissions in each year. Water, Wastewater, and Off-Road Sources emissions declined from 2005 to 2012. Off-road sources comprise a very small percentage of overall emissions but are variable primarily due to construction-related emissions, which are based on the level of development estimated in the City each year. Other metrics used in the ECAP to evaluate emissions progress include emissions per resident and per service population (residents + jobs); both metrics also show a declining emissions trend over time, of about 3 percent between 2005 and 2012.

California Green Building Standards Code

The California Green Building Standards Code or CALGreen is a regulatory code for all residential, commercial, and school buildings to meet uniform standards in building design intended to minimize impacts on climate change.

CALGreen does not prevent a local jurisdiction from adopting a more stringent code, as State law provides methods for local enhancements. CALGreen recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided they provide a minimum 50-percent diversion requirement. CALGreen also provides exemptions for areas not served

by construction and demolition recycling infrastructure. State building code provides the minimum standard, which buildings need to meet in order to be certified for occupancy. Enforcement is generally done by the local building official.

The development of CALGreen is intended to cause a reduction in GHG emissions from buildings; promote environmentally responsible, cost-effective, healthier places to live and work; reduce energy and water consumption; and respond to directives issued by the Governor, such as Assembly Bill 32, calling for the reduction of Statewide GHG emissions to 1990 levels by 2020. In short, CALGreen was established to reduce construction waste; make buildings more efficient in the use of materials and energy; and reduce environmental impacts during and after project construction.

CALGreen contains requirements for construction site selection, storm water control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation, and more. CALGreen provides for design options allowing a project designer to determine how best to achieve compliance for a given site or building condition. CALGreen also requires building commissioning, which is a process for verifying that all building systems, like heating and cooling equipment and lighting systems, are functioning at their maximum efficiency.

California Environmental Quality Act and Climate Change

Under CEQA, lead agencies are required to disclose the reasonably foreseeable adverse environmental effects of projects they are considering for approval. GHG emissions have the potential to affect the environment because they contribute to global climate change. In turn, global climate change has the potential to cause sea level rise, alter rainfall and snowfall patterns, and affect habitat.

Executive Order S-3-05

Governor Schwarzenegger established Executive Order S-3-05 in 2005, in recognition of California's vulnerability to the effects of climate change. Executive Order S-3-05 set forth a series of target dates by which Statewide emissions of GHG would be progressively reduced, as follows:

- By 2010, reduce GHG emissions to 2000 levels;
- By 2020, reduce GHG emissions to 1990 levels; and
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

The executive order directed the Secretary of the CalEPA to coordinate a multiagency effort to reduce GHG emissions to the target levels. The Secretary will also submit biannual reports to the governor and California Legislature describing the progress made toward the emissions targets, the impacts of global

climate change on California's resources, and mitigation and adaptation plans to combat these impacts. To comply with the executive order, the secretary of CalEPA created the California Climate Action Team, made up of members from various State agencies and commissions. The team released its first report in March 2006. The report proposed to achieve the targets by building on the voluntary actions of California businesses, local governments, and communities and through State incentive and regulatory programs.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

California passed the California Global Warming Solutions Act of 2006 (AB 32; California Health and Safety Code Division 25.5, Sections 38500 - 38599). AB 32 establishes regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and establishes a cap on Statewide GHG emissions. AB 32 requires that Statewide GHG emissions be reduced to 1990 levels by 2020. This reduction will be accomplished by enforcing a Statewide cap on GHG emissions that will be phased in starting in 2012. To effectively implement the cap, AB 32 directs CARB to develop and implement regulations to reduce Statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then CARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32.

AB 32 requires CARB to adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrived at the cap; institute a schedule to meet the emissions cap; and develop tracking, reporting, and enforcement mechanisms to ensure that the State reduces GHG emissions enough to meet the cap. AB 32 also includes guidance on instituting emissions reductions in an economically efficient manner, along with conditions to ensure that businesses and consumers are not unfairly affected by the reductions. Using these criteria to reduce Statewide GHG emissions to 1990 levels by 2020 would represent an approximate 25 to 30 percent reduction in current emissions levels. However, CARB has discretionary authority to seek greater reductions in more significant and growing GHG sectors, such as transportation, as compared to other sectors that are not anticipated to significantly increase emissions. Under AB 32, CARB must adopt regulations to achieve reductions in GHG to meet the 1990 emissions cap by 2020.

Climate Change Scoping Plan

AB 32 required CARB to develop a Scoping Plan that describes the approach California will take to reduce GHG to achieve the goal of reducing emissions to 1990 levels by 2020. The Scoping Plan was first approved by CARB in 2008 and must be updated every five years. The initial AB 32 Scoping Plan contains the main strategies California will use to reduce the GHG that cause climate change. The initial Scoping Plan has a range of GHG reduction actions which include direct regulations, alternative compliance mechanisms,

monetary and nonmonetary incentives, voluntary actions, market-based mechanisms such as a cap-and-trade system, and an AB 32 program implementation fee regulation to fund the program. In August 2011, the initial Scoping Plan was approved by CARB.

The 2013 Scoping Plan Update builds upon the initial Scoping Plan with new strategies and recommendations. The 2013 Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. The 2013 Update defines CARB climate change priorities for the next five years and sets the groundwork to reach California's long-term climate goals set forth in Executive Orders S-3-05 and B-16-2012. The 2013 Update highlights California progress toward meeting the near-term 2020 GHG emission reduction goals defined in the initial Scoping Plan. In the 2013 Update, nine key focus areas were identified (energy, transportation, agriculture, water, waste management, and natural and working lands), along with short-lived climate pollutants, green buildings, and the cap-and-trade program. On May 22, 2014, the First Update to the Climate Change Scoping Plan was approved by the Board, along with the finalized environmental documents. The 2017 Scoping Plan, approved on December 14, 2017, outlines options to meet California's aggressive goals to reduce GHGs by 40 percent below 1990 levels by 2030.

Executive Order No. B-30-15

On April 29, 2015, Executive Order No. B-30-15 was issued to establish a California GHG reduction target of 40 percent below 1990 levels by 2030. Executive Order No. B-30-15 sets a new, interim, 2030 reduction goal intended to provide a smooth transition to the existing ultimate 2050 reduction goal set by Executive Order No. S-3-05 (signed by Governor Schwarzenegger in June 2005). It is designed so State agencies do not fall behind the pace of reductions necessary to reach the existing 2050 reduction goal. Executive Order No. B-30-15 orders "All State agencies with jurisdiction over sources of GHG emissions shall implement measures, pursuant to statutory authority, to achieve reductions of GHG emissions to meet the 2030 and 2050 targets." The Executive Order also states that "CARB shall update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent." The CARB is currently moving forward with a second update to the Climate Change Scoping Plan to reflect the 2030 reduction target. The updated Scoping Plan will provide a framework for achieving the 2030 target. In September of 2016, the AB 32 was extended to achieve reductions in GHG of 40 percent below 1990 levels by 2030. The new plan, outlined in SB 32, involves increasing renewable energy use, putting more electric cars on the road, improving energy efficiency, and curbing emissions from key industries.

Greenhouse Gas Regional Emission Estimates

In 2018, the United States emitted about 6,677 million metric tons of CO_2. Emissions increased from 2017 to 2018 by 3.1 percent. Greenhouse gas emissions in 2018 (after accounting for sequestration from the

land sector) were 10.2 percent below 2005 levels. This increase was largely driven by an increase in emissions from fossil fuel combustion, which was a result of multiple factors, including more electricity use greater due to greater heating and cooling needs due to a colder winter and hotter summer in 2018 in comparison to 2017.[49]

In 2017, California emitted approximately 424 million metric tons of CO_2e, five million metric tons of CO_2e lower than 2016 levels and seven million metric tons of CO_2e below the 2020 GHG Limit of 431 million metric tons of CO_2e. Consistent with recent years, these reductions have occurred while California's economy has continued to grow and generate jobs. Compared to 2016, California's GDP grew 3.6 percent while the carbon intensity of its economy declined by 4.5 percent.

The transportation sector remains the largest source of GHG emissions in the State, but saw a one percent increase in emissions in 2017, the lowest growth rate over the past four years.[50]

The composition of GHG emissions in California (expressed as CO_2e) were as follows:

- CO_2 accounted for 83 percent;
- CH_4 accounted for nine percent;
- N_2O accounted for three percent; and
- Fluorinated gases (hydrofluorocarbons (HFCs), perfluorinated compounds (PFCs), and sulfur hexafluoride (SF_6)) accounted for five percent.

Of these gases, the transportation is the source of approximately 40 percent of the State's GHG emissions. The annual increase in transportation emissions in 2017 has slowed down slightly compared to the previous three years. Emissions from the electricity sector account for 15 percent of the inventory and show another large drop in 2017 due to a large increase in renewable energy. For the first time since California started to track GHG emissions, California uses more electricity from zero-GHG sources (for the purpose of the GHG inventory, these include hydro, solar, wind, and nuclear energy) than from GHG-emitting sources for both in-state generation and total (in-state plus imports) generation in 2017. The industrial sector has seen a slight emissions decrease in the past few years, and remains at 21 percent of the inventory.[51]

Thresholds of Significance

The standards of significance applied to the analysis of potential GHG impacts are based on Appendix G of the *CEQA Guidelines.* According to Appendix G evaluation thresholds, the proposed Project would be considered to have significant air quality impacts if it were to:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant effect on the environment; or
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

For the proposed Project, the City is using the SCAQMD, 10,000 MT CO_2e per year industrial project screening threshold as the significance threshold in addition to the qualitative thresholds of significance from *Section VII of Appendix G to the CEQA Guidelines*. However, this threshold has not been adopted by the SCAQMD for use in CEQA documents.

The estimated construction GHG emissions for the proposed Project are 14,348 metric tons of CO_2e, which corresponds to 1,413,632 gallons of diesel fuel.[52] Given the five year construction period, the annual construction GHG emissions for the proposed Project are 2,870 metric tons of CO_2e, which corresponds to 282,726 gallons of diesel fuel per year. As indicated, 50-year amortized construction related GHG emissions would be approximately 287 metric tons of CO_2e per year. The results of the comparison are presented in **Table 21: Estimated Construction Greenhouse Gas Emissions for the Proposed Project**.

Table 21
Estimated Construction Greenhouse Gas Emissions for the Proposed Project

Construction Year	CO_2e Metric Tons
2022	4,698
2023	4,328
2024	3,521
2025	1,361
2026	440
Total Construction Emissions	**14,348**
Total 50-Year Amortized Construction Emissions	**287**

Source: RCH Group, 2020

52 Fuel usage is estimated using the output for CO2 and a 10.15 kg-CO2/gallon conversion factor, as cited in the *U.S. Energy Information Administration Voluntary Reporting of Greenhouse Gases Program*, https://www.eia.gov/environment/pdfpages/0608s(2009)index.php.

An Energy Efficiency Climate Action Plan, as discussed previously, has been developed by the City regarding the reduction of GHG emissions.[53] The City EECAP is designed to achieve the goal for GHG emissions reductions by 40 percent before 2030 and thus, adhere to the AB 32 goals. The proposed Project would result in a significant impact if it would be in conflict with AB 32 State goals.

The proposed Project would be subject to all applicable permit and planning requirements in place or adopted by the City, the County, and the State of California at the time that building permits are issued. The proposed Project would be consistent with City and County plans, policies, and regulations for reduction of GHGs, and would therefore also be consistent with AB 32 and other Statewide goals for GHG reduction. Thus, the proposed Project would have a *less-than-significant impact* related to a conflict with a GHG reduction plan.

12.0 OPERATIONAL EMISSIONS INVENTORY

The proposed Project would consist of an automated people mover (APM) on an elevated guideway that runs approximately 1.6 miles along Market Street between Florence Avenue and Manchester Boulevard, where it transitions east along Manchester Boulevard for approximately half a mile to Prairie Avenue for approximately one mile. The proposed Project will increase transit ridership throughout the region, reduce vehicle miles traveled (VMT), criteria air pollutants, and GHG emissions, and improve air quality throughout the South Coast Air Basin. The proposed Project would also include a MSF to provide regular and preventive maintenance for the APM trains and well as for vehicle storage, and an operations control center. The MSF building will be approximately 78,000 square feet (SF) and will be elevated (to match the track elevation). Up to 300 vehicular parking spaces at-grade for public use will be available. Each of the three stations will be 8,000 square feet. Components of the proposed Project (such as APM Propulsion and Control Systems and Stations and parking facilities) would utilize electrical energy for a whole range of function.

The air quality analysis of operations includes a review of criteria pollutant emissions such as CO, NO_x, SO_2, VOC as ROG, coarse particulate or PM_{10}, fine particulate or $PM_{2.5}$, as well as GHG emissions.

Regulatory models used to estimate air quality impacts and GHG emissions include:

- CARB's EMFAC[54]emissions inventory model. EMFAC is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in

53 *City of Inglewood, Climate Action Plan,* December 2015, Accessed July 6, 2020 at: http://www.southbaycities.org/sites/default/files/EECAP_Inglewood_Final_20151218.pdf and https://www.cityofinglewood.org/225/Sustainability.

54 California Air Resources Board, EMFAC2017 User's Guide, March 1, 2018, Accessed July 23, 2020 at: https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-i-users-guide.pdf and https://www.arb.ca.gov/emfac/2017/.

California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.

- CalEEMod (California Emissions Estimator Model Version 2016.3.2)[55] land use emissions model estimates construction emissions due to demolition and construction activities and operational emissions.

Operations are expected to commence in 2026. Regulatory models used to estimate air quality emissions from proposed Project operations include the CARB EMFAC[56] emissions inventory model. Six operational scenarios were analyzed to evaluate the proposed Project operational emissions, as follows:

1. Adjusted Baseline (2016) Non-event Weekday without ITC Project
2. Adjusted Baseline (2016) Non-event Weekday with ITC Project
3. Year 2026 with Event Weekday without ITC Project
4. Year 2026 with Event Weekday with ITC Project
5. Year 2045 with Event Weekday without ITC Project
6. Year 2045 with Event Weekday with ITC Project

An Adjusted Baseline (2016) No Event and Existing Condition (2020) were also analyzed.

Supporting information for the operational emissions inventory are found in **Attachment E: Operational Air Emissions Inventory**. Emission sources associated with the Adjusted Baseline and Existing Condition include area sources (consumer products and landscaping), energy usage (natural gas), energy (electrical), and motor vehicles. Emission sources associated with the proposed project include area sources (consumer products and landscaping), energy usage (natural gas), energy (electrical for GHG only), standby generators, and motor vehicles (employee trips, deliveries and general public).

Adjusted Baseline

The Hollywood Park Specific Plan (HPSP) Adjusted Baseline projects would emit air pollutants associated with vehicle trips, maintenance operations, energy consumption, etc., from all of its operational land uses. Specifically, vehicle trips associated with activities at the HPSP would begin taking place during mid-2020 when the NFL Stadium begins operations and uses are operating on the HPSP site, which would have an impact on local and regional air quality. Accordingly, the air pollutant emissions associated with this

Existing Condition

For the proposed Project, the first phase of construction would be the demolition of the commercial property for the Market Street Station, for the Vons Supermarket and gas station on Manchester, and for the commercial building on the southeast corner of Manchester and Market Street. **Table 25: Existing Condition Land Uses Characteristics** presents the characteristics of the Existing Condition.

Operation of these existing on-site businesses result in the emission of air pollutants associated with vehicle trips to and from the proposed Project, on-site combustion of natural gas for heating and cooking, and fugitive emissions of VOC from the use of aerosol products and coatings and landscaping. However, data with respect to the exact activity level (i.e., utility consumptions) at each business may not be obtainable, so existing emissions were based on land use characteristics and default values.

The City has developed a set of broad sustainability strategies included as part of the Design Guidelines to be incorporated into the design, construction, and operations of each proposed Project component. These guidelines align with Inglewood's commitment to sustainability City-wide, as outlined in the City's Energy and Climate Action Plan and Energy Efficiency Climate Action Plan. These sustainability guidelines serve as a mechanism to promote the City's commitment to reduce its environmental footprint and promote energy efficient design requirements, water conservation and water quality improvement projects, natural resource protection efforts, waste reduction and recycling, and numerous air quality emissions reduction policies and programs.

For operational impacts, the proposed Project would comply with the requirements of California Green Building Standards Code (CALGreen) and be consistent with the City of Inglewood Energy Efficiency Climate Action Plan involving policies and programs related to sustainability, energy efficiency, and reduction in GHG emissions. The City has committed to taking an active role in promoting energy conservation and environmentally-friendly initiatives to improve the environment and realize the co-benefits, which include energy independence, cost savings for energy not used, water saved, improved air quality, and public health benefits from improved air quality.

The City has an ongoing commitment to increasing energy efficiency and implementing energy conservation measures to reduce wasteful, inefficient, and unnecessary consumption. The proposed Project would incorporate a number of sustainability features as listed in **Proposed Sustainability Guidelines** within the Project Description. These guidelines are intended to integrate the design of new and existing facilities and to create a passenger experience that reflects the City's history and architecture, while providing design guidance for new construction or modernization of the proposed Project. The City has committed to implementing, if feasible, various sustainability measures for different proposed Project elements that meet or exceed CALGreen requirements, including energy and water conservation measures, for each of the follow proposed Project components: an elevated guideway and stations and the MSF. The sustainability strategies relate to planning and design; energy efficiency and renewable energy; water efficiency and conservation; materials conservation and resource efficiency; and environmental quality.

Standby Generators

Additionally, the proposed Project would include up to two stationary standby generators with an estimated total capacity rated at approximately 4,000 kilowatts (kW) to provide emergency power primarily for lighting and other emergency building systems. Emergency generator emissions were calculated based on compliance with applicable federal emissions standards and compliance with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. This analysis also assumed that the standby generators would operate up to two hours per day and a total of 50 hours per

year for testing and maintenance (per SCAQMD Rule 1470 limit). SCAQMD requires that all internal combustion engines (ICE) greater than 50 brake horsepower (bhp) and gas turbines greater than 2,975,000 Btu per hour obtain a permit to construct prior to installation of the engines at a site.

SCAQMD defines a standby ICE or turbine for non-utility power generation as one that does not operate more than 200 hours a year and is only operated in the event of an emergency power failure or for routine testing and maintenance is considered a standby backup generator for power generation. Operators should petition the SCAQMD's Hearing Board for a variance to operate in excess of the allowed 200 hours before it is anticipated that the hours may be exceeded.

- The internal combustion engines must meet SCAQMD's Best Available Control Technology (BACT) requirements.
- It is advisable before purchasing any equipment to consult with the SCAQMD and apply for approval of a Permit to Construct from the SCAQMD prior to installation of the engine. Typically, the SCAQMD either issues a Permit to Construct or a Permit to Construct/Operate.

The Project Applicant will implement the following operational equipment requirements and operation protocols for equipment operating at the proposed Project. These features would be included in applicable bid documents, and successful contractor(s) must demonstrate the ability to supply such equipment and comply with such protocols. Operational features would include the following:

- All standby generators used for proposed Project operations shall be selected from the SCAQMD certified generators list and meet applicable federal standards for diesel emissions. For after-treatment of engine exhaust air, a diesel particulate filter shall be provided to meet the emission level requirements of SCAQMD. The proposed Project would have two standby generators, each could operate up to two hours per day and a total of 50 hours per year for testing and maintenance (per SCAQMD Rule 1470 limit) to ensure reliability in the case of a power outage.
- The Applicant shall conduct maintenance and/or testing on the two standby generators on separate days.

Therefore, each standby generators would operates for 2 hours per day during 25 days per year for a total of 50 hours per year. Each standby generator shall be tested during different days. For emergency operation both generators would operate up to 2 hours each and could occur simultaneously.

Vender specifications were used to determine air pollutants emission factors for the standby generators. Emission factors are 5.27 g/hp-hour for NOx, 0.5 g/hp-hour for CO, 0.18 g/hp-hour for VOC, and 0.4 g/hp-hour for $PM_{10}/PM_{2.5}$. The estimated annual fuel usage assuming each generator operates of 50 hours per year (2 hours per day) is 27,440 gallons of diesel fuel.[57]

57 Vender Specifications for Standby Generator, Accessed August 25, 2020 at: https://www.cat.com/en_US/products/new/power-systems/electric-power.html

Electrical Usage

Components of the proposed Project would utilize electrical energy for a whole range of function. During normal operation of the proposed TPSS at the MSF Site (TPSS 1) is estimated to have a peak power load flow of 2,008 kilowatts (kW) and normal operation of the proposed TPSS at the Transit Center TPSS (TPSS 2) is estimated to have a peak power load flow of 2,119 kW for a total of 4,127 kW. The proposed Project would operate for 18 hours per day which would generate a total electricity demand of 74,286 kWh per day or 27,114,390 kWh (27,114 Megawatts-hour or MWh) per year.[58] In the event TPSS 1 is unable to operate, TPSS 2 is estimated to have a peak power load of 4,152 kW which would generate a total electricity demand of 74,736 kWh per day or 27,278,640 kWh (27,279 MWh) per year. Similarly, in the event TPSS 2 is unable to operate, TPSS 1 is estimated to have a peak power load of 4,353 kW which would generate a total electricity demand of 78,354 kWh per day or 28,599,210 kWh (28,599 MWh) per year.

The electrical demand from the existing (but to be removed as part of the proposed Project) commercial, restaurant, and retail uses at the current commercial plaza at Florence and Market Street (proposed Market Street/Florence Avenue Station site) and the commercial plaza at 500 East Manchester Boulevard (proposed MSF site) is 5,110,987 kWh per year. Therefore, during normal operation, the electricity demand for the proposed Project results in a net increase of 22,003,403 kWh (22,003 MWh) per year. In the event TPSS-1 is unable to operate, the electricity demand for the proposed Project results in a net increase of 22,167,653 kWh (22,168 MWh) per year. In the event TPSS-1 is unable to operate, the electricity demand for the proposed Project results in a net increase of 23,488,223 kWh (23,488 MWh) per year. The electrical demand associated with the Adjusted Baseline is 16,507,545 kWh (16,508 MWh) per year.

Southern California Edison average CO_2e intensity factors for its total electricity mix is projected to be 0.173 $MTCO_2e$/MWh (or 535 pounds per MWh) and was used to determine the GHG emissions from the APM. Estimated GHG emissions from APM operations are the average CO_2e intensity factor (535 pounds per MWh) times the electrical usage (for example, 27,114 MWh for the proposed Project), which equals 6,580 metric tons.

13.0 SUMMARY

In summary, daily mitigated construction emissions would exceed the SCAQMD significance thresholds for NO_x during 2023 through 2025, as described in **Section 8**. These impacts are largely due to off-road construction equipment and to a much lesser degree due to off-site construction haul trucks. However,

58 Lea+Elliott, *Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition DRAFT - June 2020 (See Appendix 3.0.1).*

during mitigated construction activities as presented in **Section 9**, the ambient air concentration impacts due to Project construction would be less than significant at all nearby receptors for all pollutants. Therefore, although the daily construction emissions for NO_x would potentially exceed the SCAQMD significance thresholds, but the resultant air concentrations would not likely exceed the SCAQMD significance thresholds. As shown in **Section 10**, during mitigated construction activities, incremental cancer risks would not exceed significance thresholds at existing residence, existing daycare/school and off-site worker locations. As shown in **Section 11**, the GHG emissions associated with construction activities would not likely exceed the SCAQMD significance thresholds. Daily operational emissions would less than significant compared to the SCAQMD significance thresholds. Once operational, the proposed Project will increase transit ridership throughout the region, reduce vehicle miles traveled and criteria air pollutants, GHG emissions, and improve air quality throughout the South Coast Air Basin (see **Section 12**). Therefore, short-term construction-related air quality impacts would occur but long-term operational-related air quality benefits would follow.

Attachment A

Dispersion Modeling Methodology and Assumptions

Dispersion is the process by which atmospheric pollutants disseminate due to wind and vertical atmospheric stability. The results of a dispersion analysis are used to assess pollutant concentrations at or near an emission source. The results of an analysis allow predicted concentrations of pollutants to be compared directly to air quality standards and other criteria such as health risks based on modeled concentrations.

A rising pollutant plume reacts with the environment in several ways before it levels off. First, the plume's own turbulence interacts with atmospheric turbulence to entrain ambient air. This mixing process reduces and eventually eliminates the density and momentum differences that cause the plume to rise. Second, the wind transports the plume during its rise and entrainment process. Higher winds mix the plume more rapidly, resulting in a lower final rise. Third, the plume interacts with the vertical temperature stratification of the atmosphere, rising as a result of buoyancy in the unstable-to-neutrally stratified mixed layer. However, after the plume encounters the mixing lid and the stably stratified air above, its vertical motion is dampened.

Molecules of gas or small particles injected into the atmosphere will separate from each other as they are acted on by turbulent eddies. The Gaussian mathematical model such as AERMOD simulates the dispersion of the gas or particles within the atmosphere. The formulation of the Gaussian model is based on the following assumptions:

- The predictions are not time-dependent (all conditions remain unchanged with time)
- The wind speed and direction are uniform, both horizontally and vertically, throughout the region of concern
- The rate of diffusion is not a function of position
- Diffusion in the direction of the transporting wind is negligible when compared to the transport flow

Air quality impacts were determined for United States Environmental Protection Agency (USEPA) criteria pollutants such as carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter less than 10 micrometers (coarse or PM_{10}), and particulate matter less than 2.5 micrometers (fine or $PM_{2.5}$).

Dispersion Modeling Approach

Air dispersion modeling was performed to estimate the downwind dispersion of exhaust emissions resulting from construction activities and operations. The following sections present the fundamental components of an air dispersion modeling analysis including air dispersion

model selection and options, receptor locations, meteorological data, source exhaust parameters, nitrogen oxides (NOx) to NO_2 conversion, and building downwash.

Model Selection and Options

AERMOD (Version 19191)[1] was used for the dispersion analysis. AERMOD is the USEPA preferred atmospheric dispersion modeling system for general industrial sources. The model can simulate point, area, volume, and line sources. AERMOD is the appropriate model for this analysis based on the coverage of simple, intermediate, and complex terrain. It also predicts both short-term and long-term (annual) average concentrations. The model was executed using the regulatory default options (stack-tip downwash, buoyancy-induced dispersion, and final plume rise), default wind speed profile categories, default potential temperature gradients, and assuming no pollutant decay.

The selection of the appropriate dispersion coefficients depends on the land use within three kilometers (km) of the project site. The types of land use were based on the classification method defined by Auer (1978); using pertinent United States Geological Survey (USGS) 1:24,000 scale (7.5 minute) topographic maps of the area. If the Auer land use types of heavy industrial, light-to-moderate industrial, commercial, and compact residential account for 50 percent or more of the total area, the USEPA *Guideline on Air Quality Models*[2] recommends using urban dispersion coefficients; otherwise, the appropriate rural coefficients can be used. Per South Coast Air Quality Management District (SCAQMD) guidance, urban dispersion coefficients were applied within AERMOD. For this project, all emissions sources were modeled with urban effects using the population of 9,818,605 for Los Angeles County.[3]

Receptor Locations

Some receptors are considered more sensitive to air pollutants than others, because of preexisting health problems, proximity to the emissions source, or duration of exposure to air pollutants. Land uses such as primary and secondary schools, hospitals, and convalescent homes are considered to be relatively sensitive to poor air quality because the very young, the old, and the infirm are more susceptible to respiratory infections and other air quality-related health problems than the general public. Residential areas are also considered sensitive to poor air quality because people in residential areas are often at home for extended periods. Recreational land uses are moderately sensitive to air pollution because vigorous exercise

[3] South Coast Air Quality Management District, *SCAQMD Modeling Guidance for AERMOD*, Accessed July 7, 2020 at: https://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance.

associated with recreation places having a high demand on respiratory system function. The CARB has identified the following people as most likely to be affected by air pollution: children less than 14 years of age, the elderly over 65 years of age, athletes, and those with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive population groups.

In accordance with SCAQMD guidance[4], modeled receptors for the health risk assessment (HRA) were placed at locations in which people are typically located for a period of time. The receptors for the HRA within a quarter-mile of the project site are as follows:

- Single- and multi-family residences along the project length.
- Off-site workers within industrial and commercial areas surrounding the project site.
- Recreational facilities such as Queen Park.
- Medical facilities such as Hillcrest Medical Center and Centinela Hospital Medical Center.
- Educational facilities such as Inglewood High School, Inglewood Junior Academy, George W Crozier Middle School, and Kelso Elementary School.
- Off-site daycare/childcare such as South Bay Child Development Center, Tender Care Child Development Center, A Bright Beginning Child Development Center, and Debbie's Child Development Center.

Figure A-1 displays the location of the nearby residential receptors. offsite workers, and other sensitive receptors used in the HRA. There are a total of 1,287 residential, offsite workers, and other sensitive receptors**. Figure A-2** displays the specific sensitive receptors within the northern portion of the project site. **Figure A-3** displays the specific sensitive receptors within the central portion of the project site. **Figure A-4** displays the specific sensitive receptors within the southern portion of the project site. **Figure A-5** displays the location of the receptors used in the air quality analysis for the criteria pollutants impacts. There are a total of 667 air quality criteria pollutant receptors plus the 1,287 sensitive receptors (see **Figure A-1**).

All receptors were set so that only ground-level concentrations were analyzed. Flagpole receptors are only necessary for analyses that have instances where sensitive receptors are located on patios/decks at nearby high-rise buildings.[5] Generally, the modeled concentrations would be highest at the ground-level due to the ground-level emissions associated with construction activities.

FIGURE A-5
AMBIENT AIR CONCENTRATION IMPACT RECEPTORS

The air quality analysis for the criteria pollutants (NO_2, CO, SO_2, PM_{10}, and $PM_{2.5}$) were evaluated at receptors where a person has access and can be situated for an hour or longer at a time. To identify the maximum impacted receptors, a uniform Cartesian grid with a spacing of 50 meters was used for all distances less than 500 meters and with a spacing of 100 meters for all distances less than 1,500 meters. The size of the modeling domain and placement of the receptors was at such a distance and resolution to identify the maximum impacts to the surrounding areas and the significant concentration gradients from the project emission sources.[6]

The AERMOD modeling system includes AERMAP (Version 11103)[7], which is a terrain data pre-processor. Terrain data, available from the United States Geological Survey (USGS), was used by AERMAP to produce terrain base elevations for each receptor and source and a hill height scale value for each receptor. The National Elevation Dataset (NED) data in GeoTIFF format was used as input into AERMAP instead of Digital Elevation Model (DEM) data. A resolution of one-arc-second (approximately 30 meters) or 1/3 arc-second (approximately 10 meters) was used. Elevations were imported for all emission sources, receptors, and buildings in the modeling analysis.

Meteorological Data

Air quality is a function of both the rate and location of pollutant emissions under the influence of meteorological conditions and topographic features affecting pollutant movement and dispersal. Atmospheric conditions such as wind speed, wind direction, atmospheric stability, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air pollutants, and consequently affect air quality.

Hourly meteorological data from Los Angeles International Airport, located approximately four miles to the west-southwest of the proposed project was used in the dispersion modeling analysis and health risk assessment. Meteorological data from 2012 through 2016 were used.[8] **Figure A-6** displays the annual wind rose. Wind directions are predominately from the west with a large frequency of light or moderate wind speed conditions, as shown in **Figure A-7**. The average annual wind speed is 7.8 miles per hour (3.5 meters per second).

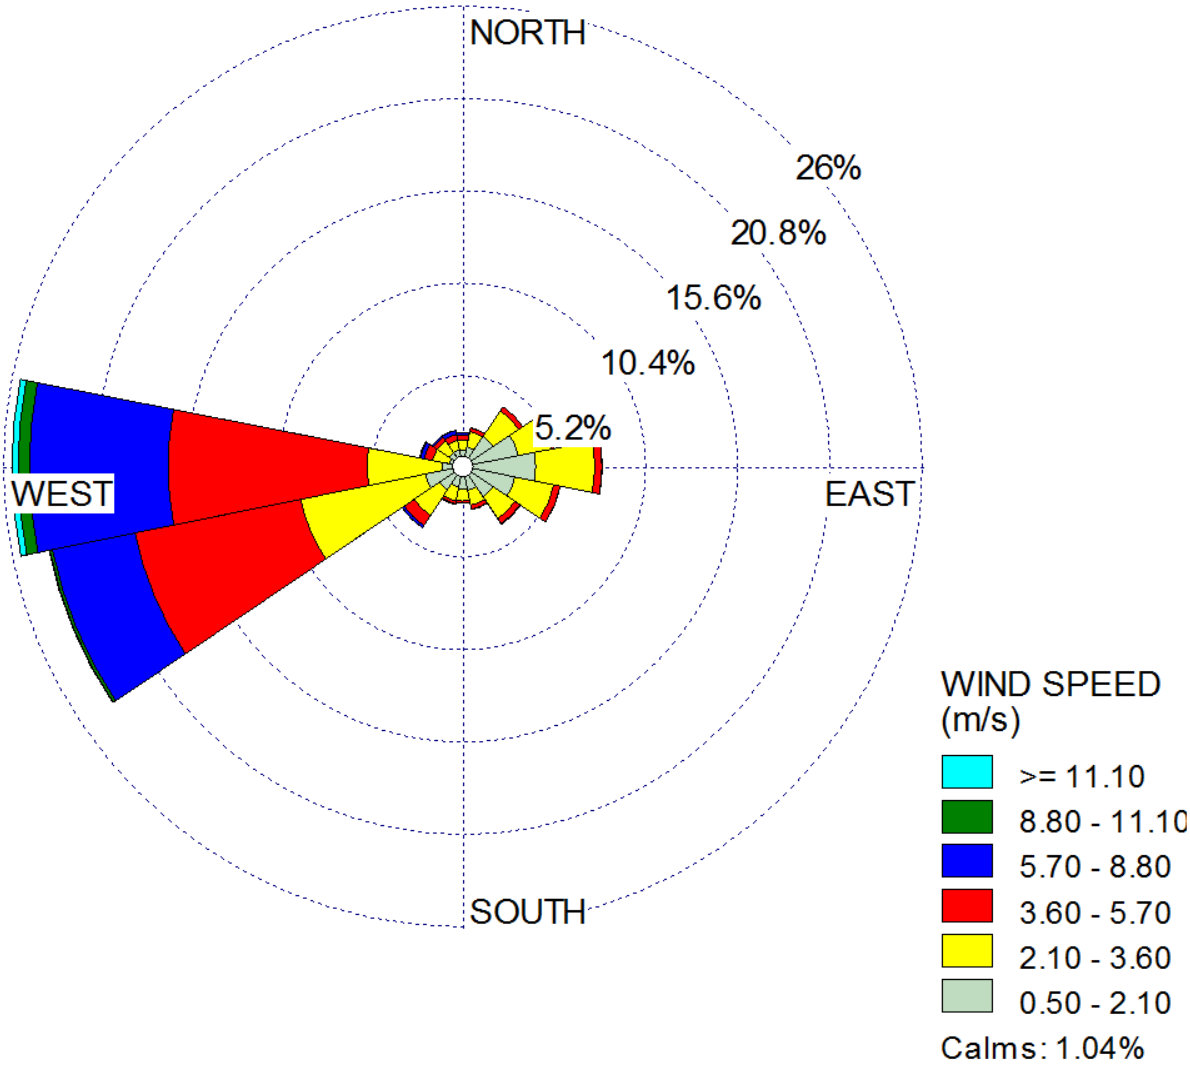
FIGURE A-6
WINDROSE FOR LOS ANGELES INTERNATIONAL AIRPORT



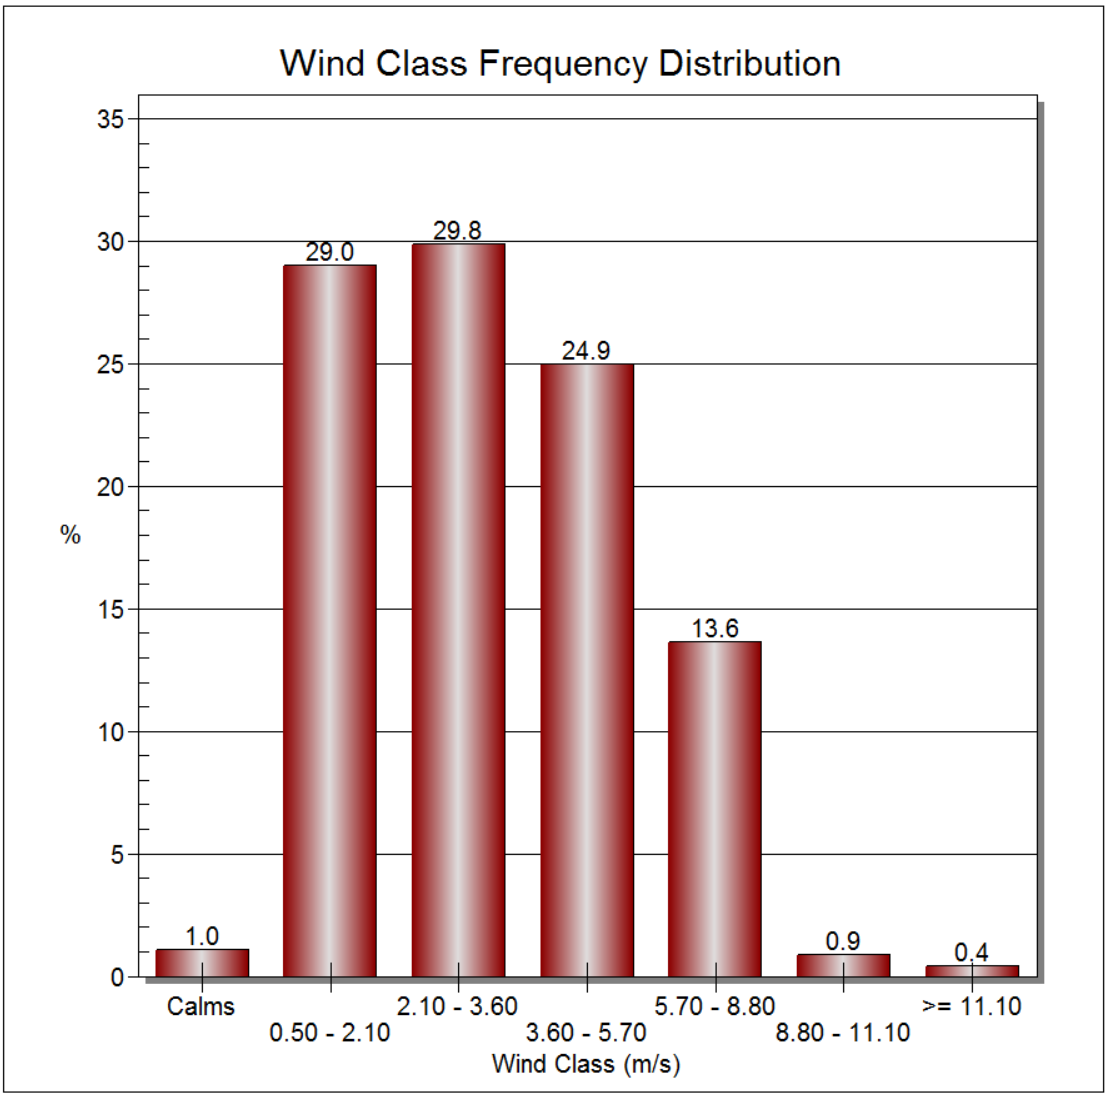


FIGURE A-7
WIND SPEED DISTRIBUTION FOR LOS ANGELES INTERNATIONAL AIRPORT

Source Release Characteristics

Construction equipment activities were treated as an area source. The release height of the off-road equipment exhaust was set to 3.05 meters and an initial vertical dimension of 4.15 meters. Offsite construction trucks were treated as a line source (i.e., volume sources placed at regular intervals) located along nearby roadways. The off-site construction trucks were assigned a release height of 3.05 meters and an initial vertical dimension of 4.15 meters, which accounts for dispersion from the movement of vehicles.[9] Terrain elevations for emission source locations were based on AERMAP (Version 11103).[10]

The primary delivery routes would utilize Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard which are currently in use by nearby projects within the two mile radius. For materials delivered to and stored at designated construction staging areas, the contractor haul routes to and from the project area would be generally on public streets. Some excavated dirt materials may be hauled at night, where possible, due to the congested freeways and surface streets around or near the excavation site during daytime hours. The contractor would develop an excavation plan that define haul routes, dust control, sweeping and disposal site.

Construction activity would primarily occur over a 16 hour / day schedule with two shifts, either a morning shift from approximately 7:00 a.m. to 3:00 p.m. or an evening shift from approx. 3:00 p.m. to 11:00 p.m., or a morning shift from approximately 7:00 a.m. to 3:00 p.m. and a night shift from approximately 11:00 p.m. to 7:00 a.m. Other minimal construction work could occur during other hours at a reduced intensity. Delivery of construction materials would occur during the night shift, as would most lane closures.

Temporal factors were used to describe the relationship of one period of time to another (i.e., the relationship of activity during one hour to activity in a 24-hour period). In AERMOD, temporal factors are applied to represent varying levels of activity as a fraction of a peak period. Using temporal factors gives the model the ability to more accurately reflect real world conditions. **Table A-1** shows the hourly construction profile which represents the construction intensity for each hour of the day relative to the peak hour. Construction activities would occur Monday through Sunday.

[9] While haul truck emissions contribute minimally to overall project construction emissions, they also are spread over many miles. Hence, the portion of trucking emissions that would impact one receptor is much smaller than the emissions that the clustered off-road activity at the project site would impact a receptor near the site.

[10] United States Environmental Protection Agency, AERMAP, Accessed July 7, 2020 at: https://www.epa.gov/scram/air-quality-dispersion-modeling-preferred-and-recommended-models.

TABLE A-1
HOURLY CONSTRUCTION PROFILE

	Hour	Morning/Evening Hourly Work Intensity	Morning/Night Hourly Work Intensity
Nighttime	12:00 AM – 1:00 AM	25%	50%
	1:00 AM – 2:00 AM	25%	50%
	2:00 AM – 3:00 AM	25%	50%

	11:00 PM – 12:00 AM	25%	50%

Nitrogen Dioxide to Nitrogen Oxides Conversion

According to USEPA, dispersion modeling results provide predicted concentrations of NOx which, for comparison to ambient air quality standards, can be converted to concentrations of NO_2. While AERMOD is generally considered a non-chemistry model, it offers three methods for modeling NO_2 formation from NOx emissions: (i) the Ambient Ratio Method (ARM and ARM tier 2), (ii) the Ozone Limiting Method (OLM), and (iii) the Plume Volume Molar Ratio Method (PVMRM). Moreover, USEPA's *Guideline on Air Quality Models* recommends a three-tiered screening approach to estimate ambient concentrations of NO_2:

- *Tier 1* – Assumes complete (100 percent) conversion of all emitted NO_x to NO_2 based on application of an appropriate refined modeling technique under Section 4.2.2 of Appendix

W (of the USEPA's *Guideline on Air Quality Models*) to estimate ambient NO_x concentrations.

- *Tier 2* – Ambient Ratio Method (ARM-2), in which model-predicted NO_x concentrations are multiplied by a NO_2/NO_x ambient ratio derived from ambient monitoring data. ARM-2 incorporates a variable ambient ratio—a function of model predicted one-hour NO_x concentration—based on an analysis of nationwide hourly ambient NO_x monitoring data from approximately 580 stations from 2001 through 2010.
- *Tier 3* – Performs a detailed analysis on a case-by-case basis by employing the OLM or PVMRM. These methods require the most detailed analysis and produce the least conservative and presumably most representative results. Tier 3 requires information such as in-stack NO_2/NO_x ratio and ambient ozone concentrations.

The air quality dispersion modeling analysis employed the ARM-2 approach. It was determined that 100 percent conversion (tier 2) was not appropriate for this air quality analysis and the use of ARM-2 provides a conservative analysis compared to the use of OLM/PVMRM (tier 3).

Background Concentrations

Background concentrations, as described in the USEPA *Guideline on Air Quality Models*[11] refers to the "…portion of the background attributable to natural sources, other unidentified sources in the vicinity of the project, and regional transport contributions from more distant sources" where "…the ambient concentrations from these sources are typically accounted for through use of ambient monitoring data…".

Generally, the closest upwind monitor should be selected, with preference to the monitor that has the most similar characteristics to the area for the source under consideration. The SCAQMD maintains a network of monitoring stations within the Air Basin that monitor air quality and compliance with applicable ambient standards. The nearest air monitoring station which measures CO, NO_2, SO_2, and PM_{10} is located near Los Angeles International Airport (7201 West Westchester Parkway, Southwest Coastal LA County, Station 820), four miles to the west of the project site. The nearest air monitoring station which measures $PM_{2.5}$ is located in central Los Angeles (1630 North Main Street, Central LA, Station 087), ten miles to the northeast of the project site. **Table A-2** summarizes the most recent three years of data (2017 through 2019) from the nearby air monitoring stations.

Consistent with SCAQMD guidance, the maximum background concentrations (in bold) were used in the air quality analysis. The most recent three years of available monitoring data have

[11] United States Environmental Protection Agency, *Guideline on Air Quality Models (Revised), 40 Code of Federal Regulations, Part 51, Appendix W*, November 2005, Accessed July 7, 2020 at: https://www3.epa.gov/scram001/guidance/guide/appw_05.pdf.

been used to develop background concentration values. For all CAAQS and most NAAQS pollutants, the maximum value from the most recent three years was used. The exceptions to this includes 1-hour NO_2 (three year average of the 98th percentile of the daily maximum 1-hour average) and 1-hour SO_2 (three year average of the 99th percentile of the daily maximum 1-hour average).[12] The exceptions for including background concentrations is the PM_{10} CAAQS and $PM_{2.5}$ NAAQS and CAAQS, due to the nonattainment status for the South Coast Air Basin. Modeled maximum 24-hour and annual concentrations were compared directly to the significant thresholds.

TABLE A-2
BACKGROUND CONCENTRATIONS (PPM)

Pollutant	Monitoring Data by Year		
	2017	2018	2019
Nitrogen Dioxide (NO_2)			
Highest 1 Hour Average (ppm)[b]- CAAQS	**0.072**	0.060	0.070
Highest 1 Hour Average (ppm)[b]- NAAQS	**0.055**	0.050	0.049
Annual Average ($\mu g/m^3$)	0.009	0.009	**0.010**
Carbon Monoxide (CO)

Attachment B

Health Risk Assessment Methodology and Assumptions

A health risk assessment (HRA) is accomplished in four steps: 1) hazards identification, 2) exposure assessment, 3) toxicity assessment, and 4) risk characterization. These steps cover the estimation of air emissions, the estimation of the air concentrations resulting from a dispersion analysis, the incorporation of the toxicity of the pollutants emitted, and the characterization of the risk based on exposure parameters such as breathing rate, age adjustment factors, and exposure duration; each depending on receptor type (i.e., residence, school, daycare centers, hospitals, senior care facilities, recreational areas, adult, infant, child).

This HRA was conducted in accordance with technical guidelines developed by federal, state, and regional agencies, including United States Environmental Protection Agency (USEPA) *Guideline on Air Quality Models*[1], California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[2], the South Coast Air Quality Management District (SCAQMD) *AB 2588 and Rule 1402 Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots" Information and Assessment Act*,[3] and SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1 and 212*.[4] This HRA addresses the emissions from construction activities (nonroad equipment at the project site and off-site truck travel along nearby roadways). Specific focus is on diesel particulate matter (DPM) emissions.

An HRA should not be interpreted as the expected rates of cancer or other potential human health effects, but rather as estimates of potential risk or likelihood of adverse effects based on current knowledge, under a number of highly conservative assumptions and the best assessment tools currently available. **Attachment C: Supplemental Health Impact Information provides** further information on health impacts.

TERMS AND DEFINITIONS

As the practice of conducting an HRA is particularly complex and involves concepts that are not altogether familiar to most people, several terms and definitions are provided that are considered essential to the understanding of the approach, methodology and results:

Acute effect – a health effect (non-cancer) produced within a short period of time (few minutes to several days) following an exposure to toxic air contaminants (TAC).

Cancer risk – the probability of an individual contracting cancer from a lifetime (i.e., 70 year) exposure to TAC such as DPM in the ambient air based on an exposure duration of 30 years.

Chronic effect – a health effect (non-cancer) produced from a continuous exposure occurring over an extended period of time (weeks, months, years).

Hazard Index (HI) – the unitless ratio of an exposure level over the acceptable reference dose. The HI can be applied to multiple compounds in an additive manner.

Hazard Quotient (HQ) – the unitless ratio of an exposure level over the acceptable reference dose. The HQ is applied to individual compounds.

Toxic Air Contaminants – any air pollutant that is capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). The current California list of TAC identify approximately 200 compounds, including particulate emissions from diesel-fueled engines.

Human Health Effects - comprise disorders such as eye watering, respiratory or heart ailments, and other (i.e., non-cancer) related diseases.

Health Risk Assessment – an analysis designed to predict the generation and dispersion of TAC in the outdoor environment, evaluate the potential for exposure of human populations, and to assess and quantify both the individual and population-wide health risks associated with those levels of exposure.

Incremental – under CEQA, the net difference (or change) in conditions or impacts when comparing the baseline to future year project conditions.

Maximum exposed individual (MEI) – an individual assumed to be located at the point where the highest concentrations of TAC, and therefore, health risks are predicted to occur.

Non-cancer risks – health risks such as eye watering, respiratory or heart ailments, and other non-cancer related diseases.

Receptors – the locations where potential health impacts or risks are predicted (i.e., schools, residences, and recreational sites).

LIMITATIONS AND UNCERTAINTIES

There are a number of important limitations and uncertainties commonly associated with a HRA due to the wide variability of human exposures to TAC, the extended timeframes over which the exposures are evaluated, and the inability to verify the results. Limitations and uncertainties associated with a HRA include: (a.) lack of reliable monitoring data; (b.) extrapolation of toxicity data in animals to humans; (c.) estimation errors in calculating TAC emissions; (d.) concentration prediction errors with dispersion models; and (e.) the variability in lifestyles, fitness and other confounding factors of the human population. This HRA was performed in accordance with USEPA, OEHHA, and SCAQMD guidance and requirements, notwithstanding the following uncertainties:

- There are uncertainties associated with the estimation of emissions from project activities. Where project-specific data, such as emission factors, are not available, default assumptions in emission models were used.
- The limitations of the air dispersion model provide a source of uncertainty in the estimation of exposure concentrations. According to USEPA, errors due to the limitation of the algorithms implemented in the air dispersion model in the highest estimated concentrations of +/- 10 percent to 40 percent are typical.[5]
- The source parameters used to model emission sources add uncertainty. For all emission sources, the source parameters used source-specific, recommended as defaults, or expected to produce more conservative results. Discrepancies might exist in actual emissions characteristics of an emission source and its representation in the dispersion model.
- The exposure duration estimates do not take into account that people do not usually reside at the same location for 30 years and that other exposures (i.e., school children) are also of much shorter durations than was assumed in this HRA. This exposure duration is a highly conservative assumption, since most people do not remain at home all day and on average residents change residences every 11 to 12 years. In addition, this assumption adopts that residents are experiencing outdoor concentrations for the entire exposure period. A school child exposure duration is between ages 2 and 16 years old, which again is conservative because the elementary, middle, and high school are not often located at the same location.
- For the risk and hazards calculations as well as the cumulative health impact, numerous assumptions must be made in order to estimate human exposure to pollutants. These

[5] United States Environmental Protection Agency, *Guideline on Air Quality Models (Revised), 40 Code of Federal Regulations, Part 51, Appendix W*, November 2005, Accessed July 7, 2020 at: https://www3.epa.gov/scram001/guidance/guide/appw_05.pdf.

assumptions include parameters such as breathing rates, exposure time and frequency, exposure duration, and human activity patterns. While a mean value derived from scientifically defensible studies is the best estimate of central tendency, most of the exposure variables used in this HRA are high-end estimates. The combination of several high-end estimates used as exposure parameters may substantially overestimate pollutant intake. The excess lifetime cancer risks calculated in this HRA are therefore likely to be higher than may be required to be protective of public health.

- The OEHHA cancer potency factor for DPM was used to estimate cancer risks associated with exposure to DPM emissions from construction activities. However, the cancer potency factor derived by OEHHA for DPM is highly uncertain in both the estimation of response and dose. In the past, due to inadequate animal test data and epidemiology data on diesel exhaust, the International Agency for Research on Cancer (IARC), a branch of the World Health Organization, had classified DPM as Probably Carcinogenic to Humans (Group 2); the USEPA had also concluded that the existing data did not provide an adequate basis for quantitative risk assessment.[6] However, based on two recent scientific studies,[7] IARC recently re-classified DPM as Carcinogenic to Humans to Group 1,[8] which means that the agency has determined that there is "sufficient evidence of carcinogenicity" of a substance in humans and represents the strongest weight-of-evidence rating in IARC's carcinogen classification scheme. This determination by the IARC may provide additional impetus for the USEPA to identify a quantitative dose-response relationship between exposure to DPM and cancer.

In summary, the estimated health impacts are based primarily on a series of conservative assumptions related to predicted environmental concentrations, exposure, and chemical toxicity. The use of conservative assumptions tends to produce upper-bound estimates of risk. The USEPA notes that the conservative assumptions used in a HRA are intended to assure that the estimated risks do not underestimate the actual risks posed by a site and that the estimated risks do not necessarily represent actual risks experienced by populations at or near a site.[9]

HAZARDS IDENTIFICATION

Diesel exhaust is a complex mixture of numerous individual gaseous and particulate compounds emitted from diesel-fueled combustion engines. Diesel particulate matter is formed primarily through the incomplete combustion of diesel fuel. DPM is removed from the atmosphere through physical processes including atmospheric fall-out and washout by rain. Humans can be exposed to airborne DPM by deposition on water, soil, and vegetation; although the main pathway of exposure is inhalation. Cal/EPA has concluded that potential cancer risk from inhalation exposure to whole diesel exhaust outweigh the multi-pathway cancer risk from the speciated components.

In August 1998, the CARB identified DPM as an air toxic. CARB developed the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel- Fueled Engines and Vehicles* and *Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines* and approved these documents on September 28, 2000.[10,11] The documents represent proposals to reduce DPM emissions, with the goal of reducing emissions and the associated health risk by requiring the use of state-of-the-art catalyzed DPM filters and ultra-low-sulfur diesel fuel.

In 2001, CARB assessed the state-wide health risks from exposure to diesel exhaust and to other toxic air contaminants. It is difficult to distinguish the health risks of diesel emissions from those of other air toxics, since diesel exhaust contains approximately 40 different TAC. The CARB study detected diesel exhaust by using ambient air carbon soot measurements as a surrogate for diesel emissions. The study reported that the state-wide cancer risk from exposure to diesel exhaust was about 540 per million population as compared to a total risk for exposure to all ambient air toxics of 760 per million. This estimate, which accounts for about 70 percent of the total risk from TAC, included both urban and rural areas in the state. The estimate can also be considered an average worst-case for the state, since it assumes constant exposure to outdoor concentrations of diesel exhaust and does not account for expected lower concentrations indoors, where most of time is spent. DPM is estimated to increase statewide cancer risk by 520 cancers per million residents exposed over a lifetime.[12]

Exposure to DPM results in a greater incidence of chronic non-cancer health effects, such as cough, labored breathing, chest tightness, wheezing, and bronchitis. Individuals particularly vulnerable to DPM are children, whose lung tissue is still developing, the elderly and people with illnesses who may have other serious health problems that can be aggravated by exposure

to DPM. In general, children are more vulnerable than adults to air pollutants because they have higher inhalation rates, narrower airways, and less mature immune systems. In addition, children with allergies may have an enhanced allergic response when exposed to diesel exhaust.

EXPOSURE PARAMETERS

Exposure to airborne chemicals occurs through inhalation and subsequent absorption into the body, potentially resulting in adverse health effects depending on toxicological properties of the chemical and other exposure parameters. This HRA was conducted in accordance with technical guidelines developed by federal, state, and regional agencies, including U.S. Environmental Protection Agency (USEPA), California Environmental Protection Agency (CalEPA), California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[13], the SCAQMD *AB 2588 and Rule 1402 Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots" Information and Assessment Act,*[14] and SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1 and 212*.[15]

OEHHA's revisions to its *Guidance Manual* were primarily designed to ensure that the greater sensitivity of children to cancer and other health risks is reflected in HRAs. For example, OEHHA now recommends that risks be analyzed separately for multiple age groups, focusing especially on young children and teenagers, rather than the past practice of analyzing risks to the general population, without distinction by age. OEHHA also now recommends that statistical "age sensitivity factors" be incorporated into a HRA, and that children's relatively high breathing rates be accounted for. On the other hand, the *Guidance Manual* revisions also include some changes that would reduce calculated health risks. For example, under the former guidance, OEHHA recommended that residential cancer risks be assessed by assuming 70 years of exposure at a residential receptor; under the *Guidance Manual*, this assumption is lessened to 30 years. This is based on studies showing that 30 years is a reasonable estimate of the 90th to 95th percentile of residency duration in the population. Therefore, the health risk assessment provides that a receptor's exposure to a project's emissions for up to 30 years and that the cancer rick is then determined based on a 70 year lifetime for that receptor.

Scientific data have shown that young animals are more sensitive than adult animals to exposure to many carcinogens. Therefore, OEHHA developed age sensitivity factors (ASF) to take into account the increased sensitivity to carcinogens during early-in-life exposures. OEHHA recommends that cancer risks be weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to 2 years of age, by a factor of 3 for exposures from 2 years through 16 years of age, and by a factor of 1 for exposures from 16 years through 30 years of age.

OEHHA and SCAQMD has developed exposure factors (e.g., daily breathing rates) for four age groups including the third trimester to birth, birth to 2 years, 2 to 16 years, and 16 to 30 years. These age bins allow for more refined exposure information to be used when estimating exposure and the potential for developing cancer over a lifetime. This means that exposure variates are needed for the third trimester, ages zero to less than two, ages two to than 16, and ages 16 to 30. Residential receptors utilize the 95th percentile breathing rate values. For residential exposures, the high end daily breathing rates (e.g., 95th percentile) for children from the third trimester through age 2, and 80th percentile daily breathing rates for all other ages is recommended. The age-specific breathing rates for the four age groups are 361 liters per kilogram-day for third trimester, 1,060 liters per kilogram-day for ages less than 2 years, 572 liters per kilogram-day for ages 2 to 16 years, and 261 liters per kilogram-day for ages 16 to 30 years. A school child (age 2 to 9 years) breathing rate is 631 liters per kilogram-day and an off-site and onsite worker breathing rate is 230 liters per kilogram-day.[16] [17]

Based on OEHHA recommendations, the cancer risk to residential receptors assumes exposure occurs 24 hours per day for 350 days per year while accounting for a percentage of time at home. OEHHA evaluated information from activity pattern databases to estimate the fraction of time at home (FAH) during the day.

This information is used to adjust cancer risk from a project's emissions, assuming that exposure to the project's emissions are not occurring away from home. A FAH factor of 0.5 applies for the offsite workers since the offsite worker is assumed to be present for a typical eight hour work day compared to the 16 hour construction schedule. In general, the FAH factors are age-specific and are 0.85 for ages less than 2 years, 0.72 for ages 2 to 16 years, and 0.73 for ages 16 to 30 years. However, SCAQMD recommends the FAH is assumed to be 1 for ages third trimester to age 16. As a conservative assumption, children are assumed to attend a

[16] Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*, March 6, 2015, Accessed July 7, 2020 at: http://oehha.ca.gov/air/hot_spots/hotspots2015.html.

[17] South Coast Air Quality Management District, *Risk Assessment Procedures for Rule 1401, 1401.1 and 212*, September 1, 2017, Accessed July 7, 2020 at: http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12.

daycare or school in close proximity to their home and no discount should be taken for time spent outside of the area affected by the project's emissions.[18] [19]

Based on OEHHA recommendations, for children at school sites, exposure is assumed to occur 10 hours per day for 180 days (or 36 weeks) per year. Cancer risk estimates for children at school sites are calculated based on nine year exposure duration. School sites also include teachers and other adult staff which are treated as off-site workers. For occupational receptors, SCAQMD guidance suggests that the exposure be based on 8 hours per day, 5 days per week, 250 working days per year, and a 25-year working lifetime. This is a conservative assumption, since most people do not remain at the same job for 25 years. For worker exposures, it is assumed that the working age begins at 16 years, and that exposures to project emissions occur during the work shift which is typically up to eight hours per day during work days. Given the exposure durations of less than 24 hours, sensitive recreational receptors were evaluated for acute impacts only.[20] [21] **Table B-1** presents a summary of the health risk assessment exposure factors.

Table B-1: Health Risk Assessment Exposure Factors

Receptor	Age	Age Specific Factor	Breathing Rate (L/kg-day)	Fraction of Time	Daily Exposure	Annual Exposure
Worker	16 to 41	1	230	1	8 hours	250 days
Residential	Third Trimester	10	361	1	24 hours	350 days
	0 to 2	10	1,090	1	24 hours	350 days
	2 to 16	3	572	1	24 hours	350 days
	16 to 30	1	261	0.73	24 hours	350 days
School Child	2 to 16	3	581	1	10 hours	180 days

RISK CHARACTERIZATION

Cancer risk is defined as the lifetime probability of developing cancer from exposure to carcinogenic substances. Cancer risks are expressed as the chance in one million of getting cancer (i.e., number of cancer cases among one million people exposed). The cancer risks are assumed to occur exclusively through the inhalation pathway. The cancer risk can be estimated by using the cancer potency factor (milligrams per kilogram of body weight per day [mg/kg-day]), the 70-year annual average concentration (microgram per cubic meter [$\mu g/m^3$]), and the lifetime exposure adjustment based on a 30-year exposure duration.

Following guidelines established by OEHHA, the incremental cancer risks attributable to the proposed project were calculated by applying exposure parameters to modeled DPM concentrations in order to determine the inhalation dose (mg/kg-day) or the amount of pollutants inhaled per body weight mass per day. The cancer risks occur exclusively through the inhalation pathway; therefore, the cancer risks can be estimated from the following equation:

$$\text{Dose-inh} = \frac{C_{air} * \{DBR\} * A * ASF * FAH * EF * ED * 10^{-6}}{AT}$$

where:

Dose-inh	= Dose of the toxic substance through inhalation in mg/kg-day
10^{-6}	= Micrograms to milligrams conversion, Liters to cubic meters conversion
C_{air}	= Concentration in air in microgram (μg)/cubic meter (m^3)
DBR	= Daily breathing rate in liter (L)/kg body weight – day
A	= Inhalation absorption factor, 1.0
ASF	= Age Sensitivity Factor
EF	= Exposure frequency (days/year)
ED	= Exposure duration (years)
FAH	= Fraction of Time at Home
AT	= Averaging time period over which exposure is averaged in days (25,550 days for a 70 year lifetime based on a 30-year exposure duration)

To determine incremental cancer risk, the estimated inhalation dose attributed to the proposed project was multiplied by the cancer potency slope factor (cancer risk per mg/kg-day). The cancer potency slope factor is the upper bound on the increased cancer risk from a lifetime exposure to a pollutant. These slope factors are based on epidemiological studies and are

different values for different pollutants. This allows the estimated inhalation dose to be equated to a cancer risk.

Non-cancer adverse health impacts, acute (short-term) and chronic (long-term), are measured against a hazard index (HI), which is defined as the ratio of the predicted incremental exposure concentration from the proposed project to a published reference exposure level (REL) that could cause adverse health effects as established by OEHHA. The ratio (referred to as the Hazard Quotient [HQ]) of each non-carcinogenic substance that affects a certain organ system is added to produce an overall HI for that organ system. The overall HI is calculated for each organ system. If the overall HI for the highest-impacted organ system is greater than one, then the impact is considered to be significant.

The HI is an expression used for the potential for non-cancer health effects. The relationship for the non-cancer health effects is given by the annual concentration (in $\mu g/m^3$) and the REL (in $\mu g/m^3$). The acute hazard index was determined using the "simple" concurrent maximum approach, which tends to be conservative (i.e., overpredicts).

The relationship for the non-cancer health effects is given by the following equation:

$$HI = C/REL$$

Where:

HI = Hazard index; an expression of the potential for non-cancer health effects.

C = Annual average concentration ($\mu g/m^3$) during the 70 year exposure period.

REL = Concentration at which no adverse health effects are anticipated.

The concentration level at or below which no adverse non-cancer health effects are anticipated for a specified exposure duration is termed the REL. REL are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. REL are designed to protect the most sensitive individuals in the population by the inclusion of margins of safety. Since margins of safety are incorporated to address data gaps and uncertainties, exceeding the REL does not automatically indicate an adverse health impact.[22] The chronic REL for DPM was established by the California OEHHA as 5 $\mu g/m^3$.[23]

Attachment C

Supplemental Health Impact Information (Friant Ranch Case)

The proposed Project is located in Los Angeles County within the South Coast Air Basin. The Basin is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties.

The South Coast Air Quality Management District (SCAQMD) has jurisdiction over an area of approximately 10,743 square miles. This area includes all of Orange County, all of Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Basin is a subregion of the SCAQMD jurisdiction. While air quality in this area has improved compared to past decades, the Basin requires continued diligence to meet air quality standards. The SCAQMD has adopted a series of Air Quality Management Plans (AQMP) to meet the California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS). These plans require control technology for existing sources, control programs for area sources and indirect sources, a SCAQMD permitting system designed to allow no net increase in emissions from any new or modified permitted emission sources, and transportation control measures.

In March of 2017, the SCAQMD adopted the 2016 AQMP which includes strategies and measures needed to meet the NAAQS. The AQMP demonstrates attainment of the ozone NAAQS as well as the latest $PM_{2.5}$ standards.[1] The SCAQMD also adopts rules and regulations to implement portions of the AQMP.

Part of the control process of the SCAQMD's duty to improve the air quality in the Basin is the uniform CEQA review procedures required by SCAQMD's CEQA Handbook. The thresholds of significance used to assess a project's direct and cumulative impacts have contributed to improving air quality within the Basin over the past decades. The District's thresholds of significance are based on factual and scientific data and are therefore appropriate thresholds of significance to use for the proposed Inglewood Transit Project.

The recent Sierra Club v. County of Fresno California Supreme Court case held, in part, that the Friant Ranch Specific Plan EIR (Friant Ranch EIR) was deficient in the informational discussion of air quality impacts as they connect to adverse human health effects. The Supreme Court concluded that an EIR's discussion must "make [ ] a reasonable effort to substantively connect a project's air quality impacts to likely health consequences."

[1] South Coast Air Quality Management District, 2016 Air Quality Management Plan, March 1, 2017, Accessed July 7, 2020 at: http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan

For the proposed Project, daily construction emissions of NOx (a precursor to the formation of ozone) would exceed significance thresholds resulting in a significant and unavoidable impact even with mitigation. Thus, the proposed Project would contribute to regional ozone contributions but determining potential health impacts caused directly by the construction activities is not feasible.

According to the San Joaquin Valley Air Pollution Control District (SJVAPCD), it is not possible to determine ozone concentrations or make a direct correlation to human health impacts, because project-focused modeling cannot feasibly predict ozone formation and resulting regional ozone concentrations. South Coast Air Quality Management District (SCAQMD) has indicated that applicable methods do exist but are not applicable or feasible in most cases. The Court did not rule on whether health impacts of the named pollutants were scientifically feasible to predict, but it did state that: "if it is not scientifically possible to do more than has already been done to connect air quality effects with potential human health impacts, the Friant Ranch EIR itself must explain why, in a manner reasonably calculated to inform the public of the scope of what is and is not yet known about the project's impacts."

The current modeling tools are not equipped to provide meaningful analysis of the correlation between a project's criteria pollutant or pollutant precursor emissions and specific health impacts. Air dispersion modeling is available, such as the American Meteorological Society/ Environmental Protection Agency Regulatory Model (AERMOD), but these models cannot accurately estimate dispersion of ozone. Ozone concentrations are dependent upon a variety of complex factors, including the presence of sunlight and precursor pollutants, natural topography, atmospheric stability, and wind patterns. Because of the dynamic nature of ozone formation and the complexities of predicting ground-level ozone concentrations in relation to ambient standards, air districts instead generally develop mass emissions thresholds for NOx that are used to make significance determinations.

In summary, modeling of the proposed Project's ozone emissions is not feasible and would not provide meaningful information given the number of variables that affect ozone formation (e.g., location of activity and weather on that day that results in conversion of precursor emissions into ozone). However, as shown in **Section 9**, the resultant air concentrations for the proposed Project would be below the significance thresholds and thus, the air quality health impacts due to the construction criteria air pollutant emissions would be expected to be less than significant. Nevertheless, the health impacts due to diesel particulate emissions would be potentially above the significance thresholds and would potentially be significant.

As stated by the California Supreme Court, an EIR should relate the expected adverse air quality impacts to likely health consequences or explain in meaningful detail why it is not feasible to provide such an analysis. In its Friant Ranch decision, the California Supreme Court conceded that an explanation of the connection between an individual project's air

pollutant emissions in excess of thresholds and human health effects may not be possible given the current state of environmental science modeling. However, the California Supreme Court concluded that the Friant Ranch Project EIR itself must explain, in a manner reasonably calculated to inform the public, the scope of what is and is not yet known about the effect of the Project's significant and unavoidable air quality impacts on human health.

As explained within the following, modeling of the Inglewood Transit Project's ozone emissions is not feasible and would not provide meaningful information given the magnitude of the emissions and the number of variables that affect ozone formation (e.g., mass of precursor emissions, background concentrations for all other emission sources in the air basin, location of activity and weather on that day that results in conversion of precursor emissions into ozone).

Consistent with the California Supreme Court's Friant Ranch decision, the analyses presented provides additional details regarding the potential health effects from the proposed Inglewood Transit's significant and unavoidable criteria pollutant construction emissions of NOx. It also explains why it is not scientifically feasible to substantively connect this individual Proposed Project's air quality impacts to likely health consequences. The criteria air pollutant construction emissions of NOx for the project are too small to model and obtain meaningful regional concentrations of criteria air pollutants and ozone.

The following information is intended to fulfil the requirements of the Superior Court decision related to the health impacts from significant and unavoidable air pollutant emissions of NOx, and related ozone. This attachment describes, in a manner intended to inform the public, why additional modeling is not feasible or meaningful given the details of the proposed Project and current state of air quality modeling.

Criteria Air Quality Pollutant Emissions and Health Impacts

In response to the California Supreme Court's Sierra Club v. County of Fresno decision (issued on December 24, 2018, and commonly referred to as the "Friant Ranch" decision), this response addresses the potential for adverse health effects from the emissions of criteria air pollutants associated with the proposed Inglewood Transit, based on scientific information and technological methods available at this time. The Friant Ranch decision addresses the relationship between significant and unavoidable pollutant emissions to specific health consequences, where "*The EIR must provide an adequate analysis to inform the public how its bare numbers translate to create potential adverse impacts or it must explain what the agency does know and why, given existing scientific constraints, it cannot translate potential health impacts further*." (Sierra Club v. County of Fresno, 2018).

Given that the air quality analysis for the proposed Project identifies a significant and unavoidable project level impacts with regard to nitrogen oxides (NOx) emissions, the following serves to address the requirements imposed under the Friant Ranch decision. Per

SCAQMD significance guidance, these impacts at the project level are also considered cumulatively significant and could occur during the construction period. NOx is an ozone precursor and emissions of NOx have the potential to contribute to existing ozone non-attainment conditions within the South Coast Air Basin (Air Basin).

Criteria Air Pollutant Health Impacts

"Criteria" air pollutants refer to those air pollutants for which the USEPA has established NAAQS under the Federal Clean Air Act, including Carbon monoxide (CO), nitrogen dioxide (NO_2), ozone (O_3), particulate matter equal to or greater than 10 micrometers (coarse particulate or PM_{10}), and particulate matter equal to or greater than 2.5 micrometers (fine particulate or $PM_{2.5}$). California has adopted ambient standards (known as CAAQS) that are more stringent than the federal standards for some criteria air pollutants. The following provides a brief summary of the potential health and welfare effects and typical sources of each of the criteria air pollutants and air toxics.

Numerous scientific studies published over the past 50 years point to the harmful effects of air pollution. The AAQS are designed to prevent these effects. The adverse health effects associated with air pollution are diverse and include[2]:

- Premature mortality
- Cardiovascular effects
- Increased health care utilization (hospitalization, physician and emergency room visits)
- Increased respiratory illness and other morbidity (symptoms, infections, and asthma exacerbation
- Decreased lung function (breathing capacity)
- Lung inflammation
- Potential immunological changes
- Increased airway reactivity to a known pharmacological agent exposure - a method used in laboratories to evaluate the tendency of airways to have an increased possibility of developing an asthmatic response
- A decreased tolerance for exercise
- Adverse birth outcomes such as low birth weights

[2] South Coast Air Quality Management District, 2016 Air Quality Management Plan Appendix I, Health Effects, March 2017, Accessed July 9, 2020 at: https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-i.pdf?sfvrsn=14

The evidence linking these effects to air pollutants is derived from population-based observational and field studies (epidemiological) as well as controlled laboratory studies involving human subjects and animals. There have been an increasing number of studies focusing on the mechanisms (that is, on learning how specific organs, cell types, and biomarkers are involved in the human body's response to air pollution) and specific pollutants responsible for individual effects. Yet the underlying biological pathways for these effects are not always clearly understood.[3]

Although individuals inhale pollutants as a mixture under ambient conditions, the regulatory framework and the control measures developed are pollutant-specific for six major outdoor pollutants covered under Sections 108 and 109 of the Clean Air Act. This is appropriate, in that different pollutants usually differ in their sources, their times and places of occurrence, the kinds of health effects they may cause, and their overall levels of health risk. Different pollutants, from the same or different sources, oftentimes occur together. Evidence for more than additive effects has not been strong and, as a practical matter, health scientists, as well as regulatory officials, usually must deal with one pollutant at a time in adopting AAQS.[4]

Health effects associated with criteria air pollutants are discussed within the following:

Ozone (O_3)

O_3 is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and that can cause substantial damage to vegetation and other materials. O_3 is not emitted directly into the atmosphere but is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving ROG and NO_x. ROG and NO_x are therefore known as precursor compounds for O_3. Substantial ozone production generally requires O_3 precursors to be present in a stable atmosphere with strong sunlight for approximately three hours. O_3 is defined as a regional air pollutant because it is not emitted directly by specific sources but is formed downwind of sources of ROG and NO_x under the influence of wind and sunlight. O_3 concentrations tend to be higher in the late spring, summer, and fall, when long sunny days combine with regional air subsidence inversions to create conditions conducive to the formation and accumulation of secondary photochemical compounds.

Inhalation of O_3 causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms. Exposure to O_3 can reduce the volume of air that the

[3] South Coast Air Quality Management District, 2016 Air Quality Management Plan Appendix I, Health Effects, March 2017, Accessed July 9, 2020 at: https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-i.pdf?sfvrsn=14

[4] South Coast Air Quality Management District, 2016 Air Quality Management Plan Appendix I, Health Effects, March 2017, Accessed July 9, 2020 at: https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-i.pdf?sfvrsn=14

lungs breathe in and cause shortness of breath. O_3 in sufficient doses increases the permeability of lung cells, rendering them more susceptible to toxins and microorganisms. The occurrence and severity of health effects from O_3 exposure vary widely among individuals, even when the dose and the duration of exposure are the same. Research shows adults and children who spend more time outdoors participating in vigorous physical activities are at greater risk from the harmful health effects of O_3 exposure.

While there are relatively few studies of ozone's effects on children, the available studies show that children are no more or less likely to suffer harmful effects than adults. However, there are a number of reasons why children may be more susceptible to O_3 and other pollutants. Children and teens spend nearly twice as much time outdoors and engaged in vigorous activities as adults. Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults. Also, children are less likely than adults to notice their own symptoms and avoid harmful exposures. Further research may be able to better distinguish between health effects in children and adults. Children, adolescents and adults who exercise or work outdoors, where O_3 concentrations are the highest, are at the greatest risk of harm from this pollutant.[5]

A number of population groups are potentially at increased risk for O_3 exposure effects. In the ongoing review of O_3, the USEPA has identified populations as having adequate evidence for increased risk from O_3 exposures include individuals with asthma, younger and older age groups, individuals with reduced intake of certain nutrients such as Vitamins C and E, and outdoor workers. There is suggestive evidence for other potential factors, such as variations in genes related to oxidative metabolism or inflammation, gender, socioeconomic status, and obesity. However further evidence is needed.[6] The adverse effects reported with short-term O_3 exposure are greater with increased activity because activity increases the breathing rate and the volume of air reaching the lungs, resulting in an increased amount of O_3 reaching the lungs.[7]

Carbon Monoxide (CO)

CO is a non–reactive pollutant that is a product of incomplete combustion of organic material, and is mostly associated with motor vehicle traffic, and in wintertime, with wood–burning stoves and fireplaces. High CO concentrations develop primarily during winter when periods of light winds combine with the formation of ground–level temperature inversions (typically

---

[7] South Coast Air Quality Management District, 2016 Air Quality Management Plan Appendix I, Health Effects, March 2017, Accessed July 9, 2020 at: https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-i.pdf?sfvrsn=14

from the evening through early morning). These conditions result in reduced dispersion of vehicle emissions. Motor vehicles also exhibit increased CO emission rates at low air temperatures.

When inhaled at high concentrations, CO combines with hemoglobin in the blood and reduces its oxygen–carrying capacity, resulting in reduced levels of oxygen reaching the brain, heart, and other body tissues. This condition is especially critical for people with cardiovascular diseases, chronic lung disease, or anemia. CO measurements and modeling were important in the early 1980s when CO levels were regularly exceeded throughout California, but in more recent years, CO measurements and modeling are not a priority in most California air districts due to the retirement of older vehicles, fewer emissions from new vehicles, and improvements to fuels.[8]

Nitrogen Oxides (NO_x)

When combustion temperatures are extremely high, as in aircraft, truck and automobile engines, atmospheric nitrogen combines with oxygen to form various oxides of nitrogen. Nitric oxide (NO) and nitrogen dioxide (NO_2) are the most significant air pollutants generally referred to as NO_x. Nitric oxide is a colorless and odorless gas that is relatively harmless to humans, quickly converts to NO_2 and can be measured. Nitrogen dioxide has been found to be a lung irritant capable of producing pulmonary edema. Inhaling NO_2 can lead to respiratory illnesses such as bronchitis and pneumonia. Nitrate particles and NO_2 can also block the transmission of light, reducing visibility in urban areas.

A large body of health science literature indicates that exposure to NO_2 can induce adverse health effects. The strongest health evidence, and the health basis for the AAQS for NO_2, results from controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics. In addition, a number of epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses.

As with other pollutants, infants and children are particularly at risk because they have disproportionately higher exposure to NO_2 than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration. Several studies have shown that long-term NO_2 exposure during childhood, the period of rapid lung growth, can lead to smaller lungs at maturity in children with higher compared to lower levels of exposure. In addition, children with asthma have a greater degree of airway responsiveness compared

[8] California Air Resources Board, 2019, Carbon Monoxide & Health, Accessed July 9, 2020 at: https://ww2.arb.ca.gov/resources/carbon-monoxide-and-health

with adult asthmatics. In adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease.[9]

Particulate Matter (PM_{10} and $PM_{2.5}$)

PM_{10} and $PM_{2.5}$ represent fractions of particulate matter that can be inhaled into the air passages and the lungs, causing adverse health effects. Particulate matter in the atmosphere results from many kinds of dust– and fume–producing industrial and agricultural operations, fuel combustion, wood burning stoves and fireplaces, and atmospheric photochemical reactions. Some sources of particulate matter, such as demolition, construction activities and mining, are more local in nature, while others, such as vehicular traffic and wood burning stoves and fireplaces, have a more regional effect.

For $PM_{2.5}$, short-term exposures (up to 24-hours duration) have been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. These adverse health effects have been reported primarily in infants, children, and older adults with preexisting heart or lung diseases. In addition, of all of the common air pollutants, $PM_{2.5}$ is associated with the greatest proportion of adverse health effects related to air pollution, both in the United States and world-wide based on the World Health Organization's Global Burden of Disease Project. Short-term exposures to PM_{10} have been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency room visits.[10]

Long-term (months to years) exposure to $PM_{2.5}$ has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children. The effects of long-term exposure to PM_{10} are less clear, although several studies suggest a link between long-term PM_{10} exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that PM in outdoor air pollution causes lung cancer.[11]

People with influenza, people with chronic respiratory and cardiovascular diseases, and older adults may suffer worsening illness and premature death as a result of breathing PM. People with bronchitis can expect aggravated symptoms from breathing PM. Children may experience a decline in lung function due to breathing in PM_{10} and $PM_{2.5}$.

---

[9] California Air Resources Board, 2019, Nitrogen Dioxide & Health, Accessed July 9, 2020 at: https://ww2.arb.ca.gov/resources/nitrogen-dioxide-and-health

[10] California Air Resources Board, 2019, Inhalable Particulate Matter Health, Accessed July 9, 2020 at: https://ww2.arb.ca.gov/resources/inhalable-particulate-matter-and-health

[11] California Air Resources Board, 2019, Inhalable Particulate Matter Health, Accessed July 9, 2020 at: https://ww2.arb.ca.gov/resources/inhalable-particulate-matter-and-health

Very small particles of certain substances (e.g., sulfates and nitrates) can cause lung damage directly, or can contain adsorbed gases (e.g., chlorides or ammonium) that may be injurious to health. Particulates can also damage materials and reduce visibility. Dust comprised of large particles settles out rapidly and is easily filtered by human breathing passages. This dust is of concern more as a soiling nuisance rather than a health hazard. The remaining fractions, PM_{10} and $PM_{2.5}$, are a health concern particularly at levels above the Federal and State ambient air quality standards. $PM_{2.5}$ (including diesel exhaust particles) is thought to have greater effects on health, because these particles are so small and thus are able to penetrate to the deepest parts of the lungs.

Acute and chronic health effects associated with high particulate levels include the aggravation of chronic respiratory diseases, heart and lung disease, and coughing, bronchitis, and respiratory illnesses in children. Mortality studies since the 1990s have shown a statistically significant direct association between mortality (premature deaths) and daily concentrations of particulate matter in the air. Despite important gaps in scientific knowledge and continued reasons for some skepticism, a comprehensive evaluation of the research findings provides persuasive evidence that exposure to fine particulate air pollution has adverse effects on cardiopulmonary health. The CARB has estimated that achieving the ambient air quality standards for PM_{10} could reduce premature mortality rates by 6,500 cases per year.[12]

Sulfur Dioxide (SO_2)

A colorless gas, SO_2 is formed when fuels containing sulfur compounds are combusted. SO_2 can cause irritation and inflammation of tissues with which it comes in contact. Inhaling elevated concentrations can irritate mucous membranes, cause bronchial damage, and exacerbate pre-existing respiratory diseases such as asthma, bronchitis, and emphysema. Sulfate particles are the major cause of reduced visibility in many areas of the United States. When combined with other substances in the air, this pollutant can fall to the earth as rain, fog, snow, or dry particles (commonly referred to as "acid rain"). SO_2 can also accelerate the decay of building materials and certain types of paint.

SO_2 is a combustion product of sulfur or sulfur–containing fuels such as coal and diesel. SO_2 is also a precursor to the formation of atmospheric sulfate and particulate matter, and contributes to potential atmospheric sulfuric acid formation that could precipitate downwind as acid rain. The maximum SO_2 concentrations recorded in the project area are well below federal and State standards; as a result, the area is in attainment status with both federal and State SO_2 standards.

Controlled human exposure and epidemiological studies show that children and adults with asthma are more likely to experience adverse responses with SO_2 exposure, compared with the

[12] California Air Resources Board, 2019, Inhalable Particulate Matter Health, Accessed July 9, 2020 at: https://ww2.arb.ca.gov/resources/inhalable-particulate-matter-and-health

non-asthmatic population. Effects at levels near the one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity. Also, exposure at elevated levels of SO_2 (above 1 ppm) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality. The elderly and people with cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most likely to experience these adverse effects.[13]

Lead

People and animals can be exposed to Pb by breathing or ingesting it in food, water, soil, or dust. Historically, the majority of Pb has come from the combustion of leaded fuels. However, the use of unleaded fuels since 1975 has reduced mobile source Pb emissions by more than 90 percent. Unlike unleaded automobile gasoline, aviation gasoline (commonly known as Avgas, or 100LL, for 100 octane low-lead) still contains Pb as an antiknock agent.

Ambient lead concentrations meet both the federal and State standards in the project area. Lead has a range of adverse neurotoxin health effects, and was released into the atmosphere via leaded gasoline products. The phase–out of leaded gasoline in California has resulted in dramatically decreased levels of atmospheric lead. Ambient lead concentrations meet both the federal and State standards in the project area. Lead has a range of adverse neurotoxin health effects, and was released into the atmosphere via leaded gasoline products. The phase–out of leaded gasoline in California has resulted in dramatically decreased levels of atmospheric lead. Metal processing is currently the primary source of lead emissions in the SCAB. The highest concentrations of lead in air are generally found near lead smelters and general aviation airports; where piston aircraft use leaded fuel. Other stationary sources that generate lead emissions include waste incinerators, utilities, and lead-acid battery manufacturers.

Reactive Organic Gases (ROGs) / Volatile Organic Compounds (VOCs)

The terms ROG and VOC are often used interchangeably, and the terminology will vary from air district to air district. Volatile organic compounds (VOC) means any compound of carbon, excluding carbon monoxide, carbon dioxide (CO_2), carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions and thus, a precursor of ozone formation. ROGs are any reactive compounds of carbon, excluding methane, CO, CO_2 carbonic acid, metallic carbides or carbonates, ammonium carbonate, and other exempt compounds.

ROGs include a variety of chemicals, some of which may have short- and long-term adverse health effects. ROGs are emitted by a wide array of products numbering in the thousands.

[13] California Air Resources Board, 2019. Sulfur Dioxide & Health, Accessed July 9, 2020 at: https://ww2.arb.ca.gov/resources/sulfur-dioxide-and-health

Examples include paints and lacquers, paint strippers, cleaning supplies, building materials and furnishings as well as fuel storage and use.

ROGs can cause eye, nose, and throat irritation; headaches, loss of coordination, nausea, and damage to liver, kidney, and central nervous system. Some organics can cause cancer in animals; some are suspected or known to cause cancer in humans. The ability of organic chemicals to cause health effects varies greatly from those that are highly toxic, to those with no known health effect. As with other pollutants, the extent and nature of the health effect will depend on many factors including level of exposure and length of time exposed. Eye and respiratory tract irritation, headaches, dizziness, visual disorders, and memory impairment are among the immediate symptoms that some people have experienced soon after exposure to some organics.

Existing Air Quality in the Inglewood Vicinity

The SCAQMD maintains a network of monitoring stations within Los Angeles County that monitor air quality and compliance with applicable ambient standards. The nearest air monitoring station which measures CO, NO_2, SO_2, and PM_{10} is located near Los Angeles International Airport (7201 West Westchester Parkway, Southwest Coastal LA County, Station 820), four miles to the west of the Project site. The nearest air monitoring station which measures $PM_{2.5}$ is located in central Los Angeles (1630 North Main Street, Central LA, Station 087), ten miles to the northeast of the Project site. This monitoring data for 2017 through 2019 from the nearby monitoring stations is summarized in **Table C-1**.

Regional Air Quality Trends

While air quality has improved, the Basin requires continued diligence to meet air quality standards. The SCAQMD has adopted a series of AQMP to meet the CAAQS and NAAQS. These plans require control technology for existing sources, control programs for area sources and indirect sources, a SCAQMD permitting system designed to allow no net increase in emissions from any new or modified permitted emission sources and transportation control measures.

SCAQMD rule development through the 1970s and 1980s resulted in dramatic improvement in Basin air quality. Nearly all control programs developed through the early 1990s relied on (i) the development and application of cleaner technology; (ii) add-on emission controls, and (iii) uniform CEQA review throughout the Basin. Industrial emission sources have been significantly reduced by this approach and vehicular emissions have been reduced by technologies implemented at the state level by CARB.

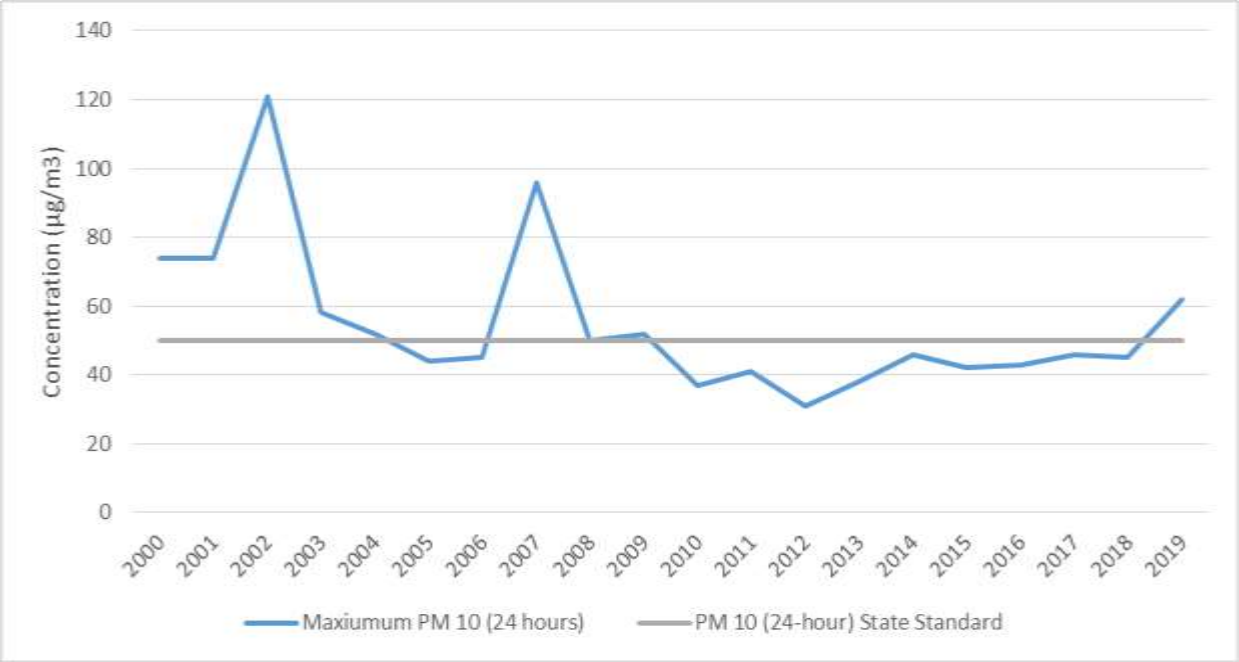
Ozone, NOx, VOC, and CO have been decreasing in the Basin since 1975 and are projected to continue to decrease. These decreases result primarily from motor vehicle controls and reductions in evaporative emissions. Although vehicle miles traveled in the Basin continue to

increase, NOx and VOC levels are decreasing because of the mandated controls on motor vehicles and the replacement of older polluting vehicles with lower-emitting vehicles. NOx emissions from electric utilities have also decreased due to use of cleaner fuels and renewable energy.

Table C-1
Air Quality Data Summary (2017 - 2019)

Pollutant	Standard[s]	Monitoring Data by Year 2017	2018	2019
Ozone				
Highest 1 Hour Average (ppm)[b]	0.09	0.086	0.074	0.082
Days over State Standard	—	0	0	0
Highest 8 Hour Average (ppm)[b]	0.070	0.070	0.065	0.067
Days over National Standard	—	0	0	0
Highest 8 Hour Average (ppm)[b]	0.070	0.070	0.060	0.060
Days over State Standard	—	0	0	0
Nitrogen Dioxide				
Highest 1 Hour Average (ppm)[b]	0.180/0.100	0.072	0.060	0.057
Days over State Standard	—	0	0	0
Annual Average (ppm) [b]	0.030/0.053	0.009	0.009	0.010
Carbon Monoxide				
Highest 1 Hour Average (ppm)[b]	20.0	2.1	1.8	1.8
Days over State Standard	—	0	0	0
Highest 8 Hour Average (ppm)[b]	9.0	1.6	1.5	1.3
Days over State Standard	—	0	0	0
Particulate Matter (PM10)				
Highest 24 Hour Average (µg/m3)[b]	50	46	45	**62**
Days over State Standard	—	0	0	2
State Annual Average (µg/m3) [b]	20	19.8	**20.5**	19.2
Particulate Matter (PM2.5)				
Highest 24 Hour Average (µg/m3)[b]	35	27.8	30.5	**43.5**
Days over National Standard	—	0	0	1
State Annual Average (µg/m3)[b]	12	11.9	**12.6**	10.9

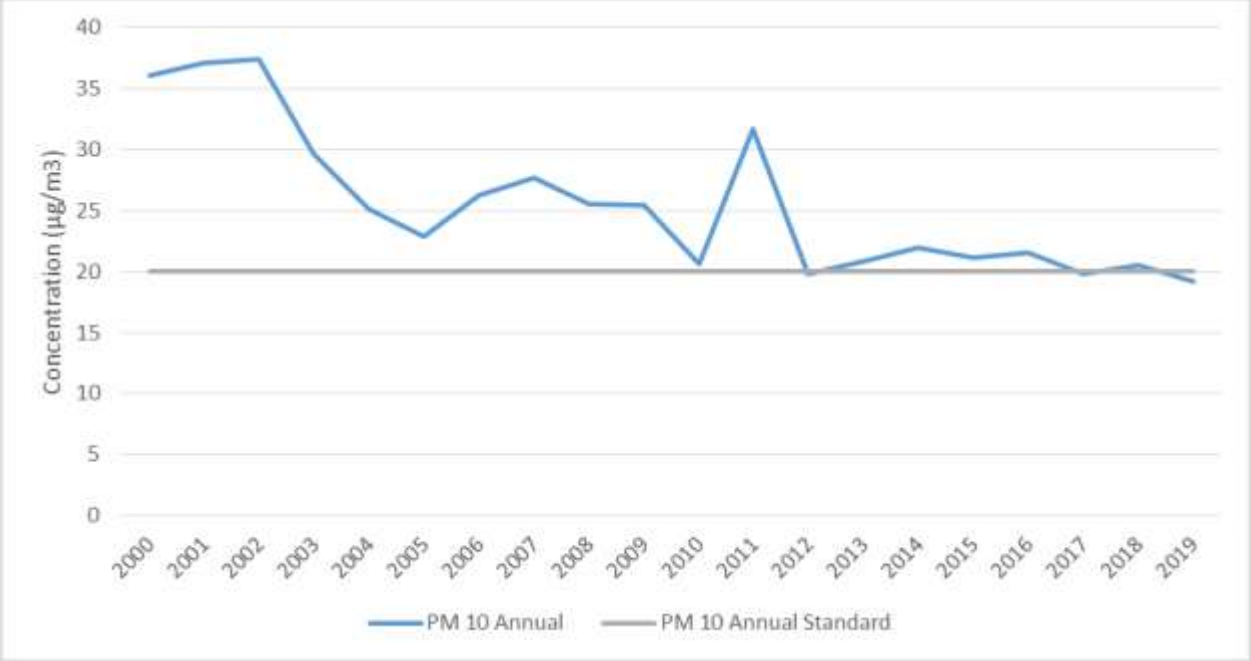
*NOTES: Values in **bold** are in excess of at least one applicable standard.*
Generally, State and national standards are not to be exceeded more than once per year.
ppm = parts per million; µg/m³ = micrograms per cubic meter.
PM_{10} is not measured every day of the year. Number of estimated days over the standard is based on 365 days per year.
Source: South Coast Air Quality Management District, Annual Air Quality Summaries, Accessed July 7, 2020 at: http://www.aqmd.gov/home/air-quality/air-quality-data-studies/historical-data-by-year



The overall trends of PM_{10} and $PM_{2.5}$ levels in the air (not emissions) show an overall improvement since 1975. Direct emissions of PM_{10} have remained somewhat constant in the

Basin and direct emissions of $PM_{2.5}$ have decreased slightly since 1975. Area wide sources (fugitive dust from roads, dust from construction and demolition, and other sources) contribute the greatest amount of direct particulate matter emissions.

The nearest air monitoring station which measures CO, NO_2, SO_2, and PM_{10} is located near Los Angeles International Airport (7201 West Westchester Parkway, Southwest Coastal LA County, Station 820), four miles to the west of the Project site. The nearest air monitoring station which measures $PM_{2.5}$ is located in central Los Angeles (1630 North Main Street, Central LA, Station 087), ten miles to the northeast of the Project site. **Figures C-1 through C-11** show the trend in ambient concentrations of PM_{10}, $PM_{2.5}$, CO, NO_2, and ozone at closest monitoring station.



Recent PM_{10} statistics (2000 through 2019) in the Basin show overall improvement as illustrated in **Figures C-1 through C-2**. As shown in **Figure C-1**, the maximum 24-hour average concentration for PM_{10} decreased by approximately 17 percent, from 74 $\mu g/m^3$ in 2000 to 62 $\mu g/m^3$ in 2019, with a peak of 121 $\mu g/m^3$ in 2002. Although the values are above the State standard of 50 $\mu g/m^3$, there were only 10 days in 2018 where the 24-hour maximum measurement exceeded the state standard (approximately 17 percent of the number of days of recorded data [60]). As shown in **Figure C-1, f**rom 2010 through 2019, Maximum 24-Hour PM_{10} concentrations were below the state standard. As shown in **Figure C-2**, the annual average for PM_{10} has decreased by approximately 47 percent, from 36.1 $\mu g/m^3$ in 2000 to 19.2 $\mu g/m^3$ in 2019, with a peak of 37.4 $\mu g/m^3$ in 2002. The annual average for PM_{10} was above the state standard of 20 $\mu g/m^3$ from 2000 through 2011, 2013 through 2016 and in 2018.

Figure C-1: Maximum 24-Hour PM_{10} Concentration ($\mu g/m^3$) Compared to State Standard

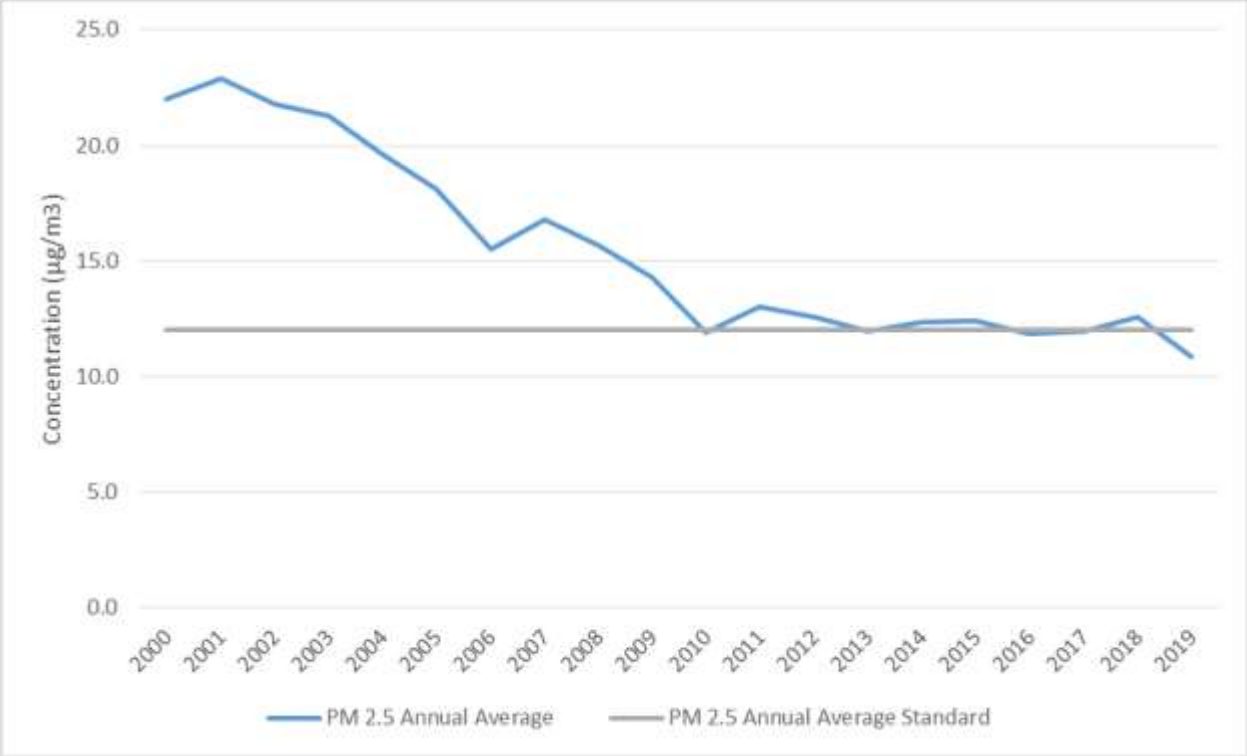
Figure C-2: Annual Average PM_{10} Concentration ($\mu g/m^3$)

Source: SCAQMD, Historical Data By Year, http://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year



Figures C-3 and C-4 show the most recent 24-hour average $PM_{2.5}$ concentrations in the Basin (2000 through 2019). As shown in **Figure C-3**, the 24-hour (98th percentile) concentration has decreased 47 percent from 53.2 µg/m³ in 2005 to 28.3 µg/m³ in 2019. As shown in **Figure C-4**, the annual average trend has decreased by 50 percent from 22 µg/m³ in 2000 to 10.9 µg/m³ in 2019. The SCAB is currently designated as nonattainment for the State and federal $PM_{2.5}$ standards.

Figure C-3: 24-Hour $PM_{2.5}$ Concentration (µg/m³)

Source: SCAQMD, Historical Data By Year, http://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year

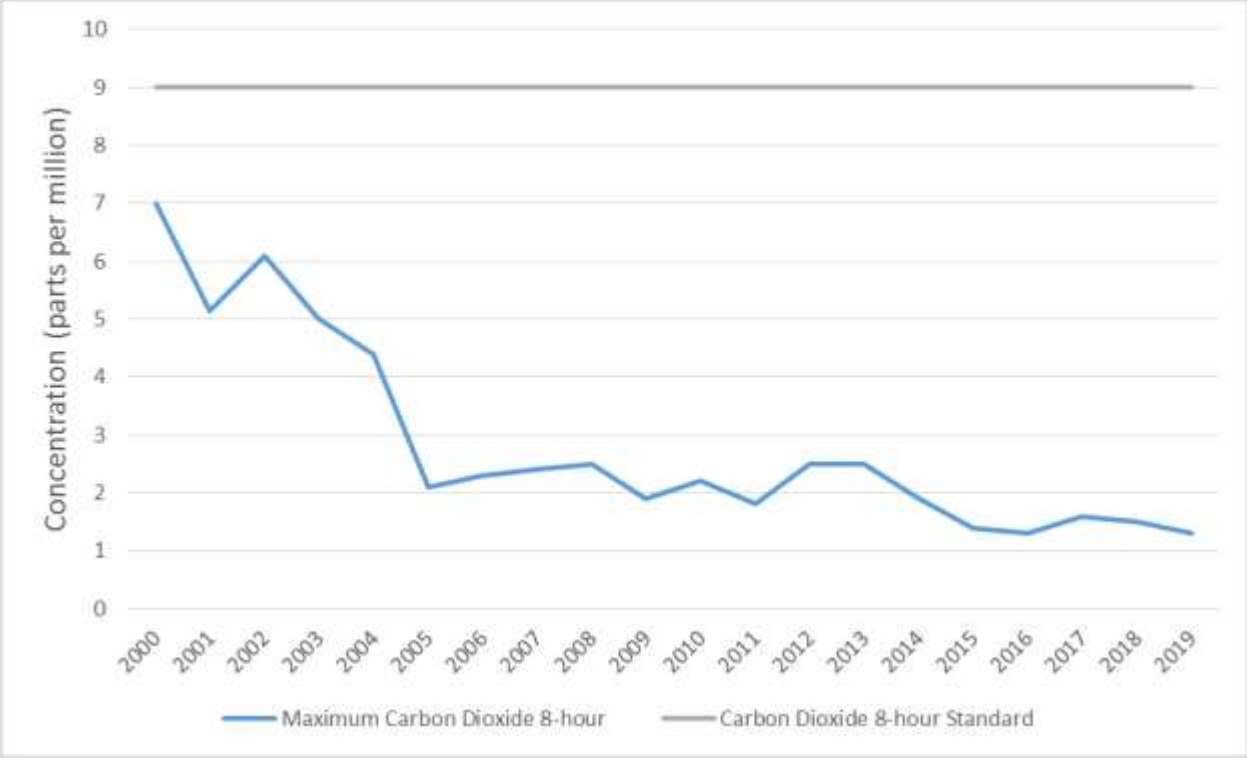


Figure C-4: Annual Average $PM_{2.5}$ Concentration ($\mu g/m^3$)

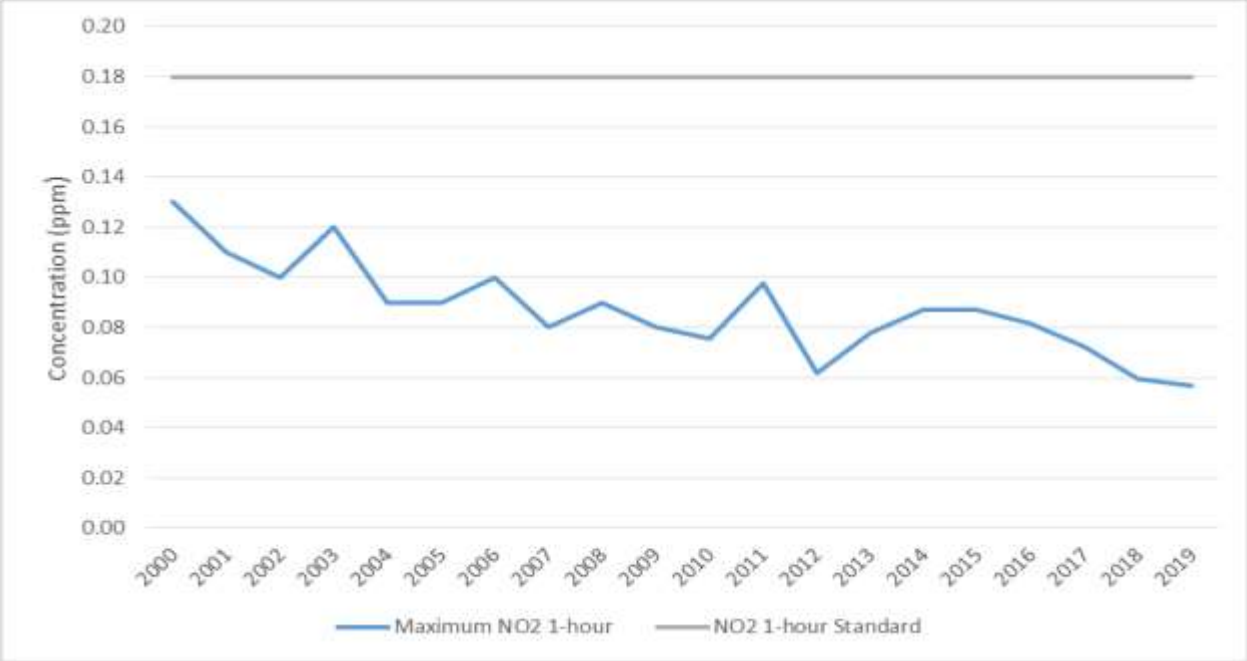
Source: SCAQMD, Historical Data By Year, http://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year

Figure C-5 shows the most recent maximum 8-hour CO concentrations in the SCAB (2000-2019). The 2019 maximum 8-hour CO concentration in the SCAB has decreased approximately 81 percent from 2000 concentration. The entire SCAB is now designated as attainment for both the state and national CO standards. Ongoing reductions from motor vehicle control programs should continue the downward trend in ambient CO concentrations.

Figure C-5: Maximum 8-Hour CO Concentration (ppm)

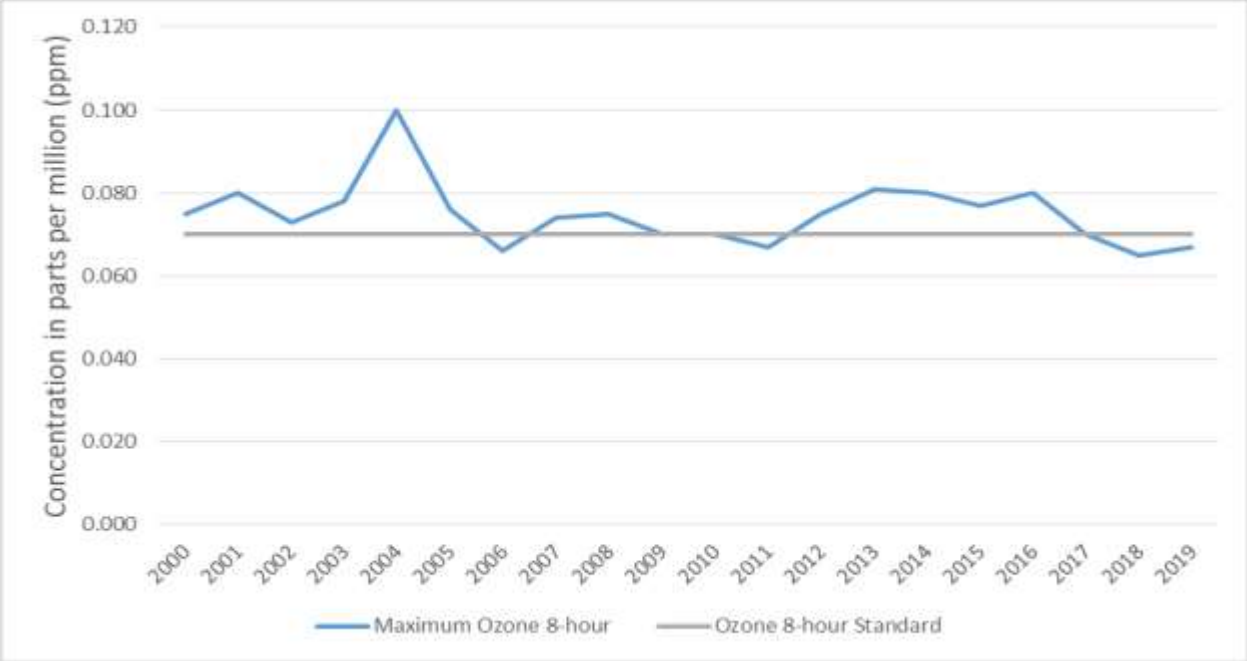


Source: SCAQMD, Historical Data By Year, http://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year

The most recent NO_2 data for the SCAB is shown in **Figure C-6**. Over the last 50 years, NO_2 values have decreased significantly; the peak 1-hour national and state averages for 2017 is approximately 77 percent lower than what it was during 1963. The SCAB attained the State 1-hour NO_2 standard in 1994, bringing the entire State into attainment. NO_2 is formed from NOx emissions, which also contribute to ozone. As a result, the majority of the future emission control measures will be implemented as part of the overall ozone control strategy. Many of these control measures will target mobile sources, which account for more than three-quarters of California's NOx emissions. These measures are expected to bring the South Coast into attainment of the State annual average standard.

Recent NO_2 data (2000 through 2019) indicate decreasing NO_2 emissions. As shown in **Figure C-6**, there was a 54 percent decrease from 130 parts per billion (ppb) in 2000 to 60 ppb in 2019 for maximum 1-hour concentrations of NO_2. Records indicate the lowest NO_2 1-hour maximum concentrations in the past 19 years (56.6 ppb) occurred in 2019.

Figure C-6: Maximum 1-Hour NO_2 Concentration (ppm)



Source: SCAQMD, Historical Data By Year, http://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year

The American Lung Association website includes data collected from State air quality monitors that are used to compile an annual State of the Air. As noted in this report, air quality in the Basin has significantly improved in terms of both pollution levels and high pollution days over the past three decades. The area's average number of high ozone days dropped from 230 days regionally in 2000 to 142 days in the 2017 and continues to decrease the number of days. The region has also seen dramatic reduction in particle pollution from 107 days regionally in 2004 to 14 days in the 2017.

The 2016 AQMP[14] includes the integrated strategies and measures needed to meet the NAAQS. The 2016 AQMP that demonstrates attainment of the 1-hour and 8-hour ozone. Recent Ozone concentration data (2000 through 2019) for 1-hour and 8-hour trends are shown in **Figures C-7 and C-8**. As shown in **Figure C-7**, an 18 percent decrease in the maximum 1-hour ozone trend from 0.1 parts per million (ppm) to 0.082 ppm occurred. **Figure C-8** illustrates an 11 percent decrease in the maximum 8-hour ozone trend that decreased from 0.075ppm to 0.067 ppm.

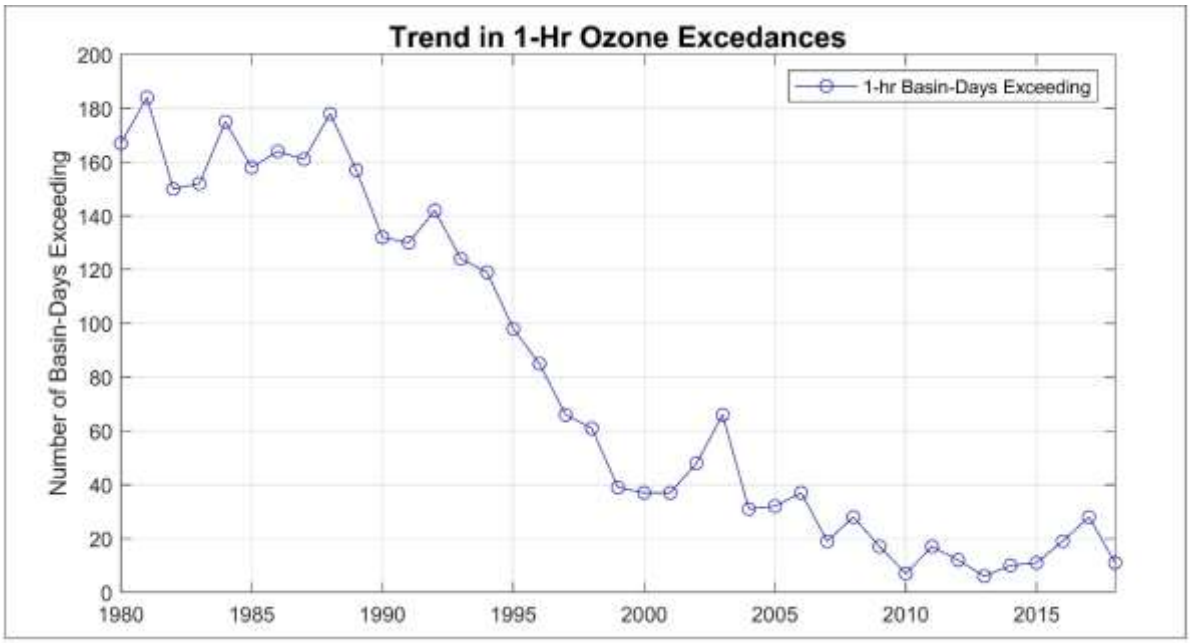
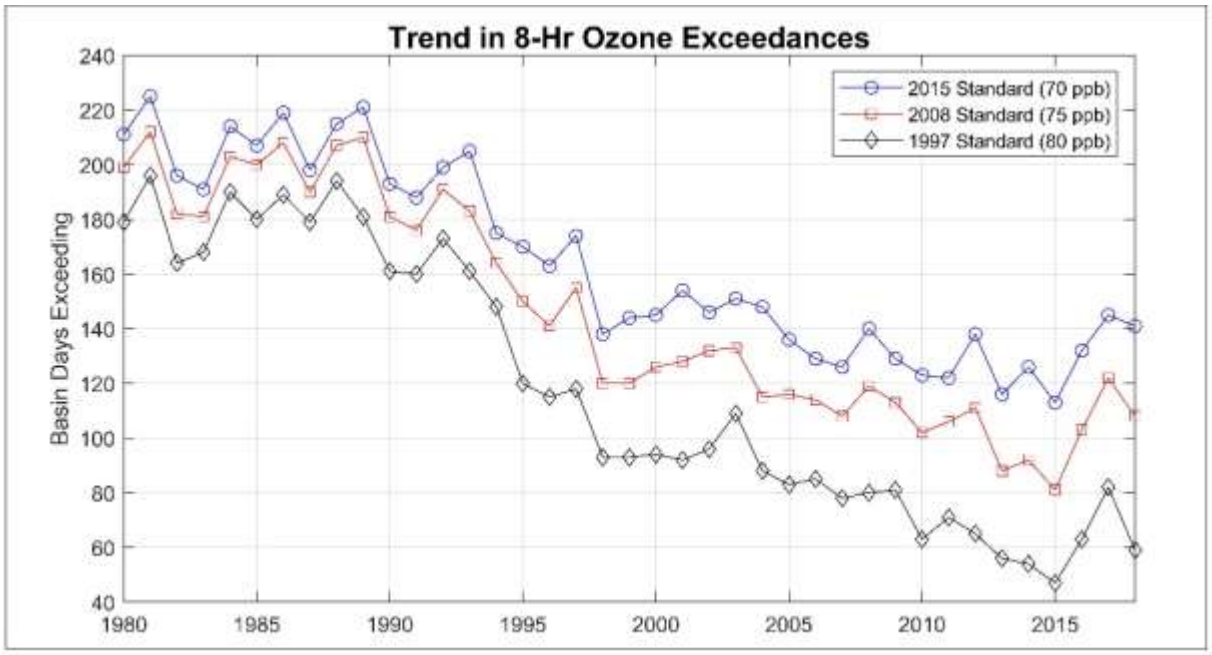
Figure C-8: Maximum 8-Hour Ozone Concentration (ppm)



Source: SCAQMD, Historical Data By Year, http://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year

Since 1980, the Basin has experienced a decrease in 1- and 8-hour Ozone exceedances and in 1-hour Ozone advisories. **Figures C-9, C-10 and C-11** show reductions in these historical Ozone air quality trends. As shown in **Figure C-9**, the number of Basin-days exceeding the 1-hour ozone exceedances decreased from 167 days to 11 days (approximately 93 percent). As shown in **Figure C-11**, the number of Basin-days exceeding health standard levels for 8-hour ozone exceedances decreased from 211 days to 141 days (approximately 33 percent). As shown in **Figure C-11**, the number of Basin-days exceeding 1-hour health advisories and 1-hour stage one episodes were both zero for 2018



Ozone contour maps show that the number of days exceeding the national 8-hour standard has decreased between 1997 and 2007. In the 2007 period, there was an overall decrease in exceedance days compared with the 1997 period. Ozone levels in the SCAB have decreased substantially over the last 30 years. Today, the maximum measured concentrations are approximately one-third of concentrations within the late 70's.

Toxic Air Contaminants (TAC)

Non-criteria air pollutants or toxic air contaminants (TAC) are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TAC include both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TAC includes approximately 200 compounds, including particulate emissions from diesel-fueled engines and asbestos.

In August of 1998, CARB identified particulate emissions from diesel-fueled engines as TAC.[15] The document represents a proposal to reduce diesel particulate emissions, with the goal to reduce emissions and the associated health risk by 75 percent in 2010 and by 85 percent in 2020. The program aims to require the use of state-of-the-art catalyzed diesel particulate filters and ultra-low sulfur diesel fuel on diesel-fueled engines.

Diesel particulate matter (DPM) is the most complex of diesel emissions. Diesel particulates, as defined by most emission standards, are sampled from diluted and cooled exhaust gases. This definition includes both solid and liquid material that condenses during the dilution process. The basic fractions of DPM are elemental carbon; heavy hydrocarbons derived from the fuel and lubricating oil and hydrated sulfuric acid derived from the fuel sulfur. DPM contains a large portion of the polycyclic aromatic hydrocarbons (PAH) found in diesel exhaust. Diesel particulates include small nuclei particles of diameters below 0.04 μm and their agglomerates of diameters up to 1 μm. DPM is a major factor in total TAC exposure in California.

California State law defines TAC as air pollutants having carcinogenic effects. A total of 243 substances have been designated as TAC under California law; they include the 187 (federal) Hazardous Air Pollutants (HAP) adopted in accordance with AB 2728. The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) seeks to identify and evaluate risk from air toxics sources but AB 2588 does not regulate air toxics emissions. Toxic air contaminant emissions from individual facilities are quantified and prioritized. Depending on the risk levels, emitting facilities are required to implement varying levels of risk reduction measures.

In 2001, CARB assessed the state-wide health risks from exposure to diesel exhaust and to other toxic air contaminants. It is difficult to distinguish the health risks of diesel emissions from those of other air toxics, since diesel exhaust contains approximately 40 different TAC. The CARB study detected diesel exhaust by using ambient air carbon soot measurements as a surrogate for diesel emissions. The study reported that the state-wide cancer risk from exposure to diesel exhaust was about 540 per million population as compared to a total risk for exposure

[15] California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*, October 2000, Accessed July 9, 2020 at: http://www.arb.ca.gov/diesel/documents/rrpfinal.pdf

to all ambient air toxics of 760 per million. This estimate, which accounts for about 70 percent of the total risk from TAC, included both urban and rural areas in the state. The estimate can also be considered an average worst-case for the state, since it assumes constant exposure to outdoor concentrations of diesel exhaust and does not account for expected lower concentrations indoors, where most of time is spent. Based on 2012 estimates of statewide exposure, DPM is estimated to increase statewide cancer risk by 520 cancers per million residents exposed over a lifetime.[16]

Exposure to DPM results in a greater incidence of chronic non-cancer health effects, such as cough, labored breathing, chest tightness, wheezing, and bronchitis. Individuals particularly vulnerable to DPM are children, whose lung tissue is still developing, the elderly and people with illnesses who may have other serious health problems that can be aggravated by exposure to DPM. In general, children are more vulnerable than adults to air pollutants because they have higher inhalation rates, narrower airways, and less mature immune systems. In addition, children with allergies may have an enhanced allergic response when exposed to diesel exhaust).

CARB published the *Air Quality and Land Use Handbook: A Community Health Perspective* in 2005. The primary goal in developing the *Handbook* was to provide information that would help keep California's children and other vulnerable populations out of harm's way with respect to nearby sources of air pollution. The *Handbook* highlights recent studies that have shown that public exposure to air pollution can be substantially elevated near freeways and certain other facilities. However, the health risk is greatly reduced with distance. For that reason, CARB provided some general recommendations aimed at keeping appropriate distances between sources of air pollution and sensitive land uses, such as residences.

In 2005, the SCAQMD conducted a comprehensive study on air toxics in the SCAB called the Multiple Air Toxics Exposure Study (MATES-III). The monitoring program measured more than 30 air pollutants, including both gas and particulates. The monitoring study was accompanied by a computer modeling study in which SCAQMD estimated the risk of cancer from breathing toxic air pollution throughout the region based on emissions and weather data. MATES-III found that the average cancer risk in the region from carcinogenic air pollutants ranges from approximately 870 in a million to 1,400 in a million, with an average regional risk of approximately 1,200 in a million.[17]

---

[16] California Air Resources Board, *Summary: Diesel Particulate Matter Health Impacts*, April 12, 2016, Accessed July 9, 2020 at: https://www.arb.ca.gov/research/diesel/diesel-health_summ.htm

[17] South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-III) in the South Coast Air Basin, September 2008, Accessed July 9, 2020 at: https://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iii

In 2015, the Multiple Air Toxics Exposure Study IV (MATES IV) is a follow up to previous air toxics studies in the Basin. The MATES IV Study includes an updated emissions inventory of toxic air contaminants and a modeling effort to characterize risk across the SCAB. The study focuses on the carcinogenic risk from exposure to air toxics but does not estimate mortality or other health effects from particulate exposures. An additional focus of MATES IV is the inclusion of measurements of ultrafine particle concentrations. Results for MATES-IV show that trends in monitored levels air toxics continue to decline, modeled exposures and risks were substantially lower compared to MATES III (approximately 60 percent decrease), and DPM remains the largest component of air toxics estimated risk, at approximately 68 percent of the South Coast Air Basin wide cancer risk of 418 per million persons, ranging from 320 to 480 per million persons. Based on data within MATES-IV, the proposed Project is within an area with an estimated cancer risk of 400 to 450 per million persons.[18]

South Coast Air Quality Management District (SCAQMD) Amicus Brief[19]

The proposed Inglewood Transit is in the South Coast Air Basin, under the jurisdiction of the SCAQMD. The following in information from the SCAQMD is included because it is the legal brief on the Friant Ranch decision from the local air district for the proposed Inglewood Transit. The SCAQMD brief describes why it is not feasible to accurately model changes in regional air quality concentrations resulting from specific projects or accurately correlate predicted minor air quality changes with specific health outcomes.

As noted in the SCAQMD brief, SCAQMD has among the most sophisticated air quality modeling and health impact evaluation capability of any of the air districts in the State, and thus it is uniquely situated to express an opinion on how lead agencies should correlate air quality impacts with specific health outcomes. SCAQMD receives as many as 60 or more CEQA documents each month (around 500 per year) in its role as commenting agency or an agency with "jurisdiction by law" over air quality. The SCAQMD staff provides comments on as many as 25 or 30 such documents each month (SCAQMD brief, p. 7). Therefore, the Inglewood Transit EIR air quality analysis appropriately relied on SCAQMD expertise, significance thresholds, and guidance to disclose the proposed Project's air quality impacts.

The SCAQMD brief makes it clear that SCAQMD does not believe that there must be a quantification of a project's health risks in all CEQA documents prepared for individual projects, and in fact, the SCAQMD brief is clear that for individual projects the results of such an assessment would be meaningless. Also, the proposed Project would not generate anywhere

---

[18] South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-IV) in the South Coast Air Basin, May 1, 2015, Accessed July 9, 2020 at: http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iv

[19] South Coast Air Quality Management District Amicus Brief, April 13, 2015, Accessed July 9, 2020 at: https://www.courts.ca.gov/documents/9-s219783-ac-south-coast-air-quality-mgt-dist-041315.pdf

near 6,620 pounds per day of NOx or 89,180 pounds per day of ROG emissions, which SCAQMD stated was a large enough emission to quantify ozone-related health impacts. (SCAQMD brief, page 12) Therefore, the emissions from the proposed Project are not sufficiently high to use a regional modeling program to correlate health effects on a basin-wide level.

The SCAQMD's numeric regional thresholds of significance are based in part on Section 180 (e) of the federal Clean Air Act (CAA). The numeric regional mass daily thresholds have not changed since their adoption as part of the CEQA Air Quality Handbook published by SCAQMD in 1993 (over 20 years ago). The numeric regional mass daily significance thresholds are also intended to provide a means of consistency in significance determination within the environmental review process.

Simply exceeding the SCAQMD's numeric regional mass daily thresholds does not constitute a particular health impact to an individual receptor. The reason for this is that the mass daily thresholds are in pounds per day (pounds/day) emitted into the air whereas health effects are determined based on the concentration of emissions in the air at a particular receptor (e.g., parts per million by volume of air, or micrograms per cubic meter of air) and usually over a longer duration such a one year of an 70-year lifetime. State and federal ambient air quality standards (CAAQS & NAAQS) were developed to protect the most susceptible population groups from adverse health effects and were established in terms of parts per million or micrograms per cubic meter for the applicable emissions.

With regard to the analysis of air quality-related health impacts, the SCAQMD, the air quality authority for the South Coast Air Basin, has stated that "*EIRs must generally quantify a project's pollutant emissions, but in some cases it is not feasible to correlate these emissions to specific, quantifiable health impacts (e.g., premature mortality; hospital admissions)*." In such cases, a general description of the adverse health impacts resulting from the pollutants at issue may be sufficient. (SCAQMD brief, page 1)

The SCAQMD has further stated that from a scientific standpoint,

> "*…it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region. For example, the SCAQMD's 2012 AQMP showed that reducing NOx by 432 tons per day and reducing VOC by 187 tons per day would only reduce ozone levels at the SCAQMD's monitor site with the highest levels by 9 parts per billion.*[20]" (SCAQMD brief, page 11)

[20] South Coast Air Quality Management District, Final 2012 AQMP, February 2013, Accessed July 9, 2020 at: www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-20212-air-quality-management-plan; then follow "Appendix V: Modelling & Attainment Demonstrations" hyperlink, pp. v-4-2, v-7-4, v-7-24

A few comparisons to this SCAQMD brief and the Inglewood Transit are appropriate. The Inglewood Transit calculated maximum unmitigated daily NOx construction emissions are 238 pounds/day or approximately 0.028 percent of the 432 tons per day.

A ratio comparison helps add perspective. Using the 0.028 percent value for the change in ozone levels at the SCAQMD's monitor site with the highest levels would change by (0.00028 x 9 parts per billion) or 0.0025 parts per billion of ozone. The lowest ozone standard is the California 8-hour standard of 0.070 ppm or 70 ppb. So, if there were a direct ratio correlation given the Inglewood Transit daily construction emissions, those emissions would change ozone levels by 0.0025 ppb compared to the most stringent 70 ppb California 8-hour standard or 0.0035 percent (0.0025/70).

The extremely small change in the ozone numbers (0.0035 percent of the standard) from this approximated calculation is an indication of why the SCAQMD does not require relatively small projects to undertake regional modeling. Even if it were a valid ozone change calculation, the correlation to health impacts from the change would be more impossible to determine. SCAQMD staff does not currently know of a way to accurately quantify ozone-related health impacts caused by NOx or VOC precursor emissions from relatively small projects such as the proposed Inglewood Transit. (SCAQMD brief, page 12)

Current scientific, technological, and modeling limitations prevent the relation of expected adverse air quality impacts to likely health consequences. Since SCAQMD staff does not currently know of a way to accurately quantify ozone-related health impacts caused by NOx or ROG emissions from relatively small projects like the proposed Project, then a general description of the adverse health impacts resulting from the criteria and toxics pollutants (as previously described) is all that can be meaningfully provided at this time.

San Joaquin Valley Air Pollution Control District Amicus Brief[21]

The proposed Friant Specific Plan is in the San Joaquin Valley Air Basin, under the jurisdiction of the SJVAPCD. The SJVAPCD Amicus Brief addresses whether it is scientifically feasible to correlate an individual project's air quality emissions of criteria air pollutants to specific health impacts. Human health impacts associated with criteria air pollutants are analyzed and taken into consideration when the USEPA sets the NAAQS for each criteria pollutant. The health impact of a particular criteria pollutant is analyzed on a regional, not a facility level, based on how close the area is to complying with (attaining) the NAAQS. As discussed in the SJVAPCD brief, it is not feasible to conduct a criteria air pollutant analysis detailing health impacts, as currently available computer modeling tools are not equipped for this task.

[21] San Joaquin Valley Air Pollution Control District Amicus Brief, April 13, 2015, Accessed July 9, 2020 at: https://www.courts.ca.gov/documents/7-s219783-ac-san-joaquin-valley-unified-air-pollution-control-dist-041315.pdf

In requiring a health risk type analysis for criteria air pollutants, it is important to understand how the relevant criteria pollutants (ozone and particulate matter) are formed, dispersed and regulated. Ground level ozone (smog) is not directly emitted into the air but is instead formed when precursor pollutants such as NOx and ROG are emitted into the atmosphere and undergo complex chemical reactions driven by sunlight. Once formed, ozone can be transported long distances by wind. Because of the complexity of ozone formation, a specific tonnage amount of NOx or ROG emitted in a particular area does not equate to a particular concentration of ozone in that area. In fact, even rural areas that have relatively low tonnages of emissions of NOx or ROG can have high levels of ozone concentrations simply due to wind transport. Conversely, areas that have substantially more NOx and ROG emissions could experience lower concentrations of ozone simply because sea breezes disperse the emissions.[22] Secondary PM, like ozone, is formed via complex chemicals such as SOx and NOx.[23] Because of the complexity of secondary PM formation, the tonnage of PM-forming precursor emissions in an area does not necessarily result in an equivalent concentration of secondary PM in that area.

The disconnect between the tonnage of precursor pollutants and the concentration of ozone or PM formed is important because it is not necessarily the tonnage of precursor pollutants that causes health effects; rather, it is the concentration of resulting ozone or PM that causes these effects. As such, the NAAQS, which are statutorily required to be set by USEPA at levels that are requisite to protect the public health, are established as concentrations of ozone and not as tonnages of their precursor pollutants. Because the NAAQS are focused on achieving a particular concentration region-wide, the SJVAPCD's tools and plans for attaining the NAAQS are regional in nature.

In regard to regional concentrations and air basin attainment, the SJVAPCD emphasized that attempting to identify a change in background pollutant concentrations that can be attributed to a single project, even one as large as the entire Friant Ranch Specific Plan, is a theoretical exercise. The SJVAPCD brief noted that it "*would be extremely difficult to model the impact on NAAQS attainment that the emissions from the Friant Ranch project may have*". The situation is further complicated by the fact that background concentrations of regional pollutants are not uniform either temporally or geographically throughout an air basin but are constantly fluctuating based upon wind speed and direction, precipitation, and topography. The currently available modeling tools are equipped to model the impact of all emission sources in the San Joaquin Valley Air Basin on attainment. The SJVAPCD indicated that, "*Running the photochemical grid model used for predicting O_3 attainment with the emissions solely from the Friant*

---

[23] USEPA, Particulate Matter: Basic Information, Accessed July 9, 2020 at: www.epa.gov/airquality/pariclepollution/basic.html

Ranch project (which equate to less than one-tenth of one percent of the total NOx and VOC [ROG] in the Valley) is not likely to yield valid information given the relative scale involved". (SQVAPCD brief, p. 9-10)

The computer models used to simulate and predict an attainment date for ozone are based on regional inventories of precursor pollutants, atmospheric chemistry and meteorology within the air basin. At a very basic level, the models simulate future ozone levels based on predicted changes in precursor emissions basin wide. The computer models are not designed to determine whether the emissions generated by an individual development project will affect the date that the air basin attains the NAAQS. Instead, the models help inform regional planning strategies based on the extent to which all of the emission-generating sources within the air basin must be controlled in order to reach attainment.

Conclusions

In the case of the Inglewood Transit, construction emissions exceed the SCAQMD's recommended daily significance thresholds for NOx. However, this does not determine the concentration of ozone that will be occur at or near the Project Site or within the region on a particular day or month of the year, or the specific health impacts that may occur as a result of that concentration. Wind speed and direction, and the presence or absence of sunlight, and other complex chemical factors all combine to determine the ultimate concentrations and locations of ozone. This is especially true for a project like the Inglewood Transit, where the criteria pollutant emissions derive not from a single "point source," but from mobile sources driving to, from and around the Project Site.

The air quality analysis for the Inglewood Transit included a site-specific localized impact analysis which found less than significant impacts. The localized impact analysis was focused on the impacts locally on receptors adjacent to the Project site. Models such a USEPA's AERMOD have been used for years to estimate local concentrations for air permitting and environmental planning. However, even these dispersion models are not suited for the chemical transformation related to the formation of ozone due to emissions of NOx and ROG and the interaction with sunlight. Ozone concentrations are dependent upon a variety of complex factors, including the presence of sunlight and precursor pollutants, natural topography, atmospheric stability, atmospheric chemistry and wind patterns. Because of the dynamic nature of ozone formation and the complexities of predicting ground-level ozone concentrations in relation to ambient standards, air districts instead develop mass emissions thresholds for ROG and NOx that are used to make significance determinations. Air districts also recommend mitigation measures for projects that exceed the significance thresholds.

On a regional scale, it would not be possible to accurately model the impact on AAQS attainment that emissions from the Inglewood Transit may have. The currently available tools

are equipped to model the impact of all emission sources in the air basin on attainment, not to evaluate an individual project. Both the SCAQMD and SJVAPCD have expressed serious concerns that the regional modeling for individual projects, such as the Inglewood Transit project, will not generate meaningful results.

In summary, modeling of the Inglewood Transit Proposed Project's ozone emissions is not feasible and would not provide meaningful information given the magnitude of the emissions and the number of variables that affect ozone formation (e.g., mass of precursor emissions, background concentrations for all other emission sources in the air basin, location of activity and weather on that day that results in conversion of precursor emissions into ozone).

Consistent with the California Supreme Court's Friant Ranch decision, the information and analyses provides additional details regarding the potential health effects from the proposed Inglewood Transit's significant and unavoidable criteria pollutant construction emissions of NOx. It also explains why it is not scientifically feasible to substantively connect this individual Proposed Project's air quality impacts to likely health consequences. The criteria air pollutant emissions of NOx for the proposed Project are too small to model and obtain meaningful regional concentrations of criteria air pollutants and ozone.

Re: Inglewood Transit Connector TIRCP Benefits Calculator Tool Memorandum

---

Introduction

The Inglewood Transit Connector Project (proposed Project) will provide a transit connection from the Metro Crenshaw/LAX Line in Downtown Inglewood to the Los Angeles Stadium and Entertainment District area and would be designed to integrate with local economic activity, transit-oriented development, and other initiatives in the area. The Project would consist of an elevated, automated people mover system with dual guideways to allow for continuous trains to travel in each direction.

As part of the City's effort, they are seeking to apply for a TIRCP grant from the CALSTA Transit and Intercity Rail Capital Program. The grant application requires that the City demonstrate the effectiveness of the proposed Project to reduce greenhouse gas (GHG) emissions using the TIRCP Benefits Calculator.

The California Air Resources Board (CARB) developed the TIRCP Benefits Calculator Tool to estimate the GHG emissions and selected co-benefits of eligible grant applications. The Benefits Calculator Tool estimates GHG emissions and air pollutant emission co-benefits using methods described in CARB's Co-Benefit Assessment Methodologies (dated October 19, 2019). Grant Applicants must use this calculator to estimate the GHG emission reductions, air pollutant emissions, and other co-benefits associated with the quantification methodology.

Purpose

This memorandum provides an overview of the technical information associated with the development of the CALSTA TIRCP Benefits Calculator Tool based on provided data related to increased ridership, vehicle miles traveled (VMT) reductions, vehicle trips reductions, and average miles traveled as a result of the Inglewood Transit Connector Project. The benefits were estimated over the project lifetime from 2026 through 2076 or 50 years.

Benefits Calculator Tool Description

The TIRCP Benefits Calculator Tool utilizes motor vehicle emission factors (in grams per mile) to estimate GHG emissions (reported as carbon dioxide or CO_2 in metric tons).[1] The TIRCP Benefits Calculator Tool also reports reactive

[1] There is international scientific consensus that human-caused increases in GHG have and will continue to contribute to global warming. Potential global warming impacts in California may include, but are not limited to, loss in snow pack, sea level rise, more extreme heat days per year, more high ozone days, more large forest fires, and more drought years. Secondary effects

organic compounds (ROG), nitrogen oxides (NO_x), particulates matter equal to or less than 2.5 micrometers ($PM_{2.5}$ or fine particulate), and diesel particulate emissions (in pounds). The emission factors are based on the California Air Resources Board's (CARB) EMFAC2017[2] emissions inventory model. EMFAC2017 is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This emission factor model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC2017 can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future. Emission factors are based on information associated with Los Angeles County and the City of Inglewood within the South Coast Air Basin.

The TIRCP Benefits Calculator Tool estimates the following co-benefits and key variables:

- GHG (as CO_2) emission reductions (metric tons or MT)
- ROG emission reductions (pounds)
- NOx emission reductions (pounds)
- $PM_{2.5}$ emission reductions (pounds),
- Diesel PM emission reductions (pounds)
- Passenger VMT reductions (miles)
- Passenger travel cost savings ($)
- Energy and fuel cost savings ($)

Notably, projects may claim additional ridership through increased transfers of passengers to adjoining systems and may be reflected in the quantification of GHG benefits if the project also documents the ability of the connected corridor to provide capacity sufficient to accommodate the riders. As such, six transit mode systems (or Quantifiable Components) were included in TIRCP Benefits Calculator Tool: Metrolink, Metro Heavy Rail (HR), Metro Light Rail (LR), Metro Bus Rapid Transit/Rapid Bus (BRT/RB), Metro Municipal Bus (MB), and Inglewood Transit Connector (ITC).

Benefits Calculator Tool Input Data

The TIRCP Benefits Calculator Tool input information includes the following parameters:

- The type of region that best encompasses the geographic location for the proposed project type: Los Angeles County within South Coast Air Basin
- TIRCP Funds Requested ($)/Total amount of TIRCP GGRF funds requested from this solicitation to implement the project: $90 million
- Total Project Cost ($) or Total amount of funding required to implement the project: $1.016 billion
- The first year of service or the first year the facility or rolling stock will be in use: 2026
- The final year of service or the final year the facility or rolling stock's useful life: 2076
- The increase in unlinked passenger trips directly associated with the proposed project in the first year: 6,959,998

---

are likely to include a global rise in sea level, impacts to agriculture, changes in disease vectors, and changes in habitat and biodiversity.

[2] California Air Resources Board, EMFAC2017 User's Guide, March 1, 2018, https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-i-users-guide.pdf and https://www.arb.ca.gov/emfac/2017/

- The increase in unlinked passenger trips directly associated with the proposed project in the final year: 13,906,110
- Discount factor applied to annual ridership to account for transit-dependent riders: 0.720
- Annual passenger miles over unlinked trips directly associated with the proposed project: 6.24 miles

Data was input into the TIRCP Benefits Calculator Tool by transit mode. The TIRCP Benefits Calculator Tool Input and Output are provided at the end of this document.

Results

Table 1 provides the increased ridership, vehicle miles traveled reductions, vehicle trips reductions, and average miles traveled for 2026 and 2076 by transit mode. The vehicle trips reductions are a function of the increased ridership times the adjustment factor. The vehicle miles traveled reductions are a function of the vehicle trips reductions times the average miles traveled.

Table 1: Estimated VMT Reductions by Mode for First Year and Final Year

Year	Parameter	Metrolink	Metro HR	Metro LR	Metro BRT/RB	Metro MB	ITC	Total
2026	VMT Reduction			23,229,237	2,954,199	1,190,852	2,649,387	30,023,675

	Vehicle Trip Reduction			2,447,706	330,238	156,013	1,937,720	4,871,677
	Length of Average Trip			9.49	8.95	7.63	1.37	6.16
	Adjustment Factor			0.734	0.685	0.689	0.665	0.700
2076	VMT Reduction	7,497,044	2,942,523	45,011,104	4,923,445	1,891,274	5,169,161	67,434,551
	Increased Ridership	305,991	431,878	6,372,441	814,252	371,676	5,609,872	13,906,110
	Vehicle Trip Reduction	257,339	351,041	4,888,502	574,791	264,952	3,808,777	10,145,402
	Length of Average Trip	29.13	8.38	9.21	8.57	7.14	1.36	6.65
	Adjustment Factor	0.841	0.813	0.767	0.706	0.713	0.679	0.730
Overall	Length of Average Trip	29.13	8.38	9.30	8.70	7.32	1.36	6.24
	Adjustment Factor	0.841	0.813	0.756	0.698	0.704	0.674	0.720

Note: The Green Line Eastern Extension (Norwalk) Project connects Green Line and Metrolink has an expected opening date of 2052. For Metro Heavy Rail, the Crenshaw Line Extension that connects the LAX/Crenshaw Line with Purple Line and Red Line has an expected opening date of 2047. The Sepulveda Pass Transit Corridor Phase III that connects Sepulveda Pass and Green Line at Aviation-96 Street Station has an expected opening date of 2057.
The unlinked trips are two-way (includes the inbound and outbound trips) and the trip lengths are one-way. Therefore, the VMT (unlinked trips x trip length) represent a round trip distance.
Source: Raju Associates, TIRCP Unlinked Trips Tables, January 7, 2020.

Table 2 displays the number of jobs supported by the Inglewood Transit Connector Project. California Climate Investments facilitate GHG emission reductions and deliver a suite of economic, environmental, and public health co-benefits, including job co-benefits. A different mix of spending on materials, equipment, and labor is expected across various California Climate Investments project types and match funding arrangements. As such, some project types

will support more jobs than others. The Job Co-Benefits Tool Input and Output are provided at the end of this document.

Table 2: Estimated Job Co-Benefit Results

Parameter	Total
Total Full-Time Equivalent Jobs Supported by the Project Budget	9,759
Total Full-Time Equivalent Jobs Supported by the Project GGRF Funds	878
Full-time Equivalent Jobs Directly Supported by the Project GGRF Funds	413
Full-time Equivalent Jobs Indirectly Supported by the Project GGRF Funds	190
Full-time Equivalent Induced Jobs Supported by the Project GGRF Funds	276

Table 3 displays the CO_2 vehicle emission factors used to determine the GHG emission reductions. The GHG emission reductions (in metric tons) are determined as the VMT reductions times the CO_2 emission factor divided by 453.592 gram/pound divided by 2000 pounds/short ton times 0.907185 metric tons/short ton. The calculation is completed by year and transit mode and summed over the project lifetime.

Table 4 displays the estimated GHG emissions reductions by mode over the project lifetime. The total estimated GHG emissions reductions are 768,922 metric tons of CO_2 which is a function of 2,322,426,448 VMT reductions with an average vehicle emission factor of 332 grams per vehicle mile. Based on TIRCP GGRF funds requested of $90,000,000,[3] this equates to $117 per metric ton of CO_2.

[3] Based on the TICRP GGRF funding contribution only ($90 million), not the full TIRCP grant request amount ($200 million).

1.0 INTRODUCTION

This tree inventory has been prepared to support California Environmental Quality Act (CEQA) analysis of the Inglewood Transit Connector (ITC) Project proposed by the City of Inglewood. This information is reported in accordance with accepted scientific and technical standards that are consistent with the requirements of the U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW).

1.1 PROJECT LOCATION

The proposed Inglewood Transit Connector (ITC) Project would include transit improvements that would be constructed in an area of the City of Inglewood within the public right-of-way from Market Street at the Metro Crenshaw/LAX Line; south to the intersection of Market Street and Manchester Boulevard; east to the intersection of Manchester Boulevard and Prairie Avenue; then south to the intersection of Prairie Avenue and Century Boulevard. The proposed Project would also include a Maintenance and Storage Facility (MSF) and Intermodal Transportation Facility (ITF). These facilities would be constructed adjacent to the right-of-way in one of four potential sites along the project alignment.

1.2 PROJECT DESCRIPTION AND BACKGROUND

The proposed Inglewood Transit Connector (ITC) Project would include transit improvements that would be constructed in an area of the City of Inglewood within the public right-of-way from Market Street at the Metro Crenshaw/LAX Line; south to the intersection of Market Street and Manchester Boulevard; east to the intersection of Manchester Boulevard and Prairie Avenue; then south to the intersection of Prairie Avenue and Century Boulevard. The proposed Project would also include a Maintenance and Storage Facility (MSF) and Intermodal Transportation Facility (ITF); these facilities would be constructed adjacent to the right-of-way in one of four potential sites along the project alignment. The study area boundary, which encompasses all areas potentially affected by the project alignment and associated facilities, is provided on the first page of Appendix 1.

1.3 REGULATORY SETTING

The City of Inglewood Municipal Code includes a Protected Tree Ordinance (Chapter 12: Planning and Zoning, Article 32: Tree Preservation) that is applicable to all types of existing or new development. Protected trees include those of specific species or size that may not be reshaped, altered, damaged, relocated or removed without first obtaining a Tree Removal and Cutting Permit from the City of Inglewood. Trees meeting the following specifications are subject to the ordinance.

A) Trees having a minimum trunk diameter of eight inches measured fifty-four inches above the ground. When measuring a multi-trunk tree, the diameters of the largest three trunks shall be added together.

B) Street trees or other required trees such as those required as a condition of approval, Use Permit,or other zoning requirement, regardless of size.

C) All memorial trees dedicated by an entity recognized by the City, and all specimen trees that define a neighborhood or community.

D) Trees of the following species that have reached a minimum of four inches diameter trunk size:

1) Big Leaf Maple (*Acer macrophyllum*)
2) California Buckeye (*Aesculus californica*)
3) Madrone (*Arbutus menziesii*)
4) Western Dogwood (*Cornus nuttallii*)
5) California Sycamore (*Platanus racemosa*)
6) Coast Live Oak (*Quercus agrifolia*)
7) Canyon Live Oak (Quercus chrysolepis)
8) Blue Oak (*Quercus douglassii*)
9) Oregon White Oak (*Quercus garryana*)
10) California Black Oak (*Quercus kelloggii*)
11) Valley Oak (*Quercus lobata*)
12) Interior Live Oak (*Quercus wislizenii*)
13) California Bay (*Umbellularia californica*)

E) A tree or trees of any size planted as a replacement for a protected tree.

2.0 SURVEY METHODOLOGY

Field surveys were conducted on November 15, 16 and 18, and December 6, 2018 by Pax Senior Biologist, Sam Stewart. Data was recorded on all trees meeting the specifications under subheadings A and D of the Protected Tree Ordinance, including any trees with a diameter at breast height (DBH) exceeding eight (8) inches regardless of species, and/or any of the fourteen listed species with a DBH of at least four (4) inches observed within the alignment boundary provided by Meridian Consultants. Data collection included a determination of species, geographic positioning system (GPS) coordinates, tree DBH (54.5 inches above the ground), and a description of tree health (poor, fair, or good as determined in the field). Health grade was based on appearance and the presence or absence of disease, structural damage including but not limited to cracked or split trunk(s), compromised roots, decay, and/or stunted or imbalanced growth.

3.0 RESULTS

A total of 549 protected trees were recorded within the project alignment boundary during the survey. Recorded trees included 25 non-native, ornamental species, and 2 California native,

ornamentally-planted species. It should be noted that the aerials used to map tree locations are somewhat outdated given the only available orthographically-corrected maps predate recent construction work on the Los Angeles Stadium at Hollywood Park and adjacent Prairie Avenue. For this reason, many of the trees shown on the aerial are no longer present. A list of species and quantities observed is provided in Table 1 below. Maps showing the locations of each of the trees on aerials are provided in Appendix 1. Tree point data, including DBH, GPS point, and health grade are provided in Appendix 2. Representative photographs of each of the tree species observed within the project alignment boundary are provided in Appendix 3.

Table 1: Tree species observed in the project alignment.

Common Name	Scientific Name	Quantity
Brazilian pepper	*Schinus terebinthifolius*	25
Cajeput	*Melaleuca quinquenervia*	10
California fan palm	*Washingtonia filifera*	2
Callery pear	*Pyrus calleryana*	4
Canary Island pine	*Pinus canariensis*	23
Carrotwood	*Cupaniopsis anacardioides*	8
Chinese elm	*Ulmus parvifolia*	15
Chinese juniper	*Juniperus chinensis*	1
Coral tree	*Erythrina caffra*	14
European hackberry	*Celtis australis*	2
Evergreen ash	*Fraxinus uhdei*	2
Fern pine	*Podocarpus gracilior*	5
Giant yucca	*Yucca elephantipes*	2
Gold medallion tree	*Cassia leptophylla*	1
Italian Cypress	*Cupressus sempervirens*	1
Italian stone pine	*Pinus pinea*	1
Jacaranda	*Jacaranda mimosifolia*	24
Liquidambar	*Liquidambar styraciflua*	10
Little-leaved Fig	*Ficus microcarpa*	71
Magnolia	*Magnolia grandiflora*	4
Mexican fan palm	*Washingtonia robusta*	222
Narrow-leaved eucalyptus	*Magnolia grandiflora*	25
Peruvian pepper	*Schinus molle*	1
Queen palm	*Syagrus romanzoffiana*	41
Red Gum	*Eucalyptus camaldulensis*	33
Red flowering gum	*Eucalyptus ficifolia*	1
Western sycamore	*Platanus racemosa*	1
Grand Total		**549**

MANAGEMENT SUMMARY

The proposed Inglewood Transit Connector Project (Project) would include an automated people mover system to transport riders to and from the regional Metro Rail system to Downtown Inglewood, the Forum, the Los Angeles Sports and Entertainment District which includes the new National Football League stadium currently under construction, and the proposed Inglewood Basketball and Entertainment Center in the city of Inglewood, California. PaleoWest Archaeology (PaleoWest) was contracted by Meridian Consultants to conduct a Phase I cultural resource assessment of the Project area in compliance with the California Environmental Quality Act (CEQA). The City of Inglewood is the Lead Agency for the purposes of the CEQA.

This report summarizes the methods and results of the cultural resource investigation of the Project area. This investigation included background research, communication with the Native American Heritage Commission (NAHC) and interested Native American tribal groups, and an intensive pedestrian survey of the Project area. The purpose of the investigation was to determine the potential for the Project to impact historic resources under CEQA.

A cultural resource records search and literature review was conducted on June 20, 2018, at the South Central Coastal Information Center of the California Historical Resource Information System housed at California State University, Fullerton. The records search indicated that no fewer than 21 previous studies have been conducted within a half-mile of the Project area; however, no prehistoric or historical archaeological resources were identified within a half-mile of the Project area.

As part of the cultural resource assessment of the Project area, PaleoWest also requested a search of the Sacred Lands File (SLF) from the NAHC. Results of the SLF search indicate that there are no known Native American cultural resources within the immediate Project area but suggested contacting five Native American tribal groups to find out if they have additional information about the Project area. Five individuals were contacted. Two responses were received as a result of the outreach efforts. The Gabrieleno Band of Mission Indians- Kizh Nation requested lead agency contact information to consult directly with the City, Gabrieleno/Tongva San Gabriel Band of Mission Indians indicated the Project area is sensitive for cultural resources and requested cultural and Native American monitoring for the Project.

PaleoWest conducted a windshield/reconnaissance survey of the proposed Project area on July 20, 2018. No prehistoric or historic archaeological resources were identified during the survey. However, ground visibility was very poor throughout the Project due the high degree of urban development disturbance. As such, the likelihood of encountering intact archaeological resources within the Project area is low. PaleoWest does not recommend any additional cultural resource management for the proposed Project.

1.0 INTRODUCTION

The proposed Inglewood Transit Connector Project (Project) would include an automated people mover (APM) system to transport riders to and from the regional Metro Rail system to Downtown Inglewood, the Forum, the Los Angeles Sports and Entertainment District (LASED) which includes the new National Football League (NFL) stadium (currently under construction), and the proposed Inglewood Basketball and Entertainment Center in the city of Inglewood, California. The proposed Project would consist of an elevated, automated people mover (APM) system with dual guideways to allow for continuous trains to travel in each direction as well as a Maintenance and Storage Facility (MSF) and Intermodal Transportation Facility (ITF). PaleoWest Archaeology (PaleoWest) was contracted by Meridian Consultants to conduct a Phase I cultural resource assessment of the Project area in compliance with the California Environmental Quality Act (CEQA). The City of Inglewood is the Lead Agency for the purposes of the CEQA.

1.1 PROJECT LOCATION AND DESCRIPTION

The proposed Project is located entirely within the city of Inglewood, in Los Angeles County, east of the San Diego Freeway (Interstate 405 [I-405]) and north of the Glen Anderson Freeway (I-105) (Figure 1-1). The proposed Project is generally bounded by the Metro Crenshaw/LAX Line to the north; Century Boulevard to the south; the LASED to the east; and La Brea Avenue to the west. The Project extends from the Market Street and Florence Avenue intersection adjacent to the Metro Crenshaw/LAX Line in Downtown Inglewood, south through Market Street, then east on Manchester Boulevard, turning south on Prairie Avenue until its intersection with Century Boulevard. The APM system will be located within the public right-of-way (ROW) for the streets and sidewalk areas along Market Street, Manchester Boulevard, and Prairie Avenue. The APM would include five proposed stations within the public ROW, located at North Market Street, East Manchester Boulevard, the Forum, Hollywood Park, and West Century Boulevard. The potential locations for the MSF and ITF would occupy parcels immediately adjacent to the APM alignment. The Project area is situated within Sections 28, 33, 34 as well as unsectioned areas, Township 2 South, Range 14 West, San Bernardino Baseline and Meridian (SBBM), as depicted on the Inglewood, CA 7.5' U.S. Geological Survey (USGS) topographic quadrangle (Figure 1-2). The elevation of the Project area ranges between 95 and 158 feet above mean sea level (amsl).

The proposed Project would include transit improvements that would be constructed in an area of the city of Inglewood within the public ROW from Market Street at the Metro Crenshaw/LAX line; south to the intersection of Market Street and Manchester Boulevard; east to the intersection of Manchester Boulevard and Prairie Avenue; then south to the intersection of Prairie Avenue and Century Boulevard. In addition to the APM system, the proposed Project will include support facilities to provide for maintenance and additional access areas that could be either co-located or individually located at several potential sites adjacent to the APM alignment. These support facilities would include a MSF, one or more ITF and other components such as a power traction system. The MSF would consist of a single four- to six-acre facility to service the APM cars and other system components. The ITFs would provide multimodal access to the APM as well as provide for parking areas and drop-off and pick-up locations.

The design and construction of the APM system elevated guideway structures, stations, and support facilities will be designed to avoid existing utility and other infrastructure to the greatest degree possible. In addition to surface improvements, some utility infrastructure that cannot be avoided may need to be relocated to accommodate the guideway columns and foundations. The proposed maximum depth of

excavation for the vertical supports of the APM guideway structures outside of the stations is approximately 100 feet below ground surface and the proposed maximum depth excavation for the vertical supports of the APM guideway structures at the stations is approximately 80 feet below ground surface.

1.2 REPORT ORGANIZATION

This report documents the results of a cultural resource investigation conducted for the proposed Project. Chapter 1 has introduced the project location and description. Chapter 2 states the regulatory context that should be considered for the Project. Chapter 3 synthesizes the natural and cultural setting of the Project area and surrounding region. The results of the cultural resource literature and records search conducted at the South Central Coastal Information Center (SCCIC) and the Sacred Lands File (SLF) search, and a summary of the Native American communications is presented in Chapter 4. The field methods employed during this investigation and findings are outlined in Chapter 5 with management recommendation provided in Chapter 6. This is followed by bibliographic references and appendices.

Figure 1-1 Project Vicinity Map

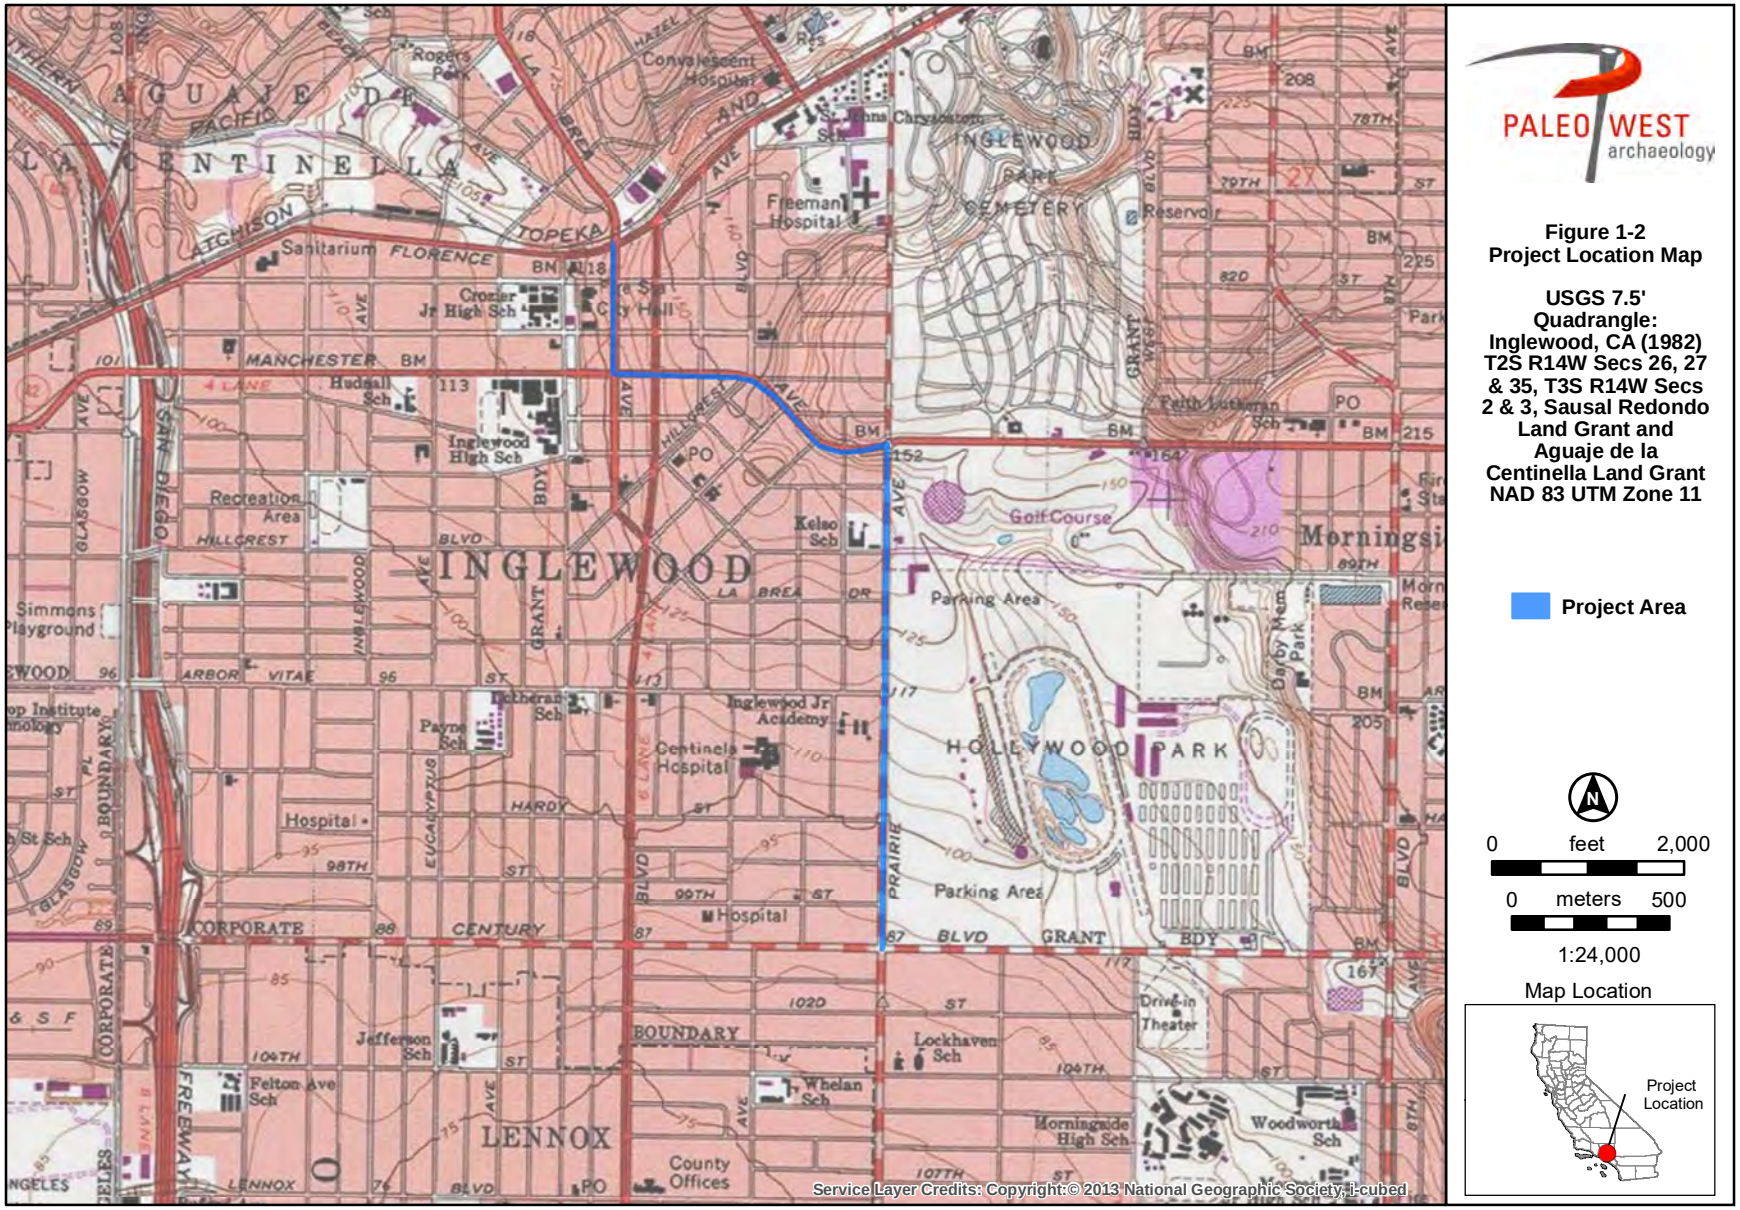

Figure 1-2 Project Location Map

2.0 REGULATORY CONTEXT

2.1 CALIFORNIA ENVIRONMENTAL QUALITY ACT

The proposed Project is subject to compliance with CEQA, as amended. Compliance with CEQA statutes and guidelines requires both public and private projects with financing or approval from a public agency to assess the project's impact on cultural resources (Public Resources Code Section 21082, 21083.2 and 21084 and California Code of Regulations 10564.5). The first step in the process is to identify cultural resources that may be impacted by the project and then determine whether the resources are "historically significant" resources.

CEQA defines historically significant resources as "resources listed or eligible for listing in the California Register of Historical Resources (CRHR)" (Public Resources Code Section 5024.1). A cultural resource may be considered historically significant if the resource is 45 years old or older, possesses integrity of location, design, setting, materials, workmanship, feeling, and association, and meets any of the following criteria for listing on the CRHR:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or,
4. Has yielded, or may be likely to yield, information important in prehistory or history (Public Resources Code Section 5024.1).

Cultural resources are buildings, sites, humanly modified landscapes, traditional cultural properties, structures, or objects that may have historical, architectural, cultural, or scientific importance. CEQA states that if a project will have a significant impact on important cultural resources, deemed "historically significant," then project alternatives and mitigation measures must be considered. Additionally, any proposed project that may affect historically significant cultural resources must be submitted to the State Historic Preservation Officer (SHPO) for review and comment prior to project approval by the responsible agency and prior to construction.

2.2 CALIFORNIA ASSEMBLY BILL 52

Signed into law in September 2014, California Assembly Bill 52 (AB 52) created a new class of resources – tribal cultural resources – for consideration under CEQA. Tribal cultural resources may include sites, features, places, cultural landscapes, sacred places, or objects with cultural value to a California Native American tribe that are listed or determined to be eligible for listing in the CRHR, included in a local register of historical resources, or a resource determined by the lead CEQA agency, in its discretion and supported by substantial evidence, to be significant and eligible for listing on the CRHR. AB 52 requires that the lead CEQA agency consult with California Native American tribes that have requested consultation for projects that may affect tribal cultural resources. The lead CEQA agency shall begin consultation with participating Native American tribes prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report. Under AB 52, a project that has potential to cause a substantial adverse change to a tribal cultural resource constitutes a significant effect on the environment unless mitigation reduces such effects to a less than significant level.

3.0 SETTING

This section of the report summarizes information regarding the physical and cultural setting of the Project area, including the prehistoric, ethnographic, and historic contexts of the general area. Several factors, including topography, available water sources, and biological resources, affect the nature and distribution of prehistoric, ethnographic, and historic-period human activities in an area. This background provides a context for understanding the nature of the cultural resources that may be identified within the region.

3.1 ENVIRONMENTAL SETTING

The City of Inglewood is located at the southern edge of the Transverse Ranges geomorphic province, which includes the San Gabriel and San Bernardino mountains to the northeast, and the Santa Monica Mountains to the north. The City is also located near the northern boundary of the Peninsular Ranges geomorphic province, which includes the San Jacinto and Santa Rosa mountains and Newport-Inglewood Fault and the Whittier-Elsinore Fault to the east and southeast (City of Inglewood 2006). Most of the City is underlain by thick (10,000 to 12,000 foot) Tertiary and Quaternary marine and continental sedimentary rocks. The Tertiary rocks, consisting primarily of sandstone, silt-stone, and shale, are almost entirely of marine origin and range in age from Eocene to Pliocene. The Quaternary rocks consist of shallow marine sandstone and siltstone as well as continental siltstone, mudstone, and gravel (City of Inglewood 2006).

Specifically, however in the Baldwin and Rosecrans hills are geomorphic features associated with uplift along the Newport –Inglewood structural zone. Older Quaternary units are exposed in these strongly dissected hills, and elevations range from approximately 75 feet to over 400 feet (Department of Conservation 1998). To the east, Holocene alluvium lies upon the regional coastal basin, also known as the Downey Plain. The sediments overlie an erosional surface of late Pleistocene age. To the west of the Rosecrans Hills is an elevated plain underlain by older Quaternary alluvium.

This area contains a drainage basin, with Holocene sediments, that narrows to the south into the Dominguez Channel. Southwest of the Project, Pleistocene dune sand overlies older alluvial deposits. The main drainage courses within the area are the Dominguez Channel, Compton Creek, and Centinela Creek (Department of Conservation 1998). Prior to the development of the area the dominant plant community consist of coastal sage scrub, freshwater and salt marshes, and riparian woodlands. Common flora found within a coastal sage scrub community consist of California sagebrush (*Artemisia californica*), black sage (*Salvia mellifera*), white sage (*Salvia apiana*), California buckwheat (*Eriogonum fasciculatum*), coast brittle-bush (*Encelia californica*), golden yarrow (*Eriophyllum confertifolium*), and lemonade berry (*Rhus integrifolia*).

3.2 PREHISTORIC SETTING

The most widely used chronological sequence in the Project vicinity distinguishes Early, Middle, and Late periods. It was initially outlined by King (1981) and later revised to include additional radiocarbon dates (King 1990) and to incorporate refinements in our understanding of cultural developments (Arnold 1992).

3.2.1 Early Holocene (9600-5600 cal B.C.)

Archaeological data compiled over the last two decades indicate that initial settlement along the coast of Southern California began at least 12,000 years before present (B.P.). Some of the earliest evidence of human occupation specifically derives from Daisy Cave (CA-SMI-261) on San Miguel Island where radiocarbon samples date the oldest cultural layer at the site between 9600 and 9000 cal B.C. (Erlandson et al. 1996). In the Southern California coastal region, the discovery of fluted projectile points indicates human use of the area possibly as early as possibly 13,000 years ago (Erlandson et al. 1996; Stickel 2010), while sites on San Miguel and Santa Rosa islands have yielded radiocarbon dates older than 10,000 years (Erlandson 1991; Johnson et al. 2001).

However, few known sites date to this earliest period (i.e., pre-10,000 years before present [B.P.]) and relatively few sites have been identified specifically within the Los Angeles Basin that date to the early Holocene. The earliest evidence of human occupation in the Los Angeles region is represented by a set of female human remains that were discovered in association with a handstone in the tar pits of Rancho La Brea in 1914 (Merriam 1914). Possible low population densities may explain the scarcity of sites dating to the early Holocene in the region, but the few known sites do suggest that they tend to be located on elevated landforms, and their presence on the Northern Channel Islands indicates early knowledge and use of marine resources. Diagnostic tools associated with this time period for coastal California have not been identified and cultural assemblages dating to this period have fewer of the grinding implements common to subsequent periods. Research suggests that inhabitants of this period lived in small groups that had a relatively egalitarian social organization and a forager-type land-use strategy (Erlandson 1994; Glassow 1996; Greenwood 1972; Moratto 1984).

3.2.2 Middle Holocene (5600–1650 cal B.C.)

Shortly after 9,000 years ago, sites in the coastal region begin to be characterized by an abundance in milling tools, and the broader subsistence regime, including utilization of plants and seeds, terrestrial animals, and shellfish (Glassow 1996; Glassow et al. 1988; Sutton and Gardner 2010). Increasing populations composed of small, dispersed groups with more generalized tool kits, and a mixed subsistence regime indicating a heavier reliance on shellfish than on fish and terrestrial food sources are also identifiers of the period (Erlandson 1991, 1994, 1997). Population densities appear to have decreased substantially between 6500 and 5000 B.P. throughout the region, and little is known about this period. It has been suggested that the arid conditions associated with the Altithermal (a mid-Holocene period of predominantly warm/dry climate) damaged the environment to the point that only low population densities were sustainable (Glassow 1996; Glassow and Wilcoxon 1988).

After 5000 B.P., population densities increased significantly as conditions became cooler and moister. Between 5000 and 3000 B.P., mortars and pestles became increasingly common throughout the region, suggesting intensified use of acorns (Basgall 1987), as well as the possibility of pulpy roots or tubers (Glassow 1997). Large side-notched and stemmed projectile points became more prevalent, presumably reflecting increased hunting.

Coastal and inland sites of this time period exhibit shallow midden accumulations, suggesting seasonal camping. Based on the distribution of sites assigned to this period, larger groups likely occupied a base camp during a portion of the year, while smaller groups of people used satellite camps to exploit seasonally available floral resources such as grass seeds, berries, tubers, and nuts (cf. Binford 1980; Warren 1968). Site assemblages in coastal Southern California dating to this time contain numerous manos and metates, charmstones, cogged stones, discoidals, and some stone balls. A significant

technological change in ground stone is seen at this time with the appearance of mortars and pestles which suggests the adoption of acorn, nut, and seed processing by coastal groups (Sutton and Gardner 2010). The quantity of projectile points also increases during this time, indicating a subsistence shift toward greater reliance on large game. Burial practices also suggest that society was primarily egalitarian (Glassow 1996). Secondary burials among coastal communities continue to be the dominant mortuary regime with a smaller number of flexed inhumations during the Middle Holocene.

3.2.3 Late Holocene (1650 cal. B.C.–cal A.D. 1542)

Cultural complexity appears to have increased around 3000–2500 B.P. Mortuary data research suggests a substantial change in social organization and political complexity during this period (King 1990). According to King, high-status positions became hereditary and individuals began to accumulate wealth and control exchange systems. Arnold (1991, 1992) proposes that this evolutionary step in socioeconomic complexity occurred around 700–800 years ago. Technological innovation as well as a continued increase in cultural complexity marks the period between 2,500 and 800 years ago. Fishing and sea mammal hunting became increasingly important. This corresponds to the development of the *tomol* (plank canoe), single-piece shell fishhooks, and harpoons (Glassow 1996; King 1990). In addition, the bow and arrow was introduced during this period. Utilization of imported obsidian continued to increase during this period as well (Jones et al. 2007).

A number of these new cultural traits have been thought to be attributable to the arrival of Takic speaking people from the southern San Joaquin Valley in the coastal California region (Sutton 2009). Biological, archaeological, and linguistic data indicate that the Takic groups who settled in the Los Angeles Basin were ethnically distinct from the indigenous Hokan-speaking Topanga populations that had inhabited the region just north of the Project. These Takic speakers are believed to be ancestral to the ethnographic Gabrielino groups (Sutton 2009).

Due to the archaeological evidence gathered it is suggested that Hokan-speaking groups were largely replaced or subsumed by the Gabrielino and Chumash by 2000 B.P. (Sutton and Gardner 2010). Several new types of material cultural appear in the archaeological record during the 700 B.C.-1800 A.D. including the presence of Cottonwood series points, birdstone and “spike” effigies, *Olivella* cupped beads, and *Mytilus* shell disk beads. Additionally, the presence of Southwestern pottery, Patayan ceramic figurines, and Hohokam shell bracelets at some of these later sites suggests interaction between populations in Southern California and the Southwest. Additionally, potential changes in trade networks at this time may be evidenced by an increase in the number and size of steatite artifacts, including large vessels, elaborate effigies, and comals in the archaeological record.

3.3 ETHNOGRAPHIC SETTING

The prehistory of California’s coast spans the entire Holocene and may extend back to late Pleistocene times. At the time of contact however, the ethnographic record indicates that the Gabrielino populations inhabited what is now known as the Los Angeles Basin and the Project region. Traditionally, the Gabrielino occupied a large territory, including the entire Los Angeles Basin, the coast from Malibu to Aliso Creek, parts of the Santa Monica Mountains, the San Fernando Valley, the San Gabriel Valley, the San Bernardino Valley, the northern part of the Santa Ana Mountains, and much of the middle and lower Santa Ana River reaches. In addition, the Gabrielino also inhabited the islands of Santa Catalina, San Clemente, and San Nicolas. The Gabrielino language was a Cupan language which is part of the Takic language family and part of a larger language group called Uto-Aztecan (Harrington 1981, Kroeber 1925).

It is believed that more than 50 communities with populations that ranged from 50-150 individuals inhabited the traditional territory of the Gabrielino pre-contact. Each autonomous community or village consisted of one or more patrilineages that maintained permanent placement and the maintenance of surrounding hunting and gathering areas, and ceremonial sites as well. The chief, his family, and elite members were typically the epicenter of the village sites. The village members would encompass and surround the homes of the chief and elite with smaller houses/structures. Other common structures found in Gabrielino villages included sweathouses, clearings for ceremonies and playing fields, as well as cemeteries or burial grounds (McCawley 1996:32-33). Management of food and resources was implemented by the chief and food stores were also kept for each family when supply was low.

The material culture of the Gabrielino is elaborate and has been compared to that of the Chumash. Sources including Padre Geronimo Boscana's accounts (Boscana 1846), Hugo Reid's 1852 letters to the *Los Angeles Star* (Reid and Heizer 1968), and Harrington's (Harrington 1981) early twentieth century interviews describe the common use of shell ornaments and beads, baskets, bone tools, flint weapons and drills, fishhooks, mortars and pestles, wooden bowls and paddles, shell spoons, wooden war clubs, and a variety of steatite items (cooking vessels, comals, ornaments) as many of artifact types common in descriptions of Gabrielino culture (Blackburn 1963). Additionally, artesian development has been observed in the artifact assemblage with the implementation of inlaid with shell (using asphalt) and in the steatite items from production centers on Catalina Island.

Trade was an important element of the Gabrielino economy. While the principal Gabrielino-produced commodity—steatite vessels from centers on Catalina Island—originated well outside the defined study region, trade in steatite items was conducted throughout local territory and involved external relations with desert, Southwestern, mountain, and coastal groups beyond Gabrielino borders (Kroeber 1925). Subsistence resources were also supplemented by additional supplies of deer skins, seeds, and acorns from interior groups such as the Serrano (Kroeber 1925:629). Additionally, *Olivella* shell callus beads, manufactured on the northern Channel Islands by the Chumash and their predecessors, were reportedly used quite frequently as a currency or as a status symbol by the Gabrielino and other Southern California groups.

As described in ethnographic sources, the subsistence resource base for the Gabrielino people included native grass seeds, six or more types of acorns, pinyon pine nuts, seeds and berries from various shrubs, fresh greens and shoots, mule deer, pronghorn, mountain sheep, rabbits and rodents, quail and waterfowl, snakes, lizards, insects, and freshwater fish, plus a wide variety of marine fish, shellfish, and sea mammals in coastal zones. Resource exploitation techniques were also described in ethnographic accounts and include rabbit drives in conjunction with seasonal controlled burning of chaparral, and the use of throwing sticks or nets in the capture of waterfowl in the low-lying marshlands. Reed rafts may have been employed for marshland hunting (Priestley 1937).

The first contact between the Europeans and the Gabrielino is thought to have occurred in 1542 when Juan Rodriguez Cabrillo's small fleet arrived at Santa Catalina Island when the Spanish exploration of North America began in the early 1500s, and Juan Rodriguez Cabrillo began exploring the Alta California coastline in 1542. Additionally, contact with the Gabrieleno by the Spanish likely occurred again in 1602 with the Sebastían Vizcaíno expedition (McCawley 1996:207) and in 1769 with the Gaspar de Portolá expedition.

Mission San Gabriel was founded on September 8, 1771, but moved to its present location around 1774, due to the second location consisting of more suitable land for agriculture. A second mission, San Fernando, was established within Gabrielino territory in 1797. The assimilation of the Gabrielino people

in to the mission system had gross negative affect on the traditional Gabrielino communities as they were depopulated, had become estranged from many of their traditional cultural practices, their lands, political autonomy, and had even become enslaved and even killed, and suffered from epidemics caused by the introduction of European diseases further reduced the indigenous population. Between 1832 and 1834, as the primary result of secularization of the former mission lands, which was theoretically designed to turn over ownership of some of the lands back to the Native peoples of California, consequently increased the displacement of the Gabrielino (McCawley 1996:208). The establishment of California as a state in 1850 brought further hardships to the Gabrielino, forcing many to eventually settle into smaller groups of Native American and Mexican settlements in places like the Eagle Rock and Highland Park districts of Los Angeles as well as in Pauma, Pala, Temecula, Pechanga, and San Jacinto.

3.4 HISTORICAL SETTING

Spanish exploration of North America in the early 1500s marked some of the first European contact with the indigenous peoples of the area now known as Los Angeles and the Project region. The mission system was established by the Catholic Church and the Spaniards to settle, colonize the Native Americans to utilize their labor to develop the lands, and spread Catholicism from Baja California to what is known today as northern California. The first mission was established in 1769 in present-day San Diego. The mission system's goal was for each mission to be self-sustaining. This required the conversion of indigenous peoples in order to claim lands in the name of Spain and required the Native American population to grow crops, raise livestock, and sustain the mission settlement and provide commodities for trade. The Mission San Gabriel Archangel was the fourth mission established in Alta California in 1771. The Native Americans that traditionally inhabited the region of the Project were assimilated into the Mission San Gabriel.

In addition to establishing the mission system in 1779, Spanish settlement of Alta California also included the establishment of pueblos and presidios. These settlements were used as bases from which to colonize the rest of California. The Spanish also laid out pueblos, or towns along the coast. Providing supplies, animals, and colonists to the Spanish missions and presidios by way of ship was difficult, time-consuming, expensive, and dangerous. Thus, an overland route was necessary to initiate a strong colonizing effort in Alta California. The City of Los Angeles was initially established by a mixed group of settlers, known as the Pobladores, as a pueblo in 1781 (Starr 2005:37). The original site of the plaza was constructed within the Los Angeles River floodplain but was moved to its current location after flooding a quickly became a center for economic, political, and social/cultural activities.

While much of the land in California was under the supervision of the Spanish missions, the Spanish government granted lands to individuals that had served the government (Beedle et al, 2008). Additionally, when Mexico achieved independence from Spain in 1821, the Spanish mission system became subject to the Secularization Act in 1833 where all mission lands became property of the new Mexican government. The former mission lands were divided into smaller land grants and distributed to prominent and wealthy Mexican military officers and families. Between 1835 and 1846, more than 600 land grants in Alta California were recorded with the Mexican government, including the Rancho Palos Verdes and Rancho Sn Pedro Dominguez in the Carson and Wilmington areas which are just south of the Project (Robinson 1948: 12-13; Starr 2005:49-51). As a result of Mexican independence, marine-based trade expanded as California ports were opened to foreign trade.

With the signing of the Treaty of Guadalupe-Hidalgo on February 2, 1848, California formally became an American territory, and two years later, on September 9, 1850, California became the thirty-first state in the Union. Prior to becoming a state, California was divided into 27 counties, and Los Angeles was one of

them. In addition to California being granted statehood, the City of Los Angeles also became incorporated in 1850. In those two years (1848–1850) there was an influx of Americans to California seeking their fortunes, triggered by James Marshall's 1848 discovery of gold at Sutter's Mill. However, statehood and an extensive drought in the 1860s eventually ended the prosperity of the ranchos (Beedle et al, 2008).

Yet, before the drought in the 1860s, a Land Commission was established in 1851 and its purpose was to verify the ownership claims of ranchos in California. Oftentimes, ownership of the ranchos was deemed invalid, consequently opening large tracts of land for purchase. Men such as Abel Stearns, James Irvine, and Llewellyn Bixby, who were notable individuals involved in the development of Southern California were able to take advantage of these newly available lands (Starr 2005:104; Cleland 1966:57-59). Although much of the lands changed ownership, the economy of the time remained largely based on agriculture with an emphasis on raising livestock and crops.

To maintain economic independence, Los Angeles was also established as a port of entry in 1853 to compete with the previously established San Francisco port. However, the port was too shallow and consisted of a rocky shoreline. Phineas Banning, David W. Alexander, and Augustus W. Timms lead efforts to reestablish the port at the Port of Los Angeles in San Pedro. Additionally, population increases in the area was brought on with the onset of the Civil War by the U.S. government establishing military posts in the Los Angeles area on lands donated by individuals like Phineas Banning and B.D. Wilson.

Development boom also occurred with the establishment of rail lines in California that made stagecoach companies obsolete. The establishment of a Southern Pacific Railroad and its completed Los Angeles route in 1880 and the Santé Fe Railway in 1886. Banning also successfully lobbied for a branch of the Southern Pacific Railroad to connect the port to Los Angeles. The establishment of these rail lines further boosted Los Angeles' role in the economic development of Southern California and the United States (Starr 2005:114-118).

The city of Inglewood, where the Project lies, was the first settlement to be established from the formerly known Rancho Agape de la Cantilena in 1888 shortly after a railroad station was constructed in the area. The town consisted of 300 residents at the time and in 1908 the city became incorporated. Inglewood recovered from the nationwide financial crash prior to that in 1905 and established the Poultry Colony in present-day North Inglewood. Additionally, the Inglewood Park Cemetery, located within the northern portion of the Project was developed and the street car line brought both coffins and mourners to the cemetery.

After the earthquake of 1920, many visitors came to observe the damage in Inglewood but stayed due to the pleasant climate. From 1920 to 1925 the city was the fastest growing city in the United States (City of Inglewood, 2018). Until World War II, Inglewood had been a hub for agriculture, but defense industries transformed it into an urban community when industrial activity, stimulated by the war, brought new workers and their families to the city.

During the 1960s and 1970s, the city continued taking on its more metropolitan look and became racially integrated in both residential and business sectors. The city of Inglewood continues to be valued for its access to the major freeways and the now established Los Angeles Airport.

4.0 CULTURAL RESOURCES INVENTORY

A literature review and records search was conducted at the SCCIC, housed at California State University, Fullerton, on June 20, 2018. This inventory effort included the Project area and a half-mile radius around the Project area, collectively termed the Project study area. The objective of this records search was to identify prehistoric or historical cultural resources that have been previously recorded within the study area during prior cultural resource investigations.

4.1 PREVIOUS CULTURAL RESOURCE INVESTIGATIONS

The records search results indicate that no less than 21 previous investigations have been conducted and documented within the Project study area since 1984 (Table 4-1). None of these studies appear to include the Project area. The records search also indicated that no prehistoric or historical archaeological resources have been recorded within the Project area or within one half mile of the Project area. However, six previously recorded built-environment cultural resources were identified within a half-mile radius of the Project. As a result, none of the Project area has been previously investigated by these studies.

4.2 CULTURAL RESOURCES REPORTED WITHIN THE STUDY AREA

The records search indicated that no prehistoric or historical archaeological resources have been recorded within the Project area or within one half mile of the Project area. However, six previously recorded built-environment cultural resources were identified within a half-mile radius of the Project. One of these resources, 19-189809, is a multi-story commercial building that is located immediately adjacent to the Project area and may be directly or indirectly impacted by the Project. In addition, five buildings/structures, located immediately adjacent to the Project area, are listed on the Directory of Historic Properties Data File. These resources may be directly or indirectly impacted by the Project as well. PaleoWest understands that a separate built-environment resource study is being prepared for this Project. As such, these resources will not be considered further during the cultural resource study conducted by PaleoWest.

4.3 ADDITIONAL SOURCES

Additional sources consulted during the cultural resource literature review and records search include the National Register of Historic Places, the Office of Historic Preservation Archaeological Determinations of Eligibility, and the Office of Historic Preservation Directory of Properties in the Historic Property Data File. There are no listed archaeological resources recorded within the Project area or within one half mile of the Project area.

4.4 NATIVE AMERICAN COORDINATION

PaleoWest contacted the NAHC, as part of the cultural resource assessment, on June 15, 2018, for a review of the SLF. The objective of the SLF search was to determine if the NAHC had any knowledge of Native American cultural resources (e.g., traditional use or gathering area, place of religious or sacred activity, etc.) within the immediate vicinity of the Project area. The NAHC responded on June 19, 2018, stating that the SLF was completed with negative results. However, the NAHC did state that the absence of specific site information in the SLF does not indicate the absence of Native American cultural resources (Appendix A). As such, the NAHC recommended that five Native American individuals and/or tribal groups be contacted to elicit information regarding cultural resource issues related to the proposed Project. PaleoWest sent outreach letters to the recommended tribal groups on July 27, 2018 after conducting the pedestrian survey of the Project area on July 20, 2018. These letters were followed up by phone calls on August 29, 2018.

To date responses have been received from three of the five contacted individuals/tribal groups. Mr. Andy Salas of the Gabrieleno Band of Mission Indians- Kizh Nation requested that an email be sent with the lead agency's contact information so that he might contact the lead agency directly with his comments regarding the Project. Mr. Salas was informed that the City would be conducting Assembly Bill 52 consultation efforts at a later date and, at that time, the City would be contacting him directly to provide his comments. Mr. Anthony Morales of the Gabrieleno/Tongva San Gabriel Band of Mission Indians stated that the Project lies within a highly sensitive cultural area and that any trenching or excavation for structures such as support columns would likely require archaeological and Native American monitoring. Additionally, Mr. Morales recommended monitoring and requests consultation for the Project. Lastly, Mr. Robert Dorame of the Gabrielino Tongva Indians of California Tribal Council requested that the original email be resent and that he would like to consult with other Tribal Members before offering official comments and recommendations regarding the Project. The email was resent to Mr. Dorame on August 29, 2018.

5.0 FIELD INVESTIGATION

5.1 FIELD METHODS

A windshield/reconnaissance survey of the Project area was conducted by PaleoWest archaeologist Oliver Hegge on July 20, 2018. The purpose of the survey was to observe and note the conditions of the Project area including the extent of the hardscape, the overall degree of ground disturbance, and the character and nature of the Project area. The surveyor drove the length of the APM alignment to identify any areas of open ground surface. He carefully inspected any areas within the Project area likely to contain or exhibit archaeologically or historically sensitive cultural resources and inspected to ensure that if any visible, potentially significant archaeological resources were discovered that they were documented.

The Project area was recorded with digital photographs for use in the report. Photographs included general views of the topography and vegetation density, and other relevant images. A photo log was maintained to include, at a minimum, photo number, date, orientation, photo description, and comments.

One of the primary goals of the reconnaissance survey was to identify historical and prehistoric site indicators. Examples of historical indicators include fence lines, ditches, standing buildings, objects or structures such as sheds, or concentrations of materials at least 45 years in age, such as domestic refuse (e.g., glass bottles, ceramics, toys, or buttons), refuse from other pursuits such as agriculture (e.g., metal tanks, farm machinery parts, horse shoes) or structural materials (e.g., nails, glass window panes, corrugated metal, wood posts or planks, metal pipes and fittings, railroad spurs, etc.). Examples of prehistoric site indicators include areas of darker soil with concentrations of ash, charcoal, animal bone (burned or unburned), shell, flaked stone, ground stone, pottery, or human bone.

5.2 FIELD RESULTS

The windshield/reconnaissance survey revealed that the majority of the Project area includes residential or commercial structures with associated landscaping and hardscaping. As such, the ground surface within the Project area is almost entirely obscured by hardscape that includes buildings, paved driveways, curbs and sidewalks, paved roadways, and parking lots. The limited small portions of the Project area that lack hardscape are characterized by landscaped lawns and yards associated with residences and businesses as well as what appear to be two or three vacant lots. Due to the lack of ground visibility and extensive disturbance from the built environment, field documentation consisted of general observations and digital photography.

No historical or prehistoric archaeological resources were observed within the Project area during the windshield/reconnaissance survey. However, six previously recorded built-environment cultural resources were identified within a half-mile radius of the Project during the records search. These resources may be directly or indirectly impacted by the Project; however, are not discussed in this study.

Figure 5-4 Overview of proposed facility site, view to the northwest

6.0 MANAGEMENT RECOMMENDATIONS

The cultural resource records search and field visit did not result in identifying any prehistoric or historical archaeological resources within the Project area. However, the ground visibility within the Project area was very poor; the APM alignment as well as the MSF and ITF locations are almost entirely hardscaped. The built nature of the Project area indicates a high degree of disturbance suggesting the likelihood of encountering intact archaeological deposits near the surface of the Project area to be very low. The Gabrieleno Band of Mission Indians- Kizh Nation and Gabrieleno/Tongva San Gabriel Band of Mission Indians both requested to consult the City on the Project. Additionally, the Gabrieleno/Tongva San Gabriel Band of Mission Indians indicated a high sensitivity for cultural resources in the Project and requested cultural and Native American monitoring be conducted for the proposed Project. However, as previously stated, the high degree of urban development disturbance suggests the likelihood of encountering intact archaeological resources is low. PaleoWest does not recommend any additional cultural resource management for the proposed Project.

In the event that potentially significant archaeological materials are encountered during Project-related ground-disturbing activities, all work should be halted in the vicinity of the archaeological discovery until a qualified archaeologist can visit the site of discovery and assess the significance of the archaeological resource. In addition, Health and Safety Code 7050.5, CEQA 15064.5(e), and Public Resources Code 5097.98 mandate the process to be followed in the unlikely event of an accidental discovery of any human remains in a location other than a dedicated cemetery. Finally, should additional actions be proposed outside the currently defined Project area that have the potential for additional subsurface disturbance, further cultural resource management may be required.

RE: Proposed Inglewood Transit Interconnect (18-195) Project, City of inglewood; Inglewood USGS Quadrangle, Los Angeles County, California

Dear Ms. Thomas:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE.

Attached is a list of tribes culturally affiliated to the project area. I suggest you contact all of the listed Tribes. If they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton

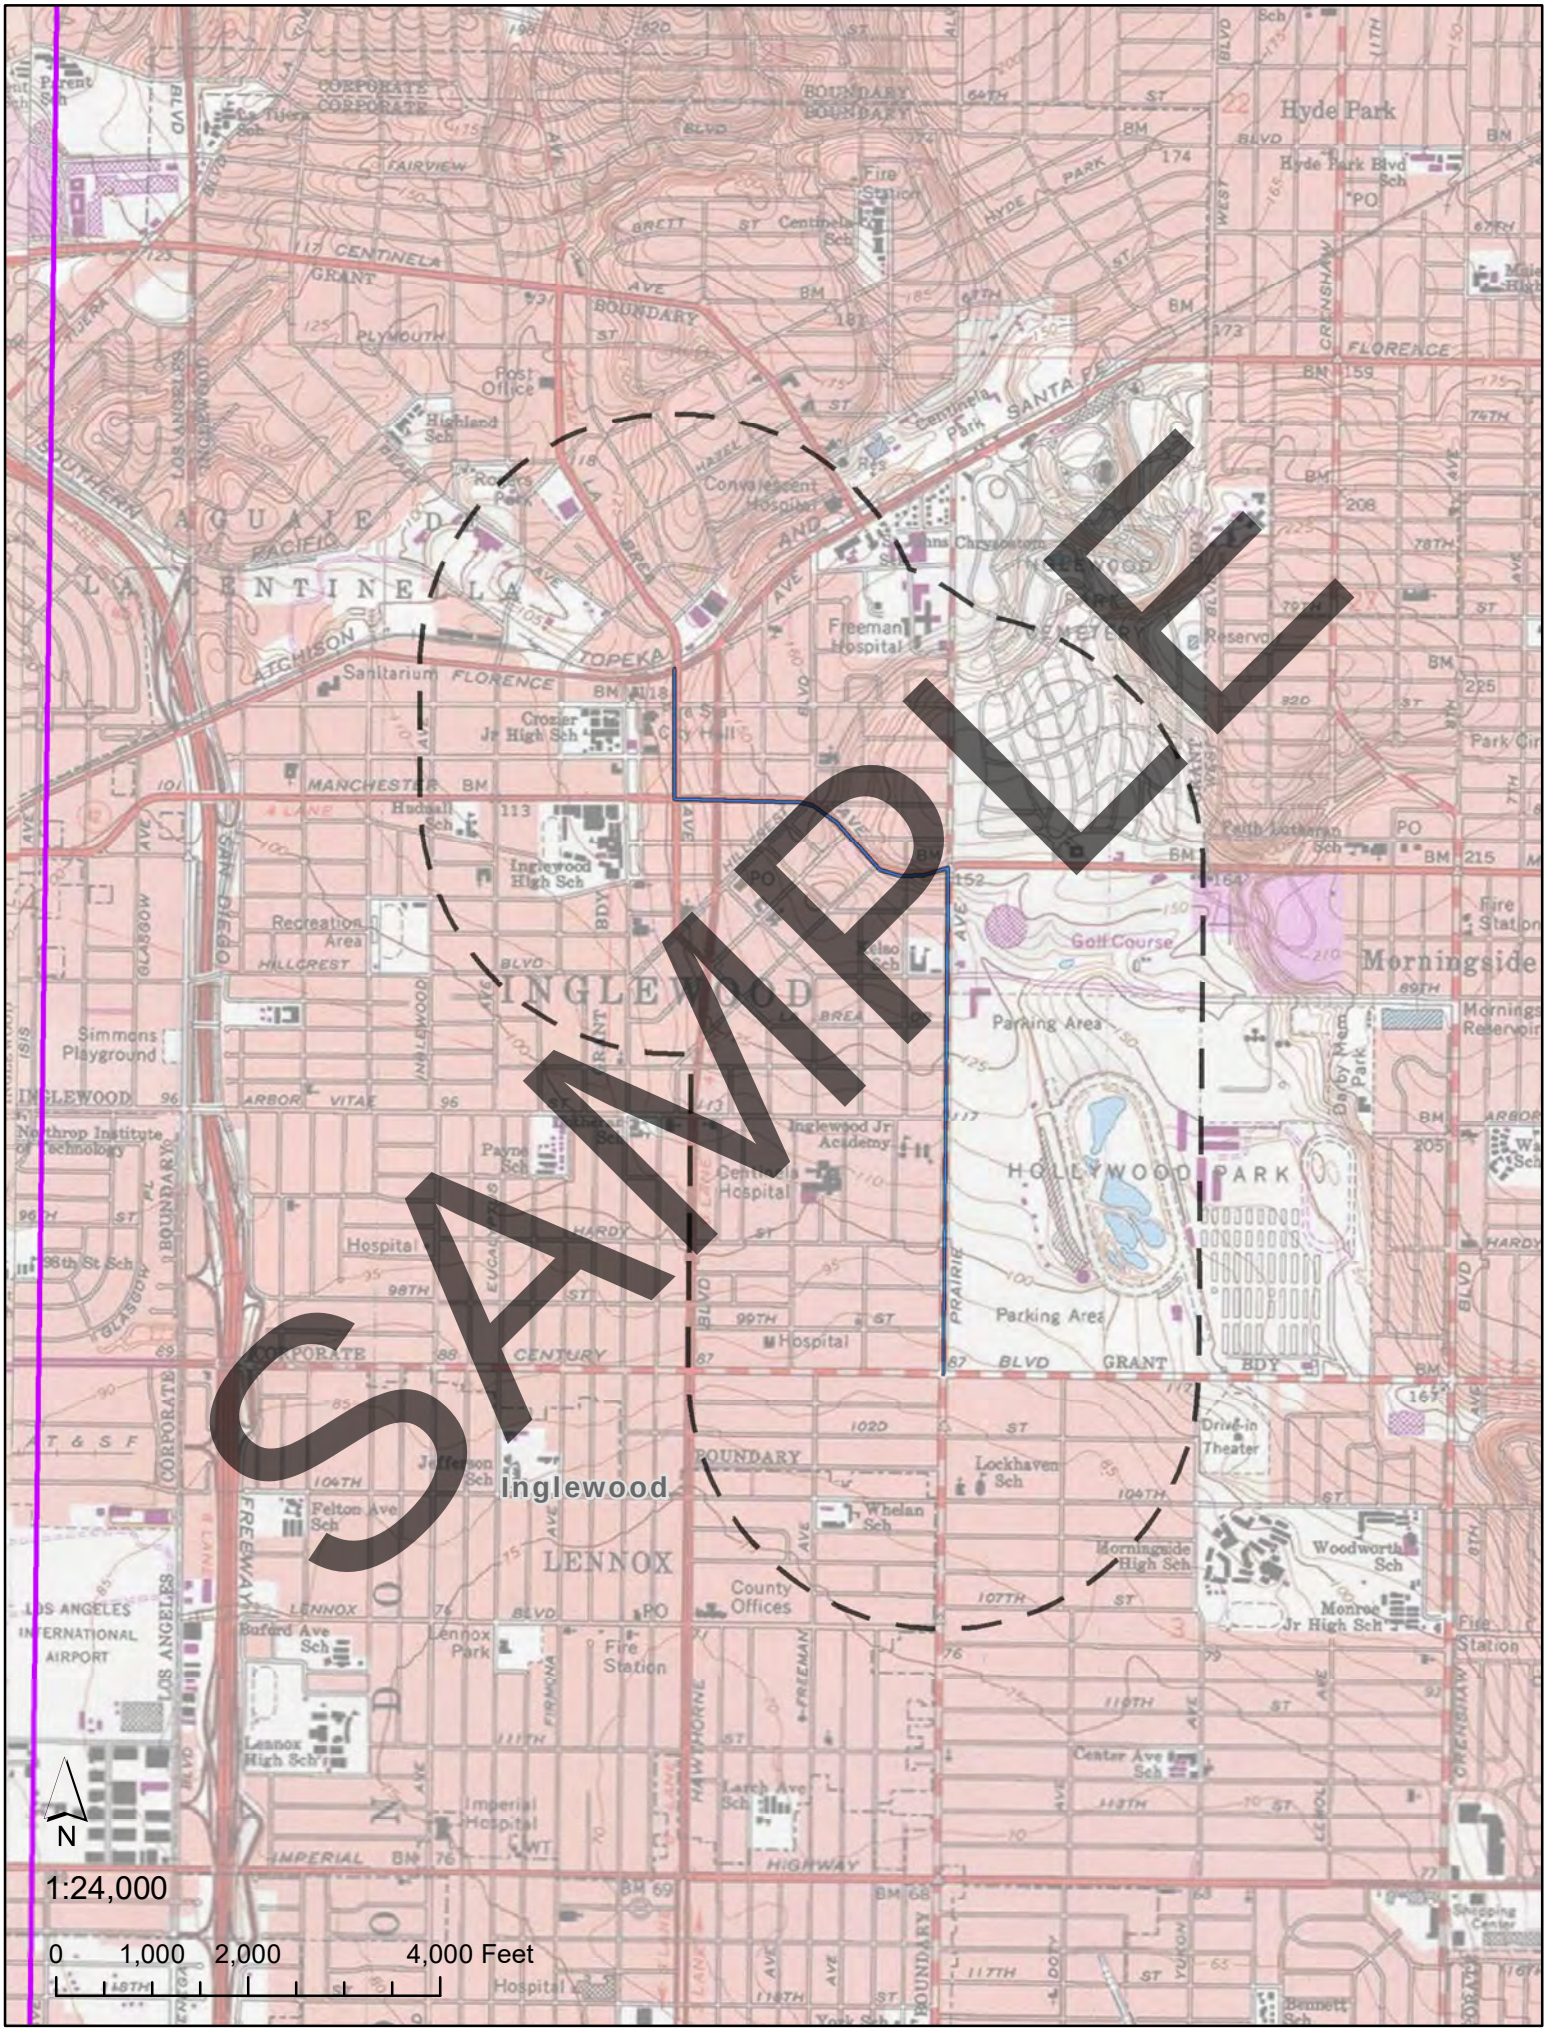
Re: Cultural Resource Investigation for the Inglewood Connector Project, Inglewood, Los Angeles County, California

Dear Mr. Salas,

On behalf of Meridian Consultants, PaleoWest Archaeology (PaleoWest) is conducting a cultural resource investigation, in compliance with the California Environmental Quality Act (CEQA), for the proposed Inglewood Connector Project (Project) within the city of Inglewood, in Los Angeles County, California. The proposed Project involves development of an elevated Automated People Mover along an aerial alignment that will provide service to Downtown Inglewood, the Forum, the Hollywood Park Development/NFL Stadium, and the Basketball and Entertainment Center. The Project area is located on the Inglewood, Calif. 7.5' USGS quadrangle map, within Sections 28, 33, 34 (Civil Colonies land grant) in T2S/R14W (see attached map).

A cultural resource literature review and records search conducted at the South Central Coastal Information Center (SCCIC) housed at California State University, Fullerton, indicates that no less than 21 cultural resource studies have been conducted within a one-half-mile radius of the Project area. Five of these studies appear to include portions or all of the Project area. The records search also indicated that no prehistoric or historic archaeological resources have been identified within a one-half-mile radius of the Project area. PaleoWest conducted a reconnaissance survey of the Project area and did not identify any archaeological resources as a result of the survey.



As part of the cultural resource investigation of the Project area, PaleoWest requested a search of the Native American Heritage Commission's (NAHC's) *Sacred Lands File* on June 15, 2018. The NAHC responded on June 19, 2018 indicating that no Native American cultural resources were identified within the Project area. However, should your records show that cultural properties exist within or near the Project area shown on the enclosed map, please contact me at (626) 408-8006 or via e-mail at rthomas@paleowest.com. I will follow-up phone call or email if I do not hear from you.

Your comments are very important to us, and to the successful completion of this Project. I look forward to hearing from you in the near future. Thank you, in advance, for taking the time to review this request.

Respectfully yours,

Roberta Thomas, M.A., RPA
Senior Archaeologist
PaleoWest Archaeology

1.0 SUMMARY OF FINDINGS

Historic Resources Group has completed this historical resources technical report to inform environmental review of the proposed Inglewood Transit Connector Project (the Project) under the California Environmental Quality Act (CEQA). The purpose of this report is to determine if historical resources as defined by CEQA are present within the Inglewood Transit Connector project area or immediate vicinity, and to identify potential impacts of the Project to those historical resources and how those impacts might be mitigated.

This report identifies a total of eleven (11) historical resources in the Project Area or Expanded Study Area for the Project. Of these, two (2) are listed in the National Register, and are therefore automatically listed in the California Register; four (4) were previously identified as historic through historic resources surveys, environmental review, or other efforts, and have been re-evaluated as appearing eligible for listing in the National Register and/or California Register; and five (5) were identified through this process and evaluated as appearing eligible for listing in the National Register and/or California Register. All of these properties are considered herein as historical resources for the purposes of CEQA. Therefore, potential impacts of the Project to these properties are analyzed.

As detailed in this report, the Project will result in both direct and indirect impacts to historical resources under CEQA. Of the eleven (11) historical resources identified in the Project Area and/or Expanded Study Area, the Project will have a significant impact on two (2) resources. These include direct impacts resulting from demolition, and indirect impacts from adjacent new construction. Due to the nature of these significant impacts, they cannot be mitigated to a less than significant level, thereby resulting in a substantial adverse change in the significance of those historical resources. Based upon this analysis, this report finds that the Project will have a significant effect on the environment as defined by CEQA.

2.0 PROPOSED PROJECT[1]

The Inglewood Transit Connector (ITC) Project (proposed Project) would develop an automated people mover (APM) system to connect Downtown Inglewood near the Metro Crenshaw/LAX Line to the city's major activity centers including the Forum, the Los Angeles Stadium and Entertainment District (LASED) at Hollywood Park, and the proposed Inglewood Basketball and Entertainment Center (IBEC).

The proposed APM system would be a 1.6-mile, fully elevated, electrically powered train system with a dual-lane guideway and three stations. The APM system would largely be contained within the public rights-of-way of Market Street between Florence Avenue and Manchester Boulevard, Manchester Boulevard between Market Street and Prairie Avenue, and Prairie Avenue between Manchester Boulevard and Hardy Street. *[See Figure 1. Project Location Map.]*

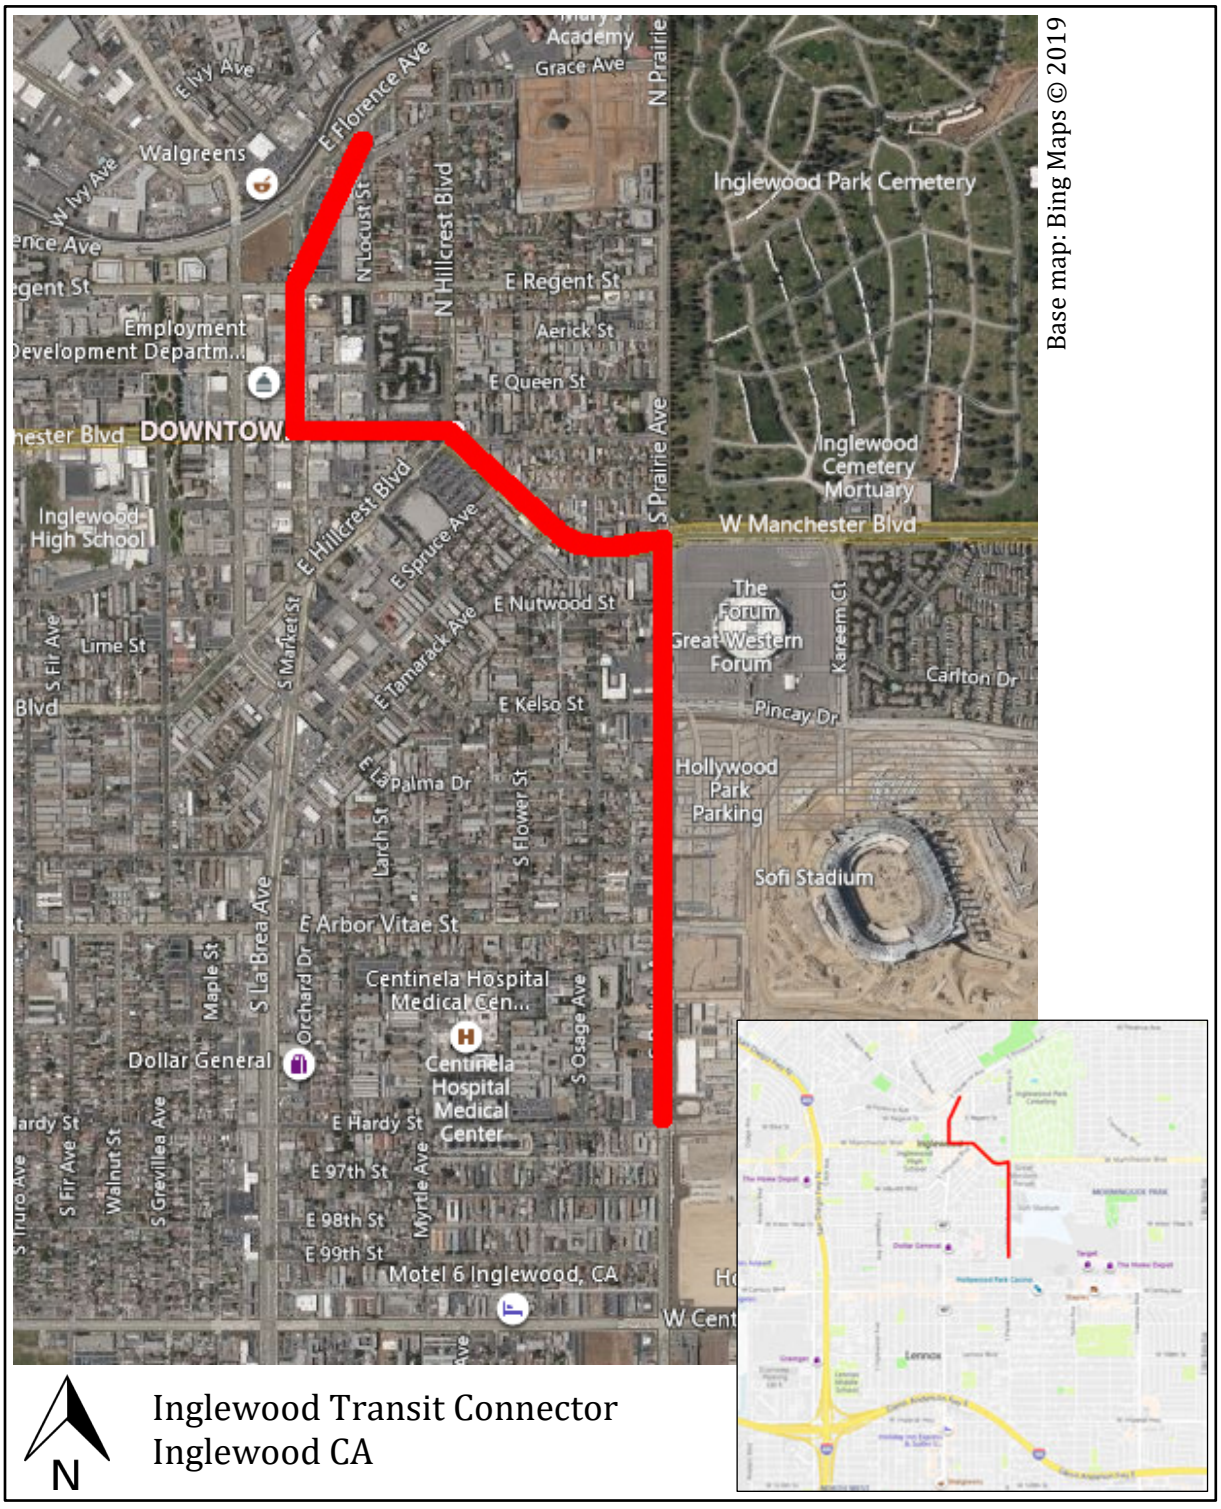
The APM guideway would vary in height between 22 feet and 45.5 feet above grade. The guideway would be a minimum of 33 feet in width, and up 42 feet in width at track switches and stations. Both lanes of the APM guideway would be situated on one side of the right-of-way in between stations and generally be supported by single columns, then gradually transition to opposite sides of the right-of-way on approach to center-platform stations where they would be supported by straddle bents with columns on both sides of the street. Guideway columns would measure 6 by 12 feet in diameter for oblong single columns, and 6 feet to 9 feet in diameter for round straddle bent columns.

The APM system would include three stations with locations at Market Street and Florence Avenue, Prairie Avenue and Pincay Drive, and Prairie Avenue and Hardy Street. Stations would measure approximately 86 feet tall, 75 feet wide, and 250 feet long. Each station would be three levels, including a ground level, mezzanine, and platform level, and would also include vertical circulation elements such as stairs, escalators, and elevators.

In addition, the proposed Project would include other support facilities including an approximately 78,000-square-foot Maintenance & Storage Facility (MSF) to accommodate storage, maintenance, and cleaning of the APM train cars; and two Traction Power Substations (TPSS), measuring approximately 30 feet wide, 100 feet long, and 20 feet tall. These support facilities would be located along the alignment and on properties adjacent to the APM system. The Project would also include the relocation of travel lanes on Prairie Avenue to the east, and a pedestrian bridge across Florence Avenue connecting the Market Street station to the existing Metro station. *[See Figure 2. Project Area Map.]*

[1] Description of the Project as provided by the Applicant.

Figure 1. PROJECT LOCATION MAP



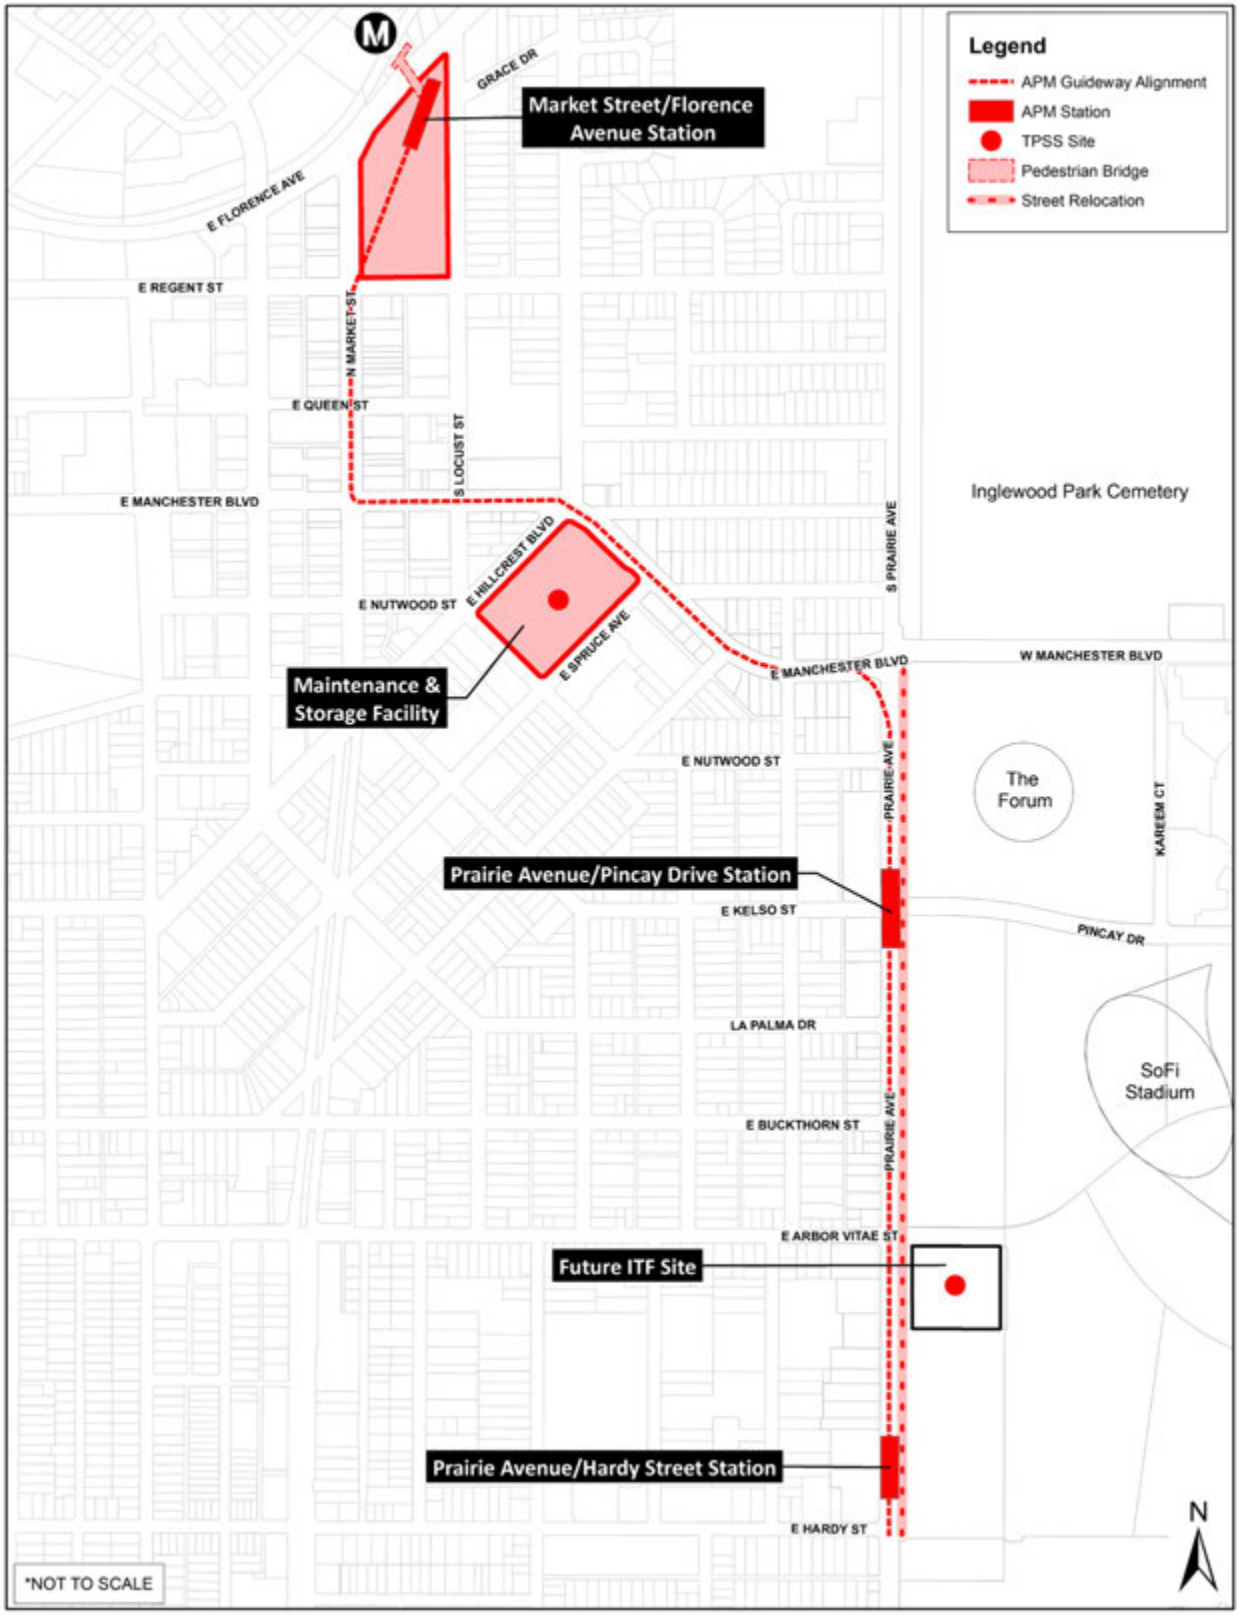


Figure 2. PROJECT AREA MAP

3.0 METHODOLOGY

This report analyzes potential project impacts to historical resources resulting from the Inglewood Transit Connector project. To identify historical resources that could be impacted, this report examines the site of the proposed Project (Project Area) and the immediately surrounding area (Expanded Study Area) to determine if historical resources are present.

The "Project Area" comprises all areas and parcels where new construction will occur. This includes the public rights-of-way along Market Street, Manchester Boulevard, and Prairie Avenue where the elevated APM guideway and two of three APM stations will be constructed; the block bounded by Market Street, Florence Avenue, Locust Street, and Regent Street where the Market Street Station would be constructed; parcels north of Florence Avenue where a pedestrian bridge from the Market Street Station to the existing Metro station will land; parcels on the east side of Prairie Avenue where vertical circulation elements (stairs, elevators, escalators) for two of the APM stations will land; the block bounded by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street, and Spruce Avenue where the Maintenance & Storage Facility (MSF) and a Traction Power Substation will be built; parcels east of Prairie Avenue between Manchester and Hardy where the travel lanes will be relocated to the east; the parcel east of Prairie Avenue and south of Arbor Vitae Street (the future site of the Intermodal Transportation Facility, to be constructed by the City of Inglewood) where a Traction Power Substation will be built.

The "Expanded Study Area" has been defined to encompass what is expected to be the maximum extent within which project impacts will occur. The Expanded Study Area includes all parcels fronting the alignment right-of-way on both sides.[2] In addition, where there will be substantial new construction outside of the alignment right-of-way, parcels immediately adjacent to or across from the new construction have been included in the Expanded Study Area. This includes parcels adjacent to or across from the block where the Market Street Station would be constructed; parcels adjacent to or across from the Maintenance & Storage Facility site; the site where the pedestrian bridge will land; and the two Traction Power Substation sites. *[See Figure 3. Expanded Study Area Map.]*

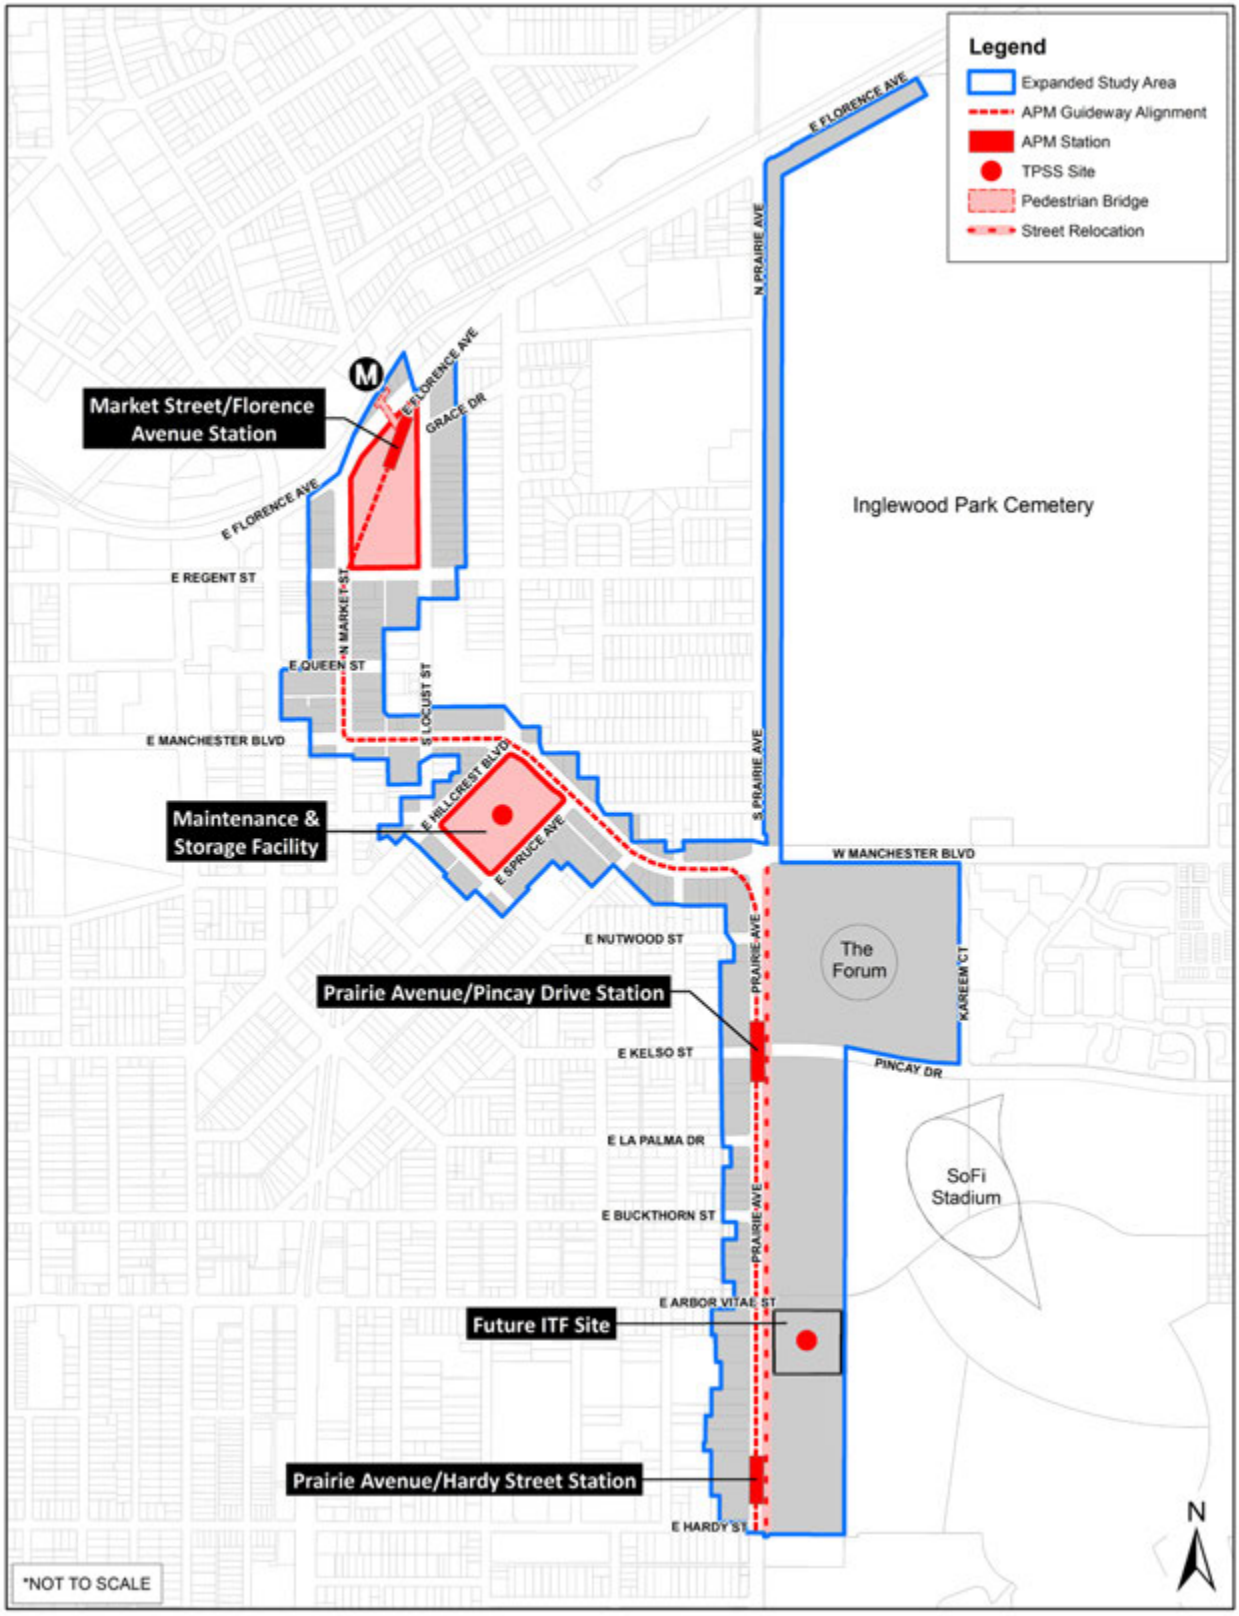
Where historical resources exist within the Project Area or Expanded Study Area, this report analyzes project impacts for any adverse change in the significance of these resources. In doing so, this report provides a comprehensive review of historical resources that could be impacted, directly or indirectly, by the proposed Project. To this end, this report contains:

[2] The parcel at the northeast corner of Manchester Boulevard and Prairie Avenue is included in the Expanded Study Area because it fronts the alignment right-of-way. While this parcel extends several blocks north of the Project Area to Florence Avenue, project impacts would only be expected in the southernmost portion of the parcel.

- A review of the existing buildings, structures, objects and landscape areas located within the Project Area and Expanded Study Area.
- A review of previous evaluations within the Project Area and Expanded Study Area through historic survey, environmental review, or other official actions.
- Identification and evaluation of historical resources within the Project Area and Expanded Study Area.
- Analysis of potential impacts to historical resources within the Project Area and Expanded Study Area.

For the purpose of this report, properties within the Project Area or Expanded Study Area have been evaluated for their eligibility for listing in the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR).

This report was prepared using primary and secondary sources related to the history and development of the City of Inglewood generally, with an emphasis on the early-20th century central business district that comprises much of the Project Area and Expanded Study Area. Documents that were consulted include:



- Previous historical resources surveys and assessments
- Previous environmental reviews
- City of Inglewood historical building permits[3]
- Los Angeles County Tax Assessor records
- Sanborn Fire Insurance maps
- Historical photographs and aerial images
- Historical newspapers and other periodicals
- Local histories and historic context statements
- California State Historic Resources Inventory, Los Angeles County

Research, field inspection, and analysis were performed by Paul Travis, AICP, Managing Principal; and Kari Fowler, Senior Preservation Planner, both of whom are qualified professionals who meet or exceed the *Secretary of the Interior's Professional Qualification Standards*. Additional assistance was provided by Robby Aranguren, Planning Associate/GIS Specialist.

[For a complete listing of all parcels examined as part of the Project Area and Expanded Study Area for the Inglewood Transit Connector Locally Preferred Alternative and Market Street Station Alternative, see Appendix B.]

3 Analysis in this report is based upon available building permits as provided by the City of Inglewood.

Figure 3. EXPANDED STUDY AREA MAP

4.1 Historical Resources under CEQA

The California Environmental Quality Act (CEQA) requires that environmental protection be given significant consideration in the decision-making process. Historical resources are included under environmental protection. Thus, any project or action which constitutes a substantial adverse change in the significance of a historical resource also has a significant effect on the environment and shall comply with the State CEQA Guidelines.

When the California Register of Historical Resources was established in 1992, the Legislature amended CEQA to clarify which cultural resources are significant, as well as which project impacts are considered to be significantly adverse. A "substantial adverse change" means "demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

CEQA defines a historical resource as a resource listed in, or determined eligible for listing, in the California Register of Historical Resources. All properties on the California Register are to be considered under CEQA. However, because a property does not appear on the California Register does not mean it is not significant and therefore exempt from CEQA consideration. All resources determined eligible for the California Register are also to be considered under CEQA.

The courts have interpreted CEQA to create three categories of historical resources:

- *Mandatory historical resources* are resources "listed in, or determined to be eligible for listing in, the California Register of Historical Resources."
- *Presumptive historical resources* are resources "included in a local register of historical resources, as defined in subdivision (k) of Section 5020.1, or deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1" of the Public Resources Code, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant.
- *Discretionary historical resources* are those resources that are not listed but determined to be eligible under the criteria for the California Register of Historical Resources.[4]

To simplify the first three definitions provided in the CEQA statute, a historical resource is a resource that is:

- Listed in the California Register of Historical Resources;

[4] *League for the Protection of Oakland's Architectural and Historic Resources vs. City of Oakland*, 52 Cal. App. 4th 896, 906-7 (1997).

- Determined eligible for the California Register by the State Historical Resources Commission; or
- Included in a local register of historical resources.

Section 15064.5 of the CEQA Guidelines (California Code of Regulations, Title 14, Chapter 3) supplements the statute by providing two additional definitions of historical resources, which may be simplified in the following manner. A historical resource is a resource that is:

- Identified as significant in a historical resource survey meeting the requirements of Public Resources Code 5024.1(g);
- Determined by a Lead Agency to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California. Generally, this category includes resources that meet the criteria for listing on the California Register (Pub. Res. Code SS5024.1, Title 14 CCR, Section 4852).

The fact that a resource is not listed in, or determined eligible for listing in, the California Register, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1, does not preclude a lead agency from determining that the resource may be an "historical resource" for purposes of CEQA.

Properties formally determined eligible for listing in the National Register of Historic Places are automatically listed in the California Register. Properties designated by local municipalities can also be considered historical resources. A review of properties that are potentially affected by a project for historic eligibility is also required under CEQA.

4.2 Historic Designations

A property may be designated as historic by National, State, and local authorities. In order for a building to qualify for listing in the National Register or the California Register, it must meet one or more identified criteria. The property must also retain sufficient architectural integrity to continue to evoke the sense of place and time with which it is historically associated.

National Register of Historic Places

The National Register of Historic Places is an authoritative guide to be used by Federal, State, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment.[5] The National Park Service administers the National Register

[5] 36CFR60, Section 60.2.

program. Listing in the National Register assists in preservation of historic properties in several ways including: recognition that a property is of significance to the nation, the state, or the community; consideration in the planning for Federal or Federally assisted projects; eligibility for Federal tax benefits; and qualification for Federal assistance for historic preservation, when funds are available.

To be listed in or eligible for listing in the National Register, a resource must possess significance in American history and culture, architecture, or archaeology. Listing in the National Register is primarily honorary and does not in and of itself provide protection of a historical resource. The primary effect of listing in the National Register on private owners of historic buildings is the availability of financial and tax incentives. In addition, for projects that receive Federal funding, a clearance process must be completed in accordance with Section 106 of the National Historic Preservation Act. Furthermore, state and local regulations may apply to properties listed in the National Register.

The criteria for listing in the National Register follow established guidelines for determining the significance of properties. The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.[6]

In addition to meeting any or all of the criteria listed above, properties nominated must also possess historic integrity. According to National Park Service guidance for applying National Register criteria, a property that is more than 50 years of age can be considered for listing in the National Register. Fifty years is a general estimate of time needed to develop historical perspective and therefore to evaluate historic significance.[7]

California Register of Historical Resources

The California Register is an authoritative guide in California used by State and local agencies, private groups, and citizens to identify the State's historical resources and to

[6] 36CFR60, Section 60.3.

[7] *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington, DC: National Park Service, 1995), 41.

indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change to their significance.[8]

The criteria for listing in the California Register are based upon National Register criteria. A property may be listed in the California Register if it:

1. Is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
2. Is associated with the lives of persons important to local, California or national history.
3. Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.[9]

The California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register includes the following:

- California properties formally determined eligible for (Category 2 in the State Inventory of Historical Resources), or listed in (Category 1 in the State Inventory), the National Register of Historic Places.
- State Historical Landmarks No. 770 and all consecutively numbered state historical landmarks following No. 770. For state historical landmarks preceding No. 770, the Office of Historic Preservation (OHP) shall review their eligibility for the California Register in accordance with procedures to be adopted by the State Historical Resources Commission (commission).
- Points of historical interest which have been reviewed by the OHP and recommended for listing by the commission for inclusion in the California Register in accordance with criteria adopted by the commission.[10]

Other resources which may be nominated for listing in the California Register include:

- Individual historical resources.
- Historical resources contributing to the significance of a historic district.
- Historical resources identified as significant in historical resources surveys, if the survey meets the criteria listed in subdivision (g).
- Historical resources and historic districts designated or listed as city or county landmarks or historic properties or districts pursuant to any city or county ordinance, if the criteria

[8] California PRC, Section 5023.1(a).
[9] California PRC, Section 5024.1(c).
[10] California PRC, Section 5023.1(d).

for designation or listing under the ordinance have been determined by the office to be consistent with California Register criteria.

- Local landmarks or historic properties designated under any municipal or county ordinance.[11]

Guidance for applying the California Register criteria does not provide a specific age threshold for eligibility. However, it does state that "sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource."[12]

Local Designation

The City of Inglewood does not have a historic preservation ordinance and does not maintain a local designation program.

4.3 Historic Significance

The definition of *historic significance* used by the California Office of Historic Preservation (OHP) in its administration of the California Register is based upon the definition used by the National Park Service for the National Register. Historic significance is defined as *the importance of a property to the history, architecture, archaeology, engineering, or culture of a community, state, or the nation.*[13] It is achieved in several ways:

- *Association with important events, activities or patterns*
- *Association with important persons*
- *Distinctive physical characteristics of design, construction, or form*
- *Potential to yield important information*

A property may be significant individually or as part of a grouping of properties.

4.4 Historic Integrity

Historic integrity is the ability of a property to convey its significance. It is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period."[14] The National Park

[11] California PRC, Section 5023.1(e).
[12] California Office of Historic Preservation, *Technical Assistance Series #6, California Register and National Register: A Comparison (for purposes of determining eligibility for the California Register)*, (Sacramento, CA: California Department of Parks and Recreation), 3.
[13] *National Register Bulletin 16A. How to Complete the National Register Registration Form* (Washington D.C.: National Park Service, U.S. Department of the Interior, 1997), 3.
[14] *National Register Bulletin 16A*, 3.

Service defines seven aspects of integrity: *location, design, setting, materials, workmanship, feeling,* and *association*. These qualities are defined as follows:

- *Location* is the place where the historic property was constructed or the place where the historic event occurred.
- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
- *Setting* is the physical environment of a historic property.
- *Materials* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- *Workmanship* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time.
- *Association* is the direct link between an important historic event or person and a historic property.[15]

4.5 Period of Significance

The National Park Service defines the *period of significance* as "the length of time when a property was associated with important events, activities or persons, or attained the characteristics which qualify it for… listing" in National, State or local registers. A period of significance can be "as brief as a single year… [or] span many years." It is based on "specific events directly related to the significance of the property," for example the date of construction, years of ownership, or length of operation as a particular entity.[16]

4.6 Historic Districts

Standard preservation practice evaluates collections of buildings from similar time periods and historic contexts as historic *districts*. The National Park Service defines a historic district as "a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development."[17] A historic district derives its significance as a single unified entity.

According to the National Park Service, "a district can comprise both features that lack individual distinction and individually distinctive features that serve as focal points. It may even be considered eligible if all of the components lack individual distinction, provided that the grouping achieves significance as a whole within its historic context. In

[15] *National Register Bulletin 15*, 44-45.
[16] *National Register Bulletin 16A*, 42.
[17] *National Register Bulletin 15*, 5.

either case, the majority of the components that add to the district's historic character, even if they are individually undistinguished, must possess integrity, as must the district as a whole." Some examples of districts include business districts, college campuses, large estates, farms, industrial complexes, residential areas and rural villages.[18]

Properties that have been found to contribute to the historic significance of a district are referred to as district contributors. Properties located within the district boundaries that do not contribute to its significance are identified as non-contributors.

[18] *National Register Bulletin 15*, 5.

5.1 Development History

The following narrative describes the evolution of the Project Area and vicinity over time, with an emphasis on the early development of Inglewood and its downtown business district. The purpose of this narrative is to provide guidance for evaluating the historic significance of properties within the Project Area and Expanded Study Area, and for determining their eligibility for listing or designation according to established criteria and integrity thresholds.

Pre-History

In the pre-historical period, the coastal plain between present-day Los Angeles and Long Beach was immensely fertile, enriched by the periodic flooding of the Los Angeles River over millennia. It was home to the Tongva people, also referred as the Gabrieleño, Fernandeño, or Nicoleño, the names given to the region's indigenous people by California's Spanish missionaries. The Tongva occupied the area now encompassed by the Los Angeles basin, San Fernando Valley, San Gabriel Valley, San Bernardino Valley, and the local California coastline. The South Bay region was home to a number of small Tongva (Gabrieleño) villages, with notable settlements at Suangna near the present-day city of Carson, near Point Fermin in San Pedro, and near Malaga Cove in Palos Verdes.[19]

Spanish Colonial and Mexican Periods

In 1542, Spanish explorer Juan Rodriguez Cabrillo led the first European expedition to explore what is now the west coast of North America. Explorers with Cabrillo's expedition encountered native people on land and sea voyages, making what is thought to be the first known contact with Alta California's indigenous tribes, including the Tongva of the Suangna area.[20] While Cabrillo claimed California for the Spanish Crown at this time, Spanish settlement would not reach this territory for another two hundred years.

On July 14th, 1769, Don Gaspar de Portolá, governor and military leader of Baja California, led the first expedition to colonize Alta California. Accompanied by Franciscan friars Junípero Serra and Juan Crespí, Portolá took a group of 64 men northward from San Diego toward Monterey. On August 2nd, the expedition camped along the east bank of the Los Angeles River just south of where it is joined by the Arroyo Seco. Fr. Crespí named the spot "El Pueblo de Nuestra Señora la Reina de los Ángeles del Río Porciúncula (translating as "town of Our Lady the Queen of Angels of the River Porciúncula"). As the expedition crossed the river and continued to the south

[19] Sam Gnerre, "The Suangna Native American Village in Carson," *South Bay Daily Breeze*, January 17, 2015.
[20] Ibid.

and west approximately one mile, they encountered the Tongva village of *Yang-na*, believed to be near the current site of *El Pueblo de Los Angeles*.

On September 8th, 1771, Spanish colonists established Mission San Gabriel, the fourth of an eventual 21 Spanish missions in California, and the first in this area. Much of the area's native population would be recruited to work the San Gabriel Mission lands. Seven years later, in 1778, Governor Felipe de Neve received approval for the creation of a civil pueblo along the *Río la Porciúncula*. Persuaded by Crespi's earlier descriptions of a well-watered valley with good soils for growing crops and an ample native population to work the land, the Spanish colonial government ordered Governor Neve to establish a settlement at this location and name the new pueblo *La Reina de los Angeles* ("Queen of the Angels").

In 1821, Mexico won its independence from Spain and Alta California became a territory of the new Mexican Republic, marking an end to Spanish colonial rule in the region. The political and social control of the military and religious leadership began to shift toward the secular and private sector, and to native-born Californios.[21] The new Mexican government sought to diminish the influence of Spain in the region, as the Spanish missions largely remained loyal to the Roman Catholic Church in Spain. At the same time, there was a need for more grazing lands to increase commerce in the hide and tallow trade. Thus, beginning in 1834, the Mexican government began to secularize the missions, confiscating mission lands to be distributed in large land grants called *ranchos*. Pío Pico, the last governor of Alta California, subdivided the former mission lands into large tracts, granting them to various prominent *Californios*.

American Period

United States troops began occupying Alta California in 1846, at the advent of the Mexican-American War, and soon gained possession of Los Angeles itself. However, Alta California would not officially come under American rule until February 2nd, 1848, with the signing of the Treaty of Guadalupe Hidalgo, which ceded the California territory to the United States and ended the war. Importantly, the treaty also provided that the existing land grants would be honored.

The origin of today's City of Inglewood dates back to the mid-1800s and a dispute between two prominent Californio families: the Ávilas and the Machados. José Manuel Orchado Machado was a Spanish soldier and mule tender who was sent west of Los Angeles in 1781 to graze his livestock. He found the area around the Centinela Springs to be excellent grazing lands and settled there with a group of ranchers.[22] In 1834,

[21] The term *Californio* refers to Spanish-speaking natives of Alta California. The Californios were elite families that received large land grants from Spain and Mexico.
[22] The site of Centinela Springs is today's Edward Vincent Junior Park, just northeast of the Project Area.

Machado's son Ygnacio built the Centinela Adobe.[23] During this same period, Francisco Ávila and his family had established grazing lands near the Centinela. As the claims of the two families clashed, they took their dispute to the local council in 1837, which gave official title of the area around Centinela Springs to the Machado family as the 2,219-acre *Rancho Aguaje de la Centinela*. The Ávila family was granted the much larger *Rancho Sausal Redondo*. At 22,458 acres, this land encompassed much of what is now the South Bay region of Los Angeles County. In 1845, Bruno Ygnacio Ávila arranged a trade with the Machados: a small tract in the *Pueblo de Los Ángeles* for *Rancho Aguaje de la Centinela*. The grant for *Rancho Sausal Redondo* was officially patented to Antonio Ygnacio Ávila in 1855; *Rancho Aguaje de la Centinela* was officially granted to Bruno Ávila in 1872.

Ultimately the Ávila family would lose both of the ranchos. Bruno Ávila lost *Rancho Aguaje de la Centinela* through foreclosure in 1857; the property was subsequently acquired by Scotsman Sir Robert Burnett in 1860. In 1868, the heirs of Antonio Ávila were forced to sell *Rancho Sausal Redondo* to pay probate costs, and it was also acquired by Burnett. By 1872, Burnett combined the total area of some 25,000 acres into the Centinela Ranch, thus reuniting the extent of the original land grant. This ranch included what would ultimately become the coastal communities of Playa del Rey, El Segundo, Manhattan Beach, Hermosa Beach, and Redondo Beach; as well as the inland communities of Westchester, Inglewood, Hawthorne, and Lawndale.

In 1873, Burnett returned to his native Scotland, leasing the combined rancho lands to Canadian attorney Daniel Freeman and his wife, Catherine, with an agreement that they could eventually purchase the property outright.[24] The Freeman family moved to the ranch, which Burnett had been using to graze sheep and cattle. Daniel Freeman continued to graze the stock, while also planting more than 10,000 fruit and nut trees. Following a drought that led to the death of some 22,000 of his sheep, Freeman turned to dry farming, eventually producing a million barrels of barley annually. Ultimately Freeman would amass a fortune farming barley, olives, citrus fruits, and almonds. He named his ranch "Inglewood," after his birthplace in Ontario.

Following Catherine's death, Daniel Freeman began to pursue the commercial development of his expansive holdings. He first established the Centinela Land Company, which proved unsuccessful. Then in 1887, as the California Central Railway laid tracks to Redondo Beach, Freeman sold some 11,000 acres of his ranch to the Centinela-Inglewood Land Company, which would subdivide the extent into small

[23] The Centinela Adobe is located in the Los Angeles community of Westchester and is the oldest building in the area. Considered the "birthplace of Inglewood," it is operated as a house museum by the Historical Society of Centinela Valley.

[24] The Freeman family officially acquired this land from Burnett in 1885.

parcels for the settlement of the new town of Inglewood. As local historian Gladys Waddingham tells it:

> *Much fanfare went into selling the first lots. Excursion trains from Los Angeles brought prospective customers as well as several dignitaries. All came to the Land Office that stood near the little depot. We can imagine the excitement! By the end of the day 300 lots had been sold.*[25]

In 1888, Freeman began work on a large mansion for himself and his family, with bricks provided by his own newly-established Continuous Brick Kiln Company of Inglewood, and lumber from the recently-acquired local planning mill.[26] In 1889, he built the Land Company office next to the train depot, moving it to the grounds of his estate in 1895 where it served as his office until his death in 1918.[27] Ultimately, all 25,000 acres of the Centinela Ranch would be subdivided and developed, with the only remaining portion of the ranch being the one-acre site on which the Centinela Adobe is situated.

Inglewood Townsite

The townsite of Inglewood was platted by the Centinela-Inglewood Land Company in 1888, by which time the town already had a population of 300.[28] The plan divided the town into northern and southern sections on either side of the newly completed Inglewood Division of the California Central Railroad line, a subsidiary of the Atchison Topeka & Santa Fe Railway, which ran along Florence Boulevard as it made its way from Los Angeles to Redondo Beach. The major north-south street leading into Inglewood was Grevillea Avenue. Development during this period was sparse, and most buildings were of impermanent wood-frame construction. The first few business buildings clustered on narrow uniform lots along Grevillea Avenue and Commercial Street (now La Brea Avenue) between Regent and Queen streets.

[26] Waddingham, 8.

[27] Waddingham, 11. Daniel Freeman is considered the founder of the City of Inglewood. Among his various pursuits, he is said to have been the first farmer to engage extensively in wheat cultivation in Southern California. Upon discovering a deposit of brick clay on his property, he established the Continuous Brick Kiln Company of Inglewood in 1888, manufacturing the building materials for many of the business blocks on Spring Street and Broadway in downtown Los Angeles, including his own building, the Freeman Block at 6th and Spring streets. He was the first president of the California Club of Los Angeles, president of the Los Angeles Chamber of Commerce in 1893-1894, and director of the Southern California Railway Co. Freeman lived in the Centinela Adobe before erecting his own residence in beginning in 1891, which was demolished 1972 to make way for the Daniel Freeman Memorial Hospital (now closed). In 1975, the Land Company office was moved from his estate to the grounds of the Centinela Adobe, where it now stands.

[28] Waddingham, 6.

By 1892, the town of Inglewood was home to several small businesses, including a grocery, post office, a barber, a restaurant, and a large two-story hotel on Queen Street between Commercial and Market.[29] At this time, Inglewood also had a post office, a railroad depot, and a large grain storage building situated along the Redondo Branch of the AT&SF railroad, as well as a handful of single-family residences. Market Street was predominantly residential during this period, before the opening of a streetcar line along its length in 1904, which would lead to its gradual transition to a commercial corridor.

By 1907, downtown Inglewood had several dozen dwellings. Commercial establishments included a drug store, general merchandise store, grocery, meat market, tailor, print shop, and various lodging buildings and offices. Institutional properties included a public school and a Presbyterian church. Industrial uses were clustered along the rail lines and included a greenhouse, planning mill, lumber yard, cement storage, gain mills and storage, and several warehouses.[30] The City of Inglewood was officially incorporated on February 14th, 1908.

[30] Sanborn Fire Insurance Maps, Inglewood CA, 1907.

City of Inglewood

Also, by this time, Inglewood was home to an expansive cemetery. In 1905, a group of local businessmen formed the Inglewood Park Cemetery Association, acquiring a large plot of land just east of what would become downtown Inglewood. A total of 32 internments took place in the cemetery's first year of operation, with funerals often arriving by rail from Los Angeles in a private funeral car.[31] In 1907, the cemetery erected the Romanesque-style Grace Chapel, a three-quarters replica of a church in Edinburgh, Scotland. Within a decade, the cemetery would erect the Neoclassical-style Inglewood Mausoleum, the first community mausoleum in the State of California.[32]

Inglewood Park Cemetery, date unknown. *(Inglewood Park Cemetery)*

Many of the South Bay region's earliest settlers have been laid to rest at Inglewood Park Cemetery, including a number of Civil War veterans.[33] Other notable residents include former Los Angeles Mayor Tom Bradley, Chet Baker, Ray Charles, Ella Fitzgerald, Etta James, boxer Sugar Ray Robinson, and architect Paul Williams.[34]

By 1912, Inglewood's commercial core was beginning to take shape along Commercial Street between Los Angeles Street/Inglewood Avenue (now Florence Avenue) and Queen Street. Deep, narrow lots were being developed with various commercial uses, from restaurants and boarding houses, to plumbers and hardware stores. Market Street remained primarily residential during this period, with a few commercial buildings, including a jeweler, a milliner, a confectioner, an undertaker, a bank, and a Methodist church.[35]

By 1920, the South Bay's local economy was booming due to the region's fertile agricultural lands, productive oil fields, and emerging aviation industry. The City of Inglewood was growing exponentially, as hundreds of new homes were being built. At the same time, the city's commercial development was coalescing into a downtown business district. Commercial Street between Regent and Queen streets was now solidly

[31] Portions of the original railroad waiting station have been incorporated into the main entrance.
[32] The Inglewood Mausoleum was erected over the course of three years, from 1913 to 1915.

commercial, boasting many of the business enterprises needed by any growing town, from banks and automobile showrooms, to furniture stores and a movie theater. South of Queen, Commercial Street was still largely undeveloped but for a few single-family residences and an apartment house. At this point, Market Street was more sparsely developed overall and displayed a combination of commercial and residential uses.[36]

Holy Faith Episcopal Church and Rectory, c. 1915. *(James H. Osborne Photo Collection, CSUDH Archives)*

The commercial structures erected in downtown Inglewood at this time were typical of those being built in downtowns throughout Southern California. These were what have since been termed "taxpayer blocks," speculative investments to generate tax benefit until more valuable development could be carried out. Early examples were multi-unit two-story buildings, frequently with retail units on the ground floor and offices or apartments above. These buildings were typically unreinforced brick in construction, with applied ornament of cast stone or terra cotta at the entrance or along the parapet. Depending on the size of the building, it may contain one or more retail storefronts, with flexible interiors to accommodate the ever-changing needs of individual tenants. While many of these buildings were vernacular in design, in Southern California they were often overlaid with details of the Spanish Colonial Revival style, including tile roofs or parapet edges, arched doors and window openings, and decorative wall tile and cast-stone detailing. With the advent of the personal automobile, a single-story version of the form became popular, with surface parking behind.[37]

Inglewood also had a number of churches by this time, including the First Methodist Episcopal Church, St. John's Catholic Church, Church of the Brethren, and Christian Church.[38] The only church that survives from this period is Holy Faith Episcopal Church, located at the southeast corner of Locust Street and Grace Avenue.[39] The church was first established in 1911, with services held in the Inglewood Masonic Hall. In 1912, Grace Freeman Howland[40] and her husband Charles donated the funds to

[40] Grace Freeman was the daughter of Daniel Freeman, considered the founder of the City of Inglewood.

erect a religious complex consisting of a church, a rectory (the dwelling to the south), and parish hall (now a school at the rear). They hired a young architect, Philip Frohman, to design what would be hailed as "the most perfect example of true Gothic architecture in the West." Frohman would go on to become nationally renowned, particularly for his work on the National Cathedral in Washington, D.C. The church was officially consecrated on November 8th, 1914, and dedicated to Catherine Freeman and Mathilda Howland, the mothers of Grace and Charles. The church lost its original bell tower in the 1933 Long Beach Earthquake, but soon thereafter gained the Stations of the Cross, imported from Italy; the pulpit, lectern and choir stalls from England; and the reredos carved and imported from Bavaria. The stained-glass windows were crafted by Judson Studios in Highland Park.[41]

Damaged buildings from Inglewood Earthquake, June 21, 1920. *(California Historical Society Collection, USC)*

On the evening of June 21st, 1920, the Los Angeles Basin was rattled by an estimated 5.0 earthquake centered near Inglewood. While tremors were felt as far away as Ventura and Riverside, almost all of the damage took place in Inglewood, and specifically to the unreinforced brick buildings along Commercial Street (now La Brea Avenue), where exterior walls fell into the street and plate glass windows shattered.[42] The Inglewood Hotel was also badly damaged and subsequently demolished. Despite the widespread damage, however, the earthquake did not seriously hamper the city's growth. In fact, according to local historian Gladys Waddingham, the quake appears to have been a boon to development, as "many of the people who flocked to see the damage were seeing Inglewood for the first time and were so impressed that they came back to live." This hypothesis is borne out by population figures: the 1920 census credited Inglewood with a population of 3,286. In just two years the figure would double, making Inglewood the fastest growing city in the nation.[43]

The 1920s was a boom period for the City of Inglewood, both in terms of population and development. While Commercial Street continued to be the primary artery of the

[43] Waddingham, 26.

downtown business district, many more businesses were being established on Market Street and its cross-streets during this period. At least seven new buildings were constructed in the 100 block of North Market Street alone. The local financial institution the People's Federal Building & Loan Association was established at this time, first in a unit of the building at 314 S. Market Street, before constructed their own building at the northeast corner of Market Street and Pimiento Street (now Manchester Boulevard) in 1927.[44] That same year, the Bank of Inglewood erected a two-story mixed-use building at the northeast corner of Market and Queen streets, at a cost of $140,000. Designed by local architect William L. Campbell in the Mediterranean Revival style, the reinforced concrete building was touted as the "first steel frame business block in this city" and as "practically fire and earthquake proof."[45]

Market Street, looking north, 1925. *(Security Pacific National Bank Collection, LAPL)*

On May 18th, 1927, some 15,000 locals came out to celebrate the "Festival of Light" which marked the opening of a new ornamental lighting system installed along Market Street. In addition to providing much needed illumination, the standards also supported the trolley wires of the Los Angeles Railway, allowing for the removal of the wooden poles from the middle of the street and the sidewalk.[46] In 1928, a two-story mixed-use structure called the Professional Building was constructed at Market Street and Manchester Boulevard's northwest corner. The building was designed in the Spanish Colonial Revival style with Churrigueresque details.[47] Also constructed in downtown Inglewood during this period were a new City Hall building (1923, demolished), the

Granada Theater (1923, demolished), an S.H. Kress Variety Store (1927), and a United Artists Theater (1931, demolished), as well as a number of auto-related businesses such as gas stations and repair garages.

Toward the end of the 1930s, Inglewood's economic base began to expand outside the downtown core. Appropriately, in 1937 Commercial Street was officially changed to La Brea Avenue, connecting it with the street in Los Angeles.[48] Also that year, Mines Field, which had been established just southwest of the city, was purchased by the City of Los Angeles to serve as its municipal airport, bringing many new jobs to the region. In 1938, the Hollywood Park, an "ultra-modern" thoroughbred racetrack, opened on 314 acres just southeast of downtown, effectively making Inglewood a destination for the first time.[49] In addition to attracting the typical racing fan, Hollywood Park brought in celebrated personalities associated with the entertainment industry—from studio executives Jack Warner, Walt Disney and Samuel Goldwyn, to A-list actors like Al Jolson and Bing Crosby—many of whom were also investors in the operation.

Wartime and Postwar Growth

As war clouds gathered in the early 1940s, a number of aviation-related and other wartime manufacturing facilities set up shop around the Los Angeles Airport. North American Aviation, Inc. and the Northrup Company both established airplane manufacturing plants in the vicinity. Due to the emergence of these new facilities, this area would not only be critical to the defense industry during World War II, but in the postwar years would evolve into one of the most important centers of the nation's aerospace industry.

Fox Theater, early 1950s. *(John Chappell Collection, Cinema Treasures)*

The presence of wartime and postwar manufacturing jobs added sharply to the local population and financially supported a growing middle class throughout the South Bay region, including in Inglewood. In 1938, the city had a population of 26,000; by 1956, that number had grown to 64,000.[50] Housing construction naturally responded to the increased demand, and commercial development followed, leading to a pattern of postwar decentralization. By the mid-1950s, the city had three retail business areas—in North Inglewood, Morningside Park, and Crenshaw—in addition to the downtown.

[48] Waddingham, 43.
[49] Bricker, 15.
[50] Ibid.

Despite this tremendous growth overall, new development in downtown Inglewood was very limited during this period. In 1941 a J.C. Penney department store opened on Market Street between Queen Street and Manchester Boulevard. Originally constructed as a one-story building, in 1954 it was expanded with a second story and remodeled in its exiting Mid-Century Modern style, with a deep front canopy and glazed terra cotta tile columns.[51]

The Fox Theater opened on March 31st, 1949, on Market Street between Regent and Queen. Erected on the site of the Granada Theater, which burned down in 1945, it was the last theater constructed by the Fox West Coast Theater chain. Designed by prolific theater architect S. Charles Lee in the Late Moderne style, it was the first theater in Inglewood to have air conditioning. Other features included automatic lobby doors, CinemaScope widescreen projections, assistance for the hearing impaired, and a soundproof "crying room." The Fox Inglewood was often used for Fox Pictures' premiers and sneak previews.[52]

Hardin & Flanagan Colonial Chapel and Mortuary (now Lighthouse McCormick Mortuary), c. 1950. *(Tichnor Brothers Collection, Boston Public Library)*

During this same period, two substantial institutions opened just outside of downtown Inglewood. In 1948, Bank of America erected a sprawling 22,000-square-foot branch at the southwest corner of Manchester Boulevard and Locust Street.[53] That same year, funeral director John Flanagan opened Hardin & Flanagan Colonial Chapel & Mortuary on Prairie Avenue at La Palma Drive, across the street from Hollywood Park. Flanagan built a number of mortuaries around the Los Angeles area using the same American Colonial Revival design. In 1959, the business was purchased by the McCormick family and renamed McCormick Mortuary.[54] The following year, the building was expanded with a two-story north wing, adding a new lobby with offices above. Today, the business is operated as Lighthouse McCormick Mortuary.[55] The other area for new development during the

postwar period was La Brea Avenue, a wide auto corridor which previously served as the western border of downtown Inglewood.[56]

Despite these examples of new construction in and around downtown during this period, the primacy of the city's downtown as a commercial district was substantially diminished by increased competition from outlying commercial areas. The removal of the Market Street trolley line in 1957 added further stress to already struggling businesses. The city responded by adding municipally-owned off-street parking lots located throughout the district to draw car-dependent shoppers. The Chamber of Commerce and Downtown Inglewood Retail Merchants Association coordinated to organize various promotional activities, as well as physical improvements like tree planting in the center strip and along sidewalks, which were in place by the early 1960s.[57] However, these effects of these efforts were soon eclipsed by the continued loss of customers to new shopping malls in communities throughout Los Angeles. Inglewood considered, but ultimately rejected plants to build a mall of its own on a large parcel at Prairie and Manchester, a proposal largely defeated by the Market Street merchants. The site would instead become the home of the Forum.[58]

Market Street, looking north from Queen Street, 1955. *(Alan Weeks, L.A. County Metropolitan Transportation Authority Library & Archive)*

By the late 1960s, downtown Inglewood was in need of reinvention. To this end, the city contemplated a wholesale redevelopment scheme for the Market Street corridor

[56] Also built during this period was a Sears department store at Manchester and Hillcrest boulevards. Opened in 1947, this was an early indicator that the future of retail in Inglewood would not be downtown. Sears was demolished in 1993 and replaced by a Vons supermarket.
[57] "Downtown Center of Many Activities," *Los Angeles Times*, March 18, 1962.
[58] "The Changing Face of South Bay: Downtowns," *Los Angeles Times*, January 4, 1987.

that would expand and remodel existing stores, construct two high-rise office and apartment towers, introduce a landscaped arcade, and build a four-square block parking deck above shops to quadruple parking capacity.[59] However, this plan would go unrealized. The United Bank of California at the southeast corner of Market and Regent streets would be the first new structure to be added to the Market Street corridor in nearly two decades, replacing several early 20th-century commercial buildings.[60] Constructed in 1967 in the Late Modern style, it was joined nine years later by a stand-alone drive-thru automated teller building situated across Regent from the bank. Both buildings are believed to have been designed by Los Angeles modernist Richard Dorman.[61]

Market Street, looking south from Regent Street, 1961. *(Inglewood Public Library, Online Archive of California)*

Beyond Downtown

In the late 1960s, nationally prominent businessman Jack Kent Cooke selected the site of a former golf course at the southeast corner of Prairie Avenue and Manchester Boulevard to erect a new venue for his three professional sports franchises: the Los Angeles Lakers NBA basketball team, the Los Angeles Kings NHL hockey team, and the short-lived Los Angeles Wolves professional soccer team. The Forum, a multi-purpose indoor arena, was designed by the prominent Los Angeles architectural firm Charles

[59] "$11 Million Center Assured in Inglewood," *Los Angeles Times*, March 31, 1968.
[60] The former United Bank of California is located at 158-170 N. Market Street.
[61] Although an original building permit for the 1967 bank building is not available from the City of Inglewood, the permit for the similarly-styled drive-thru automated teller building lists Richard Dorman as its architect.

Luckman & Associates and completed in 1967.[62] Designed in the New Formalist architectural style, it was intended as a modern and highly-stylized version of the Coliseum of ancient Rome. Nicknamed "the Fabulous Forum," it would host tennis matches, boxing matches, ice shows, rodeos, the circus, award shows, and political events. In 1972, the Forum was the site of the Lakers' first NBA championship since moving to Los Angeles; five additional titles would follow in the 1980s. From the mid-1970s through the 1990s, the Forum would serve as the premier large-scale concert venue for the Los Angeles area, and would be influential in the birth of "arena rock." During the 1984 Olympics, the Forum was the venue for men's and women's basketball.[63]

The Forum under construction, with Jack Kent Cooke and Charles Luckman, 1967. *(Herald Examiner Collection, LAPL)*

By the early 1970s, Market Street had turned into a virtual ghost town as shoppers abandoned the downtown business center for suburban malls, and key tenants like J.C. Penney closed their doors. In an effort to reinvigorate the core of the city, from 1971 to 1976 Inglewood spent about $50 million in local, county, and federal funds to erect a new civic center complex along La Brea Avenue, just one block west of downtown. This new complex combined City Hall, a courthouse, library, fire and police facilities, public health complex, and a major new parking garage onto a single super-block, surrounded by expanses of lawn and public art. As hoped, this new construction sparked a flurry of new commercial development in the larger In-Town Redevelopment Area[64]—bounded by Florence, Locust, Manchester and Fir—the vast majority of which was office space and not retail. Several residential projects were built at this time as well, most notably the 200-unit Inglewood Meadows housing complex on Locust Street, just east of downtown.[65]

While these projects brought large numbers of people into the vicinity of Market Street, their presence did not raise the corridor's fortunes, and the vitality of the downtown business district continued to wain into the 1980s. In October 1986, Market Street

[62] The Forum is located at 3900 W. Manchester Boulevard.

[63] "Forum," *National Register of Historic Places Form*. Prepared by Historic Resources Group, April 29, 2014.

[64] The In-Town Redevelopment Area was one of six redevelopment project areas adopted by the Inglewood Redevelopment Agency between 1970 and 1973.

[65] Dean Murphy and Michele L. Norris, "Government Money Becomes Urban Lifeblood: Innovation and Optimism Thrive on Public Funds in Inglewood, San Pedro," *Los Angeles Times*, January 4, 1987.

merchants brought downtown business activity to halt as they closed their shops and picketed in a city-owned parking lot in a last-ditch effort to save it from redevelopment. The parking lot at La Brea Avenue and Queen Street provided 80 metered parking spaces which local shopkeepers saw as critical to continued viability of the downtown business district, which was already suffering from a severe parking shortage. Ultimately, however, the protests were unsuccessful, and the parking lot was soon replaced by a five-story office building.[66] Yet another sign of downtown's economic decline, the Fox Theater, then owned by the Mann theater chain, closed its doors in 1988.

Since the late-1970s, at least four City-sponsored revitalization programs have focused on improving Market Street's commercial viability, introducing street landscaping and furniture as well as façade improvements to the existing buildings. Efforts have included a façade improvement program designed by architectural firm Kahn, Kappe, Lotery, Boccato (1979); a $250,000 façade improvement program, including signs and awnings (1984); a California Main Street Community Project (1990s); and the Market Street Renaissance program (2000). However, despite these efforts, Market Street has largely remained an underutilized asset.

Inglewood Today & Tomorrow

In 1994, Hollywood Park underwent a $100 million expansion into Hollywood Park Casino, which extended the facility's economic viability. However, in May of 2013, it was announced that the Hollywood Park racetrack would be closing at the end of the fall racing season. In 2015, the Inglewood City Council approved a plan to build an 70,000-seat football stadium on the site in anticipation of the St. Louis Rams moving back to Los Angeles. The Inglewood mayor was on-hand to witness the demolition by explosives of the massive grandstand.

The Forum remained the home of the Lakers and Kings until 1999, when both teams relocated to the newly-constructed Staples Center in downtown Los Angeles. Beginning in 2012, the Forum underwent a $50 million renovation, reopening in 2014. Later that year, the Forum was listed in the National Register of Historic Places. The venue is inextricably tied to the identity of the City of Inglewood, which adopted the moniker "City of Champions." The Forum is slated to host the gymnastics events for the 2028 Summer Olympics.

Over the past decade, the City of Inglewood has been acquiring select parcels throughout the city for redevelopment, including along Market Street. Various planning studies have been conducted to develop standards for transit-oriented development, mixed-use development, and parking, with the goal of revitalizing downtown Inglewood. Local advocacy organization the Inglewood Historic Preservation Alliance (IHPA, formerly the Inglewood Historic Site Preservation Committee) continues to work

[66] "Merchants Protest Proposal to Build on Parking Lot," *Los Angeles Times*, October 16, 1986.

toward the protection of the city's historic structures and places of interest, including the Fox Theatre, which was successfully listed in the National Register of Historic Places in 2013.[67] Currently, the City of Inglewood is utilizing *The New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, adopted November 1st, 2016, as the controlling document for future activity along Market Street.

On January 12th, 2016, the NFL voted to move the St. Louis Rams back to Los Angeles, with the San Diego Chargers to follow. In October 2016, the last part of the former racetrack, the Casino, was demolished and a new Hollywood Park Casino was opened next door. The new *Los Angeles Stadium at Hollywood Park* is currently under construction. When completed in 2020, it will be the new home of the NFL's Los Angeles Rams and Los Angeles Chargers. The Los Angeles Stadium is slated to host Super Bowl LVI in 2022, the College Football National Championship in 2023, and the opening and closing ceremonies and soccer events for the 2028 Summer Olympics.

5.2 Selected Chronology

Pre-History

3,500 BP The Tongva occupy the area now encompassed by the Los Angeles basin, San Fernando Valley, San Gabriel Valley, San Bernardino Valley, and the local California coastline.

Spanish Colonial Period

1542 Spanish explorer Juan Rodriguez Cabrillo makes the first documented European contact with the native Tongva people.

1769 The Portolá expedition passes through present-day downtown Los Angeles, encountering the native people from the village of Yang-na.

1771 On September 8th, Spanish colonists establish Mission San Gabriel, the fourth of California's Spanish missions.

1778 *El Pueblo de Los Angeles* is officially founded under the Spanish Laws of the Indies on September 4th.

Mexican Period

1821 Mexico wins its independence from Spain and Alta California becomes a territory of the new Mexican Republic.

1834 The California Missions are secularized by the Mexican government, and mission lands are confiscated for distribution in large land grants called *ranchos*.

Ygnacio Machado builds the Centinela Adobe, now considered the "birthplace of Inglewood."

1837 The Machado family is granted official title of the area around Centinela Springs as the 2,219-acre *Rancho Aguaje de la Centinela*.

The Ávila family is granted the 22,458-acre *Rancho Sausal Redondo,* encompassing much of what is now the South Bay region of Los Angeles County.

1845 Bruno Ygnacio Ávila acquires *Rancho Aguaje de la Centinela* from the Machados in exchange for a small tract in the *Pueblo de Los Ángeles* for.

American Period

1846 United States troops begin occupying Alta California.

1848 The signing of the Treaty of Guadalupe Hidalgo on February 2nd cedes the California territory to the United States and ends the Mexican-American War.

1850 Los Angeles incorporates as an American city on April 4th.

California is admitted to the Union as its 31st state.

1857 Bruno Ávila loses *Rancho Aguaje de la Centinela* through foreclosure.

1860 *Rancho Aguaje de la Centinela* is acquired by Scotsman Sir Robert Burnett.

1868 The heirs of Antonio Ávila are forced to sell *Rancho Sausal Redondo* to pay probate costs.

1872 Burnett acquires *Rancho Sausal Redondo*, combining his total land holdings of some 25,000 acres into the Centinela Ranch, encompassing the present-day communities of Playa del Rey, El Segundo, Manhattan Beach, Hermosa Beach, Redondo Beach, Westchester, Inglewood, Hawthorne, and Lawndale.

1873 Burnett leases his property to Daniel and Catherine Freeman.

1885 Daniel Freeman officially acquires Burnett's property and names it Inglewood.

1887 Freeman sells some 11,000 acres of his ranch to the Centinela-Inglewood Land Company for development.

Inglewood Townsite

1888 The townsite of Inglewood is platted by the Centinela-Inglewood Land Company.

The California Central Railway completes a line to Redondo Beach.

Freeman erects a large mansion in Inglewood.

1889 Freeman builds a land office on the grounds of the Centinela Adobe.

1905 A group of local businessmen forms the Inglewood Park Cemetery Association.

1907 The Romanesque-style Grace Chapel is erected at Inglewood Park Cemetery.

City of Inglewood

1908 The City of Inglewood is incorporated on February 14th.

1914 Holy Faith Episcopal Church, designed by nationally renowned architect Philip Frohman, is officially consecrated.

1915 The Neoclassical-style Inglewood Mausoleum at the Inglewood Park Cemetery is completed.

1920 On the evening of June 21st, the Los Angeles Basin is rattled by an estimated 5.0 earthquake centered near Inglewood.

1927 The People's Federal Building & Loan Association erects a building at the northeast corner of Market Street and Manchester Boulevard.

The Bank of Inglewood building is erected at the northeast corner of Market and Queen streets.

A new ornamental lighting system is installed along Market Street.

1928 The Professional Building is constructed at Market Street and Manchester Boulevard's northwest corner.

1929 The stock market crashes in late October, ultimately leading to the Great Depression.

1933 On the evening of March 10th, a magnitude 6.4 earthquake strikes off the coast of Long Beach.

1937 Mines Field, west of Inglewood, is purchased by the City of Los Angeles to serve as its municipal airport.

1938 Hollywood Park thoroughbred racetrack opens just southeast of downtown Inglewood.

Wartime & Postwar Growth

1941 On December 7th, the U.S. naval base at Pearl Harbor is attacked by the Imperial Japanese Navy, leading to the United States' entry into World War II.

A J.C. Penney department store opens in downtown Inglewood.

1945 The Granada Theater on Market Street burns down.

1947 Sears department store opens at Manchester and Hillcrest boulevards.

1948 Bank of America opens a large branch on Manchester Boulevard, just east of downtown Inglewood.

The Hardin & Flanagan Colonial Chapel and Mortuary (now Lighthouse McCormick Mortuary) opens on Prairie Avenue, across from Hollywood Park.

1949 On March 31st, the Fox Theater opens on Market Street on the site of the Granada Theater.

Los Angeles Airport is renamed Los Angeles International Airport.

Beyond Downtown

1957 The Market Street trolley line is removed.

1967 The United Bank of California becomes the first contemporary structure to be added to the Market Street corridor.

The Forum is built by prominent businessman Jack Kent Cooke as a venue for his three professional sports franchises in Los Angeles: the Lakers (basketball), Kings (hockey), and Wolves (soccer).

1972 The Forum is the site of the Lakers' first NBA championship since moving to Los Angeles.

1973 A new Inglewood Civic Center complex is constructed just west of downtown.

1984 The Forum is the venue for men's and women's basketball during the Summer Olympics.

1986 Market Street merchants picket to stop the loss of a parking lot at La Brea Avenue and Queen Street for new construction; the protest is unsuccessful.

1988 The Fox Theater, then owned by the Mann theater chain, closes its doors.

Inglewood Today & Tomorrow

1993 Sears is demolished and replaced by a Vons supermarket.

1994 Hollywood Park undergoes a $100 million expansion into Hollywood Park Casino.

1999 The Lakers and Kings leave the Forum for the newly-constructed Staples Center in downtown Los Angeles.

2013 It is announced that Hollywood Park racetrack will close at the end of the fall racing season.

The Fox Theatre is listed in the National Register of Historic Places.

2014 The Forum reopens after a $50 million renovation.

The Forum is listed in the National Register of Historic Places.

2015 The Inglewood City Council approves a plan to build an 70,000-seat football stadium on the Hollywood Park site.

2016 On January 12th, the NFL votes to move the St. Louis Rams back to Los Angeles, with the San Diego Chargers to follow.

The Hollywood Park casino is demolished, and a new casino opened next door.

2020 The *Los Angeles Stadium at Hollywood Park* (SoFi Stadium) opens as the new home of the NFL's Los Angeles Rams and Los Angeles Chargers.

2022 Los Angeles Stadium is scheduled to host Super Bowl LVI.

2023 Los Angeles Stadium will be the venue for the College Football National Championship.

2028 Los Angeles Stadium will host the opening and closing ceremonies for the Summer Olympics, as well as soccer events.

The Forum is slated to host the gymnastics events for the Summer Olympics.

6.1 Listed Historical Resources

There are two (2) properties within the Project Area and/or Expanded Study Area that are listed in the National Register, and are therefore automatically listed in the California Register. As such, these properties are considered historical resources as defined by CEQA.

3900 W. Manchester Boulevard (The Forum)

This property, located at the southeast corner of Manchester Boulevard and Prairie Avenue, contains the Forum, a multi-purpose indoor arena, surrounded by an expansive surface parking lot. It was built by nationally prominent businessman Jack Kent Cooke as a venue for his three professional sports franchises: the Los Angeles Lakers NBA basketball team, the Los Angeles Kings NHL hockey team, and the short-lived Los Angeles Wolves professional soccer team. Completed in 1967, it was designed by prominent Los Angeles architectural firm Charles Luckman & Associates in the New Formalist style. From 2012 to 2014, it underwent an extensive historic renovation.

The Forum was listed in the National Register of Historic Places on September 24th, 2014 under Criterion C as an excellent example of a 1960s New Formalist-style arena building,[68] and is therefore automatically listed in the California Register. As such, this property is a historical resource under CEQA.

115 N. Market Street (former Fox Theater)

This property, located on the west side of Market Street between Regent and Queen streets, contains a 12,090 sq. ft. neighborhood movie theater building. Originally constructed in 1949 for Fox West Coast Theaters, it was designed by prolific theater architect S. Charles Lee in the Late Moderne style. The building is currently unoccupied and its storefront windows and doors are boarded up.

In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a very good example of a 1940s Late Moderne-style movie theater building in Inglewood.[69] On January 14th, 2013, the Fox Theater was listed in the National Register of Historic Places, and is therefore automatically listed in the California Register.[70] As such, this property is a historical resource under CEQA.

[68] "Forum," *National Register of Historic Places Registration Form*, prepared by Historic Resources Group, April 29, 2014.
[69] Bricker.
[70] "Fox Theatre Inglewood," *National Register of Historic Places Registration Form*, prepared by Brian Curran, Jr. (accessed February 2019).

6.2 Previously Identified Historical Resources

There are nine (9) properties within the Project Area and/or Expanded Study Area that have been previously identified as eligible for historic listing or designation through historic resources surveys, environmental review, or other efforts. Most notably, a previous historical resources survey of Market Street was conducted as part of the *Inglewood Downtown District/Main Street Project Area Historic Design Guidelines* project, completed by Lauren Weiss Bricker, PhD, Marion Mitchell-Wilson, and Janet L. Tearnen in 2000.[71] Each of these properties has been re-examined and re-evaluated for its eligibility for listing in the National Register or California Register.

Of these previously identified historical resources, four (4) were re-evaluated as appearing eligible for listing in the National Register and/or California Register, and are therefore considered herein as historical resources for the purposes of CEQA. Five (5) were found to appear ineligible for historic listing due to substantial alteration. No historic districts have been previously identified within the Project Area and/or Expanded Study Area.[72]

302 E. Manchester Boulevard/200-204 S. Market Street (Cox Menswear)

This property, located at the southeast corner of Manchester Boulevard and Market Street, contains a two-story commercial retail building. Originally constructed in 1941, the building was designed in the Streamline Moderne style and was historically occupied by Scotty's Men's Shop. The building's current tenant is Cox Menswear. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a good example of the Streamline Moderne style in Inglewood.[73]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. On the ground story, the existing stone veneer and projecting aluminum-frame display windows appear to be the result of a mid-century remodel, replacing all of the original retail storefronts and wall cladding along both street-facing façades. On the upper story, original fenestration has been replaced with vinyl sliders. Also, the neon sign that originally adorned the corner tower has been removed. Due to these alterations, the building no

[71] This 2000 report included a historic resources survey of the Inglewood Downtown District/Main Street project area, which was bounded by La Brea Avenue to the west, Locust Street to the east, Florence Avenue to the north, and Hillcrest Boulevard to the south. The upper portion of this survey area includes the Market Street portion of the current Project Area/Expanded Study Area. The survey identified eight (8) individual properties within the current Project Area/Expanded Study Area as eligible for historic designation; no historic district was identified.

[72] The *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, adopted November 1, 2016, identifies Downtown Inglewood as "Historic Downtown." However, this appears to refer to the area's history as Inglewood's original business district, and is not an evaluation of historic eligibility.

[73] Bricker.

longer displays the characteristic features of the Streamline Moderne style, nor does it represent a comprehensive or wholesale stylistic remodel from a particular historic period. Thus, this building does not retain sufficient integrity to convey its significance as a good example of its architectural style, and therefore does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

320-330 E. Manchester Boulevard (Bank of America)

This property, located at the southwest corner of Manchester Boulevard and Locust Street, contains a 21,976 sq. ft. bank building and a rear surface parking lot.[74] Originally constructed in 1948, the building was erected for Bank of America and designed in the Late Moderne style. Bank of America continues as its current tenant. The smaller adjacent building at 320 E. Manchester Boulevard was originally constructed in 1920 and remodeled as part of the Bank of America in 1954. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a good example of a 1940s PWA Moderne-style bank building in Inglewood.[75]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its form and massing, exterior wall cladding, fenestration patterns, and decorative elements. The framing of the windows and doors may have been updated. However, the replacement material appears to be in keeping with what would have been in place historically, such that this change does not substantially diminish the building's integrity. Other changes—including lighting, signage, and the addition (and subsequent removal) of an in-wall ATM—are minor in relation to the building's overall appearance. The building remains largely intact and continues to display the characteristic features of a PWA Moderne bank building from the 1940s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

100 N. Market Street/307 E. Queen Street (former Bank of Inglewood)

This property, located at the northeast corner of Market and Queen streets, contains a two-story, 9,258 sq. ft. mixed-use commercial building constructed in 1927. The building was originally constructed for the Bank of Inglewood at a cost of $140,000. Designed by local architect William L. Campbell in the Mediterranean Revival style, the reinforced concrete building was the first steel frame business block in the city. The

[74] The main bank building uses the address 330 E. Manchester Bl.; the smaller adjacent building is at 320.
[75] Bricker.

building was sold to Bank of America National Trust & Savings Association in 1936; in 1950 it became Southwest Bank. It now serves as a retail space occupied by Vajra Books & Gifts. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as an excellent example of a 1920s Mediterranean Revival-style bank building in Inglewood.[76]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its form and massing, roof material, exterior wall cladding, fenestration patterns, elaborated arched main entrance and ground-story windows, upper-story windows, and various decorative elements. Alterations—such as replaced front doors and the addition of tile cladding on the ground story—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The building remains highly intact and continues to display the characteristic features of a Mediterranean Revival bank building from the 1920s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the National Register and the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

124-126 N. Market Street

This property, located on the east side of Market Street between Regent and Queen streets, contains a two-story, 2,750 sq. ft. mixed-use commercial building constructed in 1920. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.[77]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. The building's original retail storefronts have been replaced with floor-to-ceiling aluminum storefronts, thereby completely altering the ground story on the building's only publicly visible façade. On the upper story, original fenestration has been replaced with metal sliders. The building does not display the characteristic features of a particular architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California

[76] Bricker.

[77] Ibid. Note that Inglewood's downtown survey was completed prior to the revision of the California Historical Resources Status Codes. These codes were updated and their definitions revised in August 2003.

Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

125 S. Market Street

This property, located on the west side of Market Street between Queen Street and Manchester Boulevard, contains a one-story commercial building constructed in 1938. The building is currently occupied by Basket Beauty Supply. In 2000, the property was assigned a status code of 5S1 (eligible for local listing) under Criterion C as an intact example of a mid-century remodeled façade.[78]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it has been substantially altered over time, including since its previous evaluation. The 2000 survey referred to this building as "among the more visually interesting" mid-century façade remodels along Market Street, noting a "metal pylon sign [that] juts above the building's parapet at a sufficient height and angle to be seen by the pedestrian" and "framed [display] cases that cantilever beyond their built-in bases."[79] None of these features remain extant. Alterations include the replacement of the exterior wall cladding on both stories, the replacement of all retail storefronts and entry doors, the addition of applied decorative features above the canopy, added light fixtures, and contemporary signage. Taken together, these alterations have completely transformed the building's only publicly visible façade, such that it no longer displays any elements of its original 1930s design, nor does it represent a comprehensive mid-century façade remodel. Thus, this building does not retain sufficient integrity to convey its significance as a good example of its architectural style, and therefore does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

129-139 S. Market Street (former J.C. Penney)

This property, located on the west side of Market Street between Queen Street and Manchester Boulevard, contains a two-story, 62,583 sq. ft. commercial retail building which originally housed a J.C. Penney department store. The building was initially constructed as one story in 1941. In 1954, it was expanded with a second story and remodeled in the Mid-Century Modern style. It is currently occupied by Inglewood Marketplace. In 2000, the property was assigned a status code of 5S1 (eligible for local listing) under Criterion C as a good example of a 1950s Mid-Century Modern-style department store building.[80]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its 1950s remodel. The building

[78] Bricker.
[79] Bricker, 16.
[80] Bricker.

retains the majority of its exterior features from this period, including its form and massing, exterior wall cladding, angled storefronts, recessed entry with terrazzo flooring, entry doors, canopy, upper-story ribbon windows, and applied decoration. Alterations—such as contemporary signage and the distinctive paint job—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The building remains highly intact and continues to display the characteristic features of a Mid-Century Modern department store building from the 1950s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

132 S. Market Street

This property, located on the east side of Market Street between Queen Street and Manchester Boulevard, contains a two-story mixed-use commercial building constructed in 1925. The building is currently occupied by Smoove Fashion World. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.[81]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. The building's original retail storefront has been replaced with a floor-to-ceiling aluminum storefront, and brick veneer wall cladding and an awning have been added, thereby completely altering the building's ground story. On the upper story, original fenestration has been replaced with metal or vinyl sliders. Some original decorative features remain on the upper story. However, overall the building does not display the characteristic features of a particular architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

150 S. Market Street (former People's Federal Building & Loan Association)

This property, located at the northeast corner of Market Street and Manchester Boulevard, contains a two-story, 16,575 sq. ft. mixed-use commercial building. The building was originally constructed in 1927 as the People's Federal Building & Loan Association. It was remodeled in the Late Modern style, likely sometime in the 1960s. It is currently occupied by World Hat & Boot Mart. In 2000, the property was assigned a

[81] Bricker.

status code of 5S1 (eligible for local listing) under Criterion C as a good example of a 1960s Late Modern-style commercial building.[82]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its 1960s remodel. The building retains the majority of its exterior features from this period, including its form and massing, exaggerated arches and elevated roof plate, exterior wall cladding, metal storefronts and entry doors, canopy, and upper-story fenestration. Alterations—such as contemporary signage and the replacement of the original entry doors with a display window—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The building remains largely intact and continues to display the characteristic features of a Late Modern commercial building from the 1960s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

333 E. Nutwood Street

This property, located at the northwest corner of Locust and Nutwood streets, contains a one-story commercial office building constructed in 1940. The building is currently occupied by Anphon Medical Center. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.[83]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. The building's exterior wall cladding has been replaced with rough-textured stucco, and exaggerated stucco-clad window surrounds have been added throughout. These changes are incompatible with the building's American Colonial Revival style, and thereby substantially alter the building's overall appearance. The building is no longer a good example of its architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

6.3 Newly Identified Historical Resources

Detailed field surveys of the Project Area and Expanded Study Area were conducted on June 4th, 2018 and February 21st, 2019. These field surveys were supplemented by

[82] Bricker.
[83] Ibid.

property-specific and contextual research to identify additional properties that are eligible for listing or designation and therefore may be considered historical resources under CEQA. Through this process, five (5) additional properties were evaluated as appearing eligible for listing in the National Register and/or California Register, and are therefore considered herein as historical resources for the purposes of CEQA. No historic districts were identified within the Project Area and/or Expanded Study Area.

260 N. Locust Street (Holy Faith Episcopal Church)

This property, located at the southeast corner of Locust Street and Grace Avenue, contains the Holy Faith Episcopal Church complex. The congregation was first established in 1911, with services held in the Inglewood Masonic Hall. In 1912, funds were donated to erect a complex consisting of a church, a rectory (the dwelling to the south), and parish hall (now a school at the rear). The complex of buildings was designed by architect Philip Frohman, would go on to become nationally renowned, particularly for his work on the National Cathedral in Washington, D.C. The church building was officially consecrated on November 8th, 1914. It lost its original bell tower in the 1933 Long Beach Earthquake, but continued to be improved throughout the 1930s, with the Stations of the Cross, imported from Italy; the pulpit, lectern and choir stalls from England; and the reredos carved and imported from Bavaria. The stained-glass windows were crafted by Judson Studios in Highland Park. Due to its growing congregation, in the late 1950s architect Philip Frohman returned to design an addition to the church building.[84] The church was extended to the west and an interior balcony added, doubling its capacity from 200 to 400. The newly expanded church building was dedicated in 1959. The parish hall, which now serves as a school, has been expanded multiple times from the 1950s to the 1980s, now extending nearly the full width of the lot. The rectory appears largely intact, with some windows replaced. In 2000, the property was assigned a status code of 4S1 (may become eligible for the National Register when it becomes old enough).[85]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially intact, including the main church building, the rectory, and the school. Character-defining features of the church building include its double-cruciform plan; gabled roofs with capped parapets and decorative crosses; copper steeple; stucco exterior walls with cast-stone stepped buttresses; base with cast-stone molding; pointed-arch openings with decorative cast-stone surrounds; leaded stained-glass windows; cast-stone Gothic tracery and quoining; wood plank doors with exposed iron hardware; metal scuppers and downspouts; and decorative wrought-iron wall sconces. The church expansion was designed by the original architect to respect

[84] Bricker, 8 (Database Master Report, appendix to the *Inglewood Downtown District/Main Street Project Area Historic Design Guidelines)*.

[85] Bricker. It is unclear why this status code was assigned, as it was typically reserved for properties that were less than 50 years of age at the time of evaluation.

and complement the original church—with features such as wood entry doors and stained-glass windows retained and incorporated into the expanded design—and thus is considered to have acquired significance in its own right. Similarly, additions to the school building are compatible with yet differentiated from the original extent, which remains evident. Thus, the property as a whole retains sufficient integrity to convey its significance as an excellent and rare early 20th-century religious complex in Inglewood. Additionally, the church building appears to be an outstanding example of Late Gothic Revival architecture, representing the work of a nationally-significant architect. Therefore, the property appears eligible for listing in the National Register and the California Register under Criterion A/1 as early institutional development in Inglewood, and Criterion C/3 for its architectural merit. As such, it is considered a historical resource herein for the purposes of CEQA.

158-170 N. Market Street (former United Bank of California)

This property, located at the southeast corner of Market and Regent streets, contains a 9,000 sq. ft. branch bank building and rear surface parking lot. Originally constructed in 1967 for United Bank of California, it was designed by noted Los Angeles architect Richard Dorman in the Late Modern style.[86] Richard Dorman was a prolific modernist architect and designer who worked throughout the Los Angeles region from the 1950s through the 1970s. Over the course of his career he designed dozens of high-end residences, as well as various commercial and institutional buildings such as offices, churches, and banks. In 1976, the bank added a similarly-designed drive-thru automated teller building across Regent Street to the north, also designed by Dorman.[87] The building is currently occupied by Broadway Federal Bank. In 2000, the property was assigned a status code of 6Z (appears ineligible for the National Register).[88]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its original construction. Character-defining features include its cruciform roof plan; projecting trapezoidal volumes; battered walls; heavy wood beams; smooth exterior surfaces of brick and stucco; and large expanses of tinted glass. Alterations—such as contemporary signage, and the addition of an in-wall ATM with an access ramp and projecting canopy—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. At the time of its previous evaluation, the bank building was well below the 50-year age threshold used in standard preservation practice for evaluating eligibility for

[86] Although an original building permit for the 1967 bank building is not available from the City of Inglewood, the permit for the similarly-styled drive-thru automated teller building across the street lists Richard Dorman as its architect.

[87] Because the drive-thru automated teller building is situated across the street and was added nine years later, it is not considered part of the bank building.

[88] Bricker.

historic designation.[89] Additionally, since the 2000 survey there has been substantial new scholarship on the built environment of the mid-20th century, with new historic contexts developed to provide guidance for evaluating such properties. In light of this new scholarship, this property appears to be significant as a 1960s Late Modern-style bank building in Inglewood, representing the work of a noted architect. It remains highly intact and thus retains sufficient integrity to convey its significance as a good example of its architectural style. Therefore, the property appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, it is considered a historical resource herein for the purposes of CEQA.

149-155 S. Market Street/231-239 E. Manchester Boulevard (Professional Building)

This property, located at the northwest corner of Market Street and Manchester Boulevard, contains a two-story, 6,000 sq. ft. mixed-use commercial building. Constructed in 1928 as the Professional Building, it was designed in the Spanish Colonial Revival style with cast-stone Churrigueresque details. In 2000, the property was assigned a status code of 4S7 (may become eligible for the National Register when integrity is restored).[90]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that despite alterations on the ground story, the upper story appears substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its red clay tile shed roofs with exposed rafter tails; smooth stucco exterior cladding; wood tripartite upper-story windows; decorative cast-stone details at the roofline; and a canopy with decorative wrought-iron supports at the secondary entrance. Alterations—including replacement of ground-story storefronts and entry doors—do somewhat diminish the building's integrity. However, overall the building remains largely intact and continues to display the characteristic features of a Spanish Colonial Revival commercial building from the 1920s. Thus, it retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, this property is considered a historical resource herein for the purposes of CEQA.

619-635 S. Prairie Avenue (Lighthouse McCormick Mortuary)

This property, located at the northwest corner of Prairie Avenue and La Palma Drive, contains a two-story, 9,352 sq. ft. chapel and mortuary building. Designed in the American Colonial Revival style, the building was initially constructed in 1948 as the Hardin & Flanagan Colonial Chapel & Mortuary. In 1959, the business was acquired by the McCormick family and renamed McCormick Mortuary. Around 1960, the building

[89] According to National Park Service guidance, 50 years is a general estimate of time needed to develop sufficient historical perspective to evaluate historic significance.
[90] Bricker.

was expanded with a new two-story wing to the north. It is currently operated as Lighthouse McCormick Mortuary.

Historic Resources Group has examined this property for the purpose of this report, and finds that it appears substantially unaltered since its 1960s expansion. The building retains the majority of its exterior features from this period, including its form and massing; hipped and gable roofs with boxed eaves; decorative cornice with return; two-story porticos with slender full-height columns; stucco and wood clapboard exterior cladding; fluted pilasters; divided-light double-hung wood windows with louvred wood shutters; wood paneled doors; round and rounded-arch openings; elaborated entrances including fanlights, sidelights, and decorative wood surrounds; and hanging lanterns. Alterations—such as replacement of an original window with a vinyl slider—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The mortuary's expansion was designed to respect and complement that of the original chapel and office, and thus is considered to have acquired significance in its own right. The building remains highly intact and continues to display the characteristic features of a mid-20th century American Colonial Revival mortuary building. Thus, it retains sufficient integrity to convey its significance as an excellent example of its architectural style, and therefore appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, this property is considered a historical resource herein for the purposes of CEQA.

720 E. Florence Avenue (Inglewood Park Cemetery)[91]

This property, located at the northeast corner of Manchester Boulevard and Prairie Avenue, contains a large cemetery. In 1905, a group of local businessmen formed the Inglewood Park Cemetery Association and acquired a large plot of land just east of what would become downtown Inglewood. In 1907, the cemetery erected the Romanesque-style Grace Chapel, a three-quarters replica of a church in Edinburgh, Scotland. In these early days, funerals often arriving by rail from Los Angeles in a private funeral car; portions of the original railroad waiting station have been incorporated into the main entrance. The Neoclassical-style Inglewood Mausoleum was completed in 1915 and was the first community mausoleum in the State of California. The Mausoleum of the Golden West was built over several decades from the 1930s to the 1960s and features stained-glass representations of early California by Judson Studios. Various notable persons have been laid to rest at Inglewood Park Cemetery, including some of the South Bay region's earliest settlers, a number of Civil War veterans, and

[91] The parcel at the northeast corner of Manchester Boulevard and Prairie Avenue is included in the Expanded Study Area because it fronts the alignment right-of-way. This parcel has no address and contains only a small portion of the Inglewood Park Cemetery property. The vast majority of the cemetery occupies the adjacent parcel at 720 E. Florence Avenue (APN 4012031027). In the interest of being inclusive, the Inglewood Park Cemetery has been included in the Expanded Study Area for the purpose of this Project. While the cemetery extends several blocks north of the Project Area to Florence Avenue, project impacts would only be expected in the southwesternmost portion of the property.

famous figures such as former Los Angeles Mayor Tom Bradley, Chet Baker, Ray Charles, Ella Fitzgerald, Etta James, boxer Sugar Ray Robinson, and architect Paul Williams. At the time of this report, both Grace Chapel and the Inglewood Mausoleum were undergoing renovation.

Historic Resources Group has examined this property for the purpose of this report, and finds that it has evolved over time but that it remains substantially intact. The property appears to retain the majority of its original features, such as its overall form and configuration, landscape design, and main entrance, as well as multiple excellent examples of cemetery architecture, including Grace Chapel, Inglewood Mausoleum, and Mausoleum of the Golden West.[92] Alterations—such as the addition of more recent buildings—do not substantially diminish the integrity of the property overall. Thus, the property as a whole retains sufficient integrity to convey its significance as an excellent and rare early 20th-century cemetery in Inglewood. Additionally, Grace Chapel, Inglewood Mausoleum, and Mausoleum of the Golden West appear to be excellent examples of their architectural style. Therefore, the property appears eligible for listing in the National Register[93] and the California Register under Criterion A/1 as early institutional development in Inglewood, and Criterion C/3 and for the quality of its architectural and landscape design. As such, this property is considered a historical resource herein for the purposes of CEQA.

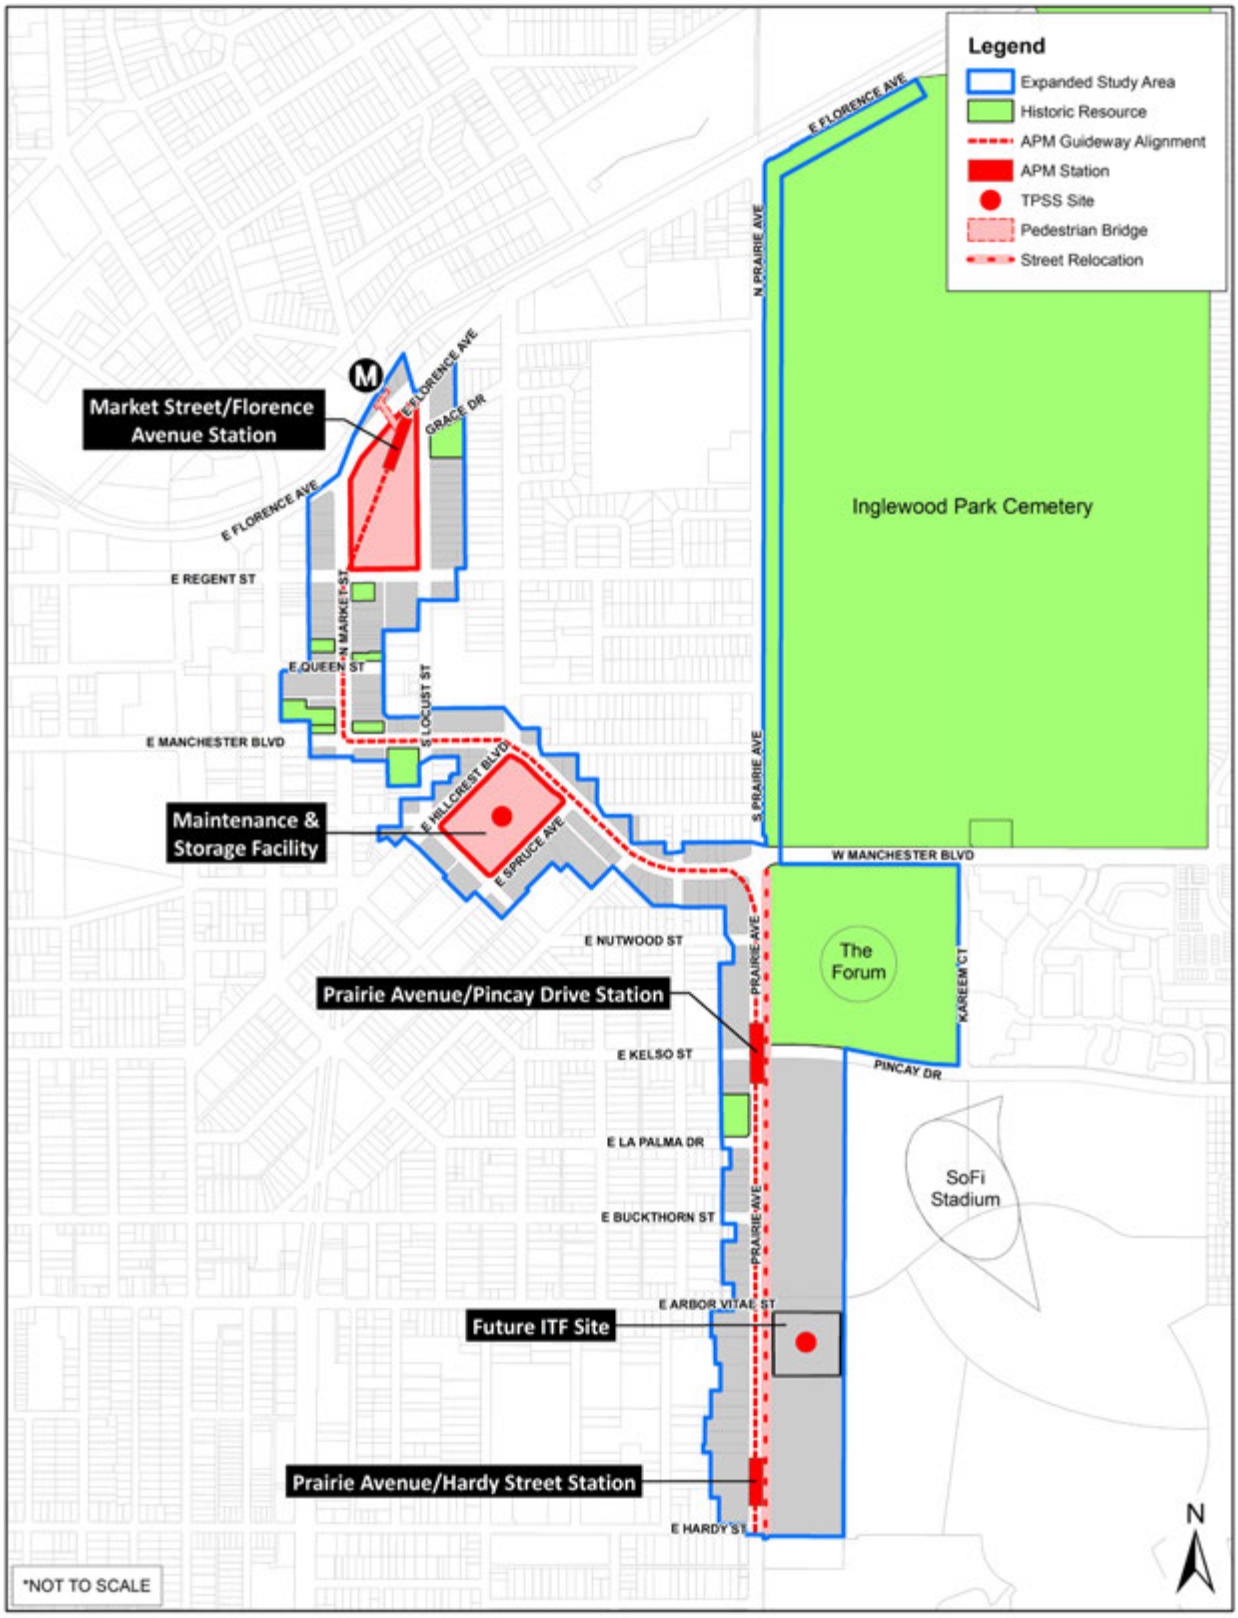
6.4 Summary of Historical Resources

To summarize, eleven (11) historical resources have been identified in the Project Area and/or Expanded Study Area. Of these, two (2) are listed in the National Register and the California Register; four (4) were previously identified as historic through historic resources surveys, environmental review, or other efforts, and have been re-evaluated as appearing eligible for listing in the National Register and/or California Register; and five (5) were identified through this process and evaluated as appearing eligible for listing in the National Register and/or California Register. All of these properties are considered herein as historical resources for the purposes of CEQA. Therefore, potential impacts of the Project to these properties are analyzed in this report. *[See Figure 4. Map of Historical Resources.]*

[For field photographs of these historical resources and their immediate surroundings, taken June 4th, 2018 and February 21st, 2019, see Appendix A.]

[92] Due to the size and complexity of this property, identification of contributing and non-contributing features was outside the scope of this report.

[93] Based upon its age, this property appears to meet National Register Criterion Consideration D for cemeteries.



Summary List of Historical Resources

ADDRESS	APN	DATE	NAME	DESCRIPTION	CURRENT EVALUATION
260 N Locust St	4015026039	1914	Holy Faith Episcopal Church	Religious complex (church, rectory and school)	Appears eligible for listing in NR & CR

720 E Florence Ave[94]	4012031930	1905	Inglewood Park Cemetery	Cemetery	Appears eligible for listing in NR & CR

[94] The parcel situated within the Expanded Study Area (APN 4012031930) has no address and contains only a small portion of the Inglewood Park Cemetery property. The vast majority of the cemetery occupies the adjacent parcel at 720 E Florence Avenue (APN 4012031027).

Figure 4. MAP OF HISTORICAL RESOURCES

7.1 Framework for Analysis

Guidelines for Implementation of CEQA are codified at Title 14 California Code of Regulations section 15000 et seq. The *CEQA Guidelines* state that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment."[95] A "substantial adverse change in the significance of a historical resource" means the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired.[96]

The CEQA Guidelines go on to state that "[t]he significance of a historical resource is materially impaired when a project…"[d]emolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources… local register of historical resources… or its identification in a historical resources survey."[97]

Thus, an evaluation of project impacts under CEQA requires a two-part inquiry: (1) a determination of whether the project site contains or is adjacent to a historical resource, and if so, (2) a determination of whether the proposed project will result in a substantial adverse change in the significance of the historical resource.

7.2 Analysis of Direct Impacts

This section analyzes the potential for the Project to have a direct impact on any historical resources under CEQA. As discussed above, the significance of a historical resource is materially impaired, and constitutes a substantial adverse change in the significance of that historical resource, if the project would materially alter in an adverse manner those physical characteristics of the resource or its immediate surroundings that convey its historical significance and justify its inclusion in the California Register, local register, or historical resource survey. The significance of a historical resource may be materially impaired through project impacts both direct and indirect. Thus, the potential for this Project to impact a historical resource, either directly or indirectly, is analyzed.

As described above, much of the Project will be constructed within the public right-of-way,[98] including the elevated APM guideway set on single or dual support columns, and two of three APM Stations. However, several Project components will be constructed on parcels immediately adjacent to the public right-of-way. These include the Market

[95] *CEQA Guidelines*, Section 15064.5(b).
[96] Ibid., Section 15064.5(b)(1).
[97] Ibid., Section 15064.5(b)(2).
[98] The public right-of-way extends to the front property line on each side of the street, including the roadway and sidewalks.

Street Station; the pedestrian bridge over Florence Avenue; vertical circulation elements for two of the APM stations; the Maintenance & Storage Facility; two Traction Power Substations; and the relocation of Prairie Avenue. Thus, the Project does have the potential to directly impact historical resources.

This report has identified two (2) historical resources within the Project Area that could be directly impacted by the Project. Potential impacts to each of these resources are described below.

3900 W. Manchester Boulevard (The Forum)

The Forum property is located within the Project Area, situated along the east side of the APM alignment as it travels north/south along Prairie Avenue. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Prairie Avenue between Manchester Boulevard and Hardy Street. Additionally, the travel lanes on Prairie Avenue will be relocated to the east (to accommodate the anticipated APM columns on the west side of Prairie and maintain a sufficient sidewalk width). The total travel lane (and turn lane) capacities on Prairie Avenue will be maintained to avoid traffic impacts on Prairie Ave (which is the main access point to the major event venues); as such there is an encroachment into the Forum property along its western boundary. With this street modification, the support columns on the east side of the APM guideway would be constructed on what is now the Forum parking lot. The APM guideway (and stations) will remain over the public right-of-way; the encroachment is due to the roadway modification and to accommodate the potential APM support columns.

The Project will not physically alter the Forum building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will alter a portion of the Forum's surface parking lot, which is identified in the National Register nomination as one of the Forum's character-defining features. The Project will encroach into the Forum parking lot along its western edge between Manchester Boulevard and Pincay Drive by less than approximately 30 feet to accommodate the modification of Prairie Avenue. Additionally, to accommodate the vertical circulation elements from the Station to the ground level, approximately 75 feet of local encroachment is anticipated. This encroachment will alter the original dimensions of the site. Despite this alteration, the parking lot will retain its overall character as an expansive, on-grade, asphalt-paved parking area surrounding the Forum building on all sides.

Additionally, the Project includes new construction of support columns for the APM guideway on the Forum site. These support columns will be constructed within or immediately adjacent to the public right-of-way of the newly relocated sidewalk on the east side of Prairie Avenue. These columns will be situated along the property's western edge, and thus there will be a substantial physical distance between the new construction and the Forum building itself. Thus, the Project will not alter the

relationship between the Forum building and its immediate surroundings in any meaningful way.

The motorist's view of the Forum from Prairie Avenue looking east will be partially obscured by the new construction. However, pedestrian views from the new sidewalk on the east side of Prairie will remain largely intact with only minimal impairment. Views of the Forum building looking south from Manchester will remain unimpaired. Overall, the new construction will not block or obscure important views of the Forum building, as there will remain multiple vantage points from which the building can be observed without obstruction. The Forum site will retain its essential character as a large circular structure set at the center of a sprawling, generally open site with largely unobstructed views from all sides.

Because the Project will not physically alter the Forum building; will not block or obscure important views of the Forum building; and will only alter a portion of the Forum parking lot; the Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Forum will continue to convey its historic significance as a 1960s New Formalist-style arena in Inglewood. Therefore, direct impacts to the Forum as a result of the Project will be less than significant.

150 S. Market Street (former People's Federal Building & Loan Association)

The former People's Federal Building & Loan Association building is located within the Project Area. The building is situated along the APM alignment at the northeast corner of Market Street and Manchester Boulevard. As described above, the Project will construct an elevated APM guideway set on support columns within the public rights-of-way of Market Street and Manchester Boulevard. Traveling southbound, the APM guideway will run along Market Street south to Manchester Boulevard, where it will make a ninety-degree left-hand turn to continue east on Manchester.[99]

Due to the existing conditions at the intersection of Market and Manchester, and the requirements of the new constriction, the APM guideway and/or support columns may touch the property on the northeast corner. Existing conditions include the relative narrowness of Market Street, the required width of the guideway, the required turning radius of the guideway, and the absence of front and side building setbacks on Market Street and Manchester Boulevard. For the purpose of this report, it is presumed that the Project will acquire this property and demolish the former People's Federal Building & Loan Association building.

Because the Project is presumed to demolish the former People's Federal Building & Loan Association building, the Project will result in a significant impact to the historical

[99] Traveling northbound, the APM guideway will run along Manchester Boulevard west to Market Street, where it will make a right-hand turn to continue north on Market.

resource. The demolition of a historical resource cannot be mitigated to a less than significant level.

7.3 Analysis of Indirect Impacts

This section analyzes the potential for the Project to have an indirect impact on any historical resources under CEQA. As discussed above, the significance of a historical resource is materially impaired, and constitutes a substantial adverse change in the significance of that historical resource, if the project would materially alter in an adverse manner those physical characteristics of the resource or its immediate surroundings that convey its historical significance and justify its inclusion in the California Register, local register, or historical resource survey. The significance of a historical resource may be materially impaired through project impacts both direct and indirect. Thus, the potential for this Project to impact a historical resource, either directly or indirectly, is analyzed.

As described above, much of the Project will be constructed within the public right-of-way,[100] including the elevated APM guideway set on support columns, and three APM Stations. An Expanded Study Area has been defined to encompass what is expected to be the maximum extent within which project impacts will occur. The Expanded Study Area includes all parcels fronting the alignment right-of-way on both sides. In addition, where there will be substantial new construction outside of the alignment right-of-way, parcels immediately adjacent to or across from the new construction have been included in the Expanded Study Area. This includes parcels adjacent to or across from the block where the Market Street Station would be constructed; parcels adjacent to or across from the Maintenance & Storage Facility site; the site where the pedestrian bridge will land; and the two Traction Power Substation sites. The Project has the potential to indirectly impact historical resources within the Expanded Study Area.

This report has identified six (6) historical resources within the Expanded Study Area that could be indirectly impacted by the Project. Potential impacts to each of these resources are described below.

320-330 E. Manchester Boulevard (Bank of America)

The Bank of America building is located within the Expanded Study Area for the Project. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Manchester Boulevard, between Market Street and Prairie Avenue. The Bank of America building is located on the south side of Manchester Boulevard, immediately adjacent to where the new APM guideway will be located.

[100] The public right-of-way extends to the front property line on each side of the street, including the roadway and sidewalks.

The Project will not physically alter the Bank of America building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to this resource, potentially altering the way in which the Bank of America building will be viewed and experienced by pedestrians and motorists. Specifically, views of the building from the north side of Manchester—a critical vantage point from which to observe the building's overall scale, massing, and composition—have the potential to be obstructed by the new construction. The building's historic significance is conveyed through its two publicly visible facades, on Manchester Boulevard (primary) and Locust Street (secondary). The Project will be located along Manchester Boulevard, and has the potential to interfere with views of the primary façade of the Bank of America building. The building's secondary façade along Locust Street will not be obscured by the Project.

The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of the Bank of America building. The edge of the guideway will be approximately 17 feet from the façade of the Bank of America building. The bottom of the APM guideway will be elevated 35 feet above the roadway at this point along the alignment. The Bank of America building measures approximately 28 feet in height; thus, the guideway will clear the top of the building by approximately seven feet. Because the guideway will be a substantial distance away from the Bank of America building's façade, and positioned a substantial distance higher than the building, it will not obscure important views of the building's primary façade when viewed from the north side of Manchester.

Additionally, the guideway will be carried by straddle-bent supports positioned along Manchester Boulevard, three of which will be located in front of or immediately adjacent to the Bank of America building. The straddle-bent columns will be approximately six feet in diameter and spaced between 67.5 and 80 feet apart. The closest columns to the Bank of American Building will be approximately 20 feet from the building's primary façade.

Because three straddle-bent supports will sit in front of or immediately adjacent to the Bank of American building, portions of the building's primary facade will be intermittently obscured depending on the position of the viewer. The columns will be six feet wide in diameter and spaced at least 67 feet apart, however, so only very limited portions of the Bank of America building's primary façade will be obstructed when viewed from Manchester Boulevard. Those portions of the building's façade that will be obscured will be minor in comparison to the façade's total size, the majority of which will remain visible. Ultimately, the building's scale, massing, and overall composition will remain readily discernable to the viewer despite some minor interruption of views.

Because the APM guideway will be located seven feet above the top of the Bank of American Building and the straddle-bent supports carrying the guideway will only obscure small portions of the building's primary façade, the Project will not obscure or interfere with views of the building such that its physical from and architectural style cannot be discerned. After construction of the Project, the ability of the Bank of America to convey its historic significance as a 1940s Moderne style bank building will not be substantially impaired. Therefore, indirect impacts to the Bank of America building as a result of the Project will be less than significant.

100 N. Market St/307 E Queen Street (former Bank of Inglewood)

The former Bank of Inglewood building is located within the Expanded Study Area. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Regent Street and Manchester Boulevard. The former Bank of Inglewood building is located on the west side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the former Bank of Inglewood building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, potentially altering the way in which the former Bank of Inglewood will be viewed and experienced by pedestrians and motorists. Specifically, views of the building from the east side of Market Street—an important vantage point from which to observe the building's primary façade and main entry—has the potential to be obstructed by the new construction. The building's historic significance is conveyed through its two publicly visible facades, on Market Street (primary) and Queen Street (secondary). The Project will be located along Market Street, and has the potential to interfere with views of the primary façade of the Bank of Inglewood building. The building's secondary façade along Queen Street will not be obscured by the Project.

The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of the Bank of Inglewood building. The edge of the guideway will be approximately 26 feet from the building's façade. The bottom of the APM guideway will be elevated 40 feet above the roadway at this point along the alignment. The Bank of Inglewood building measures approximately 33 feet in height; thus, the guideway will clear the top of the building by approximately seven feet. Because the guideway will be a substantial distance away from the Bank of Inglewood's façade, and positioned a substantial distance higher than the building, it will not obscure important views of the building's primary façade when viewed from the west side of Market Street.

Additionally, the guideway will be carried by single columns positioned in the center of Market Street, one of which will be located in front of or immediately adjacent to the

Bank of Inglewood building. In plan, the column will be an oblong shape approximately 6 by 9 feet in diameter (for dual guideway in symmetrical guideway structure) in a median. The closest column will be approximately 46.9 feet from the building's primary façade.

Because a single column will sit in front of or immediately adjacent to the Bank of Inglewood building, a portion of the building's primary facade will be intermittently obscured depending on the position of the viewer. The column will be 6 feet by 9 feet in width, however, so a limited portion of the Bank of Inglewood building's primary façade will be obstructed when viewed from Market Street. The larger south façade facing Queen Street will remain unobstructed, and columns will be placed so that the important corner view of the building which takes in both the east and south facades will be maintained. Those portions of the building's façade that will be obscured will be minor in comparison to the overall size of the building, the majority of which will remain visible. Ultimately, the building's scale, massing, and overall composition will remain readily discernable to the viewer despite some interruption of views.

Because the APM guideway will be located seven feet above the top of the Bank of Inglewood Building and the support column carrying the guideway will only obscure a portion of the building's primary façade, the Project will not obscure or interfere with views of the building such that its physical from and architectural style cannot be discerned. After construction of the Project, the ability of the Bank of Inglewood building to convey its historic significance as a 1920s Mediterranean Revival-style bank building will not be substantially impaired. Therefore, indirect impacts to the Bank of Inglewood building as a result of the Project will be less than significant.

115 N. Market Street (former Fox Theater)

The former Fox Theater building is located within the Expanded Study Area. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Regent Street and Manchester Boulevard. The former Fox Theater building is located on the west side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the former Fox Theater building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, potentially altering the way in which the former Fox Theater will be viewed and experienced by pedestrians and motorists. The building's historic significance is conveyed through its Market Street façade, which is its only publicly visible façade. The Project will be located along Market Street, and has the potential to interfere with views of the primary façade of the Fox Theater building.

The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of the Fox Theater. The edge of the guideway will be approximately 15 feet from the building's projecting theater marquee, which overhangs the sidewalk. The guideway will be carried by single columns positioned in the center of Market Street, although no column will be placed directly in front of or immediately adjacent to the Fox Theater. The main volume of the Fox Theater building measures approximately 38 feet tall, with its vertical sign pylon—an important component of the building's design—rising to a height of approximately 70 feet. In contrast, the bottom of the APM guideway will be elevated approximately 40 feet above the roadway at this point in the alignment, with the top of the guideway rising to approximately 48 feet. This will place an 8-foot-tall horizontal structure directly in front of the sign pylon, visually obscuring a portion of the sign pylon, and creating a visual separation between the uppermost portion of the pylon and the lower portion of the building containing the theater marquee and public entrance.

Due to the APM guideway interrupting views of the upper portion of the Fox Theater, including obscuring its important sign pylon, the Project will block and/or obscure important views of the building's primary façade. Specifically, views of the building from the east side of Market—a critical vantage point from which to observe the building's overall scale, massing, and composition—will be obstructed by the new APM guideway. Moreover, vantage points from which to achieve unobstructed views of the building's primary façade will largely be limited to the sidewalk directly in front of the building. Because the building is set at the sidewalk, it is difficult to appreciate the building's overall design from this perspective.

Because the Project will block and/or obscure important views of the former Fox Theater building's primary façade, and will considerably limit the vantage points from which the building can be observed without obstruction, the Project will result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the ability of the former Fox Theater to convey its historic significance as a 1940s Late Moderne-style movie theater building will be impaired. Therefore, indirect impacts to the former Fox Theater building as a result of the Project will be significant.

158-170 N. Market Street (former United Bank of California)

The former United Bank of California building is located within the Expanded Study Area. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Regent Street and Manchester Boulevard. The former United Bank of California building is located on

the east side of Market Street, immediately adjacent to where the new APM guideway will be located.[101]

The Project will not physically alter the former United Bank of California building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, potentially altering the way in which the former United Bank of California will be viewed and experienced by pedestrians and motorists. Specifically, views of the building from the west side of Market Street—an important vantage point from which to observe the building's primary façade and main entry—has the potential to be obstructed by the new construction. The building's historic significance is conveyed through its two publicly visible facades, on Market Street (primary) and Regent Street (secondary). The Project will be located along Market Street, and has the potential to interfere with views of the primary façade of the United Bank of California building. The building's secondary façade along Regent Street will not be obscured by the Project.

The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of the United Bank of California building. The edge of the guideway will be approximately 27 feet from the building's façade, and approximately 17 feet from the building's projecting entry canopy which overhangs the sidewalk. The bottom of the APM guideway will be elevated 42 feet above the roadway at this point along the alignment. The United Bank of California building measures approximately 23 feet in height; thus, the guideway will clear the top of the building by approximately 19 feet. Because the guideway will be a substantial distance away from the United Bank of California's façade, and positioned a substantial distance higher than the building, it will not obscure important views of the building's primary façade when viewed from the west side of Market Street.

Additionally, the guideway will be carried by single columns positioned in the center of Market Street, one of which will be located in front of or immediately adjacent to the United Bank of California building. In plan, the column will be an oblong shape approximately 6 feet by 9 feet in diameter. The closest column will be approximately 40.5 feet from the building's primary façade.

Because two columns will sit in front of or immediately adjacent to the United Bank of California building, a portion of the building's primary facade will be intermittently obscured depending on the position of the viewer. The column will be 6 feet by 9 feet in width, however, so a limited portion of the United Bank of California building's primary façade will be obstructed when viewed from Market Street. The north façade facing Regent Street will remain unobstructed. Those portions of the building's façade

[101] The drive-thru automated teller building across the street is not considered part of the bank building.

that will be obscured will be minor in comparison to the overall size of the building, the majority of which will remain visible. Ultimately, the building's scale, massing, and overall composition will remain readily discernable to the viewer despite some interruption of views.

Because the APM guideway will be located 19 feet above the top of the United Bank of California building and the support column carrying the guideway will only obscure a portion of the building's primary façade, the Project will not obscure or interfere with views of the building such that its physical from and architectural style cannot be discerned. After construction of the Project, the ability of the United Bank of California building to convey its historic significance as a 1960s Late Modern-style bank building will not be substantially impaired. Therefore, indirect impacts to the United Bank of California building as a result of the Project will be less than significant.

129-139 S. Market Street (former J.C. Penney)

The former J.C. Penney building is located within the Expanded Study Area. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Regent Street and Manchester Boulevard. The former J.C. Penney building is located on the west side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the former J.C. Penney building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a new physical structure immediately in front of and within close proximity to the buildings along Market Street, potentially altering the way in which the former J.C. Penney will be viewed and experienced by pedestrians and motorists. Specifically, views of the building from the east side of Market Street—an important vantage point from which to observe the building's primary façade and main entry—has the potential to be obstructed by the new construction. The building's historic significance is conveyed through its Market Street façade, which is its only publicly visible façade. The Project will be located along Market Street, and has the potential to interfere with views of the primary façade of the J.C. Penney building.

The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of the J.C. Penney building. The edge of the guideway will be approximately 30 feet from the building's façade. The bottom of the APM guideway will be elevated 40 feet above the roadway at this point along the alignment. The J.C. Penney building measures approximately 30 feet in height; thus, the guideway will clear the top of the building by approximately ten feet. Because the guideway will be a substantial distance away from the J.C. Penney building's façade, and positioned a substantial distance higher than the building, it will not obscure important views of the building's primary façade when viewed from the east side of Market Street.

Additionally, the guideway will be carried by single columns positioned in the center of Market Street, one of which will be located in front of or immediately adjacent to the J.C. Penney building. In plan, the column will be an oblong shape approximately 6 feet by 9 feet in diameter. The closest column will be approximately 43.8 feet from the building's primary façade.

Because one column will sit in front of or immediately adjacent to the J.C. Penney building, a portion of the building's primary facade will be intermittently obscured depending on the position of the viewer. The column will be 6 feet by 9 feet in width, however, so only a limited portion of the J.C. Penney building's primary façade will be obstructed when viewed from Market Street. The portion of the building's façade that will be obscured will be minor in comparison to the overall size of the building, the majority of which will remain visible. Ultimately, the building's scale, massing, and overall composition will remain readily discernable to the viewer despite some interruption of views.

Because the APM guideway will be located ten feet above the top of the J.C. Penney building and the support column carrying the guideway in front of the building will only obscure a portion of the building's primary façade, the Project will not obscure or interfere with views of the building such that its physical from and architectural style cannot be discerned. After construction of the Project, the ability of the J.C. Penney building to convey its historic significance as a 1950s Mid-Century Modern-style department store building will not be substantially impaired. Therefore, indirect impacts to the J.C. Penney building as a result of the Project will be less than significant.

149-155 S. Market Street/231-239 E Manchester Boulevard (Professional Building)

The Professional Building is located within the Expanded Study Area. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Regent Street and Manchester Boulevard. The Professional Building is located on the west side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the Professional Building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a new physical structure immediately in front of and within close proximity to the buildings along Market Street, potentially altering the way in which the Professional Building will be viewed and experienced by pedestrians and motorists. Specifically, views of the building from the east side of Market Street—an important vantage point from which to observe the building's primary façade and main entry—has the potential to be obstructed by the new construction. The building's historic significance is conveyed through its two publicly visible facades, on Market Street (primary) and Manchester Boulevard (secondary). The Project will be located along Market Street, and has the potential to

interfere with views of the primary façade of the Professional Building. The building's secondary façade along Manchester Boulevard will not be obscured by the Project.

The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of the Professional Building. The edge of the guideway will be approximately 30 feet from the building's façade. The bottom of the APM guideway will be elevated 40 feet above the roadway at this point along the alignment. The Professional Building measures approximately 32 feet in height; thus, the guideway will clear the top of the building by approximately eight feet. Because the guideway will be a substantial distance away from the Professional Building's façade, and positioned a substantial distance higher than the building, it will not obscure important views of the building's primary façade when viewed from the east side of Market Street.

Additionally, as the guideway makes its turn at Market Street and Manchester Boulevard, the columns will be placed on the opposite (east) side of the Market Street and on Manchester Boulevard. Because no columns will sit in front of or immediately adjacent to the Professional Building, the building's primary facade will not be obscured when viewed from the east side of Market Street. Ultimately, the building's scale, massing, and overall composition will remain readily discernable to the viewer with no interruption of views.

Because the APM guideway will be situated eight feet above the top of the Professional Building, and the building's primary façade will not be obscured by support columns, the Project will not obscure or interfere with views of the building such that its physical from and architectural style cannot be discerned. After construction of the Project, the ability of the Professional Building to convey its historic significance as a 1920s Spanish Colonial Revival-style commercial building will not be substantially impaired. Therefore, indirect impacts to the Professional Building as a result of the Project will be less than significant.

7.4 Analysis of No Impact

This report has identified three (3) historical resources within the Expanded Study Area that will not be impacted by the Project, either directly or indirectly. Potential impacts to each of these resources, or lack thereof, are described below.

260 N. Locust Street (Holy Faith Episcopal Church)

The Holy Faith Episcopal Church property is located within the Expanded Study Area. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Regent Street and Manchester Boulevard. North of Regent, the APM guideway will bear northeast off of the public right-of-way and onto the block bounded by Market Street, Florence Avenue, Locust Street, and Regent Street. This block will be acquired, and the existing one-story shopping center and restaurant buildings demolished to accommodate new

construction of the elevated APM guideway and Market Street Station. The Holy Faith Episcopal Church property is situated across Locust Street from this block.

The Project will not physically alter the Holy Faith Episcopal Church property in any way. The buildings will remain in their original locations and will retain all of their significant character-defining features and materials. The Project will erect substantial new physical structures across the street from the Holy Faith Episcopal Church property, thereby changing its physical surroundings to the west. However, the new construction will be separated from the Holy Faith Episcopal Church property by the width of a residential street, and thus will not interfere with existing visual and/or spatial relationships between the property and its immediate surroundings. The new construction will not block or obscure important views of the church property. Due to the physical separation between the church property and the new construction, views of the historical resource from the surrounding streets and sidewalks will not be altered.

Moreover, the existing development to be demolished has no historical relationship to the church property, which predates it by some five decades. The existing development largely turns its back to buildings on Locust Street, including the church property, with most of the shopping center buildings oriented onto the surface parking lot to the west. The church property's surroundings have evolved over time, as this is a densely developed urban area comprising a wide range of building types and uses dating from various periods of development. The buildings to be demolished do not contribute to the understanding of the significance of the historical resource, therefore their demolition will not alter the way in which the church property will be viewed or experienced.

Because the Project will not physically alter the Holy Faith Episcopal Church property, will not block or obscure important views, and will not alter its surroundings in any meaningful way, the Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Holy Faith Episcopal Church property will continue to convey its historic significance as an early 20th-century Late Gothic Revival-style religious complex in Inglewood. Therefore, there will be no impact to the Holy Faith Episcopal Church property as a result of the Project.

619-635 S. Prairie Avenue (Lighthouse McCormick Mortuary)

The Lighthouse McCormick Mortuary property is located within the Expanded Study Area. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Prairie Avenue between Manchester Boulevard and Hardy Street. The Lighthouse McCormick Mortuary property is located on the west side of Prairie Avenue, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the Lighthouse McCormick Mortuary property in any way. The building will remain in its original location and will retain all of its

significant character-defining features and materials. The Project will erect a new physical structure immediately in front of the mortuary property, thereby changing its physical surroundings to the east. The APM guideway will be elevated above the roadway and sidewalks, passing in front of the mortuary building. The bottom of the APM guideway will be elevated 60 feet above the roadway at this point along the alignment, clearing the mortuary building by approximately 10 feet. Because the guideway will be positioned a substantial distance higher than the mortuary building, it will not obscure important views of the building's primary façade when viewed from Prairie Avenue.

Additionally, support columns will be placed on the sidewalk in front of the building. As a result, some views of the mortuary building will be obstructed by the new construction. However, the mortuary's primary façade is set back from the sidewalk behind a front lawn, and thus there will be a physical separation between the building and the new construction. Due to this separation, full views of the mortuary building from multiple vantage points will remain unimpaired. Views of the mortuary building from the west side of Prairie Avenue and from La Palma Drive will not be altered. Views of the mortuary building from the east side of Prairie Avenue will be obscured by the APM support columns; however, these views are not critical to understanding the significance of the historical resource. Additionally, the Prairie/Pincay Station will be located within the Prairie Avenue right-of-way to the north of the mortuary building. However, the southern end of the station will be situated approximately a half-block north of the mortuary building. As this new construction will be at a considerable distance from the resource, it will not obscure important views of the building's primary façade.

Moreover, the mortuary property's surroundings have evolved over time, as this is a densely developed urban area comprising a wide range of building types and uses dating from various periods of development. The addition of the APM along Prairie Avenue will not alter the way in which the mortuary church property will be viewed or experienced, and will not interfere with existing visual and/or spatial relationships between the property and its surroundings in any meaningful way.

Because the Project will not physically alter the Lighthouse McCormick Mortuary property, will not block or obscure important views, and will not alter its surroundings in any meaningful way, the Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Lighthouse McCormick Mortuary property will continue to convey its historic significance as a mid-20th century American Colonial Revival-style mortuary building in Inglewood. Therefore, there will be no impact to the Lighthouse McCormick Mortuary property as a result of the Project.

720 E. Florence Avenue (Inglewood Park Cemetery)

The Inglewood Park Cemetery property is located within the Expanded Study Area. The cemetery is situated along the APM alignment at the northeast corner of Manchester Boulevard and Prairie Avenue. As described above, the Project will construct an elevated APM guideway set on support columns within the public rights-of-way of Manchester Boulevard and Prairie Avenue. Traveling southbound, the APM guideway will run along Manchester Boulevard east to Prairie Avenue, where it will make a right-hand turn to continue south on Prairie.[102]

The Project will not physically alter the Inglewood Park Cemetery property in any way. The cemetery will remain in its original location and will retain all of its significant character-defining features and materials. The Project will erect a new physical structure immediately adjacent to the cemetery property, thereby changing its physical surroundings to the southwest. However, The Project will not block or obscure important views of the cemetery property. The APM will run along Manchester Boulevard west of the cemetery, and along Prairie Avenue south of the cemetery. Thus, the APM will not run along the perimeter of the cemetery property at any point. At the intersection of Manchester and Prairie, the AMP will make a turn, touching the parcel at the southwest corner; the cemetery property is situated at the northeast corner. Thus, there will be a physical separation between the cemetery property and the new construction. At the intersection, support columns for the guideway will be placed on the sidewalk at the northwest, southwest, and southeast corners; no support columns will be placed at the northeast corner. Full views of the cemetery property from multiple vantage points along Prairie Avenue and Manchester Boulevard will remain unimpaired.

Moreover, the cemetery property's surroundings have evolved over time, as this is a densely developed urban area comprising a wide range of building types and uses dating from various periods of development. The addition of the APM will not alter the way in which the cemetery property will be viewed or experienced, and will not interfere with existing visual and/or spatial relationships between the property and its surroundings in any meaningful way. Furthermore, the most significant features of the Inglewood Park Cemetery—including the Grace Chapel (1907), Inglewood Mausoleum (1915), Mausoleum of the Golden West (1930s), and main entrance walls and gates—are clustered in the northernmost portion of the cemetery grounds or situated along Florence Avenue, whereas the Project's new construction will be southwest of the cemetery property.

Because the Project will not physically alter the Inglewood Park Cemetery property, will not alter its surroundings in any meaningful way, and will not block or obscure important views, the Project will not result in a substantial adverse change in the

[102] Traveling northbound, the APM guideway will run along Prairie Avenue north to Manchester Boulevard, where it will make a left-hand turn to continue west on Manchester.

significance of the historical resource. After construction of the Project, the Inglewood Park Cemetery will continue to convey its historic significance as an early 20th-century cemetery in Inglewood. Therefore, there will be no impact to the Inglewood Park Cemetery property as a result of the Project.

7.5 Cumulative Impact Analysis

No historic district has been identified within the Project Area or Expanded Study Area. Thus, there is no potential for cumulative impacts to historical resources as a result of the proposed Project. Other projects in the vicinity are responsible for conducting their own CEQA review, including analysis of potential impacts to historical resources.

7.6 Summary of Impacts

To summarize, the Project will result in both direct and indirect impacts to historical resources un CEQA. Of the eleven (11) historical resources identified in the Project Area and/or Expanded Study Area for the Locally Preferred Alternative and/or the Market Street Station Alternative, the Project will have a significant impact on seven (7) resources, and a less than significant impact on one (1) resource. There will be no impact to the remaining three (3) properties as a result of the Project.

Summary List of Impacts

ADDRESS	APN	NAME	NO IMPACT	LESS THAN SIGNIFICANT IMPACT	SIGNIFICANT IMPACT
260 N Locust St	4015026039	Holy Faith Episcopal Church	✓		
320-330 E Manchester Bl	4021013018	Bank of America		✓	
3900 W Manchester Bl	4025001002	The Forum		✓	
100 N Market St/307 E Queen St	4021007024	Vajra Books & Gifts (former Bank of Inglewood)		✓	
115 N Market St	4021008006	Former Fox Theater			✓
158-170 N Market St	4021007012	Broadway Federal Bank (former United Bank of California)		✓	
129-139 S Market St	4021009031	Former J.C. Penney		✓	

ADDRESS	APN	NAME	NO IMPACT	LESS THAN SIGNIFICANT IMPACT	SIGNIFICANT IMPACT
149-155 S Market St/231-239 E Manchester Bl	4021009017	Professional Building		✓	
150 S Market St	4021010015	World Hat & Boot Mart (former People's Federal Building & Loan Association)			✓
619-635 S Prairie Ave	4021038027	Lighthouse McCormick Mortuary (former Hardin & Flanagan Colonial Chapel and Mortuary)	✓		
720 E Florence Ave[103]	4012031930	Inglewood Park Cemetery	✓		

[103] The parcel situated within the Expanded Study Area (APN 4012031930) has no address and contains only a small portion of the Inglewood Park Cemetery property. The vast majority of the cemetery occupies the adjacent parcel at 720 E Florence Avenue (APN 4012031027).

As described above, the Project will have a significant impact on two (2) historical resources under CEQA. These include direct impacts resulting from demolition and indirect impacts from adjacent new construction. Due to the nature of these significant impacts, these impacts cannot be mitigated to a less than significant level, thereby resulting in a substantial adverse change in the significance of those historical resources.

While it may not be possible to mitigate all significant impacts to historical resources to a less than significant level, CEQA requires that all feasible mitigation be undertaken to reduce significant impacts to the extent possible. For this reason, recommended mitigation measures to help reduce significant impacts to each of the historical resources are described below.

8.1 Significant Direct Impacts from Demolition

One (1) historical resource may be demolished as a result of the Project. For the purpose of this report, it is presumed that the Project will acquire the property at 150 S. Market Street and demolish the former People's Federal Building & Loan Association building, thereby resulting in a substantial adverse change in the significance of the historical resource. Demolition of a historical resource is a significant impact that cannot be mitigated to a less than significant level. However, it is recommended that the follow mitigation measure be implemented to reduce the significant impact to the extent possible.

- The former People's Federal Building & Loan Association building shall be documented to HABS Level III prior to demolition. HABS Level III documentation includes a sketch plan, photographs with large-format negatives or exterior and interior views, and the completion of an architectural data form. Copies of the completed HABS documentation shall be archived with the South Central Coast Information Center at California State University, Fullerton, as well as with the Los Angeles Conservancy and the Inglewood Public Library. An additional archival copy of the documentation shall be offered to the Inglewood Historic Preservation Alliance.

8.2 Significant Indirect Impacts from Adjacent New Construction

One (1) historical resource, the former Fox Theater building at 115 N. Market Street, will be indirectly impacted by the Project. Due to the required location and scale of the new construction, and its proximity to the former Fox Theater building, the Project will result in a significant indirect impact that cannot be mitigated to a less than significant level. However, implementation of the following mitigation measures will reduce significant impacts to the fullest extent possible.

- Wherever support columns will come into close proximity to the Fox Theater building, these columns shall be situated as far away as possible from the

building's publicly visible façades; and to the extent possible, the location of the columns shall be shifted to either side of the building rather than directly in front of it, to minimize visual impacts.

- Wherever APM station vertical circulation elements—such as escalators, elevators, and stairs—will come into close proximity to the former Fox Theater building, these elements shall be situated as far away as possible from the building's publicly visible façades; and to the extent possible, the location of these elements shall be shifted to either side of the building rather than directly in front of it, to minimize visual impacts.

APPENDIX B: LIST OF PARCELS IN THE PROJECT AREA AND EXPANDED STUDY AREA

The following is a complete listing of all parcels examined as part of the Project Area and Expanded Study Area for the proposed Project. This includes all parcels fronting the alignment right-of-way on both sides, and all parcels where new construction is proposed—including the Market Street Station site; the site where the pedestrian bridge will land; the Maintenance & Storage Facility (MSF) site; and the two Traction Power Substation sites. Where there will be substantial new construction outside of the alignment right-of-way, parcels immediately adjacent to or across from the new construction are also included.

ADDRESS	APN	DATE	NAME/ DESCRIPTION	ALONG ALIGN-MENT	MSF (site or adjacent)	TPSS	PED BRIDGE

1.0 SUMMARY OF FINDINGS

Historic Resources Group has completed this historical resources technical report to inform environmental review of the proposed Inglewood Transit Connector Project (the Project) under the California Environmental Quality Act (CEQA). The purpose of this report is to determine if historical resources as defined by CEQA are present within the Inglewood Transit Connector project area or immediate vicinity, and to identify potential impacts of the Project to those historical resources and how those impacts might be mitigated.

This report identifies a total of eleven (11) historical resources, including ten (10) resources in the Project Area or Expanded Study Area for the Locally Preferred Alternative, and one (1) additional historical resource under the Market Street Station Alternative. Of these, two (2) are listed in the National Register, and are therefore automatically listed in the California Register; four (4) were previously identified as historic through historic resources surveys, environmental review, or other efforts, and have been re-evaluated as appearing eligible for listing in the National Register and/or California Register; and five (5) were identified through this process and evaluated as appearing eligible for listing in the National Register and/or California Register. All of these properties are considered herein as historical resources for the purposes of CEQA. Therefore, potential impacts of the Project to these properties are analyzed.

As detailed in this report, the Project will result in both direct and indirect impacts to historical resources under CEQA. Of the eleven (11) historical resources identified in the Project Area and/or Expanded Study Area for the Locally Preferred Alternative and/or the Market Street Station Alternative, the Project will have a significant impact on seven (7) resources. These include direct impacts resulting from demolition and new construction, and indirect impacts from adjacent new construction. Due to the nature of these significant impacts, none can be mitigated to a less than significant level, thereby resulting in a substantial adverse change in the significance of those historical resources. Based upon this analysis, this report finds that the Project will have a significant effect on the environment as defined by CEQA.

2.0 PROPOSED PROJECT[1]

Locally Preferred Alternative

Under the Locally Preferred Alternative, the Inglewood Transit Connector (ITC) Project (proposed Project) would develop an automated people mover (APM) system to connect Downtown Inglewood near the Metro Crenshaw/LAX Line to the city's major activity centers including the Forum, the Los Angeles Stadium and Entertainment District (LASED) at Hollywood Park, and the proposed Inglewood Basketball and Entertainment Center (IBEC).

The proposed APM system would be a fully automated, grade-separated train system consisting of an elevated dual-lane guideway, largely contained within the public rights-of-way, running for approximately 1.8 miles for the length of the alignment. The APM guideway would begin on Market Street near the Downtown Inglewood Metro station and proceed south on Market Street, then east on Manchester Boulevard, and turning south on Prairie Avenue until its intersection with Century Boulevard. *[See Figure 1. Project Location Map.]*

The APM guideway would be between 37 and 43 feet above grade, varying in width at track switches and stations. Both lanes of the APM guideway would be situated on one side of the right-of-way in between stations and generally be supported by single columns, then gradually transition to opposite sides of the right-of-way on approach to station platforms where they would be supported by dual columns on both sides of the street. The APM guideway would be approximately 80 feet wide when oriented on opposite sides of the roadway right-of-way and approximately 30 feet wide when situated on one side of the roadway.

The APM system would include up to five stations with proposed locations along Market Street, along Manchester Boulevard, at the Forum, at Hollywood Park, and near Century Boulevard. Stations would generally be sized approximately 300 to 400 feet long and 50 to 100 feet wide, and would include ground, mezzanine, and guideway platform levels. In general, mezzanine levels would be approximately 25 feet high, the guideway platforms would be approximately 50 feet high, and the top of station enclosures would be approximately 75 feet high.

In addition, the proposed Project would include other support facilities including a Maintenance & Storage Facility (MSF) to accommodate storage, maintenance, and cleaning of the APM train cars; an Intermodal Transportation Facility (ITF); and Traction Power Substations (TPSS). For the most part, these support facilities would be located along the alignment and on properties adjacent to the APM system. *[See Figure 2. Project Area Map (Locally Preferred Alternative).]*

[1] Description of the Project as provided by the Applicant.

Market Street Station Alternative

The Market Street Station Alternative would provide for an alternative location for the Market Street APM station and for additional mixed-use development adjacent to the station. This Alternative proposes to locate the Market Street APM station further northeast in closer proximity to the Downtown Inglewood Metro station and on adjacent property at the southeastern corner of Florence Avenue and Market Street. This property is bounded by Florence Avenue, Locust Street, Regent Street, and Market Street and is currently developed as a commercial shopping center. The Market Street Station Alternative would include a pedestrian connection across Florence Avenue connecting to the existing Metro station. Additionally, this Alternative would enable the joint development of approximately 600,000 to 700,000 square feet of mixed use (commercial, hotel, and residential uses) adjacent to the station. *[See Figure 3. Project Area Map (Market Street Station Alternative).]*

Figure 1. PROJECT LOCATION MAP

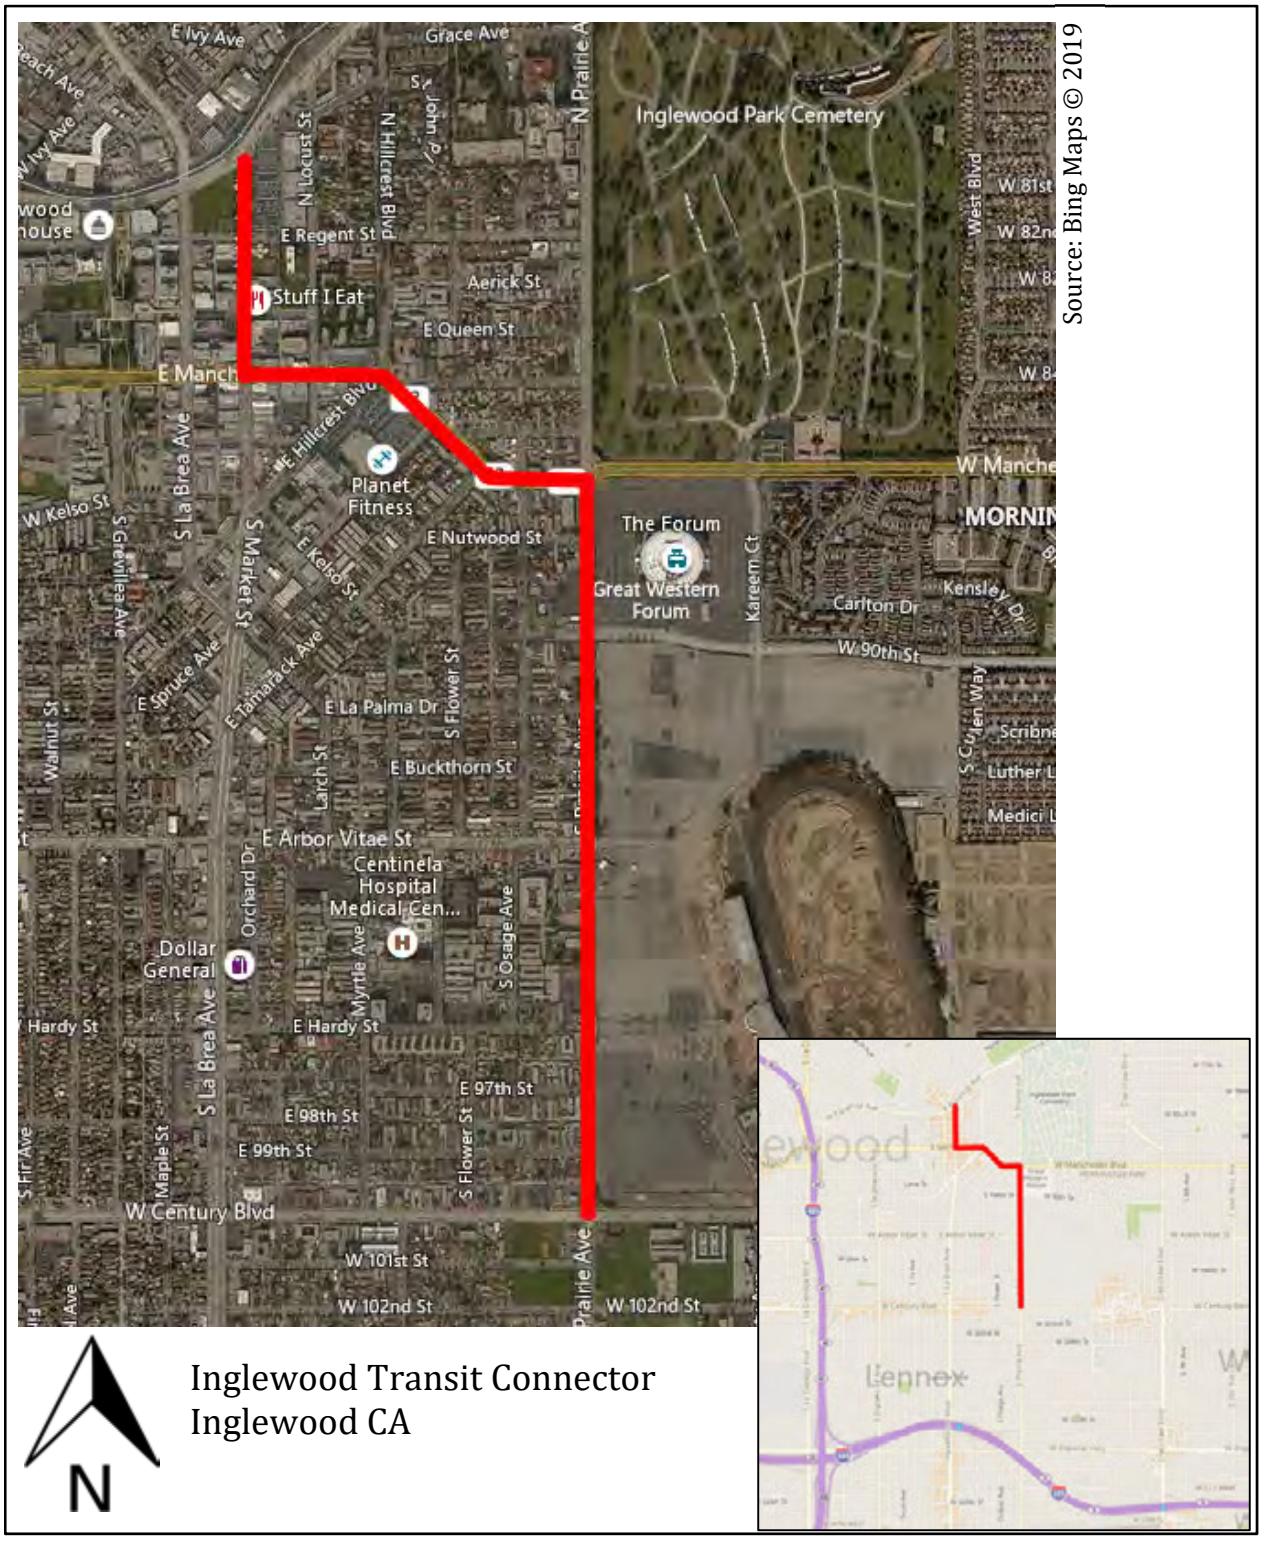

Figure 2. PROJECT AREA MAP (LOCALLY PREFERRED ALTERNATIVE)

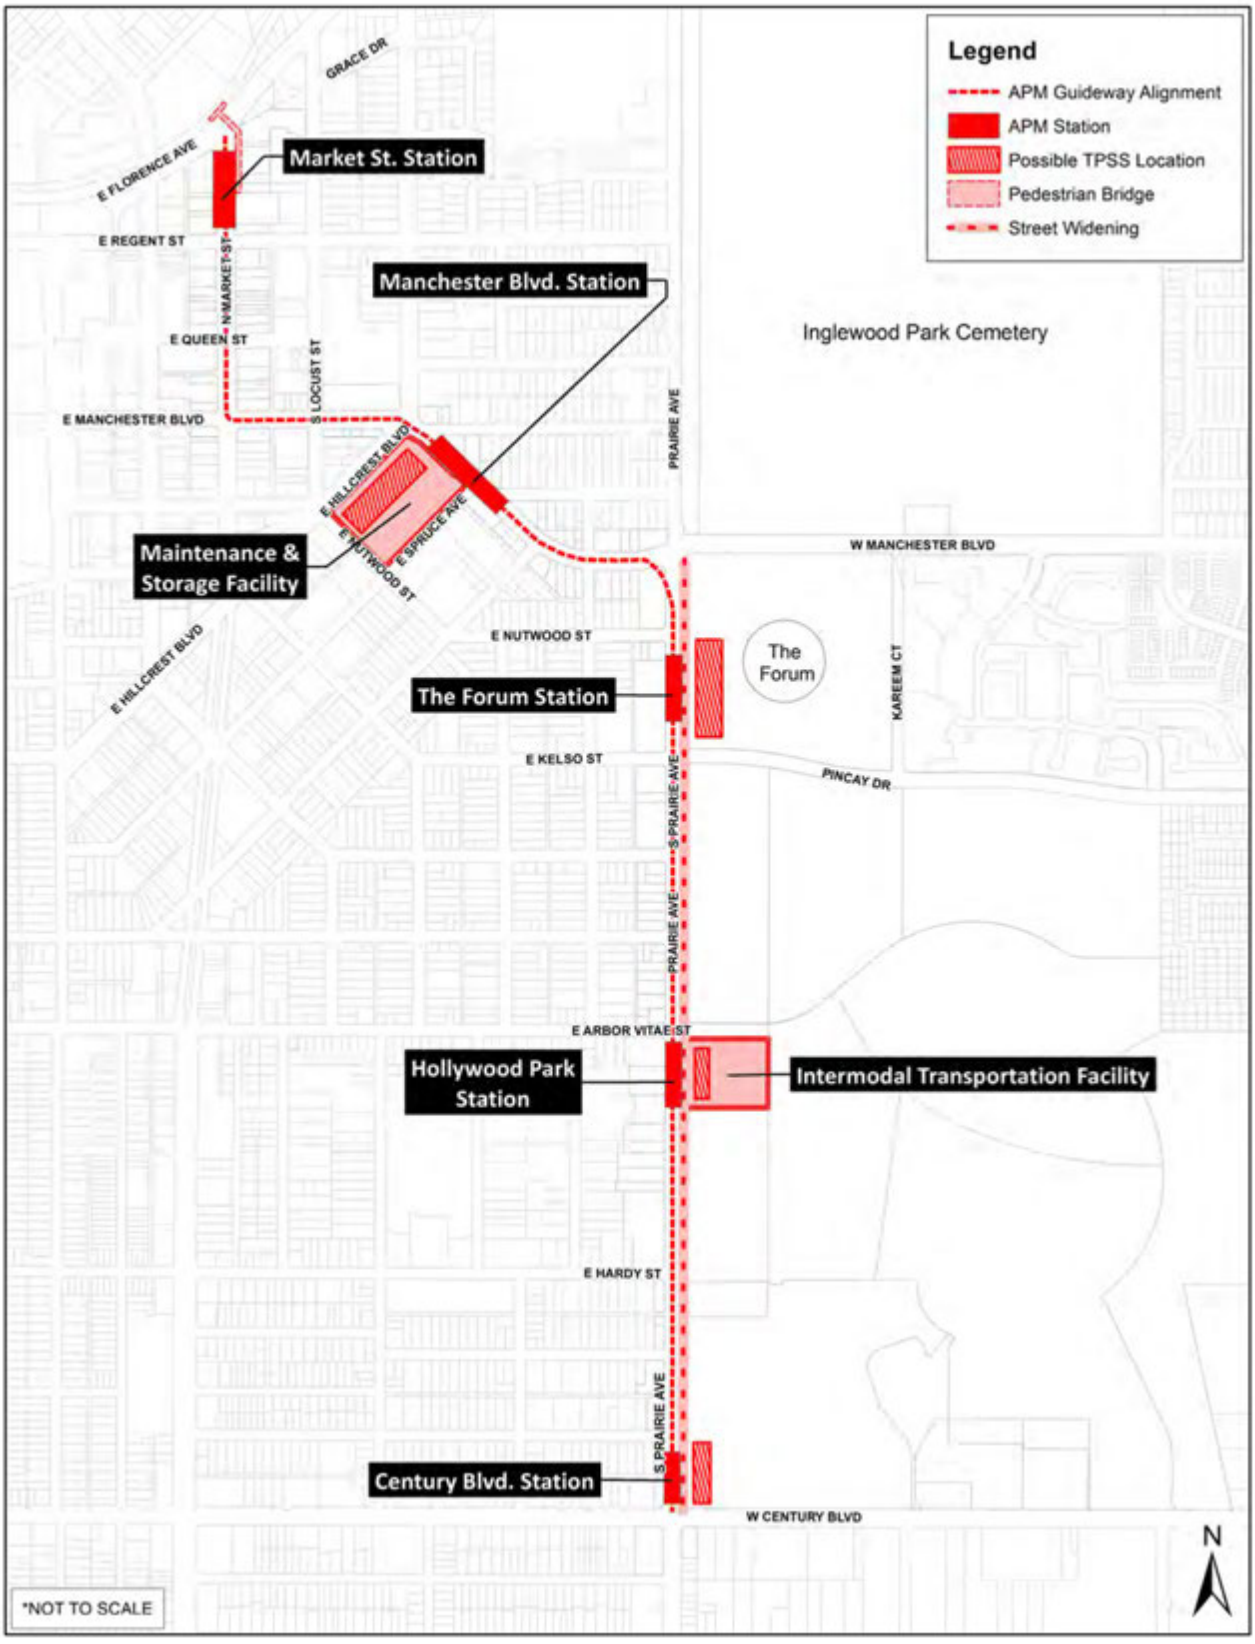

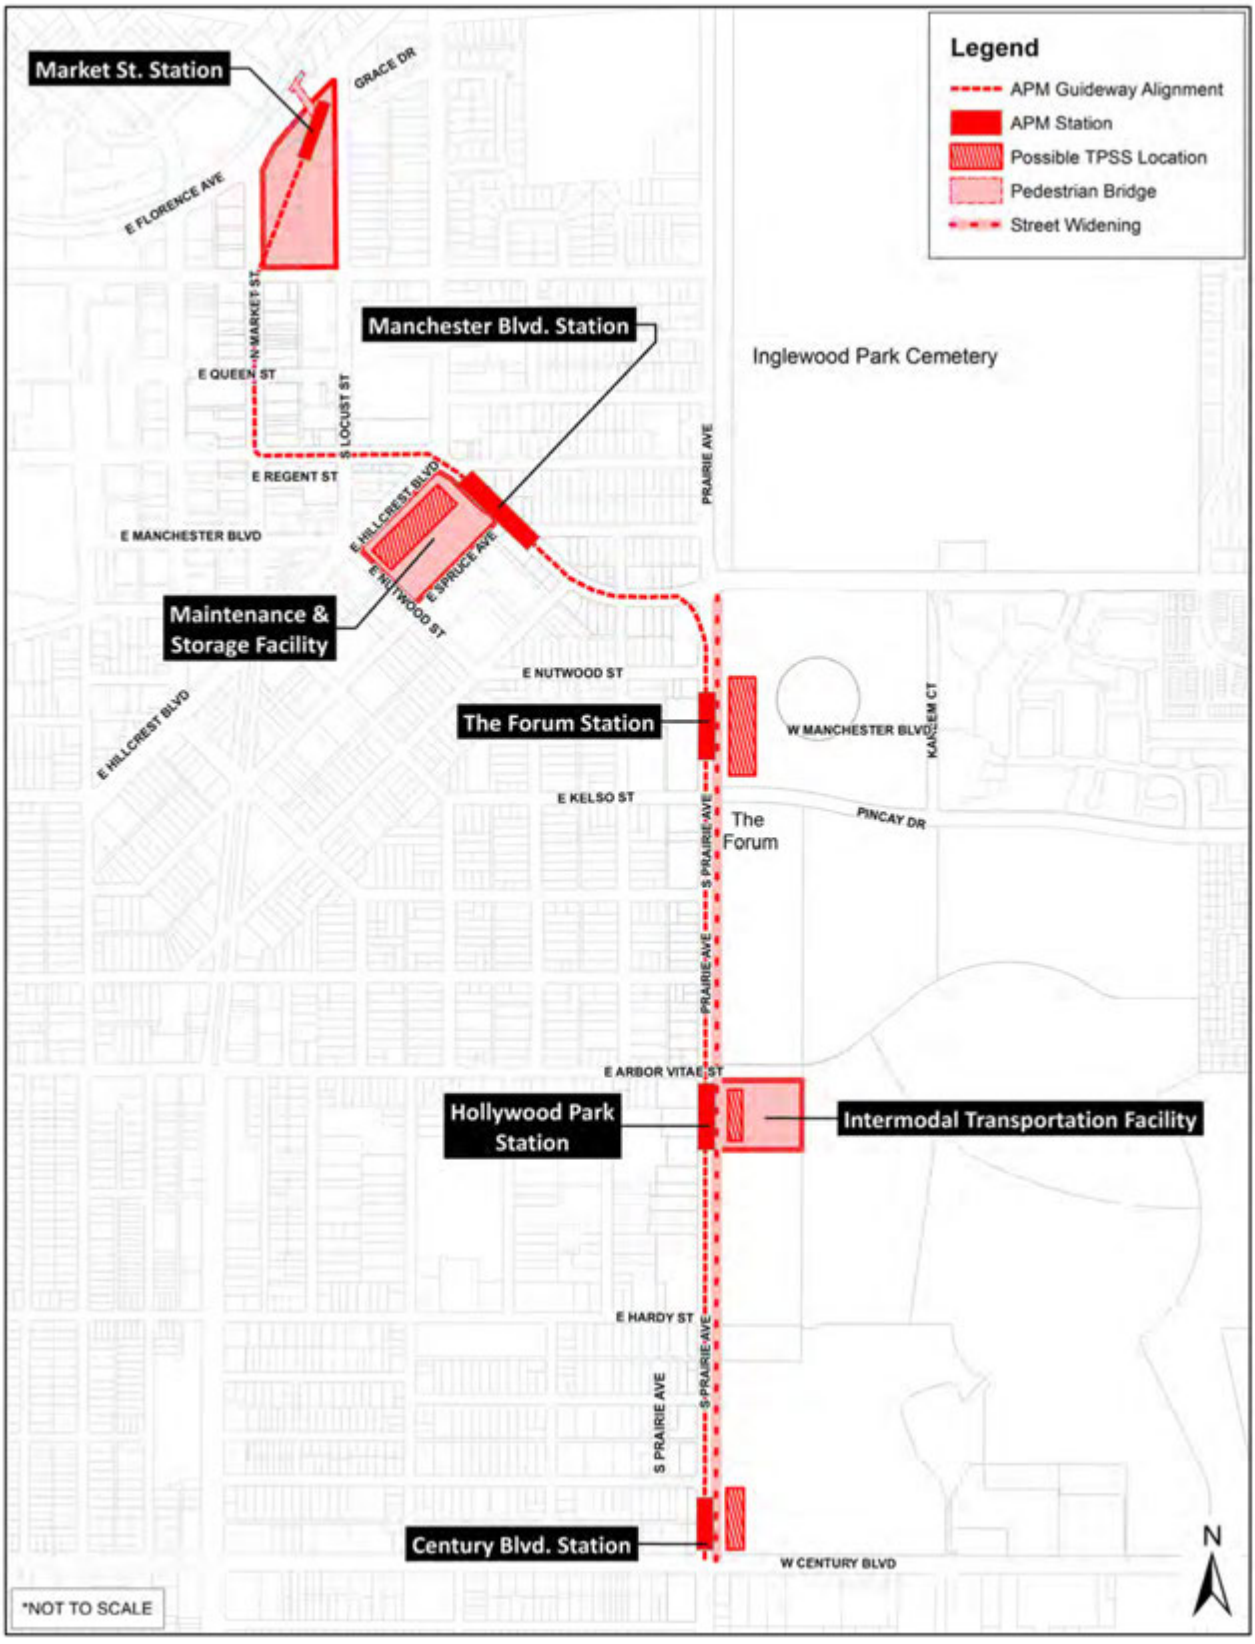

Figure 3. PROJECT AREA MAP (MARKET STREET STATION ALTERNATIVE)

3.0 METHODOLOGY

This report analyzes the Inglewood Transit Connector project's Locally Preferred Alternative, as well as the Market Street Station Alternative. For each of these project scenarios, this report examines the site of the proposed Project (Project Area) and immediately surrounding area (Expanded Study Area) to determine if historical resources are present.

The "Project Area" comprises all areas and parcels where new construction will occur. Under the Locally Preferred Alternative, this includes the public rights-of-way along Market Street, Manchester Boulevard, and Prairie Avenue where the elevated APM guideway and five APM stations will be constructed; parcels east of Market Street between Florence and Regent where vertical circulation elements (escalators, elevators, stairs) for the Market Street Station will land; a parcel north of Florence Avenue where a pedestrian bridge from the Market Street Station will land; the block bounded by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street, and Spruce Avenue where the Maintenance & Storage Facility and possibly a Traction Power Substation will be built, and where vertical circulation elements for the Manchester Boulevard Station will land; parcels east of Prairie Avenue between Manchester and Century where the roadway will be widened to the east; the parcel east of Prairie Avenue between Manchester and Pincay (the Forum property) where a Traction Power Substation may be built and vertical circulation elements for the Forum Station will land; the parcel east of Prairie Avenue and south of Arbor Vitae Street where the Intermodal Transportation Facility and possibly a Traction Power Substation will be built, and where vertical circulation elements for the Hollywood Park Station will land; and the parcel at the northeast corner of Prairie Avenue and Century Boulevard where a Traction Power Substation may be built and vertical circulation elements for the Century Boulevard Station will land.

Under the Market Street Station Alternative, the Project Area also includes the block bounded by Market Street, Florence Avenue, Locust Street, and Regent Street where the elevated APM guideway and Market Street Station would be constructed; and parcels north of Florence Avenue where a pedestrian bridge from the Market Street Station will land.

The "Expanded Study Area" has been defined to encompass what is expected to be the maximum extent within which project impacts will occur. The Expanded Study Area includes all parcels fronting the alignment right-of-way on both sides.[2] In addition, where there will be substantial new construction outside of the alignment right-of-way, parcels immediately adjacent to or across from the new construction have been included in the

[2] The parcel at the northeast corner of Manchester Boulevard and Prairie Avenue is included in the Expanded Study Area because it fronts the alignment right-of-way. While this parcel extends several blocks north of the Project Area to Florence Avenue, project impacts would only be expected in the southernmost portion of the parcel.

Expanded Study Area. This includes parcels adjacent to or across from the Maintenance & Storage Facility site; the Intermodal Transportation Facility site; the sites where the pedestrian bridges will land; and the four possible Traction Power Substation sites. Under the Market Street Station Alternative, this also includes parcels adjacent to or across from the block where the elevated APM guideway and Market Street Station would be constructed. *[See Figure 4. Expanded Study Area Map (Locally Preferred Alternative) and Figure 5. Expanded Study Area Map (Market Street Station Alternative).]*

Where historical resources exist within the Project Area or Expanded Study Area, this report analyzes project impacts for any adverse change in the significance of these resources. In doing so, this report provides a comprehensive review of historical resources that could be impacted, directly or indirectly, by the proposed Project. To this end, this report contains:

- A review of the existing buildings, structures, objects and landscape areas located within the Project Area and Expanded Study Area.
- A review of previous evaluations within the Project Area and Expanded Study Area through historic survey, environmental review, or other official actions.
- Identification and evaluation of historical resources within the Project Area and Expanded Study Area.
- Analysis of potential impacts to historical resources within the Project Area and Expanded Study Area.

For the purpose of this report, properties within the Project Area or Expanded Study Area have been evaluated for their eligibility for listing in the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR).

This report was prepared using primary and secondary sources related to the history and development of the City of Inglewood generally, with an emphasis on the early-20th century central business district that comprises much of the Project Area and Expanded Study Area. Documents that were consulted include:

- Previous historical resources surveys and assessments
- Previous environmental reviews
- City of Inglewood historical building permits[3]
- Los Angeles County Tax Assessor records
- Sanborn Fire Insurance maps
- Historical photographs and aerial images

[3] Analysis in this report is based upon available building permits as provided by the City of Inglewood.

- Historical newspapers and other periodicals
- Local histories and historic context statements
- California State Historic Resources Inventory, Los Angeles County

Research, field inspection, and analysis were performed by Paul Travis, AICP, Managing Principal; and Kari Fowler, Senior Preservation Planner, both of whom are qualified professionals who meet or exceed the *Secretary of the Interior's Professional Qualification Standards*. Additional assistance was provided by Robby Aranguren, Planning Associate/GIS Specialist.

[For a complete listing of all parcels examined as part of the Project Area and Expanded Study Area for the Inglewood Transit Connector Locally Preferred Alternative and Market Street Station Alternative, see Appendix B.]

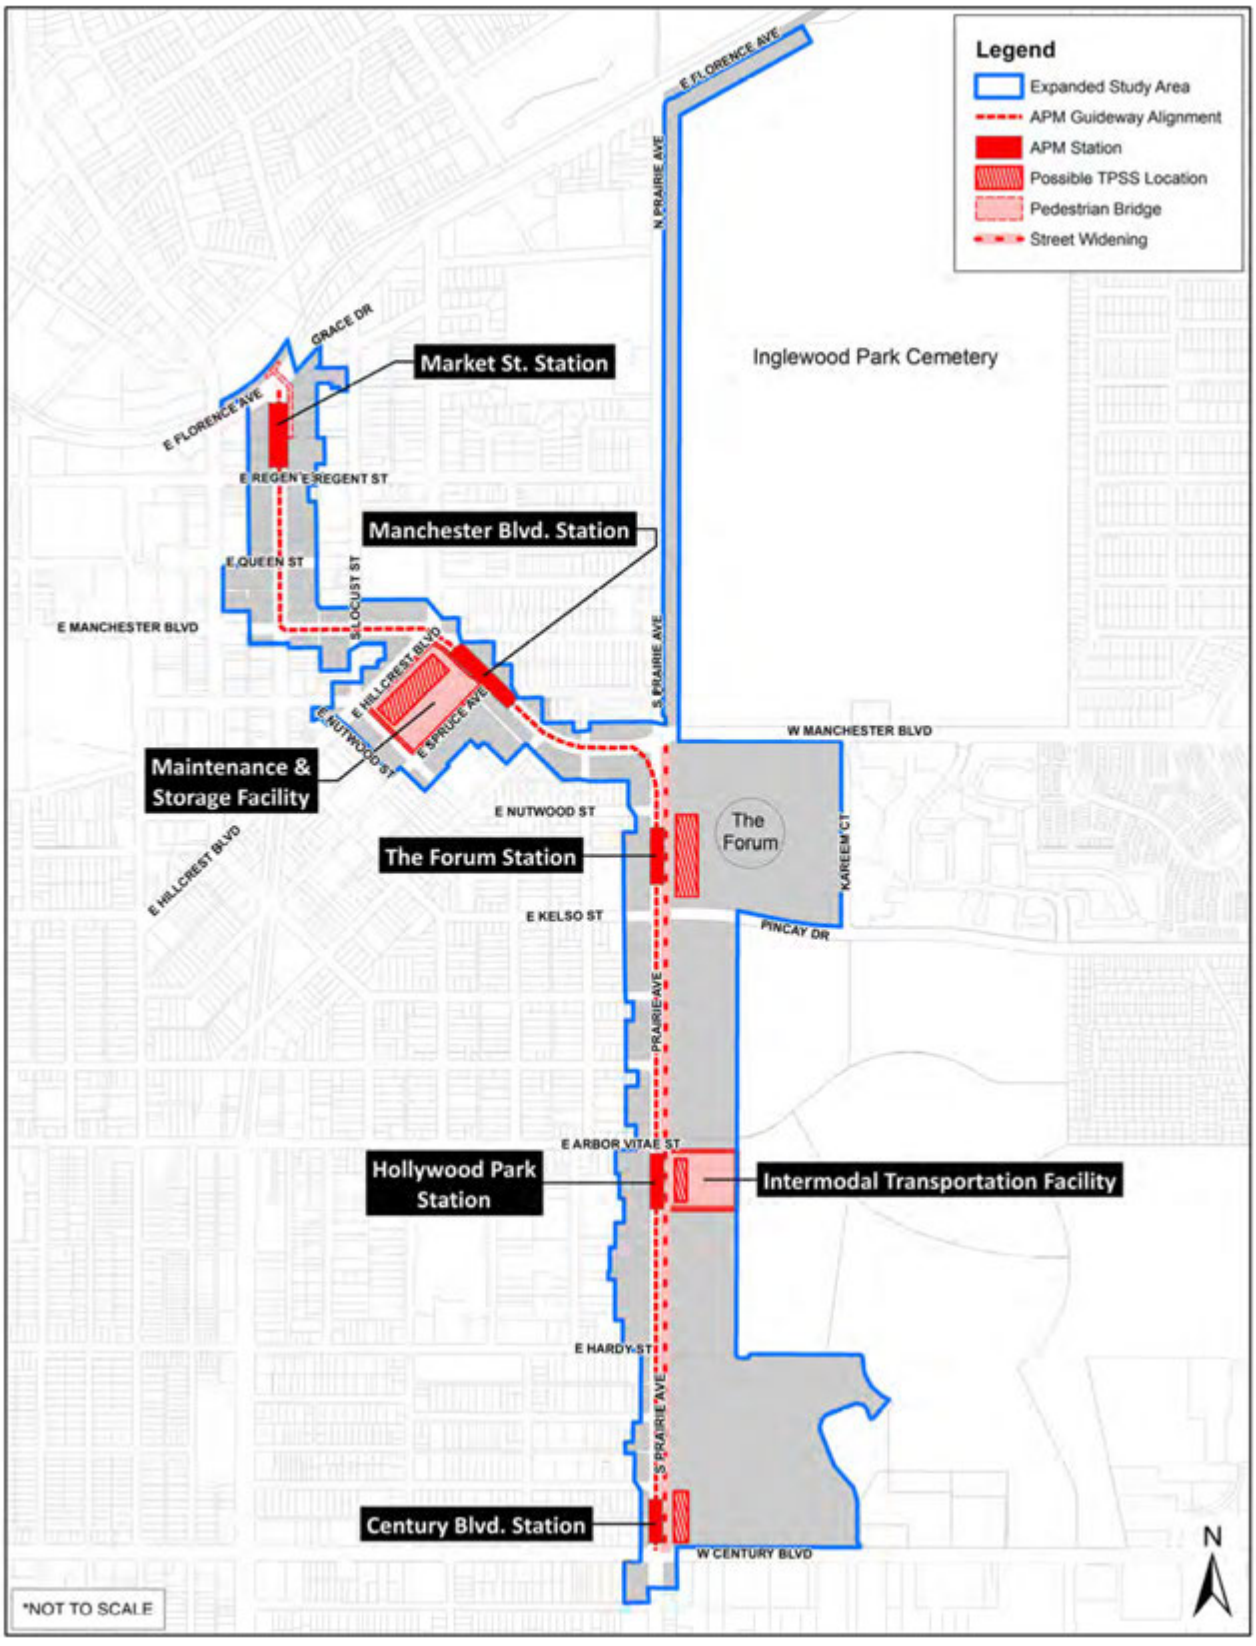

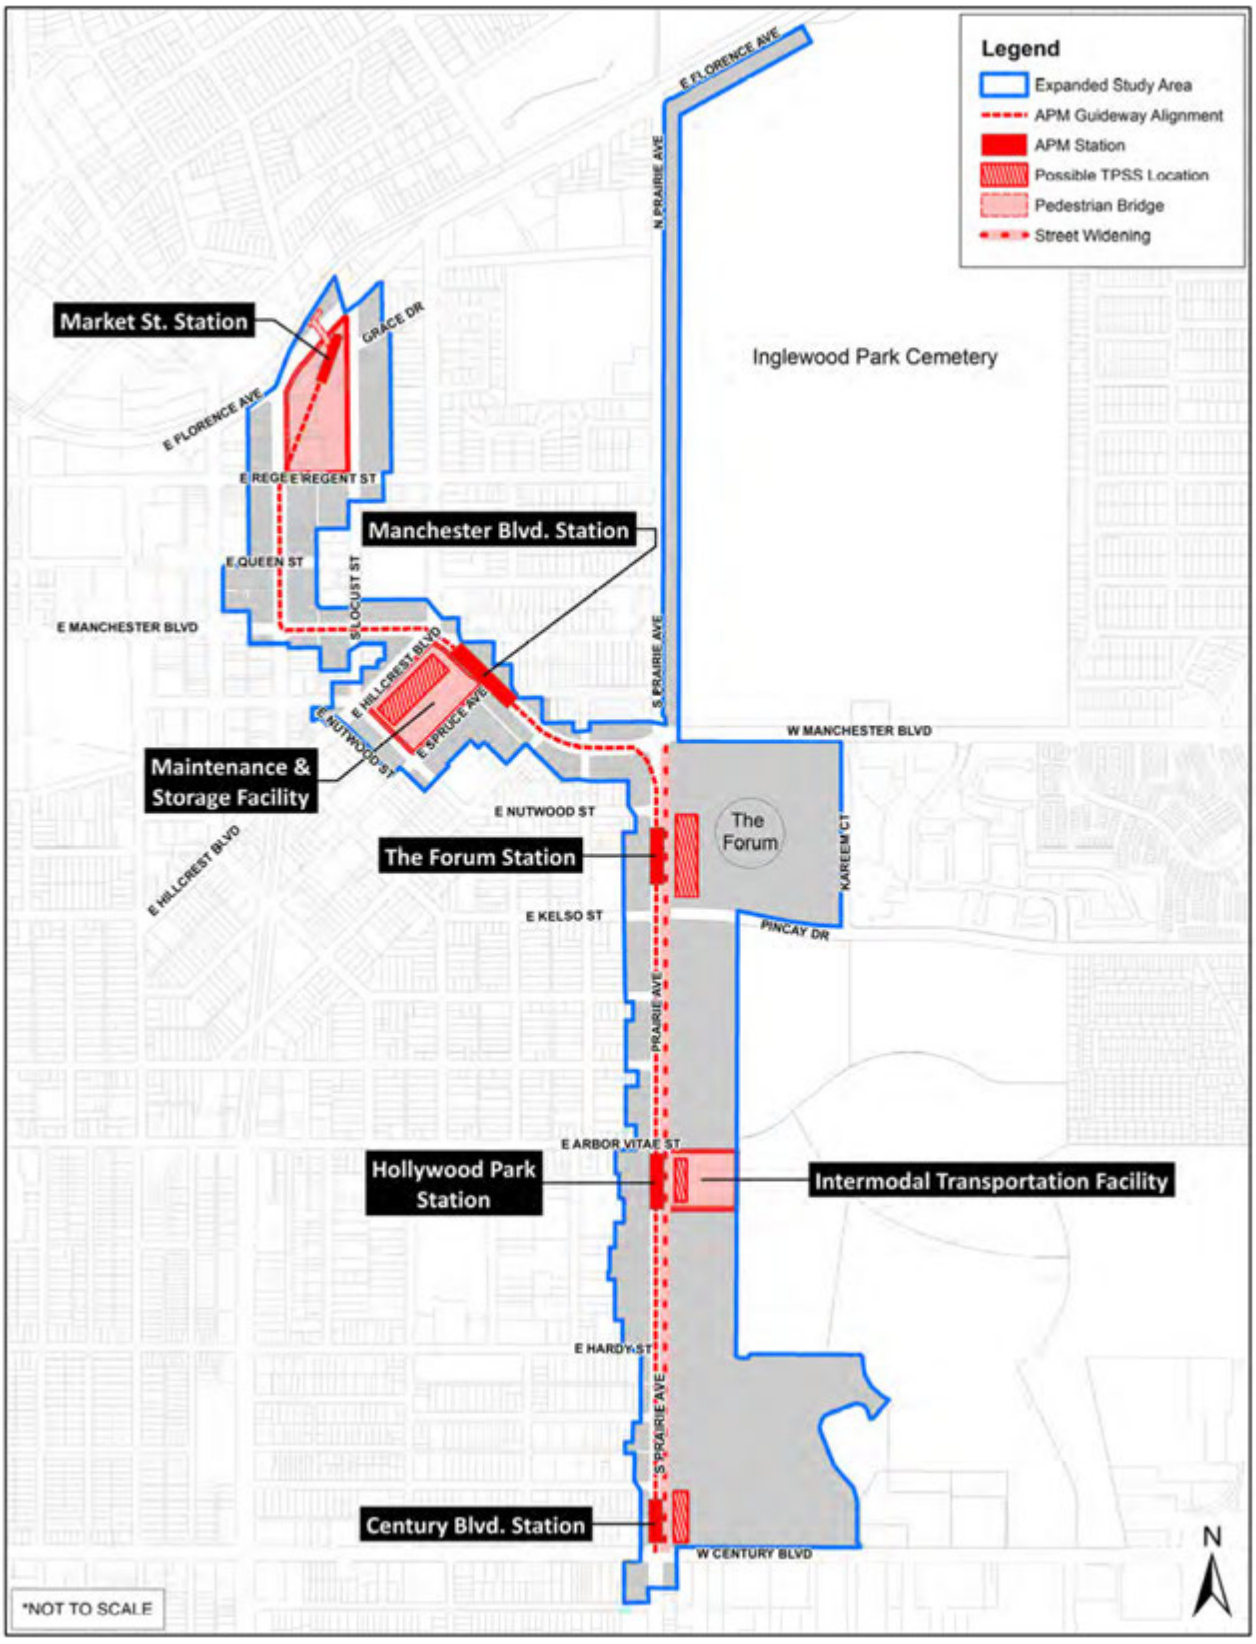

Figure 5. EXPANDED STUDY AREA MAP (MARKET STREET STATION ALTERNATIVE)

4.1 Historical Resources under CEQA

The California Environmental Quality Act (CEQA) requires that environmental protection be given significant consideration in the decision-making process. Historical resources are included under environmental protection. Thus, any project or action which constitutes a substantial adverse change in the significance of a historical resource also has a significant effect on the environment and shall comply with the State CEQA Guidelines.

When the California Register of Historical Resources was established in 1992, the Legislature amended CEQA to clarify which cultural resources are significant, as well as which project impacts are considered to be significantly adverse. A "substantial adverse change" means "demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired."

CEQA defines a historical resource as a resource listed in, or determined eligible for listing, in the California Register of Historical Resources. All properties on the California Register are to be considered under CEQA. However, because a property does not appear on the California Register does not mean it is not significant and therefore exempt from CEQA consideration. All resources determined eligible for the California Register are also to be considered under CEQA.

The courts have interpreted CEQA to create three categories of historical resources:

- *Mandatory historical resources* are resources "listed in, or determined to be eligible for listing in, the California Register of Historical Resources."
- *Presumptive historical resources* are resources "included in a local register of historical resources, as defined in subdivision (k) of Section 5020.1, or deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1" of the Public Resources Code, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant.
- *Discretionary historical resources* are those resources that are not listed but determined to be eligible under the criteria for the California Register of Historical Resources.[4]

To simplify the first three definitions provided in the CEQA statute, a historical resource is a resource that is:

- Listed in the California Register of Historical Resources;

[4] *League for the Protection of Oakland's Architectural and Historic Resources vs. City of Oakland*, 52 Cal. App. 4th 896, 906-7 (1997).

- Determined eligible for the California Register by the State Historical Resources Commission; or
- Included in a local register of historical resources.

Section 15064.5 of the CEQA Guidelines (California Code of Regulations, Title 14, Chapter 3) supplements the statute by providing two additional definitions of historical resources, which may be simplified in the following manner. A historical resource is a resource that is:

- Identified as significant in a historical resource survey meeting the requirements of Public Resources Code 5024.1(g);
- Determined by a Lead Agency to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California. Generally, this category includes resources that meet the criteria for listing on the California Register (Pub. Res. Code SS5024.1, Title 14 CCR, Section 4852).

The fact that a resource is not listed in, or determined eligible for listing in, the California Register, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1, does not preclude a lead agency from determining that the resource may be an "historical resource" for purposes of CEQA.

Properties formally determined eligible for listing in the National Register of Historic Places are automatically listed in the California Register. Properties designated by local municipalities can also be considered historical resources. A review of properties that are potentially affected by a project for historic eligibility is also required under CEQA.

4.2 Historic Designations

A property may be designated as historic by National, State, and local authorities. In order for a building to qualify for listing in the National Register or the California Register, it must meet one or more identified criteria. The property must also retain sufficient architectural integrity to continue to evoke the sense of place and time with which it is historically associated.

National Register of Historic Places

The National Register of Historic Places is an authoritative guide to be used by Federal, State, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment.[5] The National Park Service administers the National Register

[5] 36CFR60, Section 60.2.

program. Listing in the National Register assists in preservation of historic properties in several ways including: recognition that a property is of significance to the nation, the state, or the community; consideration in the planning for Federal or Federally assisted projects; eligibility for Federal tax benefits; and qualification for Federal assistance for historic preservation, when funds are available.

To be listed in or eligible for listing in the National Register, a resource must possess significance in American history and culture, architecture, or archaeology. Listing in the National Register is primarily honorary and does not in and of itself provide protection of a historical resource. The primary effect of listing in the National Register on private owners of historic buildings is the availability of financial and tax incentives. In addition, for projects that receive Federal funding, a clearance process must be completed in accordance with Section 106 of the National Historic Preservation Act. Furthermore, state and local regulations may apply to properties listed in the National Register.

The criteria for listing in the National Register follow established guidelines for determining the significance of properties. The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history.[6]

In addition to meeting any or all of the criteria listed above, properties nominated must also possess historic integrity. According to National Park Service guidance for applying National Register criteria, a property that is more than 50 years of age can be considered for listing in the National Register. Fifty years is a general estimate of time needed to develop historical perspective and therefore to evaluate historic significance.[7]

[6] 36CFR60, Section 60.3.

[7] *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation* (Washington, DC: National Park Service, 1995), 41.

California Register of Historical Resources

The California Register is an authoritative guide in California used by State and local agencies, private groups, and citizens to identify the State's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change to their significance.[8]

The criteria for listing in the California Register are based upon National Register criteria. A property may be listed in the California Register if it:

1. Is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
2. Is associated with the lives of persons important to local, California or national history.
3. Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.[9]

The California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register includes the following:

- California properties formally determined eligible for (Category 2 in the State Inventory of Historical Resources), or listed in (Category 1 in the State Inventory), the National Register of Historic Places.
- State Historical Landmarks No. 770 and all consecutively numbered state historical landmarks following No. 770. For state historical landmarks preceding No. 770, the Office of Historic Preservation (OHP) shall review their eligibility for the California Register in accordance with procedures to be adopted by the State Historical Resources Commission (commission).
- Points of historical interest which have been reviewed by the OHP and recommended for listing by the commission for inclusion in the California Register in accordance with criteria adopted by the commission.[10]

Other resources which may be nominated for listing in the California Register include:

- Individual historical resources.
- Historical resources contributing to the significance of a historic district.

[8] California PRC, Section 5023.1(a).
[9] California PRC, Section 5024.1(c).
[10] California PRC, Section 5023.1(d).

- Historical resources identified as significant in historical resources surveys, if the survey meets the criteria listed in subdivision (g).
- Historical resources and historic districts designated or listed as city or county landmarks or historic properties or districts pursuant to any city or county ordinance, if the criteria for designation or listing under the ordinance have been determined by the office to be consistent with California Register criteria.
- Local landmarks or historic properties designated under any municipal or county ordinance.[11]

Guidance for applying the California Register criteria does not provide a specific age threshold for eligibility. However, it does state that "sufficient time must have passed to obtain a scholarly perspective on the events or individuals associated with the resource."[12]

Local Designation

The City of Inglewood does not have a historic preservation ordinance and does not maintain a local designation program.

4.3 Historic Significance

The definition of *historic significance* used by the California Office of Historic Preservation (OHP) in its administration of the California Register is based upon the definition used by the National Park Service for the National Register. Historic significance is defined as *the importance of a property to the history, architecture, archaeology, engineering, or culture of a community, state, or the nation.*[13] It is achieved in several ways:

- *Association with important events, activities or patterns*
- *Association with important persons*
- *Distinctive physical characteristics of design, construction, or form*
- *Potential to yield important information*

A property may be significant individually or as part of a grouping of properties.

[11] California PRC, Section 5023.1(e).
[12] California Office of Historic Preservation, *Technical Assistance Series #6, California Register and National Register: A Comparison (for purposes of determining eligibility for the California Register)*, (Sacramento, CA: California Department of Parks and Recreation), 3.
[13] *National Register Bulletin 16A. How to Complete the National Register Registration Form* (Washington D.C.: National Park Service, U.S. Department of the Interior, 1997), 3.

4.4 Historic Integrity

Historic integrity is the ability of a property to convey its significance. It is defined as the "authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic period."[14] The National Park Service defines seven aspects of integrity: *location, design, setting, materials, workmanship, feeling,* and *association*. These qualities are defined as follows:

- *Location* is the place where the historic property was constructed or the place where the historic event occurred.
- *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
- *Setting* is the physical environment of a historic property.
- *Materials* are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
- *Workmanship* is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
- *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time.
- *Association* is the direct link between an important historic event or person and a historic property.[15]

4.5 Period of Significance

The National Park Service defines the *period of significance* as "the length of time when a property was associated with important events, activities or persons, or attained the characteristics which qualify it for… listing" in National, State or local registers. A period of significance can be "as brief as a single year… [or] span many years." It is based on "specific events directly related to the significance of the property," for example the date of construction, years of ownership, or length of operation as a particular entity.[16]

4.6 Historic Districts

Standard preservation practice evaluates collections of buildings from similar time periods and historic contexts as historic *districts*. The National Park Service defines a historic district as "a significant concentration, linkage, or continuity of sites, buildings,

[14] *National Register Bulletin 16A*, 3.
[15] *National Register Bulletin 15*, 44-45.
[16] *National Register Bulletin 16A*, 42.

structures, or objects united historically or aesthetically by plan or physical development."[17] A historic district derives its significance as a single unified entity.

According to the National Park Service, "a district can comprise both features that lack individual distinction and individually distinctive features that serve as focal points. It may even be considered eligible if all of the components lack individual distinction, provided that the grouping achieves significance as a whole within its historic context. In either case, the majority of the components that add to the district's historic character, even if they are individually undistinguished, must possess integrity, as must the district as a whole." Some examples of districts include business districts, college campuses, large estates, farms, industrial complexes, residential areas and rural villages.[18]

Properties that have been found to contribute to the historic significance of a district are referred to as district contributors. Properties located within the district boundaries that do not contribute to its significance are identified as non-contributors.

[17] *National Register Bulletin 15*, 5.
[18] Ibid.

5.1 Development History

The following narrative describes the evolution of the Project Area and vicinity over time, with an emphasis on the early development of Inglewood and its downtown business district. The purpose of this narrative is to provide guidance for evaluating the historic significance of properties within the Project Area and Expanded Study Area, and for determining their eligibility for listing or designation according to established criteria and integrity thresholds.

Pre-History

In the pre-historical period, the coastal plain between present-day Los Angeles and Long Beach was immensely fertile, enriched by the periodic flooding of the Los Angeles River over millennia. It was home to the Tongva people, also referred as the Gabrieleño, Fernandeño, or Nicoleño, the names given to the region's indigenous people by California's Spanish missionaries. The Tongva occupied the area now encompassed by the Los Angeles basin, San Fernando Valley, San Gabriel Valley, San Bernardino Valley, and the local California coastline. The South Bay region was home to a number of small Tongva (Gabrieleño) villages, with notable settlements at Suangna near the present-day city of Carson, near Point Fermin in San Pedro, and near Malaga Cove in Palos Verdes.[19]

Spanish Colonial and Mexican Periods

In 1542, Spanish explorer Juan Rodriguez Cabrillo led the first European expedition to explore what is now the west coast of North America. Explorers with Cabrillo's expedition encountered native people on land and sea voyages, making what is thought to be the first known contact with Alta California's indigenous tribes, including the Tongva of the Suangna area.[20] While Cabrillo claimed California for the Spanish Crown at this time, Spanish settlement would not reach this territory for another two hundred years.

On July 14th, 1769, Don Gaspar de Portolá, governor and military leader of Baja California, led the first expedition to colonize Alta California. Accompanied by Franciscan friars Junípero Serra and Juan Crespí, Portolá took a group of 64 men northward from San Diego toward Monterey. On August 2nd, the expedition camped along the east bank of the Los Angeles River just south of where it is joined by the Arroyo Seco. Fr. Crespí named the spot "El Pueblo de Nuestra Señora la Reina de los Ángeles del Río Porciúncula (translating as "town of Our Lady the Queen of Angels of the River Porciúncula"). As the expedition crossed the river and continued to the south

[19] Sam Gnerre, "The Suangna Native American Village in Carson," *South Bay Daily Breeze*, January 17, 2015.
[20] Ibid.

and west approximately one mile, they encountered the Tongva village of *Yang-na*, believed to be near the current site of *El Pueblo de Los Angeles*.

On September 8th, 1771, Spanish colonists established Mission San Gabriel, the fourth of an eventual 21 Spanish missions in California, and the first in this area. Much of the area's native population would be recruited to work the San Gabriel Mission lands. Seven years later, in 1778, Governor Felipe de Neve received approval for the creation of a civil pueblo along the *Río la Porciúncula*. Persuaded by Crespi's earlier descriptions of a well-watered valley with good soils for growing crops and an ample native population to work the land, the Spanish colonial government ordered Governor Neve to establish a settlement at this location and name the new pueblo *La Reina de los Angeles* ("Queen of the Angels").

In 1821, Mexico won its independence from Spain and Alta California became a territory of the new Mexican Republic, marking an end to Spanish colonial rule in the region. The political and social control of the military and religious leadership began to shift toward the secular and private sector, and to native-born Californios.[21] The new Mexican government sought to diminish the influence of Spain in the region, as the Spanish missions largely remained loyal to the Roman Catholic Church in Spain. At the same time, there was a need for more grazing lands to increase commerce in the hide and tallow trade. Thus, beginning in 1834, the Mexican government began to secularize the missions, confiscating mission lands to be distributed in large land grants called *ranchos*. Pío Pico, the last governor of Alta California, subdivided the former mission lands into large tracts, granting them to various prominent *Californios*.

American Period

United States troops began occupying Alta California in 1846, at the advent of the Mexican-American War, and soon gained possession of Los Angeles itself. However, Alta California would not officially come under American rule until February 2nd, 1848, with the signing of the Treaty of Guadalupe Hidalgo, which ceded the California territory to the United States and ended the war. Importantly, the treaty also provided that the existing land grants would be honored.

The origin of today's City of Inglewood dates back to the mid-1800s and a dispute between two prominent Californio families: the Ávilas and the Machados. José Manuel Orchado Machado was a Spanish soldier and mule tender who was sent west of Los Angeles in 1781 to graze his livestock. He found the area around the Centinela Springs to be excellent grazing lands and settled there with a group of ranchers.[22] In 1834,

[21] The term *Californio* refers to Spanish-speaking natives of Alta California. The Californios were elite families that received large land grants from Spain and Mexico.

[22] The site of Centinela Springs is today's Edward Vincent Junior Park, just northeast of the Project Area.

Machado's son Ygnacio built the Centinela Adobe.[23] During this same period, Francisco Ávila and his family had established grazing lands near the Centinela. As the claims of the two families clashed, they took their dispute to the local council in 1837, which gave official title of the area around Centinela Springs to the Machado family as the 2,219-acre *Rancho Aguaje de la Centinela*. The Ávila family was granted the much larger *Rancho Sausal Redondo*. At 22,458 acres, this land encompassed much of what is now the South Bay region of Los Angeles County. In 1845, Bruno Ygnacio Ávila arranged a trade with the Machados: a small tract in the *Pueblo de Los Ángeles* for *Rancho Aguaje de la Centinela*. The grant for *Rancho Sausal Redondo* was officially patented to Antonio Ygnacio Ávila in 1855; *Rancho Aguaje de la Centinela* was officially granted to Bruno Ávila in 1872.

Ultimately the Ávila family would lose both of the ranchos. Bruno Ávila lost *Rancho Aguaje de la Centinela* through foreclosure in 1857; the property was subsequently acquired by Scotsman Sir Robert Burnett in 1860. In 1868, the heirs of Antonio Ávila were forced to sell *Rancho Sausal Redondo* to pay probate costs, and it was also acquired by Burnett. By 1872, Burnett combined the total area of some 25,000 acres into the Centinela Ranch, thus reuniting the extent of the original land grant. This ranch included what would ultimately become the coastal communities of Playa del Rey, El Segundo, Manhattan Beach, Hermosa Beach, and Redondo Beach; as well as the inland communities of Westchester, Inglewood, Hawthorne, and Lawndale.

In 1873, Burnett returned to his native Scotland, leasing the combined rancho lands to Canadian attorney Daniel Freeman and his wife, Catherine, with an agreement that they could eventually purchase the property outright.[24] The Freeman family moved to the ranch, which Burnett had been using to graze sheep and cattle. Daniel Freeman continued to graze the stock, while also planting more than 10,000 fruit and nut trees. Following a drought that led to the death of some 22,000 of his sheep, Freeman turned to dry farming, eventually producing a million barrels of barley annually. Ultimately Freeman would amass a fortune farming barley, olives, citrus fruits, and almonds. He named his ranch "Inglewood," after his birthplace in Ontario.

Following Catherine's death, Daniel Freeman began to pursue the commercial development of his expansive holdings. He first established the Centinela Land Company, which proved unsuccessful. Then in 1887, as the California Central Railway laid tracks to Redondo Beach, Freeman sold some 11,000 acres of his ranch to the Centinela-Inglewood Land Company, which would subdivide the extent into small

[23] The Centinela Adobe is located in the Los Angeles community of Westchester and is the oldest building in the area. Considered the "birthplace of Inglewood," it is operated as a house museum by the Historical Society of Centinela Valley.

[24] The Freeman family officially acquired this land from Burnett in 1885.

parcels for the settlement of the new town of Inglewood. As local historian Waddingham tells it:

> *Much fanfare went into selling the first lots. Excursion trains from Los Angeles brought prospective customers as well as several dignitaries. All came to the Land Office that stood near the little depot. We can imagine the excitement! By the end of the day 300 lots had been sold.*[25]

In 1888, Freeman began work on a large mansion for himself and his family, with bricks provided by his own newly-established Continuous Brick Kiln Company of Inglewood, and lumber from the recently-acquired local planning mill.[26] In 1889, he built the Land Company office next to the train depot, moving it to the grounds of his estate in 1895 where it served as his office until his death in 1918.[27] Ultimately, all 25,000 acres of the Centinela Ranch would be subdivided and developed, with the only remaining portion of the ranch being the one-acre site on which the Centinela Adobe is situated.

Inglewood Townsite

The townsite of Inglewood was platted by the Centinela-Inglewood Land Company in 1888, by which time the town already had a population of 300.[28] The plan divided the town into northern and southern sections on either side of the newly completed Inglewood Division of the California Central Railroad line, a subsidiary of the Atchison Topeka & Santa Fe Railway, which ran along Florence Boulevard as it made its way from Los Angeles to Redondo Beach. The major north-south street leading into Inglewood was Grevillea Avenue. Development during this period was sparse, and most buildings were of impermanent wood-frame construction. The first few business

[26] Waddingham, 8.

[27] Waddingham, 11. Daniel Freeman is considered the founder of the City of Inglewood. Among his various pursuits, he is said to have been the first farmer to engage extensively in wheat cultivation in Southern California. Upon discovering a deposit of brick clay on his property, he established the Continuous Brick Kiln Company of Inglewood in 1888, manufacturing the building materials for many of the business blocks on Spring Street and Broadway in downtown Los Angeles, including his own building, the Freeman Block at 6th and Spring streets. He was the first president of the California Club of Los Angeles, president of the Los Angeles Chamber of Commerce in 1893-1894, and director of the Southern California Railway Co. Freeman lived in the Centinela Adobe before erecting his own residence in beginning in 1891, which was demolished 1972 to make way for the Daniel Freeman Memorial Hospital (now closed). In 1975, the Land Company office was moved from his estate to the grounds of the Centinela Adobe, where it now stands.

[28] Waddingham, 6.

buildings clustered on narrow uniform lots along Grevillea Avenue and Commercial Street (now La Brea Avenue) between Regent and Queen streets.

By 1892, the town of Inglewood was home to several small businesses, including a grocery, post office, a barber, a restaurant, and a large two-story hotel on Queen Street between Commercial and Market.[29] At this time, Inglewood also had a post office, a railroad depot, and a large grain storage building situated along the Redondo Branch of the AT&SF railroad, as well as a handful of single-family residences. Market Street was predominantly residential during this period, before the opening of a streetcar line along its length in 1904, which would lead to its gradual transition to a commercial corridor.

By 1907, downtown Inglewood had several dozen dwellings. Commercial establishments included a drug store, general merchandise store, grocery, meat market, tailor, print shop, and various lodging buildings and offices. Institutional properties included a public school and a Presbyterian church. Industrial uses were clustered along the rail lines and included a greenhouse, planning mill, lumber yard, cement storage, gain mills and storage, and several warehouses.[30] The City of Inglewood was officially incorporated on February 14th, 1908.

Market Street at the time of incorporation, 1908. *("History of Inglewood," Waddingham)*

CONFIDENTIAL DRAFT FOR INTERNAL REVIEW ONLY

Also, by this time, Inglewood was home to an expansive cemetery. In 1905, a group of local businessmen formed the Inglewood Park Cemetery Association, acquiring a large plot of land just east of what would become downtown Inglewood. A total of 32 internments took place in the cemetery's first year of operation, with funerals often arriving by rail from Los Angeles in a private funeral car.[31] In 1907, the cemetery erected the Romanesque-style Grace Chapel, a three-quarters replica of a church in Edinburgh, Scotland. Within a decade, the cemetery would erect the Neoclassical-style Inglewood Mausoleum, the first community mausoleum in the State of California.[32]

Inglewood Park Cemetery, date unknown. *(Inglewood Park Cemetery)*

Many of the South Bay region's earliest settlers have been laid to rest at Inglewood Park Cemetery, including a number of Civil War veterans.[33] Other notable residents include former Los Angeles Mayor Tom Bradley, Chet Baker, Ray Charles, Ella Fitzgerald, Etta James, boxer Sugar Ray Robinson, and architect Paul Williams.[34]

By 1912, Inglewood's commercial core was beginning to take shape along Commercial Street between Los Angeles Street/Inglewood Avenue (now Florence Avenue) and Queen Street. Deep, narrow lots were being developed with various commercial uses, from restaurants and boarding houses, to plumbers and hardware stores. Market Street remained primarily residential during this period, with a few commercial buildings, including a jeweler, a milliner, a confectioner, an undertaker, a bank, and a Methodist church.[35]

By 1920, the South Bay's local economy was booming due to the region's fertile agricultural lands, productive oil fields, and emerging aviation industry. The City of Inglewood was growing exponentially, as hundreds of new homes were being built. At

the same time, the city's commercial development was coalescing into a downtown business district. Commercial Street between Regent and Queen streets was now solidly commercial, boasting many of the business enterprises needed by any growing town, from banks and automobile showrooms, to furniture stores and a movie theater. South of Queen, Commercial Street was still largely undeveloped but for a few single-family residences and an apartment house. At this point, Market Street was more sparsely developed overall and displayed a combination of commercial and residential uses.[36]

The commercial structures erected in downtown Inglewood at this time were typical of those being built in downtowns throughout Southern California. These were what have since been termed "taxpayer blocks," speculative investments to generate tax benefit until more valuable development could be carried out. Early examples were multi-unit two-story buildings, frequently with retail units on the ground floor and offices or apartments above. These buildings were typically unreinforced brick in construction, with applied ornament of cast stone or terra cotta at the entrance or along the parapet. Depending on the size of the building, it may contain one or more retail storefronts, with flexible interiors to accommodate the ever-changing needs of individual tenants. While many of these buildings were vernacular in design, in Southern California they were often overlaid with details of the Spanish Colonial Revival style, including tile roofs or parapet edges, arched doors and window openings, and decorative wall tile and cast-stone detailing. With the advent of the personal automobile, a single-story version of the form became popular, with surface parking behind.[37]

Holy Faith Episcopal Church and Rectory, c. 1915.
(James H. Osborne Photo Collection, CSUDH Archives)

Inglewood also had a number of churches by this time, including the First Methodist Episcopal Church, St. John's Catholic Church, Church of the Brethren, and Christian Church.[38] The only church that survives from this period is Holy Faith Episcopal Church, located at the southeast corner of Locust Street and Grace Avenue.[39] The church was first

[39] Holy Faith Episcopal Church is located at 260 N. Locust Street.

established in 1911, with services held in the Inglewood Masonic Hall. In 1912, Grace Freeman Howland[40] and her husband Charles donated the funds to erect a religious complex consisting of a church, a rectory (the dwelling to the south), and parish hall (now a school at the rear). They hired a young architect, Philip Frohman, to design what would be hailed as "the most perfect example of true Gothic architecture in the West." Frohman would go on to become nationally renowned, particularly for his work on the National Cathedral in Washington, D.C. The church was officially consecrated on November 8th, 1914, and dedicated to Catherine Freeman and Mathilda Howland, the mothers of Grace and Charles. The church lost its original bell tower in the 1933 Long Beach Earthquake, but soon thereafter gained the Stations of the Cross, imported from Italy; the pulpit, lectern and choir stalls from England; and the reredos carved and imported from Bavaria. The stained-glass windows were crafted by Judson Studios in Highland Park.[41]

Damaged buildings from Inglewood Earthquake, June 21, 1920. *(California Historical Society Collection, USC)*

On the evening of June 21st, 1920, the Los Angeles Basin was rattled by an estimated 5.0 earthquake centered near Inglewood. While tremors were felt as far away as Ventura and Riverside, almost all of the damage took place in Inglewood, and specifically to the unreinforced brick buildings along Commercial Street (now La Brea Avenue), where exterior walls fell into the street and plate glass windows shattered.[42] The Inglewood Hotel was also badly damaged and subsequently demolished. Despite the widespread damage, however, the earthquake did not seriously hamper the city's growth. In fact, according to local historian Gladys Waddingham, the quake appears to have been a boon to development, as "many of the people who flocked to see the damage were seeing Inglewood for the first time and were so impressed that they came back to live." This hypothesis is borne out by population figures: the 1920 census

[40] Grace Freeman was the daughter of Daniel Freeman, considered the founder of the City of Inglewood.

credited Inglewood with a population of 3,286. In just two years the figure would double, making Inglewood the fastest growing city in the nation.[43]

The 1920s was a boom period for the City of Inglewood, both in terms of population and development. While Commercial Street continued to be the primary artery of the downtown business district, many more businesses were being established on Market Street and its cross-streets during this period. At least seven new buildings were constructed in the 100 block of North Market Street alone. The local financial institution the People's Federal Building & Loan Association was established at this time, first in a unit of the building at 314 S. Market Street, before constructed their own building at the northeast corner of Market Street and Pimiento Street (now Manchester Boulevard) in 1927.[44] That same year, the Bank of Inglewood erected a two-story mixed-use building at the northeast corner of Market and Queen streets, at a cost of $140,000. Designed by local architect William L. Campbell in the Mediterranean Revival style, the reinforced concrete building was touted as the "first steel frame business block in this city" and as "practically fire and earthquake proof."[45]

Market Street, looking north, 1925. *(Security Pacific National Bank Collection, LAPL)*

On May 18th, 1927, some 15,000 locals came out to celebrate the "Festival of Light" which marked the opening of a new ornamental lighting system installed along Market Street. In addition to providing much needed illumination, the standards also supported

the trolley wires of the Los Angeles Railway, allowing for the removal of the wooden poles from the middle of the street and the sidewalk.[46] In 1928, a two-story mixed-use structure called the Professional Building was constructed at Market Street and Manchester Boulevard's northwest corner. The building was designed in the Spanish Colonial Revival style with Churrigueresque details.[47] Also constructed in downtown Inglewood during this period were a new City Hall building (1923, demolished), the Granada Theater (1923, demolished), an S.H. Kress Variety Store (1927), and a United Artists Theater (1931, demolished), as well as a number of auto-related businesses such as gas stations and repair garages.

Toward the end of the 1930s, Inglewood's economic base began to expand outside the downtown core. Appropriately, in 1937 Commercial Street was officially changed to La Brea Avenue, connecting it with the street in Los Angeles.[48] Also that year, Mines Field, which had been established just southwest of the city, was purchased by the City of Los Angeles to serve as its municipal airport, bringing many new jobs to the region. In 1938, the Hollywood Park, an "ultra-modern" thoroughbred racetrack, opened on 314 acres just southeast of downtown, effectively making Inglewood a destination for the first time.[49] In addition to attracting the typical racing fan, Hollywood Park brought in celebrated personalities associated with the entertainment industry—from studio executives Jack Warner, Walt Disney and Samuel Goldwyn, to A-list actors like Al Jolson and Bing Crosby—many of whom were also investors in the operation.

Wartime and Postwar Growth

As war clouds gathered in the early 1940s, a number of aviation-related and other wartime manufacturing facilities set up shop around the Los Angeles Airport. North American Aviation, Inc. and the Northrup Company both established airplane manufacturing plants in the vicinity. Due to the emergence of these new facilities, this area would not only be critical to the defense industry during World War II, but in the postwar years would evolve into one of the most important centers of the nation's aerospace industry.

The presence of wartime and postwar manufacturing jobs added sharply to the local population and financially supported a growing middle class throughout the South Bay region, including in Inglewood. In 1938, the city had a population of 26,000; by 1956, that number had grown to 64,000.[50] Housing construction naturally responded to the increased demand, and commercial development followed, leading to a pattern of

postwar decentralization. By the mid-1950s, the city had three retail business areas—in North Inglewood, Morningside Park, and Crenshaw—in addition to the downtown.

Despite this tremendous growth overall, new development in downtown Inglewood was very limited during this period. In 1941 a J.C. Penney department store opened on Market Street between Queen Street and Manchester Boulevard. Originally constructed as a one-story building, in 1954 it was expanded with a second story and remodeled in its exiting Mid-Century Modern style, with a deep front canopy and glazed terra cotta tile columns.[51]

The Fox Theater opened on March 31st, 1949, on Market Street between Regent and Queen. Erected on the site of the Granada Theater, which burned down in 1945, it was the last theater constructed by the Fox West Coast Theater chain. Designed by prolific theater architect S. Charles Lee in the Late Moderne style, it was the first theater in Inglewood to have air conditioning. Other features included automatic lobby doors, CinemaScope widescreen projections, assistance for the hearing impaired, and a soundproof "crying room." The Fox Inglewood was often used for Fox Pictures' premiers and sneak previews.[52]

During this same period, two substantial institutions opened just outside of downtown Inglewood. In 1948, Bank of America erected a sprawling 22,000-square-foot branch at the southwest corner of Manchester Boulevard and Locust Street.[53] That same year, funeral director John Flanagan opened Hardin & Flanagan Colonial Chapel & Mortuary on Prairie Avenue at La Palma Drive, across the street from Hollywood Park. Flanagan built a number of mortuaries around the Los Angeles area using the same American Colonial Revival design. In 1959, the business was purchased by the McCormick family and renamed McCormick Mortuary.[54] The following year, the building was expanded with a two-story north wing, adding a new lobby with offices above. Today, the business is operated as Lighthouse McCormick Mortuary.[55] The other area for new development

[55] The Lighthouse McCormick Mortuary is located at 619-635 S. Prairie Avenue.

during the postwar period was La Brea Avenue, a wide auto corridor which previously served as the western border of downtown Inglewood.[56]

Despite these examples of new construction in and around downtown during this period, the primacy of the city's downtown as a commercial district was substantially diminished by increased competition from outlying commercial areas. The removal of the Market Street trolley line in 1957 added further stress to already struggling businesses. The city responded by adding municipally-owned off-street parking lots located throughout the district to draw car-dependent shoppers. The Chamber of Commerce and Downtown Inglewood Retail Merchants Association coordinated to organize various promotional activities, as well as physical improvements like tree planting in the center strip and along sidewalks, which were in place by the early 1960s.[57] However, these effects of these efforts were soon eclipsed by the continued loss of customers to new shopping malls in communities throughout Los Angeles. Inglewood considered, but ultimately rejected plants to build a mall of its own on a large parcel at Prairie and Manchester, a proposal largely defeated by the Market Street merchants. The site would instead become the home of the Forum.[58]

Hardin & Flanagan Colonial Chapel and Mortuary (now Lighthouse McCormick Mortuary), c. 1950. ***(Tichnor Brothers Collection, Boston Public Library)***

By the late 1960s, downtown Inglewood was in need of reinvention. To this end, the city contemplated a wholesale redevelopment scheme for the Market Street corridor that would expand and remodel existing stores, construct two high-rise office and apartment towers, introduce a landscaped arcade, and build a four-square block parking deck above shops to quadruple parking capacity.[59] However, this plan would go unrealized. The United Bank of California at the southeast corner of Market and Regent

[56] Also built during this period was a Sears department store at Manchester and Hillcrest boulevards. Opened in 1947, this was an early indicator that the future of retail in Inglewood would not be downtown. Sears was demolished in 1993 and replaced by a Vons supermarket.

streets would be the first new structure to be added to the Market Street corridor in nearly two decades, replacing several early 20th-century commercial buildings.[60] Constructed in 1967 in the Late Modern style, it was joined nine years later by a stand-alone drive-thru automated teller building situated across Regent from the bank. Both buildings are believed to have been designed by Los Angeles modernist Richard Dorman.[61]

Beyond Downtown

In the late 1960s, nationally prominent businessman Jack Kent Cooke selected the site of a former golf course at the southeast corner of Prairie Avenue and Manchester Boulevard to erect a new venue for his three professional sports franchises: the Los Angeles Lakers NBA basketball team, the Los Angeles Kings NHL hockey team, and the short-lived Los Angeles Wolves professional soccer team. The Forum, a multi-purpose indoor arena, was designed by the prominent Los Angeles architectural firm Charles Luckman & Associates and completed in 1967.[62] Designed in the New Formalist architectural style, it was intended as a modern and highly-stylized version of the Coliseum of ancient Rome. Nicknamed "the Fabulous Forum," it would host tennis

[60] The former United Bank of California is located at 158-170 N. Market Street.
[61] Although an original building permit for the 1967 bank building is not available from the City of Inglewood, the permit for the similarly-styled drive-thru automated teller building lists Richard Dorman as its architect.
[62] The Forum is located at 3900 W. Manchester Boulevard.

matches, boxing matches, ice shows, rodeos, the circus, award shows, and political events. In 1972, the Forum was the site of the Lakers' first NBA championship since moving to Los Angeles; five additional titles would follow in the 1980s. From the mid-1970s through the 1990s, the Forum would serve as the premier large-scale concert venue for the Los Angeles area, and would be influential in the birth of "arena rock." During the 1984 Olympics, the Forum was the venue for men's and women's basketball.[63]

Market Street, looking south from Regent Street, 1961. *(Inglewood Public Library, Online Archive of California)*

By the early 1970s, Market Street had turned into a virtual ghost town as shoppers abandoned the downtown business center for suburban malls, and key tenants like J.C. Penney closed their doors. In an effort to reinvigorate the core of the city, from 1971 to 1976 Inglewood spent about $50 million in local, county, and federal funds to erect a new civic center complex along La Brea Avenue, just one block west of downtown. This new complex combined City Hall, a courthouse, library, fire and police facilities, public health complex, and a major new parking garage onto a single super-block, surrounded by expanses of lawn and public art. As hoped, this new construction sparked a flurry of new commercial development in the larger In-Town Redevelopment Area[64]—bounded by Florence, Locust, Manchester and Fir—the vast majority of which

[63] "Forum," *National Register of Historic Places Form*. Prepared by Historic Resources Group, April 29, 2014.

[64] The In-Town Redevelopment Area was one of six redevelopment project areas adopted by the Inglewood Redevelopment Agency between 1970 and 1973.

was office space and not retail. Several residential projects were built at this time as well, most notably the 200-unit Inglewood Meadows housing complex on Locust Street, just east of downtown.[65]

The Forum under construction, with Jack Kent Cooke and Charles Luckman, 1967. *(Herald Examiner Collection, LAPL)*

While these projects brought large numbers of people into the vicinity of Market Street, their presence did not raise the corridor's fortunes, and the vitality of the downtown business district continued to wain into the 1980s. In October 1986, Market Street merchants brought downtown business activity to halt as they closed their shops and picketed in a city-owned parking lot in a last-ditch effort to save it from redevelopment. The parking lot at La Brea Avenue and Queen Street provided 80 metered parking spaces which local shopkeepers saw as critical to continued viability of the downtown business district, which was already suffering from a severe parking shortage. Ultimately, however, the protests were unsuccessful, and the parking lot was soon replaced by a five-story office building.[66] Yet another sign of downtown's economic decline, the Fox Theater, then owned by the Mann theater chain, closed its doors in 1988.

Since the late-1970s, at least four City-sponsored revitalization programs have focused on improving Market Street's commercial viability, introducing street landscaping and furniture as well as façade improvements to the existing buildings. Efforts have included a façade improvement program designed by architectural firm Kahn, Kappe, Lotery, Boccato (1979); a $250,000 façade improvement program, including signs and awnings (1984); a California Main Street Community Project (1990s); and the Market Street Renaissance program (2000). However, despite these efforts, Market Street has largely remained an underutilized asset.

Inglewood Today & Tomorrow

In 1994, Hollywood Park underwent a $100 million expansion into Hollywood Park Casino, which extended the facility's economic viability. However, in May of 2013, it was announced that the Hollywood Park racetrack would be closing at the end of the

[65] Dean Murphy and Michele L. Norris, "Government Money Becomes Urban Lifeblood: Innovation and Optimism Thrive on Public Funds in Inglewood, San Pedro," *Los Angeles Times*, January 4, 1987.
[66] "Merchants Protest Proposal to Build on Parking Lot," *Los Angeles Times*, October 16, 1986.

fall racing season. In 2015, the Inglewood City Council approved a plan to build an 70,000-seat football stadium on the site in anticipation of the St. Louis Rams moving back to Los Angeles. The Inglewood mayor was on-hand to witness the demolition by explosives of the massive grandstand.

The Forum remained the home of the Lakers and Kings until 1999, when both teams relocated to the newly-constructed Staples Center in downtown Los Angeles. Beginning in 2012, the Forum underwent a $50 million renovation, reopening in 2014. Later that year, the Forum was listed in the National Register of Historic Places. The venue is inextricably tied to the identity of the City of Inglewood, which adopted the moniker "City of Champions." The Forum is slated to host the gymnastics events for the 2028 Summer Olympics.

Over the past decade, the City of Inglewood has been acquiring select parcels throughout the city for redevelopment, including along Market Street. Various planning studies have been conducted to develop standards for transit-oriented development, mixed-use development, and parking, with the goal of revitalizing downtown Inglewood. Local advocacy organization the Inglewood Historic Preservation Alliance (IHPA, formerly the Inglewood Historic Site Preservation Committee) continues to work toward the protection of the city's historic structures and places of interest, including the Fox Theatre, which was successfully listed in the National Register of Historic Places in 2013.[67] Currently, the City of Inglewood is utilizing *The New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, adopted November 1st, 2016, as the controlling document for future activity along Market Street.

On January 12th, 2016, the NFL voted to move the St. Louis Rams back to Los Angeles, with the San Diego Chargers to follow. In October 2016, the last part of the former racetrack, the Casino, was demolished and a new Hollywood Park Casino was opened next door. The new *Los Angeles Stadium at Hollywood Park* is currently under construction. When completed in 2020, it will be the new home of the NFL's Los Angeles Rams and Los Angeles Chargers. The Los Angeles Stadium is slated to host Super Bowl LVI in 2022, the College Football National Championship in 2023, and the opening and closing ceremonies and soccer events for the 2028 Summer Olympics.

5.2 Selected Chronology

Pre-History

3,500 BP The Tongva occupy the area now encompassed by the Los Angeles basin, San Fernando Valley, San Gabriel Valley, San Bernardino Valley, and the local California coastline.

Spanish Colonial Period

1542 Spanish explorer Juan Rodriguez Cabrillo makes the first documented European contact with the native Tongva people.

1769 The Portolá expedition passes through present-day downtown Los Angeles, encountering the native people from the village of Yang-na.

1771 On September 8th, Spanish colonists establish Mission San Gabriel, the fourth of California's Spanish missions.

1778 *El Pueblo de Los Angeles* is officially founded under the Spanish Laws of the Indies on September 4th.

Mexican Period

1821 Mexico wins its independence from Spain and Alta California becomes a territory of the new Mexican Republic.

1834 The California Missions are secularized by the Mexican government, and mission lands are confiscated for distribution in large land grants called *ranchos*.

Ygnacio Machado builds the Centinela Adobe, now considered the "birthplace of Inglewood."

1837 The Machado family is granted official title of the area around Centinela Springs as the 2,219-acre *Rancho Aguaje de la Centinela*.

The Ávila family is granted the 22,458-acre *Rancho Sausal Redondo,* encompassing much of what is now the South Bay region of Los Angeles County.

1845 Bruno Ygnacio Ávila acquires *Rancho Aguaje de la Centinela* from the Machados in exchange for a small tract in the *Pueblo de Los Ángeles* for.

American Period

1846 United States troops begin occupying Alta California.

1848 The signing of the Treaty of Guadalupe Hidalgo on February 2nd cedes the California territory to the United States and ends the Mexican-American War.

1850 Los Angeles incorporates as an American city on April 4th.

California is admitted to the Union as its 31st state.

1857 Bruno Ávila loses *Rancho Aguaje de la Centinela* through foreclosure.

1860 *Rancho Aguaje de la Centinela* is acquired by Scotsman Sir Robert Burnett.

1868 The heirs of Antonio Ávila are forced to sell *Rancho Sausal Redondo* to pay probate costs.

1872 Burnett acquires *Rancho Sausal Redondo*, combining his total land holdings of some 25,000 acres into the Centinela Ranch, encompassing the present-day communities of Playa del Rey, El Segundo, Manhattan Beach, Hermosa Beach, Redondo Beach, Westchester, Inglewood, Hawthorne, and Lawndale.

1873 Burnett leases his property to Daniel and Catherine Freeman.

1885 Daniel Freeman officially acquires Burnett's property and names it Inglewood.

1887 Freeman sells some 11,000 acres of his ranch to the Centinela-Inglewood Land Company for development.

Inglewood Townsite

1888 The townsite of Inglewood is platted by the Centinela-Inglewood Land Company.

The California Central Railway completes a line to Redondo Beach.

Freeman erects a large mansion in Inglewood.

1889 Freeman builds a land office on the grounds of the Centinela Adobe.

1905 A group of local businessmen forms the Inglewood Park Cemetery Association.

1907 The Romanesque-style Grace Chapel is erected at Inglewood Park Cemetery.

City of Inglewood

1908 The City of Inglewood is incorporated on February 14th.

1914 Holy Faith Episcopal Church, designed by nationally renowned architect Philip Frohman, is officially consecrated.

1915 The Neoclassical-style Inglewood Mausoleum at the Inglewood Park Cemetery is completed.

1920 On the evening of June 21st, the Los Angeles Basin is rattled by an estimated 5.0 earthquake centered near Inglewood.

1927 The People's Federal Building & Loan Association erects a building at the northeast corner of Market Street and Manchester Boulevard.

The Bank of Inglewood building is erected at the northeast corner of Market and Queen streets.

A new ornamental lighting system is installed along Market Street.

1928 The Professional Building is constructed at Market Street and Manchester Boulevard's northwest corner.

1929 The stock market crashes in late October, ultimately leading to the Great Depression.

1933 On the evening of March 10th, a magnitude 6.4 earthquake strikes off the coast of Long Beach.

1937 Mines Field, west of Inglewood, is purchased by the City of Los Angeles to serve as its municipal airport.

1938 Hollywood Park thoroughbred racetrack opens just southeast of downtown Inglewood.

Wartime & Postwar Growth

1941 On December 7th, the U.S. naval base at Pearl Harbor is attacked by the Imperial Japanese Navy, leading to the United States' entry into World War II.

A J.C. Penney department store opens in downtown Inglewood.

1945 The Granada Theater on Market Street burns down.

1947 Sears department store opens at Manchester and Hillcrest boulevards.

1948 Bank of America opens a large branch on Manchester Boulevard, just east of downtown Inglewood.

The Hardin & Flanagan Colonial Chapel and Mortuary (now Lighthouse McCormick Mortuary) opens on Prairie Avenue, across from Hollywood Park.

1949 On March 31st, the Fox Theater opens on Market Street on the site of the Granada Theater.

Los Angeles Airport is renamed Los Angeles International Airport.

Beyond Downtown

1957 The Market Street trolley line is removed.

1967 The United Bank of California becomes the first contemporary structure to be added to the Market Street corridor.

The Forum is built by prominent businessman Jack Kent Cooke as a venue for his three professional sports franchises in Los Angeles: the Lakers (basketball), Kings (hockey), and Wolves (soccer).

1972 The Forum is the site of the Lakers' first NBA championship since moving to Los Angeles.

1973 A new Inglewood Civic Center complex is constructed just west of downtown.

1984 The Forum is the venue for men's and women's basketball during the Summer Olympics.

1986 Market Street merchants picket to stop the loss of a parking lot at La Brea Avenue and Queen Street for new construction; the protest is unsuccessful.

1988 The Fox Theater, then owned by the Mann theater chain, closes its doors.

Inglewood Today & Tomorrow

1993 Sears is demolished and replaced by a Vons supermarket.

1994 Hollywood Park undergoes a $100 million expansion into Hollywood Park Casino.

1999 The Lakers and Kings leave the Forum for the newly-constructed Staples Center in downtown Los Angeles.

2013 It is announced that Hollywood Park racetrack will close at the end of the fall racing season.

The Fox Theatre is listed in the National Register of Historic Places.

2014 The Forum reopens after a $50 million renovation.

The Forum is listed in the National Register of Historic Places.

2015 The Inglewood City Council approves a plan to build an 70,000-seat football stadium on the Hollywood Park site.

2016 On January 12th, the NFL votes to move the St. Louis Rams back to Los Angeles, with the San Diego Chargers to follow.

The Hollywood Park casino is demolished, and a new casino opened next door.

2020 The *Los Angeles Stadium at Hollywood Park*, currently under construction, will open as the new home of the NFL's Los Angeles Rams and Los Angeles Chargers.

2022 Los Angeles Stadium is scheduled to host Super Bowl LVI.

2023 Los Angeles Stadium will be the venue for the College Football National Championship.

2028 Los Angeles Stadium will host the opening and closing ceremonies for the Summer Olympics, as well as soccer events.

The Forum is slated to host the gymnastics events for the Summer Olympics.

6.1 Listed Historical Resources

There are two (2) properties within the Project Area and/or Expanded Study Area that are listed in the National Register, and are therefore automatically listed in the California Register. As such, these properties are considered historical resources as defined by CEQA.

3900 W. Manchester Boulevard (The Forum)

This property, located at the southeast corner of Manchester Boulevard and Prairie Avenue, contains the Forum, a multi-purpose indoor arena, surrounded by an expansive surface parking lot. It was built by nationally prominent businessman Jack Kent Cooke as a venue for his three professional sports franchises: the Los Angeles Lakers NBA basketball team, the Los Angeles Kings NHL hockey team, and the short-lived Los Angeles Wolves professional soccer team. Completed in 1967, it was designed by prominent Los Angeles architectural firm Charles Luckman & Associates in the New Formalist style. From 2012 to 2014, it underwent an extensive historic renovation.

The Forum was listed in the National Register of Historic Places on September 24th, 2014 under Criterion C as an excellent example of a 1960s New Formalist-style arena building, and is therefore automatically listed in the California Register. As such, this property is a historical resource under CEQA.

115 N. Market Street (former Fox Theater)

This property, located on the west side of Market Street between Regent and Queen streets, contains a 12,090 sq. ft. neighborhood movie theater building. Originally constructed in 1949 for Fox West Coast Theaters, it was designed by prolific theater architect S. Charles Lee in the Late Moderne style. The building is currently unoccupied and its storefront windows and doors are boarded up.

In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a very good example of a 1940s Late Moderne-style movie theater building in Inglewood. On January 14th, 2013, the Fox Theater was listed in the National Register of Historic Places, and is therefore automatically listed in the California Register. As such, this property is a historical resource under CEQA.

6.2 Previously Identified Historical Resources

There are nine (9) properties within the Project Area and/or Expanded Study Area that have been previously identified as eligible for historic listing or designation through historic resources surveys, environmental review, or other efforts. Most notably, a previous historical resources survey of Market Street was conducted as part of the *Inglewood Downtown District/Main Street Project Area Historic Design Guidelines*

project, completed by Lauren Weiss Bricker, PhD, Marion Mitchell-Wilson, and Janet L. Tearnen in 2000.[68] Each of these properties has been re-examined and re-evaluated for its eligibility for listing in the National Register or California Register.

Of these previously identified historical resources, four (4) were re-evaluated as appearing eligible for listing in the National Register and/or California Register, and are therefore considered herein as historical resources for the purposes of CEQA. Five (5) were found to appear ineligible for historic listing due to substantial alteration. No historic districts have been previously identified within the Project Area and/or Expanded Study Area.[69]

302 E. Manchester Boulevard/200-204 S. Market Street (Cox Menswear)

This property, located at the southeast corner of Manchester Boulevard and Market Street, contains a two-story commercial retail building. Originally constructed in 1941, the building was designed in the Streamline Moderne style and was historically occupied by Scotty's Men's Shop. The building's current tenant is Cox Menswear. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a good example of the Streamline Moderne style in Inglewood.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. On the ground story, the existing stone veneer and projecting aluminum-frame display windows appear to be the result of a mid-century remodel, replacing all of the original retail storefronts and wall cladding along both street-facing façades. On the upper story, original fenestration has been replaced with vinyl sliders. Also, the neon sign that originally adorned the corner tower has been removed. Due to these alterations, the building no longer displays the characteristic features of the Streamline Moderne style, nor does it represent a comprehensive or wholesale stylistic remodel from a particular historic period. Thus, this building does not retain sufficient integrity to convey its significance as a good example of its architectural style, and therefore does not appear eligible for

[68] This 2000 report included a historic resources survey of the Inglewood Downtown District/Main Street project area, which was bounded by La Brea Avenue to the west, Locust Street to the east, Florence Avenue to the north, and Hillcrest Boulevard to the south. The upper portion of this survey area includes the Market Street portion of the current Project Area/Expanded Study Area. The survey identified eight (8) individual properties within the current Project Area/Expanded Study Area as eligible for historic designation; no historic district was identified.

[69] The *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, adopted November 1, 2016, identifies Downtown Inglewood as "Historic Downtown." However, this appears to refer to the area's history as Inglewood's original business district, and is not an evaluation of historic eligibility.

listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

320-330 E. Manchester Boulevard (Bank of America)

This property, located at the southwest corner of Manchester Boulevard and Locust Street, contains a 21,976 sq. ft. bank building and a rear surface parking lot.[70] Originally constructed in 1948, the building was erected for Bank of America and designed in the Late Moderne style. Bank of America continues as its current tenant. The smaller adjacent building at 320 E. Manchester Boulevard was originally constructed in 1920 and remodeled as part of the Bank of America in 1954. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a good example of a 1940s PWA Moderne-style bank building in Inglewood.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its form and massing, exterior wall cladding, fenestration patterns, and decorative elements. The framing of the windows and doors may have been updated. However, the replacement material appears to be in keeping with what would have been in place historically, such that this change does not substantially diminish the building's integrity. Other changes—including lighting, signage, and the addition (and subsequent removal) of an in-wall ATM—are minor in relation to the building's overall appearance. The building remains largely intact and continues to display the characteristic features of a PWA Moderne bank building from the 1940s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

100 N. Market Street/307 E. Queen Street (former Bank of Inglewood)

This property, located at the northeast corner of Market and Queen streets, contains a two-story, 9,258 sq. ft. mixed-use commercial building constructed in 1927. The building was originally constructed for the Bank of Inglewood at a cost of $140,000. Designed by local architect William L. Campbell in the Mediterranean Revival style, the reinforced concrete building was the first steel frame business block in the city. The building was sold to Bank of America National Trust & Savings Association in 1936; in 1950 it became Southwest Bank. It now serves as a retail space occupied by Vajra Books & Gifts. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under

[70] The main bank building uses the address 330 E. Manchester Bl.; the smaller adjacent building is at 320.

Criterion C as an excellent example of a 1920s Mediterranean Revival-style bank building in Inglewood.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its form and massing, roof material, exterior wall cladding, fenestration patterns, elaborated arched main entrance and ground-story windows, upper-story windows, and various decorative elements. Alterations—such as replaced front doors and the addition of tile cladding on the ground story—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The building remains highly intact and continues to display the characteristic features of a Mediterranean Revival bank building from the 1920s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the National Register and the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

124-126 N. Market Street

This property, located on the east side of Market Street between Regent and Queen streets, contains a two-story, 2,750 sq. ft. mixed-use commercial building constructed in 1920. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.[71]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. The building's original retail storefronts have been replaced with floor-to-ceiling aluminum storefronts, thereby completely altering the ground story on the building's only publicly-visible façade. On the upper story, original fenestration has been replaced with metal sliders. The building does not display the characteristic features of a particular architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

125 S. Market Street

This property, located on the west side of Market Street between Queen Street and Manchester Boulevard, contains a one-story commercial building constructed in 1938. The building is currently occupied by Basket Beauty Supply. In 2000, the property was

[71] Note that Inglewood's downtown survey was completed prior to the revision of the California Historical Resources Status Codes. These codes were updated and their definitions revised in August 2003.

assigned a status code of 5S1 (eligible for local listing) under Criterion C as an intact example of a mid-century remodeled façade.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it has been substantially altered over time, including since its previous evaluation. The 2000 survey referred to this building as "among the more visually interesting" mid-century façade remodels along Market Street, noting a "metal pylon sign [that] juts above the building's parapet at a sufficient height and angle to be seen by the pedestrian" and "framed [display] cases that cantilever beyond their built-in bases."[72] None of these features remain extant. Alterations include the replacement of the exterior wall cladding on both stories, the replacement of all retail storefronts and entry doors, the addition of applied decorative features above the canopy, added light fixtures, and contemporary signage. Taken together, these alterations have completely transformed the building's only publicly-visible façade, such that it no longer displays any elements of its original 1930s design, nor does it represent a comprehensive mid-century façade remodel. Thus, this building does not retain sufficient integrity to convey its significance as a good example of its architectural style, and therefore does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

129-139 S. Market Street (former J.C. Penney)

This property, located on the west side of Market Street between Queen Street and Manchester Boulevard, contains a two-story, 62,583 sq. ft. commercial retail building which originally housed a J.C. Penney department store. The building was initially constructed as one story in 1941. In 1954, it was expanded with a second story and remodeled in the Mid-Century Modern style. It is currently occupied by Inglewood Marketplace. In 2000, the property was assigned a status code of 5S1 (eligible for local listing) under Criterion C as a good example of a 1950s Mid-Century Modern-style department store building.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its 1950s remodel. The building retains the majority of its exterior features from this period, including its form and massing, exterior wall cladding, angled storefronts, recessed entry with terrazzo flooring, entry doors, canopy, upper-story ribbon windows, and applied decoration. Alterations—such as contemporary signage and the distinctive paint job—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The building remains highly intact and continues to display the characteristic features of a Mid-Century Modern department store building from the 1950s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style,

[72] Bricker, 16.

and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

132 S. Market Street

This property, located on the east side of Market Street between Queen Street and Manchester Boulevard, contains a two-story mixed-use commercial building constructed in 1925. The building is currently occupied by Smoove Fashion World. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. The building's original retail storefront has been replaced with a floor-to-ceiling aluminum storefront, and brick veneer wall cladding and an awning have been added, thereby completely altering the building's ground story. On the upper story, original fenestration has been replaced with metal or vinyl sliders. Some original decorative features remain on the upper story. However, overall the building does not display the characteristic features of a particular architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

150 S. Market Street (former People's Federal Building & Loan Association)

This property, located at the northeast corner of Market Street and Manchester Boulevard, contains a two-story, 16,575 sq. ft. mixed-use commercial building. The building was originally constructed in 1927 as the People's Federal Building & Loan Association. It was remodeled in the Late Modern style, likely sometime in the 1960s. It is currently occupied by World Hat & Boot Mart. In 2000, the property was assigned a status code of 5S1 (eligible for local listing) under Criterion C as a good example of a 1960s Late Modern-style commercial building.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its 1960s remodel. The building retains the majority of its exterior features from this period, including its form and massing, exaggerated arches and elevated roof plate, exterior wall cladding, metal storefronts and entry doors, canopy, and upper-story fenestration. Alterations—such as contemporary signage and the replacement of the original entry doors with a display window—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The building remains largely intact and continues to display the characteristic features of a Late Modern commercial building from the 1960s. Thus, this building retains sufficient integrity to convey its significance as a good

example of its architectural style, and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

333 E. Nutwood Street

This property, located at the northwest corner of Locust and Nutwood streets, contains a one-story commercial office building constructed in 1940. The building is currently occupied by Anphon Medical Center. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears to have been substantially altered over time. The building's exterior wall cladding has been replaced with rough-textured stucco, and exaggerated stucco-clad window surrounds have been added throughout. These changes are incompatible with the building's American Colonial Revival style, and thereby substantially alter the building's overall appearance. The building is no longer a good example of its architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

6.3 Newly Identified Historical Resources

Detailed field surveys of the Project Area and Expanded Study Area were conducted on June 4th, 2018 and February 21st, 2019. These field surveys were supplemented by property-specific and contextual research to identify additional properties that are eligible for listing or designation and therefore may be considered historical resources under CEQA. Through this process, five (5) additional properties were evaluated as appearing eligible for listing in the National Register and/or California Register, and are therefore considered herein as historical resources for the purposes of CEQA. No historic districts were identified within the Project Area and/or Expanded Study Area.

260 N. Locust Street (Holy Faith Episcopal Church)

This property, located at the southeast corner of Locust Street and Grace Avenue, contains the Holy Faith Episcopal Church complex. The congregation was first established in 1911, with services held in the Inglewood Masonic Hall. In 1912, funds were donated to erect a complex consisting of a church, a rectory (the dwelling to the south), and parish hall (now a school at the rear). The complex of buildings was designed by architect Philip Frohman, would go on to become nationally renowned, particularly for his work on the National Cathedral in Washington, D.C. The church building was officially consecrated on November 8th, 1914. It lost its original bell tower

in the 1933 Long Beach Earthquake, but continued to be improved throughout the 1930s, with the Stations of the Cross, imported from Italy; the pulpit, lectern and choir stalls from England; and the reredos carved and imported from Bavaria. The stained-glass windows were crafted by Judson Studios in Highland Park. Due to its growing congregation, in the late 1950s architect Philip Frohman returned to design an addition to the church building.[73] The church was extended to the west and an interior balcony added, doubling its capacity from 200 to 400. The newly expanded church building was dedicated in 1959. The parish hall, which now serves as a school, has been expanded multiple times from the 1950s to the 1980s, now extending nearly the full width of the lot. The rectory appears largely intact, with some windows replaced. In 2000, the property was assigned a status code of 4S1 (may become eligible for the National Register when it becomes old enough).[74]

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially intact, including the main church building, the rectory, and the school. Character-defining features of the church building include its double-cruciform plan; gabled roofs with capped parapets and decorative crosses; copper steeple; stucco exterior walls with cast-stone stepped buttresses; base with cast-stone molding; pointed-arch openings with decorative cast-stone surrounds; leaded stained-glass windows; cast-stone Gothic tracery and quoining; wood plank doors with exposed iron hardware; metal scuppers and downspouts; and decorative wrought-iron wall sconces. The church expansion was designed by the original architect to respect and complement the original church—with features such as wood entry doors and stained-glass windows retained and incorporated into the expanded design—and thus is considered to have acquired significance in its own right. Similarly, additions to the school building are compatible with yet differentiated from the original extent, which remains evident. Thus, the property as a whole retains sufficient integrity to convey its significance as an excellent and rare early 20th-century religious complex in Inglewood. Additionally, the church building appears to be an outstanding example of Late Gothic Revival architecture, representing the work of a nationally-significant architect. Therefore, the property appears eligible for listing in the National Register and the California Register under Criterion A/1 as early institutional development in Inglewood, and Criterion C/3 for its architectural merit. As such, it is considered a historical resource herein for the purposes of CEQA.

[73] Bricker, 8 (Database Master Report, appendix to the *Inglewood Downtown District/Main Street Project Area Historic Design Guidelines)*.

[74] It is unclear why this status code was assigned, as it was typically reserved for properties that were less than 50 years of age at the time of evaluation.

158-170 N. Market Street (former United Bank of California)

This property, located at the southeast corner of Market and Regent streets, contains a 9,000 sq. ft. branch bank building and rear surface parking lot. Originally constructed in 1967 for United Bank of California, it was designed by noted Los Angeles architect Richard Dorman in the Late Modern style.[75] Richard Dorman was a prolific modernist architect and designer who worked throughout the Los Angeles region from the 1950s through the 1970s. Over the course of his career he designed dozens of high-end residences, as well as various commercial and institutional buildings such as offices, churches, and banks. In 1976, the bank added a similarly-designed drive-thru automated teller building across Regent Street to the north, also designed by Dorman.[76] The building is currently occupied by Broadway Federal Bank. In 2000, the property was assigned a status code of 6Z (appears ineligible for the National Register).

Historic Resources Group has re-examined this property for the purpose of this report, and finds that it appears substantially unaltered since its original construction. Character-defining features include its cruciform roof plan; projecting trapezoidal volumes; battered walls; heavy wood beams; smooth exterior surfaces of brick and stucco; and large expanses of tinted glass. Alterations—such as contemporary signage, and the addition of an in-wall ATM with an access ramp and projecting canopy—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. At the time of its previous evaluation, the bank building was well below the 50-year age threshold used in standard preservation practice for evaluating eligibility for historic designation.[77] Additionally, since the 2000 survey there has been substantial new scholarship on the built environment of the mid-20th century, with new historic contexts developed to provide guidance for evaluating such properties. In light of this new scholarship, this property appears to be significant as a 1960s Late Modern-style bank building in Inglewood, representing the work of a noted architect. It remains highly intact and thus retains sufficient integrity to convey its significance as a good example of its architectural style. Therefore, the property appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, it is considered a historical resource herein for the purposes of CEQA.

149-155 S. Market Street/231-239 E. Manchester Boulevard (Professional Building)

This property, located at the northwest corner of Market Street and Manchester Boulevard, contains a two-story, 6,000 sq. ft. mixed-use commercial building.

[75] Although an original building permit for the 1967 bank building is not available from the City of Inglewood, the permit for the similarly-styled drive-thru automated teller building across the street lists Richard Dorman as its architect.

[76] Because the drive-thru automated teller building is situated across the street and was added nine years later, it is not considered part of the bank building.

[77] According to National Park Service guidance, 50 years is a general estimate of time needed to develop sufficient historical perspective to evaluate historic significance.

Constructed in 1928 as the Professional Building, it was designed in the Spanish Colonial Revival style with cast-stone Churrigueresque details. In 2000, the property was assigned a status code of 4S7 (may become eligible for the National Register when integrity is restored).

Historic Resources Group has re-examined this property for the purpose of this report, and finds that despite alterations on the ground story, the upper story appears substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its red clay tile shed roofs with exposed rafter tails; smooth stucco exterior cladding; wood tripartite upper-story windows; decorative cast-stone details at the roofline; and a canopy with decorative wrought-iron supports at the secondary entrance. Alterations—including replacement of ground-story storefronts and entry doors—do somewhat diminish the building's integrity. However, overall the building remains largely intact and continues to display the characteristic features of a Spanish Colonial Revival commercial building from the 1920s. Thus, it retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, this property is considered a historical resource herein for the purposes of CEQA.

619-635 S. Prairie Avenue (Lighthouse McCormick Mortuary)

This property, located at the northwest corner of Prairie Avenue and La Palma Drive, contains a two-story, 9,352 sq. ft. chapel and mortuary building. Designed in the American Colonial Revival style, the building was initially constructed in 1948 as the Hardin & Flanagan Colonial Chapel & Mortuary. In 1959, the business was acquired by the McCormick family and renamed McCormick Mortuary. Around 1960, the building was expanded with a new two-story wing to the north. It is currently operated as Lighthouse McCormick Mortuary.

Historic Resources Group has examined this property for the purpose of this report, and finds that it appears substantially unaltered since its 1960s expansion. The building retains the majority of its exterior features from this period, including its form and massing; hipped and gable roofs with boxed eaves; decorative cornice with return; two-story porticos with slender full-height columns; stucco and wood clapboard exterior cladding; fluted pilasters; divided-light double-hung wood windows with louvred wood shutters; wood paneled doors; round and rounded-arch openings; elaborated entrances including fanlights, sidelights, and decorative wood surrounds; and hanging lanterns. Alterations—such as replacement of an original window with a vinyl slider—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The mortuary's expansion was designed to respect and complement that of the original chapel and office, and thus is considered to have acquired significance in its own right. The building remains highly intact and continues to display the characteristic features of a mid-20th century American Colonial Revival mortuary building. Thus, it

retains sufficient integrity to convey its significance as an excellent example of its architectural style, and therefore appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, this property is considered a historical resource herein for the purposes of CEQA.

720 E. Florence Avenue (Inglewood Park Cemetery)[78]

This property, located at the northeast corner of Manchester Boulevard and Prairie Avenue, contains a large cemetery. In 1905, a group of local businessmen formed the Inglewood Park Cemetery Association and acquired a large plot of land just east of what would become downtown Inglewood. In 1907, the cemetery erected the Romanesque-style Grace Chapel, a three-quarters replica of a church in Edinburgh, Scotland. In these early days, funerals often arriving by rail from Los Angeles in a private funeral car; portions of the original railroad waiting station have been incorporated into the main entrance. The Neoclassical-style Inglewood Mausoleum was completed in 1915 and was the first community mausoleum in the State of California. The Mausoleum of the Golden West was built over several decades from the 1930s to the 1960s and features stained-glass representations of early California by Judson Studios. Various notable persons have been laid to rest at Inglewood Park Cemetery, including some of the South Bay region's earliest settlers, a number of Civil War veterans, and famous figures such as former Los Angeles Mayor Tom Bradley, Chet Baker, Ray Charles, Ella Fitzgerald, Etta James, boxer Sugar Ray Robinson, and architect Paul Williams. At the time of this report, both Grace Chapel and the Inglewood Mausoleum were undergoing renovation.

Historic Resources Group has examined this property for the purpose of this report, and finds that it has evolved over time but that it remains substantially intact. The property appears to retain the majority of its original features, such as its overall form and configuration, landscape design, and main entrance, as well as multiple excellent examples of cemetery architecture, including Grace Chapel, Inglewood Mausoleum, and Mausoleum of the Golden West.[79] Alterations—such as the addition of more recent buildings—do not substantially diminish the integrity of the property overall. Thus, the property as a whole retains sufficient integrity to convey its significance as an excellent

[78] The parcel at the northeast corner of Manchester Boulevard and Prairie Avenue is included in the Expanded Study Area because it fronts the alignment right-of-way. This parcel has no address and contains only a small portion of the Inglewood Park Cemetery property. The vast majority of the cemetery occupies the adjacent parcel at 720 E. Florence Avenue (APN 4012031027). In the interest of being inclusive, the Inglewood Park Cemetery has been included in the Expanded Study Area for the purpose of this Project. While the cemetery extends several blocks north of the Project Area to Florence Avenue, project impacts would only be expected in the southwesternmost portion of the property.

[79] Due to the size and complexity of this property, identification of contributing and non-contributing features was outside the scope of this report.

and rare early 20th-century cemetery in Inglewood. Additionally, Grace Chapel, Inglewood Mausoleum, and Mausoleum of the Golden West appear to be excellent examples of their architectural style. Therefore, the property appears eligible for listing in the National Register[80] and the California Register under Criterion A/1 as early institutional development in Inglewood, and Criterion C/3 and for the quality of its architectural and landscape design. As such, this property is considered a historical resource herein for the purposes of CEQA.

6.4 Summary of Historical Resources

To summarize, eleven (11) historical resources have been identified in the Project Area and/or Expanded Study Area for the Locally Preferred Alternative and/or the Market Street Station Alternative. Under the Locally Preferred Alternative, there are ten (10) identified historical resources, with one (1) additional historical resource under the Market Street Station Alternative. Of these, two (2) are listed in the National Register and the California Register; four (4) were previously identified as historic through historic resources surveys, environmental review, or other efforts, and have been re-evaluated as appearing eligible for listing in the National Register and/or California Register; and five (5) were identified through this process and evaluated as appearing eligible for listing in the National Register and/or California Register. All of these properties are considered herein as historical resources for the purposes of CEQA. Therefore, potential impacts of the Project to these properties are analyzed in this report. *[See Figure 6. Map of Historical Resources (Locally Preferred Alternative) and Figure 7. Map of Historical Resources (Market Street Station Alternative).]*

[For field photographs of these historical resources and their immediate surroundings, taken June 4th, 2018 and February 21st, 2019, see Appendix A.]

Summary List of Historical Resources

ADDRESS	APN	DATE	NAME	DESCRIPTION	CURRENT EVALUATION
260 N Locust St	4015026039	1914	Holy Faith Episcopal Church	Religious complex (church, rectory and school)	Appears eligible for listing in NR & CR
320-330 E Manchester Bl	4021013018	1948	Bank of America	Branch bank, rear parking lot	Appears eligible for listing in CR

[80] Based upon its age, this property appears to meet National Register Criterion Consideration D for cemeteries.

ADDRESS	APN	DATE	NAME	DESCRIPTION	CURRENT EVALUATION
3900 W Manchester Bl	4025001002	1967	The Forum	Multi-purpose indoor arena, surrounding parking lot	Listed in NR and CR
100 N Market St/307 E Queen St	4021007024	1927	Former Bank of Inglewood (now Vajra Books & Gifts)	Two-story mixed-use commercial building	Appears eligible for listing in NR & CR
115 N Market St	4021008006	1949	Former Fox Theater	Neighborhood movie theater	Listed in NR and CR
158-170 N Market St	4021007012	1967	Former United Bank of California (now Broadway Federal Bank)	Branch bank, rear parking lot	Appears eligible for listing in CR
129-139 S Market St	4021009031	1941, addition and remodel 1954	Former J.C. Penney (now Inglewood Marketplace)	Two-story retail commercial building	Appears eligible for listing in CR
149-155 S Market St/231-239 E Manchester Bl	4021009017	1928	Professional Building	Two-story mixed-use commercial building	Appears eligible for listing in CR
150 S Market St	4021010015	1927, remodel c. 1965	Former People's Federal Building & Loan Association (now World Hat & Boot Mart)	Two-story mixed-use commercial building	Appears eligible for listing in CR
619-635 S Prairie Ave	4021038027	1948, addition c. 1960	Lighthouse McCormick Mortuary (former Hardin & Flanagan Colonial Chapel and Mortuary)	Two-story chapel and mortuary building	Appears eligible for listing in CR
720 E Florence Ave[81]	4012031930	1905	Inglewood Park Cemetery	Cemetery	Appears eligible for listing in NR & CR

[81] The parcel situated within the Expanded Study Area (APN 4012031930) has no address and contains only a small portion of the Inglewood Park Cemetery property. The vast majority of the cemetery occupies the adjacent parcel at 720 E Florence Avenue (APN 4012031027).

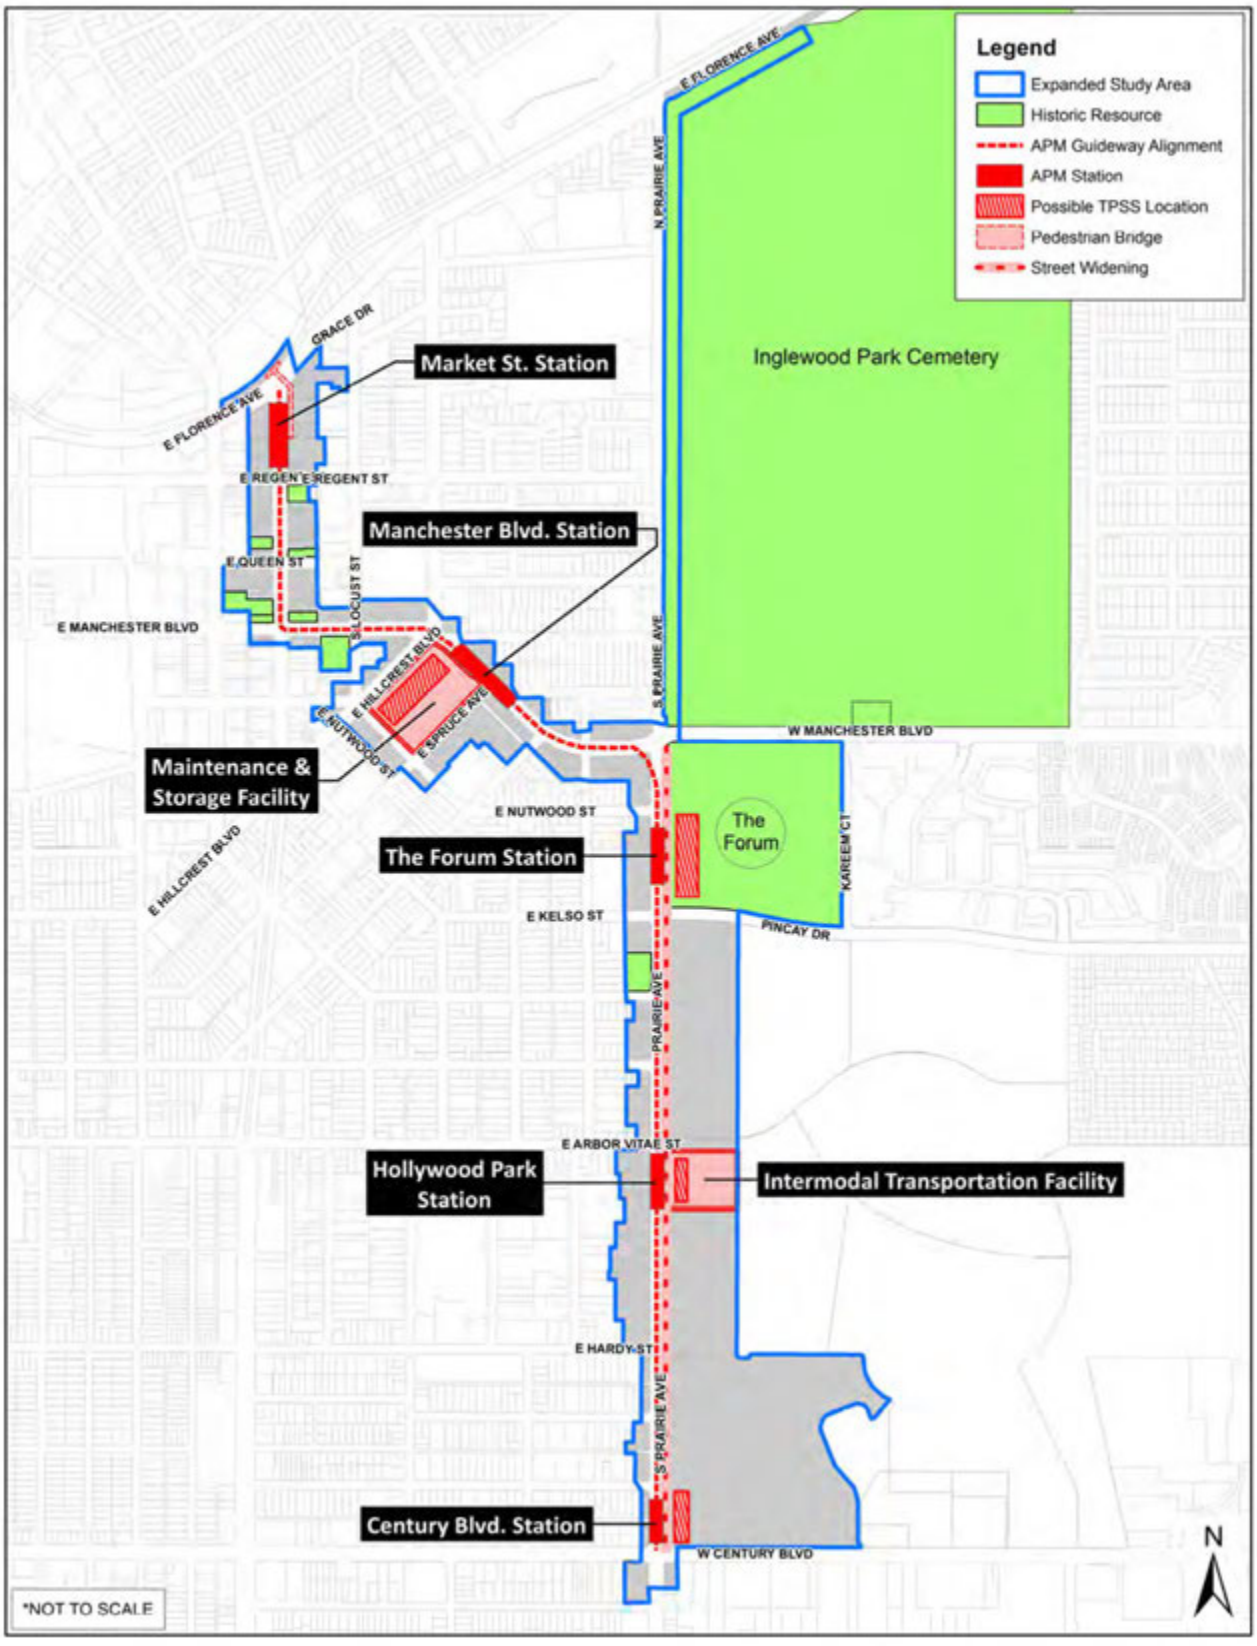

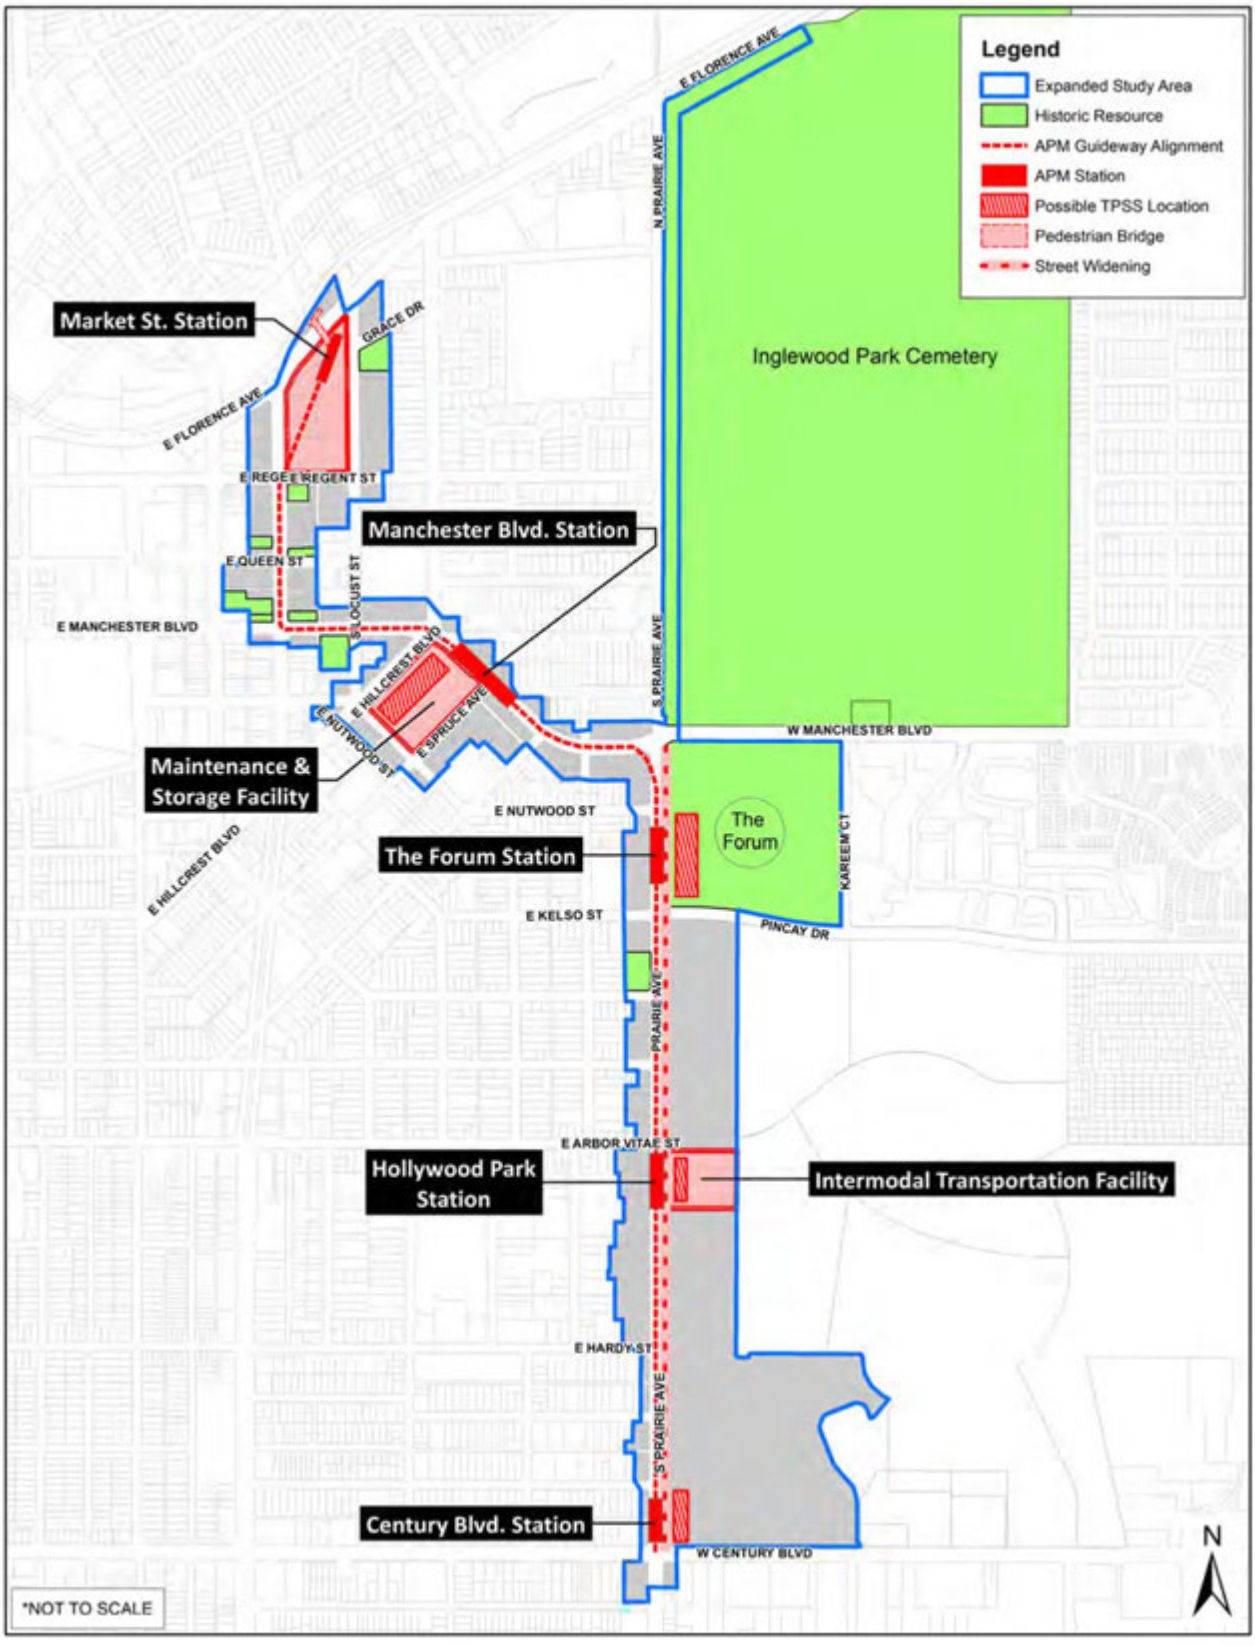

Figure 7. MAP OF HISTORICAL RESOURCES (MARKET STREET STATION ALTERNATIVE)

CONFIDENTIAL DRAFT FOR INTERNAL REVIEW ONLY

7.1 Framework for Analysis

Guidelines for Implementation of CEQA are codified at Title 14 California Code of Regulations section 15000 et seq. The *CEQA Guidelines* state that "a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment."[82] A "substantial adverse change in the significance of a historical resource" means the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired.[83]

The CEQA Guidelines go on to state that "[t]he significance of a historical resource is materially impaired when a project…"[d]emolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources… local register of historical resources… or its identification in a historical resources survey."[84]

Thus, an evaluation of project impacts under CEQA requires a two-part inquiry: (1) a determination of whether the project site contains or is adjacent to a historical resource, and if so, (2) a determination of whether the proposed project will result in a substantial adverse change in the significance of the historical resource.

7.2 Analysis of Direct Impacts

This section analyzes the potential for the Project to have a direct impact on any historical resources under CEQA. As discussed above, the significance of a historical resource is materially impaired, and constitutes a substantial adverse change in the significance of that historical resource, if the project would materially alter in an adverse manner those physical characteristics of the resource or its immediate surroundings that convey its historical significance and justify its inclusion in the California Register, local register, or historical resource survey. The significance of a historical resource may be materially impaired through project impacts both direct and indirect. Thus, the potential for this Project to impact a historical resource, either directly or indirectly, is analyzed.

As described above, much of the Project will be constructed within the public right-of-way,[85] including the elevated APM guideway set on single or dual support columns, and five APM Stations. However, several Project components will be constructed on parcels immediately adjacent to the public right-of-way. Under the Locally Preferred Alternative,

[82] *CEQA Guidelines*, Section 15064.5(b).
[83] Ibid., Section 15064.5(b)(1).
[84] Ibid., Section 15064.5(b)(2).
[85] The public right-of-way extends to the front property line on each side of the street, including the roadway and sidewalks.

these include the vertical circulation elements for each of the five APM stations; the landing for a pedestrian bridge; the Maintenance & Storage Facility; the Intermodal Transportation Facility; up to four Traction Power Substations; and the widening of Prairie Avenue. Under the Market Street Station Alternative, these also include the alternate location for the Market Street Station, and an alternate location for the Market Street Station pedestrian bridge. Thus, the Project does have the potential to directly impact historical resources.

This report has identified two (2) historical resources within the Project Area for the Locally Preferred Alternative and the Market Street Station Alternative that could be directly impacted by the Project. Potential impacts to each of these resources are described below.

3900 W. Manchester Boulevard (The Forum)

The Forum property is located within the Project Area for the Locally Preferred Alternative and the Market Street Station Alternative, situated along the east side of the APM alignment as it travels north/south along Prairie Avenue. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Prairie Avenue between Manchester and Century boulevards. Additionally, Prairie Avenue will be widened to the east, encroaching into the Forum property along its western boundary. With this street widening, additional Project components will be constructed on what is now the Forum parking lot, including the support columns east of the APM guideway; vertical circulation elements for the Forum Station; and possibly a Traction Power Substation.

The Project will not physically alter the Forum building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will alter a portion of the Forum's surface parking lot, which is identified as a character-defining feature in the National Register nomination. The Project will take approximately 20 to 25 feet of the parking lot along its western edge for the widening of Prairie Avenue between Nutwood and Kelso streets, thereby changing the original dimensions of the site. Despite this alteration, the parking lot will retain its overall character as an expansive, on-grade, asphalt-paved parking area surrounding the Forum building on all sides.

Additionally, the Project includes new construction on the Forum site, including support columns for the APM guideway; and vertical circulation elements such as escalators, elevators, stairs for the Forum Station. The Project may also construct a 3,000-square-foot Traction Power Substation at the southwest corner of the Forum site. All of these new features will be constructed within or immediately adjacent to the pubic right-of-way of the newly relocated sidewalk on the east side of Prairie Avenue. Proportionally, the new construction will be much smaller in scale as compared to the Forum building and to the parking lot itself, both of which are quite massive. These new features will be situated along the property's western edge, and thus there will be a substantial physical

distance between the new construction and the Forum building itself. Thus, the Project will not alter the relationship between the Forum building and its immediate surroundings in any meaningful way.

The motorist's view of the Forum from Prairie Avenue looking east will be partially obscured by the new construction. However, pedestrian views from the new sidewalk on the east side of Prairie will remain largely intact with only minimal impairment. Views of the Forum building looking south from Manchester will remain unimpaired. Overall, the new construction will not block or obscure important views of the Forum building, as there will remain multiple vantage points from which the building can be observed without obstruction. The Forum site will retain its essential character as a large circular structure set at the center of a sprawling, generally open site with largely unobstructed views from all sides.

Because the Project will not physically alter the Forum building; will not block or obscure important views of the Forum building; and will only alter a portion of the Forum parking lot; the Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Forum will continue to convey its historic significance as a 1960s New Formalist-style arena in Inglewood. Therefore, direct impacts to the Forum as a result of the Project will be less than significant.

150 S. Market Street (former People's Federal Building & Loan Association)

The former People's Federal Building & Loan Association building is located within the Project Area for the Locally Preferred Alternative and the Market Street Station Alternative. The building is situated along the APM alignment at the northeast corner of Market Street and Manchester Boulevard. As described above, the Project will construct an elevated APM guideway set on support columns within the public rights-of-way of Market Street and Manchester Boulevard. Traveling southbound, the APM guideway will run along Market Street south to Manchester Boulevard, where it will make a left-hand turn to continue east on Manchester.[86]

Due to the existing conditions at the intersection of Market and Manchester, and the requirements of the new constriction, the APM guideway and/or support columns may touch the property on the northeast corner. Existing conditions include the relative narrowness of Market Street, the required width of the guideway, the required guideway turning radius, and the absence of front and side building setbacks on Market Street and Manchester Boulevard. For the purpose of this report, it is presumed that the Project will acquire this property and demolish the former People's Federal Building & Loan Association building.

[86] Traveling northbound, the APM guideway will run along Manchester Boulevard west to Market Street, where it will make a right-hand turn to continue north on Market.

Because the Project is presumed to demolish the former People's Federal Building & Loan Association building, the Project will result in a significant impact to the historical resource. The demolition of a historical resource cannot be mitigated to a less than significant level.

7.3 Analysis of Indirect Impacts

This section analyzes the potential for the Project to have an indirect impact on any historical resources under CEQA. As discussed above, the significance of a historical resource is materially impaired, and constitutes a substantial adverse change in the significance of that historical resource, if the project would materially alter in an adverse manner those physical characteristics of the resource or its immediate surroundings that convey its historical significance and justify its inclusion in the California Register, local register, or historical resource survey. The significance of a historical resource may be materially impaired through project impacts both direct and indirect. Thus, the potential for this Project to impact a historical resource, either directly or indirectly, is analyzed.

As described above, much of the Project will be constructed within the public right-of-way,[87] including the elevated APM guideway set on support columns, and five APM Stations. An Expanded Study Area has been defined to encompass what is expected to be the maximum extent within which project impacts will occur. The Expanded Study Area includes all parcels fronting the alignment right-of-way on both sides. In addition, where there will be substantial new construction outside of the alignment right-of-way, parcels immediately adjacent to or across from the new construction have been included in the Expanded Study Area. This includes parcels adjacent to or across from the Maintenance & Storage Facility site; the Intermodal Transportation Facility site; the sites where the pedestrian bridges will land; and the four possible Traction Power Substation sites. Under the Market Street Station Alternative, this also includes parcels adjacent to or across from the block where the elevated APM guideway and Market Street Station would be constructed. The Project has the potential to indirectly impact historical resources within the Expanded Study Area.

This report has identified six (6) historical resources within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative that could be indirectly impacted by the Project. Potential impacts to each of these resources are described below.

320-330 E. Manchester Boulevard (Bank of America)

The Bank of America building is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. As described

[87] The public right-of-way extends to the front property line on each side of the street, including the roadway and sidewalks.

above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Manchester Boulevard, between Market Street and Prairie Avenue. The Bank of America building is located on the south side of Manchester Boulevard, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the Bank of America building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along the south side of Manchester Boulevard, substantially altering the way in which the Bank of America building will be viewed and experienced by pedestrians and motorists. The building's historic significance is conveyed through its two publicly-visible facades, on Manchester Boulevard (primary) and Locust Street (secondary). The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of Manchester Boulevard buildings at a height potentially as low as the second story. Additionally, support columns will be placed on the sidewalk, immediately in front of or adjacent to the building.

Due to the required width of the guideway, and the absence of front building setbacks on Manchester Boulevard, the Project will block and/or obscure important views of the historical resource, and particularly of its primary façade. Specifically, views of the building from the north side of Manchester—a critical vantage point from which to observe the building's overall scale, massing, and composition—will be obstructed by the new APM guideway. Moreover, vantage points from which to achieve unobstructed views of the building's primary façade will largely be limited to the sidewalk directly in front of the building. Because the building is set at the sidewalk, it is difficult to appreciate the building's overall design from this perspective. The building's secondary façade along Locust Street will not be obscured by the Project.

Because the Project will block and/or obscure important views of the Bank of America building's primary façade, and will considerably limit the vantage points from which the building can be observed without obstruction, the Project will result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the ability of the Bank of America to convey its historic significance as a 1940s PWA Moderne-style bank building will be impaired. Therefore, indirect impacts to the Bank of America building as a result of the Project will be significant.

100 N. Market St/307 E Queen Street (former Bank of Inglewood)

The former Bank of Inglewood building is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Florence Avenue and Manchester Boulevard. The former Bank of Inglewood building is located on the east

side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the former Bank of Inglewood building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, substantially altering the way in which the former Bank of Inglewood will be viewed and experienced by pedestrians and motorists. The building's historic significance is conveyed through its two publicly-visible facades, on Market Street (primary) and Queen Street (secondary). The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of Market Street buildings at a height potentially as low as the second story. Additionally, support columns will be placed on the sidewalk, immediately in front of or adjacent to the building.

Due to the relative narrowness of Market Street, the required width of the guideway, and the absence of front building setbacks, the Project will block and/or obscure important views of the historical resource, and particularly of its primary façade. Specifically, views of the building from the west side of Market—a critical vantage point from which to observe the building's overall scale, massing, and composition—will be obstructed by the new APM guideway. Moreover, vantage points from which to achieve unobstructed views of the building's primary façade will largely be limited to the sidewalk directly in front of the building. Because the building is set at the sidewalk, it is difficult to appreciate the building's overall design from this perspective. The building's secondary façade along Queen Street will not be obscured by the Project.

Because the Project will block and/or obscure important views of the former Bank of Inglewood building's primary façade, and will considerably limit the vantage points from which the building can be observed without obstruction, the Project will result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the ability of the former Bank of Inglewood to convey its historic significance as a 1920s Mediterranean Revival-style bank building will be impaired. Therefore, indirect impacts to the former Bank of Inglewood building as a result of the Project will be significant.

115 N. Market Street (former Fox Theater)

The former Fox Theater building is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Florence Avenue and Manchester Boulevard. The former Fox Theater building is located on the west side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the former Fox Theater building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, substantially altering the way in which the former Fox Theater will be viewed and experienced by pedestrians and motorists. The building's historic significance is conveyed through its Market Street façade, which is its only publicly-visible façade. The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of Market Street buildings at a height potentially as low as the second story. At the Fox Theater, the guideway's western edge could come within just a few feet or less of the theater's projecting marquee, which overhangs the sidewalk.[88] Additionally, support columns will be placed on the sidewalk, immediately adjacent to the building. The placement of these supports has been shifted to avoid placing a column directly in front of the theater, in order to minimize the visual impact; however, the impact cannot be eliminated.

Due to the relative narrowness of Market Street, the required width of the guideway, and the absence of front building setbacks, the Project will block and/or obscure important views of the historical resource, and particularly of its primary façade. Specifically, views of the building from the west side of Market—a critical vantage point from which to observe the building's overall scale, massing, and composition—will be obstructed by the new APM guideway. Moreover, vantage points from which to achieve unobstructed views of the building's primary façade will largely be limited to the sidewalk directly in front of the building. Because the building is set at the sidewalk, it is difficult to appreciate the building's overall design from this perspective.

Because the Project will block and/or obscure important views of the former Fox Theater building's primary façade, and will considerably limit the vantage points from which the building can be observed without obstruction, the Project will result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the ability of the former Fox Theater to convey its historic significance as a 1940s Late Moderne-style movie theater building will be impaired. Therefore, indirect impacts to the former Fox Theater building as a result of the Project will be significant.

158-170 N. Market Street (former United Bank of California)

The former United Bank of California building is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. As

[88] In current Project plans, the distance between the edge of the guideway and the theater marquee is not dimensioned. However, it appears possible that the guideway could come within inches of the marquee.

described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Florence Avenue and Manchester Boulevard. The former United Bank of California building is located on the east side of Market Street, immediately adjacent to where the new APM guideway will be located.[89]

The Project will not physically alter the former United Bank of California building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, substantially altering the way in which the former United Bank of California will be viewed and experienced by pedestrians and motorists. The building's historic significance is conveyed through its two publicly-visible façades, on Market Street (primary) and Regent Street (secondary). The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of Market Street buildings at a height potentially as low as the second story. Additionally, support columns will be placed on the sidewalk, immediately in front of or adjacent to the building.

Due to the relative narrowness of Market Street, the required width of the guideway, and the absence of front building setbacks on Market Street, the Project will block and/or obscure important views of the historical resource, and particularly of its primary façade. Specifically, views of the building from the west side of Market—a critical vantage point from which to observe the building's overall scale, massing, and composition—will be obstructed by the new APM guideway. Moreover, vantage points from which to achieve unobstructed views of the building's primary façade will largely be limited to the sidewalk directly in front of the building. Because the building is set at the sidewalk, it is difficult to appreciate the building's overall design from this perspective. The building's secondary façade along Regent Street will not be obscured by the Project.

Because the Project will block and/or obscure important views of the former United Bank of California building's primary façade, and will considerably limit the vantage points from which the building can be observed without obstruction, the Project will result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the ability of the former United Bank of California to convey its historic significance as a 1960s Late Modern-style bank building will be impaired. Therefore, indirect impacts to the former United Bank of California building as a result of the Project will be significant.

[89] The drive-thru automated teller building across the street is not considered part of the bank building.

129-139 S. Market Street (former J.C. Penney)

The former J.C. Penney building is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Florence Avenue and Manchester Boulevard. The former J.C. Penney building is located on the west side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the former J.C. Penney building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, substantially altering the way in which the former J.C. Penney will be viewed and experienced by pedestrians and motorists. The building's historic significance is conveyed through its Market Street façade, which is its only publicly-visible façade. The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of Market Street buildings at a height potentially as low as the second story. Additionally, support columns will be placed on the sidewalk, immediately in front of or adjacent to the building.

Due to the relative narrowness of Market Street, the required width of the guideway, and the absence of front building setbacks, the Project will block and/or obscure important views of the historical resource, and particularly of its primary façade. Specifically, views of the building from the east side of Market—a critical vantage point from which to observe the building's overall scale, massing, and composition—will be obstructed by the new APM guideway. Moreover, vantage points from which to achieve unobstructed views of the building's primary façade will largely be limited to the sidewalk directly in front of the building. Because the building is set at the sidewalk, it is difficult to appreciate the building's overall design from this perspective.

Because the Project will block and/or obscure important views of the former J.C. Penney building's primary façade, and will considerably limit the vantage points from which the building can be observed without obstruction, the Project will result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the ability of the former J.C. Penney to convey its historic significance as a 1950s Mid-Century Modern-style department store building will be impaired. Therefore, indirect impacts to the former J.C. Penney building as a result of the Project will be significant.

149-155 S. Market Street/231-239 E Manchester Boulevard (Professional Building)

The Professional Building is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. As described above, the Project will construct an elevated APM guideway set on support columns within the

public right-of-way of Market Street between Florence Avenue and Manchester Boulevard. The Professional Building is located on the west side of Market Street, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the Professional Building in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. However, the Project will erect a substantial new physical structure immediately in front of and within close proximity to the buildings along Market Street, substantially altering the way in which the Professional Building will be viewed and experienced by pedestrians and motorists. The building's historic significance is conveyed through its two publicly-visible facades, on Market Street (primary) and Manchester Boulevard (secondary). The APM guideway will be elevated above the roadway and sidewalks, passing directly in front of Market Street buildings at a height potentially as low as the second story. Additionally, support columns will be placed on the sidewalk, immediately in front of or adjacent to the building.

Due to the relative narrowness of Market Street, the required width of the guideway, and the absence of front building setbacks, the Project will block and/or obscure important views of the historical resource, and particularly of its primary façade. Specifically, views of the building from the east side of Market—a critical vantage point from which to observe the building's overall scale, massing, and composition—will be obstructed by the new APM guideway. Moreover, vantage points from which to achieve unobstructed views of the building's primary façade will largely be limited to the sidewalk directly in front of the building. Because the building is set at the sidewalk, it is difficult to appreciate the building's overall design from this perspective. The building's secondary façade along Manchester Boulevard will not be obscured by the Project.

Because the Project will block and/or obscure important views of the Professional Building, and will considerably limit the vantage points from which the building can be observed without obstruction, the Project will result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the ability of the Professional Building to convey its historic significance as a 1920s Spanish Colonial Revival-style commercial building will be impaired. Therefore, indirect impacts to the Professional Building as a result of the Project will be significant.

7.4 Analysis of No Impact

This report has identified three (3) historical resources within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative that will not be impacted by the Project, either directly or indirectly. Potential impacts to each of these resources, or lack thereof, are described below.

260 N. Locust Street (Holy Faith Episcopal Church)

The Holy Faith Episcopal Church property is located within the Expanded Study Area for the Market Street Station Alternative only.[90] As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Market Street between Florence Avenue and Manchester Boulevard. Under the Market Street Station Alternative, the APM guideway north of Regent Street will bear east off of the public right-of-way and onto the block bounded by Market Street, Florence Avenue, Locust Street, and Regent Street. This block will be acquired and the existing one-story shopping center and restaurant buildings demolished to accommodate new construction of the elevated APM guideway and Market Street Station. The Holy Faith Episcopal Church property is situated across Locust Street from this block.

The Project will not physically alter the Holy Faith Episcopal Church property in any way. The buildings will remain in their original locations and will retain all of their significant character-defining features and materials. The Project will erect substantial new physical structures across the street from the Holy Faith Episcopal Church property, thereby changing its physical surroundings to the west. However, the new construction will be separated from the Holy Faith Episcopal Church property by the width of a residential street, and thus will not interfere with existing visual and/or spatial relationships between the property and its immediate surroundings. The new construction will not block or obscure important views of the church property. Due to the physical separation between the church property and the new construction, views of the historical resource from the surrounding streets and sidewalks will not be altered.

Moreover, the existing development to be demolished has no historical relationship to the church property, which predates it by some five decades. The existing development largely turns its back to buildings on Locust Street, including the church property, with most of the shopping center buildings oriented onto the surface parking lot to the west. The church property's surroundings have evolved over time, as this is a densely developed urban area comprising a wide range of building types and uses dating from various periods of development. The buildings to be demolished do not contribute to the understanding of the significance of the historical resource, therefore their demolition will not alter the way in which the church property will be viewed or experienced.

Because the Project will not physically alter the Holy Faith Episcopal Church property, will not block or obscure important views, and will not alter its surroundings in any meaningful way, the Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Holy Faith Episcopal Church property will continue to convey its historic significance as an early

[90] This property is not within the Project Area or the Expanded Study Area for the Locally Preferred Alternative.

20th-century Late Gothic Revival-style religious complex in Inglewood. Therefore, there will be no impact to the Holy Faith Episcopal Church property as a result of the Project.

619-635 S. Prairie Avenue (Lighthouse McCormick Mortuary)

The Lighthouse McCormick Mortuary property is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. As described above, the Project will construct an elevated APM guideway set on support columns within the public right-of-way of Prairie Avenue between Manchester and Century boulevards. The Lighthouse McCormick Mortuary property is located on the west side of Prairie Avenue, immediately adjacent to where the new APM guideway will be located.

The Project will not physically alter the Lighthouse McCormick Mortuary property in any way. The building will remain in its original location and will retain all of its significant character-defining features and materials. The Project will erect a substantial new physical structure immediately in front of the mortuary property, thereby changing its physical surroundings to the east. The APM guideway will be elevated above the roadway and sidewalks, passing in front of the mortuary building at a height potentially as low as the second story. Additionally, support columns will be placed on the sidewalk in front of the building. As a result, some views of the mortuary building will be obstructed by the new construction. However, the mortuary's primary façade is set back from the sidewalk behind a front lawn, and thus there will be a physical separation between the building and the new construction. Due to this separation, full views of the mortuary building from multiple vantage points will remain unimpaired. Views of the mortuary building from the west side of Prairie Avenue and from La Palma Drive will not be altered. Views of the mortuary building from the east side of Prairie Avenue will be obscured by the APM; however, these views are not critical to understanding the significance of the historical resource.

Moreover, the mortuary property's surroundings have evolved over time, as this is a densely developed urban area comprising a wide range of building types and uses dating from various periods of development. The addition of the APM along Prairie Avenue will not alter the way in which the mortuary church property will be viewed or experienced, and will not interfere with existing visual and/or spatial relationships between the property and its surroundings in any meaningful way.

Because the Project will not physically alter the Lighthouse McCormick Mortuary property, will not block or obscure important views, and will not alter its surroundings in any meaningful way, the Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Lighthouse McCormick Mortuary property will continue to convey its historic significance as a mid-20th century American Colonial Revival-style mortuary building in Inglewood. Therefore, there will be no impact to the Lighthouse McCormick Mortuary property as a result of the Project.

720 E. Florence Avenue (Inglewood Park Cemetery)

The Inglewood Park Cemetery property is located within the Expanded Study Area for the Locally Preferred Alternative and the Market Street Station Alternative. The cemetery is situated along the APM alignment at the northeast corner of Manchester Boulevard and Prairie Avenue. As described above, the Project will construct an elevated APM guideway set on support columns within the public rights-of-way of Manchester Boulevard and Prairie Avenue. Traveling southbound, the APM guideway will run along Manchester Boulevard east to Prairie Avenue, where it will make a right-hand turn to continue south on Prairie.[91]

The Project will not physically alter the Inglewood Park Cemetery property in any way. The cemetery will remain in its original location and will retain all of its significant character-defining features and materials. The Project will erect a substantial new physical structure immediately adjacent to the cemetery property, thereby changing its physical surroundings to the southwest. However, The Project will not block or obscure important views of the cemetery property. The APM will run along Manchester Boulevard west of the cemetery, and along Prairie Avenue south of the cemetery. Thus, the APM will not run along the perimeter of the cemetery property at any point. At the intersection of Manchester and Prairie, the AMP will make a turn, touching the parcel at the southwest corner; the cemetery property is situated at the northeast corner. Thus, there will be a physical separation between the cemetery property and the new construction. At the intersection, support columns for the guideway will be placed on the sidewalk at the northwest, southwest, and southeast corners; no support columns will be placed at the northeast corner. Full views of the cemetery property from multiple vantage points along Prairie Avenue and Manchester Boulevard will remain unimpaired.

Moreover, the cemetery property's surroundings have evolved over time, as this is a densely developed urban area comprising a wide range of building types and uses dating from various periods of development. The addition of the APM will not alter the way in which the cemetery property will be viewed or experienced, and will not interfere with existing visual and/or spatial relationships between the property and its surroundings in any meaningful way. Furthermore, the most significant features of the Inglewood Park Cemetery—including the Grace Chapel (1907), Inglewood Mausoleum (1915), Mausoleum of the Golden West (1930s), and main entrance walls and gates—are clustered in the northernmost portion of the cemetery grounds or situated along Florence Avenue, whereas the Project's new construction will be southwest of the cemetery property.

Because the Project will not physically alter the Inglewood Park Cemetery property, will not alter its surroundings in any meaningful way, and will not block or obscure

[91] Traveling northbound, the APM guideway will run along Prairie Avenue north to Manchester Boulevard, where it will make a left-hand turn to continue west on Manchester.

important views, the Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Inglewood Park Cemetery will continue to convey its historic significance as an early 20th-century cemetery in Inglewood. Therefore, there will be no impact to the Inglewood Park Cemetery property as a result of the Project.

7.5 Cumulative Impact Analysis

No historic district has been identified within the Project Area or Expanded Study Area for the Locally Preferred Alternative or the Market Street Station Alternative. Thus, there is no potential for cumulative impacts to historical resources as a result of the proposed Project. Other projects in the vicinity are responsible for conducting their own CEQA review, including analysis of potential impacts to historical resources.

7.6 Summary of Impacts

To summarize, the Project will result in both direct and indirect impacts to historical resources un CEQA. Of the eleven (11) historical resources identified in the Project Area and/or Expanded Study Area for the Locally Preferred Alternative and/or the Market Street Station Alternative, the Project will have a significant impact on seven (7) resources, and a less than significant impact on one (1) resource. There will be no impact to the remaining three (3) properties as a result of the Project.

Summary List of Impacts

ADDRESS	APN	NAME/ DESCRIPTION	NO IMPACT	LESS THAN SIGNIFICANT IMPACT	SIGNIFICANT IMPACT (TO BE MITIGATED)	SIGNIFICANT IMPACT (CANNOT BE MITIGATED)
260 N Locust St	4015026039	Holy Faith Episcopal Church	✓			
320-330 E Manchester Bl	4021013018	Bank of America				✓
3900 W Manchester Bl	4025001002	The Forum		✓		
100 N Market St/307 E Queen St	4021007024	2-story mixed-use commercial building (Vajra Books & Gifts, former Bank of Inglewood)				✓
115 N Market St	4021008006	1-story neighborhood movie theater (former Fox Theater)				✓
158-170 N Market St	4021007012	Broadway Federal Bank (former United Bank of California)				✓

ADDRESS	APN	NAME/ DESCRIPTION	NO IMPACT	LESS THAN SIGNIFICANT IMPACT	SIGNIFICANT IMPACT (TO BE MITIGATED)	SIGNIFICANT IMPACT (CANNOT BE MITIGATED)
129-139 S Market St	4021009031	2-story retail commercial building (former J.C. Penney)				✓
149-155 S Market St/231-239 E Manchester Bl	4021009017	2-story commercial mixed-use building (Professional Building)				✓
150 S Market St	4021010015	2-story mixed-use commercial building (World Hat & Boot Mart, former People's Federal Building & Loan Association)				✓
619-635 S Prairie Ave	4021038027	Lighthouse McCormick Mortuary (former Hardin & Flanagan Colonial Chapel and Mortuary)	✓			
720 E Florence Ave[92]	4012031930	Inglewood Park Cemetery	✓			

[92] The parcel situated within the Expanded Study Area (APN 4012031930) has no address and contains only a small portion of the Inglewood Park Cemetery property. The vast majority of the cemetery occupies the adjacent parcel at 720 E Florence Avenue (APN 4012031027).

As described above, the Project will have a significant impact on seven (7) historical resources under CEQA. These include direct impacts resulting from demolition and indirect impacts from adjacent new construction. Due to the nature of these significant impacts, none can be mitigated to a less than significant level, thereby resulting in a substantial adverse change in the significance of those historical resources.

While it may not be possible to mitigate all significant impacts to historical resources to a less than significant level, CEQA requires that all feasible mitigation be undertaken to reduce significant impacts to the extent possible. For this reason, recommended mitigation measures to help reduce significant impacts to each of the historical resources are described below.

8.1 Significant Direct Impacts from Demolition

One (1) historical resource may be demolished as a result of the Project. For the purpose of this report, it is presumed that the Project will acquire the property at 150 S. Market Street and demolish the former People's Federal Building & Loan Association building, thereby resulting in a substantial adverse change in the significance of the historical resource. Demolition of a historical resource is a significant impact that cannot be mitigated to a less than significant level. However, it is recommended that the follow mitigation measure be implemented to reduce the significant impact to the extent possible.

- The former People's Federal Building & Loan Association building shall be documented to HABS Level III prior to demolition. HABS Level III documentation includes a sketch plan, photographs with large-format negatives or exterior and interior views, and the completion of an architectural data form. Copies of the completed HABS documentation shall be archived with the South Central Coast Information Center at California State University, Fullerton, as well as with the Los Angeles Conservancy and the Inglewood Public Library. An additional archival copy of the documentation shall be offered to the Inglewood Historic Preservation Alliance.

8.2 Significant Indirect Impacts from Adjacent New Construction

Six (6) historical resources will be indirectly impacted by the Project. These include the Bank of America building at 320-330 E. Manchester Boulevard, the former Bank of Inglewood building at 100 N. Market St/307 E Queen Street, the former Fox Theater building at 115 N. Market Street, the former United Bank of California building at 158-170 N. Market Street, the former J.C. Penney building at 129-139 S. Market Street, and the Professional Building at 149-155 S. Market Street/231-239 E Manchester Boulevard. Due to the required location and scale of the new construction, and its proximity to these historical resources, the Project will result in significant indirect impacts that cannot be mitigated to a less than significant level. However, it is

recommended that the follow mitigation measures be implemented to reduce significant impacts to the extent possible.

- Wherever the elevated APM guideway will come into close proximity with a historical resource, the guideway shall be situated with as much distance from the resource's publicly-visible façades as is feasible to minimize visual impacts.
- Wherever support columns will come into close proximity with a historical resource, they shall be situated with as much distance from the resource's publicly-visible façades as is feasible; and to the extent possible, the placement of the columns shall be shifted to either side of the resource rather than directly in front of it, to minimize visual impacts.
- Wherever APM station vertical circulation elements—such as escalators, elevators, and stairs—will come into close proximity with a historical resource, they shall be situated with as much distance from the resource's publicly-visible façades as is feasible; and to the extent possible, the placement of these elements shall be shifted to either side of the resource rather than directly in front of it, to minimize visual impacts.
- Prior to the issuance of permits, the Applicant will provide a demolition and shoring plan to ensure the proper protection and treatment of any adjacent historical resources during construction. The plan will be prepared by a qualified structural engineer with relevant experience in historic preservation projects, and will include appropriate measures to protect the adjacent historical resource from damage due to demolition, excavation, vibration, soil settlement, and general construction activities. The plan will be submitted for review and approval by the City of Inglewood.

APPENDIX B: LIST OF PARCELS IN THE PROJECT AREA AND EXPANDED STUDY AREA

The following is a complete listing of all parcels examined as part of the Project Area and Expanded Study Area for the Inglewood Transit Connector project's Locally Preferred Alternative and Market Street Station Alternative. This includes all parcels fronting the alignment right-of-way on both sides, and all parcels where new construction is proposed—including the Maintenance & Storage Facility (MSF) site; the Intermodal Transportation Facility site; the four possible Traction Power Substation sites; the alternate site for the Market Street Station; the sites where vertical circulation elements for the five APM stations will land; and the sites where pedestrian bridges will land. Where there will be substantial new construction outside of the alignment right-of-way, parcels immediately adjacent to or across from the new construction are also included.

Appendix 4.5

Energy

4.5.1

Existing Conditions Energy Calculations

Table 1. Summary of Annual Electricity Use During Operation

Land Use	Units	Buildout
Restaurant	kWh/yr	43,776
Restaurant	kWh/yr	173,718
Restaurant	kWh/yr	168,100
Auto Service	kWh/yr	371,800
Shopping Center	kWh/yr	140,712
Store	kWh/yr	253,899
Store	kWh/yr	57,200
Shopping Center	kWh/yr	291,720
Shopping Center	kWh/yr	84,061
Store	kWh/yr	189,618
Supermarket	kWh/yr	29,506,550
Gas Station	kWh/yr	1,707
Total Building	kWh/yr	31,282,861
Water	kWh/yr	386,833
Total Electricty	**kWh/yr**	**31,669,694**

Table 2. Summary of Annual Natural Gas Use During Operation

Land Use	Units	Buildout
Restaurant	kBTU/yr	919,600
Restaurant	kBTU/yr	311,184
Restaurant	kBTU/yr	1,194,950
Auto Service	kBTU/yr	919,600
Shopping Center	kBTU/yr	24,600
Store	kBTU/yr	44,388
Store	kBTU/yr	10,000
Shopping Center	kBTU/yr	51,000
Shopping Center	kBTU/yr	14,696
Store	kBTU/yr	33,150
Supermarket	kBTU/yr	1,570,060
Gas Station	kBTU/yr	4,222
Total Natural Gas	**kBTU/yr**	**5,097,450**

Table 3. Water by Land Use "Regulatory Compliance"

		Adjusted Baseline		
Land Use	**Units**	**Indoor/Outdoor Use**	**Indoor Use**	**Outdoor Use**
Combined	Mgal	24.06/6.62	24.06	6.62

Water and Wastewater Electricity Intensity (kWh/gallon)

Supply Water	0.009727
Treat Water	0.000111
Distribute Water	0.001272
Wastewater Treatment	0.001911

Source: CalEEMod User's Guide, Appendix D, Table 9.2 Los Angeles County - Los Angeles-South Coast

Indoor Water Factor	0.013021	kWh/gallon (supply, treat, distribute, wastewater treatment)
Outdoor Water Factor	0.01111	kWh/gallon (supply, treat, and distribute)

Notes:

Electricity and Natural Gas for the uses is total operational usage. Electricity, natural gas, and mobile usage was calculated from CalEEMod. Indoor water factor used for entire Project Site for conservative analysis.

ITC - Existing Parcels

Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
High Turnover (Sit Down Restaurant)	1.20	1000sqft	0.03	1,200.00	0
High Turnover (Sit Down Restaurant)	4.76	1000sqft	0.11	4,762.00	0
High Turnover (Sit Down Restaurant)	4.61	1000sqft	0.11	4,608.00	0
Automobile Care Center	44.00	1000sqft	1.01	44,000.00	0
Gasoline/Service Station	8.00	Pump	0.03	202.00	0
Regional Shopping Center	22.19	1000sqft	0.51	22,194.00	0
Regional Shopping Center	5.00	1000sqft	0.11	5,000.00	0
Regional Shopping Center	25.50	1000sqft	0.59	25,500.00	0
Regional Shopping Center	7.35	1000sqft	0.17	7,348.00	0
Regional Shopping Center	16.57	1000sqft	0.38	16,575.00	0
Regional Shopping Center	12.30	1000sqft	0.28	12,300.00	0
Supermarket	76.40	1000sqft	1.75	76,402.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	8			**Operational Year**	2018
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

ESTIMATING OWNING & OPERATING COSTS

Owning & Operating (O&O) Baseline Cost Estimate Solutions

he O&O web site provides information related to O&O baseline cost estimate development for both commercial ngine products and machines. Approved O&O baseline cost estimate ranges for machines, and links related to)&O baseline cost development are also available. **NOTE:** Access to the web sites indicated below is restricted to aterpillar and Cat® dealer personnel.

or information about O&O costs, enter the appropriate link.

neral

Machine users must balance productivity and costs to ieve optimum performance ... that is, achieve the sired production at the lowest possible cost. The proach most often used to measure machine perfor- nce is this simple equation:

$$\frac{\textit{Lowest Possible Hourly Costs}}{\textit{Highest Possible Hourly Productivity}} = \textit{Top Machine Performance}$$

machine can vary widely because they are influenced by many factors: the type of work the machine does, the ownership period, local prices of fuel and labor, the repair and maintenance costs, shipping costs from the factory, interest rates, etc. No attempt is made in this handbook to provide precise hourly costs for each model. Users must be able to estimate with a reasonable degree of accuracy what a machine will cost per hour to own and operate in a given application and locality. Therefore, this section provides a suggested method of estimating hourly owning and operating costs. When this method is coupled with local conditions and dealer input, it will result in reasonable estimates.

The method suggested follows several basic principles:

- Repair and Planned Maintenance cost per hour are developed jointly by the customer and local Cat dealer.
- In the examples, labor is assumed @ $60.00 per hour, fuel @ $1.25 per gallon. For reliable estimates, these costs must always be obtained locally.
- Because of different standards of comparison, what may seem a high application to one machine owner may appear only medium to another.
- Unless otherwise specified, the word "hour" when used in this section means clock or operating hours, not Service Meter Units.

ıcludes DEF.

Typical Application Description
(relative to work application)

Low Pulling scrapers, most agricultural drawbar, stockpile, coal pile and finish grade applications. No impact. Intermittent full throttle operation.

Medium Production dozing in clays, sands, gravels. Push loading scrapers, borrow pit ripping, most land clearing applications. Medium impact conditions. Production landfill work.

High Heavy rock ripping. Push loading and dozing in hard rock. Working on rock surfaces. Continuous high impact conditions.

Load Factor Guide
(average engine load factor based on application description for each range)

Low 35%-50%
Medium 50%-65%
High 65%-80%

Product Link™ Information — Product link measured over hundreds of Track-Type Tractors shows that more than 90% of the machines experience an average fuel consumption equal to or lower than those shown in the Medium Application profile.

E: The K Series Motor Graders meet U.S. EPATier 2 and EU Stage II emission standards.
The M Series Motor Graders meet U.S. EPATier 3 and EU Stage IIIA emission standards.

E: The Motor Grader hourly fuel rates are taken directly from customer machines registered on Product Link worldwide. Data from the top and bottom 5% of these customer machines has been excluded from the tables because it varies widely (15-60% from the extremes shown) and therefore is not considered representative of what the remaining 90% of customer experience. Hourly fuel consumption for the 90% of machines in the tables also varies depending upon geographical region, load factor variation between models, etc. Cat machines are often used in more demanding applications which can account for differences between competitive models used in lighter duty applications. M2 Series machine data is estimated since current Product Link data is immature on these models. These values are subject to change. Consult your local dealer for ways to more accurately estimate hourly fuel consumption for specific applications.

Typical Application Description
(relative to work application)

(relative to work application)

Low — Light road maintenance. Finish grading. Plant and road mix work. Large amounts of traveling. Light snow plowing.

Medium — Haul road maintenance. Average road maintenance, road mix work, scarifying. Road construction, ditching, loose fill spreading. Land forming, land leveling and elevating grader use. Medium to heavy snow removal.

High — Heavy maintenance of hard packed roads with embedded rock. Heavy fill spreading, base material spreading and ditching. Ripping/scarifying of asphalt or concrete. Continuous high load factor. High impact. Heavy snow plowing.

Load Factor Guide

– Higher Regulated Countries
– Lesser Regulated Countries

ypical Application Description
elative to work application)

ow — Light utility, construction, nursery and landscaping applications. Load and carry of free flowing, low density materials on firm, smooth surfaces for short distances with minimal grades. Light snow removal.

ledium — Industrial and construction job site applications. Loading from bank or load and carry of low to medium density materials on normal surfaces with low to medium rolling resistance and slight adverse grades. Occasional use of various attachments under normal loading conditions.

igh — Continuous industrial, construction and batch plant applications. Loading from tight banks or load and carry of high density materials on rough or very soft surfaces with high rolling resistance and adverse grades. Maximum use of high flow attachments under high loading conditions.

Typical Application Description
relative to work application)

Low — Continuous operation at <80% of maximum recommended gross weight. Short to medium haul distances: 300-1000 m (**990-3300 feet**). Well maintained, level haul roads. Considerable amount of idling. Very few tray impacts. Low load factor.

Medium — Intermittent operation at less than maximum recommended gross weight. Medium to longer haul distances: 1000-5000 m (**3300-16,000 feet**). Varying haul road conditions with some adverse grades. Occasional tray impacts. Medium load factor.

High — Continuous operation at maximum recommended gross weight. Long haul distances: >5000 m (**>16,000 feet**). Poor haul road conditions with adverse/steep grades. Frequent tray impacts. High load factor.

Load Factor Guide
average engine load factor based on application description for each range)

application of these machines is to be used for scrap handling, the LOW hourly fuel consumption rate would typically apply.
: Fuel consumption rates for 320D through 390D include machine at idle per load factor definition.
