1.0 INTRODUCTION AND BACKGROUND

1.1 PROPOSED CHANGES TO THE APPROVED PROJECT

The project Applicant, Bedford Marketplace, LLC, seeks approval of Amendment No. 3 to the Arantine Hills Specific Plan (AHSP) to increase the boundary of the AHSP by approximately 17.85 acres. The Approved Project, AHSP Amendment No. 2, permits an 80,000 square foot retail commercial center on approximately 10 acres within Planning Area (PA) 11. The Modified Project (AHSP Amendment No. 3) proposes to increase the size of the commercial center located on PA 11 by 11.64 acres and the amount of general commercial uses from 80,000 square feet to 223,108[1] square feet a 135-room hotel. The Modified Project would also add approximately 6.21 acres of Open Space to the AHSP within new PA 12A. To implement the Arantine Hills Specific Plan Amendment (AHSPA), the project Applicant proposes a General Plan Amendment (GPA), Parcel Map (PM), Noise Variance, Precise Plan (PP), and this Supplement to the previously certified AHSP EIR and subsequent amendments. These discretionary approvals represent the "proposed project," "proposed Modified Project," or "Modified Project" analyzed in this Supplemental Environmental Impact Report, and they are summarized as follows:

- GPA 2019-0002
- SPA 2019-0005
- PM 37788
- PP 2019-0008
- VMIN 2019-0006 (Noise Variance)

1.2 PURPOSE OF A SUPPLEMENTAL ENVIRONMENTAL IMPACT REPORT

The purpose of a Supplemental Environmental Impact Report (SEIR) is to assess the change in the environmental significance conclusions originally reached in a previous Environmental Impact Report (EIR) attributable to either: 1) change in a project; 2) change in the circumstance under which a project is undertaken; or 3) introduction of new information of substantial importance that was not known at the time the previous EIR was certified. The reason for preparation of this SEIR primarily relates to the first condition (i.e., change in a project), because the project definition contained in the current proposal differs from the project that was approved as part of previous environmental documents. Section 1.1 contains a brief summary of the proposed project changes and Section 2.0 contains a detailed discussion

[1] The 223,108 square feet of general commercial uses consists of 134,378 square feet of retail space and 88,730 square feet of hotel space.

of the proposed project changes. The process undertaken and the determinations reached by the City governing why this SEIR is being prepared are detailed in Section 1.3.

1.3 SUPPLEMENTAL EIR

The purpose of this document is to evaluate the proposed changes to the AHSP (i.e., proposed project or Modified Project) in comparison to the project as originally approved in 2012, amended in 2016, and amended a second time in 2018. The prior approvals were based on the original 2012 AHSP EIR, 2016 SEIR No. 1, and 2018 EIR Addendum. In this SEIR or SEIR No. 2, references to the Prior EIR constitute the three prior environmental approvals for the Approved Project (i.e., the original certified EIR, SEIR No. 1, and the EIR Addendum). All prior environmental approvals as well as SEIR No. 2 are designated by State Clearinghouse Number 2006091093.

SEIR No. 2 evaluates the proposed modifications to the Approved Project in accordance with the California Environmental Quality Act (CEQA) as implemented by Public Resources Code (PRC) Section 21000 et seq. and the CEQA Guidelines (California Code of Regulations, Title 14, Division 6, Chapter 3: Guidelines for the Implementation of the California Environmental Quality Act, Section 1500 et seq.). SEIR No. 2 has been prepared by the City to address potential impacts from the proposed changes to the AHSP in comparison to the impacts evaluated for the approved AHSP. In succinct terms, SEIR No. 2 compares the Modified Project's impacts to the Approved Project's impacts.

To determine whether the Modified Project is eligible for the preparation of an SEIR, the criteria in Section 15162 governing preparation of Subsequent CEQA documents and the additional criteria in Section 15163 governing preparation of Supplemental CEQA documents must be met, as follows:

1. There are no substantial changes associated with the Modified Project which require major revisions to the previous EIR due to new significant impacts or a substantial increase in the severity of previously identified significant effects (Section 15162).
2. There are no substantial changes with respect to the circumstances under which the Modified Project is undertaken which require major revisions to the previous EIR due to new significant impacts or a substantial increase in the severity of previously identified significant effects (Section 15162).
3. There is no new information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified that shows any of the following (Section 15162):
    (a) The Modified Project will have one or more significant effects not discussed in the previous EIR.

(b) Significant effects previously examined will be substantially more severe than shown in the previous EIR.

(c) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the Modified Project, but the project proponents decline to adopt the mitigation measure or alternative.

(d) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

4. Only minor additions or changes would be necessary to make the previous EIR adequately apply to the Modified Project in the changed situation (Section 15163).

As stated in Section 15163 of the CEQA Guidelines, the Lead Agency may choose to prepare a Supplemental EIR rather than a Subsequent EIR if:

1. Any of the conditions described in Section 15162 would require the preparation of a subsequent EIR, and
2. Only minor additions or changes would be necessary to make the previous EIR adequately apply to the Modified Project in the changed situation.

The City has determined that a Supplemental EIR, rather than a Subsequent EIR, is appropriate for the Modified Project because all of the conditions in Section 15163 regarding preparation of a Supplemental EIR can be met, including minor changes to the Prior EIR necessary to make it adequately apply to the Modified Project.

An SEIR need contain only the information necessary to make the Prior EIR adequate for the Modified Project as revised (Section 15163). Additionally, an SEIR may be circulated in accordance with CEQA Section 15087 by itself without recirculating the Prior EIR. When the Lead Agency decides whether to approve the Modified Project, the decision-making body shall consider the previous EIR as revised by the SEIR. A finding under Section 15091 must be made for each significant effect shown in the previous EIR as revised in the SEIR.

1.4 TECHNICAL STUDIES AND RELATED DOCUMENTS INCORPORATED BY REFERENCE

SEIR No. 2 incorporates and references several technical studies, analyses, and reports prepared specifically to analyze the effects of the Modified Project.

Technical studies and reports addressing the Modified Project have been used to prepare the applicable analytical sections of SEIR No. 2. These documents are included in SEIR No. 2 Appendices B through J and include:

- *Bedford Marketplace Air Quality and Greenhouse Gas Memorandum*, November 26, 2019, Urban Crossroads
- *Bedford Marketplace Soil Import/Export Air Quality Assessment*, August 9, 2019, Urban Crossroads
- *Biological Technical Report for the Bedford Marketplace Project*, October 2019, Carlson Strategic Land Solutions
- *Consistency Determination Bedford Marketplace Project*, October 2019, Carlson Strategic Land Solutions
- *Cultural and Paleontological Resources Assessment Bedford Canyon Marketplace*, August 9, 2019, Duke Cultural Resources Management
- *Cultural/Paleontological Resource Survey Update for the Bedford Canyon Marketplace Project-Bedford Ranch Phase 2B Mass Grading Plan*, November 13, 2019, Duke Cultural Resources Management
- *Preliminary Geotechnical Evaluation for Proposed Bedford Marketplace*, July 22, 2019, LGC Geotech
- *Preliminary Geotechnical Recommendations Regarding the Updated Mass Grading Plan and Haul Route Study*, August 30, 2019, LGC Geotech
- *Phase I Environmental Site Assessment Bedford Marketplace - Arantine Hills Tract 8*, June 10, 2019, EBI Consulting
- *Phase I Environmental Site Assessment Bedford Marketplace – RCTC Portion*, June 10, 2019, EBI Consulting
- *Preliminary Water Quality Management Plan Bedford Commercial Site*, January 29, 2020, Hunsaker & Associates
- *Water Supply Assessment Update*, October 17, 2019, Fusco Engineering
- *Hydrology Analysis Lot 8*, November 2019, Hunsaker & Associates
- *PA 14 Hydrology and WQMP Certification*, October 2019, Hunsaker & Associates
- *Bedford Marketplace Noise Impact Analysis*, January 30, 2020, Urban Crossroads
- *Bedford Marketplace Traffic Study*, January 10, 2020, Urban Crossroads
- *Sewer System Hydraulic Analysis*, February 14, 2020, Hunsaker & Associates

1.5 INTENDED USE OF THE SUPPLEMENTAL EIR

CEQA and the CEQA Guidelines establish the City as the Lead Agency, which is defined in CEQA Guidelines Section 15367 as "the public agency which has the principal responsibility for carrying out or approving a project." The Lead Agency is responsible for determining if a project meets the CEQA definition of a project. If determined to be a CEQA project, the Lead Agency determines if a project is exempt from CEQA, requires approval of a Negative Declaration (ND) or Mitigated Negative Declaration (MND), or requires preparation of an EIR.

SEIR No. 2 has been prepared by the City in accordance with CEQA and the CEQA Guidelines. SEIR No. 2 will be used by the City, responsible agencies, and the public for the purpose of evaluating the environmental effects associated with proposed AHSPA No. 3 and associated GPA, SPA, PM, Variance, and PP.

1.6 LEAD AGENCY CONTACT INFORMATION

The Lead Agency for the proposed project is the City of Corona. The contact person for the Lead Agency is:

Sandra Yang, Senior Planner
City of Corona
Community Development Department
400 S. Vicentia Avenue
Corona, California 92882

1.7 PUBLIC REVIEW PERIOD

A notice of preparation (NOP) was distributed to members of the public and public agencies for a 30-day review period starting October 28, 2019. The NOP requested input from recipients regarding the scope and content of the environmental information to be included in the SEIR. At the conclusion of the review period, four agencies provided comments on the NOP. A summary of the agency comment letters is shown in Table 1.A, as well as the location in SEIR No. 2 that addresses the issues raised. The NOP and the NOP response letters are included in Appendix A.

Table 1.A: Summary of Comments Received in Response to the NOP

Agency / Individual	Summary of Comments	Response / Section in SEIR Where Issue is Addressed
South Coast Air Quality Management District Lijin Sun lsun@aqmd.gov (11/19/19)	SCAQMD has provided the following comments/recommendations: • Requested a copy of the SEIR and technical appendices be sent directly to SCAQMD. • The analysis in the SEIR should use the CEQA Air Quality Handbook for guidance and rely on the CalEEMod land use emissions software. • Quantify criteria pollutant emissions and compare the results to SCAQMD's CEQA regional pollutant emissions significance thresholds. • Calculate localized air quality impacts and compare results to localized significance thresholds (LSTs). • Analyze potential adverse air quality impacts from all phases of the project, including construction and operations. • If the project generates substantial heavy-duty diesel vehicle trips, conduct a mobile source health risk assessment. If the project generates significant adverse air quality impacts, alternatives capable of lessening or avoiding the impacts should be considered.	Potential air quality impacts are analyzed in Section 3.4.3. The analysis included in Section 3.4.3 is based on an Air Quality Technical Memo included in Appendix B. The technical memo includes analysis using CalEEMod and incorporates an LST analysis. The proposed Modified Project does not generate or attract substantial heavy-duty diesel vehicle trips; therefore, a health risk assessment is not warranted and was not conducted.
Southern California Association of Governments Ping Chang Anita Au au@scag.ca.gov (11/21/19)	The Southern California Association of Governments (SCAG) recommends the SEIR compare the Modified Project's consistency with the goals and strategies contained in the 2016 Regional Transportation Plan/Sustainable Communities Strategies (2016 RTP/SCS). In addition, SCAG offers assistance regarding where to find applicable demographic and growth forecast data and suggestions regarding mitigation measures.	Consistency with the 2016 RTP/SCS is discussed in Section 3.4.10. Because the Modified Project is part of a larger planning effort (i.e., the AHSP) and the proposed commercial uses will bring commercial uses and services into an area that is lacking such uses and services, the Modified Project is consistent with the 2016 RTP/SCS goals and policies regarding location of land uses to reduce vehicle miles traveled,

Table 1.A: Summary of Comments Received in Response to the NOP

Agency / Individual	Summary of Comments	Response / Section in SEIR Where Issue is Addressed
		reducing traffic congestion and associated noise and air quality impact.
California Department of Fish and Wildlife Joanna Gibson Scott Wilson Joanna.gibson@wildlife.ca.gov (11/25/19)	CDFW recommends the following information be provided/assessed within the SEIR: • An assessment of the various habitat types located within the project footprint and a map that identifies the location of each habitat type. • A general biological inventory of the fish, amphibian, reptile, bird, and mammal species present or have the potential to be present on the project site. • A recent inventory of rare, threatened, endangered, or other sensitive species located within the project footprint and within offsite areas with the potential to be affected. • A recent floristic-based assessment of special status plants and natural communities. • Information regarding the regional setting that is critical to the assessment of environmental impacts. • A full accounting of all mitigation/conservation lands within and adjacent to the project site. • A discussion of potential impacts from lighting, noise, human activity, defensible space, and wildlife-human interactions, including changes to drainage patterns and water quality. • A discussion of potential indirect impacts on biological resources within and adjacent to the project footprint.	Potential impacts to biological resources, including the topics raised by CDFW, are discussed in Section 3.4.4. The analysis included in Section 3.4.4 is based on a Biological Technical Report included in Appendix C-1. The Biological Technical Report also includes a MSHCP Consistency analysis (Appendix C-2), as suggested by CDFW. It is important to note the comment incorrectly describes the project site within the Stephen's Kangaroo Rat Habitat Conservation Plan (SKR HCP) fee are boundary. The project site is located west of I-15 and not within the SKR HCP fee are boundary. Mitigation Measures from the Prior EIR remain applicable, with modifications, to the Modified Project.

Table 1.A: Summary of Comments Received in Response to the NOP

Agency / Individual	Summary of Comments	Response / Section in SEIR Where Issue is Addressed
	• An evaluation of impacts to adjacent open space lands from both construction and long-term operational and maintenance. • A cumulative effects analysis as described under CEQA Guidelines Section 15130. • An analysis of a range of reasonable project alternatives. • CDFW provided sample mitigation measures to consider. • The project is located within the boundaries of the MSHCP and must be evaluated for consistency. • The project is located within the Stephen's Kangaroo Rat Habitat Conservation Plan (SKR HCP) fee are boundary. • The project may be subject to the Lake and Streambed Alteration Program under Section 1602 of the Fish and Game Code.	
Riverside County Transportation Commission Stephanie Bianco sblanco@rctc.org (12/6/19)	The Riverside County Transportation Commission (RCTC) generally supports the Modified Project. To mitigate short term noise impacts, RCTC suggests the Modified Project's soil import operation be limited to hours of the day/night that do not conflict with the general flow of traffic on I-15. In addition, RCTC recommends that the SEIR analyze the effects of I-15 traffic noise levels on the sensitive land uses proposed as part of the Modified Project including a 500-foot buffer.	The project Applicant proposes to import soil during nighttime hours (8:00 p.m. to 4:00 a.m.), if the soil is to be imported from an off-site location as opposed to PA 14. Regarding the effects of traffic noise on the proposed Modified Project's sensitive uses, recent case law has clarified that the purpose of CEQA analysis is to address a project's impacts on the environment and not the environment's impacts on a project. Noise from the I-15 freeway is an existing environmental condition, and therefore the SEIR will not address impacts of

Table 1.A: Summary of Comments Received in Response to the NOP

Agency / Individual	Summary of Comments	Response / Section in SEIR Where Issue is Addressed
		freeway noise on the proposed Modified Project. However, the Modified Project is required to comply with the City's noise ordinance governing interior and exterior noise levels. This will be conducted as part of Precise Plan review and approval.

The Draft SEIR is being distributed to public agencies and other interested parties for review and comment. The Draft SEIR is also available at the following locations and on the City's website:

Corona City Hall
Community Development Department
400 South Vicentia Avenue
Corona, California 92882
Phone: (951) 736-2434

Circulation Desk
Corona Public Library
650 South Main Street
Corona, California 92882
Phone: (951) 736-2381

Hours: Monday through Friday: 8:00 a.m. to 5:00 p.m. www.Corona.Ca.gov

All comments received from agencies and individuals on the Draft SEIR will be accepted during the public review period, which will not be less than 45 days, in compliance with CEQA. All comments on the Draft SEIR should be sent to the City contact person at the address listed above.

Following the close of the public review period, the City will prepare responses to all comments and will compile these comments and responses into a Final SEIR. All responses to comments submitted on the Draft SEIR by public agencies during the CEQA comment period will be provided to those agencies at least 10 days prior to final action on the Modified Project. The City will make findings regarding the extent and nature of the impacts as presented in the Final SEIR. The Final SEIR will need to be certified as complete by the City Council prior to making a decision to approve or deny the Modified Project (i.e., the GPA, SPA, PM, Noise Variance, and PP. Public input is encouraged at all public hearings (e.g., Planning and Housing Commission, City Council) regarding the proposed Modified Project before the City.

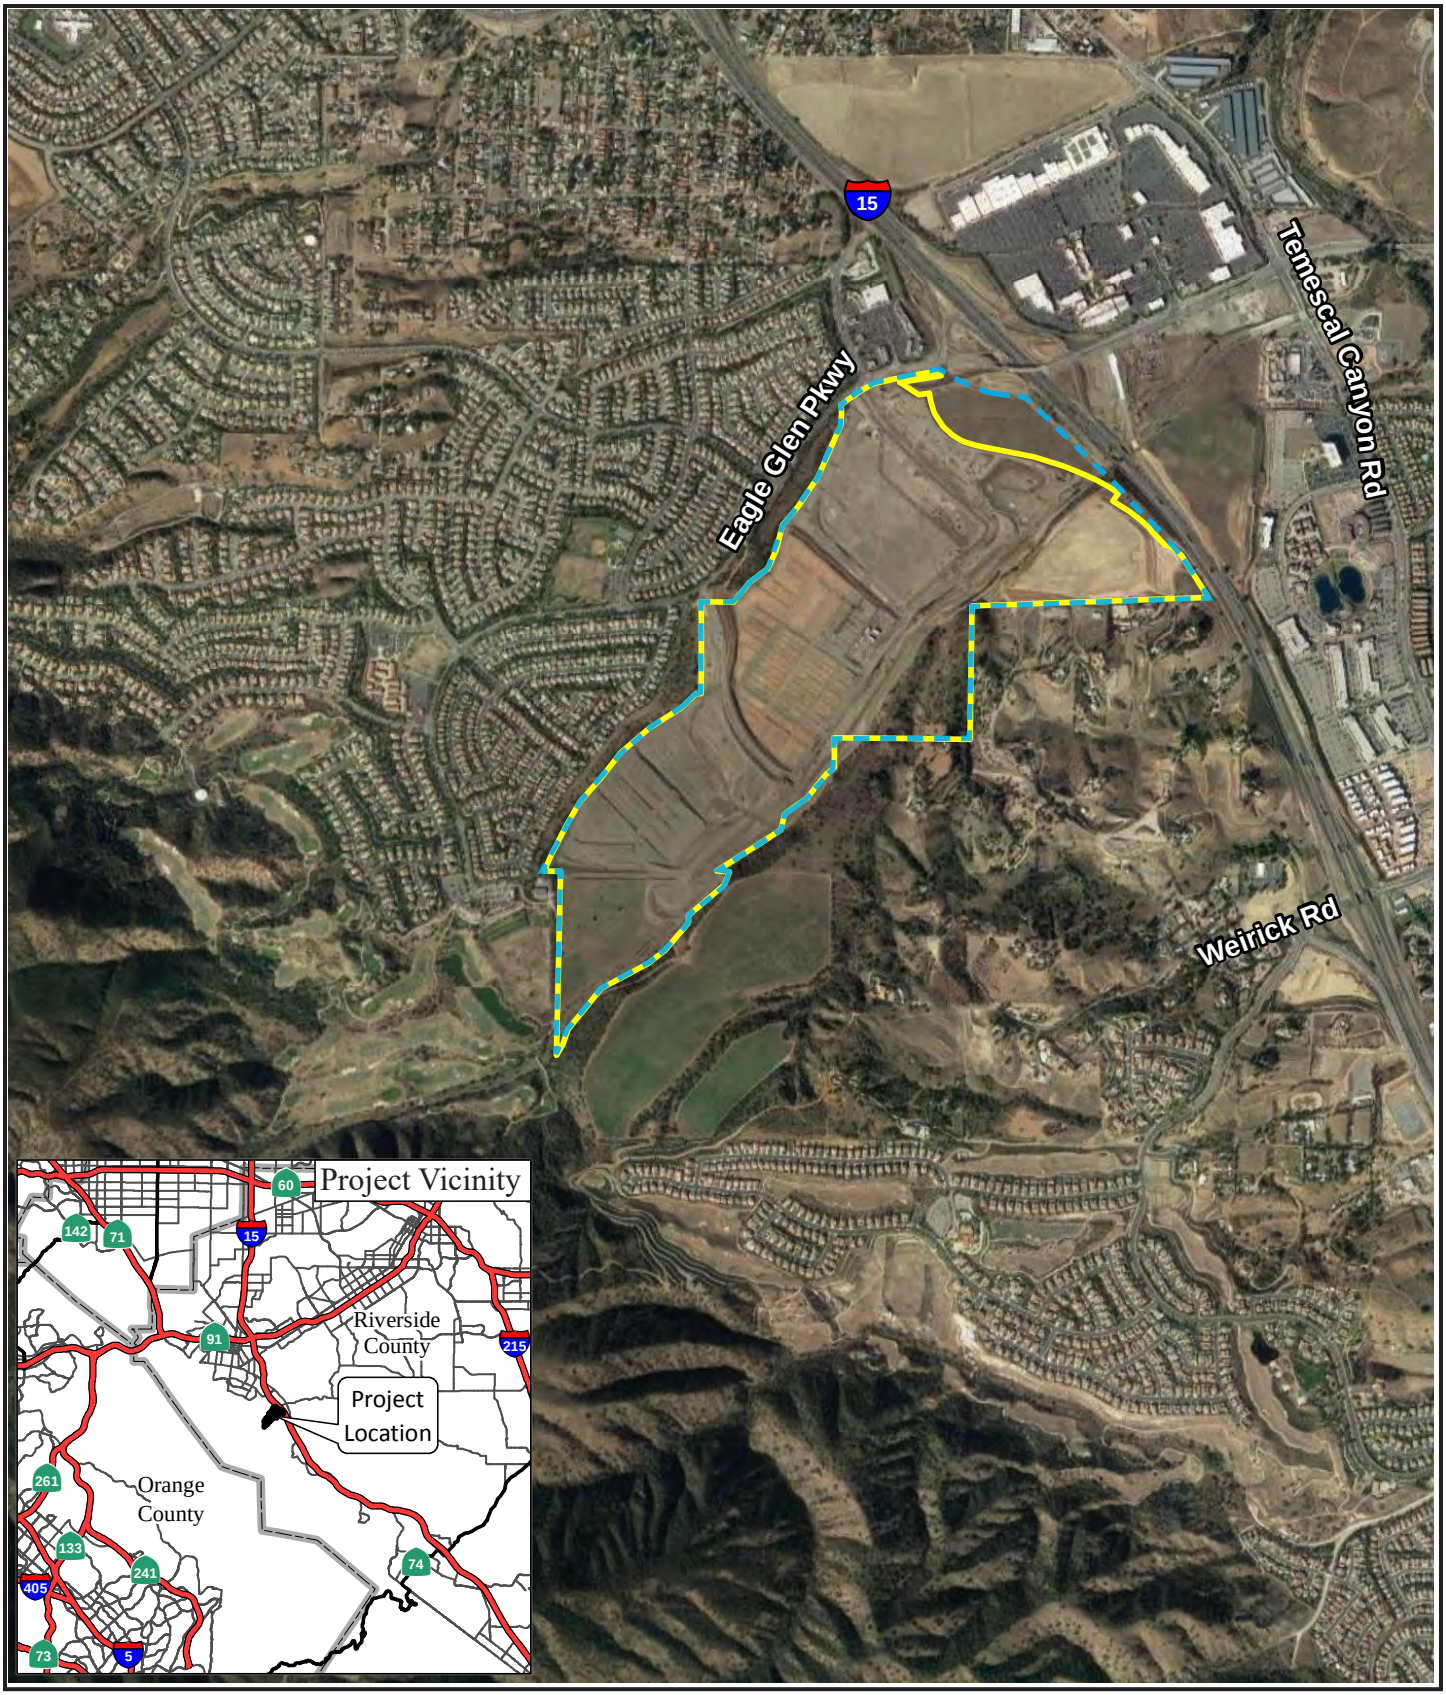
1.8 FORMAT OF THIS ENVIRONMENTAL ANALYSIS REPORT

This report has been organized into seven chapters, described below:

- Chapter 1.0: Introduction and Background. Chapter 1.0 includes an introduction to SEIR No. 2, a summary of the project changes constituting the proposed Modified Project and necessitating preparation of SEIR No. 2, a discussion of why SEIR No. 2 is being prepared, documents incorporated by reference, technical studies prepared assessing the Modified Project, intended use of SEIR No. 2, definition of the City as Lead Agency and contact person, the public review process, and the format of SEIR No. 2.
- Chapter 2.0: Modified Project Description. Chapter 2.0 summarizes the proposed Modified Project, describes the location and setting of the Modified Project site and vicinity, describes in detail the major components of the Modified Project requiring discretionary actions by the City, compares the proposed land use changes to the Approved Project, lists the Modified Project objectives, and defines the major discretionary actions and steps necessary to carry out the proposed Modified Project.
- Chapter 3.0: Comparative Evaluation of Environmental Impacts. Chapter 3.0 addresses the Modified Project's potential to have a physical effect on the environment and includes a comparison of those impacts to the Approved Project's impacts analyzed in the Prior EIR. This comparative analysis has been undertaken pursuant to provisions of CEQA to provide decision-makers with a factual basis for determining if any topics would need further assessment in SEIR No. 2 by the application of CEQA Guidelines Section 15163.
- Chapter 4.0: Updated Mitigation Monitoring and Reporting Program. Chapter 4.0 includes the updated Mitigation Monitoring and Reporting Program resulting from the analysis of impacts contained in SEIR No. 2.
- Chapter 5.0: List of Preparers. Chapter 6.0 includes a list of the key individuals who participated in preparing SEIR No. 2.

2.0 MODIFIED PROJECT DESCRIPTION

2.1 MODIFIED PROJECT LOCATION AND SETTING



The "proposed project" or "Modified Project" consists of proposed changes to the Arantine Hills Specific Plan (AHSP). The AHSP boundary currently covers 307.8 acres located below the foothills of the Santa Ana Mountains adjacent to the southeastern boundary of the City of Corona (City). The City is generally situated southwest of the City of Riverside, south of the City of Norco, and northwest of the City of Lake Elsinore. The AHSP is bounded by the Eagle Glen Specific Plan development on the north and west, the Cleveland National Forest to the south, and Interstate 15 (I-15) to the east. The proposed project is located within the United States Geological Survey (USGS) 7.5-Minute Topographic Map Corona South, California Quadrangle.

The project Applicant, Bedford Marketplace, LLC, proposes to amend the Arantine Hills Specific Plan (AHSP) to increase the AHSP boundary by approximately 17.85 acres. The proposed Specific Plan Amendment (SPA) would be the third amendment to the AHSP. Arantine Hills Specific Plan Amendment (AHSPA) No. 3 would result in a revised AHSP boundary of 325.7 acres. The 17.85 acre expansion area is located in the northeast portion of the AHSP, adjacent to the east side of Planning Area (PA) 11, at the southwest quadrant of the I-15/Cajalco Road interchange. The 17.85 acre property is currently owned by the Riverside County Transportation Commission (RCTC). The project Applicant proposes to expand commercial land use within the AHSP using a portion of this property. The revised commercial acreage would be developed as a coordinated commercial center referred to as Bedford Marketplace. The remainder of the RCTC property would be designated open space.

A portion of the additional property, currently owned by the Riverside County Transportation Commission (RCTC), would increase the size of the planned commercial center within the AHSP. The resulting acreage would be developed as a coordinated commercial center referred to as Bedford Marketplace. The remainder of the RCTC property would be designated open space.

An aerial view of the existing and proposed AHSP boundaries is shown in Figure 2.1.

FIGURE 2.1

Arantine Hills Specific Plan Amendment No. 3
Supplemental EIR No. 2
City of Corona

Aerial View of Regional and Project Location

This Page Intentionally Left Blank

The AHSP lies on an alluvial plain located within the Bedford Canyon Wash on the eastern slopes of the Santa Ana Mountains. The AHSP contains varied terrain comprising alluvial deposits over stable bedrock below. Bedford Canyon Wash runs northeast through the AHSP. The AHSP consists of two topographical areas, the elevated bluff above and south of the canyon and the lower-lying Bedford Canyon Wash. The Bedford Canyon Wash separates the bluff area from the lower-lying areas immediately to the north. The lower-lying areas are relatively flat, with an overall downward slope to the northeast.

Consistent with the approved and current AHSP, a majority of the property in the AHSP boundary has been previously graded as part of the developing Bedford residential community. The 17.85-acre expansion area is located adjacent to the east side of the current PA 11 boundary. PA 11 is located on the east side of the Bedford Canyon Road southerly extension from Cajalco Road, with the Bedford community on the west side of the Bedford Canyon Road extension. The I-15 freeway including the I-15/Cajalco Road Interchange currently under construction is located to the east of PA 11 and the 17.85-acre expansion area. The expansion area contains ruderal vegetation and has been subject to disturbance from construction of the I-15/Cajalco Road Interchange.

PA 11 currently consists of an approximately 10-acre property planned for commercial uses located adjacent to the expansion area. PA 11 has been graded as a flat pad consistent with the approved and current AHSP, and utility connections have been stubbed at the entrance to the pad. The extension of Bedford Canyon Road southerly from Cajalco Road forms the western boundary of current PA 11. The new section of Bedford Canyon Road has been graded, paved, and curb, gutter, and sidewalk have been installed.

Bedford Canyon Wash lies to the south of the expansion area along the southern portion of the lower-lying region of the current AHSP and marks the boundary of the elevated areas further south. The Wash is an ephemeral stream with a sandy bottom and sparsely vegetated alluvial fan sage scrub and non-native vegetation. The Wash receives flows from the Santa Ana Mountains, through the Eagle Glen Golf Club, through the AHSP area, continuing downstream to Temescal Creek and ultimately the Santa Ana River. As part of implementation of the current AHSP, the Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Canyon Wash includes planting with an alluvial fan sage scrub seed mix. The aerial view of the project area shown in previously referenced Figure 2.1 provides an indication of the project site coverage.

2.2 MODIFIED PROJECT DEFINITION

2.2.1 Modified Project

The proposed changes to the Arantine Hills Specific Plan (AHSP) represent the "Modified Project" or "proposed project" under scrutiny in this Supplemental EIR (SEIR). To implement the proposed Arantine Hills Specific Plan Amendment (AHSPA) requested by the project Applicant, Bedford Marketplace, LLC, several discretionary actions must be approved by the City of Corona (City). These actions include approval of this SEIR (SEIR No. 2), a General Plan Amendment (GPA), Specific Plan Amendment (SPA), Parcel Map (PM), Noise Variance, and Precise Plan (PP). Each of these actions, or project components, is described in Section 2.5.

The AHSP was first approved in 2012 by certified EIR, amended in 2016 by SEIR No. 1, and amended a second time in 2018 by EIR Addendum. The AHSP guides development of up to 1,806 residential dwelling units (dus) on 191.6 acres, 80,000 square feet (sf) of commercial building area on 10.03 acres, 9.9 acres of parks, 77.4 acres of open space, and 18.9 acres of master planned roadways within the current 307.8-acre AHSP boundary.

The proposed SPA is the third amendment to the AHSP. AHSPA No. 3 would expand the AHSP boundary by approximately 17.85 acres consisting of 11.64 acres of additional General Commercial (GC) land use and 6.21 acres of additional Open Space (OS). Specifically, the 17.85 acres would be added to PA 11. The overall AHSP boundary would expand from 307.8 to 325.7 acres, with GC land use increasing from 10.0 to 21.7 acres and OS increasing from 77.4 to 83.6 acres. Planned residential, park, and roadway development quantities/acreages would not be affected.

The 11.64 acre increase in GC land use would expand the quantity of commercial building area by approximately 143,108 sf that includes a 135-room hotel. The resulting commercial building area would be 223,108 sf on 21.67 acres. The permitted land use types in the AHSP GC category include retail, restaurants, services, entertainment, lodging and offices plus community services including daycare, emergency medical care and others. The permitted GC land use types would remain unchanged as part of AHSPA No. 3.

As noted previously, the 6.21 acre increase in OS would result in a revised total of 83.6 acres.

For the purposes of SEIR No. 2, the following naming conventions are used interchangeably:

- Approved Project = current AHSP = existing AHSP. As originally approved in 2012, modified by SPA No. 1 in 2016, and modified by SPA No. 2 in 2018. The Approved Project encompasses 307.8 acres and allows up to 1,806 residential dus on 191.6 acres, 80,000 sf of commercial building area on 10.03 acres, 9.9 acres of parks, 77.4 acres of open space, and 18.9 acres of master planned roadways within a 307.8-acre AHSP boundary.

- Modified Project = proposed Modified Project = proposed project = proposed AHSPA No. 3. The overall AHSP boundary would increase from 307.8 to 325.7 acres, with GC acreage increasing from 10.0 to 21.7 (11.64) acres and OS acreage increasing from 77.4 to 83.6 (6.21 acres). Planned residential, park, and roadway development quantities/acreages would not be affected. The expansion of the AHSP boundary would result in an increase of approximately 143,108 sf in commercial building area that includes a 135-room hotel over and above the Approved Project.

- Modified Project Site = the 17.85-acre expansion area. The Modified Project Site pertains only to the 11.64 acres of GC and 6.21 acres of OS land uses to be added to the AHSP. The property to be designated GC would be added to existing PA 11 and the property to be designated OS would form new PA 12A.

Because of the naming convention similarity between the Modified Project and the Modified Project Site as used in SEIR No. 2, it is worth reiterating the difference. The Modified Project or proposed project refers to the entire AHSP as revised by proposed AHSPA No. 3. The Modified Project Site references only the 17.85-acre property to be added to the AHSP boundary.

The Modified Project Site currently has a lower elevation than the commercial pad in PA 11. The Modified Project Site is also lower in elevation than the sewer lift station recently constructed as part of the approved AHSP in PA 12 and 13 adjacent to the south of PA 11. Sewage from the Modified Project Site would not be able to gravity flow to the lift station. To bring the Modified Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad in PA 11 and to enable gravity flow to the existing sewer lift station, import of approximately 440,000 cubic yards of soil is required.

Table 2.A summarizes the Approved Project and Modified Project land use acreages and development quantities by land use type.

Table 2.A: Comparison of the Approved Land Uses and the Proposed Amendment to the Arantine Hills Specific Plan

Land Use	Approved Project		Modified Project	
	Acreage	DUs/SF	Acreage	DUs/SF
Residential	191.6	1,806	191.6	1,806
Commercial	10.03	80,000	21.7	223,108[1]
Parks	9.9	NA	9.9	NA
Open Space	77.4	NA	83.6	NA
Roadways	18.9	NA	18.9	NA

DUs = residential dwelling units

SF = commercial building area
NA = not applicable, not considered a developed land use
[1] Includes a 135-room hotel.

2.2.2 Proposed Commercial

The 11.64 acre increase in GC land use would expand the quantity of commercial building area in the AHSP by approximately 143,108 sf which includes a 135-room hotel. The resulting commercial building area would be 223,108 sf on 21.67 acres. The permitted land use types in the AHSP GC category include retail, restaurants, services, entertainment, lodging and offices plus community services including daycare, emergency medical care and others. The permitted GC land use types would remain unchanged as part of AHSPA No. 3.

Bedford Marketplace would have three entrances from the extension of Bedford Canyon Road south from Cajalco Road/Eagle Glen Parkway. A combination 8-foot sidewalk and 6-foot trail would form the western boundary of the commercial center. The pedestrian linkages are intended to provide connectivity between the Bedford Canyon Road/Eagle Glen Parkway intersection to the south and a recently constructed trail system located on the north side of Bedford Canyon Wash, a recently constructed dog park, and to the developing Bedford residential community.

The retail and service uses would occupy a majority of PA 11 fronting Cajalco Road to the north and Bedford Canyon Road (extended) to the west. The eastern border of the retail and service uses would be the limits of the AHSP boundary as revised by the Modified Project. While the retail and service entities have not been finalized and are subject to change, potential uses within Bedford Marketplace include a fuel facility with convenience store, auto-spa, quick serve coffee with drive thru, financial institution with drive thru, day care center, health and fitness club, super market, pharmacy, hotel, sit-down restaurants, quick serve restaurants, and other retail stores consistent with neighborhood retail centers.

Parking consistent with the City's parking code is planned throughout Bedford Marketplace. Shopping center identification monument signage is planned at the corner of Bedford Canyon Road and Eagle Glen Parkway. A tenant identification pylon sign facing I-15 is planned north of the hotel site and a pylon sign specific to the hotel is planned south of the hotel site along I-15. A tenant monument sign is planned at the north perimeter of the site adjacent to Eagle Glen Parkway as well as along the west perimeter adjacent to Bedford Canyon Road. Certain uses, such as the hotel, will also have wall-mounted building signage on the eastern elevation of the building. A detailed master sign program outlines all proposed signage.

The proposed 135-room hotel would be located south of the commercial uses in the southeastern portion of the Modified Project Site, north of the proposed water quality basin, and east of the existing water

quality basin in PA's 12 and 13. The hotel would have a height of four stories or 50 feet, whichever is greater. Hotel parking would be accommodated by surface parking lots.

2.2.3 Proposed Open Space

The 6.21 acre increase in OS land use would increase the quantity of open space area in the AHSP from 77.4 to 83.6 acres. The increase in OS would occur in newly created PA 12A proposed as part of AHSPA No. 3.

2.3 ADJACENT LAND USES

Directly north of the Modified Project is the Eagle Glen Specific Plan area, a residential and golf course community. There is an existing neighborhood commercial center located on Bedford Canyon Road, just north of Cajalco Road, adjacent to I-15. To the south of the Modified Project lies unincorporated land and a series of large scattered lots located on rugged topography that are privately owned agricultural and estate residential land.

Table 2.B provides a summary of existing land use, General Plan land use designations, and zoning within the AHSP boundary and the surrounding areas.

Table 2.B: Existing and Surrounding Land Use, General Plan Land Use Designations, Zoning

Location	Current Land Uses	General Plan Land Use Designations	Zoning
Existing AHSP boundary	Vacant/developing residential and commercial uses	General Commercial; High Density Residential; Medium Density Residential; Low Density Residential; Parks; Open Space; and Master Planned Roadways	General Commercial; High Density Residential; Medium Density Residential; Low Density Residential; Parks; Open Space; and Master Planned Roadways
North and Northwest	Eagle Glen Specific Plan	Low Density Residential and Commercial Center	Single-Family Residential
Southeast	Unincorporated Rural Residential	Riverside County Rural Residential	Riverside County Rural Residential
Northeast	I-15 right-of-way; improvements under construction	Agriculture (including the 17.85 acre RCTC property constituting the Modified Project Site	Agriculture

2.4 GENERAL PLAN LAND USE DESIGNATIONS AND ZONING

Existing land use, General Plan Land Use Designations, and Zoning for the current AHSP and adjacent properties are shown in previously referenced Table 2.B. The Approved Project (i.e., current AHSP) and Modified Project (i.e., proposed AHSP) General Plan, Specific Plan, and Zoning quantities are shown in Table 2.C. Figure 2.2 illustrates the existing and proposed General Plan land use designations for the AHSP. Figure 2.3 illustrates the existing and proposed zoning designations for the AHSP.

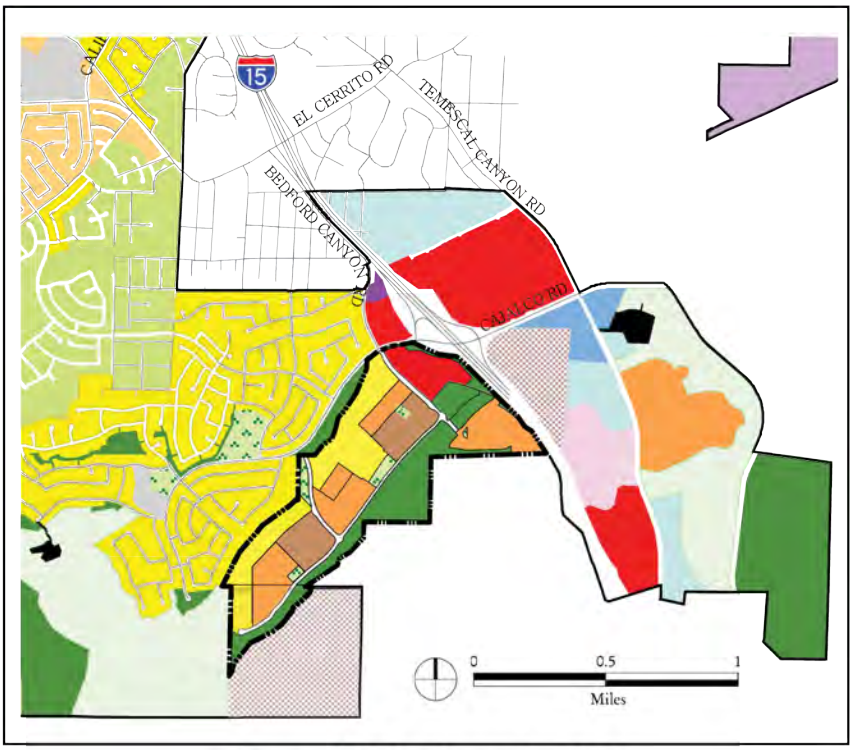

Table 2.C: Existing and Proposed General Plan, Specific Plan, and Zoning Quantities

Land Use	Approved Project Quantities	Modified Project Quantities
General Commercial (GC)	10.03 acres	21.7 acres
High Density Residential (HDR)	39.6 acres	39.6 acres
Medium Density Residential (MDR)	81.8 acres	81.8 acres
Low Density Residential (LDR)	70.2 acres	70.2 acres
Parks (P)	9.9 acres	9.9 acres
Open Space (OS)	77.4 acres	83.6 acres
Master Plan of Roadways	18.9 acres	18.9 acres
TOTAL	307.8 acres	325.7 acres

2.5 MODIFIED PROJECT COMPONENTS

As summarized in Section 2.2, the Modified Project consists of changes to the AHSP proposed as part AHSPA No. 3. The Modified Project represents the proposed project under scrutiny in SEIR No. 2. These components are a GPA, SPA, PM, PP, and Noise Variance. Each of these components is described in detail below.

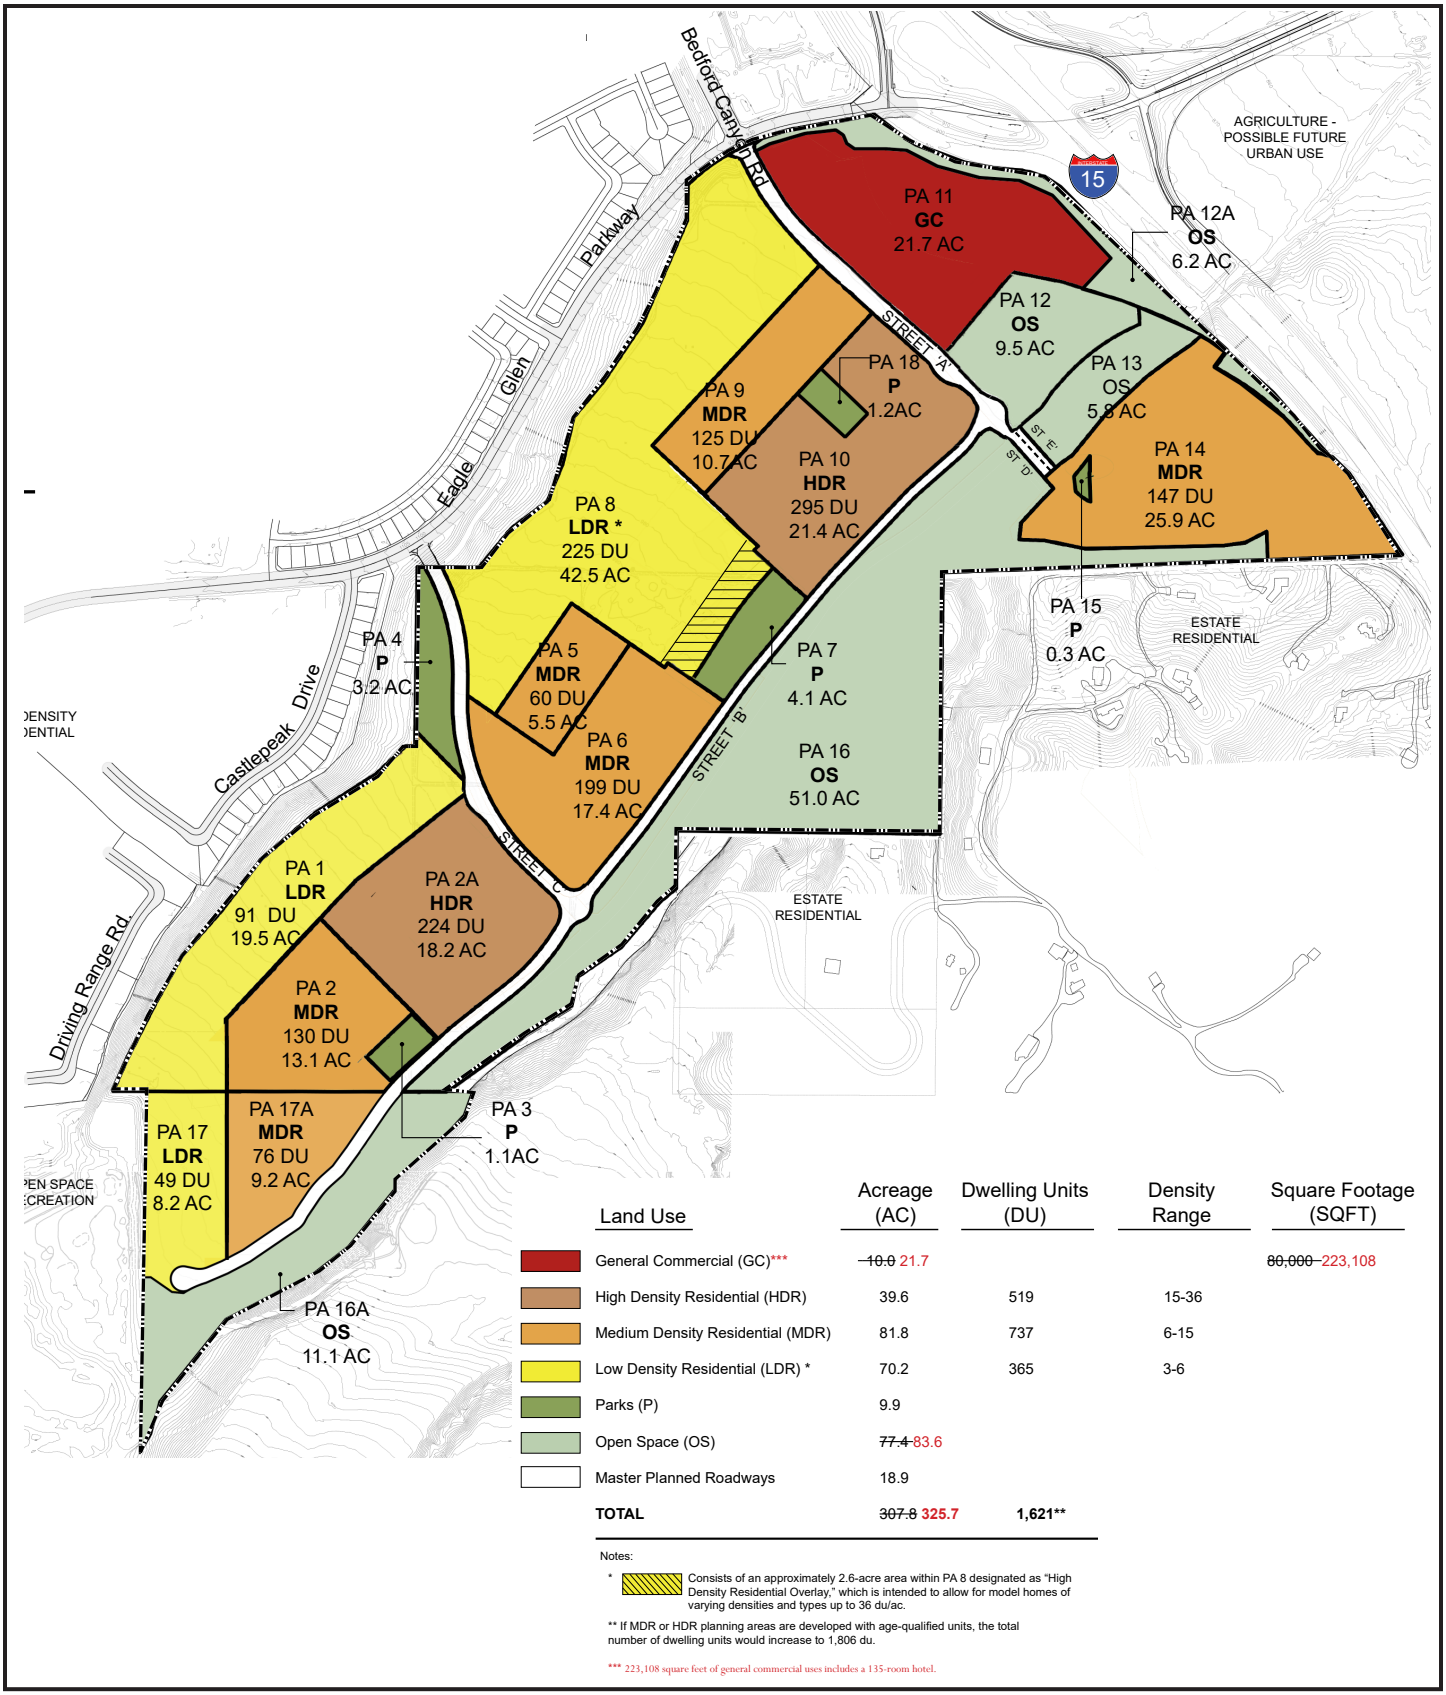
2.5.1 General Plan Amendment

The 17.85-acre Modified Project Site currently has a General Plan land use designation of Agriculture. The GPA necessary to implement Modified Project would change the land use designation of the property from Agriculture to GC and OS. The GC designation would consist of an 11.64 acre increase to be allocated to PA 11. The GPA would expand PA 11, as well as the commercial development land use, from approximately 10 acres to 21.67 acres. The OS designation would consist of a 6.21 acre increase in open space land to be allocated to newly formed PA 12A. The GPA would expand OS acreage in the AHSP from approximately 77.4 to 83.6 acres.

2.5.2 Specific Plan Amendment

The Modified Project, proposed AHSPA No. 3, would result in the following changes to the AHSP.

- Change the General Plan land use designation and zoning on the 17.85 acre Modified Project Site from Agriculture to GC and OS.
- Adjust the AHSP boundary by the addition of the approximately 17.85-acre Modified Project Site.
- Designate 11.64 acres of the Modified Project Site as PA 11 in the AHSP with a land use designation of GC. PA 11 would expand from 10.03 to 21.67 acres.
- Increase the total permitted commercial development in the AHSP by 143,108 sf that includes a 135-room hotel. The resulting permitted commercial development in the AHSP would increase from 80,000 sf to 223,108 sf[1] of commercial building which includes the 135-room hotel.
- Designate 6.21 acres of the Modified Project Site as newly formed PA 12A in the AHSP with a land use designation of OS. PA 12A would increase open space in the AHSP by approximately 6.21 acres.
- Increase the overall AHSP boundary from 307.8 to 325.7 acres, with GC land use increasing from 10.0 to 21.7 acres and OS increasing from 77.4 to 83.6 acres.



[1] The 223,108 square feet represents the current design of the proposed commercial center and hotel. Minor changes to the design of the center could occur during the entitlement and planning process resulting in minor changes to the square footage of the center. The AHSP has a process to accommodate minor statistical changes without requiring a subsequent Specific Plan Amendment.

- Edits to AHSP Table 6-1 to clarify the application of shared parking and FAR requirements, and minor additional edits to the AHSP for data and text consistency.
- Permit the use of American Farmhouse architecture for the commercial center.

The permitted land use types in the AHSP GC category include retail, restaurants, services, entertainment, lodging and offices plus community services including daycare, emergency medical care and others. The permitted GC land use types would remain unchanged as part of AHSPA No. 3. Planned residential, park, and roadway development quantities/acreages would not be affected by AHSPA No. 3. The resulting land use plan with the incorporation of SPA No. 3 is shown in Figure 2.4.

2.5.3 Parcel Map

The 17.85-acre Modified Project Site is comprised of Assessor's Parcel Numbers 279-240-033 and 279-240-019. The Modified Project includes a request by the project Applicant to subdivide the parcels into five numbered parcels and four lettered lots. Parcels 1 through 5 would be designated for commercial uses while lots A, B, C and D would be designated for open space. The PM is shown in Figure 2.5.

Land Use	Acreage (AC)	Dwelling Units (DU)	Density Range	Square Footage (SQFT)
General Commercial (GC)***	~~10.0~~ 21.7			~~80,000~~ 223,108
High Density Residential (HDR)	39.6	519	15-36	
Medium Density Residential (MDR)	81.8	737	6-15	
Low Density Residential (LDR) *	70.2	365	3-6	
Parks (P)	9.9			
Open Space (OS)	~~77.4~~ 83.6			
Master Planned Roadways	18.9			
TOTAL	~~307.8~~ 325.7	1,621**		

Notes:

* Consists of an approximately 2.6-acre area within PA 8 designated as "High Density Residential Overlay," which is intended to allow for model homes of varying densities and types up to 36 du/ac.

** If MDR or HDR planning areas are developed with age-qualified units, the total number of dwelling units would increase to 1,806 du.

*** 223,108 square feet of general commercial uses includes a 135-room hotel.

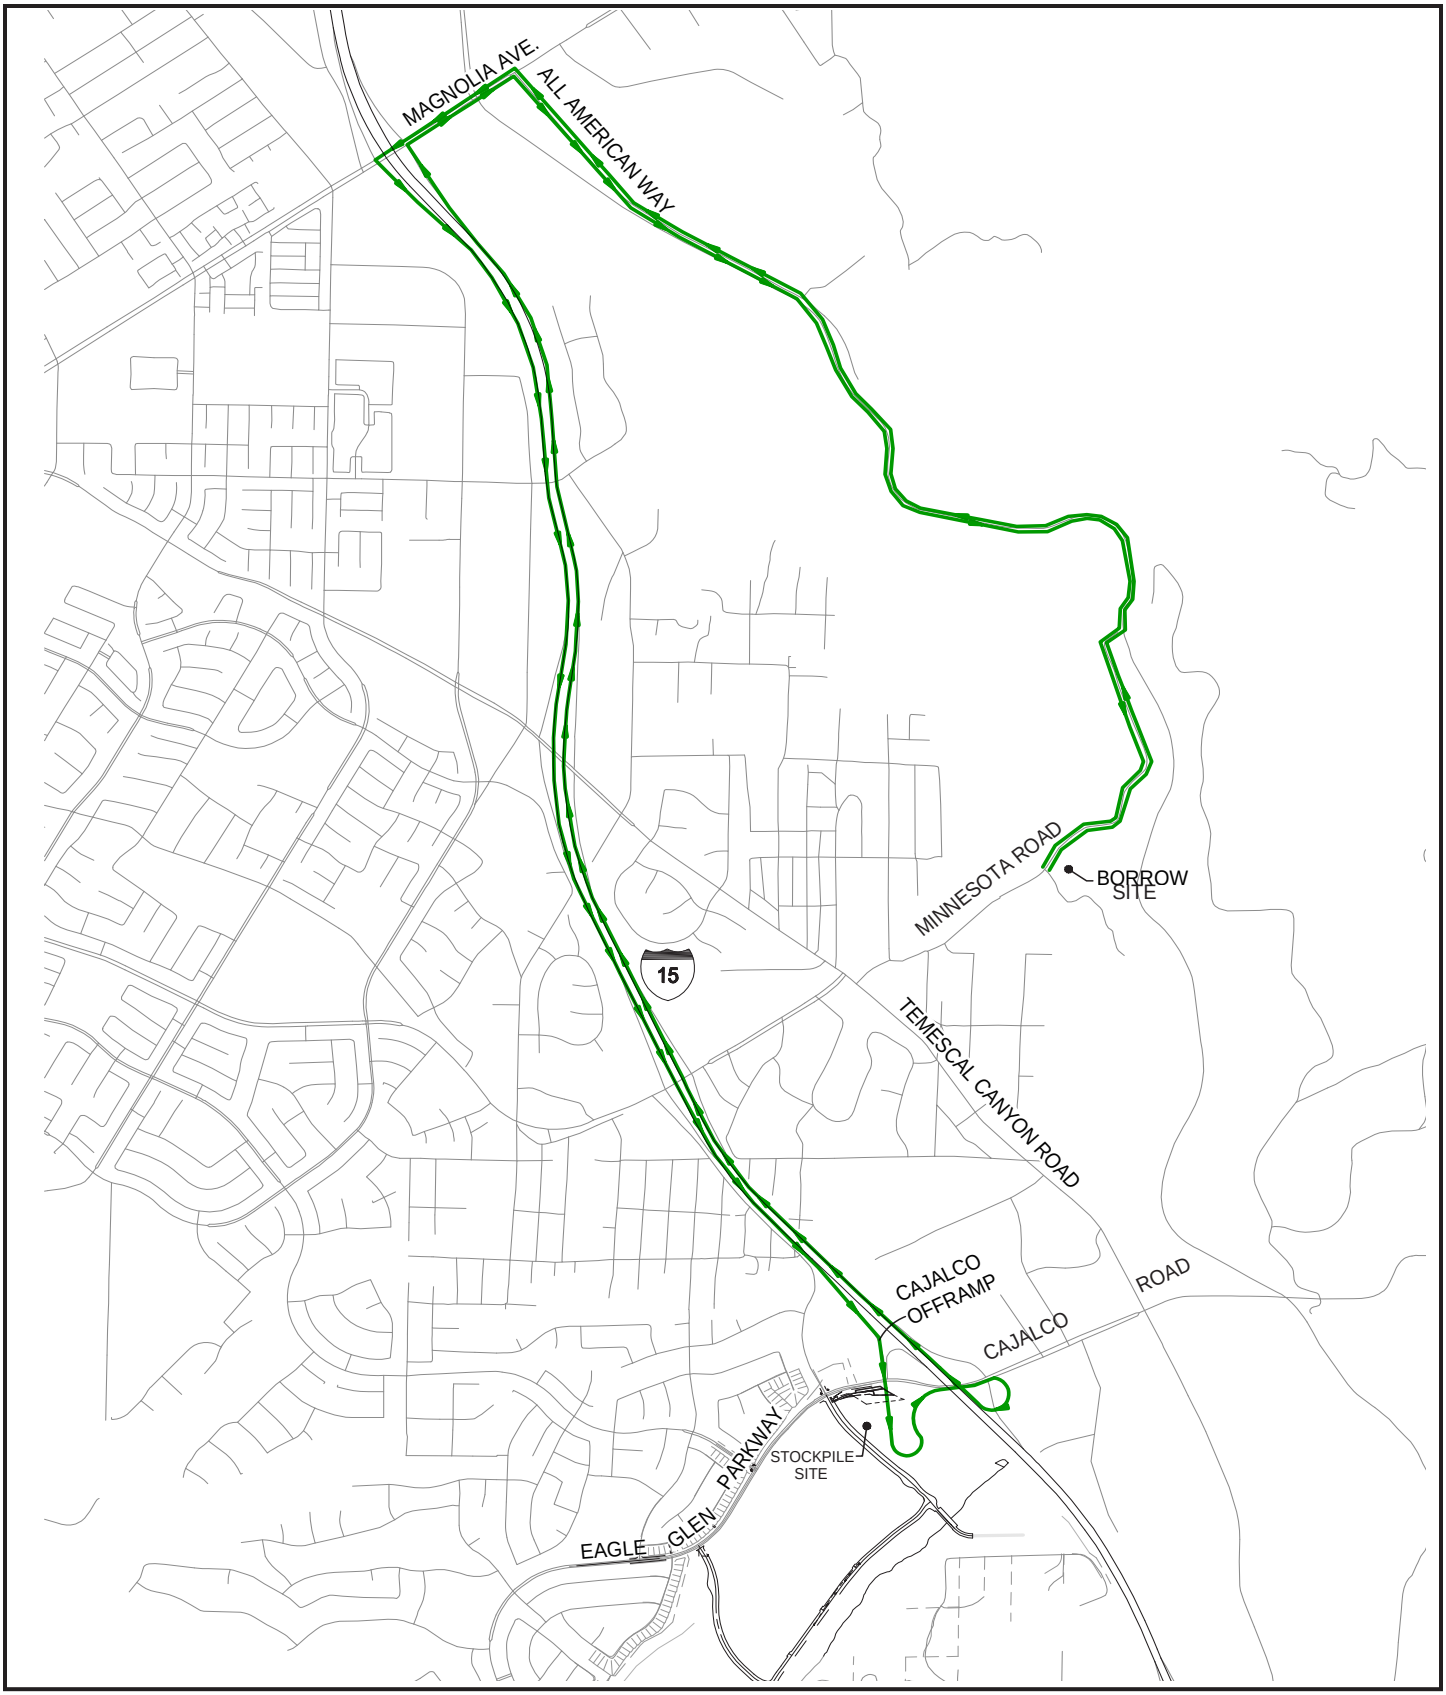
2.5.4 Noise Variance



As explained in detail below, the Modified Project Site requires the import of a substantial quantity of soil to raise the elevation close to the elevation of existing PA 11 and to allow gravity flow to the existing sewer lift station in PA 12. The Applicant has presented two alternatives for soil import. One of the alternatives would require importing soil by truck and at night. The other alternative would import soil from adjacent development area by scraper and occur during the day. Due to the long duration (118 nights) of importing soil by truck and the proposal to conduct the soil import operations during nighttime hours, potential nighttime noise violations may occur on a temporary basis during the soil import operations. If violations are anticipated, a Noise Variance to allow temporary non-compliance with the City's noise ordinance will be required. It should be noted that the Noise Variance is subject to further review as part of a separate discretionary review process.

The project Applicant proposes to import soil during nighttime hours (8:00 p.m. to 4:00 a.m.), and complete grading operations during both daytime and nighttime hours. Two sources of soil have been identified for importing soil onto the Modified Project Site. Descriptions of Soil Import Alternatives 1 and 2 are discussed below

Soil Import Alternative 1: One alternative to importing soil to the Modified Project Site would occur by truck from an off-site source. One potential source of import, or borrow site, has been identified from the FST Sand and Gravel Mine, located east of I-15 and approximately ½ mile east of El Cerrito Road. Other import sites are being considered within an approximately 10-mile radius of the project site.

Trucks would haul the soil from a borrow site on Minnesota Road to Sherborn Street, to Magnolia Avenue, to the I-15 Freeway southbound on ramp at Magnolia Avenue, travel southbound on the freeway, and exit the southbound off-ramp at Cajalco Road. Trucks would access the Modified Project Site by proceeding straight through the off-ramp intersection onto the Modified Project Site. Returning trucks would exit in similar manner by returning to Cajalco Road and turning right at the off-ramp intersection. Trucks would return onto Cajalco Road, enter I-15 Freeway northbound to Magnolia Avenue to Sherborn Street and travel south to the borrow site. In essence, a temporary fourth leg to the I-15 Southbound offramp/Cajalco Road intersection would be added. Traffic control or a temporary signal modification would be required for this additional truck movement. This proposed haul route requires approval of a temporary encroachment permit from Caltrans and the City. Figure 2.6 shows the proposed haul route for Soil Import Alternative 1.

Soil Import Alternative 1 Haul Route

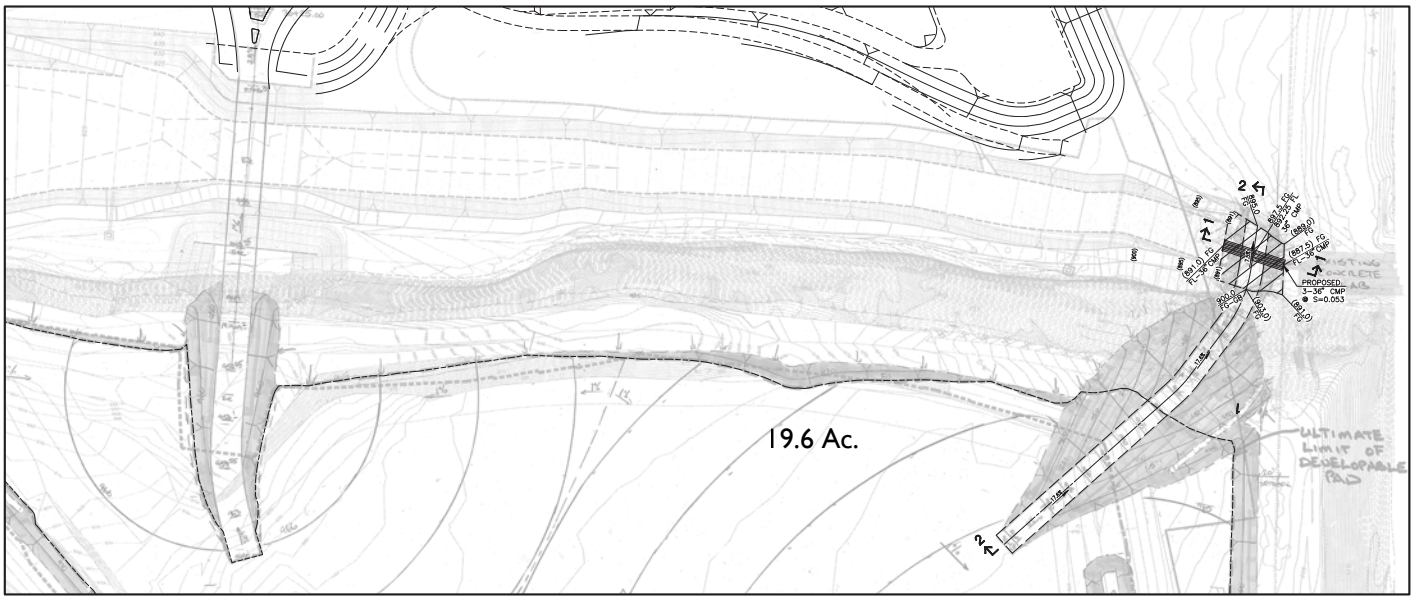
This Page Intentionally Left Blank

Daytime grading activities would initially last for approximately two weeks and begin before the soil import operation, and grading operations would overlap with initial soil import. The daytime grading activities would include remedial grading, which requires the over-excavation of approximately four to six feet below existing ground surface. To accomplish the over-excavation, the grading contractor would likely use three (3) Caterpillar 651 scrapers, one (1) tracked bulldozer (Caterpillar D-8), one (1) water truck, and one (1) street sweeper. The over-excavated soil would be stockpiled on site. Additional daytime grading would occur after imported soil has been placed in the over-excavated areas to raise the site towards proposed grades. The stockpiled over-excavated soil would then be placed over the imported soil, and compacted to geotechnical specifications to create the finished building pad.

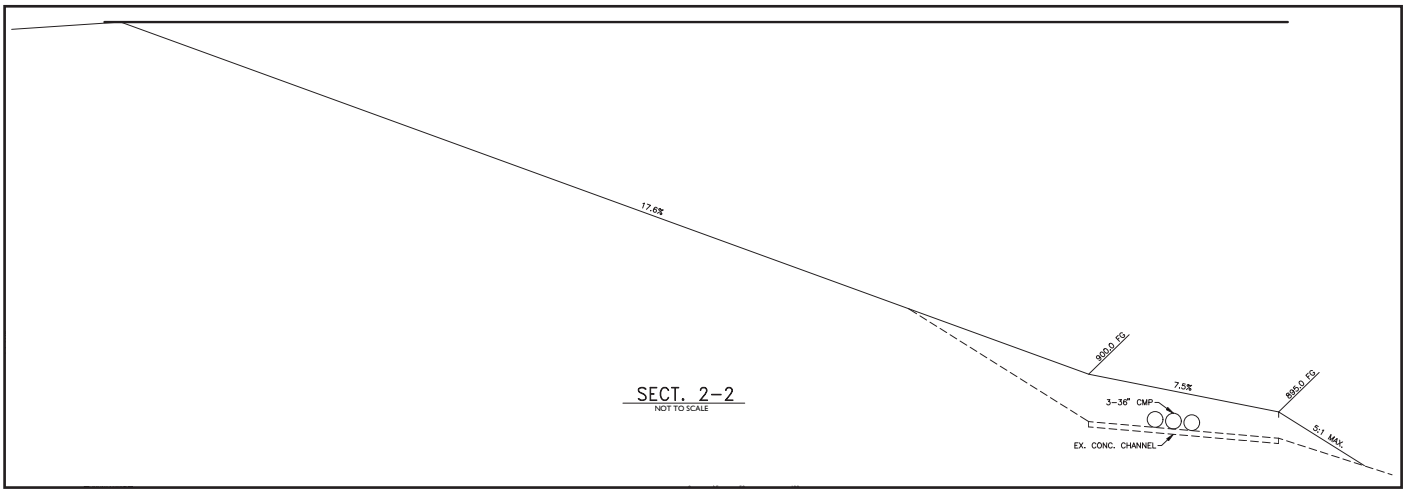
During the nighttime hours, soil would be imported to the Modified Project Site, dumped, and moved by grading equipment. Double-belly dirt haulers would be used, which do not require backing up or banging of tailgates. The trucks would drive a continuous route across the Modified Project Site while dumping their load. One (1) rubber tire bulldozer, such as a Caterpillar 834, would be used to move and compact the imported soil. The site is large enough to avoid backing up and the use of warning signals. Additionally, the rubber tire equipment would be used to avoid the noise from tracked equipment. In addition to the bulldozer, one (1) water truck (4,000 gallon) and one (1) street sweeper would be used during the soil import operation.

The soil import operation would include 250 full truck loads per night. Based on 15 cubic yards per truck load, a total of approximately 3,750 cubic yards would be imported per night. To import 440,000 cubic yards of soil, approximately 118 nights of soil import would be required.

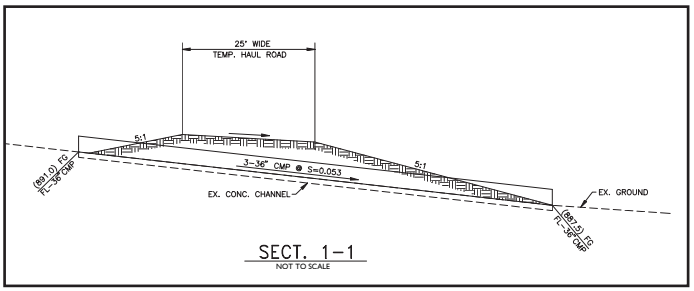
Soil Import Alternative 2: The second alternative to importing soil to the Modified Project Site would occur by importing soil from PA 14 of the existing AHSP. PA 14 is located to the south of the Modified Project Site and further south of Bedford Canyon Wash. PA 14 is approximately 26 acres, undeveloped, and planned for Medium Density Residential development in the current AHSP. This area forms an elevated plateau above Bedford Canyon Wash. Lowering the elevation of PA 14 by approximately 13 feet would generate approximately 425,000 cubic yards of soil for the Modified Project Site. The remaining 15,000 cubic yards would be generated by lowering PA 14 an additional half foot or importing the remaining soil from an off-site location.



To haul the soil from PA 14, an access ramp would be graded in the northeast portion of PA 14 leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes opened at a 2:1 grade. The lower portion of the access ramp would be steeper than 2:1 and reinforced with geo-grids or similar stabilizers. Five to 10 feet of soil would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation towards the top of the Wash banks.



The ramp from PA 14 to the concrete crossing of Bedford Canyon Wash would be constructed by an excavator. Careful grading operations and BMPs would avoid soil spoils into Bedford Canyon Wash. While this import operation would need to take place during the dry season, temporary pipe culverts would be placed on top of the concrete pad under the soil ramp in case unexpected storms cause Bedford Canyon Wash to flow. Following grading of the ramp, scrapers would move the soil from PA 14 to the Modified Project Site. Only one scraper at a time would fit on the soil bridge across Bedford Canyon Wash, so this part of the haul route would be limited to one-way traffic. After crossing Bedford Canyon Wash, scrapers would continue north, paralleling I-15, on the Modified Project Site property to place the fill soil. All soil movement would be done off street.



Following completion of the soil import, the temporary soil bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash. The notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff and minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

For this alternative, the over-excavation work would be the same as described for Soil Import Alternative No. 1. To move the soil from PA 14 to the Modified Project Site, the grading contractor would likely use six (6) Caterpillar 657 scrapers, one (1) D-10 bulldozer, one (1) Caterpillar 834 Rubber Tire Compactor, three (3) water trucks, and one 14H Blade for finishing. Following soil movement, the bluff would be reconstructed using one (1) Caterpillar 345 Excavator, one (1) Caterpillar 623 Scraper, one (1) Caterpillar 834 Rubber Tire Compactor, one (1) Caterpillar 980 Rubber Tire Loader, one (1) D-5 bulldozer, one (1) 84-inch Compactor, and a water truck.

Figure 2.7 shows the proposed haul route for Soil Import Alternative 2.

2.5.5 Precise Plan

A Precise Plan is required to approve the final design of the entire Bedford Marketplace, which includes both the Modified Project Site and a portion of the Approved Project Site (i.e., the existing 10 acres designated GC in current PA 11). Bedford Marketplace is planned as a neighborhood commercial center designed to bring commercial services to the Bedford and Eagle Glen communities Bedford Marketplace and would consist of 223,108 sf of GC uses that includes a 135-room hotel on 21.7 acres. The center would be designed in the farmhouse style of architecture that would be added as part of the Modified Project. Figure 2.8 shows the Modified Project Site Plan.

Bedford Marketplace would have three entrances from the extension of Bedford Canyon Road. A combination 8-foot sidewalk and 6-foot trail would form the western boundary and provide pedestrian connectivity from the intersection of Bedford Canyon Road and Eagle Glen Parkway to the newly installed trail system located on the north side of Bedford Canyon Wash, including the new dog park, and to residential areas within the Bedford residential community.

While the retail and service users have not been finalized and are subject to change, potential uses within Bedford Marketplace would include a fuel facility with convenience store, auto-spa, quick serve coffee with drive thru, financial institution with drive thru, day care center, health and fitness club, super market, pharmacy, hotel, sit-down restaurants, quick serve restaurants, and other retail stores that are consistent with a neighborhood retail center.

Located in the southeastern portion of the Modified Project Site is a planned hotel. The proposed 135-room hotel would be located south of the commercial uses in the southeastern portion of the Modified Project Site, north of the proposed water quality basin, and east of the existing water quality basin PAs 12 and 13. The hotel would have a height of four stories or 50 feet, whichever is greater. Hotel parking would be accommodated by surface parking lots.

Parking consistent with the City's parking code is planned throughout Bedford Marketplace. Shopping center identification monument signage is planned at the corner of Bedford Canyon Road and Eagle Glen Parkway. A tenant identification pylon sign facing I-15 is planned north of the hotel site and a pylon sign specific to the hotel is planned south of the hotel site along I-15. Certain uses, such as the hotel, will also have wall-mounted building signage on the eastern elevation of the building. A detailed master sign program outlines all proposed signage.

The Modified Project will include review and approval of infrastructure improvements as part of the PP. These improvements include domestic water connections, dry utility connections, sewer connections, and stormwater conveyance features and a water quality basin.

KEY PLAN
SCALE: NTS

FIRE DEPARTMENT GENERAL NOTES:

1. PLANS SHALL SHOW A MINIMUM DRIVE WIDTH OF 28 FEET.
2. PROVIDE PLANS FOR TWO (2) ALL WEATHER SURFACE ACCESS WAYS TO BE APPROVED BY THE FIRE PREVENTION MANAGER AND CONSTRUCT THE ACCESS WAY(S) TO ACCOMMODATE 70,000 LBS. GVW DURING ALL PHASES OF CONSTRUCTION.
3. ALL PROJECTS SHALL COMPLY WITH THE CITY OF CORONA FIRE DEPARTMENT SITE CONSTRUCTION STANDARD. A COPY OF WHICH IS AVAILABLE AT THE FIRE DEPARTMENT COUNTER. PROJECTS SHALL HAVE APPROVED ALL WEATHER ACCESS FROM TWO (2) DIRECTIONS AND FIRE HYDRANTS PROVIDING THE REQUIRED FIRE FLOW TESTED AND ACCEPTED PRIOR TO COMBUSTIBLE CONSTRUCTION.
4. PROVIDE A MINIMUM TWENTY-FIVE (25) FOOT INSIDE AND FIFTY (50) FOOT OUTSIDE RADIUS FOR ACCESS DRIVE(S).
5. STREET AND DRIVE GRADES SHALL NOT EXCEED 10% UNLESS APPROVED BY THE FIRE CHIEF AND CITY ENGINEER.
6. ANY OVERHEAD OBSTRUCTION SUCH AS THE SECOND STORY OF A BUILDING, PORTE COCHERE, ETC., THAT INTRUDES INTO THE REQUIRED CLEAR WIDTH OF FIRE VEHICLE ACCESS DRIVES SHALL PROVIDE A MINIMUM CLEAR HEIGHT OF FIFTEEN (15) FEET UNLESS OTHERWISE APPROVED BY THE FIRE CHIEF.
7. MODIFY THE SITE PLAN TO PROVIDE AN ALL-WEATHER ACCESS WITHIN 150 FEET OF PORTIONS OF EXTERIOR WALLS OF THE FIRST STORY OF THE BUILDING AS MEASURED BY AN UNOBSTRUCTED ROUTE AROUND THE EXTERIOR OF THE BUILDING.
8. MEET WITH CORONA FIRE DEPARTMENT TO DETERMINE LOCATIONS OF RED CURBING AND SIGNAGE BY FIRE HYDRANTS, FIRE DEPARTMENT CONNECTIONS, AND DESIGNATED FIRE LANES ON SITE.
9. A KNOX BOX SHALL BE PROVIDED FOR THE FOLLOWING BUILDING(S):
10. A MINIMUM FIRE FLOW OF 3000 GPM SHALL BE PROVIDED.
11. THE FIRE SERVICE WATERLINE SHALL BE LOOPED AND PROVIDED WITH TWO (2) SEPARATE POINTS OF CONNECTION.
12. FIRE HYDRANTS ARE TO BE SPACED A MAXIMUM 250 FEET APART.
13. BUILDING(S) SHALL NOT BE CONSTRUCTED ACROSS PROPERTY LINE(S) WITHOUT APPROVAL OF THE BUILDING OFFICIAL.
14. PROVIDE CLASS A ROOFING MATERIAL.
15. A FIRE FACILITIES FEE OF $231.00 PER ACRE IS REQUIRED PER CORONA MUNICIPAL CODE SECTION 3.36.030 AND MUST BE PAID PRIOR TO BUILDING PERMIT ISSUANCE.
16. PER 511 OF THE CORONA MUNICIPAL CODE, A PUBLIC SAFETY RADIO COMMUNICATION STUDY IS REQUIRED. CONSULT WITH THE FIRE DEPARTMENT FOR SPECIFIC REQUIREMENTS FOR THIS STUDY.
17. GROVES AND WEED ABATEMENT SHALL BE MAINTAINED SO AS NOT TO POSE A FIRE HAZARD UNTIL TIME OF DEVELOPMENT.
18. A SPECIFIC ADDRESS, ASSIGNED BY THE CITY OF CORONA, SHALL BE PROVIDED FOR EACH BUILDING AS SPECIFIED BY THE FIRE DEPARTMENT ADDRESS STANDARD WHICH CAN BE OBTAINED AT THE FIRE DEPARTMENT COUNTER AT CITY HALL. ADDRESS MUST BE ILLUMINATED DURING ALL HOURS OF DARKNESS.
19. FIRE EXTINGUISHERS SHALL BE PROVIDED PRIOR TO OCCUPANCY. FIRE EXTINGUISHERS SHALL BEAR A CALIFORNIA STATE FIRE MARSHALS SERVICE TAG; IT SHALL BE APPROPRIATELY RATED FOR THE HAZARD; IT SHALL BE MOUNTED SO THAT THE TOP OF THE EXTINGUISHER IS NO HIGHER THAN FIVE (5) FEET ABOVE FLOOR LEVEL; AND SHALL BE LOCATED SUCH THAT THE TRAVEL DISTANCE TO AN EXTINGUISHER DOES NOT EXCEED SEVENTY-FIVE (75) FEET.
20. AT NO TIME SHALL FIRE HYDRANTS OR FIRE LANES BE BLOCKED BY BUILDING MATERIALS, STORAGE, EQUIPMENT, AND/OR VEHICLES.
21. MULTIPLE UNIT BUILDINGS SHALL HAVE SUITE NUMBER IDENTIFICATION ASSIGNED BY THE FIRE DEPARTMENT. SUBMIT AN EXHIBIT FOR REVIEW AND APPROVAL TO THE FIRE DEPARTMENT. A COPY OF THE PREMISE IDENTIFICATION STANDARD IS AVAILABLE AT CORONACA.GOV.

Supplemental EIR No. 2
City of Corona

Modified Project Site Plan

This Page Intentionally Left Blank

Domestic water and dry utility lines currently exist within the extension of Bedford Canyon Road adjacent to the existing 10-acre commercial pad within the existing AHSP. An update to the Water Supply Assessment for the AHSP has been prepared and forms the basis for the conclusions in Chapter 3.0 regarding water availability.

Sewer is planned to gravity flow to the existing lift station located within the PA 12 of the AHSP.

Stormflows from the Modified Project Site would be collected in a new detention/water quality basin located south of the proposed commercial center in revised PA 11. The basin would be sized to retard peak flows to below the level of existing peak discharge conditions. In addition to detaining flows, the basin would allow for infiltration and provide water quality treatment. The detention basin is planned to discharge to Bedford Canyon Wash. An outlet pipe and associated headwall would be constructed within the previously disturbed and newly constructed bank of Bedford Canyon Wash on the concrete spillway, which would avoid disturbing the soft bottom of Bedford Canyon Wash and impacting native vegetation.

2.6 COMPARISON OF MODIFIED PROJECT (PROPOSED AHSP) TO APPROVED PROJECT (APPROVED AHSP)

The proposed AHSP, or Modified Project, would entail a larger footprint in comparison to the approved AHSP, or Approved Project. The Modified Project would encompass 325.7 total acres while the Approved Project encompasses 307.8 acres. The Modified Project would permit development of 223,108 sf of GC uses including a 135-room hotel on 21.7 acres while the Approved Project permits development of 80,000 sf of GC uses on 10 acres. The permitted GC land use types would remain unchanged as part of the Modified Project. The Modified Project would provide for 83.6 acres of OS while the Approved Project provides 77.4 acres of OS. Both the Approved and Modified Project allow up to 1,806 residential dus on 191.6 acres, 9.9 acres of parks, and 18.9 acres of master planned roadways. Previously referenced Table 2.A presents a breakdown of the approved and proposed land uses by the specific land uses contained in the AHSP.

2.7 PROJECT OBJECTIVES

The California Environmental Quality Act (CEQA) Guidelines require an EIR Project Description include “a statement of objectives sought by the proposed project.” The following project objectives from the approved AHSP remain valid for the proposed AHSP.

- Build upon the platform of high-quality design, architecture, and landscaping established by the neighboring Eagle Glen residential community to provide a cohesive, pedestrian-friendly community that offers a variety of recreational amenities to residents of Arantine Hills.

- Establish open space preservation area-adjacent to Bedford Canyon Wash to provide an important link to the natural environment.
- Develop Arantine Hills as a well-designed, high quality residential community that integrates residential uses with retail commercial uses.
- Benefit the City and its residents to fund and implement the needed improvements to the I-15/ Cajalco Road freeway Interchange.
- Develop a planning area with retail commercial uses to serve local and nearby residents and generate revenue for the City.
- Provide a General Commercial planning area that will accommodate retail and service uses, that will offer new employment opportunities, and contribute to a strong and diversified economic base.
- Address the City's current and projected housing needs for all segments of the community by providing a range of family-oriented single-family detached and attached housing and multifamily residences.
- Establish a mix of land uses and local-serving activities that meet the General Plan's objectives concerning community character and pedestrian-friendly design.
- Implement the City's General Plan Land Use Element goal to provide for compatibility of land uses, recreation, and resource protection.
- Create a system of roads, trails, and sidewalks that will fulfill the policies of the Corona General Plan by allowing residents to live in proximity to park and recreational opportunities and retail commercial shops and services.
- Provide a network of pleasant, safe, and convenient sidewalks, and a bikeway along "B" Street.
- Concentrate development within neighborhoods to promote greater efficiency of land use, and promote walking and bicycling as an alternative to motor vehicle use.
- Incorporate "green" and sustainable practices, as practicable, in developing buildings and infrastructure in Arantine Hills.
- Maximize opportunities for using water-wise plant materials in the project landscaping to promote water conservation.
- Identify and address safety hazards, such as wildfire and flooding dangers, through implementation of design safety features and improvements to Bedford Canyon Wash.
- Undertake development of the project site in a manner that is economically feasible and balanced to address both the applicant's and the City's economic concerns.

- Pass storm flows through either Bedford Canyon Wash or an adjacent bypass channel in a manner that minimizes erosion in Bedford Canyon Wash, safely conveys storm flows in a manner that protects adjacent housing and property, and creates a more conducive setting to reestablishment of natural vegetation within Bedford Canyon Wash.

2.8 Discretionary Actions, Permits, and Other Approvals

In accordance with Sections 15050 and 15367 of the State CEQA Guidelines, the City as Lead Agency has principal authority and jurisdiction for CEQA actions. Responsible Agencies are those agencies that have jurisdiction or authority over one or more aspects associated with the development of a proposed project and/or mitigation. Trustee Agencies are State agencies that have jurisdiction by law over natural resources affected by the proposed project.

The legislative and discretionary actions to be considered by the City as part of the proposed project include:

- **Approval of a General Plan Amendment (GPA 2019-0002):** The Modified Project requires City approval of a GPA to amend the existing General Plan Land Use designations consistent with AHSPA No. 3. As discussed in Section 2.5.1, the General Plan land use designation on 11.7 acres would change from Agricultural to GC. The General Plan land use designation on 6.21 acres would change from Agricultural to OS.
- **Approval of a Specific Plan Amendment (SPA 2019-0005):** The Modified Project requires City approval of an SPA to amend the existing AHSP Land Use Plan and the City's Zoning Map consistent with AHSPA No. 3. As discussed in Section 2.5.2, GC land uses within the AHSP would increase by 11.7 acres from 10.0 to 21.7 acres, and the amount of GC square footage would correspondingly increase by 143,108 sf from 80,000 to 223,108 sf which includes a 135-room hotel. The additional GC land use quantities would be added to PA 11 and the permitted GC land use types would remain unchanged. OS land uses within the AHSP would increase by 6.21 acres from 77.4 to 83.6 acres. The increase in OS would occur in newly created PA 12A proposed as part of AHSPA No. 3. The maximum permitted number of residences (1,806 dus) on 191.6 acres, 9.9 acres of parks, and 18.9 acres of master planned roadways would remain unchanged. As part of these amendments to the AHSP, the City's Zoning Map would result in the conversion of 11.7 acres from Agricultural to GC zoning and the conversion of 6.21 acres from Agricultural to OS zoning.
- **Approval of a Parcel Map (PM 37788):** The Modified Project requires City approval of a PM to change the City Zoning Map consistent with AHSPA No. 3. As discussed in Section 2.5.3, the Modified Project Site is comprised of Assessor's Parcel Numbers 279-240-033 and 279-240-019. The PM would subdivide the two parcels into five numbered parcels and four lettered lots. New

parcels 1 through 5 would be designated for commercial uses while lots A, B, C and D would be designated for open space.

- **Approval of a Noise Variance (VMIN 2019-0006):** As discussed in Section 2.5.4, a Variance from the City's noise ordinance may be required to allow nighttime noise violations to occur on a temporary basis during soil import operations. This application is subject to further discretionary view separate from the GPA, SPA, PM, and PP.
- **Approval of a Precise Plan (PP 2019-0005):** The Modified Project requires City approval of a PP to approve the final design of the entire Bedford Marketplace including both the Modified Project Site and a portion of the Approved Project Site (i.e., the existing 10 acres of GC designated land in current PA 11). As discussed in Section 2.5.5, the PP would result in a neighborhood commercial center designed to bring commercial services to the Bedford and Eagle Glen communities Bedford Marketplace and would consist of 223,108 sf of GC uses that includes a 135-room hotel on 21.7 acres.

  As discussed in Section 2.5.5, the PP will include review and approval of infrastructure improvements associated with domestic water connections, dry utility connections, sewer connections, and stormwater conveyance features and a water quality basin.

3.0 COMPARATIVE EVALUATION OF ENVIRONMENTAL IMPACTS

3.1 INTRODUCTION

This section compares the impact analysis for the Approved Project as contained in the prior or previous Environmental Impact Report (EIR) prepared for the Arantine Hills Specific Plan (AHSP). The AHSP was originally approved by certified EIR in 2012, the first amendment to the AHSP was approved by Supplemental EIR (SEIR) No. 1 in 2016, and a second amendment to the AHSP was approved by EIR Addendum in 2018. In this SEIR, SEIR No. 2, references to the Prior EIR constitute the three prior environmental approvals for the Approved Project. All prior environmental approvals as well as SEIR No. 2 are designated by State Clearinghouse Number 2006091093.

As defined in Chapter 2.0 of this SEIR, the following naming conventions are used interchangeably:

- Approved Project = current AHSP = existing AHSP. As originally approved in 2012, modified by SPA No. 1 in 2016, and modified by SPA No. 2 in 2018. The Approved Project encompasses 307.8 acres and allows up to 1,806 residential dwelling units (dus) on 191.6 acres, 80,000 square (sf) of General Commercial (GC) building area on 10.03 acres, 9.9 acres of parks, 77.4 acres of Open Space (OS), and 18.9 acres of master planned roadways within a 307.8-acre Planning Area (PA) boundary.
- Modified Project = proposed Modified Project = proposed project = proposed AHSP Amendment No. 3 = AHSPA No. 3. The overall AHSP boundary would increase from 307.8 to 325.7 acres, with GC acreage increasing from 10.0 to 21.7 (11.64) acres and OS acreage increasing from 77.4 to 83.6 (6.21 acres). Planned residential, park, and roadway development quantities/acreages would not be affected. The expansion of the AHSP boundary would result in an increase of approximately 143,730 sf in commercial building area that includes a 135-room hotel over and above the Approved Project.
- Modified Project Site = the 17.85-acre expansion area. The Modified Project Site pertains only to the 11.64 acres of GC and 6.21 acres of OS land uses to be added to the AHSP. The property to be designated GC would be added to existing PA 11 and the property to be designated OS would form new PA 12A.

As emphasized in Chapter 2.0, the distinction between Modified Project and the Modified Project Site as used in SEIR No. 2 is worth reiterating. The Modified Project or proposed project refers to the entire

AHSP as revised by proposed AHSPA No. 3. The Modified Project Site references the 17.85-acre property to be added to the AHSP boundary.

A detailed description of the changes to the AHSP proposed as part of the Modified Project is contained in Chapter 2.0 of this SEIR. In general, the overall AHSP boundary would expand from 307.8 to 325.7 acres, consisting of an increase GC land use from 10.0 to 21.7 acres and increase OS land use from 77.4 to 83.6 acres. The quantity of GC building area would increase from 80,000 sf to 223,730 sf.

The comparative analysis contained in SEIR No. 2 and Chapter 2.0 reviews changes included in the proposed Modified Project, changes to existing conditions, and changes to circumstances under which the Modified Project would be undertaken that have occurred since approval of the Prior EIR documents. This chapter reviews any new information of substantial importance that was not known and could not have been known with exercise of reasonable diligence at the time that the EIR was certified. This section further provides supporting evidence as to why, as a result of such changes or new information, an SEIR is required. This examination includes an analysis consistent with State Public Resources Code Section 21166 and California Environmental Quality Act (CEQA) Guidelines Sections 15162 and 15163 of and their applicability to the proposed Modified Project.

The environmental checklist form contained in CEQA Guidelines Appendix G has been modified as shown in Section 3.3. In this way, the comparative analysis contained in Section 3.4 for the environmental topics contained in the Prior EIR can demonstrate compliance with CEQA Guidelines Sections 15162 and 15163 regarding preparation of Subsequent and Supplemental EIRs. For each environmental topic, findings are made regarding 1) environmental effects of the proposed Modified Project in comparison to the findings of the Approved Project in the Prior EIR; and 2) whether the Prior EIR adequately analyzes the potential impacts of the Modified Project. Each environmental topic discussed in this analysis includes an overview of the impacts to the environment evaluated in the Prior EIR, a comparison between the Modified Project's effects on the environment and the effects identified in the Prior EIR, and whether the Modified Project's physical effects on the environment are within the scope of those analyzed in the Prior EIR. The mitigation measures from the Prior EIR that are being carried forward and incorporated into the Modified Project are also identified in this analysis (pursuant to CEQA Guidelines Section 151688 [c]) and assessed for applicability and the need for modifications to reflect the Modified Project.

For the reasons identified in the checklist below, this SEIR evaluation determined that the Modified Project results in no substantial changes with the potential for new significant impacts and no additional analysis is required.

3.2 MODIFIED ENVIRONMENTAL CHECKLIST

The City created modified checklist headings to address the questions posed by CEQA Guidelines Sections 15162 and 15163 regarding Subsequent and Supplemental documents. The headings are included in Section 3.3 and include the following:

- Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR;
- Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR;
- Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR;
- Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required.

3.3 ENVIRONMENTAL TOPICS CHANGED BY MODIFIED PROJECT

The environmental topics checked below would involve at least one impact that is a "substantial change in a project" or "involves circumstances" resulting in new or more severe impacts requiring revisions to the Prior EIR as indicated by the analysis contained in Section 3.4. In these cases, the new or more severe impact would be fully mitigated by implementation of new mitigation measures or modifications to the mitigation measures from the Prior EIR. For other topics, there have been no changes to the severity of the impact but minor changes to mitigation measures are required to reflect changes proposed by the Modified Project or to update the measures to reflect current best practices.

3.4 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

3.4.1 Aesthetics

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?	☐	☐	☐	☒
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	☐	☐	☐	☒
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Have a substantial adverse effect on a scenic vista

The Prior EIR determined development of the Approved Project would not physically obstruct City-designated scenic vistas and would be consistent with development envisioned in the City's General Plan. The prior EIR determined development of the Approved Project would not have significant impacts on visual resources because the Approved Project site does not constitute a scenic resource or provide views of a scenic vista. As determined in the Prior EIR, development of the current AHSP would be far below the elevation of adjacent viewers and would not obstruct views beyond Bedford Canyon Wash and views from the elevated Eagle Glen area would not be substantially affected. Therefore, impacts to scenic vistas were found to be less than significant.

b) Damage scenic resources and vistas within or from scenic highways and arterials

The Prior EIR determined although there are significant scenic resources and scenic vista visible from the AHSP area and surrounding roadways, none are visible from a designated scenic highway or arterial as there are no state or City-designated scenic highways or arterials in the vicinity of the Approved Project. Therefore, impacts related to scenic highways would not occur.

c) Degrade visual character or quality of site and surrounding resources

The Prior EIR determined that although implementation of the Approved Project would result in development that would alter the existing visual character of the property within the AHSP boundary, the site was not considered to be an aesthetic resource in its (then) current undeveloped state. Adherence to established and proposed City requirements for architectural elements, design features, landscape requirements (as specified in current AHSP) would ensure a high-quality, consistent, and compatible development that would not substantially degrade the visual character or quality of the site. The Prior EIR concluded implementation of the AHSP would not conflict with applicable City General Plan policies related to aesthetics. Therefore, impacts were considered less than significant.

d) New source of light and glare affecting day or nighttime views

The Prior EIR determined the Approved Project site was located at a lower elevation than the existing adjacent land uses, and therefore lighting from the Approved Project would not spill over onto adjacent or near-by properties. The Prior EIR noted all lighting fixtures installed for the Approved Project would comply with City lighting standards requiring minimal to no spillover onto adjacent residences, sensitive land uses, and open space, resulting in a less than significant impact. Similarly, the Prior EIR determined traffic signal lights installed as part of the Approved Project would be shielded to prevent light spill, and since there are sources of higher power lighting in the area of the proposed traffic signal lights, lighting impacts from the placement of traffic signals were considered less than significant. The Prior EIR determined adherence to the AHSP and City's Zoning Code

lighting standards would ensure building or parking lighting would not impact adjacent land uses. Therefore, impacts associated with light and glare were found to be less than significant.

Impacts Associated with the Modified Project

(a) Have a substantial adverse effect on a scenic vista?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project Site and current Planning Area (PA) 11 are located in the lowest elevations within the AHSP along with PAs 12, 13 and 14. Due to the higher elevation of the surrounding properties to the northwest and southwest, adjacency of I-15 to the northeast, and higher elevations to the south and southwest within the Approved Project and elevated bluffs further south and southwest above Bedford Canyon Wash, development of the Modified Project would not obstruct views from these locations. Views from the elevated Eagle Glen area would not be substantially affected. Therefore, no new or substantially greater impacts related to scenic vistas would occur with implementation of the Modified Project compared to those identified in Prior EIR. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project Site is currently vacant property with rolling topography and ruderal vegetation. No trees, rock outcroppings, historic buildings, or any other scenic resource is located on the Modified Project Site. Furthermore, the Modified Project would expand PA 11 toward the I-15 freeway and the I-15/Cajalco Road Southbound On and Off-Ramp intersection. The Modified Project would not result in changes such that the Modified Project Site would be visible from a designated scenic highway. Although there are significant visual resources visible from within the AHSP boundary and surrounding roadways, none of these resources are visible from a designated scenic highway or arterial and the AHSP is not located within a State scenic highway. No new State scenic highways or local scenic arterials have been designated in the area surrounding the AHSP since its initial adoption in 2012. Therefore, no new impacts related to scenic resources within a State scenic highway or local scenic highway would occur. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This impact will not be evaluated further in this SEIR.

(c) Substantially degrade the existing visual character or quality of the site and its surroundings?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project proposes an expansion of the AHSP with land use designations consistent with the current AHSP. As indicated in the Prior EIR, implementation of the AHSP would result in development that would alter the existing visual character of the site. The Modified Project would adhere to the development regulations contained in the AHSP and zoning code pertaining to architectural, design, and landscape features to ensure high-quality, consistent, and compatible development. With implementation of these design related regulations, the Prior EIR determined the visual character or quality of the site and surroundings would not be substantially degraded. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would add commercial and open space property in the northeast portion of the Approved Project, adjacent to I-15 and the I-15 Southbound On- and Off-Ramp intersection with Cajalco Road. An 11.64-acre property would be added to PA 11 and increase commercial development, introducing additional sources of light and glare from the increase in commercial development as compared to the Approved Project. As stated in the Prior EIR and above, the Modified Project Site and current PA 11 are located in the lowest elevations within the AHSP along with PAs 12, 13 and 14. Due to the higher elevation of the surrounding properties to the northwest and southwest, adjacency of I-15 to the northeast, higher elevations to the south and southwest within the Approved Project, and elevated bluffs further south and southwest above Bedford Canyon Wash, day time glare and nighttime lighting associated with commercial development on the Modified Project Site would not be highly visible to surrounding development. As discussed in the Prior EIR, all lighting fixtures associated with implementation of the Approved Project would adhere to the City's lighting standards and would be required to direct light downward with minimal spillover onto adjacent residences, sensitive land uses, and open space. Adherence to the AHSP and the City's Zoning Code lighting standards that require adequate light shielding, appropriate light intensity, and proper light location would ensure building or parking lighting would not significantly impact adjacent uses. Therefore, no new or substantially greater impacts would occur with implementation of the Modified Project when compared to those identified in the Prior EIR. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of

impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. The Modified Project would add commercial and open space property in the northeast portion of the Approved Project, adjacent to I-15 and the I-15 Southbound On- and Off Ramp intersection with Cajalco Road. The preceding Aesthetics analysis is an assessment of the 17.85 acre Modified Project Site's cumulative impacts with respect to the Approved Project, or the balance of the 307.8-acre current AHSP boundary. As concluded, the Modified Project would not change the significance of Aesthetic impacts as compared to the Prior EIR.

Consistent with the conclusions in the Prior EIR, there are no cumulative projects in the vicinity whose impacts would intermingle with the Modified Project and create a cumulatively significant impact related to scenic views, vistas or resources. The Modified Project Site and the balance of PA 11 would be developed in accordance with the AHSP as amended, resulting in a coordinated, integrated neighborhood commercial center. Consistent with the conclusions in the Prior EIR, there are no cumulative projects in the vicinity whose impacts would intermingle with the Modified Project and create a cumulatively significant degradation of the existing visual character of the site and surroundings. Consistent with the conclusions in the Prior EIR, there are no cumulative projects in the vicinity whose impacts would intermingle with the Modified Project that would create cumulatively significant light and glare impacts.

In summary, the Modified Project would not create a cumulatively significant Aesthetic impact consistent with the Prior EIR. Compliance with the City's Municipal Code, General Plan standards, and proposed AHSP development regulations would ensure the Modified Project in combination with other projects in the area would not result in significant impacts associated with: scenic views, vistas, or resources; degradation of site or surroundings; or introduce substantial new source of light and glare.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

No mitigation measures related to Aesthetics were outlined in the Prior EIR. As discussed above, no new impact has been identified. Lacking any new impacts, no new mitigation measures or new alternatives are required for the Modified Project.

This Page Intentionally Left Blank

3.4.2 Agriculture and Forestry Resources

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	☐	☐	☐	☒

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Conversion of prime, unique, or statewide important farmland

The Prior EIR concluded development of the Approved Project would cause a significant unavoidable impact as a result of impacts to areas designated prime farmland and unique farmland within the AHSP boundary. The Prior EIR concluded this impact was cumulatively considerable, and therefore cumulatively significant and unavoidable.

b) Conflict with an existing agricultural zone or a Williamson Act contract

As concluded in the Prior EIR, the AHSP boundary was zoned "Agricultural." Adoption of the AHSP and the first two amendments established new zoning for the AHSP area. The AHSP established zoning for residential, commercial, park, and open space land uses. The Prior EIR found the change from Agricultural zoning and land use designations to the designations contained in the AHSP to be less than significant because the General Plan also states the purpose of the designation is to "…allow for the continued production of agricultural lands as interim uses preceding urban development and/or as a long-term use." The zone change facilitated development that was consistent with the City's General Plan. Because the proposed zone change and subsequent development of on-site uses was

considered consistent with the General Plan, a less than significant impact associated with the change of zone from Agricultural to the Approved Project zoning designations was identified.

The Prior EIR described the current status of the request filed in 2003 by the project applicant to cancel the Williamson Act contracts within the AHSP. The Prior EIR noted the California Department of Conservation (DOC) concurred with the cancellation request in 2012. Because the process to cancel the existing Williamson Act contract for the applicable lands within the AHSP had commenced and was confirmed by DOC, the Prior EIR found the Approved Project would not result in a significant impact related to Williamson Act contracts.

c) Conflict with existing zoning for, or cause rezoning of, forest land

The Prior EIR concluded the Approved Project did not have any designated forest land and was not zoned for timberland uses. Rezoning of the Approved Project therefore was determined not to conflict with existing forest zoning, did not cause rezoning of forest land, and did not result in the loss or conversion of forest lands to non-forest uses. Therefore, no impacts associated with forest zoning were identified in the Prior EIR.

d) Result in loss of forest land or conversion of forest land

The Prior EIR concluded the Approved Project did not have any designated forest land. The proposed land uses that would result from implementation of the Approved Project would therefore not reduce forest land or convert forest land to non-forest uses. Therefore, no impact associated with loss of forest land or conversion of forest land was identified in the Prior EIR.

e) Other changes that could convert farmland or forest land

As noted above under item a), the Prior EIR noted portions of the Approved Project were designated farmland of local importance, prime farmland, and unique farmland by the California Department of Conservation's Farmland Mapping & Monitoring Program (FMMP). The Prior EIR concluded the conversion of prime farmland was a cumulatively considerable impact, as well as a cumulatively significant and unavoidable impact associated with the Approved Project.

As noted above under item b), the Prior EIR found the change from Agricultural zoning to the zoning proposed by the Approved Project to be less than significant because the General Plan states the purpose of the designation is to "…allow for the continued production of agricultural lands as interim uses preceding urban development and/or as a long-term use." The zone change facilitated development that was consistent with the City's General Plan. Because the proposed zone change and subsequent development of on-site uses was considered consistent with the General Plan, a less than significant impact associated with the change of zone from Agricultural to the Approved Project zoning designations was identified in the Prior EIR.

As noted above under item d), the Prior EIR concluded the Approved Project did not have any designated forest land. Implementation of the Approved Project would not reduce forest land or convert forest land to non-forest uses. No impact associated with loss of forest land or conversion of forest land was identified in the Prior EIR.

Therefore, the Prior EIR determined the Approved Project would result in significant project and cumulative impacts from the loss of prime farmland, a less than significant impact from the conversion of Agricultural zoning to the zoning proposed by the Approved Project, and no impact from the conversion of forest land to non-forest uses.

Impacts Associated with the Modified Project

(a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) to nonagricultural use?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project Site is designated farmland of local importance by the DOC's FMMP. The Modified Project site is not designated as prime farmland, unique farmland, or farmland of statewide importance by the FMMP. Therefore, development of the Modified Project Site in accordance with the proposed Modified Project would not cause new impacts to occur. The Modified Project's impacts to farmland of local importance are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Conflict with existing zoning for agricultural use or a Williamson Act contract?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project Site is zoned Agriculture on the City's Zoning Map designated Agriculture by the City's General Plan. The Prior EIR found the change from Agricultural zoning and land use designations to the designations contained in the AHSP to be less than significant because the General Plan also states the purpose of the designation is to "…allow for the continued production of agricultural lands as interim uses preceding urban development and/or as a long-term use." The Modified Project is consistent with the General Plan objective to consider urban uses that complement development located on adjoining properties. The adjoining property to the Modified Project site is the balance of the Approved Project that has been previously graded in preparation for implementation of the current AHSP. The Modified Project proposes an expansion of the commercial and open space land uses approved in the current AHSP, consistent with the General Plan objective to consider urban uses that complement development located on adjoining properties.

According to the Riverside County Williamson Act FY 2015/2016 map (Sheet 1 of 3) prepared by the DOC as part of the FMMP, the Modified Project site is mapped as Non-Williamson Act Land, Non-Enrolled Land. Therefore, the Modified Project would not conflict with a Williamson Act contract.

The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant or no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(c) Conflict with existing zoning for, or cause rezoning of, forest land, timberland, or timberland zoned Timberland Production?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. According to the General Plan and Zoning Map, no timber farmland designation exists on the Modified Project Site. The Modified Project would not change those designations; therefore, no new impacts would occur. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Result in the loss of forest land or conversion of forest land to non-forest use?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. No forest or timber resources are located on the Modified Project Site. Therefore, no new impacts would occur. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project Site is designated farmland of local importance by the FMMP, with no prime or unique farmland designations. The Modified Project Site is currently zoned Agriculture, and the Modified Project would result in the conversion of the 17.85 acre property from Agricultural zoning to commercial and open space zoning. The change to commercial and open space zoning proposed by the Modified Project would result in a less than significant impact because the General Plan states the purpose of the from Agricultural zone is to "…allow for the continued production of agricultural lands as interim uses preceding urban development and/or as a long-term use." The Modified Project zone change would facilitate development consistent with both the current AHSP currently being developed and the proposed AHSP. The Modified Project proposed uses would be

consistent with the General Plan, and therefore a less than significant impact associated with the change of zone from Agricultural to commercial and open space zoning would occur.

In summary, the Modified Project would result in a less than significant impact from the conversion of farmland of local significance to non-agricultural use and the change in zoning from Agricultural to non-agricultural, and no impact from the conversion of forest land to non-forest uses. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant and no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. As stated previously, the Modified Project would not result in increased impacts to agricultural or forest land as compared to the Prior EIR. Although the Modified Project would result in the development of land currently designated farmland of local importance and change zoning from Agricultural to commercial and open space, impacts were determined to be less than significant. No impacts were determined regarding forest lands. The City maintains an interim General Plan designation for agricultural uses until such time agricultural land is converted to uses consistent with the General Plan. The cumulative effect of development in the region will continue to result in the conversion of agricultural lands to non-agricultural uses. Because agricultural land, including prime farmland, Williamson Act land, and land zoned for agricultural operations, is a finite resource, the conversion of the 17.85 acre Modified Project Site to urban uses, combined with planned and future development in the City and region, represents a significant cumulative impact to agricultural operations and resources that cannot be mitigated. This determination is consistent with the conclusions from the Prior EIR. The Modified Project's cumulative impact would remain the same as the level cited in the Prior EIR. This topic will not be analyzed further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

No mitigation measures related to agriculture and forest lands were outlined in the Prior EIR. As discussed above, no new impact has been identified. Lacking any new impacts, no new mitigation measures or new alternatives are required for the Modified Project.

3.4.3 Air Quality

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☐	☒
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☐	☐	☐	☒
c) Result in cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☐	☐	☐	☒
d) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☐	☒
e) Create objectionable odors affecting a substantial number of people?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Conflict or obstruct applicable air quality plan

The Prior EIR concluded growth forecasts contained in the Southern California Association of Governments (SCAG) Regional Transportation Plan were used in the South Coast Air Quality Management District (SCAQMD) regional Air Quality Management Plan (AQMP) growth forecasts. These forecasts were based on future land use assumptions for the Approved Project as provided by the City. The Approved Project was found to be consistent with the AQMP since the residential and commercial development quantities would remain the same. Therefore, the Prior EIR determined the Approved Project is consistent with the AQMP and no new or increased impact would occur.

b) Violate air quality standard or contribute to existing or projected air quality violation
c) Cumulatively considerable net increase of criteria pollutant in non-attainment status

The Prior EIR determined construction emissions during the peak construction day of the Approved Project would exceed SCAQMD thresholds for nitrogen oxides ($NO_{x)}$ and particulate matter (PM_{10} and $PM_{2.5}$), which was a significant impact that required mitigation. The Prior EIR identified mitigation measures to reduce construction PM_{10} and $PM_{2.5}$ emissions to less than significant. With implementation of mitigation, the Prior EIR concluded NO_x construction emissions would remain significant and unavoidable.

The Prior EIR determined the Approved Project would exceed SCAQMD daily operational thresholds for carbon monoxide (CO), volatile organic compounds (VOC), NO_x, and PM_{10}, which resulted in a significant impact that required mitigation. However, the Prior EIR conducted a long-term microscale (CO hot spot) emissions analysis that determined CO emissions would not result in a significant impact and no mitigation was necessary for CO impacts. With implementation of mitigation, the Prior EIR concluded VOC, NO_x PM_{10} emissions would remain significant and unavoidable.

d) Expose sensitive receptors to pollutants

The Prior EIR conducted Localized Significance Threshold (LST) and CO hotspot screening analyses and determined CO hotspot impacts would be less than significant, and no mitigation was required. The LST analyses identified a significant construction LST impact from PM_{10} emissions, and mitigation was required. The Prior EIR identified mitigation measures to reduce construction LST impacts from PM_{10} to less than significant.

e) Create objectionable odors

The Prior EIR noted SCAQMD Rule 402 prohibits air discharges that can cause injury, nuisance, or annoyance to the health, safety, or comfort of the public. With the exception of short-term construction-related odors (e.g., equipment exhaust and asphalt odors), the Prior EIR found Approved

Project would not include uses that would generate offensive odors such as agricultural uses, wastewater treatment plants, or landfills. The Prior EIR noted application of architectural coatings and installation of asphalt would generate odors, but such odors would be temporary and would not be noticeable beyond the Approved Project construction boundaries. SCAQMD Rules 1108 and 113 identify standards regarding the application of asphalt and architectural coatings, respectively. The Prior EIR determined adherence to applicable provisions of those Rules was a standard requirement for all development projects within the City, and implementation of those Rules as part of the Approved Project's construction would result in a less than significant impact and no mitigation was required.

Impacts Associated with the Modified Project

(a) Conflict with or obstruct implementation of the applicable air quality plan?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. Projects are considered consistent with the AQMP if the growth in socioeconomic factors (e.g., population, employment) is consistent with the underlying regional plans used to develop the AQMP. The future emissions forecasts are primarily based on demographic and economic growth projections provided by SCAG. Thus, demographic growth forecasts for various socioeconomic categories developed by SCAG in their current 2016 RTP/SCS were in turn used to estimate future emissions by SCAQMD in their current 2016 AQMP (SCAQMD 2016).

Pursuant to SCAQMD's consistency analysis guidelines contained in their CEQA Air Quality Handbook, the AQMP is affirmed when a project: (1) does not increase the frequency or severity of an air quality standards violation or cause a new violation; and (2) is consistent with the growth assumptions in the AQMP.

AQMP Consistency Criterion 1: The Modified Project would generate short-term and long-term pollutant emissions over and above those estimated for the Approved Project. However, as detailed in the *Bedford Marketplace Air Quality and Greenhouse Gas Memorandum* (November 26, 2019) prepared by Urban Crossroads and included in Appendix B, and discussed below in items b) and c), construction emissions attributable to development of the Modified Project site plus the balance of PA 11 would be fully mitigated with the introduction of a new mitigation measure related to NO_x construction emissions. Increased operational emissions from the Modified Project (i.e., from the net increase in commercial development on the Modified Project Site) would not create any new impacts or require new mitigation. However, the additional commercial development would incrementally increase VOC, NO_x and PM_{10} emissions determined in the Prior EIR to be a significant and unavoidable impact. The Modified Project would not exceed the significance threshold of the other regulated pollutants (CO, SO_x, PM_{10}, and $PM_{2.5}$).

AQMP Consistency Criterion 2: The CEQA Air Quality Handbook indicates that consistency with AQMP growth assumptions must be analyzed for new or amended General Plans or elements, Specific Plans, and significant projects. The Modified Project includes General Plan and Specific Plan Amendments but is not defined as a significant project. The Modified Project would convert 11.64 acres of Agricultural zoned land to commercial resulting in an increase of 143,730 square feet of commercial building area that includes a 135-room hotel over and above the Approved Project. However, the Modified Project would result in the creation of a neighborhood retail center serving the nearby Eagle Glen and developing Bedford communities. The Modified Project would introduce retail and service uses in an area underserved by such uses, which would result in a reduction in vehicle trips and trip lengths. For these reasons, the Modified Project is considered to be consistent with the AQMP and no mitigation is required. The Modified Project's impacts associated with the AQMP are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

(c) Result in cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project requires import of 440,000 cubic yards of soil to raise the Modified Project Site to within five feet of current PA 11 and to allow sewer gravity flow to the AHSP sewer lift station in PA 12. Two options have been identified to import soil to the Modified Project site. One option is to haul soil in from an off-site source in trucks during the nighttime hours. The trucking operations are expected to require up to 118 nights. Incoming soil would be trucked onto the Modified Project Site, dumped, and moved and spread around the site. There would also be some overlap of the soil import and daytime grading operations.

A second option is to haul soil in scrapers from AHSP PA 14, which is located south of the Modified Project Site across Bedford Wash. The area of PA 14 would be lowered approximately 13 feet to generate the fill, which would be hauled in scrapers down a constructed ramp and across Bedford Canyon Wash to the project site. This import option would occur during daytime hours and require approximately 100 days to complete.

In addition to importing soil, the Modified Project would result in the development of a larger commercial center as compared to the Approved Project, resulting in additional construction emissions than analyzed in the Prior EIR.

As documented in the *Bedford Marketplace Air Quality and Greenhouse Gas Memorandum* (November 26, 2019) and the *Bedford Marketplace Soil Import/Export Air Quality Assessment* (August 9, 2019) prepared by Urban Crossroads and included in Appendix B, construction operations, including the import of soil by truck, would cause an exceedance of NO_x emissions as shown in Table 3.4.3.A below. Emissions associated with the option to import soil by truck is shown specifically in the table below. If the second option to import soil from PA 14 were implemented, those emissions are incorporated into the grading quantities and overall emissions would be reduced compared to importing soil by truck.

3.4.3.A: Unmitigated Modified Project Site Construction Emissions

Phase	Emissions (lbs/day)					
	VOC	**NO_X**	**CO**	**SO_X**	**PM_{10}**	**$PM_{2.5}$**
Summer						
2020 (Soil Import Process)	8.86	149.11	54.15	0.26	12.89	6.75
2020 (Construction Process)	4.97	50.27	39.65	0.12	10.89	6.11
2021 (Construction Process)	65.75	50.91	58.59	0.15	8.57	3.57
Winter						
2020 (Soil Import Process)	8.99	147.70	56.45	0.25	12.90	6.75
2020 (Construction Process)	5.00	50.27	36.91	0.11	10.89	6.11
2021 (Construction Process)	65.78	50.83	55.33	0.15	8.57	3.57
Maximum Daily Emissions	**65.78**	**149.11**	**58.59**	**0.26**	**12.90**	**6.75**
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	**NO**	**YES**	**NO**	**NO**	**NO**	**NO**

The exceedance of the maximum daily threshold for NO_x can be mitigated through the use of Tier 4 engines for off-road construction equipment. Prior EIR Mitigation Measure 4.3.6.1E requires the use of Tier 4 engine technology on off-road construction equipment after January 1, 2015. Following implementation of Mitigation Measure 4.3.6.1E and new Mitigation Measure 4.3.6.1I, construction emissions would be reduced to less than significant as shown in Table 3.4.3.B below. Because the Prior EIR concluded NO_x emissions would remain significant and unavoidable even with implementation of mitigation, the Modified Project's NO_x impacts with implementation of revised Mitigation Measure 4.3.6.1E and new Mitigation Measure 4.3.6.1I are less severe and therefore reduced in comparison to the Approved Project.

3.4.3.B: Mitigated Modified Project Site Construction Emissions						
Phase	**Emissions (lbs/day)**					
	VOC	**NO_X**	**CO**	**SO_X**	**PM_{10}**	**$PM_{2.5}$**
Summer						
2020 (Soil Import Process)	4.49	94.52	51.69	0.26	10.51	4.56
2020 (Construction Process)	4.59	34.09	40.13	0.12	9.27	4.62
2021 (Construction Process)	65.41	46.37	59.21	0.15	8.39	3.39
Winter						
2020 (Soil Import Process)	4.62	93.11	53.99	0.25	10.51	4.57
2020 (Construction Process)	4.62	34.03	37.39	0.11	9.27	4.62
2021 (Construction Process)	65.44	46.29	55.95	0.15	8.39	3.40
Maximum Daily Emissions	**65.44**	**94.52**	**59.21**	**0.26**	**10.51**	**4.62**
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

The increase of 143,730 square feet of commercial building area that includes a 135-room hotel over and above the Approved Project would incrementally increase operational air emissions. Table 3.4.3.C shows the increase in emissions from the Modified Project would not cause a new significant impact.

Table 3.4.3.C: Increase in Emissions from Modified Project Site						
Operational Activities – Summer Scenario	**Emissions (lbs/day)**					
	VOC	**NO_X**	**CO**	**SO_X**	**PM_{10}**	**$PM_{2.5}$**
Bedford Marketplace Maximum Daily Emissions	45.50	106.89	206.50	0.48	36.83	10.50
80 TSF Commercial Maximum Daily Emissions	12.97	67.29	99.94	0.36	24.08	6.61
Net Increase	***32.54***	***39.61***	***106.56***	***0.12***	***12.75***	***3.89***
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**
Operational Activities – Winter Scenario	**Emissions (lbs/day)**					

	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Bedford Marketplace Maximum Daily Emissions	42.24	109.60	194.87	0.46	36.83	10.50
80 TSF Commercial Maximum Daily Emissions	11.42	66.73	91.31	0.33	24.08	6.61
Net Increase	***30.82***	***42.87***	***103.56***	***0.12***	***12.74***	***3.89***
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

In summary, the proposed increase in soil import and grading activity associated with the Modified Project would cause an exceedance in NO_x emissions without mitigation. However, as specified in the Prior EIR, Mitigation Measure 4.3.6.1E requires the use of Tier 4 engine technology on off-road construction equipment, which would reduce impacts to less than significant. The increase in operational emissions would not exceed significance standards. Therefore, with implementation of the Mitigation Measures specified in the Prior EIR, the level of impact (less than significant with mitigation) remains unchanged from the Prior EIR. This topic will not be evaluated further in this SEIR.

(d) Expose sensitive receptors to substantial pollutant concentrations?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The soil import and construction operations have the potential to cause impacts to sensitive receptors. The haul route identified for importing off-site fill material would rely on local roadways (Minnesota Road to Sherborn Street to Magnolia Avenue to the I-15 Freeway) that do not have sensitive receptors and the I-15 Freeway, which has adjacent sensitive receptors, but is used as a regional truck route. Additional sensitive receptors are proximate to the Modified Project Site, such as residences in the Eagle Glen and Bedford Neighborhoods, the closest of which was used for this analysis. As such, the *Bedford Marketplace Air Quality and Greenhouse Gas Memorandum* (November 26, 2019) prepared by Urban Crossroads and included in Appendix B, includes a Localized Significance Threshold (LST) analysis based on SCAQMD methodology. The analysis quantified localized impacts (maximum daily emissions) at the nearest sensitive receptor compared to the thresholds established by the SCAQMD. During all phases of construction, the LST analysis determined no exceedances of SCAQMD thresholds would occur and impacts would be less than significant.

According to SCAQMD methodology, LSTs would apply to the operational phase of a project if the project includes stationary sources of emissions or attracts mobile sources that may spend long periods of time queuing and idling (such as warehouse or transfer facilities). Since the Modified

Project does not include such uses, due to the lack of stationary source emissions, no long-term localized significance thresholds would occur.

The Modified Project's impacts to sensitive receptors are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(e) Create objectionable odors affecting a substantial number of people?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. Short-term odors can occur during construction both during grading and painting of structures, and long-term odors depend on the type of land use.

Although the Modified Project would result in a substantive increase in construction from nighttime soil import activities and daytime daily grading that may result in construction odors, these activities are temporary. Similarly, the long-term commercial land uses would also remain the same as the Approved Project, resulting in similar impacts as presented in the Prior EIR. In the same manner as determined in the Prior EIR, adherence to applicable provisions of SCAQMD Rules 402, 1108, and 113 would reduce construction nuisances from the Modified Project to a less than significant impact and no mitigation is required

The Modified Project proposes commercial land uses that would not generate offensive odors such as agricultural uses, wastewater treatment plants, or landfills. In the same manner as determined in the Prior EIR, operational odors from the Modified Project would be considered less than significant and no mitigation is required. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. As shown in the analysis above, the Modified Project would not exceed regional or local emissions thresholds established by SCAQMD for construction and operations. SCAQMD, in CEQA documents for which it is the lead agency, uses a zone of influence of 1 mile from the Modified Project Site for ambient pollutants and 500 feet for toxic air contaminants to identify cumulatively relevant projects. This represents a likely worst-case scenario and is more restrictive than most other lead agencies. Given the location of the Modified Project Site, no cumulatively relevant projects have been identified.

State CEQA Guidelines §15064(h)(4) states that "The mere existence of cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed Project's

incremental effects are cumulatively considerable." SCAQMD has developed a policy to address the cumulative impacts of CEQA projects. The policy holds that project impacts would be cumulatively considerable if they were to exceed the project-specific air quality significance thresholds. The analysis above demonstrates that emissions from the Modified Project can be mitigated below all SCAQMD CEQA thresholds related to air quality. Therefore, since no cumulatively relevant projects occur and the Modified Project's emissions are below significance thresholds, the Modified Project's contribution would not be cumulatively considerable.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures from the Prior EIR, with the addition of new measure 4.3.6.1I, were found to be applicable to the Modified Project:

Air Quality	
4.3.6.1A	Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors. Contract specifications shall be included in the project Specific Plan construction documents, which shall be reviewed by the City.
4.3.6.1B	Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel generators. Contract specifications should be included in the Specific Plan construction documents, which shall be reviewed by the City.
4.3.6.1C	Prior to the issuance of a grading permit, the project developer shall require contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the Specific Plan construction documents, which shall be reviewed by the City.
4.3.6.1D	Prior to issuance of building permits, the project applicant shall provide evidence to the City that his contractor uses 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) to the extent feasible. If the project applicant and his contractor determine that 2010 model year or newer diesel trucks cannot be obtained, the project applicant shall notify the City that trucks with EPA 2007 model year NO_x emissions shall be utilized.

4.3.6.1E	Prior to issuance of building permits, the project applicant shall provide evidence to the City that his contractor use on-site construction equipment that meet EPA Tier 3 or higher emissions standards according to the following schedule: • Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. • A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided at the time of mobilization of each applicable unit of equipment.
4.3.6.1F	The City shall encourage construction contractors to apply for SCAQMD "SOON" funds by advising project applicants and their contractors of this programs availability. Information on this program can be found at the following website: http://www.aqmd.gov/home/programs/business/businessdetail?title=off-road-diesel-engines&parent=vehicle-engineupgrades.
4.3.6.3A	Prior to the issuance of each building permit, the project applicant shall require by contract specifications that architectural coatings require the use of either HVLP spraying equipment or manual application techniques to apply architectural coatings. Contract specifications shall be included in the Specific Plan construction documents, which shall be reviewed by the City.
4.3.6.4A	Prior to issuance of each building permit associated with the Specific Plan, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of the following design features may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent: • Exceed 2008 California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling. • Increase in insulation such that heat transfer and thermal bridging is minimized.

	• Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. • Incorporate dual-paned or other energy efficient windows. • Incorporate energy efficient space heating and cooling equipment. • Install interior and exterior energy efficient lighting which exceeds the 2008 California Title 24 Energy Efficiency performance standards including but not limited to automatic devices to turn off lights when they are not needed. • To the extent that they are compatible with landscaping guidelines established by the City, include shade producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings, within the project site. • Use light and off-white colors in the paint and surface color palette for project buildings to reflect heat away. • All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.
4.3.6.4B	Prior to issuance of each building permit associated with the Specific Plan, the following design features shall be implemented to reduce energy demand associated with potable water conveyance: • Landscaping palette emphasizing drought-tolerant plants; • Use of water-efficient irrigation techniques; and • U.S. EPA Certified WaterSense labeled or equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.
4.3.6.4E	The developer shall provide electric car charging infrastructure for multi-family residential and commercial land uses.
4.3.6.1H	The developer(s) within the multi-family and single family developments shall provide outside electric outlets and natural gas stub outs.
4.3.6.1I	When using construction equipment greater than 150 horsepower (>150 HP) during soil import/hauling activity, the Construction Contractor shall ensure that off-road diesel construction equipment complies with Environmental Protection Agency (EPA)/California Air Resources Board (CARB) Tier 4 emission standards or equivalent and shall ensure that all construction equipment is turned and maintained in accordance with the manufacturer's specifications.

Summary of Impacts Identified in Prior EIR

a) Impact candidate, sensitive, or special status species

The Prior EIR determined the coastal California gnatcatcher (*Polioptila californica californica*) was the only endangered or threatened species with a potential to occur within the Approved Project. The coastal California gnatcatcher (CAGN) was not detected during site visits; however, suitable habitat occurred in the Riversidean sage scrub communities. The Prior EIR noted the CAGN was designated as a Covered Species Adequately Conserved under the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) with no additional conservation requirements. The Prior EIR noted vegetation clearing of occupied habitat within Public/Quasi Public lands and Criteria Area between March 1 and August 15 was prohibited. Development of CAGN habitat was identified in the Prior EIR as a significant impact, and appropriate mitigation was prescribed.

The Prior EIR identified the following seven special status wildlife species observed within the Approved Project during site visits:

- Bobcat (*Lynx rufus*)
- California horned lark (*Eremophila alpestris actia*)
- Coastal western whiptail (*Aspidoscelis tigris multiscutatus*);
- Cooper's hawk (*Accipiter cooperi*);
- Northern harrier (*Circus cyaneus*);
- San Diego desert woodrat (*Neotoma lepida intermedia*); and

- Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)

All seven special status species observed during site surveys were noted as being covered under the take and incidental take provisions of the MSHCP, and potential impacts to these species were mitigated through compliance and participation in the MSHCP, including payment of the required MSHCP impact fee.

The Prior EIR noted the Approved Project is located within the MSHCP Burrowing Owl Survey Area. Due to the presence of suitable burrowing owl (*Athene cunicularia*) habitat throughout the Approved Project, focused surveys for burrowing owl were conducted in 2009 and 2010. The focused burrowing owl survey determined that no burrowing owls, potential burrowing owl burrows, or diagnostic signs (e.g., whitewash, pellets, bones, or feathers) of burrowing owl were observed within the Approved Project boundary or a 150-meter (500-foot) buffer area. While no burrowing owls were identified, the Prior EIR noted suitable habitat is present within the Approved Project. Because the species is highly mobile, the EIR concluded the burrowing owl could occupy the site prior to development resulting in a potentially significant impact that required mitigation. The Prior EIR prescribed pre-construction survey mitigation to avoid impacts to the burrowing owl species.

As discussed in the Prior EIR, the Approved Project Specific would result in the removal of vegetation suitable for nesting migratory birds, including raptors. Impacts to nesting migratory birds were noted as being prohibited under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code. Because suitable habitat to support nesting migratory birds was present within the Approved Project, a potential for impacts to species that occupy the site prior to development existed. The Prior EIR prescribed pre-construction survey mitigation to avoid impacts to the nesting bird species.

b) Impact riparian habitats or other sensitive natural communities

The Prior EIR analyzed the project design feature included as part of the Approved Project to widen, stabilize, and restore Bedford Wash to improve its ability handle storm flows and avoid flooding while reducing scouring and erosion. The plans for Bedford Wash included habitat restoration within the wash and adjacent areas to replace California Department of Fish and Wildlife (CDFW) defined streambed and riparian jurisdictional areas temporarily and permanently impacted by the widening and stabilization activities. The Prior EIR identified the quantity of CDFW streambed and riparian areas that would be temporarily and permanently impacted. The Prior EIR noted most of the impacts to CDFW defined jurisdictional areas involved unvegetated streambed containing little to no riparian canopy. Impacts to CDFW jurisdictional habitat were identified as potentially significant and mitigation was prescribed.

As noted previously, the approved and planned widening, stabilization, and restoration improvements to Bedford Wash have been completed as part of the Approved Project. To permit those activities, the following Regulatory Permits and MSHCP Consistency Determination were issued:

- U.S. Army Corps of Engineers (Corps File No. SPL-2015-00361-ERS)
- California Department of Fish and Wildlife (Notification No. 1600-2015-0055-R6)
- Regional Water Quality Control Board (SARWQCB Project NO. 332014-24)
- U.S. Fish and Wildlife Service (FWS-WRIV-15B0271-16F0852)
- MSHCP Consistency Determination and Determination of Biologically Equivalent or Superior Preservation (DBESP) (FWS/CDFW-15BO0271-15CPA0281)

The Regulatory Permits and MSHCP Consistency authorized the widening and restoration of Bedford Wash, including improvements for flood protection. Buried rip-rap extending down to scour depth was permitted along both sides of Bedford Wash. Grade stabilizing structures were permitted perpendicular to flows. Several stormdrain outlet structures surrounded by a concrete structure were incorporated into the rip-rap lined banks to outlet storm flows on both sides of Bedford Wash. Additionally, two concrete crossings were permitted, at the far upstream and downstream limits within the Approved Project. The concrete crossings allow maintenance vehicles to cross Bedford Wash and access the bluff on the south side. Additionally, the Approved Project includes a future bridge crossing Bedford Wash that is authorized by the Regulatory Permits. The Regulatory Permits remain active and Approved Project activities authorized under the permits remain on-going.

As stated in the Prior EIR, the current AHSP was designed to reduce impacts to native habitat through the designation of 67.9 acres of native habitat included as permanent open space. Because the Approved Project contained measures to reduce impacts to habitat consistent with the MSHCP, impacts to Disturbed Riversidean Sage Scrub, Riversidean Sage Scrub, and Riversidean Sage Scrub/Chaparral habitats were considered to be less than significant and no mitigation was required.

Pursuant to the terms of the MSHCP and Implementing Agreement with the U.S. Fish and Wildlife Service (USFWS) and CDFW, compliance with provisions of the MSHCP provides full mitigation under CEQA, Federal Endangered Species Act (FESA), and California Endangered Species Act (CESA) for impacts to the species and habitats covered by the MSHCP. Therefore, impacts to sensitive communities would be reduced to a less than significant level.

c) Impact federally protected wetlands

The Prior EIR analyzed the widening, stabilization, and restoration of Bedford Wash and identified the quantity of on-site U.S. Army Corps of Engineers (USACE) jurisdictional waters that would be temporarily and permanently impacted. No federally protected wetlands were identified or impacted. Bedford Wash was determined to be an ephemeral drainage under the jurisdiction of the USACE.

Impacts to USACE non-wetland jurisdictional areas were identified as a significant impact and mitigation was prescribed. The widening, stabilization, and restoration of Bedford Wash has been implemented and is a current or existing condition.

d) Interfere with species movement or migratory wildlife corridors, or impede use of wildlife nurseries

As discussed in the Prior EIR, the Approved Project and surrounding areas were previously disturbed and diminished in quality either through past agricultural uses or the development of residential and commercial uses. The Approved Project had been insolated from nearby open spaces because of existing development. Bedford Wash was noted as providing an avenue for wildlife movement from the Santa Ana Mountains to the west, through the Approved Project, and to the east to Temescal Creek. The Prior EIR indicated the Bedford Wash would be widened and maintained in a semi-natural condition as an earthen bottomed channel and concrete sides as part of the Approved Project design, and this widening and restoration of the Wash would facilitate future wildlife movement through the area. The actual work within the widened Bedford Wash consisted of buried rip-rap extending down to scour depth and grade stabilizing structures perpendicular to flows. The result is a less impactful design than analyzed in the Prior EIR. The widening, stabilization, and restoration of Bedford Wash has been implemented and is a current or existing condition.

Due to the disturbed condition of the site and adjacent areas, the planned widening, stabilization, and restoration improvements to Bedford Wash that enhanced the ability of the Wash to function as a wildlife corridor, the proposed the Prior EIR found development of the Approved Project would not interfere with migratory fish or wildlife species movement and would not interfere with migratory wildlife corridors, or impede the use of native wildlife nursery sites resulting in a less than significant impact and no mitigation was required.

e) Conflict with local policies or ordinances protecting biological resources

The Prior EIR did not identify any local policies or ordinances protecting biological resources that the Approved Project was in conflict with, and impacts were determined less than significant.

f) Conflict with habitat conservation plans, natural community conservation plans, or other approved habitat conservation plans

Although the Approved Project was not covered by a conservation area delineated in the MSHCP, the Prior EIR noted the Approved Project was subject to provisions of the MSHCP. The Prior EIR noted these provisions included payment of mitigation fees by project proponents, and adherence to the requirements established in the MSHCP. The Prior EIR noted the City has adopted a Local Development Mitigation Fee to assist in the acquisition and maintenance of natural ecosystems pursuant to the terms of the MSHCP and Implementing Agreement with the USFWS and the CDFW.

Compliance with provisions of the MSHCP provides full mitigation under CEQA, FESA, and CESA for impacts to the species and habitats covered by the MSHCP. Therefore, impacts associated with compatibility of the Approved Project with the MSHCP were determined to be less than significant.

Impacts Associated with the Modified Project

(a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The *Biological Technical Report* (BTR) prepared for the Modified Project (Carlson Strategic Land Solutions, October 2019) contained in Appendix C determined none of the four potentially occurring special status plant species were observed on the Modified Project Site and suitable habitat was absent. The BTR also determined eight of ten potentially occurring special status wildlife species were not observed on the Modified Project Site and habitat was absent. Impacts to these species are therefore considered less than significant. The Modified Project Site does contain suitable habitat for the California Horned Lark and limited habitat for the red-diamond rattlesnake. Impacts to these two species are considered significant and mitigation is required, in the same manner as identified in the Prior EIR for different special status species.

A pre-construction nesting bird survey requirement as outlined in Prior EIR Mitigation Measure 4.4.5.2B is in place to avoid impacts to nesting birds, including the California Horned Lark, that are protected under the MBTA from development on the Modified Project Site. The BTR also recommended biological monitoring during initial ground disturbances to identify and locate any red-diamond rattlesnakes within the Modified Project Site to avoid impacts to the snake species. The biological monitoring provisions will be added to Prior EIR Mitigation Measure 4.4.5.2B. The Modified Project's impacts to special status species are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. As noted previously, the Approved Project's widening, stabilization, and restoration improvements to Bedford Wash have been mostly completed and remain active. The improvements constructed and currently in place include concrete ingress and egress ramps, buried riprap slope protection, and a concrete crossing. In its improved condition, Bedford Wash exhibits biological and

physical indicators of Waters of the State and MSHCP Features through the presence of channel bed and bank, extending from top of bank to top of bank. The BTR found 0.20 acres of CDFW Waters of the State and MSHCP Features located in the southern portion of the Modified Project Site in Bedford Wash.

Two components of the Modified Project could affect the jurisdictional areas of Bedford Canyon Wash. One component is a storm drain pipe from the proposed on-site detention basin that must outlet into Bedford Wash. The Modified Project proposes to outlet the storm drain pipe with the same design as the other outlet already installed into the improved Bedford Wash channel. The storm drain pipe would outlet through a concrete structure constructed into the rip-rap lined bank of Bedford Wash, which would result in approximately 0.01 acre of modification to the rip-rap lined bank of Bedford Wash. The outlet structure would be constructed on the downstream concrete crossing to avoid impacts to the soft bottom portion of Bedford Wash. The outlet structure would not impact jurisdictional limits of Waters of the United States, but would impact Waters of the State and MSHCP Features. The proposed outlet structure is located in an area that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency Determination for the widening and restoration of Bedford Canyon Wash, and those permits remain active. No new impacts to Waters of the State or MSHCP Features would occur, and no additional Regulatory Permits or mitigation is required.

The second component of the Modified Project that could affect the jurisdictional areas of Bedford Wash would occur if Soil Import Alternative 2 is selected for importing fill soil. As described in Chapter 2.0, this alternative would involve importing soil from Planning Area 14 on the south side of Bedford Wash, crossing the Wash at the existing downstream concrete crossing, and onto the Modified Project Site. The placement of temporary soil on the concrete pad would cover an area of 0.09 acre of Waters of the State/MSHCP Features, which matches the area of the existing concrete pad crossing. No temporary soil would be placed in the soft-bottom portion of Bedford Wash. The proposed ramp is located in an area that consists of existing concrete and was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, and those permits remain active. No new impacts to Waters of the State or MSHCP Features would occur, and no additional Regulatory Permits or mitigation is required.

The Modified Project's impacts to State and MSHCP jurisdictional areas are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. As discussed in item b), the Approved Project's planned widening, stabilization, and restoration improvements to Bedford Wash have been mostly completed and remain active. In its improved condition, Bedford Wash exhibits biological and physical indicators of Waters of the United States through the presence of channel bed and bank, extending from top of bank to top of bank. The BTR found 0.10 acres of Waters of the United States located in the southern portion of the Modified Project Site in Bedford Wash.

As discussed in item b), two components of the Modified Project could affect the jurisdictional areas of Bedford Canyon Wash. One component is a storm drain pipe from the proposed on-site detention basin that must outlet into Bedford Wash. The storm drain pipe would outlet through a concrete structure constructed into the rip-rap lined bank of Bedford Wash, which would not impact jurisdictional limits of Waters of the United States.

As discussed in item b), the second component of the Modified Project that could affect the jurisdictional areas of Bedford Wash would occur if Soil Import Alternative 2 is selected for importing fill soil from PA 14, across Bedford Wash, and onto the Modified Project Site. The placement of temporary soil on the concrete pad would cover an area of 0.06 acres of Waters of the United States, which matches the area of the existing concrete pad crossing. No temporary soil would be placed in the soft-bottom portion of Bedford Wash. The proposed ramp is located in an area that consists of existing concrete and was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, and those permits remain active. No new impacts to Waters of the United States would occur, and no additional Regulatory Permits or mitigation is required. The Modified Project's impacts to Federal jurisdictional areas are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. Bedford Wash serves a function in local wildlife movement as a connection between the Santa Ana Mountains and Lake Matthews and across Temescal Creek. The Wash provides a connection between large areas of undeveloped land, which may be utilized for wildlife movement. With the prior implementation of the widened and restored Bedford Canyon Wash, it will continue to

provide a valuable linkage for wildlife. Implementation of the Modified Project would not impact the ability of Bedford Wash to serve as a wildlife movement corridor. No impacts to wildlife movement would result from the Modified Project.

Implementation of the Modified Project would remove vegetation that could impact nesting birds. A pre-construction nesting bird survey requirement as outlined in Prior EIR Mitigation Measure 4.4.5.2B to avoid impacts to nesting birds protected under the MBTA from development on the Modified Project Site. The Modified Project's impacts to wildlife corridors and migratory bird species are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The City does not have any local policies or ordinances that protect biological resources. Therefore, no impacts would occur, and no mitigation is necessary. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project Site is located in the Temescal Canyon Area Plan within the MSHCP. An MSHCP Consistency Determination has been prepared for the Modified Project (Carlson Strategic Land Solutions, October 2019). As discussed previously, storm drain outlet will be installed within the buried rip-rap slope protection of Bedford Wash, with the outlet opening at the existing concrete Wash crossing. In the event Soil Import Alternative 2 is implemented, soil will be temporarily placed across the existing concrete crossing and then removed once soil import and grading operations are completed. Since the proposed outlet structure under both soil import alternatives and the temporary soil bridge included Soil Import Alternative 2 are located areas of Bedford Wash previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of the Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

The Modified Project Site is located in an MSHCP defined Narrow Endemic Plants survey area (Survey Area Number 7). As concluded in item a), no special status plant species were observed on the Modified Project Site and none are expected to occur due to the lack of suitable habitat.

Implementation of the Modified Project under either soil import alternative would not impact Narrow Endemic Plants and would not conflict with an approved conservation plan.

The Modified Project Site is located in an MSHCP defined burrowing owl (BUOW) survey area, and a series of BUOW surveys were conducted per MSHCP protocol. While potentially suitable habitat exists onsite, no BUOW, suitable burrows, or signs of BUOW were observed. Since BUOW are a migratory species, a pre-construction BUOW survey is required prior to ground disturbance. A pre-construction BUOW survey requirement as outlined in Prior EIR Mitigation Measure 4.4.5.2A to avoid impacts to BUOW from development on the Modified Project Site.

The Modified Project's impacts regarding the MSHCP are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. Direct impacts to nesting birds, including the BUOW, from development of the Modified Project may occur should construction activities and vegetation removal take place during the typical nesting season, under both of the soil import alternatives. However, implementation of Prior EIR Mitigation Measures 4.4.5.2A and 4.4.5.2B as modified by the addition of BMPs recommended by the BTR will ensure impacts to special status species or their habitats are minimized, and reduce the Modified Project's contribution to cumulative impacts to less than significant.

The Modified Project's proposed storm drain pipe that would outlet into Bedford Wash and the temporary soil bridge across the Wash included in Soil Import Alternative 2 would involve impacts to the Wash and jurisdictional Waters of the State and MSHCP Features. The temporary soil bridge would be placed on an existing concrete crossing and would not impact jurisdictional areas. Since the proposed storm drain outlet is located in an area of Bedford Wash previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

By design, the MSHCP covers a large geographical area so that numerous special-status species and sensitive habitats are protected throughout its boundary. The MSHCP was approved to offset the cumulative negative effect future development has on the covered habitats and species. Because the MSCHP provides a regional and comprehensive approach to conservation planning, impacts to MSHCP covered habitats and species are considered less than significant if a development project is consistent with the MSHCP. Since the Modified Project has been shown to be consistent with the MSHCP, the Modified Project's contribution to cumulative impacts would be less than significant.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures, with minor edits, from the Prior EIR were found to be applicable to the Modified Project:

Biological Resources	
4.4.5.1A	If grading and construction activities begin during the California gnatcatcher breeding season (February 15 through August 30), a qualified biologist shall survey all potential nesting vegetation within and adjacent to the site for nesting birds, prior to commencing vegetation removal. Surveys shall be conducted at the appropriate time of day. If no nesting birds were observed, project activities may begin. If an active bird nest is located, the nest site shall be fenced a minimum of 500 feet in all directions, and this area shall not be disturbed until after the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, or the young will no longer be impacted by the activities. Alternatively, a qualified biologist may determine that construction can be permitted within the buffer areas provided the qualified biologist develops a monitoring plan to prevent any impacts while the nest continues to be active (eggs, chicks, etc.). This monitoring plan will be submitted to the City of Corona for approval prior to work within the buffer.
4.4.5.2A	Pre-construction presence/absence surveys for burrowing owl within the survey area where suitable habitat is present shall be conducted by a qualified biologist (as determined by the City of Corona) within 30 days prior to the commencement of ground disturbing activities. If active burrowing owl burrows are detected during the breeding season, all work within 300 feet of any active burrow will be halted until that nesting effort is finished. The on-site biologist will review and verify compliance with these boundaries and will verify the nesting effort has finished. Work can resume when no other active burrowing owl burrows are found. If active burrowing owl burrows are detected outside the breeding season, then passive and/or active relocation may be approved following consultation with CDFW and/or USFWS. If owls are found to be present on site, the CDFW should be notified within three days of the detection of occupied burrows, and a project burrowing owl conservation strategy should be developed in cooperation with the CDFW, USFWS, and the Western Riverside County Regional Conservation Authority. One-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and backfilled to ensure

	that animals do not reenter the holes/dens. Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to the City for mitigation monitoring compliance record keeping.
4.4.5.2B	A Biological Monitor shall be onsite during the initial ground disturbances to identify and locate any red-diamond rattlesnake within the PAs 11 and 12A. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the immediate area of the identified species shall cease to allow for the species to vacate or be relocated from the area safely. Work can resume when the species has vacated the immediate ground disturbances work area. To reduce harm to the red-diamond rattlesnake and other species in the areas being disturbed, the following best management practices shall be added to the soil import and grading plans: • Work area limits will be defined and respected. All grading areas will have their boundaries clearly flagged or marked before Project implementation and all disturbances will be confined to the flagged areas. All key Project personnel will be instructed that their activities must be confined to locations within the flagged areas. Disturbance beyond the actual grading zone is prohibited without site-specific surveys. • Cleared or trimmed non-native, exotic vegetation, and woody debris will be disposed of in a legal manner at an approved disposal site. • Employees, contractors, and site visitors will be prohibited from collecting plants and wildlife. • Water pollution and erosion control plans will be developed and implemented in accordance with SWPPP requirements. • Access to construction sites will be via preexisting access routes. • Construction equipment will be properly maintained; construction employees and contractors will be trained on proper implementation and monitoring of BMPs; and procedures will be implemented to minimize the likelihood of hazardous spills and to control sediment-laden runoff. • Effective perimeter control BMPs to control discharge of pollutants from the Project site during construction. • All temporary construction-related night lighting used in onsite development areas will be shielded and/or directed downward to avoid indirect impacts to nocturnal wildlife such that night lighting could increase predation rates.

	• All construction contractors, subcontractors, and employees will comply with the litter and pollution laws and will institute a litter control/removal program during the course of construction activities to reduce the attractiveness of the area to opportunistic predators such as coyotes, opossums, and common ravens. • Active nests (nests with chicks or eggs) cannot be removed or disturbed. Nests may be removed or disturbed by a qualified biologist, if not active. The removal of potential nesting bird habitat will be conducted outside of the nesting season (February 15 to September 15~~August 31~~) to the extent feasible. If grading or site disturbance is to occur between February 15 to September 15~~August 31~~, a nesting bird survey shall be conducted by a qualified biologist ~~(as determined by the City of Corona)~~ within no more than five days ~~72 hours~~ of scheduled vegetation removal, to determine the presence of nests or nesting birds. If active nests are identified, the biologist will establish buffers around the vegetation (500 feet for raptors and sensitive species, 200 feet for non-raptors/non-sensitive species). All work within these buffers will be halted until the nesting effort is finished (i.e. the juveniles are surviving independent from the nest). The on-site biologist will review and verify compliance with these nesting boundaries and will verify the nesting effort has finished. Work can resume when no other active nests are found. Alternatively, a qualified biologist may determine that construction can be permitted within the buffer areas and would develop a monitoring plan to prevent any impacts while the nest continues to be active (eggs, chicks, etc.). Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to the CDFW~~City~~ for mitigation monitoring compliance record keeping. If vegetation clearing is not completed within five days ~~72 hours~~ of a negative survey, the nesting survey must be repeated to confirm the absence of nesting birds.
4.4.5.3A	Prior to the issuance of grading permits for the affected jurisdictional areas, the project applicant shall provide evidence to the City that a Section 404 Permit from the USACE, a Section 401 Permit from the RWQCB, and a Section 1602 Streambed Alteration Agreement from the CDFW have been obtained for impacts to jurisdictional waters in the project site.
4.4.5.3B	Prior to the issuance of grading permits for the affected jurisdictional areas, a Determination of Biological Superior or Equivalent Preservation (DBESP) shall be submitted to the Riverside Conservation Authority (RCA) identifying potential impacts to riparian/riverine areas, discussing why avoidance of impacts to riparian/riverine areas was not feasible, and identifying compensation for the loss of riparian/riverine areas.

4.4.5.3C	The Applicant shall mitigate for the permanent loss of USACE and CDFW jurisdictional and MSHCP riparian/riverine resources on site at a 2:1 ratio. Mitigation may occur on-site within Bedford Canyon Wash or one of its tributaries; mitigation may occur through applicant-sponsored mitigation at an off-site location within the MSHCP boundaries: or mitigation may occur through purchase of credits at an approved mitigation bank or in-lieu fee program such as the Santa Ana Watershed Association (SAWA) In-Lieu Fee Wetland Creation Program or equivalent, if available.
4.4.5.3D	Following the completion of grading, all of USACE and CDFW jurisdictional areas that will be temporarily impacted shall be restored using native vegetation.
4.4.5.3E	For Bedford Canyon Wash design options 2 and 3, it is anticipated that periodic maintenance may be necessary within the soft bottom channel/Bedford Canyon Wash, such as trash and invasive species removal; riprap and grade control structure repair; therefore, an Operations and Maintenance Manual or Long-Term Management Plan shall be prepared, subject to the approval of the Resource Agencies, which will identify the appropriate methods and timing regarding the maintenance of the restored wash.

This Page Intentionally Left Blank

3.4.5 Cultural Resources

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Cause a substantial adverse change in the significance of a historical resources as defined in §15064.5?	☐	☐	☐	☒
b) Cause a substantial adverse change in the significance of an archaeological resources pursuant to §15064.5?	☐	☐	☐	☒
c) Directly or indirectly destroy a unique paleontological resource or site of unique geologic feature?	☐	☐	☐	☒
d) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Impact historic resources

The Prior EIR concluded no resources, structures, or features were located within the Approved Project boundaries. Consequently, the Prior EIR concluded the Approved Project would not impact historic resources.

b) Impact archaeological resources

Based on the results of literature review and field surveys, the Prior EIR concluded the Approved Project did not contain archaeological or cultural resources and the probability of such resources being unearthed during Approved Project construction was very low. However, during separate SB 18 consultations with the Pechanga and Soboba Tribes, the Tribes requested that Native American monitors be present on site during all clearing, rough grading, and excavation activities due to the potential for such activities to unearth ancient remains and related artifacts from sacred burial sites. In order to ensure that cultural resources were identified during earthmoving activities, the Prior EIR included mitigation requiring the project Applicant retain a qualified archaeologist to direct an archaeological monitoring program during project construction. While the possibility of finding archaeological resources within the AHSP boundary was very remote, grading of the Approved Project could have uncovered previously undetected subsurface archaeological resources which resulted in a significant impact and mitigation in the form of monitoring was prescribed. The monitoring would be directed by a qualified archaeologist with assistance from Native American monitors. The Prior EIR concluded less than significant impacts with mitigation.

c) Impact paleontological resources

The Prior EIR found the Approved Project includes a high paleontological sensitivity area, indicating fossils are likely at or below four feet below ground surface. Since the possibility of discovering paleontological resources within the AHSP boundary was high, the Approved Project could have resulted in the discovery of previously undetected subsurface resources resulting in a significant impact. Mitigation in the form of paleontological monitoring conducted by a qualified paleontologist was prescribed. The Prior EIR concluded less than significant impacts with implementation of mitigation.

d) Impact human remains

The Prior EIR noted the AHSP boundary encompassed undeveloped land that exhibited no evidence suggesting the area had been utilized in the past for human burials. The Prior EIR noted compliance with State Health and Safety Code 7050.5 dictated procedures to be followed should human remains be discovered during grading or construction activities. These existing requirements were imposed on any construction activity in which human remains are detected. Compliance with State law would have

ensured that impacts related to the discovery of buried human remains would be less than significant and no mitigation was required.

Impacts Associated with the Modified Project

(a) Cause a substantial adverse change in the significance of a historical resources as defined in §15064.5?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. Cultural and Paleontological Resources Assessments (Duke Cultural Resources Management, August and November 2019) was prepared for the Modified Project and are included as Appendix D to SEIR No. 2. The cultural resource record search did not reveal any cultural resources on the Modified Project Site. However, seventeen previously recorded cultural resources were identified within one-mile buffer of the Modified Project Site, none associated with historic structures. The field survey confirmed the Modified Project Site contains no historic structures or evidence of prior historic structures.

The Modified Project would extend the AHSP boundary to the east. The cultural resources study determined development of the Modified Project Site would have no impact on historic resources because the Modified Project Site is vacant, and no historic resources are present. The Modified Project's impacts to historic resources are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Cause a substantial adverse change in the significance of an archaeological resources pursuant to §15064.5?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The cultural and paleontological resources assessment prepared for the Modified Project Site included background research and field survey to identify cultural resources. The cultural resources record search did not reveal any cultural resources within the Modified Project Site but did note seventeen previously recorded cultural resources located within a one-mile. The field survey identified one isolated prehistoric artifact, a trifacial granite mano/shaping tool, within the southeast portion of the Modified Project Site west of Bedford wash, in the area of the proposed detention basin. In addition to the prehistoric isolated artifact observed during the field survey, five artifacts and one potential archaeological feature were observed in 2018 during construction monitoring within the Approved Project. Based on the prehistoric isolated artifact observed on the Modified Project Site and the resources observed previously during grading of the Approved Project, development of the Modified Project may unearth previously undiscovered historic and pre-historic archaeological resources resulting in a significant impact requiring mitigation. An archaeological monitoring requirement to be directed by a qualified archaeological monitor during project earthmoving activities is outlined in Prior

EIR Mitigation Measure 4.5.6.1A. The measure includes preparation of an Archaeological Resources Mitigation Monitoring Plan and assistance by Native American monitors.

In accordance with SB 18 and AB 52, invitations to consult were distributed to Native American tribes in October 2019. Four tribes (Gabrieleno, November 5, 2019; Rincon, November 20, 2019; Pechanga, November 27, 2019; Soboba, December 7, 2019) requested formal consultation. It is worth noting the City consulted with the Pechanga and Soboba Tribes on the original SP approval and all prior amendments. As a result of the original consultations and mitigation measures, the two Tribes shared tribal monitoring duties during all rough grading activities that took place on the Approved Project site as part of Phase 1 construction of Arantine Hills including the approximately 10-acre portion of the proposed 21.7-acre Bedford Marketplace site that was previously graded.

The current status of tribal consultation is the following:

- Gabrieleno – Completed February 18, 2020;
- Rincon – Completed as of January 29, 2020;
- Pechanga – Completed as of January 31, 2020; and
- Soboba – Completed February 3, 2020.

As a result of these consultations, the Rincon, Pechanga, and Soboba Tribes have agreed with the language of Prior EIR Mitigation Measures 4.5.6.1A through 4.5.6.1D, as modified to reflect the Planning Area naming changes proposed as part of the Modified Project (i.e., AHSP Amendment No. 3). The Gabrieleno and Rincon Tribes request that their standard mitigation language be incorporated into this SEIR. The Pechanga and Soboba Tribes have already agreed to the mitigation measures from the Prior EIR, both Tribes have been consulted with regarding the Approved Project since its inception, and both Tribes were actively involved as tribal monitors during rough grading of approximately 10 of the 21.7-acre Bedford Marketplace site. For these reasons, Prior EIR Mitigation Measures 4.5.6.1A through 4.5.61.D will remain as shown at the end of this section.

Soil Import Alternative 2 involves the excavation of soil in PA 14 and hauling the soil across a temporary soil bridge across Bedford Wash on the existing concrete crossing to the Modified Project Site (revised PA 11 and a portion of new PA 12A). PA 14 was graded previously as part of the Approved Project and is currently a rough graded pad at the established elevation. As part of the previous grading operations, PA 14 was over-excavated approximately 5 to 7 feet below the current elevation. These soils were removed, blended, replaced, and compacted to 90%. Under Soil Import Alternative 2, soil would be removed from PA 14 to a depth approximately 13 feet below the current pad elevation. This will require the excavation of 5 to 7 feet below the new pad elevation, disturbing the underlying native soils with a very low probability, but nonetheless a potential, for containing

tribal cultural resources. This is considered a significant impact and mitigation is required. As noted above, the Prior EIR includes Mitigation Measure 4.5.6.1A requiring archaeological monitoring. The measure will be revised to include monitoring within the Modified Project Site (PAs 11 and12A) and within the Approved Project (PA 14) to mitigate potential impacts should Soil Import Alternative 2 be implemented.

The Modified Project's impacts to archeological resources are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

c) Directly or indirectly destroy a unique paleontological resource or site of unique geologic feature?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. Research conducted as part of the cultural and paleontological resources assessment prepared for the Modified Project Site found multiple fossil localities documented in the Modified Project vicinity. As documented in the Prior EIR, there is a high sensitivity for paleontological resources within the Modified Project Site. Deposits of high paleontological sensitivity may be encountered in native soils during deep excavation in the northwest portion of the Modified Project Site (PA 11) and in ground disturbances at the surface of the southeast portion of the Modified Project Site (PA 12A). This ground disturbance would have the potential to unearth and impact unique paleontological resources resulting in a significant impact requiring mitigation. An archaeological monitoring requirement to be directed by a qualified archaeological monitor during project earthmoving activities is outlined in Prior EIR Mitigation Measures 4.5.6.2A, B, and C. The measures include preparation of a Paleontological Resource Impact Mitigation Program (PRIMP), presence of a paleontological monitor during earthmoving activities, and a treatment process/plan to be implemented if paleontological resources are unearthed.

Soil Import Alternative 2 involves the excavation of soil in PA 14 and hauling the soil across a temporary soil bridge across Bedford Wash on the existing concrete crossing and to the Modified Project Site (revised PA 11 and a portion of new PA 12A). PA 14 was graded previously as part of the Approved Project and is currently a rough graded pad at the established elevation. As part of the previous grading operations, PA 14 was over-excavated approximately 5 to 7 feet below the current elevation. These soils were removed, blended, replaced, and compacted to 90%. Under Soil Import Alternative 2, soil would be removed from PA 14 to a depth approximately 13 feet below the current pad elevation. This will require the excavation of 5 to 7 feet below the new pad elevation, disturbing the underling native soils with a very low but nonetheless a potential for containing paleontological resources. This is considered a significant impact and mitigation is required. As noted above, the Prior EIR includes Mitigation Measures 4.5.6.2A, B, and C that will result in preparation of a PRIMP,

presence of a paleontological monitor during earthmoving activities, and a treatment process/plan to be implemented if paleontological resources are unearthed requiring archaeological monitoring. The measure will be revised to include monitoring within the Modified Project Site (PAs 11 and12A) and within the Approved Project (PA 14) to mitigated potential impacts should Soil Import Alternative 2 be implemented.

The Modified Project's impacts to paleontological resources are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Disturb any human remains, including those interred outside of formal cemeteries?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The cultural and paleontological resources assessment prepared for the Modified Project confirmed there is no evidence suggesting the Modified Project Site has been utilized in the past for human burials. The assessment noted existing regulations are in place dictating procedures should human remains be discovered during grading or construction activities within the area, per State Health and Safety Code 7050.5. These procedures were also noted in the Prior EIR. The Modified Project's impact regarding disturbances to human remains is consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. Although the Modified Project would expand the AHSP boundary, project-specific impacts to cultural resources were determined to be the same as found in the Prior EIR. The Prior EIR found potential impacts associated with human remains would be reduced to a less than significant level through adherence to existing State law. There are no other development projects that would, in combination with the proposed project, result in any significant cumulative impacts to historical, archaeological, paleontological resources, or human remains. The Modified Project, in a similar manner as the Approved Project and other projects within the City, would be required to adhere to similar mitigation measures that would reduce the potential for any individual or cumulative impacts. Therefore, the level of impact (less than significant with mitigation) remains the same as the level cited in the Prior EIR. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures, with minor edits, from the Prior EIR were found to be applicable to the Modified Project:

Cultural Resources	
4.5.6.1A	The applicant shall retain a qualified archaeological monitor who shall prepare an Archaeological Resources Mitigation Monitoring Plan in consultation with the Native American Tribe. The qualified archaeological monitor shall attend all pre-grading meetings to inform the grading and excavation contractors of the archaeological resources mitigation program and shall instruct them with respect to its implementation. The qualified archaeological monitor shall be on site at all times during the initial phases of clearing and rough grading in the Modified Project Site (PAs 11 and 12A) and Approved Project (PA 14) if Soil Import Alternative 2 is implemented to inspect cuts for archaeological and cultural resources. If such resources are discovered, and are in danger of loss and/or destruction, the qualified archaeological monitor shall recover them. In instances where recovery requires an extended salvage time, the qualified archaeological monitor shall be allowed to temporarily direct, divert or halt grading to allow recovery of resource(s) in a timely manner. Recovered archaeological resources, along with copies of pertinent field notes, photographs, and maps, shall be deposited in a certified curation facility that meets the standards of the California Office of Historic Preservation. The resources shall be recorded in the California Archaeological Inventory Database. All sacred sites, should they be encountered within the project area, shall be avoided and preserved as the preferred mitigation, if feasible. A final monitoring report shall be submitted to the City within 30 days of the end of monitoring activities.
4.5.6.1B	All grading, excavation, and ground-breaking activities shall be monitored by a qualified tribal monitor(s). The project applicant shall pay all fees associated with such tribal monitors(s) and shall contact the Native American Tribe at least 30 days before pulling grading permits from the City. In the event of the discovery of Native American burial(s), the qualified tribal monitor(s) will have the authority to temporarily stop and redirect grading activities, in consensus with the archaeological monitor. The tribal monitor(s) shall attend all pre-grading meetings to assist the archaeological monitor with informing the grading and excavation contractors of the archaeological resources mitigation program and instruct them with respect to its implementation. The qualified tribal monitor shall be on site at all times during clearing and rough grading to inspect cuts for archaeological and cultural resources.
4.5.6.1C	The developer shall enter into a Treatment and Disposition Agreement with the appropriate Native American Tribe(s) prior to the issuance of a grading permit. The Treatment and Disposition Agreement shall identify the treatment of cultural items (artifacts) and the treatment and the disposition of human remains.

4.5.6.1D	Unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and is not subject to public disclosure requirements of the California Public Records Act, pursuant to the specific exemption set forth in California Government Code Section 6254(r).
4.5.6.2A	Prior to the issuance of grading permits, the project proponent shall submit to and receive approval from the City, a Paleontological Resource Impact Mitigation Program (PRIMP). The PRIMP shall include the provision of a trained paleontological monitor during on-site soil disturbance activities on the north and south sides ~~side~~ of Bedford Wash within the Modified Project Site (revised PA 11 and new PA 12A~~PAs 16 and 17~~) and Approved Project (PA 14) if Soil Import Alternative 2 is implemented ~~boundary~~. The monitoring for paleontological resources shall be conducted on a full-time basis during the rough-grading phases of the Modified Project Site within native soils that have the potential to harbor paleontological resources.
4.5.6.2B	The paleontological monitor shall be equipped to rapidly remove any large fossil specimens encountered during excavation. During monitoring, samples of soil shall be collected and processed to recover micro-vertebrate fossils. Processing shall include wet screen washing and microscopic examination of the residual materials to identify small vertebrate remains.
4.5.6.2C	If paleontological resources are unearthed or discovered during excavation of the AHSP, the following recovery processes shall apply: • Upon encountering a large deposit of bone, salvage of all bone in the area shall be conducted with additional field staff and in accordance with modern paleontological techniques. • All fossils collected during the project shall be prepared to a reasonable point of identification. Excess sediment or matrix shall be removed from the specimens to reduce the bulk and cost of storage. Itemized catalogs of all material collected and identified shall be provided to the museum repository along with the specimens. • A report documenting the results of the monitoring and salvage activities and the significance of the fossils shall be prepared. • All fossils collected during this work, along with the itemized inventory of these specimens, shall be deposited in a museum repository (such as the Western Center for Archaeology & Paleontology, the Riverside Metropolitan Museum, or the San Bernardino County Museum) for permanent curation and storage.

3.4.6 Geology and Soils

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) (i) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Summary of Impacts Identified in Prior EIR

a) (i) Risk from rupture of Alquist-Priolo designated earthquake fault

The Prior EIR acknowledged the Approved Project is located in a seismically active region, but found the AHSP boundary would not have resulted in the development of structures within an Alquist Priolo Earthquake Fault Zone. The nearest known active earthquake fault was identified as the Elsinore Fault Zone located approximately 0.5 mile southwest of the Approved Project. In the absence of an active fault located on site, the Prior EIR concluded no fault rupture hazard would have occurred and no mitigation was required.

a) (ii) Risk from strong seismic ground shaking

The Prior EIR acknowledged ground shaking resulting from activity on local faults would have been felt within the Approved Project area during a seismic event. The Prior EIR noted all future construction and development resulting from implementation of the Approved Project would be required to comply with applicable provisions of the most recent adopted version of the California Building Code (CBC) and the City's Municipal Code. These codes and regulations detail specific measures regarding structural, mechanical, electrical, and plumbing construction practices including seismic design parameters to minimize the risk of loss, injury, or death resulting from strong ground shaking.

The Prior EIR also noted State law prohibits the placement of habitable structures within 50 feet of an active fault. Adherence to the CBC and the Municipal Code, which is required of all construction within the City, would reduce potential impacts associated with this issue to a less than significant level. These provisions along with project-specific geotechnical recommendations from the Approved Project's geotechnical and soil studies were required by Prior EIR Mitigation Measures 4.6.6 A through F and 4.6.6.2A The Prior EIR concluded a less than significant impact from strong seismic ground shaking would occur with implementation of these measures.

a) (iii) Risk from seismic-related ground failure, including liquefaction

Subsidence and Seismic Settlement. The Prior EIR noted land subsidence had been identified in the Chino region and the most northerly portion of the City. These subsidence events resulted from pumping drawdown of the regional groundwater table. The Prior EIR noted there were no signs of subsidence in the City south of the Prado Flood Control Basin, which had experienced significant regional subsidence. Since the AHSP boundary is located southeast of the Prado Flood Control Basin area, which had not shown indications of subsidence, impacts associated with this issue were considered to be less than significant and no mitigation was required.

The Prior EIR found the Approved Project did not include any activity known to cause subsidence-related damage (e.g., oil, gas, or groundwater extraction). The Prior EIR found AHSP boundary was underlain by relatively dense alluvial and dense sedimentary bedrock materials that have a low potential for subsidence or settlement, and therefore impacts were considered less than significant and no mitigation was required.

Liquefaction. The Prior EIR identified areas with a high potential for liquefaction, including the Prado Basin and adjacent areas in the northwestern portion of the City. Areas in the City with a low potential for liquefaction occurred in generally north–south running bands in the western, central, and southeastern portions of the City, with an east–west running band across the northern portion of the City. The Prior EIR found impacts associated with liquefaction to be less than significant because the Approved Project was located in an area with low liquefaction potential, was underlain by soils not susceptible to liquefaction, and did not contain high groundwater levels that contribute to liquefaction. No mitigation was required.

a) (iv) Risk from landslides

The Prior EIR acknowledged the potential for earthquake-induced landslides exist on the City's hillside terrain. The Prior EIR noted the majority of the Approved Project encompasses relatively flat land, and no areas of landsliding or mass movement had been observed in the flatter portions of the site. The Prior EIR noted the presence of near vertical cliffs were found along portions of the lower-lying Bedford Wash and small landslides had been observed along the southern wall of the northern bluff. Larger landslides were observed within the southeastern and southwestern portions of the site on the steep cliffs. Other than the landslides within the steep bluffs, landslides generally did not exist within the Approved Project. Landslides observed were mostly smaller surficial failures associated with erosion of the steep bluffs. The Prior EIR concluded the presence of those landslides indicated the potential for future landsliding to occur resulting in a significant impact and Mitigation Measures 4.6.6.1C and 4.6.6.1D were prescribed, which reduced impacts to less than significant.

b) Substantial soil erosion or loss of topsoil

The Prior EIR noted all large development projects within the City are required to obtain coverage under the National Pollution Discharge Elimination System (NPDES) General Construction Permit. One of the requirements of the NPDES General Construction permit is to implement Best Management Practices (BMPs) that would control erosion and runoff generated from construction activities. The Prior EIR concluded impacts from soil erosion and loss of topsoil to be less than significant through compliance with the existing construction regulations of NPDES General Construction Permit. Since the NPDES General Construction Permit requires erosion control measures during construction activities, potential erosion impacts were determined to be less than significant and no mitigation was required.

c) Located on unstable geologic unit or soil, result in landslide, lateral spreading, subsidence, liquefaction or collapse

The Prior EIR addressed the issues of landslides, subsidence, and liquefaction as summarized in items a) iii and a) iv above. As stated above, the Prior EIR found impacts associated with these issues to be less than significant with implementation of mitigation.

d) Located on expansive soil

The Prior EIR concluded one area within the Approved Project contained soils classified as clayey fines, considered to have a medium expansion potential. The Prior EIR concluded impacts from expansive soils were considered potentially significant, and prescribed Mitigation Measure 4.6.6.2A.

e) Incapable of supporting septic tanks or alternative waste water disposal systems

The Approved Project included the construction of habitable structures that would connect to existing wastewater facilities owned and operated by the City. Therefore, septic tanks were not proposed for the Approved Project. Because the Approved Project does not include the installation of septic tanks or alternative wastewater disposal systems, the Prior EIR concluded no impacts would occur and no mitigation was required.

Impacts Associated with the Modified Project

(a) (i) Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. A *Preliminary Geotechnical Evaluation* (LGC Geotechnical, July 2019) was prepared for the Modified Project and is included as Appendix E to SEIR No. 2. The evaluation confirmed the Modified Project Site is not located within an Alquist-Priolo Earthquake Fault Act Zone, and no active faults are known to cross the site. Therefore, the evaluation concluded the possibility of damage due to ground rupture is considered low. For this reason, the Modified Project will not be exposed to fault rupture hazard impacts and no mitigation is required. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(a) (ii) Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The geotechnical evaluation for the Modified Project noted there are secondary effects resulting from seismic shaking during large earthquakes on the major faults in the region, and these events may affect the Modified Project Site. These effects include ground lurching and shallow ground rupture, soil liquefaction, and dynamic settlement. The geotechnical evaluation notes these secondary effects exist throughout the Southern California region and are dependent on the proximity to the fault and onsite geology. The closest major active faults that could produce these secondary effects include the Elsinore, San Jacinto, and San Andreas Faults, among others. A detailed discussion of the secondary effects is contained in the geotechnical evaluation. The geotechnical evaluation provides recommendations regarding soil treatment, building foundations, and building construction in the same manner as Prior EIR Mitigation Measures 4.6.6A through F and 4.6.6.2A. The Modified Project's association with strong seismic ground shaking is consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(a) (iii) Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The geotechnical evaluation noted the main seismic hazard that may affect the Modified Project Site is ground shaking from one of the active regional faults and therefore the Modified Project Site will likely experience strong seismic ground shaking during its design life. This is a significant impact and mitigation is required. To mitigate impacts to structures, the geotechnical evaluation provides recommendations regarding soil treatment, building foundations, and building construction in the same manner as Prior EIR Mitigation Measures 4.6.6.1A through 4.6.6.1F and 4.6.6.2A. The Modified Project's impacts associated with seismic related ground failure are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

Based on the lack of shallow groundwater (greater than 65 feet below ground surface) and geotechnical conditions subsequent to rough grading (compacted artificial fill overlying dense alluvium), the geotechnical evaluation concluded the potential for liquefaction to impact the Modified Project Site is considered very low. Impacts associated with liquefaction are considered less than significant, and no mitigation is required. The Modified Project's impacts regarding liquefaction are

consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(a) (iv) Would the project expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. Based on review of readily available geologic resources and field observations, the geotechnical evaluation found landslides do not exist on the Modified Project Site or in the immediate vicinity. Topographically, the geotechnical evaluation notes the site is relatively flat-lying and is therefore not susceptible to landslides, seismically-induced landslides, debris flows, rock falls, etc. The Modified Project's impacts regarding landslides is less than significant and no mitigation is required. The Modified Project's impacts regarding landslides are reduced (less than significant) in comparison to the Approved Project (less than significant with mitigation). This topic will not be evaluated further in this SEIR.

(b) Would the project result in substantial soil erosion or the loss of topsoil?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The project Applicant will be required to obtain coverage under the NPDES General Construction Permit that will result in the implementation of BMPs that would control soil erosion and stormwater runoff generated from construction activities. Through compliance with the existing construction regulations of the NPDES General Construction Permit, the Modified Project's impacts from soil erosion or the loss of topsoil would be less than significant and no mitigation is required. The Modified Project's impacts regarding soil erosion and the loss of topsoil are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(c) Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The issues of landslides, subsidence, and liquefaction for the Modified Project Site are summarized in items (a) iii and (a) iv above. As stated previously, impacts associated with these issues are less than significant with implementation of mitigation, and consistent with the impacts identified in the Prior EIR.

Soil Import Alternative 2 involves the excavation of soil in PA 14 and hauling the soil across a temporary soil bridge across Bedford Wash on the existing concrete crossing and to the Modified Project Site (revised PA 11 and a portion of new PA 12A). PA 14 was graded previously as part of

the Approved Project and is currently a rough graded pad at the established elevation. As part of the previous grading operations, PA 14 was over-excavated approximately 5 to 7 feet below the current elevation. These soils were removed, blended, replaced, and compacted to 90%. Under Soil Import Alternative 2, soil would be removed from PA 14 to a depth approximately 13 feet below the current pad elevation.

Even though the grading of PA 14 was analyzed in the Prior EIR, the re-grading of PA 14 associated with Soil Import Alternative 2 was evaluated for potential geotechnical impacts. As specified in Appendix E (*Preliminary Geotechnical Recommendations Regarding the Updated Mass Grading Plan and Haul Route Study Phase 2b,* LGC Geotechnical, August 30, 2019), the lowering of PA 14 is geotechnically feasible with the incorporation of recommended measures. Those measures require excavation of 5 to 7 feet below the new pad elevation, extension of the previously constructed keyway, and stabilization of the ramp from PA 15 to Bedford Wash, which will serve as the haul route. All of the proposed measures are similar and consistent with the recommendations included in Prior EIR Mitigation Measures 4.6.6.1B through 4.6.6.1F and 4.6.6.2A.

With incorporation of mitigation measures, impacts would remain less than significant. The Modified Project's impacts associated with unstable soils are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The geotechnical investigation determined the Modified Project Site contains soils with "Very Low" to "Medium" expansion potential. Final design of soil preparation procedures and building foundations must be determined after completion of grading operations. To mitigate impacts to structures, the geotechnical evaluation provides recommendations regarding soil treatment, building foundations, and building construction in the same manner as Prior EIR Mitigation Measures 4.6.6.1A through 4.6.6.1F and 4.6.6.2A. The Modified Project's impacts associated with expansive soils are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of wastewater?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project includes connections to the City's sewer system owned and operated

by the City. Septic tanks or alternative waste water disposal systems will not be constructed as part of the Modified Project, resulting in no impact. The Modified Project's impact regarding Septic tanks or alternative waste water disposal systems is consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. The Modified Project will expand the AHSP boundary and expose new areas to geologic hazards not previously analyzed in the Prior EIR. However, the Modified Project will be required to adhere to applicable State regulations, CBC standards, and the design and siting standards required by the City, as well as the geologic hazard recommendations contained in the geotechnical evaluation prepared for the Modified Project. All cumulative projects would also be required to adhere to applicable regulations related to geologic and soils hazards. Therefore, a less than significant cumulative impact would occur with implementation of the Modified Project. The level of impact (less than significant with mitigation) remains the same as the level cited in the Prior EIR. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures, with minor edits to reflect updated recommendations contained in the geotechnical evaluation prepared for the Modified Project, from the Prior EIR were found to be applicable to the Modified Project:

Geology and Soils	
4.6.6.1A	Prior to the grading of areas to receive structural fill or engineered structures, these areas should be cleared of surface obstructions and unsuitable material (such as undocumented fill, colluvium, and topsoil). Vegetation and debris should be removed and properly disposed of offsite. Holes resulting from the removal of buried obstructions, which extend below proposed removal bottoms, should be replaced with suitable compacted fill material. ~~Prior to the initiation of any on-site construction, the project contractor shall remove all loose, compressible alluvial and fill materials from areas to receive engineered compact fill. Actual depths of removal shall be verified during future site specific preliminary soils investigations and ultimately during the grading operation by observation and in-place density testing.~~

4.6.6.1B	**Onsite Soils/Unsuitable.** All unsuitable and potentially compressible materials not removed by design cuts shall be excavated to competent materials and replaced with compacted fill soils. This includes all existing undocumented artificial fill, residual soil, and upper portions of the previously placed compacted fill within PA 11 and alluvial deposits. Specific procedures by soil type are summarized below. *Previously Placed Artificial Fill:* The previously placed compacted fill within PA 11 are considered suitable to support proposed structures and/or additional fill placement. The upper 1-foot of the previously placed fill soils shall be removed and replaced with compacted fill soils in order to remove any weathered or desiccated materials. *Alluvial Deposits:* Alluvial deposits are generally located within the Modified Project Site. The upper approximately 5 feet of the alluvial deposits is loose, weathered, and/or desiccated and shall be removed and replaced with compacted artificial fill soils. Removal depths are estimated to range between approximately 1 to 5 feet below existing grade. Localized areas of deeper removals should be anticipated during grading. Removal bottoms should be extended laterally in order to support a 1:1 (horizontal to vertical) projection away from proposed structures or improvements. The actual depths and lateral extents of removals will be determined by the geotechnical consultant during grading based on the actual subsurface conditions encountered. Several methods shall be utilized in determining the suitability of the material observed in the removal bottom excavations. Observation of material, proof rolling, probing, and occasional field density testing of the removal bottoms shall be performed by a field technician and/or field geologist to verify removal bottom suitability. When field density test data is utilized for the approval of a removal bottom, an in-place relative compaction of 85 percent or greater and/or a degree of saturation of 85 percent or greater will be considered suitable. **Onsite Soils/Over-Excavation.** In order to provide a uniform fill blanket beneath proposed structures, design cut and cut/fill transition pads shall be over-excavated a minimum of 3 feet below ultimate finish pad grade based on the future rough grading design. A maximum 3:1 differential fill thickness underneath individual lots shall be maintained in order to reduce the potential for future differential settlement. Over-excavation shall extend laterally a minimum of 5 feet beyond proposed building footprints. Streets in design cut areas shall be over-excavated a minimum of 2 feet below design

	subgrade elevations. In addition, retaining wall footings located on cut or a cut/fill transition should be over-excavated a minimum of 2 feet below and 2 feet beyond the edges of the proposed footings. Utility excavations may be completed utilizing typical heavy machinery. The native soils at the site are generally uncemented alluvial soils (Class "C" per Cal OSHA) and are anticipated to be unstable when excavated vertically. At the owner's discretion the streets could be over-excavated, such that utility trenches will then be excavated through compacted fill soils. If desired, it is recommended that the street over-excavation extend approximately 2-foot below the lowest utility. Over-excavations/undercuts must be confirmed and mapped by the geotechnical consultant prior to subsequent fill placement. The actual depth and lateral extents of over-excavation should be determined by the geotechnical consultant during grading based on the actual subsurface conditions encountered. Estimated removals in the previously graded portin of PA 11 may extend deeper than the recommended over-excavation in order to remove unsuitable materials. **Removal Bottoms and Subgrade Preparation.** Removal bottoms, over-excavation bottoms, and areas to receive compacted fill shall be scarified to a minimum depth of 6 to 8 inches, brought to a near-optimum moisture condition (generally within optimum and 2 percent above optimum moisture content) and re-compacted per project requirements. Removal bottoms, over-excavation/undercut bottoms, and areas to receive fill shall be observed and accepted by the geotechnical consultant prior to fill placement. **Temporary Excavations.** Temporary excavations shall be performed in accordance with project plans, specifications, and applicable Occupational Safety and Health Administration (OSHA) requirements. Excavations shall be laid back or shored in accordance with OSHA requirements before personnel or equipment are allowed to enter. The majority of site alluvial soils are anticipated to be OSHA Type "C" soils. Soil conditions shall be regularly evaluated during construction to verify conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate the soil conditions. Close coordination with the geotechnical consultant shall be maintained to facilitate construction while providing safe excavations. Excavation safety is the sole responsibility of the contractor. Vehicular traffic, stockpiles, and equipment storage shall be set back from the perimeter of excavations a minimum distance equivalent to a 1:1 projection from the bottom of the excavation or 5 feet, whichever is greater. Once an excavation has been initiated, it shall

	be backfilled as soon as practical. Prolonged exposure of temporary excavations may result in some localized instability. Excavations shall be planned so that they are not initiated without sufficient time to shore/fill them prior to weekends, holidays, or forecasted rain. ~~All on-site soils shall provide adequate quality fill material provided they are free from organic matter and other deleterious materials. Rock or similar irreducible material with a maximum dimension greater than six inches shall not be buried or placed in fills. However, oversized materials, with a maximum dimension greater than 8 inches, may be placed in fills or buried on site in accordance with recommendations proved by the geotechnical engineer during grading. Oversized material may be stockpiled for landscaping purposes or placed in a rock disposal area as approved by the project owner, developer, geotechnical engineer, and City. Import fill shall be inorganic, non-expansive granular soils free from rocks or lumps greater than six inches in maximum dimension. Sources for import fill shall be approved by the project geotechnical engineer prior to their use. Fill shall be spread in maximum eight inch uniform loose lifts; each lift brought to near optimum moisture content, and compacted to a relative compaction of at least 90 percent in accordance with ASTM D 1557.~~
4.6.6.1C	Stabilization fills shall be constructed on proposed cut slopes over 5 feet in height in accordance with the detail provided in Appendix D. Keyway widths shall be a minimum of 15 feet wide. Keyways shall be a minimum of 2 feet deep, determined from the lowest toe-of-slope elevation, and tilted back towards the heel a minimum 2 percent or 1-foot (whichever is greater). Stabilization fill backcuts shall be excavated so that at least a minimum 15-foot fill width is maintained for the entire height of the stability fill slope. In general, backcuts shall be excavated at a maximum 1.5:1 (horizontal to vertical) inclination. Properly outletted back drains shall be constructed along stabilization fill backcuts in accordance with SEIR Appendix E in the Geotechnical Evaluation, General Earthwork and Grading Specifications for Rough Grading. Flatter backcut inclinations may be required based on observed conditions during grading. The backcuts should not be initiated prior to forecasted rain or be left open for extended periods of time. Backcuts and keyway excavations must be geologically mapped by the geotechnical consultant during excavation to confirm the anticipated conditions. If adverse conditions are exposed, additional analysis and/or remediation measures may be required. The grading contractor must trim the backcuts with a slope board to remove loose material to

	allow for confirmational mapping. Updated and/or revised geotechnical recommendations may be required based on observed conditions. ~~Cut and fill slopes shall be planned at gradients no steeper than two horizontal to one vertical. Additional information regarding any proposed cut slopes and the existing natural slope stability should be addressed within the site specific preliminary soils investigations when grading/development plans are made available for the specific tracts/development areas.~~
4.6.6.1D	Design fill slopes are anticipated to be both grossly and surficially stable as designed provided they are constructed in accordance with SEIR Appendix E in the Geotechnical Evaluation, General Earthwork and Grading Specifications for Rough Grading and properly maintained subsequent to construction. Fill slopes shall be constructed with a maximum slope ratio of 2:1 (horizontal to vertical). Slope faces shall also be compacted to project recommendations. To improve surficial stability, vegetation specified by the landscape architect shall be established on the slope face as soon as it is practical. ~~Where fills are to be placed against existing slopes steeper than five horizontal to one vertical, the fill shall be properly keyed and benched into competent native materials. The key, constructed across the toe of the slope, shall be a minimum of 12 to 15 feet wide, a minimum of two feet deep at the toe, and sloped back at 2 percent. Benches shall be constructed at approximately two to four feet vertical intervals.~~
4.6.6.1E	Graded slopes shall be planted with groundcover vegetation as soon as practical to protect against erosion by reducing runoff velocity. Deep-rooted vegetation that requires little water and is able to survive local climate conditions shall also be established to protect against surficial slumping. Under no circumstances shall slopes be allowed to be bare of vegetation. Landscape vegetation must not be "trimmed" to root structures leaving no protection of the slopes. Irrigation levels shall be kept to the minimum level necessary to establish healthy plant growth. Slopes must not be overwatered. If automatic sprinklers are used, they must be adjusted during periods of rainfall. A landscape professional must be consulted for landscape recommendations. A program for the elimination of burrowing animals in both native and graded slope areas must be established to protect slope stability by reducing the potential for surface water to penetrate into the slope face. Continuous erosion control, rodent control, and maintenance are essential to the long-term stability of all slopes. Trenches excavated on a slope face for

	utility or irrigation lines and/or for any purpose must be properly backfilled and compacted to project recommendations to the slope face. Observation/testing and acceptance by the geotechnical consultant during trench backfill are recommended. V-ditches shall be inspected and cleared of loose soil and/or debris on a routine basis, especially prior to and during the rainy season. ~~Slopes at the project site shall be planted with a deep-rooted groundcover as soon as possible after completion. The use of succulent ground covers such as ice plant or sedum is not recommended. If watering is necessary to sustain plant growth on slopes, then the watering operation shall be monitored to ensure proper operation of the irrigation system and to prevent overwatering.~~
4.6.6.1F	Prior to the initiation of any on-site construction, evidence shall be submitted to the City for review and approval that on-site development has incorporated the design and siting recommendations detailed in the site-specific Geotechnical Evaluation~~investigation~~.
4.6.6.2A	On-site soils and any imported soils for individual tracts/development areas shall be evaluated for their expansion potential prior to grading and ultimately following completion of the grading operation. The evaluation shall determine and identify specialized construction procedures to specifically resist expansive soil activity in accordance with the CBC and/or applicable local ordinances.

3.4.7 Greenhouse Gas Emissions

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☐	☒
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Generate significant greenhouse gas emissions

The Prior EIR calculated greenhouse gas (GHG) emissions for the Approved Project, and prescribed Mitigation Measures 4.3.6.4A, 4.3.6.4B, 4.7.6.1A, and 4.7.6.1B to reduce GHG emissions from the Approved Project. The GHG methodology employed at the time was to reduce business as usual (BAU) emissions by 25 percent. With implementation of mitigation, the Prior EIR found GHG emissions would be reduced by 31.5 percent less than the BAU scenario. The Prior EIR concluded the level of impact would be less than significant with mitigation.

b) Consistency with greenhouse gas plan, policy, regulation

Analysis of GHG emissions in the original environmental approval for the Approved Project noted the City had not yet adopted its Climate Action Plan (CAP), which was implemented in 2012. Nonetheless, the Prior EIR conducted a GHG consistency analysis against the City's draft CAP. As discussed above, the Prior EIR noted the City's CAP required a reduction of GHG emissions by 25 percent compared to the BAU scenario. With implementation of mitigation, the Approved Project would have a reduction of 31.5 percent below BAU. The Approved Project was determined to be consistent with the applicable CAP resulting in a less than significant impact with implementation of Prior EIR Mitigation Measures 4.3.6.4A, 4.3.6.4B, 4.7.6.1A, and 4.7.6.1B.

Impacts Associated with the Modified Project

(a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP commercial area by 11.64 acres, resulting in 143,730 sf of commercial building area that includes a 135-room hotel added to the Approved Project, increasing construction and operational GHG emissions over and above those analyzed in the Prior EIR. An *Air Quality and Greenhouse Gas Memorandum* (Urban Crossroads, November 26, 2019) contained in Appendix B was prepared to assess GHG impacts from the Modified Project.

As detailed in the *Air Quality and Greenhouse Gas Memorandum*, the Modified Project would result in an incremental increase of GHG emissions of 3,325.07 $MTCO_2e$ per year, resulting in total emissions of 8,537.89 $MTCO_2e$ per year for the entire commercial center. The City has adopted a Climate Action Plan (CAP) that specifies compliance with the CAP as the CEQA threshold of significance. This threshold was applied to the Approved Project and also applies to the Modified Project. The CAP includes design features that reduce GHG emissions. Each design feature is assigned a numerical value. In order to comply with the CAP, the Modified Project must incorporate enough design features to reach 100 points, which are verified and implemented during final design. Compliance with the CAP is consistent with the analysis included in the Prior EIR and no significant impacts would occur. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would generate GHG emissions that would contribute to cumulative emissions in California. As indicated above and in the same manner as for the Approved Project, the

Modified Project's GHG impacts would be reduced to less than significant with implementation of Mitigation Measures 4.3.6.4A, 4.3.6.4B, 4.7.6.1A, and 4.7.6.1B. The Modified Project is consistent with State and City GHG emissions reduction requirements. With the implementation of mitigation and GHG reduction strategies, the Modified Project's cumulative GHG emissions would not be considered significant. The Modified Project's cumulative impacts are consistent with the cumulative impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures from the Prior EIR were found to be applicable to the Modified Project:

Greenhouse Gas Emissions	
4.3.6.4A	Prior to issuance of each building permit associated with the Specific Plan, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of the following design features may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent: • Exceed 2008 California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling. • Increase in insulation such that heat transfer and thermal bridging is minimized. • Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. • Incorporate dual-paned or other energy efficient windows. • Incorporate energy efficient space heating and cooling equipment. • Install interior and exterior energy efficient lighting which exceeds the 2008 California Title 24 Energy Efficiency performance standards including but not limited to automatic devices to turn off lights when they are not needed. • To the extent that they are compatible with landscaping guidelines established by the City, include shade producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings, within the project site. • Use light and off-white colors in the paint and surface color palette for project buildings to reflect heat away. • All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.
4.3.6.4B	Prior to issuance of each building permit associated with the Specific Plan, the following design features shall be implemented to reduce energy demand associated with potable water conveyance: • Landscaping palette emphasizing drought-tolerant plants; • Use of water-efficient irrigation techniques; and • U.S. EPA Certified WaterSense labeled or equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.

4.7.6.1A	Prior to the issuance of each grading permit associated with the Specific Plan, the project developer shall develop and implement a construction waste management plan that would require the recycling and/or salvaging of non-hazardous construction and demolition waste.
4.7.6.1B	Prior to the issuance of each building permit associated with the Specific Plan, the project developer shall facilitate the reduction of waste generated by building occupants that is hauled to and disposed of in landfills by providing easily accessible areas that serve each building and are dedicated to the collection and storage of paper, cardboard, glass, plastics, and metals.

h) Expose people or structures to a significant risk of loss, injury of death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Hazard from routine transport, use, or disposal of hazardous materials
b) Release of hazardous materials from reasonably foreseeable upset and accident conditions

The Prior EIR noted development of the Approved Project would introduce potentially hazardous materials (e.g., petroleum products, pesticides, fertilizer, and other household hazardous products such as paint products, solvents, and cleaning products) to the AHSP site. In addition, the Prior EIR noted hazardous materials would be present during construction of the Approved Project, including typical fluids, solvents, cleansers used to operate/drive/maintain equipment and vehicles.

The Prior EIR noted the potential for exposure of hazardous materials into the environment from accidental releases of typical products stored and sold in conjunction with retail sales within the commercial area of the Approved Project, as well as the presence of household hazardous materials purchased by residents in the residential areas of the Approved Project. Hazardous material spills associated with household hazardous products sold in retail stores or stored in residential areas within the Approved Project was determined to be small and easily contained and less than significant and no mitigation was required.

The Prior EIR noted appropriate documentation for all hazardous waste transported in connection with project activities would have be required to comply with existing hazardous materials handling regulations. The United States Department of Transportation Office of Hazardous Materials Safety established strict regulations for the safe transportation of hazardous materials. Transportation of all hazardous materials would have complied with all applicable regulations resulting in a less than significant impact and no mitigation was required.

The Prior EIR also noted the California Hazardous Materials Management Act required businesses handling or storing certain amounts of hazardous materials prepare a Hazardous Materials Business Emergency Plan (HMBEP), which would include an inventory of hazardous materials stored on site, an emergency response plan, and an employee training program. The handling of hazardous materials in accordance with the HMBEP as required by applicable local, State, and Federal standards, ordinances, and regulations would have ensured that impacts associated with environmental and health hazards related to an accidental release of hazardous materials on the Specific Plan area were less than significant and no mitigation was required.

c) Hazardous emissions or materials within one-quarter mile of an existing or proposed school

The Prior EIR noted there were no schools within 0.25 mile of the Approved Project. In addition, the Prior EIR stated students residing in the AHSP residential community would have attended existing schools within the Corona-Norco Unified School District. Therefore, no new school facilities were proposed to be built within 0.25 mile of a project that would emit hazardous emissions. In addition, the handling of hazardous materials or emission of hazardous substances in accordance with the HMBEP as required by applicable local, State, and Federal standards, ordinances, and regulations would have ensured that impacts associated with environmental and health hazards related to an accidental release of hazardous materials or emissions of hazardous substance near existing or proposed schools were less than significant and no mitigation was required.

d) Site found on list of hazardous materials sites

The Prior EIR noted the Approved Project site was not listed in any regulatory database for hazardous materials. Based on the information provided by the public, regulatory and governmental agencies, and information obtained during the records search and literature review, there did not appear to be any sites within a mile of the Approved Project that would have resulted in an adverse impact on the Approved Project.

The Prior EIR noted the existence of structures/infrastructure scattered throughout the Approved Project. All of these structures and infrastructure features were previously used for agricultural purposes. None of the existing structures/features exhibited a hazardous condition.

Due to the past agricultural use of the Approved Project and surrounding area, an assessment was conducted to address residual organochlorine pesticides (OCPs), a smudge pot storage area, a 10,000-gallon aboveground smudge oil storage tank, and a 10-foot by 10-foot storage shed. The assessment concluded there were no hazardous conditions at these locations other than very high levels of pesticides found in the soil beneath the wood floor of the shed, which resulted in a significant impact requiring mitigation.

The Prior EIR noted the Approved Project was not listed as a hazardous materials release area, was not included on the Cortese List, and no on-site violations were noted in the regulatory database. The Prior EIR found it was highly unlikely that hazardous materials would have been uncovered during soil-disturbing activities on site, however there was a chance that unknown wastes or suspect materials may have been encountered during soil-disturbing activities resulting in a significant impact requiring mitigation.

e) Public safety hazards within ALUP or within two miles of public airport
f) Public safety hazards within vicinity of private airport

The Prior EIR noted the Approved Project was noted located within an Airport Land Use Plan, within two miles of a public use airport, or in the vicinity of a private airport. The Corona Municipal Airport (CMA) located approximately 6.5 miles northwest of the Approved Project was noted as the closes airport. Due to the distance of the Specific Plan area from the CMA, the Prior EIR concluded potential development of the Approved Project would not have resulted in a safety hazard for people residing or working within the AHSP area. Therefore, no impacts associated with this issue were found to occur.

g) Conflict with an Emergency Response Plan

The Prior EIR noted the Approved Project was accounted for in the City's General Plan as evidenced by designation of the Approved Project as "possible future urban use." The Prior EIR noted the Approved Project would have been designed, constructed, and maintained in accordance with applicable standards associated with vehicular access, which would have ensured that access would have been properly provided for adequate emergency access and evacuation. Construction activities that could have temporarily restricted vehicular traffic would have been required to implement a Traffic Management Plan as part of the building permit that would have required adequate and appropriate measures to facilitate the passage of persons and vehicles through/around any required road closures. The Prior EIR concluded compliance with existing regulations for emergency access and evacuation would have ensured that impacts related to this issue were less than significant and no mitigation was required.

h) Safety hazard from wildland fires

The Prior EIR noted the majority of the Approved Project was located in a "Non-wildland/non-urban" zone as identified by the California Department of Forestry and Fire Protection (CDFFP). The southeastern portion of the Approved Project above Bedford Canyon Wash was located in a "Very High Fire Hazard" Severity Zone. Neighboring land to the east and south of the Approved Project were was also identified as a "Very High Fire Hazard" Severity Zone as well as a State Responsibility Area (SRA) designated "Very High Fire Hazard Severity Zone" by the CDFFP. The Prior EIR noted development of the Approved Project would have been required to comply with all applicable fire code requirements and associated fire prevention measures to reduce the risk of wildland fires. In addition, these areas were subject to the requirements of the City of Corona Fire Department construction design guidelines and fuel modification standards.

In addition, the Prior EIR noted the Approved Project would comply with the County of Riverside Fire Authority Design Guidelines and fuel modification standards resulting in a 200-foot fuel modification zone along the easterly edge of the Specific Plan area. The 200-foot defensible space zone would have served to reduce the amount of fuel surrounding buildings and structures within the Approved Project. To ensure that impacts associated with wildfires would have been reduced to less than significant, Mitigation Measure 4.8.6.2A was identified in the Prior EIR.

Impacts Associated with the Modified Project

(a) Create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials?

(b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. All fuels, solvents and other materials used during construction would be required to comply with applicable standards and regulations related to hazardous materials and hazardous waste as specified in the Prior EIR. The additional commercial land uses would result in an incremental increase in the potential for accidental releases of hazardous materials during routine transportation and disposal of hazardous materials. All materials used during construction and operation would be required to comply with applicable standards and regulations related to hazardous waste as specified in the Prior EIR, and no new or substantially greater impacts would occur. The Modified Project's impacts associated with hazards from routine transport, use, or disposal of hazardous materials and from the release of hazardous materials from upset and accident conditions are consistent with the impacts identified in the

Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. As noted in the Prior EIR, there were no schools within 0.25 mile of the Approved Project. No schools have been built within 0.25 mile of the Modified Project Site since approval of the Approved Project. Therefore, no new or substantially greater impacts would occur with implementation of the Modified Project as compared to the Prior EIR. The Modified Project's impacts regarding are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 67962.5 and, as a result, would it create a significant hazard to the public or the environment?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. Separate Phase I Environmental Site Assessments (EBI Consulting, June 2019) were prepared for the existing property in PA 11 and the Modified Project Site, and are included as Appendix F to SEIR No. 2. Based on research conducted as part of the assessments, existing PA 11 and the Modified Project Site are not on the Cortese/HIST Cortese databases. In addition, there are not sites on the Cortese List located within 0.5 mile of the two properties. The Modified Project's impacts regarding contaminated sites are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(e) For a project located within an airport land use plan, or where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the Specific Plan area?

(f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the Specific Plan area?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project.

The Prior EIR noted the Approved Project was noted located within an Airport Land Use Plan, within two miles of a public use airport, or in the vicinity of a private airport. No airports have been built near the AHSP since the Approved Project was approved. Due to the 6.5 mile distance between the Modified Project Site and the closest airport, Corona Municipal Airport, development of the Modified Project would not result in a safety hazard for people residing or working within the AHSP area. No new or substantially greater impacts would occur with implementation of the Modified Project. The Modified Project's impacts regarding public and private airports are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Modified Project would be designed, constructed, and maintained in accordance with applicable standards associated with vehicular access, which would ensure that access would have been properly provided for adequate emergency access and evacuation. Construction activities that could temporarily restrict vehicular traffic would be required to implement a Traffic Management Plan as part of building permit approval to ensure adequate access is maintained. Compliance with existing regulations for emergency access and evacuation would ensure impacts related to emergency access and response is less than significant and no mitigation is required. The Modified Project's impacts associated this issue are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(h) Expose people or structures to a significant risk of loss, injury of death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Modified Project Site is located adjacent to a previously graded pad within existing PA 11 to the west, I-15 to the east, and Cajalco Road to the north. Bedford Canyon Wash was recently widened, stabilized, and restored and is located to the south of the Modified Project Site. High fire risk areas as indicated by the CDFFP are located in the vicinity to the southeast of the Modified Project Site on the slopes of the Santa Ana Mountains in the US National Forest. Implementation of the Approved Project requires preparation and implementation of project-specific Wildland Fire Plan/Fuel Modification Plan, which would mitigate potential threat of wildfires. Therefore, no new or substantially greater impacts would

occur with implementation of the Modified Project as compared to those identified in the Prior. The Modified Project's impact regarding wildfires is consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. As identified above, project-specific impacts form the Modified Project related to hazards and hazardous materials would not change relative to those identified in the Prior EIR.

While project-specific hazardous material impacts resulting from individual future development projects will be mitigated via application of applicable regulations or addressed separately in future CEQA documents, anticipated future development will contribute, through increases in population and the number of outlets that transport or dispose of hazardous materials, to a cumulative increase in risk for hazardous material incidents. Although each project has unique hazardous materials considerations, future cumulative projects would comply with the local, State, and Federal regulations and requirements as these are required for all development projects. As a result, cumulative impacts associated with hazardous materials would be less than significant.

Cumulative aircraft hazard impacts consist of future development within the boundaries of the Airport Land Use Plan (ALUP) accident potential zones. The risk to each future project is based on the specific accident potential zone. The risks associated with development in these accident potential zones can only be reduced through conformance with land use guidelines and policies identified by the ALUP. However, because the surrounding cities as well as the County of Riverside have implemented comprehensive land use plans that incorporate applicable ALUP recommendations, it is anticipated cumulative development within the accident potential zones would in a less than significant cumulative impact associated with aircraft accident hazards.

Similar to the conclusions for the Approved Project contained in the Prior EIR, the Modified Project would be required to comply with local, State, and Federal regulations and requirements related to hazardous materials. With adherence to these measures, the proposed project's impacts would not contribute to cumulatively significant impact. The Modified Project's level of impact for cumulative hazards and hazardous materials impacts is consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures, with minor edits to reflect updated recommendations contained in the geotechnical evaluation prepared for the Modified Project, from the Prior EIR were found to be applicable to the Modified Project:

Hazards and Hazardous Materials	
~~4.8.6.1B~~	~~If soil from any location on the project site is to be removed or transported off site, the soil export must have a DDT level of less than 1 part per million (ppm). Soil to be exported off site shall be tested, and verification of the soil results shall be submitted to the City for review prior to the issuance of soil export operations.~~
4.8.6.1C	If unknown wastes or suspected hazardous materials are discovered during any construction activities on the project site, the following shall occur: • Immediately stop work in the vicinity of the suspected contaminant, removing workers and the public from the area; • Notify the City of Corona Fire Department and the Riverside County Department of Environmental Health; • Notify the project engineer of the implementing agency (the City of Corona) and secure the area containing the unknown wastes or suspect materials as directed by the project engineer; and • Notify the project engineer of the implementing agency (the City of Corona) and secure the area containing the unknown wastes or suspect materials as directed by the project engineer; and • Notify the implementing agency's Hazardous Waste/Materials Coordinator.
4.8.6.1E	Prior to the issuance of demolition permits for any planning areas containing structures, any remaining structures on site shall be visually inspected by the project engineer of the implementing agency (City of Corona) prior to demolition activities. If hazardous materials are encountered, the materials shall be tested and properly disposed of in accordance with state and federal regulatory requirements. Any stained soils or surfaces underneath the removed materials shall be sampled. Results of the sampling would indicate the appropriate level of remediation efforts that may be required. Testing and remediation of unknown wastes or suspect materials shall be conducted under the

	purview of the applicable agency (i.e., DTSC, Santa Ana RWQCB, and/or City). Remediation shall be conducted to the standards established by the Lead Agency (i.e., DTSC, Santa Ana RWQCB, and/or City). All contaminated soil locations identified shall be remediated below hazardous levels established by Title 22 of the California Code of Regulations and to the satisfaction of the applicable Lead Agency.
4.8.6.1F	Prior to the issuance of grading permits for each planning area, all miscellaneous debris (e.g., wood and concrete) shall be removed and disposed of at an approved landfill facility prior to construction activities under the purview of the appropriate agency (i.e., DTSC, Santa Ana RWQCB, and/or City). Once removed, a visual inspection of the areas beneath the removed materials shall be performed by the construction contractor as specified by the City of Corona. Any stained soils observed underneath the removed materials shall be sampled. Results of the sampling, if necessary, would indicate the level of remediation efforts that may be required. Remediation shall be conducted to the standards established by the Lead Agency (i.e., DTSC, Santa Ana RWQCB, and/or City). All contaminated soil locations identified shall be remediated below hazardous levels established by Title 22 of the California Code of Regulations and to the satisfaction of the applicable Lead Agency.
4.8.6.2A	Prior to the issuance of building permits for each planning area, the project proponent shall prepare, submit, and receive approval from the City and Riverside County Fire Department, a project-specific Wildland Fire Plan/Fuel Modification Plan. The Wildland Fire Plan/Fuel Modification Plan shall include but shall not be limited to the following: • Goals, policies, and actions related to fire funding and fire rehabilitation; • Fire protection and evacuation plan; • Vegetative fuels management plan; • Public education program; and • Defensible space requirements which meet and/or exceed the City of Corona Fire Department and Riverside County Fire Department Fuel Modification Requirements.

3.4.9 Hydrology and Water Quality

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Violate any water quality standards or waste discharge requirements?	☐	☐	☐	☒
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	☐	☐	☐	☒
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?	☐	☐	☐	☒

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off site?	☐	☐	☐	☒
e) Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?	☐	☐	☐	☒
f) Otherwise substantially degrade water quality?	☐	☐	☐	☒
g) Place housing within a 100-year flood hazard area as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☐	☒
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☐	☐	☐	☒

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	☐	☒
j) Expose people or structures to inundation by seiche, tsunami, or mudflow?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Violate water quality standards and waste discharge requirements

f) Otherwise degrade water quality

The Prior EIR noted short-term storm water pollutant discharges from each individual site within the Approved Project would be prevented through compliance with the applicable construction oriented best management practices (BMPs) implemented by the NPDES permitting process. Coverage with applicable NPDES permits would prevent sedimentation and soil erosion through implementation of an SWPPP and periodic inspections by RWQCB staff. During the construction period, the development associated with the Approved Project would utilize a series of BMPs to reduce erosion and sedimentation. The Prior EIR prescribed Mitigation Measures 4.9.6.1A through 4.9.6.1C to ensure future construction within the Approved Project obtains coverage under the NPDES General Construction permit, resulting in a less than significant impact with mitigation.

To comply with operational water quality standards, the Approved Project would be required to prepare a site-specific Water Quality Management Plan (WQMP) to identify low-impact development storm water retention strategies and appropriate controls to mitigate potential violations of water quality standards or waste discharge requirements. The Prior EIR prescribed Mitigation Measure 4.9.6.2A requiring approval of a final WQMDP and concluded the Approved Project's operational water quality

impacts would less than significant with adherence to existing regulatory requirements and implementation of mitigation.

b) Deplete groundwater supplies

Groundwater levels can be affected by increased impervious surfaces reducing infiltration into underlying groundwater basins. Groundwater levels can also be affected by increased water demand that is supplied by groundwater sources.

The Prior EIR noted the City's primary water source is groundwater from the Temescal, Bedford, and Coldwater groundwater sub-basins. The secondary source is water imported by the Metropolitan Water District of Southern California (MWDSC) from the Colorado River and the State Water Project (SWP). The MWDSC provides wholesale water to Western Municipal Water District (WMWD) who in turn sells water to the City.

The Prior EIR noted the City's Groundwater Management Plan (GWMP) developed strategies for more sustainable management and use of groundwater resources to meet future water demands in recognition of decreasing groundwater levels in regional groundwater basins. The GWMP recommended these strategies be implemented through 2020 to reduce demands for imported water and to meet projected demands. The City shares one or more of the three groundwater sub-basins with the City of Norco, Home Gardens County Water District, Lee Lake Water District (LLWD), and Elsinore Valley Municipal Water District (EVMWD). LLWD participated in the GWMP and proposed a groundwater recharge project with recycled water in the Bedford Sub-basin.

The Prior EIR acknowledged the serious water supply issues facing California and noted Governor Brown's 2015 declared State of Emergency due to drought conditions. The Prior EIR noted the City would rely solely on groundwater supplies to meet existing and future water demands in the event of a prolonged drought resulted in curtailed water supply deliveries from MWDSC. The Prior EIR analyzed the Approved Project's affect on groundwater supplies should the City be forced to rely solely on groundwater to supply City water demand during a prolonged drought.

The Prior EIR noted the City's 2010 Urban Water Management Plan (UWMP) identified the availability of sufficient water supplies to meet future water demand in the City's service area including the additional water demand from the Approved Project in year 2030 under normal, single-dry and multiple-dry water years. The Prior EIR found the City had sufficient groundwater rights to extract the necessary water to serve the Approved Project, and noted additional groundwater supplies could be utilized to meet demand if necessary. The Prior EIR prescribed Mitigation Measures 4.9.6.3A and 4.9.6.3B requiring a project level water conservation plan and water conservation educational program, reducing impacts from the Approved Project on groundwater supplies to a less than significant level.

c) Alter existing drainage pattern, stream or river, resulting in erosion or siltation
d) Alter existing drainage pattern, stream or river, resulting in increased runoff
e) Create runoff exceeding capacity of storm water drainage system or substantially increase polluted runoff

The Prior EIR noted stormwater flows from the Approved Project would be adequately detained and handled by a system of drainage facilities and detention basins to mitigate increased peak flows and mitigate how fast the increased volume would be released into the natural streambed. The Prior EIR noted the system included underground drainage facilities below streets construction within the AHSP, an open channel along the north side of the AHSP, a regional detention/water quality basin located in PA 12 and a local detention/water quality basin located in PA 14. The basins would detain storm water flows before outletting into Bedford Canyon Wash. The Prior EIR noted the basins would be designed to treat water quality pollutants prior to discharging waters into Bedford Canyon Wash.

The Prior EIR also assessed the impacts as well as the benefits from the planned widening, stabilization and restoration of Bedford Canyon Wash included as part of the Approved Project. The improvement project was developed to maintain and restore the natural channel in such a manner to minimize erosion to the existing bluff and perpetuating the sediment transport capabilities of the natural wash. The Prior EIR noted each of the three design options would safely convey 100-year storm events and would achieve the following general hydraulic objectives:

- Accommodate the 100-year storm event for Bedford Canyon Wash in a burned and bulked condition with sufficient additional freeboard above design flow elevations.
- Protect the existing bluff on the east side of Bedford Canyon Wash from erosive velocities by either placing high velocity storm flows in a bypass channel or protecting the bluff with buried riprap.
- Lower the elevation of storm flows in either the bypass channel or Bedford Canyon Wash to an elevation below proposed Street "B" and adjoining residential building pads.
- Discharge storm flows at the downstream (northern) property line in a manner consistent with existing flows, including peak volumes, velocities, and debris conveyance.

The Prior EIR noted design of the Approved Project included storm water and water quality facilities and prescribed Mitigation Measure 4.9.6.2A requiring approval of a final that would result in less than significant impacts associated with altering existing drainage patterns, producing erosion and siltation, and exceeding the capacity of the storm water drainage system.

g) Place housing in 100-year flood hazard area

h) Impede or redirect flood flows by placing structures in 100-year flood hazard area

The Prior EIR noted the Approved Project would adhere to the Federal Emergency Management Agency (FEMA) Conditional Letter of Map Revision (CLOMR) and Letter of Map Revision (LOMR) certification processes to ensure the project would not result in flooding. The Prior EIR noted all drainage facilities and flood control measures would be designed in accordance with the requirements of the City and Riverside County Flood Control and Water Conservation District. The Prior EIR identified Mitigation Measure 4.9.6.4A to ensure drainage facilities would be sufficiently located, sized, and constructed to protect the Approved Project from 100-year flood hazards.

i) Expose people or structures to loss, injury or death from flooding including levee or dam failure

The Prior EIR concluded development of the Approved Project would not expose people or structures to flooding as a result of levee or dam failure.

j) Inundation by seiche, tsunami, or mudflow?

The Prior EIR concluded development of the Approved Project would not inundate people or structures by seiche, levee or mudflow.

Impacts Associated with the Modified Project

(a) Violate any water quality standards or waste discharge requirements?

(f) Otherwise substantially degrade water quality?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. As identified in the Prior EIR, short-term storm water pollutant discharges from each individual site within the AHSP would be prevented through compliance with applicable NPDES permitting processes. The Modified Project would be required install BMPs to prevent sedimentation and soil erosion through implementation of an SWPPP and periodic inspections by RWQCB staff. During the construction period, development of the Modified Project's BMPs would reduce erosion and sedimentation consistent with the analysis contained in the Prior EIR. To ensure that future development within the AHSP area obtains coverage under the NPDES General Construction permit, the Prior EIR included Mitigation Measures 4.9.6.1A through 4.9.6.1C. These measures are applicable to the Modified Project to ensure appropriate BMPs are constructed. With implementation of Mitigation Measures 4.9.6.1A through 4.9.6.1C, construction water quality impacts would be less than significant.

A *Preliminary Water Quality Management Plan* (Hunsaker & Associates, January 29, 2020, Appendix G-1 to SEIR No. 2) and *PA 14 Hydrological and WQMP* (Hunsaker & Associates, October 4, 2019, Appendix G-3 to SEIR No. 2) was prepared for the Modified Project to assess operational and construction impacts to water quality from storm water and low flow conditions, and provide

recommendations regarding BMPs to reduce water quality impacts. The Water Quality Management Plan (WQMP) concluded the drainage system for existing PA plus the Modified Project Site included low impact development BMPs that would properly detain and treat storm flows resulting in a less than significant. The Prior EIR included Mitigation Measure 4.9.6.2A requiring approval of a final WQMP to ensure appropriate BMPs are included in the project design and constructed. The measure is applicable to the Modified Project to ensure appropriate BMPs are constructed. With implementation of Mitigation Measure 4.9.6.2A, operational water quality impacts would be less than significant.

The Modified Project's impacts regarding water quality are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The increase in commercial land use will incrementally increase water demands in comparison to the Approved Project. A *Water Supply Assessment Update Memo* (Fuscoe Engineering, October 17, 2019) was prepared to assess the increase in water demand attributable to the Modified Project Site and is included as Appendix G-2 to SEIR No. 2. The 2019 *Water Supply Assessment* (WSA) noted the original water demands projected for the current AHSP (Approved Project) is 795.6 acre-feet per year (AFY), the Modified Project would increase water demands by 6.60 AFY, resulting in water demand for the AHSP as revised by the Modified Project of 802.2 AFY.

The original WSA for the Approved Project was based on data and information from the 2010 UWMP. Since approval of the original WSA, the City has updated and approved the 2015 UWMP. For this reason, the 2019 WSA compares the additional water demands associated with the Modified Project with the findings from the updated 2015 UWMP as well as the 2015 UWMP.

The 2019 WSA includes a comparison of the differences for the Multiple Dry Year (MDY) scenarios contained in the 2010 and 2015 UWMPs. The WSA notes this comparison represents the worst-case scenario, as opposed to the Normal Dry Year (NDY) and Single Dry Year (SDY) scenarios also included in the UWMPs. The MDY from the 2010 UWMP projects a surplus of 6,289 AFY in 2015 increasing to 9,236 AFY from 2015-2035. The MDY from the 2015 UWMP projects a surplus of 5,933

AFY in 2020 decreasing to 2,535 AFY from 2020-2040. The 2019 WSA finds the City has a surplus of water available in the MDY scenarios summarized in the 2010 and 2015 UWMPs.

With the 802.2 AFY water demand from the AHSP as revised by the Modified Project are included in the capacity/surplus calculations from the 2015 UWMP, the Modified Project did not result in a deficit in any scenario. The 2019 WSA water demand calculations for each climate scenario from the 2015 UWMP projections minus the AHSP new water demand are a minimum surplus of 1,733 AFY in 2040 in the MDY scenario, representing the worst case scenario.

The water demands from the Modified Project do not alter the conclusion of the original WSA. The 2019 WSA determined water supplies are available to meet water demands from the revised AHSP in multiple climate scenarios (i.e. Normal, Single Dry, or Multiple Dry Years). The 2019 WSA concluded there are adequate water supplies to serve the Modified Project's anticipated water demand increases as well as other demands within the City's jurisdiction.

Mitigation Measures 4.9.6.3A and 4.9.6.3B from the Prior EIR requiring a project level water conservation plan and water conservation educational program are applicable to the Modified Project. The Modified Project's impacts regarding groundwater depletion are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on or off site?

(d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off site?

(e) Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. A Hydrology Analysis (Hunsaker & Associates, November 2019) was prepared to assess hydrology and hydraulic conditions for the entire commercial development resulting from the Modified Project, including both the proposed Modified Project Site as well as the property in the current PA 11 boundary. The hydrology report is included as Appendix G-3 to SEIR No. 2. The report supplements previous hydrology studies prepared for the Approved Project in 2015 and 2017.

The commercial lands in revised PA 11 were divided into two onsite drainage areas A and B. Drainage management (DMA) area A consists of the approximately 10-acre existing commercial pad in PA previously graded as part of the Approved Project. Run-off from DMA A would be collected by a series of private catch basins connected to a private storm drain system within the commercial site, flowing easterly and ultimately connecting to the existing AHSP backbone storm drain system within Bedford Canyon Road at its intersection with the Lift Station access road. The backbone storm drain facilities for DMA A had already been accounted for and designed as part of the overall hydrology master drainage plan for the Approved Project (Tract 36294) to convey the 100-year storm event. The 2019 report confirmed the proposed improvements associated with the Modified Project commercial development in conjunction with the AHSP backbone storm drain facilities would adequately handle the 2-year, 10-year, and 100-year storm events from DMA A. The hydrology report confirmed the proposed storm drain system and AHSP backbone storm drain facilities including the existing infiltration basin in PA 12 would accommodate these flows prior to outletting into Bedford Canyon Wash, and no additional design modifications or mitigation measures are required.

DMA B consists of approximately 13.8 acres adjacent to the north/east side of Tract 36294 consisting of the additional commercial and open space land to be added to PA 11 and PA 12A as part of the Modified Project. Runoff from DMA B would be collected by a series of private catch basins connected to a private storm drain system flowing northeasterly towards and into a proposed water quality basin located in the southeastern portion of revised PA 11. Flows from the proposed water quality basin would outlet into Bedford Canyon Wash at a concrete encased outlet and onto the existing concrete crossing to avoid erosion and scouring of the unlined, soft bottom portions of the Wash. The hydrology report confirmed the proposed storm drain facilities for DMA B included as part of the Modified Project would accommodate the 2-year, 10-year, and 100-year storm event design flows, and no additional design modifications or mitigation measures are required.

All flows generated from PA 11 would be conveyed to Bedford Canyon Wash, where it will follow the path of the Santa Ana Watershed towards the Pacific Ocean. The Prior EIR noted design of the Approved Project included storm water and water quality facilities and prescribed Mitigation Measure 4.9.6.2A requiring approval of a final WQMP that would result in less than significant impacts associated with altering existing drainage patterns, producing erosion and siltation, and exceeding the capacity of the storm water drainage system.

In the event soil is imported from PA 14 to raise the height of the Modified Project Site to within five feet of the exiting commercial pad in PA 12 and to allow gravity flow of wastewater to the sewer lift station near the Bedford Canyon Road/Hudson House Road intersection, a temporary soil bridge will be constructed across Bedford Canyon Wash on the existing concrete crossing to protect the crossing and to maintain elevation across the channel banks. The temporary soil bridge will be equipped with pipe culverts to allow nuisance and storm flows to pass under the soil bridge. A large storm event would

create the possibility of flooding from the bridge acting as a dam. To avoid the possibility of inundation, new Mitigation Measure 4.9.6.3BA has been added to provide start and end dates for the bridge to exist, subject to approval by the Riverside County Flood Control and Water Conservation District.

The Modified Project's impacts regarding alteration of drainage patterns, erosion, runoff, flooding, and polluted runoff are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(g) Place housing within a 100-year flood hazard area as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

(h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Modified Project Site is currently below the existing commercial pad previously graded in PA 11. The elevation of the Modified Project Site will be raised to within five feet of the existing commercial pad and to allow the sewer system installed on the Modified Project site to gravity flow to the existing sewer lift station located near the Bedford Canyon Road/Hudson House Drive (internal AHSP roadway) intersection. Since the Approved Project was approved, portions of the AHSP has been constructed including a majority of the widening, stabilization and rehabilitation of Bedford Canyon Wash and installation of backbone storm drain infrastructure within internal roadways and some of the PAs within the current AHSP boundary. The Bedford Canyon Wash improvements have created an environmentally superior drainage system designed to accommodate 100-year storm flows from the larger watershed in Bedford Canyon as well as from the AHSP. As discussed in detail as part of items (c), (d), and (e), the proposed storm drain facilities included as part of the Modified Project in conjunction with the installed AHSP backbone storm drain facilities (i.e., existing basin in PA 12; existing backbone storm drain line in Bedford Canyon Road) would accommodate 2-year, 10-year, and 100-year storm event design flows. As a result of existing improvements and those proposed as part of the Modified Project, housing will not be exposed to a 100-year flood hazard and structures will not restrict or redirect storm flows resulting in a 100-year flood hazard. The Modified Project's impacts associated a 100-year flood hazard are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The expanded AHSP boundary is not located in an area near a levee or dam, and therefore the Modified Project Site would not expose people or structures to potential loss, injury or death from flooding associated with a levee or dam failure. The Modified Project's impacts associated with flooding from levee or dam failures are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

The Prior EIR concluded development of the Approved Project would not expose people or structures to flooding as a result of levee or dam failure.

(j) Expose people or structures to inundation by seiche, tsunami, or mudflow?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The expanded AHSP boundary is not located in an area near bodies of water that would result in inundation from by seiche, tsunami, or mudflow. The Modified Project's impacts associated with inundation by seiche, tsunami, or mudflow are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. Development of the Modified Project Site would result in an increase in impervious surfaces in addition to changes in increased commercial land uses and associated pollutant runoff characteristics. Increased impervious surfaces are likely to alter existing hydrology and increase potential pollutant loads. As discussed above, the Modified Project would not introduce a substantially greater percentage of impervious surfaces than originally analyzed in the Prior EIR that would substantially increase storm flows and degrade water quality as a result of an increase in the volume of runoff. As determined in the Prior EIR, the Master Drainage Plan would implement BMPs to manage storm flows and treat runoff and pollutant loads. Similarly, cumulative development projects would be required to minimize their individual storm flow and water quality impacts by implementing tailored BMPs. The Modified Project's cumulative contribution to storm water flows and water quality would be mitigated to less than significant with implementation of mitigation similar to the Approved Project. The Modified

Project's level of impact to hydrology and water quality is consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures, with minor edits to reflect updated recommendations contained in the geotechnical evaluation prepared for the Modified Project, from the Prior EIR were found to be applicable to the Modified Project:

Hazards and Hazardous Materials	
4.9.6.1A	Prior to the ~~first~~ issuance of a grading permit by the City for any development within PA 11 and 12A of the Arantine Hills Specific Plan, the project proponent shall file a Notice of Intent (NOI) with the Santa Ana Regional Water Quality Control Board (RWQCB) to be covered under the State National Pollutant Discharge Elimination System (NPDES) General Construction Permit for discharge of storm water associated with construction activities. The project proponent shall submit to the City the Waste Discharge Identification Number as proof that the project's NOI to be covered by the General Construction Permit has been filed with the appropriate RWQCB.
4.9.6.1B	Prior to the ~~first~~ issuance of a grading permit by the City for any development within PA 11 and 12A of the Arantine Hills Specific Plan, the project proponent shall submit to the City of Corona and receive approval for a project-specific Storm Water Pollution Prevention Plan (SWPPP). The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. In addition, the SWPPP shall emphasize structural and nonstructural best management practices (BMPs) to control sediment and nonvisible discharges from the site. Some of the BMPs to be implemented may include (but shall not be limited to) the following: • Sediment discharges from the site may be controlled by the following: sandbags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge control devices. The construction and condition of the BMPs would be periodically inspected during construction, and repairs would be made when necessary as required by the SWPPP.

	• Materials that have the potential to contribute nonvisible pollutants to storm water must not be placed in drainage ways and must be contained, elevated, and placed in temporary storage containment areas. • All loose piles of soil, silt, clay, sand, debris, and other earthen material shall be protected in a reasonable manner to eliminate discharge from the site. Stockpiles would be surrounded by silt fences and covered with plastic tarps. • The SWPPP would include inspection forms for routine monitoring of the site during the construction phase to ensure NPDES compliance. • Additional BMPs and erosion control measures would be documented in the SWPPP and utilized if necessary. • The SWPPP would be kept on site for the entire duration of project construction and will also be available to the local Regional Water Quality Control Board for inspection at any time. • In the event that it is not feasible to implement the above BMPs, the City of Corona can make a determination that other BMPs would provide equivalent or superior treatment either on site or off site.
4.9.6.1C	The Construction Contractor shall be responsible for performing and documenting the application of BMPs identified in the project-specific SWPPP. Weekly inspections shall be performed on sediment control measures called for in the SWPPP. Monthly reports shall be maintained by the Contractor and available for City inspection. A more frequent inspection schedule may be required based on the condition of the site and as required in the NPDES General Construction Permit. In addition, the Contractor would also be required to maintain an inspection log and have the log on site available for review by the City of Corona and the representatives of the Regional Water Quality Control Board.
4.9.6.2A	Prior to the first issuance of a permit by the City for any project within the Specific Plan area (which includes the issuance of grading permits and building permits), the project proponent shall receive approval from the City of Corona, a project site specific Water Quality Management Plan (WQMP). The WQMP shall specifically identify pollution prevention, source control, treatment control measures, and other BMPs that shall be used on site to control predictable pollutant runoff in order to reduce impacts to water quality to the maximum extent practicable.

4.9.6.3A	Prior to the issuance of grading permits of any development within the Arantine Hills Specific Plan, the project proponent shall submit to the City for review and approval, a water conservation plan. The water conservation plan shall include but shall not be limited to the following: • Drought-tolerant landscaping plan; • Indoor project design features such as low-flush toilets and low-flow faucets; • Outdoor project design features such as subsurface irrigation systems, rain sensors, drip irrigation, or high-efficiency sprinkler heads; • Use of alternative water sources (e.g., reclaimed water); and • Educational materials to be utilized by the project tenants.
4.9.6.3B	Prior to the issuance of occupancy permits for any development within the Arantine Hills Specific Plan, the project proponent shall submit proof to the City that an educational program regarding water usage has been developed for use within the proposed project.
4.9.6.3C	Prior to the issuance of grading permits for soil movement from PA 14, across Bedford Canyon Wash, and to the Modified Project Site, the project Applicant shall construct the soil bridge on the concrete crossing with Bedford Canyon Wash no earlier than May 1 and remove the bridge no later than October 15. Extensions to these time limits can be made at the discretion of the Riverside County Flood Control and Water Conservation District.
~~4.9.6.4A~~	~~Prior to the issuance of grading permits of any development within the Bedford Canyon Wash Channel, the project proponent shall ensure that drainage facilities and/or improvements necessary for the protection of the development project from the 100-year flood are identified and incorporated into the improvement plans that will be reviewed and approved by the City. A floodplain and sediment transport study, along with other required drainage and/or hydraulic studies, shall be submitted to the Riverside County Flood Control and Water Conservation District for review, approval, and consideration of acceptance of the channel improvements associated with the proposed development. Acceptance of development improvements by the Flood Control and Water Conservation District requires approval of the associated plans and pertinent drainage studies including the sediment transport study. These drainage improvements are required to ensure the proposed project will be protected from a 100-year flood. No building permits shall be~~

	~~issued for lots within the 100-year floodplain as mapped for the Conditional Letter of Map Revision (CLOMR), until Bedford Canyon Wash Channel improvements have been constructed and deemed operationally functional by the City of Corona. At the discretion of the City of Corona, building permits for model home sales may be issued prior to the construction of the channel improvements.~~
~~4.9.6.4B~~	~~Prior to the issuance of rough grading permits of for any development within the Arantine Hills Specific Plan, the project proponent shall submit the Conditional Letter of Map Revision (CLOMR) to the Federal Emergency Management Agency (FEMA). Prior to issuance of any building permits, project proponent shall have received approval of the CLOMR certification process by FEMA. The applicant shall secure FEMA's approval for the Letter of Map Revision (LOMR) as appropriate after development is complete.~~

This Page Intentionally Left Blank

3.4.10 Land Use and Planning

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☐	☒
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Physically divide established community

The Prior EIR noted the nearest residential land uses to the Approved Project were located to the west and northwest of the AHSP area and were a part of the Eagle Glen Specific Plan development, a golf course residential development. The Prior EIR noted the Eagle Glen community was located on elevations higher than the Approved Project and was separated by a vegetated bluff. The land uses adjacent to the south side of the Approved Project were noted as unincorporated rural residential, to the east the I-15 freeway, and to the west open space and agricultural parcels. The Prior EIR found because

the Approved Project was an infill project with development surrounding most of it, it would not have divided an established community.

Because the existing residential uses surrounding the Approved Project were elevated and separated by undeveloped natural areas (a bluff), implementation of the Approved Project would not physically divide an established community. While the physical construction of barriers would occur (e.g., roadways, natural areas, and open space), the division of an established community would not have occurred because the residential uses in the project vicinity were already separated by existing natural features. The Prior EIR concluded the Approved Project would have no impact associated with physically dividing an established community.

b) Conflict with applicable land use plans, policies, or regulations

The Prior EIR found the change from Agricultural land use and zoning designations to the AHSP land uses to be less than significant because the General Plan states the purpose of the Agricultural designation is to "…allow for the continued production of agricultural lands as interim uses preceding urban development and/or as a long-term use." The City's General Plan further states on Page 83 for the Cajalco Road-Interstate 15/McMillan Site, "The Land Use Element designates these lands consistent with their current use and provides for the future consideration of urban uses that would complement development located on adjoining properties." The Prior EIR found future development on the Approved Project site appeared to have been contemplated. Conflicts with applicable land use plans, policies and regulations approved for the purposes of mitigating environmental impacts were found to be less than significant and no mitigation was required.

c) Conflict with applicable habitat conservation plans

The Prior EIR noted the Approved Project would be required to adhere to the requirements of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP), including its Implementation Agreement and fee mitigation program. The Prior EIR noted the fee mitigation program authorizes local member agencies to collect development impact fees and remit such fees to the Riverside Conservation Authority (RCA). These fees are in turn used to acquire lands suitable for habitat preservation for species covered by the MSHCP. Because compliance with the requirements of the MSHCP is mandatory, the Prior EIR found the Approved Project Specific Plan would be consistent with the MSHCP resulting in a less than significant impact and no mitigation was required.

Impacts Associated with the Modified Project

(a) Physically divide an established community??

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730

square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Modified Project Site and associated commercial land uses would be located next to the I-15 freeway to the east, Cajalco Road to the west, and integrated into existing PA 11 to the west.

The Modified Project Site would be located within one of the lower areas within the AHSP boundary. As noted in the Prior EIR, the existing residential communities surrounding the Approved Project are separated by elevation and an undeveloped natural area (a bluff). The Modified Project Site would be added to an existing master planned community, the AHSP, and would not physically divide an established community. While development of the Modified Project Site would incrementally add more physical barriers (e.g., roadways, natural areas, and open space), the division of an established community would not occur because the Modified Project Site's barriers are integrated into the overall AHSP and adequate vehicle and pedestrian linkages are provided. The Modified Project would result in a less than significant associated with physically dividing an established community and no mitigation is required. The Modified Project's impacts regarding this issue are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Modified Project Site is currently designated Agricultural by the General Plan and zoned Agricultural. Approval of the Modified Project would change the designation and zoning to General Commercial and Open Space. As noted in the Prior EIR, the General Plan states the purpose of the Agricultural designation is to "…allow for the continued production of agricultural lands as interim uses preceding urban development and/or as a long-term use." The Prior EIR also notes the General Plan states the following regarding the Cajalco Road-Interstate 15/McMillan Site: "The Land Use Element designates these lands consistent with their current use and provides for the future consideration of urban uses that would complement development located on adjoining properties."

Similar to the conclusions in the Prior EIR, future development on the Modified Project Site appears to have been contemplated. With the addition of the Modified Project Site to the AHSP, the Modified Project would be consistent with the objective to consider urban uses that complement development located on adjoining properties. The adjoining property to the Modified Project Site is the balance of the AHSP, and the Modified Project proposes a continuation of Approved Project land uses, consistent

with the stated objective to consider urban uses that complement development located on adjoining properties. The Modified Project would be consistent with the AHSP, and would not conflict with land use plans, policies, or regulations approved for the purpose of mitigating environmental impacts resulting in a less than significant impact and no mitigation is required. The Modified Project's impacts regarding this issue are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. As described in Section 3.4.4 - Biological Resources, a Biological Technical Report (BTR) was prepared for the Modified Project to assess impacts to biological resources from proposed development on the Modified Project Site. The BTR included an MSHCP consistency analysis, and found the Modified Project to be consistent with the MSHPC with implementation of mitigation. Consistent with the Prior EIR, the Modified Project would be required to adhere to the requirements of the MSHCP payment of the applicable mitigation program fee. The Modified Project's impacts associated with consistency with applicable habitat conservation plans are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. As discussed under item (a), the Modified Project would result in an expansion to AHSP and would not physically divide an established community. Similarly, the Modified Project was found to be consistent with applicable land use plans, policies, and regulations adopted for the purpose of avoiding or mitigating an environmental effect. Lastly, the Modified Project was found to be consistent with the MSHCP. The Modified Project's impacts associated with these three topics were determined to be less than significant. All three of these topics are inherently cumulative in nature, and therefore the Modified Project's cumulative impacts are less than significant. The Modified Project's impacts associated with land use and planning are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The Prior EIR determined no land use and planning mitigation measures were necessary, and the Modified Project did not require any revised or new mitigation measures.

This Page Intentionally Left Blank

3.4.11 Mineral Resources

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Regionally significant mineral resources

b) Locally significant mineral resources

The Prior EIR noted the Approved Project was classified as a MRZ-3 zone, identified as a mineral zone that contains deposits whose significance cannot be evaluated from available data. The Prior EIR noted no mineral extraction activity had occurred or was planned to occur on or near the Approved Project. The Prior EIR found development of the Approved Project would not result in the loss of identified regional or local mineral resources, conversion of an identified mineral resource use, or conflict with existing mineral resource extraction activities. Therefore, the Prior EIR concluded development of the

Approved Project would not result in a loss of statewide, regional, or locally important mineral resources and no impact would occur.

Impacts Associated with the Modified Project

(a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

(b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Prior EIR noted the Approved Project was classified as a MRZ-3 zone, identified as a mineral zone that contains deposits whose significance cannot be evaluated from available data. The Modified Project Site is also classified as an MRZ-3 zone. Page 4.12-7 of the City General Plan Final EIR states "the City is only required to respond to mineral resource recovery areas that have been designated by the State as MRZ-2 (significant existing or likely mineral deposits)." The Modified Project Site has not recently been used for mineral extraction activity and none has occurred in the past. Development of the Modified Project Site would not result in the loss of identified regional or local mineral resources, conversion of an identified mineral resource use, or conflict with existing mineral resource extraction activities. The Modified Project's impacts regarding mineral resources are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary and result in the development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. As discussed above, the Modified Project would not affect any known locally or regionally important mineral deposits. The Modified Project is located adjacent to the Approved Project as analyzed in the Prior EIR. While cumulative development would increase demand for mineral resources, development of the Modified Project would not reduce mineral resources and therefore have no significant cumulative impact to mineral resources. The Modified Project's cumulative impacts regarding mineral resources are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The Prior EIR determined no mineral resources mitigation measures were necessary, and the Modified Project did not require any revised or new mitigation measures.

This Page Intentionally Left Blank

3.4.12 Noise

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☐	☒
b) Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☐	☒
c) Cause a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☐	☒
d) Cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☐	☒

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the Specific Plan area to excessive noise levels?	☐	☐	☐	☒
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the Specific Plan area to excessive noise levels?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Expose people to excessive noise
b) Expose people to excessive groundborne vibration
c) Substantial permanent increase in ambient noise
d) Substantial temporary or periodic increase in ambient noise

The Prior EIR noted details regarding the Approved Project's grading plans were not available, and therefore the location of potential noise sources required implementation of Mitigation Measure 4.12.6.1A. The measure was prescribed to ensure construction noise impacts at the time development commenced would be adequately mitigation by implementation of a Construction Noise Mitigation Program and Construction Contractor Requirements.

The Prior EIR found outdoor living areas within the AHSP would experience elevated levels of on-site traffic noise. The Prior EIR prescribed Mitigation Measure 4.12.6.2A to reduce on-site traffic noise levels to less than significant levels at the outdoor living areas.

The Prior EIR analyzed the proposed commercial land uses and the potential for stationary noise impacts at adjacent residential land uses. Potential stationary noise sources included rooftop air conditioning units, parking lot vehicle movement, drive-through speakerphones, and loading dock activity. The Prior EIR identified Mitigation Measure 4.12.6.3A, which required a noise analysis to determine the stationary noise impacts from commercial land uses within the Approved Project. Implementation of the measure would reduce impacts from commercial stationary-sources to a less than significant level.

The Prior EIR noted the nearest existing sensitive receptors in the vicinity of the Approved Project were residences to the northwest, across Eagle Glen Parkway, at distances ranging from 174 feet to 972 feet. The Prior EIR found groundborne vibration from grading equipment such as earthmovers and haul trucks at distances of more than 10 feet would not create vibration amplitudes that cause structural damages. The Prior EIR concluded impacts as a result of groundborne vibration during construction to be less than significant and no mitigation was required.

e) Expose people to excessive public airport noise

f) Expose people to excessive private airport noise

The Prior EIR noted the Approved Project was not located within an airport land use plan (ALUP), within two miles of a public airport, and not located in the vicinity of a private airport. For these reasons, the Prior EIR concluded the Approved Project would result in no impact related to exposure of people to excessive noise from a public or private airport.

Impacts Associated with the Modified Project

(a) Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

(b) Result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

(c) Cause a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

(d) Cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP commercial area by 11.64 acres, resulting in 143,730 sf of commercial building area that includes a 135-room hotel added to the Approved Project. The Modified Project also requires import of 440,000 cubic yards of soil to raise the Modified Project Site to within five feet of current PA 11 and to allow sewer to gravity flow the AHSP sewer lift station in PA 12. Two options have been identified to import soil to the Modified Project site. One option is to haul soil in from an off-site source in trucks during the nighttime hours. The trucking operations are expected to require 118 nights. Incoming soil will be trucked onto the Modified Project Site, dumped, and moved and spread around the site. There would also be some overlap of the soil import and daytime grading operations.

A second option for importing soil is to haul soil in scrapers from AHSP PA 14, which is located south of the Modified Project Site across Bedford Wash. The area of PA 14 would be lowered approximately 13 feet to generate the fill, which would be hauled in scrapers down a constructed ramp and across Bedford Canyon Wash to the project site. This import option would occur during daytime hours and require approximately 100 days to complete.

In addition to importing soil, the Modified Project would result in the development of a larger commercial center as compared to the Approved Project, resulting in additional construction emissions than analyzed in the Prior EIR.

As documented in the *Bedford Marketplace Noise Impact Analysis* (January 30, 2020) prepared by Urban Crossroads and included in SEIR Appendix H, noise impacts can occur from construction activities, including soil import and operational activities.

On-site Construction Noise Impacts. Construction related noise impacts are expected to create temporary and intermittent high-level noise conditions at receivers surrounding the Modified Project

Site when certain activities occur at the Project site boundary. Using sample reference noise levels to represent the planned construction activities of the site, construction noise levels at nearby sensitive receiver locations were estimated. The analysis shows the Modified Project-related short-term construction noise levels are expected to approach 63.9 dBA L_{max} at nearby sensitive receiver locations, and will not exceed the 75 dBA L_{max} construction noise level threshold. Therefore, based on the results of this analysis, all nearby sensitive receiver locations will experience less than significant impacts due to site construction noise levels. This topic will not be evaluated further in this SEIR.

Soil Import Noise Impacts from Off-site Soil Source. To bring the Modified Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad, import of approximately 440,000 cubic yards of soil is required. One option is to import soil from an off-site location via truck. The import operation is expected to include 250 full loads per night, assuming 15 cubic yards per load, for a total of 3,750 cubic yards per night. To import 440,000 cubic yards, approximately 118 nights of import would be required.

The Project proposes to import soil during the hours (8:00 p.m. to 4:00 a.m.) and complete grading operations both during daytime and nighttime hours. A source of import has been identified from the FST Sand and Gravel Mine, located east of the I-15. The soil would be hauled from the borrow site on Minnesota Road to Sherborn Street to Magnolia Avenue to the I-15 southbound on ramp at Magnolia Avenue, exit at Cajalco Road and enter the Modified Project Site by crossing Cajalco Road from the southbound off-ramp with traffic control. Trucks would return onto Cajalco Road, enter I-15 northbound to Magnolia Avenue to Sherborn Street and travel south to the borrow site.

The proposed soil import/export haul route was specially developed to avoid potentially significant impacts to potential noise sensitive residential land uses. The off-site soil import/export analysis shows that haul truck trips will generate a noise level increase ranging from 0.2 dBA CNEL on I-15 to 5.4 dBA CNEL on Sherborn Street. A review of the haul route shows that the only adjacent noise sensitive residential land uses are located adjacent to I-15. Many of the noise sensitive residential land uses near the I-15 benefit from existing Caltrans sound walls that have been developed to reduce traffic noise. Based on the significance criteria outlined above, the Modified Project soil import/export truck trip-related noise level increases are considered less than significant impacts at the land uses adjacent to roadways conveying Modified Project haul truck traffic. Although the construction noise levels are less than significant, the applicant is required to obtain a Noise Variance in order to conduct the hauling operations during evening and early morning hours (8:00 p.m. to 4:00 a.m.) that are not allowed by the City's noise ordinance that restricts construction to the hours of 7:00 a.m. to 8:00 p.m. Monday through Saturday and 10 a.m. to 6 p.m. Sundays and federal holidays. This topic will not be evaluated further in this SEIR.

The Noise Impact Analysis also includes an assessment of nighttime activities associated with import operations on surrounding sensitive receptors. According to the project Applicant, every effort will be made to limit on-site construction activities particularly during the noise sensitive nighttime hours. For this reason, the Applicant is proposing to limit nighttime operations to permit only the essential equipment needed to support the soil import/export haul truck operations. The results of the soil import/export construction noise analysis, all nearby receiver locations will experience less than significant impacts due to the daytime and nighttime soil import/export noise construction noise levels at the Modified Project Site. This topic will not be evaluated further in this SEIR.

Noise Impacts from PA 14 Soil Source. The second alternative to importing soil to the Modified Project Site would occur by importing soil from PA 14 of the existing AHSP. PA 14 is located to the south of the Modified Project Site and further south of Bedford Canyon Wash. PA 14 is approximately 26 acres, undeveloped, and planned for Medium Density Residential development in the current AHSP. This area forms an elevated plateau above Bedford Canyon Wash. Lowering the elevation of PA 14 by approximately 13 feet would generate approximately 425,000 cubic yards of soil for the Modified Project Site. The remaining 15,000 cubic yards would be generated by lowering PA 14 an additional half foot or importing the remaining soil from an off-site location. Construction noise associated with hauling soil from PA 14 to the Modified Project site would occur during typical days and hours of operation permitted by the City's noise ordinance (7:00 a.m. to 8:00 p.m. Monday through Saturday and 10 a.m. to 6 p.m. Sundays and federal holidays) resulting in a less than significant impact. This topic will not be evaluated further in this SEIR.

Vibration Noise Impacts. Ground-borne vibration levels resulting from construction activities occurring within the Modified Project site were estimated using data from the Federal Transit Administration (FTA). Based on the detailed analysis contained in the Bedford Marketplace Noise Study, the Modified Project is not expected to generate vibration levels exceeding the maximum acceptable vibration standard of 0.05 in/sec root-mean-square (RMS). Vibration levels at the closest sensitive receiver are unlikely to be sustained during the entire construction period, but will randomly occur during the times that heavy construction equipment is operating proximate to the Modified Project site perimeter. Construction will also be restricted to daytime hours consistent with City Noise Ordinance, thereby eliminating potential vibration impact during the sensitive nighttime hours. The potential for the Modified Project to result in exposure of persons to, or generation of, excessive ground-borne vibration is therefore to be less than significant and no mitigation is required. This topic will not be evaluated further in this SEIR.

Operational Stationary Source Noise Impacts. Using reference noise levels to represent the expected noise sources from the Modified Project Site, stationary-source noise levels at nearby sensitive receiver

locations were estimated.[1] The normal activities associated with the Modified Project are anticipated to include roof-top air conditioning units, drive-thru speakerphones, trash enclosures, parking lots, gas station activity, car wash tunnel, car wash vacuums, and outdoor playground activity resulting in noise levels ranging from 32.7 to 40.0 dBA L_{50} at the noise-sensitive off-site receiver locations.

The analysis shows that the Modified Project-related operational noise levels will meet City daytime and nighttime exterior noise level standards at the closest noise-sensitive receiver locations in the study area.[2] Therefore, the operational noise impacts are considered less than significant at all receiver locations. In addition, the Modified Project operational noise level contribution analysis shows Project-related incremental noise level increases to the ambient noise environment would be less than significant at all receiver locations. This topic will not be evaluated further in this SEIR.

The Noise Impact Analysis includes an on-site exterior noise impact analysis to determine the traffic noise exposure and to identify potential necessary noise abatement measures for the Modified Project. It is expected that the primary source of noise impacts to the Modified Project Site will be traffic noise from the I-15. To control transportation related noise sources, the City has adopted exterior and interior noise standards by land use type.

Operational Traffic Noise Impacts. The City has adopted an exterior noise standard of 65 dBA CNEL for noise sensitive land uses that include residential, lodging, hospitals, schools, and parks.[3] The exterior noise standards typically apply to outdoor areas where people congregate. Traffic noise level impacts were assessed by estimating the resulting CNEL noise levels for study area roadway segment with the addition of the Modified Project's traffic to existing, Interim Year 2021, and Future Year 2035 traffic conditions. The significance of traffic noise impacts was assessed based on the following criteria:

When the noise levels at existing and future noise-sensitive land uses (e.g. residential, etc.):

- are less than 60 dBA CNEL and the Modified Project creates a readily perceptible 5 dBA CNEL or greater Project-related noise level increase; or
- range from 60 to 65 dBA CNEL and the Project creates a barely perceptible 3 dBA CNEL or greater Project-related noise level increase; or
- already exceed 65 dBA CNEL, and the Project creates a community noise level increase of greater than 1.5 dBA CNEL (FICON, 1992).

[1] See Exhibit 9-A: Sensitive Receiver Locations, *Bedford Marketplace Noise Impact Analysis*, SEIR Appendix H.
[2] See Exhibit 3-B: Interior and Exterior Noise Standards, *Bedford Marketplace Noise Impact Analysis*, SEIR Appendix H.
[3] See Exhibit 3-B: Interior and Exterior Noise Standards, *Bedford Marketplace Noise Impact Analysis*, SEIR Appendix H.

Existing with Modified Project conditions will result in CNEL values on study area roadways ranging from 64.5 to 71.4 dBA. The Modified Project will generate a noise level increase of up to 2.6 dBA CNEL on the study area roadway segments. Interim Year 2021 with Modified Project conditions will result in CNEL values ranging from 64.8 to 71.7 dBA. The Modified Project will generate a noise level increase of up to 0.2 dBA CNEL on the study area roadway segments. These Project-related noise level increases are considered less than significant under Interim Year 2021 with Modified Project conditions at the land uses adjacent to study area roadways based on the significance criteria. Future Year 2035 with Modified Project conditions will range from 66.6 to 72.1 dBA CNEL. The Modified Project will generate a noise level increase of up to 2.6 dBA CNEL on the study area roadway segments. Based on the significance criteria, the Project-related noise level increases are considered less than significant under Future Year 2035 with Project conditions at the land uses adjacent to the study area roadways. Impacts are considered to be less than significant. The Prior EIR included Mitigation Measure 4.12.6.2A that required submittal and approval of a final noise analysis to confirm CNEL traffic noise levels resulting from the Approved Project fall within the 65 dBA CNEL and 70 dBA CNEL noise contours for Eagle Glen Parkway from Masters Drive to Bedford Canyon Road, "A" Street, and I-15. As a result of the conclusions contained in this SEIR, implementation of Mitigation Measure 4.12.6.2A is not required. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. The Modified Project would expand the AHSP boundary and result in additional commercial development, generating additional trips and traffic volume increases to the local and regional transportation system. The Modified Project would also generate temporary construction noise and new stationary noise sources. As discussed previously, construction and operational noise impacts from the Modified Project were assessed. In all scenarios, the contribution of noise is based against ambient conditions and in the case of traffic, future traffic projections. No foreseeable projects are close enough to the Modified Project Site to alter the ambient condition and create cumulative impacts. Furthermore, the future traffic projections represent a cumulative impact assessment. As concluded above, the Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (significant and unavoidable with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures from the Prior EIR were found to be applicable to the Modified Project:

Noise	
4.12.6.1A	Prior to the approval of a tentative tract map for each residential area or approval of commercial or industrial uses within the Specific Plan area, the project proponent shall prepare, submit, and receive approval from the City, a final noise analysis. This final noise analysis shall be completed at the tract map level for each residential area or commercial/industrial area when the precise grading and the architectural plans are available to ensure that all noise sensitive areas will meet the City of Corona noise standards. The final noise analysis shall include but shall not be limited to the following: • *Construction Noise Mitigation Program.* The program shall include noise monitoring at selected noise sensitive locations, monitoring complaints procedures, identification of haul routes (if applicable), and identification and mitigation of the major sources of noise. • *Construction Contractor Requirements.* These requirements shall include contract provisions regarding construction equipment noise features and equipment staging procedures.
4.12.6.2A	Prior to the approval of a tentative tract map for each residential area or approval of commercial or industrial uses within the Specific Plan area within the 65 dBA CNEL and 70 dBA CNEL noise contours for Eagle Glen Parkway from Masters Drive to Bedford Canyon Road, "A" Street, and I-15, the project proponent shall prepare, submit, and receive approval from the City, a final noise analysis. This final noise analysis shall be completed at the tract map level for each residential area or commercial/industrial area when the precise grading and the architectural plans are available to ensure that all noise sensitive areas will meet the City of Corona noise standards.
4.12.6.3A	Prior to the approval of a tentative tract map for each residential area adjacent to commercial or industrial uses within the Specific Plan area, the project proponent shall prepare, submit, and receive approval from the City, a final noise analysis. This final noise analysis shall be completed at the tract map level for each residential area or commercial/industrial area when the precise grading and the architectural plans are available to ensure that all noise sensitive areas will meet the City of Corona noise standards.

3.4.13 Population and Housing

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☒
b) Displace substantial amounts of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Induce substantial population growth

The Prior EIR noted the Approved Project was originally designated and zoned Agriculture and would result in a direct increase in population. However, the Prior EIR concluded the Approved Project but

would not induce population growth beyond the growth attributable to the residential land uses within the AHSP.

b) Displace housing

c) Displace people

The Prior EIR noted the Approved Project was originally designated and zoned Agriculture, and the land had never been occupied by residential uses. No residential structures were located within the Approved Project limits with the exception of a mobile trailer used by an on-site property caretaker associated with the past history of agricultural uses. The Prior EIR found development of the Approved Project would not displace existing housing and residents, and would not require the construction of replacement housing elsewhere in the City. In the absence of any residential displacement or a substantial change in the availability of residential units, the Prior EIR concluded no significant impact related to this issue would occur.

Impacts Associated with the Modified Project

(a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Modified Project would indirectly contribute to incremental population growth by expanding the neighborhood commercial development component within the AHSP, in an area currently underserved by local commercial retail and services. The additional commercial development would contribute to meeting existing demand, and would not induce growth and impacts would be less than significant. The Modified Project would also result in the extension of local serving roads and infrastructure, but these improvements would facilitate access and operation of the commercial uses and would not induce growth. Impacts associated with growth inducement would be less than significant and no mitigation is required. The Modified Project's impacts regarding growth inducement are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Displace substantial amounts of existing housing, necessitating the construction of replacement housing elsewhere?

(c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project will expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project. The Modified Project Site is currently designated and zoned Agriculture, and has never been occupied by residential uses. No residential structures are located within the Modified Project Site. The Modified Project would not displace existing housing and residents, and would not require the construction of replacement housing elsewhere in the City. The Modified Project's impacts regarding growth inducement are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. As discussed above, the Modified Project would not directly increase population or growth, induce growth, or remove an obstacle to growth. The Modified Project incrementally expands an already approved commercial center to serve surrounding residential neighborhoods. No new or substantially greater population growth impacts would occur with implementation of the Modified Project when compared to those identified in the Prior EIR. Implementation of the proposed project would not result in a cumulatively significant population or housing impact, nor would the proposed Modified Project uses significantly induce growth in areas where growth was not previously anticipated. The Modified Project's cumulative impacts regarding population and housing are consistent with the impacts identified in the Prior EIR and the level of cumulative impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The Prior EIR determined no population and housing mitigation measures were necessary, and the Modified Project does not require any revised or new mitigation measures.

Summary of Impacts Identified in Prior EIR

a) Fire protection facilities

The Prior EIR noted development of the Approved Project would be designed, constructed, and operated per applicable fire prevention/protection standards established by the Corona Fire Department (CFD), other City Departments, and the State. The Prior EIR noted these requirements would result in adequate provisions for smoke alarms; sprinklers; building and emergency access; adequate emergency notification; and fire hydrant sizing, pressure, and siting. With provision of the required site related fire safety measures and payment of City impact fees to fund future fire facilities, the Prior EIR concluded the Approved Project would not result in the need to renovate existing or construct new fire protection facilities the construction of which would create an impact to the environment. Impacts were determined to be less than significant and no mitigation was required.

b) Police facilities

The Prior EIR noted development of the Approved Project would be designed, constructed, and operated per applicable public safety standards established by the Corona Police Department (CPD), other City Departments, and the State. With provision of the required site related public safety measures and payment of City impact fees to fund future police facilities, the Prior EIR concluded the Approved Project would not result in the need to renovate existing or construct new police facilities the construction of which would create an impact to the environment. Impacts were determined to be less than significant and no mitigation was required.

c) School facilities

The Prior EIR noted school fees are uniformly applied to all development in the City, and the payment of such fees would ensure significant impacts associated with the renovation of existing or construction of new school facilities would not occur. The Prior EIR noted payment of the required school fees provides "full and complete" mitigation for school-related impacts, and impacts would be less than significant with no mitigation required.

d) Park facilities

Park and recreational facilities as they pertain to the Modified Project are analyzed in Section 3.4.15 (Recreation) of SEIR No. 2.

e) Other facilities

The Prior EIR noted the increase in population from the Approved Project would not substantially increase demand on other public facilities. Therefore, the Prior EIR concluded the Approved Project would not result in the need to renovate existing or construct new public facilities. Impacts were determined to be less than significant and no mitigation was required.

Impacts Associated with the Modified Project

(a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project and incrementally increasing demand on fire protection services. In the same manner as discussed in the Prior EIR, development of the Modified Project would be designed,

constructed, and operated per applicable fire prevention/protection standards established by the CFD, other City Departments, and the State. The Modified Project would be required to pay development impact fees to fund the construction of future fire facilities. With provision of the required site related fire protection safety measures and payment of City impact fees, the Modified Project would not result in the need to renovate existing or construct new fire protection facilities the construction of which would create an impact to the environment. Impacts would be less than significant and no mitigation is required. The Modified Project's impacts regarding construction of fire protection facilities are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for police services?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project and incrementally increasing demand on police services. In the same manner as discussed in the Prior EIR, development of the Modified Project would be designed, constructed, and operated per applicable public safety standards established by the CPD, other City Departments, and the State. With provision of the required site related public safety measures and payment of City impact fees, the Modified Project would not result in the need to renovate existing or construct new police facilities the construction of which would create an impact to the environment. Impacts would be less than significant and no mitigation is required. The Modified Project's impacts regarding construction of police facilities are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(c) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for schools?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project and incrementally increasing demand on school services. In the same

manner as discussed in the Prior EIR, development of the Modified Project would be required to pay applicable school fees. Payment of the required school fees provides "full and complete" mitigation for school-related impacts, and impacts from the Modified Project would be less than significant with no mitigation required. The Modified Project's impacts regarding construction of school facilities are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for parks?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. Park and recreational facilities as they pertain to the Modified Project are analyzed in Section 3.4.15 (Recreation) of SEIR No. 2.

(e) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for other public facilities?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP boundary to the east, resulting in development of 143,730 square feet of commercial space that includes a 135-room hotel over and above the Approved Project, which would incrementally increase demand on other public facilities. In the same manner as described in the Prior EIR, the incremental increase in population from the Modified Project would not substantially increase demand on other public facilities and the Modified Project would not result in the need to renovate existing or construct new public facilities, the construction of which would create an impact to the environment. The Modified Project's impacts regarding construction of other public facilities are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. In the same manner as described in the Prior EIR, new development within the service areas of the CFD and CPD would be required to adhere to conditions established by fire and police service providers, and pay the applicable fees to ensure adequate facilities are provided. New school

facilities would be constructed as determined by Corona-Norco Unified School District to accommodate growth in the local student population. School districts are engaged in planning new facilities in anticipation of future local and regional growth. Each district requires the payment of development fees to provide for new school services and/or facilities. The Prior EIR concluded the payment of applicable fees would reduce cumulative public services impacts to a less than significant level. The Modified Project would be required to pay applicable development impact fees. Cumulative development projects would also pay development fees. Since the Modified Project does not substantially increase demand for public services relative to the Approved Project, cumulative impacts to public services would also be less than significant. The Modified Project's cumulative impacts regarding public services are consistent with the impacts identified in the Prior EIR and the level of cumulative impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The Prior EIR determined no public services mitigation measures were necessary, and the Modified Project does not require any revised or new mitigation measures.

3.4.15 Recreation

Impacts	Would the Modified Project result in new or more severe impacts requiring revisions to the Prior EIR?	Would the Modified Project be implemented under changed circumstances resulting in new or more severe impacts requiring revisions to the Prior EIR?	Is there new information that would result in new or more severe impacts from the Modified Project requiring revisions to the Prior EIR?	Would the Modified Project result in eliminated, reduced, or no changes to impacts and no changes to the Prior EIR are required?
Would the project:				
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Increased use of existing recreational facilities

The Prior EIR found the Approved Project would increase the City's population by 6,249 people, resulting in an increase in demand for parks and recreational facilities. The Prior EIR noted the City had a surplus of approximately 1,725 acres of parkland. With the increase in people that would have resulted from the development of the Approved Project, the Prior EIR found the City would maintain

a surplus of parkland and recreation facilities to accommodate existing residents and residents from the Approved Project. Impacts were determined to be less than significant and no mitigation was required.

b) New or Physically Altered Recreation and Park Facilities

The Prior EIR noted the Approved Project included 9.9 acres of park land and recreation uses consisting of two neighborhood parks and two mini parks. In addition to the park facilities, the Approved Project would preserve approximately 81.5 acres of open space including a continuous pedestrian/bicycle trail constructed along the north side of the Bedford Canyon Wash.

The Prior EIR assessed the impacts from the construction of parks and open space within the Approved Project and concluded construction of those amenities would not have resulted in an adverse physical effect on the environment. Impacts associated with this issue were considered to be less than significant and no mitigation was required.

Impacts Associated with the Modified Project

(a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP commercial area by 11.64 acres. However, the Modified Project does not generate a new population of park users. Park demand is linked to residential development whereby residents place additional demand on park and recreation facilities. The Modified Project provides commercial uses that serve surrounding residential neighborhoods and does not generate new park users. Additionally, the Modified Project would pay applicable Parkland and Open Space development impact fees. The increase in commercial development associated with the Modified Project would also not remove existing park or recreation space and would not result in a net deficit of parklands that could increase the use of existing parks or accelerate their deterioration, requiring expansion or replacement that would result in an environmental impact. Therefore, no new or substantially greater impacts would occur with implementation of the Modified Project when compared to those identified in the Prior EIR. The Modified Project's impacts associated with expansion of existing parks or construction of new parks is consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP commercial area by 11.64 acres. The increase in commercial development from the Modified Project does not include parks or recreational facilities, and the planned parks and open space in the existing AHSP would not be affected. The recreational facilities in the AHSP were analyzed for physical effects to the environment in the Prior EIR. Therefore, no new or substantially greater impacts would occur with implementation of the Modified Project when compared to those identified in the Prior EIR. The Modified Project's impacts associated with the construction of new recreational facilities are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. The Modified Project would expand the AHSP boundary and result in additional commercial development. However, the Modified Project does not generate a new population of park users. Park demand is linked to residential development whereby residents place additional demand on park and recreation facilities. The Modified Project provides commercial uses that serve surrounding residential neighborhoods and does not generate new park users. Additionally, the Modified Project would pay applicable Parkland and Open Space development impact fees. Therefore, the Modified Project does not contribute to a cumulative impact on park and recreation facilities. The Modified Project's impacts associated with the construction of park and recreation facilities are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

No mitigation measures related to recreation were outlined in the Prior EIR. As discussed above, no new impact has been identified. Lacking any new impacts, no new mitigation measures or new alternatives are required for the Modified Project.

e) Result in inadequate emergency access?	☐	☐	☐	☒
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Conflict with established measures of effectiveness rating performance of circulation system

b) Conflict with CMP LOS standards and travel demand measures

For year 2019, the Prior EIR concluded the Approved Project would create or contribute to LOS performance standard failures at five study area intersections. For year 2035, the Prior EIR concluded the Approved Project would create or contribute to LOS performance standard failures at eight study area intersections. The identified performance standard failures were considered significant impacts, requiring mitigation. Mitigation measures forming a long list of local and regional transportation improvements were prescribed in the Prior EIR to mitigate project direct and cumulative impacts.

At the time the Prior EIR was approved, the Riverside County Transportation Commission (RCTC) had plans to reconstruct the I-15/Cajalco Road interchange with a new and widened Cajalco Road

bridge over the I-15 freeway mainline lanes and new freeway ramps. The Prior EIR acknowledged the Approved Project developer would advance the total cost for the construction of the I-15/Cajalco Road interchange improvements, but the construction completion date of the interchange improvement project was uncertain. The Prior EIR concluded that all traffic improvements would ultimately mitigate traffic impacts to less than significant once installed, and established occupancy limits that prohibited development of Phase 2 of the Approved Project until the interchange improvements were completed and operational. Because the identified local roadway and Cajalco Road freeway interchange improvement completion dates were uncertain, the Prior EIR determined traffic impacts would be significant and unavoidable at those locations until those improvements were installed.

c) Air traffic

The Prior EIR noted the nearest airport to the Approved Project was the Corona Municipal Airport, located approximately 6.5 miles to the northwest. The Prior EIR concluded the Approved Project was not located within any airport influence area for the Corona Municipal Airport or any other airport in the vicinity. Additionally, the Prior EIR concluded the Approved Project did not include any structure or features that would alter air traffic patterns or the level of air traffic at the Corona Municipal Airport. Therefore, no impacts to air safety would have occurred and no mitigation was required.

d) Design hazards

The Prior EIR found the Approved Project had the potential to create temporary impacts associated with the construction of infrastructure improvements, which could cause temporary hazards. However, the Prior EIR found temporary construction activities are reviewed on a project-by-project basis by the City and are required to ensure adequate traffic flow as part of a construction traffic management plan. At the time infrastructure improvement plans are approved for construction, the Approved Project would implement measures in accordance with a construction traffic management plan to maintain traffic flow and local access resulting in a less than significant impact.

e) Inadequate emergency access

The Prior EIR noted roadway improvements resulting from implementation of the Approved Project would improve traffic circulation in the surrounding area, and correspondingly improve emergency vehicle access. Development of the Approved Project would comply with standards established by the City Public Works Department and Fire Department enabling emergency access, as well compliance with applicable Uniform Fire Code standards, as part of the City's permitting process. The Prior EIR noted these standards included compliance with street width standard plans as determined in the California Building Code (CBC), Master Plan of Streets, and the Uniform Fire Code. The Prior EIR concluded implementation of the Approved Project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan with adherence to existing procedures, and no mitigation was required.

f) Conflict with alternative modes of transportation

The Prior EIR noted the Approved Project would be conditioned to provide sidewalks and landscaping treatments to allow pedestrian access throughout the site and Class 2 bike lanes to allow bicycle traffic throughout the site and area. The Prior EIR noted the Approved Project design was consistent with applicable City standards, which support and/or facilitate alternative modes of transportation. Policies, plans, and/or programs supporting alternative transportation would be incorporated as applicable. Consequently, the Prior EIR found the Approved Project would be consistent with alternative modes of transportation as a result of existing City design review procedures.

Impacts Associated with the Modified Project

(a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

(b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand the AHSP commercial area by 11.64 acres, resulting in 143,730 sf of commercial building area that includes a 135-room hotel added to the Approved Project. A *Traffic Study* prepared for the Modified Project (Urban Crossroads, January 10, 2020) assessed impacts associated with the incremental increase in commercial development and is included and included in Appendix I. The Traffic Study found the Modified Project would generate 2,061 daily, 281 a.m. peak hour, and 285 p.m. peak hour trips over and above the Approved Project and assessed the Modified Project's impacts on Interim Year 2021 and Future Year 2035 time horizons. Because the original approval was seven years ago and there have been two amendments to the AHSP since that time, the traffic study for the Modified Project was based on existing traffic volumes (2017 and 2018) used to develop Interim Year 2021 background traffic volumes. Future Year 2035 traffic volume forecasts from the Prior EIR were used for the Modified Project traffic study.

At the time the Prior EIR was approved, the I-15/Cajalco Road interchange improvement project had begun construction. Since that time, the interchange improvements have been largely completed including a 6-lane bridge deck on Cajalco Road over the I-15 freeway mainline lanes replacing the old 2-lane bridge. The entire improvement project is nearly finished with remaining improvements including the freeway on- and off-ramps under construction, and a ceremonial grand opening is

scheduled for March 2020. For Interim Year (2021) and Future Year 2035 conditions, the I-15/Cajalco Road interchange improvement project was considered to be completed.

In addition to the regional I-15/Cajalco Road interchange project, improvements to local intersections and roadways in the vicinity of the Approved Project have taken place since approval of the Prior EIR including installation of traffic signals at the intersections of Masters Drive/Eagle Glen Parkway and Clementine Way/Eagle Glen Parkway.

In summary, assessment of the Modified Projects traffic impacts was conducted assuming the following improvements were installed and operational:

- Widening of Cajalco Road from a 2-lane divided roadway to a 4-lane divided roadway between Bedford Canyon Road and the I-15 Southbound Ramps
- Widening of Cajalco Road from a 2-lane divided roadway to a 6-lane divided roadway between the I-15 Southbound and Northbound Ramps
- Widening of Cajalco Road from a 5-lane divided roadway to a 6-lane divided roadway between the I-15 Northbound Ramps and Temescal Canyon Road
- Installation of a traffic signal at Masters Drive/Eagle Glen Parkway
- Installation of a traffic signal at Clementine Way/Eagle Glen Parkway
- Completion of Bedford Canyon Road south of Eagle Glen Parkway including a roundabout at the Bedford Canyon Road/Hudson House Drive (AHSP internal roadway providing connection to the Bedford residential community)
- Installation of three Bedford Marketplace driveways on Bedford Canyon Road to provide site access

The Interim Year 2021 assessment concluded the Modified Project would contribute to previously identified LOS failures that would occur with or without the Modified Project at the following four study area intersections:

- Masters Drive/California Avenue
- Masters Drive/Christopher Lane
- Via Castilla Street/Masters Drive
- Morales Way/Masters Drive

The Prior EIR included Mitigation Measures 4.16.6.2A and 4.16.6.3B to address all four LOS failures, requiring the Approved Project's fair share contribution towards the construction of traffic signals or roundabouts at those intersections. With implementation of the intersection control improvements defined in Mitigation Measures 4.16.6.2A and 4.16.6.3B, the resulting LOS would be improved to within the performance standards. Because the completion dates for these improvements are uncertain, the Prior EIR determined impacts would be significant and unavoidable until the improvements are

installed. The same conclusion applies to the Modified Project; the additional traffic generated by the Modified Project would not change or expand the intersection control improvements necessary to improve LOS, therefore, Mitigation Measures 4.16.6.2A and 4.16.6.3B remain applicable and unchanged. The Modified Project's impacts associated with LOS impacts in the Interim 2021 condition is consistent with the impacts identified in the Prior EIR and the level of impact (significant and unavoidable with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

The Future Year 2035 assessment concluded the Modified Project would contribute to previously identified LOS failures that would occur with or without the Modified Project at the following eight study area intersections:

- Masters Drive/California Avenue
- Masters Drive/Bennett Avenue
- Bedford Canyon Road/Eagle Glen Parkway
- I-15 SB Ramps/El Cerrito Road
- Temescal Canyon Road/Cajalco Road
- Masters Drive/Christopher Lane Corona
- Via Castilla Street/Masters Drive Corona
- Morales Way/Masters Drive

The Prior EIR included Mitigation Measures 4.16.6.1A, 4.16.6.2A, 4.16.6.3B, and 4.16.6.4A to address all of the previously identified LOS failures, requiring construction of improvements by the Approved Project or fair share contributions towards the construction of improvements. With implementation of the improvements defined in Mitigation Measures 4.16.6.1A, 4.16.6.2A, 4.16.6.3B, and 4.16.6.4A, the resulting LOS would be improved to within the performance standard. Because the completion dates for these improvements are uncertain, the Prior EIR determined impacts would be significant and unavoidable until the improvements are installed. The same conclusions apply to the Modified Project; the additional traffic generated by the Modified Project would not change or expand the intersection control improvements necessary to improve LOS in the Future Year 2035, therefore, Mitigation Measures 4.16.6.1A, 4.16.6.2A, 4.16.6.3B, and 4.16.6.4A remain applicable and unchanged. The Modified Project's impacts associated with LOS impacts in the Future Year 2035 conditions are consistent with the impacts identified in the Prior EIR and the level of impact (significant and unavoidable with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

In addition to mitigation of off-site intersections, the Modified Project plans include installation of a right in/out only secondary driveway, a full access signalized main driveway, and a full access secondary driveway on Bedford Canyon Road into the proposed commercial development. The two full access driveways will require installation of inbound left turn lanes. These project design elements will be implemented as part of the precise plan and do not require creation of a new mitigation measure.

While not analyzed in the Prior EIR, the City has adopted Vehicle Miles Traveled (VMT) Guidelines in response to the passage of Senate Bill 743, which becomes effective July 1, 2020. VMT is calculated using the City's traffic model, then compared to Service Population (SP), which consists of population and employment. Project VMT is considered a significant impact if the project generates VMT/SP above the Citywide VMT/SP. The Western Riverside Council of Governments (WRCOG) have estimated the total VMT per service population for the traffic analysis zone surrounding the Modified Project Site at 27.78, in comparison to the average in Corona of 30.52 VMT/SP.

The Modified Project proposed mix of uses provides diversity that would reduce VMT by internal trip capture. By providing a mix of hotel, restaurant, retail, and day care uses within an underserved area of the City including the surrounding Eagle Glen and Bedford residential communities, typical "isolated use" travel characteristics are estimated to be substantially reduced.

The Modified Project is projected to incrementally increase the number of employees from 320 to 582, an increase of 262 employees. Accounting for the mix of uses and the increase in number of employees, the TIA determined the Modified Project would generate approximately 29 VMT/SP. Since this is less than the City average, VMT impacts are considered to be less than significant and no mitigation is required.

(c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand AHSP PA 11 to the east, towards the I-15. Development of the Modified Project would not impact air traffic or air travel. The Modified Project's impacts associated with air traffic patterns are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand AHSP PA 11 to the east, towards the I-15. The Modified Project would expand the commercial development within the AHSP. Development of Modified Project Site would comply with existing development review procedures in accordance with the municipal code, zoning code, and the AHSP that would reduce hazards (e.g., intersection design, roadway design, driveway design, etc.). The design of the Modified Project has been reviewed by the project traffic engineer and City's engineering and fire departments for inconsistencies with design standards and hazardous conditions, and none have been identified. To accommodate additional vehicle trips beyond that analyzed in the Prior EIR, the TIA for the Modified Project recommended a left turn pocket length

of 200 feet for the center signalized entry and a left turn pocket length of 100 feet for the southern project entry, which have been incorporated into the Modified Project design. Therefore, the Modified Project would not create new hazardous conditions or incompatible land uses. The Modified Project's impacts associated with hazards are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(e) Result in inadequate emergency access?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would expand AHSP PA 11 to the east, towards the I-15. Other than site access driveways to/from the expanded commercial area in PA 11, no new internal roadways would be constructed and no new off-site roadways would be constructed. In the same manner as detailed in the Prior EIR, roadway improvements associated with the Modified Project would improve traffic circulation within the AHSP area and would, therefore, improve access for emergency vehicles. The Modified Project's driveways on Bedford Canyon Road would be required to comply with standards established by the City Public Works Department. The size and location of fire suppression facilities (e.g., hydrants) and fire access routes would be required to conform to Fire Department standard. A Fire Access Plan, detailing fire lanes and hydrant locations has been prepared and approved by Corona Fire. Development of the Modified Project would conform to applicable California Fire Code standards, California Building Code (CBC) standards, and the Master Plan of Streets. The Modified Project's impacts associated with emergency access are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Modified Project would result in the development of the Bedford Marketplace and bring a neighborhood commercial center and associated commercial retail and services close to the Bedford and Eagle Glen communities. The commercial center is designed to add a 6-foot wide trail adjacent to the existing 8-foot sidewalk on the western boundary of the commercial center along the Bedford Canyon Road frontage. The Modified Project site plan also permits pedestrian linkages to provide connectivity from the Bedford Canyon Road/Eagle Glen Parkway intersection towards the south and the recently constructed trail system at Bedford Canyon Wash, a planned dog park, and to the developing Bedford residential community.

The Modified Project would not affect the other portions of the planned roadway system within the AHSP, including internal roadway lanes, bicycle facilities, bus routes and pedestrian linkages. No new

impacts would occur as a result of the Modified Project. The Modified Project's impact regarding alternative modes of transportation are consistent with the impacts identified in the Prior EIR and the level of impact (no impact) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. The Modified Project would expand the AHSP boundary and result in additional commercial development, generating additional trips and traffic volume increases to the local and regional transportation system. As discussed previously, traffic impacts from the Modified Project were assessed at Future Year 2035 conditions, which represents a cumulative impact assessment. As concluded above, the Modified Project's impacts associated with LOS impacts in the cumulative scenario (Future Year 2035) are consistent with the impacts identified in the Prior EIR and the level of impact (significant and unavoidable with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures identified in the Prior EIR remain applicable to the Approved Project. The Modified Project would not cause new or more intense significant impacts and no new mitigation is required for the Modified Project.

Transportation and Traffic	
4.16.6.1A	The master developer shall construct the improvements identified below as mitigation measures for 2017 plus Phase 1 conditions to improve levels of service in accordance with City requirements: • Street "C"/Eagle Glen Parkway: Prior to issuance of a Certificate of Occupancy for the first model home, install a traffic signal, a northbound left-turn lane, a northbound right-turn lane, and a westbound left-turn lane. • Bedford Canyon Road/Eagle Glen Parkway: Prior to issuance of the first production home building permit, add a northbound left-turn lane, a northbound through/right lane, modify striping to provide a southbound through lane, modify striping to provide a shared eastbound through/right lane, and a westbound left-turn lane.

4.16.6.2A	Prior to issuance of the first production home building permit, the master developer shall pay a 64% fair share contribution towards the construction of a traffic signal at the Masters Drive/California Avenue intersection.
4.16.6.3A	Prior to the issuance of the first building permit after Phase 1, the master developer shall construct those improvements identified below as mitigation measures for year 2017 plus project conditions to improve levels of service in accordance with City requirements. • Masters Drive/Eagle Glen Parkway: Install a traffic signal. • Bedford Canyon Road/Eagle Glen Parkway: Add a northbound right-turn lane with northbound right-turn overlap phasing, modify striping to provide a shared southbound left/through lane, and add a westbound left-turn lane. • Street "C"/Street "B": Install a roundabout and an all-way lane at all approaches. • Street "A" – Street "D"/Street "B": Install a roundabout and an all-way lane at all approaches. • Street "A"/Main Driveway (TAZ 4): Install a traffic signal, two northbound through lanes, a southbound left-turn lane, two southbound through lanes, a westbound left-turn lane, and a westbound right-turn lane. • Street "A"/South Driveway (TAZ 4): Install a stop sign on the westbound approach, two northbound through lanes, a southbound left-turn lane, two southbound through lanes, a westbound left-turn lane, and a single westbound approach lane.
4.16.6.3B	Prior to the issuance of the first building permit after Phase 1, the master developer shall pay a 99% fair share contribution towards the construction of either a roundabout or traffic signal at the Morales Way/Masters Drive intersection; a 27% fair-share contribution toward the construction of either a roundabout or traffic signal at the Masters Drive/Christopher Lane intersection; and a 98% fair-share contribution towards the construction of either a roundabout or stop sign control at the Via Castilla Street/Masters Drive intersection.

4.16.6.3C	Prior to the issuance of the first building permit, the master developer shall post bonds for the full amount of the total estimated cost of the I-15/Cajalco Road Interchange Improvement project.
4.16.6.4A	Prior to the issuance of the first building permit after Phase 1, the master developer shall make a fair share contribution towards the improvements identified below as mitigation measures for year 2035 plus project conditions. • Masters Drive/Bennett Avenue: 32% of the cost to install a traffic signal. • Bedford Canyon Road/Georgetown Road: 100% of the cost to install a traffic signal. • I-15 Southbound Ramps/El Cerrito Road: 58% of the cost to add an eastbound right-turn lane. • Temescal Canyon Road/Cajalco Road: 91% of the cost to add a second southbound left-turn lane, a second eastbound through lane, and a westbound right-turn lane. • Street "C"/Eagle Glen Parkway: 100% of the cost to add a traffic signal.

g) Comply with Federal, State, and local statutes and regulations related to solid waste?	☐	☐	☐	☒

Summary of Impacts Identified in Prior EIR

a) Exceed wastewater treatment requirements

The Prior EIR noted wastewater from the Approved Project would be treated at City Water Reclamation Facility (WRF) No. 2, and the City had planned upgrades to increase capacity at the facility to accommodate anticipated growth. The Prior EIR found the Approved Project would contribute to the need for expanded sewer facilities. The Prior EIR concluded impacts from the Approved Project would be mitigated to less than significant with implementation of Mitigation Measures 4.17.6.1A and 4.17.6.1B. The Prior EIR also noted the master project developer would pay a fair-share fee of

approximately 40 percent of the cost for the sewer system upgrade determined necessary to serve the Approved Project as stipulated in the Development Agreement between the City and the Approved Project master developer.

b) New or expanded water or wastewater treatment facilities

Water. The Prior EIR found imported water and its treatment were not proposed to expand significantly, due to use of available local groundwater supplies as managed by the City's Groundwater Management Plan (GWMP). The Water Supply Assessment (WSA) for the Approved Project noted groundwater is considered a reliable supply source that is not significantly affected by short-term droughts, as groundwater basins replenish in years with excess rainfall to supply water in drought years. During extended drought periods, groundwater elevations may fall, as the basins do not receive replenishment for an extended period of time. The Prior EIR found the GWMP identifies measures to decrease its reliance on imported water by utilizing groundwater and managing groundwater supplies by implementing sustainable groundwater management strategies in the GWMP. The Prior EIR noted the Approved Project would implement the same groundwater management strategies resulting in a less than significant impact with no mitigation required.

Wastewater. As noted previously, the Prior EIR concluded the Approved Project's impacts associated with wastewater treatment facilities would be mitigated to less than significant with implementation of Mitigation Measures 4.17.6.1A and 4.17.6.1B and the master project developer would pay a fair-share fee of approximately 40 percent of the cost for sewer system upgrades to WRF No. 2 as part of a Development Agreement.

c) New or expanded storm water drainage facilities

The Prior EIR noted stormwater flows from the Approved Project would be adequately detained and handled by a system of drainage facilities and detention basins to mitigate increased peak flows and mitigate how fast the increased volume would be released into the natural streambed. The Prior EIR noted the system included underground drainage facilities below streets construction within the AHSP, an open channel along the north side of the AHSP, a regional detention/water quality basin located in PA 12 and a local detention/water quality basin located in PA 14. The basins would detain storm water flows before outletting into Bedford Canyon Wash. The Prior EIR noted the basins would be designed to treat water quality pollutants prior to discharging waters into Bedford Canyon Wash.

The Prior EIR also assessed the impacts as well as the benefits from the planned widening, stabilization and restoration of Bedford Canyon Wash included as part of the Approved Project. The improvement project was developed to maintain and restore the natural channel in such a manner to minimize erosion to the existing bluff and perpetuating the sediment transport capabilities of the natural wash. The Prior

EIR noted each of the three design options would safely convey 100-year storm events and would achieve the following general hydraulic objectives:

- Accommodate the 100-year storm event for Bedford Canyon Wash in a burned and bulked condition with sufficient additional freeboard above design flow elevations.
- Protect the existing bluff on the east side of Bedford Canyon Wash from erosive velocities by either placing high velocity storm flows in a bypass channel or protecting the bluff with buried riprap.
- Lower the elevation of storm flows in either the bypass channel or Bedford Canyon Wash to an elevation below proposed Street "B" and adjoining residential building pads.
- Discharge storm flows at the downstream (northern) property line in a manner consistent with existing flows, including peak volumes, velocities, and debris conveyance.

The Prior EIR noted design of the Approved Project included storm water and water quality facilities and prescribed Mitigation Measure 4.9.6.2A requiring approval of a final WQMP that would result in less than significant impacts associated with altering existing drainage patterns, producing erosion and siltation, and exceeding the capacity of the storm water drainage system.

d) Adequate water supplies

The Prior EIR noted the City's primary water source is groundwater from the Temescal, Bedford, and Coldwater groundwater sub-basins. The secondary source is water imported by the Metropolitan Water District of Southern California (MWDSC) from the Colorado River and the State Water Project (SWP). The MWDSC provides wholesale water to Western Municipal Water District (WMWD) who in turn sells water to the City.

The Prior EIR noted the City's Groundwater Management Plan (GWMP) developed strategies for more sustainable management and use of groundwater resources to meet future water demands in recognition of decreasing groundwater levels in regional groundwater basins. The GWMP recommended these strategies be implemented through 2020 to reduce demands for imported water and to meet projected demands. The City shares one or more of the three groundwater sub-basins with the City of Norco, Home Gardens County Water District, Lee Lake Water District (LLWD), and Elsinore Valley Municipal Water District (EVMWD). LLWD participated in the GWMP and proposed a groundwater recharge project with recycled water in the Bedford Sub-basin.

The Prior EIR acknowledged the serious water supply issues facing California and noted Governor Brown's 2015 declared State of Emergency due to drought conditions. The Prior EIR noted the City would rely solely on groundwater supplies to meet existing and future water demands in the event of a prolonged drought resulted in curtailed water supply deliveries from MWDSC. The Prior EIR analyzed

the Approved Project's effect on groundwater supplies should the City be forced to rely solely on groundwater to supply City water demand during a prolonged drought.

The Prior EIR noted the City's 2010 Urban Water Management Plan (UWMP) identified the availability of sufficient water supplies to meet future water demand in the City's service area including the additional water demand from the Approved Project in year 2030 under normal, single-dry and multiple-dry water years. The Prior EIR found the City had sufficient groundwater rights to extract the necessary water to serve the Approved Project, and noted additional groundwater supplies could be utilized to meet demand if necessary. The Prior EIR prescribed Mitigation Measures 4.9.6.3A and 4.9.6.3B requiring a project level water conservation plan and water conservation educational program, reducing impacts from the Approved Project on groundwater supplies to a less than significant level.

e) Adequate wastewater treatment capacity

As noted previously, the Prior EIR concluded the Approved Project's impacts associated with wastewater treatment facilities would be mitigated to less than significant with implementation of Mitigation Measures 4.17.6.1A and 4.17.6.1B and the master project developer would pay a fair-share fee of approximately 40 percent of the cost for sewer system upgrades to WRF No. 2 as part of a Development Agreement.

f) Adequate landfill capacity

The Prior EIR noted solid waste generated by the Approved Project would by hauled away by WMI and transported to the El Sobrante Landfill, located south of the City. The Prior EIR found adequate capacity existed at the receiving landfill, and the Approved Project would not significantly affect operations or the expected lifetime of the landfill. Therefore, the Prior EIR found no significant solid waste disposal impacts would occur as a result of the Approved Project.

g) Solid waste regulations

The Prior EIR noted all uses within the City that generate waste are required to coordinate with a waste hauler to develop collection of recyclable materials for the project on a common schedule as set forth in applicable local, regional, and State programs. Additionally, the Prior EIR noted all development within the City is required to comply with applicable elements of AB 1327, Chapter 18 (California Solid Waste Reuse and Recycling Access Act of 1991) and other applicable local, State, and Federal solid waste disposal standards, thereby ensuring that the solid waste stream to the El Sobrante Sanitary Landfill was reduced and no hazardous waste was received in accordance with existing regulations. The Prior EIR concluded the Approved Project would comply with applicable solid waste regulations resulting in a less than significant impact and no mitigation was required.

Impacts Associated with the Modified Project

(a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Prior EIR noted wastewater from the Approved Project would be treated at City Water Reclamation Facility (WRF) No. 2, and the City had planned upgrades to increase capacity at the facility to accommodate anticipated growth. The Prior EIR also noted the master project developer would pay a fair-share fee of approximately 40 percent of the cost for the sewer system upgrade determined necessary to serve the Approved Project as stipulated in the Development Agreement between the City and the Approved Project master developer. The incremental increase in wastewater generated by the Modified Project represents a small percentage of the total treatment capacity at WRF No. 2 and would not cause a new impact. Furthermore, a *Sewer System Hydraulic Analysis Bedford Marketplace* was prepared by Hunsaker & Associates (Appendix J to SEIR No. 2), which analyzed the capacity of the sewer system to accommodate the additional wastewater generated by the Modified Project. The study determined the proposed sewer lines and existing 12-inch sewer main within Bedford Canyon Road have sufficient capacity to accommodate the Modified Project. Therefore, no new or substantially greater impacts would occur with implementation of the Modified Project when compared to those identified in the Prior EIR. The Modified Project's impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required.

Water. The Prior EIR found the Approved Project would not have a significant impact on water supplies based on the conclusions of a Water Supply Assessment (WSA). A *Water Supply Assessment Update* was prepared for the Modified Project (Fuscoe, October 17, 2019), included in Appendix G-2 to SEIR No. 2, to analyze whether the additional commercial and hotel development associated with the Modified Project created a new impact on water supply. The WSA determined the Modified Project would increase water demand approximately 6.6 acre feet per year (AFY), which would increase the demand for the AHSP from 795.6 AFY to 802.2 AFY. Compared to the 2015 Urban Water Management Plan, the increased total water demand of 802.2 AFY would not result in a deficit in any planning scenario and the City would continue to have a water surplus.

Wastewater. As noted previously, the Prior EIR concluded the Approved Project's impacts associated with wastewater treatment facilities would be mitigated to less than significant with implementation of Mitigation Measures 4.17.6.1A and 4.17.6.1B and the master project developer would pay a fair-share

fee of approximately 40 percent of the cost for sewer system upgrades to WRF No. 2 as part of a Development Agreement. The incremental increase in wastewater generated by the Modified Project represents a small percentage of the total treatment capacity at the City Water Reclamation Facility No. 2 and would not cause a new impact.

Therefore, no new or substantially greater impacts would occur with implementation of the Modified Project when compared to those identified in the Prior EIR. The Modified Project's impacts are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Bedford Marketplace commercial center has two drainage areas. The 10-acre portion originally included in PA 11 of the AHSP will continue to drain to an existing water quality/detention basin located in AHSP PA 12. This basin currently outlets into Bedford Canyon Wash and no new facilities are required and no impacts would occur. The Modified Project Site will drain to a new water quality/detention basin located in PA 12A. The construction of this basin has been analyzed in SEIR No. 2 as part of the overall development footprint and no impacts would occur. The basin within PA 12A will also outlet in Bedford Canyon Wash. A new outlet structure will be constructed as part of the Modified Project. The outlet structure has been located within the existing rip-rap lined banks and on the existing concrete pad crossing Bedford Canyon Wash. Therefore, the outlet structure will not impact the soft bottom portion of Bedford Canyon Wash and will not cause new biological impacts as analyzed in Section 3.4.4.

Therefore, no new or substantially greater impacts would occur with implementation of the Modified Project when compared to those identified in the Prior EIR. The Modified Project's impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required.

The original WSA for the Approved Project was based on data and information from the 2010 UWMP. Since approval of the original WSA, the City has updated and approved the 2015 UWMP. For this

reason, the 2019 WSA compares the additional water demands associated with the Modified Project with the findings from the updated 2015 UWMP as well as the 2015 UWMP.

The 2019 WSA includes a comparison of the differences for the Multiple Dry Year (MDY) scenarios contained in the 2010 and 2015 UWMPs. The WSA notes this comparison represents the worst-case scenario, as opposed to the Normal Dry Year (NDY) and Single Dry Year (SDY) scenarios also included in the UWMPs. The MDY from the 2010 UWMP projects a surplus of 6,289 AFY in 2015 increasing to 9,236 AFY from 2015-2035. The MDY from the 2015 UWMP projects a surplus of 5,933 AFY in 2020 decreasing to 2,535 AFY from 2020-2040. The 2019 WSA finds the City has a surplus of water available in the MDY scenarios summarized in the 2010 and 2015 UWMPs.

With the 802.2 AFY water demand from the AHSP as revised by the Modified Project are included in the capacity/surplus calculations from the 2015 UWMP, the Modified Project did not result in a deficit in any scenario. The 2019 WSA water demand calculations for each climate scenario from the 2015 UWMP projections minus the AHSP new water demand are a minimum surplus of 1,733 AFY in 2040 in the MDY scenario, representing the worst case scenario.

The water demands from the Modified Project do not alter the conclusion of the original WSA. The 2019 WSA determined water supplies are available to meet water demands from the revised AHSP in multiple climate scenarios (i.e. Normal, Single Dry, or Multiple Dry Years). The 2019 WSA concluded there are adequate water supplies to serve the Modified Project's anticipated water demand increases as well as other demands within the City's jurisdiction.

Mitigation Measures 4.9.6.3A and 4.9.6.3B from the Prior EIR requiring a project level water conservation plan and water conservation educational program are applicable to the Modified Project. The Modified Project's impacts regarding groundwater depletion are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. As noted previously, the Prior EIR concluded the Approved Project's impacts associated with wastewater treatment facilities would be mitigated to less than significant with implementation of Mitigation Measures 4.17.6.1A and 4.17.6.1B and the master project developer would pay a fair-share fee of approximately 40 percent of the cost for sewer system upgrades to WRF No. 2 as part of a Development Agreement. The incremental increase in wastewater generated by the Modified Project represents a small percentage of the total treatment capacity at the City Water Reclamation Facility No.

2 and would not cause a new impact. The Modified Project's impacts regarding wastewater treatment are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

(f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Prior EIR noted solid waste generated by the Approved Project would by hauled away by WMI and transported to the El Sobrante Landfill, located south of the City. The Prior EIR found adequate capacity existed at the receiving landfill, and the Approved Project would not significantly affect operations or the expected lifetime of the landfill. The incremental increase in solid waste generated by the Modified Project represents a small percentage of the total capacity at the El Sobrante Landfill and would not cause a change in the conclusion that sufficient capacity exists. The Modified Project's impacts regarding solid waste disposal are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

(g) Comply with federal, state, and local statutes and regulations related to solid waste?

Eliminated, Reduced, or No Changes to Impacts and No Changes to the Prior EIR are Required. The Prior EIR noted all uses within the City that generate waste are required to coordinate with a waste hauler to develop collection of recyclable materials for the project on a common schedule as set forth in applicable local, regional, and State programs. Additionally, the Prior EIR noted all development within the City is required to comply with applicable elements of AB 1327, Chapter 18 (California Solid Waste Reuse and Recycling Access Act of 1991) and other applicable local, State, and Federal solid waste disposal standards, thereby ensuring that the solid waste stream to the El Sobrante Sanitary Landfill was reduced and no hazardous waste was received in accordance with existing regulations. The Modified Project would not change the requirements to comply with local, State, and Federal regulations, or the requirement to coordinate with the waste hauler. The Prior EIR concluded the Approved Project would comply with applicable solid waste regulations resulting in a less than significant impact and no mitigation was required. The Modified Project's impacts regarding solid waste disposal are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant) remains unchanged. This topic will not be evaluated further in this SEIR.

Cumulative Impacts Associated with the Proposed Project

Less Than Significant Impact/No Changes or No New Information Requiring Preparation of an EIR. The Modified Project would not generate a substantial increase in wastewater, drainage, water and solid waste services relative to the Approved Project analyzed in the Prior EIR. Therefore, the

Modified Project's level of cumulative impact to these utilities would not differ from the less than significant impact conclusion in the Prior EIR. The Modified Project's cumulative impacts associated with utilities are consistent with the impacts identified in the Prior EIR and the level of impact (less than significant with mitigation) remains unchanged. This topic will not be evaluated further in this SEIR.

Mitigation Measures Identified in Prior EIR and Applicable to Modified Project

The following mitigation measures from the Prior EIR were found to be applicable to the Modified Project:

Utilities and Service Systems	
4.17.6.1A	Prior to the issuance of grading permits for any development phase that would occur under the Specific Plan, the project proponent shall obtain verification from the City that planned wastewater capacity improvements at WRF2 or elsewhere in the city's wastewater system are in place and operational or said improvements are funded or under construction and will be available for service to completed homes and businesses.
4.17.6.1B	The City shall implement the mitigation and monitoring plan identified in the EIR for Wastewater Treatment Plant No. 2 as a part of any expansion of said plant. Alternatively, the Developer shall negotiate an advanced funding option for implementation of the mitigation and monitoring plan identified in the EIR for Wastewater Treatment Plant No. 2 in lieu of paying a Sewer Connection Fee for sewer capacity to ensure that wastewater plant capacity is available so phases of the project may proceed without being delayed. Sediment discharges from the site may be controlled by the following: sandbags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge control devices. The construction and condition of the BMPs would be periodically inspected during construction, and repairs would be made when necessary as required by the SWPPP.

4.0 UPDATED MITIGATION MONITORING AND REPORTING PROGRAM

This Mitigation Monitoring and Reporting Program (MMRP) was originally formulated based on the findings of the certified Environmental Impact Report (Certified EIR) for the Arantine Hills Specific Plan, State Clearinghouse No. 2006091093, approved in 2012. This MMRP has been updated with changes to mitigation measures included in SEIR No. 1 approved in 2016, an EIR Addendum approved in 2018, and SEIR No. 2. This MMRP is in compliance with Section 15097 of the CEQA Guidelines, which requires that the Lead Agency "adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects."

This Page Intentionally Left Blank

UPDATED MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: Arantine Hills Specific Plan Amendment **Applicant: Bedford Marketplace, LLC**

Date: February 2020

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
AIR QUALITY						
4.3.6.1A: Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors. Contract specifications shall be included in the project Specific Plan construction documents, which shall be reviewed by the City.	City of Corona Public Works Building and Safety Planning Division	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection.		Withhold Grading Permit and/or Issuance of a Stop Work Order
4.3.6.1B: Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel generators. Contract specifications should be included in the Specific Plan construction documents, which shall be reviewed by the City.	City of Corona Public Works Building and Safety Planning Division	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection.		Withhold Grading Permit and/or Issuance of a Stop Work Order
4.3.6.1C: Prior to the issuance of a grading permit, the project developer shall require contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of	City of Corona Public Works Building and Safety	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and		Withhold Grading Permit and/or Issuance

equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the Specific Plan construction documents, which shall be reviewed by the City.	Planning Division			on-site inspection.		of a Stop Work Order
4.3.6.1D: Prior to issuance of building permits, the project applicant shall provide evidence to the City that his contractor uses 2010 and newer diesel haul trucks (e.g., material delivery trucks and soil import/export) to the extent feasible. If the project applicant and his contractor determine that 2010 model year or newer diesel trucks cannot be obtained, the project applicant shall notify the City that trucks with EPA 2007 model year NO_x emissions shall be utilized.	City of Corona Building and Safety Planning Division	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection.		Withhold Grading Permit and/or Issuance of a Stop Work Order
4.3.6.1E: Prior to issuance of building permits, the project applicant shall provide evidence to the City that his contractor use on-site construction equipment that meet EPA Tier 3 or higher emissions standards according to the following schedule: • Post-January 1, 2015: All off-road diesel-powered construction equipment greater than 50 hp shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by CARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by CARB regulations. • A copy of each unit's certified tier specification, BACT documentation, and CARB or SCAQMD	City of Corona Building and Safety Planning Division	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection.		Withhold Grading Permit and/or Issuance of a Stop Work Order

operating permit shall be provided at the time of mobilization of each applicable unit of equipment.						
4.3.6.1F: The City shall encourage construction contractors to apply for SCAQMD "SOON" funds by advising project applicants and their contractors of this programs availability. Information on this program can be found at the following website: http://www.aqmd.gov/home/programs/business/business-detail?title=off-road-diesel-engines&parent=vehicle-engine-upgrades.	The City of Corona Building and Safety Planning Division	Prior to site grading.	Prior to issuance of a grading permit	The City shall provide the applicant and the construction contractor(s) the relevant information.		Withhold Grading Permit
4.3.6.3A: Prior to the issuance of each building permit, the project applicant shall require by contract specifications that architectural coatings require the use of either HVLP spraying equipment or manual application techniques to apply architectural coatings. Contract specifications shall be included in the Specific Plan construction documents, which shall be reviewed by the City.	City of Corona Building and Safety	Prior to Construction (once)	Prior to issuance of Building Permit	Review of construction documents and on-site inspection		Withhold Building Permit and/or Issuance of a Stop Work Order
4.3.6.4A: Prior to issuance of each building permit associated with the Specific Plan, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of the following design features may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:	City of Corona Building and Safety Planning Division	Prior to Construction (once)	Prior to Issuance of Building Permits	Review of building plans and on-site inspection		Withhold Building Permits

• Exceed 2008 California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling. • Increase in insulation such that heat transfer and thermal bridging is minimized. • Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. • Incorporate dual-paned or other energy efficient windows. • Incorporate energy efficient space heating and cooling equipment. • Install interior and exterior energy efficient lighting which exceeds the 2008 California Title 24 Energy Efficiency performance standards including but not limited to automatic devices to turn off lights when they are not needed. • To the extent that they are compatible with landscaping guidelines established by the City, include shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings, within the project site. • Use light and off-white colors in the paint and surface color palette for project buildings to reflect heat away. • All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.						
4.3.6.4B: Prior to issuance of each building permit associated with the Specific Plan, the following design features shall be implemented to reduce energy demand associated with potable water conveyance: • Landscaping palette emphasizing drought-tolerant plants;	City of Corona Building and Safety Planning Division	Prior to Construction (once)	Prior to Issuance of Building Permits and Final Site Plan Approval	Review of final site plan and building plans and on-site inspection.		Withhold Building Permits

• Use of water-efficient irrigation techniques; and • U.S. EPA Certified WaterSense labeled ~~f~~or equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.						
4.3.6.4E: The developer shall provide electric car charging infrastructure for multi-family residential and commercial land uses.	City of Corona Building and Safety Planning Division	Prior to Construction (once)	Prior to Issuance of Building Permits and Final Site Plan Approval	Review of final site plan and building plans and on-site inspection.		Withhold Building Permits
4.3.6.1H: The developer(s) within the multi-family and single family developments shall provide outside electric outlets and natural gas stub outs.	City of Corona Building and Safety Planning Division	Prior to Construction (once)	Prior to Issuance of Building Permits and Final Site Plan Approval	Review of final site plan and building plans and on-site inspection.		Withhold Building Permits
4.3.6.1I: When using construction equipment greater than 150 horsepower (>150 HP) during soil import/hauling activity, the Construction Contractor shall ensure that off-road diesel construction equipment complies with Environmental Protection Agency (EPA)/California Air Resources Board (CARB) Tier 4 emission standards or equivalent and shall ensure that all construction equipment is turned and maintained in accordance with the manufacturer's specifications.	City of Corona Building and Safety Planning Division	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection.		Withhold Grading Permit and/or Issuance of a Stop Work Order

BIOLOGICAL RESOURCES						
4.4.5.1A: If grading and construction activities begin during the California gnatcatcher breeding season (February 15 through August 30), a qualified biologist shall survey all potential nesting vegetation within and adjacent to the site for nesting birds, prior to commencing vegetation removal. Surveys shall be conducted at the appropriate time of day. If no nesting birds were observed, project activities may begin. If an active bird nest is located, the nest site shall be fenced a minimum of 500 feet in all directions, and this area shall not be disturbed until after the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, or the young will no longer be impacted by the activities. Alternatively, a qualified biologist may determine that construction can be permitted within the buffer areas provided the qualified biologist develops a monitoring plan to prevent any impacts while the nest continues to be active (eggs, chicks, etc.). This monitoring plan will be submitted to the City of Corona for approval prior to work within the buffer.	City of Corona Planning Division	Prior to Grading	Prior to Issuance of Grading Permit	Submittal of Evidence that the pre-construction survey has been completed.		Withhold Grading Permit
4.4.5.2A: Pre-construction presence/absence surveys for burrowing owl within the survey area where suitable habitat is present shall be conducted by a qualified biologist (as determined by the City of Corona) within 30 days prior to the commencement of ground disturbing activities. If active burrowing owl burrows are detected during the breeding season, all work within 300 feet of any active burrow will be halted until that nesting effort is finished. The on-site biologist will review and verify compliance with these boundaries and will verify the nesting effort has	City of Corona Planning Division	Prior to grading	Prior to Issuance of Grading Permit	Submittal of Evidence that a qualified biologist has been hired and the pre-construction survey has been completed.		Withhold Grading Permit

finished. Work can resume when no other active burrowing owl burrows are found. If active burrowing owl burrows are detected outside the breeding season, then passive and/or active relocation may be approved following consultation with CDFW and/or USFWS. If owls are found to be present on site, the CDFW should be notified within three days of the detection of occupied burrows, and a project burrowing owl conservation strategy should be developed in cooperation with the CDFW, USFWS, and the Western Riverside County Regional Conservation Authority. One-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and backfilled to ensure that animals do not reenter the holes/dens. Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to the City for mitigation monitoring compliance record keeping.				Submittal of a report of the survey findings to the City. If active burrows are detected provide evidence to the City that the passive relocation plan has been approved by CDFW and USFWS.		
4.4.5.2B: A Biological Monitor shall be onsite during the initial ground disturbances to identify and locate any red-diamond rattlesnake within the PAs 11 and 12A. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the immediate area of the identified species shall cease to allow for the species to vacate or be relocated from the area safely. Work can resume when the species has vacated the immediate ground disturbances work area. To reduce harm to the red-diamond rattlesnake and other species in the areas being disturbed, the following best management practices shall be added to the soil import and grading plans:	City of Corona Planning Division	Prior to site grubbing or grading	Prior to Issuance of Grading Permit	Submittal of evidence that a qualified biologist has been hired and the pre-construction survey has been completed. Submittal of a report of the		Withhold Grading Permit

• Work area limits will be defined and respected. All grading areas will have their boundaries clearly flagged or marked before Project implementation and all disturbances will be confined to the flagged areas. All key Project personnel will be instructed that their activities must be confined to locations within the flagged areas. Disturbance beyond the actual grading zone is prohibited without site-specific surveys. • Cleared or trimmed non-native, exotic vegetation, and woody debris will be disposed of in a legal manner at an approved disposal site. • Employees, contractors, and site visitors will be prohibited from collecting plants and wildlife. • Water pollution and erosion control plans will be developed and implemented in accordance with SWPPP requirements. • Access to construction sites will be via preexisting access routes. • Construction equipment will be properly maintained; construction employees and contractors will be trained on proper implementation and monitoring of BMPs; and procedures will be implemented to minimize the likelihood of hazardous spills and to control sediment-laden runoff. • Effective perimeter control BMPs to control discharge of pollutants from the Project site during construction. • All temporary construction-related night lighting used in onsite development areas will be shielded and/or directed downward to avoid indirect impacts to nocturnal wildlife such that night lighting could increase predation rates. • All construction contractors, subcontractors, and employees will comply with the litter and pollution				survey findings to the City.		

laws and will institute a litter control/removal program during the course of construction activities to reduce the attractiveness of the area to opportunistic predators such as coyotes, opossums, and common ravens. • Active nests (nests with chicks or eggs) cannot be removed or disturbed. Nests may be removed or disturbed by a qualified biologist, if not active. The removal of potential nesting bird habitat will be conducted outside of the nesting season (February 15 to September 15~~August 31~~) to the extent feasible. If grading or site disturbance is to occur between February 15 and Aug September 15~~August 31~~, a nesting bird survey shall be conducted by a qualified biologist ~~(as determined by the City of Corona)~~ within no more than five days~~72 hours~~ of scheduled vegetation removal, to determine the presence of nests or nesting birds. If active nests are identified, the biologist will establish buffers around the vegetation (500 feet for raptors and sensitive species, 200 feet for non-raptors/non-sensitive species). All work within these buffers will be halted until the nesting effort is finished (i.e. the juveniles are surviving independent from the nest). The on-site biologist will review and verify compliance with these nesting boundaries and will verify the nesting effort has finished. Work can resume when no other active nests are found. Alternatively, a qualified biologist may determine that construction can be permitted within the buffer areas and would develop a monitoring plan to prevent any impacts while the nest continues to be active (eggs, chicks, etc.). Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to the CDFW~~City~~ for mitigation monitoring compliance record keeping. If vegetation clearing is not completed within five days~~72 hours~~ of a						

negative survey, the nesting survey must be repeated to confirm the absence of nesting birds.						
4.4.5.3A: Prior to the issuance of grading permits for the affected jurisdictional areas, the project applicant shall provide evidence to the City that a Section 404 Permit from the USACE, a Section 401 Permit from the RWQCB, and a Section 1602 Streambed Alteration Agreement from the CDFW have been obtained for impacts to jurisdictional waters in the project site.	City of Corona Planning Division	Prior to grubbing and grading	Prior to Issuance of Grading Permit	Provide evidence to the City that the 404 Permit, 401 Permit and Section 1602 Agreement have been obtained.		Withhold Grading Permit
4.4.5.3B: Prior to the issuance of grading permits for the affected jurisdictional areas, a Determination of Biological Superior or Equivalent Preservation (DBESP) shall be submitted to the Riverside Conservation Authority (RCA) identifying potential impacts to riparian/riverine areas, discussing why avoidance of impacts to riparian/riverine areas was not feasible, and identifying compensation for the loss of riparian/riverine areas.	City of Corona Planning Division	Prior to grubbing and grading	Prior to Issuance of Grading Permit	Provide evidence the DBESP has been submitted to the RCA and mitigation in the DBESP is approved by the RCA and City.		Withhold Grading Permit
4.4.5.3C: The Applicant shall mitigate for the permanent loss of USACE and CDFW jurisdictional and MSHCP riparian/riverine resources on site at a 2:1 ratio. Mitigation may occur on-site within Bedford Canyon Wash or one of its tributaries; mitigation may occur through applicant-sponsored mitigation at an off-site location within the MSHCP boundaries: or mitigation may occur through purchase of credits at an approved mitigation bank or in-lieu	City of Corona Planning Division	Prior to grubbing and grading	Prior to Issuance of Grading Permit	Provide evidence to the City or participation in a mitigation bank or in-lieu fee program has been		Withhold Grading Permit

fee program such as the Santa Ana Watershed Association (SAWA) In-Lieu Fee Wetland Creation Program or equivalent, if available.				secured by the applicant.		
4.4.5.3D Following the completion of grading, all of USACE and CDFW jurisdictional areas that will be temporarily impacted shall be restored using native vegetation.	City of Corona Planning Division	Onsite inspection after grading	After onsite grading.	Onsite inspection.		Withhold Occupancy permits and/or Issuance of a Stop Work Order.
4.4.5.3E: For Bedford Canyon Wash design options 2 and 3, it is anticipated that periodic maintenance may be necessary within the soft bottom channel/Bedford Canyon Wash, such as trash and invasive species removal; riprap and grade control structure repair; therefore, an Operations and Maintenance Manual or Long Term Management Plan shall be prepared, subject to the approval of the Resource Agencies, which will identify the appropriate methods and timing regarding the maintenance of the restored wash.	City of Corona Planning Division Riverside County Flood Control and Water Conservation District	Prior to Grading	Prior to Issuance of Grading Permits for the affected jurisdictional areas	Submittal by applicant of Evidence that the Operations and Maintenance Manual has been approved by the Resource Agencies.		Withhold Grading Permit
CULTURAL RESOURCES						
4.5.6.1A: The applicant shall retain a qualified archaeological monitor who shall prepare an Archaeological Resources Mitigation Monitoring Plan in consultation with the Native American Tribe. The qualified archaeological monitor shall attend all pre-grading meetings to inform the grading and excavation contractors of the archaeological resources mitigation program and shall instruct them with respect to its implementation. The qualified archaeological	City of Corona Planning Division	Prior to grading and on-going during ground disturbing activities.	Prior to Issuance of Grading Permit	Provide evidence to the City that a qualified archeologist(s) monitor has been retained, and that the		Withhold Grading Permit and/or Issuance of a Stop Work Order

monitor shall be on site at all times during the initial phases of clearing and rough grading in the Modified Project Site (PAs 11 and 12A) and Approved Project (PA 14) if Soil Import Alternative 2 is implemented to inspect cuts for archaeological and cultural resources. If such resources are discovered~~,~~ and are in danger of loss and/or destruction, the qualified archaeological monitor shall recover them. In instances where recovery requires an extended salvage time, the qualified archaeological monitor shall be allowed to temporarily direct, divert or halt grading to allow recovery of resource(s) in a timely manner. Recovered archaeological resources, along with copies of pertinent field notes, photographs, and maps, shall be deposited in a certified curation facility that meets the standards of the California Office of Historic Preservation. The resources shall be recorded in the California Archaeological Inventory Database. All sacred sites, should they be encountered within the project area, shall be avoided and preserved as the preferred mitigation, if feasible. A final monitoring report shall be submitted to the City within 30 days of the end of monitoring activities.				monitor will be present during all grading and other significant ground-disturbing. A report of findings shall be submitted to the City 30 days of the end of monitoring activities.		
4.5.6.1B: All grading, excavation, and ground-breaking activities shall be monitored by a qualified tribal monitor(s). The project applicant shall pay all fees associated with such tribal monitors(s) and shall contact the Native American Tribe at least 30 days before pulling grading permits from the City. In the event of the discovery of Native American burial(s), the qualified tribal monitor(s) will have the authority to temporarily stop and redirect grading activities, in consensus with the archaeological monitor. The tribal monitor(s) shall attend all pre-grading meetings to assist the archaeological monitor with informing the grading and	City of Corona Planning Division	Prior to grading, excavation, and ground-breaking activities.	Prior to Issuance of Grading Permit	Provide evidence to the City that a tribal monitor or fees have been paid to the City to retain a tribal monitor has been retained, and that the		Withhold Grading Permit and/or Issuance of a Stop Work Order

excavation contractors of the archaeological resources mitigation program and instruct them with respect to its implementation. The qualified tribal monitor shall be on site at all times during clearing and rough grading to inspect cuts for archaeological and cultural resources.				monitor will be present during all grading and other significant ground-disturbing.		
4.5.6.1C: The developer shall enter into a Treatment and Disposition Agreement with the appropriate Native American Tribe prior to the issuance of a grading permit. The Treatment and Disposition Agreement shall identify the treatment of cultural items (artifacts) and the treatment and the disposition of human remains.	City of Corona Planning Division	Prior to grading, excavation, and ground-breaking activities.	Prior to Issuance of Grading Permit	The developer shall submit to the City a copy of the Treatment and Disposition Agreement entered into between the developer and the Native American Tribe.		Withhold Grading Permit and/or Issuance of a Stop Work Order
4.5.6.1D: Unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and is not subject to public disclosure requirements of the California Public Records Act, pursuant to the specific exemption set forth in California Government Code Section 6254(r).	City of Corona Planning Division	On-going as necessary during grading and construction phase.	During grading and construction phase.	A written agreement is entered into by the City, developer and Coroner.		Issuance of a Stop Work Order.

4.5.6.2A: Prior to the issuance of grading permits, the project proponent shall submit to and receive approval from the City, a Paleontological Resource Impact Mitigation Program (PRIMP). The PRIMP shall include the provision of a trained paleontological monitor during on-site soil disturbance activities on the north and south sides ~~side~~ of Bedford Wash within the Modified Project site (revised PA 11 and new PA 12A~~PAs 16 and 17~~) and Approved Project (PA 14) if Soil Import Alternative 2 is implemented~~boundary~~. The monitoring for paleontological resources shall be conducted on a full-time basis during the rough-grading phases of the Modified Project site within native soils that have the potential to harbor paleontological resources.	City of Corona Planning Division	Prior to grading, excavation, and ground-breaking activities.	Prior to Issuance of Grading Permit	A Paleontological Resource Impact Mitigation Program (PRIMP) shall be submitted to the City for review and approval.		Withhold Grading Permit
4.5.6.2B: The paleontological monitor shall be equipped to rapidly remove any large fossil specimens encountered during excavation. During monitoring, samples of soil shall be collected and processed to recover micro-vertebrate fossils. Processing shall include wet screen washing and microscopic examination of the residual materials to identify small vertebrate remains.	City of Corona Planning Division	During grading, excavation, and ground-breaking activities.	During grading, excavation, and ground-breaking activities.	On-site inspection.		Issuance of a Stop Work Order.
4.5.6.2C: If paleontological resources are unearthed or discovered during excavation of the Specific Plan area, the following recovery processes shall apply: • Upon encountering a large deposit of bone, salvage of all bone in the area shall be conducted with additional field staff and in accordance with modern paleontological techniques. • All fossils collected during the project shall be prepared to a reasonable point of identification.	City of Corona Planning Division	During grading, excavation, and ground-breaking activities.	During grading, excavation, and ground-breaking activities.	On-site inspection.		Issuance of a Stop Work Order.

Excess sediment or matrix shall be removed from the specimens to reduce the bulk and cost of storage. Itemized catalogs of all material collected and identified shall be provided to the museum repository along with the specimens. • A report documenting the results of the monitoring and salvage activities and the significance of the fossils shall be prepared. • All fossils collected during this work, along with the itemized inventory of these specimens, shall be deposited in a museum repository (such as the Western Center for Archaeology & Paleontology, the Riverside Metropolitan Museum, or the San Bernardino County Museum) for permanent curation and storage.						
GEOLOGY AND SOILS						
4.6.6.1A: Prior to the grading of areas to receive structural fill or engineered structures, these areas should be cleared of surface obstructions and unsuitable material (such as undocumented fill, colluvium, and topsoil). Vegetation and debris should be removed and properly disposed of offsite. Holes resulting from the removal of buried obstructions, which extend below proposed removal bottoms, should be replaced with suitable compacted fill material. ~~Prior to the initiation of any on-site construction, the project contractor shall remove all loose, compressible alluvial and fill materials from areas to receive engineered compact fill. Actual depths of removal shall be verified during future site-specific preliminary soils investigations and ultimately~~	City of Corona Planning Division Public Works	During grading, excavation, and ground-breaking activities.	Prior to on-site construction.	Review of construction documents and on-site inspection.		Issuance of Stop Work Order.

~~during the grading operation by observation and in place density testing.~~						
4.6.6.1B: Onsite Soils/Unsuitable. All unsuitable and potentially compressible materials not removed by design cuts shall be excavated to competent materials and replaced with compacted fill soils. This includes all existing undocumented artificial fill, residual soil, and upper portions of the previously placed compacted fill within PA 11 and alluvial deposits. Specific procedures by soil type are summarized below. *Previously Placed Artificial Fill:* The previously placed compacted fill within PA 11 are considered suitable to support proposed structures and/or additional fill placement. The upper 1-foot of the previously placed fill soils shall be removed and replaced with compacted fill soils in order to remove any weathered or desiccated materials. *Alluvial Deposits:* Alluvial deposits are generally located within the Modified Project Site. The upper approximately 5 feet of the alluvial deposits is loose, weathered, and/or desiccated and shall be removed and replaced with compacted artificial fill soils. Removal depths are estimated to range between approximately 1 to 5 feet below existing grade. Localized areas of deeper removals should be anticipated during grading. Removal bottoms should be extended laterally in order to support a 1:1 (horizontal to vertical) projection away from proposed structures or improvements. The actual depths and lateral extents of removals will be determined by the geotechnical consultant	City of Corona Planning Division Building and Safety Engineering	During grading, excavation, and ground-breaking activities.	Prior to on-site construction.	Review of grading and construction documents and on-site inspection.		Issuance of Stop Work Order.

during grading based on the actual subsurface conditions encountered. Several methods shall be utilized in determining the suitability of the material observed in the removal bottom excavations. Observation of material, proof rolling, probing, and occasional field density testing of the removal bottoms shall be performed by a field technician and/or field geologist to verify removal bottom suitability. When field density test data is utilized for the approval of a removal bottom, an in-place relative compaction of 85 percent or greater and/or a degree of saturation of 85 percent or greater will be considered suitable. **Onsite Soils/Over-Excavation.** In order to provide a uniform fill blanket beneath proposed structures, design cut and cut/fill transition pads shall be over-excavated a minimum of 3 feet below ultimate finish pad grade based on the future rough grading design. A maximum 3:1 differential fill thickness underneath individual lots shall be maintained in order to reduce the potential for future differential settlement. Over-excavation shall extend laterally a minimum of 5 feet beyond proposed building footprints. Streets in design cut areas shall be over-excavated a minimum of 2 feet below design subgrade elevations. In addition, retaining wall footings located on cut or a cut/fill transition should be over-excavated a minimum of 2 feet below and 2 feet beyond the edges of the proposed footings. Utility excavations may be completed utilizing typical heavy machinery. The native soils at the site are generally uncemented alluvial soils (Class "C" per Cal OSHA) and are anticipated to be unstable when excavated vertically. At the						

owner's discretion the streets could be over-excavated, such that utility trenches will then be excavated through compacted fill soils. If desired, it is recommended that the street over-excavation extend approximately 2-foot below the lowest utility. Over-excavations/undercuts must be confirmed and mapped by the geotechnical consultant prior to subsequent fill placement. The actual depth and lateral extents of over-excavation should be determined by the geotechnical consultant during grading based on the actual subsurface conditions encountered. Estimated removals in the previously graded portin of PA 11 may extend deeper than the recommended over-excavation in order to remove unsuitable materials. **Removal Bottoms and Subgrade Preparation.** Removal bottoms, over-excavation bottoms, and areas to receive compacted fill shall be scarified to a minimum depth of 6 to 8 inches, brought to a near-optimum moisture condition (generally within optimum and 2 percent above optimum moisture content) and re-compacted per project requirements. Removal bottoms, over-excavation/undercut bottoms, and areas to receive fill shall be observed and accepted by the geotechnical consultant prior to fill placement. **Temporary Excavations.** Temporary excavations shall be performed in accordance with project plans, specifications, and applicable Occupational Safety and Health Administration (OSHA) requirements. Excavations shall be laid back or shored in accordance with OSHA requirements before personnel or equipment are allowed to enter. The majority of site alluvial soils are anticipated to be OSHA						

Type "C" soils. Soil conditions shall be regularly evaluated during construction to verify conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate the soil conditions. Close coordination with the geotechnical consultant shall be maintained to facilitate construction while providing safe excavations. Excavation safety is the sole responsibility of the contractor. Vehicular traffic, stockpiles, and equipment storage shall be set back from the perimeter of excavations a minimum distance equivalent to a 1:1 projection from the bottom of the excavation or 5 feet, whichever is greater. Once an excavation has been initiated, it shall be backfilled as soon as practical. Prolonged exposure of temporary excavations may result in some localized instability. Excavations shall be planned so that they are not initiated without sufficient time to shore/fill them prior to weekends, holidays, or forecasted rain. ~~All on-site soils shall provide adequate quality fill material provided they are free from organic matter and other deleterious materials. Rock or similar irreducible material with a maximum dimension greater than six inches shall not be buried or placed in fills. However, oversized materials, with a maximum dimension greater than 8 inches, may be placed in fills or buried on site in accordance with recommendations proved by the geotechnical engineer during grading. Oversized material may be stockpiled for landscaping purposes or placed in a rock disposal area as approved by the project owner, developer, geotechnical engineer, and City. Import fill shall be inorganic, non-expansive granular soils free from rocks or lumps greater than six inches in maximum dimension. Sources for import~~						

~~fill shall be approved by the project geotechnical engineer prior to their use. Fill shall be spread in maximum eight inch uniform loose lifts; each lift brought to near optimum moisture content, and compacted to a relative compaction of at least 90 percent in accordance with ASTM D 1557.~~						
4.6.6.1A: Stabilization fills shall be constructed on proposed cut slopes over 5 feet in height in accordance with the detail provided in Appendix D. Keyway widths shall be a minimum of 15 feet wide. Keyways shall be a minimum of 2 feet deep, determined from the lowest toe-of-slope elevation, and tilted back towards the heel a minimum 2 percent or 1-foot (whichever is greater). Stabilization fill backcuts shall be excavated so that at least a minimum 15-foot fill width is maintained for the entire height of the stability fill slope. In general, backcuts shall be excavated at a maximum 1.5:1 (horizontal to vertical) inclination. Properly outletted back drains shall be constructed along stabilization fill backcuts in accordance with Appendix D in the Geotechnical Evaluation, General Earthwork and Grading Specifications for Rough Grading. Flatter backcut inclinations may be required based on observed conditions during grading. The backcuts should not be initiated prior to forecasted rain or be left open for extended periods of time. Backcuts and keyway excavations must be geologically mapped by the geotechnical consultant during excavation to confirm the anticipated conditions. If adverse conditions are exposed, additional analysis and/or remediation measures may be required. The grading contractor must trim the backcuts with a slope board to remove loose material to allow	City of Corona Public Works Building and Safety	Prior to grading	Prior to Issuance of Grading Permit	Review of grading and construction documents, site specific preliminary soils investigations, and on-site inspection.		Withhold Grading Permit and/or Issuance of Stop Work Order

for confirmational mapping. Updated and/or revised geotechnical recommendations may be required based on observed conditions. ~~Cut and fill slopes shall be planned at gradients no steeper than two horizontal to one vertical. Additional information regarding any proposed cut slopes and the existing natural slope stability should be addressed within the site specific preliminary soils investigations when grading/development plans are made available for the specific tracts/development areas.~~						
4.6.6.1D: Design fill slopes are anticipated to be both grossly and surficially stable as designed provided they are constructed in accordance with Appendix D in the Geotechnical Evaluation, General Earthwork and Grading Specifications for Rough Grading and properly maintained subsequent to construction. Fill slopes shall be constructed with a maximum slope ratio of 2:1 (horizontal to vertical). Slope faces shall also be compacted to project recommendations. To improve surficial stability, vegetation specified by the landscape architect shall be established on the slope face as soon as it is practical. ~~Where fills are to be placed against existing slopes steeper than five horizontal to one vertical, the fill shall be properly keyed and benched into competent native materials. The key, constructed across the toe of the slope, shall be a minimum of 12 to 15 feet wide, a minimum of two feet deep at the toe, and sloped back at 2 percent. Benches shall be constructed at approximately two to four feet vertical intervals.~~	City of Corona Public Works Building and Safety	During grading, excavation, and ground-breaking activities.	Prior to on-site construction.	Review of grading and construction documents, site specific preliminary soils investigations, and on-site inspection.		Issuance of Stop Work Order

4.6.6.1E: Graded slopes shall be planted with groundcover vegetation as soon as practical to protect against erosion by reducing runoff velocity. Deep-rooted vegetation that requires little water and is able to survive local climate conditions shall also be established to protect against surficial slumping. Under no circumstances shall slopes be allowed to be bare of vegetation. Landscape vegetation must not be "trimmed" to root structures leaving no protection of the slopes. Irrigation levels shall be kept to the minimum level necessary to establish healthy plant growth. Slopes must not be overwatered. If automatic sprinklers are used, they must be adjusted during periods of rainfall. A landscape professional must be consulted for landscape recommendations. A program for the elimination of burrowing animals in both native and graded slope areas must be established to protect slope stability by reducing the potential for surface water to penetrate into the slope face. Continuous erosion control, rodent control, and maintenance are essential to the long-term stability of all slopes. Trenches excavated on a slope face for utility or irrigation lines and/or for any purpose must be properly backfilled and compacted to project recommendations to the slope face. Observation/testing and acceptance by the geotechnical consultant during trench backfill are recommended. V-ditches shall be inspected and cleared of loose soil and/or debris on a routine basis, especially prior to and during the rainy season. ~~Slopes at the project site shall be planted with a deep-rooted groundcover as soon as possible after completion. The use of succulent ground covers such as iceplant or sedum is not recommended. If watering is necessary to sustain plant growth on slopes, then the watering operation shall be~~	City of Corona Public Works Building and Safety	During construction after on-site grading	During construction after on-site grading	Review of grading and construction documents, site specific preliminary soils investigations, and on-site inspection.		Issuance of Stop Work Order

~~monitored to ensure proper operation of the irrigation system and to prevent overwatering.~~						
4.6.6.1F: Prior to the initiation of any on-site construction, evidence shall be submitted to the City for review and approval that on-site development has incorporated the design and siting recommendations detailed in the site-specific geotechnical evaluation~~investigation~~.	City of Corona Public Works Building and Safety	Prior to Construction and during construction	Prior to Construction and during construction	Review of grading and construction documents, detailed in the site-specific geotechnical investigation, and on-site inspection.		Withhold Building Permit
4.6.6.2A: On-site soils and any imported soils for individual tracts/development areas shall be evaluated for their expansion potential prior to grading and ultimately following completion of the grading operation. The evaluation shall determine and identify specialized construction procedures to specifically resist expansive soil activity in accordance with the CBC and/or applicable local ordinances.	City of Corona Public Works Building and Safety	During grading and construction	Prior to grading and construction	Submit to the City evidence that the soils have been evaluated and construction measures to reduce soil expansion will be implemented.		Withhold Grading Permit and/or Issuance of Stop Work Order
GREENHOUSE GASES AND GLOBAL CLIMATE CHANGE						
4.7.6.1A: Prior to the issuance of each grading permit associated with the Specific Plan, the project developer shall develop and implement a construction waste management plan that would require the recycling and/or salvaging of non-hazardous construction and demolition waste.	City of Corona Building and Safety Planning Division	Prior to issuance of each grading permit.	Prior to issuance of grading permits	Review of construction documents and on-site inspection		Withhold Grading Permit

4.7.6.1B: Prior to the issuance of each building permit associated with the Specific Plan, the project developer shall facilitate the reduction of waste generated by building occupants that is hauled to and disposed of in landfills by providing easily accessible areas that serve each building and are dedicated to the collection and storage of paper, cardboard, glass, plastics, and metals.	City of Corona Building and Safety Planning Division	Prior to construction	Prior to issuance of building permits	Review of construction documents and on-site inspection		Withhold Building Permit
HAZARDOUS MATERIALS						
~~**4.8.6.1B:** If soil from any location on the project site is to be removed or transported off site, the soil export must have a DDT level of less than 1 part per million (ppm). Soil to be exported off site shall be tested, and verification of the soil results shall be submitted to the City for review prior to the issuance of soil export operations.~~	~~City of Corona Building and Safety Planning Division~~	~~Prior to Grading~~	~~Prior to issuance of grading permits~~	~~Submit to the City for review and approval a Hazardous Waste Phase II.~~		~~Withhold Grading Permit~~
4.8.6.1C: If unknown wastes or suspected hazardous materials are discovered during any construction activities on the project site, the following shall occur: • Immediately stop work in the vicinity of the suspected contaminant, removing workers and the public from the area; • Notify the City of Corona Fire Department and the Riverside County Department of Environmental Health; • Notify the project engineer of the implementing agency (the City of Corona) and secure the area containing the unknown wastes or suspect materials as directed by the project engineer; and	City of Corona Building and Safety Public Works	During grading and construction	During grading and construction	On-site Inspection		Issuance of Stop Work Order.

• Notify the implementing agency's Hazardous Waste/Materials Coordinator.						
4.8.6.1D: Testing and remediation of unknown wastes or suspect materials shall be conducted under the purview of the applicable agency (i.e., DTSC, Santa Ana RWQCB, and the Riverside County Department of Environmental Health and/or City). Remediation shall be conducted to the standards established by the Lead Agency (i.e., DTSC, Santa Ana RWQCB, and the Riverside County Department of Environmental Health and/or City). All contaminated soil locations identified shall be remediated below hazardous levels established by Title 22 of the California Code of Regulations and to the satisfaction of the applicable Lead Agency.	City of Corona Building and Safety Public Works	During grading and construction	During grading and construction			Issuance of Stop Work Order.
4.8.6.1E: Prior to the issuance of demolition permits for any planning areas containing structures, any remaining structures on site shall be visually inspected by the project engineer of the implementing agency (City of Corona) prior to demolition activities. If hazardous materials are encountered, the materials shall be tested and properly disposed of in accordance with state and federal regulatory requirements. Any stained soils or surfaces underneath the removed materials shall be sampled. Results of the sampling would indicate the appropriate level of remediation efforts that may be required. Testing and remediation of unknown wastes or suspect materials shall be conducted under the purview of the applicable agency (i.e., DTSC, Santa Ana RWQCB, and/or City). Remediation shall be conducted to the standards established by the Lead Agency (i.e., DTSC, Santa Ana RWQCB, and/or City). All contaminated soil locations identified shall be remediated below hazardous	City of Corona Building and Safety Public Works	Prior to issuance of any Demolition Permit	Prior to issuance of any Demolition Permit	Inspection by the project engineer of the implementing agency (City of Corona) prior to demolition activities.		Withhold Demolition Permit

levels established by Title 22 of the California Code of Regulations and to the satisfaction of the applicable Lead Agency.						
4.8.6.1F: Prior to the issuance of grading permits for each planning area, all miscellaneous debris (e.g., wood and concrete) shall be removed and disposed of at an approved landfill facility prior to construction activities under the purview of the appropriate agency (i.e., DTSC, Santa Ana RWQCB, and/or City). Once removed, a visual inspection of the areas beneath the removed materials shall be performed by the construction contractor as specified by the City of Corona. Any stained soils observed underneath the removed materials shall be sampled. Results of the sampling, if necessary, would indicate the level of remediation efforts that may be required. Remediation shall be conducted to the standards established by the Lead Agency (i.e., DTSC, Santa Ana RWQCB, and/or City). All contaminated soil locations identified shall be remediated below hazardous levels established by Title 22 of the California Code of Regulations and to the satisfaction of the applicable Lead Agency.	City of Corona Building and Safety Public Works	During grading and construction	During grading and construction			Issuance of Stop Work Order.
4.8.6.2A: Prior to the issuance of building permits for each planning area, the project proponent shall prepare, submit, and receive approval from the City and Riverside County Fire Department, a project-specific Wildland Fire Plan/Fuel Modification Plan. The Wildland Fire Plan/Fuel Modification Plan shall include but shall not be limited to the following: • Goals, policies, and actions related to fire funding and fire rehabilitation;	City of Corona Building and Safety Fire Department Riverside County Fire Department	Prior to issuance of Building Permits for each Planning Area	Prior to issuance of Building Permits	Developer shall prepare, submit, and receive approval from the City and Riverside County Fire Department, a project-specific Wildland Fire		Withhold Building Permits

• Fire protection and evacuation plan; • Vegetative fuels management plan; • Public education program; and • Defensible space requirements which meet and/or exceed the City of Corona Fire Department and Riverside County Fire Department Fuel Modification Requirements.				Plan/Fuel Modification Plan for each Planning Area.		
HYDROLOGY AND WATER QUALITY						
4.9.6.1A: Prior to the ~~first~~ issuance of a grading permit by the City for any development within PA 11 and 12A of the Arantine Hills Specific Plan, the project proponent shall file a Notice of Intent (NOI) with the Santa Ana Regional Water Quality Control Board (RWQCB) to be covered under the State National Pollutant Discharge Elimination System (NPDES) General Construction Permit for discharge of storm water associated with construction activities. The project proponent shall submit to the City the Waste Discharge Identification Number as proof that the project's NOI to be covered by the General Construction Permit has been filed with the appropriate RWQCB.	City of Corona Public Works	Prior to grading for any development.	Prior to the Issuance of Grading Permits	Submittal of copy of Notice of Intent (NOI) to City filed with the RWQCB		Withhold Grading Permits
4.9.6.1B: Prior to the first issuance of a grading permit by the City for any development within PA 11 and 12A of the Arantine Hills Specific Plan, the project proponent shall submit to the City of Corona and receive approval for a project-specific Storm Water Pollution Prevention Plan (SWPPP). The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to	City of Corona Public Works	Prior to grading for any development.	Prior to the Issuance of Grading Permits	Review and approval of SWPPP		Withhold Grading Permits

control on-site and off-site erosion during the entire grading and construction period. In addition, the SWPPP shall emphasize structural and nonstructural best management practices (BMPs) to control sediment and non-visible discharges from the site. Some of the BMPs to be implemented may include (but shall not be limited to) the following: • Sediment discharges from the site may be controlled by the following: sandbags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge control devices. The construction and condition of the BMPs would be periodically inspected during construction, and repairs would be made when necessary as required by the SWPPP. • Materials that have the potential to contribute non-visible pollutants to storm water must not be placed in drainage ways and must be contained, elevated, and placed in temporary storage containment areas. • All loose piles of soil, silt, clay, sand, debris, and other earthen material shall be protected in a reasonable manner to eliminate discharge from the site. Stockpiles would be surrounded by silt fences and covered with plastic tarps. • The SWPPP would include inspection forms for routine monitoring of the site during the construction phase to ensure NPDES compliance. • Additional BMPs and erosion control measures would be documented in the SWPPP and utilized if necessary. • The SWPPP would be kept on site for the entire duration of project construction and will also be available to the local Regional Water Quality Control Board for inspection at any time.						

• In the event that it is not feasible to implement the above BMPs, the City of Corona can make a determination that other BMPs would provide equivalent or superior treatment either on site or off site.						
4.9.6.1C: The Construction Contractor shall be responsible for performing and documenting the application of BMPs identified in the project-specific SWPPP. Weekly inspections shall be performed on sediment control measures called for in the SWPPP. Monthly reports shall be maintained by the Contractor and available for City inspection. A more frequent inspection schedule may be required based on the condition of the site and as required in the NPDES General Construction Permit. In addition, the Contractor would also be required to maintain an inspection log and have the log on site available for review by the City of Corona and the representatives of the Regional Water Quality Control Board.	City of Corona Public Works	During grading and construction weekly inspections	Prior to grading and during grading.	On-site weekly inspections by City and Contractor shall prepare and make available to the City monthly reports and an inspection log.		Issuance of Stop Work Order
4.9.6.2A: Prior to the first issuance of a permit by the City for any project within the Specific Plan area (which includes the issuance of grading permits and building permits), the project proponent shall receive approval from the City of Corona, a project site-specific Water Quality Management Plan (WQMP). The WQMP shall specifically identify pollution prevention, source control, treatment control measures, and other BMPs that shall be used on site to control predictable pollutant runoff in order to reduce impacts to water quality to the maximum extent practicable.	City of Corona Public Works	Prior to grading	Prior to Issuance of Grading Permit and Building Permits	Submittal of WQMP to City for review and approval		Withhold Grading Permit and/or Building Permits.
4.9.6.3A: Prior to the issuance of grading permits of any development within the Arantine Hills Specific Plan, the project proponent shall submit to the City for review and approval, a water conservation plan. The water conservation plan shall include but shall not be limited to the following: • Drought-tolerant landscaping plan; • Indoor project design features such as low-flush toilets and low-flow faucets;	City of Corona Building and Safety Water and Power	Prior to grading	Prior to Issuance of Precise Grading Permits	Submittal of a Water Conservation Plan for City review and approval.		Withhold Precise Grading Permit

• Outdoor project design features such as subsurface irrigation systems, rain sensors, drip irrigation, or high-efficiency sprinkler heads; • Use of alternative water sources (e.g., reclaimed water); and • Educational materials to be utilized by the project tenants.						
4.9.6.3B: Prior to the issuance of occupancy permits for any development within the Arantine Hills Specific Plan, the project proponent shall submit proof to the City that an educational program regarding water usage has been developed for use within the proposed project.	City of Corona Building and Safety Water and Power	Prior to issuance of Occupancy Permits for any development.	Prior to issuance of Occupancy Permits for any development. NOTICE OF PREPARATION

TO:	Responsible Agencies and Interested Parties	FROM:	City of Corona Community Development Department 400 S. Vicentia Avenue Corona, CA 92882

SUBJECT: Notice of Preparation of a Supplemental Environmental Impact Report to the Arantine Hills Specific Plan EIR (SCH #2006091093)

The **City of Corona** will be the Lead Agency and will prepare a supplemental environmental impact report for the project identified below. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the supplemental EIR prepared by our agency when considering your permit or other approval for the project. The Project description, location, and the potential environmental effects are contained in the attached materials.

☐	A copy of the Initial Study IS attached.
☒	A copy of the Initial Study IS NOT attached.
☒	The proposed project IS considered a project of statewide, regional or areawide significance.
☐	The proposed project IS NOT considered a project of statewide, regional or areawide significance.
☐	The proposed project WILL affect highways or other facilities under the jurisdiction of the State Department of Transportation.
☒	The proposed project WILL NOT affect highways or other facilities under the jurisdiction of the State Department of Transportation.
☐	A scoping meeting WILL be held by the Lead Agency.
☒	A scoping meeting WILL NOT be held by the Lead Agency.

If the project meets the criteria requiring the scoping meeting, or if the agency voluntarily elects to hold such a meeting, the date, time and location of the scoping meeting are as follows:

Date: N/A	Time:	Location: N/A

Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice.

Please send your response to **Sandra Yang** at the address shown above. We will need the name of a contact person in your agency.

PROJECT DESCRIPTION

Overview

The Applicant, Bedford Marketplace, LLC, proposes to amend the Arantine Hills Specific Plan (AHSP) to increase the boundary of the AHSP by approximately 17.85 acres. A portion of the additional property, currently owned by the Riverside County Transportation Commission (RCTC), would increase the size of the planned commercial center within the Arantine Hills Specific Plan, referred to as Bedford Marketplace. The remainder of the RCTC surplus property would be designated open space.

The current specific plan permits 80,000 square feet of commercial uses on 10.03 acres zoned for commercial by the specific plan. The amendment to the specific plan, also referred to as AHSP Amendment No. 3, would increase the amount of commercial use to approximately 134,378 square feet plus a 135-room hotel on a combined approximately 21.67 acres. The amendment would also increase the amount of designated Open Space in the AHSP by approximately 6.21 acres.

The applications being processed at the city includes a General Plan Amendment, Specific Plan Amendment, Parcel Map, Noise Variance for construction hours, Precise Plan, and Conditional Use Permits.

While the proposed amendment encompasses both the RCTC property and the 10 acres within the AHSP, reference to the amendment project site pertains only to the 17.85-acre RCTC property, being added into the Arantine Hills Specific Plan boundary.

Location and Surrounding Land Uses

The Arantine Hills Specific Plan and specific plan amendment project site is located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of Corona. The City of Corona is generally situated southwest of the City of Riverside, south of the City of Norco, and north of the City of Lake Elsinore in Riverside County, California (Figure 1). Areas surrounding the amendment include the I-15 freeway to the east, Arantine Hills Specific Plan to the south and west; and Cajalco Road to the north (Figure 2). The Project Site for the amendment is located within the United States Geological Survey (USGS) 7.5-Minute Topographic Map *Corona South* Quadrangle.

The Project Site is owned by the Riverside County Transportation Commission and has Assessor's Parcel Numbers (APN) 279-240-033 (6.44 acres) and 279-240-019 (11.33 acres).

Existing Site Conditions

The Project Site for the amendment is located between the new residential community of Bedford within the Arantine Hills Specific Plan, which has been graded, and the I-15 freeway, including the Cajalco Interchange, which is currently under construction. The Project Site contains ruderal vegetation and has been subject to areas of disturbance from both the grading of Arantine Hills and the construction of the Cajalco Interchange.

The 10-acre commercial property already located within the Arantine Hills Specific Plan adjacent to the Project Site, has been graded as a flat pad and utilities have been stubbed at the entrance to the pad. The extension of Bedford Canyon Road, which would form the western boundary of the Bedford Marketplace has been graded, paved, and curb, gutter, and sidewalk installed. All of this was done with the grading and public improvement permits issued by the city for the portions of the master planned Arantine Hills community currently under construction.

Bedford Canyon Wash, located to the south of the Project Site, is an ephemeral wash with a sandy bottom and sparsely vegetated alluvial fan sage scrub and non-native vegetation. The Wash receives flows from the Santa Ana mountains, through the Eagle Glen Golf Club, through the AHSP area, continuing downstream to Temescal Creek and ultimately the Santa Ana River. As part of implementation of the AHSP, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Wash includes planting with an alluvial fan sage scrub seed mix.

Existing General Plan and Zoning

The Project Site subject to the specific plan amendment is currently designated Agriculture on the City of Corona General Plan Land Use Map and is currently zoned Agriculture on the City of Corona Zoning Map.

Background

The AHSP was first approved by the City of Corona on August 15, 2012, by Resolution No. 2012-091. Project approval included a General Plan Amendment (GPA09-005), a Specific Plan (SP09-001), a Tentative Tract Map (TTM 36294), and an EIR which authorized a 276- acre site, located west of Interstate 15 and south of Cajalco Road, for future residential and non-residential development. AHSP Amendment No.1 was adopted by City Council in June 2016. Project approval included a General Plan Amendment (GPA2015-001), a Specific

Plan Amendment (SPA2015-002), a Tentative Map (TTM 36294R), and a Supplement to the certified EIR. AHSP Amendment No.2 was adopted by the City Council on December 19, 2018. Project approval included a General Plan Amendment (GPA2018-001), a Specific Plan Amendment (SPA2018-001), a Parcel Map (PM 37036), and an Addendum to the SEIR. The AHSP as approved allows up to a maximum of 1,806 dwelling units and 80,000 square feet of General Commercial uses within the 307.8-acre Specific Plan area.

The following descriptions are used interchangeably:

- Approved Project = Original Arantine Hills Specific Plan, as modified by Specific Plan Amendment (SPA) No. 1 and SPA No. 2; and
- Amended Project = Proposed Project = Arantine Hills SPA No. 3 = additional 11.64 acres designated Commercial and 6.21 acres designed Open Space, resulting in an expansion of the commercial use from 80,000 square feet in the approved specific plan to approximately 134,378 square feet plus a 135-room hotel (Amended Project).

Project Description

The Applicant, Bedford Marketplace, LLC, proposes to amend the Arantine Hills Specific Plan (AHSP Amendment No. 3) to increase the boundary of the AHSP by approximately 17.85 acres (Amended Project Site). The proposal would also increase the area designated Commercial in the AHSP from 10.03 acres to approximately 21.67 acres and increase the amount of commercial use from 80,000 square feet to approximately 134,378 square feet plus a 135-room hotel (with a height of four stories or 50 feet, whichever is greater). Approximately 6.21 acres of the Proposed Project would be designated Open Space within the AHSP. The Applicant is requesting a General Plan Amendment, Specific Plan Amendment, Parcel Map, Construction Hours/Noise Variance, Precise Plan, and Conditional Use Permits.

General Plan Amendment

The Project Site currently has a General Plan land use designation of Agriculture. The proposed General Plan Amendment would change the land use designation from Agriculture to General Commercial and Open Space.

Specific Plan Amendment (AHSP Amendment No. 3)

The proposed AHSP Amendment No. 3 would make the following changes to the Arantine Hills Specific Plan.

- Adjust the boundary of the AHSP to add the approximately 17.85 acres to the specific plan.

- Change the zoning on the 17.85 acres through the specific plan amendment from Agriculture to 11.64 acres of Commercial and 6.21 acres of Open Space.

- Designate the Amended Project Site as Planning Area 11 in the AHSP with a land use designation of Commercial and increase the acreage of PA 11 from 10.03 acres to 21.67 acres.

- Increase the total permitted commercial development in the AHSP from 80,000 square feet to 134,378 square feet[1] plus a 135-room hotel.

- Create Planning Area 12A with an Open Space Designation and increase the amount of open space in the AHSP by approximately 6.21 acres.

- Edits to Table 6-1 to clarify the application of shared parking and FAR requirements, and minor additional edits to the Specific Plan for data and text consistency.

[1] The 134,378 square feet represents the current design of the proposed commercial center. Minor changes to the design of the center could occur during the entitlement and planning process resulting in minor changes to the square footage of the center. The AHSP has a process to accommodate minor statistical changes without requiring a subsequent Specific Plan Amendment.

- Permit the use of Farmhouse architecture for the commercial center.

Parcel Map

Subdivide Assessor's Parcel Numbers 279-240-033 and 279-240-019 (17.77 acres) into nine parcels for commercial purposes with certain parcels being created for open space.

Grading Plan - Construction Hours/Noise Variance

The Amended Project Site currently has a lower elevation than the existing graded commercial pad included in the Arantine Hills Specific Plan. The Amended Project Site is also lower in elevation than the newly constructed sewer lift station within the Arantine Hills Specific Plan, such that at the current elevation, the Amended Project Site would not gravity flow to the lift station, resulting in the need for additional pumps. To bring the Amended Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad and at an elevation where sewer could gravity flow to the existing lift station, import of approximately 440,000 cubic yards of dirt is required.

Two alternatives have been identified for importing dirt onto the Amended Project Site.

Import Alternative 1: One alternative to importing dirt to the Amended Project Site would occur by truck from an off-site source. A potential source of import (Borrow Site) has been identified from the FST Sand and Gravel Mine, located east of I-15 and approximately ½ mile east of El Cerrito Road. The dirt would be hauled from a Borrow Site on El Cerrito to I-15 southbound, exit at Cajalco Road and enter the Amended Project Site by crossing Cajalco Road from the southbound off-ramp with traffic control. Trucks would return onto Cajalco Road, enter I-15 northbound to El Cerrito Road and travel east to the Borrow Site. This proposed haul route requires approval of a temporary encroachment permit from Caltrans and the City of Corona.

The Applicant proposes to import dirt during the nighttime hours (8 pm to 4 am) and complete grading operations both during daytime and nighttime hours. During the nighttime hours, dirt would be imported to the Amended Project Site, dumped, and placed by grading equipment. Double-belly dirt haulers would be used, which do not require backing or banging of tailgates. The trucks would drive a continuous route across the Amended Project Site while dumping their load. One (1) rubber tire bulldozer, such as a Caterpillar 834, would be used to move and compact the imported dirt. The site is large enough to avoid backing up and the use of warning signals. Additionally, the rubber tire equipment would be used to avoid the noise from tracked equipment. In addition to the bulldozer, one (1) water truck (4,000 gallon) and one (1) street sweeper would be used during the import operation.

The import operation would include 250 full loads per night, assuming 14 cubic yards per load, for a total of 3,500 cubic yards per night. To import 440,000 cubic yards, approximately 126 nights of import would be required. The grading contractor and dirt hauler can double the amount of import per night if no new significant environmental impacts or no substantial increase in the severity of previously identified significant impacts would occur, which would cut the import duration in half.

Daytime grading activities would initially last for approximately two weeks and begin before import and overlap with initial import operations. The daytime activities include remedial grading, which requires the over-excavation of approximately four to six feet below existing ground surface. To accomplish the over-excavation, the grading contractor would use three (3) Caterpillar 651 scrapers, one (1) tracked bulldozer (Caterpillar D-8), one (1) water truck, and one (1) street sweeper. The over-excavated material would be stockpiled on site. Additional daytime grading would occur after imported material has been placed in the over-excavated areas to bring the site closer to proposed grades. The stockpiled material would then be placed over the imported material to create the finished building pad, compacted to meet geotechnical specifications.

Import Alternative 2: Another alternative to import dirt to the Amended Project Site involves importing dirt from Planning Area 14 within the Arantine Hills Specific Plan (AHSP). Planning Area 14, approximately 26 acres, is located south of Bedford Canyon Wash and is designated Medium Density Residential. This area

forms an elevated plateau above Bedford Canyon Wash. Lowering the elevation of PA 14 by approximately 13 feet would generate approximately 425,000 cubic yards of fill for the Amended Project Site. The remaining 15,000 cubic yards could be generated by lowering PA 14 an additional half foot or importing the remaining fill from off-site.

To import dirt from PA 14, an access ramp would be graded in the northeast portion of PA 14 leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes opened at a 2:1 grade. The lower portion of the access ramp would be steeper than 2:1 and reinforced with geo-grid or similar stabilizer. Fill, ranging from 5 feet to 10 feet would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation.

The ramp from PA 14 to the concrete crossing of Bedford Canyon Wash would be constructed by an excavator. Careful grading operations and BMPs would avoid dirt spoils in Bedford Wash. While this import operation would need to take place during the dry season, temporary pipe culverts would be placed on top of the concrete pad under the dirt ramp in case unexpected monsoonal storms caused Bedford Canyon Wash to flow. Following grading of the ramp, scrapers would move the fill dirt from PA 14 to the Amended Project Site. Only one scraper would fit on the dirt bridge across Bedford Canyon Wash, therefore, this part of the haul route would be limited to one-way traffic. After crossing Bedford Wash, scrapers would continue north, paralleling the I-15 freeway, on the Amended Project Site property to place the fill dirt. All dirt movement would be done off street.

Following completion of the import, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

For this alternative, the over-excavation work would be the same as described in Alternative No. 1. To move the soil from PA 14 to the Amended Project Site the grading contractor would use six (6) 657 scrapers, one (1) D-10 bulldozer, one (1) 834 Rubber Tire Compactor, three (3) water trucks, and on 14H Blade for finishing. Following dirt movement, the bluff would be reconstructed using one (1) 345 Excavator, one (1) 623 Scraper, one (1) 834 Rubber Tire Compactor, one (1) 980 Rubber Tire Loader, one (1) D-5 bulldozer, one (1) 84-inch Compactor, and a water truck,

Infrastructure Improvements

Domestic water and dry utility lines currently exist within the extension of Bedford Canyon Road adjacent to the existing 10-acre commercial pad within the AHSP. An update to the Water Supply Assessment will be prepared, but there is no indication any additional domestic water improvements would be necessary.

Sewer is planned to gravity flow to the existing lift station located within the AHSP.

Stormflows from the Amended Project Site would be collected in a new detention/water quality basin located south of the proposed commercial center. The basin would be sized to retard peak flows to below the level of existing peak discharge conditions. In addition to detaining flows, the basin would allow for infiltration and provide water quality treatment. The detention basin is planned to discharge to Bedford Wash. An outlet pipe and associated headwall would be constructed within the previously disturbed and newly constructed bank of Bedford Wash on the concrete spillway, which would avoid disturbing the soft bottom of Bedford Wash and impacting native vegetation.

Precise Plan

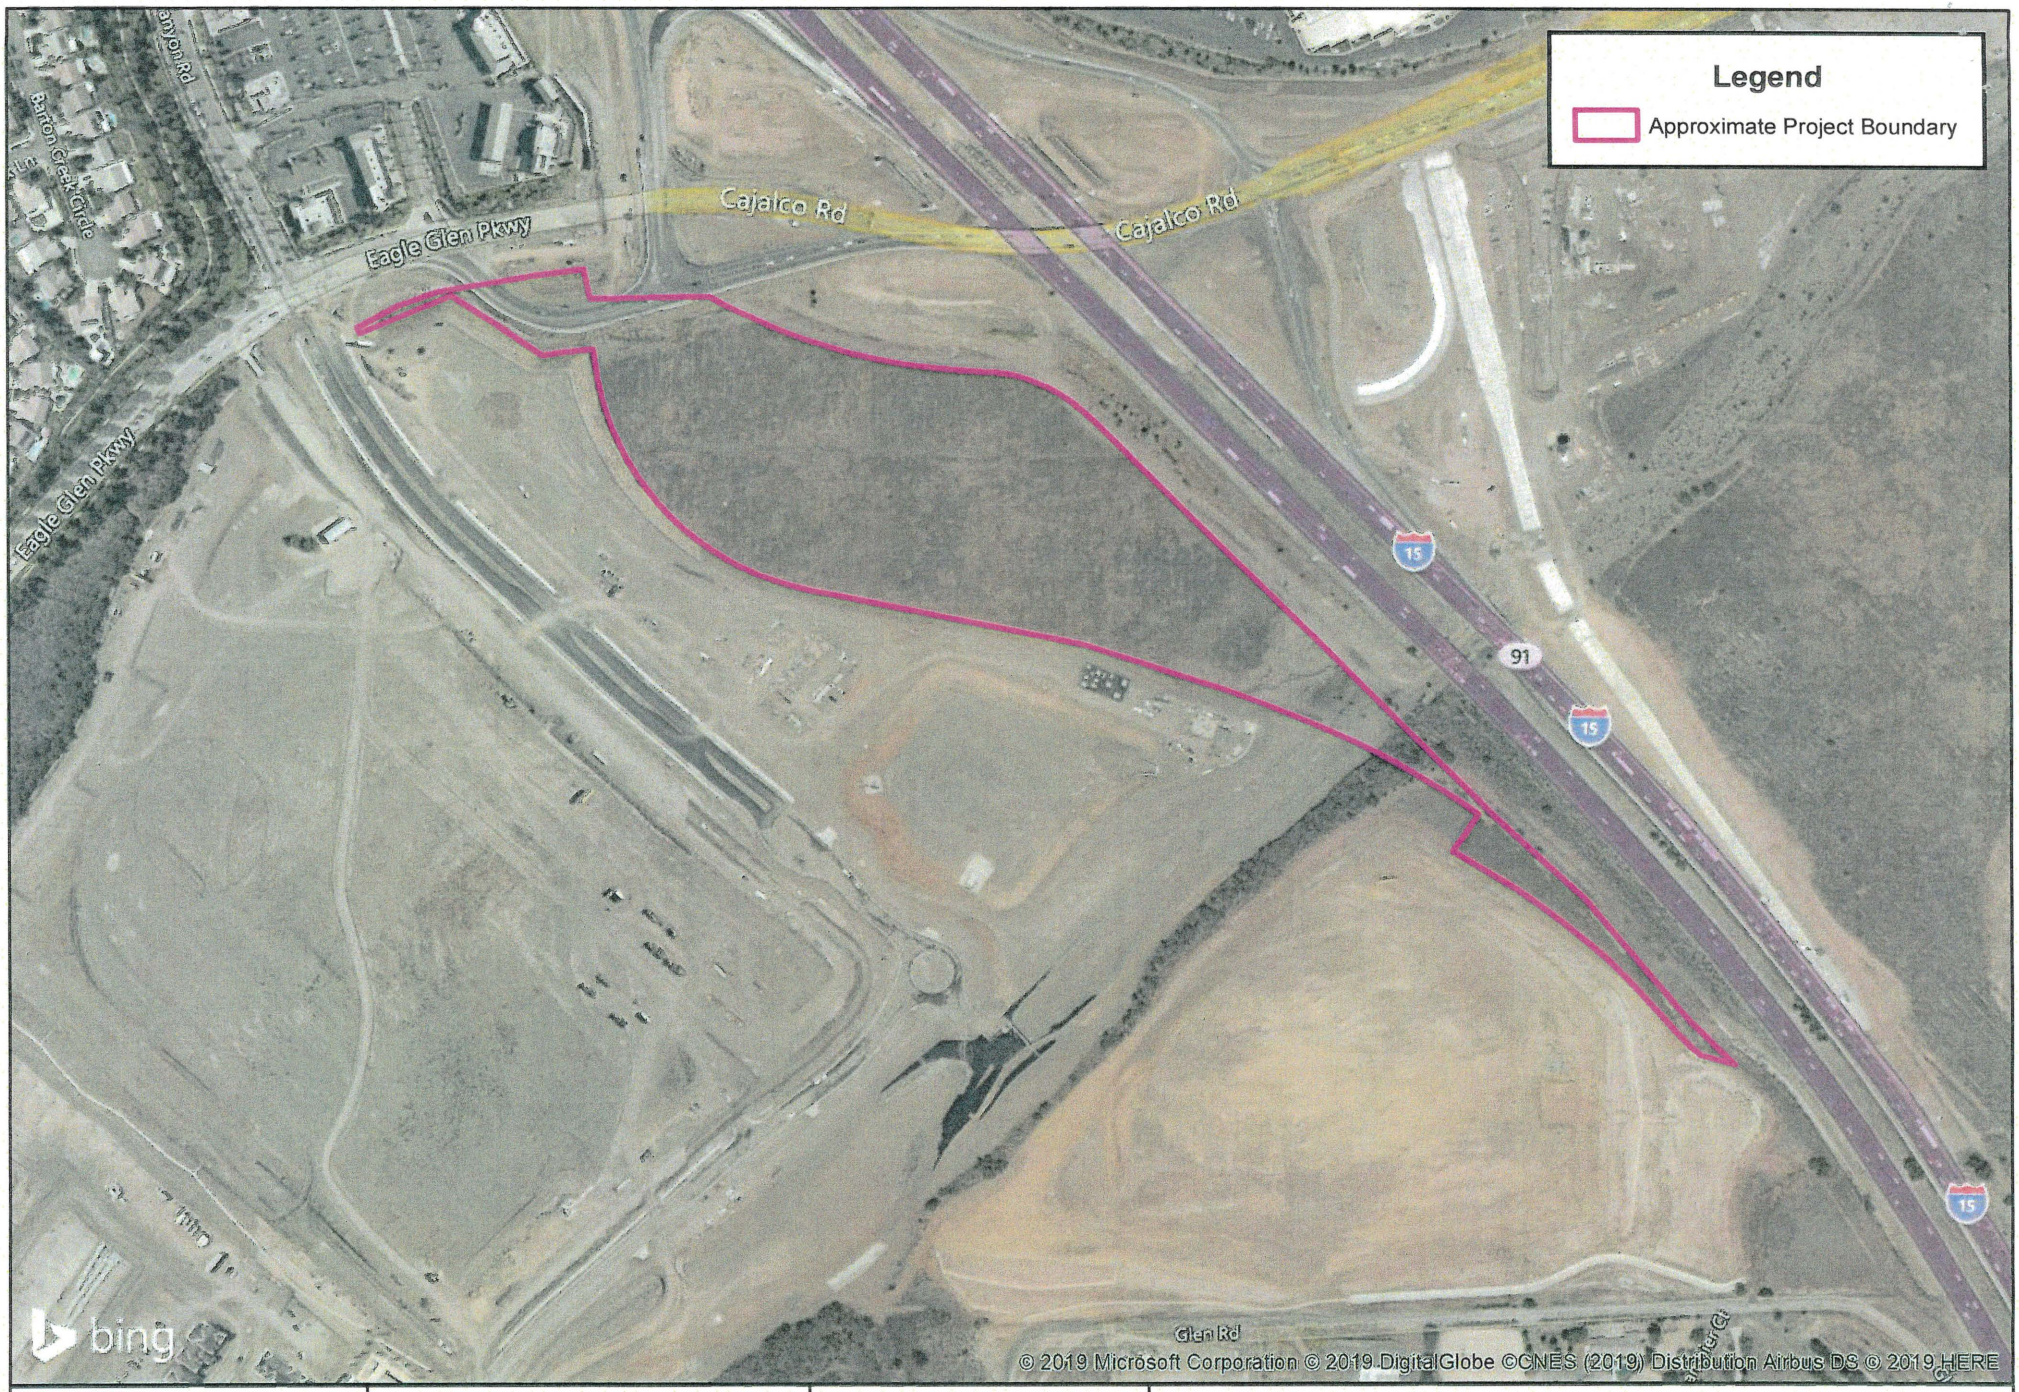
A Precise Plan is required to approve the final design of the entire Bedford Marketplace, which includes the Amended Project Site and the Approved Project Site (the existing 10 acres designated Commercial in the AHSP). Bedford Marketplace is planned as a neighborhood serving commercial center designed to bring commercial services to the Bedford and Eagle Glen communities. Bedford Marketplace would have three

entrances from the extension of Bedford Canyon Road. A combination 8-foot sidewalk and 6-foot trail would form the western boundary and provide pedestrian connectivity from the intersection of Bedford Canyon Road and Eagle Glen Parkway to the newly installed trail system located on the north side of Bedford Wash, including the new dog park, and to residential areas within the Bedford residential community.

While the retail and service users have not been finalized and are subject to change, potential uses within Bedford Marketplace include: a fuel facility with convenience store, auto-spa, quick serve coffee with drive thru, financial institution with drive thru, day care center, health and fitness , super market, pharmacy, sit-down restaurants, quick serve restaurants, and other retail stores that are consistent in other neighborhood serving centers. Located in the southeastern portion of the Amended Project Site is a planned hotel. The hotel is planned for 135 rooms with surface parking.

Parking consistent with the City's parking code is planned throughout Bedford Marketplace. Trail users could utilize the parking within Bedford Marketplace and access the trail along Bedford Canyon Wash by either using the new trail planned along the east side of Bedford Marketplace or by using the sidewalk along the east side of Bedford Canyon Road. The fuel facility and convenience store would provide convenient services for trail users, as well as the other restaurants and retail businesses within the center.

Shopping center identification monument signage is planned at the corner of Bedford Canyon Road and Eagle Glen Parkway. A tenant identification pylon sign facing I-15 is planned north of the hotel site and a pylon sign specific to the hotel is planned south of the hotel site along I-15. Certain uses, such as the hotel, will also have wall-mounted building signage on the eastern elevation of the building. A detailed master sign program outlines all proposed signage.



Conditional Use Permits

Several of the proposed uses will require a Conditional Use Permit (CUP). These include a carwash, drive-through coffee shop, drive-through restaurant, and daycare.

Subject: Notice of Preparation of a Supplemental Impact Report to Arantine Hills Specific Plan EIR (SCH #2006091093)

Dear Ms. Yang:

The Riverside County Transportation Commission (RCTC), received the above referenced document on November 7, 2019. As the owner of the property that is in escrow and is proposed to be sold to Bedford Market Place, LLC., RCTC supports efforts to amend the supplemental Environmental Impact Report (SEIR) for the Arantine Hills Specific Plan Amendment. RCTC has and will continue to coordinate closely with Bedford Market Place, LLC. through the sale of the property. To ensure the success of the Arantine Hills development, the operation of the I-15 Express Lanes, and future toll facility development, RCTC is requesting that the following be considered during the processes to approve the Supplemental Environmental Impact Report, Specific Plan Amendment, Precise Plan, Project Conditional Use Permit, Final Project Plans, and Construction Permitting:

1. To ensure that hauling does not impact operations of the I-15 Express Lanes, it is requested that this hauling operation be conducted outside the following expected I-15 peak hours:
    - Monday – Thursday: 4:00 AM – 10:00 AM and 3:00 PM – 8:00 PM
    - Friday: 1:00 PM – 10:00 PM
2. The proposed Arantine Hills development project indicates that there will be hotels, restaurants, day care placed on the property. Caltrans requirements for traffic noise sensitive areas include, outside eating areas, outside recreational areas, or patios. If these areas are within 500 feet of the freeway lanes, a noise study will be required and potential noise barriers be considered with development of the future toll facilities on I-15. RCTC requests that where practical, these areas be placed in an area beyond 500 feet of the freeway lanes or that noise studies be completed for these potential noise sensitive areas.

RCTC appreciates your consideration of the above comments and looks forward to working with you to further your development and improve mobility on the I-15 corridor. If you have any questions or would like to discuss further, please contact me at 951.787.7141 or sblanco@rctc.org.

Sincerely,

Stephanie Blanco
Capital Projects Manager

Notice of Preparation of a Supplemental Environmental Impact Report for the Proposed Arantine Hills Specific Plan

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. South Coast AQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Supplemental Environmental Impact Report (EIR). Please send South Coast AQMD a copy of the Supplemental EIR upon its completion and public release. Note that copies of the Supplemental EIR that are submitted to the State Clearinghouse are not forwarded to South Coast AQMD. Please forward a copy of the Supplemental EIR directly to South Coast AQMD at the address shown in the letterhead. **In addition, please send with the Supplemental EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, South Coast AQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

South Coast AQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. South Coast AQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from South Coast AQMD's Subscription Services Department by calling (909) 396-3720. More guidance developed since this Handbook is also available on South Coast AQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). South Coast AQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

South Coast AQMD has also developed both regional and localized significance thresholds. South Coast AQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

to South Coast AQMD's CEQA regional pollutant emissions significance thresholds to determine air quality impacts. South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found here at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In addition to analyzing regional air quality impacts, South Coast AQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by South Coast AQMD staff or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance[2] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project, including:

[2] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

- Chapter 11 "Mitigating the Impact of a Project" of South Coast AQMD'S *CEQA Air Quality Handbook* South Coast AQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- South Coast AQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- South Coast AQMD's Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the Supplemental EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.

Permits

If implementation of the Proposed Project requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. For more information on permits, please visit South Coast AQMD's webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

South Coast AQMD rules and relevant air quality reports and data are available by calling South Coast AQMD's Public Information Center at (909) 396-2001. Much of the information available through the Public Information Center is also available at South Coast AQMD's webpage at: http://www.aqmd.gov.

South Coast AQMD staff is available to work with the Lead Agency to ensure that project's air quality and health risk impacts are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

RE: SCH# 2006091093, Bedford Marketplace/ DPR2019-0019, DPR2019-0020 and DPR2019-0021 Project, Riverside County

Dear Ms. Yang:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
    a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
    b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
    a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
    b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
    a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
    b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
    c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

RE: SCAG Comments on the Notice of Preparation of a Draft Supplemental Environmental Impact Report for the Arantine Hills Specific Plan [SCAG NO. IGR7456]

Dear Ms. Yang,

Thank you for submitting the Notice of Preparation (NOP) of a Draft Supplemental Environmental Impact Report (SEIR) for the Arantine Hills Specific Plan ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

SCAG is also the designated Regional Transportation Planning Agency under state law, and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS) pursuant to Senate Bill (SB) 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.[1] SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Community Strategies (RTP/SCS) goals and align with RTP/SCS policies.

SCAG staff has reviewed the NOP of the Draft SEIR for the Arantine Hills Specific Plan (AHSP). The proposed project includes an amendment to the AHSP by adding approximately 17.85 acres which will increase the amount of commercial use to 134,378 square feet, add a 135-room hotel and increase the acreage of designated open space to approximately 6.21 acres.

When available, please send environmental documentation to *SCAG's Los Angeles office in Los Angeles (900 Wilshire Boulevard, Ste. 1700, Los Angeles, California 90017) or by email to au@scag.ca.gov* providing, at a minimum, the full public comment period for review.

If you have any questions regarding the attached comments, please contact the Inter-Governmental Review (IGR) Program, attn.: Anita Au, Associate Regional Planner, at (213) 236-1874 or au@scag.ca.gov. Thank you.

Sincerely,

Ping Chang
Manager, Compliance and Performance Monitoring

[1] Lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS for the purpose of determining consistency for CEQA. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a determination of consistency with the 2016 RTP/SCS for CEQA.

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT SUPPLEMENTAL ENVIRONMENTAL IMPACT REPORT FOR THE ARANTINE HILLS SPECIFIC [SCAG NO. IGR7456]

CONSISTENCY WITH RTP/SCS

SCAG reviews environmental documents for regionally significant projects for their consistency with the adopted RTP/SCS. For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the RTP/SCS.

Please note the Draft 2020 RTP/SCS (Connect SoCal) was released for public review on November 14, 2019 until January 24, 2019. The Final Connect SoCal is anticipated to be adopted in April 2020. Please refer to Connect SoCal goals and growth forecast for RTP/SCS consistency for future projects. The Draft Connect SoCal can be reviewed here: https://www.connectsocal.org/Pages/Connect-SoCal-Draft-Plan.aspx.

2016 RTP/SCS GOALS

The SCAG Regional Council adopted the 2016 RTP/SCS in April 2016. The 2016 RTP/SCS seeks to improve mobility, promote sustainability, facilitate economic development and preserve the quality of life for the residents in the region. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health (see http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx). The goals included in the 2016 RTP/SCS may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project within the context of regional goals and policies. Among the relevant goals of the 2016 RTP/SCS are the following:

SCAG 2016 RTP/SCS GOALS	
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*
RTP/SCS G3:	*Ensure travel safety and reliability for all people and goods in the region*
RTP/SCS G4:	*Preserve and ensure a sustainable regional transportation system*
RTP/SCS G5:	*Maximize the productivity of our transportation system*
RTP/SCS G6:	*Protect the environment and health for our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking)*
RTP/SCS G7:	*Actively encourage and create incentives for energy efficiency, where possible*
RTP/SCS G8:	*Encourage land use and growth patterns that facilitate transit and active transportation*
RTP/SCS G9:	*Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies**
	**SCAG does not yet have an agreed-upon security performance measure.*

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
   a. A brief description of the project.
   b. The lead agency contact information.
   c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
   d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).
   a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
   a. Alternatives to the project.
   b. Recommended mitigation measures.
   c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
   a. Type of environmental review necessary.
   b. Significance of the tribal cultural resources.
   c. Significance of the project's impacts on tribal cultural resources.
   d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
   a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
   b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

SCAG 2016 RTP/SCS GOALS		
	Goal	Analysis
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
etc.		etc.

2016 RTP/SCS STRATEGIES

To achieve the goals of the 2016 RTP/SCS, a wide range of land use and transportation strategies are included in the 2016 RTP/SCS. Technical appendances of the 2016 RTP/SCS provide additional supporting information in detail. To view the 2016 RTP/SCS, please visit: http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx. The 2016 RTP/SCS builds upon the progress from the 2012 RTP/SCS and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that the SCAG region strives toward a more sustainable region, while the region meets and exceeds in meeting all of applicable statutory requirements pertinent to the 2016 RTP/SCS. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

DEMOGRAPHICS AND GROWTH FORECASTS

Local input plays an important role in developing a reasonable growth forecast for the 2016 RTP/SCS. SCAG used a bottom-up local review and input process and engaged local jurisdictions in establishing the base geographic and socioeconomic projections including population, household and employment. At the time of this letter, the most recently adopted SCAG jurisdictional-level growth forecasts that were developed in accordance with the bottom-up local review and input process consist of the 2020, 2035, and 2040 population, households and employment forecasts. To view them, please visit http://www.scag.ca.gov/Documents/2016GrowthForecastByJurisdiction.pdf. The growth forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts			Adopted City of Corona Forecasts		
	Year 2020	Year 2035	Year 2040	Year 2020	Year 2035	Year 2040
Population	19,663,000	22,091,000	22,138,800	166,100	170,500	172,300
Households	6,458,000	7,325,000	7,412,300	49,500	51,300	52,000
Employment	8,414,000	9,441,000	9,871,500	74,300	82,300	88,400

MITIGATION MEASURES

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for the 2016 RTP/SCS for guidance, as appropriate. SCAG's Regional Council certified the Final PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on April 7, 2016 (please see: http://scagrtpscs.net/Pages/FINAL2016PEIR.aspx). The Final PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

Attention: Sandra Yang

Re: GPA 2019-0002, SPA 2019-0005,
Parcel Map 37788 and PP 2019-0008

The Riverside County Flood Control and Water Conservation District (District) does not usually review land divisions/land use cases or provide State Division of Real Estate letters/flood hazard reports for projects that are located within incorporated cities. Exceptions are made for cases with items of specific interest to the District including District Master Drainage Plan facilities, other regional flood control and drainage facilities which could be considered a logical component or extension of a master plan system, and District Area Drainage Plan fees (development mitigation fees).

The District's review is based on the above-referenced project transmittal, November 12, 2019. The District **has not** reviewed the proposed project in detail, and the following comments do not in any way constitute or imply District approval or endorsement of the proposed project with respect to flood hazard, public health and safety, or any other such issue:

☒ This project would not be impacted by District Master Drainage Plan facilities, nor are other facilities of regional interest proposed.

☐ This project involves District proposed Master Drainage Plan facilities, namely, _____. The District will accept ownership of such facilities on written request of the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection, and administrative fees will be required.

☐ This project proposes channels, storm drains 36 inches or larger in diameter, or other facilities that could be considered regional in nature and/or a logical extension of an existing District's facility. The District would consider accepting ownership of such facilities on written request from the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection, and administrative fees will be required.

☐ An encroachment permit shall be obtained for any construction related activities occurring within District right of way or facilities, namely, _____. For further information, contact the District's Encroachment Permit Section at 951.955.1266.

☐ The District's previous comments are still valid.

City of Corona
Re: GPA 2019-0002, SPA 2019-0005,
Parcel Map 37788 and PP 2019-0008

228348

GENERAL INFORMATION

This project may need to obtain an applicable National Pollutant Discharge Elimination System (NPDES) permit coverage from the State Water Resources Control Board or the California Regional Water Quality Control Board. Clearance for grading, recordation, or other final approval should not be given until the City has determined that the project has been granted a permit or is shown to be exempt.

If this project involves a Federal Emergency Management Agency (FEMA) mapped floodplain, then the City should require the applicant to provide all studies, calculations, plans, and other information required to meet FEMA requirements, and should further require that the applicant obtain a Conditional Letter of Map Revision (CLOMR) prior to grading, recordation, or other final approval of the project and a Letter of Map Revision (LOMR) prior to occupancy.

If a natural watercourse or mapped floodplain is impacted by this project, the City should require the applicant to obtain a Section 1601/1603 Agreement from the California Department of Fish and Wildlife and a Clean Water Act Section 404 Permit from the U.S. Army Corps of Engineers, or written correspondence from these agencies indicating the project is exempt from these requirements. A Clean Water Act Section 401 Water Quality Certification may be required from the local California Regional Water Quality Control Board prior to issuance of the Corps 404 permit.

Very truly yours,

Deborah de Chambeau

November 26, 2019

Mr. Glen Powels
Guardian Capital
5780 Fleet Street, Suite 225
Carlsbad, CA 92008

SUBJECT: BEDFORD MARKETPLACE AIR QUALITY AND GREENHOUSE GAS MEMORANDUM

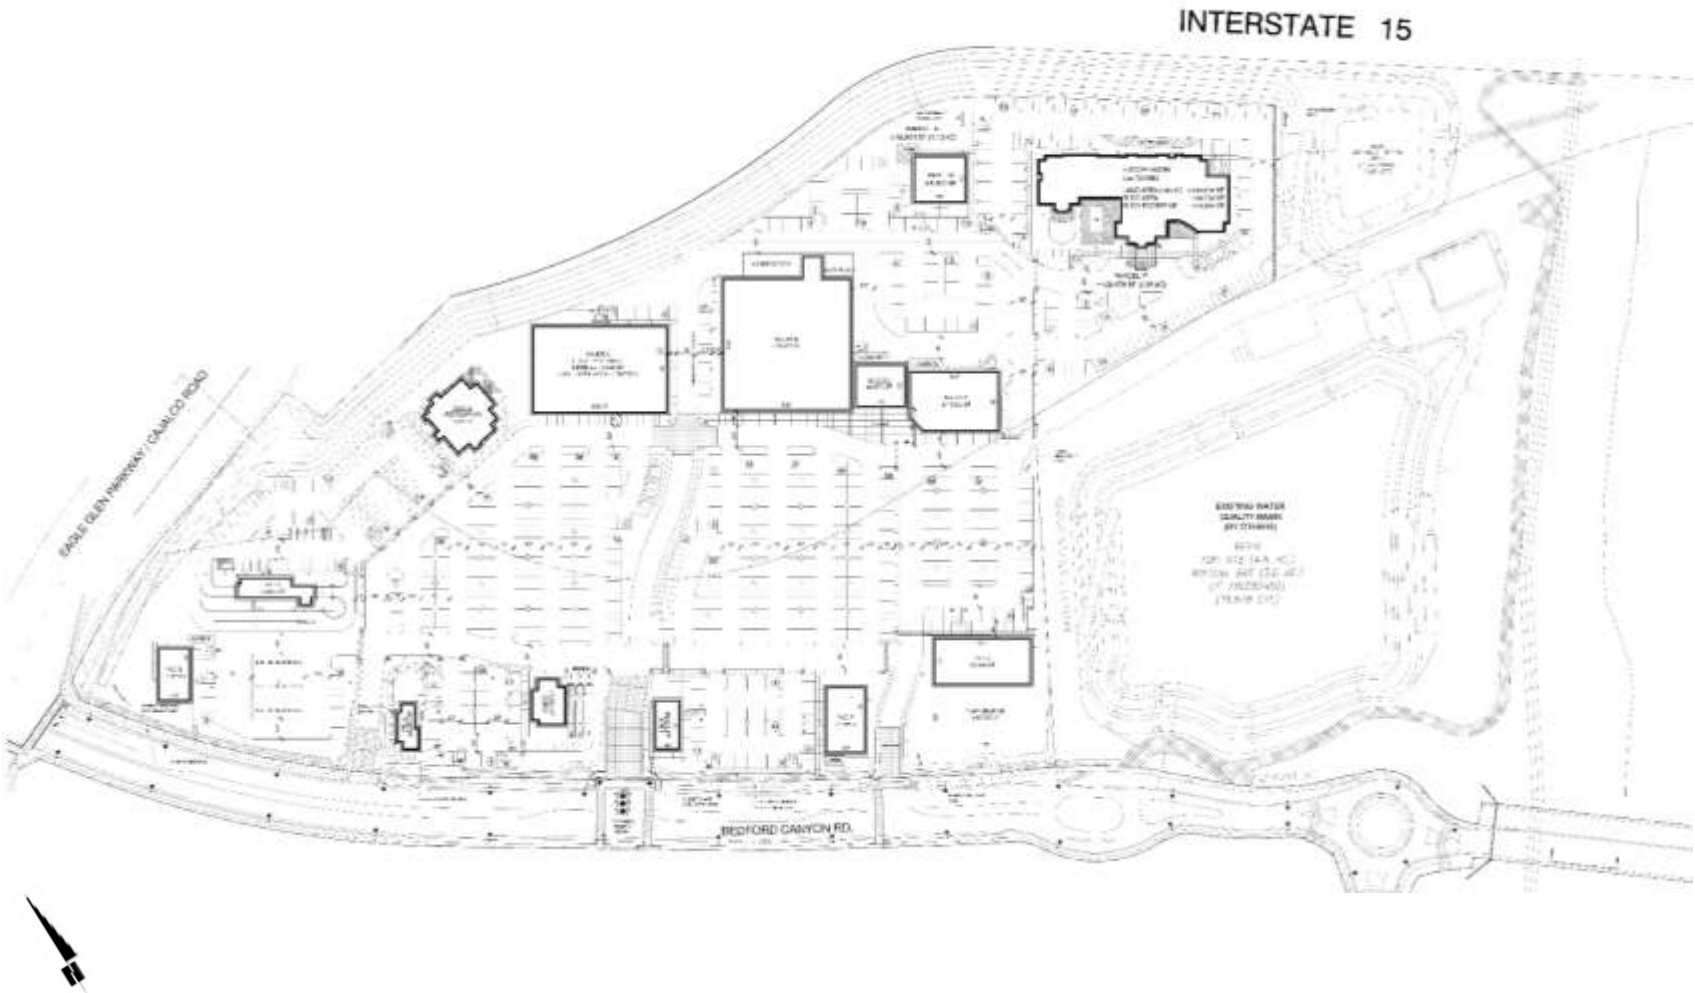
Dear Mr. Glen Powels:

The purpose of this memorandum is to determine the potential air quality and greenhouse gas (GHG) impacts associated with the development of the proposed Bedford Marketplace ("Project") an expansion of the previously approved commercial development area included within the Arantine Hills Specific Plan. The 80,000 square feet (sf) of commercial retail use included in the Arantine Hills Specific Plan was evaluated in prior studies prepared for amendments to the Arantine Hills Specific Plan. The proposed Project represents the expansion of Bedford Marketplace from 80,000 sf to 135,000 sf of retail uses and a 135-room hotel. Consistent with the *Bedford Marketplace Traffic Study* prepared by Urban Crossroads, Inc., the incremental expansion of Bedford Marketplace constitutes the "Project" analyzed in this study (1). Reference to "Bedford Marketplace" includes the total development of the center, equal to the combination of the proposed Project and the previously approved 80,000 sf in the Arantine Hills Specific Plan. Based on the currently approved commercial trip generation in the *Arantine Hills Traffic Assessment* (November 2018), the Project is anticipated to generate an additional 2,061 external trips per day.

SITE LOCATION

The Project site is located south of Eagle Glen Parkway – Cajalco Road and west of the I-15 Freeway in the City of Riverside as shown on Exhibit A. The Project site is currently vacant. Nearby existing residential land uses are located north, west, and south of the Project site. Commercial land uses near the Project site are located to the north at the I-15 Freeway southbound off-ramp, and east of the I-15 Freeway north of Cajalco Road. The Corona Municipal Airport is located approximately 6.5 miles northwest of the Project site.

BEDFORD MARKETPLACE LAND USE DESCRIPTION



The Bedford Marketplace site plan (shown on Exhibit B) expands the approved commercial site and is proposed to consist of the following uses:

- Hotel - 135 rooms
- Health/fitness club - 38,000 sf
- Day Care Center - 9,990 sf
- Retail Shopping Center – 51,000 sf
- Bank – 6,562 sf
- Restaurant – 21,230 sf
- Gas Station – 18-vehicle fueling positions (vfp)
- Automated Car Wash – 3,600 sf

EXHIBIT A: LOCATION MAP

EXHIBIT B: BEDFORD MARKETPLACE SITE PLAN

PROJECT AIR QUALITY IMPACT ANALYSIS

CONSTRUCTION EMISSIONS

Construction activities associated with the Project would result in emissions of carbon monoxide (CO), Volatile Organic Compounds (VOCs), Nitrogen Oxides (NO_X), Sulfur Oxides (SO_X), particulate matter ≤ 10 microns (PM_{10}), and particulate matter ≤ 2.5 microns ($PM_{2.5}$). The duration of construction activity was based on the 2021 Opening Year. The construction schedule utilized in the analysis, shown in Table 1, represents a "worst-case" analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as time passes and the analysis year increases due to emission regulations becoming more stringent.[1]

TABLE 1: CONSTRUCTION DURATION

Phase Name	Start Date	End Date	Days
Dirt Import Process			
Import Activities	01/01/2020	06/24/2020	126
Grading	01/01/2020	06/24/2020	126
Construction Process			
Site Preparation	06/25/2020	07/08/2020	10
Grading	07/09/2020	08/26/2020	35
Building Construction	08/27/2020	12/29/2021	350
Paving	12/02/2021	12/29/2021	20
Architectural Coating	12/02/2021	12/29/2021	20

Grading Activities

The activities associated with the Project are intended to bring the Modified Bedford Marketplace Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad, import of approximately 440,000 cubic yards of dirt is required. The import operation is expected to include 232 full loads per night, assuming 15 cubic yards per load, for a total of 3,500 cubic yards per night. To import 440,000 cubic yards, approximately 126 nights of import would be required.

The Applicant proposes to import dirt during the hours (8 pm to 4 am) and complete grading operations both during daytime and nighttime hours. A source of import has been identified from the FST Sand and Gravel Mine, located east of the I-15 Freeway as shown on Exhibit C.

[1] As shown in the CalEEMod User's Guide Version 2016.3.2, Section 4.3 "OFFROAD Equipment" as the analysis year increases, emission factors for the same equipment pieces decrease due to the natural turnover of older equipment being replaced by newer less polluting equipment and new regulatory requirements.

EXHIBIT C: SOIL IMPORT/EXPORT HAUL TRUCK ROUTE

EXHIBIT D: PHASE 2B BORROW SITE LOCATION

The dirt would be hauled from the borrow site on Minnesota Road to Sherborn Street to Magnolia Avenue to the I-15 Freeway southbound on ramp at Magnolia Avenue, exit at Cajalco Road and enter the Modified Project Site by crossing Cajalco Road from the southbound off-ramp with traffic control. Trucks would return onto Cajalco Road, enter I-15 Freeway northbound to Magnolia Avenue to Sherborn Street and travel south to the borrow site for a total haul route distance (one-way) of approximately 5 miles. Notwithstanding, in the event that other borrow sites may be utilized, the analysis herein assumes a haul route distance (one-way) of up to 6.0 miles as a conservative measure.

Additionally, there is potential that dirt may be obtained from the adjacent Arantine Hills Specific Plan Phase 2B borrow site. As such, the applicant has identified two potential borrow sites to provide the necessary fill dirt. The FST Sand and Gravel Mine, located east of the I-15 Freeway and the Arantine Hills Specific Plan, as shown on Exhibit C and the Phase 2B site as shown on Exhibit D. It should be noted that if the Phase 2B site is utilized as a borrow site, dirt from Phase 2B would be pushed via scrapers as part of the grading equipment identified below and would not be hauled by truck. As such, no additional impacts beyond what is already identified herein would occur if the dirt were to be obtained from Phase 2B.

The associated construction equipment was generally based on information provided by the Project Applicant and CalEEMod defaults. A detailed summary of construction equipment assumptions by phase is provided at Table 2.

TABLE 2: CONSTRUCTION EQUIPMENT

Activity	Equipment	Amount	Hours Per Day
Dirt Import Process			
Import	Water Truck	1	8
	Street Sweeper	1	8
	Rubber Tired Dozers	1	8
	Tractors/Loaders/Backhoes	1	8
Grading	Water Truck	1	8

REGIONAL CONSTRUCTION EMISSIONS SUMMARY

Without Mitigation

The estimated maximum daily regional construction emissions are summarized on Table 3. Detailed construction model outputs are presented in Attachment A. Under the assumed scenarios, emissions resulting from the Project construction would exceed criteria pollutant thresholds established by the SCAQMD for emissions of NO_X during hauling activity associated with dirt import activity.

TABLE 3: PROJECT REGIONAL CONSTRUCTION EMISSIONS SUMMARY (WITHOUT MITIGATION)

Phase	Emissions (lbs/day)					
	VOC	**NO_X**	**CO**	**SO_X**	**PM_{10}**	**$PM_{2.5}$**
Summer						
2020 (Dirt Import Process)	8.86	149.11	54.15	0.26	12.89	6.75
2020 (Construction Process)	4.97	50.27	39.65	0.12	10.89	6.11
2021 (Construction Process)	65.75	50.91	58.59	0.15	8.57	3.57
Winter						
2020 (Dirt Import Process)	8.99	147.70	56.45	0.25	12.90	6.75
2020 (Construction Process)	5.00	50.27	36.91	0.11	10.89	6.11
2021 (Construction Process)	65.78	50.83	55.33	0.15	8.57	3.57
Maximum Daily Emissions	**65.78**	**149.11**	**58.59**	**0.26**	**12.90**	**6.75**
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	**NO**	**YES**	**NO**	**NO**	**NO**	**NO**

Recommended Mitigation Measure

MM AQ-1

When using construction equipment greater than 150 horsepower (>150 HP) during dirt import/hauling activity, the Construction Contractor shall ensure that off-road diesel construction equipment complies with Environmental Protection Agency (EPA)/California Air Resources Board (CARB) Tier 4 emission standards or equivalent and shall ensure that all construction equipment is turned and maintained in accordance with the manufacturer's specifications.

With Mitigation

The estimated maximum daily regional construction emissions are summarized on Table 4 with implementation of MM AQ-1. Detailed construction model outputs are presented in Attachment B. After implementation of MM AQ-1, Project construction-source emissions of NO_X would not exceed the applicable SCAQMD thresholds. Thus, a less than significant impact would occur for Project-related construction-source emission.

TABLE 4: PROJECT REGIONAL CONSTRUCTION EMISSIONS SUMMARY (WITH MITIGATION)

Phase	Emissions (lbs/day)					
	VOC	NO_X	CO	SO_X	PM_{10}	$PM_{2.5}$
Summer						
2020 (Dirt Import Process)	4.49	94.52	51.69	0.26	10.51	4.56
2020 (Construction Process)	4.59	34.09	40.13	0.12	9.27	4.62
2021 (Construction Process)	65.41	46.37	59.21	0.15	8.39	3.39
Winter						
2020 (Dirt Import Process)	4.62	93.11	53.99	0.25	10.51	4.57

SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**	**NO**	**NO**

OPERATIONAL EMISSIONS

Operational activities associated with the Project would result in emissions of CO, VOCs, NO_X, SO_X, PM_{10}, and $PM_{2.5}$. Operational related emissions are expected from the following primary sources: area source emissions, energy source emissions, mobile source emissions, and on-site equipment emissions.

Area Source Emissions

Architectural Coatings – Over a period of time, the buildings that are part of this Project will be subject to emissions resulting from the evaporation of solvents contained in paints, varnishes, primers, and other surface coatings as part of Project maintenance. The emissions associated with architectural coatings were calculated using the CalEEMod.

Consumer Products – Consumer products include, but are not limited to detergents, cleaning compounds, polishes, personal care products, and lawn and garden products. Many of these products contain organic compounds which when released in the atmosphere can react to form ozone and other photochemically reactive pollutants. The emissions associated with use of consumer products were calculated based on defaults provided within CalEEMod.

Landscape Maintenance Equipment – Landscape maintenance equipment would generate emissions from fuel combustion and evaporation of unburned fuel. Equipment in this category would include lawnmowers, shedders/grinders, blowers, trimmers, chain saws, and hedge trimmers used to maintain the landscaping of the Project. The emissions associated with landscape maintenance equipment were calculated based on assumptions provided in CalEEMod.

Energy Source Emissions

Combustion Emissions Associated with Natural Gas and Electricity – Electricity and natural gas are used by almost every project. Criteria pollutant emissions are emitted through the generation of electricity and consumption of natural gas. However, because electrical generating facilities for the Project area are located either outside the region (state) or offset through the use of pollution credits (RECLAIM) for generation within the SCAB, criteria pollutant emissions from offsite generation of electricity is generally excluded from the evaluation of significance and only natural gas use is considered. The emissions associated with natural gas use were calculated using CalEEMod.

Title 24 Energy Efficiency Standards – California's Energy Efficiency Standards for Residential and Nonresidential Buildings was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption. The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity. The 2019 version of Title 24 was adopted by the CEC and will become effective on January 1, 2020. As a conservative measure, the analysis herein assumes compliance with the 2016 Title 24 Standards and no additional reduction for compliance with the 2019 standards have been taken.

Mobile Source Emissions

Project mobile source emissions impacts are primarily dependent overall daily vehicle trip generation. According to the *Bedford Marketplace Traffic Study*, the Project is anticipated to generate an additional 2,061 external trips per day (1).

REGIONAL OPERATIONAL EMISSIONS SUMMARY

Table 5 summarizes the Project's daily regional emissions from on-going operations. Detailed operational model outputs are presented in Attachment B. As shown, during operational activity, the net increase in emissions associated with Project-related activity would not exceed the SCAQMD regional thresholds of significance for emissions of any criteria pollutant.

TABLE 5: OPERATIONAL EMISSIONS SUMMARY (BEDFORD MARKETPLACE VS. 80 TSF COMMERCIAL USES)

Operational Activities – Summer Scenario	**Emissions (lbs/day)**					
	VOC	**NO_X**	**CO**	**SO_X**	**PM_{10}**	**$PM_{2.5}$**
Bedford Marketplace Maximum Daily Emissions	45.50	106.89	206.50	0.48	36.83	10.50

LOCALIZED CONSTRUCTION EMISSIONS SUMMARY

The analysis makes use of methodology included in the SCAQMD *Final Localized Significance Threshold Methodology* (LST Methodology) (2). The SCAQMD has established that impacts to air quality are significant if there is a potential to contribute or cause localized exceedances of the federal and/or state ambient air quality standards (NAAQS/CAAQS). Collectively, these are referred to as Localized Significance Thresholds (LSTs). The SCAQMD established LSTs in response to the SCAQMD Governing Board's Environmental Justice Initiative I-4[2]. LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard at the sensitive receptor. The SCAQMD states that lead agencies can use the LSTs as another indicator of significance in its air quality impact analyses.

Sensitive Receptors

Receptor locations are off-site locations where individuals may be exposed to emissions from Project activities. This Memorandum analyzes localized construction and operational emissions impacts at the nearest sensitive receptors.

Residential Receptors – Some people are especially sensitive to air pollution and are given special consideration when evaluating air quality impacts from projects. These groups of people include children, the elderly, individuals with pre-existing respiratory or cardiovascular illness, and athletes and others who engage in frequent exercise. Structures that house these persons or places where they gather to exercise are defined as "sensitive receptors". These structures typically include residences, hotels, hospitals, etc. as they are also known to be locations where an individual can remain for 24 hours. Consistent with the *LST Methodology*, the nearest land use where an individual could remain for 24 hours to the Project site (in this case the nearest residential land use) has been used to determine construction and operational air quality impacts for emissions of PM_{10} and $PM_{2.5}$, since PM_{10} and $PM_{2.5}$ thresholds are based on a 24 hour averaging time.

Non-Residential Receptors – As per the *LST Methodology*, commercial and industrial facilities are not included in the definition of sensitive receptor because employees do not typically remain onsite for a full 24 hours but are typically onsite for 8 hours. However, it should be noted that the *LST Methodology* explicitly states that "*LSTs based on shorter averaging periods, such as the NO_2 and CO LSTs, could also be applied to receptors such as industrial or commercial facilities since it is reasonable to assume that a worker at these sites could be present for periods of one to eight hours* (2)." Consistent with the SCAQMD's Final LST Methodology, the nearest industrial or commercial use to the Project site will be used to determine operational and construction air impacts for emissions of NO_2 and CO. Receptors in the Project study area are shown on Exhibit E as they relate to the Project site and potential Phase 2B borrow site.

[2] The purpose of SCAQMD's Environmental Justice program is to ensure that everyone has the right to equal protection from air pollution and fair access to the decision-making process that works to improve the quality of air within their communities. Further, the SCAQMD defines Environmental Justice as "…equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution."

EXHIBIT E: RECEPTOR LOCATIONS

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Project's potential to cause an individual and cumulatively significant impact. As such, the nearest sensitive receptor for evaluation of localized PM_{10} and $PM_{2.5}$ emissions are the existing residential homes represented by R4, R5, and R6 which are located 20 feet/ 6 meters east from the Project site. It should be noted that he *LST Methodology* explicitly states that "*It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters* (2)." As such, a 25-meter receptor distance will be utilized as a screening threshold to determine LSTs for emissions of PM_{10} and $PM_{2.5}$. For evaluation of localized NO_X and CO emissions, the same 25-meter distance used for evaluation of localized PM_{10} and $PM_{2.5}$ emissions will be utilized as an individual can remain at these locations for an 8-hour period.

Table 6 identifies the localized impacts at the nearest receptor location in the vicinity of the Project. Outputs from the model runs for construction LSTs are provided in Attachment A. Under the assumed scenarios, emissions resulting from the Project construction will not exceed the numerical thresholds of significance established by the SCAQMD for any criteria pollutant. Thus, a less than significant impact would occur for localized Project-related construction-source emissions and no mitigation is required.

TABLE 6: PROPOSED PROJECT LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION

On-Site Dirt Import Process – Site Preparation	**Emissions (lbs/day)**			
	NO_X	**CO**	**PM_{10}**	**$PM_{2.5}$**

Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**

LOCALIZED OPERATIONAL EMISSIONS SUMMARY

The proposed project involves the construction and operation 135,000 sf of retail uses and a 135-room hotel. According to SCAQMD LST methodology, LSTs would apply to the operational phase of a proposed project, if the project includes stationary sources, or attracts mobile sources that may spend long periods queuing and idling at the site (e.g., warehouse or transfer facilities). The proposed project does not include such uses, and thus, due to the lack of stationary source emissions, no long-term localized significance threshold analysis is needed.

GREENHOUSE GAS EMISSIONS

As shown on Table 7, the Project would generate a total of approximately 8,537.89 $MTCO_2e$ per year. The net increase in GHG emissions is estimated to be 3,325.07 $MTCO_2e$ per year. Notwithstanding, the Project will be required to adhere to and implement a minimum of 100 points pursuant to the City of Corona's Climate Action Plan (CAP). Detailed model outputs are presented in Attachment C for the Project.

TABLE 7: PROPOSED PROJECT GHG EMISSIONS

Emission Source	Emissions (MT/yr)
	Total CO_2e
Bedford Marketplace	**8,537.89**
80 TSF Commercial	**5,212.83**
Net Increase	***3,325.07***

MT/yr = metric tons per year

CONCLUSIONS

Based on the preceding, the Project is not anticipated to result in any new impacts as compared to the Currently Approved Project as previously analyzed.

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - The Dirt Import Process anticipated to 126 days.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Trips and VMT - Hauling trips based on the amount of import and the 15 cubic yard hauling capacity.

Grading - For purposes of analysis, total acres graded per day is based on the equipment specific grading rates (CalEEMod Appendix A) and the equipment list.

Architectural Coating -

Vehicle Trips - Construction Run Only.

Energy Use - Construction Run Only.

Water And Wastewater - Construction Run Only.

Solid Waste - Construction Run Only.

Construction Off-road Equipment Mitigation - Rule 403

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - The Dirt Import Process anticipated to 126 days.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Trips and VMT - Hauling trips based on the amount of import and the 15 cubic yard hauling capacity.

Grading - For purposes of analysis, total acres graded per day is based on the equipment specific grading rates (CalEEMod Appendix A) and the equipment list.

Architectural Coating -

Vehicle Trips - Construction Run Only.

Energy Use - Construction Run Only.

Water And Wastewater - Construction Run Only.

Solid Waste - Construction Run Only.

Construction Off-road Equipment Mitigation - Rule 403

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - The Dirt Import Process anticipated to 126 days.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Trips and VMT - Hauling trips based on the amount of import and the 15 cubic yard hauling capacity.

Grading - For purposes of analysis, total acres graded per day is based on the equipment specific grading rates (CalEEMod Appendix A) and the equipment list.

Architectural Coating -

Vehicle Trips - Construction Run Only.

Energy Use - Construction Run Only.

Water And Wastewater - Construction Run Only.

Solid Waste - Construction Run Only.

Construction Off-road Equipment Mitigation - All equipment operating at >150 HP shall comply with EPA/CARB Tier 4 emissions standards

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - The Dirt Import Process anticipated to 126 days.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Trips and VMT - Hauling trips based on the amount of import and the 15 cubic yard hauling capacity.

Grading - For purposes of analysis, total acres graded per day is based on the equipment specific grading rates (CalEEMod Appendix A) and the equipment list.

Architectural Coating -

Vehicle Trips - Construction Run Only.

Energy Use - Construction Run Only.

Water And Wastewater - Construction Run Only.

Solid Waste - Construction Run Only.

Construction Off-road Equipment Mitigation - All equipment operating at >150 HP shall comply with EPA/CARB Tier 4 emissions standards

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - Operations Run Only.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Operations Run Only.

Trips and VMT - Operations Run Only.

Grading -

Architectural Coating - Rule 1113

Vehicle Trips - Trip Rates based on information provided in the TIA.

Energy Use - Energy rates for User Defined Recreational (Coffee/Shop use) reflect the CalEEMod default rates for Fast-Food Restaurant with Drive Thru.

Water And Wastewater - Water rates adjusted to assume that half of the trips to the car wash will use approximately 30 gallons of water

Solid Waste -

Construction Off-road Equipment Mitigation -

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Bank (with Drive-Through)	6.00	1000sqft	0.14	6,000.00	0
Day-Care Center	9.99	1000sqft	0.23	9,990.00	0
Other Asphalt Surfaces	408.85	1000sqft	9.39	408,852.00	0
Parking Lot	890.00	Space	8.17	356,000.00	0
Health Club	38.00	1000sqft	0.87	38,000.00	0
High Turnover (Sit Down Restaurant)	5.83	1000sqft	0.13	5,826.00	0
Hotel	135.00	Room	0.57	88,730.00	0
Quality Restaurant	13.20	1000sqft	0.30	13,200.00	0
User Defined Recreational	2.20	User Defined Unit	0.05	2,200.00	0
Automobile Care Center	3.60	1000sqft	0.08	3,600.00	0
Gasoline/Service Station	18.00	Pump	0.09	4,000.00	0
Regional Shopping Center	51.00	1000sqft	1.17	51,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - Operations Run Only.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Operations Run Only.

Trips and VMT - Operations Run Only.

Grading -

Architectural Coating - Rule 1113

Vehicle Trips - Trip Rates based on information provided in the TIA.

Energy Use - Energy rates for User Defined Recreational (Coffee/Shop use) reflect the CalEEMod default rates for Fast-Food Restaurant with Drive Thru.

Water And Wastewater - Water rates adjusted to assume that half of the trips to the car wash will use approximately 30 gallons of water

Solid Waste -

Construction Off-road Equipment Mitigation -

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - The Dirt Import Process anticipated to 126 days.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Off-road Equipment - Equipment adjusted per information provided by the Project Applicant.

Trips and VMT - Hauling trips based on the amount of import and the 15 cubic yard hauling capacity.

Grading - For purposes of analysis, total acres graded per day is based on the equipment specific grading rates (CalEEMod Appendix A) and the equipment list.

Architectural Coating -

Vehicle Trips - Construction Run Only.

Energy Use - Construction Run Only.

Water And Wastewater - Construction Run Only.

Solid Waste - Construction Run Only.

Construction Off-road Equipment Mitigation - All equipment operating at >150 HP shall comply with EPA/CARB Tier 4 emissions standards

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - Construction Scheduled adjsuted to meet the 2021 Opening Year.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Hours are based on an 8-hour workday

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Grading - For purposes of analysis, total acres graded per day is based on the equipment specific grading rates (CalEEMod Appendix A) and the equipment list.

Architectural Coating - Rule 1113

Vehicle Trips - Construction Run Only.

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Energy Use - Construction Run Only.

Water And Wastewater - Construction Run Only.

Solid Waste - Construction Run Only.

Construction Off-road Equipment Mitigation - All equipment operating at >150 HP are required to be equipped with Tier 4 engines

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - Operations Run Only.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Operations Run Only.

Trips and VMT - Operations Run Only.

Grading -

Architectural Coating - Rule 1113

Vehicle Trips - Trip Rates based on information provided in the TIA.

Energy Use - Energy rates for User Defined Recreational (Coffee/Shop use) reflect the CalEEMod default rates for Fast-Food Restaurant with Drive Thru.

Water And Wastewater - Water rates adjusted to assume that half of the trips to the car wash will use approximately 30 gallons of water

Solid Waste -

Construction Off-road Equipment Mitigation -

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - Operations Run Only.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Operations Run Only.

Trips and VMT - Operations Run Only.

Grading -

Architectural Coating - Rule 1113

Vehicle Trips - Trip Rates based on information provided in the TIA.

Energy Use - Energy rates for User Defined Recreational (Coffee/Shop use) reflect the CalEEMod default rates for Fast-Food Restaurant with Drive Thru.

Water And Wastewater - Water rates adjusted to assume that half of the trips to the car wash will use approximately 30 gallons of water

Solid Waste -

Construction Off-road Equipment Mitigation -

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - Operations Run Only.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Operations Run Only.

Trips and VMT - Operations Run Only.

Grading -

Architectural Coating - Rule 1113

Vehicle Trips - Trip Rates based on information provided in the TIA.

Energy Use - Energy rates for User Defined Recreational (Coffee/Shop use) reflect the CalEEMod default rates for Fast-Food Restaurant with Drive Thru.

Water And Wastewater - Water rates adjusted to assume that half of the trips to the car wash will use approximately 30 gallons of water

Solid Waste -

Construction Off-road Equipment Mitigation -

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Bank (with Drive-Through)	6.00	1000sqft	0.14	6,000.00	0
Day-Care Center	9.99	1000sqft	0.23	9,990.00	0
Other Asphalt Surfaces	408.85	1000sqft	9.39	408,852.00	0
Parking Lot	890.00	Space	8.17	356,000.00	0
Health Club	38.00	1000sqft	0.87	38,000.00	0
High Turnover (Sit Down Restaurant)	5.83	1000sqft	0.13	5,826.00	0
Hotel	135.00	Room	0.57	88,730.00	0
Quality Restaurant	13.20	1000sqft	0.30	13,200.00	0
User Defined Recreational	2.20	User Defined Unit	0.05	2,200.00	0
Automobile Care Center	3.60	1000sqft	0.08	3,600.00	0
Gasoline/Service Station	18.00	Pump	0.09	4,000.00	0
Regional Shopping Center	51.00	1000sqft	1.17	51,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	32
Climate Zone	10			**Operational Year**	2021
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Net Land Area per the Site Plan is +/-21.2 acres.

Construction Phase - Operations Run Only.

Off-road Equipment - Hours are based on an 8-hour workday.

Off-road Equipment - Operations Run Only.

Trips and VMT - Operations Run Only.

Grading -

Architectural Coating - Rule 1113

Vehicle Trips - Trip Rates based on information provided in the TIA.

Energy Use - Energy rates for User Defined Recreational (Coffee/Shop use) reflect the CalEEMod default rates for Fast-Food Restaurant with Drive Thru.

Water And Wastewater - Water rates adjusted to assume that half of the trips to the car wash will use approximately 30 gallons of water

Solid Waste -

Construction Off-road Equipment Mitigation -

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Vehicle Emission Factors - EMFAC2017

Carlsbad, CA 92008

SUBJECT: BEDFORD MARKETPLACE SOIL IMPORT/EXPORT AIR QUALITY ASSESSMENT

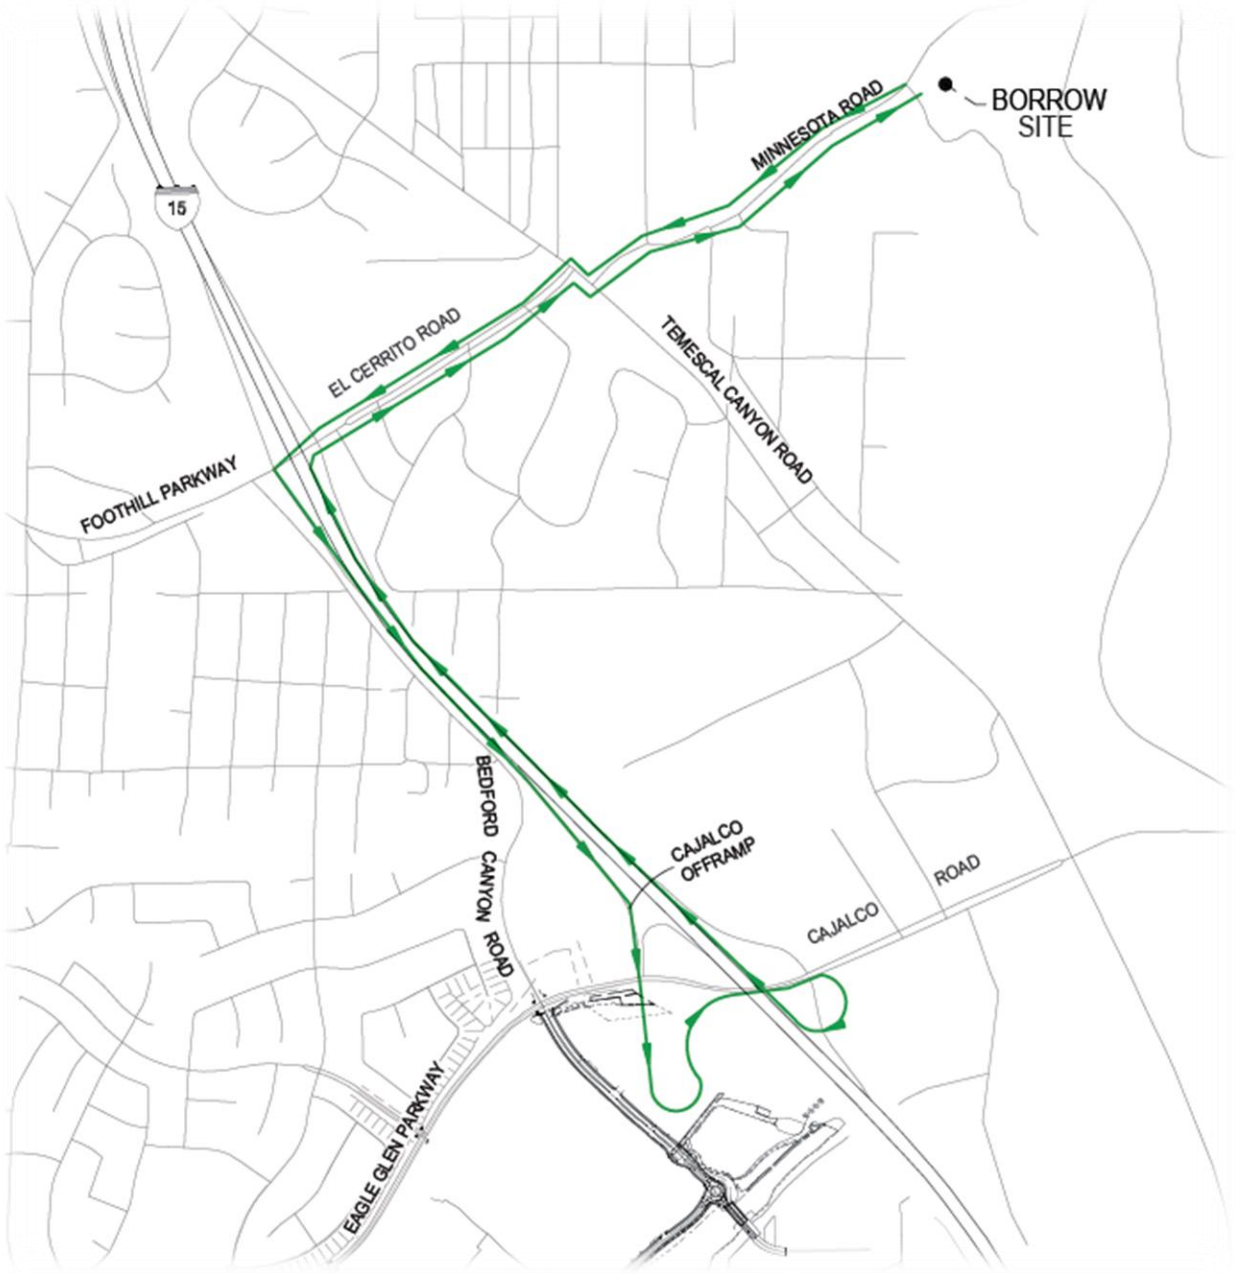
Dear Mr. Glen Powels:

The purpose of this Air Quality Assessment is to identify the potential air impacts associated with the Bedford Marketplace Soil Import/Export activities. ("Project").

SUMMARY OF FINDINGS

Results of the Memo indicate the construction and operations of the Project would result in *less than significant impacts* associated with air quality emissions after implementation of recommended mitigation measures.

PROJECT DESCRIPTION



The activities associated with the Project are intended to bring the Modified Bedford Marketplace Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad, import of approximately 440,000 cubic yards of dirt is required. The import operation is expected to include 250 full loads per night, assuming 14 cubic yards per load, for a total of 3,500 cubic yards per night. To import 440,000 cubic yards, approximately 126 nights of import would be required.

The Applicant proposes to import dirt during the hours (8 pm to 4 am) and complete grading operations both during daytime and nighttime hours. A source of import has been identified from the FST Sand and Gravel Mine, located east of I-15. The dirt would be hauled from the borrow site on El Cerrito to I-15 southbound, exit at Cajalco Road and enter the Modified Project Site by crossing Cajalco Road from the southbound off-ramp with traffic control. Trucks would return onto Cajalco Road, enter I-15 northbound to El Cerrito Road and travel east to the borrow site. Exhibit A presents the proposed haul routes.

SOIL IMPORT/EXPORT HAUL TRUCK TRAFFIC

The Project haul truck trips include the both the 250 import and 250 export trips representing a total of 500 two-way (import and export) trips per day.

EXHIBIT A: PROPOSED HAUL ROUTES

BEST AVAILABLE CONTROL MEASURES (BACMS)

BACM AQ-1

All applicable measures included in Rule 403, shall be incorporated into Project plans and specifications as implementation of Rule 403, which include but are not limited to (1):

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that traffic speeds on unpaved roads and Project site areas are limited to 15 miles per hour or less.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Project are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.

RECOMMENDED MITIGATION MEASURE

MM AQ-1

When using construction equipment greater than 150 horsepower (>150 HP), the Construction Contractor shall ensure that off-road diesel construction equipment complies with EPA/CARB Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications.

CONSTRUCTION EMISSIONS

On October 17, 2017, the SCAQMD in conjunction with the CAPCOA and other California air districts, released the latest version of the California Emissions Estimator Model™ (CalEEMod™) v2016.3.2. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures (35). Accordingly, the latest version of CalEEMod™ has been used for this Project to determine construction air quality emissions.

The number of days of construction are shown on Table 1, as a conservative measure, it is anticipated that all daytime and night time activities would occur concurrently for 126 days. Equipment employed for Project construction activities are based on information provided by the project applicant, as shown on Table 2. Air quality outputs from the model runs are provided in Attachment A.

Grading

The Project is anticipated to include soil import as a part of Project construction. Based on information provided by the Project Applicant, the Project is expected require 440,000 cubic yards soil import. For

purposes of analysis, 440,000 cubic yards of import will be analyzed and with a hauling trip length of 2.8 miles.

REGIONAL CONSTRUCTION EMISSIONS

Impacts without Mitigation

The estimated maximum daily regional construction emissions without mitigation are summarized on Table 3. Under the assumed scenarios, emissions resulting from the Project construction would exceed criteria pollutant thresholds established by the SCAQMD for emissions of NO_X.

Impacts with Mitigation

The estimated maximum daily regional construction emissions without mitigation are summarized on Table 4. After implementation of MM AQ-1, emissions resulting from the Project construction would not exceed criteria pollutant thresholds established by the SCAQMD for emissions of any criteria pollutant. Thus, a less than significant impact would occur for Project-related construction-source emissions with implementation of MM AQ-1.

LOCALIZED SIGNIFICANCE - CONSTRUCTION ACTIVITY

BACKGROUND ON LOCALIZED SIGNIFICANCE THRESHOLD (LST) DEVELOPMENT

The analysis makes use of methodology included in the SCAQMD *Final Localized Significance Threshold Methodology* (LST Methodology) (2). The SCAQMD has established that impacts to air quality are significant if there is a potential to contribute or cause localized exceedances of the federal and/or state ambient air quality standards (NAAQS/CAAQS). Collectively, these are referred to as Localized Significance Thresholds (LSTs).

The significance of localized emissions impacts depends on whether ambient levels in the vicinity of any given project are above or below State standards. In the case of CO and NO_2, if ambient levels are below the standards, a project is considered to have a significant impact if project emissions result in an exceedance of one or more of these standards. If ambient levels already exceed a state or federal standard, then project emissions are considered significant if they increase ambient concentrations by a measurable amount. This would apply to PM_{10} and $PM_{2.5}$; both of which are non-attainment pollutants.

The SCAQMD established LSTs in response to the SCAQMD Governing Board's Environmental Justice Initiative I-4[1]. LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard at the nearest residence or sensitive receptor. The SCAQMD states that lead agencies can use the LSTs as another indicator of significance in its air quality impact analyses.

LSTs were developed in response to environmental justice and health concerns raised by the public regarding exposure of individuals to criteria pollutants in local communities. To address the issue of localized significance, the SCAQMD adopted LSTs that show whether a project would cause or contribute to localized air quality impacts and thereby cause or contribute to potential localized adverse health effects. The analysis makes use of methodology included in the *LST Methodology* (2).

SENSITIVE RECEPTORS

As previously stated, LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard at the nearest residence or sensitive receptor. Receptor locations are off-site locations where individuals may be exposed to emissions from Project activities. This assessment analyzes localized construction emissions impacts at the nearest sensitive receptors.

Some people are especially sensitive to air pollution and are given special consideration when evaluating air quality impacts from projects. These groups of people include children, the elderly, individuals with pre-existing respiratory or cardiovascular illness, and athletes and others who engage in frequent

[1] The purpose of SCAQMD's Environmental Justice program is to ensure that everyone has the right to equal protection from air pollution and fair access to the decision-making process that works to improve the quality of air within their communities. Further, the SCAQMD defines Environmental Justice as "…equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution."

exercise. Structures that house these persons or places where they gather to exercise are defined as "sensitive receptors"; they are also known to be locations where an individual can remain for 24 hours.

LOCALIZED CONSTRUCTION EMISSIONS

Impacts without Mitigation

Table 5 identifies the localized impacts at the nearest receptor location in the vicinity of the Project. Without mitigation, localized construction emissions would exceed the applicable SCAQMD LSTs for emissions of PM_{10} during import activities.

TABLE 5: LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION (WITHOUT MITIGATION)

On-Site Grading Emissions	Emissions (lbs/day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Maximum Daily Emissions	52.91	30.32	5.96	3.43
SCAQMD Localized Threshold	220	1,354	9	7
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**
On-Site Import Emissions	**Emissions (lbs/day)**			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Maximum Daily Emissions	25.00	14.34	4.13	2.46
SCAQMD Localized Threshold	118	674	4	3
Threshold Exceeded?	**NO**	**NO**	**YES**	**NO**

Impacts with Mitigation

Table 6 identifies the localized impacts at the nearest receptor location in the vicinity of the Project. MM AQ-1 is recommended to reduce the impacts during import activities. After implementation of MM AQ-1, localized construction emissions would not exceed the applicable SCAQMD LSTs for any criteria pollutant. Therefore, a less than significant impact would occur.

TABLE 6: LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION (WITH MITIGATION)

On-Site Import Emissions	Emissions (lbs/day)			
	NO_X	CO	PM_{10}	$PM_{2.5}$
Maximum Daily Emissions	14.12	14.05	3.59	1.96
SCAQMD Localized Threshold	118	674	4	3
Threshold Exceeded?	**NO**	**NO**	**NO**	**NO**

1.0 Introduction

On behalf of Bedford Marketplace, LLC (Applicant), Carlson Strategic Land Solutions (SLS) prepared this Biological Technical Report for the proposed Bedford Marketplace Project (Project) located on approximately 18 acres in the City of Corona. The Biological Technical Report for the approximately 18-acre Project site and the surrounding 500-feet, collectively known as the "Study Area," incorporates the findings from field surveys conducted on June 27, 2019; and a total of four focused Burrowing Owl Surveys conducted in June, July, and August 2019 (Appendix A).

1.1 Purpose and Approach

This report provides a summary of the conditions present during the 2019 field surveys, an assessment of the potential presence of sensitive biological resources, an analysis of the potential impacts to those resources due to Project implementation, and proposed mitigation. This report describes the current biological resources present within the Study Area including habitat communities, jurisdictional waters, and the potential occurrence of listed and special status plant and wildlife species. The potential biological significance of site construction and development in view of federal, state, and local laws and regulations are also identified in this report. The report also recommends, as appropriate, Best Management Practices (BMPs) and avoidance and minimization measures to reduce or avoid potential impacts. While general biological resources are discussed, the focus of this assessment is on those resources considered to be sensitive. This report was prepared based upon results of a literature review and field surveys.

1.2 Project Terms

The following terms will be used throughout this document and are defined as follows:

- Project site: the approximately 18-acre Bedford Marketplace Project site.
- Study Area: the area evaluated during the field survey, including the approximately 18-acre Project site and the surrounding 500-feet area.
- Project Vicinity: intended to be a general term to describe the broader area surrounding the Study Area.

1.3 Project Location

The Project Site is located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of Corona. The City of Corona is generally situated southwest of the City of Riverside, south of the City of Norco, and north of the City of Lake Elsinore in Riverside County, California (Figure 1). Areas surrounding the Project Site include the I-15 freeway to the east, Arantine Hills Specific Plan to the south and west; and Cajalco Road to the north (Figure 2). The

Project Site is located within the United States Geological Survey (USGS) 7.5-Minute Topographic Map *Corona South* Quadrangle.

The Project Site is owned by the Riverside County Transportation Commission and has Assessor's Parcel Numbers (APN) 279-240-033 and 279-240-019.

Access to the Project site is from the residential project referred to as Bedford, located to the west of the Project site, off Eagle Glen Parkway via Hudson House Drive. Directions to the Project site from Interstate 15 (I-15) is to exit Cajalco Road and head west onto Eagle Glen Parkway. Access is obtained via Hudson House Drive.

1.4 Existing and Historical Land Use

The overall Study Area has historically been farmed for citrus production between 1962 and 2007. Prior to the 1962 aerial photograph, the Project Site was vacant land. The former agricultural operation has reverted to ruderal vegetation. The Project site is located between the new residential community of Bedford within the Arantine Hills Specific Plan (AHSP), which has been graded, and the I-15 freeway, including the Cajalco Interchange, which is currently under construction.

Bedford Canyon Wash, located to the south of the Project Site, is an ephemeral wash with a sandy bottom and sparsely vegetated alluvial fan sage scrub and non-native vegetation. The Wash receives flows from the Santa Ana mountains, through the Eagle Glen Golf Club, through the AHSP area, continuing downstream to Temescal Creek and ultimately the Santa Ana River. As part of implementation of the AHSP, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Wash includes planting with an alluvial fan sage scrub seed mix.

2.0 Project Description

The intent of the Project is to incorporate the approximate 18 acres into the existing Arantine Hills Specific Plan (AHSP) and build a new commercial center. The Project site, currently owned by the Riverside County Transportation Commission (RCTC), would increase the size of the planned commercial center within the Arantine Hills Specific Plan.

The Applicant proposes to amend the Arantine Hills Specific Plan (AHSP Amendment No. 3) to increase the boundary of the AHSP by approximately 18 acres (Project Site). The proposal would also increase the area designated Commercial in the AHSP to approximately 22 acres and increase the amount of commercial use from 80,000 square feet to approximately 134,378 square feet plus a 135-room hotel.

Project implementation includes two alternatives for construction and the importing of dirt for grading operations.

Import Alternative 1: The first option to import dirt onsite is by truck from an off-site source. A potential source of import (Borrow Site) has been identified from the FST Sand and Gravel Mine, located east of I-15 and approximately ½ mile east of El Cerrito Road. The dirt would be hauled from the Borrow Site to the Project site.

Import Alternative 2: The second option to import dirt to onsite involves importing dirt from Planning Area 14 (PA 14) within the Arantine Hills Specific Plan (AHSP). PA 14, approximately 26 acres, is located south of Bedford Canyon Wash and forms an elevated plateau above Bedford Canyon Wash.

To import dirt from PA 14, an access ramp would be graded in the northeast portion of PA 14 leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes. The lower portion of the access ramp would be steeper and reinforced with geo-grid or similar stabilizer. Fill, ranging from 5 feet to 10 feet would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation.

Careful grading operations and BMPs would avoid dirt spoils in Bedford Wash. While this import operation would need to take place during the dry season, temporary pipe culverts would be placed on top of the concrete pad under the dirt ramp in case unexpected monsoonal storms caused Bedford Canyon Wash to flow.

Following completion of the import, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

3.0 Regulatory Context

The following is a list of the key local, state, and federal laws and regulations that apply to protecting plant communities, plants, wildlife, and water quality from project impacts relevant to the Project.

3.1 Federal Laws and Regulations

- Federal Endangered Species Act (FESA)
- Federal Clean Water Act (CWA)
- Migratory Bird Treaty Act (MBTA)

3.2 California State Laws and Regulations

- California Environmental Quality Act (CEQA)
- California Endangered Species Act (CESA) and Fish and Game Code (FGC) sections 2050 et seq.

3.3 Local Plans/Regulations

- City of Corona General Plan
- Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP): Temescal Canyon Area Plan

3.4 Regulatory Permits

This report is prepared pursuant to and in support of CEQA, and any applicable regulatory permit applications, including the California Department of Fish and Wildlife (CDFW) Streambed Alteration Agreement (SAA), Regional Water Quality Control Board (RWQCB) Section 401 Water Quality Certification (WQC), United States Army Corps of Engineers (Corps) Section 404 permit, and United States Fish and Wildlife Service Section 7 Biological Opinion.

4.0 Survey and Methods

Preparation for this biological study began with a review of relevant available literature and review of historical biological documentation. This effort was followed by an onsite field survey on June 27, 2019. The purpose of the field survey was to assess the existing habitat, map any onsite sensitive plant communities and jurisdictional waters, and determine whether special status plant and wildlife species occur or potentially occur within the Study Area.

4.1 Literature Review

The study began with a review of relevant available literature on the biological resources within the Study Area and Project Vicinity. The Project site is located within the boundary of the Western Riverside MSHCP, specifically within the Temescal Canyon Area Plan.

4.1.1 Sensitive Plant Communities

Sensitive plant communities (sensitive habitats) are of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects. Sensitive habitats are often threatened with local extirpation and are therefore considered valuable biological resources. Plant communities are considered “sensitive” by the California Native Plant Society (CNPS) and CDFW if they meet any of the criteria listed below.

- The habitat is recognized and considered sensitive by CDFW, United States Fish and Wildlife Service (USFWS), and/or special interest groups such as CNPS.
- The habitat is under the jurisdiction of the Corps pursuant to Section 404 of the CWA.
- The habitat is under the jurisdiction of the CDFW pursuant to Sections 1600 through 1612 of the California Fish and Game Code.
- The habitat is known or believed to be of high priority for inventory in the California Natural Diversity Database (CNDDB).
- The habitat is considered regionally rare.
- The habitat has undergone a large-scale reduction due to increased encroachment and development.
- The habitat supports special status plant and/or wildlife species (defined below).
- The habitat functions as an important corridor for wildlife movement.

4.1.2 Critical Habitat

Under the ESA, the federal government is required to designate "critical habitat" for any species it lists under the ESA. Federal agencies are prohibited from authorizing, funding or carrying out actions that "destroy or adversely modify" critical habitats. Section 3 of the ESA defines critical habitat as:

- The specific areas within the geographic area occupied by a species, at the time it is listed in accordance with the ESA, on which are found those physical or biological features essential to the conservation of the species and that may require special management considerations or protection.

- The specific areas outside the geographic area occupied by a species at the time it is listed, upon a determination that such areas are essential for the conservation of the species.

"Conservation" means the use of all methods and procedures that are necessary to bring an endangered or a threatened species to the point at which listing under the ESA is no longer necessary. Critical habitat receives protection under Section 7(a)(2) of the ESA through the prohibition against destruction or adverse modification of critical habitat with regard to actions carried out, funded, or authorized by a federal agency. Section 7(a)(2) also requires conferences on federal actions that are likely to result in the destruction or adverse modification of proposed critical habitat.

The USFWS's online service for information regarding Threatened and Endangered Species Final Critical Habitat designation within California was reviewed to determine if the Study Area is within any species' designated Critical Habitat (USFWS 2019a). The USFWS regulatory mapping process for the designation of critical habitat is an imprecise, broad-based, mapping exercise of areas that may or may not include constituent elements of the critical habitat designation. Due to this approach in mapping, large areas are designated as critical habitat regardless of the existing habitat, and as a result may include developed areas, such as buildings, roads, hardscape, and other such facilities, as well as natural habitats.

The constituent elements of the critical habitat designation consider the physical and biological features needed for life processes and successful reproduction of the listed species, including:

- Space for individual and population growth for normal behavior;
- Habitat cover or shelter;
- Food, water, or other nutritional or physiological requirements;
- Sites for breeding and rearing offspring; and
- Habitat that is protected from disturbance or is representative of the historical geographic and ecological distribution of a species.

4.1.3 Special Status Plants and Wildlife

Species of plants and animals are afforded "special status" by federal agencies, state agencies, and/or non-governmental organizations (e.g., USFWS, CDFW, and USFS, and CDF) because of their recognized rarity, potential vulnerability to extinction, and local importance. These species typically have a limited geographic range and/or limited habitat and are referred to collectively as "special status" species. Plant and wildlife species are considered "special status" species if they meet any of the following criteria.

- Taxa with official status under ESA, CESA, and/or the NPPA.
- Taxa proposed for listing under ESA and/or CESA.
- Taxa designated a species of special concern by CDFW.
- Taxa designated a state fully protected species by CDFW.

- Taxa identified as sensitive, unique or rare, by the USFWS, CDFW, the United States Forest Service (USFS), the United States Bureau of Land Management (BLM), and/or the California Department of Forestry and Fire Protection (CDF).
- Plants that meet the definition of rare or endangered under CEQA §15380(b) and (d). Species that may meet the definition of rare or endangered include the following:
    - Species considered by CNPS and CDFW to be "rare, threatened or endangered in California" (California Rare Plant Rank [CRPR] 1A, 1B and 2) (CNPS 2018). A majority of the CRPR 3 and CRPR 4 plant species generally do not qualify for protection under CESA and NPPA.
    - Species that may warrant consideration on the basis of local significance or recent biological information.
    - Some species included on the CNDDB Special Plants, Bryophytes, and Lichens List (CDFW 2019g).
- Considered a locally significant species, that is, a species that is not rare from a statewide perspective but is rare or uncommon in a local context such as within a county or region (CEQA §15125 (c)) or is so designated in local or regional plans, policies, or ordinances (CEQA Guidelines, Appendix G). Examples include a species at the outer limits of its known range or a species occurring on an uncommon soil type.

Available literature and databases were reviewed regarding sensitive habitats and special status plant and wildlife species. Special status plant and wildlife species that have the potential to occur within the immediate region of the Study Area were identified. Several agencies, including the USFWS, CDFW, and CNPS publish lists of particular taxa (species and subspecies) and the associated level of protection or concern associated with each. Reviewed and consulted literature and databases focused on the Study Area, and included the following sources listed below:

- The CNDDB, a CDFW species account database that inventories status and locations of rare plants and wildlife in California, was used to identify any sensitive plant communities and special status plants and wildlife that may exist within a two-mile radius of the Project site. A CNDDB search was performed by assessing a two-mile radius around the Study Area (CDFW 2019f). CNDDB records are generally used as a starting point when determining what special status species, if any, may occur in a particular area. However, these records may be old, lack data not yet entered, and do not represent all the special status species that could be in that particular area (Figure 3).
- A map of USFWS critical habitat to determine species with critical habitat mapped in the general vicinity of the Project (Figure 4) (USFWS 2019a).
- Online CNPS Inventory of Rare and Endangered Plants of California (CNPS 2019). A search for the USGS 7.5-Minute Topographic Map Corona South Quadrangle provided information regarding the distribution and habitats of special status vascular plants in the Project Vicinity.
- Pertinent maps, scientific literature, websites, and regional flora and fauna field guides.

The literature review was used as a resource to better understand the biological resources potentially occurring within the Study Area. Although the inventory list of special status plant and wildlife species was not exhaustive of all species that might occur on the property, it provides a wide range of species that are representative of the wildland habitats in the area. Species occurrence and distribution information is based on documented occurrences where surveys have taken place for individual projects; therefore, a lack of documented occurrence does not necessarily indicate that a given species is absent from the Study Area.

4.1.4 Jurisdictional Waters

The following sources were reviewed to determine the potential presence or absence of jurisdictional streams/drainages, wetlands, and their location within the watersheds associated with the Study Area, and other features that might contribute to federal or state jurisdictional authority located within watersheds associated with the Study Area:

- National Wetlands Inventory (NWI) maps (USFWS 2019c). The NWI database indicates potential wetland areas based on changes in vegetation patterns as observed from satellite imagery. This database is used as a preliminary indicator of wetland habitats because the satellite data are not precise.
- Title 33 Code of Federal Register (CFR): Navigation and Navigable Waters Part 328
- USGS National Hydrography Dataset (NHD). Provides the locations of "blue-line" streams as mapped on 7.5-Minute Topographic Map coverage.
- Aerial Imagery (Google Earth©) (Google 2019).
- USGS 7.5-Minute Topographic Maps.
- Natural Resource Conservation Service (NRCS) Soil Survey.

4.1.5 MSHCP Assessment

The Project site is located within the MSHCP, specifically within the Temescal Canyon Area Plan. The MSHCP is a comprehensive plan that includes portions of the County of Riverside and numerous cities. The MSHCP plans for conservation of 146 species and proposes a reserve system of approximately 500,000 acres. The MSHCP is intended to contribute to the economic viability of the County of Riverside by providing landowners, developers, and public infrastructure projects a streamlined regulatory process.

The Riverside Conservation Authority (RCA) MSHCP Information Application website was reviewed to verify any overlays that may occur on the Project site. Regardless of other overlays, MSHCP Section 6.1.2, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools*, is applicable to all projects within the MSHCP and describes the process through which protection of riparian/riverine areas, and vernal pools will occur within the MSHCP Area. Protection of these resources is important for a number of MSHCP conservation objectives. An assessment of a Project's potentially significant effects on riparian/riverine areas and vernal pools is required. Guidelines for determining whether or not these resources exist on site are described as follows:

- **Riparian/Riverine Areas** include "lands which contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens which occur close to or which depend upon soil moisture from a nearby fresh water source or areas with fresh water flow during all or a portion of the year." Riparian/riverine areas under the MSHCP also include drainage areas that are vegetated or have upland (non-riparian/riverine) vegetation and that drain directly into an area that is described for conservation under the MSHCP (or areas already conserved). The Project site was assessed for areas meeting this definition during the jurisdictional delineation performed on June 27, 2019.

- **Vernal Pools** are described by the MSHCP as "seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season." This definition excludes artificially created wetlands created for proving wetlands habitat or human actions to create open waters or altering natural streams demonstrating characteristic as described above. The Project site was assessed for areas meeting this definition during the jurisdictional delineation performed on June 27, 2019.

4.2 Biological Survey

4.2.1 General Biological Survey

A field survey was performed on June 27, 2019 by SLS biologist Brianna Bernard to assess and map vegetation communities, plants, and wildlife, and to identify habitat areas that could be suitable for special status plant species.

Plant species were identified using plant field and taxonomical guides, such as The Jepson Manual: Vascular Plants of California, second edition (Baldwin et al. 2012). All plant species encountered during the field survey were identified and recorded in field notes. A one-day survey cannot be used to conclusively determine presence or absence of a species; therefore, assessments of presence/absence were made based on the previous surveys, presence of suitable habitat and soils to support the species, known records or occurrence within the area, and known distribution and elevation range obtained from the relevant literature.

During the field survey, the biologist assessed the existing habitat within the Study Area using aerial maps and a Trimble R1 GNSS Receiver paired with the ARC Geographical Information System (ARCGIS) Collector Application. The biologist paid special attention to those habitat areas that had the potential to provide suitable habitat for special status plant and wildlife species. Aerial photographs and maps were used to assist in the delineation of plant community boundaries. Following field mapping, the plant communities were digitized, and the vegetation map was created. General wildlife surveys were conducted on foot and with binoculars within the Study Area.

All wildlife species encountered visually or audibly during the field survey were identified and recorded in field notes. Biologists also recorded signs of wildlife species including animal tracks,

burrows, nests, scat, and remains. Binoculars were used to aid in the identification of observed wildlife. Wildlife field guides and photographs were used to assist with identification of wildlife species during the field survey, as necessary. Photographs were taken to document existing conditions within the Study Area (Appendix B).

4.3 Focused Burrowing Owl Survey

The Project site falls within a MSHCP Burrowing Owl (BUOW) overlay (Figure 4). A Habitat Assessment was conducted on June 27, 2019 to determine any suitable BUOW habitat onsite. Following the assessment, a series of Focused Burrowing Owl surveys were conducted on July 8, July 25, and August 1, 2019 pursuant to MSHCP Section 6.3.2, MSHCP Protocol Survey Instructions, and the methods used to detect and identify BUOW included observation of key signs identified by the *California Burrowing Owl Consortium (CBOC).* This includes observation of key signs such as sight, scat, tracks, burrows, nests, and calls. All encountered burrows or structure entrances were checked for the presence of BUOWs, molted feathers, cast pellets, prey remains, eggshell fragments, tracks, or excrement at or near a burrow entrance. Natural or man-made structures that could support BUOWs were also surveyed when present. The complete results for the Protocol Focused BUOW Report can be found in Appendix A.

Each of the survey efforts were conducted in the morning between 7:15 a.m. and 11:50 a.m. and were not performed during periods of excessive or abnormal heat, wind, rain, or other inclement weather. The Study Area was assessed for the suitability to support burrowing owls and all suitable burrows were inspected for signs of use by burrowing owls. The survey involved walking through suitable habitat within the Study Area (the Project site and a 500-foot buffer). The pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface.

4.4 Jurisdictional Delineation

An assessment of the Study Area for the presence of jurisdictional features was conducted by SLS biologist Brianna Bernard on June 27, 2019. All depressions and drainages were evaluated for the presence of jurisdictional waters and wetlands according to the Corps and CDFW delineation guidelines, including connectivity or lack of connectivity to Traditional Navigable Waters. Dominant vegetation within and adjacent to the jurisdictional features within the Study Area was identified and recorded.

The Corps and the RWQCB have jurisdiction over Waters of the United States. Jurisdictional non-wetland features for the Waters of the United States are typically determined through the observation of an Ordinary High Water Mark (OHWM), which is defined as the “line on the shore established by the fluctuation of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider

the characteristics of the surrounding areas." Projects with impacts to Waters of the United States are regulated under Sections 401 and 404 of the Clean Water Act.

To determine the presence of a jurisdictional wetland for the Waters of the United States, three indicators are required: (1) hydrophytic vegetation, (2) hydric soils, and (3) wetland hydrology. The methodology published in the *United States Army Corps of Engineers 1987 Wetland Delineation Manual* and the *Arid West Supplement* sets the standards for meeting each of the three indicators, which normally require more than 50 percent cover of dominant plant species typical of a wetland, soils exhibiting characteristics of saturation, and hydrological indicators be present.

CDFW has jurisdiction over water of the Department's interest (California Fish and Game Code §§1600 et seq.; California Code of Regulations, Title 14, §720). Section 1602 of the California Fish and Game Code (FGC) applies to all rivers, streams, lakes and streambeds. CDFW defines a stream as "a body of water that flows perennially or episodically and that is defined by the area in which water currently flows, or has flowed, over a given course during the historic hydrologic course regime, and where the width of its course can reasonably be identified by physical or biological indicators" (Brady and Vyverberg 2013). Likewise, CDFW regulates jurisdictional areas of riparian habitat only to the extent that those areas are part of a stream, river, or lake as defined above. Waters of the State pertaining to Porter-Cologne in relation to RWQCB jurisdiction are defined by California Water Code Section 13050(e) as any surface or ground water within the boundaries of the state.

Prior to the field investigation, SLS biologist reviewed adjacent project biological reports, historical aerial imagery and topography for the Study Area to determine the potential for perennial, intermittent, or ephemeral drainages and associated riparian resources. Generally, indicators of jurisdictional drainages on an aerial photo include vegetation and/or incised lines indicating the path of flowing water. Following the desktop research, SLS biologist conducted an onsite field investigation. Based on the collective results of the desktop investigation and the field surveys, any observed jurisdictional features were mapped using the following parameters:

- The limits of the Corps' jurisdiction extend to the OHWM. OHWM indicators include: the observation of benches, break in bank slope, particle size distribution, sediment deposits, drift, litter, and/or change in plant community.
- The RWQCB shares the Corps' jurisdictional methodology.
- CDFW's jurisdiction applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the state. CDFW's authority also includes riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, CDFW jurisdiction is mapped to the top of bank of the stream.

5.0 Results

5.1 Vegetation Communities

The vegetation communities and habitat conditions were inspected to confirm presence and habitat quality of the vegetation found onsite. Vegetation communities were mapped based on the Holland Classification System (Holland 1986). Where necessary, deviations were made on best professional judgment when areas did not fit into a specific habitat description provided by Holland. Plant communities were mapped in the field directly onto a 200-scale (1" = 200') aerial photograph and a Trimble R1 GNSS Receiver paired with the ARCGIS Collector Application was utilized during the survey. Biologists confirmed the presence and general quality of the four vegetation communities. Vegetation mapping and acreages for each vegetation community is based on the observations of the field surveys, which are listed below in Table 1 and graphically depicted on Figure 5. Representative photographs of the vegetation communities can be found in Appendix B.

The deviations from Holland include the Disturbed/Developed and the Widened and Restored Wash categories. The deviations for the Developed community was made because of the lack of, or limited habitat values, and includes non-native or invasive species. The deviations for the Widened and Restored Wash community was made because installation of riprap bank protection, grade stabilizers, concrete crossings, and associated ramps deviate from a natural wash classification. This was a result of implementation of the adjacent Arantine Hills Project and impacts were previously accounted for and permits obtained for Arantine Hills implementation. While Bedford Wash currently exhibits limited habitat value, the area is to be seeded with Alluvial Fan Sage Scrub and maintained in perpetuity per the Arantine Hills Long-Term Management Plan.

The field survey included a 500-foot buffer around the Project site to determine what vegetation types exist adjacent to the Project site in order to determine the potential significance of indirect impacts. As shown on Figure 5, the surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project. A small portion of the 500-foot buffer area includes the Widened and Restored Bedford Canyon Wash.

Table 1. Vegetation Community Observed within the Project Site[1]

Vegetation Community	Acreage within in the Project Site (acres)
Riversidian Sage Scrub/Chaparral	0.15
Widened and Restored Bedford Canyon Wash[2]	0.20
Ruderal	15.14
Disturbed/Developed	2.28
TOTAL	**17.77**

***Notes**:*
1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.
2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protections, and concrete Wash crossing and grade stablization.

The general description of the habitat observed during the 2019 field survey is described below.

5.1.1 Riversidian Sage Scrub/Chaparral

Approximately 0.15 acres of the Project site is comprised of Riversidian Sage Scrub/Chaparral. This vegetation community is located on the slope of the south bluff of Bedford Canyon Wash. The Riversidean Sage Scrub/Chaparral community is dominated by shrubs such as laurel sumac (*Malosma laurina*), white sage (Salvia apiana), toyon (*Heteromeles arbutifolia*), Mexican elderberry (*Sambucus mexicana*), California sagebrush (*Artemisia californica*), black sage (*Salvia mellifera*), deerweed (*Acmispon glaber*), California buckwheat (*Eriogonum fasciculatum*), chamise (*Adenostoma fasciculatum*), and tree tobacco (*Nicotiana glauca*). The understory of the community consists primarily of non-native species such as red brome (*Bromus madritensis ssp. rubens*), ripgut brome (*Bromus diandrus*), tocalote (*Centaurea melitensis*), and summer mustard (*Hirschfeldia incana*).

5.1.2 Widened and Restored Wash

Approximately 0.20 acres of the Project site is comprised of widened and restored Bedford Canyon Wash (Wash). The original Wash was widened from an approximately 90 feet to 200 feet. Various structures, including buried slope protection, buried grade control structures, and access ramps, are included within the design. The overall restored Wash will be hydroseeded with an alluvial fan sage scrub hydroseed mixture. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protections, and the concrete Wash crossing and grade stabilization.

5.1.3 Ruderal

A total of 15.14 acres of the Project site consists of the ruderal community. This vegetation community occurs in the location of the historical citrus operations. It is generally maintained (trimmed) annually due to fire management. Vegetation within this area is comprised of

predominantly of cheeseweed (*Malva parviflora*). Other species include Russian thistle (*Salsola tragus*), summer mustard (*Hirschfeldia incana*), rat-tail fescue (*Festuca microstachys*), foxtail brome (*Bromus madritensis ssp. rubens*), ripgut brome (*Bromus diandrus*), tocalote (*Centaurea melitensis*), Jimson weed (*Datura stramonium*), giant reed (*Arundo donax*), and a few scattered coyote bush (*Baccharis pilularis*), and laurel sumac (*Malosma laurina*).

5.1.4 Developed/Disturbed

A total of 2.28 acres of disturbed area consisting of bare dirt, dirt roads, and sparse vegetation is mapped onsite. The developed/disturbed community contains limited habitat value and includes non-native or invasive species. This community also includes areas of disturbance from both the grading of Arantine Hills and the construction of the Cajalco Interchange.

5.2 Plants

Sensitive plant species include federal or state listed threatened or endangered species, those species listed on the CNPS rare and endangered plant inventory. A single listed plant species occurs within the USGS 7.5' Corona South quadrangle and a brief description of that species is included below. Special status plant species with the potential to occur in the Project site were analyzed based on distribution, habitat requirements, and existing site conditions (Appendix C). All plant species observed within the Project site totaled 22 species during the survey on June 27, 2019 are listed in Appendix D of this report.

Brand's Phacelia (*Phacelia stellaris*)
Status: California Rare Plant Rank 1B.1
Distribution: Orange, Riverside, San Bernardino, and San Diego Counties.
Habitat(s): Habitats supporting coastal scrub and coastal dunes. Known from 1 to 400 meters (3 to 1,300 feet) MSL. Blooms March through June.
Status onsite: None. The site lacks suitable habitat and soils. Not observed during field visit.

Munz's Onion (*Allium munzii*)
Status: state threatened, federally endangered
Distribution: Los Angeles, Riverside, San Bernardino, and San Diego Counties.
Habitat(s): Clay soils supporting chaparral, cismontane woodland, coastal scrub, pinyon-juniper woodland, and valley and foothill grassland. Known from 300 to 1,070 meters (1,000 to 3,500 feet) MSL. Blooms March through May.
Status onsite: None. The site lacks suitable habitat and soils. Not observed during field visit.

San Diego ambrosia (*Ambrosia pumila*)
Status: federally endangered
Distribution: Riverside County and San Diego Counties.
Habitat(s): Found along drainages and areas adjacent to riparian areas. Nearest location is San Luis Rey. Blooms June through September.

Status onsite: Clay or sandy loam soils supporting chaparral, costal scrub valley and foothill grassland and vernal pools. Known from 20 to 415 meters (65 to 1,300 feet) MSL. Blooms April through October. Not observed during field visit.

San Miguel Savory (*Satureja chandleri*)
Status: California Rare Plant Rank 1B.2
Distribution: Los Angeles, Riverside, San Bernardino, and San Diego Counties.
Habitat(s): Rocky, gabbroic, or metavolcanic soils supporting chaparral, cismontane woodland, coastal scrub, riparian woodland, and valley and foothill grassland. Known from 120 to 1,075 meters (390 to 3,500 feet) MSL. Blooms March through July.
Status onsite: None. The site lacks suitable habitat and soils. Not observed during field visit.

As determined through the 2019 survey, no special status plant species were observed within the Study Area and there is no opportunity for them to occur due to the disturbed and developed area onsite. Furthermore, the Study Area lacks suitable habitat and soils.

5.3 Critical Habitat

The USFWS's online service for information regarding Threatened and Endangered Species Final Critical Habitat designation within California was reviewed to determine if the Project site is within any species' designated Critical Habitat. The Project site and Buffer Area do not contain a designated Critical Habitat overlay. The closest designated Critical Habitat is located approximately 0.01 mile south for the coastal California gnatcatcher (*Polioptila californica californica* [CAGN]) (Figure 4).

5.4 Wildlife

Special status wildlife species with the potential to occur on the Project site were analyzed based on the species identified in USGS 7.5' Corona South quadrangle and the surrounding eight quadrangles, distribution, habitat requirements, and existing site conditions (Appendix E). No special status wildlife was identified or observed within the Project site during the field visit. However, the following species were listed through the CNDDB as being observed within 2-miles of the Project site: California horned lark (*Eremophila alpestris actia*), coastal California gnatcatcher, coastal whiptail *(Aspidoscelis tigrus stejnegeri*), coast horned lizard (*Phrynosoma blainvillii*), least Bell's vireo (*Vireo bellii pusillus*), orange-throated whiptail (*Aspidoscelis hyperythra*), red-diamond rattlesnake (*Crotalus ruber*), Stephen's Kangaroo Rat (*Dipodomys stephensi*), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*), and western spadefoot (*Spea hammondii*). A brief description of those species and their habitat is included below.

California Horned Lark (*Eremophila alpestris actia*)
Status: CDFW watch list
Habitat(s): A year-long resident within the state and within a variety of open habitats, usually where trees and large shrubs are absent. They are not particular about the nature of the field, so long as it has very little vegetation. Range-wide, they breed in level or gently sloping short grass prairies, montane meadows, "bald" hills, open coastal plains, fallow grain fields, alkali flats, and rangelands. Within southern California, California horned larks breed primarily in open fields, (short) grasslands, and rangelands. Grasses, shrubs, forbs, rocks, litter, clods of soil, and other surface irregularities provide cover.
Status onsite: Moderate potential to occur onsite. Suitable habitat exists onsite due to the maintenance for fire abatement and bare areas, which results in areas with little to no vegetation. Observed during the field survey within the surrounding 500-feet buffer, however, was not observed onsite.

Coastal California gnatcatcher (*Polioptila californica californica*)
Status: federally threatened, CDFW species of special concern
Distribution: Southern Los Angeles, Orange, western Riverside, and San Diego counties south into Baja.
Habitat(s): Coastal sage scrub of varying subtypes, sometimes riparian, chaparral, and other habitats as well.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Coastal whiptail (*Aspidoscelis tigrus stejnegeri*)
Status: CDFW species of special concern
Habitat(s): This species is found in a variety of habitats, primarily hot and dry open areas with sparse vegetation including chaparral, woodland, and riparian areas. This subspecies is found in coastal southern California, north into Ventura County, and south into Baja California. Additional important habitat characteristics include Important habitat components include shrub cover with accumulated leaf litter, and an abundance of invertebrate prey, particularly termites.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Coast horned lizard (*Phrynosoma blainvillii*)
Status: CDFW species of special concern
Habitat(s): Occurs in a variety of vegetation types including coastal sage scrub, chaparral, annual grassland, oak woodland and riparian woodlands.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Least Bell's Vireo (*Vireo bellii pusillus*)
Status: federally endangered, state endangered
Habitat(s): This species primarily occupies riverine riparian habitats that typically feature dense cover within 1-2 m of the ground and a dense, stratified canopy. Typically, it is associated with southern willow scrub, cottonwood-willow forest, mule fat scrub, sycamore alluvial woodland, coast live oak riparian forest, arroyo willow riparian forest, or mesquite in desert localities. It uses habitat which is limited to the immediate vicinity of water courses.

Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Orange-Throated Whiptail (*Aspidoscelis hyperythra*)
Status: CDFW species of special concern
Habitat(s): The species is generally found in semi-arid brushy areas typically with loose soil and rocks, including washes, stream sides, rocky hillsides, and coastal chaparral. Habitat types include low elevational chaparral, non-native grassland, (Riversidian) coastal sage scrub, juniper woodland and oak woodland. Associations include alluvial fan scrub and riparian areas. Friable soil appears to be a necessary requirement for excavating burrows and hiding eggs.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Red-Diamond Rattlesnake (*Crotalus ruber*)
Status: species of special concern
Habitat(s): It can be found from the desert, through dense chaparral in the foothills (it avoids the mountains above around 4,000 feet), to warm inland mesas and valleys, all the way to the cool ocean shore. It is most commonly associated with heavy brush with large rocks or boulders. Dense chaparral in the foothills, cactus or boulder associated coastal sage scrub, oak and pine woodlands, and desert slope scrub associations are known to carry populations of the northern red-diamond rattlesnake, however, chamise and red shank associations may offer better structural habitat for refuges and food resources for this species than other habitats. They need rodent burrows, cracks in rocks or surface cover objects.
Status onsite: Limited habitat is found onsite due to the bare and disturbed areas with heavy brush found onsite, and maintenance for fire abatement. Not observed during field visit.

Stephen's Kangaroo Rat (*Dipodomys stephensi*)
Status: federally endangered, state threatened
Habitat(s): This species prefers large areas of disturbed or patchy annual and perennial grasslands and open coastal sage scrub. Preferred perennials plant species include buckwheat and chamise and preferred annual plant species include brome grass. The nearest known populations are in Rancho Guejito and at the Naval Weapons Station in Fallbrook.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)
Status: CDFW watch list
Habitat(s): They are found on grass-covered hillsides, coastal sage scrub, and chaparral and often occur near the edges of the denser scrub and chaparral associations. Preference is shown for tracts of California sagebrush. Optimal habitat consists of sparse, low brush or grass, hilly slopes preferably interspersed with boulders and outcrops. The species may occur on steep grassy slopes without shrubs if rock outcrops are present. It is a very secretive species.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Western Spadefoot (*Spea hammondii*)
Status: CDFW species of special concern
Habitat(s): May be found in coastal sage scrub, open chaparral, pine-oak woodlands and grassland habitats, but is most common in grasslands with vernal pools or mixed grassland/coastal sage scrub areas. Within these habitats, they require rain pools/vernal pools in which to reproduce and that persist with more than three weeks of standing water in which to metamorphose successfully. They can also breed in slow-moving streams (e.g., areas flooded by intermittent streams). Water breeding sites must lack fish, bullfrogs, and crayfish in order for to successfully reproduce and metamorphose.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Summary of Sensitive Species
No special status species or evidence of their presence were observed or heard during the 2019 survey. Given the site's annual maintenance for fire abatement, existing surrounding uses (Arantine Hills Construction and I-15/Cajalco construction), and lack of habitat there is no opportunity for them to occur within the Study Area.

5.4.1 Wildlife Species Observed or Detected

The animal species or signs thereof observed during the SLS survey are listed below:

Birds:

- American crow (*Corvus brachyrhynchos*)
- Anna's hummingbird (*Calypte anna*)
- black phoebe (*Sayornis nigricans*)
- California quail (*Callipepla californica*)
- California towhee (*Melozone crissalis*)
- house finch (*Haemorhous mexicanus*)
- mourning dove (*Zenaida macroura*)
- red-tailed hawk (*Buteo jamaicensis*)
- song sparrow (*Melospiza melodia*)
- turkey vulture (*Cathartes aura*)
- California Horned Lark (*Eremophila alpestris actia*)
- western scrub jay (*Aphelocoma californica*)

Mammals:

- California ground squirrel (*Spermophilus beecheyi*)
- desert cottontail (*Sylvilagus audubonii*)

Reptiles:

- western fence lizard (*Sceloporus occidentalis*)

5.5 Focused Burrowing Owl Survey

Per the MSHCP BUOW Survey Instructions, a Habitat Assessment was conducted on June 27, 2019 to determine if any suitable BUOW habitat occurred onsite. Following the habitat assessment, three additional focused surveys took place on July 8, 25, and August 1, 2019 between 7:15 a.m. and 11:50 a.m. Temperatures during the survey ranged between 64° F and 95° F, with generally predominant sunny, clear skies and 0-2 mph winds. The surveys were conducted during typical BUOW peak activity time and was not conducted during rain, high winds (> 20 miles per hour), dense cloud cover >75%. Prior to the commencement of the survey, SLS biologist scanned the Study Area, consisting of the Project site and the surrounding 500-foot buffer, using binoculars to look for burrowing owl. The Study Area was assessed for the suitability to support burrowing owls and all suitable burrows were inspected for signs of use by burrowing owls. The surveys involved walking through suitable habitat within the Study Area. Pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface.

No BUOWs or evidence of BUOWs were observed on site within the Study Area during the focused survey. A majority of the Project site was characterized by actively maintained ruderal fields, lacking necessary sized burrows to provide suitable nesting habitat for BUOW. Much of the buffer area is developed, with Arantine Hills to the west and I-15 to the east. California ground squirrels and their burrows were observed within the Study Area. These burrows were actively utilized by the California ground squirrels and contained no BUOW or keys signs (sight, whitewash, burrows, bones, feathers, pellets, nests, and calls). Furthermore, the Project site is maintained for fire abatement and the property adjacent to the Project site has active construction and grading activities including the I-15/Cajalco Interchange. Please refer to Appendix A for the complete results for the focused survey.

5.6 Regional Connectivity/Wildlife Movement

Wildlife corridors link together areas of suitable habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated “islands” of wildlife habitat. In the absence of habitat linkages that allow movement to adjoining open space areas, various studies have concluded that some wildlife species, especially the larger and more mobile mammals, would not likely persist over time in fragmented or isolated habitat areas because they prohibit the infusion of new individuals and genetic information (MacArthur and Wilson 1967, Soule 1987, Harris and Gallager 1989). Corridors effectively act as links between different populations of a species. A group of smaller populations (termed “demes”) linked together via a system of corridors is termed a “meta-population.” The long-term health of each deme within the meta-population is dependent upon its size and the frequency of interchange of individuals (immigration versus emigration). The smaller the deme, the more important immigration becomes, because prolonged inbreeding with the same individuals can reduce genetic variability. Immigrant individuals that move into the deme from adjoining demes mate with individuals and supply that deme with new genes and

gene combinations that increases overall genetic diversity. An increase in a population's genetic variability is generally associated with an increase in a population's health.

Corridors mitigate the effects of habitat fragmentation by:

- Allowing animals to move between remaining habitats, which allows depleted populations to be replenished and promotes genetic diversity.
- Providing escape routes from fire, predators, and human disturbances, thus reducing the risk that catastrophic events (such as fires or disease) will result in population or local species extinction.
- Serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs (Fahrig and Merriam 1985, Simberloff and Cox 1987, Harris and Gallagher 1989).

Wildlife movement activities usually fall into one of three movement categories:

- Dispersal (e.g., juvenile animals from natal areas, individuals extending range distributions).
- Seasonal migration.
- Movements related to home range activities (foraging for food or water, defending territories, searching for mates, breeding areas, or cover).

A number of terms have been used in various wildlife movement studies, such as "wildlife corridor," "travel route," "habitat linkage," and "wildlife crossing" to refer to areas in which wildlife moves from one area to another. To clarify the meaning of these terms and facilitate the discussion on wildlife movement in this study, these terms are defined as follows:

- Travel route: a landscape feature (such as a ridge line, drainage, canyon, or riparian strip) within a larger natural habitat area that is used frequently by animals to facilitate movement and provide access to necessary resources (e.g., water, food, cover, den sites). The travel route is generally preferred because it provides the least amount of topographic resistance in moving from one area to another; it contains adequate food, water, and/or cover while moving between habitat areas; and provides a relatively direct link between target habitat areas.

- Wildlife corridor: a piece of habitat, usually linear in nature, that connects two or more habitat patches that would otherwise be fragmented or isolated from one another. Wildlife corridors are usually bounded by urban land areas or other areas unsuitable for wildlife. The corridor generally contains suitable cover, food, and/or water to support species and facilitate movement while in the corridor. Larger, landscape-level corridors (often referred to as "habitat or landscape linkages") can provide both transitory and resident habitat for a variety of species.

- Wildlife crossing: a small, narrow area, relatively short in length and generally constricted in nature, that allows wildlife to pass under or through an obstacle or barrier that otherwise hinders or prevents movement. Crossings are typically manmade and include culverts, underpasses, drainage pipes, and tunnels to provide access across or under roads, highways, pipelines, or other physical obstacles. These are often "choke points" along a movement corridor.

5.6.1 Wildlife Movement within the Study Area

The Study Area may serve a function in local wildlife movement; however, the Study Area was not identified in the MSHCP as a Core Linkage, indicating a lack of importance for regional wildlife movement. Bedford Canyon Wash may provide a linkage for wildlife between the Cleveland National Forest and Lake Matthews. A recent restoration project proposed by the Riverside-Corona Resource Conservation District (RCRCD) for a downstream parcel within the Bedford Canyon Wash would, "Preserve the channel/floodplain location which historically functioned as part of a regionally significant east- west wildlife corridor," suggesting that this corridor provides a valuable linkage. Bedford Canyon Wash will not be impacted as part of the proposed project and continue to provide the opportunity for wildlife movement.

5.7 Jurisdictional Areas

5.7.1 Waters of the United States

This section relies on the term "Waters of the United States" as it applies to the jurisdictional limits under the authority of the Army Corps of Engineers under the Clean Water Act and applies to the jurisdiction of the Regional Water Quality Control Board under the Porter-Cologne Water Quality Act. Based on the methodology described in Section 4.4, both literature/data base review and a field delineation were conducted to determine the presence of Waters of the United States.

The only jurisdictional feature located on the Project Site is Bedford Canyon Wash, which is presented in Table 2 and shown on Figure 6.

As part of the implementation of the Arantine Hill Specific Plan, Bedford Canyon Wash has been widened and restored, including the placement of rip-rap bank protection, grade control structures, concrete crossings, and access ramps. Specifically, the portion of Bedford Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and a concrete Wash crossing that includes grade stabilization. Jurisdictional Waters of the U.S. extend from invert to invert.

Table 2. Jurisdictional Waters of the United States within the Project site

Drainage	Total Acreage
Bedford Canyon Wash	0.10[1]
[1]. Consists of non-wetland jurisdictional features.	

5.7.2 Waters of the State

The Project site includes Waters of the State that meet CDFW characteristics in accordance with FGC Section 1600 (Brady and Vyverberg 2013). The only Waters of the State jurisdictional feature located on the Project Site is Bedford Canyon Wash due to the presence of biological and physical characteristics of a stream subject to the Jurisdiction of CDFW under FGC §1600 et seq. The Wash exhibits biological and physical indicators of Waters of the State through the presence of channel bed and bank. The total inventory of Waters of the State is presented in Table 3 and shown on Figure 6.

As part of the implementation of the Arantine Hill Specific Plan, Bedford Canyon Wash has been widened and restored. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and the concrete Wash crossing. Jurisdictional Waters of the State extend from top of bank to top of bank.

Table 3. Jurisdictional Waters of the State within the Project Site

Drainage	Total Acreage
Bedford Canyon Wash	0.20[1]
[1]. Widened and Restored Wash.	

5.7.3 MSHCP Riparian/Riverine and Vernal Pool Assessment

Volume I, Section 6.1.2 of the MSHCP describes the process through which protection of riparian/riverine areas and vernal pools would occur within the MSHCP Plan Area. The purpose is to ensure that the biological functions and values of these areas throughout the MSHCP Plan Area are maintained such that habitat values for species inside the MSHCP Conservation Area are maintained. The MSHCP requires that as projects are proposed within the overall Plan Area, the effect of those projects on riparian/riverine areas and vernal pools must be addressed.

The MSHCP defines riparian/riverine areas as:

> *…lands which contain Habitat dominated by trees, shrubs, persistent emergent mosses and lichens, which occur close to or which depend upon soils moisture from a nearby fresh water source; or areas with fresh water flow during all or a portion of the year.*

The MSHCP defines vernal pools as:

> *…seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indictors of hydrology and/or vegetation during the drier portion of the growing season.*

With the exception of wetlands created for the purpose of providing wetlands habitat or resulting from human actions to create open waters or from the alteration of natural stream courses, areas demonstrating characteristics as described above which are artificially created are not included in these definitions.

The total inventory of MSHCP Riparian and Riverine is presented in Table 4 and shown on Figure 7. The Project site contains no vernal pools or depressions as defined under MSHCP vernal pool features.

As part of the implementation of the Arantine Hill Specific Plan, the acreage identified as Riparian/Riverine Habitat includes the widened and restored Bedford Wash. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection and a concrete Wash crossing that includes grade stabilization.

Table 4. Riparian/Riverine Habitat

Community Type	Acreage Onsite
Riparian/Riverine	0.20[1]
1. Widened and Restored Wash.	

5.8 MSHCP Assessment

The Project is located within the Temescal Canyon Area Plan of the MSHCP. The Project site is not located within any MSHCP Criteria Areas, Cell Groups, or Subunits. Furthermore, the Project site is not located in survey areas for Amphibians, Mammals, or Special Linkage areas. The Project site is located within the Narrow Endemic Plants Overlay (Survey Area Number 7) pursuant to MSHCP Section 6.1.3 and Western Burrowing Owl overlay pursuant to MSHCP Section 6.3.2. The Project site was surveyed and assessed for the following:

- Riparian and Riverine Areas (Section 6.1.2)
- Narrow Endemic Plants - Survey Area Number 7 (Section 6.1.3)
- Western Burrowing Owl Survey Area (Section 6.3.2)

Thus, a separate Consistency Assessment has been prepared pursuant to those sections.

5.9 Soils Mapping

The United States Department of Agriculture Natural Resources Conservation Service lists four soil types (series) for the Project Site (Figure 8). The following soil types are located on the Project site and described below.

AkC: Arbuckle loam, 2 to 8 percent slopes
Soils of the Arbuckle series consist of well-drained soils and have slopes of 2 to 25 percent. These soils occur on alluvial fans and developed in alluvium from metasedimentary rocks. Arbuckle soils are not designated as a sensitive soil type by the MSHCP.

AIC: Arbuckle gravelly loam, 2 to 8 percent slopes
Soils of the Arbuckle series consist of well-drained soils and have slopes of 2 to 25 percent. These soils occur on alluvial fans and developed in alluvium from metasedimentary rocks. Arbuckle soils are not designated as a sensitive soil type by the MSHCP.

AID: Arbuckle gravelly loam, 8 to 15 percent slopes
Soils of the Arbuckle series consist of well-drained soils and have slopes of 2 to 25 percent. These soils occur on alluvial fans and developed in alluvium from metasedimentary rocks. Arbuckle soils are not designated as a sensitive soil type by the MSHCP.

CmC: Cortina cobbly loamy sand, 2 to 8 percent slopes
The Cortina series consists of somewhat excessively drained and excessively drained soils on alluvial fans and in valley fills. These soils formed in alluvium from metasedimentary rocks. Cortina soils are not designated as a sensitive soil type by the MSHCP.

GdC: Garretson gravelly very fine sandy loam, 2 to 8 percent slope
The Garretson series consists of well-drained soils on alluvial fans. These soils formed in alluvium made up chiefly of metasedimentary materials. Garretson soils are not designated as a sensitive soil type by the MSHCP. Garretson soils are mapped within the several areas within the Project Study Area.

SuF2: Soper cobbly loam, 25 to 50 percent slopes, eroded
The Soper series consists of moderately deep well drained soils that formed in material weathered from conglomerate and sandstone. Soper soils are on hills and uplands and have slopes of 15 to 50 percent. The mean annual precipitation is about 18 inches and the mean annual air temperature is about 60 degrees Fahrenheit. These soils are mapped in the southern most portion of the Project Boundary.

TeG: Terrace Escarpments
Terrace escarpments consist of variable alluvium on terraces and barrancas. Small areas of recently deposited alluvium may be near the bottom of the escarpments. This land is unaltered alluvial outwash derived from granite, gabbro, metamorphosed sandstone, sandstone, or mica schist. Terrace escarpments are not designated as a sensitive soil type by the MSHCP.

6.0 Project Impacts

This section discusses potential impacts to biological resources that could result from Project implementation. Biological resources may be either directly or indirectly impacted by a Project. Direct and indirect impacts may be either permanent or temporary in nature. These impact categories are defined below.

- Direct impact: any loss, alteration, disturbance or destruction of biological resources that would result from project-related activities is a direct impact. Examples include vegetation clearing, encroaching into wetlands, diverting natural surface water flows, and the loss of individual species and/or their habitats. Direct permanent impacts resulting from Project implementation consist of any ground-disturbing activities (i.e., vegetation removal, grading, paving, building of structures, installing landscaping, creating the fuel modification zone, etc.).

- Indirect impact: as a result of Project-related activities, biological resources may also be affected in a manner that is not direct. Examples of indirect impacts include elevated noise, light, and dust levels, increased human activity, decreased water quality, erosion created by the removal of vegetation, and the introduction of invasive plants and unnatural predators (e.g. domestic cats and dogs). These indirect impacts may be both short term and long term in their extent.

- Permanent impacts: all impacts that result in the long-term or irreversible removal of biological resources are considered permanent. Examples include constructing a building or permanent road on an area containing biological resources.

- Temporary impacts: any impacts considered to have reversible effects on biological resources can be viewed as temporary. Examples include the generation of fugitive dust during grading or removing vegetation and either allowing the natural vegetation to recolonize or actively revegetating the impact area.

Under each section, potential impacts are discussed.

6.1 Impacts to Vegetation Communities/Habitats

Impacts are provided for both alternative methods regarding importing dirt to the site. Calculations were based on the currently proposed development design in combination with the vegetation map from the field survey and aerial imagery.

Indirect temporary impacts to plant communities include the effects of fugitive dust created by grading activities, vehicle construction traffic, or offsite discharge of surface water runoff with its associated erosion and sedimentation. Grading-related dust could settle on plant surfaces and indirectly inhibit metabolic processes such as photosynthesis and respiration. Grading-related

erosion, runoff, sedimentation, soil compaction, and alteration of drainage patterns may affect plants by altering site conditions so that the location in which they are growing becomes unfavorable. Another example of indirect impacts includes the introduction and spread of invasive, exotic plants which could result in permanent indirect impacts to adjacent native plant communities.

6.1.1 Total Project Impacts with Alternative 1: Off-site Dirt Import

Figure 9 and Table 5 describe and list the approximate total acreages of vegetation communities that will be permanently and temporary impacted by Project activities should Alternative 1 be implemented.

Table 5. Alternative 1: Off-site Dirt Import – On-Site Vegetation Community Impacts[1]

Vegetation Community	Existing Vegetation onsite (acres)	Total Permanent Impacts (acres)	Total Temporary Impacts (acres)	Avoided (acres)
Riversidian Sage Scrub/Chaparral	0.15	0.00	0.00	0.15
Widened and Restored Bedford Canyon Wash[2]	0.20	0.01	0.00	0.19
Ruderal	15.14	14.32	0.00	0.82
Disturbed/Developed	2.28	2.00	0.00	0.28
TOTAL	**17.77**	**16.33**	**0.00**	**1.44**

Notes:

1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.

2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portions of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and concrete Wash crossing.

Direct impacts to 16.33 acres on the Project site are not considered significant because the habitats are common in the Project Vicinity and have minimal habitat value. Furthermore, these impacts do not represent CNDDB, State, or MSHCP sensitive plant communities. In addition, many of these areas within the Study Area exhibit a moderate or high level of disturbance.

Of the total 16.33 acres impacted onsite, the 0.01 acre of impacts to Bedford Canyon Wash would occur within an area that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash and does not contain native vegetation. Therefore, no new impacts to jurisdictional waters would occur and no additional Regulatory Permits are required.

No direct impacts are expected to occur within the surrounding buffer area. Indirect impacts to the surrounding 500-foot buffer area could occur from construction activities, however impacts would be less than significant because no sensitive habitat or sensitive species are located within the Buffer Area, the habitats are common in the Project Vicinity; the area consists of

disturbed/developed vegetation communities; and construction BMP's such as compliance with air quality regulations would require frequent watering during construction activities to minimize dust.

6.1.2 Total Project Impacts with Alternative 2: PA 14 Dirt Import

Figure 10 and Table 6 describe and list the approximate total acreages of vegetation communities that will be permanently and temporary impacted by Project activities should Alternative 2 for importing dirt be implemented.

Table 6. Alternative 2: PA 14 Dirt Import – On-Site Vegetation Community Impacts[1]

Vegetation Community	Existing Vegetation onsite (acres)	Total Permanent Impacts (acres)	Total Temporary Impacts[3] (acres)	Avoided (acres)
Riversidian Sage Scrub/Chaparral	0.15	0.00	0.10	0.05
Widened and Restored Bedford Canyon Wash[2]	0.20	0.01	0.09[4]	0.10
Ruderal	15.14	14.86	0.00	0.28
Disturbed/Developed	2.28	2.05	0.00	0.23
TOTAL	**17.77**	**16.92**	**0.19[3]**	**0.66**

Notes:

1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.

2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portions of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and concrete Wash crossing.

3. Temporary impacts are due to the access ramp from PA 14 to the commercial site, which is to be constructed during grading operations. Following the completion of the grading operations the temporary dirt ramp would be removed and the bluff will be reconstructed and replanted with coastal sage scrub mix.

4. The 0.09 acres of temporary impacts to the Widened and Restored Bedford Canyon Wash occur completely within the limits of the existing concrete pad crossing and do not impact native or seeded habitat.

Of the total 16.92 acres impacted onsite, direct impacts to 16.91 acres are not considered significant because the habitats are common in the Project Vicinity and have minimal habitat value. Furthermore, these impacts do not represent CNDDB, State, or MSHCP sensitive plant communities. In addition, many of these areas within the Study Area exhibit a moderate or high level of disturbance.

Temporary impacts would occur to 0.19 acres. These impacts are due to the construction of an access ramp leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes. Fill, ranging from 5 feet to 10 feet, would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation.

Careful grading operations and BMPs would avoid dirt spoils in Bedford Canyon Wash. Import operation would need to take place during the dry season, however, temporary pipe culverts

would be placed on top of the concrete pad under the dirt ramp in case unexpected monsoonal storms caused Bedford Canyon Wash to flow.

Following completion of the grading operations, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

Of the total 16.92 acres impacted onsite, the 0.01 acre of impacts to Bedford Canyon Wash would occur within an area that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash. Therefore, no new impacts to jurisdictional waters would occur and no additional Regulatory Permits are required.

No direct impacts are expected to occur within the surrounding buffer area. Indirect impacts to the surrounding 500-foot buffer area could occur from construction activities, however impacts would be less than significant because no sensitive habitat or sensitive species are located within the Buffer Area, the habitats are common in the Project Vicinity; the area consists of disturbed/developed vegetation communities; and construction BMP's such as compliance with air quality regulations would require frequent watering during construction activities to minimize dust.

6.2 Potential Impacts to Special Status Plants

As concluded in Section 5.2 above, no special status plant species were observed during the 2019 surveys and none are expected to occur onsite due to the lack of suitable habitat found on the Project site; therefore, for either dirt import alternative there are no potential impacts to special status plants due to Project implementation.

6.3 Potential Impacts to Critical Habitat

As concluded in Section 5.3 above, the Project site does not contain a designated Critical Habitat overlay. The closest designated Critical Habitat is located approximately 0.01 mile south for the CAGN. No designated Critical Habitat is located onsite; therefore, for either dirt import alternative there are no potential impacts to designated Critical Habitat due to Project implementation.

6.4 Potential Impacts to Special Status Wildlife

As shown in Table 7 below, some impacts to avian species protected by the MBTA may occur as a result of Project construction for both dirt import alternatives. If Project construction is scheduled to occur during the typical breeding bird season (January 1 through August 15 for raptors and February 15 through September 15 for all other avian species), short-term noise

effects to birds that may forage or nest onsite may occur. A pre-construction nesting bird survey is required within five (5) days of ground disturbances during typical nesting bird season to delineate any active nests found within the Project site and 300-foot buffer. Should an active nest be observed onsite, a no-work buffer shall occur surrounding the active nest, until determined by the Project Biologist it has become inactive. The implementation of the pre-construction nesting bird survey shall prevent any impacts due to construction-related noise levels on species covered under the MBTA.

Of the total ten special status wildlife identified below, the Project site lacks suitable habitat for eight of the species, therefore, no impacts are expected to occur to the eight special status wildlife species as a result of Project implementation and either dirt import alternatives. It was determined the Project site contains habitat for the California Horned Lark and limited habitat for the red-diamond rattlesnake. Pre-construction nesting bird surveys as outlined above shall occur to prevent any construction-related impacts during the typical nesting bird season. Furthermore, Biological Monitoring during initial ground disturbances shall occur to identify and locate any red-diamond rattlesnake within the Project site. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the area shall cease to allow for the species to vacate or be relocated from the area safely to prevent any impacts by construction-related earthwork on the species.

Table 7. Impact Analysis Summary for Special Status Species

Species	Extent of Impact	Significance of Impact
California Horned Lark MSHCP: Covered Species	Suitable habitat is found within the Project site as a result of the bare spots and developed area as identified within Section 5.4.	Less than significant impact with pre-construction surveys. No species were observed on site during surveys and this species does not occupy sensitive habitat. Pre-construction surveys would ensure no direct impacts during vegetation removal.
Coastal California gnatcatcher MSHCP: Covered Species	Suitable habitat is not found on the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Coastal whiptail MSHCP: Covered Species	Suitable habitat is not found on the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.

Species	Extent of Impact	Significance of Impact
Coastal Horned Lizard MSHCP: Covered Species	Suitable habitat is not found on the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Least Bell's Vireo MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Orange-throated Whiptail MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Red-Diamond Rattlesnake MSHCP: Covered Species	Limited habitat is found onsite due to the bare and disturbed areas with heavy brush found onsite as identified within Section 5.4.	Less than significant impact with Biological Monitoring during initial ground disturbances. No species were observed onsite during surveys. Biological Monitoring during initial ground disturbances would ensure no direct impacts during ground disturbances.
Stephen's Kangaroo Rat MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Southern California Rufous-Crowned Sparrow MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Western Spadefoot MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.

Project construction could also result in additional short-term impacts including night lighting, littering, and illegal wildlife collections. However, Project compliance with the following BMPs consistent with State and federal laws would reduce the potential for such indirect impacts to below significance:

- All temporary construction-related night lighting used in onsite development areas will be shielded and/or directed downward to avoid indirect impacts to nocturnal wildlife such that night lighting could increase predation rates.

- All construction contractors, subcontractors, and employees will comply with the litter and pollution laws and will institute a litter control/removal program during the course of construction activities to reduce the attractiveness of the area to opportunistic predators such as coyotes, opossums, and common ravens.

- Active nests (nests with chicks or eggs) cannot be removed or disturbed. Nests may be removed or disturbed by a qualified biologist, if not active.

- Construction employees, contractors, and site visitors will be prohibited from collecting wildlife.

With implementation of the night lighting reduction PDFs via their inclusion in the Project's MMRP, potential indirect long-term impacts to wildlife would be reduced to below significance.

6.5 Potential Impacts to Wildlife Movement

As described earlier, Bedford Canyon Wash may serve a function in local wildlife movement. Bedford Canyon Wash provides connectivity between the Santa Ana Mountains and Lake Matthews. Therefore, Bedford Canyon Wash does provide a connection between large areas of undeveloped land, which may be utilized for wildlife movement. Furthermore, with the widened and restored Bedford Canyon Wash on the Arantine Hills project located upstream, Bedford Canyon Wash corridor will continue to provide a valuable linkage for wildlife. Project implementation will not impact the ability of Bedford Canyon Wash to continue to serve as a movement corridor.

Therefore, no impacts to wildlife movement are anticipated as a result of implementation of the Project and either dirt import alternative.

6.6 Potential Impacts to Jurisdictional Features

Implementation of the Arantine Hills Specific Plan includes the widening, protection, and restoration of Bedford Canyon Wash. To permit those activities, the following Regulatory Permits and MSHCP Consistency Determination were issued:

- U.S. Army Corps of Engineers (Corps File No. SPL-2015-00361-ERS)
- California Department of Fish and Wildlife (Notification No. 1600-2015-0055-R6):
- Regional Water Quality Control Board (SARWQCB Project NO. 332014-24)
- U.S. Fish and Wildlife Service (FWS-WRIV-15B0271-16F0852)

- MSHCP Consistency Determination and Determination of Biologically Equivalent or Superior Preservation (DBESP) (FWS/CDFW-15BO0271-15CPA0281)

The Regulatory Permits and MSHCP Consistency authorized the widening and restoration of Bedford Wash, including certain improvements for flood protection. Buried rip-rap extending down to scour depth was permitted along both sides of the Wash. Grade stabilizing structures were permitted perpendicular to flows. Several stormdrain outlet structures surrounded by a concrete structure were incorporated into the rip-rap lined banks to outlet storm flows from the development area into Bedford Wash. Additionally, two concrete crossings were permitted, at the far upstream and downstream limits within the Arantine Hills Specific Plan. The concrete crossings allow maintenance vehicles to cross the Wash and access the bluff side. Additionally, a future bridge crossing Bedford Wash is authorized by the Regulatory Permits. The Regulatory Permits remain active and Project activities authorized under the permits remain on-going.

The proposed Project has two components that could affect the jurisdictional areas of Bedford Canyon Wash. One component of the Project is a storm drain pipe from the on-site detention basin that must outlet into Bedford Wash. The Project proposes to outlet the storm drain pipe with the same design as other outlets into Bedford Wash, with the pipe outletting through a concrete structure constructed into the rip-rap lined bank of Bedford Wash, which results in approximately 0.01 acre of modification to the rip-rap lined bank of Bedford Wash (Figure 11). For the proposed Project, the outlet structure will be constructed on the downstream concrete crossing, eliminating any impacts to the soft bottom portion of the Wash. Since the outlet structure is located outside of the invert of Bedford Canyon Wash, construction of the outlet structure would occur beyond the jurisdictional limits of Waters of the United States. Furthermore, since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency Determination for the widening and restoration of Bedford Canyon Wash, and those permits remain active, no new impacts to Waters of the State or MSHCP Features would occur and no additional Regulatory Permits are required.

The second component of the Project would only occur if Alternative 2, which includes moving fill dirt from Planning Area 14 to the Project site across Bedford Wash, is implemented. In order to move fill dirt across Bedford Wash, fill would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation. A notch would be graded into the plateau to the south of Bedford Wash and scrapers would move dirt across the temporary earthen ramp placed on the existing concrete pad crossing Bedford Wash. The placement of temporary fill on the concrete pad would cover an area of 0.09 acre of Waters of the State/MSHCP Features and 0.06 acres of Waters of the United States, which matches the area of the existing concrete pad crossing (Figure 12). No temporary fill dirt would be placed in the soft-bottom portion of Bedford Wash. Since the proposed ramp is located in an area that consists of existing concrete and was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, and those permits remain active, no new impacts to Waters of the State, Waters of the United States, or MSHCP Features would occur and no additional Regulatory Permits are required.

6.7 Potential Impacts to MSHCP Features

As part of Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. Please refer to the discussion within Section 6.6. Since the proposed outlet structure, and should Alternative 2 be implemented the dirt ramp, are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

A separate MSHCP Consistency Analysis Report has been prepared, which analyzes whether project impacts are consistent with MSHCP goals and objectives.

7.0 BMPs/PDFs Incorporated into the Project and MMRP

The Project will comply with the following:

- Work area limits will be defined and respected. All grading areas will have their boundaries clearly flagged or marked before Project implementation and all disturbances will be confined to the flagged areas. All key Project personnel will be instructed that their activities must be confined to locations within the flagged areas. Disturbance beyond the actual grading zone is prohibited without site-specific surveys.

- Cleared or trimmed non-native, exotic vegetation, and woody debris will be disposed of in a legal manner at an approved disposal site.

- Employees, contractors, and site visitors will be prohibited from collecting plants and wildlife.

- Water pollution and erosion control plans will be developed and implemented in accordance with SWPPP requirements.

- Access to construction sites will be via preexisting access routes.

- Construction equipment will be properly maintained; construction employees and contractors will be trained on proper implementation and monitoring of BMPs; and procedures will be implemented to minimize the likelihood of hazardous spills and to control sediment-laden runoff.

- Effective perimeter control BMPs to control discharge of pollutants from the Project site during construction.

- All temporary construction-related night lighting used in onsite development areas will be shielded and/or directed downward to avoid indirect impacts to nocturnal wildlife such that night lighting could increase predation rates.

- All construction contractors, subcontractors, and employees will comply with the litter and pollution laws and will institute a litter control/removal program during the course of construction activities to reduce the attractiveness of the area to opportunistic predators such as coyotes, opossums, and common ravens.

- Active nests (nests with chicks or eggs) cannot be removed or disturbed. Nests may be removed or disturbed by a qualified biologist, if not active.

8.0 Significance Determination and Proposed Mitigation

8.1 Threshold No. 1

Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

No special status plant species exist on the Project site. Furthermore, no suitable habitat for the plant species and eight of the wildlife species identified within Table 6 is found within the Project site, and no observations of the species have been made.

It was determined the Study Area contains habitat for the California Horned Lark and limited habitat for the red-diamond rattlesnake. Pre-construction nesting bird surveys as outlined within **MM_BIO-1** shall occur to prevent any construction-related noise impacts during the typical nesting bird season on nesting bird species protected under MBTA. Furthermore, Biological Monitoring shall occur during initial ground disturbances to identify and locate any red-diamond rattlesnake within the Project site as outlined within **MM BIO-2**. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the area shall cease to allow for the species to vacate the area safely to prevent any impacts by construction-related earthwork on the species.

The Migratory Bird Treaty Act protects nesting activities of both native and non-native bird species. Under the Act it is unlawful to harm, harass, or take a nest. Since removal of vegetation could result in impacts to nesting birds, the following mitigation measure is included to reduce impacts to less than significant.

MM BIO – 1: The removal of potential nesting bird habitat shall be conducted outside of the nesting season (February 15 to September 15) to the extent feasible. If grading or site disturbance is to occur between February 15 and September 15, a nesting bird survey shall be conducted by a qualified biologist within no more 5 days of scheduled vegetation removal, to determine the presence of nests or nesting birds. If active nests are identified, the biologist would establish buffers around the vegetation (500 feet for raptors and sensitive species, 200 feet for non-raptors/non-sensitive species). All work within these buffers would be halted until the nesting effort is finished (i.e. the juveniles are surviving independent from the nest). The onsite biologist would review and verify compliance with these nesting boundaries and would verify the nesting effort has finished. Work can resume when no other active nests are found. Alternatively, a qualified biologist may determine that construction can be permitted within the buffer areas and would develop a monitoring plan to prevent any impacts while the nest continues to be active (eggs, chicks, etc.). Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to CDFW for mitigation

monitoring compliance record keeping. If vegetation clearing is not completed within 5 days of a negative survey, the nesting survey must be repeated to confirm the absence of nesting birds.

Red-diamond Rattlesnake is a CDFW species of special concern. Since removal of the heavy brush could result in impacts to the species, the following mitigation measure is included to reduce impacts to less than significant.

> **MM BIO – 2:** A Biological Monitor shall be onsite during the initial ground disturbances to identify and locate any red-diamond rattlesnake within the Project site. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the immediate area of the identified species shall cease to allow for the species to vacate or be relocated from the area safely. Work can resume when the species has vacated the immediate ground disturbances work area.

With the implementation of MM BIO-1 and MM BIO-2, potential impacts to nesting birds and special status wildlife species are reduced to a less than significant level.

8.2 Threshold No. 2

Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

As part of both of the alternatives and overall Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Furthermore, for the import of dirt utilizing dirt from Planning Area 14, a temporary dirt bridge and culvert will be placed on the existing concrete pad crossing and removed following grading operation completion. Since the proposed outlet structure (for both alternatives), and dirt ramp (for Alternative 2), are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, no new impacts to Waters of the State or Waters of the United States would occur and no additional Regulatory Permits are required. The outlet is located within the slope and beyond jurisdiction of Waters of the US. Furthermore, no riparian habitat or sensitive natural communities is identified within this area; therefore, no impacts to riparian habitat or sensitive natural communities would occur and no mitigation is required. Further discussion can be found in Section 6.6.

8.3 Threshold No. 3

Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

As part of Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, no new impacts to Waters of the State would occur and no additional Regulatory Permits are required. The outlet is located within the slope and beyond jurisdiction of Waters of the US. This area was previously disturbed and outside of the original limits of Bedford Canyon Wash prior to the widened Wash. As a result, no additional permits are required with Project implementation. Furthermore, the Project will not have a substantial adverse effect on federally protected wetlands as define by Section 404, since the minimal impacts are expected to occur within the riprap slope protection; therefore, no impacts to federally protected wetlands as define by Section 404 would occur and no mitigation is required.

8.4 Threshold No. 4

Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory corridors, or impede the use of native wildlife nursery sites?

Bedford Canyon Wash may serve a function in local wildlife movement. Bedford Canyon Wash provides connectivity between the Santa Ana Mountains and Lake Matthews and does provide a connection between large areas of undeveloped land, which may be utilized for wildlife movement. Furthermore, with the implementation of the widened and restored Bedford Canyon Wash, it will continue to provide a valuable linkage for wildlife. Project implementation will not impact the ability of Bedford Canyon Wash to continue to serve as a movement corridor. Therefore, no impacts to wildlife movement are anticipated as a result of implementation of the Project.

Since removal of vegetation could result in impacts to nesting birds, **MM BIO-1** shall be implemented to reduce impacts to less than significant.

8.5 Threshold No. 5

Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The City does not have any local policies, such as a tree preservation ordinance, that protect biological resources. Therefore, no impacts would occur, and no mitigation is necessary.

8.6 Threshold No. 6

Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The Project site is located within the MSHCP, specifically within the Temescal Canyon Area Plan. A Project Consistency Analysis has been prepared analyzing the impacts and mitigation measures.

As part of Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Furthermore, as part of Project impacts, the alternative 2 would create a temporary dirt bridge placed on the existing concrete pad crossing and removed following grading operation completion. Since the proposed outlet structure (both import alternatives) and temporary dirt bridge (Alternative 2) are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

The Project site falls within Narrow Endemic Plants (Survey Area Number 7). As concluded in Section 6.2 above, no special status plant species were observed during the 2019 surveys and none are expected to occur onsite due to the lack of suitable habitat found on the Project site; therefore, there are no impacts to Narrow Endemic Plants and no conflicts with an approved conservation plan for either dirt import alternatives and Project implementation.

Furthermore, the Project site contains the BUOW overlay. As a result, a series of four focused BUOW survey was conducted per MSHCP Section 6.3.2 and MSHCP protocol Focused Survey Instructions. While potentially suitable habitat exists onsite, no BUOW, suitable burrows, or signs of BUOW were present during the surveys. Complete results can be found within the Focused BUOW Report in Appendix A. Since BUOW are migratory species, **MM BIO – 3** shall be implemented prior to ground disturbance.

> **MM BIO – 3:** Pre-construction presence/absence surveys for burrowing owl within the survey area where suitable habitat is present shall be conducted by a qualified biologist within 30 days of ground disturbing activities. If active burrowing owl burrows are detected during the breeding season, all work within 300 feet of any active burrow will

be halted until that nesting effort is finished. The on-site biologist will review and verify compliance with these boundaries and will verify the nesting effort has finished. Work can resume when no other active burrowing owl burrows nests are found.

If active burrowing owl burrows are detected outside the breeding season or during the breeding season and it is determined nesting activities have not begun, then passive and/or active relocation may be approved following consultation with CDFW. The installation of one-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools when determined to be unoccupied by Project biologist, and back filled to ensure that animals do not re-enter the burrows. Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to CDFW, and the City for mitigation monitoring compliance record keeping.

With the implementation of MM BIO-3, potential impacts to existing MSHCP features are reduced to a less than significant level.

9.0 Cumulative Impacts

Direct impacts may occur to nesting birds, should construction activities and vegetation removal take place during the typical nesting season, regardless of the alternative implemented. However, adherence to the BMPs as outlined in Section 7.0, as well as implementation of MM-Bio 1, and MM-Bio 2 will ensure impacts to special status species or their habitats are minimized thus reducing the Project's contribution to cumulative impacts to less than significant.

As part of both import alternatives, an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Furthermore, as part of Alternative 2: PA14 Dirt Import, a temporary dirt bridge and culvert will be placed on the existing concrete pad crossing and removed following grading operation completion. Since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

Furthermore, the MSHCP was specifically designed to cover a large geographical area so that it would protect numerous special-status species and sensitive habitats throughout the region. It is the projected cumulative effect of future development that has required the preparation and implementation of the MSHCP to protect multiple habitats and species. Because the MSCHP provides a regional and comprehensive approach to conservation planning, the proposed Project's contribution to cumulative impacts would also be less than significant.

1.0 Introduction

On behalf of Bedford Marketplace, LLC (Guardian Capital), Carlson Strategic Land Solutions (SLS) prepared this Focused Burrowing Owl Results Report, which documents the results of the focused protocol Burrowing Owl (*Athene cunicularia [BUOW]*) surveys for the proposed Bedford Marketplace Project (Project). The Project is located on approximately 18-acres in the City of Corona. The Focused BUOW Report incorporates the findings from the focused burrow and BUOW field surveys within the Study, which is comprised of the 18-acre Project site and surround 500-foot buffer. The protocol survey was conducted following the *Burrowing Owl Survey Instructions for the Western Riverside County Multiple Species Habitat Conservation Plan Area* (County of Riverside 2006). The purpose of the survey was to identify presence or absence of BUOW, suitable burrows and/or burrow surrogates, and any other sign of BUOW within the Study Area.

1.1 Project Terms

The following terms will be used throughout this document and are defined as follows:

- Project site: the approximately 18-acre Bedford Marketplace Project site.
- Study Area: the area evaluated during the field survey, including the approximately 18-acre Project site and the surrounding 500-feet (150-meters).
- Project Vicinity: intended to be a general term to describe the broader area surrounding the Study Area.

1.2 Project Location

The Project Site is located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of Corona. The City of Corona is generally situated southwest of the City of Riverside, south of the City of Norco, and north of the City of Lake Elsinore in Riverside County, California (Figure 1). Areas surrounding the Project Site include the I-15 freeway to the east, Arantine Hills Specific Plan to the south and west; and Cajalco Road to the north (Figure 2). The Project Site is located within the United States Geological Survey (USGS) 7.5-Minute Topographic Map *Corona South* Quadrangle.

The Project Site is owned by the Riverside County Transportation Commission and has Assessor's Parcel Numbers (APN) 279-240-033 and 279-240-019.

Access to the Project site is from the residential project referred to as Bedford, located to the west of the Project site, off Eagle Glen Parkway via Hudson House Drive. Directions to the Project site from Interstate 15 (I-15) is to exit Cajalco Road and head west onto Eagle Glen Parkway. Access is obtained via Hudson House Drive.

1.3 Existing and Historical Land Use

The overall Study Area has historically been farmed for citrus production between 1962 and 2007. Prior to the 1962 aerial photograph, the Project Site was vacant land. The former agricultural operation has reverted to ruderal vegetation. The Project site is located between the new residential community of Bedford within the Arantine Hills Specific Plan (AHSP), which has been graded, and the I-15 freeway, including the Cajalco Interchange, which is currently under construction.

Bedford Canyon Wash, located to the south of the Project Site, is an ephemeral wash with a sandy bottom and sparsely vegetated alluvial fan sage scrub and non-native vegetation. The Wash receives flows from the Santa Ana mountains, through the Eagle Glen Golf Club, through the AHSP area, continuing downstream to Temescal Creek and ultimately the Santa Ana River. As part of implementation of the AHSP, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Wash includes planting with an alluvial fan sage scrub seed mix.

1.4 MSHCP Survey Requirements for the Burrowing Owl

The Project site is found within the MSHCP BUOW survey area. The BUOW is designated as a "Covered Species Adequately Conserved" under MSHCP, but with specific survey/conservation requirements as described in Volume I, Section 6.3.2 of the MSHCP and species-specific objectives. Pursuant to the MSHCP, if a site occurs within the BUOW survey area, and suitable habitat is present, then focused surveys shall be conducted following the *Burrowing Owl Survey Instructions for the Western Riverside County Multiple Species Habitat Conservation Plan Area* (County of Riverside 2006). The survey instructions note the following steps to the MSHCP BUOW assessment:

- Step I: Habitat Assessment
- Step II: Locating Burrows and Burrowing Owls
    - » Part A: Focused Burrow Survey
    - » Part B: Focused Burrowing Owl Surveys (a total of 4 separate surveys)

Step I of the survey instructions requires that an assessment be conducted to determine the presence of suitable habitat for the BUOW. The habitat assessment must be conducted by walking the Project site and surrounding 500-foot buffer, where feasible. Habitat for the BUOW is varied and includes short-grass prairies, grasslands, lowland scrub, agricultural lands (particularly rangelands), coastal dunes, desert floors, and some artificial open areas. BUOW require large open expanses of sparsely vegetated areas with an abundance of active small mammal burrows. The mammal burrows are often modified and enlarged. For nesting BUOW,

one burrow is typically selected for use; however, satellite burrows are usually found within the immediate vicinity of the nest burrow within the defended territory of the owl.

Pursuant to MSHCP Section 6.3.2 and the methods are used to detect and identify BUOW included observation of key signs identified by the *California Burrowing Owl Consortium (CBOC).* This includes observation of key signs such as sight, scat, tracks, burrows, nests, and calls. All encountered burrows or structure entrances, suitable or non-suitable, were checked for the presence of BUOWs, molted feathers, cast pellets, prey remains, eggshell fragments, tracks, or excrement at or near a burrow entrance. Natural or man-made structures that could support BUOWs were also surveyed when present.

Once a basis for suitability for BUOW is determined, the presence/absence of suitable burrows is to be determined during Step II of the MSHCP Survey Instructions. Step II surveys must be conducted during breeding season (March 1 through August 31). All surveys are to be conducive to observing owls outside their burrows and detecting BUOW signs. Surveys shall not be conducted during rain, high winds (>20mph), dense fog.

As outlined within Step II of the MSHCP Survey Instructions, Step II is separated into two parts, Part A and Part B. Part A includes the detailed focused burrow survey, which consists of systematic survey for suitable burrows to support BUOW. This includes mammal burrows as well as suitable artificial and/or manmade structures. The pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface. The locations of suitable habitat, potential owl burrows and key signs should be mapped and recorded.

Part B is only conducted if suitable burrows and habitat is present as identified during Part A.

2.0 Methodology

SLS biologist conducted the initial habitat assessment on June 27, 2019 to determine the locations of suitable habitat. Based on this assessment, it was determined the Project site contained suitable habitat, therefore three (3) additional focused BUOW surveys were conducted on July 8, July 25, and August 1, 2019 pursuant to MSHCP Section 6.3.2, MSHCP Protocol Survey Instructions.

2.1 Focused Burrow Survey

Prior to the field survey, available literature and databases including the California Natural Diversity Database (CNDDB), were reviewed to identify sensitive habitats and special status wildlife species, including BUOW in the vicinity of the Study Area. Consistent with the MSHCP Survey Instructions, a focused burrow survey was conducted on June 27, 2019 and pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface.

According to the MSHCP guidelines, the biologist should also walk the perimeter of the property, which consists of a 150-meter (approximately 500 feet) buffer zone around the Project boundary. If permission to access the buffer area cannot be obtained, the biologist shall not trespass, but visually inspect adjacent habitats with binoculars. Parcels of land that could not be accessed (e.g. private property) were viewed using binoculars from vantage points to survey for BUOW activity or signs thereof, as well as other nesting bird activity.

2.2 Focused Burrowing Owl Survey

If no potential suitable BUOW burrows were observed within the Project Study Area or the 150-meter buffer area then Step II Part B, the focused BUOW surveys, are not required per to the BUOW Survey Instructions.

3.0 Results

Step I Habitat Assessment was conducted on June 27, 2019 to determine suitable Habitat. Based on the Habitat Assessment it was determined the Project site contains suitable habitat. Step II, Part A and B of the MSHCP Survey Instructions took place on July 8, July 25, and August 1, 2019. Each of the survey efforts were conducted in the morning between 7:15 a.m. and 11:50 a.m. and were not performed during periods of excessive or abnormal heat, wind, rain, or other inclement weather. Temperatures during the survey ranged between 64° F and 95° F, with predominant sunny, clear skies and 0-2 mph winds. The survey was conducted during typical BUOW peak activity time and was not conducted during rain, high winds (> 20 miles per hour), or dense fog >75%. Prior to the commencement of the survey, SLS biologist scanned the Study Area using binoculars to look for BUOW. The Study Area was assessed for the suitability to support BUOWs and all suitable burrows were inspected for signs of use by BUOWs. The survey involved walking through suitable habitat within the Study Area (the Project site and a 500-foot buffer). Pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface (Figure 3).

No BUOWs or evidence of BUOWs were observed on site within the Study Area during the focused survey. A majority of the Project site was characterized by actively maintained ruderal fields, lacking necessary sized burrows and dense vegetation cover to provide suitable nesting habitat for BUOW. Much of the 500-foot buffer is developed. California ground squirrels (*Spermophilus beecheyi*) and their burrows were observed within the Study Area. These burrows were actively utilized by the California Squirrels and contained no BUOW or keys signs (sight, whitewash, burrows, bones, feathers, pellets, nests, and calls). Furthermore, the Project site is annually maintained for fire abatement and the property adjacent to the Project site has active construction and grading activities, including the I-15/Cajalco Interchange. Therefore, based on the lack of suitable BUOW burrows, routine maintenance and mowing, and adjacent construction activity, it is determined that the Project site is not occupied by BUOW.

All wildlife species encountered visually or audibly during the field survey were identified and recorded in field notes. Photographs were taken to document existing conditions within the Study Area; photo-pages are attached (Appendix A).

The animal species or signs thereof observed during the SLS survey are listed below:

Birds:

- American crow (*Corvus brachyrhynchos*)
- Anna's hummingbird (*Calypte anna*)
- black phoebe (*Sayornis nigricans*)
- California quail (*Callipepla californica*)
- California towhee (*Melozone crissalis*)
- house finch (*Haemorhous mexicanus*)
- mourning dove (*Zenaida macroura*)
- red-tailed hawk (*Buteo jamaicensis*)
- song sparrow (*Melospiza melodia*)
- turkey vulture (*Cathartes aura*)
- California Horned Lark (*Eremophila alpestris actia*)
- western scrub jay (*Aphelocoma californica*)

Mammals:

- California ground squirrel (*Spermophilus beecheyi*)
- desert cottontail (*Sylvilagus audubonii*)

Reptiles:

- western fence lizard (*Sceloporus occidentalis*)

4.0 Discussion

While a majority of the Study Area consist of ruderal vegetation, no BUOWs, suitable sized burrows, or key diagnostic signs (i.e., whitewash, pellets, bones, feathers, etc.) of BUOWs were observed within the Study Area. California ground squirrels and their burrows were observed within the Study Area. However, these burrows are actively utilized by California ground squirrels and contained no BUOWs or key diagnostic signs (i.e., whitewash, pellets, bones, feathers, etc.) of BUOWs. Furthermore, the Project site is annually maintained for fire abatement and the property adjacent to the Project site has active construction and grading activities associated with the I-15/Cajalco Interchange. Therefore, based on the lack of suitable BUOW burrows, routine maintenance and mowing, lack of proper vegetation cover, and adjacent construction activities, it is determined the Project site is not occupied by BUOW.

Based on the results of the field survey, the Study Area is not considered to be occupied by BUOWs. However, since the BUOW is a migratory species the Project will be required to conduct

a 30-day pre-construction survey for the BUOW. The following shall take the following measure to avoid impacts to BUOW.

- Pre-construction surveys for BUOW within the survey area where suitable habitat is present shall be conducted by a qualified biologist within 30 days prior to the commencement of ground disturbing activities. If active BUOW burrows are detected during the breeding season, all work within 300 feet of any active burrow will be halted until that nesting effort is finished. The on-site biologist will review and verify compliance with these boundaries and will verify the nesting effort has finished. Work can resume when no other active BUOW burrows nests are found.

  If active BUOW burrows are detected outside the breeding season or during the breeding season and its determined nesting activities have not begun, then passive and/or active relocation may be approved following consultation with the City. The installation of one-way doors may be installed as part of a passive relocation program. BUOW burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and back filled to ensure that animals do not re-enter the holes/dens. Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to the City for mitigation monitoring compliance record keeping.

5.0 Certification

I hereby certify that the statements furnished above and in the attached exhibits present data and information required for this biological evaluation, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

A. Biological Technical Report for Bedford Marketplace (October 2019)

Executive Summary

Bedford Marketplace, LLC proposes to amend the Arantine Hills Specific Plan (AHSP Amendment No. 3) to increase the boundary of the AHSP by approximately 18 acres (Project Site). The proposal would also increase the area designed Commercial in the AHSP to approximately 22 acres and increase the amount of commercial use from 80,000 square feet to approximately 134,378 square feet plus a 135-room hotel. The Project site, currently owned by the Riverside County Transportation Commission (RCTC), would increase the size of the planned commercial center within the Arantine Hills Specific Plan.

Project implementation includes two alternatives for construction and the importing of dirt for grading operations.

Import Alternative 1: The first option to import dirt onsite is by truck from an off-site source. A potential source of import (Borrow Site) has been identified from the FST Sand and Gravel Mine, located east of I-15 and approximately ½ mile east of El Cerrito Road. The dirt would be hauled from the Borrow Site to the Project site.

Import Alternative 2: The second option to import dirt to onsite involves importing dirt from Planning Area 14 (PA 14) within the Arantine Hills Specific Plan (AHSP). PA 14, approximately 26 acres, is located south of Bedford Canyon Wash and forms an elevated plateau above Bedford Canyon Wash.

To import dirt from PA 14, an access ramp would be graded in the northeast portion of PA 14 leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes. The lower portion of the access ramp would be steeper and reinforced with geo-grid or similar stabilizer. Fill, ranging from 5 feet to 10 feet would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation.

Careful grading operations and BMPs would avoid dirt spoils in Bedford Wash. While this import operation would need to take place during the dry season, temporary pipe culverts would be placed on top of the concrete pad under the dirt ramp in case unexpected monsoonal storms caused Bedford Canyon Wash to flow.

Following completion of the import, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains

would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

The Project site is located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of the City of Corona. The Project is located within the Temescal Canyon Area Plan of the Riverside County Multiple Species Habitat Conservation Plan (MSHCP); however, the Project site is not located within any MSHCP Criteria Areas, Cell Groups, or Subunits. Portions of the Project site are located within overlay areas, as follows:

- Riparian and Riverine Areas (Section 6.1.2)
- Narrow Endemic Plants – Survey Area Number 7 (Section 6.1.3)
- Western burrowing owl (*Athene cunicularia hypugaea*) (Section 6.3.2)

Thus, this consistency determination has been prepared pursuant to those sections.

The majority of the Project site (approximately 98 percent) consists of ruderal vegetation and disturbed/developed land. The remainder of the Project site (approximately 2 percent) consisting of Riversidian sage scrub and widened and restored Bedford Canyon Wash.

The Project site is not located within or adjacent to any MSHCP Conservation Area. The area does not support the Section 6.1.2 special status species. Thus, no mitigation is proposed for the Section 6.1.2 special status species.

The site was evaluated for Narrow Endemic Plants and suitable for the species identified within Survey Area Number 7 pursuant to Section 6.1.3. No species identified within Survey Area Number 7 were observed during the field survey. Furthermore, the Project site lacks suitable habitat and suitable soils and habitat. Therefore, no mitigation is necessary.

The site was evaluated for suitable burrowing owl habitat pursuant to Section 6.3.2, Species Survey Requirements. Following a habitat assessment and three (3) additional focused burrowing owl surveys, no burrowing owls or diagnostic signs of burrowing owls were observed. However, the site was deemed to have potential habitat for the burrowing owl, therefore pre-construction surveys will be conducted by a qualified biologist 30 days prior to the commencement of any ground disturbing activities. With implementation of the pre-construction surveys, the Project would be consistent with the MSHCP requirements as outlined within Section 6.3.2.

Section 1. Introduction

The following Consistency Determination has been prepared by Carlson Strategic Land Solutions (SLS), on behalf of Bedford Marketplace, LLC (Applicant) pursuant to Section 6.1.2 *Protection of Species Associated with Riparian/Riverine areas and Vernal Pools,* Section 6.3.1 *Narrow Endemic Plants,* and Section 6.3.2 *Species Survey Requirements* of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The purpose of the Consistency Determination is to determine if implementation of the Project is consistent with the requirements of the MSHCP.

The Applicant proposes to amend the Arantine Hills Specific Plan (AHSP Amendment No. 3) to increase the boundary of the AHSP by approximately 18 acres (Project Site). The proposal would also increase the area designed Commercial in the AHSP to approximately 22 acres and increase the amount of commercial use from 80,000 square feet to approximately 134,378 square feet plus a 135-room hotel. The Project site assessor parcel number's (APN) are 308-040-053 and 308-040-054.

1.1 Project Terms

The following terms will be used throughout this document and are defined as follows:

- Project site: the approximately 18-acre Bedford Marketplace Project site.
- Study Area: the area evaluated during the field survey, including the approximately 18-acre Project site and the surrounding 500-feet area.
- Project Vicinity: intended to be a general term to describe the broader area surrounding the Study Area.

1.2 Definition of Project Area

The proposed Project site encompasses approximately 18 acres and is located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of the City of Corona. The City of Corona is generally situated southwest of the City of Riverside, south of the City of Norco, and north of the City of Lake Elsinore in Riverside County, California (Figure 1). The Project site is found within Section 20 of Township 4 South, Range 6 West, of the Corona South USGS 7.5" Quadrangle Map. Areas surrounding the Project Site include the Arantine Hills Specific Plan to the south and west; I-15/Cajalco Interchange construction to the north; and the I-15 to the east. The Study Area, consisting of the approximately 18-acre Project site and surrounding 500-foot buffer, and includes

elevations that range from 1,100 to 1,200 feet above mean sea level (MSL) (Figure 2). The buffer area was evaluated as a precautionary measure for potential off-site impacts.

The Project site is located within the Temescal Canyon Area Plan of the MSHCP. The Project is not located within any MSHCP Criteria Areas, Cell Groups, or Subunits. Portions of the Survey Area is located within MSHCP Section 6.1.2 Riparian and Riverine Areas, Section 6.1.3 Narrow Endemic Plant Species Survey Area (NEPSSA) Number 7, and Section 6.3.2 Species Survey Requirements for the western burrowing owl (*Athene cunicularia hypugaea* [BUOW]) habitat (Figure 3). The Project is not located within MSHCP survey areas for Criteria Area Plant Species, Amphibians, Mammals, or Special Linkage Areas.

Bedford Canyon Wash, located to the south of the Project Site, is an ephemeral wash with a sandy bottom and sparsely vegetated alluvial fan sage scrub and non-native vegetation. The Wash receives flows from the Santa Ana mountains, through the Eagle Glen Golf Club, through the AHSP area, continuing downstream to Temescal Creek and ultimately the Santa Ana River. As part of implementation of the AHSP, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Wash will include planting with an alluvial fan sage scrub seed mix.

Section 2. Project Background

Upstream of the Project site is the Arantine Hills Specific Plan Project (Arantine Hills Project). Arantine Hills Project was approved by the City of Corona in 2012 and received Resource Agency approval in 2016 to widen and restore Bedford Canyon Wash creating 23.87 acres of alluvial fan sage scrub habitat permanently protected in a Conservation Easement. As part of implementation of the AHSP, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road.

The approved regulatory permits for the Arantine Hills Project include the following:

CDFW Streambed Alteration Agreement

- Final Streambed Alteration Agreement Notification No. 1600-2015-0055-R6 Arantine Hills Development Project - Issued July 25, 2016
- Amendment Letter 1 Notification No. 1600-2015-0055-R6 - Issued April 1, 2017
- Amendment 2 Notification No. 1600-2015-0055-R6 - Issued December 21, 2017

Corps Section 404 Nationwide Permit

- Corps File No. SPL-2015-00361-ERS – Originally issued September 20, 2016, a Reverification letter was issued November 29, 2017

RWQCB Section 401 Water Quality Certificate

- SARWQCB Project NO. 332014-24 – Issued July 7, 2016

US Fish and Wildlife Service Streamline Section 7

- FWS-WRIV-15B0271-16F0852 - Issued August 12, 2016

DBESP and MSHCP Consistency Determination

- FWS/CDFW-15BO0271-15CPA0281 – Approval via email June 23, 2016 and incorporated into the Streamline Section 7.

Section 3. Project Description

The intent of the Project is to incorporate the approximate 18 acres into the existing Arantine Hills Specific Plan (AHSP) and build a new commercial center. The Project site, currently owned by the Riverside County Transportation Commission (RCTC), would increase the size of the planned commercial center within the Arantine Hills Specific Plan, and is referred to as Bedford Marketplace Project (Project).

The Applicant proposes to amend the Arantine Hills Specific Plan (AHSP Amendment No. 3) to increase the boundary of the AHSP by approximately 18 acres (Project Site). The proposal would also increase the area designated Commercial in the AHSP to approximately 22 acres and increase the amount of commercial use from 80,000 square feet to approximately 134,378 square feet plus a 135-room hotel.

Project implementation includes two alternatives for construction and the importing of dirt for grading operations.

Import Alternative 1: The first option to import dirt onsite is by truck from an off-site source. A potential source of import (Borrow Site) has been identified from the FST Sand and Gravel Mine, located east of I-15 and approximately ½ mile east of El Cerrito Road. The dirt would be hauled from the Borrow Site to the Project site.

Import Alternative 2: The second option to import dirt to onsite involves importing dirt from Planning Area 14 (PA 14) within the Arantine Hills Specific Plan (AHSP). PA 14, approximately 26 acres, is located south of Bedford Canyon Wash and forms an elevated plateau above Bedford Canyon Wash.

To import dirt from PA 14, an access ramp would be graded in the northeast portion of PA 14 leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes. The lower portion of the access ramp would be steeper and reinforced with geo-grid or similar stabilizer. Fill, ranging from 5 feet to 10 feet would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation.

Careful grading operations and BMPs would avoid dirt spoils in Bedford Wash. While this import operation would need to take place during the dry season, temporary pipe culverts would be placed on top of the concrete pad under the dirt ramp in case unexpected monsoonal storms caused Bedford Canyon Wash to flow.

Following completion of the import, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

Access to the Project site is from the residential project referred to as Bedford, located to the west of the Project site, off Eagle Glen Parkway via Hudson House Drive. Directions to the Project site from Interstate 15 (I-15) is to exit Cajalco Road and head west onto Eagle Glen Parkway. Access is obtained via Hudson House Drive.

Section 4. Methodology

The Study Area is located within the planning area for the Western Riverside County MSHCP (Temescal Canyon Area Plan), but is not located within any Criteria Cells, Cell Groups, or Subunits. Portions of the Study Area is located within the Narrow Endemic Plants Survey Area Number 7 and survey area for the burrowing owl (*Athene cunicularia* [BUOW]) (Figure 3).

Biologist and Regulatory Specialist from SLS conducted site-specific surveys at the Study Area from June through August 2019. SLS conducted biological surveys in three main components in order to identify and evaluate actual or potential impacts to biological resources associated with the proposed Project, including: (1) vegetation mapping; (2) site-specific biological surveys to evaluate the presence/absence of special-status species (or potentially suitable habitat) to the satisfaction of the MSHCP, CEQA, and Federal and State regulations; and (3) delineation of aquatic resources (including wetlands/riparian habitat) subject to the jurisdiction of the Corps, RWQCB, and CDFW. The jurisdictional delineation was conducted to determine the limits of Corps jurisdiction pursuant to Section 404 of the CWA, and CDFW jurisdiction pursuant to Division 2, Chapter 6, Section 1600 of the California Fish and Game Code.

The field studies focused on a number of primary objectives that would satisfy the special provisions of the MSHCP and also comply with CEQA requirements, including: (1) general reconnaissance surveys and vegetation mapping; (2) general wildlife surveys; (3) habitat assessments and surveys for special-status plants; (4) habitat assessments and focused biological surveys for special-status animals (including species designated by MSHCP survey areas); (5) wildlife movement analysis; (6) assessments of riparian/riverine areas and vernal pool habitats; and (7) delineation of areas subject to the jurisdiction of the Corps, RWQCB, and CDFW. Observations of plant and wildlife species were recorded during each of the above-mentioned survey efforts. The attached Biological Report provides results of the surveys and personnel (Appendix A).

The Biological Technical Report for Bedford Marketplace Project dated October 2019 (Biological Report) evaluates individual plants and animal species based on their special-status. For the purpose of the Biological Report, plants were considered special-status based on one or more of the following criteria:

- Listing through the Federal and/or State Endangered Species Act (ESA);
- Taxa designated a species of special concern by CDFW.
- Taxa designated a state fully protected species by CDFW.
- Taxa identified as sensitive, unique or rare, by the USFWS, CDFW, the United States Forest Service (USFS), the United States Bureau of Land Management (BLM), and/or the California Department of Forestry and Fire Protection (CDF).

- Plants that meet the definition of rare or endangered under CEQA §15380(b) and (d). Species that may meet the definition of rare or endangered include the following:
    - Species considered by CNPS and CDFW to be "rare, threatened or endangered in California" (California Rare Plant Rank [CRPR] 1A, 1B and 2) (CNPS 2019). A majority of the CRPR 3 and CRPR 4 plant species generally do not qualify for protection under CESA and NPPA.
    - Species that may warrant consideration on the basis of local significance or recent biological information.
    - Some species included on the CNDDB Special Plants, Bryophytes, and Lichens List (CDFW 2019g).
- Considered a locally significant species, that is, a species that is not rare from a statewide perspective but is rare or uncommon in a local context such as within a county or region (CEQA §15125 (c)) or is so designated in local or regional plans, policies, or ordinances (CEQA Guidelines, Appendix G). Examples include a species at the outer limits of its known range or a species occurring on an uncommon soil type.
- Evaluation and coverage under the MSHCP.

Prior to conducting fieldwork, pertinent literature on the flora of the region was examined. A thorough archival review was conducted using available literature and other historical records. These resources included, but were not limited to, the following: CNPS Inventory of Rare and Endangered Plants of California [CNPS 2019]; CNDDB for the Corona South, and surrounding USGS quadrangle maps (CNDDB 2019); and MSHCP Document, including *Section 6.1.2, Section 6.1.3, Section 6.3*, and Table 9.3 (Riverside County Integrated Project 2003).

Vegetation communities were mapped based on the Holland Classification System (Holland 1986). Where necessary, deviations were made on best professional judgment when areas did not fit into a specific habitat description provided by Holland. Plant communities were mapped in the field directly onto a 200-scale (1" = 200') aerial photograph and a Trimble R1 GNSS Receiver paired with the ARCGIS Collector Application was utilized during the survey. Figure 4 (Vegetation Map) provides vegetation mapping for the Project site.

4.1 Section 6.1.2 Riparian/Riverine Areas and Vernal Pools

Volume I, Section 6.1.2 of the MSHCP describes the process through which protection of riparian/riverine areas and vernal pools would occur within the MSHCP Plan Area. The purpose is to ensure that the biological functions and values of these areas throughout the MSHCP Conservation Area are maintained. The MSHCP requires that as projects are

proposed within the overall Plan Area, the effect of those projects on riparian/riverine areas and vernal pools must be addressed. The Study Area was evaluated for the presence/absence of MSHCP riparian/riverine areas and vernal pools. With respect to riparian habitat, the Study Area was evaluated for the potential habitat to support the special status species including the least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii traillii*), the western yellow-billed cuckoo (*Coccyzus americanus occidentalis*), listed fairy shrimp, and other species identified in Section 6.1.2 of the MSHCP.

The Project site was evaluated to determine the limits of (1) Corps jurisdiction pursuant to Section 404 of the CWA; (2) CDFW jurisdiction pursuant to Division 2, Chapter 6, Section 1600 of the Fish and Game Code; and (3) MSHCP riparian/riverine areas and vernal pools. Suspected jurisdictional areas were field checked for the presence of definable channels and/or wetland vegetation, soils and hydrology. Suspected wetland habitat on the site were evaluated using the methodology set forth in the Corps' 1987 Wetland Delineation Manual (Wetland Manual) and the 2008 Regional Supplement to the Corps Wetland Delineation Manual: Arid West Region Version 2.0 (Arid West Supplement). While in the field, the limits of Corps and CDFW jurisdiction were recorded onto a 200-scale (1" = 200') color aerial photograph and a Trimble R1 GNSS Receiver paired with the ARCGIS Collector Application, with accuracy to +/- one foot. Enclosed is a delineation graphic (Figure 5), which depicts the areas of Corps and CDFW jurisdiction identified within the Study Area.

4.2 Section 6.1.3 Narrow Endemic Plants

The CNDDB and MSHCP were initially consulted to determine known occurrences of special- status plants in the region. Based on this information, a list of target plants (including their suitable habitats and soil) was developed and incorporated into a survey program to achieve the following goals: (1) characterize the vegetation associations and land use; (2) prepare a detailed floral compendium; and (3) document the distribution and abundance of any special-status plant species within the Project Study Area.

General surveys were conducted to identify potential sensitive plant habitats, and to establish the accuracy of the data identified from the literature review. An aerial photograph and topographic map were used to determine the community types and other physical features that may support sensitive species or communities within the Project Study Area. The reconnaissance surveys also considered the guidelines adopted by CNPS and CDFW (Nelson 1984, CNPS 2001).

Where potentially suitable habitat was present, focused plant surveys included those MSCHP Covered Species identified by the NEPSSA Survey Area Number 7. For locations with positive survey results, the MSHCP requires that 90 percent of those portions of the property that provide for long-term conservation value for the identified species shall be avoided until it is demonstrated that conservation goals for the particular species are met. Findings of equivalency shall be made demonstrating that the 90-percent standard has been met.

All plant species encountered during the field surveys were identified and recorded following the guidelines adopted by CNPS (2001) and CDFW by Nelson (1984). A complete list of the species observed is provided in Appendix D of the Biological Technical Report for Bedford Marketplace Project dated October 2019.

4.3 Section 6.3.1 Special Survey Requirements

The CNDDB and MSHCP were initially consulted to determine known occurrences of special- status animals in the region. Based on this information, a list of target animal species (including their suitable habitats) was developed and incorporated into a survey program to achieve the following goals: (1) prepare a detailed faunal compendium; and (2) implement general reconnaissance field work and focused surveys to document the distribution and quantity of any special-status animal species within the Study Area.

The Project site and surrounding 500-feet was evaluated for suitable burrowing owl habitat, and where present, focused surveys were conducted for the BUOW to satisfy the requirements of the MSHCP.

4.3.1 General Biological Surveys

Wildlife species were evaluated and detected during field surveys by sight, call, tracks, and scat. Site surveys were conducted in such a manner as to allow inspection by direct observation, including the use of binoculars. Observations of physical evidence and direct sightings of wildlife were recorded in field notes during each visit. A complete list of wildlife species observed within the Project site is provided in the Biological Report. Scientific nomenclature and common names for vertebrate species referred to in this report follow the Complete List of Amphibian, Reptile, Bird, and Mammal Species in California, Standard Common and Scientific Names for North American Amphibians, Turtles, Reptiles, and Crocodilians 6th Edition, Collins and Taggert (2009) for amphibians and reptiles, and the AOU Checklist (2018) for birds. The methodology (including any applicable survey protocols) utilized to conduct the focused surveys or the habitat assessments for special-status animals is included below.

Reptiles and Amphibians

During general surveys, reptiles and amphibians were identified incidentally during surveys within each habitat type. Habitats were examined for diagnostic reptile sign, which include shed skins, scat, tracks, snake prints, and lizard tail drag marks. All reptiles and amphibian species observed, as well as diagnostic sign, were recorded in field notes.

Birds

During general surveys, birds were identified incidentally during surveys within each habitat type. Birds were detected by both direct observation and by vocalizations and were recorded in field notes. The majority of the Project site consists of lowlands containing ruderal (former agricultural) areas and other disturbed areas that provide suitable foraging habitat for raptors, including a few special-status species. These areas serve as potential foraging habitat for a variety of raptor species. During general and focused biological surveys, raptor use within the Study Area was documented to identify species using the property for foraging habitat, as well as to identify any locations of nesting raptors.

Mammals

During general surveys, mammals were identified incidentally during surveys within each habitat type. Mammals were detected both by direct observations and by the presence of diagnostic sign (i.e., tracks, burrows, scat, etc.).

Botanical Resources

During general surveys, botanical resources were identified during survey within each habitat type. Botanical resource surveys consisted of five components: (1) a literature search; (2) preparation of a list of target special-status plant species and sensitive vegetation communities that could occur on site; (3) general field reconnaissance survey; (4) vegetation mapping based on the Holland Classification System; and (5) preparation of a vegetation map, including the location of any sensitive vegetation communities found on site.

4.3.2 Burrowing Owl Surveys

The entire Project site is located within the MSHCP Survey Area for the burrowing owl (*Athene cunicularia* [BUOW]). The BUOW is designated as a State Species of Special Concern. The BUOW occurs in short grass prairies, grasslands, lowland scrub, former agricultural lands (particularly rangelands), prairies, coastal dunes, desert floors, and some artificial, open areas as a year-long resident (Haug, et al.1993). They require large open expanses of sparsely vegetated areas on gently rolling or level terrain with an

abundance of active small mammal burrows (e.g., ground squirrels, rabbits, etc.). They require the use of rodent or other burrows for roosting and nesting cover. They may also dig their own burrow in soft, crumbly soil and may also use pipes, culverts, and nest boxes where burrows are scarce. In the case of nesting owls, one burrow is typically selected for use as the nest; however, satellite burrows are usually found within the immediate vicinity of the nest burrow, within the defended territory of the owl.

Pursuant to the MSHCP, if a site occurs within the BUOW survey area, and suitable habitat is present, then focused burrow and BUOW surveys are to be conducted following the 2012 MSHCP Burrowing Owl Survey Instructions. The Project site was evaluated for suitable BUOW habitat.

Focused Survey Requirements

The Burrowing Owl Survey Instructions are divided into two steps, including the habitat assessment (Step 1) and locating burrows and BUOWs (Step II). Step I of the MSHCP Survey Instructions requires that an assessment be conducted to determine the presence of suitable habitat for the BUOW. A Habitat Assessment was conducted on June 27, 2019 to determine any suitable BUOW habitat on the Project site and surrounding 500-foot buffer. The MSHCP Survey Instructions acknowledge that the presence of suitable burrows is not the deciding factor on whether a site contains suitable habitat for BUOWs. The presence/absence of suitable burrows is to be determined during Step II of the Survey Instructions (Part A: Focused Burrow Survey, and Part B: Additional Focused Burrowing Owl Surveys), once it has been determined that a site contains suitable habitat for the BUOW. The Study Area contains former agricultural lands, ruderal vegetation areas, and unvegetated disturbed areas, many of which exhibit some basic suitability for BUOWs. As such, a focused burrow survey (Step II Part A) was required for the Project.

Following the assessment, a three additional focused BUOW surveys were conducted on July 8, 25, and August 1, 2019 between 7:15 a.m. and 11:50 a.m. pursuant to MSHCP Section 6.3.2, MSHCP Protocol Survey Instructions, and the methods used to detect and identify BUOW included observation of key signs identified by the California Burrowing Owl Consortium (CBOC).

The 2019 focused BUOW surveys were conducted within suitable habitat of the Project site and surrounding 500-foot buffer. The surveys were conducted by walking pedestrian transects within areas of suitable habitat in order to map suitable burrows. The transects were spaced 10 to 15 meters apart, in order to

effectively cover 100 percent of the ground surface. If suitable burrows were encountered, the burrows were mapped using a Trimble R1 GNSS Receiver paired with the ARC Geographical Information System (ARCGIS) Collector Application. Any encountered burrows were inspected for the presence of diagnostic owl sign, including "whitewash" (owl excrement), regurgitated pellets, bones, feathers, etc.

4.3.3 Wildlife Movement Analysis

In order to evaluate direct, indirect, and cumulative impacts of the proposed Project on wildlife movement, an analysis of wildlife use/movement was conducted for the Project site and adjacent buffer area. The analysis considered the movement and use of large mammals (i.e., mountain lion and mule deer), medium-sized mammals (mesocarnivores), and other wildlife such as small mammals, birds, reptiles, and amphibians. Methods utilized for the wildlife analysis included a review of existing information on wildlife use (including the MSHCP), general and focused biological surveys to document the presence/absence of wildlife, and opportunistic observations of mammal tracks and scat. The analysis considered the Project site, but with particular focus on Bedford Canyon Wash.

A portion of the Project site contains the Bedford Canyon Wash, which within the MSHCP has not been identified as an important regional wildlife corridor connecting the Santa Ana Mountains to other MSHCP Core Areas. Bedford Canyon Wash continues through the Project site, where it has been widened and restored. Further downstream (under Interstate 15), a portion of Bedford Canyon Wash has been lined with concrete bed, bank, and channel, before it connects to Temescal Creek. The portion of Bedford Canyon Wash that has been lined with concrete bed, bank, and channel, provides limited wildlife movement to Temescal Creek. The Project site would preserve the widened and restored Bedford Canyon Wash, consistent with the restoration occurring through the Arantine Hills project site, which would maintain existing wildlife movement opportunities through the Project site.

Section 5. Existing Conditions

5.1 Existing Conditions and Land Use

The Project site, currently owned by RCTC, would increase the size of the planned commercial center within the Arantine Hills Specific Plan. The Project site has historically been farmed for citrus production between 1962 and 2007. Prior to the 1962 aerial photograph, the Project Site was vacant land. The former agricultural operation has reverted to ruderal vegetation, which is managed on an annual basis for fuel modification (fire prevention). In addition, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Wash includes planting with an alluvial fan sage scrub seed mix.

The majority of the Project site (approximately 98 percent) consists of ruderal vegetation and disturbed/developed land. The remainder of the Project site (approximately 2 percent) consisting of Riversidian sage scrub and widened and restored Bedford Canyon Wash, see Figure 4.

The MSHCP requires habitat assessments within designated Survey Areas and focused surveys within areas of suitable habitat. For locations with positive focused survey results, the MSHCP requires that 90 percent of those portions of the property that provide for long-term conservation value for the identified species be avoided until it is demonstrated that conservation goals for the particular species are met. Findings of equivalency shall be made demonstrating that the 90-percent standard has been met. If the focus survey findings are negative, then a preconstruction survey is required 30 days prior to ground disturbance.

Surrounding land uses include the Arantine Hills Specific Plan to the south and west; commercial and Cajalco Road to the north; and the I-15 to the east.

5.2 Vegetation Communities

Four vegetation communities were observed within the Project site surrounding 500-foot Buffer. The acreages of vegetation communities and land covers are shown in Table 1 and depicted in Figure 4. As shown on Figure 5, the surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project. A small portion of the 500-foot buffer area includes the Widened and Restored Bedford Canyon Wash.

As stated in Section 2 above, since the Regulatory Permits and DBESP/MSHCP Consistency Determination for the Arantine Hills Project previously accounted for the impacts associated with the widened and restored Bedford Canyon Wash improvements located within the Project site.

Table 1. Summary of Vegetation Communities Onsite[1]

Vegetation Community	Acreage within in the Project Site (acres)
Riversidian Sage Scrub/Chaparral	0.15
Widened and Restored Bedford Canyon Wash[2]	0.20
Ruderal	15.14
Disturbed/Developed	2.28
TOTAL	**17.77**

Notes:

1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.

2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protections, and concrete Wash crossing.

Riversidian Sage Scrub/Chaparral

Approximately 0.15 acres of the Project site is comprised of Riversidian Sage Scrub/Chaparral. This vegetation community is located on the slope of the south bluff of Bedford Canyon Wash. The Riversidean Sage Scrub/Chaparral community is dominated by shrubs such as laurel sumac (*Malosma laurina*), white sage (Salvia apiana), toyon (*Heteromeles arbutifolia*), Mexican elderberry (*Sambucus mexicana*), California sagebrush (*Artemisia californica*), black sage (*Salvia mellifera*), deerweed (*Acmispon glaber*), California buckwheat (*Eriogonum fasciculatum*), chamise (*Adenostoma fasciculatum*), and tree tobacco (*Nicotiana glauca*). The understory of the community consists primarily of non-native species such as red brome (*Bromus madritensis ssp. rubens*), ripgut brome (*Bromus diandrus*), tocalote (*Centaurea melitensis*), and summer mustard (*Hirschfeldia incana*).

Widened and Restored Wash

Approximately 0.20 acres of the Project site is comprised of widened and restored Bedford Canyon Wash (Wash). The original Wash was widened from an approximately 90

feet to 200 feet. Various structures, including buried slope protection, buried grade control structures, and access ramps, are included within the design. The overall restored Wash will be hydroseeded with an alluvial fan sage scrub hydroseed mixture. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protections, and the concrete Wash crossing and grade stabilization.

Ruderal

A total of 15.14 acres of the Project site consists of the ruderal community. This vegetation community occurs in the location of the historical citrus operations. It is generally maintained (trimmed) annually due to fire management. Vegetation within this area is comprised of predominantly of cheeseweed (*Malva parviflora*). Other species include Russian thistle (*Salsola tragus*), summer mustard (*Hirschfeldia incana*), rat-tail fescue (*Festuca microstachys*), foxtail brome (*Bromus madritensis ssp. rubens*), ripgut brome (*Bromus diandrus*), tocalote (*Centaurea melitensis*), Jimson weed (*Datura stramonium*), giant reed (*Arundo donax*), and a few scattered coyote bush (*Baccharis pilularis*), and laurel sumac (*Malosma laurina*).

Developed/Disturbed

A total of 2.28 acres of disturbed area consisting of bare dirt, dirt roads, and sparse vegetation is mapped onsite. The developed/disturbed community contains limited habitat value and includes non-native or invasive species. This community also includes areas of disturbance from both the grading of Arantine Hills and the construction of the Cajalco Interchange.

5.3 MSHCP Riparian/Riverine and Vernal Pool Assessment

Volume I, Section 6.1.2 of the MSHCP describes the process through which protection of riparian/riverine areas and vernal pools would occur within the MSHCP Plan Area. The purpose is to ensure that the biological functions and values of these areas throughout the MSHCP Plan Area are maintained such that habitat values for species inside the MSHCP Conservation Area are maintained.

The MSHCP defines riparian/riverine areas as:

> *…lands which contain Habitat dominated by trees, shrubs, persistent emergent mosses and lichens, which occur close to or which depend upon soils moisture from a nearby fresh water source; or areas with fresh water flow during all or a portion of the year.*

The MSHCP defines vernal pools as:

> *…seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indictors of hydrology and/or vegetation during the drier portion of the growing season.*

With the exception of wetlands created for the purpose of providing wetlands habitat or resulting from human actions to create open waters or from the alteration of natural stream courses, areas demonstrating characteristics as described above which are artificially created are not included in these definitions.

The only MSHCP Riparian and Riverine features located on the Project Site is Bedford Canyon Wash. The total inventory of MSHCP Riparian and Riverine is presented in Table 2 and shown on Figure 5. The Project site contains no vernal pools or depressions as defined under MSHCP vernal pool features.

As part of the implementation of the Arantine Hill Specific Plan, the acreage identified as Riparian/Riverine Habitat includes the widened and restored Bedford Wash. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection and a concrete Wash crossing that includes grade stabilization.

Table 2. Riparian/Riverine Habitat Onsite

Community Type	Acreage Onsite
Riparian/Riverine	0.20[1]
1. Widened and Restored Wash.	

Section 6. Results and Impact Analysis

6.1 Vegetation Communities

Proposed impacts to vegetation communities onsite is summarized in Tables 3 and 4 below based on the Alternative for Dirt Import for grading operations. Calculations were based on the currently proposed development design in combination with the vegetation map from the field survey and aerial imagery.

Indirect temporary impacts to plant communities include the effects of fugitive dust created by grading activities, vehicle construction traffic, or offsite discharge of surface water runoff with its associated erosion and sedimentation. Grading-related dust could settle on plant surfaces and indirectly inhibit metabolic processes such as photosynthesis and respiration. Grading-related erosion, runoff, sedimentation, soil compaction, and alteration of drainage patterns may affect plants by altering site conditions so that the location in which they are growing becomes unfavorable. Another example of indirect impacts includes the introduction and spread of invasive, exotic plants which could result in permanent indirect impacts to adjacent native plant communities.

6.1.1 Alternative 1: Off-site Dirt Import

Figure 6 and Table 3 provides the approximate total acreages of vegetation communities that will be permanently and temporary impacted by Project activities should Alternative 1 be implemented.

Table 3. Total Project Impacts with Alternative 1: Off-site Dirt Import - Onsite Vegetation Community Impacts[1]

Vegetation Community	Existing Vegetation onsite (acres)	Total Permanent Impacts (acres)	Total Temporary Impacts (acres)	Avoided (acres)
Riversidian Sage Scrub/Chaparral	0.15	0.00	0.00	0.15
Widened and Restored Bedford Canyon Wash[2]	0.20	0.01	0.00	0.19
Ruderal	15.14	14.32	0.00	0.82
Disturbed/Developed	2.28	2.00	0.00	0.28
TOTAL	**17.77**	**16.33**	**0.00**	**1.44**

Notes:
1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.

2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portions of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and concrete Wash crossing.

Impacted Native Habitat

Direct impacts to 16.33 acres on the Project site as a result of Alternative 1 are not considered significant because the habitats are common in the Project Vicinity and have minimal habitat value and are non-native habitats. Furthermore, these impacts do not represent CNDDB, State, or MSHCP sensitive plant communities. In addition, many of these areas within the Study Area exhibit a moderate or high level of disturbance.

Of the total 16.33 acres impacted onsite, the 0.01 acre of impacts to Bedford Canyon Wash would occur within an area that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash and does not contain native vegetation. Therefore, no new impacts to jurisdictional waters would occur and no additional Regulatory Permits are required.

No direct impacts are expected to occur within the surrounding buffer area. Indirect impacts to the surrounding 500-foot buffer area could occur from construction activities, however impacts would be less than significant because no sensitive habitat or sensitive species are located within the Buffer Area, the habitats are common in the Project Vicinity; the area consists of disturbed/developed vegetation communities; and construction BMP's such as compliance with air quality regulations would require frequent watering during construction activities to minimize dust.

6.1.2 Alternative 2:PA 14 Dirt Import

Figure 7 and Table 4 provides the approximate total acreages of vegetation communities that will be permanently and temporary impacted by Project activities should Alternative 2 for importing dirt be implemented.

Table 4. Total Project Impacts with Alternative 2: PA14 Dirt Import – Onsite Vegetation Community Impacts[1]

Vegetation Community	Existing Vegetation onsite (acres)	Total Permanent Impacts (acres)	Total Temporary Impacts[3] (acres)	Avoided (acres)
Riversidian Sage Scrub/Chaparral	0.15	0.00	0.10	0.05
Widened and Restored Bedford Canyon Wash[2]	0.20	0.01	0.09[4]	0.10
Ruderal	15.14	14.86	0.00	0.28
Disturbed/Developed	2.28	2.05	0.00	0.23

TOTAL	**17.77**	**16.92**	**0.19[3]**	**0.66**

Notes:

1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.

2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portions of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and concrete Wash crossing.

3. Temporary impacts are due to the access ramp from Phase 2B to the commercial site, which is to be constructed during grading operations. Following the completion of the grading operations the temporary dirt ramp would be removed and the bluff will be reconstructed and replanted with coastal sage scrub mix.

4. The 0.09 acres of temporary impacts to the Widened and Restored Bedford Canyon Wash occur completely within the limits of the existing concrete pad crossing and do not impact native or seeded habitat.

Impacted Native Habitat

Of the total 16.92 acres impacted onsite as a result of Alternative 2, direct impacts to 16.91 acres are not considered significant because the habitats are common in the Project Vicinity and have minimal habitat value and are non-native habitats. Furthermore, these impacts do not represent CNDDB, State, or MSHCP sensitive plant communities. In addition, many of these areas within the Study Area exhibit a moderate or high level of disturbance.

Of the total 16.92 acres impacted onsite, the 0.01 acre of impacts to Bedford Canyon Wash would occur within an area that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash. Therefore, no new impacts to jurisdictional waters would occur and no additional Regulatory Permits are required.

Temporary impacts would occur to 0.19 acres. These impacts are due to the construction of an access ramp leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes and temporarily fill placed on top of the existing concrete pad crossing.

Following completion of the grading operations, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

No direct impacts are expected to occur within the surrounding buffer area. Indirect impacts to the surrounding 500-foot buffer area could occur from construction activities,

however impacts would be less than significant because no sensitive habitat or sensitive species are located within the Buffer Area, the habitats are common in the Project Vicinity; the area consists of disturbed/developed vegetation communities; and construction BMP's such as compliance with air quality regulations would require frequent watering during construction activities to minimize dust.

6.2 Section 6.1.2 - Riparian/Riverine Areas and their Associated Species

The Project site was assessed for MSHCP riparian/riverine areas and vernal pools pursuant to Section 6.1.2 of the MSHCP. The Project site contains MSHCP riparian/riverine features, which are associated with the previously authorized widened and restored Bedford Canyon Wash. Impacts to Bedford Wash are associated with construction of an outlet and a temporary dirt bridge (Alternative 2).

Implementation of the Arantine Hills Specific Plan includes the widening, protection, and restoration of Bedford Canyon Wash. To permit those activities, the following Regulatory Permits and MSHCP Consistency Determination were issued:

- U.S. Army Corps of Engineers (Corps File No. SPL-2015-00361-ERS)
- California Department of Fish and Wildlife (Notification No. 1600-2015-0055-R6):
- Regional Water Quality Control Board (SARWQCB Project NO. 332014-24)
- U.S. Fish and Wildlife Service (FWS-WRIV-15B0271-16F0852)
- MSHCP Consistency Determination and Determination of Biologically Equivalent or Superior Preservation (DBESP) (FWS/CDFW-15BO0271-15CPA0281)

The Regulatory Permits and MSHCP Consistency authorized the widening and restoration of Bedford Wash, including certain improvements for flood protection. Buried rip-rap extending down to scour depth was permitted along both sides of the Wash. Grade stabilizing structures were permitted perpendicular to flows. Several stormdrain outlet structures surrounded by a concrete structure were incorporated into the rip-rap lined banks to outlet storm flows from the development area into Bedford Wash. Additionally, two concrete crossings were permitted, at the far upstream and downstream limits within the Arantine Hills Specific Plan. The concrete crossings allow maintenance vehicles to cross the Wash and access the bluff side. Additionally, a future bridge crossing Bedford Wash is authorized by the Regulatory Permits. The Regulatory Permits remain active and Project activities authorized under the permits remain on-going.

The proposed Project has two components that could affect the jurisdictional areas of Bedford Canyon Wash. One component of the Project is a storm drain pipe from the on-site detention basin that must outlet into Bedford Wash. The Project proposes to outlet

the storm drain pipe with the same design as other outlets into Bedford Wash, with the pipe outletting through a concrete structure constructed into the rip-rap lined bank of Bedford Wash, which results in approximately 0.01 acre of modification to the rip-rap lined bank of Bedford Wash (Figure 6). For the proposed Project, the outlet structure will be constructed on the downstream concrete crossing, eliminating any impacts to the soft bottom portion of the Wash. Since the outlet structure is located outside of the invert of Bedford Canyon Wash, construction of the outlet structure would occur beyond the jurisdictional limits of Waters of the United States. Furthermore, since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency Determination for the widening and restoration of Bedford Canyon Wash, and those permits remain active, no new impacts to Waters of the State or MSHCP Features would occur and no additional Regulatory Permits are required.

The second component of the Project would only occur if Alternative 2, which includes moving fill dirt from Planning Area 14 to the Project site across Bedford Wash, is implemented. In order to move fill dirt across Bedford Wash, fill would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation. A notch would be graded into the plateau to the south of Bedford Wash and scrapers would move dirt across the temporary earthen ramp placed on the existing concrete pad crossing Bedford Wash. The placement of temporary fill on the concrete pad would cover an area of 0.09 acre of Waters of the State/MSHCP Features and 0.06 acres of Waters of the United States, which matches the area of the existing concrete pad crossing (Figure 7). No temporary fill dirt would be placed in the soft-bottom portion of Bedford Wash. Since the proposed ramp is located in an area that consists of existing concrete and was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, and those permits remain active, no new impacts to Waters of the State, Waters of the United States, or MSHCP Features would occur and no additional Regulatory Permits are required.

6.2.1 Impacts to Species Protected under Section 6.1.2

During vegetation mapping conducted for the Project site, no special status plants were detected during the 2019 surveys. Likewise, the Project site did not contain any suitable habitat for the avian species listed in Section 6.1.2: Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools. Regardless of the Dirt Import Alternative implemented, no impacts to those special status plants and wildlife listed in Section 6.1.2 of the MSHCP are associated with Project implementation.

6.2.2 Vernal Pools

The Project site does not contain suitable habitat for any of the riparian/riverine vernal pool species listed in Section 6.1.2 of the MSHCP, including listed fairy shrimp. Regardless of the Dirt Import Alternative implemented, no impacts to those species listed in Section 6.1.2 of the MSHCP are associated with Project implementation and Dirt Import Alternative.

6.3 Section 6.1.2 - Riparian/Riverine Areas and their Associated Species

Portions of the Project site are located within the Narrow Endemic Plant Species Survey Areas (NEPSSA) Number 7, which include the following target species:

Narrow Endemic Plants

- San Diego ambrosia (*Ambrosia pumila*)
- Brand's phacelia (*Phacelia stellaris*)
- San Miguel savory (*Satureja chandleri*)

No special status plant species were observed during the 2019 surveys and none are expected to occur onsite due to the lack of suitable habitat or suitable soil found on the Project site; therefore, there are no potential impacts to special status plants due to Project implementation regardless of the Import Alternative implemented.

6.4 Section 6.3.2 -- Species Survey Requirements

The majority of the Project site supports suitable habitat for the BUOW based on the June habitat assessment. No BUOWs, suitable sized burrows, or evidence of BUOWs were observed on site within the Project site and surrounding 500-foot buffer during the focused surveys. A majority of the Project site was characterized by heavily vegetated ruderal fields and lacking adequately sized burrows to provide suitable nesting habitat for BUOW. Much of the buffer area is developed/disturbed. California ground squirrels were observed within the Project site and surrounding 500-foot buffer. The Project site contained no BUOW or keys signs (sight, whitewash, burrows, bones, feathers, pellets, nests, and calls). Furthermore, the Project site is maintained for fire abatement and the property adjacent to the Project site has active construction and grading activities (Arantine Hills Construction and I-15/Cajalco construction). Therefore, based on the lack of suitable BUOW burrows, adjacent construction activities, and maintenance and mowing of the Project site is not considered occupied by BUOW.

Section 7. Description of Avoidance and Mitigation Measures

The guidelines presented in Section 6.1.4 of the MHSCP are intended to address indirect effects associated with locating development in proximity to the MSHCP Conservation Area. Development located in proximity to the MSHCP Conservation Area may result in edge effects that will adversely affect biological resources within the Conservation Area. The Project Site is not within or adjacent to a Criteria Cell and, therefore, a discussion of the effects pertaining to the urban/wildlife interface is not required.

7.1 Section 6.1.2 Riparian/Riverine Areas and their Associated Species

7.1.1 Avoidance and Minimization – Riparian/Riverine Areas

As part of both Project dirt import alternatives and Project implementation, an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing.

As part of Import Alternative 2, temporary impacts will occur due to the construction of an access ramp leading down to the existing concrete pad crossing of Bedford Canyon Wash. Fill would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation. The temporary impacts total 0.09 acre of MSHCP Features will occur on the existing concrete pad crossing only (Figure 7). Furthermore, following the completion of the grading operations, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash. Further detail is provided in Section 6.2.

Since the proposed outlet structure and temporary dirt bridge are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

7.1.2 Mitigation – Riparian/Riverine Areas

For both Project dirt import alternatives, since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur and no compensatory mitigation is required.

7.2 Section 6.1.3 Narrow Endemic Plant Species

7.2.1 Avoidance and Minimization - Narrow Endemic Plant Species

No narrow endemic plant species were observed during the 2019 surveys, and the Project site does not contain suitable habitat or soils; therefore, no avoidance and minimization measures are proposed.

7.2.2 Mitigation - Narrow Endemic Plant Species

No narrow endemic plant species were observed during the 2019 surveys, and the Project site does not contain suitable habitat or soils; therefore, no compensatory mitigation measures are proposed.

7.3 Section 6.3.2 -- Species Survey Requirements

7.3.1 Avoidance and Minimization – Burrowing Owl

Complete avoidance of the BUOW habitat is not feasible for Import Alternative 1 and 2.

Pre-construction presence/absence surveys for burrowing owl within the survey area where suitable habitat is present shall be conducted by a qualified biologist within 30 days of ground disturbing activities for both Import Alternatives.

If active burrowing owl burrows are detected during the breeding season, all work within 300 feet of any active burrow will be halted until that nesting effort is finished. The on-site biologist will review and verify compliance with these boundaries and will verify the nesting effort has finished. Work can resume when no other active burrowing owl burrows nests are found.

If active burrowing owl burrows are detected outside the breeding season or during the breeding season and it is determined nesting activities have not begun, then passive and/or active relocation may be approved following consultation with CDFW. The installation of one-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools when determined to be unoccupied by Project biologist, and back filled to ensure that animals do not re-enter the burrows.

Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to CDFW, and the City for mitigation monitoring compliance record keeping.

7.3.2 Mitigation – Burrowing Owl

Compensatory mitigation is not proposed because impacts to the burrowing would be avoided and/or minimized to less than significant for both Import Alternatives.

Section 8. Consistency Analysis

8.1 Section 6.1.2 - Riparian/Riverine Areas and their Associated Species

As part of both Import Alternatives and Project implementation, an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing.

As part of Alternative 2 grading operations, temporary impacts will occur due to the construction of an access ramp leading down to the existing concrete pad crossing of Bedford Canyon Wash. Fill would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash. Following the completion of the grading operations, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash.

Since the proposed outlet structure and temporary dirt bridge are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur. No species under "Purpose" of Section 6.1.2 were found in the riparian/riverine areas of the Project site.

Therefore, the proposed Project is consistent with Section 6.1.2 (Riparian/Riverine Guidelines) of the MSHCP.

The Project site is not located within or adjacent to any MSHCP Conservation Area. The area does not support the Section 6.1.2 species. Thus, no mitigation is proposed.

8.2 Section 6.1.3 – Protection of Narrow Endemic Plant Species

No narrow endemic plant species were observed in the 2019 surveys, and the Project site does not contain suitable habitat or soils.

8.3 Section 6.3.2 - Species Survey Requirements

No BUOWs or BUOW burrows were located within the Project site per the results of the focused surveys.

Regardless of the Import Alternative, the Project will be required to conduct a 30-day pre-construction survey for the BUOW according to the MSHCP Volume II, Birds, BUOW, Conservation Objective 6: "Pre-construction presence/absence surveys for burrowing owl

within the survey area where suitable habitat is present will be conducted for all Covered Activities through the life of the permit. Surveys will be conducted within 30 days prior to disturbance. Take of active nests will be avoided. Passive relocation (use of one-way doors and collapse of burrows) will occur if owls are present outside the nesting season."

The Project is consistent with Section 6.3.2 (Species Surveys). While the Project site supports suitable habitat for the BUOW, during the focused surveys no BUOWs, or diagnostic signs of BUOWs were observed within the Project site and surrounding 500-foot buffer. However, the Project will be required to conduct a 30-day pre-construction survey for the BUOW according to *MSHCP Volume II, Birds, Burrowing Owl, Conservation Objective 6,* which states that pre-construction presence/absence surveys for the BUOW where suitable habitat is present within the survey area will be conducted 30 days prior to disturbance and ensures that take of active nests will be avoided and passive relocation will occur when owls are present outside the nesting season.

1.0 Introduction

On behalf of Bedford Marketplace, LLC (Applicant), Carlson Strategic Land Solutions (SLS) prepared this Biological Technical Report for the proposed Bedford Marketplace Project (Project) located on approximately 18 acres in the City of Corona. The Biological Technical Report for the approximately 18-acre Project site and the surrounding 500-feet, collectively known as the "Study Area," incorporates the findings from field surveys conducted on June 27, 2019; and a total of four focused Burrowing Owl Surveys conducted in June, July, and August 2019 (Appendix A).

1.1 Purpose and Approach

This report provides a summary of the conditions present during the 2019 field surveys, an assessment of the potential presence of sensitive biological resources, an analysis of the potential impacts to those resources due to Project implementation, and proposed mitigation. This report describes the current biological resources present within the Study Area including habitat communities, jurisdictional waters, and the potential occurrence of listed and special status plant and wildlife species. The potential biological significance of site construction and development in view of federal, state, and local laws and regulations are also identified in this report. The report also recommends, as appropriate, Best Management Practices (BMPs) and avoidance and minimization measures to reduce or avoid potential impacts. While general biological resources are discussed, the focus of this assessment is on those resources considered to be sensitive. This report was prepared based upon results of a literature review and field surveys.

1.2 Project Terms

The following terms will be used throughout this document and are defined as follows:

- Project site: the approximately 18-acre Bedford Marketplace Project site.
- Study Area: the area evaluated during the field survey, including the approximately 18-acre Project site and the surrounding 500-feet area.
- Project Vicinity: intended to be a general term to describe the broader area surrounding the Study Area.

1.3 Project Location

The Project Site is located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of Corona. The City of Corona is generally situated southwest of the City of Riverside, south of the City of Norco, and north of the City of Lake Elsinore in Riverside County, California (Figure 1). Areas surrounding the Project Site include the I-15 freeway to the east, Arantine Hills Specific Plan to the south and west; and Cajalco Road to the north (Figure 2). The

Project Site is located within the United States Geological Survey (USGS) 7.5-Minute Topographic Map *Corona South* Quadrangle.

The Project Site is owned by the Riverside County Transportation Commission and has Assessor's Parcel Numbers (APN) 279-240-033 and 279-240-019.

Access to the Project site is from the residential project referred to as Bedford, located to the west of the Project site, off Eagle Glen Parkway via Hudson House Drive. Directions to the Project site from Interstate 15 (I-15) is to exit Cajalco Road and head west onto Eagle Glen Parkway. Access is obtained via Hudson House Drive.

1.4 Existing and Historical Land Use

The overall Study Area has historically been farmed for citrus production between 1962 and 2007. Prior to the 1962 aerial photograph, the Project Site was vacant land. The former agricultural operation has reverted to ruderal vegetation. The Project site is located between the new residential community of Bedford within the Arantine Hills Specific Plan (AHSP), which has been graded, and the I-15 freeway, including the Cajalco Interchange, which is currently under construction.

Bedford Canyon Wash, located to the south of the Project Site, is an ephemeral wash with a sandy bottom and sparsely vegetated alluvial fan sage scrub and non-native vegetation. The Wash receives flows from the Santa Ana mountains, through the Eagle Glen Golf Club, through the AHSP area, continuing downstream to Temescal Creek and ultimately the Santa Ana River. As part of implementation of the AHSP, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Wash includes planting with an alluvial fan sage scrub seed mix.

2.0 Project Description

The intent of the Project is to incorporate the approximate 18 acres into the existing Arantine Hills Specific Plan (AHSP) and build a new commercial center. The Project site, currently owned by the Riverside County Transportation Commission (RCTC), would increase the size of the planned commercial center within the Arantine Hills Specific Plan.

The Applicant proposes to amend the Arantine Hills Specific Plan (AHSP Amendment No. 3) to increase the boundary of the AHSP by approximately 18 acres (Project Site). The proposal would also increase the area designated Commercial in the AHSP to approximately 22 acres and increase the amount of commercial use from 80,000 square feet to approximately 134,378 square feet plus a 135-room hotel.

Project implementation includes two alternatives for construction and the importing of dirt for grading operations.

Import Alternative 1: The first option to import dirt onsite is by truck from an off-site source. A potential source of import (Borrow Site) has been identified from the FST Sand and Gravel Mine, located east of I-15 and approximately ½ mile east of El Cerrito Road. The dirt would be hauled from the Borrow Site to the Project site.

Import Alternative 2: The second option to import dirt to onsite involves importing dirt from Planning Area 14 (PA 14) within the Arantine Hills Specific Plan (AHSP). PA 14, approximately 26 acres, is located south of Bedford Canyon Wash and forms an elevated plateau above Bedford Canyon Wash.

To import dirt from PA 14, an access ramp would be graded in the northeast portion of PA 14 leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes. The lower portion of the access ramp would be steeper and reinforced with geo-grid or similar stabilizer. Fill, ranging from 5 feet to 10 feet would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation.

Careful grading operations and BMPs would avoid dirt spoils in Bedford Wash. While this import operation would need to take place during the dry season, temporary pipe culverts would be placed on top of the concrete pad under the dirt ramp in case unexpected monsoonal storms caused Bedford Canyon Wash to flow.

Following completion of the import, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

3.0 Regulatory Context

The following is a list of the key local, state, and federal laws and regulations that apply to protecting plant communities, plants, wildlife, and water quality from project impacts relevant to the Project.

3.1 Federal Laws and Regulations

- Federal Endangered Species Act (FESA)
- Federal Clean Water Act (CWA)
- Migratory Bird Treaty Act (MBTA)

3.2 California State Laws and Regulations

- California Environmental Quality Act (CEQA)
- California Endangered Species Act (CESA) and Fish and Game Code (FGC) sections 2050 et seq.

3.3 Local Plans/Regulations

- City of Corona General Plan
- Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP): Temescal Canyon Area Plan

3.4 Regulatory Permits

This report is prepared pursuant to and in support of CEQA, and any applicable regulatory permit applications, including the California Department of Fish and Wildlife (CDFW) Streambed Alteration Agreement (SAA), Regional Water Quality Control Board (RWQCB) Section 401 Water Quality Certification (WQC), United States Army Corps of Engineers (Corps) Section 404 permit, and United States Fish and Wildlife Service Section 7 Biological Opinion.

4.0 Survey and Methods

Preparation for this biological study began with a review of relevant available literature and review of historical biological documentation. This effort was followed by an onsite field survey on June 27, 2019. The purpose of the field survey was to assess the existing habitat, map any onsite sensitive plant communities and jurisdictional waters, and determine whether special status plant and wildlife species occur or potentially occur within the Study Area.

4.1 Literature Review

The study began with a review of relevant available literature on the biological resources within the Study Area and Project Vicinity. The Project site is located within the boundary of the Western Riverside MSHCP, specifically within the Temescal Canyon Area Plan.

4.1.1 Sensitive Plant Communities

Sensitive plant communities (sensitive habitats) are of limited distribution statewide or within a county or region and are often vulnerable to environmental effects of projects. Sensitive habitats are often threatened with local extirpation and are therefore considered valuable biological resources. Plant communities are considered “sensitive” by the California Native Plant Society (CNPS) and CDFW if they meet any of the criteria listed below.

- The habitat is recognized and considered sensitive by CDFW, United States Fish and Wildlife Service (USFWS), and/or special interest groups such as CNPS.
- The habitat is under the jurisdiction of the Corps pursuant to Section 404 of the CWA.
- The habitat is under the jurisdiction of the CDFW pursuant to Sections 1600 through 1612 of the California Fish and Game Code.
- The habitat is known or believed to be of high priority for inventory in the California Natural Diversity Database (CNDDB).
- The habitat is considered regionally rare.
- The habitat has undergone a large-scale reduction due to increased encroachment and development.
- The habitat supports special status plant and/or wildlife species (defined below).
- The habitat functions as an important corridor for wildlife movement.

4.1.2 Critical Habitat

Under the ESA, the federal government is required to designate "critical habitat" for any species it lists under the ESA. Federal agencies are prohibited from authorizing, funding or carrying out actions that "destroy or adversely modify" critical habitats. Section 3 of the ESA defines critical habitat as:

- The specific areas within the geographic area occupied by a species, at the time it is listed in accordance with the ESA, on which are found those physical or biological features essential to the conservation of the species and that may require special management considerations or protection.

- The specific areas outside the geographic area occupied by a species at the time it is listed, upon a determination that such areas are essential for the conservation of the species.

"Conservation" means the use of all methods and procedures that are necessary to bring an endangered or a threatened species to the point at which listing under the ESA is no longer necessary. Critical habitat receives protection under Section 7(a)(2) of the ESA through the prohibition against destruction or adverse modification of critical habitat with regard to actions carried out, funded, or authorized by a federal agency. Section 7(a)(2) also requires conferences on federal actions that are likely to result in the destruction or adverse modification of proposed critical habitat.

The USFWS's online service for information regarding Threatened and Endangered Species Final Critical Habitat designation within California was reviewed to determine if the Study Area is within any species' designated Critical Habitat (USFWS 2019a). The USFWS regulatory mapping process for the designation of critical habitat is an imprecise, broad-based, mapping exercise of areas that may or may not include constituent elements of the critical habitat designation. Due to this approach in mapping, large areas are designated as critical habitat regardless of the existing habitat, and as a result may include developed areas, such as buildings, roads, hardscape, and other such facilities, as well as natural habitats.

The constituent elements of the critical habitat designation consider the physical and biological features needed for life processes and successful reproduction of the listed species, including:

- Space for individual and population growth for normal behavior;
- Habitat cover or shelter;
- Food, water, or other nutritional or physiological requirements;
- Sites for breeding and rearing offspring; and
- Habitat that is protected from disturbance or is representative of the historical geographic and ecological distribution of a species.

4.1.3 Special Status Plants and Wildlife

Species of plants and animals are afforded "special status" by federal agencies, state agencies, and/or non-governmental organizations (e.g., USFWS, CDFW, and USFS, and CDF) because of their recognized rarity, potential vulnerability to extinction, and local importance. These species typically have a limited geographic range and/or limited habitat and are referred to collectively as "special status" species. Plant and wildlife species are considered "special status" species if they meet any of the following criteria.

- Taxa with official status under ESA, CESA, and/or the NPPA.
- Taxa proposed for listing under ESA and/or CESA.
- Taxa designated a species of special concern by CDFW.
- Taxa designated a state fully protected species by CDFW.

- Taxa identified as sensitive, unique or rare, by the USFWS, CDFW, the United States Forest Service (USFS), the United States Bureau of Land Management (BLM), and/or the California Department of Forestry and Fire Protection (CDF).
- Plants that meet the definition of rare or endangered under CEQA §15380(b) and (d). Species that may meet the definition of rare or endangered include the following:
    - Species considered by CNPS and CDFW to be "rare, threatened or endangered in California" (California Rare Plant Rank [CRPR] 1A, 1B and 2) (CNPS 2018). A majority of the CRPR 3 and CRPR 4 plant species generally do not qualify for protection under CESA and NPPA.
    - Species that may warrant consideration on the basis of local significance or recent biological information.
    - Some species included on the CNDDB Special Plants, Bryophytes, and Lichens List (CDFW 2019g).
- Considered a locally significant species, that is, a species that is not rare from a statewide perspective but is rare or uncommon in a local context such as within a county or region (CEQA §15125 (c)) or is so designated in local or regional plans, policies, or ordinances (CEQA Guidelines, Appendix G). Examples include a species at the outer limits of its known range or a species occurring on an uncommon soil type.

Available literature and databases were reviewed regarding sensitive habitats and special status plant and wildlife species. Special status plant and wildlife species that have the potential to occur within the immediate region of the Study Area were identified. Several agencies, including the USFWS, CDFW, and CNPS publish lists of particular taxa (species and subspecies) and the associated level of protection or concern associated with each. Reviewed and consulted literature and databases focused on the Study Area, and included the following sources listed below:

- The CNDDB, a CDFW species account database that inventories status and locations of rare plants and wildlife in California, was used to identify any sensitive plant communities and special status plants and wildlife that may exist within a two-mile radius of the Project site. A CNDDB search was performed by assessing a two-mile radius around the Study Area (CDFW 2019f). CNDDB records are generally used as a starting point when determining what special status species, if any, may occur in a particular area. However, these records may be old, lack data not yet entered, and do not represent all the special status species that could be in that particular area (Figure 3).
- A map of USFWS critical habitat to determine species with critical habitat mapped in the general vicinity of the Project (Figure 4) (USFWS 2019a).
- Online CNPS Inventory of Rare and Endangered Plants of California (CNPS 2019). A search for the USGS 7.5-Minute Topographic Map Corona South Quadrangle provided information regarding the distribution and habitats of special status vascular plants in the Project Vicinity.
- Pertinent maps, scientific literature, websites, and regional flora and fauna field guides.

The literature review was used as a resource to better understand the biological resources potentially occurring within the Study Area. Although the inventory list of special status plant and wildlife species was not exhaustive of all species that might occur on the property, it provides a wide range of species that are representative of the wildland habitats in the area. Species occurrence and distribution information is based on documented occurrences where surveys have taken place for individual projects; therefore, a lack of documented occurrence does not necessarily indicate that a given species is absent from the Study Area.

4.1.4 Jurisdictional Waters

The following sources were reviewed to determine the potential presence or absence of jurisdictional streams/drainages, wetlands, and their location within the watersheds associated with the Study Area, and other features that might contribute to federal or state jurisdictional authority located within watersheds associated with the Study Area:

- National Wetlands Inventory (NWI) maps (USFWS 2019c). The NWI database indicates potential wetland areas based on changes in vegetation patterns as observed from satellite imagery. This database is used as a preliminary indicator of wetland habitats because the satellite data are not precise.
- Title 33 Code of Federal Register (CFR): Navigation and Navigable Waters Part 328
- USGS National Hydrography Dataset (NHD). Provides the locations of "blue-line" streams as mapped on 7.5-Minute Topographic Map coverage.
- Aerial Imagery (Google Earth©) (Google 2019).
- USGS 7.5-Minute Topographic Maps.
- Natural Resource Conservation Service (NRCS) Soil Survey.

4.1.5 MSHCP Assessment

The Project site is located within the MSHCP, specifically within the Temescal Canyon Area Plan. The MSHCP is a comprehensive plan that includes portions of the County of Riverside and numerous cities. The MSHCP plans for conservation of 146 species and proposes a reserve system of approximately 500,000 acres. The MSHCP is intended to contribute to the economic viability of the County of Riverside by providing landowners, developers, and public infrastructure projects a streamlined regulatory process.

The Riverside Conservation Authority (RCA) MSHCP Information Application website was reviewed to verify any overlays that may occur on the Project site. Regardless of other overlays, MSHCP Section 6.1.2, *Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools*, is applicable to all projects within the MSHCP and describes the process through which protection of riparian/riverine areas, and vernal pools will occur within the MSHCP Area. Protection of these resources is important for a number of MSHCP conservation objectives. An assessment of a Project's potentially significant effects on riparian/riverine areas and vernal pools is required. Guidelines for determining whether or not these resources exist on site are described as follows:

- **Riparian/Riverine Areas** include "lands which contain habitat dominated by trees, shrubs, persistent emergents, or emergent mosses and lichens which occur close to or which depend upon soil moisture from a nearby fresh water source or areas with fresh water flow during all or a portion of the year." Riparian/riverine areas under the MSHCP also include drainage areas that are vegetated or have upland (non-riparian/riverine) vegetation and that drain directly into an area that is described for conservation under the MSHCP (or areas already conserved). The Project site was assessed for areas meeting this definition during the jurisdictional delineation performed on June 27, 2019.

- **Vernal Pools** are described by the MSHCP as "seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetlands indicators of hydrology and/or vegetation during the drier portion of the growing season." This definition excludes artificially created wetlands created for proving wetlands habitat or human actions to create open waters or altering natural streams demonstrating characteristic as described above. The Project site was assessed for areas meeting this definition during the jurisdictional delineation performed on June 27, 2019.

4.2 Biological Survey

4.2.1 General Biological Survey

A field survey was performed on June 27, 2019 by SLS biologist Brianna Bernard to assess and map vegetation communities, plants, and wildlife, and to identify habitat areas that could be suitable for special status plant species.

Plant species were identified using plant field and taxonomical guides, such as The Jepson Manual: Vascular Plants of California, second edition (Baldwin et al. 2012). All plant species encountered during the field survey were identified and recorded in field notes. A one-day survey cannot be used to conclusively determine presence or absence of a species; therefore, assessments of presence/absence were made based on the previous surveys, presence of suitable habitat and soils to support the species, known records or occurrence within the area, and known distribution and elevation range obtained from the relevant literature.

During the field survey, the biologist assessed the existing habitat within the Study Area using aerial maps and a Trimble R1 GNSS Receiver paired with the ARC Geographical Information System (ARCGIS) Collector Application. The biologist paid special attention to those habitat areas that had the potential to provide suitable habitat for special status plant and wildlife species. Aerial photographs and maps were used to assist in the delineation of plant community boundaries. Following field mapping, the plant communities were digitized, and the vegetation map was created. General wildlife surveys were conducted on foot and with binoculars within the Study Area.

All wildlife species encountered visually or audibly during the field survey were identified and recorded in field notes. Biologists also recorded signs of wildlife species including animal tracks,

burrows, nests, scat, and remains. Binoculars were used to aid in the identification of observed wildlife. Wildlife field guides and photographs were used to assist with identification of wildlife species during the field survey, as necessary. Photographs were taken to document existing conditions within the Study Area (Appendix B).

4.3 Focused Burrowing Owl Survey

The Project site falls within a MSHCP Burrowing Owl (BUOW) overlay (Figure 4). A Habitat Assessment was conducted on June 27, 2019 to determine any suitable BUOW habitat onsite. Following the assessment, a series of Focused Burrowing Owl surveys were conducted on July 8, July 25, and August 1, 2019 pursuant to MSHCP Section 6.3.2, MSHCP Protocol Survey Instructions, and the methods used to detect and identify BUOW included observation of key signs identified by the *California Burrowing Owl Consortium (CBOC).* This includes observation of key signs such as sight, scat, tracks, burrows, nests, and calls. All encountered burrows or structure entrances were checked for the presence of BUOWs, molted feathers, cast pellets, prey remains, eggshell fragments, tracks, or excrement at or near a burrow entrance. Natural or man-made structures that could support BUOWs were also surveyed when present. The complete results for the Protocol Focused BUOW Report can be found in Appendix A.

Each of the survey efforts were conducted in the morning between 7:15 a.m. and 11:50 a.m. and were not performed during periods of excessive or abnormal heat, wind, rain, or other inclement weather. The Study Area was assessed for the suitability to support burrowing owls and all suitable burrows were inspected for signs of use by burrowing owls. The survey involved walking through suitable habitat within the Study Area (the Project site and a 500-foot buffer). The pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface.

4.4 Jurisdictional Delineation

An assessment of the Study Area for the presence of jurisdictional features was conducted by SLS biologist Brianna Bernard on June 27, 2019. All depressions and drainages were evaluated for the presence of jurisdictional waters and wetlands according to the Corps and CDFW delineation guidelines, including connectivity or lack of connectivity to Traditional Navigable Waters. Dominant vegetation within and adjacent to the jurisdictional features within the Study Area was identified and recorded.

The Corps and the RWQCB have jurisdiction over Waters of the United States. Jurisdictional non-wetland features for the Waters of the United States are typically determined through the observation of an Ordinary High Water Mark (OHWM), which is defined as the “line on the shore established by the fluctuation of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider

the characteristics of the surrounding areas." Projects with impacts to Waters of the United States are regulated under Sections 401 and 404 of the Clean Water Act.

To determine the presence of a jurisdictional wetland for the Waters of the United States, three indicators are required: (1) hydrophytic vegetation, (2) hydric soils, and (3) wetland hydrology. The methodology published in the *United States Army Corps of Engineers 1987 Wetland Delineation Manual* and the *Arid West Supplement* sets the standards for meeting each of the three indicators, which normally require more than 50 percent cover of dominant plant species typical of a wetland, soils exhibiting characteristics of saturation, and hydrological indicators be present.

CDFW has jurisdiction over water of the Department's interest (California Fish and Game Code §§1600 et seq.; California Code of Regulations, Title 14, §720). Section 1602 of the California Fish and Game Code (FGC) applies to all rivers, streams, lakes and streambeds. CDFW defines a stream as "a body of water that flows perennially or episodically and that is defined by the area in which water currently flows, or has flowed, over a given course during the historic hydrologic course regime, and where the width of its course can reasonably be identified by physical or biological indicators" (Brady and Vyverberg 2013). Likewise, CDFW regulates jurisdictional areas of riparian habitat only to the extent that those areas are part of a stream, river, or lake as defined above. Waters of the State pertaining to Porter-Cologne in relation to RWQCB jurisdiction are defined by California Water Code Section 13050(e) as any surface or ground water within the boundaries of the state.

Prior to the field investigation, SLS biologist reviewed adjacent project biological reports, historical aerial imagery and topography for the Study Area to determine the potential for perennial, intermittent, or ephemeral drainages and associated riparian resources. Generally, indicators of jurisdictional drainages on an aerial photo include vegetation and/or incised lines indicating the path of flowing water. Following the desktop research, SLS biologist conducted an onsite field investigation. Based on the collective results of the desktop investigation and the field surveys, any observed jurisdictional features were mapped using the following parameters:

- The limits of the Corps' jurisdiction extend to the OHWM. OHWM indicators include: the observation of benches, break in bank slope, particle size distribution, sediment deposits, drift, litter, and/or change in plant community.
- The RWQCB shares the Corps' jurisdictional methodology.
- CDFW's jurisdiction applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the state. CDFW's authority also includes riparian habitat (including wetlands) supported by a river, stream, or lake regardless of the presence or absence of hydric soils and saturated soil conditions. Generally, CDFW jurisdiction is mapped to the top of bank of the stream.

5.0 Results

5.1 Vegetation Communities

The vegetation communities and habitat conditions were inspected to confirm presence and habitat quality of the vegetation found onsite. Vegetation communities were mapped based on the Holland Classification System (Holland 1986). Where necessary, deviations were made on best professional judgment when areas did not fit into a specific habitat description provided by Holland. Plant communities were mapped in the field directly onto a 200-scale (1" = 200') aerial photograph and a Trimble R1 GNSS Receiver paired with the ARCGIS Collector Application was utilized during the survey. Biologists confirmed the presence and general quality of the four vegetation communities. Vegetation mapping and acreages for each vegetation community is based on the observations of the field surveys, which are listed below in Table 1 and graphically depicted on Figure 5. Representative photographs of the vegetation communities can be found in Appendix B.

The deviations from Holland include the Disturbed/Developed and the Widened and Restored Wash categories. The deviations for the Developed community was made because of the lack of, or limited habitat values, and includes non-native or invasive species. The deviations for the Widened and Restored Wash community was made because installation of riprap bank protection, grade stabilizers, concrete crossings, and associated ramps deviate from a natural wash classification. This was a result of implementation of the adjacent Arantine Hills Project and impacts were previously accounted for and permits obtained for Arantine Hills implementation. While Bedford Wash currently exhibits limited habitat value, the area is to be seeded with Alluvial Fan Sage Scrub and maintained in perpetuity per the Arantine Hills Long-Term Management Plan.

The field survey included a 500-foot buffer around the Project site to determine what vegetation types exist adjacent to the Project site in order to determine the potential significance of indirect impacts. As shown on Figure 5, the surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project. A small portion of the 500-foot buffer area includes the Widened and Restored Bedford Canyon Wash.

Table 1. Vegetation Community Observed within the Project Site[1]

Vegetation Community	Acreage within in the Project Site (acres)
Riversidian Sage Scrub/Chaparral	0.15
Widened and Restored Bedford Canyon Wash[2]	0.20
Ruderal	15.14
Disturbed/Developed	2.28
TOTAL	**17.77**

***Notes**:*
1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.
2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protections, and concrete Wash crossing and grade stablization.

The general description of the habitat observed during the 2019 field survey is described below.

5.1.1 Riversidian Sage Scrub/Chaparral

Approximately 0.15 acres of the Project site is comprised of Riversidian Sage Scrub/Chaparral. This vegetation community is located on the slope of the south bluff of Bedford Canyon Wash. The Riversidean Sage Scrub/Chaparral community is dominated by shrubs such as laurel sumac (*Malosma laurina*), white sage (Salvia apiana), toyon (*Heteromeles arbutifolia*), Mexican elderberry (*Sambucus mexicana*), California sagebrush (*Artemisia californica*), black sage (*Salvia mellifera*), deerweed (*Acmispon glaber*), California buckwheat (*Eriogonum fasciculatum*), chamise (*Adenostoma fasciculatum*), and tree tobacco (*Nicotiana glauca*). The understory of the community consists primarily of non-native species such as red brome (*Bromus madritensis ssp. rubens*), ripgut brome (*Bromus diandrus*), tocalote (*Centaurea melitensis*), and summer mustard (*Hirschfeldia incana*).

5.1.2 Widened and Restored Wash

Approximately 0.20 acres of the Project site is comprised of widened and restored Bedford Canyon Wash (Wash). The original Wash was widened from an approximately 90 feet to 200 feet. Various structures, including buried slope protection, buried grade control structures, and access ramps, are included within the design. The overall restored Wash will be hydroseeded with an alluvial fan sage scrub hydroseed mixture. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protections, and the concrete Wash crossing and grade stabilization.

5.1.3 Ruderal

A total of 15.14 acres of the Project site consists of the ruderal community. This vegetation community occurs in the location of the historical citrus operations. It is generally maintained (trimmed) annually due to fire management. Vegetation within this area is comprised of

predominantly of cheeseweed (*Malva parviflora*). Other species include Russian thistle (*Salsola tragus*), summer mustard (*Hirschfeldia incana*), rat-tail fescue (*Festuca microstachys*), foxtail brome (*Bromus madritensis ssp. rubens*), ripgut brome (*Bromus diandrus*), tocalote (*Centaurea melitensis*), Jimson weed (*Datura stramonium*), giant reed (*Arundo donax*), and a few scattered coyote bush (*Baccharis pilularis*), and laurel sumac (*Malosma laurina*).

5.1.4 Developed/Disturbed

A total of 2.28 acres of disturbed area consisting of bare dirt, dirt roads, and sparse vegetation is mapped onsite. The developed/disturbed community contains limited habitat value and includes non-native or invasive species. This community also includes areas of disturbance from both the grading of Arantine Hills and the construction of the Cajalco Interchange.

5.2 Plants

Sensitive plant species include federal or state listed threatened or endangered species, those species listed on the CNPS rare and endangered plant inventory. A single listed plant species occurs within the USGS 7.5' Corona South quadrangle and a brief description of that species is included below. Special status plant species with the potential to occur in the Project site were analyzed based on distribution, habitat requirements, and existing site conditions (Appendix C). All plant species observed within the Project site totaled 22 species during the survey on June 27, 2019 are listed in Appendix D of this report.

Brand's Phacelia (*Phacelia stellaris*)
Status: California Rare Plant Rank 1B.1
Distribution: Orange, Riverside, San Bernardino, and San Diego Counties.
Habitat(s): Habitats supporting coastal scrub and coastal dunes. Known from 1 to 400 meters (3 to 1,300 feet) MSL. Blooms March through June.
Status onsite: None. The site lacks suitable habitat and soils. Not observed during field visit.

Munz's Onion (*Allium munzii*)
Status: state threatened, federally endangered
Distribution: Los Angeles, Riverside, San Bernardino, and San Diego Counties.
Habitat(s): Clay soils supporting chaparral, cismontane woodland, coastal scrub, pinyon-juniper woodland, and valley and foothill grassland. Known from 300 to 1,070 meters (1,000 to 3,500 feet) MSL. Blooms March through May.
Status onsite: None. The site lacks suitable habitat and soils. Not observed during field visit.

San Diego ambrosia (*Ambrosia pumila*)
Status: federally endangered
Distribution: Riverside County and San Diego Counties.
Habitat(s): Found along drainages and areas adjacent to riparian areas. Nearest location is San Luis Rey. Blooms June through September.

Status onsite: Clay or sandy loam soils supporting chaparral, costal scrub valley and foothill grassland and vernal pools. Known from 20 to 415 meters (65 to 1,300 feet) MSL. Blooms April through October. Not observed during field visit.

San Miguel Savory (*Satureja chandleri*)
Status: California Rare Plant Rank 1B.2
Distribution: Los Angeles, Riverside, San Bernardino, and San Diego Counties.
Habitat(s): Rocky, gabbroic, or metavolcanic soils supporting chaparral, cismontane woodland, coastal scrub, riparian woodland, and valley and foothill grassland. Known from 120 to 1,075 meters (390 to 3,500 feet) MSL. Blooms March through July.
Status onsite: None. The site lacks suitable habitat and soils. Not observed during field visit.

As determined through the 2019 survey, no special status plant species were observed within the Study Area and there is no opportunity for them to occur due to the disturbed and developed area onsite. Furthermore, the Study Area lacks suitable habitat and soils.

5.3 Critical Habitat

The USFWS's online service for information regarding Threatened and Endangered Species Final Critical Habitat designation within California was reviewed to determine if the Project site is within any species' designated Critical Habitat. The Project site and Buffer Area do not contain a designated Critical Habitat overlay. The closest designated Critical Habitat is located approximately 0.01 mile south for the coastal California gnatcatcher (*Polioptila californica californica* [CAGN]) (Figure 4).

5.4 Wildlife

Special status wildlife species with the potential to occur on the Project site were analyzed based on the species identified in USGS 7.5' Corona South quadrangle and the surrounding eight quadrangles, distribution, habitat requirements, and existing site conditions (Appendix E). No special status wildlife was identified or observed within the Project site during the field visit. However, the following species were listed through the CNDDB as being observed within 2-miles of the Project site: California horned lark (*Eremophila alpestris actia*), coastal California gnatcatcher, coastal whiptail *(Aspidoscelis tigrus stejnegeri*), coast horned lizard (*Phrynosoma blainvillii*), least Bell's vireo (*Vireo bellii pusillus*), orange-throated whiptail (*Aspidoscelis hyperythra*), red-diamond rattlesnake (*Crotalus ruber*), Stephen's Kangaroo Rat (*Dipodomys stephensi*), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*), and western spadefoot (*Spea hammondii*). A brief description of those species and their habitat is included below.

California Horned Lark (*Eremophila alpestris actia*)
Status: CDFW watch list
Habitat(s): A year-long resident within the state and within a variety of open habitats, usually where trees and large shrubs are absent. They are not particular about the nature of the field, so long as it has very little vegetation. Range-wide, they breed in level or gently sloping short grass prairies, montane meadows, "bald" hills, open coastal plains, fallow grain fields, alkali flats, and rangelands. Within southern California, California horned larks breed primarily in open fields, (short) grasslands, and rangelands. Grasses, shrubs, forbs, rocks, litter, clods of soil, and other surface irregularities provide cover.
Status onsite: Moderate potential to occur onsite. Suitable habitat exists onsite due to the maintenance for fire abatement and bare areas, which results in areas with little to no vegetation. Observed during the field survey within the surrounding 500-feet buffer, however, was not observed onsite.

Coastal California gnatcatcher (*Polioptila californica californica*)
Status: federally threatened, CDFW species of special concern
Distribution: Southern Los Angeles, Orange, western Riverside, and San Diego counties south into Baja.
Habitat(s): Coastal sage scrub of varying subtypes, sometimes riparian, chaparral, and other habitats as well.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Coastal whiptail (*Aspidoscelis tigrus stejnegeri*)
Status: CDFW species of special concern
Habitat(s): This species is found in a variety of habitats, primarily hot and dry open areas with sparse vegetation including chaparral, woodland, and riparian areas. This subspecies is found in coastal southern California, north into Ventura County, and south into Baja California. Additional important habitat characteristics include Important habitat components include shrub cover with accumulated leaf litter, and an abundance of invertebrate prey, particularly termites.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Coast horned lizard (*Phrynosoma blainvillii*)
Status: CDFW species of special concern
Habitat(s): Occurs in a variety of vegetation types including coastal sage scrub, chaparral, annual grassland, oak woodland and riparian woodlands.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Least Bell's Vireo (*Vireo bellii pusillus*)
Status: federally endangered, state endangered
Habitat(s): This species primarily occupies riverine riparian habitats that typically feature dense cover within 1-2 m of the ground and a dense, stratified canopy. Typically, it is associated with southern willow scrub, cottonwood-willow forest, mule fat scrub, sycamore alluvial woodland, coast live oak riparian forest, arroyo willow riparian forest, or mesquite in desert localities. It uses habitat which is limited to the immediate vicinity of water courses.

Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Orange-Throated Whiptail (*Aspidoscelis hyperythra*)
Status: CDFW species of special concern
Habitat(s): The species is generally found in semi-arid brushy areas typically with loose soil and rocks, including washes, stream sides, rocky hillsides, and coastal chaparral. Habitat types include low elevational chaparral, non-native grassland, (Riversidian) coastal sage scrub, juniper woodland and oak woodland. Associations include alluvial fan scrub and riparian areas. Friable soil appears to be a necessary requirement for excavating burrows and hiding eggs.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Red-Diamond Rattlesnake (*Crotalus ruber*)
Status: species of special concern
Habitat(s): It can be found from the desert, through dense chaparral in the foothills (it avoids the mountains above around 4,000 feet), to warm inland mesas and valleys, all the way to the cool ocean shore. It is most commonly associated with heavy brush with large rocks or boulders. Dense chaparral in the foothills, cactus or boulder associated coastal sage scrub, oak and pine woodlands, and desert slope scrub associations are known to carry populations of the northern red-diamond rattlesnake, however, chamise and red shank associations may offer better structural habitat for refuges and food resources for this species than other habitats. They need rodent burrows, cracks in rocks or surface cover objects.
Status onsite: Limited habitat is found onsite due to the bare and disturbed areas with heavy brush found onsite, and maintenance for fire abatement. Not observed during field visit.

Stephen's Kangaroo Rat (*Dipodomys stephensi*)
Status: federally endangered, state threatened
Habitat(s): This species prefers large areas of disturbed or patchy annual and perennial grasslands and open coastal sage scrub. Preferred perennials plant species include buckwheat and chamise and preferred annual plant species include brome grass. The nearest known populations are in Rancho Guejito and at the Naval Weapons Station in Fallbrook.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)
Status: CDFW watch list
Habitat(s): They are found on grass-covered hillsides, coastal sage scrub, and chaparral and often occur near the edges of the denser scrub and chaparral associations. Preference is shown for tracts of California sagebrush. Optimal habitat consists of sparse, low brush or grass, hilly slopes preferably interspersed with boulders and outcrops. The species may occur on steep grassy slopes without shrubs if rock outcrops are present. It is a very secretive species.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Western Spadefoot (*Spea hammondii*)
Status: CDFW species of special concern
Habitat(s): May be found in coastal sage scrub, open chaparral, pine-oak woodlands and grassland habitats, but is most common in grasslands with vernal pools or mixed grassland/coastal sage scrub areas. Within these habitats, they require rain pools/vernal pools in which to reproduce and that persist with more than three weeks of standing water in which to metamorphose successfully. They can also breed in slow-moving streams (e.g., areas flooded by intermittent streams). Water breeding sites must lack fish, bullfrogs, and crayfish in order for to successfully reproduce and metamorphose.
Status onsite: None. The site lacks suitable habitat. Not observed during field visit.

Summary of Sensitive Species
No special status species or evidence of their presence were observed or heard during the 2019 survey. Given the site's annual maintenance for fire abatement, existing surrounding uses (Arantine Hills Construction and I-15/Cajalco construction), and lack of habitat there is no opportunity for them to occur within the Study Area.

5.4.1 Wildlife Species Observed or Detected

The animal species or signs thereof observed during the SLS survey are listed below:

Birds:

- American crow (*Corvus brachyrhynchos*)
- Anna's hummingbird (*Calypte anna*)
- black phoebe (*Sayornis nigricans*)
- California quail (*Callipepla californica*)
- California towhee (*Melozone crissalis*)
- house finch (*Haemorhous mexicanus*)
- mourning dove (*Zenaida macroura*)
- red-tailed hawk (*Buteo jamaicensis*)
- song sparrow (*Melospiza melodia*)
- turkey vulture (*Cathartes aura*)
- California Horned Lark (*Eremophila alpestris actia*)
- western scrub jay (*Aphelocoma californica*)

Mammals:

- California ground squirrel (*Spermophilus beecheyi*)
- desert cottontail (*Sylvilagus audubonii*)

Reptiles:

- western fence lizard (*Sceloporus occidentalis*)

5.5 Focused Burrowing Owl Survey

Per the MSHCP BUOW Survey Instructions, a Habitat Assessment was conducted on June 27, 2019 to determine if any suitable BUOW habitat occurred onsite. Following the habitat assessment, three additional focused surveys took place on July 8, 25, and August 1, 2019 between 7:15 a.m. and 11:50 a.m. Temperatures during the survey ranged between 64° F and 95° F, with generally predominant sunny, clear skies and 0-2 mph winds. The surveys were conducted during typical BUOW peak activity time and was not conducted during rain, high winds (> 20 miles per hour), dense cloud cover >75%. Prior to the commencement of the survey, SLS biologist scanned the Study Area, consisting of the Project site and the surrounding 500-foot buffer, using binoculars to look for burrowing owl. The Study Area was assessed for the suitability to support burrowing owls and all suitable burrows were inspected for signs of use by burrowing owls. The surveys involved walking through suitable habitat within the Study Area. Pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface.

No BUOWs or evidence of BUOWs were observed on site within the Study Area during the focused survey. A majority of the Project site was characterized by actively maintained ruderal fields, lacking necessary sized burrows to provide suitable nesting habitat for BUOW. Much of the buffer area is developed, with Arantine Hills to the west and I-15 to the east. California ground squirrels and their burrows were observed within the Study Area. These burrows were actively utilized by the California ground squirrels and contained no BUOW or keys signs (sight, whitewash, burrows, bones, feathers, pellets, nests, and calls). Furthermore, the Project site is maintained for fire abatement and the property adjacent to the Project site has active construction and grading activities including the I-15/Cajalco Interchange. Please refer to Appendix A for the complete results for the focused survey.

5.6 Regional Connectivity/Wildlife Movement

Wildlife corridors link together areas of suitable habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated “islands” of wildlife habitat. In the absence of habitat linkages that allow movement to adjoining open space areas, various studies have concluded that some wildlife species, especially the larger and more mobile mammals, would not likely persist over time in fragmented or isolated habitat areas because they prohibit the infusion of new individuals and genetic information (MacArthur and Wilson 1967, Soule 1987, Harris and Gallager 1989). Corridors effectively act as links between different populations of a species. A group of smaller populations (termed “demes”) linked together via a system of corridors is termed a “meta-population.” The long-term health of each deme within the meta-population is dependent upon its size and the frequency of interchange of individuals (immigration versus emigration). The smaller the deme, the more important immigration becomes, because prolonged inbreeding with the same individuals can reduce genetic variability. Immigrant individuals that move into the deme from adjoining demes mate with individuals and supply that deme with new genes and

gene combinations that increases overall genetic diversity. An increase in a population's genetic variability is generally associated with an increase in a population's health.

Corridors mitigate the effects of habitat fragmentation by:

- Allowing animals to move between remaining habitats, which allows depleted populations to be replenished and promotes genetic diversity.
- Providing escape routes from fire, predators, and human disturbances, thus reducing the risk that catastrophic events (such as fires or disease) will result in population or local species extinction.
- Serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs (Fahrig and Merriam 1985, Simberloff and Cox 1987, Harris and Gallagher 1989).

Wildlife movement activities usually fall into one of three movement categories:

- Dispersal (e.g., juvenile animals from natal areas, individuals extending range distributions).
- Seasonal migration.
- Movements related to home range activities (foraging for food or water, defending territories, searching for mates, breeding areas, or cover).

A number of terms have been used in various wildlife movement studies, such as "wildlife corridor," "travel route," "habitat linkage," and "wildlife crossing" to refer to areas in which wildlife moves from one area to another. To clarify the meaning of these terms and facilitate the discussion on wildlife movement in this study, these terms are defined as follows:

- Travel route: a landscape feature (such as a ridge line, drainage, canyon, or riparian strip) within a larger natural habitat area that is used frequently by animals to facilitate movement and provide access to necessary resources (e.g., water, food, cover, den sites). The travel route is generally preferred because it provides the least amount of topographic resistance in moving from one area to another; it contains adequate food, water, and/or cover while moving between habitat areas; and provides a relatively direct link between target habitat areas.

- Wildlife corridor: a piece of habitat, usually linear in nature, that connects two or more habitat patches that would otherwise be fragmented or isolated from one another. Wildlife corridors are usually bounded by urban land areas or other areas unsuitable for wildlife. The corridor generally contains suitable cover, food, and/or water to support species and facilitate movement while in the corridor. Larger, landscape-level corridors (often referred to as "habitat or landscape linkages") can provide both transitory and resident habitat for a variety of species.

- Wildlife crossing: a small, narrow area, relatively short in length and generally constricted in nature, that allows wildlife to pass under or through an obstacle or barrier that otherwise hinders or prevents movement. Crossings are typically manmade and include culverts, underpasses, drainage pipes, and tunnels to provide access across or under roads, highways, pipelines, or other physical obstacles. These are often "choke points" along a movement corridor.

5.6.1 Wildlife Movement within the Study Area

The Study Area may serve a function in local wildlife movement; however, the Study Area was not identified in the MSHCP as a Core Linkage, indicating a lack of importance for regional wildlife movement. Bedford Canyon Wash may provide a linkage for wildlife between the Cleveland National Forest and Lake Matthews. A recent restoration project proposed by the Riverside-Corona Resource Conservation District (RCRCD) for a downstream parcel within the Bedford Canyon Wash would, "Preserve the channel/floodplain location which historically functioned as part of a regionally significant east- west wildlife corridor," suggesting that this corridor provides a valuable linkage. Bedford Canyon Wash will not be impacted as part of the proposed project and continue to provide the opportunity for wildlife movement.

5.7 Jurisdictional Areas

5.7.1 Waters of the United States

This section relies on the term "Waters of the United States" as it applies to the jurisdictional limits under the authority of the Army Corps of Engineers under the Clean Water Act and applies to the jurisdiction of the Regional Water Quality Control Board under the Porter-Cologne Water Quality Act. Based on the methodology described in Section 4.4, both literature/data base review and a field delineation were conducted to determine the presence of Waters of the United States.

The only jurisdictional feature located on the Project Site is Bedford Canyon Wash, which is presented in Table 2 and shown on Figure 6.

As part of the implementation of the Arantine Hill Specific Plan, Bedford Canyon Wash has been widened and restored, including the placement of rip-rap bank protection, grade control structures, concrete crossings, and access ramps. Specifically, the portion of Bedford Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and a concrete Wash crossing that includes grade stabilization. Jurisdictional Waters of the U.S. extend from invert to invert.

Table 2. Jurisdictional Waters of the United States within the Project site

Drainage	Total Acreage
Bedford Canyon Wash	0.10[1]
[1]. Consists of non-wetland jurisdictional features.	

5.7.2 Waters of the State

The Project site includes Waters of the State that meet CDFW characteristics in accordance with FGC Section 1600 (Brady and Vyverberg 2013). The only Waters of the State jurisdictional feature located on the Project Site is Bedford Canyon Wash due to the presence of biological and physical characteristics of a stream subject to the Jurisdiction of CDFW under FGC §1600 et seq. The Wash exhibits biological and physical indicators of Waters of the State through the presence of channel bed and bank. The total inventory of Waters of the State is presented in Table 3 and shown on Figure 6.

As part of the implementation of the Arantine Hill Specific Plan, Bedford Canyon Wash has been widened and restored. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and the concrete Wash crossing. Jurisdictional Waters of the State extend from top of bank to top of bank.

Table 3. Jurisdictional Waters of the State within the Project Site

Drainage	Total Acreage
Bedford Canyon Wash	0.20[1]
[1]. Widened and Restored Wash.	

5.7.3 MSHCP Riparian/Riverine and Vernal Pool Assessment

Volume I, Section 6.1.2 of the MSHCP describes the process through which protection of riparian/riverine areas and vernal pools would occur within the MSHCP Plan Area. The purpose is to ensure that the biological functions and values of these areas throughout the MSHCP Plan Area are maintained such that habitat values for species inside the MSHCP Conservation Area are maintained. The MSHCP requires that as projects are proposed within the overall Plan Area, the effect of those projects on riparian/riverine areas and vernal pools must be addressed.

The MSHCP defines riparian/riverine areas as:

> *…lands which contain Habitat dominated by trees, shrubs, persistent emergent mosses and lichens, which occur close to or which depend upon soils moisture from a nearby fresh water source; or areas with fresh water flow during all or a portion of the year.*

The MSHCP defines vernal pools as:

> *…seasonal wetlands that occur in depression areas that have wetlands indicators of all three parameters (soils, vegetation, and hydrology) during the wetter portion of the growing season but normally lack wetland indictors of hydrology and/or vegetation during the drier portion of the growing season.*

With the exception of wetlands created for the purpose of providing wetlands habitat or resulting from human actions to create open waters or from the alteration of natural stream courses, areas demonstrating characteristics as described above which are artificially created are not included in these definitions.

The total inventory of MSHCP Riparian and Riverine is presented in Table 4 and shown on Figure 7. The Project site contains no vernal pools or depressions as defined under MSHCP vernal pool features.

As part of the implementation of the Arantine Hill Specific Plan, the acreage identified as Riparian/Riverine Habitat includes the widened and restored Bedford Wash. Specifically, the portion of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection and a concrete Wash crossing that includes grade stabilization.

Table 4. Riparian/Riverine Habitat

Community Type	Acreage Onsite
Riparian/Riverine	0.20[1]
1. Widened and Restored Wash.	

5.8 MSHCP Assessment

The Project is located within the Temescal Canyon Area Plan of the MSHCP. The Project site is not located within any MSHCP Criteria Areas, Cell Groups, or Subunits. Furthermore, the Project site is not located in survey areas for Amphibians, Mammals, or Special Linkage areas. The Project site is located within the Narrow Endemic Plants Overlay (Survey Area Number 7) pursuant to MSHCP Section 6.1.3 and Western Burrowing Owl overlay pursuant to MSHCP Section 6.3.2. The Project site was surveyed and assessed for the following:

- Riparian and Riverine Areas (Section 6.1.2)
- Narrow Endemic Plants - Survey Area Number 7 (Section 6.1.3)
- Western Burrowing Owl Survey Area (Section 6.3.2)

Thus, a separate Consistency Assessment has been prepared pursuant to those sections.

5.9 Soils Mapping

The United States Department of Agriculture Natural Resources Conservation Service lists four soil types (series) for the Project Site (Figure 8). The following soil types are located on the Project site and described below.

AkC: Arbuckle loam, 2 to 8 percent slopes
Soils of the Arbuckle series consist of well-drained soils and have slopes of 2 to 25 percent. These soils occur on alluvial fans and developed in alluvium from metasedimentary rocks. Arbuckle soils are not designated as a sensitive soil type by the MSHCP.

AIC: Arbuckle gravelly loam, 2 to 8 percent slopes
Soils of the Arbuckle series consist of well-drained soils and have slopes of 2 to 25 percent. These soils occur on alluvial fans and developed in alluvium from metasedimentary rocks. Arbuckle soils are not designated as a sensitive soil type by the MSHCP.

AID: Arbuckle gravelly loam, 8 to 15 percent slopes
Soils of the Arbuckle series consist of well-drained soils and have slopes of 2 to 25 percent. These soils occur on alluvial fans and developed in alluvium from metasedimentary rocks. Arbuckle soils are not designated as a sensitive soil type by the MSHCP.

CmC: Cortina cobbly loamy sand, 2 to 8 percent slopes
The Cortina series consists of somewhat excessively drained and excessively drained soils on alluvial fans and in valley fills. These soils formed in alluvium from metasedimentary rocks. Cortina soils are not designated as a sensitive soil type by the MSHCP.

GdC: Garretson gravelly very fine sandy loam, 2 to 8 percent slope
The Garretson series consists of well-drained soils on alluvial fans. These soils formed in alluvium made up chiefly of metasedimentary materials. Garretson soils are not designated as a sensitive soil type by the MSHCP. Garretson soils are mapped within the several areas within the Project Study Area.

SuF2: Soper cobbly loam, 25 to 50 percent slopes, eroded
The Soper series consists of moderately deep well drained soils that formed in material weathered from conglomerate and sandstone. Soper soils are on hills and uplands and have slopes of 15 to 50 percent. The mean annual precipitation is about 18 inches and the mean annual air temperature is about 60 degrees Fahrenheit. These soils are mapped in the southern most portion of the Project Boundary.

TeG: Terrace Escarpments
Terrace escarpments consist of variable alluvium on terraces and barrancas. Small areas of recently deposited alluvium may be near the bottom of the escarpments. This land is unaltered alluvial outwash derived from granite, gabbro, metamorphosed sandstone, sandstone, or mica schist. Terrace escarpments are not designated as a sensitive soil type by the MSHCP.

6.0 Project Impacts

This section discusses potential impacts to biological resources that could result from Project implementation. Biological resources may be either directly or indirectly impacted by a Project. Direct and indirect impacts may be either permanent or temporary in nature. These impact categories are defined below.

- Direct impact: any loss, alteration, disturbance or destruction of biological resources that would result from project-related activities is a direct impact. Examples include vegetation clearing, encroaching into wetlands, diverting natural surface water flows, and the loss of individual species and/or their habitats. Direct permanent impacts resulting from Project implementation consist of any ground-disturbing activities (i.e., vegetation removal, grading, paving, building of structures, installing landscaping, creating the fuel modification zone, etc.).

- Indirect impact: as a result of Project-related activities, biological resources may also be affected in a manner that is not direct. Examples of indirect impacts include elevated noise, light, and dust levels, increased human activity, decreased water quality, erosion created by the removal of vegetation, and the introduction of invasive plants and unnatural predators (e.g. domestic cats and dogs). These indirect impacts may be both short term and long term in their extent.

- Permanent impacts: all impacts that result in the long-term or irreversible removal of biological resources are considered permanent. Examples include constructing a building or permanent road on an area containing biological resources.

- Temporary impacts: any impacts considered to have reversible effects on biological resources can be viewed as temporary. Examples include the generation of fugitive dust during grading or removing vegetation and either allowing the natural vegetation to recolonize or actively revegetating the impact area.

Under each section, potential impacts are discussed.

6.1 Impacts to Vegetation Communities/Habitats

Impacts are provided for both alternative methods regarding importing dirt to the site. Calculations were based on the currently proposed development design in combination with the vegetation map from the field survey and aerial imagery.

Indirect temporary impacts to plant communities include the effects of fugitive dust created by grading activities, vehicle construction traffic, or offsite discharge of surface water runoff with its associated erosion and sedimentation. Grading-related dust could settle on plant surfaces and indirectly inhibit metabolic processes such as photosynthesis and respiration. Grading-related

erosion, runoff, sedimentation, soil compaction, and alteration of drainage patterns may affect plants by altering site conditions so that the location in which they are growing becomes unfavorable. Another example of indirect impacts includes the introduction and spread of invasive, exotic plants which could result in permanent indirect impacts to adjacent native plant communities.

6.1.1 Total Project Impacts with Alternative 1: Off-site Dirt Import

Figure 9 and Table 5 describe and list the approximate total acreages of vegetation communities that will be permanently and temporary impacted by Project activities should Alternative 1 be implemented.

Table 5. Alternative 1: Off-site Dirt Import – On-Site Vegetation Community Impacts[1]

Vegetation Community	Existing Vegetation onsite (acres)	Total Permanent Impacts (acres)	Total Temporary Impacts (acres)	Avoided (acres)
Riversidian Sage Scrub/Chaparral	0.15	0.00	0.00	0.15
Widened and Restored Bedford Canyon Wash[2]	0.20	0.01	0.00	0.19
Ruderal	15.14	14.32	0.00	0.82
Disturbed/Developed	2.28	2.00	0.00	0.28
TOTAL	**17.77**	**16.33**	**0.00**	**1.44**

Notes:

1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.

2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portions of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and concrete Wash crossing.

Direct impacts to 16.33 acres on the Project site are not considered significant because the habitats are common in the Project Vicinity and have minimal habitat value. Furthermore, these impacts do not represent CNDDB, State, or MSHCP sensitive plant communities. In addition, many of these areas within the Study Area exhibit a moderate or high level of disturbance.

Of the total 16.33 acres impacted onsite, the 0.01 acre of impacts to Bedford Canyon Wash would occur within an area that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash and does not contain native vegetation. Therefore, no new impacts to jurisdictional waters would occur and no additional Regulatory Permits are required.

No direct impacts are expected to occur within the surrounding buffer area. Indirect impacts to the surrounding 500-foot buffer area could occur from construction activities, however impacts would be less than significant because no sensitive habitat or sensitive species are located within the Buffer Area, the habitats are common in the Project Vicinity; the area consists of

disturbed/developed vegetation communities; and construction BMP's such as compliance with air quality regulations would require frequent watering during construction activities to minimize dust.

6.1.2 Total Project Impacts with Alternative 2: PA 14 Dirt Import

Figure 10 and Table 6 describe and list the approximate total acreages of vegetation communities that will be permanently and temporary impacted by Project activities should Alternative 2 for importing dirt be implemented.

Table 6. Alternative 2: PA 14 Dirt Import – On-Site Vegetation Community Impacts[1]

Vegetation Community	Existing Vegetation onsite (acres)	Total Permanent Impacts (acres)	Total Temporary Impacts[3] (acres)	Avoided (acres)
Riversidian Sage Scrub/Chaparral	0.15	0.00	0.10	0.05
Widened and Restored Bedford Canyon Wash[2]	0.20	0.01	0.09[4]	0.10
Ruderal	15.14	14.86	0.00	0.28
Disturbed/Developed	2.28	2.05	0.00	0.23
TOTAL	**17.77**	**16.92**	**0.19[3]**	**0.66**

Notes:

1. Acreages presented in the table represent those found within the Project Boundary. The surrounding 500-foot buffer consists primarily of developed/disturbed vegetation community including; Interstate-15, Eagle Glen Road, graded and disturbed land within the Arantine Hills Project.

2. Included within the Arantine Hills Project, Widened and Restored Wash design. Specifically, the portions of the Widened and Restored Wash within the Project Boundary includes concrete ramps entering and exiting the Wash, buried riprap slope protection, and concrete Wash crossing.

3. Temporary impacts are due to the access ramp from PA 14 to the commercial site, which is to be constructed during grading operations. Following the completion of the grading operations the temporary dirt ramp would be removed and the bluff will be reconstructed and replanted with coastal sage scrub mix.

4. The 0.09 acres of temporary impacts to the Widened and Restored Bedford Canyon Wash occur completely within the limits of the existing concrete pad crossing and do not impact native or seeded habitat.

Of the total 16.92 acres impacted onsite, direct impacts to 16.91 acres are not considered significant because the habitats are common in the Project Vicinity and have minimal habitat value. Furthermore, these impacts do not represent CNDDB, State, or MSHCP sensitive plant communities. In addition, many of these areas within the Study Area exhibit a moderate or high level of disturbance.

Temporary impacts would occur to 0.19 acres. These impacts are due to the construction of an access ramp leading down to the existing concrete crossing of Bedford Canyon Wash. Grading the access ramp would require creating a notch in the existing bluff with side slopes. Fill, ranging from 5 feet to 10 feet, would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation.

Careful grading operations and BMPs would avoid dirt spoils in Bedford Canyon Wash. Import operation would need to take place during the dry season, however, temporary pipe culverts

would be placed on top of the concrete pad under the dirt ramp in case unexpected monsoonal storms caused Bedford Canyon Wash to flow.

Following completion of the grading operations, the temporary dirt bridge and culverts would be removed from the concrete pad crossing Bedford Canyon Wash and the notch in the bluff for the access ramp would be reconstructed at 2:1 slopes and surface terrace drains would be added to control storm runoff to minimize erosion. The graded slopes would be replanted with a native coastal sage scrub mix.

Of the total 16.92 acres impacted onsite, the 0.01 acre of impacts to Bedford Canyon Wash would occur within an area that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash. Therefore, no new impacts to jurisdictional waters would occur and no additional Regulatory Permits are required.

No direct impacts are expected to occur within the surrounding buffer area. Indirect impacts to the surrounding 500-foot buffer area could occur from construction activities, however impacts would be less than significant because no sensitive habitat or sensitive species are located within the Buffer Area, the habitats are common in the Project Vicinity; the area consists of disturbed/developed vegetation communities; and construction BMP's such as compliance with air quality regulations would require frequent watering during construction activities to minimize dust.

6.2 Potential Impacts to Special Status Plants

As concluded in Section 5.2 above, no special status plant species were observed during the 2019 surveys and none are expected to occur onsite due to the lack of suitable habitat found on the Project site; therefore, for either dirt import alternative there are no potential impacts to special status plants due to Project implementation.

6.3 Potential Impacts to Critical Habitat

As concluded in Section 5.3 above, the Project site does not contain a designated Critical Habitat overlay. The closest designated Critical Habitat is located approximately 0.01 mile south for the CAGN. No designated Critical Habitat is located onsite; therefore, for either dirt import alternative there are no potential impacts to designated Critical Habitat due to Project implementation.

6.4 Potential Impacts to Special Status Wildlife

As shown in Table 7 below, some impacts to avian species protected by the MBTA may occur as a result of Project construction for both dirt import alternatives. If Project construction is scheduled to occur during the typical breeding bird season (January 1 through August 15 for raptors and February 15 through September 15 for all other avian species), short-term noise

effects to birds that may forage or nest onsite may occur. A pre-construction nesting bird survey is required within five (5) days of ground disturbances during typical nesting bird season to delineate any active nests found within the Project site and 300-foot buffer. Should an active nest be observed onsite, a no-work buffer shall occur surrounding the active nest, until determined by the Project Biologist it has become inactive. The implementation of the pre-construction nesting bird survey shall prevent any impacts due to construction-related noise levels on species covered under the MBTA.

Of the total ten special status wildlife identified below, the Project site lacks suitable habitat for eight of the species, therefore, no impacts are expected to occur to the eight special status wildlife species as a result of Project implementation and either dirt import alternatives. It was determined the Project site contains habitat for the California Horned Lark and limited habitat for the red-diamond rattlesnake. Pre-construction nesting bird surveys as outlined above shall occur to prevent any construction-related impacts during the typical nesting bird season. Furthermore, Biological Monitoring during initial ground disturbances shall occur to identify and locate any red-diamond rattlesnake within the Project site. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the area shall cease to allow for the species to vacate or be relocated from the area safely to prevent any impacts by construction-related earthwork on the species.

Table 7. Impact Analysis Summary for Special Status Species

Species	Extent of Impact	Significance of Impact
California Horned Lark MSHCP: Covered Species	Suitable habitat is found within the Project site as a result of the bare spots and developed area as identified within Section 5.4.	Less than significant impact with pre-construction surveys. No species were observed on site during surveys and this species does not occupy sensitive habitat. Pre-construction surveys would ensure no direct impacts during vegetation removal.
Coastal California gnatcatcher MSHCP: Covered Species	Suitable habitat is not found on the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Coastal whiptail MSHCP: Covered Species	Suitable habitat is not found on the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.

Species	Extent of Impact	Significance of Impact
Coastal Horned Lizard MSHCP: Covered Species	Suitable habitat is not found on the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Least Bell's Vireo MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Orange-throated Whiptail MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Red-Diamond Rattlesnake MSHCP: Covered Species	Limited habitat is found onsite due to the bare and disturbed areas with heavy brush found onsite as identified within Section 5.4.	Less than significant impact with Biological Monitoring during initial ground disturbances. No species were observed onsite during surveys. Biological Monitoring during initial ground disturbances would ensure no direct impacts during ground disturbances.
Stephen's Kangaroo Rat MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Southern California Rufous-Crowned Sparrow MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.
Western Spadefoot MSHCP: Covered Species	No suitable habitat is found within the Project site as identified within Section 5.4.	No Impact due to lack of suitable habitat onsite. Not observed during field visit.

Project construction could also result in additional short-term impacts including night lighting, littering, and illegal wildlife collections. However, Project compliance with the following BMPs consistent with State and federal laws would reduce the potential for such indirect impacts to below significance:

- All temporary construction-related night lighting used in onsite development areas will be shielded and/or directed downward to avoid indirect impacts to nocturnal wildlife such that night lighting could increase predation rates.

- All construction contractors, subcontractors, and employees will comply with the litter and pollution laws and will institute a litter control/removal program during the course of construction activities to reduce the attractiveness of the area to opportunistic predators such as coyotes, opossums, and common ravens.

- Active nests (nests with chicks or eggs) cannot be removed or disturbed. Nests may be removed or disturbed by a qualified biologist, if not active.

- Construction employees, contractors, and site visitors will be prohibited from collecting wildlife.

With implementation of the night lighting reduction PDFs via their inclusion in the Project's MMRP, potential indirect long-term impacts to wildlife would be reduced to below significance.

6.5 Potential Impacts to Wildlife Movement

As described earlier, Bedford Canyon Wash may serve a function in local wildlife movement. Bedford Canyon Wash provides connectivity between the Santa Ana Mountains and Lake Matthews. Therefore, Bedford Canyon Wash does provide a connection between large areas of undeveloped land, which may be utilized for wildlife movement. Furthermore, with the widened and restored Bedford Canyon Wash on the Arantine Hills project located upstream, Bedford Canyon Wash corridor will continue to provide a valuable linkage for wildlife. Project implementation will not impact the ability of Bedford Canyon Wash to continue to serve as a movement corridor.

Therefore, no impacts to wildlife movement are anticipated as a result of implementation of the Project and either dirt import alternative.

6.6 Potential Impacts to Jurisdictional Features

Implementation of the Arantine Hills Specific Plan includes the widening, protection, and restoration of Bedford Canyon Wash. To permit those activities, the following Regulatory Permits and MSHCP Consistency Determination were issued:

- U.S. Army Corps of Engineers (Corps File No. SPL-2015-00361-ERS)
- California Department of Fish and Wildlife (Notification No. 1600-2015-0055-R6):
- Regional Water Quality Control Board (SARWQCB Project NO. 332014-24)
- U.S. Fish and Wildlife Service (FWS-WRIV-15B0271-16F0852)

- MSHCP Consistency Determination and Determination of Biologically Equivalent or Superior Preservation (DBESP) (FWS/CDFW-15BO0271-15CPA0281)

The Regulatory Permits and MSHCP Consistency authorized the widening and restoration of Bedford Wash, including certain improvements for flood protection. Buried rip-rap extending down to scour depth was permitted along both sides of the Wash. Grade stabilizing structures were permitted perpendicular to flows. Several stormdrain outlet structures surrounded by a concrete structure were incorporated into the rip-rap lined banks to outlet storm flows from the development area into Bedford Wash. Additionally, two concrete crossings were permitted, at the far upstream and downstream limits within the Arantine Hills Specific Plan. The concrete crossings allow maintenance vehicles to cross the Wash and access the bluff side. Additionally, a future bridge crossing Bedford Wash is authorized by the Regulatory Permits. The Regulatory Permits remain active and Project activities authorized under the permits remain on-going.

The proposed Project has two components that could affect the jurisdictional areas of Bedford Canyon Wash. One component of the Project is a storm drain pipe from the on-site detention basin that must outlet into Bedford Wash. The Project proposes to outlet the storm drain pipe with the same design as other outlets into Bedford Wash, with the pipe outletting through a concrete structure constructed into the rip-rap lined bank of Bedford Wash, which results in approximately 0.01 acre of modification to the rip-rap lined bank of Bedford Wash (Figure 11). For the proposed Project, the outlet structure will be constructed on the downstream concrete crossing, eliminating any impacts to the soft bottom portion of the Wash. Since the outlet structure is located outside of the invert of Bedford Canyon Wash, construction of the outlet structure would occur beyond the jurisdictional limits of Waters of the United States. Furthermore, since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency Determination for the widening and restoration of Bedford Canyon Wash, and those permits remain active, no new impacts to Waters of the State or MSHCP Features would occur and no additional Regulatory Permits are required.

The second component of the Project would only occur if Alternative 2, which includes moving fill dirt from Planning Area 14 to the Project site across Bedford Wash, is implemented. In order to move fill dirt across Bedford Wash, fill would be temporarily placed on top of the existing concrete pad crossing Bedford Canyon Wash to both protect the concrete pad and function as a ramp to gain elevation. A notch would be graded into the plateau to the south of Bedford Wash and scrapers would move dirt across the temporary earthen ramp placed on the existing concrete pad crossing Bedford Wash. The placement of temporary fill on the concrete pad would cover an area of 0.09 acre of Waters of the State/MSHCP Features and 0.06 acres of Waters of the United States, which matches the area of the existing concrete pad crossing (Figure 12). No temporary fill dirt would be placed in the soft-bottom portion of Bedford Wash. Since the proposed ramp is located in an area that consists of existing concrete and was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, and those permits remain active, no new impacts to Waters of the State, Waters of the United States, or MSHCP Features would occur and no additional Regulatory Permits are required.

6.7 Potential Impacts to MSHCP Features

As part of Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. Please refer to the discussion within Section 6.6. Since the proposed outlet structure, and should Alternative 2 be implemented the dirt ramp, are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

A separate MSHCP Consistency Analysis Report has been prepared, which analyzes whether project impacts are consistent with MSHCP goals and objectives.

7.0 BMPs/PDFs Incorporated into the Project and MMRP

The Project will comply with the following:

- Work area limits will be defined and respected. All grading areas will have their boundaries clearly flagged or marked before Project implementation and all disturbances will be confined to the flagged areas. All key Project personnel will be instructed that their activities must be confined to locations within the flagged areas. Disturbance beyond the actual grading zone is prohibited without site-specific surveys.

- Cleared or trimmed non-native, exotic vegetation, and woody debris will be disposed of in a legal manner at an approved disposal site.

- Employees, contractors, and site visitors will be prohibited from collecting plants and wildlife.

- Water pollution and erosion control plans will be developed and implemented in accordance with SWPPP requirements.

- Access to construction sites will be via preexisting access routes.

- Construction equipment will be properly maintained; construction employees and contractors will be trained on proper implementation and monitoring of BMPs; and procedures will be implemented to minimize the likelihood of hazardous spills and to control sediment-laden runoff.

- Effective perimeter control BMPs to control discharge of pollutants from the Project site during construction.

- All temporary construction-related night lighting used in onsite development areas will be shielded and/or directed downward to avoid indirect impacts to nocturnal wildlife such that night lighting could increase predation rates.

- All construction contractors, subcontractors, and employees will comply with the litter and pollution laws and will institute a litter control/removal program during the course of construction activities to reduce the attractiveness of the area to opportunistic predators such as coyotes, opossums, and common ravens.

- Active nests (nests with chicks or eggs) cannot be removed or disturbed. Nests may be removed or disturbed by a qualified biologist, if not active.

8.0 Significance Determination and Proposed Mitigation

8.1 Threshold No. 1

Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

No special status plant species exist on the Project site. Furthermore, no suitable habitat for the plant species and eight of the wildlife species identified within Table 6 is found within the Project site, and no observations of the species have been made.

It was determined the Study Area contains habitat for the California Horned Lark and limited habitat for the red-diamond rattlesnake. Pre-construction nesting bird surveys as outlined within **MM_BIO-1** shall occur to prevent any construction-related noise impacts during the typical nesting bird season on nesting bird species protected under MBTA. Furthermore, Biological Monitoring shall occur during initial ground disturbances to identify and locate any red-diamond rattlesnake within the Project site as outlined within **MM BIO-2**. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the area shall cease to allow for the species to vacate the area safely to prevent any impacts by construction-related earthwork on the species.

The Migratory Bird Treaty Act protects nesting activities of both native and non-native bird species. Under the Act it is unlawful to harm, harass, or take a nest. Since removal of vegetation could result in impacts to nesting birds, the following mitigation measure is included to reduce impacts to less than significant.

MM BIO – 1: The removal of potential nesting bird habitat shall be conducted outside of the nesting season (February 15 to September 15) to the extent feasible. If grading or site disturbance is to occur between February 15 and September 15, a nesting bird survey shall be conducted by a qualified biologist within no more 5 days of scheduled vegetation removal, to determine the presence of nests or nesting birds. If active nests are identified, the biologist would establish buffers around the vegetation (500 feet for raptors and sensitive species, 200 feet for non-raptors/non-sensitive species). All work within these buffers would be halted until the nesting effort is finished (i.e. the juveniles are surviving independent from the nest). The onsite biologist would review and verify compliance with these nesting boundaries and would verify the nesting effort has finished. Work can resume when no other active nests are found. Alternatively, a qualified biologist may determine that construction can be permitted within the buffer areas and would develop a monitoring plan to prevent any impacts while the nest continues to be active (eggs, chicks, etc.). Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to CDFW for mitigation

monitoring compliance record keeping. If vegetation clearing is not completed within 5 days of a negative survey, the nesting survey must be repeated to confirm the absence of nesting birds.

Red-diamond Rattlesnake is a CDFW species of special concern. Since removal of the heavy brush could result in impacts to the species, the following mitigation measure is included to reduce impacts to less than significant.

> **MM BIO – 2:** A Biological Monitor shall be onsite during the initial ground disturbances to identify and locate any red-diamond rattlesnake within the Project site. Should any red-diamond rattlesnake species be located within the Project site, construction and earthwork within the immediate area of the identified species shall cease to allow for the species to vacate or be relocated from the area safely. Work can resume when the species has vacated the immediate ground disturbances work area.

With the implementation of MM BIO-1 and MM BIO-2, potential impacts to nesting birds and special status wildlife species are reduced to a less than significant level.

8.2 Threshold No. 2

Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

As part of both of the alternatives and overall Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Furthermore, for the import of dirt utilizing dirt from Planning Area 14, a temporary dirt bridge and culvert will be placed on the existing concrete pad crossing and removed following grading operation completion. Since the proposed outlet structure (for both alternatives), and dirt ramp (for Alternative 2), are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, no new impacts to Waters of the State or Waters of the United States would occur and no additional Regulatory Permits are required. The outlet is located within the slope and beyond jurisdiction of Waters of the US. Furthermore, no riparian habitat or sensitive natural communities is identified within this area; therefore, no impacts to riparian habitat or sensitive natural communities would occur and no mitigation is required. Further discussion can be found in Section 6.6.

8.3 Threshold No. 3

Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

As part of Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits for the widening and restoration of Bedford Canyon Wash, no new impacts to Waters of the State would occur and no additional Regulatory Permits are required. The outlet is located within the slope and beyond jurisdiction of Waters of the US. This area was previously disturbed and outside of the original limits of Bedford Canyon Wash prior to the widened Wash. As a result, no additional permits are required with Project implementation. Furthermore, the Project will not have a substantial adverse effect on federally protected wetlands as define by Section 404, since the minimal impacts are expected to occur within the riprap slope protection; therefore, no impacts to federally protected wetlands as define by Section 404 would occur and no mitigation is required.

8.4 Threshold No. 4

Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory corridors, or impede the use of native wildlife nursery sites?

Bedford Canyon Wash may serve a function in local wildlife movement. Bedford Canyon Wash provides connectivity between the Santa Ana Mountains and Lake Matthews and does provide a connection between large areas of undeveloped land, which may be utilized for wildlife movement. Furthermore, with the implementation of the widened and restored Bedford Canyon Wash, it will continue to provide a valuable linkage for wildlife. Project implementation will not impact the ability of Bedford Canyon Wash to continue to serve as a movement corridor. Therefore, no impacts to wildlife movement are anticipated as a result of implementation of the Project.

Since removal of vegetation could result in impacts to nesting birds, **MM BIO-1** shall be implemented to reduce impacts to less than significant.

8.5 Threshold No. 5

Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The City does not have any local policies, such as a tree preservation ordinance, that protect biological resources. Therefore, no impacts would occur, and no mitigation is necessary.

8.6 Threshold No. 6

Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The Project site is located within the MSHCP, specifically within the Temescal Canyon Area Plan. A Project Consistency Analysis has been prepared analyzing the impacts and mitigation measures.

As part of Project implementation an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Furthermore, as part of Project impacts, the alternative 2 would create a temporary dirt bridge placed on the existing concrete pad crossing and removed following grading operation completion. Since the proposed outlet structure (both import alternatives) and temporary dirt bridge (Alternative 2) are located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

The Project site falls within Narrow Endemic Plants (Survey Area Number 7). As concluded in Section 6.2 above, no special status plant species were observed during the 2019 surveys and none are expected to occur onsite due to the lack of suitable habitat found on the Project site; therefore, there are no impacts to Narrow Endemic Plants and no conflicts with an approved conservation plan for either dirt import alternatives and Project implementation.

Furthermore, the Project site contains the BUOW overlay. As a result, a series of four focused BUOW survey was conducted per MSHCP Section 6.3.2 and MSHCP protocol Focused Survey Instructions. While potentially suitable habitat exists onsite, no BUOW, suitable burrows, or signs of BUOW were present during the surveys. Complete results can be found within the Focused BUOW Report in Appendix A. Since BUOW are migratory species, **MM BIO – 3** shall be implemented prior to ground disturbance.

> **MM BIO – 3:** Pre-construction presence/absence surveys for burrowing owl within the survey area where suitable habitat is present shall be conducted by a qualified biologist within 30 days of ground disturbing activities. If active burrowing owl burrows are detected during the breeding season, all work within 300 feet of any active burrow will

be halted until that nesting effort is finished. The on-site biologist will review and verify compliance with these boundaries and will verify the nesting effort has finished. Work can resume when no other active burrowing owl burrows nests are found.

If active burrowing owl burrows are detected outside the breeding season or during the breeding season and it is determined nesting activities have not begun, then passive and/or active relocation may be approved following consultation with CDFW. The installation of one-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools when determined to be unoccupied by Project biologist, and back filled to ensure that animals do not re-enter the burrows. Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to CDFW, and the City for mitigation monitoring compliance record keeping.

With the implementation of MM BIO-3, potential impacts to existing MSHCP features are reduced to a less than significant level.

9.0 Cumulative Impacts

Direct impacts may occur to nesting birds, should construction activities and vegetation removal take place during the typical nesting season, regardless of the alternative implemented. However, adherence to the BMPs as outlined in Section 7.0, as well as implementation of MM-Bio 1, and MM-Bio 2 will ensure impacts to special status species or their habitats are minimized thus reducing the Project's contribution to cumulative impacts to less than significant.

As part of both import alternatives, an outlet will be installed within the buried riprap slope protection of Bedford Canyon Wash. The apron for the outlet opening occurs at the downstream concrete Wash crossing. Furthermore, as part of Alternative 2: PA14 Dirt Import, a temporary dirt bridge and culvert will be placed on the existing concrete pad crossing and removed following grading operation completion. Since the proposed outlet structure is located in an area of Bedford Wash that was previously disturbed through authorization of Regulatory Permits and MSHCP Consistency for the widening and restoration of Bedford Canyon Wash, no new impacts to MSHCP Riparian/Riverine Features would occur.

Furthermore, the MSHCP was specifically designed to cover a large geographical area so that it would protect numerous special-status species and sensitive habitats throughout the region. It is the projected cumulative effect of future development that has required the preparation and implementation of the MSHCP to protect multiple habitats and species. Because the MSCHP provides a regional and comprehensive approach to conservation planning, the proposed Project's contribution to cumulative impacts would also be less than significant.

1.0 Introduction

On behalf of Bedford Marketplace, LLC (Guardian Capital), Carlson Strategic Land Solutions (SLS) prepared this Focused Burrowing Owl Results Report, which documents the results of the focused protocol Burrowing Owl (*Athene cunicularia [BUOW]*) surveys for the proposed Bedford Marketplace Project (Project). The Project is located on approximately 18-acres in the City of Corona. The Focused BUOW Report incorporates the findings from the focused burrow and BUOW field surveys within the Study, which is comprised of the 18-acre Project site and surround 500-foot buffer. The protocol survey was conducted following the *Burrowing Owl Survey Instructions for the Western Riverside County Multiple Species Habitat Conservation Plan Area* (County of Riverside 2006). The purpose of the survey was to identify presence or absence of BUOW, suitable burrows and/or burrow surrogates, and any other sign of BUOW within the Study Area.

1.1 Project Terms

The following terms will be used throughout this document and are defined as follows:

- Project site: the approximately 18-acre Bedford Marketplace Project site.
- Study Area: the area evaluated during the field survey, including the approximately 18-acre Project site and the surrounding 500-feet (150-meters).
- Project Vicinity: intended to be a general term to describe the broader area surrounding the Study Area.

1.2 Project Location

The Project Site is located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of Corona. The City of Corona is generally situated southwest of the City of Riverside, south of the City of Norco, and north of the City of Lake Elsinore in Riverside County, California (Figure 1). Areas surrounding the Project Site include the I-15 freeway to the east, Arantine Hills Specific Plan to the south and west; and Cajalco Road to the north (Figure 2). The Project Site is located within the United States Geological Survey (USGS) 7.5-Minute Topographic Map *Corona South* Quadrangle.

The Project Site is owned by the Riverside County Transportation Commission and has Assessor's Parcel Numbers (APN) 279-240-033 and 279-240-019.

Access to the Project site is from the residential project referred to as Bedford, located to the west of the Project site, off Eagle Glen Parkway via Hudson House Drive. Directions to the Project site from Interstate 15 (I-15) is to exit Cajalco Road and head west onto Eagle Glen Parkway. Access is obtained via Hudson House Drive.

1.3 Existing and Historical Land Use

The overall Study Area has historically been farmed for citrus production between 1962 and 2007. Prior to the 1962 aerial photograph, the Project Site was vacant land. The former agricultural operation has reverted to ruderal vegetation. The Project site is located between the new residential community of Bedford within the Arantine Hills Specific Plan (AHSP), which has been graded, and the I-15 freeway, including the Cajalco Interchange, which is currently under construction.

Bedford Canyon Wash, located to the south of the Project Site, is an ephemeral wash with a sandy bottom and sparsely vegetated alluvial fan sage scrub and non-native vegetation. The Wash receives flows from the Santa Ana mountains, through the Eagle Glen Golf Club, through the AHSP area, continuing downstream to Temescal Creek and ultimately the Santa Ana River. As part of implementation of the AHSP, Bedford Wash has been widened and improved with buried rip-rap along the banks and buried grade control structures to control erosion and scour. Two concrete crossings (upstream and downstream) provide access to the south side of the Wash and the associated maintenance access road. Restoration of Bedford Wash includes planting with an alluvial fan sage scrub seed mix.

1.4 MSHCP Survey Requirements for the Burrowing Owl

The Project site is found within the MSHCP BUOW survey area. The BUOW is designated as a "Covered Species Adequately Conserved" under MSHCP, but with specific survey/conservation requirements as described in Volume I, Section 6.3.2 of the MSHCP and species-specific objectives. Pursuant to the MSHCP, if a site occurs within the BUOW survey area, and suitable habitat is present, then focused surveys shall be conducted following the *Burrowing Owl Survey Instructions for the Western Riverside County Multiple Species Habitat Conservation Plan Area* (County of Riverside 2006). The survey instructions note the following steps to the MSHCP BUOW assessment:

- Step I: Habitat Assessment
- Step II: Locating Burrows and Burrowing Owls
    - » Part A: Focused Burrow Survey
    - » Part B: Focused Burrowing Owl Surveys (a total of 4 separate surveys)

Step I of the survey instructions requires that an assessment be conducted to determine the presence of suitable habitat for the BUOW. The habitat assessment must be conducted by walking the Project site and surrounding 500-foot buffer, where feasible. Habitat for the BUOW is varied and includes short-grass prairies, grasslands, lowland scrub, agricultural lands (particularly rangelands), coastal dunes, desert floors, and some artificial open areas. BUOW require large open expanses of sparsely vegetated areas with an abundance of active small mammal burrows. The mammal burrows are often modified and enlarged. For nesting BUOW,

one burrow is typically selected for use; however, satellite burrows are usually found within the immediate vicinity of the nest burrow within the defended territory of the owl.

Pursuant to MSHCP Section 6.3.2 and the methods are used to detect and identify BUOW included observation of key signs identified by the *California Burrowing Owl Consortium (CBOC).* This includes observation of key signs such as sight, scat, tracks, burrows, nests, and calls. All encountered burrows or structure entrances, suitable or non-suitable, were checked for the presence of BUOWs, molted feathers, cast pellets, prey remains, eggshell fragments, tracks, or excrement at or near a burrow entrance. Natural or man-made structures that could support BUOWs were also surveyed when present.

Once a basis for suitability for BUOW is determined, the presence/absence of suitable burrows is to be determined during Step II of the MSHCP Survey Instructions. Step II surveys must be conducted during breeding season (March 1 through August 31). All surveys are to be conducive to observing owls outside their burrows and detecting BUOW signs. Surveys shall not be conducted during rain, high winds (>20mph), dense fog.

As outlined within Step II of the MSHCP Survey Instructions, Step II is separated into two parts, Part A and Part B. Part A includes the detailed focused burrow survey, which consists of systematic survey for suitable burrows to support BUOW. This includes mammal burrows as well as suitable artificial and/or manmade structures. The pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface. The locations of suitable habitat, potential owl burrows and key signs should be mapped and recorded.

Part B is only conducted if suitable burrows and habitat is present as identified during Part A.

2.0 Methodology

SLS biologist conducted the initial habitat assessment on June 27, 2019 to determine the locations of suitable habitat. Based on this assessment, it was determined the Project site contained suitable habitat, therefore three (3) additional focused BUOW surveys were conducted on July 8, July 25, and August 1, 2019 pursuant to MSHCP Section 6.3.2, MSHCP Protocol Survey Instructions.

2.1 Focused Burrow Survey

Prior to the field survey, available literature and databases including the California Natural Diversity Database (CNDDB), were reviewed to identify sensitive habitats and special status wildlife species, including BUOW in the vicinity of the Study Area. Consistent with the MSHCP Survey Instructions, a focused burrow survey was conducted on June 27, 2019 and pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface.

According to the MSHCP guidelines, the biologist should also walk the perimeter of the property, which consists of a 150-meter (approximately 500 feet) buffer zone around the Project boundary. If permission to access the buffer area cannot be obtained, the biologist shall not trespass, but visually inspect adjacent habitats with binoculars. Parcels of land that could not be accessed (e.g. private property) were viewed using binoculars from vantage points to survey for BUOW activity or signs thereof, as well as other nesting bird activity.

2.2 Focused Burrowing Owl Survey

If no potential suitable BUOW burrows were observed within the Project Study Area or the 150-meter buffer area then Step II Part B, the focused BUOW surveys, are not required per to the BUOW Survey Instructions.

3.0 Results

Step I Habitat Assessment was conducted on June 27, 2019 to determine suitable Habitat. Based on the Habitat Assessment it was determined the Project site contains suitable habitat. Step II, Part A and B of the MSHCP Survey Instructions took place on July 8, July 25, and August 1, 2019. Each of the survey efforts were conducted in the morning between 7:15 a.m. and 11:50 a.m. and were not performed during periods of excessive or abnormal heat, wind, rain, or other inclement weather. Temperatures during the survey ranged between 64° F and 95° F, with predominant sunny, clear skies and 0-2 mph winds. The survey was conducted during typical BUOW peak activity time and was not conducted during rain, high winds (> 20 miles per hour), or dense fog >75%. Prior to the commencement of the survey, SLS biologist scanned the Study Area using binoculars to look for BUOW. The Study Area was assessed for the suitability to support BUOWs and all suitable burrows were inspected for signs of use by BUOWs. The survey involved walking through suitable habitat within the Study Area (the Project site and a 500-foot buffer). Pedestrian survey transects were spaced approximately 10 to 15 meters apart to allow 100 percent visual coverage of the ground surface (Figure 3).

No BUOWs or evidence of BUOWs were observed on site within the Study Area during the focused survey. A majority of the Project site was characterized by actively maintained ruderal fields, lacking necessary sized burrows and dense vegetation cover to provide suitable nesting habitat for BUOW. Much of the 500-foot buffer is developed. California ground squirrels (*Spermophilus beecheyi*) and their burrows were observed within the Study Area. These burrows were actively utilized by the California Squirrels and contained no BUOW or keys signs (sight, whitewash, burrows, bones, feathers, pellets, nests, and calls). Furthermore, the Project site is annually maintained for fire abatement and the property adjacent to the Project site has active construction and grading activities, including the I-15/Cajalco Interchange. Therefore, based on the lack of suitable BUOW burrows, routine maintenance and mowing, and adjacent construction activity, it is determined that the Project site is not occupied by BUOW.

All wildlife species encountered visually or audibly during the field survey were identified and recorded in field notes. Photographs were taken to document existing conditions within the Study Area; photo-pages are attached (Appendix A).

The animal species or signs thereof observed during the SLS survey are listed below:

Birds:

- American crow (*Corvus brachyrhynchos*)
- Anna's hummingbird (*Calypte anna*)
- black phoebe (*Sayornis nigricans*)
- California quail (*Callipepla californica*)
- California towhee (*Melozone crissalis*)
- house finch (*Haemorhous mexicanus*)
- mourning dove (*Zenaida macroura*)
- red-tailed hawk (*Buteo jamaicensis*)
- song sparrow (*Melospiza melodia*)
- turkey vulture (*Cathartes aura*)
- California Horned Lark (*Eremophila alpestris actia*)
- western scrub jay (*Aphelocoma californica*)

Mammals:

- California ground squirrel (*Spermophilus beecheyi*)
- desert cottontail (*Sylvilagus audubonii*)

Reptiles:

- western fence lizard (*Sceloporus occidentalis*)

4.0 Discussion

While a majority of the Study Area consist of ruderal vegetation, no BUOWs, suitable sized burrows, or key diagnostic signs (i.e., whitewash, pellets, bones, feathers, etc.) of BUOWs were observed within the Study Area. California ground squirrels and their burrows were observed within the Study Area. However, these burrows are actively utilized by California ground squirrels and contained no BUOWs or key diagnostic signs (i.e., whitewash, pellets, bones, feathers, etc.) of BUOWs. Furthermore, the Project site is annually maintained for fire abatement and the property adjacent to the Project site has active construction and grading activities associated with the I-15/Cajalco Interchange. Therefore, based on the lack of suitable BUOW burrows, routine maintenance and mowing, lack of proper vegetation cover, and adjacent construction activities, it is determined the Project site is not occupied by BUOW.

Based on the results of the field survey, the Study Area is not considered to be occupied by BUOWs. However, since the BUOW is a migratory species the Project will be required to conduct

a 30-day pre-construction survey for the BUOW. The following shall take the following measure to avoid impacts to BUOW.

- Pre-construction surveys for BUOW within the survey area where suitable habitat is present shall be conducted by a qualified biologist within 30 days prior to the commencement of ground disturbing activities. If active BUOW burrows are detected during the breeding season, all work within 300 feet of any active burrow will be halted until that nesting effort is finished. The on-site biologist will review and verify compliance with these boundaries and will verify the nesting effort has finished. Work can resume when no other active BUOW burrows nests are found.

  If active BUOW burrows are detected outside the breeding season or during the breeding season and its determined nesting activities have not begun, then passive and/or active relocation may be approved following consultation with the City. The installation of one-way doors may be installed as part of a passive relocation program. BUOW burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and back filled to ensure that animals do not re-enter the holes/dens. Upon completion of the survey and any follow-up construction avoidance management, a report shall be prepared and submitted to the City for mitigation monitoring compliance record keeping.

5.0 Certification

I hereby certify that the statements furnished above and in the attached exhibits present data and information required for this biological evaluation, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

MANAGEMENT SUMMARY

Duke Cultural Resources Management, LLC (DUKE CRM) is under contract to Bedford Marketplace, LLC to provide cultural and paleontological resources services for the Bedford Canyon Marketplace Project (Arantine Hills Specific Plan Amendment No. 3) (Project), located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of the City of Corona, Riverside County, California. The Project boundaries encompass approximately 27.8 acres. Guardian Capital proposes to amend the Arantine Hills Specific Plan (AHSP) to increase the boundary of the AHSP by approximately 17.7 acres. The purpose of this report is to document efforts made to comply with the California Environmental Quality Act (CEQA).

The cultural and paleontological resources assessment includes background research and a field survey to identify cultural and paleontological resources. The cultural resource record search did not reveal any cultural resources within the Project boundary; however, seventeen previously recorded cultural resources were identified within a one-mile buffer of the project. Multiple fossil localities were documented in the vicinity of the Project. The field survey identified one isolated prehistoric artifact, a trifacial granite mano/shaping tool, within the Project area west of the Bedford Canyon wash.

There is a high sensitivity for paleontological resources in the Project. Deposits of high paleontological sensitivity may be encountered in deep ground excavation (greater than 10 feet) in the north portion of the project, and in ground disturbance at the surface in the southern portion of the Project. This ground disturbance would have the potential to impact unique paleontological resources. As a result, DUKE CRM recommends paleontological monitoring for any ground disturbance in APN 279-240-019 south of the Bedford Canyon Wash and for ground disturbance deeper than 10 feet b.g.s. throughout the Project area west of the Bedford Canyon Wash.

Our research shows that the Project was previously farmed for citrus production for multiple decades. However, one prehistoric isolated artifact was observed within the Project during the 2019 field survey. Additionally, five artifacts and one potential archaeological feature were observed during construction monitoring in 2018 on the adjacent AHSP property. DUKE CRM recommends that ground disturbance may have the potential to impact prehistoric and historic archaeological resources and recommends archaeological monitoring during ground disturbance for the Project.

If human remains are encountered, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC. The MLD may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials.

INTRODUCTION

Duke Cultural Resources Management, LLC (DUKE CRM) is under contract to Bedford Marketplace, LLC to provide cultural and paleontological resources services for Bedford Canyon Marketplace Project (Arantine Hills Specific Plan Amendment No. 3) (Project), located in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of the City of Corona, Riverside County, California. The Project boundaries encompass approximately 27.8 acres. The purpose of this report is to document efforts made to comply with the California Environmental Quality Act (CEQA).

Project Description

The Applicant, Bedford Marketplace, LLC, proposes to amend the Arantine Hills Specific Plan (AHSP Amendment No. 3) to increase the boundary of the AHSP on its eastern most side by approximately 17.7 acres. The entire Project area is 27.8 acres, where approximately 10 acres was included in the AHSP (located on the northeastern portion of the current Project area, west of the newly constructed Bedford Canyon Road) and designated for Commercial use. Approximately 5.82 acres of the Modified Project Site would be designated Open Space within the AHSP. The Applicant is requesting a General Plan Amendment, Zone Change, Specific Plan Amendment, Parcel Map, Construction Hours/Noise Variance, Precise Plan, Conditional Use Permit, and Supplement to the previously certified AHSP EIR.

The additional 17.7 acres is located on a lower elevation than the existing 10-acre graded commercial pad included in the AHSP. The additional acreage on the eastern edge of the Project area is also lower in elevation than the newly constructed sewer lift station within the AHSP, such that at the current elevation, the added acreage would not gravity flow to the lift station, resulting in the need for additional pumps. To bring Project area up to an elevation similar (within five feet) of the existing 10-acre commercial pad and at an elevation where sewer could gravity flow to the existing lift station, import of approximately 440,000 cubic yards of dirt is required. Prior to the import operations, the eastern portion of the Project area (the additional 17.7 acres to the AHSP) will require the over-excavation of approximately 4-6 feet below existing ground surface.

Project Location

The Project site is situated in the Bedford Canyon area of the Santa Ana Mountain foothills in the southeastern portion of Corona. The City of Corona is generally situated southwest of the City of Riverside, south of the City of Norco, and north of the City of Lake Elsinore in Riverside County, California (Map 1). Areas surrounding the Project include the AHSP to the north and west; undeveloped land and rural residential to the south; and the Eagle Glen Golf Club to the west. The Project is located within the United States Geological Survey (USGS) 7.5-Minute Topographic Map *Corona South* Quadrangle (Map 2). The eastern most 17.7 acres is owned by the Riverside County Transportation Commission (RCTC) and has Assessor's Parcel Numbers (APN) 279-240-033 and 279-240-019. The Project boundary overlaid onto an aerial photograph is shown in Map 3. All Project maps are located in Appendix A.

SETTING

Natural

California is divided into 11 geomorphic provinces, each naturally defined by unique geologic and geomorphic characteristics. The Project is located in the northwestern portion of the Peninsular Ranges geomorphic province. The Peninsular Ranges province is distinguished by northwest trending mountain ranges and valleys following faults branching from the San Andreas Fault. The Peninsular Ranges are bound to the east by the Colorado Desert and extend north locally to the Santa Monica Mountains (Yerkes and Campbell, 2005; Hillhouse, 2010), west into the submarine continental shelf, and south to the California state line.

The Project area is located between two topographic highs, the Temescal Mountains to the east and the Santa Ana Mountains to the south. The Temescal Mountains are a portion of the Peninsular Ranges Batholith known as the Perris Block. The Perris Block is a large, relatively unbroken, body of igneous rock that originally formed underground between 120 and 105 million years ago (Todd et al., 2003). The Santa Ana

Mountains are the result of two geologic processes. First, an episode of folding in the Plio-Pleistocene (approximately 2.5 million years ago) uplifted the future Santa Ana Mountains and caused an accompanying down-drop to the northeast that created the current valley that contains Corona (Gray, 1961). In the late Pleistocene (approximately 10,000 years ago), the formation of the Corona and Elsinore Fault uplifted the Santa Ana Mountains and resulted in abundant sediment being eroded off the mountains and deposited onto the valley floor (Gray, 1961). In the area of Corona, this sediment was deposited as one large fan, the Corona Fan that essentially defines the borders of the modern City of Corona (Gray, 1961). The Project area is located in an incised valley that has been cut into the southeastern portion of the Corona Fan.

The geology in the vicinity of the Project has been mapped by Morton and Miller (2006) at a scale of 1:100,000. A review of this map indicated that the Project area is located on two geologic units: young alluvial fan deposits (*Qyf*) and old alluvial fan deposits (*Qof*) (Figure 4). Young alluvial fan deposits (*Qyf*) are composed of unconsolidated to moderately consolidated silt, sand, pebbly cobbly sand, and bouldery alluvial fan deposits of late Pleistocene (2.5 million years ago to 11,700 years ago) to Holocene (11,700 years ago to today) Epochs, with local deposits dominated by cobbles and boulders (Morton and Miller, 2006). These deposits occur in most of the Project area. Old alluvial fan deposits (*Qof*) are composed of moderately to well-consolidated silt, sand, and gravel, with local deposits dominated by sand to boulder size clasts (Morton and Miller, 2006). These deposits occur in the southern "finger" of the eastern 17.7 acres in APN 279-240-019, south of Bedford Canyon Wash.

Cultural

Prehistory

Two primary regional schemas are commonly cited in the archaeological literature for western Riverside County where the Project is located. These schemas or syntheses generalize the presence or absence of certain artifact types into explanatory frameworks of temporal chronologies and/or subsistence practices. Schemas are necessary because many archaeological sites lack absolute datable material (ex. Carbon for radiometric ^{14}C dating) and so researchers need to cross-date sites by comparison to either coastal or desert chronologies with established chronological sequences backed by absolute dates. In western Riverside County, it is thought to be the meeting ground of both coastal and inland desert schemas and neither exclusively explains prehistoric finds.

The first schema, advanced by Wallace (1955), defines four cultural horizons for the southern California coastal province, each with characteristic local variations:

I. Early Man (~9000–8500 B.P.) is a hunting culture based on almost exclusive evidence of chipped-stone hunting materials: dart points, scrapers, choppers, and bifaces.
II. Milling Stone (8500–4000 B.P.) reflects a change to a more sedentary, plant-collecting lifestyle as evidenced by the introduction and dominance of milling stone artifacts and a decrease in well-made projectile points.
III. Intermediate (4000–1500 B.P.) is characterized by a larger dependency on hunting, use of the dart and atlatl, and the shift from using the mano/metate to mortar/pestle. However, knowledge of this horizon suffers from lack of knowledge about what occurred during this time, not a lack of inhabitants along the southern California coast.
IV. Late Prehistoric (1500~200 B.P.) contains a more nuanced artifact assemblage indicative of a more complex lifestyle and an increase of population. This horizon is characterized by an increase in bow and arrow use, steatite containers, pottery, circular fish hooks, perforated stones, asphaltum, diversified bone tools, ample shell ornaments, and elaborate mortuary customs.

Warren and Crabtree (1986) employ a more ecological approach to the deserts of southern California, defining five traditions in prehistory:

I. Lake Mojave (12000–7000 B.P.)
II. Pinto (7000–4000 B.P.)

III. Gypsum (4000–1500 B.P.)
IV. Saratoga Springs (1500–800 B.P.)
V. Shoshonean (800~200 B.P.)

Warren and Crabtree (1986) viewed cultural continuity and change in terms of various significant environmental shifts, defining the cultural ecological approach for archaeological research of the California deserts. The authors viewed changes in settlement pattern and subsistence as cultural adaptations to a changing environment, beginning with the gradual environmental warming in the late Pleistocene, the desiccation of the desert lakes during the early Holocene, the short return to pluvial conditions during the middle Holocene, and the general warming and drying trend, with periodic reversals, that continues to this day. The work by Warren and Crabtree (1986) is built upon, in part, by Warren (1980) in which he argued for a chronology based on projectile points as period markers backed by radiocarbon assays providing absolute dates.

The two schemas contrast in important ways. The units employed by Warren are "traditions," and in contrast to Wallace (1955), traditions may be spatially restricted but display temporal continuity. For Wallace, "horizons" or "periods," are extensive through space but restricted in time. More recent schema have been attempted to reconcile these differences. More recently, Koerper and Drover (1983) synthesized chronologies for coastal southern California and employed Wallace's (1955) horizon terminology but use radiometric data to sequence stylistic changes observed in the artifact assemblages, which they interpreted as material indication of cultural change through time. Regardless of the overall schema to best explain the prehistory of western Riverside County, the region can be understood within broad chronological frameworks and as the meeting ground of the coastal and desert subsistence patterns.

Early Holocene (11,600 – 7,600 BP)

Traditional models of the prehistory of California hypothesize that its first inhabitants were the big game hunting Paleoindians who lived at the close of the last ice-age (~11,000 years before present [BP]). As the environment warmed and dried, large Ice Age fauna died out, requiring adaption by groups to survive. The western Great Basin and deserts of southern California were characterized by large pluvial (rainfall-fed) lakes, streams, marshes, and grasslands. The human response to this environment is known as the Western Pluvial Lakes Tradition (WPLT) (Moratto 1984). The WPLT is generally identified by an advanced flaked-stone industry of foliate knives/points, Silver Lake and Lake Mojave points, lanceolate bifaces, and long-stemmed points. Other flaked-stone tools include crescents, scrapers, choppers, scraper-planes, hammer stones, cores, drills, and gravers. People of this period hunted diverse populations of smaller animals and collected a wide number of plants from diverse eco-zones. Importantly, this period lacks widespread evidence of milling stones, and, therefore, hard seed processing was likely not widely practiced. Sites are generally found along the shores of former pluvial lakes, marshes, and streams (Moratto 1984). The desert manifestation of the WPLT is the Lake Mojave Complex, while along the coast the WPLT is seen in the San Dieguito Complex. Along the coast, rising sea levels created bays and estuaries. Following initial settlement along the coast, groups adopted marine subsistence including fish and shellfish. These shell middens contain flaked cobble tools, metates, manos, discoidals, and flexed burials and allowed for a semi sedentary life style (Byrd and Raab 2007). Eventually, shellfish became the primary source of food, while plant gathering, hunting and fishing were less important.

The Paleocoastal Tradition (PCT) has many similarities to the WPLT but it reflects a coastal adaptation (Davis et al. 1969). PCT sites are located along bays and estuaries. Subsistence patterns indicate the eating of mollusks, sea mammals, sea birds, and fish in addition to land plants and animals. The argument for a PCT has gained momentum. This is based on a vast amount of recent research that has been conducted along the California coast and the Channel Islands (Byrd and Raab 2007). A recent study dates habitation on San Miguel Island back to ~11,300 BP (Daisy Cave), while a site on San Clemente (Eel Point) shows that a Paleocoastal Tradition was entrenched at Eel point in the early Holocene, with the hunting of seals, sea lions, and dolphins, as well as the gathering of shellfish.

Middle Holocene (7,600 – 3,650 BP)

The middle Holocene is a time of change and transition. As conditions continued to warm and dry, lakes and streams in the desert disappeared. This resulted in a shift in subsistence strategies, namely a shift to the gathering of plant seeds, grasses and shellfish along the coast as the primary dietary staple. Fishing and the hunting of smaller animals played a less important role in day to day activity. This shift in subsistence is what Wallace named the Millingstone Horizon (Wallace 1955) and this name has continued among archaeologists working on the coastal province of southern California. Large habitations are seen in the inland areas and considerable variability is seen along coastal occupation of southern California. Occupation revolved around seasonal and semi-sedentary movements in coastal Orange and San Diego counties. Trade networks are postulated by researchers that have dated Ollivella grooved rectangle shell beads as far north as central Oregon dating to 4900-3500 BP (Byrd and Raab 2007). Characteristics of the middle Holocene sites include ground stone artifacts (manos and metates) used for processing plant material and shellfish, flexed burial beneath rock or milling stone cairns, flaked core or cobble tools, dart points, cogstones, discoidals, and crescentics.

Late Holocene (3,650 – 233 BP)

During the late Holocene there was a migration of Takic speakers from the Great Basin into southern California. Sutton (2009) was able to show while Takic speakers did in fact physically migrate, linguistic, biological, and archaeological evidence indicates that by about 1,500 B.P., the Gabrielino language had become sufficiently distinct from its northern origins to be classified in a different branch of Takic. About this same time, the language was adopted by an existing Yuman group to the south that would become Luiseño (Sutton 2009:62). Characteristics of the late Holocene include the introduction of the bow and arrow, mortar and pestle, use of ceramics, and a change in mortuary behavior from inhumations to cremations in southern California. This was also a period of climatic fluctuation. Paleoenvironmental data show that periods of drought alternated with cooler and moister periods (Vellanoweth and Grenda 2002; Byrd and Raab 2007; Jones et al. 2004). This resulted in dynamic regional cultural patterns with considerable local variation. Byrd and Raab (2007) suggest that foragers in southern California over-exploited high-ranked food, such as shellfish, fish, marine and land mammals, and plant remains. This led to resource depression, causing people to forage more costly resources that were more abundant.

Ethnography

The Project is located in an area that was used by three Tribes: the Gabrielino, the Cahuilla, and, the Luiseño Indians. All are Takic speakers and descended from Late Prehistoric populations of the region. Takic is part of the larger Uto-Aztecan language stock which migrated west from the Great Basin (Bean and Smith 1978).

The Gabrielino are one of the least known Native American groups in California (Bean and Smith 1978; Bean and Shipley 1978). Generally, their territory included all of the Los Angeles Basin, parts of the Santa Ana and Santa Monica Mountains along the coast from Aliso Creek in the south to Topanga Canyon in the north, and San Clemente, San Nicolas, and Santa Catalina Islands. The environmental conditions within this territory are very diverse, including the following zones: interior mountains/foothills, Prairie, exposed coast, and sheltered coast. The Gabrielino lived in villages year-round and utilized smaller camps from which they could hunt and gather, likely on a seasonal basis. Villages were almost always situated near water. Gabrielino families lived in domed, round structures with thatching made from local plants. Villages were politically autonomous from other villages, while each village was led by a chief who would, at times, reign over several villages (Bean and Smith 1978).

Acorns were the most important food for the Gabrielino; although the types and quantity of different foods varied by season and locale. Other important sources of food were grass and many other seed types, deer, rabbit, jackrabbit, woodrat, mice, ground squirrels, quail, doves, ducks and other fowl, fish, shellfish, and marine mammals.

The territory of the Luiseño extended along the coast south to Agua Hedionda Lagoon, northwestward to Aliso Creek just north of San Juan Capistrano, and eastward to the Elsinore Valley and Palomar Mountain. Like other Native American groups in southern California, the Luiseño caught and collected seasonally

available food resources and led a semi-sedentary lifestyle with the majority of individuals residing at the village for the entire year (Oxendine 1983:57). Luiseño villages were generally located in valley bottoms near to water. The Luiseño had a well-developed sense of ownership (White 1963:122), and their concept of property rights included the idea of private property. Property rights covered items and land owned by the village as well as items such as houses, gardens, ritual equipment, trade beads, eagle nests, and songs that were owned by individuals. Luiseño villages were politically independent and were administered by a chief, who inherited his position from his father (Bean and Shipek 1978).

Subsistence was based primarily on seeds from local grasses, manzanita, sunflower, sage, chía, and pine nuts, as well as acorns. Seeds were dried, ground, and cooked into a mush. Seasonal camps were also established along the coast and near bays and estuaries to gather shellfish and hunt waterfowl (Hudson 1971). Game animals such as deer, rabbit, jackrabbit, wood rat, mice, antelope, and many types of birds were regularly hunted (Bean and Shipek 1978). In addition, the Luiseño utilized fire for crop management and communal rabbit drives (Bean and Shipek 1978). Small seasonal habitation sites in the area would contain quantities of fire affected rock (FAR), some burned bone, and small amounts of ground and flaked stone tools. They might be found as open sites atop knolls or ridges, or in protected areas near streams, or even in rock shelters.

Cahuilla territory included the Coachella Valley, the San Jacinto and Santa Rosa Mountain ranges. Bean and Shipek (1978) estimated that the Cahuilla numbered between 6,000 and 10,000 people at the time of Spanish Contact. Politically and ceremonially Cahuilla clans were led by a Chief or *Net*. The *Net* had charge of the sacred dance house and the sacred bundle, *masut*, which consisted of matting which was wrapped around items sacred to the clan such as ritual paraphernalia. Importantly, the *masut* was the sacred expression of each clan. A *Paha*, ritual assistant, is also found among other Takic speaking groups. The office of *Paha* varied however, as it was not always present within some of the southern-most Desert Cahuilla clans (Bean and Saubel 1972, Bean and Shipeck1978; Hooper 1920). As other Takic speaking groups did, the Cahuilla would publically gather for the naming of children, marriage, female and male initiation ceremonies, for the ascendency of a *Net*, for an Eagle-Killing Ceremony and the mourning ceremony. The mourning ceremony took place as a way to collectively mourn all those that died since the previous mourning ceremony. Each person was cremated along with his or her individual possessions in a ceremony separate from the mourning ceremony. Mourning ceremonies were one of the most important ceremonies for clan in that sacred songs were sung, sacred dances were danced, and moieties exchanged food and valued goods.

Cahuilla diet emphasized acorn, *Salvia islay*, yucca, agave and pinyon gathering, or the gathering of mesquite, cactus, and hard seeds such as screwbean, juniper and mesquite depending upon the local environment (Bean and Saubel 1972). The Cahuilla were also observed to cultivate small quantities of corn, beans, squashes, pumpkins, melons and wheat as early as 1824 by the Romero expedition. These crops and the cultivation of them potentially made their way from the Colorado River area to the Coachella Valley. The inhabitants of the Coachella did not practice flood recessional agriculture of the Colorado River groups (Bean and Lawton 1993).

History

The first Europeans to explore what would become the state of California belonged to the 1542 expedition of Juan Rodriguez Cabrillo, who sailed along and occasionally landed on the coast. Europeans are thought to have first visited portions of the interior in 1769, when Gaspar de Portola (Brown 2001) led a 62-person overland expedition from San Diego to Monterey (Cramer 1988). Two later expeditions, led by Juan Bautista de Anza in 1774 and 1775 from Sonora through southwestern Arizona and southern California, crossed the Santa Ana River at Anza Narrows in today's Santa Ana River Regional Park.

The Spanish government subsequently established missions and military outposts in San Diego in 1769 to facilitate colonization of the area and to keep rival European nations out of the area. After Mexico won independence from Spain in 1822, colonization efforts in Alta California decreased. The Spanish mission system was largely abandoned and the Mexican government bestowed land grants or ranchos to those loyal to the Mexican government including some Anglo settlers. The Mexican period (1822-1848) is largely identified

with the ranchos acquired by individuals through the land grant system as well as the secularization of the missions. Mission secularization began on July 25, 1826 with a decree by Governor Jose Maria Echeandfa and was completed by 1836 after an additional decree in 1831 (Engstrand and Ward 1995).

The end of the Mexican period in California began on June 14, 1846 when a band of American settlers supported by the American explorer John C. Fremont and his team captured Mexican General Mariano Guadalupe Vallejo in a dawn raid in Sonoma (Ide 1967, Rolle 2003). The Americans raised a flag for the "California Republic" and their actions became known as the "Bear Flag Revolt." The so-called California Republic was short-lived however, as on July 7, 1846, U.S. Navy forces captured Monterey, California, where the U.S. flag was raised (Rolle 2003). On February 2, 1848, the war between the U.S. and Mexico ended with the signing of the Treaty of Guadalupe Hidalgo, which greatly expanded U.S. territory (including California) and resulted in Mexico being paid $15 million for the land (Rolle 2003).

Although gold had been found prior to this in various parts of California, the well-publicized discovery of gold near Sutter's fort in 1848 dramatically increased the Anglo settlement of California. Despite property rights of rancho owners being secured by provisions in the Treaty of Guadalupe Hidalgo, California in the early American period experienced the transfer and subdivision of many of the ranchos as well as a shift from ranching to agriculture as the primary means of subsistence.

In 1886, the City of Corona was established by the South Riverside Water and Land Company (Duke 2010). The company developed the purchased 12,000 acres of land then known as southwestern San Bernardino County. A railroad depot and irrigation systems were put in place to transform the territory which would soon include a new citrus industry (City of Corona). As the rural community began to develop, it was referred to as South Riverside and on July 13,1896, the citizens voted for the incorporation of their small town into the newly formed Riverside County. Between 1913 and 1916 an international speedway was established which attracted over one million spectators in total during its operation. Ultimately, the speedway failed to attract additional commerce and development to the city and the speedway was shut down. Ultimately, the citrus industry would be responsible for attracting larger populations to the city (Duke 2010).

METHODS

Research materials, including historic maps, previous surveys, planning documents, ordinances, and published local and regional historical accounts were collected and reviewed.

Record Search

A record search was conducted on June 18, 2019, at the Eastern Information Center (EIC) by DUKE CRM archaeologist, Megan Wilson M.A., R.P.A. The EIC is part of the California Historical Resources Information System (CHRIS) and is located at University of California, Riverside. The records search included a review of all recorded historic and prehistoric archaeological sites within the Project area as well as a one-mile radius of the Project and included a review of cultural resource survey and excavation reports. In addition, the California State Historic Property Data File (HPD) was reviewed, which includes the National Register of Historic Places (National Register), California Register of Historical Resources (California Register), California Historical Landmarks (CHL), and California Points of Historical Interest (CPHI). The paleontological research conducted for the Project was conducted by Benjamin Scherzer, M.S. This included a paleontological records search though the Western Science Center (WSC) in Hemet. In addition, DUKE CRM paleontologist Benjamin Scherzer performed a search of the University of California Museum of Paleontology (UCMP) and San Diego Natural History Museum online collections, the online Paleobiology Database and Quaternary Faunal Mapping Project, and other published literature for fossil localities from similar deposits near the Project.

Field Survey

The goal of the pedestrian survey was to identify cultural or paleontological resources that may be within the Project boundaries. The pedestrian survey covered the entire Project area using 15 meter transects. Transects covered all areas within the Project which included areas of minimal disturbance, areas that had a moderate to

high sensitivity for cultural resources, as well as various areas of prior disturbance. Special attention was paid to rodent burrows, erosion cuts that allowed the observation of soils below the surface, including a close inspection of the approximately 15 meter high vertical cliff face along the eastern edge of the project. Digital photographs of the Project were taken, along with detailed field notes.

Personnel

Mr. Duke is the Principal Archaeologist of DUKE C R M . Mr. Duke meets the professional qualifications of the Secretary of the Interior for prehistoric and historical archaeology; he is also a Registered Professional Archaeologist (RPA) who has worked in all phases of archaeology (archival research, field survey, testing and data recovery excavation, laboratory analysis, construction monitoring) since 1994. Mr. Duke holds a Master of Arts degree in Anthropology with an emphasis in archaeology from California State University, Fullerton and a Bachelor of Arts degree in Anthropology from the University of California, Santa Cruz. Mr. Duke has worked throughout southern and Northern California and parts of Arizona and Nevada. He is included on the County's list of qualified archaeologists. Mr. Duke is the Principal Investigator and oversaw completion of all tasks and reviewed this report.

Megan Wilson conducted the records search, filed survey, produced the report maps, and drafted portions of this report. Ms. Wilson received a M.A. in Anthropology with an emphasis in archaeology from California State University, Fullerton and a B.A. degree in Anthropology from the University of California, Los Angeles. Ms. Wilson is a Registered Professional Archaeologist and GIS analyst with 8 years of experience in archaeology and cultural resources management in southern California

Benjamin Scherzer prepared the paleontology and geology sections of this report. Mr. Scherzer received a M.S. in Earth Sciences from Montana State University, Bozeman. He has 16 years of experience in paleontological research, field surveys, fossil salvage, laboratory identification, report preparation, and curatorial experience. Mr. Scherzer is a listed paleontologist with the Riverside County.

Please see Appendix B for staff resumes.

RESULTS

Records Search

Cultural Resources

On June 18, 2019, Megan Wilson conducted a records search at the EIC. One previous cultural resources study included a portion of the current Project area; however, no cultural resources were identified in the Project area. There are 36 cultural resources reports on file within one-mile of the Project. All reports that fall within the Project area are listed in Table 1.

Table 1. - Prior Cultural Report within the Project

Report No.	Author(s)	Title	Year
RI-04985	Mckenna et al.	A Phase I Cultural Resources Investigation of 500 Acres in the Bedford Canyon Area near the City of Corona of Riverside County, California	2003

Records from the EIC indicate that there are no previously recorded cultural resources mapped within the Project area. There are 17 previously recorded cultural resources within a one-mile radius of the Project area and include one prehistoric archaeological site, nine prehistoric isolates, six historic archaeological sites, and one historic resource. These resources are summarized in Table 2 below.

Table 2. Cultural Resources within One Mile of the Project

Primary No.	Trinomial	Resource Type	Resource Description	Year Recorded	Distance (mi), Direction
P-33-000883	CA-RIV-883	Prehistoric Archaeological Site	Lithic and Groundstone Scatter	1973, 1987, 1988, 2007, 2011	0.5-1, NE
P-33-003832	CA-RIV-3832	Historic Archaeological Site	Railroad, Old Santa Fe Railroad through the Temescal Valley	1990, 1996, 2001, 2005, 2006, 2011	0.5-1, NE
P-33-004112	CA-RIV-4112H	Historic Archaeological Site	Concrete foundations of an industrial plant, water conveyance system, tailings, structural debris, former location of the Owens-Illinois Glass/Sand Plant	1991, 1997, 2005, 2007	0.25-0.5,
P-33-007719	CA-RIV-6197	Historic Archaeological Site	Mine, open pit "Jones/Hoag Ranch sand deposit"	1999	0.25-0.5, W
P-33-012557		Prehistoric Isolate	Quartzite flake	1986	0.5-1, NE
P-33-012559		Prehistoric Isolate	Quartzite secondary flake	1987, 2007	0.5-1, NE
P-33-012560		Prehistoric Isolate	Dactite flake	1987	0.5-1, SE
P-33-013146		Prehistoric Isolate	Bifacial mano	Unknown	0.5-1, NE
P-33-013147		Prehistoric Isolate	Mano fragment	1990, 2007	0.5-1, NE
P-33-013148		Prehistoric Isolate	Mano/hammerstone	1990, 2007	0.5-1, NE
P-33-015322	CA-RIV-8090	Historic Resource	Historic mine/quarry, " Harlow Quarry"	2006	0.5-1, E
P-33-023790	CA-RIV-11685	Historic Archaeological Site	Refuse deposit	2013	0.5-1, N
P-33-024723	CA-RIV-12241	Historic Archaeological Site	Road, "Starne Road" segment and historic refuse deposit	2015	0.5-1, N
P-33-024724		Prehistoric Isolate	Chert core	2015	0.5-1, NW
P-33-024725		Prehistoric Isolate	Siltstone core	2015	0.5-1, NW
P-33-024726		Prehistoric Isolate	Chert flake tool	2015	0.5-1, NW
P-33-026860	CA-RIV-12617	Historic Archaeological Site	bedrock milling feature	2016	0.5-1, NE

Paleontological Resources

On July 11, 2019 the WSC performed a paleontological records search to locate fossil localities within and in the vicinity (one-mile radius) of the proposed Project area. No fossil localities were documented within or in the vicinity of the project area (Radford, 2019). The records search by B. Scherzer for fossil localities in similar deposits nearby (within three miles) produced two localities:

- "Bedford Properties" (SBCM 5.6.229-5.6.246 and 5.6.250-5.6.258) produced material from desert cottontail (*Sylvilagus audubonii*), smooth-toothed pocket gopher (*Thomomys bottae*), kangaroo rat (*Dipodomys*), pocket mouse (*Perognathus*), harvest mouse (*Reithrodontomys*), deer mouse (*Peromyscus*), pack rat (*Neotoma*), California vole (*Microtus californicus*), fox (*Vulpes*), mastodon (*Mammut americanum*), mammoth (*Mammuthus*), camel (*Camelops*), chub (*Gila*), toad (*Bufo*), pond frog (*Rana*), turtle (Chelonia), western side-blotched lizard (*Uta stansburiana*), skink (*Eumeces*), milk snake (*Lampropeltis*), pit viper (*Crotalidae*), and bird (Aves) from Pleistocene deposits at an unspecified depth and unspecified distance from the Project (Jefferson, 1991a,b).
- "Corona East" (UC-RV8601) produced material from mastodon (*Mammut*), horse (*Equus*), camel (*Camelops*), bison (*Bison*), rabbit (Lagomorpha), and multiple rodents including California vole (*M. californicus*), and pack rat (*Neotoma*) from Pleistocene deposits at an unspecified depth and unspecified distance from the Project (UCMP).

Holocene deposits are too young to have accumulated or fossilized enough biologic material to contain significant paleontological resources and are assigned a low paleontological sensitivity. However, these deposits may transition with depth to Pleistocene deposits, which are assigned a high paleontological sensitivity. The Paleontological Resources Impact Mitigation Program (PRIMP) prepared for this Project in indicates the young alluvial fan deposits (*Qaf*) are composed of Holocene deposits from the surface until approximately 10 feet below ground surface (b.g.s.), where they transition into Pleistocene deposits (Rieboldt, 2015). As a result, the young alluvial fan deposits (*Qaf*) in the Project are assigned a low paleontological sensitivity at the surface, but a high paleontological sensitivity below 10 feet b.g.s. The old alluvial fan deposits (*Qof*) are assigned a high paleontological sensitivity at the surface.

Table 3. Geologic Units and Their Paleontological Potential

Age	Geologic Unit	Fossils Present[1]	Paleontological Sensitivity
Holocene	Young alluvial fan deposits (*Qaf*)	Desert cottontail, smooth-toothed pocket gopher, kangaroo rat, pocket mouse, harvest mouse, deer mouse, pack rat, California vole, fox, mastodon, mammoth, camel, chub, toad, pond frog, turtle, western side-blotched lizard, skink, milk snake), pit viper, bird, horse, camel, bison, rabbit	Low at surface, high at depth (>10')[2]
Pleistocene			
Pleistocene	Old alluvial fan deposits (*Qof*)		High

Additional Research

Previous Arantine Hills Specific Plan Reports

Reports pertaining to the AHSP not filed and/or processed at theEIC were also reviewed. These reports include the *Cultural and Paleontological Resources Assessment, Arantine Hills Specific Plan Amendment No.2, City of Corona, California* (Duke and Scherzer 2018), the *Results of Paleontological Mitigation Monitoring for the Arantine Hills Specific Plan Project, Corona, Riverside County, California* (Reiboldt 2018), the *Phase IV Archaeological Monitoring for the Arantine Hills Project*, (Tonley et al.), and the *Cultural Resources Assessment, Arantine Hills Specific Plan, City of Corona, Riverside County, California* (Duke 2010).

The results of the 2018 archaeological monitoring indicated that five isolated artifacts, one archaeological feature, and 14 isolated tribal cultural resources were observed and recorded (Tonely et al. 2018). The results for the 2018 paleontological monitoring were negative (Rieboldt 2018). The results for the original 2010 and extended 2018 cultural resources field surveys were both negative for surface cultural resources.

Historic Map and Aerial Photograph Analysis

USGS topographic maps of the Project (1948 through present) were examined for details that would aid in reconstructing the history of the Project property. Maps were obtained from the USGS TopoView website (U.S. Department of the Interior, USGS 2019). The maps available earlier than 1942 are 1:250,000 scale and do not offer suitable resolution for analysis of this type. The 1947- Present USGS Corona South, Calif. 1:24,000 maps indicate that no structures, roads, or dwellings have been built within the Project. The most substantial development in the area appears on the 1967 Corona South 7.5' Topographic map that depicts interstate 15 immediately north of the Project area. No other changes are noted on the topographic maps.

A review of available historic aerial photographs (Nationwide Environmental Title Research, LLC (NETR 2019) was conducted to document changes to the Project area as far back as 1948. At that time, the Project property was undeveloped and located within the Bedford Wash. At some time between 1948- 1966 the Project property was converted to orchards with dirt roads bisecting the northern and southern ends of the Project area. The Project area was utilized for agriculture as late as 2005 and agriculture activities were abandoned after that.

Field Survey

On July 3, 2019 a pedestrian survey of the 27.8 acres Project and was conducted by DUKE C R M Archaeologist and cross trained paleontologist Megan Wilson, M.A., RPA. The pedestrian survey covered the entire Project using 15 meter transects. Special attention was paid to rodent burrows, erosion cuts that allowed the observation of soils below the surface, including a close inspection of the approximately 15 meter high vertical cliff face (Figures 1 and 2) along the eastern boundary of the Project along the Bedford Canyon Wash. Soils are alluvial in origin, dark-brown to tan coarse sand at the surface, and contain approximately 60% gravel, cobbles, and boulders of Bedford Canyon Metasedimentary rock. Granite, quartzite, and sandstone cobbles make up less than 1% of the content. Soils at depth in the cliff face and erosion cut (Figure 1 below) appear to be a dark brown to brown, alluvial, coarse sand with the same gravel and cobble content.

Topography of the Project area is relatively flat within the confines of the canyon, with Bedford Wash bisecting the Project area on the eastern end in a southwest to northeast orientation. Although the Project is relatively flat there exist two steep changes in elevation. The first occurs on the west side where previous grading has already taken place in the original 10 -acres designated for Commcerial use by the AHSP and is approximately six meters higher than the newly added 17.7 acres below it (Figure 3). The second change in elevation occurs in the eastern portion of the Project area immediately east of the Bedford Canyon Wash where an approximately 15-meter cliff (Figure 1) exists between the wash and another flat, disturbed area of land formally utilized for agriculture above it.

Ground visibility was poor and averaged 70% over the entire Project due to thick vegetation cover. Plant species within the Project include invasive grasses and weeds, although some Jimson weed (*Datura stramonium*) was observed. Observable ground surface was limited to the previously graded are to the west (previously approved AHSP), the access roads throughout the Project area (Figure 4), and within and adjacent to the Bedford Canyon Wash.

Disturbances include agricultural plowing, grading, erosion, modern ground disturbance, and a scatter of modern construction refuse. As previously stated, the western portion of the Project area was previously graded as part of the previously approved AHSP (Figure 5). An area was recently disturbed immediately west of the Bedford Canyon Wash and north (below) the six-meter terrace within the additional 17.7 acres added to the AHSP an isolated trifacial mano/shaping stone was observed (Figure 6).

Isolated Artifact

In the eastern end of the Project area an isolated trifacial granite mano/shaping tool was observed in the recently disturbed area west of the Bedford Canyon Wash (452143.59 m_E, 3742149.12 m_N). The mano/shaping stone is triangular in shape due to its three grinding surfaces, tapering slightly at one end. Two of the grinding surfaces are concave, while one grinding surface is convex. These grinding surfaces are atypical of more common manos, or hand-held grinding stones indicating it may have been utilized for primarily shaping versus grinding. The artifact measures 16 cm long, 8.5 cm wide, and 6.5cm wide at its tapered end. No other cultural resources were observed.

Figure 6. Close up of mano observed.

IMPACTS ANALYSIS AND RECOMMENDATIONS

This section addresses the Project's potential to impact cultural and paleontological resources. If changes are made to the Project or if the level of planned disturbance changes, the recommendations herein may be subject to change.

Paleontological Resources

Our research indicates that there is a high sensitivity for paleontological resources in the Project area, as a result of the age of the deposits and nearby fossil localities in similar geological units. Ground disturbance past 10 feet b.g.s. in the eastern portion of the Project area has the potential to impact high-sensitivity Pleistocene deposits of young alluvial fan deposits (*Qaf*), and ground disturbance at the surface in APN 279-240-019 south of the basin will impact high-sensitivity old alluvial fan deposits (*Qof*). Paleontological monitoring is recommended for any ground disturbance in APN 279-240-019 south of the Bedford Canyon Wash and for ground disturbance deeper than 10 feet b.g.s. throughout the Project area west of the Bedford Canyon Wash.

A paleontological monitor shall be present to observe ground disturbing activities within the project. The monitor shall work under the direct supervision of a qualified paleontologist (B.S. /B.A. in geology, or related discipline with an emphasis in paleontology and demonstrated experience and competence in paleontological research, fieldwork, reporting, and curation).

1. The qualified paleontologist shall be on-site at the pre-construction meeting to discuss monitoring protocols.
2. Paleontological monitoring shall start at full-time. If no paleontological resources are discovered after half of the ground disturbance has occurred, monitoring can be reduced to part-time or spot-checking.
3. The monitor shall be empowered to temporarily halt or redirect grading efforts if paleontological resources are discovered.
4. In the event of a paleontological discovery the monitor shall flag the area and notify the construction crew immediately. No further disturbance in the flagged area shall occur until the qualified paleontologist has cleared the area.
5. In consultation with the qualified paleontologist the monitor shall quickly assess the nature and significance of the find. If the specimen is not significant it shall be quickly removed and the area cleared.
6. If the discovery is significant the qualified paleontologist shall notify the applicant immediately.
7. In consultation with the applicant, the qualified paleontologist shall develop a plan of mitigation which will likely include salvage excavation and removal of the find, removal of sediment from around the specimen (in the laboratory), research to identify and categorize the find, curation of the find in a local qualified repository, and preparation of a report summarizing the find.

Cultural Resources

Impacts to cultural resources are generally considered to be direct (e.g. destruction or demolition of a resource) or indirect (e.g. visual, audible, or cumulative changes to the setting). Under CEQA cultural resources are evaluated for significance and eligibility for the California Register. If a resource is considered eligible for the California Register it is considered a historical resource under CEQA. For the purposes of CEQA, impacts are only considered significant for historical resources.

DUKE CRM conducted a records search, field survey, and supplemental research for archaeological and historical resources. The results of the records search indicate there are no previously recorded cultural resources within, or near, the Project boundary. One isolated, granite mano was observed within the Project area west of the Bedford Canyon Wash. This isolated artifact is consistent with six prehistoric artifacts observed during archaeological monitoring for the 2018 Arantine Hills Project (Toney et al. 2018). Although there is a high energy deposition of Bedford Canyon Wash and the area is highly disturbed due to decades of agricultural activities, the results of the pedestrian survey coupled with the presence of artifacts observed during the 2018 construction indicates that there is a moderate probability to observe additional cultural

resources during ground disturbing activities. Therefore, DUKE CRM recommends that ground disturbance may have the potential to impact prehistoric and historic archaeological resources. Due to the moderate potential to impact cultural resources, DUKE CRM recommends archaeological monitoring during ground disturbances related to the Project, specifically during grading activities within the eastern portion of the Project area.

If archaeological and/or paleontological resources are discovered during construction, a qualified archaeologist and/or paleontologist shall be retained to assess the nature and significance of the discovery. If human remains are encountered, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC. The MLD may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials. In addition, according to the California Health and Safety Code, six or more human burials at one location constitute a cemetery (Section 8100), and unauthorized disturbance of Native American cemeteries is a felony (Section 7052).

If the proposed Project changes additional efforts may be necessary.

e. Other Locational Data: APN 279-240-019, approximately 80 meters west of Bedford Creek

***P3a. Description** This artifact consists of one isolated trifacial granite mano. The mano was observed in the recently disturbed area 80 meters west of the Bedford Canyon Wash. The Bedford Canyon is a dry wash formally utilized for agriculture, specifically a citrus orchard. The location of the artifact was located in a recently plowed area; the surrounding area was covered in dense invasive weeds. The mano is triangular in shape due to its three grinding surfaces, tapering slightly at one end. Two of the grinding surfaces are slightly concave, while one is convex, which indicates is may have been used more as a shaping tool than a mano to grind against a metate or bedrock mortar. It measures 16 cm long, 8.5 cm wide, and 6.5cm wide at its tapered end.

Mr. Glen L. Powles
Guardian Capital
5780 Fleet Street, Suite 225
Carlsbad, CA 92008

Subject: Cultural/Paleontological Resource Survey Update for the Bedford Canyon Marketplace Project-Bedford Ranch Phase 2B Mass Grading Plan, City of Corona, County of Riverside, California

Dear Mr. Powles:

At the request of Guardian Capital, Duke Cultural Resources Management, LLC (DUKE CRM) has conducted a cultural and paleontological assessment update for the Bedford Canyon Marketplace Project-Bedford Ranch Phase 2B Mass Grading Plan Alternative, located in the City of Corona, Riverside County, California. The purpose of this letter is to address any impacts to cultural and paleontological resources for the updated Bedford Canyon Marketplace Phase 2B Mass Grading Plan Alternative.

The Bedford Ranch Phase 2B Mass Grading Plan Alternative (Project Alternative) exists entirely within the original Arantine Hills Specific Plan (AHSP) limits (Figure 1). DUKE CRM conducted a cultural and paleontological resources study for the Bedford Canyon Marketplace Project in August 2019 (Duke et al. 2019) and LSA conducted a cultural resources assessment (Duke 2010) for the original AHSP in 2010 as well conducted archaeological (Tonley et al. 2018) and paleontological monitoring (Reiboldt 2018) during ground disturbances for the AHSP.

The primary difference in the Project Alternative from the original Bedford Canyon Marketplace Project is an increase in vertical impacts to potential cultural and paleontological resources. As stated in the original Bedford Canyon Marketplace Project description (Duke et al. 2019), the majority of the Bedford Canyon Marketplace Project area (west of the Bedford Canyon wash) is at a lower elevation than the adjacent portion of the AHSP and requires the import of approximately 440,000 cubic yards of dirt. The Project Alternative proposes to export sediments and fill material from the Phase 2B Mass Grading area (depicted in blue-Figure 1), located east of the Bedford Canyon Wash (Wash), directly west across the Wash to utilize in elevating the 17.7 acres located within the Bedford Canyon Marketplace Project area (depicted in green-Figure1). Project proponents include:

1. Phase 2B area was previously graded and a new existing pad elevation established.
2. Phase 2B area was over-excavated approximately 5 to 7 feet below the current pad elevation. That dirt was removed, blended, replaced, and compacted to 90%.
3. Therefore, the area previously disturbed extends 5 to 7 feet below the existing pad grade.
4. This area was monitored for archaeology, paleontology and Native American cultural resources.
5. The Project Alternative proposes to lower Phase 2B area approximately 13 feet. This will require the over excavation of 5 to 7 feet below the new pad elevation.

6. Therefore, of the 13 feet of removal, 5 to 7 feet has already been disturbed. The remaining 6 feet of over-excavation would disturb native material.
7. Archaeological and paleontological monitoring would be required for work within native material.

The original grading for the AHSP (depicted in yellow – Figure 1) included the removal of five to seven feet of sediments. The sediments were removed, blended, replaced, and compacted. The updated Project Alternative proposes to lower Phase 2B area 13 feet and export the fill and sediments west of the Wash into the Bedford Canyon Marketplace Project area (depicted in green-Figure 1).

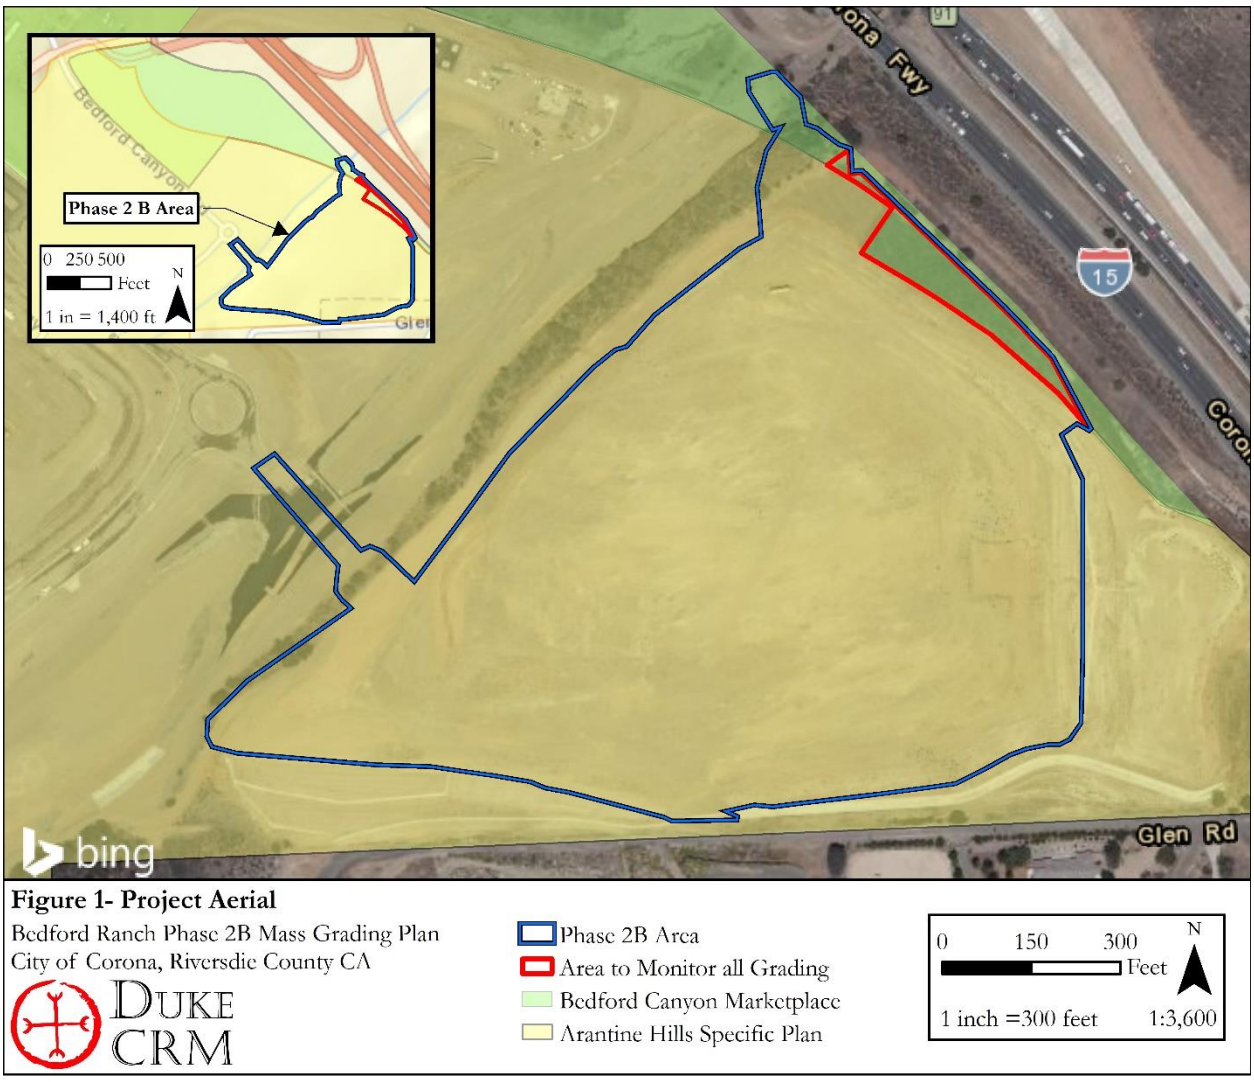

Figure1. Bedford Ranch Phase 2B Mass Grading Plan

CONCLUSION AND RECOMMENDATIONS

The majority of the Bedford Ranch Phase 2B Mass Grading Plan Alternative has been previously graded to a depth of five to seven feet. It is recommended that no archaeological or paleontological monitoring is required within the previously graded and recompacted fill area.

However, archaeological paleontological monitoring is recommended for native sediments, which is assumed to be at a depth of five-seven feet below the present ground surface in Phase 2B area as well as for all ground disturbances in the northeastern portion of the Project Alternative (depicted in red-Figure 1). Archaeological and paleontological monitoring recommendations for the Project Alternative shall be the same mitigation measures outlined in the Cultural and Paleontological Resources Assessment, Bedford Canyon Marketplace Report (Duke et al. 2019). If the proposed Project Alternative changes, additional survey efforts may be necessary.

If you have any questions or comments, you can contact me at (949) 303-0420 or by e-mail at curt@dukecrm.com.

Sincerely,

DUKE CULTURAL RESOURCES MANAGEMENT, LLC

Subject: ***Preliminary Geotechnical Evaluation for Proposed Bedford Marketplace, Tracts 37030, 36294, and 37644, Corona, California***

In accordance with your request, LGC Geotechnical, Inc. has prepared this preliminary geotechnical evaluation report for the proposed Bedford Marketplace, Tracts 37030, 36294, and 37644, located in the City of Corona, California. This report summarizes our findings, conclusions, and preliminary recommendations with regards to the proposed development.

If you should have any questions regarding this report, please do not hesitate to contact our office. We appreciate this opportunity to be of service.

Respectfully,

LGC Geotechnical, Inc.

1.0 INTRODUCTION

1.1 Site Description

The entire Bedford development includes Tracts 37030, 36294, and 37644 and encompasses approximately 275 acres of land at the foothills of the Santa Ana Mountains near the southern boundary of the City of Corona, Riverside County, California. In general, the site is bound by the Eagle Glen Specific Plan development on the north and west, by the existing residential lots to the south, and by Interstate 15 to the east.

Ascending slopes up to approximately 90 feet in height with varying slope ratios ranging from approximately 1.25:1 to 3:1 (horizontal to vertical) are present near the northern boundary of the site. In addition, steep bluffs associated with the Bedford Canyon Wash with varying slope ratios ranging from approximately 1:1 (horizontal to vertical) to near vertical are generally located near the southern boundary of the site. In general, the site can be divided into two basic regions based on topography. The lower-lying Bedford Canyon Wash area in the central and northern portion of the site and the elevated regions above the bluffs in the southern and eastern portions of the site.

The proposed Bedford Marketplace site is located in the lower-lying Bedford Canyon Wash area at the eastern boundary of the Bedford development and includes an additional parcel owned by the Riverside County Transportation Commission (RCTC). The proposed Bedford Marketplace combines the approximately 10-acre Bedford commercial parcel with the 17.85-acre RCTC parcel resulting in an approximately 27.85-acre area for commercial development. In general, Bedford Marketplace is bound by Eagle Glen Parkway/Cajalco Road to the north, Interstate 15 to the east, a flood control channel to the south, and Bedford Canyon Road to the west (Figure 1 – Site Location Map).

1.2 Background

Recommendations regarding remedial grading for the entire Bedford development, previously known as Arantine Hills, were provided by LGC Geotechnical (2014 & 2015). These recommendations were based on mass grading and stockpile plans prepared by CASC (2014 & 2015) and preliminary rough grading plans for Phase 1 prepared by Hunsaker & Associates (2015). Rough grading of Phase 1 began in October 2016 and was essentially completed in May 2017. Subsequent postgrading and construction operations for the backbone streets including Clementine Way, Hudson House Drive, and Bedford Canyon Road have also been completed.

Remedial removals and fill placement for portions of the Bedford Marketplace area were completed as a part of the Phase 1 rough grading operations. This was performed in order to facilitate the construction of backbone utilities, roadways, a basin, and a pump station adjacent to the subject commercial site. In general, remedial removals and fill placement to near design grades were completed for the Bedford commercial area and the RCTC parcel remains undeveloped (Sheet 1 – Geotechnical Map).

1.3 Project Description

The conceptual grading plan (Hunsaker, 2019) indicates relatively shallow cuts and fills with intermediate slopes on the order of approximately 20 feet in height to achieve design grades. Based on our review of the Bedford Marketplace conceptual site plan (MCG, 2019) the development will consist of restaurant and retail buildings, a gas station, a hotel, and associated parking improvements.

The conceptual grading plan prepared by Hunsaker & Associates (2019) is utilized as the base map for our Geotechnical Map (Sheet 1). It is our understanding that the provided grading plan is preliminary and changes to design grades are anticipated. The recommendations provided herein are to be based on the ultimate rough grade design. The rough grading plan should be reviewed by this office in order to verify or adjust the geotechnical recommendations provided herein.

PROJECT NAME	Bedford Marketplace

FIGURE 1
Site Location Map

2.0 GEOTECHNICAL CONDITIONS

2.1 Regional Geology

The subject site is located along the northeastern flank of the Santa Ana Mountains, just north of the Elsinore-Temecula basin, within the Peninsular Ranges Geomorphic Province. In this area, the Santa Ana Mountains are composed of a core of metamorphic rocks of the Bedford Canyon Formation with lesser amounts of volcanic rock. Erosion has led to a series of sub-parallel canyons travelling out of the mountains. The material eroded from the mountains has formed a series of coalescing older alluvial fans, also referred to as older alluvial deposits. Subsequently these older fan deposits have been eroded by a series of younger drainage courses. The subject site is located in one of these younger drainages known as the "Bedford Canyon Wash". Additionally, the Elsinore Fault Zone located at the base of the eastern flank of the Santa Ana Mountains is considered a major active fault zone and is regionally part of the San Andreas Fault system. The San Andreas Fault system distributes right-lateral movement across the North American and Pacific Plates.

2.2 Site-Specific Geology

The majority of the site is located on alluvial deposits of the Bedford Canyon Wash with isolated zones of undocumented artificial fill associated with existing dirt roads from previous site operations. Some areas within the Bedford Marketplace commercial area have been subject to remedial grading resulting in the presence of compacted artificial fill.

2.2.1 Artificial Fill, Undocumented (Not Mapped)

Undocumented fill soils were encountered in localized areas within the subject site. These fill soils are presumed to be related to agricultural activities and the grading of dirt roads throughout the site. Undocumented fill is considered to have variable lateral extents and is anticipated to only extend approximately 2 feet below the existing ground surface. Undocumented fill soils were not mapped.

2.2.2 Artificial Fill (Symbol - Af)

Phase 1 rough grading operations included remedial removals and fill placement to near design grades within the Bedford commercial parcel. As a result, compacted artificial fill is present adjacent to Bedford Canyon Road and the existing detention basin. These fill materials were derived from onsite alluvial soils and consist of a mixture of gravel, sand, and minor amounts of silt and clay. These materials were placed with geotechnical observation and testing provided by LGC Geotechnical and are considered suitable to support proposed structures and/or additional fill soils.

2.2.3 Quaternary Alluvial Deposits (Symbol – Qal)

The alluvial deposits encountered during previous subsurface exploration (Appendix A) and Phase 1 rough grading generally consisted of interbedded layers of predominately sand and gravel with varying amounts of silt, cobbles and minor amounts of clay. Apparent density of these materials generally ranged from medium dense to very dense, increasing in depth. The alluvial deposits are present in the area of the RCTC parcel and are underlying the previously placed artificial fill (Af).

2.3 Groundwater

Groundwater and/or seepage was not encountered during rough grading of Phase 1 or during previous subsurface eploration (Appendix A). Groundwater is not considered to be an issue during site grading and development.

Seasonal fluctuations of groundwater elevations should be expected over time. In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present due to local seepage caused by irrigation and/or recent precipitation. Local perched groundwater conditions or surface seepage may develop once site development is completed.

2.4 Seismic Design Criteria

The site seismic characteristics were evaluated per the guidelines set forth in Chapter 16, Section 1613 of the 2016 California Building Code (CBC). Representative site coordinates of latitude 33.8191 degrees north and longitude -117.5199 degrees west were utilized in our analyses. Please note that these coordinates are considered representative of the site for preliminary planning purposes. The maximum considered earthquake (MCE) spectral response accelerations (S_{MS} and S_{M1}) and adjusted design spectral response acceleration parameters (S_{DS} and S_{D1}) for Site Class D are provided in Table 1 on the following page.

TABLE 1

Seismic Design Parameters

Selected Parameters from 2016 CBC, Section 1613 - Earthquake Loads	Seismic Design Values
Site Class per Chapter 20 of ASCE 7	D
Risk-Targeted Spectral Acceleration for Short Periods (S_S)*	2.352g
Risk-Targeted Spectral Accelerations for 1-Second Periods (S_1)*	0.918g
Site Coefficient F_a per Table 1613.3.3(1)	1.0
Site Coefficient F_v per Table 1613.3.3(2)	1.5
Site Modified Spectral Acceleration for Short Periods (S_{MS}) for Site Class D [Note: $S_{MS} = F_aS_S$]	2.352
Site Modified Spectral Acceleration for 1-Second Periods (S_{M1}) for Site Class D [Note: $S_{M1} = F_vS_1$]	1.378g
Design Spectral Acceleration for Short Periods (S_{DS}) for Site Class D [Note: $S_{DS} = (^2/_3)S_{MS}$]	1.568g
Design Spectral Acceleration for 1-Second Periods (S_{D1}) for Site Class D [Note: $S_{D1} = (^2/_3)S_{M1}$]	0.918g
Mapped Risk Coefficient at 0.2 sec Spectral Response Period, C_{RS} (per ASCE 7)	0.948
Mapped Risk Coefficient at 1 sec Spectral Response Period, C_{R1} (per ASCE 7)	0.937

* From SEAOC, 2018

Section 1803.5.12 of the 2016 CBC (per Section 11.8.3 of ASCE 7) states that the maximum considered earthquake geometric mean (MCE_G) Peak Ground Acceleration (PGA) should be used for liquefaction potential. The PGA_M for the site is equal to 0.892g.

2.5 Faulting and Seismic Hazards

The subject site is not located within a State of California Earthquake Fault Zone (i.e., Alquist-Priolo Earthquake Fault Act Zone) and no active faults are known to cross the site (CDMG, 2000). A fault is considered "active" if evidence of surface rupture in Holocene time (the last approximately 11,650 years) is present. The possibility of damage due to ground rupture is considered low since no active faults are known to cross the site.

Secondary effects of seismic shaking resulting from large earthquakes on the major faults in the Southern California region, which may affect the site, include ground lurching and shallow ground rupture, soil liquefaction, and dynamic settlement. These secondary effects of seismic shaking are a possibility throughout the Southern California region and are dependent on the distance between the site and causative fault and the onsite geology. The closest major active faults that could produce these secondary effects include the Elsinore, San Jacinto, and San Andreas Faults, among others. A discussion of theses secondary effects is provided in the following sections.

2.5.1 Liquefaction and Dynamic Settlement

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. Liquefaction occurs when three general conditions coexist: 1) shallow groundwater; 2) low density non-cohesive (granular) soils; and 3) high-intensity ground motion. Studies indicate that loose, saturated, near-surface, cohesionless soils exhibit the highest liquefaction potential, while dry, dense, cohesionless soils, and cohesive soils exhibit low to negligible liquefaction potential. In general, cohesive soils are not considered susceptible to liquefaction. Effects of liquefaction on level ground include settlement, sand boils, and bearing capacity failures below structures. Furthermore, dynamic settlement of dry sands can occur as the sand particles tend to settle and densify as a result of a seismic event.

Based on the lack of shallow groundwater (greater than 65 feet below ground surface) and anticipated geotechnical conditions subsequent to rough grading (compacted artificial fill overlying dense alluvial deposits) the potential for liquefaction to impact the site is considered very low.

2.5.2 Lateral Spreading

Lateral spreading is a type of liquefaction induced ground failure associated with the lateral displacement of surficial blocks of sediment resulting from liquefaction in a subsurface layer. Once liquefaction transforms the subsurface layer into a fluid mass, gravity plus the earthquake inertial forces may cause the mass to move downslope towards a free face (such as a river channel or an embankment). Lateral spreading may cause large horizontal displacements and such movement typically damages pipelines, utilities, bridges, and structures.

Due to the low potential for liquefaction, the potential for lateral spreading is considered very low.

2.6 Landslides

Review of readily available geologic resources and field observations of the surficial conditions do not indicate the presence of landslides on the site or in the immediate vicinity. In general, the site consists of relatively flat-lying alluvial deposits which are not considered susceptible to landslides, seismically-induced landslides, or other mass wasting processes (debris flows, rockfalls, etc.).

2.7 Expansion Potential

Based on the results of previous laboratory testing, site soils are anticipated to have a "Very Low" to "Medium" expansion potential. Final expansion potential of site soils should be determined at the completion of grading. Results of expansion potential testing at finish grades will be utilized to confirm final foundation design.

2.8 Oversized Material

Minor amounts of oversized material (material larger than 12 inches in maximum dimension) were encountered during previous subsurface exploration (Appendix A) and Phase 1 rough grading operations. Recommendations for the appropriate handling of oversized material are provided in our General Earthwork & Grading Specifications for Rough Grading (Appendix D).

2.9 Rippability

In general, the undocumented fill, artificial fill, and Quaternary Alluvial soils are anticipated to be rippable with heavy equipment (Caterpillar D-9 or equivalent).

3.0 CONCLUSIONS

Based on the results of our knowledge of the subject site, it is our opinion that the proposed improvements are feasible from a geotechnical standpoint, provided that the recommendations contained in the following sections are incorporated during site grading and development. A summary of our geotechnical conclusions are as follows:

- The near-surface onsite soils are not considered suitable for support of the planned development and will need to be removed and replaced with compacted fill materials. Removal recommendations are provided below in Section 4.1.
- Artificial fill soils placed with geotechnical observation and testing provided by LGC Geotechnical and are considered suitable to support proposed structures and/or additional fill soils. Minor reprocessing recommendations for these soils are provided below in Section 4.1.
- Groundwater and/or seepage was not encountered during rough grading of Phase 1 or during previous subsurface evaluations (Appendix A). Groundwater is not considered to be an issue during site grading and development.
- The subject site is not located within a State of California Earthquake Fault Zone (i.e., Alquist-Priolo Earthquake Fault Act Zone) and no active faults are known to cross the site (CDMG, 2000). Therefore, the possibility of damage due to ground rupture is considered low.
- The main seismic hazard that may affect the site is ground shaking from one of the active regional faults. The subject site will likely experience strong seismic ground shaking during its design life.
- Based on the lack of shallow groundwater (greater than 65 feet below ground surface) and geotechnical conditions subsequent to rough grading (compacted artificial fill overlying dense alluvium) the potential for liquefaction to impact the site is considered very low.
- Review of readily available geologic resources and field observations of the surficial conditions do not indicate the presence of landslides on the site or in the immediate vicinity. Topographically, the site is relatively flat-lying and is not considered susceptible to landslides, seismically-induced landslides, or other mass wasting processes (debris flows, rock falls, etc.).
- Based on the results of laboratory testing, site soils are anticipated to have “Very Low” to “Medium” expansion potential. Final design expansion potential must be determined at the completion of grading operations.
- In general, the undocumented fill, artificial fill, and Quaternary Alluvial soils are anticipated to be rippable with heavy equipment (Caterpillar D-9 or equivalent).
- We anticipate that the onsite soils generated from excavations will be generally suitable for re-use as compacted fill, provided they are relatively free of rocks larger than 12 inches in maximum dimension, construction debris, and significant organic material.
- It is our understanding that the conceptual grading plan (Hunsaker, 2019) is preliminary and changes to design grades are anticipated. The rough grading plan should be reviewed by this office in order to verify or adjust the geotechnical recommendations provided herein.
- Proposed slopes are to be constructed in accordance with recommendations provided herein. Subsequent to construction, the proposed slopes are anticipated to be both grossly and surficially stable.

4.0 RECOMMENDATIONS

The following recommendations are to be considered preliminary and should be confirmed upon completion of grading and earthwork operations. In addition, they should be considered minimal from a geotechnical viewpoint, as there may be more restrictive requirements from the architect, structural engineer, building codes, governing agencies, or the owner.

It should be noted that the following geotechnical recommendations are intended to provide sufficient information to develop the site in general accordance with the 2016 CBC requirements. With regard to the possible occurrence of potentially catastrophic geotechnical hazards such as fault rupture, earthquake-induced landslides, liquefaction, etc. the following geotechnical recommendations should provide adequate protection for the proposed development to the extent required to reduce seismic risk to an "acceptable level." The "acceptable level" of risk is defined by the California Code of Regulations as "that level that provides reasonable protection of the public safety, though it does not necessarily ensure continued structural integrity and functionality of the project" [Section 3721(a)]. Therefore, repair and remedial work of the proposed improvement may be required after a significant seismic event. With regards to the potential for less significant geologic hazards to the proposed development, the recommendations contained herein are intended as a reasonable protection against the potential damaging effects of geotechnical phenomena such as expansive soils, fill settlement, groundwater seepage, etc. It should be understood, however, that our recommendations are intended to maintain the structural integrity of the proposed development and structures given the site geotechnical conditions but cannot preclude the potential for some cosmetic distress or nuisance issues to develop as a result of the site geotechnical conditions.

The geotechnical recommendations contained herein must be confirmed to be suitable or modified based on the actual as-graded conditions.

4.1 Site Earthwork

Rough grading is anticipated to include remedial earthwork, excavation of cut areas, and placement of compacted fill to design grades. We recommend that earthwork onsite be performed in accordance with the following recommendations, the 2016 CBC/City of Corona requirements, and the General Earthwork and Grading Specifications for Rough Grading included in Appendix D. In case of conflict, the following recommendations shall supersede those included in Appendix D.

4.1.1 Site Preparation

Prior to the grading of areas to receive structural fill or engineered structures, these areas should be cleared of surface obstructions and unsuitable material (such as undocumented fill, colluvium, and topsoil). Vegetation and debris should be removed and properly disposed of offsite. Holes resulting from the removal of buried obstructions, which extend below proposed removal bottoms, should be replaced with suitable compacted fill material.

4.1.2 Removal Depths

All unsuitable and potentially compressible materials not removed by design cuts should be excavated to competent materials and replaced with compacted fill soils. In general, this includes all existing undocumented artificial fill, residual soil, and upper portions of the previously placed compacted fill and alluvial deposits. Removals specific to the differing types of soils are summarized below.

Previously Placed Artificial Fill: Portions of the Bedford Marketplace area were partially graded during Phase 1 rough grading operations in order to facilitate the construction of the backbone roadways and improvements. LGC Geotechnical provided observation and testing services during the Phase 1 rough grading operations. Removal bottoms achieved during Phase 1 grading were observed and accepted prior to the placement of compacted fill soils. The previously placed compacted fill (Map Symbol – Af) are considered suitable to support proposed structures and/or additional fill placement. It is recommended that the upper 1-foot of the previously placed fill soils be removed and replaced with compacted fill soils in order to remove any weathered or desiccated materials.

Alluvial Deposits: Alluvial deposits (Map Symbol – Qal) are generally located in the area of the RCTC parcel in the eastern portion of the subject site. It is anticipated that the upper approximately 5 feet of the alluvial deposits will be loose, weathered, and/or desiccated and should be removed and replaced with compacted artificial fill soils.

In general, removal depths are estimated to range between approximately 1 to 5 feet below existing grade as outline above. Estimated removal depths are depicted on the Geotechnical Map (Sheet 1). Localized areas of deeper removals should be anticipated during grading. Removal bottoms should be extended laterally in order to support a 1:1 (horizontal to vertical) projection away from proposed structures or improvements. The actual depths and lateral extents of removals will be determined by the geotechnical consultant during grading based on the actual subsurface conditions encountered.

Several methods will be utilized in determining the suitability of the material observed in the removal bottom excavations. Observation of material, proof rolling, probing, and occasional field density testing of the removal bottoms shall be performed by a field technician and/or field geologist to verify removal bottom suitability. When field density test data is utilized for the approval of a removal bottom, an in-place relative compaction of 85 percent or greater and/or a degree of saturation of 85 percent or greater will be considered suitable.

4.1.3 Over-Excavation

In order to provide a uniform fill blanket beneath proposed structures, it is recommended that design cut and cut/fill transition pads be over-excavated a minimum of 3 feet below ultimate finish pad grade based on the future rough grading design. A maximum 3:1 differential fill thickness underneath individual lots should be maintained in order to

reduce the potential for future differential settlement. Over-excavation should extend laterally a minimum of 5 feet beyond proposed building footprints.

Streets in design cut areas should be over-excavated a minimum of 2 feet below design subgrade elevations. In addition, retaining wall footings located on cut or a cut/fill transition should be over-excavated a minimum of 2 feet below and 2 feet beyond the edges of the proposed footings.

It is our opinion that utility excavations may be completed utilizing typical heavy machinery. The native soils at the site are generally uncemented alluvial soils (Class "C" per Cal OSHA) and are anticipated to be unstable when excavated vertically, see Section 4.1.5. At the owner's discretion the streets could be overexcavated, such that utility trenches will then be excavated through compacted fill soils. If desired, it is recommended that the street overexcavation extend approximately 2-foot below the lowest utility.

Over-excavations/undercuts must be confirmed and mapped by the geotechnical consultant prior to subsequent fill placement. The actual depth and lateral extents of over-excavation should be determined by the geotechnical consultant during grading based on the actual subsurface conditions encountered. Please note that some estimated removals in the western portion of the site may extend deeper than the recommended over-excavation in order to remove unsuitable materials.

4.1.4 Removal Bottoms and Subgrade Preparation

In general, removal bottoms, over-excavation bottoms, and areas to receive compacted fill should be scarified to a minimum depth of 6 to 8 inches, brought to a near-optimum moisture condition (generally within optimum and 2 percent above optimum moisture content) and re-compacted per project requirements.

Removal bottoms, over-excavation/undercut bottoms, and areas to receive fill should be observed and accepted by the geotechnical consultant prior to fill placement.

4.1.5 Temporary Excavations

Temporary excavations should be performed in accordance with project plans, specifications, and applicable Occupational Safety and Health Administration (OSHA) requirements. Excavations should be laid back or shored in accordance with OSHA requirements before personnel or equipment are allowed to enter. The majority of site alluvial soils are anticipated to be OSHA Type "C" soils. Soil conditions should be regularly evaluated during construction to verify conditions are as anticipated. The contractor shall be responsible for providing the "competent person" required by OSHA standards to evaluate the soil conditions. Close coordination with the geotechnical consultant should be maintained to facilitate construction while providing safe excavations. Excavation safety is the sole responsibility of the contractor.

Vehicular traffic, stockpiles, and equipment storage should be set back from the perimeter

of excavations a minimum distance equivalent to a 1:1 projection from the bottom of the excavation or 5 feet, whichever is greater. Once an excavation has been initiated, it should be backfilled as soon as practical. Prolonged exposure of temporary excavations may result in some localized instability. Excavations should be planned so that they are not initiated without sufficient time to shore/fill them prior to weekends, holidays, or forecasted rain.

4.1.6 Material for Fill

From a geotechnical perspective, the onsite soils are generally considered suitable for use as general compacted fill, provided they are screened of construction debris, any oversized material (12 inches in greatest dimension), and significant organic content. From a geotechnical perspective, compacted fill with an average organic content less than 2 percent is generally not considered significant. Any oversized material (greater than 12 inches in maximum dimension) encountered must be appropriately handled as outlined in Appendix D.

From a geotechnical viewpoint, any required import soils (excluding retaining wall backfill import) should consist of clean, relatively granular soils of Low expansion potential (expansion index 50 or less based on ASTM D4829) and no particles larger than 3 inches in greatest dimension. Source samples of planned importation should be provided to the geotechnical consultant for laboratory testing a minimum of 10 working days prior to any planned importation.

Retaining wall backfill should consist of sandy soils with a maximum of 35 percent fines (passing the No. 200 sieve) per American Society for Testing and Materials (ASTM) Test Method D1140 (or ASTM D6913/D422) and a Very Low expansion potential (EI of 20 or less per ASTM D4829). Soils should also be screened of organic materials, construction debris, and any material greater than 3 inches in maximum dimension. Portions of the onsite soil may not be suitable for retaining wall backfill due to their fines content (i.e., silt and clay content) and expansion potential. Therefore, either select grading and stockpiling and/or import of suitable soils meeting the criteria outlined above will be required.

Aggregate base should conform to the requirements of Section 200-2 of the Standard Specifications for Public Works Construction ("Greenbook") for untreated base materials, Caltrans Class 2 aggregate base and/or the County of Riverside requirements.

4.1.7 Fill Placement and Compaction

Material to be placed as fill should be brought to near optimum moisture content (generally within optimum and 2 percent above optimum moisture content) and compacted to at least 90 percent relative compaction (per ASTM D1557). Moisture conditioning of site soils will be required in order to achieve adequate compaction. Due to the granular nature of the site soils, pre-watering the site prior to grading may be beneficial. The optimum lift thickness to produce a uniformly compacted fill will depend

on the type and size of compaction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in compacted thickness. Each lift should be thoroughly compacted and accepted prior to subsequent lifts. Generally, placement and compaction of fill should be performed in accordance with local grading ordinances with observation and testing performed by the geotechnical consultant.

Fill placed on any slopes greater than 5:1 (horizontal to vertical) inclination should be properly keyed and benched into firm and competent soils as it is placed in lifts. During backfill of temporary excavations, fill should be properly benched into firm and competent soils as it is placed in lifts and compacted.

Slope face compaction must be achieved by the contractor by overfilling the slope face a minimum of 2 feet and cutting back to design finish grades or by other acceptable methods.

Aggregate base material should be compacted to a minimum of 95 percent relative compaction at or slightly above optimum moisture content per ASTM D1557. Subgrade below aggregate base should be compacted to a minimum of 90 percent relative compaction at or slightly above optimum moisture content per ASTM D1557.

4.1.8 Shrinkage and Bulking

Volumetric changes in earth quantities will occur when excavated onsite earth materials are replaced as properly compacted fill. The following is an estimate of shrinkage factors for the various geologic units found onsite. These estimates are based on in-place densities of the various materials and on the estimated average degree of relative compaction that will be achieved during grading.

TABLE 2

Estimated Shrinkage

Soil Type	Allowance	Estimated Range
Artificial Fill (Af)	Shrinkage/Bulk	+/- 5%
Alluvial Deposits (Qal) – Upper 4 Feet	Shrinkage	10 to 15%
Alluvial Deposits (Qal) – Below 4 Feet	Shrinkage	0 to 10%

Subsidence due to earthwork equipment is expected to be on the order of 0.1-foot. It should be stressed that these values are only estimates and that actual shrinkage factors are extremely difficult to predict. The effective shrinkage of onsite soils will depend primarily on the type of compaction equipment and method of compaction used onsite by the contractor. The above shrinkage estimates are intended as an aid for others in determining preliminary earthwork quantities. However, these estimates should be used

with some caution since they are not absolute values.

If importing/exporting a large volume of soils is not considered feasible or economical, we recommend a balance area be designated onsite that can fluctuate up or down based on the actual volume of soil. We recommend a "balance" area that can accommodate on the order of 5 to 10 percent (plus or minus) of the total grading volume be considered.

Volumetric changes based on quantities from previous grading activities (Phase 1, Channel, etc.) should also be reviewed and taken into consideration.

4.1.9 Trench and Retaining Wall Backfill and Compaction

The onsite soils may generally be suitable as trench backfill, provided the soils are screened of rocks and other material greater than 6 inches in diameter and organic matter. If trenches are shallow or the use of conventional equipment may result in damage to the utilities, sand having a sand equivalent (SE) of 30 or greater (per California Test Method [CTM] 217) may be used to bed and shade the pipes. Sand backfill within the pipe bedding zone may be densified by jetting or flooding and then tamped to ensure adequate compaction. Subsequent trench backfill should be compacted in uniform thin lifts by mechanical means to at least a minimum 90 percent relative compaction (per ASTM D1557). It is our understanding that the upper 3 feet of trench backfill below proposed street subgrade is to be compacted to a minimum 95-percent relative compaction in accordance with requirements set forth by the City of Corona.

Retaining wall backfill should consist of sandy soils as outlined in the preceding Section 4.1.6. The limits of select sandy backfill should extend at minimum ½ the height of the retaining wall or the width of the heel (if applicable), whichever is greater, refer to Figure 2 (rear of text). Retaining wall backfill soils should be compacted in relatively uniform thin lifts to at least 90 percent relative compaction (per ASTM D1557). Jetting or flooding of retaining wall backfill materials should not be permitted.

A representative from LGC Geotechnical should observe and test the backfill to verify compliance with the project recommendations.

4.2 Slope Stability

4.2.1 Cut Slopes

Stabilization fills should be constructed on proposed cut slopes over 5 feet in height in accordance with the detail provided in Appendix D. Keyway widths should be a minimum of 15 feet wide. Keyways should be a minimum of 2 feet deep, determined from the lowest toe-of-slope elevation, and tilted back towards the heel a minimum 2 percent or 1-foot (whichever is greater).

Stabilization fill backcuts should be excavated so that at least a minimum 15-foot fill width

is maintained for the entire height of the stability fill slope. In general, backcuts should be excavated at a maximum 1.5:1 (horizontal to vertical) inclination. Properly outletted back drains should be constructed along stabilization fill backcuts in accordance with the General Earthwork and Grading Specifications for Rough Grading included in Appendix D. Flatter backcut inclinations may be required based on observed conditions during grading. The backcuts should not be initiated prior to forecasted rain or be left open for extended periods of time.

Backcuts and keyway excavations must be geologically mapped by the geotechnical consultant during excavation to confirm the anticipated conditions. If adverse conditions are exposed, additional analysis and/or remediation measures may be required. The grading contractor must trim the backcuts with a slope board to remove loose material to allow for confirmational mapping. Updated and/or revised geotechnical recommendations may be required based on observed conditions.

4.2.2 Fill Slopes

Design fill slopes depicted on the grading study (Hunsaker, 2019) are anticipated to be both grossly and surficially stable as designed provided they are constructed in accordance with the General Earthwork and Grading Specifications for Rough Grading included in Appendix D and properly maintained subsequent to construction (Section 4.2.3). Fill slopes should be constructed with a maximum slope ratio of 2:1 (horizontal to vertical). Slope faces should also be compacted to project recommendations. To improve surficial stability, vegetation specified by the landscape architect should be established on the slope face as soon as it is practical.

4.2.3 Slope Maintenance Guidelines

It is recommended that any graded slopes be planted with groundcover vegetation as soon as practical to protect against erosion by reducing runoff velocity. Deep-rooted vegetation that requires little water and is able to survive local climate conditions should also be established to protect against surficial slumping. Under no circumstances should slopes be allowed to be bare of vegetation. Landscape vegetation must not be "trimmed" to root structures leaving no protection of the slopes. Irrigation levels should be kept to the minimum level necessary to establish healthy plant growth. Slopes must not be overwatered. If automatic sprinklers are used, they must be adjusted during periods of rainfall. A landscape professional must be consulted for landscape recommendations.

A program for the elimination of burrowing animals in both native and graded slope areas must be established to protect slope stability by reducing the potential for surface water to penetrate into the slope face. Continuous erosion control, rodent control, and maintenance are essential to the long-term stability of all slopes. Trenches excavated on a slope face for utility or irrigation lines and/or for any purpose must be properly backfilled and compacted to project recommendations to the slope face. Observation/testing and acceptance by the geotechnical consultant during trench

backfill are recommended. V-ditches should be inspected and cleared of loose soil and/or debris on a routine basis, especially prior to and during the rainy season.

4.3 Subdrains

If unanticipated groundwater or areas of potential future groundwater seepage and/or accumulation are encountered during grading subdrain systems may be recommended by the geotechnical consultant. Subdrains are to be properly outletted and connected to a suitable discharge point.

A representative of the project civil engineer should survey the installed subdrains for alignment and grade prior to fill placement above the subdrains. The location and elevations of subdrains and subdrain outlets should be recorded on as-built plans and made available to future homeowners and/or homeowner associations. It is the responsibility of the contractor to locate and protect subdrain outlets prior to the completion of work.

4.4 Provisional Soil Bearing and Lateral Resistance

An allowable soil bearing pressure of 2,000 pounds per square foot (psf) may be used for the design of footings having a minimum width of 12 inches and a minimum embedment of 24 inches below lowest adjacent ground surface. This value may be increased by 300 psf for each additional foot of embedment or 100 psf for each additional foot of foundation width to a maximum value of 2,500 psf. In addition, an allowable soil bearing pressure of 1,200 psf may be used for a mat post-tensioned slab a minimum of 6 inches below lowest adjacent grade. These allowable bearing pressures are applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. Bearing values indicated are for total dead loads and frequently applied live loads and may be increased by ⅓ for short duration loading (i.e., wind or seismic loads). These values are presented under the assumption that the soils surrounding the foundation will remain intact. For shallow foundations with less than approximately 24 inches of embedment, we recommend that homeowners be advised not to excavate adjacent to their foundations. In addition, shallow foundations with less than approximately 24 inches of embedment have a greater potential of moisture migrating beneath the slab from outside sources.

In utilizing the above-mentioned allowable bearing capacity and provided our earthwork recommendations are implemented, total foundation settlement due to soil and structural loads is anticipated to be on the order of 2 inches. Differential settlement may be taken as half of the total settlement (i.e., 1-inch over a horizontal span of 40 feet).

Resistance to lateral loads can be provided by friction acting at the base of foundations and by passive earth pressure. For concrete/soil frictional resistance, an allowable coefficient of friction of 0.35 may be assumed with dead-load forces. An allowable passive lateral earth pressure of 300 psf per foot of depth (or pcf) to a maximum of 2,500 psf may be used for the sides of footings poured against properly compacted fill. This passive pressure is applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. The passive pressure may be increased by one-third due to wind or seismic forces. We recommend that the upper foot of passive resistance be neglected if finished grade will not be covered with concrete or asphalt. Frictional resistance and passive pressure may be used in combination without reduction. The

provided allowable passive pressures are based on a factor of safety of 1.5 and may be increased by one-third for short duration seismic loading conditions.

4.5 Lateral Earth Pressures for Retaining Walls

Based on our review, retaining walls up to approximately 8 feet in height are planned for the subject site. Lateral earth pressures are provided as equivalent fluid unit weights, in pounds per square foot (psf) per foot of depth or pcf. These values do not contain an appreciable factor of safety, so the retaining wall designer should apply the applicable factors of safety and/or load factors during design. A soil unit weight of 130 pcf may be assumed for calculating the actual weight of soil over the wall footing.

The following lateral pressures presented on Table 3 are for approved onsite soils with a maximum of 35 percent fines (passing the No. 200 sieve) per American Society for Testing and Materials (ASTM) Test Method D1140 (or ASTM D6913/D422) and a Very Low expansion potential (EI of 20 or less per ASTM D4829). The retaining wall designer should clearly indicate on the retaining wall plans that the backfill material is to be approved onsite soils.

TABLE 3

Lateral Earth Pressures – Select Onsite Backfill

Condition	**Equivalent Fluid Weight (pcf)**	**Equivalent Fluid Weight (pcf)**
	Level Backfill	**2:1 Sloping Backfill**
	Approved Backfill Material	**Approved Backfill Material**
Active	40	60
At-Rest	60	93

If the wall can yield enough to mobilize the full shear strength of the soil, it can be designed for "active" pressure. If the wall cannot yield under the applied load, the earth pressure will be higher. This would include 90-degree corners of retaining walls. Such walls should be designed for "at-rest." The equivalent fluid pressure values assume free-draining conditions. If conditions other than those assumed above are anticipated, the equivalent fluid pressure values should be provided on an individual-case basis by the geotechnical engineer. We recommend retaining walls be provided with construction joints in order to mitigate cosmetic distress from wall movement.

Surcharge loading effects from any adjacent structures should be evaluated by the retaining wall designer. In general, structural loads within a 1:1 (horizontal to vertical) upward projection from the bottom of the proposed retaining wall footing will surcharge the proposed retaining wall. In addition to the recommended lateral earth pressure, retaining walls adjacent to streets should be designed to resist a uniform lateral pressure of 100 pounds per square foot

(psf) due to normal street vehicle traffic, if applicable. The retaining wall designer should contact the geotechnical engineer for any required geotechnical input in estimating surcharge loads.

If required, the retaining wall designer may use a seismic lateral earth pressure increment of 14 pcf. This increment should be applied in addition to the provided static lateral earth pressure using a triangular distribution with the resultant acting at H/3 in relation to the base of the retaining structure (where H is the retained height). Per Section 1803.5.12 of the California Building Code (CBC), the seismic earth pressure is applicable to "structures assigned to Seismic Design Category D, E, or F in accordance with Section 1613." This seismic lateral earth pressure is estimated using the procedure outlined by the Structural Engineers Association of California (Lew, et al, 2010). The provided seismic lateral earth pressure is for a level backfill condition. Due to the sensitivity of seismic earth pressures for sloping conditions, the retaining wall designer should provide the geotechnical engineer with cross sections based on the configuration of the planned retaining walls in order to estimate the specific seismic increment.
