BEDFORD COMMERCIAL SITE - PRELIMINARY SUPLIMENTAL HYDROLOGY STUDY – AREA 'B'
EXISTING CONDITION UNIT HYDROGRAPH - 100 YEAR 6 HOUR STORM
HUNSAKER & ASSOCIATES, JULY 2019
BY: BRIAN LOWELL, PE
------------------------------------------------------------------------
Drainage Area =      15.70(Ac.)  =      0.025 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =      15.70(Ac.)  =      0.025 Sq. Mi.
Length along longest watercourse =    1928.00(Ft.)
Length along longest watercourse measured to centroid =     884.00(Ft.)
Length along longest watercourse =      0.365 Mi.
Length along longest watercourse measured to centroid =      0.167 Mi.
Difference in elevation =      15.00(Ft.)
Slope along watercourse =     41.0788 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time =    0.123 Hr.
Lag time =     7.37 Min.
25% of lag time =     1.84 Min.
40% of lag time =     2.95 Min.
Unit time =     5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       15.70           1.40                 21.98

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       15.70           3.00                 47.10

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.400(In)
Area Averaged 100-Year Rainfall =    3.000(In)

Point rain (area averaged) =    3.000(In)
Areal adjustment factor =   99.99 %
Adjusted average point rain =    3.000(In)

Sub-Area Data:

```

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

Unit Time	Pattern	Storm Rain	Loss rate(In./Hr)		Effective
(Hr.)	Percent	(In/Hr)	Max	Low	(In/Hr)
1 0.08	0.07	0.064	(0.229)	0.017	0.047
2 0.17	0.07	0.064	(0.228)	0.017	0.047
3 0.25	0.07	0.064	(0.227)	0.017	0.047

SECTION 4 - Infiltration Testing

- **Infiltration Testing Results**

LGC Geotechnical, Inc.

PROJECT MEMORANDUM

To: Bedford Marketplace, LLC
5780 Fleet Street, Suite 225
Carlsbad, CA 92008

Date: December 4, 2019
Project No.: 19080-01

Attention: Mr. Glen Powles

From: Mr. Kevin Dyekman, CEG 2595 KAD

Subject: ***Updated Infiltration Testing for Proposed Water Quality Basin, Bedford Marketplace, Tracts 37030, 36294, and 37644, Corona, California***

References: Hunsaker & Associates, 2019, Conceptual Grading Plan, Bedford Market Place, dated October 14, 2019.

LGC Geotechnical, Inc. 2019, Preliminary Geotechnical Evaluation for Proposed Bedford Marketplace, Tracts 37030, 36294, and 37644, Corona, California, Project No. 19080-01, dated August 9, 2019.

In accordance with your requested, LGC Geotechnical, Inc. has prepared this memorandum in order summarize our updated infiltration testing for the proposed water quality basin, Bedford Marketplace, Tracts 37030, 36294, and 37644, located in Corona, California. The recent infiltration testing was performed in order to confirm the provisional design infiltration rate previously provided in our report dated August 9, 2019.

Based on previous nearby infiltration testing and knowledge of the site soils, a design infiltration rate of 2.0 inches per hour was previously provided for infiltration systems associated with Bedford Marketplace (LGC Geotechnical, 2019). Recent infiltration testing was performed within the location of the proposed water quality basin depicted on the Conceptual Grading Plan (Hunsaker, 2019) in order to confirm the previously provided infiltration rate. The estimation of infiltration rates was performed in general accordance with guidelines set forth by the County of Riverside. The recent infiltration test data is summarized in Table 1 on the following page.

January 27, 2015 Project No: 13208-01

Mr. John Sherwood
The New Home Company
85 Enterprise, Suite 450
Aliso Viejo, CA 92656

Subject: ***Summary of Field Infiltration Testing, Proposed Arantine Hills Residential Development, Tract No. 36294, City of Corona, California***

Introduction

In accordance with your request and authorization, LGC Geotechnical, Inc. has prepared this summary of field infiltration testing performed for the proposed basin located in the southeastern portion of the Arantine Hills Residential Development, Tract No. 36294 located in the City of Corona, California (Figure 1 – Site Location Map). The purpose of our study was to perform onsite infiltration testing as it relates to infiltration of future storm water.

Field Infiltration Testing

Field infiltration rate testing was performed in general accordance with guidelines set forth by the County of Riverside (2011). Two approximately 12-foot square areas were excavated to approximately 2 feet above basin design elevations in the northern and southern portions of the proposed infiltration basin (Figure 2 – Infiltration Testing Locations). Subsequent to excavating to the target elevation, three approximately 8 to 12-inch diameter test borings were hand excavated to approximate design basin elevations. The infiltration test borings were pre-soaked in accordance with the County guidelines. Based on the County of Riverside methodology, the tested field infiltration rates, summarized in Table 1, have normalized the three-dimensional flow that occurs within the field test to one-dimensional flow out of the bottom of the boring. The approximate locations of the field infiltration tests are shown on Figure 2 and the infiltration test data is attached.

TABLE 1

Summary of Field Infiltration Testing

Boring/Infiltration Location	Approx. Depth Below EG (ft)	Approx. Bottom of Infiltration Test Elevation (ft)	Infiltration Rate (in/hr)	
			Tested	Design*
I-1B	6	908	7.4	2.5
I-2B	6	908	27.7	9.2
I-3B	4	908	13.9	4.6

*Includes factor of safety of 3 from Tested Rate per Table 1 – Infiltration Testing Requirements, County of Riverside Guidelines (2011).

Groundwater

Groundwater was not encountered during the recent excavations for infiltration testing. Groundwater and seepage was also not encountered to the maximum explored depth of approximately 65 feet below existing grade during our previous subsurface evaluation (LGC, 2015a).

Seasonal fluctuations of groundwater elevations should be expected over time. In general, groundwater levels fluctuate with the seasons and local zones of perched groundwater may be present due to local seepage caused by irrigation and/or recent precipitation. Local perched groundwater conditions or surface seepage may develop once site development is completed.

Conclusions and Recommendations

The tested infiltration rates provided in the report are considered a general representation of the infiltration rates at the location of the proposed basin. It is our understanding that a preliminary infiltration rate of approximately 4.0 in/hr was utilized in the design of the proposed basin. It is our opinion that the infiltration rate used in the design adequately represents the site soils and is acceptable from a geotechnical viewpoint. In accordance with Appendix A of the Riverside County – Low Impact Development BMP Design Handbook, a minimum factor of safety of 3 has been applied to the tested rates in this report. It is the purview of the project civil engineer to determine which design infiltration rate should be used and if any additional factors of safety should be applied.

Please note, the testing of infiltration rates is highly dependent upon the materials encountered at the point of testing (i.e. location and depth of testing). Variations from our test results must be expected.

Limitations

Our services were performed using the degree of care and skill ordinarily exercised, under similar circumstances, by reputable soils engineers and geologists practicing in this or similar localities. No other warranty, expressed or implied, is made as to the conclusions and professional advice included in this report.

It should be understood that LGC Geotechnical has relied on the accuracy of documents, verbal information, and other material and information provided by you and other associated parties in preparation of this report. LGC Geotechnical makes no warranties or guarantees as to the accuracy or completeness of information obtained from or compiled by others.

We appreciate this opportunity to be of service. Should you have any questions or concerns regarding this letter, please do not hesitate to contact our office.

Sincerely,

LGC Geotechnical, Inc.

Tim Lawson, CEG 1821, GE 2626
Geotechnical Engineer

Table 1

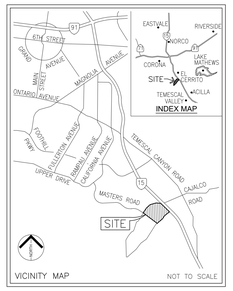
Summary of Infiltration Testing December 3, 2019

Boring/Infiltration Location	Approx. Depth Below EG (ft)	Infiltration Rate (in/hr.)	
		Tested	Design*
I-1C	5	31.5	10.5
I-2C	4.8	3.2	1.1
I-3C	5	11.2	3.7

*Includes a minimum factor of safety of 3 from Tested Rate per Table 1 – Infiltration Testing Requirements, County of Riverside Guidelines (2011).

Based on the recent confirmational infiltration testing performed, a design infiltration rate of 2.0 inches per hour is considered suitable for use in the design of the proposed water quality basin.

It should be emphasized that infiltration test results are only representative of the location and depth where they are performed. Varying subsurface conditions may exist outside of the test locations which could alter the calculated infiltration rates indicated above. Infiltration tests are performed using relatively clean water free of particulates, silt, etc.



Should you have any questions regarding this memo, please do not hesitate to contact our office.

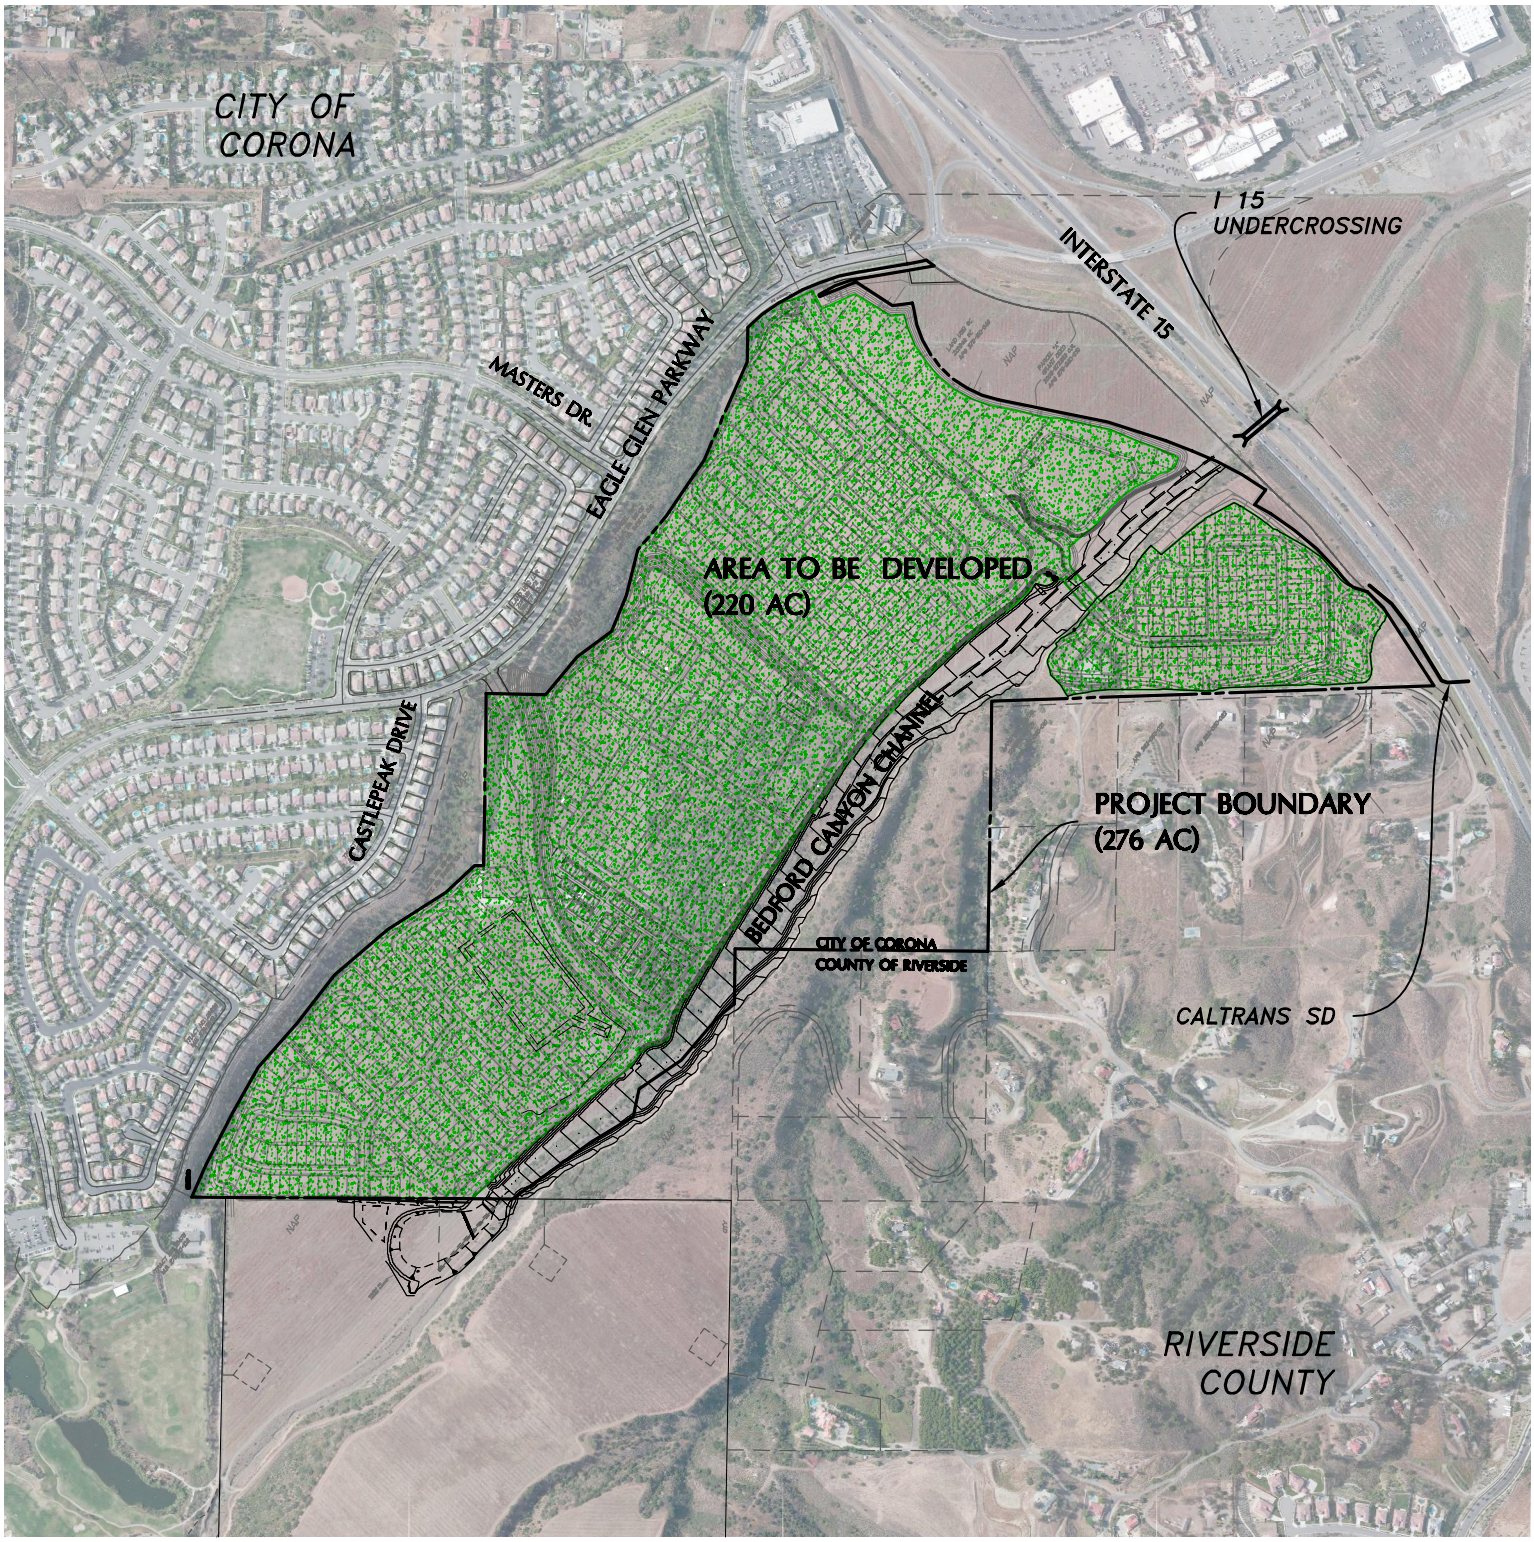
SECTION 1
DISCUSSION



A. PROJECT SITE

The proposed Arantine Hills Project, Tentative Tract 36294 (Project) is located in the southeasterly portion of the City of Corona. The Project property is comprised of approximately 276 acres of undeveloped land lying to the south of Cajalco Rd / I-15 Freeway Interchange, as shown in the Vicinity Map below.

The Bedford Canyon Wash is a major regional watercourse, conveying runoff from an approximately 7.5 square mile watershed lying to the south, traverses through the Project site. The wash flows adjacent to a bluff that extends along the easterly portion of the Project in south to north direction, exiting the Project through an undercrossing structure in I-15 Freeway discharging to Temescal Canyon Creek.

Along with channelizing Bedford Canyon Wash flows in the proposed Bedford Canyon Channel (that will extend from a proposed levee along the southerly property line of the Project to the I-15 Undercrossing), the Project proposes to develop approximately 220 acres of the property into high, medium and low density residential, parks, and general commercial land uses; approximately 56 acres of the property will be within the footprint of the proposed Bedford Canyon Channel or will remain as natural open space, as shown on Exhibit 1.

B. PURPOSE AND SCOPE

The purpose of this study is to investigate and evaluate the 100-year storm runoffs for post-project conditions and compare with pre-project conditions of the Arantine Hills Project, and to develop preliminary sizing of a drainage system that will provide flood protection from up to 100-year frequency storm events.

Hydrology study for existing condition of the Project site was analyzed in a report titled "*Master Drainage Plan for T*ract 36294- Mass Grading" dated Dec. 2015, prepared by CASC Engineering.

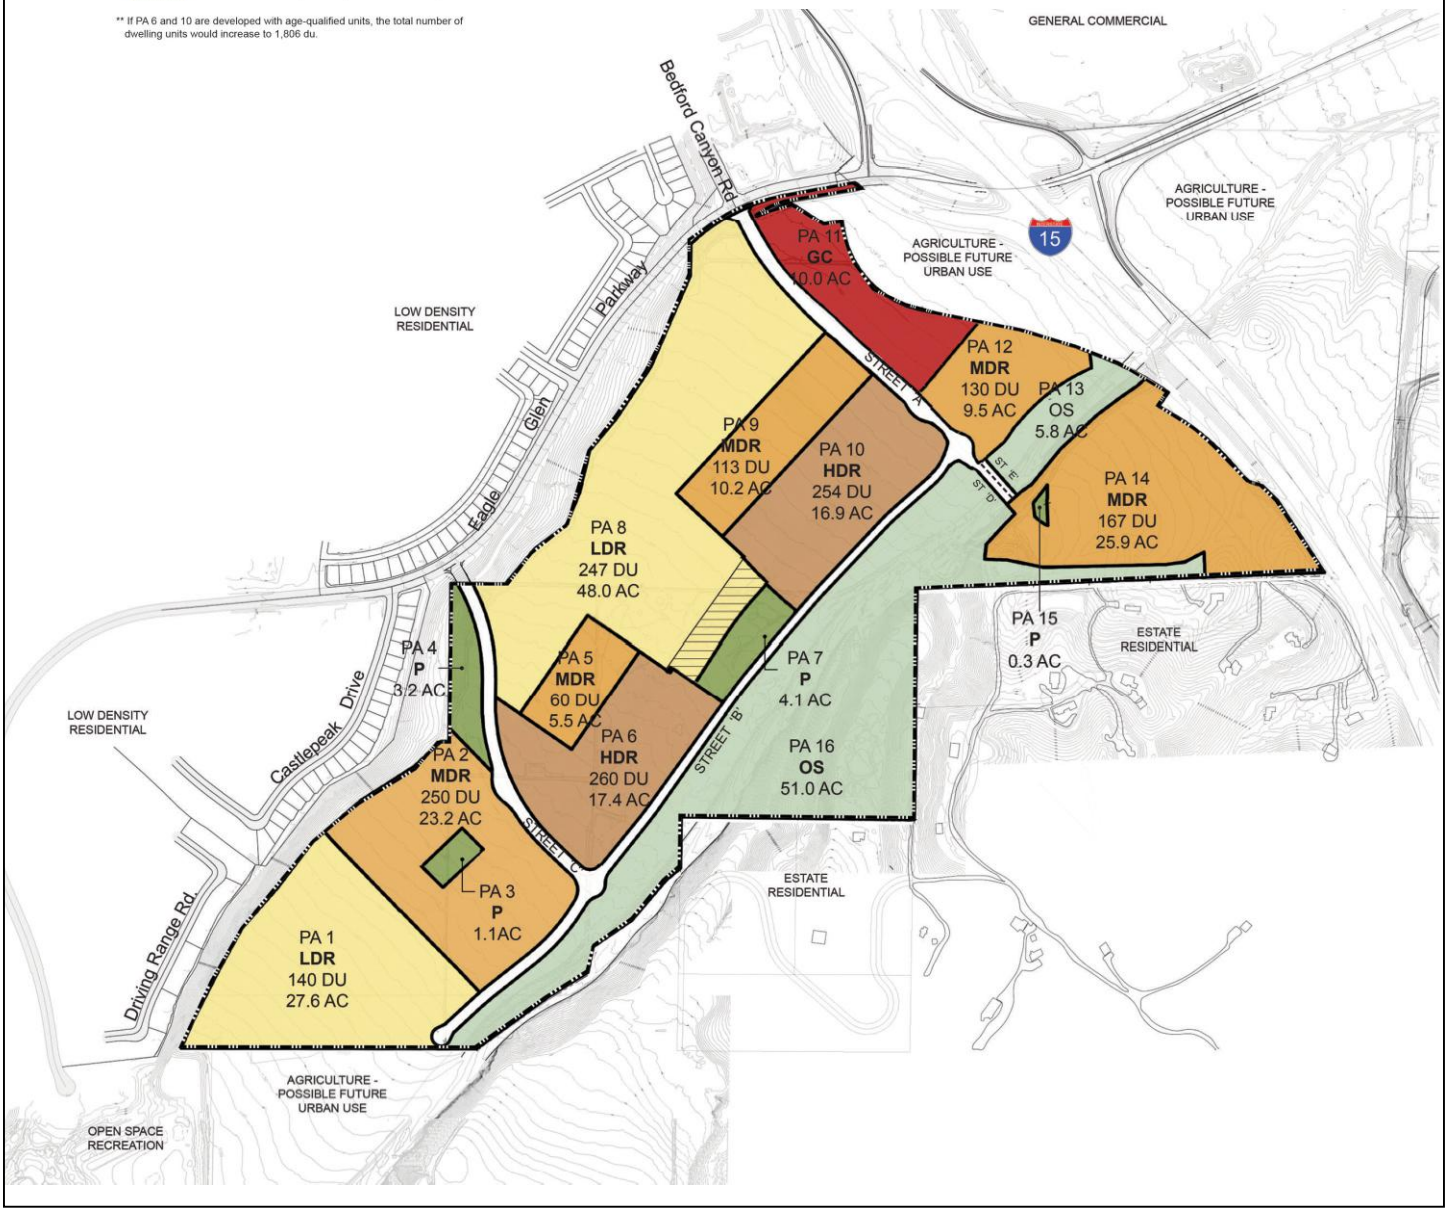
Runoff values for pre-project condition from the "Approved" hydrology study prepared by CASC have been used to evaluate the level of mitigation needed for the proposed development. This approved study has been included in Reference Section 5 of this report.

The scope of this study includes the following:

- Review of the available drainage report for the project site- "Master Drainage Plan for Tract 36294- Mass Grading".
- Prepar drainage area map and determine the points of discharge for proposed Project.
- Evaluated the storm runoffs for 2-, 5-, 10-, and 100-year storm events for 1, 3, 6, and 24-hour durations storm based on post- project condition.
- Determine preliminary sizing of BMPs and detention needed to mitigate water quality impact and increased runoff for 2-, 5-, 10-year storm events for 1, 3, 6, and 24-hour durations.
- Preliminary storm drain system pipe layout (sizing storm drain conduits and catch basins will be determined during final design phase of the project).

P.S. Evaluation of the proposed Bedford Canyon Channel and related improvements is not a part of this study.

C. LAND USE PLAN



Land uses for proposed conditions are based Arantine Hills Specific Plan, dated October 2015, as shown on the Land Use Plan included in the following page.

Land Use	Acreage (AC)	Dwelling Units (DU)	Density Range
General Commercial (GC)	10.0		
High Density Residential (HDR)	34.3	514	15-36
Medium Density Residential (MDR)	74.3	720	6-15
Low Density Residential (LDR) *	75.6	387	3-6
Parks (P)	8.7		
Open Space (OS)	56.8		
Master Planned Roadways	16.3		
TOTAL	**276.0**	**1,621****	

Notes:

* Includes 2.6 acres of High Density Residential Overlay

** If PA 6 and 10 are developed with age-qualified units, the total number of dwelling units would increase to 1,806 du.

D. **METHODOLOGY**

The methodology used to for this hydrology study is based on Riverside County Hydrology Manual dated 1978. The hydrology and hydraulic software utilized are accepted by Riverside County Flood Control and Water Conservation District (District) which include the following:

Rational Method: Riverside County Rational Hydrology Program - CIVILCADD/ CIVILDESIGN Engineering Software by Bonadiman and Associates – Version 8.0.

Unit Hydrograph: Riverside County Synthetic Unit Hydrology Method - CIVILCADD/ CIVILDESIGN Engineering Software by Bonadiman and Associates – Version 8.2.

Basin Routing: Hydrograph Routing - CIVILCADD/ CIVILDESIGN Engineering Software by Bonadiman and Associates – Version 7.0.

Soils Types were based on soils map for Corona South, Plate C-1.27

The methodology used to design the treatment control BMP's and the project's drainage characteristic is based on the requirements set in the Riverside County Design Handbook for Low Impact Development Best Management Practices.

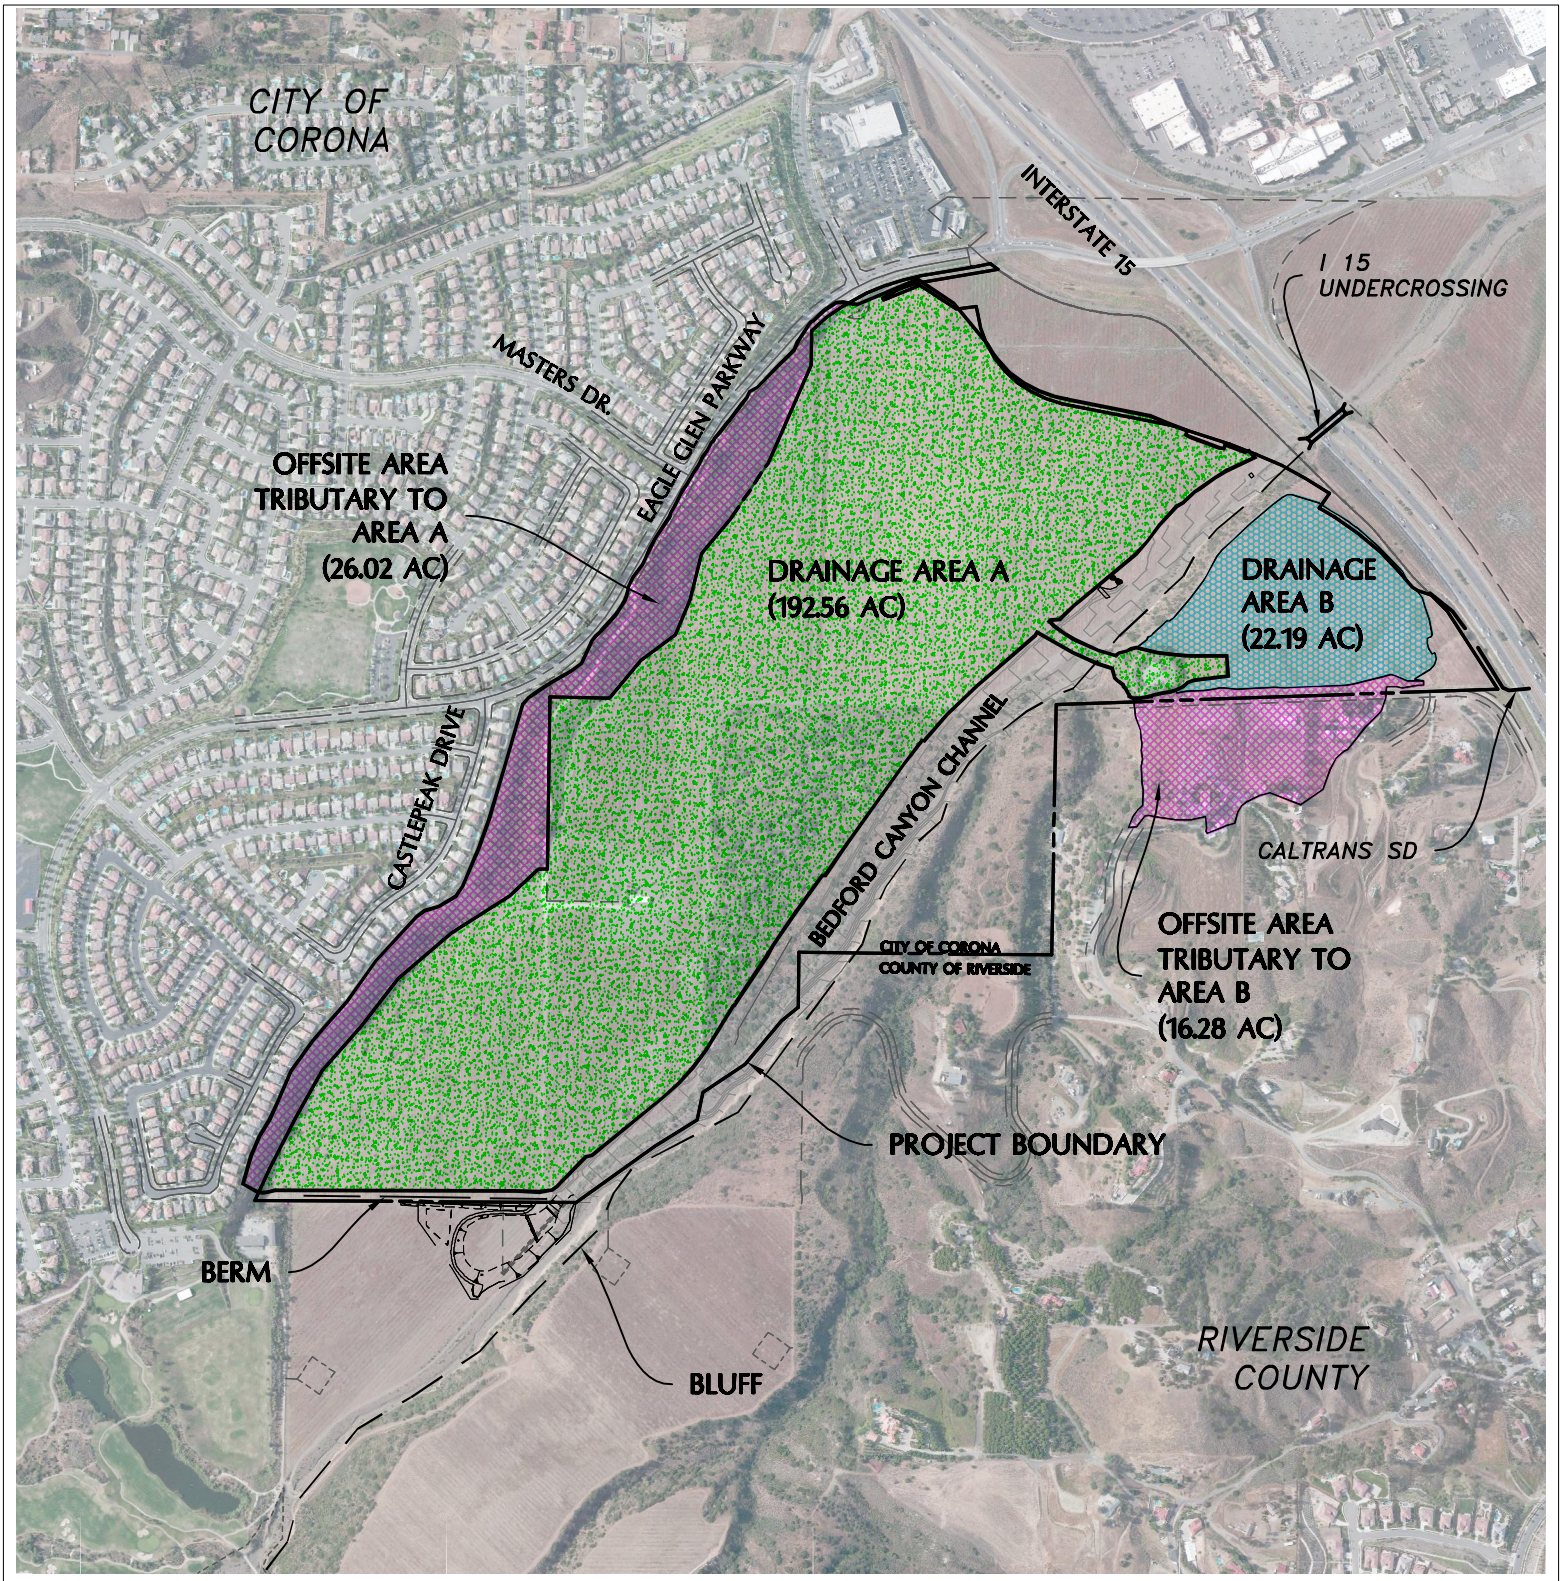
Proposed land use is based on 55 percent imperviousness for developed residential areas. Proposed land use for hillside areas was selected as open brush, poor cover.

Unit hydrographs were used to compare peak flows for the 2-year, 5-year, and 10-year storm events, for 1-, 3-, 6-, and 24-hour durations.

- Antecedent Moisture Condition (AMC) II was used to determine the peak storms and flood volumes for the 100-year and 10-year storm events per approved CASC's hydrology report..

E. PRE-PROJECT CONDITION

The Project site is comprised of two distinct drainage areas separated by the bluff that runs along the easterly edge of Bedford Canyon Wash. The two drainage areas are as follows:



- Area A is low lying area that lies to the west of the bluff and is within the existing Bedford Canyon Wash. With the proposed construction of Bedford Canyon Channel and levee along the southerly property line of the Project, approximately 192.6 acres of the Project property lying to the west of the Bedford Canyon Channel will become developable (Area A) as shown in Exhibit 2. Area A is tributary to the Bedford Canyon Channel. Approximately 26 acres of offsite area that lies to the west of the Project drains through Area A to the Bedford Canyon Wash Channel.

- Area B is comprised of approximately 22 acres the lies to the east of the bluff and drains in a northeasterly direction a Caltrans' storm drain facility in I-15 Freeway. Approximately 16 acres of off-site area lying to the south of Area B drains through the Project.

F. POST-PROJECT CONDITION

Under post-project condition the discharge points for the two drainage areas, Area A and Area B, will remain similar to that under pre-project condition. Project area lying to the west of Bedford Canyon Channel will drain to the I-15 Undercrossing, and Project area lying to the east of the channel will drain to the existing storm drainage system along I-15 Freeway.

Area A: For the Project area lying to the west of Bedford Canyon Channel, runoff generated from off-site areas lying to the west of the Project will drain through Area A. All the storm flows in this Area A will be collected and conveyed via two proposed on-site storm drain system, and routed through a proposed detention basin "Basin A" located at the northeast corner of Area A, as shown in Exhibit 3.

Exhibit 3

POST-PROJECT CONDITION

F:\0853\Engineering\Hydrology\EXH3-proposed DRAINAGE.dwg

With a total capacity of approximately 45 acre-feet, Basin A has been sized to mitigate both flood control and water quality impacts caused by proposed development within this drainage area. Basin A will function as an extended detention/infiltration basin for low flows and urban nuisance runoff, and will retard peak flow generated in Area A to less than the flow rates for pre-project conditions for 2, 5, 10 and 100-year storm events (as calculated in the approved CASC hydrology study).

Area **B**: Storm runoff from most of the Project area lying to the east of Bedford Canyon Channel will be collected and conveyed to a proposed flow-through detention Basin B via a proposed on-site storm drain system. Outflow from Basin B will be conveyed to the existing Caltrans' storm drain along I-15 Freeway. Runoff generated from the off-site areas (16.28 acres) lying to the south of the Area B will be routed directly to the existing I-15 storm drain via a separate storm drain.

With a total capacity of approximately 4.4 acre-feet, Basin B has been sized to mitigate both flood control and water quality impacts caused by proposed development within this drainage area. Basin B will include a water quality (sand filter) basin for low flows and urban nuisance runoff, and will retard peak flow generated in Area B to less than the flow rates for pre-project conditions for 2, 5, 10 and 100-year storm events (as calculated in the approved CASC hydrology study).

Area **C**: Due to the grades of the proposed roadway crossing over Bedford Canyon Channel, approximately 4 acres will drain westerly to the Bedford Canyon Channel. This area has been identified as Area C (4.22 Acres), as shown in Exhibit 3. Flows generated in Area C will be routed through a Modular Wetland Unit (MWU) prior to being discharged into the Bedford Canyon Channel.

G. CONCLUSION

Tables 1 and Table 2 summarize pre-project and post-project flows exiting the Project from Area A and Area B, respectively. Hydrologic conditions summarized include 2, 5, 10 and 100-year return frequency storms, with 1, 3, 6 and 24-hour durations. Flows generated in Area C have been combined with Area A for post-project conditions, since both of these areas will be tributary to the Bedford Canyon Channel, upstream of the I-15 Undercrossing

As shown in Tables 1 and 2, development impacts will be mitigated by proposed on-site detention, resulting in reducing post-project flow rates to less than pre-project flows under all the hydrological conditions evaluated, including the County's Hydromodification criteria by limiting post-project flows discharged from the Project to no greater than 110 percent of the pre-project flows for 2-year, 24-hour storm event.

I. PURPOSE AND SCOPE

The purpose of this report is to investigate and evaluate the drainage conditions of the Arantine Hills Project area and to develop a drainage plan that will provide this 276-acre project area with improved drainage and flood protection from the 100-year flood. Implementation of this plan, in conjunction with the improvement of the major drainage facility, the Bedford Canyon Wash Channel, will achieve this goal.

The scope of this drainage plan includes the following:

A. Review of available drainage reports for the project site.

B. Preparation of a drainage area map and points of flow concentration of storm runoff in the project area.

C. Determination of the quantities of the 100-year and 10-year storm runoff based on existing (pre-project) and proposed (with-project) conditions.

D. Determination of the location and size of the proposed drainage facilities.

E. Preparation of the drainage report and hydrology maps.

For purposes of this drainage plan, ultimate improvements to the Bedford Canyon Wash Channel located along the east side of the property are assumed to be in place. The development of preliminary plans and supporting studies for the Bedford Canyon Wash Channel is included in a separate report entitled, "Sediment Yield and Transport Study for Arantine Hills, Baseline and With-Project Conditions, Bedford Wash".

II. PROJECT SITE AND DRAINAGE AREA OVERVIEW

The Arantine Hills Specific Plan is located in the City of Corona. The project is generally bounded by Eagle Glen Parkway to the west, I-15 to the north, and Bedford Canyon Wash to the east (see Figure 1).

The drainage area covered by this plan consists of approximately 241 acres or 0.38 square miles (excluding the area tributary to the Bedford Canyon Wash Channel, which is approximately 35 acres). The watershed tributary to the Arantine Hills Specific Plan is characterized by uniform, steep slopes with elevations ranging from a high of 1,218 feet above sea level to a low of 894 feet near I-15. The 276-acre Arantine Hills project is currently undeveloped. The upper portion of the project site is covered with annual grass

and open brush. The project site generally slopes northerly at a grade of approximately 3-5 percent.

The project is impacted by Bedford Canyon Wash traversing along the southeast side of the property (see Figure 2). The flow tributary to this wash is currently conveyed in a natural channel. Bedford Canyon Wash discharges into Temescal Canyon Creek.

III. PREVIOUS STUDIES

AEI-CASC Consulting prepared a master drainage plan (MDP) in support of a previous SP application for this property in July 2002 (Reference 1). That MDP was used in the preparation of this report. A list of other study references is included in Section X.

IV. HYDROLOGY

Drainage basin boundaries and points of storm flow concentration associated with the existing or pre-project condition were determined utilizing the existing project site topography (2014 aerial topographic map). For the proposed with-project condition, the roadway and grading layouts were utilized in the analysis. Field investigations were conducted to verify the relative accuracy of the drainage boundaries. Exhibits "A" and "C" show the rational method and hydrograph method hydrology maps, respectively, for the existing condition while Exhibits "B" and "D" show the rational method and hydrograph method hydrology maps, respectively, for the proposed condition.

The results of the rational method calculations for Drainage Area "A" based upon the existing and proposed conditions are included in Appendix A and Appendix B, respectively. The results of the rational method calculations for Drainage Area "B" based upon the existing and proposed conditions are included in Appendix C and Appendix D, respectively.
The hydrograph calculations for Drainage Area "A" based upon the existing and proposed conditions are included in Appendix E and Appendix F, respectively, while the results of the hydrograph calculations for Drainage Area "B" based upon the existing and proposed conditions are included in Appendix G and Appendix H, respectively.

The RCFC & WCD Hydrology Manual was used to develop the hydrologic parameters for the 100-year, 10-year 5-year and 2-year storm events (Reference 2). The rational tabling method was utiltized to determine the peak flow rates for the study areas. Computations were performed using the RRIV computer program developed by CivilCadd/CivilDesign (CDD). The unit hydrograph method was utilized for basin routing. This method was performed using the UNRIV computer program developed by CDD.

The rainfall values and slope of intensity duration curves used for the study were obtained from the maps contained in the RCFCD hydrology manual (see Plates Attached). The rainfall values for the 2-year/1-hour and 100-year/1-hour storm events are 0.55 inches and 1.36 inches, respectively. For the 2-year/24-hour and 100-year/24-hour storm events, the rainfall values are 2.5 inches and 8.0 inches, respectively. The slope of intensity duration curve of 0.43 was used in the study (Plate D-4.6)

The entire study area consists of four hydrologic soils groups, A, B, C and D (Plate C1.27). Antecedent Moisture Condition (AMC) 2 was used to determine the peak storm flows and flood volumes for the 100-year and 10-year storm events, while AMC 1 was used to determine the peak storm flows and flood volumes for the 5-year and 2-year storm events.

Land use category descriptions for this drainage plan were derived from the Arantine Hills Specific Plan (see Figure 5 and Reference 6). For the existing condition hydrology analysis, grass, annual or perennial (fair) cover types were used.

V. FLOOD PLAIN STUDY

As shown on Figure 3, the Arantine Hills project is currently "unmapped". However, the area immediately downstream of I-15 and east of the project (adjacent to Bedford Canyon Wash) falls within the "Zone A" flood plain as determined by the Federal Emergency Management Agency (FEMA). The "Zone A" flood plain designation is defined by FEMA as "Areas of 100-year flood; base flood elevations and flood hazard factors not determined". The origin of this Zone "A" flood plain is the storm flows emanating from Bedford Canyon Wash.

FEMA has not mapped the flood plain information for the Arantine Hills project and in particular, for the Bedford Canyon Wash. AEI-CASC prepared a detailed flood plain and sediment transport study entitled, "Sediment Yield and Transport Study for Arantine Hills, Baseline and With-Project Conditions, Bedford Wash" (Reference 5). The flood plain information derived in that study will provide the existing, or "baseline", hydraulic parameters for the areas off-site from the Arantine Hills project. The parameters will be necessary for evaluating the adverse impacts, if any, associated with the construction of the proposed channel improvements.

VI. FACILITY DESIGN CRITERIA

Criteria for the conceptual layout and design of drainage improvements were adopted based on the current guidelines of the City of Corona and Riverside County Flood Control and Water Conservation District (RCFC & WCD). The criteria are defined below:

A. UNDERGROUND STORM DRAINS

All underground storm drains proposed in this plan are intended to collect local urban runoff and offsite undeveloped flows. For the most part, these drains are located in existing and proposed street rights-of-way including proposed easements. For local and major streets located within the plan area, runoff from a 10-year storm is allowed to accumulate in the streets until it reaches the top of the curb. The 100-year storm flow, on the other hand, is allowed to accumulate within the street section until it reaches the right-of-way. If either of these two conditions is violated, the plan proposes to construct an underground storm drain to convey the tributary 100-year flows. These conduits are proposed to be either reinforced concrete pipes (RCP) or cast-in-place concrete pipes (CIPCP) or reinforced concrete boxes (RCB). Manning's roughness coefficients (n-values) of 0.013 and 0.014 were used for the proposed RCPs, RCBs, and CIPCPs respectively.

B. OPEN CHANNELS

Open channels are proposed when construction and right-of-way costs for a channel improvement prove to be significantly less than the costs of an underground storm drain. The open channels proposed within this plan are temporary facilities which are designed to convey the peak 100-year storm flows. These channels are proposed to be lined with concrete with 1.5:1 side slopes. A manning's N-value of 0.015 is used to perform the normal-depth calculations. A minimum channel freeboard of 1.0 feet is used since these are temporary facilities on private property, and will be replaced with permanent underground facilities.

C. DETENTION BASINS

The proposed detention basins are designed to ensure that the total combined developed outflows are less than or equal to the existing undeveloped flows for the 2-year, 5-year, 10-year and 100-year, 24-hour storm events (see Figure 4). The 24-hour event duration, for all return periods, typically generates the lowest peak flow rate and the highest flood volume. Therefore, the detention basins are capable of also handling the 1-hour, 3-hour, and 6-hour events for all four return periods.

The proposed detention basin design volumes include the volumes required for treatment by the water quality basins, as the water quality basins will be situated within the footprint of each proposed detention basin (Figure 4). The incorporation of a water quality basin within each detention basin will allow for the treatment of runoff flows as well as flood control without requiring additional on-site area. Basin "A" utilizes Infiltration for water quality treatment, while Basin "B" utilizes a Sand Filter for water

quality treatment, since the infiltration rate is only 0.3in/hr. This design will be in accordance with the City's and RCFC & WCD requirements.

Each proposed detention basin will be sized based upon the design criteria established by RCFC & WCD (Reference 3), and located within a drainage easement. The proposed detention basins will each have an emergency spillway capable of safely conveying the 100-year flood. A minimum freeboard of one foot above the 100-year water surface elevation will be incorporated in the basin design.

D. WATER QUALITY BASINS

The drainage plan proposes to construct water quality basins to remove pollutants from surface runoff by capturing the tributary water quality volume and treating flows via infiltration (Basin "A") or sand filtration (Basin "B"). The detention/water quality basins will be owned and maintained by the development's Home Owners' Association.

The primary functions of the proposed water quality basins are to remove pollutants from storm water runoff and to recharge or replenish the ground water. Additionally, these basins can significantly reduce the total annual surface runoff volume, which can reduce stream or overland erosion and other adverse impacts to stream habitat from the proposed development project. The water quality basins will be sized based upon ASCE Manual and Report on Engineering Practice No. 87 (Reference 7). The water quality volume quantity will be included in the detention basin storage volume.

Proposed Drainage Design and Maintenance Program

1. All drainage facilities and flood control measures will be designed in accordance with the requirements of the City of Corona and RCFC & WCD.

2. The proposed public drainage facilities will be maintained by the City of Corona and RCFC & WCD.

3. Detention basins are proposed in order to mitigate the impact of increased runoff due to the proposed development.

4. This project shall comply with the requirements of the State Water Resources Control Board (SWRCB) Order No. 2009-0009-DWQ permit as amended by Order No. 2010-0014-DWQ (NPDES No. CAS000002) and 2012-0006-DWQ at the time of final development entitlement. All projects proposing construction activities including cleaning, grading or excavation that results in the disturbance of at least one acre of total land area should obtain the appropriate State General Permit for National Pollution

Discharge Elimination System (NPDES) and pay the appropriate fees. All developments within the Specific Plan boundaries shall be subject to future requirements adopted by the City for implementation of the NPDES program.

5. Water quality basins are proposed in order to remove pollutants from surface discharges by capturing the tributary water quality volume and infiltrating or sand filtering it prior to the next significant storm event. The water quality basin will be located within the footprint of the proposed detention basin (see Figure 4). The primary functions of the proposed water quality basins are to remove pollutants from storm water runoff and to recharge or replenish the ground water. Maintenance of the water quality basins (Infiltration Basin and Sand Filter Basin) shall be in accordance with the maintenance requirements outlined in the project's Preliminary Water Quality Management Plan (P-WQMP).

6. Storm drainage facilities should ensure the acceptance and disposal of storm run-off without damage to streets or adjacent properties.

VII. EXISTING FACILITIES

With the exception of the Bedford Canyon Wash that runs along the southeast side of the project and small culverts under I-15 near the southeast and northeast sides of the project, there are no other drainage facilities existing near and within the project area.

VIII. RECOMMENDED PLAN

The drainage plan for the Arantine Hills project proposes a system of drainage channels, underground storm drains and basins to intercept and convey the storm flows generated by the project site as well as off-site run-on flows.

Bedford Canyon Wash is to maintain the existing 5-year flows within the existing natural channel. The greater than 5-year flows will be split from the natural wash into a 26-foot-wide concrete rectangular channel via a side weir. The concrete rectangular channel is sized to convey the 100-year flow of 4,370 cfs with 40% bulking for a total 100-year bulked flow of 6,114 cfs. The approach is to maintain the existing bluffs within the Army Corps of Engineers (ACOE) jurisdictional limits to the south while minimizing the impacts due to water volume, depths and erosive velocities. The existing flow depths ranged from 6.1 – 10.9 feet with velocities from 8.3 – 14.4 fps. The 5-year flows will have flow depths ranging from 3.5 – 5.3 feet with velocities from 4.3 -11.1 fps. These reduced depths and velocities will minimize the erosion potential on the existing bluffs. The concrete rectangular channel will convey the flows to the northeasterly project limits then through a CSU Rigid Boundary Basin (RBB) per FHWA HEC No. 14 design requirements before it

outlets back into the existing natural Bedford Wash. Three (3) separate designs were analyzed for the CSU RBB. It was determined that the fifty-two (52) feet wide outlet would best reduce the flow velocities while allowing a reasonable transition back into existing Bedford Wash. A separate report entitled, "Sediment Yield and Transport Study for Arantine Hills, Baseline and With-Project Conditions, Bedford Wash".

The majority of the underground drainage facilities are proposed to be placed under the future streets. An open channel is proposed along the north side of the project site. Detention basins are proposed at two locations in order to mitigate increases in storm runoff due to the development of the various planning areas. These detention basins are located toward the north end of Planning Area 12 and the east end of Planning Area 11.

The improvements proposed by this plan are shown on Exhibits "B" and "D", which are enclosed in the back of this report. These exhibits not only show proposed preliminary alignments, but pertinent preliminary size information, as well as the design flow rates, and detention basin volumes and outflows.

Basin routing calculations for Basins "A" and "B" are included in Appendix I and Appendix J, respectively.

All proposed drainage infrastructure locations, sizes, and design flow rates can be found on Exhibit "B". The following is a brief description of the major on-site drainage improvements proposed in this MDP:

Line "A"

Line "A" is an approximately 1-mile-long storm drain system that extends from the Temporary Desilting Basin #1 Outlet Pipe, toward the upstream end of the Project site, to Basin "A", toward the downstream end. Line "A" is a concrete-lined trapezoidal channel with a bottom width that ranges from 4 feet to 6 feet, height from 3 feet to 5.5 feet, and side slopes of 1.5 horizontal to 1 vertical. The channel is proposed to intercept and convey the on-site peak 100-year storm flows from the majority of the Project site through direct runoff and multiple proposed lateral storm drains. Flows within Line "A" range from 91.2 cfs to 310.8 cfs, and discharge into Basin "A". Underground pipe culverts (54-inch and 72-inch RCPs) are proposed at two roadway crossings.

Detention Basin "A"

Detention Basin "A" is proposed to attenuate the increase in storm runoff due to the proposed development of the various upstream planning areas tributary to the basin. This basin is sized to attenuate the 2, 5, 10 and 100-year developed storm flows. The proposed basin volume of approximately 43.3 acre-feet includes the water quality volume required

for treatment of approximately 7.5 acre-feet. The basin will utilize a concrete outlet structure to regulate flows leaving the basin (See Figure 6). The bottom 2 feet of storage will be infiltrated and evaluated per the Project WQMP. The maximum basin outflow of 134.5 cfs will discharge to the Bedford Canyon Wash Channel. In the event the outlet structure fails, the basin also includes an emergency spillway capable of safely conveying the 100-year peak flow rate of 483.1 cfs. Table 8.1, below, shows the on-site peak flow rates for both the existing and proposed conditions, and the design outflows for Detention Basin "A". Basin routing calculations for Detention Basin "A" are included in Appendix I.

Table 8.1: Detention Basin "A" Routing Summary

EVENT FREQ./DURATION		PEAK FLOW RATE (CFS)		
		EXIST.	PROP.	OUTFLOWS
2-YR	1-HR	55.6	151.8	0.1
	3-HR	30.9	102.0	0.5
	6-HR	22.9	92.5	1.6
	24-HR	7.0	40.6	5.5
5-YR	1-HR	94.7	221.6	0.1
	3-HR	70.6	155.5	1.6
	6-HR	49.5	128.9	3.4
	24-HR	10.7	61.5	9.3
10-YR	1-HR	164.3	291.1	0.7
	3-HR	137.0	213.7	3.3
	6-HR	104.2	175.1	5.5
	24-HR	44.6	81.4	41.7
100-YR	1-HR	302.8	483.1	3.9
	3-HR	259.2	360.0	8.5
	6-HR	196.4	283.0	9.7
	24-HR	134.8	176.2	134.5

Line "F"

Line "F" is a proposed underground storm drain line designed to direct outflows from Detention Basin "A" to the Bedford Canyon Wash Channel. Line "F" consists of two 36-inch RCPs that are sized to convey the maximum basin outflow of 134.5 cfs.

Detention Basin "B"

Detention Basin "B" is proposed to attenuate the increase in storm runoff due to the proposed development of the upstream Planning Area 11. This basin is sized to attenuate

the 2, 5, 10 and 100-year developed storm flows. The proposed basin volume of approximately 5.6 acre-feet includes the water quality volume required for treatment of approximately 1.2 acre-feet. The basin will utilize an 18-inch diameter outlet riser to regulate flows leaving the basin (See Figure 7). The bottom 1.58 feet of storage will be infiltrated and evaluated per the Project WQMP. The maximum basin outflow of 17.5 cfs will discharge to the existing watercourse running along the south side of I-15 via the proposed Line "G". In the event the outlet riser fails, the basin also includes an emergency spillway capable of safely conveying the 100-year peak flow rate of 58.7 cfs. Table 8.2, below, shows the on-site peak flow rates for both the existing and proposed conditions, and the design outflows for Detention Basin "B". Basin routing calculations for Detention Basin "B" are included in Appendix J.

Table 8.2: Detention Basin "B" Routing Summary

EVENT FREQ./DURATION		PEAK FLOW RATE (CFS)		
		EXIST.	PROP.	OUTFLOWS
2-YR	1-HR	13.7	20.9	0.0
	3-HR	7.0	15.6	0.1
	6-HR	5.6	14.3	0.3
	24-HR	0.8	5.6	0.7
5-YR	1-HR	21.9	29.3	0.1
	3-HR	13.1	22.1	0.3
	6-HR	9.7	19.2	0.6
	24-HR	1.1	8.5	1.6
10-YR	1-HR	32.9	37.0	0.1
	3-HR	22.2	28.2	0.5
	6-HR	17.4	24.2	0.7
	24-HR	7.6	11.9	6.5
100-YR	1-HR	54.8	58.7	0.5
	3-HR	37.9	44.5	1.3
	6-HR	28.9	36.7	1.7
	24-HR	17.4	21.7	17.5

Line "G"

Line "G" is a proposed underground storm drain pipe designed to direct outflows from Detention Basin "B" to the existing watercourse running along the south side of I-15. Line "G" is a 30-inch RCP that is sized to convey the maximum basin outflow of 17.5 cfs.

Transverse Levee

The Transverse Levee system is located along the southerly boundary of the Project site. The Transverse Levee system consists of a concrete-lined open channel and levee, and is primarily designed to intercept and convey the 100-year breakout or errant flows from Bedford Canyon Channel. The channel portion is trapezoidal shaped with a bottom width of 6 feet, height of 8 feet, and side slopes of 1.5 horizontal to 1 vertical. The levee is concrete lined with side slopes of 1.5 horizontal to 1 vertical and varying height. The height of the levee varies from a maximum height of 10 feet and minimum height of 5 feet measured from the top of the concrete-lined channel to the top of the levee. The channel portion of the system has the capacity to convey approximately the 10-year **clear-water** flow of 2,535 cfs, which is equivalent to just over the 5-year **bulked** flow condition. The combined channel and levee system is able to convey the entire 100-year **bulked** flow of Bedford Canyon Channel with a minimum of 7.4 feet of freeboard (i.e. 4.4 feet of freeboard for super-elevation plus 3 feet of freeboard for levee condition). The 100-year storm flow emanating from the local off-site area is 39.4 cfs, which can easily be accommodated by the proposed system. The Transverse Levee system will require a right of way width of 54 feet. In order to provide access for future development to the south, Street "B" will be extended southerly across the Transverse Levee. This drainage system will be modified to include a culvert (pipe or box) under the roadway to allow safe passage of storm flows. The Transverse Levee is identified on Exhibit "B".

IX. RECOMMENDATIONS

This report recommends that:

- The master drainage plan, as set forth herein, be approved and adopted by the City of Corona as part of the overall master plan of drainage for the City.

- The master drainage plan, as set forth herein, be used as support for the mass grading developments within the Arantine Hills Specific Plan area and that such developments be required to conform to the plan insofar as possible.

English Rainfall Data (Inches) Input Values Used

English Units used in output format

AREA "A"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
100 YEAR - 6 HOUR
FN: AUH1006EXIST

Drainage Area = 218.56(Ac.) = 0.342 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 218.56(Ac.) = 0.342 Sq. Mi.
Length along longest watercourse = 7012.00(Ft.)
Length along longest watercourse measured to centroid = 3373.00(Ft.)
Length along longest watercourse = 1.328 Mi.
Length along longest watercourse measured to centroid = 0.639 Mi.
Difference in elevation = 321.00(Ft.)
Slope along watercourse = 241.7114 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.278 Hr.
Lag time = 16.69 Min.
25% of lag time = 4.17 Min.
40% of lag time = 6.68 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	1.40	305.98

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	3.00	655.68

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.400(In)
Area Averaged 100-Year Rainfall = 3.000(In)

Point rain (area averaged) = 3.000(In)
Areal adjustment factor = 99.92 %
Adjusted average point rain = 2.998(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
218.560	60.00	0.000

Total Area Entered = 218.56(Ac.)

Adjusted average point rain = 4.761(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
218.560	60.00	0.000

Total Area Entered = 218.56(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
60.0	60.0	0.470	0.000	0.470	1.000	0.470
					Sum (F) =	0.470

Area averaged mean soil loss (F) (In/Hr) = 0.470
Minimum soil loss rate ((In/Hr)) = 0.235
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6268

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

AREA "A"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
10 YEAR - 6 HOUR
FN: AUH106EXIST

Drainage Area = 218.56(Ac.) = 0.342 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 218.56(Ac.) = 0.342 Sq. Mi.
Length along longest watercourse = 7012.00(Ft.)
Length along longest watercourse measured to centroid = 3373.00(Ft.)
Length along longest watercourse = 1.328 Mi.
Length along longest watercourse measured to centroid = 0.639 Mi.
Difference in elevation = 321.00(Ft.)
Slope along watercourse = 241.7114 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.278 Hr.
Lag time = 16.69 Min.
25% of lag time = 4.17 Min.
40% of lag time = 6.68 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	1.40	305.98

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	3.00	655.68

STORM EVENT (YEAR) = 10.00
Area Averaged 2-Year Rainfall = 1.400(In)
Area Averaged 100-Year Rainfall = 3.000(In)

Point rain (area averaged) = 2.058(In)
Areal adjustment factor = 99.92 %
Adjusted average point rain = 2.057(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
218.560	60.00	0.000

Total Area Entered = 218.56(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
60.0	60.0	0.470	0.000	0.470	1.000	0.470
					Sum (F) =	0.470

Area averaged mean soil loss (F) (In/Hr) = 0.470
Minimum soil loss rate ((In/Hr)) = 0.235
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

AREA "A"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
5 YEAR - 24 HOUR
FN: AUH524EXIST

Drainage Area = 218.56(Ac.) = 0.342 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 218.56(Ac.) = 0.342 Sq. Mi.
Length along longest watercourse = 7012.00(Ft.)
Length along longest watercourse measured to centroid = 3373.00(Ft.)
Length along longest watercourse = 1.328 Mi.
Length along longest watercourse measured to centroid = 0.639 Mi.
Difference in elevation = 321.00(Ft.)
Slope along watercourse = 241.7114 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.278 Hr.
Lag time = 16.69 Min.
25% of lag time = 4.17 Min.
40% of lag time = 6.68 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	2.50	546.40

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	8.00	1748.48

STORM EVENT (YEAR) = 5.00
Area Averaged 2-Year Rainfall = 2.500(In)
Area Averaged 100-Year Rainfall = 8.000(In)

Point rain (area averaged) = 3.788(In)
Areal adjustment factor = 99.96 %
Adjusted average point rain = 3.787(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
218.560	60.00	0.000

Total Area Entered = 218.56(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
60.0	40.0	0.670	0.000	0.670	1.000	0.670
					Sum (F) =	0.670

Area averaged mean soil loss (F) (In/Hr) = 0.670
Minimum soil loss rate ((In/Hr)) = 0.335
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

AREA "A"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
5 YEAR - 6 HOUR
FN: AUH56EXIST

Drainage Area = 218.56(Ac.) = 0.342 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 218.56(Ac.) = 0.342 Sq. Mi.
Length along longest watercourse = 7012.00(Ft.)
Length along longest watercourse measured to centroid = 3373.00(Ft.)
Length along longest watercourse = 1.328 Mi.
Length along longest watercourse measured to centroid = 0.639 Mi.
Difference in elevation = 321.00(Ft.)
Slope along watercourse = 241.7114 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.278 Hr.
Lag time = 16.69 Min.
25% of lag time = 4.17 Min.
40% of lag time = 6.68 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	1.40	305.98

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	3.00	655.68

STORM EVENT (YEAR) = 5.00
Area Averaged 2-Year Rainfall = 1.400(In)
Area Averaged 100-Year Rainfall = 3.000(In)

Point rain (area averaged) = 1.775(In)
Areal adjustment factor = 99.92 %
Adjusted average point rain = 1.773(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
218.560	60.00	0.000

Total Area Entered = 218.56(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
60.0	40.0	0.670	0.000	0.670	1.000	0.670
					Sum (F) =	0.670

Area averaged mean soil loss (F) (In/Hr) = 0.670
Minimum soil loss rate ((In/Hr)) = 0.335
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

AREA "A"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
2 YEAR - 6 HOUR
FN: AUH26EXIST

Drainage Area = 218.56(Ac.) = 0.342 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 218.56(Ac.) = 0.342 Sq. Mi.
Length along longest watercourse = 7012.00(Ft.)
Length along longest watercourse measured to centroid = 3373.00(Ft.)
Length along longest watercourse = 1.328 Mi.
Length along longest watercourse measured to centroid = 0.639 Mi.
Difference in elevation = 321.00(Ft.)
Slope along watercourse = 241.7114 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.278 Hr.
Lag time = 16.69 Min.
25% of lag time = 4.17 Min.
40% of lag time = 6.68 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	1.40	305.98

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
218.56	3.00	655.68

STORM EVENT (YEAR) = 2.00
Area Averaged 2-Year Rainfall = 1.400(In)
Area Averaged 100-Year Rainfall = 3.000(In)

Point rain (area averaged) = 1.400(In)
Areal adjustment factor = 99.92 %
Adjusted average point rain = 1.399(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
218.560	60.00	0.000

Total Area Entered = 218.56(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
60.0	40.0	0.670	0.000	0.670	1.000	0.670
					Sum (F) =	0.670

Area averaged mean soil loss (F) (In/Hr) = 0.670
Minimum soil loss rate ((In/Hr)) = 0.335
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

English Rainfall Data (Inches) Input Values Used

English Units used in output format

AREA "B"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
10 YEAR - 24 HOUR
FN: BUH1024EXIST

Drainage Area = 22.17(Ac.) = 0.035 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 22.17(Ac.) = 0.035 Sq. Mi.
Length along longest watercourse = 1554.00(Ft.)
Length along longest watercourse measured to centroid = 665.00(Ft.)
Length along longest watercourse = 0.294 Mi.
Length along longest watercourse measured to centroid = 0.126 Mi.
Difference in elevation = 68.00(Ft.)
Slope along watercourse = 231.0425 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.085 Hr.
Lag time = 5.12 Min.
25% of lag time = 1.28 Min.
40% of lag time = 2.05 Min.
Unit time = 5.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
22.17	2.50	55.43

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
22.17	8.00	177.36

STORM EVENT (YEAR) = 10.00
Area Averaged 2-Year Rainfall = 2.500(In)
Area Averaged 100-Year Rainfall = 8.000(In)

Point rain (area averaged) = 4.763(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.763(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
22.170	71.00	0.000

Total Area Entered = 22.17(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
71.0	71.0	0.350	0.000	0.350	1.000	0.350
					Sum (F) =	0.350

Area averaged mean soil loss (F) (In/Hr) = 0.350
Minimum soil loss rate ((In/Hr)) = 0.175
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

U n i t H y d r o g r a p h
VALLEY S-Curve

Unit Hydrograph Data

Unit time period (hrs)	Time % of lag	Distribution Graph %	Unit Hydrograph (CFS)
1	0.083	97.593	18.462	4.125
2	0.167	195.186	48.190	10.767
3	0.250	292.779	16.014	3.578

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6268

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

AREA "B"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
10 YEAR - 6 HOUR
FN: BUH106EXIST

Drainage Area = 22.17(Ac.) = 0.035 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 22.17(Ac.) = 0.035 Sq. Mi.
Length along longest watercourse = 1554.00(Ft.)
Length along longest watercourse measured to centroid = 665.00(Ft.)
Length along longest watercourse = 0.294 Mi.
Length along longest watercourse measured to centroid = 0.126 Mi.
Difference in elevation = 68.00(Ft.)
Slope along watercourse = 231.0425 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.085 Hr.
Lag time = 5.12 Min.
25% of lag time = 1.28 Min.
40% of lag time = 2.05 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
22.17	1.40	31.04

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
22.17	3.00	66.51

STORM EVENT (YEAR) = 10.00
Area Averaged 2-Year Rainfall = 1.400(In)
Area Averaged 100-Year Rainfall = 3.000(In)

Point rain (area averaged) = 2.058(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 2.058(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
22.170	71.00	0.000

Total Area Entered = 22.17(Ac.)

RI AMC2	RI AMC-2	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
71.0	71.0	0.350	0.000	0.350	1.000	0.350
					Sum (F) =	0.350

Area averaged mean soil loss (F) (In/Hr) = 0.350
Minimum soil loss rate ((In/Hr)) = 0.175
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

Unit	Time (Hr.)	Pattern Percent	Storm Rain (In/Hr)	Loss rate(In./Hr) Max	Low	Effective (In/Hr)
1	0.08	0.07	0.030	(0.974)	0.027	0.003
2	0.17	0.07	0.030	(0.970)	0.027	0.003

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6268

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

AREA "B"
TENTATIVE TRACT MAP 36294 - EXISTING CONDITION
5 YEAR - 6 HOUR
FN: BUH56EXIST

Drainage Area = 22.17(Ac.) = 0.035 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 22.17(Ac.) = 0.035 Sq. Mi.
Length along longest watercourse = 1554.00(Ft.)
Length along longest watercourse measured to centroid = 665.00(Ft.)
Length along longest watercourse = 0.294 Mi.
Length along longest watercourse measured to centroid = 0.126 Mi.
Difference in elevation = 68.00(Ft.)
Slope along watercourse = 231.0425 Ft./Mi.
Average Manning's 'N' = 0.035
Lag time = 0.085 Hr.
Lag time = 5.12 Min.
25% of lag time = 1.28 Min.
40% of lag time = 2.05 Min.
Unit time = 5.00 Min.
Duration of storm = 6 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
22.17	1.40	31.04

100 YEAR Area rainfall data:

Area(Ac.)[1]	Rainfall(In)[2]	Weighting[1*2]
22.17	3.00	66.51

STORM EVENT (YEAR) = 5.00
Area Averaged 2-Year Rainfall = 1.400(In)
Area Averaged 100-Year Rainfall = 3.000(In)

Point rain (area averaged) = 1.775(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 1.775(In)

Sub-Area Data:

Area(Ac.)	Runoff Index	Impervious %
22.170	71.00	0.000

Total Area Entered = 22.17(Ac.)

RI AMC2	RI AMC-1	Infil. Rate (In/Hr)	Impervious (Dec.%)	Adj. Infil. Rate (In/Hr)	Area% (Dec.)	F (In/Hr)
71.0	52.2	0.550	0.000	0.550	1.000	0.550
					Sum (F) =	0.550

Area averaged mean soil loss (F) (In/Hr) = 0.550
Minimum soil loss rate ((In/Hr)) = 0.275
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

Unit	Time (Hr.)	Pattern Percent	Storm Rain (In/Hr)	Loss rate(In./Hr) Max	Low	Effective (In/Hr)
1	0.08	0.07	0.020	(0.974)	0.018	0.002

Attn: Mr. Tom Koper, PE

Mr. Koper,

This letter is to address the Hydrological and WQMP studies previously prepared for PA-14 (new home phasing 2B). Please be advised that by lowering the elevation of PA-14 by 13' to generate needed soils to raise the proposed commercial site, the change will not result in any diversion or alteration of drainage patterns. While lowering the elevation of PA-14 by 13 feet could create approximately 1 additional acre of developable area, the drainage areas and discharge points will be maintained as envisioned in New Home master plan of drainage and the drainage facilities as designed are sufficiently sized to accommodate the additional discharge from the 1 acre increase in developable area. Similarly, water quality goals can be achieved in the same way as proposed by the master WQMP plan for the Bedford community. No additional water quality facilities are envisioned at this time and the currently designed water quality facilities have sufficient capacity to treat the increase in developable area associated with lowering the elevation of PA-14.

EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this noise study to determine the noise exposure and the necessary noise mitigation measures for the proposed Bedford Marketplace development ("Project") an expansion of the previously approved commercial development area included within the Arantine Hills Specific Plan. The 80,000 square feet (sf) of commercial retail use included in the Arantine Hills Specific Plan was evaluated in prior studies prepared for amendments to the Arantine Hills Specific Plan. The proposed Project represents the expansion of Bedford Marketplace from 80,000 sf to 135,000 sf of retail uses and a 135-room hotel. Consistent with the *Bedford Marketplace Traffic Study* (1) prepared by Urban Crossroads, Inc., the incremental expansion of Bedford Marketplace constitutes the "Project" analyzed in this study. Reference to "Bedford Marketplace" includes the total development of the center, equal to the combination of the proposed Project and the previously approved 80,000 sf in the Arantine Hills Specific Plan. The Project site is located south of Eagle Glen Parkway – Cajalco Road and west of the I-15 Freeway in the City of Corona

This study has been prepared consistent with applicable City of Corona noise standards, and significance criteria based on guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (2)

OFF-SITE PROJECT TRAFFIC NOISE ANALYSIS

Traffic generated by the operation of the proposed Project will influence the traffic noise levels in surrounding off-site areas. To quantify the off-site traffic noise increases on the surrounding off-site areas, the changes in traffic noise levels on 21 roadway segments surrounding the Project site were calculated based on the change in the average daily traffic (ADT) volumes. The traffic noise levels provided in this analysis are based on the traffic forecasts found in *Bedford Marketplace Traffic Study*. (1) To assess the off-site noise level impacts associated with the proposed Project, noise contour boundaries were developed for Existing, Interim Year 2021, and Horizon Year 2035 traffic conditions. The analysis shows that the unmitigated Project-related traffic noise level increases under all traffic scenarios will be *less than significant*.

SOIL IMPORT/EXPORT HAUL TRUCK OFF-SITE TRAFFIC NOISE ANALYSIS

To bring the Modified Bedford Marketplace Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad, import of approximately 440,000 cubic yards of dirt is required. The import operation is expected to include 250 full loads per night, assuming 15 cubic yards per load, for a total of 3,750 cubic yards per night. To import 440,000 cubic yards, approximately 118 nights of import would be required.

The Project proposes to import dirt during the hours (8:00 p.m. to 4:00 a.m.) and complete grading operations both during daytime and nighttime hours. A source of import has been identified from the FST Sand and Gravel Mine, located east of the I-15 Freeway. The dirt would be hauled from the borrow site on Minnesota Road to Sherborn Street to Magnolia Avenue to the I-15 Freeway southbound on ramp at Magnolia Avenue, exit at Cajalco Road and enter the

Modified Project Site by crossing Cajalco Road from the southbound off-ramp with traffic control. Trucks would return onto Cajalco Road, enter I-15 Freeway northbound to Magnolia Avenue to Sherborn Street and travel south to the borrow site.

The proposed soil import/export haul route was specially developed to avoid potentially significant impacts to potential noise sensitive residential land uses. The off-site soil import/export analysis shows that Project haul truck trip will generate a noise level increase ranging from 0.2 dBA CNEL on the I-15 Freeway to 5.4 dBA CNEL on Sherborn Street. A review of the haul route shows that the only adjacent noise sensitive residential land uses are located adjacent to the I-15 Freeway. Many of the noise sensitive residential land uses near the I-15 Freeway benefit from existing Caltrans sound walls that have been developed to reduce traffic noise. Based on the significance criteria outlined above, the Project soil import/export truck trip-related noise level increases are considered *less than significant* impacts at the land uses adjacent to roadways conveying Project haul truck traffic.

ON-SITE TRAFFIC NOISE IMPACTS

An on-site exterior noise impact analysis has been completed to determine the traffic noise exposure and to identify potential necessary noise abatement measures for the proposed Bedford Marketplace Project. It is expected that the primary source of noise impacts to the Project site will be traffic noise from the I-15 Freeway. To control transportation related noise sources, the City of Corona has adopted exterior and interior noise standards by land use type.

EXTERIOR NOISE

The City of Corona has adopted an exterior noise standard of 65 dBA CNEL for noise sensitive land uses. The exterior noise standards typically apply to outdoor areas where people congregate. The only noise sensitive outdoor area in the proposed Bedford Marketplace is the outdoor pool area. The City of Corona does not identify any exterior noise standards for any of the commercial land use activities such as the outdoor patio areas for proposed restaurant uses. The on-site traffic noise level impacts indicate that outdoor hotel pool area will experience unmitigated exterior noise levels of 52.3 dBA CNEL. Since the unmitigated on-site traffic noise levels satisfy the City of Corona 65 dBA CNEL exterior noise level standards, the on-site traffic noise level impacts are considered as *less than significant*.

INTERIOR NOISE

To satisfy the City of Corona 45 dBA CNEL interior noise level criteria for noise sensitive land use, hotel rooms facing the I-15 Freeway will require a Noise Level Reduction (NLR) of up to 26.5 dBA and a windows closed condition requiring a means of mechanical ventilation (e.g. air conditioning). In order to meet the City of Corona 45 dBA CNEL interior noise standards, the Project shall provide a minimum STC ratings of 30 for windows facing the I-15 Freeway. With the recommended upgraded windows, the future on-site interior traffic noise impacts are expected to meet the City of Corona 45 dBA CNEL interior noise level standards and will be *less than significant*.

PROJECT OPERATIONAL NOISE ANALYSIS

Using reference noise levels to represent the expected noise sources from the Bedford Marketplace site, this analysis estimates the Project-related stationary-source noise levels at nearby sensitive receiver locations. The normal activities associated with the proposed Bedford Marketplace are anticipated to include roof-top air conditioning units, drive-thru speakerphones, trash enclosures, parking lots, gas station activity, car wash tunnel, car wash vacuums, and outdoor playground activity.

The analysis shows that the Project-related operational noise levels will satisfy the City of Corona daytime and nighttime exterior noise level standards at the closest noise-sensitive receiver locations in the Project study area. Therefore, the operational noise impacts are considered *less than significant* at all receiver locations. In addition, the project operational noise level contribution analysis shows Project-related incremental noise level increase to the ambient noise environment would be *less than significant* at all receiver locations.

SOIL IMPORT/EXPORT CONSTRUCTION NOISE ANALYSIS

The applicant has identified two potential borrow sites to provide the necessary fill dirt. The FST Sand and Gravel Mine, located east of the I-15 Freeway and the Arantine Hills Specific Plan Phase 2B site.

FST SAND AND GRAVEL MINE BORROW SITE

During the nighttime hours, dirt would be imported to the Modified Project Site, dumped, and placed by grading equipment. Daytime grading activities would initially last for approximately two weeks and begin before import and overlap with initial import operations. The daytime activities include remedial grading, which requires the over-excavation of approximately four to six feet below existing ground surface. The over-excavated material would be stockpiled on site. Additional daytime grading would occur after imported material has be placed in the over-excavated areas to bring the site closer to proposed grades. The stockpiled material would then be placed over the imported material to create the finished building pad, compacted to meet geotechnical specifications.

According to the Project applicant, every effort will be made to limit on-site construction activities particularly during the noise sensitive nighttime hours. For this reason, the Applicant is proposing to limit nighttime operations to permit only the essential equipment needed to support the soil import/export haul truck operations. The results of the soil import/export construction noise analysis, all nearby receiver locations will experience *less than significant* impacts due to the daytime and nighttime soil import/export noise construction noise levels at the Project site.

PHASE 2B BORROW SITE

Preliminary estimates suggest that the existing Phase 2B site will be lowered by approximately 13 feet to provide the necessary supply of dirt for import. Unlike the FST Sand and Gravel Mine borrow site, Phase 2B will not require any off-site haul trucks. In addition, due to the proximity of Phase 2B to the Bedford Marketplace, import of dirt will limited to the daytime hours from 7:00 a.m. to 7:00 p.m.

SOIL IMPORT/EXPORT CONSTRUCTION NOISE ANALYSIS (DAYTIME)

The analysis shows that either borrow site will satisfy the City of Corona maximum acceptable threshold for determining the impacts due to Project construction for sensitive receiver's daytime exterior noise level of 75 dBA L_{max}. Therefore, based on the results of the analysis, all nearby receiver locations will experience *less than significant* impacts due to the daytime soil import/export noise construction noise levels at the Project site.

SOIL IMPORT/EXPORT CONSTRUCTION NOISE ANALYSIS (NIGHTTIME)

The estimated Project nighttime construction noise levels from the import of dirt from the FST Sand and Gravel Mine will satisfy the City of Corona 50 dBA L_{max} stationary source nighttime noise level thresholds at all receiver locations. Therefore, based on the results of the analysis, all nearby receiver locations will experience *less than significant* impacts due to the nighttime soil import/export noise construction noise levels at the Project site. However, planned nighttime Project soil import/export activity will require a noise variance consistent with the provisions outlined in the City of Corona Municipal Code Section 17.84.040(H)(1) to perform the evening and nighttime grading activities

PROJECT SITE CONSTRUCTION NOISE ANALYSIS

Construction-related noise impacts are expected to create temporary and intermittent high-level noise conditions at receivers surrounding the Project site when certain activities occur at the Project site boundary. Using sample reference noise levels to represent the planned construction activities of the Bedford Marketplace site, this analysis estimates the Project-related construction noise levels at nearby sensitive receiver locations. The analysis shows that the Project-related short-term construction noise levels, are expected to approach 63.9 dBA L_{max} and will not exceed the 75 dBA L_{max} construction noise level threshold at the nearby sensitive receiver locations. Therefore, based on the results of this analysis, all nearby sensitive receiver locations will experience *less than significant* impacts due to Project site construction noise levels.

SUMMARY OF CEQA SIGNIFICANCE FINDINGS

The results of this Bedford Marketplace Noise Impact Analysis are summarized below based on the significance criteria in Section 4 of this report consistent with Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (2).

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

1 INTRODUCTION

This noise analysis has been completed to determine the noise impacts associated with the development of the proposed Bedford Marketplace ("Project") an expansion of the previously approved commercial development area included within the Arantine Hills Specific Plan. The 80,000 square feet (sf) of commercial retail use included in the Arantine Hills Specific Plan was evaluated in prior studies prepared for amendments to the Arantine Hills Specific Plan. The proposed Project represents the expansion of Bedford Marketplace from 80,000 sf to 135,000 sf of retail uses and a 135-room hotel. Consistent with the *Bedford Marketplace Traffic Study* (1) prepared by Urban Crossroads, Inc., the incremental expansion of Bedford Marketplace constitutes the "Project" analyzed in this study. Reference to "Bedford Marketplace" includes the total development of the center, equal to the combination of the proposed Project and the previously approved 80,000 sf in the Arantine Hills Specific Plan. Based on the currently approved commercial trip generation in the Arantine Hills Traffic Assessment (November 2018), the Project is anticipated to generate an additional 2,061 external trips per day.

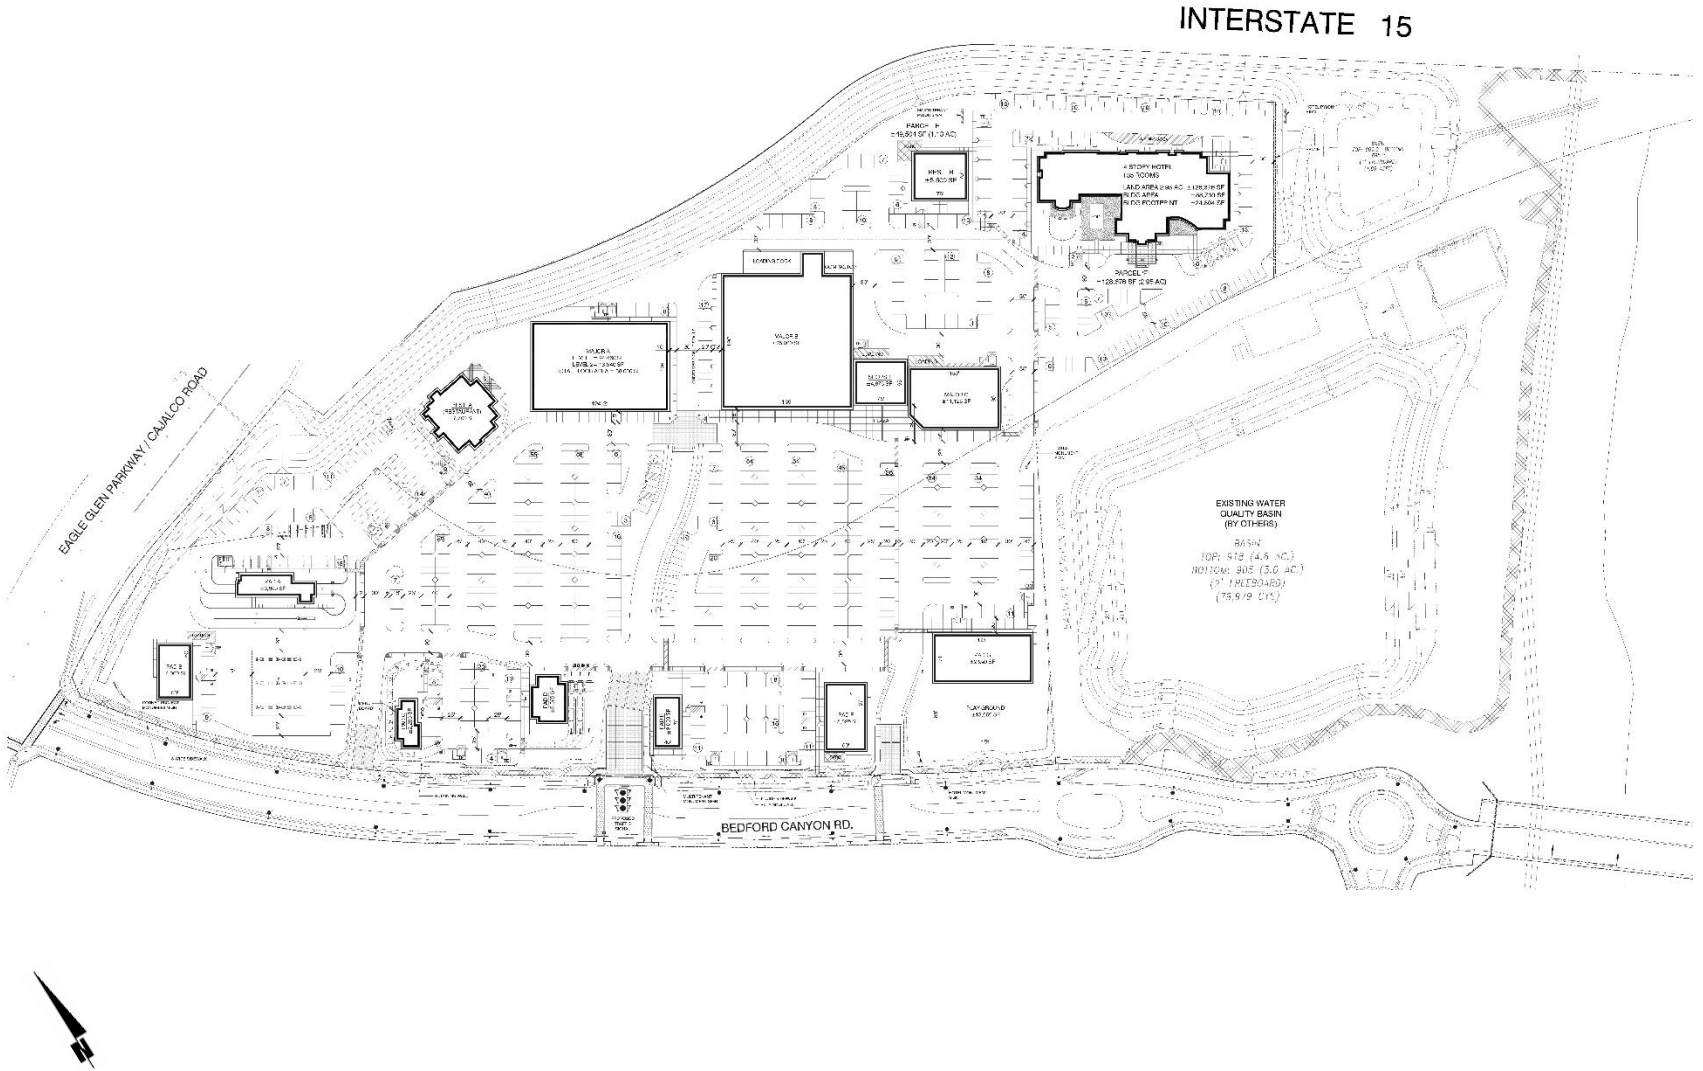
This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, describes the local regulatory setting, provides the study methods and procedures for transportation noise analysis, soil import/export haul traffic noise and evaluates the future exterior noise environment. In addition, this study includes an analysis of the potential Project-related long-term operational noise and short-term construction noise and vibration impacts.

1.1 SITE LOCATION

The Project site is located south of Eagle Glen Parkway – Cajalco Road and west of the I-15 Freeway in the City of Corona as shown on Exhibit 1-A. The Project site is currently vacant. Nearby existing residential land uses are located north, west, and south of the Project site. Commercial land uses near the Project site are located to the north at the I-15 Freeway southbound off-ramp, and east of the I-15 Freeway north of Cajalco Road. The Corona Municipal Airport is located approximately 6.5 miles northwest of the Project site.

1.2 BEDFORD MARKETPLACE LAND USE DESCRIPTION

The Bedford Marketplace site plan (shown on Exhibit 1-B) expands the approved commercial site and is proposed to consist of the following uses:



- Hotel - 135 rooms
- Health/fitness club - 38,000 sf
- Day Care Center - 9,990 sf
- Retail Shopping Center – 51,000 sf
- Bank – 6,562 sf
- Restaurant – 21,230 sf
- Gas Station – 18 vehicle fueling positions (vfp's)
- Automated Car Wash – 3,600 sf

The on-site Project-related noise sources are expected to include: roof-top air conditioning units, drive-thru speakerphones, trash enclosures, parking lots, gas station activity, car wash tunnel, car wash vacuums, and outdoor playground activity. This noise analysis is intended to describe noise level impacts associated with the expected typical, 24-hour seven days per week operational activities at the Project site.

2 FUNDAMENTALS

Noise has been simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90

LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0		

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (3) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA at approximately 100 feet, which can cause serious discomfort. (4) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period and is commonly used to describe the "average" noise levels within the environment.

To describe the time-varying character of environmental noise, the statistical or percentile noise descriptors L_{50}, L_{25}, L_8 and L_2, are commonly used. The percentile noise descriptors are the noise levels equaled or exceeded during 50 percent, 25 percent, 8 percent and 2 percent of a stated time. Sound levels associated with the L_2 and L_8 typically describe transient or short-term events, while levels associated with the L_{50} describe the steady state (or median) noise conditions. The City of Corona relies on the percentile noise levels to describe the stationary source noise level limits. While the L_{50} describes the noise levels occurring 50 percent of the time, the L_{eq} accounts for the total energy (average) observed for the entire hour.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The CNEL is the weighted average of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The time of day corrections require the addition of 5 decibels to dBA L_{eq} sound levels in the evening from 7:00 p.m. to 10:00 p.m., and the addition of 10 decibels to dBA L_{eq} sound levels at night between 10:00 p.m. and 7:00 a.m. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. CNEL does not represent the actual sound level heard at any time, but rather represents the total sound exposure. The City of Corona relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (3)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receiver is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (5)

2.3.3 ATMOSPHERIC EFFECTS

Receivers located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (3)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an “out of sight, out of mind” effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby resident. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure. (5)

2.4 NOISE CONTROL

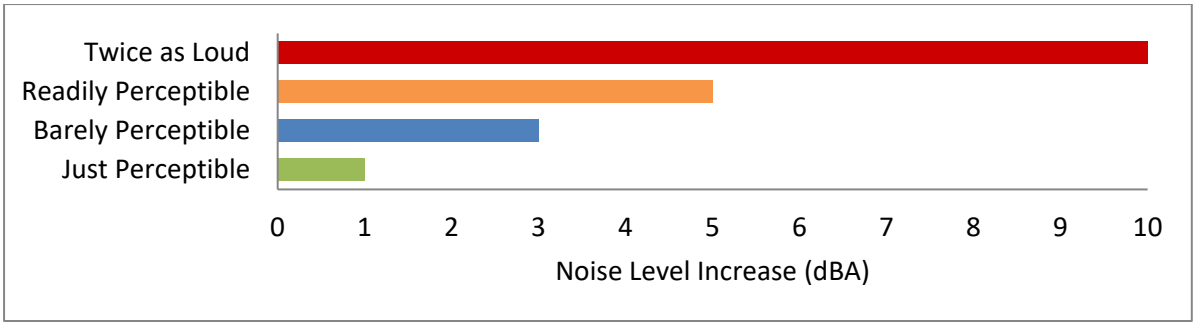
Noise control is the process of obtaining an acceptable noise environment for an observation point or receiver by controlling the noise source, transmission path, receiver, or all three. This concept is known as the source-path-receiver concept. In general, noise control measures can be applied to these three elements.

2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by up to 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receiver. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source. (5)

2.6 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (6)



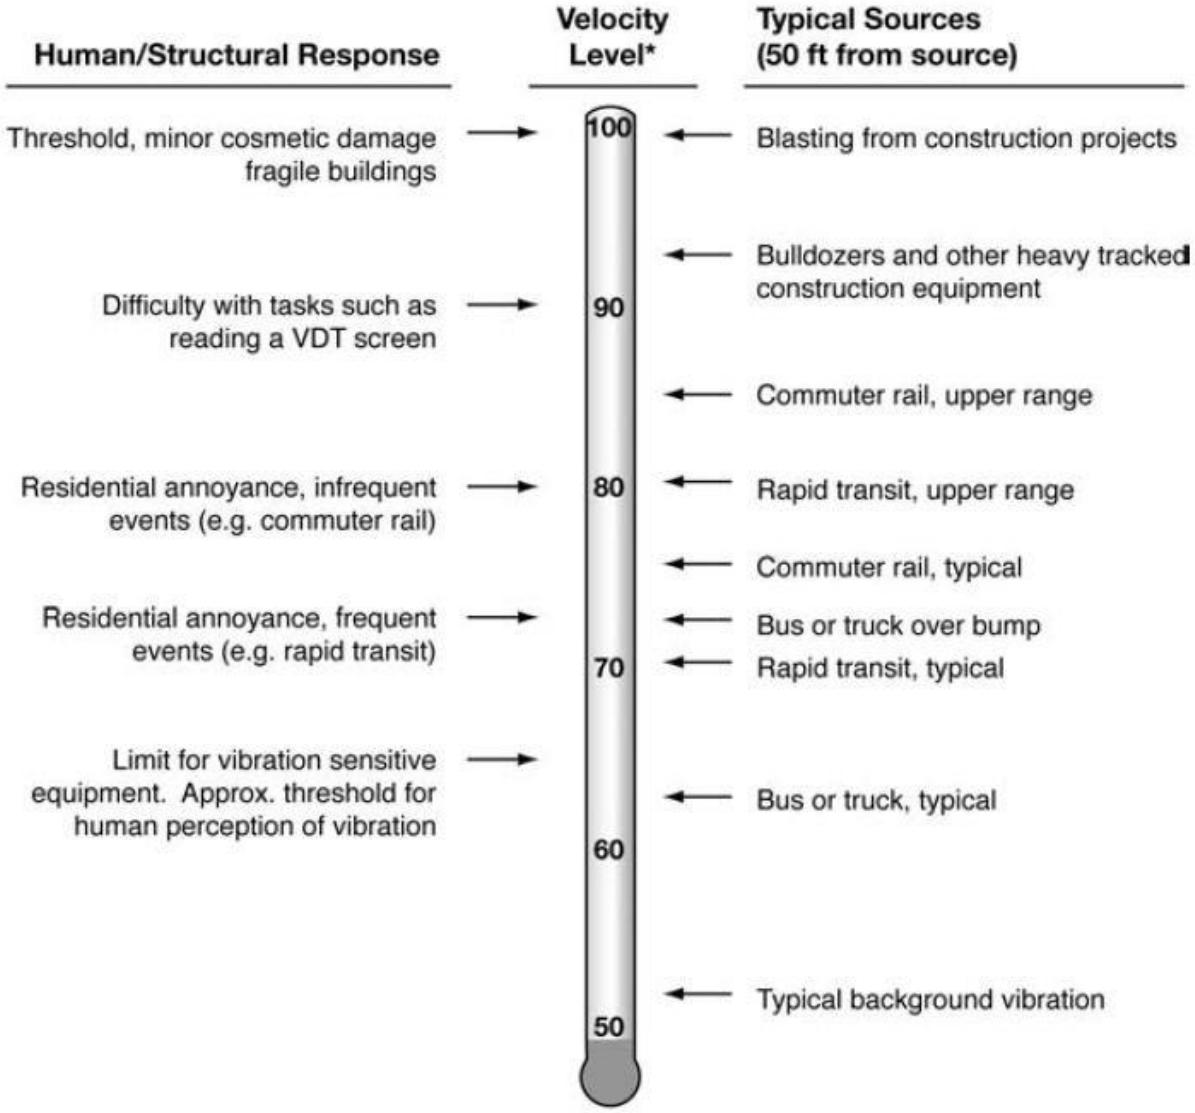
2.7 COMMUNITY RESPONSE TO NOISE

Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon everyone's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:

- Fear associated with noise producing activities;
- Socio-economic status and educational level;
- Perception that those affected are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Belief that the noise source can be controlled.

Approximately ten percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Another twenty-five percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. (7) Surveys have shown that about ten percent of the people exposed to traffic noise of 60 dBA will report being highly annoyed with the noise, and each increase of one dBA is associated with approximately two percent more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain. (7) Despite this variability in behavior on an individual level, the population can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. A change of 3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*. (5)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.8 VIBRATION

Per the Federal Transit Administration (FTA) *Transit Noise Impact and Vibration Assessment*, vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts to buildings but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. Decibel notation (VdB) serves to reduce the range of numbers used to describe human response to vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receivers for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment and/or activities.

The background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION

* *RMS Vibration Velocity Level in VdB relative to 10^{-6} inches/second*

3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared per guidelines adopted by the Governor's Office of Planning and Research (OPR). (8) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*. In addition, the California Environmental Quality Act (CEQA) requires that all known environmental effects of a project be analyzed, including environmental noise impacts.

3.2 STATE OF CALIFORNIA GREEN BUILDING STANDARDS CODE

The State of California's Green Building Standards Code contains mandatory measures for non-residential building construction in Section 5.507 on Environmental Comfort. (9) These noise standards are applied to new construction in California for controlling interior noise levels resulting from exterior noise sources. The regulations specify that acoustical studies must be prepared when non-residential structures are developed in areas where the exterior noise levels exceed 65 dBA CNEL, such as within a noise contour of an airport, freeway, railroad, and other areas where noise contours are not readily available. If the development falls within an airport or freeway 65 dBA CNEL noise contour, the combined sound transmission class (STC) rating of the wall and roof-ceiling assemblies must be at least 50. For those developments in areas where noise contours are not readily available, and the noise level exceeds 65 dBA L_{eq} for any hour of operation, a wall and roof-ceiling combined STC rating of 45, and exterior windows with a minimum STC rating of 40 are required (Section 5.507.4.1).

3.3 CITY OF CORONA GENERAL PLAN PUBLIC HEALTH AND SAFETY ELEMENT

The City of Corona has adopted a Noise section in its Public Health and Safety Element of the General Plan to control and abate environmental noise, and to protect the citizens of the City of Corona from excessive exposure to noise. (10) The Public Health and Safety Element specifies the maximum allowable exterior noise levels for new developments impacted by transportation noise sources such as arterial roads, freeways, airports and railroads. In addition, the Public

Health and Safety Element identifies several polices to minimize the impacts of excessive noise levels throughout the community and establishes noise level requirements for all land uses. To protect City of Corona residents from excessive noise, the Public Health and Safety Element contains the following six goals:

11.4 Ensure that appropriate actions are taken to protect residents, visitors, and noise-sensitive land uses from adverse human health and environmental impacts created by excessive noise levels from ambient sources.

11.5 Prevent and mitigate the adverse impacts of excessive ambient noise exposure on residents, employees, visitors, and noise-sensitive land uses within the City of Corona.

11.6 Provide sufficient information concerning community noise levels to ensure that noise can be objectively considered and incorporated into land use planning.

11.7 Provide for the reduction of noise spillover or encroachment where the noise environment from commercial and industrial land uses is unacceptable; and protect and maintain adjoining residential areas and other noise-sensitive areas having acceptable noise environments.

11.8 Minimize potentially adverse noise impacts associated with the development of mixed-use structures in which residential dwelling units are proposed above ground floor commercial or institutional uses.

11.9 Minimize noise impacts created by the Santa Fe railroad transit on residential areas and other noise-sensitive land use areas.

To protect its residents, visitors, and noise-sensitive land uses from high levels of noise (Goal 11.4), Table 4 of the Public Health and Safety Element identifies guidelines to evaluate proposed developments based on exterior and interior noise level limits for land uses. The Public Health and Safety Element requires new developments in areas where existing ambient exterior noise levels already exceed 65 dBA CNEL to include satisfactory buffering or construction mitigation measures to reduce noise impacts to levels lower than the standards found in Table 5 (Goal 11.5). To satisfy Goal 11.6, the City will maintain its Noise Ordinance and noise regulations to incorporate noise considerations into land use planning decisions for future incompatibilities. The intent of Goal 11.7 is to require new commercial and industrial uses to include mitigation measures in the site design in order to reduce impacts to neighboring noise-sensitive land uses. To mitigate the noise from mixed-use development (Goal 11.8), the Public Health and Safety Element requires mixed-use structures to incorporate noise reducing design elements and prohibits high noise-generating uses below or near residential land uses unless a noise analysis can demonstrate appropriate noise mitigation is attainable. Goal 11.9 seeks to prevent current and future operations of the Santa Fe railroad from impacting noise-sensitive land uses through rail line maintenance, noise mitigation features, and lower speed limits during early morning and late evening hours. (10)

3.3.1 LAND USE COMPATIBILITY

The noise criteria identified in the City of Corona Public Health and Safety Element (Table 4) are guidelines to evaluate the land use compatibility of transportation related noise. The compatibility criteria, shown on Exhibit 3-A, provides the City with a planning tool to gauge the compatibility of land uses relative to existing and future exterior noise levels

The *Land Use Noise Compatibility Matrix* describes categories of compatibility and not specific noise standards. The proposed Bedford Marketplace contains a hotel, health/fitness club, day care center, retail shopping center, bank, restaurants, gas station and automated car wash uses.

These general commercial land uses are considered *clearly compatible* with unmitigated exterior noise levels of less than 60 dBA CNEL, *normally compatible* with unmitigated exterior noise levels approaching 70 dBA CNEL and *normally incompatible* with unmitigated exterior noise levels approaching 80 dBA CNEL. For *normally incompatible* land use, *new construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of noise reduction requirements must be made and needed noise insulation features included in the design.*

3.3.2 ON-SITE TRANSPORTATION NOISE STANDARDS

The City of Corona General Plan Public Health and Safety Element specifies the maximum noise levels allowable for new developments impacted by transportation noise sources such as arterial roads, freeways, airports and railroads.

For noise-sensitive uses, Table 5 *Interior and Exterior Noise Standards* of the Public Health and Safety Element indicates that the exterior noise levels shall not exceed 65 dBA CNEL and interior noise levels of 45 dBA CNEL. The 65 dBA CNEL exterior noise standards typically apply to outdoor areas where people congregate. In relation to the proposed Bedford Marketplace, the 65 dBA CNEL exterior noise standards apply only to the hotel outdoor pool area. The City of Corona does not identify any exterior noise standards for other commercial land use activities such as restaurant outdoor patio areas. The City of Corona transportation noise standards are shown on Exhibit 3-B.

EXHIBIT 3-A: LAND USE NOISE COMPATIBILITY MATRIX

Land Use Categories		*Community Noise Equivalent Level CNEL*						
Categories	*Uses*	*<55*	*60*	*65*	*70*	*75*	*80>*

Interpretation

Zone A Clearly Compatible	Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
Zone B Normally Compatible	New construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice. Note that residential uses are prohibited with airport CNEL greater than 65.
Zone C Normally Incompatible	New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of noise reduction requirements must be made and needed noise insulation features included in the design.
Zone D Clearly Incompatible	New construction of development should generally not be undertaken.

EXHIBIT 3-B: INTERIOR AND EXTERIOR NOISE STANDARDS

Land Use Categories		Energy Average CNEL	
Categories	Uses	Interior[1]	Exterior[2]
RESIDENTIAL	Single Family, Duplex, Multiple Family	45[3]	65
	Mobile Home	NA	65[4]

OPEN SPACE	Parks	NA	65

INTERPRETATION

1. Indoor environment excluding bathrooms, toilets, closets, corridors.
2. Outdoor environment limited to:
   - Private yard of single family
   - Multi-family private patio or balcony that is served by a means of exit from inside
   - Mobile home park
   - Hospital patio
   - Park's picnic area
   - School's playground
   - Hotel and motel recreation area
3. Noise level requirement with closed windows. Mechanical ventilating system or other means of natural ventilation shall be provided as of Chapter 12, Section 1205 of UBC.
4. Exterior noise level should be such that interior noise level will not exceed 45 CNEL
5. Except those areas affected by aircraft noise.

3.4 OPERATIONAL NOISE STANDARDS

To analyze noise impacts originating from a designated fixed location or private property such as the Bedford Marketplace, operational source noise such as roof-top air conditioning units, drive-thru speakerphones, trash enclosures, parking lots, gas station activity, car wash tunnel, car wash vacuums, and outdoor playground activity are typically evaluated against standards established under a City's Municipal Code.

3.4.1 CITY OF CORONA OPERATIONAL NOISE STANDARDS

The City of Corona Municipal Code, Section 17.84.040 *Noise*, provides noise control guidelines for determining and mitigating non-transportation or stationary-source noise impacts from operations at private properties. The City of Corona Municipal Code defines *Stationary Noise Source Standards* in Section 17.84.040(C)(2), Table 1, for different land uses. For noise-sensitive residential properties, the Municipal Code identifies operational noise level limits for the daytime (7:00 a.m. to 10:00 p.m.) hours of 55 dBA L_{50} and 50 dBA L_{50} during the nighttime (10:00 p.m. to 7:00 a.m.) hours. (11) These standards shall apply for a cumulative period of 30 minutes in any hour, as well as plus 5 dBA cannot be exceeded for a cumulative period of more than 15 minutes in any hour, or the standard plus 10 dBA for a cumulative period of more than 5 minutes in any

hour, or the standard plus 15 dBA for a cumulative period of more than 1 minute in any hour, or the standard plus 20 dBA for any period of time. The City of Corona Municipal Code noise standards are shown on Table 3-1 and included in Appendix 3.1.

TABLE 3-1: OPERATIONAL NOISE STANDARDS

Jurisdiction	Land Use	Time Period	Exterior Noise Level Standards (dBA Leq)[2]				
			L_{50} (30 mins)	L_{25} (15 mins)	L_8 (5 mins)	L_2 (1 min)	L_{max} (Anytime)
City of Corona[1]	Residential	Daytime	55.0	60.0	65.0	70.0	75.0
		Nighttime	50.0	55.0	60.0	65.0	70.0

[1] Source: City of Corona Municipal Code, Section 17.84.040 Noise (Appendix 3.1).
[2] The percent noise level is the level exceeded "n" percent of the time during the measurement period. L25 is the noise level exceeded 25% of the time.
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

3.5 CONSTRUCTION NOISE STANDARDS

To analyze noise impacts originating from the construction of the Bedford Marketplace, noise from construction activities are typically evaluated against standards established under a City's Municipal Code. The construction-related noise standards for the City are summarized in Table 3-2.

3.5.1 CITY OF CORONA CONSTRUCTION NOISE STANDARDS

Section 17.84.040(D)(2) of the City of Corona Municipal Code, provided in Appendix 3.1, indicates that construction noise is prohibited between the hours of 8:00 p.m. to 7:00 a.m., Monday through Saturday and 6:00 p.m. to 10:00 a.m. on Sundays and federal holidays. (11) Construction noise is defined as noise which is disturbing, excessive or offensive and constitutes a nuisance involving discomfort or annoyance to persons of normal sensitivity residing in the area, which is generated by the use of any tools, machinery or equipment used in connection with construction operations. The City of Corona Municipal Code effectively considers construction noise as exempt if construction noise is limited to the permitted hours of activity.

However, neither the General Plan nor Municipal Code establish numeric maximum acceptable construction source noise levels at potentially affected receivers, which would allow for a quantified determination of what CEQA constitutes a *substantial temporary or periodic noise increase*. To allow for a quantified determination of what the City of Corona Municipal Code constitutes as noise that *may be detrimental to the public health, safety or general welfare* due to Project construction activity, relevant stationary source noise standards established in Section 17.84.040(C)(2) Table 1, are used in this analysis to assess the Project construction noise levels at nearby sensitive receivers. Section 17.84.040(C)(2) Table 1 establishes a maximum allowable exterior noise level standard for residential land use of 55 dBA L_{50} for a cumulative period of more 30 minutes in any hour. This same noise standard limits the exterior noise levels to the noise standard (55 dBA) plus 20 dBA for any period of time. This effectively limits the maximum noise

level to 75 dBA L_{max} as shown on Table 3-1. Therefore, consistent with the City of Corona Municipal Code, an exterior noise level of 75 dBA L_{max} is used to describe the maximum acceptable threshold for determining the impacts due to Project construction for sensitive receivers. The City of Corona construction noise standards are shown on Table 3-2 and included in Appendix 3.1.

TABLE 3-2: CONSTRUCTION NOISE STANDARDS

Jurisdiction	Permitted Hours of Construction Activity	Construction Noise Level Standard
City of Corona[1]	7:00 a.m. to 8:00 p.m. Monday to Saturday; 10:00 a.m. to 6:00 p.m. on Sundays & Holidays.	75 dBA L_{max}

[1] Source: City of Corona Municipal Code, Section 17.84.040(D)(2) (Appendix 3.1).
[2] Acceptable construction noise threshold based on the maximum stationary source noise level standards shown on Table 3-1.

3.6 CONSTRUCTION VIBRATION STANDARDS

To analyze the vibration impacts originating from the construction of the Project, vibration from construction activities are typically evaluated against standards established under a City's Municipal Code.

3.6.1 CITY OF CORONA VIBRATION STANDARDS

The City of Corona Municipal Code, Section 17.84.050, identifies a vibration velocity standard of 0.05 in/sec root-mean-square (RMS) for sensitive land uses which is used in this analysis as the basis for determining the relative significance of potential Project related vibration impacts. (11) The City of Corona vibration standards are shown on Table 3-3 and included in Appendix 3.1.

3.6.2 HUMAN PERCEPTION OF VIBRATION

Typically, the human response at the perception threshold for vibration includes annoyance in residential areas as previously shown on Exhibit 2-B, when vibration levels expressed in vibration decibels (VdB) approach 75 VdB. The City of Corona, however, identifies a vibration perception threshold of 0.05 in/sec at or beyond the property line of the source land use. For vibration levels expressed in velocity, the human body responds to the average vibration amplitude often described as the root-mean-square (RMS). The RMS of a signal is the average of the squared amplitude of the signal, typically calculated over a one-second period. As with airborne sound, the RMS velocity is often expressed in decibel notation as vibration decibels (VdB), which serves to reduce the range of numbers used to describe human response to vibration. Therefore, the City of Corona vibration standard of 0.05 in/sec in RMS velocity levels is used in this analysis to assess the human perception of vibration levels due to Project-related construction activities.

TABLE 3-3: CONSTRUCTION VIBRATION STANDARDS

Jurisdiction	Root-Mean-Square Velocity Standard (in/sec)
City of Corona[1]	0.05

[1] Source: City of Corona Municipal Code, Section 17.84.050 Vibration (Appendix 3.1).

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on currently adopted guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (2) For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

B. Generation of excessive ground-borne vibration or ground-borne noise levels?

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

While the City of Corona General Plan Guidelines provide direction on noise compatibility and establish noise standards by land use type that are sufficient to assess the significance of noise impacts, they do not define the levels at which increases are considered substantial for use under Guideline A. CEQA Appendix G Guideline C applies to nearby public and private airports, if any, and the Project's land use compatibility.

4.1 CEQA GUIDELINES NOT FURTHER ANALYZED

The Project site is located roughly 6.5 miles southeast of Corona Municipal Airport. Therefore, the Project site is not located within two miles of a public airport or the vicinity of a private airstrip, and as such, no impact related to the exposure of people residing or working in the Project area to excessive airport related noise levels is anticipated.

4.2 PROJECT RELATED NOISE LEVEL INCREASES

Noise level increases resulting from the Project are evaluated based on the Appendix G CEQA Guidelines described above at the closest sensitive receiver locations. Under CEQA, consideration must be given to the magnitude of the increase, the existing ambient noise levels, and the location of noise-sensitive receivers to determine if a noise increase represents a significant adverse environmental impact. This approach recognizes *that there is no single noise increase that renders the noise impact significant.* (12) Unfortunately, there is no completely satisfactory way to measure the subjective effects of noise or of the corresponding human reactions of annoyance and dissatisfaction. This is primarily because of the wide variation in individual thresholds of annoyance and differing individual experiences with noise. Thus, an important way of determining a person's subjective reaction to a new noise is the comparison of it to the existing environment to which one has adapted—the so-called *ambient* environment.

In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will typically be judged. The Federal Interagency Committee on Noise (FICON) (13) developed guidance to be used for the assessment of project-generated increases in noise levels that consider the ambient noise level. The FICON recommendations are based on

studies that relate aircraft noise levels to the percentage of persons highly annoyed by aircraft noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these recommendations are often used in environmental noise impact assessments involving the use of cumulative noise exposure metrics, such as the average-daily noise level (CNEL) and equivalent continuous noise level (L_{eq}).

As previously stated, the approach used in this noise study recognizes *that there is no single noise increase that renders the noise impact significant*, based on a 2008 California Court of Appeal ruling on Gray v. County of Madera. (12) For example, if the ambient noise environment is quiet (<60 dBA) and the new noise source greatly increases the noise levels, an impact may occur if the noise criteria may be exceeded. Therefore, for this analysis, FICON identifies a *readily perceptible* 5 dBA or greater project-related noise level increase is considered a significant impact when the noise criteria for a given land use is exceeded. Per the FICON, in areas where the without project noise levels range from 60 to 65 dBA, a 3 dBA *barely perceptible* noise level increase appears to be appropriate for most people. When the without project noise levels already exceed 65 dBA, any increase in community noise louder than 1.5 dBA or greater is considered a significant impact if the noise criteria for a given land use is exceeded, since it likely contributes to an existing noise exposure exceedance. Table 4-1 below provides a summary of the potential noise impact significance criteria, based on guidance from FICON.

TABLE 4-1: SIGNIFICANCE OF NOISE IMPACTS AT NOISE-SENSITIVE RECEIVERS

Without Project Noise Level	Potential Significant Impact
< 60 dBA	5 dBA or more
60 - 65 dBA	3 dBA or more
> 65 dBA	1.5 dBA or more

Federal Interagency Committee on Noise (FICON), 1992.

4.3 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development. The significance criteria are shown on Table 4-2.

OFF-SITE TRAFFIC NOISE

- When the noise levels at existing and future noise-sensitive land uses (e.g. residential, etc.):
    - are less than 60 dBA CNEL and the Project creates a *readily perceptible* 5 dBA CNEL or greater Project-related noise level increase; or
    - range from 60 to 65 dBA CNEL and the Project creates a *barely perceptible* 3 dBA CNEL or greater Project-related noise level increase; or
    - already exceed 65 dBA CNEL, and the Project creates a community noise level increase of greater than 1.5 dBA CNEL (FICON, 1992).

ON-SITE TRAFFIC NOISE

- If the on-site exterior noise levels exceed 65 dBA CNEL at the outdoor pool area of the hotel use. Interior noise levels shall not exceed 45 dBA CNEL for hotel uses and 55 dBA CNEL for all other commercial uses consistent with the General Plan Public Health and Safety Element interior and exterior noise standards. (See Exhibit 3-B).

OPERATIONAL NOISE

- If Project-related operational (stationary-source) noise levels:
    - exceed the exterior 55 dBA L_{50} daytime or 50 dBA L_{50} nighttime noise level standards for sensitive residential land uses. These standards shall not be exceeded for a cumulative period of 30 minutes (L_{50}), or plus 5 dBA cannot be exceeded for a cumulative period of more than 15 minutes (L_{25}) in any hour, or the standard plus 10 dBA for a cumulative period of more than 5 minutes (L_8) in any hour, or the standard plus 15 dBA for a cumulative period of more than 1 minute (L_2) in any hour, or the standard plus 20 dBA at any time (L_{max}) (City of Corona Municipal Code, Section 17.84.040).
- If the existing ambient noise levels at the nearby noise-sensitive receivers near the Project site:
    - are less than 60 dBA L_{50} and the Project creates a readily perceptible 5 dBA L_{50} or greater Project-related noise level increase; or
    - range from 60 to 65 dBA L_{50} and the Project creates a barely perceptible 3 dBA L_{50} or greater Project-related noise level increase; or
    - already exceed 65 dBA L_{50}, and the Project creates a community noise level increase of greater than 1.5 dBA L_{50} (FICON, 1992).

CONSTRUCTION NOISE

- If Project-related construction activities:
    - occur at any time other than between the permitted the hours of 7:00 a.m. and 8:00 p.m., Monday through Saturday, and 10:00 a.m. and 6:00 p.m. on Sundays and Federal holidays (City of Corona Municipal Code Section 17.84.040(D)(2)); or
    - create noise levels at sensitive residential receivers in the which exceed the short-term construction noise level limit of 75 dBA L_{max} (City of Corona Municipal Code Section 17.84.040).

CONSTRUCTION VIBRATION

- If short-term Project generated construction source vibration levels exceed the City of Corona maximum acceptable vibration standard of 0.05 in/sec at noise-sensitive receiver locations (City of Corona Municipal Code Section 17.84.050).

TABLE 4-2: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Receiving Land Use	Condition(s)	Significance Criteria	
			Daytime	Nighttime
Off-Site Traffic	Noise-Sensitive[1]	If ambient is < 60 dBA CNEL	≥ 5 dBA CNEL Project increase	
		If ambient is 60 - 65 dBA CNEL	≥ 3 dBA CNEL Project increase	
		If ambient is > 65 dBA CNEL	≥ 1.5 dBA CNEL Project increase	
On-Site Traffic[2]	Hotel	Exterior Noise Level Standard	65 dBA CNEL (hotel pool)	
		Interior Noise Level Standard	45 dBA CNEL	
	Commercial	Exterior Noise Level Standard	n/a	
		Interior Noise Level Standard	55 dBA CNEL	
Operational	Noise-Sensitive	Exterior Noise Level Standards[3]	See Table 3-1.	
Construction	Noise-Sensitive	Noise Level Threshold[3]	75 dBA L_{max}	n/a
		Vibration Level Threshold[4]	0.05 in/sec RMS	n/a

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, 24-hour noise level measurements were taken at four locations in the Project study area. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibit 5-A provides the boundaries of the Project study area and the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Friday, August 2nd, 2019. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the daytime and nighttime hourly noise levels and calculate the 24-hour CNEL. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (14)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent every part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (3) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (15)

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. (15) In other words, the area represented by the receiver shares similar shielding, terrain, and geometric relationship to the reference noise source. Receivers represent a location of noise sensitive areas and are used to estimate the future noise level impacts. Collecting reference ambient noise level measurements at the nearby sensitive receiver locations allows for a comparison of the before and after Project noise levels

and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (L_{eq}). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) noise levels at each noise level measurement location. Appendix 5.2 provides a summary of the existing hourly ambient noise levels described below:

- Location L1 represents the noise levels northwest of Project site on Eagle Glen Parkway and Bedford Canyon Road near existing residential homes. The noise levels at this location consist primarily of traffic noise from Glen Eagle Parkway and Bedford Canyon Road. The noise level measurements collected show an overall 24-hour exterior noise level of 71.4 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 67.3 dBA L_{eq} with an average nighttime noise level of 63.9 dBA L_{eq}.
- Location L2 represents the noise levels west of the Project site near existing vacant dirt lot. The ambient noise levels at this location account for the background traffic from Glen Eagle Parkway and Interstate 15 Freeway. The noise level measurements collected show an overall 24-hour exterior noise level of 62.7 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 57.3 dBA L_{eq} with an average nighttime noise level of 55.8 dBA L_{eq}.
- Location L3 represents the noise levels South of the project site on Glen Road and North Weirick Road near vacant land and existing residential homes. The noise level measurements collected show an overall 24-hour exterior noise level of 59.0 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 53.3 dBA L_{eq} with an average nighttime noise level of 52.1 dBA L_{eq}. The noise levels at this location consist primarily of traffic noise from North Weirick Road and Glen Road.
- Location L4 represents the noise levels southeast of the Project site on Glen Road near existing residential homes and vacant lot. The 24-hour CNEL indicates that the overall exterior noise level is 55.9 dBA CNEL. The energy (logarithmic) average daytime noise level was calculated at 49.6 dBA L_{eq} with an average nighttime noise level of 49.2 dBA L_{eq}. Traffic on Glen Road represents the primary source of noise at this location.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods.

The background ambient noise levels in the Project study area are dominated by the transportation-related noise associated with surface streets as well as Interstate 15. This includes the auto and heavy truck activities on study area roadway segments near the noise level measurement locations. The 24-hour existing noise level measurement results are shown on Table 5-1.

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Description	Energy Average Noise Level (dBA L_{eq})[2]		Median Noise Level (dBA L_{50})[2]		CNEL
		Daytime	Nighttime	Daytime	Nighttime	
L1	Located northwest of Project site on Eagle Glen Parkway and Bedford Canyon Road near existing residential homes.	67.3	63.9	60.2	53.7	71.4
L2	Located west of the Project site near existing vacant dirt lot.	57.3	55.8	54.4	52.1	62.7
L3	Located South of the project site on Glen Road and North Weirick Road near vacant land and existing residential homes.	53.3	52.1	52.0	50.8	59.0
L4	Located southeast of the Project site on Glen Road near existing residential homes and vacant lot.	49.6	49.2	47.7	47.7	55.9

Noise Measurement Locations

6 METHODS AND PROCEDURES

The following section outlines the methods and procedures used to model and analyze the future traffic noise environment.

6.1 FHWA TRAFFIC NOISE PREDICTION MODEL

The estimated roadway noise impacts from vehicular traffic were calculated using a computer program that replicates the Federal Highway Administration (FHWA) Traffic Noise Prediction Model- FHWA-RD-77-108. (16) The FHWA Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). In California the national REMELs are substituted with the California Vehicle Noise (Calveno) Emission Levels. (17) Adjustments are then made to the REMEL to account for: the roadway classification (e.g., collector, secondary, major or arterial), the roadway active width (i.e., the distance between the center of the outermost travel lanes on each side of the roadway), the total average daily traffic (ADT), the travel speed, the percentages of automobiles, medium trucks, and heavy trucks in the traffic volume, the roadway grade, the angle of view (e.g., whether the roadway view is blocked), the site conditions ("hard" or "soft" relates to the absorption of the ground, pavement, or landscaping), and the percentage of total ADT which flows each hour throughout a 24-hour period. Research by Caltrans has shown that the use of soft site conditions is appropriate for the application of the FHWA traffic noise prediction model used in this analysis. (18)

6.2 OFF-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

Table 6-1 presents the roadway parameters used to assess the Project's off-site transportation noise impacts. Table 6-1 identifies the 21 study area roadway segments, the distance from the centerline to adjacent land use based on the functional roadway classifications per the City of Corona General Plan Circulation Element, and the posted vehicle speeds. For the purpose of the off-site analysis, soft site conditions were used to analyze the traffic noise impacts for the Project study area. Soft site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation.

6.2.1 PROJECT TRAFFIC

The Existing, Interim Year 2021, and Horizon Year 2035 average daily traffic volumes used for this study are presented on Table 6-2 and are provided by *Bedford Marketplace Traffic Study*. (1) Table 6-3 presents the time of day vehicle splits and Table 6-4 presents the traffic flow distributions (vehicle mix) used for this analysis. The vehicle mix provides the hourly distribution percentages of automobile, medium trucks and heavy trucks for input into the FHWA noise prediction model

6.2.2 SOIL IMPORT/EXPORT HAUL TRUCK TRAFFIC

The Existing and Existing with Project (haul truck trips) average daily traffic volumes used for the soil import/export off-site traffic noise analysis are presented on Table 6-5. The without project average daily traffic volumes shown on Table 6-5 are based the published City of Corona average daily traffic volumes and the Kearny Sherborn Traffic Study prepared by Urban Crossroads, Inc. The with Project haul truck trips include both the 250 import and 250 export trips representing a total of 500 two-way (import and export) trips.

TABLE 6-5: SOIL IMPORT/EXPORT HAUL TRUCK AVERAGE DAILY TRAFFIC VOLUMES

ID	Roadway	Segment	Adjacent Existing Land Use	Average Daily Traffic Volumes[1]	
				Without Project[1]	With Project Haul Truck Trips
1	I-15 Freeway	n/o Cajalco Rd.	Residential/Commercial	164,000	164,500
2	Magnolia Ave.	e/o I-15 Freeway	Commercial/Industrial	40,000	40,500
3	Sherborn St.	s/o Magnolia Ave.	Commercial/Industrial	7,900	8,400

[1] Source: City of Corona Average Daily Traffic Volumes (5/30/2017) and Kearny Sherborn Traffic Study (7/25/2019).

To quantify the off-site traffic noise levels, the Project related haul trips were added to the heavy truck category in the FHWA noise prediction model. The addition of the Project related haul trips increases the percentage of heavy trucks in the vehicle mix. This approach recognizes that the FHWA noise prediction model is significantly influenced by the number of heavy trucks in the vehicle mix. Table 6-6 presents the without project traffic flow distribution by vehicle type.

TABLE 6-6: WITHOUT SOIL IMPORT/EXHPORT HAUL TRUCK TRIPS (VEHICLE MIX)

ID	Roadway	Segment	Total % Traffic Flow			Total
			Autos	Medium Trucks	Heavy Trucks	
1	I-15 Freeway	n/o Cajalco Rd.	94.39%	1.95%	3.66%	100%
2	Magnolia Ave.	e/o I-15 Freeway	97.42%	1.84%	0.74%	100%
3	Sherborn St.	s/o Magnolia Ave.	97.42%	1.84%	0.74%	100%

Table 6-7 presents the with project haul trips traffic flow distribution by vehicle type. As shown on Table 6-7, all the off-site roadway segments have a higher percentage of heavy trucks reflecting the additional haul heavy truck trips.

TABLE 6-7: WITH SOIL IMPORT/EXHPORT HAUL TRUCK TRIPS (VEHICLE MIX)

ID	Roadway	Segment	Total % Traffic Flow			Total
			Autos	Medium Trucks	Heavy Trucks	
1	I-15 Freeway	n/o Cajalco Rd.	94.10%	1.94%	3.95%	100%
2	Magnolia Ave.	e/o I-15 Freeway	96.25%	1.82%	1.93%	100%
3	Sherborn St.	s/o Magnolia Ave.	91.09%	1.72%	7.19%	100%

6.3 ON-SITE TRAFFIC NOISE PREDICTION MODEL INPUTS

The on-site roadway parameters including the average daily traffic (ADT) volumes used for this study are presented on Table 6-8. The traffic volumes shown on Table 6-5 reflect future long-range traffic conditions needed to assess the future on-site traffic noise environment and to identify the any noise mitigation measures to address the worst-case future conditions. For the purposes of this analysis, soft site conditions were used to analyze the on-site traffic noise impacts for the Project study area. Soft site conditions account for the sound propagation loss over natural surfaces such as normal earth and ground vegetation.

TABLE 6-8: ON-SITE ROADWAY PARAMETERS

Roadway Segment	Lanes	Classification	Traffic Volume[1]	Speed (MPH)	Site Conditions
I-15 Freeway s/o Cajalco Rd.	6	Freeway	198,280	65	Soft

[1] Source: Arantine Hills Modified Project Traffic Study (March 2015).

The site plan was used to identify the relationship between the roadway centerline elevation, the pad elevation and the centerline distance to the noise barrier, and the building façade. The exterior noise level impacts at the outdoor pool area of the hotel use were placed five feet above the pad elevation. The second floor receivers were located 15 feet above the proposed finished floor elevation, all third floor receivers were located 25 feet above the proposed finished floor elevation and all fourth floor receiver were located 35 feet above the proposed finished floor elevation.

6.4 VIBRATION ASSESSMENT

This analysis focuses on the potential ground-borne vibration associated with vehicular traffic and construction activities. Ground-borne vibration levels from automobile traffic are generally overshadowed by vibration generated by heavy trucks that roll over the same uneven roadway surfaces. However, due to the rapid drop-off rate of ground-borne vibration and the short duration of the associated events, vehicular traffic-induced ground-borne vibration is rarely perceptible beyond the roadway right-of-way, and rarely results in vibration levels that cause damage to buildings in the vicinity.

While vehicular traffic is rarely perceptible, construction has the potential to result in varying degrees of temporary ground vibration, depending on the specific construction activities and equipment used. Ground vibration levels associated with various types of construction equipment are summarized on Table 6-9. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the human response (annoyance) using the following vibration assessment methods defined by the FTA. To describe the human response (annoyance) associated with vibration impacts the FTA provides the following equation: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

TABLE 6-9: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Jackhammer	0.035
Loaded Trucks	0.076
Large bulldozer	0.089

7 OFF-SITE TRAFFIC NOISE IMPACTS

To assess the off-site transportation CNEL noise level impacts associated with development of the proposed Project, noise contours were developed based on *Bedford Marketplace Traffic Study*. (1) The off-site traffic noise analysis has been completed to determine the noise impacts associated with the development of the proposed Bedford Marketplace ("Project") an expansion of the previously approved commercial development area included within the Arantine Hills Specific Plan. The proposed Project represents the expansion of Bedford Marketplace from 80,000 sf to 135,000 sf of retail uses and a 135-room hotel. The incremental expansion of Bedford Marketplace constitutes the "Project" analyzed in this study. Based on the currently approved commercial trip generation in the Arantine Hills Traffic Assessment (November 2018), the Project is anticipated to generate an additional 2,061 external trips per day.

Noise contour boundaries represent the equal levels of noise exposure and are measured in CNEL from the center of the roadway. Noise contours were developed for the following traffic scenarios:

PROJECT TRAFFIC

- Existing Without / With Project: This scenario refers to the existing present-day noise conditions, without and with the proposed Project. This condition is provided solely for analytical purposes and will not occur, since the Project will not be fully developed and occupied under Existing conditions.
- Interim Year 2021 Without / With Project: This scenario refers to the combination of existing traffic, ambient growth (total of 8%), approved Arantine Hills Specific Plan traffic, and increases in traffic volumes associated with the added Project land uses. The approved Arantine Hills Project traffic is also included as background traffic for Interim Year 2021 conditions.
- Horizon Year 2035 Without / With Project: This scenario refers the horizon year 2035 forecasts are derived from the approved Arantine Hills Specific Plan Traffic Assessment (November 2018).

SOIL IMPORT/EXPORT HAUL TRUCK CONSTRUCTION TRAFFIC

- Existing Without / With Project: This scenario refers to the existing present-day noise conditions with the proposed 500 daily soil import/export truck haul trips.

7.1 PROJECT TRAFFIC NOISE CONTOURS

Noise contours were used to assess the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The noise contours represent the distance to noise levels of a constant value and are measured from the center of the roadway for the 70, 65, and 60 dBA noise levels. The noise contours do not consider the effect of any existing noise barriers or topography that may attenuate ambient noise levels. In addition, because the noise contours reflect modeling of vehicular noise on area roadways, they appropriately do not reflect noise contributions from the surrounding stationary noise sources within the Project study area. Tables 7-1 and 7-6 present a summary of the exterior traffic noise levels, without barrier attenuation, for the study area roadway segments analyzed from the without Project to the with

Project conditions for Existing, Interim Year 2021, and Horizon Year 2035 conditions. Appendix 7.1 includes a summary of the traffic noise level contours for each of the traffic scenarios.

7.2 EXISTING CONDITIONS PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

An analysis of existing traffic noise levels plus traffic noise generated by the proposed Project has been included in this report for informational purposes and to fully analyze all the traffic conditions identified in the *Bedford Marketplace Traffic Study* prepared by Urban Crossroads, Inc. This condition is provided solely for analytical purposes and will not occur, since the Project will not be fully developed and occupied under Existing conditions.

Table 7-1 presents the Existing without Project conditions CNEL noise levels. The without Project exterior noise levels are expected to range from 64.3 to 70.9 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography. Table 7-2 shows the Existing with Project conditions will range from 64.5 to 71.4 dBA CNEL. As shown on Table 7-7 the Project will generate a noise level increase of up to 2.6 dBA CNEL on the study area roadway segments.

7.3 INTERIM YEAR 2021 PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-3 presents the Interim Year 2021 without Project conditions CNEL noise levels which are expected to range from 64.8 to 71.6 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography.

Table 7-4 shows the Interim Year 2021 with Project conditions will range from 64.8 to 71.7 dBA CNEL. As shown on Table 7-8 the Project will generate a noise level increase of up to 0.2 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, the Project-related noise level increases are considered *less than significant* under Interim Year 2021 with Project conditions at the land uses adjacent to roadways conveying Project traffic.

7.4 HORIZON YEAR 2035 PROJECT TRAFFIC NOISE LEVEL CONTRIBUTIONS

Table 7-5 presents the Horizon Year 2035 without Project conditions CNEL noise levels are expected to range from 65.6 to 72.0 dBA CNEL, without accounting for any noise attenuation features such as noise barriers or topography.

Table 7-6 shows the Horizon Year 2035 with Project conditions will range from 66.6 to 72.1 dBA CNEL. As shown on Table 7-9 the Project will generate a noise level increase of up to 2.6 dBA CNEL on the study area roadway segments. Based on the significance criteria in Section 4, the Project-related noise level increases are considered *less than significant* under Horizon Year 2035 with Project conditions at the land uses adjacent to roadways conveying Project traffic.

TABLE 7-7: EXISTING OFF-SITE PROJECT-RELATED TRAFFIC NOISE IMPACTS

[2] Significance Criteria (Section 4). "n/a" not applicable, adjacent land use is not noise sensitive.

7.5 SOIL IMPORT/EXPORT HAUL TRUCK OFF-SITE TRAFFIC ANALYSIS

To bring the Modified Bedford Marketplace Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad, import of approximately 440,000 cubic yards of dirt is required. The import operation is expected to include 250 full loads per night, assuming 15 cubic yards per load, for a total of 3,750 cubic yards per night. To import 440,000 cubic yards, approximately 118 nights of import would be required.

The Project proposes to import dirt during the hours (8:00 p.m. to 4:00 a.m.) and complete grading operations both during daytime and nighttime hours. A source of import has been identified from the FST Sand and Gravel Mine, located east of the I-15 Freeway as shown on Exhibit 7-A. The dirt would be hauled from the borrow site on Minnesota Road to Sherborn Street to Magnolia Avenue to the I-15 Freeway southbound on ramp at Magnolia Avenue, exit at Cajalco Road and enter the Modified Project Site by crossing Cajalco Road from the southbound off-ramp with traffic control. Trucks would return onto Cajalco Road, enter I-15 Freeway northbound to Magnolia Avenue to Sherborn Street and travel south to the borrow site.

The proposed soil import/export haul route was specially developed to avoid potentially significant impacts to potential noise sensitive residential land uses. A review of the haul route shows that the only adjacent noise sensitive residential land uses are located adjacent to the I-15 Freeway. Many of these noise sensitive residential land uses benefit from existing sound walls that have been developed to control traffic noise from the I-15 Freeway.

The following analysis describes the potential off-site Project haul trips traffic noise impacts if all truck haul trips occur during the evening and nighttime hours from 8:00 pm to 4:00 am. This analysis describes the Project's incremental traffic-related noise impacts at land uses adjacent to roadways conveying Project traffic. The predicted future exterior noise levels (included in Appendix 7.2) represent the distance from the center of the roadway to the nearest noise receiver locations. Table 7-10 presents the Existing without Project off-site traffic CNEL noise levels which are expected to range from 58.4 to 71.1 dBA CNEL. Table 7-10 shows that the With Project Haul Truck Trips off-site traffic noise conditions will range from 63.8 to 72.8 dBA CNEL.

As shown on Table 7-10, the Project haul truck trips will generate a noise level increase ranging from 0.2 dBA CNEL on the I-15 Freeway to 5.4 dBA CNEL on Sherborn Street. Based on the significance criteria outlined above, the Project soil import/export truck trip-related noise level increases are considered *less than significant* impacts at the land uses adjacent to roadways conveying Project haul truck traffic.

EXHIBIT 7-A: SOIL IMPORT/EXPORT HAUL TRUCK ROUTE

TABLE 7-10: EXISTING OFF-SITE PROJECT-RELATED TRAFFIC NOISE IMPACTS

ID	Road	Location	Adjacent Land Use	CNEL at Adjacent Land Use (dBA)[1]			Noise-Sensitive Land Use?	Off-Site Traffic Noise Threshold[2]	Threshold Exceeded?
				No Haul	With Haul	Haul Addition			
1	I-15 Freeway	20225 Bedford Canyon Rd.	Residential	69.8	70.0	0.2	Yes	1.5	No
2	Magnolia Ave.	1295 Magnolia Ave.	Commercial	71.1	72.8	1.7	No	n/a	No
3	Sherborn St.	1168 Sherborn St.	Commercial/Industrial	58.4	63.8	5.4	No	n/a	No

[1] The CNEL is calculated at the nearest representative receiver of the nearest adjacent land use.

[2] Significance Criteria (Section 4). "n/a" not applicable, adjacent land use is not a noise sensitive.

8 ON-SITE NOISE IMPACTS

An on-site exterior noise impact analysis has been completed to determine the noise exposure levels that would result from adjacent traffic noise sources in the Project study area, and to identify potential noise mitigation measures that would achieve acceptable Project exterior and interior noise levels. The primary source of traffic noise affecting the Project site is anticipated to be from the I-15 Freeway. The Project will also experience some background traffic noise impacts from its internal streets and parking lots, however, due to the low traffic volume and low speeds of vehicles travelling on these roadways, traffic noise will not make a significant contribution to the noise environment beyond of the right-of-way of each road.

8.1 EXTERIOR NOISE ANALYSIS

Using the FHWA traffic noise prediction model and the parameters outlined in Section 6, the expected future exterior noise levels for the noise sensitive on-site building were calculated. For noise-sensitive uses, Table 5 *Interior and Exterior Noise Standards* of the Public Health and Safety Element indicates that the exterior noise levels shall not exceed 65 dBA CNEL for the planned hotel use.

8.1.1 OUTDOOR COMMON AREAS

The 65 dBA CNEL exterior noise standards typically apply to outdoor areas where people congregate. In relation to the proposed Bedford Marketplace, the 65 dBA CNEL exterior noise standards apply only to the hotel outdoor pool area. The City of Corona does not identify any exterior noise standards for any of the commercial land use activities such as the outdoor patio areas for proposed restaurant uses.

Table 8-1 presents a summary of future exterior noise level impacts at the outdoor pool area of the hotel use. To minimize the potential exterior noise level impacts, the outdoor pool area is located behind the 4-story hotel building that effectively blocks the noise sensitive area from the I-15 Freeway. The on-site traffic noise level impacts indicate that outdoor pool area will experience unmitigated exterior noise levels of 52.3 dBA CNEL. Since the unmitigated on-site traffic noise levels satisfy the City of Corona 65 dBA CNEL exterior noise level standards, the on-site exterior traffic noise levels are considered *less than significant* impacts.

TABLE 8-1: UNMITIGATED EXTERIOR TRAFFIC NOISE LEVELS

Outdoor Common Area	Floor	Roadway	Exterior Noise Level (dBA CNEL)[1]	Threshold (dBA CNEL)[2]	Threshold Exceeded?
Hotel Pool	1	I-15 Freeway	52.3	65	No

[1] Unmitigated exterior noise level within the hotel outdoor pool area.
[2] Source: Public Health & Safety Element Interior and Exterior Noise Standards (Exhibit 3-B).

8.1.2 BUILDING FACADE

Table 8-2 presents a summary of future exterior noise levels at the 1st, 2nd, 3rd and 4th-floor hotel building facades. Exterior noise levels at the building façade are presented to estimate the interior noise levels. The on-site transportation analysis indicates that the unmitigated exterior noise levels will range from 66.3 to 71.5 dBA CNEL at the hotel building façades. The on-site traffic noise analysis calculations at are provided in Appendix 8.1.

TABLE 8-2: EXTERIOR TRAFFIC NOISE LEVELS AT THE BUILDING FACADE

Receiver Location	Roadway	Exterior Noise Level at Façade (dBA CNEL)			
		1st Floor	2nd Floor	3rd Floor	4th Floor
Hotel	I-15 Fwy.	66.3	71.5	71.4	71.4

8.2 INTERIOR NOISE ANALYSIS

To ensure that the interior noise levels comply with the City of Corona interior noise level standards, future noise levels were calculated at the estimated building façade locations. For noise-sensitive uses, Table 5 *Interior and Exterior Noise Standards* of the Public Health and Safety Element indicates that Interior noise levels shall not exceed 45 dBA CNEL for hotel uses and 55 dBA CNEL for all other commercial uses consistent with the General Plan Public Health and Safety Element interior and exterior noise standards (See Exhibit 3-B).

8.2.1 NOISE REDUCTION METHODOLOGY

The interior noise level is the difference between the predicted exterior noise level at the building facade and the noise reduction of the structure. Typical building construction will provide a Noise Reduction (NR) of approximately 25 dBA noise reduction with "windows closed." (19; 20) However, sound leaks, cracks and openings within the window assembly can greatly diminish its effectiveness in reducing noise. Several methods are used to improve interior noise reduction, including: (1) weather-stripped solid core exterior doors; (2) upgraded dual glazed windows; (3) mechanical ventilation/air conditioning; and (4) exterior wall/roof assembles free of cut outs or openings.

8.2.2 INTERIOR NOISE LEVEL ASSESSMENT

Table 8-2 shows that the Project buildings will require a windows-closed condition and a means of mechanical ventilation (e.g. air conditioning). Table 8-2 shows that the future exterior noise levels at the hotel building façades are expected to range from 66.3 to 71.5 dBA CNEL. The interior noise level analysis shows that the City of Corona 55 dBA CNEL interior noise standards can be satisfied using typical building construction for all commercial buildings. The interior noise analysis for the noise sensitive hotel use shows that the City of Corona 45 dBA CNEL interior noise standards can be satisfied using typical building construction with a minimum STC ratings of 30

for windows facing the I-15 Freeway. With the STC ratings of 30 for windows facing the I-15 Freeway, the future on-site interior traffic noise impacts will be *less than significant*.

TABLE 8-3: INTERIOR NOISE LEVELS (CNEL)

Receiver Location	Floor	Noise Level at Façade[1]	Required Interior NR[2]	Minimum Interior NR[3]	Upgraded Windows[4]	Interior Noise Level[5]	Threshold	Threshold Exceeded?
Hotel	1	66.3	21.3	30.0	Yes	36.3	45	No
	2	71.5	26.5	30.0	Yes	41.5	45	No
	3	71.4	26.4	30.0	Yes	41.4	45	No
	4	71.4	26.4	30.0	Yes	41.4	45	No

[1] Exterior noise level at the facade with a windows closed condition requiring a means of mechanical ventilation (e.g. air conditioning).
[2] Noise reduction required to satisfy the City of Corona 45 dBA CNEL interior noise standard for noise sensitive uses.
[3] Estimated interior noise reduction with upgraded windows with an STC rating of 30.
[4] Does the required interior noise reduction trigger upgraded windows with a minimum STC rating of 30?
[5] Estimated interior noise level with STC rating of for all windows facing the I-15 Freeway.
"NR" = Noise Reduction

This page intentionally left blank

9 RECEIVER LOCATIONS

To assess the potential for long-term operational and short-term construction noise impacts, the following sensitive receiver locations, as shown on Exhibit 9-A, were identified as representative locations for analysis. Consistent with CEQA Guidelines Section 15125, the noise sensitive locations described below represent only those locations *as they exist at the time the notice of preparation (NOP) is published.* The Bedford Marketplace NOP was published on October 28, 2019 prior to the development and occupancy of the future residential community (Tentative Tract Map No. 37644) located west of Bedford Canyon Road. Therefore, no receivers have been identified for the planned Tentative Tract Map No. 37644 since the Bedford Marketplace will likely be developed prior to occupancy of the nearby residential community. However, noise sensitive receivers have been identified for existing Bedford South Corona community (Tentative Tract Map No. 37030).

Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. Noise-sensitive land uses are generally considered to include schools, hospitals, single-family dwellings, mobile home parks, churches, libraries, and recreation areas. Moderately noise-sensitive land uses typically include multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

Receiver locations are located in outdoor living areas (e.g., backyards) at 10 feet from any existing or proposed barriers or at the building façade, whichever is closer to the Project site, based on FHWA guidance, and consistent with additional guidance provided by Caltrans and the FTA, as previously described in Section 5.2. Sensitive receiver locations in the Project study area include residential uses and a church, as described below. Other sensitive land uses in the Project study area that are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures.

R1: Located approximately 285 feet northwest of the Project site, R1 represents existing residential homes north of Eagle Glen Parkway. A 24-hour noise measurement was taken near this location, L1, to describe the existing ambient noise environment.

R2: Location R2 represents the existing residential homes located west of the Project site at roughly 1,343 feet, on the west side of Glen Eagle Parkway. A 24-hour noise measurement was taken near this location, L1, to describe the existing ambient noise environment.

R3: Location R3 represents the existing residential homes on the east side of North Weirick Road at approximately 1,276 feet from the Project site. A 24-hour noise measurement near this location, L3, is used to describe the existing ambient noise environment.

R4: Location R4 represents the existing residential homes on the south side of Glen Road at approximately 1,137 feet from the Project site. A 24-hour noise measurement near this location, L4, is used to describe the existing ambient noise environment.

R5: Location R5 represents the Hudson House outdoor community center recreation area for the Bedford South Corona community located approximately 1,502 feet from the Project site. A 24-hour noise measurement near this location, L2, is used to describe the existing ambient noise environment.

EXHIBIT 9-A: SENSITIVE RECEIVER LOCATIONS

This page intentionally left blank

10 OPERATIONAL IMPACTS

This section analyzes the potential operational noise impacts due to the Project's stationary noise sources on the off-site sensitive receiver locations identified in Section 9. Exhibit 10-A identifies the noise source locations used to assess the Project-related operational noise levels.

10.1 REFERENCE NOISE LEVELS

To estimate the Project operational noise impacts, reference noise level measurements were collected from similar types of activities to represent the noise levels expected with the development of the proposed Project. This section provides a detailed description of the reference noise level measurements shown on Table 10-1 used to estimate the Project operational noise impacts.

It is important to note that the following projected noise levels assume the worst-case noise environment with the roof-top air conditioning units, drive-thru speakerphones, trash enclosures, parking lots, gas station activity, car wash tunnel, car wash vacuums, and outdoor playground activity all operating simultaneously. These noise level impacts will vary throughout the day. All noise sources were modeled assuming peak operational activity with no periods of inactivity, and are assumed to operate simultaneously, to present a conservative analysis.

TABLE 10-1: REFERENCE NOISE LEVEL MEASUREMENTS

Noise Source	Measurement Duration (hh:mm:ss)	Distance From Source (Feet)	Noise Source Height (Feet)	Reference Noise Levels (dBA L_{50})	
				@ Ref. Dist.	@ 50 Feet
Roof-Top Air Conditioning Units[1]	96:00:00	5'	5'	74.4	54.4
Drive-Through Speakerphone[2]	00:03:00	15'	3'	60.9	50.4
Trash Enclosure Activity[3]	00:00:32	5'	5'	69.0	49.0
Commercial Parking Lot[4]	00:15:00	5'	5'	56.7	36.7
Gas Station Activities[5]	01:00:00	5'	5'	65.6	45.6
Car Wash Tunnel[6]	00:03:04	10'	8'	81.6	67.6
Car Wash Vacuum[7]	00:01:02	5'	3'	74.2	54.2
Outdoor Playground[8]	00:15:00	5'	5'	61.7	41.7

[1] As measured by Urban Crossroads, Inc. on 7/27/2015 at the Santee Walmart located at 170 Town Center Parkway.
[2] As measured by Urban Crossroads, Inc. on 12/19/2014 at a Panera Bread drive-thru in the City of Brea.
[3] As measured by Urban Crossroads, Inc. on 5/3/2018 at trash enclosure in a parking lot in the City of Costa Mesa.
[4] As measured by Urban Crossroads, Inc. on 5/30/2012 at the Laguna Niguel Walmart located at 27470 Alicia Parkway.
[5] As measured by Urban Crossroads, Inc. on 4/26/2016 at an ARCO gas station located at 6501 Quail Hill Parkway in the City of Irvine.
[6] As measured by Urban Crossroads, Inc. on 6/6/2016 at the Audi Mission Viejo Dealership located at 28451 Marguerite Parkway.
[7] As measured by Urban Crossroads, Inc. on 5/27/2011 at an express car wash located at 1195 Baker Street in Costa Mesa.
8 As measured by Urban Crossroads, Inc. on 10/8/2014 at an outdoor playground in Ladera Ranch.

EXHIBIT 10-A: OPERATIONAL NOISE SOURCE LOCATIONS

10.1.1 ROOF-TOP AIR CONDITIONING UNITS

To assess the noise levels created by the roof-top air conditioning units at the Project site, reference noise levels measurements were taken at the Santee Walmart on July 27th, 2015. Located at 170 Town Center Parkway in the City of Santee, the noise level measurements describe a single mechanical roof-top air conditioning unit on the roof of an existing Walmart store with additional background units. The reference noise level represents a Lennox SCA120 series 10-ton model packaged air conditioning unit in addition to background units operating simultaneously. Using a uniform reference distance of 50 feet, the reference noise level noise level is 54.4 dBA L_{50}. The operating conditions of the reference noise level measurement reflect peak summer cooling requirements with measured temperatures approaching 96 degrees Fahrenheit (°F) with average daytime temperatures of 82°F. The noise attenuation provided by a parapet wall is not reflected in this reference noise level measurement.

10.1.2 DRIVE-THROUGH SPEAKERPHONE

To describe the potential noise level impacts associated with potential drive-through speakerphones and vehicle activities, a reference noise level measurement was collected on Friday, December 19th, 2014 at a Panera Bread restaurant located at 423 South Associated Road in the City of Brea. The reference noise levels collected at the Panera Bread restaurant are expected to reflect potential drive-through speakerphone noise level activities at the Project site, since the reference measurement includes both drive-through speakerphone and vehicle activity noise. The noise sources included in the reference noise level measurement consist of voices of the Panera Bread employees over the speakerphone, customers' voices ordering food, car engines idling, car radios playing music, and cars queuing in the drive-through lane. At 50 feet from the speakerphone, a reference noise level of 50.4 dBA L_{50} was measured. This reference noise level measurement overstates the actual average noise levels since it represents the average of 28 speakerphone menu board ordering events observed over a two-hour period. In other words, the Panera Bread speakerphone menu board reference noise level describes continuous drive-through operations and does not include any periods of inactivity.

10.1.3 TRASH ENCLOSURE ACTIVITY

To describe the noise levels associated with a trash enclosure, Urban Crossroads collected a reference noise level measurement on May 3rd, 2018 at an existing commercial and office park trash enclosure within a parking lot on the northeast corner of Baker Street and Red Hill Avenue. The measured reference noise level at the uniform 50-foot reference distance is 49.0 dBA L_{50} for the trash enclosure activity. The trash enclosure activity noise levels include two metal gates opening and closing, metal scraping against concrete floor sounds, dumpster movement on metal wheels, trash dropping into the metal dumpster, and background parking lot vehicle movements.

10.1.4 COMMERCIAL PARKING LOT

To determine the noise levels associated with commercial parking lot vehicle movements, Urban Crossroads collected reference noise level measurements at the Laguna Niguel Walmart located at 27470 Alicia Parkway on May 30, 2012. The 15-minute noise level measurement indicates that the parking lot vehicle movements generates noise levels of 36.7 dBA L_{50} at a normalized distance of 50 feet. The parking lot noise levels are mainly due to cars pulling in and out of spaces, car alarms sounding, and customers moving shopping carts.

10.1.5 GAS STATION ACTIVITIES

To describe the potential noise level impacts created by the gas station of the Project, a reference noise level measurement was collected on Tuesday, April 26th, 2016 at an ARCO gas station located at 6501 Quail Hill Parkway in the City of Irvine. The reference noise level measurement includes six cars fueling at once, car doors closing, engines starting, fuel pump TV sounds and background car pass-by events within a 3-minute period. At 50 feet from the gas station, a reference noise level of 45.6 dBA L_{50} was measured.

10.1.6 CAR WASH TUNNEL AIR BLOWERS

On June 10th, 2016, a reference noise level measurement was taken by Urban Crossroads at the Audi Mission Viejo dealership to describe the air blowers used in a car wash tunnel. A reference noise level of 67.6 dBA L_{50} was measured at the uniform distance of 50 feet. The reference noise level measurement includes an exposed five-unit air blower system with background pressure washer noise and is used to represent the proposed Project facilities. It is anticipated that the air dryers within the proposed car wash will operate continuously during the peak operating conditions. Further, this noise analysis does not include any additional attenuation or directional influence provided by locating the car wash air blower and dryer equipment inside the tunnel itself, but rather, models the tunnel exit activities as occurring at the building façade. As such, the analysis may conservatively overstate actual noise levels produced by the car wash tunnel air blower and dryer equipment.

10.1.7 CAR WASH VACUUM ACTIVITY

To represent the self-serve vacuums within the Project site, a reference noise level measurement was collected on May 27th, 2011 at an express car wash located at 1195 Baker Street in the City of Costa Mesa. The reference noise level measurement represents up to four vacuums operating simultaneously at the Costa Mesa express car wash. At a uniform reference distance of 50 feet, the vacuum reference noise level is 54.2 dBA L_{50}. This reference car wash vacuum activity noise level is anticipated to conservatively overstate those of the Project, since this reference noise level includes more vacuums operating simultaneously (4 vacuums) than what will be possible at the Project site (2 vacuums).

10.1.8 OUTDOOR PLAYGROUND ACTIVITIES

To describe the potential noise level impacts associated with the Project's playground activities ("tot-lot" and turf play areas), a reference noise level measurement was collected on Wednesday, October 8th, 2014 at the Founders Park in the City of Ladera Ranch. The reference noise levels collected at the Founders Park are expected to reflect the noise level activities at the tot-lot and turf play areas within Project site, since the reference noise level measurement includes tot-lot activities, girls youth soccer, coaches shouting instructions, parents speaking on cell phones, kids playing on swing sets, cheering and clapping. At a uniform reference distance of 50 feet, the outdoor playground activity reference noise level is 41.7 dBA L_{50}.

10.2 PROJECT OPERATIONAL NOISE LEVELS

Based upon the reference noise levels, it is possible to estimate the Project operational stationary-source noise levels at each of the sensitive receiver locations. The operational noise level calculations shown on Table 10-2 account for the distance attenuation provided due to geometric spreading, when sound from a localized stationary source (i.e., a point source) propagates uniformly outward in a spherical pattern. Hard site conditions are used in the operational noise analysis which result in noise levels that attenuate (or decrease) at a rate of 6 dBA for each doubling of distance from a point source. The basic noise attenuation equation shown below is used to calculate the distance attenuation based on a reference noise level (SPL_1):

$$SPL_2 = SPL_1 - 20\log(D_2/D_1)$$

Where SPL_2 is the resulting noise level after attenuation, SPL_1 is the source noise level, D_2 is the distance to the reference sound pressure level (SPL_1), and D_1 is the distance to the receiver location.

Table 10-2 indicates that the unmitigated combined Project operational noise levels associated with the roof-top air conditioning units, drive-thru speakerphones, trash enclosures, parking lots, gas station activity, car wash tunnel, car wash vacuums, and outdoor playground activity are expected to range from 32.7 to 40.0 dBA L_{50} at the noise-sensitive off-site receiver locations. The unmitigated operational noise level calculation worksheets are included in Appendix 10.1.

TABLE 10-2: UNMITIGATED PROJECT OPERATIONAL NOISE LEVELS

Receiver Location[1]	Noise Sources[2]	Distance (Feet)	Operational Noise Levels (dBA)[3]				
			L_{50} (30 mins)	L_{25} (15 mins)	L_8 (5 mins)	L_2 (1 min)	L_{max} (Anytime)

[2] Reference noise sources as shown on Table 10-1.
[3] Stationary source noise level calculations are provided in Appendix 10.1.

10.3 PROJECT OPERATIONAL NOISE LEVEL COMPLIANCE

Table 10-3 indicates that the noise levels associated with Project operational noise sources are expected to range from 32.7 to 40.0 dBA L_{50} at sensitive off-site sensitive receiver locations. Table 10-3 shows that the Project operational-source noise levels at potentially affected receivers satisfy the City of Corona daytime and nighttime exterior noise level standards without mitigation. Therefore, the unmitigated Project operational noise level impacts are considered *less than significant.*

TABLE 10-3: OPERATIONAL NOISE LEVEL COMPLIANCE

Receiver Location[1]	Land Use	Noise Level at Receiver Locations (dBA)[2]					Threshold Exceeded?[3]	
		L_{50} (30 mins)	L_{25} (15 mins)	L_8 (5 mins)	L_2 (1 min)	L_{max} (Anytime)	Daytime	Nighttime

R5	Residential	35.3	45.1	45.8	46.6	47.3	No	No

[1] See Exhibit 10-A for the noise source locations.
[2] Estimated Project operational noise levels as shown on Table 10-2.
[3] Do the Project operational noise levels satisfy the operational noise level standards?
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m.

10.4 PROJECT OPERATIONAL NOISE LEVEL CONTRIBUTIONS

To describe the Project operational noise level contributions, the Project operational noise levels are combined with the existing ambient noise levels measurements for the nearby receiver locations potentially impacted by Project operational noise sources. Since the units used to measure noise, decibels (dB), are logarithmic units, the Project-operational and existing ambient noise levels cannot be combined using standard arithmetic equations. (3) Instead, they must be logarithmically added using the following base equation:

$$SPL_{Total} = 10\log_{10}[10^{SPL1/10} + 10^{SPL2/10} + \ldots 10^{SPLn/10}]$$

Where "SPL1," "SPL2," etc. are equal to the sound pressure levels being combined, or in this case, the Project-operational and existing ambient noise levels. The difference between the combined Project and ambient noise levels describe the Project noise level contributions to the existing ambient noise environment. Noise levels that would be experienced at receiver locations when Project-source noise is added to the daytime and nighttime ambient conditions are presented on Tables 10-4 and 10-5, respectively.

As indicated on Tables 10-4 and 10-5, the Project will generate daytime and nighttime operational noise level increases of up to 0.2 dBA L_{50} at the nearby receiver locations. Since the Project-related operational noise level contributions with mitigation will satisfy the operational noise level increase significance criteria presented in Table 4-2, the increases at the sensitive receiver locations will be *less than significant*.

TABLE 10-4: PROJECT DAYTIME OPERATIONAL NOISE CONTRIBUTIONS

Receiver Location[1]	Unmitigated Project Operational Noise Level (dBA)[2]	Meas. Location[3]	Reference Ambient Noise Levels (dBA)[4]	Combined Project and Ambient (dBA)[5]	Project Increase (dBA)[6]	Threshold (dBA)[7]	Threshold Exceeded?[7]

11 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the short-term construction activities associated with the development of the Project. Exhibit 11-A shows the boundaries of the soil import/export activity area and the construction activity areas at the Project site in relation to the nearby sensitive receiver locations.

11.1 CONSTRUCTION NOISE LEVELS

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers, and portable generators that when combined can reach high levels. The number and mix of construction equipment are expected to occur in the following stages:

- Soil Import/Export
- Grading
- Building Construction
- Paving
- Architectural Coating

This construction noise analysis was prepared using reference noise level measurements taken by Urban Crossroads, Inc. to describe the typical construction activity noise levels for each stage of Project construction. The construction reference noise level measurements represent a list of typical construction activity noise levels. Noise levels generated by heavy construction equipment can range from approximately 68 dBA to in excess of 80 dBA when measured at 50 feet. Hard site conditions are used in the construction noise analysis which result in noise levels that attenuate (or decrease) at a rate of 6 dBA for each doubling of distance from a point source (i.e. construction equipment). For example, a noise level of 80 dBA measured at 50 feet from the noise source to the receiver would be reduced to 74 dBA at 100 feet from the source to the receiver and would be further reduced to 68 dBA at 200 feet from the source to the receiver. The construction stages used in this analysis are consistent with the data used to support the construction emissions in the *Bedford Marketplace Air Quality Impact Analysis* prepared by Urban Crossroads, Inc. (21)

11.2 CONSTRUCTION REFERENCE NOISE LEVELS

To describe the Project construction noise levels, measurements were collected for similar activities at several construction sites. Table 11-1 provides a summary of the construction reference noise level measurements. Since the reference noise levels were collected at varying distances, all construction noise level measurements presented on Table 11-1 have been adjusted to describe a common reference distance of 50 feet.

[1] As measured by Urban Crossroads, Inc. on 10/14/15 at a business park construction site located at the northwest corner of Barranca Parkway and Alton Parkway in the City of Irvine.
[2] As measured by Urban Crossroads, Inc. on 10/20/15 at a construction site located in Rancho Mission Viejo.
[3] As measured by Urban Crossroads, Inc. on 10/20/15 at a residential construction site located in Rancho Mission Viejo.
[4] As measured by Urban Crossroads, Inc. on 10/30/15 during grading operations at an industrial construction site in the City of Ontario.
[5] Reference noise level measurements were collected from a nighttime concrete pour at an industrial construction site, located at 27334 San Bernardino Avenue in the City of Redlands, between 1:00 a.m. to 2:00 a.m. on 7/1/15.
[6] Reference noise levels are calculated at 50 feet using a drop off rate of 6 dBA per doubling of distance (point source).

11.3 SOIL IMPORT/EXPORT CONSTRUCTION BORROW SITES

To bring the Modified Bedford Marketplace Project Site up to an elevation similar (within five feet) of the existing 10-acre commercial pad, import of approximately 440,000 cubic yards of dirt is required. The applicant has identified two potential borrow sites to provide the necessary fill dirt. The FST Sand and Gravel Mine, located east of the I-15 Freeway and the Arantine Hills Specific Plan Phase 2B site as shown on Exhibit 11-A.

11.3.1 FST SAND AND GRAVEL MINE BORROW SITE

The import operation is expected to include 250 full loads per night, assuming 15 cubic yards per load, for a total of 3,750 cubic yards per night. To import 440,000 cubic yards, approximately 118 nights of import would be required. The Project proposes to import dirt during the hours (8:00 p.m. to 4:00 a.m.) and complete grading operations both during daytime and nighttime hours.

During the nighttime hours, dirt would be imported to the Modified Project Site, dumped, and placed by grading equipment. Daytime grading activities would initially last for approximately two weeks and begin before import and overlap with initial import operations. The daytime activities include remedial grading, which requires the over-excavation of approximately four to six feet below existing ground surface. The over-excavated material would be stockpiled on site.

Additional daytime grading would occur after imported material has be placed in the over-excavated areas to bring the site closer to proposed grades. The stockpiled material would then be placed over the imported material to create the finished building pad, compacted to meet geotechnical specifications. According to the Project applicant, every effort will be made to limit on-site construction activities particularly during the noise sensitive nighttime hours. For this reason, the Applicant is proposing to limit nighttime operations to permit only the essential equipment needed to support the soil import/export haul truck operations. This focused on-site construction noise analysis is based on the following construction equipment profile:

Daytime: During the daytime hours from 7:00 a.m. to 7:00 p.m. the project will rely on the following equipment for the over-excavation activities:

- three (3) Caterpillar 651 scrapers
- one (1) tracked bulldozer (Caterpillar D-8)
- one (1) water truck

Nighttime: According the Project applicant nighttime (8:00 p.m. to 4:00 a.m.) construction activities will be limited to the following construction equipment:

- one (1) rubber tire bulldozer, such as a Caterpillar 834, would be used to move and compact the imported dirt. The site is large enough to avoid backing up and the use of warning signals. Additionally, the rubber tire equipment would be used to avoid the noise from tracked equipment.
- one (1) water truck (4,000 gallon)
- one (1) street sweeper would be used during the import operation.

11.3.2 PHASE 2B BORROW SITE

As a potential borrow site, Phase 2B could provide the necessary source of dirt to support the planned Bedford Marketplace pad elevation increase. Preliminary estimates suggest that the existing Phase 2B site will be lowered by approximately 13 feet to provide the necessary supply of dirt for import. Due to the proximity to the Bedford Marketplace, import of dirt from Phase 2B will limited to the daytime hours from 7:00 a.m. to 7:00 p.m.

11.4 SOIL IMPORT/EXPORT CONSTRUCTION NOISE ANALYSIS

To describe the soil import/export construction noise impacts at nearby noise sensitive receiver locations, exterior noise levels have been calculated for the daytime and the potential nighttime activities.

11.4.1 SOIL IMPORT/EXPORT CONSTRUCTION NOISE ANALYSIS (DAYTIME)

Based on the daytime construction equipment profile, Table 11-2 provides a summary of the estimated daytime construction noise levels for each borrow site at each of the sensitive receiver locations nearest the soil import/export area identified on Exhibit 11-A. Table 11-2 shows that the daytime import/export construction noise levels will range from 51.2 to 59.1 dBA L_{max} for the FST Sand and Gravel Mine borrow site. Since Phase 2B borrow site is closer to the nearby receiver

locations, the daytime import/export construction noise levels will range from 49.0 to 68.0 dBA L_{max}

TABLE 11-2: SOIL IMPORT/EXPORT ACTIVITY NOISE LEVELS (DAYTIME)

Reference Construction Activity[1]	Reference Noise Level @ 50 Feet (dBA L_{max})
Truck Pass-Bys & Dozer Activity	63.7
Dozer Activity	72.0
Rough Grading Activities	80.4
Scraper, Water Truck, & Dozer Activity	83.3
Highest Reference Noise Level at 50 Feet (dBA L_{eq}):	83.3

Borrow Site	Receiver Location	Distance to Closest Fill Site Activity (Feet)[2]	Distance Attenuation (dBA L_{max})[3]	Estimated Noise Barrier Attenuation (dBA L_{max})[4]	Construction Noise Level (dBA L_{max})
FST Sand and Gravel Mine	R1	808'	-24.2	0.0	59.1
	R2	1,435'	-29.2	0.0	54.1
	R3	1,830'	-31.3	0.0	52.0
	R4	1,549'	-29.8	0.0	53.4
	R5	2,016'	-32.1	0.0	51.2

[2] Distance from the nearest point of construction activity to the nearest receiver.
[3] Point (stationary) source drop off rate of 6.0 dBA per doubling of distance.
[4] Estimated barrier attenuation from existing barriers in the Project study area, if any.

11.4.2 SOIL IMPORT/EXPORT CONSTRUCTION NOISE ANALYSIS (NIGHTTIME)

Based on the nighttime construction equipment profile for the FST Sand and Gravel Mine construction activity, Table 11-3 provides a summary of the estimated nighttime construction noise levels at each of the sensitive receiver locations. No nighttime construction is needed to support the Phase 2B borrow site. As shown on Table 11-3 the Project-related daytime soil import/export construction noise levels when the highest reference noise level is operating will range from 39.9 to 47.8 dBA L_{max}.

TABLE 11-3: SOIL IMPORT/EXPORT ACTIVITY NOISE LEVELS (NIGHTTIME)

Reference Construction Activity[1]	Reference Noise Level @ 50 Feet (dBA L_{max})
Truck Pass-Bys & Dozer Activity	63.7
Dozer Activity	72.0
Highest Reference Noise Level at 50 Feet (dBA L_{eq}):	72.0

Borrow Site	Receiver Location	Distance to Closest Fill Site Activity (Feet)[2]	Distance Attenuation (dBA L_{max})[3]	Estimated Noise Barrier Attenuation (dBA L_{max})[4]	Construction Noise Level (dBA L_{max})
FST Sand and Gravel Mine	R1	808'	-24.2	0.0	47.8
	R2	1,435'	-29.2	0.0	42.8
	R3	1,830'	-31.3	0.0	40.7
	R4	1,549'	-29.8	0.0	42.1
	R5	2,016'	-32.1	0.0	39.9

[1] Reference construction noise level measurements taken by Urban Crossroads, Inc.
[2] Distance from the nearest point of construction activity to the nearest receiver.
[3] Point (stationary) source drop off rate of 6.0 dBA per doubling of distance.
[4] Estimated barrier attenuation from existing barriers in the Project study area, if any.

11.5 SOIL IMPORT/EXPORT NOISE COMPLIANCE

To analyze noise impacts originating from the construction of the Bedford Marketplace, noise from construction activities are typically evaluated against standards established under a City's Municipal Code. The City of Corona Municipal Code, Section 17.84.040(D)(2) establishes the permitted hours during which construction within the City of Corona may take place, between 7:00 a.m. to 8:00 p.m. on Mondays through Saturdays, and 10:00 a.m. to 6:00 p.m. on Sundays and holidays. (11) Therefore, the planned nighttime Project soil import/export activity will require a noise variance consistent with the provisions outlined in the City of Corona Municipal Code Section 17.84.040(H)(1) to perform the evening and nighttime grading activities.

For daytime construction activities, this analysis relies on the City of Corona Municipal Code Section 17.84.040 permitted daytime operational noise standards for residential properties to establish the exterior construction noise level criteria. Based on these criteria, a daytime exterior noise level of 75 dBA L_{max} is be used to describe the maximum acceptable threshold for determining the impacts due to Project construction for sensitive receivers. To account for the noise sensitive nighttime hours between 10:00 p.m. and 7:00 a.m., this analysis relies on a maximum exterior noise level of 50 dBA L_{max}.

11.5.1 SOIL IMPORT/EXPORT NOISE COMPLIANCE (DAYTIME)

As shown on Table 11-4 the estimated Project daytime construction noise levels will approach 59.1 dBA L_{max} for construction activity associated with the FST Sand and Gravel Mine and 68.0 dBA L_{max} for Phase 2B construction activity. The analysis shows that either borrow site will satisfy the City of Corona maximum acceptable threshold for determining the impacts due to Project construction for sensitive receiver's daytime exterior noise level of 75 dBA L_{max}. Therefore, based on the results of the analysis, all nearby receiver locations will experience *less than significant* impacts due to the daytime soil import/export noise construction noise levels at the Project site.

TABLE 11-4: SOIL IMPORT/EXPORT NOISE COMPLIANCE (DAYTIME)

Borrow Site	Receiver Location[1]	Unmitigated Construction Noise Levels (dBA L_{max})[2]	Daytime	
			Threshold (dBA L_{max})[3]	Threshold Exceeded?[4]
FST Sand and Gravel Mine	R1	59.1	75	No

[3] City of Corona Daytime Construction noise standard.
[4] Do the estimated Project construction noise levels satisfy the construction noise level threshold?

11.5.2 SOIL IMPORT/EXPORT NOISE COMPLIANCE (NIGHTTIME)

As shown on Table 11-5 the estimated Project nighttime construction noise levels from the import of dirt from the FST Sand and Gravel Mine will satisfy the City of Corona 50 dBA L_{max} stationary source nighttime noise level thresholds at all receiver locations. Therefore, based on the results of the analysis, all nearby receiver locations will experience *less than significant* impacts due to the nighttime soil import/export noise construction noise levels at the Project site. However, planned nighttime Project soil import/export activity will require a noise variance consistent with the provisions outlined in the City of Corona Municipal Code Section 17.84.040(H)(1) to perform the evening and nighttime grading activities.

11.6 CONSTRUCTION NOISE ANALYSIS

Tables 11-6 to 11-9 show the Project construction stages and the reference construction noise levels used for each stage. Table 11-10 provides a summary of the noise levels from each stage of construction at each of the sensitive receiver locations. Based on the reference construction noise levels, the Project-related construction noise levels when the highest reference noise level is operating at the edge of primary construction activity nearest each sensitive receiver location will range from 50.9 to 63.9 dBA L_{max} at the noise-sensitive receiver locations, as shown on Table 11-10

TABLE 11-6: GRADING ACTIVITY NOISE LEVELS

R5	50.9	42.8	49.7	42.8	50.9

[1] Noise receiver locations are shown on Exhibit 9-A.
[2] Estimated construction noise levels based on the highest reference construction activity for each stage.

11.7 CONSTRUCTION NOISE LEVEL COMPLIANCE

The construction noise analysis shows that the highest construction noise levels will occur when construction activities take place at the closest point from primary Project construction activity to each of the nearby receiver locations. As shown on Table 11-11, the unmitigated construction noise levels are expected to range from 50.9 to 63.9 dBA L_{max} at the nearby receiver locations.

To evaluate whether the Project will generate potentially significant short-term noise levels at off-site sensitive receiver locations a construction-related noise level threshold of 75 dBA L_{max} is used as acceptable thresholds for construction noise at the nearby sensitive receiver locations. Table 11-11 shows the highest construction noise levels at the potentially impacted receiver locations are expected to approach 63.9 dBA L_{max} and will satisfy the 75 dBA L_{max} daytime significance threshold during temporary Project construction activities. The noise impact due to unmitigated Project construction noise levels is, therefore, considered a *less than significant* impact at all nearby sensitive receiver locations.

TABLE 11-11: CONSTRUCTION EQUIPMENT NOISE LEVEL COMPLIANCE

Receiver Location[1]	Unmitigated Construction Noise Levels (dBA L_{max})[2]	Daytime	
		Threshold (dBA L_{max})[3]	Threshold Exceeded?[4]
R1	63.9	75	No

[2] Estimated daytime construction noise levels, as shown on Table 11-2
[3] City of Corona Daytime Construction noise standard.
[4] Do the estimated Project construction noise levels satisfy the construction noise level threshold?

11.8 CONSTRUCTION VIBRATION IMPACTS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from Project construction activities would cause only intermittent, localized intrusion. The proposed Project's construction activities most likely to cause vibration impacts are:

- Heavy Construction Equipment: Although all heavy mobile construction equipment has the potential of causing at least some perceptible vibration while operating close to buildings, the vibration is usually short-term and is not of sufficient magnitude to cause building damage.
- Trucks: Trucks hauling building materials to construction sites can be sources of vibration intrusion if the haul routes pass through residential neighborhoods on streets with bumps or potholes. Repairing the bumps and potholes generally eliminates the problem.

Ground-borne vibration levels resulting from construction activities occurring within the Project site were estimated by data published by the Federal Transit Administration (FTA). Construction activities that would have the potential to generate low levels of ground-borne vibration within the Project site include mobile equipment activities and pile driving, among others. Using the vibration source level of construction equipment provided on Table 6-9 and the construction vibration assessment methodology published by the FTA, it is possible to estimate the Project vibration impacts. The construction vibration analysis is based on the shortest distance to either Project site construction or Excess Fill Dirt Site soil import/export activities. Based on the reference vibration levels provided by the FTA, a large bulldozer represents the peak source of vibration with a reference level of 0.089 in/sec PPV at a distance of 25 feet. At distances ranging from 332 to 1,494 feet from the Project site, construction vibration levels are expected to range from 0.000 to 0.002 in/sec PPV. In order to assess the human perception of vibration levels in PPV, as previously discussed in Section 3.6.2, the velocities are converted to RMS vibration levels based on the Caltrans *Transportation and Construction Vibration Guidance Manual* conversion factor of 0.71. Table 11-9 shows the construction vibration levels in RMS are expected to range from 0.000 to 0.001 in/sec (RMS) at the five receiver locations. Based on the City of Corona vibration standards, the proposed Project site will not include or require equipment, facilities, or activities that would result in a human response (annoyance).

The Project construction is not expected to generate vibration levels exceeding the City of Corona maximum acceptable vibration standard of 0.05 in/sec (RMS). Further, impacts at the site of the closest sensitive receiver are unlikely to be sustained during the entire construction period, but will occur rather only during the times that heavy construction equipment is operating proximate to the Project site perimeter. Moreover, construction at the Project site will be restricted to daytime hours consistent with City requirements thereby eliminating potential vibration impact during the sensitive nighttime hours. On this basis the potential for the Project to result in exposure of persons to, or generation of, excessive ground-borne vibration is determined to be *less than significant*.

TABLE 11-12: CONSTRUCTION EQUIPMENT VIBRATION LEVELS

Receiver Location[1]	Distance To Property Line (In Feet)	Receiver PPV Levels (in/sec)[2]					RMS Velocity Levels[3] (in/sec)	Potential Significant Impact?[4]
		Small Bulldozer	Jack-hammer	Loaded Trucks	Large Bulldozer	Peak Vibration		
R1	332'	0.0001	0.0007	0.0016	0.0018	0.002	0.001	No
R2	1,383'	0.0000	0.0001	0.0002	0.0002	0.000	0.000	No
R3	1,303'	0.0000	0.0001	0.0002	0.0002	0.000	0.000	No
R4	1,361'	0.0000	0.0001	0.0002	0.0002	0.000	0.000	No
R5	1,494'	0.0000	0.0001	0.0002	0.0002	0.000	0.000	No

[1] Noise receiver locations are shown on Exhibit 11-A.
[2] Based on the Vibration Source Levels of Construction Equipment included on Table 6-9.
[3] Vibration levels in PPV are converted to RMS velocity using a 0.71 conversion factor identified in the Caltrans Transportation and Construction Vibration Guidance Manual, September 2013.
[4] Does the Peak Vibration exceed the City of Corona maximum acceptable vibration standard of 0.05 in/sec?

CHAPTER 17.84
PERFORMANCE STANDARDS

Sections

17.84.010 Compliance required.

17.84.020 Fire and explosion hazards.

17.84.030 Radio-frequency energy or electrical disturbance.

17.84.040 Noise.

17.84.050 Vibration.

17.84.060 Dust, smoke, glare – Emission.

17.84.070 Glare.

17.84.080 Underground storage tanks.

17.84.010 Compliance required.

All uses established or placed into operation after the effective date of the ordinance codified in this title shall comply at all times hereafter with the following limitations or performance standards. All uses actually established and in operation on the effective date of the ordinance codified in this title shall be made to comply with the limitations or performance standards set forth in this chapter on or before January 3, 1967 and shall comply at all times thereafter.

(`78 Code, § 17.84.010.) (Ord. 2161 § 1 (part), 1993.)

17.84.020 Fire and explosion hazards.

The storage and handling of flammable liquids, liquified petroleum, gases and explosives shall comply with the state rules and regulations and ordinances of the city.

(`78 Code, § 17.84.020.) (Ord. 2161 § 1 (part), 1993.)

17.84.030 Radio-frequency energy or electrical disturbance.

Devices which radiate radio-frequency energy shall be so operated as not to cause interference with any activity carried on beyond the boundary line of the property upon which the device is located. Radio-frequency energy is electromagnetic energy at any frequency in the radio spectrum between ten kilocycles and three million megacycles.

(`78 Code, § 17.84.030.) (Ord. 2161 § 1 (part), 1993.)

17.84.040 Noise.

(A) **Purpose and intent**.

(1) The purpose of this section is to regulate noise and vibration in the interest of the public health, safety and general welfare. The city finds that certain noise levels and vibrations are detrimental to the public health, safety and general welfare and that the primary sources of noise in the city are freeways, highways, manufacturing uses, railroads, the airport and construction noise. The noise element of the General Plan contains the city's policies regarding noise and identifies noise contours for existing and future roadways and the Corona Municipal Airport, which are implemented by this chapter. The General Plan noise element shall govern all noise standards and policies.

(2) In order to control unnecessary, excessive and annoying noise and vibration in the city, it is hereby declared to be the policy of the city to prohibit such noise and vibration generated from or by all sources as specified in this chapter. It shall be the policy of the city to maintain quiet in those areas which exhibit low noise levels and to implement programs to reduce noise in those areas within the city where noise levels are above acceptable values. It is the intent of the city to minimize noise impacts to adjacent land uses pursuant to the standards identified herein.

(B) **Definitions**. Terms found in this chapter shall be defined as follows. Additional definitions are found in the noise element of the General Plan.

(1) "**A-weighted sound level**." The sound pressure level in decibels as measured on a sound level meter using the A-weighted filter network. The A-weighted filter network is designed to simulate the response of the human ear. The A-weighted sound level is expressed by the symbol dBA.

(2) "**Ambient noise**." The composite of noise from all existing sources near and far. The ambient noise level constitutes the normal or existing level of environmental noise at a given location, excluding any alleged offensive noise.

(3) "**Cumulative period**." An additive period of time composed of individual time segments which may be continuous or interrupted.

(4) "**Community noise equivalent level (CNEL)**." The average equivalent A-weighted sound level during a 24 hour day, obtained after addition of five decibels to sound levels between 7:00 p.m. and 10:00 p.m. and the addition of ten decibels to sound levels between 10:00 p.m. and 7:00 a.m.

(5) "**Decibel (dB)**." A unit for measuring the amplitude of a sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals.

(6) "**Impulsive noise**." A noise of short duration, usually less than one second, and of high intensity, with an abrupt onset and rapid decay.

(7) "**Noise study**." An acoustical analysis performed by a qualified noise engineer which determines the potential noise impacts of a roadway, land use or operation of equipment. The noise study will generate noise contours and recommend mitigation for noise impacts which exceed the city's noise standards.

(8) "**Sensitive land uses**." Those specific land uses which have associated human activities that may be subject to stress or significant interference from noise. Sensitive land uses include single family residential, multiple family residential, churches, hospitals and similar health care institutions, convalescent homes, libraries and school classroom areas.

(9) “**Simple tone noise**.” A noise characterized by a predominant frequency or frequencies so that other frequencies cannot be readily distinguished. When measured, a simple tone noise shall exist if the one-third octave band sound pressure levels in the band with the tone exceeds the arithmetic average of the sound pressure levels of the two continuous one-third octave bands as follows: 5 dB for frequencies of 500 hertz or above or by 15 dB for frequencies less than or equal to 125 hertz.

(10) “**Sound attenuation device**.” An enclosure, blanket, vault, box, wall, fence, panel, baffle, coating, material, silencer, or other appurtenance, mechanism, or device intended to reduce the noise level of mechanical equipment.

(C) **Noise standards**.

(1) The noise ordinance identifies two separate types of noise sources: transportation and stationary. Transportation related noise sources, such as freeways, airports and railroads, are identified within this chapter and are mainly for the planning stages of project development. The noise metrics used for this noise type is the Community Noise Equivalent Level (CNEL) which is a 24 hour time weighted average noise level. The other type of noise standard is for stationary noise sources, such as industrial or construction noise, that may be intrusive to a neighboring private property. The noise metric used for stationary sources is defined as noise levels that cannot be exceeded for certain percentages of time. The noise standards shown in Table 1 are for regulating the impact of stationary noise sources to a neighboring private property. Standards for transportation related noise are found in Table 2.

(2) Stationary noise sources.

TABLE 1
STATIONARY NOISE SOURCE STANDARDS

TYPE OF LAND USE	MAXIMUM ALLOWABLE NOISE LEVELS			
	Exterior Noise Level		Interior Noise Level	
	7 a.m. to 10 p.m.	10 p.m. to 7 a.m.	7 a.m. to 10 p.m.	10 p.m. to 7 a.m.
Single-, Double- and Multi- Family Residential	55 dBA	50 dBA	45 dBA	35 dBA
Other Sensitive Land Uses	55 dBA	50 dBA	45 dBA	35 dBA
Commercial Uses	65 dBA	60 dBA	Not applicable	Not applicable
Industrial, Manufacturing or Agricultural	75 dBA	70 dBA	Not applicable	Not applicable

(a) Each of the noise limits specified here shall be reduced by 5 dBA for impulse or simple tone noises; provided, however, that if the ambient noise level exceeds the resulting standards, the ambient shall be the standard.

(b) If the measurement location is on the boundary between two different zones, the lower noise level standard applicable to the zone shall apply.

(c) If the intruding noise is continuous and cannot be reasonably discontinued or stopped for a time period whereby the ambient noise level can be determined, the measured noise level

obtained while the source is in operation shall be compared directly to the allowable noise level standards as specified respective to the measurement location's designated land use and for the time of the day the noise level is measured. The reasonableness of temporarily discontinuing the noise generation by an intruding noise source shall be determined by the Code Enforcement Officer for the purpose of establishing the existing ambient noise level at the measurement location.

(d) Exterior noise:

1. It shall be unlawful for any person, entity or operation at any location within the incorporated area of the city to create any noise, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which causes the noise level when measured on any other property to exceed:

a. The noise standard for a cumulative period of more than 30 minutes in any hour;

b. The noise standard plus 5 dB for a cumulative period of more than 15 minutes in any hour;

c. The noise standard plus 10 dB for a cumulative period of more than five minutes in any hour;

d. The noise standard plus 15 dB for a cumulative period of more than one minute in any hour; or

e. The noise standard plus 20 dB for any period of time.

2. In the event the ambient noise level exceeds any of the first four noise limit categories above, the cumulative period applicable to the category shall be increased to reflect the ambient noise level. In the event the ambient noise level exceeds the fifth noise category, the maximum allowable noise level under said category shall be increased to reflect the maximum ambient noise level.

(e) Interior noise. It shall be unlawful for any person at any location within the incorporated area of the city to create any noise or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such a person which causes the noise level when measured within any other residential dwelling unit or sensitive land use to exceed:

1. The noise standard for a cumulative period of more than five minutes in any hour;

2. The noise standard plus 5 dB for a cumulative period of more than one minute in any hour; or

3. The noise standard plus 10 dB, or the maximum measured ambient, for any period of time.

(3) Transportation noise sources.

TABLE 2
TRANSPORTATION NOISE SOURCE STANDARDS

TYPE OF LAND USE	**EXTERIOR NOISE LEVEL**	**INTERIOR NOISE LEVEL**
	(Private Outdoor Living Areas)	
Residential (Roadway)	65 CNEL	45 CNEL
Residential (Airport)	65 CNEL	45 CNEL
Other sensitive land uses	65 CNEL	45 CNEL

(Roadway)		
Other sensitive land uses (Airport)	65 CNEL	45 CNEL
Hotels/Motels (Roadway)	65 CNEL	45 CNEL
Hotels/Motels (Airport)	65 CNEL	45 CNEL

(a) **Roadway noise**. A noise study shall be performed prior to the construction of new master planned roads, roadway improvements, rail lines and/or prior to the construction of residential or sensitive land uses adjacent to existing or master planned roads or railways. The noise study shall identify the existing and future noise contours for the roadway and propose mitigation measures to reduce the noise impacts to a maximum of 65 dBA CNEL in the private outdoor living area of residences and to a maximum interior noise level of 45 dBA CNEL for residential and sensitive land uses, as shown in Table 2.

(b) **Airport noise**. Sensitive land uses, site-built homes and institutional uses are prohibited in airport noise contours above 65 dBA CNEL. All subdivisions within two miles of the Corona Municipal Airport or within the 65 dBA CNEL contour shall show and record an avigation easement for the benefit of the airport. The avigation easement shall provide notification to potential buyers and occupants of the presence of the easement and the potential for over flights and aircraft noise.

(D) **Special provisions**.

(1) **Mechanical equipment in residential zones.** Upon application for a building permit to install mechanical equipment, such as air conditioner and pool equipment, in a residential zone, the equipment shall be setback at least ten feet from an adjoining property line except where a five foot high block sound wall is maintained extending a distance of two feet on each side of such equipment and situated either between such equipment and the property line or on said property line. Exception: Mechanical equipment in residential zones shall be permitted closer than ten feet from an adjoining property line without a five foot high block sound wall when sound attenuation devices approved by the Building Official are installed. The noise level with sound attenuation devices installed shall comply with the limits and conditions specified in § 17.84.040(C)(2) when measured from any adjoining property. The approved sound attenuation devices shall be maintained and any approvals shall not be construed to permit violations of this code.

(2) **Construction noise**. Construction noise is prohibited between the hours of 8:00 p.m. to 7:00 a.m., Monday through Saturday and 6:00 p.m. to 10:00 a.m. on Sundays and federal holidays. Construction noise is defined as noise which is disturbing, excessive or offensive and constitutes a nuisance involving discomfort or annoyance to persons of normal sensitivity residing in the area, which is generated by the use of any tools, machinery or equipment used in connection with construction operations.

(3) **Noise devices**. In accordance with Chapter 9.24, no loudspeaker, bells, gongs, buzzers, mechanical equipment or other sounds, attention-attracting or communication device associated with any use adjacent to residential or sensitive land uses shall be discernible beyond the boundary line of the parcel, except fire protection devices, burglar alarms and church bells. Noise generated by these sources shall be enforced by the Police Department.

(4) **Noisy animals**. Noise generated by animals shall be regulated by the Police Department in accordance with Chapter 6.11.

(E) **Exemptions**. The following activities shall be exempt from these noise standards:

(1) Special events pursuant to an approved special use permit. Noise impacts shall be evaluated and conditioned as part of the special use permit;

(2) Filming pursuant to a film permit. Noise impacts shall be evaluated and conditioned as part of the film permit;

(3) Activities conducted on public parks, public playgrounds and public or private school grounds, including school athletic and entertainment events that are conducted under the sanction of the school or which a license or permit has been duly issued pursuant to any provision of city code;

(4) Noise sources associated with the maintenance of real property, provided the activities take place between the hours of 7:00 a.m. to 8:00 p.m. on any day except Sunday or between the hours of 9:00 a.m. to 8:00 p.m. on Sunday;

(5) Any activity too the extent regulation thereof has been preempted by state or federal law;

(6) Repairs to and replacement of mechanical equipment in residential zones installed by permit prior to May 20, 1993 shall be exempt from the requirements in division (D) of this section;

(7) Noise variances granted pursuant to subsection (H)(1) below;

(8) Short-term, non-continuous operations associated with government and public utility facilities that are necessary to maintain the delivery of services for the benefit of public health and safety.

(F) **Noise level measurements**. All noise shall be measured in accordance with the following standards. Measurements shall be taken of the ambient noise level and any alleged offensive noise. If the measurement location is on the boundary of two different noise zones, the lower noise level standard shall apply.

(1) **Sound level meter**. A sound level meter shall mean an instrument meeting the American National Standards Institute's S1.4 - 1971 for Type 1 sound level meters or an instrument and the associated recording and analyzing equipment which will provide equivalent data.

(2) **Ambient noise**. A measurement of the ambient noise level shall be taken according to the procedures in this chapter. If the ambient noise level exceeds the standard, the ambient level shall be the standard. If an alleged intruding noise source is continuous and cannot be reasonably discontinued or stopped for a time period whereby the ambient noise level can be determined, the measured noise level obtained while the alleged intruding noise source is in operation shall be compared directly to the applicable noise level standard.

(G) **Noise studies required**. As referenced in division (C) of this section, there are essentially two different types of noise sources that have been identified in Corona and each has its own noise metrics as well as its own required noise studies. The noise metrics used for transportation related noise sources is the CNEL which is a 24 hour time weighted average noise level. The noise metrics used for stationary sources are defined as noise levels that cannot be exceeded for certain percentages of time.

(1) **Predevelopment noise studies**. A predevelopment noise study is performed prior to development and is designed to project future noise levels and recommend mitigation measures to be implemented in project development. All noise studies shall be prepared by a registered noise engineer as approved by the city. Noise studies will be required for the construction of master planned roadways, for development adjacent to master planned roadways, when a noise generating use, such as a factory, is proposed in proximity to residential uses and when residential uses are proposed in proximity to an existing noise source. The need for a noise study will be determined at development plan review. Predevelopment noise studies shall project future noise levels based on proposed uses, traffic volumes and other relevant future conditions. Existing and projected noise shall be evaluated pursuant to the noise standards within this chapter and the noise element of the General Plan. Mitigation measures shall be proposed to bring noise levels into compliance with these standards. Mitigation measures may consist of

walls, berms, setbacks, landscaping, building materials, construction methods and any other means whereby noise can be reduced to the maximum amounts within this chapter.

(2) **Studies of existing stationary noise**. At times it will be necessary to study the noise generated by an existing source, either due to alleged violations of the noise ordinance or for monitoring purposes. These noise studies shall be prepared by a registered noise engineer as approved by the city in accordance with the standards in Table 1.

(H) **Noise variance**.

(1) The owner or operator of a noise or vibration source which violates any of the provisions of this chapter may file an application with the Community Development Department for a variance from the provisions thereof wherein said owner or operator shall set forth all actions taken to comply with the provisions, the reasons why immediate compliance cannot be achieved, a proposed method of achieving compliance and a proposed time schedule for its accomplishment. The application shall be accompanied by a fee as determined by City Council resolution. A separate application shall be filed for each noise source; provided, however, that several fixed sources on a single property may be combined into one application. An application for a variance shall remain subject to prosecution under the terms of this chapter until a variance is granted.

(2) The Board of Zoning Adjustment shall evaluate all applications for variance from the requirements of this chapter and may grant the variances with respect to time for compliance, subject to such terms, conditions and requirements as it may deem reasonable to achieve maximum compliance with the provisions of this chapter. The terms, conditions and requirements may include, but shall not be limited to, limitations on noise levels and operating hours. Each such variance shall set forth in detail the approved method of achieving maximum compliance and a time schedule for its accomplishment. In its determinations, the Board shall consider the following:

(a) The magnitude of the nuisance caused by the offensive noise;

(b) The uses of property within the area of impingement by the noise;

(c) The time factors related to study, design, financing and construction of remedial work;

(d) The economic factors related to age and useful life of the equipment;

(e) The general public interest, welfare and safety.

(3) Any variance granted by the Board shall be by resolution and shall be transmitted to the Code Enforcement Officer for enforcement. Any violation of the terms of the variance shall be unlawful and enforced pursuant to division (I) of this section.

(I) **Enforcement**.

(1) It shall be unlawful for any person at any location within the City of Corona to create any exterior noise or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which causes the noise level when measured according to this chapter to exceed the maximum allowable noise levels in Table 1 of § 17.84.040(C).

(2) No person shall interfere with, oppose or resist any authorized person charged with the enforcement of this chapter while such person is engaged in the performance of his or her duty.

(3) Any person violating any provision of this chapter shall be deemed guilty of a misdemeanor.

(4) The operation or maintenance of any device, instrument, vehicle or machinery in violation of any noise standard identified in this chapter is declared to be a public nuisance and may be

abated pursuant to the nuisance abatement procedure in Chapter 8.32 of this code.

(5) Pursuant to § 1.08.020(A) of this code, each person shall be deemed guilty of a separate offense for each and every day during any portion of which any violation of any provision of this chapter is committed, continued or permitted by such person and shall be punished accordingly.

(`78 Code, § 17.84.040.) (Ord. 3277 §§ 4, 5, 2018; Ord. 3188 § 3, 2015; Ord. 2372 § 2, 1999; Ord. 2161 § 1 (part), 1993.)

17.84.050 Vibration.

It shall be unlawful for any person to create, maintain or cause any ground vibration which is perceptible without instruments at any point on any affected property adjoining the property on which the vibration source is located. For the purposes of this section, the perception threshold shall be presumed to be more than 0.05 inches per second RMS vertical velocity.

(`78 Code, § 17.84.050.) (Ord. 2161 § 1 (part), 1993.)

17.84.060 Dust, smoke, glare – Emission.

The emission of dust, odor, smoke and glare shall conform to the standards established by the South Coast Air Quality Management District. Every use shall be so operated that it does not emit dust, odor, heat or glare in such quantities or degree as to be readily detectable on any boundary line of the lot on which the use is located.

(`78 Code, § 17.84.060.) (Ord. 2161 § 1 (part), 1993.)

17.84.070 Glare.

Glare from arc welding, acetylene torch cutting or similar processes shall be performed so as not to be seen from any point beyond the boundary line of the property. All areas of exterior lighting shall be designed to direct light downward with minimal spillover onto adjacent residences, sensitive land uses and open space.

(`78 Code, § 17.84.070.) (Ord. 2161 § 1 (part), 1993.)

17.84.080 Underground storage tanks.

Notwithstanding any provision of this code to the contrary, no underground tank for the storage of any type of chemical, gasoline, fuel, oil or other petroleum product shall be constructed within 500 feet of a well owned or operated by the City of Corona which supplies drinking water. Reconstruction or replacement of any underground storage tank, basin, or skimming pond existing within 500 feet of a well supplying drinking water as of the effective date of this chapter shall be subject to the review and approval of the General Manager of the Department of Water and Power, or his or her designee. The General Manager shall require:

(A) Testing of the tank site to ascertain whether contamination exists, and at what depth;

(B) That all testing and analysis be performed in accordance with California Environmental Protection Agency and U.S. Environment Protection Agency standards and methods by a qualified person, with laboratory certification of the test results; and

(C) That the removal or reconstruction of the existing tank and installation of any new tank be undertaken in strict compliance with all applicable federal, state, and local statutes, regulations, standards, and requirements.

(Ord. 2971 § 1 (part), 2009.)

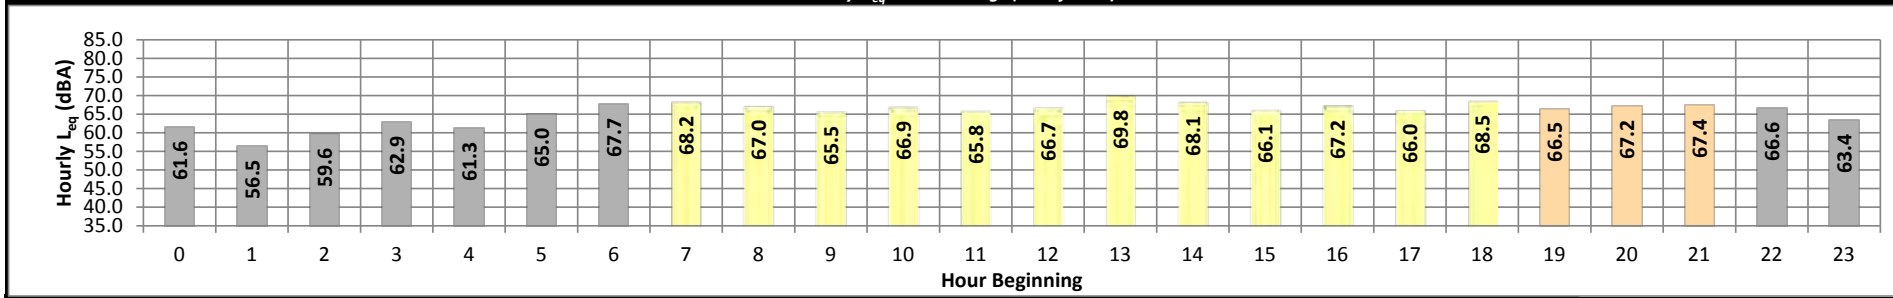
24-Hour Noise Level Measurement Summary



Date: Friday, August 02, 2019
Project: Bedford Marketplace

Location: L3 - Located South of the project site on Glen Road and North Weirick Road near vacant land and existing residential homes.

Meter: Piccolo I

JN: 12751
Analyst: P. Mara

APPENDIX 7.1:

OFF-SITE TRAFFIC NOISE LEVEL CONTOURS

This page intentionally left blank

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Existing
Road Name: Masters Dr.
Road Segment: n/o California Av.
Project Name: Bedford Marketplace
Job Number: 12751

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	4,452 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	445 vehicles
Vehicle Speed:	40 mph
Near/Far Lane Distance:	14 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	34.0 feet
Centerline Dist. to Observer:	34.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	77.5%	12.9%	9.6%	97.42%
Medium Trucks:	84.8%	4.9%	10.3%	1.84%
Heavy Trucks:	86.5%	2.7%	10.8%	0.74%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.006	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	33.645
Medium Trucks:	33.381
Heavy Trucks:	33.407

FHWA Noise Model Calculations

VehicleType	REMEL	Traffic Flow	Distance	Finite Road	Fresnel	Barrier Atten	Berm Atten
Autos:	66.51	-4.95	2.48	-1.20	-4.53	0.000	0.000

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Interim Year 2021
Road Name: Masters Dr.
Road Segment: s/o California Av.
Project Name: Bedford Marketplace
Job Number: 12751

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	10,071 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	1,007 vehicles
Vehicle Speed:	40 mph
Near/Far Lane Distance:	14 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	34.0 feet
Centerline Dist. to Observer:	34.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	77.5%	12.9%	9.6%	97.42%
Medium Trucks:	84.8%	4.9%	10.3%	1.84%
Heavy Trucks:	86.5%	2.7%	10.8%	0.74%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.006	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	33.645
Medium Trucks:	33.381
Heavy Trucks:	33.407

FHWA Noise Model Calculations

VehicleType	REMEL	Traffic Flow	Distance	Finite Road	Fresnel	Barrier Atten	Berm Atten
Autos:	66.51	-1.41	2.48	-1.20	-4.53	0.000	0.000

Scenario: Interim Year 2021 Plus Project
Road Name: Bedford Cyn. Rd.
Road Segment: n/o Georgetown Dr.
Project Name: Bedford Marketplace
Job Number: 12751

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	9,790	vehicles
Peak Hour Percentage:	10%	
Peak Hour Volume:	979	vehicles
Vehicle Speed:	40	mph
Near/Far Lane Distance:	24	feet

Site Data

Barrier Height:	**0.0**	**feet**
Barrier Type (0-Wall, 1-Berm):	0.0	
Centerline Dist. to Barrier:	38.0	feet
Centerline Dist. to Observer:	38.0	feet
Barrier Distance to Observer:	0.0	feet
Observer Height (Above Pad):	5.0	feet
Pad Elevation:	0.0	feet
Road Elevation:	0.0	feet
Road Grade:	0.0%	
Left View:	-90.0	degrees
Right View:	90.0	degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	*Day*	*Evening*	*Night*	*Daily*
Autos:	77.5%	12.9%	9.6%	97.42%
Medium Trucks:	84.8%	4.9%	10.3%	1.84%
Heavy Trucks:	86.5%	2.7%	10.8%	0.74%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.006	*Grade Adjustment:*	0.0

Lane Equivalent Distance (in feet)

Autos:	36.401
Medium Trucks:	36.157
Heavy Trucks:	36.181

FHWA Noise Model Calculations

FHWA-RD-77-108 HIGHWAY NOISE PREDICTION MODEL

Scenario: Horizon Year 2035
Road Name: California Av.
Road Segment: w/o Masters Dr.
Project Name: Bedford Marketplace
Job Number: 12751

SITE SPECIFIC INPUT DATA

Highway Data

Average Daily Traffic (Adt):	8,300 vehicles
Peak Hour Percentage:	10%
Peak Hour Volume:	830 vehicles
Vehicle Speed:	40 mph
Near/Far Lane Distance:	14 feet

Site Data

Barrier Height:	**0.0 feet**
Barrier Type (0-Wall, 1-Berm):	0.0
Centerline Dist. to Barrier:	34.0 feet
Centerline Dist. to Observer:	34.0 feet
Barrier Distance to Observer:	0.0 feet
Observer Height (Above Pad):	5.0 feet
Pad Elevation:	0.0 feet
Road Elevation:	0.0 feet
Road Grade:	0.0%
Left View:	-90.0 degrees
Right View:	90.0 degrees

NOISE MODEL INPUTS

Site Conditions (Hard = 10, Soft = 15)

Autos:	15
Medium Trucks (2 Axles):	15
Heavy Trucks (3+ Axles):	15

Vehicle Mix

VehicleType	Day	Evening	Night	Daily
Autos:	77.5%	12.9%	9.6%	97.42%
Medium Trucks:	84.8%	4.9%	10.3%	1.84%
Heavy Trucks:	86.5%	2.7%	10.8%	0.74%

Noise Source Elevations (in feet)

Autos:	0.000		
Medium Trucks:	2.297		
Heavy Trucks:	8.006	Grade Adjustment:	0.0

Lane Equivalent Distance (in feet)

Autos:	33.645
Medium Trucks:	33.381
Heavy Trucks:	33.407

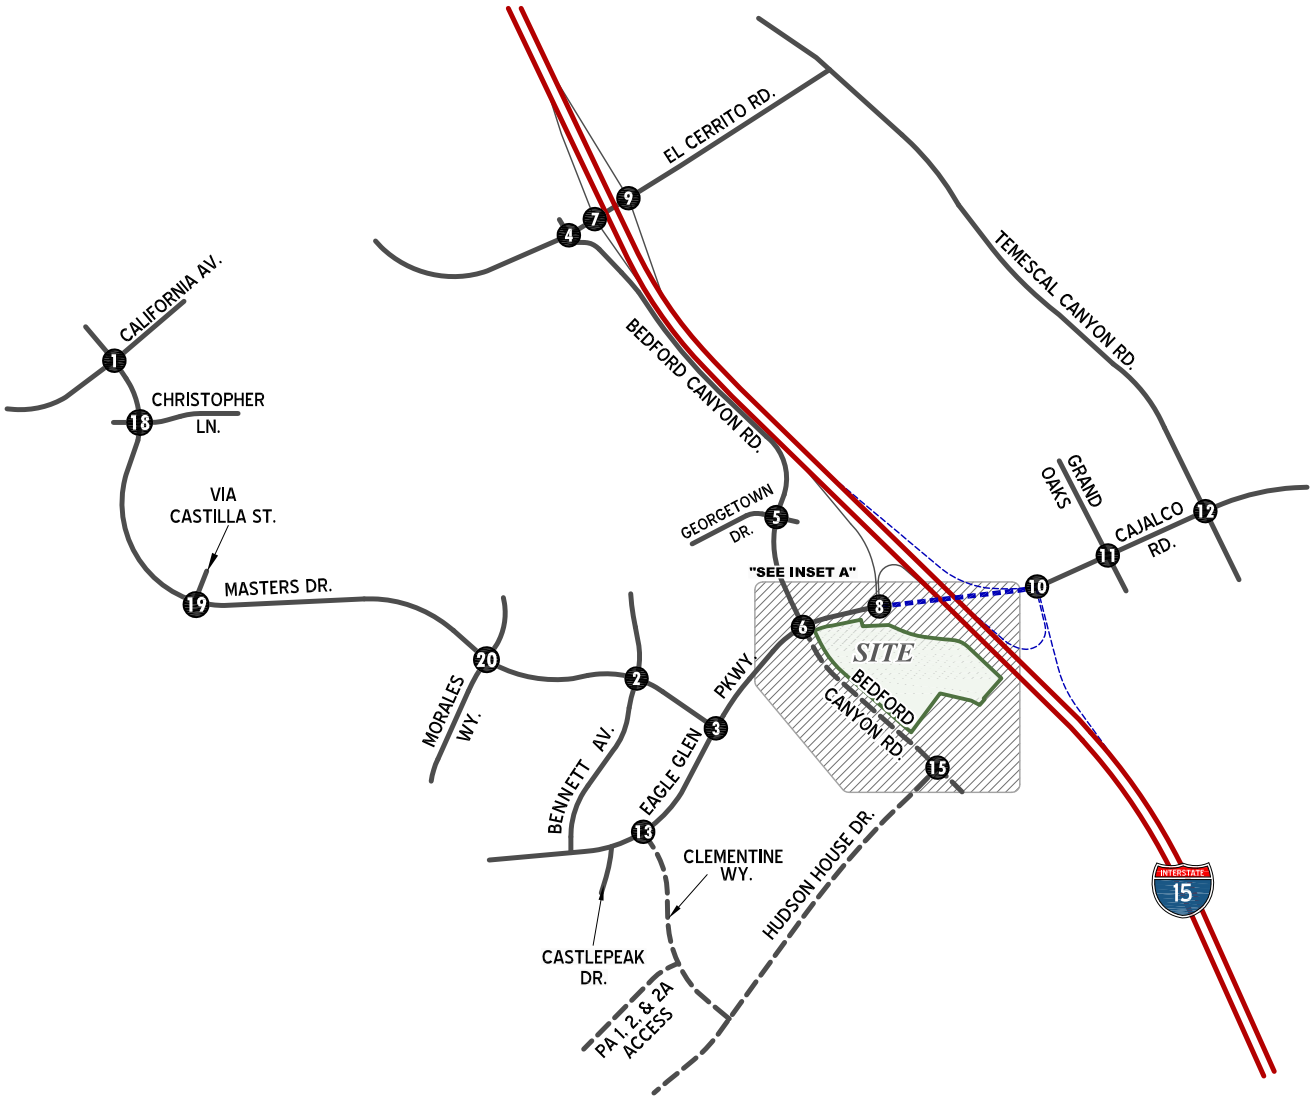
1.0 INTRODUCTION AND KEY FINDINGS

The purpose of this traffic study report is to evaluate the proposed Bedford Marketplace development ("Project"), an expansion of the previously approved commercial development area included within the Arantine Hills Specific Plan. The 80,000 square feet (sf) of commercial retail use included in the Arantine Hills Specific Plan was evaluated in 2015 and 2018 traffic studies prepared for amendments to the Arantine Hills Specific Plan. The proposed Project being studied in this TIA is the expansion of Bedford Marketplace from 80,000 sf to 135,000 sf of retail uses and a 135-room hotel. The incremental expansion of Bedford Marketplace constitutes the "Project" analyzed in this study. Reference to "Bedford Marketplace" includes the total development of the center, equal to the combination of the proposed Project and the previously approved 80,000 sf in the Arantine Hills Specific Plan.

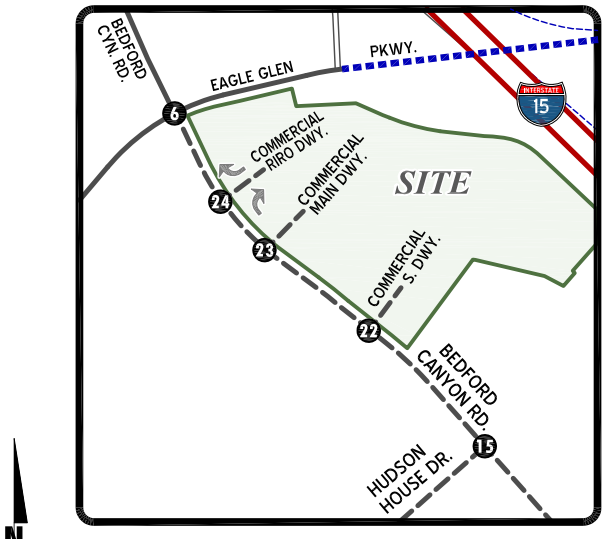
Study objectives include (1) evaluation of interim year 2021 without and with Project conditions; (2) evaluation of horizon year 2035 without and with Project conditions; (3) determination of on-site and off-site improvements needed to achieve City of Corona level of service (LOS) requirements, and (4) estimation of the Project vehicle miles traveled (VMT). The City is in the process of updating its General Plan and adopting an updated Citywide traffic model. This TIA analyzes the incremental change in traffic impacts of the Project in the same manner as previously analyzed in the 2015 and 2018 studies.

The Project is located south of Eagle Glen Parkway – Cajalco Road and west of the I-15 Freeway in the City of Corona as shown on Exhibit 1-1.



1.1 PROJECT OVERVIEW

The Project land use plan (shown on Exhibit 1-2) expands the approved commercial site and is proposed to consist of the following uses:



- Hotel - 135 rooms
- Health/fitness club - 38,000 sf
- Day Care Center - 9,990 sf
- Retail Shopping Center – 51,000 sf
- Bank – 6,562 sf
- Restaurant – 21,230 sf
- Gas Station – 18 vehicle fueling positions (vfp's)
- Automated Car Wash – 3,600 sf

Access to the Project site will be provided via Bedford Canyon Road. The Project will provide two full access driveways and one right-in/right-out driveway, consistent with the amended Arantine Hills Specific Plan.

12554 - 002_volumes.dwg

URBAN CROSSROADS

EXHIBIT 1-4: PROJECT ONLY VOLUME (EXTERNAL TRIPS) NET INCREASES IN COMPARISON TO 80 TSF RETAIL PM PEAK HOUR

Trips generated by the proposed Project's land plan have been estimated based on trip generation rates collected by the Institute of Transportation Engineers (ITE) as presented in ITE's most current edition of Trip Generation (10th Edition, 2017). Bedford Marketplace is estimated to generate a total of approximately 7,014 external trips per day with 394 AM peak hour external trips and 686 PM peak hour external trips. Of the total number of vehicle trips, the proposed Project generates 2,061 external trips per day with 281 AM peak hour external trips and 285 PM peak hour external trips.

The net increase to the AM peak hour and PM peak hour project volumes related to the Project, as compared to the previously approved project, are presented in Exhibit 1-3 (morning peak hour) and Exhibit 1-4 (evening peak hour) for the study area intersections.

1.2 ANALYSIS SCENARIOS

This traffic study includes the following conditions:

- Existing (2017 and 2018) Conditions
- Interim Year (2021) Without and With Project Conditions
- Horizon Year 2035 Without and With Project Conditions

1.2.1 STUDY AREA INTERSECTIONS

The intersection analysis locations for this traffic study are listed in Table 1-1 and previously shown on Exhibit 1-1.

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS

ID	Intersection Location	Jurisdiction
1	Masters Drive / California Avenue	Corona
2	Masters Drive / Bennett Avenue	Corona
3	Masters Drive / Eagle Glen Parkway	Corona
4	Bedford Canyon Road / El Cerrito Road	Corona
5	Bedford Canyon Road / Georgetown Drive	Corona
6	Bedford Canyon Road / Eagle Glen Parkway	Corona

18	Masters Drive / Christopher Lane	Corona
19	Via Castilla Street / Masters Drive	Corona
20	Morales Way / Masters Drive	Corona

TABLE 1-1: INTERSECTION ANALYSIS LOCATIONS (CONTINUED)

ID	Intersection Location	Jurisdiction
22	Bedford Canyon Road / Commercial South Driveway	Corona
23	Bedford Canyon Road / Commercial Main Driveway	Corona
24	Bedford Canyon Road / Commercial Right-In/Right-Out (RIRO) Driveway	Corona

1.3 STUDY AREA CIRCULATION CONDITIONS

Construction activity is still underway in the Cajalco Road / I-15 interchange area. A new 6-lane bridge has been built over the I-15 mainline, replacing the previous 2-lane divided roadway, between the I-15 SB and I-15 NB ramps. Extensive improvements are also being made to the I-15 on and off ramps.

Cajalco Road / I-15 interchange area improvement plans are illustrated in Appendix 1.1. Consistent with the previously approved Arantine Hills Traffic Impact Analysis (2015), LOS "E" is anticipated to be considered acceptable level of service for the I-15 / Cajalco Road interchange.

1.3.1 INTERSECTION OPERATIONS ANALYSIS

For Existing (2017 and 2018) Conditions, the following study area intersections are currently operating at deficient level of service during the morning peak hours:

ID	Intersection Location	Jurisdiction
1	Masters Drive / California Avenue	Corona
18	Masters Drive / Christopher Lane	Corona
19	Via Castilla Street / Masters Drive	Corona
20	Morales Way / Masters Drive	Corona

Improvements have previously been identified to address these existing deficiencies in 2015 and 2018 traffic studies prepared for amendments to the Arantine Hills Specific Plan.

For Interim Year (2021) conditions, the improvements under construction at or near the Cajalco Road / I-15 Interchange area are assumed to be completed. No additional off-site intersections are anticipated to operate at unacceptable level of service, beyond those intersections previously identified under existing conditions.

For Horizon Year 2035 Without Project Conditions, the following four additional intersections are anticipated to operate at deficient levels of service (without currently planned improvements), beyond those intersections previously identified under existing conditions:

ID	Intersection Location	Jurisdiction
2	Masters Drive / Bennett Avenue	Corona
5	Bedford Canyon Road / Georgetown Drive	Corona
7	I-15 SB Ramps / El Cerrito Road	Caltrans
12	Temescal Canyon Road / Cajalco Road	Corona

Improvements have also previously been identified to address these 2035 deficiencies in 2015 and 2018 traffic studies prepared for amendments to the Arantine Hills Specific Plan.

For Horizon Year 2035 With Project Conditions, there are no new intersections anticipated to operate at deficient level of service, beyond the intersections identified under 2035 Without Project Conditions.

1.3.2 TRAFFIC SIGNAL WARRANT ANALYSIS

For Existing (2017 and 2018) Conditions, the following unsignalized intersections warrant a traffic signal:

ID	Intersection Location	Jurisdiction
1	Masters Drive / California Avenue	Corona
18	Masters Drive / Christopher Lane	Corona
20	Morales Way / Masters Drive	Corona

For Interim Year (2021) Without Project Conditions, the intersection of Bedford Canyon Road / Commercial Main Driveway (#23) is anticipated to meet traffic signal warrants (in addition to the intersection previously identified under Existing conditions).

It should be noted that new traffic signals were recently installed at the intersections of Masters Drive / Eagle Glen Parkway (#3) and Clementine Way / Eagle Glen Parkway (#13).

For Horizon Year 2035 Without Project Conditions, the following intersections are anticipated to meet traffic signal warrants, in addition to the intersections identified previously under Interim Year (2021) conditions:

ID	Intersection Location	Jurisdiction
2	Masters Drive / Bennett Avenue	Corona
5	Bedford Canyon Road / Georgetown Drive	Corona

For Horizon Year 2035 With Project Conditions, there are no additional intersections anticipated to meet traffic signal warrants (beyond the intersections identified previously under 2035 Without Project conditions).

1.4 RECOMMENDED IMPROVEMENTS

For Interim Year (2021) Without and With Project Conditions, the following off-site improvements have previously been recommended in the study area in 2015 and 2018 traffic studies prepared for amendments to the Arantine Hills Specific Plan:

Masters Drive / California Drive (#1)

- Participate in the installation of a traffic signal.

Bedford Canyon Road / Eagle Glen Parkway - Cajalco Road (#6) *– Under Construction*

- Traffic Signal Modification.
- Adjust the east leg striping to provide a 2nd receiving lane.
- NB Approach: Participate in the construction of one left turn lane, one through lane and one right turn lane with overlap phasing.
- SB Approach: Modify striping to provide a new shared left-through lane.
- EB Approach: Modify striping to provide a new shared through/right turn lane.
- WB Approach: Construct 2 left turn lanes.

I-15 SB Ramps / Cajalco Road (#8) *– Under Construction*

- SB Approach: Participate in the construction of 2nd left turn lane and 2nd right turn lane.
- EB Approach: Participate in the construction of 2nd left turn lane, 2nd through lane, and 3rd through lane.
- WB Approach: Participate in the construction of 2nd through lane
- It should be noted that the planned I-15/Cajalco Road interchange improvements accommodate triple southbound left turns. However, based on the intersection operations results, providing a minimum of two southbound left turns would result to an acceptable level of service.

I-15 NB Ramps / Cajalco Road (#10)

- NB Approach: Participate in the construction of 2nd left turn lane and 2nd right turn lane.
- EB Approach: Participate in the construction of 2nd and 3rd through lanes and one right turn lane with overlap phasing.
- WB Approach: Participate in the construction of 3rd and 4th through lanes.

Grand Oaks / Cajalco Road (#11)

- EB Approach: Participate in the construction of 3rd through lane.

Masters Drive / Christopher Lane (#18)

- Participate in the installation of a traffic signal, or roundabout.

Via Castilla Street / Masters Drive (#19)

- Participate in the conversion to cross-street stop control on Via Castilla Street (in conjunction with Masters Drive / Christopher Lane and Morales Way / Masters Drive traffic signals), or roundabout.

Morales Way / Masters Drive (#20)

- Participate in the installation of a traffic signal, or roundabout.

For Horizon Year 2035 Without and With Project Conditions, the following off-site improvements have previously been recommended in the study area in 2015 and 2018 traffic studies prepared for amendments to the Arantine Hills Specific Plan:

Masters Drive / Bennett Avenue (#2)

- Participate in the installation of a traffic signal.

Bedford Canyon Road / Georgetown Drive (#5)

- Participate in the installation of a traffic signal.

I-15 SB Ramps / El Cerrito Road (#7)

- EB Approach: Participate in the construction of a separate right turn lane.

Temescal Canyon Road / Cajalco Road (#12)

- Participate in the widening of Cajalco Road east of Temescal Canyon Road to provide 2nd and 3rd eastbound lane within 600 feet of Temescal Canyon Road.
- SB Approach: Modify striping to provide a 2nd left turn lane, in addition to the existing two through lanes.
- EB Approach: Modify striping to provide a 2nd through lane, in addition to the existing left turn lane and right turn lane.
- WB Approach: Construct one right turn lane.

Improvements recommended in this study with the proposed Project are consistent to the previously approved Arantine Hills TIA (2015) under 2035 conditions; the Project does not trigger the need for additional improvements beyond those identified in the 2015 study for 2035 conditions.

1.5 SITE ACCESS

Access in and out of the Project occurs at three existing driveways along Bedford Canyon Road south of Eagle Glen Parkway/Cajalco Road. The northerly driveway is limited to right-in right-out (RIRO) conditions, without an opening of the median on Bedford Canyon Road. It serves as a convenient exit for vehicles leaving the Gas Station and Automated Car Wash, bound for Eagle Glen Parkway/Cajalco Road. The RIRO driveway also accommodates entering vehicles from northbound on Bedford Canyon Road.

The main Project driveway is located at a mid-point along the site frontage to Bedford Canyon Road. It is a full access location, serving left and right turns to and from Bedford Canyon Road with traffic signal control. With expansion of commercial uses at the Project site, the existing

southbound left turn lane (approximately 50 feet turn pocket) serving the main Project driveway is recommended to be extended to provide 200 feet of vehicle queuing.

The southerly Project driveway is also a full access location, serving left and right turns to and from Bedford Canyon Road with cross-street stop sign control of the exiting vehicles. At this location, the existing southbound left turn lane is recommended to be extended to provide 150 feet of vehicle queuing with the expansion of commercial uses at the Project site.

An efficient network of on-site driveways provides connectivity to all access points and facilitates the internal flow of activity between the variety of Project land uses.

1.6 VEHICLE MILES TRAVELED

The California Environmental Quality Act (CEQA) procedures for determination of transportation impacts have recently changed to an evaluation of Vehicle Miles Traveled (VMT) rather than vehicle delay or level of service, due to Senate Bill 743 (SB 743). The City of Corona VMT Analysis Guidelines provide a structure for evaluating VMT on a project level basis. Vehicle delay and level of service are still used in Corona traffic studies, as presented in sections 2 through 7 of this traffic study.

Approximately 582 employees (including 240 temporary and 342 permanent positions) are anticipated for Bedford Marketplace. The previous approval of commercial use for the site accounts for approximately 320 employees (based upon an average of 4 employees per tsf of gross floor area). An increase of approximately 262 jobs will occur with the Project.

The mix of land uses (including hotel, retail, and service-oriented uses for Bedford Marketplace) is anticipated to encourage trip capture on-site, resulting in a lower than usual VMT per service population (SP). The combination of banking, restaurant, gas, health club, retail, and a day care center in close proximity to residential and hotel uses is expected to encourage internal interaction.

Pathways and bike routes associated with the site provide an integrated sidewalk and trails system that conveniently links the Bedford Marketplace site to community facilities, residential neighborhoods, and parks. The Project is also located within a Low VMT generating traffic analysis zone (TAZ), with a VMT / service population between 26.6 and 27.8 VMT/SP, which is less than the City of Corona average of approximately 30 VMT/SP.

The VMT / SP associated with the Project could potentially fall within the range of approximately 26.6 to 31.5, but the Project location, mix of uses, and effectiveness of the design features support a conservative estimate of 29 VMT / SP, which has been developed utilizing the procedures documented in Section 7. The resulting total Project VMT is approximately 7,598 for the 262 employees added by the project, which is less than the City average per SP and considered a less than significant impact based upon City criteria.

This page intentionally left blank.

2.0 AREA CONDITIONS

This section provides a summary of the existing circulation network, the City of Corona General Plan Circulation Network, and a review of existing peak hour intersection operations, roadway analyses and traffic signal warrants.

2.1 EXISTING CIRCULATION NETWORK

Per discussion with City of Corona staff, the study area includes a total of twenty (20) existing and future intersections as shown previously on Exhibit 1-1. Of these twenty (20) intersections, the existing study area circulation network includes fifteen (15) intersections. The other five (5) intersections in the study area are future planned intersections that are currently under construction (Arantine Hills roadways and key project driveways).

Exhibit 2-1 illustrates the study area intersections located near the proposed Project and identifies the number of through traffic lanes for existing roadways and intersection traffic controls (during interchange construction in 2018).

2.2 CITY OF CORONA GENERAL PLAN CIRCULATION ELEMENT

As previously noted, the Project site is located within the City of Corona. Exhibit 2-2 shows the City of Corona General Plan Circulation Element, and Exhibit 2-3 illustrates the City of Corona General Plan Roadway Cross-Sections.

2.3 EXISTING (2017 AND 2018) TRAFFIC COUNTS

The AM peak hour traffic volumes were determined by counting traffic volumes in the three hour period between 6:00 and 9:00 AM. The PM peak hour traffic volumes were identified by counting traffic volumes in the two hour period from 4:00 to 6:00 PM. For the purpose of this analysis, the counts provided in the November 2018 traffic assessment for the Arantine Hills Specific Plan Amendment No. 2 are presented in this report due to ongoing construction activity in the Cajalco interchange area.

The manual AM and PM peak hour turning movement counts were conducted in October 2017 and March 2018. The raw manual peak hour turning movement traffic count data sheets are included in Appendix "2.1". Flow conservation checks have been performed to the existing peak hour counts in an effort to ensure the flow of traffic volumes between closely spaced intersections is maintained.

Existing (2017 and 2018) AM and PM peak hour intersection volumes are shown on Exhibit 2-4 and Exhibit 2-5, respectively.

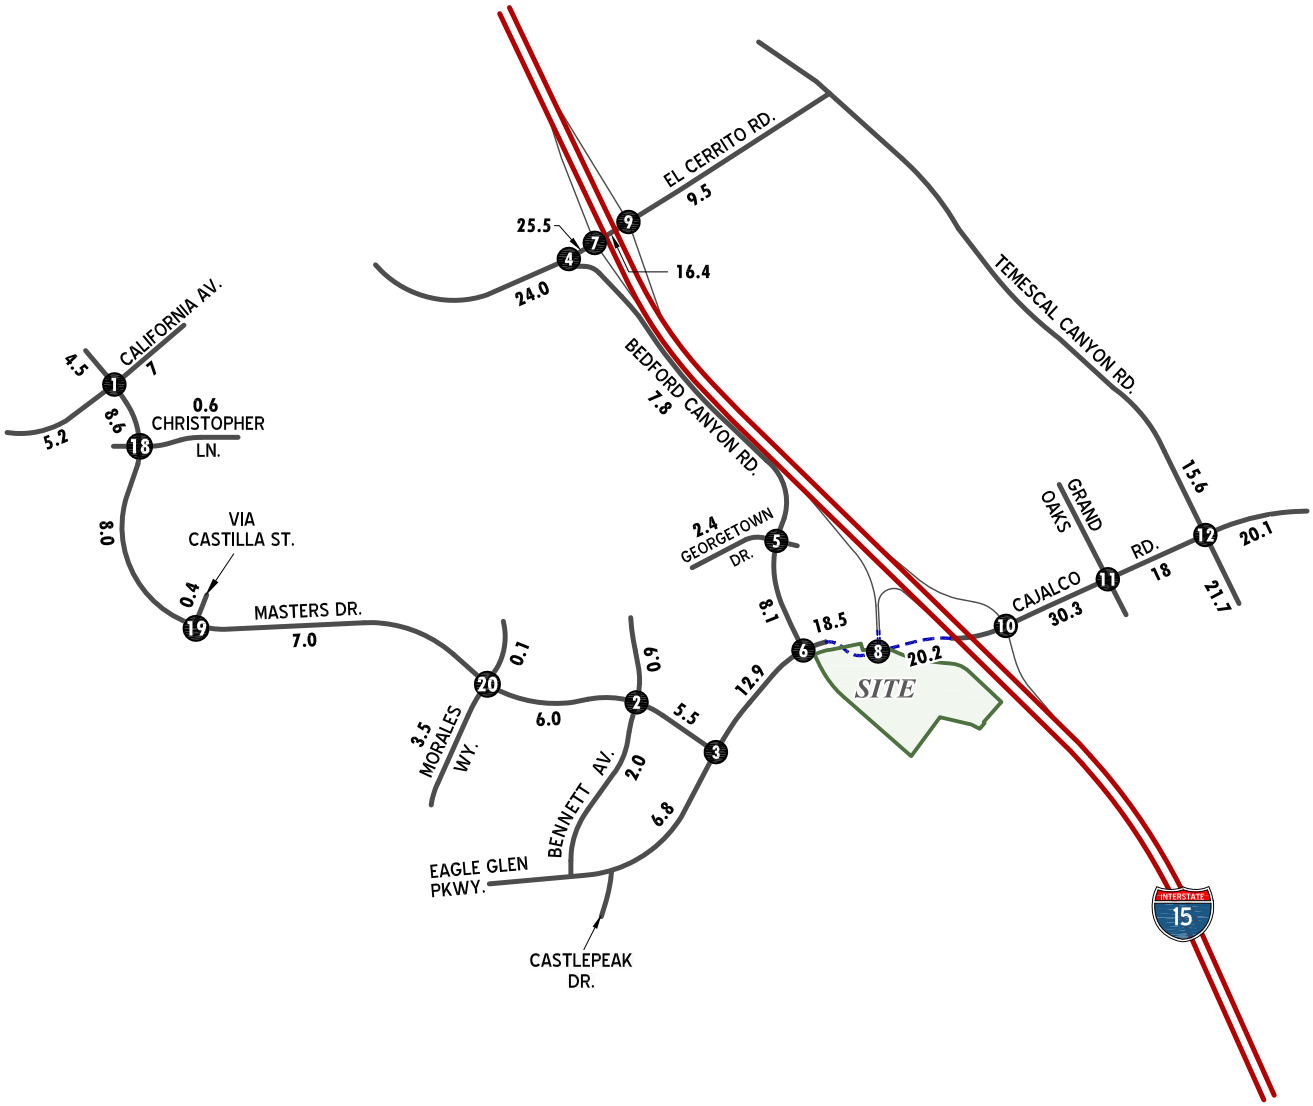
Existing (2017 and 2018) average daily traffic (ADT) volumes on arterial highways throughout the study area are shown on Exhibit 2-6. The ADT volumes are either based on traffic counts or have been estimated by factoring up peak hour counts. The following formula was used to estimate the daily volume for each intersection leg if daily traffic counts were not available:

PM Peak Hour (Approach Volume + Exit Volume) x 12 = Leg Volume

2.4 EXISTING (2017 AND 2018) CONDITIONS INTERSECTION OPERATIONS ANALYSIS

Existing (2017 and 2018) peak hour traffic operations have been evaluated for the study area intersections based on the analysis methodologies presented in Section 4.2 *Intersection Capacity Analysis* of this report. The intersection operations analysis results are summarized in Table 2-1 which indicates that the intersections of Masters Drive / California Avenue (#1), Masters Drive / Christopher Lane (#18), Via Castilla Street / Masters Drive (#19), and Morales Way / Masters Drive (#20) do not operate at an acceptable level of service (LOS) during the peak hours. The intersection operations analysis worksheets are included in Appendix "2.2" of this TIA.



2.5 EXISTING (2017 AND 2018) CONDITIONS TRAFFIC SIGNAL WARRANTS ANALYSIS

Traffic signal warrants for Existing (2017 and 2018) traffic conditions are based on existing peak hour intersection turning volumes. For Existing (2017 and 2018) traffic conditions, the following unsignalized study area intersections appear to warrant traffic signals (See Appendix "2.3"):

ID	Intersection Location	Jurisdiction
1	Masters Drive / California Avenue	Corona
18	Masters Drive / Christopher Lane	Corona
20	Morales Way / Masters Drive	Corona

It should be noted that in the 2015 traffic study, the intersection of Masters Drive / Eagle Glen Parkway (#3) warrants a traffic signal under Existing (2014 and 2015) conditions and the intersection of Clementine Way / Eagle Glen Parkway (#13) did not exist. New traffic signals were recently installed at these locations. Therefore, evaluation of existing (2017 and 2018) traffic signal warrants at the intersection of Masters Drive / Eagle Glen Parkway (#3) and Clementine Way / Eagle Glen Parkway (#13) are no longer needed.

EXHIBIT 2-6: EXISTING (2017/2018) AVERAGE DAILY TRAFFIC (ADT) VOLUMES

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; > = Right-Turn Overlap Phasing; 1! = Shared Left-Through-Right turn lane; d= Defacto Right Turn Lane;

1 = Lane reduction during interchange construction

[2] Per the Highway Capacity Manual 6th Edition (HCM6), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control. For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown. Delay and level of service is calculated using Synchro 10.1 analysis software.

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[3] TS = Traffic Signal; CSS = Cross-street Stop; AWS = All-Way Stop

3.0 PROJECTED FUTURE TRAFFIC

Future traffic from the Project has been estimated for interim year (2021) conditions, horizon year 2035 conditions.

Future 2021 traffic is represented by the combination of existing traffic, ambient growth (total of 8%), approved Arantine Hills Specific Plan traffic, and increases in traffic volumes associated with the added Project land uses.

The horizon year 2035 forecasts are derived from the approved Arantine Hills Specific Plan Traffic Assessment (November 2018).

3.1 PROJECT TRAFFIC

3.1.1 PROJECT TRIP GENERATION

Table 3-1 presents overall Project trip generation. Bedford Marketplace is anticipated to generate a total of approximately 7,014 external trips per day with 394 AM peak hour external trips and 686 PM peak hour external trips. Of the total trips for Bedford Marketplace, the Project will generate approximately 2,061 external trips per day with 281 AM peak hour external trips and 285 PM peak hour external trips.

The ITE Trip Generation manual is a nationally recognized source for estimating site specific trip generation. The ITE 2017 Trip Generation manual (10th Edition) trip generation rates are used to estimate Project trip ends generated by each individual use, which is then considered in combination with the mix of site uses. Internal interaction represents the trips captured internally because of the opportunity to visit various land uses without using the arterial roadway system (for example, exiting the hotel in the morning and stopping at the gas station before leaving the Bedford Marketplace property). Internal capture calculations for each use are indicated on Table 1.

In addition to the internal capture adjustment, trips generated by the commercial site are adjusted due to interactions with nearby residential areas. Due to the location of Bedford Marketplace, some of the existing and future residential trips are diverted from the surrounding arterial system. These trips represent travelers who interact with a shop, service, or restaurant and then continue traveling elsewhere. To understand the traffic volume effects at study area intersections, estimates of diverted pass-by trips are necessary.

As shown on Table 3-1, in comparison to the approved commercial trip generation in the Arantine Hills Traffic Assessment (November 2018), the Project is anticipated to generate an additional 2,061 external trips per day with 281 AM peak hour external trips and 285 PM peak hour external trips.

3.1.2 PROJECT TRIP DISTRIBUTION

Trip distribution is the process of identifying the probable destinations, directions or traffic routes that will be utilized by Project traffic.

TABLE 3-1: BEDFORD MARKETPLACE PROJECT TRIP GENERATION SUMMARY

R:\UXRjobs_12100-12500\12554\Excel\[12554 - Report.xlsx]3-1

The potential interaction between the planned land uses and surrounding regional access routes are considered to identify the routes where Project traffic would travel. The Project trip distribution was developed based on anticipated travel patterns to and from the Project site and are consistent with the commercial trip distribution patterns reviewed and approved by the City as part of the 2015 and 2018 studies. The proposed Project does not cause any change to the previously approved trip distribution patterns included in the *Arantine Hills Modified Project Traffic Study*, dated September 11, 2015 and *Arantine Hills Specific Plan Amendment No. 2 Traffic Assessment*, dated November 12, 2018. Recent select zone traffic assignments from the recently updated City of Corona traffic model were also reviewed.

The trip distribution pattern is heavily influenced by the geographical location of the site, the location of surrounding uses, and the proximity to the arterial network and regional freeway system. Exhibit 3-1 include the Project distribution used in this study.

3.1.3 MODAL SPLIT

The traffic-reducing potential of public transit has not been considered in this report. Essentially the traffic projections are "conservative" in that public transit might be able to reduce the traffic volumes.

3.1.4 PROJECT TRIP ASSIGNMENT

The assignment of traffic from the Project area to the adjoining roadway system is based upon the Project trip generation, trip distribution, and the arterial highway and local street system improvements that would be in place by the time of initial occupancy of the Project.

Based on the identified Project traffic generation and trip distribution patterns, the increase in AM and PM peak hour volumes generated by the Project are shown on Exhibit 3-2 and Exhibit 3-3, respectively.

3.2 TOTAL FUTURE TRAFFIC

This analysis assesses the following future traffic conditions.

- Interim Year (2021) Without Project conditions
- Interim Year (2021) With Project conditions
- Horizon Year 2035 Without Project Conditions
- Horizon Year 2035 With Project Conditions

Interim Year (2021) Without Project conditions AM and PM peak hour intersection turning movement volumes are shown on Exhibit 3-4 and Exhibit 3-5, respectively. Interim Year (2021) With Project conditions AM and PM peak hour intersection turning movement volumes are shown on Exhibit 3-6 and Exhibit 3-7, respectively.

Horizon Year 2035 Without Project Conditions AM and PM peak hour intersection turning movement volumes are shown on Exhibit 3-8 and 3-9, respectively. Horizon Year 2035 With Project Conditions AM and PM peak hour intersection turning movement volumes are shown on Exhibit 3-10 and Exhibit 3-11, respectively.

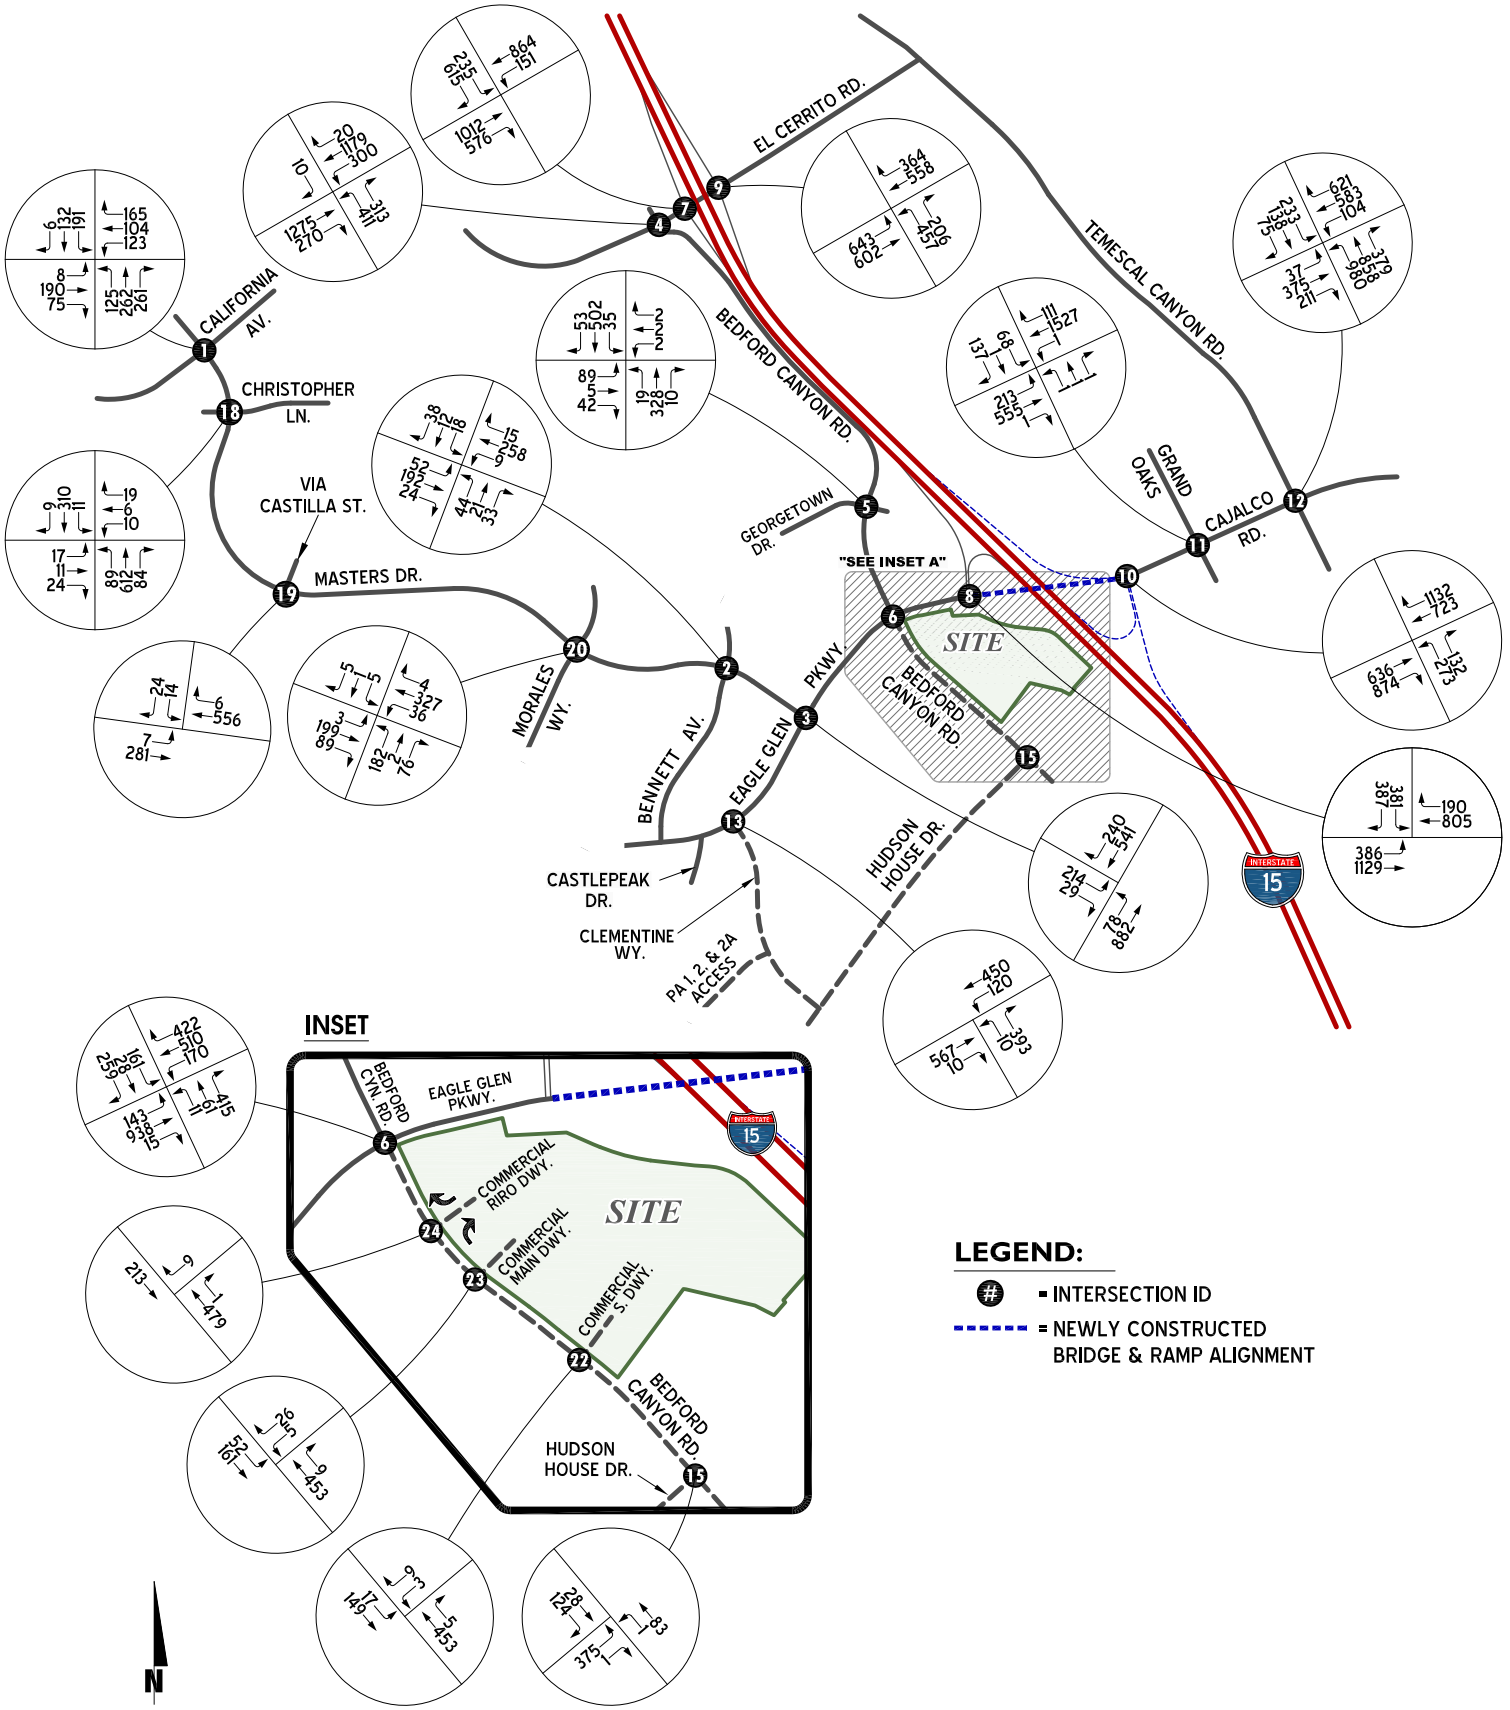
3.3 SITE ACCESS IMPROVEMENTS

Access in and out of Bedford Marketplace occurs at three existing driveways along Bedford Canyon Road south of Eagle Glen Parkway/Cajalco Road. The northerly driveway is limited to right-in right-out (RIRO) conditions, without an opening of the median on Bedford Canyon Road. It serves as a convenient exit for vehicles leaving the Gas Station and Automated Car Wash, bound for Eagle Glen Parkway/Cajalco Road. The RIRO driveway also accommodates entering vehicles from northbound on Bedford Canyon Road.

The main driveway to Bedford Marketplace is located at a mid-point along the site frontage to Bedford Canyon Road. It is a full access location, serving left and right turns to and from Bedford Canyon Road with traffic signal control. With additional traffic generated by the Project, the existing southbound left turn lane serving the main driveway to Bedford Marketplace is recommended to be extended to provide 200 feet of vehicle queuing.

The southerly driveway to Bedford Marketplace is also a full access location, serving left and right turns to and from Bedford Canyon Road with cross-street stop sign control of the exiting vehicles. At this location, the existing southbound left turn lane is recommended to be extended to provide 150 feet of vehicle queuing with to accommodate the additional traffic generated by the Project.

An efficient network of on-site driveways provides connectivity to all access points and facilitates the internal flow of activity between the variety of land uses.



In conjunction with approved 80 TSF commercial, the following site access provisions were included as follows, and remain unchanged with the Project:

- Restrict the intersection of Bedford Canyon Road / Commercial RIRO Driveway (#24) to a right-in/right-out only intersection
- Install a traffic signal at the Bedford Canyon Road / Commercial Main Driveway (#23).
- Provide a well-integrated network of on-site driveways to facilitate the internal flow of activity between the variety of Project land uses.
- Sight distance at each project access driveway should be reviewed with respect to Caltrans and City of Corona sight distance standards at the time of preparation of final grading, landscape and street improvement plans.

The Project generates the need for the following site access improvements as illustrated on Exhibit 3-12:

- Extend the existing southbound left turn lane at Bedford Canyon Road / Commercial Main Driveway (#23) to provide 200 ft. storage length.
- Extend the existing southbound left turn lane at Bedford Canyon Road / Commercial South Driveway (#22) to provide a minimum of 150 ft. storage length.
- On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the Project, along with any modifications to sight distance.

3.4 INTERNAL CIRCULATION

The internal network of driveways and parking aisles shown on Exhibit 3-12 has been refined in response to City of Corona technical comments. The three driveway entries to the site are connected internally by a 30' north/south drive aisle (westerly drive aisle), and movement along this spine driveway is not interrupted by direct access to parking stalls.

At each of the three driveway entries, an uninterrupted travel way is provided between the street and the westerly drive aisle. The central driveway entry (commercial main driveway) accommodates two inbound and two outbound lanes. Entering vehicles which turn left or right at the westerly drive aisle are therefore served by separate travel lanes.

Approximately six vehicles per lane can be stored within each of the inbound and outbound lanes at the three driveway entries to the site without affecting Bedford Canyon Road traffic flows. The design of the site entries and internal drive aisles minimizes conflict points which would interfere with key traffic movements. Each of the three driveway entries extends into the site beyond the westerly drive aisle and connects to other parallel internal driveways.

The central parking lots provide parking spaces suited to travelers who wish to access multiple shops, restaurants, health / fitness club, day care center, and banks. The central parking lots are located east of the westerly drive aisle and west of the central north/south drive aisle which is adjacent to the major retail buildings. Vehicles turn into parking aisles which in turn provide direct access to parking stalls. Parking spaces are also located near Pads A, B, C, D, and E, in addition to the hotel, providing convenient access to these establishments.

Pad C and Pad D are located south of the northerly right in / right out driveway, in an area of the parking lot that is separated from the main parking lot area with two internal drive aisle openings. Entry to the Pad C and Pad D drive-thru aisles is provided by two separate parking aisles from the westerly drive aisle. For Pad D, the exiting drive-thru lanes connect directly to the westerly drive aisle. Parking is also provided in this area for visitors who may decide to park and enter Pad C and Pad D on foot.

This page intentionally left blank.

4.0 METHODOLOGIES

This section of the report presents the methodologies used to perform the traffic analyses summarized in this report. The methodologies described are generally consistent with the City of Corona traffic impact study guidelines.

4.1 LEVEL OF SERVICE

Traffic operations of roadway facilities are described using the term "Level of Service" (LOS). LOS is a qualitative description of traffic flow based on several factors such as speed, travel time, delay, and freedom to maneuver. Six levels are typically defined ranging from LOS A, representing completely free-flow conditions, to LOS F, representing breakdown in flow resulting in stop-and-go conditions. LOS E represents operations at or near capacity, an unstable level where vehicles are operating with the minimum spacing for maintaining uniform flow.

4.2 INTERSECTION CAPACITY ANALYSIS

The definitions of LOS for interrupted traffic flow (flow restrained by the existence of traffic signals and other traffic control devices) differ slightly depending on the type of traffic control. The LOS is typically dependent on the quality of traffic flow at the intersections along a roadway. The *Highway Capacity Manual* (HCM) methodology expresses the LOS at an intersection in terms of delay time for the various intersection approaches. The HCM uses different procedures depending on the type of intersection control.

The following peak hours were selected for analysis:

- Weekday AM Peak Hour (peak hour between 7:00 AM and 9:00 AM)
- Weekday PM Peak Hour (peak hour between 4:00 PM and 6:00 PM)

4.2.1 SIGNALIZED INTERSECTIONS

The City of Corona requires signalized intersection operations analysis based on the methodology described in Chapter 18 and Chapter 31 of the HCM 6th Edition. Intersection LOS operations are based on an intersection's average control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. For signalized intersections LOS is directly related to the average control delay per vehicle and is correlated to a LOS designation as described in Table 4-1.

Study area intersections have been analyzed using the software package Synchro (Version 10). Synchro is a macroscopic traffic software program that is based on the signalized intersection capacity analysis as specified in the Chapter 18 of the HCM. Macroscopic level models represent traffic in terms of aggregate measures for each movement at the study intersections. Equations are used to determine measures of effectiveness such as delay and queue length.

TABLE 4-1: SIGNALIZED INTERSECTION LOS THRESHOLDS

Description	Average Control Delay (Seconds), V/C ≤ 1.0	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Operations with very low delay occurring with favorable progression and/or short cycle length.	0 to 10.00	A	F
Operations with low delay occurring with good progression and/or short cycle lengths.	10.01 to 20.00	B	F
Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.01 to 35.00	C	F
Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.01 to 55.00	D	F
Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.01 to 80.00	E	F
Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	80.01 and up	F	F

Source: HCM 6th Edition

The level of service and capacity analysis performed by Synchro takes into consideration optimization and coordination of signalized intersections within a network. The LOS analysis for signalized intersections has been performed using optimized signal timing for existing traffic conditions. Signal timing optimization has considered pedestrian safety and signal coordination requirements. Appropriate time for pedestrian crossings has also been considered in the signalized intersection analysis. Signal timing for study area intersections have been requested and utilized. Where signal timing was unavailable, the local accepted standards were utilized in lieu of actual signal timing.

The peak hour traffic volumes have been adjusted using a peak hour factor (PHF) to reflect peak 15 minute volumes. Flow rates are typically expressed in vehicles per hour. The PHF is the relationship between the peak 15-minute flow rate and the full hourly volume (e.g. PHF = [Hourly Volume] / [4 x Peak 15-minute Flow Rate]). The use of a 15-minute PHF produces a more detailed analysis as compared to analyzing vehicles per hour. Existing PHFs have been used for all analysis scenarios. Per Chapter 4 of the HCM 6th Edition (HCM6), PHF values over 0.95 often are indicative of high traffic volumes with capacity constraints on peak hour flows while lower PHF values are indicative of greater variability of flow during the peak hour.

4.2.2 UNSIGNALIZED INTERSECTIONS

The City of Corona requires the operations of unsignalized intersections be evaluated using the methodology described in Chapter 19, Chapter 20, and Chapter 32 of the HCM 6th Edition. The LOS rating is based on the weighted average control delay expressed in seconds per vehicle (see Table 4-2).

TABLE 4-2: UNSIGNALIZED INTERSECTION DESCRIPTION OF LOS

Description	Average Control Delay Per Vehicle (Seconds)	Level of Service, V/C ≤ 1.0	Level of Service, V/C > 1.0
Little or no delays.	0 to 10.00	A	F
Short traffic delays.	10.01 to 15.00	B	F
Average traffic delays.	15.01 to 25.00	C	F
Long traffic delays.	25.01 to 35.00	D	F
Very long traffic delays.	35.01 to 50.00	E	F
Extreme traffic delays with intersection capacity exceeded.	> 50.00	F	F

Source: HCM 6th Edition

At two-way or side-street stop-controlled intersections, LOS is calculated for each controlled movement and for the left turn movement from the major street, as well as for the intersection as a whole. For approaches composed of a single lane, the delay is computed as the average of all movements in that lane.

To evaluate roundabout intersections, the HCM6 methodology has been utilized. The LOS for roundabouts is based on average vehicle delay and utilizes the same LOS threshold used for unsignalized intersections and previously presented on Table 4-2.

4.3 QUEUING ANALYSIS

For the purpose of this analysis and per the City of Corona's request, the 95th percentile queuing of vehicles has been assessed along Eagle Glen – Cajalco Road from Bedford Canyon Road to I-5 / Cajalco Interchange, Bedford Canyon Road / Foothill Parkway – El Cerrito Road, and Project Access points on Bedford Canyon Road to determine potential queuing deficiencies.

The traffic progression analysis tool and HCM intersection analysis program, Synchro, has been used to assess the potential deficiencies/needs of the intersections with traffic added from the proposed Project. Storage (turn-pocket) length recommendations have been based upon the 95th percentile queue resulting from the Synchro progression analysis. The queue length reported is for the lane with the highest queue in the lane group.

A vehicle is considered queued whenever it is traveling at less than 10 feet/second. A vehicle will only become queued when it is either at the stop bar or behind another queued vehicle. Although only the 95th percentile queue has been reported in the tables, the 50th percentile queue can be found in the appendix alongside the 95th percentile queue for each ramp location. The 50th percentile maximum queue is the maximum back of queue on a typical cycle during the peak hour, while the 95th percentile queue is the maximum back of queue with 95th percentile traffic volumes during the peak hour. In other words, if traffic were observed for 100 cycles, the 95th percentile queue would be the queue experienced with the 95th busiest cycle (or 5% of the time). The 50th percentile or average queue represents the typical queue length for peak hour traffic conditions, while the 95th percentile queue is derived from the average queue plus

1.65 standard deviations. The 95th percentile queue is not necessarily ever observed, it is simply based on statistical calculations.

4.4 TRAFFIC SIGNAL WARRANT ANALYSIS METHODOLOGY

The term "signal warrants" refers to the list of established criteria used by Caltrans and other public agencies to quantitatively justify or ascertain the potential need for installation of a traffic signal at an otherwise unsignalized intersection. This TIA uses the signal warrant criteria presented in the latest edition of the Federal Highway Administration's (FHWA) *Manual on Uniform Traffic Control Devices (MUTCD)*, as amended by *the MUTCD 2012 California Supplement*, for all study area intersections.

The signal warrant criteria for Existing conditions are based upon several factors, including volume of vehicular and pedestrian traffic, frequency of accidents, and location of school areas. Both the FHWA's *MUTCD* and the *MUTCD 2012 California Supplement* indicate that the installation of a traffic signal should be considered if one or more of the signal warrants are met. Specifically, this TIA utilizes the Peak Hour Volume-based Warrant 3 as the appropriate representative traffic signal warrant analysis for existing traffic conditions. Warrant 3 criteria are basically identical for both the FHWA's *MUTCD* and the *MUTCD 2012 California Supplement*. Warrant 3 is appropriate to use for this TIA because it provides specialized warrant criteria for intersections with rural characteristics (e.g. located in communities with populations of less than 10,000 persons or with adjacent major streets operating above 40 miles per hour). For the purposes of this study, the speed limit was the basis for determining whether Urban or Rural warrants were used for a given intersection. It should be noted that Rural warrants have been utilized along Masters Drive and Bedford Canyon Road.

Future intersections that do not currently exist have been assessed regarding the potential need for new traffic signals based on future average daily traffic (ADT) volumes, using the Caltrans planning level ADT-based signal warrant analysis worksheets.

Traffic signal warrant analyses were performed for the unsignalized study area intersections listed in Table 4-3.

TABLE 4-3: TRAFFIC SIGNAL WARRANT ANALYSIS LOCATIONS

ID	Intersection Location	Jurisdiction
1	Masters Drive / California Avenue	Corona
2	Masters Drive / Bennett Avenue	Corona
5	Bedford Canyon Road / Georgetown Drive	Corona
18	Masters Drive / Christopher Lane	Corona
19	Via Castilla Street / Masters Drive	Corona
20	Morales Way / Masters Drive	Corona
22	Bedford Canyon Road / Commercial South Driveway – *Future Intersection*	Corona
23	Bedford Canyon Road / Commercial Main Driveway – *Future Intersection*	Corona

The Existing (2017 and 2018) conditions traffic signal warrant analysis is presented previously in Section 2.5. The traffic signal warrant analysis for future conditions are presented in Section 5.0 *Interim Year (2021) Traffic Analysis*, and Section 6.0 *Horizon Year 2035 Traffic Analysis* of this report.

It is important to note that a signal warrant defines the minimum condition under which the installation of a traffic signal might be warranted. Meeting this threshold condition does not require that a traffic control signal be installed at a particular location, but rather, that other traffic factors and conditions be evaluated in order to determine whether the signal is truly justified. It should also be noted that signal warrants do not necessarily correlate with LOS. An intersection may satisfy a signal warrant condition and operate at or above acceptable LOS or operate below acceptable LOS and not meet a signal warrant.

4.5 LOS CRITERIA

In accordance with the City of Corona General Plan, the following intersection LOS thresholds from the General Plan are to be implemented:

- LOS C or better shall be maintained for local intersections in residential/industrial areas.
- LOS D or better shall be maintained on collector and arterial intersections.
- Consistent with the previously approved Arantine Hills Traffic Impact Analysis (2015) and Arantine Hills Specific Plan Amendment No.2 Traffic Assessment (November 2018), LOS "E" is anticipated to be permitted for the ramp intersections at the I-15 / Cajalco Road interchange.

The City of Corona LOS criteria for the study area intersections are listed below:

ID	Intersection	LOS Criteria
1	Masters Drive / California Avenue	*C*
2	Masters Drive / Bennett Avenue	*C*
3	Masters Drive / Eagle Glen Parkway	*D*
4	Bedford Canyon Road / El Cerrito Road	*D*
5	Bedford Canyon Road / Georgetown Drive	*C*
6	Bedford Canyon Road / Eagle Glen Parkway	*D*
7	I-15 SB Ramps / El Cerrito Road	*D*
8	I-15 SB Ramps / Cajalco Road	*E*
9	I-15 NB Ramps / El Cerrito Road	*D*
10	I-15 NB Ramps / Cajalco Road	*E*
11	Grand Oaks / Cajalco Road	*D*
12	Temescal Canyon Road / Cajalco Road	*D*
13	Clementine Way / Eagle Glen Parkway	*D*
14	Clementine Way / Hudson House Drive	*C*
15	Bedford Canyon Road / Hudson House Drive	*C*
18	Masters Drive / Christopher Lane	*C*
19	Via Castilla Street / Masters Drive	*C*

ID	Intersection (Continued)	LOS Criteria
20	Morales Way / Masters Drive	*C*
22	Bedford Canyon Road / Commercial RIRO Driveway	*C*
23	Bedford Canyon Road / Commercial Main Driveway	*C*
24	Bedford Canyon Road / Commercial South Driveway	*C*

The Arantine Hills Project Traffic Study provides the mitigation measures needed to satisfy the minimum level of service thresholds defined by the City of Corona. This is consistent with the Caltrans Guide for the preparation of Traffic Impact Studies that states "Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D on State highway facilities". However, it should be noted that Caltrans acknowledges that maintaining these levels of service thresholds may not always be feasible and recommends the lead agency consult with Caltrans to determine the appropriate target level of service. If an existing facility is operating at less than the appropriate target LOS, the existing LOS should be maintained.

5.0 INTERIM YEAR (2021) TRAFFIC ANALYSIS

This section discusses the methods used to develop Interim Year (2021) without and with Project traffic conditions and the resulting intersection operations.

5.1 ROADWAY IMPROVEMENTS

The lane configurations and traffic controls assumed for Interim Year (2021) Conditions are as follows:

- Bedford Marketplace driveways and those facilities assumed to be constructed as part of the Bedford Marketplace to provide site access are assumed to be in place for With Project conditions only (e.g., intersection and roadway improvements at the Project's frontage and driveways).

Planned improvements (currently under construction) at or near the Cajalco Road/I-15 interchange area include the following:

- Widen Cajalco Road from a 2-lane divided roadway to a 4-lane divided roadway, between Bedford Canyon Road and I-15 SB Ramps.
- Widen Cajalco Road from a 2-lane divided roadway to a 6-lane divided roadway, between the I-15 SB and I-15 NB ramps.
- Widen Cajalco Road from a 5-lane divided roadway to a 6-lane divided roadway, between the I-15 NB ramps Temescal Canyon Road.

The unsignalized intersection of Masters Drive / Eagle Glen Parkway (#3) and future intersection of Clementine Way / Eagle Glen Parkway (#13) under existing conditions are evaluated with traffic signal control for Interim Year (2021) conditions. These traffic signal improvements were recently installed after existing (2017/2018) counts were taken.

5.2 INTERIM YEAR (2021) TRAFFIC VOLUME FORECASTS

To account for ambient growth on area roadways, future 2021 traffic volumes have been estimated based on an annual growth of 2% per year (total of 8% growth for 4 years). In addition, the approved Arantine Hills Project traffic is also included as background traffic for 2021 conditions.

The Interim Year (2021) Without Project conditions peak hour intersection turning movement volumes were shown previously on Exhibits 3-4 and 3-5. The 2021 With Project conditions peak hour intersection turning movement volumes were shown previously on Exhibits 3-6 and 3-7.

5.3 INTERSECTION OPERATIONS ANALYSIS AND RECOMMENDED IMPROVEMENTS

Table 5-1 provides an overall summary of intersection operations in the study area with Interim Year (2021) without and with Project conditions.

TABLE 5-1: INTERSECTION ANALYSIS SUMMARY FOR INTERIM YEAR (2021) CONDITIONS

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; d = Defacto Right Turn Lane; 1! = Shared Left-Through-Right turn lane; > = Right Turn Overlap; >> = Free-Right;

1 = Recently Completed Improvement; ***1*** = Lane reduction/configuration during interchange construction; **1** = Improvement; ***1*** = Planned Interchange Improvement

[2] Per the Highway Capacity Manual 6th Edition (HCM6), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control.

For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

Delay and level of service is calculated using Synchro 10.1 analysis software.

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[3] TS = Traffic Signal; CSS = Cross-street Stop; AWS = All-Way Stop; RDB = Roundabout

[4] Per City of Corona staff, a 3rd EBT lane is recommended.

[6] Source: Arantine Hills Modified Project Traffic Study (September 2015). Prepared by Urban Crossroads, Inc.

R:\UXRjobs_12100-12500\12554\Excel\[12554 - Report.xlsx]5-1

The Interim Year (2021) Without Project conditions intersection operations analysis worksheets are provided in Appendix "5.1". The 2021 With Project conditions intersection operations analysis worksheets are provided in Appendix "5.2".

For Interim Year (2021) Without Project and With Project scenarios, LOS deficiencies occur at the following intersections:

ID	Intersection Location	Jurisdiction
1	Masters Drive / California Avenue	Corona
6	Bedford Canyon Road / Eagle Glen Parkway	Corona
8	I-15 SB Ramps / Cajalco Road	Caltrans
10	I-15 NB Ramps / Cajalco Road	Caltrans
11	Grand Oaks / Cajalco Road	Corona
18	Masters Drive / Christopher Lane	Corona
19	Via Castilla Street / Masters Drive	Corona
20	Morales Way / Masters Drive	Corona

With the recommended intersection improvements listed below, the deficient intersections identified under Interim Year (2021) Without Project conditions are projected to operate at acceptable level of service during both AM and PM peak hours. Planned improvements (see Caltrans improvement plans in Appendix 1.2) at or near the Cajalco Road / I-15 Interchange area are also included below.

Masters Drive / California Drive (#1)

- Install a traffic signal.

Bedford Canyon Road / Eagle Glen Parkway - Cajalco Road (#6) *– Under Construction*

- Traffic Signal Modification.
- Adjust the east leg striping to provide a 2nd receiving lane.
- NB Approach: Construct one left turn lane, one through lane, and one-right turn lane.
- SB Approach: Modify striping to provide a new shared left/through lane.
- EB Approach: Modify striping to provide a new shared through/right turn lane.
- WB Approach: Construct 2 left turn lanes.

I-15 SB Ramps / Cajalco Road (#8) *– Under Construction*

- SB Approach: Construct a 2nd left turn lane and 2nd right turn lane.
- EB Approach: Construct a 2nd left turn lane, 2nd through lane, and 3rd through lane.
- WB Approach: Construct a 2nd through lane

I-15 NB Ramps / Cajalco Road (#10) *– Under Construction*

- NB Approach: Construct a 2nd left turn lane and 2nd right turn lane.
- EB Approach: Construct a 2nd and 3rd through lanes and one right turn lane with overlap phasing.
- WB Approach: Construct a 2nd and 3rd through lanes.

Grand Oaks / Cajalco Road (#11) *– Under Construction*

- EB Approach: Construct a 3rd through lane.

Bedford Canyon Road / Hudson House Drive (#15)

- Install roundabout.
- NB Approach: Provide a shared left/through lane.
- SB Approach: Provide a shared through/right turn lane.
- EB Approach: Provide a shared left/right turn lane.

Masters Drive / Christopher Lane (#18)

- Provide traffic signal, or small roundabout (within existing right-of-way).

Via Castilla Street / Masters Drive (#19)

- Convert to cross-street stop control on Via Castilla Street (in conjunction with Masters Drive / Christopher Lane and Morales Way / Masters Drive traffic signals), or construct a roundabout (within existing right-of-way).

Morales Way / Masters Drive (#20)

- Install a traffic signal, or construct a roundabout (within existing right-of-way).

Bedford Canyon Road / Commercial South Driveway (#22)

- Install a stop sign control for the westbound approach.
- NB Approach: Provide one through lane and one shared through/right lane.
- SB Approach: Provide a left turn (minimum 150 ft.) lane and two through lanes.
- WB Approach: Provide a shared left/right turn lane.

Bedford Canyon Road / Commercial Main Driveway (#23)

- Install a traffic signal.
- NB Approach: Provide one through lane and one shared through/right lane.
- SB Approach: Provide a left turn (minimum 200 ft.) lane and two through lanes.
- WB Approach: Provide one left turn lane and one right turn lane.

Bedford Canyon Road / Commercial RIRO Driveway (#24)

- Install a stop sign control for the westbound approach.
- Restrict intersection to right-in/right-out access only
- NB Approach: Provide one through lane and one shared through/right lane.
- SB Approach: Provide two through lanes.
- WB Approach: Provide one right turn lane.

For Interim Year (2021) With Project Conditions, the Project does not generate impacts that require new improvements beyond the improvements identified under Interim Year (2021) Without Project conditions.

5.4 QUEUING ANALYSIS

A queuing analysis was performed for With Project Conditions to assess the adequacy of turn bay lengths to accommodate vehicle queues at the Bedford Marketplace entries and nearby interchange area (including Eagle Glen Parkway – Cajalco Road between Bedford Canyon Road and I-15 Ramps, Bedford Canyon Road / Foothill Parkway - El Cerrito Road). The simulation and optimization traffic modeling tools Synchro and SimTraffic were utilized to perform this evaluation of traffic flows and vehicle queuing. Synchro is a macroscopic analysis and optimization program, and SimTraffic performs microsimulations and animation of vehicle traffic. The SimTraffic analysis includes the effects of nearby intersections on arrival time at an intersection, during the AM and PM peak periods.

In SimTraffic, each vehicle in the traffic system is individually tracked and operational measures of effectiveness are collected on every vehicle during each 10th of a second of simulation. Driver behavior characteristics (ranging from passive to aggressive) are assigned to each vehicle by the model, affecting the vehicle's free-flow speed, queue discharge headways, and other behavioral attributes. The variation in each vehicle's behavior is simulated in a manner reflecting real-world operations.

The queue length reported for each movement in SimTraffic is responsive to the turn pocket length, just like in the real world. SimTraffic simply observes the actual queue activity as it unfolds during the peak hour. Any spillover from the left turn pocket would be reported in the adjacent lane queue length. The random simulations generated by SimTraffic have been utilized to determine the 95th percentile queue lengths observed for each turn lane.

The estimated turn lane storage length requirements for the Project entries and nearby interchange area for Interim Year (2021) with Project traffic conditions are summarized in Table 5-2. These lengths are based on the volumes presented in Chapter 3, and queue length worksheets are included in Appendix 5.2.

TABLE 5-2: INTERIM YEAR (2021) WITH PROJECT CONDITIONS LANE STORAGE LENGTHS

ID	Intersection	Turning Movement Lane	# of Lanes	2035 With Project				Storage Length[2] (ft.)	95th Percentile Queue Length[1]	
				AM	PM	Peak Hour	Volume		AM	PM

[1] Queue length calculated using SimTraffic.

[2] Existing/Proposed length of storage. Existing = 100; Proposed =**100**

[3] Review of SimTraffic simulation results indicate that the turn lane queue is anticipated to clear in a timely manner and that the provided pocket length is adequate.

R:\UXRjobs_12100-12500\12554\Excel\[12554 - Report.xlsx]2-1

5.5 TRAFFIC SIGNAL WARRANT ANALYSIS

For Interim Year (2021) Without Project Conditions, the intersection of Bedford Canyon Road / Commercial Main Driveway (#23) is anticipated to meet traffic signal warrants in addition to the intersection previously identified under Existing conditions.

For Interim Year (2021) With Project traffic conditions, there are no new unsignalized intersections anticipated to meet traffic signal warrants, in addition to the intersections identified under Interim Year (2021) without Project conditions.

The 2021 Without and With Project traffic signal warrant analysis worksheets are provided in Appendix "5.3". For 2021 conditions without the Project, the intersection of Bedford Canyon Road / Commercial Main Driveway (#23) is anticipated to meet traffic signal warrants (in addition to the intersection previously identified under Existing conditions).

6.0 HORIZON YEAR 2035 TRAFFIC ANALYSIS

6.1 HORIZON YEAR 2035 TRAFFIC VOLUME FORECASTS

The Horizon Year 2035 volumes from Arantine Hills Specific Plan Amendment No. 2 Traffic Assessment (November 2018) have been utilized in this report to represent "Without Project" conditions.

The Horizon Year 2035 Without Project Conditions peak hour intersection turning movement volumes were shown previously on Exhibits 3-8 and 3-9.

The Horizon Year 2035 With Project Conditions peak hour intersection turning movement volumes were shown previously on Exhibits 3-10 and 3-11.

6.2 INTERSECTION OPERATIONS ANALYSIS AND RECOMMENDED IMPROVEMENTS

Table 6-1 provides an overall summary of intersection operations in the study area with 2035 Without Project and With Project conditions.

The Horizon Year 2035 Without Project Conditions intersection operations analysis worksheets are provided in Appendix "6.1". The Horizon Year 2035 With Project Conditions intersection operations analysis worksheets are provided in Appendix "6.2".

For Horizon Year 2035 Without Project Conditions, the following intersections are anticipated to operate at unacceptable level of service, with planned improvements at or near the Cajalco Road / I-15 interchange area:

ID	Intersection Location	Jurisdiction
1	Masters Drive / California Avenue	Corona
2	Masters Drive / Bennett Avenue	Corona
5	Bedford Canyon Road / Eagle Glen Parkway	Corona
7	I-15 SB Ramps / El Cerrito Road	Caltrans
12	Temescal Canyon Road / Cajalco Road	Corona
18	Masters Drive / Christopher Lane	Corona
19	Via Castilla Street / Masters Drive	Corona
20	Morales Way / Masters Drive	Corona

For Horizon Year 2035 With Project Conditions, there are no new intersections anticipated to operate at deficient level of service, beyond the intersections previously identified under Horizon Year 2035 Without Project Conditions. Project driveways and those facilities to be constructed by Bedford Marketplace to provide site access are assumed to be in place for With Project conditions (e.g., intersection and roadway improvements at the Project's frontage and driveways).

[1] When a right turn is designated, the lane can either be striped or unstriped. To function as a right turn lane there must be sufficient width for right turning vehicles to travel outside the through lanes.

L = Left; T = Through; R = Right; d = Defacto Right Turn Lane; 1! = Shared Left-Through-Right turn lane; > = Right Turn Overlap; >> = Free-Right;

1 = Recently Completed Improvement; **1** = Improvement; ***1*** = Planned Interchange Improvement

[2] Per the Highway Capacity Manual 6th Edition (HCM6), overall average intersection delay and level of service are shown for intersections with a traffic signal or all way stop control.

For intersections with cross street stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

Delay and level of service is calculated using Synchro 10.1 analysis software.

BOLD = LOS does not meet the applicable jurisdictional requirements (i.e., unacceptable LOS).

[3] TS = Traffic Signal; CSS = Cross-street Stop; AWS = All-Way Stop; RDB = Roundabout

[4] Per City of Corona staff, a 3rd EBT lane is recommended.

[6] Source: Arantine Hills Modified Project Traffic Study (September 2015). Prepared by Urban Crossroads, Inc.

R:\UXRjobs_12100-12500\12554\Excel\[12554 - Report.xlsx]6-1

With the recommended intersection improvements listed below (in addition to the previously identified improvements under Interim Year (2021) Without Project conditions), the deficient intersections identified under Horizon Year 2035 Without Project Conditions are projected to operate at acceptable level of service during both AM and PM peak hours.

I-15 SB Ramps / El Cerrito Road (#7)

- EB Approach: Construct a separate right turn lane

Temescal Canyon Road / Cajalco Road (#12)

- Widen Cajalco Road from four-lane divided to six-lane divided roadway, east of Temescal Canyon Road.
- SB Approach: Modify striping to provide a 2nd left turn lane, in addition to the existing two through lanes.
- EB Approach: Modify striping to provide a 2nd through lane, in addition to the existing left turn lane and right turn lane.
- WB Approach: Construct one right turn lane.

Traffic signal improvements are also recommended at the following intersections without the Project based on the traffic signal warrant results discussed in section 6.4:

Masters Drive / Bennett Avenue (#2)

- Install a traffic signal.

Bedford Canyon Road / Georgetown Drive (#5)

- Install a traffic signal.

For Horizon Year 2035 With Project Conditions, the Project does not generate impacts that require new improvements beyond the improvements identified under Horizon Year 2035 Without Project conditions.

6.3 QUEUING ANALYSIS

A queuing analysis was performed for With Project Conditions to assess the adequacy of turn bay lengths to accommodate vehicle queues at the Bedford Marketplace entries and nearby interchange area (including Eagle Glen Parkway – Cajalco Road between Bedford Canyon Road and I-15 Ramps, Bedford Canyon Road / Foothill Parkway - El Cerrito Road). The simulation and optimization traffic modeling tools Synchro and SimTraffic were utilized to perform this evaluation of traffic flows and vehicle queuing. Synchro is a macroscopic analysis and optimization program, and SimTraffic performs microsimulations and animation of vehicle traffic. The SimTraffic analysis includes the effects of nearby intersections on arrival time at an intersection, during the AM and PM peak periods.

In SimTraffic, each vehicle in the traffic system is individually tracked and operational measures of effectiveness are collected on every vehicle during each 10th of a second of simulation. Driver behavior characteristics (ranging from passive to aggressive) are assigned to each vehicle by the model, affecting the vehicle's free-flow speed, queue discharge headways, and other behavioral attributes. The variation in each vehicle's behavior is simulated in a manner reflecting real-world operations.

The queue length reported for each movement in SimTraffic is responsive to the turn pocket length, just like in the real world. SimTraffic simply observes the actual queue activity as it unfolds during the peak hour. Any spillover from the left turn pocket would be reported in the adjacent lane queue length. The random simulations generated by SimTraffic have been utilized to determine the 95th percentile queue lengths observed for each turn lane.

The estimated turn lane storage length requirements for the Project entries and nearby interchange area for Horizon Year 2035 with Project traffic conditions are summarized in Table 6-2. These lengths are based on the volumes presented in Chapter 3, and queue length worksheets are included in Appendix 6.2.

6.4 TRAFFIC SIGNAL WARRANT ANALYSIS

For Horizon Year 2035 Without Project Conditions, the following intersections are anticipated to meet traffic signal warrants, in addition to the intersections identified previously under Interim Year (2021) conditions:

ID	Intersection Location	Jurisdiction
2	Masters Drive / Bennett Avenue	Corona
5	Bedford Canyon Road / Georgetown Drive	Corona

For Horizon Year 2035 With Project Conditions, there are no new intersections anticipated to meet traffic signal warrants, in addition to the intersections identified previously under 2035 Without Project conditions.

The 2035 Without Project and With Project traffic signal warrant analysis worksheets are provided in Appendix "6.3".

TABLE 6-2: HORIZON YEAR 2035 WITH PROJECT CONDITIONS LANE STORAGE LENGTHS

ID	Intersection	Turning Movement Lane	# of Lanes	2035 With Project				Storage Length[2] (ft.)	95th Percentile Queue Length[1]	
				AM	PM	Peak Hour	Volume		AM	PM
4	Bedford Cyn. Rd. / El Cerrito Rd.	NBR	1	319	194	AM	319	125	188 [3]	199 [3]

23	Bedford Cyn. Rd. / Commercial Main Dwy.	SBL	1	174	281	PM	281	**200**	180	195

[1] Queue length calculated using SimTraffic.

[2] Existing/Proposed length of storage. Existing = 100; Proposed = **100**

[3] Review of SimTraffic simulation results indicate that the turn lane queue is anticipated to clear in a timely manner and that the provided pocket length is adequate.

R:\UXRjobs_12100-12500\12554\Excel\[12554 - Report.xlsx]2-1

7.0 VEHICLE MILES TRAVELED (VMT)

The California Environmental Quality Act (CEQA) procedures for determination of transportation impacts have recently changed to an evaluation of Vehicle Miles Traveled (VMT) rather than vehicle delay or level of service, due to Senate Bill 743 (SB 743). The City of Corona VMT Analysis Guidelines provide a structure for evaluating VMT on a project level basis. Vehicle delay and level of service are still used in Corona traffic studies, as presented in earlier sections of this traffic study.

7.1 CORONA VMT ANALYSIS GUIDELINES

The Corona VMT Analysis Guidelines (Fehr & Peers, January 2019) recommend a VMT assessment procedure that is consistent with the Western Regional Council of Governments (WRCOG). Projects are first screened to determine if a VMT analysis is required. If a Project has the potential to reduce VMT/SP, a VMT impact is not anticipated.

Consistency with the SCAG RTP/SCS is reviewed, and an analysis is necessary if the Project is inconsistent with the RTP/SCS. The Project area is screened to determine if it is in a Transit Priority Area or High Quality Transit Corridor. Local serving retail Projects of less than 50,000 square feet and neighborhood schools are not anticipated to cause VMT impacts. Projects in low VMT-generating TAZs may not require VMT analysis.

Per the Corona General Plan VMT Assessment, Corona residents on average travel 30 VMT per weekday. Projects that are consistent with the General Plan can tier off the General Plan EIR and therefore do not require VMT analysis.

Based upon the WRCOG VMT Screening Tool, the Project is located within a Low VMT generating TAZ. The total VMT per service population for the TAZ is estimated by WRCOG at 27.78 in comparison to the jurisdictional average of 30.52.

VMT is calculated via the City of Corona traffic model, then compared to Service Population (SP), which consists of Population and Employment. Project VMT is considered a significant impact if the Project generates VMT/SP above the Citywide VMT/SP.

Although the Project is located within a Low VMT generating TAZ, the Project TAZ VMT was extracted from the Corona General Plan traffic model for information purposes. The service population in the TAZ that contains the Project is 6,073 residents and employees. The VMT / service population is approximately 26.6 VMT/SP, which is less than the City of Corona average of approximately 30 VMT/SP.

7.2 PROJECT DESIGN FEATURES

The Project is part of the Arantine Hills Specific Plan, with connectivity and mix of uses providing opportunities for on-site interaction, such as restaurant to hotel, hotel to gas station, residential to child care, etc. The Project incorporates the following strategies to reduce automobile trips and the distance traveled per service population:

1. Increase diversity of land uses - This strategy focuses on inclusion of mixed uses within the project and in consideration of the surrounding area to minimize vehicle travel in terms of both the number of auto trips and the length of those trips. By providing a healthy mix of hotel, restaurant, retail, and day care near one another and the surrounding Arantine Hills Specific Plan residential uses, typical "isolated use" travel characteristics are estimated to be reduced by at least nine percent. An increase in diversity of suburban development can reduce VMT within a single development by as much as 12%.

2. Provide pedestrian network improvements - This strategy focuses on creating pedestrian accommodations within the project and connecting to nearby destinations. The backbone plan of pathways and bike routes for Arantine Hills provides an integrated sidewalk and trails system that conveniently links the Bedford Marketplace site to community facilities, residential neighborhoods, and parks. The VMT reduction due to the provision of a compete pedestrian network is up to 5.7%.

3. Provide traffic calming measures and low-stress bicycle network improvements - Multi-purpose trails (Off road paved trails for pedestrians and bicyclist) are located on the north side of Bedford Canyon Road, the east side of Hudson House Drive, and the south side of Clementine Way where public uses can be conveniently accessed by both visitors and residents. This design approach safely accommodates travel by those bicycling in a traditional manner, as well as e-bikes (and e-scooters) which extend the effective range of travel on the bicycle network and enhance the effectiveness of this strategy. Providing accommodations for bicycle facilities results in a potential VMT reduction of 1.7%.

7.3 PROJECT EMPLOYMENT AND VMT ESTIMATES

Project employment information was provided by the Client and is provided in Appendix "7.1". Approximately 582 jobs (including 240 temporary and 342 permanent positions) are anticipated for Bedford Marketplace. The previous approval consists of approximately 80,000 square feet of retail, which accounts for approximately 320 employees (based upon an average of 4 employees per tsf of gross floor area).

Therefore, an increase of approximately 262 jobs will occur with the Project.

The Project mix of land uses (including hotel, retail, and service-oriented uses) is anticipated to encourage trip capture on-site, resulting in a lower than usual VMT. The combination of banking, restaurant, gas, health club, retail, and a day care center in close proximity to residential and hotel uses is expected to capture trips within and near to the site.

As noted above, pathways and bike routes associated with the site provide an integrated sidewalk and trails system that conveniently links the Bedford Marketplace site to community facilities, residential neighborhoods, and parks. The Project is located within a Low VMT generating TAZ, with a VMT / service population between 26.6 and 27.8 VMT/SP, which is less than the City of Corona average of approximately 30 VMT/SP.

The VMT / SP associated with the Project could potentially fall within the range of approximately 26.6 to 31.5, but the Project location, mix of uses, and effectiveness of the

design features support a conservative estimate of 29 VMT / SP. The resulting total Project VMT is approximately 7,598 annual vehicle miles traveled for the 262 employees added by the Project, which is less than the City average per SP and considered a less than significant impact based upon City criteria.

This page intentionally left blank.

8.0 FINDINGS AND CONCLUSIONS

This study assesses the traffic circulation of the proposed Bedford Marketplace which is an expansion of commercial development area adjacent to Arantine Hills. The conclusions and recommendations are summarized below.

- Based on the currently approved commercial trip generation in the Arantine Hills Traffic Assessment (November 2018), the Project is anticipated to generate an additional 2,061 external trips per day with 281 AM peak hour external trips and 285 PM peak hour external trips.
- For Interim Year (2021) conditions, the improvements under construction at or near the Cajalco Road / I-15 Interchange area are assumed to be completed. No additional off-site intersections are anticipated to operate at unacceptable level of service, beyond those intersections previously identified under existing conditions with traffic generated by the Project.
- For Horizon Year 2035 With Project Conditions, there are no new intersections anticipated to operate at deficient level of service, beyond the intersections identified under Without Project Conditions.
- Access in and out of Bedford Marketplace occurs at three existing driveways along Bedford Canyon Road south of Eagle Glen Parkway/Cajalco Road. The northerly driveway is limited to right-in right-out (RIRO) conditions, without an opening of the median on Bedford Canyon Road. It serves as a convenient exit for vehicles leaving the Gas Station and Automated Car Wash, bound for Eagle Glen Parkway/Cajalco Road. The RIRO driveway also accommodates entering vehicles from northbound on Bedford Canyon Road.
- The main Bedford Marketplace driveway is located at a mid-point along the site frontage to Bedford Canyon Road. It is a full access location, serving left and right turns to and from Bedford Canyon Road with traffic signal control. With expansion of commercial uses at the Project site, the existing southbound left turn lane serving the main Bedford Marketplace driveway is recommended to be extended to provide 200 feet of vehicle queuing.
- The southerly Bedford Marketplace driveway is also a full access location, serving left and right turns to and from Bedford Canyon Road with cross-street stop sign control of the exiting vehicles. At this location, the existing southbound left turn lane is recommended to be extended to provide 150 feet of vehicle queuing with the expansion of commercial uses at the Project site.
- An efficient network of on-site driveways provides connectivity to all access points and facilitates the internal flow of activity between the variety of Project land uses.
- The Project mix of land uses (including hotel, retail, and service-oriented uses) is anticipated to encourage trip capture on-site, resulting in a lower than usual VMT per

service population (SP). The Project is also located within a Low VMT generating traffic analysis zone (TAZ), with a VMT / service population between 26.6 and 27.8 VMT/SP.

- The VMT / SP associated with the Project could potentially fall within the range of approximately 26.6 to 31.5, but the Project location, mix of uses, and effectiveness of the design features support a conservative estimate of 29 VMT / SP. The resulting total Project VMT is approximately 7,598 for the 262 employees added by the project, which is less than the City average per SP and considered a less than significant impact based upon City criteria.

8.1 PROJECT FAIR SHARE CALCULATIONS

The project proponent shall participate in the City of Corona Development Impact Fee Program and the Western Riverside Council of Governments Transportation Uniform Mitigation Fee Program, with appropriate credits for overlapping participation in off-site improvements (to be determined by the City of Corona).

The City of Corona Traffic Impact Study Guidelines provide a formula for estimating the project fair share percentages based on average intersection delay. The percentage of fair share for the project shall be calculated at each location as the ratio of the increase in delay from project trips divided by the difference between total delay (including) and delay at acceptable Level of Service. In addition, for non-master planned facilities where there is no reasonable expectation that future development will significantly impact the facility, the project will be responsible for 100% of the mitigation cost and "fair share" will not apply. The following equation is used to calculate the project fair share percentage:

$$\text{Project Fair Share \%} = \frac{\text{Project Only Delay}}{\text{(Total Delay "with project" – Max Acceptable Delay Traffic)}}$$

The volume-based share calculation results are based on both the project percentage of total traffic (Project Only Traffic / Horizon Year With Project Traffic) and project percentage of new traffic (Project Only Traffic / Total New Traffic). Table 8-1 present the Project peak hour fair share calculations using this procedure.

Study area intersection improvement measures for each analysis scenario are shown on Exhibit 8-1. This summary exhibit provides an overview of intersection geometrics by scenario / timeframe. Exhibit 8-1 identifies improvements that would allow the study intersections to operate at acceptable levels of service with the project and with cumulative growth, in addition to improvements for the new project access connections. The proposed Bedford Canyon Road median design with Project left turn pockets is illustrated on Exhibit 8-2.

Project: **Bedford Marketplace, Parcel Map 37788**

Introduction

Hunsaker & Associates Irvine, Inc. (H&A) is pleased to submit the supplemental Sewer System Hydraulic Analysis for Bedford Marketplace. This hydraulic analysis has been prepared to describe the proposed sewer system for the aforementioned retail commercial and hotel project in the City of Corona. The project lies within the jurisdiction of City of Corona Department of Water and Power and their standards have been used for this report. Hydraulic calculations were prepared using FlowMaster software to model peak sewer flows.

The goal of this hydraulic analysis is to evaluate the sewer collection system for the proposed retail commercial and hotel development identifying the general location and size of the pipelines. This evaluation is based on existing and known conditions and should be re-evaluated if these conditions change or new information becomes available. Any interpretation of the information presented in this report should be referred to Hunsaker & Associates to ensure the integrity of the results.

This Sewer System Hydraulic Analysis is tiered off a larger study prepared for the Arantine Hills Specific Plan, a master planned community approved for up to a maximum of 1,806 dwelling units and 80,000 square feet of General Commercial uses. The Applicant, Bedford Marketplace, LLC, proposes to expand the Bedford Marketplace from 80,000 square feet of commercial uses to approximately 134,378 square feet of commercial uses plus a 135-room hotel on approximately 27.8 acres.

Project Location

The overall Arantine Hills project comprises approximately 275.7 acres and is located south of Cajalco Road, West of Interstate 15 and north of Bedford Creek in the City of Corona, County of Riverside, California. More specifically, Bedford Marketplace comprises of 27.8 acres and is located east of Bedford Canyon Road, west of Interstate 15, south of Cajalco Road and north of an existing sewer lift station. The general project location is shown on the exhibit entitled, “Vicinity Map – Figure 1.”

Summary of Findings

1. The Bedford Marketplace commercial center has 2 points of connection to the existing 15-inch main within the sewer lift station access road. The proposed sewer system schematic is shown on the attached exhibit entitled "Proposed Sewer System Model - Figure 3."

2. The total estimated sanitary sewer flows for the proposed Bedford Marketplace commercial center (Parcel Map 37788) were based upon the direction of the "City of Corona Department of Water and Power, Sewer Master Plan" – Section 4.0.

3. The sewer system for the proposed Bedford Marketplace commercial center (Parcel Map 37788) was designed to meet all of the design criteria contained within "City of Corona Department of Water and Power, Design Policy" updated November 2012.

Sewer System Analysis

In order to calculate the pipe sizes and capacity of the proposed sewer system, we have prepared a hydraulic model using FlowMaster 2009 (v8.0) by Haestad Methods. The summary of outputs from the model runs is included in the Appendix of this report. The plan layout of the model is located in the attached exhibit entitled "Proposed Sewer System Model – Figure 3."

Sewer System Design Criteria

Sanitary sewers are designed to carry the estimated wastewater flows during peak periods. Sanitary sewers are also designed to carry these wastes while flowing only part full. The surplus design capacity, or safety factor, is available as a precaution for unusual flow peaking and to permit the sewer to function even with some minor blockage.

Sanitary sewers shall be designed using the following Pipeline Hydraulics Criteria required by the "City of Corona Department of Water and Power":

- Manning's "n" of 0.013
- Minimum velocity = 2 fps or Minimum slope = 0.0100
- Maximum velocity = 8 fps
- Pipes ≤ 10-inch ≡ D/d = 50% (PWWF D/d ≤ 0.82)
- Pipes ≥ 12-inch ≡ D/d = 67% (PWWF D/d ≤ 0.82)

The minimum slope was designated in accordance with Section C.2 'Pipeline Design Criteria' in the attached "City of Corona Department of Water and Power, Design Policy"

- Preferred minimum slope for 8-inch pipes = 0.0040 ft/ft
- Preferred minimum slope for 10-inch pipes = 0.0025 ft/ft
- Preferred minimum slope for 12-inch pipes = 0.0020 ft/ft
- Preferred minimum slope for 15-inch pipes = 0.0012 ft/ft

Estimated Onsite Sewer Flows

The proposed sewer systems for Bedford Marketplace commercial center and the residential neighborhoods within Tract 37644 both connect to an existing 12-inch sewer main within Bedford Canyon Road. The estimated wastewater flow for both developments is based upon the "Unit Flow Factors" – Section 4-3 of "City of Corona Department of Water and Power, Sewer Master Plan", as the "City of Corona Department of Water and Power Design Policy", dated November 2012.

Unit Flow Requirements

For the proposed project, the unit flows for the average day sewer generation were determined from Table 4-2 of the 2005 Sewer Master Plan Report (Included in Appendix).

- Commercial =1,000 gpd/ac
- Hotel =125 gpd/room

The peaking factor for this study is the same factor utilized in the Master Plan and previous analysis, and are as provided in Section 4-4 of the Sewer Master Plan (included in Appendix). The following equations were used to determine the 'Peak Dry Weather Flow' and 'Peak Wet Weather Flow':

- Peak Dry Weather Flow
  $Q_{Peak\ Dry\ (cfs)} = 1.95 \times Q_{Avg\ (cfs)}^{0.92}$
  $Q_{Avg\ Dry\ (cfs)}$ = Average Dry Weather Flow

- Peak Wet Weather Flow (the larger of the two following equations govern)
  1) $Q_{PWWF\ (cfs)} = 2.6 \times Q_{Avg\ Dry\ (cfs)}$
  2) $Q_{PWWF\ (cfs)} = 1.265 \times Q_{Peak\ Dry\ (cfs)}$

Table 1 – Residential Tract 37644 Estimated Sewer Flows

Land Use	Proposed Units	Demand	$Q_{Avg.\ Dry}$	$Q_{Peak\ Dry} = 1.95 \times Q_{Avg\ Dry}^{0.92}$	$Q_{PWWF} = 2.6 \times Q_{Avg\ Dry}$	$Q_{PWWF} = 1.265 \times Q_{Peak\ Dry}$
Hotel	135 rooms	125 gpd/room	16,875 gpd 0.0261 cfs	44,049 gpd 0.0682 cfs	43,875 gpd 0.0679 cfs	**55,722 gpd** **0.0862 cfs**

16	0.00 ac	24.66 ac 135 rooms	15	0.0020	157,814 (1,419,958 total)	2.59	0.656	0.82

We sincerely trust these calculations will provide sufficient evidence that the proposed sewer system for Bedford Marketplace commercial center within the Bedford development, Parcel Map 37788, provides sufficient capacity to accommodate the proposed development and meets the City of Corona Department of Water and Power's Sewer Design Guidelines based on the preceding summaries and attached calculations. Please contact me at (951) 509-7055 if you have any questions.

Sincerely,

Brian R. Lowell, PE

Tom Koper, PE
District Engineer
R.C.E. No. 50258

11-28-2012
Date

C. WATER RECLAMATION (SEWER) COLLECTION SYSTEM

1. GENERAL

The following sections provide criteria to be used in the design of water reclamation collection (sewer) systems. The developer and his engineer shall be responsible to ensure all design work is in conformance with this Design Policy, the City of Corona Standard Plans and Specifications for sewer systems, State of California Department of Health Services Criteria for the Separation of Water Mains and Sanitary Sewers, as shown on City Standard Drawings 419, and generally accepted standards of good engineering practice. Two sets of calculations are required with first plan check.

2. PIPELINE DESIGN CRITERIA

a. Velocity - Design Engineer shall calculate the velocity of flow under proposed conditions. Velocity shall not be less than 2 fps a minimum of once per day to provide sufficient scouring action for self-cleaning. Maximum velocity shall not be greater than 8 fps at design flow. Where 2 fps velocity cannot be provided at least once per day, the slope shall be at least 0.01 ft/ft unless approved in writing by DWP.

b. Use a Manning's "n" of 0. 013 for sewer design.

c. Maximum allowable depth of flow (d/D) at peak flows, is as follows:

   1) 10-inch and smaller 50 percent

   2) 12-inch and larger 67 percent

d. For more information refer to the engineering report in the Sewer Master Plan for Trunk Line Sewers.

e. Minimum slope(s) shall be:

   S = 0.0040 for 8-inch sewer

   S = 0.0025 for 10-inch sewer

   S = 0.0020 for 12-inch sewer

   S = 0.0012 for 15-inch sewer

   S = 0.0010 for 18-inch sewer

   S = 0.0008 for 21-inch sewer

   S = 0.0007 for 24-inch sewer

   Design slopes conforming to the minimum and maximum velocity criteria described in section 2(a) above.

   The design engineer shall submit calculation including the slopes for each segment of the pipeline. Sewer slope shall not be changed in the field unless approved by the DWP District Engineer as it could negatively impact future capacity.

f. Manholes are required at grade breaks.

g. Provide 0.10-foot drop of invert elevation through manholes. Provide 0.20-foot drop of invert elevation at right angle alignment or bends.

h. Minimum 12-inch vertical separation is required when a sewer line crosses water/reclaimed water lines. Encase the sewer line in concrete in accordance with the City of Corona Standard Detail 419.

i. If separation with a parallel water main is less than 10 feet clear (edge-to-edge), design must meet requirements of City Standard Drawings 419 and be reviewed and approved by CDPH or DWP.

j. A minimum of 1-foot vertical separation is required between potable waterlines and both non-potable waterlines and sewer lines. The potable waterline must be above the non-potable waterlines and sewer lines. Separation criteria must follow current CDPH requirements.

k. The minimum unit flow factors used shall be per the following table or as revised in subsequent Sewer Master Plan Updates:

Land Use		*Existing Unit Flow Factor (gpd/ac)	*Ultimate Unit Flow Factor (gpd/ac)	Residential Flow Factors (gpd/du)
RR1	Rural Residential 1 (0.2 to 0.5 du/ac)	150	150	300
RR2	Rural Residential 2 (1 du/ac)	300	300	300
E	Residential Estate (1-3 du/ac)	500	500	300
LDR	Residential Low Density (3-6 du/ac)	1,000	1,000	270
LMDR	Low Medium Density (6-8 du/ac)	1,200	1,200	270
MDR	Medium Density (6-15 du/ac)	1,700	1,700	240
HDR	High Density (15-36 du/ac)	2,000	2,000	200
CBD	Commercial Business District	1,000	1,050	-
C or GCC	General Community Commercial	1,000	1,050	-
CP or OP	Office Professional	1,200	1,260	-
GI	General Industrial	1,100	1,155	-
LI	Light Industrial	800	840	-
I or School	Institutional	800	800	-
OS-R or OS-P	Open Space Recreational	130	130	-
QP or MU	Quasi-Public / Mixed Use	700	700	-

**Unit flow factors based on gross acres*

3. HORIZONTAL PIPE ALIGNMENT CRITERIA

a. Main Lines

1) Line to be 5.0 feet off centerline of street, and located on the opposite side as the potable water main.

2) Minimum ten (10) feet clear separation from potable and non-potable water mains.

3) Minimum three (3) feet separation with other utilities.

4) Curvilinear alignment will not be permitted except when approved by DWP.

5) Manholes are required at all change of directions, both horizontal and vertical, and at 350-foot maximum spacing.

6) Clean-outs shall not be permitted except when approved by DWP.

7) Private sewer mains shall have a manhole spacing every 350 feet.

b. Sewer Laterals

1) Must clear driveway and be provided with clean-out.

2) Ten (10) feet clear separation with waterlines and water services unless otherwise approved by DWP.

4. VERTICAL PIPE ALIGNMENT CRITERIA

a. Main Lines

1) Minimum depth shall be 7.0 feet of cover over the top of the pipe, except terminal reaches may be reduced to 6.0 feet of cover, where the line will not be extended in the future.

2) Vertical curve may be permitted – prior written approval from DWP is required.

b. Sewer Laterals

1) Minimum 5.0-foot cover at property line, minimum slope S = 0.02 with a saddle unless otherwise approved.

2) Laterals shall be located below the water main with a minimum clearance of 12 inches. Where clearances are critical lateral profiles are to be detailed on the plans.

3) Laterals shall not enter a manhole.

4) A backwater sewer valve shall be installed in an inspection vault, in conformance with the plumbing code, for all buildings where the rim elevation of the upstream manhole on the sewer main is above the pad elevation of the structure.

5. SANITARY SEWER MANHOLES

a. Pre-cast concrete manholes shall be constructed and lined with polyurethane (Sancon 100™ or equal) per City Standard Drawing 302.

b. Manholes shall be 5-foot in diameter with 3-foot frame and cover for depths up to 12 feet from finish grade to sewer invert. Manholes deeper than 12 feet shall be 6-foot diameter.

c. On the center of each manhole cover, lettering shall be cast to read "CITY OF CORONA - SEWER." This lettering shall be cast into the lid.

d. Manhole rim elevations shall be lower than all pad elevations immediately downstream. If this condition cannot be met, then back water valves must be installed in accordance with the Uniform Plumbing Code, Section 710.1. A letter with the tract

number and affected lots shall be prepared by the Design Engineer and submitted to the contractor/developer/owner with a copy to the Building Inspector, the Building Department, the Department of Public Works and the Department of Water and Power. Identify these lots on the grading and plumbing plans.

e. Manholes located in undeveloped land shall be surrounded by a 10-foot by 10-foot by 6-inch concrete pad reinforced with 6x6 10/10 WWF (minimum), marked with a 4-inch pipe embedded in concrete 2 feet below existing ground and 4 feet above existing ground. Manholes located in improved areas shall be located by chipping 1½-inch lettering in the curb face "MH" with dimensions to the manhole from a minimum of 2 ties points.

f. No stub-outs allowed on manholes, except where future connections are anticipated.

6. DROP MANHOLES

Drop manholes are not allowed except when specifically approved by the Department of Water and Power General Manager. If approved, the design shall be in accordance with the City of Corona Standard Detail 303.

7. PIPE MATERIAL AND SIZE

a. Main Lines

1) Main line minimum size shall be 8 inches.

2) Use SDR 26 PVC green pipe for all residential developments.

3) Use extra-strength Vitrified Clay Pipe (VCP) for all commercial and industrial developments.

4) Use ductile iron pipe with Protecto 401 ™ lining and two sheets of 8-mil polyethylene encasement, color green, where construction constraints, such as clearances with waterlines or excessive loading condition (depth of cover greater than 15 feet), warrant their use.

5) Construct all pipelines of the same material between manholes.

b. Laterals

1) Lateral minimum size for residences shall be 4 inches. Lateral minimum size for commercial and industrial units shall be 6 inches.

2) Use green PVC pipe, SDR 21, CERTA LOK ™ restrained joints for residential laterals. Call out pipe material, wall thickness, and joint style on the plans.

3) Use extra-strength vitrified clay pipe for all commercial and industrial laterals.

4) Laterals shall not be connected/manifolded together. Every individual building shall be connected to a public sewer line by a single sewer lateral. Multiple buildings on same property must have separate laterals connecting to the public sewer.

5) Use ductile iron pipe where separation criteria with water mains (i.e., clearances) cannot be met per CDPH separation requirements.

8. CORROSIVE SOIL

a. All pipeline designs shall require a geotechnical engineer to determine the existing soil corrosivity and the design engineer to recommend the appropriate cathodic protection facilities. The engineer shall specify on the plans and in the specifications the applicable corrosion control facilities.

b. All ductile iron pipes shall have at a minimum two 8-mil polyethylene protective sleeves color coded to match the contents of the pipe. Clearly denote this on each plan sheet.

c. All ductile iron pipelines crossing railroad facilities, large natural gas pipelines, or electrical facilities having impressed currents shall be provided with cathodic protection facilities.

d. All ductile iron transmission lines shall have cathodic test stations per DWP Standard Details 450 through 458. Clearly denote this on each plan sheet.

9. EASEMENTS

Where public sanitary sewers cannot be located in public roads, they shall be constructed in a prescribed easement to meet the following conditions:

a. A separate instrument is required if the easement is not shown on the Tract or Parcel Map. The instrument includes a legal description and exhibit 8½" x 11" showing the location of said easement. Private sewers are not allowed to cross adjacent/adjoining private parcels/land without special approval from DWP.

b. The easement shall be a minimum of 20 feet wide. Easements shall contain an all-weather access road in order to maintain the entire sewer system (pipeline, manholes, lift station, etc.) within the easement.

c. Easements for deep sewers shall be wide enough for sewer maintenance. The minimum width of easement shall be wide enough to accommodate a maximum of 1:1 side slopes, with a 5-foot wide by 10-foot maximum depth trench shield, and an additional 10-foot wide truck access road.

d. All legal easement descriptions and exhibits shall be prepared and stamped by a Registered Civil Engineer licensed in the State of California or Professional Land Surveyor licensed in the State of California and filed with the County Recorder if not shown on a tract or parcel map. Professional licenses must be current at the time of plan preparation.

10. LIFT STATION DESIGN CRITERIA

Avoid the use of lift stations wherever possible due to the associated cost and maintenance required. Design Engineer shall utilize the following minimum sewer lift station design guidelines.

a. Design the wet well with sufficient capacity to prevent short cycles whereby the pumps frequently start and stop, yet small enough that it will regularly evacuate sewage from the wet well to prevent the wastewater from becoming septic. The desired number of pump cycles should be limited to no more than 6 per hour for motors up to 10 horsepower. Motors up to 75 horsepower should start no more than 4 times per hour. Larger motors should cycle less frequently. Lift stations should have sufficient volume to store sewage in the event of mechanical or electrical failures, until the City can respond to the failure and prevent overflows.

b. Size the pumps to efficiently handle the peak wet weather flows. Provide a minimum of two pumps sized at the peak wet weather flow to the station, so that sufficient standby capacity is available when one pump is removed for repairs or experiences a mechanical failure. Select pumps capable of passing a minimum solid size of 3-inches without clogging. Select pumps with shafts, seals and impellers constructed of wear resistant material to provide long life. Provide Tungsten Carbide seals, Ni-Hard impellers, and 316 stainless steel pump shafts. For services where aggressive agents may be found in the sewage, such as at golf courses, select pumps with complete stainless steel construction, including the pump bowl, shaft, impeller, and motor housing.

c. Dry well lift stations must be properly ventilated and provide unobstructed access to all equipment. A minimum 3-foot clearance from all obstructions should be provided. Greater clearances may be required for equipment with special maintenance needs. Provisions for equipment removal including hatches, large door openings, and hoists shall also be provided.

d. Install discharge piping, valves, and equipment at submersible pump installations above grade.

11. FORCEMAINS

Force main Systems shall be of adequate size to efficiently transmit the total ultimate peak operational flows supplied by the connected wastewater pumping station(s), to the discharge point. Coordinate capacity computations with the proposed pumping system(s), along with any future flow requirement, if applicable. In order to provide adequate pipeline cleansing, force main flow velocity shall not be less than four (4) feet per second at the minimum pumping capacity nor exceed six (6) feet per second at ultimate design pumping capacity. The force main diameter, material, coating, pressure class/thickness class, etc. shall be as required by the City Standard Details, City Design Policy, and the design engineer. Provide signed and sealed calculations to substantiate the force main diameter. Design a redundant force main or a gravity bypass line if physically possible.

Other features, provisions, and operational procedures for these systems include:

a. Auto flushing connection with an approved backflow preventer and air gap.

b. The force main shall be flushed once per month with a minimum of 1½ force main volumes.

c. Emergency shutdown provisions to mitigate sewer spills/overflows.

d. Contractor/Engineer/Private Owner shall submit an operations and maintenance procedure complete with calculations.

e. Pipe shall be Ductile Iron Pipe with Protecto 401 ™ epoxy lining and wrapped with green-colored polyethylene encasement. 4-inch minimum pipe size.

f. Provide combination sewage and air vacuum valve assemblies at high points.

12. INVERTED SIPHONS

Avoid inverted sewer siphons wherever possible. If required, utilize the following minimum design guidelines.

a. Locate the inverted siphon completely within a public right-of-way. If a location within public right-of-way is unavailable, an easement or other right-of-entry is required subject to approval by the Department of Water and Power.

b. The inverted siphon shall not impact other facilities or be impacted by other facilities. Maintain adequate clearances from other facilities.

c. Provide a minimum of two barrels. Always provide one redundant barrel for by-pass capacity, emergencies, and maintenance purposes.

d. Minimum pipe size of 6-inch and minimum velocity of 3 ft/sec shall be considered for design of each barrel.

e. Minimize bends and angle points.

f. Provide cleanouts where the length of inverted siphon exceeds 400-ft. The size of the cleanout shall be adequate to handle the debris that may accumulate, and at least as large as the size of the inverted siphon.

13. PIPE TRENCH BACKFILL

a) All pipeline trench backfill within paved areas shall be per Public Works Standard 150.

b) All pipeline trench backfill within landscaped parkway areas shall be per Public Works Standard 149

c) All pipeline bedding shall be per Department of Water and Power Standard 308.

D. LOW PRESSURE SEWER SYSTEMS

1. GENERAL PROVISIONS

a. Submit plans and specifications for low-pressure sewer systems to the Department of Water and Power for review and approval. Secure a permit for each low-pressure sewer installation. Approval of low-pressure wastewater systems as an alternative to conventional wastewater systems shall be in accordance with the conditions listed in Subsection 2 unless other special circumstances justifying their use are affirmatively demonstrated.

b. It is not the intent of this design policy to utilize low-pressure systems as a replacement for conventional gravity sewer systems. However, as a means to provide service to an individual lot or a small group of lots or buildings where conventional gravity service cannot be utilized within reason, the Department of Water and Power may consider the use of a low-pressure system; providing the Design Engineer can show reasonable justification for its use.

2. CONDITIONS OF APPROVAL

a. The use of low-pressure sewer systems will be considered where:

1) build-out has left small parcels of property in precarious locations in relation to the lay of the land,

2) shallow bedrock conditions would require extensive rock removal,

3) unstable soil conditions prohibit construction of deep sewers,

4) temporary use would provide a cost effective alternative until gravity system construction is completed,

5) the proposed sewer is located a considerable distance from existing gravity sewers, or

6) the use of a low-pressure sewer system will eliminate the need for small public lift stations.

b. The applicant is responsible to evaluate all potential alternative wastewater collection systems and justify the selection of the low-pressure sewer system based on engineering and surrounding conditions.

c. Based on the information furnished by the Developer and the Design Engineer, the Department of Water and Power will decide the acceptability, scope and extent of the low pressure sewer system to be permitted.

CITY OF CORONA
DEPARTMENT OF WATER AND POWER

SEWER MASTER PLAN
SECTION 4

Section 4

CRITERIA

4-1 General

Establishing performance standards is an important part of developing new wastewater collection systems, and evaluating existing systems, as it forms the basis for system analysis and system improvement recommendations. These standards include methodology for estimating wastewater design flows and minimum design standards for the collection system pipes, lift stations, and force mains.

Average wastewater flows can be reasonably estimated from land use and their corresponding unit flow factors. The results are then compared to measured flows. Peaking relationships are needed for estimating peak dry weather and peak wet weather flows. Peak wet weather flows also include an allowance for inflow / infiltration (I/I).

Collection system design standards include minimum pipe size, minimum flow velocity, and depth of flow to pipe diameter ratio. Lift station criteria includes the capacity and number of pumps, wet well and force main sizes, redundancy, emergency power, remote monitoring capabilities, as well as safety and regulatory agency requirements. Finally, facility useful lives are needed for adequately scheduling replacement of the aging infrastructure.

4-2 Flow Monitoring

Flow monitoring is essential in developing unit flow factors, calibrating the system model, and estimating the average and peak flows.

A temporary flow monitoring program was developed, and field flow monitoring was conducted by ADS Environmental Services. The study was conducted over a period of seven (7) days at eleven (11) locations. The selected flow monitoring locations and a summary of the results are shown on Figure 4-1 and in Table 4-1. The flow monitors were in place from February 13, 2004 through February 19, 2004.

Insert Figure 4-1 (Flow Monitoring Sites)

The flow monitoring sites were strategically chosen to aid in the development of unit flow factors. Because single family residential land uses make up nearly 30 percent of the total area and generate about 70 percent of the total wastewater, it was very important to monitor several different areas with primarily residential land uses. Flow monitoring Sites 1, 5, 6, 7, and 11 were selected specifically because the existing tributary areas were dominated by single family residential uses.

Flow monitoring Site 2 was selected to aid in the development of the industrial unit flow factor. Sites 3 and 4 were selected to gauge minimum, average, and peak flows into Wastewater Treatment Plant 1 for model calibration purposes. Similarly, Sites 8A, 8B and 9 gauged the flows into Wastewater Treatment Plant 2.

4-3 Unit Flow Factors

Unit flow factors utilized in this study were developed based upon the land use data obtained from the City's existing GIS and results of the temporary flow monitoring study. Atlas maps, aerial photographs and field reviews supplemented this information.

The average daily flow recorded at each flow monitoring site and gross acreage was utilized in determining calibrated unit flow factors for each land use. The calibrated flow factors were then increased to account for vacancy rates and any inconsistencies in the flow monitoring data. The resultant flow factors represent the existing conditions. The current residential vacancy rate is 3.65 percent. The current commercial / industrial vacancy rate is approximately 6 to 7 percent. The ultimate unit flow factors are not expected to increase dramatically, because densification is not expected. The industrial and commercial flow factors were increased by 5 percent to account for any changes from the existing types of uses that may generate more wastewater.

The unit flow factors developed for this study, representing average dry weather flows, are shown in Table 4-2. The existing and ultimate unit flow factors are given in gallons per day per gross acre. Residential flow factors are also shown in gallons per day per dwelling unit. These factors are based on the fact that the existing right-of-way and railroads account for about 22 percent of the total existing developed lands (see Table 3-1) and an estimated target density for each land use category. The average density specified per the General Plan was used for residential estate, residential low density, and residential medium density lands. For the categories of residential low medium and residential high, 6 du/net acre and 15 du/net acre were implemented, respectively. This resulted in a more conservative unit flow factor but comparable in relation to the factors estimated for the other residential areas.

The residential flow factors in gallons per day per dwelling unit, also shown in Table 4-2, can be utilized by the City to make decisions regarding the revenue and rates, such as the distribution of connection fee costs associated with the improvement and expansion of wastewater treatment plants.

Table 4-2
Unit Flow Factors

Land Use		*Existing Unit Flow Factor (gpd/ac)	*Ultimate Unit Flow Factor (gpd/ac)	Residential Flow Factors (gpd/du)
RR1	Rural Residential 1 (0.2 to 0.5 du/ac)	150	150	300
RR2	Rural Residential 2 (1 du/ac)	300	300	300
E	Residential Estate (1-3 du/ac)	500	500	300
LDR	Residential Low Density (3-6 du/ac)	1,000	1,000	270
LMDR	Low Medium Density (6-8 du/ac)	1,200	1,200	270
MDR	Medium Density (6-15 du/ac)	1,700	1,700	240
HDR	High Density (15-36 du/ac)	2,000	2,000	200

**Unit flow factors based on gross acres*

4-4 Peaking Factors

The wastewater unit flow factors discussed in Sub-section 4-3 are used to generate average dry weather flows (ADWF) entering the collection system. However, the adequacy of a sewage collection system is based upon its ability to convey the peak flows. At any individual point in the system, peak dry weather flow (PDWF) is estimated by converting the total average flow upstream of the point in question to peak dry weather flow by an empirical peak-to-average relationship.

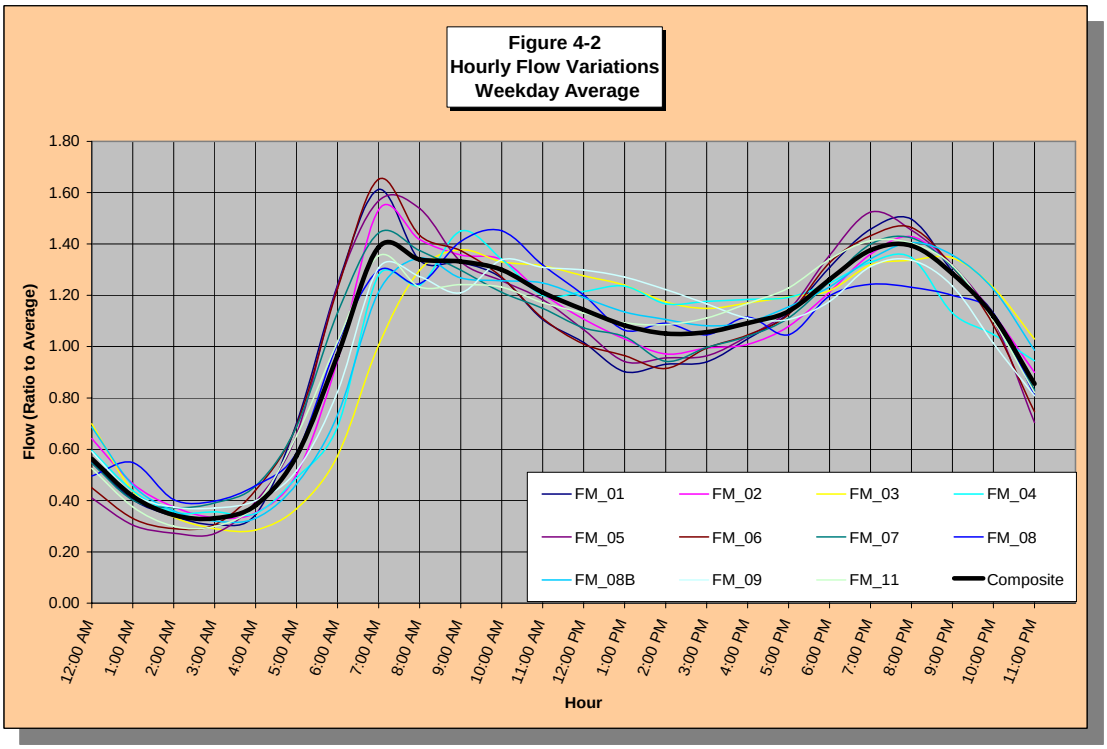
The peaking formula commonly used in sewerage studies is of the following form:

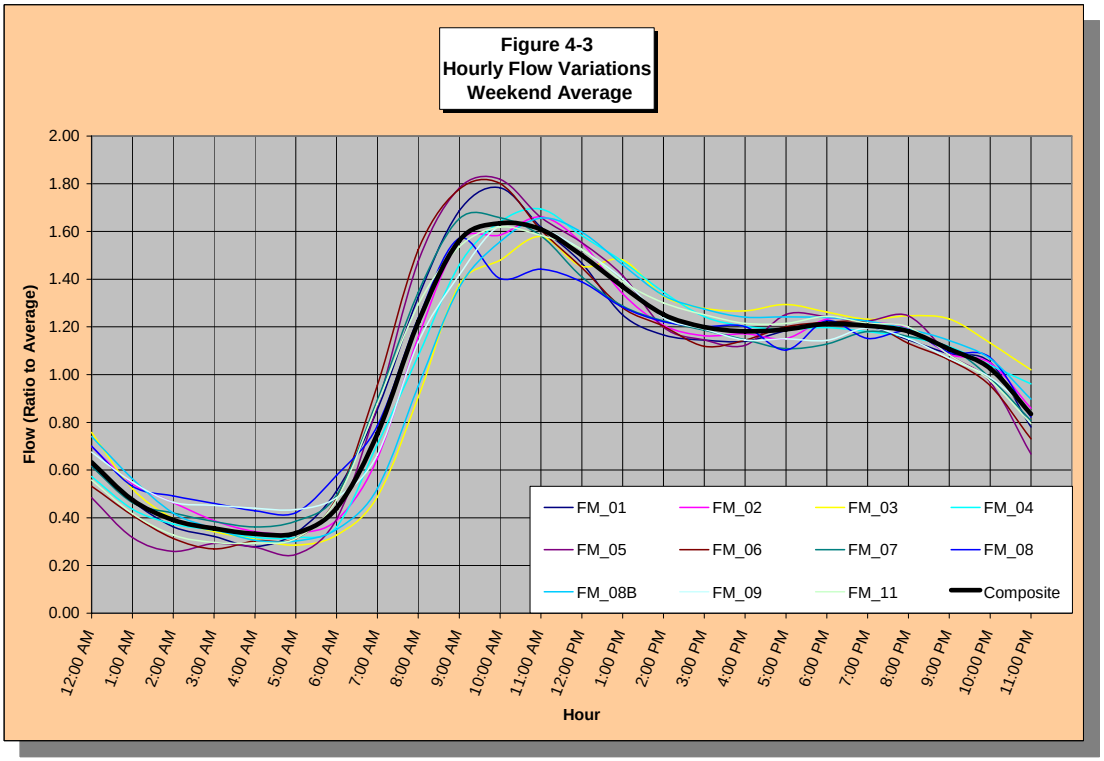
$Q_{peak} = a\ Q_{ave}^{\ b}$

where Q_{peak} = Peak Dry Weather Flow
Q_{ave} = Average Dry Weather Flow
a, b = Peaking Formula Coefficients

The temporary flow monitoring data was reviewed to develop peaking relationships at each site. As expected, these relationships varied from site to site depending upon the makeup and size of the tributary land use. Several diurnal curves were developed for each of the (11) flow monitoring sites. Average hourly flows for each hour of the day at each of the sites were used to produce diurnal curves for each day of the week as well as composite diurnal curves for the weekend and weekday. Figures 4-2, 4-3 and 4-4 illustrate the citywide flow monitoring site and composite weekday, weekend, and overall diurnal curves. These figures all indicate the expected peaks and epitomize a typical diurnal curve. The highest peak occurs during the morning hours with another peak occurring in the evening. While peaking factors at the different sites ranged from 1.5 to 2.2 the overall composite factors were between 1.8 and 1.9.

Figure 4-2
Hourly Flow Variations
Weekday Average





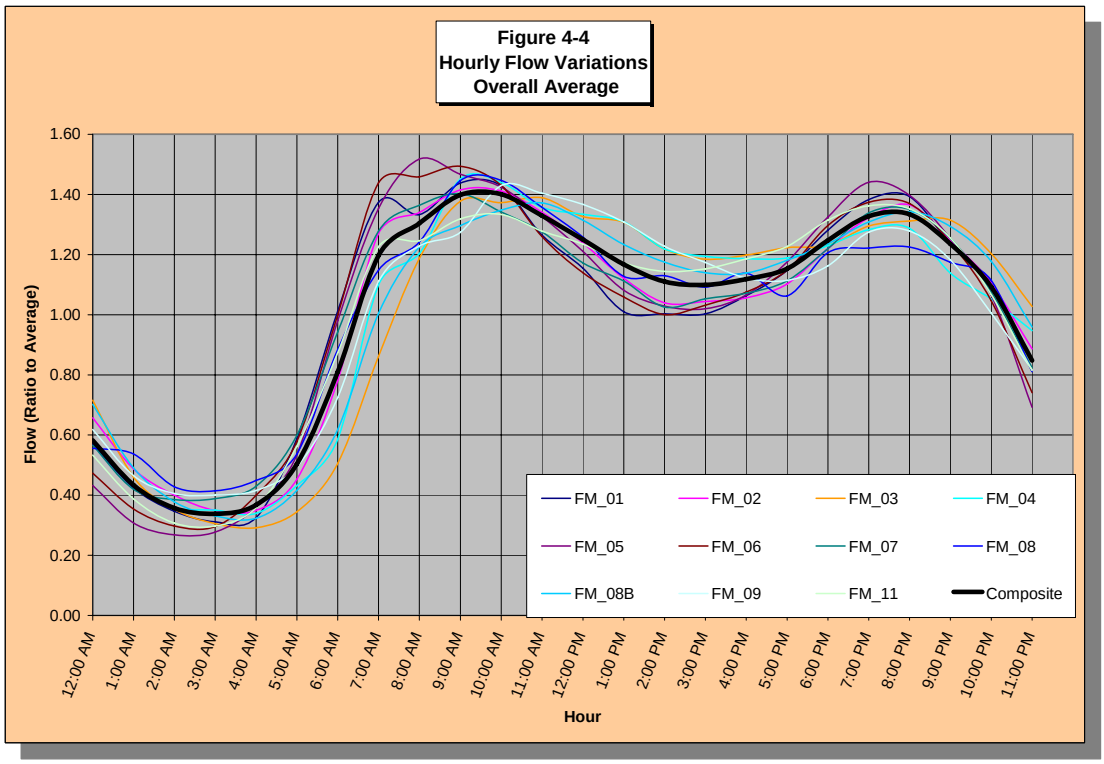


Figure 4-3
Hourly Flow Variations
Weekend Average

Based on the flow monitoring data, and our previous experience, the following peaking relationship was selected for this study:

$$Q_{peak}\ (cfs) = 1.95 \times Q_{ave}(cfs)^{0.92}$$

The peak wet weather flow (PWWF) has two components: peak dry weather flow (PDWF) and rainfall dependent inflow/infiltration (I/I). Therefore, the following equation applies:

$$PWWF = PDWF + I/I$$

Inflow and infiltration is discussed further in Sub-section 4-5.

4-5 Inflow and Infiltration

Inflow is the surface water that typically gains entry to the sewer system through perforated or unsealed manhole covers and illegal connections, such as roof and yard drains, during rainfall events. Infiltration is defined as water entering the collection system from the ground through defective pipes, pipe joint connections, or manhole walls. The sewer system design capacity must include allowances for these extraneous components, which inevitably become a part of the total flow. The amount of inflow and infiltration (I/I) that enters the system typically depends upon the availability and location of the stormwater drainage facilities, age of structures, materials and methods of construction, the location of the groundwater table, and the characteristics of the soil. In absence of flow monitoring data, many regulating agencies implement commonly accepted practices for estimating I/I. For example, I/I is often estimated based on the diameter and length of pipeline (100 to 400 gpd/ in. dia/ mile) or as a percentage of the peak flow or pipeline capacity.

Our experience from other master planning studies and review of limited flow monitoring information available during severe rainfall events indicate that the peak wet weather flow can vary from 10 percent of average dry weather flows in steeper areas with adequate drainage facilities, to over 400 percent of average dry weather flows in flat areas that lack significant drainage facilities.

For this master plan, several of the more significant and recent storm events that occurred during the past 10-years were studied. Rainfall information as well as treatment plant flows was used to evaluate the extent of the inflow and infiltration in the study area. Rain data was collected at two rain gage stations: Prado Dam (Army Corp of Engineers) and Chase and Taylor (Riverside County Flood Control and Water Conservation District). The studied rain events occurred on January 4, 1995; December 6, 1997; January 10, 2001; February 25, 2003; and March 16, 2003. Hydrographs were created for each of these rainfall events. Based on the Riverside County Hydrology Manual criterion, each event was assigned a storm frequency.

The average dry weather flows before and after the rainfall were compared to the peak flows seen at Wastewater Treatment Plants 1 and 2 during the wet weather events. A ratio of peak wet weather flow to average dry weather flow was then calculated. This factor was then plotted versus the frequency of the event and extrapolated. For a wet weather event with a 10-year frequency, the peak wet weather flow to average dry weather flow ratio is estimated at 2.5. Per conversations with City staff, the recent design of Wastewater Treatment Plant 3 utilized a factor of 2.6. Therefore, a factor of 2.6 will also be used for this Master Plan.

4-6 Sewer Design Criteria

Design criteria are established to ensure that the wastewater collection system can operate effectively under all flow conditions. Each pipe segment must be capable of carrying the peak flows without surcharging the system. Low flows must be conveyed at a velocity that will prevent solids from settling and blocking the system.

The City of Corona's minimum allowed slope of an 8-inch gravity sewer pipe is 0.004 feet per foot. Where this slope cannot be attained due to existing constraints, a more in-depth analysis must be performed and submitted to the City for approval. At a minimum, all pipes must be 8 inches or larger in diameter and the velocity of flow should be greater than 2 feet per second at average flow. This velocity will prevent deposition of solids in the sewer. A velocity of 3 feet per second is desired at peak dry weather flow, to resuspend any materials that may have already settled in the pipe. The corresponding minimum slopes for the various pipe sizes are as shown in Table 4-3.

It is important to note that the sewer sizes and slopes in Table 4-3 are provided for information only and assume the depth of flow in the pipe is half or two-thirds full (see footnote below Table 4-3). If there is insufficient flow to create this condition, greater slopes than those shown are necessary to acquire the desired minimum velocities.

Table 4-3
Minimum Sewer Sizes

Sewer Size	2 ft/sec Velocity Slope	3 ft/sec Velocity Slope
8" [(1)]	0.0040	0.0074
10" [(1)]	0.0025	0.0055
12" [(1)]	0.0020	0.0044
15" [(2)]	0.0012	0.0027
18" [(2)]	0.0010	0.0021
21" [(2)]	0.0008	0.0017
24" [(2)]	0.0007	0.0015

[(1)] Assuming sewer is flowing 1/2 full and n = 0.013

[(2)] Assuming sewer is flowing 2/3 full and n = 0.013

The design and analysis of gravity sewer systems are typically based upon the depth to diameter ratio (d/D). Pipes should meet the City's established criterion as follows:

- ***New*** pipes 12-inches in diameter and smaller: **d/D = 0.50** at peak dry weather flow.
- ***New*** pipes 15-inches in diameter and larger: **d/D = 0.67** at peak dry weather flow.
- ***Existing*** pipes 12-inches in diameter and smaller: **d/D = 0.64** at peak dry weather flow.
- ***Existing*** pipes 15-inches in diameter and larger: **d/D = 0.67** at peak dry weather flow.

All pipes should be designed with a d/D less than or equal to 0.82 at peak wet weather flows. This reserves a minimum of 50 percent (12-inch and smaller pipes) to 26.5 percent (larger pipes) of the pipe's full flow capacity for inflow and infiltration.

Considering the City's I/I study, it is recommended that the peak wet weather flow be estimated as the larger of the two following equations:

1. Peak Wet Weather Flow (PWWF) = 1.265 x Peak Dry Weather Flow (PDWF)

2. Peak Wet Weather Flow (PWWF) = 2.60 x Average Dry Weather Flow (ADWF)

The extra pipeline capacity also allows for the possibility that actual wastewater flows may be slightly higher than anticipated, especially during the hours when instantaneous or intermittent peak flows may occur. The peak dry weather flows are generally observed between the hours of 6:00 a.m. and 9:00 a.m. and 7:00 p.m. and 9:00 p.m. in residential areas. Industrial areas usually produce peaks later in the day. Peak flows may also be observed during rainfall events due to inflow. In addition to providing peak wet weather flow capacity, the area above the peak daily water surface helps to keep the sewage aerated, reducing the possibility of septic conditions and odors.

The design capacity of a gravity pipeline is the calculated capacity of the pipeline based on the Manning formula:

$$Q = 1.486 \; A \; R^{2/3} \; S^{1/2} / n$$

Q = flow in cubic feet per second

R = hydraulic radius in feet = A / P

A = cross-sectional area of the pipe in square feet

P = wetted perimeter in feet

S = slope of pipe in feet of rise per foot of length

n = Manning's friction factor

Sewer system capacity is established using a Manning's friction factor of 0.013 for vitrified clay pipe. A summary of sewer system design criteria is listed in Table 4-4.

Table 4-4
Sewer System Criteria

Collection System	
Minimum Pipe Size	8-inch
Minimum Velocity	2.0 ft/sec at average flow
	3.0 ft/sec at peak dry weather flow
Pipe Depth to	0.50 for pipes 12-inches and smaller at peak dry weather flow
Diameter Ratio	0.67 for pipes 15-inches and larger at peak dry weather flow
Lift Station	
Pumps	* Minimum 2 each sized at peak flow
	* Minimum solids handling capacity 3"
Wet Wells	* Sized to limit pump cycling to less than 4 to 5 times/hr
	* Provide sufficient storage at peak flow to allow response to a failure
	* Equipment to be maintained must be accessible without entering structure
Ventilation	* 12 air changes/hr minimum in dry well and as required by NFPA 820
	* 30 air changes/hr minimum in wet well if not operated continuously
	* 12 air changes/hr minimum in wet well if operated continuously
Controls	Redundant system. Float operated back-up controls.
Emergency Power	Stationary source with automatic transfer switch
Telemetry	Dialer system (minimum) at all pump stations to alert personnel in the event of a station failure
Forcemains	* Minimum velocity 3.0 ft/sec
	* Minimum size 4-inches
	* Air Vacs installed in vaults

4-7 Lift Station Design Criteria

It is desirable to develop a sewer collection system with as few lift stations as possible due to the associated cost and maintenance required. This master plan recommends replacement and upgrading of 9 lift stations. Further analyses, evaluation, and recommendations regarding the City's lift stations are found in Section 7. No new lift stations are currently recommended. However, in the case that a lift station is necessary or when upgrading or replacing an existing lift station, it must be designed to be reliable and sized with sufficient capacity. It must contain redundant equipment, an emergency power supply, sufficient storage, and be able to notify the appropriate personnel in the event of failure.

The primary components of a typical lift station are the wet well, dry well, pumps, motors, valves, ventilation and electrical equipment, controls and the force main. The following general criteria are recommended.

The wet well stores the incoming wastewater until a pump is activated to discharge it to a gravity facility for further conveyance to a treatment facility. It should be designed with sufficient capacity to prevent short cycles whereby the pumps frequently start and stop, yet small enough that it will regularly evacuate sewage from the wet well to prevent the wastewater from becoming septic. Generally, the desired number of pump cycles should be limited to no more that 6 per hour for motors up to 10 horsepower. Motors up to 75 horsepower should start no more than 4 times per hour. Larger motors should cycle less frequently. Lift stations should also have sufficient volume to store sewage in the event of mechanical or electrical failures, until the City can respond to the failure and prevent overflows.

The pumps should be sized to efficiently handle the peak wet weather flows. A minimum of two pumps sized at the peak wet weather flow to the station should be provided so that sufficient standby capacity is available when one pump is removed for repairs or experiences a mechanical failure. The pumps should be able to pass a minimum solid size of 3-inches without clogging. The shafts, seals and impellers should be constructed of wear resistant material to provide long life. Tungsten Carbide seals, Ni-Hard impellers, and 316 stainless steel pump shafts are recommended. For services where aggressive agents may be found in the sewage, such as at golf courses, complete stainless steel construction is recommended. This includes the pump bowl, shaft, impeller, and motor housing.

The dry well houses the valves, pumps, motors and electrical equipment and controls. It must be properly ventilated and provide unobstructed access to all equipment. A minimum 3-foot clearance from all obstructions should be provided. Greater clearances may be required for equipment with special maintenance needs. Provisions for equipment removal including hatches, large door openings, and hoists should also be provided.

The force mains should be selected to operate within a 3 feet per second to 5 feet per second velocity range, but should not be smaller than 4-inches in diameter.

While submersible lift stations may be utilized for the small flows, the larger lift stations should be the wet well/dry well type. They should be designed with easy access to all equipment. The National Electric Code classifies the wet wells of wastewater pumping stations as Class I, Group D, Division 1 facilities if continuously ventilated at less than 12 air changes per hour, and Division 2 if continuously ventilated at 12 or more air changes per hour. Dry wells, which are physically separated from wet wells, if ventilated at less than 12 air changes per hour, are classified as Class I, Group D, Division 2 locations. Wet wells, and under certain circumstances dry wells, are considered confined spaces and should be entered in accordance with the corresponding requirements of Occupational Safety and Health Administration (OSHA).

All lift stations should incorporate redundant control systems for operation of the pumps. A float system should be used as a backup for a primary control system that utilizes an ultrasonic device or a bubbler system for level measurement and pump operation.

Stations in which have an ultimate peak wet weather flow 500-gpm or greater shall be wet well/dry type pump stations. Stations with less than 500-gpm ultimate peak wet weather flow should be submersible type pump stations.

Telemetry equipment is required in all stations. The City's standard telemetry equipment consists of a radio, a telemetry panel, a RTU/PLC, and an antenna. Depending upon the complexity of the installation the City may also employ ethernet equipment and switches so that programming, data acquisition, monitoring of other sites can be accomplished with a laptop computer in the field.

An emergency power source is required to operate the pump station during outages of the primary power source. A standby generator with an automatic transfer switch is the preferred type of emergency power source.

While lift stations may be necessary to serve portions of the City's service area because of topographic requirements, all feasible efforts should be made to eliminate their use. In evaluating the feasibility of constructing a lift station, a detailed comparison with a gravity alternative should be made. The service lives of each facility, the cost of operation and maintenance, as well as the

many problems associated with the development of flows during the first several years should be carefully considered. Service criteria for sewer lift stations are summarized in Table 4-4.

4-8 Service Life of Pipe and Lift Station Equipment

In addition to the design criteria discussed in previous sections, the useful lives for which relatively trouble-free service can be expected are also of great importance when assessing an existing or future sewer system. Once the service life of a facility is exceeded, it becomes subject to failure and is often expensive to maintain. The determination of useful life can be difficult and depends on many different considerations including the following:

- Type of materials used and recorded performance of similar installations
- Velocities and flow rates expected in the system
- Chemical and biological conditions of the wastewater
- Construction methods and installation quality
- Frequency, thoroughness, and types of Maintenance

The useful life values listed in Table 4-5 are generally accepted as prudent planning criteria and are used as benchmarks for replacement recommendations in this study. The majority of the pump stations' piping, valves, mechanical, and electrical components have exceeded the recommended useful lives listed in Table 4-5 due in large part to the City's fine maintenance practices.

Table 4-5
Planning Criteria for Facility Useful Life

Facility	Description	Useful Life (Years)
Gravity Sewers:	Asbestos Cement Pipe (ACP)	50
	Cast Iron Pipe (cip)	50
	Ductile Iron Pipe (DIP)	50
	Plastic Pipe	50
	Truss Pipe	50
	Vitrified Clay Pipe (VCP)	50
	Manholes	50
Forcemains:	Asbestos Cement Pipe (ACP)	50
	Cast Iron Pipe (cip)	50
	Ductile Iron Pipe (DIP)	50
	Plastic Pipe	50
Lift Stations:	Structure	40
	Piping	15
	Valving	15
	Mechanical	15
	Electrical	20

Values listed above are from the State Controller's Uniform Utility Accounting System for the State of California, Appendix A, Suggested Useful Lives of Fixed Assets
