Notes and Definitions

M1	Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample.
ND	Analyte is not detected at or above the Practical Quantitation Limit (PQL). When client requests quantitation against MDL, analyte is not detected at or above the Method Detection Limit (MDL)
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
NR	Not Reported
RPD	Relative Percent Difference
CA2	CA-ELAP (CDPH)
OR1	OR-NELAP (OSPHL)
TX1	TX-NELAP (TCEQ)

Notes:

- (1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.
- (2) The suffix [2C] of specific analytes signifies that the reported result is taken from the instrument's second column.
- (3) Results are wet unless otherwise specified.

Enclosed are the results for sample(s) received on January 22, 2016 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "E Rodriguez", is placed above the printed name.

Eddie Rodriguez
Laboratory Director

Hi Jelisa,

The WET test we are performing is for Total Chromium by Method 6010. If needed, we could do WET Hexavalent Chromium by Method 7196.

I hope this helps!

Diane

Hi Diane,

The client has a few additional questions:

Would you please confirm that the WET test that the lab is conducting tests for both hex chrome concentrations as well as total chromium concentrations? Can you also please confirm what methodologies they will use for each?

Could you help me respond to these questions, please?

To: Diane Galvan
Subject: FW: Results/EDD/Invoice - 777 N Front St. (1600338)

Hi Diane,

Would it be possible to run additional tests on the sample we provided from 777 N. Front Street. Here is what we've been requested to ask for:

The detected chromium concentration of 86 mg/kg was more than 10 times the CA STLC of 5 mg/L (i.e., 50 mg/kg). In accordance with general practice, I recommend telling the lab to run the soil sample for soluble chromium using the CA Waste Extraction Test. All the other analytical tests looked fine.

Please let me know if there is enough soil sample remaining, or if we would need to submit a new sample / if it would be ok to submit a sample that has been in a lidded drum for about a week.

Thank you,

Jelisa Thomas, PE | *Project Engineer*

SUBJECT: ORDER REQUIRING A TECHNICAL REPORT PURSUANT TO CALIFORNIA WATER CODE SECTION 13267

SITE: FORMER ZERO CORPORATION FACILITY, 777 NORTH FRONT STREET, BURBANK, CALIFORNIA FILE NO. 109.6162

Dear Mr. Skobin and Northridge Properties:

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) is the public agency with the primary responsibility for the protection of ground and surface water within major portions of Los Angeles and Ventura Counties. To accomplish this, the Regional Board issues investigative orders pursuant to the Porter-Cologne Water Quality Control Act (California Water Code [CWC], §§13000 et seq.).

Regional Board staff have reviewed the final report entitled "Soil Assessment Report," (Geosyntec September 10, 2012) for the former Zero Corporation facility located at 777 North Front Street, Burbank, California from the 1960s to the 1990s (Site). Additionally, staff reviewed additional technical information in the Regional Board files that indicates the documented use of hexavalent chromium (CrVI) at the Site. The staff's conclusion is that there has not been adequate soil sampling data collected with regard to CrVI in soils that are deeper than 5 feet below grade.

Thus, staff has determined that an additional investigation is warranted due to the historical use of chromium at the Site. The requirement for an additional investigation is further warranted by information presented to the Regional Board in a 2009 soil investigation report for the Site that was prepared on behalf of the California Department of Transportation (CalTrans). The report indicates that CrVI is present at the Site at a concentration of 410 micrograms per kilogram ($\mu\text{g/Kg}$) which is above the typical background level concentration of non-detect (ND) in the native soils in the Burbank area.

The former responsible party, APW North America, received a Certificate of Completion from the California Environmental Protection Agency in 2002 with respect to volatile organic compounds (VOCs), but not CrVI. The Regional Board is the administering agency of record and has determined the CrVI contamination was not fully investigated prior to the issuance of the certificate of completion for VOCs.

Enclosed is a Regional Board Order requiring the submittal of a technical report pursuant to California Water Code section 13267 (Order). As the current property owner, you are required to comply with the Order to prepare and submit a technical soil investigation work plan to conduct an onsite soil investigation for soil sampling, to evaluate the presence of CrVI beneath the 3-stage clarifier.

You are required to submit the report to the Regional Board by **October 1, 2015**.

If you have any questions regarding this project, please contact **Mr. Larry Moore at (213) 576-6730** (Lawrence.Moore@waterboards.ca.gov or Dr. Arthur Heath at (213) 576-6725 (Arthur.Heath@waterboards.ca.gov)).

Sincerely,

A handwritten signature in dark ink, appearing to read "Samuel Unger", is written over a horizontal line.

Samuel Unger, P.E.
Executive Officer

Los Angeles Regional Water Quality Control Board

**ORDER TO PROVIDE A TECHNICAL REPORT
FOR SUBSURFACE INVESTIGATION
CALIFORNIA WATER CODE SECTION 13267 ORDER NO. R4-2015-0065**

**DIRECTED TO MR. ALAN SKOBIN
NORTHRIDGE PROPERTIES, LLC
777 NORTH FRONT STREET
BURBANK, CA 91502
(WIP NO. 109.6162)**

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) makes the following findings and issues this Order pursuant to California Water Code (CWC) section 13267, which authorizes the Regional Board to require the submittal of technical and monitoring reports.

1. During the 1998 United States Environmental Protection Agency Superfund investigation, information provided to the California Regional Quality Control Board, Los Angeles Region (Regional Board) from the Upper Los Angeles River Area Watermaster (ULARA) indicated some of the groundwater supply wells in the San Fernando Valley Groundwater Basin (SFVGB) had been contaminated by hexavalent chromium (Cr). Upon receipt of this information, the Regional Board re-evaluated the Chemical Use Questionnaire (CUQ) provided by each facility from the Superfund investigation to determine which facilities stored and/or used chromium compounds, including CrVI.

Based on evaluation of these CUQs, the Regional Board identified 112 sites needing further investigation to determine whether chromium and CrVI in the soil at these sites indicate whether past discharges of waste pose a threat to public drinking water supply wells or may have already polluted groundwater. These investigations are being conducted at each site under a Regional Board order dated March 15, 2004, pursuant to CWC section 13267.

2. California Water Code section 13267 states, in part: (b)(1) In conducting an investigation. . . , the regional board may require that any person who has discharged, discharges, or is suspected of having discharged or, discharging, or who proposes to discharge waste within its region . . . shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the regional board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports.
3. The Regional Board finds that the person named herein is discharging, has discharged or is suspected of having discharged or is discharging waste within the Region based on evidence regarding chromium use at 777 North Front Street, Burbank, California (Site) in the following data sources:

- a. **Regional Board Documentation** - The documentation is comprised of technical reports, correspondence, site inspections, and other documents that have been compiled regarding the historical environmental investigations completed at the Site. Furthermore, the documentation includes documents provided to the Regional Board by other public agencies as well as newspaper articles. Aggregately this documentation indicates the extensive use of chromate salts (hexavalent chromium) as part of the aluminum chromate conversion coating operations performed at the former Zero Corporation (Zero Corp.) facility between the 1960s and late 1990s.

In 1975, Zero Corp. was cited by the Department of Health Services (DHS) and the City of Burbank for disposing excess chromium in a wastewater discharge. After an inspection of the Site and housekeeping activities, no further action was recommended by DHS. A land ban generator inspection report was written in August 1988 by DHS which primarily discussed chemical handling and disposal practices. The report did not indicate whether the chemicals had been discharged to the ground nor identify the presence of observed surface chemical staining.

In 1991, the City of Burbank was cited by USEPA for allowing Zero Corp. to exceed discharge limits for chromium, other heavy metals and volatile organic compounds (VOCs) to the Publicly Owned Treatment Works (POTW). These were later discharged to the Burbank Western Channel, which drains to the Los Angeles River, and the Crystal Springs well field.

The former Zero Corp. facility is located within the Burbank Operable Unit (BOU), a region within the San Fernando Valley Superfund Area. From 1920 to 1961, the Site was occupied by General Water Heater Company, and then was purchased by Zero Corp. for use by a division of the company called Zero Enclosures, whose primary business was fabrication of metal enclosures. Six buildings were constructed at the Site to house historical manufacturing operations. In addition to Zero Enclosures' operations, from 1964 to 1973, a part of the Site was leased to Ocean Technology Inc., a subsidiary of Zero Corp., which used the space to manufacture and assemble electronic products.

Zero Corp.'s manufacturing operations were discontinued in December 1991. From that point until 2002, the Site was used for storage (a 1995 city directory shows the occupant as Western Moving & Storage, Inc.) and later as film studios for the entertainment industry. After that time, the Site was unoccupied, with on-site buildings demolished in 2004. Current aerial photographs show that concrete pads and foundations remain on the Site. The Site was sold in 1998 by Zero Corp. to the Ford Leasing Development Company, which sold it to Mr. Alan Skobin and Northridge Properties, LLC (c/o Mr. Alan Skobin), in 2005. A parcel of land adjacent to the Site on the southwest was leased by Zero Corp. from the Southern Pacific Transportation Company for use as chemical storage. This parcel is currently owned by the City of Burbank and was used in part for realignment of Front Street.

Zero Corp.'s manufacturing operations included aluminum case drawing and washing, aluminum alodining (a metal coating process), chromate deoxidizing, steel phosphate coating and chromium sealing. The Zero Corp. facility contained paint booths, a water-based paint shop and drying booth), aluminum machining, etching, deoxidizing and cleaning, aluminum

vapor degreasing, and grinding. During Zero Enclosure's operations, the Site also contained four clarifiers, two underground storage tanks (USTs), two designated chemical storage areas, two paint storage areas, one oil storage area, one acid storage area, one acid/caustic soda storage area, and one hazardous waste staging area. In 1987, the two USTs, which had been used to store unleaded gasoline, were removed from the Site under Los Angeles County Department of Public Works (LACDPW) oversight. A building permit was issued in 1993 for the removal and/or abandonment of clarifiers on the Site. A review of historical information indicates that an industrial waste permit was issued to Zero Corp. in 1967. Wastes generated onsite included acetone, ketones, 1,1,1-Trichloroethane (1,1,1,-TCA), waste oil, waste acids and paint sludges. Hazardous materials used in and/or generated from industrial activities on the Site were stored in the storage areas described above (chemical storage, oil storage, acid storage, acid/caustic soda storage, and hazardous waste staging areas).

- b. **2009 CalTrans Environmental Investigation Report** – the report summarizes the onsite soil sample results from a soil investigation conducted on the property, near the former waste discharge features. The results revealed there were detectable concentrations of CrVI in the soil which exceed the typical background concentration in the native soils in the San Fernando Valley.

The CalTrans investigation also indicated that the shallow soil vapor results for volatile organic compounds (VOCs) such as perchloroethylene (PCE) and trichloroethylene (TCE) exceeded California Human Health Screening Levels (CHHSLs) in the shallow soils. Additionally, the report also suggests that subsurface VOC concentrations have rebounded significantly since the site was remediated in 2001.

NEW INFORMATION

- c. Additional Environmental Protection Agency Remedial Investigation (EPA RI) groundwater monitoring wells PWA-2 and PWA-3 were constructed on Front Street up and cross gradient to the Site. These wells were installed September 2012. Analytical results indicate concentrations of CrVI which are similar to the regional groundwater CrVI plume. The lifespan of the wells may be cut short, as they appear to be located in the new proposed CalTrans I-5 Freeway Widening Construction right of way.
 - d. In 2002, a responsible party for this Site (APW North America, Inc.) was issued a *Certificate of Completion* letter by the Regional Board as the Administering Agency pursuant to California Health and Safety Code §§ 25260 et seq. that addressed volatile organic compounds (VOCs), but not CrVI. Due to the occurrence of CrVI pollution in the regional aquifer providing public water supply, and because the compound was not part of the *Certificate of Completion* as specified in the Health and Safety Code, this action is justified and warranted.
4. This Order identifies Mr. Alan Skobin and Northridge Properties as the entities responsible for the discharges of waste or suspected discharges of waste identified in paragraphs a. through b.

above, because Mr. Skobin and Northridge Properties owns the property on which the waste is or has been discharged.¹

5. This Order requires the persons named herein to prepare and submit a technical report (work plan) to complete the onsite subsurface soil assessment work of the previous soil investigation.
6. The Regional Board needs this information in order to determine the vertical extent of CrVI in former soil boring SS-4 which is located within the area of a particular three-stage clarifier.
7. The burdens, including costs, of these reports bear a reasonable relationship to the need for the reports and the benefits to be obtained from the reports. The information is necessary to assure adequate cleanup of the former Zero Corp. site, which poses significant threats to public health and the environment.
8. The issuance of this Order is an enforcement action by a regulatory agency and is categorically exempt from the provisions of the California Environmental Quality Act (CEQA) pursuant to section 15321(a) (2), Chapter 3, and Title 14 of the California Code of Regulations. This Order requires submittal of technical and/or monitoring reports and work plans. The proposed activities under the work plans are not yet known. It is unlikely that implementation of the work plans associated with this Order could result in anything more than minor physical changes to the environment. If the implementation may result in significant impacts on the environment, the appropriate lead agency will address the CEQA requirements prior to implementing any work plan.
9. Any person aggrieved by this action of the Regional Water Board may petition the State Water Resources Control Board (State Water Board) to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050 and following. The State Water Board must *receive* the petition by 5:00 p.m., 30 days after the date of this Order, except that if the thirtieth day following the date of this Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at: http://www.waterboards.ca.gov/public_notices/petitions/water_quality or will be provided upon request.

THEREFORE, IT IS HEREBY ORDERED that Mr. Alan Skobin and Northridge Properties, pursuant to section 13267(b) of the California Water Code, are required to submit the following technical reports:

On or before **October 1, 2015**:

1. A work plan (Technical Report) to complete the onsite soil investigation for CrVI and determine the vertical extent of CRVI contamination in former soil boring SS-4 which is located within the area of

¹ Under precedential Orders issued by the State Water Resources Control Board (State Water Board), Mr. Alan Skobin and Northridge Properties, LLC are liable for the cleanup of wastes at the Site regardless of its involvement in the activities that initially caused the pollution. The discharge of the chemicals did not cease when Zero Corporation vacated the premises. The State Water Board has interpreted the term "discharge" to include not only an active initial release, but also a passive migration of waste. The discharge continues as long as the waste remains in the soil and groundwater at the Site (See State Water Board Orders WQ 86-2 (Zoecon Corporation), WQ- 89-1 (Schmidt), and WQ 89-8 (Spitzer).)

a particular three-stage clarifier.

The guidance document entitled "*General Work Plan Requirements for a Heavy Metal Soil Investigation*" will assist you with this task. Additional information can be found in our guidance manual entitled "*Interim Site Assessment & Cleanup Guidebook (May 1996)*," which can be found at the Regional Board website at the following link:

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/brownfields/RBs%201996%20Guide%20Book1_1.pdf.

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/DocAndInfo/RWQC_B_QAPP_2015_FINAL_03-05-15.pdf

2. Specifically, the Technical Report shall be developed to evaluate the lateral and vertical extent of CrVI in subsurface soils in the area above the referenced three-stage clarifier. Moreover, the Technical Report shall include, but not be limited to the following:
 - a. Completion of one soil boring in the area of the three-stage clarifier;
 - b. The location of the boring will be determined in the field with Regional Board staff present;
 - c. The soil boring will be completed to a depth of at least 50-feet below ground surface (bgs). A determination will be made in the field by Regional Board staff whether the boring should be advanced to a deeper depth. The determination will be based on field observations and professional judgment;
 - d. The soil samples will be collected at 1-foot, 5-foot, and then every 5-feet until the desired depth is attained;
 - e. The soil samples will be analyzed for CrVI by EPA Method 7196;
 - f. Field log sheets will be generated during the completion of the boring; and
 - g. The soil boring activities and sample results will be provided to the Regional Board in a final report, which shall be submitted within 90 calendar days of the completion of the field work.
3. The Technical Report must contain a health and safety plan (H&SP), as per the February 2015 Quality Assurance Project Plan (QAPP) guidelines;
4. The Technical Report shall include the detailed information of former and existing chromium storage, hazardous waste management, and associated practices
5. The Technical Report must include a quality assurance/quality control QA/QC section, which discusses the types of field and laboratory QA/QC samples to be analyzed and how analytical data is validated and how suspect data is merged. For additional procedural information and

QA/QC guidelines refer to the following web link:

**[http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/DocAndInfo/RWQC
B_QAPP_2015_FINAL_03-05-15.pdf](http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/DocAndInfo/RWQC_B_QAPP_2015_FINAL_03-05-15.pdf)**

The above items shall be submitted to:

Mr. Lawrence Moore
Remediation Section
Los Angeles Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, CA 90013
Phone: (213) 576-6730
Email: Lawrence.Moore@waterboards.ca.gov

Pursuant to 13268(a) of the CWC, any person who fails to submit reports in accordance with the Order is guilty of a misdemeanor. Pursuant to section 13268(b) (1) of the CWC, failure to submit the required technical report described above by the specified due date(s) may result in the imposition of administrative civil liability by the Regional Board in an amount up to one thousand dollars (\$1,000) per day for each day the technical report is not received after the above due date. These civil liabilities may be assessed by the Regional Board for failure to comply, beginning with the date that the violations first occurred, and without further warning.

State Water Resources Control Board regulations (Chapter 30, Division 3 of Title 23 & Division 3 of Title 27, and California Code of Regulation) require the electronic submittal of information (ESI) for all site cleanup programs, starting January 1, 2005. Currently, all of the information on electronic submittals and GeoTracker contacts can be found at http://www.waterboards.ca.gov/ust/electronic_submittal.

To comply with the above referenced regulation, you are required to upload all technical reports, documents, and well data to GeoTracker by the due dates specified in the Regional Board letters and orders issued to you or for the site. However, we may request that you submit hard copies of selected documents and data to the Regional Board in addition to electronic submittal of information to GeoTracker.

The Regional Board, under the authority given by CWC section 13267, subdivision (b) (1), requires you to include a perjury statement in all reports submitted under the 13267 Order. The perjury statement shall be signed by a senior authorized Company Name representative (not by a consultant). The perjury statement shall be in the following format:

"I, [NAME], certify under penalty of law that this document and all attachments were prepared by me, or under my direction or supervision, in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the

information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

SO ORDERED.

Five-Year Review Report

Second Five-Year Review Report for San Fernando Valley – Area 2 Superfund Site Glendale, Los Angeles County, California

PREPARED BY
United States Army Corps of Engineers
Seattle District
Seattle, Washington

Approved by:

Kathleen Salyer
Assistant Director, Superfund Division
California Site Cleanup Branch

U.S. Environmental Protection Agency Region IX

Date:

[This page is intentionally left blank.]

Executive Summary

This is the second Five-Year Review of the San Fernando Valley (SFV) – Area 2 Superfund Site (Site) located in Glendale, California. The purpose of this Five-Year Review is to review information to determine if the remedy is and will continue to be protective of human health and the environment. The triggering action for this Five-Year Review (FYR) was the signing of the previous FYR on September 30, 2008.

The Area 2 Site is about 6 miles long from east to west and about 3 miles wide from north to south. The SFV – Area 2 Site is adjacent to the Los Angeles River. The Site consists of three operable units (OUs), including the Glendale North Operable Unit (GNOU), Glendale South Operable Unit (GSOU), and the Glendale Chromium Operable Unit (GCOU). The GNOU is located at the north end of the Los Angeles River Narrows (where the Los Angeles River turns from an easterly course to run southerly between the Verdugo Mountains to the northeast and the Hollywood Hills to the southwest). The GSOU is located within the Narrows itself (see Figure 1 and Figure 2). The GCOU was established in 2007 to study the distribution of chromium (including hexavalent chromium), metals contamination in groundwater, and to evaluate the risks these contaminants posed to human health and the environment. The GCOU is still in the remedial investigation (RI) phase of the Superfund process.

In 1979, the California Department of Public Health (CDPH), formerly the Department of Health Services (DHS), requested that all major water providers sample and analyze groundwater for contamination as part of a statewide groundwater quality surveillance effort. Trichloroethylene (TCE) was consistently detected in a large number of production wells in the SFV at concentrations greater than the maximum contaminant level (MCL) of 5 parts per billion (ppb). Chlorinated solvents including TCE and perchloroethylene (PCE) were widely used from 1940 to 1967 for dry cleaning and degreasing machinery, and disposal of these solvents was not well-regulated. The SFV Area 2 Site was listed on the National Priorities List in 1986.

The State of California's Los Angeles Regional Water Quality Control Board (LA RWQCB) and, the U.S. Environmental Protection Agency (EPA) split remedial oversight activities in Area 2 with RWQCB responsible for source/facility remediation and the EPA responsible for overseeing groundwater clean-up. EPA supports the RWQCB efforts to identify new sources through a cooperative grant. RWQCB source control investigations include conducting assessments of facilities to determine the extent of VOC solvent usage, past and current chemical handling, storage, and disposal practices. Facilities identified as sources are often ordered to remediate. While most SFV source activities are under the lead of the LA RWQCB, the California Department of Toxic Substances Control (DTSC) also participates in the investigation and oversight of SFV source areas.

The 1993 Records of Decision (RODs) for the GNOU and GSOU select an interim containment remedy to address the volatile organic compound (VOC)-contaminated groundwater plume in the Glendale area. The remedial action objectives for the remedy include:

- Inhibition of vertical and horizontal migration of groundwater contaminants in the North and South Plumes of the Glendale Study Area;
- Removal of contaminant mass from the shallow zone of the aquifer in the North and South Plumes of the Glendale Study Area.

EPA interprets the phrase “inhibition” to mean full hydraulic control of contaminated groundwater. The remedy consists of the following features: 1) four groundwater extraction wells in the GNOU and four groundwater extraction wells in the GSOU; 2) treatment of contaminated groundwater in a 5,000 gallon per minute (gpm) VOC treatment plant located between the two extraction well fields; 3) primary removal of contaminants from the liquid phase using air stripping and polishing by liquid phase granular activated carbon (LPGAC); 4) treatment of the air stream by vapor phase granular activated carbon (VPGAC); and 5) final use of treated water as drinking water. The treatment plant is operated by the Glendale Respondents Group contractor CDM, Smith in cooperation with the City of Glendale (via its contractor). The groundwater treatment system began operations in November 2000.

The extraction and treatment systems are operationally functional and provide clean drinking water to the City of Glendale. The remedial action provides drinking water to the City of Glendale that meets all water quality requirements. There have been no changes in ARARs that would affect the protectiveness of the remedy.

Groundwater model particle tracking and downgradient VOC and metals concentrations, indicate that groundwater contaminants in the North and South Plumes are not completely captured, so contaminant migration is not inhibited. The installation of additional extraction well(s) is needed to fully achieve plume capture and containment.

The California Department of Public Health (CDPH) released a draft MCL for hexavalent chromium of 10 ppb in August 2013. A new MCL for hexavalent chromium may affect the duration and effectiveness of the current remedy and/or the treatment technology being used if the system cannot treat hexavalent chromium to the required level.

This FYR, in contrast to previous FYRs, undertook an evaluation of the potential for regional groundwater vapor intrusion to impact protectiveness at the site. The potential for occurrences of vapor intrusion was determined using EPA’s Vapor Intrusion Screening Level Calculator with groundwater depth and volatile organic compound (VOC) concentrations as inputs. Calculator results showed there is the potential for a vapor intrusion exposure pathway in Area 2. Field data needed to make a determination on the existence of such pathways has yet to be gathered; therefore an overall protectiveness determination for this FYR cannot be made at this time and is thus deferred.

A protectiveness determination of the remedy for Area 2 cannot be made at this time until further information is obtained on regional groundwater vapor intrusion pathways. It is expected that a vapor intrusion investigation will be completed within a five year period. Following the completion of the investigation of regional groundwater vapor intrusion pathways, a protectiveness determination will be made. In addition, to be protective in the long term, complete hydraulic capture of the plume must be established.

Five-Year Review Summary Form

SITE IDENTIFICATION		
Site Name: San Fernando Valley (Area 2) Superfund Site		
EPA ID: CAD980894901		
Region: 9	State: CA	City/County: Glendale, Burbank, Los Angeles/Los Angeles County
SITE STATUS		
NPL Status: Final		
Multiple OUs? Yes	Has the site achieved construction completion? No	
REVIEW STATUS		
Lead agency: EPA If "Other Federal Agency" was selected above, enter Agency name:		
Author name (Federal or State Project Manager): ZiZi Searles		
Author affiliation: EPA		
Review period: January 2013 – September 2013		
Date of site inspection: 28 February 2013		
Type of review: Statutory		
Review number: 2		
Triggering action date: 09/30/2008		
Due date (five years after triggering action date): 09/30/2013		

Five-Year Review Summary Form (continued)

Issues/Recommendations				
OU(s) without Issues/Recommendations Identified in the Five-Year Review:				
None				
Issues and Recommendations Identified in the Five-Year Review:				
Affect Current Protectiveness	Affect Future Protectiveness	Implementing Party	Oversight Party	Milestone Date
Yes*	Yes	EPA	EPA	09/2018
OU(s): GNOU, GSOU	Issue Category: Monitoring Issue: The vapor intrusion pathway of the regional groundwater has not been evaluated for the Area 2 Site. Recommendation: Complete a regional groundwater evaluation of the potential for vapor intrusion at the San Fernando Valley Area 2 Superfund Site.			

* The CERCLIS database only accepts "Yes" or "No" entries regarding whether an issue affects current or future protectiveness. However, this protectiveness determination has been deferred because there is not enough information to make the determination. For the purposes of the CERCLIS database, a "defer" determination is equivalent to "yes" entry.

Issues/Recommendations				
Issues and Recommendations Identified in the Five-Year Review:				
Affect Current Protectiveness	Affect Future Protectiveness	Implementing Party	Oversight Party	Milestone Date
No	Yes	EPA	EPA	9/2016
OU(s): GNOU, GSOU	Issue Category: Remedy Performance Issue: The remedy is not fully capturing and containing groundwater contamination. Recommendation: Evaluate installation and operation of new wells to achieve plume capture and containment.

WBA	Weak-base anion exchange

Second Five-Year Review Report for San Fernando Valley – Area 2 Superfund Site

1. Introduction

The purpose of a Five-Year Review (FYR) is to evaluate the implementation and performance of a remedy in order to determine if the remedy will continue to be protective of human health and the environment. The methods, findings, and conclusions of FYRs are documented in five-year review reports. In addition, FYR reports identify issues found during the review, if any, and document recommendations to address them.

The U.S. Environmental Protection Agency (EPA) prepares FYRs pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Section 121 and the National Contingency Plan (NCP). CERCLA 121 states:

“If the President selects a remedial action that results in any hazardous substances, pollutants, or contaminants remaining at the site, the President shall review such remedial action no less often than each five years after the initiation of such remedial action to assure that human health and the environment are being protected by the remedial action being implemented. In addition, if upon such review it is the judgment of the President that action is appropriate at such site in accordance with section [104] or [106], the President shall take or require such action. The President shall report to the Congress a list of facilities for which such review is required, the results of all such reviews, and any actions taken as a result of such reviews.”

EPA interpreted this requirement further in the NCP; 40 Code of Federal Regulations (CFR) Section 300.430(f)(4)(ii), which states:

“If a remedial action is selected that results in hazardous substances, pollutants, or contaminants remaining at the site above levels that allow for unlimited use and unrestricted exposure, the lead agency shall review such actions no less often than every five years after the initiation of the selected remedial action.”

The United States Army Corps of Engineers (USACE) conducted the FYR and prepared this report regarding the remedy implemented at the San Fernando Valley (SFV) Area 2 Superfund Site (SFV Area 2 Site or Site) in Los Angeles County, California. EPA is the lead agency for developing and implementing the remedy for the Site. The California Department of Toxic Substances Control and the Los Angeles Regional Water Quality Control Board (RWQCB), as the support agencies representing the State of California, have reviewed all supporting documentation and provided input to EPA during the FYR process.

This is the second FYR for the SFV Area 2 Site. The triggering action for this statutory review is the previous FYR. The FYR is required due to the fact that hazardous substances, pollutants, or contaminants remain at the site at levels above those that would allow for unlimited use and unrestricted exposure.

The SFV Area 2 Site (Figure 1) consists of three groundwater Operable Units (OUs): Glendale North Operable Unit (GNOU), Glendale South Operable Unit (GSOU), and Glendale Chromium Operable Unit (GCOU). Collectively, the three OUs are referred to as the Glendale Operable Unit (GOU).

The GNOU is located adjacent to and north of the Los Angeles River. The GSOU is located in the Los Angeles Narrows itself (see Figure 1 and Figure 2). Each of these two OUs has an extraction system consisting of four wells for eight total extraction wells. Water from the extraction wells is pumped to the Glendale Water Treatment Plant (GWTP), which is located between the GNOU and GSOU well fields. The GWTP utilizes air stripping, liquid-phase granular activated carbon (LPGAC), and vapor-phase GAC (VPGAC) for VOC treatment. In 2007, EPA established the GCOU to study the distribution of chromium (including hexavalent chromium) and metals contamination in groundwater in Area 2 and to evaluate potential associated unacceptable risks to human health and the environment.

This FYR primarily addresses the GNOU and the GSOU, and partly addresses the GCOU. The GCOU is in the remedial investigation (RI) stage; hence, this OU has no implemented remedy available for review at this time.

Figure 1. Location Map for the SFV Area 2 Superfund Site

2. Site Chronology

Table 1 lists the dates of important events for the SFV Area 2 Superfund Site.

Table 1. Chronology of Site Events

Event	Date
The California Department of Health Services (DHS; now the California Department of Public Health) detected trichloroethylene (TCE), perchloroethylene (PCE), and other volatile organic compounds (VOCs) in a large number of production wells at levels exceeding their respective maximum contaminant levels (MCLs) and/or State Action Levels (SALs); those wells were removed from service. Alternative water supply was obtained from the Metropolitan Water District (MWD) where needed.	1979-1980
The Los Angeles Department of Water and Power (LADWP) completed the Groundwater Management Plan – San Fernando Valley Basin. The study detected widespread VOC contamination in the eastern San Fernando Valley and also located a contaminant plume migrating to the southeast at 300 feet per year.	July 1983
San Fernando Valley Areas 1, 2, 3, and 4 were listed on the National Priorities List (NPL).	1986
A basin-wide remedial investigation/feasibility study (RI/FS) was initiated under LADWP lead.	1987
The RWQCB issued Cleanup and Abatement Order No. 87-161 directing Lockheed to implement specific assessment and remediation tasks at its B1 Plant near Building 175 in Burbank, CA.	December 1987
The RI for the entire San Fernando Valley was completed (including Area 2).	April 1992
Records of Decision (RODs) were signed for Glendale North and South Operable Units (OUs).	June 1993
Well construction was started.	November 1997
Glendale water treatment plant (GWTP) construction was started.	July 1998
The City of Glendale (City) initiated the application process pursuant to DHS Policy 97-005 for the Glendale Treatment Plant.	November 1998
EPA initiated a chromium source investigation by providing funds to RWQCB to investigate 4,040 potential chromium users in the SFV.	January 1999
The Offices of Environmental Health Hazard Assessment of California EPA formally adopted a public health goal for total chromium of 2.5 µg/L, with 0.2 µg/L for hexavalent chromium assumed as part of the goal.	February 1999
The GWTP began Operation in “start-up” mode (except for well GS-1; the DHS permit did not allow operation of GS-1; thus, full operation was not achieved).	August 1, 2000
Glendale Respondents Group and EPA sign GSOU and GCOU CDs	November 2000
The City of Glendale has been responsible for day-to-day operations of the GOU treatment facility since they assumed responsibility as the operator in March 2001.	March 2001
Well GS-1 began operation after DHS approved City of Glendale’s focused 97-005 application. Full operation was achieved.	June 6, 2002
The City proposed new pumping rates for GS-3 and other extraction wells (“alternative pumping scheme”) to moderate chromium concentrations.	August 2002
The City initiates bench-scale study of chromium treatment technologies.	Late 2002
The City performed capture analysis to demonstrate their alternative pumping scheme could provide equal containment to treatment plant operation at design flows. EPA approved the alternate pumping scheme.	May 2003
EPA assigned contractor support staff to the Los Angeles Regional Water Quality Control Board (RWQCB) for investigation of chromium-related sites.	June 2003

Event	Date
EPA performed a modeling study for chromium fate and transport.	April 2004
RWQCB completed the Chromium Investigation: San Fernando Valley Phase 1- Inspections Final Report. Further assessment was recommended for 105 sites. RWQCB issued seven Cleanup and Abatement Orders.	August 2004
The well screen in well GN-3 failed; the well was offline for about 21 months.	March 2005
City conducted batch pilot tests on various chromium treatment technologies.	Early 2006
EPA established the GCOU to study the distribution of hexavalent chromium contamination in groundwater and to evaluate potential associated unacceptable risks to human health and the environment.	2007
RWQCB revised the general permit, thereby lowering the limit for hexavalent chromium to 8 ppb for discharge to the river	June 2007
EPA approved alternate pumping of wells GS-3 and GN-3 (the two highest chromium wells) to aid compliance with the new hexavalent chromium limit for river discharge.	June 2007
The City conducted a pilot test (continuous flow) of a Reduction/Coagulation/Filtration (RCF) process.	February 2008
EPA approved a modification to the Statement of Work of the Consent Decree to allow construction of demonstration projects for hexavalent chromium treatment at the Glendale OU (GOU).	August 2008
EPA approved the final design/build proposal for two demonstration projects for chromium treatment: a) RCF, and b) weak-base anion exchange (WBA).	September 2008
The first FYR for the SFV Area 2 Superfund Site was completed.	September 2008
The City prepared an extraction well evaluation plan to evaluate and maintain the wells to avoid unplanned outages similar to the outage of well GN-3 for screen failure.	2009
RCF demonstration project was implemented at well GN-3.	April 2010
WBA demonstration project was implemented at well GS-3.	May 2010
Glendale Respondents Group agrees perform a FFS as additional work under the 2000 CDs in order to update and revise the groundwater remedy at the San Fernando Valley ("SFV") Area 2 Superfund Site, Glendale North and South Operable Units (collectively, the "GOU")	August 2010
EPA initiated a remedial investigation (RI) of chromium in groundwater in the GCOU.	2011
The EPA entered into an Administrative Order on Consent with GCOU Respondents to perform part of the RI work.	2011
CH2M Hill submitted the final RI Work Plan for the GCOU to EPA.	April 2012
RCF operation ceased.	July 2012
A splitter pipe was installed to allow splitting of plant influent to allow for the GWTP to operate during well rehabilitation.	February 2013

3. Background

3.1. Physical Characteristics

The SFV Area 2 Site is located within the San Fernando Basin. This area includes the western portion of the City of Glendale and portions of the City of Los Angeles and Burbank. Glendale North and South Operable Units (OUs), the primary focus of this FYR, are located within Area 2 (Figure 1). The Glendale Chromium OU (GCOU), also within Area 2, is discussed separately in this FYR.

The San Fernando Basin is located within the Upper Los Angeles River Area (ULARA), which consists of the entire watershed of the Los Angeles River and its various tributaries. The San Fernando Basin covers approximately 122,800 acres. The basin is approximately 23 miles long in an east-west direction and up to approximately 12 miles wide in a north-south direction. The elevation of the Los Angeles River valley floor slopes from 1,100 feet above mean sea level (msl) in the northwestern portion of the valley to approximately 350 feet above msl near the southern portion of the Los Angeles Narrows. The valley is bounded on the northeast by the San Gabriel Mountains with the Verdugo Mountains to the southeast, on the north and northwest by the Santa Susana Mountains, on the west by the Simi Hills, and on the south by the Santa Monica Mountains.

The GOU is located south and down-gradient of the SFV Area 1 Superfund Site in the southeastern portion of the San Fernando Basin and north of the Pollock Area. Within Area 2, the Los Angeles River turns southward from its west to east course. The GOU is about 6 miles long from east to west and about 3 miles wide from north to south. The SFV Area 2 Site is adjacent to the Los Angeles River. The GNOU is located at the north end of the Los Angeles River Narrows, and the GSOU is located within the Narrows, to the east of the river, and north of Los Angeles.

A single treatment facility for both the GNOU and GSOU is located in Glendale. There are eight extraction wells associated with the Glendale Water Treatment Plant (Figure 2).

This page is intentionally left blank.

3.2. Hydrology

The uplands surrounding the SFV are comprised of crystalline and sedimentary rocks. Quaternary alluvium up to 2,000 feet thick was derived by erosion of the surrounding uplands (RWQCB 2002). Lateral zonation is present due to the changes in the pattern of deposition of the Tujunga fan at the northeast corner of the SFV.

Groundwater in the eastern SFV occurs primarily in alluvial valley-fill deposits of Quaternary age, eroded from the adjacent San Gabriel and Verdugo Mountains. The valley fill is estimated to be at least 1,200 feet thick in places, and is bounded to the east and at depth by granitic and metamorphic bedrock of low permeability. The valley-fill deposits of the eastern SFV are relatively permeable and have been subdivided into four distinct lithologic/aquifer zones as follows (James M. Montgomery, Inc. 1992):

- Upper Zone (0-250 ft bgs) – The Upper Zone consists of layers and lenses of silt, sand, and gravel from land (ground) surface to a depth of approximately 250 feet below land surface (below ground surface, or bgs). According to aquifer tests conducted during the SFV RI in the North Hollywood and Crystal Springs Study Areas, hydraulic conductivities in the Upper Zone range from about 30 to 360 feet per day (ft/day).
- Middle Zone (250-300 ft bgs) – The Middle Zone is approximately 50 feet thick and contains increased proportions of fine-grained sand and silt compared to the other zones. Because of its fine-grained nature and anticipated poor yield characteristics, few production wells have been completed in this zone. The Middle Zone appears to grade to coarser-grained deposits in the GSOU, where the Upper and Middle Zones become difficult to distinguish lithologically.
- Lower Zone (300-550 ft bgs)– The Lower Zone consists of interbedded sand, silt, and gravel, with cobbles in the upper portion. Thickness of this zone is estimated to be 200 to 250 feet, and hydraulic conductivity ranges from 130 to 900 ft/day. Most of the groundwater pumped from the eastern SFV is pumped from this highly productive zone.
- Deep Zone (550+ ft bgs) – Where encountered during drilling, the Deep Zone consists mainly of fine-grained, relatively low-permeability sediments, including silt and clay. Few wells have penetrated this zone; therefore, thickness and hydraulic characteristics of this zone are poorly understood.

Depths to groundwater measured at monitoring wells in the eastern SFV range from approximately 30 to 200 feet bgs (CH2M Hill 2003). Therefore, groundwater is typically first encountered in the Upper Zone; the Middle, Lower, and Deep zones are believed to be fully saturated through most of the study area. The water table or potentiometric surface typically occurs within the Upper or Middle zone of the regional aquifer. Groundwater levels at these monitoring wells have commonly declined approximately 30 feet since the mid-1990s, resulting from several factors, including: (1) large-scale groundwater withdrawals, (2) less-than-average precipitation during the past decade, and (3) an approximate 70 percent reduction in the amount of groundwater recharged through spreading.

For the purposes of differentiating groundwater elevations and the distribution of chemicals of concern (COC) with respect to depth, USEPA designated wells screened within 50 feet of the water table as

“Shallow Zone” wells, and wells screened greater than 50 feet of the water table as “Deep Zone” wells. These hydrological designations should not be confused with the lithological designations of the Upper, Middle, Lower, and Deep Regional Zones (ERM 2011).

Horizontal hydraulic gradients in the GOU are generally southeast toward the Los Angeles River Narrows, where essentially all groundwater and surface water outflow from the SFV occurs (Figure 3). Localized deviations to this pattern occur in the vicinity of pumping wells at several locations in the study area, and a large cone of depression is present in the Burbank OU to the northwest.

Groundwater flow velocities in the eastern SFV are estimated by the ULARA Watermaster to range from approximately 300 to 1,300 feet per year (ft/yr), depending on location (Upper Los Angeles River Area Watermaster 2012). Groundwater flow velocities are highest in the in the Glendale South OU and Los Angeles River Narrows area.

Vertical hydraulic gradients in the eastern SFV generally are much smaller than horizontal gradients, but can be strongly influenced in the vicinity of well fields by groundwater withdrawals (James M. Montgomery, Inc. 1992). Extraction wells in the Glendale and Burbank OUs are mostly screened in the lower portion of the Upper Zone, and for this reason, upward gradients from the Middle and Lower zones are assumed to occur near these well fields. However, the SFV RI concluded that the relatively fine-grained, low-permeability nature of the Middle Zone impedes movement of groundwater between the Upper and Lower zones in much of the eastern SFV. Deposits that comprise the Middle Zone become coarser in the GSOU and in the Los Angeles River Narrows, making the Middle Zone less distinct hydraulically from the Upper and Lower zones. In this area, the Middle Zone probably does not substantially impede vertical groundwater movement.

Figure 3. Groundwater Elevation Contours December 2010 (CH2M Hill 2010).

3.3. Land and Resource Use

The Site and its vicinity encompass an area of urban mixed land use. The area supports industrial, light industrial, low-high density residences, recreational, retail, and commercial land use. The Site consists of parts of the Cities of Glendale, Burbank, and Los Angeles.

The San Fernando Basin is a significant source of drinking water, with an estimated volume of 3 million acre-feet of groundwater stored in the aquifer within the alluvial fill of the basin. Groundwater as a source of drinking water is utilized by the Cities of Burbank, Glendale and Los Angeles and historically have accounted for between 15 and 50 percent of the water needs. Groundwater extractions from the San Fernando Basin typically provide up to 25 percent of the annual average water supply for Glendale's 191,000 residents..

3.4. History of Contamination

In 1979, the California Department of Public Health (CDPH), formerly the Department of Health Services (DHS), requested that all major water providers sample and analyze groundwater for contamination as part of a statewide groundwater quality surveillance effort. TCE was consistently detected in a large number of production wells in the SFV at concentrations greater than the MCL. Chlorinated solvents including TCE and PCE were widely used from 1940 to 1967 for dry cleaning and degreasing machinery, and disposal of these solvents was not well-regulated.

The SFV Area 2 Site includes two portions of the aquifer where high concentrations of contaminants have been identified: the North Plume and the South Plume. Although contamination has been detected throughout the Site in an apparently contiguous plume, differences exist between the North Plume and South Plume, including the types of contaminants detected and the concentrations of the contaminants. An area of lower-level groundwater contamination separates the Glendale North and South Plumes. Plume maps and well data charts in section 6.4.1 (Figure 4 through Figure 15) show the known extent of contaminants of concern (COCs) in the SFV in the area of the GOU. The SFV Area 2 Site was listed on the NPL in 1986 (along with Areas 1, 3, and 4).

3.5. Initial Responses

In 1980, the Los Angeles Department of Water and Power (LADWP) commenced a two-year study to define the extent of groundwater contamination in the SFV. The results of the study, published in 1983, revealed widespread VOC-contaminated groundwater in the SFV, specifically a contaminant plume migrating to the southeast at a rate of 300 ft/yr. These findings resulted in a number of municipal supply wells for the cities of Los Angeles, Burbank, and Glendale being taken out of service. Water for the City of Glendale was purchased as needed from the Metropolitan Water District (MWD) of Southern California.

As part of the GCOU RI and GOU FFS 40 additional monitoring wells have been installed and pump-tests have been performed on existing extraction wells further refining the nature and extent of contamination and the conceptual site model.

The original COCs for the SFV Area 2 Site were TCE and PCE. The presence of TCE, PCE, in groundwater at concentrations greater than the MCL provided the original basis for taking action under CERCLA. In the past 15 years EPA is also concerned with preventing exposure to other groundwater COCs such as perchlorate, chromium (especially hexavalent chromium), 1,4 dioxane, and Trichloropropane (TCP). Possible routes of exposure to COCs include ingestion, inhalation, and dermal contact.

The most prevalent groundwater contaminants in the SFV were found to be TCE and PCE. In 1992, the highest concentrations of TCE and PCE detected in EPA monitoring wells in the SFV were 1,700 micrograms per liter (µg/L) and 160 µg/L, respectively. A basin-wide RI was completed in 1992, and 87 groundwater monitoring wells were installed throughout the eastern SFV. The 1992 Basinwide RI provided the baseline assessment for the extent of contamination in all Areas of the SFV. Since the 1992 RI, additional monitoring and characterization have taken place in Area 2, especially in the past 10 years. As part of the GCOU RI and GOU FFS 40 additional monitoring wells have been installed and pump-tests have been performed on existing extraction wells further refining the nature and extent of contamination and the conceptual site model.

Due to the large area and complexity of the site EPA shares oversight responsibilities with the State of California. Pursuant to cooperative Agreement, EPA oversees the remediation of groundwater while the State of California oversees the remediation of sources. From the late 1980s to the present, EPA has provided a grant to the Los Angeles Regional Water Quality Control Board (RWQCB) to conduct assessments of facilities in the SFV to determine the extent of VOC solvent, and more recently metals usage at facilities to assess past and current chemical handling, storage, and disposal practices. These investigations were conducted pursuant to the RWQCB's Well Investigation Program and resulted in source remediation activities at facilities within the SFV where the release of solvents had occurred. The cooperative grant with the RWQCB remains ongoing, facilitating source investigations and remediation activities in progress. Although EPA does not have a cooperative grant with the California Department of Toxic Substances Control (DTSC), DTSC is overseeing clean-up at selected sites in the SFV.

In 1999, EPA provided funds to the RWQCB to investigate potential chromium sources in the SFV. In November 2002, the RWQCB released the findings from its investigation of more than 4,000 potential chromium sources, recommending further assessment of 105 sites. Of these 105 sites identified in the RWQCB study, 7 facilities in the SFV were given Cleanup and Abatement Orders (CAOs) from the RWQCB. In 2007, based on the RWQCB and subsequent EPA investigation results, EPA established the Glendale Chromium Operable Unit (GCOU) to study the distribution of hexavalent chromium contamination in groundwater and to evaluate potential associated unacceptable risks to human health and the environment. Other potential chromium groundwater contaminant sources in the SFV are being evaluated by RWQCB, DTSC, and EPA. EPA completed removal actions on two facilities; one in December 2007 and the other in 2010.

4. Remedy Selection

The 1993 RODs for the GNOU and GSOU selected interim remedies to address the VOC-contaminated groundwater plume in the Glendale area. The remedial action objectives (RAOs) for GNOU and GSOU were presented in the RODs as follows:

- To inhibit vertical and horizontal migration of groundwater contaminants in the North and South Plumes of the Glendale Study Area; and
- To begin to remove contaminant mass from the upper zone of the aquifer in the North and South Plumes of the Glendale Study Area.

EPA interprets the phrase “inhibition” to mean full hydraulic control of contaminated groundwater. EPA’s expectation in its first remedial action objective is that the contamination will be hydraulically contained and not migrate to areas not previously impacted.

The RODs selected groundwater extraction, treatment of VOCs by air stripping and liquid phase granular activated carbon (LPGAC), blending to meet the nitrate MCL, and conveyance to a public water distribution system. In addition, the RODs stated the air stream resulting from air stripping will be treated using vapor-phase GAC (VPGAC) to ensure that air emissions meet Federal air quality standards as regulated by the South Coast Air Quality Management District (SCAQMD). The RODs selected a combined treatment system (a single treatment plant [GWTP]) for both OUs.

4.1. *Remedy Implementation*

The GNOU and GSOU remedy construction occurred from 1997 to 2000 and included:

- Installation of eight extraction wells, (four wells each in the north and south wellfields , GN-1 through GN-4 and GS-1 through GS-4), capable of producing a total of 5,000 gallons per minute (gpm)
- Conveyance piping from extraction wells to the groundwater treatment facility
- Design and construction of the groundwater treatment facility capable of treating 5,000 gpm
- Conveyance piping of treated water from the groundwater treatment facility to the City of Glendale Grandview Reservoir
- Conveyance piping for discharge of treated water to the Los Angeles River during routine maintenance or in the event of a system malfunction

Four of the extraction wells are located in the GNOU, and four are located in the GSOU. Seven of the wells were completed in the Shallow Zone (approximately 200 feet deep) and one well (GN-4) was completed in the Deeper Zone (approximately 400 feet deep). Wellhead facilities for each extraction well consist of a pump and appurtenances to accomplish pumping to the GWTP.

The treatment facility is composed of two single-stage packed air strippers, eight 20,000-pound (lb) LPGAC units (operated in parallel), and six 10,000-lb VPGAC vessels (two trains of three VPGAC units operated in parallel; one train per air stripper). Groundwater from the transmission pipelines flows

directly into two single-stage packed air strippers for VOC removal. The water is collected at the bottom of each air stripper and pumped into LPGAC vessels where residual VOCs are adsorbed. The water pumped through the LPGAC units is disinfected and delivered to the City of Glendale for transmission to the Grandview Reservoir. The off-gases from the air strippers are treated by passing them through the VPGAC vessels. As the off-gases pass through the VPGAC vessels, VOCs are adsorbed onto the GAC, and the treated air is released through discharge stacks.

The interim remedy began initial operation in August 2000, and all extraction wells were operational by 2002.

4.2. Operation and Maintenance (O&M)

The City of Glendale (via its contractor CDM Smith) is conducting long-term monitoring and maintenance activities for the GOU according to the Revised O&M Manual (CDM 2003). CDM provides monthly operations reports to EPA, the City of Glendale, DTSC, RWQCB, ULARA Watermaster, and other parties detailing the scheduled and unscheduled maintenance; volumes of water extracted, treated, and discharged; contaminant concentrations in extraction wells, plant influent, and plant effluent; and estimated VOC mass removal.

From 2008-2012, frequent scheduled maintenance activities included carbon replacement, air filter replacement, carbon bed expansions, cleaning or installing disinfectant injection components, instrument calibration, flow meter replacement, pump lubrication, piezometer sampling, safety inspections, equipment inspections, and other preventative maintenance. Common occurrences that resulted in unscheduled maintenance included communication issues with extraction wells and well failure due to power conditions. Significant O&M activities over the same period included:

- Installing and testing a new sodium hypochlorite (NaOCl) storage tank (November 2008-January 2009) in response to a leak in September 2008. 2008 maintenance reports indicate a leak was detected in the NaOCl tank on 9/10/2008, with the contents being transferred to temporary totes (all leakage contained). Several scheduled maintenance activities over the months from November 2008 - January 2009 indicate the installation and testing of a new tank.
- Well rehabilitation for GN-4 (2009) and GS-2 (2011)
- Setup and testing of the demonstration scale hexavalent chromium removal treatment systems the WBA (GS-3) and RCF (GN-3) from December 2009 – April 2010; startup of WBA in March 2010 and RCF in April 2010
 - Formaldehyde was found to be associated with the resin product after the initial flushing of the W. BA system. Initial flushing water is now stored in large tanks on site for biological treatment.

Annual O&M costs for the GOU from January 2010 through December 2012 are shown in Table 2.

Table 2. Annual O&M Costs

Date Range	Total Cost (rounded to the nearest \$1,000)
January – December 2010	\$2,917,000
January – December 2011	\$3,224,000
January – December 2012	\$3,158,000

5. Progress Since the Last Five-Year Review

5.1. Previous Five-Year Review Protectiveness Statement and Issues

The protectiveness statement from the 2008 FYR for the SFV Area 2 Site stated the following:

“The interim remedies at the San Fernando Valley, Area 2, Superfund Site are protective of human health and the environment because all exposure pathways are currently being controlled. To be protective in the long-term, the operational problems due to the chromium discharge limit and their effect on plume containment must be addressed.”

The 2008 FYR included one issue and recommendation. The recommendation and the current status are discussed below.

Table 3. Status of Recommendations from the 2008 FYR

Issues from previous FYR	Recommendations	Party Responsible	Milestone Date	Action Taken and Outcome	Date of Action
Reduced pumping of two extraction wells due to high chromium concentrations has caused some loss of plume capture and migration of VOCs	Complete the Chromium Demonstration Project	City of Glendale	January 2009	WBA and RCF selected for pilot- and demonstration-scale testing	Ongoing

Weak-base anion exchange (WBA) and reduction, coagulation, and filtration (RCF) were selected as alternative treatments for pilot and demonstration scale testing. WBA was installed to treat groundwater pumped from GS-3, the extraction well with the highest hexavalent chromium concentrations in GSOU, and began operation in May 2010 (concentration data for all extraction wells can be found in section 5.4). An RCF system was also installed to treat a 100-gpm slipstream from the GOU north extraction well GN-3, the extraction well with the highest hexavalent chromium concentrations in GNOU, and began operation in April 2010. In July 2012, the RCF system was shut down because pilot testing was completed; the WBA well head system is still operating and adopted as part of operations in order to allow the plant to achieve pumping requirements for the GS-3 well.

5.2. Work Completed at the Site During this Five Year Review Period

In addition to the completion of the Chromium Demonstration Project (research project done in parallel with the operation of the hexavalent chromium demonstration facilities) and the installation of WBA and RCF, several actions have been completed during this FYR period.

In 2009, CDM Smith completed an evaluation of the extraction wells, and presented the results in a document titled Extraction Well Evaluation Results (EWER). The EWER established a priority list for wells needing rehabilitation. Well GN-4 was rated first in need and was rehabilitated in 2009. The following year well GS-2 was rehabilitated from April through June of 2011.

In 2010, EPA initiated a removal action at a former metal plating facility in Glendale. The cleanup involved the excavation of 460 tons of soil contaminated with chromium. In 2011, EPA initiated the RI for groundwater chromium contamination in Area 2 and parts of Area 1. In November 2011, EPA entered into an agreement, an Administrative Order on Consent (AOC), with the GCOU respondents to perform a portion of the RI work. In April 2012, the Final RI Work Plan for the GCOU was prepared by CH2M Hill on behalf of the EPA. The RI Work Plan identified areas where additional chromium investigation may be warranted to more completely delineate the extent of chromium contamination. The GCOU respondents have installed 12 new monitoring wells as part of the RI activities. EPA plans to install up to 17 new monitoring wells to address data needs that are not being addressed by the GCOU RI field work began in 2012.

The GCOU field work is important for the future of the GNOU and GSOU since chromium has the potential to impair the operation of the current VOC remedy. The GNOU and GSOU remedies (collectively called the GOU) are not designed to treat Chromium. At this moment Chromium influent is blended so the hexavalent chromium component does not exceed 5 ppb prior to delivery to the public water system. The 5 ppb standard is a voluntary standard that is derived from a Glendale City ordinance which states the City will not accept water designated as a drinking water source that has hexavalent Chromium concentrations above 5 ppb. The GCOU remedial investigation activities are important to future operations of the GNOU and GSOU as an upgradient chromium plume front has the potential debilitate future remedy operations as hexavalent chromium concentrations increase in more wells. In such a scenario blending to 5 ppb for hexavalent chromium will become logistically difficult with increases in influent concentration and number of wells impacted.

Several efforts have been completed in accordance with the *GOU Focused Feasibility Study (FFS) Statement of Work (SOW)* developed by EPA and the Glendale Respondents Group (GRG), the *FFS Work Plan* (ERM 2010), and the *FFS Work Plan Addendum* (ERM 2011). These efforts have been documented in technical memorandums (TMs). In their most recent forms, these documents (all produced by ERM on behalf of the GRG) include: *Draft Extraction Well GS-1 Evaluation TM* (June 2012), *Final Site Characterization TM* (October 2012), *Draft Emerging Compounds Evaluation TM* (October 2012), and *Revised Draft Hydraulic Containment Evaluation TM* (October 2012). It should be noted that most of these documents have significant comments from EPA, California Department of Public Health (CDPH), and/or the City of Glendale. The following is a summary of the findings in various technical memos:

- The purpose of the *Extraction Well GS-1 Evaluation* was to assess the impacts of surface water on extraction well GS-1. CDPH had raised concerns that groundwater extracted by GS-1 may be influenced by the adjacent Los Angeles River or upgradient wastewater treatment plant retention pond. Detections of n-nitrosodimethylamine (NDMA) in the Los Angeles River raised the possibility that there was a surface water connection to groundwater extracted by GS-1. The GS-1 Technical Memo concluded that the primary source of NDMA in GS-1 was the Los Angeles-Glendale Water Reclamation Plant (LAGWRP) retention pond. The presence of NDMA in well GS-1 suggested a surface water influence from the Los Angeles River (85% of river flow is treated wastewater) or the upgradient LAGWRP facility. During the past five years NDMA

reached a maximum concentration of 0.2 µg/L, exceeding the CDPH notification level for NDMA of 0.01 µg/l.

Historical investigations of LAGWRP operations revealed that the pond was potentially breached in 1992 when it was used as a staging area for construction equipment. Analysis of historical trends also showed that increasing concentrations of NDMA in well GS-1 coincided with a 2007 process change at the wastewater facility. The *Extraction Well GS-1 Evaluation* concluded that the LAGWRP pond was the most likely NDMA source.

In response to the conclusion that the wastewater pond was the source of well GS-1 NDMA contamination, LAGWRP changed operations so wastewater effluent bypassed the pond. Over the course of 9 months (April-December 2012) the pond was drained and VOC and NDMA concentrations were monitored monthly at well GS-1. Results showed that NDMA concentrations decreased as the pond drained. An August 2012 report shows NDMA concentrations decreasing to 0.022 µg/L. In December 2012, EPA and CDPH concurred with the GRG report that the pond was the source of NDMA and requested that the GRG continue to work with LAGWRP to ensure that the pond would not be put back into use unless the liner was repaired. As of the writing of this Five-Year Review the LAGWRP pond remains dry and GS-1 NDMA concentrations continue to decrease.

- The purpose of the *Site Characterization TM* is to present data collected during specific field investigations and to address data gaps so that evaluations of hydraulic containment, emerging compounds, and extraction well GS-1 could be completed. The document essentially revises the conceptual site model for the site. As part of the site characterization effort 14 new monitoring wells were installed in the vicinity of the GNOU and GSOU, and pump test were performed on selected extraction wells.
- *The purpose of the Emerging Contaminants Evaluation* was to assess groundwater analytical data for emerging contaminant identification and determine potential current and future impacts to GOU remedy performance and GWTP operations for constituents identified as emerging contaminants. The evaluation identified two compounds, 1,4-dioxane and hexavalent chromium, as having the most potential to impact GOU remedy performance and GWTP operations. Chromium, especially hexavalent chromium, has the potential to impair the existing remedy since the current treatment system was not designed to treat chromium. 1, 4 dioxane could impair remedy performance if extraction well and treatment facility effluent exceed the CDPH notification level of 1ug/L. Concentrations of 1,2,3-TCP in GOU extraction wells are likely to increase because up-gradient areas (specifically the Burbank Operable Unit) have higher concentrations. Increasing 1,2,3-TCP concentrations would ultimately increase facility O&M costs as treatment of 1,2,3-TCP increases the frequency of change outs in GAC and LPGAC vessels. In summary the report details the distribution and concentrations of emerging contaminants chromium, 1,4-dioxane, 1,2,3-TCP, perchlorate, and NDMA throughout Area 2.

- The purposes of the *Hydraulic Containment Evaluation* TM was to determine whether the interim remedy, as it is operated currently, achieves the RAO of inhibition of vertical and horizontal migration and to evaluate alternatives to enhance the interim remedy and the degree of hydraulic containment. EPA interprets the phrase “inhibition” to mean full hydraulic control of contaminated groundwater. The study found hydraulic control is not being achieved. Groundwater modeling in this report indicates a loss of capture between wells GN-2 and GN-3 in the GNOU (north well field), and between all wells in the GSOU (south wellfield), is not being achieved.

Groundwater model particle tracking results showed that particles were escaping between the aforementioned wells (Figures 30 and 31). To mitigate the escape of contamination downgradient, an alternative was identified to achieve hydraulic containment in the GSOU. The chosen alternative involves the installation of a new extraction well in the GSOU between well GS-2 and GS-3, relocation of the WBA system from well GS-3 to well GN-3, and adjustment of pumping rates of existing extraction wells. The GNOU and GSOU parties have committed to moving forward with implementing the design enhancements recommended in the *Hydraulic Containment Evaluation*. EPA is working to implement the aforementioned improvements and to address areas where only partial hydraulic containment is being achieved through the installation of additional extraction wells.

6. Five-Year Review Process

6.1. Administrative Components

EPA Region 9 initiated the FYR in January 2013 and scheduled its completion for September 2013. The review team was led by ZiZi Searles of EPA, Remedial Project Manager (RPM) and contractor support was provided by USACE (David Sullivan, geologist and Aaron King, environmental engineer). On January 9, 2013, EPA held a scoping call with the review team to discuss the Site and items of interest as they related to the protectiveness of the remedy currently in place. A review schedule was established that consisted of the following: community notification, 2) document review, 3) data collection and review, 4) site inspection; 5) local interviews; and 6) Five-Year Review Report development and review.

6.2. Community Involvement

On January 30, 2013, a public notice was published in the *Los Angeles Daily News* announcing the commencement of the Five-Year Review process for the San Fernando Valley Area 2 Site, providing contact information for EPA's San Fernando Valley Sites Community Involvement Coordinator, Jackie Lane, and inviting community participation. The press notice is available in Appendix B. The Five-Year Review report will be made available to the public once it has been finalized. Copies of this document will be placed in the designated public repositories: City of Glendale Public Library, 222 East Harvard St. Glendale, CA or call (818) 548-2021 and Los Angeles Public Library, 630 W. Fifth St., Los Angeles CA 90071 or call (213) 228-7000. Upon completion of the FYR, a public notice will be placed in the *(Daily News Los Angeles)* to announce the availability of the final FYR report in the Site document repositories.

6.3. Document Review

This FYR includes a review of site-related documents including the ROD, remedial action reports, and recent monitoring data. A complete list of the documents reviewed can be found in Appendix A.

6.3.1. ARARs Review

Section 121 (d)(2)(A) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) specifies that Superfund Remedial Actions (RAs) must meet any federal standards, requirements, criteria, or limitations that are determined to be legally applicable or relevant and appropriate requirements (ARARs). ARARs are those standards, criteria, or limitations promulgated under federal or state law that specifically address a hazardous substance, pollutant, contaminant, RA, location, or other circumstance at a CERCLA site.

Changes (if any) in ARARs are evaluated to determine if the changes affect the protectiveness of the remedy. The 1993 GNOU ROD and the 1993 GSOU ROD identified only chemical- and action-specific ARARs for the site; no location-specific ARARs were identified for the Site. Each ARAR and any change to the applicable standard or criterion are discussed below. The selected interim remedies are expected to comply with all federal and state ARARs except for 40 CFR § 300.430(e)(2)(i)(A), which requires that the contaminant levels of the groundwater that remains in the aquifer be reduced below MCLs.

6.3.1.1 Chemical-specific ARARs

Because these were interim actions for containment of groundwater contamination, EPA has not established chemical-specific ARARs for restoration of groundwater remaining on-Site. EPA is waiving this ARAR pursuant to CERCLA Section 121(d)(4)(A), 42 U.S.C. § 9621(d)(4)(A), and 40 CFR § 300.430(f)(1)(ii)(C), which allows EPA to select a remedy that does not achieve an ARAR when the remedial alternative selected is an interim measure that will become part of a total remedial action that will attain ARARs. EPA's waiver of the aquifer cleanup standard does not apply to water extracted from the aquifer and delivered to municipalities for use as drinking water; all extracted and treated water is expected to comply with MCL ARARs

Performance standards for treated groundwater are summarized in Table 4. The current regulatory standards for TCE, PCE, and the other VOC COCs are the state and federal MCLs. The current regulatory standard for total chromium is the state MCL of 50 µg/L. Hexavalent chromium is not regulated by itself, but addressed by both federal and state MCLs for total chromium. Recently, CDPH has proposed a draft MCL specific for hexavalent chromium at a value of 10 µg/L (August 2013). US EPA is currently revising the hexavalent chromium toxicity assessment and plans to revisit the MCL upon its completion. A final MCL for hexavalent chromium is expected to be announced during the period of the next FYR.

In April 2007, the Los Angeles RWQCB changed the effluent standards for the maintenance and emergency discharges of treated water to the Los Angeles River. The effluent standard for hexavalent chromium was changed to 8 µg/L. The City of Glendale is required to keep hexavalent chromium concentrations in the combined discharge from the extraction wells below 8 µg/L in order to ensure that any emergency bypasses do not violate the current river discharge limits. The 8 µg/L limit became effective in June 2007. Also, the City of Glendale adopted a goal of 5 µg/L for hexavalent chromium prior to distribution in the City's water system. When delivering water to the distribution system, the hexavalent chromium concentration in the effluent from the GOU treatment system is not to exceed 11 µg/L; blending is performed with water from the City of Glendale G-3 turn-out prior to delivery to the distribution system, which is meant to achieve the 5 µg/L limit.

At the time of this FYR no final state or federal MCLs had been promulgated for 1,2,3-TCP, 1,4-dioxane, or NDMA. For these emerging contaminants that lack MCLs, the CDPH notification levels, which are health-based advisory levels for drinking water use, may be treated as criteria to-be-considered (TBC) in setting alternative performance standards for extracted groundwater.

Nitrate is also present in groundwater in excess of the MCL, as a result of past agricultural and sewage disposal practices in the SFV, but is not targeted for treatment as part of the GNOU or GSOU interim remedies. Complying with all applicable requirements for drinking water at the tap will also require attainment of the MCL for nitrate prior to serving the water to the public.

The State of California's Secondary Drinking Water Standards are also ARARs for the Site if the final use option involves serving treated groundwater as drinking water (22 CCR 64471). The California SDWS are selected as ARARs because they are promulgated state standards and are relevant and appropriate to

the action of supplying the treated water to a public water supplier. Although California Secondary Drinking Water Standards are not applicable to non-public water system suppliers, they are relevant and appropriate since the treated water under this action would be put into the City's drinking water system.

Table 4. Performance Standards for Treated Groundwater

Contaminant of Concern	Federal MCL (µg/L)	California MCL (µg/L)	CDPH Notification Level (µg/L)	Basis for Performance Standard	Performance Standard (µg/L) ^a
TCE	5	5	None	Federal MCL	5
PCE	5	5	None	Federal MCL	5
1,1-DCA	None	5	None	California MCL	5
1,2-DCA	5	0.5	None	California MCL	0.5
1,1-DCE	7	6	None	California MCL	6
cis-1,2-DCE	70	6	None	California MCL	6
1,1,1-TCA	200	200	None	Federal MCL	200
1,1,2,2-Tetrachloroethane	None	1	None	California MCL	1
Vinyl chloride	2	0.5	None	California MCL	0.5
Carbon tetrachloride	5	0.5	None	California MCL	0.5
Methylene chloride	5	5	None	Federal MCL	5
Benzene	5	1	None	California MCL	1
Toluene	1,000	150	None	California MCL	150
Ethylbenzene	700	300	None	California MCL	300
Xylene, Total	10,000	1,750	None	California MCL	1,750
MTBE	None	13	None	California MCL	13
Nitrate (as nitrogen)	10,000	10,000 ^b	None	Federal MCL	10
Total chromium ^c	100	50	None	California MCL	50
Hexavalent chromium ^{d,e,f}	None	None	None	RWQCB: See note e Glendale: See note f	8 ^e ; 5 & 11 ^f
Perchlorate	None	6	None	California MCL	6
1,2,3-TCP	None	None	0.005	CDPH Notification Level	0.005
1,4-dioxane	None	None	1 ^g	CDPH Notification Level	1
NDMA	None	None	0.01	CDPH Notification Level	0.01

a. The CDPH permitting process may require lower concentrations in the treated effluent.

b. MCL is listed as 45 mg/L nitrate as nitrate, which is equivalent to 10 mg/L nitrate as nitrogen.

c. When speciation data is unavailable the State of California uses 50 micrograms per liter, and for risk evaluation reasons, assumes all total chromium is hexavalent chromium.

d. Federal and state MCLs specific to hexavalent chromium have not been established. In August 2013 CDPH announced a draft hexavalent chromium MCL of 10 µg/L for public comment.

e. The City of Glendale is required to keep treatment plant and well effluent hexavalent chromium concentrations below 8 µg/L in order to ensure that any emergency bypasses does not violate the current RWQCB-mandated limits for discharging to the river.

f. The City of Glendale passed a city ordinance requiring drinking water to meet a standard of 5 µg/L for hexavalent chromium prior to distribution in the City's water system. To meet this requirement treatment plant effluent delivered to the distribution system is not to exceed 11 µg/L for hexavalent chromium. The City has determined effluent with hexavalent chromium above 11 µg/L may not blend with the City's other water sources to meet the 5 µg/L city requirement.

g. In 1998, CDPH established its initial notification level at 3 µg/L, based on a EPA drinking water concentration that corresponded with a 10⁻⁶ theoretical lifetime excess cancer risk. In 2010, EPA revised its 1,4-dioxane risk evaluation such that a 10⁻⁶ risk level corresponds to 0.35 µg/L. CDPH revised its notification level to 1 µg/L in November 2010

i. The CDPH Notification Level for 1, 2, 3 TCP is the same as the detection limit. The detection limit for 1,2,3 TCP in water is 0.005µg/L.

6.3.1.2 Other ARARs

Federal and state laws and regulations other than chemical-specific ARARs that have changed over the past five years are described in Table 5. These ARARs were pre-construction requirements, so it is assumed that all applicable requirements were obtained before the units went on-line. However, if the systems are modified significantly, these ARARs would still apply. There have been no other revisions to laws and regulations that affect the protectiveness of the remedy. A full summary of ARARs listed in the 1993 GNOU and GSOU RODs is given in Appendix F.

Table 5. Applicable or Relevant and Appropriate Requirements Evaluation

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
Clean Air Act SCAQMD	Regulation XIII	Regulation XIII requires that stationary sources of air emissions meet best available control technology (BACT) standards.	Rules 1309 (Emission Reduction Credits and Short Term Credits), 1315 (Federal New Source Tracking System), and 1325 (Federal PM _{2.5} New Source Review Program) of Regulation XIII have been amended or adopted since the previous FYR, but none of the changes affect protectiveness.	For air strippers, SCAQMD considers vapor phase GAC (with 90-99% removal efficiency) devices to be BACT. These are pre-construction requirements, so it is assumed that all applicable requirements were obtained before treatment units went on-line.	Latest amendment was on June 3, 2011.
Clean Air Act SCAQMD	Rule 1401	Rule 1401 specifies limits for individual cancer risk and excess cancer cases from new or modified stationary sources which emit carcinogenic air contaminants. The rule requires BACT for toxic air discharge for new stationary sources where a lifetime maximum individual cancer risk of one in one million or greater is estimated to occur.	The list of chronic and acute toxic air contaminants was expanded, but this does not affect protectiveness.	As Rule 1401 is a pre-construction regulation, it is assumed that all applicable requirements were attained before the treatment units went on-line. If the air stripping treatment system is modified significantly, substantive provisions of Rule 1401 will still apply.	Latest amendment was on September 10, 2010.

6.3.2. Human Health Risk Assessment Review

A human health risk assessment was completed for the Site as part of the San Fernando Valley groundwater RI (James M. Montgomery, Inc. 1992). For this FYR, the risk assessment was reviewed to identify any changes in exposure or toxicity that would impact protectiveness.

The 1992 risk assessment identified two exposure pathways at SFV Area 2 Site: ingestion of drinking water and inhalation of vapors during showering. The dermal absorption pathway was considered, but it was determined that its potential contribution to overall risk would not be significant. There have been no

changes in exposure pathways that were listed in the RI. The vapor intrusion pathway (discussed in Section 6.3.2.1 below) was not evaluated in the 1992 RI.

In the RI, lifetime excess cancer risks and non-cancer hazard quotients were calculated for the ingestion and inhalation pathways for the shallow and deeper aquifer zones under three different exposure scenarios: average, reasonable maximum exposure (RME), and maximum. The different scenarios essentially represent exposures to different contaminant concentrations found during the RI. The average scenario represents an exposure to average contaminant concentrations, the RME scenario represents an exposure to contaminant concentrations corresponding to the upper bound 95% confidence interval, and the maximum scenario represents an exposure to the maximum observed contaminant concentrations. Table 6 shows cancer risks associated with ingestion and inhalation exposure pathways.

Table 6. Site Risks Identified in the San Fernando Valley RI/FS

Exposure Scenario and Pathway	Non-cancer Hazard Index	Cancer Risk
Shallow Zone – San Fernando Valley Groundwater		
Average - Ingestion	1.7	4.0E-04
RME - Ingestion	3.1	8.0E-04
Maximum - Ingestion	20	6.0E-03
Average - Inhalation	1.2	6.0E-04
RME - Inhalation	2.2	1.0E-03
Maximum - Inhalation	14	1.0E-02
Deeper Zone – San Fernando Valley Groundwater		
Average - Ingestion	0.26	4.0E-05
RME - Ingestion	0.42	6.0E-05
Maximum - Ingestion	1.7	2.0E-04
Average - Inhalation	0.17	1.0E-05
RME - Inhalation	0.32	2.0E-05
Maximum - Inhalation	1.6	1.0E-04

6.3.2.1 Vapor Intrusion

EPA's understanding of contaminant migration from soil gas and/or groundwater into buildings has evolved over the past few years leading to the conclusion that vapor intrusion may have a greater potential for posing risk to human health than assumed when the ROD was prepared. In April 2013 EPA released an external review draft version of its vapor intrusion guidance titled "*OSWER Final Guidance for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Sources to Indoor Air*" (EPA 2013). This guidance was used to evaluate the SFV Area 2 potential for vapor intrusion discussed in following paragraphs.

In the late 1980's and early 90's a regional groundwater soil gas investigations were as part of OU specific and Basinwide SFV RI activities. This soil gas sampling was performed to gather information on the

extent of VOC contamination in the basin. Soil gas data collected for the purpose of assessing the potential for regional groundwater vapor intrusion was not obtained at this time.

The potential for regional groundwater vapor intrusion was evaluated in this FYR following a “multiple lines of evidence” approach. PCE, TCE (i.e.VOCs) present in regional groundwater are of such a concentration, sufficiently toxic, and volatile that certain areas of the site are potentially susceptible to vapor intrusion. Groundwater PCE and TCE concentrations over large areas of Area 2 are greater than the generic groundwater screening levels for a vapor intrusion hazard quotient equal to 1 for a residential exposure scenario (58 µg/L for PCE, 5.2 µg/L for TCE) as shown in EPA’s Vapor Intrusion Screening Level Calculator (EPA 2013). The fact that the area is heavily populated and contains numerous buildings is another condition that suggests the possibility for vapor intrusion. Finally groundwater elevations are shallow enough for groundwater VOC volatilization to potentially reach the surface. This assessment also found that the areas most vulnerable to potential vapor intrusion are areas where groundwater is the shallowest. The most recent ULARA Watermaster Report (2012) shows water levels in three wells in Area 2 to be less than 50 feet bgs. Groundwater levels documented in the *Revised Draft Hydraulic Containment Technical Memorandum* (ERM 2012), show PCE and/or TCE contamination above the hazard quotient in many wells where the top of screen is less than 100 feet bgs and 50 feet bgs.

At time of the writing of this FYR the potential for regional groundwater vapor intrusion is unknown. Given the EPA’s Vapor Intrusion Screening Level Calculator results show there is potential for Area 2’s vapor intrusion, further investigation is needed to assess whether such vapor intrusion pathways exist. The uncertainty surrounding the potential for vapor intrusion requires a protectiveness deferred determination for this FYR. In the next five years an investigation will be conducted to gather information on the existence or non-existence of these pathways. The results of this investigation will be discussed in the next FYR, at which time a protectiveness determination will be made.

6.3.2.2 Toxicity values

EPA’s Integrated Risk Information System (IRIS) has a program to update toxicity values used by the Agency in risk assessment when newer scientific information becomes available. In the past five years, there have been a number of changes to the toxicity values for certain contaminants of concern at the Site. Revisions to the toxicity values for TCE, PCE, 1,4-dioxane, methylene chloride, carbon tetrachloride, cis-1,2-DCE, and 1,2,3-TCP indicate changes in risk from exposure to these chemicals, such that risk is now considered to exist at levels different than previously considered. Table 7 shows the changes in toxicity values for these contaminants. TCE, PCE, and 1,4-dioxane are discussed further; hexavalent chromium, for which a new final standard is expected soon, is also discussed.

Table 7. Changes in Toxicity Values in the Last Five Years

Contaminant	Toxicity Value	RI Value ^a	November 2012 RSL Table Value	Change
PCE	SFO (kg-day/mg)	5.10E-02	2.10E-03	Less stringent
	RfD _o (mg/kg-day)	1.00E-02	6.00E-03	More stringent
TCE	SFO (kg-day/mg)	1.10E-02	4.60E-02	More stringent
	RfD _o (mg/kg-day)	1.00E-02	5.00E-04	More stringent
1,4-dioxane	SFO (kg-day/mg)	1.10E-02 ^b	1.00E-01	More stringent
	RfD _o (mg/kg-day)	--	3.00E-02	More stringent
cis-1,2-DCE	SFO (kg-day/mg)	--	--	No change
	RfD _o (mg/kg-day)	1.00E-02 ^b	2.00E-03	More stringent
Carbon tetrachloride	SFO (kg-day/mg)	1.30E-01	7.00E-02	Less stringent
	RfD _o (mg/kg-day)	7.00E-04	4.00E-03	Less stringent
Methylene chloride	SFO (kg-day/mg)	7.50E-03 ^b	2.00E-03	Less stringent
	RfD _o (mg/kg-day)	6.00E-02 ^b	6.00E-03	More stringent
1,2,3-TCP	SFO (kg-day/mg)	2.00E+00 ^b	3.00E+01	More stringent
	RfD _o (mg/kg-day)	6.00E-03 ^b	4.00E-03	More stringent

Notes

^a As listed in SFV RI

^b Because toxicity values from the original risk assessment were not provided, these values are as listed in the EPA Region 9 2004 Preliminary Remediation Goals (PRGs) Table.

^c SFO = oral slope factor

^d RfD_o = oral reference dose

TCE and PCE: Groundwater results are compared to EPA regional screening levels (RSLs; previously called preliminary remediation goals [PRGs]) as a first step in determining whether response actions may be needed to address potential human health exposures. The RSLs are chemical-specific concentrations that correspond to an excess cancer risk level of 1×10^{-6} (or a hazard quotient (HQ) of 1 for noncarcinogens) developed for standard exposure scenarios (e.g., residential and commercial/industrial). RSLs are not de facto cleanup standards for a Superfund site, but they do provide a good indication of whether actions may be needed. In September 2011, EPA completed a review of the TCE toxicity literature and posted on IRIS both cancer and non-cancer toxicity values which resulted in lower RSLs for TCE. The screening level for chronic exposure for cancer excess risk level of 1×10^{-6} is 0.44 µg/L. EPA uses an excess cancer risk range between 10^{-4} and 10^{-6} for assessing potential exposures, which means a TCE concentration between 0.44 and 44 µg/L. The current MCL for TCE is 5 µg/L, which is within the revised protective carcinogenic risk range. EPA's 2011 Toxicological Review for TCE also developed safe levels that include at least a 10-fold margin of safety for health effects other than cancer. Any concentration below the non-cancer RSL indicates that no adverse health effect from exposure is expected. Concentrations significantly above the RSL may indicate an increased potential of non-cancer effects. The non-cancer RSL for TCE is 2.6 µg/L. EPA considers the TCE MCL of 5 µg/L protective for both cancer and non-cancer effects.

EPA also recently reassessed PCE toxicity literature for both cancer and non-cancer effects and released the toxicological review in February 2012, posted on IRIS. The reassessment determined that risk for cancer in excess of 1×10^{-6} was a less stringent risk criterion than previously assumed, and EPA has raised the cancer RSL for PCE to 9.7 µg/L. The non-cancer RSL was also revised based on adverse neurological effects and resulted in a non-cancer risk RSL of 35 µg/L. The PCE MCL of 5 µg/L remains protective for both carcinogenic and non-cancer effects. Table 8 summarizes the RSLs for TCE and PCE.

Table 8. Summary of Drinking Water RSLs for TCE and PCE

Contaminant of Concern	RSL for cancer excess risk level of 1×10^{-6} (µg/L)	RSL for non-cancer hazard (µg/L)
TCE	0.44	2.6
PCE	9.7	35

1,4-Dioxane: There are currently no federal or state MCLs for 1,4-dioxane. The current RSL is 0.67 µg/L (or equivalent units: parts per billion [ppb]). CDPH established a Notification Level (formerly "action level") for 1,4-dioxane at 3 µg/L. Notification to the CDPH is required in the event treated water with a concentration exceeding a notification level is delivered to a municipal water purveyor. In 2010, EPA revised its 1,4-dioxane risk evaluation such that a 10^{-6} risk level corresponds to 0.35 µg/L, as noted in IRIS, though the RSL table has not yet been updated. In response to EPA's revision, CDPH revised its notification level from 3 to 1 µg/L in November 2010.

Hexavalent Chromium: There is currently no MCL specific for hexavalent chromium; however, there is a federal MCL for total chromium at 100 µg/L (ppb) and a California MCL for total chromium at 50 µg/L (ppb). These total chromium MCLs assume that the majority of chromium in drinking water is in the hexavalent state.

In 2010, EPA updated its RSLs for hexavalent chromium. The RSL update was based on a revised toxicity assessment by the New Jersey Department of Environmental Protection following new toxicity information from the National Toxicology Program. The current hexavalent chromium RSL for tap water ingestion is 0.031 µg/L (ppb). The EPA IRIS program is conducting its own reassessment of the toxicity of hexavalent chromium and EPA has committed to revise the chromium MCL upon completion of the IRIS reassessment. Any potential change to these chemicals will need to be addressed in subsequent five-year reviews.

In addition, the California Office of Environmental Health Hazard Assessment released a new Public Health Goal for hexavalent chromium at 0.02 µg/L(ppb) in 2010. The California Department of Public Health (CDPH) released a proposed MCL for hexavalent chromium of 10 ppb in August 2013. Once new federal and/or state MCLs for hexavalent chromium are adopted, further evaluation regarding the protectiveness of the remedy will be completed.

6.3.3. Ecological Review

A brief ecological risk assessment was performed during the 1992 SFV RI. No threatened or endangered species were found to use the area. There is limited habitat use of the Los Angeles River by water fowl, although most of the habitat potential has been displaced through development and urbanization of the site. The ecological exposure pathway of primary concern for Area 2 is the discharge of contaminated groundwater to surface water bodies (i.e. the Los Angeles River, recharge basins, and other lake like bodies of water) and of treated effluent to the Los Angeles River. There is no information to indicate that untreated groundwater from the GNOU or GSOU reaches the surface water bodies. Discharges of untreated water to the Los Angeles River are expected to be infrequent, seasonal, and localized. These discharges usually occur to facilitate well development, well rehabilitation, or other treatment facility operational repairs requiring discharge of untreated water. Treated water discharged from the groundwater treatment system is required to be within discharge limits for VOCs and for hexavalent chromium (at 8 µg/L) (see section 5.3.1).

The 1992 RI suggests the potential for GSOU groundwater discharge to the Los Angeles River under rising water conditions (usually associated with major precipitation events) if the GSOU extraction wellfield is not operating. However, this scenario is unlikely given that the GSOU PRPs are under an order to ensure operation of the extraction wells year round. To evaluate the impact of such an event on water fowl should it ever occur, the 1992 RI compared maximum contaminant concentrations in groundwater to Los Angeles River ambient water quality criteria and sediment quality criteria. The RI concluded that there no ecological risk posed to water fowl. No complete ecological exposure pathways and/or significant exposures are expected to occur in Area 2.

6.4. *Data Review*

To evaluate whether the interim remedies at the GNOU and the GSOU are meeting RAOs and remain protective of human health and the environment, data and other information regarding groundwater quality throughout Area 2, the performance of the groundwater extraction and treatment system, and plume containment achieved by the extraction wells were reviewed.

Data that were reviewed include plume maps generated by CH2M Hill (EPA oversight contractor), data used to generate those plume maps, available monthly reports on the GOU by CDM Smith (January 2008 – December 2012), data (July 2010 – January 2012) and figures given to the review team during the site visit, the Revised Hydraulic Containment Technical Memorandum, the Extraction Well GS-1 Evaluation, Draft Emerging Compounds Evaluation Technical Memorandum, Final Remedial Investigation Work Plan, Final Site Characterization Technical Memorandum, and Results of Capture Modeling and Recommendations for Hydraulic Containment Monitoring.

A complete list of documents reviewed, with their sources, is shown in Appendix A.

6.4.1. Area 2 Groundwater Quality

The primary contaminants of concern (COCs) in Area 2 are TCE and PCE. The compounds chromium, 1,4-dioxane, 1,2,3-TCP, and perchlorate are considered emerging contaminants. Nitrate is also present in

groundwater. Plume maps or plotted extraction well data for these contaminants in Area 2 are shown in Figure 4 through Figure 15. Each plume map was constructed using the most recent data available from a well within that plume area from the period from January 2006 to July 2011. The plots were given to the review team during the site inspection. Appendix G contains additional summary information regarding VOC and chromium concentrations in extraction wells from January 2008 – December 2012. NDMA was also identified as an emerging contaminant in extraction well GS-1.

6.4.1.1 PCE and TCE

The PCE and TCE plumes in Area 2 have fluctuated in extent and concentration since the completion of the previous FYR. The fluctuations may have resulted from changing groundwater levels, migration of plumes, or changes in geochemical conditions in the aquifer; alternatively, they may reflect the incorporation of additional (or more recent) water quality data. Figure 4 through Figure 7 show the PCE and TCE plume maps for the Shallow and Deeper zones of Area 2. Over the last five years, PCE concentrations appear to be increasing in extraction wells GN-2 and GS-1 (Figure 8 and Figure 9). Over the last five years, TCE concentrations appear to be increasing in extraction well GN-3 and potentially in GS-3 as well (Figure 10 and Figure 11).

Results presented in the *Emerging Contaminants Evaluation* (ERM 2012) show PCE and TCE concentrations at levels above their respective MCLs in monitoring wells down-gradient of the GNOU and GSOU extraction wells. In particular, shallow monitoring well GS-P13 (screened at 30-50 feet bgs in the Shallow Zone) shows PCE and TCE concentrations of 5.1 µg/L and 81 µg/L, respectively. Also, PCE and TCE were detected at levels above the MCLs in shallow monitoring well GN-P11 (screened depth 60-80 feet bgs), which is across the Los Angeles River southwest of the Glendale Water Treatment Plant. The study also found that the migration inhibition remedial action objective is not being achieved, i.e. complete capture between wells GN-2 and GN-3 in the GNOU, and between all wells in the GSOU, is not being achieved. Due to the size of the data section in the *Emerging Contaminants Evaluation* document (over 1000 pages) EPA is unable to include the raw data as an appendix, although EPA is happy to furnish a copy of this report upon request.

6.4.1.2 Chromium

Generally, the chromium plumes (which are dominated by hexavalent chromium) have fluctuated in extent and concentrations. Figure 12 and Figure 13 show total chromium and hexavalent chromium plume maps for the Shallow Zone of Area 2. Total and hexavalent chromium have been detected in Shallow Zone monitoring wells down-gradient of the GNOU and GSOU extraction wells. Over the last five years, hexavalent chromium concentrations appear to be decreasing in extraction wells GN-2 and GS-3 (Figure 14 and Figure 15), but increasing in GN-3 (Figure 14). The current GOU facility does not treat for chromium, but wellhead chromium treatment by WBA at GS-3 and RCF at GN-3 were implemented in the last five years, though RCF operation has ceased because it was a demonstration scale pilot designed for research purposes. The WBA is still in operation because it can treat up to 400 gpm of water whereas the RCF was designed to treat 100 gpm of water. At this time the PRPs have voluntarily integrated the operation of the WBA into treatment facility operations.

6.4.1.3 Emerging Contaminants

Concentrations of 1, 4-dioxane are frequently detected at levels exceeding the CDPH notification level of 1 µg/L in Area 2 (Appendix H). 1,4-dioxane concentrations are not reported in the monthly progress reports for individual extraction wells or in the influent or effluent of the treatment plant. The treatment plant does not treat for 1,4-dioxane. Based on data received during the site inspection, from January 2009 to October 2012, 1,4-dioxane has been detected in extraction wells GS-1 and GS-2. Over that period, detected concentrations (16 samples, 5 non-detects) of 1,4-dioxane in GS-1 ranged from 1.5 to 2.6 µg/L, and averaged 2.05 µg/L, though there is no apparent trend. In GS-2, there was one detection (1.2 µg/L in the September 2012 sample) out of six samples.

Concentrations of 1, 2, 3-TCP have frequently been detected at levels exceeding the CDPH notification levels of 0.005 µg/L in Area 2. 1,2,3-TCP concentrations are not reported in the monthly progress reports for individual extraction wells or in the influent or effluent of the treatment plant. Based on data received during the site inspection, over the last five years, 1,2,3-TCP concentrations above the notification level have been detected in all extraction wells except GS-3 and GS-4. 1, 2, 3-TCP concentrations appear to be increasing in extraction wells GN-2 and GS-2, but decreasing in GS-1. The treatment plant effectively treats 1,2,3-TCP via the LPGAC treatment process, and 1,2,3-TCP is the primary driver for replacement of used LPGAC units with fresh GAC.

Perchlorate has been detected in some areas of the Shallow Zone of Area 2 at levels above the state MCL of 6 µg/L, though perchlorate concentrations are not reported in the monthly progress reports for individual extraction wells or in the influent or effluent of the treatment plant. Based on data received during the site inspection, perchlorate has been detected in extraction wells GN-3 and GS-4, though not above the state MCL.

Nitrate is present in Area 2 groundwater at levels in excess of the MCL (Appendix H, Figure 21). The presence of nitrate is speculated to occur as a result of past agricultural and sewage disposal practices in the SFV. Nitrate is not targeted for treatment as part of the GOU interim remedy. When elevated nitrate concentrations are present in groundwater produced by extraction wells or municipal water supply wells in Area 2, they are mitigated by blending with imported water from other sources. Blending, disinfection, and other routine municipal water treatment and delivery operations in Area 2 are performed by the City of Glendale. Nitrate concentrations above its MCL of 45 mg/L have been detected in several portions of the Shallow Zone in Area 2, and in the northwestern portion of the Deeper Zone.

More information about the emerging contaminants including concentrations detected and trends can be found in Appendix H.

6.4.1.4 Other VOCs

In addition to PCE and TCE, other VOCs are present in Area 2. 1,1-DCE was detected at a level above the state MCL of 6 µg/L in at least one sample each from extraction wells GN-2, GN-3, GS-1, and GS-2. 1,2-DCA was detected at a level above the state MCL of 0.5 µg/L in all 56 samples from extraction well GN-3. Carbon tetrachloride was detected at a level above the state MCL of 0.5 µg/L in numerous samples from extraction wells GN-1, GN-2, GN-3, GS-2, GS-3, and GS-4. Cis-1,2-DCE was detected at a level

above the state MCL of 6 µg/L in nearly all the samples from extraction wells GS-1 and GS-2. The treatment plant effectively treats these other VOCs to non-detect levels.

Appendix G summarizes the extraction well concentrations reported in the January 2008 to December 2012 monthly progress reports

6.4.1.5 NDMA

Prior to July 2007, NDMA concentrations in well GS-1 were generally below the CDPH notification level of 0.01 µg/L. NDMA concentrations increased substantially after July 2007, which coincided with a nitrification-denitrification process change at the Los Angeles-Glendale Water Reclamation Plant (LAGWRP). The treatment process change included the addition of a polymer that led to the formation of NDMA in the tertiary treated water present in the LAGWRP pond. In March 2012, the polymer dosing was reduced and, in May 2012, treated effluent was piped directly to the outfall to the Los Angeles River, bypassing the LAGWRP pond. NDMA concentrations in GS-1 decreased substantially in the following months, and were near or below the notification level about November 2012.

6.4.2. Groundwater Extraction and Treatment System

Approximately 29 billion gallons of groundwater have been extracted by the GOU wells and treated since 2000, roughly 10 billion gallons of which were extracted and treated from January 2008 to December 2012. In the last five years, monthly extracted volumes ranged from 285 to 712 acre feet (acre-ft), with a median of 650 acre-ft. Average flow rates in the treatment plant ranged from 2,150 to 5,226 gpm, with median and average flow rates of 4,831 gpm and 4,683 gpm, respectively. Monthly extraction volumes below roughly 550 acre-ft and average flow rates below roughly 4,100 gpm were generally a result of the GN-4 and GS-2 well rehabilitation activities in June 2009 and April– June 2011. Appendix I includes a plot of total monthly extracted volumes from 2008 – 2012; and average flow rates produce a similar plot. Considering down time for the GN-4 and GS-2 rehabilitations, an increase in flow rate on GS-3 resulting from the installation of WBA, and other variations in monthly extracted volumes from individual wells. Total extracted volumes and treatment plant flow rates have been reasonably consistent in the last five years.

Table 9 summarizes the contaminant concentrations measured in the treatment plant influent from 2008 – 2012. Of the contaminants sampled for, detected, and reported, only TCE, PCE, and carbon tetrachloride concentrations in the plant influent were found at levels above their respective MCLs.

Table 9. Summary of Plant Influent Contaminant Concentrations

Contaminant	Max	Min	Median	Average	Number of Samples	Number of Non-detects
TCE (µg/l)	151	68	96	98	58	0
PCE (µg/l)	140	26	72	73	58	0
Benzene (µg/l)	--	--	--	--	58	58
Carbon Tetrachloride (µg/l)	1.8	0.78	1.3	1.2	58	2
1,1-DCA (µg/l)	0.57	0.57	0.57	0.57	58	57
1,2-DCA(µg/l)	--	--	--	--	58	58
1,1-DCE (µg/l)	6	0.8	4	3.6	58	1
cis-1,2-DCE (µg/l)	3.5	0.55	2.7	2.6	58	1
trans-1,2-DCE (µg/l)	1.4	0.5	0.6	0.7	58	26
1,1,2-TCA (µg/l)	--	--	--	--	0	--
Xylenes (µg/l)	--	--	--	--	0	--
Total Chromium (µg/l)	--	--	--	--	0	--
Chromium VI (hexavalent) (µg/l)	--	--	--	--	0	--
Nitrate-N (mg/l as Nitrogen)	--	--	--	--	0	--

From 2008 – 2012, VOC concentrations in the treatment system effluent have been nondetect, and have been so since the beginning of operations. During that period, an estimated 18,400 lbs of VOCs have been removed. Monthly estimated VOC removal ranged from 149.1 to 444.1 lbs with a median of 314 pounds. Estimated monthly VOC removals of less than 235 lbs were a result of GN-4 rehabilitation activities in June 2009. Figure 16 shows a plot of estimated monthly VOC removal from 2008 – 2012. Approximately 42,700 lbs of VOCs have been removed since 2000. Considering down time for the GN-4 rehabilitation and variations in extraction rates from individual wells, estimated monthly VOC removal has been slowly increasing over the past five (and more) years.

Figure 16. Estimated Monthly VOC Removal from 2008 – 2012

Over the last five years, effluent hexavalent chromium concentrations have ranged from 3.3 to 11 µg/L (Figure 17) and averaged 7.8 µg/L.

Nitrate has not been sampled in the effluent in the last five years.

Figure 17. Hexavalent Chromium in Treatment Plant Effluent from 2008 – 2012 (See Table 4 for an explanation on the difference between Targeted Delivery Limit -11 µg/L, and RWQCB Discharge Limit -8 µg/L).

6.4.3. Containment of Contaminated Groundwater

In October 2012, Environmental Resources Management (ERM) submitted a revised draft hydraulic containment technical memorandum for the Glendale Respondents Group with the results of a hydraulic containment study pursuant to the Focused Feasibility Study Statement of Work, developed by the EPA (ERM 2012). The results of this study show that complete containment is not being achieved in the GNOU or the GSOU.

The *Hydraulic Containment Technical Memorandum* (ERM 2010) evaluated empirical potentiometric data, empirical water quality data, trend analyses, and analytical hydraulic containment calculations (i.e., groundwater flux and capture zone widths via particle tracking) to assess the degree of hydraulic capture. The report demonstrates based on all available data, that full hydraulic containment of the VOC plume for both the GNOU and GSOU is not being achieved. The data also shows that, at recent pumping rates, containment gaps exist between extraction wells GN-2 and GN-3 (Figure 18), and among all GSOU wells (Figure 19). Figures 30 and 31 were created by ERM based on the GOU FFS groundwater model utilizing PATH3D and MODFLOW.

Figure 18. GNOU Hydraulic Containment Simulation at Recent Pumping Rates

Figure 19. GSOU Hydraulic Containment Simulation at Recent Pumping Rates

6.5. Site Inspection

The GOU was inspected on Thursday, February 28, 2013. Charles Cron (CDM Smith, Lead O&M Specialist) guided the inspection. Attendees included Daniel Hutton (CDM Smith, Project Manager), ZiZi Searles (EPA, Remedial Project Manager), Leo Chan (City of Glendale Water and Power, Project Engineer), Karen Meade (CH2M Hill, Project Manager), David Sullivan (USACE, Geologist), and Aaron King (USACE, Environmental Engineer). The group met at the Glendale Water Treatment Plant. There, Mr. Cron described the operations of the air stripping and GAC treatment system and answered questions. All treatment facility components appeared to be in good condition and operating as desired. Required site documents were well organized. Both chemical feed rooms (sodium hypochlorite and blended polyphosphate) were clean and ventilated. CDM Smith appears to be very proactive when it comes to maintaining and optimizing the treatment system.

Mr. Cron then led the group on a tour of the extraction wells, beginning with extraction well GN-3 and the full-scale RCF system. Mr. Cron described the RCF process and answered questions. The RCF process was shut down in July 2012. The RCF was an automated 100-gpm process that worked very well if the hexavalent chromium goal is 5 µg/L. A smaller pilot-scale system using zero-valent iron was also on site. Then, the group traveled to the DreamWorks property, located extraction wells GN-1, GN-2, and GN-4 and inspected GN-4. Extraction well GN-4 and its vault appeared to be in good condition and operating as desired. The group then toured the GSOU extraction wells, stopping at GS-1 near the LAGWRP facility and at GS-3. Well GS-1 appeared to be in good condition. GS-1 has greater sampling requirements than the other extraction wells due to its proximity to the Los Angeles River and the NDMA detections. The WBA well-head treatment on GS-3, which treats 425 gpm, also appeared to be in good condition and operating as desired. Formaldehyde leaches from resin on startup flushing, so three large tanks are kept on site for storage and biological treatment. Resin disposal has been another issue; in addition to chromium, the resin also removes uranium (this is an unintended consequence; uranium is not a COC).

The completed Site Inspection Checklist is given in Appendix D. Site inspection photographs are provided in Appendix E.

6.6. Interviews

During the FYR process, interviews were conducted with parties impacted by the Site, including the current OU operators and regulatory agencies involved in Site activities or aware of the Site. The purpose of the interviews was to document the perceived status of the Site and any perceived problems or successes with the phases of the remedy that have been implemented to date. All of the interviews were conducted during the Site visit between February 26 and February 28, 2013. Interviews are summarized below and completed interview forms are included in Appendix C.

Charles Cron, Lead O&M Specialist, CDM Smith; and Daniel Hutton, Project Manager, CDM Smith (O&M contractor); 28 February, 2013. Mr. Cron and Mr. Hutton both agreed that the system was well-designed, is flexible, is adaptable to changing water quality regulations, and had been consistently operable and able to meet extraction and water quality requirements. There have not been problems with

access controls or the construction of the remedy. There have been no O&M problems in the last five years. The only unusual issues were with the WBA; specifically with formaldehyde leaching from new resin and with resin disposal because the resin also removes uranium.

Leighton Fong, Civil Engineer, City of Glendale Water and Power; and Leo Chan, Project Engineer, City of Glendale Water and Power; 28 February, 2013. Mr. Fong and Mr. Chan both agreed that the project is well-run; that CDM and GRG are supportive and go beyond the call of duty, and take ownership and pride in their work. The remedy is achieving the desired mass removal rates and the desired extraction rates, but there might be some leakage (regarding containment). There have not been problems with access controls or the construction of the remedy. O&M issues include: 1) sometimes wells trip (shut off due to low voltage), go offline, and sound a general alarm; to address this, CDM put electrical monitoring instruments on some of the wells; and 2) metering to air strippers failed causing a temporary shutdown until the meters were replaced within a month, but this is not unexpected since the equipment is old, so it tends to fail. Some successes with system O&M include splitting of the influent pipeline and improved reliability of the chlorine injection system. LPGAC regeneration is being considered.

Karen Meade, Project Manager, CH2M Hill (EPA oversight contractor), 28 February 2013. Ms. Meade felt the project has been impressive; the City and CDM are very proactive, and GRG seems fairly proactive and supportive of current operations. There have not been problems with access controls or the construction of the remedy. Problems with system operations/O&M include: 1) particle tracking in the Hydraulic Containment Technical Memorandum shows escape from north and south wells, even when all wells are operating, and the alternatives shown in the same memorandum still do not show complete capture; 2) PCE and TCE concentrations are above the MCL down-gradient of the south extraction wells; 3) well GN-P11 on the other side of the Los Angeles River has relatively high concentrations of PCE and TCE, so there is a question regarding new sources or sources not completely defined. Successes include waste minimization during well rehabilitation and carbon regeneration on-site.

Thomas Tsui, Associate Sanitary Engineer, CDPH; and Chi Diep, Senior Sanitary Engineer, CDPH; 27 February 2013. Mr. Tsui and Mr. Diep noted that the GOU runs better than other OUs; it's newer, and it benefited from experience of other OUs. It's easy to oversee, and it's well covered from the permit point of view. There have not been problems with access controls or the construction of the remedy. The system runs well most of the time; the only issue has been with NDMA in GS-1. Identifying the source was a problem, and there was some concern about the drinking water quality from GS-1 prior to the decommissioning of the LAGWRP detention pond. There was also a malfunction of a magnetic flow meter in the air stripping tower. It's old equipment (more than 10 years old). The extraction wells need attention to keep from failing; some wells have to be rehabilitated quite often. A current project to split the influent pipeline may change O&M procedures, but will save money and time and allow the treatment system to operate while wells are rehabilitated. Research has been completed to evaluate different hexavalent chromium treatment technologies. The only unusual issue is that, often during well rehabilitation, bacteria problems occur and take time to flush out. The sources of bacteria and E. coli aren't known, though they don't often get E. coli detections.

Larry Moore, Staff Environmental Scientist, Los Angeles RWQCB; and Alex Lapolstol, Technical Consultant, E2 Consulting Engineers; 26 February 2013. The discussion covered SFV Areas 1 and 2. Mr. Moore and Mr. Lapolstol felt that, overall, the projects are a positive thing; the only unfortunate aspect being that it takes longer than they would like to do things. However, it is a slow process. It is difficult to contain plumes the way the remedy has been operated. For the GOU, PCE, TCE, total chromium, and hexavalent chromium have been found down-gradient of well GS-3. The characterization of the GOU is insufficient. Part of the plume has gone off-site of the Excelllo facility [the Excelllo Plating Company, located about 1 mile SSE of the treatment plant, and about 100 yards from extraction well GS-3]. There have not been problems with access controls or the construction of the remedies.

Richard Slade, ULARA Watermaster; and Anthony Hicke, Assistant to the Watermaster; 28 February 2013. The discussion covered SFV Areas 1 and 2. Mr. Slade and Mr. Hicke noted that the plumes are still there and have spread more. It seems like the people involved never want to commit to anything without more data, delaying cleanup. COCs are contaminating new wells [wells not specified]. The groundwater model needs updating. The project has been frustrating because things in all OUs take too long. The remedy has not performed as expected. The plumes are as big as or bigger than they were twenty years ago. Production has moved "stuff" around. But something is better than nothing. Improvement is needed, sooner rather than later. The hydrogeology is not well defined or understood. There have not been problems with access controls or the construction of the remedies.

Tedd Yargeau, Senior Scientist, Department of Toxic Substances Control (DTSC); 6 May 2013. The discussion covered SFV Areas 1 and 2. Mr. Yargeau felt that the remedy was functioning as expected and noted that all of the remedies appear to be head in the right direction and that the projects are a positive for the SFV. Contaminant levels appear to be decreasing. DTSC does not deal directly with O&M, but is aware of EPA's O&M oversight activities. DTSC feels that EPA has done a good job managing a complex site.

6.7. Institutional Controls

There are no specifically tailored institutional control (IC) instruments in place within Area 2, although there is an effective governmental control in place to assist with the prevention of contaminated groundwater. The primary governmental control is the 1979 Final Judgment in *Los Angeles v. San Fernando*, (Superior Court Case No. 650079) (*LA v. San Fernando*). The 1979 Final Judgment in *LA v. San Fernando* upheld the Pueblo Right of the City of Los Angeles to all groundwater in the ULARA Basin from precipitation within the ULARA and all surface and groundwater flows from the Sylmar and Verdugo Basins. 14 Cal. 3d 199 (1975). *LA v. San Fernando* also established the water rights of the cities of Los Angeles, Glendale, and Burbank to all water imported from outside the Basin and either spread or delivered within the Basin. With the exception of a few legacy entities including a few cemeteries and a hotel, only the Cities that are party to the Judgment have the authority to extract groundwater from the basin.

The Final Judgment created the entity known as "Watermaster" with full authority to administer the adjudication, under the auspices of the Superior Court. Under the final judgment in *LA v. San Fernando*, with the exception of certain minor historical water rights holders, only the cities of Los Angeles,

Burbank, and Glendale are permitted to extract groundwater from the Basin. Each of these municipalities administers a public water system, which is regulated by the California Department of Public Health (CDPH).

Governmental controls on the use of groundwater as drinking water include EPA and State of California-promulgated MCLs and California State Action Levels that require drinking water standards to be met before delivery of the treated water to the potable water supply. These drinking water controls and the Watermaster's authority to regulate and allocate water resources eliminate unregulated use of area groundwater; therefore, the interim remedies are currently protective of human health.

7. Technical Assessment

7.1. *Question A: Is the remedy functioning as intended by the decision documents?*

Remedial Action Performance

The remedy is functioning as intended by the decision documents. The median and average treatment facility flow rates over the last five years are 4,831 gpm and 4,683 gpm, respectively, both of which are below the design flow rate of 5,000 gpm. The remedial action continues to provide water to the City of Glendale that meets all water quality requirements, including primary drinking water quality standards. As of late, though, the treatment system has been more consistently meeting the design flow rate. Excluding the three months when GS-2 rehabilitation was occurring (April – June 2011), the average flow rate has been greater than 5,000 gpm in 17 of the last 36 months.

The remedial action objective calling for inhibition of contaminant migration is not being met. EPA interprets the phrase “inhibition” to mean full hydraulic control of contaminated groundwater. The *Hydraulic Containment Technical Memorandum* (summarized in Section 6.4.3) provides evidence that complete capture is not achieved in either the GNOU or the GSOU. EPA is taking action to ensure that the remedy fully contains contaminated groundwater.

System Operations/O&M

Current operating procedures, as implemented, are sufficient to maintain the current level of effectiveness of the treatment system. O&M costs have slowly risen over time, in an expected and reasonable manner. Large, unexpected variances in costs have not occurred, and are not anticipated.

Opportunities for System Optimization

- Optimizing the treatment facilities sampling requirements.
- LPGAC regeneration
- Installation of an additional extraction well(s) to achieve 100% capture

Early Indicators of Potential Issues

Equipment breakdowns have been infrequent and not unexpected. The plant operator, CDM, is proactive in their approach to maintenance.

The publication of the draft MCL for hexavalent chromium and preliminary findings of the GCOU RI/FS indicate that the current GSOU and GNOU interim remedy may be inadequate to meet the goals of maintaining capture and containment for a drinking water end use at some point in the near future.

Implementation of Institutional Controls and Other Measures

There are no specifically tailored institutional control (IC) instruments in place within Area 2. However, the governmental controls in place at the site are effective in preventing exposure to contaminated groundwater.

7.2. Question B: Are the exposure assumptions, Toxicity Data, Cleanup Levels, and Remedial Action Objectives (RAOs) Used at the Time of Remedy Selection Still Valid?

Exposure assumptions and RAOs used at the time of remedy selection are still valid. Toxicity data for some VOCs have changed, but this does not affect the protectiveness of the remedy because treated water is non-detect for VOCs. Cleanup levels were not established at the time of remedy selection. No ARARs have changed in a way that would affect the protectiveness of the remedy. However, the recently released draft MCL of 10 µg/L for hexavalent chromium) may affect the duration of the remedy and/or the treatment technology being used if the current system cannot treat hexavalent chromium to the required level. Groundwater modeling and contaminant concentrations in wells downgradient of the GCOU show that full containment is not being achieved and suggests some contamination is migrating past capture zone in the GSOU.

Changes in Standards and TBCs

There have been no changes to ARARs identified in the ROD that affect the protectiveness of the remedy. The 1,4-dioxane notification level changed from 3 to 1 µg; the treatment system does not treat for 1,4-dioxane. Concentrations of 1,4-dioxane in extraction wells GS-1 and GS-2 exceeded the notification level at least once from January 2009 to October 2012; plant influent and effluent data for 1,4-dioxane were unavailable. The proposed MCL of 10 µg/L for hexavalent chromium may affect the duration of the remedy and the treatment technology being used if the treatment technology can not treat hexavalent chromium to at or below to the draft level.

Changes in Exposure Pathways

The exposure pathways evaluated in the RI have not changed, but the vapor intrusion pathway for contaminant migration has not been evaluated. New ecological routes of exposure have not been identified.

No new contaminants of concern have been identified; EPA has been aware of emerging contaminants such as hexavalent chromium, 1,4-dioxane, 1,2,3-TCP, and NDMA. The primary source of the NDMA in GS-1 was determined to be the upgradient LAGWRP pond. Discontinued use and pond draining and during the later part of 2012 has led to substantially lower NDMA concentrations in GS-1.

Formaldehyde is leached from resin during startup of the WBA process, and is being treated by microbial action in storage tanks; alternative resins are being investigated. The resin also removes uranium from the groundwater, creating a waste handling issue when it is time to dispose of the resin. Because of the manner in which these unanticipated WBA byproducts are handled, protectiveness is not affected. Physical site conditions or the understanding of these conditions has not changed.

Changes in Toxicity and Other Contaminant Characteristics

Toxicity factors for TCE, PCE, 1,4-dioxane, methylene chloride, carbon tetrachloride, cis-1,2-DCE, and 1,2,3-TCP have changed in the last five years. However, VOCs are treated to non-detect levels at the treatment system. The current GOU LPGAC vessels are used to ensure that 1,2,3-TCP does not increase to a concentration above the CDPH notification level. Other contaminant characteristics have not changed in a way that could affect the protectiveness of the remedy. Also, cleanup levels for groundwater were not selected for this site.

Changes in Risk Assessment Methods

Standardized risk assessment methodologies have not changed in a way that could affect the protectiveness of the remedies.

Expected Progress Towards Meeting RAOs

The remedy is partially meeting the RAOs set forth in the 1993 GNOU and GSOU RODs in substantial VOC contaminant mass has been removed from the shallow zone of the aquifer in and around the GNOU and GSOU wellfields. However, the remedy is not fully capturing and containing groundwater contamination. Groundwater model particle tracking and downgradient VOC and metals concentrations indicate that groundwater contaminants in the North and South Plumes are not completely captured, so contaminant migration is not inhibited. The installation of additional extraction well(s) is needed to fully achieve plume capture and containment.

7.3. Question C: Has Any Other Information Come to Light That Could Call Into Question the Protectiveness of the Remedy?

No other information has come to light which could affect the protectiveness of the remedy. There are no newly identified ecological risks. There have been no impacts from natural disasters.

7.4. Technical Assessment Summary

The extraction and treatment systems are functioning as intended by the decision documents. The remedial action continues to provide water to the City of Glendale that meets all water quality

requirements. Partial inhibition of migration is being achieved, although groundwater model particle tracking and contaminant concentrations in wells downgradient of the GSOU show that complete containment is not being achieved.

Groundwater model particle tracking results indicate that contamination is escaping between wells the GNOU and GSOU. To mitigate the escape of contamination the installation of a new extraction well in the GSOU between well GS-2 and GS-3 was proposed. EPA is working to implement the aforementioned improvements and to address areas where only partial hydraulic containment is being achieved through the installation of additional extraction wells.

Treatment plant operating procedures, as implemented, are sufficient to maintain the current level of effectiveness of that system. O&M costs are within expected norms. The plant is actively managed to improve and, where possible, optimize system operations and reduce costs. Governmental controls in place at the site are effective in preventing exposure to contaminated groundwater. There have been no changes in ARARs that would affect the protectiveness of the remedy. Regional groundwater vapor intrusion has not yet been evaluated, but may be a viable exposure pathway in Area 2. CDPH released a proposed MCL of 10 µg/L for hexavalent chromium in the August 2013 that may affect the duration of the remedy and/or the treatment technology being used if the current system cannot treat hexavalent chromium to the required level.

8. Issues

Table 10 summarizes the current issues for the San Fernando Valley Area 2 Site.

Table 10. Current Issues for the San Fernando Valley Area 2 Site

Issue	Affects Current Protectiveness (Yes or No)	Affects Future Protectiveness (Yes or No)
1. The regional groundwater vapor intrusion pathway has not been evaluated for the Area 2 Site.	Yes*	Yes
2. The remedy is not fully capturing and containing groundwater contamination.	No	Yes

* The Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database only accepts “Yes” or “No” entries regarding whether an issue affects current or future protectiveness. However, this protectiveness determination has been deferred because there is not enough information to make the determination. For the purposes of the CERCLIS database, a “defer” determination is equivalent to “yes” entry.

9. Recommendations and Follow-up Actions

Table 11 provides recommendations to address the current issues at the San Fernando Valley Area 2 Site.

Table 11. Recommendations to Address Current Issues at the San Fernando Valley Area 2 Site

Issue	Recommendations/ Follow-Up Actions	Party Responsible	Oversight Agency	Milestone Date	Affects Protectiveness? (Yes or No)	
					Current	Future
1	Complete an evaluation of the regional groundwater vapor intrusion pathway for the San Fernando Valley Superfund Sites.	EPA	EPA	09/2018	Yes*	Yes
2	Evaluate installation and operation of new wells to achieve plume capture and containment.	EPA	EPA	09/2016	No	Yes

* The CERCLIS database only accepts “Yes” or “No” entries regarding whether an issue affects current or future protectiveness. However, this protectiveness determination has been deferred because there is not enough information to make the determination. For the purposes of the CERCLIS database, a “defer” determination is equivalent to “yes” entry.

In addition, the following recommendations that may improve effectiveness of the remedy but do not affect current or future protectiveness were identified during the Five-Year Review:

- Involvement of the ULARA Watermaster as often as practicable in evaluation of current remedies and future designs should be explored.
- PCE and TCE were detected at levels above the MCLs in shallow monitoring well GN-P11, which is across the Los Angeles River southwest of the Glendale Water Treatment Plant. The nature and extent of contamination across the Los Angeles River in the GNOU should be more fully characterized.
- CDPH released a draft MCL of 10 µg/L in August 2013. Relevant parties should continue to monitor the situation and continue reasonable preparations to achieve the new hexavalent chromium MCL.

11. Protectiveness Statement

GNOU

A protectiveness determination of the remedy for the GNOU cannot be made at this time until further information is obtained. Further information will be obtained by evaluating the regional groundwater vapor intrusion pathway in Area 2. It is expected that a vapor intrusion investigation will take approximately five years, at which time a protectiveness determination will be made. In addition, to be protective in the long term, complete hydraulic capture of the plume must be established.

GSOU

A protectiveness determination of the remedy for the GSOU cannot be made at this time until further information is obtained. Further information will be obtained by evaluating the regional groundwater vapor intrusion pathway in Area 2. It is expected that a vapor intrusion investigation will take approximately five years, at which time a protectiveness determination will be made. In addition, to be protective in the long term, complete hydraulic capture of the plume must be established.

12. Next Five Year Review

This is a statutory Site that requires ongoing Five Year Reviews as long as waste is left on site that does not allow for unlimited use and unrestricted exposure. The next Five Year Reviews will be due within five years of the signature date of this FYR.

Appendix B: Press Notices

[This page is intentionally blank]

Press Notice

Public Notice
The United States Environmental Protection Agency (EPA)
Start of Five-Year Review of Groundwater Cleanup
San Fernando Valley Superfund Sites (Areas 1 and 2)

The EPA has begun the Second Five-Year Review (FYR) process for cleanup actions undertaken at the San Fernando Valley Superfund Sites (SFV Sites) for Areas 1 and 2. Area 1 includes North Hollywood and Burbank Operable Units (OUs). Area 2 includes Glendale North and South OUs, and the Glendale Chromium OU. EPA often addresses clean-up at a large site by breaking the site into small operable units (OUs) to manage cleanup actions. This notice addresses the FYRs for Areas 1 (North Hollywood and Burbank OUs) and 2 (Glendale North and South OUs). Upon completion of the review EPA will issue two separate reports that evaluate whether the cleanup actions for Areas 1 and 2 remain protective of human health and the environment.

The Review Process: When EPA's cleanup action leaves some waste in place or the action will take longer than five years to complete, the Superfund law requires an evaluation of the protectiveness of the cleanup systems every five years until the site has been cleaned up sufficiently to allow unrestricted use. The purpose of the FYR is to publically document the effectiveness of cleanup systems and to measure progress towards achieving cleanup goals. FYRs consist of evaluating the effectiveness of clean-up in both the short and long-term, facility inspections, and the analysis of 2008-2013 groundwater data. The FYR will report the amount of contaminant mass being removed by groundwater treatment facilities, evidence of natural processes that may assist with the breakdown of chemicals, cleanup progress within the Superfund sites, and treatment facility operations. This review also includes interviews with regulators, government officials, and community representatives. To date, previous FYR reviews conducted for Areas 1 and 2 have shown the clean-up systems to be protective of human health and the environment. The 2013 FYRs will comment on the status of 2008 recommendations and offer new recommendations if necessary. The 2008 FYR for Areas 1 and 2 are available on EPA's web page and at the information repositories listed below. Both 2013 FYR reports will be completed by September 30, 2013 and copies will be made available to the public via the websites.

Community Involvement: EPA invites the community to learn more about the Sites, the FYR review process and provide input to EPA. Interviewees can contact Jackie Lane, Community Involvement Coordinator **no later than July 31, 2013** at (415) 972-3236 or by email at lane.jackie@epa.gov to be interviewed.

Information and Repositories: **Area 1:** Burbank Public Library, 110 North Glen Oaks Blvd, Burbank, CA or call (818) 238-5580 and Los Angeles Public Library, 630 W. Fifth St., Los Angeles CA 90071 or call (213) 228-7000. **Area 2:** City of Glendale Public Library, 222 East Harvard St. Glendale, CA or call (818) 548-2021 and Los Angeles Public Library, 630 W. Fifth St., Los Angeles CA 90071 or call (213) 228-7000.

Interview Forms

Five-Year Review Interview Record			
Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	GOU Treatment Facility		
Date:	2/28/2013	Time:	10:00 AM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Charles Cron	Title:	Lead O&M Specialist
Telephone:	(818) 550-5975	Address:	800 Flower St Glendale, CA 91201
Name:	Daniel Hutton	Title:	Project Manager
Telephone:	(909) 579-3500	Address:	9220 Cleveland Ave, Suite 100 Rancho Cucamonga, CA 91730
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The designers of the system did a great job. The system is flexible, even with changing water quality regulations. The system has consistently been able to operate and meet extraction and water quality requirements.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>Mr. Cron is the site manager and Mr. Hutton is the project manager; both ensure compliance while minimizing water loss.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>There are multiple points of communication every day, whether between Charles, Dan, Leo, and/or EPA. Also, there are monthly stakeholder meetings.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>No.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>Somehow, the Glendale Police Department has received three 911 calls from the site that are not alarm triggered. It is not known why or how this occurs. All responses by local authorities have been false alarms.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>Yes. The remedy is performing better than expected with respect to mass removal and extraction rates. CDPH's flexibility has been very encouraging.</p>			

7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

Trend charts show several COC concentrations, including VOCs and chromium, are climbing in some wells, in accordance with predictions.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

There are operators on-site 8 hours per day, 7 days per week, daily inspections, and 24/7 remote monitoring.

9) What are the annual O&M costs for your organization's involvement at the site?

Funding has not been an issue for justifiable expenses. Roughly \$4.3 million is budgeted for the coming year.

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

Nothing in the last five years, excluding the WBA. And the uranium disposal issue.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

Resin disposal has been an unexpected difficulty because of the uranium content of the spent resin (uranium originates in the groundwater and the resin removes it from the groundwater). Also, formaldehyde has been found to leach from the resin on startup, so a system to contain and treat the water used during startup has been implemented.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

Plant and process optimization occurred years ago. CDPH is open to reducing sampling.

13) What effects have site operations had on the surrounding community?

The plant provides 25% of the City's water supply, and the water meets drinking water standards.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

No.

15) Do you feel well informed about the site's activities and progress?

Yes.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

CDM is keeping an eye on the chromium MCL development, but also EPA's carcinogenic VOC rule.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No. The desires and expectations of all parties are being met. The cooperativeness of all parties makes it much easier.

Five-Year Review Interview Record			
Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	City of Glendale Water and Power Office		
Date:	2/28/2013	Time:	1:00 PM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Leighton Fong	Title:	Civil Engineer II
		Organization:	City of Glendale Water and Power
Telephone:	(818) 548-3982	Address:	141 N Glendale Ave, Level 4 Glendale, CA 91206
Name:	Leo Chan	Title:	Project Engineer
		Organization:	City of Glendale Water and Power
Telephone:	(818) 548-3905	Address:	141 N Glendale Ave, Level 4 Glendale, CA 91206
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The project is well-run. CDM and GRG are supportive and go beyond the call of duty; and they take ownership and pride in their work.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>City owns the operable unit, oversees plant operation, and reports to CDPH, EPA, etc. Also, the City is in charge of permitting, disposal, manifesting, and invoice review. They have a focus on water loss prevention.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>GWP talks to Charles at least every other day, and receives daily status reports by e-mail and monthly reports.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>The Bureau of Sanitation wanted to split a sample of the industrial waste discharge from GS-3 (formaldehyde), but was not notified when the last sample was taken.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>There has been no vandalism. Someone broke into the control panel at extraction well GS-3, but nothing was taken or broken.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>The remedy is getting mass removal and the desired extraction rates, but there might be some leakage (regarding containment).</p> <p>7) What does the monitoring data show? Are there any trends that show</p>			

contaminant levels are decreasing?

VOCs remain steady. Chromium concentrations are declining in GS-3 and increasing in GN-3.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

Charles and his staff are very conscientious and stable. They are very responsible and on top of problems.

9) What are the annual O&M costs for your organization's involvement at the site?

To be given at a later date. GRG pays for the O&M; all justified costs are fine.

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

Sometimes, the wells will trip (under voltage), go offline, and sound a general alarm. CDM put electrical monitoring on some of the wells.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

Metering to the packed towers failed causing a temporary shutdown. The meters were replaced within a month. Nothing unexpected; the equipment is old, so it tends to fail.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

The influent splitter pipe is a positive change. LPGAC regeneration is being considered. They have improved the reliability of the chlorine injection.

13) What effects have site operations had on the surrounding community?

With the WBA at GS-3, they had to add a sound blanket because of complaints about the noise. There have not been any new complaints.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

No.

15) Do you feel well informed about the site's activities and progress?

Yes. The monthly stakeholder meetings keep GWP well informed.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

NPDES is an ongoing issue for discharging well-rehab water.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

EPA is working on remedy optimization, and there is uncertainty regarding the new remedy.

Five-Year Review Interview Record			
Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	Restaurant near GWP Offices		
Date:	2/28/2013	Time:	2:45 PM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Karen Meade	Title:	Project Manager
		Organization:	CH2M Hill
Telephone:	(714) 429-2000	Address:	6 Hutton Centre Drive, Suite 700 Santa Ana, CA 92707
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The project has been impressive. The City and CDM are very proactive and aware of requirements. Monthly meetings are effective. GRG seems fairly proactive, and supportive of current operations, and there have been no budget issues.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>CH2M Hill is EPA's contractor to provide oversight of ongoing remedial work.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>CH2M Hill attends the monthly meetings. Weekly site inspections were performed during the construction and startup of the WBA and RCF facilities.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>No.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>As Charles talked about...</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>Work to date has helped inhibit migration and mass removal; containment could be better. GS-3 is not getting capture. Particle tracking in the Hydraulic Containment Technical Memorandum shows escape from north and south wells, even when all wells are operating. The alternatives shown in the same memorandum still do not show complete capture. It would be better to look at it as one OU rather than two. It is functioning as expected, but there is room for improvement, and doesn't believe there is complete containment.</p> <p>7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?</p>			

Capture doesn't appear to have been achieved or there was a loss of capture due to GS-3 down time. PCE and TCE concentrations are above the MCL down-gradient of the south extraction wells. Down-gradient well GS-P13 (screen depth 30-50 feet) has high PCE and TCE concentrations, whereas down-gradient wells GS-P4 and GS-P5 (screened depth is deeper at approximately 100 feet) have low concentrations of PCE and TCE. Also, GN-P11 on the other side of the LA River has relatively high concentrations of PCE and TCE, which might be from a different source, so there is a question regarding new sources or sources not completely defined.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

N/A

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

The Draft O&M Manual for WBA has not been integrated to the Site O&M Manual.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

As Charles said earlier, plus resin issues at the WBA, but it's being worked on. Looking at re-activated carbon use. Should look at other resins that don't produce the formaldehyde issue.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

Waste minimization during well rehabilitation; carbon regeneration on-site

13) What effects have site operations had on the surrounding community?

There was a noise issue at the WBA, but it was addressed through the use of noise attenuation blankets.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

No.

15) Do you feel well informed about the site's activities and progress?

Yes.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

Only the chromium MCL to be released in the summer.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No. Charles is very proactive on permitting and other issues.

ive-Year Review Interview Record			
Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	CDPH Office		
Date:	2/27/2013	Time:	3:40 PM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
Organization:	USEPA USACE USACE		
Individuals Contacted			
Name:	Thomas Tsui	Title:	Associate Sanitary Engineer
Organization:	CDPH		
Telephone:	(818) 551-2036	Address:	500 N Central Ave, Suite 500 Glendale, CA 91203
Name:	Chi Diep	Title:	Senior Sanitary Engineer
Organization:	CDPH		
Telephone:	(818) 551-2039	Address:	500 N Central Ave, Suite 500 Glendale, CA 91203
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>It runs better than other OUs, it's newer, and so it benefited from experience of other OUs. It's easy to oversee, and it's well covered from the permit point of view.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>To ensure potable water produced by the site meets standards and policy requirements for impaired sources. Review reports, be involved in future design changes, and to evaluate hexavalent chromium treatment.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>Gets monthly reports, sampling reports, and does an inspection every 3 years. 2010 was the last inspection - nothing unique noted.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>99.5% of the time it runs good. Only issue has been with NDMA in GS-1. Identifying the source was a problem, and there was some concern about the drinking water quality from GS-1 prior to the decommissioning of the LAGWRP detention pond. There was also a malfunction of a mag meter in the air stripping tower. It's old equipment, more than 10 years old. The extraction wells need attention to keep from failing. They have to rehab some wells every year, but others not as often.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>There are occasional access issues with DreamWorks, but otherwise, there are no issues. The site is secure.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>Remedy functions as expected; it meets expectations and treatment goals, and there haven't been any violations.</p> <p>7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?</p>			

There aren't any decreasing trends; it's pretty steady, though hexavalent chromium is increasing a little.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

Yes. Personnel are there every day and there is a SCADA system.

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

No, but there is project coming up that requires separation of a pipeline that may change O&M procedures. GOU wells in general are only 200 feet deep, so when they do the rehabs, per industry standards, they often get bacteria problems that take time to flush out. The sources of bacteria and E. coli aren't known, though they don't often get E. coli hits.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

The only thing has been the mag meter in the tower. It took 4-7 days to change.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

The pipeline separation project will be a money and time saving improvement. There's also the hex chrome research.

13) What effects have site operations had on the surrounding community?

Some residents have complained of noise near the WBA wellhead treatment. The OU put sound blankets up in response.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

An elected official has voiced desire to have CDPH attend board meetings of the LA county board of supervisors, regarding hex chrome, but they haven't done that yet.

15) Do you feel well informed about the site's activities and progress?

Yes. City of Glendale has gone through significant personnel changes lately, so the contacts aren't as tight as they used to be.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

The only thing is the upcoming hexavalent chromium MCL. That, and the reduction in the 1,4 dioxane NL.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

It runs well, but there's always room for improvement, but nothing in particular. GRG and CDM have been responsive and CDPH appreciates EPA's involvement with GS-1. Overall, a great team effort.

Five-Year Review Interview Record			
Site:	San Fernando Valley Areas 1 and 2 Superfund Sites		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	Los Angeles Regional Water Quality Control Board Office		
Date:	2/26/2013	Time:	3:00 PM

		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Larry Moore	Title:	Staff Environmental Scientist
		Organization:	Los Angeles RWQCB
Telephone:	(213) 576-6730	Address:	320 W 4th Street Suite 200 Los Angeles, CA 90013
Name:	Alex Lapolstol	Title:	Technical Consultant
		Organization:	E2 Consulting Engineers
Telephone:	(213) 576-6801	Address:	320 W 4th Street Suite 200 Los Angeles, CA 90013
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>It's a positive project; the only unfortunate thing being that it takes longer than they would like to do things. However, it is a slow process because of due process.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>RWQCB works to identify PRPs, and make sure PRPs are in compliance and responsible. Mr. Moore works as a state employee on site cleanup with an emphasis on chromium, but is still involved with VOCs. Mr. Lapolstol provides support on behalf of EPA to identify chromium PRPs (though in some cases VOCs and chromium overlap), fulfill EPA information needs, and assist the state in enforcing the water code.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>RWQCB conducts site inspections, reviews work plans, completes chemical use questionnaires from PRPs, and oversees the cleanup process. EPA provides concurrence with cleanup levels. Mr. Lapolstol is the "eyes and ears" of EPA so that EPA isn't surprised by what the RWQCB is doing.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>There have been no public complaints, and no PRP complaints that have required a response. Glendale, Burbank, and LADWP complain about the slow pace of investigations and response times of EPA and RWQCB. PRPs complain about paying for cleanup.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>No, though residents near the former Excelllo plating facility admitted to trespassing and rolling around in the dirt when the facility was still operational, but that did not occur in the last five years.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p>			

For the NHO, EPA has spent lots of money on the remedy, but unless LADWP uses appropriate pumping rates, it's a moot point; they're just spreading contamination around. It is difficult to contain plumes the way the remedy has been operated. For the GOU, PCE, TCE, total chromium, and hexavalent chromium have been found down gradient of GS-3. The characterization of the GOU is insufficient. Part of the plume has gone off-site of the Excella facility.

7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

The BOU has not been completely assessed in regard to chromium. Honeywell (NHO) has been remediating an on-site source by injecting calcium polysulfide, and has been seeing reductions in off-site wells. Decreasing chromium concentrations have not been observed in the GOU; the plume appears to be shifting, rather than decreasing in concentrations.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

RWQB has no day-to-day interactions with facilities, but receives monthly updates from the GOU.

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

N/A

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

N/A

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

N/A

13) What effects have site operations had on the surrounding community?

For example, the BOU is pumping their own water, meaning they don't have to purchase all of their water from the Metropolitan Water District. The water is clean, and no one sees the plant; it's a great benefit. In general, the public is interested. If the site has a Cleanup and Abatement Order, the PRP must do community outreach before RWQCB will issue a closure.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

Nothing to add; refer to response to question 13.

15) Do you feel well informed about the site's activities and progress?

Yes. The updates and contact with EPA are sufficient.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

OEHHA developed a PHG for hexavalent chromium, which is the precursor for development of an MCL. This will result in higher costs for treatment facilities, which will be passed on to consumers.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No.

Summary of Conversation					
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The plumes are still there and have spread more. It seems like the people involved never want to commit to anything without more data, delaying cleanup. COCs are contaminating new wells, and newly contaminating old ones. The model needs updating. The project has been frustrating because things in all OUs take too long.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>Court-appointed Watermaster. The Watermaster accounts for extractions and protects the pumping rights and water quality in the Upper Los Angeles River Area per the 1979 judgment.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>There are Quarterly EPA meetings. GOU and BOU extraction reports are provided, though the Watermaster was unaware that 14 more wells had been installed at the GOU. There are Quarterly Administrative Committee meetings as part of the judgment.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>N/A</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>N/A</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p>					

No. The remedy has not performed as expected. The plumes are as big or bigger than they were twenty years ago. Production has moved "stuff" around. But something is better than nothing. A lot of improvement is needed, sooner rather than later. There is a goal, and it has to be met. The Judge might be unhappy if the Watermaster were to give her an update on the Sites.

7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

The Watermaster has only seen plume maps, but would like to see more depth-discrete plume maps.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

N/A

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

N/A

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

N/A

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

The wells should be pumped more efficiently to capture the most contamination, through, for example, the use of packers and static spinners.

13) What effects have site operations had on the surrounding community?

The wells cannot be pumped to safe yield or are forced to exceed safe yield, which ultimately means it costs more for customers to buy water, due in part to cities having to buy outside water. The region will need a new safe yield study soon.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

N/A

15) Do you feel well informed about the site's activities and progress?

The Watermaster receives a lot of PRP reports (not all of them), but trusts regulators to review these. The Watermaster likes to be kept informed.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

Yes.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

Older wells in the NHOU and BOU lack sanitary seals. Static surveys should be performed to ascertain the direction of groundwater flow within the wells. Also, it cannot be assumed that water removed from the same depth at different wells comes from the same aquifer system; the hydrogeology is not well defined or understood.

Five-Year Review Interview Record			
Site:	San Fernando Valley Area 1 and Area 2 Superfund Sites		EPA ID No: CAD980894893
Interview Type:	Phone		
Location of Visit:	N/A		
Date:	5/6/2013	Time:	11:00 AM
Interviewer:	ZiZi Searles Aaron King	Title: RPM Environmental Engineer	Organization: USEPA USACE
Individuals Contacted			
Name:	Tedd Yargeau	Title:	Senior Scientist
Telephone:	(818) 212-5340	Address:	9211 Oakdale Avenue Chatsworth, CA 91311
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>Overall, the projects are very good. Things are moving forward with the GCOU and things are going well with the BOU. There have been some issues in the NHOU with bringing in other responsible parties.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>Peer-reviewing documents. DTSC ensures that the state's interests are represented.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>There have been no recent site visits, though DTSC is well aware of what is going on due to communications from EPA and PRPs.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>No.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>No.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>The remedies are functioning for the most part with the exception of the NHOU (regarding containment). However, all of the remedies are headed in the right direction.</p> <p>7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?</p> <p>Contaminant levels are definitely decreasing, except for hexavalent chromium in some wells in the NHOU.</p>			

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

There is no oversight on behalf of the state but DTSC is aware of EPA's oversight.

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

The only new thing is the new and emerging compounds, especially hexavalent chromium. The second remedy for the NHOU will treat for hexavalent chromium, and the GOU is actively working on a chromium remedy.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

Bringing more PRPs on board has been a challenge in the NHOU.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

EPA has been trying to be more efficient in sampling by reducing the number of mobilizations.

13) What effects have site operations had on the surrounding community?

DTSC has not heard any complaints; EPA has been running a great outreach program.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

There was a recent inquiry regarding a real estate purchase in the San Fernando Valley and whether the presence of the contamination could affect the value of the property. DTSC responded that property values would not be affected.

15) Do you feel well informed about the site's activities and progress?

Yes. EPA has actively notified DTSC.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

The MCL for hexavalent chromium may impact protectiveness, and the challenge has been how to address it. EPA has moved in the right direction, and technologies are being tested that could treat hexavalent chromium down to what the MCL might be.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No. EPA has done a very good job at managing a complex project, and DTSC certainly appreciates it.

Appendix D: Site Inspection Checklist

[This page is intentionally blank]

Site Inspection Checklist

I. SITE INFORMATION	
Site name: San Fernando Valley- Area 2	Date of inspection: 28 February 2013
Location: Glendale/Los Angeles County/California	EPA ID: CAD980894901
Agency, office, or company leading the five-year review: USACE	Weather/temperature Sunny, calm wind, 73 degrees F
Remedy Includes: (Check all that apply) <div style="display: flex; flex-wrap: wrap; justify-content: space-between; margin-top: 10px;"> <div style="width: 45%;"> ☐ Landfill cover/containment ☒ Access controls ☒ Institutional controls ☒ Groundwater pump and treatment ☐ Surface water collection and treatment ☐ Other: _____ </div> <div style="width: 45%;"> ☐ Monitored natural attenuation ☒ Groundwater containment ☐ Vertical barrier walls </div> </div>	
Attachments: ☐ Inspection team roster attached ☐ Site map attached	
II. INTERVIEWS (Check all that apply)	
1. O&M site manager <u>Charles Cron</u> <u>Lead O&M Specialist</u> <u>28 February 2013</u>	
Name	Title Date
Interviewed ☒ at site ☐ at office ☐ by phone	
Problems, suggestions; ☒ Report attached <u>See Appendix C</u>	
2. O&M staff _____	
Name	Title Date
Interviewed ☐ at site ☐ at office ☐ by phone	
Problems, suggestions; ☐ Report attached <u>See Appendix C</u>	

3. **Local regulatory authorities and response agencies** (i.e., State and Tribal offices, emergency response office, police department, office of public health or environmental health, zoning office, recorder of deeds, or other city and county offices, etc.) Fill in all that apply.

Agency: RWQCB

Contact: Larry Moore Staff Environmental Scientist 26 February 2013

Name	Title	Date
------	-------	------

Problems; suggestions; ☒ Report attached See Appendix C

Agency: EPA Consultant

Contact: Alex Lapolstol Technical Consultant 26 February 2013

Name	Title	Date

IV. O&M COSTS				
1.	O&M Organization			
	☐ State in-house	☐ Contractor for State		
	☐ PRP in-house	☐ Contractor for PRP		
	☐ Federal Facility in-house	☐ Contractor for Federal Facility		
	☒ Other Contractor <u>CDM Smith is contracted by the City of Glendale.</u>			

2.	O&M Cost Records ☒ Readily available ☒ Up to date ☒ Funding mechanism/agreement in place Original O&M cost estimate ☐ Breakdown attached Total annual cost by year for review period if available From <u>Jan 2010</u> To <u>Dec 2010</u> <u>\$2,917,282.34</u> ☒ Breakdown attached Date Date Total cost From <u>Jan 2011</u> To <u>Dec 2011</u> <u>\$3,224,070.94</u> ☒ Breakdown attached Date Date Total cost From <u>Jan 2012</u> To <u>Dec 2012</u> <u>\$3,157,578.17</u> ☒ Breakdown attached Date Date Total cost		
3.	Unanticipated or Unusually High O&M Costs During Review Period Describe costs and reasons: <u>None</u>		
V. ACCESS AND INSTITUTIONAL CONTROLS ☒ Applicable ☐ N/A			
A. Fencing			
1.	Fencing damaged ☐ Location shown on site map ☒ Gates secured ☐ N/A Remarks <u>Security fence and gate in good condition.</u>		
B. Other Access Restrictions			
1.	Signs and other security measures ☐ Location shown on site map ☐ N/A Remarks <u>Has 4 surveillance cams, which are monitored at the power substation. There are intrusion alarms at all buildings, well covers, and control panels.</u>		
C. Institutional Controls (ICs)			

1.	Implementation and enforcement	
	Site conditions imply ICs not properly implemented	☐ Yes ☒ No ☐ N/A
	Site conditions imply ICs not being fully enforced	☐ Yes ☒ No ☐ N/A
	Type of monitoring (<i>e.g.</i> , self-reporting, drive by) <u>N/A</u>	
	Frequency <u>N/A</u>	
	Responsible party/agency <u>N/A</u>	
	Reporting is up-to-date	☐ Yes ☐ No ☐ N/A
	Reports are verified by the lead agency	☐ Yes ☐ No ☐ N/A
	Specific requirements in deed or decision documents have been met	☐ Yes ☐ No ☒ N/A
	Violations have been reported	☐ Yes ☐ No ☒ N/A
	Other problems or suggestions: ☐ Report attached	
	<u>No problems or suggestions; See Section 6.7</u>	
2.	Adequacy ☒ ICs are adequate ☐ ICs are inadequate ☐ N/A	
	Remarks <u>None</u>	
D. General		
1.	Vandalism/trespassing ☐ Location shown on site map ☐ No vandalism evident	
	Remarks <u>No trespassing. Minor graffiti on front gate and an exposed pipeline near the Los Angeles River.</u>	
2.	Land use changes on site ☒ N/A	
	Remarks <u>None</u>	
3.	Land use changes off site ☒ N/A	
	Remarks <u>None</u>	
VI. GENERAL SITE CONDITIONS		
A. Roads ☒ Applicable ☐ N/A		
1.	Roads damaged ☐ Location shown on site map ☒ Roads adequate ☐ N/A	
	Remarks <u>None</u>	
B. Other Site Conditions		
	Remarks <u>In general, site is clean and in good condition.</u>	
VII. LANDFILL COVERS ☐ Applicable ☒ N/A		
VIII. VERTICAL BARRIER WALLS ☐ Applicable ☒ N/A		

IX. GROUNDWATER/SURFACE WATER REMEDIES ☒ Applicable ☐ N/A	
A. Groundwater Extraction Wells, Pumps, and Pipelines ☒ Applicable ☐ N/A	
1.	Pumps, Wellhead Plumbing, and Electrical ☒ Good condition ☒ All required wells properly operating ☐ Needs Maintenance ☐ N/A Remarks <u>None</u>
2.	Extraction System Pipelines, Valves, Valve Boxes, and Other Appurtenances ☒ Good condition ☐ Needs Maintenance Remarks <u>None</u>
3.	Spare Parts and Equipment ☒ Readily available ☒ Good condition ☐ Requires upgrade ☐ Needs to be provided Remarks <u>None</u>
B. Surface Water Collection Structures, Pumps, and Pipelines ☐ Applicable ☒ N/A	
C. Treatment System ☒ Applicable ☐ N/A	
1.	Treatment Train (Check components that apply) ☒ Metals removal ☐ Oil/water separation ☐ Bioremediation ☒ Air stripping ☒ Carbon adsorbers ☐ Filters _____ ☒ Additive (<i>e.g.</i> , chelation agent, flocculent) <u>Polyphosphate antiscalant</u> ☐ Others _____ ☒ Good condition ☐ Needs Maintenance ☒ Sampling ports properly marked and functional ☒ Sampling/maintenance log displayed and up to date ☒ Equipment properly identified ☒ Quantity of groundwater treated annually <u>7,180 – 8,000 acre-ft</u> ☐ Quantity of surface water treated annually <u>None</u> Remarks <u>None</u>
2.	Electrical Enclosures and Panels (properly rated and functional) ☐ N/A ☒ Good condition ☐ Needs Maintenance Remarks <u>None</u>

3.	Tanks, Vaults, Storage Vessels ☐ N/A ☒ Good condition ☒ Proper secondary containment ☐ Needs Maintenance Remarks <u>Materials in tanks properly identified</u>
4.	Discharge Structure and Appurtenances ☐ N/A ☒ Good condition ☐ Needs Maintenance Remarks <u>None</u>
5.	Treatment Building(s) ☐ N/A ☒ Good condition (esp. roof and doorways) ☐ Needs repair ☒ Chemicals and equipment properly stored Remarks <u>None</u>
6.	Monitoring Wells (pump and treatment remedy) ☐ Properly secured/locked ☐ Functioning ☐ Routinely sampled ☐ Good condition ☐ All required wells located ☐ Needs Maintenance ☐ N/A Remarks <u>Monitoring wells were not visited on the site inspection</u>
D. Monitoring Data	
1.	Monitoring Data ☒ Is routinely submitted on time ☒ Is of acceptable quality
2.	Monitoring data suggests: ☐ Groundwater plume is effectively contained ☐ Contaminant concentrations are declining
E. Monitored Natural Attenuation	
1.	Monitoring Wells (natural attenuation remedy) ☐ Properly secured/locked ☐ Functioning ☐ Routinely sampled ☐ Good condition ☐ All required wells located ☐ Needs Maintenance ☐ N/A Remarks <u>This is not an MNA remedy, it is a containment remedy.</u>
X. OTHER REMEDIES	
<u>N/A</u>	

XI. OVERALL OBSERVATIONS	
A. Implementation of the Remedy	
	<p>Describe issues and observations relating to whether the remedy is effective and functioning as designed. Begin with a brief statement of what the remedy is to accomplish (i.e., to contain contaminant plume, minimize infiltration and gas emission, etc.).</p> <p><u>The purposes of the remedy are plume containment, mass removal, and maintaining an extraction rate of 5,000 gpm. Mass removal and the targeted extraction rate are being achieved, but the extent of plume containment is unknown. The only challenge has been extraction well maintenance routines; wastewater is generated and must be dealt with. Routine operations have not been affected by bacteria; bacteria is only an issue during well rehabilitation.</u></p>
B. Adequacy of O&M	
	<p>Describe issues and observations related to the implementation and scope of O&M procedures. In particular, discuss their relationship to the current and long-term protectiveness of the remedy.</p> <p><u>There have been no O&M challenges along these lines in the last 5 years. Adequate time has been available to schedule any necessary maintenance.</u></p>
C. Early Indicators of Potential Remedy Problems	
	<p>Describe issues and observations such as unexpected changes in the cost or scope of O&M or a high frequency of unscheduled repairs that suggest that the protectiveness of the remedy may be compromised in the future.</p> <p><u>None</u></p>
D. Opportunities for Optimization	
	<p>Describe possible opportunities for optimization in monitoring tasks or the operation of the remedy.</p> <p><u>The influent line pipe was split so that the system would not have to completely shut down during well rehabilitation. CDM Smith is looking at different ways to treat or use wastewater generated during well rehab. Looking to recycle backwash water through the plant, which CDPH is considering. CDPH has shown an increased willingness to allow increased flow rates though LPGAC units during change outs.</u></p>

Glendale Operable Unit
O&M Expenses

2010	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEPT	OCT	NOV	DEC	TOTAL
City Utility Charges	34,682.28	27,333.07	33,882.34	24,428.91	30,388.72	34,838.95	32,389.30	46,684.20	32,732.81	33,423.51	35,183.25	30,844.46	396,811.80

Notes
City Utility Charges - Water and power costs, City oversight, CDPH charges. Credit given for energy and lab costs City would have incurred.
CDM Charges - Labor and materials to operate GWTP and wells, includes chemicals, lab analysis, and GAC.
KJ -Kennedy/Jenks expenses as cost consultant.
 Not included are the Operational Loss payments, the Settlement Agreement payments (\$124,000/yr from 2008 - 2011) or property easements fees.

Appendix F: ARARs Summary

[This page is intentionally blank]

ARARs Summary

Chemical-specific ARARs

Chemical-specific ARARs are discussed in section **Error! Reference source not found.**1. Table 1 summarizes the chemical-specific ARARs.

Action-specific ARARs

Action-specific ARARs identified include Air Quality Standards, Hazardous Waste Management Regulations, and Water Quality Standards for ReInjection. These are summarized in Table 2.

In California, the authority for enforcing the standards established under the Clean Air Act has been delegated to the State. The program is administered by the South Coast Air Quality Management District (SCAQMD).

The State of California has been authorized by the EPA to develop and enforce its own hazardous waste regulations in lieu of the Federal program. These requirements are found in 22 CCR Division 4.5. The source of the VOCs in groundwater is unknown and, therefore, cannot be definitively classified as listed hazardous wastes. However, EPA determined in both RODs that the contaminants are sufficiently similar in nature to listed hazardous wastes that certain substantive requirements of California's hazardous waste regulations are relevant and appropriate at the site.

To-Be-Considered (TBC) Criteria

Two TBC criteria were identified for the GOU and are summarized in Table 3. As noted previously, the 1,4-dioxane notification level was revised from 3 to 1 µg/L in November 2010.

Table 1. Chemical-specific ARARs

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
SDWA (2 USC 300 et seq.)	National Primary Drinking Water Standards, including 40 CFR 141.61 and 40 CFR 141.62	Chemical-specific drinking water standards and MCLs have been promulgated under the SDWA; MCLGs above zero are considered chemical-specific ARARs under the NCP (40 CFR 300.430(e)(2)(i)(B)). When the MCLGs are equal to zero, which is generally the case for a chemical considered to be a carcinogen, the MCL is considered the chemical-specific ARAR instead of the MCLG (40 CFR 300.430(e)(2)(i)(C)). Established MCLs for COCs are listed in Error! Reference source not found..	There have been no changes to the federal MCLs since the last FYR. Protectiveness is not affected.	The MCLs are ARARs for the purpose of establishing performance standards for the treated water from the GOU treatment plant.	N/A
California Safe Drinking Water Act	California Safe Drinking Water Regulations, including 22 CCR 64431 and 22 CCR 64444	Contains provision for California domestic water quality; establishes MCLs for primary drinking water chemicals. Established MCLs for COCs are listed in Error! Reference source not found..	There have been no changes to the state MCLs since the last FYR. Protectiveness is not affected.	The MCLs are ARARs for the purpose of establishing performance standards for COCs in the water extracted from the basin and treated at the treatment plants.	N/A
California Domestic Water Quality Monitoring Regulations	CCR Title 22 Sections 64421 – 64445.2	Requires monitoring for any treated water which will be delivered to a distribution system.	No changes have been made to this requirement. Protectiveness is not affected.	Substantive monitoring requirements are relevant and appropriate to ensure that treated effluent is meeting performance standards.	N/A
California Secondary Drinking Water Standards (SDWS)	22 CCR 64471	Secondary Drinking Water Standards were promulgated to address the taste, odor, and appearance of drinking water, and apply the action of supplying the treated water to a public water supplier.	No changes have been made to this requirement. Protectiveness is not affected.	Although California SDWS are not applicable to non-public water system suppliers, the California SDWS are relevant and appropriate since the treated water under this action would be put into the City's drinking water system action.	N/A

Table 2. Action-specific ARARs

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
Clean Air Act SCAQMD	Regulation XIII	Regulation XIII requires that stationary sources of air emissions meet best available technology standards.	Rules 1309 (Emission Reduction Credits and Short Term Credits), 1315 (Federal New Source Tracking System), and 1325 (Federal PM _{2.5} New Source Review Program) of Regulation XIII have been amended or adopted since the previous FYR, but none of the changes affect protectiveness.	For air strippers, SCAQMD considers vapor phase GAC (with 90-99% removal efficiency) devices to be BACT. These are pre-construction requirements, so it is assumed that all applicable requirements were obtained before treatment units went on-line.	Latest amendment was on June 3, 2011.
Clean Air Act SCAQMD	Rule 1401	Rule 1401 specifies limits for individual cancer risk and excess cancer cases from new or modified stationary sources which emit carcinogenic air contaminants. The rule requires Best Available Control Technology (BACT) for toxic air discharge for new stationary sources where a lifetime maximum individual cancer risk of one in one million or greater is estimated to occur.	The list of chronic and acute toxic air contaminants was expanded, but this does not affect protectiveness.	As Rule 1401 is a pre-construction regulation, it is assumed that all applicable requirements were attained before the treatment units went on-line. If the air stripping treatment system is modified significantly, substantive provisions of Rule 1401 will still apply.	Latest amendment was on September 10, 2010.
Clean Air Act SCAQMD	Rule 401, Rule 402, Rule 403	Limit the visible emissions from a point source (Rule 401), prohibits discharge of material that is odorous or causes injury, nuisance or annoyance to the Public (Rule 402), and limits down-wind particulate concentrations (Rule 403).	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	These rules limit or prohibit visible, odorous or injurious, and particulate emissions from the treatment facility.	N/A
California Hazardous Waste Regulations, General Requirements	22 CCR 66264.14, 66264.18, and 66264.25	These sections specify security requirements (66264.14), location standards (66264.18), and precipitation standards (66264.25).	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	These are pre-construction requirements, so it is assumed that all applicable requirements were obtained before treatment units went on-line.	N/A

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
California Hazardous Waste Regulations, General Requirements	22 CCR 66264.15, 66264.16, and 66264.30-66264.56	These sections specify general inspection requirements (66264.15), personnel training (66264.16), and Preparedness and Prevention and Contingency and Emergency Preparedness (66264.30-66264.56)	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	The treatment plant is required to have health and safety plans and operation and maintenance plans under CERCLA that are substantively equivalent to these sections.	N/A
California Hazardous Waste Regulations, Generator Requirements	22 CCR 66264.600 - .603 ; 22 CCR 66264.111- .115	22 CCR 66264.600 - .603 contains requirements for miscellaneous units (air stripper is considered a miscellaneous unit). 22 CCR 66264.111- .115 contains closure requirements for the air stripper. The air stripper should be designed, operated, maintained, and closed in a manner that will ensure the protection of human health and the environment.	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	The substantive requirements for miscellaneous units and related substantive closure requirements appropriate and relevant for the air stripper.	N/A
California Hazardous Waste Regulations, Generator Requirements	22 CCR 66262.34 and 66264.170-.178	Waste stored on-site over 90 days should be placed in containers or tanks that are in compliance with California Waste Regulations.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	Storage of hazardous waste accumulated on-site must be in compliance with substantive requirements for interim status facilities.	N/A
California Land Disposal Restrictions, Requirements for Generators	22 CCR 66268	Compliance with land disposal regulation treatment standards is required if hazardous waste (contaminated groundwater or spent GAC) is placed on land.	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	Hazardous waste hauled off-site must meet “land-ban” requirements.	N/A

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
Groundwater ReInjection	40 CFR 144.12-.13	Federal Underground Injection Control Plan and prohibits injection wells such as those that would be located at the Site from (1) causing a violation of primary MCLs in the receiving waters and (2) adversely affecting the health of persons (40 C.F.R. §144.12). Section 144.13 provides that contaminated ground water that has been treated may be reinjected into the formation from which it is withdrawn if such injection is conducted pursuant to a CERCLA cleanup and is approved by EPA.	40 CFR 144.12 was amended in December 2010, but the amendment does not affect protectiveness.	These regulations are applicable to any treated water that is reinjected into the groundwater.	Dec 10, 2010
Groundwater ReInjection or Discharge to Surface Water	State Water Resources Control Board Resolution 68-16	Requires that reinjected water not unreasonably degrade existing water quality.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	Resolution 68-16 (Statement of Policy with respect to Maintaining High Quality of Waters in California) does not contain substantive requirements in and of itself. These regulations are applicable to any treated water that is reinjected into the groundwater or discharged to surface water.	N/A
Groundwater ReInjection	RCRA Section 3020	Provides that the ban on the disposal of hazardous waste into a formation which contains an underground source of drinking water shall not apply to the injection of contaminated groundwater into the aquifer if: 1) such reinjection is part of a response action under CERCLA, 2) such contaminated groundwater is treated to substantially reduce hazardous constituents prior to such reinjection, and 3) such response action will, upon completion, be sufficient to protect human health and the environment.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	This regulation is applicable to any treated water that is reinjected into the groundwater.	N/A

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
Treated Groundwater Discharge to Surface Water	Water Quality Control Plan for Los Angeles River Basin (RWQCB)	Treated water that is discharged, on a short term basis, to the Los Angeles River is subject to the National Pollutant Discharge Elimination System (NPDES) Program which is implemented by the Los Angeles RWQCB. In establishing effluent limitations for such discharges, the Los Angeles RWQCB considers the Basin Plan, which incorporates Resolution 68-16, and the best available technology economically achievable.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	This requirement is applicable to any treated water that is discharged to surface water.	N/A
Mineral Quality Objectives for Treated Groundwater Discharge to Surface Water	Water Quality Control Plan for Los Angeles River Basin (RWQCB)	The Los Angeles RWQCB established mineral quality objectives for individual surface waters for the Los Angeles River Watershed. The mineral quality objective for nitrate in the Los Angeles River of 36 mg/L (8 mg/L nitrate-N).	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	Because the anticipated average concentration of nitrate in the short-term discharge is likely to be close to the MCL, and any discharge would be short-term, there should not be any significant long-term effects on the mineral quality of the Los Angeles River associated with short-term discharges of VOC-treated water. This requirement is applicable to any treated water that is discharged to surface water.	N/A

Table 3. To Be Considered Criteria

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
California PHGs, California Environmental Protection Agency, and OEHHA	California Calderon-Sher SDWA of 1996, California Health and Safety Code 116365	OEHHA has adopted PHGs for chemicals in drinking water. PHGs are levels of drinking water contaminants at which adverse health effects are not expected to occur from a lifetime of exposure.	No changes have been made to this requirement. Protectiveness is not affected.	In the absence of MCLs, the state PHGs adopted by OEHHA have been considered during selection of performance standards for extracted groundwater.	N/A
CDPH Drinking Water Notification Levels	California Health and Safety Code 116455	CDPH has established drinking water notification levels (formerly known as action levels) based on health effects, but in some cases they are based on taste and odor values for chemicals without MCLs.	CDPH revised its notification level for 1,4-dioxane from 3 to 1 µg/L. Notification levels are not ARARs. Protectiveness is not affected.	In the absence of MCLs, the drinking water notification levels established by CDPH have been considered during selection of performance standards for extracted groundwater.	December 14, 2010

**Appendix G: Summary of Contaminant
Concentrations in GOU
Extraction Wells from January
2008 – December 2012**

[This page is intentionally blank]

Summary of Contaminant Concentrations in GOU Extraction Wells from January 2008 – December 2012

Highlighted cells indicate that values are above the most stringent performance standard listed in **Error! Reference source not found.**

Maximum, minimum, median, and average values are based on detected values; non-detect values were not included in these calculations.

Contaminant	Summary Parameter	Well

Appendix B: Press Notices

[This page is intentionally blank]

Press Notice

Public Notice
The United States Environmental Protection Agency (EPA)
Start of Five-Year Review of Groundwater Cleanup
San Fernando Valley Superfund Sites (Areas 1 and 2)

The EPA has begun the Second Five-Year Review (FYR) process for cleanup actions undertaken at the San Fernando Valley Superfund Sites (SFV Sites) for Areas 1 and 2. Area 1 includes North Hollywood and Burbank Operable Units (OUs). Area 2 includes Glendale North and South OUs, and the Glendale Chromium OU. EPA often addresses clean-up at a large site by breaking the site into small operable units (OUs) to manage cleanup actions. This notice addresses the FYRs for Areas 1 (North Hollywood and Burbank OUs) and 2 (Glendale North and South OUs). Upon completion of the review EPA will issue two separate reports that evaluate whether the cleanup actions for Areas 1 and 2 remain protective of human health and the environment.

The Review Process: When EPA's cleanup action leaves some waste in place or the action will take longer than five years to complete, the Superfund law requires an evaluation of the protectiveness of the cleanup systems every five years until the site has been cleaned up sufficiently to allow unrestricted use. The purpose of the FYR is to publically document the effectiveness of cleanup systems and to measure progress towards achieving cleanup goals. FYRs consist of evaluating the effectiveness of clean-up in both the short and long-term, facility inspections, and the analysis of 2008-2013 groundwater data. The FYR will report the amount of contaminant mass being removed by groundwater treatment facilities, evidence of natural processes that may assist with the breakdown of chemicals, cleanup progress within the Superfund sites, and treatment facility operations. This review also includes interviews with regulators, government officials, and community representatives. To date, previous FYR reviews conducted for Areas 1 and 2 have shown the clean-up systems to be protective of human health and the environment. The 2013 FYRs will comment on the status of 2008 recommendations and offer new recommendations if necessary. The 2008 FYR for Areas 1 and 2 are available on EPA's web page and at the information repositories listed below. Both 2013 FYR reports will be completed by September 30, 2013 and copies will be made available to the public via the websites.

Community Involvement: EPA invites the community to learn more about the Sites, the FYR review process and provide input to EPA. Interviewees can contact Jackie Lane, Community Involvement Coordinator **no later than July 31, 2013** at (415) 972-3236 or by email at lane.jackie@epa.gov to be interviewed.

Information and Repositories: **Area 1:** Burbank Public Library, 110 North Glen Oaks Blvd, Burbank, CA or call (818) 238-5580 and Los Angeles Public Library, 630 W. Fifth St., Los Angeles CA 90071 or call (213) 228-7000. **Area 2:** City of Glendale Public Library, 222 East Harvard St. Glendale, CA or call (818) 548-2021 and Los Angeles Public Library, 630 W. Five-Year Review Interview Record			
Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	GOU Treatment Facility		
Date:	2/28/2013	Time:	10:00 AM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Charles Cron	Title:	Lead O&M Specialist
Telephone:	(818) 550-5975	Address:	800 Flower St Glendale, CA 91201
Name:	Daniel Hutton	Title:	Project Manager
Telephone:	(909) 579-3500	Address:	9220 Cleveland Ave, Suite 100 Rancho Cucamonga, CA 91730
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The designers of the system did a great job. The system is flexible, even with changing water quality regulations. The system has consistently been able to operate and meet extraction and water quality requirements.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>Mr. Cron is the site manager and Mr. Hutton is the project manager; both ensure compliance while minimizing water loss.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>There are multiple points of communication every day, whether between Charles, Dan, Leo, and/or EPA. Also, there are monthly stakeholder meetings.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>No.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>Somehow, the Glendale Police Department has received three 911 calls from the site that are not alarm triggered. It is not known why or how this occurs. All responses by local authorities have been false alarms.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>Yes. The remedy is performing better than expected with respect to mass removal and extraction rates. CDPH's flexibility has been very encouraging.</p>			

7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

Trend charts show several COC concentrations, including VOCs and chromium, are climbing in some wells, in accordance with predictions.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

There are operators on-site 8 hours per day, 7 days per week, daily inspections, and 24/7 remote monitoring.

9) What are the annual O&M costs for your organization's involvement at the site?

Funding has not been an issue for justifiable expenses. Roughly \$4.3 million is budgeted for the coming year.

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

Nothing in the last five years, excluding the WBA. And the uranium disposal issue.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

Resin disposal has been an unexpected difficulty because of the uranium content of the spent resin (uranium originates in the groundwater and the resin removes it from the groundwater). Also, formaldehyde has been found to leach from the resin on startup, so a system to contain and treat the water used during startup has been implemented.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

Plant and process optimization occurred years ago. CDPH is open to reducing sampling.

13) What effects have site operations had on the surrounding community?

The plant provides 25% of the City's water supply, and the water meets drinking water standards.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

No.

15) Do you feel well informed about the site's activities and progress?

Yes.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

CDM is keeping an eye on the chromium MCL development, but also EPA's carcinogenic VOC rule.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No. The desires and expectations of all parties are being met. The cooperativeness of all parties makes it much easier.

Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	City of Glendale Water and Power Office		
Date:	2/28/2013	Time:	1:00 PM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Leighton Fong	Title:	Civil Engineer II
		Organization:	City of Glendale Water and Power
Telephone:	(818) 548-3982	Address:	141 N Glendale Ave, Level 4 Glendale, CA 91206
Name:	Leo Chan	Title:	Project Engineer
		Organization:	City of Glendale Water and Power
Telephone:	(818) 548-3905	Address:	141 N Glendale Ave, Level 4 Glendale, CA 91206
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The project is well-run. CDM and GRG are supportive and go beyond the call of duty; and they take ownership and pride in their work.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>City owns the operable unit, oversees plant operation, and reports to CDPH, EPA, etc. Also, the City is in charge of permitting, disposal, manifesting, and invoice review. They have a focus on water loss prevention.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>GWP talks to Charles at least every other day, and receives daily status reports by e-mail and monthly reports.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>The Bureau of Sanitation wanted to split a sample of the industrial waste discharge from GS-3 (formaldehyde), but was not notified when the last sample was taken.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>There has been no vandalism. Someone broke into the control panel at extraction well GS-3, but nothing was taken or broken.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>The remedy is getting mass removal and the desired extraction rates, but there might be some leakage (regarding containment).</p> <p>7) What does the monitoring data show? Are there any trends that show</p>			

contaminant levels are decreasing?

VOCs remain steady. Chromium concentrations are declining in GS-3 and increasing in GN-3.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

Charles and his staff are very conscientious and stable. They are very responsible and on top of problems.

9) What are the annual O&M costs for your organization's involvement at the site?

To be given at a later date. GRG pays for the O&M; all justified costs are fine.

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

Sometimes, the wells will trip (under voltage), go offline, and sound a general alarm. CDM put electrical monitoring on some of the wells.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

Metering to the packed towers failed causing a temporary shutdown. The meters were replaced within a month. Nothing unexpected; the equipment is old, so it tends to fail.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

The influent splitter pipe is a positive change. LPGAC regeneration is being considered. They have improved the reliability of the chlorine injection.

13) What effects have site operations had on the surrounding community?

With the WBA at GS-3, they had to add a sound blanket because of complaints about the noise. There have not been any new complaints.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

No.

15) Do you feel well informed about the site's activities and progress?

Yes. The monthly stakeholder meetings keep GWP well informed.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

NPDES is an ongoing issue for discharging well-rehab water.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

EPA is working on remedy optimization, and there is uncertainty regarding the new remedy.

Five-Year Review Interview Record			
Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	Restaurant near GWP Offices		
Date:	2/28/2013	Time:	2:45 PM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Karen Meade	Title:	Project Manager
		Organization:	CH2M Hill
Telephone:	(714) 429-2000	Address:	6 Hutton Centre Drive, Suite 700 Santa Ana, CA 92707
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The project has been impressive. The City and CDM are very proactive and aware of requirements. Monthly meetings are effective. GRG seems fairly proactive, and supportive of current operations, and there have been no budget issues.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>CH2M Hill is EPA's contractor to provide oversight of ongoing remedial work.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>CH2M Hill attends the monthly meetings. Weekly site inspections were performed during the construction and startup of the WBA and RCF facilities.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>No.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>As Charles talked about...</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>Work to date has helped inhibit migration and mass removal; containment could be better. GS-3 is not getting capture. Particle tracking in the Hydraulic Containment Technical Memorandum shows escape from north and south wells, even when all wells are operating. The alternatives shown in the same memorandum still do not show complete capture. It would be better to look at it as one OU rather than two. It is functioning as expected, but there is room for improvement, and doesn't believe there is complete containment.</p> <p>7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?</p>			

Capture doesn't appear to have been achieved or there was a loss of capture due to GS-3 down time. PCE and TCE concentrations are above the MCL down-gradient of the south extraction wells. Down-gradient well GS-P13 (screen depth 30-50 feet) has high PCE and TCE concentrations, whereas down-gradient wells GS-P4 and GS-P5 (screened depth is deeper at approximately 100 feet) have low concentrations of PCE and TCE. Also, GN-P11 on the other side of the LA River has relatively high concentrations of PCE and TCE, which might be from a different source, so there is a question regarding new sources or sources not completely defined.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

N/A

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

The Draft O&M Manual for WBA has not been integrated to the Site O&M Manual.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

As Charles said earlier, plus resin issues at the WBA, but it's being worked on. Looking at re-activated carbon use. Should look at other resins that don't produce the formaldehyde issue.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

Waste minimization during well rehabilitation; carbon regeneration on-site

13) What effects have site operations had on the surrounding community?

There was a noise issue at the WBA, but it was addressed through the use of noise attenuation blankets.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

No.

15) Do you feel well informed about the site's activities and progress?

Yes.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

Only the chromium MCL to be released in the summer.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No. Charles is very proactive on permitting and other issues.

ive-Year Review Interview Record			
Site:	San Fernando Valley Area 2 Superfund Site		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	CDPH Office		
Date:	2/27/2013	Time:	3:40 PM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
Organization:	USEPA USACE USACE		
Individuals Contacted			
Name:	Thomas Tsui	Title:	Associate Sanitary Engineer
Organization:	CDPH		
Telephone:	(818) 551-2036	Address:	500 N Central Ave, Suite 500 Glendale, CA 91203
Name:	Chi Diep	Title:	Senior Sanitary Engineer
Organization:	CDPH		
Telephone:	(818) 551-2039	Address:	500 N Central Ave, Suite 500 Glendale, CA 91203
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>It runs better than other OUs, it's newer, and so it benefited from experience of other OUs. It's easy to oversee, and it's well covered from the permit point of view.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>To ensure potable water produced by the site meets standards and policy requirements for impaired sources. Review reports, be involved in future design changes, and to evaluate hexavalent chromium treatment.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>Gets monthly reports, sampling reports, and does an inspection every 3 years. 2010 was the last inspection - nothing unique noted.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>99.5% of the time it runs good. Only issue has been with NDMA in GS-1. Identifying the source was a problem, and there was some concern about the drinking water quality from GS-1 prior to the decommissioning of the LAGWRP detention pond. There was also a malfunction of a mag meter in the air stripping tower. It's old equipment, more than 10 years old. The extraction wells need attention to keep from failing. They have to rehab some wells every year, but others not as often.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>There are occasional access issues with DreamWorks, but otherwise, there are no issues. The site is secure.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>Remedy functions as expected; it meets expectations and treatment goals, and there haven't been any violations.</p> <p>7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?</p>			

There aren't any decreasing trends; it's pretty steady, though hexavalent chromium is increasing a little.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

Yes. Personnel are there every day and there is a SCADA system.

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

No, but there is project coming up that requires separation of a pipeline that may change O&M procedures. GOU wells in general are only 200 feet deep, so when they do the rehabs, per industry standards, they often get bacteria problems that take time to flush out. The sources of bacteria and E. coli aren't known, though they don't often get E. coli hits.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

The only thing has been the mag meter in the tower. It took 4-7 days to change.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

The pipeline separation project will be a money and time saving improvement. There's also the hex chrome research.

13) What effects have site operations had on the surrounding community?

Some residents have complained of noise near the WBA wellhead treatment. The OU put sound blankets up in response.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

An elected official has voiced desire to have CDPH attend board meetings of the LA county board of supervisors, regarding hex chrome, but they haven't done that yet.

15) Do you feel well informed about the site's activities and progress?

Yes. City of Glendale has gone through significant personnel changes lately, so the contacts aren't as tight as they used to be.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

The only thing is the upcoming hexavalent chromium MCL. That, and the reduction in the 1,4 dioxane NL.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

It runs well, but there's always room for improvement, but nothing in particular. GRG and CDM have been responsive and CDPH appreciates EPA's involvement with GS-1. Overall, a great team effort.

Site:	San Fernando Valley Areas 1 and 2 Superfund Sites		EPA ID No: CAD980894901
Interview Type:	Visit		
Location of Visit:	Los Angeles Regional Water Quality Control Board Office		
Date:	2/26/2013	Time:	3:00 PM
Interviewer:	ZiZi Searles David Sullivan Aaron King	Title:	RPM Geologist Environmental Engineer
		Organization:	USEPA USACE USACE
Individuals Contacted			
Name:	Larry Moore	Title:	Staff Environmental Scientist
		Organization:	Los Angeles RWQCB
Telephone:	(213) 576-6730	Address:	320 W 4th Street Suite 200 Los Angeles, CA 90013
Name:	Alex Lapolstol	Title:	Technical Consultant
		Organization:	E2 Consulting Engineers
Telephone:	(213) 576-6801	Address:	320 W 4th Street Suite 200 Los Angeles, CA 90013
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>It's a positive project; the only unfortunate thing being that it takes longer than they would like to do things. However, it is a slow process because of due process.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>RWQCB works to identify PRPs, and make sure PRPs are in compliance and responsible. Mr. Moore works as a state employee on site cleanup with an emphasis on chromium, but is still involved with VOCs. Mr. Lapolstol provides support on behalf of EPA to identify chromium PRPs (though in some cases VOCs and chromium overlap), fulfill EPA information needs, and assist the state in enforcing the water code.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>RWQCB conducts site inspections, reviews work plans, completes chemical use questionnaires from PRPs, and oversees the cleanup process. EPA provides concurrence with cleanup levels. Mr. Lapolstol is the "eyes and ears" of EPA so that EPA isn't surprised by what the RWQCB is doing.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>There have been no public complaints, and no PRP complaints that have required a response. Glendale, Burbank, and LADWP complain about the slow pace of investigations and response times of EPA and RWQCB. PRPs complain about paying for cleanup.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>No, though residents near the former Excelllo plating facility admitted to trespassing and rolling around in the dirt when the facility was still operational, but that did not occur in the last five years.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p>			

For the NHO, EPA has spent lots of money on the remedy, but unless LADWP uses appropriate pumping rates, it's a moot point; they're just spreading contamination around. It is difficult to contain plumes the way the remedy has been operated. For the GOU, PCE, TCE, total chromium, and hexavalent chromium have been found down gradient of GS-3. The characterization of the GOU is insufficient. Part of the plume has gone off-site of the Excella facility.

7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

The BOU has not been completely assessed in regard to chromium. Honeywell (NHO) has been remediating an on-site source by injecting calcium polysulfide, and has been seeing reductions in off-site wells. Decreasing chromium concentrations have not been observed in the GOU; the plume appears to be shifting, rather than decreasing in concentrations.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

RWQB has no day-to-day interactions with facilities, but receives monthly updates from the GOU.

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

N/A

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

N/A

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

N/A

13) What effects have site operations had on the surrounding community?

For example, the BOU is pumping their own water, meaning they don't have to purchase all of their water from the Metropolitan Water District. The water is clean, and no one sees the plant; it's a great benefit. In general, the public is interested. If the site has a Cleanup and Abatement Order, the PRP must do community outreach before RWQCB will issue a closure.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

Nothing to add; refer to response to question 13.

15) Do you feel well informed about the site's activities and progress?

Yes. The updates and contact with EPA are sufficient.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

OEHHA developed a PHG for hexavalent chromium, which is the precursor for development of an MCL. This will result in higher costs for treatment facilities, which will be passed on to consumers.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No.

Anthony Hicke		Assistant to the Watermaster		ULARA Watermaster	
Telephone:		Address:			
(818) 506-0418		12750 Ventura Blvd, Suite 202 Studio City, CA 91604			
Summary of Conversation					
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>The plumes are still there and have spread more. It seems like the people involved never want to commit to anything without more data, delaying cleanup. COCs are contaminating new wells, and newly contaminating old ones. The model needs updating. The project has been frustrating because things in all OUs take too long.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>Court-appointed Watermaster. The Watermaster accounts for extractions and protects the pumping rights and water quality in the Upper Los Angeles River Area per the 1979 judgment.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>There are Quarterly EPA meetings. GOU and BOU extraction reports are provided, though the Watermaster was unaware that 14 more wells had been installed at the GOU. There are Quarterly Administrative Committee meetings as part of the judgment.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>N/A</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>N/A</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p>					

No. The remedy has not performed as expected. The plumes are as big or bigger than they were twenty years ago. Production has moved "stuff" around. But something is better than nothing. A lot of improvement is needed, sooner rather than later. There is a goal, and it has to be met. The Judge might be unhappy if the Watermaster were to give her an update on the Sites.

7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?

The Watermaster has only seen plume maps, but would like to see more depth-discrete plume maps.

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

N/A

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

N/A

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

N/A

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

The wells should be pumped more efficiently to capture the most contamination, through, for example, the use of packers and static spinners.

13) What effects have site operations had on the surrounding community?

The wells cannot be pumped to safe yield or are forced to exceed safe yield, which ultimately means it costs more for customers to buy water, due in part to cities having to buy outside water. The region will need a new safe yield study soon.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

N/A

15) Do you feel well informed about the site's activities and progress?

The Watermaster receives a lot of PRP reports (not all of them), but trusts regulators to review these. The Watermaster likes to be kept informed.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

Yes.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

Older wells in the NHOU and BOU lack sanitary seals. Static surveys should be performed to ascertain the direction of groundwater flow within the wells. Also, it cannot be assumed that water removed from the same depth at different wells comes from the same aquifer system; the hydrogeology is not well defined or understood.

Five-Year Review Interview Record			
Site:	San Fernando Valley Area 1 and Area 2 Superfund Sites		EPA ID No: CAD980894893
Interview Type:	Phone		
Location of Visit:	N/A		
Date:	5/6/2013	Time:	11:00 AM
Interviewer:	ZiZi Searles Aaron King	Title: RPM Environmental Engineer	Organization: USEPA USACE
Individuals Contacted			
Name:	Tedd Yargeau	Title:	Senior Scientist
Telephone:	(818) 212-5340	Address:	9211 Oakdale Avenue Chatsworth, CA 91311
Summary of Conversation			
<p>1) What is your overall impression of the project (general sentiment)?</p> <p>Overall, the projects are very good. Things are moving forward with the GCOU and things are going well with the BOU. There have been some issues in the NHOU with bringing in other responsible parties.</p> <p>2) What is your current role and your agency's role with respect to the site?</p> <p>Peer-reviewing documents. DTSC ensures that the state's interests are represented.</p> <p>3) Have there been routine communications or activities (site visits, inspections, reporting activities, etc.) conducted by your office regarding the site? If so, please give the purpose and results.</p> <p>There have been no recent site visits, though DTSC is well aware of what is going on due to communications from EPA and PRPs.</p> <p>4) Have there been any complaints, violations, or other incidents related to the site requiring a response by your office? If so, please give details of the events and the results of the responses.</p> <p>No.</p> <p>5) Are you aware of any events, incidents, or activities at the site such as vandalism, trespassing, or emergency responses from local authorities? If so, please give details.</p> <p>No.</p> <p>6) Is the remedy functioning as expected? How well is the remedy performing?</p> <p>The remedies are functioning for the most part with the exception of the NHOU (regarding containment). However, all of the remedies are headed in the right direction.</p> <p>7) What does the monitoring data show? Are there any trends that show contaminant levels are decreasing?</p> <p>Contaminant levels are definitely decreasing, except for hexavalent chromium in some wells in the NHOU.</p>			

8) Is there a continuous on-site O&M presence? If so, please describe staff and activities. If there is not a continuous on-site presence, describe staff and frequency of site inspection and activities.

There is no oversight on behalf of the state but DTSC is aware of EPA's oversight.

9) What are the annual O&M costs for your organization's involvement at the site?

N/A

10) Have there been any significant changes in the O&M requirements, maintenance schedules, or sampling routines since start-up or in the last five years? If so, do they affect the protectiveness of the remedy? Please describe changes and impacts.

The only new thing is the new and emerging compounds, especially hexavalent chromium. The second remedy for the NHOU will treat for hexavalent chromium, and the GOU is actively working on a chromium remedy.

11) Have there been unexpected O&M difficulties or costs at the site since start-up or in the last five years? If so, please give details.

Bringing more PRPs on board has been a challenge in the NHOU.

12) Have there been opportunities to optimize O&M or sampling efforts? Please describe changes and resultant or desired cost savings or improved efficiency.

EPA has been trying to be more efficient in sampling by reducing the number of mobilizations.

13) What effects have site operations had on the surrounding community?

DTSC has not heard any complaints; EPA has been running a great outreach program.

14) Are you aware of any community concerns regarding the site or its operation and administration? If so, please summarize the concerns.

There was a recent inquiry regarding a real estate purchase in the San Fernando Valley and whether the presence of the contamination could affect the value of the property. DTSC responded that property values would not be affected.

15) Do you feel well informed about the site's activities and progress?

Yes. EPA has actively notified DTSC.

16) Are you aware of any changes in Federal/State/County/Local laws and regulations that may impact the protectiveness of the site?

The MCL for hexavalent chromium may impact protectiveness, and the challenge has been how to address it. EPA has moved in the right direction, and technologies are being tested that could treat hexavalent chromium down to what the MCL might be.

17) Do you have any comments, suggestions, or recommendations regarding the site's management, operation, or any other aspects of the site?

No. EPA has done a very good job at managing a complex project, and DTSC certainly appreciates it.

Appendix D: Site Inspection Checklist

[This page is intentionally blank]

Site Inspection Checklist

I. SITE INFORMATION	
Site name: San Fernando Valley- Area 2	Date of inspection: 28 February 2013
Location: Glendale/Los Angeles County/California	EPA ID: CAD980894901
Agency, office, or company leading the five-year review: USACE	Weather/temperature Sunny, calm wind, 73 degrees F
Remedy Includes: (Check all that apply) <div style="display: flex; flex-wrap: wrap; justify-content: space-between; margin-top: 10px;"> <div style="width: 45%;"> ☐ Landfill cover/containment ☒ Access controls ☒ Institutional controls ☒ Groundwater pump and treatment ☐ Surface water collection and treatment ☐ Other: _____ </div> <div style="width: 45%;"> ☐ Monitored natural attenuation ☒ Groundwater containment ☐ Vertical barrier walls </div> </div>	
Attachments: ☐ Inspection team roster attached ☐ Site map attached	
II. INTERVIEWS (Check all that apply)	
1. O&M site manager <u>Charles Cron</u> <u>Lead O&M Specialist</u> <u>28 February 2013</u>	
Name	Title Date
Interviewed ☒ at site ☐ at office ☐ by phone	
Problems, suggestions; ☒ Report attached <u>See Appendix C</u>	
2. O&M staff _____	
Name	Title Date
Interviewed ☐ at site ☐ at office ☐ by phone	
Problems, suggestions; ☐ Report attached <u>See Appendix C</u>	

3. **Local regulatory authorities and response agencies** (i.e., State and Tribal offices, emergency response office, police department, office of public health or environmental health, zoning office, recorder of deeds, or other city and county offices, etc.) Fill in all that apply.

Agency: RWQCB

Contact: Larry Moore Staff Environmental Scientist 26 February 2013

Name	Title	Date
------	-------	------

Problems; suggestions; ☒ Report attached See Appendix C

Agency: EPA Consultant

Contact: Alex Lapolstol Technical Consultant 26 February 2013

Name	Title	Date

Remarks <u>None</u>				
IV. O&M COSTS				
1.	O&M Organization			
	☐ State in-house	☐ Contractor for State		
	☐ PRP in-house	☐ Contractor for PRP		
	☐ Federal Facility in-house	☐ Contractor for Federal Facility		
	☒ Other Contractor <u>CDM Smith is contracted by the City of Glendale.</u>			

2.	O&M Cost Records ☒ Readily available ☒ Up to date ☒ Funding mechanism/agreement in place Original O&M cost estimate ☐ Breakdown attached Total annual cost by year for review period if available From <u>Jan 2010</u> To <u>Dec 2010</u> <u>\$2,917,282.34</u> ☒ Breakdown attached Date Date Total cost From <u>Jan 2011</u> To <u>Dec 2011</u> <u>\$3,224,070.94</u> ☒ Breakdown attached Date Date Total cost From <u>Jan 2012</u> To <u>Dec 2012</u> <u>\$3,157,578.17</u> ☒ Breakdown attached Date Date Total cost		
3.	Unanticipated or Unusually High O&M Costs During Review Period Describe costs and reasons: <u>None</u>		
V. ACCESS AND INSTITUTIONAL CONTROLS ☒ Applicable ☐ N/A			
A. Fencing			
1.	Fencing damaged ☐ Location shown on site map ☒ Gates secured ☐ N/A Remarks <u>Security fence and gate in good condition.</u>		
B. Other Access Restrictions			
1.	Signs and other security measures ☐ Location shown on site map ☐ N/A Remarks <u>Has 4 surveillance cams, which are monitored at the power substation. There are intrusion alarms at all buildings, well covers, and control panels.</u>		
C. Institutional Controls (ICs)			

1.	Implementation and enforcement	
	Site conditions imply ICs not properly implemented	☐ Yes ☒ No ☐ N/A
	Site conditions imply ICs not being fully enforced	☐ Yes ☒ No ☐ N/A
	Type of monitoring (<i>e.g.</i> , self-reporting, drive by) <u>N/A</u>	
	Frequency <u>N/A</u>	
	Responsible party/agency <u>N/A</u>	
	Reporting is up-to-date	☐ Yes ☐ No ☐ N/A
	Reports are verified by the lead agency	☐ Yes ☐ No ☐ N/A
	Specific requirements in deed or decision documents have been met	☐ Yes ☐ No ☒ N/A
	Violations have been reported	☐ Yes ☐ No ☒ N/A
	Other problems or suggestions: ☐ Report attached	
	<u>No problems or suggestions; See Section 6.7</u>	
2.	Adequacy ☒ ICs are adequate ☐ ICs are inadequate ☐ N/A	
	Remarks <u>None</u>	
D. General		
1.	Vandalism/trespassing ☐ Location shown on site map ☐ No vandalism evident	
	Remarks <u>No trespassing. Minor graffiti on front gate and an exposed pipeline near the Los Angeles River.</u>	
2.	Land use changes on site ☒ N/A	
	Remarks <u>None</u>	
3.	Land use changes off site ☒ N/A	
	Remarks <u>None</u>	
VI. GENERAL SITE CONDITIONS		
A. Roads ☒ Applicable ☐ N/A		
1.	Roads damaged ☐ Location shown on site map ☒ Roads adequate ☐ N/A	
	Remarks <u>None</u>	
B. Other Site Conditions		
	Remarks <u>In general, site is clean and in good condition.</u>	
VII. LANDFILL COVERS ☐ Applicable ☒ N/A		
VIII. VERTICAL BARRIER WALLS ☐ Applicable ☒ N/A		

IX. GROUNDWATER/SURFACE WATER REMEDIES ☒ Applicable ☐ N/A	
A. Groundwater Extraction Wells, Pumps, and Pipelines ☒ Applicable ☐ N/A	
1.	Pumps, Wellhead Plumbing, and Electrical ☒ Good condition ☒ All required wells properly operating ☐ Needs Maintenance ☐ N/A Remarks <u>None</u>
2.	Extraction System Pipelines, Valves, Valve Boxes, and Other Appurtenances ☒ Good condition ☐ Needs Maintenance Remarks <u>None</u>
3.	Spare Parts and Equipment ☒ Readily available ☒ Good condition ☐ Requires upgrade ☐ Needs to be provided Remarks <u>None</u>
B. Surface Water Collection Structures, Pumps, and Pipelines ☐ Applicable ☒ N/A	
C. Treatment System ☒ Applicable ☐ N/A	
1.	Treatment Train (Check components that apply) ☒ Metals removal ☐ Oil/water separation ☐ Bioremediation ☒ Air stripping ☒ Carbon adsorbers ☐ Filters _____ ☒ Additive (<i>e.g.</i> , chelation agent, flocculent) <u>Polyphosphate antiscalant</u> ☐ Others _____ ☒ Good condition ☐ Needs Maintenance ☒ Sampling ports properly marked and functional ☒ Sampling/maintenance log displayed and up to date ☒ Equipment properly identified ☒ Quantity of groundwater treated annually <u>7,180 – 8,000 acre-ft</u> ☐ Quantity of surface water treated annually <u>None</u> Remarks <u>None</u>
2.	Electrical Enclosures and Panels (properly rated and functional) ☐ N/A ☒ Good condition ☐ Needs Maintenance Remarks <u>None</u>

3.	Tanks, Vaults, Storage Vessels ☐ N/A ☒ Good condition ☒ Proper secondary containment ☐ Needs Maintenance Remarks <u>Materials in tanks properly identified</u>
4.	Discharge Structure and Appurtenances ☐ N/A ☒ Good condition ☐ Needs Maintenance Remarks <u>None</u>
5.	Treatment Building(s) ☐ N/A ☒ Good condition (esp. roof and doorways) ☐ Needs repair ☒ Chemicals and equipment properly stored Remarks <u>None</u>
6.	Monitoring Wells (pump and treatment remedy) ☐ Properly secured/locked ☐ Functioning ☐ Routinely sampled ☐ Good condition ☐ All required wells located ☐ Needs Maintenance ☐ N/A Remarks <u>Monitoring wells were not visited on the site inspection</u>
D. Monitoring Data	
1.	Monitoring Data ☒ Is routinely submitted on time ☒ Is of acceptable quality
2.	Monitoring data suggests: ☐ Groundwater plume is effectively contained ☐ Contaminant concentrations are declining
E. Monitored Natural Attenuation	
1.	Monitoring Wells (natural attenuation remedy) ☐ Properly secured/locked ☐ Functioning ☐ Routinely sampled ☐ Good condition ☐ All required wells located ☐ Needs Maintenance ☐ N/A Remarks <u>This is not an MNA remedy, it is a containment remedy.</u>
X. OTHER REMEDIES	
<u>N/A</u>	

XI. OVERALL OBSERVATIONS	
A. Implementation of the Remedy	
	<p>Describe issues and observations relating to whether the remedy is effective and functioning as designed. Begin with a brief statement of what the remedy is to accomplish (i.e., to contain contaminant plume, minimize infiltration and gas emission, etc.).</p> <p><u>The purposes of the remedy are plume containment, mass removal, and maintaining an extraction rate of 5,000 gpm. Mass removal and the targeted extraction rate are being achieved, but the extent of plume containment is unknown. The only challenge has been extraction well maintenance routines; wastewater is generated and must be dealt with. Routine operations have not been affected by bacteria; bacteria is only an issue during well rehabilitation.</u></p>
B. Adequacy of O&M	
	<p>Describe issues and observations related to the implementation and scope of O&M procedures. In particular, discuss their relationship to the current and long-term protectiveness of the remedy.</p> <p><u>There have been no O&M challenges along these lines in the last 5 years. Adequate time has been available to schedule any necessary maintenance.</u></p>
C. Early Indicators of Potential Remedy Problems	
	<p>Describe issues and observations such as unexpected changes in the cost or scope of O&M or a high frequency of unscheduled repairs that suggest that the protectiveness of the remedy may be compromised in the future.</p> <p><u>None</u></p>
D. Opportunities for Optimization	
	<p>Describe possible opportunities for optimization in monitoring tasks or the operation of the remedy.</p> <p><u>The influent line pipe was split so that the system would not have to completely shut down during well rehabilitation. CDM Smith is looking at different ways to treat or use wastewater generated during well rehab. Looking to recycle backwash water through the plant, which CDPH is considering. CDPH has shown an increased willingness to allow increased flow rates though LPGAC units during change outs.</u></p>

Notes
City Utility Charges - Water and power costs, City oversight, CDPH charges. Credit given for energy and lab costs City would have incurred.
CDM Charges - Labor and materials to operate GWTP and wells, includes chemicals, lab analysis, and GAC.
KJ -Kennedy/Jenks expenses as cost consultant.
Not included are the Operational Loss payments, the Settlement Agreement payments (\$124,000/yr from 2008 - 2011) or property easements fees.

Appendix F: ARARs Summary

[This page is intentionally blank]

ARARs Summary

Chemical-specific ARARs

Chemical-specific ARARs are discussed in section **Error! Reference source not found.**1. Table 1 summarizes the chemical-specific ARARs.

Action-specific ARARs

Action-specific ARARs identified include Air Quality Standards, Hazardous Waste Management Regulations, and Water Quality Standards for ReInjection. These are summarized in Table 2.

In California, the authority for enforcing the standards established under the Clean Air Act has been delegated to the State. The program is administered by the South Coast Air Quality Management District (SCAQMD).

The State of California has been authorized by the EPA to develop and enforce its own hazardous waste regulations in lieu of the Federal program. These requirements are found in 22 CCR Division 4.5. The source of the VOCs in groundwater is unknown and, therefore, cannot be definitively classified as listed hazardous wastes. However, EPA determined in both RODs that the contaminants are sufficiently similar in nature to listed hazardous wastes that certain substantive requirements of California's hazardous waste regulations are relevant and appropriate at the site.

To-Be-Considered (TBC) Criteria

Two TBC criteria were identified for the GOU and are summarized in Table 3. As noted previously, the 1,4-dioxane notification level was revised from 3 to 1 µg/L in November 2010.

Table 1. Chemical-specific ARARs

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
SDWA (2 USC 300 et seq.)	National Primary Drinking Water Standards, including 40 CFR 141.61 and 40 CFR 141.62	Chemical-specific drinking water standards and MCLs have been promulgated under the SDWA; MCLGs above zero are considered chemical-specific ARARs under the NCP (40 CFR 300.430(e)(2)(i)(B)). When the MCLGs are equal to zero, which is generally the case for a chemical considered to be a carcinogen, the MCL is considered the chemical-specific ARAR instead of the MCLG (40 CFR 300.430(e)(2)(i)(C)). Established MCLs for COCs are listed in Error! Reference source not found..	There have been no changes to the federal MCLs since the last FYR. Protectiveness is not affected.	The MCLs are ARARs for the purpose of establishing performance standards for the treated water from the GOU treatment plant.	N/A
California Safe Drinking Water Act	California Safe Drinking Water Regulations, including 22 CCR 64431 and 22 CCR 64444	Contains provision for California domestic water quality; establishes MCLs for primary drinking water chemicals. Established MCLs for COCs are listed in Error! Reference source not found..	There have been no changes to the state MCLs since the last FYR. Protectiveness is not affected.	The MCLs are ARARs for the purpose of establishing performance standards for COCs in the water extracted from the basin and treated at the treatment plants.	N/A
California Domestic Water Quality Monitoring Regulations	CCR Title 22 Sections 64421 – 64445.2	Requires monitoring for any treated water which will be delivered to a distribution system.	No changes have been made to this requirement. Protectiveness is not affected.	Substantive monitoring requirements are relevant and appropriate to ensure that treated effluent is meeting performance standards.	N/A
California Secondary Drinking Water Standards (SDWS)	22 CCR 64471	Secondary Drinking Water Standards were promulgated to address the taste, odor, and appearance of drinking water, and apply the action of supplying the treated water to a public water supplier.	No changes have been made to this requirement. Protectiveness is not affected.	Although California SDWS are not applicable to non-public water system suppliers, the California SDWS are relevant and appropriate since the treated water under this action would be put into the City's drinking water system action.	N/A

Table 2. Action-specific ARARs

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
Clean Air Act SCAQMD	Regulation XIII	Regulation XIII requires that stationary sources of air emissions meet best available technology standards.	Rules 1309 (Emission Reduction Credits and Short Term Credits), 1315 (Federal New Source Tracking System), and 1325 (Federal PM _{2.5} New Source Review Program) of Regulation XIII have been amended or adopted since the previous FYR, but none of the changes affect protectiveness.	For air strippers, SCAQMD considers vapor phase GAC (with 90-99% removal efficiency) devices to be BACT. These are pre-construction requirements, so it is assumed that all applicable requirements were obtained before treatment units went on-line.	Latest amendment was on June 3, 2011.
Clean Air Act SCAQMD	Rule 1401	Rule 1401 specifies limits for individual cancer risk and excess cancer cases from new or modified stationary sources which emit carcinogenic air contaminants. The rule requires Best Available Control Technology (BACT) for toxic air discharge for new stationary sources where a lifetime maximum individual cancer risk of one in one million or greater is estimated to occur.	The list of chronic and acute toxic air contaminants was expanded, but this does not affect protectiveness.	As Rule 1401 is a pre-construction regulation, it is assumed that all applicable requirements were attained before the treatment units went on-line. If the air stripping treatment system is modified significantly, substantive provisions of Rule 1401 will still apply.	Latest amendment was on September 10, 2010.
Clean Air Act SCAQMD	Rule 401, Rule 402, Rule 403	Limit the visible emissions from a point source (Rule 401), prohibits discharge of material that is odorous or causes injury, nuisance or annoyance to the Public (Rule 402), and limits down-wind particulate concentrations (Rule 403).	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	These rules limit or prohibit visible, odorous or injurious, and particulate emissions from the treatment facility.	N/A
California Hazardous Waste Regulations, General Requirements	22 CCR 66264.14, 66264.18, and 66264.25	These sections specify security requirements (66264.14), location standards (66264.18), and precipitation standards (66264.25).	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	These are pre-construction requirements, so it is assumed that all applicable requirements were obtained before treatment units went on-line.	N/A

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
California Hazardous Waste Regulations, General Requirements	22 CCR 66264.15, 66264.16, and 66264.30-66264.56	These sections specify general inspection requirements (66264.15), personnel training (66264.16), and Preparedness and Prevention and Contingency and Emergency Preparedness (66264.30-66264.56)	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	The treatment plant is required to have health and safety plans and operation and maintenance plans under CERCLA that are substantively equivalent to these sections.	N/A
California Hazardous Waste Regulations, Generator Requirements	22 CCR 66264.600 - .603 ; 22 CCR 66264.111- .115	22 CCR 66264.600 - .603 contains requirements for miscellaneous units (air stripper is considered a miscellaneous unit). 22 CCR 66264.111- .115 contains closure requirements for the air stripper. The air stripper should be designed, operated, maintained, and closed in a manner that will ensure the protection of human health and the environment.	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	The substantive requirements for miscellaneous units and related substantive closure requirements appropriate and relevant for the air stripper.	N/A
California Hazardous Waste Regulations, Generator Requirements	22 CCR 66262.34 and 66264.170-.178	Waste stored on-site over 90 days should be placed in containers or tanks that are in compliance with California Waste Regulations.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	Storage of hazardous waste accumulated on-site must be in compliance with substantive requirements for interim status facilities.	N/A
California Land Disposal Restrictions, Requirements for Generators	22 CCR 66268	Compliance with land disposal regulation treatment standards is required if hazardous waste (contaminated groundwater or spent GAC) is placed on land.	No changes have been made to these requirements since that last FYR. Protectiveness is not affected.	Hazardous waste hauled off-site must meet “land-ban” requirements.	N/A

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
Groundwater ReInjection	40 CFR 144.12-.13	Federal Underground Injection Control Plan and prohibits injection wells such as those that would be located at the Site from (1) causing a violation of primary MCLs in the receiving waters and (2) adversely affecting the health of persons (40 C.F.R. §144.12). Section 144.13 provides that contaminated ground water that has been treated may be reinjected into the formation from which it is withdrawn if such injection is conducted pursuant to a CERCLA cleanup and is approved by EPA.	40 CFR 144.12 was amended in December 2010, but the amendment does not affect protectiveness.	These regulations are applicable to any treated water that is reinjected into the groundwater.	Dec 10, 2010
Groundwater ReInjection or Discharge to Surface Water	State Water Resources Control Board Resolution 68-16	Requires that reinjected water not unreasonably degrade existing water quality.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	Resolution 68-16 (Statement of Policy with respect to Maintaining High Quality of Waters in California) does not contain substantive requirements in and of itself. These regulations are applicable to any treated water that is reinjected into the groundwater or discharged to surface water.	N/A
Groundwater ReInjection	RCRA Section 3020	Provides that the ban on the disposal of hazardous waste into a formation which contains an underground source of drinking water shall not apply to the injection of contaminated groundwater into the aquifer if: 1) such reinjection is part of a response action under CERCLA, 2) such contaminated groundwater is treated to substantially reduce hazardous constituents prior to such reinjection, and 3) such response action will, upon completion, be sufficient to protect human health and the environment.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	This regulation is applicable to any treated water that is reinjected into the groundwater.	N/A

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
Treated Groundwater Discharge to Surface Water	Water Quality Control Plan for Los Angeles River Basin (RWQCB)	Treated water that is discharged, on a short term basis, to the Los Angeles River is subject to the National Pollutant Discharge Elimination System (NPDES) Program which is implemented by the Los Angeles RWQCB. In establishing effluent limitations for such discharges, the Los Angeles RWQCB considers the Basin Plan, which incorporates Resolution 68-16, and the best available technology economically achievable.	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	This requirement is applicable to any treated water that is discharged to surface water.	N/A
Mineral Quality Objectives for Treated Groundwater Discharge to Surface Water	Water Quality Control Plan for Los Angeles River Basin (RWQCB)	The Los Angeles RWQCB established mineral quality objectives for individual surface waters for the Los Angeles River Watershed. The mineral quality objective for nitrate in the Los Angeles River of 36 mg/L (8 mg/L nitrate-N).	No changes have been made to this requirement since that last FYR. Protectiveness is not affected.	Because the anticipated average concentration of nitrate in the short-term discharge is likely to be close to the MCL, and any discharge would be short-term, there should not be any significant long-term effects on the mineral quality of the Los Angeles River associated with short-term discharges of VOC-treated water. This requirement is applicable to any treated water that is discharged to surface water.	N/A

Table 3. To Be Considered Criteria

Source	Citation	Description	Effect on Protectiveness	Comments	Amendment Date
California PHGs, California Environmental Protection Agency, and OEHHA	California Calderon-Sher SDWA of 1996, California Health and Safety Code 116365	OEHHA has adopted PHGs for chemicals in drinking water. PHGs are levels of drinking water contaminants at which adverse health effects are not expected to occur from a lifetime of exposure.	No changes have been made to this requirement. Protectiveness is not affected.	In the absence of MCLs, the state PHGs adopted by OEHHA have been considered during selection of performance standards for extracted groundwater.	N/A
CDPH Drinking Water Notification Levels	California Health and Safety Code 116455	CDPH has established drinking water notification levels (formerly known as action levels) based on health effects, but in some cases they are based on taste and odor values for chemicals without MCLs.	CDPH revised its notification level for 1,4-dioxane from 3 to 1 µg/L. Notification levels are not ARARs. Protectiveness is not affected.	In the absence of MCLs, the drinking water notification levels established by CDPH have been considered during selection of performance standards for extracted groundwater.	December 14, 2010

SOIL ASSESSMENT REPORT

777 North Front Street

Burbank, California

July 2016

Supervision of fieldwork activities related to implementing the approved work plan was performed by the staff of Geosyntec Consultants, Inc., (Geosyntec) under the direction of the licensed professional with sufficient hydrogeologic experience whose signature appears hereon. The Soil Assessment Report (the "Report") was prepared under the supervision of the same. Consistent with applicable professional standards of care, our opinions and recommendations are based, in part, on data furnished by others as noted in this Report where applicable. Geosyntec is not able to independently verify data provided by others. Geosyntec services were performed, and this Report has been prepared, in accordance with generally accepted professional standards of care applicable to the scope of services authorized by Northridge Properties, LLC, consistent with direction from the Los Angeles Regional Water Quality Control Board, and no other warranty is provided in connection therewith.

Eric Smalstig, P.E.

Senior Principal, Geosyntec Consultants, Inc.

License No. C56128

I, Herbert F. Boeckmann, II, do hereby declare under penalty of perjury under the laws of the State of California that I am a Member of Northridge Properties, LLC, a California limited liability company (the "Company"); that I am authorized to attest to the veracity of the information contained in the report described herein; that the information contained in Geosyntec Consultants, Inc.'s "Soil Assessment Report, Additional Boring SS-4A, 777 North Front Street, Burbank, California," dated July 8, 2016 (the "Report"), is true and correct; that I have no personal knowledge or expertise with respect to the findings and information contained in the Report and I am relying on the professionals who prepared it; that the issuance of the Report and this Declaration is not an admission that the Company was or is a discharger within the meaning of Water Code Section 13267, which the Company expressly denies; and that this Declaration was executed at North Hills, California, on July 22, 2016.

Herbert F. Boeckmann, II, Member

1. INTRODUCTION

1.1 Project Overview

This Soil Assessment Report (Report) contains a summary of the soil sampling activities performed in June 2016 at the former industrial site located at 777 North Front Street, in Burbank, California (the Site), and an assessment of the analytical results. The Report was prepared by Brian Penserini of Geosyntec Consultants, Inc. (Geosyntec), and was reviewed by Matt Thomas, Ph.D., and Eric Smalstig, P.E., also of Geosyntec, in accordance with the peer review policy of the firm. Geosyntec has prepared this Report on behalf of its client Northridge Properties, LLC, for submission to the Los Angeles Regional Water Quality Control Board (LARWQCB) per the requirements of the approved Work Plan (Appendix A) [Geosyntec, 2015] that was prepared in response to the June 3, 2015 Order No. R4-2015-0065 [LARWQCB, 2015a]. The Work Plan was approved, with conditions, in a letter from the LARWQCB dated March 18, 2016 [LARWQCB, 2016].

Based on the results and conclusions of this Report presented in Sections 4 and 5: (1) that hexavalent chromium (Cr^{6+}) was not detected in the deepest soil horizon (i.e., 40 feet below ground surface (ft bgs); (2) that the vertical distribution of detections of Cr^{6+} encountered during this and previous Site investigations continue to be inconsistent with a historical Site release of Cr^{6+} at concentrations that could have impacted groundwater in the past; and (3) that Cr^{6+} concentrations in Site soils do not pose a threat to groundwater at the Site in the future, Geosyntec concludes that no further Cr^{6+} -specific investigations are warranted.

1.2 Report Organization

The remainder of this Report is organized into the following sections:

- Section 2, *Background*;
- Section 3, *Soil Sampling*;
- Section 4, *Results*; and
- Section 5, *Conclusions*.

References, a table, figures, and appendices are included at the end of the text.

2. BACKGROUND

2.1 Property Description

The Site located at 777 North Front Street (LARWQCB File No. 109.6162) consists of an approximately 8-acre lot in the City of Burbank, approximately 13 miles north-northwest of downtown Los Angeles (Figure 1). It is bordered by Interstate 5, Burbank Boulevard, and Front Street. From 1920 to 1961, the Site was occupied by General Water Heater Company, and then was purchased by Zero Corporation (Zero) for use by a division of the company called Zero Enclosures, whose primary business was fabrication of metal enclosures. In addition to Zero Enclosures' operations, from 1964 to 1973, a part of the Site was leased to Ocean Technology Inc., a subsidiary of Zero, which used the space to manufacture and assemble electronic products.

Zero's manufacturing operations were discontinued in December 1991. From then until 2002, the Site was used for storage (a 1995 city directory shows the occupant as Western Moving & Storage, Inc.) and later as temporary filming locations for the entertainment industry [Mactech 2005, p. 14; Law/Crandall 1997, p. 1]. The Site was sold to the Ford Leasing Development Company in 1998. Since 2002, the Site has been unoccupied, with on-site buildings having been demolished in 2004, leaving concrete pads and foundations currently remaining on the Site. The Site was periodically used for traveling circus operations (e.g., most recently Circus Vargas in 2016).

Recent activities associated with California Department of Transportation (Caltrans') widening of I-5 adjacent to the Site have resulted in some alterations to Site features, including in the area around the former clarifier near the SS-4 and SS-4A sampling locations (Figure 2). The activities were primarily related to stockpile soil storage and miscellaneous materials storage (e.g., large steel I-beams).

2.2 Regional Cr6+ Contamination and Recent Regulatory Context

This section summarizes the environmental context of the Site, both in terms of regional contamination, as well as regulatory actions. Previous Site reports provide additional details related to these topics. The Site is located within the San Fernando Valley Groundwater Basin (SFVGB). In 1980, the California Department of Health Services (DHS) requested that all major groundwater users conduct tests for the presence of certain industrial chemicals in the water they were serving. The results of testing indicated elevated concentrations of a number of volatile organic compounds (VOCs) in groundwater under large portions of the San Fernando Valley, which led to the designation of four separate areas that together comprise the San Fernando Valley Superfund Sites.

In 1998, during the United States Environmental Protection Agency (USEPA) Superfund investigation, information provided to LARWQCB from the Upper Los Angeles River Area Watermaster (ULARA) indicated that some of the groundwater supply wells in the SFVGB had been contaminated by hexavalent chromium (Cr^{6+}) [LARWQCB, 2011b]. Subsequently, the LARWQCB re-evaluated Chemical Use Questionnaires (CUQs) provided by each facility during the Superfund investigation and identified 112 sites, presumably the most suspect sites, and required that they conduct further investigations to determine whether Cr^{6+} concentrations in the soil at these sites indicated past release that may have contributed to the regional Cr^{6+} contamination or that might pose a threat to public drinking water supply wells in the future. It is significant to note that the subject Site was not among the 112 sites identified by the LARWQCB at that time.

The former responsible party for the Site had been issued a Certificate of Completion by Cal/EPA in 2002. The Site remained closed until it was reopened by the LARWQCB Order titled “*Requirement to Provide Technical Report – Work Plan*” [LARWQCB, 2011b]. The primary reasons for issuance of the Order given in the accompanying letter [LARWQCB, 2011a] were: (1) the records of historical use of Cr^{6+} at the facility; and (2) the results of a Caltrans soil investigation that indicated there exist a limited number of detections of Cr^{6+} at the Site [Ninyo & Moore, 2009] at concentrations that, according to the LARWQCB, are in exceedance of normal background concentrations of Cr^{6+} in the San Fernando Valley [LARWQCB, 2011a]. A detailed summary of the results of the Caltrans report were provided in the original approved investigation Work Plan for Cr^{6+} sampling at the Site.

The aforementioned Order was issued by LARWQCB to Northridge Properties, LLC, on May 10, 2011. Northridge Properties, LLC, worked with LARWQCB to target locations at the Site where impacts, if any, would be anticipated should any unauthorized releases of Cr^{6+} have occurred in the past. The five former clarifier locations shown on Figure 2 were selected. On behalf of Northridge Properties, LLC, Geosyntec submitted the Soil Assessment Work Plan – Hexavalent Chromium [Geosyntec, 2011], which was approved by the LARWQCB in a letter dated December 20, 2011. Work was completed in June 2012. After the LARWQCB review of the Site Assessment Report [Geosyntec, 2012] and the coordinated discussions between Northridge Properties and the LARWQCB that followed, the LARWQCB issued the June 3, 2015 Order No. R4-2015-0065 requiring additional soil assessment at the Site. A Work Plan was prepared responding to the order which was subsequently approved, with conditions, in a letter from the LARWQCB dated March 18, 2016 [LARWQCB, 2016]. Sampling activities in the approved Work Plan were implemented on June 2, 2016, and Geosyntec has prepared this Report to present and provide an assessment of the analytical results obtained.

3. SOIL SAMPLING

3.1 General

The Soil Assessment activities described in this Report were conducted in accordance with the Site-specific Health and Safety Plan (HASP) and the approved Work Plan (Appendix A) prepared in accordance with the LARWQCB request. To supplement the previous assessments of the Site, specifically with respect to vertical delineation of hexavalent chromium (Cr^{6+}) in the vicinity of one of the former clarifiers, and in accordance with the approved Work Plan, an additional soil boring (SS-4A) was drilled to a depth of 40 ft bgs and soil samples were collected at various depths. The location of SS-4A is shown on Figure 2, along with the locations where Geosyntec collected previous soil samples in June 2012.

SS-4A was drilled to a depth of 40 ft bgs and soil samples were collected at 10, 20, 25, 30, 35, and 40 ft bgs. Duplicate samples were collected at 10 ft and 20 ft bgs. The shallowest two depths were also intended to compare and/or confirm the results from the previous soil testing at SS-4, and the subsequent samples were collected at 5-foot intervals to the termination depth of the boring. The results from this sampling event are documented and summarized in this Report, along with Geosyntec's previous assessment results.

3.2 Field Work Preparation

The location of SS-4A was selected pursuant to conversations with the LARWQCB related to the detection of Cr^{6+} at a concentration above the laboratory reporting limit in sample SS-4 (at 20 ft bgs). SS-4 was located in an area originally identified as a potential area of concern based on discussions with LARWQCB and review of facility maps, which indicated the former presence of a clarifier (now closed and filled with concrete). LARWQCB agreed that for this supplemental investigation, one additional boring would be drilled adjacent to the former clarifier and in the vicinity of the previous location SS-4 (June 2012); LARWQCB representatives also attended a field walk with Geosyntec to confirm the location of SS-4A.

Underground Service Alert (USA) was notified more than 48 hours prior to beginning drilling activities to identify underground utilities in the vicinity of the proposed borehole location and to reduce the potential for accidentally encountering buried utility lines (USA ticket number A61341104). Once utilities were cleared, drilling of the borehole was scheduled. Geosyntec also contracted with Goldak Geophysics to conduct a subsurface geophysical survey to identify locations of potential underground utilities. Goldak identified a subsurface anomaly in the approximate location of the former clarifier

and marked the outline of the anomaly with high-visibility paint. SS-4A was then positioned approximately 5 ft north of the anomaly.

3.3 Soil Sampling

On June 2, 2016, under the direction of Geosyntec, Gregg Drilling advanced a single boring (labeled SS-4A; Figure 2) using a hollow-stem auger rig to a depth of approximately 40 ft bgs and several depth discrete soil cores were collected using a 18-inch split-spoon sampler. Borings were visually logged for geologic lithology in accordance with the Unified Soil Classification System (USCS). The first 5 ft of the boring was completed by hand auger to reduce the potential for impairing unidentified underground utilities or pipes. Soil samples were collected from the cores at 10, 20, 25, 30, 35, and 40 ft bgs in accordance with the approved Work Plan (Appendix A) using disposable sampling equipment in order to avoid cross contamination of samples. A photographic log showing the Site soil assessment field procedures is provided in Appendix D. A total of six primary soil samples and two duplicate soil samples (labeled SS-4A-10DUP and SS-4A-20DUP) were collected in this manner.

The soil samples were collected in 4-oz. glass jars sealed with Teflon®-lined plastic caps for Cr⁶⁺ analysis (EPA Method 7199). Individual soil samples were labeled with unique identifiers, logged on laboratory chain of custody forms, placed in an ice-filled cooler, and transported to Eurofins-Calscience Environmental Laboratories, Inc. (Eurofins-Calscience), a local National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory. The boring was backfilled with bentonite from the borehole terminus to ground surface. Remaining soil cores were stored in a 55-gallon DOT-approved drum during drilling and sampling activities and were removed from the Site. Upon receipt of laboratory results and waste profiling, the remaining soil cores were properly disposed of by the driller as non-hazardous waste.

The non-dedicated soil sampling equipment (e.g., coring bits and hand augers) was washed prior to each sample collection by the “three-bucket-wash” method; sampling equipment was first washed in a solution of Alconox and potable water, then rinsed with potable water, and finally rinsed with distilled water and allowed to air-dry.

3.4 Laboratory Analysis

Samples were transported with proper chain of custody forms to Eurofins-Calscience, located at 7440 Lincoln Way, in Garden Grove, California, and were analyzed for Cr⁶⁺ using EPA Method 7199. The laboratory analytical results for the soil samples are discussed in Section 4. The laboratory analytical report is provided in Appendix B.

4. RESULTS

4.1 Introduction

The laboratory analytical results for the soil samples arranged by boring location and depth for both the samples collected in June 2012 and in June 2016 are summarized in Table 1. In order to have a basis of comparison, Table 1 also includes the USEPA Region 9 Soil Screening Levels for Cr^{6+} in Soil (SSLs) for both residential and commercial/industrial land use [USEPA, 2016, and subsequent revisions to tables]. Soil lithology and analytical results are described in the following sections, and the laboratory analytical report is included in Appendix B.

4.2 Soil Lithology

The soil boring (SS-4A) advanced at the Site was logged for soil lithology in accordance with the Unified Soil Classification System (USCS) and screened visually for evidence of contamination. No visually evidence of metals staining was observed in the primarily sandy alluvial soils to 40 ft bgs. The boring log showing the soil lithology at the boring location is provided in Appendix C. Soil lithology was consistent with previous borings described in the 2012 Site assessment report [Geosyntec, 2012].

4.3 Soil Sample Cr^{6+} Analytical Results

A total of six primary and two duplicate soil samples were collected from SS-4A and were analyzed for Cr^{6+} using EPA Method 7199. Table 1 summarizes the analytical results and provides commercial/industrial SSLs (i.e., chemical-specific soil health screening levels for commercial/industrial land use) for comparison. A plan view of boring locations from June 2012 and June 2016 is provided in Figure 3 that includes tables with soil sample depths and concentrations of Cr^{6+} . Per the request of the LARWQCB in the conditional approval letter [LARWQCB, 2016], the vertical distribution of Cr^{6+} results is also shown on Figure 4 along with a general lithologic profile.

Cr^{6+} , which was the primary constituent of concern for this Site soil assessment, was detected in only one of the six primary soil samples collected. This detection was in a sample collected at a depth of 35 ft bgs in boring SS-4A. The measured concentration was less than 10 times below the industrial USEPA SSL, (see Table 1) and was 0.09 mg/kg greater than the laboratory method quantitative reporting limit of 0.4 mg/kg, slightly above the residential SSL at 35 ft bgs (where no exposure would occur). Moreover, Cr^{6+} was not detected in the sample collected at a depth of 40 ft bgs in boring SS-4A.

5. CONCLUSIONS

5.1 Summary

Based on the soil sampling data collected as part of this Soil Assessment as presented in the preceding section of this Report (see Table 1 and Figure 3) and the analyses presented in the following sections, several conclusions related to chemical impacts at the Site can be drawn:

- The single low-level detection of Cr^{6+} in the soil samples collected from the SS-4A location where impacts, if any, would be anticipated (i.e., near the former clarifier location detected at a concentration significantly less than 10 times below the USEPA SSL) confirm the previous report [Geosyntec, 2012] finding that the limited number and low concentrations of Cr^{6+} detections at the Site are not significant; and
- The single detection of Cr^{6+} in SS-4A at 35 ft bgs, with no detection at 40 ft bgs, is inconsistent with historical releases of Cr^{6+} at concentrations that could have impacted groundwater and do not provide evidence to suggest that historical Site activities contributed to the San Fernando Valley Groundwater Basin (SFVGB) Cr^{6+} contamination that is currently under investigation by LARWQCB and USEPA.

The conclusions summarized above in bulleted format are described in more detail in the following sections.

5.2 Hexavalent Chromium

Hexavalent chromium, the chief focus of the LARWQCB Orders [LARWQCB, 2011b and 2015a] and of this Soil Assessment, was detected in one of the six primary soil samples collected (one of eight samples, if the duplicates are counted) from the sample location SS-4A that was specifically selected for this field program and approved by LARWQCB. Furthermore, the detection of Cr^{6+} was at a low concentration (below the industrial SSL as shown in Table 1). When combined with the previous results in 2012, these results provide further indication that the limited Cr^{6+} detections at the Site are not significant.

In terms of vertical distribution, the one detection at 35 ft bgs was at a low concentration, just 0.09 mg/kg above the detection limit. These results are inconsistent with historical releases of Cr^{6+} at concentrations that could have impacted groundwater and do not provide evidence to suggest that historical Site activities contributed to the San Fernando

Valley Groundwater Basin (SFVGB) Cr^{6+} contamination that is currently under investigation by LARWQCB and USEPA. In addition, because Cr^{6+} was not detected in the sample collected at the base of the soil boring (40 ft bgs), the vertical distribution of Cr^{6+} detections in boring SS-4A, as well as the previous soil sampling results, makes it unlikely that the groundwater table would come into contact with these soils. Furthermore, the low concentrations of Cr^{6+} are orders of magnitude below the Total Threshold Limit Concentration (TTLC = 500 mg/kg) and the more conservative value of 10 times the Soluble Threshold Limit Concentration (STLC; i.e., the comparable threshold value for STLC leachability testing = 50 mg/kg) which is an indication of a contaminant's potential to impact (i.e., leach into and/or migrate downward to) groundwater. These results demonstrate that Cr^{6+} concentrations in Site soils do not pose a threat to groundwater at the Site in the future. Finally, the LARWQCB committed to add Cr^{6+} to the Certificate of Completion for the Site and to reissue it if the additional boring documented in this Report yields a non-detect finding at depth for Cr^{6+} , which it has yielded [LARWQCB, 2015b].

5.3 Conclusion

Given the conclusions of this and the previous Soil Assessment and their consistency with past soil sampling findings provided by previous technical investigations, Geosyntec concludes that no further hexavalent chromium-specific investigations are warranted.

APPENDIX A

APPROVED WORK PLAN

October 1, 2015

Samuel Unger
Executive Officer
Regional Water Quality Control Board, Los Angeles Region
320 West Fourth Street, Suite 200
Los Angeles, CA 90013

**Subject: Supplemental Investigation Work Plan – Hexavalent Chromium
777 North Front Street, Burbank, California**

Dear Mr. Unger:

INTRODUCTION

This document consists of a Work Plan for supplemental soil assessment to be conducted at the 777 North Front Street property, located in Burbank, California (the Site). This Work Plan was prepared by Geosyntec Consultants, Inc. (Geosyntec) at the request of Gilchrist & Rutter Professional Corp. (Gilchrist) on behalf of Northridge Properties, LLC, the owner of the property, for submittal to the Los Angeles Regional Water Quality Control Board (LARWQCB). The soil assessment is being conducted in response to a LARWQCB letter addressed to Northridge Properties, LLC, dated June 3, 2015 (LARWQCB Case File No. 109.6162). The letter required that Northridge Properties, LLC, complete a supplemental soil investigation in the vicinity of one of the previous investigation boring locations, and submit a technical report documenting the results of the supplemental investigation.

SAMPLING AND ANALYSIS PLAN

General

To supplement the previous assessments of the Site, specifically with respect to vertical extent of hexavalent chromium in the vicinity of a former clarifier, an additional soil boring will be drilled in the location to a depth of 40 feet below ground surface (bgs) in the area identified in the attached Figure 1. The proposed sample location SS-4A was selected pursuant to conversations with the LARWQCB related to the detection of hexavalent chromium at a concentration above the laboratory reporting limit in sample

SS-4 (at 20 ft bgs). The locations where Geosyntec collected previous soil samples are also shown on Figure 1. While the LARWQCB requires in their June 3, 2015, letter that the boring shall be advanced to 50 ft bgs, subsequent conversations with Mr. Larry Moore of the LARWQCB, case representative for this site, allowed for the depth of the new boring at the SS-4 location to be 40 ft bgs, doubling the depth achieved during the previous soil investigation. Northridge Properties, LLC, understands that, if hexavalent chromium is detected in soils at 40 ft bgs, additional supplemental soil investigation may be required to the originally specified depth of 50 ft bgs¹.

The proposed boring location SS-4A will be drilled to 40 ft bgs, with soil samples to be collected at the following depths below ground surface: 10 ft, 20 ft, 25 ft, 30 ft, 35 ft, and 40 ft. The shallowest two depths are intended to confirm results from the previous soil testing at SS-4, and the subsequent samples collected at 5 ft intervals to the termination depth of the boring. The results from this sampling event will be documented and summarized along with Geosyntec's previous assessment results.

Fieldwork Preparation and Borehole Installation

The soil boring location will be determined in the field during a site walk with representatives of Northridge Properties, LLC, and the LARWQCB.

The soil boring will be installed using hollow stem drilling technology. The boring will be drilled to a depth of up to a maximum of 40 ft bgs or until refusal; if drilling refusal is encountered prior to reaching 40 ft bgs, then the location will be relocated in the immediate vicinity of SS-4A and drilling resumed. As the Site is vacant without knowledgeable Site personnel, borehole locations will be cleared of underground utilities by performing a geophysical survey in advance of field work, and notification of Underground Service Alert (USA) prior to commencing field work. Concrete coring will be performed prior to drilling in areas currently covered with a concrete foundation.

Sample Collection

Samples of the subsurface soil will be recovered at approximately the intervals noted above over the entire borehole depth using an approximately 2-inch diameter California split spoon sampler. The boring will be overseen by a registered Professional Engineer

¹ Based on field drilling conditions, Geosyntec may opt to continue the boring to 50 ft bgs as specified in the RWQCB June 3, 2015, letter, and to hold soil samples collected from 45 ft bgs and 50 ft bgs for analysis only if the presence of a detectible level of hexavalent chromium is confirmed in the soil sample collected from 40 ft bgs.

or Geologist, with visually logging for geologic lithology in accordance with the Unified Soil Classification System (USCS) through evaluation of drill cuttings and soil samples by the field representative. The soil core will be visually evaluated for evidence of impacts. Select soil samples will be retained for laboratory analytical testing at the intervals identified above. Soil sampling intervals may be adjusted based on the results of observations of visual impacts, or the identification of low permeable layers. Soil samples will be stored in a cooler on ice pending shipment to Eurofins/Calscience Laboratories under chain of custody protocol. Samples will be analyzed for hexavalent chromium speciation. Similar to the previous soil investigation, the laboratory reporting limit for hexavalent chromium is 0.40 milligram per kilogram (mg/kg).

Decontamination and Investigation-Derived Waste Disposal

The borehole will be abandoned with hydrated bentonite pellets. Augers will be decontaminated with a three-stage rinse; waste cuttings and decontamination water that are generated are referred to as investigation-derived waste. Investigation-derived wastes will be stored in drums for off-site disposal.

Quality Assurance/Quality Control

Duplicate samples will be collected from each sampling depth as a contingency. Trip blanks will be stored with analytical samples during transport to the analytical lab. Quality control procedures of Eurofins/Calscience Laboratories will be included in an appendix to the final report along with lab reports.

DATA ANALYSIS AND REPORTING

A data summary report will be prepared to document field activities and present the findings of the investigation. This report will be submitted to the LARWQCB within six weeks of receipt of the laboratory analytical results. The report will include figures illustrating sampling locations and copies of laboratory analytical data. The investigation analytical results will be evaluated based on a comparison with historical hexavalent chromium data, as well as EPA-established screening levels. If appropriate, the report will include recommendations for further analysis or investigation/delineation; pursuant to discussions with the LARWQCB, the recommendations may include a request for soil closure if the soil sample hexavalent chromium concentrations are below screening limits and the deepest (i.e., 40 ft bgs) sample is below laboratory reporting limit of 0.40 mg/kg. Per the requirements of the LARWQCB, the boring log will also be prepared and included in the report.

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 06/02/16. They were assigned to Work Order 16-06-0179.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of ≤ 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 16-06-0179

Page 1 of 1

<u>Qualifiers</u>	<u>Definition</u>
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.
	Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.
	Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.
	A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

1.0 INTRODUCTION

This report presents the results of a soil gas survey and soil investigation conducted on behalf of SJ4 Burbank LLC, a Delaware Limited Liability Company (SJ4) and Manatt, Phelps & Phillips LLP (Manatt) for the approximately 8-acre property located at 777 North Front Street in Burbank, California (the “site” or “subject property”). A Vicinity Map of the site is presented in Figure 1.

The purpose of Leighton’s environmental investigation of the site was to evaluate subsurface soil conditions at the site for the presence of chemicals of potential concern (COPCs) that may be encountered during the planned excavation activities associated with the subsurface parking structures of the redevelopment. Because of the industrial history of the site and previously identified areas where soil has been affected by hazardous substances and/or petroleum products, characterizing subsurface soils prior to excavation is a critical factor in determining the cost for the redevelopment. A site-wide soil gas survey was also performed to evaluate for the presence of volatile organic compounds (VOCs) that may represent a potential vapor intrusion concern for the residential and commercial structures planned at the site.

2.0 BACKGROUND

It is our understanding that SJ4 plans to redevelop the site into a mixed-use residential apartment complex with some ground level retail and a hotel (collectively, "Redevelopment"). Single-level, and some two-level, subterranean parking are currently planned for the residential/commercial complex. We understand a hotel is planned for the northwestern-most portion of the site and will have subgrade parking with initial indications of one parking level.

The subject property is the former location of a water heater manufacturing company known as General Water Heater Company (GWHC) which operated onsite from the 1930s until 1961. Galvanizing and later vulcanizing operations were conducted in a building in the central portion of the site and a building where plating operations were performed was also noted in the same general area. Welding and metal working was performed at multiple areas onsite. Other than conducting galvanizing, vulcanizing, plating, welding, and metalwork in the northwestern portion of their facility (Sanborn maps from 1940s and 1950s), little information is known about the management of hazardous substances and petroleum products conducted by General Water Heater at the site.

Zero Corporation (Zero) which manufactured metal cases and other products operated onsite from approximately 1961 to 1991. Zero's manufacturing operations included aluminum case drawing and washing, aluminum alodining (a metal coating process involving chromium and aluminum), chromate deoxidizing, steel phosphate coating and chromium sealing. The Zero facility was comprised of six buildings and contained paint booths, a water-based paint shop and drying booth, aluminum machining, etching, deoxidizing and cleaning, aluminum vapor degreasing, and grinding. Zero also operated five clarifiers, two unleaded gasoline underground storage tanks (USTs), exterior chemical storage areas, paint storage areas, an oil storage area, an acid storage area, an acid/caustic soda storage area, and an exterior hazardous waste staging area.

Ford Leasing Development Company (FLDC) purchased the site in 1998 from Zero with the intent to redevelop the property as a car dealership. The FLDC redevelopment of the site did not occur. Since Zero's 1991 departure, the site has been dormant other than occasionally being leased for storage and as a filming location for the entertainment industry. The former Zero buildings were demolished with the building slabs left intact in 2004. The site was purchased by Northridge Properties, LLC the current owner, from FLDC in 2005.

2.1 Regional Groundwater Issue

The subject property is located within the eastern portion of the San Fernando Valley Superfund area. The former Zero facility was listed as a potential responsible party (PRP) of this groundwater contamination based on the historical uses described in the section above. The US Environmental Protection Agency, Region 9 (US EPA) has jurisdiction of the regional groundwater contamination in the San Fernando Valley Superfund area, and state agencies, including the Regional Water Quality Control Board-Los Angeles Region (RWQCB) and the Department of Toxic Substances Control (DTSC), are assisting agencies with jurisdiction regarding PRP source investigation and control. The subject property was assigned to RWQCB for that purpose, originally with respect to VOC impacts to the regional groundwater contamination plume. In 1998, the US EPA expanded the regional investigation to include chromium impacts to groundwater. In addition, in 1998, the Site Designation Committee of the California Environmental Protection Agency (Cal/EPA) designated the RWQCB to be the Administering Agency for the subject property under California's Unified Agency Review of Hazardous Materials Release Sites Law. Since that time, the RWQCB has continued as the lead state regulatory agency and a review of the numerous reports provided to us indicates the site has been extensively investigated for soil, soil gas, and groundwater contamination.

In 2000 (effective in 1998), the US EPA entered into an agreement and Covenant Not to Sue (Covenant) with FLDC, the then potential site developer identified as the Settling Respondent. In exchange for the issuance of the Covenant, FLDC paid \$150,000 to the US EPA. In general terms, we understand that Northridge Properties, LLC was assigned the benefits of the Covenant when it acquired the subject property in 2005 and that SJ4 is seeking an assignment of the Covenant should they acquire the subject property. However, as further explained below, the RWQCB is currently evaluating the site as part of its investigation of the regional hexavalent chromium (CrVI) contamination in groundwater. The presence of CrVI in soil recently detected at a concentration of 0.41 milligrams per kilogram (mg/kg) at the subject property has resulted in the RWQCB requiring further environmental evaluation of this emergent chemical which has affected groundwater beneath the Burbank area. It is our understanding that Northridge Properties, LLC and their environmental consultant, Geosyntec

Consultants, are in the process of addressing the request by the RWQCB to further investigate CrVI on the subject property, as further explained below.

2.2 Historical Assessment Activities

According to records provided by Northridge Properties, LLC, environmental assessment activities began at the site in 1991 to comply with the RWQCB Well Investigation Program directive regarding the regional groundwater issue described above. Targhee, Inc. (Targhee) completed an initial investigation of the site, collecting several soil samples in areas of concern such as, but not limited to, adjacent to the clarifiers and within the chemical storage areas, hazardous waste storage area, oil storage area, and solvent storage area. Evidence of soil affected by chlorinated VOCs and total petroleum hydrocarbons was discovered by Targhee.

Leighton represented the City of Burbank on the adjacent Hyrail property in 1991. The Hyrail property, which is approximately 2,150 feet long by 50 feet wide, is situated primarily at the westerly edge of the site. Two soil gas surveys were performed by Leighton at the Hyrail property in 1991. Soil gas probes were installed at depths of 10 and 24 feet below ground surface (bgs) and two soil borings were drilled to groundwater (encountered at approximately 110 feet bgs). The predominant chlorinated VOCs detected in groundwater at concentrations exceeding their Maximum Contaminant Levels (MCL) included perchloroethylene (PCE), trichloroethylene (TCE), cis-1,2-dichloroethylene, and 1,1-dichloroethylene (1,1-DCE). It was Leighton's opinion that the VOCs detected in groundwater originated from the subject property (i.e., Zero facility).

Based on Targhee's and Leighton's findings, Hydro Geo Chem, Inc. (HGC) completed a site investigation of the Zero property in 1992 on behalf of Zero and determined that soil and soil gas were contaminated with chlorinated VOCs. Figures prepared by HGC showing the sampling locations and distribution of VOCs in soil gas are included in Appendix A (Appendix A-1 - Hydro Geo Chem, Inc. 1992 Figures). HGC completed several additional site investigations in the 1990s assessing the extent of chlorinated VOCs in soil, soil gas, and groundwater at the site. A total of nine groundwater monitoring wells were installed at the site to evaluate the distribution of VOCs in groundwater. Soil gas remediation efforts completed by HGC at the site are described in the next section – Historical Remediation Activities.

In 2005, Golder Associates, Inc. (Golder) was contracted by FLDC to conduct soil sampling adjacent to 12 oil-filled transformers, two capacitor banks, and a former in-ground hydraulic elevator remaining onsite following the demolition of the Zero buildings in 2004. Golder collected soil samples from one boring adjacent to the former in-ground hydraulic elevator and 14 surficial concrete or gravel samples adjacent to the electrical units. Polychlorinated biphenyls (PCBs) were not detected in the soil samples collected adjacent to the former hydraulic elevator and PCBs detected in the concrete and gravel samples did not exceed 12 parts per million (ppm) and were not considered regulated under the Toxic Substance Control Act (TSCA). Golder's subsequent 2006 report documents the removal and excavation of oil-stained concrete transformer pads, the removal of former electrical equipment from the site, and the removal of stained soil from the four former substation locations. Golder's post-excavation soil sampling revealed no detectable PCB concentrations.

In 2009, Caltrans contracted with Ninyo & Moore (N&M) to evaluate the northeasterly portion of the former Zero property with the intent to widen Interstate 5 to accommodate the development of High Occupancy Vehicle (HOV) lanes. This portion of the former Zero property has since been deeded to Caltrans as a permanent easement. N&M collected numerous soil and soil gas samples from the easement area. The results of N&M's investigation revealed there were detectable concentrations of CrVI in the soil which exceed the typical background concentration in the native soils in the San Fernando Valley. It should be noted that N&M included in their report that the former Zero facility received a notice of violation from the City of Burbank Public Works Department in 1975 for discharging wastewater with elevated chromium concentrations. The N&M investigation also indicated that the shallow soil gas results for VOCs, such as PCE, exceeded California Human Health Screening Levels (CHHSLs) for both residential and commercial/industrial settings. Additionally, their report also suggested that subsurface VOC concentrations have rebounded significantly since the site was remediated in 2001. Figures showing the concentrations of PCE detected in soil gas during N&M's investigation are included in Appendix A.

As part of the ongoing evaluation of the San Fernando Superfund case, groundwater supply wells in the San Fernando Basin were identified to have been contaminated with CrVI in 1998. The RWQCB identified 112 initial facilities at which further investigation was required to determine whether CrVI concentrations in soil at these locations indicates a significant past release that

may have contributed to the regional contamination. The former Zero property was not included among the initially identified facilities, but in May 2011, a letter from the RWQCB mandated soil investigation at the site based on past use of chromate salts and the findings of the 2009 Caltrans investigation (described above) that identified CrVI in onsite soil.

In their December 2011 Work Plan approval letter regarding the CrVI investigation, the RWQCB indicated that the property owner would also be required to perform soil vapor evaluation of VOCs to assess the extent it may affect human health via shallow soil vapor intrusion into habitable places. Due to the then-current site conditions and the eventual demolition of the remaining concrete slabs and subsurface features, and correspondent soil grading and redevelopment activities, the RWQCB agreed to put the requirement into temporary abeyance pending such redevelopment actions.

In 2012, GeoSyntec Consultants (GeoSyntec) was contracted by Northridge Properties, LLC to further evaluate CrVI in onsite soil to comply with the RWQCB's directive. A total of 5 borings were advanced at the site in the vicinity of the former clarifiers and soil samples were collected from each boring at 5-foot intervals from 5 feet bgs to the maximum investigation depth of 20 feet bgs. GeoSyntec found that CrVI was detected in 4 of the 20 soil samples collected during the investigation at concentrations that did not exceed the residential CHHSSL, which was the risk-based threshold in place at the time. GeoSyntec concluded that the vertical distribution of detections of CrVI in soil were inconsistent with historical releases of CrVI that would have affected groundwater and were not evidence to suggest that historical site activities had contributed to the groundwater basin's regional CrVI contamination. In response to GeoSyntec's report, the RWQCB issued a subsequent order, dated June 3, 2015, indicating that additional investigation is required around boring SS-4 (completed in 2012) located near a former 3-stage clarifier. On October 1, 2015, GeoSyntec submitted a Work Plan to the RWQCB for the completion of one additional boring, SS-4A, to a depth of 40 feet bgs in the area of the former 3-stage clarifier. It is Leighton's understanding that the scope of work outlined in the October 2015 Work Plan has been completed after approval of their Work Plan by RWQCB. We understand the results of their findings will be shared with SJ4 in the future. A figure showing the CrVI concentrations previously detected in soil samples collected at the site during GeoSyntec's investigation is included in Appendix A (Appendix A-4 - GeoSyntec Consultants 2012 Figure).

2.3 **Historical Remediation Activities**

Two phases of soil remediation for chlorinated VOCs have been conducted by HGC at the site on behalf of Zero, and later for APW North America Inc., after Zero's acquisition in or about 1998. A shallow soil vapor extraction (SVE) system (Phase 1) remediated the top 20 feet of soil within the proposed excavation/redevelopment areas between May 1998 and July 1999. A workplan to remediate VOCs in deeper site soil (Phase 2) was developed in 1996 by HGC. Cleanup progress was monitored using multi-level soil gas monitoring probes. The deeper soil SVE system included air sparging wells and began operation in December 1998 and full-scale operation began in February 1999 and operated until 2001.

On November 28, 2001, the RWQCB reviewed HGC's *Supplemental Site Closure Information* report dated August 23, 2001. The RWQCB indicated that "... Based on our review of the available information and with provision that the information provided to this agency was accurate and representative site conditions, we have no further requirements for VOCs soil contamination with respect to the San Fernando Valley Cleanup Program at the subject site. The relatively small volume of impacted soil, attenuation of concentrations with depth, and the diminished concentrations of VOCs remaining in soil appear not to pose a present or continuing threat to groundwater quality. Therefore, no further VOC assessment or cleanup of soil is warranted." On July 1, 2002, the Regional Board issued a Certificate of Completion for the site pursuant to California Health & Safety Code Section 25264, finding among other things that the site investigation and remediation at the site has been satisfactorily completed and a permanent remedy has been accomplished and that applicable remedial standards and objectives were achieved.

2.4 **Ongoing Environmental Concerns**

One of the environmental concerns associated with the subject property is that the original slabs from the Zero facility have not been removed from the site and that notwithstanding extensive past studies, there remains significant uncertainty regarding the environmental condition of shallow soils and soil gas beneath the site as they relate to the potential presence of VOCs, CrVI, additional hazardous substances and/or petroleum products. The RWQCB has ordered that a soil vapor intrusion assessment of the site be completed prior to redevelopment and

has ordered the Northridge Properties, LLC to investigate the potential presence of the emergent chemical, CrVI. Although groundwater quality may not be threatened by residual VOCs beneath the site, a complete exposure pathway via inhalation of residual VOCs could exist for future site residential and commercial occupants. However, SJ4's planned construction of a subgrade parking structure with adequate ventilation could serve to mitigate the potential for vapor intrusion by VOCs into future residential and commercial areas. Furthermore, the potential presence of residual contamination in soil could represent a significant cost concern for SJ4 when soil excavation commences during site redevelopment if disposal at a permitted facility is required and the risks associated with residual contamination remaining on-site from unexcavated soils will need to be assessed.

2.5 Leighton Observation of Site Conditions

Leighton conducted an initial site visit of the subject property on February 2, 2016 to observe existing conditions. The subject property is currently undeveloped with the exception of the building slabs that were associated with the former Zero manufacturing facility as well as possibly, the General Water Heater facility. Multiple features observed on the building slabs included concrete-filled former clarifiers, concrete-filled service trenches, metal forms of unknown purpose, concrete-patched exploratory boring locations and groundwater monitoring/vapor extraction wells, structural metal supports cut on-grade, and areas where a vapor extraction system (VES) was utilized to remove VOCs from soil at the site.

3.0 PURPOSE

Based on SJ4's planned redevelopment activities, the purpose of Leighton's environmental investigation of the site is two-fold:

Evaluate Soil Planned for Excavation - Evaluate subsurface soil conditions at the site for the presence of chemicals of potential concern (COPCs) that may be encountered during the planned excavation activities associated with the subsurface parking structures of the redevelopment. Subsurface soil in areas where single-level subterranean parking is planned will likely have to be excavated to a depth of approximately 12 to 15 feet below grade. In addition, in the area where two-level subterranean parking is planned, soil will have to be excavated to a depth of approximately 22 to 25 feet below grade. Because of the industrial history of the site and previously identified areas where soil has been affected by hazardous substances and/or petroleum products, characterizing subsurface soils prior to excavation is a critical factor in determining the cost for the redevelopment.

Evaluate Potential for Vapor Intrusion into Future Structures – To evaluate for the presence of VOCs that may represent a potential vapor intrusion concern for the residential and commercial structures planned at the site, a soil gas survey was performed throughout the subject property. The soil gas probes were installed at the bottom of each soil boring and located approximately 5 feet beneath the parking garage slab and/or building footprint. In a December 20, 2011 letter, the RWQCB required that an additional soil vapor evaluation (i.e., soil gas survey) be performed to evaluate the potential effect on human health via shallow soil vapor intrusion into habitable spaces. (This requirement was held in abeyance by the RWQCB pending commencement of redevelopment activities.) The results of the soil gas survey will be integrated into a site-specific human health risk assessment (HHRA) to assess the health risk to future residents/occupants of the site and if needed, to estimate the cost to develop and install a proper mitigation system, if needed. The soil gas survey was performed in general accordance with the July 2015 Advisory, Active Soil Gas Investigations, which was jointly developed by the California-EPA, Department of Toxic Substances Control's (DTSC's), Los Angeles Regional Water Quality Control Board, and the San Francisco Regional Water Quality Control Board.

4.0 INVESTIGATIVE METHODOLOGY

The investigative methods for the site investigation included, and were limited to, the following tasks:

4.1 Task 1 – Pre-Field Activities

The following tasks were performed prior to initiating field activities:

- **Notified Underground Services Alert** - Marked the proposed soil and soil gas probe locations and notified Underground Services Alert (USA) of Southern California (a.k.a. DigAlert) at the site to mark the location of public utilities entering the site. The location of each proposed boring was clearly marked in either white paint or with a lumber crayon. Leighton notified USA at least two (2) full working days prior to initiating the drilling activities. An oil pipeline operated by Mobil Oil crosses the southern portion of the site and was marked by Mobil Oil. In addition, on the first day of drilling (May 4, 2016), a representative from Mobil Oil entered the site and specifically identified the location of their pipeline and requested that no borings be drilled within 20 feet of the pipeline. Leighton complied with Mobil's request.
- **Private Utility Survey** - A Leighton CA Professional Geologist met onsite on May 3, 2016 with Spectrum Geophysics, a private utility locator subcontractor to evaluate for the presence of private subsurface utilities, as well as, unknown underground obstructions/features that may be encountered at the proposed boring locations.
- **Preparation of a Site-Specific Health and Safety Plan** - In accordance with standard environmental practices, Leighton prepared a site-specific Health and Safety Plan (HSP) describing safety aspects of the work to be performed at the subject site by Leighton. The HSP was prepared in compliance with the Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1910.120, Hazardous Waste Operations and Emergency Response (Hazwoper) and 8 California Code of Regulations (CCR) 5192. All onsite Leighton personnel reviewed and signed the HSP acknowledging acceptance prior to initiation of fieldwork. Drilling subcontractors at the site had their own HSP and attended Leighton's tail gate meetings each day discussing the scope of work and safety measures at the site prior to drilling. The drilling

subcontractor signed Leighton's HSP to acknowledge they attended the tailgate meeting.

4.2 Task 2 – Soil Investigation and Soil Gas Survey

Soil Gas and Soil Sampling Locations - As noted on Figure 2, Leighton monitored the advancement of 36 soil borings. Due to drilling refusal, Boring A5 was moved about 4 feet to the southwest and drilled as boring A5B. Borings were advanced using direct-push technology by InterPhase Environmental (Los Angeles, CA). The borings were drilled at 28 unbiased, grid-based sampling locations at the site. The grid-based locations have sampling points based on a 100 foot x 100 foot grid network and are meant to evaluate the overall distribution of VOCs in soil gas and VOCs, metals, and total petroleum hydrocarbons in soil throughout the site. In addition to the grid-based sampling locations, an additional eight biased boring locations were installed to investigate areas where VOCs or other hazardous substances were historically detected during prior investigations at the site.

Soil gas probes were installed at the bottom of each of the 36 boring locations. The installation depth of the soil gas probes varied and was dependent on the depth of the proposed subterranean parking slabs and/or building foundations. In accordance with the DTSC guidance, the soil gas probes were installed in soil types that appeared the most permeable and conducive to the collection of soil gas. Therefore, at the discretion of the field geologist, the installation of some of the probes was shallower (e.g., 17.5 feet versus 20.5 feet) due to the predominance of clay which was observed in some of the borings at their total depth. In boring location LB1 and due to uncertainty regarding the clay content at 20.5 feet bgs, two soil gas probes were installed with one at a depth of 15 feet bgs and the other at 20.5 feet bgs. Table 1 provides summary information regarding each of the borings and includes the boring ID number, date of sampling, soil sampling depths, boring location, rationale for sampling, and the installation depth for the soil gas probes. The depths of the soil sample intervals differ in the northwest portion of the site, within former Buildings 11 through 13 footprints, because this area is approximately 3.5 feet higher in elevation than the adjoining Building 14 area. Therefore, a soil sample collected from a depth of 1 foot bgs from the Building 14 footprint area would correlate to a depth of approximately 4.5 feet bgs in borings drilled to the northwest of Building 14.

Figure 2 shows the proposed soil/soil gas boring locations. The total depth of the five grid-based borings drilled in the former Building 14 footprint area (borings A-12, B-12, A-13, B-13, and B-14) was 17 feet bgs, which is approximately 5 feet below the anticipated 12 foot bgs base of the subterranean parking garage. Grid-based boring B-15, which is located in the southeastern-most portion of the former Building 14 footprint area, was drilled to a total depth of 5 feet bgs because it is located in a future park or landscaped area. The total depth of the four grid-based borings (i.e., borings A-9, A-10, B-9, B-10) drilled in the area of the two-level subterranean garages is approximately 30.5 feet bgs, which is approximately 5 feet below the anticipated 25.5 feet bgs base of the parking garage. With the remaining 18 grid-based borings (i.e., borings A-1, A-2, A-3, A-4, A-5, A-6, A-7, A-8, B-1, B-2, B-3, B-4, B-5, B-6, B-7, B-8, A-11, and B-11) northwest of the Building 14 footprint, the total depth of the borings was 20.5 feet bgs which is approximately 5 feet below the anticipated 15.5 feet bgs base of the single-level parking garage. For the biased soil gas probes, probes LB1 through LB5 were installed at a depth of 20.5 feet bgs and probes LB6 through LB8 were installed at a depth of 17 feet bgs.

At each of the boring locations, soil samples were collected at a depth of 1 foot below grade and at approximate 5-foot intervals afterwards to the total depth the boring. The soil sampling depths collected at each soil boring are also summarized in Table 1. Duplicate soil and soil gas samples were collected and submitted for analysis for each 20 samples that were collected. The duplicates are designated with either "D" (for soil samples) or "REP" (for soil gas samples) on the chain of custody and in the final laboratory report.

Drilling refusal, due to the presence of cobbles, gravels or generally coarse fill material was encountered directly beneath the slab when shallow hand augering was attempted to clear borings for potential utilities. To address the drilling refusal issue, all soil sampling was conducted using direct-push drilling technology and hand augering was discontinued. No utilities or subsurface structures were encountered during drilling.

For boring A5, drilling refusal was encountered at a depth of approximately 10 feet bgs. In accordance with our work plan, the field geologist modified the drilling location and relocated it to a distance approximately 4 feet to the southwest of boring location A5. The boring was re-designated as boring A5B and no drilling

refusal was encountered during the advancement of this boring. Drilling refusal was not encountered in any of the other borings.

Soil cuttings were monitored for VOCs using a properly calibrated photoionization detector (PID). To observe for physical evidence of potential hazardous substance and/or petroleum product contamination (e.g., PID response, discoloration, unusual odors, if observed), the soil in the boreholes was continually cored so that the cored intervals could be observed and logged. As noted above and on Table 1, prior to installing the soil gas probes, some vertical adjustments were made so that the probes were installed into the most permeable intervals (as required in the DTSC Advisory, July 2015). For the vapor probes installed at locations B6 and B7, the laboratory field technician was not able to obtain a soil gas sample because it appeared the probes had been installed in clay-rich soil with insufficient permeability to allow for the collection of a sample.

Soils observed during drilling were classified in accordance with the Unified Soil Classification System (USCS). A log of boring was prepared in the field for each soil boring.

Soil Gas Probe Design and Sampling Procedures - Soil gas probes were installed at the total depth of the boring in accordance with the DTSC's Advisory, Active Soil Gas Investigations, dated July 2015. A diagram of the soil gas probe design, obtained from the DTSC Advisory, is present in Appendix B. The soil gas probes consisted of inert 1/4-inch Nylaflow tubing fitted with a porous airstone at the terminus, which was set within one foot of sand pack, one foot of dry bentonite above, followed by hydrated bentonite. The bentonite was hydrated at the surface in a container and then slowly poured or pumped into the borehole. For the probes installed at depths deeper than 15 feet, a tremie pipe was used to place the hydrated bentonite. The surface end of the probes was fitted with a gas-tight Luer-lock to prevent infiltration of water or air.

A tracer gas n-pentane, was applied by the laboratory technician with Jones Environmental, Inc. (Jones) (mobile analytical laboratory) to the soil gas probes at each point of connection in which ambient air could enter the sampling system. These points include the top of the sampling probe where the tubing meets the probe connection and the surface bentonite seals. No n-pentane was detected in any of the soil gas samples analyzed by Jones.

At each sampling location, an electric vacuum pump (set to draw 0.200 liters/min of soil gas at a maximum vacuum of 100-inch of water) or dedicated disposable syringe was attached to the probe for purging. In accordance with the July 2015 DTSC Advisory, a default three purge volumes were used by Jones prior to sampling of the soil gas probes. The soil gas sample was collected from the Luer-lock connection into a laboratory-provided, pre-cleaned soil gas 100 milliliter (ml) gas tight glass syringes and analyzed by Jones directly after sampling using their onsite mobile analytical laboratory.

4.3 Task 3 – Analytical Testing

4.3.1 Soil Gas Samples

A mobile analytical laboratory (Jones Environmental Inc., Santa Fe Springs, CA) was onsite on May 6, 2016 for collection and analysis of the soil gas samples. Soil gas samples collected from the probes were immediately injected into the onsite mobile laboratory gas chromatograph/purge and trap system using a pre-cleaned glass syringe. Soil gas samples, including the duplicates, were analyzed for the tracer gas and VOCs by modified EPA Method 8260B with a laboratory reporting limit at or below residential screening level of 1.0 microgram per liter (µg/L) or less.

4.3.2 Soil Samples

Soil samples intended to be analyzed for VOCs were collected using EPA Method 5035 (e.g., using Lock 'n Load™ 5035 syringes) and analyzed by Jones at their Santa Fe Springs stationary laboratory using EPA Method 8260B. In addition, the soil samples were tested by Jones for Total Petroleum Hydrocarbons-Carbon Chain (TPH-CC; C10 through C28 for diesel and C29-C32 for oil) using EPA Method 8015M. The soil samples were also tested for gasoline range organics and fuel oxygenates by Jones using EPA method 8260B.

Soil samples were also analyzed by Jones Environmental, Inc. for the 17 metals listed in the California Code of Regulations, Title 22, Article 11 (CAM-17 metals). In soil samples where CAM-17 metals were detected at

concentrations in excess of 10 times their Soluble Threshold Limit Concentration (STLC), the soil samples were also analyzed using the California Waste Extraction Test (CA WET). After transport under proper chain-of-custody by a courier from Jones, the CA WET analyses were performed by SunStar Laboratories, Inc. (Lake Forest, CA). If the metal chromium was detected at a concentration exceeding 10 times its 5 mg/L STLC (i.e., 50 mg/kg), it was also analyzed for both the CA WET - Total Chromium using EPA Method 6010 and for Hexavalent Chromium using EPA Method 7199.

4.4 Task 4 - Equipment Decontamination Procedures, Backfilling of Borings, and Soil Gas Probe Abandonment

Before and between sample points, reusable soil sampling and drilling equipment were first washed in a 5-gallon bucket filled with tap water and Alconox or a non-phosphate detergent, followed by a tap water rinse, and finally, a distilled water rinse.

Investigation-derived wastes (IDW) including soil cuttings from boreholes, decontamination fluids, and disposable protective clothing and supplies are stored onsite in separate Department of Transportation (DOT) approved 55-gallon drums. Leighton has submitted the soil sample analytical test results to American Integrated Services (AIS) (Wilmington, CA), a licensed waste hauler. Upon review of an estimate for drum disposal by AIS, the drummed materials will be transported offsite for disposal, as appropriate. If additional analytical tests for sample profiling are required by AIS, SJ4 will be notified. Manifests documenting the proper transport and disposal of IDW will be provided in the project report.

Upon completion of sampling, the tubing for all temporary soil gas probes was pulled from the ground, the open hole was filled with cement grout to within 1 foot of the surface grade, and the concrete slab (if present) was patched with a concrete mix.

5.0 INVESTIGATIVE RESULTS

The findings from the soil gas survey and the soil investigation are presented in the following sections.

5.1 Physical Observations

Logs of boring were prepared for each probe location and included USCS soil descriptions, PID measurements for VOCs, presence of soil discoloration and/or unusual odors (if observed), and other physical observations. The logs of boring are presented in Appendix C, and photographs of select cored soil intervals are presented in Appendix D.

Generally, the upper 8.5 feet of soil encountered beneath the slabs across the site consisted of silty sand or sandy silt, and in some instances containing varied amounts of clay. From 8.5 feet bgs to 14.5 feet bgs, silty sand, poorly graded sand, poorly graded sand with gravel, sandy silt, or silt was encountered. Beneath 14.5 feet bgs and where present, clay content generally increased with depth from roughly 17 feet to 20.5 feet bgs. When clay content was not observed in soils between 14.5 feet and 20.5 feet, silt, silty sand, and sandy silt was observed. Four borings were advanced to 30.5 feet bgs (i.e., borings A9, A10, B9, and B10); between 20.5 feet and 30.5 feet bgs, poorly graded sand or silty sand was observed. No groundwater was encountered during drilling activities.

PID measurements for VOCs collected from the soil during drilling and installation of the soil gas probes ranged from 0.0 part per million (ppm) equivalents to 3.5 ppm equivalents. PID measurements did not exceed 0.0 ppm equivalents (i.e., background) in borings B5, B8, B11, B12, B14, B15, LB1, LB2, LB5, and LB6. Unusual odors emanating from soil intervals/cuttings during sample preparation were not noted; however, a PID response of 13.0 ppm equivalents was measured during drilling at A6 between 1.5 feet and 2.5 feet bgs when a solvent-like odor was detected near the borehole. Discolored soils were observed at the following locations and depths:

- In boring A6, dark red-colored soil was encountered in layers at 4.5 feet bgs in the silt interval;

- In boring A7, dark gray to black-colored soil was encountered in the silt interval at 3.5 feet bgs; and
- In boring B15, dark red-colored soil was encountered in the silty sand interval at 4 feet bgs.

As noted above, drilling refusal was encountered on an unknown subsurface obstruction in boring A5 at 10 feet bgs. A step-out boring location, designated as boring A5B, was advanced approximately 4 feet to the southwest of A5 and was completed to the total depth of 20.5 feet bgs. In accordance with DTSC guidance (Advisory, July 2015) and our workplan, where clay-rich soils were encountered, soil gas probes were installed in more permeable soil intervals either above or below the clay-rich soil horizon in order to collect a complete soil gas sample volume. Table 1 presents the locations and depths of installation of the soil gas probes for each location. Collection of soil gas samples from the probes B1 at 16 feet bgs, B6 at 20.5 feet bgs, and B7 and 20.5 feet bgs was not achieved because of the apparent presence of clay-rich soils at these intervals, preventing the collection of a complete soil gas sample volume. The analytical laboratory report prepared by Jones designated the soil gas probe boring locations where no soil gas sample was possible as “No Flow”.

5.2 Soil Gas Survey

5.2.1 Analytical Test Results for Soil Gas Samples

The laboratory reports and chain-of-custody documentation from the soil gas sample analysis are presented in Appendix E. Table 2 summarizes the analytical test results for the soil gas samples. Targeted Cleanup Levels for Soil Gas utilized by the RWQCB to issue closure in 2002 are depth-specific and are presented in the bottom portions of Table 2. The Targeted Cleanup Levels for Soil Gas were developed to be protective for groundwater.

As noted above and as presented in Table 1, the soil gas samples were collected at multiple depths based on the approximate foundation depth of the subterranean parking structure. Due to the predominance of what was interpreted to be clay-rich soils, we were not able to obtain soil gas samples from probe locations B1, B6, and B7. A total of 37 soil gas samples, including two duplicates, were analyzed for VOCs. Duplicate soil

gas samples were collected for A13-17' and B10-30.5' and were designated with as A13-17' REP and B10-30.5' REP.

Multiple VOCs were detected in the soil gas samples and are presented in Table 2. The predominant VOCs (VOCs present in more than 50% of the 37 samples) detected in the soil gas samples included PCE, TCE, 1,1,1-trichloroethane (1,1,1-TCA), dichlorodifluoromethane (DCFM), toluene and total xylenes.

For comparison purposes with prior studies, Leighton prepared colorized iso-concentration maps for PCE, TCE, and 1,1,1-TCA for the shallow soil gas samples. The VOCs detected in the deeper soil gas samples (i.e., A9, A10, B9, B10) that were collected at a depth of 30.5 feet bgs were not integrated into the colorized concentration maps. Therefore, the iso-concentration maps are representative of the VOC concentrations that would be present beneath the slab of the first level of subterranean parking level. It should be emphasized that variation in the soil types as well as soil gas sample depths could affect the concentrations represented on the maps. The concentrations and areal distribution of PCE, TCE, and 1,1,1-TCA in soil gas are summarized below and also depicted in the isoconcentration maps presented in Figure 3, Figure 4, and Figure 5, respectively. The soil gas samples in Figures 3, 4, and 5 were collected at depths ranging from 17.5 feet bgs to 20.5 feet bgs and represent the approximate base of the proposed first level subterranean parking structure. PCE, TCE and 1,1,1-TCA soil gas sampling data from grid locations A9, A10, B9, and B10 was excluded from Figures 3, 4, and 5 because the soil gas samples were collected at 30.5 feet bgs (i.e., from beneath the proposed second level of parking). Similarly, PCE, TCE, and 1,1,1-TCA soil gas data from grid location B15 was excluded because the soil gas sample was collected at a depth of 5 feet bgs (i.e., future green or park area).

5.2.1.1 Distribution of PCE

Figure 3 is an isoconcentration map that presents the PCE concentrations in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) for shallow soil gas samples that were collected and analyzed at the site on May 6, 2016. PCE was detected in all 37 soil gas samples (including the four deep 30.5 feet bgs) samples at concentrations

ranging from 143 ug/m³ to 10,600,000 ug/m³ (sample LB3-20'). The Targeted Cleanup Levels for PCE of 55,000 ug/m³ was established for depths between 20 to 30 feet bgs and was exceeded in nine of 37 soil gas samples. In general, the concentrations of PCE detected suggest that significant rebound has occurred has occurred in the area that was previously remediated by HGC using a Vapor Extraction System (VES). The most elevated PCE concentration in soil gas (sample LB 3-20' at 10,600,000 ug/m³) is located in the central portion of the previously remediated VOC plume.

5.2.1.2 Distribution of TCE

Figure 4 shows the distribution of TCE in shallow soil gas samples from across the site. TCE was detected in 36 of 37 soil gas samples (including the four deep 30.5 feet bgs) at concentrations ranging from 17 ug/m³ to 40,500 ug/m³ (A7-20.5'). The Targeted Cleanup Levels for TCE of 20,000 ug/m³ was established for depths between 20 to 30 feet bgs and was exceeded in only 1 of 37 soil gas samples (A7-20.5'). TCE in soil gas is distributed across the site in a similar manner to PCE, though TCE concentrations are generally lower by comparison and have a slightly more southeastern lateral distribution.

5.2.1.3 Distribution of 1,1,1-TCA

Figure 5 shows the distribution of 1,1,1-TCA in shallow soil gas samples from across the site. 1,1,1-TCA was detected in 23 of 37 soil gas samples (including the four deep 30.5 feet bgs) at concentrations ranging from 8.0 ug/m³ to 6,060 ug/m³ (sample A13-17'). The most elevated 1,1,1-TCA concentrations in soil gas are primarily distributed in the southeastern-most portion of the site in the area where 1,1,1-TCA was previously remediated by HEC using a VES system. The Targeted Cleanup Level for 1,1,1-TCA of 295,000 ug/m³ was established for depths between 20 to 30 feet bgs and was not exceeded in any of the 37 soil gas samples.

5.2.1.4 Other VOCs

The following is a list of the remaining VOCs detected in soil gas samples that exceeded their respective detection limits:

- Benzene was detected in 12 of 37 soil gas samples at concentrations ranging from 13.4 ug/m³ to 124 ug/m³ (sample B3-17').
- N-Butylbenzene was detected in 3 of 37 soil gas samples at concentrations ranging from 11 ug/m³ to 24.8 ug/m³ (sample B9-30.5').
- Chlorobenzene was detected in 1 soil gas sample at 9.0 ug/m³ (sample A5-20.5').
- Chloroform was detected in 12 of 37 soil gas samples at concentrations ranging from 14.2 ug/m³ to 121 ug/m³.
- Dichlorodifluoromethane (DCFM) was detected in 34 of 37 soil gas samples at concentrations ranging from 8.2 ug/m³ to 3,060 ug/m³ (sample B8-20.5').
- 1,1-Dichloroethane (1,1-DCA) was detected in 2 of 37 soil gas samples at concentrations ranging from 20.2 ug/m³ to 21.2 ug/m³ (sample B9-30.5').
- 1,1-DCE was detected in 12 of 37 soil gas samples at concentrations ranging from 67.2 ug/m³ to 937 ug/m³ (sample LB8-17').
- Cis-1,2-DCE was detected in 1 of 37 soil gas samples at a concentration of 21.6 ug/m³ (sample A7-20.5').
- Ethylbenzene was detected in 13 of 37 soil gas samples at concentrations ranging from 17.8 ug/m³ to 335 ug/m³ (sample B-17').
- Freon 113 was detected in 15 of 37 soil gas samples at concentrations ranging from 53.2 ug/m³ to 390 ug/m³ (sample B8-20.5').

- 4-isopropyltoluene was detected in 13 of 37 soil gas samples at concentrations ranging from 8.6 ug/m³ to 4,050 ug/m³ (sample B3-17).
- N-Propylbenzene was detected in 3 of 37 soil gas samples at concentrations ranging from 16.2 ug/m³ to 67.6 ug/m³ (sample B3-17').
- 1,1,1,2-Tetrachloroethane was detected in 6 of 37 soil gas samples at concentrations ranging from 10.6 ug/m³ to 847 ug/m³ (sample A5-20.5').
- Toluene was detected in 30 of 37 soil gas samples at concentrations ranging from 9.4 ug/m³ to 1,290 ug/m³ (sample B3-17').
- Trichlorofluoromethane (TCFM) was detected in 2 soil of 37 gas samples at concentrations ranging from 10.8 ug/m³ to 29.4 ug/m³ (sample A7-20.5').
- 1,2,4-Trimethylbenzene was detected in 13 of 37 soil gas samples at concentrations ranging from 10.6 ug/m³ to 619 ug/m³ (sample B3-17').
- 1,3,5-Trimethylbenzene was detected in 6 of 37 soil gas samples at concentrations ranging from 20.4 ug/m³ to 177 ug/m³ (sample B3-17').
- Xylenes were detected in 20 of 37 soil gas samples at concentrations ranging from 8.0 ug/m³ to 1,850 ug/m³ (sample B3-17').

None of the above-listed other VOCs detected at the site had Targeted Cleanup Levels for Soil Gas that were established with the RWQCB.

5.3 Soil Investigation

As discussed, soil samples were collected at approximately 5 foot intervals starting at a depth of approximately 1 foot below the former building slab. A total

of 187 soil samples, of which 9 were duplicates, were collected and analyzed as part of the soil investigation. Discussion related to the analytical test results will describe VOCs, TPH-CC and the CAM-17 metals in consecutive order.

5.3.1 VOCs

VOCs detected in the soil samples included PCE, TCE, 1,1,1-TCA, benzene, cis-1,2-DCE, trans-1,2-DCE, ethylbenzene, and toluene. The laboratory reports and chain-of-custody documentation from the soil sample analyses are presented in Appendix F. Table 3 and Figure 6 summarize the analytical test results for VOCs detected in the soil samples. A summary of the results is provided below.

- PCE was detected in 120 of 187 soil samples at concentrations ranging from 1.0 ug/kg to 3,330 ug/kg (sample B4-1'). PCE was the predominant VOC detected in soil samples throughout the site. Eleven of the 120 PCE detections exceeded multiple HGC *Phase 2 Targeted Soil Cleanup Levels* (06/26/2000) established for PCE in soil at varying depths ranging from 1 foot bgs to 20.5 feet bgs. Two of the soil samples collected from 20.5 feet bgs (samples A5B-20.5' and B4-20.5') contained PCE in soil exceeding the 48 ug/kg *HGC Phase 2 Targeted Soil Cleanup Level* established for that depth interval.
- TCE was detected in 19 of 187 soil samples at concentrations ranging from 1.0 ug/kg to 4,800 ug/kg (sample A7-3.5'). After PCE, TCE was the second most prevalent VOC detected in soil. Two of the 19 PCE detections exceeded the 78 ug/kg *HGC Phase 2 Targeted Soil Cleanup Level* established for TCE in soil at depths ranging from 1 foot bgs to 10 feet bgs.
- 1,1,1-TCA was detected in two of 187 soil samples at concentrations ranging from 4.1 ug/kg (sample LB*-5') to 20.9 ug/kg (sample LB8-1'). None of the two 1,1,1-TCA detections exceeded the 3,112 ug/kg *HGC Phase 2 Targeted Soil Cleanup Level* established for 1,1,1-TCA in soil at depths ranging from 1 foot bgs to 10 feet bgs.
- Benzene was detected in 2 of 187 soil samples at concentrations ranging from 1.7 micrograms per kilogram (ug/kg) to 4.3 ug/kg (soil sample B8-1'). There is no *Phase 2 Targeted Soil Cleanup Level*

established for benzene. Cis-1,2-DCE was detected in 1 of 187 soil samples at a concentration of 5.0 ug/kg (sample B4-1). There is no *Phase 2 Targeted Soil Cleanup Level* established for cis-1,2-DCE.

- Trans-1,2-DCE was detected in 1 of 187 soil samples at a concentration of 2.3 ug/kg (sample B4-1). There is no *Phase 2 Targeted Soil Cleanup Level* established for trans-1,2-DCE.
- Ethylbenzene was detected in 1 of 187 soil samples at a concentration of 3.0 ug/kg (sample B15-5'). There is no *Phase 2 Targeted Soil Cleanup Level* established for ethylbenzene.
- Toluene was detected in 1 of 187 soil samples at a concentration of 1.8 ug/kg (sample B15-5'). There is no *Phase 2 Targeted Soil Cleanup Level* established for toluene.

VOCs that were not listed above were not detected above their respective laboratory Practical Quantitation Limits (PQLs). In addition, no gasoline range organics or fuel oxygenates were detected in any of the 187 soil samples.

5.3.2 TPH Carbon Chain

All 187 soil samples were analyzed for TPH Carbon Chain (TPH-CC) which included Diesel Range Organics (DRO) and Oil Range Organics (ORO). The laboratory reports and chain-of-custody documentation from the soil sample analyses are presented in Appendix F. Table 4 summarizes the analytical test results for TPH-CC detections in the soil samples. As can be discerned upon review of Table 4, a total of five soil samples were affected by DRO and/or ORO.

DRO were detected in 5 of 187 soil samples at concentrations ranging from 21.8 mg/kg to 241 mg/kg (soil sample A5B-1'). Four of the five soil samples where DRO was detected were collected from a depth of 1 foot bgs and the other was at 3.5 feet bgs.

ORO were detected in 4 of the 187 soil samples at concentrations ranging from 42.1 mg/kg to 356 mg/kg (sample LB6-1'). ORO were detected in four of the five soil samples where DRO were detected.

5.3.3 CAM-17 Metals

All 187 soil samples were analyzed for CAM-17 Metals. The laboratory reports and chain-of-custody documentation from the soil sample analyses are presented in Appendix F. Table 5 summarizes the analytical test results for CAM-17 Metals in the soil samples. As discussed, since most of the soil beneath the site will be excavated to allow for the construction of the subterranean parking structure, the primary purpose of the analytical testing was to evaluate the classification of the soil prior to its off-site transport and disposal and to estimate the resulting costs.

Metals Exceeding the CA TTLC:

Soil samples that exceeded their California Total Threshold Limit Concentration (TTLC) require management as a California hazardous waste and are designated with a superscript 2 (e.g., 6,060² for soil sample A5B-1') in Table 5. The TTLC for each CAM-17 Metal is listed on the last page of Table 5. The metals which had concentrations exceeding their TTLC are also summarized below:

Total Lead - Soil sample A7-3.5' contained 1,110 mg/kg total lead which exceeds its TTLC of 1,000 mg/kg.

Copper - Soil sample A7-3.5' contain 6,740 mg/kg copper which exceeds its TTLC of 2,500 mg/kg.

Zinc - Soil samples:

- A5B-1' contained 6,040 mg/kg
- A6-4.5' contained 6,260 mg/kg
- A6-20.5' contained 6,660 mg/kg
- A6-20.5'D contained 7,050 mg/kg
- A7-3.5' contained 6,920 mg/kg

The five above-listed soil samples, which include a duplicate soil sample, exceeded the TTLC of 5,000 mg/kg established for zinc and therefore, require management as a California hazardous waste.

Metals Analyzed Using the CA WET and Exceeding Their STLC:

Soil samples were analyzed using the CA WET if their CAM-17 metal concentrations exceeded 10 times their respective CA STLC but were less

than their TTLC. After performing CA WET, soil samples containing soluble CAM-17 metals that exceed their respective CA STLC require management as a California hazardous waste. The metal concentrations for soil samples that were analyzed for the CA WET are designated with a superscript 1 in Table 5 (e.g., 1,980¹ for copper for soil sample A3-1'). The information below and on Table 6 summarize the results of CA WET analysis:

Chromium - Five soil samples exceeded 50 mg/kg chromium and were analyzed using the CA WET. None of the five soil samples exceeded the 5.0 mg/L CA STLC established for chromium and therefore are not required to be managed as a California hazardous waste.

Total Lead - Five soil samples exceeded 50 mg/kg total lead and were analyzed using the CA WET. Four of the five soil samples (i.e., A5B-1', A6-4.5, A6-8.5', and A7-8.5') exceeded the 5 mg/L CA STLC established for total lead and therefore, should be managed as California hazardous waste.

Copper - Three soil samples exceeded 250 mg/kg copper and were analyzed using the CA WET. Two of the three soil samples (i.e., A3-1' and A7-8.5') exceeded the 25 mg/L CA STLC established for copper and therefore, should be managed as California hazardous waste.

Zinc - Two soil samples exceeded 2,500 mg/kg zinc and were analyzed using the CA WET. None of the two soil samples exceeded the 250 mg/kg CA STLC established for zinc and therefore, are not required to be managed as a California hazardous waste.

Figure 7 has been prepared to summarize the distribution of metals detected in soil samples collected from the site that exceed California hazardous waste criteria. The lateral area where metal-affected soil potentially exceeds California hazardous waste criteria is approximately 600 feet northwest to southeast by approximately 200 feet southwest to northeast. This area should be considered a rough estimate of the affected areas dimensions and is based on known grid or biased soil sampling locations which did not have metals exceeding California hazardous waste criteria. More localized soil sampling (e.g., stepout soil

borings drilled at distances between the 100 foot X 100 foot spacing of the grid samples) conducted in this area in the future will better define the lateral and vertical extent of soils affected by the elevated metals. In general and based on the depth of soil samples that do not contain metals at concentrations requiring management as a California hazardous waste, the estimated volume of soil potentially requiring management as California hazardous waste is roughly 52,500 tons. This rough estimate is based on the area and known depths of metal-affected soil as depicted on Figure 8. This estimate also assumes that the excavation activities for soil requiring management as California hazardous waste will not exceed the depth of the base of the subterranean parking structure foundation. Review the zinc data from boring A7 (Figure 7) reveals that California hazardous waste is present at least to a depth of 20.5 feet bgs which is beneath the proposed subterranean parking garage foundation.

Hexavalent Chromium - In accordance with our work plan, the five soil samples which exceeded 50 mg/kg for total chromium were also analyzed for hexavalent chromium using EPA method 7199. The concentrations of hexavalent chromium detected in the five soil samples are as follows:

<u>Soil Sample ID #</u>	<u>Hexavalent Chromium (mg/kg)</u>
A6-4.5'	1.1
A6-8.5'	2.8
A6-14.5'	1.5
A6-20.5	3.3
B14-1'	0.19

None of the hexavalent chromium detections listed above exceeded the 500 mg/kg TTLC and therefore, based solely on the chromium levels detected, excavated soil from these locations will not require management as California hazardous waste.

5.4 Quality Assurance/Quality Control

To ensure that the extent of affected soil gas and soil present at the site is properly evaluated, quality assurance/quality control (QA/QC) measures were taken by Leighton personnel to produce samples of the highest integrity for

submittal to Jones Environmental, Inc. and SunStar Laboratories, Inc. The following measures were employed:

- Stringent procedures for proper soil gas and soil sampling and equipment decontamination;
- Collection and submittal of 10% of all samples as duplicates; and
- Adherence to strict chain-of-custody protocol during storage and transfer of samples to the analytical laboratory.

QA/QC practices conducted by the analytical laboratories used for this project are described in the formal analytical reports presented in Appendix E (soil gas sample analyses) in Appendix F (soil sample analyses).

6.0 CONCLUSIONS

The soil gas survey and soil investigation detailed in this report were performed to evaluate and more fully characterize the presence of hazardous substances and/or petroleum products in the vadose zone at the site.

Soil Gas Survey - The soil gas survey included the collection and analysis of multiple soil gas samples in a grid network and from eight biased locations where VOCs were historically discovered during past environmental investigations. The most elevated concentrations of chlorinated VOCs, primarily PCE, TCE, and 1,1,1-TCA, were detected in areas where Vapor Extraction Systems (VES) were utilized in the 1990s to remediate VOCs beneath the site. The VES remedial activities were performed by Hydro Geo Chem, Inc. on behalf of Zero. On June 30, 2002, the RWQCB issued a Certificate of Completion to APW North America, Inc. (formerly known as Zero Corporation) for the site pursuant to California Health & Safety Code Section 25264, finding among other things that the site investigation and remediation at the site had been satisfactorily completed and a permanent remedy had been accomplished and that applicable remedial standards and objectives were achieved. However, the results of Leighton's May 2016 soil gas investigation revealed that significant rebound by PCE, TCE, and 1,1,1-TCA has occurred in the central and southeastern portions of the site at levels similar to those previously investigated and remediated. Nine of 37 soil gas samples exceeded the Targeted Cleanup Level for Soil Gas for PCE at a depth between 20 to 30 feet bgs. Only 1 of 37 soil gas samples exceeded the Targeted Cleanup Level for Soil for TCE at a depth between 20 to 30 feet bgs. None of the 37 soil gas samples contained 1,1,1-TCA at concentrations exceeding the Targeted Cleanup Level for Soil Gas.

While the soil vapor levels would likely require vapor intrusion mitigation measures, the site improvements proposed by SJ4 include the installation of a single and two-level subterranean parking structure which will underlie the footprint of the residential apartments, hotel, and commercial businesses planned at the site. The subterranean parking structure planned by SJ4 should mitigate the potential for vapor intrusion by VOCs into the occupied areas of the proposed development. The fact that parking structures are required to have ventilation systems to mitigate VOCs emanating from vehicle exhaust could provide a benefit by mitigating the chlorinated VOCs originating from past land uses; however, the performance of a Human Health Risk Assessment (HHRA) would be required to fully evaluate this potential.

Soil Investigation

VOCs - Low concentrations of VOCs were detected in most of the 187 soil samples collected from the site. The primary VOC detected was PCE and to a lesser degree TCE. The concentrations of PCE and TCE detected in the soil samples did not exceed 50 mg/kg and would be acceptable for disposal as nonhazardous waste at a municipal landfill. The most elevated detections of PCE and TCE were limited to soil samples collected shallower than 3.5 feet bgs.

PCE was detected in 120 of 187 soil samples at concentrations ranging from 1.0 ug/kg to 3,330 ug/kg (sample B4-1'). Eleven of the 120 PCE detections exceeded multiple HGC *Phase 2 Targeted Soil Cleanup Levels* established for PCE in soil at varying depths ranging from 1 foot bgs to 20.5 feet bgs.

TCE was detected in 19 of 187 soil samples at concentrations ranging from 1.0 ug/kg to 4,800 ug/kg (sample A7-3.5'). Two of the 19 PCE detections exceeded the 78 ug/kg HGC *Phase 2 Targeted Soil Cleanup Level* established for TCE in soil at depths ranging from 1 foot bgs to 10 feet bgs.

Soil in some of the boring sampling locations located in the southeastern-most portion of the site (e.g., A11, A12, A13, and B14) did not have detections of VOCs and with the approval of the RWQCB, may be suitable as a source of unrestricted use fill material.

TPH-CC - Low concentrations of TPH diesel range organics (DRO) and oil range organics (ORO) were found in no more than 5 of 187 soil samples. No gasoline range organics or fuel oxygenates were found in any of the soil samples. Based on the low concentrations of TPH-CC detected, soil affected by TPH-CC would be suitable for disposal as nonhazardous waste at a municipal landfill.

CAM-17 Metals - Multiple soil samples collected in the northwest-central portion of the site contained elevated concentrations of total lead, zinc, and copper which when excavated, will require management of the soil as California hazardous waste and possibly federal RCRA waste. Based on the current data set, a rough estimate of approximately 52,000 tons of soil may require disposal as California hazardous waste. This number should be considered conservative; however, the estimate is based on limited data and assumes that no excavation will occur beneath the proposed subterranean parking structure foundation. Further, drilling of step-out soil borings and soil sampling in the future between the 100 foot x 100 foot grid points should result in a

reduction is the volume of soil requiring removal as a California hazardous waste. The source of the CAM-17 metals found in the soil requiring management as California hazardous waste is unknown; however, prior tenants including General Water Heater and Zero Corporation both conducted industrial activities involving metals (e.g. plating activities, galvanizing operations, and metal working activities) at the site. The most elevated zinc, lead and copper concentrations were found in the northwest-central portion of the site which generally coincides with the area where the most elevated VOCs were detected in soil gas. Because many of the metal-affected soils are relatively shallow, some regularly spaced potholing and and/or concrete slab removal activities may be beneficial in better delineating the metal-affected soils and potential source areas.

Hexavalent Chromium - Although total chromium was not found in any of the soil samples at concentrations that would require management as a California hazardous waste, hexavalent chromium was found in soil samples collected from one soil boring at levels above the 2012 soil investigation conducted by Northridge Properties, Inc.

7.0 LIMITATIONS/DISCLOSURE

Services were performed in accordance with Leighton Consulting, Inc.'s agreement and understanding with SJ4 Burbank, LLC, and Manatt, Phelps & Phillips LLP and solely for their use and their designated representatives. Opinions and/or recommendations are intended for use by SJ4 Burbank, LLC, and Manatt, Phelps & Phillips LLP and the purpose, site, location, time frame, and project parameters indicated. Leighton and Associates, Inc. is not responsible for subsequent separation, detachment, or partial use of this document. Any reliance on this report by a third party shall be at such party's sole risk.

This report has been prepared exclusively for SJ4 Burbank, LLC, and Manatt, Phelps & Phillips LLP or its assigns. The information contained herein is only valid as of the date of the report. While the work was intended to describe the soil gas and soil investigation performed at the site, SJ4 Burbank, LLC, and Manatt, Phelps & Phillips LLP or its assigns should recognize that this report is not a comprehensive site characterization and should not be construed as such. The findings as presented in this report are predicated on the results of the soil gas and soil sampling and laboratory analyses performed. In addition, the information obtained is not intended to address potential impacts related to sources other than those specified herein. Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee or warranty of the results of the report is implied within the intent of this report or any subsequent reports, correspondence or consultation, either expressed or implied. Leighton strived to perform the services summarized herein in accordance with the local standard of care in the geographic region at the time the services were rendered. Should you have any questions related to the information presented in this report, please contact us.

Notes:

REP = Duplicate sample

ft bgs = Feet below ground surface

ug/m³ = Micrograms per cubic meter

< 8.0 = Concentration reported below laboratory detection limit

NE = Cleanup concentrations not established for this compound

8.0 = Concentration reported above laboratory detection limit

All concentrations reported in ug/m³

PCE = Tetrachloroethylene

TCE = Trichloroethylene

1,1,1-TCA = 1,1,1-Trichloroethane

1,1-DCE = 1,1-Dichloroethene

¹ = Cleanup levels obtained from *Table 1, Phase 2 Targeted Soil Cleanup Levels*, presented in *Work Plan for No Further Action Closure: Soil Vapor Extraction and Groundwater Monitoring Systems, Former ZERO Facility, 777 Front Street, Burbank, California (RWQCB File No. 109.6162)*, by Hydro Geo Chem, Inc., dated June 26, 2000.

¹ Targeted Soil Cleanup Levels (ug/kg), 10-20 feet bgs			NE	NE	NE	NE	63	NE	2,520	63
¹ Targeted Soil Cleanup Levels (ug/kg), 20-30 feet bgs			NE	NE	NE	NE	48	NE	1,928	48

Notes:

ft bgs = Feet below ground surface

ug/kg = Micrograms per kilogram

VOC concentrations reported in ug/kg

< 1.0 = Not reported above practical quantitation limit

1.2 = Concentration reported above practical quantitation limit

cis-1,2-DCE = cis-1,2-Dichloroethene

trans-1,2-DCE = trans-1,2-Dichloroethene

1,1,1-TCA = 1,1,1-Trichloroethane

PCE = Tetrachloroethylene

TCE = Trichloroethylene

DTSC-SLs = Department of Toxic Substances Control (DTSC) Recommended Screening Levels (SLs) for Residential Soil for Cancer and Non-cancer Endpoints, January 2016.

RSLs = US EPA Region 9 Regional Screening Levels (RSLs) for Residential Soil, May 2016, based on a Target Hazard Quotient (THQ) of 1.0.

NE = Screening level not established

¹ = Targeted Soil Cleanup Levels obtained from *Table 1, Phase 2 Soil Cleanup Levels*, presented in *Work Plan for No Further Action Closure: Soil Vapor Extraction and Groundwater Monitoring Systems, Former ZERO Facility, 777 Front Street, Burbank, California (RWQCB File No. 109.6162)*, by Hydro Geo Chem, Inc., dated June 26, 2000.

Table 4
Summary of TPH (mg/kg) Detected in Soil Samples
SJ4 Burbank, LLC Site
777 North Front Street, Burbank, California

Sample ID#	Depth (ft bgs)	Sample Collection Date	DRO (C10-C28)	ORO (C29-C32)
A5B-1'	1	5/4/2016	241	169
A7-3.5'	3.5	5/5/2016	21.8	< 10.0
LB2-1'	1	5/6/2016	66.6	128
LB3-1'	1	5/6/2016	22.5	42.1
LB6-1'	1	5/5/2016	79.1	356

Notes:

ft bgs = Feet below ground surface

mg/kg = Milligrams per kilogram

< 10.0 = Concentration not reported above laboratory method reporting limit of 10.0 mg/kg

21.8 = Concentration reported above laboratory method reporting limit

DRO = Diesel range organics, carbon chain ranges C10 through C28

ORO = Oil range organics, carbon chain ranges C29 through C32

Notes:

CA WET = California Waste Extraction Test

ft bgs = Feet below ground surface

mg/kg = Milligrams per kilogram

mg/L = Milligrams per liter

Concentrations reported in mg/kg

< 0.020 = Less than the Practical Quantitation Limit

1.1 = Concentration reported above the Practical Quantitation Limit

CA STLC = California Soluble Threshold Limit Concentration

CA TTLC = California Total Threshold Limit Concentration

NA = Not applicable/not analyzed

¹ = Concentration exceeds 10x the STLC value for the metal; CA WET analysis was performed - see Table 3 for CA WET results. Concentrations exceeding 20x the TCLP value for the metal were not included as a part of CA WET analysis.

² = Concentration exceeds the CA TTLC for the respective metal, lead TTLC is 1,000 mg/kg; copper TTLC is 2,500 mg/kg; zinc TTLC is 5,000 mg/kg.

Soil samples exceeding their respective TTLC require management as a California Hazardous Waste.

Leighton

included in the project workplan if the project proponent chooses not to use probe support for deep soil gas wells.

Figure 1

Neat-Cement Grout means a mixture in the proportion of 94 pounds of Portland cement and not more than 6 gallons of water. Bentonite up to 5 percent by weight of cement (4.7 pounds of bentonite per 94 pounds of Portland cement) may be used to reduce shrinkage.

3.2.2 Sampling Tubing

Small diameter (1/8 to 1/4 inch) tubing is typically used for probe construction, made of material which will not react or interact with site contaminants. At sites where soil

Client Ref. No.: 11235.002

Attn: Robin Ferber

Date Sampled: 5/6/2016

Project Name: SJ4 Burbank LLC
Project Address: 777 North Front Street
Burbank, CA

Date Received: 5/6/2016

Date Analyzed: 5/6/2016

Physical State: Soil Gas

ANALYSES REQUESTED

1. EPA 8260B - Volatile Organics by GC/MS + Oxygenates

Sampling – Soil Gas samples were collected in glass gas-tight syringes equipped with Teflon plungers.

A tracer gas, n-pentane, was placed at the tubing-surface interface before sampling. This compound was analyzed during the 8260B analytical run to determine if there were surface leaks into the subsurface due to improper installation of the probe. N-pentane was not found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min, except when noted differently on the chain of custody record, using a glass gas-tight syringe. Purging was completed using a pump set at approximately 200 cc/min, except when noted differently on the chain of custody record. A default of 3 purge volumes was used as recommended by July 2015 DTSC/RWQCB guidance documents.

Prior to purging and sampling of soil gas at each point, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of 100 inches of water, sealing the entire system and watching the vacuum for at least one minute. A vacuum gauge attached in parallel to the apparatus measured the vacuum. If there was any observable loss of vacuum, the fittings were adjusted as needed until the vacuum did not change noticeably. The soil gas sample was then taken.

No flow conditions occur when a sampling rate greater than 10 mL/min cannot be maintained without applying a vacuum greater than 100 inches of water to the sampling train. The sampling train is left at a vacuum for no less than three minutes. If the vacuum does not subside appreciably after three minutes, the sample location is determined to be a no flow sample.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Sampling Blanks were analyzed every 12 hours as prescribed by the method. In addition, a Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) were analyzed with each batch of Soil Gas samples. A duplicate/replicate sample was analyzed each day of the sampling activity. All samples were injected into the GC/MS system within 30 minutes of sampling.

LABORATORY RESULTS**

Client: Leighton & Associates, Inc.
Client Address: 25570 Rye Canyon Road, Suite G
Santa Clarita, CA 91355

Report date: 5/10/2016
JEL Ref. No.: ST-9288
Client Ref. No: 11235.002

Attn: Robin Ferber

Date Sampled: 5/4/2016

Project: SJ4 Burbank
Project Address: 777 N. Front St.
Burbank, CA

Date Received: 5/4/2016

Date Analyzed: 5/5-6,9-10/2016

Physical State: Soil

ANALYSES REQUESTED

1. EPA 8015M – Semivolatile Hydrocarbons as Diesel & Oil
2. EPA 8260B by 5035 – Volatile Organics by GC/MS + Oxygenates/Gasoline Range Organics
3. EPA 6010B by 3050B and EPA 7471A – CAM 17 Metals

Approval:

Steve Jones, Ph.D.
Laboratory Manager

May 18, 2016; ~2:45 PM

Karen and Carolyn,

Please run the **CA WET** on the following 10 soil samples collected as a part of the SJ4 Burbank project:

- B14-1' ST-9297-29 – Chromium
- A3-1' ST-9288-11 – Copper
- A4-1' – ST-9288-17 – Copper
- B4-1' – ST-9288-32 – Lead
- A5B-1' – ST-9293-03 – Lead
- A6-4.5' – ST-9293-09 – Lead and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-8.5' – ST-9293-10 - Zinc, Lead, and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-14.5' – ST9293-11 – Zn and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-20.5 ST-9293-12 - Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A7-8.5 – ST-9293-16 – Lead, Copper

Please confirm that we can get these analyzed by Wednesday (if not earlier). Let me know if you have any questions

Best regards,

Robin

Robin J. Ferber, PG, Principal Geologist

May 18, 2016; ~2:45 PM

Karen and Carolyn,

Please run the **CA WET** on the following 10 soil samples collected as a part of the SJ4 Burbank project:

- B14-1' ST-9297-29 – Chromium
- A3-1' ST-9288-11 – Copper
- A4-1' – ST-9288-17 – Copper
- B4-1' – ST-9288-32 – Lead
- A5B-1' – ST-9293-03 – Lead
- A6-4.5' – ST-9293-09 – Lead and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-8.5' – ST-9293-10 - Zinc, Lead, and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-14.5' – ST9293-11 – Zn and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-20.5 ST-9293-12 - Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A7-8.5 – ST-9293-16 – Lead, Copper

Please confirm that we can get these analyzed by Wednesday (if not earlier). Let me know if you have any questions

Best regards,

Robin

Robin J. Ferber, PG, Principal Geologist

Karen and Carolyn,

Please run the **CA WET** on the following 10 soil samples collected as a part of the SJ4 Burbank project:

- B14-1' ST-9297-29 – Chromium
- A3-1' ST-9288-11 – Copper
- A4-1' – ST-9288-17 – Copper
- B4-1' – ST-9288-32 – Lead
- A5B-1' – ST-9293-03 – Lead
- A6-4.5' – ST-9293-09 – Lead and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-8.5' – ST-9293-10 - Zinc, Lead, and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-14.5' – ST9293-11 – Zn and Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A6-20.5 ST-9293-12 - Total Chromium (EPA 6010) and Hexavalent Chromium (EPA 7196).
- A7-8.5 – ST-9293-16 – Lead, Copper

Please confirm that we can get these analyzed by Wednesday (if not earlier). Let me know if you have any questions

Best regards,

Robin

Robin J. Ferber, PG, Principal Geologist

HUMAN HEALTH RISK ASSESSMENT

**777 North Front Street
Burbank, California**

Prepared for

Northridge Properties, LLC

Geosyntec's services were performed and this report has been prepared in accordance with generally accepted professional standards of care applicable to the scope of services authorized by the client, and no other warranty is provided in connection therewith.

Consistent with applicable professional standards of care, our opinions and recommendations were based in large part on data furnished by others. Although we were not able to independently verify such data, we did evaluate it to determine whether it was consistent with other information that was developed in the course of our performance of this scope of services.

1. INTRODUCTION

Geosyntec Consultants, Inc. (Geosyntec) has prepared this human health risk assessment (HHRA) for Northridge Properties, LLC to evaluate the potential risk to human health associated with residual concentrations of chemicals detected in soil and soil vapor samples collected from the 8-acre proposed mixed use development property located at 777 North Front Street in Burbank, California (“the Site”, **Figure 1**). The lead agency providing oversight for the HHRA is the Los Angeles Regional Water Quality Control Board (LARWQCB) and the Office of Environmental Health Hazard Assessment (OEHHA).

Site data collected during the soil vapor survey and soil investigation by Leighton and Associates, Inc. in May 2016 [Leighton, 2016] were utilized in this HHRA. Additional soil data from an investigation performed by Geosyntec in June 2012 were also utilized in this HHRA.

This HHRA presents the approach and methodologies that were used to estimate potential human health risks associated with residual concentrations of chemicals detected in soil and soil vapor samples collected from the Site. This HHRA evaluates the planned use of the property as a mixed-use residential and commercial complex, from construction to tenant occupancy.

1.1 Overview

Background information regarding the Site presented in this section is summarized from the *Soil Gas Survey and Soil Investigation, Eight-Acre Proposed Mixed Use Development* by Leighton [Leighton, 2016]. The Site property is located within a commercial/industrial area of Los Angeles County in the city of Burbank (**Figure 1**). The Site is bounded by the Interstate-5 Freeway to the northeast, North Front Street to the southwest, West Burbank Boulevard to the northwest and West Magnolia Boulevard to the southeast (**Figure 2**).

From the 1930’s to 1961, the Site was the location of a water heater manufacturing company with activities that included galvanizing, vulcanizing, plating, welding, and metalwork. From 1961 to 1991, the Site was owned and operated by Zero Corporation, whose operations included aluminum case drawing and washing, aluminum alodining (a metal coating process involving chromium and aluminum), chromate deoxidizing, steel phosphate coating and chromium sealing [Leighton, 2016]. Zero Corporation ceased operations on site in 1991. The buildings onsite were demolished in 2004, and there have been no significant Site uses since 1991. Northridge Properties, LLC purchased the Site in 2005, and is the current owner. The Site is currently vacant.

A number of previous environmental investigations have been performed on site and in the surrounding areas, primarily related to regional groundwater issues of elevated volatile organic

compounds (VOCs) and hexavalent chromium (CrVI) in the area. A brief summary of previous environmental investigations is included below [summarized from Leighton, 2016]:

- An initial Site investigation in 1991 by Targhee Inc. found that underlying soils in the vicinity of former clarifiers and former chemical/oils storage were impacted by VOCs and total petroleum hydrocarbons (TPH) in soils.
- A Site investigation performed in 1992 by Hydro Geo Chem, Inc., also indicated that Site soil vapor and soil were impacted by chlorinated VOCs. Additional investigations were performed to assess the extent of soil and soil vapor contamination. Remedial activities were performed by Hydro Geo Chem from 1998 to 2001, including a shallow soil vapor extraction (SVE) system and a deeper SVE system with air sparging wells.
- Soil sampling performed in 2005 by Golder & Associates in areas adjacent to potential polychlorinated biphenyl (PCB) sources did not indicate PCBs were a concern on site.
- A soil and soil vapor sampling investigation by Ninyo & Moore in 2009 of the northeastern portion of the Site indicated soil concentrations of CrVI above regional background and concentrations of VOCs in soil vapor above relevant human health screening criteria. The area of this investigation has since been deeded to CalTrans as a permanent easement in connection with an Interstate Highway No. 5 widening project.
- A soil investigation conducted by Geosyntec in 2012 found detectable levels of CrVI that were below the residential and commercial/industrial soil California Human Health Screening Levels (CHHSLs). The CrVI concentrations were above the USEPA residential soil regional screening level (RSL), but below the commercial/industrial soil RSL. Select soil samples were additionally analyzed for metals. The vertical distribution of CrVI in soil was inconsistent with historical releases of CrVI that would have affected groundwater and did not suggest that historical Site activities had contributed to the groundwater basin's regional CrVI contamination. Additional sampling in the area of Boring SS-4 (**Figure 2**) was performed in 2016 as well, with no detectable concentration of CrVI in shallow soils [Geosyntec, 2016].

The proposed redevelopment of the Site is a mixed-use residential and commercial complex. Proposed features include residential apartments, a hotel, ground floor commercial use, a park and bike hub with amphitheater style seating, multiple courtyards, and first floor (i.e., at grade) and subterranean parking structures (**Figure 6**).

1.2 Human Health Risk Assessment Approach

The overall approach that was used in this HHRA is consistent with guidelines provided by the United States Environmental Protection Agency (USEPA) and by Cal-EPA [USEPA, 1989;

1991ab; 2002; 2016; Cal-EPA 1996; 1997, 2011, 2015]. As described by the USEPA, a risk assessment is a predictive tool used to assess the potential human health risks associated with exposure to Site-related chemicals of potential concern (COPCs). There are five basic steps in the quantitative HHRA process, which are summarized briefly as follows:

- Data Evaluation and Selection of COPCs: COPCs at the Site (defined as potentially hazardous chemicals associated with the Site that are present at concentrations higher than background levels) are identified by reviewing environmental sampling data collected in soil and soil vapor. Site-specific physical characteristics, including soil properties and geology are also evaluated.
- Exposure Assessment: Potentially relevant populations that could be exposed to Site-related COPCs, based on the current and proposed land use plans, are identified. For each land use scenario, the magnitude, frequency, and duration of the exposures and the pathways by which humans could potentially be exposed to Site-related COPCs are evaluated. The exposure scenarios are summarized in the Conceptual Site Model (CSM), which includes the sources, affected media, release mechanisms, and exposure pathways for each identified receptor population.
 - Fate and Transport Modeling: Current agency-approved fate and transport models are used to estimate the movement of volatile COPCs from soil to outdoor air and soil vapor into indoor air. Both the Johnson and Ettinger Model [J&E, 1991; Cal-EPA, 2011] and the *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (Soil Screening Guidance) [USEPA, 2002] are used.
- Toxicity Assessment: The relationship between the magnitude of exposure and potential adverse health effects on each receptor (dose-response assessment) is presented for each COPC. Toxicity criteria for each COPC are identified and are then used to estimate the likelihood of adverse effects which potentially could occur at different exposure levels.
- Risk Characterization: Results of the exposure and toxicity assessments are analyzed and combined to develop COPC-specific Risk-Based Concentrations (RBCs) for each exposure scenario. The RBCs represent the concentrations of chemicals in the relevant environmental media (e.g., soil and soil vapor) that would be considered safe for current and future land uses under conservative exposure conditions. Comparison of the RBCs to the detected soil and soil vapor concentrations for a given land use can then be conducted to estimate the cumulative health risks posed by the presence of multiple COPCs. In addition, RBCs can be used in potential remedial decision-making to determine if further action is warranted.

- **Uncertainty Analysis:** The uncertainties associated with each of the previous steps are discussed to assist decision-makers in evaluating the HHRA results in the context of the assumptions and variability in the data used.

Since the Site is currently vacant, consistent with the proposed future land uses of the Site, this HHRA addresses potential onsite exposures to future residents, future commercial workers, as well as to future construction workers. Potential exposures to COPCs detected in shallow soils (i.e., generally up to 12 feet (ft) below existing grade) were evaluated for the direct contact pathways, as well as outdoor inhalation of volatile COPCs in outdoor air and nonvolatile COPCs in fugitive dust. Additionally, the potential for volatile COPCs to migrate from the subsurface into above-ground structures was also evaluated using soil vapor data. Potential exposures to VOCs migrating from groundwater, which is in excess of 100 ft below ground surface (ft bgs) at the Site [OTIE, 2016], into indoor air were not quantitatively evaluated in this HHRA. For the purposes of this HHRA, deeper zone onsite soils (i.e., generally greater than 12 ft to 30.5 ft below existing grade) are characterized by detected concentrations of VOCs in soil vapor samples. Direct contact to groundwater was not evaluated quantitatively in this HHRA as this was not determined to be a complete exposure pathway. The Site does not maintain natural resources required to support wildlife habitats; therefore, onsite ecological exposures were not evaluated quantitatively in this HHRA.

1.3 Report Outline

The remaining sections of this report are organized as follows:

- Section 2 presents the data evaluation for the HHRA, including the identification of COPCs and the evaluation of background metal concentrations in soil;
- Section 3 describes the Conceptual Site Model (CSM) for the Site, which identifies potential human receptors that could be exposed to the COPCs and the pathways through which exposures could occur. This section also presents the methodology for estimating the fate and transport of COPCs at the Site;
- Section 4 presents the COPC-specific toxicity criteria;
- Section 5 describes the methodology used to derive the RBCs, summarizes the RBCs developed for all populations included in this HHRA and presents the proposed risk management criteria;
- Section 6 presents the methodology used to evaluate cumulative cancer risk and noncancer hazard for each specific land use;
- Section 7 presents the uncertainty analysis;
- Section 8 presents the conclusions; and
- Section 9 presents the references used in this HHRA.

A summary of the analytical data used in this HHRA is provided in **Appendix A**. The background metals evaluation is presented in **Appendix B**. The calculation of Site-specific soil properties is presented in **Appendix C**. The fate and transport modeling used for the vapor intrusion pathway is presented in **Appendix D**. The RBC derivation is presented in **Appendix E**, while the details of the cumulative cancer risk and noncancer hazard calculations are presented in **Appendix F**.

2. DATA EVALUATION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN

An initial step in the HHRA process is an evaluation of available data to: 1) characterize the Site; 2) develop a data set for use in the estimation of potential risks; and 3) identify media-specific COPCs. Appropriate Site data must be available to support the characterization of chemical levels and media relevant to transport processes and exposure pathways. Federal [USEPA, 1989] and state [Cal-EPA, 2014]-recommended methods were used to select chemicals with the potential to contribute to overall human health. This section discusses the data evaluation that was conducted in this HHRA, as well as the methodology that was used to identify the COPCs for the Site.

2.1 Data Evaluation

A variety of samples have been collected at the Site. However, not all chemicals detected may be attributable to an onsite release and not all data may be of acceptable quality. Previous and recent data collected were evaluated to determine which of the chemicals identified are likely to be Site-related and to assess whether the reported concentrations for these chemicals are of acceptable quality for use in this HHRA.

The data evaluation was consistent with guidance provided by USEPA in their *Risk Assessment Guidance for Superfund* (1989) and *Guidance for Data Usability in Risk Assessments* (1992). The evaluation included:

- Evaluating the appropriateness of the analytical methods employed during the Site investigations in relation to the types of industrial processes and potential COPCs;
- Evaluating the quality of data with respect to sample quantification and detection limits;
- Examining laboratory qualifiers assigned to monitoring data and evaluating potential quality assurance/quality control problems; and
- Evaluating field duplicate samples.

The analytical data were also reviewed for potential qualifiers that may impact the HHRA significantly. Site data utilized in this HHRA included VOCs, TPH as diesel range organics (DRO) and oil range organics (ORO), metals, and CrVI results collected during the Leighton [2016] investigation, as well as metals and CrVI data collected by Geosyntec in 2012.

The Geosyntec 2012 investigation included soil borings at five locations, with samples collected approximately every 5 vertical feet below grade. All samples were analyzed for CrVI and select samples were analyzed for Title 22 metals. During the Site Investigation by Leighton

[Leighton, 2016], a total of 36 soil borings were advanced and sampled at multiple depths, and soil samples were analyzed for VOCs, TPH, and metals. Soil samples with total chromium results greater than 50 milligrams per kilogram (mg/kg) were subsequently analyzed for CrVI. Soil vapor probes were installed at the bottom of all borings, at various depths. Soil vapor samples were analyzed for VOCs.

The determination was made to utilize the Leighton [2016] and Geosyntec [2012] dataset in the HHRA (**Figure 2**), including all soil vapor samples and shallow soil samples collected from depths of 0 to 12 ft bgs, based on the following considerations:

- These two datasets are the most recently collected on site and therefore best represent current Site conditions. While previous investigations have included VOC analyses of soil and soil vapor samples from the Site, historical remediation activities conducted up to 2001 and the highly mobile nature of VOCs suggest previous datasets will not represent current Site conditions.
- Results of the 2009 Ninyo & Moore Site investigation were considered for inclusion in the HHRA dataset, but were not included, as this portion of the Site had since been deeded to CalTrans as a permanent easement and is not within the proposed redevelopment Site boundary. Additionally, a review of this 2009 dataset indicated that concentrations of VOCs and metals in soils were generally higher in the 2016 dataset. While some chemicals were detected in the 2009 dataset at higher concentrations or were not analyzed for in the more recent data collection effort, such as semi-volatile organic compounds (SVOCs) and polychlorinated biphenyls (PCBs), Ninyo & Moore's investigation concluded that concentrations of VOCs, metals, PCBs, SVOCs, and TPH in soil were below the Site-specific cleanup goals approved by the LARWQCB and were therefore not at a level of significant concern [Ninyo & Moore, 2009].

Within the retained HHRA dataset, field duplicates were evaluated as part of the data evaluation procedure. Field duplicates are collected to evaluate the quality of sample collection as well as sample analysis. Field duplicate samples are usually two samples collected simultaneously from the same sampling location and are used as measures of either the homogeneity of the medium sampled in a particular location or the precision in the sampling and sample handling (in transport and/or in the laboratory) [USEPA, 1989]. For cases where a field duplicate sample result is present for the same chemical in a sample, a single representative concentration for the sample was selected as follows:

- 1) If there is a detection in both samples, the higher concentration was selected;
- 2) If there is a detection in one sample but not the other, the detected concentration was selected; and

- 3) If both samples are nondetects, the lowest method detection limit was selected and appropriate techniques for handling nondetect data were applied in calculating statistics later in the data evaluation.

2.2 Selection of Chemicals of Potential Concern

USEPA risk assessment guidance presents a methodology for identifying which detected chemicals should be included in a quantitative HHRA. These are defined by USEPA [1989] as chemicals potentially related to the Site whose data are of sufficient quality for use in a quantitative HHRA. USEPA guidance states that the list of chemicals should include chemicals that were:

- 1) Positively detected in at least one sample;
- 2) Detected above levels of the same chemicals found in associated blank samples;
- 3) Tentatively identified, but may be associated with the Site based on historical information;
- 4) Transformation products of detected chemicals; and
- 5) Detected above naturally occurring levels (background).

Data determined to be of sufficient quality were carried forward into the COPC selection process described below.

Analytical results for shallow soil samples collected between 0 and 12 ft bgs (see **Table A-1 in Appendix A**) were used to evaluate the direct contact pathway and inhalation of fugitive dust and outdoor air vapors that may volatilize from soil. This soil interval was evaluated based on the assumption that 12 ft would be the likely maximum depth of disturbance during potential future redevelopment and Site use and maintenance activities, and is therefore the maximum depth of soil to which future receptor populations would likely be directly exposed.

Shallow zone soils are characterized by detected concentrations of VOCs and non-VOCs in soil matrix samples collected from 0 to 12 ft bgs (note: non-VOCs include inorganic constituents that exceed background concentrations, as described below). It is assumed that receptor populations may be directly exposed to VOCs and non-VOCs in shallow zone soils and that shallow zone soils contain a finite mass of VOCs available for upward diffusive and advective transport to the ground surface. This soil depth interval was evaluated for future residents and future workers (commercial and construction). Deeper zone soils and groundwater are not accessible for direct contact and were, therefore, not included in this evaluation.

Because soil vapor data are preferred over soil data for the evaluation of the vapor intrusion pathway [Cal-EPA, 2011], potential indoor air exposures estimated from soil samples were not

included in this HHRA. The potential exposure to VOCs in soil and/or underlying groundwater for the vapor intrusion pathway was evaluated through the use of the soil vapor data collected at 4, 15, 20, and 30 ft bgs (see **Table A-2** in **Appendix A**). Available soil matrix and soil vapor data were reviewed to determine their usability in this HHRA; the data were accepted.

The COPC screening process for inorganic compounds included a background metals evaluation following Cal-EPA guidance [Cal-EPA, 1997]. Metals were excluded from the HHRA if they were considered to be at or below naturally occurring background concentrations. A summary of the results of this background evaluation is discussed in the next section with the details presented in **Appendix B**. The statistical analysis conducted for metals is summarized in **Table 1**. The COPC screening process for TPH included a comparison to screening levels, which is described in Section 2.2.2 below.

The list of COPCs that were evaluated in this HHRA is summarized in **Table 2**. All organic chemicals detected in at least one sample in a given media were included as COPCs. A summary of analytical results used in this HHRA for soil and soil vapor is presented in **Appendix A**.

2.2.1 Background Metals Evaluation

Based on the results of the background metals evaluation (see **Appendix B**), concentrations of arsenic, barium, cobalt, mercury, molybdenum, nickel, and vanadium in soils were considered to be within background levels for the Site. For arsenic, the maximum concentration in soil (6.8 mg/kg) was compared to the regional background level of 12 mg/kg [Cal-EPA, 2008] and was determined to be within background. For beryllium and molybdenum, too few samples had detectable concentrations to perform robust statistical analysis; therefore, only the coefficient of variation (CV) and the presence of inflection points were considered as outlined in **Appendix B**. For molybdenum, the CV was less than one, and no inflection point could be identified; therefore, this metal was considered within background. Beryllium was carried forward as a COPC due to elevated detection limits in the dataset. For cadmium, total chromium, copper, lead, nickel, vanadium and zinc, more than one population could be distinguished (an ambient and a potentially Site-impacted population). Additionally, the plots for total chromium, copper, lead, and zinc did not indicate a goodness of fit (GOF) to a particular distribution. The CVs for cadmium, copper, lead and zinc were greater than 1. CrVI was included in the background evaluation; however, as CrVI is a known regional contaminant of concern, it was carried forward as a COPC. Therefore, concentrations of beryllium, cadmium, total chromium, CrVI, copper, lead, and zinc were considered above background or of regional concern as they relate to this Site. These metals were thus selected as COPCs to be quantitatively evaluated in this HHRA.

Details of the background metals evaluation are presented in **Appendix B**.

2.2.2 Evaluation of Total Petroleum Hydrocarbons

TPH as DRO and ORO detected in the soil matrix (see **Table A-1** in **Appendix A**) were evaluated by comparing the data to the San Francisco Bay Regional Water Quality Control Board (SFRWQCB)-approved Tier 1 Environmental Screening Levels derived for protection of residential land use [ESLs; SFRWQCB 2016].

ORO (C29-C32) was detected in soil samples collected between 0 and 12 ft bgs at concentrations ranging from nondetect to 169 mg/kg, which were all less than the TPH motor oil Tier 1 ESL of 5,100 mg/kg. DRO (C10-C28) was detected in soil between 0 and 12 ft bgs at concentrations ranging from nondetect to 241 mg/kg, with only the maximum detected concentration slightly exceeding the Tier 1 ESL of 230 mg/kg. The average DRO concentration is 13 mg/kg with the 95 percent upper confidence limit (95UCL) of the average concentration at 16.7 mg/kg. Both the average and 95UCL DRO concentrations are well below the ESL. Therefore, TPH compounds were not selected as COPCs to be quantitatively evaluated in this HHRA.

3. EXPOSURE ASSESSMENT

The exposure assessment quantifies the magnitude, frequency, and duration of COPC intake (daily intake) by receptor populations using USEPA and Cal-EPA guidelines, Site-specific information, and professional judgment, as appropriate. To determine whether the levels of COPCs present in soil and soil vapor would pose a health risk to human populations, it is necessary to identify the receptors (populations) that may potentially be exposed to these COPCs and determine the pathways by which the exposures may occur. Once the potentially exposed populations are identified, the complete exposure pathways by which the individuals may contact COPCs must be determined. A complete exposure pathway requires a source and mechanism of chemical release, a point of potential human contact within the impacted medium, and an exposure route (e.g., ingestion) at the contact point. These source-pathway-receptor relationships provide the basis for the quantitative exposure assessment. Potentially complete source-pathway-receptor relationships which were included in this HHRA are depicted in the Conceptual Site Model (CSM) discussed below.

3.1 Conceptual Site Model

The CSM identifies potential chemical sources, release mechanisms, transport media, routes of chemical migration through the environment, exposure media, and potential receptors. Potential receptors that may be exposed to Site-related chemicals are identified in the CSM to help assess the likelihood and extent of their potential exposures.

A general CSM for this HHRA was constructed based on a review of the available Site information regarding the environmental setting and chemical distribution in environmental media. The CSM, presented in **Figure 3**, represents the current understanding of the sources of COPCs, the means by which they may be released and transported within and among media, and the exposure pathways and routes by which they may contact human receptors. The major components of the CSM are discussed below.

3.1.1 Chemical Characteristics and Potential Exposure Routes

Potential exposure to COPCs detected in soil and soil vapor at the Site is partly dependent on the type of chemicals that are present and the respective exposure media. Potential exposure routes to be considered include both direct and indirect contact with soil and soil vapor. If volatile chemicals are detected in soil vapor, indirect exposures (indoor inhalation) from vapors migrating from the subsurface may occur. If metals are detected in soil, the direct contact routes of exposure, such as incidental ingestion or dermal contact, are the most relevant.

3.1.2 Identification of Potential Receptors and Exposure Pathways

The Site is currently vacant. The proposed redevelopment plans for the Site will include future residential and commercial uses. Therefore, the onsite receptors that were evaluated in this HHRA consisted of a future resident and a future commercial worker. In addition, a construction worker was evaluated for potential exposures during redevelopment activities.

Exposure pathways associated with potential domestic use of groundwater are not considered to be complete and are therefore not quantified in this HHRA. Groundwater is not currently used nor is it reasonably expected to be used in the future at the Site. Pathways associated with surface waters are not considered in the HHRA because there are no surface waters within the bounds of the Site. The concrete-lined Burbank Western Channel is off site to the west of the railroad tracks and is not considered to impact the Site.

The exposure pathways evaluated in this HHRA include indoor inhalation of volatiles from soil vapor and exposures via direct contact to soils (incidental ingestion and dermal contact with soils) and outdoor air inhalation. Outdoor air inhalation was not evaluated for soil vapor, as the indoor air pathway is the most sensitive exposure for this media and provides the most conservative evaluation of potential health risks associated with soil vapor exposure. The receptors and exposure pathways selected for evaluation in this HHRA were based on these considerations and are discussed in more detail below.

3.1.2.1 Future Resident

The proposed redevelopment for the Site includes two residential buildings expected to be 6-story structures with ground floor parking and a lobby (**Figure 6**). Conservatively, residential exposures via direct contact to soils (incidental ingestion and dermal contact with soils) and outdoor air inhalation were evaluated in this HHRA. The potential also exists for vapor migration into indoor air from COPCs detected in soil vapor; therefore, potential indoor air exposures to future residents at the Site were quantitatively evaluated in this HHRA in both a “slab-on-grade” exposure scenario and a “second floor” exposure scenario for comparison purposes.

It was also conservatively assumed that future residents will be on site for 24 hours each day, 7 days per week for 50 weeks each year (350 days per year) for 26 years.

3.1.2.2 Future Commercial Worker

The proposed redevelopment includes commercial uses of the Site such as retail shops and hospitality services. Current plans include a hotel with retail, food service and other

amenities, along with courtyards, a bike hub and park. It is anticipated that the majority of the Site will be covered by pavement and buildings following redevelopment, which reduces the potential for direct exposure to soils. However, commercial exposures via direct contact to soils (incidental ingestion and dermal contact with soils) and outdoor air inhalation were evaluated in this HHRA. The potential also exists for vapor migration into indoor air from COPCs detected in soil vapor; therefore, potential indoor air exposures to workers at the Site were quantitatively evaluated in this HHRA.

It was assumed that future commercial workers will be on site for 8 hours each day, 5 days per week for 50 weeks (250 days per year) for 25 years. In addition, workers were assumed to be either outdoors or indoors for the full exposure duration since a worker could not be both indoors and outdoors at the same time, but would likely spend a portion of the day in each location.

3.1.2.3 Future Construction Worker

Construction workers will be involved in Site grading and excavation for footings and utility lines during Site redevelopment. Due to the estimated maximum depth of typical footings and utilities, it is assumed that construction workers may potentially be exposed to COPCs in the top 12 ft of soil. Such activities may potentially expose a construction worker to COPCs in shallow soil via dermal contact and incidental ingestion. The construction worker may also be exposed via inhalation to COPCs which migrate from soil to outdoor air and to COPCs present in airborne dust generated by wind erosion and by intrusive soil-handling activities.

It was assumed that future construction workers will be on site for 8 hours each day, 5 days per week for 50 weeks during a single construction event for up to 1 year (i.e., 250 days per year of exposure). Although their exposures were evaluated in this HHRA, it is anticipated that potential exposure to construction workers would be minimized by adherence to Health and Safety plans that may potentially be required for work on the Site during potential redevelopment.

3.1.3 Exposure Assumptions

The proposed exposure parameters for the receptors identified above are listed in **Table 3** and are consistent with those recommended by Cal-EPA and USEPA.

3.1.4 Summary of Selected Exposure Pathways

An exposure pathway describes a specific environmental pathway by which an individual (receptor) can be exposed to COPCs present at or originating from a source. The following five elements comprise a complete exposure pathway:

- A source of chemical;
- A mechanism of chemical release to the environment;
- An environmental transport medium (e.g., soil or air);
- A point of potential human contact with the medium; and
- A means of entry (i.e., intake route) into the body (e.g., ingestion).

There must be a complete exposure pathway from the source of chemicals in the environment (i.e., from soil or air) to human receptors in order for chemical intake to occur. If all exposure pathways are incomplete for human receptors, no chemical intake occurs and hence, no human health effects are associated with site-related COPCs.

Given the characteristics of the COPCs and the Site conditions, several exposure pathways have been identified as potentially complete. The CSM (**Figure 3**) presents a summary of the exposure pathways for each receptor evaluated in this HHRA. The following table summarizes the receptor groups, exposure medium and potential exposure pathways that were evaluated quantitatively in this HHRA.

Receptor Population	Exposure Medium	Potentially Complete Exposure Pathway
Future Resident	Shallow Soil (0 - 12 ft bgs)	<ul style="list-style-type: none"> • Incidental Ingestion • Dermal Contact • Outdoor Fugitive Dust Inhalation • Outdoor Vapor Inhalation
	Soil Vapor	<ul style="list-style-type: none"> • Indoor Air Inhalation
Future Commercial Worker	Shallow Soil (0 - 12 ft bgs)	<ul style="list-style-type: none"> • Incidental Ingestion • Dermal Contact • Outdoor Fugitive Dust Inhalation • Outdoor Vapor Inhalation
	Soil Vapor	<ul style="list-style-type: none"> • Indoor Air Inhalation
Future Construction Worker	Shallow Soil (0 - 12 ft bgs)	<ul style="list-style-type: none"> • Incidental Ingestion • Dermal Contact • Outdoor Fugitive Dust Inhalation • Outdoor Vapor Inhalation

3.2 Fate and Transport Modeling

Fate and transport modeling is the quantitative analysis of how chemicals move through the environment and how they are transformed by processes such as chemical reaction and biological degradation. In the context of this HHRA, fate and transport modeling was employed to predict the movement of COPCs from impacted media (i.e., soil and soil

vapor) to points of exposure for human populations. Also adding to the conservative nature of this evaluation, with respect to fate and transport modeling, chemical transformation processes of chemical reaction and biological degradation were not evaluated in this HHRA for the Site.

Fate and transport modeling was required to assess the indirect-exposure pathways identified in the CSM (**Figure 3**). Specifically, the following are the distinct transport mechanisms for which fate and transport modeling was employed:

- Transport of particulate-phase COPCs from soil matrix to outdoor air;
- Transport of vapor-phase COPCs from soil matrix to outdoor air; and
- Transport of vapor-phase COPCs from soil vapor to indoor air (vapor intrusion pathway).

For each of these transport mechanisms, fate and transport modeling was employed to quantify the relationship between the COPC concentration in the impacted medium (soil or soil vapor) and the COPC concentration in the exposure medium (indoor or outdoor air). The relationship is expressed in the form of a “transfer factor,” defined as, the ratio of the COPC concentration in the exposure medium to the COPC concentration in the impacted medium. The specific definition of the TF for each of the transport mechanisms identified above is presented in **Table 4**. The TFs were used in the intake factor and exposure concentration factor equations presented in the Sections below to derive COPC-specific RBCs. The fate and transport modeling that was used to assess the indirect-exposure pathways and the methodology for calculation of TFs are further discussed below.

3.2.1 Fugitive Dust Emissions into Outdoor Air

Metals were detected in soil at the Site at concentrations above background levels. It is assumed that these COPCs could become airborne due to fugitive dust emissions; therefore, exposure to these chemicals may occur via inhalation of fugitive dust. Inhalation exposure to non-volatile compounds is typically minor in fugitive dust when compared to direct ingestion exposure [USEPA, 2002]. Nevertheless, a relationship can be estimated between the COPC concentration in soil and the corresponding concentration in air (secondary media) attributable to fugitive dust emissions from soil.

Potential exposure to airborne dust is estimated using a TF called the particulate emission factor (PEF), which relates the chemical concentration in soil to the concentration of dust particles in outdoor air. The PEF is defined as the ratio of the COPC concentration in outdoor air to the COPC concentration in soil:

$$PEF = \frac{C_s}{C_{oa}}$$

Where:

- PEF = particulate emission factor (mg/kg per mg/m³, or m³/kg);
C_s = concentration of COPC in soil (mg/kg); and
C_{oa} = concentration of COPC in outdoor air (mg/m³).

The PEF is related to the concentration of particulate matter (dust) in air:

$$PEF = \frac{1}{CD}$$

Where:

- CD = concentration of dust in air (kg/m³).

The PEF represents an annual average emission rate based on wind erosion. The PEF equation can be found in the Soil Screening Guidance [USEPA, 2002]. The emissions part of the PEF equation is based on the “unlimited reservoir” model developed to estimate PM₁₀ emissions (particulate matter less than 10 micrometers in diameter) due to wind erosion (Cowherd et al., 1985).

3.2.1.1 Future Resident/Future Commercial Worker PEF

For the future resident and future commercial worker, the following equation was used to estimate the PEF [USEPA, 2002]:

$$PEF_{res/commW} = \frac{(Q/C_{res/commW} \times CF)}{[0.036 \times (1 - G_{res/commW}) \times \left(\frac{U_M}{U_T}\right)^3 \times F_x]}$$

Where:

- PEF_{res/commW} = particulate emission factor, cubic meters per kilogram (m³/kg);
Q/C_{res/commW} = inverse of the ratio of the geometric mean air concentration to the emission flux at center of the source (g/m²-s per kg/m³);
CF = units conversion factor (3,600 s/hr);
0.036 = empirical constant (g/m²-hr);
G_{res/commW} = fraction of vegetative or other cover [0.5 unitless; USEPA, 2002];

- U_M = mean annual wind speed [3.31 m/sec, average wind speed for Los Angeles; NCDC, 2010];
- U_T = equivalent threshold value of wind speed at 7 meters above ground surface (11.32 m/sec; USEPA, 2002); and
- F_x = function dependent on U_M/U_T [0.00474 unitless; USEPA, 1996].

The dispersion coefficient (Q/C) in units of grams per square meter-second per kilogram per cubic meter ($\text{g/m}^2\text{-s per kg/m}^3$) was generated using the Industrial Source Complex model and varies depending on the source area, city, and climatic zone. This term accounts for the dispersion of particulate matter after emission and was estimated using the following equation [USEPA, 2002]:

$$Q/C = A \times \exp\left[\frac{(\ln A_{\text{SITE}} - B)^2}{C}\right]$$

Where:

- Q/C = inverse of the ratio of the geometric mean air concentration to the emission flux at center of the source ($\text{g/m}^2\text{-s per kg/m}^3$);
- A_{SITE} = areal extent of soil impact; default 0.5-acre source in Los Angeles [USEPA, 2002];
- A = coefficient; default = 11.911, based on air dispersion modeling for specific climate zones [unitless; USEPA, 2002];
- B = coefficient; default = 18.4385 [unitless; USEPA, 2002]; and
- C = coefficient; default = 209.7845 [unitless; USEPA, 2002].

The A_{SITE} value of 0.5 acre is based on a default source size, which is generally considered an appropriate assumption for a typical exposure unit [USEPA, 2002]. The coefficients A , B , and C are for the Los Angeles area [USEPA, 2002]. A $Q/C_{\text{res/commW}}$ value of 68.18 $\text{g/m}^2\text{-s per kg/m}^3$ was estimated as the inverse of the mean concentration at the center of a 0.5-acre square source. The resulting PEF for a future resident and a future commercial worker is $1.2 \times 10^{11} \text{ m}^3/\text{kg}$ (**Table 5**). This PEF was incorporated into the exposure concentration factor equation for outdoor inhalation of particulates in this HHRA.

3.2.1.2 Future Construction Worker PEF

A Site-specific, time-weighted PEF was used in this HHRA for the future construction worker based on the assumption that only a fraction of the construction time would have elevated dust levels. During times of intrusive activities, such as site grading, fugitive dust emissions are expected to be higher. During other times, such as building construction, fugitive dust emissions are expected to be lower and due only to wind-

blown dust. The Site-specific, time-weighted PEF was developed to account for these differences in emission mechanisms coupled with the estimated time in which intrusive or non-intrusive construction activities would take place. It is assumed that the intrusive soil-handling activities will be conducted for a portion of the exposure duration for the future construction worker (e.g., intrusive soil handling would occur for the first 60 days of construction when Site soils will be graded and the emissions during the remaining 190 working days, of the total 250 working days, would primarily be due to the more passive emission mechanisms such as wind-blown dust).

As noted above, the PEF is related to the concentration of particulate matter (dust) in air:

$$PEF = \frac{1}{CD}$$

Where:

CD = concentration of dust in air (kg/m³).

Therefore, the Site-specific, time-weighted PEF is the sum of the contributions from the total dust concentration from intrusive activities (e.g., soil excavation, dumping, or hauling that may potentially generate relatively high levels of dust) and from non-intrusive activities (e.g., wind erosion of surface soil expected to generate lower levels of dust), as follows:

$$PEF_{\text{constW}} = \frac{1}{CD_{\text{TOT}}} = (CD_{\text{INTR}} + CD_{\text{WIND}})^{-1}$$

Where:

CD_{TOT} = total concentration of dust in air (kg/m³);

CD_{INTR} = concentration of airborne dust resulting from intrusive soil-handling activities (kg/m³); and

CD_{WIND} = concentration of airborne dust resulting from wind erosion (kg/m³).

The dust concentration resulting from intrusive work (e.g., excavation, dumping, hauling, and other soil-handling activities) is assumed to be equal to 1 mg/m³ or 1×10⁻⁶ kg/m³ [Cal-EPA, 2014]¹ for the future construction worker:

¹ The respirable dust concentration of 1 mg/m³ is based on a maximum concentration of dust in air of 10 mg/m³ recommended by the American Conference of Governmental Industrial Hygienists (ACGIH 2004,

$$CD_{INTR} = 1 \times 10^{-6} \text{ kg/m}^3$$

The concentration of dust in air resulting from dust emissions due to unpaved road traffic and wind erosion was calculated as:

$$CD_{WIND} = \frac{0.036 \times (1 - G_{constW}) \times \left(\frac{U_M}{U_T} \right)^3 \times F_x}{CF} \times \frac{1}{(Q/C_{p,cw})}$$

Where:

- CD_{WIND} = concentration of airborne dust resulting from dust emissions from unpaved road traffic and wind erosion (kg/m^3);
- 0.036 = empirical constant ($\text{g/m}^2\text{-hr}$);
- G_{constW} = fraction of vegetative or other cover (0, unitless);
- U_M = mean annual wind speed [3.31 m/sec, average wind speed for Los Angeles; NCDC, 2010];
- U_T = equivalent threshold value of wind speed at 7 meters above ground surface (11.32 m/sec) [USEPA, 2002];
- F_x = function dependent on U_M/U_T derived using Cowherd et al. [1985] (0.00474, unitless) [USEPA, 1996];
- CF = units conversion factor (3,600 sec/hr); and
- $Q/C_{p,cw}$ = inverse of the ratio of the geometric mean air concentration to the emission flux at center of the source ($\text{g/m}^2\text{-sec}$ per kg/m^3) [USEPA 2002].

The first term of the equation for CD_{WIND} represents the emission rate of particulate matter from the ground surface to air (i.e., erosion). This flux is a function of wind speed and surface vegetation. The 0% coverage assumes that source area is essentially exposed where bare soil is available for contact.

The second term of the equation for CD_{WIND} is the inverse of the ratio of the geometric mean air concentration to the emission flux along a straight road segment bisecting a square site. Therefore, the equation above accounts for both wind erosion emissions and emissions from other construction activities (e.g., traffic on unpaved roads). According

Threshold Limit Values and Biological Exposure Indices), and the assumption that 10 percent of the mass of particles are in the respirable PM_{10} range.

to USEPA, construction traffic on impacted, unpaved roads “typically accounts for the majority of emissions, with wind erosion, excavation soil dumping, dozing, grading, and tilling operations contributing lesser emissions. The ambient air dispersion of emissions, therefore, is different for these two classes of emission sources” [USEPA, 2002]. Therefore, the equation presented above, CD_{WIND} , accounts for subchronic exposures to dust from unpaved road traffic and from other construction activities (including wind erosion). The subchronic dispersion factor ($Q/C_{p,cw}$) term of the above equation was calculated as:

$$(Q/C_{p,cw}) = A \times \exp \left[\frac{(\ln A_{SITE} - B)^2}{C} \right]$$

Where:

- A_{SITE} = areal extent of soil impact (future construction worker Site-specific = 8 acres);
- A = coefficient; default = 12.9351, based on air dispersion modeling [unitless; USEPA, 2002];
- B = coefficient; default = 5.7383 [unitless; USEPA, 2002]; and
- C = coefficient; default = 71.7711 [unitless; USEPA, 2002].

A subchronic ($Q/C_{p,cw}$) dispersion factor of 15.59 g/m²-s per kg/m³ was estimated as the inverse of the mean concentration at the center of the 8-acre Site for a future construction worker. The PEF_{constW} for the future onsite construction worker was estimated as a time-weighted average:

$$PEF_{constW} = \left(\frac{\left[(CD_{INTR}) \times \left(\frac{8 \text{ hr}}{8 \text{ hr}} \right) \times (EF_i) \right] + \left[(CD_{WIND}) \times \left(\frac{8 \text{ hr}}{8 \text{ hr}} \right) \times (EF_w) \right]}{EF} \right)^{-1}$$

Where:

- EF_i = exposure frequency during intrusive activities (construction worker = 60 days);
- EF_w = exposure frequency during the remaining wind-dispersed exposure period (construction worker = 190 days); and
- EF = exposure frequency, total number of days at the Site (construction worker = 250 days).

This equation results in a Site-specific PEF_{constW} of $4.2 \times 10^6 \text{ m}^3/\text{kg}$ for the future construction worker. This PEF_{constW} was incorporated into the exposure concentration factor equation for outdoor inhalation of particulates in this HHRA. The inverse of the PEF equation results in an average dust concentration (CD) of $2.4 \times 10^{-7} \text{ kg/m}^3$, or $240 \text{ } \mu\text{g/m}^3$ of dust (**Table 5**).

3.2.2 Fugitive Dust Emissions into Outdoor Air

Because VOCs were detected in soil samples collected at the Site, individuals could potentially be exposed to vapors migrating through the soil to outdoor air. Therefore, outdoor air exposures were evaluated for VOCs detected in soil, as discussed below.

Potential migration of vapors from vadose zone soil to outdoor air was estimated using the volatilization factor (VF), as presented in Section 4.2.3 of the *Soil Screening Guidance* [USEPA, 2002; Equation 4-8: *Derivation of the VF*]. Site-specific soil physical property data (e.g., bulk density, porosity) for shallow soils collected between 0 to 14 ft bgs were used to derive COPC-specific VFs for the soil to outdoor air pathway (see **Table 5**) based on the geotechnical investigation performed by Geocon West dated 12 February 2016. Details of the calculation of site-specific soil properties are provided in **Appendix C**. The VF was used in this HHRA to estimate outdoor inhalation exposures for future residents, future commercial workers, and future construction workers.

3.2.2.1 Future Resident and Future Commercial Worker VF

For future residents and future commercial workers, COPC-specific VFs were derived using the following equation [USEPA, 2002]:

$$VF_{soil} = \frac{Q/C \times \left(10^{-4} \frac{\text{m}^2}{\text{cm}^2} \right) \times (3.14 \times D_A \times T)^{1/2}}{(2 \times Pb \times D_A)}$$

Where:

- Q/C = inverse of the ratio of the geometric mean air concentration to the emission flux at center of the source ($\text{g/m}^2\text{-sec}$ per kg/m^3) and is the same as that calculated in Section 3.2.1.1;
- D_A = COPC-specific apparent diffusivity (cm^2/sec);
- T = exposure interval (future resident 26 years = 8.2×10^8 commercial worker 25 years = 7.9×10^8 sec); and
- Pb = dry soil bulk density (1.77 g/cm^3).

And where:

$$D_A = \frac{\left(\frac{D_{\text{air}} \times \theta_a^{3.33}}{\theta_T^2} \right) + \left(\frac{D_{\text{water}} \times \theta_w^{3.33}}{H \times \theta_T^2} \right)}{(\text{Pb} \times K_{oc} \times \text{foc}) + \theta_w + (\theta_a \times H)}$$

Where:

- D_{air} = COPC-specific vapor diffusion coefficient in air (cm²/sec);
- D_{water} = COPC-specific molecular diffusion coefficient in water (cm²/sec);
- θ_a = air-filled porosity (0.109 cm³-air/cm³-soil);
- θ_w = water-filled porosity (0.224 cm³-water/cm³-soil);
- θ_T = total soil porosity (0.333 cm³-air/cm³-soil);
- H' = COPC-specific Henry's law coefficient (unitless);
- Pb = dry soil bulk density (1.77 g/cm³);
- K_{oc} = COPC-specific soil organic carbon partition coefficient (cm³/g); and
- foc = fraction organic carbon in soil [0.006 g/g; USEPA, 2016 default].

The COPC-specific VF_{soil} for a future resident and (VF_{res}) and future commercial worker (VF_{commw}) are presented in **Table 5**. These VFs were incorporated into the exposure concentration factor equation for outdoor inhalation of VOCs detected in vadose zone soil for a future resident and future commercial worker.

3.2.2.2 Future Construction Worker VF

The Q/C term for a future construction worker is specific to sub-chronic inhalation exposures and not specific to climatic zone, which differs from the residential Q/C term. Therefore, for future construction workers, a $\text{Q/C}_{\text{vol,cw}}$ dispersion factor was estimated as the inverse of the ratio of the geometric mean air concentration to the emission flux at center of the source using the following equation [USEPA, 2002]:

$$\text{Q/C}_{\text{vol,cw}} = A \cdot \exp \left[\frac{(\ln A_{\text{SITE}} - B)^2}{C} \right]$$

Where:

- A_{SITE} = areal extent of soil impact (future construction worker = 8 acres);
- A = coefficient; default = 2.4538, based on air dispersion modeling [unitless; USEPA, 2002];
- B = coefficient; default = 17.566 [unitless; USEPA, 2002]; and

C = coefficient; default = 189.0426 [unitless; USEPA, 2002].

A $Q/C_{vol,cw}$ of $8.73 \text{ g/m}^2\text{-s}$ per kg/m^3 was estimated as the inverse of the mean concentration at the center of the 8-acre Site for a future construction worker. COPC-specific VF_{constW} for future construction worker exposures were derived using the following equation [USEPA, 2002]:

$$VF_{constW} = Q/C_{vol,cw} \times \left(\frac{1}{F_D} \right) \times \frac{\left(10^{-4} \frac{\text{m}^2}{\text{cm}^2} \right) \times (3.14 \times D_A \times T_{constW})^{1/2}}{(2 \times Pb \times D_A)}$$

Where:

- VF_{constW} = COPC-specific volatilization factor for a future construction worker (m^3/kg);
- $Q/C_{vol,cw}$ = inverse of the ratio of the geometric mean air concentration to the emission flux at center of the source ($\text{g/m}^2\text{-sec}$ per kg/m^3);
- F_D = sub-chronic dispersion correction factor (unitless);
- D_A = COPC-specific apparent diffusivity (cm^2/sec);
- T_{constW} = exposure interval (construction worker for 1 year = 3.2×10^7 sec); and
- Pb = dry soil bulk density (1.77 g/cm^3).

The subchronic dispersion correction factor, F_D , was used in the equation for a future construction worker to adjust for the shorter, 1-year construction duration. The F_D of 0.188 was estimated using the following equation [USEPA, 2002]:

$$F_D = 0.1852 + \frac{5.3537}{tc} + \frac{-9.6318}{(tc)^2}$$

Where:

- 0.1852 = constant [unitless, US EPA 2002];
- 5.3537 = constant [unitless, US EPA 2002];
- 9.6318 = constant [unitless, US EPA 2002]; and
- t_c = duration of construction ($250 \text{ days/yr} \times 8 \text{ hours/day} = 2,000 \text{ hrs}$).

The COPC-specific VF_{constW} for a future construction worker are presented in **Table 5**. These VFs were incorporated into the exposure concentration factor equation for outdoor inhalation of VOCs detected in soil for a future construction worker.

3.2.3 Vapor Emissions into Indoor Air

The potential exists for VOCs to volatilize from the subsurface and migrate into indoor air. This pathway was evaluated using the Johnson and Ettinger [J&E, 1991] subsurface vapor intrusion model [USEPA, 2004] along with updated chemical physical properties from the USEPA RSL table [USEPA, 2016]. The model accounts for the diffusion of chemicals through the subsurface, the advection of chemicals through soil and concrete slabs due to pressure differentials between the soil and buildings, and the mixing in indoor air caused by heating and ventilation systems.

Soil vapor data are typically the preferred medium from which to evaluate the vapor intrusion pathway [Cal-EPA, 2011]. Therefore, potential indoor air exposure to VOCs in soil for the vapor intrusion pathway was evaluated through the use of the soil vapor data. Concentrations at each location and depth were evaluated so as to provide a complete profile of potential cancer risks and noncancer hazards associated with soil vapor at the Site. Therefore, soil vapor RBCs were derived based on modeled soil vapor attenuation factors and Site-specific sampling depths (e.g., 4, 15, 20 and 30 ft bgs).

Geotechnical data for soil samples collected at the Site were reviewed to characterize soil property parameters for use in the vapor intrusion modeling (**Appendix C**). Based on review of the geotechnical investigation report by Geocon [2016], two distinct soil layers were identified at the Site. A layer of fill materials exists from the existing Site surface to approximately 14 ft bgs. Below the fill layer is a layer of alluvial soils that continued to the maximum exploration depth of 61.5 ft bgs. Based upon the boring logs and geotechnical laboratory data [Geocon, 2016], the soils at the Site are predominantly sandy silts, silty sands, and sands with varying amounts of gravel. Bulk density, total porosity, air-filled and water-filled porosities were derived for both the upper fill material 0-14 ft bgs, and the deeper alluvium (greater than 14 ft bgs), considered as Strata A and B, respectively, in the J&E model.

The J&E vapor intrusion model requires the characterization of several building-specific parameters including building size (area and floor height), slab thickness, crack fraction (the ratio of crack area to building area), ventilation rate, and volumetric flow rate of soil vapor into the building. For a future resident, the DTSC default building dimensions (1000 centimeters, cm × 1000 cm) with a ceiling height of 8 feet (244 cm) were used in the model [Cal-EPA, 2011] along with an air exchange rate (AER) of 0.5 exchange per hour (hr⁻¹). For a future commercial worker, the DTSC default building dimensions (1000 centimeters, cm × 1000 cm) with a ceiling height of 12 feet (366 cm) were used in the model [Cal-EPA, 2011] along with an AER of 1 exchange hr⁻¹. The DTSC default volumetric flow rate of soil vapor into the building, Q_{soil} , value of 5 liters per minute (L/min) per 100 m² of floor space to represent the flow rate of COPCs from directly below

the building foundation into indoor air [Cal-EPA, 2011] was also used in the model. The USEPA version of the J&E spreadsheets was used to calculate the COPC-specific soil vapor to indoor air attenuation factors, AF_{SV-IA} (also called indoor air transfer factors, TFs), based on the model input parameters presented in **Table 6**.

Two exposure scenarios were considered for the indoor air pathway evaluation based on the potential building designs indicated in the proposed redevelopment plans. First, a slab-on-grade scenario was evaluated to represent a reasonable maximum exposure for future residents living, and future commercial workers working, on the first floor of the building using the parameters describe above. Additionally, a second floor exposure scenario was evaluated in this HHRA based on the proposed redevelopment plans for a first floor parking garage, where residential or commercial units begin on the second floor above a ground floor parking garage. The J&E model was parameterized using assumptions for a ground floor parking garage, assuming DTSC default building dimensions $(1000\text{ cm} \times 1000\text{ cm})^2$ with a ceiling height of 12 feet [366 cm; Cal-EPA, 2011] along with an AER of 0.75 exchange hr^{-1} .

The J&E model was used to calculate the attenuation factor for soil vapor to ground floor indoor air (slab-on-grade scenario). For the second floor exposure scenario, a leakage factor for vapor migration between the ground floor parking garage and the second floor was then used to calculate an overall attenuation factor for future residents and future commercial workers on the second floor. A leakage factor for indoor air flow between floors was established based on published studies of air flow distribution in multi-family buildings [Feustel and Diamond, 1996 and Center for Energy and Environment, 2004]. In these studies, measured air leakage between residential units on the lower floors ranged from less than 4% to approximately 2%. These studies were conducted on multi-family buildings in colder climates (Minnesota and Massachusetts) where stack effects are likely to be more significant than in California. To account for the additional attenuation from leakage from the ground floor parking garage to the second floor residential or commercial units, the depth-specific soil vapor AF_{SV-IA} were adjusted by a factor of 3%. As a result of applying a leakage factor assumption, the VOC concentrations on the second floor would be much lower than predicted for the ground floor. This attenuation value is considered to be conservative (i.e., a higher reduction is expected) given the building ventilation code requirements for new construction in California.

The indoor air TFs (AF_{SV-IA}) for the slab-on-grade and second floor exposure scenarios are summarized in **Table 7a** for future residents and **Table 7b** for future commercial workers.

² The length and width of the parking garage do not affect the AFs because then the Q_{soil} factor is scaled according to the building dimensions.

The J&E vapor intrusion model spreadsheets used in this HHRA are provided in **Appendix D**.

3.3 Estimating COPC Intake

Estimates of exposure or COPC intake were calculated based on assumptions regarding exposure pathways and exposure parameters. The COPC intake factor (IF) was estimated for the incidental ingestion and dermal contact pathways. For the inhalation pathways, USEPA [2009] recommends that when estimating cancer risk or noncancer hazard via inhalation, the concentration of the COPC in air should be used as the exposure metric (e.g., mg/m³), rather than inhalation intake of a contaminant in air based on inhalation rate and body weight (e.g., mg/kg-day). Therefore, the COPC intake factor is replaced with an exposure concentration factor (ECF) for the soil to outdoor air inhalation pathway. For the soil vapor to indoor air inhalation pathway, indoor air screening levels (SL_{air}) were used to derive soil vapor RBCs and are based on COPC-specific toxicity criteria and target risk and hazard, which are discussed in Section 3.3.3.2 below.

The sections below present the equations used to estimate the IF, ECF, and SL_{air} for each COPC. The exposure parameters (**Table 3**) used in the IF, ECF, and SL_{air} equations are considered to be adequately conservative and are consistent with typical values recommended and approved by regulatory agencies.

3.3.1 Incidental Soil Ingestion

The rate of soil ingestion is based on the amount of soil an individual inadvertently swallows in a given day from all sources. Exposure to COPCs, via incidental ingestion of soil, was estimated using the following variables: (1) the rate of ingestion; (2) the fraction of ingested soil that is impacted; and (3) the frequency and duration of exposure. Individuals may ingest soil through incidental contact of the mouth with hands and clothing. The following equation was used to estimate the intake factor for incidental ingestion of soil (IF_{oral}):

$$IF_{oral} = \frac{IngR \times EF \times ED \times CF}{BW \times AT}$$

Where:

- IngR = ingestion rate of soil (mg/day);
- EF = exposure frequency (days/yr);
- ED = exposure duration (yrs);
- CF = conversion factor for soil (10⁻⁶ kg/mg);
- BW = body weight (kg);

AT = averaging time (days):
cancer effects: 70 yrs x 365 days; and
noncancer effects: ED x 365 days.

The exposure parameters used to estimate IF_{oral} for incidental soil ingestion are presented in **Table 3** for a future resident, future commercial worker, and a future construction worker.

3.3.2 Dermal Contact with Soil

COPCs in soil may come into contact with skin and then become absorbed across the skin into the bloodstream. The amount of absorption into the body depends upon the amount of soil in contact with the skin, COPC concentrations in soil, the skin surface area exposed, and the potential for the chemical to be absorbed across the skin. The following equation was used to estimate the intake factor for dermal contact with soil (IF_{dermal}):

$$IF_{\text{dermal}} = \frac{SA \times AF \times EF \times ED \times CF \times ABSd}{BW \times AT}$$

Where:

SA = skin surface area exposed to soil per day (cm^2/day);
AF = soil-skin adherence factor (mg/cm^2);
EF = exposure frequency (days/yr);
ED = exposure duration (yrs);
CF = conversion factor for soil ($10^{-6} \text{ kg}/\text{mg}$);
ABSd = percent dermal absorption (COPC-specific; unitless);
BW = body weight (kg);
AT = averaging time (days):
cancer effects: 70 yrs $\times$ 365 days; and
noncancer effects: ED $\times$ 365 days.

The exposure parameters that were used to estimate IF_{dermal} for dermal contact with soil are presented in **Table 3** for a future resident, future commercial worker, and a future construction worker.

3.3.3 Inhalation of Vapors and Fugitive Dust

Inhalation of fugitive dust-containing COPCs and volatile COPCs in outdoor air is a consideration for soil matrix exposures. Inhalation of indoor air vapors is a consideration

for soil vapor exposures. For the inhalation pathways, the IF is replaced with an ECF for soil to outdoor air and with SL_{air} for soil vapor to indoor air. The equations used to estimate the ECF and SL_{air} are presented below.

3.3.3.1 Soil to Outdoor Air Pathway

The following equation was used to estimate the ECF for the inhalation pathway for outdoor air from soil:

$$ECF_{inh,s} = \frac{EF \times ED \times ET}{AT \times (VF_{soil} \text{ or } PEF)}$$

Where:

- $ECF_{inh,s}$ = exposure concentration factor of COPC in outdoor air from soil (kg/m^3);
- EF = exposure frequency (days/yr);
- ED = exposure duration (yrs);
- ET = exposure time (8 hrs/24 hrs for workers);
- AT = averaging time (days):
cancer effects: 70 yrs $\times$ 365 days;
noncancer effects: ED $\times$ 365 days;
- PEF = particulate emission factor for soil (m^3/kg);
 $PEF_{res/commW}$ = for a resident and commercial worker (m^3/kg);
 PEF_{constW} = for a construction worker (m^3/kg);
- VF_{soil} = volatilization factor for soil (m^3/kg);
 $VF_{res/commW}$ = for a resident or commercial worker;
 VF_{constW} = for a construction worker.

The exposure parameters used in the above ECF equations are presented in **Table 3**.

3.3.3.2 Soil Vapor to Indoor Air Pathway

The following equation was used to estimate the indoor air screening level, SL_{air} based on cancer effects:

$$SL_{air-C} = \frac{TR \times AT}{EF \times ED \times ET \times IUR}$$

SL_{air} based on noncancer health effects:

$$SL_{air-NC} = \frac{THQ \times AT \times CF}{EF \times ED \times ET \times \left(\frac{1}{RfC} \right)}$$

Where:

- SL_{air-C} = indoor air screening level based on cancer health effects (µg/m³);
- TR = target cancer risk;
- AT = averaging time (days):
cancer effects: 25,550 days; and
noncancer effects: 9,125 days.
- EF = exposure frequency (days/yr);
- ED = exposure duration (yrs);
- ET = exposure time (24/24 hours for a future resident, and 8 hrs/24 hrs for a future commercial worker);
- IUR = inhalation unit risk (µg/m³)⁻¹;
- SL_{air-NC} = indoor air screening level based on noncancer health effects (µg/m³);
- THQ = target hazard quotient;
- CF = unit conversion factor, 1000 µg/mg; and
- RfC = inhalation reference concentration (mg/m³).

The exposure parameters used in the above equations are presented in **Table 3**.

4. TOXICITY ASSESSMENT

The toxicity assessment characterizes the relationship between the magnitude of exposure to a COPC and the nature and magnitude of adverse health effects that may result from such exposure. Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are classified into two broad categories: cancer effects and noncancer effects. The basis for the selection of toxicity values in each of these categories is described in more detail below.

The two key toxicity criteria used in this HHRA are: 1) oral cancer slope factors (CSFs) and inhalation unit risk factors (IURs) for estimating long term, chronic cancer risks from exposure to carcinogens, and 2) oral reference doses (RfDs) and inhalation reference concentrations (RfCs) for estimating long term hazard from exposure to noncarcinogens. In addition, Cal-EPA has developed chronic Reference Exposure Levels (RELs) for noncancer effects from inhalation exposures. For this HHRA, toxicity criteria were selected from the following sources, in order of preference and based on availability:

- 1) Cal-EPA DTSC's Human Health Risk Assessment (HHRA) Note 3 [Cal-EPA, 2016a];
- 2) Cal-EPA Office of Environmental Health Hazard Assessment (OEHHA) Toxicity Criteria Database, online [Cal-EPA, 2016b]; and
- 3) USEPA Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites [USEPA, 2016].

Final selection of the appropriate toxicity criteria was based on recommendations presented in Cal-EPA DTSC's Note 3 [Cal-EPA, 2016a]. For TCE, the USEPA inhalation IUR of $4.1 \times 10^{-6} (\mu\text{g}/\text{m}^3)^{-1}$ and oral CSF of $4.6 \times 10^{-2} (\text{mg}/\text{kg}\cdot\text{day})^{-1}$ were used [USEPA, 2011] in this HHRA, which are the most conservative toxicity criteria for this VOC and are also recommended in the USEPA RSL table [USEPA, 2016].

At the present time, Cal-EPA and USEPA have only developed toxicity criteria for the oral and inhalation routes of exposure. In the absence of values specific to the dermal route, the oral toxicity criteria were used to evaluate dermal exposures to soil. For those COPCs for which RfCs or RELs are not available, route-to-route extrapolated values from oral RfDs were used. Route-to-route extrapolation can be considered a conservative approach as current USEPA RSL guidance does not include the route-to-route extrapolation. For those COPCs for which noncarcinogenic toxicity values are not available, a surrogate chemical approach was employed in which toxicity values developed for structurally similar compounds were assigned to the COPCs lacking toxicity criteria to avoid underestimating potential noncarcinogenic hazards (e.g. trivalent chromium for total chromium, isopropyl benzene for 4-isopropyltoluene).

A summary of the toxicity criteria for the COPCs is presented in **Table 8**.

The traditional RfD approach to evaluating COPCs is not applied to lead because most adverse human health effects data associated with exposure to lead have been correlated with concentrations of lead in blood and not with oral intake or inhalation of lead by an individual [Cal-EPA, 1996]. Blood lead concentration is an integrated measure of internal dose, reflecting total exposure from Site-related and background sources. In the absence of RfDs, Cal-EPA uses a 1 microgram per deciliter ($\mu\text{g}/\text{dL}$) benchmark for source-specific incremental change in blood lead levels for protection of school children and fetuses [Cal-EPA, 2007] as the revised health criterion for lead. This benchmark is the estimated incremental increase in a child's blood lead level that would reduce their IQ by up to 1 point. Based on this revised benchmark of 1 $\mu\text{g}/\text{dL}$, Cal-EPA has recommended a residential screening level of 80 mg/kg and an industrial screening level of 320 mg/kg [Cal-EPA, 2016a] which is considered protective of the developing child of pregnant females. Detected lead concentrations at the Site are compared to these screening levels; unlike the other COPCs, lead is not included in the quantitative evaluation of a cancer risk or a noncancer hazard.

5. RISK-BASED CONCENTRATIONS

The following section presents the methodology used to derive RBCs for future residents, future commercial workers, and future construction workers, who have the potential to be exposed to residual COPCs detected in soil or soil vapor. The RBCs include the results of the exposure assessment and toxicity assessment and represent the concentrations of COPCs in the relevant environmental media (e.g., soil and soil vapor) that would be considered safe for the various current and future land uses under conservative (i.e., protective) exposure conditions. Potential cumulative cancer risks and noncancer hazards may then be estimated by summing the ratios of measured COPC concentrations and the appropriate RBCs.

5.1 Methodology

Deriving RBCs for COPCs in soil and soil vapor requires information regarding the level of human intake of the COPC (exposure assessment), the relationship between intake of the COPC and its toxicity (toxicity assessment), and the assumed target cancer risk or noncancer hazard. The sections below present the equations used in the development of the RBCs for soil and soil vapor. The methodology is based principally on guidelines provided by the USEPA in *Risk Assessment Guidance for Superfund, Volume I, Human Health Evaluation Manual (Part A), Interim Final* [USEPA, 1989] and *Risk Assessment Guidance for Superfund, Volume I, Human Health Evaluation Manual (Part B: Development of Risk-Based Preliminary Remediation Goals)*, [USEPA, 1991a].

Various demarcations of acceptable risk have been established by regulatory agencies. The National Oil and Hazardous Substances Pollution Contingency Plan [NCP; 40 CFR 300] indicates that lifetime incremental cancer risks posed by a site should not exceed a range of one in one million (1×10^{-6}) to one hundred in one million (1×10^{-4}) and noncarcinogenic chemicals should not be present at levels expected to cause adverse health effects (i.e., a Hazard Index [HI] greater than 1). In addition, other relevant guidance [USEPA, 1991b] states that sites posing a cumulative cancer risk of less than 10^{-4} and hazard indices less than unity (1) for noncancer endpoints are generally not considered to pose a significant risk warranting remediation. The California Hazardous Substances Account Act (HSAA) incorporates the NCP by reference, and thus also incorporates the acceptable risk range set forth in the NCP. In California, the Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) regulates chemical exposures to the general population and is based on an acceptable risk level of 1×10^{-5} . The DTSC considers the 1×10^{-6} risk level as the generally accepted point of departure for unrestricted land use. For evaluating worker exposures, a 1×10^{-5} risk level is commonly used for managing commercial/industrial sites in California.

Under most situations, cancer risks in the range of 10^{-6} to 10^{-4} may be considered to be acceptable with cancer risks less than 10^{-6} considered *de minimus*. These risk estimates are in

contrast to the background risk of Americans developing cancer. The background risk is one chance in three (0.3 or 3×10^{-1}) for an American female, and one chance in two (0.5 or 5×10^{-1}) for an American male of eventually developing cancer [ACS, 2016].

For future residents, Site-specific RBCs were derived using a target cancer risk level of 1×10^{-6} . For future commercial workers and future construction workers, Site-specific RBCs were derived using a target cancer risk level of 1×10^{-5} . This target risk of 1×10^{-5} for potential worker exposures has been used in many DTSC-approved risk assessments. It should be noted that the risk results presented in the risk characterization are independent of the target cancer risk used to derive the Site-specific RBCs and are therefore not affected by that assumption. The target hazard quotient (THQ) used for noncarcinogens of 1 was used for all exposure scenarios. Note that the final target cancer risk and noncancer hazard level to be considered applicable for the Site is a risk management decision. The results of the HHRA risk characterization are the starting point for risk management considerations for a site [USEPA, 1995].

5.2 RBCs Based on Cancer Health Effects

The equations below describe the derivation of soil and soil vapor RBCs based on cancer health effects.

For COPCs in soil:

$$RBC_{\text{soil-C}} = \frac{TR}{[CSF_{\text{oral}} \times (IF_{\text{oral}} + IF_{\text{dermal}})] + (IUR \times ECF_{\text{inh,s}} \times CF_1)}$$

For COPCs in soil vapor:

$$RBC_{\text{SV-C}} = \frac{SL_{\text{air-C}}}{AF_{\text{SV-IA}}}$$

Where:

- $RBC_{\text{soil-C}}$ = risk-based concentration for soil based on cancer effects (mg/kg);
- TR = target cancer risk level (unitless);
- CSF_{oral} = cancer slope factor for oral (ingestion and dermal-contact) exposures (mg/kg-d)⁻¹;
- IF_{oral} = intake factor for ingestion (kg soil per kg body weight per day);
- IF_{dermal} = intake factor for dermal contact (kg soil per kg body weight per day);
- IUR = inhalation unit risk ($\mu\text{g/m}^3$)⁻¹;
- $ECF_{\text{inh,s}}$ = exposure concentration factor for outdoor inhalation of COPCs from soil (kg/m^3);

- CF_1 = conversion factor (1,000 $\mu\text{g}/\text{mg}$);
 RBC_{SV-C} = risk-based concentration for soil vapor based on cancer effects (mg/m^3);
 SL_{air-C} = indoor air screening level based on cancer health effects ($\mu\text{g}/\text{m}^3$); and
 AF_{SV-IA} = J&E model-predicted attenuation factor for soil vapor (unitless).

The formulas used in this HHRA for developing the IFs, $ECF_{inh,s}$, and SL_{air} were presented in Section 3.3 above. The soil RBCs based on cancer health effects are presented in **Table 9**. The soil vapor RBCs based on cancer health effects for the indoor air pathway are presented in **Table 10a** for future residents and in **Table 10b** for future commercial workers for the slab-on-grade and second floor exposure scenarios. To account for the various depths at which soil vapor samples were collected, soil vapor RBCs were derived for the following depths: 4, 15, 20, and 30 ft bgs. The RBC derivation spreadsheets are presented in **Appendix E**.

5.3 RBCs Based on Noncancer Health Effects

The equations below describe the derivation of soil and soil vapor RBCs based on noncancer health effects.

For COPCs in soil:

$$RBC_{soil-NC} = \frac{THQ}{\left(\frac{IF_{oral}}{RfD_{oral}}\right) + \left(\frac{IF_{dermal}}{RfD_{oral}}\right) + \left(\frac{ECF_{inh,s}}{RfC}\right)}$$

For COPCs in soil vapor:

$$RBC_{SV-NC} = \frac{SL_{air-NC}}{AF_{SV-IA}}$$

Where:

- $RBC_{soil-NC}$ = risk-based concentration for soil based on noncancer effects (mg/kg);
 THQ = target noncancer hazard quotient (unitless);
 RfD_{oral} = noncancer reference dose for oral (ingestion and direct-contact) exposures ($\text{mg}/\text{kg}\cdot\text{day}$);
 IF_{oral} = intake factor for ingestion (kg soil per kg body weight per day);
 IF_{dermal} = intake factor for dermal contact (kg soil per kg body weight per day);
 RfC = noncancer reference concentration for inhalation exposure (mg/m^3);
 $ECF_{inh,s}$ = exposure concentration factor for outdoor inhalation of COPCs from soil (kg/m^3);

- RBC_{SV-NC} = risk-based concentration for soil vapor based on noncancer effects (mg/m^3);
- SL_{air-C} = indoor air screening level based on cancer health effects ($\mu g/m^3$); and
- AF_{SV-IA} = J&E model-predicted attenuation factor for soil vapor (unitless).

The soil RBCs based on noncancer health effects are presented in **Table 9**. The soil vapor RBCs based on noncancer health effects for the indoor air pathway are presented in **Table 10a** for future residents and in **Table 10b** for future commercial workers for the slab-on-grade and second floor exposure scenarios. To account for the various depths at which soil vapor samples were collected, soil vapor RBCs were derived for the following depths: 4, 15, 20, and 30 ft bgs. The RBC derivation spreadsheets are presented in **Appendix E**.

6. RISK CHARACTERIZATION

Risk characterization integrates the results of the toxicity assessment and the exposure assessment to estimate potential cancer risks and adverse noncancer health effects associated with exposure to chemicals detected at the Site. This integration provides quantitative estimates of cancer risk and noncancer hazard that are then compared to acceptable standards.

The process of a risk assessment is an iterative process where factual site, receptor, and chemical-specific data are used when available. When specific data are not available, conservative, i.e., health protective, assumptions are utilized (e.g., assuming a worker will be working at the same location for 25 years and ingesting soil at a rate of 100 mg/day). The use of repeated, conservative assumptions can lead to overly conservative estimations of cancer risk or noncancer hazard, but which provides an upper-bound estimate of the actual risk or hazard. Thus, for any site, the estimated cancer risk or noncancer hazard level reflects an upper-bound estimate of the most probable risk or hazard. The most probable cancer risk or noncancer hazard is likely to be much less, perhaps as low as zero, and probably not measurable in the potentially exposed population.

The methodology for deriving RBCs for the receptor populations and potential exposure routes were presented above. This section presents the methodology in which RBCs were used to evaluate COPC-specific and cumulative cancer risk and noncancer hazard for the receptors of concern.

6.1 Cumulative Risk Methodology

This section presents the specific approach used in comparing the concentrations of individual COPCs detected in the various environmental media to the RBCs and in estimating the cumulative cancer risk and noncancer hazard associated with exposure to all detected COPCs at the Site. This approach can be used to determine if the target risk or hazard ranges are exceeded for a given land use scenario. The cumulative cancer risk and noncancer hazard posed by the presence of all COPCs detected in soil and soil vapor at a given sampling location were estimated in this HHRA using the following equations.

Cumulative cancer risk (at a given sampling location):

$$CR_{\text{tot}} = \left[\sum_{i=1}^n \left(\frac{C_{Si}}{RBC_{\text{soil-C},i}} \right) \right] \times TR$$

$$CR_{\text{tot}} = \left[\sum_{i=1}^n \left(\frac{C_{SVi}}{RBC_{\text{SV-C},i}} \right) \right] \times TR$$

Cumulative noncancer hazard index (at a given sampling location):

$$HI_{tot} = \left[\sum_{i=1}^n \left(\frac{C_{Si}}{RBC_{soil-NC,i}} \right) \right] \times THI$$

$$HI_{tot} = \left[\sum_{i=1}^n \left(\frac{C_{SVi}}{RBC_{SV-NC,i}} \right) \right] \times THI$$

Where:

- CR_{tot} = cumulative cancer risk from all COPCs detected in specific medium at a given sampling location (unitless);
- C_{Si} = concentration of COPC i detected in soil (mg/kg);
- $RBC_{soil-C,i}$ = risk-based concentration for COPC i in soil based on cancer effects (mg/kg);
- C_{SVi} = concentration of COPC i detected in soil vapor (mg/m³);
- $RBC_{SV-C,i}$ = risk-based concentration for COPC i in soil vapor based on cancer effects (mg/m³);
- TR = target cancer risk (unitless);
- HI_{tot} = cumulative noncancer hazard index from all COPC detected in the specific medium at given sampling location (unitless);
- $RBC_{soil-NC,i}$ = risk-based concentration for COPC i in soil based on noncancer effects (mg/kg);
- $RBC_{SV-NC,i}$ = risk-based concentration for COPC i in soil vapor based on noncancer effects (mg/m³);
- THI = target noncancer hazard index (unitless); and
- n = number of COPCs for the medium evaluated (unitless).

Using the methodology presented here, the cumulative cancer risk and noncancer hazard posed by the presence of multiple COPC can be estimated for each sample location and at each sample depth (i.e., a boring where multiple samples have been collected).

For soil vapor samples, because the vapor migration evaluation considers the vertical migration of constituents from a subsurface source toward a building foundation, the shallowest sample provides the most relevant concentration in evaluating potential cancer risk and noncancer hazard as it is closest to a building foundation. However, cumulative cancer risk and noncancer hazard estimates for all sample depths were reported to document the estimated potential cancer risk and noncancer hazard for each sample location and depth, which may be used in the risk-based decision making process.

For soil matrix samples, potential cancer risks or noncancer hazards were estimated for each soil sample location and depth within the top 12 ft. Soil matrix data were used to estimate potential cancer risk and noncancer hazard due to direct contact and outdoor inhalation exposures. Soil vapor data were used to evaluate the potential risk and hazard due to indoor air inhalation. Note however, that this approach in evaluating all soil and soil vapor data, regardless of sample location and future redevelopment plans (construction of buildings), is considered conservative. For example, if a building were to be constructed at a particular location, then direct contact with soils would not be applicable at this location, since the soils would be covered by the building, and thus only the vapor intrusion cancer risks or noncancer hazards would apply.

6.2 Additional Risk Characterization Considerations

The RBC methodology for determining cumulative cancer risks and noncancer hazards can be applied to each COPC detected in each soil matrix and soil vapor sample at the Site. However, it is not always appropriate to include every COPC in the cumulative cancer risk and noncancer hazard calculations. Background metal concentrations and nondetected chemical concentrations should not be considered in the calculations of cumulative cancer risk and noncancer hazard.

Background concentrations are those concentrations, either native or anthropogenic, that are present, but not associated with any Site activities. This HHRA took into account background concentrations, as discussed in Section 2.2.1, and only included those chemicals that were considered to be above background for the Site. Since metals are naturally occurring in the environment, background concentrations are generally applied to metals detected at a site. As discussed in Section 2.2.1, beryllium, cadmium, total chromium, CrVI, copper, lead, and zinc were considered to be above background (**Table 1**); therefore, these metals were selected as COPCs and thus, RBCs were derived for them. Note, however, that the RBCs for lead are represented by the residential screening level of 80 mg/kg and the industrial screening level of 320 mg/kg presented in the Cal-EPA Note 3 guidance [Cal-EPA, 2016a]. As a next step, for the metal COPC to be considered in the cumulative risk evaluation, its concentration detected at each sample boring location must be above its respective background concentration. If so, then the RBC approach was applied to that metal COPC and a cancer risk and/or noncancer hazard was estimated for that metal at that specific boring location.

Note that a quantitative risk evaluation of lead was not conducted, as this metal is compared to the Cal-EPA screening levels noted above (see Section 4). In other words, lead concentrations detected at this Site are not factored into the cancer risk and noncancer hazard estimates.

6.3 Risk Characterization Results

This section presents the results of the risk characterization which integrates the results of the exposure and toxicity assessments to estimate potential cancer risks (CR) and noncancer hazard indices (HIs) associated with exposure to COPCs at the Site. As discussed in Section 5.1, various demarcations of acceptable risk have been established by regulatory agencies. Under most situations, cancer risks in the range of 10^{-6} to 10^{-4} may be considered to be acceptable with cancer risks less than 10^{-6} considered *de minimus*. The cumulative CR estimates for future residents were compared to a target cancer risk of 1×10^{-6} . The cumulative CR estimates for future commercial workers and future construction workers were compared to a target cancer risk of 1×10^{-5} , which is commonly used for managing commercial/industrial sites in California. The cumulative noncancer HI estimates were compared to a target noncancer hazard of 1.

Cumulative CRs and HIs for each soil sample location are summarized in **Table 11a** for future residents, along with a comparison of lead concentrations to the Cal-EPA residential screening level of 80 mg/kg. Cumulative CRs and HIs for each soil sample location are summarized in **Table 11b** for future commercial workers and in **Table 11c** for future construction workers, along with a comparison of lead concentrations to the Cal-EPA industrial screening level of 320 mg/kg. Cumulative CRs and HIs for each soil vapor sample location are summarized in **Table 12a** for future residents and future commercial workers for the slab-on-grade scenario, and in **Table 12b** for the second floor scenario. The detailed cancer risk and noncancer hazard calculation spreadsheets are presented in **Appendix F**.

The results for each receptor and exposure pathway scenarios are summarized in the following subsections in relation to the target cancer risk and target noncancer hazard mentioned above.

6.3.1 Future Resident

6.3.1.1 Soil

Soil risk characterization results for future residents potentially exposed via ingestion, dermal contact, and outdoor inhalation for individual sampling locations with COPCs selected for this medium are provided in **Table 11a** and presented in **Figure 4a**.

For the soil exposure pathways, the cumulative CR estimates for future residents ranged from 3×10^{-12} to 9×10^{-6} and exceeded the target risk of 1×10^{-6} at six sample locations (**Table 11a**). CrVI, tetrachloroethylene (PCE), and trichloroethylene (TCE) were the COPCs with CRs above the target risk of 1×10^{-6} . CrVI was detected at concentrations ranging from 0.96 mg/kg to 2.8 mg/kg with COPC-specific CRs greater than 1×10^{-6} at locations A6, SS-2, and SS-5. PCE had CRs greater than 1×10^{-6} at locations A4, A7, and B4, ranging in concentration from 2.47 mg/kg to 3.33 mg/kg. However, it is worth noting that a 95UCL of 0.33 mg/kg derived for PCE

is below its RBC of 0.86 mg/kg. TCE had a CR estimate greater than 1×10^{-6} at only one location, A7, with a 95UCL of 1.08 mg/kg below its RBC of 2.0 mg/kg.

The cumulative HI estimates ranged from 1×10^{-6} to $4 \times 10^{+0}$ and exceeded the target hazard of 1 at only one location (Sample A7 at 3.5 ft bgs) (**Table 11a**). Copper was the only COPC with an HI estimate greater than the target hazard; however, a 95UCL of 401 mg/kg for copper (see **Table 1**) was below its RBC of 3,100 mg/kg.

Lead concentrations at only two locations (A7 and B4) exceeded the residential soil screening level of 80 mg/kg, as indicated in **Table 11a**. The 95UCL lead concentration of 63 mg/kg is below the residential soil screening level.

6.3.1.2 Soil Vapor to Indoor Air

Soil vapor risk characterization results for future residents potentially exposed via indoor air inhalation for individual sampling locations are provided in **Table 12a** and presented in **Figure 5a** for the slab-on-grade scenario and in **Table 12b** and **Figure 5b** for the second floor exposure scenario (i.e., with a parking level between grade and the floor of the residence).

For the slab-on-grade scenario, the cumulative CR estimates for future residents ranged from 8×10^{-9} to 4×10^{-4} and exceeded the target risk of 1×10^{-6} at 10 sample locations. PCE had CR estimates above 1×10^{-6} at nine locations, while TCE had a CR estimate greater than 1×10^{-6} at only one location, A7 (**Table 12a**). The cumulative HI estimates ranging from 4×10^{-4} to 5×10^0 were below the target hazard of 1 at all but two sample locations (A5B and LB3), with PCE as the only COPC with HI estimates greater than 1 (**Table 12a**).

For the second floor exposure scenario, the cumulative CR estimates for future residents ranged from 1×10^{-10} to 5×10^{-6} and exceeded the target risk of 1×10^{-6} at only two sample locations (A5B and LB3). PCE was the only COPC with CR estimates greater than 1×10^{-6} at both locations (**Table 12b**). The cumulative HI estimates were below the target hazard of 1 at all sample locations, ranging from 5×10^{-6} to 7×10^{-2} (**Table 12b**). Note that these calculations do not assume any engineering controls present within the parking area (i.e., mechanical ventilation) or liners beneath the slabs. In addition, the two specific sampling locations highlighted above (A5B and LB3) may be sufficiently separated from the second floor residents, depending on the placement of the multi-story portion of the parking structure.

6.3.2 Future Commercial Worker

6.3.2.1 Soil

Soil risk characterization results for future commercial workers potentially exposed via ingestion, dermal contact, and outdoor inhalation for individual sampling locations with COPCs selected for this medium are provided in **Table 11b** and presented in **Figure 4b**.

For the soil exposure pathways, the cumulative CR estimates for future commercial workers were below the target cancer risk of 1×10^{-5} at all sample locations, ranging from 7×10^{-13} to 9×10^{-7} . The cumulative HI estimates were at or below the target hazard of 1 at all sample locations, ranging from 2×10^{-7} to $1 \times 10^{+0}$ (**Table 11b**).

Lead concentration at only one location (A7 at 3.5 ft bgs) exceeded the industrial soil screening level of 320 mg/kg, as indicated in **Table 11b**. The 95UCL lead concentration of 63 mg/kg is well below the industrial soil screening level.

6.3.2.2 Soil Vapor to Indoor Air

Soil vapor risk characterization results for future commercial workers potentially exposed via indoor air inhalation for individual sampling locations are provided in **Table 12a** and presented in **Figure 5c** for the slab-on-grade scenario and **Table 12b** and in **Figure 5d** for the second floor exposure scenario.

For the slab-on-grade scenario, the cumulative CR estimates for future commercial workers ranged from 6×10^{-10} to 3×10^{-5} and exceeded the target risk of 1×10^{-5} at only one sample location (LB3). PCE was the only COPC with a CR estimate greater than 1×10^{-5} at this location. The cumulative HI estimates were less than the target hazard of 1 at all sample locations, ranging from 3×10^{-5} to 4×10^{-1} (**Table 12a**).

For the second floor exposure scenario, the cumulative CR estimates for future commercial workers was below the target risk of 1×10^{-5} at all sample locations, ranging from 2×10^{-11} to 1×10^{-6} . The cumulative HI estimates were below the target hazard of 1 at all sample locations, ranging from 1×10^{-6} to 2×10^{-2} (**Table 12b**).

6.3.3 Future Construction Worker

6.3.3.1 Soil

Soil risk characterization results for future construction workers potentially exposed via ingestion, dermal contact, and outdoor inhalation for individual sampling locations with COPCs selected for this medium are provided in **Table 11c** and presented in **Figure 4c**.

For the soil exposure pathways, the cumulative CR estimates for future construction workers were below the target risk of 1×10^{-5} at all sample locations, ranging from 1×10^{-11} to 4×10^{-7} . The cumulative HI estimates ranged from 1×10^{-6} to $4 \times 10^{+0}$ and exceeded the target hazard of 1 at only one sample location (A7 at 3.5 ft bgs) (**Table 11c**). Cadmium was the only COPC with an HI estimate greater than the target hazard; however, a Site 95UCL of 0.565 mg/kg for cadmium was well below its RBC of 4.5 mg/kg.

As mentioned above in Section 6.3.2.1, lead concentration at only one sample location (A7 at 3.5 ft bgs) exceeded the industrial soil screening level of 320 mg/kg (**Table 11c**).

6.3.4 Summary of Risk Characterization

The results of this HHRA indicate that cumulative cancer risks and noncancer hazards exceed the target health risks of 1×10^{-6} and 1, respectively, for a future resident at six soil sample locations (**Figure 4a**), 10 soil vapor locations based on the slab-on-grade scenario (**Figure 5a**), and only two soil vapor locations based on the second floor scenario (**Figure 5b**). Cumulative cancer risks and noncancer hazards were below the target health risks of 1×10^{-5} and 1, respectively, for a future commercial worker, with the exception of only one soil vapor location (LB3 with a CR estimate of 3×10^{-5}) based on the slab-on-grade scenario (**Figure 5c**). Cumulative cancer risks and noncancer hazards were below the target health risks of 1×10^{-5} and 1, respectively, for a future construction worker, with the exception of one soil location (A7 with an HI estimate of 4) (**Figure 4c**). Additionally, two locations had lead concentrations greater than the residential screening level, and one location had a lead concentration greater than the industrial soil screening level. However, the 95UCL lead concentration is below the soil screening levels. Overall, potential health risks on site are driven primarily by PCE and to a lesser extent based on Site development plans to CrVI, TCE, cadmium, copper, and lead.

7. UNCERTAINTY ANALYSIS

The methodology used in this HHRA is consistent with USEPA and Cal-EPA risk assessment guidance. However, the procedures used in any quantitative HHRAs are conditional estimates given the many assumptions that must be made about exposure and toxicity. Where possible, conservative (health-protective) assumptions were used for the inputs into the HHRA, which is consistent with agency guidance. Major sources of uncertainty in an HHRA may include the following:

- 1) Natural variability (e.g., differences in body weight in a population);
- 2) Lack of knowledge about basic physical, chemical, and biological properties and processes (e.g., the affinity of a chemical for soil and degradation rates);
- 3) Assumptions in the models used to estimate key inputs (e.g., exposure, dose response models, fate and transport models); and
- 4) Measurement error primarily with respect to sampling and laboratory analysis.

Site-specific factors, which this assessment incorporates, decrease uncertainty, although uncertainty may persist in even the most Site-specific HHRAs due to the inherent uncertainty in the process. However, because the assumptions used are generally health-protective and conservative in nature, the estimated health risks are likely to exceed the most probable risk posed to potential receptors at the Site.

Key uncertainties associated with this HHRA include:

- The potential for concentrations to attenuate over time were not considered in this HHRA. For example, the J&E vapor intrusion model assumes that the source of contamination is infinite (i.e., not depleting) and fixed in place (i.e., steady-state conditions are present) even though the concentrations would likely deplete over time. This depletion would be accelerated by biodegradation or other processes, which were not considered in this HHRA. Therefore, the risks and hazards estimated in this HHRA are likely to be lower than predicted, especially if biodegradation or other processes are occurring.
- Uncertainty in the toxicity assessment arises for those chemicals which rely on animal studies as the basis for determining the appropriate toxicity value for effects on humans. Toxicity values typically assume that adverse effects observed in animal toxicity experiments would also be observed in humans. In addition, the use of surrogate chemicals to represent the COPCs that appear to be structurally similar could result in an over- or under-estimation of potential cancer risk or noncancer hazard for that compound. Likewise, the use of route-to-route extrapolation for those COPCs for which inhalation toxicity criteria (RfCs or RELs) are not available could be considered

a conservative approach and thus result in an over-estimation of potential cancer risk or noncancer hazard for that compound.

- Assumed exposure durations used in this HHRA represent upper-bound estimates of the total amount of time that an individual may be either indoors or outdoors for the full duration of the exposure period. In other words, the HHRA assumptions entail the receptor staying outdoor or indoors the entire duration of the exposure period. As a result, the estimated incremental cancer risks and noncancer hazards are overestimated.
- A time-weighted PEF was developed for a construction worker assuming that only a fraction of the construction time would have elevated dust levels. It was assumed that the intrusive soil-handling activities will be conducted for the first 60 days of construction when Site soils will be graded and the emissions during the remaining 190 working days, of the total 250 working days, would primarily be due to wind-blown dust. This approach could over- or under-estimate COPC concentrations in fugitive dust as there is uncertainty as to the length and type of actual construction activities that will take place.
- Conservatively assumed 100% bare soil was available for contact, where soil is exposed to the surface with no hardscape, buildings or landscaping in place. However, when accounting for the proposed redevelopment plans for the Site, much of the soil is covered with asphalt pavement, buildings, landscaping, and hardscape. If these types of coverings were included in the soil to outdoor air fugitive dust and vapor modeling, the emissions estimates would be significantly lower, or non-existent, resulting in lower cancer risk and noncancer hazard estimates than reported. Additionally, future residents and workers would not be directly exposed to soil via ingestion and dermal contact if covered by landscape and/or hardscape (i.e., soil is inaccessible).

In summary, because a HHRA contains multiple sources of uncertainty, simplifying assumptions are often made so that potential health risks and hazards can be estimated quantitatively. Since the exact amount of uncertainty cannot be quantified, the HHRA is intended to be conservative (i.e., overestimate rather than underestimate probable cancer risk or noncancer hazard), with the results of this assessment, therefore, tending to err on the side of caution relative to being protective of health despite the inherent uncertainties in the process.

8. CONCLUSIONS

This HHRA was prepared consistent with Cal-EPA and USEPA guidance. Potential cancer risk and noncancer hazard to future residents, future commercial workers, and future construction workers were evaluated assuming exposure occurs to residual COPC concentrations detected in soil and soil vapor samples collected from the Site. Mixed residential and commercial land use is planned for this Site; therefore, both of these scenarios were evaluated in this HHRA.

The cancer risk and noncancer hazard estimates presented in this HHRA likely over-estimate the potential health risk because several conservative assumptions were used throughout the HHRA process. Moreover, no engineering or other controls were included in the assessment that would reduce or mitigate exposures post-development.

For future residents, the cumulative CR estimates for the soil exposure pathway exceeded the target risk of 1×10^{-6} at a small number of sample locations and depths. The target noncancer hazard was exceeded at only one location, and lead exceeded the residential screening level at two locations. In general, while select sample locations show elevated potential health risks, the Site-wide 95UCL concentrations were below RBCs for the COPCs with CRs or HIs greater than target risk levels, indicating that Site risks are not widespread and instead are isolated to specific sample locations. Note that the number of detections of CrVI is relatively small with a low detection frequency. Additionally, because of the proposed extensive hardscape with soils predominantly under a building footprint, it is unlikely that future residents will come into direct contact with the existing impacted soils under the proposed development scenario.

For the soil vapor to indoor air pathway under the slab-on-grade scenario, the cumulative CR estimates for future residents exceeded the target risk of 1×10^{-6} at 10 sample locations, and the cumulative HI estimates were below the target hazard of 1 at all but two sample locations. For the soil vapor to indoor air pathway under the second floor scenario, the cumulative CR estimates for future residents exceeded the target risk of 1×10^{-6} at only two sample locations, and the cumulative HI estimates were below the target hazard at all sample locations. As noted previously, no engineering controls are considered in this calculation, and the two specific locations are likely to be located below the multi-story portion of the future parking structure.

For future commercial workers, the cumulative CR and HI estimates for the soil exposure pathways were below the target risks of 1×10^{-5} and 1, respectively, at all sample locations. Only one location had a lead concentration that exceeded the industrial screening level of 320 mg/kg, sample A7 at 3.5 ft bgs. However, the 95UCL lead concentration is well below the screening level. For the soil vapor to indoor air pathway under the slab-on-grade scenario, the cumulative CR estimates for future commercial workers exceeded the target risk of 1×10^{-5} at only one sample location, and the cumulative HI estimates were below the target hazard of 1 at all sample locations. For the soil vapor to indoor air pathway under the second floor scenario, the

cumulative CR and HI estimates for future commercial workers were below the target risks of 1×10^{-5} and 1, respectively, at all sample locations.

For future construction workers, the cumulative CR estimates for the soil exposure pathways were below the target risk of 1×10^{-5} at all sample locations. The cumulative HI estimates exceeded the target hazard of 1 at one location with cadmium as the only COPC with an HI greater than 1. Note that the 95UCL concentration of cadmium is below the construction worker soil RBC. Additionally, only one location had a lead concentration that exceeded the screening level of 320 mg/kg but the 95UCL lead concentration was below 320 mg/kg.

The results of this HHRA indicate that, given planned future mixed residential and commercial land uses, residual concentrations of COPCs that remain in the subsurface are not expected to pose a significant health concern across the Site. However, select sample locations have COPC concentrations that result in exceedances of risk based thresholds and the soil and soil vapor impacts in the areas in the vicinity of these sample locations should, therefore, be considered further during development planning.

Notes:

" -- " not applicable; " mg/kg " milligram per kilogram

" ND " non-detect; " CV " coefficient of variation; " n " number of samples

" 95UCL " 95% upper confidence limit

(1) Excludes duplicates

(2) Calculated based on only detections (i.e., omitting NDs from the dataset)

(3) Distribution of the data and 95 percent upper confidence limit (95UCL) of the average concentration determined using USEPA ProUCL version 5.0.00 software

(4) Cal-EPA, 2009. Arsenic Strategies. Determination of Arsenic Remediation, Development of Arsenic Cleanup Goals for Proposed and Existing School Sites.

(5) Selected background level = inflection point from the Q-Q plots (Figures B-1 through B-18) or the maximum detected value.

(6) A Metal was selected as a COPC based on a weight of evidence approach, including if at least one of the following criteria were met:

a) Coefficient of Variation (CV) > 1

b) If the distribution can not be determined from the Q-Q plots or the Goodness of Fit (GOF) test

c) If an inflection point can be identified in the Q-Q plots (Figures B-1 to B-18)

(7) Regional background of 12 mg/kg applied.

(8) Not enough data to perform Goodness of Fit Test

(9) Be is carried forward as COPC due to elevated NDs

(10) Cr(VI) is carried forward as COPC due to known impacts in region and lack of natural sources.

Table 4
Definition of Transfer Factors
777 North Front Street
Burbank, California

Exposure Route	Transfer Factor	Definition
Inhalation of particulates in outdoor air	Particulate emission factor (PEF) (kg/m ³)	Ratio of chemical concentration in outdoor air (mg/m ³) to chemical concentration in soil (mg/kg)
Inhalation of vapors in outdoor air	Soil-to-air volatilization factor (VF _{Soil}) (kg/m ³)	Ratio of chemical concentration in outdoor air (mg/m ³) to chemical concentration in soil (mg/kg)
Inhalation of vapors in indoor air	Soil vapor-to-indoor air attenuation factor (AF _{SV-IA}) (unitless)	Ratio of chemical concentration in indoor air (mg/m ³) to chemical concentration in soil vapor (mg/m ³)

Table 5
Outdoor Air Transfer Factors for Soil
777 North Front Street
Burbank, California

Parameter			Value	Units	Reference
Water-filled soil porosity (θ_w)			0.224	(L _{water} -L _{soil})	Site-specific, see Attachment A.
Total soil porosity (θ_t)			0.333	(L _{pore} -L _{soil})	Site-specific, see Attachment A.
Air-filled soil porosity (θ_a)			0.109	(L _{air} -L _{soil})	Site-specific, see Attachment A.
Soil bulk density (P _b)			1.77	g/cm ³	Site-specific, see Attachment A.
Fraction organic carbon in soil (f _{oc})			0.006	unitless	USEPA 2016 RSL default
Mean annual windspeed		U _m	3.31	m/s	Average for Los Angeles, 7.4 mph (USEPA 2002)
Equivalent threshold value of windspeed at 7m		U _t	11.32	m/s	Default (USEPA 2002)
Windspeed distribution function dependent on U _m /U _t		F _x	4.74E-03	unitless	Los Angeles-Specific (Appendix D, Table 2 in USEPA 1996)
Dispersion correction factor, construction		F _D	0.188	unitless	assumes 1-yr construction (eqn E-16, US EPA 2002)
Exposure interval	residential	T _{res}	8.2E+08	sec	26 year exposure duration
	commercial	T _{commW}	7.9E+08	sec	25 year exposure duration
	construction	T _{constW}	3.2E+07	sec	1 year exposure duration
Inverse of mean concentration	residential/commercial	Q/C _{res/commW}	68.18	(g/m ² -s per kg/m ³)	Calculated for a 0.5-acre site in Los Angeles (USEPA 2002)
	construction, particulates	Q/C _{p,cw}	15.59	(g/m ² -s per kg/m ³)	Estimated for an 8-acre site (eqn E-19, USEPA 2002)
	construction, volatiles	Q/C _{vol,cw}	8.73	(g/m ² -s per kg/m ³)	Estimated for an 8-acre site, subchronic (eqn E-15, USEPA 2002)
Fraction of vegetative cover	residential/commercial	G _{res/commW}	0.5	unitless	Default (USEPA 2002)
	construction	G _{cw}	0	unitless	Professional Judgment
Particulate Emission Factor	residential/commercial	PEF _{res/commW}	1.2E+11	(m ³ /kg)	Estimated for a limited area, 0.5-acre (USEPA 2002)
	construction	PEF _{constW}	4.2E+06	(m ³ /kg)	Estimated for an 8-acre site, = approximately 240 µg/m ³ of dust

Notes:

Particulate Emission Factor; PEF (USEPA 2002): $PEF = [(Q/C * 3600) / (0.036 * (1-G) * (U_m/U_t)^3 * F_x)]$

Table 6
Model Input Parameters
777 North Front Street
Burbank, California

Model Input Parameter		Value Used	Rationale
General and Soil Physical Property Assumptions			
Average Soil Temperature (Ts), °C		19	Area-specific average
Depth below grade to bottom of enclosed space floor (L _F), cm		15	Slab construction
Soil gas sampling depth below grade (L _s), cm		sample-specific	Actual sample depths: 4-, 15-, 20-, and 30-ft bgs
Soil stratum A SCS soil type		S	Sand based on boring logs & grain texture distribution
Thickness of soil stratum A (h _A), cm		0 to 14 ft bgs	Based on Site boring logs and soil physical properties
Used to Derive 0 to 14-ft RBCs	Stratum A soil dry bulk density, gm/cm ³	1.77	Based on soil physical properties; see Appendix C
	Stratum A soil total porosity, unitless	0.333	
	Stratum A soil water-filled porosity, cm ³ /cm ³	0.224	
	Stratum A soil air-filled porosity, cm ³ /cm ³	0.109	
Soil stratum B SCS soil type		SL	Sandy loam based on boring logs & grain texture distribution
Thickness of soil stratum B (h _B), cm		14 to 61.5 ft bgs	Based on Site boring logs and soil physical properties
Used to Derive >14-ft RBCs	Stratum B soil dry bulk density, gm/cm ³	1.87	Based on soil physical properties; see Appendix C
	Stratum B soil total porosity, unitless	0.294	
	Stratum B soil water-filled porosity, cm ³ /cm ³	0.159	
	Stratum B soil air-filled porosity, cm ³ /cm ³	0.135	
Crack-to-total-area ratio (η), unitless		0.005	Default building dimension (Cal-EPA, 2011)
Floor-wall seam crack width (w), cm		0.1	Default building dimension (Cal-EPA, 2011)
Enclosed space floor thickness (L _{crack}), cm		15	Default building dimension (Cal-EPA, 2011)
Soil building pressure differential (ΔP), g/cm-sec ²		40	Default building dimension (Cal-EPA, 2011)
Average vapor flow rate into building (Q _{soil}), L/m		5	Based on 5 L/min per 100 m ² of building floor space
Future Residential Building Parameters			
Enclosed space floor length (L _B), cm		1000	Default building dimension (Cal-EPA, 2011)
Enclosed space floor width (W _B), cm		1000	Default building dimension (Cal-EPA, 2011)
Enclosed space height (H _B), cm		244	Default ceiling height, 8 feet (Cal-EPA, 2011)
Indoor air exchange rate (ER), hour ⁻¹		0.5	Default residential building assumption (Cal-EPA, 2011)
Future Commercial Building Parameters			
Enclosed space floor length (L _B), cm		1000	Default building dimension (Cal-EPA, 2011)
Enclosed space floor width (W _B), cm		1000	Default building dimension (Cal-EPA, 2011)
Enclosed space height (H _B), cm		366	Proposed ceiling height (12 feet or 3.66 meters)
Indoor air exchange rate (ER), hour ⁻¹		1	Default commercial building assumption
First Floor Parking Garage Parameters			
Enclosed space floor length (L _B), cm		1000	Default building dimension (Cal-EPA, 2011)
Enclosed space floor width (W _B), cm		1000	Default building dimension (Cal-EPA, 2011)
Enclosed space height (H _B), cm		366	Proposed garage ceiling height (12 feet or 3.66 meters)
Indoor air exchange rate (ER), hour ⁻¹		0.75	Default garage building assumption (CEES, 2013)
Leakage Factor (LF), %		3	Average air leakage to account for vapor migration between the ground floor use and the second floor (CEE, 2004)

Notes:

ft bgs - feet below ground surface

CEE, 2004. Reduction of Environmental Tobacco Smoke Transfer in Minnesota Multifamily Buildings Using Air Sealing and Ventilation Treatments. Center for Energy and Environment. November.

Cal-EPA, 2011. Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air. Final. October 2011.

California Energy Efficiency Standards (CEES), 2013 which lists a garage ventilation rate of 0.15 ft³/ft². When converted using a ceiling height of 12 feet, we get an AER of 0.75 per hour = (0.15 ft³/ft²-min) x (60 min/hour) x (1/12 ft) = 0.75 per hour

Notes:

IUR - inhalation unit risk

CSF_{oral} - cancer slope factor, oral

RfC - reference concentration

RfD_{oral} - reference dose, oral

NA - not available; route-specific toxicity value for this chemical is not available

NC - not considered to be a carcinogen via this route

ABS - absorption

a - Route-to-route extrapolation

b - Surrogate value - assumes toxicity for trivalent chromium

c - Surrogate value - assumes toxicity for cumene (isopropylbenzene)

Notes:

" -- " not applicable

µg/m³ - micrograms per cubic meter; ft bgs - feet below ground surface

M - mutagen. Mutagenic equations (USEPA RSL 2016) were used to derive the residential RBCs.

RBC_{SV-C} - risk-based concentration based on cancer effects; RBC_{SV-NC} based on noncancer effects

RBCs based on target cancer risk = 10⁻⁶ for future residents and target noncancer hazard = 1

Notes:

" -- " not applicable; ft bgs - feet below ground surface; " ND " not detected above method detection limit

PCE - tetrachloroethylene; TCE - trichloroethylene; CrVI - hexavalent chromium

* Lead is not quantitatively evaluated as part of the cancer risk and noncancer hazard estimates. Lead concentrations are compared to Cal-EPA DTSC 2016 Note 3 residential Screening Level (SL) of 80 mg/kg.

(a): No chemicals were detected and/or all metals considered within background.

Target cancer risk (CR) = 10^{-6} and target noncancer hazard index (HI) = 1

Shaded/bold: indicates cumulative risk > target risk, cumulative hazard > target hazard; and/or Pb concentration > SL

Risk drivers are those chemicals that have a cancer risk > target CR or a noncancer hazard > target HI

Notes:

" -- " not applicable; ft bgs - feet below ground surface; " ND " not detected above method detection limit

* Lead is not quantitatively evaluated as part of the cancer risk and noncancer hazard estimates. Lead concentrations are compared to Cal-EPA DTSC 2016 Note 3 industrial worker Screening Level (SL) for Lead of 320 mg/kg.

(a): No chemicals were detected and/or all metals considered within background.

Target cancer risk (CR) = 10^{-5} and target noncancer hazard index (HI) = 1

Shaded/bold: indicates cumulative risk > target risk, cumulative hazard > target hazard; and/or Pb concentration > SL

Risk drivers are those chemicals that have a cancer risk > target CR or a noncancer hazard > target HI
