RE: 207126015

Attention: David Shaler

Enclosed are the results for sample(s) received on April 20, 2009 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

This is an addendum report. Please incorporate with documentation previously submitted.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

A handwritten signature in black ink, appearing to read "E. Rodriguez".

Eddie F. Rodriguez
Laboratory Director

RE: 207126015

Attention: David Shaler

Enclosed are the results for sample(s) received on April 21, 2009 by Advanced Technology Laboratories . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

A handwritten signature in black ink, appearing to read "E. Rodriguez", written over the printed name.

Eddie F. Rodriguez
Laboratory Director

CLIENT: Ninyo & Moore
Project: 207126015
Lab Order: 105148

CASE NARRATIVE

All volatile analyses were performed using 5035 preservation requirements. Any high level dilutions were performed on a preserved methanol sample unless otherwise noted.

Sample Receiving/General Comment

Trip Blank sample was not received, client was notified on 4/21/09. Analytical Comments for METHOD 8270_S_FULL, SAMPLE 105148-006A: black sample extract

Analytical Comments for EPA 6010B

1. Samples 105148-020ADUP and 105148-023ADUP, RPD for Sample Duplicate (DUP) is outside criteria; however, the Laboratory Control Sample (LCS) validated the analytical batch.

Analytical Comments for EPA 8015B(M)

1. Sample 105148-011ADUP, RPD for Sample Duplicate (DUP) is outside criteria; however, the Laboratory Control Sample (LCS) validated the analytical batch.
2. Samples MB-54952MS and MB-54952MSD, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Analytical Comments for EPA 8270C

1. Sample 105148-006A, dilution was necessary due to samples' dark extract.

Analytical Comments for SM4500-H+B

1. Samples 105148-024A and 105148-024ADUP, were received and analyzed past holding time.

ANALYTICAL QC SUMMARY REPORT

TestCode: 9045_S

Sample ID: 105148-011ADUP		SampType: DUP		TestCode: 9045_S		Units: pH Units		Prep Date:			RunNo: 108436	
Client ID: 1001-108-5-S		Batch ID: R108436		TestNo: EPA 9045C		Analysis Date: 4/23/2009			SeqNo: 1701352			
Analyte		Result	PQL	SPK value	SPK Ref Val	%REC	LowLimit	HighLimit	RPD Ref Val	%RPD	RPDLimit	Qual
pH		8.200	0.10						8.220	0.244	20	

Qualifiers:

B	Analyte detected in the associated Method Blank	E	Value above quantitation range	H	Holding times for preparation or analysis exceeded
ND	Not Detected at the Reporting Limit	R	RPD outside accepted recovery limits	S	Spike/Surrogate outside of limits due to matrix interference
DO	Surrogate Diluted Out		Calculations are based on raw values

RE: 207126015

Attention: David Shaler

Enclosed are the results for sample(s) received on April 22, 2009 by Advanced Technology Laboratories . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

Eddie F. Rodriguez
Laboratory Director

RE: 207126015

Attention: David Shaler

Enclosed are the results for sample(s) received on April 23, 2009 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

Eddie F. Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and cannot be reproduced in part or in its entirety without written permission from the client and Advanced Technology Laboratories.

Project: 207126015
Lab Order: 105210

CASE NARRATIVE

All volatile analyses were performed using 5035 preservation requirements. Any high level dilutions were performed on a preserved methanol sample unless otherwise noted.

Analytical Comments for EPA 8260B

1. Samples 105070-001AMS, 105070-001AMSD, 105070-007AMS and 105070-007AMSD, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria; however, the analytical batch was validated by the Laboratory Control Sample (LCS).
2. Sample 105188-001AMSD, RPD for Matrix Spike Duplicate (MSD) is outside criteria; however, the analytical batch was validated by the Laboratory Control Sample (LCS).
2. Sample 105188-001A, surrogate recovery biased low possibly due to matrix interferences. The analytical batch was validated by the Laboratory Control Sample (LCS).

CSDLAC No.: 10196

Workorder No.: 105173

Enclosed are the results for sample(s) received on April 22, 2009 by Advanced Technology Laboratories . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

This is an addendum report. Please incorporate with documentation previously submitted.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

Eddie F. Rodriguez
Laboratory Director

CASE NARRATIVE

All volatile analyses were performed using 5035 preservation requirements. Any high level dilutions were performed on a preserved methanol sample unless otherwise noted.

Analytical Comments for EPA 8015B(M)

Samples 105173-002, 105173-003, 105173-005, 105173-007, 105173-009, 105173-009EDUP, 105210-006GDUP, 105210-006GMS and 105210-006GMSD were requested and analyzed past hold time.

RE: 207126015

Attention: David Shaler

Enclosed are the results for sample(s) received on April 23, 2009 by Advanced Technology Laboratories . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

This is an addendum report. Please incorporate with documentation previously submitted.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

Eddie F. Rodriguez
Laboratory Director

Lab Order: 105210

CASE NARRATIVE

All volatile analyses were performed using 5035 preservation requirements except sample 1001-120-40-S. Any high level dilutions were performed on a preserved methanol sample unless otherwise noted.

Analytical Comments for EPA 8015B(M)

Samples 105210-006, 105210-008, 105210-009, 105210-011, 105210-014, 105210-019, 105210-021, 105210-027, 105210-029, 105210-030, 105210-036, 105210-038, 105210-044, 105210-046, 105173-009EDUP, 105210-006GDUP, 105210-019EDUP, 105210-027GDUP, 105210-006GMS, 105210-006GMSD, 105210-030GMS and 105210-030GMSD were requested and analyzed past hold time.

JONES ENVIRONMENTAL

LABORATORY REPORT

Client:	Ninyo & Moore, Inc.	Report Date:	04/21/09
Client Address:	475 Goddard, Suite 200 Irvine, CA 92618	JEL Ref. No.:	C-1511
		Client Ref. No.:	TO-15
Attn:	Nancy Anglin	Date Sampled:	04/21/09
		Date Received:	04/21/09
Project	Cal Trans TO-15	Date Analyzed:	04/21/09
Project Address:	777 N. Front Street., Burbank, CA	Physical State:	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B- Volatile Organics by GC/MS + Oxygenates
1. EPA 8260B- Volatile Hydrocarbons as Gasoline by GC/MS

Sampling – Soil Gas samples are collected in glass gas-tight syringes equipped with Teflon plungers. Tubing placed in the ground for soil gas sampling is purged three different times as recommended by DTSC/RWQCB regulations. This purge test determines how many purges of the soil gas tubing are needed throughout the project. One, three and seven purge volumes were analyzed to make this determination.

A tracer gas, n-Propanol, was placed at the tubing-surface interface before sampling. This compound is analyzed during the 8260B analytical run to determine if there are surface leaks into the subsurface due to improper installation of the probe. No n-Propanol was found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min except when noted differently on the chain of custody record using a gas tight syringe. 7 purge volumes were used since this purging level gave the highest results for the compound(s) of greatest interest.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Ambient Air Blanks are analyzed every 12 hours as prescribed by the method. In addition, Matrix Spike (MS) and Matrix Spike Duplicates (MSD) are analyzed with each batch of Soil Gas samples. A duplicate sample is analyzed each day of the sampling activity.

All samples were analyzed within 30 minutes of sampling.

LABORATORY REPORT

Client:	Ninyo & Moore, Inc.	Report Date:	04/24/09
Client Address:	475 Goddard, Suite 200 Irvine, CA 92618	JEL Ref. No.:	C-1512
		Client Ref. No.:	TO-15
Attn:	Nancy Anglin	Date Sampled:	04/22/09
		Date Received:	04/22/09
Project	Cal Trans TO-15	Date Analyzed:	04/22/09
Project Address:	777 N. Front Street., Burbank, CA	Physical State:	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B- Volatile Organics by GC/MS + Oxygenates
1. EPA 8260B- Volatile Hydrocarbons as Gasoline by GC/MS

Sampling – Soil Gas samples are collected in glass gas-tight syringes equipped with Teflon plungers. Tubing placed in the ground for soil gas sampling is purged three different times as recommended by DTSC/RWQCB regulations. This purge test determines how many purges of the soil gas tubing are needed throughout the project. One, three and seven purge volumes were analyzed to make this determination.

A tracer gas, n-Propanol, was placed at the tubing-surface interface before sampling. This compound is analyzed during the 8260B analytical run to determine if there are surface leaks into the subsurface due to improper installation of the probe. No n-Propanol was found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min except when noted differently on the chain of custody record using a gas tight syringe. 7 purge volumes were used since this purging level gave the highest results for the compound(s) of greatest interest.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Ambient Air Blanks are analyzed every 12 hours as prescribed by the method. In addition, Matrix Spike (MS) and Matrix Spike Duplicates (MSD) are analyzed with each batch of Soil Gas samples. A duplicate sample is analyzed each day of the sampling activity.

All samples were analyzed within 30 minutes of sampling.

LABORATORY REPORT

Client:	Ninyo & Moore, Inc.	Report Date:	04/24/09
Client Address:	475 Goddard, Suite 200 Irvine, CA 92618	JEL Ref. No.:	C-1513
		Client Ref. No.:	TO-15
Attn:	Nancy Anglin	Date Sampled:	04/23/09
		Date Received:	04/23/09
Project	Cal Trans TO-15	Date Analyzed:	04/23/09
Project Address:	777 N. Front Street., Burbank, CA	Physical State:	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B- Volatile Organics by GC/MS + Oxygenates
1. EPA 8260B- Volatile Hydrocarbons as Gasoline by GC/MS

Sampling – Soil Gas samples are collected in glass gas-tight syringes equipped with Teflon plungers. Tubing placed in the ground for soil gas sampling is purged three different times as recommended by DTSC/RWQCB regulations. This purge test determines how many purges of the soil gas tubing are needed throughout the project. One, three and seven purge volumes were analyzed to make this determination.

A tracer gas, n-Propanol, was placed at the tubing-surface interface before sampling. This compound is analyzed during the 8260B analytical run to determine if there are surface leaks into the subsurface due to improper installation of the probe. No n-Propanol was found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min except when noted differently on the chain of custody record using a gas tight syringe. 7 purge volumes were used since this purging level gave the highest results for the compound(s) of greatest interest.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Ambient Air Blanks are analyzed every 12 hours as prescribed by the method. In addition, Matrix Spike (MS) and Matrix Spike Duplicates (MSD) are analyzed with each batch of Soil Gas samples. A duplicate sample is analyzed each day of the sampling activity.

All samples were analyzed within 30 minutes of sampling.

LABORATORY REPORT

Client:	Ninyo & Moore, Inc.	Report Date:	04/24/09
Client Address:	475 Goddard, Suite 200 Irvine, CA 92618	JEL Ref. No.:	C-1514
		Client Ref. No.:	TO-15
Attn:	Nancy Anglin	Date Sampled:	04/24/09
		Date Received:	04/24/09
Project	Cal Trans TO-15	Date Analyzed:	04/24/09
Project Address:	777 N. Front Street., Burbank, CA	Physical State:	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B- Volatile Organics by GC/MS + Oxygenates
1. EPA 8260B- Volatile Hydrocarbons as Gasoline by GC/MS

Sampling – Soil Gas samples are collected in glass gas-tight syringes equipped with Teflon plungers. Tubing placed in the ground for soil gas sampling is purged three different times as recommended by DTSC/RWQCB regulations. This purge test determines how many purges of the soil gas tubing are needed throughout the project. One, three and seven purge volumes were analyzed to make this determination.

A tracer gas, n-Propanol, was placed at the tubing-surface interface before sampling. This compound is analyzed during the 8260B analytical run to determine if there are surface leaks into the subsurface due to improper installation of the probe. No n-Propanol was found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min except when noted differently on the chain of custody record using a gas tight syringe. 7 purge volumes were used since this purging level gave the highest results for the compound(s) of greatest interest.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Ambient Air Blanks are analyzed every 12 hours as prescribed by the method. In addition, Matrix Spike (MS) and Matrix Spike Duplicates (MSD) are analyzed with each batch of Soil Gas samples. A duplicate sample is analyzed each day of the sampling activity.

All samples were analyzed within 30 minutes of sampling.

PETROLEUM CONTAMINATED SOIL CALCULATIONS AND CONTAMINATION RELATED CONSTRUCTION COSTS

TABLE F1 – PETROLEUM CONTAMINATED SOIL VOLUME CALCULATIONS

Area	Volume
Surface to 2 feet below ground surface	1200 x 60 x 2 feet = 144,000 cubic feet ≈ 5,500 cubic yards
2 to 20 feet below ground surface North portion South portion	180 x 75 x 18 feet = 294,300 cubic feet ≈ 11,000 cubic yards + 75 x 38 x 18 feet
Total Volume	438,300 cubic feet ≈ 16,500 cubic yards

TABLE F2 – COSTS FOR EXCAVATION AND VAPOR MONITORING OF SOIL

Work Plan/Sampling and Analysis Plan/Health and Safety Plan/Soil Management Plan	\$8,000.00
Permitting	\$5,000.00
Excavation and Loading (assumes up to 30 field days)	\$60,000.00
Management, Field Observation, and Vapor Monitoring (assumes up to 30 field days)	\$60,000.00
Laboratory Testing	\$5,000.00
Reporting	\$6,000.00
TOTAL	\$144,000.00
Estimate based on 2009 rates and assumes no more than 30 days of field activities	

TABLE F3 – RANGE OF COSTS FOR TRANSPORT AND DISPOSAL OF PETROLEUM CONTAMINATED SOIL

Transport of up to 24,750 tons of soil to be used as daily cover at the County Sanitation Scholl Canyon Landfill in Glendale, California at \$45.00/ton. Soil can not contain TPH concentrations in excess of 1,000 mg/kg. Soil must be brought in end dumps. Soil containing TPH detections greater than ND but less than 1,000 mg/kg must be permitted by the RWQCB and may not contain odors or it will be rejected.	Transportation	\$866,250.00	
	Disposal	\$247,500.00	
	Total	<u>\$1,113,750.00</u>	≈ \$67.50 /cubic yard
Transport of up to 24,750 tons of soil to be treated at Thermal Remediation Services in Adelanto, California at \$70.00/ton.	Transportation	\$594,000.00	
	Disposal	\$977,625.00	
	Total	<u>\$1,571,625.00</u>	≈ \$95.25 /cubic yard
Transport and disposal of up to 24,750 tons of soil at the Sunshine Class III landfill in Sylmar, California at \$75.00/ton. Soil can not contain TPH concentrations in excess of 100 mg/kg. Soil may not contain odors or it will be rejected.	Transportation	\$1,113,750.00	
	Disposal	\$742,500.00	
	Total	<u>\$1,856,250.00</u>	≈ \$112.50 /cubic yard
Estimate based on 2009 rates and assumes no more than 16,500 cubic yards/24,750 tons of petroleum contaminated soil.

Governor

**REQUIREMENT TO PROVIDE TECHNICAL REPORT - WORK PLAN
(CALIFORNIA WATER CODE SECTION 13267¹)
DIRECTED TO NORTHRIDGE PROPERTIES, LLC
FORMER ZERO CORPORATION FACILITY
777 NORTH FRONT STREET, BURBANK, CALIFORNIA
(FILE NO. 109.6162)**

You are legally obligated to respond to this Order. Please read this carefully.

You are the responsible party identified for a soil investigation at the referenced site.

During the 1998 United States Environmental Protection Agency Superfund investigation, information provided to the California Regional Quality Control Board, Los Angeles Region (Regional Board) from the Upper Los Angeles River Area Watermaster (ULARA) indicated some of the groundwater supply wells in the San Fernando Valley Groundwater Basin (SFVGB) had been contaminated by hexavalent chromium (Cr⁶). Upon receipt of this information, the Regional Board re-evaluated the Chemical Use Questionnaire (CUQ) provided by each facility from the Superfund investigation to determine which facilities stored and/or used chromium compounds, including Cr⁶.

Based on our evaluation of these CUQs, Regional Board identified 112 sites to conduct further investigation to determine whether chromium and Cr⁶ concentrations in the soil at these sites indicate any significant past release and pose a threat to public drinking water supply wells or may have already polluted groundwater resources. These investigations are conducted under Regional Board's order of March 15, 2004, pursuant to California Water Code (CWC) Section 13267.

Although the referenced site was not among the 112 aforementioned sites, additional investigation at the referenced site is warranted upon further review of the following information:

The primary responsible party for this case was previously issued a *Certificate of Completion* letter by the Los Angeles Regional Water Quality Control Board, as the Administering Agency, in 2002. However, due to the occurrence of Cr⁶ contamination of the aquifer providing public water supply, and exceptions to the *Certificate of Completion* as specified in the Health and Safety Code², this action is

¹ California Water Code section 13267 states, in part: (b)(1) In conducting an investigation. . . , the regional board may require that any person who has discharged, discharges, or is suspected of having discharged or, discharging, or who proposes to discharge waste within its region . . . shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the regional board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports.

² Health and Safety Code section 25264(c) states that after a certificate of completion has been issued, the agency may not take action further action against the party receiving the certificate of completion with respect to the hazardous materials release that was the subject of the investigation and remediation unless: (4) A hazardous materials release is discovered at the site that was not the subject of the site investigation and remedial action for which the certificate of completion was issued; and (5) new facts causes the administering agency to find that further

May 10, 2011

justified and warranted. Detailed information regarding chromium use at the former industrial facility has come to the attention of Regional Board staff as follows:

1. Regional Board files indicate the extensive use of chromate salts (hexavalent chromium) as part of the aluminum chromate conversion coating operations performed at the former Zero Corporation facility between the 1960's and late 1990's.
2. The 2009 Caltrans soil investigation conducted on the property, near former waste discharge features revealed that there were detectable concentrations of Cr⁶ in the soil which exceed the typical background concentration in the native soils in the San Fernando Valley.
3. The Caltrans investigation also shows that the shallow soil vapor results for volatile organic compounds (VOCs) such as perchloroethylene (PCE) and trichloroethylene (TCE) exceeds California Human Health Screening Levels (CHHSLs) in the shallow soils. Additionally, the report also suggests that subsurface VOC concentrations have rebounded significantly since the site was remediated in 2001.

Therefore, pursuant to section 13267(b) of the CWC, you are hereby directed to submit the following on or before **July 15, 2011**:

1. A work plan for an onsite soil investigation. We are providing a guidance document entitled "*General Work Plan Requirements for a Heavy Metal Soil Investigation*" to assist you with this task. Additional information can be found in our guidance manual entitled "*Interim Site Assessment & Cleanup Guidebook (May 1996)*," which can be found at the Regional Board web-site at:

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/may_1996_voc_guidance.shtml.

2. The work plan must contain a health and safety plan (H&SP), as per the guidelines.
3. The work plan shall include the detailed information of former and existing chromium storage, hazardous waste management, and associated practices;
4. The work plan must include proposed soil sampling borings in various locations down to a depth of 25 feet below grade in the areas of the former plating process and waste treatment (all sumps, and clarifiers, etc.).
5. The Work plan must include a quality assurance/quality control QA/QC section, which discusses the types of field and laboratory QA/QC samples to be analyzed and how analytical data is validated and how suspect data is merged. For additional procedural information and QA/QC guidelines refer to the following web links:

site investigation and remedial action are required in order to prevent a significant risk to human health and safety or to the environment.

Mr. Alan Skobin

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/Board_SGV-SFVCleanupProgram_Sept2008_QAPP.pdf

The California Business and Professions Code Sections 6735, 7835, and 7835.1 require that engineering and geologic evaluations and judgments be performed by or under the directions of registered professionals. All fieldwork related to implementing the required work plan (technical report) such as well installation(s) must be conducted by, or under the direct responsible supervision of, a registered geologist or licensed civil engineer. All technical documents submitted to this Regional Board must be reviewed, signed and stamped by a State of California Professional Geologist, or a Professional Civil Engineer with at least five years hydrogeologic experience. Therefore, all future work must be performed by or under the direction of a professional geologist or California registered civil engineer. A statement is required in the report that the registered professional in responsible charge actually supervised or personally conducted all the work associated with the project.

Pursuant to section 13268(b)(1) of the CWC, failure to submit the required technical or monitoring reports described above may result in the imposition of civil liability penalties by the Regional Board, without further warning, of up to \$1,000 per day for each day the report is not received after the above due dates.

Please note that the Regional Board requires you to include a perjury statement in all reports submitted under 13267 Order and Cleanup and Abatement Order. The perjury statement shall be signed by a senior authorized representative of Northridge Properties, LLC (and not by a consultant). The statement shall be in the following format:

"I, [NAME], do hereby declare under penalty of perjury under the laws of State of California that I am [JOB TITLE] for Northridge Properties, LLC, that I am authorized to attest to the veracity of the information contained in [NAME AND DATE OF REPORT] is true and correct, and that this declaration was executed at [PLACE], [STATE], on [DATE]."

The State Water Resources Control Board (State Water Board) adopted regulations requiring the electronic submittals of information over the Internet using the State Water Board GeoTracker database. You are required not only to submit hard copy reports required in this Order but also to comply by uploading all reports and correspondence prepared to date and additional required data to the GeoTracker system. Information about GeoTracker submittals, including links to text of the governing regulations, can be found on the Internet at the following link:

http://www.waterboards.ca.gov/water_issues/programs/ust/electronic_submittal

We believe that the burdens, including costs, of these reports bear a reasonable relationship to the need for the reports and the benefits to be obtained from the reports. If you disagree and have information about the burdens, including costs, of complying with these requirements, provide such information to Mr. Larry Moore within ten days of the date of this letter so that we may reconsider the requirements.

Mr. Alan Skobin
777 North Front Street, Burbank, California

May 10, 2011

Any person aggrieved by this action of the Regional Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050 and following. The State Water Board must *receive* the petition by 5:00 p.m., 30 days after the date of this Order, except that if the thirtieth day following the date of this Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at: http://www.waterboards.ca.gov/public_notices/petitions/water_quality or will be provided upon request.

SO ORDERED.

December 20, 2011

Mr. Donald C. Nanney, Esq.
for Northridge Properties, LLC
Gilchrist & Rutter Professional Corp.
1299 Ocean Avenue
Santa Monica, California 90401

SUBJECT: APPROVAL OF SOIL ASSESSMENT WORK PLAN

**CASE/FILE: FORMER ZERO CORPORATION AT 777 NORTH FRONT STREET,
BURBANK, CALIFORNIA (FILE NO. 109.6162)**

Dear Mr. Nanney:

The Los Angeles Regional Water Quality Control Board (Regional Board) staff has reviewed your draft "Soil Assessment Work plan" (Work plan) dated August 15, 2011, and a work plan revision letter and figure dated November 23, 2011 that was submitted by your consultant, Geosyntec, Inc. (Geosyntec) for the above reference property (Site).

The Regional Board arranged for an on-site inspection meeting on October 13, 2011 between your environmental consultant, Mr. Eric Smalstig, the United States Environmental Protection Agency (USEPA), Region 9 contractor, Alex Lapostol, and yourself. This meeting was intended to make an observation of the current conditions of the site, and to confirm previous assumptions regarding the subsurface features of the former industrial waste water treatment system, i.e. clarifiers and sumps.

Based on discussions during the on-site inspection, Geosyntec produced the aforementioned November 23, 2011 revision letter and figure. The figure shows proposed soil borings, and the additional clarifier observed at the site during the October 13, 2011 site inspection.

The EPA contractor discussed a modified scope of work with your consultant based on the specific requirements of the Regional Board, including additional requirements as per the California Health and Safety code is described, as follows:

CALIFORNIA HEALTH AND SAFETY CODE REQUIREMENTS -- INDOOR AIR

Based on State legislation, Senate Bill 32 – California Land, Environment, and Restoration and Reuse Act, and California Health and Safety Code, Sections 57008-57010, this Regional Board, as a regulatory agency, has been designated to require "specified information" and/or to compare shallow soil vapor results at your site, and to screen those values against the California Human Health Screening Levels (CHHSLs), at 5 and 10 feet below grade surface (bgs) at the subject site. Thus, the property owner will subsequently be required to provide additional soil vapor evaluations to determine the nature of a

California Environmental Protection Agency

previous hazardous materials release; to the extent which it may affect human health via shallow soil vapor intrusion into habitable spaces, such as an office or commercial setting.

However, due to the current site conditions, and the eventual demolition of the remaining concrete slab(s) and subsurface features, and correspondent soil grading and redevelopment activities, this requirement will be put in abeyance until those aforementioned activities commence. You, or the future property owner, must notify this office upon finalizing a demolition and soil grading plan and coordinate with Regional Board staff to implement field work to comply with this requirement.

REQUIRED SCOPE OF WORK

Regional Board staff hereby approves your Work Plan, with the following additions:

1. Soil matrix sampling: Drilling and completion of 5 soil borings (at each clarifier identified during the Oct 13th site inspection) to a total depth of 25 feet below grade. Soil samples will be collected at 5 foot intervals, and submitted to the California certified analytical laboratory and submitted for analysis for Title 22 metals, and hexavalent chromium.
2. You shall prepare and submit a subsurface Soil Investigation Report (Investigation Report) to document and summarize the field activities and findings of the completed work. The investigation Report summarizing the field work shall be developed following the Regional Board's "*Guidelines for Report Submittals*" (March 1991, Revised June 1993) and shall be submitted as electronic Adobe® "pdf" format for Geotracker upload. Additionally, laboratory Quality Assurance/Quality Control (QA/QC) data should be included with each final report. A copy of the guidelines can be found at the following URL:

http://www.waterboards.ca.gov/losangeles/water_issues/programs/ust/guidelines/la_county_guidelines_93.pdf

3. The investigation should be conducted in accordance with the "*Quality Assurance Project Plan (QAPP) for the San Fernando Valley/San Gabriel Valley Cleanup Program*" guidance document, located at the following URL Website:

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/

The due date for submitted the final report is 90 calendar days after the completion of the field work. Please inform the Regional Board staff at least five working days prior to the commencement of the work in order that we may have a representative present. Regional Board staff recommends that two copies of the investigative report be submitted to this Regional Board approximately three weeks prior to completion of the field work.

If you have any questions, please contact me via telephone at (213) 576-6730, or via electronic mail Imoore@waterboards.ca.gov.

SOIL ASSESSMENT REPORT

777 North Front Street

Burbank, California

September 2012

Supervision of fieldwork activities related to implementing the approved work plan was performed by the staff of Geosyntec Consultants, Inc., (Geosyntec) under the direction of the licensed professional with sufficient hydrogeologic experience whose signature appears hereon. The Soil Assessment Report was prepared under the supervision of the same. Consistent with applicable professional standards of care, our opinions and recommendations are based, in part, on data furnished by others as noted in this report where applicable. Geosyntec is not able to independently verify data provided by others. Geosyntec services were performed, and this report has been prepared, in accordance with generally accepted professional standards of care applicable to the scope of services authorized by Northridge Properties, LLC, consistent with direction from the Los Angeles Regional Water Quality Control Board, and no other warranty is provided in connection therewith.

1. INTRODUCTION

1.1 Project Overview

This Soil Assessment Report (Report) contains a summary of the soil sampling activities performed at the former industrial site located at 777 North Front Street, in Burbank, California (the Site) and an assessment of the analytical results. The Report was prepared by Dr. Rita Kampalath of Geosyntec Consultants, Inc. (Geosyntec), and was reviewed by Dr. Matt Thomas and Mr. Eric Smalstig, P.E. also of Geosyntec, in accordance with the peer review policy of the firm. Geosyntec has prepared this Report on behalf of its client Northridge Properties, LLC, for submission to the Los Angeles Regional Water Quality Control Board (LARWQCB) per the requirements of the approved Work Plan (Appendix A) that was prepared in response to an Order to provide a soil investigation work plan (LARWQCB, 2011b) sent to Northridge Properties, LLC, in a letter dated May 10, 2011 (LARWQCB, 2011a).

Based on the conclusions of this Report presented in Section 5: (1) that the limited number of hexavalent chromium (Cr^6) detections at the Site are not significant, (2) that the vertical distribution of detections of Cr^6 are inconsistent with historical releases of Cr^6 at concentrations that could have impacted groundwater in the past, (3) that Cr^6 concentrations in Site soils do not pose a threat to groundwater at the Site in the future, (4) that the low concentrations of Cr^6 and Title 22 metals in the soils at the Site are at levels that are protective of human health, and (5) that arsenic detected in soils at the Site are consistent with naturally occurring background arsenic levels in California, and given their consistency with past soil sampling results as detailed in the LARWQCB approved Work Plan (Appendix A) and summarized in Section 2.3 of this Report, Geosyntec concludes that no further investigations for hexavalent chromium or other metals are warranted and recommends Northridge Properties, LLC, request Site closure from LARWQCB.

Therefore, on behalf of Northridge Properties, LLC, Geosyntec has been asked to respectfully request that LARWQCB issue a closure letter for the above referenced Site. In addition, because the Site reopener was not due to any regulatory concern regarding volatile organic compounds or other contaminants, which were the subject of previous investigations and remedial action and closure, the requested closure should clarify that the Site was not reopened for any purpose other than this soil assessment and that no further action is required.

1.2 **Report Organization**

The remainder of this Report is organized into the following sections:

- Section 2, *Background*;
- Section 3, *Soil Sampling*;
- Section 4, *Results*; and
- Section 5, *Conclusions and Recommendations*.

References, a table, figures, and appendices are included at the end of the text.

2. BACKGROUND

2.1 Property Description

The Site located at 777 North Front Street (LARWQCB File No. 109.6162) consists of an approximately 8-acre lot in the City of Burbank, approximately 13 miles north-northwest of downtown Los Angeles (Figure 1). It is bordered by Interstate 5, Burbank Boulevard, and Front Street (Figure 2).

From 1920 to 1961, the Site was occupied by General Water Heater Company, and then was purchased by Zero Corporation (Zero) for use by a division of the company called Zero Enclosures, whose primary business was fabrication of metal enclosures. In addition to Zero Enclosures' operations, from 1964 to 1973, a part of the Site was leased to Ocean Technology Inc., a subsidiary of Zero, which used the space to manufacture and assemble electronic products.

Zero's manufacturing operations were discontinued in December, 1991. From then until 2002, the Site was used for storage (a 1995 city directory shows the occupant as Western Moving & Storage, Inc.) and later as temporary filming locations for the entertainment industry (Mactech 2005, p. 14; Law/Crandall 1997, p. 1). The Site was sold to the Ford Leasing Development Company in 1998. Since 2002, the Site has been unoccupied, with on-site buildings having been demolished in 2004 leaving concrete pads and foundations currently remaining on the Site.

A parcel of land adjacent to the Site on the southwest was leased by Zero from the Southern Pacific Transportation Company for chemical storage. This parcel is currently owned by the City of Burbank and was used in part for realignment of Front Street and with a portion remaining as a strip between the Site and realigned Front Street.

2.2 Regional Hexavalent Chromium Contamination

The Site is located within the San Fernando Valley Groundwater Basin (SFVGB). In 1980, the California Department of Health Services (DHS) requested all major groundwater users to conduct tests for the presence of certain industrial chemicals in the water they were serving. The results of testing indicated elevated concentrations of a number of volatile organic compounds (VOCs) in groundwater under large portions of the San Fernando Valley, which led to the designation of four separate areas that together comprise the San Fernando Valley Superfund Sites.

During the 1998 United States Environmental Protection Agency (USEPA) Superfund investigation, information provided to LARWQCB from the Upper Los Angeles River Area Watermaster (ULARA) indicated some of the groundwater supply wells in the SFVGB had been contaminated by hexavalent chromium (Cr^6) (LARWQCB, 2011b). Subsequently, the Regional Board re-evaluated Chemical Use Questionnaires (CUQs) provided by each facility during the Superfund investigation and identified 112 sites, presumably the most suspect sites, to conduct further investigation to determine whether Cr^6 concentrations in the soil at these sites indicated any significant past release that may have contributed to the regional Cr^6 contamination or that might pose a threat to public drinking water supply wells in the future. It is significant to note that the subject Site was not among the 112 sites identified by the Regional Board at that time.

2.3 Recent Site Regulatory Context

The former responsible party for the Site had been issued a Certificate of Completion by Cal/EPA in 2002 for a remediation effort unrelated to Cr^6 . The Site remained closed until it was reopened by the LARWQCB Order entitled “*Requirement To Provide Technical Report – Work Plan*” (LARWQCB, 2011b). The primary reasons for issuance of the Order given in the accompanying letter (LARWQCB, 2011a) were: (1) the records of historical use of Cr^6 at the facility and (2) the results of a California Department of Transportation (Caltrans) soil investigation that indicated there exist a limited number of detections of Cr^6 at the Site (Ninyo & Moore, 2009) at concentrations that, according to the Regional Board, are in exceedance of normal background concentrations of Cr^6 in the San Fernando Valley (LARWQCB, 2011a).

A few important results from the Caltrans soil investigation are summarized here. During the investigation 12 soil borings were advanced and samples were collected at 2, 5, 10, and 20 feet below ground surface (bgs) and analyzed for metals (including Cr^6). The soil boring locations were toward the eastern side of the Site nearer Interstate 5 and away from some of the larger building pads where Cr^6 was directly handled and/or used in industrial activities. Hexavalent chromium was detected in only four of the 48 samples (~8%), with three of four detections occurring in soils at or lesser than 5 feet bgs. There was a single detection of Cr^6 at 20 feet bgs at a concentration that was just 0.04 mg/kg above the detection limit. The concentrations of these detections were low, the highest concentration being 0.18 mg/kg, nearly 100 times lower than the California Human Health Screening Levels for Soil (CHHSLs) for residential land use which is more conservative than the commercial/industrial CHSSL (see Table 1). A detailed

summary of the results of the Caltrans Report were provided in the approved Work Plan (Appendix A).

It is important to note that the detections of Cr⁶ reported in the Caltrans Report (Ninyo & Moore, 2009) were not a cause for health or environmental concerns in and of themselves, but they raised the question to LARWQCB as to whether there might be significant Cr⁶ impacts to soils in other locations at the Site where Cr⁶ was directly handled and/or used in industrial activities. In addition, previous investigations in those areas had tested for Title 22 metals, including total chromium, not speciated for Cr⁶, with sampling at shallow depths not exceeding five feet bgs (Law/Crandall 1997); and LARWQCB now questions whether deeper sampling with testing speciated for Cr⁶, and a screening for other Title 22 metals, would reveal evidence for concern.

The aforementioned Order was issued by LARWQCB to Northridge Properties, LLC, on May 10, 2011. Northridge Properties, LLC, worked with LARWQCB to target locations at the Site where impacts, if any, would be anticipated should any unauthorized releases of Cr⁶ have occurred in the past. The five former clarifier locations shown on Figure 2 were selected. On behalf of Northridge Properties, LLC, Geosyntec submitted the Soil Assessment Work Plan – Hexavalent Chromium (Geosyntec, 2011), which was approved by the Regional Board in a letter dated 20 December, 2011. After that time, further negotiations and clarifications with LARWQCB resulted in a requirement to analyze samples collected at 10 and 20 feet bgs from two of the five locations for the suite of Title 22 metals in addition to Cr⁶. These changes were confirmed in a letter sent to the Regional Board on 7 June, 2012. The original work plan submitted (Geosyntec, 2011) and the subsequent confirmation letter of 7 June 2012, constitute the approved Work Plan and are included in Appendix A.

Sampling activities in the approved Work Plan were implemented on 28 June, 2012, and Geosyntec has prepared this Report to present and provide an assessment of the analytical results obtained.

3. SOIL SAMPLING

3.1 General

The Soil Assessment activities described in this Report were conducted in accordance with the Site-specific Health and Safety Plan (HASP) and the approved Work Plan (Appendix A) prepared in accordance with the LARWQCB request.

3.2 Field Work Preparation

Five locations on the Site were chosen for sampling with LARWQCB concurrence. As mentioned previously, these locations were identified as potential areas of concern based on discussions with LARWQCB and review of facility maps, which indicated the former presence of clarifiers (now closed and filled with concrete, with the locations visible on site). It was determined that one boring would be drilled adjacent to each former clarifier to a maximum depth of 20 feet bgs or refusal (see Figure 2 for boring locations). Each clarifier was located in the field and a boring location was marked with white paint on the concrete surface approximately 2.5 feet from the edge of the clarifier in the locations shown on Figure 2.

Underground Service Alert (USA) was notified more than 48 hours prior to beginning drilling activities to identify underground utilities in the vicinity of the proposed borehole locations and to reduce the potential for accidentally encountering buried utility lines (USA ticket number B21730160). Geosyntec also contracted with Goldak Geophysics to conduct a subsurface geophysical survey on June 14, 2012, to identify locations of potential underground utilities. Once all utilities were cleared, concrete coring was scheduled.

Due to uncertainty in the thickness of the concrete surface cover at the Site and uncertainty in the dimensions of the former clarifiers, it was determined that slant drilling was not feasible at the Site. On June 27, 2012, Interphase Environmental, Inc., (Interphase), a drilling and soil sampling subcontractor, cored through the concrete at the marked boring locations prior to drilling activities which began the following day.

3.3 Soil Sampling

On June 28, 2012, under the direction of Geosyntec, Interphase advanced five borings (labeled SS-1 through SS-5; Figure 2) in the cored boring locations identified using a direct push drill rig and a continuous soil core was collected to a depth of approximately 20 feet bgs using a 4-foot sampler lined with acetate sleeves. Borings were visually logged for geologic lithology in accordance with the Unified Soil Classification System (USCS). The first 5 feet of each boring was completed by hand auger to reduce the potential for impairing unidentified underground utilities or pipes. Soil samples were collected from the cores at 5-foot intervals using disposable sampling equipment in order to avoid cross contamination of samples. The first sample was collected at a depth of 5 feet bgs, with subsequent samples collected at depths of 10, 15, and 20 feet bgs in accordance with the approved Work Plan (Appendix A). A total of 20 primary soil samples were collected in this manner and two duplicate soil samples (labeled SS-6-10 and SS-7-20) were collected from two of the sampling locations (SS-3-10 and SS-5-20, respectively), which had been chosen at random. The duplicate samples were submitted to the laboratory blind.

The soil samples were collected in 4-oz. glass jars sealed with Teflon®-lined plastic caps for analysis of Cr⁶ (EPA Methods 3060A and 7199), with samples at 10 and 20 feet bgs from two of the borings (borings SS-2 and SS-3) also analyzed for the suite of Title 22 metals (EPA Methods 3050B and 6010B). Individual soil samples were labeled with unique identifiers, logged on laboratory chain of custody forms, placed in an ice-filled cooler, and transported to Calscience Environmental Laboratories, Inc. (Calscience), a local National Environmental Laboratory Accreditation Conference (NELAC) accredited laboratory. The borings were backfilled with bentonite chips from 20 feet bgs to just below the concrete surface and capped with concrete flush to existing grade. Remaining soil cores were stored in a 55-gallon DOT-approved drum during drilling and sampling activities and were removed from the Site. Upon receipt of laboratory results and waste profiling, the remaining soil cores were properly disposed by the driller as non-hazardous waste.

The non-dedicated soil sampling equipment (e.g., coring bits and hand augers) was washed prior to each sample collection by the “three-bucket-wash” method; sampling equipment was first washed in a solution of Alconox and potable water, then rinsed with potable water, and finally rinsed with distilled water and allowed to air-dry.

3.4 **Laboratory Analysis**

Samples were transported with proper chain of custody forms to Calscience Environmental Laboratories, Inc. (Calscience), located at 7440 Lincoln Way, in Garden Grove, California. Samples were analyzed for Cr⁶ using EPA Method 3060A for extraction, and EPA Method 7199 for analysis. Samples at 10 and 20 feet bgs from borings SS-2 and SS-3 were additionally analyzed for Title 22 metals using EPA Method 3050B for extraction, and EPA Method 6010B for analysis. The laboratory analytical results for the soil samples are discussed in Section 4. The laboratory analytical report is provided in Appendix B.

4. RESULTS

4.1 Introduction

The laboratory analytical results for the soil samples arranged by boring location and depth are summarized in Table 1. In order to have a basis of comparison, Table 1 also includes the California Human Health Screening Levels for Soil (CHHSLs) for both residential and commercial/industrial land use (OEHHA, 2005, and subsequent revisions to tables). Soil lithology and analytical results are described in the following sections and the laboratory analytical report is included in Appendix B.

4.2 Soil Lithology

The five soil borings (SS-1 through SS-5) advanced at the Site were logged for soil lithology in accordance with the Unified Soil Classification System (USCS) and screened visually for evidence of contamination. The boring logs showing the soil lithology at each boring location are provided in Appendix C.

4.3 Soil Analytical Results

A total of 20 primary soil samples were collected at five-foot intervals from 5 to 20 feet bgs from the five soil boring locations, with all samples analyzed for Cr⁶ using EPA Method 3060A for extraction, and EPA Method 7199 for analysis, and samples collected at 10 and 20 feet bgs from borings SS-2 and SS-3 also analyzed for Title 22 metals using EPA Method 3050B for extraction, and EPA Method 6010B for analysis. Table 1 summarizes the analytical results and provides commercial/industrial CHHSLs (i.e., chemical-specific soil health screening levels for commercial/industrial land use) for comparison. A plan view of boring locations is provided in Figure 3 that includes tables with soil sample depths and concentrations of Cr⁶. Results of these analyses are summarized in the bulleted list below and described in more detail in the sections that follow:

- Cr⁶ was detected in only four of 20 (20%) soil samples collected from locations where impacts, if any, would be anticipated;
- Concentrations of Cr⁶ detected were significantly less than 10 times below the residential CHHSL, which is more conservative than the commercial/industrial CHHSL (see Table 1);

- Three of the four detections of Cr⁶ were in shallow soils (at or lesser than 10 feet bgs);
- The single detection of Cr⁶ at 20 feet bgs was at a concentration that was just 0.01 mg/kg above the detection limit;
- The concentrations of arsenic detected at the Site, while exceeding the commercial/industrial CHHSL, are consistent with naturally occurring background arsenic levels in California (Bradford et. al, 1996; LBNL, 2002);
- With the exception of arsenic and the single detection of cadmium, all Title 22 metals detected at the Site were at concentrations below residential CHHSLs (see Table 1);
- The concentration of the single detection of cadmium at a depth of 20 feet bgs was below the commercial/industrial CHHSL (see Table 1).

4.3.1 Hexavalent Chromium

Hexavalent chromium, which was the primary constituent of concern for this Soil Assessment was detected in only four of the 20 (20%) primary soil samples collected. These detections were in samples collected at depths of 5 and 10 feet bgs in boring SS-2, at 20 feet bgs in boring SS-4 and at 5 feet bgs in boring SS-5. All concentrations were significantly less than 10 times below the residential CHHSL, which is more conservative than the commercial/industrial CHHSL (see Table 1).

4.3.2 Title 22 Metals

Two of the five borings (SS-2 and SS-3) were analyzed for Title 22 metals at depths of 10 and 20 feet bgs, in accordance with the approved Work Plan (Appendix A). These four soil samples had detections of several Title 22 metals.

Arsenic was detected in all four soil samples analyzed at levels that exceeded CHHSLs. However, it has been noted that natural background levels of arsenic in California soils are often found to exceed health-based, direct-exposure goals. The concentrations of

arsenic detected at the Site are consistent with naturally occurring background arsenic levels in California (Bradford et. al, 1996; LBNL, 2002).

Barium, beryllium, total chromium, cobalt, copper, lead, nickel, vanadium and zinc were detected in soil samples collected from borings SS-2 and SS-3, while cadmium was detected in only one soil sample at a depth of 20 feet bgs from boring SS-2. With the exception of naturally occurring arsenic levels and the single detection of cadmium, concentrations of all analytes were below the more conservative residential CHHSLs. The concentration of the single detection of cadmium was below the commercial/industrial CHHSL (see Table 1).

5. CONCLUSIONS AND RECOMMENDATIONS

5.1 Summary

Based on the soil sampling data collected as part of this Soil Assessment as presented in the preceding section of this Report (see Table 1) and the analyses presented in the following sections, several conclusions related to chemical impacts at the Site can be drawn:

- The detections of Cr⁶ in only 20% of the soil samples collected from locations where impacts, if any, would be anticipated and at low concentrations significantly less than 10 times below the more conservative residential CHHSL indicate that the limited number and low concentrations of Cr⁶ detections at the Site are not significant;
- The vertical distribution of detections of Cr⁶, primarily in shallow soil samples (at or lesser than 10 feet bgs) are inconsistent with historical releases of Cr⁶ at concentrations that could have impacted groundwater and do not provide evidence to suggest that historical Site activities contributed to the San Fernando Valley Groundwater Basin (SFVGB) Cr⁶ contamination that is currently under investigation by LARWQCB and USEPA;
- The vertical distribution primarily in shallow soil samples and the concentrations of Cr⁶, orders of magnitude below the TTLC (500 mg/kg) and the more conservative value of 10 times the STLC, demonstrate that Cr⁶ concentrations in Site soils are unlikely to pose a threat to groundwater at the Site in the future;
- The low concentrations of Cr⁶ and Title 22 metals with the exceptions of arsenic and the single detection of cadmium (i.e., below residential CHHSLs other than the single detection of cadmium which was below commercial/industrial CHHSLs and at a depth of 20 feet bgs) and the concentrations of arsenic being consistent with naturally occurring background arsenic levels in California demonstrate that metals concentrations in the soils at the Site are at levels that are protective of human health.

The conclusions summarized above in bulleted format are described in more detail in the following sections.

5.2 Hexavalent Chromium

Hexavalent chromium, the chief focus of the LARWQCB Order (LARWQCB, 2011b) and of this Soil Assessment, was detected in only four of the 20 soil samples collected (20%) from sample locations that were specifically selected for this field program and approved by LARWQCB because they were locations where impacts, if any, would be anticipated (i.e., adjacent to the former clarifiers, now closed and filled with concrete). Furthermore the detections of Cr⁶ were at low concentrations (below the commercial/industrial CHSSL and significantly less than 10 times lower than the more conservative residential CHHSL as shown in Table 1). These results indicate that the limited Cr⁶ detections at the Site are not significant.

In terms of vertical distribution, three of the four detections of Cr⁶ occurred in soils at or fewer than 10 feet bgs. The single detection that occurred at 20 feet bgs was at a low concentration, just 0.01 mg/kg above the detection limit. These results are inconsistent with historical releases of Cr⁶ at concentrations that could have impacted groundwater and do not provide evidence to suggest that historical Site activities contributed to the San Fernando Valley Groundwater Basin (SFVGB) Cr⁶ contamination that is currently under investigation by LARWQCB and USEPA.

The vertical distribution of Cr⁶ detections in shallow soils makes it unlikely that the groundwater table would come into contact with these soils. Furthermore, the low concentrations of Cr⁶ are orders of magnitude below the Total Threshold Limit Concentration (TTLC = 500 mg/kg) and the more conservative value of 10 times the Soluble Threshold Limit Concentration (STLC; i.e., the threshold value for STLC leachability testing = 50 mg/kg) which is an indication of a contaminant's potential to impact (i.e., leach into and/or migrate downward to) groundwater. These results demonstrate that Cr⁶ concentrations in Site soils do not pose a threat to groundwater at the Site in the future.

5.3 Title 22 Metals

Several Title 22 metals, specifically arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, lead, nickel, vanadium and zinc were detected in soil

samples collected from the Site. These metals are commonly detected in soils within Southern California. With the exception of arsenic and the single detection of cadmium, the concentrations of Title 22 metals were below the more conservative residential CHHSLs. The concentration of the single detection of cadmium was still low, below the commercial/industrial CHHSL (see Table 1), and at a depth of 20 feet bgs, making contact with potential surface receptors highly unlikely. These results together indicate that Site soils do not pose a risk to human health due to these metals.

Although arsenic was found at concentrations above the commercial/industrial CHHSL, it has been well-documented that natural background levels of arsenic in California soils are often found to exceed published health-based, direct-exposure goals. The concentrations of arsenic detected at the Site are consistent with naturally occurring background arsenic levels in California (Bradford et. al, 1996; LBNL, 2002). A study conducted by the California Department of Toxic Substances Control (DTSC) on Los Angeles United School District sites estimated the 95% upper confidence limit of the 99th percentile concentration for arsenic at 6 mg/kg (DTSC, 2005). Another DTSC study determined an upper-bound estimate of 12 mg/kg for naturally occurring arsenic in Southern California soils (DTSC, 2008). The levels of arsenic found at the Site are also consistent with these regionally-specific background levels.

5.4 Recommendations

Given the conclusions of this Soil Assessment and their consistency with past soil sampling results detailed in the approved Work Plan (Appendix A) and summarized in Section 2.3 of this Report, Geosyntec concludes that no further investigations for hexavalent chromium or other metals are warranted and recommends Northridge Properties, LLC, request Site closure from LARWQCB.

Therefore, on behalf of Northridge Properties, LLC, Geosyntec has been asked to respectfully request that LARWQCB issue a closure letter for the Site referenced herein. In addition, because the Site reopener was not due to any regulatory concern regarding volatile organic compounds or other contaminants, which were the subject of previous investigations and remedial action and closure, the requested closure should clarify that the Site was not reopened for any purpose other than this soil assessment and that no further action is required.

APPENDIX A

APPROVED WORK PLAN

August 15, 2011
DRAFT

Samuel Unger
Executive Officer
Regional Water Quality Control Board, Los Angeles Region
320 West Fourth Street, Suite 200
Los Angeles, CA 90013

Subject: Soil Assessment Work Plan – Hexavalent Chromium
777 North Front Street, Burbank, California

Dear Mr. Unger:

INTRODUCTION

This document consists of a Work Plan for additional soil assessment to be conducted at the 777 North Front Street property, located in Burbank, California (the Site). This Work Plan was prepared by Geosyntec Consultants, Inc. (Geosyntec) at the request of Gilchrist & Rutter Professional Corp. (Gilchrist) on behalf of Northridge Properties, LLC, the owner of the property, for submittal to the Los Angeles Regional Water Quality Control Board (LARWQCB). The soil assessment is being conducted in response to a LARWQCB requirement sent to the Northridge Properties, LLC, in a letter dated May 10, 2011 [LARWQCB, 2011a]. The historical information contained in this Work Plan is based on Geosyntec's review and understanding of previous environmental reports and other reference material prepared by third parties (see Reference section). No warranty of the information provided in the third party reports or referenced materials is expressed or implied. Geosyntec reserves the right to correct any statement that we later find to be inaccurate in any way.

During the 1998 United States Environmental Protection Agency (USEPA) Superfund investigation of the San Fernando region which focused on volatile organic compounds (VOCs), groundwater supply well testing indicated the presence of hexavalent chromium (Cr^6) at levels significantly higher than expected background concentrations [LARWQCB, 2011a]. Based on this information, the LARWQCB reviewed Chemical Use Questionnaires (CUQs) provided by facilities in the area and identified 112 sites on which to conduct further investigation based on information that may indicate past

usage of chromium in their industrial activities. Though the Site was not part of the original 112 sites, further evaluation by the LARWQCB and results from an onsite 2009 Caltrans soil investigation of a strip of land along the northeasterly border of the Site led the LARWQCB to request that a soil investigation be conducted focused on Cr⁶ as described in their May 10 letter [LARWQCB, 2011a]. The primary objective of the scope of work described in this work plan is to satisfy the request of the LARWQCB to conduct a soil assessment at the Site for Cr⁶. The remainder of this Work Plan is divided into the following sections:

- Background;
- Sampling and Analysis Plan;
- Data Analysis and Reporting; and
- Closing.

BACKGROUND

Site Description & Operational History

The Site is located on an approximately 8-acre parcel in the City of Burbank, approximately 13 miles north-northwest of downtown Los Angeles. It is bordered to the northeast by old, vacated alignment of Front Street (beyond which is Interstate 5), to the northwest by Burbank Boulevard, to the southwest by a flood control channel and by a strip of land owned by the City of Burbank (beyond which is the new alignment of Front Street, and Front Street, and to the southeast by a parcel of land between old and new Front Street (also owned by the City) (Figure 1).

From 1920 to 1961, the Site was occupied by General Water Heater Company, and then was purchased by Zero Corporation (Zero) for use by a division of the company called Zero Enclosures, whose primary business was fabrication of metal enclosures. Six buildings were constructed at the Site to house historical manufacturing operations (Figure 2). In addition to Zero Enclosures' operations, from 1964 to 1973, a part of the Site was leased to Ocean Technology Inc., a subsidiary of Zero, which used the space to manufacture and assemble electronic products.

Zero's manufacturing operations were discontinued in December 1991. From that point until 2002, the Site was used for storage (a 1995 city directory shows the occupant as Western Moving & Storage, Inc.) and later as film studios for the entertainment industry [Mactech, 2005; Law/Crandall, 1997]. After that time, the Site was unoccupied, with on-site buildings demolished in 2004. Current aerial photographs show that concrete pads and foundations remain on the Site. The Site was sold in 1998 by Zero to the Ford Leasing Development Company, which sold it to Northridge Properties, LLC, in 2005.

A parcel of land adjacent to the Site on the southwest was leased by Zero from the Southern Pacific Transportation Company for use as chemical storage. This parcel is currently owned by the City of Burbank and was used in part for realignment of Front Street.

Description of Historical Activities

Zero's manufacturing operations included aluminum case drawing and washing, aluminum alodining (a metal coating process), chromate deoxidizing, steel phosphate coating and chromium sealing, painting (the Zero facility contained paint booths, a water-based paint shop and drying booth), aluminum machining, etching, deoxidizing and cleaning, aluminum vapor degreasing, and grinding [Targhee, 1991]. During Zero Enclosure's operations, the Site also contained four clarifiers, two underground storage tanks (USTs), two designated chemical storage areas, two paint storage areas, one oil storage area, one acid storage area, one acid/caustic soda storage area, and one hazardous waste staging area [Targhee, 1991]. The approximate former locations of the four clarifiers are shown in Figure 2. In 1987, the two USTs, which had been used to store unleaded gasoline, were removed from the Site under Los Angeles County Department of Public Works (LACDPW) oversight. A building permit was issued in 1993 for the removal and/or abandonment of clarifiers on the Site [Mactech, 2005].

A review of historical information indicates that an industrial waste permit was issued to Zero in 1967 [Targhee, 1991]. Wastes generated onsite included acetone, ketones, 1,1,1-TCA, waste oil, waste acids and paint sludges [Targhee, 1991]. Hazardous materials used in and/or generated from industrial activities on the Site were stored in the storage areas described above (chemical storage, oil storage, acid storage, acid/caustic soda storage, and hazardous waste staging areas) [Meredith/Boli & Associates, 1997].

In 1975, Zero was cited by the California Department of Health Services (DHS) and the City of Burbank for disposing excess chromium in a wastewater discharge. After an inspection of the Site and housekeeping activities, no further action was recommended by DHS [Targhee 1991]. A land ban generator inspection report was written in August 1988 by DHS which primarily discussed Site chemical handling and disposal practices. The report did not indicate chemicals had been disposed to the ground nor the presence of observed surface chemical staining [Targhee, 1991].

Site Geologic/Hydrogeologic Setting

The Site is located within the eastern San Fernando Valley. The majority of this area consists of alluvium, lake, playa and terrace deposits, and unconsolidated and semi-consolidated sedimentary deposits, with the area beneath the Site including recent Holocene-age to Pleistocene-age alluvial fan deposits derived from the Verdugo Mountains [Mactech, 2005]. During the most recent drilling activities conducted at a portion of the Site in 2009, soil encountered to depths of approximately 40 feet consisted primarily of sand, silty sand, clayey sand and sandy silt with trace gravel [Ninyo and Moore, 2009].

Based on measurements from on-site monitoring wells (installed after groundwater monitoring was required by LARWQCB as part of Site soil remediation activities described further in the next section) and recent environmental investigations over the period 1992 to 2009, depth to groundwater at the Site has varied between 94 and 126 feet below ground surface. The 1998 Seismic Hazard Evaluation for the Burbank Quadrangle [Mactech, 2005] indicated that the highest historical groundwater in the area was between 20 and 30 feet below ground surface.

Groundwater in the vicinity of the Site generally flows south to southeast toward the Los Angeles River. As a result of local groundwater treatment pumping activities close to the Site, the groundwater gradient and flow direction at the Site has been known to fluctuate in the past [Ninyo & Moore, 2009].

Previous Environmental Investigation and Regulatory History

Following excavation and removal of the USTs from the Site in 1987, samples were taken beneath each tank at a depth of 3 feet. The highest level of Total Petroleum Hydrocarbons detected was 31 parts per million (ppm) in one location. Based on this result, after the tank excavation pit was backfilled and repaved, and the tanks were triple rinsed with rinsate and disposed off-site, the LACDPW signed closure documentation indicating that no further action was required [Targhee, 1991].

In 1991, as part of its Well Investigation Program, the LARWQCB mandated that an initial subsurface investigation be conducted at the Site to assess VOC concentrations in soils. Based on the results of this initial survey, follow-on studies were conducted which eventually led to remedial activities aimed at addressing elevated levels of several chlorinated hydrocarbons in both shallow and deep soils. These activities (primarily Soil Vapor Extraction) were completed in 2000, with a Certificate of Completion issued by the LARWQCB dated July 1, 2002 [LARWQCB, 2002]. Waste soils generated by sampling activities were tested for metals including total chromium, which was detected in the one sample analyzed at 33 milligrams per kilogram (mg/kg) (shown on Table 1) [Hydro Geo Chem, 1998].

The soil remediation activities performed by Hydro Geo Chem also included a requirement for onsite groundwater monitoring [Hydro Geo Chem, 1998]. Trichloroethene (TCE) and tetrachloroethene (PCE) were the primary VOCs detected in groundwater samples, with only TCE detected above the targeted cleanup goal established in the Phase 1 remediation Work Plan during the last two years of remediation activities [Hydro Geo Chem 2000]. Based on comparison to the relatively low VOC levels detected in soil and soil vapor samples it was concluded that the groundwater TCE concentrations could not be entirely attributed to on-site contamination and was probably due to regional VOC issues. Hydro Geo Chem also tested for heavy metals, including chromium, in monitoring well purge water and reported these data in self-monitoring reports submitted to the LARWQCB (analytical results from samples collected between 1999 and 2001 ranged from non-detect to 12ug/L). A request to end groundwater monitoring activities was included with the request for a No Further Action determination for the remediation activities submitted by Hydro Geo Chem [Hydro Geo Chem, 2000]. A Certificate of Completion indicating that “the Site Investigation and Remedial Action at the Site has been satisfactorily completed and a permanent remedy has been accomplished” was issued by LARWQCB on July 1, 2002 [LARWQCB, 2002].

In October 1997, as part of a Site environmental assessment for Galpin Motors, Inc. (at the time, a prospective buyer of the property, but did not purchase it), Law/Crandall collected soil samples from a total of 18 borings for analysis of Title 22 (California Code of Regulations) metals. Twenty (20) soil samples collected from depths between 1 and 5 feet below ground surface (bgs) were analyzed for total chromium; duplicate (split) samples from 12 of the 20 Law/Crandall sampling locations were also analyzed by Hydro Geo Chem. The soil boring locations are included on Figure 2 and a summary of the total chromium soil sample results is included as Table 1. Total

chromium was detected in each of the 20 soil samples analyzed, up to a maximum concentration of 42.5 mg/kg. In September 1997, Emcon conducted a Site assessment for the City of Burbank along the previous, now vacated, alignment of North Front Street. Six borings were drilled and soil samples were collected from depths between 5 to 20 feet bgs, with one sample collected at 40 feet bgs. Samples were analyzed for eight of the Title 22 metals including: barium, chromium (total), cobalt, copper, lead, nickel, vanadium, and zinc. These soil results were compared to ten times their Soluble Threshold Limit Concentration (10xSTLC) which, if exceeded, would indicate the need for further analysis and a possible classification as hazardous waste. The soil boring locations are included on Figure 2 and the total chromium soil data are presented in Table 1. The results indicated that reported total chromium concentrations were below the 10xSTLC screening level of 50 mg/kg. One sample at 10 ft bgs tested higher than the 10xSTLC for copper (sample concentration was 421 mg/kg). As a follow-up, additional samples were taken in the same boring location at several depths to test for soluble copper using the California Waste Extraction Test (WET) method. Results from this testing were found to be significantly lower than the STLC for copper [Emcon, 1998]. Based on these results, no further investigation or analysis was performed by Emcon.

In 2009, Ninyo & Moore performed an investigation for the California Department of Transportation (Caltrans) in support of a possible acquisition of a portion of the Site along the previous, now vacated, alignment of North Front Street. In addition to data collected to confirm the adequacy of Site closure with respect to VOCs, 20 soil borings were drilled to depths of up to 20 feet bgs and soil samples were analyzed for metals (including total chromium and Cr⁶). The soil boring locations are included on Figure 2 and the total and Cr⁶ soil sample results are included in Table 1. Total chromium was detected in each of the samples at relatively low levels (highest was 54 mg/kg) and Cr⁶ was detected in 4 samples, with the highest concentration reported at 0.18 mg/kg. Results for total chromium were concluded to be significantly below the 10xSTLC level (50 mg/kg), and Cr⁶ concentrations in each of the samples were also significantly lower than the target screening level used in the report, which was the EPA Preliminary Remediation Goal (PRG) for commercial/industrial properties of 200 mg/kg [Ninyo & Moore 2009].

SAMPLING AND ANALYSIS PLAN

General

To expand on the previous assessments of the Site for evidence of historical chromium releases described in previous sections, soil borings will be drilled in five locations (one boring per location) to a depth of 20 feet bgs in the areas identified in Figure 3. These locations were designated as areas of concern based on conversations with the LARWQCB and review of Zero Enclosures facility maps which indicated the presence of Site features, such as clarifiers and a former pretreatment process area. Locations where previous sampling activities had occurred were also taken into account. Based on the amount of sampling that has taken place at the Site to date, and the geologic materials present at the Site, one boring per Site feature location to 20 feet bgs will be sufficient to characterize these areas for the potential for Cr⁶ impacts. The results from this sampling event will be documented and summarized along with previous assessment results for the LARWQCB to confirm closure of the Cr⁶ question or to develop next steps, as needed.

Fieldwork Preparation and Borehole Installation

Soil borings will be installed using a direct push drill rig. Borings will be drilled to depths of up to 20 feet bgs or until refusal. As the Site is vacant without knowledgeable Site personnel, borehole locations will be cleared of underground utilities by performing a geophysical survey in advance of field work, and notification of Underground Service Alert (USA) prior to commencing field work. Concrete coring will be performed prior to drilling in areas currently covered with a concrete foundation.

Sample Collection

Soil cores will be continuously recovered over the entire borehole depth using a 2-foot sampler lined with acetate sleeves. Boreholes will be visually logged for geologic lithology in accordance with the Unified Soil Classification System (USCS) through evaluation of drill cuttings and soil samples. Soil cores will be visually evaluated for evidence of impacts or odors. Select soil samples will be retained for laboratory analytical testing. Soil samples will be collected at roughly 5-foot intervals, however sample locations may be adjusted based on the results of observations of visual impacts or odors, or the identification of low permeable layers. Soil samples will be stored in a cooler on ice pending shipment to CalScience Laboratories under chain of custody protocol. Samples will be analyzed for Cr⁶ speciation.

Decontamination and Investigation-Derived Waste Disposal

Boreholes will be abandoned with hydrated bentonite pellets. Augers will be decontaminated with a three-stage rinse between borehole locations. The direct push method does not produce drill significant cuttings; however, some waste cuttings and decontamination water will be generated. Investigation-derived wastes will be stored in drums for off-site disposal.

Quality Assurance/Quality Control

Duplicate samples will be collected from each sample location and approximately 10% of the total sample number will be analyzed. Samples of water used to rinse equipment after decontamination procedures are completed will be collected to evaluate the effectiveness of decontamination protocols. Trip blanks will be stored with analytical samples during transport to the analytical lab.

Quality control procedures of Calscience Laboratories will be included in an appendix to the final report along with lab reports.

DATA ANALYSIS AND REPORTING

A data summary report will be prepared to document field activities and present the findings of the investigation. This report will be submitted to the LARWQCB within six weeks of receipt of the laboratory analytical results. The report will include figures illustrating sampling locations and copies of laboratory analytical data. The investigation analytical results will be evaluated based on a comparison with historical Cr⁶ data, background levels of Cr⁶ in the area, as well as EPA-established screening levels. If appropriate, the report will include recommendations for further analysis or investigation/delineation. Per the requirements of the LARWQCB, boring logs will also be prepared and included in the report.

Larry Moore
Project Manager
Regional Water Quality Control Board, Los Angeles Region
320 West Fourth Street, Suite 200
Los Angeles, CA 90013

Subject: Soil Assessment Confirmation / Metals Testing
Case/File: Former Zero Corporation (File No. 109.6162)
777 North Front Street, Burbank, California

Dear Mr. Moore:

This letter supersedes our letter dated May 24, 2012. The purpose of this letter is to confirm specific provisions of the Regional Water Quality Control Board (Regional Board) approved Work Plan for additional soil assessment to be conducted at the 777 North Front Street property, located in Burbank, California (the Site). The soil assessment is to be conducted in response to a letter and California Water Code Section 13267 Requirement to Provide Technical Report, dated May 10, 2011 [LARWQCB, 2011a], sent by the Regional Board to the owner of the Site, Northridge Properties, LLC. The Soil Assessment Work Plan (Work Plan) proposed analysis of soil samples only for hexavalent chromium (Cr⁶), consistent with the focus of LARWQCB, 2011a. The Work Plan was approved by the Regional Board in a letter dated December 20, 2011, which called for analysis of soil samples for Title 22 metals and Cr⁶. This confirmation letter was prepared by Geosyntec Consultants, Inc. (Geosyntec) at the request of Gilchrist & Rutter Professional Corp. (Gilchrist) on behalf of Northridge Properties, LLC.

Because past studies of soil samples for Title 22 metals have not indicated metals of concern [Law/Crandall, 1997; Hydro Geo Chem, 2000; and Ninyo & Moore, 2009], other than the Regional Board's concern regarding Cr⁶ as stated in LARWQCB, 2011a, and to avoid incurring unwarranted analytical costs, we requested (in our letter of May 24, 2012) confirmation that the soils to be sampled again at identified Site locations in accordance with the approved Work Plan will be analyzed only for speciated chromium

(specifically Cr⁶). Following subsequent discussions, we understand that you have agreed instead to limit the number of soil samples to be analyzed for Title 22 metals. Specifically, two of the five borings will include soil sampling for Title 22 metals analysis at 10 feet and 20 feet (boring termination depth), in addition to speciated Cr⁶. We will work with you to select the two borings for this additional testing. We also understand that the purpose for the testing for Title 22 metals is to obtain additional data to support the issuance of a no further action determination for the Site if indicated by the data.

We are seeking your concurrence with this confirmation letter as to the required scope of work. If you have questions or comments on the contents of this letter, please do not hesitate to contact Eric Smalstig of Geosyntec at 714-969-0800.

Finally, while cooperating with the Section 13267 Requirement to Provide Technical Report, Northridge Properties reserves all its contentions, rights, remedies and defenses in this matter, including but not limited to those stated in Petition No. A-2167 on file with the State Water Resources Control Board.

Sincerely,

Mike Reardon, P.E.
Senior Engineer

Eric Smalstig, P.E.
Principal

Glossary of Terms and Qualifiers

Work Order Number: 12-06-1919

Qualifier	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported without further clarification.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS/LCSD Recovery Percentage is within Marginal Exceedance (ME) Control Limit range.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

MPN - Most Probable Number

Re: ATL Work Order Number : 1600338
Client Reference : 777 N Front St., A9377-06-01

Enclosed are the results for sample(s) received on January 22, 2016 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated on the enclosed chain of custody in accordance with applicable laboratory certifications. The laboratory results contained in this report specifically pertains to the sample(s) submitted.

Thank you for the opportunity to serve the needs of your company. If you have any questions, please feel free to contact me or your Project Manager.

Sincerely,

A handwritten signature in black ink, appearing to read "Eddie Rodriguez", with a small "ER" monogram below it.

Eddie Rodriguez
Laboratory Director

The cover letter and the case narrative are an integral part of this analytical report and its absence renders the report invalid. Test results contained within this data package meet the requirements of applicable state-specific certification programs. The report cannot be reproduced without written permission from the client and Advanced Technology Laboratories.
