APPENDICES

Appendix A: Site Maps, Plans and Photographs

- Site Location Map
- Site Plan
- Site Photographs

Appendix B: Historical Sources

- Historical Fire Insurance Maps
- Historical Aerial Photographs
- Historical Topographic Maps

Appendix C: Environmental Lien/ AUL Search Information

Appendix D: Select Previous Environmental Reports

Appendix E: Environmental Database Search Report

Appendix F: AAI User Questionnaire

Appendix G: Owner Questionnaire

Appendix H: Qualifications of Professionals

EXECUTIVE SUMMARY

Blackstone Consulting LLC (Blackstone) performed a Phase I Environmental Site Assessment (Phase I ESA) of the parcel located at 777 North Front Street in Burbank, Los Angeles County, California (site). It is understood that the site is planned for acquisition and future redevelopment. The purpose of the Phase I ESA is to identify recognized environmental conditions (RECs) in accordance with ASTM Standard E 1527-13 and other agreed-upon ASTM *Non-Scope Considerations (Business Environmental Risk Issues)*. Blackstone also understands that this document may be submitted to the Los Angeles Regional Water Quality Control Board (LA-RWQCB), as a Phase I ESA is a requirement for admission to that agency's California Land Reuse and Revitalization (CLRRA) program.

SITE INSPECTION

Name of Inspector: Sarah L. Denton

Date of Inspection: June 13, 2018

Site Representative: None

SITE DESCRIPTION

Street Address: 777 North Front Street

City and State: Burbank, California

County: Los Angeles

Legal Description: Los Angeles County Assessor Parcel Number: 2449-037-013

Owner(s): Northridge Properties, LLC, A California limited liability company

Site Size: Approximately 8.0 acres

Site Use: Vacant

Year(s) Built: Not applicable; no buildings currently occupy the site. Foundations remain on the site from building constructed in the 1960s.

Structure(s)	<i>Location On Site</i>	<i>Number of Stories</i>	<i>Size (approx. square feet)</i>
Foundations and pads	Throughout	-	-
Other Site Features:	Historical site buildings have been demolished, but former building foundations and parking areas remain at the site. The eastern and		

northern portions of the site are occupied by considerably large soil piles and gravel storage apparently staged by the California Department of Transportation (Cal-Trans) for use at an off-site construction project. Evidence of former manufacturing features, such as former clarifiers, drains, restrooms, trench drains and other past in-ground features, were observed throughout the site. Evidence of environmental investigation, including current monitoring borings and former exploration borings, were also observed at the site.

Proposed Site Use:

Blackstone understands that the site is proposed to be redeveloped with mixed residential and commercial uses, specifically multi-family residential apartments, a hotel, limited ground-level commercial uses, underground and aboveground parking levels, and recreational spaces that will include a park and bicycle hub with amphitheater-style seating. The specific development plans are subject to change, such as during the permitting process with the local building and development agency.

HISTORICAL INFORMATION

Reasonably ascertainable historical information indicates the eastern portion of the site consisted of dwellings constructed prior to 1928 while the remainder of the site was undeveloped. From the 1930s until 1961, General Water Heater Company (General) operated a water heater manufacturing facility at the site. Limited information regarding General's operations are available; however, historical resources indicate that structures and site uses during General's site operation included a metal working building with an oil tank, a boiler shop, a galvanizing and foundry building, an assembly, stockroom and machine shop building with spray-painting and plating rooms, storage buildings and offices. General also utilized a rail spur located on the western portion of the site.

In approximately 1961, Zero Manufacturing Corporation (Zero) purchased the site and reportedly demolished the former General structures. Zero redeveloped the site with a manufacturing facility to fabricate metal enclosures. By 1968, four large manufacturing buildings and three smaller structures, including a machine shop and offices, occupied the majority of the site. Zero operated a manufacturing plant at the site that fabricated metal enclosures and containers from the mid-1960s until approximately 1991. According to the California Regional Water Quality Control Board (RWQCB), Zero's manufacturing operations included aluminum case drawing and washing, aluminum alodining (a metal coating process), chromate deoxidizing, steel phosphate coating and chromium sealing. The Zero facility was comprised of six buildings and contained paint booths, a water-based paint shop and drying booth, aluminum machining, etching, deoxidizing and cleaning, aluminum vapor degreasing, and grinding. The site also operated five clarifiers, two unleaded gasoline underground storage tanks (USTs), exterior chemical storage areas, paint storage areas, an oil storage area, an acid storage area, an acid/caustic soda storage area, and an exterior hazardous waste staging area. An industrial waste permit was also issued to Zero in 1967. Wastes generated onsite included acetone, ketones, 1,1,1,-

trichloroethane (1,1,1-TCA), waste oil, waste acids and paint sludges. Zero leased a portion of land from the railroad yard west of the site. According to historical maps, Zero's hazardous materials storage area, drum storage and parking occupied this off-site area. From 1964 to 1973, Zero leased a portion of the site to Ocean Technology, Inc., a separate subsidiary of Zero Corp., for the manufacturing and assembly of electronic products; however, few details regarding this operation were included in the available historical resources.

After Zero discontinued operations at the site in 1991, the site was leased for storage and as a filming location for the entertainment industry. The clarifiers were abandoned and removed in 1993. In 1998, FLDC acquired the site with the intention of redeveloping the property with a car dealership; however, that development was tabled. The City of Burbank purchased a portion of the former rail area west of the site in 1998 to develop the new Front Street, which was opened in June 1999. The former Zero facility buildings were demolished to the foundation slabs in 2004 and the site has remained essentially unchanged since that time.

The adjoining properties surrounding the site were dwellings or undeveloped prior to the current developments. The single and multi-tenant retail buildings northeast of the site beyond Interstate 5 and the former Front Street were constructed between 1989 and 2002. The parking lot adjoining the site to the southwest was constructed between 1983 and 1989. The lumber company and a City of Burbank water reclamation plant southwest of the site beyond a railroad and North Front Street were constructed between 1964 and 1972, with the Front Street expansion in 1999. The undeveloped land northwest of the site beyond East Burbank Boulevard has historically been undeveloped.

Blackstone performed a Phase I ESA of the site in conformance with the scope and limitations of ASTM Standard Practice E 1527-13, the regulations at 40 CFR Part 312, and the November 9, 2015, proposal (Agreement) between 4Terra-LA I LLC and Blackstone. Any exceptions to, or deletions from, this practice are described in Sections 1.2 through 1.4 of this report. This assessment has revealed no evidence of *recognized environmental conditions (RECs)* in connection with the site with the exception of the following:

- **Volatile Organic Compounds (VOCs) and Metals Impacts** – In 2009, CalTrans contracted Ninyo & Moore to evaluate the northeastern portion of the site where CalTrans is planning to widen Interstate 5 to accommodate the development of High Occupancy Vehicle (HOV) lanes. Ninyo & Moore retrieved soil and soil vapor samples from the northeast and eastern portion of the site (this was not a site-wide evaluation). Ninyo & Moore concluded that their detected concentrations of VOCs, metals, PCBs, semi-volatile organic compounds (SVOCs), petroleum hydrocarbons, and pH in soil samples retrieved from their investigation area did not exceed the site-specific cleanup goals previously established by the LA-RWQCB during the previous remediation investigation. However, Ninyo & Moore reported chlorinated VOCs, other VOCs and TPHg in their soil vapor samples, including concentrations of tetrachloroethene (PCE) and trichloroethene (TCE) that exceeded the Department of Toxic Substances' (DTSC's) California Human Health Soil Screening Levels (CHHSLs) for industrial sites, which were the risk-based screening

standard in effect at the time of the investigation.¹ Ninyo & Moore reported that the maximum detected concentration of PCE in soil vapor identified from their investigation (52,400 µg/m³) suggested that concentrations of chlorinated VOCs in site soil vapor condition rebounded following the completion of remediation in 2001.

In 2016, Leighton completed a pre-development soil vapor investigation to evaluate the subsurface soil conditions for chemicals of concern that may be encountered during the planned excavation activities associated with the subsurface parking structures of the proposed redevelopment and evaluate whether VOCs present in soil vapor at the site presented a potential vapor intrusion concern for the residential and commercial structures planned at the site. The investigation consisted of the completion of 36 mostly grid-based shallow borings and the retrieval of soil and soil vapor samples from each boring. Laboratory analyses of soil vapor samples revealed elevated concentrations of chlorinated VOCs, namely PCE, TCE and 1,1,1-TCA in the area of the site where SVE remediation had been performed in the late 1990s; the maximum detected concentration of PCE in soil gas identified during Leighton's investigation (10,600,000 µg/m³) suggests that significant rebound has occurred in the subsurface at the site to pre-remediation levels in the decades since the SVE remediation system operated. Leighton's investigation also identified chlorinated VOCs in soil samples at concentrations in excess of residential screening levels. During the 2016 Leighton subsurface investigation, laboratory analyses of retrieved soil samples also revealed elevated concentrations of metals, namely zinc, total lead, and copper, at concentrations that suggest that the soil, once excavated, may require management as California hazardous waste and possibly federal RCRA waste. The interpreted maximum lateral extent of the metal-affected soils that may require management as California hazardous waste include an approximately 3.63-acre area in the central northwestern portion of the site. Geosyntec's subsequent 2017 soil and soil vapor investigation generally confirmed Leighton's findings, and their human health risk screening indicated that concentrations of chlorinated solvents exceed the site's previously established depth-specific soil screening levels for the protection of groundwater, soil risk-based concentrations, and depth-specific soil vapor screening levels.

The elevated concentrations of VOCs and metals on the site are considered a REC. Blackstone understands these impacts will continue to be evaluated prior to and during redevelopment of the site, and mitigation, risk-assessment and/or remediation will be performed at the site concurrent with redevelopment to ensure the proposed future land uses are protective of human health and the environment.

- **Active CrVI Investigation** – As part of ongoing evaluation of the San Fernando groundwater basin Superfund site, groundwater supply wells in the basin were identified to have been contaminated with Chromium VI (CrVI) in 1998. The LA-RWQCB identified 112 initial sites at which further investigation was required to determine whether CrVI concentrations in soil at these locations indicate a significant past release that may have contributed to the regional contamination. Although the Zero operation on the site was

¹ DTSC Note Human and Ecological Risk Office (HERO Note Number 3, DTSC-modified Screening Levels, May 2015

not identified in the initial group of 112, a May 2011 letter from the LA-RWQCB ordered soil investigation at the site based on past use of chromate salts and based on the findings of the 2009 CalTrans investigation that had identified CrVI in site soil. The CalTrans investigation also indicates that the former Zero facility received a notice of violation from the City of Burbank Public Works Department in 1975 for discharging wastewater with elevated chromium concentrations.

According to the 2012 Geosyntec report, to further evaluate CrVI conditions in soil at the site, 5 borings were advanced in the vicinity of former clarifiers, and soil samples were retrieved from each boring at 5-foot intervals from 5 feet bgs to the maximum investigation depth of 20 feet bgs. Geosyntec reports that CrVI was detected in 4 of the 20 retrieved soil samples at concentrations that did not exceed the residential CHSSL, which was the risk-based threshold in place at the time. In their response to the Geosyntec investigation report, a subsequent directive dated June 3, 2015, from the RWQCB indicated that additional investigation is required around former boring SS-4, located near a former 3-stage clarifier based on the findings of Geosyntec's initial investigation. In 2016, Geosyntec performed supplemental evaluation around SS-4 consisting of the installation of a soil boring to 40 feet bgs. Laboratory analyses of soil samples retrieved from discrete intervals in the boring revealed a detectable concentration of CrVI at 35 ft bgs significantly less than the applicable soil screening level; no CrVI was detected in the deeper soil sample retrieved from 40 ft bg. Geosyntec concluded that the comprehensive investigation data for CrVI indicate that the vertical distribution of detections of CrVI are inconsistent with historical releases of CrVI that would have impacted groundwater and are not evidence to suggest that historical site activities contributed to the groundwater basin's regional CrVI contamination. Geosyntec recommended no further investigation with respect to CrVI at the site. Although the LA-RWQCB reportedly committed to extending CrVI to the existing Certificate of Completion for the site, correspondence records on the RWQCB Geotracker database do not include a response from the agency confirming no further action as to CrVI contamination is required; therefore, the open status of the CrVI investigation remains a REC until agency concurrence is received.

- **Regional Superfund Groundwater Plumes** – The site is within the boundaries of the San Fernando Valley Area 2 (Crystal Springs) Superfund Site. Groundwater contamination with VOCs and metals (specifically CrVI) associated with the Superfund site has undergone investigation in the region since 1979. The former site owner, Zero (later known as APW), is an identified potentially responsible party (PRP) in the Superfund Site. The US EPA assigned management of the Superfund PRP investigation to the RWQCB in 1998. Groundwater monitoring data for the site area is sparse given the location of existing groundwater monitoring wells. Blackstone understands that the LA-RWQCB has requested the installation of at least one groundwater monitoring well at the site to evaluate current groundwater conditions in this area of the regional plumes. Additionally, the FYR indicates that potential for vapor intrusion concerns from volatilization from underlying groundwater exist in Area 2; however, field data necessary to determine whether any such pathways exist has not been required as part of the Superfund monitoring. In 2000, the US EPA recorded an agreement and Covenant Not to Sue (Covenant) with FLDC, a potential site developer identified as the Settling Respondent.

In exchange for the issuance of the Covenant, FLDC agreed to pay \$150,000 to the US EPA within a specified time period of taking ownership of the site. Blackstone understands the Covenant established with the US EPA remains applicable, with the LA-RWQCB maintaining independent jurisdiction of certain environmental conditions at the site. Geosyntec's updated 2018 GIA, performed to evaluate whether soil impacts identified at the site pose a threat to groundwater, indicated a potential for VOCs to enter groundwater under current and future site conditions. UP EPA's active regulatory status of the Superfund groundwater plumes in the area of the site and the potential for soil vapor intrusion from the underlying plumes is considered a REC and will continue to be evaluated as part of redevelopment of the site.

The following *Business Environmental Risk Issues* were identified in connection with the site:

- **Asbestos-Containing Materials (ACM):** Based on the construction date of the former site buildings (1960s) and Blackstone's limited visual survey, Blackstone recommends conducting a comprehensive pre-demolition survey to identify and characterize residual potential ACM at the site, including remaining floor tiles observed on the remnant building foundations. All potentially impacted ACM should be removed from the site structures in accordance with applicable regulations prior to demolition.
- **Underground Product Pipelines:** A correspondence from Mobil Oil Company in 1967 objected to construction of a Zero building over a pipeline reportedly located in the southern portion of the site. According to the National Pipeline Mapping System, a crude oil pipeline operated by ExxonMobil Oil Corporation remains active and traverses the southern portion of the site. No pipeline markers were observed at the site during the site inspection. The status of this pipeline should be confirmed and adequately accounted for prior to the proposed redevelopment at the site.

This section is only intended to represent a brief summary of our findings and is not a detailed account of all the information provided in this report. The report should be reviewed in its entirety prior to drawing any final conclusions as to potential environmental conditions associated with the site.

1.0 INTRODUCTION

1.1 PURPOSE

Blackstone Consulting LLC (Blackstone) performed a Phase I Environmental Site Assessment (Phase I ESA) of the parcel located at 777 North Front Street in Burbank, Los Angeles County, California (site).

The purpose of this Phase I ESA is to investigate and identify *recognized environmental conditions* (RECs) associated with the site and/or surrounding properties. ASTM Standard Practice E 1527-13 defines RECs as:

The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property due to any release to the environment, under conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

A *de minimis condition* is a condition that generally does not present a threat to human health or the *environment* and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

Additionally, this Phase I ESA was conducted to identify *controlled recognized environmental conditions* (CRECs) associated with the site and/or surrounding properties. ASTM Standard Practice E 1527-13 defines CRECs as:

A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by a regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

This Phase I ESA also was conducted to identify *historical recognized environmental conditions* (HRECs) associated with the site and/or surrounding properties. ASTM Standard Practice E 1527-13 defines HRECs as:

A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).

This practice is generally intended for the User to satisfy one of the requirements to qualify for the *innocent landowner, contiguous property owner, or bona fide prospective purchaser* limitations on CERCLA liability; that is, this practice constitutes all appropriate inquiries (AAI) into the

previous ownership and uses of the site consistent with good commercial or customary practice as defined at 42 U.S.C. §9601(35)(B) and the regulations at 40 CFR Part 312.

ASTM *Non-Scope Considerations (Business Environmental Risk Issues)* are detailed in Section 1.3 and outlined in the November 9, 2015 proposal (Agreement) between 4Terra-LA I LLC and Blackstone.

1.2 SPECIAL TERMS AND CONDITIONS

This Phase I ESA has been conducted in accordance with ASTM Standard Practice E 1527-13, the regulations at 40 CFR Part 312, and the Agreement between 4Terra-LA I LLC and Blackstone. Qualifications of the professionals conducting this assessment have been provided in Appendix H.

Blackstone performed the professional services, obtained findings, rendered conclusions, and prepared recommendations in accordance with generally accepted practices of other environmental consultants undertaking similar assessments at the same time in the same geographical area.

Historical and environmental information pertaining to the site has been included in this report to the extent that such information is *practically reviewable*, as defined in the above-referenced standard practice.

1.3 SCOPE OF SERVICES

As detailed in the Agreement, this Phase I ESA was conducted in accordance with the industry standard ASTM Standard Practice E 1527-13 and as such in accordance with all appropriate inquiries (AAI) into the previous ownership and uses of the site consistent with good commercial or customary practice as defined at 42 U.S.C. §9601(35)(B) and the regulations at 40 CFR Part 312. This Phase I ESA included the following services:

1. A site inspection to identify and evaluate potential sources of RECs such as underground storage tanks (USTs), aboveground storage tanks (ASTs), equipment containing polychlorinated biphenyls (PCBs), waste and chemical storage areas, and wastewater and stormwater discharges. The inspection included observations for evidence of chemical spills, releases, or on site waste disposal.
2. A review of site records and interviews with site representatives with regard to current and former site operations to identify known or potential environmental concerns.
3. A visual survey of the properties in the vicinity of the site to evaluate the potential for RECs at the site from these properties.
4. A review of historical information to identify RECs at the site from historic on-site and off-site uses. To the extent feasible under the conditions of the assessment, the historical

information obtained included verbal information from site and/or local agency representatives. In addition, some or all of the following records, where *publicly available* and *practically reviewable*, were reviewed: construction plans, zoning maps, building permits, property record cards, topographic maps, fire insurance maps, historical city directories, and aerial photographs.

5. A review of State and Federal environmental database information.

Blackstone also performed the following activities to identify ASTM *Non-Scope Considerations (Business Environmental Risk Issues)* in addition to the ASTM requirements and as required per the Agreement:

Document research, visual and/or sampling surveys, and interviews for the presence of:

- Air Emissions,
- Asbestos-containing materials (ACM),
- Lead-based paint (LBP),
- Radon,
- Wetlands,
- Apparent mold growth (AMG) and water intrusion,
- Lead in Drinking Water,
- Potable/Irrigation Groundwater Well Survey, and
- Oil and Gas Survey.

The scope of this Phase I ESA did not include surface water, soil, soil vapor, or groundwater sampling. Consequently, conclusions provided with regard to surface water, soil, soil vapor, and groundwater impacts are limited to those that can be formed based on a non-intrusive investigation. The absence of environmental hazards in the subsurface cannot be guaranteed based on conditions observed on the surface.

Where performed, the limited ACM, LBP, AMG, and radon surveys are intended to provide an indication of the potential for significant environmental issues associated with these ASTM *Non-Scope Considerations (Business Environmental Risk Issues)*. Hidden materials or locations such as those inside walls, inaccessible attics, crawl spaces, and inside ductwork and piping were not evaluated. As such, these surveys should not be regarded as comprehensive surveys for demolition or renovation purposes or indoor air quality health risk assessments, vapor intrusion into buildings, or explosion hazards.

1.4 SIGNIFICANT ASSUMPTIONS AND DATA GAPS

The site inspection consisted of a walkover of the site perimeter and site areas. Blackstone was not accompanied during the site inspection. During the site inspection, Blackstone did not inspect inaccessible areas of the site including under soil stockpiles or inside clarifiers. The adjoining properties were visually observed from curbside without being entered. There is no reason to

believe the inability to inspect these areas would alter the findings or recommendations set forth in this report or be considered a significant data gap.

The historical information reviewed for the site did not confirm the first developed use of the site. *Data failure*, as defined by ASTM, has occurred in attempting to identify obvious uses of the site back to the first developed use, or back to 1940, whichever is earlier. Information regarding the use of the site prior to 1928 was not available from the *standard historical sources* (including available aerial photographs, fire insurance maps, property tax files, recorded land title records, USGS topographic maps, local street directories, building department records, or zoning/land use records). There were no other reasonably ascertainable historical sources available for review that were considered sufficiently useful. It is the opinion of Blackstone that the data failure does not represent a significant data gap that impacts our ability to identify RECs.

Conclusions stated herein are based upon publicly available information and other documented sources. Blackstone has assumed, where reasonable, that the information reviewed is true and accurate. Blackstone assumes no responsibility for inaccurate information that is not otherwise obvious in light of information of which Blackstone has actual knowledge. Blackstone's site observations are of the conditions observed at the time of the assessment.

Blackstone reviewed an environmental database search report. Blackstone's conclusions based on the search report are limited to the accuracy of that report. To the extent possible, Blackstone's field observations are used to verify the information or identify errors and inconsistencies in the search report regarding the listed facilities in the immediate vicinity of the site.

This report provides an estimation of groundwater flow direction at the site based on visual observations and topographical data. This assessment did not include groundwater sampling and water table elevation measurement. True groundwater flow direction can only be determined through direct measurement of groundwater elevations from properly installed on-site groundwater monitoring wells. The groundwater flow direction estimation should not be considered a true measurement of groundwater flow direction.

2.0 USER PROVIDED INFORMATION

As defined under ASTM Standard Practice E 1527-13, SJ4 Burbank LLC is considered the “User” of this Phase I ESA report. To qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2002 (the “*Brownfields Amendments*”), the User must provide certain information based on their relationship to the purpose of the due diligence and as required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31.

As part of this Phase I ESA, Blackstone requested certain information from the User. A copy of the User Questionnaire is provided in Appendix F. The information requested and associated responses are outlined below in Sections 2.2 through 2.4.

2.1 REASON FOR PERFORMING THE PHASE I ESA

Blackstone understands that this assessment was performed for SJ4 Burbank LLC as the potential purchaser of the site. As such, this Phase I ESA was conducted in an effort to qualify for the *innocent landowner, contiguous property owner, and bona fide prospective purchaser* defense to CERCLA liability and performed as an appropriate risk management and due diligence standard for real estate transactions in accordance with general industry standards which include ASTM Standard E 1527-13 and the regulations at 40 CFR Part 312. Blackstone also understands that this document may be submitted to the Los Angeles Regional Water Quality Control Board (LA-RWQCB), as a Phase I ESA is a requirement for admission to that agency’s California Land Reuse and Revitalization (CLRRRA) program.

2.2 ENVIRONMENTAL LIENS AND ACTIVITY USE AND LIMITATIONS (AULS)

With reference to environmental liens that are filed or recorded against the site (40 CFR 312.25) in recorded land title records or judicial records, the User did not provide this information to Blackstone.

With reference to activity and use limitations (AULs) that are in place on the site or that have been filed or recorded against the site (40 CFR 312.26(a)(1)(v) and (vi)) in recorded land title records or judicial records, the User did not provide this information to Blackstone.

PENDING: The User requested Blackstone to perform an environmental lien and AUL search as part of the scope of work. Refer to Section 6.6 for a discussion of the environmental lien and AUL search. In addition, in accordance with ASTM E 1527-13, Blackstone reviewed an environmental database search report that included a search of institutional control and engineering control databases as further discussed in Section 7.0.

The User indicated that the site is subject to an “Agreement and Covenant Not to Sue” by and between the United Environmental Protection Agency (US EPA) and Ford Leasing Development Company, dated March 16, 2000, which was recorded July 28, 2000, together with a “Notice of Agreement And Covenant Not To Sue, Between The U.S. Environmental Protection Agency And

Ford Leasing Development Company, including access rights to real property,” as document #00 1062454, official records of Los Angeles County, California.

The User provided Blackstone with a preliminary Title Report for the property, dated October 28, 2015. The Title Report identifies Northridge Properties, LLC, a California limited liability company, as the vested interest. Item 17 of Schedule B of the Title Report also notes that Zero Manufacturing Company, a Corporation, applied for a permit to encroach of City of Burbank Property in 1998 to install Soil Vapor Extraction and Monitoring Well. The previous site occupant and related past remediation at the site are discussed in greater detail in Section 6.7.

2.3 SPECIALIZED KNOWLEDGE, COMMONLY KNOWN & DEGREE OF OBVIOUSNESS

With reference to specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28), the User indicated they possessed no specialized knowledge or experience related to the site or nearby properties.

With reference to commonly known or *reasonably ascertainable* information about the site (40 CFR 312.30), the User, to the best of their ability, provided commonly known or *reasonably ascertainable* information about the site that would help the *environmental professional* to identify conditions indicative of releases or threatened releases, such as:

1. Past uses of the site;
2. Specific chemicals that are present or once were present at the site;
3. Spills or other chemical releases that have taken place at the site; and
4. Environmental cleanups that have taken place at the site.

The User provided Blackstone with several prior environmental reports for the site, which are discussed in Section 6.7.

With reference to the degree of obviousness of the presence or likely presence of releases or threatened releases at the site, and the ability to detect releases or threatened releases by appropriate investigation (40 CFR 312.31), the User provided Blackstone with prior environmental reports for the site that are further discussed in Section 6.7. The User also provided the preliminary waste profiling laboratory analysis for drill cuttings from an on-site geotechnical investigation boring, which reportedly did not meet hazardous waste criteria (the lab reports and soil boring diagram are included in Appendix D).

2.4 VALUE REDUCTION FOR ENVIRONMENTAL ISSUES

With reference to the relationship of the purchase price to the fair market value of the site if it were not contaminated (40 CFR 312.29), the User indicated that, to their knowledge, the purchase price of the site reasonably reflects the fair market value of the site *and* has not been reduced due to contamination known or believed to be present at the site.

2.5 OWNER, KEY SITE MANAGER, AND OCCUPANT INFORMATION

An Owner's Representative completed an Owner Questionnaire and provided available environmental reports for the site, which are discussed further in Section 6.7. A copy of the Owner Questionnaire is provided as Appendix G.

2.6 PAST OWNERS, OPERATORS AND OCCUPANT INTERVIEWS

In accordance with ASTM Standard Practice E 1527-13, interviews with past owners, operators, and occupants shall be conducted to the extent that they have been identified and that the information likely to be obtained is not duplicative of information already obtained. There is no reason to believe that such interviews were necessary for this site or would alter the findings or recommendations set forth in this report.

2.7 RELIANCE

This report may be relied upon by SJ4 Burbank LLC, 4-Terra-LA I LLC, 4Terra Investments, and JLB Realty LLC and each of its affiliates, attorneys, lenders, investors and each of their assigns subject to the terms and conditions of the Agreement between 4Terra-LA I LLC and Blackstone. No other person may rely on this report without written authorization from Blackstone and SJ4 Burbank LLC. If any of the above limitations conflict with the Agreement, the Agreement governs.

3.0 SITE DESCRIPTION

The site is located at 777 North Front Street in Burbank, Los Angeles County, California. A Site Location Map, depicted on the U.S. Geological Survey (USGS) *Burbank, California*, topographic quadrangle, is included in Appendix A.

3.1 SITE CHARACTERISTICS AND FEATURES

Street Address:	777 North Front Street
City and State:	Burbank, California
County:	Los Angeles
Legal Description:	Los Angeles County Assessor Parcel Number: 2449-037-013
Owner(s):	Northridge Properties, LLC, A California limited liability company
Site Size:	Approximately 8.0 acres
Zoning:	AD (Auto Dealership)
Site Use:	Vacant
Year(s) Built:	Not applicable; no buildings currently occupy the site. Foundations remain on the site from building constructed in the 1960s.

Structure(s)	<i>Location On Site</i>	<i>Number of Stories</i>	<i>Size (approx. square feet)</i>
Foundations and pads	Throughout	-	-
Construction Materials	Concrete		
Heating/Cooling Systems:	None		

Other Site Features:	Historical site buildings have been demolished, but former building foundations and parking areas remain at the site. The eastern and northern portions of the site are occupied by considerably large soil piles and gravel storage apparently staged by the California Department of Transportation (Cal-Trans) for use at an off-site construction project. Evidence of former manufacturing features, such as former clarifiers, drains, restrooms, trench drains and other past in-ground features were observed throughout the site. Evidence of environmental investigation, including current monitoring borings and former exploration borings, were also observed at the site.
Proposed Site Use:	Blackstone understands that the site is proposed to be redeveloped with mixed residential and commercial uses, specifically multi-family residential apartments, a hotel, limited ground-level commercial uses, underground and aboveground parking levels, and recreational spaces, that will include a park and bicycle hub with amphitheater-style seating. The site's development plans are subject to change, such as during the permitting process with the local building and development agency.

A Site Plan and Site Photographs are provided in Appendix A.

3.2 UTILITIES

Electricity Provider:	Not provided
Natural Gas Provider:	Not provided
Potable Water:	Not provided
Sewer Services:	Not provided

According to the City of Burbank, the most recent former site buildings were once connected to the municipal system for sanitary sewer disposal and potable water supply.

RECs identified at the site are discussed in greater detail in Section 6.7.

4.0 VICINITY RECONNAISSANCE

The site is located in Burbank, Los Angeles County, California, within an area characterized by commercial warehouse/distribution and residential development. Adjoining property use is summarized as follows:

Northeast: A permanent Cal-Trans easement immediately adjoins the northeastern portion of the site; the former Front Street and Interstate 5 followed by a large mixed-used retail and commercial area

Southeast: Vacant lot utilized for parking and light pole storage

Southwest: North Front Street immediately adjoins the site; followed by a railroad easement then a large industrial area farther to the southwest, which includes a lumber company (5 West Magnolia Boulevard) and a City of Burbank water reclamation plant (740 North Lake Street)

Northwest: An embankment that supports East Burbank Boulevard and an Interstate 5 access ramp

Source	Findings
Field observations	Blackstone observed no industrial, manufacturing or military operations such as outdoor chemical or hazardous waste storage or handling activities that may impact the site and no evidence of chemical spills, releases, or waste disposal. Blackstone identified no outdoor chemical or waste storage, wastewater treatment facilities, or other operations that may impact the site and no pits, ponds or lagoons for apparent discharge and/or treatment of process water.
Environmental databases search	Adjoining and/or nearby properties identified on the environmental databases searched are discussed further in Section 7.0.

No RECs were identified as a result of the vicinity reconnaissance.

5.0 PHYSICAL SETTING

	<i>Findings</i>	<i>Sources of Findings</i>
Surficial Soils Beneath Site	Urban land	EDR Report
Bedrock Identification	Stratified sequence of the Mesozoic era	EDR Report
Depth to Bedrock	Greater than 100 feet bgs	California Water Resources Control Board, Geotracker website
Topography	The general site vicinity is moderately sloping with an overall area declination to the southwest.	Site observation and USGS <i>Burbank, California</i> , topographic map
Elevation	Approximately 582 feet NAVD	USGS <i>Burbank, California</i> , topographic map
Depth to Shallow Groundwater	Approximately 83-100 feet bgs	Previous site investigations, California Water Resources Control Board, Geotracker website

bgs: below ground surface

EDR Report: Environmental Data Resources Database Report with GeoCheck®

NAVD: North American Vertical Datum, 1988

USGS: United States Geological Survey

Previous Site Investigations: Section 6.7 Previous Environmental Reports

No RECs were identified as a result of the physical setting records review.

6.0 HISTORICAL INFORMATION REVIEW

As part of this Phase I ESA, Blackstone reviewed historical information to identify RECs associated with the historical use of the site and surrounding properties. Blackstone obtained historical information from interviews with individuals familiar with the site as well as aerial photographs, historical maps, and other *practically reviewable* standard historical sources that are considered *reasonably ascertainable*.

6.1 HISTORICAL FIRE INSURANCE MAPS

Environmental Data Resources, Inc. (EDR) conducted a search of available historical fire insurance maps for the site and site vicinity. Historical fire insurance maps are scaled drawings that indicate the location and use of building structures present in a given area from as early as the late 1800s. The maps provide information regarding the development and historical use of site structures and can indicate the historical presence of tanks at the site and other potential environmental concerns.

Sanborn Fire Insurance Company maps were available for the site from EDR. Select Sanborn maps are reproduced in Appendix B and are summarized as follows:

Year	Sanborn Fire Insurance Maps: Development/Land Uses/Occupants	
	Site	Adjoining Properties
1941	The northwest portion of the site is not depicted. The central portion of the site is depicted with four structures associated with the General Water Heater Corporation. The buildings in the central portion of the site are a boiler shop, a galvanizing and foundry building, an assembly, stockroom and machine shop building with spray-painting and lumber room and a storage building. A rail spur serves an assembly, stockroom and machine shop building. The southeast portion of the site is depicted with two office buildings.	The surrounding properties are not depicted.
1949	The site is depicted similar to the previous map.	The surrounding properties are not depicted.

Year	Sanborn Fire Insurance Maps: Development/Land Uses/Occupants	
	Site	Adjoining Properties
1950	The northwest portion of the site is depicted with a metal working building. An oil tank (un-detailed capacity) is depicted adjacent to the metal working building. The central portion of the site is depicted with six structures associated with the General Water Heater Corporation. The buildings in the central portion of the site are a boiler shop, a galvanizing and foundry building, an assembly, stockroom and machine shop building with spray-painting and plating rooms, two storage buildings and an office. A rail spur serves the boiler shop and the assembly, stockroom and machine shop building. The southeast portion of the site is depicted with two office buildings.	The properties to the northeast beyond State Highway 99 (the current abandoned North Front Street that adjoins the site to the northeast and east) are depicted as dwellings. The property to the southeast is depicted as undeveloped. The properties to the southwest beyond North Flower Street (present-day North Front Street) and a railroad are partially depicted as manufacturing building. The property to the northwest is not depicted.
1957	The northwest portion of the site is depicted with a metal working building. An oil tank (un-detailed capacity) is depicted adjacent to the building. The buildings in the central portion of the site are a boiler shop, a welding building, storage buildings, an assembly, stockroom and machine shop building with spray-painting and plating rooms, two storage buildings and an office. A rail spur serves the boiler shop and the assembly, stockroom and machine shop building. The southeast portion of the site is depicted with two office buildings and parking.	The adjoining properties are depicted similar to the previous map.
1960	The site is depicted similar to the previous map	The properties to the northeast beyond State Highway 99 (abandoned North Front Street, east-adjointing of the site) and Interstate 5 are depicted as dwellings. The property to the southeast is not depicted. The properties to the southwest beyond a railroad and North Flower Street (present-day North Front Street) are partially depicted as manufacturing buildings. The property to the northwest is not depicted.

Year	Sanborn Fire Insurance Maps: Development/Land Uses/Occupants	
	Site	Adjoining Properties
1968	The buildings formerly associated with General and depicted on earlier Sanborn Maps appear to have been demolished. The northwest portion of the site is depicted with a large machine shop with an attached parts warehouse. The central portion of the site is depicted with several structures associated with Zero Manufacturing Corporation (Zero). The buildings in the central portion of the site are several machine shops, offices, warehouses, and storage buildings. All of the buildings are depicted with concrete surfaces. A rail spur serves the machine shops in the central portion of the site. The southeast portion of the site is depicted with a parking lot.	The properties to the northeast beyond State Highway 99 (abandoned North Front Street, east-adjointing of the site) and Interstate 5 are depicted as dwellings. The property to the southeast is not depicted. The properties to the southwest beyond a railroad and North Flower Street (present-day North Front Street) are partially depicted as manufacturing buildings and sediment tanks. The property to the northwest is not depicted.
1970	There are four large warehouses depicted at the site similar to the foundations observed during the site inspection. There are also three smaller structures depicted in the central portion of the site. The site is still depicted as occupied by Zero. The northwest portion of the site is depicted with a large machine shop with an attached foam products manufacturing room. The central portion of the site is depicted with two warehouses and three smaller machine shops and storage buildings. All of the buildings are depicted with concrete surfaces. A rail spur serves the machine shops in the central portion of the site. The southeast portion of the site is depicted with another manufacturing building associated with Zero.	The adjoining properties are depicted similar to the previous map.

Findings: As further discussed in Section 6.7, the presence of environmental impacts associated with historical site uses and the current environmental regulatory status of the site are considered a REC.

6.2 AERIAL PHOTOGRAPHS

Aerial photographs of the site area were obtained from EDR. The aerial photographs are reproduced in Appendix B and are summarized as follows:

Year	Aerial Photographs: Development/Land Uses	
	Site	Adjoining Properties
1928	Dwellings are visible in the eastern portion of the site. The remainder of the site is undeveloped land. A dirt road (Future location of North Front Street) traverses the western portion of the site from the northwest to the southeast.	Dwellings are visible to the northeast. Undeveloped land is visible to the southeast, southwest beyond a railroad and northwest.
1938	The site appears similar to the previous photograph.	The adjoining properties appear similar to the previous aerial photograph.
1940	A large manufacturing building and two smaller associated buildings are visible in the central portion of the site. The dwellings previously in the 1928 and 1938 photographs are still visible. A dirt road (future location of North Front Street) traverses the western portion of the site from the northwest to the southeast. A rail spur is located on the western portion of the site. The northwest and southeast portions of the site are undeveloped.	The adjoining properties appear similar to the previous aerial photograph except a few manufacturing buildings are visible farther southwest.
1952	The site footprint has been significantly enlarged to the northeast as the dwellings formerly visible has been razed and replaced with structures and paved parking areas. Two manufacturing buildings are visible in the northwest and central portions of the site. Several smaller associated manufacturing structures are also visible in the central portion of the site. The southeast portion of the site is depicted with two office type buildings and unpaved parking. A rail spur is located on the western portion of the site.	Dwellings are visible to the northeast beyond the present-day abandoned North Front Street and Interstate 5 (smaller version than present-day). A commercial building is visible to the southeast. Manufacturing buildings are visible to the southwest beyond a railroad. Undeveloped land is visible to the northwest beyond East Burbank Boulevard.

Year	Aerial Photographs: Development/Land Uses	
	Site	Adjoining Properties
1954	Two manufacturing buildings are visible in the northwest and central portions of the site. The building in the northwest portion of the site now includes an additional structure. Several smaller associated manufacturing structures are also visible in the central portion of the site. The southeast portion of the site is depicted with two office type buildings and paved parking. A rail spur is located on the western portion of the site.	The adjoining properties appear similar to the previous aerial photograph.
1964	The northwest portion of the site is vacant. The formerly visible manufacturing building has been razed. Excavation for a present-day stormwater channel is visible in the northwest portion of the site. The central and southeast portions of the site are relatively unchanged since 1954. A rail spur is located on the western portion of the site.	Dwellings are visible to the northeast beyond the present-day abandoned North Front Street and Interstate 5. Interstate 5 has been significantly widened. A commercial building is visible to the southeast. Manufacturing buildings are visible to the southwest beyond a railroad. Undeveloped land is visible to the northwest beyond East Burbank Boulevard.
1972	Four connected manufacturing buildings are visible from the northwest to the southeast. There are also two associated structures located in the central portion of the site. Parking for the site is located west of the four manufacturing buildings in the present-day location of North Front Street.	Commercial buildings and dwellings are visible to the northeast beyond the abandoned North Front Street and Interstate 5. A commercial building is visible to the southeast. Manufacturing buildings, an equipment yard and the present-day wastewater treatment plant are visible to the southwest beyond the site parking lot, and a railroad. Undeveloped land is visible to the northwest beyond East Burbank Boulevard.
1979	The site appears similar to the previous photograph.	The adjoining properties appear similar to the previous aerial photograph.
1983	The site appears similar to the previous photograph.	The adjoining properties appear similar to the previous aerial photograph.
1989	The site appears similar to the previous photograph.	Vacant land is visible to the northeast beyond the present-day abandoned North Front Street and Interstate 5. A commercial building is visible to the southeast. Present-day buildings are visible to the southwest beyond the site parking lot, and railroad. Undeveloped land is visible to the northwest beyond East Burbank Boulevard.

Year	Aerial Photographs: Development/Land Uses	
	<i>Site</i>	<i>Adjoining Properties</i>
1994	The site appears similar to the previous photograph.	Present-day commercial buildings and vacant land is visible adjoining to the northeast beyond the present-day abandoned North Front Street and Interstate 5. A parking lot is visible adjoining to the southeast. Present-day buildings are visible adjoining to the southwest beyond a railroad. Undeveloped land is visible to the northwest beyond East Burbank Boulevard.
2002	The site appears similar to the previous photograph except parking on the western portion of the site is now the present-day location of North Front Street.	Present-day commercial buildings are visible to the northeast beyond the present-day abandoned North Front Street and Interstate 5. A parking lot is visible to the southeast. Present-day buildings are visible to the southwest beyond a railroad and present-day location of North Front Street. Undeveloped land is visible to the northwest beyond East Burbank Boulevard.
2005	The former buildings have been razed and the site is vacant except for the concrete foundations.	The adjoining properties appear similar to the previous aerial photograph.
2009	The site appears similar to the previous photograph.	The adjoining properties appear similar to the previous aerial photograph.
2010	The site appears similar to the previous photograph.	The adjoining properties appear similar to the previous aerial photograph.
2012	The site appears similar to the previous photograph.	The adjoining properties appear similar to the previous aerial photograph.

Findings: As further discussed in Section 6.7, the presence of environmental impacts associated with historical site uses and the current environmental regulatory status of the site are considered a REC.

6.3 HISTORICAL TOPOGRAPHIC MAPS

Historical topographic maps of the site area were obtained from EDR. The historical topographic maps are included in Appendix B and are summarized as follows:

Year	Historical Topographic Maps: Development/Land Uses	
	<i>Site</i>	<i>Adjoining Properties</i>
1894	The entire area is depicted with no shading (indicative of undeveloped and/or agricultural land)	The entire area is depicted with no shading. The present-day railroad is depicted adjoining to the southwest of the site.
1896	Similar to previous topographic map	Similar to previous topographic map
1898	Similar to previous topographic map	Similar to previous topographic map
1900	Similar to previous topographic map	Similar to previous topographic map
1900		
1902		
1921		
1926		

Year	Historical Topographic Maps: Development/Land Uses	
	Site	Adjoining Properties
1948	The entire area is depicted with a manufacturing building	The property adjoining to the northeast is depicted with pink shading. The property adjoining to the southeast is depicted with no shading. The property adjoining to the southwest beyond the railroad is depicted with manufacturing buildings. The property adjoining to the northwest is depicted with no shading.
1953	The site is depicted with pink shading. No structure is depicted.	The entire area is depicted with pink shading. The present-day railroad is depicted adjoining to the southwest of the site.
1966	The entire area is depicted with several manufacturing buildings	The property adjoining to the northeast is depicted with pink shading. The property adjoining to the southeast is depicted with no shading. The property adjoining to the southwest beyond the railroad is depicted with pink shading. The property adjoining to the northwest is depicted with no shading.
1972	Similar to previous topographic map	Similar to previous topographic map
1994	Similar to previous topographic map	Similar to previous topographic map
2012	The entire area is depicted with no shading (indicative of developed and/or urban land)	The entire area is depicted with no shading. The present-day railroad is depicted adjoining to the southwest of the site.

Findings: As further discussed in Section 6.7, the presence of environmental impacts associated with historical site uses and the current environmental regulatory status of the site are considered a REC. No other RECs were identified as a result of the review of historical topographic maps.

6.4 AGENCY RECORDS, INTERVIEWS AND OTHER HISTORICAL SOURCES

In accordance with ASTM E1527-13, Blackstone requested site history and/or regulatory information regarding the site from federal, state and/or local government officials. Information regarding the site is obtained from regulatory agency officials either by:

- 1) Conducting interviews by telephone or in-person at various federal, state and/or local agencies; or
- 2) Requesting file information via submission of an open records request to the appropriate agency contact based upon applicable agency requirements, and in accordance with the Freedom of Information Act (FOIA).

Findings from the interviews/records review are summarized below:

<i>Source</i>	<i>Information Requested</i>	<i>Findings</i>
United States Environmental Protection Agency (USEPA)	NPL and archived NPL sites	Information provided on the US EPA website for the on-going monitoring of the regional Superfund groundwater site is discussed in greater detail in Section 6.7. Blackstone participated in an introductory phone conference between the EPA case manager, User, Owner and counsel January 7, 2016.
United States Geological Survey	Active well information	No records were identified for the site.
CWRCB via online GEOTRACKER database	Underground storage tanks (USTs)/depth to groundwater/spills, leaks and clean-up sites	The site is listed as Ford Leasing Development Company (Former Zero Corp) in the Geotracker website. The nature of the listing appears consistent with the recent RWQCB orders to investigate the site. These orders, related reports and the on-going investigation are discussed further in Section 6.7.
Los Angeles Regional Water Quality Control Board	Underground storage tanks (USTs)/depth to groundwater/spills, leaks and clean-up sites	Information related to the RWQCB on-going management of the regional Superfund groundwater site is discussed in greater detail in Section 6.7.
California Department of Toxic Substances Control via on-line ENVIROSTOR database	Underground storage tanks, spills, leaks and clean-up sites	No listings for the site.
CA Department of Conservation, Division of Oil, Gas and Geothermal on-line database and Munger Map Book, 2001	Oil, gas, or geothermal wells	No active, dry, or plugged wells were identified the on-site or in the surrounding area.
National Pipeline Mapping System online database	Pipeline locations	An active crude oil transmission pipeline operated by ExxonMobil Oil Corporation is mapped traversing the southern portion of the site. No pipeline makers were observed at the site during the site inspection. The presence of this pipeline is considered a Business Environmental Risk Issue for the proposed redevelopment.

South Coast Air Quality Management District (AQMD) Facility Information Detail (FIND) online database	AQMD permits/violations	The AQMD FIND website details 30 inactive permits issued to Zero Corporation and dated between 1969 and 1990 for operation of various systems including degreasers, a chlorinated storage tank, spray booths with solvents and ovens. Two permits from 1996 detail operation of a vapor extraction system to treat volatile organic compounds in soil. Historical site uses and the past remediation at the site are discussed in greater detail in Section 6.7.
Los Angeles County Assessor	Property construction dates/land size	Incorporated into the appropriate report sections. Adjoining property information was also obtained. No environmental conditions noted.
Los Angeles County Department of Public Works (LACoDPW)	Methane Zone Information	The site is not located within a Methane Zone.
Los Angeles County Department of Public Health	Records of water wells and septic systems	No current listings for the site.
Burbank Fire Department	Aboveground and/or underground storage tanks (ASTs/USTs), past hazardous materials spills, and/or any emergency environmental responses or incidents	Blackstone submitted a FOIA request to this agency, but a response has not been received and these records are not considered reasonably ascertainable for inclusion in this report.
Burbank Department of Building and Safety	Building records	Numerous general building, plumbing and electrical permits were on file. No records of environmental concern were identified.
Burbank Planning Department	Zoning information	C2-1VL (General Commercial)

Findings: As further discussed in Section 6.7, the presence of environmental impacts associated with historical site uses and the current environmental regulatory status of the site are considered a REC.

6.5 CITY DIRECTORIES

Blackstone requested a city directory review for the site address from EDR. City directories were reviewed at approximately five-year intervals for the years spanning 1911 through 2013.

City Directory Review		
<i>Site Listings</i>		
<i>Address</i>	<i>Occupant</i>	<i>Years</i>
777 North Front Street	Western Moving and Storage	1995

City Directory Review			
Site Listings			
	Ocean Technology/Zero Manufacturing	1967-1991	
City Directory Review			
Adjoining Property Listings*			
Address	Occupant	Years	Direction
5 West Magnolia Boulevard	Protection Products/Swanner Hardwood	1950-2006	Southwest
	B A Master Gasoline Station	1937-1942	
740 North Lake Street	Not listed	1920-2013	Southwest
*not all adjoining property addresses included in city directory abstract			

Findings: As further discussed in Section 6.7, the presence of environmental impacts associated with historical site uses and the current environmental regulatory status of the site are considered a REC.

6.6 ENVIRONMENTAL LIEN/AUL SEARCH

Blackstone independently obtained an environmental lien and activity & use limitation (AUL) search report from EDR. The lien and AUL report includes results from a search of available current land title records for environmental cleanup liens and other AULs, such as engineering controls and institutional controls. Review of the lien and AUL search report did not indicate evidence of environmental cleanup liens against the site or AULs having been filed or recorded under federal, tribal, state or local law. The lien and AUL search report is included in Appendix C.

6.7 PREVIOUS ENVIRONMENTAL REPORTS

To generate this summary, Blackstone reviewed numerous technical reports, agency correspondence, permits, work plans and other documents related to the environmental status of the site that were provided by the current site owner, Northridge Properties LLC (Northridge), to support due diligence review. Of the voluminous materials provided, Blackstone identified the following salient documents primarily used to support this summary, listed in date order:

- *Health Risk Assessment and Environmental Fate Analysis of Volatile Organic Contamination in Soil, Soil Vapor and Groundwater at the Hyrail Site, located at 415 North Front Street, Burbank, California*, prepared by Leighton and Associates, Inc. (Leighton) for the City of Burbank, dated May 3, 1993
- *Proposed Phase I Shallow Soils Remediation System, Zero Facility, 777 Front Street, Burbank, California*, prepared by Hydro Geo Chem, Inc. (HGC), on behalf of Zero Corporation (Zero) and submitted to the Los Angeles Regional Water Quality Control Board (RWQCB), dated December 18, 1997

- *Agreement and Covenant Not to Sue*, recorded between the United States Environmental Protection Agency (US-EPA) and the Ford Leasing Development Company (FLDC) 2000
- *Results of Site Remediation and Request for No Further Action*, Former APW facility, 777 Front Street, Burbank, California, prepared by HGC on behalf of APW North America, Inc. (APW) and submitted to the RWQCB, dated April 5, 2001
- *Supplemental Site Closure Information*, Former APW Facility, 777 Front Street, Burbank, California, prepared by HGC on behalf of APW and submitted to the RWQCB, dated August 23, 2001
- *No Further Requirements – Former Zero Corporation Facility*, 777 Front Street, Burbank, California, letter prepared by the RWQCB and addressed to APW, dated November 28, 2001 (a Certificate of Completion for the site is enclosed with this letter)
- *Report of Phase I Environmental Site Assessment (Phase I ESA)*, Former Zero Corporation Facility, 777 North Front Street, Burbank, California, prepared by Mactec Engineering and Consulting, Inc. (Mactec), on behalf of Northridge, dated April 5, 2005
- *Environmental Sampling and Analysis Report*, Front Street Property, Burbank, California, prepared by Golder Associated, for FLDC, dated May 2, 2005
- *Parcel Acquisition Site Investigation*, 777 North Front Street, I-5 Southbound, Between Magnolia and Burbank Avenues, Burbank, California, prepared by Ninyo & Moore on behalf of the California Department of Transportation (CalTrans), dated June 30, 2009
- *Requirement for Technical Report*, Pursuant to California Water Code Section 16267, 777 North Front Street, Burbank, California, Former Zero Corporation, by the RWQCB and addressed to Northridge Properties, LLC (Northridge), dated May 10, 2011
- *Approval of Soil Assessment Workplan*, Former Zero Corporation at 777 North Front Street, Burbank, California, by the RWQCB and addressed to Northridge, dated December 20, 2011
- *Soil Assessment Report*, 777 North Front Street, Burbank, California, prepared by Geosyntec Consultants (Geosyntec), on behalf of Northridge for submission to RWQCB, dated September 10, 2012
- *Second Five-Year Review (FYR) Report for San Fernando Valley – Area 2 Superfund Site*, Glendale, Los Angeles County, California, prepared by the United States Army Corps of Engineers for the US-EPA, dated September 30, 2013.
- *Order Requiring a Technical Report Pursuant to California Water Code Section 13267*, Former Zero Corporation Facility, 777 North Front Street, Burbank, California, by the RWQCB and addressed to Northridge, dated June 3, 2015

- *Report Soil Gas Survey and Soil Investigation Eight-Acre Proposed Mixed Use Development, 777 North Front Street, City of Burbank, California*, prepared by Leighton Consulting, Inc., on behalf of SJ4 Burbank, LLC, dated July 12, 2016
- *Human Health Risk Assessment (HHRA), 777 North Front Street, Burbank, California*, prepared by Geosyntec on behalf of Northridge, dated May 2017
- *Technical Memorandum, Addendum to HHRA dated May 2017, 777 North Front Street, Burbank, California*, prepared by Geosyntec on behalf of Northridge, dated January 2018
- *Updated Groundwater Impacts Assessment (GIA), 777 North Front Street, Burbank, California*, prepared by Geosyntec on behalf of Northridge, dated January 2018
- *Supplemental Site Investigation Report, 777 North Front Street, Burbank, California*, prepared by Geosyntec on behalf of Northridge, dated April 2018 (this document reports the findings of Geosyntec's 2017 supplemental investigation of soil vapor and soil at the site)

Based on information provided in previous reports, the site was primarily undeveloped prior to the 1920s. From the 1930s to the mid-1960s, General Water Heater operated a water heater manufacturing facility at the site. Limited information regarding General's operations are available; however, historical resources indicate that structures and site uses during General's site operation included a metal working building with an oil tank, a boiler shop, a galvanizing and foundry building, an assembly, stockroom and machine shop building with spray-painting and plating rooms, storage buildings and offices. General also utilized a rail spur located on the western portion of the site.

In approximately 1961, Zero Manufacturing Corporation (Zero) purchased the facility and operated a manufacturing plant that fabricated metal enclosures and containers from the mid-1960s until approximately 1991. According to the RWQCB, Zero's manufacturing operations included aluminum case drawing and washing, aluminum alodining (a metal coating process), chromate deoxidizing, steel phosphate coating and chromium sealing. The Zero facility was comprised of six buildings and contained paint booths, a water-based paint shop and drying booth, aluminum machining, etching, deoxidizing and cleaning, aluminum vapor degreasing, and grinding. The site also operated 5 clarifiers, two unleaded gasoline underground storage tanks (USTs), exterior chemical storage areas, paint storage areas, an oil storage area, an acid storage area, an acid/caustic soda storage area, and an exterior hazardous waste staging area. An industrial waste permit was also issued to Zero in 1967. Wastes generated onsite included acetone, ketones, 1,1,1-trichloroethane (1,1,1-TCA), waste oil, waste acids and paint sludges. Zero leased a portion of land from the railroad yard west of the site. According to historical maps, Zero's hazardous materials storage area, drum storage and parking occupied this off-site land area. From 1964 to 1973, Zero leased a portion of the site to Ocean Technology, Inc., a separate subsidiary of Zero Corp., for the manufacturing and assembly of electronic products; however, few details regarding this operation were included in the available historical resources.

After Zero discontinued operations at the site in 1991, the site was leased for storage and as a filming location for the entertainment industry. The clarifiers were abandoned and removed in 1993. In 1998, FLDC acquired the site with the intention of redeveloping the property with a car

dealership; however, that development was never initiated. The City of Burbank purchased a portion of the former rail area west of the site in 1998 to develop the new Front Street, which was opened in June 1999. The former Zero buildings were demolished to their foundations in 2004.

From the available reports, the following summarizes the site investigation and remediation history:

- **1990s site characterization** – Following a preliminary evaluation by Targhee, Inc., and an order from the LA-RWQCB to evaluate the site, in January 1992, HGC conducted a soil vapor survey at the site to depths of 5 to 28.5 feet below ground surface (bgs). This investigation delineated areas of tetrachloroethene (PCE), 1,1-dichloroethene (1,1-DCE), trichloroethene (TCE), and 1,1,1-trichloroethane (1,1,1-TCA) in soil vapor. Supplemental investigation included the installation of groundwater monitoring wells, which were sampled and analyzed as part of site monitoring that continued through the end of the 1990s. Exhibit 2 includes excerpts of the site characterization maps provided in HGC's remediation work plan. These maps identify a PCE plume with concentrations in excess of 1,000 micrograms per liter ($\mu\text{g/L}$)² in soil vapor in the center of the site near the connection between former Buildings 11 and 12. HGC also identified TCA plumes in soil vapor near the northern extent of Building 11, at the connection between Buildings 11 and 12, and beneath Building 14 in the southern portion of the site.

In the 1990s, the characterization investigations also included areas outside of the current site boundary where the City of Burbank proposed to develop the current Front Street. Zero reportedly leased this area from the railroad for parking and for their exterior hazardous waste and chemical storage area. According to Leighton's Risk Assessment performed to support the City of Burbank's road development, soil and soil vapor contamination were identified where the road was proposed: in the region of the former abandoned drum storage area and near the location of the former chemical storage area. According to the figures provided in HGC's 2001 closure request report, SVE wells, injection wells and multi-level soil vapor monitoring probes were limited to the area defined by the current site boundary. Blackstone understands that the City of Burbank and their consultant, Leighton, initially objected to the soil vapor remediation workplan planned for the Zero property, citing that it did not adequately include remediation of this proposed road area west of the Zero property boundary. However, this dispute was apparently resolved by the placement of soil vapor extraction wells closer to the road, the radius of influence of which would better address this off-site area.

- **HGC Soil Vapor Remediation** – HGC's remediation workplan indicates that a potential site buyer (no longer involved with the project) desired to avoid expensive soils re-handling and testing during construction and remediating excavated soils after construction; therefore, a remediation program was proposed to remove VOCs from site soil in-situ. According to HGC, remediation was performed at the facility between May 1998 and October 2000 and consisted of two phases of soil vapor extraction (SVE) to remove volatile organic compounds (VOCs) in site soil. There is no indication in the

² Modern soil vapor investigations typically use the unit micrograms per cubic meter ($\mu\text{g}/\text{m}^3$); a concentration of 1,000 $\mu\text{g/L}$ of PCE in soil vapor is approximately equivalent to 10⁶ $\mu\text{g}/\text{m}^3$

workplan and subsequent remediation completion reports that soil excavation was performed to remove hotspots of VOCs and no direct groundwater remediation was performed at the site.

Phase I of the soil vapor remediation was designed to treat shallow soil vapor in specific areas to accommodate anticipated development of a car dealership on the site by the new site owner at the time, FLDC, who acquired the site in 1998. The Phase I remediation system consisted of 59 shallow SVE wells and 25 shallow air injections wells, and a remediation unit consisting of a blower, injector and off-gas treatment. Treatment was performed from May 1998 to early 1999.

Phase II of HGC's remediation system was designed to treat deeper soil (to approximately 90 feet bgs). The system consisted of 19 deep SVE wells, 13 of which were combination SVE/air sparging wells. Treatment commenced early 1999, and February 2000 monitoring data reportedly identified Phase II cleanup levels had been attained.

HGC performed closure and rebound monitoring between October 2000 and January 2001 and submitted a request for no further action (NFA) to the LA-RWQCB in April 2001. In their closure request documentation, HGC reported maximum concentrations of PCE and TCE in groundwater of 11.0 and 1,800 µg/L, respectively, for the final 2000 groundwater monitoring event performed for the remediation effort. HGC stated that, because no source of TCE has been detected in shallow soil beneath the facility, either from subsurface exploration, soil gas monitoring, or the extensive SVE activities; no on-site source of TCE in groundwater is evident and suggested that the source of TCE in soil gas samples closest to the water table is volatilization of TCE from the underlying regional groundwater plume. HGC requested an NFA determination for the site based on the achievement of the cleanup standard for soil at the site via the performance of soil vapor remediation.

According to HCG's summary letter report, supplemental remediation targeted residual VOC concentrations in soil gas in response to objections the RWQCB raised during a May 2001 NFA discussion meeting. The supplemental soil remediation was completed via SVE and air injection wells screened at depths of 5 and 20 feet in the vicinity of B-02. The supplemental remediation operated between June 18 and July 18, 2001, and HGC performed verification sampling in August 2001 to evaluate potential rebound of soil vapor concentrations. According the supplemental HCG report, the additional shallow remedial activities diminished the soil vapor concentrations in the shallow soils in the vicinity of B-02 to achieve the cleanup goals for Phase II of the remediation program. On November 28, 2001, the RWQCB published its Certificate of Completion determination that "no further requirements" were necessary for the site. In 2002, HGC subsequently decommissioned the site's SVE remediation system and abandoned the 9 remaining groundwater monitoring and SVE/sparge wells. The limitations of the NFA are discussed further in the data gaps section presented below.

- **2005-2006 Golder PCB Investigation and Remediation** – According to the 2005 Golder report, the former facility buildings were demolished to foundation slabs in 2004, with four electric substations remaining in place containing 12 total transformers. Oil sampling indicated that positive detections of polychlorinated biphenyls (PCBs) did not exceed 12

parts per million (ppm) and were not considered regulated under the Toxic Substance Control Act (TSCA). Golder also represented the results of an earlier Law/Crandall 1997 soil sampling effort performed proximal to the substations, which indicated no concentrations of PCBs in excess of method detection limits (MDLs) of 0.033 milligrams per kilogram (mg/kg). To supplement the dataset, Golder placed one soil boring adjacent to a former in-ground hydraulic elevator pit and retrieved 14 surface concrete or gravel samples adjacent to electrical units. Bulk surficial (concrete and gravel) samples yielded positive detections of PCBs; however, the soil samples did not contain positive detections of petroleum hydrocarbons or PCBs. Golder's subsequent 2006 report documents the removal and excavation of oil-stained concrete transformer pads, the removal of former electrical equipment from the site, and the removal of stained soil from the 4 former substation locations. Golder's post-excavation sampling revealed no detectable PCB concentrations in confirmation soil samples retrieved from the excavation areas.

- **Post-Remediation Investigations** - In 2009, CalTrans contracted Ninyo & Moore to evaluate the northeastern portion of the site where CalTrans is planning to widen Interstate 5 to accommodate the development of High Occupancy Vehicle (HOV) lanes. Ninyo & Moore retrieved soil and soil vapor samples from the northeast and eastern portion of the site (this was not a site-wide evaluation). Ninyo & Moore concluded that their detected concentrations of VOCs, metals, PCBs, semi-volatile organic compounds (SVOCs), petroleum hydrocarbons, and pH in soil samples retrieved from their investigation area did not exceed the site-specific cleanup goals previously established by the LA-RWQCB during the previous remediation investigation. However, Ninyo & Moore reported chlorinated VOCs, other VOCs and TPHg in their soil vapor samples, including concentrations of PCE and TCE that exceeded the Department of Toxic Substances' (DTSC's) California Human Health Soil Screening Levels (CHHSLs) for industrial sites, which were the risk-based screening standard in effect at the time of the investigation.³ Ninyo & Moore reported that the maximum detected concentration of PCE in soil vapor identified from their investigation (52,400 µg/m³) suggested that concentrations of chlorinated VOCs in site soil vapor condition rebounded following the completion of remediation in 2001.

In 2016, Leighton completed a pre-development soil vapor investigation to evaluate the subsurface soil conditions for chemicals of concern that may be encountered during the planned excavation activities associated with the subsurface parking structures of the proposed redevelopment and evaluate whether VOCs present in soil vapor at the site presented a potential vapor intrusion concern for the residential and commercial structures planned at the site. The investigation consisted of the completion of 36 mostly grid-based shallow borings and the retrieval of soil and soil vapor samples from each boring. Laboratory analyses of soil vapor samples revealed elevated concentrations of chlorinated VOCs, namely PCE, TCE and 1,1,1-TCA, in the area of the site where SVE remediation had been performed in the late 1990s; the maximum detected concentration of PCE in soil gas identified during Leighton's investigation (10,600,000 µg/m³) suggests that significant rebound has occurred in the subsurface at the site to pre-remediation levels in the decades since the SVE remediation system operated. Leighton's investigation

³ DTSC Note Human and Ecological Risk Office (HERO Note Number 3, DTSC-modified Screening Levels, May 2015
Project No. TERRCA003.03

also identified chlorinated VOCs in soil samples at concentrations in excess of residential screening levels. During the 2016 Leighton subsurface investigation, laboratory analyses of retrieved soil samples also revealed elevated concentrations of metals, namely zinc, total lead, and copper, at concentrations that suggest that the soil, once excavated, may require management as California hazardous waste and possibly federal RCRA waste. The interpreted maximum lateral extent of the metal-affected soils that may require management as California hazardous waste include an approximately 3.63-acre area in the central northwestern portion of the site. Geosyntec's subsequent 2017 soil and soil vapor investigation generally confirmed Leighton's findings, and their human health risk screening indicated that concentrations of chlorinated solvents exceed the site's previously established depth-specific soil screening levels for the protection of groundwater, soil risk-based concentrations, and depth-specific soil vapor screening levels.

Blackstone understands that VOC and metals impacts at the site are considered a REC and will continue to be evaluated prior to and during redevelopment of the site, and mitigation, risk-assessment and/or remediation will be performed at the site concurrent with redevelopment to ensure the proposed future land uses are protective of human health and the environment.

- **CrVI Investigation** – As part of ongoing evaluation of the San Fernando groundwater basin Superfund site, groundwater supply wells in the basin were identified to have been contaminated with CrVI in 1998. The LA-RWQCB identified 112 initial sites at which further investigation was required to determine whether CrVI concentrations in soil at these locations indicate a significant past release that may have contributed to the regional contamination. Although the Zero site was not identified in the initial group of 112, a May 2011 letter from the LA-RWQCB ordered soil investigation at the site based on past use of chromate salts and based on the findings of the 2009 CalTrans investigation that had identified CrVI in site soil. The CalTrans investigation also indicates that the former Zero facility received a notice of violation from the City of Burbank Public Works Department in 1975 for discharging wastewater with elevated chromium concentrations.

According to the 2012 Geosyntec report, to further evaluate CrVI conditions in soil at the site, 5 borings were advanced in the vicinity of former clarifiers, and soil samples were retrieved from each boring at 5-foot intervals from 5 feet bgs to the maximum investigation depth of 20 feet bgs. Geosyntec reports that CrVI was detected in 4 of the 20 retrieved soil samples at concentrations that did not exceed the residential CHSSL, which was the risk-based threshold in place at the time. In their response to the Geosyntec investigation report, a subsequent directive dated June 3, 2015, from the RWQCB indicated that additional investigation is required around former boring SS-4, located near a former 3-stage clarifier based on the findings of Geosyntec's initial investigation. In 2016, Geosyntec performed supplemental evaluation around SS-4 consisting of the installation of a soil boring to 40 feet bgs. Laboratory analyses of soil samples retrieved from discrete intervals in the boring revealed a detectable concentration of CrVI at 35 ft bgs significantly less than the applicable soil screening level; no CrVI was detected in the deeper soil sample retrieved from 40 ft bg. Geosyntec concluded that the comprehensive investigation data for CrVI indicate that the vertical distribution of detections of CrVI are

inconsistent with historical releases of CrVI that would have impacted groundwater and are not evidence to suggest that historical site activities contributed to the groundwater basin's regional CrVI contamination. Geosyntec recommended no further investigation with respect to CrVI at the site. Although the LA-RWQCB reportedly committed to extending CrVI to the existing Certificate of Completion for the site, correspondence records on the RWQCB Geotracker database do not include a response from the agency confirming no further action as to CrVI contamination is required; therefore, the open status of the CrVI investigation remains a REC until agency concurrence is received.

- **Regional Superfund Groundwater Plumes** – The site is within the boundaries of the San Fernando Valley Area 2 (Crystal Springs) Superfund Site. Groundwater contamination with VOCs and metals (specifically CrVI) associated with the Superfund site has undergone investigation in the region since 1979. The former site owner, Zero (later known as APW), is an identified potentially responsible party (PRP) in the Superfund Site. The US EPA assigned management of the Superfund PRP investigation to the RWQCB in 1998. Groundwater monitoring data for the site area is sparse given the location of existing groundwater monitoring wells. Blackstone understands that the LA-RWQCB has requested the installation of at least one groundwater monitoring well at the site to evaluate current groundwater conditions in this area of the regional plumes. Additionally, the FYR indicates that potential for vapor intrusion concerns from volatilization from underlying groundwater exist in Area 2; however, field data necessary to determine whether any such pathways exist has not been required as part of the Superfund monitoring. In 2000, the US EPA recorded an agreement and Covenant Not to Sue (Covenant) with FLDC, a potential site developer identified as the Settling Respondent. In exchange for the issuance of the Covenant, FLDC agreed to pay \$150,000 to the US EPA within a specified time period of taking ownership of the site. Blackstone understands the Covenant established with the US EPA remains applicable, with the LA-RWQCB maintaining independent jurisdiction of certain environmental conditions at the site. Geosyntec's updated 2018 GIA, performed to evaluate whether soil impacts identified at the site pose a threat to groundwater, indicated a potential for VOCs to enter groundwater under current and future site conditions. UP EPA's active regulatory status of the Superfund groundwater plumes in the area of the site and the potential for soil vapor intrusion from the underlying plumes is considered a REC and will continue to be evaluated as part of redevelopment of the site.

The RECs and Business Environmental Risk Issues identified from a review of historical records and reports for the site are summarized in Section 10.0. Select previous environmental reports are provided in Appendix D.

6.8 HISTORICAL INFORMATION CONCLUSIONS

Reasonably ascertainable historical information indicates the eastern portion of the site consisted of dwellings constructed prior to 1928 while the remainder of the site was undeveloped. From the 1930s until 1961, General Water Heater Company (General) operated a water heater manufacturing facility at the site. Limited information regarding General's operations are available; however, historical resources indicate that structures and site uses during General's

site operation included a metal working building with an oil tank, a boiler shop, a galvanizing and foundry building, an assembly, stockroom and machine shop building with spray-painting and plating rooms, storage buildings and offices. General also utilized a rail spur located on the western portion of the site.

In approximately 1961, Zero Manufacturing Corporation (Zero) purchased the site and reportedly demolished the former General structures. Zero redeveloped the site with a manufacturing facility to fabricate metal enclosures. By 1968, four large manufacturing buildings and three smaller structures, including a machine shop and offices, occupied the majority of the site. Zero operated a manufacturing plant at the site that fabricated metal enclosures and containers from the mid-1960s until approximately 1991. According to the California Regional Water Quality Control Board (RWQCB), Zero's manufacturing operations included aluminum case drawing and washing, aluminum alodining (a metal coating process), chromate deoxidizing, steel phosphate coating and chromium sealing. The Zero facility was comprised of six buildings and contained paint booths, a water-based paint shop and drying booth, aluminum machining, etching, deoxidizing and cleaning, aluminum vapor degreasing, and grinding. The site also operated five clarifiers, two unleaded gasoline underground storage tanks (USTs), exterior chemical storage areas, paint storage areas, an oil storage area, an acid storage area, an acid/caustic soda storage area, and an exterior hazardous waste staging area. An industrial waste permit was also issued to Zero in 1967. Wastes generated onsite included acetone, ketones, 1,1,1-trichloroethane (1,1,1-TCA), waste oil, waste acids and paint sludges. Zero leased a portion of land from the railroad yard west of the site. According to historical maps, Zero's hazardous materials storage area, drum storage and parking occupied this off-site area. From 1964 to 1973, Zero leased a portion of the site to Ocean Technology, Inc., a separate subsidiary of Zero Corp., for the manufacturing and assembly of electronic products; however, few details regarding this operation were included in the available historical resources.

After Zero discontinued operations at the site in 1991, the site was leased for storage and as a filming location for the entertainment industry. The clarifiers were abandoned and removed in 1993. In 1998, FLDC acquired the site with the intention of redeveloping the property with a car dealership; however, that development was tabled. The City of Burbank purchased a portion of the former rail area west of the site in 1998 to develop the new Front Street, which was opened in June 1999. The former Zero facility buildings were demolished to the foundation slabs in 2004 and the site has remained essentially unchanged since that time.

The adjoining properties surrounding the site were dwellings or undeveloped prior to the current developments. The single and multi-tenant retail buildings northeast of the site beyond Interstate 5 and the former Front Street were constructed between 1989 and 2002. The parking lot located adjoining the site to the southwest was constructed between 1983 and 1989. The lumber company and a City of Burbank water reclamation plant southwest of the site beyond a railroad and North Front Street were constructed between 1964 and 1972. The undeveloped land located adjoining to the northwest beyond East Burbank Boulevard has historically been undeveloped.

The RECs and Business Environmental Risk Issues identified from a review of historical records and reports for the site are summarized in Section 10.0.

7.0 ENVIRONMENTAL DATABASE SEARCH AND REVIEW

EDR provided Blackstone a search report of federal, state, local, tribal and proprietary environmental databases to determine the environmental regulatory status of the site, adjoining facilities, and facilities identified within the specified approximate minimum search distance (AMSD) of the site. ASTM Standard E 1527-13, Section 8.2.1 establishes the distance from the site that each database is searched. *Standard federal, state, and tribal databases* searched and the search distances specified for each database are summarized as follows:

<i>Standard Environmental Record Sources</i>	<i>Search Distance</i>
<i>Federal Databases</i>	
NPL: National Priority List Sites	1.0 mile
Proposed NPL: Proposed National Priority List Sites	1.0 mile
Delisted NPL: National Priority List Deletions	0.5 mile
NPL Liens: Federal Superfund Liens	Site only
FEDERAL FACILITY: Federal Facility Site Information Listing	1.0 mile
SEMS: Superfund Enterprise Management System	0.5 mile
SEMS-ARCHIVE: Superfund Enterprise Management System Archive	0.5 mile
RCRA CORRACTS: Resource Conservation and Recovery Act - Corrective Action Sites	1.0 mile
RCRA TSDF: RCRA - Treatment, Storage and Disposal Facilities	0.5 mile
RCRA LQGs: RCRA - Large-Quantity Generators	Site and adjoining
RCRA SQGs: RCRA - Small-Quantity Generators	Site and adjoining
RCRA CESQG: RCRA - Conditionally Exempt Small-Quantity Generators	Site and adjoining
US ENG CONTROLS: Engineering Controls Sites List	Site only
US INST CONTROL: Sites with Institutional Controls	Site only
ERNS: Emergency Response Notification System	Site only
<i>State and Tribal Databases</i>	
SHWS: State Hazardous Waste Site	1.0 mile
SWF/LF: Solid Waste Facilities & Landfill Sites	0.5 mile
LUST: Leaking Underground Storage Tanks	0.5 mile
LAST: Leaking Aboveground Storage Tanks	0.5 mile
INDIAN LUST: Leaking Underground Storage Tanks on Indian Lands	0.5 mile
UST: Registered Underground Storage Tanks	Site and adjoining
AST: Registered Aboveground Storage Tanks	Site and adjoining
INDIAN UST: Registered Underground Storage Tanks on Indian Lands	Site and adjoining
INST CONTROL: Sites with Institutional Controls	Site only
ENG CONTROLS: Sites with Engineering Controls	Site only
VCP: Voluntary Cleanup Program Sites	0.5 mile
INDIAN VCP: Voluntary Cleanup Priority sites on Indian Lands	0.5 mile
BROWNFIELDS: Brownfields Listings	0.5 mile

All federal, state, local, tribal and proprietary databases searched, the search distances specified for each database, and the results of the environmental database search are provided in the complete database report (*EDR Radius Map*) in Appendix E. The database search report also includes the date and a detailed description of each database searched. These databases include, but are not limited to, the *standard environmental records sources*, as defined in ASTM Standard E 1527-13.

7.1 FEDERAL, STATE, LOCAL, TRIBAL AND PROPRIETARY DATABASES

A review of the databases included in the *EDR Radius Map* has been performed. Please refer to Appendix E for a complete list of the properties included on the databases within the required AMSD. The summary below includes database listings, if present, associated with the site and adjoining properties, as well as any additional property/listing within the AMSD that is deemed by the *environmental professional* to be at a distance or status that presents a higher potential risk for environmental concerns to the site and requires discussion.

The results of the database search are summarized as follows:

SITE:

The site (777 North Front Street) is listed on the HAZNET, Los Angeles County HMS, HIST FTTS, FTTS, EMI, SLIC, SWEEPS UST, HIST CORTESE, CREC-NFRAP, Los Angeles County Site Mitigation, WIP and ICS databases. Several other former site tenants including Ford Motor Land Development, Ford Leasing Development, T.O.W. Productions, and Jerry Gates, The Crow were listed in the database. The site is also within Area 2 of the San Fernando Valley groundwater Superfund site; Area 2 has known groundwater contamination plumes. RECs associated with historical site uses and the underlying Superfund groundwater plumes are considered RECs and are discussed in greater detail in Section 10.0.

ADJOINING OR FACILITIES IN CLOSE PROXIMITY:

Hyrrail, the City of Burbank's transportation development at 415 North Front Street, is southeast of the site in an estimated downgradient direction based on inferred groundwater flow and is included on the CA SLIC database, likely related to remediation required to support the development of the transportation terminal at the property, and is also listed in the CA WIP databases, likely related to determination as to whether this property was a contributor to the regional CrVI groundwater plume. The SLIC case received closure in 2014. Based on documents provided on the Geotracker website, this property also received a determination from the RWQCB that this facility was not considered a contributor to regional CrVI contamination. Based on case status, this adjoining property listing is not considered a REC.

Swanner Hardwood (5 Magnolia Boulevard) is southwest of the site beyond North Front Street and the railroad easement. This property is crossgradient of the site based on inferred groundwater flow and is included on the RCRA-SQG, UST, SWEEPS UST, FID UST, HAZNET, and Los Angeles County HMS databases. No RCRA violations were detailed for this property. No release or spill cases are noted for this location. Based on the regulatory status, this adjoining property listing is not considered a REC.

Burbank Yard (4 West Burbank Boulevard) is southwest of the site beyond North Front Street and the railroad easement. This property is crossgradient direction based on inferred groundwater flow and is included on the HIST UST, SWEEPS UST, FID UST, and Los Angeles County HMS databases. No release or spill cases are noted for this location. Based on the regulatory status, this adjoining property listing is not considered a REC.

Uni-Plate (6 West Burbank Boulevard) is southwest of the site beyond North Front Street and the railroad easement. This property is crossgradient of the site based on inferred groundwater flow and is included on the CERCLIS, SLIC, CA HIST UST, and CA WIP, databases. The CERCLIS case is closed as of 2012 and the SLIC case is closed as of 2014. Based on the regulatory status, this adjoining property listing is not considered a REC.

NON-ADJOINING FACILITIES WITHIN APPROXIMATE MINIMUM SEARCH DISTANCE:

As detailed in the EDR Report, several facilities on various databases are within the ASTM E 1527-13 Approximate Minimum Search Distance (AMSD). Based on factors such as distance to the site, topography, media affected (surface water, soil, soil vapor, groundwater, or air), depth to groundwater, anticipated groundwater flow direction away from the site, and/or a “Case Closed” and/or “No Further Action (NFA)” regulatory status, these non-adjoining facilities within the AMSD are unlikely to have current or former releases of hazardous substances and/or petroleum products that could migrate to the site and are not considered RECs.

7.2 UNMAPPABLE FACILITIES

Due to inadequate address information or other erroneous facility information, several facilities listed in the environmental databases searched could not be plotted by EDR on a radius map. However, these facilities are still identified in the EDR report by grouping them into an unmappable facility summary. Blackstone reviewed this summary to determine if any of the listed facilities include or adjoin the site. The unmappable facility listings are summarized as follows:

SITE:

Not listed

ADJOINING FACILITIES:

None listed

No facilities listed on the Unmappable site summary are located on or adjoining the site.

7.3 AFFIRMATION

Blackstone’s conclusions based on the EDR report are limited to the accuracy of that report. To the extent possible, Blackstone uses field observations to verify the information or identify errors and inconsistencies in the search report regarding the listed facilities in the immediate vicinity of the site. The provided database summary is sufficiently complete and current to be used as a source to satisfy the regulatory database requirements outlined in ASTM Standard E 1527-13.

7.4 ENVIRONMENTAL DATABASE SEARCH AND REVIEW CONCLUSIONS

As previously discussed in greater detail in Section 10.0, the current condition and regulatory status associated with past manufacturing use at the site and the underlying Superfund groundwater plumes are considered RECs.

8.0 SITE INSPECTION

Name of Inspector: Sarah Denton

Date of Site Inspection: June 13, 2018

SITE REPRESENTATIVE		
<i>Name</i>	<i>Title or Association with Site</i>	<i>Years Associated with Site</i>
None		

The site inspection consisted of a walkover of the site perimeter and site areas. Blackstone was not accompanied during the site inspection. During the site inspection, Blackstone did not inspect inaccessible areas of the site including under soil stockpiles or inside clarifiers. The adjoining properties were visually observed from curbside without being entered. There is no reason to believe the inability to inspect these areas would alter the findings or recommendations set forth in this report or be considered a significant data gap.

8.1 UNDERGROUND STORAGE TANKS (USTS)

<i>Number of USTs</i>	<i>Capacity (gallons)</i>	<i>Contents</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
None					No

No physical evidence of current or former USTs was identified during the site inspection.

8.2 ABOVEGROUND STORAGE TANKS (ASTS)

<i>Number of ASTs</i>	<i>Capacity (gallons)</i>	<i>Contents</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
None					No

No physical evidence of current ASTs was identified during the site inspection.

8.3 CHEMICALS AND MATERIALS USAGE

The following section describes non-bulk (55-gallons or less) chemical and petroleum storage at the site. Where applicable, all bulk fixed chemical and petroleum product storage (i.e. USTs and/or ASTs) is discussed in Sections 8.1 and 8.2.

<i>Chemical or Material</i>	<i>Use</i>	<i>Container Type</i>	<i>Location</i>	<i>REC</i>
None				No

No evidence of surface staining, spills, or other current releases was apparent at the site.

8.4 HAZARDOUS WASTES

<i>Hazardous Waste</i>	<i>Generated By</i>	<i>Storage Container</i>	<i>Storage Location</i>	<i>Disposal Details</i>	<i>REC</i>
None				No concerns noted	No

No physical evidence of on-site hazardous waste disposal was identified during the site inspection.

8.5 NON-HAZARDOUS WASTES

<i>Non-Hazardous Waste</i>	<i>Generated By</i>	<i>Storage Container</i>	<i>Storage Location</i>	<i>Disposal Details</i>	<i>REC</i>
None				No concerns noted	No

No physical evidence of on-site non-hazardous waste disposal was identified during the site inspection.

8.6 POLYCHLORINATED BIPHENYLS (PCBS)

PCBs can be present in coolants or lubricating oils used in older electrical transformers, hydraulic systems, and other similar equipment. The 1976 Toxic Substances Control Act (TSCA) extended regulatory control over the use of PCBs to the United States Environmental Protection Agency (USEPA). In November 1979, the USEPA generally prohibited the domestic manufacture of PCBs in electromagnets, transformers, and heat-transfer and hydraulic equipment.

<i>Equipment</i>	<i>Location</i>	<i>Owner</i>	<i>Status/Notes</i>	<i>REC</i>
None				No

8.7 WASTEWATER DISCHARGES

<i>Type</i>	<i>Generated By</i>	<i>Discharged To</i>	<i>Status/Notes</i>	<i>REC</i>
Clarifiers	Abandoned	Unknown	Discussed below	Yes

Clarifiers, floor drains, sewage pipes, trench drains and evidence of past in-ground equipment for wastewater management were observed throughout the site. As previously discussed in further in Sections 6.7 and 6.8, the current environmental regulatory status associated with past manufacturing use at the site is considered a REC.

8.8 STORMWATER DISCHARGES

<i>Discharged From</i>	<i>Discharged To</i>	<i>Potential Impacts</i>	<i>REC</i>
Exterior site surfaces	Municipal stormwater drains located off site	None	No

No on-site stormwater retention basins were observed.

8.9 PITS, PONDS, AND LAGOONS (ON-SITE PROCESS WATER DISCHARGE)

<i>Type</i>	<i>Contents</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
None			No concerns noted	No

No active pits, ponds, lagoons or other areas of process water discharge were observed at the site other than evidence of the historical features noted in Section 8.7.

8.10 WELLS

<i>Type</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
None		No concerns noted	No

No physical evidence of current groundwater monitoring wells, dry wells, injection wells, extraction wells, vapor wells, or groundwater production wells was identified during the site inspection. During the site walk, evidence of past environmental investigation was observed, specifically former groundwater well and abandoned investigation boring locations.

8.11 UNDERGROUND PRODUCT PIPELINES

<i>Type</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
Crude Oil		Discussed below	No

A correspondence from Mobil Oil Company in 1967 objected to construction of a Zero building over a pipeline reportedly located in the southern portion of the site. According to the National Pipeline Mapping System, a crude oil pipeline operated by ExxonMobil Oil Corporation remains active and traverses the southern portion of the site. No pipeline markers were observed at the site during the site inspection. As a *Business Environmental Risk Issue*, the status of this pipeline should be confirmed and adequately accounted for prior to the proposed redevelopment at the site.

8.12 ODORS

<i>Odors</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
None		No concerns noted	No

No unusual odors indicative of environmental concerns were identified during the site inspection.

8.13 POOLS OF LIQUID

<i>Pools of Liquid</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
None		No concerns noted	No

No pools or sumps containing liquids indicative of environmental concerns were identified during the site inspection.

8.14 STRESSED VEGETATION OR STAINED SURFACES

<i>Stressed Vegetation or Stained Surfaces</i>	<i>Location</i>	<i>Status/Notes</i>	<i>REC</i>
None		No concerns noted	No

No stained soils or stressed vegetation were observed by Blackstone.

8.15 SITE INSPECTION CONCLUSIONS

Although no RECs were identified directly from the site inspection observations, as is noted in other report sections, the active status crude oil pipeline traversing the southern portion of the site is a *Business Environmental Risk Issue* and the current environmental regulatory status associated with past manufacturing use at the site is considered a REC.

9.0 ASTM NON-SCOPE CONSIDERATIONS

Blackstone performed the following client-specific activities to identify ASTM *Non-Scope Considerations (Business Environmental Risk Issues)* in addition to the ASTM requirements and as required per the Agreement.

9.1 AIR EMISSIONS

<i>Regulated Emissions Source</i>	<i>Discharged To</i>	<i>Potential Impacts</i>	<i>Status/Notes</i>	<i>REC</i>
None				No

9.2 ASBESTOS-CONTAINING MATERIALS (ACM)

Frequently encountered types of ACM used in building construction include floor tile and mastic, spray-applied fireproofing, acoustical/decorative ceiling plaster, wallboard and joint compound, insulation, and many other building materials in common use prior to 1981. Materials that contain greater than one percent asbestos fibers are considered regulated ACM and must be handled according to USEPA and Occupational Safety and Health Administration (OSHA) regulations.

Blackstone conducted a limited survey for the presence of typically suspect ACM at the site. Materials that are typically considered suspect ACM were identified at the site, including areas where remnant vinyl floor tile and associated mastic remain affixed to the former building foundations. The condition of the suspect materials identified was poor but non-friable.

Based on the construction date of the former site buildings (1960s) and the Blackstone's limited visual survey, as a *Business Environmental Risk Issue*, Blackstone recommends conducting a comprehensive pre-demolition survey to identify and characterize residual potential ACM at the site, including remaining floor tiles observed on the remnant building foundations. All potentially impacted ACM should be removed from the site structures in accordance with applicable regulations prior to demolition.

9.3 LEAD-BASED PAINT (LBP)

No structures are currently on the site and no suspect LBP was observed. As such, sampling was not required, and no further evaluation is recommended.

9.4 RADON GAS

A review of records regarding radon concentrations in Los Angeles County, California, was conducted to determine if concentrations of radon in the general area of the site are within the USEPA guidelines. The USEPA uses a continuous exposure level of 4.0 pCi/L (picoCuries per

liter of air) or greater as a guidance level at which further evaluation and potential remedial actions are recommended.

According to USEPA Office of Radiation and Indoor Air information/mapping, the site is located within a Radon Zone Level 2. This zone has a predicted average indoor radon gas screening level between 2.0 pCi/L and 4.0 pCi/L, which is within USEPA guidance levels. Based on the Radon Zone Level 2 designation, no further evaluation of radon is recommended.

9.5 APPARENT MOLD GROWTH (AMG)

No structures are currently on the site and no AMG was observed. As such, no further evaluation is recommended.

9.6 WETLANDS

As defined by the USEPA and U.S. Army Corps of Engineers (USACE), wetlands are "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions."

Wetlands possess three essential characteristics: (1) hydrophytic vegetation; (2) hydric soils; and (3) hydrology. All three characteristics must be prevalent to document an area as a jurisdictional wetland.

Wetlands	
<i>Information Source</i>	<i>Findings</i>
National Wetlands Inventory (NWI) on-line Wetland Mapper: (http://wetlandsfws.er.usgs.gov/NWI/download.html)	No mapped, potential federal wetlands are located at the site.
Field observations	No vegetation or ponded areas that are characteristic of possible wetlands were observed at the site.

9.7 LEAD IN DRINKING WATER

The City of Burbank provides drinking water to the site area. The City of Burbank 2014 Drinking Water Quality Report indicates that the municipal water system meets the requirements as established by the USEPA, state, and local authorities for lead content in drinking water.

9.8 POTABLE/IRRIGATION GROUNDWATER WELL SURVEY

Blackstone contacted the City of Burbank and performed an inspection of the site. According to the City of Burbank and the site inspection, no potable or irrigation wells are located on or within one-

half mile of the site. Additionally, groundwater use from the basin is highly restricted due to the presence of regional groundwater contamination. The Superfund investigation is discussed in greater detail in Section 6.7.

9.9 OIL AND GAS SURVEY

Blackstone reviewed records provided by the California Department of Conservation Division of Oil, Gas and Geothermal Resources (DOGGR) regarding current and former oil and gas wells in the site vicinity. DOGGR records indicate that no current or former oil or gas wells are onsite or located on adjoining properties.

10.0 CONCLUSIONS

Blackstone performed a Phase I ESA of the site in conformance with the scope and limitations of ASTM Standard Practice E 1527-13, the regulations at 40 CFR Part 312, and the November 9, 2015, proposal (Agreement) between 4Terra-LA I LLC and Blackstone. Any exceptions to, or deletions from, this practice are described in Sections 1.2 through 1.4 of this report. This assessment has revealed no evidence of *recognized environmental conditions (RECs)* in connection with the site with the exception of the following:

- **VOCs and Metals Impacts** – In 2009, CalTrans contracted Ninyo & Moore to evaluate the northeastern portion of the site where CalTrans is planning to widen Interstate 5 to accommodate the development of High Occupancy Vehicle (HOV) lanes. Ninyo & Moore retrieved soil and soil vapor samples from the northeast and eastern portion of the site (this was not a site-wide evaluation). Ninyo & Moore concluded that their detected concentrations of VOCs, metals, PCBs, semi-volatile organic compounds (SVOCs), petroleum hydrocarbons, and pH in soil samples retrieved from their investigation area did not exceed the site-specific cleanup goals previously established by the LA-RWQCB during the previous remediation investigation. However, Ninyo & Moore reported chlorinated VOCs, other VOCs and TPHg in their soil vapor samples, including concentrations of PCE and TCE that exceeded the Department of Toxic Substances' (DTSC's) California Human Health Soil Screening Levels (CHHSLs) for industrial sites, which were the risk-based screening standard in effect at the time of the investigation.⁴ Ninyo & Moore reported that the maximum detected concentration of PCE in soil vapor identified from their investigation (52,400 µg/m³) suggested that concentrations of chlorinated VOCs in site soil vapor condition rebounded following the completion of remediation in 2001.

In 2016, Leighton completed a pre-development soil vapor investigation to evaluate the subsurface soil conditions for chemicals of concern that may be encountered during the planned excavation activities associated with the subsurface parking structures of the proposed redevelopment and evaluate whether VOCs present in soil vapor at the site presented a potential vapor intrusion concern for the residential and commercial structures planned at the site. The investigation consisted of the completion of 36 mostly grid-based shallow borings and the retrieval of soil and soil vapor samples from each boring. Laboratory analyses of soil vapor samples revealed elevated concentrations of chlorinated VOCs, namely PCE, TCE and 1,1,1-TCA in the area of the site where SVE remediation had been performed in the late 1990s; the maximum detected concentration of PCE in soil gas identified during Leighton's investigation (10,600,000 µg/m³) suggests that significant rebound has occurred in the subsurface at the site to pre-remediation levels in the decades since the SVE remediation system operated. Leighton's investigation also identified chlorinated VOCs in soil samples at concentrations in excess of residential screening levels. During the 2016 Leighton subsurface investigation, laboratory analyses of retrieved soil samples also revealed elevated concentrations of metals, namely zinc, total lead, and copper, at concentrations that suggest that the soil, once excavated, may require management as California hazardous waste and possibly federal RCRA waste.

⁴ DTSC Note Human and Ecological Risk Office (HERO Note Number 3, DTSC-modified Screening Levels, May 2015
Project No. TERRCA003.03

The interpreted maximum lateral extent of the metal-affected soils that may require management as California hazardous waste include an approximately 3.63-acre area in the central northwestern portion of the site. Geosyntec's subsequent 2017 soil and soil vapor investigation generally confirmed Leighton's findings, and their human health risk screening indicated that concentrations of chlorinated solvents exceed the site's previously established depth-specific soil screening levels for the protection of groundwater, soil risk-based concentrations, and depth-specific soil vapor screening levels.

The elevated concentrations of VOCs and metals on the site are considered a REC. Blackstone understands these impacts will continue to be evaluated prior to and during redevelopment of the site, and mitigation, risk-assessment and/or remediation will be performed at the site concurrent with redevelopment to ensure the proposed future land uses are protective of human health and the environment.

- **Active CrVI Investigation** – As part of ongoing evaluation of the San Fernando groundwater basin Superfund site, groundwater supply wells in the basin were identified to have been contaminated with Chromium VI (CrVI) in 1998. The LA-RWQCB identified 112 initial sites at which further investigation was required to determine whether CrVI concentrations in soil at these locations indicate a significant past release that may have contributed to the regional contamination. Although the Zero operation on the site was not identified in the initial group of 112, a May 2011 letter from the LA-RWQCB ordered soil investigation at the site based on past use of chromate salts and based on the findings of the 2009 CalTrans investigation that had identified CrVI in site soil. The CalTrans investigation also indicates that the former Zero facility received a notice of violation from the City of Burbank Public Works Department in 1975 for discharging wastewater with elevated chromium concentrations.

According to the 2012 Geosyntec report, to further evaluate CrVI conditions in soil at the site, 5 borings were advanced in the vicinity of former clarifiers, and soil samples were retrieved from each boring at 5-foot intervals from 5 feet bgs to the maximum investigation depth of 20 feet bgs. Geosyntec reports that CrVI was detected in 4 of the 20 retrieved soil samples at concentrations that did not exceed the residential CHSSL, which was the risk-based threshold in place at the time. In their response to the Geosyntec investigation report, a subsequent directive dated June 3, 2015, from the RWQCB indicated that additional investigation is required around former boring SS-4, located near a former 3-stage clarifier based on the findings of Geosyntec's initial investigation. In 2016, Geosyntec performed supplemental evaluation around SS-4 consisting of the installation of a soil boring to 40 feet bgs. Laboratory analyses of soil samples retrieved from discrete intervals in the boring revealed a detectable concentration of CrVI at 35 ft bgs significantly less than the applicable soil screening level; no CrVI was detected in the deeper soil sample retrieved from 40 ft bg. Geosyntec concluded that the comprehensive investigation data for CrVI indicate that the vertical distribution of detections of CrVI are inconsistent with historical releases of CrVI that would have impacted groundwater and are not evidence to suggest that historical site activities contributed to the groundwater basin's regional CrVI contamination. Geosyntec recommended no further investigation with respect to CrVI at the site. Although the LA-RWQCB reportedly committed to

extending CrVI to the existing Certificate of Completion for the site, correspondence records on the RWQCB Geotracker database do not include a response from the agency confirming no further action as to CrVI contamination in groundwater; therefore, the active status of the CrVI investigation remains a REC until agency concurrence is received.

- **Regional Superfund Groundwater Plumes** – The site is within the boundaries of the San Fernando Valley Area 2 (Crystal Springs) Superfund Site. Groundwater contamination with VOCs and metals (specifically CrVI) associated with the Superfund site has undergone investigation in the region since 1979. The former site owner, Zero (later known as APW), is an identified potentially responsible party (PRP) in the Superfund Site. The US EPA assigned management of the Superfund PRP investigation to the RWQCB in 1998. Groundwater monitoring data for the site area is sparse given the location of existing groundwater monitoring wells. Blackstone understands that the LA-RWQCB has requested the installation of at least one groundwater monitoring well at the site to evaluate current groundwater conditions in this area of the regional plumes. Additionally, the FYR indicates that potential for vapor intrusion concerns from volatilization from underlying groundwater exist in Area 2; however, field data necessary to determine whether any such pathways exist has not been required as part of the Superfund monitoring. In 2000, the US EPA recorded an agreement and Covenant Not to Sue (Covenant) with FLDC, a potential site developer identified as the Settling Respondent. In exchange for the issuance of the Covenant, FLDC agreed to pay \$150,000 to the US EPA within a specified time period of taking ownership of the site. Blackstone understands the Covenant established with the US EPA remains applicable, with the LA-RWQCB maintaining independent jurisdiction of certain environmental conditions at the site. Geosyntec's updated 2018 GIA, performed to evaluate whether soil impacts identified at the site pose a threat to groundwater, indicated a potential for VOCs to enter groundwater under current and future site conditions. UP EPA's active regulatory status of the Superfund groundwater plumes in the area of the site and the potential for soil vapor intrusion from the underlying plumes is considered a REC and will continue to be evaluated as part of redevelopment of the site.

The following *Business Environmental Risk Issues* were identified in connection with the site:

- **Asbestos-Containing Materials (ACM):** Based on the construction date of the former site buildings (1960s) and the limited nature of Blackstone's survey, Blackstone recommends conducting a comprehensive pre-demolition survey to identify and characterize residual potential ACM at the site, including remaining floor tiles observed on the remnant building foundations. All potentially impacted ACM should be removed from the site structures in accordance with applicable regulations prior to demolition.
- **Underground Product Pipelines:** A correspondence from Mobil Oil Company in 1967 objected to construction of a Zero building over a pipeline reportedly located in the southern portion of the site. According to the National Pipeline Mapping System, a crude oil pipeline operated by ExxonMobil Oil Corporation remains active and traverses the southern portion of the site. No pipeline makers were observed at the site during the site inspection. The status of this pipeline should be confirmed and adequately accounted for prior to the proposed redevelopment at the site.

11.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

This Phase I Environmental Site Assessment (ESA) Report documents the research methodology used by qualified environmental professionals of Blackstone Consulting LLC (Blackstone) to identify recognized environmental conditions using the scope and limitations of ASTM Standard E 1527-13 and the November 9, 2015, proposal (Agreement) between 4Terra-LA I LLC and Blackstone.

We declare that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR 312, and we have the specific qualifications based on education, training, and experience to assess a site of the nature, history, and setting of the subject site. We have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.

Please contact EDR at 1-800-352-0050
with any questions or comments.

FORD LEASING DEVELOPMENT COMPANY, a Delaware corporation, Grantor, hereby GRANTS to NORTHRIDGE PROPERTIES, LLC, a California limited liability company, Grantee, that certain real property situated in the City of Burbank, County of Los Angeles, State of California, and more particularly described in Exhibit "A," attached hereto and by this reference incorporated herein

This grant is made subject to easements, covenants, conditions, reservations and restrictions of record

This grant is also made subject to the following covenants restricting the use of the land granted herein, which covenants are intended by Grantor and by Grantee to run with the land as provided in California Civil Code Section 1468 as it exists as of the date hereof, and to be binding upon their respective successors and assigns. The burdened property is the real property described in Exhibit A. The property of Grantor intended to be benefited by the restrictive covenants is the real property described in Exhibit B, attached hereto and by this reference incorporated herein.

By its acceptance of the within grant, Grantee does hereby covenant and agree that it shall not use the land described in Exhibit A attached hereto ("Burdened Lands") for an Automotive Dealership as defined below for the sale of new motor vehicles of any brand whatsoever for a period of twenty five (25) years from the date hereof. In addition, Grantee does hereby covenant and agree that it shall not use the Burdened Land for (1) an Automotive Dealership for the sale, lease or distribution of used motor vehicles, nor (2) for any facility for the service or repair of motor vehicles, for a period of twenty five (25) years from the date hereof without in each case having first received the prior written consent of Grantor. The term Automotive Dealership shall mean any sales or leasing facility or activity for distribution, sale and/or leasing of new or used automobiles, sport utility vehicles, light or heavy trucks (by whatever source of motive power as to any of them)

These covenants are for the express benefit of the Benefited Property, Grantor and its successors and assigns.

The covenants provided for herein shall run with the Burdened Lands and shall be binding upon each successor owner, during his ownership of any portion of the Burdened Lands affected thereby and upon each person having an interest in the Burdened Lands derived through any owner thereof.

The covenants provided for herein shall automatically terminate and shall be of no further force or effect on the date which is twenty five (25) years from the date of recordation of this Grant Deed and Indenture.

Grantee acknowledges and agrees that a breach or potential breach of these covenants shall cause substantial harm and that monetary damages shall not be sufficient or adequate to remedy any such breach or potential breach. Therefore, the injured party shall have the right to seek injunctive relief, including an injunction requiring any Automotive Dealership or facility for the service or repair of automotive products on the Burdened Lands to be removed. The owners from time to time of the Burdened Lands shall not acquire any equitable rights whatsoever as a result of making any Automotive Dealership, service or repair improvements to the Burdened Lands.

Grantee hereby agrees, on its own behalf and on behalf of all successors and assigns of any interest in the Burdened Lands, that upon any sale, conveyance or other transfer of all or a portion of the Burdened Lands, it shall cause such transferee to expressly assume the restriction of the covenants herein contained in any deed transferring title. Such assumption shall also obligate each transferee to obtain such an assumption in each and every subsequent transfer of title from each subsequent transferee.

Grantee further agrees, on its own behalf and on behalf of all successors and assigns of any interest in the Burdened Lands, that if for any reason the within covenants and restrictions are deemed not to run with the land as to the Burdened Lands, then each of them shall be enforceable as an equitable servitude by Grantor, its successors and assigns of the Benefited Property, against Grantee, its successors and assigns.

NOTICE: THE REAL PROPERTY DESCRIBED IN EXHIBIT A IS SUBJECT TO THAT CERTAIN "AGREEMENT AND COVENANT NOT TO SUE FORD LEASING DEVELOPMENT COMPANY AND FORD FRONT REALTY CORP." BY AND BETWEEN THE UNITED STATES ENVIRONMENTAL PROTECTION AGENCY AND FORD LEASING DEVELOPMENT COMPANY, DATED MARCH 16, 2000, A TRUE AND CORRECT COPY OF WHICH WAS CERTIFIED BY THE UNITED STATES ENVIRONMENTAL PROTECTION AGENCY ON JUNE 28, 2000 AND RECORDED JULY 28, 2000 TOGETHER WITH THAT CERTAIN "NOTICE OF AGREEMENT AND COVENANT NOT TO SUE, BETWEEN THE U.S. ENVIRONMENTAL PROTECTION AGENCY AND FORD LEASING DEVELOPMENT COMPANY, INCLUDING ACCESS RIGHTS TO REAL PROPERTY," AS DOCUMENT # 00 1062454, OFFICIAL RECORDS OF LOS ANGELES COUNTY, CALIFORNIA. BY ITS ACCEPTANCE OF THIS DEED GRANTEE ACKNOWLEDGES RECEIPT OF A TRUE COPY THEREOF.

(BALANCE OF THIS PAGE INTENTIONALLY LEFT BLANK)

IN WITNESS WHEREOF, Grantor has caused these presents to be executed this 6 day of May, 2005. 4

EXHIBIT A

LEGAL DESCRIPTION

BURDENED PROPERTY

9

All that certain real property situated in the County of Los Angeles, State of California, described as follows:

Parcel 1:

Lots 14 and 15 of Tract No. 5617, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 85, Page 77 of Maps, in the office of the County Recorder of said County

Parcel 2:

Lots 3, 4, 5, 6, 7, 8 and 9 of Tract No. 5617, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 85, Page 77 of Maps, in the office of the County Recorder of said County.

EXCEPT therefrom those portions thereof described as a whole as follows:

Beginning at the most Northerly corner of said Lot 9; thence Southeasterly along the Northeasterly lines of said Lots 9, 8, 7, 6, 5, 4, 3, to the most Easterly corner of said Lot 3; thence Southwesterly along the Southeasterly line of said Lot 3 to the most Southerly corner thereof; thence Northwesterly along the Southwesterly line of said Lot 3; a distance of 15.28 feet to a point on a curve concave Southwesterly, and having a radius of 1,746 feet; thence Northwesterly along said curve, through an angle of 11° 31' 17" an arc distance of 351.07 feet to a point on the Northwesterly line of said Lot 9, distant thereon 24.16 feet Southwesterly from said most Northerly corner thereof; thence Northeasterly along said Northwesterly line of said Lot 9, a distance of 24.16 feet to the point of beginning.

Parcel 3:

Lots 10, 11, 12 and 13 of Tract No 5617, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 85, Page 77 of Maps, in the office of the County Recorder of said County.

EXCEPT from said land that portion of thereof, described as follows:

Beginning at the most Easterly corner of said Lot 10; thence Southwesterly along the Southeasterly line of said Lot 10; a distance of 24.16 feet; thence Northwesterly along a curve concave Southwesterly and having a radius of 1,746 feet, an arc distance of 198.08 feet to a point on the Northeasterly line of said Lot 13, distant thereon 1.44 feet Southeasterly from the most Northerly corner of Lot 13, thence Southeasterly along the Northeasterly lines of said Lots 13, 12, 11 and 10 to the point of beginning.

Parcel 4:

Those portions of Lots 16 and 18 in Block 64 of Town of Burbank, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 17, Page 19 of

09300/0016/457931 7

10
Miscellaneous Records, in the office of the County Recorder of said County, described as a whole as follows:

Beginning at the most Westerly corner of said Lot 18; thence Southeasterly along the Southwesterly line of said lot to the intersection thereof with the Northwesterly line of San Jose Avenue, 60 feet wide, as described in deed recorded in Book 3034, Page 316, Official Records, thence Northeasterly along said Northwesterly line of San Jose Avenue, a distance of 7.52 feet to the Northeasterly line of the land described in deed recorded in Book 33012, Page 309, Official Records, as Parcel 2; thence Northwesterly along said last mentioned Northeasterly line to a point on the Northwesterly line of said Lot 16, distant along the Northwesterly lines of said Lots 18 and 16, 120.02 feet Northeasterly from said most Westerly corner of said Lot 18; thence Southwesterly along said Northwesterly lines of said Lots 16 and 18; a distance of 120.02 feet to the point of beginning.

Parcel 5:

Those portions of Cypress Avenue and Front Street, in the City of Burbank, County of Los Angeles, State of California, as shown on said map of Town of Burbank, as per map recorded in Book 17, Pages 19 et seq. of Miscellaneous Records, in the office of the County Recorder of said County, vacated by Resolution No. 6190, passed by the Council of said City of Burbank, on May 19, 1950, a certified copy thereof having been recorded in Book 33185, Page 116 of Official Records, of said County, and described as a whole as follows:

Beginning at the most Westerly corner of Lot 18 in Block 64 of said Town of Burbank, thence North 41° 16' 39" East along the Northwesterly lines of said Lots 18 and 16 in said Block 64, a distance of 120.02 feet to the most Northerly corner of the land described as Parcel 2 in said deed to the State of California, recorded in Book 33012, Page 309, Official Records of said County; thence North 24° 52' 30" West along the Northwesterly prolongation of the Northeasterly line of said Parcel so described in said last mentioned deed, a distance of 65.60 feet to a point in the Northwesterly line of said Cypress Avenue, 60 feet wide, distant thereon 49.66 feet Southwesterly from the most Southerly corner of Lot 1 of Tract No. 5617, as per map recorded in Book 85, Page 77 of Maps; records of said County; thence Southwesterly, along said Northwesterly line of Cypress Avenue, to the intersection thereof with the Southwesterly line of said Front Street, 66 feet wide; thence South 43° 33' 18" East along said Southwesterly line of Front Street, a distance of 381.53 feet, more or less, to the Southwesterly prolongation of the Northwesterly line of said San Jose Avenue, 60 feet wide; thence along said Southwesterly prolongation, North 41° 15' 35" East a distance of 65.27 feet to the Southwesterly line of said Lot 18; thence North 43° 33' 18" West along said Southwesterly line of said Lot 18, a distance of 321.34 feet to the point of beginning.

Parcel 6:

That portion of Bonnywood Place, as shown on map of Tract No. 5617, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 85, Page 77 of Maps, in the office of the County Recorder of said County, vacated by Resolution No. 6190, passed by the Council of said City of Burbank, on May 16, 1950, a certified copy thereof having been recorded in Book 33185, Page 116, Official Records, of said County, and described as follows:

Beginning at the most Northerly corner of Lot 14 in said Tract No. 5617; thence Southeasterly along the Northeasterly lines of Lots 14 and 13 of said Tract, to a point distant thereon 1.44 feet Southeasterly from the most Northerly corner of said Lot 13, said last mentioned point being a

09300/0016/457931 7

05 1111340

point on a curve concave Southwesterly and having a radius of 1,746 feet; thence Northwesterly along said curve, through an angle of 1° 14' 24" an arc distance of 51.50 feet, to a point on the Northeasterly prolongation of the Northwesterly line of said Lot 14; said last mentioned point being distant along said Northeasterly prolongation 2.55 feet Northeasterly from said most Northerly corner of Lot 14; thence Southwesterly along said Northeasterly prolongation, a distance of 2 55 feet to the point of beginning.

Parcel 7:

Those portions of Lots 3 and 4 in Block 91 of the Rancho Providencia and Scott Tract, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 43, Page 47 et seq. of Miscellaneous Records, of said County, lying Southwesterly of the Southwesterly line of Tract No. 5617, recorded in Book 85, Page 77 of Maps.

EXCEPT therefrom the Southwesterly 67 feet (measured at right angles) of said Lots 3 and 4.

ALSO EXCEPT from said Lot 4 that portion thereof described as follows:

Beginning at the most Southerly corner of Lot 1 of Tract No. 5617, as per map recorded in Book 85, Page 77 of Maps; thence South 41° 16' 39" West along the Southwesterly prolongation of the Southeasterly line of said Lot 1, a distance of 49.66 feet; thence North 24° 62' 30" West a distance of 58.54 feet; thence Northwesterly along a curve concave Southwesterly tangent to said last described line and having a radius of 1,746 feet, an arc distance of 66.96 feet to a point on the Southwesterly line of Lot 3, of said Tract 5617, said point being distant along the Southwesterly lines of Lots 1, 2 and 3, Tract No. 5617, a distance of 115.28 feet from said most Southerly corner of Lot 1, thence Southeasterly along the said Southwesterly line of said Lots 3, 2 and 1, a distance of 115.28 feet to the point of beginning.

Parcel 8:

Those portions of Lots 6, 7 and 8 of Tract No. 2792, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 28, Page 15 of Maps, in the office of the County Recorder of said County, lying Southeasterly of a line parallel with and distant Northwesterly 85 feet at right angles from the Southeasterly line of said Lots 6, 7 and 8.

EXCEPT from said Lots 7 and 8 those portions lying Southwesterly of the Northeasterly line of the land conveyed to the Southern Pacific Railway Company, by deed recorded in Book 4681, Page 111, Official Records, in the office of the County Recorder of said County.

ALSO EXCEPT from said Lot 6 that portion thereof, described as follows:

Beginning at the intersection of the Easterly line of said Lot 6 with a line parallel with and distant 85 feet Northwesterly measured at right angles from the Southeasterly line of said lot; thence Southwesterly along said parallel line a distance of 6.50 feet to a point on a curve concave Southwesterly and having a radius of 1,746 feet; thence Southeasterly along said curve, through an angle of 0° 22' 51" an arc distance of 11.61 feet to a point on said Easterly line of said lot, distant thereon 12.98 feet Southerly from said point of beginning; thence Northerly along said Easterly line a distance of 12.98 feet to the point of beginning.

Parcel 9:

Those portions of Lots 6, 7 and 8 of Tract No. 2792, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 28, Page 15 of Maps, in the office of

the County Recorder of said County, lying Northwesterly of a line parallel with and distant Northwesterly 85 feet at right angles from the Southeasterly line of said Lots 6, 7 and 8.

EXCEPT from Lots 7 and 8, those portions lying Westerly of the Easterly lines of Parcels 1 and 2 as described in the deed to Southern Pacific Railroad Company, recorded in Book 4681, Page 111, Official Records.

ALSO EXCEPT that portion of said Lot 8, which lies Westerly of the Easterly line of the land condemned for flood control purposes by Final Decree of Condemnation, entered in Case No. 474741, Los Angeles County Superior Court, a certified copy of said Decree being recorded in Book 19995, Page 375, Official Records.

ALSO EXCEPT for said land that portion thereof described as follows:

Those portions of Lots 6, 7 and 8 of Tract No. 2792, described as follows:

Beginning at the most Northerly corner of said Lot 6, thence South 68° 02' 26" West along the Northwesterly lines of said Lots 6, 7 and 8 to a point distant thereon 19.81 feet Southwesterly from the most Northerly corner of said Lot 8; thence South 60° 27' 30" East, a distance of 179.12 feet; thence Southeasterly along a curve concave Southwesterly tangent to the last described line and having a radius of 1,746 feet, an arc distance of 254.95 feet to a point on a line parallel with and distant 85 feet Northwesterly, measured at right angles from the Southeasterly line of said Lot 6; thence North 41° 16' 51" East, along said last mentioned parallel line, a distance of 6.50 feet to the Northeasterly line of Lot 6; thence Northwesterly along said Northeasterly line of Lot 6; a distance of 347.67 feet to the point of beginning.

ALSO EXCEPT from the remainder of said Lots 7 and 8, those portions thereof lying Northwesterly of a line parallel with and distant Southeasterly 60 feet, measured at right angles from, the Northwesterly lines of said Lots 7 and 8.

Parcel 10:

That portion of Lot 5 of Tract No. 2792, in the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 28, Page 15 of Maps, in the office of the County Recorder of said County, described as follows.

Beginning at the most Southerly corner of said lot; thence along the Southeasterly line of said Lot 5, North 41° 15' 50" East 40.10 feet to a non-tangent curve concave Southwesterly and having a radius of 1,746.00 feet; thence from a tangent bearing North 49° 20' 21" West, Northwesterly along said curve through an angle of 2° 27' 19", an arc distance of 74.82 feet to a point in the Westerly line of said Lot 5, distant along said Westerly line, 83.75 feet from said most Southerly corner; thence Southerly along said Westerly line 83.75 feet to the point of beginning.

EXCEPT therefrom all minerals, oils, gases and other hydrocarbons by whatsoever name known that may be within or under the parcel of land hereinabove described without, however the right to drill, dig or mine through the surface thereof as disclosed in deed from the State of California recorded June 9, 1965 as Instrument No. 4355 of Official Records.

Parcel 11:

That portion of Bonnywood Place, lying Northeasterly of Lot 15 and within the Northeasterly prolongations of the Northwesterly and Southeasterly lines of said Lot 15 of Tract No. 5617, in

13
the City of Burbank, County of Los Angeles, State of California, as per map recorded in Book 85, Page 77 of Maps, in the office of the County Recorder of said County, as vacated by the City Council of said City in Resolution No. 6190 recorded May 19, 1950 in Book 33185, Page 116 of Official Records of said County, described as follows:

Beginning at the most Northerly corner of said Lot 15 in said Tract No. 5617; thence Southeasterly along the Northeasterly lines of Lots 15, 14 and 13 of said Tract, to a point in the Northeasterly line of said Lot 13, distant 1.44 feet Southeasterly from the most Northerly corner of said Lot 13; said point being on curve in the Southwesterly line of the land conveyed to the State of California for highway purposes October 19, 1945 by Superior Court Case No. 506667 as shown on Clerk's Field Map No. 2295 in the office of the County Surveyor of said County, said curve being concave Southwesterly, having a radius of 1,746.00 feet; thence Northwesterly along said Southwesterly line, through an angle of 4° 13' 59" an arc distance of 129.00 feet to a point in the Northeasterly prolongation of the Northwesterly line of said Lot 15, distant Northeasterly thereon 3.50 feet from the most Northerly corner thereof; thence Southwesterly along said prolongation 3.50 feet to the point of beginning.

Burbank, California 91502

Attention: Mr Jim O'Neil

Subject: Executive Summary and Recommendations of Health Risk Assessment and Environmental Fate Analysis of Volatile Organic Contamination in Soil, Soil Vapor, and Ground Water at the Hyrail Site, Located at 415 North Front Street, Burbank, California

Per your request and authorization, Leighton and Associates, Inc. (Leighton) has prepared this health risk assessment and environmental fate analysis for the subject site. The health risk assessment was performed to determine whether detected contaminants would pose a significant risk to the health of potential residents at the site, as a worst case scenario, and to the health of workers and visitors to the site, for its planned use as a paved parking area. The environmental fate analysis was performed to determine the impact of the contaminated ground water beneath the site on the soil and soil vapor concentrations, as well as the impact of the soil and soil vapor contaminants on the ground water.

The following conclusions and recommendations are presented:

- Thirteen Volatile Organic Contaminants were detected in the soil and soil vapor, at the Hyrail site, 415 North Front Street, Burbank. Four Volatile Organic Contaminants were detected in the ground water (at approximately 110 feet below grade) in concentrations exceeding their respective Maximum Contaminant Levels.
- Soil and soil vapor contamination was found at the site in two major areas: in the region of the abandoned drum storage area (close to Monitoring Well MW-3), and near the location of the former chemical storage area (close to Monitoring Well MW-6). High levels of Trichloroethene (TCE) contamination in the soil were also detected in the location of Monitoring Well MW-2, which showed high levels of TCE contamination in the soil and ground water.
- Using the California Department of Health Services method of risk assessment, calculations indicated that there was no significant risk to human health in outside air at the subject site, but that there could be a significant risk to health inside a potential residence (worst case scenario) in the region of the abandoned drum storage area at the site, due to the presence in the soil of the carcinogen

Tetrachloroethene (PCE), and the hepatotoxin (liver toxin) 1,1,1-Trichloroethane (1,1,1-TCA).

- Using the U.S. Environmental Protection Agency (EPA) method of risk assessment, the Hazard Indices for potential residents at the site (worst case scenario) from the chronic inhalation of outdoor vapors and particulates, and indoor vapors, as well as from the chronic ingestion of contaminated soil, were all less than unity. This indicates that there would be no significant health hazard to residents at the site due to the noncarcinogenic effects of contaminants detected in site soil and soil vapor.
- Using the U.S. EPA method of risk assessment, the Carcinogenic Risk to potential residents at the site (worst case scenario) from the chronic inhalation of indoor vapors was found to be greater than 1 in 1,000,000 (a significant risk to human health), in the region of the abandoned drum storage area, due to the presence of the carcinogens 1,1-Dichloroethene in the soil vapor, and Tetrachloroethene in the soil.
- Using the U.S. Environmental Protection Agency (EPA) method of risk assessment, the Hazard Indices for workers and visitors to the site from the subchronic inhalation of outdoor vapors and particulates, as well as from the subchronic ingestion of contaminated soil, were all less than unity. This indicates that there would be no significant health hazard to workers and visitors to the site due to the noncarcinogenic effects of contaminants detected in site soil and soil vapor.
- Using the U.S. EPA method of risk assessment, the Carcinogenic Risk to workers and visitors to the site from the subchronic inhalation of outdoor vapors and particulates, as well as from the subchronic ingestion of site soil, was found to be less than 1 in 1,000,000 (no significant risk to human health), due to the presence of the contaminants detected in site soil and soil vapor.
- Using the U.S. EPA method of risk assessment, for outdoor air exposure, preliminary remediation goals for all contaminants detected in soil and soil vapor were satisfied without remediation.
- Using the U.S. EPA method of risk assessment, for indoor air exposure at a potential residence (worst case scenario), preliminary remediation goals (PRGs) were determined for the carcinogens 1,1-Dichloroethene (1,1-DCE) in soil vapor (2.45×10^{-2} mg/L), and PCE in soil (3.66 mg/kg).
- For the worst case scenario, remediation is likely to be required by regulating agencies; for the planned development, remediation may not be required.
- The environmental fate analysis showed that TCE in the ground water could impact the soil and soil vapor beneath the site, by ground water table fluctuations and vapor partitioning, and is suspected to be responsible for the high concentrations of TCE detected in soil in Monitoring Well MW-2.

- Based on the site data provided, the environmental fate analysis did not show that soil and soil vapor contaminants at the site had likely impacted the ground water table.
- The analyses performed represent Leighton's professional opinion concerning the risk of organic contaminant exposure at the site through volatilization from soil and soil vapor and the subsequent inhalation of contaminated air, as well as from the ingestion of contaminated soil.

This opportunity to be of service is sincerely appreciated. If you have any questions regarding this report, please contact Dr. Hedy Abedi in our Irvine office at (714) 250-1421.

1.0 INTRODUCTION

Soil and ground water at the subject site have been found to contain levels of volatile organic contaminants. This report addresses potential human health risks considering two scenarios: 1) the subject site is developed into a residential area and the residents are exposed to the chemicals of concern; and 2) the site is developed into a paved parking area where workers and visitors could potentially be exposed. The report also discusses the environmental fate of contaminants in the ground water, soil, and the soil vapor. The site is planned for development into a paved parking area.

1.1 Site History

The site, approximately 2,150 feet by 50 feet, is situated at the rear (west) of the Zero Corporation building between the Magnolia and Burbank Boulevard over-crossings, in the City of Burbank, California (Figure 1). A County of Los Angeles flood control channel, a concrete-lined storm water drainage channel that is a tributary of the Los Angeles river, runs along the northwestern corner boundary of the property. The Southern Pacific Transportation Company tracks are located on the southwestern side of the property. A single, vacant commercial structure (Bethanis Home Appliances) is located near the southern site boundary and is bisected by the western property line. Most of the property had been used in recent years as a parking area for the Zero Corporation, a manufacturer of sheet metal enclosures for electronic equipment. Portions of the Hyrail property were also used as storage areas for chemicals used at the Zero Corporation.

Operations that took place at the site from 1961 through December, 1991, included aluminum case drawing and washing; chromate deoxidizing; steel phosphate coating and chromium sealing; painting; aluminum machining; etching, deoxidizing and cleaning; aluminum vapor degreasing, and metal grinding.

2.0 SITE INVESTIGATION

2.1 Site Reconnaissance

On November 11, 1991, a visual site reconnaissance was performed by Leighton (Leighton, 1991) that included the northern and western sides of the Zero Corporation building. Plate 1 shows the locations and approximate dimensions of the observed features.

Seven (7) relatively large areas of freshly patched asphalt were observed on the west side of the Zero Corporation building, north of the abandoned Cypress Street crossing. These areas appeared to be associated with the empty drum storage areas, loading docks, former underground storage tanks (new and used hydraulic oil), and areas where equipment (e.g., compressors) had been used (see Figure 2, abandoned drum storage area). At one location, three signs on posts were seen leaning against a chain-link fence. These signs identified caustic soda, hydrochloric acid and nitric acid.

At the far north end of the Zero Corporation building, adjacent to the flood control channel, two drum storage areas with shed roofs were observed. The northernmost area was identified as being a storage location for caustic soda, the other area was identified as a storage location for drawing wax. Between the covered storage areas was a tank for recycled oil, a hydraulic oil (mineral oil) tank, two abandoned tanks (approximately 500 gallons) labeled 1,1,1-Trichloroethane (1,1,1-TCA)-inhibitor, and miscellaneous 55-gallon drums (see Figure 2, former chemical storage area).

At the southern end of the site, south of a vacant commercial structure, there were numerous abandoned television sets.

2.2 Soil and Ground Water Sampling History

In January 1991, Targhee, Inc. (Targhee, 1991) performed a site investigation on the Zero Corporation and Hyrail properties, including seven soil borings on the Hyrail site to depths of between 1 and 20 feet below grade. A summary of the chemical results from this investigation is presented in Appendix D, Table D-1.

In November, 1991, two soil borings were drilled and two soil gas surveys were performed at the Hyrail site (Leighton, 1991) (see Plate 1). Soil borings were drilled in two areas of the site thought to be contaminated. Boring B-25 was drilled in the northern part of the site close to the location of the former chemical storage area. Boring B-25 was drilled to a depth of 113 feet with ground water occurring at approximately 107 feet below grade.

Boring B-26 was drilled near the center of the site, just north of the vacated Cypress Street crossing, near an abandoned drum storage area. Boring B-26 was drilled to a total depth of 113 feet with ground water occurring at about 112 feet below ground surface (bgs).

In July 1992, Hydro Geo Chem Inc. (HGC) conducted soil sampling on the Hyrail property in the course of drilling four ground water monitoring wells on the site (Hydro Geo Chem, 1992c). Soil samples were collected and analyzed at 5-foot intervals to 120 feet below grade in Monitoring Wells MW-2, MW-3, MW-5, and MW-6. A summary of the chemical results from this soil sampling is presented in Appendix D, Table D-1, and monitoring well locations are shown in Figure 2.

In November 1991, Target Environmental Services, Inc. (Target) was contracted to identify whether soil gas contamination existed on the property (Leighton, 1991). Twenty-five (25) soil gas survey sample points were located at approximately equal increments along the length of the subject site. Soil gas samples were collected from 10-foot and 24-foot depths from each sample site where possible. Five (5) additional soil gas survey points and two soil boring locations were determined from the sampling. A summary of the chemical results from Target's soil gas sampling is presented in Appendix D, Table D-2.

Later in November 1991, Aero Vironment, Inc. (Aero) was contracted to access the source of soil gas contamination on the property (Leighton, 1991). Fifteen (15) soil gas samples were obtained, seven from a depth of 24 feet below grade (bg), and eight from a depth of 10 feet bg. A summary of the chemical results from Aero's soil gas sampling is presented in Appendix D, Table D-2.

In September 1992, HGC conducted soil gas sampling on the Hyrail property in Monitoring Wells MW-3 and MW-5, at various depths to 75 feet below grade (Hydro Geo Chem, 1992c). Results are presented in Appendix D, Table D-2.

Leighton also sampled the ground water in Borings B-25 and B-26 in November, 1991 (Leighton, 1991). A summary of the chemical results from the ground water sampling is presented in Appendix D, Table D-3.

Between July and September, 1992, HGC installed four ground water monitoring wells (MW-2, MW-3, MW-5 and MW-6) at the Hyrail site. A summary of the chemical results from ground water sampling of these monitoring wells in August 1992, is presented in Appendix D, Table D-3, and monitoring well locations are shown in Figure 2.

3.0 CHEMICAL EVALUATION

3.1 Contaminants Found Onsite

Soil samples from the Targhee, Inc., investigation in January, 1991 (Targhee, 1991) were chemically analyzed by EPA Method 8010/8020 for Halogenated Volatile Organics and Aromatic Volatile Organics, and by EPA Method 418.1 for Total Recoverable Petroleum Hydrocarbons (TRPH). Results indicated the presence of Volatile Organic Contaminants (VOCs) including 1,1-Dichloroethane (1,1-DCA), 1,1-Dichloroethene (1,1,-DCE), 1,1,1-Trichloroethane (1,1,1-TCA), Trichloroethene (TCE), and Tetrachloroethene (PCE) as well as the hydrocarbon Toluene. The region of highest contamination was found to be near the former chemical storage area on the west side of the Zero Corporation buildings, north of the abandoned Cypress Street crossing.

Samples from the two soil borings drilled at the site by Leighton in November, 1991, were analyzed by EPA Method 8015 (modified for gasoline) for Total Volatile Petroleum Hydrocarbons, by EPA Method 8020 for Benzene, Toluene, Ethylbenzene and Total Xylenes, as well as by EPA Method 8240 for Volatile Organics. The VOCs 1,1,1-TCA, 1,1-DCE and PCE were detected in the soil samples. Soil samples collected by HGC in July 1992 from Monitoring Wells MW-2, MW-3, MW-5, and MW-6, were analyzed by EPA Methods 418.1 and 8010. All of the above named contaminants were detected in the site soil from this investigation.

From Target's soil gas survey conducted in November, 1991 (Leighton, 1991), and using EPA Method 601 (modified) for chlorinated solvents, the VOCs 1,1-DCE, Chloroform, 1,1,1-TCA, TCE, and PCE were detected in the soil gas samples. From Aero's soil gas survey, also conducted in November, 1991, the VOCs 1,1,1-TCA, TCE, PCE, and 1,2-Dichloroethane (1,2-DCA) were detected in the soil gas samples. From HGC's soil gas survey of Monitoring Wells MW-3 and MW-5, in September 1992, the above named contaminants were also detected.

From the site investigations, soil and soil vapor contamination was found at the site in two major areas: in the region of the abandoned drum storage area (close to Monitoring Well MW-3), and near the location of the former chemical storage area (close to Monitoring Well MW-6). The highest concentrations of 1,1-DCE, 1,2-Dichloropropane, Methylene Chloride, PCE, and 1,1,1-TCA in the soil and/or soil vapor were found in the region of the abandoned drum storage area. The highest concentrations of Chloroform, Dibromochloromethane, 1,1-DCA, 1,2-DCA, 1,1,2-TCA, Toluene and Dichlorodifluoromethane in the soil and/or soil vapor were found in the region of the former chemical storage area. High levels of TCE contamination in the soil were detected in the location of Monitoring Well MW-2. The three areas of contamination at the site are shown in Figure 2.

From Leighton's November 1991 investigation, ground water samples from soil Borings B-25 and B-26 were analyzed using EPA Method 8015 (modified for gasoline) for Total Volatile Petroleum Hydrocarbons (TVPH); EPA Method 8020 for Benzene, Toluene Ethylbenzene, and Total Xylenes; and EPA Method 8240 for Volatile Organics. The major contaminants

detected were 1,1-DCE, cis-1,2-Dichloroethene (cis-1,2-DCE), TCE, and PCE. In September 1992, HGC analyzed ground water samples from Monitoring Wells MW-1 to MW-6 on the Hyrail and Zero Corporation properties by EPA Method 8260 for Volatile Organics. Only TCE and Chloroform were detected above their detection limits.

3.2 Chemicals of Concern

Thirteen VOCs were detected in the soil and soil vapor samples. All were designated chemicals of concern because they were chemicals for which one or some of the following had been determined: California Environmental Protection Agency (Cal. EPA) Applied Action Levels; California Code of Regulations Title 22 Sections 12703, 12705, and 12709, no significant risk levels; and U.S. EPA toxicity values. The contaminants are shown in Table 1, along with their concentrations in soil and/or soil vapor, that would produce the highest emission rates.

Four VOCs were detected in the ground water (at approximately 110 feet below grade) in concentrations above their respective California Maximum Contaminant Levels (MCLs). The highest concentrations detected were: 1,1-DCE (9 µg/L), cis-1,2-DCE (37 µg/L), PCE (7 µg/L), and TCE (6,200 µg/L).

3.3 Regulatory Criteria

Site assessment and mitigation of contaminated soil is under jurisdiction of the California Environmental Protection Agency, Department of Toxic Substances Control (formerly the Department of Health Services). One of the tools this agency uses to analyze site assessment and mitigation is The California Site Mitigation Decision Tree Manual (Manual). The Manual sets forth protocols for determining risks of contaminants through different exposure routes. The Manual also sets forth Applied Action Levels (AALs) in air and water media for known contaminants. AALs are criteria that delineate the concentration of a substance in a medium which when exceeded is determined to present a significant risk of adverse impact to a biological receptor. Three tests have been formulated to determine whether there is a significant risk for single chemical/single medium exposure, single chemical/multiple media exposure, and multiple chemical/multiple media exposure.

The U.S. EPA has also issued procedures to be used in assessing health risk (U.S. EPA, 1989, and U.S. EPA, 1986). The baseline risk assessment (U.S. EPA, 1989) is an analysis of the potential adverse health effects caused by hazardous substance releases from a site, in the absence of actions to control or mitigate the releases. There are four steps in the U.S. EPA baseline risk assessment process:

- Data collection and analysis;
- Exposure assessment;
- Toxicity assessment; and
- Risk characterization.

Data collection and analysis involves gathering and analyzing site data to identify potential chemicals of concern. Exposure assessment involves the estimation of the type and magnitude of exposures to chemicals of potential concern at the site, including identifying potential exposure pathways and estimating contaminant intakes. Toxicity assessment involves evaluating the potential for chemicals to cause adverse health effects. This information is available from EPA's Integrated Risk Information System (IRIS) (U.S. EPA, 1992) and Health Effects Assessment Summary Tables (U.S. EPA, 1990). Risk characterization involves estimating cancer risks and non-cancer hazard indices as well as evaluating uncertainty. References are presented in Appendix A.

4.0 DEVELOPMENT OF SOIL CLEANUP LEVELS

4.1 Overview

The U.S. EPA has recently issued procedures for developing risk-based preliminary remediation goals (U.S. EPA, 1991) together with standardized default exposure parameters for use when site conditions are unknown. Risk-based equations have been derived by the U.S. EPA to reflect the potential risk from exposure to a contaminant, given a specific pathway, medium, and land-use combination. By setting the total risk for carcinogenic effects for each contaminant at a target level of 1 in 1,000,000, the concentration term (i.e., the risk-based preliminary remediation goal) can be calculated. As well as this, the total risk for non-carcinogenic effects for each contaminant is set at a Hazard Index level of 1.0 in each medium.

4.2 Exposure Scenarios and Pathways

This report provides an assessment of the exposure of organic vapors to potential residents (if the site were to be developed to a residential area) as a worst case scenario, as well as to workers and visitors to the site at 415 North Front Street, Burbank, California (see Appendix B). Four contaminants found in the soil and soil vapor (Chloroform, Trichloroethene, Toluene and 1,1,1-Trichloroethane) have AALs. Six contaminants (Dibromochloromethane, 1,1-Dichloroethane, 1,2-Dichloroethane, Methylene Chloride, Tetrachloroethene, and 1,1,2-Trichloroethane) have CCR Title 22 No Significant Risk levels. An assessment was performed based on the concentrations of the contaminants found in the soil and soil vapor that would produce the highest emission rates, using data collected during subsurface investigations in 1991 and 1992. The calculations (Appendix B) estimate the emission rates of the contaminants from the soil and soil vapor, and the resultant concentrations of these contaminants in outdoor air, and inside a residence at 415 North Front Street, as a worst case scenario. The calculated air concentrations are then compared to criteria set forth by the California EPA to estimate the attendant health risks.

Exposure assessment has also been performed in accordance with the U.S. EPA risk assessment procedures as set forth in the U.S. EPA (1989). When any chemical enters the environment, it becomes distributed in soil, water, air and biota. The exact distribution into these media depends on each compound's physical and chemical properties. Once a chemical is in the soil, it can reach humans in five ways by:

1. Mobilizing into water and then being ingested or absorbed;
2. Passing into the food chain and then being ingested;
3. Volatilizing into the air and then being inhaled;
4. Mobilizing into air as dust through wind action, and then being inhaled; or

5. Remaining in the soil and then being ingested or absorbed.

These pathways to man are shown schematically in Figure 3.

Path 1: Ground water levels were observed to vary between 106 and 116 feet. Because ground water is not a source of drinking water, and is not foreseen as becoming a source of drinking water, this pathway will not be considered in the analysis.

Path 2: Exposure to contaminants through the food chain is not a potential exposure pathway to a human receptor because the land will not be used for agricultural purposes. Because of this, exposure to contaminants through the food chain has not been considered in the analysis.

Path 3: Volatilization of contaminants from the soil and soil vapor at the site would be a potential exposure pathway to man in outdoor air for the planned development and in indoor air as a worst case. Analyses for inhalation of site air contaminated with volatile organic compounds (VOCs) are shown in Appendix B.

Path 4: In the event that contaminated soil were to remain on the ground surface, analyses for inhalation of contaminated soil suspended in air as dust are shown in Appendix B.

Path 5: In the event that contaminated soil were to remain on the ground surface, analyses for the direct ingestion of contaminated soil are shown in Appendix B. Skin absorption of contaminated soil is assumed insignificant compared with soil ingestion.

4.3 Exposure Assumptions and Assessment Methodology

For the three exposure pathways considered, the concentrations of contaminants detected in site soil and soil vapor that would produce the highest emission rates were used in the analyses. U.S. EPA Hazard Indices and Carcinogenic Risks were calculated for exposure pathways 3, 4 and 5. The Hazard Index has been developed to assess the overall potential for noncarcinogenic effects from exposure to multiple contaminants. It is defined as the sum of more than one hazard quotient for multiple substances and/or multiple exposure pathways. It is calculated for chronic (30-year) exposures and subchronic (periodic) exposures at the site. The hazard quotient is defined as the ratio of a single substance exposure level over a specified time period to a reference dose for that substance derived from a similar exposure period. This index is not a mathematical prediction of incidence or severity of effects. It is a numerical index used to identify potential exposure problems. U.S. EPA Chronic Reference Dose values are provided in Appendix E, Table E-1, Subchronic Reference Dose values are provided in Table E-2.

For carcinogens, the U.S. EPA estimates the risks as the incremental probability of an individual developing cancer over a lifetime as a result of exposure to the potential carcinogen. The EPA has also developed Slope Factors that convert estimated daily intakes, averaged over a lifetime (70 years) of exposure, directly to incremental risk of an individual

developing cancer. This carcinogenic risk estimate is generally an upper-bound estimate, so that the true risk is likely to be less than that predicted. U.S. EPA Cancer Potency Factors are provided in Appendix E, Table E-3.

4.4 Results of Risk Calculations

Tests performed for single chemical/air exposure and multiple chemical/air exposure to evaluate the health risks to humans of volatile chemicals of potential concern diffusing from site soil and soil vapor into outdoor air showed that there would be no risk of an adverse health impact from individual chemicals (Table B-2 and B-4) or groups of chemicals (Table B-5). The same tests performed for the contaminants diffusing from site soil and soil vapor into the indoor air of a potential residence (worst case scenario), located in the region of the abandoned used drum storage area, showed that there may be a potential risk of an adverse impact on humans due to the presence in the soil of the carcinogen Tetrachloroethene, and the hepatotoxin (liver toxin) 1,1,1-Trichloroethane (see Appendix B, Table B-2). The assessment was performed using data for worst case conditions of low wind speed, slow dispersion of the plume, minimum exchange rate of air inside a building, minimum ceiling height under the Building Code, and highest concentrations of contaminants detected. The potential risk for an adverse effect from Tetrachloroethene and 1,1,1-Trichloroethane also means there is a potential risk from the carcinogenic and hepatotoxin (liver toxin) groups (see Table B-5).

Using the standard parameter values shown in Table 2, the exposure routes of chronic inhalation of outdoor vapors and particulates and indoor vapors, as well as chronic ingestion of contaminated soil (residential land use) were analyzed as a worst case scenario. Hazard Indices averaged over a period of 30 years (U.S. EPA, 1989) for potential residents at the site (worst case scenario) showed that there would be no significant health hazard due to the noncarcinogenic effects of contaminants detected in site soil and soil vapor (see Appendix B, Tables B-7 to B-11).

The exposure routes of chronic inhalation of outdoor vapors and particulates and indoor vapors, as well as chronic ingestion of contaminated soil, were also analyzed in order to determine the lifetime carcinogenic risk as a result of exposure to carcinogens. The Carcinogenic Risk (U.S. EPA, 1989) calculated for infants, and children to 6 years of age, as well as for older people were averaged over a lifetime of 70 years. Results are shown in Appendix B, Tables B-12 to B-16. It can be seen from these tables that there may be a significant carcinogenic risk to health from the chronic inhalation of indoor vapors (Table B-14), in the region of the abandoned drum storage area, due to the presence of 1,1-DCE in the soil vapor, and PCE in the soil, and consequently when residential land use is considered (Table B-16).

Using the standard parameter values shown in Table 2, the exposure routes of subchronic (workers and visitors to the site) inhalation of outdoor vapors and particulates, as well as the subchronic ingestion of contaminated soil were analyzed as the proposed commercial land use scenario. Hazard Indices averaged over a period of 30 years (U.S. EPA, 1991) at the site

showed that there would be no health hazard due to the noncarcinogenic effects of contaminants detected in site soil and soil vapor (see Appendix B, Tables B-18 to B-21).

The exposure routes of the subchronic inhalation of outdoor vapors and particulates, as well as the subchronic ingestion of contaminated soil (commercial land use), were also analyzed in order to determine the lifetime Carcinogenic Risk as a result of exposure to carcinogens. The Carcinogenic Risk (U.S. EPA, 1989) calculated for infants, and children to 6 years of age, as well as for older people were averaged over a lifetime of 70 years. Results are shown in Appendix B, Tables B-22 to B-25. It can be seen from these tables that there would be no significant subchronic Carcinogenic Risk to health due to the presence of the contaminants detected in site soil and soil vapor.

4.5 Calculation of Soil Cleanup Levels

Using the data available and the U.S. EPA risk assessment methodology, all calculated Hazard Indices for chronic and subchronic exposures were less than 1.0 (see Table 3), thereby satisfying preliminary remediation goals for noncarcinogenic health effects, without remediation of detected contaminants in site soil and soil vapor. Detailed results are shown in Appendix B, Tables B-7 to B-11 and B-18 to B-21.

For the worst case scenario of chronic exposures to carcinogens (residential land use), the risk level of 1 in 1,000,000 was exceeded for indoor air due to 1,1-DCE in soil vapor and PCE in soil (see Table 4). Detailed calculations to determine Preliminary Remediation Goals for these contaminants (2.45×10^{-2} mg/L for 1,1-DCE, and 3.66 mg/kg for PCE) are presented in Appendix B, Section 7.3.

For the planned scenario of subchronic exposures to carcinogens (commercial land use), the risk level of 1 in 1,000,000 is not exceeded (see Table 4). This indicates that the preliminary remediation goals for carcinogenic effects from use of the site as a paved parking area, have been satisfied without remediation of contaminants in site soil and soil vapor.

5.0 ENVIRONMENTAL FATE ANALYSIS

An environmental fate analysis was performed in order to determine the impact of the ground water contamination plume beneath the Hyrail and Zero Corporation properties, on the soil and soil vapor concentrations at the Hyrail site. Contaminated ground water is located at between 106 and 116 feet below grade at the Hyrail site. The impact of soil and soil vapor contaminants on the ground water table was also examined.

Four contaminants: 1,1-Dichloroethene, cis-1,2-Dichloroethene, Tetrachloroethene, and Trichloroethene were detected in ground water exceeding their California Maximum Contaminant Levels (MCLs). An estimate was made of the soil concentration of these contaminants in contact and in equilibrium with the ground water concentration of the same contaminants. This analysis showed that except for TCE, the resulting soil concentrations were insignificant. The equilibrium soil concentration for TCE indicated that this contaminant in the ground water could impact the soil and soil vapor beneath the site, and could possibly be responsible for the high concentrations of Trichloroethene detected in soil in Monitoring Well MW-2.

The soil vapor concentrations for the four ground water contaminants were calculated using Henry's Law. The calculations showed that only the TCE soil vapor concentration was significant. The equilibrium soil vapor concentration for TCE indicated that this contaminant in the ground water could impact the soil vapor beneath the site by upward diffusion from the water table. However, no soil gas samples were collected from depths approaching the ground water table during site investigations.

With respect to the impact of soil and soil vapor contaminants on the ground water, the only significant contamination detected in the soil at ground water depth, was TCE in MW-2 at depths of between 100 and 120 feet below grade. The high concentrations of TCE in the soil in the vicinity of MW-2 could possibly have originated from the ground water. Soil vapor data was found to be lacking at ground water depth (see Appendix D, Table D-2). As a result, the impact of the soil contaminants on the ground water could not be adequately evaluated.

The effect of biodegradation of chlorinated contaminants in the ground water was not observed.

6.0 CONCLUSIONS

Based on the data obtained by Leighton and other consultants from subsurface investigations conducted at the subject site and on the adjacent Zero Corporation property in 1991 and 1992, the following conclusions are presented:

- Thirteen Volatile Organic Contaminants were detected in the soil and soil vapor, at the Hyrail site, 415 North Front Street, Burbank. Four Volatile Organic Contaminants were detected in the ground water (at approximately 110 feet below grade) in concentrations exceeding their respective Maximum Contaminant Levels.
- Soil and soil vapor contamination was found at the site in two major areas: in the region of the abandoned drum storage area (close to Monitoring Well MW-3), and near the location of the former chemical storage area (close to Monitoring Well MW-6). High levels of TCE contamination in the soil were also detected in the location of Monitoring Well MW-2, which showed high levels of TCE contamination in the ground water.
- Using the California Department of Health Services method of risk assessment, calculations indicated that there was no significant risk to human health in outside air at the subject site, but that there could be a significant risk to health inside a potential residence (worst case scenario) in the region of the abandoned drum storage area at the site, due to the presence in the soil of the carcinogen PCE, and the hepatotoxin (liver toxin) 1,1,1-TCA.
- Using the U.S. Environmental Protection Agency (EPA) method of risk assessment, the Hazard Indices for potential residents at the site (worst case scenario) from the chronic inhalation of outdoor vapors and particulates, and indoor vapors, as well as from the chronic ingestion of contaminated soil, were all less than unity. This indicates that there would be no significant health hazard to residents at the site due to the noncarcinogenic effects of contaminants detected in site soil and soil vapor.
- Using the U.S. EPA method of risk assessment, the Carcinogenic Risk to potential residents at the site (worst case scenario) from the chronic inhalation of indoor vapors was found to be greater than 1 in 1,000,000 (a significant risk to human health), in the region of the abandoned drum storage area, due to the presence of the carcinogens 1,1-Dichloroethene in the soil vapor, and Tetrachloroethene in the soil.
- Using the U.S. Environmental Protection Agency (EPA) method of risk assessment, the Hazard Indices for workers and visitors to the site from the subchronic inhalation of outdoor vapors and particulates, as well as from the subchronic ingestion of contaminated soil, were all less than unity. This indicates that there would be no significant health hazard to workers and visitors to the site due to the noncarcinogenic effects of contaminants detected in site soil and soil vapor.

- Using the U.S. EPA method of risk assessment, the Carcinogenic Risk to workers and visitors to the site from the subchronic inhalation of outdoor vapors and particulates, as well as from the subchronic ingestion of site soil, was found to be less than 1 in 1,000,000 (no significant risk to human health), due to the presence of the contaminants detected in site soil and soil vapor.
- Using the U.S. EPA method of risk assessment, for outdoor air exposure, preliminary remediation goals for all contaminants detected in soil and soil vapor were satisfied without remediation.
- Using the U.S. EPA method of risk assessment, for indoor air exposure at a potential residence (worst case scenario), preliminary remediation goals were determined for the carcinogens 1,1-DCE (2.45×10^{-2} mg/L) in soil vapor, and PCE in soil (3.66 mg/kg).
- For the worst case scenario, remediation is likely to be required by regulating agencies; for the planned development, remediation may not be required.
- The environmental fate analysis showed that TCE in the ground water could impact the soil and soil vapor beneath the site by ground water table fluctuations and vapor partitioning, and is suspected to be responsible for the high concentrations of TCE detected in soil in Monitoring Well MW-2.
- Based on available site data, the environmental fate analysis did not show that soil and soil vapor contaminants at the site had likely impacted the ground water table.
- The analyses performed represent Leighton's professional opinion concerning the risk of organic contaminant exposure at the site through volatilization from soil and soil vapor and the subsequent inhalation of contaminated air, as well as from the ingestion of contaminated soil.

TABLE 1

Summary of Chemicals of Potential Concern

Chemical of Potential Concern		Maximum Concentration in Soil (mg/kg)	Maximum Concentration in Soil Vapor (mg/L)	Formula	Formula Weight M_1 (g/g mol)
Carcinogens	Chloroform	2.00×10^{-3}	3.40×10^{-4}	CHCl_3	119.38
	Dibromochloromethane	2.80×10^{-3}		CHBr_2Cl	208.28
	1,1-Dichloroethane	8.00×10^{-4}		$\text{C}_2\text{H}_4\text{Cl}_2$	98.96
	1,2-Dichloroethane		7.80×10^{-2}	$\text{C}_2\text{H}_4\text{Cl}_2$	98.96

APPENDIX B

Risk Assessment Calculations and Determination of
Soil Clean-up Levels

Two risk assessments will be performed for the Hyrail site; first the worst-case scenario that of residential land use, and second, for the planned commercial land use, that of a paved parking area.

1.0 CALCULATION OF DIFFUSION COEFFICIENT IN AIR:

In order to calculate the concentrations of contaminants in outside air and inside a residential building constructed on the Hyrail site, the diffusion coefficient for each contaminant in air was first calculated.

Assuming ambient temperature 20°C

Using equation of Fuller et al. (1966) as shown in CDHS Decision Tree Manual (1986), para 8.6.4 II.B.2., p. 8-56.

$$D_{i, \text{air}} = \frac{10^{-3} T^{1.75} [(1/M_{\text{air}}) + (1/M_i)]^{0.5}}{P[(\Sigma v)_{\text{air}}^{0.333} + (\Sigma v)_i^{0.333}]^2} \quad (1)$$

Where

- $D_{i, \text{air}}$ = diffusion coefficient of contaminant i in air, cm^2/s
- T = ambient temperature, K
- M_{air} = molecular weight of air = 28.95 g/g mol
- M_i = formula weight of contaminant i, g/g mol
- P = absolute pressure, atm
- $(\Sigma v)_{\text{air}}$ = sum of diffusion volume increments for components of air
- $(\Sigma v)_i$ = sum of diffusion volume increments for components of contaminant i

A simplified version of Equation 1 for ambient temperature $T = 293$ K, and atmospheric pressure $P = 1$ atm is:

$$D_{i,\text{air}} = \frac{20.75 [0.0345 + (1/M_i)]^{0.5}}{[2.72 + (\Sigma v_i)^{0.333}]^2}$$

Fuller et al. (1969) updated the data of Fuller et al. (1966) and provided the following values for diffusion volume increments:

$$(\Sigma v)_{\text{air}} = 19.7$$

$$C = 15.9 \quad Cl = 21.0 \quad Br = 21.9 \quad H = 2.31 \quad \text{and,}$$

subtract 18.3 for a compound with an aromatic or heterocyclic ring.

For example:

For Toluene, C_7H_8 (with one aromatic ring), the sum of diffusion volume increments is:

$$7(15.9) + 8(2.31) - (18.3) = 111.48$$

Table B-1 lists the diffusion coefficients calculated using Equation 1 and the diffusion volumes, formula weights and formulae for the 13 organic contaminants found site soil and/or soil vapor.

2.0 SOIL CONCENTRATION ANALYSIS

2.1 Calculation of Emission Rate Due to Soil Contamination

The emission rate from soil to air for each of the 10 organic contaminants detected in site soil was calculated using the CDHS California Site Mitigation Decision Tree Manual, Paragraph 8.5.4a, Equation 2.

$$\text{Where: } Q_i = D_{i,\text{air}} C_{s,i} (P_i)^{4/3} W_i A_i / L_i \quad (2)$$

$$Q_i = \text{emission rate of contaminant } i, \text{ g/s}$$

$$D_{i,\text{air}} = \text{diffusion coefficient of contaminant } i \text{ in air, cm}^2/\text{s}$$

$C_{s,i}$ = saturation or equilibrium vapor concentration of component i at 20°C , g/cm^3

Where:

$C_{s,i}$ = $P_i M_i / (RT)$ and

P_i = vapor pressure of contaminant i at temperature T , mm Hg

M_i = formula weight of contaminant i $\text{g}/\text{g mol}$

R = gas constant = $82.05 \text{ cm}^3 \cdot \text{atm}/(\text{g mol} \cdot \text{K})$

T = ambient temperature, 293 K

p_t = total soil porosity

W_i = weight fraction of contaminant i in the soil

A_i = surface area of contaminated land, for contaminant i cm^2

L_i = depth of soil cover over W_i , cm

Soil contamination was found at the site in two major areas: in the region of the abandoned drum storage area (close to monitoring well MW-3; see Figure 2), and near the location of the former chemical storage area (close to monitoring well MW-6). The area near MW-3 was approximated as an ellipse 200 feet by 50 feet, area 7854 feet^2 ($7.3 \times 10^6 \text{ cm}^2$) where the highest concentrations of 1,1-DCE, 1,2-Dichloropropane, PCE and 1,1,1-TCA were detected. The area near MW-6 was approximated as an ellipse 400 feet by 100 feet, area $31,416 \text{ feet}^2$ ($2.92 \times 10^7 \text{ cm}^2$) where the highest concentrations of Chloroform, Dibromochloromethane, 1,1-DCA, 1,1,2-TCA and Toluene were detected. High levels of TCE contamination in the soil were also detected in the location of monitoring well MW-2. This area was approximated as a semicircle of 50-foot radius, area 3927 feet^2 ($3.65 \times 10^6 \text{ cm}^2$).

The depth of soil cover L_i at which the highest contamination was detected varied with the contaminant, but ranged from 1.0 to 106 feet (30 cm to 3230 cm).

Values for saturation concentration $C_{s,i}$ at 20°C were calculated as shown above and are presented in Table B-1.

The total soil porosity was estimated to be 0.30, which is representative of alluvial soil. The weight fraction of each contaminant in the soil was taken to be the concentration that would produce the highest emission rate (see Appendix D, Table D-1). The weight fraction of each contaminant in the soil was the worst case value identified at the site. These values are tabulated in Table B-1 together with the depth of soil cover at which they occurred.

Substituting values for soil porosity p_i into Equation 2 gives:

$$Q_i = \frac{2.01 \times 10^{-1}}{L_1} D_{i,air} C_{s,i} W_i A_i$$

Calculated values of Q_i are shown in Table B-1.

2.2 Concentration of Soil Contaminants in Outdoor Air

The concentrations of contaminants in outdoor air above the site of contamination were calculated using the following equation (CDHS, California Site Mitigation Decision Tree Manual, Paragraph 8.6.1.b):

$$C_{o,i} = 16 Q_i / (L_v \sigma_z U (2\pi)^{1/2}) \quad (3)$$

Where:

$C_{o,i}$ = concentration of contaminant i in outdoor air, g/m^3

Q_i = emission rate of contaminant i , g/s

U = wind speed, m/s

σ_z = standard deviation of the plume concentration in the vertical (z) direction, m

L_v = $L_1 + L'$, m

L_1 = distance from the site center to the receptor, m

L' = distance from the site center to the virtual upwind point source and is given by 2.5 times the cross-wind width of the site, m

The minimum distance L_1 from the center of the site to the receptor, for which this equation applies, is 100m. Since the receptors will be located at the site, this value of L_1 was used. The maximum cross-wind width of the site permitted under the conditions applying to this equation is 40 m, giving a value for L' , the distance from the site center to the virtual upwind point source of 100 m. The standard deviation σ_z of the plume concentration in the vertical direction was assumed to be low. A value of unity was used in Equation 3. The wind speed U was also assumed to be low. A value of 2 m/s was used.

Substituting in Equation 3:

$$\begin{aligned} C_{o,i} &= 16Q_i / (200 \times 1 \times 2 \times (6.2832)^{1/2}) \\ &= 1.60 \times 10^{-2} Q_i \text{ g/m}^3 \\ &= 1.60 \times 10^4 Q_i \text{ } \mu\text{g/m}^3 \end{aligned}$$

Calculated soil/contaminant concentrations in outdoor air above the site area are shown in Table B-2.

2.3 Concentration of Soil Contaminants in Indoor Air

The concentration of contaminants in air inside a residential building at the Hyrail site was calculated using the following equation:

$$C_{I,i} = Q_i A_B / (A_i V_B a) \quad (4)$$

Where:

- $C_{I,i}$ = contaminant i concentration in indoor air, g/m^3
- Q_i = contaminant i emission rate, g/s
- A_B = area of building in contact with soil, m^2
- A_i = surface area of contaminated land for contaminant i, m^2
- V_B = volume of air inside building, m^3
- a = air exchange rate, s^{-1}

The area of the building in contact with soil (A_B) divides into the volume of air inside the building (V_B), so the height of the rooms is the determining factor. The worst case situation would exist when the height of the room is 7.5 feet (2.29 m) which is the minimum height in the California Building code. The same areas of contaminated land as used in Equation 2 were used here (see page B-3).

The 1989 Residential Energy Regulations for California specify a minimum air exchange rate of 0.5 air changes per hour. This value was used for "a" in Equation 4.

Equation 4 then becomes:

$$\begin{aligned} C_{i,l} &= Q_i \times 3600 / (A_i \times 2.29 \times 0.5) \\ &= 3.14 \times 10^3 Q_i / A_i \text{ g/m}^3 \\ &= 3.14 \times 10^9 Q_i / A_i \text{ } \mu\text{g/m}^3 \end{aligned}$$

Calculated worst case contaminant concentrations in indoor air are shown in Table B-2.

3.0 SOIL VAPOR CONCENTRATION ANALYSIS

3.1 Calculation of Emission Rate Due to Soil Vapor Contamination

The emission rate for each of the contaminants in air above the site was calculated based on soil gas concentrations using the CDHS Decision Tree Manual, Paragraph 8.5.4.a, Equation 1.

$$Q_{s,i} = D_{i,air} C_{a,i} (p_a^{10/3} / p_t^2) A_i / L_i \quad (5)$$

Where:

- $Q_{s,i}$ = soil gas emission rate of contaminant i, g/s
- $D_{i,air}$ = diffusion coefficient of contaminant i in air, cm^2/s
- $C_{a,i}$ = soil gas concentration of contaminant i, g/cm^3
- p_a = air-filled soil porosity
- p_t = total soil porosity
- A_i = surface area of contaminated land for contaminant i, cm^2
- L_i = depth of soil cover above contaminant i, cm

Values of highest soil vapor concentrations detected are shown in Table B-3.

The soil at the site consists of alluvium deposits with an estimated total porosity of 0.30. Soil moisture is estimated to be 10 percent, leaving an air-filled porosity of 0.25. Values for diffusion coefficients were calculated using Equation 1 and are shown in Table B-3. The depth of soil cover for the soil gas samples ranged from 5 feet (152.4 cm) to 50 feet (1524 cm) and the areas of contaminated land varied with the contaminants. The area near MW-3 showed the

highest soil gas concentrations for 1,1-DCE, Methylene Chloride, PCE, TCE and 1,1,1-TCA ($7.30 \times 10^6 \text{ cm}^2$). The area near MW-6 showed the highest soil gas concentrations for Chloroform, 1,2-DCA, and Dichlorodifluoromethane ($2.92 \times 10^7 \text{ cm}^2$). Calculated values of emission rates are presented in Table B-3.

3.2 Concentration of Soil Vapor Contaminants in Outdoor and Indoor Air

The outdoor and indoor air concentrations due to soil vapor contamination were calculated using Equations 3 and 4, respectively, and are presented in Table B-4.

4.0 RISK APPRAISAL PROCEDURE

In order to determine the level of risk associated with both the outdoor and indoor contaminant concentrations in air, the concentrations calculated are compared with the California Department of Health Services Applied Action Levels (CDHS AALs) and California Title 22 No Significant Risk Levels (NSRLs). These are shown in Tables B-2 and B-4.

From Table B-2, all outdoor air concentrations due to soil contamination are lower than their AALs or NSRLs. For indoor air, the values are exceeded for PCE and 1,1,1-TCA. From Table B-4, all outdoor and indoor air concentrations due to soil vapor contamination are lower than their AALs.

The CDHS Manual (1986) and Applied Action Levels (1991) describe three tests for evaluating the risk associated with exposure by a biological receptor to contaminants on a site containing them. If any of the tests fail, it is concluded that a sensitive biological receptor of concern is considered at significant risk for an adverse impact, and that a risk management process should be initiated.

The first test evaluates single chemical/single medium exposure:

$$\frac{C_{\text{medium}, i}}{\text{AAL}_{\text{medium}, i}} < 1.0 \quad (6)$$

Values for $C_{\text{medium}, i}$ were taken from Tables B-2 and B-4 for the media of outdoor and indoor air. Values for $\text{AAL}_{\text{medium}, i}$ are also shown in these Tables. The ratios $C_{o,i}/\text{AAL}_{\text{air},i}$ and $C_{i,i}/\text{AAL}_{\text{air},i}$ for each contaminant are also shown in Tables B-2 and B-4. All the values calculated are below 1.0 except for PCE and 1,1,1-TCA in indoor air. Test 1 shows that there may be a potential risk to humans from the indoor air concentration of PCE and 1,1,1-TCA detected in soil at the Hyrail site. This is the worst case scenario that is not actually planned for the site.

The second test evaluates a single chemical/multiple media exposure. Since no AALs for soil contact by human receptors have been determined by the CDHS, for the chemicals of concern, only one medium, air, is involved in this assessment. The second test cannot be performed.

The third test evaluates multiple chemical/multiple media exposure:

$$\sum \frac{C_{\text{medium}, i}}{\text{AAL}_{\text{medium}, i}} < 1.0 \quad (7)$$

Test 3 is conducted for each group of chemicals that produces the same toxic effect. If the sum for any group exceeds unity, then the test fails and the biological receptor is considered at significant risk for an adverse impact. The chemicals detected at the site for which AALs and NSRLs have been determined were considered to fall into four groups: carcinogens, developmental toxins, hepatotoxins and pulmonary toxins. Test 1 ratios were summed within each group. Test 3 shows that there may be a potential risk to human health from the indoor air concentration of carcinogens and hepatotoxins (see Table B-5).

5.0 U.S. EPA EXPOSURE PATHWAY ANALYSIS FOR NONCARCINOGENIC EFFECTS - RESIDENTIAL LAND USE

5.1 Inhalation of Contaminated Air

The worst case exposure pathway at the subject site would be for residential land use. Analyses will, therefore, be performed for chronic exposures to potential residents at the site, as a worst case situation.

In U.S. EPA (1991), a residential period of 30 years is recommended when estimating chronic exposures. For inhalation of contaminated air by residents at the site over a 30-year period, the time weighted average intake rate of contaminant i per day, per kilogram of body weight for each age group j , $I_{a,ij}$ is represented by the following equation (U.S. EPA, 1989, Exhibit 6-16):

$$I_{a,ij} = C_{a,i} I_{h,j} E_F F_j E_{Dj} / (B_j T_A) \quad (8)$$

Where:

$I_{a,ij}$ = Intake rate of contaminant i for age group j , mg/(kg body wt.d)

$C_{a,i}$ = Concentration of contaminant i in air, mg/m³

$I_{h,j}$ = Inhalation rate of air per day for age group j , m³/d

- E_F = Exposure frequency, or fraction of year age group is exposed
 F_j = Exposure time, or fraction of day age group j is exposed
 $E_{D,j}$ = Exposure duration for age group j, yr
 B_j = Body weight for age group j, kg
 T_A = Total period over which exposure is averaged, yr

Table B-6 presents a summary of parameter values accepted as standard by the U.S. EPA for residential land use. The concentrations of contaminants found in site soil or soil vapor that would produce the highest emission rates were used in the analyses. All contaminant concentrations detected are shown in Appendix D. Air concentrations calculated from these (shown in Sections 2 and 3) are presented in Tables B-2 and B-4.

For an infant of 10 kg body weight, inhalation rate of 5 m³/d (see Table B-6), exposure time 0.17 (outdoors 4 hours per day), exposure frequency 0.96 (350 days per year), exposure duration of 2 years, total period 30 years, breathing Chloroform in site air of 7.35 x 10⁻⁹ mg/m³, Equation (8) becomes:

$$\begin{aligned}
 I_{a,\text{Chloroform,infant}} &= \frac{7.35 \times 10^{-9} \text{ mg/m}^3 \times 5 \text{ m}^3/\text{d} \times 0.96 \times 0.17 \times 2 \text{ yr}}{10 \text{ kg body wt} \times 30 \text{ yr}} \\
 &= 4.00 \times 10^{-11} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated chronic time weighed average intake rates by inhalation of outdoor vapors for each age group averaged over 30 years are presented in Table B-7.

5.2 Inhalation of Contaminated Soil and Dust

For inhalation of contaminated soil and dust by residents at the site, the time weighted average intake rate of contaminant i per day, per kilogram of body weight for each age group j, $I_{d,i,j}$, is represented by the following equation. A dust loading of 0.3 mg dust/m³ air was assumed, and 20 percent of airborne dust was assumed to be respirable by site receptors. Standard parameter values as shown in Table B-6 were also assumed.

$$I_{d,i,j} = C_{d,i} I_{h,j} c_f E_F F_j D_L F E_{D,j} / (B_j T_A) \quad (9)$$

Where:

- $I_{d,i,j}$ = Intake rate of contaminant i for age group j, mg/(kg body wt.d)
 $C_{d,i}$ = Concentration of contaminant i in the soil or dust, mg/kg dust
 $I_{h,j}$ = Inhalation rate of air per day for age group j, m³ air/d
 c_f = Conversion factor, 10⁻⁶ kg dust/mg dust
 E_F = Exposure frequency or fraction of year age group is exposed
 F_j = Exposure time or fraction of day age group j is exposed
 D_L = Dust loading in air = 0.3 mg dust/m³ air
 F = Fraction of respirable dust = 0.2
 $E_{D,j}$ = Exposure duration for age group j, yr
 B_j = Body weight for age group j, kg
 T_A = Total period over which exposure is averaged, yr

For an infant of 10 kg breathing air containing Chloroform contaminated dust (2.0×10^{-3} mg/kg), for 4 hours per day (0.17), 350 days per year (0.96), averaged over 30 years, and other data according to Table B-6, Equation 9 becomes:

$$\begin{aligned}
 I_{d,\text{Chloroform},\text{Infant}} &= \frac{1.2 \times 10^{-3} \text{ mg/kg} \times 5 \text{ m}^3/\text{d} \times 10^{-6} \text{ kg/mg} \times 0.96 \times 0.17 \times 0.3 \text{ mg/m}^3 \times 0.2 \times 2 \text{ yr}}{10 \text{ kg body wt} \times 30 \text{ yr}} \\
 &= 6.53 \times 10^{-13} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated chronic time weighted average intake rates by the inhalation of contaminated soil and dust for each age group averaged over 30 years are shown in Table B-8.

5.3 Hazard Index for Chronic Exposures

The Hazard Index for chronic exposures has been developed by the U.S. EPA to assess the overall potential for noncarcinogenic effects from chronic lifetime exposure to multiple contaminants. This index is not a mathematical prediction of incidence or severity of effects. It is simply a numerical index to help identify potential exposure problems.

The Chronic Reference Dose by the inhalation exposure route for each of the potential contaminants of concern is taken from U.S. EPA (1990), and values are shown in Table B-8. The Chronic Hazard Index for all contaminants i is:

$$H_I = \sum_i (C_{DE,i} / R_{D,i}) \quad (10)$$

Where:

H_I = Hazard Index for chronic exposures

$C_{DE,i}$ = Chronic dose estimate for contaminant i , mg/(kg body wt.d)

$R_{D,i}$ = Chronic Reference Dose for contaminant i (noncarcinogenic effects), mg/(kg body wt.d)

Results from Equation 10 are shown in Tables B-7 and B-8, using the outdoor vapor inhalation dose estimate for an adult (total 30-year average exposure time) for Table B-7, and the contaminated soil and dust inhalation dose estimate for an adult for Table B-8. When H_I is less than 1, there is probably no chronic health hazard from the exposure routes analyzed (U.S. EPA, 1989). Tables B-7 and B-8 show Hazard Indices of less than 1.

Equation 8 is also used to calculate the chronic time weighted average intake rates by inhalation of indoor vapors (20 hours per day) for each age group averaged over 30 years. Standard parameter values used are shown in Table B-6. Equation 10 is then used to calculate the Hazard Index for chronic inhalation of indoor vapors. Results are shown in Table B-9. The Hazard Index is again less than 1.

5.4 Ingestion of Contaminated Soil

For the soil ingestion pathway to man, the majority of exposure to contaminants occurs during childhood. Children are at greater risk of exposure to contaminants in soil because of their tendency to play in and ingest soil.

For residents at the site, the time weighted average intake rate of contaminant i per day per kilogram of body weight for each age group j , I_{ij} is represented by the following equation (U.S. EPA, 1989, Exhibit 6-14).

$$I_{ij} = C_i I_{r,j} c_i E_F F_j E_{D,j} / (B_j T_A) \quad (11)$$

Where:

I_{ij}	=	Intake rate of contaminant i in the body for age group j, mg/(kg body wt.d)
C_i	=	Concentration of contaminant i in the soil, mg/kg soil
I_{rj}	=	Ingestion rate of soil per day for age group j, mg soil/d
c_f	=	Conversion factor, 10^{-6} kg soil/mg soil
E_F	=	Exposure frequency or fraction of year age group is exposed
F_j	=	Exposure time or fraction of day age group j is exposed
E_{Dj}	=	Exposure duration for age group j, yr
B_j	=	Body weight for age group j, kg
T_A	=	Total lifetime over which exposure is averaged, yr

For an infant of 10 kg body weight, ingestion rate 200 mg soil/d, exposed to contaminated soil for 4 hours per day (0.17), 350 days per year (0.96), with a Chloroform soil concentration of 2.0×10^{-3} mg/kg, exposure time 30 years, Equation 11 becomes:

$$\begin{aligned}
 I_{\text{Chloroform, Infant}} &= \frac{2.0 \times 10^{-3} \text{ mg/kg} \times 200 \text{ mg soil/d} \times 10^{-6} \text{ kg/mg} \times 0.96 \times 0.17 \times 2 \text{ yr}}{10 \text{ kg body wt} \times 30 \text{ yr}} \\
 &= 4.35 \times 10^{-10} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated chronic time weighed average intake rates by ingestion of contaminated soil for each age group and for a lifetime are presented in Table B-10.

The Hazard Index for the chronic ingestion of contaminated soil by an adult (total 30-year average exposure time) was calculated using Equation 10. The Chronic Reference Doses by the ingestion exposure route for each of the potential contaminants of concern were taken from U.S.EPA (1992) and (1990), and values are shown in Table B-10. Results are shown in Table B-10. The Hazard Index is less than 1.0, so there is probably no health hazard to residents at the site from the ingestion of contaminated soil.

5.5 Chronic Noncarcinogenic Effects From Inhalation and Ingestion Exposures

The total Hazard Index for chronic exposures is calculated by combining the outdoor, particulate and indoor inhalation Hazard Indices together with the oral Hazard Index. The total Hazard Index for all contaminants as presented in Table B-11, is estimated to be less than 1, indicating that there is probably not health hazard to residents at the site from noncarcinogenic inhalation and ingestion exposures.

6.0 U.S. EPA EXPOSURE PATHWAY ANALYSIS FOR CARCINOGENIC EFFECTS - RESIDENTIAL LAND USE

For carcinogens, the U.S. EPA (1989) guidelines state that contaminated intake rates may be calculated by prorating the total cumulative dose over a lifetime of 70 years (i.e., Chronic Daily Intakes). The approach for carcinogens is based on the assumption that a high dose received over a short period of time is equivalent to a corresponding low dose spread over a lifetime.

6.1 Inhalation of Contaminated Air

For the inhalation of contaminated air over a lifetime (70 years), the time weighted average intake rate of contaminant i per day, per kilogram of body weight for each age group j , is represented by Equation 8.

For an infant of 10 kg body weight, inhalation rate of $5 \text{ m}^3/\text{d}$ (see Table B-6), exposure time of 0.17 (outdoors 4 hours per day), exposure frequency 0.96 (350 days per year), exposure duration of 2 years, total lifetime 70 years, breathing Chloroform in outdoor air of $7.35 \times 10^{-6} \text{ } \mu\text{g}/\text{m}^3$ (from Table B-4), Equation 8 becomes:

$$\begin{aligned}
 I_{a,\text{Chloroform,infant}} &= \frac{7.35 \times 10^{-6} \text{ } \mu\text{g}/\text{m}^3 \times 10^{-3} \text{ mg}/\mu\text{g} \times 5 \text{ m}^3/\text{d} \times 0.96 \times .17 \times 2 \text{ yr}}{10 \text{ kg body wt} \times 70 \text{ yr}} \\
 &= 1.71 \times 10^{-11} \text{ mg}/(\text{kg body wt.d})
 \end{aligned}$$

The calculated chronic exposure levels for inhalation of outdoor vapors for each age group over a 70 year lifetime are presented in Table B-12.

6.2 Inhalation of Contaminated Soil and Dust

For the inhalation of contaminated soil and dust by residents over a lifetime (70 years) the average intake rate of contaminant i per day, per kilogram of body weight for each age group j , is calculated using Equation 9.

For an infant of 10 kg body weight, inhaling $5 \text{ m}^3/\text{d}$ (see Table B-6), exposure time of 0.17 (outdoors 4 hours per day), exposure frequency 0.96 (350 days per year), exposure duration of 2 years, total lifetime of 70 years, breathing Chloroform contaminated dust ($2.00 \times 10^{-3} \text{ mg/kg}$), with a dust loading of 0.3 mg dust/m^3 air and 20 percent of the dust respirable, Equation 9 becomes:

$$I_{d,\text{Chloroform,infant}} = \frac{2.0 \times 10^{-3} \text{ mg/kg} \times 5 \text{ m}^3/\text{d} \times 10^{-6} \text{ kg/mg} \times 0.96 \times 0.17 \times 0.3 \text{ mg/m}^3 \times 0.2 \times 2 \text{ yr}}{10 \text{ kg body wt} \times 70 \text{ yr}}$$

$$= 2.8 \times 10^{-13} \text{ mg/(kg body wt.d)}$$

The calculated chronic particulate inhalation doses are shown in Table B-13.

6.3 Cancer Risk from Chronic Exposures

For carcinogens, risks are estimated as the incremental probability of an individual developing cancer over a lifetime as a result of exposure to the potential carcinogen (i.e., incremental or excess individual lifetime cancer risk). The U.S. EPA Potency or Slope Factor for carcinogenic effects (U.S. EPA, 1992 and 1990) converts estimated daily intakes averaged over a lifetime of exposure directly to incremental risk above one in one million, of an individual developing cancer. Because relatively low intakes are likely from environmental exposure, it is assumed that the dose-response relationship is linear, and risk is directly related to intake. This is a valid assumption at low risk levels (U.S. EPA, 1989) (i.e., below estimated risks of 0.01 or 1 in 100).

The linear low-dose cancer risk equation for all contaminants i is:

$$C_R = \sum_i (C_{DL,i} P_{F,i}) \quad (12)$$

Where:

$$C_R = \text{Carcinogenic Risk - a unitless probability of an individual developing cancer}$$

$C_{DI,i}$ = Chronic Daily Intake rate of contaminant i, mg/(kg body wt.d)

$P_{F,i}$ = Potency (Slope) Factor for carcinogenic effects from contaminant i, assuming a risk level of 1×10^{-6} (mg/(kg body wt.d))⁻¹

Results from Equation 12 are shown in Table B-12 using the outdoor inhalation dose estimate (Chronic Daily Intake Rate). Table B-12 shows risk probabilities of less than 1×10^{-6} or 1 in 1,000,000.

Results from Equation 12 are also shown in Table B-13, using the particulate inhalation dose estimate.

Equations 8 and 12 are also used to calculate the Carcinogenic Risk from the chronic inhalation of indoor vapors assuming indoor residence 20 hr/d, and a 70 year lifetime.

For an infant of 10 kg body weight, inhalation rate of 5 m³/day (see Table B-6), exposure time of 0.83 (indoors 20 hours per day), exposure frequency 0.96 (350 days per year), exposure duration of 2 years, total lifetime 70 years, breathing Chloroform in indoor air of 4.96×10^{-4} µg/m³ (from Table B-4), Equation 8 becomes:

$$I_{a, \text{Chloroform, infant}} = \frac{4.96 \times 10^{-4} \text{ } \mu\text{g/m}^3 \times 10^{-3} \text{ mg/} \mu\text{g} \times 5 \text{ m}^3/\text{d} \times 0.96 \times .83 \times 2 \text{ yr}}{10 \text{ kg body wt} \times 70 \text{ yr}}$$

$$= 5.64 \times 10^{-9} \text{ mg/(kg body wt.d)}$$

Results are shown in Table B-14. The cancer risk is less than 1 in 1,000,000, for all contaminants except for 1,1-DCE and PCE, indicating a significant risk to health due to the inhalation of 1,1-DCE and PCE in indoor air.

This is worst case scenario that is not actually planned for the site.

6.4 Ingestion of Contaminated Soil

Equation 11 is used to calculate the time weighted average intake rate of contaminant i per day averaged over a lifetime (70 years), with other parameter values as shown in Table B-6.

For an infant of 10 kg body weight, ingestion rate of 200 mg soil/d, exposed to contaminated soil for 4 hours per day (0.17), 350 days per year (0.96), with a Chloroform concentration in soil of 2.0×10^{-3} mg/kg, exposure time 70 yr, Equation 11 becomes:

$$\begin{aligned}
 I_{\text{Chloroform, infant}} &= \frac{2.0 \times 10^{-3} \text{ mg/kg} \times 200 \text{ mg soil/d} \times 10^{-6} \text{ kg/mg} \times 0.96 \times 0.17 \times 2 \text{ yr}}{10 \text{ kg body wt} \times 70 \text{ yr}} \\
 &= 1.87 \times 10^{-10} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The cancer risk from chronic ingestion of site soil and dust over a lifetime (70 years) is calculated using Equation 12. The calculated Carcinogenic Risks are presented in Table B-15. It can be seen that the Carcinogenic Risk is less than 1 in 1,000,000, for this exposure route, indicating that there is no significant risk to health from the ingestion of site soil during residential occupation.

6.5 Carcinogenic Effects from Inhalation and Ingestion Exposures

The total Carcinogenic Risk from inhalation and ingestion exposures is the sum of the Carcinogenic Risks from outdoor inhalation, particulate inhalation, indoor inhalation and ingestion (U.S. EPA, 1991). The carcinogenic risk summed over these exposure routes is shown in Table B-16. It can be seen that the risk level of 1 in 1,000,000 is exceeded for TCE, DCE and PCE and consequently that there may be a significant risk to human health if residential land use were planned for the site.

7.0 U.S. EPA RISK BASED PRELIMINARY REMEDIATION GOALS - RESIDENTIAL LAND USE

As set out in U.S. EPA (1991), the baseline risk assessment can be used to develop risk based preliminary remediation goals. By setting the total risk for carcinogenic effects for each contaminant at a target level of 1 in 1,000,000, the concentration term (i.e., the risk based preliminary remediation goal) can be calculated. In addition, the total risk for noncarcinogenic effects for each contaminant is set at a Hazard Index level of 1.0 in each medium.

From inspection of the Hazard Indices calculated in Tables B-7 to B-11, it can be seen that for every chemical the Hazard Index is less than unity. This indicates that the preliminary remediation goals for noncarcinogenic effects from residential use of the site, have been satisfied without remediation of site soil or soil vapor.

From inspection of Carcinogenic Risks calculated in Tables B-12 to B-16, it can be seen that for the two carcinogens 1,1-Dichloroethene and Tetrachloroethene, the Carcinogenic Risk is greater than 1 in 1,000,000. This indicates that the preliminary remediation goals for carcinogenic effects must be determined for these contaminants.

7.1 Cancer Risk from Soil Vapor

The cancer risk associated with each carcinogenic chemical detected in soil vapor found to exceed the 1 in 1,000,000 risk level was identified from Tables B-4 and B-14. Only one contaminant, 1,1-Dichloroethene, was found to exceed this risk level.

7.2 Cancer Risk from Soil

The cancer risk associated with each carcinogenic chemical detected in soil found to exceed the 1 in 1,000,000 risk level was identified from Tables B-2 and B-14. Only one contaminant, Tetrachloroethene, was found to exceed this risk level.

7.3 Calculation of Risk Based Preliminary Remediation Goals

The calculated cancer risks found to exceed 1 in 1,000,000, shown in Table B-14 for indoor vapor inhalation were compared with the target level of 1 in 1,000,000 or 1×10^{-6} . When the risk is less than this level for a particular exposure pathway, no remediation of site soil is required. The two exposure pathways considered for the contaminants were:

- the total risk of carcinogenic effects from soil vapor in indoor air; and
- the total risk of carcinogenic effects from soil in indoor air.

When the risk is greater than the target level, the contaminant concentration that would produce the target risk level is calculated by proportionality from the concentration found on site.

For soil vapor, the relationship is expressed as follows:

$$C_{i,g} = 1 \times 10^{-6} C_i / C_R \quad (13)$$

Where:

- $C_{i,g}$ = Risk based preliminary remediation goal, mg/L
- C_i = Concentration of contaminant i in the soil vapor, mg/L
- C_R = Carcinogenic risk calculated from soil vapor

For 1,1-Dichloroethene in indoor air (from Tables B-3 and B-14):

$$C_{1,1-DCE,g} = \frac{1 \times 10^{-6} \times 5.7 \text{ mg/L}}{2.3^3 \times 10^{-4}}$$

$$= 2.45 \times 10^{-2} \text{ mg/L}$$

The preliminary remediation goal concentrations were calculated similarly for Tetrachloroethene soil in mg/kg units (from Tables B-1 and B-14):

$$C_{\text{Tetrachloroethene,g}} = \frac{1 \times 10^{-6} \times 1.60 \times 10^1 \text{ mg/kg}}{4.37 \times 10^{-6}}$$

$$= 3.66 \text{ mg/kg}$$

All calculations were performed using conservative assumptions. When the soil is remediated to the minimum remediation goal concentrations calculated, there should be no significant risk of an adverse impact on the health of residents at the site.

8.0 U.S. EPA EXPOSURE PATHWAY ANALYSES FOR NONCARCINOGENIC EFFECTS - COMMERCIAL LAND USE

8.1 Inhalation of Contaminated Air

The subject site is planned for commercial development into a paved parking area. Analyses will, therefore, be performed for subchronic exposures to potential workers and visitors to the site.

For inhalation of contaminated air by workers, and visitors to the site, the intake rate of contaminant *i* per day, per kilogram of body weight for each age group *j*, $I_{a,ij}$ is represented by the following equation (U.S. EPA, 1989, Exhibit 6-16):

$$I_{a,ij} = C_{a,i} I_{h,j} E_F F_j / B_j \quad (14)$$

Where:

$I_{a,ij}$ = Intake rate of contaminant *i* for age group *j*, mg/(kg body wt.d)

$C_{a,i}$ = Concentration of contaminant *i* in air, mg/m³

- $I_{h,j}$ = Inhalation rate of air per day for age group j, m^3/d
 E_F = Exposure frequency, or fraction of year age group is exposed
 F_j = Exposure time, or fraction of day age group j is exposed
 B_j = Body weight for age group j, kg

Table B-17 presents a summary of parameter values accepted as standard by the U.S. EPA for commercial land use. The concentrations of contaminants found in site soil and soil vapor that would produce the highest emission rates were used in the analyses. Air concentrations calculated (shown in Sections 2 and 3) are presented in Table B-18.

For an infant of 10 kg body weight, inhalation rate of $5 m^3/d$, exposure time 0.04 (1 hour per day), exposure frequency 0.68 (250 days per year), breathing Chloroform in site air of $7.35 \times 10^{-6} \mu g/m^3$, Equation (14) becomes:

$$\begin{aligned}
 I_{a, \text{Chloroform, infant}} &= \frac{7.35 \times 10^{-6} \mu g/m^3 \times 10^{-3} mg/\mu g \times 5 m^3/d \times 0.68 \times 0.04}{10 \text{ kg body wt}} \\
 &= 9.99 \times 10^{-11} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated subchronic exposure levels for inhalation of outdoor vapors for each age group are presented in Table B-18.

8.2 Inhalation of Contaminated Soil and Dust

For inhalation of contaminated soil and dust by workers and visitors to the site, the intake rate of contaminant i per day, per kilogram of body weight for each age group j, $I_{d,ij}$, is represented by the following equation. A dust loading of $0.3 \text{ mg dust}/m^3$ air was assumed, and 20 percent of airborne dust was assumed to be respirable by site receptors.

$$I_{d,ij} = C_{d,i} I_{h,i} c_r E_F F_j D_L F / B_j \quad (15)$$

Where:

- $I_{d,ij}$ = Intake rate of contaminant i for age group j, mg/(kg body wt.d)
 $C_{d,i}$ = Concentration of contaminant i in the soil or dust, mg/kg dust
 I_{hj} = Inhalation rate of air per day for age group j, m^3 air/d
 c_r = Conversion factor, 10^{-6} kg dust/mg dust
 E_F = Exposure frequency or fraction of year age group is exposed
 F_j = Exposure time or fraction of day age group j is exposed
 D_L = Dust loading in air = $0.3 \text{ mg dust}/m^3 \text{ air}$
 F = Fraction of respirable dust = 0.2
 B_j = Body weight for age group j, kg

For an infant of 10 kg breathing air containing Chloroform contaminated dust (2.0×10^{-3} mg/kg), for 1 hour per day (0.04), 250 days per year (0.68) and other data according to Table B-17, Equation 15 becomes:

$$\begin{aligned}
 I_{d,\text{Chloroform,infant}} &= \frac{2.0 \times 10^{-3} \text{ mg/kg} \times 5 \text{ m}^3/\text{d} \times 10^{-6} \text{ kg/mg} \times 0.68 \times 0.04 \times 0.3 \text{ mg/m}^3 \times 0.2}{10 \text{ kg body wt}} \\
 &= 1.63 \times 10^{-12} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated intake rates for the inhalation of contaminated soil and dust for each age group are shown in Table B-19.

8.3 Hazard Index for Subchronic Exposures

The Hazard Index for subchronic exposures has been developed by the U.S. EPA to assess the overall potential for noncarcinogenic effects from subchronic exposure (portion of a lifetime) to multiple contaminants. This index is not a mathematical prediction of incidence or severity of effects. It is simply a numerical index to help identify potential exposure problems.

The Subchronic Reference Doses by the inhalation exposure route for each of the potential contaminants of concern is taken from U.S. EPA (1992) and (1990), and are shown in Tables B-18 and B-19. The Subchronic Hazard Index for all contaminants i is:

$$S_{HI} = \sum_i (S_{DE,i} / R_{DS,i}) \quad (16)$$

Where:

S_{HI} = Hazard Index for subchronic exposures

$S_{DE,i}$ = Subchronic dose estimate for contaminant i , mg/(kg body wt.d)

$R_{DS,i}$ = Subchronic Reference Dose for contaminant i (noncarcinogenic effects), mg/(kg body wt.d)

Results from Equation 16 are shown in Table B-18, using the highest outdoor vapor inhalation dose estimate. For the particulate inhalation exposure route, the highest subchronic particulate inhalation Hazard Index is shown in Table B-19. When S_{HI} is less than 1, there is probably no subchronic health hazard from the exposure routes analyzed (U.S. EPA, 1989). Tables B-18 and B-19 show Hazard Indices of less than 1.

The Hazard Index for subchronic inhalation of indoor vapors was not calculated because of the planned use of the site as a paved parking area.

8.4 Ingestion of Contaminated Soil

For the soil ingestion pathway to man, the majority of exposure to contaminants occurs during childhood. Children are at greater risk of exposure to contaminants in soil because of their tendency to play in and ingest soil.

For visitors and workers at the site, the intake rate of contaminant i per day per kilogram of body weight for each age group j , I_{ij} is represented by the following equation (U.S. EPA, 1989, Exhibit 6-14).

$$I_{ij} = C_i I_{rj} c_f E_F F_j / B_j \quad (17)$$

Where:

I_{ij} = Intake rate of contaminant i in the body for age group j , mg/(kg body wt.d)

C_i = Concentration of contaminant i in the soil, mg/kg soil

- $I_{r,j}$ = Ingestion rate of soil per day for age group j, mg soil/d
 c_r = Conversion factor, 10^{-6} kg soil/mg soil
 E_F = Exposure frequency or fraction of year age group is exposed
 F_j = Exposure time or fraction of day age group j is exposed
 B_j = Body weight for age group j, kg

For an infant of 10 kg body weight, ingestion rate 200 mg soil/d, exposed to contaminated soil for 1 hour per day (0.04), 250 days per year (0.68), with a Chloroform soil concentration of 2.0×10^{-3} mg/kg, Equation 17 becomes:

$$\begin{aligned}
 I_{\text{Chloroform, infant}} &= \frac{2.0 \times 10^{-3} \text{ mg/kg} \times 200 \text{ mg soil/d} \times 10^{-6} \text{ kg/mg} \times 0.68 \times 0.04}{10 \text{ kg body wt}} \\
 &= 1.09 \times 10^{-9} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated subchronic exposure levels for ingestion of contaminated soil for each age group are presented in Table B-20.

The Hazard Index for subchronic ingestion of contaminated soil was calculated using Equation 16. Results are shown in Table B-20. The Hazard Index is less than 1.0 for all contaminants, so there is probably no health hazard to workers and visitors to the site from the ingestion of contaminated soil.

8.5 Subchronic Noncarcinogenic Effects from Inhalation and Ingestion Exposures

The total Hazard Index for subchronic exposures is calculated by combining the outdoor and particulate inhalation Hazard Indices together with the subchronic oral Hazard Index. The total Hazard Index for all contaminants is presented in Table B-21. It can be seen that the total Hazard Index is approximately three orders of magnitude lower than 1. This means that there will be no health hazard to workers and visitors from subchronic exposure to site soil and soil vapor.

9.0 U.S. EPA EXPOSURE PATHWAY ANALYSES FOR CARCINOGENIC EFFECTS - COMMERCIAL LAND USE

The U.S. EPA approach for carcinogens is based on the assumption that a high dose received over a short period of time is equivalent to a corresponding low dose spread over a lifetime. The Carcinogenic Risk to workers and visitors to the site from soil and soil vapor contaminants will be calculated for subchronic exposures.

9.1 Inhalation of Contaminated Air

For the inhalation of contaminated air over a lifetime (70 years), the time weighted average intake rate of contaminant *i* per day, per kilogram of body weight for each age group *j*, is calculated using Equation 8:

For an infant of 10 kg body weight, inhalation rate of 5 m³/d (Table B-17), exposure duration of 2 years, total lifetime 70 years, breathing contaminated air with a Chloroform concentration of 7.35×10^{-6} µg/m³ for 1 hour per day (0.07), 250 days per year (0.68), Equation 8 becomes:

$$I_{c, \text{Chloroform, infant}} = \frac{7.35 \times 10^{-6} \text{ } \mu\text{g/m}^3 \times 10^{-3} \text{ mg/} \mu\text{g} \times 5 \text{ m}^3/\text{d} \times 0.04 \times 0.68 \times 2 \text{ yr}}{10 \text{ kg body wt.} \times 70 \text{ yr}}$$

$$= 2.85 \times 10^{-12} \text{ mg/(kg body wt.d)}$$

The calculated subchronic intake rates from the inhalation of outdoor vapors for each age group over a 70 year lifetime are presented in Table B-22.

9.2 Inhalation of Contaminated Soil and Dust

For inhalation of contaminated soil and dust over a lifetime of 70 years, the intake rate of contaminant *i* per day, per kilogram of body weight for each age group *j*, is calculated using Equation 9:

For an infant of 10 kg breathing air containing Chloroform contaminated dust (2.0×10^{-3} mg/kg), with a dust loading of 0.3 mg dust/m³ air, 20 percent of the dust respirable, and other data according to Table B-17, Equation 9 becomes:

$$\begin{aligned}
 I_{i,\text{Chloroform,infant}} &= \frac{2.0 \times 10^{-3} \text{ mg/kg} \times 5 \text{ m}^3/\text{d} \times 10^{-6} \text{ kg/mg} \times 0.04 \times 0.68 \times 0.3 \times 0.2 \times 2 \text{ yr}}{10 \text{ kg body wt.} \times 70 \text{ yr}} \\
 &= 4.66 \times 10^{-14} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated subchronic intake rates from the inhalation of contaminated soil and dust for each age group and a 70 year lifetime are presented in Table B-23.

9.3 Cancer Risk from Subchronic Exposures

The Carcinogenic Risk from subchronic exposures is calculated similarly to those for chronic exposure, using Equation 12. Results from Equation 12 are shown in Table B-22, using the outdoor inhalation dose estimate (Chronic Daily Intake Rate). Table B-22 shows risk probabilities of less than 1 in 1,000,000, showing no significant risk to human health.

Results from Equation 12 are also shown in Table B-23, using the particulate inhalation dose estimate. Again the risk probabilities are less than 1 in 1,000,000, showing no significant risk to human health.

9.4 Ingestion of Contaminated Soil

For chronic exposure to contaminants, the time weighted average intake rate of contaminant *i* per day, per kilogram of body weight for each age group *j*, is calculated using Equation 11:

For an infant of 10 kg body weight, ingestion rate 200 mg soil/day, exposed to contaminated soil with a Chloroform concentration in soil of 2.0×10^{-3} mg/kg, and other parameter values as shown in Table B-17, Equation 11 becomes:

$$\begin{aligned}
 I_{w,\text{Chloroform,infant}} &= \frac{2.0 \times 10^{-3} \text{ mg/kg} \times 200 \text{ mg soil/d} \times 10^{-6} \text{ kg/mg} \times 0.04 \times 0.68 \times 2 \text{ yr}}{10 \text{ kg body wt.} \times 70 \text{ yr}} \\
 &= 3.11 \times 10^{-11} \text{ mg/(kg body wt.d)}
 \end{aligned}$$

The calculated subchronic exposure levels for ingestion of contaminated soil for each age group and over a 70 year lifetime, are presented in Table B-24.

The Carcinogenic Risk from the subchronic ingestion of contaminated soil was calculated using Equation 12. Results are shown in Table B-24. The Carcinogenic Risk is clearly less than 1 in 1,000,000, showing no significant risk to human health.

9.5 Carcinogenic Effects from Inhalation and Ingestion Exposures

The total Carcinogenic Risk from inhalation and ingestion exposures is the sum of the Carcinogenic Risks from outdoor inhalation, particulate inhalation, and soil ingestion. The Carcinogenic Risk summed over these exposure routes is shown in Table B-25. It can be seen that the risk level of 1 in 1,000,000 is never exceeded, and consequently that there is no significant risk to human health from the commercial use of the site as a paved parking area.

10.0 U.S. EPA RISK BASED PRELIMINARY REMEDIATION GOALS - COMMERCIAL LAND USE

From inspection of the Hazard Indices calculated in Tables B-18 to B-21, it can be seen that for every chemical and exposure route, and for the sum of all chemicals and exposure routes, the Hazard Index is clearly less than 1. This indicates that the preliminary remediation goals for noncarcinogenic effects from use of the site as a paved parking area, have been satisfied without remediation of contaminants in site soil and soil vapor.

From inspection of the Carcinogenic Risks calculated in Tables B-22 to B-25, it can be seen that for every chemical, and exposure route, and for the sum of all chemicals and exposure routes, the Carcinogenic Risk is less than 1 in 1,000,000. This indicates that the preliminary remediation goals for carcinogenic effects from use of the site as a paved parking area, have been satisfied without remediation of contaminants in site soil and soil vapor.

APPENDIX C

Environmental Fate Analysis1.0 INTRODUCTION

An environmental fate analysis was performed in order to determine the impact of the ground water contamination plume beneath the Hyrail and Zero Corporation properties, on the soil and soil vapor concentrations at the Hyrail site. Contaminated ground water is located at between 106 and 116 feet below grade at the Hyrail site. The impact of soil and soil vapor contaminants on the ground water table was also examined.

2.0 CONTAMINANT RELEASE FROM GROUND WATER

Partitioning of a volatile organic chemical can occur at the interface of the saturated and unsaturated zones in the subsurface. It is possible for a dissolved organic contaminant in a polluted aquifer to contaminate the unsaturated zone above it. In the saturated zone, the volatile organic contaminant can move upward by gas-phase diffusion, eventually reaching the soil surface where it volatilizes. Both laboratory and field evidence has shown that air emissions of volatile organics from polluted aquifers can occur. In general, emissions from contaminated aquifers are expected to be relatively insignificant.

2.1 Equilibrium Relationship Between Ground Water and Soil Concentrations

For screening purposes, the highest concentration of contaminants detected in ground water from previous site investigations were compared to the California Maximum Contaminant Levels (MCLs) for those compounds (see Appendix D, Table D-3). Four contaminants, 1,1-Dichloroethene, cis-1,2-Dichloroethene, Tetrachloroethene and Trichloroethene were detected in concentrations exceeding their MCLs.

An estimate of the soil concentration of contaminants in contact and in equilibrium with the ground water concentration of the same contaminants is provided by the distribution coefficient, $K_{D,i}$, as follows:

$$K_{D,i} = C_{s,i}/C_{w,i} = K_{oc,i} f_{oc} \quad (1)$$

Where:

$K_{D,i}$	=	distribution (sorption) coefficient of contaminant i, cm^3/g
$C_{s,i}$	=	concentration of contaminant i in soil, mg/g
$C_{w,i}$	=	concentration of contaminant i in ground water, mg/cm^3
$K_{oc,i}$	=	ground water/organic carbon distribution coefficient, cm^3/g

f_{oc} = fraction of naturally occurring organic carbon in soil

Table C-1 shows the highest detected concentrations of the above four contaminants, their ground water/organic carbon distribution coefficients and their resultant soil concentrations. The equilibrium relationship shows that except for Trichloroethene, the resulting soil concentrations are a few parts per billion ($\mu\text{g/kg}$). The equilibrium soil concentration for Trichloroethene indicates that this contaminant in the ground water could impact the soil beneath the site, and could possibly be responsible for the high concentrations of Trichloroethene detected in soil in Monitoring Well MW-2.

2.2 Equilibrium Relationship Between Ground Water and Soil Vapor Concentrations

An equilibrium relationship also exists between ground water and soil vapor. Contaminants can be released from the ground water and diffuse into the soil vapor and subsequently to the soil surface with the potential to impact residents or workers and visitors to the site.

The maximum soil vapor concentration was calculated using the following equation (CDHS, California Site Mitigation Decision Tree Manual, Paragraph 8.5.2):

$$C_{a,i} = H_i C_{w,i} / RT \quad (2)$$

Where:

$C_{a,i}$	=	soil vapor concentration of contaminant i, mg/L
H_i	=	Henry's Law Constant for contaminant i, atm.L/mol
$C_{w,i}$	=	concentration of contaminant i in ground water, mg/L
R	=	Gas Law constant, = 0.08205 L.atm/(mol.K)
T	=	ambient temperature, K

This calculation is highly conservative in estimating the concentration of contaminants in soil vapor above the contaminated ground water. It does not take into account dispersion or dilution of contaminants. Values of Henry's Law Constant were taken from Montgomery and Welkom, 1989. An ambient soil temperature of 20°C (293 K) was assumed. The concentration of each contaminant in ground water was taken to be the highest concentration detected during ground water sampling in 1991 and 1992 (see Appendix D, Table D-3). These values are shown in Table C-2, together with the calculated values of soil vapor concentration.

Equation 2 shows that except for Trichloroethene, the resulting soil vapor concentrations are a few parts per billion ($\mu\text{g/L}$). The equilibrium soil vapor concentration for Trichloroethene indicates that this contaminant in the ground water could impact the soil vapor beneath the

site by upward diffusion from the water table. Soil gas sampling at the site was mainly conducted at shallow depths. No soil gas samples were collected from depths approaching the ground water table.

3.0 IMPACT OF SOIL AND SOIL VAPOR CONTAMINANTS ON GROUND WATER

Two major areas of contamination exist at the site (see Figure 2), an abandoned drum storage area in the middle of the site, close to Monitoring Well MW-3; and a former chemical storage area in the northern part of the site, close to Monitoring Well MW-6. The location of Monitoring Well MW-2, between these two areas, also showed high levels of Trichloroethene contamination in the soil and ground water.

Soil sampling was conducted at ground water depth for Monitoring Wells MW-2, MW-3, MW-5, and MW-6 (see Appendix D, Table D-1). The only significant contamination detected in the soil was Trichloroethene in MW-2, at depths of between 100 and 120 feet below grade. This is most likely due to ground water contamination, as discussed in Section 2 above, and because of the direction of ground water flow from the adjacent Zero Corporation property. It does not appear that soil contamination at the site has impacted the ground water table.

Because soil vapor concentrations appear to decrease with depth to 75 feet (see Appendix D, Table D-2), and because soil vapor data is lacking at ground water depth, there is no evidence to show that the soil vapor contamination at the site has impacted the ground water table.

4.0 BIOTRANSFORMATION

Biological transformation of chlorinated solvents has been observed in laboratory studies of both artificial systems and systems simulating actual aquifer conditions. In the absence of light and oxygen, anaerobic microorganisms utilize the energy released from oxidation/reduction reactions for cell growth and maintenance. The sequential dehalogenation of PCE follows the general sequence:

Ground water concentrations at the Hyrail site showed that TCE was present in concentrations that were two and three orders of magnitude higher than those of PCE and DCE so the effect of biodegradation of contaminants in the ground water was not observed.

TABLE C-1

Soil Concentrations in Equilibrium with Ground Water at the Hyrail Site

Contaminant i	Well No.	Highest Concentration in Ground Water $C_{w,i}$ (mg/cm ³)	Log $K_{oc,i}$ *	$K_{oc,i}$ (cm ³ /g)	Estimated f_{oc}	Equilibrium Concentration in Soil $C_{s,i}$ (mg/g)	Equilibrium Concentration in Soil (μ g/kg)	Highest Concentration Detected in Soil (μ g/kg)	Sample ID and depth and (ft)
1,1-Dichloroethene	D-26	9.0×10^{-6}	1.81	6.46×10^1	1×10^{-3}	5.81×10^{-7}	5.81×10^{-1}	100	B-26-20
cis-1,2-Dichloroethene	B-26	3.7×10^{-5}	1.81	6.46×10^1	1×10^{-3}	2.39×10^{-6}	2.39	<5	
Tetrachloroethene	B-25	7.0×10^{-6}	2.56	3.65×10^2	1×10^{-3}	2.54×10^{-6}	2.54	1.6×10^4	ACS-1
Trichloroethene	MW-2	6.2×10^{-3}	2.03	1.07×10^2	1×10^{-3}	6.63×10^{-4}	6.63×10^2	2.3×10^2	MW-2-116

Mr. Eric Nupen
Senior Engineering Geologist
California Regional Water Quality Control Board, Los Angeles Region
101 Centre Plaza Drive
Monterey Park, California 91754-2156

Re: Proposed Phase 1 Shallow Soils Remediation System
ZERO Facility, 777 Front Street, Burbank CA
RWQCB File No. 109,6162

Dear Mr. Nupen:

At the request of ZERO Corporation, we are providing the following description of proposed shallow soils remedial action at the ZERO Facility. As we discussed during our meeting in your office on December 15, 1997, planned site redevelopment will be greatly facilitated by prior removal of volatile organic compounds (VOCs) from soils subject to disturbance during construction. Water Quality Control Board concurrence with this proposed plan and cleanup levels is sought.

Objectives

Planned redevelopment of the ZERO Facility (Figure 1) includes razing all existing structures, excavating for spread footings, subterranean garages and service areas; and grubbing/recompacting much of the remainder of the 8-acre site. Redevelopment plans also include an adjacent, smaller parcel currently owned by the City of Burbank.

Elevated concentrations of VOCs have been detected in shallow (5 to 15 feet below grade) soil gas samples at the facility. Tetrachloroethylene (PCE) and 1,1,1-trichloroethane (TCA) are the predominant VOCs that have been detected in soil gas. The distribution of these VOCs in shallow soil gas are shown in Figures 2 and 3. Impacted shallow soils will be disturbed during redevelopment.

The buyer desires to avoid expensive soils rehandling and testing during construction and remediating excavated soils after construction. Therefore, this Phase 1 work plan for in-situ remediation of the shallow soils was developed to reduce VOC soil concentrations in selected areas of the site to acceptable cleanup levels prior to site development so that such soils may be excavated, moved, and used on the combined site without restriction (recognizing applicable South Coast Air Quality Management District and Occupational Health and Safety Administration rules and regulations must be met during site development activities).

Scope of Phase 1 Remedial Activities

The proposed Phase 1 remediation is limited to the surficial 15 to 20 feet of soils within the impacted areas shown in Figures 2 and 3. It is recognized that site soils have been impacted by VOCs to depths exceeding 60 feet, however, VOC concentrations in the deeper soils will be addressed in a Phase 2 remediation system, consistent with Hydro Geo Chem's 1996 work plan for site soils remediation¹, approved by the Water Quality Control Board (Board) on February 26, 1996. The Phase 1 plan described below is for a three-month remediation period using soil vapor extraction (SVE) and air injection.

Construction

In order to decrease the length of time required to remediate the shallow soils to be disturbed, it is necessary to shorten soil air flow path lengths. Therefore, air injection is being added to the Phase 1 work. Figure 4 shows the approximate number and location of extraction and injection wells and piping proposed for the areas of concern. The network will consist of approximately 47 SVE wells, and 26 air injection wells. This configuration may be adapted, expanded or reduced based on initial organic vapor measurements after well installation and completion of the site grading plans by the buyer. Soil vapor extraction and injection wells will be installed to a depth of approximately 20 feet. Approximate well locations and areas of possible system expansion are shown in Figure 4. The anticipated extraction and injection rate is 15 to 20 standard cubic feet per minute (scfm) per well. The existing 750 scfm SVE blower and control system will be used to provide the needed extraction rate and vacuum in Buildings 11 - 13. A 500 scfm injection system will be used. A separate SVE blower may be used in Building 14. The equipment will have a multiple-locations permit from the Air Quality Management District.

As you recommended, we will construct a network of soil gas monitoring probes prior to Phase 1 startup. This network will supplement the multi-level soil gas monitoring points already established at the site. The purpose of these probes will be to evaluate remedial progress and to

¹ Hydro Geo Chem, Inc. 1996. *Results of Soil Vapor Extraction Simulations and Work Plan for Soils Remediation. To California Regional Water Quality Control Board, January 15, 1996.*

establish soils cleanup verification points. Approximately 25 monitoring points will be constructed. Locations will be determined based on organic vapor measurements collected from the extraction and injection wells and existing monitoring points prior to Phase 1 startup.

Operation

System operation over a 3-month period will consist of daily (for the first 2 weeks) measurements of flow and organic vapors (using a hand-held organic vapor meter and an air velocity meter) and well pressures; and subsequently at the schedule required by the air discharge permits. Organic vapor concentrations will be measured at all extraction wells and soil-gas monitoring points. The latter data will be used to establish soils cleanup progress. Regular system evaluation during this period will also allow system changes to optimize air flow and VOC removal rates.

Closure

As discussed during our December 15, 1997, meeting, closure of Phase 1 remedial action will be based on 1) SVE performance after 3 months indicating minimal continued effective removal of VOCs from the shallow soils, and 2) reductions in soil gas concentrations measured in the soil gas monitoring points to the agreed-upon cleanup levels. During this meeting it was also agreed that a PCE concentration between 600 and 1,000 micrograms per liter in soil gas has been determined by the Board staff to be an acceptable range.

Performance monitoring will be conducted through periodic sampling and analysis of extracted vapors from the SVE wells, and calculation of VOC mass removal rates. Soil gas concentrations in the verification sampling will be determined using a Board staff-approved on-site mobile laboratory or by outside analysis by a California-certified laboratory.

A description of Phase 1 SVE activities and results of sampling and analysis will be reported to the Board. If the cleanup objectives are achieved, as determined by the above sampling and analysis, you have indicated that a No Further Action determination will be made by Board staff agreeing that remediated soils may be excavated and used without restriction or limitation as fill on other portions of the property that is the subject of redevelopment.

If the objectives are not achieved for certain soils, then alternatives for managing these soils will be considered based on location and residual VOC concentrations. Soils that are not excavated will be remediated during Phase 2 pursuant to the approved ZERO remedial action plan.

Mr. Eric Nupen

IN THE MATTER OF:	)	
San Fernando Valley	)	[Docket Number]
Area 2 (Crystal Springs)	)	
Glendale Operable Units	)	
UNDER THE AUTHORITY OF THE	)	AGREEMENT AND COVENANT
COMPREHENSIVE ENVIRONMENTAL	)	NOT TO SUE FORD LEASING
RESPONSE, COMPENSATION, AND	)	DEVELOPMENT COMPANY
LIABILITY ACT OF 1980, 42 U.S.C.	)	
§ 9601, <u>et seq.</u> , as amended.	)	
_____	)	

I. INTRODUCTION

1. This Agreement and Covenant Not to Sue ("Agreement") is made and entered into by and between the United States Environmental Protection Agency ("EPA") and Ford Leasing Development Company, a Delaware corporation ("Ford") (collectively "the Parties").

2. This Agreement is entered into pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended ("CERCLA"), 42 U.S.C. § 9601, et seq., and the authority of the Attorney General of the United States to compromise and settle claims of the United States.

3. Ford ("Settling Respondent") is principally officed at One Parklane Boulevard, Suite 1500 East, Dearborn, Michigan, 48126. On or about June 27, 1997, Herbert F. Boeckmann, II, entered into an option agreement with ZERO Corporation ("ZERO"), and later assigned the option agreement to Settling Respondent. Subject to certain terms and conditions, the option agreement provides an option to the Settling Respondent to purchase certain improved real property located in the City of Burbank, County of Los Angeles, State of California, which is located at the southwest corner of Burbank Boulevard and Front Street, and which is more particularly described in Exhibit 1 to this Agreement. Settling

Respondent intends to develop such real property and certain other parcels of real property currently owned by the City of Burbank, with respect to which Settling Respondent has entered into an agreement or option to purchase, and which are more particularly described in Exhibit 2 to this Agreement, into a retail automobile dealership mall with related amenities ("the Project"). (The real property described in Exhibits 1 and 2 is collectively referred to as the "Property").

4. Portions of the Property currently include certain improvements, including approximately six buildings that from approximately 1962 through 1991 housed certain manufacturing operations. Since 1991, portions of the Property have been rented for location services and other marginal uses.

5. The Property consists of a total of approximately 12.1 acres. A portion of the Property was previously owned and operated by ZERO (see Exhibit 1). A portion of the Property currently is owned and operated by the City of Burbank (see Exhibit 2).

6. The Property is located within the San Fernando Valley Area 2 Crystal Springs Superfund Site.

7. The Parties agree to undertake all actions required by the terms and conditions of this Agreement. The purpose of this

Agreement is to settle and resolve, subject to the reservations and limitations contained herein, the potential liability of the Settling Respondent for the Existing Contamination (as defined below) at the Property which otherwise would arise under Sections 106 and/or 107(a) of CERCLA, 42 U.S.C. §§ 9606 and 9607(a), and/or Section 7003 of RCRA, 42 U.S.C. § 6973.

8. The Parties agree that the Settling Respondent's entry into this Agreement, and the actions undertaken by the Settling Respondent in accordance with the Agreement, do not constitute an admission of any liability by the Settling Respondent.

The resolution of this potential liability, in exchange for provision by the Settling Respondent to EPA of a substantial benefit, is in the public interest.

II. DEFINITIONS

9. Unless otherwise expressly provided herein, terms used in this Agreement that are defined in CERCLA or in regulations promulgated under CERCLA shall have the meaning assigned to them in CERCLA or in such regulations, including any amendments thereto.

10. "EPA" shall mean the United States Environmental Protection Agency and any successor departments or agencies of the United States.

11. "Existing Contamination" shall mean:

a. Any hazardous substances, pollutants or contaminants, present or existing on or under the Site as of the effective date of this Agreement and for which Settling Respondent is not presently liable in any way.

b. Any hazardous substances, pollutants or contaminants that (1) migrated from the Property prior to the effective date of this Agreement; or (2) migrate from the Property after the effective date of this Agreement, provided that Settling Respondent is not presently liable in any way for such hazardous substances, pollutants or contaminants and does not cause or contribute to the migration of such hazardous substances, pollutants or contaminants from the Property.

c. Any hazardous substances, pollutants or contaminants that migrate onto or under the Property after the effective date of this Agreement, provided that Settling Respondent is not presently liable in any way for such hazardous substances, pollutants or contaminants and does not cause or contribute to the migration of such hazardous substances, pollutants or contaminants onto or under the Property.

12. "Parties" shall mean EPA and the Settling Respondent.

13. "Property" shall mean that certain real property which is

described in Exhibits 1 and 2 of this Agreement.

14. "Settling Respondent" shall mean Ford and any assignee or transferee of this Agreement pursuant to paragraphs 51, 52 and 53.

15. "Site" shall mean the San Fernando Valley Area 2 Crystal Springs Superfund Site generally encompassing the cities of Burbank and Glendale in the State of California. The Site is depicted generally on the map attached as Exhibit 3. The Site shall include the Property, and all areas to which hazardous substances and/or pollutants or contaminants have come to be located.

16. "United States" shall mean the United States of America, its departments, agencies, and instrumentalities.

III. STATEMENT OF FACTS

17. Settling Respondent is in the business of acquiring, developing and building automobile dealerships and related amenities for sale or lease to dealerships.

18. Settling Respondent plans to acquire the Property and construct an automobile dealership mall and related amenities thereon. A preliminary project plan for the Project is included in Exhibit 4 hereto.

19. The Property consists of approximately 12.1 acres that were,

in part, formerly used and zoned for industrial use and have been owned and operated by ZERO (see Exhibit 1) or the City of Burbank (see Exhibit 2). The Property is within the San Fernando Valley Area 2, Crystal Springs Superfund Site (hereinafter "Site"). The Site includes the Glendale North and South Operable Units. The Site includes contamination to regional groundwater as the result of volatile organic compounds ("VOCs") including, but not limited to, trichloroethylene ("TCE") and tetrachloroethylene ("PCE"), as well as areas to which the contamination has migrated.

20. Based on subsurface contamination at portions of the Property, ZERO has been included in EPA's enforcement actions at the Site.

21. The Property is within a City of Burbank redevelopment plan area. Such area includes blighted properties. The goal of the redevelopment plan is to revitalize said blighted properties in the redevelopment area by putting them to a more productive and beneficial use.

22. The City of Burbank considers the Settling Respondent's Project to be in the best interests of the public.

23. The City of Burbank supports the Project and has so notified EPA.

24. Settling Respondent's Project will convert the marginally

productive Property into a more productive and beneficial retail use.

25. Settling Respondent's Project will generate substantial benefits for the City of Burbank and the public at large. These benefits include long term economic benefits from the retail sales tax revenues generated by the Project. In addition, the Property will result in sales tax revenue on construction. Other income will be derived from property tax revenues, business license taxes, and other government fees.

26. The City of Burbank stands to benefit further from the Project, not only due to the sales tax revenues, but also because the Project is expected to encourage further redevelopment in the area.

27. The Property is located within the Site. EPA has collected information and conducted its own investigation of the Site. A portion of the Property has been known to EPA and referred to in certain EPA documents as the ZERO facility.

28. Settling Respondent does not operate a facility within the Site and is not, and has never been, named or identified as a responsible party for or at the Site.

29. Settling Respondent's Project will create a substantial number of construction-related jobs and an estimated 125-150

employment positions.

30. Settling Respondent's Project will provide substantial and meaningful employment. The workforce will be engaged in jobs requiring varying degrees of training, and many of the workers will be highly skilled at their positions. These new jobs are particularly important to the City of Burbank because of the substantial loss of the aerospace industry employment.

31. As a part of Settling Respondent's Project, Settling Respondent will contribute to public art in the City of Burbank.

32. Settling Respondent's Project is located immediately adjacent to the "Metrolink" station, thereby promoting the use of mass transport for employees, service department customers, and/or prospective automobile purchasers.

33. Settling Respondent represents that it anticipates that automobile dealerships that will occupy the Property will be active in community and civic affairs and will support community services through such participation in the community surrounding the Project.

34. Settling Respondent represents, and for the purposes of this Agreement EPA relies on said representations, that Settling Respondent's involvement with the Property has been limited to inspecting and performing environmental and other due diligence

with respect to the Property in connection with Settling Respondent's proposed acquisition of the Property, and completing its acquisition of the Zero portion of the Property.

IV. PAYMENT

35. In consideration of and in exchange for the United States' Covenant Not to Sue in Section VIII herein, Settling Respondent agrees to pay to EPA the sum of \$ 150,000, within thirty (30) days of the later of either: (1) the date that Settling Respondent takes title to the Property, or (2) the date that Settling Respondent receives notice from the EPA that the public comment period for this Agreement has expired and that the United States has determined not to withdraw its consent to this Agreement. The Settling Respondent shall make all payments required by this Agreement in the form of a certified check or checks made payable to "EPA Hazardous Substance Superfund," referencing the EPA Region IX, EPA Docket number, and Site/Spill ID # 091G, 091H, and 09N2, DOJ case number_____, if applicable, and the name and address of Settling Respondent. The Settling Respondent shall send such payments to the following address:

U.S. EPA
Region IX, Attn: Superfund Accounting
P.O. Box 360863M

Pittsburgh, PA 15251

Notice of payment shall be sent to those persons listed in
Section XV (Notices and Submissions) and to EPA Region IX
Financial Management Officer:

Catherine Shen
Financial Management Specialist (PMD-6)
USEPA Region IX
75 Hawthorne St.
San Francisco, CA 94105

The total amount to be paid to EPA shall be placed in the
Glendale Special Account and used to conduct or finance the
response action at or in connection with the Glendale North and
South Operable Units. Any balance remaining in the Glendale
Special Account at the completion of the response at or in
connection with the Glendale North and South Operable Units shall
be deposited in the EPA Hazardous Substance Superfund.

36. Amounts due and owing pursuant to the terms of this
Agreement but not paid in accordance with the terms of this
Agreement shall accrue interest at the rate established pursuant
to Section 107(a) of CERCLA, 42 U.S.C. § 9607(a), compounded on
an annual basis.

37. If Settling Respondent does not perform pursuant to
paragraphs 33 and 34 of this Agreement, Settling Respondent may
be deemed to be in material default of this Agreement.

V. ACCESS/NOTICE TO

SUCCESSORS-IN-INTEREST

38. Commencing upon the date that it acquires title to any part of the Property, Settling Respondent agrees to provide to EPA, its authorized officers, employees, representatives, and all other persons performing response actions under EPA or state oversight, an irrevocable right of access at all reasonable times to the portions of the Property it has acquired and to any other property to which access is required for the implementation of response actions at the Site, to the extent access to such other property is controlled by Settling Respondent, for the purposes of performing and overseeing response actions at the Site under federal and state law. EPA agrees to provide reasonable notice to Settling Respondent of the timing of response actions to be undertaken at the Property if such actions are undertaken by EPA and will use reasonable efforts to minimize interference with the use of the Property; provided, however, that nothing herein shall provide Settling Respondent with a claim or cause of action against EPA including, without limitation, any claim or cause of action for injunctive relief. Notwithstanding any provision of this Agreement, EPA retains all of its access authorities and rights, including enforcement authorities related thereto, under

CERCLA, the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act, 42 U.S.C. § 6901, ("RCRA") et. seq., and any other applicable statute or regulation, including any amendments thereto.

39. Within thirty (30) days after the later of either (a) the effective date of this Agreement, or (b) the date that Settling Respondent receives notice from the EPA that the public comment period for this Agreement has expired and that the United States has determined not to withdraw its consent to this Agreement, Settling Respondent shall record a certified copy of this Agreement with the Recorder's Office or Registry of Deeds for Los Angeles County, State of California. Thereafter, each deed, title, or other instrument conveying an interest in the portions of the Property Settling Respondent has acquired shall contain a notice stating that the Property is subject to this Agreement. A copy of these documents should be sent to the persons listed in Section XV (Notices and Submissions).

40. Settling Respondent shall ensure that assignees, successors-in-interest, lessees, and sublessees of the portions of the Property Settling Respondent has acquired shall provide the same access and cooperation as required of Settling Respondent under the terms of this Agreement. Settling Respondent shall ensure

that a copy of this Agreement is provided to any current lessee or sublessee on the portions of the Property Settling Defendant has acquired as of the effective date of this Agreement and shall ensure that any subsequent leases, subleases, assignments or transfers of the Property or an interest in the Property are consistent with this Section, and Section XI (Parties Bound/Transfer of Covenant), of this Agreement.

VI. DUE CARE/COOPERATION

41. Settling Respondent shall exercise due care at the Site with respect to the Existing Contamination and shall comply with all applicable local, State, and federal laws and regulations. Settling Respondent recognizes that the implementation of response actions at the Site may interfere with Settling Respondent's use of the Property and may require closure of its operations or a part thereof. Settling Respondent agrees to cooperate fully with EPA in the implementation of response actions at the Site and further agrees not to interfere with such response actions. EPA agrees, consistent with its responsibilities under applicable law, to use reasonable efforts to minimize any interference with Settling Respondent's operations by such entry and response. In the event Settling Respondent becomes aware of any action or occurrence that causes

or threatens a release of hazardous substances, pollutants or contaminants at or from the Property that constitutes an emergency situation or that may present an immediate threat to the public health or welfare or the environment, Settling Respondent shall immediately take all appropriate action to prevent, abate, or minimize such release or threat of release, and shall, in addition to complying with any applicable notification requirements under Section 103 of CERCLA, 42 U.S.C. §9603, or any other law, immediately notify EPA of such release or threatened release.

VII. CERTIFICATION

42. By entering into this agreement, Settling Respondent certifies that to the best of its knowledge and belief it has fully and accurately disclosed to EPA all information known to Settling Respondent and all information in the possession or control of its officers, directors, employees, contractors and agents that relates in any way to any Existing Contamination or any past or potential future release of hazardous substances, pollutants or contaminants at or from the Property or otherwise relates in any way to its qualification for this Agreement; provided, however, that Settling Respondent shall not be obligated to disclose any privileged or confidential

communications with the exception of any data that may be contained therein. Settling Respondent also certifies that, to the best of its knowledge and belief, it has not caused or contributed to a release or threat of release of hazardous substances or pollutants or contaminants at the Site. If the United States determines that information provided by Settling Respondent is not materially accurate and complete, the Agreement, at the sole discretion of the United States, shall be voidable and the United States reserves all rights it may have in the event of such occurrence.

VIII. UNITED STATES' COVENANT NOT TO SUE

43. Subject to the Reservation of Rights in Section IX of this Agreement, upon payment of the amount specified in Section IV (Payment) of this Agreement, the United States covenants not to sue or take any other civil or administrative action against Settling Respondent for any and all civil liability for injunctive relief or reimbursement of response costs pursuant to Sections 106 or 107(a) of CERCLA, 42 U.S.C. §§ 9606 or 9607(a), or Section 7003 of RCRA, 42 U.S.C. § 6973 with respect to the Existing Contamination.

IX. RESERVATION OF RIGHTS

44. The covenant not to sue set forth in Section VIII, above

(United States' Covenant Not to Sue), does not pertain to any matters other than those expressly specified therein. The United States reserves, and this Agreement is without prejudice to, all rights against Settling Respondent with respect to all other matters including, but not limited to, the following:

a. claims based on a failure by Settling Respondent to meet a requirement of this Agreement including, but not limited to, Section IV (Payment), Section V (Access/Notice to Successors-in-Interest), Section VI (Due Care/Cooperation), and Section XIV (Payment of Costs);

b. any liability resulting from past or future releases of hazardous substances, pollutants or contaminants at or from the Site caused or contributed to by Settling Respondent, its successors, assignees, lessees or sublessees;

c. any liability resulting from exacerbation by Settling Respondent, its successors, assignees, lessees or sublessees, of Existing Contamination;

d. any liability resulting from the release or threat of release of hazardous substances, pollutants or contaminants at or from the Site after the effective date of this Agreement, not within the definition of Existing Contamination;

e. criminal liability;

f. liability for damages for injury to, destruction of, or loss of natural resources and for the costs of any natural resource damage assessment incurred by federal agencies other than EPA; and

g. liability for violations by Settling Respondent of local, state or federal law or regulations.

45. With respect to any claim or cause of action asserted by the United States, Settling Respondent shall bear the burden of proving that the claim or cause of action, or any part thereof, is attributable solely to Existing Contamination.

46. Nothing in this Agreement is intended as a release or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, that the United States may have against any person, firm, corporation or other entity not a party to this Agreement.

47. Except as provided in Paragraphs 51 and 53 of this Agreement, nothing in this Agreement is intended to limit the right of EPA to undertake future response actions at the Site or to seek to compel parties other than Settling Respondent to perform or pay for response actions at the Site. Nothing in this Agreement shall in any way restrict or limit the nature or scope

of the response actions that may be taken or be required by EPA in exercising its authority under federal law. Settling Respondent acknowledges that it is purchasing property where response actions may be required.

X. SETTLING RESPONDENT'S COVENANT NOT TO SUE

48. In consideration of the United States' Covenant Not To Sue in Section VIII of this Agreement, Settling Respondent hereby covenants not to sue and not to assert any claims or causes of action against the United States, its authorized officers, employees, or representatives, with respect to the Site or this Agreement, including, but not limited to, any direct or indirect claims for reimbursement from the Hazardous Substance Superfund established pursuant to the Internal Revenue Code, 26 U.S.C. § 9507, through CERCLA Sections 106(b)(2), 111, 112, 113, 42 U.S.C. §§ 9606(b)(2), 9611, 9612, 9613, or any other provision of law; any claim against the United States, including any department, agency or instrumentality of the United States, under CERCLA Sections 107 or 113, 42 U.S.C. §§ 9607, 9613, related to the Site; or any claims arising out of response activities at the Site, including claims based on EPA's oversight of such activities or approval of plans for such activities.

49. Settling Respondent reserves, and this Agreement is without

prejudice to, actions against the United States based on negligent actions taken directly by the United States, not including oversight or approval of the Settling Respondent's plans or activities, that are brought pursuant to any statute other than CERCLA or RCRA and for which the waiver of sovereign immunity is found in a statute other than CERCLA or RCRA.

Nothing herein shall be deemed to constitute preauthorization of a claim within the meaning of Section 111 of CERCLA, 42 U.S.C. § 9611, or 40 C.F.R. § 300.700(d).

XI. PARTIES BOUND/TRANSFER OF COVENANT

50. This Agreement shall apply to and be binding upon the United States and shall apply to and be binding on Settling Respondent, its officers, directors, employees, and agents. Each signatory of a Party to this Agreement represents that he or she is fully authorized to enter into the terms and conditions of this Agreement and to legally bind such Party.

51. Notwithstanding any other provisions of this Agreement, all of the rights, benefits and obligations conferred upon Settling Respondent under this Agreement may be assigned or transferred in whole or in part with the prior written consent of EPA at its sole discretion, to any person to whom Settling Respondent may sell, lease, assign or transfer all or portions of the Property,

and this Agreement shall apply to the purchaser, lessee, assignee or transferee with respect to the Property or the portion thereof transferred. Provided, however, that Settling Respondent may, in connection with the initial acquisition of the Property or portion thereof, transfer the Property or portion that it has acquired to a party Settling Respondent has identified to EPA in writing at least thirty (30) days prior to the closing of the assignment or transfer, and as to whom EPA has not objected within thirty (30) days. If the EPA has not objected to the proposed assignee or transferee within thirty (30) days of its receipt of such written notice, such assignment or transfer shall be deemed approved.

52. Settling Respondent agrees to pay the reasonable costs incurred by EPA to review any subsequent requests for consent to assign or transfer the Property or this Agreement.

53. In the event of an assignment or transfer of the Property, or of this Agreement, or an assignment or transfer of an interest in the Property, the assignor or transferor shall continue to be bound by all the terms and conditions, and be subject to all the benefits, of this Agreement, except to the extent that EPA and the assignor or transferor otherwise agree and accordingly modify this Agreement, in writing. Moreover, prior to or simultaneous

with any assignment or transfer of the Property, the assignee or transferee must consent in writing to be bound by the terms of this Agreement including, but not limited to, the certification requirement in Section VII of this Agreement in order for the Covenant Not to Sue in Section VIII of this Agreement to be available to that party. The Covenant Not To Sue in Section VIII shall not be effective with respect to any assignees or transferees who fail to provide such written consent to EPA.

XII. DISCLAIMER

54. This Agreement in no way constitutes a finding by EPA as to the risks to human health and the environment that may be posed by contamination at the Property or the Site, nor constitutes any representation by EPA that the Property or the Site is fit for any particular purpose.

XIII. DOCUMENT RETENTION

55. Settling Respondent agrees to retain and make available to EPA all business and operating records, contracts, site studies and investigations, and documents relating to operations at the Property, for at least ten years following the effective date of this Agreement, unless otherwise agreed to in writing by the Parties. At the end of ten years, Settling Respondent shall notify EPA of the location of such documents and shall provide

EPA with an opportunity to copy any documents at EPA's expense.

XIV. PAYMENT OF COSTS

56. If Settling Respondent fails to comply with the terms of this Agreement including, but not limited to, the provisions of Section IV (Payment) of this Agreement, it shall be liable for all litigation and other enforcement costs incurred by the United States to enforce this Agreement or otherwise obtain compliance.

XV. NOTICES AND SUBMISSIONS

57. Notices to Settling Respondent shall be sent to:

Ford Leasing Development Company
One Parklane Boulevard
Suite 1500 East
Dearborn, MI 48126
attention: N.E. Sirosky

with a copy to

Michael Laber, Esq.
Office of the General Counsel
Ford Motor Company
Parklane Towers East, Suite 728
One Parklane Boulevard
Dearborn, MI 78126-2493

58. Notices to EPA shall be sent to:

Marie M. Rongone
Assistant Regional Counsel
ORC-3
U.S. EPA Region IX
75 Hawthorne St.
San Francisco, CA 94105

with copies to:

Duane James
Remedial Project Manager
SFD-7-4
U.S. EPA Region IX
75 Hawthorne St.
San Francisco, CA 94105

and

David Glazer
Department of Justice

301 Howard St., Suite 870
San Francisco, CA 94105

XVI. EFFECTIVE DATE

59. Settling Respondent plans to take possession or control of a portion of the Property, at its own risk, before EPA completes its review of the public comments pursuant to Paragraph 68 of this Agreement, and possibly before the Superfund Division Director and the Assistant Attorney General consent to and execute this Agreement. If the Superfund Division Director and the Assistant Attorney General execute this Agreement and the United States does not withdraw its consent to this Agreement after reviewing public comments, then the effective date of this Agreement shall be the date upon which Settling Respondent took possession or control of any portion of the Property. If the Superfund Division Director or the Attorney General does not execute this Agreement, or if EPA withdraws or modifies its consent to this Agreement after reviewing public comments, then there is no Agreement and no effective date.

XVII. TERMINATION

60. If any Party believes that any or all of the obligations under Section V (Access/Notice to Successors-in-Interest) are no longer necessary to ensure compliance with the requirements of this Agreement, that Party may request in writing that the other

Party agree to terminate the provision(s) establishing such obligations; provided, however, that the provision(s) in question shall continue in force unless and until the party requesting such termination receives written agreement from the other party to terminate such provision(s).

XVIII. CONTRIBUTION PROTECTION

61. With regard to claims for contribution against Settling Respondent, the Parties hereto agree that the Settling Respondent is entitled to protection from contribution actions or claims as provided by CERCLA Section 113(f)(2), 42 U.S.C. § 9613(f)(2), for matters addressed in this Agreement. The matters addressed in this Agreement are all response actions taken or to be taken and response costs incurred or to be incurred by the United States or any other person for the Site with respect to the Existing Contamination.

62. Settling Respondent agrees that, with respect to any suit or claim for contribution brought by it for matters related to this Agreement it will notify the United States in writing no later than sixty (60) days prior to the initiation of such suit or claim.

63. Settling Respondent also agrees that, with respect to any suit or claim for contribution brought against it for matters

related to this Agreement, it will notify in writing the United States within ten (10) days of service of the complaint on it.

XIX. EXHIBITS

64. Exhibit 1 shall mean the description of certain real property that is the subject of this Agreement.

65. Exhibit 2 shall mean the description of certain additional real property that is also the subject of this Agreement.

66. Exhibit 3 shall mean the map depicting the Site.

67. Exhibit 4 shall mean the depiction of Settling Respondent's proposed redevelopment Site Plan for the Property.

//

//

XXI. PUBLIC COMMENT

68. This Agreement shall be subject to a thirty-day public comment period, after which the United States may modify or withdraw its consent to this Agreement if comments received disclose facts or considerations that indicate that this Agreement is inappropriate, improper or inadequate.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

REGION IX

IN THE MATTER OF:	)	
San Fernando Valley	)	[Docket Number]
Area 2 (Crystal Springs)	)	
Glendale Operable Units	)	
UNDER THE AUTHORITY OF THE	)	AGREEMENT AND COVENANT
COMPREHENSIVE ENVIRONMENTAL	)	NOT TO SUE FORD LEASING
RESPONSE, COMPENSATION, AND	)	DEVELOPMENT COMPANY
LIABILITY ACT OF 1980, 42 U.S.C.	)	
§ 9601, <u>et seq.</u> , as amended.	)	
<hr/>	)	

I. INTRODUCTION

1. This Agreement and Covenant Not to Sue ("Agreement") is made and entered into by and between the United States Environmental Protection Agency ("EPA") and Ford Leasing Development Company, a Delaware corporation ("Ford") (collectively "the Parties").

2. This Agreement is entered into pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended ("CERCLA"), 42 U.S.C. § 9601, et seq., and the authority of the Attorney General of the United States to compromise and settle claims of the United States.

3. Ford ("Settling Respondent") is principally officed at One Parklane Boulevard, Suite 1500 East, Dearborn, Michigan, 48126. On or about June 27, 1997, Herbert F. Boeckmann, II, entered into an option agreement with ZERO Corporation ("ZERO"), and later assigned the option agreement to Settling Respondent. Subject to certain terms and conditions, the option agreement provides an option to the Settling Respondent to purchase certain improved real property located in the City of Burbank, County of Los Angeles, State of California, which is located at the southwest corner of Burbank Boulevard and Front Street, and which is more particularly described in Exhibit 1 to this Agreement. Settling

Respondent intends to develop such real property and certain other parcels of real property currently owned by the City of Burbank, with respect to which Settling Respondent has entered into an agreement or option to purchase, and which are more particularly described in Exhibit 2 to this Agreement, into a retail automobile dealership mall with related amenities ("the Project"). (The real property described in Exhibits 1 and 2 is collectively referred to as the "Property").

4. Portions of the Property currently include certain improvements, including approximately six buildings that from approximately 1962 through 1991 housed certain manufacturing operations. Since 1991, portions of the Property have been rented for location services and other marginal uses.

5. The Property consists of a total of approximately 12.1 acres. A portion of the Property was previously owned and operated by ZERO (see Exhibit 1). A portion of the Property currently is owned and operated by the City of Burbank (see Exhibit 2).

6. The Property is located within the San Fernando Valley Area 2 Crystal Springs Superfund Site.

7. The Parties agree to undertake all actions required by the terms and conditions of this Agreement. The purpose of this

Agreement is to settle and resolve, subject to the reservations and limitations contained herein, the potential liability of the Settling Respondent for the Existing Contamination (as defined below) at the Property which otherwise would arise under Sections 106 and/or 107(a) of CERCLA, 42 U.S.C. §§ 9606 and 9607(a), and/or Section 7003 of RCRA, 42 U.S.C. § 6973.

8. The Parties agree that the Settling Respondent's entry into this Agreement, and the actions undertaken by the Settling Respondent in accordance with the Agreement, do not constitute an admission of any liability by the Settling Respondent.

The resolution of this potential liability, in exchange for provision by the Settling Respondent to EPA of a substantial benefit, is in the public interest.

II. DEFINITIONS

9. Unless otherwise expressly provided herein, terms used in this Agreement that are defined in CERCLA or in regulations promulgated under CERCLA shall have the meaning assigned to them in CERCLA or in such regulations, including any amendments thereto.

10. "EPA" shall mean the United States Environmental Protection Agency and any successor departments or agencies of the United States.

11. "Existing Contamination" shall mean:

a. Any hazardous substances, pollutants or contaminants, present or existing on or under the Site as of the effective date of this Agreement and for which Settling Respondent is not presently liable in any way.

b. Any hazardous substances, pollutants or contaminants that (1) migrated from the Property prior to the effective date of this Agreement; or (2) migrate from the Property after the effective date of this Agreement, provided that Settling Respondent is not presently liable in any way for such hazardous substances, pollutants or contaminants and does not cause or contribute to the migration of such hazardous substances, pollutants or contaminants from the Property.

c. Any hazardous substances, pollutants or contaminants that migrate onto or under the Property after the effective date of this Agreement, provided that Settling Respondent is not presently liable in any way for such hazardous substances, pollutants or contaminants and does not cause or contribute to the migration of such hazardous substances, pollutants or contaminants onto or under the Property.

12. "Parties" shall mean EPA and the Settling Respondent.

13. "Property" shall mean that certain real property which is

described in Exhibits 1 and 2 of this Agreement.

14. "Settling Respondent" shall mean Ford and any assignee or transferee of this Agreement pursuant to paragraphs 51, 52 and 53.

15. "Site" shall mean the San Fernando Valley Area 2 Crystal Springs Superfund Site generally encompassing the cities of Burbank and Glendale in the State of California. The Site is depicted generally on the map attached as Exhibit 3. The Site shall include the Property, and all areas to which hazardous substances and/or pollutants or contaminants have come to be located.

16. "United States" shall mean the United States of America, its departments, agencies, and instrumentalities.

III. STATEMENT OF FACTS

17. Settling Respondent is in the business of acquiring, developing and building automobile dealerships and related amenities for sale or lease to dealerships.

18. Settling Respondent plans to acquire the Property and construct an automobile dealership mall and related amenities thereon. A preliminary project plan for the Project is included in Exhibit 4 hereto.

19. The Property consists of approximately 12.1 acres that were,

in part, formerly used and zoned for industrial use and have been owned and operated by ZERO (see Exhibit 1) or the City of Burbank (see Exhibit 2). The Property is within the San Fernando Valley Area 2, Crystal Springs Superfund Site (hereinafter "Site"). The Site includes the Glendale North and South Operable Units. The Site includes contamination to regional groundwater as the result of volatile organic compounds ("VOCs") including, but not limited to, trichloroethylene ("TCE") and tetrachloroethylene ("PCE"), as well as areas to which the contamination has migrated.

20. Based on subsurface contamination at portions of the Property, ZERO has been included in EPA's enforcement actions at the Site.

21. The Property is within a City of Burbank redevelopment plan area. Such area includes blighted properties. The goal of the redevelopment plan is to revitalize said blighted properties in the redevelopment area by putting them to a more productive and beneficial use.

22. The City of Burbank considers the Settling Respondent's Project to be in the best interests of the public.

23. The City of Burbank supports the Project and has so notified EPA.

24. Settling Respondent's Project will convert the marginally

productive Property into a more productive and beneficial retail use.

25. Settling Respondent's Project will generate substantial benefits for the City of Burbank and the public at large. These benefits include long term economic benefits from the retail sales tax revenues generated by the Project. In addition, the Property will result in sales tax revenue on construction. Other income will be derived from property tax revenues, business license taxes, and other government fees.

26. The City of Burbank stands to benefit further from the Project, not only due to the sales tax revenues, but also because the Project is expected to encourage further redevelopment in the area.

27. The Property is located within the Site. EPA has collected information and conducted its own investigation of the Site. A portion of the Property has been known to EPA and referred to in certain EPA documents as the ZERO facility.

28. Settling Respondent does not operate a facility within the Site and is not, and has never been, named or identified as a responsible party for or at the Site.

29. Settling Respondent's Project will create a substantial number of construction-related jobs and an estimated 125-150

employment positions.

30. Settling Respondent's Project will provide substantial and meaningful employment. The workforce will be engaged in jobs requiring varying degrees of training, and many of the workers will be highly skilled at their positions. These new jobs are particularly important to the City of Burbank because of the substantial loss of the aerospace industry employment.

31. As a part of Settling Respondent's Project, Settling Respondent will contribute to public art in the City of Burbank.

32. Settling Respondent's Project is located immediately adjacent to the "Metrolink" station, thereby promoting the use of mass transport for employees, service department customers, and/or prospective automobile purchasers.

33. Settling Respondent represents that it anticipates that automobile dealerships that will occupy the Property will be active in community and civic affairs and will support community services through such participation in the community surrounding the Project.

34. Settling Respondent represents, and for the purposes of this Agreement EPA relies on said representations, that Settling Respondent's involvement with the Property has been limited to inspecting and performing environmental and other due diligence

with respect to the Property in connection with Settling Respondent's proposed acquisition of the Property, and completing its acquisition of the Zero portion of the Property.

IV. PAYMENT

35. In consideration of and in exchange for the United States' Covenant Not to Sue in Section VIII herein, Settling Respondent agrees to pay to EPA the sum of \$ 150,000, within thirty (30) days of the later of either: (1) the date that Settling Respondent takes title to the Property, or (2) the date that Settling Respondent receives notice from the EPA that the public comment period for this Agreement has expired and that the United States has determined not to withdraw its consent to this Agreement. The Settling Respondent shall make all payments required by this Agreement in the form of a certified check or checks made payable to "EPA Hazardous Substance Superfund," referencing the EPA Region IX, EPA Docket number, and Site/Spill ID # 091G, 091H, and 09N2, DOJ case number_____, if applicable, and the name and address of Settling Respondent. The Settling Respondent shall send such payments to the following address:

U.S. EPA
Region IX, Attn: Superfund Accounting
P.O. Box 360863M

Pittsburgh, PA 15251

Notice of payment shall be sent to those persons listed in Section XV (Notices and Submissions) and to EPA Region IX Financial Management Officer:

Catherine Shen
Financial Management Specialist (PMD-6)
USEPA Region IX
75 Hawthorne St.
San Francisco, CA 94105

The total amount to be paid to EPA shall be placed in the Glendale Special Account and used to conduct or finance the response action at or in connection with the Glendale North and South Operable Units. Any balance remaining in the Glendale Special Account at the completion of the response at or in connection with the Glendale North and South Operable Units shall be deposited in the EPA Hazardous Substance Superfund.

36. Amounts due and owing pursuant to the terms of this Agreement but not paid in accordance with the terms of this Agreement shall accrue interest at the rate established pursuant to Section 107(a) of CERCLA, 42 U.S.C. § 9607(a), compounded on an annual basis.

37. If Settling Respondent does not perform pursuant to paragraphs 33 and 34 of this Agreement, Settling Respondent may be deemed to be in material default of this Agreement.

V. ACCESS/NOTICE TO

SUCCESSORS-IN-INTEREST

38. Commencing upon the date that it acquires title to any part of the Property, Settling Respondent agrees to provide to EPA, its authorized officers, employees, representatives, and all other persons performing response actions under EPA or state oversight, an irrevocable right of access at all reasonable times to the portions of the Property it has acquired and to any other property to which access is required for the implementation of response actions at the Site, to the extent access to such other property is controlled by Settling Respondent, for the purposes of performing and overseeing response actions at the Site under federal and state law. EPA agrees to provide reasonable notice to Settling Respondent of the timing of response actions to be undertaken at the Property if such actions are undertaken by EPA and will use reasonable efforts to minimize interference with the use of the Property; provided, however, that nothing herein shall provide Settling Respondent with a claim or cause of action against EPA including, without limitation, any claim or cause of action for injunctive relief. Notwithstanding any provision of this Agreement, EPA retains all of its access authorities and rights, including enforcement authorities related thereto, under

CERCLA, the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act, 42 U.S.C. § 6901, ("RCRA") et. seq., and any other applicable statute or regulation, including any amendments thereto.

39. Within thirty (30) days after the later of either (a) the effective date of this Agreement, or (b) the date that Settling Respondent receives notice from the EPA that the public comment period for this Agreement has expired and that the United States has determined not to withdraw its consent to this Agreement, Settling Respondent shall record a certified copy of this Agreement with the Recorder's Office or Registry of Deeds for Los Angeles County, State of California. Thereafter, each deed, title, or other instrument conveying an interest in the portions of the Property Settling Respondent has acquired shall contain a notice stating that the Property is subject to this Agreement. A copy of these documents should be sent to the persons listed in Section XV (Notices and Submissions).

40. Settling Respondent shall ensure that assignees, successors-in-interest, lessees, and sublessees of the portions of the Property Settling Respondent has acquired shall provide the same access and cooperation as required of Settling Respondent under the terms of this Agreement. Settling Respondent shall ensure

that a copy of this Agreement is provided to any current lessee or sublessee on the portions of the Property Settling Defendant has acquired as of the effective date of this Agreement and shall ensure that any subsequent leases, subleases, assignments or transfers of the Property or an interest in the Property are consistent with this Section, and Section XI (Parties Bound/Transfer of Covenant), of this Agreement.

VI. DUE CARE/COOPERATION

41. Settling Respondent shall exercise due care at the Site with respect to the Existing Contamination and shall comply with all applicable local, State, and federal laws and regulations.

Settling Respondent recognizes that the implementation of response actions at the Site may interfere with Settling Respondent's use of the Property and may require closure of its operations or a part thereof. Settling Respondent agrees to cooperate fully with EPA in the implementation of response actions at the Site and further agrees not to interfere with such response actions. EPA agrees, consistent with its responsibilities under applicable law, to use reasonable efforts to minimize any interference with Settling Respondent's operations by such entry and response. In the event Settling Respondent becomes aware of any action or occurrence that causes

or threatens a release of hazardous substances, pollutants or contaminants at or from the Property that constitutes an emergency situation or that may present an immediate threat to the public health or welfare or the environment, Settling Respondent shall immediately take all appropriate action to prevent, abate, or minimize such release or threat of release, and shall, in addition to complying with any applicable notification requirements under Section 103 of CERCLA, 42 U.S.C. §9603, or any other law, immediately notify EPA of such release or threatened release.

VII. CERTIFICATION

42. By entering into this agreement, Settling Respondent certifies that to the best of its knowledge and belief it has fully and accurately disclosed to EPA all information known to Settling Respondent and all information in the possession or control of its officers, directors, employees, contractors and agents that relates in any way to any Existing Contamination or any past or potential future release of hazardous substances, pollutants or contaminants at or from the Property or otherwise relates in any way to its qualification for this Agreement; provided, however, that Settling Respondent shall not be obligated to disclose any privileged or confidential

communications with the exception of any data that may be contained therein. Settling Respondent also certifies that, to the best of its knowledge and belief, it has not caused or contributed to a release or threat of release of hazardous substances or pollutants or contaminants at the Site. If the United States determines that information provided by Settling Respondent is not materially accurate and complete, the Agreement, at the sole discretion of the United States, shall be voidable and the United States reserves all rights it may have in the event of such occurrence.

VIII. UNITED STATES' COVENANT NOT TO SUE

43. Subject to the Reservation of Rights in Section IX of this Agreement, upon payment of the amount specified in Section IV (Payment) of this Agreement, the United States covenants not to sue or take any other civil or administrative action against Settling Respondent for any and all civil liability for injunctive relief or reimbursement of response costs pursuant to Sections 106 or 107(a) of CERCLA, 42 U.S.C. §§ 9606 or 9607(a), or Section 7003 of RCRA, 42 U.S.C. § 6973 with respect to the Existing Contamination.

IX. RESERVATION OF RIGHTS

44. The covenant not to sue set forth in Section VIII, above

(United States' Covenant Not to Sue), does not pertain to any matters other than those expressly specified therein. The United States reserves, and this Agreement is without prejudice to, all rights against Settling Respondent with respect to all other matters including, but not limited to, the following:

a. claims based on a failure by Settling Respondent to meet a requirement of this Agreement including, but not limited to, Section IV (Payment), Section V (Access/Notice to Successors-in-Interest), Section VI (Due Care/Cooperation), and Section XIV (Payment of Costs);

b. any liability resulting from past or future releases of hazardous substances, pollutants or contaminants at or from the Site caused or contributed to by Settling Respondent, its successors, assignees, lessees or sublessees;

c. any liability resulting from exacerbation by Settling Respondent, its successors, assignees, lessees or sublessees, of Existing Contamination;

d. any liability resulting from the release or threat of release of hazardous substances, pollutants or contaminants at or from the Site after the effective date of this Agreement, not within the definition of Existing Contamination;

e. criminal liability;

f. liability for damages for injury to, destruction of, or loss of natural resources and for the costs of any natural resource damage assessment incurred by federal agencies other than EPA; and

g. liability for violations by Settling Respondent of local, state or federal law or regulations.

45. With respect to any claim or cause of action asserted by the United States, Settling Respondent shall bear the burden of proving that the claim or cause of action, or any part thereof, is attributable solely to Existing Contamination.

46. Nothing in this Agreement is intended as a release or covenant not to sue for any claim or cause of action, administrative or judicial, civil or criminal, past or future, in law or in equity, that the United States may have against any person, firm, corporation or other entity not a party to this Agreement.

47. Except as provided in Paragraphs 51 and 53 of this Agreement, nothing in this Agreement is intended to limit the right of EPA to undertake future response actions at the Site or to seek to compel parties other than Settling Respondent to perform or pay for response actions at the Site. Nothing in this Agreement shall in any way restrict or limit the nature or scope

of the response actions that may be taken or be required by EPA in exercising its authority under federal law. Settling Respondent acknowledges that it is purchasing property where response actions may be required.

X. SETTLING RESPONDENT'S COVENANT NOT TO SUE

48. In consideration of the United States' Covenant Not To Sue in Section VIII of this Agreement, Settling Respondent hereby covenants not to sue and not to assert any claims or causes of action against the United States, its authorized officers, employees, or representatives, with respect to the Site or this Agreement, including, but not limited to, any direct or indirect claims for reimbursement from the Hazardous Substance Superfund established pursuant to the Internal Revenue Code, 26 U.S.C. § 9507, through CERCLA Sections 106(b)(2), 111, 112, 113, 42 U.S.C. §§ 9606(b)(2), 9611, 9612, 9613, or any other provision of law; any claim against the United States, including any department, agency or instrumentality of the United States, under CERCLA Sections 107 or 113, 42 U.S.C. §§ 9607, 9613, related to the Site; or any claims arising out of response activities at the Site, including claims based on EPA's oversight of such activities or approval of plans for such activities.

49. Settling Respondent reserves, and this Agreement is without

prejudice to, actions against the United States based on negligent actions taken directly by the United States, not including oversight or approval of the Settling Respondent's plans or activities, that are brought pursuant to any statute other than CERCLA or RCRA and for which the waiver of sovereign immunity is found in a statute other than CERCLA or RCRA. Nothing herein shall be deemed to constitute preauthorization of a claim within the meaning of Section 111 of CERCLA, 42 U.S.C. § 9611, or 40 C.F.R. § 300.700(d).

XI. PARTIES BOUND/TRANSFER OF COVENANT

50. This Agreement shall apply to and be binding upon the United States and shall apply to and be binding on Settling Respondent, its officers, directors, employees, and agents. Each signatory of a Party to this Agreement represents that he or she is fully authorized to enter into the terms and conditions of this Agreement and to legally bind such Party.

51. Notwithstanding any other provisions of this Agreement, all of the rights, benefits and obligations conferred upon Settling Respondent under this Agreement may be assigned or transferred in whole or in part with the prior written consent of EPA at its sole discretion, to any person to whom Settling Respondent may sell, lease, assign or transfer all or portions of the Property,

and this Agreement shall apply to the purchaser, lessee, assignee or transferee with respect to the Property or the portion thereof transferred. Provided, however, that Settling Respondent may, in connection with the initial acquisition of the Property or portion thereof, transfer the Property or portion that it has acquired to a party Settling Respondent has identified to EPA in writing at least thirty (30) days prior to the closing of the assignment or transfer, and as to whom EPA has not objected within thirty (30) days. If the EPA has not objected to the proposed assignee or transferee within thirty (30) days of its receipt of such written notice, such assignment or transfer shall be deemed approved.

52. Settling Respondent agrees to pay the reasonable costs incurred by EPA to review any subsequent requests for consent to assign or transfer the Property or this Agreement.

53. In the event of an assignment or transfer of the Property, or of this Agreement, or an assignment or transfer of an interest in the Property, the assignor or transferor shall continue to be bound by all the terms and conditions, and be subject to all the benefits, of this Agreement, except to the extent that EPA and the assignor or transferor otherwise agree and accordingly modify this Agreement, in writing. Moreover, prior to or simultaneous

with any assignment or transfer of the Property, the assignee or transferee must consent in writing to be bound by the terms of this Agreement including, but not limited to, the certification requirement in Section VII of this Agreement in order for the Covenant Not to Sue in Section VIII of this Agreement to be available to that party. The Covenant Not To Sue in Section VIII shall not be effective with respect to any assignees or transferees who fail to provide such written consent to EPA.

XII. DISCLAIMER

54. This Agreement in no way constitutes a finding by EPA as to the risks to human health and the environment that may be posed by contamination at the Property or the Site, nor constitutes any representation by EPA that the Property or the Site is fit for any particular purpose.

XIII. DOCUMENT RETENTION

55. Settling Respondent agrees to retain and make available to EPA all business and operating records, contracts, site studies and investigations, and documents relating to operations at the Property, for at least ten years following the effective date of this Agreement, unless otherwise agreed to in writing by the Parties. At the end of ten years, Settling Respondent shall notify EPA of the location of such documents and shall provide

EPA with an opportunity to copy any documents at EPA's expense.

XIV. PAYMENT OF COSTS

56. If Settling Respondent fails to comply with the terms of this Agreement including, but not limited to, the provisions of Section IV (Payment) of this Agreement, it shall be liable for all litigation and other enforcement costs incurred by the United States to enforce this Agreement or otherwise obtain compliance.

XV. NOTICES AND SUBMISSIONS

57. Notices to Settling Respondent shall be sent to:

Ford Leasing Development Company
One Parklane Boulevard
Suite 1500 East
Dearborn, MI 48126
attention: N.E. Siroskey

with a copy to

Michael Laber, Esq.
Office of the General Counsel
Ford Motor Company
Parklane Towers East, Suite 728
One Parklane Boulevard
Dearborn, MI 78126-2493

58. Notices to EPA shall be sent to:

Marie M. Rongone
Assistant Regional Counsel
ORC-3
U.S. EPA Region IX
75 Hawthorne St.
San Francisco, CA 94105

with copies to:

Duane James
Remedial Project Manager
SFD-7-4
U.S. EPA Region IX
75 Hawthorne St.
San Francisco, CA 94105

and

David Glazer
Department of Justice

301 Howard St., Suite 870
San Francisco, CA 94105

XVI. EFFECTIVE DATE

59. Settling Respondent plans to take possession or control of a portion of the Property, at its own risk, before EPA completes its review of the public comments pursuant to Paragraph 68 of this Agreement, and possibly before the Superfund Division Director and the Assistant Attorney General consent to and execute this Agreement. If the Superfund Division Director and the Assistant Attorney General execute this Agreement and the United States does not withdraw its consent to this Agreement after reviewing public comments, then the effective date of this Agreement shall be the date upon which Settling Respondent took possession or control of any portion of the Property. If the Superfund Division Director or the Attorney General does not execute this Agreement, or if EPA withdraws or modifies its consent to this Agreement after reviewing public comments, then there is no Agreement and no effective date.

XVII. TERMINATION

60. If any Party believes that any or all of the obligations under Section V (Access/Notice to Successors-in-Interest) are no longer necessary to ensure compliance with the requirements of this Agreement, that Party may request in writing that the other

Party agree to terminate the provision(s) establishing such obligations; provided, however, that the provision(s) in question shall continue in force unless and until the party requesting such termination receives written agreement from the other party to terminate such provision(s).

XVIII. CONTRIBUTION PROTECTION

61. With regard to claims for contribution against Settling Respondent, the Parties hereto agree that the Settling Respondent is entitled to protection from contribution actions or claims as provided by CERCLA Section 113(f)(2), 42 U.S.C. § 9613(f)(2), for matters addressed in this Agreement. The matters addressed in this Agreement are all response actions taken or to be taken and response costs incurred or to be incurred by the United States or any other person for the Site with respect to the Existing Contamination.

62. Settling Respondent agrees that, with respect to any suit or claim for contribution brought by it for matters related to this Agreement it will notify the United States in writing no later than sixty (60) days prior to the initiation of such suit or claim.

63. Settling Respondent also agrees that, with respect to any suit or claim for contribution brought against it for matters

related to this Agreement, it will notify in writing the United States within ten (10) days of service of the complaint on it.

XIX. EXHIBITS

64. Exhibit 1 shall mean the description of certain real property that is the subject of this Agreement.

65. Exhibit 2 shall mean the description of certain additional real property that is also the subject of this Agreement.

66. Exhibit 3 shall mean the map depicting the Site.

67. Exhibit 4 shall mean the depiction of Settling Respondent's proposed redevelopment Site Plan for the Property.

//

//

XXI. PUBLIC COMMENT

68. This Agreement shall be subject to a thirty-day public comment period, after which the United States may modify or withdraw its consent to this Agreement if comments received disclose facts or considerations that indicate that this Agreement is inappropriate, improper or inadequate.

**NO FURTHER REQUIREMENTS - FORMER ZERO CORPORATION FACILITY,
777 FRONT STREET, BURBANK, CALIFORNIA (FILE NO. (109.6162;PCA NO. 2046J)**

Dear Mr. Habel:

We are in receipt of the *Supplemental Site Closure Information* report, dated August 23, 2001, prepared by Hydro-Geo-Chem Inc., for the subject site. The report contains the results of the soil vapor rebound sampling following the completion of additional soil vapor extraction in impacted areas designated as Phase 2 (Deep Soil Vapor Extraction Program) for removal of tetrachloroethylene (PCE) and trichloroethylene (TCE) contamination. The report also contained your request for no further action based on the submitted laboratory analytical results.

Laboratory analysis of soil vapor samples detected rebound concentrations of 11 µg/L for PCE in Well B-2 at 25 feet below ground surface (bgs). TCE concentrations were reduced to non-detect at 85 feet bgs. No other volatile organic compounds (VOC) were detected above the laboratory detection limits. Groundwater beneath the site is reported to be encountered at depths ranging from 94 feet bgs in MW-3 to 126 feet bgs in MW-7.

Based on our review of the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, we have no further requirements for VOC soil contamination with respect to the San Fernando Valley Cleanup Program at the subject site.

The relatively small volume of impacted soil, attenuation of concentrations with depth, and the diminished concentration of VOCs remaining in the soil appear not to pose a present or continuing threat to groundwater quality. Therefore, no further VOC assessment or cleanup of soil is warranted.

California Environmental Protection Agency

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption
For a list of simple ways to reduce demand and cut your energy costs, see the tips at: <http://www.swrcb.ca.gov/news/echallenge.html>

Our mission is to preserve and enhance the quality of California's water resources for the benefit of present and future generations.

EXECUTIVE SUMMARY

This report describes remedial action completed at the former APW facility in Burbank, California, and provides the basis for a No Further Action (NFA) determination for the facility. Remediation was performed at the facility between May 1998 and October 2000 and has consisted of two phases of soil vapor extraction (SVE) for removal of volatile organic compounds (VOCs) in site soil. Each phase's remedial plans were approved by the California Regional Water Quality Control Board (Board) and remedial progress reports were regularly submitted to the Board. Active SVE was discontinued in mid-October 2000 to begin closure verification activities, pursuant to the Phase 2 No Further Action Plan (June 26, 2000) as approved by the Board.

Since remediation began in May 1998, approximately 8,000 pounds of VOCs have been removed from site soil via SVE. Of this total mass, 71% (5,700 pounds) consisted of chlorinated VOCs and 29% (2,300 pounds) consisted of petroleum hydrocarbon constituents. The occurrence of these petroleum hydrocarbons in the SVE influent stream was unexpected and extended the period of remediation.

Of the chlorinated VOC mass, approximately 70% was tetrachloroethene (PCE), 20% was trichloroethene (TCE), 7% was 1,1-dichloroethene (1,1-DCE), and 3% was 1,1,1-trichloroethane (1,1,1-TCA). More than 80% of the VOC mass was removed between May 1998 and mid-1999. During this period, VOC mass removal rates were a maximum of 30 pounds per day and an average of 15 pounds per day. From January to October 2000, the VOC mass removal rate averaged about 1.5 pounds per day, with approximately 10% of this mass consisting of chlorinated VOCs and 90% petroleum hydrocarbon constituents.

VOC concentrations have declined significantly in all areas. The decline in total VOCs in the 60 monitoring points used to assess remedial progress ranged between 94% and 99.8%, and averaged 99%. Maximum soil gas concentrations, detected in the shallowest sample at Boring B-2, declined from greater than 36,000 to 710 micrograms per liter, a 98% reduction.

VOC concentrations in all site soil between the land surface and approximately 60 to 85 feet below land surface declined below Phase 1 or Phase 2 cleanup goals for chlorinated VOCs and the soil cleanup standards for petroleum hydrocarbons. Analytical results from a few of the monitoring points closest to the water table indicate that VOC concentrations, mainly TCE, slightly exceed cleanup goals, and that the SVE remedial activities do not appear effective at reducing these concentrations. The TCE concentrations in the deep soil gas samples are believed to result from volatilization of TCE from the residual groundwater within the vadose zone as the water table declines, not from a source within shallower soil. Soil TCE concentrations have always been low relative to groundwater concentrations, suggesting an off-site source of TCE to groundwater.

Conclusions

1. Approximately 8,000 pounds of VOCs have been removed with the SVE system. The predominant VOCs removed have been PCE and petroleum hydrocarbon constituents, which accounted for 78% of the total mass removed. TCE, 1,1,1-TCA, and 1,1-DCE accounted for the remainder of the total mass removed.
2. SVE mass removal rates have declined from more than 30 to less than 1.5 pounds VOCs per day. Of these 1.5 pounds, approximately 90% of the mass was petroleum hydrocarbon constituents. The VOC mass removal rates showed asymptotic behavior, indicating that continuing SVE is of little benefit.
3. The SVE system has been effective in removing VOC concentrations to below cleanup goals for chlorinated VOCs in nearly all areas on site. The SVE system has removed petroleum hydrocarbons to concentrations below soil cleanup standards in the area where these were detected.
4. In the Boring B-2 area, shallow PCE concentrations rebounded, however, concentrations were less than Phase 1 cleanup goals. This rebound appears to be due to reduced SVE efficiency within an old concrete floor buried within a few feet of the surface in this area. Because of this floor and low PCE concentrations beneath this area, it is evident that this is not a continuing source area, and there is limited potential for significant downward migration of PCE.
5. Shallow and intermediate depth site soil has non-detectable or very low TCE concentrations. The source of TCE concentrations detected in deep soil gas samples near the water table is apparently from the groundwater from an off-site source, not from the shallower soil.

Recommendations

1. Soil cleanup goals have been substantially achieved and it is no longer efficient or cost effective to continue SVE. Therefore, further SVE is not justified or warranted.
2. The groundwater monitoring system has shown that groundwater movement beneath the site is very slow, and VOC concentrations in groundwater are not influenced by, or are correlatable to, shallow and intermediate depth soil concentrations. Therefore, continued groundwater monitoring is not warranted.
3. Because cleanup standards and goals have been substantially met, no further remedial action is recommended, and a NFA is appropriate for this site.

1. INTRODUCTION

This document presents results of site remediation activities including results and interpretation of closure sampling at the former APW property (facility), 777 Front Street in Burbank, California (Figures 1 and 2). Remedial activities were conducted on behalf of APW North America, Inc., a successor corporation to ZERO Corporation, by Hydro Geo Chem, Inc. (HGC).

Closure activities were conducted in accordance with a Work Plan for No Further Action Closure (HGC, 2000c), submitted to the California Regional Water Quality Control Board (Board) on June 26, 2000. The Work Plan for No Further Action Closure was approved in writing by the Board on October 2, 2000, and closure-related activities took place between October 2000 and January 2001. The work conducted during this investigation was under active supervision of a California Registered Geologist and California Certified Hydrogeologist.

1.1 Purpose

The objectives of the closure activities were to document the remedial action, to compare sampling results to closure criteria, and to provide the basis for a No Further Action (NFA) request for both the soil remediation system and the groundwater monitoring requirements.

This document also provides a summary of all investigation and remedial activities conducted at the site. Previous and recent groundwater analysis results are tabulated, as are soil gas analyses. The reference section provides a listing of all reports of environmental investigations at the facility that have been previously submitted to the Board.

1.2 Scope

The Work Plan for NFA Closure (HGC, 2000c) included the following activities:

1. Shutting off the soil vapor extraction (SVE) system,
2. Collecting a round of soil gas samples from all deep SVE wells and multi-level soil gas monitoring probes,
3. Monitoring organic vapor concentrations for a three-month period,
4. Resampling soil gas from all deep SVE wells and multi-level probes,
5. Collecting a round of groundwater samples from the nine facility groundwater monitoring wells for analysis of volatile organic compounds (VOCs); including 1,4-dioxane.

In the Board's October 2, 2000, approval letter, three additional conditions were required:

1. The detection limit for 1,4-dioxane should be 0.5 micrograms per liter ($\mu\text{g/L}$), instead of the 3 $\mu\text{g/L}$ limit (current advisory action level) proposed.
2. Activities must be supervised or conducted by a California registered professional (geologist, engineering geologist, civil or geotechnical engineer).
3. An updated health and safety plan must be on site and followed.

HGC attempted to resolve the 1,4-dioxane detection limit difference by discussing capabilities with several laboratories and with the California Department of Health Services. The best reliable detection limit was determined to be 2 µg/L. This was discussed with Mr. Elijah Hill of the Board, who subsequently approved the 2 µg/L detection limit. Conditions 2 and 3 were fully complied with.

After work plan approval, HGC advised Board staff of the field activities schedule. The SVE system was shut off on October 24, 2000, and a round of soil gas sampling was conducted October 24 through 27, 2000. Groundwater sampling was conducted between November 29 and December 1, 2000. The final round of soil gas sampling was conducted January 30 through February 2, 2001.

1.3 Site Description

The site is a closed manufacturing facility in Burbank, California, comprising approximately eight acres, as shown on Figure 2. Vacant warehousing, manufacturing, and office buildings take up approximately 75% of the facility, and the remaining area is asphalt-covered and was used for parking, driveways, and storage. The site is bordered by old Front Street and Interstate 5 on the north and northeast, Burbank Boulevard and County Flood Control Channel on the west and northwest, and New Front Street and the Southern Pacific Railroad tracks on the south. The facility lies on a

southeasterly-sloping alluvial surface of the San Fernando Valley. Site elevations range from 573 feet above mean sea level (amsl) in the southeast corner, to 590 feet amsl in the northwest corner.

The history of industrial operations at the site dates from the 1930s (Targhee, Inc., 1991a). ZERO Corporation purchased the property in the early 1960s. ZERO Corporation operations included manufacture of metal enclosures in Buildings 11 through 14. Building 10 housed administrative offices, and Building 15 housed the maintenance department. ZERO Corporation leased a parcel of land between the manufacturing buildings and the Southern Pacific Railroad tracks from Southern Pacific Transportation Company for storage and parking. Manufacturing at the plant was discontinued in December 1991 and by early 1992 all manufacturing equipment and materials had been removed from the facility. The property is currently inactive.

The leased area between Buildings 11 through 14 and the railroad tracks was sold by Southern Pacific to the City of Burbank in 1998, on which the new Front Street was constructed. Old Front Street was closed upon opening of the new Front Street in June 1999. In 1998 the Burbank facility was sold to the Ford Leasing Development Company (FLDC).

2. SUMMARY OF INVESTIGATION ACTIVITIES

2.1 Site Investigation and Remediation Activities

Environmental site investigation activities by Targhee, Inc., included a site audit (Targhee, 1991a) and a subsurface investigation of storage and use areas (Targhee, 1991b). Samples were collected from 21 borings at various depths to a maximum of 20 feet below land surface (ft bls). These locations are shown on Figure 3, and analytical results are summarized in Table 1. Predominant VOCs detected in these samples were tetrachloroethene (PCE) and 1,1,1-trichloroethane (1,1,1-TCA), with minor detections of other VOCs; such as trichloroethene (TCE) and 1,1-dichloroethene (1,1-DCE). The results were reported by Targhee, Inc. to the Board in 1991 and were also summarized in HGC's subsurface investigation report (HGC, 1992c).

In January 1992, at the request of the Board, HGC conducted a soil gas survey at the facility using removable soil gas drive points installed to depths of between 5 and 28.5 ft bls and an on-site mobile laboratory. The results of this investigation were reported to the Board in February 1992 (HGC, 1992a). Figure 4 shows locations of all drive point soil gas samples and results are tabulated in Appendix A. The results supported the earlier testing and delineated areas of PCE and 1,1,1-TCA in soil gas. The results also confirmed that 1,1,1-TCA and 1,1-DCE concentrations were correlated, and that TCE concentrations were mostly 10 to 100 times less than PCE concentrations.

A work plan for a supplemental site investigation including installation of eight multi-level soil gas monitoring probes and six groundwater monitoring wells was submitted to the Board on June 24, 1992 (HGC, 1992b), and approved by the Board on June 30, 1992. This work was completed and results were submitted in September 1992 (HGC, 1992c). Four additional groundwater monitoring wells, three of them on City of Burbank property along Front Street, were installed in November and December 1992 (HGC, 1993a). Results from quarterly, semi-annual, and annual groundwater monitoring from these wells have been reported in the various groundwater monitoring reports listed in the References section. A listing of all groundwater sampling results is provided in Appendix B.

In response to a December 15, 1993, request from the Board, a work plan to determine the feasibility of soil remediation using SVE was prepared and submitted to the Board on February 25, 1994 (HGC, 1994a). The Board approved the plan on April 25, 1994, and the Air Quality Management District permitted operation of the SVE unit on October 6, 1994. Additional soil gas monitoring probes and a deep SVE well were installed and pilot testing was conducted in November and December 1994. The report of test results was submitted to the Board on February 22, 1995 (HGC, 1995a). This was followed by a soil remediation work plan, based on the Board's VOC-cleanup screening level procedure (California Regional Water Quality Control Board, 1996), and submitted to the Board in January 1996 (HGC, 1996a). The Board approved this work plan (subsequently called the Phase 2 Remedial Plan) and screening levels in February 1996. To accommodate construction of the new Front Street, the City of Burbank requested the installation

of an additional soil gas monitoring probe (B-12, installed in June 1999 [HGC, 1999d]), and also requested changes in the number and locations of SVE wells.

In the fall of 1997, ZERO Corporation began negotiations with FLDC for sale of the facility. To accommodate FLDC's then-proposed property development a shallow soil cleanup work plan (the Phase 1 Remedial Plan) was developed and submitted to the Board on December 18, 1997 (HGC, 1997). The Phase 1 SVE work plan was approved in writing by the Board on December 22, 1997. The system was constructed in March and April 1998 and was operated between May 1998 and April 1999. Figures 5, 6, and 7 show locations of shallow SVE wells, injection wells, and vapor monitoring probes installed for the Phase 1 system, respectively. Reports documenting Phase 1 progress were submitted to the Board on a regular basis during the remediation period (HGC, 1998b-d, 1999a-d).

Once monitoring results indicated that Phase 1 cleanup goals had been achieved, a Phase 1 Closure Verification Sampling Plan was prepared and submitted to the Board on April 21, 1999 (HGC, 1999c). On June 24, 1999, the Board approved the work plan and directed APW to complete verification sampling and submit its report by September 1999. The work plan elements were conducted in July 1999 and the results showed that Phase 1 cleanup goals had been attained in the Phase 1 cleanup area. The report documenting these results and requesting closure of the Phase 1 remedial system was submitted to the Board on August 11, 1999 (HGC, 1999f). The Board has not acted on this request.

The Phase 2 SVE system was incrementally incorporated into the Phase 1 system during the fall and winter of 1998. The Phase 2 system became fully operational in early March 1999 and was operated at full capacity once the Phase 1 system was shut down in April 1999. The system consisted of 19 deep SVE wells, 14 of which were dual-completion allowing air injection near the water table (Figure 8). Phase 2 system construction is described in the April 13, 1999 monitoring report (HGC, 1999b). Cleanup progress was monitored by organic vapor measurements and soil gas sampling from the deep SVE wells and in multi-level soil gas monitoring probes (Figure 9). Reports of Phase 2 remedial progress were submitted to the Board on a periodic basis since the beginning of Phase 2 remedial activities (HGC, 1999b, 1999d, 1999g, 2000a, 2000b, 2001).

By February 2000, monitoring data indicated that the Phase 2 cleanup levels had been attained. On June 26, 2000, HGC submitted a work plan for site closure based on remedial progress and on concerns raised by the Board during a February 25, 2000 meeting. The Board approved the work plan on October 2, 2000, with the additional conditions added to their approval, as described above in Section 1.2. Closure activities; consisting of two rounds of soil gas sampling, rebound monitoring, and groundwater sampling, were conducted between October 2000 and January 2001.

2.2 Site Hydrogeologic Conditions

The facility lies in the San Fernando Valley, part of the Upper Los Angeles River watershed. Nearest bedrock outcrops are in the Verdugo Mountains north of the site. Drainage is toward the

southeast into the Los Angeles River. In the vicinity of the site, drainage is into the concrete-lined Burbank Western Flood Control Channel (Figure 2). There are no perennial streams near the site.

Thickness of the valley fill deposits beneath the facility is not known, but is believed to be less than 600 feet (ft) (Yerkes and others, 1965). The valley fill deposits are generally consolidated; the composition of which is dependent on source rock, distance from the source, and amount of reworking by streams after deposition. Valley fill in the vicinity of the site is highly heterogeneous and primarily coarse-grained (sand, gravel, cobbles), with 10 to 50% fines (silt and minor clay).

Site lithologic conditions have been evaluated to a depth of 160 ft bls. Fines predominate in fill near the surface beneath the buildings, extending to about eight feet below grade in most areas, and as deep as 20 feet below grade in others (HGC, 1992c). Some of this fill may contain concrete rubble or intact concrete floors in the Building 11 and 12 areas. Geologic cross sections prepared from logs of boreholes drilled at the facility indicate variable lithologies which do not correlate from boring to boring, that is, there are no strong mapable units within the depth of investigation.

Groundwater is encountered at depths ranging from 94 ft bls in MW-3 to 126 ft bls in MW-7. Groundwater levels have shown significant changes since site monitoring began in 1992. As shown on Figure 10, water levels rose nearly 20 ft from early 1993 to 1996. The water table elevation in 1998 was probably at an historic high since at least the early 1950s (HGC, 1992c). Water levels have declined about 25 ft since then. Currently, water levels are lowest since the early 1970s.

Groundwater flow directions and gradients beneath the facility since monitoring began in 1992 are shown in a series of maps on Figure 11. All groundwater level measurements in facility monitoring wells are listed in Appendix C. Groundwater flow directions have ranged between southwest and northeast, a direction shift of about 180 degrees. These changes are due primarily to pumping, either by the City of Burbank (south of the site) or by Lockheed (northwest of the site). Gradients have ranged between 2×10^{-3} and 7.6×10^{-3} feet/foot (ft/ft) (11 and 40 ft per mile) and average 3.8×10^{-3} ft/ft. These gradients are considered slight, and indicate a comparatively slow groundwater flow rate.

2.3 VOCs in Facility Groundwater Monitoring Wells

2.3.1 VOC Occurrence and Distribution

Groundwater has been monitored on- and off-site and groundwater samples have been collected from all facility groundwater monitoring wells since 1992 and have been reported to the Board. All of the VOCs that have been detected in groundwater samples are listed in Table 2 (including the most recent sampling results, discussed below), ranked by detection frequency. The list includes most analytes determined using Environmental Protection Agency (EPA) analytical methods 8240, 8260 or 524.2. (1,4-dioxane was analyzed by EPA method 8270.)

The predominant VOCs detected in groundwater samples have been TCE, chloroform, and PCE. Other VOCs that have been detected in at least several samples are 1,1-DCE, cis-1,2-dichloroethene, and 1,1,1-TCA, although the latter two have not been detected above their maximum contaminant levels (MCLs). Chloroform is a recognized contaminant in much of the regional basin groundwater, thought to be a chlorination byproduct of recharge water. It has not been detected above its MCL and is not discussed further.

Concentrations of TCE above its maximum contaminant level (MCL) have been detected in samples from wells MW-1, MW-2, MW-3, MW-9, and MW-10. Maximum TCE concentrations have ranged from 830 to 6,200 $\mu\text{g/L}$. On the other hand, the highest concentrations of PCE have been detected in samples from wells MW-6, MW-7, and MW-10 at a maximum concentration of 100 $\mu\text{g/L}$. Since 1998, the maximum PCE concentration has been 11 $\mu\text{g/L}$. We have found that there is no statistical correlation between PCE and TCE detections or concentrations in groundwater samples, suggesting that the groundwater TCE does not occur due to degradation of PCE.

However, a strong inverse correlation is apparent between groundwater TCE concentrations and water table movement beneath the site, as shown on Figure 12. The lowest TCE concentrations have corresponded with a high water table in 1995, 1996, and 1998 and higher TCE concentrations occurred in 1992, 1997, and 2000, corresponding with a lower water table. As discussed in previous reports (HGC, 1995d; 1999b; 2000b), these variations are explained by the vertical distribution of TCE in the groundwater. At low groundwater levels, water samples from facility monitoring wells reflect conditions

within a few feet of the water table, and these samples have had higher TCE concentrations. At high groundwater levels, the water samples reflect conditions of greater saturated thickness, usually about 20 ft below the water table, and these samples have had comparatively lower TCE concentrations.

Because no source of TCE has been detected in shallow soil beneath the facility, either from subsurface exploration, soil gas monitoring, or the extensive SVE activities, no on-site source of TCE to groundwater is evident. Instead, the soil gas sampling results indicate that the source of TCE in soil gas samples closest to the water table is volatilization of TCE from the residual groundwater within the vadose zone as the water table declines.

2.3.2 Results of November 2000 Groundwater Sampling

Groundwater samples were collected from the groundwater monitoring wells between November 28 and December 1, 2000. The following procedures were followed for this sampling round. After groundwater levels were measured, a Redi-Flow II, 2-inch-diameter submersible, stainless-steel pump was then set in the well approximately 10 ft below the static water level.

Each well was then purged of standing water from the wellbore to ensure that sampled groundwater was representative of formation conditions. Wells were purged at rates between 0.5 and 1.5 gallons per minute (gpm). At least three, wetted-casing volumes of water were pumped from each well. Water temperature, pH, electrical conductivity, and turbidity were monitored during sampling. Purge volumes, pumping rates, and field measurements are listed in *Groundwater*

Sampling Forms (Appendix D). Purge water was temporarily stored in 55-gallon drums, pending treatment and discharge pursuant to the facility NPDES permit (CAG 990000).

When the minimum number of casing volumes had been pumped and the field-measured parameters were relatively stable, groundwater was sampled using a disposable polyethylene bailer. Sample containers were obtained from Weck Labs in City of Industry, California. Samples for VOC analyses were contained in pre-acidified, 40-milliliter glass volatile organic analysis (VOA) vials with Teflon®-lined septa.

VOC sampling procedures consisted of filling two VOA vials from the bailer, making sure that sample agitation and air entrapment were minimized, that hydrochloric acid preservative was not lost during filling, and that air bubbles were not present after capping. All samples were labeled with the sample location, time, and date; enclosed in ziplock bags; and placed on ice in a cooler. A chain-of-custody form was included with each laboratory shipment. Samples were analyzed for VOCs by gas chromatography and mass spectrometry using EPA Drinking Water Method 524.2. Samples were analyzed for 1,4-dioxane using EPA Method 8270 (modified). Analytical reports are provided in Appendix E. Water Quality Control Board report forms are provided in Appendix F. Analytical results for this sampling round are summarized in Table 4 and results from all previous sampling rounds are listed in Appendix B.

Between sampling locations, the external portions of the pump and other sampling equipment were thoroughly cleaned with a soap and tap water solution and rinsed in tap water. Cleaning

solution was then circulated through all internal portions of the pump and tubing followed by a tap water rinse. Cleaning water was stored in 55-gallon drums and disposed of with the purge water for subsequent disposal as described above.

Results are listed in Table 3 and are displayed for TCE and PCE on Figure 13. The results indicate that TCE, chloroform, and PCE are the primary VOCs detected in groundwater samples, in agreement with previous results. TCE was detected above its MCL in eight of nine samples, and PCE was detected above its MCL in two of nine samples. Cis-1,2-DCE was detected above its MCL in one of nine samples. The compound 1,4-dioxane was not detected in any groundwater sample.

TCE concentrations increased in five samples and decreased in four samples compared to the previous sampling round. Increases in TCE concentrations occurred in samples from MW-1, MW-2, MW-3, MW-5, and MW-8, while samples from the remaining wells showed decreases. PCE concentrations increased slightly in seven samples (an average increase of 2.7 µg/L). The remaining two samples decreased in concentration.

Although the mass of petroleum hydrocarbon constituents removed by SVE from site soil has been significant, no petroleum hydrocarbon constituents (benzene, toluene, ethylbenzene, or xylenes [BTEX]) were detected in groundwater samples. The gasoline additives methyl tert butyl ether (MTBE) and ethylene dibromide (EDB) have not been detected in these or previous groundwater samples. Furthermore, MTBE has not been detected in previous soil gas samples.

3. RESULTS OF SOIL VAPOR EXTRACTION

The results of SVE performance are discussed in terms of effectiveness at 1) VOC mass removal, 2) reduction in VOC concentrations, and 3) continued efficiency or cost-effectiveness.

3.1 VOC Mass Removal

Mass removal rates have been tabulated in previous progress reports and are summarized in Table 4, which lists cumulative mass removed and mass removal rates for each quarter. The total mass removed is calculated at approximately 8,000 pounds. Of this total, about an equal mass of VOCs was removed during each phase of remediation.

When wells SVE-8 and SVE-15 came on line in early 1999, the predominant VOCs detected in soil gas from these wells was petroleum hydrocarbon constituents (Appendix A and Table 5). Through 1999, an increased proportion of total VOCs came from these wells, as is indicated by the increasing mass of petroleum hydrocarbons listed in Table 4. The total mass of petroleum hydrocarbon constituents removed from the site is approximately 29% of the total VOC mass.

The chlorinated VOCs removed from site soil are (by decreasing mass): PCE, TCE, 1,1-DCE, and 1,1,1-TCA. PCE was the main VOC removed, accounting for approximately 50% (4,000 pounds) of the entire VOC mass and nearly 70% of the chlorinated VOC mass removed.

During Phase 1, PCE accounted for more than 90% of the total VOC mass removed. The remaining chlorinated VOCs removed amounted to 20% for TCE, 7% for 1,1-DCE, and 3% for 1,1,1-TCA.

As can be seen in the quarterly total in Table 4, most of the total VOC mass removed from site soil occurred between Phase 1 startup in May 1998 and mid-1999. This amounted to more than 6,300 pounds, or 79% of the total mass removed. During this period, VOC mass removal rates reached a maximum of 30 pounds per day in early 1999, and averaged 15 pounds per day.

From January 2000 to system shut down in October 2000, the VOC mass removal rate averaged about 1.5 pounds per day. The mass removed during this period was about 88% petroleum hydrocarbon constituents and about 12% chlorinated VOCs. In terms of effectiveness, the decreasing mass removal rates are shown below to be a function of decreasing VOC soil concentrations.

3.2 VOC Concentrations

VOC concentrations in all soil gas samples have been tabulated in Appendix A. Soil gas analytical results from closure sampling conducted in October 2000 and January 2001 are appended in Appendices G and H.

Table 5 provides a summary of all VOCs detected in each soil gas sampling round for all Phase 2 (deep) SVE wells and for all multi-level soil vapor monitoring wells. The chlorinated VOC results from this table are provided as graphs in Plates 1 and 2, showing spatial and temporal distributions of VOCs before, during, and after remedial activities. These distributions are also shown on Figures 14 through 22. Each of these figures shows soil concentrations of PCE, TCE, and 1,1,1-TCA prior to and subsequent to remediation for each of three soil depths: shallow, corresponding to depths between 0 and 25 ft; intermediate, corresponding to depths between approximately 25 and 60 ft; and deep, corresponding to depths between 60 and 85 ft.

Prior to remedial activities, maximum VOC concentrations were detected in the shallow soil gas samples from B-2 and B-3 (PCE) and MW-3 (1,1,1-TCA), shown on Figure 15. Intermediate level maximum concentrations were also detected in these probes (Figure 18). Deep-level maximum concentrations were highest in probes B-2 and B-3 (Figure 21). The distribution of PCE and TCE in the shallow soil gas were spatially similar and centered in Buildings 11 and 12, while the distributions of 1,1,1-TCA and 1,1-DCE were also spatially similar and were centered in the northwest corner of Building 11 and the southeast corner of Building 14.

During SVE remediation, VOC concentrations declined in all SVE areas. Vapor phase PCE concentrations in boring B-2 at 25 ft declined from 36,000 µg/L to 25 µg/L (subsequently rebounding to 710 µg/L), and the 50-foot sample declined from 16,000 µg/L to non-detectable (with a slight rebound to 16 µg/L, Table 5). Similar decreases occurred at all monitoring points where

pre-remedial concentrations were in the 1,000 to 10,000 µg/L range. Decreases in total chlorinated VOCs ranged between 94 and 99.8%, and averaged 99% for all 60 soil gas monitoring points used to assess remedial progress at the site (Table 5). Decreases in petroleum hydrocarbon constituents, detected primarily in SVE-8 and SVE-15, ranged between 76% and 93%.

High pre-remedial concentrations of 1,1,1-TCA and 1,1-DCE were reduced at all monitoring points to levels below detection, except at Borings B-12 and MW-3. In the deep soil gas samples from those probes, 1,1-DCE was detected at 10 and 32 µg/L, respectively. This represents a 63-fold reduction in 1,1-DCE at MW-3. (No pre-remedial values are available from B-12, as it was installed after remediation began.)

VOC concentrations in all site soil between the surface and 60 to 75 ft. bls (shallow and intermediate depths) declined to less than the Phase 1 or Phase 2 soil cleanup goals for chlorinated VOCs (Table 6). Also, concentrations of all petroleum hydrocarbon constituents in SVE-8 and SVE-15 samples declined to less than the maximum soil screening levels listed in Table 7.

Analytical results from 7 of 35 deep soil gas samples within the 75- to 85-ft bls range indicate that VOC concentrations, mainly TCE, slightly exceed cleanup goals for those depths. These concentrations cannot be attributed to shallower soil beneath the site because this soil did not have significant TCE concentrations. Instead, the shallow- and intermediate-zone soil primarily contained PCE, which has been removed to very low concentrations through remediation. The TCE

concentrations in these deep soil gas samples correspond with TCE concentrations in the groundwater, and are believed to result from volatilization of TCE at the water table, as described in more detail in Section 2.3.1.

The post-remedial deep soil gas sample results from MW-3 and B-12 indicate the occurrence of 1,1,1-TCA and 1,1-DCE (Table 5). These VOCs do not occur in the shallower samples from those locations. Because SVE would draw soil vapors past B-12 and MW-3 toward SVE-4 (Figure 8), a non-facility source of these VOCs, probably in a southwesterly direction from SVE-4 and B-12, is indicated. It should be noted that since 1993, the only detection of either of these VOCs in groundwater samples from MW-3, the closest monitoring well, has been 1,1-DCE at 0.7 µg/L.

In the Boring B-2 area, site exploration and remedial information indicate that the rebound in PCE concentration in the shallowest soil gas sample from 25 to 710 µg/L may be due to reduced SVE efficiency within an old concrete floor area buried within a few feet of the surface. The area may also include footings and stem walls, which would impede soil vapor flow. This rebound concentration does not exceed the Phase 1 cleanup goal. Furthermore, the B-2 sample at 50 ft (Table 5) indicates PCE concentrations less than the Phase 2 cleanup goals. The PCE concentrations indicate a limited extent of PCE (local to the B-2 vicinity) and a limited potential for significant downward migration of PCE.

3.3 Remedial Efficiency

Remedial efficiency may be measured using SVE cost, extraction rates, or other performance or energy ratings. Remedial efficiency in terms of VOC mass removed per standard cubic foot of gas extracted is calculated in Table 8. Results indicate that the maximum remedial efficiency occurred during the November 1998 - January 1999 quarter. Since then, overall remedial efficiency has declined by a factor of six. In terms of chlorinated VOCs, remedial efficiencies have declined by a factor of 50. Remedial efficiency has remained fairly constant over the past three quarters because the overall extraction flow rate has been reduced and efforts concentrated on fewer active SVE wells. Because most of the remaining VOCs are petroleum hydrocarbons, the extraction efficiency for chlorinated VOCs is considerably less than this overall efficiency, as Table 8 indicates.

The cumulative VOC mass removed is shown on Figure 23. The asymptotic behavior of both the overall and chlorinated VOC curves is evident. This behavior shows that, from an efficiency and cost-effectiveness point-of-view, continued SVE is inefficient and of little benefit.

4. CONCLUSIONS AND RECOMMENDATIONS

4.1 Conclusions

SVE has been conducted at the facility in two phases and was run on a continual basis between May 1998 and October 2000. Nearly 8,000 pounds of VOCs have been removed by the SVE system. The predominant VOCs removed have been PCE (4,000 pounds) and petroleum hydrocarbon constituents (2,300 pounds), accounting for 79% of the total mass removed. TCE, 1,1,1-TCA, and 1,1-DCE have been the remaining VOCs detected in the SVE system, accounting for 21% (1,700 pounds) of the total mass removed.

SVE mass removal rates have declined fifteen-fold, from more than 30 pounds to approximately 1.5 pounds VOCs per day. Of this, approximately 90% is petroleum hydrocarbon constituents. Overall extraction efficiencies have declined by a factor of six, and chlorinated VOC extraction efficiencies have declined by a factor of 50. VOC mass removal rates over time show asymptotic behavior, indicating the inefficiency and marginal benefit of continuing SVE.

VOC concentrations have declined significantly in all areas. The decline in total VOCs in the 60 monitoring points used to assess remedial progress ranged between 94% and 99.8%, and averaged 99%. Decreases in petroleum hydrocarbon constituents ranged between 76% and 93%. Maximum soil gas concentrations, detected in the shallowest sample at Boring B-2, declined from

greater than 36,000 to 710 $\mu\text{g/L}$, a 98% reduction. The SVE system has been effective in removing VOC concentrations to below cleanup goals for chlorinated VOCs and petroleum hydrocarbon constituents in nearly all areas on site.

In the Boring B-2 area, shallow PCE concentrations rebounded above Phase 2 screening levels (although concentrations are less than the Phase 1 cleanup goals). This appears to be due to trapping of VOCs and low SVE sweeping efficiency above old concrete flooring, supports, or stem walls known to exist within a few feet of the surface in this area. Because of this and low PCE concentrations beneath this area, there is limited potential for significant downward migration of PCE.

Shallow and intermediate depth site soil have non-detectable or very low TCE concentrations. The current source of TCE concentrations in deep soil gas samples near the water table is either within the groundwater or capillary fringe area, not from the shallow or intermediate depth soil. As discussed in previous monitoring reports, site soil does not appear to be a source of TCE to groundwater beneath the site, because soil TCE concentrations have always been low relative to groundwater concentrations.

4.2 Recommendations

1. Because soil cleanup goals have been substantially achieved for both chlorinated VOCs and petroleum hydrocarbons, it is no longer efficient or cost-effective to continue SVE. SVE should be discontinued.

2. The groundwater monitoring system has shown that groundwater movement beneath the site is very slow, and that VOC concentrations in groundwater are not influenced by, or appear correlated with, shallow and intermediate depth soil concentrations. Therefore, continued groundwater monitoring should be discontinued.
3. Because Phase 2 screening levels have been substantially met across the site, no further remedial action is recommended and a NFA should be granted.

Notes Summary lists only those analytes that were detected
 TPH: Total Petroleum Hydrocarbons, method 418.1
 VOCs were analyzed by EPA Methods 8010 and 8021
 na: Not analyzed
 nd: Not detected. Detection limits variable
 Results reported in Targhee, 1991b

TABLE 2
Statistical Summary of Groundwater Sampling Results

Compound	Number of samples	Number of Detections	Detection Frequency	Max. Concentration (ug/L)	Number of Detections above MCL	MCL ^a (ug/L)

Notes:

(0.5) Not detected at this practical quantitation limit
 No other analytes detected during this sampling round

TABLE 4
VOC Mass Removal Rates

Quarterly Period	Phase 1 (Pounds VOCs)	Phase 2	Total/Quarter	Cumulative	Petr. Hyd. ^a	Chlorinated VOCs ^b
May - July 1998	1,730	0	1,730	1,730	0	1,730
August - October 1998	940	100	1,040	2,770	100	940
November 1998 - January 1999	1,010	1,300	2,310	5,080	230	2,080
February - April 1999	80	700	780	5,860	200	580
May - July 1999	40	400	440	6,300	200	240
August - October 1999	0	490	490	6,790	430	60
November 1999 - January 2000	0	710	710	7,500	680	30
February - April 2000	0	135	135	7,635	110	30
May - July 2000	0	158	158	7,793	140	20
August - October 2000	0	179	179	7,972	160	20
Totals:	3,800	4,172		7,972	2,250	5,730

Notes:

- ^a Values rounded. Petroleum hydrocarbons (toluene, ethylbenzene, xylenes, total volatile hydrocarbons) Calculated from spent carbon profiles and soil gas samples and flow rates from SVW-8 and SVE-15 Interpolated for quarters between analytical results
- ^b Values rounded. Chlorinated VOCs detected in soil gas from SVE wells are PCE, 1,1-DCE, 1,1,1-TCA and TCE

TABLE 6
Targeted Soil Cleanup Levels

Depth Below Land Surface (Feet)	Targeted Cleanup Level (µg/kg) ^{a-}				Equivalent Soil Gas Concentration (µg/L) ^{b-}			
	PCE	TCE	1,1,1-TCA	1,1-DCE	PCE	TCE	1,1,1-TCA	1,1-DCE
0 - 10	544 - 900 ^{c-}	78	3,112	93	800 - 1000 ^{c-}	35	475	187
10 - 20	544 - 900 ^{c-}	63	2,520	76	600 - 1000 ^{c-}	28	385	150
20 - 30	544 - 900 ^{c-}	48	1,928	58	600 - 1000 ^{c-}	20	295	120
30 - 40	34	34	1,354	41	38	15	205	80
40 - 50	20	20	780	23	22	10	120	50
50 - 60	18	18	700	21	20	9	105	45
60 - 70	9	9	352	11	10	6	55	25
70 - 80	6	6	248	7	7	4	40	15
80 - water table	5	5	200	6	6	3	30	12

Notes:

- a- Targeted cleanup goals (HGC, 1996)
- b- Equivalent mass calculated from equation 14, Appendix A of Interim Site Assessment and Cleanup Guidebook (California Regional Water Quality Control Board, 1996)
- c- Phase 1 Cleanup Level, specified to 25 feet for PCE only

TABLE 7
Maximum Soil Screening Levels for Petroleum Hydrocarbons

Compound	Maximum Soil Screening Level		Equivalent Soil Gas Concentration	
	80 Feet ^a	20 Feet ^a	80 Feet ^a	20 Feet ^a
	mg/kg		µg/L	
Benzene	0.033	0.011	15.0	5.0
Toluene	2.0	0.3	528	79.2
EthylBenzene	7.0	0.7	2,450	245
Total Xylenes	20	1.75	7,150	625
TPH, as gasoline	500	500	2,300	2,300

Notes:

^a Distance in feet above water table

µg/L: micrograms per liter

mg/kg Milligrams per kilogram

Soil screening levels from Table 1-4 of Interim Site Assessment and Cleanup Guidebook

Equivalent mass calculated from equation 14,

Appendix A of Interim Site Assessment and Cleanup Guidebook

TABLE 8
Soil Vapor VOC Mass Extraction Efficiency

<i>Quarterly Period</i>	<i>Average Extraction Rate (scfm)</i>	<i>VOC Mass Removed Per Quarter (lbs)</i>	<i>Overall Extraction Efficiency (lbs VOC / scf)</i>	<i>Extraction Efficiency for Chlorinated VOCs (lbs VOC / scf)</i>
May - July 1998	700	1730	2.54E-05	2.54E-05
August - October 1998	760	1040	1.41E-05	1.27E-05
November 1998 - January 1999	710	2310	3.35E-05	3.01E-05
February - April 1999	700	780	1.15E-05	8.52E-06
May - July 1999	690	440	6.56E-06	3.58E-06
August - October 1999	730	490	6.91E-06	8.46E-07
November 1999 - January 2000	760	710	9.51E-06	4.06E-07
February - April 2000	640	135	2.17E-06	4.82E-07
May - July 2000	640	158	2.54E-06	3.22E-07
August - October 2000	430	179	4.28E-06	4.79E-07

Notes *VOC: Volatile organic compound*
Chlorinated VOC: Primarily PCE
scfm: Standard cubic foot (of gas) per minute
lbs VOC / scf: Pounds of VOCs extracted
per standard cubic foot of gas extracted
Extraction efficiency calculated by dividing VOC mass by the product of
average extraction rate and number of minutes system ran per quarter

CAUTION

1. Do not photocopy this Target Card.
2. Replace this card when it gets dirty.

HYDRO GEO CHEM, INC.

Groundwater Sampling Form

Well No: MW-1
Project Name/Number: ZERO - 46505 Date: 11/30/00
Recorder/Sampler: [Signature]

WELL INFORMATION

TD of Casing Diameter ("d", in.): 4 Screened Interval (ft) From: To:
Well/Packer Depth ("a", ft): 148.7 Depth to Water ("b", ft): 122.08
Wetted Casing Volume: $(a - b) \cdot d^2 \cdot 0.0408 =$ 7.3 Gallons

PURGE INFORMATION AND FIELD MEASUREMENTS

Time Started: 11:00 Time Completed: 14:00 Total Purge Time: 3:00
Purge Method: Pump Pump Setting: 137 Total Purge Volume: 220

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 10 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 5 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

Notes:

Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
All results are expressed on wet weight basis unless specified.
RL = Reporting Limit.
ND = Not detected, below the reporting limit.
Sub = Subcontracted analysis, original report enclosed.

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 5 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

Notes:

- Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
- All results are expressed on wet weight basis unless specified.
- RL = Reporting Limit.
- ND = Not detected, below the reporting limit.
- Sub = Subcontracted analysis, original report enclosed.

Flags for Data Qualifiers:

B = Compound detected in the blank. Sample result equal or less than 5 times the concentration in the blank.

J = Estimated value, detected but below the reporting limit.

H = Estimated value, result over the calibration range.

R = Result is suspect, LCS recovery greater than the upper control limit.

L = Result is suspect, LCS recovery lower than the control limit.

Q = QC result out of acceptance limits.

T = Trace detection, detected but below the reporting limit.

Notes:

Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless specified.

RL = Reporting Limit.

ND = Not detected, below the reporting limit.

Sub = Subcontracted analysis, original report enclosed.

CERTIFICATE OF ANALYSIS

Authorized Signature

ELAP # 1132
LACSD # 10143
AZ0526

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 10 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

Notes:

- Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
- All results are expressed on wet weight basis unless specified.
- RL = Reporting Limit.
- ND = Not detected, below the reporting limit.
- Sub = Subcontracted analysis, original report enclosed.

Flags for Data Qualifiers:

B = Compound detected in the blank. Sample result equal or less than 10 times the concentration in the blank.

J = Estimated value, detected but below the reporting limit.

H = Estimated value, result over the calibration range

R = Result is suspect, LCS recovery greater than the upper control limit.

L = Result is suspect, LCS recovery lower than the control limit.

Q = QC result out of acceptance limits.

T = Trace detection, detected but below the reporting limit.

Notes:

Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
All results are expressed on wet weight basis unless specified.

All results are expressed on wet weight basis unless specified.

RL = Reporting Limit.

ND = Not detected, below the reporting limit.

Sub = Subcontracted analysis, original report enclosed.

Project Name: 46500 Zero

Report Date: Thursday, December 21, 2000

CERTIFICATE OF ANALYSIS

Authorized Signature

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 10 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

ELAP # 1132
LACSD # 10143
AZ0526

Notes:

- Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
- All results are expressed on wet weight basis unless specified.
- RL = Reporting Limit.
- ND = Not detected, below the reporting limit.
- Sub = Subcontracted analysis, original report enclosed.

CERTIFICATE OF ANALYSIS

Authorized Signature

ELAP # 1132
LACSD # 10143
AZ0526

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 5 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

Notes:

- Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
- All results are expressed on wet weight basis unless specified.
- RL = Reporting Limit.
- ND = Not detected, below the reporting limit.
- Sub = Subcontracted analysis, original report enclosed.

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 5 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

Notes:

- Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
- All results are expressed on wet weight basis unless specified.
- RL = Reporting Limit.
- ND = Not detected, below the reporting limit.
- Sub = Subcontracted analysis, original report enclosed.

Flags for Data Qualifiers:

- B = Compound detected in the blank. Sample result equal or less than 5 times the concentration in the blank.
- J = Estimated value, detected but below the reporting limit.
- H = Estimated value, result over the calibration range
- R = Result is suspect, LCS recovery greater than the upper control limit.
- L = Result is suspect, LCS recovery lower than the control limit.
- Q = QC result out of acceptance limits.
- T = Trace detection, detected but below the reporting limit.

Notes:

- Any remaining sample(s) for testing will be disposed of one month from the final report date unless other arrangements are made in advance.
- All results are expressed on wet weight basis unless specified.
- RL = Reporting Limit.
- ND = Not detected, below the reporting limit.
- Sub = Subcontracted analysis, original report enclosed.

Monday, November 13, 2000

Mr. John Ward
Hydro Geo Chem, Inc.
51 Wetmore, Suite 101
Tucson, AZ 85705-1678

Phone: (800) 727-5547
FAX: (520) 293-1550

Dear Mr. Ward:

Enclosed is the analytical report for the samples analyzed by InterPhase Environmental, Inc. for the following project.

Project Name: Zero Facility, Burbank, CA
Project Number: 00273

The report consists of the following sections:

- I. Sample Description;
- II. Laboratory Case Narrative and Chain of Custody Forms;
- III. Analytical Results;
- IV. Laboratory Certification.

If you have any questions regarding the results, please call me at (800) 457-3300.

Sincerely,
InterPhase Environmental

David Q. Feng, Ph.D.
Director of Laboratories

Analytical Report

InterPhase Project Number: 00273

Analysis Performed for: Hydro Geo Chem, Inc.

Project Name: Zero Facility, Burbank, CA

*Los Angeles Regional Water Quality Control Board (LARWQCB) for active soil gas investigations under the Well Investigation Program (WIP), (February 1997).

**Three samples were collected and analyzed for a purge volume test.

II. LABORATORY CASE NARRATIVE AND CHAIN OF CUSTODY FORMS

InterPhase Project Number: 00273

Analysis Performed for: Hydro Geo Chem, Inc.

All samples were collected in gas-tight syringes by Hydro Geo Chem's field representative on Tuesday, October 24, 2000 through Friday, October 27, 2000. The samples were collected from existing vapor monitoring wells and sampling points along the vapor extraction manifold system. Samples were delivered to InterPhase's onsite laboratory and analyzed immediately after their collection. InterPhase's Field Data Sheets were used as chain of Custody Forms.

All the samples in this report met all laboratory quality control procedures. InterPhase followed analytical protocols acceptable to the Los Angeles Regional Water Quality Control Board (LARWQCB) for active soil gas investigation under the Well Investigation Program (WIP), (February 1997).

III. ANALYTICAL RESULTS

Table 1: Analytical Results of Samples presents the measured analyte concentrations of all samples and blanks analyzed during the investigation. Concentrations are reported in micrograms per liter ($\mu\text{g/L}$). Detected target contaminants are reported only if their concentrations are greater than the report limit of 1 $\mu\text{g/L}$. Surrogate recoveries are also reported in *Table 1*. All monitored surrogate recoveries are within the control limits (75% to 125%), except for some matrix interference.

A 4-point calibration was performed on October 24, 2000 at the beginning of this investigation. *Table 11: Initial Calibration Results* presents the results of this calibration. Percent relative standard deviations (%RSD) for all target compounds are within control limits for at least three calibration points.

A Laboratory Control Standard (LCS) was used to check and validate the calibration. The middle concentration LCS check was performed immediately after completion of the calibration and at the end of every day, as required by the client. *Table III: LCS Check Results* presents these checks. The percent differences of responses for the calibration and the LCS check are within control limits for all target analytes.

Table IV: Daily Calibration Check Results presents the middle concentration calibration check performed on October 25, 26 & 27 2000. The percent differences of responses for the initial calibration and the daily check are within control limits for the target analytes which are mandated to pass the calibration check by LARWQCB.

IV. LABORATORY CERTIFICATION

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness.

David Q. Feng, Ph.D.

APPENDIX H

SOIL GAS ANALYTICAL REPORT - FEBRUARY 13, 2001

INTERPHASE ENVIRONMENTAL, INC.

MOBILE LABORATORIES AND DIRECT PUSH DRILLING

Tuesday, February 13, 2001

Mr. John Ward
Hydro Geo Chem, Inc.
51 Wetmore, Suite 101
Tucson, AZ 85705-1678

Phone: (800) 727-5547
Fax: (520) 293-1550

Dear Mr. Ward:

Enclosed is the analytical report for the samples analyzed by InterPhase Environmental, Inc. for the following project.

Project Name: Zero Facility, Burbank, CA
Project Number: 01018

The report consists of the following sections;

- I. Sample Description;
- II. Laboratory Case Narrative and Chain of Custody Forms;
- III. Analytical Results;
- IV. Laboratory Certification.

If you have any questions regarding the results, please call me at (800) 457-3300.

Sincerely,
InterPhase Environmental

David Q. Feng, Ph.D.
Director of Laboratories

II. LABORATORY CASE NARRATIVE AND CHAIN OF CUSTODY FORMS

InterPhase Project Number: 01018

Analysis Performed for: Hydro Geo Chem, Inc.

All samples were collected in gas tight syringes by Hydro Geo Chem's field representative on Wednesday, January 31, 2001 through Friday, February 2, 2001. The samples were collected from existing vapor monitoring wells and sapling points along the vapor extraction manifold system. Samples were delivered to InterPhase's onsite laboratory and analyzed immediately after their collection. Sample collecting information was recorded on InterPhase's Chain of Custody Forms and InterPhase's Field Data Sheets.

All the samples in this report met all laboratory quality control procedures. InterPhase followed analytical protocols acceptable to the Los Angeles Regional Water Quality Control Board (LARWQCB) for active soil gas investigation under the Well Investigation Program (WIP), (February 1997).

III. ANALYTICAL RESULTS

Table I: Analytical Result of Samples presents the measured analyte concentrations of all samples and ambient air analyzed during the investigation. Concentrations are reported in micrograms per liter ($\mu\text{g/L}$) for Volatile Organic Compounds (VOCs). Surrogate recoveries are also reported in *Table I*. All surrogate recoveries are within the control limits (70% to 130%).

Table II: Initial Calibration Results presents the multi-point calibration performed on January 17th, 2001. For all target compounds, the percent relative standard deviations (%RSD) are within the control limits required by the QA/QC objective.

Table III: LCS Check Results presents the middle concentration check of the calibration results by a Laboratory Control Standard to validate the calibration. The percent differences of responses for the calibration and the LCS check are within control limits for all target analytes.

Table IV: Daily Calibration Check Results presents the daily middle concentration calibration check performed on January 31, February 1, and February 2, 2001, before sample analyses were

started. For all target compounds, the percent deviation of response factor was within control limits required by the QA/QC objective.

IV. LABORATORY CERTIFICATION

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness.

David Q. Feng, Ph.D.
Director of Laboratories

Senior Engineering Geologist
California Regional Water Quality Control Board,
Los Angeles Region
320 West 4th Street, Suite 200
Los Angeles CA 90013

Supplemental Site Closure Information
Former APW Facility, 777 Front Street, Burbank CA
RWQCB File No. 109.6162

Dear Mr. Oriola:

This letter presents the data, analysis and interpretation of results of the additional focused shallow soil remediation at the former APW facility in Burbank. The supplemental remediation targeted the residual volatile organic compound (VOC) concentrations in soil gas at monitoring probe B-02 (Figure 1). The supplemental work was conducted in response to issues raised during the May 30, 2001, meeting with Board staff to discuss APW's request for no further action closure of the facility¹.

This supplemental remediation targeted the residual VOC concentrations in soil gas at monitoring probe B-02@25. The work was conducted according to our June 8, 2001, work plan², approved by Board staff on June 12.

Field Activities and Measurements

The supplemental soil remediation began on June 18, 2001, using shallow soil vapor extraction (SVE) and air injection wells in the vicinity of B-02 (Figure 1). The shallow SVE and injection wells are 20 feet deep and screened between depths of 5 and 20 feet. The B-02 soil gas probe is a nested array with three ½-inch diameter tubes installed to depths of 25, 50 and 75 feet, each screened over the lower 1 foot of tubing.

Additionally, to evaluate whether the source of VOCs detected at B-02 may be close to the surface, several holes were hand-drilled through the concrete slab within an approximate 15-foot radius of B-02 on June 12, 2001. The holes were 8 inches deep by 3/4 inches in diameter and were used to measure organic vapor levels with a photoionization detector (PID) in the soil immediately beneath the slab. PID concentrations, however, were all relatively low (between 3 and 27 parts per million by volume) and did not indicate proximity to a VOC source.

Soil vapor extraction took place from Ssve-18, Ssve-20, Ssve-50 and Ssve-53. Air injection took place into Sinj-12, Sinj-15, Sinj-22, and Ssve-60 (which was converted from a shallow SVE well). Air velocity and organic vapor measurements were collected from each well on a weekly basis between June 18 and July 18, 2001, when the vapor extraction and air injection systems were turned off. These field measurements and run times are summarized in Table 1.

Soil Gas Sample Collection

Soil gas samples were collected from the shallow SVE wells, B-02@25, B02-@50, and the influent to the vapor extraction system at system startup on June 18, 2001 approximately two hours after the system was turned on. A final set of soil gas samples was collected on August 6 from B-02@25, Ssve18, Ssve-20, and Ssve-53, approximately three weeks after the system was turned off. These samples were collected and analyzed by InterPhase Environmental, Inc., under the direction of the Hydro Geo Chem field representative according to the field sampling procedures described in the closure work plan³. Samples were transported by InterPhase to their Los Angeles lab for analysis. The results are summarized in Table 2. The laboratory analytical reports are appended.

³ Hydro Geo Chem. 2000. Work Plan for No Further Action Closure: Soil Vapor Extraction and Groundwater Monitoring Systems, Former ZERO Facility, 777 Front Street, Burbank, CA. Submitted to California Regional Water Quality Control Board, June 26, 2000.

Results

Soil gas was extracted from the shallow SVE wells at a weighted average of 75 standard cubic feet per minute (scfm) for the 30-day extraction period. Analytical results (Table 2) indicate that perchloroethylene (PCE) and trichloroethylene (TCE) were the only VOCs detected in soil gas samples. The highest concentration of PCE, 605 micrograms per liter ($\mu\text{g/L}$), was detected in the June 18, 2001, the 25-foot soil gas sample from B-02 (B-02@25). This concentration is slightly lower than detected at that probe in January, 2001 (720 $\mu\text{g/L}$). The 50-foot sample from B-02 (B-02@50) had nondetectable soil gas PCE concentrations, a decrease from 16 $\mu\text{g/L}$ of PCE detected in that probe in January, 2001. TCE was only detected in one sample, B-02@25, at 2.6 $\mu\text{g/L}$.

During this extraction period and subsequent rebound interval, soil gas PCE concentrations detected in B-02@25 declined from 605 to 11 $\mu\text{g/L}$, and soil gas PCE concentrations detected in Ssve-53 declined from 137 to 70 $\mu\text{g/L}$.

The flow measurements and concentration levels (Tables 1 and 2) indicate that most of the VOCs were extracted from Ssve-53. The blower influent concentration and flow rate indicates an initial VOC mass removal rate of 0.58 pounds per day. The final (August 6, 2001) VOC concentrations indicate a VOC concentration decrease of more than an order of magnitude, and a final mass removal rate of probably less than 0.1 pounds per day. The total VOC mass removal during this 30-day period, estimated by assuming an exponential decline from 0.58 to 0.1 pounds per day, is between 7 and 12 pounds.

Conclusions

The additional shallow remedial activities have resulted in a diminishment of soil gas concentrations in the shallow soils in the vicinity of B-02. VOC concentrations at that probe and the shallow SVE wells used for this focused remediation have declined to levels below the stringent Phase II cleanup goals.

Mr. Dixon Oriola
August 23, 2001
Page 4

The goal of this supplemental focused remediation has been achieved, and the issue raised about the B-02 VOC concentrations during the May 30, 2001 meeting has been addressed. HGC, on behalf of APW, again requests that the Board make a "no further action" determination for the subject site. This further request is based upon this letter report and our April 5, 2001, report. If you have any questions or concerns, please feel free to contact me.

Sincerely yours,

John J. Ward
Associate Hydrogeologist

Re: Soil Gas Investigation
InterPhase Project #: 01171
Zero Facility
Burbank, CA

Dear Mr. Ward:

This report presents the results of the soil gas investigation performed on Monday, August 6, 2001 in Burbank, California. InterPhase Environmental, Inc. (InterPhase) under contract to Hydro GeoChem, Inc. conducted the investigation.

Soil gas analyses were performed in accordance with our firms Standard Operating Procedures, which was based on the guidelines for soil gas investigation set by California Regional Water Quality Control Board, Los Angeles (February 25, 1997).

Please do not hesitate to give us a call if you have any questions or need further information.

Sincerely,

InterPhase Environmental, Inc.

**RE: ENVIRONMENTAL SAMPLING AND ANALYSIS REPORT
FRONT STREET PROPERTY, BURBANK, CALIFORNIA**

Dear Mr. Baldwin:

Golder Associates Inc. (Golder) has completed an environmental sampling and analysis program at the 777 Front Street property in Burbank, California (subject property). This letter report summarizes the work completed and information acquired at the subject property during March 2005.

BACKGROUND

The Front Street property is a former manufacturing facility within a commercial area of Burbank, California. The facility was demolished to slab grade in 2004, with four electrical substations remaining in place. Golder conducted a site visit in December 2004 to observe the conditions of the electrical equipment and adjacent surfaces. A total of 12 oil-filled transformers and two capacitor banks were noted. At this time, oily staining was also observed on the base slab and/or surrounding gravel surfaces adjacent to 10 of the 12 transformers and both capacitor banks. The following background information regarding this property has been provided to Golder by Ford Leasing Development Company to date:

- A summary of data from previous oil sampling efforts of the electrical equipment (data included as Attachment A). These data indicated that positive detections of PCBs were exhibited in most samples, although none of the concentrations exceeded 12 ppm, and, therefore, the units do not appear to be regulated under 40 CFR 761 (TSCA). Further, no information is present to indicate that past retrofilling was performed.
- Summary information from the "Report of Environmental Evaluation, 777 North Front Street, Burbank, California", prepared by Law/Crandall, dated October 1, 1997. This information describes previous surface soil sampling efforts proximal to the electrical substations on the property, the results for which indicated no concentrations of PCBs above method detection limits of 0.033 mg/kg.
- Information from a recent Phase I Environmental Assessment Report that describes the presence of a former in-ground hydraulic elevator in the northeast corner of former Building 10 (Figure 1). No information regarding the decommissioning of the elevator has been provided to date.

PROJECT OBJECTIVES

The overall objective of this project was two-fold: 1) to obtain data regarding the surfaces below the electrical equipment that will help facilitate the need for, and methods of, disposal of these areas; and 2) to obtain information regarding the subsurface conditions related to the former in-ground hydraulic lift. To meet this objective, Golder completed a sampling and analysis program that was described in the "Proposal for Environmental Sampling Services, Front Street Property" dated February 18, 2005.

A summary of the work completed, field observations, and data obtained during these efforts is provided herein. Selected photographs taken during the onsite activities are included in Attachment B.

REGULATORY FRAMEWORK

Regarding the In-Ground Elevator

Based on our experience and interpretation of applicable State and local regulations and guidelines, as confirmed in the past by personnel from the Los Angeles County Regional Water Quality Control Board (LARWQCB), hydraulic lifts/elevators are exempt from the State of California and Los Angeles County underground storage tank regulations. In 1995, the California State Water Resources Control Board issued a report to the California Legislature on the effect of hydraulic lift tanks on the environment, entitled "Report on Hydraulic Lift Tanks", dated February 1995. To summarize, this document indicates that the potential impact and risk to the environment from hydraulic lifts (or elevators) is low enough that to regulate the lifts as underground storage tanks would put an undue burden on the regulatory community. Therefore, the document recommends that hydraulic lifts not be regulated, which was accepted in 1996 by the State legislature. However, local Regional Water Quality Control Boards retain the right to require corrective action where beneficial uses of water are affected or threatened.

Golder has previously contacted personnel from the LARWQCB, who stated that in order to determine whether or not a hydraulic fluid release has the potential to impact usable groundwater resources, samples collected during an environmental assessment should be analyzed for total petroleum hydrocarbons (full range carbon chain identification) via USEPA/CA Method 8015M, and for VOCs via USEPA Method 8260B (for vehicle lifts). There are no mandated cleanup criteria set forth by the LARWQCB for total petroleum hydrocarbons (TPH) from non-regulated releases such as hydraulic fluid. The agency does have screening levels that are based on the depths to usable groundwater resources, such as less than 20 feet and within 150 feet.

SUMMARY OF ACTIVITIES AND RESULTS

Sampling and Analysis Program

The sampling and analysis program entailed the completion of one soil boring advanced directly adjacent to the former in-ground hydraulic elevator pit and 14 surfacial concrete or gravel samples collected adjacent to electrical units. The soil boring extended to 20 feet below ground level (bgl). A summary of the boring and sample locations (Figure 1), analytical program, and field observations are presented in the following paragraphs.

Surface Sampling Procedures

Golder collected a total of 10 bulk concrete samples and four gravel samples from stained surface areas adjacent to the remaining electrical equipment. For paved areas, a small portion of concrete was "chipped" out of the slab and containerized. For unpaved areas where stained gravel was observed, a sample of the loose surface materials was collected. All samples were submitted to Del Mar Analytical in Irvine, California for laboratory analysis of PCBs via USEPA Method 8082. The samples were crushed by the laboratory prior to analysis in accordance with standard laboratory methods.

Soil Boring and Sampling Procedures

The soil boring program was conducted by Golder and our subcontractor, Kehoe Drilling, on March 29, 2005. Continuous soil samples were collected at 2-foot intervals to the borehole terminus using direct push (i.e., GeoProbe[®]) techniques. Upon retrieval to the surface, each soil sample was visually inspected for indications of impact (stained soil, odor, etc.) and geologically classified following Unified Soil Classification System (USCS) procedures. Sample descriptions and classifications were documented on the soil boring log (included as Attachment C).

The soil samples that corresponded to the top of the elevator piston (4-6 feet bgl as measured in the pit) and the borehole terminus (18-20 feet) were containerized and submitted to Del Mar Analytical for analysis of Gas Range Organic compounds (GRO), Diesel Range Organic compounds (DRO), and Heavy Oil Range Organic compounds (ORO) via USEPA/CADHS Method 8015M and PCBs via USEPA Method 8082.

The borehole was backfilled with a mixture of bentonite hole plug and soil cuttings. The surface was then patched to match the adjacent pavement.

Sample Management

Sample preparation and transport followed generally acceptable EPA sample collection and handling protocols. The soil samples submitted for laboratory analysis were placed in appropriate pre-cleaned containers following acceptable procedures and temporarily stored on frozen packs in an insulated cooler to maintain a temperature of 4° C. Chain-of-custody forms were filled out by field personnel and maintained with the samples. A copy of the laboratory report and chain-of-custody is included in Attachment D.

Geology/Hydrogeology

Based on the data obtained from the soil boring, the subject property in the area of the former in-ground hydraulic elevator is underlain primarily with brown to gray, fine to coarse sand intermixed with some fines (i.e., silt) to at least 20 feet bgl (terminus of boring). Saturated conditions were not observed during advancement or upon completion of the soil boring.

Field Observations

As noted previously, oily staining was observed on concrete and/or gravel surfaces adjacent to 10 of the 12 transformers and both capacitor banks. This staining is roughly approximated as shown on Figure 1. No pooled accumulations of oil or other liquids were observed.

As indicated on the soil boring log (Appendix C), no stained or odorous soils were observed in the subsurface samples collected from the boring. The hydraulic cylinder appeared to be present in the base of the elevator pit, along with other unknown circular openings.

Summary of Analytical Results

A summary of the sample analytical results collected during this program is provided on Table 1 (attached). As shown on Table 1, positive detections of PCBs were exhibited in 12 of the 14 bulk surficial samples collected, ranging from 0.051 mg/kg (ppm) to 1.1 mg/kg. The soil samples collected did not exhibit positive detections of GRO/DRO/ORO or PCBs. The laboratory data package is provided as Attachment D.

MANAGEMENT OF IMPACTED MATERIALS

Based on the analytical data obtained to date, the oil-containing electrical equipment will be removed from the property and managed as non-hazardous PCB wastes per 40 CFR 263 and applicable State or local regulations as part of further demolition activities. Dielectric oils will be drained from the equipment and transported to an oil reclamation or disposal facility licensed to accept low levels of PCBs. The resulting equipment carcasses may also be disposed as a PCB containing waste, or they may be flushed (using the guidelines set forth in 40 CFR 761).

The PCB impacted concrete and gravel will be managed as non-hazardous PCB wastes per 40 CFR 263 and applicable State or local regulations. Visibly stained concrete and gravel will be removed in full and disposed at a landfill or other appropriate facility licensed to accept low-level PCBs. For the unpaved areas where removal is to take place, confirmation samples will be collected from the underlying soils at each discrete location and analyzed for PCBs via USEPA Method 8082. Any PCB impacted media that may be identified will be removed or remediated to applicable cleanup criteria. Certificates of destruction for all waste materials will be prepared and issued to applicable parties and regulatory agencies as necessary.

CLOSING

We appreciate this opportunity to be of service to Ford Leasing. If you have any questions or are in need of additional information, please call me at (517) 482-2262.

Sincerely,

GOLDER ASSOCIATES INC.

Andy Lewis
Program Manager/Associate

**Subject: Report of Phase I Environmental Site Assessment
Former Zero Corporation Facility
777 North Front Street
Burbank, California
MACTEC Project 4951-04-3101**

Dear Mr. Skobin:

Attached is our report of Phase I Environmental Site Assessment (ESA) for the above-referenced site. In performing the Phase I ESA, we evaluate whether activities at the site or nearby properties may have contaminated the site's soil or ground water.

Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. This warranty is in lieu of all other warranties, expressed or implied. This report has been prepared for Northridge Properties, LLC to be used solely in evaluating potential environmental implications at the subject site. The report has not been prepared for use by other parties, and may not contain sufficient information for purposes of other parties or other uses. However, applicable federal, state and local regulatory agencies may rely on this report.

We appreciate the opportunity to work with you on this project. Please contact us if you have any questions or if we may be of further service.

Respectfully submitted,

MACTEC Engineering and Consulting, Inc.

EXECUTIVE SUMMARY

Northridge Properties, LLC engaged MACTEC Engineering and Consulting, Inc. (MACTEC) to perform a Phase I Environmental Site Assessment (ESA) of the proposed former Zero Corporation facility (subject site) located at 777 North Front Street in Burbank, Los Angeles County, California. Our services were provided in general accordance with our Proposal 4951-04-9580 dated October 6, 2004.

This executive summary is a synopsis of findings based on our Phase I ESA. For detailed information regarding the findings, please refer to the text of our report.

The subject site is located on the west side of the Golden State Freeway (I-5) and south of Burbank Boulevard in the City of Burbank, Los Angeles County, California. The irregular-shaped site is situated in an area occupied by retail and commercial/light industrial businesses. The site is covered with concrete slabs which are remnants of large buildings that were recently demolished. The remainder of the site (portions along the eastern edge) is covered with asphalt-concrete paving. Concrete tilt-up walls, which surround electrical transformer rooms, are the only vertical structures that remain on the site. The northern portion of the site is bordered by large retaining walls due to the elevation difference between the site and the surrounding properties.

Our historical research indicates that the site consisted primarily of undeveloped land up through 1930. From approximately 1930 to 1940, a portion of the site was occupied by General Water Heater Corporation, a manufacturer of water heaters. Between approximately 1940 and 1965, a majority of the site was occupied by General Water Heater Corporation. Zero Manufacturing Company, a manufacturer of metal and aluminum containers/cases, occupied the site from approximately 1965 to 1991 when manufacturing operations were discontinued. The site was then used for storage and filming purposes through 2002. Thereafter, the site was unoccupied. The on-site buildings were demolished in 2004.

Our Phase I ESA included a review of various federal, state and local regulatory records and a review of numerous environmental reports. The subject site and many nearby properties appeared on the databases that we reviewed. The site is part of a federal Superfund Site. Assessment and remediation activities at the site achieved regulatory closure in 2001 and a formal certificate of completion in 2002.

We have performed a Phase I ESA of the former Zero Corporation facility (subject site) located in Burbank, California. The scope of work was performed in general conformance with the scope and limitations of ASTM E 1527-00. Any exceptions to, or deletions from, the ASTM E 1527-00 scope is described in Section 2.2 of this report.

This assessment has revealed no evidence of recognized environmental conditions (RECs) in connection with the subject site except for the following:

Superfund Site. The site is located within the boundaries of a National Priorities List Superfund Site which addresses regional groundwater contamination. The Superfund Site is separated into four areas managed by the U.S. Environmental Protection Agency (EPA). The area in which the site is located is known as San Fernando Valley Area 2 (Crystal Springs). The former owner of the site, Zero Corporation (now known as APW North America, Inc.), is an identified potentially responsible party in the Superfund Site based on alleged hazardous substance releases from past manufacturing operations at the site. The Superfund Site is a long-term environmental issue for this site and the surrounding region. However, in connection with its acquisition of the site, the current owner, Ford Leasing Development Company, obtained an Agreement and Covenant Not to Sue (commonly known as a prospective purchaser agreement) from the U.S. EPA. In addition, many years of on-site assessment and remediation activities have occurred. These activities were conducted by the former owner under the regulatory oversight of the Los Angeles Regional Water Quality Control Board (RWQCB), which was officially designated in 1998 to serve as the administering agency for this site under the California law for Unified Agency Review of Hazardous Materials Release Sites. The RWQCB issued a “no further requirements” letter in 2001 and a formal “certificate of completion” was issued in 2002 by the RWQCB under the Unified Agency Review law.

1.0 INTRODUCTION

Northridge Properties, LLC engaged MACTEC Engineering and Consulting, Inc. (MACTEC) to perform a Phase I Environmental Site Assessment (ESA) of the former Zero Corporation facility (subject site) located at 777 North Front Street in Burbank, Los Angeles County, California. This report was prepared for the exclusive use of Northridge Properties, LLC (and applicable federal, state and local regulatory agencies), in general accordance with our Proposal 4951-04-9580, dated October 6, 2004. If other parties wish to rely on this report, please have them contact us, so we can execute a secondary client agreement.

2.0 PURPOSE, SCOPE, AND REPORT FORMAT

2.1 PURPOSE

The purpose of the Phase I ESA was to identify recognized environmental conditions (RECs) arising from activities on the subject site or nearby properties. Activities of concern are those that may have contaminated, or have the potential to contaminate, the subject site's soil or ground water. The purpose of this assessment was not to determine the actual presence, degree, or extent of contamination, if any, on the site. Such a determination would require additional exploratory work.

2.2 SCOPE OF WORK

A Phase I ESA is intended to be a general characterization of selected environmental concerns. The characterization is based on readily ascertainable information and subject site observations. The assessment included the following services:

- **Geology, Surface Drainage, and Ground-Water Flow Assessment** — We reviewed available information regarding the geology, surface drainage, and ground-water flow within the area of the site. An interpretive model of the subject property was then generated based on the information gathered. The interpretive model was then used to identify possible pathways along which contaminants, if present, may migrate.
- **Site and Area Reconnaissance** — We visited the site and surrounding area to document observations of conditions on and near the site. We looked for obvious indications of activities that may have contaminated, or have the potential to contaminate the site's soil or ground water. We did not enter off site properties.

- **Historical Review** — We reviewed past activities that occurred on or near the site to assess whether these past activities may have contaminated the site's soil or ground water.
- **Regulatory Agency Lists Review** — We reviewed site-specific excerpts from lists published by environmental regulatory agencies. We looked for listed information on the site or nearby properties that indicated known or suspected environmental concerns. If nearby properties were listed, we assessed their potential for contaminating the site's soil or ground water.
- **Document Review** — We reviewed environmental, legal and real estate documents that were provided by Northridge Properties, LLC related to the subject site and some adjacent properties.

Our scope of services did not include the sampling or laboratory analysis of soil, ground water, or other materials.

2.3 REPORT FORMAT

Our report contains the following assessment sections:

- Geology, Surface Drainage, and Ground-Water Flow
- Site and Area Reconnaissance
- Historical Review
- Regulatory Agency Lists Review
- Document Review

An evaluation section includes conclusions based on the assessment sections. A statement of interpretive limitations follows the conclusions section.

3.0 GEOLOGY, SURFACE DRAINAGE, AND GROUND-WATER FLOW

A consideration of surface and subsurface drainage and geology are of interest because they provide an indication of the direction that contaminants, if present, could be transported. We reviewed the following information regarding the hydrogeology of the site and surrounding area:

3.1 SURFACE DRAINAGE

The subject site is relatively flat with an average elevation of approximately 580 feet above mean sea level (msl). The nearest significant drainage feature is the Burbank Western Channel which runs along the southwestern boundary of the site and drains toward the southeast. The Los Angeles River is located approximately 1.8 miles south of the site and drains toward the east before turning south

near Glendale Narrows. The nearest reservoir to the site is Burbank No. 1 reservoir located approximately 1.2 miles to the northeast (Thomas Guide, 2003).

3.2 GEOLOGY

The site is situated within the eastern San Fernando Valley. The San Fernando Valley is an alluvium-filled basin, approximately 23 miles wide and 12 miles long. The alluvium is mainly derived from the Santa Monica Mountains to the south, the Santa Susana Mountains to the north, the Simi Hills to the west, the San Gabriel Mountains to the northeast, and the Verdugo Mountains to the east. Regionally, the site is located in the Transverse Ranges geomorphic province. The province is bounded by the Big Pine fault on the north, the San Andreas fault zone on the east, the Pacific Ocean on the west, and the Santa Monica, Raymond, Sierra Madre, and Cucamonga faults on the south. The province is characterized by east-west trending mountain ranges that include the Santa Ynez, San Gabriel, San Bernardino, and Santa Monica Mountains and associated valleys. In particular, the site is located on an alluvial fan to the southwest of the Verdugo Mountains.

In general, the geologic materials beneath the site include recent Holocene-age to Pleistocene-age alluvial fan deposits derived from the Verdugo Mountains. The alluvium consists of sand with silty sand, and silt and gravel. Holocene alluvium in the San Fernando Valley reaches a maximum thickness of 900 feet in the Burbank area (California Department of Water Resources, 2004).

3.3 GROUND WATER

Two important factors affecting the ground-water flow are the local topography (the slope of the land surface) and the depositional direction (the direction in which water-bearing sediments were deposited). The topography and depositional direction are important because they influence the net direction of ground-water flow, although, in some situations, other factors (such as faults, bedrock structures, and local ground-water pumping and/or injection) may override them. Ground-water flow is a major factor in the spread of contaminants underground.

The site is located within Township 1 North, Range 14 West (T1N R14W), Section 11 of the USGS Burbank Topographic Quadrangle (1966). Water level measurements for Los Angeles County Well No. 3882P, located approximately ¼ mile east of the site, indicate the depth to ground water was 69.2 feet below ground surface (bgs) in November 1987 (County of Los Angeles, 2004). In addition, water level measurements for Los Angeles County Well No. 3871G, located approximately ½ mile west of

the site, indicate the depth to ground water was 109.7 feet below ground surface (bgs) in April 1997 (County of Los Angeles, 2004). However, the Seismic Hazard Evaluation for the Burbank Quadrangle (1998) indicates that the highest historical ground water in the area was between 20 and 30 feet bgs. Measurements from ground-water monitoring wells that formerly existed on the site indicated ground-water levels fluctuated between approximately 95 and 120 feet bgs between 1992 and 2001 (HGC).

Based on the local topography, geomorphology, and depositional direction of geologic materials, the direction of the local ground water is interpreted to have a general gradient toward the south to southeast. It is anticipated that regional ground-water in the vicinity of the site flows in this direction. However, due to local ground-water pumping, depositional direction, and shallow bedrock conditions interpreted to exist beneath the site, the ground-water flow direction could vary significantly. In addition, it is possible that local subsurface conditions, the presence of perched ground water and/or local bodies of water may have an influence on the direction of ground-water flow.

3.4 POTENTIAL PATHWAYS FOR CONTAMINANT MIGRATION

Local pathways of contaminant migration probably follow the topography, the ground-water gradient, the depositional direction, and/or the orientation of bedrock joints and fractures. The contaminant sources most likely to affect the site are either upgradient, up slope (of the surface drainage), opposite the depositional direction, and/or along bedrock structure trends. Based on the information presented above, it is our opinion that the probable direction of contaminant migration underground is toward the south to southeast, which is the anticipated direction of shallow ground-water flow.

3.5 OIL AND GAS WELLS

Oil and gas wells are considered as potential concerns when they seep oil or gas, are not abandoned to current regulations, or have associated surface contamination. They may also be associated with methane and hydrogen sulfide hazards. This section discusses the oil wells reported on the records we reviewed. Unreported “wildcat” oil wells could be on or near the site.

The site is not within an identified oil field. There are two wells approximately 1 mile southeast of the site. The Henry E. Luttcg Well was drilled in 1917 to a depth of 1,700 feet bgs and is plugged and abandoned. The Jeffrey, Overton & Halfhill Well was drilled in 1926 to a depth of 1,003 feet bgs and is now considered idle.

Considering the limited amount of documented oil exploration activities in the Burbank area and the associated results (“plugged and abandoned – dry hole”), in our opinion, there is a low likelihood that undocumented oil exploration activities occurred on the site. Additionally, the presence of subsurface methane or hydrogen sulfide gases resulting from oil exploration is also considered to be low.

4.0 SITE AND AREA RECONNAISSANCE

In performing the site and area reconnaissance, our assessor describes the site and looks for obvious signs of items that may be a source of environmental concern, such as aboveground storage tanks (ASTs), underground storage tanks (USTs), hazardous materials, and hazardous wastes.

Some of the items or activities we observe on the site may be associated with environmental concerns. Certain businesses or occupations may typically use hazardous substances or create hazardous waste. Storage tanks may leak and contaminate soil and ground water. Other signs of potential environmental concerns include unusual odors, pools of liquids, drums, unidentified containers, items that may contain polychlorinated biphenyls (PCBs), stains or corrosion, and drains or sumps.

Mr. Matt Fraychineaud, a MACTEC environmental professional experienced in similar site assessments, performed the reconnaissance on October 22 and 25, 2004. We were not escorted during the site visit.

The site and surrounding vicinity is depicted on Figure 1, Site Location Map. Figure 2, Site and Vicinity Sketch, shows the site and surrounding property uses. Figure 3, Site Plan, shows the general site conditions documented during the reconnaissance.

4.1 SITE RECONNAISSANCE

4.1.1 Site Description

The subject site is located on the west side of the Golden State Freeway (I-5) and south of Burbank Boulevard in the City of Burbank, Los Angeles County, California. The irregular-shaped site is situated in an area occupied by retail and commercial/light industrial businesses. The site is covered

with concrete slabs which are remnants of large buildings that were recently demolished. The remainder of the site (portions along the eastern edge) is covered with asphalt-concrete paving. Concrete tilt-up walls, which surround electrical transformer rooms, are the only vertical structures that remain on the site. The northern portion of the site is bordered by large retaining walls due to the elevation difference between the site and the surrounding properties. Photographs of the site are included in Appendix A.

For purposes of describing the site in this section, we make reference to Figure 9 – Locations of Multi-Level Soil Vapor Monitoring Probes, dated March 17, 2000, from a report prepared by Hydro Geo Chem, Inc. (HGC). The buildings in the referenced figure, which we used in the field during the site reconnaissance, are identified by building numbers as also shown in our report on Figure 3 - Site Plan.

4.1.2 Aboveground and Underground Storage Tanks

Our assessor looks for obvious evidence of aboveground storage tanks (ASTs) and underground storage tanks (USTs), such as vent pipes, fill caps, or fuel pumps. Agency information regarding storage tanks is discussed in Section 6.0 (Regulatory Agency Lists Review) of this report.

We did not observe indications of existing ASTs or USTs on the subject site during the reconnaissance.

4.1.3 Hazardous Substances and Petroleum Products

We did not observe hazardous materials, chemicals or petroleum products stored at the subject site during our reconnaissance. We observed one empty, 55-gallon drum within the former Building 14 area that had some residual staining inside. We also observed a few oil or grease stains on the concrete slab in a few areas on the site. These small stains were likely from the large equipment that was used in demolishing the on-site buildings.

4.1.4 Solid Waste

During our reconnaissance, we did not observe significant amounts of debris on the site other than some miscellaneous trash (e.g., paper and plastic) and some remnant construction debris from the

building demolition activities. We did not observe indications of unauthorized dumping such as debris piles.

4.1.5 Electrical Transformers

We observed several pad-mounted electrical transformers on the site during our reconnaissance. The following table provides detailed information on the locations and observations.

LOCATION	NUMBER OF TRANSFORMERS	OBSERVATIONS
Southeast Corner of Building 13 (Transformer Room)	3	Moderate staining on concrete base pad and surrounding aggregate base material. "No PCB" labels affixed to each transformer.
East Side of Building 13 (Fenced Transformer Enclosure)	3	Moderate staining on concrete base pad and surrounding aggregate base material. "No PCB" labels affixed to each transformer.
Near Southwest Corner of Building 10	3	Moderate staining on concrete base pad and surrounding aggregate base material. No labels identified pertaining to PCB status.
Southeast Corner of Building 11 (Transformer Room)	3	Moderate to heavy staining on concrete base pad and surrounding aggregate base material. No labels identified pertaining to PCB status.

The presence of stained concrete and aggregate base material in the above-described areas indicates that leaks or spills have occurred in the past. The transformers in two of the four locations contained labels stating that they were tested and found to contain no PCBs (below 50 parts per million).

In 1997, Law/Crandall (now MACTEC) collected shallow subsurface soil samples adjacent to four transformer equipment locations. The soil samples were analyzed for the presence of PCBs. The analytical results showed that PCBs were not present above the laboratory reporting limits.

4.1.6 Water Supply

The site is currently vacant. Therefore, it is likely that the main water supply line valves were disconnected (turned off) prior to the commencement of building demolition activities. The City of Burbank Water and Power (BWP) provides water to properties within the City of Burbank. According to Mr. Jim Lovell with the BWP, the agency obtains approximately 95 percent of its water from the Metropolitan Water District and 5 percent from local ground water wells. Some or all of the well water apparently requires treatment prior to distribution into the municipal supply lines.

4.1.7 Waste Water

Waste water is not generated at the subject site. However, as discussed below, we observed several features (e.g., former clarifiers) that would indicate large quantities of waste water were generated at the site during previous manufacturing operations that ceased in 1991. As noted in Section 5.1 of this report, a building permit was issued in 1993 for the removal and/or abandonment of clarifiers on the site.

4.1.8 Wetlands

We did not observe obvious signs of the presence of wetlands on the site, i.e., open water or marshes. We did not observe symbols on the United States Geological Survey (USGS) maps indicating the presence of wetlands. According to the National Wetlands Inventory (U.S. Department of the Interior, 2004), there are no designated wetland areas located within the site boundaries.

4.1.9 Wells and Mine Shafts

We did not observe indications of existing wells or mine shafts on the site during our reconnaissance. However, we observed numerous circular patches in the concrete slab and asphalt paving surfaces where former wells (ground water or vapor) and soil borings were previously located.

4.1.10 Pits, Ponds and Lagoons

We observed several rectangular- and square-shaped patches in the building concrete slabs that were likely the former locations of pits used during previous operations at the site. In the central portion of former Building 14, we observed two breaks in the concrete slab. Beneath the slab appeared to be a large pit that was partially filled with liquid (possibly water from recent precipitation events). The pit dimensions were estimated to be 50 by 20 feet by approximately 10 feet deep. We were not able to determine the purpose of this covered pit which could also have served as a basement storage area due to the estimated size.

We also observed a hydraulic elevator pit in the northeast corner of former Building 10. We observed some minimal stains in the concrete pit. However, we did not observe obvious evidence of significant hydraulic fluid leaks associated with the equipment. We were not able to observe the subsurface conditions below the pit.

We observed several other areas throughout the site where former clarifiers and trenches associated with past manufacturing operations that had been filled and covered with concrete.

We did not observe indications of ponds or lagoons on the site during our reconnaissance.

4.1.11 Dry Cleaning Operation

We did not observe dry cleaning operations on the subject site.

4.2 AREA RECONNAISSANCE

The area reconnaissance helps us evaluate whether adjacent or nearby property uses may have contaminated the site. Our assessor conducted the reconnaissance by touring the area by automobile and viewing particular businesses from public rights of way, but did not enter off site properties. The findings of our area reconnaissance are discussed according to their direction from the site: north, east, south, and west. Please note that the directions referred to in this section are based on reference north, not true north, as indicated on Figures 2 and 3. All other directional references in this report are based on true north.

4.2.1 North

The subject site is bounded to the north by a tall, concrete retaining wall, on the north side of which is a landscaped slope and then Burbank Boulevard. A freeway onramp and offramp for the southbound lanes of the Golden State Freeway and landscaped areas are located on the opposite side of Burbank Boulevard.

4.2.2 East

Old Front Street forms the eastern boundary to the site. This street dead ends near the northern portion of the site approximately 50 feet south of Burbank Boulevard. The Golden State Freeway is located east of Old Front Street. The Media City Center (retail mall) is situated on the opposite side of the freeway further to the east.

4.2.3 South

San Jose Avenue, a narrow street segment, borders the site to the south. An asphalt-paved parking lot is situated on the south side of the street and is apparently used by employees of local businesses and the Metrolink trains. The Magnolia Boulevard overcrossing is located further to the south. Beyond Magnolia Boulevard is the Metrolink train station.

4.2.4 West

The site is bordered on the west by (from north to south) the Burbank Western Channel, a vacant strip of land between the site and New Front Street and New Front Street. Two railroad tracks, part of the Metrolink right-of-way (ROW), parallel New Front Street on the west. The properties on the west side of the ROW are occupied by the City of Burbank water reclamation facility, Swaner Hardwood Company and other commercial and light industrial operations. A concrete-lined flood control channel (Burbank Western Channel) runs parallel, and approximately 150 feet west of, the ROW. The channel then curves eastward and actually borders the northwestern end of the subject site near Burbank Boulevard.

4.2.5 Summary of Area Reconnaissance

We found no obvious evidence of activities on adjacent properties during our area reconnaissance that, in our opinion, may have contaminated soil or ground water at the site. However, due to the business operations in the general site vicinity (light industrial) and the regional ground-water contamination that is part of the Superfund Site, soil and ground water has apparently been impacted in the vicinity of the site from some of these businesses.

5.0 HISTORICAL REVIEW

In the historical review, we reviewed information on the past uses of the site and nearby properties. We assessed whether these uses may have contaminated the site's soil or ground water.

The earliest historical references we consult date from 1940 or from the first developed use of the site or nearby properties. Information sources we commonly use include aerial photographs, fire insurance maps, and United States Geological Survey (USGS) topographic maps. For a list of the

information sources used in this section, refer to the Information Sources list following the statement of limitations.

The historical review results in two histories: a history of the past use of the site and a history of the past use of the adjacent properties. Additional historical information may exist; therefore, alternative histories could be construed for the site and nearby properties.

Please note that all directions pertain to reference north, not true north.

5.1 PAST SITE USE

Topographic Maps

The 1902 and 1915 topographic maps depict the site as undeveloped land. However, it appears that two streets, which run parallel and perpendicular to the railroad ROW, may be located within the site boundaries. The 1926 and 1941 maps depict similar site conditions to the earlier maps.

The 1966 map shows the site occupied by most of the buildings that were recently demolished. However, the former location of Building 14 is occupied by a smaller, U-shaped building. Additionally, a rail spur from the ROW is situated adjacent to the western edge of the site next to the large buildings. The 1972 (photorevised) and 1994 maps depict conditions similar to those in existence prior to the recent demolition activities. Based on the topographic map review, former Building 14 was constructed between 1966 and 1972.

Sanborn® Maps

The 1941 and 1949 maps show the site occupied by the General Water Heater Corporation (water heater factory) facility. The southern portion of the site is occupied by offices while the central portion of the site (mostly the western half) is occupied by buildings identified as “boiler shop”, “storage” and “assembly, stock rooms and machine shop”. The use of another building is difficult to confirm due to the copy quality of the map. Map coverage for the northern portion of the site is not shown. The words “no exposure” is written along the edge where coverage ends.

The 1950 map shows similar conditions to the previous two map coverage years (1941 and 1949). However, one additional building is located on the central portion of the site. The use of this building

is not known due to the poor print quality of the map. The map for this specific year also covers the northern portion of the site which is occupied by a building labeled “metal working”.

Additional buildings and renovations to existing buildings are apparent on the 1957 and 1960 maps that provide coverage of the site. Two new buildings are located along the eastern edge of the site and are identified as “machine shop & engineering” and “heater & parts storage”. Another building where renovation activities occurred is labeled “vulcanizing & welding”.

The 1968 map shows the southern portion of the site occupied by a parking lot. The site is now occupied by Zero Production, Division of Zero Manufacturing, Inc. The configuration of the buildings on the central portion of the site is similar to that shown on the previous (1957 and 1960) maps. However, some renovation work and a few additional buildings are apparent. The metal working building on the northern portion of the site was apparently demolished and a larger building was constructed. The larger building is labeled “metal parts warehouse and machine shop”.

Based on the site conditions depicted on the 1970 map, it appears that significant remodeling and new construction activities occurred between 1968 and 1970. The buildings on the central portion of the site increased in size and appeared to be incorporated into two large buildings. A new building was also constructed on the southern portion of the site (former Building 14). The occupant(s) of the site was identified, from north to south, as: “Zero Foam Products, a Division of Zero Manufacturing Co.”, “Ocean Technology, Inc.”, “Zero Manufacturing Co.” and “Zero Honeycomb Structures, Division of Zero Manufacturing Co.”. The products manufactured on the site were described as “foam” and “metal”.

Aerial Photographs

The 1928 aerial photograph shows the site as mostly undeveloped land. However, it appears that one residential street may cross the southern portion of the site and the eastern portion of the site is possibly occupied by single-family residences.

The 1940 aerial photograph shows the southern and northern portions of the site as undeveloped land. Large buildings on the central portion of the site (likely the General Water Heater complex) and portions of a few single-family residential properties occupy the central portion of the site.

The 1956 and 1965 aerial photographs show site conditions similar to those described on the 1957 and 1960 Sanborn® maps.

The site conditions depicted on the 1976, 1989, 1994 and 2002 aerial photographs are similar to those described on the 1970 Sanborn® map and the conditions of the site prior to demolition activities.

City Directories

The subject site address (777 North Front Street) was not listed in the EDR city directory abstract report between the years 1920 and 1966. [Note: No data was reported for 1922, 1941, 1943, 1953 and 1959]. Between 1967 and 1991, the listed occupants included Ocean Technology, Inc., Zero Manufacturing Company (Metal Box Manufacturers), Zero Halliburton Burbank, Dacobas and MSH Technologies. The 1995 list identifies the site occupant as Western Moving & Storage, Inc. In 2001, the tenants were listed as Productions and Showmaker.

Building Permits

We visited the City of Burbank Building Department to review available permits for the subject site address. The table below provides a summary of selected permits that we reviewed.

Year	Permit/Document Description
1964	Geotechnical report for proposed 4-story building.
1965	Certificate of occupancy issued to Zero Mfg. Corp.
1965	Industrial Waste Application for Discharge from hot water rinse/spray tanks. Waste described as "soap cleaner rinse", "alkali aluminum etch (caustic)" and "chromate rinse".
1967	Letter from Mobil Oil Corporation objecting to Zero Mfg. Co.'s proposed construction of a building over their existing pipeline.
Post 1970	Building plan showing locations of clarifiers, metal cleaning tanks and paint booths in the various buildings.
c. 1987	Permit to remove two 5,000-gallon, gasoline USTs. "No Compaction" written in Description of Work portion of the form. A site plan indicates the USTs were located on the west side of either former Buildings 10 or 15.
1993	Permit to remove one clarifier and cap off in-place four clarifiers.
1995	Permit issued for filming.
1996	Permit indicates owner as "Front Street Studios". Building use identified as film studio.
Unknown	Building plan showing electrical diagram and equipment locations inside former Building 11. The building contained one can washer, six toggle presses and 11 hydraulic presses.

Several permits were issued to Zero Manufacturing in the 1960s and 1970s for additions and other remodeling activities at the site.

Summary of Site History

Based on our review of historical documents, we have prepared the following summary of past site uses. The timeframes are approximate and the property use description is approximated.

- Prior to 1930: Generally undeveloped land.
- c. 1930 -1940: Portion of the site occupied by General Water Heater Corporation.
- 1940 – 1965: Site occupied by General Water Heater Corporation for manufacturing water heaters.
- 1965 – 1991: Site occupied by Zero Manufacturing company for the production of metal containers.
- 1991 – 2002: Site used as a storage facility and for the production of films and movies.
- 2002 – Present: Unoccupied.

Copies of selected documents are included in Appendix B, Historical References.

5.2 PAST USE OF SURROUNDING PROPERTIES

The following information was obtained from our historical research pertaining to properties surrounding the subject site:

- North: The 1902 and 1915 topographic maps show Burbank Boulevard located on the north side of the site. The 1926 and 1941 topographic maps and the 1928 and 1940 aerial photographs show some buildings (likely residential) situated north of the street. By 1965, the Golden State Freeway was constructed and the properties on the north side of Burbank Boulevard were occupied by the onramp/offramp areas which are the same as current conditions.
- East: The 1902, 1915 and 1926 topographic maps show the properties east of the site occupied by streets and some residential buildings. The 1928 and 1940 aerial photographs show the adjacent property developed with single-family residences. These residential neighborhoods were demolished for the construction of a two-lane divided highway that is first noted on the 1956 aerial photograph. This highway was eventually widened for the construction of the Golden State Freeway which currently occupies the property east of the site (beyond Old Front Street). The Media Center Mall, located on the east side of the freeway, was constructed by 1994.
- South: The 1902, 1915 and 1926 topographic maps and the 1928 and 1940 aerial photographs show the properties south of the site occupied by streets and some residential/commercial buildings. Magnolia Avenue was noted on the 1902 topographic map further to the south. The residential/commercial areas were generally demolished for the construction of the divided highway and eventually the Golden State Freeway. The 1956 aerial photograph and remaining references generally show conditions similar to the present for properties located south of the site.

- West: The 1902, 1915, 1926 and 1941 topographic maps and the 1928 and 1940 aerial photographs show the Southern Pacific Railroad tracks located on the property west of the site. Additionally, the Sanborn maps show two rail spurs located on the adjacent property near the existing buildings. Beyond is mostly undeveloped land. By 1956, as noted on the aerial photograph from that year, the drainage channel had been reconfigured and lined with concrete. The properties between the railroad tracks and the channel remained undeveloped while the properties west of the channel consisted of commercial buildings and undeveloped land. By 1976, the properties west of the site resembled present-day conditions.

6.0 REGULATORY AGENCY LISTS REVIEW

We reviewed excerpts of federal, state, and local environmental regulatory agency lists for those properties which were within the search ranges as noted in the excerpts that were prepared by EDR, an environmental data search firm. Due to the size of the subject site, the search radius for each list was extended by 1/8 mile.

EDR revises their lists periodically when they receive updates from the agencies. The date of the latest revision is shown on their report, which is appended to this report as Appendix C, The EDR-Radius Map with GeoCheck®. The EDR report also summarizes the origin and purpose of each list.

Please note that regulatory listings are limited and include only those sites that are known to the regulatory agencies at the time of publication to be contaminated or in the process of evaluation for potential contamination.

6.1 FEDERAL CONTACTS

Environmental Protection Agency (EPA) National Priorities List (NPL), dated 7/30/04

The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) established the National Priorities List (NPL) of federal "Superfund" Sites. This list identifies Superfund Sites that have been designated as national priority clean-up sites and targeted for immediate action due to their high assigned ranking, in terms of potential public health effects, by the EPA.

- The subject site address does not appear on the NPL but is within the boundaries of the NPL site discussed below.

- The subject site is located within the boundaries of an NPL-listed area. Map No., 0, identified as the San Fernando Valley (Area-2) – Crystal Springs Wellfield Area, is an area of contaminated ground water located beneath the Cities of Los Angeles and Glendale. According to information in the EDR report, this specific area encompasses approximately 6,680 acres and is within the San Fernando Valley Basin, a large ground water reservoir used for municipal water supply. The primary contaminants identified are trichloroethylene (TCE) and perchloroethylene [or tetrachloroethylene] (PCE). The status date for this listing is June 10, 1986. More current information for this area and impacted ground water is provided in the CERCLIS listing below. Additionally, this listing is discussed in Section 7.0 of this report.

EPA Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), dated 5/17/04

The CERCLIS lists and identifies suspected contamination sites throughout the nation; CERCLIS contains information on sites identified by the U.S. EPA as known or suspect abandoned, inactive, or uncontrolled hazardous waste sites which may require cleanup.

- The subject site does not appear on the CERCLIS list.
- The subject site is located within the boundaries of a CERCLIS-listed area. Map No. 0 is the San Fernando Valley (Area 2) listing that also appeared on the NPL list (discussed above). The information for the CERCLIS listing in the EDR report shows that the contaminated ground water was discovered in 1983. The latest status report in the historical summary listing was completed on March 24, 2004 and is identified as "Ready-for-Reuse Evaluation Checklist".

We obtained information from the Department of Toxic Substances Control (DTSC) website for this specific listing. The fact sheet indicates that the San Fernando Valley Basin is divided into four areas. It appears that Area 1 (North Hollywood NPL site) is in close proximity to the site, also. However, the ground-water contaminants are essentially the same in the four areas (solvents) and resulted from the improper use, storage and disposal of chemicals associated with operations associated with the aerospace industry, dry cleaners, automotive facilities and metal plating operations. The discovery of the contamination occurred in 1979. Ground-water remedial activities commenced in Areas 1 and 2 during the mid- to late-1990s. Hexavalent chromium, a new chemical of potential concern (COPC), was reportedly identified in the ground-water basin. According to the website, the Environmental Protection Agency (EPA) and the Regional Water Quality Control Board (RWQCB) are in the process of identifying potentially responsible parties (PRPs) with respect to this COPC.

There is one CERCLIS-listed facility within ½ mile of the site. Map No. T90 (Dynamic Plating, Inc.) is located approximately 2,000 feet west-southwest of the site. The status of this facility is listed as "cleaned up". Considering the distance of this facility from the site and the regulatory status, in our opinion, this listing does not warrant further investigation.

Corrective Action Report (CORRACTS) list, dated 6/15/04

The CORRACTS list identifies hazardous waste handlers with RCRA corrective action activity.

- The subject site is not included on the CORRACTS list.
- There is one CORRACTS-listed facility located within 1 mile of the subject site. Map No. R81 (Railchem) is located approximately 1,500 feet southeast of the site. The status of the facility is listed as “medium corrective action priority”. Considering the distance of this facility from the site, in our opinion, this listing does not warrant further investigation.

EPA Resource Conservation and Recovery Information System (RCRIS), dated 6/15/04

RCRIS, or the Resource Conservation and Recovery Act (RCRA) Notifiers List, is an EPA database of facilities that generate and/or transport hazardous waste. This list also serves to track the status of hazardous waste treatment, storage, and/or disposal (TSD) facilities regulated under RCRA.

- The subject site does not appear on the RCRIS list.
- There are three facilities reported on the RCRIS – Large Quantity Generator (LQG) list located within a ¼-mile radius of the subject site. The appearance of a facility on the RCRIS list does not necessarily indicate that an environmental problem exists. The listing merely identifies facilities that use, store and dispose of hazardous materials and wastes. These three listed facilities (Map Nos. E12, J55 and P65) are not located on adjacent properties to the site. Additionally, the status of these facilities is listed as “no violations found”. In our opinion, these listings are not considered as an environmental concern with respect to the site.

There are 31 listings on the RCRIS – Small Quantity Generator (SQG) list. None of these facilities are located on adjacent properties to the site. The nearest facility (Map No. D11 - Swaner Hardwood Co., Inc.) is located approximately 300 feet west of the site. The status of this facility is listed as “no violations found”. In our opinion, these listings are not considered as an environmental concern with respect to the site.

- There is one facility reported on the RCRIS TSD list located within a ½-mile radius of the subject site. Map No. R81 (Railchem), also discussed above on the CORRACTS list, appears on this list with three violations and subsequent enforcement actions between 1990 and 1991. This facility is not considered as a recognized environmental condition with respect to the site and, in our opinion, does not require further investigation.

EPA Emergency Response Notification System (ERNS), dated 12/31/03

The ERNS list is a national database used to collect information on reported releases of oil and hazardous substances.

- The subject site does not appear on the ERNS list.

SARA Title III, Section 313 (TRIS), dated 12/31/02

Title III of the Superfund Amendments and Reauthorization Act requires that owners or operators of facilities with more than ten employees and that are listed under Standard Industries Classification (SIC) Codes 20 to 39 report the manufacturing, processing or use of more than a threshold quantity of certain chemicals listed under Section 313. This database is also known as the Toxic Release Information System (TRIS).

- The subject site does not appear on the TRIS list.

6.2 STATE CONTACTS

Annual Work Plan (AWP) list, dated 6/1/04

The Annual Work Plan (AWP) of the California Hazardous Substance Cleanup Bond Act of 1984 (state Superfund act) identifies California hazardous waste facilities targeted for cleanup by responsible parties, the state, and the EPA over the next five years.

- The subject site is not included on the AWP list.
- There is one AWP-listed facility located within a 1-mile radius of the subject site. Map No. 0 is the same listing that also appeared on the NPL and CERCIS lists discussed above. The information under this listing shows the site as “active” and the lead agency as the “EPA”.

CALSITES (CALIS) list, dated 6/1/04

The CALSITES database identifies certain potential hazardous waste facilities, based on file searches and windshield surveys. Some of the facilities may have undergone supplemental inspection or sampling.

- The subject site is not included on the CALSITES list.

- There is one CALSITES-listed facility within a 1-mile radius of the subject site. This is the same listing (Map No. 0) that appeared on the NPL, CERCLIS and AWP lists.

California Office of Planning and Research (CORTESE) list, dated 4/1/01

The CORTESE database, a consolidation of information from various sources, lists potential and confirmed hazardous waste facilities or hazardous substance facilities.

- The subject site address appears on the CORTESE list as Map No. A3 (Unocal Service Station #0535, 777 Front, Burbank, CA 91503). Based on the information we obtained during the assessment, we did not find evidence that the site was previously occupied by a gasoline service station. Additionally, the zip code for the listing is not for the subject site (which is 91502). We sent a request for information to the Regional Water Quality Control Board (RWQCB) regarding this site which also appears on the SLIC list (discussed later in this section). We have not yet received a response to our request.
- There are 10 CORTESE-listed facilities located within a 1-mile radius of the subject site. The CORTESE listings are usually associated with underground storage tank (UST) leaks. Nine of the 10 facilities that are on the CORTESE list also appear on the Leaking Underground Storage Tank (LUST) list and are discussed below. The remaining facility (Map No. X103) is located over 2,000 feet south-southeast of the site and, in our opinion, is not considered as an environmental concern with respect to the site.

Leaking Underground Storage Tank (LUST) list, California and Regional, dated 7/12/04

The State Water Resources Control Board and Regional Water Quality Control Boards maintain the LUST lists with reported leaks from underground storage tanks.

- The subject site does not appear on the LUST list.
- There are 11 facilities included on the LUST list located within a ½-mile radius of the subject site. Three facilities are listed as “soil only, case closed”. Four other facilities are listed as “soil only”. Three of the remaining four facilities are listed as “ground water, case closed”. No specific data is provided for the remaining facility. However, the facility is located approximately 1,700 feet west of the site. Considering the above information, these listings are not considered as an environmental concern with respect to the site.

Permitted Underground Storage Tanks (UST) list dated 7/12/04

The UST list inventories tanks registered on the State Water Resources Control Board’s Hazardous Substance Storage Container Database.

- The subject site does not appear on the UST list.

- There are six UST-listed facilities located within a ¼-mile radius of the subject site. The appearance of a facility on this list does not necessarily imply that a UST leak has occurred. The listing merely indicates the facility maintains USTs. Only one of the listed facilities (Map No. J54) appears on the LUST list. This facility was previously discounted as an environmental concern to the site. None of the remaining five facilities are located on an adjacent property to the site. Considering this, in our opinion, further investigation associated with these facilities is not warranted.

Waste Management Unit Database (WMUDS) List, dated 4/1/00

The WMUDS is used by the State Water Resources Control Board Staff and the Regional Water Quality Control Boards for program tracking and inventory of waste management units. The WMUDS includes the SWAT database.

- The subject site is not included on the WMUDS list.
- There are no WMUDS-listed facilities located within a ½-mile radius of the subject site.

Solid Waste Information System (SWIS) list, dated 6/14/04

The SWIS list inventories active, inactive, and closed solid waste disposal and transfer facilities.

- The subject site is not included on the SWIS list.
- There are no SWIS-listed facilities reported within a ½-mile radius of the subject site.

6.3 OTHER LISTS

Twelve of the 47 remaining regulatory lists contain listings within the search radius as designated in the EDR report. The listings appeared on the following lists discussed below:

CERCLIS-NFRAP

This list provides information on properties that were removed from the CERCLIS list and are identified as “No Further Remedial Action Planned”. One facility (Map No. R81) appears on this list and was previously addressed earlier in this section. Considering the appearance on this list, in our opinion, this listing is not considered to represent an environmental concern.

Notify 65

This list contains information on facility notifications about any releases that could impact drinking water. Two facilities appear on this list. Map No. B6 (Burbank Waste Reclamation Plant) is located approximately 300 feet west of the northern portion of the site. No specific information is provided for this listing. We observed rectangular-shaped reclamation ponds on the opposite [west] side of the railroad tracks across from the site which is likely the location of this facility. Strictly from a surficial pathway, in our opinion, this facility has not likely impacted the subject site. The other facility is located greater than 2,500 feet south of the site and is not considered as an environmental concern.

Voluntary Cleanup Program

This list contains information on facilities that have entered into a voluntary cleanup program with the DTSC. One facility (Map No. J53), which is located approximately 500 feet south-southwest of the site, appears on this list. The status of this facility is listed as “No Further Action for DTSC”. Therefore, this property is not considered as an environmental concern.

CA FID UST

The CA FID UST list contains a historical listing of active and inactive underground storage tank locations. This listing is similar to the UST list previously discussed in this section. Seven facilities appear on this list. None of the facilities are located on properties which are adjacent to the site. Considering the LUST facilities have already been addressed, in our opinion, these listings do not warrant further investigation.

HIST UST

The HIST UST list is a historical listing of UST sites. The subject site appears on this list as Map No. A5 (Zero West Division). The information in the EDR report indicates that two 5,000-gallon USTs containing unleaded fuel were installed at the site in 1975. The owner was listed as “Zero Corporation”. Our review of specific records at the Burbank Fire Department is discussed later in this section and contains information on former on-site USTs.

Twenty other listings are present on this list. None of these facilities are located on properties adjacent to the site. Additionally, as previously stated, the LUST sites have already been addressed. Therefore, these listed facilities do not warrant additional investigation.

ROD

The records of decision documents mandate a permanent remedy at an NPL site. One listing (Map No. 0) appears on this list and was previously discussed earlier in this section.

FINDS

The FINDS list contains data usually obtained from other regulatory lists. One listing (Map No. 0) appears on this list and was previously discussed earlier in this section.

CLEANERS

This is a list of dry cleaner facilities with EPA identification numbers. Three separate listings appear on this database. However, all three appear to be for the same facility (Map No. N43, N44 and N45 at 928 [West or North] San Fernando [Road or Street]. This facility is located approximately 700 feet north of the subject site. The database listing does not state that a release has actually occurred at this facility. Therefore, in our opinion, this facility is not considered as a recognized environmental condition with respect to the site.

EMI

The Emissions Inventory Data list contains information on toxic and pollutant emissions that are collected by local air pollution agencies. The subject site appears on the list as Map No. A4 (Zero West Division). No pertinent information related to this listing is provided in the EDR report. In our opinion, the site was likely issued permits and monitored for air emissions by the South Coast Air Quality Management District. However, considering the site is no longer occupied by the Zero Corporation facility, air emissions issues are no longer applicable.

SLIC

The SLIC list contains information on sites which have contaminated ground water or have the potential to impact ground water. The list is prepared by the RWQCB. The subject site address appears on the list as Map No. A3 (Unocal SS #0535 at 777 Front Street). No specific information is provided in the EDR report for this listing. We submitted a request to the RWQCB – SLIC Unit to confirm whether they maintained a file for this listing. We have yet to receive a response to our request on this issue.

There are 26 facilities located within 1 mile of the site that appear on the SLIC list. Twenty-three of these facilities are located approximately ¼ mile or further from the site. The remaining three

facilities (Map Nos. B9, E16 and G22) are located within approximately 500 to 750 feet of the site. The substances released at these facilities are identified as volatile organic compounds (VOCs) and chromium (CR). In our opinion, considering the proximity of these facilities to the site, there is a low to moderate likelihood that they have contributed to ground water contamination beneath the site.

HAZNET

The HAZNET list contains hazardous waste manifest information from the Department of Toxic Substances Control. The HAZNET listing merely indicates that these facilities generate and transport hazardous waste materials and does not necessarily imply an environmental problem exists.

The subject site appears on the HAZNET list as Map No. A1 (Independence Inc.) and Map No. A2 (Erry Gates-The Crow), both located at 777 Front Street. The information in the EDR report shows that the listed facilities have an EPA identification number for the disposal of “oxygenated solvents” and “unspecified organic liquid mixture”. Based on our site reconnaissance observations, these materials are no longer generated or used on the site.

Los Angeles County HMS

The list is prepared by the Los Angeles County Department of Public Works and provides information on industrial waste and UST sites. The site appears on the list as Map No. A4 (Zero Corporation). Both the facility and permit statuses are listed as “Removed”.

Gas Stations/Dry Cleaners

This EDR database contains a listing of possible current/former gas station, automotive and dry cleaner facilities that appeared in business directories. Numerous facilities located within ¼ mile of the site. The closest facility is identified as Hoffman R D located at 402 North Front Street and was listed in the year 1942. This facility is no longer present. Considering the large number of these former/current businesses, there is some likelihood that the operations conducted at these facilities may have impacted soil and/or ground water in the general area of the site.

VCP

The Voluntary Cleanup Program list identifies low threat level properties with confirmed or unconfirmed releases where the project proponents have entered into a oversight agreement with the DTSC. There is one facility that appears on this list (Map No. J53 at 164 West Magnolia Boulevard). The status of the site is listed as “No Further Action for DTSC”.

Orphan Summary

The Orphan Summary list consists of sites with poor address quality, usually without zip code information. However, if street addresses are available, these site locations are checked against the known vicinity of the subject site to evaluate if they are located within the select ASTM search distance. We did not identify orphan properties that include the site or immediately adjacent properties. However, based on the listed addresses, some of these former or existing facilities are within approximately 1,000 feet of the site. Considering the number of facilities and type of listings (e.g., SLIC), in our opinion, there appears to be some likelihood that ground water in the general site vicinity is impacted from these facility operations.

6.4 BURBANK FIRE DEPARTMENT

We visited the Burbank Fire Department and reviewed microfiche records for the subject site address. We also spoke to Mr. Devin Burns, Hazardous Materials Specialist with the Burbank Fire Prevention Bureau. A summary of the review is provided below:

- 1975: Application to store flammable liquids underground. Two 5,000-gallon USTs. A note on the document indicates they were removed in 1987.
- 1987: Application to remove two USTs submitted.
- August 10, 1987: Letter from the Los Angeles County Department of Public Works stating that, based on their review of a UST closure report, the “closure is final and no further action is required”. The subject report indicated that soil samples collected from 3 feet below the UST inverts contained TPH as gasoline concentrations ranging from 2.5 to 31 parts per million.
- April 9, 1990: A handwritten note from David (?) on Zero Corporation letterhead stating “Gentlemen: Please be advised that there are no USTs at this site”.

6.5 SUMMARY OF RECORDS REVIEW

Please note that regulatory listings are limited and include only those sites that are known to the regulatory agencies at the time of publication to be contaminated or in the process of evaluation for potential contamination. Our review of the above-referenced regulatory information suggests that there are several properties in the general area of the site where environmental conditions are documented and have resulted in soil and/or ground-water contamination. As previously stated, in our opinion, there is a moderate likelihood that ground water beneath the site is affected from some of these off-site facilities.

7.0 DOCUMENT REVIEW

Northridge Properties, LLC provided us with copies of numerous documents related to environmental assessment and remediation, real estate and legal activities associated with the site. The documents were prepared between approximately 1991 and 2002. This section provides a generalized summary of these documents and past activities associated with the subject site.

In 1991, Zero-West retained Targhee, Inc. to conduct a preliminary subsurface investigation to document whether the subsurface soils at the site were impacted with chemical constituents of concern as identified by the RWQCB. The investigation was reportedly conducted as part of the RWQCB's Well Investigation Program directive (Targhee, 1991). Targhee collected soil samples from borings placed adjacent to the on-site clarifiers and chemical storage areas. Total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs), such as PCE, trichloroethene [TCE] and 1,1,1-trichloroethane [1,1,1-TCA or TCA], were identified in the subsurface soils. Targhee conducted several follow-up assessments and subsurface investigations based on the findings of the initial assessment.

In 1992, at the request of both the RWQCB and the United States EPA (US EPA), Zero Corporation retained the services of Hydro Geo Chem, Inc. (HGC) to perform a subsurface investigation at the subject site and an adjacent parcel of property owned by the Southern Pacific Transportation Company that was previously leased by the Zero Corporation for storage purposes. The findings were submitted in a report dated September 29, 1992 (HGC, 1992). HGC collected soil, soil gas and ground-water samples during the investigation which included the installation of six ground-water monitoring wells. PCE, TCE, TCA and/or 1,1-dichloroethene (1,1-DCE or DCE) were identified in the soil, soil gas and ground-water samples. HGC concluded that the TCE and DCE were likely a result of the degradation of PCE and TCA, respectively. HGC continued by stating that the concentrations of PCE in the ground water were likely from former on-site activities. However, HGC stated that the TCE concentrations found in the ground water were not consistent with the concentrations found in the soil and soil vapor and concluded that the TCE was from an off-site source.

HGC subsequently installed four additional ground-water monitoring wells on the site in late 1992 based on the findings of the previous investigation and discussions with the RWQCB (HGC, 1993).

The installation of the additional ground-water wells commenced a monthly, quarterly, semi-annual and annual ground-water monitoring program at the site that continued through approximately 2001.

Based on a review of the subsequent ground-water monitoring reports, the ground water beneath the site ranged in depths from approximately 95 to 120 feet bgs throughout the approximately 8-year monitoring period. The ground-water gradient beneath the site was generally in a south- to southeasterly direction. However, due to ground-water pumping associated with municipal water supply wells and ground-water remediation occurring at other nearby properties, both the ground-water levels and gradient fluctuated over time.

The US EPA issued various dockets between 1994 and 1997 related to the San Fernando Valley Area 2 (Glendale North and Glendale South Operable Units) site. The Area 2 site appears on the NPL list due to the presence of solvents (generally PCE and TCE) in the ground water. The EPA dockets identified respondents (potentially responsible parties [PRPs]) and consisted of administrative orders, records of decision and orders for remedial action. The PRPs identified on the various dockets were represented by the Glendale Respondents Group which enabled the PRPs to work in a unified manner to address the EPA's requirements associated with the ground-water contamination issue. On March 30, 1998 the California EPA issued a letter indicating that the RWQCB was the designated administering agency for overseeing remediation activities at the site.

In 1997, Law/Crandall conducted an environmental assessment of the site for Galpin Motors, Inc. (an affiliate of Northridge Properties, LLC) that consisted of a review of previous environmental reports and subsurface sampling activities. Selected soil samples were analyzed for semi-volatile organic compounds (SVOCs), VOCs, Title 22 Metals, PCBs and TPH. The results of the assessment showed that SVOCs, PCBs and TPH as gasoline [including MTBE] were not detected. The metals concentrations detected were found to be below California hazardous waste criteria. VOCs and TPH as diesel and heavy hydrocarbons were detected in some of the samples.

In December 1997, Emcon conducted an environmental assessment within (old) Front Street located on the east side of the subject site. As part of their assessment, Emcon advanced one direct-push boring (GP-3) in the proximity of a Mobil oil pipeline that was reportedly installed in an east-west direction beneath the former Cypress Avenue. The pipeline was interpolated to extend in a westerly direction beneath the subject site. While a portion of the pipeline was reportedly removed by the City of Burbank, and while correspondence from Mobil Oil Co. in 1967 objected to Zero Manufacturing

Co.'s proposed construction of a building over the pipeline, the actual current disposition of the pipeline beneath the subject site (removed or in-place) is not known. The purpose of the boring was to assess for impacts to the soil from leaks in the oil pipeline. Three soil samples from GP-3, collected at depths of approximately 5, 7 and 10 feet below ground surface, were analyzed for total petroleum hydrocarbons (fuel scan). A review of the laboratory analyses indicates that the suspect constituents were not present above the laboratory reporting limits.

HGC submitted various remediation work plans to the RWQCB based on preliminary studies to identify the most effective and feasible alternative for site remediation. HGC performed remediation activities on the site in a two-phased approach. The "Phase I" portion of the remediation was designed to remediate shallow soils (to depths of approximately 20 feet bgs) in areas where proposed building development was expected to occur. This portion of the remedial work consisted of soil vapor extraction (SVE) wells and air injection wells and was conducted between May 1998 and early 1999. The "Phase 2" portion was designed to treat areas of VOC-impacted soils to depths of up to approximately 90 feet and consisted of SVE and SVE/air sparging wells. This phase of remedial activities occurred between early 1999 and October 2000 (HGC, 2001). The RWQCB-imposed cleanup objectives were eventually met and HGC submitted reports for site closure in August 1999 (Phase I) and April 2001 (Phase 2), as supplemented by a Summary of Site Remedial Activities dated May 30, 2001, a Progress Update dated July 12, 2001, and a report of Supplemental Site Closure Information dated August 23, 2001.

On November 28, 2001 the RWQCB issued a "No Further Requirements" letter stating that, based on the findings of a closure report, "...we have no further requirements for VOC soil contamination with respect to the San Fernando Valley Cleanup Program at the subject site". They continued by stating that "...the diminished concentration of VOCs remaining in the soil appear not to pose a present or continuing threat to groundwater quality. Therefore, no further VOC assessment or cleanup of soil is warranted". On July 1, 2002, the RWQCB, as administering agency for the site under California's law for Unified Agency Review of Hazardous Materials Release Sites, issued a "Certificate of Completion" and cover letter stating that the site mitigation activities had satisfied the requirements of all agencies concerned with the hazardous substance release. A copy of each document is included in Appendix D.

A grant deed was issued on March 25, 1998 whereby Zero Corporation transferred the ownership of the subject site to Ford Leasing Development Company (FLDC). The US EPA and FLDC signed an "Agreement and Covenant Not to Sue" (under US EPA Region IX Docket No. 2000-03) whereby FDLC issued a check to the US EPA for \$150,000 for the US EPAs assurance that FDLC and permitted transferees would not be named as a PRP with respect to contamination issues at the site. A stipulation in the agreement allows the EPA to access the site for investigative purposes.

8.0 CONCLUSIONS

We have performed a Phase I ESA of the former Zero Corporation facility (subject site) located in Burbank, California. The scope of work was performed in general conformance with the scope and limitations of ASTM E 1527-00. Any exceptions to, or deletions from, the ASTM E 1527-00 scope is described in Section 2.2 of this report.

This assessment has revealed no evidence of RECs in connection with the subject site except for the following:

Superfund Site. The site is located within the boundaries of a National Priorities List Superfund Site which addresses regional groundwater contamination. The Superfund Site is separated into four areas managed by the U.S. Environmental Protection Agency (EPA). The area in which the site is located is known as San Fernando Valley Area 2 (Crystal Springs). The former owner of the site, Zero Corporation (now known as APW North America, Inc.), is an identified potentially responsible party in the Superfund Site based on alleged hazardous substance releases from past manufacturing operations at the site. The Superfund Site is a long-term environmental issue for this site and the surrounding region. However, in connection with its acquisition of the site, the current owner, Ford Leasing Development Company, obtained an Agreement and Covenant Not to Sue (commonly known as a prospective purchaser agreement) from the U.S. EPA. In addition, many years of on-site assessment and remediation activities have occurred. These activities were conducted by the former owner under the regulatory oversight of the RWQCB, which was officially designated in 1998 to serve as the administering agency for this site under the California law for Unified Agency Review of Hazardous Materials Release Sites. The RWQCB issued a “no further requirements” letter in 2001 and a formal “certificate of completion” was issued in 2002 by the RWQCB under the Unified Agency Review law.

9.0 LIMITATIONS

The findings and opinions in this report are relevant to the dates of our site work. They should not be relied upon to represent conditions at later dates.

Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the professional advice included in this report.

The opinions included in this report are based on information obtained during the study and on our experience. If additional information becomes available that might affect our conclusions, we request the opportunity to review the information, reassess the potential environmental concerns, and modify our opinion, if warranted.

Although this assessment has attempted to identify the potential for site contamination, potential sources of contamination may have escaped detection. They may have been overlooked because of the limited scope of this assessment, the inaccuracy of public records, or the presence of undetected and unreported environmental concerns.

The purpose of this assessment was not intended to identify *de minimus* conditions (e.g. those conditions that do not represent a material risk to public health or the environment) as recognized environmental conditions.

EXHIBIT E

LIST OF DOCUMENTS KNOWN TO SELLER WHICH MAY CONTAIN MATERIAL FACTS
AND OTHER MATTERS CONCERNING THE PROPERTY

Copies of the following documents are in the possession of Seller (except as noted) and will be delivered to Buyer upon execution of this Purchase Agreement. Seller urges Buyer to secure and review copies of the missing materials.

1. ENVIRONMENTAL REPORTS.

Law/Crandall.

- 2 copies → 1. Report of Pre-Demolition Asbestos Survey to Identify Asbestos-Containing Materials, dated July 31, 1997.
2. Report of Environmental Evaluation, dated October 1, 1997.
3. Letter to Mr. Skobin Re: Additional Metals Testing, dated January 8, 1998 (addendum to October 1, 1997, Report of Environmental Evaluation).
4. Report of Geotechnical Investigation, Proposed Galpin Ford Development, dated October 1, 1997.
5. Project Manual for the Removal of Hazardous Materials @ 777 N. Front Street, Burbank, CA, dated January 1998.

B. City of Burbank.

1. Letter from Erella Dimentstein to Donald Nanney, dated January 19, 1998, enclosing the following documents:
- a. Letter from Leighton and Associates, Inc., to the City of Burbank, dated October 23, 1992: Cost Estimate for Soil and Ground Water Remediation at the Zero Enclosures Property, 777 North Front Street, Burbank, CA.
- b. Letter from Leighton and Associates, Inc., to the City of Burbank, dated November 4, 1992: Cost Estimate for Soil and Ground Water Remediation at the Hyrail Site located at 415 North Front Street, Burbank, CA.
- c. Draft Results of Soil Gas Survey, Former Leased Area - Zero Facility 777 Front Street, Burbank, CA, prepared by Hydro Geo Chem for Zero Corporation, dated February 2, 1995.
- d. Report prepared by Leighton and Associates, Inc., to the City of Burbank, dated March 6, 1996: A review of Soil Vapor Extraction Simulation and Work Plan for Soils Remediation Conducted by Hydro Geo Chem, Inc., of the Zero Enclosures Facility located at 777 Front Street, Burbank, CA and attached letter from the City of Burbank to the California Regional Water Quality Control Board, dated March 7, 1996.
- e. Letter from Zero Corporation to the City of Burbank, dated April 8, 1996 referencing 777 Front Street.
- f. Letter from Hydro Geo Chem, Inc., to the City of Burbank, dated May 23, 1996: Exhibit A - Well Locations Zero Facility, Burbank.

C. Cal/EPA or Los Angeles Regional Water Quality Control Board.

1. Letter from LARWQCB to Michael Francis Re: Well Investigation Program - Soil Remediation Workplan, Zero Enclosures, 777 Front Street, Burbank (File No. 109.6162), dated February 26, 1996 (approving January 15, 1996, Workplan).
2. Letter from Eric Nupen of LARWQCB to Mr. Francis re: Work Plan, dated December 22, 1997 (approving December 18, 1997, Phase I Shallow Soils Remediation System).
3. Letter from Hank H. Yacoub of LARWQCB to Mr. Francis re: Due Date Extension, dated January 27, 1998

09300/0016/441248.3

(approving extension for start of Phase I).

2 copies 4. Letter from Cal/EPA Site Designation Committee to Hank Y. Yacoub, Cleanup Section Chief, Regional Water Quality Control Board - Los Angeles, re: Designation of an Administering Agency for Zero Corporation - 777 Front Street, Burbank, California, County of Los Angeles, dated March 30, 1998, and its enclosure, California Environmental Protection Agency, Site Designation Committee Resolution No. 97-19, February 5, 1998, ZERO Corporation, Burbank, certified copy dated March 30, 1998.

5. Letter from LARWQCB to APW North America, Inc., re "No Further Requirements - Former ZERO Corporation Facility, 777 Front Street, Burbank, California (File No. (109.6162; PCA No. 2046J))," dated November 28, 2001, together with letter from Donald C. Nanney of Gilchrist & Rutter to Dixon Oriola, Senior Engineering Geologist, Los Angeles Regional Water Quality Control Board, dated December 19, 2001.

BUILDING PERMITS

1964 Geotech Report

-2-

Zero Manufacturing Company

SITE CONDITIONS

The area of construction is within the present facilities of the Zero Manufacturing Company's Front Street site. The immediate area is presently employed for company parking and is paved with asphaltic concrete. The site drains slightly from northeast to southwest. The north side of the proposed building will approach the chain link fence on the company property line; the east side of the proposed building will approach within about 20 feet of a single-story, sheet metal, shop building. No other structures were noted near the area of proposed construction.

At grade (below the asphaltic concrete) in all borings the soils were described as moderately dense, silty sands. With depth, below about 4 or 5 feet, the soils grade to slightly silty, dense sands with occasional gravel. At about 6 or 7 feet in all borings the soils are described as gravelly sands. Borings were terminated at relatively shallow depths (about 9 feet) due to extreme difficulty in drilling. Ground water was not encountered in any of the borings.

CONCLUSIONS

The underlying gravelly sands should offer excellent support for the intended structure. The upper silty sands, extending to about 4 feet below grade, possess relatively high shear strengths; the consolidation characteristics of these sandy soils indicate that rather high settlements could occur under the proposed loading. Due to the importance of the structure, foundations should: (1) extend through the silty sands and seat in the gravels at depths of 6 or 7 feet or; (2) shallow footings could be used providing that the

TORRANCE, CALIFORNIA 90503

November 27, 1967

Mr. F. C. Butcher
Director of Public Works
City of Burbank
Burbank, California

Attention: Mr. D. E. Warner

Gentlemen:

This letter serves as notification of Mobil Oil Corporation's objection to the proposed construction of a building by the Zero Manufacturing Company over our petroleum products pipe line in the vicinity of Cypress and Front Streets.

We wish to request of the City of Burbank to withhold the issuance of any permit covering the construction of said building pending the resolvment of the existing pipe line problem.

It would appear prudent not to permit the construction of any type over a petroleum products line and pray that the City of Burbank concurs with our thinking.

Very truly yours,

W.C. Meek

California Environmental Protection Agency

Air Resources Board • Department of Pesticide Regulation • Department of Toxic Substances Control
Integrated Waste Management Board • Office of Environmental Health Hazard Assessment
State Water Resources Control Board • Regional Water Quality Control Boards

Pete Wilson
Governor

March 30, 1998

Mr. Hank H. Yacoub
Cleanup Section Chief
Regional Water Quality Control Board - Los Angeles
101 Centre Plaza Drive
Monterey Park, California 91754-2156

Dear Mr. Yacoub:

DESIGNATION OF AN ADMINISTERING AGENCY FOR ZERO CORPORATION - 777 FRONT STREET, BURBANK, CALIFORNIA COUNTY OF LOS ANGELES

Pursuant to Health and Safety Code, Division 20, Chapter 6.65, Section 25260 *et seq.* (AB 2061, Chapter 1184, Statutes of 1993 (Umberg)), the Site Designation Committee has designated the Regional Water Quality Control Board as the administering agency for the Zero Corporation hazardous materials release site (site). The site is located at 777 Front Street, Burbank, California, County of Los Angeles. Enclosed is a copy of approved Resolution No. 97-19.

The administering agency's responsibilities include administering all state and local laws that govern the site cleanup, determining the adequacy and extent of cleanup, issuance of necessary authorizations and permits, and following the determination that an approved remedy has been accomplished, issuance of a certificate of completion. All of these activities should be administered after consultation with other regulatory agencies having jurisdiction over cleanup activities at the site. The administering agency should hold an initial meeting with support agencies to clarify roles, arrange cost recovery contracts, and set project proposed timeliness.

If requested, a Consultative Work Group can assist in coordinating all site investigation and remediation activities. The work group would consist of front-line staff from all appropriate agencies. As the administering agency, your staff should

Mr. Hank H. Yacoub
March 30, 1998
Page 2

organize and chair meetings of the work group if one is formed. The work group should meet within 45 days of designation and as often as necessary thereafter. The administering agency, and any interested members of the work group, should meet with the responsible party to discuss the results of the meetings within 60 days of designation.

To optimize coordination, the work group would develop a work plan for site cleanup. The work plan should layout the time frame for accomplishing site cleanup activities. The work plan should identify all permits and authorizations necessary for site cleanup; requirements for compliance with appropriate agency laws, ordinances and regulations; and areas where regulatory duplication and overlap can be eliminated. Streamlining the process should be emphasized.

Please keep us advised of the progress made on this site cleanup by providing reports on a regular basis. Enclosed is a recommended reporting form.

This new program, and all our existing programs, can be successful only if original and flexible processes are used to implement our state's high environmental standards. I am confident that your staff has the expertise and ingenuity to make this Site Designation application a model of success. The Office of the Secretary supports and is available to assist you in these efforts. If you have any concerns, please call Ms. Laurie Grouard, Acting Site Designation Coordinator, at (916) 323-3394.

Sincerely,

Kenneth Selover, Chair
Site Designation Committee

**CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY
SITE DESIGNATION COMMITTEE
RESOLUTION NO. 97-19
FEBRUARY 5, 1998
ZERO CORPORATION, BURBANK, CA**

WHEREAS, Chapter 6.65 of the Health and Safety Code, commencing with Section 25260 establishes a Site Designation Committee; and

WHEREAS, the Site Designation Committee may designate an administering agency to oversee a site investigation and remedial action at a hazardous materials release site upon request of a responsible party; and

WHEREAS, Zero Corporation, a responsible party as defined in Health and Safety Code Section 25260(h), requested the Site Designation Committee to designate an administering agency to oversee site investigation and remedial action at Zero Corporation's property within the San Fernando Valley Area 2 Crystal Springs Superfund Site, Glendale North and South Operable Units, and areas where hazardous materials have migrated from that property, at 777 North Front Street, Burbank, Los Angeles, Los Angeles County, California, more particularly described in Attachment B; and

WHEREAS, this site is a hazardous materials release site as defined in Health and Safety Code Section 25260; and

WHEREAS, the Site Designation Committee held a meeting on February 5, 1998, and provided an opportunity at the meeting for public comment regarding the application; and

WHEREAS, the Site Designation Committee considered the application and furthermore, considered all factors and criteria set forth in Health and Safety Code Section 25262(c); and

WHEREAS, Zero Corporation agrees to reimburse appropriate agencies for their appropriate oversight costs and/or costs of permit development, where those agencies' significant involvement and/or permit development is necessary for the furtherance of the project goals; and

WHEREAS, the Site Designation Committee has determined that, based on consideration of all of the factors listed in Health and Safety Code Section 25262(c), the California Regional Water Quality Control Board, Los Angeles Region, is the appropriate agency to act as the administering agency; and

WHEREAS, designation of an administering agency by the Site Designation Committee and compliance with state and local requirements does not release the responsible party from liability under the federal Comprehensive Environmental Response, Compensation, and Liability Act or other federal requirements.

**SITE DESIGNATION COMMITTEE
RESOLUTION NO. 97-19
Page Two**

NOW, THEREFORE BE IT RESOLVED that the Site Designation Committee hereby designates the California Regional Water Quality Control Board, Los Angeles Region, as the administering agency for the site; and

BE IT FURTHER RESOLVED that this designation is subject to the following conditions:

1. California Regional Water Quality Control Board, Los Angeles Region, shall consult, on an ongoing basis, with all appropriate agencies who have expressed an interest in this site, including all agencies who would otherwise be issuing a permit or other form of authorization:
 - a) in administering all state and local laws which are applicable;
 - b) in determining the adequacy of site investigation and remedial action activities; and
 - c) prior to issuing any permit or other form of authorization.
2. Such consultation will also include notification if information becomes available to the administering agency that the original application was inaccurate or was incomplete.
3. If an advisory team is convened by the Site Designation Committee, a representative of the administering agency shall attend all advisory team meetings.
4. The California Regional Water Quality Control Board, Los Angeles Region, shall submit quarterly reports to the Site Designation Committee and to other appropriate agencies concerning the status of the investigation and/or remediation of the Site and shall comply with applicable public participation requirements.

CERTIFICATION

The undersigned Chair of the Site Designation Committee does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the Site Designation Committee held in Sacramento, California on February 5, 1998.

DATED: March 30, 1998

Wilbraham, MA 01095

**NO FURTHER REQUIREMENTS - FORMER ZERO CORPORATION FACILITY,
777 FRONT STREET, BURBANK, CALIFORNIA (FILE NO. (109.6162;PCA NO. 2046J)**

Dear Mr. Habel:

We are in receipt of the *Supplemental Site Closure Information* report, dated August 23, 2001, prepared by Hydro-Geo-Chem Inc., for the subject site. The report contains the results of the soil vapor rebound sampling following the completion of additional soil vapor extraction in impacted areas designated as Phase 2 (Deep Soil Vapor Extraction Program) for removal of tetrachloroethylene (PCE) and trichloroethylene (TCE) contamination. The report also contained your request for no further action based on the submitted laboratory analytical results.

Laboratory analysis of soil vapor samples detected rebound concentrations of 11 µg/L for PCE in Well B-2 at 25 feet below ground surface (bgs). TCE concentrations were reduced to non-detect at 85 feet bgs. No other volatile organic compounds (VOC) were detected above the laboratory detection limits. Groundwater beneath the site is reported to be encountered at depths ranging from 94 feet bgs in MW-3 to 126 feet bgs in MW-7.

Based on our review of the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, we have no further requirements for VOC soil contamination with respect to the San Fernando Valley Cleanup Program at the subject site.

The relatively small volume of impacted soil, attenuation of concentrations with depth, and the diminished concentration of VOCs remaining in the soil appear not to pose a present or continuing threat to groundwater quality. Therefore, no further VOC assessment or cleanup of soil is warranted.

CERTIFICATE OF COMPLETION – APW NORTH AMERICA, INC. (FORMER ZERO CORPORATION) 777 FRONT STREET, BURBANK, CA (FILE NO. 109.6162; PCA NO. 2046J)

Dear Mr. Habel:

This letter transmits the attached *Certificate of Completion* for the subject site in accordance with State Board Resolution No. 97-17. Site mitigation activities have satisfied the requirements of all agencies concerned with the hazardous substance release. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries is greatly appreciated.

This notice is issued pursuant to California Health and Safety Code Section 25264.

If you have any questions concerning this letter, please contact Mr. Dixon Oriola at (213) 576-6803 or Mr. Elijah Hill at (213) 576-6730.

Sincerely,

Dennis A. Dickerson

Our mission is to preserve and enhance the quality of California's water resources for the benefit of present and future generations.

Number 97-19

CERTIFICATE OF COMPLETION

Unified Agency Review of Hazardous Materials Release Sites
California Health and Safety Code § 25260-25268

Los Angeles Regional Water Quality Control Board was designated as the Administering Agency by the Site Designation Committee after a request by APW North America Inc., a Delaware Corporation, formerly known as Zero Corporation to oversee the Site Investigation and Remedial Action at 777 North Front Street, Burbank, CA (the Hazardous Materials Release Site). See Resolution No. 97-19, attached as Exhibit A to this Certificate.

In accordance with Health and Safety Code § 25264, the Administering Agency, after appropriate consultation with other agencies, has determined and/or certifies that:

1. The Site Investigation and Remedial Action at the Site has been satisfactorily completed and a permanent remedy has been accomplished [§ 25264(b)]. Actions taken are described in Exhibit B attached.
2. Applicable Remedial Action standards and objectives were achieved [§ 25264(b)].
3. The Responsible Party has complied with the requirements of all state and local laws, ordinances, regulations, and standards that are applicable to the Site Investigation and Remedial Action [§ 25264(c)].

No agency may take action against the Responsible Party with respect to the hazardous materials release at the site except as specified in Health and Safety Code § 25264(c)(1) through (6).

Issued this 30th day of June, 2002 by the
Administering Agency

Name: Dennis A Dickerson

Signature: Dennis A. Dickerson

Title: Executive Officer

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

See the EDR Proprietary Historical Database Section for details

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in *bold italics* are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 07/30/2004 has revealed that there is 1 NPL site within approximately 1.125 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
<i>SAN FERNANDO VALLEY (AREA 2)</i>	<i>CRYSTAL SPRINGS WELLFIE</i>	<i>0 - 1/8</i>	<i>0</i>	<i>9</i>

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA).

CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 05/17/2004 has revealed that there are 2 CERCLIS sites within approximately 0.625 miles of the target property.

EXECUTIVE SUMMARY

CERCLIS-NFRAP: As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 05/17/2004 has revealed that there is 1 CERC-NFRAP site within approximately 0.375 miles of the target property.

RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRIS-TSD list, as provided by EDR, and dated 06/15/2004 has revealed that there is 1 RCRIS-TSD site within approximately 0.625 miles of the target property.

FEDERAL ASTM SUPPLEMENTAL

RODS: Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid the cleanup.

A review of the ROD list, as provided by EDR, has revealed that there is 1 ROD site within approximately 1.125 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
SAN FERNANDO VALLEY (AREA 2)	CRYSTAL SPRINGS WELLFIE	0 - 1/8	0	9

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 04/08/2004 has revealed that there is 1 FINDS site within approximately 0.125 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
SAN FERNANDO VALLEY (AREA 2)	CRYSTAL SPRINGS WELLFIE	0 - 1/8	0	9

STATE OR LOCAL ASTM SUPPLEMENTAL

DRYCLEANERS: A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; drycleaning plants except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

A review of the CLEANERS list, as provided by EDR, has revealed that there are 3 CLEANERS sites within approximately 0.375 miles of the target property.

EXECUTIVE SUMMARY

NPL:

EPA ID: CAD980894901
Region: 09
Federal: General
Final Date: 06/10/1986

NPL SUMMARY:

Summary :

Conditions at proposal October 15, 1984): San Fernando Valley Area 2) is an area of contaminated ground water located in the vicinity of the Crystal Springs Well Field in the Cities of Los Angeles and Glendale, Los Angeles County, California. Th

is area is part of the San Fernando Valley Basin, a natural underground reservoir that represents an important source of drinking water for at least 3 million people in the Los Angeles metropolitan area. The contaminated ground water, which underli

es an area of approximately 6,680 acres, contains trichloroethylene (TCE) and perchloroethylene (PCE), according to tests conducted by the California Department of Health Services, as well as numerous local government agencies.

The State s recommen

ded drinking water guidelines for TCE and PCE (5 and 4 parts per billion respectively) are exceeded in a number of public wells in this area. To alleviate this contamination, wells are either taken out of service or blended with water from clean so

urces to ensure that the public receives water with TCE/PCE concentrations below the State s guidelines.Status June 10, 1986): EPA and the Los Angeles Department of Water and Power are entering into a cooperative agreement for a remedial investiga

tion of the San Fernando Valley Basin and a feasibility study targeted at Area 1, the most contaminated area. The RI is scheduled to begin in early 1986.

NPL Contaminant:

NPL Status: Final
Substance Id: U044
Case Num: 67-66-3
Substance : CHLOROFORM
Pathway : The Ground water migration route , or pathway.

Agency Address: 0
Agency Contact: Not reported
Design Flow: 0 Million Gal/Day
Facility Type: Not reported
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
Agency Type: Not reported
Waste Type: Stormwater Runoff - Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils, rubble and concrete are examples of this category.
Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a Higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Reclamation: No reclamation requirements associated with this facility.
POTW: The facility is not a POTW.
NPDES Number: CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

Design Flow:	0 Million Gal/Day	Baseline Flow:	0 Million Gal/Day
Facility Type:	Other - Does not fall into the category of Municipal/Domestic, Industrial, Agricultural or Solid Waste (Class I, II or III)		
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.		
Agency Type:	City		
Waste Type:	Miscellaneous (Includes wastes from dewatering, recreational lake overflow, swimming pool wastes, water ride wastewater, ground water seepage and other wastes of this type) - Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.		
Threat to Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.		
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water

Background Info : The Magnolia Power Plant site consists of only a portion of the City of Burbank Public Services Department (PSD) facility. The majority of PSD facility is occupied by electrical generating and utility service equipment. The Site is the proposed location for 328 MW natural gas combined-cycle generating facility, and will be constructed on about 3 acres of existing 23 acre facility. The subject site includes Magnolia Units #1 and #2, associated cooling towers, transpower storage area, a large 78,000-barrel above ground storage tank. Magnolia Units #1, #2 were constructed in 1941 and then shut down in 1980s. A phase I and phase II Site Assessment indicate that constituents of concern include Total Petroleum Hydrocarbon (TPH) up to 2,570 mg/kg and Volatile Organic Compounds including 1,1,2,2 - Tetrachloreth and 5.81 ppb and 1,2,3 - Trichloropropane (6.9 ppb) and Arsenic.

Comments Date : 01062003

Comments : DTSC entered into a VCA with Southern California Public Power Authorities (Docket No. HSA-A 02/03-086) to conduct a Site Characterization and Removal Action Workplan for Magnolia Power Plant Site at 164 West Magnolia Blvd., Burbank. DTSC completed review of the PEA and concurred with the PEA conclusion and recommendation and terminated that NO FURTHER ACTION is required at the Site.

this category.
Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Reclamation: No reclamation requirements associated with this facility.
POTW: The facility is not a POTW.
NPDES Number: CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

EPA Waste Codes Appendix

Code	Description
D001	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKEY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
D002	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
D007	CHROMIUM
D039	TETRACHLOROETHYLENE
F001	THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F006	WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

- **Elapsed ASTM days:** Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List

Source: EPA

Telephone: N/A

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

Source: EPA

Telephone: 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Source: EPA

Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRIS: Resource Conservation and Recovery Information System

Source: EPA

Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

FEDERAL ASTM SUPPLEMENTAL RECORDS

BRS: Biennial Reporting System

Source: EPANTIS

Telephone: 800-424-9346

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/01/01
Database Release Frequency: Biennially

Date of Last EDR Contact: 09/20/04
Date of Next Scheduled EDR Contact: 12/13/04

CONSENT: Superfund (CERCLA) Consent Decrees

Source: Department of Justice, Consent Decree Library

Telephone: Varies

Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: 03/05/04
Database Release Frequency: Varies

Date of Last EDR Contact: 07/30/04
Date of Next Scheduled EDR Contact: 10/25/04

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ROD: Records Of Decision

Source: EPA

Telephone: 703-416-0223

Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 06/07/04

Database Release Frequency: Annually

Date of Last EDR Contact: 07/07/04

Date of Next Scheduled EDR Contact: 10/04/04

DELISTED NPL: National Priority List Deletions

Source: EPA

Telephone: N/A

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 07/30/04

Database Release Frequency: Quarterly

Date of Last EDR Contact: 06/03/04

Date of Next Scheduled EDR Contact: 11/01/04

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report

Source: EPA

Telephone: N/A

Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 04/08/04

RMP: Risk Management Plans

Source: Environmental Protection Agency

Telephone: 202-564-8600

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g. the fire department) should an accident occur.

UMTRA: Uranium Mill Tailings Sites
Source: Department of Energy
Telephone: 505-845-0011

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

EDR PROPRIETARY HISTORICAL DATABASES

EDR Historical Gas Station and Dry Cleaners: EDR has searched select national collections of business directories and has collected listings of potential dry cleaner and gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning and gas station/filling station/service station establishments. The categories reviewed included, but were not limited to: gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, dry cleaner, cleaners, laundry, laundromat, cleaning/laundry, wash & dry, etc.

This information is meant to assist and complement environmental professionals in their conduct of environmental site assessments, and is not meant to be a substitute for a full historical investigation as defined in ASTM E1527. The information provided in this proprietary database may or may not be complete; i.e., the absence of a dry cleaner or gas station/filling station/service station site does not necessarily mean that such a site did not exist in the area covered by this report.

(A note on "dry cleaning" sites: it is not possible for EDR to differentiate between establishments that use PERC on-site as a cleaning solvent and sites that function simply as drop-off and pick-up locations or that are traditional wet cleaning/laundry facilities. Therefore, it is essential for environmental professionals to incorporate professional judgment in the evaluation of each site.)

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

BROWNFIELDS DATABASES**VCP: Voluntary Cleanup Program Properties**

Source: Department of Toxic Substances Control

Telephone: 916-323-3400

Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

US BROWNFIELDS: A Listing of Brownfields Sites

Source: Environmental Protection Agency

Telephone: 202-566-2777

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients: States, political subdivisions, territories, and Indian tribes become BCRLF cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation
 Telephone: (800) 823-6277

This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
 Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
 Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

GEOCHECK - PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

FORMER ZERO CORPORATION FACILITY
777 NORTH FRONT STREET
BURBANK, CA 91502

TARGET PROPERTY COORDINATES

Latitude (North):	34.183102 - 34° 10' 59.2"
Longitude (West):	118.316299 - 118° 18' 58.7"
Universal Transverse Mercator:	Zone 11
UTM X (Meters):	378697.3
UTM Y (Meters):	3783046.0
Elevation:	584 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map: 34118-B3 BURBANK, CA
General Topographic Gradient: General SSW
Source: USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

-  Groundwater Flow Direction
-  Indeterminate Groundwater Flow at Location
-  Groundwater Flow Varies at Location
-  Closest Hydrogeological Data
-  Oil, gas or related wells

GEOCHECK - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Cenozoic
System: Quaternary
Series: Quaternary
Code: Q (decoded above as Era, System & Series)

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Amdt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Surficial Soil Types: loam
clay
silt loam
clay loam
sandy loam
gravelly - sandy loam
loamy sand
fine sand
coarse sand
sand
gravelly - sand

Shallow Soil Types: fine sandy loam
gravelly - loam
sand
silty clay

Deeper Soil Types: stratified
clay loam
silty clay loam
gravelly - sandy loam
coarse sand
sand
weathered bedrock
very fine sandy loam

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

Water System Information:

Prime Station Code:	G19/179-VOACEFF	User ID:	4TH
FRDS Number:	1910179013	County:	Los Angeles
District Number:	07	Station Type:	WELL/AMBNT/MUN/INTAKE
Water Type:	Well/Groundwater	Well Status:	Combined Treated
Source Lat/Long:	341100.0 1181900.0	Precision:	100 Feet (one Second)
Source Name:	GAC - COMBINED EFFLUENT		
System Number:	1910179		
System Name:	BURBANK-CITY, WATER DEPT.		
Organization That Operates System:	PO BOX 631		
	BURBANK, CA 91503		
Pop Served:	93643	Connections:	25731
Area Served:	BURBANK		

Sample Information: * Only Findings Above Detection Level Are Listed

Sample Collected:	12/07/1993	Findings:	1.070 UG/L

Dear Mr. Rahman:

Ninyo & Moore has prepared this report to document the procedures and results for soil and soil vapor sampling conducted at 777 North Front Street, in Burbank, California. Fieldwork was conducted by Ninyo & Moore on April 20 through 24, 2009, in accordance with the State of California, Department of Transportation (Department) Contract No. 07A2211, Task Order No. 15 and Ninyo & Moore's work plan dated April 3, 2009. A description of field procedures and results, figures, tables, and appendices are attached. We appreciate the opportunity to provide service on this project.

Sincerely,
NINYO & MOORE

EXECUTIVE SUMMARY

The Department is planning to acquire a portion of the property located at 777 North Front Street in order to construct high occupancy vehicle (HOV) lanes along Interstate 5 (I-5). The site will be used for widening the I-5 by replacing the existing retaining wall to the west of the site.

Former activities at the 777 North Front included metal and foam packaging operations, sulfuric anodizing operations, chromate conversion coating operations, and iron phosphate operations conducted by the Zero Manufacturing Corporation from 1975 to 1991. Contaminants of concern based on past site uses include tetrachloroethylene (PCE), trichloroethylene (TCE), 1,1,1-trichloroethane (1,1,1-TCA), 1,1-dichloroethene (1,1-DCE), and fuel products. Investigation and remediation activities were conducted from 1991 to 2001. The Regional Water Quality Control Board (RWQCB) issued a Certification of Completion in 2002 for the site investigation and remedial action conducted at the 777 North Front Street property.

Based on the results of this assessment the following conclusions have been made:

- Concentrations of volatile organic compounds (VOCs), metals, polychlorinated biphenyls (PCBs), semivolatile organic compounds (SVOCs), petroleum hydrocarbons, and pH were detected in the soil samples collected at the site at levels below the site specific clean up goals approved by the RWQCB. Chlorinated VOCs associated with off site sources or the San Fernando Valley Superfund Site (Superfund Site) were detected in low concentrations in some soil samples collected at the site. With the exception of one boring (1001-117), chlorinated VOCs were not detected in soil samples collected deeper than 5 feet bgs. In boring 1001-117, the deepest sample analyzed (40 feet bgs) did not contain detectable VOCs. As was discussed in the April 15, 2001, Hydro Geo Chem report, site soil does not appear to be a source of chlorinated VOC contamination because soil concentrations are low relative to other affected media such as soil vapor.
- PCE, TCE, freon 113, chloroform, toluene, 1,1,1-TCA, 1,1-DCE, 1,1,2-trichloroethane (1,1,2-TCA), and total petroleum hydrocarbons gasoline (TPHg) range were detected in soil vapor samples collected at the site. Concentrations of PCE and TCE exceeded California Human Health Screening Levels (CHHSLs). Concentrations of freon 113, chloroform, toluene, 1,1,1-TCA, 1,1-DCE, 1,1,2-TCA, and TPHg did not exceed CHHSLs. Freon 113, toluene, and chloroform were not detected in soil samples, so their source is likely off site. An on-site source for TPHg and the five chlorinated solvents that were detected in soil vapor, PCE, TCE, 1,1,1-TCA, 1,1-DCE, and 1,1,2-TCA, was not identified. The soil vapor contamination appears most elevated along the northwestern edge of the site. Impacts to the site likely have an off-site source and off-gassing from contaminated groundwater beneath the site associated with the Superfund Site may be contributing to the VOCs in soil vapor.

For these reasons there is a low likelihood that this site has contributed to contamination associated with the Superfund Site. It would appear that a rebound in soil vapor concentrations has occurred since the site was remediated as a portion of the 777 North Front Street property. However, these rebounded concentrations remain below the site clean up goals (Appendix G) approved by the RWQCB. Because the soil vapor PCE concentrations have increased from less than approximately 2,000 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) following remediation in 2001 to as much as 52,400 $\mu\text{g}/\text{m}^3$ reported in this study, there is a possibility that VOC concentrations could continue to increase and possibly exceed site clean-up goals of 71,000 $\mu\text{g}/\text{m}^3$, additional remedial action may be required. Insufficient data regarding the location, nature, concentration, and mass of the likely off-site source of VOC and groundwater beneath the site does not allow the likelihood of such a possible outcome to be estimated.

- Concentrations of PCE in soil vapor ranged from less than the detection limit of 20 to 52,400 $\mu\text{g}/\text{m}^3$. Concentrations of PCE in soil ranged from less than the detection limit of 5.5 to 63 micrograms per kilogram ($\mu\text{g}/\text{kg}$). Concentrations of TPH $\text{C}_4\text{-C}_{12}$ in soil were less than the detection limit of 1.0 mg/kg. Concentrations of TPH $\text{C}_{13}\text{-C}_{22}$ in soil ranged from less than the detection limit of 10 to 300 milligrams per kilogram (mg/kg). Concentrations of TPH $\text{C}_{23}\text{-C}_{32}$ in soil ranged from less than the detection limit of 10 to 1,300 mg/kg. Concentrations of TPH $>\text{C}_{32}$ in soil ranged from less than the detection limit of 10 to 1,800 mg/kg. Soil with detectable concentrations of petroleum hydrocarbons, approximately 16,500 cubic yards of soil from the surface to 20 feet below ground surface (bgs), would be classified as petroleum contaminated non-hazardous waste if it were disturbed during construction activities (e.g., excavation, grading). No detectable concentrations of petroleum hydrocarbons were reported in the site soil from depths of 20 to 40 feet bgs, so soil generated during construction activities at depths greater than 20 feet bgs would be considered clear of hazardous waste. Excavated site soil from the upper 20 feet containing petroleum hydrocarbon detections can be treated, recycled, reused, or disposed at a Class III disposal facility after acceptance from the selected facility as petroleum contaminated non-hazardous waste, based on their criterion (Refer to Appendix F, Figures 3, 5a, 5b, 5c, and 5d for further details). The source of petroleum hydrocarbon contamination in site soil is likely from the past property operations which for the most part occurred off site, or from sources such as spills, releases, etc. located off site. A specific source of petroleum hydrocarbon contamination in site soil was not located on site.
- The estimated cost to excavate, transport, and dispose the approximately 16,500 cubic yards of petroleum contaminated non-hazardous soil expected to be generated and the estimated cost to perform vapor monitoring and suppression for the remaining earth moving activities is approximately \$1,300,000 to \$2,000,000. The cost tables are presented in Appendix F.
- Residential land use CHHSLs are generally considered adequate for sensitive uses such as day-care centers, hospitals and the like, some of which house sensitive receptors such as toddlers, the elderly or even immune-compromised patients on a full time basis. For this reason, the CHHSLs are relatively conservative compared to the Threshold Limit Values

(TLVs) and Occupational Safety and Health Administration (OSHA) Permissible Exposure Limits (PELs), which were developed for healthy adults of working age and are based upon 8-hour exposures and 40 hour work weeks. Based on the TLVs and PELs the VOCs and TPHg concentrations detected in the soil vapor samples do not pose a risk to worker safety. Even so, it is recommended that the results of this site investigation (SI) be used in the development of a site-specific health and safety plan (HSP) for the proposed construction, because chemical exposure to site workers may still occur under certain conditions.

Based on the results of this assessment, Ninyo & Moore recommends the following:

- Prepare and implement a lead compliance plan due to the presence of lead in the soil.
- Prepare and implement a fugitive dust mitigation plan based on South Coast Air Quality Monitoring District (SCAQMD) Rule 403.
- Apply for and implement a SCAQMD Site Specific Rule 1166 permit for VOC contaminated soil excavation exceeding 2,000 cubic yards in a two year period.
- Prepare and implement a HSP for the proposed construction. Although the chemicals detected in soil and soil vapor are present in concentrations below risk levels, preparation of a HSP is still recommended to address worker safety.
- Soil containing petroleum hydrocarbons that is disturbed during construction activities should be removed and disposed or recycled as petroleum contaminated non-hazardous waste. If the department has the ability to reuse petroleum contaminated soil on the site, this would be allowed based on the soil analytical results; the maximum TPH C₄-C₁₂ concentration was less than the detection limit of 10 mg/kg that is less than the screening level of 500 mg/kg, the maximum TPH C₁₃-C₂₂ concentration was 300 mg/kg that is less than the screening level of 1,000 mg/kg, and the maximum TPH C₂₃-C₃₂ concentration was 1,300 mg/kg that is less than the screening level of 10,000 mg/kg, as specified in the RWQCB Interim Site Assessment & Cleanup Guidebook. Additional options for soil disposal may present themselves based on possible regulatory agency review and approval. We have not relied on this possibility in considering disposal options because we do not know what potential reuse options might exist in order to evaluate possible regulatory agency. This is a waste-handling requirement only, classification of site soil as petroleum contaminated non-hazardous waste does not indicate the need for site remediation or health and safety requirements.
- Based on the results of the analytical data and the proposed future site use, additional environmental assessment is not warranted.

1. INTRODUCTION

In accordance with the State of California, Department of Transportation (Department) Contract No. 07A2211, Task Order No. 15 (TO 15) and Ninyo & Moore's work plan dated April 3, 2009 (work plan), Ninyo & Moore has performed a parcel acquisition site assessment (SI) at a portion of 777 North Front Street in Burbank, California (site; Figure 1). This report has been prepared in general accordance with the work plan. This report is based on conditions at the site at the time of the sampling activities and provides documentation of our findings and recommendations.

1.1. Project Location

The project includes a portion of the private property at 777 North Front Street in Burbank, California (site, Figure 1). This currently vacant strip of land will be used for widening the Interstate 5 (I-5) by replacing the existing retaining wall to the west of the site. The site will be a partial-take by the Department as part of the reconfiguration project. The partial-take is within the former Zero Corporation portion of the 777 North Front Street property.

1.2. Proposed Project

Two HOV lanes will be constructed on the I-5. The widened freeway will be placed in private properties which the Department is planning to acquire. In support of the project, Ninyo & Moore has conducted a SI at the aforementioned site.

1.3. Site Description

The site is a strip of land on the northeast side of the 777 North Front Street property in Burbank, California. Adjacent to the northeast of the site is the Department right-of-way. Adjacent to the southwest of the site is the remainder of the 777 North Front Street property beyond which is North Front Street.

2. ENVIRONMENTAL SETTING

2.1. Geology/Hydrogeology

The site is within the northwestern block of the Los Angeles Basin. A majority of this province consists of alluvium, lake, playa, and terrace deposits, and unconsolidated and semi-consolidated sedimentary deposits. According to the Soil Survey of Los Angeles County, published by the United States Department of Agriculture Soil Conservation Service, dated June 1967, revised December 1969, the near surface soil associations underlying the site belong primarily to the Hanford association and the Tujunga-Soboba association.

Soil encountered during drilling activities was primarily layers of brown sand, silty sand, clayey sand, and sandy silt with trace gravel.

The site is within the San Fernando Valley Groundwater Basin of Los Angeles. Groundwater uses in the basin as designated by the Regional Water Quality Control Board (RWQCB) include, but are not limited to, municipal and domestic supply, industrial services and process supply, and agricultural supply. The closest surface water to the site is the Burbank Western Channel approximately 500 feet south of the site. The channel flows southeast into the Los Angeles River.

Drinking water in the San Fernando Valley Basin has been contaminated with trichloroethylene (TCE) and tetrachloroethylene (PCE) from numerous sources. Several plumes of contaminated groundwater are referred to collectively as the San Fernando Valley Superfund Site (Superfund Site). Based on the information provided by the United States Environmental Protection Agency (EPA), the site is within the portion of the Superfund Site known as the Burbank Operable Unit.

Based on the information obtained from the State Water Resources Control Board (SWRCB) Geotracker Website and obtained during the file reviews, the depth to groundwater in the site vicinity is approximately 100 feet below ground surface (bgs); the groundwater flow direction in the site vicinity is to the southeast. Based on this SI, groundwater beneath the site is present at depths greater than 100 feet bgs.

3. PROPERTY BACKGROUND RESEARCH

This site is located in the Superfund Site. Sometime between 1992 to 1995, the EPA placed this property on the List of Remedial Action Special Notice Recipients. Being on this list indicates that the owners of the property were potentially responsible for response actions taken by EPA pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) for activities related to the Superfund Site.

Based on an Initial Site Assessment Report by Professional Services Industries (PSI), dated June 26, 2003, Zero Manufacturing Company performed metal stamping on this parcel and was a large-scale generator of hazardous waste. This property was identified to have recognized environmental conditions, as it was listed on the CERLIS/NFRAP, UNIQUE CO FINDS UST and GNRTR databases. The PSI report indicates that: “no further investigation is required by the Department of Toxic Substances Control (DTSC)”.

Ninyo & Moore contacted the DTSC, the RWQCB and the Burbank Fire Department (BFD) to request a file review for the 777 North Front Street property. Copies of documents reviewed are included in Appendix B of the work plan. Based on the documents reviewed, the following were noted:

- Past operations (1975-1991) at the property include metal and foam packaging operations, sulfuric anodizing operations, chromate conversion coating operations, and iron phosphate operations.
- 1975 – Violation issued for discharging waste water with elevated chromium concentrations by the City of Burbank Public Works Department.
- Various waste manifests reviewed indicating the accumulation of waste solvent, waste oil, waste acids, and paint sludge at the site. Chemicals routinely used at the property include: 1,1,1-trichloroethane (1,1,1-TCA), hydrochloric acid, nitric acid, chromic acid (aluminum coating process), sodium hydroxide, paint thinner, and hydraulic oil.
- 1991-1994 – Initial site investigations indicated the presence of volatile organic compounds (VOC) contamination in the soil. The following chemicals were reported above cleanup levels: PCE, TCE, 1,1,1-TCA, and 1,1-dichloroethene (1,1-DCE).
- 1998-1999 – Approved “Phase I” work plan initiated to remediate shallow soil contamination areas on the property to depths of 20 feet. A soil vapor extraction (SVE) system was

installed to remediate shallow soil contamination. Specific areas addressed in the Phase I remediation activities could not be determined based on the files reviewed by Ninyo & Moore.

- 1999-2000 – Approved “Phase II” work plan initiated to remediate deep soil and groundwater contamination to depths greater than 75 feet. Phase II work included a dual completion SVE system allowing for air sparging. Specific areas addressed in the Phase II remediation activities could not be determined based on the files reviewed by Ninyo & Moore.
- RWQCB requested additional soil and groundwater sampling for the evaluation of chromium, methyl tertiary butyl ether (MTBE) and 1,4-dioxane. Analytical results from 2000 do not indicate the presence of 1,4-dioxane or MTBE in the vicinity of the proposed sampling. Information regarding the results of chromium evaluation were unavailable in the files reviewed by Ninyo & Moore.
- PCE, TCE, and chloroform were reported in the groundwater in the vicinity of the proposed sampling locations. Documents indicate that five monitoring wells were installed in the area of the proposed sampling locations (MW1, and MW-7 through MW-10).
- References were made to a “no further action” determination of Phase I activities by RWQCB. However, actual RWQCB letters were not available for review. References made to a “no further requirements” determination of Phase II activities dated November 28, 2001. However, actual RWQCB letters were not available for review.
- Records reviewed from the BFD indicate two, 5,000-gallon, underground storage tanks (UST) containing flammable liquids installed in 1975. Records show that two, 5,000-gallon USTs were removed from the property on July 8, 1987. The location of the USTs could not be determined based on the records reviewed. A hand drawn figure of the property dated August 19, 1985, shows four clarifiers and makes reference to several tanks throughout the southern portion of the property along North Front Street. None of the USTs, aboveground storage tank (ASTs) or clarifiers appear to be in the area of the site.
- Groundwater direction varies in the site vicinity due primarily to pumping by the City of Burbank (south of the site) or Lockheed (northwest of the site, possibly as part of remediation activities in the site vicinity). The most recent groundwater data was from 2000, which shows groundwater flowing in a southeasterly direction. Groundwater levels during remediation activities ranged from 94 and 126 feet bgs.
- Groundwater in the site vicinity may still be impacted by VOCs, primarily TCE. Reports prepared on behalf of Zero Manufacturing by Hydro Geo Chem (HGC) suggest an upgradient, off-site source.
- Ninyo & Moore interviewed a RWQCB case manager familiar with the site who stated that he was unaware of requirements by the RWQCB for continued action at the site and that it was his understanding that the case was closed.

A report prepared by HGC called Results of Site Remediation and Request for No Further Action, dated April 5, 2001 is summarized as follows: Remediation was performed at the APW facility between May 1998 and October 2000 in the form of two phases of SVE to remove VOCs from the property soil. Based on HGC's estimates, approximately 8,000 pounds of VOCs were removed from the property via SVE including PCE, TCE, 1,1-DCE, 1,1,1-TCA, and fuel products. According to HGC, VOC concentrations from surface to 60 to 85 feet bgs have been reduced to below property cleanup goals. However, property cleanup goals were still exceeded for some VOCs, mainly TCE, in soil close to the water table. HGC attributes this to volatilization from TCE in the groundwater and suggests it is the result of an off-site source. The site cleanup goals were described in their Table 6 which is presented in Appendix B of the work plan.

HGC concluded that because VOC mass removal rates had been reduced to approximately 1.5 pounds of VOCs per day (mainly fuel components) and the VOC mass removal rates showed asymptotic behavior, continuing SVE would provide little benefit. They concluded that the system had effectively removed VOC concentrations to below property cleanup goals in most site areas.

HGC noted that in the boring B-2 area, shallow PCE concentrations rebounded, but the rebound concentrations remained below the property cleanup goals. They suspected the rebound was the result of reduced SVE efficiency within an old concrete floor buried near the surface in the area. It is unclear from the figures provided in the HGC report the location of boring B-2.

HGC also concluded that shallow and intermediate depth soil had non-detectable or 'very low' TCE concentrations and the suspected source of the TCE concentrations in soil gas samples collected from near the water table is the groundwater contaminated from an off-site source rather than a source on the property.

Based on the conclusions above, HGC recommended the SVE system be shut down, continued groundwater monitoring cease, and no further action be required for the property.

On June 30, 2002, the RWQCB issued a Certification of Completion for the former Zero Corporation facility at 777 North Front Street. The certification indicated the SI and remedial action (RA) at the property has been satisfactorily completed and a permanent remedy has been accom-

plished; applicable RA standards and objectives were achieved; and the responsible party has complied with the requirements of all state and local laws, ordinances, regulations, and standards that are applicable to the SI and RA.

The certification did not state to which levels the property had been remediated or if disturbance of property soil would constitute a construction worker hazard. The certification also did not state what the accomplished permanent remedy was. A copy of the certification and the accompanying RWQCB letter (dated July 1, 2002) are included in Appendix B of the work plan.

4. OBJECTIVES

The objective of this SI was to evaluate the potential existence of soil, soil vapor, and groundwater contamination at the site. The Department will be obtaining part of the parcel for the widening project. The SI will evaluate the presence of possible contaminants that may exceed the acceptable regulatory limits or compromise the safety of the construction workers on site. Project depths are not expected to exceed 40 feet bgs. The SI identifies the concentration of contaminants in the subsurface so that worker safety can be addressed during construction and handling and/or disposal of excess soil can be evaluated. The information obtained may be used to help the Project Engineer estimate the volume of soil impacted, and the cost for remedial activities and/or for the appraisal for the acquisition.

5. SCOPE OF WORK

The following scope of work was performed in accordance with the work plan.

5.1. Site-Specific Health and Safety Plan

Ninyo & Moore prepared and provided a site-specific HSP, under separate cover, based on the scope of work and potential hazards observed during site reconnaissance. The HSP covered the field activities conducted by Ninyo & Moore personnel and was approved by a California Certified Industrial Hygienist (CIH).

The HSP was prepared in accordance with applicable local, state, and federal regulations. The HSP included health and safety requirements related to the proposed scope of the project and planned fieldwork activities.

5.2. Site Investigation

5.2.1. Site Reconnaissance

Ninyo & Moore and the Department visited the site on February 26, 2009. Twelve locations were marked with white spray paint at the approximate locations shown as borings 1001-101 through 1001-111 and 1001-201 and 1001-202 on Figure 2. The remaining borings (1001-112 through 1001-120) were installed as step-out borings based on initial soil vapor results from the first 12 borings.

5.2.2. Underground Service Alert (USA)

Ninyo & Moore obtained an inquiry identification number from USA at least 48 hours prior to start of work at the site. This number was obtained for the proposed SI borings.

5.2.3. Geophysical Survey

The investigation areas were evaluated by a geophysical subcontractor in order to locate utilities or other interferences which might interfere with sampling.

5.2.4. Soil Sampling

Twenty direct push borings were advanced and sampled on the site at the approximate locations shown on Figure 2. Four samples were collected from borings 1001-101 through 1001-112 at 2, 5, 10, and 20 feet bgs. Four samples were collected from borings 1001-113 and 1001-114 at 25, 30, 35, and 40 feet bgs. Eight samples were collected from borings 1001-115, 1001-118, 1001-119, and 1001-120 at depths of 2, 5, 10, 20, 25, 30, 35, and 40 feet bgs. Seven soil samples were collected from boring 1001-116 at depths of 5, 10, 20, 25, 30, 35, and 40 feet bgs.

5.2.5. Sampling Procedures - Soil

Soil borings were located based on the site reconnaissance, surface markings, geophysical survey, and initial sampling. Soil samples were collected using a hydraulic push rig and a hollow-stem auger. Excess soil not collected as a sample was placed in a Department of Transportation (DOT) approved container and stored on the site pending removal. Please refer to Appendix A for specific procedures.

Sample containers were labeled with boring number, unique Department ID number, and sample depth. Sampling information, time, date of sample collection, sample matrix type, turn-around-time, container type, requested analysis, and other information was recorded on the chain-of-custody. Soil samples were stored in an ice chest for transport to an Environmental Laboratory Accreditation Program (ELAP) certified laboratory within 24 hours of collection.

5.2.6. Groundwater Sampling

Two borings 1001-201-G and 1001-202-G were advanced with a hollow-stem auger to 100 feet bgs to attempt to collect grab groundwater samples. Groundwater was not encountered during drilling. The borings were terminated and backfilled the same day.

5.2.7. Soil Vapor Sampling Procedures

Two soil vapor samples were collected from borings 1001-101 through 1001-112 at depths of 5 and 15 feet bgs. Two soil vapor samples were collected from borings 1001-113, 1001-114, and 1001-117 at depths of 25 and 40 feet bgs. Four soil vapor samples were collected from borings 1001-115, 1001-116, and 1001-118 through 1001-120 at depths of 5, 15, 25, and 40 feet bgs. If elevated concentrations of VOCs were detected in the 15 foot bgs vapor probe then additional samples were collected at depths of 25 and 40 feet bgs in that probe vicinity, with Department approval. Soil vapor samples were collected to evaluate gross and significant concentrations of VOCs in the vapor phase. The soil vapor samples were collected in accordance with the DTSC RWQCB guidance for active soil gas investigations and the procedures outlined in Appendix C of

the work plan. Soil vapor samples were analyzed on site by a state certified mobile laboratory.

5.2.8. Decontamination

Clean and decontaminated sampling equipment was used for each borehole location. Sampling equipment was decontaminated between boreholes to prevent introduction of foreign materials and cross contamination. Specific decontamination procedures are described in Appendix A.

Soil and decontamination water generated from the soil survey on the private properties were placed in DOT approved drums and stored on the site pending removal. The drums were subsequently transported to the Crosby & Overton disposal facility in Long Beach, California. A copy of the disposal documentation is presented in Appendix D.

5.2.9. Investigative Derived Wastes (IDW)

Discarded equipment/items, such as gloves and pails, were disposed of accordingly. IDW is not considered hazardous and can be disposed of at a permitted disposal facility. Discarded equipment that is to be disposed of, which can still be re-used, was rendered inoperable prior to its disposal in the refuse facility at the direction of the Department.

5.3. GPS Data Collection

Borings were located and marked in the field using the Departments GPS NAD83 datum. Investigative data for each boring, sample, and test performed were entered into an electronic Microsoft Access 2000 database file. Borings were identified by a unique identification number system. Analytic data for each boring is included in the database file (Appendix E).

5.4. Laboratory Analysis

Selected soil samples were analyzed for VOCs by EPA Method 8260B/5035; total petroleum hydrocarbons (TPH) in the gasoline, diesel, C₄-C₁₂, C₁₃-C₂₂, C₂₃-C₃₂, and greater than C₃₂

ranges by modified EPA Method 8015/5035; PCBs by EPA Method 8082; SVOCs by EPA Method 8270C; pH by EPA Method 9045C; and Title 22 Metals by EPA Method 6010B.

Soil vapor samples were analyzed for VOCs and TPHg by EPA Method 8260B and in accordance with the DTSC/RWQCB guidance for active soil gas investigations.

The laboratory detection and reporting limits for the analyses are reported as the Method Detection Limit (MDL) and Practical Quantitation Limit (PQL). Soil vapor samples were analyzed by an on-site state-certified mobile laboratory operated by Jones Environmental. Soil samples were analyzed by Advanced Technology Laboratories (ATL), a state-certified laboratory in Signal Hill, California.

5.5. Quality Control and Quality Assurance (QA/QC)

5.5.1. Field QA/QC

Field procedures, including decontamination of field sampling equipment, described in Appendix A, were utilized to ensure quality of samples during field sampling. Duplicate samples were collected. The number of duplicate samples to be collected was approximately 10 percent of the total number of samples collected from the site. Duplicate samples were collected, numbered, and packaged in the same manner as other samples. Rinsate blank (equipment blank) samples were collected at a rate of one per day and consisted of distilled water poured through decontaminated sampling equipment. A trip blank was included in each cooler containing VOC soil samples.

5.5.2. Laboratory QA/QC

ATL analyzed samples in accordance with the requirements of their in-house QA/QC program (a copy of which will be provided to the Department upon request) and the requirements of contract 07A2211.

Jones Environmental analyzed soil vapor samples in accordance with the DTSC/RWQCB Guidance for Soil Gas Investigations.

6. ANALYTICAL RESULTS

6.1. Chemical Results for Soil Samples

Results of the chemical analyses of soil samples are summarized in Table 1, Table 2, and Table 3. Selected data are presented on Figures 3 and 5. Boring logs are included in Appendix B. A copy of the laboratory reports is included in Appendix C. Analytical results are also presented in the attached Access database file (Appendix E). Chemical results for the soil samples collected during the current assessment are summarized as follows:

- Concentrations of PCE were detected in sixteen soil samples with the highest detected concentration of 63 micrograms per kilogram ($\mu\text{g/kg}$) in soil sample 1001-112-2-S. A detected concentration of TCE in soil sample 1001-103-2-S of 5.4 $\mu\text{g/kg}$ was reported. The concentrations of PCE and TCE detected are below their respective EPA preliminary remediation goals for industrial properties (PRGi) (PCE – 2,700 $\mu\text{g/kg}$; TCE – 14,000 $\mu\text{g/kg}$).
- One soil sample exceeded 10 times the State of California Soluble Threshold Limit Concentration (STLC) for lead: 1001-112-2-S (100 milligrams per kilogram [mg/kg]). The sample was subsequently analyzed for soluble lead by California Waste Extraction Test (WET) and a detected concentration of 2.4 milligrams per liter (mg/l) was reported. Detected concentrations of other Title 22 Metals were below 10 times their respective STLCs.
- Hexavalent chromium was detected in four samples with the greatest concentration of 0.18 mg/kg in soil sample 1001-106-5-S. The concentrations of hexavalent chromium detected are below the PRGi of 200 mg/kg .
- Diesel range organics were detected in twenty-five samples with the greatest concentration of 970 mg/kg in soil sample 1001-111-2-S. Gasoline range organics were not detected. TPH $\text{C}_4\text{-C}_{12}$ was not detected. TPH $\text{C}_{13}\text{-C}_{22}$ was detected in nineteen samples with the greatest concentration of 300 mg/kg in soil sample 1001-111-2-S. TPH $\text{C}_{23}\text{-C}_{32}$ was detected in twenty-one samples with the greatest concentration of 1,300 mg/kg in soil sample 1001-111-2-S. TPH $>\text{C}_{32}$ was detected in twelve samples with the greatest concentration of 1,800 mg/kg in soil sample 1001-111-2-S. The maximum concentrations detected are less than the maximum soil screening level (SSL) (Diesel - 1000 mg/kg ; TPH $\text{C}_{13}\text{-C}_{22}$ – 1,000 mg/kg ; TPH $\text{C}_{23}\text{-C}_{32}$ – 10,000 mg/kg ; TPH $>\text{C}_{32}$ – 10,000 mg/kg) for the protection of groundwater published by the Los Angeles Regional Water Quality Control Board (LARWQCB).
- PCBs were detected in one sample with concentration of 28 $\mu\text{g/kg}$ of aroclor 1260 in sample 1001-104-2-S. The concentration is below the PRGi for this aroclor of 740 $\mu\text{g/kg}$.

- SVOC concentrations of phenol were detected in four soil samples. The highest concentration of 1,000 µg/kg was detected in 1001-111-5. The detected concentrations were below the PRGi for phenol of 180,000,000 µg/kg.
- Concentrations of pH detected in soil samples ranged from 6.9 to 9.1.

6.2. Chemical Results for Soil Vapor Samples

Results of the chemical analyses of soil vapor samples are summarized in Table 4. Selected data are presented on Figures 3 and 4. A copy of the laboratory report is included in Appendix C. Results for the soil vapor samples are summarized as follows:

- The twenty soil vapor borings had detectable concentrations of PCE, TCE, freon 113, chloroform, toluene, 1,1,1-TCA, 1,1-DCE, 1,1,2-TCA, and TPHg.
- The greatest concentration of PCE was 52,400 micrograms per cubic meter (µg/m³) in 1001-103-15-SG. The CHHSL for PCE of 603 µg/m³ was exceeded.
- The greatest concentration of TCE was 6,920 µg/m³ in 1001-120-15-SG. The CHHSL for TCE of 1,770 µg/m³ was exceeded.
- The greatest concentration of freon 113 was 195 µg/m³ in 1001-120-40-SG. There is no listed CHHSL for freon 113.
- The greatest concentration of chloroform was 725 µg/m³ in 1001-119-40-SG. There is no listed CHHSL for chloroform.
- The greatest concentration of toluene was 587 µg/m³ in 1001-106-5-SG. The CHHSL for toluene of 378,000 µg/m³ was not exceeded.
- The greatest concentration of 1,1,1-TCA was 1,460 µg/m³ in 1001-116-25-SG. The CHHSL for 1,1,1-TCA of 2,790,000 µg/m³ was not exceeded.
- The greatest concentration of 1,1-DCE was 1,530 µg/m³ in 1001-116-25-SG. There is no listed CHHSL for 1,1-DCE.
- The greatest concentration of 1,1,2-TCA was 235 µg/m³ in 1001-116-40-SG. There is no listed CHHSL for 1,1,2-TCA.
- The greatest concentration of TPHg was 242 µg/m³ in 1001-116-15-SG. There is no listed CHHSL for TPHg.

6.3. Chemical Results for Blank Samples

Results of the chemical analyses of blank samples are summarized in Tables 5 through 7. A copy of the laboratory report is included in Appendix C. Barium, molybdenum, and zinc were detected at 0.0052, 0.022, and 0.018 milligrams per liter (mg/l), respectively, in blank sample ERB-1. These concentrations are below the soil detection limits and are unlikely to have contributed significantly to the soil sample results for that date of sampling (4/20/09). The pH of blank samples ERB-1 and QCEB was 6.5 and 5.8, respectively.

7. ESTIMATED VOLUME OF PETROLEUM IMPACTED SOIL

Based on the distribution of detected petroleum hydrocarbons in soil as shown in Figures 5a through 5d, the upper 2 feet and portions of the next 18 feet (down to approximately 20 feet bgs) will be classified as petroleum contaminated non-hazardous waste and should be recycled or disposed at a Class III disposal facility. The approximate volume of petroleum-impacted soil is estimated to be 16,500 cubic yards. However, confirmation testing should be conducted during earthwork activities.

8. CONCLUSIONS

Based on the results of the assessments conducted to date, the following conclusions have been made:

- Concentrations of VOCs, metals, PCBs, SVOCs, petroleum hydrocarbons, and pH were detected in the soil samples collected at the site at levels below the site specific clean up goals approved by the RWQCB. Chlorinated VOCs associated with off site sources or the Superfund Site were detected in low concentrations in some soil samples collected at the site. With the exception of one boring (1001-117), chlorinated VOCs were not detected in soil samples collected deeper than 5 feet bgs. In boring 1001-117, the deepest sample analyzed (40 feet bgs) did not contain detectable VOCs. As was discussed in the April 15, 2001, Hydro Geo Chem report, site soil does not appear to be a source of chlorinated VOC contamination because soil concentrations are low relative to other affected media such as soil vapor.
- PCE, TCE, freon 113, chloroform, toluene, 1,1,1-TCA, 1,1-DCE, 1,12-TCA, and TPHg range were detected in soil vapor samples collected at the site. Concentrations of PCE and TCE exceeded CHHSLs. Concentrations of freon 113, chloroform, toluene, 1,1,1-TCA, 1,1-

DCE, 1,1,2-TCA, and TPHg did not exceed CHHSLs. Freon 113, toluene, and chloroform were not detected in soil samples, so their source is likely off site. An on-site source for TPHg and the five chlorinated solvents that were detected in soil vapor, PCE, TCE, 1,1,1-TCA, 1,1-DCE, and 1,1,2-TCA, was not identified. The soil vapor contamination appears most elevated along the northwestern edge of the site. Impacts to the site likely have an off-site source and off-gassing from contaminated groundwater beneath the site associated with the Superfund Site may be contributing to the VOCs in soil vapor. For these reasons there is a low likelihood that this site has contributed to contamination associated with the Superfund Site. It would appear that a rebound in soil vapor concentrations has occurred since the site was remediated as a portion of the 777 North Front Street property. However, these rebounded concentrations remain below the site clean up goals (Appendix G) approved by the RWQCB. Because the soil vapor PCE concentrations have increased from less than approximately 2,000 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) following remediation in 2001 to as much as 52,400 $\mu\text{g}/\text{m}^3$ reported in this study, there is a possibility that VOC concentrations could continue to increase and possibly exceed site clean-up goals of 71,000 $\mu\text{g}/\text{m}^3$, additional remedial action may be required. Insufficient data regarding the location, nature, concentration, and mass of the likely off-site source of VOC and groundwater beneath the site does not allow the likelihood of such a possible outcome to be estimated.

- Concentrations of PCE in soil vapor ranged from less than the detection limit of 20 to 52,400 $\mu\text{g}/\text{m}^3$. Concentrations of PCE in soil ranged from less than the detection limit of 5.5 to 63 $\mu\text{g}/\text{kg}$. Concentrations of TPH $\text{C}_4\text{-C}_{12}$ in soil were less than the detection limit of 1.0 mg/kg. Concentrations of TPH $\text{C}_{13}\text{-C}_{22}$ in soil ranged from less than the detection limit of 10 to 300 mg/kg. Concentrations of TPH $\text{C}_{23}\text{-C}_{32}$ in soil ranged from less than the detection limit of 10 to 1,300 mg/kg. Concentrations of TPH $>\text{C}_{32}$ in soil ranged from less than the detection limit of 10 to 1,800 mg/kg. Soil with detectable concentrations of petroleum hydrocarbons, approximately 16,500 cubic yards of soil from the surface to 20 feet bgs, would be classified as petroleum contaminated non-hazardous waste if it were disturbed during construction activities (e.g., excavation, grading). No detectable concentrations of petroleum hydrocarbons were reported in the site soil from depths of 20 to 40 feet bgs, so soil generated during construction activities at depths greater than 20 feet bgs would be considered clear of hazardous waste. Excavated site soil from the upper 20 feet containing petroleum hydrocarbon detections can be treated, recycled, reused, or disposed at a Class III disposal facility after acceptance from the selected facility as petroleum contaminated non-hazardous waste, based on their criterion (Refer to Appendix F, Figures 3, 5a, 5b, 5c, and 5d for further details). The source of petroleum hydrocarbon contamination in site soil is likely from the past property operations which for the most part occurred off site, or from sources such as spills, releases, etc. located off site. A specific source of petroleum hydrocarbon contamination in site soil was not located on site.
- The estimated cost to excavate, transport, and dispose the approximately 16,500 cubic yards of petroleum contaminated non-hazardous soil expected to be generated and the estimated cost to perform vapor monitoring and suppression for the remaining earth moving activities is approximately \$1,300,000 to \$2,000,000. The cost tables are presented in Appendix F.

- Residential land use CHHSLs are generally considered adequate for sensitive uses such as day-care centers, hospitals and the like, some of which house sensitive receptors such as toddlers, the elderly or even immune-compromised patients on a full time basis. For this reason, the CHHSLs are relatively conservative compared to the TLVs and OSHA PELs, which were developed for healthy adults of working age and are based upon 8-hour exposures and 40 hour work weeks. Based on the TLVs and PELs the VOCs and TPHg concentrations detected in the soil vapor samples do not pose a risk to worker safety. Even so, it is recommended that the results of this SI be used in the development of a site-specific HSP for the proposed construction, because chemical exposure to site workers may still occur under certain conditions.

9. RECOMMENDATIONS

The following recommendations are based on the findings of this assessment.

- Prepare and implement a lead compliance plan due to the presence of lead in the soil.
- Prepare and implement a fugitive dust mitigation plan based on SCAQMD Rule 403.
- Apply for and implement a SCAQMD Site Specific Rule 1166 permit for VOC contaminated soil excavation exceeding 2,000 cubic yards in a two year period.
- Prepare and implement a HSP for the proposed construction. Although the chemicals detected in soil and soil vapor are present in concentrations below risk levels, preparation of a HSP is still recommended to address worker safety.
- Soil containing petroleum hydrocarbons that is disturbed during construction activities should be removed and disposed or recycled as petroleum contaminated non-hazardous waste. If the department has the ability to reuse petroleum contaminated soil on the site, this would be allowed based on the soil analytical results; the maximum TPH C₄-C₁₂ concentration was less than the detection limit of 10 mg/kg that is less than the screening level of 500 mg/kg, the maximum TPH C₁₃-C₂₂ concentration was 300 mg/kg that is less than the screening level of 1,000 mg/kg, and the maximum TPH C₂₃-C₃₂ concentration was 1,300 mg/kg that is less than the screening level of 10,000 mg/kg, as specified in the RWQCB Interim Site Assessment & Cleanup Guidebook. Additional options for soil disposal may present themselves based on possible regulatory agency review and approval. We have not relied on this possibility in considering disposal options because we do not know what potential reuse options might exist in order to evaluate possible regulatory agency. This is a waste-handling requirement only, classification of site soil as petroleum contaminated non-hazardous waste does not indicate the need for site remediation or health and safety requirements.
- Based on the results of the analytical data and the proposed future site use, additional environmental assessment is not warranted.

10. LIMITATIONS

The services outlined in this report have been conducted in a manner generally consistent with current regulatory guidelines. No warranty, expressed or implied, is made regarding the professional opinions presented in this report. Ninyo & Moore's opinions are based on an analysis of observed conditions and on information obtained from third parties. It is likely that variations in soil conditions may exist which were beyond the scope of work.

The samples collected and chemically analyzed and the observations made are believed to be representative of the general area evaluated; however, conditions can vary significantly between sampling locations. The interpretations and opinions contained in this report are based on the results of laboratory tests and analyses intended to detect the presence and measure the concentration of certain chemical or physical constituents in samples collected from the site. The analyses have been conducted by an independent laboratory, which is accredited by the United States EPA and/or certified by the State of California to conduct such analyses. Ninyo & Moore has no involvement in, or control over, such analyses and has no means of confirming the accuracy of laboratory results. Ninyo & Moore, therefore, disclaims any responsibility for inaccuracy in such laboratory results.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document. Opinions and judgments expressed herein, which are based on our understanding and interpretation of current regulatory standards, should not be construed as legal opinions.

FIELD PROCEDURES

Drilling, Soil Sampling and Probe Installation Procedures

SOIL VAPOR SURVEY PROCEDURES

Pre-Installation Probe

Prior to installing soil vapor probes, the proposed locations are probed for underground pipes or utilities to a depth of approximately 5 feet using a tile probe.

Soil-Vapor Probe Installation

Soil vapor probes were installed using either a truck-mounted direct-push device (a Geoprobe or equivalent), equipped with a hydraulic percussion hammer, or manually. One-inch-diameter, hollow-steel rods were pushed to the target depths using the Geoprobe, a roto-hammer, jackhammer, or slam bar.

An expendable drive point/anchor was attached to the bottom probe rod prior to insertion. Once the target depth is reached, the probe is withdrawn approximately 6 inches to 1 foot, disengaging the drive point. A ¼-inch-diameter polyethylene tube, with perforations along the bottom 4 inches, is inserted into the bottom of the hole inside the steel pipe. Alternatively, the tubing can be connected to a vapor sampling implant prior to lowering down hole. The rods are then retrieved leaving the tubing in the hole. Fine-grained sand was poured around the tube openings to approximately 2 inches above the perforations. The annulus is then grouted with granular bentonite hydrated in place to form a tight seal around the tube and reduce the chance of sampling ambient air. The tubing was then labeled with the probe designation and total depth. Vapor sampling was conducted after one hour to allow for equilibration of the subsurface vapor regime.

Soil Sampling

1. Probes were installed, using hydraulic push sampling system. Soil probes were drilled to depths up to 20 feet below ground surface (bgs). A 1½-inch-diameter, hollow, stainless steel rod was hydraulically driven into the subsurface to obtain continuous soil samples. Relatively undisturbed soil samples were collected from the probe tip at approximately one and five-foot depth intervals for chemical analyses. Soil samples were retrieved by retracting the probe rod and sampler to the surface and disassembling the sampler. Drilling services were provided by a State-licensed drilling contractor.

2. During drilling, soil classification (in general accordance with the USCS), sample type and depth, and related drilling information were recorded on boring logs.
3. Discrete, relatively undisturbed soil samples were collected in industry standard 1½-inch acetate sleeves.
4. The sampler was cleaned prior to use and between sampling intervals, using a bristle brush and a detergent solution; this was followed by two tap water rinses and a deionized-water rinse. The sampler was dried by air or with a paper towel prior to being used for sampling.
5. Following retrieval of the sampler, the acetate sleeve was cut at the appropriate depth interval to obtain a sample; its ends were covered with Teflon tape, and capped with polyethylene end caps. The sample tube was labeled with the project number, sample number, sample depth, and collection date.
6. The soil samples were placed in sealable plastic bags and stored in an ice chest, which was cooled, using bagged ice, to a temperature of approximately four degrees Celsius.
7. The remaining soil in the acetate tube was used to describe the soil lithology, to observe indications of petroleum hydrocarbon discoloration and/or odor.

Soil-Vapor Sampling

Soil gas sampling was not conducted within three days following rainy weather due to possible effects on the subsurface vapor regime.

The polyethylene tubing was connected to a glass-sampling bulb fitted with Teflon stopcocks and a Viton rubber sampling port. The bulb was connected in turn to a vacuum gauge, a flowmeter, and portable sampling pump in series. The sampling train was tested for leakage. The glass-sampling bulb was wrapped in aluminum foil to minimize photoreactions with captured chemicals. Alternatively, soil gas samples can be collected using a syringe by inserting the needle into silicon tubing attaching the top of the probe to the sampling pump.

For volatile organic compounds, approximately 1 to 7 purge volumes of air are removed prior to sample collection. Lighter gases may need less purging prior to sampling. After purging, first the pump-end and then the probe-end sample cocks were closed in sequence. Once collected, the sample was labeled, injected with isotopically labeled surrogate compounds, recorded on a chain-of-custody, and immediately transferred to a mobile laboratory for chemical analysis. Soil gas probes were then removed.

Detection Limits

A detection limit of 1 µg/l will be specified for VOC target compounds, as requested by the RWQCB.

QUALITY ASSURANCE/QUALITY CONTROL EVALUATION – SOIL GAS SURVEY

The purpose for the quality assurance (QA) procedures and collecting quality control (QC) samples is to acquire data to assess and document the effectiveness of probe-installation, field sampling and laboratory-analysis procedures in producing accurate and precise analytical data. A description of the field QA procedures, QC sample types, and an evaluation of the analytical results of these samples for this project are presented in the following sections.

FIELD QA PROCEDURES

Sample-Train Leakage Test

Prior to sampling, the sampling train was tested for leakage. Initially, both stopcocks in the sample train were closed. The absence of flow and the presence of a slight vacuum demonstrated that the pump-end side of the sampling train had no leaks. Then the first stopcock (pump end) was opened. The absence of flow demonstrated that the sampling bulb itself did not leak.

Annular-Seal Leakage Test

To ensure proper probe installation and sealing, a leakage test was performed during sampling procedures. The leakage test consists of placing a shallow container of analytical-grade pentane next to the top of the probe hole. The container and probe hole are covered by a special trap. Pentane vapors fill the trap and surround the hole. The presence of analytical-grade pentane in the soil-vapor sample would indicate a leakage of ambient air down from the surface through the annular seal into the sample zone. If this occurs, the sample was then determined to be invalid and the probe was reconstructed to prevent leakage.

Purge-Volume Test

A purge volume test was conducted after the first sample containing VOC concentrations was detected. The purge volume test was conducted so that equilibrium soil gas concentrations are being sampled. Ambient air may intrude into the sand pack and native pore spaces surrounding the probe during probe installation. Similarly, VOC vapors may accumulate in previously installed probes. Unless these are purged prior to collecting the sample, the sample may not be representative of the vapor regime beneath the site. The 'probe volume' is the volume of air contained in the vapor-probe tubing and sand-pack. The 'purge volume' is the amount of air required to be purged in order to obtain a vapor sample representative of subsurface vapor conditions. During the purge volume test, samples were collected after purging 1, 3, and 7 probe volumes. Chemical results for the samples

were graphed as a function of the amount of air purged. The correct purge volume was then evaluated as the point at which concentrations begin to stabilize.

LABORATORY QC PROCEDURES

Calibration

Analytical procedures are evaluated by the laboratory by conducting equipment calibration, analyzing a laboratory control standard (LCS), a daily standard, and generating a surrogate calibration curve in accordance with Los Angeles Regional Water Quality Control Board procedures.

LCS will be prepared for the initial calibration, the daily mid-point calibration, and if required, the end-of-day test run. An initial calibration and daily mid-point calibration of target compounds (23 for VOCs) must be conducted prior to analysis of site samples. During the initial calibration, three different concentrations of the LCS will be prepared and analyzed, with the lowest concentration less than five times the detection limit for each compound. The response factor (RF) for each compound and calibration concentrations were calculated. The average RF for each compound was then calculated. The percent relative standard deviation (percent RSD) for each target compound must not exceed 20 percent except for Freon 11, Freon 12, Freon 113, chloroethane, and vinyl chloride. For these chemicals the percent RSD cannot exceed 30 percent. The initial calibration was performed if the RF from the daily mid-point calibration check exceeded ± 15 percent difference from the initial calibration's average RF.

The daily mid-point calibration check was conducted by taking a LCS with a mid-point concentration within the linear range of the initial calibration.

Surrogate Compounds & Recovery

Upon collection of each soil-vapor sample, approximately 5 to 25 nanograms (ng) each of deuterated-chloroform, deuterated-methylene chloride, deuterated-tetrahydrofuran, deuterated-acetone, and deuterated -benzene are introduced through the Viton rubber septum into the sampling bulb. The recovery of these isotopically labeled surrogate compounds is used to determine if the bulbs remained leak-free between sample collection and analysis.

A recovery of 90 percent deuterated-benzene and deuterated chloroform is desirable. A recovery of less than 75 percent invalidates the sample;

Deuterated-acetone is added as a measure of water vapor in the sampling and analysis systems. A recovery of greater than 70 percent is acceptable, although levels of the water-soluble compounds (ketones) may be affected.

APPENDIX B
BORING LOGS

U.S.C.S. METHOD OF SOIL CLASSIFICATION				
MAJOR DIVISIONS		SYMBOL		TYPICAL NAMES
COARSE-GRAINED SOILS (More than 1/2 of soil >No. 200 sieve size)	GRAVELS (More than 1/2 of coarse fraction > No. 4 sieve size)		GW	Well graded gravels or gravel-sand mixtures, little or no fines
			GP	Poorly graded gravels or gravel-sand mixtures, little or no fines
			GM	Silty gravels, gravel-sand-silt mixtures
			GC	Clayey gravels, gravel-sand-clay mixtures
	SANDS (More than 1/2 of coarse fraction <No. 4 sieve size)		SW	Well graded sands or gravelly sands, little or no fines
			SP	Poorly graded sands or gravelly sands, little or no fines
			SM	Silty sands, sand-silt mixtures
			SC	Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (More than 1/2 of soil <No. 200 sieve size)	SILTS & CLAYS Liquid Limit <50		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean
			OL	Organic silts and organic silty clays of low plasticity
	SILTS & CLAYS Liquid Limit >50		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
			CH	Inorganic clays of high plasticity, fat clays
			OH	Organic clays of medium to high plasticity, organic silty clays, organic silts
HIGHLY ORGANIC SOILS		Pt	Peat and other highly organic soils

RE: 207126015

Attention: David Shaler

Enclosed are the results for sample(s) received on April 20, 2009 by Advanced Technology Laboratories. The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (562)989-4045 if I can be of further assistance to your company.

Sincerely,

A handwritten signature in black ink, appearing to read "E. Rodriguez".

Eddie F. Rodriguez
Laboratory Director

CLIENT: Ninyo & Moore
Project: 207126015
Lab Order: 105139

CASE NARRATIVE

All volatile analyses were performed using 5035 preservation requirements. Any high level dilutions were performed on a preserved methanol sample unless otherwise noted.

Analytical Comments for EPA 6010B

1. Samples 105139-010ADUP, 105139-020ADUP and 105139-032ADUP, RPD for Sample Duplicate (DUP) is outside criteria; however, the Laboratory Control Sample (LCS) validated the analytical batch.

Analytical Comments for EPA 8015B(M)

1. Samples 105139-005AMSD, 105139-014AMS, MB-54952MS and MB-54952MSD, Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria; however, the analytical batch was validated by the Laboratory Control Sample (LCS).

Analytical Comments for EPA 8260B

1. Sample 105139-007C, surrogate recovery biased high possibly due to matrix interferences; however the results were non-detect (ND) for analytes of interest and reanalysis of the sample was not necessary.
2. Sample 105139-001C, RPD for Sample Duplicate (DUP) is outside criteria; however, the Laboratory Control Sample (LCS) validated the analytical batch.

Analytical Comments for EPA 8270C

1. Samples 105139-002A, 105139-013A, 105139-020A, 105139-023A, 105139-024A and 105139-025A, dilution was necessary due to samples' dark extract.
2. Sample 105139-025A, surrogate recovery biased low possibly due to matrix interferences.
