DRAFT ENVIRONMENTAL IMPACT REPORT

WEST JACKSON HIGHWAY MASTER PLAN

Control Number: PLNP2008-00240

State Clearinghouse Number: 2013092021

This Environmental Impact Report has been prepared pursuant to the California Environmental Quality Act of 1970 (Public Resources Code Division 13). An Environmental Impact Report is an informational document which, when this Office requires its preparation, shall be considered by every public agency prior to its approval or disapproval of a project. The purpose of an Environmental Impact Report is to provide public agencies with detailed information about the effect that a proposed project is likely to have on the environment; to list ways in which any adverse effects of such a project might be minimized; and to suggest alternatives to such a project.

Prepared by the
COUNTY OF SACRAMENTO
DEPARMENT OF COMMUNITY DEVELOPMENT
PLANNING AND ENVIRONMENTAL REVIEW

Table of Contents

EXECUTIVE SUMMARY **ES-1**
- **Summary of the Proposed Project** **ES-1**
- **Project Alternatives** **ES-1**
- **Organization of This Draft Environmental Impact Report** **ES-1**
- **Scoping Comments and Areas of Controversy** **ES-2**
- **Terminology Used in This EIR** **ES-3**
- **Mitigation Monitoring and Reporting Program** **ES-4**
- **Summary of Significant Impacts and Mitigation Measures** **ES-4**

1 INTRODUCTION **1-1**
- **Summary of the Proposed Project** **1-1**
- **Environmental Impact Report Scope and Process** **1-1**
  - Purpose of This Environmental Impact Report 1-1
  - Lead, Responsible, and Trustee Agencies 1-1
  - Type of Environmental Impact Report 1-2
  - Scope of This Environmental Impact Report 1-3
  - Public and Environmental Review Process 1-4
- **Intended Uses of This EIR** **1-5**

2 Project Description **2-1**
- **Project Location** **2-1**
  - Assessor's Parcel Numbers 2-1
- **Project Proponents** **2-1**
  - Project Applicants 2-1
- **Existing Conditions** **2-4**
  - Environmental Setting 2-4
  - Existing Land Uses 2-7
  - General Plan Land Use Designations 2-13
  - Community Plan Land Use Designations 2-13
  - Community Plan Designations 2-15
  - Existing Zoning 2-15
- **Background** **2-20**
  - Regional Growth Projections and Planning Context 2-20
  - Application and Project Initiation 2-23
- **Project Objectives** **2-24**
- **Plan Characteristics** **2-25**
  - Organization of the Plan 2-26
  - Features of the Plan 2-26
- **Proposed Land Uses** **2-30**
  - Residential and Mixed Use 2-31

Commercial and Employment 2-32
Industrial 2-33
School and Institutional Land Uses 2-33
Recreation and Open Space 2-33
Infrastructure Improvements 2-35
Avigation Easements 2-50
Construction and Implementation 2-50
Buildout Assumptions 2-55
Required Discretionary Actions 2-69
Lead Agency 2-69
Responsible and Trustee Agencies 2-69

3 ALTERNATIVES 3-1
Introduction 3-1
Evolution of the WJHMP Land Use Plan 3-2
Considerations for Selection of Alternatives 3-5
Attainment of Project Objectives 3-5
Environmental Impacts of the WJHMP Project 3-6
Alternatives Considered but Not Evaluated Further 3-7
Off-Site Alternative 3-7
2017 Submittal Alternative 1-A 3-8
Alternatives Selected for Detailed Analysis 3-9
Alternative 1: No Project Alternative 3-9
Alternative 2: Reduced Footprint Alternative 3-14
Alternative 3: Development of Reclamation Lands Alternative 3-21
Environmentally Superior Alternative 3-29

4 AESTHETICS 4-1
Introduction 4-1
Environmental Setting 4-1
Visual Character of Region 4-1
Visual Character 4-1
Scenic Views and Resources 4-2
Light and Glare Sources 4-2
Regulatory Setting 4-2
State 4-2
Local 4-3
Significance Criteria and Methodology 4-4
Significance Criteria 4-4
Methodology 4-5
West Jackson Highway Master Policies 4-8

Impacts and Analysis **4-31**
Impact AE-1: Degradation of Existing Character or Quality of Public Views of the Plan Area and Its Surroundings 4-31
Impact AE-2: New Sources of Light or Glare 4-38

5 AGRICULTURAL RESOURCES **5-1**
Introduction **5-1**
Environmental Setting **5-1**
Protected Farmland 5-1
Regulatory Setting **5-5**
Federal 5-5
State 5-5
Local 5-6
Significance Criteria and Methodology **5-9**
Significance Criteria 5-9
Issues Not Discussed Further 5-9
Methodology 5-9
West Jackson Highway Master Plan Policies 5-13
Impacts and Analysis **5-13**
Impact AR-1: Convert Farmland to Non-Agricultural Uses 5-13
Impact AR-2: Result in Conversion of Farmland to Non-Agricultural Use due to Conflict with Existing, Adjacent Agricultural Use and Zoning 5-17

6 Air Quality **6-1**
Introduction **6-1**
Environmental Setting **6-1**
Climate, Meteorology, and Topography 6-1
Criteria Air Pollutants 6-2
Toxic Air Contaminants 6-5
Odors 6-5
Sensitive receptors 6-6
Regulatory Setting **6-8**
Federal 6-8
State 6-10
Local 6-12
Significance Criteria and Methodology **6-17**
Significance Criteria 6-17
Methodology 6-17
Impacts and Analysis **6-20**
Impact AIR-1: Generate Construction Emissions of Criteria Air Pollutants and Precursors (ROG, NO_X, PM_{10}, and $PM_{2.5}$) that Exceed Standards 6-20

Impact AIR-2: Generate Long-Term Operational Emissions of Criteria Air Pollutants and Ozone Precursors (ROG, NO_X, PM_{10}, and $PM_{2.5}$) that Exceed Standards 6-25
Impact AIR-3: Conflict with an Air Quality Plan 6-34
Impact AIR-4: Result in Substantial Mobile-Source CO Concentrations 6-35
Impact AIR-5: Exposure of Sensitive Receptors to TACs 6-36
Impact AIR-6: Exposure to Odors Affecting a Substantial Number of People 6-42

7 AIRPORT COMPATIBILITY 7-1
Introduction 7-1
Environmental Setting 7-1
Airport Land Use Compatibility Planning 7-1
Mather Airport 7-2
Regulatory Setting 7-8
Federal 7-8
State 7-11
Local 7-12
Significance Criteria and Methodology 7-20
Significance Criteria 7-20
Issues Not Discussed Further 7-21
Methodology 7-21
West Jackson Highway Master Plan Policies 7-22
Impacts and Analysis 7-23
Impact AC-1: Result in a Safety Hazard to People Living and Working in the Vicinity of an Airport 7-23
Impact AC-2: Result in Exposure to Excessive Noise Levels Associated with Airport Operations 7-27
Impact AC-3: Result in Effects on Safe and Efficient Use of Navigable Airspace 7-31

8 Biological Resources 8-1
Introduction 8-1
Environmental Setting 8-1
Habitats 8-1
Special-Status Species 8-10
Regulatory Setting 8-22
Federal 8-22
State 8-24
Local 8-26

Significance Criteria and Methodology 8-33
Significance Criteria 8-33
Issues Not Discussed Further 8-33
Methodology 8-33
West Jackson Highway Master Plan Policies 8-35
Impacts and Analysis 8-35
Impact BR-1: Result in Loss of Wetlands and Surface Waters 8-35
Impact BR-2: Have a Substantial Adverse Effect on Special-Status Mammals 8-40
Impact BR-3: Have a Substantial Adverse Effect on Special-Status Birds 8-41
Impact BR-4: Have a Substantial Adverse Effect on Special-Status Reptiles 8-55
Impact BR-5: Have a Substantial Adverse Effect on Special-Status Amphibians 8-57
Impact BR-6: Have a Substantial Adverse Effect on Special-Status Invertebrates 8-58
Impact BR-7: Have a Substantial Adverse Effect on Special-Status Plants 8-66
Impact BR-8: Result in the Loss of Trees 8-70
Impact BR-9: Disturbance of Riparian Habitats 8-75
Impact BR-10: Interfere with the Movement of Any Native Resident or Migratory Species or Impede the Use of Native Wildlife Nursery Sites 8-76
Impact BR-11: Result in Potential Inconsistency with the South Sacramento Habitat Conservation Plan 8-76
9 CLIMATE CHANGE 9-1
Introduction 9-1
Environmental Setting 9-1
The Physical Scientific Basis of Greenhouse Gas Emissions and Climate Change 9-1
Greenhouse Gas Emission Sources 9-2
Effects of Climate Change on the Environment 9-3
Regulatory Setting 9-4
Federal 9-4
State 9-5
Local 9-7
Significance Criteria and Methodology 9-11
Significance Criteria 9-11
Issues Not Discussed Further 9-13
Methodology 9-13
West Jackson Highway Master Plan Policies 9-15

Impacts and Analysis **9-15**
Impact CC-1: Result in Project-Generated GHG Emissions and Potential Inconsistency with Plans and Regulations 9-15

10 CULTURAL RESOURCES **10-1**
Introduction **10-1**
Environmental Setting **10-1**
Precontact History 10-1
Post-Contact History 10-3
Regulatory Setting **10-5**
Federal 10-5
State 10-6
Local 10-8
Community Plans 10-9
Significance Criteria and Methodology **10-9**
Significance Criteria 10-9
Issues Not Discussed Further 10-9
Methodology 10-9
West Jackson Highway Master Policies 10-11
Impacts and Analysis **10-15**
Impact CR-1: Cause a Substantial Adverse Change in the Significance of a Built-Environment Historical Resource 10-15
Impact CR-2: Cause a Substantial Adverse Change to an Archaeological Resource 10-16
Impact CR-3: Disturb Human Remains 10-19

11 ENERGY **11-1**
Introduction **11-1**
Existing Energy Environmental Setting **11-1**
Energy Facilities and Services 11-1
Existing Energy Regulatory Setting **11-3**
Federal 11-3
Local 11-7
Significance Criteria and Methodology **11-9**
Significance Criteria 11-9
Issues Not Discussed Further 11-9
Methodology 11-9
West Jackson Highway Master Policies 11-10
Impacts and Analysis **11-10**
Impact EN-1: Result in Wasteful, Inefficient, or Unnecessary Consumption of Energy 11-10
Impact EN-2: Conflict with or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency 11-14

12 GEOLOGY, SOILS, AND MINERAL RESOURCES 12-1
Introduction 12-1
Environmental Setting 12-1
Regional Geology 12-1
Plan Area Geology 12-1
Soils and Soil Hazards 12-5
Mineral Resources 12-10
Paleontological 12-13
Regulatory Setting 12-14
Federal 12-14
State 12-15
Local 12-17
Significance Criteria and Methodology 12-19
Significance Criteria 12-19
Methodology 12-21
West Jackson Highway Master Policies 12-21
Impacts and Analysis 12-21
Impact GS-1: Exacerbate Unstable Soil Conditions 12-21
Impact GS-2: Result in Substantial Soil Erosion 12-22
Impact GS-3: Result in Soil Subsidence 12-24
Impact GS-4: Exposure to Landslides 12-25
Impact GS-5: Exposure to Expansive Soils 12-25
Impact GS-6: Potential Destruction of Buried Paleontological Resources 12-26
Impact GS-7: Obstruction of Access to Mineral Resources 12-27
13 HAZARDS AND HAZARDOUS MATERIALS 13-1
Introduction 13-1
Environmental Setting 13-1
Hazardous Materials 13-1
Transport of Hazardous Materials 13-7
Sensitive Receptors 13-7
Schools 13-7
Wildland Fire Hazards 13-8
Regulatory Setting 13-8
Federal 13-8
State 13-10
Local 13-13
Significance Criteria and Methodology 13-15
Significance Criteria 13-15
Methodology 13-16
West Jackson Highway Master Policies 13-16

Impacts and Analysis **13-17**
Impact HAZ-1: Accidental Release Due to Transport, Use, or Disposal of Hazardous Materials 13-17
Impact HAZ-2: Potential for Release of Hazardous Materials from Undocumented or Documented Sites of Contamination 13-19
Impact HAZ-3: Result in Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within 0.25 Mile within an Existing or Proposed School 13-24
Impact HAZ-4: Impair Implementation of or Physically Interfere with an Adopted Emergency Response Plan or Emergency Evacuation Plan 13-24
Impact HAZ-5: Expose People or Structures to Wildland Fires 13-26

14 HYDROLOGY, DRAINAGE, AND WATER QUALITY **14-1**
Introduction **14-1**
Environmental Setting **14-1**
Hydrology and Drainage 14-1
Water Quality 14-11
Regulatory Setting **14-13**
Federal 14-13
State 14-14
Local 14-19
Significance Criteria and Methodology **14-25**
Significance Criteria 14-25
Issues Not Discussed Further 14-26
Methodology 14-26
West Jackson Highway Master Plan Policies 14-26
Impacts and Analysis **14-26**
Impact HYD-1: Violate Water Quality Standards 14-26
Impact HYD-2: Substantially Decrease Groundwater Supplies or Interfere Substantially with Groundwater Recharge 14-29
Impact HYD-3: Substantially Alter the Existing Drainage Pattern of the Plan Area Such That Substantial Erosion, Flooding, or Polluted Runoff Could Occur 14-30
Impact HYD-4: Risk Release of Pollutants due to Inundation in Flood Hazard Zones 14-33
Impact HYD-5: Conflict with a Water Quality Control Plan or Sustainable Groundwater Management Plan 14-41
Impact HYD-6: Result in Potential Climate Change Effects on the Project 14-41
Impact HYD-7: Contribute to Flooding of Beach Stone Lakes 14-43

15 LAND USE, POPULATION, AND HOUSING 15-1
Introduction 15-1
Environmental Setting 15-1
Sacramento County Demographics 15-1
Regional Setting 15-1
Plan Area Setting 15-2
Regulatory Setting 15-6
Federal 15-6
State 15-6
Regional 15-7
Local 15-9
Significance Criteria and Methodology 15-27
Significance Criteria 15-27
Issues Not Discussed Further 15-27
Methodology 15-27
West Jackson Highway Master Plan Policies 15-27
Impacts and Analysis 15-28
Impact LU-1: Physically Divide an Established Community 15-28
Impact LU-2: Cause a Significant Environmental Impact Due to a Conflict with Any Land Use Plan, Policy, or Regulation Adopted for the Purpose of Avoiding or Mitigating an Environmental Effect .. 15-28
Impact LU-3: Induce Substantial Unplanned Population Growth 15-45
Impact LU-4: Displace Substantial Numbers of Existing People or Housing, Necessitating the Construction of Replacement Housing Elsewhere 15-46

16 NOISE 16-1
Introduction 16-1
Environmental Setting 16-1
Acoustic Fundamentals 16-1
Existing Conditions 16-7
Regulatory Setting 16-27
Federal 16-27
State 16-28
Local 16-29
Significance Criteria and Methodology 16-38
Significance Criteria 16-38
Issues Not Discussed Further 16-39
Methodology 16-40
West Jackson Highway Master Plan Policies 16-42

Impacts and Analysis **16-42**
Impact NO-1: Exceed County Standards during Construction 16-42
Impact NO-2: Generate Excessive Construction Vibration 16-46
Impact NO-3: Generate a Substantial Permanent Increase in Traffic Noise Levels 16-50
Impact NO-4: Expose New or Existing Sensitive Receptors to New Stationary Noise Sources 16-58

17 PUBLIC SERVICES **17-1**
Introduction **17-1**
Environmental Setting **17-1**
Fire Protection and Emergency Response 17-1
Law Enforcement 17-2
Schools 17-2
Parks and Recreation Services 17-3
Libraries 17-4
Regulatory Setting **17-4**
Federal 17-4
State 17-4
Local 17-5
Significance Criteria and Methodology **17-9**
Significance Criteria 17-9
Methodology 17-10
West Jackson Highway Master Policies 17-10
Impacts and Analysis **17-12**
Impact PS-1: Result in substantial Adverse Physical Impacts Associated with the Provision of Fire Protection and Emergency Services 17-12
Impact PS-2: Result in Substantial Adverse Physical Impacts Associated with the Provision of Law Enforcement 17-13
Impact PS-3: Result in Substantial Adverse Physical Impacts Associated with the Provision of Schools 17-13
Impact PS-4: Result in Substantial Adverse Physical Impacts Associated with the Provision of Parks and Recreation Services or Substantial Physical Deterioration of an Existing Facility 17-15
Impact PS-5: Result in Substantial Adverse Physical Impacts Associated with the Provision of Libraries 17-19

18 PUBLIC UTILITIES **18-1**
Introduction **18-1**
Environmental Setting **18-1**
Urban Services Boundary 18-1
Sewer Service 18-2

Stormwater Drainage 18-3
Electricity and Natural Gas 18-3
Communications 18-3
Solid Waste 18-4
Regulatory Setting 18-4
Federal 18-4
State 18-5
Local 18-6
Significance Criteria and Methodology 18-9
Significance Criteria 18-9
Issues Not Discussed Further 18-10
Methodology 18-10
West Jackson Highway Master Policies 18-11
Impacts and Analysis 18-11
Impact PU-1: Result in Adverse Effects Associated with Construction of Expanded Wastewater Treatment Infrastructure 18-11
Impact PU-2: Result in Adverse Effects Associated with Construction of Stormwater Infrastructure 18-13
Impact PU-3: Result in Adverse Effects Associated with Construction of Electric Power and Telecommunications Facilities 18-14
Impact PU-4: Exceed the Capacity of the Wastewater Treatment Provider 18-15
Impact PU-5: Generate Solid Waste in Excess of State Standards or in Excess of the Capacity of Local Infrastructure 18-15
19 TRANSPORTATION 19-1
Introduction 19-1
Environmental Setting 19-1
Roadway System 19-1
Transit System 19-3
Bicycle System 19-4
Pedestrian System 19-5
Regulatory Setting 19-6
Federal 19-6
State 19-6
Regional 19-7
Local 19-8
Significance Criteria and Methodology 19-15
Significance Criteria 19-15
Issues Not Discussed Further 19-16

Methodology 19-17
West Jackson Highway Master Plan Policies 19-19
Impacts and Analysis 19-20
Impact TR-1: Adversely Affect an Existing Bicycle and Pedestrian Facility, Interfere with the Implementation of a Planned Bikeway, or Result in Unsafe Conditions for Bicyclists or Pedestrians 19-20
Impact TR-2: Adversely Affect Public Transit Operations or Fail to Provide Access to Transit 19-21
Impact TR-3: Generate VMT That Exceeds County Standards 19-22
Impact TR-4: Substantially Increase Hazards Due to a Geometric Design Feature or Incompatible Uses 19-24
Impact TR-5: Result in Inadequate Emergency Access 19-28
20 WATER SUPPLY 20-1
Introduction 20-1
Environmental Setting 20-1
Water Purveyors 20-1
Surface Water 20-5
Groundwater 20-6
Water Infrastructure 20-8
Regulatory Setting 20-9
Federal 20-9
State 20-9
Local 20-12
Significance Criteria and Methodology 20-14
Significance Criteria 20-14
Methodology 20-15
West Jackson Highway Master Policies 20-15
Impacts and Analysis 20-15
Impact WS-1: Environmental Effects Due to the Construction of New or the Expansion of Existing Water Facilities 20-16
Impact WS-2: Result in Demand for Water that Cannot be Met by Existing or Reasonably Foreseeable Future Service Capacity 20-17
Impact WS-3: Contribute to Groundwater Pumping Such That the Average Annual Sustainable Yield for the South American Subbasin Basin is Exceeded 20-23
21 TRIBAL CULTURAL RESOURCES 21-1
Introduction 21-1
Environmental Setting 21-1
Ethnography 21-1

EXECUTIVE SUMMARY

This draft environmental impact report (Draft EIR) describes the potential environmental impacts of developing the West Jackson Highway Master Plan (WJHMP or project). The purpose of an EIR is to evaluate the project's effects on environmental resources, both singularly and in a cumulative context, to examine alternatives to the project as proposed, and identify mitigation measures to reduce or avoid potentially significant effects. This document has been prepared in compliance with the California Environmental Quality Act (CEQA) (Sections 21000-21189 of the Public Resources Code) and the State CEQA Guidelines (Title 14, Sections 15000-15387 of the California Code of Regulations).

SUMMARY OF THE PROPOSED PROJECT

The WJHMP establishes a framework and strategy for future land use development of approximately 5,913 acres in unincorporated Sacramento County (referred to herein as the plan area). It includes proposed land use designations and policies, as well as planning for infrastructure and public services. Implementing the WJHMP would provide a mixture of residential, commercial, industrial, recreational, farming, employment, and educational nodes within two districts and three future planning areas.

PROJECT ALTERNATIVES

Chapter 3, "Alternatives," includes evaluation of three alternatives:

- **Alternative 1: No Project Alternative**. This alternative assumes that the project is not approved and development occurs in a manner consistent with adopted land use designations and zoning.
- **Alternative 2: Reduced Footprint Alternative.** This alternative would remove approximately 2,000 acres of land east of Bradshaw Road and south of State Route 16 from the plan area.
- **Alternative 3: Development of Reclamation Lands Alternative.** With this alternative, development would occur only on the aggregate mining properties that are owned by the Project Applicants which will have been reclaimed.

ORGANIZATION OF THIS DRAFT ENVIRONMENTAL IMPACT REPORT

The remainder of this document includes a detailed description of the project, analysis of potential environmental impacts that could result from project implementation, discussion of cumulative and growth-inducing impacts, and evaluation of potential alternatives to the project. This information is organized as detailed below.

Chapter 1, “Introduction,” provides important context, including the purpose and scope of this EIR; an overview of the public and environmental review process; and an outline of the intended use of this EIR.

Chapter 2, “Project Description,” describes the location of the project, project background, existing conditions in the plan area, and the nature and location of specific elements of the project.

Chapter 3, “Alternatives,” describes feasible alternatives to the project, including the no project alternative, describing the consequences of taking no action.

Chapters 4–20 include a topic-by-topic analysis of impacts that would or could result from project implementation. Each chapter includes a discussion of the environmental and regulatory setting, impact analysis, and mitigation measures.

Chapter 21, “Summary of Impacts and Their Disposition,” provides an overview of the environmental evaluation, including impact conclusions and cumulative impacts.

Chapter 22, “Bibliography,” lists all the resources used to prepare this Draft EIR.

Chapter 23, “Acknowledgments,” identifies the preparers of this Draft EIR.

The appendices contain several reference items providing support and documentation of the analyses performed for this EIR.

SCOPING COMMENTS AND AREAS OF CONTROVERSY

The scope and content of this EIR has been informed by comments received from other agencies in response to the revised notice of preparation released in April 2017 (see Appendix A). Generally, concerns raised in response to noticing included:

- location of residences and schools in proximity to established agricultural uses,
- potential to increase vehicle miles traveled on State Route 16,
- potential for project-generated traffic to disrupt interregional travel,
- provision of public transit and opportunities to improve bicycle and pedestrian facilities,
- consistency with the City of Sacramento’s planned transportation infrastructure and the transportation diagram in the Sacramento Area Council of Governments’ adopted Metropolitan Transportation Plan,
- the appropriate mix of residential densities,
- dedication of adequate community park lands,
- potential for off-site impacts associated with the extension of infrastructure, and
- necessary electrical infrastructure.

Expansion of the Urban Policy Area and contemplation of development that is not within identified infill areas has been an area of controversy since the County adopted the 2030 General Plan in 2011. Other key areas of concern identified during the outreach process for this project have related to traffic generation and congestion, and associated greenhouse gas emissions, as well as consistency with the Airport Land Use Plan for Mather Airport.

In addition to their discretion as the lead agency with respect to the requested project entitlements, issues to be resolved by the Board of Supervisors include the choice among alternatives and whether to adopt the mitigation measures identified in this EIR to address the significant effects of the project.

TERMINOLOGY USED IN THIS EIR

This Draft EIR uses the following terminology to describe environmental effects of the project.

Significance Criteria. A set of criteria used by the lead agency to determine at what level, or "threshold," an impact would be considered significant. Significance criteria used in this EIR include those that are set forth in the CEQA Guidelines, or can be discerned from the CEQA Guidelines; criteria based on factual or scientific information; criteria based on regulatory standards of local, state, and federal agencies; and criteria based on goals and policies identified in the Sacramento County General Plan.

Less-than-Significant Impact. A project impact is considered less than significant when it does not reach the standard of significance and would therefore cause no substantial change in the environment. No mitigation is required for less-than-significant impacts.

Potentially Significant Impact. A potentially significant impact is a substantial, or potentially substantial, adverse change in the environment. Physical conditions which exist within the area will be directly or indirectly affected by the proposed project. Impacts may also be short-term or long-term. A project impact is considered significant if it reaches the threshold of significance identified in the EIR. Mitigation measures may reduce a potentially significant impact to a less-than-significant level.

Significant Unavoidable Impact. A project impact is considered significant and unavoidable if it is significant and cannot be avoided or mitigated to a less-than-significant level once the project is implemented.

Cumulative Significant Impact. A cumulative impact can result when a change in the environment results from the incremental impact of a project when added to other related past, present or reasonably foreseeable future projects. Significant cumulative impacts may result from individually minor but collectively significant projects.

Mitigation. Mitigation measures are revisions to the project that would minimize, avoid, or reduce a significant effect on the environment. CEQA Guidelines Section 15370 identifies the following five types of mitigation:

a) Avoiding the impact altogether by not taking a certain action or parts of an action.

b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.

c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.

d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.

e) Compensating for the impact by replacing or providing substitute resources or environments.

MITIGATION MONITORING AND REPORTING PROGRAM

It shall be the responsibility of the future project applicants/property owners to comply with the Mitigation Monitoring and Reporting Program (MMRP) for this project and to reimburse the County for all expenses incurred in the implementation of the MMRP, including any necessary enforcement actions. The future project applicants/property owners shall pay an initial deposit to be determined upon subsequent application review, including administrative costs, which must be paid to the Department of Community Development, Planning and Environmental Review Division prior to recordation of the MMRP and prior to recordation of any final parcel or subdivision map. The remaining balance will be due prior to review of any plans by the Environmental Coordinator or issuance of any building, grading, work authorization, occupancy or other project-related permits. Over the course of the project, the Department of Community Development, Planning and Environmental Review Division will regularly conduct cost accountings and submit invoices to the future project applicants/property owners when the County monitoring costs exceed the initial deposit.

SUMMARY OF SIGNIFICANT IMPACTS AND MITIGATION MEASURES

The following environmental impact and mitigation summary table (Table ES-1) briefly describes the project impacts and the mitigation measures recommended to eliminate or reduce the impacts. The residual impact after mitigation is also identified. Immediately following the summary table is a list of recommendations/requirements of various agencies pertaining to the project, and a description of mandated mitigation monitoring requirements. Detailed discussions of each of the identified impacts and mitigation measures, including pertinent support data, can be found in the specific topic chapters in the remainder of this report.

Table ES-1 Executive Summary of Impacts and Mitigation

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
AESTHETICS			
Impact AE-1: Degradation of Existing Character or Quality of Public Views of the Plan Area and Its Surroundings	S	No mitigation is available.	SU
Impact AE-2: New Sources of Light or Glare	S	**Mitigation Measure AE-2: Lighting Standards** The WJHMP shall be amended to require all lighting applications subject to the 2022 Building Efficiency Standards Section 140.7 during buildout, and as amended thereafter, to use fixtures approved by the International Dark Sky Association.	SU
AGRICULTURAL RESOURCES			
Impact AR-1: Convert Farmland to Non-Agricultural Uses	S	**Mitigation Measure AR-1: Preservation of Farmland** Prior to Sacramento County's approval of onsite grading permits or improvement plans within the portion of the Plan Area where Prime or Local Importance Farmland is impacted, whichever occurs first, the developers of the master plan shall demonstrate that adequate land has been set aside through participation in the South Sacramento Habitat Conservation Plan to offset the loss of Important Farmland within the portion of the Plan Area proposed for development. Acreage of land preserved shall, at a minimum, result in a 1:1 preservation ratio for the portion of the Plan Area under consideration. Farmland preservation can also be achieved through developing urban farms meeting the requirements identified in Sacramento County 2030 General Plan Policy AG-6.	SU

[1] PS = Potentially Significant S = Significant SU = Significant and Unavoidable LS = Less Than Significant

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
Impact AR-2: Result in Conversion of Farmland to Non-Agricultural Use Due to Conflict With Existing, Adjacent Agricultural Use and Zoning	S	**Mitigation Measure AR-2: Provide Right-To-Farm Notification** Prior to the settlement of the real estate transactions, properties sellers and/or agents shall provide a notice to the prospective buyers of properties within 500 feet of existing pasture, cropland, orchards or nurseries. The notice shall appear in the Title Report that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County Right-To-Farm Ordinance.	LTS
AIR QUALITY			
Impact AIR-1: Generate Construction Emissions of Criteria Air Pollutants and Precursors (ROG, NO_X, PM_{10}, AND $PM_{2.5}$) that Exceed Standards	S	**Mitigation Measure AIR-1A: SMAQMD'S Basic Construction Emission Control Practices** For all future land use development applications processed within the plan area, future project applicants, its designee, or subsequent developer(s), shall require its construction contractors to implement SMAQMD's Basic Construction Emission Control Practices in place at the time of construction, which currently include the following: • water all exposed surfaces two times daily (exposed surfaces include, but are not limited to soil piles, graded areas, unpaved parking areas, staging areas, and access roads); • cover or maintain at least 2 feet or free board space on haul trucks transporting soil, sand, or other loose material on the site and cover any haul trucks traveling along freeways or major roadways; • use wet power vacuum street sweepers to remove any visible trackout mud or dirt onto adjacent public roads at least once a day (note: use of dry power sweeping is prohibited); • limit vehicle speeds on unpaved roads to 15 miles per hour (mph);	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• complete construction of all roadways, driveways, sidewalks, parking lots as soon as possible; • building pads should be laid as soon as possible after grading unless seeding or soil binders are used; • provide clear signage the entrances to construction sites that posts the requirement to minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes [required by California Code of Regulations, Title 13, sections 2449(d)(3) and 2485]; and • maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determined to be running in proper condition before it is operated. These measures shall be included in project improvement plans as a condition of approval. **Mitigation Measure AIR-1B: SMAQMD'S Enhanced Exhaust Control Practices for NO_X and Exhaust PM** For all future land use development applications processed within the plan area, future project applicants, their designee, or subsequent developer(s), shall implement SMAQMD's Enhanced Exhaust Control Practices for NO_X and exhaust PM emissions. Before the issuance of grading and/or building permits, future project applicants, or its designee, shall submit to the County and SMAQMD an initial report of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used 8 hours or more during any portion of the construction project before any grading activities. The initial report shall include the horsepower rating, engine model year, and projected hours of use for each piece of equipment. Future project applicants shall provide the anticipated construction timeline including start date, and	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		name and phone number of the project manager and on-site foreman. The information shall be submitted at least four business days before the use of subject heavy-duty off-road equipment. The report shall be updated and submitted monthly throughout the duration of the project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs. • Before any grading activities, future project applicants, or its designee, shall provide a plan for approval by the County and SMAQMD demonstrating that the heavy-duty off-road vehicles (50 horsepower or more) to be used in the construction project, including owned, leased, and subcontractor vehicles, will achieve a project-wide fleet-average of 10 percent NO_X reduction (depending on available technology and engine Tier) compared to the most recent CARB fleet average. This plan shall be submitted in conjunction with the equipment inventory. Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available. If achievement of the aforementioned reductions over the statewide average are deemed infeasible by the County, SMAQMD, or construction contractor, the future project applicants shall ensure the construction fleet meets the lowest fleetwide emissions average possible, through the use of all available on-site emissions reduction measures (e.g., highest tier engines, emission control devices, cleaner burning fuel). • The future project applicants, or its designee, shall submit a final report at the end of the job, phase, or calendar year, as pre-arranged with SMAQMD staff and documented in the approval letter, to demonstrate continued project compliance. If modeled construction-generated emissions of NO_X are not reduced to a level below SMAQMD's thresholds of significance by the	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		application of the aforementioned mitigation measures, then the project developer must pay a mitigation fee into SMAQMD's off-site mitigation program. • Once initial construction activities are finalized by the developer and all on-site mitigation has been exhausted, and before the issuance of grading and/or building permits, quantification of construction-related emissions shall be verified at the project level. As each project-level construction phase is finalized throughout the duration of the project buildout, the mitigation fee shall be calculated based on current information, available construction equipment, and proposed construction activities. As construction activities occur over the buildout period, the developer shall work with SMAQMD to continually update mitigation fees based on actual on-the-ground emissions. The final mitigation fees shall be based on the contractor equipment report provided by the developer to SMAQMD and shall reconcile any fee discrepancies due to schedule adjustments and increased or decreased equipment inventories. Equipment inventories and NO_X emission estimates for subsequent construction phases shall be coordinated with SMAQMD, and the off-site mitigation fee measure shall be assessed to any construction phase that would result in an exceedance of SMAQMD's mass emission threshold for NO_X.	
Impact AIR-2: Generate Long-Term Operational Emissions of Criteria Air Pollutants and Ozone Precursors (ROG, NO_X, PM_{10}, AND $PM_{2.5}$) that Exceed Standards	S	**Mitigation Measure AIR-2: Air Quality Management Plan Reduction Measures** The project shall include the following quantifiable reduction measures included in the AQMP prepared for the project (Appendix B of the EIR), which would reduce the project's operational criteria air pollutants and ozone precursors by, at a minimum, 35 percent in comparison to the "unmitigated" project, as conditions of approval.	SU

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		Electric Vehicle Charing Infrastructure Prior to the issuance of a certificate of occupancy for any project structure with parking, the future project applicants shall demonstrate compliance with the most recently adopted version of the California Green Building Standards (CALGreen Code) Tier 2 voluntary electric vehicle (EV) charging requirements or the mandatory requirements of the most recently adopted version of the County of Sacramento building code, whichever is more stringent. The installation of all EV charging equipment shall be included on the project drawings submitted for the construction-related permit(s) demonstrating the future development is meeting the Tier 2 voluntary EV requirements of the most recent version of the CalGreen code as verified by the County. **Operational Truck Emissions Reductions** The project applicants shall incorporate the following measures into the project contracts (as applicable) to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with operational on-road trucks, along with the potential health risk caused by exposure to toxic air contaminants from operational on-road trucks. These features shall be submitted to the County for review and approval prior to the issuance of building permits and shall be included on the project drawings submitted for the construction-related permit or on other documentation submitted to Planning and Environmental Review. ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions from project-related operational diesel trucks shall be reduced by implementing the following measures: • Equip all truck delivery bays with electrical hook-ups for diesel trucks at loading docks to accommodate plug-in electric truck transport refrigeration units (TRUs) or auxiliary power units during project operations.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Provide a notice on the lease to all new tenants or owners of the project or any portion thereof requiring any truck-intensive uses on the site, such as large grocery stores or distribution facilities with their own fleet of trucks, to use TRUs and auxiliary power units that are electric plug-in capable and trucks that use advanced exhaust technology (e.g., hybrid) or alternative fuels. This shall be enforced through oversight by the County and shall be included as part of contractual lease agreement language to ensure the tenants/lessees are informed of all ongoing operational responsibilities. • Prohibit TRUs from operating at loading docks for more than thirty minutes, and post signs at each loading dock presenting this TRU limit. • All newly constructed loading docks that are on a commercial or industrial property and can accommodate trucks with TRUs shall be equipped with electric vehicle (EV) charging equipment for heavy-duty trucks. This measure does not apply to temporary street parking for loading or unloading. • Prohibit trucks from idling for more than two minutes, and post "no idling" signs at the site entry point, at all loading locations, and throughout the project site. **Best Available Emissions Controls for Stationary Emergency Generators** To reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with operation of any emergency generators that would be installed in the plan area, the future project applicants shall implement the following measures. These features shall be submitted to County Planning and Environmental Review for review and approval, and shall be included on the project drawings submitted for the construction-related permit(s) or on other documentation submitted to the lead agency prior to the issuance of any building permits:	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Permanent stationary emergency generators installed on-site shall have engines that meet or exceed CARB Tier 4 Off-Road Compression Ignition Engine Standards (California Code of Regulations Title 13, Section 2423). If the CARB adopts future emissions standards that exceed the Tier 4 requirement, the emissions standards resulting in the lowest ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions shall apply. • As non-diesel-fueled emergency generator technology becomes commercially available, and subject to the review and approval of the County of Sacramento fire department for safety purposes, non-diesel-fueled generators shall be installed in new buildings, provided that alternative fuels used in generators, such as biodiesel, renewable diesel, natural gas, or other biofuels or other non-diesel emergency power systems, are demonstrated to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions compared to diesel fuel. • For each new diesel backup generator permit submitted to air district for the proposed project, the future project applicants shall submit the anticipated location and engine specifications to the lead agency for review and approval prior to issuance of a permit for the generator. Once operational, all diesel backup generators shall be maintained in good working order for the life of the equipment, and any future replacement of the diesel backup generators must be consistent with these emissions specifications. The operator of the facility at which the generator is located shall maintain records of the testing schedule and emergency operations for each diesel backup generator for the life of that diesel backup generator and shall provide this information for review to the County within three months of requesting such information.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• A non-diesel-fueled emergency generator shall ordinarily be considered commercially available if the generator is capable of serving the intended purpose, is approved by the local fire department, and is available for commercial purchase and installation within California. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such generators are commercially unavailable, the operator must submit documentation from a minimum of three (3) non-diesel-fueled emergency generator dealers demonstrating the inability to obtain the required non-diesel-fueled emergency generators needed within 6 months.	
Impact AIR-3: Conflict With an Air Quality Plan	S	Implement Mitigation Measure AIR-2	SU
Impact AIR-4: Result in Substantial Mobile-Source CO Concentrations	LTS	No mitigation is required.	LTS
Impact AIR-5: Exposure of Sensitive Receptors to TACs	S	**Mitigation Measure AIR-5A: CARB Land Use Siting Standards** The design guidelines and development standards of the Master Plan shall include consideration of CARB's *Air Quality and Land Use Handbook: A Community Health Perspective* recommendations in land use siting. These include the following. • Prohibit siting new sensitive land uses within 500 feet of urban roads carrying 100,000 vehicles per day. • Prohibit siting new sensitive land uses within 300 feet of a large gasoline station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation is recommended for typical gasoline-dispensing facilities.	SU

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Prohibit siting new sensitive land uses within 300 feet of any dry-cleaning operation using perchloroethylene. For operations with two or more machines, provide 500 feet. For operations with three or more machines, consult the local air district. Do not site new sensitive land uses in the same building with dry-cleaning operations that use perchloroethylene. • Obtain facility-specific information from SMAQMD where there are questions about siting a sensitive land use close to an industrial facility, including the amount of pollutant emitted and its toxicity, distance to nearby receptors, and types of emissions controls in place. **Mitigation Measure AIR-5B: Project-Level Construction and Operational Health Risk Assessment** Future project applicants shall prepare construction and operational health risk assessments (HRAs) specific to each proposed development in the plan area. For projects that do not introduce a new stationary source of TACs (i.e., residential development), an operational HRA need not be prepared. The HRAs shall be prepared by a qualified air quality analyst and submitted to the County of Sacramento for review and approval prior to project approval as a component of an initial entitle application package. The HRAs shall be prepared based on the latest methodology recommended by the Office of Environmental Health Hazard Assessment (OEHHA) and the Sacramento Metropolitan Air Quality Management District (SMAQMD). The HRAs shall evaluate the development's potential health risk impacts pursuant to SMAQMD CEQA guidelines and thresholds. Specifically, each HRAs must evaluate the development's incremental increase in cancer risk, acute hazard index, chronic hazard index, and annual average concentrations of particulate matter in size fractions of 2.5 microns or less	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		in diameter ($PM_{2.5}$) associated with the development's TAC emissions at all sensitive receptor locations within 1,000 feet of the development's boundaries. Impacts shall be identified by comparing health risks to the SMAQMD's current CEQA health risk thresholds (the current thresholds as of April 2024 are an incremental increase in cancer risk greater than 10 in one million or a hazard index greater than 1). The HRAs must also identify all feasible mitigation measures to reduce the development's potentially significant impacts to less-than-significant levels. Any mitigation measures reported in the HRAs shall be implemented by the applicants and enforced by the County of Sacramento.
		
		Mitigation Measure AIR-5C: Clean Off-Road Construction Equipment
		
		In order to reduce the impact of PM10 off-road equipment exhaust emissions during construction, the applicant shall ensure that all construction contracts stipulate the following as a component of the project's construction plans:
		
		• Engine Requirements:
		  • All portable engines, such as generators, shall be electric. If grid electricity is not available, propane or natural gas generators shall be used.
		  • Electric engines shall be used for all equipment that is commercially available as plug-in or battery-electric equipment, to the maximum extent feasible during each construction phase and activity. Portable equipment shall be powered by grid electricity if available. Electric equipment shall include, but is not limited to, concrete/industrial saws, sweepers/scrubbers, aerial lifts, welders, air compressors, fixed cranes, forklifts, and cement and mortar mixers, pressure washers, and pumps. To qualify for an exception, future project applicants	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		shall provide the County with evidence supporting its conclusion that electric equipment is not commercially available and shall use the next cleanest piece of off-road equipment in terms of diesel PM and $PM_{2.5}$. • Engines that cannot be electrically powered must meet or exceed either EPA or CARB Tier 4 Final or cleaner engines. Exceptions to the requirement for engines that meet Tier 4 Final emission standards shall include only select pieces of specialty equipment, such as those specified below, for which such engines may not be commercially available at the start of a construction phase requiring that equipment. Exceptions may be granted for certain pieces of equipment; examples include bore/drill rigs required for grading/shoring/excavation and for mobile cranes required for building construction. To qualify for an exception, future project applicants shall provide the County with evidence supporting its conclusion that equipment meeting Tier 4 Final standards is not commercially available and shall use the next cleanest piece of off-road equipment in terms of diesel PM and $PM_{2.5}$. • Engines shall be fueled with alternative fuels, including natural gas, propane, hydrogen fuel cell, and electricity, as commercially available and to the maximum extent feasible during each construction phase and activity. • Any other best technology available in the future may be included in the construction emissions minimization plan as substitutions for the above items a–d, provided that the project sponsor submits documentation to the lead agency demonstrating that (1) the technology would result in comparable ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions reductions and (2) it would not increase other pollutant emissions or exacerbate other impacts, such as	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		noise. This may include new alternative fuels or engine technology for off-road equipment (such as electric or hydrogen fuel cell equipment) that is not available as of 2024. • Idling time for off-road equipment shall be limited to 2 minutes, except as provided in exceptions to the applicable state regulations regarding idling for offroad equipment. Documentation shall be provided to equipment operators in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit. • Construction operators shall be required to properly maintain and tune equipment in accordance with manufacturer specifications. For the purpose of this mitigation measure, "not commercially available" is defined as either: (1) not being used for other large-scale projects in Sacramento County occurring at the same time; (2) cannot be obtained without significant delays to critical-path timing of construction; or (3) not available within the larger northern California region. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. For the County to make a determination that such equipment is commercially unavailable, the operator must submit documentation from a minimum of three (3) electric offroad equipment dealers demonstrating the inability to obtain the required electric equipment needed within 6 months. **Mitigation Measure AIR-5D: Clean On-Road Construction Trucks** Heavy-duty on-road construction trucks shall comply with the following, which would reduce PM_{10} and $PM_{2.5}$ emissions:	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		• Engine Requirements:
		  • All on-road heavy-duty diesel trucks with a gross vehicle weight rating of 19,500 pounds or greater used at the plan area (such as haul trucks, water trucks, dump trucks, concrete trucks, and vendor trucks) shall be model year 2020 or newer.
		  • Use alternative fuels as commercially available, such as natural gas, propane, hydrogen fuel cell, and electric vehicles or other fuels where the future project applicants can provide evidence which suggests that PM_{10} and $PM_{2.5}$ emissions would be reduced compared to conventional diesel fuel.
		  • Any other best technology available in the future (i.e., not available as of 2023) may be used in lieu of or in addition to the above items, provided that the project sponsor submits documentation to the County demonstrating that (1) the technology would result in comparable PM_{10} and $PM_{2.5}$ emissions reductions and (2) that such measures would not increase other pollutant emissions or result in other impacts, such as noise. This may include new alternative fuels for on-road trucks.
		  • An alternative-fueled and ZEV truck shall ordinarily be considered commercially available if the vehicle is capable of serving the intended purpose and is included in California's Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project, https://californiahvip.org/ or listed as available in the US on the Global Commercial Vehicle Drive to Zero inventory, https://globaldrivetozero.org/. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such vehicles are commercially unavailable, the	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		operator must submit documentation from a minimum of three ZEV dealers identified on the californiahvip.org website demonstrating the inability to obtain the required ZEVs or equipment needed within 6 months. This shall be enforced through oversight by the County and shall be included as part of contractual lease agreement language to ensure the tenants/lessees are informed of all ongoing operational responsibilities. • Require the idling time for on-road vehicles be limited to 2 minutes, except as provided in exceptions to the applicable state regulations regarding idling for on-road vehicles. Documentation shall be provided to truck drivers in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit.	
Impact AIR-6: Exposure to Odors Affecting A Substantial Number of People	LTS	No mitigation is required.	LTS
AIRPORT COMPATIBILITY			
Impact AC-1: Result in a Safety Hazard to People Living and Working in the Vicinity of an Airport	LTS	No mitigation is required.	LTS
Impact AC-2: Result in Exposure to Excessive Noise Levels Associated With Airport Operations	S	**Mitigation Measure AC-2A: Noise Mitigation Within the Mather Airport 60 CNEL Noise Contours** All residential development proposed within the Mather Airport 60 CNEL noise contours shall include sufficient noise mitigation to satisfy the requirements of Sacramento County General Plan Policies NO-2, NO-3, and NO-4, including the footnotes to General Plan Noise Element Table 4.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		Mitigation Measure AC-2B: Acoustical Testing Plan for Residences Within the 60-65 DB CNEL Mather Airport Noise Contours Implement the Acoustical Testing Plan for Mather Airport for residences proposed within the 60-65 dB CNEL Mather Airport noise contours (HMMH 2022). This testing plan shall be followed to ensure satisfaction of the County General Plan policies pertaining to Mather Airport noise exposure within new residential developments. The following measures, which shall be implemented for homes constructed between the 60 and 65 dB CNEL contours (Bollard Acoustical Consultants 2022): 1. The master permit plan set for each floorplan type to be built between the 60 and 65 dB CNEL contours shall include the following: a. All exterior door and window assemblies of each residence shall provide a minimum sound transmission class rating of 32 and a minimum outdoor-indoor transmission class (OITC) rating of 28, respectively. b. The exterior structural façade elements shall satisfy an OITC rating of at least 28. For example, exterior walls should achieve OITC 28 via an insulated 2x4 construction with gypsum board on the interior and siding over sheathing on the exterior. c. All structural façade elements should be properly installed to prevent any noise leakage. Construction plans shall include notes stating that exterior doors shall compress the seals when fully closed and locked with a deadbolt. d. Residential structures shall include positive flow ventilation systems designed to provide adequate fresh air circulation to allow all of the exterior	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		windows and doors to remain closed to achieve the noise level reduction from aircraft operations. 2. The master permit plan set for each floorplan type to be built between the 60 and 65 dB CNEL contours, shall be reviewed by an acoustical consultant to ensure the designs will provide a minimum OITC rating of 25 for the exterior facades of habitable spaces of the residence. The findings of this review shall be provided to the County of Sacramento as a condition to issuance of building permits for homes conforming to a master permit set for a floorplan type. 3. In order to verify that homes are constructed in substantial conformance to a particular master permit plan set for a floorplan type and satisfy the design goal of achieving 25 dB noise level reduction (NLR), post-construction acoustical testing shall be conducted in conformance with the methodology prescribed in the Acoustical Testing Plan for Mather Airport (HMMH 2022). 4. Appropriate solar power capacity shall be provided to ensure compliance with Title 24 to account for the need to keep windows closed for acoustic isolation.	
Impact AC-3: Result in Effects on Safe and Efficient Use of Navigable Airspace	LTS	No mitigation is required.	LTS
BIOLOGICAL RESOURCES			
Impact BR-1: Result in Loss of Wetlands and Surface Waters	S	**Mitigation Measure BR-1a: Site Specific Biological Reports** Prior to an entitlement application being deemed complete, future projects within the WJHMP area shall prepare a site specific biological resources assessment in accordance with the Sacramento County Guidelines for SSHCP Biological Resources Reports. The report shall contain information that documents existing landcover	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		habitats as defined in the SSHCP and an assessment of species occurrences and potential habitat for SSHCP covered species. If potentially state or federal jurisdictional waters occur onsite, then an aquatic resources delineation shall also be prepared. **Mitigation Measure BR-1b: South Sacramento Habitat Conservation Plan Participation** Future project applicants shall participate in the South Sacramento Habitat Conservation Plan (SSHCP). Prior to the approval of grading permits, civil improvement plans, or building permits (whichever occurs first): • project applicants shall prepare project plans in accordance with the SSHCP, and follow all avoidance and minimization measures (AMMs) outlined in the SSHCP. To compensate for the permanent loss of terrestrial and aquatic SSHCP landcover types, project applicants shall complete payment of all SSHCP landcover mitigation fees pursuant to the current fee schedule, or land dedications to compensate for losses of terrestrial and aquatic landcovers AMMs currently provided in the SSHCP are included in Appendix F. Species specific AMMs include compliance with the following, as applicable and identified in project level biological surveys per Mitigation Measure BR-1a. • Ahart's dwarf rush, • Boggs lake hedge-hyssop, • legenere, • dwarf downingia, • pin cushion navarretia, • Sacramento orcutt grass, • saline clover, • Sanford's arrowhead, • slender orcutt grass,	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Crotch bumble bee, • midvalley fairy shrimp, • vernal pool tadpole shrimp, • vernal pool fairy shrimp, • Ricksecker's scavenger beetle, • valley elderberry longhorn beetle, • western spadefoot, • giant garter snake, • western pond turtle, • Cooper's hawk, • tricolored blackbird, • western burrowing owl, • golden eagle, • ferruginous hawk, • Swainson's hawk, • northern harrier, • white-tailed kite, • loggerhead shrike, • western red bat, and • American badger.	
Impact BR-2: Have a Substantial Adverse Effect on Special-Status Mammals	S	Implement Mitigation Measures BR-1a and BR-1b. **Mitigation Measure BR-2: Conduct American Badger Surveys and Avoid Active Dens** Before construction activities within suitable habitat for American badger, a qualified biologist shall conduct surveys to identify any American badger burrows/dens. These surveys shall be conducted not more than 15 days before the start of construction. If occupied burrows are not found, further mitigation will not be required. If occupied burrows are found, CDFW shall be notified and	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		impacts to active badger dens shall be avoided by establishing exclusion zones around all active badger dens, within which construction-related activities shall be prohibited until denning activities are complete or the den is abandoned. A qualified biologist shall monitor each den once per week to track the status of the den and to determine when a den area has been cleared for construction.	
Impact BR-3: Have a Substantial Adverse Effect on Special-Status Birds	S	Implement Mitigation Measures BR-1a and BR-1b. **Mitigation Measure BR-3: Common Bird (Including Raptors) Nesting Surveys and Active Nest Avoidance** Tree removal and tree trimming activities shall be confined between September 1 and the end of February. If tree removal or tree trimming occurs between November 15 and the end of February, a pre-activity survey for nesting great-horned owl shall take place as they tend to start nesting in mid-November in our region. To minimize potential loss or disturbance of raptors and active common bird nests, project activities, including removal of ground vegetation, shall occur during the non-breeding season. If all suitable nesting habitat is removed during the non-breeding season, no further mitigation is required. If it is not feasible to remove vegetation prior to the breeding season (March 1-August 31), the project proponent will retain a qualified biologist to conduct pre-activity surveys for nesting birds on and within 500 feet of disturbance activities. The surveys will be conducted no more than 7 days before ground disturbance activities commence (including vegetation removal). If active bird nests are found, the qualified biologist shall establish buffers around nests that are sufficient to ensure that breeding is not likely to be disrupted or adversely affected by construction. Buffers around active	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		common bird nests will be a minimum of 50 feet. Buffers around raptor nests, besides Swainson's hawk, will be a minimum of 500 feet, unless the qualified biologist determines that smaller buffers would be sufficient or greater buffers are needed to avoid impacts to nesting birds. Factors to be considered for determining buffer size will include: the presence of natural buffers provided by vegetation or topography; nest height; locations of foraging territory; and baseline levels of noise and human activity. Buffers will be maintained until young have fledged or the nests become inactive.	
Impact BR-4: Have a Substantial Adverse Effect on Special-Status Reptiles	S	Implement Mitigation Measures BR-1a and BR-1b.	LTS
Impact BR-5: Have a Substantial Adverse Effect on Special-Status Amphibians	S	Implement Mitigation Measures BR-1a and BR-1b.	LTS
Impact BR-6: Have a Substantial Adverse Effect on Special-Status Invertebrates	S	Implement Mitigation Measures BR-1a and BR-1b. **Mitigation Measure BR-6A: Habitat Assessment for Crotch's Bumble Bee Habitat** For areas that have potential to provide foraging, nesting, or overwintering habitat for Crotch's bumble bees (i.e., most areas that do not solely contain developed land covers, including gardens and some other urban landscaping in otherwise developed areas): • A qualified biologist shall assess the WJHMP area through a desktop analysis and site visit to determine whether the WJHMP area contains foraging, nesting, or overwintering habitat for Crotch's bumble bee. If the site visit does not occur during the blooming season for most flowering plants, historic aerial imagery will be referenced and a conservative approach will be used to determine whether potential foraging habitat for the species is present.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• If habitat suitable for Crotch's bumble bee is determined not to be present on the WJHMP area, then further mitigation would not be required. • If habitat suitable for Crotch's bumble bee is determined to be present on the WJHMP area, then Mitigation Measure BR-6b and Mitigation Measure BR-6c shall be implemented. **Mitigation Measure BR-6B: Limited Operating Period During the Crotch's Bumble Bee Colony Active Period** For WJHMP areas that contain foraging habitat only, or foraging habitat and nesting habitat for Crotch's bumble bee (i.e., no overwintering habitat), initial ground-disturbing work (e.g., grading, vegetation removal, staging) shall take place between August 15 and March 15, if feasible, to avoid impacts on nesting Crotch's bumble bees. If this limited operating period is determined to be infeasible, Mitigation Measure BR-6c shall be implemented. **Mitigation Measure BR-6C: Focused Surveys and Avoidance Measures for Crotch's Bumble Bee** WJHMP areas that contain overwintering habitat likely also contain foraging and nesting habitat. Therefore, Crotch's bumble bees may be present in these WJHMP areas year-round, there is no limited operating period that would completely avoid impacts on Crotch's bumble bee. If the limited operating period for WJHMP areas that contain foraging habitat only or foraging habitat and nesting habitat (i.e., no overwintering habitat) is determined to be infeasible, or for WJHMP areas that contain overwintering habitat, the following shall be implemented:	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		• Future project applicants shall retain a qualified biologist familiar with bumble bees of California and experienced using survey methods for bumble bees. The qualified biologist shall conduct a habitat assessment and focused survey for Crotch's bumble bee before the start of any ground-disturbing activities. Surveys shall be performed when Crotch's bumble bee is most likely to be identified, typically from April through August when floral resources and ideal weather conditions are present, and shall follow the methods in Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species (CDFW 2023) or any subsequent protocol approved by CDFW.
		• Future project applicants shall submit a survey report to CDFW within 1 month of survey completion and shall notify CDFW within 24 hours if Crotch's bumble bees are detected.
		• If Crotch's bumble bees are detected during the focused survey, appropriate avoidance measures shall be implemented. Avoidance measures may include, but not be limited to, the following:
		  • Protective buffers shall be implemented around active nesting colonies or overwintering queens until these sites are no longer active. A qualified biologist, in consultation with CDFW, shall determine the appropriate buffer size to protect nesting colonies or overwintering queens.
		  • If impacts on Crotch's bumble bee cannot be avoided, future project applicants shall obtain an incidental take permit (ITP) from CDFW and shall implement all avoidance measures included in the ITP and will provide compensatory mitigation for loss of Crotch's bumble bee habitat as specified in the terms of the ITP. While Crotch's bumble bee is not	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		covered by the SSHCP; participation in the SSHCP would result in preservation of grassland habitat to offset the loss of Swainson's hawk foraging habitat, which could simultaneously offset the loss of habitat for Crotch's bumble bee.	
Impact BR-7: Have a Substantial Adverse Effect on Special-Status Plants	S	Implement Mitigation Measures BR-1a and BR-1b.	LTS
Impact BR-8: Result in the Loss of Trees	S	**Mitigation Measure BR-8A: Arborist Report and Native Tree Protection** i. Project proponents of subsequent development projects within the WJHMP area shall submit an arborist report for the project impact areas when appropriate habitat exists. The report shall include the species, diameter at breast height (dbh), dripline, and health of the trees present, and shall be prepared by an ISA certified arborist. The report shall include an exhibit that shows the trees and their driplines in proximity to the project improvements. The report shall identify any tree proposed for removal and shall quantify any encroachment from project equipment or facilities within driplines of native trees. ii. The removal of native trees shall be compensated for by planting in-kind native trees equivalent to the dbh inches lost, based on the ratios listed below, at locations that are authorized by the Environmental Coordinator. On-site preservation of native trees that are less than 6 inches dbh may also be used to meet this compensation requirement. Replacement tree planting shall be completed prior to approval of grading or improvement plans, whichever comes first. Equivalent compensation based on the following ratio is required:	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• one preserved native tree < 6 inches dbh on-site = 1 inch dbh, • one D-pot seedling (40 cubic inches or larger) = 1 inch dbh, • one 15-gallon tree = 1 inch dbh, • one 24-inch box tree = 2 inches dbh, and • one 36-inch box tree = 3 inches dbh. Prior to the approval of Improvement Plans or Building Permits, whichever occurs first, a Replacement Tree Planting Plan shall be prepared by a certified arborist or licensed landscape architect and shall be submitted to the Environmental Coordinator for approval. The Replacement Tree Planting Plan(s) shall include the following minimum elements: 1. species, size and locations of all replacement plantings and < 6-inch dbh trees to be preserved; 2. method of irrigation; 3. if planting in soils with a hardpan/duripan or claypan layer, include the Sacramento County Standard Tree Planting Detail L-1, including the 10-foot deep boring hole to provide for adequate drainage; 4. planting, irrigation, and maintenance schedules; 5. identification of the maintenance entity and a written agreement with that entity to provide care and irrigation of the trees for a 3-year establishment period, and to replace any of the replacement trees which do not survive during that period; and 6. designation of 20-foot root zone radius and landscaping to occur within the radius of trees < 6 inches dbh to be preserved on-site. No replacement tree shall be planted within 15 feet of the driplines of existing native trees or landmark size trees that are retained on-site, or within 15 feet of a building	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		foundation or swimming pool excavation. The minimum spacing for replacement native trees shall be 20 feet on-center. Examples of acceptable planting locations are publicly owned lands, common areas, and landscaped frontages (with adequate spacing). Generally unacceptable locations are utility easements, under overhead utility lines, private yards of single-family lots (including front yards), and roadway medians. Native trees <6 inches dbh to be retained on-site shall have at least a 20-foot radius suitable root zone. The suitable root zone shall not have impermeable surfaces, turf/lawn, dense plantings, soil compaction, drainage conditions that create ponding (in the case of oak trees), utility easements, or other overstory tree(s) within 20 feet of the tree to be preserved. Trees to be retained shall be determined to be healthy and structurally sound for future growth by an ISA Certified Arborist subject to Environmental Coordinator approval. If tree replacement plantings are demonstrated to the satisfaction of the Environmental Coordinator to be infeasible for any or all trees removed, then compensation shall be through payment into the County Tree Preservation Fund. Payment shall be made at a rate of $325.00 per dbh inch removed but not otherwise compensated, or at the prevailing rate at the time payment into the fund is made. **Mitigation Measure BR-8B: Native Tree Construction Protection** a) With the exception of the native trees removed and compensated for through Mitigation Measure BR-8a, all healthy native trees that are 6 inches dbh or larger on the WJHMP area, all portions of adjacent off-site healthy native trees that are 6 inches dbh or larger and have driplines that extend onto the WJHMP area, and all off-site healthy native trees that are 6 inches dbh or	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		larger and could be damaged by utility installation and/or improvements associated with this project, shall be preserved and protected as follows: 1. A circle with a radius measurement from the trunk of the tree to the tip of its longest limb shall constitute the dripline protection area of the tree. Limbs shall not be cut back to change the dripline. The area beneath the dripline is a critical portion of the root zone and defines the minimum protected area to sustain the tree. Removing limbs which make up the dripline does not change the protected area. 2. Chain link fencing or a similar protective barrier shall be installed one foot outside the driplines of the native trees prior to initiating project construction to avoid damage to the trees and their root systems. 3. No signs, ropes, cables (except cables which may be installed by a certified arborist to provide limb support) or any other items shall be attached to the native trees. 4. No vehicles, construction equipment, mobile home/office, supplies, materials or facilities shall be driven, parked, stockpiled or located within the driplines of the native trees. 5. Any soil disturbance (scraping, grading, trenching, and excavation) is to be avoided within the driplines of the native trees. Where this is necessary, an ISA Certified Arborist will provide specifications for this work, including methods for root pruning, backfill specifications and irrigation management guidelines. 6. All underground utilities and drain or irrigation lines shall be routed outside the driplines of native trees. Trenching within protected tree driplines is not permitted. If utility or irrigation lines must encroach	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		upon the dripline, they should be tunneled or bored under the tree under the supervision of an ISA Certified Arborist. 7. If temporary haul or access roads must pass within the driplines of oak trees, a roadbed of six inches of mulch or gravel shall be created to protect the root zone. The roadbed shall be installed from outside of the dripline and while the soil is in a dry condition, if possible. The roadbed material shall be replenished as necessary to maintain a 6-inch depth. 8. Drainage patterns on the site shall not be modified so that water collects or stands within, or is diverted across, the dripline of oak trees. 9. No sprinkler or irrigation system shall be installed in such a manner that it sprays water within the driplines of the oak trees. 10. Tree pruning that may be required for clearance during construction must be performed by an ISA Certified Arborist or Tree Worker and in accordance with the American National Standards Institute (ANSI) A300 pruning standards and the International Society of Arboriculture (ISA) “Tree Pruning Guidelines”. 11. Landscaping beneath the oak trees may include non-plant materials such as boulders, decorative rock, wood chips, organic mulch, and non-compacted decomposed granite. Landscape materials shall be kept 2 feet away from the base of the trunk. The only plant species which shall be planted within the driplines of the oak trees are those which are tolerant of the natural semi-arid environs of the trees. Limited drip irrigation approximately twice per summer is recommended for the understory plants.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		12. Any fence/wall that will encroach into the dripline protection area of any protected tree shall be constructed using grade beam wall panels and posts or piers set no closer than 10 feet on center. Posts or piers shall be spaced in such a manner as to maximize the separation between the tree trunks and the posts or piers in order to reduce impacts to the trees. 13. For a project constructing during the months of June, July, August, and September, deep water trees by using a soaker hose (or a garden hose set to a trickle) that slowly applies water to the soil until water has penetrated at least 1 foot in depth. Sprinklers may be used to water deeply by watering until water begins to run off, then waiting at least an hour or two to resume watering (provided that the sprinkler is not wetting the tree's trunk). Deep water every 2 weeks and suspend watering 2 weeks between rain events of 1 inch or more.	
Impact BR-9: Disturb Riparian Habitats	S	Implement Mitigation Measures BR-1a and BR-1b.	LTS
Impact BR-10: Interfere With the Movement of any Native Resident or Migratory Species or Impede the Use of Native Wildlife Nursery Sites	S	Implement Mitigation Measures BR-1a, BR-1b, and BR-3.	LTS
Impact BR-11: Result in Potential Inconsistency With the South Sacramento Habitat Conservation Plan	LTS	No mitigation is required.	LTS
CLIMATE CHANGE			
Impact CC-1: Result in Project-Generated GHG Emissions and Potential Inconsistency with Plans and Regulations	S	Implement Mitigation Measures AQ-1a, AQ-1b, AQ-1d, AQ-1e, AQ-1f, AQ-2a, AQ-2b, and AQ-3c.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		Mitigation Measure CC-1A: Construction GHG Emissions Reduction
		County approval of any grading or improvement plans shall include the following SMAQMD Construction GHG Emissions Reduction Measures:
		• Improve fuel efficiency from construction equipment:
		  • Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to no more than 2 minutes (5-minute limit is required by the state airborne toxics control measure [Title 13, Sections 2449(d)(3) and 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site.
		  • Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determined to be running in proper condition before it is operated.
		  • Train equipment operators in proper use of equipment.
		• Perform on-site material hauling with trucks equipped with on-road engines.
		• Use alternative fuels for generators at construction sites such as propane or solar, or
		• Use electrical power, as feasible for each construction site and development project.
		• Use a CARB-approved low carbon fuel for construction equipment, such as renewable diesel, if commercially available and feasible for use, in construction equipment for each construction site and development project (NOx emissions from the use of low carbon fuel must be reviewed and any increases in NOx through the use of low carbon fuel must be mitigated.)	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Encourage and provide carpools, shuttle vans, transit passes and/or secure bicycle parking for construction worker commutes. • Reduce electricity use in the construction office by using compact fluorescent bulbs, powering off computers every day, and replacing heating and cooling units with more efficient ones. • Recycle or salvage non-hazardous construction and demolition debris (goal of at least 75 percent by weight). • Use locally sourced or recycled materials for construction materials (goal of at least 20 percent based on costs for building materials, and based on volume for roadway, parking lot, sidewalk and curb materials). Wood products utilized should be certified through a sustainable forestry program. • Minimize the amount of concrete for paved surfaces or utilize a low carbon concrete option. • Produce concrete on-site if determined to be less emissive than transporting ready mix and if feasible for each construction site and development project. • Use SmartWay certified trucks for deliveries and equipment transport. • Develop a plan to efficiently use water for adequate dust control. **Mitigation Measure CC-1B: Refrigerant Emissions** Prior to the issuance of building permits, the future project applicants shall demonstrate to the County that low-global warming potential refrigerants in heat pumps shall be installed in residential and nonresidential buildings, such as for HVAC systems, water heaters, and refrigeration.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		Mitigation Measure CC-1c: Greenhouse Gas Reduction Plan
		Prior to the approval of entitlements, improvement plans, or grading permits, each future nonresidential or mixed-use development project implemented under the plan area buildout shall prepare a GHG Reduction Plan meeting the requirements stipulated in Appendix B of this Draft EIR. Future nonresidential development must demonstrate that additional measures contribute its "fair share" toward reducing project-wide GHG emissions 18,234 $MTCO_2e$ per year or 1.02 $MTCO_2e$ per year per 1,000 square feet of non-residential development. Considering the total development area, a hypothetical 100,000 square foot nonresidential project would represent 0.56 percent of the total nonresidential development area and would be required to show a GHG emissions reduction or savings of 102 $MTCO_2e$ per year, which would represent 0.56 percent of the 18,234 $MTCO_2e$ per year reduction required for the nonresidential development in the plan area.
		The following mechanisms may be used to demonstrate compliance with the project's reduction targets:
		• *Compliance with the Sacramento County Communitywide Climate Action Plan (CAP)*. If Sacramento County has adopted a Revised CAP that aligns with the long-term targets of AB 1279, compliance with provisions of the CAP may be applied.
		• *Reduce Vehicle Miles Traveled*. Reduce VMT traveled by project residents and employes through the implementation of reasonable design measures such as:
		  • improve or increase access to transit;
		  • increase access to common goods and services, such as groceries, schools, and daycare;	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• incorporate affordable housing into the project; • orient the project toward transit, bicycle and pedestrian facilities; • improve pedestrian or bicycle networks, or transit service; • provide traffic calming; • provide bicycle parking; • limit or eliminate parking supply; • unbundle parking costs; • provide parking cash-out programs; • implement roadway pricing; • implement or provide access to a commute reduction program; • provide car-sharing, bike sharing, and ride-sharing programs; • provide transit passes; • shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services; • provide telework options; • provide incentives or subsidies that increase the use of modes other than single-occupancy vehicle; • provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms; • provide employee transportation coordinators at employment sites; and • provide a guaranteed ride home service to users of non-auto modes.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		• *Promote Electric and Alternative-Fuel Vehicles*. Promote the use of alternative fuel and electric vehicles through implementation of reasonable and feasible design measures, such as:
		  • develop and implement electric vehicle charging infrastructure plan;
		  • install electric vehicle charging stations at residential and commercial buildings; and
		  • install electric vehicle charging and natural gas fueling stations at public facilities, such as at parking lots and retail centers.
		• *Minimize Energy Demand*. Construct and operate an environmentally sound project that minimizes electricity demand through implementation of reasonable and feasible design measures, such as:
		  • exceed 2022 Title 24 Energy Efficiency requirements;
		  • electrify loading docks to reduce emission from engine idling of transport refrigeration units;
		  • install all-electric appliances, including water heaters and heating, ventilation, and air conditioning (HVAC) systems;
		  • implement indoor water use efficiency;
		  • use energy efficient street lighting fixtures;
		  • include of electric vehicle parking infrastructure;
		  • institute a composting and recycling program in excess of local standards; and
		  • implement an Urban Forestry Management Plan to reduce the urban heat island effect.
		• *On-Site Renewable Energy Use*. During the design phase, conduct analysis to optimize on-site renewable energy use to reduce further reduce project GHG emissions, based on the site layout, environmental	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		factors, and viable technology available as confirmed in a formal report submitted for County approval. Specific actions may include: • On-site carbon-zero renewable energy capable of serving energy needs of any urban development in the plan area, including energy needed for streetlights, sewer pumps, drainage pumps, traffic signals, and water pumps. • Residential photovoltaic systems designed to be scalable over time to accommodate varying energy demands. • *Renewable Power Purchase Agreement*. Procure renewable energy from off-site sources within California via purchases from one or more of the following, depending on regulatory feasibility and availability: (a) Sacramento Municipal Utility District (SMUD); (b) a community choice aggregator such as the joint SMUD agreement with Valley Clean Energy and the East Bay Community Energy; or (c) other renewable energy provider. • *Renewable Energy Certificates*. Procure and retire Renewable Energy Certificates (also known as RECs, green tags, Renewable Energy Credits, Renewable Electricity Certificates, or Tradable Renewable Certificates) for projects or activities located in California as confirmed in a formal report submitted for County approval. • *Purchase Real, Quantifiable, Permanent, Verifiable, Enforceable, and Additional Carbon Offsets.* If, following the application of all feasible on-site GHG reduction measures listed above would continue to generate GHG emissions exceeding the nonresidential target of 102 $MTCO_2e$ per year per 1,000 square feet, the future project applicants shall offset the remaining GHG emissions by funding activities that directly reduce or	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		sequester GHG emissions or by purchasing and retiring carbon credits as confirmed in a formal report submitted for County approval. To the degree that a project relies on GHG mitigation measures, Sacramento County, SMAQMD, and CARB recommend that project applicants prioritize on-site design features, such as those listed under above and direct investments in GHG reductions within the vicinity of the plan area to provide potential air quality and economic co-benefits locally. While emissions of GHGs and their contribution to climate change is a global problem, emissions of air pollutants, which have an adverse localized effect, are often emitted from similar activities that generate GHG emissions (i.e., mobile, energy, and area sources). For example, direct investment in a local building retrofit program could pay for cool roofs, solar panels, solar water heaters, smart meters, energy efficient lighting, energy efficient appliances, energy efficient windows, insulation, and water conservation measures for homes in the plan area. Other examples of local direct investments include financing installation of regional electric vehicle charging stations, paying for electrification of public school buses, and investing in local urban forests. These investments would not only achieve GHG reductions, but would also directly improve regional and local ambient air quality. However, to adequately mitigate GHG emissions 102 $MTCO_2e$ per year per 1,000 square feet, it is critical that any such investments in actions to reduce GHG emissions meet the criteria of being real, quantifiable, permanent, verifiable, enforceable, and additional, consistent with the standards set forth in Health and Safety Code Section 38562, subdivisions (d)(1) and (d)(2) through the submittal of a formal report for	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		County approval demonstrating that offsets meet these criteria. Such credits shall be based on protocols approved by CARB, consistent with Section 95972 of Title 17 of the California Code of Regulations. The future project applicants shall not use offset projects originating outside of California, except to the extent that the quality of the offsets, and their sufficiency under the standards set forth herein, can be verified by the County or SMAQMD. Such credits must be purchased through one of the following: (i) a CARB-approved registry, such as the Climate Action Reserve, the American Carbon Registry, and the Verified Carbon Standard; (ii) any registry approved by CARB to act as a registry under the California Cap and Trade program; or (iii) through the California Air Pollution Control Officers Association's (CAPCOA's) GHG Rx and SMAQMD.	
CULTURAL RESOURCES			
Impact CR-1: Cause a Substantial Adverse Change in the Significance of a Built-Environment Historical Resource	S	**Mitigation Measure CR-1: Historic Resource Surveys on Non-Participant Properties Prior to Development** Prior to the development or redevelopment of non-participant properties, during the entitlement phase or design review, whichever is first, intensive historic resources surveys will be required for all historic-age buildings and structures. Buildings or structures 50 years old or older will be documented on a California Department of Parks and Recreation 523 forms and their significance shall be assessed by a qualified architectural historian and evaluated against National Register of Historic Places and California Register of Historical Resources criteria. For buildings or structures that do not meet significance and integrity criteria, no further mitigation is required.	SU

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		If historical resources are determined to be present, then the potential impacts of any proposed future projects must be determined and all appropriate measures will be implemented. If the project cannot avoid modifications to a historic building or structure, the following protocol shall be followed: (i) If the building or structure can be preserved on-site, but remodeling, renovation or other alterations are required, this work shall be conducted in compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings. (ii) If a significant historic building or structure is proposed for major alteration or renovation, or to be moved and/or demolished, a qualified architectural historian shall thoroughly document the building and associated landscaping and setting. Documentation shall include still and video photography and a written documentary record of the building to the standards of the Historic American Building Survey or Historic American Engineering Record, including accurate scaled mapping, architectural descriptions, and scaled architectural plans, if available. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site specific and comparative archival research, and oral history collection as appropriate. A copy of the record shall be provided to the appropriate repositories, which could include the Center for Sacramento History and the North Central Information Center.	
Impact CR-2: Cause a Substantial Adverse Change to an Archaeological Resource	S	**Mitigation Measure CR-2A: Archaeological Surveys**	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		If ground disturbing activities are planned within areas that have not been surveyed for archaeological resources within 5 years, the following shall be required: 1. Future project applicants shall retain an archaeologist meeting the Secretary of the Interior's Professional Standards to conduct intensive archaeological surveys of the site. If archaeological material is discovered, the archaeologist shall prepare a site record, and determine whether it qualifies as a historical resource or a unique archaeological resource under the criteria of CEQA Guidelines Section 15064.5. If the archaeological site does not qualify, or if no resource is present within the project's area of effects, no further mitigation is required. Following field investigations, a technical report describing the survey should be prepared and filed with the appropriate Information Center of the California Historical Resources Information System. 2. Based on this review, if deemed necessary by the qualified professional archaeologist appropriate, a subsurface testing program will be developed and implemented to determine if the property meets criteria to be listed on the CRHR and/or the NRHP. The course of the testing program should be clearly delineated in a research design which outlines prehistory of the area; research domains, questions, and data requirements; research methods inclusive of field and laboratory studies; report preparation; and significance criteria. 3. If, based on the results of field investigations, resources were identified as being significant the following mitigation would apply: a. Total Avoidance: Redesign the proposed project to preserve and protect all significant cultural	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		resources. This would reduce impacts to less than significant levels. OR, if a redesign is determined infeasible by the Environmental Coordinator, then, b. Data Recovery: After all design options have been exhausted that would result in the preservation of significant resources, institute a data recovery program to the satisfaction of the Environmental Coordinator. **Mitigation Measure CR-2B: Archaeological Monitoring by an SOI-Qualified Archaeologist** A cultural resources awareness training program will be provided to all construction personnel active on the project site during earth moving activities. The first training will be provided prior to the initiation of ground disturbing activities. The training will be developed and conducted in coordination with a qualified archaeologist meeting the United States Secretary of Interior guidelines for professional archaeologists. The program will include relevant information regarding sensitive cultural resources, including applicable regulations, protocols for avoidance, and consequences of violating State laws and regulations. The worker cultural resources awareness program will also describe appropriate avoidance and minimization measures for resources that have the potential to be located on the project site and will outline what to do and whom to contact if any potential archaeological resources or artifacts are encountered. For all initial ground disturbing activities, a qualified archaeologist meeting the United States Secretary of Interior guidelines for professional archaeologists will monitor ground- disturbing activities. The monitor shall complete daily monitoring logs that describe each day's activities, including construction activities, locations, soil, and any cultural materials identified.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		Mitigation Measure CR-2C: Inadvertent Discoveries If subsurface deposits believed to be cultural in origin are discovered during construction, then all work must halt within a 100-foot radius of the discovery. A qualified professional archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for precontact and historic-period archaeology, shall be retained at the expense of future project applicants to evaluate the significance of the find. If it is determined due to the types of deposits discovered that a Native American monitor is required, the Guidelines for Monitors/Consultants of Native American Cultural, Religious, and Burial Sites as established by the Native American Heritage Commission shall be followed, and the monitor shall be retained at the future project applicants' expense. Work cannot continue within the 100-foot radius of the discovery site until the archaeologist conducts sufficient research and data collection to make a determination that the resource is either 1) not cultural in origin; or 2) not potentially eligible for listing on the National Register of Historic Places or California Register of Historical Resources. If a potentially eligible resource is encountered, then the archaeologist, Sacramento County, and the future project applicants shall arrange for either 1) total avoidance of the resource, if possible; or 2) test excavations or total data recovery as mitigation. The determination shall be formally documented in writing and submitted to Sacramento County Planning and Environmental Review as verification that the provisions of CEQA for managing unanticipated discoveries have been met.	
Impact CR-3: Disturb Human Remains	LTS	No mitigation is required.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
ENERGY			
Impact EN-1: Result in Wasteful, Inefficient, or Unnecessary Consumption of Energy	LTS	No mitigation is required.	LTS
Impact EN-2: Conflict With or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency	LTS	No mitigation is required.	LTS
GEOLOGY, SOILS, AND MINERAL RESOURCES			
Impact GS-1: Exacerbate Unstable Soil Conditions	S	**Mitigation Measure GS-1: Liquefaction Remediation of Wash Water Ponds** Prior to development in areas that have sediment from wash water ponds future project applicants or their designee shall prepare a technical study to identify the liquefaction potential of the area. The technical study shall include all necessary measures to provide sufficient stability to resist soil liquefaction. A technical report documenting the effectiveness of such measures in eliminating soil liquefaction shall be provided to the County prior to approval of a grading or building permit.	LTS
Impact GS-2: Result in Substantial Soil Erosion	LTS	No mitigation is required.	LTS
Impact GS-3: Result in Soil Subsidence	LTS	No mitigation is required.	LTS
Impact GS-4: Exposure to Landslides	S	**Mitigation Measure GS-4: Erosion Protection on Exposed Slopes** To prevent erosion and shallow surface instability, there shall be a condition of approval for the project that slope stabilization features such as landscaping and/or slope armor (such as rip rap) shall be installed on all exposed slopes of 1.5:1 or steeper during construction of urban development. Conditions of approval for the project shall also require the project applicant to provide routine maintenance of the landscaping and slope armor.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
Impact GS-5: Exposure to Expansive Soils	LTS	No mitigation is required.	LTS
Impact GS-6: Potential Destruction of Buried Paleontological Resources	S	**Mitigation Measure GS-6: On-Site Training for Paleontological Resources** Future project applicants, subsequent developers, or their designee, shall retain a qualified paleontologist to conduct an on-site training that will alert all construction personnel and operational staff about the possibility of encountering fossils. The appearance and types of fossils likely to be seen during construction will be described. Construction personnel shall be trained in the proper notification procedures should fossils be encountered. If paleontological resources are discovered during earthmoving activities, operations shall immediately be immediately halted within 100 feet of the find and the County Environmental Coordinator shall be notified. Future project applicants, subsequent developers, or their designee, shall retain a qualified paleontologist for identification and salvage of fossils so that construction delays can be minimized. If large specimens are discovered, the paleontologist shall have the authority to halt or divert grading and construction equipment while the finds are removed. The paleontologist shall be responsible for implementing all tasks summarized below: • In the event of discovery, salvage of unearthed fossil remains, typically involving simple excavation of the exposed specimen but possibly also plaster-jacketing of large and/or fragile specimens, or more elaborate quarry excavations of richly fossiliferous deposits. • Recovery of stratigraphic and geologic data to provide a context for the recovered fossil remains, typically including description of lithologies of fossil-bearing strata, measurement and description of the overall stratigraphic section, and photographic documentation of the geologic setting.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Laboratory preparation (cleaning and repair) of collected fossil remains to a point of curation, generally involving removal of enclosing rock material, stabilization of fragile specimens (using glues and other hardeners), and repair of broken specimens. • Cataloging and identification of prepared fossil remains, typically involving scientific identification of specimens, inventory of specimens, assignment of catalog numbers, and entry of data into an inventory database. • Preparation of a final report summarizing the field and laboratory methods used, the stratigraphic units inspected, the types of fossils recovered, and the significance of the curated collection.	
Impact GS-7: Obstruction of Access to Mineral Resources	LTS	No mitigation is required.	LTS
HAZARDS AND HAZARDOUS MATERIALS			
Impact HAZ-1: Accidental Release Due to Transport, use, or Disposal of Hazardous Materials	LTS	No mitigation is required.	LTS
Impact HAZ-2: Potential for Release of Hazardous Materials From Undocumented or Documented Sites of Contamination	S	**Mitigation Measure HAZ-2A: Phase I Environmental Site Assessment** Prior to approval of projects plans, grading permits, and/or demolition permits for properties in the plan area that have not already been evaluated for the presence of hazardous materials and hazardous conditions, Phase I Environmental Site Assessments (ESAs) shall be prepared by a qualified professional. Each Phase I ESA shall assess the potential for hazards and provide recommendations whether additional investigation (Phase II ESA, see Mitigation Measures HAZ-2B) should be completed. The County shall not issue a grading or building permit for a site where contamination has been	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		identified until remediation or effective site management controls appropriate for the site use have been completed consistent with applicable regulations and to the satisfaction of the Sacramento County Planning and Environmental Review Division, the California Department of Substances Control, and/or Central Valley Regional Water Quality Control Board, as appropriate. All applicable recommendations from the Phase I ESA shall be incorporated into the future project as required conditions of approval. If the Phase I ESA determines there are no recognized environmental conditions, no further action is required. However, the County shall ensure any grading or project plan or building permit includes a statement that if hazardous materials contamination is discovered or suspected during construction activities, all work in the vicinity of the contamination shall stop immediately until a qualified professional has evaluated the site and determined an appropriate course of action. **Mitigation Measure HAZ-2B: Phase II Environmental Site Assessment** If determined necessary, a Phase II ESA shall be conducted to determine the lateral and vertical extent of soil, groundwater, and/or soil vapor contamination, as recommended by the Phase I ESA. The Phase II ESA shall be prepared by the project applicant prior to issuance of grading or building permit. The Phase II shall include recommendations for remediation activities if contaminants are detected in the subsurface at the project site and/or contaminants are present at concentrations exceeding hazardous waste screening thresholds for contaminants in soil and/or groundwater (CCR Title 22, Section 66261.24 Characteristics of Toxicity).	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		All recommendations for remediation activities and additional studies from the Phase II ESA shall be incorporated into the future project as required conditions of approval. **Mitigation Measure HAZ-2C: Hazardous Materials Contingency Plan** Prior to issuance of a grading or building permit, the County shall require that the applicant provide a hazardous materials contingency plan to Sacramento County EMD. The plan will describe the necessary actions that would be taken if evidence of contaminated soil or groundwater is encountered during construction. The contingency plan shall identify conditions that could indicate potential hazardous materials contamination, including soil discoloration, petroleum or chemical odors, and presence of underground storage tanks or buried building material. The plan shall include the provision that, if at any time during the course of constructing the project, evidence of soil and/or groundwater contamination with hazardous material is encountered, the contractor, future project applicants, or their designee, shall immediately halt construction and contact Sacramento County EMD. Work shall not recommence until the discovery has been assessed/treated appropriately (through such mechanisms as soil or groundwater sampling and remediation if potentially hazardous materials are detected above threshold levels) to the satisfaction of Sacramento County EMD, RWQCB, and DTSC (as applicable). The plan, and obligations to abide by and implement the plan, shall be incorporated into the construction and contract specifications of the project.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
Impact HAZ-3: Result in Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste Within 0.25 Mile Within an Existing or Proposed School	LTS	No mitigation is required.	LTS
Impact HAZ-4: Impair Implementation of or Physically Interfere With an Adopted Emergency Response Plan or Emergency Evacuation Plan	LTS	No mitigation is required.	LTS
Impact HAZ-5: Expose People or Structures to Wildland Fires	LTS	No mitigation is required.	LTS
HYDROLOGY, DRAINAGE, AND WATER QUALITY			
Impact HYD-1: Violate Water Quality Standards	LTS	No mitigation is required.	LTS
Impact HYD-2: Substantially Decrease Groundwater Supplies or Interfere Substantially With Groundwater Recharge	LTS	No mitigation is required.	LTS
Impact HYD-3: Substantially Alter the Existing Drainage Pattern of the Plan Area Such That Substantial Erosion, Flooding, or Polluted Runoff Could Occur	S	**Mitigation Measure HYD-3A: Project-Level Drainage Studies** Before approval of future tentative maps, the Project Applicant(s) or future developer(s) shall submit a drainage study in accordance with the requirements outlined in the Sacramento Stormwater Quality Partnership's 2018 Stormwater Quality Design Manual (or subsequent updates) and Sacramento County's Hydromodification Management Plan. Project-level studies must identify the applicable watersheds and associated basins and pumping features described in the Master Drainage & Flood Control Study. The study shall describe permanent stormwater quality treatment facilities and low-impact design techniques that will be	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		incorporated and provide evidence that the techniques satisfy the assumptions in the Master Drainage & Flood Control Study prepared for the project and ensure no exceedance of existing discharge rates. **Mitigation Measure HYD-3B: Detailed Drainage Designs** Prior to construction of all drainage improvements, detailed plans for the design of the improvements that demonstrate the proposed improvements will achieve the primary functions of flood conveyance and stormwater quality treatment while minimizing maintenance requirements shall be submitted to the County DWR for review and approval.	
Impact HYD-4: Risk Release of Pollutants Due to Inundation in Flood Hazard Zones	S	**Mitigation Measure HYD-4: Conditional Letter of Map Revision** Prior to any modification of the existing FEMA mapped floodplain in the Morrison Creek and Elder Creek watersheds in the plan area, the Project Applicant(s) or subsequent developer(s) shall obtain approval of a Conditional Letter of Map Revision (CLOMR) from FEMA. In addition, the Project Applicant(s) or subsequent developer(s) shall provide in-kind replacement for any loss in flood storage capacity resulting from floodplain modifications.	LTS
Impact HYD-5: Conflict With a Water Quality Control Plan or Sustainable Groundwater Management Plan	LTS	No mitigation is required.	LTS
Impact HYD-6: Result in Potential Climate Change Effects on the Project	NA	**Mitigation Measure HYD-6: Hydrologic Analysis for a Climate Change Scenario** At the time of submittal of backbone infrastructure plans, the Project Applicant or subsequent developers of the master plan shall submit a hydrologic analysis that is based upon adopted County guidance regarding a	NA

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		reasonably foreseeable climate change scenario. Based on the results of the hydrologic analysis and if impacts are identified, the Project Applicant shall implement all feasible design measures within the Project's drainage system to adequately maintain pre-project flows with consideration of climate change effects. Potential improvements could include larger and additional culverts at roadway crossings and deepening the existing basin(s) within the Plan Area that would be subject to over-topping. Basin deepening would require minimal construction-related impacts including excavation and hauling of an additional increment of soil from the site. These construction-related impacts have been evaluated throughout this EIR. Alternatively, if the County has adopted a regional solution for flooding related to climate-change, the Project Applicant or subsequent developers of the master plan plan shall contribute its fair share towards funding the construction of the regional solution. If the County has not developed a regional solution or has not adopted guidance for evaluating hydrologic climate-related impacts, the Project Applicant or subsequent developers of the master plan shall prepare and submit a hydrologic analysis that is based on the best available technical information at that time, in consultation with the County's Department of Water Resources and the Office of Planning and Environmental Review.	
Impact HYD-7: Contribute to Flooding of Beach Stone Lakes	S	***Mitigation Measure HYD-7: Beach Stone Lake Mitigation*** The Project Applicant(s) and subsequent developer(s) shall mitigate downstream impacts by either of the following options: a. Payment of the Beach Stone Lakes Mitigation Fee (Sacramento County Water Agency Zone 11A).	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		b. Ensuring no net project-related increase in volume in Beach Stone Lakes by metering outflow from the plan area, increasing storage capacity of onsite facilities, directing drainage into downstream facilities offsite, or other regional drainage solutions as determined by the County Department of Water Resources.	
LAND USE, POPULATION, AND HOUSING			
Impact LU-1: Physically Divide an Established Community	LTS	No mitigation is required.	LTS
Impact LU-2: Cause a Significant Environmental Impact Due to a Conflict With any Land Use Plan, Policy, or Regulation Adopted for the Purpose of Avoiding or Mitigating an Environmental Effect	LTS	No mitigation is required.	LTS
Impact LU-3: Induce Substantial Unplanned Population Growth	LTS	No mitigation is required.	LTS
Impact LU-4: Displace Substantial Numbers of Existing People or Housing, Necessitating the Construction of Replacement Housing Elsewhere	LTS	No mitigation is required.	LTS
NOISE			
Impact NO-1: Exceed County Standards During Construction	S	**Mitigation Measure NO-1: Nighttime Construction Noise Control Plan** This mitigation measure shall apply to sites where construction would take place outside of the timeframes exempt from County Code noise standards as defined in Section 8.68.090 of the County Code (i.e., between 8:00 p.m. and 6:00 a.m. Monday through Friday and between the hours of 8:00 p.m. and 7:00 a.m. Saturday and Sunday), and within 1,500 feet of a sensitive receptor. Prior to commencement of any nighttime construction	SU

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		activity, the future project applicants, in coordination with selected construction contractors, and a qualified acoustical professional, shall prepare a nighttime construction noise control plan based on finalized project-specific information (e.g., specific equipment, construction location). This plan shall be submitted to the County for review prior to project construction. The plan shall include: • a detailed description of the proposed nighttime construction activities. • a list of equipment used during all nighttime construction activities. • projected noise levels generated during the nighttime construction activities at surrounding noise-sensitive land uses. • location(s) of sensitive receptors in relation to the proposed nighttime construction activities, and • designation of a disturbance coordinator. The following noise control measures (or other equally effective measures approved by the County) shall be included in the plan as necessary to reduce noise levels to the appropriate threshold (i.e., 50 dB L_{eq}), to the extent feasible, at the nearest sensitive receptor. • For construction activity that would occur within a clear line-of-sight of offsite sensitive receptors, temporary noise curtains shall be installed as close as possible to the noise-generating activity such that the curtains obstruct the direct line of sight between the noise-generating construction activity and the nearby sensitive receptors. Temporary noise curtains shall consist of durable, flexible composite material featuring a noise barrier layer bound to sound-absorptive material on one side. The noise barrier layer shall consist of rugged, impervious, material with a surface	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		weight of at least one pound per square foot and be designed to result in a 10-dB reduction at the sensitive receptor location. • Noise-reducing enclosures and techniques shall be used around stationary noise-generating equipment (e.g., concrete mixers, generators, compressors) to break the line of sight between the noise source and receiver. Techniques used could greatly vary depending on equipment type and project-specific information. • Heavy-duty equipment shall be operated at the lowest operating power possible and shall be restricted in close proximity to sensitive receptors. • All heavy construction equipment and all stationary noise sources shall have manufacturer-installed mufflers. Mufflers and noise suppressors shall be properly maintained and tuned to ensure proper fit, function, and minimization of noise. • Where available and feasible, equipment with back-up alarms shall be equipped with either audible self-adjusting backup alarms or alarms that only sound when an object is detected. Self-adjusting backup alarms shall automatically adjust to 5 dB over the surrounding background levels. All non-self-adjusting backup alarms shall be set to the lowest setting required to be audible above the surrounding noise levels. • Construction scheduling and phasing shall be designed so that impact equipment (e.g., pile drivers) is not used between 8:00 p.m. and 6:00 a.m. on Monday through Friday or between 8:00 p.m. and 7:00 a.m. on Saturday and Sunday.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
Impact NO-2: Generate Excessive Construction Vibration	S	**Mitigation Measure NO-2: Vibration Control Plan** This mitigation measure would apply to construction activity involving pile driving located within 97 feet of any building, to reduce the potential for structural damage, and within 537 feet of an occupied residence or building, to minimize the disturbance from pile-driving activities; or vibratory roller activities located within 26 feet of any building in order to reduce the potential for structural damage, and within 96 feet of an occupied residence or building to minimize the disturbance from vibratory roller activities. A vibration control plan shall be developed by the construction contractor(s) to be submitted to and approved by Sacramento County before issuance of any improvement plans or grading permits for the project. The plan shall consider all potential vibration-inducing activities that would occur within the distance parameters described above and include various measures, setback distances, precautions, monitoring programs, and alternative methods to traditional pile driving or other vibration intensive activities with the potential to result in structural damage or adverse impacts to sensitive receptors. The following vibration control measures (or other equally effective measures approved by the County) shall be included in the plan: • To prevent structural damage minimum setback requirements for different types of ground vibration-producing activities (e.g., pile driving, vibratory roller) for the purpose of preventing damage to nearby structures shall be established based on the proposed pile-driving activities and locations, once determined. Factors to be considered include the specific nature of the vibration producing activity (e.g., type and duration of pile driving), local soil conditions, and the fragility/resiliency of the nearby structures as	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		determined by a site-specific building survey, documentation related to building integrity, or other appropriate methods determined by a qualified engineer. Established setback requirements (e.g., 97 feet) can be breached if a project-specific, site-specific analysis is conducted by a qualified geotechnical engineer or ground vibration specialist that indicates that no structural damage would occur at nearby buildings or structures. • To prevent disturbance for sensitive land uses, minimum setback requirements for different types of ground vibration producing activities (e.g., pile driving, vibratory roller) shall be established based on the proposed activities and locations, once determined. Established setback requirements (e.g., 537 feet) can be breached only if a project-specific, site-specific, technical adequate ground vibration study indicates that the buildings would not be exposed to ground vibration levels in excess of 72 VdB, and ground vibration measurements performed during the construction activity confirm that the buildings are not being exposed to levels in excess of 72 VdB. • All vibration-inducing activity within the distance parameters described above shall be monitored and documented for ground vibration noise and vibration noise levels at the nearest sensitive land use and associated recorded data submitted to Sacramento County so as not to exceed the recommended vibration damage and annoyance standards, respectively. • Alternatives to traditional pile driving (e.g., sonic pile driving, jetting, cast-in-place or auger cast piles, non-displacement piles, pile cushioning, torque or hydraulic piles) shall be considered and implemented where feasible to reduce vibration levels.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Limit vibration-inducing vibratory and impact activities (e.g., pile driving, vibratory rollers, jackhammers) to the daytime hours between 6:00 a.m. and 8:00 p.m. Monday through Friday and between 8:00 a.m. and 8:00 p.m. on Saturday and Sunday. • Operate all vibration inducing impact equipment as far away from vibration-sensitive sites as reasonably possible. • Phase pile-driving and high-impact activities so as not to occur simultaneously with other construction activities, to the extent feasible. The total vibration level produced could be significantly less when each vibration source is operated at separate times.	
Impact NO-3: Generate a Substantial Permanent Increase in Traffic Noise Levels	S	**Mitigation Measure NO-3A: Rubberized Asphalt** The County shall require the use of rubberized asphalt rubberized hot-mix asphalt (RHMA) or another equally effective type of noise-reducing pavement along (a) future roadway construction within the WJHMP and (b) at the time of the next repaving of the roadway segment. The RHMA overlay shall be designed with appropriate thickness and rubber component quantity (typically 15 percent by weight of the total blend), such that traffic noise levels are reduced by an average of 4 to 6 dB (noise levels vary depending on travel speeds, meteorological conditions, and pavement quality) as compared to noise levels generated by vehicle traffic traveling on standard asphalt. **Mitigation Measure NO-3B: New, Expanded, or Extended Roadway Noise Reduction** Before finalizing roadway design for roadway expansion or new roadway construction associated with the WJHMP, a design-level acoustical analysis shall be prepared to identify specific roadway design considerations, which shall be incorporated into final road	SU

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		design and approved by Sacramento County for roadways identified in Table 16-19 that result in a substantial increase in noise. The following design features shall be considered: • Roadway design shall provide sufficient setback between any occupied structures or planned future structures that are defined as sensitive land uses by Sacramento County and the roadway to minimize noise exposure and meet County noise standards. • In locations where setback is not feasible to reduce noise levels at existing sensitive receptors from new or expanded roadways, the County shall coordinate with property owners of the existing sensitive receptors regarding installation of sound barriers along property lines to minimize traffic noise to meet applicable County exterior noise standards and, if necessary, interior noise standards. **Mitigation Measure NO-3C: Acoustical Assessments for All New Land Developments** The County shall require a design-level acoustical assessment to be prepared and submitted alongside the project application for all new land use development projects associated with the WJHMP that would be located within the noise contours defined under General Plan Policy NO-1 and identified in Table 16-12 of this EIR. Specifically, for all new land use developments, except for "playgrounds, parks, etc.," located within the 65 dB Ldn traffic noise contour; and for "playgrounds, parks, etc.," located within the 70 dB Ldn traffic noise contour the County shall require an acoustical assessment to be prepared. The acoustical assessment shall evaluate the compatibility of the proposed development in comparison to applicable County noise standards and provide recommendations to achieve acceptable interior noise levels appropriate to the land use. Noise control	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		measures may include building façade improvements; mechanical ventilation for all schools and residences; increased vegetation; roadway pavement improvements and maintenance; and site design features. If such measures are not sufficient to reduce noise levels and there are no other feasible alternatives that could be implemented, a sound barrier may be constructed.	
Impact NO-4: Expose New or Existing Sensitive Receptors to New Stationary Noise Sources	S	**Mitigation Measure NO-4A: Design Strategies for Proposed Sensitive Land Uses** This mitigation measure would apply to noise sensitive land uses developed as part of the WJHMP that would be located within 1,000 feet of existing or proposed industrial land uses. To prevent future noise sensitive receptors from disturbance associated with existing and proposed industrial land uses within the WJHMP, design principles and strategies shall be used to reduce noise exposure to sensitive land uses in compliance with the WJHMP Design Guidelines, County Design Guidelines, and County noise standards. Common design principles to reduce noise exposure to sensitive land uses that shall be considered during the site design process include: • increasing the distance between the noise source and the receiver, • locating barrier-type buildings parallel to the noise source, • orienting the residences and outdoor activity areas for those residences away from the noise source, and • arranging the site plan to use buildings as noise barriers. Upon application for entitlements, all future project applicants proposing a noise-sensitive land use within 1,000 feet of an existing or proposed industrial land use	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		shall provide to the County a site-specific noise study prepared by a qualified acoustical professional/engineer addressing exterior noise levels for applicable noise sensitive land uses and interior noise levels in residential units. The noise study shall confirm, using approved calculation methodologies, that building design (e.g., building orientation) and building materials as well as exterior design features (e.g., fences, walls, and landscaping features) are sufficient to maintain, consistent with Sacramento County non-transportation noise standards, exterior noise levels of 55 L50 and 75 L_{max} during the daytime and 50 L50 and 70 L_{max} during the nighttime. If the study shows such standards would not be met with the site design as proposed, the future project applicants or subsequent developers shall implement recommendations of the study that are shown to achieve the standards. **Mitigation Measure NO-4B: Noise Attenuation Features for Proposed Commercial, Employment, and Industrial Land Uses** Land use developments proposed under the WJHMP that include substantial truck activity (e.g., warehouses, grocery stores, repair facilities, storage yards, and truck terminals) and are proposed within 325 feet of existing or proposed residential developments shall be required to provide noise attenuation features to reduce noise generated by on-site truck and delivery activity to levels that are below County daytime residential noise standards (i.e., 55 dB L50). These features may include: • site design features, including buildings and soundwalls, sited between the noise-generating activity and the residential land; and	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• vegetative screening that fully restricts the line of sight between the noise-generating activity and the residences; or • setbacks between the noise-generating activity and the residences. The proposed noise attenuation features shall be demonstrated to reduce noise exposure such that the median daytime noise level on the nearest point of the residential parcel does not exceed the median daytime noise level (L50) of 55 dB. Future project applicants shall be required to demonstrate compliance with these requirements at the time of application for subsequent tentative maps or development applications.	
PUBLIC SERVICES			
Impact PS-1: Result in Substantial Adverse Physical Impacts Associated With the provision of Fire Protection and Emergency Services	LTS	No mitigation is required.	LTS
Impact PS-2: Result in Substantial Adverse Physical Impacts Associated With the Provision of Law Enforcement	LTS	No mitigation is required.	LTS
Impact PS-3: Result in Substantial Adverse Physical Impacts Associated With the Provision of Schools	LTS	No mitigation is required.	LTS
Impact PS-4: Result in Substantial Adverse Physical Impacts Associated With the Provision of Parks and Recreation Services or Substantial Physical Deterioration of an Existing Facility	LTS	No mitigation is required.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
Impact PS-5: Result in Substantial Adverse Physical Impacts Associated With the Provision of Libraries	LTS	No mitigation is required.	LTS
PUBLIC UTILITIES			
Impact PU-1: Result in adverse Effects Associated With Construction of Expanded Wastewater Treatment Infrastructure	LTS	No mitigation is required.	LTS
Impact PU-2: Result in Adverse Effects Associated With Construction of Stormwater Infrastructure	LTS	No mitigation is required.	LTS
Impact PU-3: Result in Adverse Effects Associated With Construction of Electric Power and Telecommunications Facilities	LTS	No mitigation is required.	LTS
Impact PU-4: Exceed the Capacity of the Wastewater Treatment Provider	LTS	No mitigation is required.	LTS
Impact PU-5: Generate Solid Waste in Excess of State Standards or in Excess of the Capacity of Local Infrastructure	LTS	No mitigation is required.	LTS
TRANSPORTATION			
Impact TR-1: Adversely Affect an Existing Bicycle and Pedestrian Facility, Interfere With the Implementation of a Planned Bikeway, or Result in Unsafe Conditions for Bicyclists or Pedestrians	LTS	No mitigation is required.	LTS
Impact TR-2: Adversely Affect Public Transit Operations or Fail to Provide Access to Transit	LTS	No mitigation is required.	LTS
Impact TR-3: Generate VMT That Exceeds County Standards	LTS	No mitigation is required.	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
Impact TR-4: Substantially Increase Hazards Due to a Geometric Design Feature or Incompatible Uses	S	**Mitigation Measure TR-4A: Install Traffic Signals Throughout WJHMP Area** If the County determines, through application of the Dynamic Implementation Tool or similar means, that any subsequent entitlement would result in roadway design deficiencies, the applicant for the development shall be required to construct or fund the improvement. Required traffic signal installations will include the following improvements proposed in the Local Traffic Study, as determined appropriate by the County: • Hedge Avenue and Florin Road • Happy Lane and Old Placerville Road • Excelsior Road and Gerber Road • Eagles Nest Road and Jackson Road • Excelsior Road and Calvine Road • Douglas Extension/Douglas Road and Mather Road • Mayhew Road and Rock Creek Parkway eastbound and westbound **Mitigation Measure TR-4B: Roadway Design Improvements** If the County determines, through application of the Dynamic Implementation Tool or similar means, that any subsequent entitlement would result in roadway design deficiencies, the applicant shall be required to construct or fund the improvement. Required physical roadway modifications will include the following improvements proposed in the Local Traffic Study, as determined appropriate by the County: • **Watt Avenue and Folsom Boulevard:** Configuration involving grade separation of the northbound and southbound through movements of Watt Avenue. Access to and from Folsom Boulevard would be accomplished via on and off ramps from the left lanes	SU

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		of Watt Avenue to a single signalized intersection. A bus rapid transit lane along Watt Avenue would also intersect Folsom Boulevard at the traffic signal.
		• **Watt Avenue and Kiefer Boulevard:** The ultimate improvement would involve a tight diamond interchange. The through movements (and bus rapid transit lane) on Watt Avenue would be grade separated from Kiefer Boulevard. Access to and from Kiefer Boulevard would be accomplished via on and off-ramps at two signalized intersections along Kiefer Boulevard.
		• **Watt Avenue and Jackson Road:** Improvements would include the implementation of a standard six-by-six signalized intersection (two left-turn lanes, three through lanes, and one right-turn lane, on each approach) with three modifications.
		  • The southbound left-turn movement would be grade separated;
		  • The westbound right-turn movement would be grade separated; and
		  • Three northbound left-turn lanes.
		• **Bradshaw Road and Jackson Road:** Improvements would involve grade separating the northbound and southbound through movements.
		• **Grant Line Road and Prairie City Road, White Rock Road, Douglas Road, Kiefer Boulevard, Jackson Road, and Sunrise Boulevard:** Implementation of grade separated intersections.
		Each of these intersections have unique travel movements, volumes and existing context sensitive conditions (potential environmental issues, right-of-way, physical constraints), and the special treatments utilized at each location shall be studied to select the treatments that address the operational deficiency as it relates to safety, while avoiding or minimizing other operational or	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		environmental implications. Other equivalent treatments may be selected to the satisfaction of the Department of Transportation to mitigate safety impacts. **Mitigation Measure TR-4C: Bus Queue Jumps** The responsible project applicant(s), County, and Sacramento Regional Transit District (SacRT) shall work in coordination to implement bus queue jump lanes at signalized intersections to provide dedicated channelization for buses that allow buses to approach and traverse an intersection in priority position as deemed necessary. Bus queue jumps are only recommended where volume of right-turning vehicles would not cause significant interference with transit operations; locations where right turn volumes are less than 200 vehicles per hour per lane would meet this criteria (DKS Associates 2024: 142). Bus queue jumps shall meet the following infrastructure and geometric improvements unless otherwise agreed upon by the County and SacRT: • Extend the right turn pocket on the approach (or construct a right turn pocket if one has not previously been identified) long enough to extend past the end of queue for the adjacent through travel lanes; • Install signal heads for the right turn lane to allow for dedicated right turn phase and bus through phase; • Build a dedicated receiving lane and far-side bus stop for intersections where a nearby bus stop is desired; and • Install “No Right turn on red” blank out signs on the perpendicular approaches to the transit queue jump which would be activated based on bus calls for the queue jump. As identified in the Local Traffic Analysis, at a minimum, the following locations for bus queue jump lanes shall be considered:	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		• Jackson Road and Excelsior Road (southbound, westbound, and eastbound) • Vineyard Road and Jackson Road (southbound and westbound) • Mayhew Road and Jackson Road (all directions of travel) • South Watt Avenue and Jackson Road (northbound) • South Watt Avenue and Kiefer Boulevard (southbound)	
Impact TR-5: Result in Inadequate Emergency Access	LTS	No mitigation is required.	LTS
WATER SUPPLY			
Impact WS-1: Environmental Effects Due to the Construction of New or the Expansion of Existing Water Facilities	LTS	No mitigation is required.	LTS
Impact WS-2: Result in Demand for Water that cannot be Met by Existing or Reasonably Foreseeable Future Service Capacity	LTS	No mitigation is required.	LTS

TRIBAL CULTURAL RESOURCES			
Impact TCR-1: Cause a Change in Significance of a Tribal Cultural Resource	S	**Mitigation Measure TCR-1a: Inventory and Significance Evaluation of Tribal Cultural Resources** Upon submittal of subsequent development applications, the Project Applicant(s) or subsequent developer(s) shall coordinate with the County and consulting Native American tribes (tribes) for each project-specific area. The tribes shall be offered the opportunity to identify	LTS

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		portions of the project site that could be sensitive or potentially sensitive for tribal cultural resources. Tribes may request additional testing and boundary delineation prior to the disturbance of any potential tribal cultural resource site. In consultation with County, the treatment plan may include identification methods including, but not limited to, canine forensic surveys, ground penetrating radar, vegetation clearing for surface visibility, and/or subsurface testing. When subsequent development applications are deemed complete, the tribes shall be provided the following information for each subsequent notification to assist in their determination of the potential to impact tribal cultural resources: • map(s) and verbal description of the project-specific area that delineates both the horizontal and vertical extents of where a project could result in impacts, including both direct and indirect, on tribal cultural resources; • descriptions of proposed ground disturbances and construction activities; • the results of an updated records search of the project-specific area from the Northwest Information Center of the California Historical Resources Information System; • the results of an archaeological sensitivity analysis to assess the potential for buried archaeological resources using geologic and historic maps, soils data, and other sources; and • the results of an archaeological field survey. Tribes may also request separate tribal cultural surveys. If the consulting Native American tribe(s) determine that a tribal cultural monitor is warranted for a project, the tribe(s) shall be offered the opportunity to engage in compensated construction monitoring. Tribes must be	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation

		contacted for the opportunity to monitor each separate development stage. For monitoring, the provisions of Mitigation Measure CUL-2b will be followed.
		If potentially significant impacts on tribal cultural resources that qualify as historical resources (per State CEQA Guidelines Section 15064.5) are identified, a treatment plan for avoiding or minimizing such impacts shall be developed, in coordination with tribes. Measures for avoiding or minimizing impacts include:
		• avoidance and preservation of the resources in place, including planning and construction to avoid the resources and protect the cultural and natural context or planning greenspace, parks, or other open space to incorporate the resources with culturally appropriate protection and management criteria;
		• treating the resource with culturally appropriate dignity taking into account the tribal cultural values and meaning of the resource, including:
		  • protecting the cultural character and integrity of the resource;
		  • protecting the traditional use of the resource;
		  • protecting the confidentiality of the resource;
		  • permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places; or
		  • protecting the resource.
		The consultation shall be considered concluded when (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.	

Impacts	Level of Significance before Mitigation [1]	Mitigation Measure	Level of Significance after Mitigation
		Mitigation Measure TCR-1b: Tribal Repatriations In the event that remain-in-place measures are infeasible for disturbed human remains, the Project Applicant(s) or subsequent developer(s), in consultation with tribal and County representatives, shall identify an on-site repatriation location with conservation easement. This shall include an agreement to maintain resource location confidentiality. Tribes may request additional materials and monitoring in the event of human remains discovery. This may include, but is not limited to, on-site storage of remains in a locked, air-conditioned facility with access controlled by tribal monitors, materials required for appropriate recovery and reinternment, and physical control mechanisms such as subsurface coverings and above-ground deterrents such as site fencing.

1 INTRODUCTION

SUMMARY OF THE PROPOSED PROJECT

The West Jackson Highway Master Plan (WJHMP or project) establishes a framework and strategy for future land use development of approximately 5,913 acres in unincorporated Sacramento County (referred to herein as the plan area). The WJHMP includes proposed land use designations and policies, as well as planning for infrastructure and public services. The WJHMP would provide a mixture of residential, commercial, industrial, recreational, farming, employment, and educational nodes within two districts and three future planning areas.

ENVIRONMENTAL IMPACT REPORT SCOPE AND PROCESS

PURPOSE OF THIS ENVIRONMENTAL IMPACT REPORT

This environmental impact report (EIR) evaluates the potential environmental impacts associated with implementation of the WJHMP. This EIR has been prepared under the direction of Sacramento County in accordance with the requirements of the California Environmental Quality Act (CEQA) (Public Resources Code [PRC] Section 21000 et seq.) and the State CEQA Guidelines (California Code of Regulations [CCR] Title 14. Natural Resources Division 6 Section 15000 et seq.). An EIR discloses known or possible impacts on the environment that may result from a project, alternatives to the project, and measures to mitigate those impacts to decision makers (e.g., the Sacramento County Board of Supervisors), public agencies, and the general public. The intent of the EIR is to provide objective information to allow the Sacramento County Board of Supervisors to make an informed decision when considering whether to approve or deny the project. The EIR does not comment on the merits of the project and does not make a recommendation for or against its approval.

LEAD, RESPONSIBLE, AND TRUSTEE AGENCIES

Sacramento County is the Lead Agency under CEQA for this EIR because it has discretionary authority to determine whether or how to approve the project. Responsible Agencies are other agencies that are responsible for carrying out or implementing a specific component of the WJHMP or for approving a project (such as an annexation) that implements the goals and policies of the plan. Trustee agencies have jurisdiction over certain resources held in trust for the people of California, but do not have legal authority over approving or carrying out the project. Based on the potential effects known at this time, responsible agencies may include: US Army Corps of Engineers, US Fish and Wildlife Service, the California Department of Transportation, the California Department of Fish and Wildlife, the South Sacramento Conservation Agency, the Central Valley Regional Water Quality Control Board, Sacramento Municipal Utility District, Sacramento Area Sewer District, Sacramento County Water Authority, Cordova Recreation and Park

District, Southgate Recreation and Park District, Sacramento Metropolitan Air Quality Management District, the Elk Grove Unified School District (Elk Grove USD), the Central Valley Flood Protection Board, and California American Water.

TYPE OF ENVIRONMENTAL IMPACT REPORT

This EIR fulfills the requirements for a Program EIR. Although the legally required contents of a Program EIR are the same as those of a Project EIR, Program EIRs typically cover broad programs or large projects, such as a master plan, and contain a more general discussion of impacts, alternatives, and mitigation measures than a Project EIR. As provided in Section 15168 of the State CEQA Guidelines, a Program EIR may be prepared on a series of actions that could be characterized as one large project. Impacts may be generally characterized, and mitigation measures may include programs and performance standards that address the impacts. Use of a Program EIR provides the County (as Lead Agency) with the opportunity to consider broad policy alternatives and program-wide mitigation measures and greater flexibility to address environmental issues and/or cumulative impacts on a comprehensive basis. Agencies generally prepare Program EIRs for programs or a series of related actions that are linked geographically, are logical parts of a chain of contemplated events, rules, regulations, or plans that govern the conduct of a continuing program, or are individual activities carried out under the same authority and having generally similar environmental effects that can be mitigated in similar ways. By its nature, a Program EIR considers the overall effects of implementing a program and does not, and is not intended to, examine individual projects that may be implemented pursuant to the master plan.

Once a Program EIR has been prepared, subsequent activities within the program must be evaluated to determine if additional CEQA documentation is required to address the significant impacts of such activities. Subsequent activities could be found to be within the Program EIR scope and additional environmental documents may not be required (CEQA Guidelines Section 15168[c]). When a Program EIR is relied on for a subsequent activity, the Lead Agency must incorporate feasible mitigation measures and alternatives developed in the Program EIR into the subsequent activities (CEQA Guidelines Section 15168[c][3]). If a subsequent activity could result in effects not within the scope of the Program EIR, including new or more severe significant impacts than identified in the Program EIR, the Lead Agency must prepare a Negative Declaration, Mitigated Negative Declaration, or a project-level subsequent or supplemental EIR. The County's Initial Study Checklist is used to determine if a subsequent activity is within the scope of the Program EIR and if not, what type of CEQA document is needed to address its effects.

The process described above provides a road map for consideration of subsequent projects and the associated CEQA documentation. Future projects within the plan area that are consistent with the approved master plan and the analysis found in the Program EIR do not require additional CEQA review. If a future project within the plan area was not considered in this EIR, is inconsistent with the WJHMP, or may result in additional or more severe impacts or require more mitigation than is identified in this EIR, additional CEQA analysis will be required.

SCOPE OF THIS ENVIRONMENTAL IMPACT REPORT

Pursuant to CEQA and the State CEQA Guidelines, a lead agency shall focus the EIR's discussion on significant environmental effects and may limit discussion on other effects to brief explanations about why they are not significant (PRC Section 21002.1; State CEQA Guidelines Section 15128). Potentially significant impacts were identified based on review of comments received as part of the public scoping process (see Appendix A) and additional research and analysis of the relevant project data during preparation of this EIR.

The County has determined that the project has the potential to result in significant environmental impacts on the following resources, which are addressed in detail in this EIR:

- aesthetics;
- agricultural resources;
- air quality;
- airport compatibility;
- biological resources;
- climate change;
- cultural resources;
- energy;
- geology, soils, and mineral resources;
- hazards and hazardous materials;
- hydrology, drainage, and water quality;
- land use, population, and housing;
- noise;
- public services;
- public utilities;
- transportation;
- water supply; and
- tribal cultural resources.

Wildfire impacts have been omitted from detailed evaluation in this EIR because the plan area is not located in or near a state responsibility area or on lands classified as within very high fire hazard severity zones.

This Draft EIR also addresses other CEQA-mandated issues (e.g., cumulative impacts, growth-inducing impacts, significant unavoidable impacts, alternatives).

PUBLIC AND ENVIRONMENTAL REVIEW PROCESS

NOTICE OF PREPARATION

A Notice of Preparation (NOP) for the WJHMP was first published on September 10, 2013. The Project Applicants and County of Sacramento staff subsequently reviewed the results of several CEQA-related studies, consulted interested and affected parties, and had extensive conversations concerning how the original project might adversely affect the environment. As that information became available, the Project Applicants, in coordination with County staff, modified the original project to lessen its potential to result in environmental impacts. Specifically, the project was modified to reduce traffic and associated effects on air quality and climate change, improve transit, reduce effects on biological resources and increase open space, avoid potential noise effects, and improve groundwater recharge.

In 2013 and 2016, the County held four joint Vineyard and Cordova Community Planning Advisory Council (CPAC) workshops for the Jackson Highway Master Plans (which included the WJHMP) that covered: the planning and environmental review process for master plans; transportation planning in the area; water supply, sewer, and drainage in the area; and infrastructure financing.

Due to project revisions, a new NOP was issued in February 2017. In response to comments from Elk Grove USD requesting additional location specificity for possible sites of the proposed middle/high school, a revised NOP was subsequently released on April 26, 2017.

The NOP and copies of the comments received in response to the NOP are provided in Appendix A. All NOP comments were considered by the EIR preparers. The introduction of each environmental resource area chapter (Chapters 4 through 20) identifies NOP comment topics addressed in the respective chapter.

DRAFT ENVIRONMENTAL IMPACT REPORT

This Draft EIR is being circulated for public review and comment for a period of 45 days. During this period, comments from agencies, as well as organizations and the general public, on environmental issues may be submitted to the County.

During the public review period, the Draft EIR is available for review between 8:30 a.m. and 4:30 p.m. Monday through Friday at the County Planning and Environmental Review Division located at:

827 7th Street, Room 225
Sacramento, CA 95814

The Draft EIR is also available online at:

> https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/WestJacksonHighwayMasterPlan.aspx.

All agencies, organizations, and interested parties, have the opportunity to comment on the Draft EIR during the public review period.

Written comments on this Draft EIR should be addressed to:

> Julie Newton, Environmental Coordinator
> Sacramento County
> Department of Community Development
> Planning and Environmental Review Division
> 827 7th Street, Room 225
> Sacramento, CA 95814

Written comments may also be submitted to CEQA@saccounty.gov.

Following the close of the public comment period, the County will prepare a Final EIR, which will include written responses to comments on the Draft EIR and will identify any changes to the EIR that may be required to address comments or new information, if applicable. Once the Final EIR is completed, the Board of Supervisors must certify the EIR and adopt Findings of Fact before it can approve the project. If the EIR finds that the project would result in any significant and unavoidable impacts, then the Board of Supervisors must also adopt a Statement of Overriding Considerations.

Intended Uses of This EIR

The Sacramento County Board of Supervisors will use the information contained in this EIR to evaluate the project and render a decision to approve or deny the requested entitlements (as described further in Chapter 2, “Project Description”).

The following responsible agencies may also use this EIR for planning or permitting purposes:

- US Army Corps of Engineers,
- US Fish and Wildlife Service,
- California Department of Transportation,
- California Department of Fish and Wildlife,
- South Sacramento Conservation Agency,
- Central Valley Regional Water Quality Control Board,
- Sacramento Area Sewer District,

- Sacramento Municipal Utility District,
- Sacramento County Water Authority,
- Cordova Recreation and Park District,
- Southgate Recreation and Park District,
- Sacramento Metropolitan Air Quality Management District,
- Elk Grove USD,
- Central Valley Flood Protection Board, and
- California American Water.

2 PROJECT DESCRIPTION

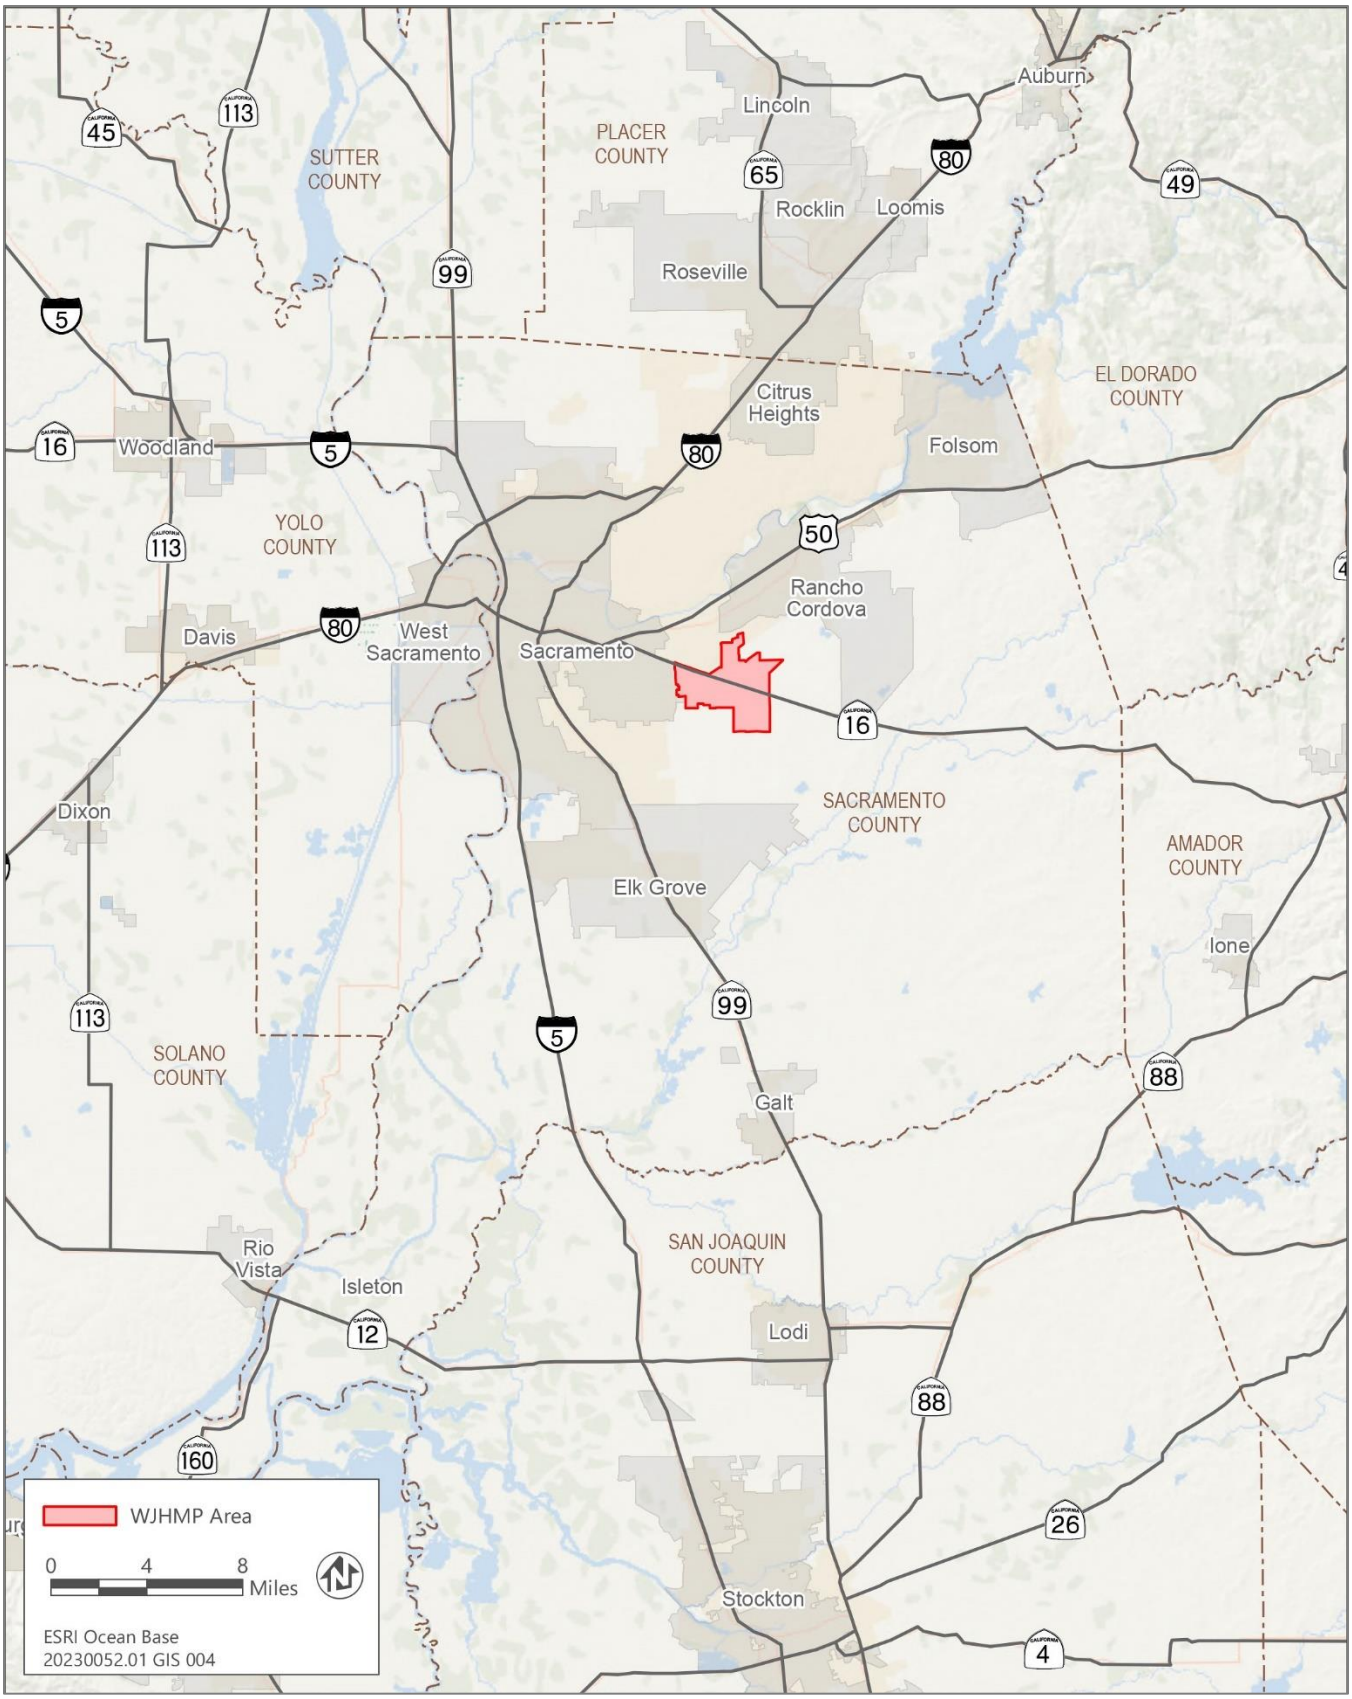
This chapter provides a detailed description of the WJHMP (project). The WJHMP establishes a framework and strategy for future land use within the WJHMP boundaries (referred to herein as the plan area). The WJHMP includes proposed land use designations and policies, as well as planning for infrastructure and public services. As described in greater detail below, the master plan would provide a mixture of residential, commercial, industrial, recreational, farming, employment, and institutional nodes within two districts and three future planning areas (FPAs).

PROJECT LOCATION

The plan area is located on approximately 5,913 acres adjacent to the eastern limits of the city of Sacramento and the southern boundary of Mather Airport, in unincorporated Sacramento County (Figure 2-1). The WJHMP boundaries are generally Jackson Highway (State Highway 16), Kiefer Boulevard, and Goethe Road to the north; portions of Elder Creek Road and Florin Road to the south; the city of Sacramento to the west; and Excelsior Road to the east (Figure 2-2).

ASSESSOR'S PARCEL NUMBERS

The plan area encompasses the following Assessor's Parcel Numbers:



062-0030-004 through 030, 062-0041-003 through 027, 062-0042-018 through 028, 063-0012-025, 063-0013-002 through 023, 063-0030-005 through 018, 063-0040-029 through 061, 063-0051-008 through 023, 063-0052-001 through 033, 063-0060-011 through 051, 063-0070-004 through 028, 063-0080-001 through 027, 063-0090-013 through 014, 063-0100-018 through 028, 063-0110-010 through 013, 063-0130-006 through 023, 063-0150-002 through 034, 063-0170-003 through 019, 063-0180-009 through 029, 063-0190-039, 063-0200-001 through 012, 063-0260-015, 066-0030-004 through 020, 066-0050-011 through 015, 066-0060-001 through 014, 067-0150-024 through 057, 067-0160-011 through 098.

Source: Adapted by Ascent in 2023.

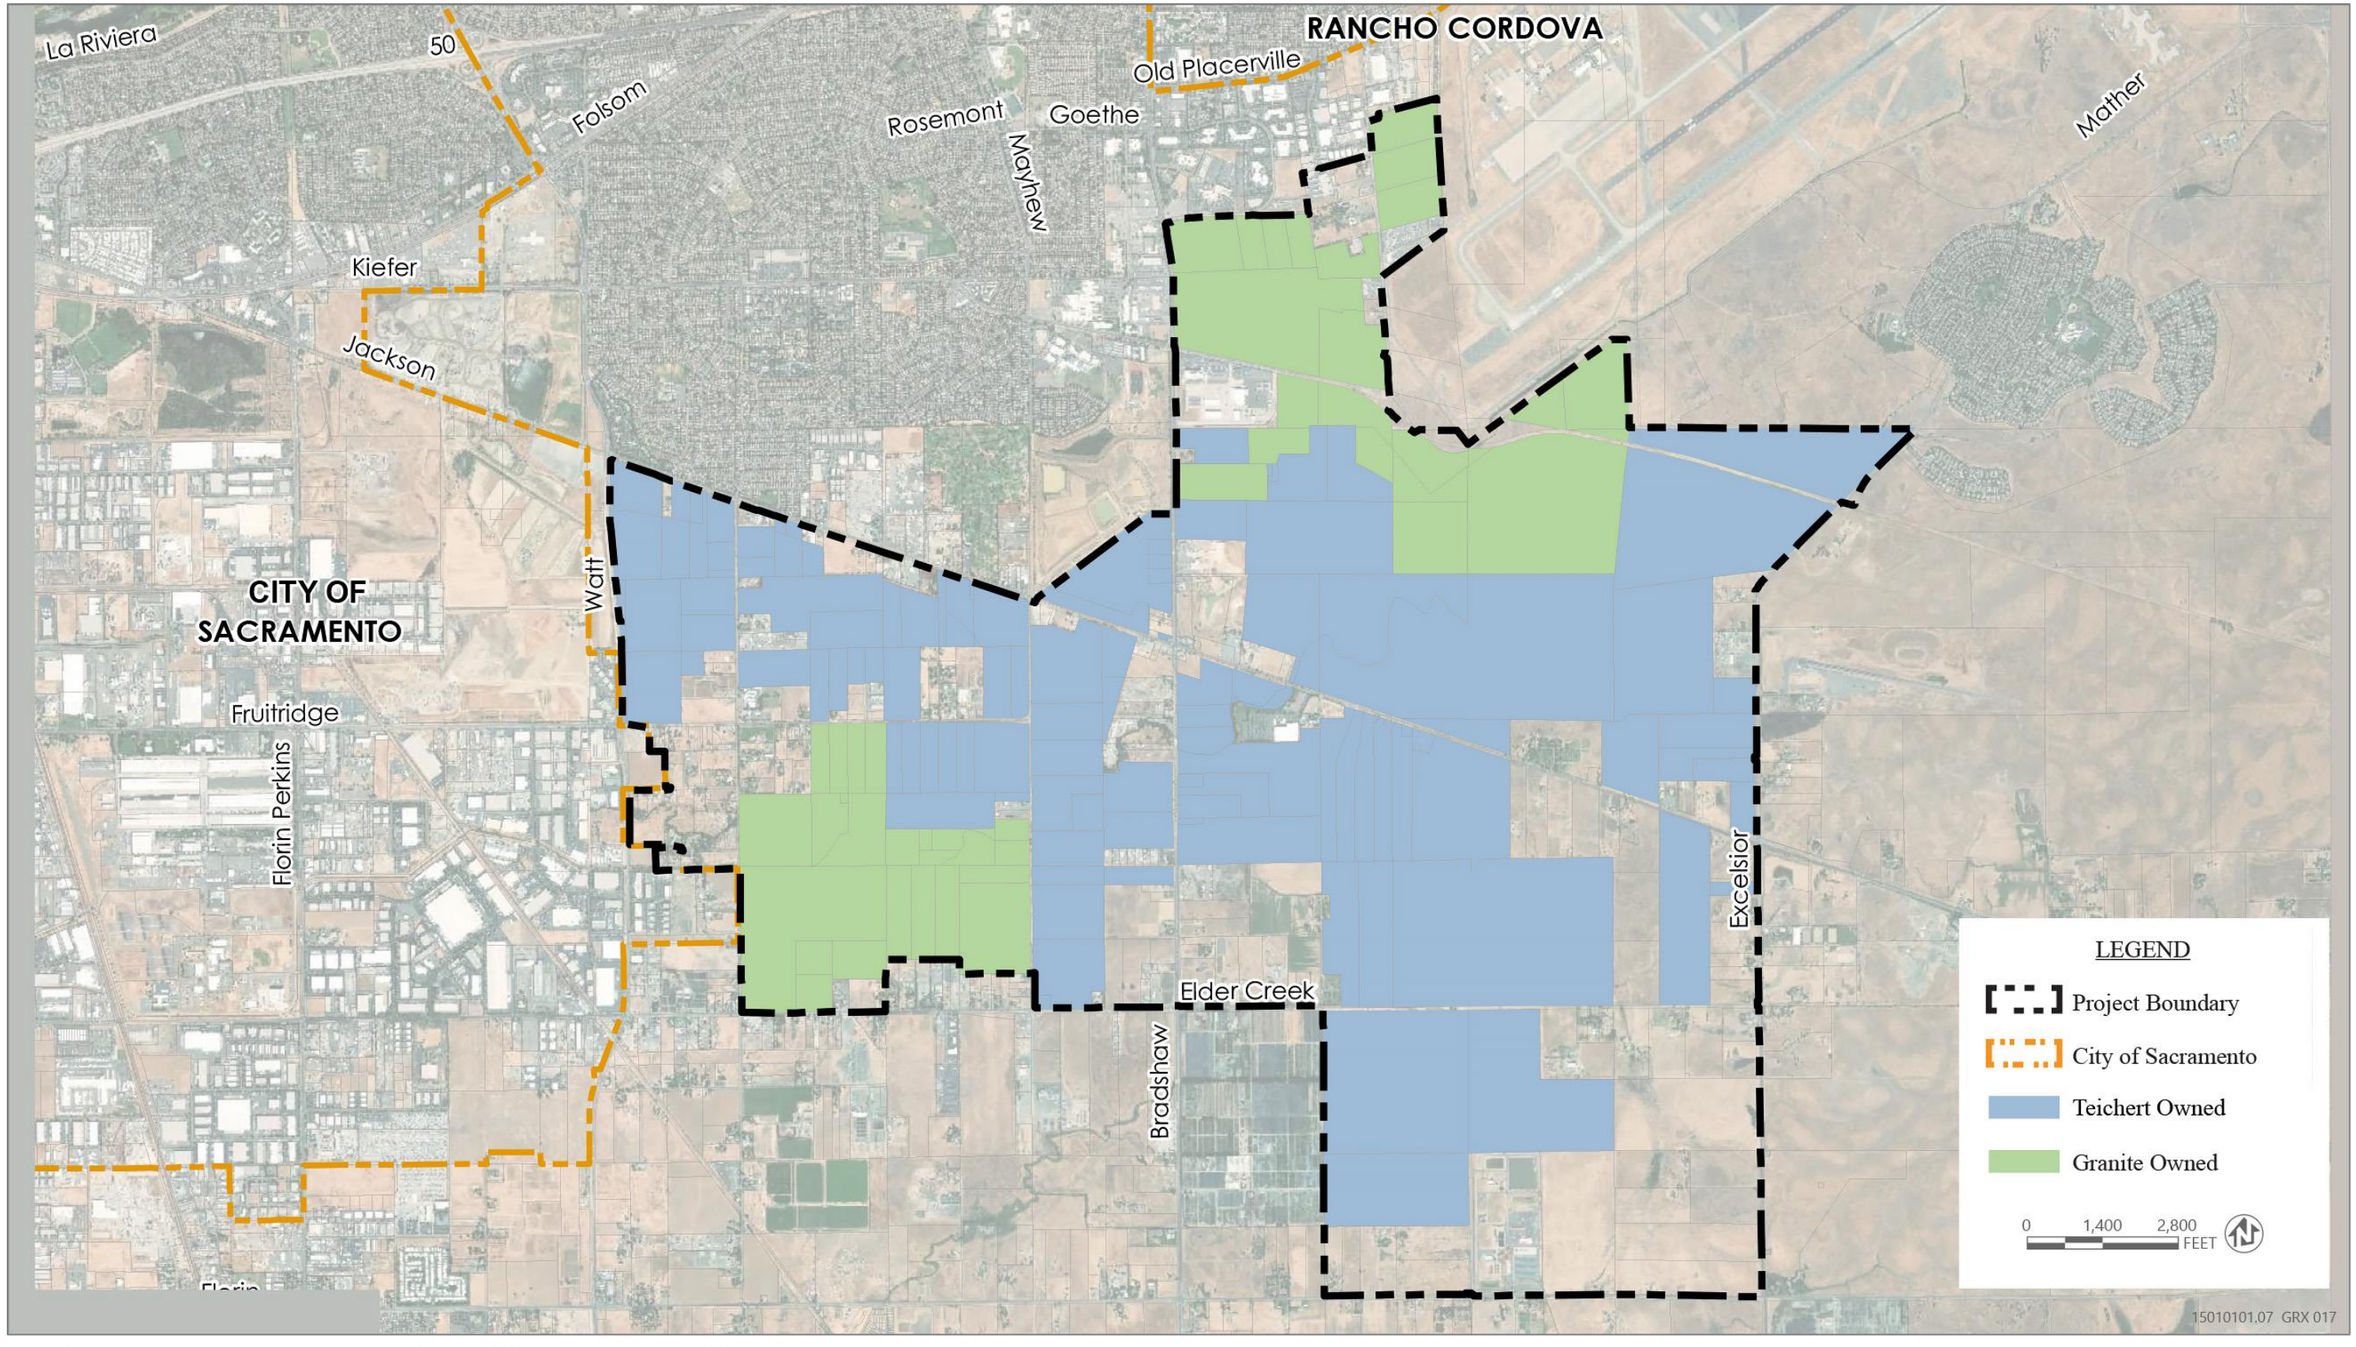
Figure 2-2 West Jackson Highway Master Plan Area

EXISTING CONDITIONS

The Project Applicants separately own a total of approximately 4,079 acres of the plan area; with Teichert owning approximately 3,016 acres and Granite owning approximately 1,063 acres. In total, properties owned by the Project Applicants represent approximately 69 percent of the plan area. Properties owned by the Project Applicants primarily include aggregate mining sites used for sand and gravel extraction, many of which have been closed and reclaimed. Although most of the mining in the plan area is complete, considerable portions of the Project Applicants' properties still support various construction- and mining-related activities. For example, Granite operates an aggregate processing facility at the northeast corner of Bradshaw Road and Kiefer Boulevard, which includes an aggregate processing plant, construction materials recycle operation, and asphaltic concrete batch plant.



Besides mining, other developed areas include a SMUD Corporation Yard, Pacific Coast Building Products processing facility, the Bethany Slavic Missionary Church, assorted truck storage yards, warehouses, building and landscaping supply yards, and the Camellia Memorial Lawn cemetery. These land uses are mostly in the western and central portions of the WJHMP area, with the cemetery and building and landscaping supply businesses concentrated along Jackson Road. There are also small commercial and agricultural-residential areas that are distributed along major roads.

Properties not owned by the Project Applicants (referred to herein as non-participating properties) total approximately 1,834 acres and are included in the proposed master plan per Sacramento County 2030 General Plan requirements. The portion of the plan area not owned by the Project Applicants includes small rural residential parcels; parcels owned by institutional landowners, such as the Elk Grove Unified School District (Elk Grove USD); parcels owned by religious organizations, and parcels owned by various industrial users.

Figure 2-3 identifies the parcels owned by Teichert and Granite, as well as the non-participating properties within the plan area.

ENVIRONMENTAL SETTING

The plan area is traversed by two perennial waterways, which flow through the plan area from roughly the northeast to the southwest: Elder Creek and Morrison Creek. Rainfall and urban runoff collect in these creeks, which drain into the Beach-Stone Lakes area and ultimately flow into the Sacramento/San Joaquin Delta. Elder Creek flows from roughly the intersection of Jackson Highway and Excelsior Road at the eastern boundary of the plan area to the southwest. Morrison Creek extends from the southwest corner of Mather Airport, at Excelsior Road, crosses Jackson Highway east of Bradshaw Road, and flows towards the southwestern edge of the plan area. There is a small concentration of oak trees along undisturbed portions of Morrison Creek near the southeast intersection of Jackson Highway and Bradshaw Road, and there are oak mitigation plantings on the south side of Morrison Creek east of Bradshaw Road.

Source: Image produced and provided by Sacramento County in 2023, adapted by Ascent in 2023.

Figure 2-3 Participating and Non-Participating Parcels

Mining has been a prevalent land use in the plan area since the 1930s, and the natural topography of the plan area has been altered by the history of sand and gravel mining. Two reaches of Morrison Creek (one east of Jackson Highway and one west of Jackson Highway) were realigned within human-made channels constructed as part of the reclamation operations for the mines. In addition, the previously mined portions of the plan area are approximately 20–30 feet lower than the surrounding ground surface and the channel elevation of Morrison Creek is higher than the areas that have been mined. In these areas, the embankments function as levees (Langan Treadwell Rollo 2014). Although portions of the mined areas historically flowed to Morrison Creek, many of these areas now retain stormwater, and some are connected by conveyor tunnels at South Watt Avenue, Hedge Avenue, Bradshaw Road, Jackson Road, and Fruitridge Road. Upstream of Bradshaw Road, in the northeastern portion of the plan area, Morrison Creek spills over an approximately 800-foot-long weir structure during periods of high flow and the plan area detains runoff from the upstream watershed (Wood Rodgers 2022). The elevation of the plan area is shown in Figure 2-4.

Two open space areas in the plan area have vernal pools constructed for mitigation purposes: an approximately 150-acre area in the northern portion of the plan area created by Granite and Teichert to mitigate lost wetland habitat associated with mining in other parts of the plan area, and 24 acres of created vernal pools in Teichert's Aspen VI mining area. Neither of these mitigation sites are protected by a conservation easement at this time. There is also an 82-acre preserve located south of Jackson Highway and approximately 1 mile east of the intersection of Jackson Highway with Bradshaw Road. This property is under a conservation easement held by the California Department of Fish and Wildlife.

Existing Land Uses

Existing land uses within the plan area include a mixture of active and reclaimed surface mining sites; industrial properties such as storage, trucking, and rock processing and sales; and limited rural residential, commercial, institutional, and agricultural uses. In some areas, vegetative screens consisting of oleander, redwood, and cedar plantings buffer the plan area from adjacent roadways. Elk Grove USD currently operates an elementary school (Sierra Enterprise) within the plan area at the Hedge Avenue/Fruitridge Road intersection. There are three existing clusters of residential dwellings in the plan area, summarized below. Refer to Chapter 15, "Land Use," for further discussion of these existing land uses.

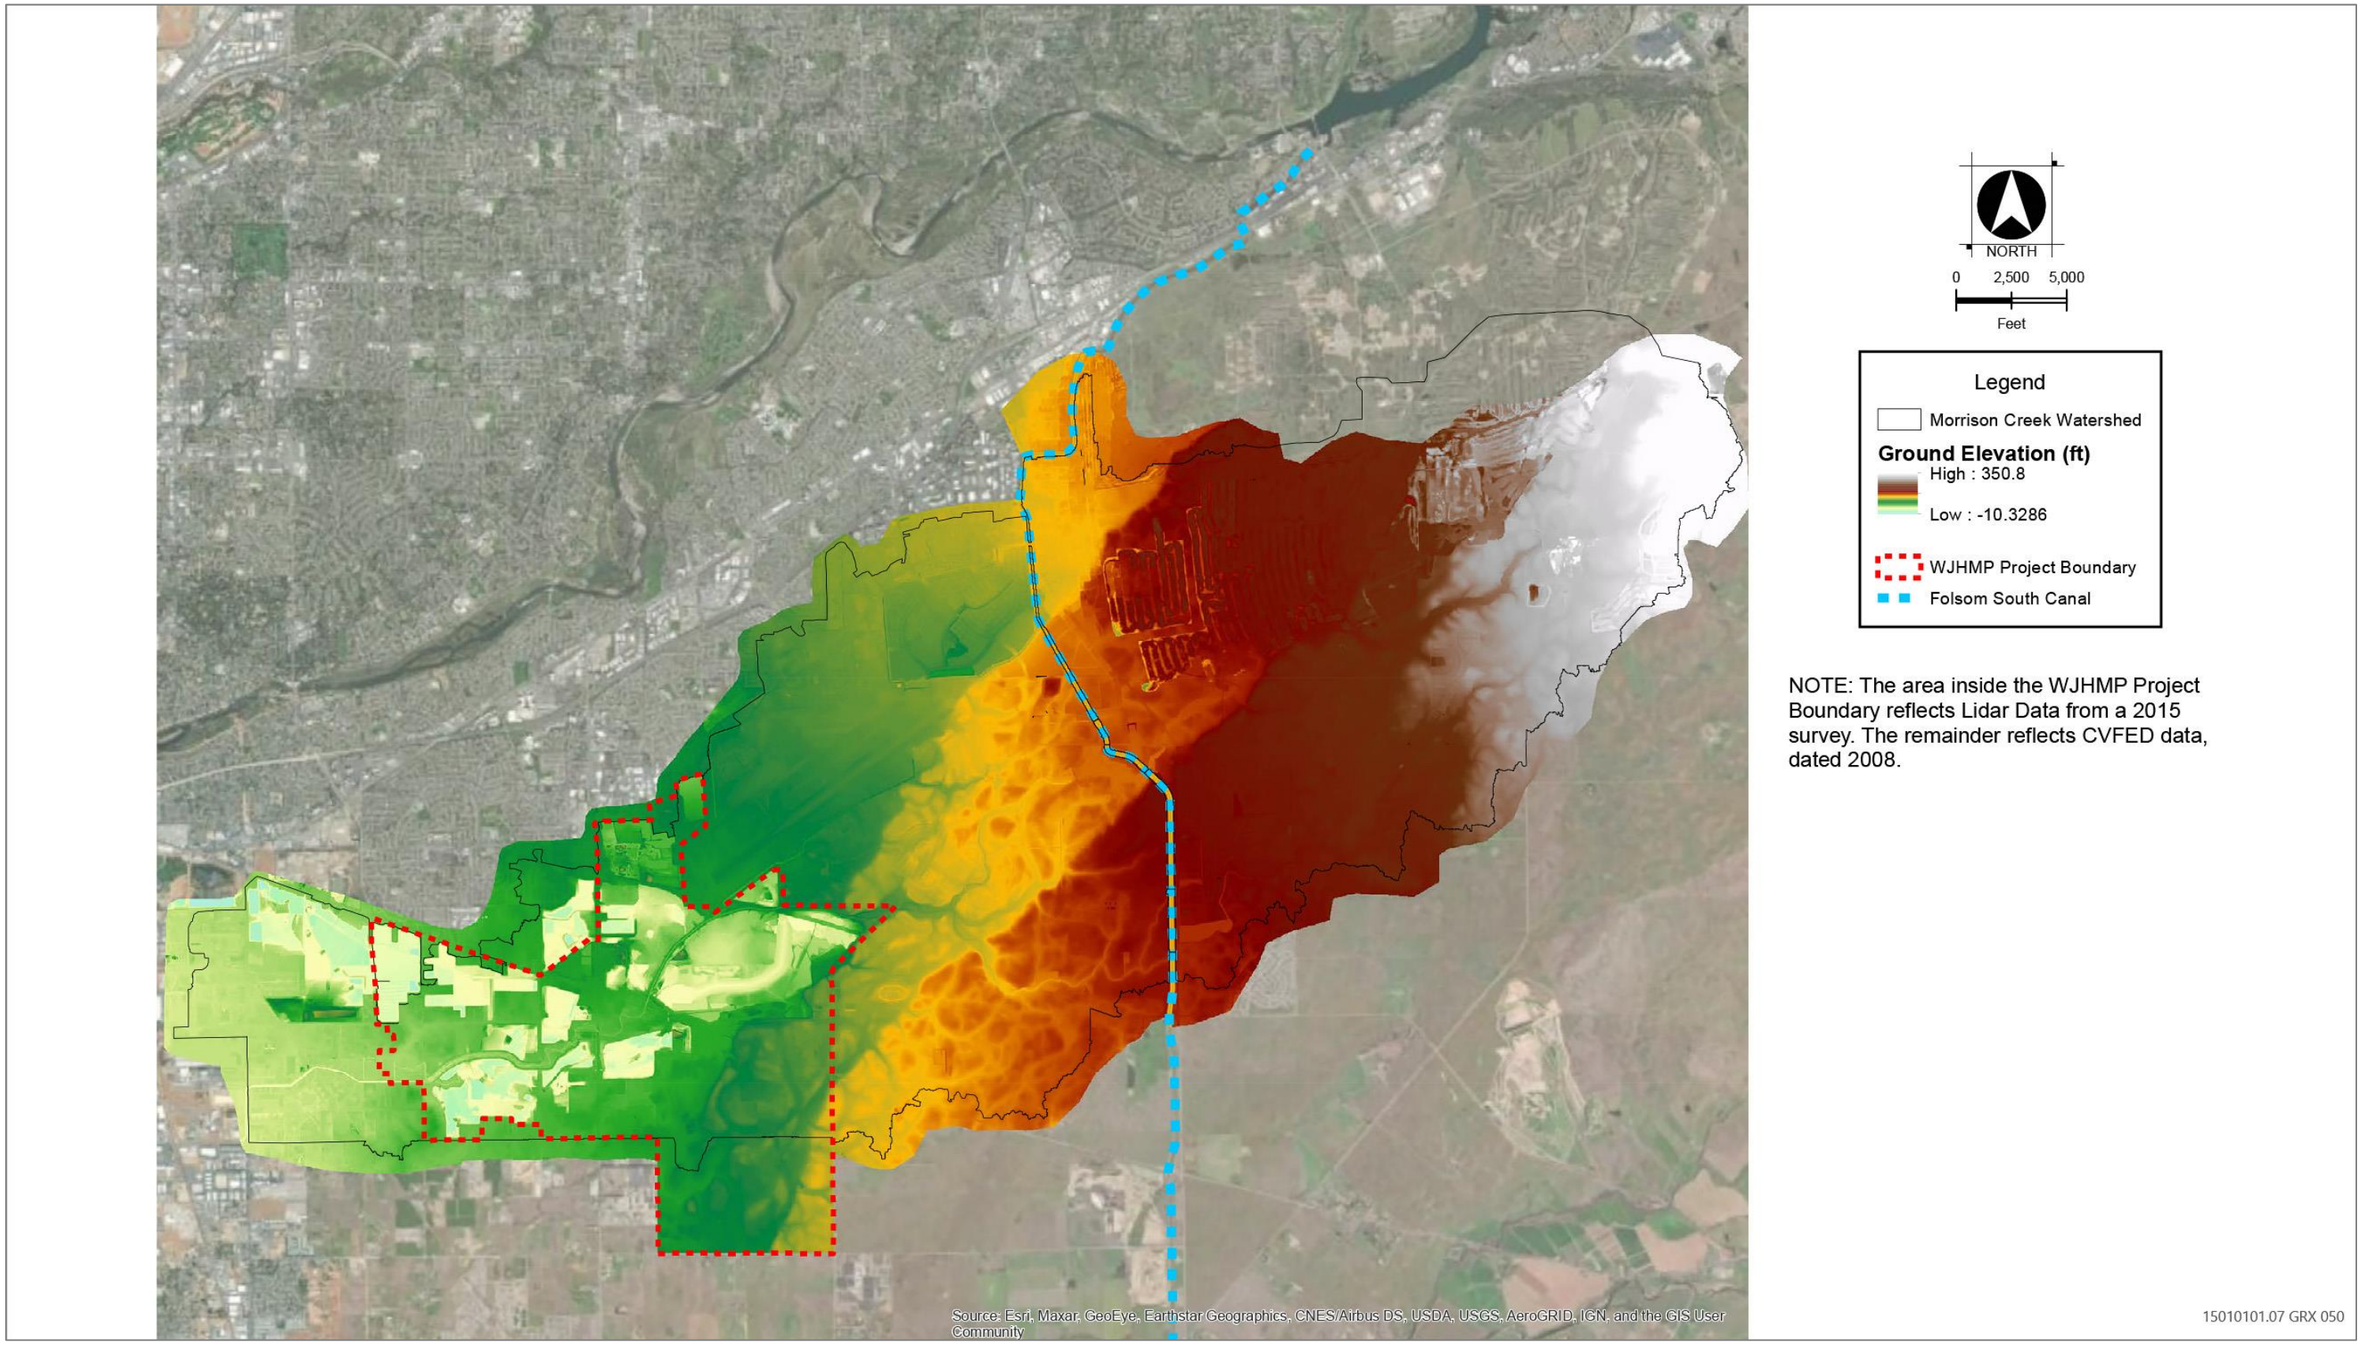
Adjacent Land Uses

West

The plan area is bound to the west by the city of Sacramento along South Watt Avenue, an area characterized by the presence of industrial facilities (warehouses, storage yards, manufacturing), employment centers, and mining sites. The City of Sacramento 2040 General Plan designates the area as Industrial Mixed-Use (City of Sacramento 2024).

The Teichert Land Company owns approximately 232 acres of land at the southwestern corner of Jackson Highway and South Watt Avenue in the city of Sacramento. This area is also a former mining site that is currently used for wash ponds, drying facilities, and a conveyor belt system that transports raw aggregate from nearby mining sites to the Teichert Perkins plant. The Teichert Land Company's Aspen 1- New Brighton development project, which was approved by the City of Sacramento in 2015, is planned for this site. The Aspen 1-New Brighton development consists of 232 acres designated for single-family residential, multi-family residential, an elementary school, and mixed-use; a 13-acre shopping center; 14 acres of parks and open space; and a 28-acre urban farm (City of Sacramento 2012). The Aspen 1-New Brighton project and the proposed project have been designed to be compatible with each other.

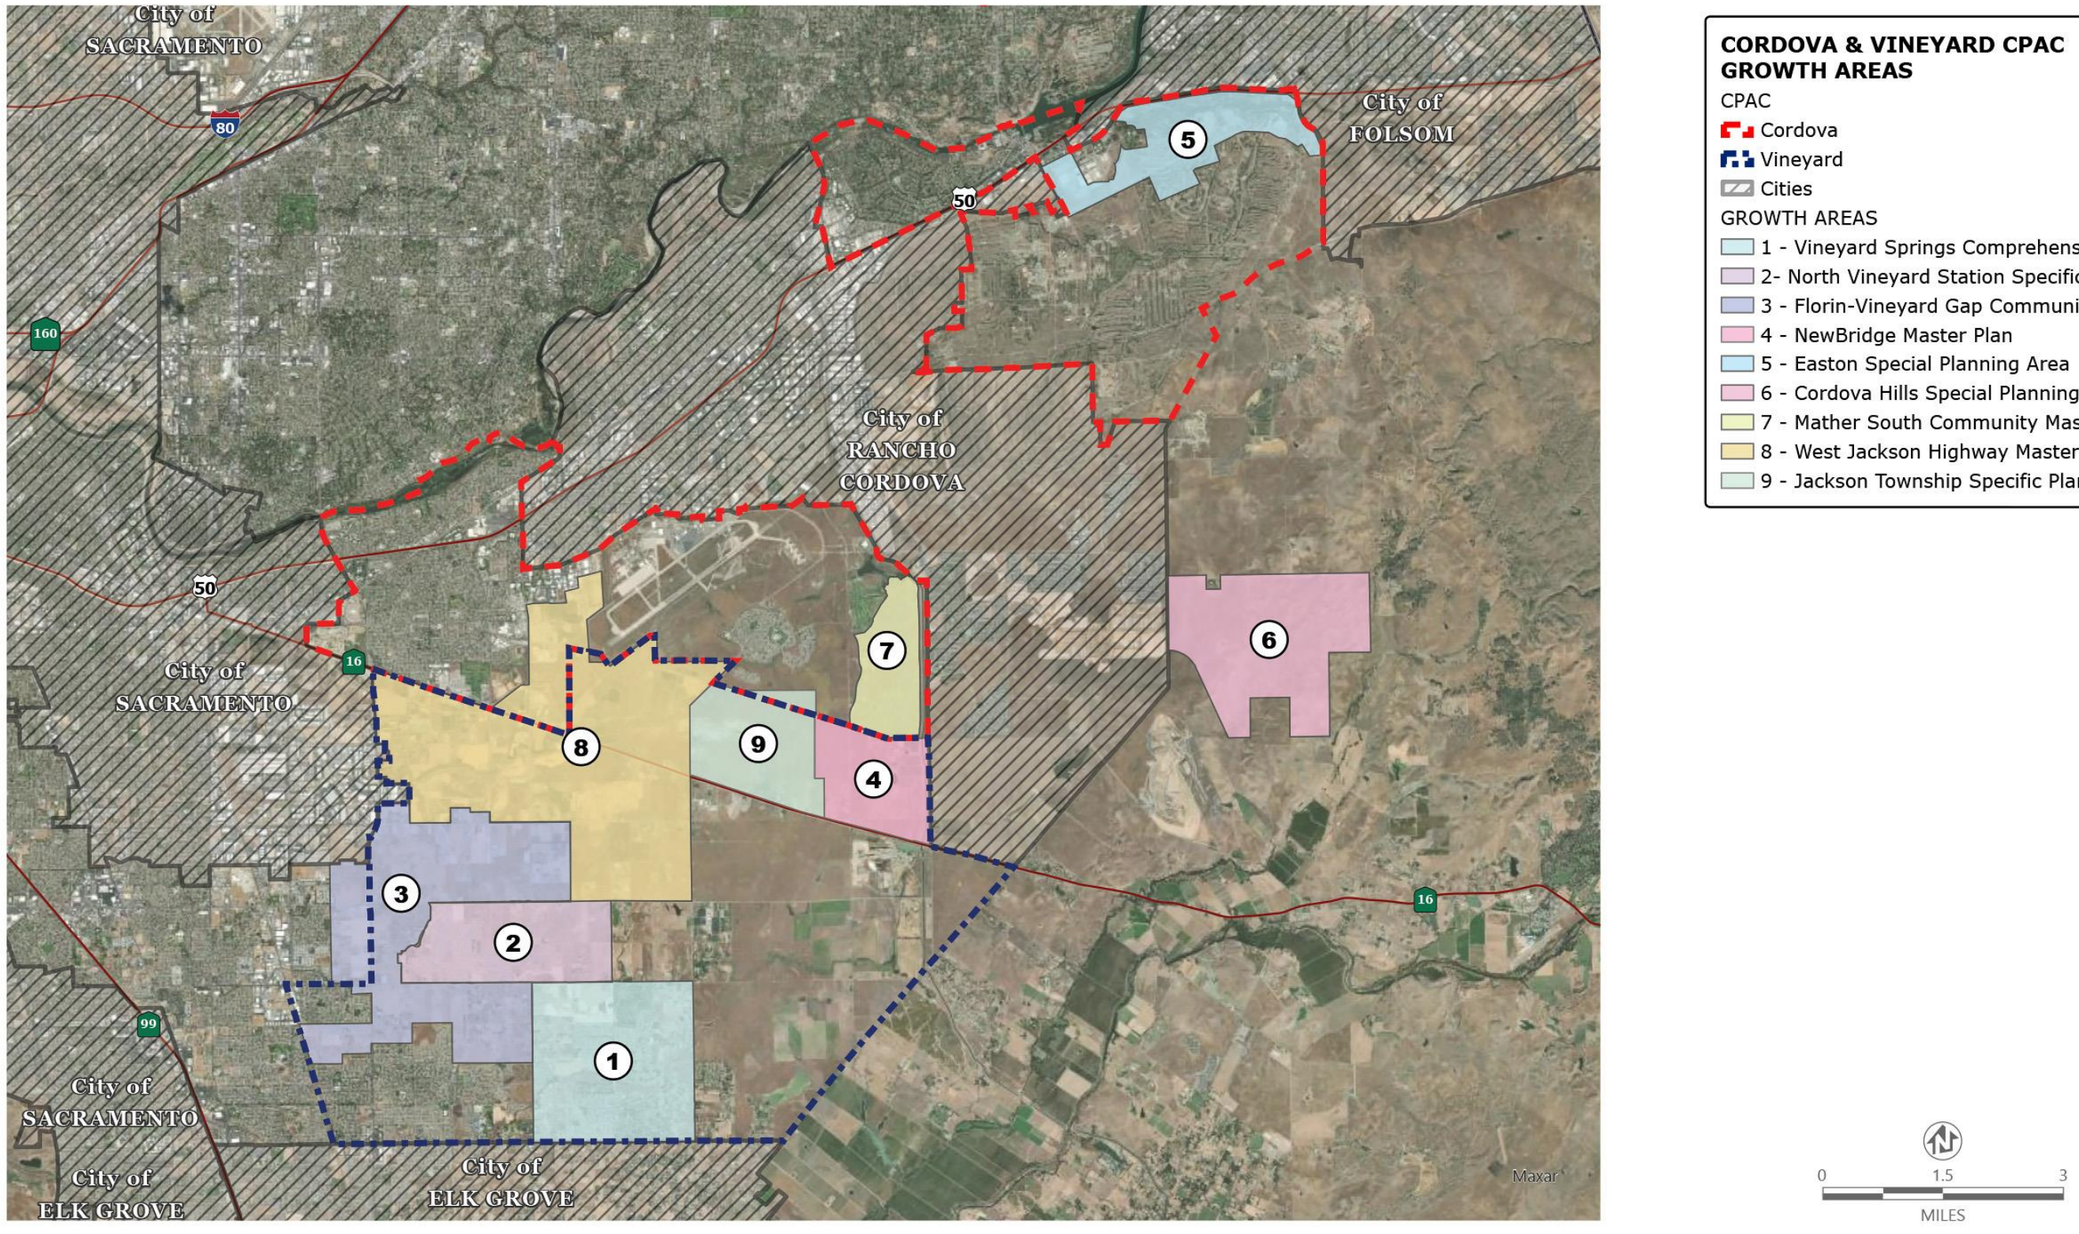
NORTH



The existing, unincorporated community of Rosemont is located immediately north of the plan area. The community is comprised of predominantly lower density single-family neighborhoods and small neighborhood commercial centers. Additional land uses along the northern edge of the plan area include the Cordova Golf Course; a small assortment of industrial uses including Silverado Building Materials and Nursery, a large rock, stone, and retail nursery business; and Mather Airport. Mather Airport is the former Mather Air Force Base and is now primarily used as an air cargo facility and business park that provides predominately aviation services. A portion of the plan area is located within the Mather Airport 60 decibel (dB) community noise equivalent level (CNEL) noise contour line, which generally prohibits the location of certain types of sensitive land uses such as homes and schools. Sacramento City Unified School District (City USD) operates Rosemont High School, located adjacent to the plan area at the southwest corner of Kiefer Boulevard and Bradshaw Road.

EAST

Existing land uses along the eastern plan area boundary include agricultural and residential parcels. This area is planned for development as part of the approved Jackson Township Specific Plan (refer to Figure 2-5). The 1,391-acre Jackson Township Specific Plan is a master planned community that is planned to include up to 5,690 housing units; just over 2 million square feet of commercial, office and mixed-use development; schools; a fire station and community center; parks; and a large wetland preserve.



SOUTH

Properties south of the plan area include rural residential properties, agricultural land, and a commercial nursery. Some of this land is part of the approved Florin-Vineyard Community Plan area and the North Vineyard Station Specific Plan (refer to Figure 2-5). These communities are planned to support residential, commercial, and industrial land uses and are in the process of being built out.

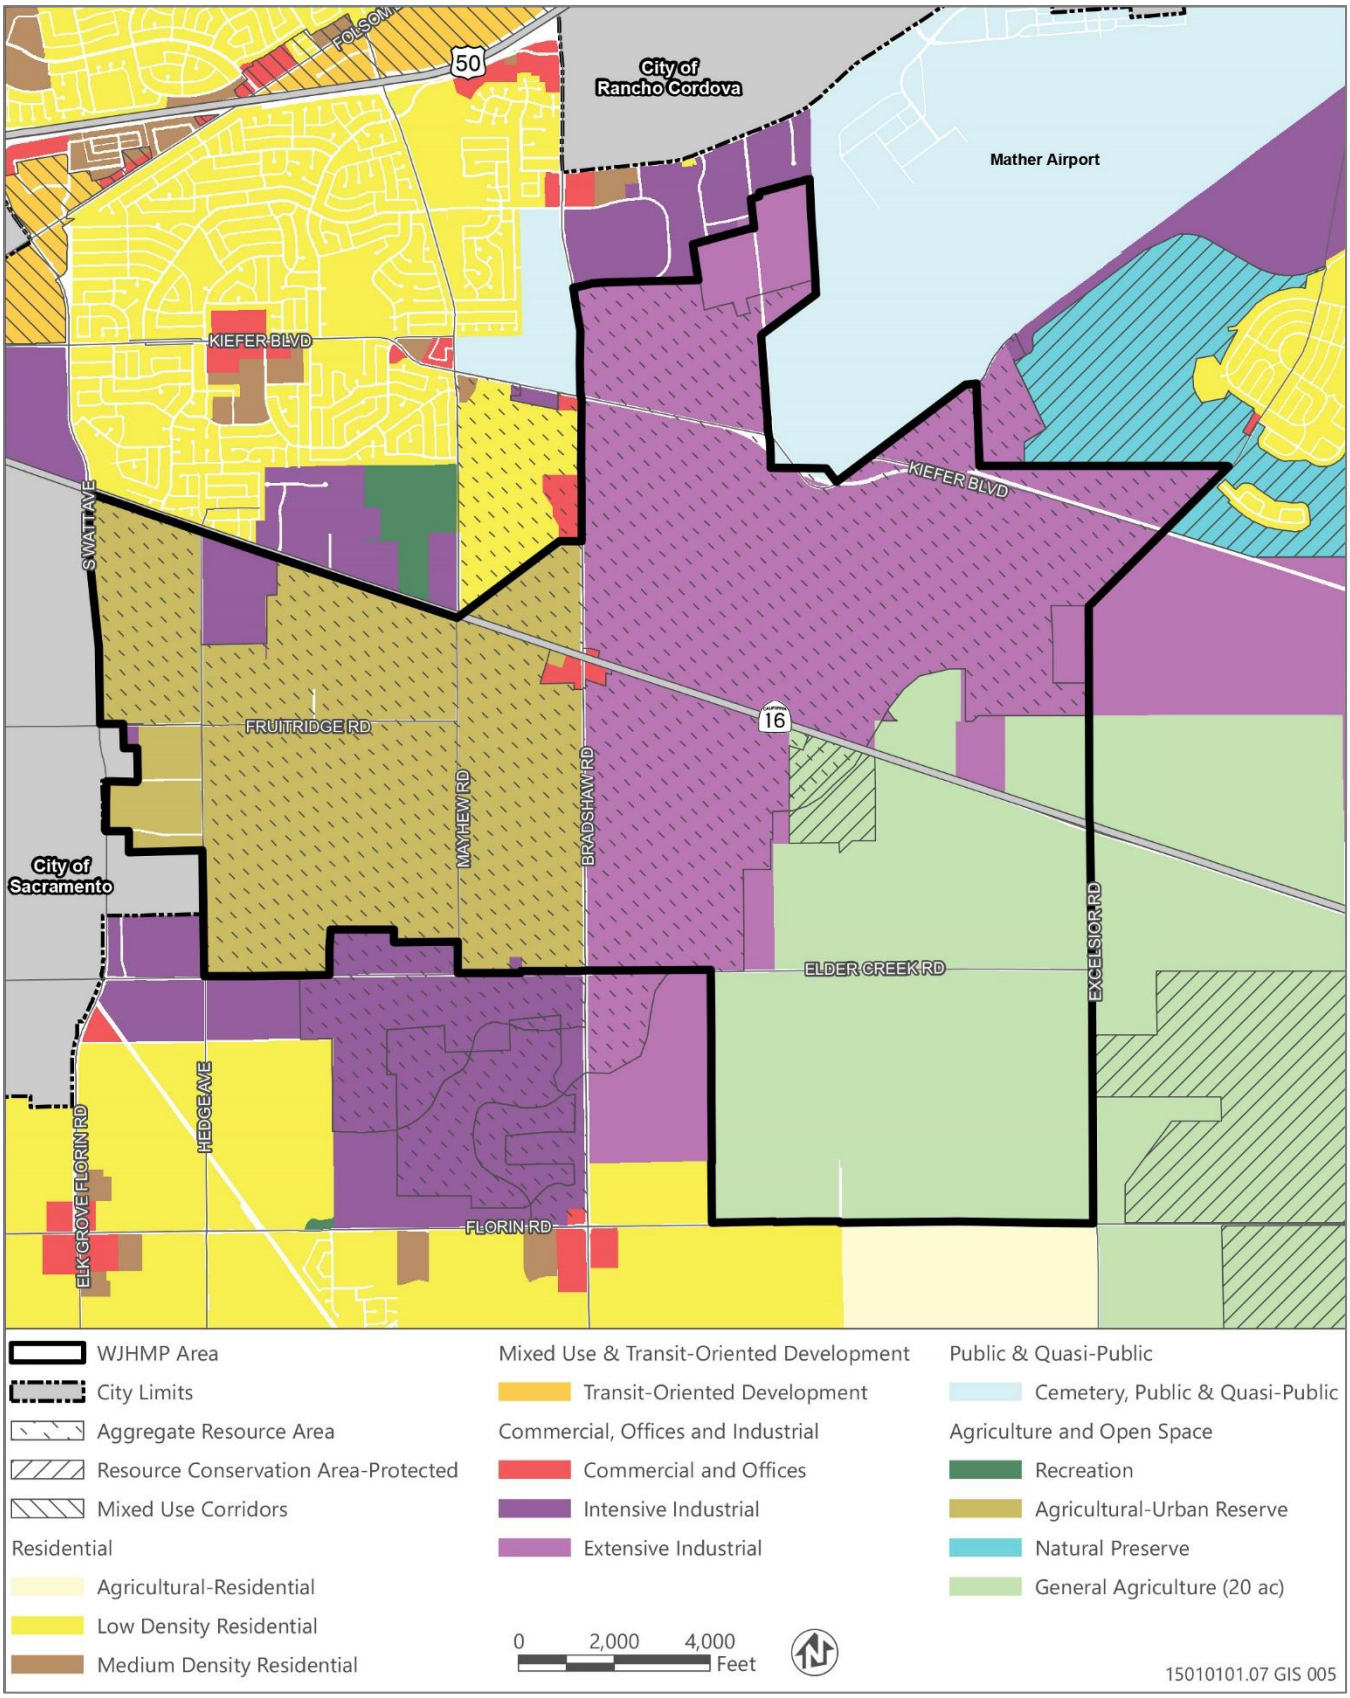
Figure 2-5 Regional Planning Context

EMPLOYMENT AND RECREATIONAL CENTERS

The plan area is geographically located within 5 miles of several employment centers, including Mather Airport, the city of Rancho Cordova; the Sacramento County Branch Center offices and transportation center; the Sacramento Municipal Utility District's (SMUD's) East County Operations Center and Corporation Yard; Depot Park (the former Sacramento Army Depot); California State University, Sacramento; the University of California, Davis Medical Center; Granite Business Park, and the Power Inn Road industrial area. Based on SACOG's 2020 data, there are approximately 243,234 jobs located within 5 miles of the WJHMP area (Navarro, pers. comm., 2024).

Currently, there are no major retail centers immediately serving the plan area except for neighborhood commercial centers along Bradshaw Road and Kiefer Boulevard in the Rosemont community and some neighborhood and community commercial centers in Rancho Cordova. Nearby recreational opportunities include the American River Parkway, Granite Regional Park, Cordova and Wildhawk golf courses, and trails along the Illa M. Collin Conservation Preserve near Mather Airport.



GENERAL PLAN LAND USE DESIGNATIONS

The plan area is currently designated by the Sacramento County General Plan as: General Agriculture (1,713 acres), Agricultural-Urban Reserve (1,722 acres), Extensive Industrial (2,385 acres), Intensive Industrial (72 acres), Commercial & Offices (17 acres), and Public/Quasi-Public (4 acres) (see Figure 2-6). In addition, portions of the plan area contain an aggregate resource area overlay. Pursuant to General Plan Policy CO-37, the County applies the aggregate resources combining land use category to areas determined to contain mineral resources that are appropriate for mining.

COMMUNITY PLAN LAND USE DESIGNATIONS

VINEYARD COMMUNITY PLAN

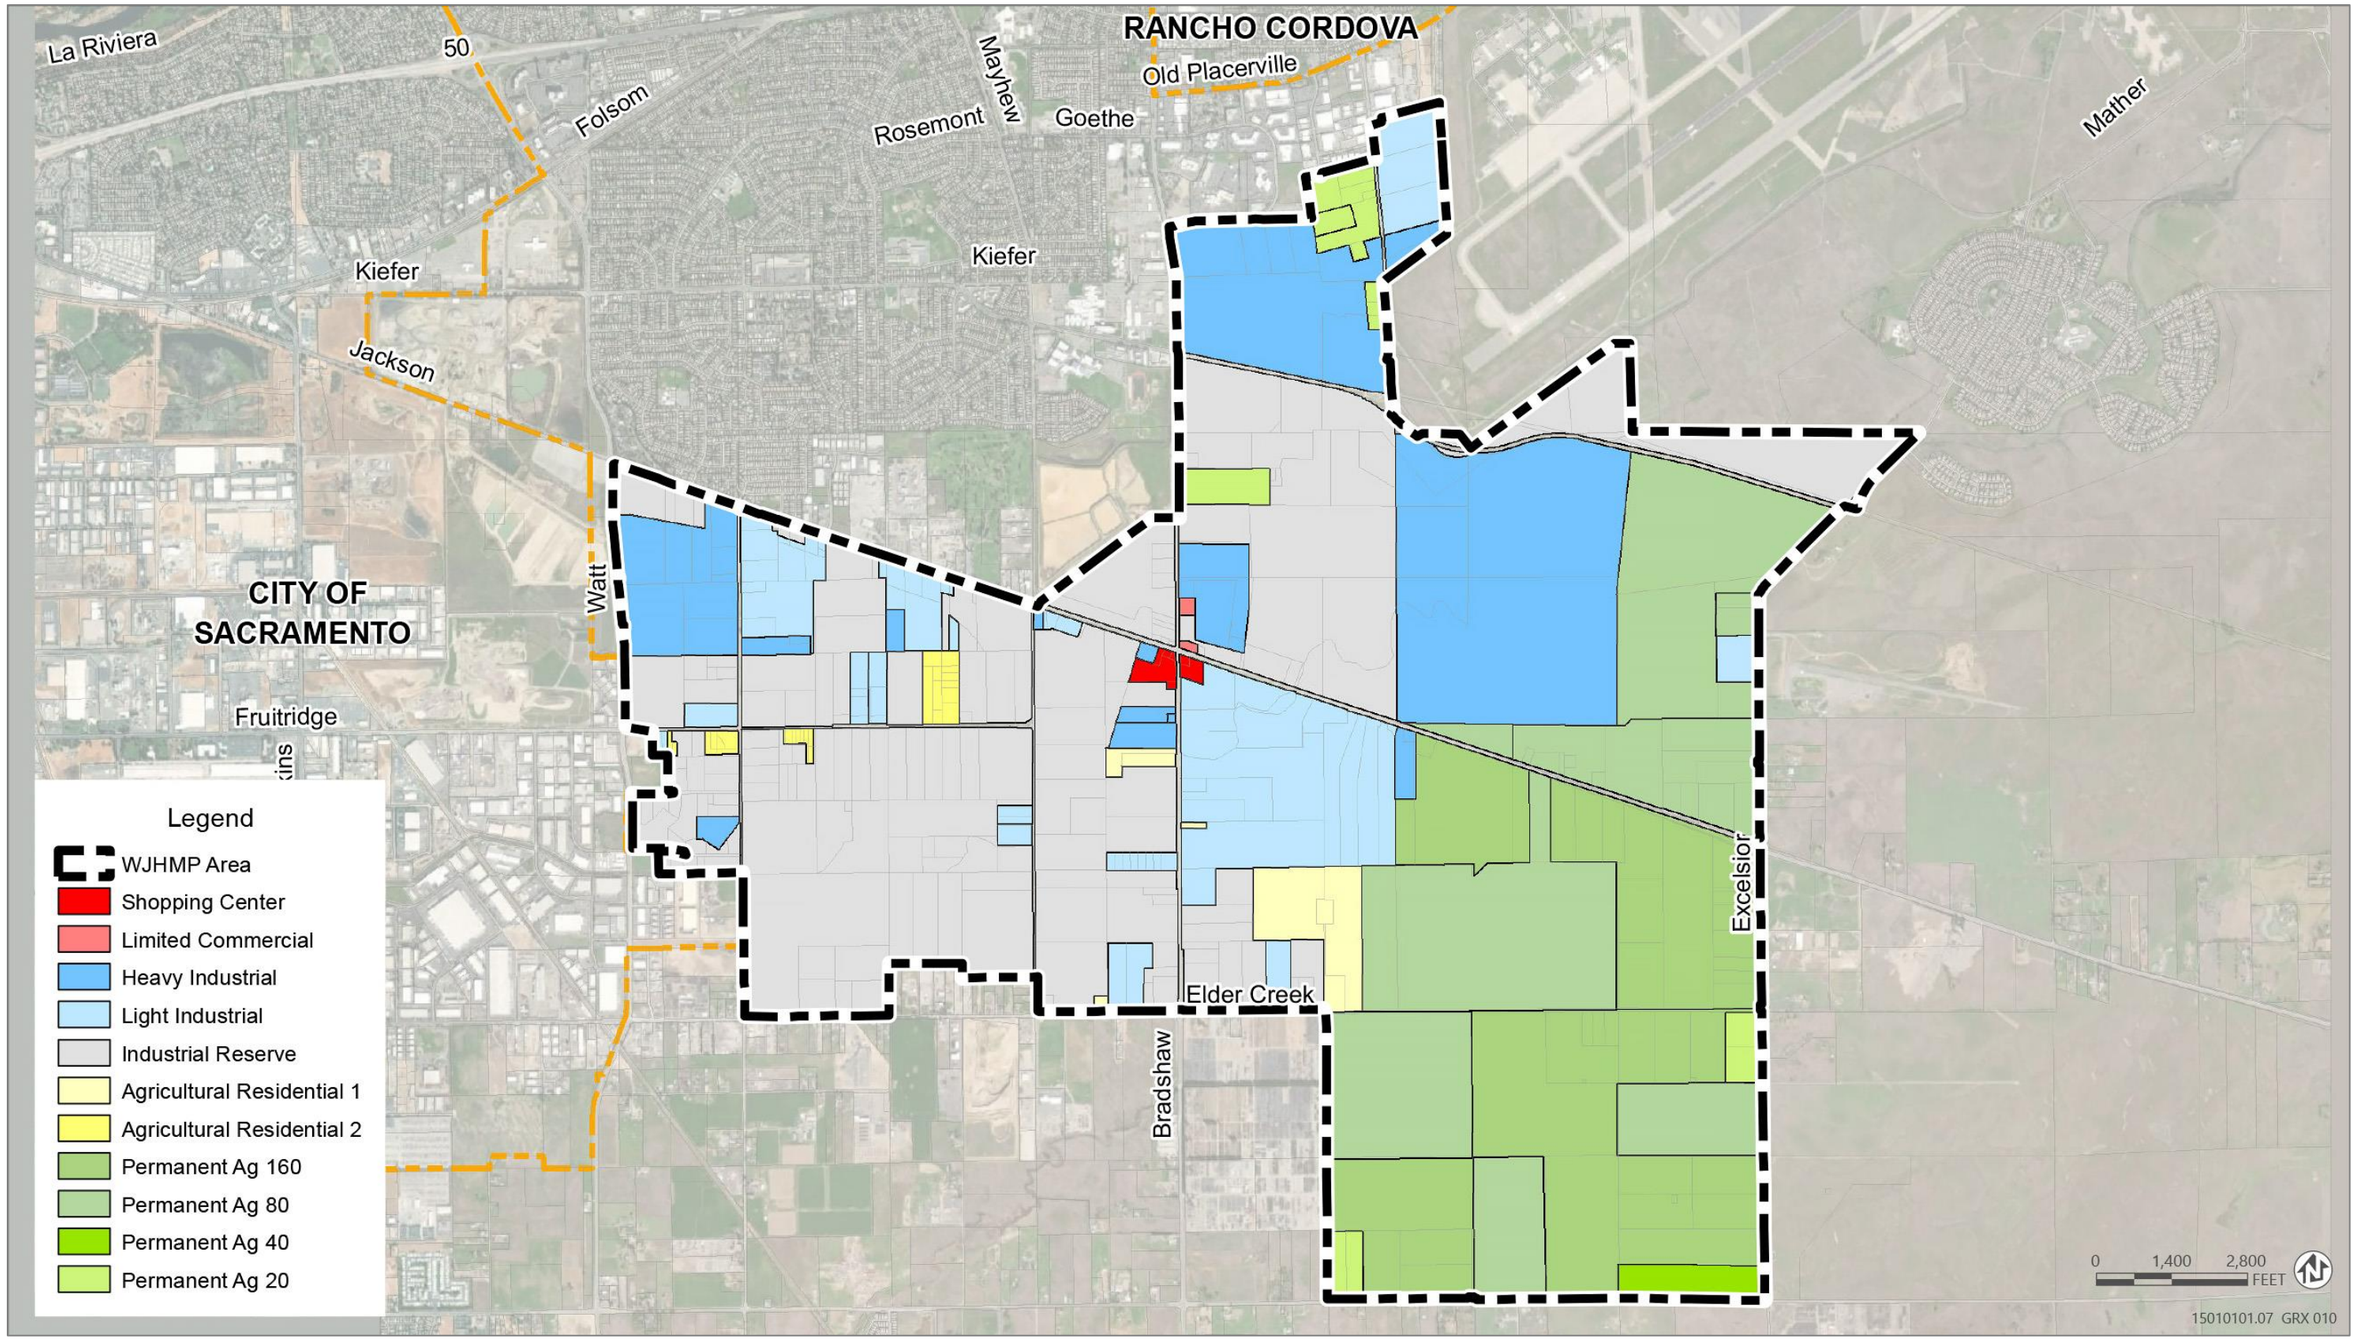
Lands within the plan area south of Jackson Highway and a portion north of Jackson Highway are within the Vineyard Community Plan area (see Figure 2-5). The Vineyard Community Plan was adopted in 1985 and was intended to be a guide for future growth and development in the Vineyard area. However, many of the Vineyard Community Plan's land use assumptions are now obsolete because of land use changes since its adoption. For example, the Vineyard Community Plan assumed that the Vineyard community would retain its rural character. Instead, large areas of the Vineyard Community Plan area developed after the County's 1993 General Plan opened the area to urban development. Another assumption was that Mather Air Force base would continue as a military facility and that its associated noise impacts would have a major influence on land uses in most of the Vineyard community. Subsequent to the Vineyard Community Plan adoption, however, the potential for noise impacts has been reduced because of the military base's closure and conversion to a civilian airfield and air cargo facility.

Sources: Data downloaded from the County of Sacramento in 2023; adapted by Ascent in 2023.

Figure 2-6 Existing General Plan Designations

COMMUNITY PLAN DESIGNATIONS

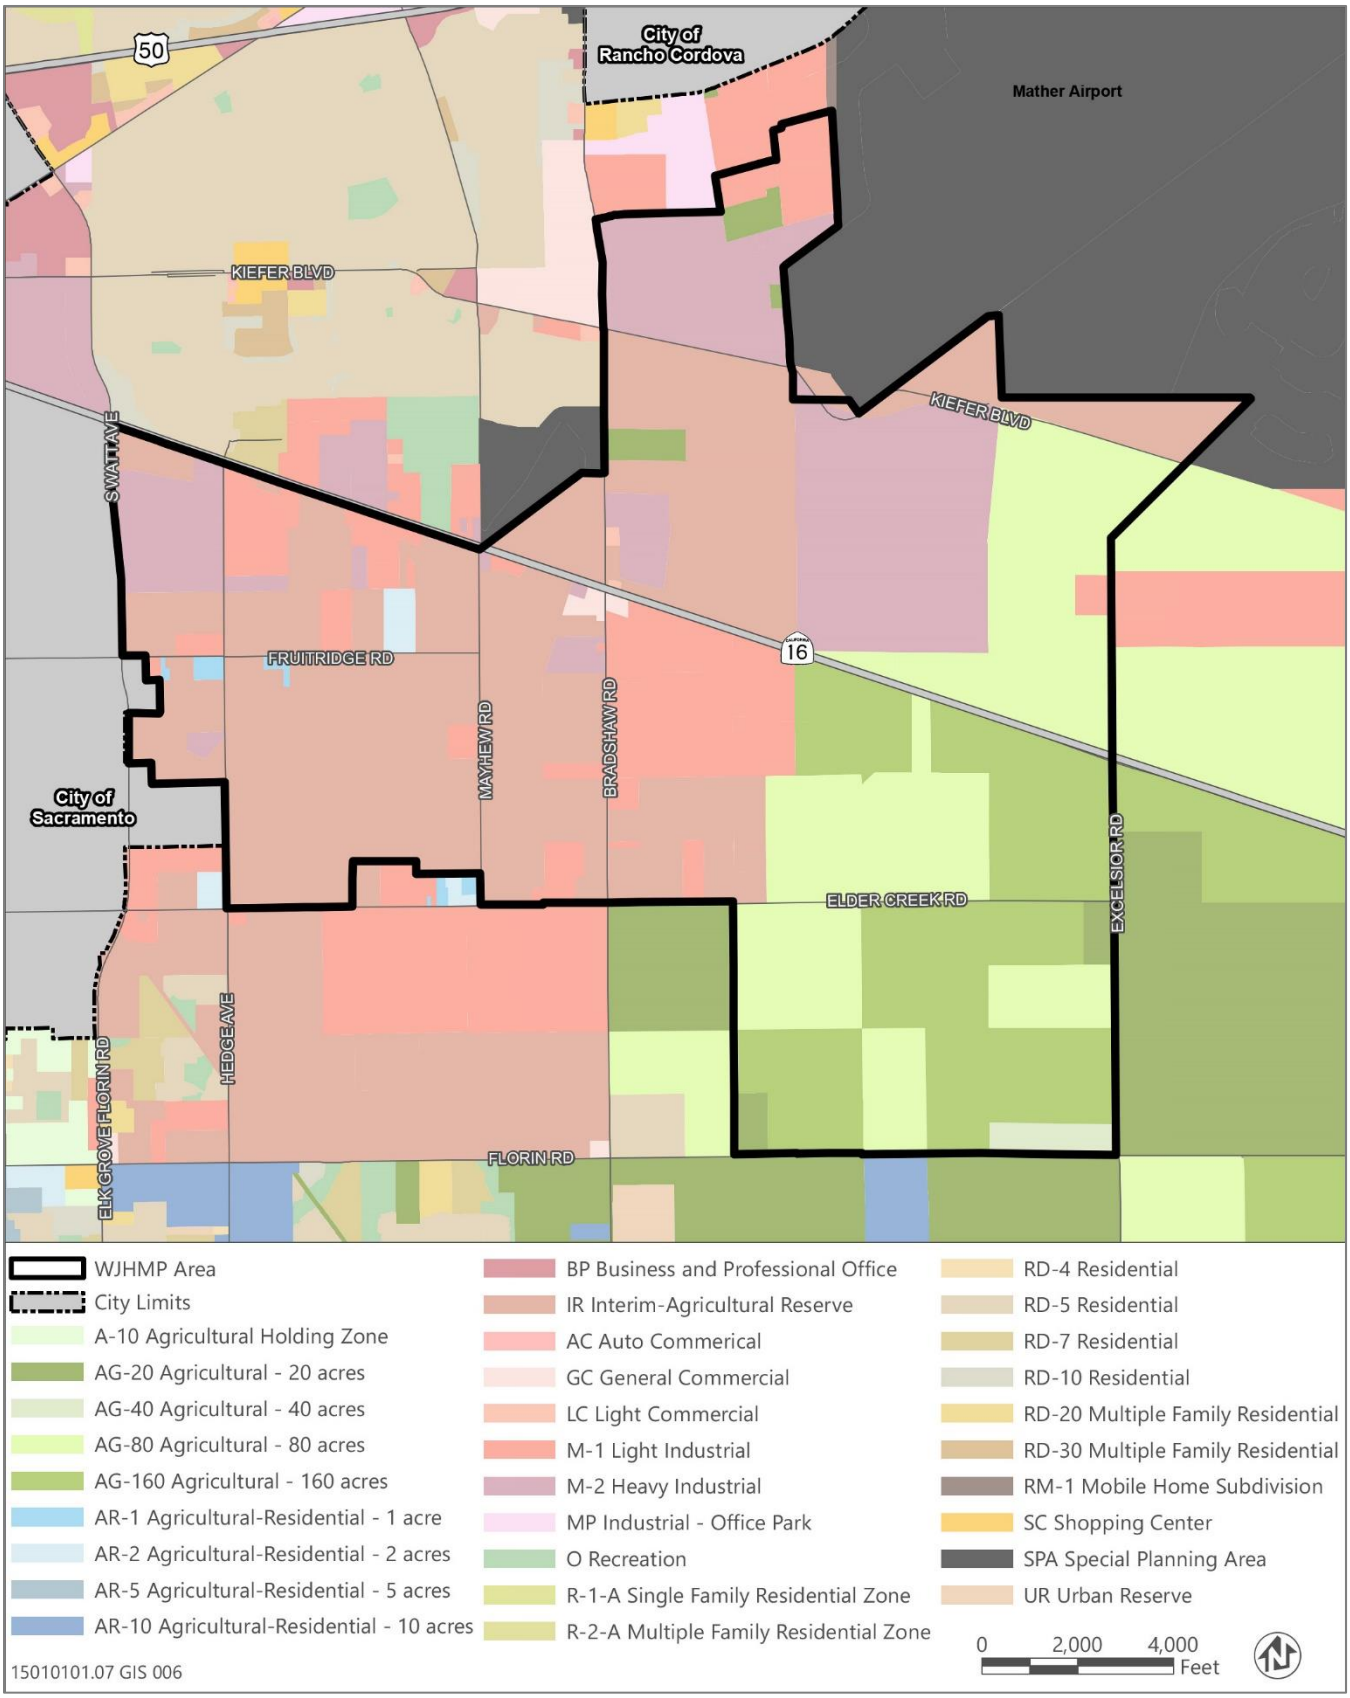
The WJHMP area is designated by the Vineyard and Cordova Community Plans with the following land use designations (see Figure 2-7):



- Permanent Agriculture (AG-20)
- Permanent Agriculture (AG-40)
- Permanent Agriculture (AG-80)
- Permanent Agriculture (AG-160)
- Agricultural Residential 1
- Agricultural Residential 2
- Shopping Center
- Limited Commercial
- Light Industrial
- Heavy Industrial
- Industrial Reserve
- Major Roads

EXISTING ZONING

Existing zoning designations within the WJHMP area include the following (see Figure 2-8):



- AG-20: Agriculture-20 ac. Minimum
- AG-40: Agriculture-40 ac. Minimum
- AG-80: Agriculture-80 ac. Minimum
- AG-20(SM): Agriculture-20 ac. Minimum (Surface Mining)
- AG-80(SM): Agriculture-80 ac. Minimum (Surface Mining)
- AG-160: Agriculture-160 ac. Minimum
- AG-160(SM): Agriculture-160 ac. Minimum (Surface Mining)
- AR-1: Agricultural-Residential-1 ac. Minimum
- AR-2: Agricultural-Residential-2 ac. Minimum
- IR: Interim Agricultural Reserve
- IR(SM): Interim Agricultural Reserve (Surface Mining)

- LC(SM): Light Commercial (Surface Mining)
- GC: General Commercial
- M-1: Light Industrial
- M-1(SM): Light Industrial (Surface Mining)
- M-2: Heavy Industrial
- M-2(SM): Heavy Industrial (Surface Mining)

Figure 2-8 Existing Zoning Designations

BACKGROUND

REGIONAL GROWTH PROJECTIONS AND PLANNING CONTEXT

County staff prepared the Jackson Highway Visioning Study for approximately 12,000 acres in central Sacramento County along Jackson Road as part of the General Plan update process in the early 2000s. This study was initiated in response to the Sacramento Region Blueprint, which was adopted by the Sacramento Area Council of Governments (SACOG) in 2004. The Sacramento County 1993 General Plan had assumed the need for approximately 29,000 new residential units in the unincorporated county, but the Blueprint assumed nearly 100,000 new units, more than triple the previously assumed demand, amidst a housing boom in the region. The Jackson Highway Visioning Study (and a concurrent visioning study completed for 10,000 acres along Grant Line Road) were developed to provide a guide for long-term future growth, based on the Blueprint's housing demand projections. The Jackson Highway Visioning Study was completed in 2008; however, it was not adopted by the Board of Supervisors.

The housing boom ended in 2008, followed by a recession. During the same period, the State adopted several regulatory changes that required local governments to drastically change their approach to land use planning, including Assembly Bill (AB) 32 in 2006 and Senate Bill (SB) 375 in 2008. SACOG's regional growth projections were adjusted to reflect shifts in the economy and regulatory environment. By the time the 2030 General Plan was adopted in 2011, SACOG's growth demand projections for new housing for the unincorporated county had been reduced from nearly 100,000 to less than 50,000 during a 6-year period. This resulted in the need to change the County's approach to approving new growth. The revised approach to new growth areas incorporates strict criteria for growth based on smart growth principles that are intended to assist the County in meeting its obligations to reduce greenhouse gas emissions under AB 32 and SB 375. Additional information on this topic and the analysis of the project's ability to meet the criteria can be found in Chapter 15, "Land Use."

The most current SACOG growth forecast was created for the 2025 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS), and adopted in February 2022. This forecast uses a 2020 base year estimate with projections to 2050 for housing units and employment. These projections estimate demand for 167,710 new residential units in unincorporated Sacramento County between 2020 and 2050 (SACOG 2022).

URBAN POLICY AREA AND URBAN SERVICES BOUNDARY

Urbanization in the unincorporated county is largely shaped by the Urban Policy Area (UPA) and Urban Services Boundary (USB). The UPA identifies the area in the county anticipated to accommodate projected near-term growth. The intent of the UPA is to direct growth in a logical manner and to identify areas where infrastructure requiring near-term large capital investments will be needed. The USB delineates the ultimate boundary of the urban area in the unincorporated county (beyond 25 years). It is intended to be a permanent growth boundary not subject to modification except under extraordinary circumstances.

The UPA and USB are the backbone of Sacramento County's urban planning philosophy. While the USB is intended to be a permanent boundary, the UPA is adjusted incrementally as needed to ensure that the county can accommodate anticipated growth over the next 25-year planning cycle. The area between the two lines is reserved for future urbanization and is only to be developed when lands within the existing UPA can no longer accommodate projected growth or the project meets expansion criteria pursuant to General Plan Policy LU-120.

A portion (approximately 69 acres) of the WJHMP area is within the UPA. Although most of the plan area is outside the UPA, most of the WJHMP boundary (approximately 87 percent) is immediately adjacent to the UPA (see Figure 2-2). The entire WJHMP area is within the USB.

South Sacramento Habitat Conservation Plan (SSHCP)

The SSHCP was developed through an iterative process that began in 1992. The current conservation plan concept was initiated in 2012 and adopted by the partner agencies in 2018. The SSHCP was developed as a collaborative effort to streamline permitting and protect covered species habitat. The SSHCP covers 28 different species of plants and wildlife, including 10 that are state and/or federally listed as threatened or endangered. The 50-year incidental take permit is currently being implemented and is valid through 2059.

The WJHMP is within the Urban Development Area (UDA) identified in the SSHCP, and the project is considered a Covered Activity. Covered Activities within the UDA include activities and projects related to urban development and associated infrastructure. Covered Activities are allowable under the SSHCP's Incidental Take Permits and can use the SSHCP to mitigate for impacts that result from implementation of the Covered Activity. Covered Activities must comply with all SSHCP requirements, including SSHCP avoidance and minimization measures (AMMs).

In addition to AMMs that pertain to the design and construction of specific developments in the plan area, there are several AMMs that influence the land use framework established in the WJHMP. For example, covered activities in the UDA must comply with AMM LID-3, which requires preservation of a site's natural aquatic features (such as creeks and streams) into project design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species, and AMM STREAM-2, which requires a minimum 100-foot setback from Morrison Creek. In addition, AMM STREAM-5 establishes design standards for stream channel re-routing.

Pursuant to AMM ROAD-1, roadways must be located in the least environmentally sensitive area to minimize impacts on Covered Species, Covered Species habitat, and waters of the United States, following existing roads, road easements, and rights-of-way, or be sited in disturbed areas to minimize habitat loss and additional habitat fragmentation. Roadway projects are also required to include wildlife crossing structures to provide for continued dispersal and movement of native wildlife throughout the SSHCP Plan Area (AMM ROAD-2). SSHCP wildlife crossing structures may include structures such as bridges, arches, or box and pipe culverts.

As described above, there is one existing preserve identified by the SSHCP within the WJHMP area located on the south side of Jackson Highway (APN 063-0170-023). Additional AMMs apply to development adjacent to SSHCP preserves, including EDGE-3, which requires that UDA Covered Activities constructed adjacent to existing or planned preserves establish a minimum 50-foot-wide setback from the boundary of any preserve.

MATHER AIRPORT LAND USE COMPATIBILITY PLAN

The Mather Airport Comprehensive Land Use Plan (CLUP) was adopted by SACOG in 1997 following the closure of Mather Air Force Base and its transition to Sacramento County ownership and operation as an airport in 1995. The 1997 Mather CLUP included aircraft noise contours based on anticipated operations at the time. In 2006, the Board of Supervisors adopted the theoretical capacity methodology for compatible land use planning for Mather Airport. This methodology has been utilized for planning documents, including the General Plan and master plans. In 2014, the Mather Airport Master Plan was adopted by the Board of Supervisors. The 2014 Mather Airport Master Plan Environmental Impact Report included mitigation requiring replacement of the 2006 CNEL theoretic capacity noise contour with a new CNEL contour to be adopted for land use compatibility planning and adoption in the Airport Land Use Compatibility Plan (ALUCP) and County General Plan. An updated 2018 theoretic capacity contour was released as part of the Mather Airport ALUCP update in 2020 and the CNEL contours in use are calculated using this methodology. The Mather ALUCP was updated and adopted by SACOG in August 2022. Sacramento County subsequently amended its General Plan Land Use and Noise Elements to incorporate the updated Mather ALUCP, including the new noise contours and safety zones. The General Plan Amendments were adopted in December 2022.

The most current theoretical capacity CNEL 60 – 65 dB noise contour overlaps with the northeast portion of the plan area. While most permanent housing is prohibited within this area, the CLUP identifies an array of compatible and conditionally compatible uses, including agricultural uses; open space and outdoor recreation; indoor assembly uses (e.g., event centers, places of worship); schools, commercial, office, and service uses; industrial uses and mining; and transportation, communication, and utility infrastructure. General Plan Policy NO-2 establishes that development proposals which may be affected by aircraft noise from Mather Airport shall be evaluated relative to the Land Use Compatibility Plan prepared for Mather Airport dated February 2021 (as well as applicable footnotes in General Plan Noise Element Table 4 (*Land Use Compatibility for Aircraft Noise*). Footnote 2 of General Plan Noise Element Table 4 provides that single family detached residential units within the 60-65 dB CNEL noise contours of the Mather Airport Policy Area may be considered a compatible use if: approved by the Board of Supervisors upon completion of Sacramento County's master plan process, including demonstration of compliance with General Plan Policies LU-119 and LU-120; and an evaluation of potential noise and safety impacts pursuant to CEQA has occurred and appropriate noise mitigation measures to reduce interior noise levels to 45 dB have been included in the environmental document and adopted as conditions of approval.

Concurrent Planning Processes

The WJHMP is one of four major planning applications for future urban growth along the Jackson Highway corridor, which are collectively referred to as the Jackson Highway Master Plans. The other three plans, the Jackson Township Specific Plan, the NewBridge Specific Plan, and the Mather South Community Master Plan, were approved by the County in December 2022, October 2020, and January 2020 respectively. The Jackson Township Specific Plan area is located just east of the WJHMP and includes approximately 1,391 acres located south of Mather Field, north of Jackson Road, east of Excelsior Road and generally west of Eagles Nest Road. The NewBridge Specific Plan area is located just east of the WJHMP and includes approximately 1,095 acres north of Jackson Highway. The Mather South Community Master Plan includes approximately 884 acres northeast of the WJHMP (refer to Figure 2-5).

In total, the four master plans cover approximately 9,250 acres and would provide for the development of more than 27,000 new housing units of varying densities; nearly 6.8 million square feet of commercial space, employment-generating uses, and mixed-use space; 12 schools; approximately 322 acres of developed parkland; and approximately 1,882 acres of designated open space and urban farm. The master plans were initiated at the request of each of the project applicants in response to long term growth projections and are anticipated to build out over several decades. Economic and market conditions would determine when future projects are built. These master plans are considered in the cumulative context and infrastructure planning for the project.

Application and Project Initiation

The master plan process was begun in February 2009 with a pre-submittal review process followed by a formal initiation in 2012 following the Sacramento County Board of Supervisors' review and acceptance of the application to expand the UPA pursuant to 2030 General Plan Policy LU-119.

CEQA Noticing and Public Involvement

A Notice of Preparation (NOP) for the WJHMP was first published on September 10, 2013. The Project Applicants and County of Sacramento staff subsequently reviewed the results of several CEQA-related studies, consulted interested and affected parties, and had extensive conversations concerning how the original project might adversely impact the environment. As that information became available, the Project Applicants, in coordination with County staff, modified the original project to lessen its potential to result in environmental impacts. Specifically, the project was modified to reduce traffic and associated effects on air quality and climate change, improve transit, reduce effects on biological resources and increase open space, avoid potential noise effects, and improve groundwater recharge.

In 2013 and 2016, the County held four joint Vineyard and Cordova Community Planning Advisory Council (CPAC) workshops for the Jackson Highway Master Plans that covered: the planning and environmental review process for master plans; transportation planning in the area; water supply, sewer, and drainage in the area; and infrastructure financing.

Due to project revisions that were made in response to these public hearings, a new NOP was issued in February of 2017. In response to comments from Elk Grove USD requesting additional location specificity for possible sites of the proposed middle/high school, a revised NOP was subsequently released on April 26, 2017. The April 2017 NOP identifies three "project options." In addition to the version of the WJHMP proposed at the time, Options 1, 2, and 3 (also referred to as Alternative 1-A, Alternative 1-B, and Alternative 1-C) were provided to assess variations in the project. Option 2 described a land use plan based on the 2014 Mather Airport Master Plan Forecast 60 dB CNEL line (instead of the Theoretic Capacity 60 dB CNEL line adopted at the time). This option plans residential uses at the geographic center of the project rather than employment uses. As described above, the Mather ALUCP, which updates the land use compatibility noise contours, was adopted by the SACOG Board of Directors and incorporated into the Sacramento County General Plan in 2022. With this update, the proposed project would include low density residential development within the 60 to 65 dB contour. The area within Mather Airport's 60 dB CNEL noise contour line, where residential uses are restricted, is proposed to contain major commercial, employment and industrial centers as well as large open space areas. Comments on the NOP are summarized in the applicable technical chapters of this EIR.

PROJECT OBJECTIVES

Outlined below are the primary objectives for the proposed WJHMP. The objectives identified for the project were developed in a manner consistent with Section 15124(b) of the State CEQA Guidelines and establish a "statement of the objectives sought by the proposed project." While the County's overarching goal is to accommodate projected population growth in the unincorporated county, as envisioned in the General Plan, the Project Applicants have established more specific objectives for the project.

1. Identify and redevelop former mining properties and properties formerly restricted by airport operations of Mather Air Force base into a vibrant master planned community.

2. Provide a broad mix of needed housing in close proximity to existing and future job centers, including affordable housing as required by the County's Inclusionary Housing Ordinance.

3. Support development located and designed to reduce the per capita vehicle miles traveled and greenhouse gas emissions relative to the Sacramento County regional average.

4. Achieve a Net Zero Greenhouse Gas community at buildout.

5. Provide commercial and recreational services that are connected to and serve adjacent communities.

6. Provide for the development and improvement of services that will serve Environmental Justice areas.

7. Provide equitable protection from environmental and health hazards for disadvantaged communities within the plan area.

8. Include a variety of land use types that will provide employment, commercial, industrial, recreational, and housing opportunities. Locate the different land uses within easy walking distance of each other.

9. Encourage health and wellness by providing an extensive system of trails and parks that are distributed throughout the community and are within easy walking and biking distance of residents. Provide also urban farms and community gardens that will be centrally located and will enable residents, as well as adjacent communities, to obtain locally grown produce and farm products.

10. Incorporate sustainable design practices through a variety of measures including energy efficient design, urban forests, and Low Impact Development (LID). These measures are intended to reduce the overall carbon footprint of the community.

11. Provide a high level of connectivity through an extensive network of streets and off-street trails. Provide bicycle and pedestrian trails that will allow connectivity up slope banks to key intersections, schools, or commercial centers in order to facilitate access options.

12. Provide infrastructure for a variety of transportation options, including roadways, bike trails, walking trails, electric vehicle (EV) charging, and public transportation.

13. Create distinctive community and neighborhood nodes that create a sense of place and opportunities for social and recreational activity.

14. Provide a range of housing choices that could include semi-rural, traditional single-family homes, condominiums/townhomes, apartments, active adult/seniors, and mixed-use development.

15. Develop a master plan within and consistent with the South Sacramento Habitat Conservation Plan.

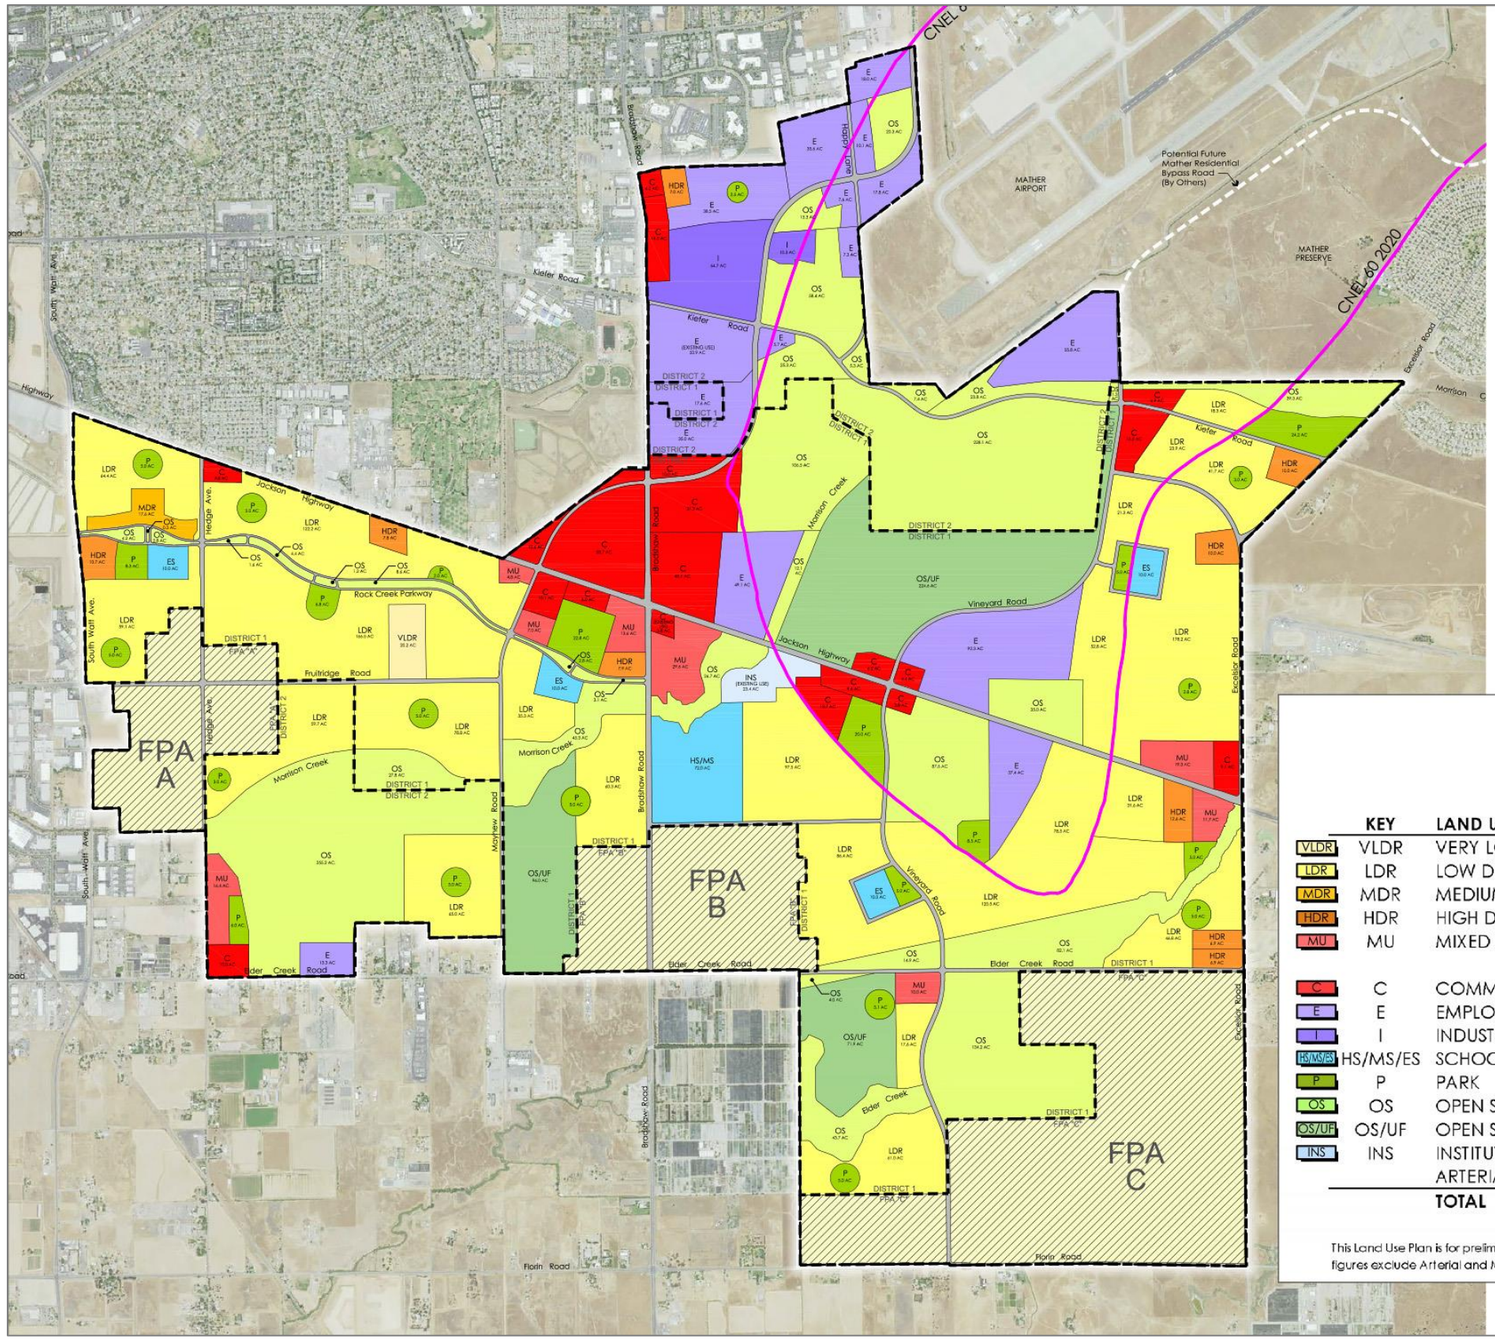
16. Achieve an economically viable master planned development.

PLAN CHARACTERISTICS

The proposed WJHMP includes a wide variety of residential, commercial, office, industrial, agricultural, recreational, open space, public, and educational uses (Figure 2-9). The land use plan has been designed to reduce vehicle miles traveled and support the use of a variety of transportation alternatives within the plan area. A major feature of the master plan would be activity centers comprised of commercial, park and/or civic

uses with nearby high density residential. These activity centers would be connected to linear parkways with roadways and off-street trails. From the activity centers, there would be a gradual reduction in residential densities toward the eastern and southern extents of the plan area. The project would also include a variety of regional, community, and neighborhood retail centers; office uses; research facilities; employment centers; and a network of trails and public uses.

The WJHMP allows and promotes the continued operation of construction material production facilities (such as the existing Teichert Perkins Plant and the Granite Bradshaw aggregate processing plants) concurrent with the transition of the plan area to more urban uses. Implementation of the quarry's reclamation plans will result in developable lands consistent with County standards and the Surface Mining and Reclamation Act.



If adopted, the WJHMP would become an extension of the Sacramento County General Plan and serve as a planning and policy tool that refines and implements countywide goals, objectives, and policies. To facilitate the transition to the land uses envisioned in the WJHMP, the plan area has been divided into two districts (within which the Project Applicants are the majority landowners) and three FPAs. The WJHMP establishes land use designations, distribution, and intensity (density and/or floor area ratio) for the properties in the plan area.

Organization of the Plan

The master plan document is composed of 11 chapters. Chapters 1 through 3 provide introductory information related to regional and planning context, establish the vision and guiding goals of the plan, and characterize existing conditions. Chapter 4 establishes the land use plan and provides an overview of the proposed land uses. Chapters 5 through 8 describe elements of the WJHMP related to mobility, parks and open space, public infrastructure, and public services. Plan objectives related to environmental justice and climate change adaptation and resilience are provided in Chapters 9 and 10, respectively. Chapter 11 includes administrative details related to authority, implementation, future planning, plan revisions, and fees and financing.

Features of the Plan

The WJHMP is intended to build upon the existing assets and opportunities of the plan area and guide future development in a manner consistent with adjacent development and the General Plan’s goals and policies. The WJHMP is also designed to dovetail with surrounding recently adopted planning efforts, such as the adjacent Jackson Township Specific Plan.

LAND USE SUMMARY

KEY	LAND USE	AC±	DENSITY & FAR RANGES	TARGET DENSITY	EST. DU	EST. FAR	EST. SQ. FT.
VLDR	VERY LOW DENSITY RESIDENTIAL	115.6	1.0 - 4.0	2.0	230		
LDR	LOW DENSITY RESIDENTIAL	1,955.1	3.0 - 10.0	5.0	9,774		
MDR	MEDIUM DENSITY RESIDENTIAL	58.6	10.0 - 20.0	14.0	820		
HDR	HIGH DENSITY RESIDENTIAL	121.2	25.0 - 40.0	30.0	3,636

Figure 2-9 WJHMP Land Use Diagram

DISTRICTS AND FUTURE PLANNING AREAS

As described further below, the WJHMP established logical planning boundaries and provides comprehensive land use and infrastructure planning for the entire plan area. Within the plan area, two districts and three FPAs are established to reflect existing land ownership. District 1 covers land primarily owned by Teichert, District 2 covers land primarily owned by Granite, and the FPAs are composed of three distinct geographic areas over which the Project Applicants do not have land use control.

DISTRICT 1

District 1 is 3,487 acres and is comprised primarily of lands owned or controlled by Teichert (3,016 acres), as well as several properties controlled by others not connected to Teichert (i.e., non-participating properties). District 1 is in the center of the plan area and spans both sides of Jackson Highway. District 1 includes a wide variety of residential, commercial, employment, mixed use, park, open space, schools, urban farm, industrial, and institutional land uses needed to support the community.

Within this district, commercial and mixed-use opportunities are identified along Jackson Highway, particularly at the intersection with Bradshaw Road. Land designated for employment is located along Jackson Highway in three locations east of Bradshaw Road. The district includes open space along Morrison Creek and an adjacent area (approximately 225 acres) designated for open space/urban farm. The remaining areas of District 1 are dominated by low density residential uses.

DISTRICT 2

District 2 is comprised of two distinct areas in the WJHMP: the northern areas and the southwest corner. District 2 is 1,203 acres and is comprised primarily of lands owned or controlled by Granite (1,063 acres). District 2 includes residential, commercial, employment, parks, open space, and industrial uses needed to support the community.

In the northern area, land is primarily designated for employment (approximately 284 acres) and open space (approximately 380 acres) uses that are generally consistent with existing land uses. The northwest corner of the plan area also provides open space (approximately 255 acres) associated with Morrison Creek. This area would also include parks (approximately 14 acres total) and low density residential (approximately 125 acres). Mixed use, commercial, and employment land uses (approximately 39 acres collectively) would be located along Hedge Avenue and Elder Creek Road.

FUTURE PLANNING AREAS

Originally intended to re-design, re-purpose, and reconnect current and former mining properties to the Rosemont and Vineyard Communities, the WJHMP was augmented during the project initiation phase to include a number of smaller non-participating parcels. This was done to establish a more logical planning boundary and a comprehensive vision for the 5,913-acre plan area.

The WJHMP land use map designates these areas for residential use for the purpose of resource planning and to ensure appropriate sizing of infrastructure. The West Jackson Master Plan Overlay would be applied to the FPAs; however, these areas would retain their current General Plan land use designations (General Agriculture – 20 acre minimum and Agricultural-Urban Reserve) with adoption of the WJHMP. In order to change existing land use designations and zoning in the FPAs, landowners of these areas would need to initiate amendment(s) to the WJHMP or prepare subsequent comprehensive planning documents. The FPAs are not currently planned in sufficient detail to allow development.

PROPOSED LAND USES

Table 2-1 summarizes the proposed land uses in the plan area, consistent with County zoning, and the growth potential of the plan area at full buildout. The plan area would be rezoned as a separate action subsequent to the master plan, if adopted.

Table 2-1 WJHMP Land Use Summary

WJHMP Land Use	Consistent County Zoning	Acres	Residential			Non-Residential	
			Density Range	Target Density	Estimated Dwelling Units	Estimated Floor Area Ratio	Estimated Square Feet
Very low density residential	RD-1, RD-2, RD-3, RD-4, SPA	115.6	1.0-4.0	2.0	230		
Low density residential	RD-3, RD-4, RD-5, RD-7, RD-10, SPA	1,955.1	3.0-10.0	5.0	9,774		
Medium density residential	RD-10, RD-15, RD-20, SPA	58.6	10.0-20.0	14.0	820		
High density residential	RD-25, RD-30, RD-40, SPA	121.2	25.0-40.0	30.0	3,636		
Mixed use	NMC .25-2.0, SPA	112.5	25.0-35.0	30.0	2,024	00.20-2.0 (commercial and/or office)	1,225,125
Commercial	NMC, BP, C-O, GC, LC, SPA	290.7				0.25-1.25	3,165,723
Employment	NMC, BP, C-O, GC, LC, SPA	543.3				0.25-1.25	7,099,844
Industrial	M-1, M-2, MP, SPA	154.4				0.25-1.25	2,017,699
School	RD-5 (PQP), RD-7, RD-10, SPA	132.0					

WJHMP Land Use	Consistent County Zoning	Acres	Residential			Non-Residential	
			Density Range	Target Density	Estimated Dwelling Units	Estimated Floor Area Ratio	Estimated Square Feet

Institutional	M-1	98.9					
Arterial / collector roads	N/A	229.8					
Total		**5,913.3**			**16,484**		**13,508,392**

RESIDENTIAL AND MIXED USE

The proposed project includes a maximum of 16,484 residential units. Assuming 2.77 persons per household[1], the WJHMP would provide housing for approximately 45,661 residents. Table 2 summarizes the residential density ranges and the number of dwelling units that are proposed.

Table 2-2 Residential Unit Totals by Planning Area

District Area/Future Planning Area	Number of Units
District 1 (Teichert)	11,510
District 2 (Granite)	1,128
Future Planning Area “A”	662
Future Planning Area “B”	1,131
Future Planning Area “C”	2,053
Project Total	*16,484*

The WJHMP has been designed to provide a wide variety of housing options including apartments, condominiums, townhouses, and single-family detached homes. Neighborhood centers would have higher density residential developments, providing housing opportunities near essential services and transit. To further increase housing options, the provision of residential accessory dwellings such as a “granny flat” above

[1] Average persons per household in Sacramento County between 2017 and 2021 (US Census Bureau 2023).

garages, detached in-law structures, or multi-generational architecture is encouraged in all residential neighborhoods.

- Very Low Density Residential (VLDR) would be developed lands within a density range of up to four dwelling units per acre. The plan area contains 115.6 acres of VLDR. With a target density of two dwelling units per acre, the plan would result in 230 VLDR dwelling units.
- Low Density Residential (LDR) would be developed at a density range of three to 10 dwelling units per acre. The WJHMP area contains approximately 1,955 acres designated for LDR. With a target density of five dwelling units per acre, the plan would result in 9,774 LDR dwelling units.
- Medium Density Residential (MDR) would be developed with a density range of 10 to 20 dwelling units per acre. The WJHMP designates 58.6 acres of MDR. With a target density of 14 dwelling units per acre, the plan would result in 820 MDR dwelling units.
- High Density Residential (HDR) would be developed with a density range of 25 to 40 dwelling units per acre. The WJHMP designates 121.2 acres of HDR. With a target density of 30 dwelling units per acre, the plan would result in 3,636 HDR dwelling units.
- Mixed Use (MU) lands would be developed with a residential density range of 25 to 35 dwelling units per acre and/or commercial/employment uses with a Floor Area Ratio (FAR) of .20-2.00 FAR. The MU target density is 30 dwelling units per acre. The plan area contains 112.5 acres of MU. Assuming 60 percent of the MU acreage is developed with residential uses, the plan would result in 2,024 MU dwelling units, and 1,225,125 square feet of commercial/employment.

COMMERCIAL AND EMPLOYMENT

Retail and employment opportunities would be available in each of the districts, from small scale retail shops and professional offices in neighborhood centers, to chain stores and office complexes in the business districts. Employment centers would provide a mix of office and light-industrial uses, such as manufacturing, research, warehousing, aviation service industry, and equipment storage. Business parks would provide a mix of office uses such as banks, libraries, doctors' offices, general business offices, and other similar uses.

The project includes an estimated total of 3.2 million square feet of commercial use and another 1.2 million square feet of mixed-use. Most of this square footage would be located in District 1, where a large commercial area focused on the Bradshaw Road/Jackson Highway intersection is envisioned. It is likely that there would be a regional or community commercial center located in this area, containing a large array of retail types, including restaurants, movie theatres, bookstores, home supply stores, electronic stores, and other types of similar retail. There would be additional commercial areas at the Vineyard Road/Jackson Highway intersection as well as at the Excelsior Road/Jackson Highway intersection comprised of commercial and mixed-use acreage. There would also be neighborhood commercial and/or mixed-use centers distributed

throughout this district, all of which would be connected by off-street trails. These neighborhood-serving retail centers consist of grocery stores, dry cleaners, restaurants, and other retail stores that meet the daily needs of residents within the community.

The plan area also provides 543.3 acres for employment uses, which could support over 7 million square feet of employment space. Based upon an estimate of typical employment yields for planned land uses, the WJHMP is anticipated to generate approximately 29,233 jobs. Based on these numbers, the WJHMP would provide approximately 1.7 jobs per household. These job opportunities are anticipated to contribute to a reduction in overall vehicle miles traveled in the region by helping to correct the existing jobs imbalance in the vicinity of the plan area.

Industrial

The WJHMP incorporates industrial land uses for manufacturing, warehousing, distribution and assembly, research and development, and related uses. The plan contains 154.4 acres of land designated industrial, which could support over 2 million square feet of industrial space. This land is currently used for industrial- and construction-related activities including aggregate, asphalt concrete, and recycled material processing.

Offices and light-industrial uses that do not generate heavy truck traffic would be used to buffer residential uses from more intensive industrial land use types, as appropriate. To ensure there are no conflicts, uses that would allow for idling trucks such as repair facilities, storage yards or truck terminals would be prohibited unless adequate screening, setbacks, and landscaping are established.

School and Institutional Land Uses

The plan includes 132 acres for five school sites, which would be developed consistent with Elk Grove USD requirements. For planning purposes, total enrollment for grades Kindergarten through 12 is estimated at about 10,375 students, some of which would come from housing units outside of the plan area. The WJHMP also includes 98.9 acres of land designated Institutional, which is applied to land that is currently used for a church as well as the Sacramento County Vineyard Water Treatment Plan located within FPA C on Florin Road.

Recreation and Open Space

The WJHMP area straddles the Cordova Recreation and Park District (Cordova) and the Southgate Recreation and Park District (Southgate), which operate on the north and south sides of Fruitridge Road and Jackson Highway, respectively. Each of these districts would develop and maintain the proposed park systems within their respective jurisdiction.

The WJHMP proposes a mix of parks, open space, recreation, and non-vehicular circulation amenities, including a community park, neighborhood parks, pocket parks, linear parks, detention basin parks, open space, utility easements, drainage corridors, wetland avoidance areas, and a large trail network.

COMMUNITY AND NEIGHBORHOOD PARKS

Park lands within the plan area total 219.3 acres, consisting of 153.6 acres in District 1, 16.5 acres in District 2, 8.8 acres in FPA A, 14.7 acres in FPA B, and 25.7 acres in FPA C. Park acreage is based on the General Plan's requirement of 5 acres of improved parkland for every 1,000 residents.

Specific park locations are established for District 1 and District 2, as shown on Figure 2-9. Park locations are not identified for the FPAs. However, the WJHMP establishes the following parameters for future parks in these areas:

- FPA A shall have two parks, one east and one west of Hedge Avenue.
- FPA B shall have two parks, with at least one approximately 5-acre park located west of Bradshaw Road.
- FPA C shall have three parks, with one located west of Vineyard Road and two located east of Vineyard Road. One of the parks located east of Vineyard Road shall be a Community Park.

The park system within the plan area has been designed to include a network of community, neighborhood, and pocket parks that provide a range of activities serving a variety of needs for users within the neighborhood, including active sports fields, tot lots, and trailheads. As illustrated by Figure 2-9, the plan features a large community park facility located just west of Bradshaw Road and north of Rock Creek Parkway. This park is sited to provide various sports fields, passive recreational and picnic areas, access to the Morrison Creek and Rock Creek parkway trail systems, and a link to the planned transit system and bicycle lanes within Rock Creek Parkway.

Neighborhood parks would serve as recreational focal points for neighborhoods within the plan area. Where practical, neighborhood parks would connect with open space corridors, school sites, or trail systems. The type and size of parks would be dependent upon the projected needs within the neighborhood. Although approximate locations and minimum park acreages have been determined for neighborhood parks, the ultimate location and acreage of neighborhood park sites may vary based upon the actual number of residential units in individual development applications.

Where appropriate, neighborhood parks of 5 acres or more may be co-located with proposed schools in accordance with Elk Grove USD policy. Combined schools and parks may include sports fields, playgrounds, and lawns for recreational uses. A neighborhood park could also be the site of a community garden and/or limited commercial uses such as cafes and recreation-supportive uses, such as bicycle shops.

In addition to larger neighborhood parks of 5 acres or greater, the plan area may include smaller "pocket" parks that are approximately 2 acres in size. These parks are intended to establish unique recreational and theming opportunities within the plan area and are intended for more specialized purposes such as tot lots geared toward small children or enhanced medians and other spaces that contribute to the identity and character of neighborhoods (also referred to as "image parks").

Open Space

The WJHMP includes a network of approximately 1,489 acres of open space. Open space corridors within the plan area have been designed to protect streams and wetlands, and accommodate planned stormwater detention and drainage features, utility easements, and transit and trail corridors. Linear parkways would generally align with regional trail systems, including the Rock Creek Parkway and the Morrison and Elder Creek parkway systems, and would provide passive recreational opportunities.

The Open Space designation would also generally be applied to areas where wetlands have been constructed or preserved in conjunction with former and existing mining operations. There are also existing conservation easements on land within the Open Space designation that would continue to be protected in perpetuity. Modification of the adopted reclamation plan for Aspen VI (i.e., land owned by Teichert along Morrison Creek north of SR 16) would be necessary to increase the open space around the pond and remove the off-stream channel area.

Detention basins within the designated open space may provide recreational opportunities during the dry season. Detention basins are encouraged to include passive and active recreational facilities, such as archery ranges, equestrian centers, and nature/bird watching trails; however, no specific facilities have been designed. In addition, some open space lands may be used as urban forests, which can be achieved by planting region-appropriate tree species in multiple sizes to reach tree canopy coverage consistent with current County standards. New tree species would be selected using Sacramento Tree Foundation's "Shady 80" list and SMAQMD's "Landscaping Guidance for Improving Air Quality Near Roadways."

Urban Farms

In addition to land designated for Open Space, the WJHMP includes approximately 393 acres designated Open Space/Urban Farm. Urban farms are incorporated into the network of community spaces to provide access to fresh local produce and encourage educational opportunities related to agriculture and food production. As shown on Figure 2-9, there are three distinct areas designated for urban farming, each of which is adjacent to open space. In addition to farming, these areas can be developed with educational and agricultural processing facilities (e.g., olive oil press, canning machinery) per County code. All processing of agricultural products would be 5 acres or less in total area and adhere to a minimum setback of 200 feet from any residential uses.

Infrastructure Improvements

Schools

The WJHMP area is within the service areas of two school districts: Elk Grove USD and Sacramento City USD. Most of the plan area is in the Elk Grove USD with a smaller portion (i.e., the northernmost part of the plan area) in the Sacramento City USD.

Based on the number of residences projected to be within the plan area upon full buildout, anticipated student enrollment is approximately 5,544 elementary students,

1,758 middle school students, and 3,073 high school students. If buildout within the plan area occurs as anticipated, the plan area would require six elementary schools, a middle school, and a high school within the Elk Grove USD. Elk Grove USD has determined that students within its district boundaries could be served by existing schools outside of the plan area.

As indicated above, within District 1, land is reserved for five schools, including a 70-acre middle/high school site and four elementary schools that average 10 acres in size. Where possible, elementary school sites would be combined with other land uses such as public parks, open space, and higher density residential to create activity centers for their respective neighborhoods. These activity centers would be connected to other areas of the plan area through the proposed trail system. Each school would have access to nearby neighborhoods and three of the elementary schools would be co-located with public parks to encourage shared use of recreational facilities. In addition to the four elementary schools identified within District 1, there would be a need for at least two elementary schools in FPAs. The ultimate location of these facilities would be determined when a future specific plan, master plan amendment, or subsequent entitlements are prepared for the FPAs. A middle school/high school is planned a little northeast of the intersection of Elder Creek Road and Bradshaw Road that would serve the entire plan area, including FPAs.

Law Enforcement

The Sacramento County Sheriff 's Department currently provides law enforcement services and police protection to the plan area. This includes response to calls and incidents, investigations, surveillance, and routine patrolling. Police services within the plan area are currently provided by the nearest substation (Kilgore Station), which is located within the city of Rancho Cordova. This station has Sheriff's personnel that handle calls for service within the unincorporated county.

To facilitate future infrastructure in the plan area, the WJHMP includes Policy 8.2, which allows Sheriff's Department stations and substations in all commercial, industrial, and residential areas.

Fire Protection and Emergency Response

The Sacramento Metropolitan Fire District (Metro Fire) currently provides fire protection and emergency medical response to the plan area. The nearest fire station is located on Bradshaw Road, approximately 0.8 mile north of the WJHMP boundary. Another station is located on South Watt Avenue and is approximately 1.5 miles to the northwest of the WJHMP boundary. Both of these stations currently serve the plan area. It is anticipated that two new fire stations could be located in the plan area, if determined necessary by Metro Fire. Specific sites would be identified during the tentative map process.

Public Library

The Sacramento Public Library provides library services to the plan area. The nearest public library branch is the Rancho Cordova Community Library in the city of Rancho Cordova, which is approximately 3.5 miles from the plan area. In order to accommodate

increased demand, the Sacramento Public Library is planning to develop two new libraries south of the plan area within the Vineyard Community and another new library north of the plan area within the Cordova Community. The Sacramento Public Library anticipates that these new branches and the existing Rancho Cordova branch will be sufficient to meet the library needs of residents in the WJHMP area.

Utilities

Water Supply

The WJHMP is located within the Zone 40/41 service area of the Sacramento County Water Agency (SCWA) and the service area of California American Water Company (Cal Am). Cal Am serves the northwest third of the plan area and SWCA serves the remainder; the boundary between the two purveyors roughly follows Fruitridge Road and Happy Lane. Figure 2-10 shows the portions of the plan area that are served by the two water purveyors, as well as existing and proposed water infrastructure.

Generally, the on-site water transmission system would consist of 16-inch to 24-inch mains. A grid of 8-inch to 12-inch distribution mains would extend from the transmission system to serve local developments. Due to the varying elevations of the plan area, several booster pumps and pressure-reducing stations would be required to maintain system pressures. Water infrastructure would be phased with development to meet end user demands, as well as operational criteria. While some streets would have both Cal Am- and SWCA-owned mains, no interconnections are currently anticipated between the Cal Am and SWCA systems.

Off-site improvements would consist of SWCA transmission mains looping to the Vineyard Surface Water Treatment Plant along Florin Road and Elder Creek Road (consistent with SWCA's Water Supply Master Plan), a 24-inch Cal Am water line extending to Folsom Boulevard within Watt Avenue, and a 12-inch Cal Am water line extending north in Mayhew Road to the existing domestic water facilities at Oxwood Drive.

Wastewater

The WJHMP is within the service areas of the Sacramento Area Sewer District (SacSewer). SacSewer owns and operates sewer trunk and collection systems throughout Sacramento County. SacSewer owns and operates the EchoWater Resource Recovery Facility and an interceptor system throughout Sacramento County.

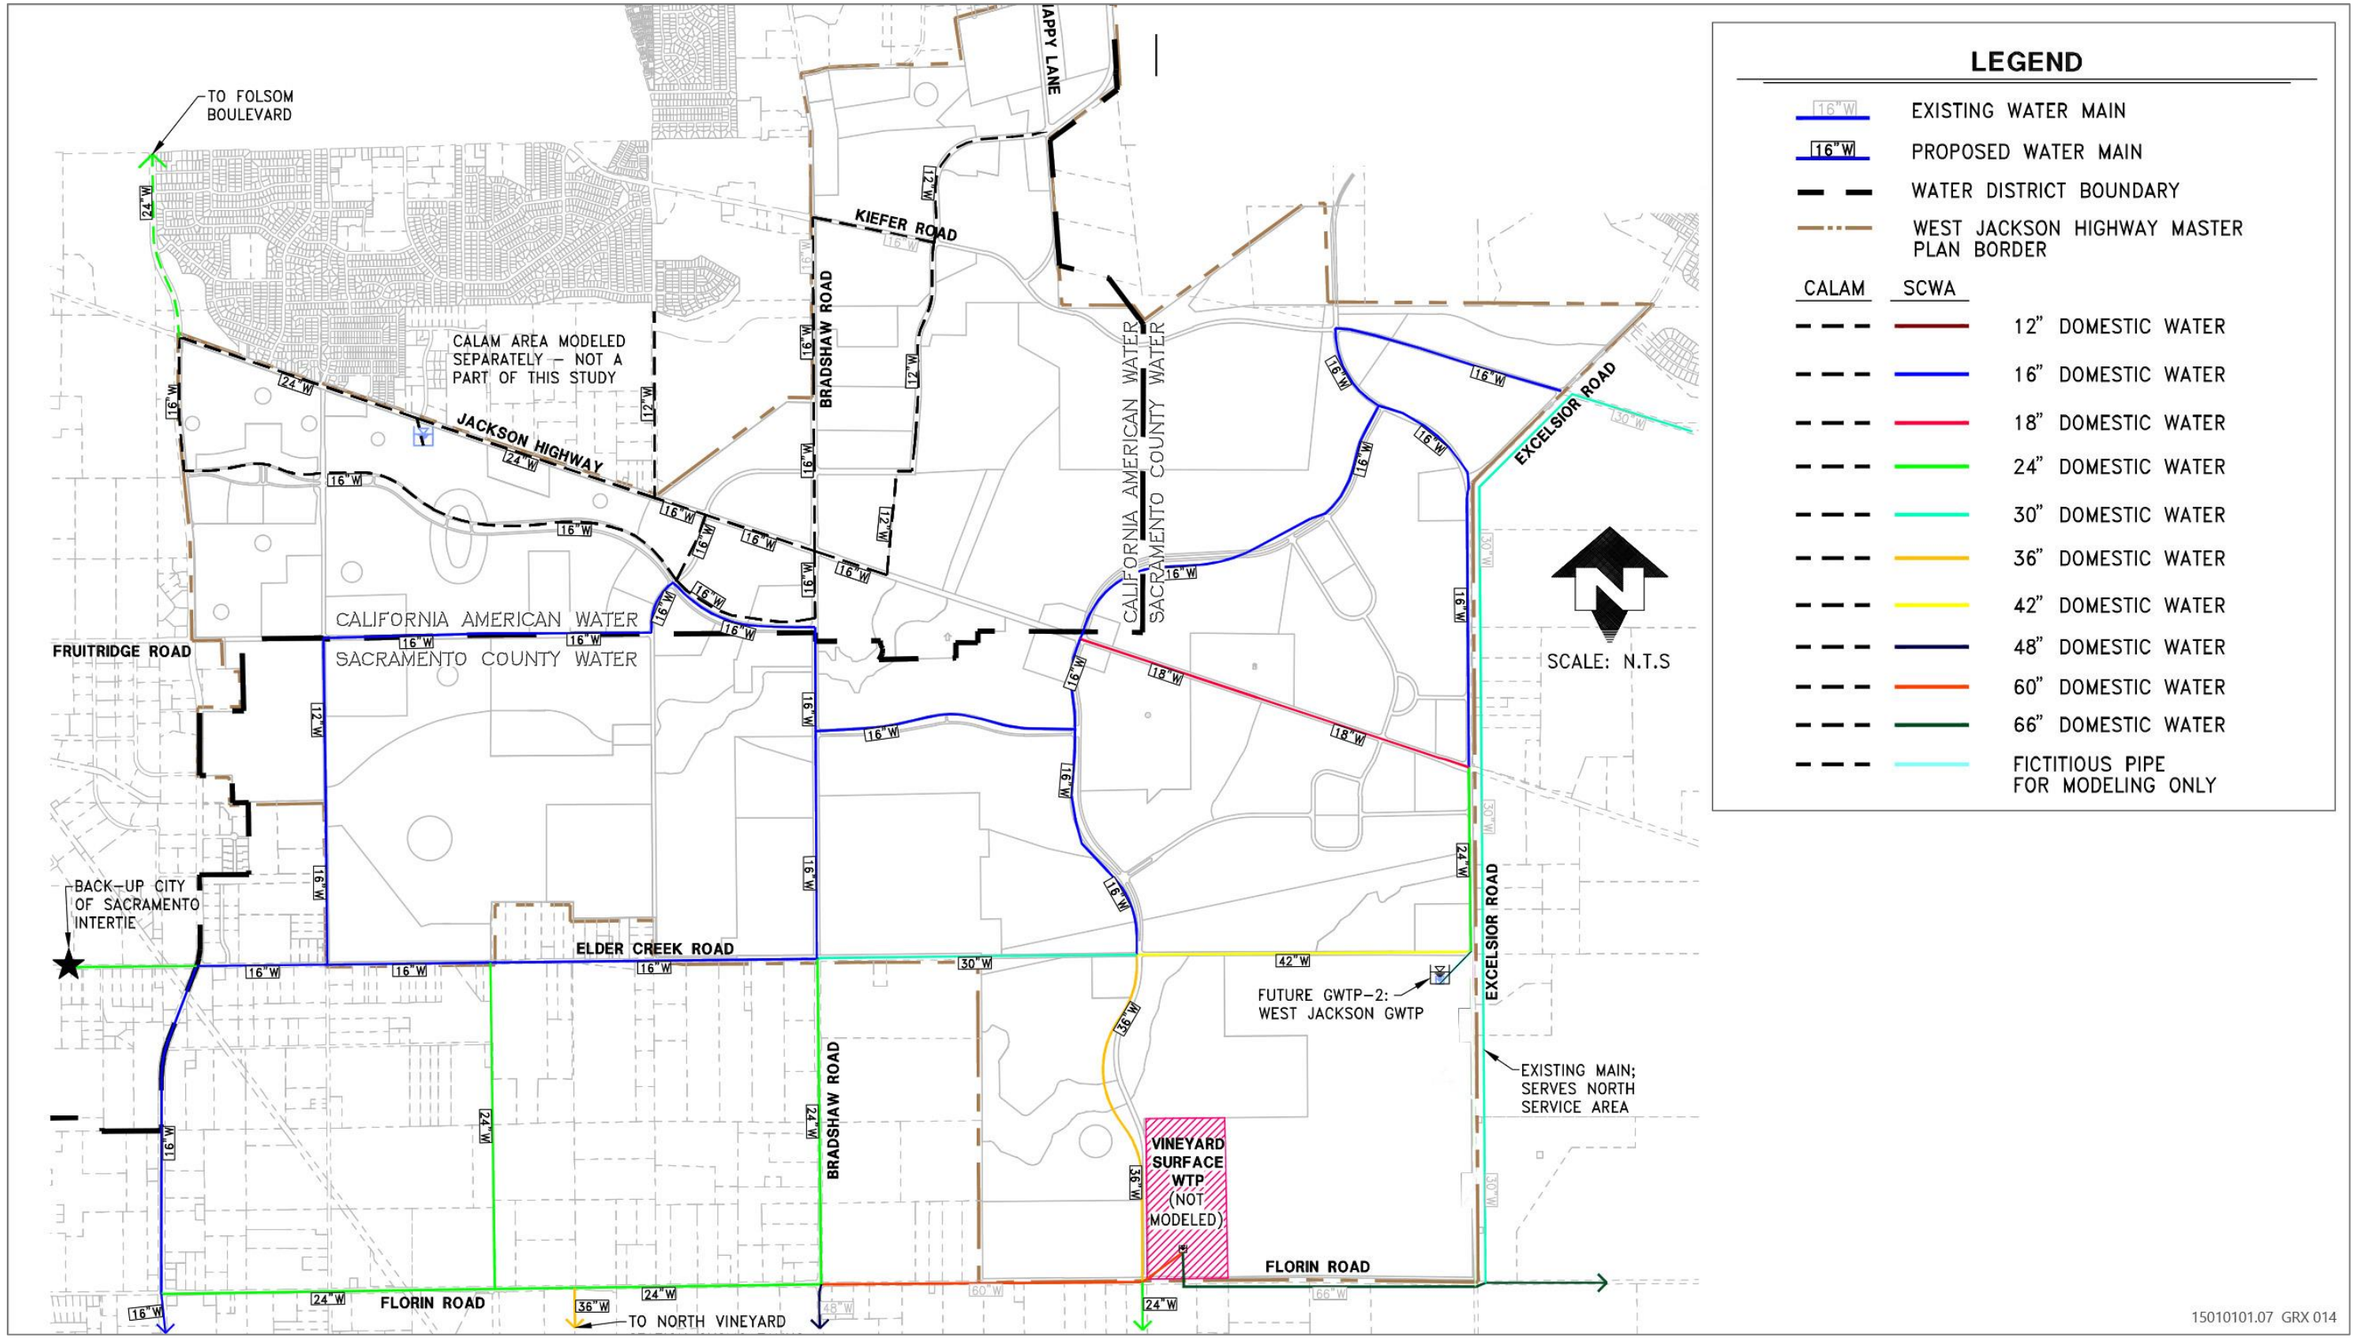
There are existing interceptor and trunk sewer lines located within the plan area. These existing lines would be expanded to include a system of trunk and collector wastewater pipes that would feed into the existing Bradshaw Interceptor, located in the central portion of the plan area, and Northeast Interceptor, located in the northwest portion of the plan area. In addition, the Central Interceptor is located within South Watt Avenue at the western boundary of the plan area (Figure 2-11).

A new interceptor is proposed along Florin Road. This trunk line would be located within the road right of way From Excelsior Road west to the edge of the plan area near Bradshaw Road. From the edge of the plan area to the existing Bradshaw Interceptor

along Morrison Creek (approximately 1.5 miles), the new interceptor would be constructed within the right of way of Florin Road outside of the plan area. Similarly, trunk line extensions would occur along Jackson Highway for approximately 0.5 mile east of the plan area and less than 0.5 mile along Elder Creek Road between Hedge Avenue and South Watt Avenue (Figure 2-11). Much of the plan area would gravity drain; however, some mined areas would require pumping via lift stations.

STORMWATER DRAINAGE AND FLOOD PROTECTION

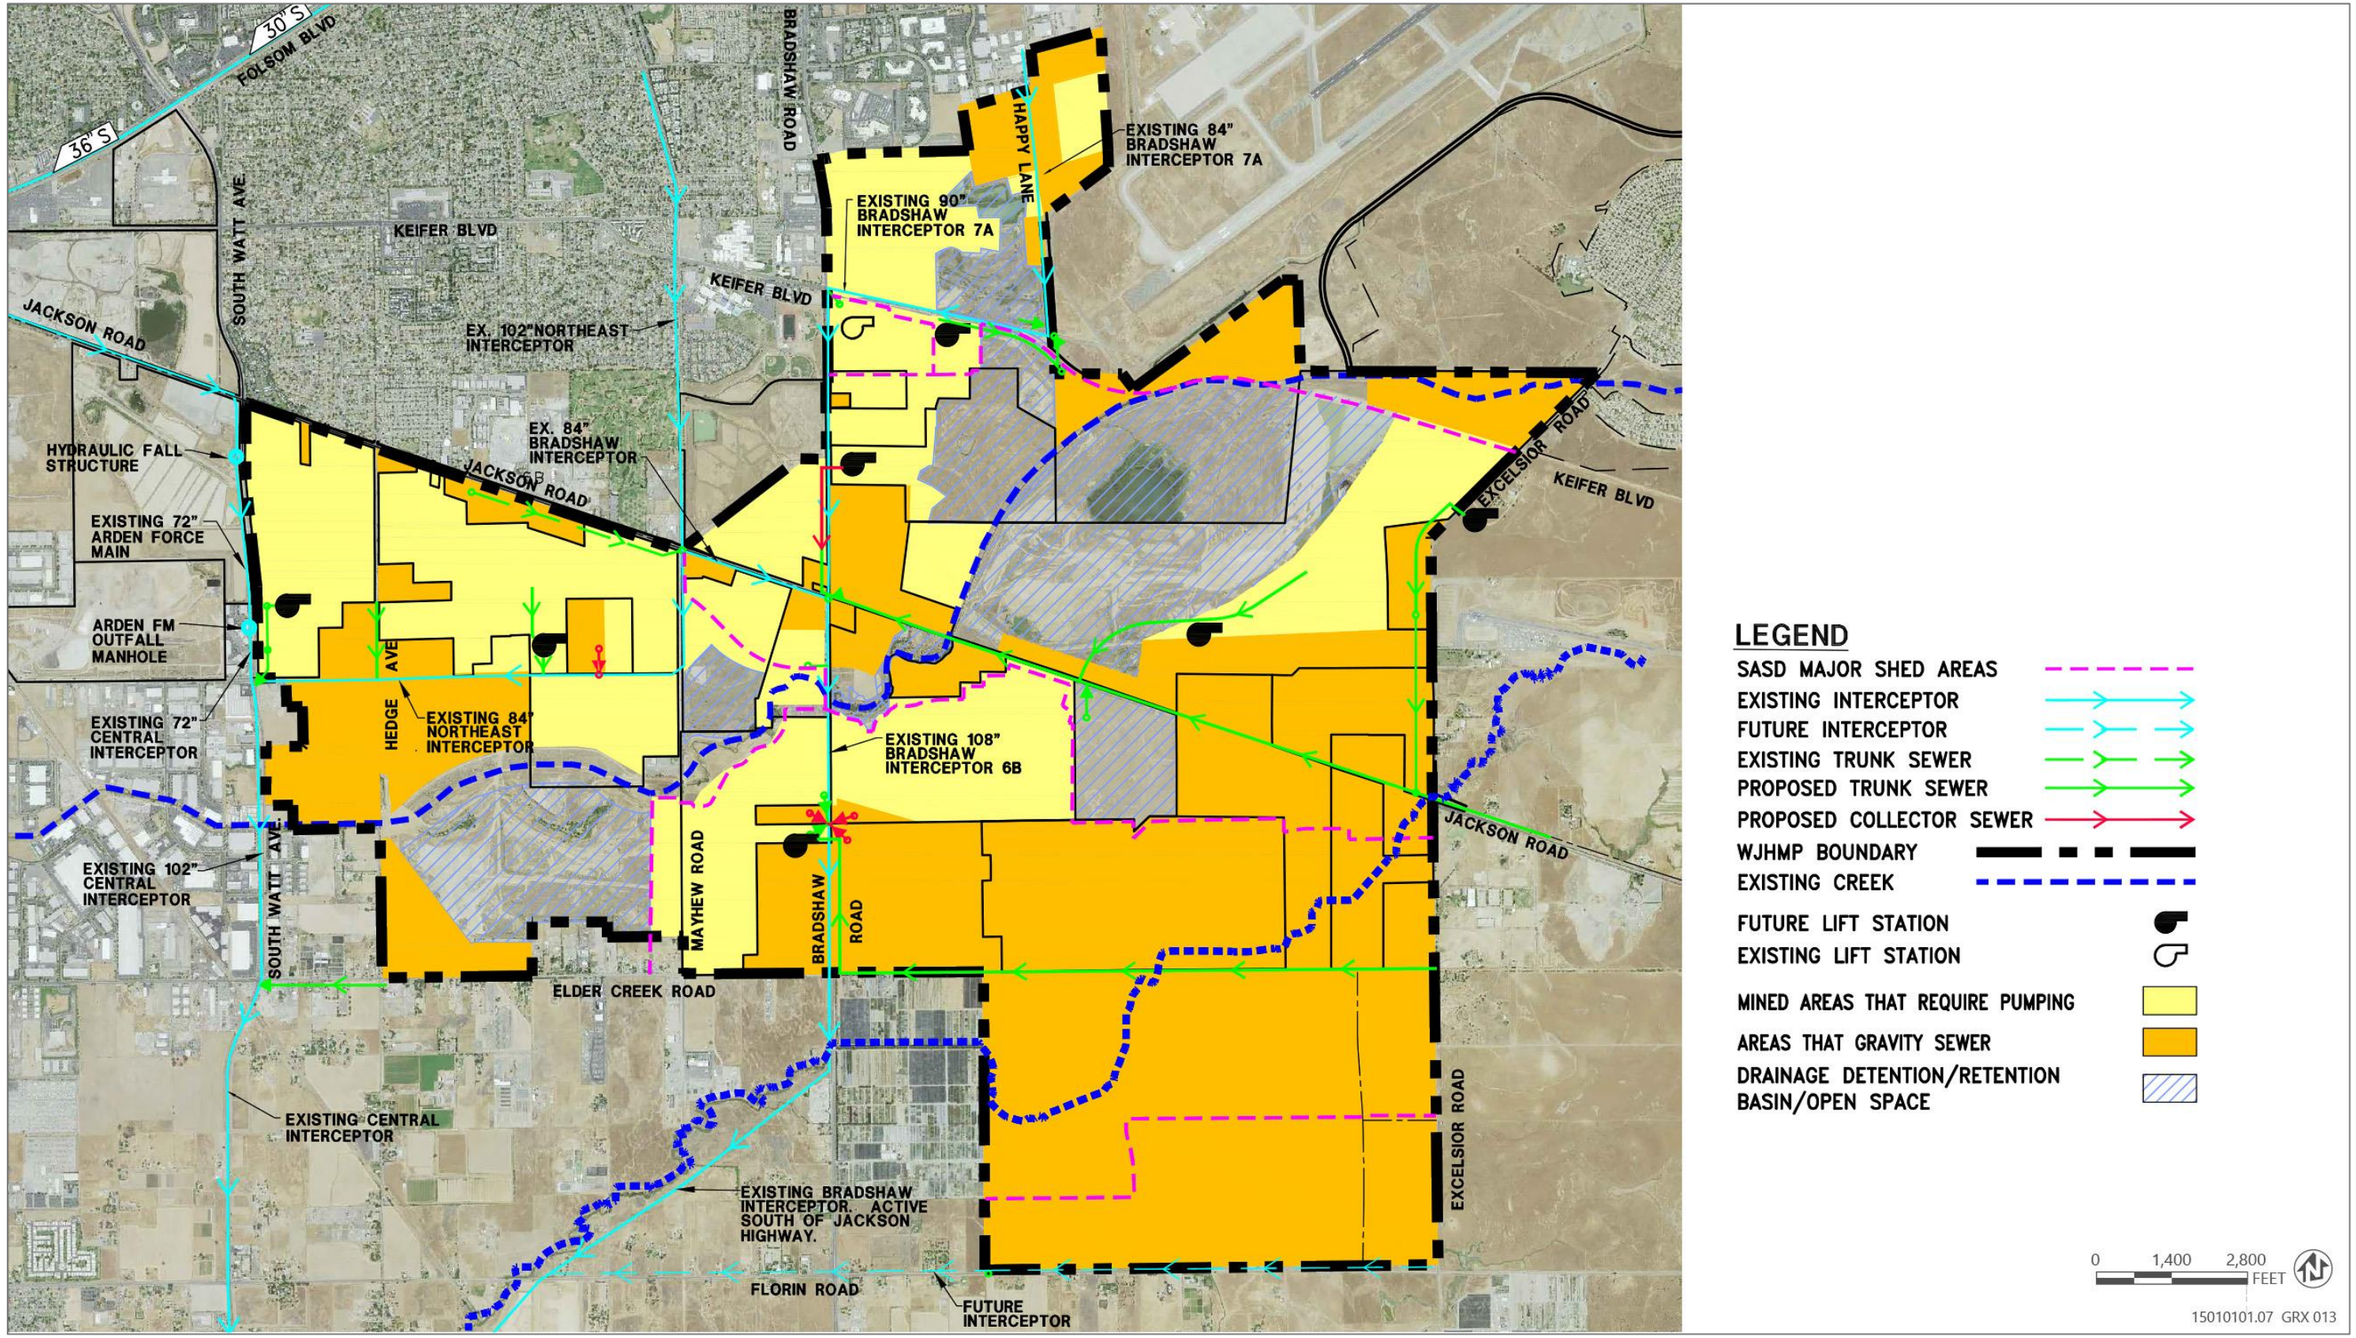
With implementation of the WJHMP, stormwater would continue to drain into Morrison and Elder Creeks. The plan area has been designed with an integrated drainage network that utilizes a series of detention basins that would attenuate stormwater runoff to pre-development levels and improve water quality. As illustrated in Figure 2-12, piped drainage systems within the developed areas would discharge to either a constructed open channel along the future Rock Creek Parkway or detention basins prior to being discharged to Morrison or Elder Creeks. To limit runoff from development, Low Impact Design (LID) principles would be employed to the greatest extent feasible and when soil conditions permit.



A total of 26 detention basins are anticipated, with seven of these detention basins requiring pumping facilities (Wood Rodgers 2022). The pumping facilities would be regulated using monitoring stations at the outfalls of the pump station in Morrison Creek and pumping would be curtailed during peak flow conditions. Other improvements include raising previously mined areas above the floodplain, levee improvements, and closure of the conveyor tunnels at Fruitridge Road, Jackson Road, and Bradshaw Road. See Figure 2-12. The drainage system has been designed to provide a minimum of 200-year (0.5-percent annual chance of flooding) storm event protection and to include resiliency to the anticipated effects of climate change on future flood events.

MORRISON CREEK

Morrison Creek has been previously modified and partially realigned. The current creek alignment would be maintained, and the waterway would be used to convey stormwater flows. An existing weir and large detention basin are planned to be improved near the northeast portion of the plan area, which drained naturally to Morrison Creek prior to mining activities that lowered the ground surface to below creek elevation. The peak flows would enter the detention basin through the weir and would later be pumped back into the Morrison Creek system. Some previously mined areas are planned to be filled above the floodplain to allow gravity drainage back to Morrison Creek. Modeled water surface elevations in Morrison Creek would be unchanged or lower than the existing condition water surface elevations throughout the channel after project drainage improvements are completed (Wood Rodgers 2022).



ELDER CREEK

The Elder Creek channel would remain in a natural state with no channel modifications. Detention basins would be configured within the Elder Creek drainage shed to maintain Elder Creek conditions and planned development and levees would not encroach into the existing Elder Creek floodplain. No increase or change to peak flow conditions is anticipated following development of the WJHMP.

Figure 2-13 Proposed Roadway Network

ROCK CREEK PARKWAY CHANNEL

A new unlined channel along Rock Creek Parkway would convey the runoff from proposed development west of the plan area, as well as the on-site watersheds north of Morrison Creek, to the culvert crossing under Morrison Creek. The channel would be approximately 15 feet deep, with 4:1 side slopes and an 8-foot bottom width, and bounded by the Rock Creek Parkway travel lanes. Rock Creek Parkway and the associated detention basins have been designed to provide storage for 100-year (1-percent chance of flooding), 200-year, and in some cases 500-year (0.2-percent annual chance of flooding) storm events and would detain stormwater runoff prior to discharge or pumping to Morrison Creek.

PLANNED LEVEES AND FLOOD CONTROL FACILITIES

In some areas of the plan area, levee improvements adjacent to Morrison Creek would be required in order to achieve freeboard above the maximum 200-year water surface elevation. To provide flood protection, portions of existing levees adjacent to development areas would be improved (where deemed necessary by subsequent analysis). In the northeastern portion of the plan area, a setback levee along Vineyard Road (or elevated pads) would allow for 9,250 acre-feet of surface water storage in the adjacent Open Space/Urban Farm designated land area without cresting Jackson Road (see Figure 2-12).

ENERGY

SMUD would provide electricity to the plan area. SMUD has existing 12 kV and 69 kV electric transmission and bulk substation infrastructure within the plan area and has identified the proposed locations of future 69 kV electrical transmission and bulk substations. The WJHMP would be an all-electric development; as a result, no natural gas infrastructure has been planned for future buildings.

TRANSPORTATION AND CIRCULATION

The WJHMP includes an extensive network of streets and off-street trails to connect uses within each district and between districts. Street patterns have been designed to maximize connectivity, while off-street trails are proposed in open space corridors to provide pedestrian and bicycle access to destinations. The major trails within the WJHMP would extend along linear parkways, creeks, and the powerline corridor north of Elder Creek Road.

The established roadway system provides several access points into the plan area (see Figure 2-13). From the south, the major access point is Bradshaw Road, which bisects the plan area and provides an access point to the plan area's major commercial center. Other access points from the south are provided by South Watt Avenue, Hedge Avenue, Mayhew Road, Vineyard Road, and Excelsior Road. The major access point from the west is Jackson Highway and other access points are Kiefer Road, Fruitridge Road, Elder Creek Road, and Florin Road. Bradshaw Road is the major access point from the north and other access points are provided by South Watt Avenue and Excelsior Road.

The proposed Street Master Plan integrates a variety of streets configured to provide an adequate level of service for the planned land use densities and traffic loads (Figure 2-13). At full development, the WJHMP would include six-lane thoroughfares, four-lane

arterials, two-lane community boulevards, two-lane neighborhood collectors and residential streets with detached sidewalks. Thoroughfares and arterials would connect the residential neighborhoods and employment centers in the plan area with areas outside of the plan area.

Rock Creek Parkway has been developed as a primary collector roadway within the plan area. The parkway provides east west mobility and opportunities for transit linkages and an internal trail system. For each directional lane of travel Rock Creek Parkway would include a 12-foot travel lane, 5-foot bike lane, street parking, a 10-foot planter, and 6-foot sidewalk. The parkway would allow for linkages to the trail network throughout the plan area. The project includes a stormwater channel along Rock Creek Parkway with sufficient storm water runoff volume for 100-year through 500-year storm events. See Figure 2-12. Stormwater would either be discharged or pumped into Morrison Creek. Figure 2-14 provides a cross section of Rock Creek Parkway.

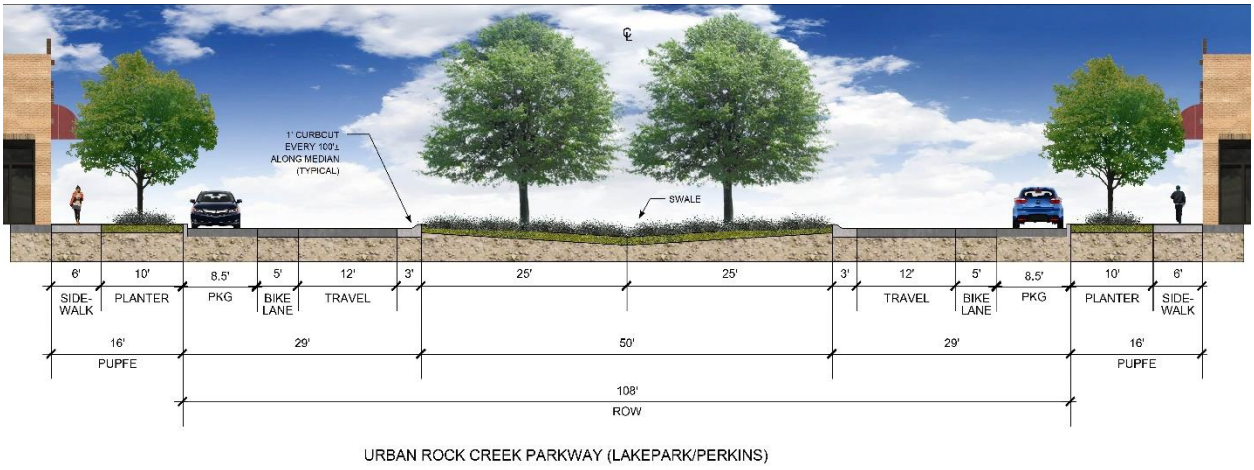

Figure 2-14 Rock Creek Parkway Cross Section

Traffic calming measures such as traffic circles, roundabouts, intersection bulb-outs, lane width restrictions, and other measures would be utilized in order to reduce vehicle speeds and enhance pedestrian safety.

TRANSPORTATION MANAGEMENT ASSOCIATION

The WJHMP includes a mandatory communitywide Transportation Management Association (TMA) to reduce vehicle trips. This program has been designed based on similar, existing programs throughout the county. The TMA would consist of the following four programs:

- **Commute Trip Reduction Marketing**. This program would include on-site or online commuter information services, employee transportation coordinators, and a guaranteed ride home service (as described below).

- **Guaranteed Ride Home.** To ensure that employees have the flexibility to adapt to changes in circumstances, this aspect of the TMA would provide the assurance of a ride home if, for example, an employee is required to work later than when the last available carpool leaves or transit options are available.
- **Provide Employer-Sponsored Vanpool.** Each employer would be required to participate in and implement an individual monitoring program or a vanpool program.
- **Provide Ridesharing and Carpooling Program:** The ridesharing program would be provided as a single program throughout the WJHMP employment community, providing benefits at the community scale.

TRANSIT

The WJHMP includes a transit concept that is intended to initially use a combination of transit shuttles, local bus service, and bus rapid transit (BRT), but anticipates evolving in response to technology and ridership patterns changes. The plan area is located along major planned transit corridors on Jackson Highway, South Watt Avenue, Bradshaw Road, and Excelsior Road. In addition, the plan area is located in close proximity to the Watt/Manlove Transit Priority Area (TPA) and its existing light rail station.

The proposed transit service route within the plan area is located within 0.5 mile from approximately 83 percent of WJHMP residents, and is located to provide easy access for residents to travel to and from commercial and community areas. See Figure 2-15.

TRAILS

The WJHMP includes a trail network that utilizes existing conveyor tunnel crossings and at-grade crossings, as well as new facilities located along Rock Creek Parkway, Morrison Creek, and several open space areas to facilitate widespread pedestrian and bicyclist opportunities throughout the plan area. This network is designed to connect to a series of Class II bikeways and lesser trails in order to provide ample opportunities for alternative modes of travel.

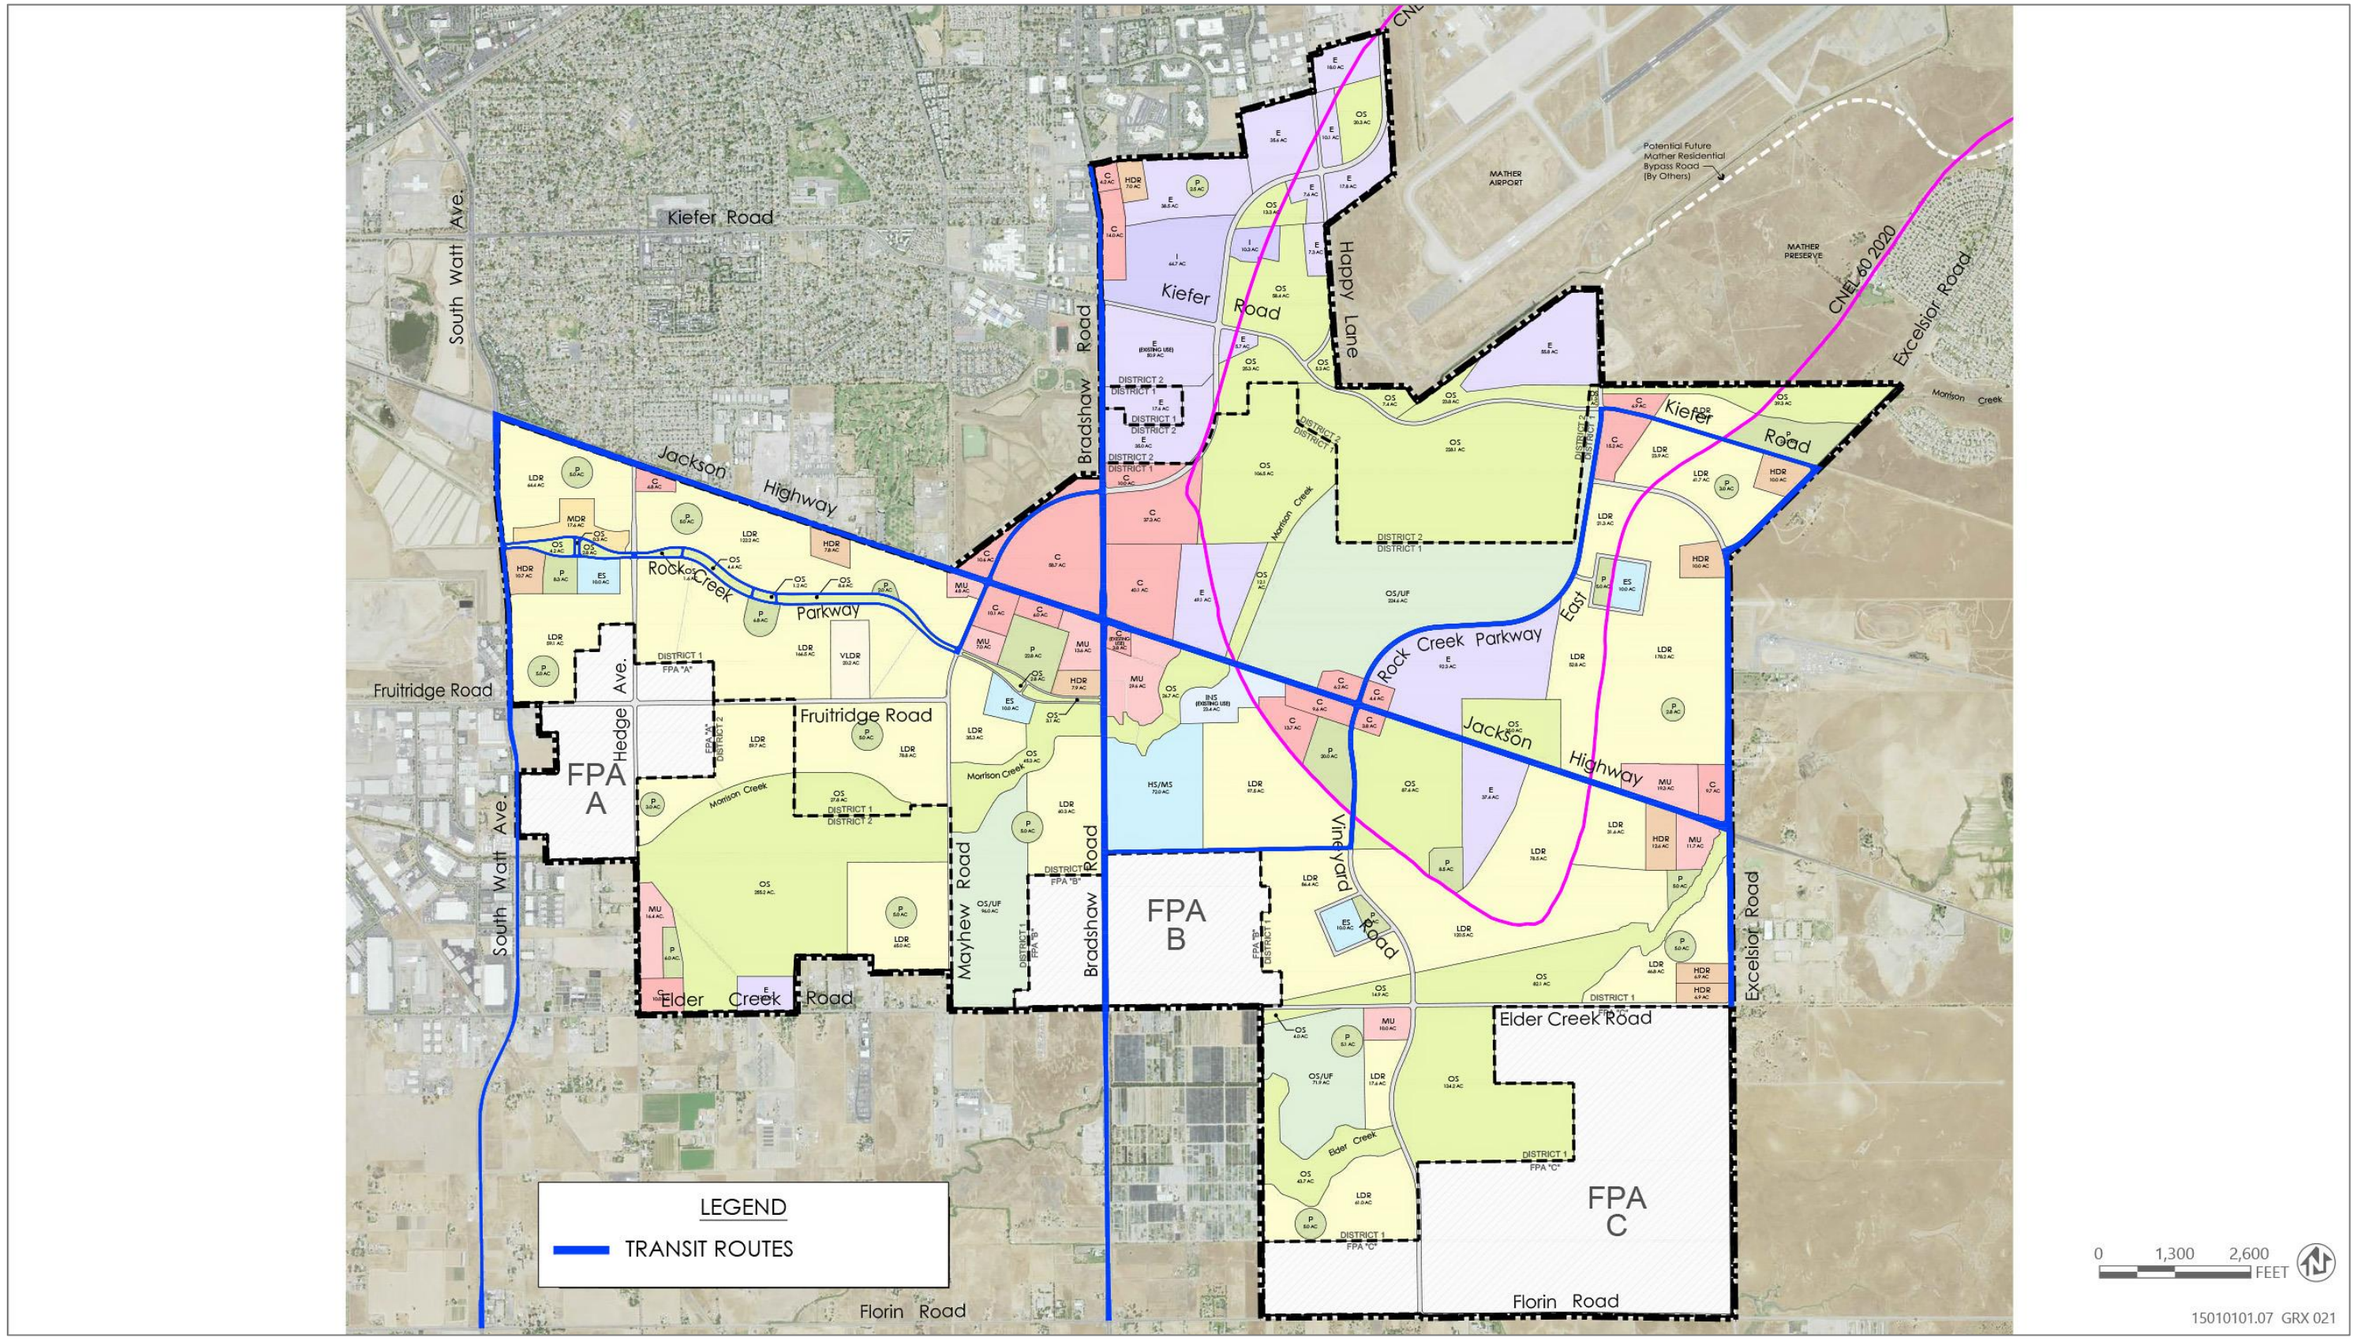
Three types of trails are identified in the WJHMP:

- **Regional trails** would generally follow Rock Creek Parkway, Morrison Creek, Elder Creek, and Vineyard Road. Regional trails would be paved 12-foot-wide, two-way, off-street trails with 2-foot-wide decomposed granite shoulders on both sides of the trail and associated landscape corridors of approximately 40 feet. Regional trails would provide continuous routes for active recreation and for providing connectivity between communities and to other existing and planned Regional Trails.
- **Conventional trails** are planned along portions of Hedge Avenue, Mayhew Road, Bradshaw Road, and Excelsior Road. Conventional trails would be paved 10-foot-wide, off-street trails with 2-foot-wide decomposed granite shoulders on both sides of the trail and associated landscape corridors of approximately 30 feet. Conventional trails would provide connectivity to primary destinations, such as schools, parks, employment centers, and transit.

- **Local trails** would be paved 8-foot-wide, off-street trails with 2-foot-wide decomposed granite shoulders on one side of the trail and associated landscape corridors of approximately 24 feet. Local Trails are intended to reach deep into the community, providing connections to local community destinations within the community, such as elementary schools, local parks, commercial areas, and to the conventional trail networks.

The alignment of proposed regional and conventional trails are shown in Figure 2-16. The location of local trails would be determined during future entitlements.

Avigation Easements



Due to the proximity of Mather Airport, avigation easements would be recorded on all properties within the Mather Airport Planning Policy Area. These avigation easements shall acknowledge that the plan area lies within the Mather Airport Planning Policy Area and include the following:

- Notification to all prospective buyers that residential parcels are located within the Mather Airport Planning Policy Area and that aircraft operations occur over the plan area.
- Granting the right of flight and unobstructed passage of aircraft into and out of Mather Airport and recordation of the avigation easement to the benefit of Sacramento County.

Construction and Implementation

As a master planned development, the project would build out in response to market demand over the course of decades. Build-out of the plan area is anticipated to occur in phases, with the initial phases of development within Districts 1 and 2, for which the WJHMP provides specific land uses to accompany development applications. Individual development projects would be submitted to the County pursuant to the WJHMP, with the likely scenario of development generally progressing from the east (adjacent to Excelsior Road) to the west.

For the purpose of analysis, construction is assumed to begin in 2025 and end in 2055, with construction activities allocated evenly through the 30-year duration of the construction period. Each year would be roughly assumed to entail 1 month of site preparation, 4 months of grading, 5 months of building construction, 1 month of paving, and 1 month of architectural coating application. In total, 500,000 cubic yards of soil import would be needed during the grading phases. As noted above, economic and market conditions would determine the actual timing and duration of project construction as well as total soil import needs.

BUILDOUT ASSUMPTIONS

SUBSEQUENT DEVELOPMENT REVIEW

If the WJHMP is adopted, applications for projects (such as tentative maps) within Districts 1 and 2 would be submitted to the County Planning & Environmental Review Division (PER) for review. These applications would be reviewed to determine consistency with the WJHMP and other County regulatory documents.

PER would conduct an initial review of each application for completeness and consistency with regulatory documents and compliance with CEQA. This EIR would serve as the base or "master" environmental review document for subsequent discretionary planning projects within the plan area. Subsequent master plans or specific plans, zoning requests, and project applications would be reviewed by PER for consistency.

In some cases, subsequent master plans, specific plans, zoning requests, and other project applications may require additional environmental review to evaluate the potential for environmental impacts beyond the scope of this EIR. If it is determined that there would be potentially new or additional significant environmental impacts, a subsequent EIR, mitigated negative declaration, or negative declaration will be required. Such environmental documents could utilize and supplement this master EIR with additional analysis.

SACRAMENTO COUNTY SUBDIVISION ORDINANCE

Subdivision of properties within the plan area will conform to design and improvement standards contained in Title 22 of the Sacramento County Land Development Code. Prior to the subdivision of any property in the plan area, the County must approve a parcel or tentative map, and a final map must be filed for that property with the County Recorder. As conditions of map approval, the County may require dedication of land, payment of impact fees, and the construction of public improvements reasonably required for the promotion of health, safety, and welfare.

REQUESTED ENTITLEMENTS

The following is a complete list of requested entitlements:

1. A **General Plan Amendment** to move the UPA boundary south and east to include the WJHMP area (Figure 2-17).

2. A **General Plan Amendment** to amend the Land Use Diagram from Agricultural-Urban Reserve, General Agriculture, Extensive Industrial, Intensive Industrial, Commercial and Offices and Cemetery, Public/Quasi Public, to Low Density Residential, Medium Density Residential, Mixed Use, Commercial and Office, Recreation, Intensive Industrial, Extensive Industrial, General Agriculture, Agricultural-Urban Reserve, and Cemetery, Public/Quasi Public for approximately 5,913 acres (Figure 2-18). Note: Amendments to the land use designations listed above will not affect the designation of the existing Aggregate Resource Area Overlay, which will remain in place.

3. **Amend the General Plan Transportation Plan** to show proposed roadway alignments as shown in the Transportation General Plan Amendment Diagram dated January 2017 (Figure 2-19).

4. **Amend the Active Transportation Plan** to add on- and off-street bikeways as shown in the Active Transportation Plan Amendment Diagram dated January 2017 (Figure 2-20).

5. A **Community Plan Amendment** to amend the Cordova Community Plan to add a West Jackson Highway Master Plan Overlay and apply it to the approximately 1,112 acres of the WJHMP area located within the boundaries of the Cordova Community Plan (Figure 2-21).

6. A **Community Plan Amendment** to amend the Vineyard Community Plan to add a West Jackson Highway Master Plan Overlay and apply it to the approximately 3,779.5 acres of the WJHMP area located within the boundaries of the Vineyard Community Plan (Figure 2-22).

7. **Adoption of the West Jackson Highway Master Plan** for approximately 5,913 acres.

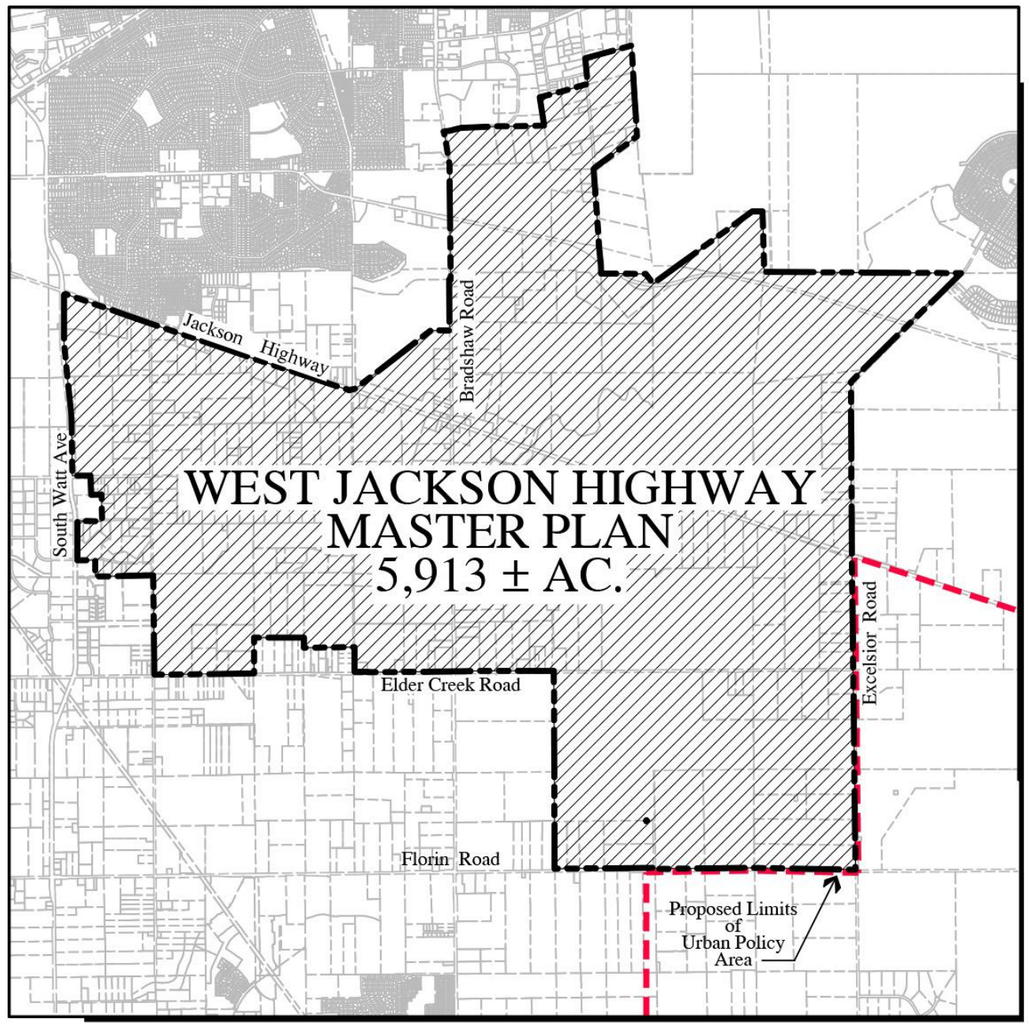
8. A **Development Agreement** for District 1 by and between the County of Sacramento and Teichert Land Company.

9. A **Development Agreement** for District 2 by and between the County of Sacramento and Granite Construction Company.

10. **Affordable Housing Strategy** for District 1 by and between the County of Sacramento and Teichert Land Company.

11. **Affordable Housing Strategy** for District 2 by and between the County of Sacramento and Granite Construction Company

12. **Adoption of a Public Facilities Financing Plan** for West Jackson Highway that includes a Capital Improvement Program and Financing Plan.



13. **Adoption of an Urban Services Financing Plan** for West Jackson Highway.

14. A **Water Supply Master Plan Amendment** to amend the Existing Zone 40 Water Supply Master Plan to include provision of water service to the WJHMP area.

15. **Approve the Water Supply Assessment for the WJHMP:** Required by the California Water Code to link land use and water supply planning activities.

Figure 2-22 Proposed Vineyard Community Plan Amendment

REQUIRED DISCRETIONARY ACTIONS

LEAD AGENCY

Sacramento County is the Lead Agency for the CEQA evaluation of the proposed WJHMP.

The project would require the following actions, permits, or approvals from the County:

- certification of this EIR,
- adoption of a mitigation monitoring and reporting plan,
- adoption of findings and any statement of overriding considerations,
- adoption of affordable housing plans,
- adoption of a General Plan amendment,
- adoption of Community Plan amendments,
- approval of the WJHMP, and
- execution of development agreements.

Future actions, permits or approvals required from the County would include:

- Rezoning of property consistent with the Master Plan,
- Tentative Subdivision Maps, and
- Various development permits.

RESPONSIBLE AND TRUSTEE AGENCIES

Responsible Agencies are other agencies that are responsible for carrying out or implementing a specific component of the WJHMP or for approving a project (such as an annexation) that implements the goals and policies of the plan. Trustee agencies have jurisdiction over certain resources held in trust for the people of California, but do not have legal authority over approving or carrying out the project. Based on the potential effects known at this time, responsible agencies may include: US Army Corps of Engineers, US Fish and Wildlife Service, the California Department of Transportation, the California Department of Fish and Wildlife, the South Sacramento Conservation Agency, the Central Valley Regional Water Quality Control Board, SMUD, Sacramento Area Sewer District, Sacramento County Water Authority, Cordova Recreation and Park District, Southgate Recreation and Park District, Sacramento Metropolitan Air Quality Management District, Elk Grove USD, the Central Valley Flood Protection Board, and Cal American Water.

3 ALTERNATIVES

INTRODUCTION

State CEQA Guidelines Section 15126.6(a) requires EIRs to describe "a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather, it must consider a range of potentially feasible alternatives that will avoid or substantially lessen the significant adverse impacts of a project, and foster informed decision making and public participation. An EIR is not required to consider alternatives that are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason." This section of the State CEQA Guidelines also provides guidance regarding what the alternatives analysis should consider. Subsection (b) further states the purpose of the alternatives analysis is as follows:

> Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code [PRC] Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

The State CEQA Guidelines require that the EIR include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative must be discussed, but in less detail than the significant effects of the project as proposed (Section 15126.6[d]).

The State CEQA Guidelines further require that the "no project" alternative be considered (Section 15126.6[e]). The purpose of describing and analyzing a no project alternative is to allow decision makers to compare the impacts of approving a proposed project with the impacts of not approving the proposed project. If the no project alternative is the environmentally superior alternative, CEQA requires that the EIR "shall also identify an environmentally superior alternative among the other alternatives" (Section 15126[e][2]).

In defining "feasibility" (e.g., "feasibly attain most of the basic objectives of the project"), Section 15126.6(f)(1) states, in part:

> Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent). No one of these factors establishes a fixed limit on the scope of reasonable alternatives.

In determining what alternatives should be considered in the EIR, it is important to consider the objectives of the project, the project's significant effects, and unique project considerations. These factors are crucial to the development of alternatives that meet the criteria specified in Section 15126.6(a). Although, as noted above, EIRs must contain a discussion of "potentially feasible" alternatives, the ultimate determination as to whether an alternative is feasible or infeasible is made by the lead agency's decision-making body, here the Board of Supervisors. (See CEQA Sections 21081.5 and 21081[a][3].)

Evolution of the WJHMP Land Use Plan

The proposed WJHMP is the product of an approximately 20-year planning process. During this time, the Project Applicants and the County worked collaboratively to identify and resolve issues and develop a plan that minimizes the environmental effects of development. As described below, the iterative review process has resulted in a project with fewer environmental effects than the project in the original proposal.

The Project Applicants first engaged in preapplication processes with the County approximately 10 years before submittal of a formal project application in 2013. The County released a notice of preparation of an EIR in 2013 and began initial evaluations, including a draft cumulative traffic study, preliminary biological resources assessments, and noise studies. As environmental review of the 2013 submission progressed, it became clear that certain environmental impacts warranted attention. Foremost among these were traffic impacts, with the analysis revealing that the project as proposed in 2013 would, because of the intensity of employment generating land uses, result in an excessive number of trips being attracted to the plan area with resulting adverse traffic impacts. To lessen these identified impacts, the intensity of the proposed employment areas was reduced in revised plans submitted to the County in 2017. Other modifications made in the 2017 submission to address potential impact areas identified through initial CEQA review of the 2013 submission included:

- **Air Quality Impacts**. The traffic related impacts modifications were, in part, also made to achieve a reduction in air quality and greenhouse gas impacts.

- **Transit Impacts**. More direct and efficient transit routes were developed to respond to identified transit and transportation impacts.
- **Biological Impacts**. Various modifications were made to address a series of identified biological impacts, including:
    - eliminating impacts to vernal pools in Aspen IX, which is south of Jackson Highway, by not proposing development in that area;
    - eliminating impacts to various natural areas along Morrison Creek by eliminating road and bridge crossings;
- **Open Space Impacts**. The loss of open space was addressed by identifying 1,945.8 acres as compared to 1,583.4 acres as proposed in the 2013 submission;
- **Groundwater Impacts**. The amount of groundwater recharge capability was increased as a by-product of increasing the amount of open space; and
- **High School/Middle School Impacts**. The high school/middle school site was altered to move it outside of the Mather Airport 60-decibel (dB) community noise equivalent level (CNEL) noise contour line.

The 2017 submittal included a preferred land use diagram and three design options that changed the location of the proposed middle school/high school site. Following submittal of these plans and release of the revised notice of preparation in April 2017, the Sacramento Area Council of Governments updated the Mather Airport noise contours and safety zones. In addition, designs were developed for the drainage features within the plan area. Then, in 2020, the Project Applicants submitted a package of three alternative land use plans that had been revised to reflect the direction of the County Department of Airports and County Department of Water Resources.

Alternative 1-A was initially the preferred alternative. This alternative differed from the 2017 submission by:

- providing a setback levee along the extension of Vineyard Road to achieve satisfactory drainage control;
- converting residential land uses to employment/commercial uses within the area in response to revisions to the then-proposed Mather Airport noise contour and making appropriate adjustments to the remainder of the plan;
- modifying a portion of the project by shifting high-density residential uses to mixed use and employment uses to accommodate the newly proposed safety zone associated with Mather Airport;
- making minor design changes to the Mayhew Road/Happy Lane Roadway alignment in accordance with direction from Sacramento County Department of Transportation (SACDOT) staff; and

- moving the location of the 70-acre high school/middle school site to the east side of Bradshaw Road, rather than at the Granite Vineyard mine property west of Bradshaw Road.

Alternative 1-B differed from the 2017 submission by:

- employing high ground and a possible small setback levee to achieve satisfactory drainage control;
- providing a loop street off Excelsior Road to access designated residential development rather than an extension of Vineyard Road;
- converting residential land uses to employment/commercial uses within the area affected by the proposed Mather Airport noise contour;
- modifying a portion of the project by shifting higher-density residential uses to mixed use and employment uses so as to accommodate the newly proposed safety zone associated with Mather Airport;
- changing uses at Excelsior Road and Jackson Highway by shifting high-density residential uses slightly to the west;
- modifying the land uses associated with the western portion of the project;
- making minor design changes to the Mayhew Road/Happy Lane Roadway alignment that has been designed in accordance with direction from SACDOT staff; and
- moving the location of the 70-acre high school/middle school site to the east side of Bradshaw Road, rather than at the Granite Vineyard mine property west of Bradshaw Road.

Alternative 1-C proposed the same changes as Alternative 1-A except that this alternative retained the low-density residential land uses located within the eastern portion of the plan area within the proposed noise contour. The Project Applicants later designated this alternative as their proposed project because the distribution of housing rendered it the most economically viable from an infrastructure financing perspective. Alternative 1-C is the foundation of the plan evaluated in this EIR.

As indicated above, the project, as currently proposed, is the result of discussions between the Project Applicant and County staff, as well as input from other regulatory agencies and the public. Through this process, the severity of potential environmental effects has been reduced through a more efficient land use pattern, inclusion of a multi-modal trail system, expansion of the proposed open space, and incorporation of public transportation.

CONSIDERATIONS FOR SELECTION OF ALTERNATIVES

ATTAINMENT OF PROJECT OBJECTIVES

As described above, one factor that must be considered in selection of alternatives is the ability of a specific alternative to attain most of the basic objectives of the project (State CEQA Guidelines Section 15126.6[a]). Chapter 2, "Project Description," articulates the following project objectives:

1. Identify and redevelop former mining properties and properties formerly restricted by airport operations of Mather Air Force Base into a vibrant master planned community.
2. Provide a broad mix of needed housing in close proximity to existing and future job centers, including affordable housing as required by the County's Inclusionary Housing Ordinance.
3. Support development located and designed to reduce the per capita vehicle miles traveled and greenhouse gas emissions relative to the Sacramento County regional average.
4. Achieve a Net Zero Greenhouse Gas community at buildout.
5. Provide commercial and recreational services that are connected to and serve adjacent communities.
6. Provide for the development and improvement of services that will serve Environmental Justice areas.
7. Provide equitable protection from environmental and health hazards for disadvantaged communities within the plan area.
8. Include a variety of land use types that will provide employment, commercial, industrial, recreational, and housing opportunities. Locate the different land uses within easy walking distance of each other.
9. Encourage health and wellness by providing an extensive system of trails and parks that are distributed throughout the community and are within easy walking and biking distance of residents. Provide also urban farms and community gardens that will be centrally located and will enable residents, as well as adjacent communities, to obtain locally grown produce and farm products.
10. Incorporate sustainable design practices through a variety of measures including energy efficient design, urban forests, and Low Impact Development (LID). These measures are intended to reduce the overall carbon footprint of the community.
11. Provide a high level of connectivity through an extensive network of streets and off-street trails. Provide bicycle and pedestrian trails that will allow connectivity up slope banks to key intersections, schools, or commercial centers in order to facilitate access options.

12. Provide infrastructure for a variety of transportation options, including roadways, bike trails, walking trails, electric vehicle charging, and public transportation.
13. Create distinctive community and neighborhood nodes that create a sense of place and opportunities for social and recreational activity.
14. Provide a range of housing choices that could include semi-rural, traditional single-family homes, condominiums/townhomes, apartments, active adult/seniors, and mixed-use development.
15. Develop a master plan within and consistent with the South Sacramento Habitat Conservation Plan.
16. Achieve an economically viable master planned development.

Environmental Impacts of the WJHMP Project

Chapters 4–21 of this EIR address the environmental impacts of implementation of the proposed project. Potentially feasible alternatives were developed with consideration of avoiding or lessening the significant, and potentially significant, adverse impacts of the project, as identified in this EIR and summarized below. The WJHMP would result in significant impacts, some of which could be reduced to a less-than-significant level, in the following resources areas:

- aesthetics;
- agricultural resources;
- air quality;
- airport compatibility;
- biological resources;
- climate change;
- cultural resources;
- geology, soils, and mineral resources;
- hazards and hazardous materials;
- hydrology, drainage, and water quality;
- noise;
- transportation; and
- tribal cultural resources.

ALTERNATIVES CONSIDERED BUT NOT EVALUATED FURTHER

As described above, State CEQA Guidelines Section 15126.6(c) provides that the range of potential alternatives for the project shall include those that could feasibly accomplish most of the basic objectives of the project, and could avoid or substantially lessen one or more of the significant effects. Alternatives that fail to meet the fundamental project purpose need not be addressed in detail in an EIR (*In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* [2008] 43 Cal.4th 1143, 1165-1167).

In determining what alternatives should be considered in the EIR, it is important to acknowledge the objectives of the project, the project's significant effects, and unique project considerations. These factors are crucial to the development of alternatives that meet the criteria specified in Section 15126.6(a). Although, as noted above, EIRs must contain a discussion of "potentially feasible" alternatives, the ultimate determination as to whether an alternative is feasible or infeasible is made by lead agency decision maker(s). (See CEQA Section 21081[a][3].) At the time of action on the project, the decision maker(s) may consider evidence beyond that found in this EIR in addressing such determinations. The decision maker(s), for example, may conclude that a particular alternative is infeasible (i.e., undesirable) from a policy standpoint, and may reject an alternative on that basis provided that the decision maker(s) adopts a finding, supported by substantial evidence, to that effect, and provided that such a finding reflects a reasonable balancing of the relevant economic, environmental, social, and other considerations supported by substantial evidence (*City of Del Mar v. City of San Diego* [1982] 133 Cal.App.3d 401, 417; *California Native Plant Society v. City of Santa Cruz* [2009] 177 Cal.App.4th 957, 998).

The EIR should also Identify any alternatives that were considered by the lead agency but were rejected during the planning or scoping process and briefly explain the reasons underlying the lead agency's determination.

The following alternatives were considered by the County but are not evaluated further in this Draft EIR.

OFF-SITE ALTERNATIVE

Under an off-site alternative, the project would be developed on a separate site within the unincorporated county. An alternative site would need to be of a size similar to that of the plan area (5,913 acres) and would need to be able to be acquired, at least in part, by the Project Applicants. Further, the alternative site would need to be located a similar distance from downtown Sacramento to provide commensurate benefits to residents, including short commute times and future transit access, as well as favorable vehicle miles traveled to support the project's net zero GHG objective. The off-site alternative would also need to be within the Urban Services Boundary and either within the Urban Policy Area (UPA) or adjacent to the UPA such that incorporation into the UPA would be a logical extension. As described further in Chapter 15, "Land Use, Population, and Housing," Sacramento County 2030 General Plan Policy LU-119 establishes that

proposed UPA expansions must have significant borders that are adjacent to the existing UPA or a city boundary. The boundary of the UPA expansion must be logical and consistent with LU-119 for the Board of Supervisors to approve the project.

Although there are other areas within the county that could potentially be developed to accommodate the anticipated growth in the Jackson Corridor, the plan area is intended to make use of property already owned by the Project Applicants. With such a large plan area, it is difficult to bring together multiple property owners for a large-scale planning process. With the Project Applicants owning most of the plan area, the planning process is simpler and more likely to eventually build out successfully.

Moreover, while an off-site alternative could feasibly achieve many of the project objectives, one of the stated objectives of the project is to "redevelop former mining properties and properties formerly restricted by airport operations of Mather Air Force Base into a vibrant master planned community." The County has directed long-term planning efforts to prepare for future development along Jackson Road (also referred to as Jackson Highway). Despite the area's proximity to urban development and jobs in Sacramento, Rancho Cordova, and Elk Grove, development potential has been limited due to the proximity of mining activities and military operations at the former Mather Air Force Base. However, with the closure of historic mines and decommissioning of Mather Air Force Base, many of the prior limitations on the land have been lifted, making this area an acceptable and convenient location for new development. Maintaining consistency with this goal would dramatically reduce the potential locations of an off-site alternative.

There are limited areas of land of a similar size adjacent to, or within, the UPA, most of which are already under consideration as other potential growth areas, and this is the only area that meets the project's objectives and is also majority owned by the Project Applicants. For these reasons, an off-site alternative was determined to be infeasible.

2017 Submittal Alternative 1-A

As described above, this alternative was developed by the Project Applicants in 2017. It is substantially similar to the proposed project evaluated in this EIR but would provide greater consistency with the Mather Airport Comprehensive Land Use Plan (CLUP). As discussed further in Chapter 7, "Airport Compatibility," the project as proposed would be consistent with the County's General Plan and impacts to future residents would be addressed through mitigation measures requiring special building considerations and acoustical testing for homes constructed between the 60- and 65-dB CNEL contours. This alternative would not reduce the impacts of the project on the environment and has not been carried forward for detailed analysis.

ALTERNATIVES SELECTED FOR DETAILED ANALYSIS

The following alternatives are evaluated in this EIR:

- **Alternative 1: No Project Alternative**. This alternative assumes that the project is not approved and development occurs in a manner consistent with adopted land use designations and zoning.
- **Alternative 2: Reduced Footprint Alternative.** This alternative would remove approximately 2,000 acres of less disturbed land east of Bradshaw Road and south of State Route (SR) 16 from the plan area.
- **Alternative 3: Development of Reclamation Lands Alternative.** With this alternative, development would occur only on the aggregate mining properties that are owned by the Project Applicants and have been reclaimed.

Further details on these alternatives, and an evaluation of environmental effects relative to the proposed project, are provided below.

ALTERNATIVE 1: NO PROJECT ALTERNATIVE

Section 15126.6(e) of the State CEQA Guidelines requires that an EIR evaluate and analyze the environmental impacts of the No Project Alternative to examine and compare the potential environmental consequences associated with not approving the project. For the purposes of this analysis, the No Project Alternative would allow for development consistent with the existing General Plan land use and zoning designations on properties within the plan area. Generally, the portion of the plan area west of Bradshaw Road is designated for Agricultural-Urban Reserve. East of Bradshaw Road, the northern portion of the plan area is generally designated Extensive Industrial and the southern portion of the plan area is designated General Agriculture (see Figure 2-6 in Chapter 2, “Project Description”).

This alternative would not result in the development of a master planned community and would not meet any of the project objectives.

AESTHETICS

Development of the plan area according to the existing zoning would result in limited potential for changes in the portion of the plan area designated for agricultural use. The northeast portion of the plan area could be developed for industrial uses, which would be a substantial change to the character and quality of the area and could introduce sources of light or glare. Because the potential for changes to the visual character of the plan area would be less overall, the visual and lighting impacts of the No Project Alternative would be less than those anticipated for the project.

AGRICULTURAL RESOURCES

The No Project Alternative would not change the land use designations or zoning of the plan area. As a result, the No Project Alternative would not conflict with existing

agricultural zoning. Alternative 1 would also avoid the conversion of Prime Farmland and limit conversion of Farmland of Statewide Importance within the plan area. Impacts on agricultural resources would be less for the No Project Alternative than for the proposed project.

Air Quality

The No Project Alternative would generate lower air pollutant emissions (particulate matter and ozone precursors) because of continued agricultural activities and rural residential use of the plan area. Although aggregate mining activities currently result in emissions, these activities are planned to sunset, and required reclamation plans would address the potential for erosion or other ongoing air quality concerns once mining operations cease. The significant construction, operational, and cumulative air quality impacts identified for the project would not occur. Therefore, the air quality impacts of the No Project Alternative would be less than those that would occur with the project.

Airport Compatibility

Under the No Project Alternative, development would be implemented in a manner consistent with the Mather Airport CLUP, 2030 General Plan, and zoning code. Further, development in the Overflight Zone would be subject to Sacramento Area Council of Governments review. This review process would ensure that development would not interfere with the safe and efficient use of navigable air space. Development of the portion of the plan area that is zoned industrial would also result in a net reduction of wetland features with the potential to serve as wildlife attractants, which could improve safe and efficient use of navigable airspace. Therefore, the No Project Alternative would not create substantial safety hazards to people living and working in the vicinity of an airport, expose sensitive receptors to excessive noise, or impair the safe and efficient use of navigable air space. Impacts would be similar to, but less than, those anticipated with implementation of the project.

Biological Resources

Under the No Project Alternative, activity within the plan area would be limited to the continued operation of agricultural, rural residential, industrial, and mining uses, with potential for additional industrial development in the central portion of the plan area. This alternative would retain the grasslands, agricultural habitat, and trees in southeastern portion of the plan area that may support special-status plant and wildlife species known to occur in the region. Impacts would be similar to, but less than, those anticipated with implementation of the project.

Climate Change

The No Project Alternative would generate lower greenhouse gas (GHG) emissions from continued agricultural and mining operations in the plan area. When compared to the proposed land use plan there may be less development overall; however, the type of development that occurs would be industrial-type uses that are typically associated with emissions from operations and truck traffic. If new industrial land uses were developed in the future, these land uses could generate substantial GHG emissions

from processing activities, loading docks, and heavy truck travel that would be subject to project-level review and mitigation to reduce GHG emissions.

In addition, the No Project Alternative may create development pressure elsewhere in the unincorporated county that is further from established cities because development of the plan area according to adopted zoning would not generate substantial housing. This could result in higher vehicle miles traveled (VMT) and fewer opportunities to develop large-scale programs that reduce VMT. However, the potential for less GHG-efficient development to indirectly result from implementation of the No Project Alternative is speculative at this time. Overall, the GHG emission impacts of the No Project Alternative would be similar to those that would occur with the project.

Cultural Resources

Under the No Project Alternative, new ground disturbance would be largely concentrated in the area zoned for industrial uses, which is an area that has been largely disturbed by past mining activities. Overall, impacts on cultural resources under the No Project Alternative would be less than under the project because less ground would be disturbed.

Energy

As described above in relation to climate change and GHG emissions, the No Project Alternative could result in new industrial development in the plan area and, indirectly, residential development in other areas of the county. The energy efficiency of such developments cannot be precisely determined at this time. However, any future development would be held to the same energy efficiency standards as the project and would be supplied with largely renewable energy by Sacramento Municipal Utility District (SMUD). the potential for wasteful or inefficient use of energy under the No Project Alternative that could result in conflict with state or local plans for renewable energy or energy efficiency is expected to be similar to that under the proposed project.

Geology, Soils, and Mineral Resources

The No Project Alternative would substantially reduce the potential for development in the plan area. Reclaimed lands would be retained in their restored state, typically characterized by grasses established to limit erosion. Development that does occur would be consistent with the established zoning and would be subject to the same regulations as the project, including the Uniform Building Code (UBC) and California Uniform Building Code (CBC), which would ensure the maximum necessary protection available for development within areas known to contain expansive soils. Due to the reduction in development, impacts associated with soil erosion, siltation, loss of topsoil, exposure to expansive soils, and destruction of paleontological resources would be less than those associated with development of the project.

Hazards and Hazardous Materials

The No Project Alternative could result in development of a portion of the plan area for light industrial use. This zoning generally allows for the assembly of manufactured

goods and is not associated with use of large quantities of potentially hazardous materials. Further, any construction and operation of light industrial uses would be subject to existing regulations governing the use, transport, and disposal of hazardous materials. Therefore, although more industrial and agricultural land uses, which may use and generate large quantities of potentially hazardous materials, could occur under Alternative 1, impacts are anticipated to be similar to those that would occur with development of the WJHMP following adherence to existing regulatory standards.

Hydrology, Drainage, and Water Quality

The No Project Alternative would result in less impervious surface area than anticipated due to future development potential under the WJHMP. This would increase surface water infiltration and reduce sedimentation and other pollutants in stormwater runoff. However, Alternative 1 would not result in improvement to Morrison Creek and the existing weir that are proposed as part of the project and are anticipated to benefit off-site drainage and water quality. Overall, the hydrology, drainage, and water quality impacts of the No Project Alternative would be less than those of the project.

Land Use, Population, and Housing

This alternative would not result in any conflicts with existing land uses or adopted plans because no changes to the General Plan land use designations or zoning would occur. The No Project Alternative also would not result in revision to the UPA. However, the analysis in Chapter 15, “Land Use, Population, and Housing” indicates that the WJHMP would not result in significant impacts as a result of the proposed land use changes and expansion of the UPA. For this reason, the land use, population, and housing impacts under this alternative would be similar to those of the project.

Noise

The No Project Alternative would generally reduce the potential for construction and operation noise compared to that identified for the project based on the reduced area of potential development. As described above, the central portion of the plan area could be built out with light industrial uses, and agricultural and rural residential lands would provide a partial buffer for the existing communities to the north and south.

Future industrial uses may result in short-term construction noise and operational noise sources similar to those described for industrial uses in the WJHMP in Chapter 16, “Noise.” Discretionary development in the plan area would likely be subject to mitigation related to construction and operational noise that is similar to the mitigation measures included in Chapter 16. However, the actual mitigation requirements and effectiveness are unknown. Further, the overall amount of industrial development, which is generally noisier than residential mixed-use development, would be greater than proposed in the WJHMP. Therefore, the noise and vibration impacts of the No Project Alternative would be similar to those anticipated with implementation of the project.

Public Services

The No Project Alternative would have less potential to trigger the need for new or improved fire, law enforcement, or park facilities because most of the area is designated for light industrial or agricultural uses and this limits the potential to introduce residents into the plan area. Overall, the public service impacts of the No Project Alternative would be less than those of the project.

Public Utilities

Under the No Project Alternative, the potential for development in the plan area would be substantially reduced. Development of the industrially zoned areas could result in additional solid waste and wastewater generation, which could require limited on-site and off-site infrastructure, including septic systems. A comprehensive on-site wastewater system similar to that evaluated for the project would not be constructed. Effects would be less than those anticipated with implementation of the project.

Transportation

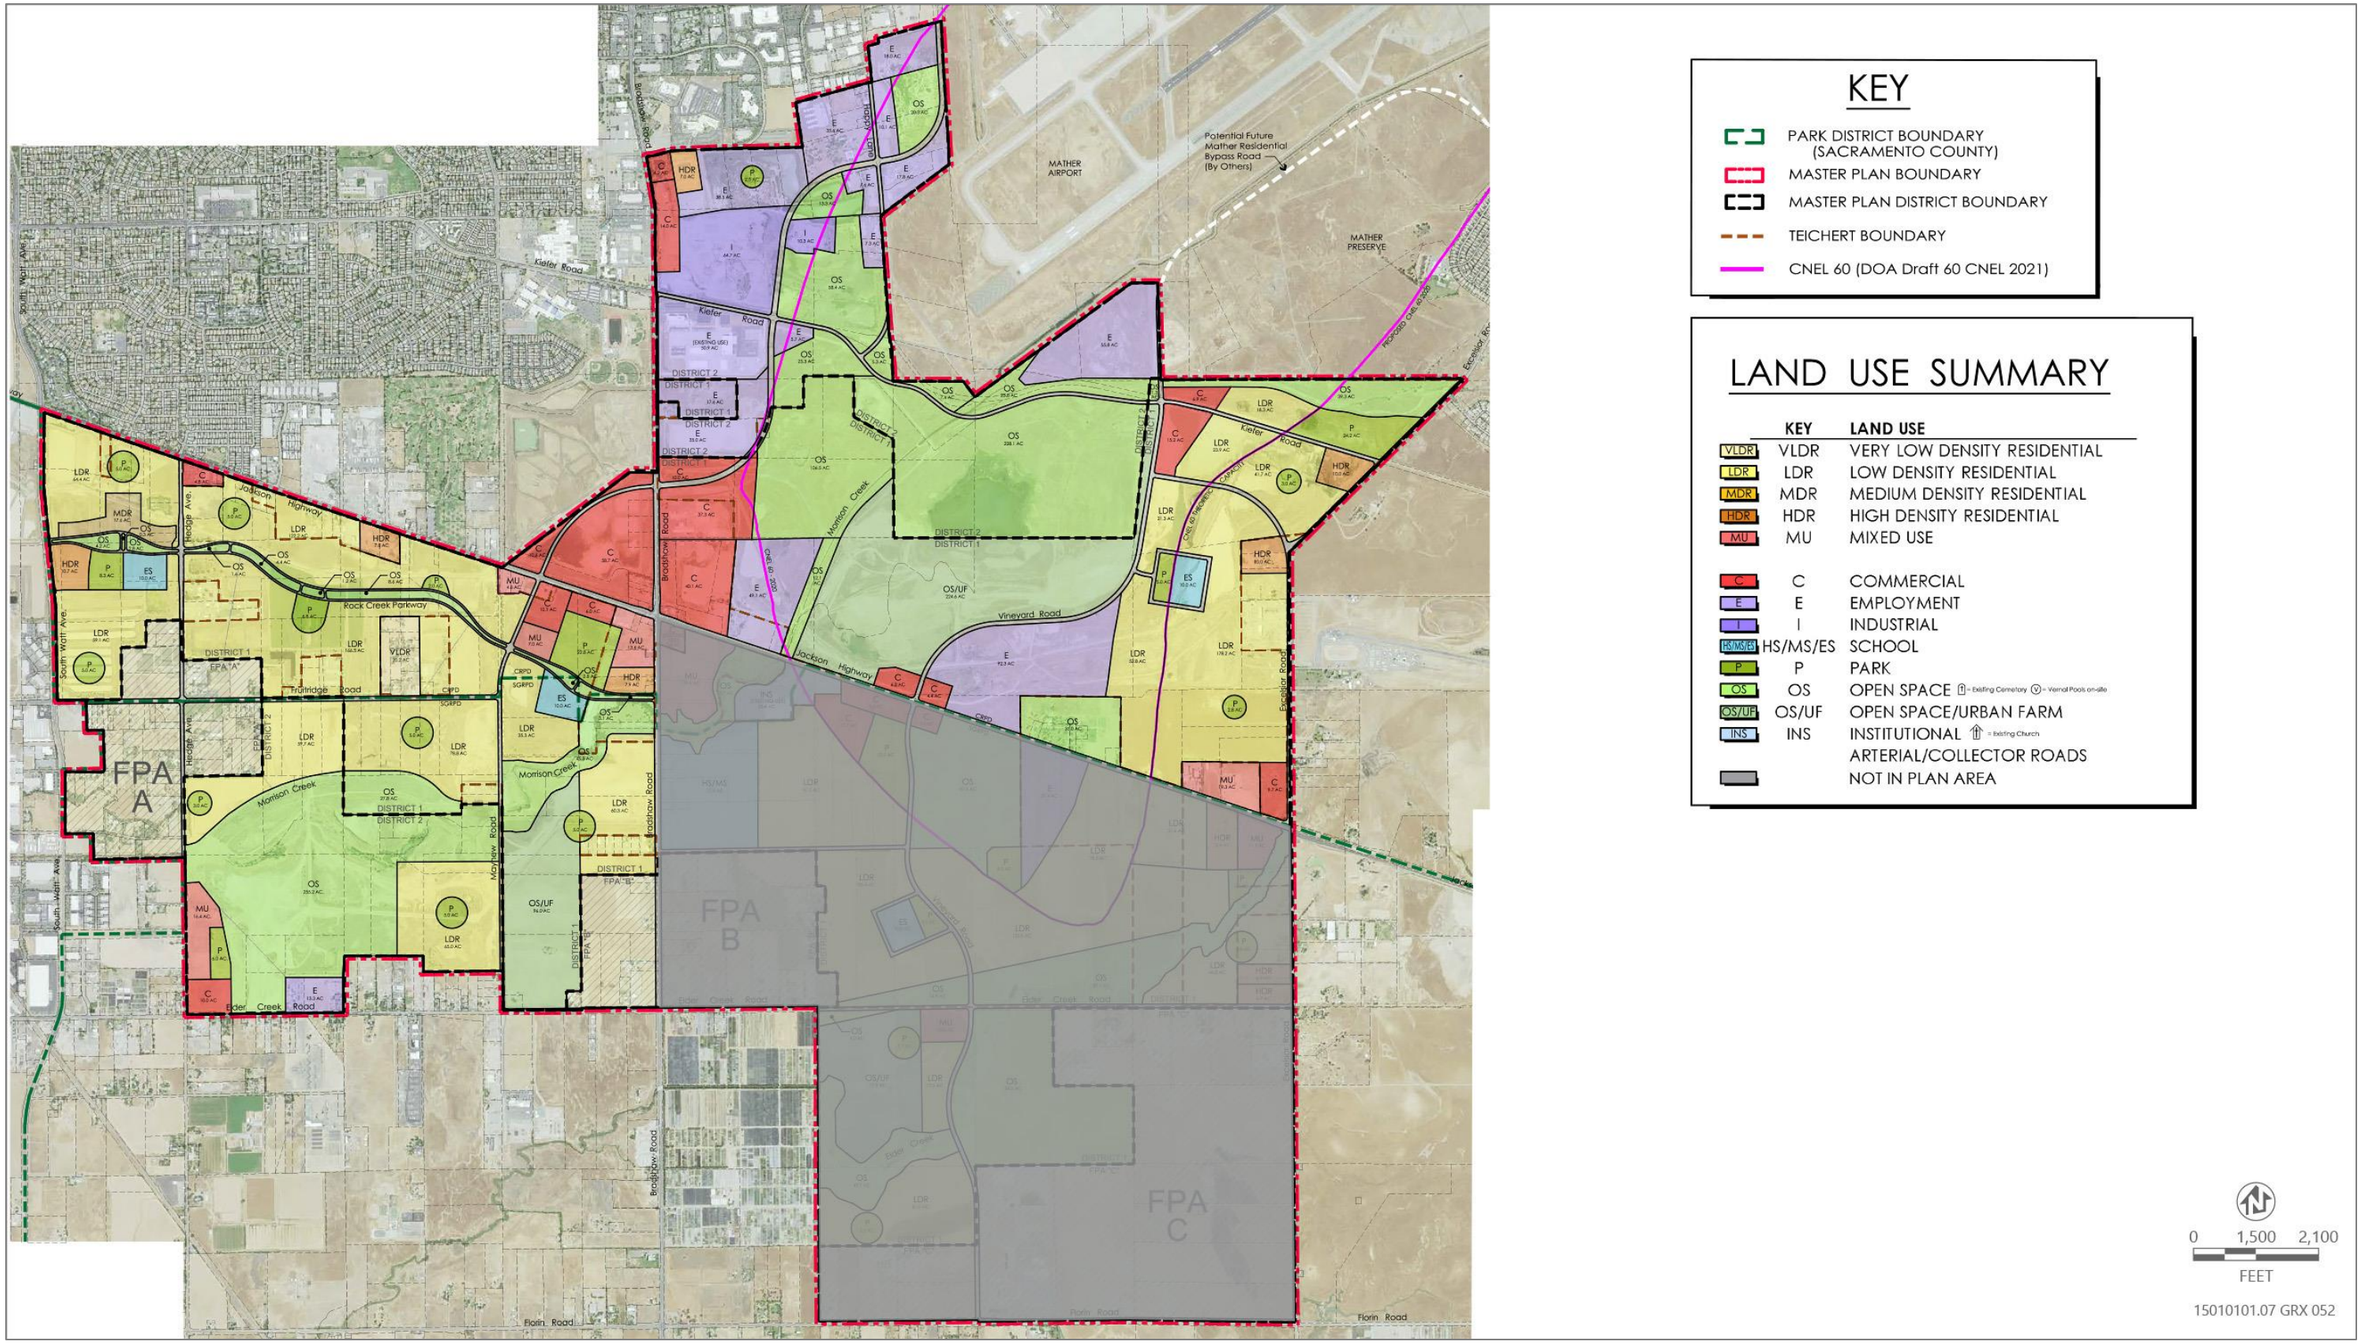
The No Project Alternative would have limited potential to affect the operation of area roadways and would not change conditions relative to bicycle, pedestrian, or transit facilities. The plan area has limited potential to accommodate residential or employment uses under the existing land use designations; as a result, the potential for the No Project Alternative to generate new VMT is also relatively low. However, the No Project Alternative would not implement updates to the transit plan or Active Transportation Plan. As a result, a gap in transit and trail systems would occur between the Vineyard Community to the south, Rosemont Community to the north, and approved master plans along the east Jackson Corridor (e.g., Jackson Township, Mather South, Newbridge). It is expected that the No Project Alternative would have less impact on transportation than the project.

Water Supply

Under the No Project Alternative, the potential for development of the plan area and corresponding water demand would be considerably reduced. Due to the reduced development footprint, the No Project Alternative would also result in less potential to affect groundwater recharge. Overall, the effect on water supply would be less than with implementation of the project.

Tribal Cultural Resources

Under the No Project Alternative, new ground disturbance would be largely concentrated in the area zoned for industrial uses, which is an area that has been largely disturbed by past mining activities. Overall, impacts on tribal cultural resources under the No Project Alternative would be less than under the project because less ground would be disturbed.



Alternative 2: Reduced Footprint Alternative

Alternative 2 would implement the same land use plan and policy framework as the WJHMP but would not include any land use changes east of Bradshaw Road and south of Jackson Highway. Removing approximately 2,000 acres in the southeast portion of the plan area would reduce the overall plan area by approximately 36 percent. See Figure 3-1. With this modification, most of the plan area that is currently designated for agricultural use would remain designated for agricultural use and all Prime Farmland in the plan area would be avoided. This alternative would also eliminate the potential for any direct impacts on Elder Creek. In total, Alternative 2 would eliminate approximately 42 acres of mixed use, 28 acres of commercial use, 37 acres of employment uses, 27 acres of high-density residential, and 463 acres of low-density residential. A 10-acre elementary school site would not be included and FPA C and most of FPA B would be outside of the plan area. The high school/middle school site would also be affected, and it is anticipated that the land use plan would have to be modified to accommodate the school within the remainder of the plan area. Because this alternative would reduce the overall disturbance and development footprint for the project, effects that are associated with ground disturbance (i.e., potential to encounter undocumented cultural resources) and effects inherent in the magnitude of the project (i.e., air quality impacts) would be reduced, although likely not to a less-than-significant level.

Alternative 2 would achieve most of the basic project objectives, including redeveloping mined properties formerly incompatible with development due to operation of Mather Air Force Base, providing a broad mix of needed housing in close proximity to existing and future job centers and supporting development that is located and designed to reduce per capita vehicle miles traveled and greenhouse gas emissions; creating a community with net zero greenhouse gas emissions, providing commercial and recreational services that are connected to and serve adjacent communities and a variety of land use types, and encouraging health and wellness by providing an extensive system of trails and parks that are distributed throughout the community and are within easy walking and biking distance of residents. The alternative would also meet project objectives related to sustainable design practices, community connectivity, and range of transportation choices, and would be consistent with the South Sacramento Habitat Conservation Plan (SSHCP).

Aesthetics

Alternative 2 would result in less development at the southeastern boundary of the plan area than the project. This could result in slightly less off-site lighting effects to the southeast of the plan area. However, like the project, this alternative would introduce a substantial amount of new lighting to an area that is currently rural and largely unlit. Although Alternative 2 would reduce the footprint of the plan area, it would also result in the near complete conversion of the remaining area from undeveloped rural land to a fully developed urban community, which would result in a permanent, substantial alteration to existing viewsheds within the area. Overall, impacts on the visual quality and character of the area would be less than those of the proposed project.

Source: Image produced and provided by Wood Rodgers in 2023, adapted by Ascent in 2024.

Figure 3-1 Cordova and Vineyard CPAC Growth Areas

Agricultural Resources

As described above, Alternative 2 removes most of the existing agricultural land and all of the land designated as Prime Farmland from the plan area. In addition, this alternative includes both portions of the plan that are designated for Open Space/Urban Farm and is assumed, for the purpose of this analysis, to provide this community resource as described for the project. As a result, the potential for the plan to result in the conversion of Farmland would be reduced. Alternative 2 would have less impact on agricultural resources than the proposed project.

Air Quality

Alternative 2 would generate lower air pollutant emissions (particulate matter and ozone precursors) because of continued agricultural activities and rural residential use of the majority of the plan area. This alternative would avoid project air quality impacts related to toxic air contaminants (TACs) and potential odor generation. The significant construction, operational, and cumulative air quality impacts identified for the project would not occur in the southeast portion of the plan area. Therefore, the air quality impacts of Alternative 2 would be less than those that would occur with the project.

Airport Compatibility

Alternative 2 would remove approximately 79 acres of low-density residential that is proposed within the 60-dB CNEL from the plan area. This would reduce the potential for future residents to be affected by airport-generated noise and improve alignment with the adopted land use plan for the airport. Impacts would be less than those anticipated with implementation of the project.

Biological Resources

Alternative 2 would not include the area east of Bradshaw Road and south of SR 16. This area has experienced less historical disturbance than the remainder of the plan area and provides most of the annual grassland habitat in the plan area. Therefore, this alternative would retain the grasslands, agricultural habitat, and trees in northeastern portion of the plan area that may support special-status plant and wildlife species known to occur in the region. In addition, the overall reduction in disturbance and loss of habitat would reduce impacts on species such as Swainson's hawk, Cooper's hawk, white-tailed kite, grasshopper sparrow, song sparrow (Modesto population), yellow-headed blackbird, northern harrier, and other special-status birds. In addition, Figure 8-2 in Chapter 8, "Biological Resources," identifies possible direct impacts to wetlands in this portion of the plan area. Impacts to biological resources from implementation of Alternative 2 would be less than those anticipated with implementation of the project.

Climate Change

Although Alternative 2 would reduce the project footprint, construction and operational GHG impacts are likely to be similar due to the size and scale of the overall development. Mitigation similar to that proposed for the project would be required to reduce emission to below Sacramento County's per capita thresholds of significance for residential and nonresidential development. The contribution to global climate change under Alternative 2 would be similar to that under the project.

Cultural Resources

Under Alternative 2, ground disturbance would occur only in the west and northeast portions of the plan area, which are areas that have been largely disturbed by past mining activities. Unevaluated cultural resources may still be encountered, but the potential to encounter resources would be reduced proportionately with the reduction in plan area. Overall, impacts on cultural resources under Alternative 2 would be less than under the project because less ground area would be disturbed.

Energy

Alternative 2 would include design features from the WJHMP document that would increase energy efficiency in the buildings and facilities when compared to development consistent with Alternative 2. This alternative would not result in the wasteful, inefficient, or unnecessary consumption of energy resources during construction or operation. This alternative would comply with the California Energy Code, and SMUD would comply the state's Renewable Portfolio Standard. As a result, this alternative would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. This impact would be similar to that of the project.

Geology, Soils, and Mineral Resources

Alternative 2 would remove roughly 2,000 acres from the plan area, which would result in reduced potential for erosion due to less ground disturbance. Development would be subject to the same regulations as the project, including the UBC and CBC, which would ensure the maximum necessary protection available for development within areas known to contain expansive soils.

The potential to encounter unanticipated paleontological resources would also be similar or slightly reduced, because the potential is associated with land disturbance. With the implementation of Mitigation Measures CR-2a and CR-2b, impacts would be reduced because construction workers and operational personnel would be alerted to the possibility of encountering paleontological resources and professionally-accepted and legally compliant procedures for the discovery of paleontological resources would be implemented in the event of a find. Because the area of disturbance would be reduced, the potential for impacts would also be less than for the project.

Hazards and Hazardous Materials

With the removal of approximately 2,000 acres from the plan area, Alternative 2 would result in less potential for ground disturbance than the project. However, the remainder of the plan area would remain subject to the potential for discovery of, and exposure to, contaminated soils and/or groundwater. Alternative 2 would be subject to the same strict regulations that control the transport, use, and disposal of hazardous materials, and would not result in the development of different types of land uses that would be subject to greater risk from accidental release than the project. Implementation of Mitigation Measures HAZ-2a and HAZ-2b would require further evaluation and characterization of the plan area.

The effects of Alternative 2 on emergency response and evacuation plans would be similar to the project because the basic roadway network would be substantially similar to the project and implementation would be phased so that the County's emergency planning could incorporate the growth in the plan area gradually. Overall impacts associated with Alternative 2 would be less than those of the project.

Hydrology, Drainage, and Water Quality

Alternative 2 would retain the amount of undeveloped land in the southeastern portion of the plan area, which would eliminate most effects within the Elder Creek watershed. Further, the main design features of the Drainage Plan that contribute to stormwater quality and hydromodification attenuation are proposed in the northeastern portion of the plan area along Morrison Creek and would not be affected.

Alternative 2 would occur in the same location as the plan area and would have a similar impact associated with the potential for flooding because of dam or levee failure due to recently completed flood protection projects and distance from dams and levees. Alternative 2 would be required to comply with the same stormwater quality regulations as the project. The effects on hydrology, drainage, and water quality would be less than those of the proposed project.

Land Use, Population, and Housing

Alternative 2 would also require expansion of the UPA and would include similar smart growth principles. By creating boundaries along major roadways, the alternative would provide a logical extension of the UPA and is anticipated to satisfy the requirements of General Plan Policy LU-120. Alternative 2 would eliminate approximately 42 acres of mixed use, 28 acres of commercial use, 37 acres of employment uses, 27 acres of high-density residential, and 463 acres of low-density residential. A 10-acre elementary school site would not be included and FPA C and most of FPA B would be outside of the plan area. The high school/middle school site would also be affected, and it is anticipated that the land use plan would have to be modified to accommodate the school within the remainder of the plan area. Like the project, Alternative 2 would not physically divide an established community, induce substantial population growth, or displace housing. Impacts would be similar to those of the project.

Noise

Alternative 2 would reduce the size of the plan area, but would include a similar mix and configuration of land uses in the western and northeastern portion of the plan. Similar to the project, sensitive receptors could be exposed to construction noise levels above the Sacramento County noise standards if development of land uses adjacent to the sensitive receptors were to occur during nighttime hours. Implementation of the noise control measures identified in Mitigation Measure NO-1 would substantially reduce construction noise levels and, subsequently, levels of annoyance and potential sleep disruption to occupants of nearby residential dwellings. Also similar to the project, vibration-inducing construction activity could occur within 550 feet or within 100 feet of sensitive land uses with new sensitive receptors, resulting in disturbance or possible structural damage. Mitigation Measure NO-2 would reduce potential impacts by

requiring minimum setbacks to sensitive land uses, impact monitoring during pile driving activity, use of alternative equipment when appropriate, and restrictions on hours of use to avoid annoyance to sensitive receptors. Similar to the project, new stationary noise sources would be at a distance at which noise levels from these sources would not exceed Sacramento County's exterior noise standard for daytime noise (i.e., 55 dBA) or nighttime noise (i.e., 50 dBA. Mitigation Measures NO-4a and NO-4b could reduce noise exposure to sensitive residents from industrial land uses). Overall, the noise and vibration effects of Alternative 2 would be similar to those of the project.

Public Services

The overall land uses proposed under Alternative 2 would be roughly the same as proposed for the project, and demand for public services would be generally consistent with the demand generated by the project, although reduced by approximately one-third. As described above, Alternative 2 would eliminate two school sites from the plan. It is anticipated that this would create an impact on school services unless the schools are accommodated within the revised land use plan. Loss of parkland would be roughly proportionate to the reduction in dwelling units and is not anticipated to substantially affect the provision of park services, although segments of the planned trail linkages would be lost. Impacts would be greater than those disclosed for the project.

Public Utilities

Alternative 2 would reduce the project's demand for public utilities. It also would result in slightly less development and would likely require slightly less wastewater treatment capacity than the project. The Sacramento Regional Wastewater Treatment Plant (SRWTP) would have adequate capacity to treat wastewater flows generated by future development. As identified above for the project, it is anticipated that Kiefer Landfill would have adequate capacity to accept waste generated by future development. Impacts on wastewater and solid waste service capacity would be less than those of the project.

Transportation

VMT is dependent on multiple, interrelated local and regional factors and includes consideration of data points such as the jobs/housing balance and availability of services. No VMT modeling of Alternative 2 was conducted; however, the VMT that would result from Alternative 2 could be similar at the programmatic level. The same general types and pattern of development would occur, although Alternative 2 would eliminate approximately 42 acres of mixed use, 28 acres of commercial use, 37 acres of employment uses, 27 acres of high-density residential, and 463 acres of low-density residential. As indicated above, the net effect of removing this mix of land uses from the plan area has not been modeled; however, the reduction in low-density residential may reduce VMT.

The alternative would also include the provision of new bicycle and pedestrian facilities throughout the reduced plan area, and between the plan area and other nearby land uses. However, as noted above, a substantial portion of the proposed trail system linkages would not be constructed. Sidewalks would be required as part of the frontage improvements along all new roadway construction in conformance with County design

standards. Like the project, Alternative 2 would be designed to meet all the design and safety standards established by the County, which requires coordination with Sacramento Metropolitan Fire District to ensure that the design of local roads will accommodate emergency vehicles. Adherence to these design standards would ensure that adequate site distances and access for vehicles entering and leaving the site is provided for safe travel. The transportation effects of this alternative would be similar to those of the project.

Water Supply

The overall level of development under Alternative 2 (and corresponding water demand) would be less than under the WJHMP. Alternative 2 would require less water in the Sacramento Water Agency's service area. Off-site and on-site infrastructure improvements are anticipated to be substantially the same as discussed for the project in Chapter 20, "Water Supply," because the extension of water services from the Vineyard treatment plant through this area would still be required. Implementation of planned off-site expansion projects would be conducted by the water purveyors and would be subject to separate environmental review and approval. Development of on-site water supply infrastructure would not result in utility-specific adverse physical impacts. Assuming that the area excluded from the plan area under this alternative remains in agricultural use, this alternative would improve the potential for groundwater recharge. Impacts on water supply would be less with implementation of Alternative 2 than with implementation of the project.

Tribal Cultural Resources

Under Alternative 2, ground disturbance would occur only in the west and northeast portions of the plan area, which are areas that have been largely disturbed by past mining activities. Unevaluated tribal cultural resources may still be encountered, but the potential to encounter resources would be reduced proportionately with the reduction in plan area. Overall, impacts on tribal cultural resources under Alternative 2 would be less than under the project because less ground area would be disturbed.

Alternative 3: Development of Reclamation Lands Alternative

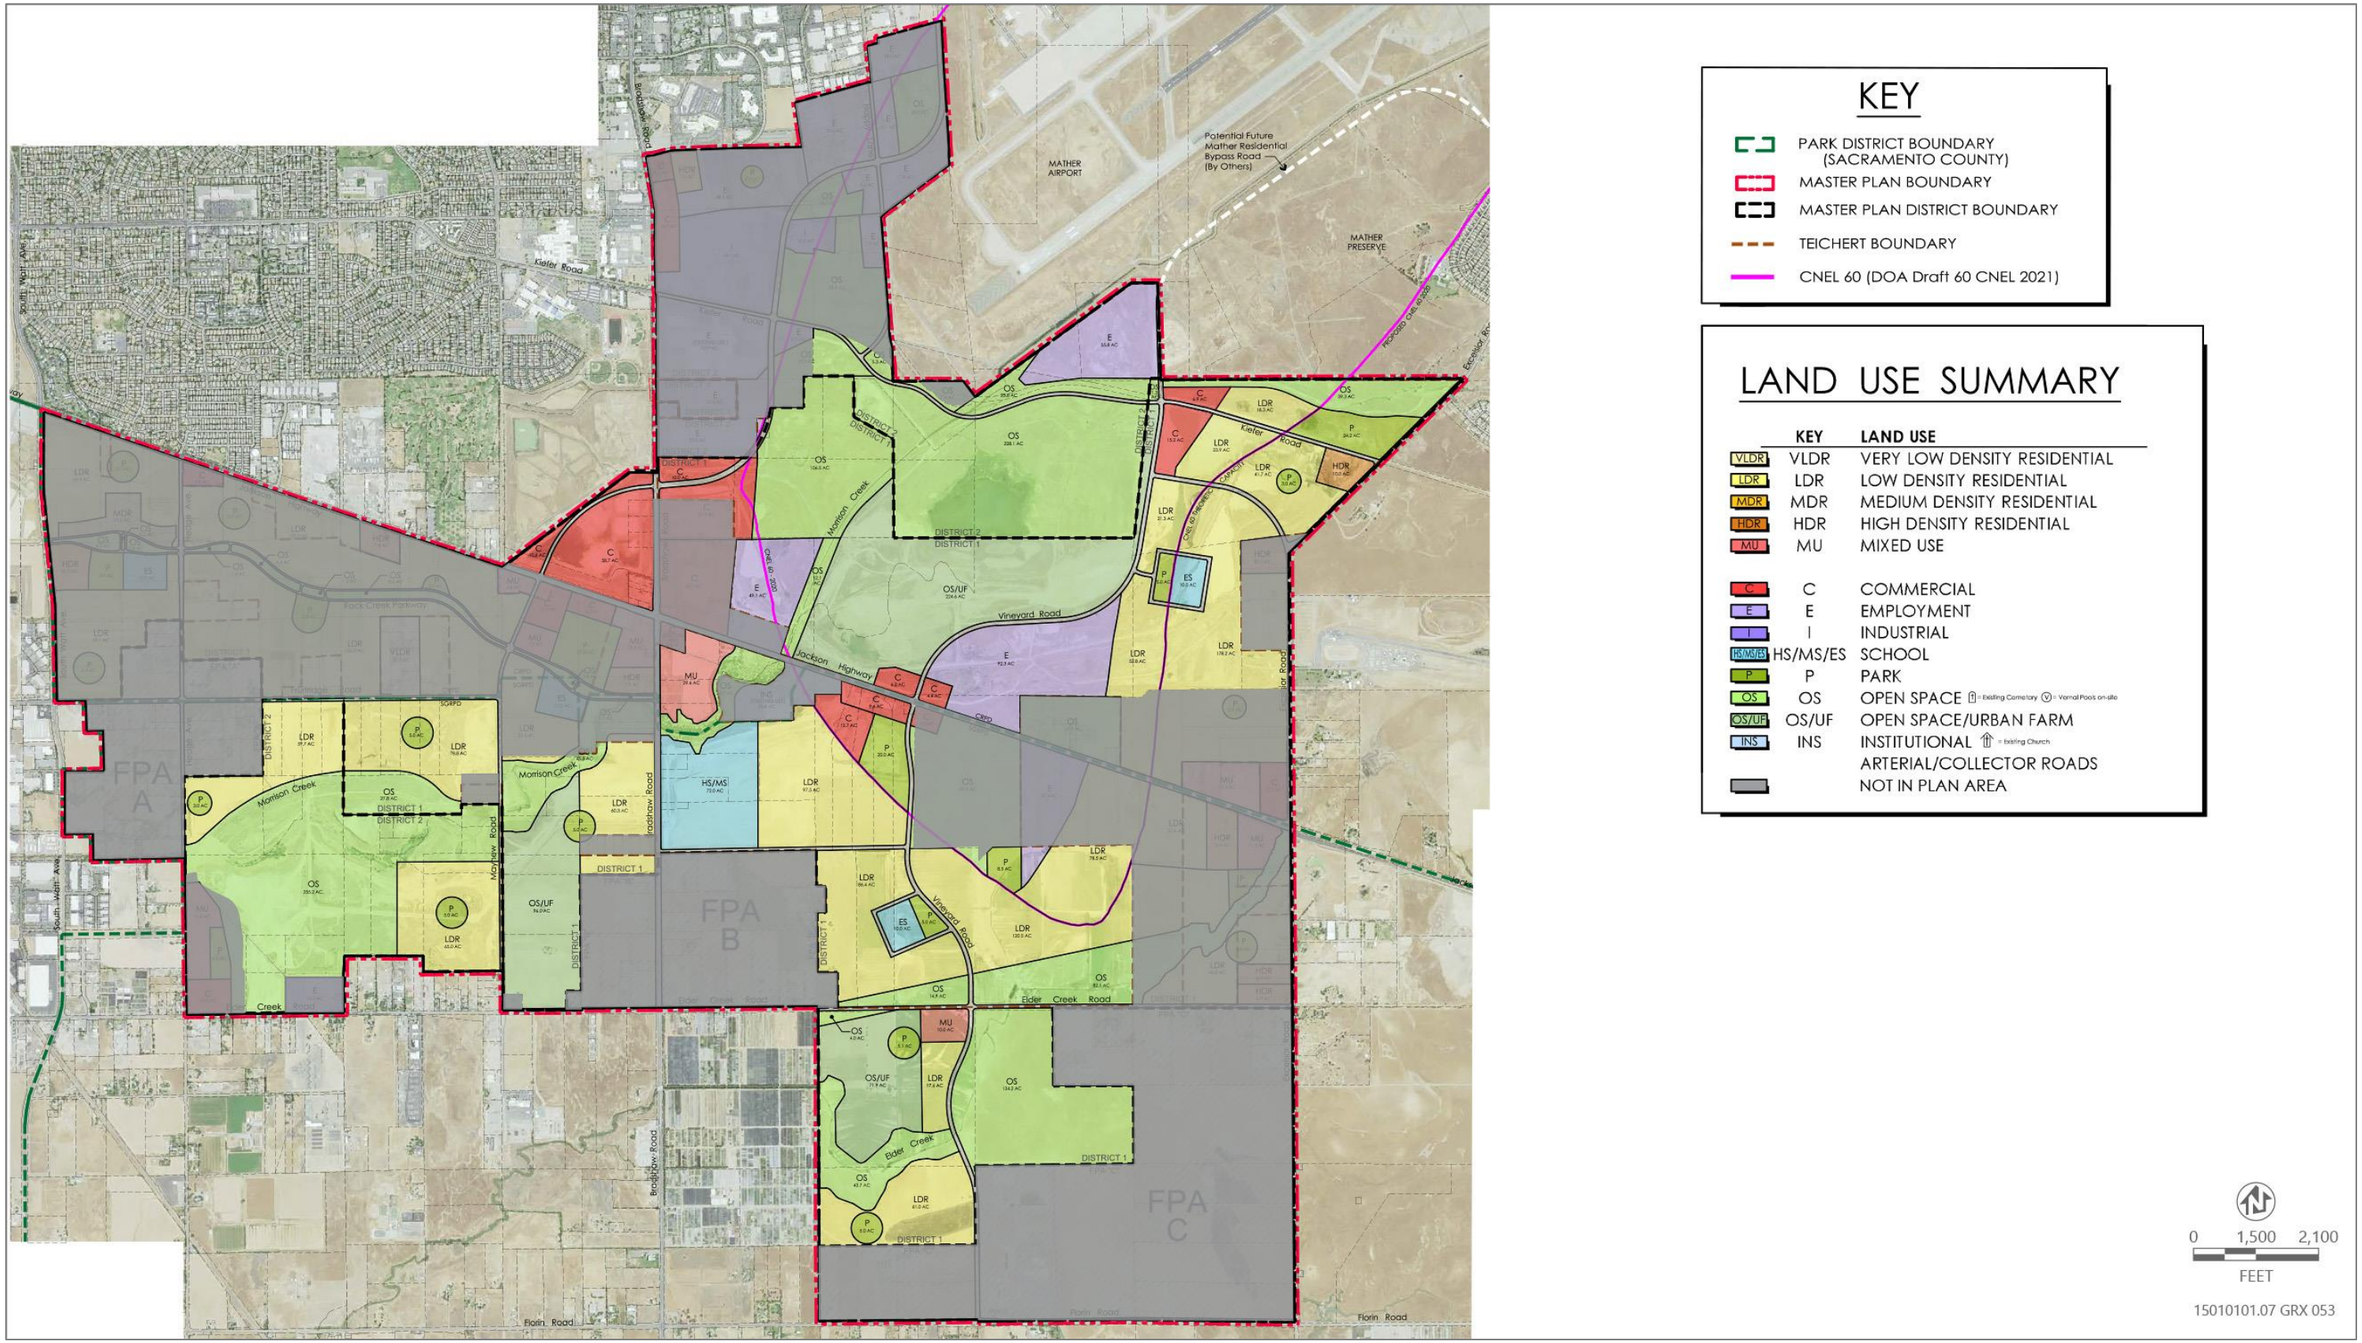
As described in Chapter 15, "Land Use, Population, and Housing," the properties owned by the Project Applicants primarily include aggregate mining sites used for sand and gravel extraction. Most of these sites have already been reclaimed and the remainder will be reclaimed following exhaustion of the valuable resources in the area. Although the reclamation process addresses general project conditions and requires actions to ensure that the mined property does not contribute to contamination through soil erosion or release of other media, mining generally results in degradation of the natural attributes of an area. As a result, development in these areas would have fewer effects on biological, cultural, and paleontological resources.

Alternative 3 would allow development to occur only on former mining sites that have been previously disturbed (see Figure 3-2) and would achieve the project objective of redeveloping former mine sites. Like Alternative 2, this alternative would limit the overall project footprint. The total developed area would be approximately 2,940 acres, or

roughly half of the proposed plan area. For the purpose of this evaluation, it is assumed that all of the mined areas would be designated for the same land use as proposed in the WJHMP. However, the open space areas (which are largely on previously mined sites) are assumed to be reduced to accommodate income-generating designations that accommodate housing, commercial, and industrial uses. In addition, the viability of programs to reduce per capita VMT and GHG emissions with the substantially reduced footprint is unknown. Therefore, it is possible that project objectives related to connectivity, SSHCP consistency, and net zero development could not be achieved by this alternative.

Aesthetics

Alternative 3 would generally concentrate development in the center of the plan area. This could result in slightly less off-site lighting effects to the southeast of the plan area. However, like the project, this alternative would introduce a substantial amount of new lighting to an area that is currently rural and largely unlit. Overall, impacts on the visual quality and character of the area would be less than those of the proposed project.



Agricultural Resources

Under Alternative 3, most of the existing agricultural land and all of the land designated as Prime Farmland would remain within the plan area. Nevertheless, the potential for the plan to result in the conversion of Farmland of Statewide Importance and Farmland of Local Importance would be reduced. Alternative 3 would have less impact on agricultural resources than would the proposed project.

Air Quality

Construction impacts are likely to be similar due to the size and scale of the development in Alternative 3. Application of Mitigation Measures AIR-1a and AIR-1b would be sufficient to reduce construction impacts to levels below Sacramento Metropolitan Air Quality Management District mass emissions thresholds. As identified for the project, implementation of Mitigation Measures AIR-2a through AIR-2f would reduce operational emissions. Alternative 3 would be beholden to the same air quality plans cited in the discussion of the project's consistency with applicable air quality plans.

Alternative 3 would result in fewer residences and other development, which would generate fewer additional daily trips than the project. Potential for adverse carbon monoxide impacts and TAC exposure impacts would be similar due to the size and scale of the overall development. Implementation of Mitigation Measures AIR-5a through AIR-5d would reduce potential TAC exposure by providing guidelines when siting sensitive land uses near land uses that could be sources of diesel particulate matter and TACs. Overall, the air quality impacts of Alternative 3 would be slightly less than those of the project.

Source: Image produced and provided by Wood Rodgers in 2023, adapted by Ascent in 2024.

Figure 3-2 Cordova and Vineyard Mined Areas

Airport Compatibility

Under Alternative 3, roughly half of the developable area would be in the northeast portion of the plan area that is closest to Mather Airport. Land use designations would be the same as those identified in the master plan. As a result, similar airport compatibility impacts would occur to those identified for the project.

Biological Resources

Alternative 3 would occur only on lands that have been previously mined and would remove many of the areas with the greatest habitat value from the plan area. Although the previously mined properties have been restored through the required mining reclamation process and do provide some habitat value (see Chapter 8, "Biological Resources"), overall impacts on biological resources would be reduced compared to those of the project due to the relative size of the plan area and the concentration of development on lands that have been previously disturbed.

Climate Change

Although Alternative 3 would reduce the project footprint, construction and operational GHG impacts are likely to be similar due to the size and scale of the overall development. Mitigation similar to that proposed for the project would be required to reduce emission to below Sacramento County's per capita thresholds of significance for residential and nonresidential development. However, as indicated above, the effectiveness of programs designed to reduce GHG emissions may be hampered by the layout of the plan area under Alternative 3 and could result in slightly greater impacts than those identified for the project.

Cultural Resources

Under Alternative 3, ground disturbance would occur in approximately the half of the plan area that has been largely disturbed by past mining activities. Unevaluated cultural resources may still be encountered, but the potential to encounter resources would be reduced proportionately with the reduction in plan area. Overall, impacts on cultural resources under Alternative 3 would be less than under the project because less ground area would be disturbed.

Energy

Alternative 3 would include design features from the WJHMP document that would result in energy efficiency in the buildings and facilities in the plan area. Alternative 3 would also include design features to reduce the project's anticipated annual VMT and, therefore, reduce transportation-related energy demand. This alternative would not result in the wasteful, inefficient, or unnecessary consumption of energy resources during construction or operation. This alternative would comply with the California Energy Code and SMUD would comply with the state's Renewable Portfolio Standard. As a result, this alternative would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. This impact would be similar to that of the project.

Geology, Soils, and Mineral Resources

As described for Alternative 2, Alternative 3 would result in reduced potential for erosion due to less ground disturbance. Development would be subject to the same regulations as the project, including the UBC and CBC, which would ensure the maximum necessary protection available for development within areas known to contain expansive soils.

The potential to encounter unanticipated paleontological resources would also be similar or slightly reduced, because the potential is associated with land disturbance. With the implementation of Mitigation Measures CR-2a and CR-2b, impacts would be reduced because construction workers and operational personnel would be alerted to the possibility of encountering paleontological resources and professionally-accepted and legally-compliant procedures for the discovery of paleontological resources would be implemented in the event of a find. Because the area of disturbance would be reduced, the potential for impacts would also be less than for the project.

Hazards and Hazardous Materials

With the removal of approximately half of the plan area and limiting the project to redevelopment of areas previously mined for aggregate resources, Alternative 3 would result in less potential for new ground disturbance that could encounter undocumented resources than the project. Alternative 3 would be subject to the same strict regulations that control the transport, use, and disposal of hazardous materials, and would not result in the development of different types of land uses that would be subject to greater risk from accidental release than would the project. Implementation of Mitigation Measures HAZ-2a and HAZ-2b would require further evaluation and characterization of the plan area.

The effects of Alternative 3 on emergency response and evacuation plans would be similar to those of the project. Although the comprehensive roadway network proposed in the WJHMP would likely not be developed, the mined areas are generally adjacent to major transportation corridors (i.e., SR 16, Bradshaw Road) that would continue to provide emergency access and evacuation routes. Overall impacts associated with Alternative 3 would be less than those of the project.

Hydrology, Drainage, and Water Quality

Alternative 3 would remove lands in the northwestern, northern, and southwestern corners of the plan area from the project. The proposed drainage along Rock Creek Parkway would not be constructed because it would be outside the previously mined areas included in the plan

Alternative 3 would occur in the same location as the plan area and would have a similar impact associated with the potential for flooding because of dam or levee failure due to recently completed flood protection projects and distance from dams and levees. Alternative 3 would be required to comply with the same stormwater quality regulations as the project. Both the Morrison and Elder Creek watersheds would be affected by this alternative; however, only of the drainage and stormwater improvements identified in

mined areas would be implemented. In addition, the layout and relationship of the previously mined areas would limit the potential for comprehensive planning of surface drainage, which may result in localized and off-site drainage effects. The effects on hydrology and water quality would be greater than those of the proposed project because the effective attenuation of flows may not occur, which could increase impacts associated with drainage and water quality.

Land Use, Population, and Housing

Alternative 3 would also require expansion of the UPA; however, the previously mined areas do not provide a logical boundary for urban development and are not anticipated to satisfy the requirements of General Plan Policy LU-120. Further, planning for intense development of residential uses in the center of the WJHMP area could induce unplanned growth on the surrounding properties (particularly in the north and northeast where incorporated cities are relatively close by). This could result in land use policy effects if regional infrastructure is not properly planned. Like the project, Alternative 3 would not physically divide an established community or displace housing. Due to potential conflicts with the County's growth management policies, land use impacts would be greater under Alternative 3 than under the project.

Noise

Alternative 3 would reduce the size of the plan area and would increase the interface between urban land use and agricultural and industrial uses of adjacent lands. Similar to the project, sensitive receptors could be exposed to construction noise levels above the Sacramento County noise standards if development of land uses adjacent to the sensitive receptors were to occur during nighttime hours. Implementation of the noise control measures identified in Mitigation Measure NO-1 would substantially reduce construction noise levels and, subsequently, levels of annoyance and potential sleep disruption to occupants of nearby residential dwellings. Also similar to the project, vibration-inducing construction activity could occur within 550 feet or within 100 feet of sensitive land uses with new sensitive receptors, resulting in disturbance or possible structural damage. Mitigation Measure NO-2 would reduce potential impacts by requiring minimum setbacks to sensitive land uses, impact monitoring during pile driving activity, use of alternative equipment when appropriate, and restrictions on hours of use to avoid annoyance to sensitive receptors. Finally, new stationary noise sources would be at a distance at which noise levels from these sources would not exceed Sacramento County's exterior noise standard for daytime noise (i.e., 55 dBA) or nighttime noise (i.e., 50 dBA). Mitigation Measures NO-4a and NO-4b could reduce noise exposure to sensitive residents from industrial land uses. In addition, because many of the previously mined are below the elevation of the surrounding land, the grade separation may provide a degree of noise attenuation to surrounding uses. Overall, the noise and vibration effects of Alternative 3 would be similar to those of the project.

Public Services

Alternative 3 would encompass roughly half of the plan area. Demand for public services, including police and fire protection, is anticipated to be reduced under Alternative 3 compared to the project. As described above, modifications to the

proposed land use plan would be anticipated under this alternative and schools and parks would need to be sited within the revised plan area. The County has not determined whether adequate land for the required school and park sites could be accommodated and an impact on school services and parkland could occur. Overall, there is a potential for greater impacts on public services under this alternative compared with the project.

Public Utilities

Alternative 3 would have a reduced demand for public utilities compared with the project. Alternative 3 would result in less development and would likely require slightly less wastewater treatment capacity than the project. The SRWTP would have adequate capacity to treat wastewater flows generated by future development. As identified above for the project, it is anticipated that Kiefer Landfill would have adequate capacity to accept waste generated by future development. Impacts on wastewater and solid waste service capacity would be less under this alternative than under the project.

Transportation

VMT is dependent on multiple, interrelated local and regional factors and includes consideration of data points such as the jobs/housing balance and availability of services. Although overall VMT generation may be reduced under this alternative due to the reduction in plan area size, Alternative 3 would likely increase VMT generation per acre because complementary uses and programs that reduce VMT and are included in the project may not be feasible under this alternative due to the size and layout of the previously mined properties. The alternative would also include the provision of new bicycle and pedestrian facilities throughout the plan area, and between the plan area and other nearby land uses. Sidewalks would be required as part of the frontage improvements along all new roadway construction in conformance with County design standards. Like the project, Alternative 3 would be designed to meet all the design and safety standards established by the County, which requires coordination with Sacramento Metropolitan Fire District to ensure that the design of local roads will accommodate emergency vehicles. Adherence to these design standards would ensure that adequate site distances and access for vehicles entering and leaving the site is provided for safe travel. The transportation effects of this alternative would be similar to those of the project.

Water Supply

The overall level of development under Alternative 3 (and corresponding water demand) would be less than under the WJHMP. Off-site and on-site infrastructure improvements are anticipated to be substantially the same as discussed for the project in Chapter 20, “Water Supply.” Implementation of planned off-site expansion projects would be conducted by the water purveyors and would be subject to separate environmental review and approval. Assuming that the area excluded from the plan area under this alternative remains in agricultural use, this alternative would improve potential for groundwater recharge. Impacts on water supply would be less under Alternative 3 than under the project.

TRIBAL CULTURAL RESOURCES

Under Alternative 3, ground disturbance would occur in approximately the half of the plan area that has been largely disturbed by past mining activities. Unevaluated tribal cultural resources may still be encountered, but the potential to encounter resources would be reduced proportionately with the reduction in plan area. Overall, impacts on tribal cultural resources under Alternative 3 would be less than under the project because less ground area would be disturbed.

ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Table 3-1 summarizes the significance conclusions reached for impacts on the resources evaluated in Chapters 4–20 of this EIR.

As indicated above, the No Project Alternative would reduce or result in similar impacts on all resource areas. As a result, this alternative would be environmentally superior. However, State CEQA Guidelines Section 15126.6(e)(2) requires that if an EIR determines that the No Project Alternative is environmentally superior to the project, the EIR must identify an environmentally superior alternative from among the other alternatives considered.

Based on potential to reduce impacts, the Reduced Footprint Alternative (Alternative 2) would be environmentally superior. In addition, as discussed above, this alternative would meet most of the basic objectives of the project.

Table 3-1 Summary of Environmental Effects of the Alternatives Relative to the Proposed Project

Environmental Topic	Proposed WJHMP	Alternative 1: No Project	Alternative 2: Reduced Footprint Alternative	Alternative 3: Development of Reclamation Lands Alternative

4 AESTHETICS

INTRODUCTION

This chapter addresses aesthetics and visual quality issues related to the development of the plan area. This chapter also documents existing aesthetic and visual resources of the plan area, presents standards to judge visual sensitivity, and addresses relevant scenic resource issues. No comments regarding aesthetics, lighting, or visual character were received in response to the notice of preparation.

ENVIRONMENTAL SETTING

VISUAL CHARACTER OF REGION

Sacramento County lies near the center of California's Central Valley, at the southern end of the Sacramento Valley. Open space views within the valley region are generally characterized by broad sweeping panoramas of flat agricultural lands and open space dotted with trees, divided by numerous rivers and creeks. To the east, the Sierra Nevada and their foothills are visible in the background, and the Coast Range provides a backdrop on the western horizon.

VISUAL CHARACTER

From the perspective of travelers on roadways adjacent to mining excavation areas within the plan area, the roadway frontage is dominated by fencing and landscaping comprised of trees and shrubs used to screen mining sites. Drivers see security fencing and landscaping along long stretches of Jackson Highway, South Watt Avenue, Bradshaw Road, Hedge Road, and Fruitridge Road. The character is rural, and grasslands used for grazing land and agriculture dominate the views. In areas not impacted by mining activity, travelers see grassland areas. Houses on 1 to 10- acre lots are interspersed among the mining sites and grasslands along the major roadways. Most of the businesses are along Jackson Highway, including storage yards with sand and gravel or rental equipment can be seen from the roadway. There are large overhead transmission towers in the southwestern and southeastern portions of the plan area.

The visual character of the properties to the east and south consist of flat open fields intermixed with limited residential and commercial development. Mather Airport is located to the north of the plan area and the runways and associated buildings are visible from the northernmost portions of the plan area. To the west is the Aspen 1 mining site with landscaping along South Watt Avenue and an industrial business park area in the city of Sacramento. To the northwest is the existing community of Rosemont which is comprised of predominately single-family homes.

Scenic Views and Resources

The plan area is generally flat, with depressed pockets where aggregate extraction has lowered parcels elevations. The plan area does not contain scenic resources such as trees, rock outcroppings, and historic buildings that act as the focal point of a viewshed and are usually foreground elements.

Scenic vistas are elements of the broader viewshed such as mountain ranges, valleys, and ridgelines that possess visual and aesthetic qualities of high value to the community. They are usually middle ground or background elements of a viewshed that can be seen from a range of viewpoints, often along a roadway or other corridor. Distant views of the Sierra Nevada, the Coast Range, Mount Diablo, and the Sutter Buttes can be visible under clear conditions and are also considered part of the county's visual heritage (Sacramento County 2010). Views of the Sierra Nevada mountain range, which is visible from the plan area, is an important scenic vista in the area. However, no designated scenic vistas are located within the plan area.

The County General Plan designates scenic corridors within the county. These corridors include River Road, Isleton Road, Garden Highway, Scott Road (from White Rock Road south to Latrobe Road), Latrobe Road, Michigan Bar Road, and Twin Cities Road (from State Route 160 east to Highway 99). SR160/River Road from the Contra Costa County line to the southern city limit of Sacramento is a state designated scenic highway (Sacramento County 2010). There are no county-designated scenic corridors within or adjacent to the plan area.

Light and Glare Sources

The unincorporated rural and agricultural areas of the county, which includes the plan area, are sparsely developed and used for agriculture. These rural land uses typically do not generate substantial amounts of glare, lighting, or illumination, and the ambient nighttime lighting and illumination levels are very low. Mobile light sources are generated by vehicles traveling on roadways.

Regulatory Setting

State

California Scenic Highway Program

California's Scenic Highway Program was created by the California Legislature in 1963 and is managed by the California Department of Transportation (Caltrans). The goal of this program is to preserve and protect scenic highway corridors from changes that would affect the aesthetic value of the land adjacent to highways. A highway may be eligible or officially designated "scenic" depending on how much of the natural landscape travelers can see, the scenic quality of the landscape, and the extent to which development intrudes on travelers' enjoyment of the view. There are no designated scenic highways in the immediate vicinity of the plan area (Caltrans 2023).

NIGHTTIME SKY – TITLE 24 OUTDOOR LIGHTING STANDARDS

The California legislature passed a bill in 2001 requiring the California Energy Commission (CEC) to adopt energy efficiency standards for outdoor lighting for both the public and private sectors. In addition to improved energy efficiency standards, Title 24 standards regulate lighting characteristics such as maximum power and brightness, shielding, and sensor controls to turn lighting on and off. Different lighting standards are set by classifying areas by lighting zone. The classification is based on population figures of the 2010 Census. Areas can be designated as one of three lighting zones (LZs): LZ1 (dark), LZ2 (rural), or LZ3 (urban). Lighting requirements for dark and rural areas are stricter in order to protect the areas from new sources of light pollution and light trespass. Sacramento County Code designates the plan area as LZ2 in conformance with Title 24 zoning rules.

LOCAL

SACRAMENTO COUNTY 2030 GENERAL PLAN

The following 2030 General Plan policies are applicable to the project.

- **Policy LU-16.** Apply the "Community Design Guidelines" and design review authority to all long-range planning efforts, including but not limited to Specific Plans, Comprehensive Plans, Community Plans, and Commercial Corridor Plans.
- **Policy LU-17.** Support implementation of the design review program on a project-by-project basis to ensure that all development applications positively contribute to the immediate neighborhood and the surrounding community.
- **Policy LU-18.** Encourage development that complements the aesthetic style and character of existing development nearby to help build a cohesive identity for the area.
- **Policy LU-19.** Incompatible land uses should be buffered from one another by methods that retain community character, and do not consume large land areas or create pedestrian barriers.
- **Policy LU-20.** Planning processes for existing communities, commercial corridors and new growth areas shall provide for distinct and identifying physical elements, which may include: gateways, signage, public art, common site or street layout, shared design qualities of buildings or infrastructure, or prominent landmarks or destinations.
- **Policy LU-21.** Promote a better balance of employment, neighborhood services, and different housing types by reviewing development projects and the surrounding community and designing new projects wherever feasible so that they maintain or improve the mix of uses in the community.
- **Policy LU-23.** Providing compact, mixed use developments shall be an integral part of all master planning efforts for new growth areas and commercial corridors.

- **Policy LU-24.** Support private development requests that propose pedestrian- and transit-friendly mixed use projects in commercial corridors, town centers, and near existing or proposed transit stops.
- **Policy LU-94.** Use design review to ensure that new commercial and residential development projects are designed to be compatible with existing neighborhoods and improve quality of life.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community Plans relevant to the WJHMP are the Cordova Community Plan and the Vineyard Community Plan.

Cordova Community Plan

The Cordova Community Plan does not contain specific policies related to aesthetics.

Vineyard Community Plan

The Vineyard Community Plan does not contain specific policies related to aesthetics.

Sacramento County Zoning Code

Title 1 (General Provisions) of the Zoning Code contains standards requiring that illumination of buildings, landscaping, signs, and parking and loading areas be shielded and directed so that no light trespasses onto adjacent properties. Title III (Use Regulations and Development Standards) requires that lighting shall be directed away from residential areas and public streets so that glare is not produced that could impact the general safety of vehicular traffic and the privacy and well-being of residents.

Significance Criteria and Methodology

Significance Criteria

An aesthetics impact would be significant if implementation of the project would:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway;
- Substantially degrade the existing visual character or quality of public views of the plan area and its surroundings; and/or
- Create a new substantial source of light and glare, which would adversely affect day or nighttime views in the area.

Issues Not Discussed Further

Substantial Adverse Effects on Scenic Vistas

A scenic vista is generally considered to be a location from which the public can experience unique and exemplary high-quality views—typically from elevated vantage points that offer panoramic views of great breadth and depth. The primary visual character of the site is that of undeveloped flat grasslands and mining excavations, with rural residences and limited development – including the existing racetrack. Views of the plan area are not unique in the eastern portion of the county and do not constitute a scenic vista. Impacts to scenic vistas are not discussed further in this EIR.

Substantial Adverse Effects on Scenic Resources within a State Scenic Highway

The plan area is not visible from a designated state scenic highway or county scenic corridor (Caltrans 2023). Therefore, the project would not result in damage to scenic resources within view of a state scenic highway or locally designated roadways. Impacts related to state scenic highways or county scenic roads would not occur and are not discussed further in this EIR.

Methodology

The US Department of Transportation, Federal Highway Administration (FHWA) developed a manual to aid in the preparation of visual assessments for highway projects. Although the project does not propose a highway, the key concepts established by FHWA apply to all visual settings and were used to help evaluate the visual character and quality of the region and the plan area. Many of these same key concepts are used to evaluate aesthetics in many contexts, including artistic compositions, architecture, and residential landscaping design. For the purposes of landscapes, the concepts of vividness, intactness, and unity define visual quality. Definitions of key terms and the project impacts to visual quality and character are described below.

- *Vividness* is a measure of the visual impression that remains in the memory of the viewer (e.g. Niagara Falls). Vivid visual experiences are striking and distinctive.
- *Intactness* is the visual integrity of the natural and built landscape. This represents the degree to which past or present actions within the viewshed have noticeably and unfavorably changed the view by introducing features which are incompatible or incongruent with the overall character of the viewshed.
- *Unity* refers to the pattern formed by connected landscape elements. A high degree of unity creates a harmonious visual pattern. This differs from “congruence” in that “unity” describes whether or not the combined visual elements within a viewshed have a noticeable pattern and cohesive composition, while “congruence” focuses on comparing individual elements. For instance, a cellular tower and a large industrial building would be consistent in character (congruent), but have very different shapes, massing, and overall appearance (not unified).

Visual character is derived from visual pattern elements and their dominance, scale (apparent size relationship), diversity, and/or continuity (uninterrupted flow of patterns). Visual pattern elements include form (visual mass or shape), line (silhouette), color, and texture (apparent coarseness). Although visual character and quality can be described objectively, there is no established official process that will identify all areas of high visual quality. Therefore, visual quality is often defined in part by viewer sensitivity. Viewer sensitivity is defined using the following criteria:

- visibility of resources in the landscape,
- proximity of viewers to the visual resource,
- elevation of viewers relative to the visual resource,
- frequency and duration of views,
- number of viewers, and
- types and expectations of individuals and viewer groups.

Viewer Groups

The visual experience is a combination of visual resources and viewer response. Different viewer groups respond differently to visual environments. The opinions or preferences of different groups depend on viewer activity and awareness, local values, and the cultural significance of the visual resources. Viewer activity affects the viewers' ability to perceive the landscape. Depending on the activity, a viewer may be attracted or distracted from the landscape. For example, a person reclining in a backyard ("Resident") or sitting on a bench will be encouraged to view the landscape, whereas a person driving along a road ("Motorist") on an errand will be distracted from the landscape and concentrate more on the road itself.

Viewer awareness also affects the viewer's receptivity to the landscape. Viewer awareness is affected by position, preconceptions, and recent visual experience. If viewer sensitivity is very high, any visible change in the area may be perceived as a negative effect. Typically, residents and recreational viewer groups are especially concerned about the appearance of their visual environment because their viewing experience is more than merely transitory. Perceived adverse visual impacts associated with a project typically occur not because of the quality of the project in question, but rather because of the substantial change in the nature of the view. Many viewers value undisturbed open space views much more highly than views of urbanized or developed property, however well-designed and visually balanced the development may be.

The following groups are likely to have views of the plan area: motorists on local roadways and residents of adjacent communities, including Rosemont and Independence at Mather. The visual character and availability of site views are similar from all viewing locations.

Impact Quantification Methodology

The FHWA guidance manual contains a numeric formula to quantify the change in visual quality. Each of the three primary characteristics (vividness, intactness, and unity) is given a numeric rating between 1 and 7 (from very low to very high). The following formula is then applied: (Vividness + Intactness + Unity)/3. The numeric difference between the existing visual quality and the proposed visual quality is a representation of the impact to a project site. Table 4-1 provides a basic explanation of some (not all) factors to take into account when applying the scale.

The perceived impact to the quality of a view is not a strict linear function. If a project resulted in a decrease of 2 points of visual quality, the degree to which viewers would be affected by that decrease would depend on the initial quality of the site. When a site is considered of high visual quality, even small decreases in the quality are much more noticeable and remarked on. However, when a site is only of moderate or low visual quality, observers do not tend to be as affected by the change. The significance of a decrease in visual quality will also depend on how often and for how long the site will be viewed.

Table 4-1 Evaluation Scale

Scale	Vividness	Human-made development	Encroachments or Eyesores	Unity/Intactness
7	Very High	None	None	Very High
6	High	Little	Few	High
5	Moderately High	Some	Some	Moderately High
4	Average	Average	Average	Average
3	Moderately Low	Moderately High	Several	Moderately Low
2	Low	High	Many	Low
1	Very Low	Very High	Very Many	Very Low

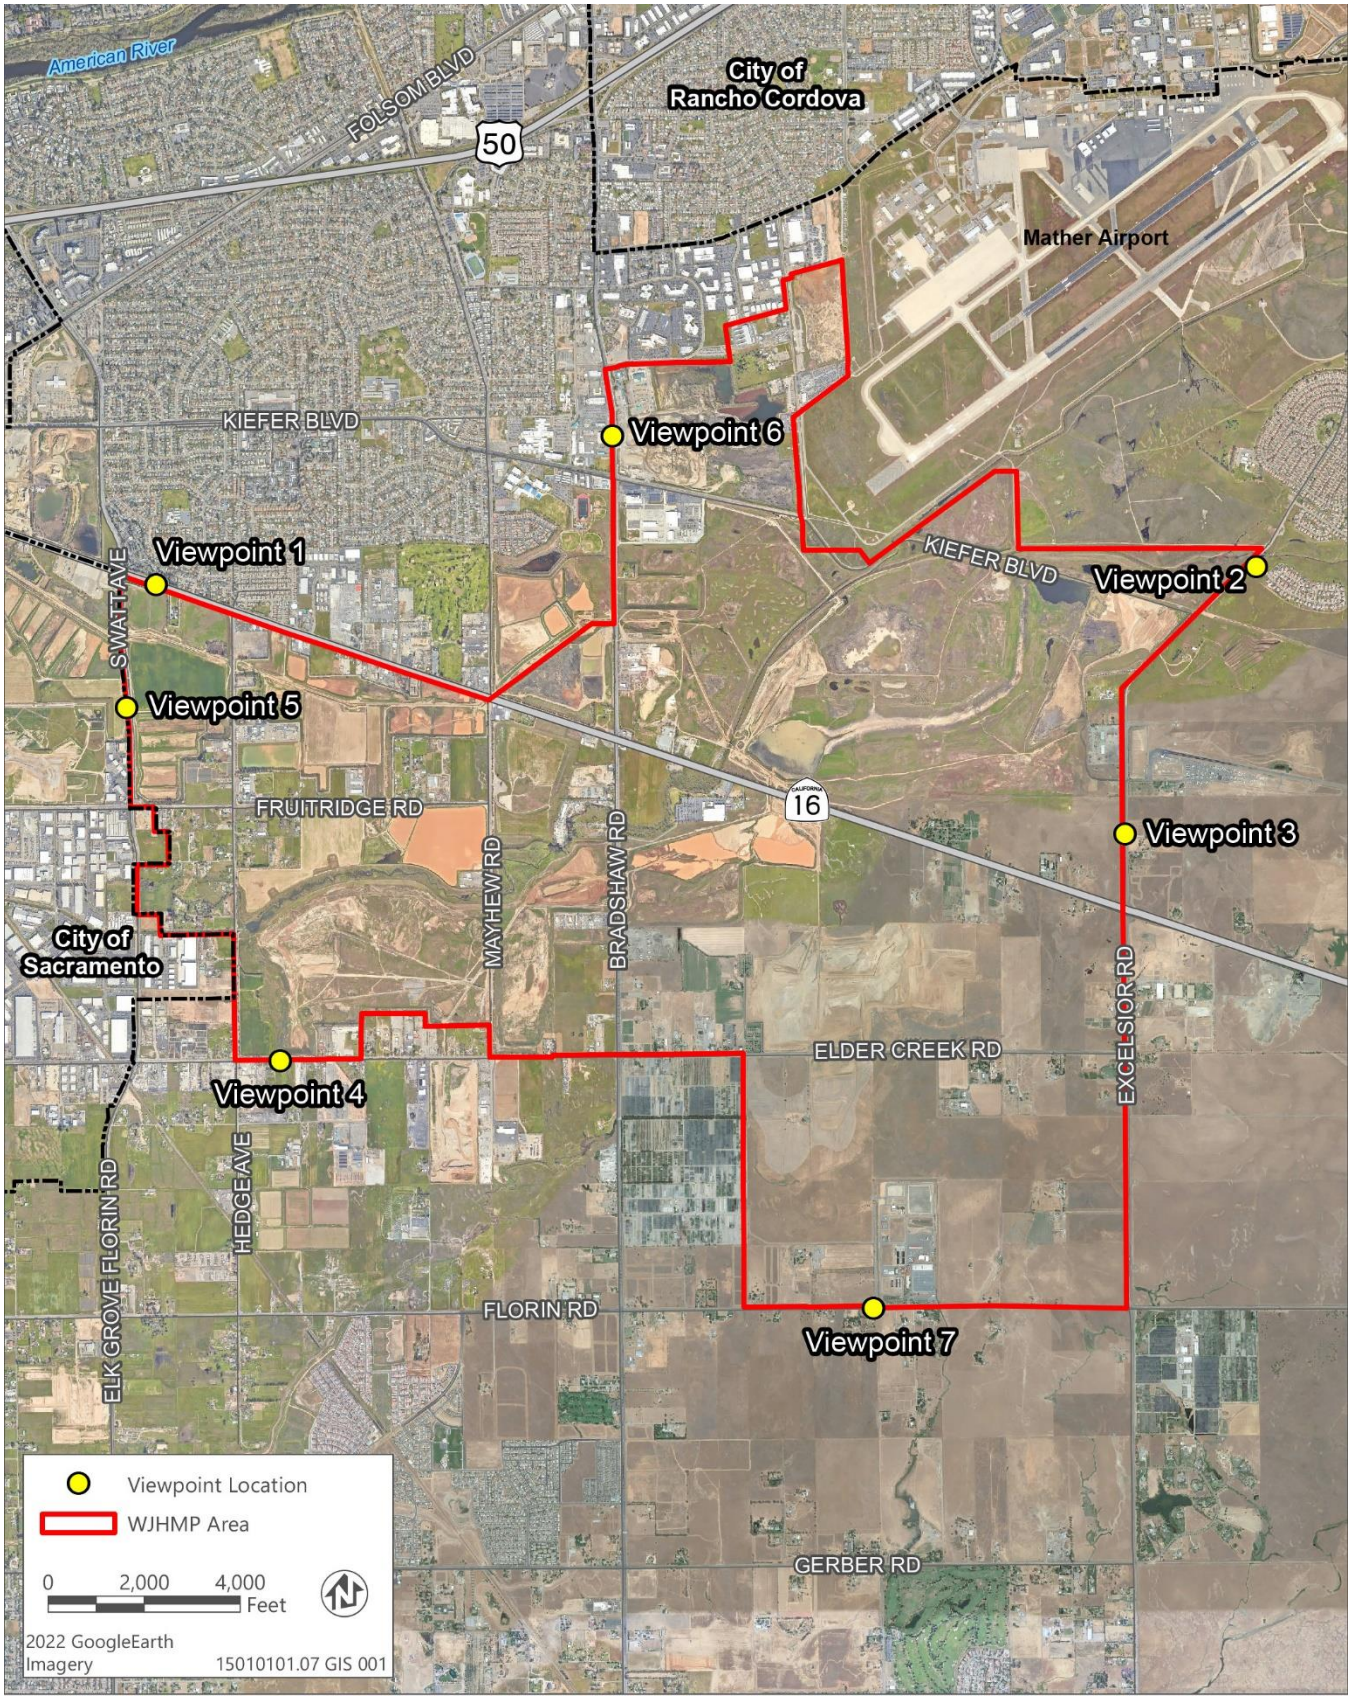
Representative Viewpoints



For the purpose of the following analysis, seven viewpoints were identified that represent predominate public views of the plan area (Figure 4-1):

- Viewpoint 1: Jackson Highway (near South Watt Avenue) looking east and west. This represents typical views along the most heavily traveled thoroughfare in the plan area (Figures 4-2a and 4-2b).
- Viewpoint 2: Excelsior Road looking southwest, representing the closest point of the Independence at Mather residential community (Figure 4-2c).
- Viewpoint 3: Excelsior Road looking west, representing the rural landscape of the plan area (Figure 4-2d).
- Viewpoint 4: Elder Creek Road looking north, representing open grasslands and mining areas from rural residences (Figure 4-2e).
- Viewpoint 5: South Watt Avenue looking north and south, representing an existing mining area near the western boundary of the plan area that is screened by motorists as a result of thick vegetation (Figures 4-2f and 4-2g).
- Viewpoint 6: Bradshaw Road looking north and south, representing an existing mining area in the northern boundary of the plan area that is screened by motorists as a result of thick vegetation (Figures 4-2h and 4-2i).
- Viewpoint 7: Florin Road looking north, representing rural residential near the southern boundary of the plan area (Figure 4-2j).

West Jackson Highway Master Policies

The WJHMP includes the following policies related to aesthetics.

- **Policy 6.22.** Trees, shrubs and other landscape elements may be used to create a shaded environment that will act as a visually attractive background for neighbors that will be located below grade. This will also provide an appealing and shaded environment for those using slope roadways, trails, and connections.
- **Policy 6.27.** A tree planting plan shall accompany all tentative map applications and can be provided in the form of a conceptual landscape plan.
- **Policy 6.28.** Conceptual landscape plans required as part of Policy 6.27 shall be implemented through the use of landscape drawings for street trees that are reviewed and approved through the improvement plan process. Street tree plantings shall consider and detail the use of appropriate street tree species for the Sacramento region and take into account tree size, spacing, water use, and potential utility conflicts at maturity.

IMPACTS AND ANALYSIS

IMPACT AE-1: DEGRADATION OF EXISTING CHARACTER OR QUALITY OF PUBLIC VIEWS OF THE PLAN AREA AND ITS SURROUNDINGS

JACKSON HIGHWAY VIEWER GROUP (VIEWPOINT 1)

Near this viewpoint there are residences on the north side of Jackson Highway that potentially have views into the plan area. However, dense landscaping along the north side of the roadway has blocked views into the plan area for many of the residents. Also, some multifamily residences near the Jackson Highway/South Watt Avenue intersection are set back from the roadway. For this reason, the major viewer group for Viewpoint 1 is travelers along Jackson Highway, with a high rate of travel that limits the duration of the motorists' views of the plan area.

From this viewpoint, views of the plan area are obscured by trees, shrubs, a man-made berm, and chain link fencing along Jackson Highway. There are also utility poles and overhead electric wires along the roadway that detract from the view of the sky. Visual breaks in the screen landscaping and fencing show a background landscape that has been extensively modified by human activity. There are visible mining floors and slopes in the background landscape, but yellow and green grasses have softened these features. Trees and transmission towers can also be seen in the distance.

The foreground of screen trees and shrubs provides a certain amount of unity for this view. However, the chain link fence, utility pole and overhead electric wires detract from the view's intactness because of their incongruence with the screen landscaping. These man-made features are straight and angular while the landscaping has curves and generally round shapes. Existing condition vividness is rated 2 (low), unity is rated 3 (moderately low), and intactness is rated 2 (low), for an average rating of 2 (low).

The project would improve the visual quality and characteristics of this view by providing street trees, decorative trees and shrubs that contribute to a cohesive and unified landscape design, and by removing the chain link fence, utility poles and overhead wires. The grasses in the background view would be replaced by rooftops and trees that are located 20 to 25 feet below the elevation of the viewpoint. Due to the lack of hills in this portion of the unincorporated county, this view of rooftops and trees (and lighting during night) from a higher elevation would be unique for this area. With project buildout, vividness would be rated 4 (average), while unity would be rated 5 (moderately high), and intactness would be rated 4 (average), for an average rating of 4 (average). Because the existing view from this viewpoint has low visual quality, changes that the project would make to this viewshed would have minimal effect on the viewer group.

Independence at Mather Viewer Group (Viewpoint 2)

The primary viewer group for this viewpoint is motorists on Excelsior Road, with a rate of travel that limits motorists' views of the plan area. The views from Excelsior Road include green and yellow grassland on slightly rolling hills with trees planted at regular intervals along the roadway in the foreground and scattered trees in the background. In the foreground there is a chain link security fence running parallel to Excelsior Road, but this fence does not detract from the visual attractiveness of the view because it is 25 to 30 feet from the roadway. In the background, transmission line towers can be seen in the distance. The towers and security fence do not dominate the viewshed because the towers and the fence's posts are quite narrow and spaced far apart and are a small portion of the entire viewshed.

The primary visual breaks in this view are the street trees, the chain link fence and the transmission towers. Nonetheless, the overall impression is still one of openness and continuity; the views are highly intact – meaning that there are few unattractive or negative encroachments in the view. Drivers pass by the site quickly and their focus is on the roadway and the periphery, so it is doubtful that most drivers notice the towers or the chain link fence as they pass. The grasslands appear to continue unbroken into the horizon. Though unified and intact, the uniformity of the view means that it is not particularly vivid. One cannot distinguish the plan area from the surrounding grasslands – there is nothing particularly memorable or striking. Existing condition vividness is rated 2 (low), while unity and intactness are rated 6 (high), for an average rating of 5 (moderately high).

The project would remove the illusion of continuity – that is, the illusion that the grasslands continue unbroken up into the horizon – both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The project would introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously uniform. Though this will increase the diversity of the view, the loss of continuity and the sense of open space have the potential to significantly and negatively impact the quality of the views. However, the completed project would provide landscaping along Excelsior Road. Due to these decorative features, project condition vividness would be rated 5 (moderately high), intactness would be rated 4 (average), and unity would be rated 2 (low), for an average rating of 3 (moderately low).

Excelsior Road Viewer Group (Viewpoint 3)

In the existing condition, the views from residences along Excelsior Road east of the plan area include flat and open grassland against the backdrop of scattered trees and white buildings in the distance. The primary visual break in the landscape is a cluster of trees at a church site. This collection of trees is particularly dominant in the landscape during the late summer because the trees are tall, dark green, and rough-textured while the majority of the viewshed is taken up by smooth-textured, low-profile, and wheat-colored grasslands. During the winter the contrast is not as high and, thus, the trees are not as dominant. The grouping of trees detracts from the visual quality and character of the view because they are so unique and dominant in the landscape that they are not unified with the rest of the view. The trees draw the eye of the viewer somewhat away from the whole.

The landscape in this view gives an overall impression of openness and continuity but the intactness is broken up by some man-made features. The view includes overhead transmission lines that run parallel with the roadway. The higher wires are thin and light colored and, thus, their visual impact is minimal, but the lowest wire is thick and black and very visible to residences at this viewpoint. This transmission line directs the eyes of the observer away from the landscape to the thick and black wire. However, long-time residents who live at this viewpoint may no longer be aware of the transmission lines. They may be acclimated to the overhead lines just as those who live near an airport get acclimated to airplane noise. Other encroachments include some fencing in the grassland, utility poles along the roadway, and the road itself.

Though the landscape in this view is unified and intact (if one ignores the transmission lines and utility poles), one cannot distinguish the plan area from the surrounding grasslands – there is nothing particularly memorable or striking. Existing condition vividness is rated 2 (low), while unity and intactness are both rated 6 (high), for an average rating of 5 (moderately high). These scores are assuming that the residents have become acclimated to the overhead wires.

The project would introduce hard, angled shapes into an area that previously appeared smooth, and would introduce a wider array of color into an area that was previously quite uniform. Though this would increase the diversity of the view, the loss of continuity and the sense of open space have the potential to significantly and negatively impact the quality of the views. However, the project landscaping along Excelsior Road would give an element of unity to the view, which is typical of landscape plans designed by landscape architects. Project condition vividness would be rated 5 (moderately high), intactness would be rated 1 (very low), and unity would be rated 2 (low), for an average rating of 3 (moderately low).

This viewer group is anticipated to be sensitive to any changes the project makes to the viewshed, even with the continued presence of the transmission lines. There are three reasons for this sensitivity: in the existing condition the entire site is visible, the viewers are relatively close to the site, and the viewpoints are from residences. Residents usually consider the surrounding views to be part of their property and are thus more protective of existing scenic views. Residents also observe views for much longer periods of time, and during times of relaxation and enjoyment when scenic resources are typically more appreciated. However, as noted above, the evaluation of environmental effects in non-urbanized areas under CEQA is focused on public views of the plan area and surroundings.

ELDER CREEK ROAD VIEWER GROUP (VIEWPOINT 4)

In the existing condition, the viewshed from residences along Elder Creek Road south of the plan area include shrubs, chain-link security fence, utility poles and overhead lines in the foreground and a landscape of flat open grassland and distant clusters of trees in the background. A portion of the grassland has been cleared by tractors with exposed dirt that is visible to the residences. The visual extent of this grassland is not limitless – as one travels a short distance eastward on Elder Creek Road, the landscape alters significantly to become the jagged slopes and flat floors of a mining excavation pit. There is nothing memorable or striking in this view as open grasslands and mining areas are common sights in the plan area.

Looking northwestward from the viewpoint, the grassland and trees give an overall impression of openness and continuity which contribute to the unity of the view. However, this overall impression is lost when one looks in a different direction from the viewpoint (northeastward) where the landscape of flat grassland and trees gives way to the exposed floors and slopes of a nearby mining pit. Thus, this view's unity that has been provided by the open grassland has been negatively impacted by human activity. The view's intactness has been broken up by various man-made features. This includes the utility pole, which has the most visual impact due to its stark verticalness, the chain-link fence, and the overhead wires. There is also a row of transmission towers, but their impact is reduced by their distance from this viewpoint. Existing condition vividness is rated 1 (very low), unity and intactness are rated 2 (low) as well, for an average rating of 2 (low).

Similar to Viewpoint 1, the project would improve the visual quality and character of this view of the plan area by providing street trees, landscaping, and decorative fencing along the roadway, which would contribute to a unified and cohesive landscape design. A decorative 6-foot-high masonry wall would be provided along the landscape corridor and would replace the chain-link fence. The existing background landscape would undergo major changes, with grasslands and mining areas replaced by houses and trees. The project would introduce hard, angled shapes into an area that previously appeared smooth, and would introduce a wider array of color into an area that is now quite uniform. With implementation of the project, it is anticipated that vividness would be rated 5 (moderately high), intactness would be rated 1 (very low), and unity would be rated 2 (low), for an average rating of 3 (moderately low). Because the existing view from this viewpoint has low visual quality, changes that the project would make to the view from this viewshed is anticipated to have minimal effect on residents. However, as noted above, the evaluation of environmental effects in non-urbanized areas under CEQA is focused on public views of the plan area and surroundings.

South Watt Avenue Viewer Group (Viewpoint 5)

The primary viewer group for this viewpoint is motorists traveling along South Watt Avenue. This viewpoint along South Watt Avenue is another viewpoint that has a view into a mining area. Like other similar viewpoints, the viewshed is dominated by screen landscaping. A chain-link fence along the roadway detracts from the visual quality and character of this view but the existing screen landscaping is visually attractive with a variety of textures, shades, and shapes. Trees closest to the roadway are planted at regular intervals in front of dense foliage of trees and shrubs. There are no breaks in the screen landscaping and, thus, the background landscape is not visible from this viewpoint.

All of the components of this view are provided by the landscaping along the roadway. The existing screen landscaping provides unity for this view, but this view's intactness is broken by the chain-link fencing. The straight lines of the fence posts are incongruent with the curves and roundness of the trees and shrubs. Unlike Viewpoints 1 and 4, there is no utility pole or overhead wires to detract from the view's attractiveness. Though this view is a good example of attractive screen landscaping, there is nothing memorable or striking in this view due to the presence of similar views throughout the plan area. In addition, South Watt Avenue is a multi-lane roadway with a rate of travel that limits

motorists' views of the plan area. Existing condition vividness is rated 2 (low), unity is rated 5 (moderately high), and intactness is rated 2 (low), for an average rating of 3 (moderately low).

The project would provide street trees, landscaping and security fencing along South Watt Avenue that would provide some unity to this viewshed. The proposed street trees, decorative trees, and shrubbery would contribute to a unified and cohesive landscape design. The chain-line fencing adjacent to the Watt Avenue right of way would be replaced with fencing associated with the development. Urban development of predominantly residential buildings would occur beyond the landscaping, but these buildings would not be visible to travelers along South Watt Avenue. The buildings would be at an elevation 20 to 25 feet below the roadway and would be two stories or less. Project condition vividness is rated 4 (average), intactness is rated 1 (low), and unity is rated 4 (average); for an average rating of 4 (average).

Bradshaw Road Viewer Group (Viewpoint 6)

The primary viewer group for Viewpoint 6 are motorists on Bradshaw Road, which is a north-south roadway that crosses through the WJHMP area. Bradshaw Road is a multi-lane roadway with a rate of travel that limits motorists' views of the plan area. The view from Viewpoint 6 is from Bradshaw Road, north of Jackson Highway. This view is similar to those at Viewpoints 1 and 5 where landscaping used to screen mining areas is the predominant feature. The blooming oleanders in the background and the green shrubbery in the foreground provide a certain amount of unity to this view but the view's intactness has been reduced by a palm tree next to the roadway and the chain link fence. The mining and construction material processing areas beyond the landscaping are not visible to travelers along Bradshaw Road because there are no breaks in the screen landscaping. Like the view from Viewpoint 5, this view is a good example of attractive screen landscaping but there is nothing memorable or striking to this view due to the presence of similar views throughout the plan area. Existing condition vividness is rated 1 (low), intactness is rated 4 (average), and unity is rated 5 (moderately high); for an average rating of 3 (moderately low).

The project would provide a landscaped corridor along Bradshaw Road with trees, shrubbery, and a pedestrian walkway. The proposed landscaping along Bradshaw Road would have a unified and cohesive design. According to the project's land use plan, there would be a commercial center along this stretch of Bradshaw Road on land that was raised to the level of the roadway grade after the conclusion of mining activity. The buildings of the commercial center and the landscaping along Bradshaw Road will increase the view's diversity by introducing angled shapes into an area that previously appeared smooth and will introduce a wider array of color into an area that was previously quite uniform. In the project condition, vividness would be rated 5 (moderately high), intactness would be rated 1 (very low), and unity would be rated 2 (low); for an average rating of 3 (moderately low).

Florin Road Viewer Group (Viewpoint 7)

In the existing condition, the views from residences along Florin Road, south of the plan area include the flat grassland of the site against the backdrop of scattered trees and buildings. The primary visual breaks in this view are a cluster of large white buildings with red roofs, a utility pole along the roadway and an overhead utility line. There are also utility poles and a cellular tower in the distance.

The overall impression of this view is one of openness and continuity; the views are highly intact – meaning that there are few unattractive or negative encroachments in the view. The utility poles, cellular towers, and the cluster of white buildings do not dominate the viewshed because the poles and tower are thin and the white buildings are on the view's periphery. The only dominating man-made feature in the viewshed is the overhead electric line. Similar to Viewpoint 3, the overhead line could potentially be visually intrusive to residents at this viewpoint, but there is the possibility that residents have been acclimated to the overhead line.

Though the view may appear unified and intact, particularly if one is acclimated to the overhead electric line, the view may not be particularly vivid. One cannot distinguish the plan area from the surrounding grasslands – there is nothing particularly memorable or striking. Existing condition vividness is rated 2 (low), while unity and intactness are both rated 6 (high), for an average rating of 5 (moderately high).

The project would introduce hard, angled shapes into an area that previously appeared smooth, and would introduce a wider array of color into an area that was previously quite uniform. Though this would increase the diversity of the view, the loss of continuity and the sense of open space have the potential to significantly and negatively impact the quality of the views. The proposed landscaping along Bradshaw Road would have a unified and cohesive design which would be the major element that would contribute to the view's unity. With project buildout vividness would be rated 5 (moderately high), intactness would be rated 1 (very low), and unity would be rated 2 (low), for an average rating of 3 (moderately low). Similar to Viewpoint 3, residents will be most sensitive to any changes the project would make to this viewshed for the reasons stated earlier, including increased observation duration. However, as noted above, the evaluation of environmental effects in non-urbanized areas under CEQA is focused on public views of the plan area and surroundings.

Summary of Viewshed Impacts

Views of the plan area for travelers on Jackson Highway, South Watt Avenue, and Bradshaw Road would be affected by implementation of the WJHMP. However, because views from these viewpoints are dominated by screen landscaping and security fencing for mining and construction material processing areas in the existing condition, the project would improve the visual quality of these views by providing street trees, decorative trees, and shrubbery along the roadway that would be part of a unified and cohesive landscape design. The chain link security fence which currently detracts from the viewshed's attractiveness would be removed. Therefore, although the character of the views would change, the overall quality of the views is anticipated to be improved for most viewers.

Table 4-2 provides a breakdown of the average rating as it relates to visual quality of each viewpoint and identifies the change in ratings of these viewsheds from existing conditions to post-project conditions. The overall change in visual quality is quantified based on the modification of the viewsheds from existing conditions to post-project conditions, and results in either a positive, negative, or unchanged average rating. In this case, a positive number concludes an improved change in visual quality, whereas a negative number concludes a decline in visual quality. Additionally, the table depicts the main view group from each viewpoint. Views from residences are not considered a public view, and as noted above, the evaluation of environmental effects in non-urbanized areas under CEQA is focused on public views of the plan area and surroundings.

Table 4-2 Average Rating of Visual Quality from Viewsheds

Viewshed	Existing	Post-Project	Overall Change	Viewer Group
Viewpoint 1	2	4	+2	Motorists
Viewpoint 2	5	3	-2	Motorists
Viewpoint 3	5	3	-2	Residents
Viewpoint 4	2	3	+1	Residents
Viewpoint 5	3	4	+1	Motorists
Viewpoint 6	3	3	0	Motorists
Viewpoint 7	5	3	-2	Residents

Source: Prepared by Ascent in 2024.

Open grassland is a dominant feature of views of the plan area from residences south of Elder Creek Road in the existing condition. The project would result in the loss of this grassland and the sense of openness and continuity that it provides. However, the other dominant feature of this viewshed is the open mining pit which detracts from the viewshed's attractiveness. Because the project would reclaim the mining pit for urban development and use landscaping and grading to conceal evidence of mining activity, the project would result in a net gain in the visual quality and character of this viewshed.

Views of the plan area from the southernmost residences of Independence at Mather include a wide expanse of grassland, but portions of this grassland have been affected by mining activity. Also, background structures detract from the view's visual attractiveness. For this reason, there would be no net loss in visual quality after urban development occurs in this portion of the plan area.

The viewshed's overall impression of openness and continuity would be replaced by a large urban development that would introduce hard, angled shapes into an area that previously appeared smooth, and would introduce a wider array of color into an area that was previously quite uniform. Though this would increase the diversity of the view and thereby affect the overall visual character of the plan area, the loss of continuity and impression of openness would also impact the quality of the views. These impacts are due to the placement of a large urban development in an area currently dominated by open space; the impact is not due to any particular feature or features that could be changed.

While the project includes adoption of design guidelines and development standards and would implement a cohesive landscaping program to ensure an attractive new development that would integrate the new uses, the change in visual character would be permanent and drastic, regardless of whether or not the new development community would be visually appealing. To sensitive viewer groups, particularly area residents, this could be perceived as a substantial degradation. This would be a significant impact. Besides design guidelines and policies that would guide the visual characteristics of development, including but not limited to landscaping, building design standards, setbacks, and massing, which are already required for the project, no other feasible mitigation is available to reduce the magnitude of visual changes that would occur. Therefore, this impact would be **significant and unavoidable**.

MITIGATION MEASURES

No mitigation is available.

IMPACT AE-2: NEW SOURCES OF LIGHT OR GLARE

The project does not involve any elements with particularly reflective surfaces, and thus would not introduce a significant new source of glare. The project would, on the other hand, involve a substantial amount of new residential, commercial, employment, and industrial development that would include lighting sources such as streetlights and security lights. Nighttime lighting has been associated with negative human health impacts and ecological impacts. In humans, the primary effect is sleep disruption. Nighttime lighting is necessary for safety, for work productivity, and for recreation, but Title 24 and County Ordinances were instituted in recognition that excess lighting should be avoided.

The plan area is within a rural area that has minimal lighting and is designated as an LZ2 zone (low levels of ambient nighttime light). Because the plan area is in an LZ2 zone, the lighting restrictions will be more robust than if the plan area were in a more urban environment. For instance, Table 140.7-B of the 2022 Building Efficiency standards indicates that building entrances in an LZ2 zone are limited to 15 watts, while in an LZ4 (urbanized) zone the allowance is 21 watts (CEC 2022).

Most of the project would result in standard urban lighting systems with average light output, including porch lights and parking lot lights. Though there are existing restrictions that minimize the impacts of new lighting sources on existing nighttime conditions, the project would result in a substantial new source of light. Existing residents in the Rosemont community to the north (across Jackson Highway) and Independence at Mather to the northeast are accustomed to nighttime light sources. Existing residents to the east of Excelsior Road, to the south of Elder Creek Road, and to the south of Florin Road would likely be more disturbed by the new sources of light which may result in nighttime sleep disruption, however, it is assumed that residences will include window coverings (i.e. curtains, blinds, etc.) to reduce impacts from nighttime lighting. However, lighting, including adverse effects of glare and light trespass or spillover light are considerations addressed by the city through the site plan and design review process. All future development in the plan area would be subject to this review process, ensuring that the effects of glare and spillover light would be addressed.

Although the project introduces a substantial new source of light that may adversely impact views, there are existing regulations that would minimize lighting impacts. The project would, nonetheless, result in a significant impact related to new lighting sources. This impact is not due to any individual feature or features, but due to introducing a large urban development within a rural landscape. However, there are means available to further reduce the level of light pollution produced by the project.

The International Dark-Sky Association (IDA) is a world-recognized authority on nighttime lighting and light pollution. IDA operates a program which reviews and rates outdoor lighting fixtures, giving IDA-approved status to fixtures that minimize glare and light trespass. The IDA maintains a list of fixtures that have been approved. Pursuant to Mitigation Measure AE-2, future project applicants would be required to amend the WJHMP to include a requirement to use IDA-approved fixtures. Though feasible mitigation is applied, the project would generate a substantial new source of light; impacts would be **significant and unavoidable***.*

MITIGATION MEASURES

MITIGATION MEASURE AE-2: LIGHTING STANDARDS

The WJHMP shall be amended to require all lighting applications subject to the 2022 Building Efficiency Standards Section 140.7 during buildout, and as amended thereafter, to use fixtures approved by the International Dark Sky Association.

This page is intentionally left blank.

5 AGRICULTURAL RESOURCES

INTRODUCTION

This chapter describes the existing agricultural resources within the plan area and analyzes possible impacts to agricultural resources that could occur as the result of the project. The discussion focuses on the impact of converting the designated Farmland in the plan area to non-agricultural uses, impacts related to Williamson Act contracts, and possible impacts to agricultural activities on adjacent lands. There is no forest land (as defined in Public Resources Code section 12220(g)) or timberland (as defined by Public Resources Code section 4526) within or near the plan area. As a result, effects of project implementation on forestry resources are not evaluated in this EIR.

A comment received from the Agricultural Commissioner in response to the Notice of Preparation (NOP) raised concern about the proximity of Village Nursery to proposed residential development and potential placement of the middle/high school site. Village Nursery has since permanently closed this location and is no longer considered a concern. Other nurseries that are located in the vicinity of the plan area are discussed in Impact AR-2 below. The NOP and comments received in response to the NOP are included in Appendix A.

ENVIRONMENTAL SETTING

The plan area is largely undeveloped. Established uses include grazing, aggregate mining and processing activities, and agricultural-residential homes. The entirety of the plan area is within the Urban Services Boundary (USB), and a small portion (approximately 69 acres) of the plan area is within the Urban Policy Area (UPA).

The plan area is designated for various land uses. The majority of the plan area is zoned for agriculture in the Sacramento County Zoning Code. As discussed further in Chapter 2, “Project Description,” and Chapter 15. “Land Use,” the plan area includes the following zoning designations: Agricultural 20 (AG-20) (91 acres), Agricultural 40 (AG-40) (39 acres), Agricultural 80 (AG-80) (1,090 acres), Agricultural 160 (AG-160) (918 acres), Agricultural-Residential 1 (AR-1) (114 acres), and Agricultural- Residential 2 (AR-2) (21 acres) (see Figure 2-8). There are no parcels in the plan area that are under Williamson Act contracts.

PROTECTED FARMLAND

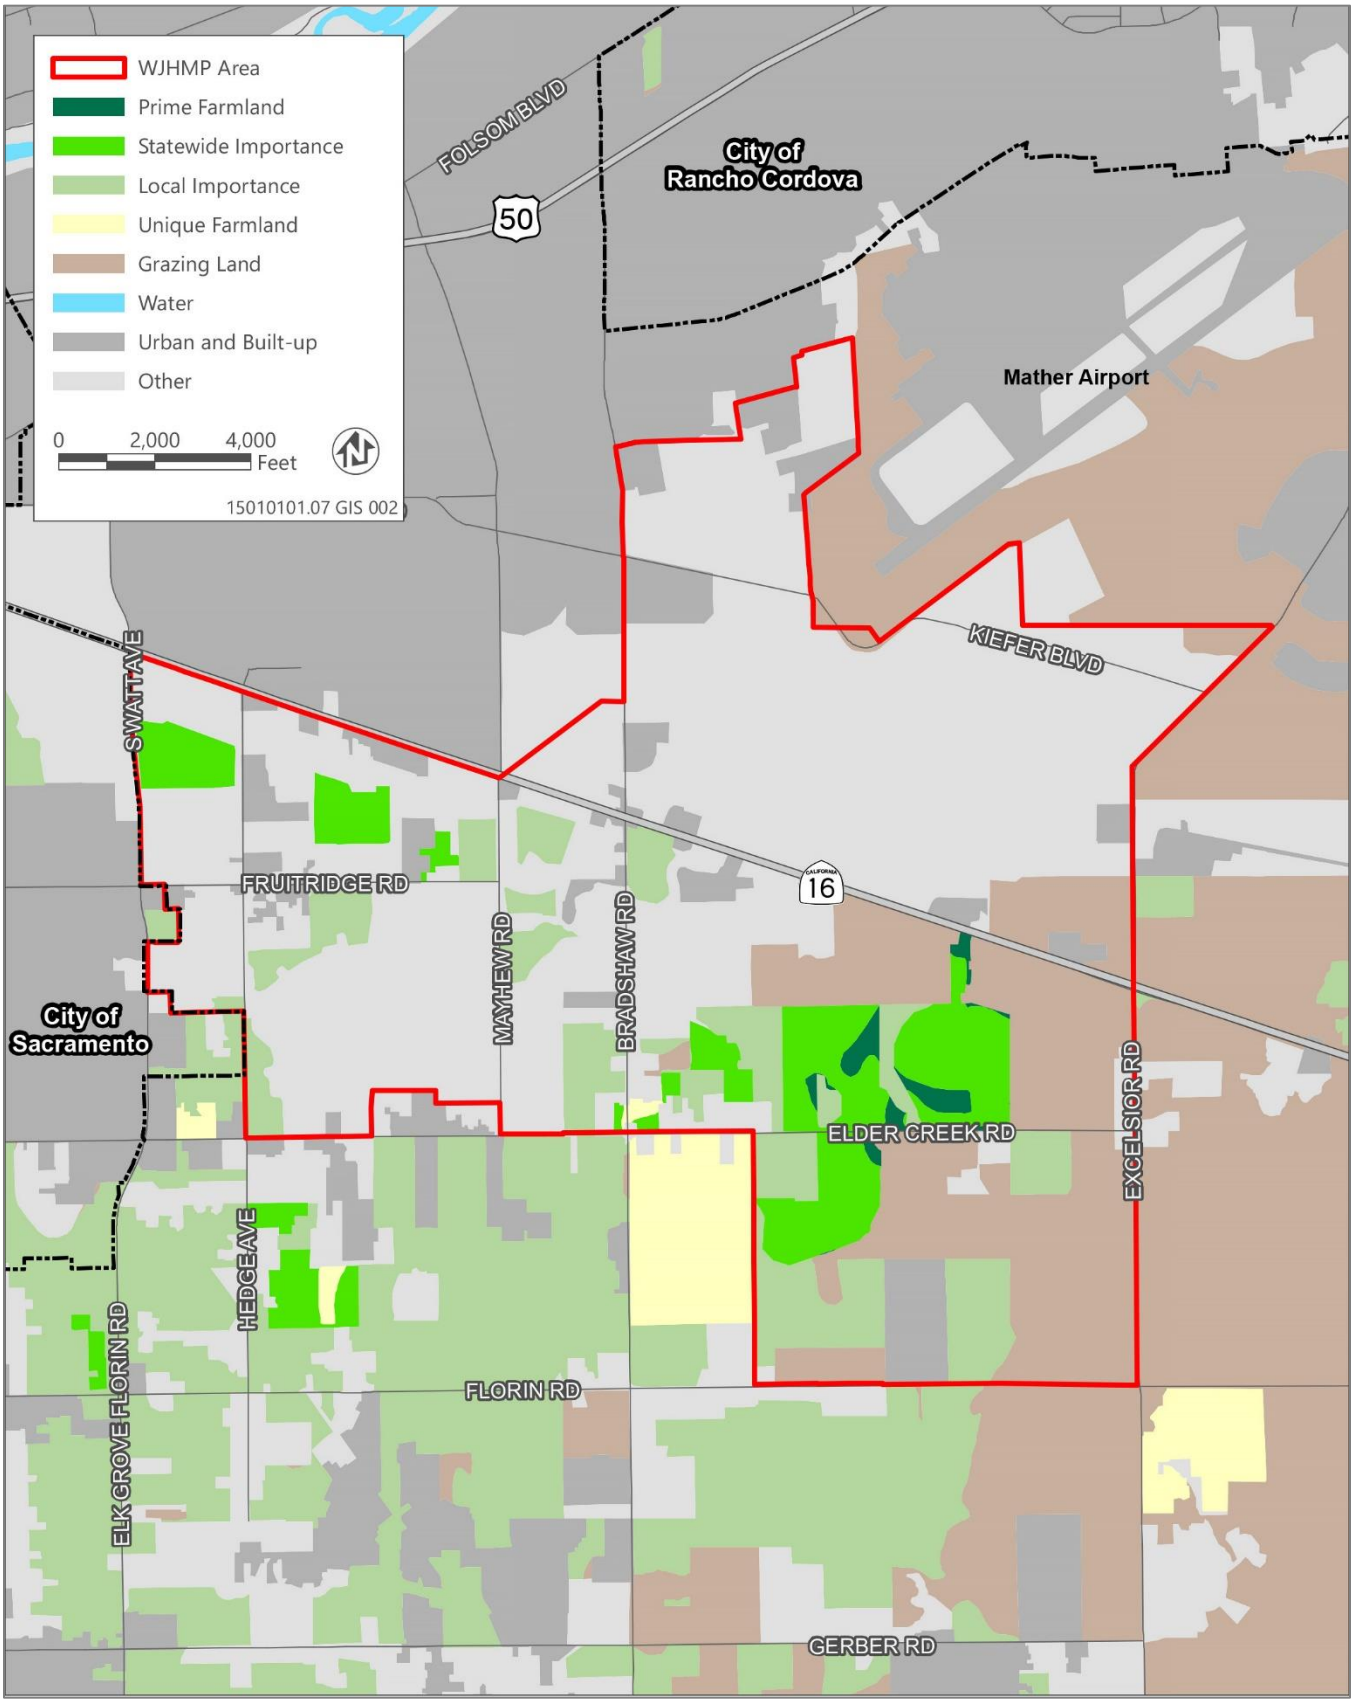
FARMLAND MAPPING AND MONITORING PROGRAM DESIGNATION

The State of California maps and classifies farmland through the California Department of Conservation’s Farmland Mapping and Monitoring Program (FMMP). The goal of the FMMP, which typically updates maps every 2 years, is to document the location and

extent of California's agricultural resources so that they can be considered in the planning process. Although the FMMP typically prepares and maintains an automated map and data base system to record and report changes in the use of agricultural lands every 2 years on even numbered calendar years, the most current important farmland data that is available in Sacramento County is from 2020 (DOC 2024). Classifications are based on a combination of land use and soil characteristics and climate that determine the degree of suitability of the land for crop production. The classifications under the FMMP are as follows:

- *Prime Farmland* is defined by the state as "land with the best combination of physical and chemical features able to sustain long-term production of agricultural crops." Prime Farmland has the soil, quality, growing season, and moisture supply needed to produce sustained high yields. To be designated as Prime Farmland, the land must have been used for production of irrigated crops at some time during the four years prior to the mapping date.
- *Farmland of Statewide Importance* is defined by the state as "land similar to Prime Farmland that has a good combination of physical and chemical characteristics for the production of agricultural crops." This land has less ability to store moisture than Prime Farmland. In order for land to be designated as Farmland of Statewide Importance, it must have been used for production of irrigated crops at some time during the four years prior to the mapping date.
- *Unique Farmland* consists of lower-quality soils but is nonetheless used for production of the state's leading agricultural crops. Unique Farmland is usually irrigated, but may include non-irrigated orchards or vineyards in some climatic zones in California. To qualify for this designation, land must have been used for crops at some time during the four years prior to the mapping date.
- *Farmland of Local Importance* is determined by each county's board of supervisors and a local advisory committee. For Sacramento County, this classification refers to lands which do not qualify as Prime, Statewide, or Unique designation but are currently irrigated crops or pasture or nonirrigated crops; lands that would be Prime or Statewide designation and have been improved for irrigation but are now idle; and lands which currently support confined livestock, poultry operations, and aquaculture.
- *Grazing Lan*d is land which is suitable for grazing livestock. The minimum mapping unit for this category is 40 acres.
- *Urban and Built-Up Land* is defined as land occupied by structures at a density of at least one dwelling unit per 1.5 acres.
- *Land Committed to Nonagricultural Use* consists of existing land that has a permanent commitment to development but has an existing land use of agricultural or grazing lands.
- *Other Land* is not included in any other mapping category, common examples of which include low-density rural developments, brush, timber, wetland, and vacant and nonagricultural land surrounded by urban development.

According to the current (2020) California Department of Conservation's FMMP, the plan area contains roughly 49 acres of Prime Farmland, 459 acres of Farmland of Statewide Importance, 630 acres of Farmland of Local Importance, 1,014 acres of Grazing Land, and 9 acres of land designated as Unique Farmland (see Figure 5-1).



FARMLAND CONVERSION

Over the 6-year period from 2014 to 2020, the California Department of Conservation estimates that the total acreage of Important Farmland in Sacramento County decreased by approximately 1,371 acres annually, with notable losses to Prime Farmland and gains in Unique Farmland. Table 5-1 summarizes the acreages of agricultural land in Sacramento County between 2014 and 2020 (DOC 2016, 2020).

Table 5-1 Farmland Conversion in Sacramento County, 2014-2020

Land Use Category	Acreage by Category				Average Annual Acreage Change (2014 – 2020)
	2014	2016	2018	2020	
Prime Farmland	91,569	90,691	86,963	84,684	-1,147.5
Farmland of Statewide Importance	43,104	43,342	44,003	43,825	120
Unique Farmland	15,125	15,540	15,579	15,642	86
Farmland of Local Importance	58,852	57,910	55,049	56,275	-429.5
Important Farmland Subtotal	208,650	207,483	201,594	200,426	-1,371
Grazing Land	153,454	153,174	149,987	147,789	-944
Agricultural Land Subtotal	362,104	360,657	351,581	348,215	-2,315
Urban and Built-Up Land	181,297	182,237	183,975	185,537	707
Other Land	74,558	75,069	83,619	85,437	1,813
Water Area	18,120	18,116	16,910	16,896	-204
Total Area Inventoried	636,079	636,079	636,085	636,085	-

Figure 5-1 Farmland Mapping and Monitoring Program Designations

REGULATORY SETTING

FEDERAL

There are no federal policies or regulations applicable to the analysis of agricultural resources.

STATE

FARMLAND MAPPING AND MONITORING PROGRAM

The California Department of Conservation's FMMP was established in 1984 to document the location, quality, and quantity of agricultural lands and conversion of those lands over time. The program provides impartial analysis of agricultural land use changes throughout California.

The FMMP is tasked with mapping and monitoring important farmlands for most of the State's agricultural areas. The maps are prepared based on soil survey information and land inventory and monitoring criteria developed by the US Department of Agriculture (USDA), Natural Resources Conservation Service. The minimum mapping unit used for all agricultural land categories except grazing land is 10 acres. The minimum unit for grazing land is 40 acres. Though the FMMP typically updates its farmland maps every 2 years based on information from local agencies and recent aerial photography, the most recent Sacramento County Important Farmland Map is dated 2020.

WILLIAMSON ACT

The Williamson Act, also known as the California Land Conservation Act of 1965, enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space uses. When the County enters into a contract with the landowners under the Williamson Act, the landowner agrees to limit the use of the land to agriculture and compatible uses for a period of at least 10 years and the County agrees to tax the land at a rate based on the agricultural production of the land, rather than its real estate market value.

The plan area does not contain any properties under an active Williamson Act contract. However, there are parcels in active Williamson Act contracts in the vicinity, primarily south of Jackson Highway.

PUBLIC RESOURCES CODE

The CEQA Statute, Public Resources Code Section 21060.1, defines "agricultural land" as: Prime Farmland, Farmland of Statewide Importance or Unique Farmland, as defined by the United States Department of Agriculture land inventory and monitoring criteria, as modified for California.

LOCAL

SACRAMENTO COUNTY 2030 GENERAL PLAN

The following policies of the 2030 General Plan are applicable to the project:

- **Policy AG-3.** The County shall permit agricultural uses on buffers, provided such uses are conducted in a manner compatible with urban uses. Buffers shall be used to separate farming practices incompatible with adjacent urban uses. Any homeowners' association or similar entity within the development shall assist in determining compatible use. Buffers shall not adversely conflict with agricultural uses on adjoining property.
- **Policy AG-4**. Prospective buyers of property adjacent to agricultural land shall be notified through the title report that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County's right-to-farm ordinance.
- **Policy AG-5.** Projects resulting in the conversion of more than fifty (50) acres of farmland shall be mitigated within Sacramento County, except as specified in the paragraph below, based on a 1:1 ratio, for the loss of the following farmland categories through the specific planning process or individual project entitlement requests to provide in-kind or similar resource value protection (such as easements for agricultural purposes):
    - prime, statewide importance, unique, local importance, and grazing farmlands located outside the USB;
    - prime, statewide importance, unique, and local importance farmlands located inside the USB.

    The Board of Supervisors retains the authority to override impacts to Unique, Local, and Grazing farmlands, but not with respect to Prime and Statewide farmlands. However, if that land is also required to provide mitigation pursuant to a Sacramento County endorsed or approved habitat conservation plan (HCP), then the Board of Supervisors may consider the mitigation land provided in accordance with the HCP as meeting the requirements of this section including land outside of Sacramento County.

    Note: This policy is not tied to any maps contained in the Agricultural Element. Instead, the most current Important Farmland map from the Department of Conservation should be used to calculate mitigation.
- **Policy AG-6.** If a property owner is required to mitigate for the loss of farmland under Policy AG-5, and the approved master plan or community plan includes land permanently set aside for an urban farm, a 1:1 farmland credit will be given to projects that incorporate urban farming within the project that permanently preserves farmland. Urban farms may qualify for credit for the proposed master plan or community plan and will be considered as part of the master plan or community plan process subject to the following criteria:

- The required minimum urban farm size to qualify for the credit shall be at least 5 acres.
- Only land that is fully available for farming shall count towards the credit. Ancillary facilities such as education buildings, farmer's markets, and parking areas shall not be included in the acreage calculation.
- Community gardens shall not count toward the credit.
- The zoning shall be a permanent agricultural zone, or similar zone, that ensures the permanency of the agricultural use.
- An appropriate source of water shall be identified and provided.
- A permanent agricultural easement shall be recorded over the site. The agricultural easement shall be dedicated to the County of Sacramento or an organization approved by the County to preserve the farmland.
- If there is a separate farm management entity, a recorded farming management agreement shall be required between the landowner and the farm manager.

Any reversion to a non-farming use on an urban farm site that received farmland credit shall trigger farmland mitigation regardless of the size. The mitigation shall be equivalent to the mitigation required at the time of the original project approval. In addition, the mitigation shall be based on the farmland category at the time of original project approval; however, in the event the farmland category has been upgraded to a higher category as shown on the latest Important Farmland Map from the Department of Conservation, that farmland category shall be used as the basis in determining equivalent mitigation.

- **Policy AG-9.** Agricultural land divisions shall not adversely affect the integrity of agricultural pursuits. Agricultural land divisions may be denied if the reviewing authority finds that the division of land is likely to create circumstances inconsistent with this policy.
- **Policy CO-51.** Direct development away from prime or statewide importance farmlands or otherwise provide for mitigation as required by AG-5 slowing the loss of additional farmland conversion to other uses.
- **Policy CO-52.** Recreational uses shall not be constructed on prime, statewide importance, unique or local farmland outside of the Urban Services Boundary where the use would impede agricultural practices.

Community Plans

Community Plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and the Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan does not contain objectives related to agricultural resources that would apply to the project.

VINEYARD COMMUNITY PLAN

- **Policy AG-1.** Support agriculturally compatible development proposals.
- **Policy AG-4.** Recognize and support the necessity and desirability of agricultural land allocation and uses as legitimate and appropriate in the Vineyard Community.
- **Policy AG-5.** Solicit input and participation from Vineyard ranchers and farmers on all land use matters.

SACRAMENTO COUNTY ZONING CODE

The Agricultural Land Use Zone is designed to promote and protect the public health, safety, and general welfare within Sacramento County.

In general, the agricultural land use zone is designed to:

- Eliminate encroachment of incompatible land uses on agricultural lands;
- Preserve the supply of agricultural land in order to conserve the County's economic resources;
- Discourage premature and unnecessary conversion of agricultural land to urban uses;
- Preserve agricultural lands as open space and for production of agricultural products so as to preserve an important physical, social, esthetic and economic asset of the residents of the County; and
- Encourage retention of large agricultural lots to assure viable agricultural units.

SACRAMENTO COUNTY CODE 14.05 (AGRICULTURAL ACTIVITIES)

Sacramento County has adopted a right-to-farm ordinance to provide legal assurance that established agricultural operations are allowed to continue, and to inform residents of areas zoned or designated for agriculture that they may be subject to inconvenience or discomfort resulting from accepted agricultural operations. This ordinance does not, however, prevent residents of farming areas from complaining about such inconvenience or discomfort.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

An agricultural resources impact would be significant if implementation of the project would:

- convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;
- conflict with existing zoning for agricultural use or a Williamson Act contract; or
- involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland to non-agricultural use.

In addition to the CEQA Guidelines criteria for significance of farmland loss, General Plan Policy AG-5 defines a substantial farmland loss as 50 acres. The State CEQA Guidelines indicate that loss of Prime Farmland, Farmland of Statewide Importance, and Unique Farmland may be a significant impact, but the General Plan further includes Farmland of Local Importance and Grazing Land – though in the case of Grazing Land, the threshold specifically applies only to such lands which occur outside of the USB.

ISSUES NOT DISCUSSED FURTHER

CONFLICT WITH WILLIAMSON ACT ZONING

There are no active Williamson Act contracts within the plan area, or adjacent to the plan area. There are parcels in active Williamson Act contracts in the vicinity, primarily south of Jackson Highway, but none directly adjacent to the plan area. Because no Williamson Act parcels are located within or adjacent to the plan area, implementation of the project would not result in conflicts with Williamson Act contracts, and there would be no impact on Williamson Act properties.

METHODOLOGY

The following evaluation of potential impacts associated with agricultural resources is based on a review of planning documents, including policies of the 2030 General Plan, field reviews, and maps. The impact assumes that the entire plan area would be developed consistent with the Land Use Plan, although there are a few areas within the plan area that may continue existing land uses for the time being, including some small rural residential parcels, institutional landowners such as the Elk Grove USD, religious organizations, and various industrial users on the non-participating properties.

The impact evaluation is based on the thresholds established in the State CEQA Guidelines and the mitigation requirements in 2030 General Plan Policy AG-5. Conversion of more than 50 acres of Farmland classified as Prime, Statewide

Importance, Unique, or Local Importance within the USB is considered a significant impact. Furthermore, Policy AG-5 specifies that mitigation calculations are based on the most current Important Farmland map prepared by the Department of Conservation. Therefore, the following analysis is based on the 2020 FMMP, which is the most current map publicly available.

Conversion of Farmland to Non-Agricultural Use

Mining projects have impacted extensive areas of Prime, Statewide Importance, Local Importance, and Unique Farmlands within the plan area. Many of the mining projects have mitigation measures and reclamation plans that require mining areas to be reclaimed back to agriculture and other uses upon completion of mining activities. Therefore, two methodologies are used to identify farmland conversion impact. The first methodology (Methodology 1) uses the most current FMMP map (as described in General Plan Policy AG-5) to identify existing farmland. The second methodology (Methodology 2) calculates impacted farmland acreage within mining projects with active reclamation plans. Methodology 2 takes into account future conditions that will exist after reclamation plans are implemented. Methodology 1 and Methodology 2 are described below.

Methodology 1

General Plan Policy AG-5 is used to identify impacts to farmland in non-mining areas, mining projects with closed reclamation plans, and mining projects that do not meet Methodology 2 criteria. Mining projects with closed reclamation plans in the project area are Aspen II, Aspen III, and Sacramento Aggregates 2. According to General Plan Policy AG-5, the most current Important Farmland map from the Department of Conservation should be used to calculate agriculture mitigation acreage. The 2020 FMMP map (Figure 5-1) is the most current map that is available at the time of preparing this document. Open space is not considered agricultural use in this analysis. If an area designed for open space and open space/urban farm is located on Prime, Statewide Importance, Local Importance, or Unique Farmlands, it would be considered as conversion of farmland to non-agricultural use.

Methodology 2

The most current FMMP map does not show farmland that has been impacted by active mining activities. However, mining reclamation plans required by Sections 3708 and 3711 of the State Mining and Geology Board's (SMGB) Reclamation Regulations provide the potential to restore farmland within mining areas. For this reason, Methodology 2 is used to assess impacts to farmland that are not shown in the most current FMMP. This methodology utilizes each active mining project's environmental document to determine whether farmland has been impacted by the mining project and whether the impacted farmland would need to be restored through a reclamation plan. Projects under this methodology were assumed to result in a temporary loss of farmland and contained mitigation to restore the project site to an equivalent level of farmland quality. Therefore, Methodology 2 assumes a future baseline condition where some previously impacted farmland in mining areas has been reclaimed to agricultural use consistent with previously adopted mitigation measures, conditions of approval, or

applicable SMGB regulations. The following criteria are used to determine whether reclaimed farmland within a mining project would be impacted by the project:

- a CEQA document was prepared for the mining project;
- the CEQA document states that the mining project would cause a significant impact to farmland;
- the CEQA document has mitigation measures, and the mining use permit has conditions of approval to reduce this impact to farmland; and
- to mitigate the loss of farmland caused by the mining project, the reclamation plan implemented mitigation measures identified in the CEQA document and conditions of approval.

The following steps are used to calculate the impacted farmland if a mining project meets the above criteria:

1. Determine on-site agricultural acreage required by the mining project's conditions of approval, mitigation measures or reclamation plan. This acreage presents the amount of farmland that would exist after the mining area is reclaimed for agricultural use.
2. Use the mining project's environmental document to identify the type of farmland (e.g., Prime, Statewide, etc.) and the acreages for each type. Because it is not possible to determine the type of farmland that would be present after the mining area is reclaimed, agricultural use conditions that existed before the commencement of mining activity were assessed. If the environmental document did not identify the type of farmland, the Farmland Map during the time of environmental document preparation is used for the assessment.

Table 5-2 summarizes the mining projects that are evaluated against the Methodology 2 criteria.

Table 5-2 Mining Projects Evaluated under Methodology 2

Mining Project	Criterion 1: Was a CEQA document prepared?	Criterion 2: Did the CEQA document identify potentially significant agriculture impact?	Criterion 3: Did CEQA mitigation measures and project conditions of approval include reclamation to agriculture?	Criterion 4: Did the project's reclamation plan implement CEQA mitigation measures and project conditions of approval?
Aspen V South Vineyard 1 Aspen III South Aspen IV South	**YES.** Morrison Creek Mining Reach Downstream (South) of Jackson Road EIR/EIS (94-0671)	**YES**. Land Use Impact #2: The proposed project would disturb 31 acres of Prime Farmland, 435 acres of Farmland of Statewide Importance, and 419 acres of Local Importance (*Significant Impact*) (p. 5-86 of Environmental Document)	**YES.** Mitigation Measure and Condition of Approval for Mining Projects: Prior to issuance of work authorization, the proponents shall prepare a plan for the preservation and salvage of topsoil resources suitable for sustaining economically viable agricultural uses, consistent with the performance standards set forth in Sections 3708 and 3711 of the State Mining and Geology Board Reclamation Guidelines (p. 5-89 of Environmental Document)	**YES.**
Aspen VI Granite 1 Aspen V, Va	**YES.** Morrison Creek Mining Reach Downstream (North) of Jackson Road EIR/EIS (89-1195)	**NO.** Loss of farmland not considered impact at time of CEQA document preparation.	**NO.**	**YES.**
Fairbairn South	**YES.**	**NO.** Loss of farmland land is not considered impact at time of CEQA document preparation	**NO.**	**NO.**

Source: prepared by Sacramento County in 2024.

There is one additional mining project that does not meet either methodology. The newest mining project, Aspen VIII/IX, has already mitigated the permanent conversion of a total of 355 acres of Farmland (39 acres of Prime Farmland, 225 acres of Farmland of Statewide Importance, and 91 acres of Farmland of Local Importance) and would not be subject to additional mitigation.

West Jackson Highway Master Plan Policies

The WJHMP includes the following policies related to agricultural resources.

- **Policy 6.20.** Urban Farms and agricultural uses may utilize portions of detention and retention basins as appropriate, subject to Clean Water Act and National Pollutant Discharge Elimination System (NPDES) requirements as applicable.
- **Policy 6.24.** Sloped areas may be utilized for agricultural production including urban farming and community gardens.

Impacts and Analysis

Impact AR-1: Convert Farmland to Non-Agricultural Uses

As shown in Figure 5-1, there are lands within the plan area that are designated Prime Farmland, Farmland of State Importance, Farmland of Local Importance, and Unique Farmland in the most current FMMP data. The impacted farmland acreage using the 2020 FMMP map is estimated and summarized in Table 5-3 below.

Table 5-3 Impacted Farmland Acreage Based on Department of Conservation Data under Methodology 1

Category	Prime Farmland	Farmland of State Importance	Farmland of Local Importance	Unique Farmland	Total
Non-Mining Area	13.86	205.20	422.82	6.45	648.33
Mining Projects with Closed Reclamation Plans	0	105.0	24.16	0	129.16
Mining Projects Do Not Meet Methodology 2 Criteria	0	0	0	0	0
Total	13.86	310.2	446.98	6.45	777.49

Source: prepared by Sacramento County in 2024.

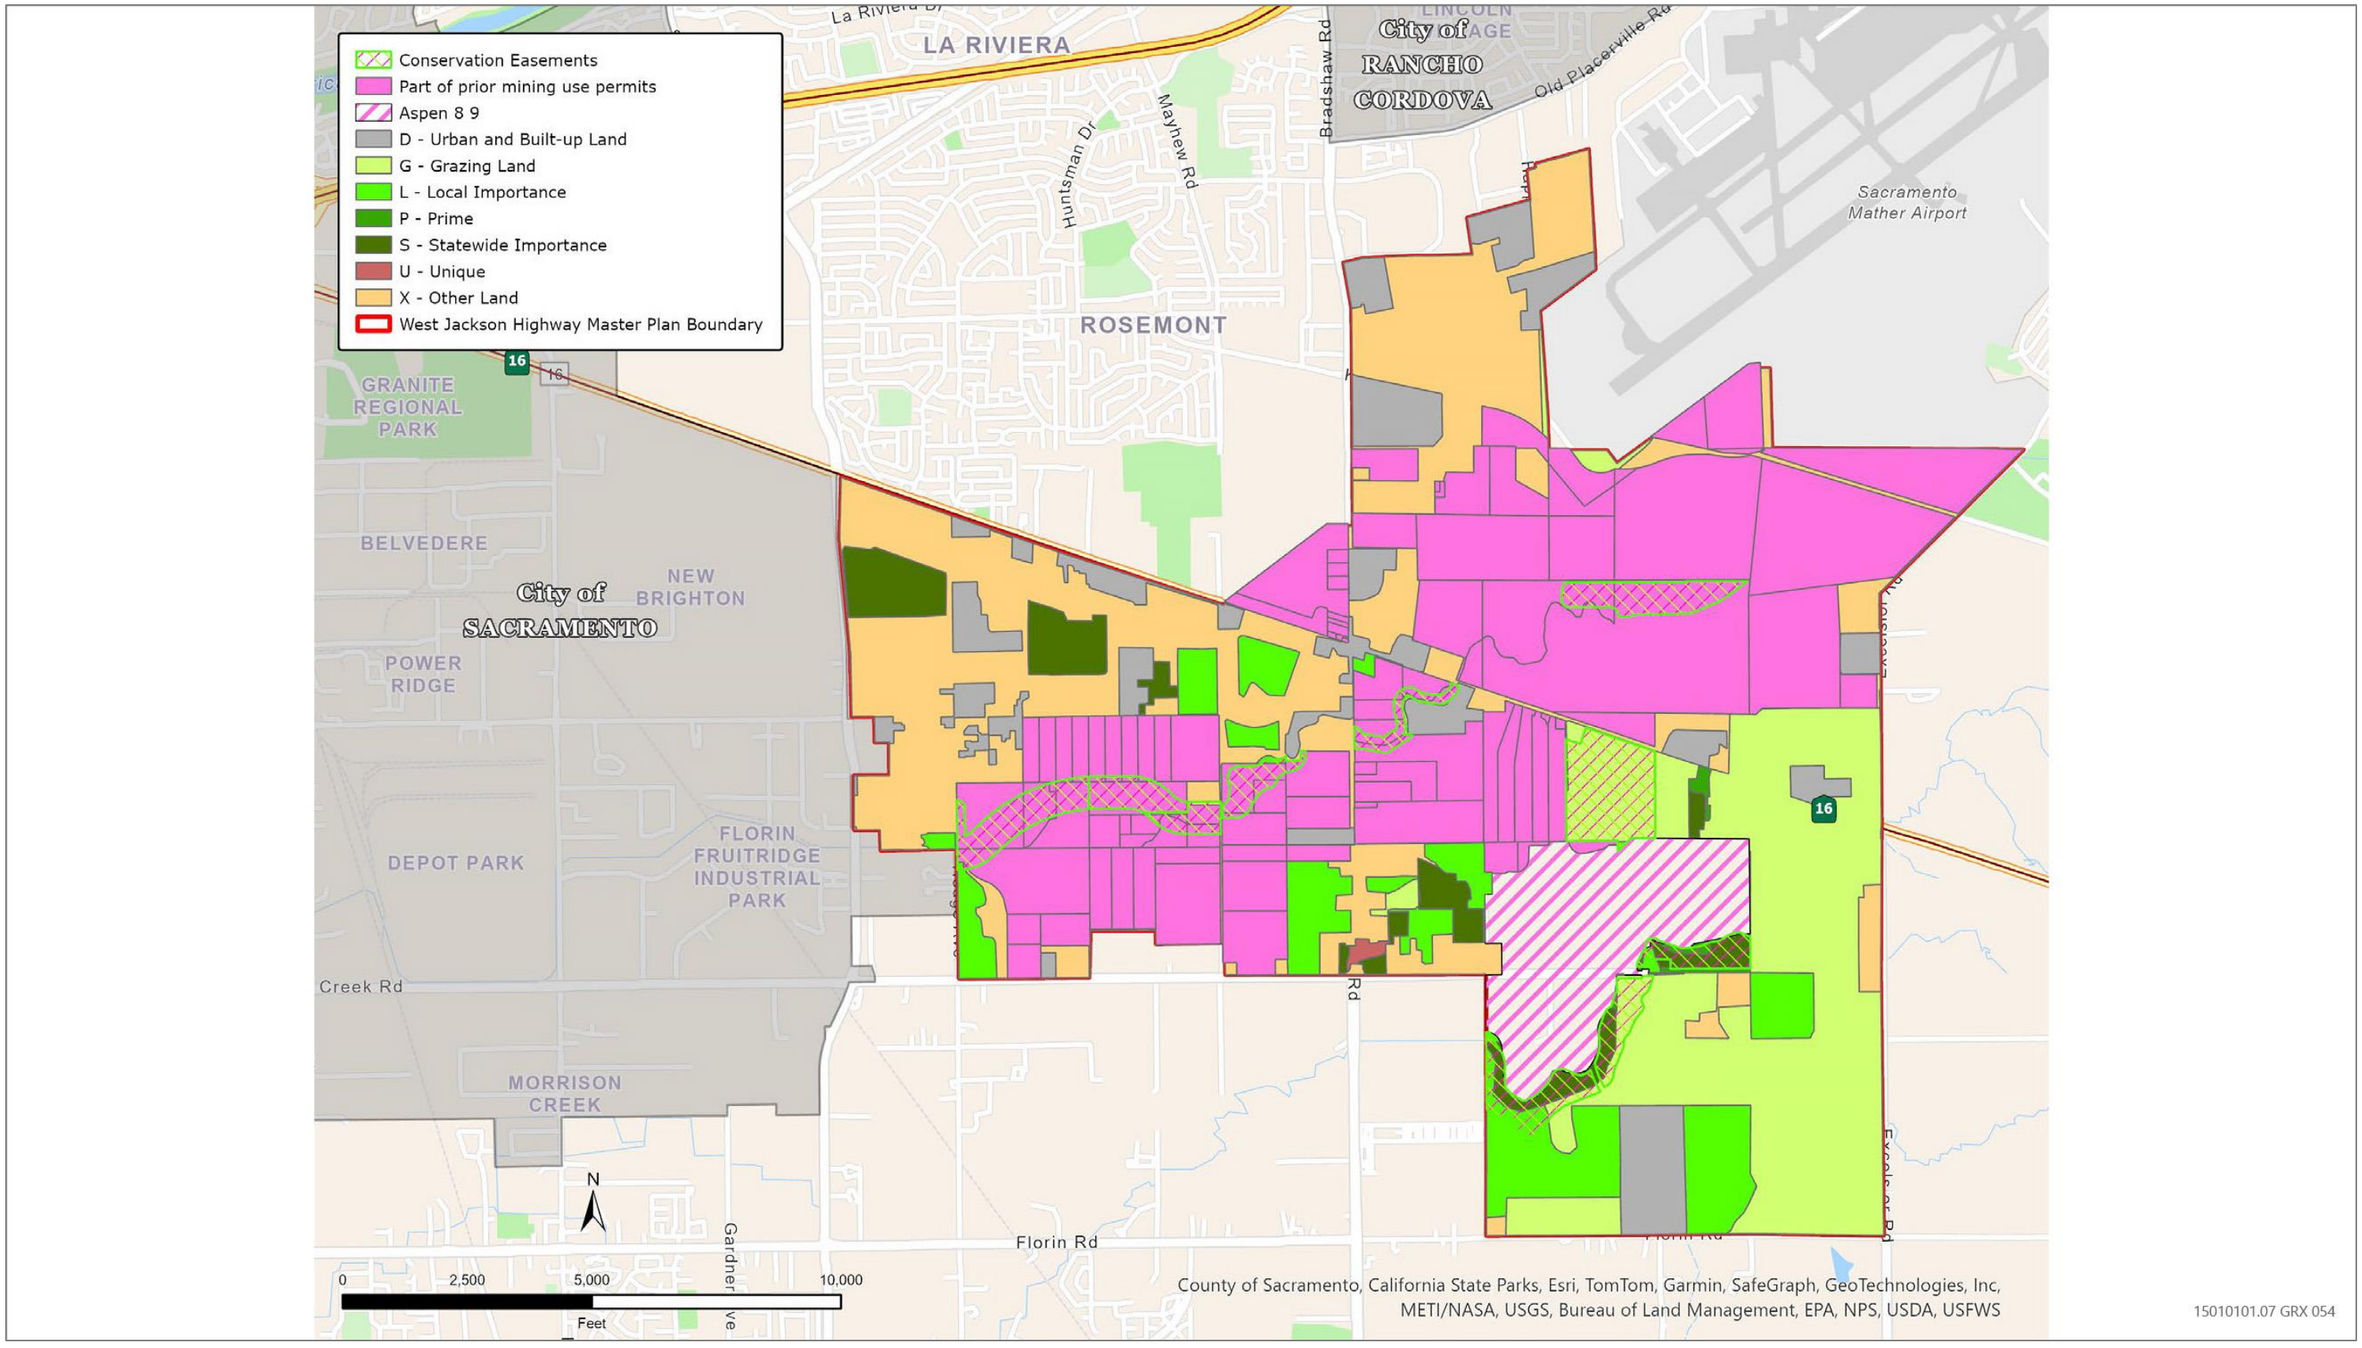
In addition, there is land in the plan area that is not mapped because it does not currently meet the FMMP farmland definition due to active mining. As explained above, because these areas are subject to established mitigation agreements that would result in the ultimate restoration of the properties to their former agricultural uses, the available FMMP data has been augmented to reflect the ultimate restoration obligations of these

mining projects. As shown in Table 5-3, four mining projects with active reclamation plans meet the Methodology 2 criteria: Aspen III South, Aspen IV South, Aspen V South, and Vineyard 1. The estimated impacted farmland acreage resulting from these four mining projects is summarized in Table 5-4 below.

Table 5-4 Impacted Farmland Acreage on Reclaimed Mining Land under Methodology 2

Mining Project	Prime Farmland	Farmland of State Importance	Farmland of Local Importance	Unique Farmland	Total
Aspen III South	0.17	0.01	74.84	0	75.02
Aspen IV South	5.78	41.32	106.85	0	153.95
Aspen V South	0	124.84	84.03	0	208.87
Vineyard I	0	122.44	26.39	0	148.83
Total	5.95	288.61	292.11	0	586.67

Source: prepared by Sacramento County in 2024.



The total impacted farmland is estimated by combining the impacted farmland identified under Methodology 1 and Methodology 2. Table 5-5 summarizes the total impacted farmland. Figure 5-2 shows Prime, Statewide Importance, Local Importance, Unique Farmlands, and prior mining projects that have had various mitigation obligations within the plan area.

Table 5-5 Total Impacted Farmland Acreage under Both Methodology 1 and 2

Methodology	Prime Farmland	Farmland of State Importance	Farmland of Local Importance	Unique Farmland	Total
Methodology 1	13.86	310.2	446.98	6.45	777.49
Methodology 2	5.95	288.61	292.11	0	586.67
Total	**19.81**	**598.81**	**739.09**	**6.45**	**1,364.16**

Source: prepared by Sacramento County in 2024.

In total, implementation of the project would convert a total of 1,364.16 acres of Importance Farmland (19.81 acres of Prime Farmland, 598.81 acres of Farmland of State Importance, 739.09 acres of Farmland of Local Importance, and 6.45 acres of Unique Farmland) to non-agricultural use (see Table 5-5). Note that this evaluation assumes full conversion of the plan area to non-agricultural uses. Although the master plan includes approximately 393 acres of open space/urban farm designation, the master plan does not include specific requirements for development of the urban farmland and it is uncertain whether the urban areas would meet the farmland mitigation credit criteria described in General Plan Policy AG-6. Therefore, no reduction in total agricultural land compensation is assumed at this time.

Source: image provided by Sacramento County in 2024.

Figure 5-2 Important Farmland and Prior Mining Projects with Agriculture Mitigation in the Plan Area

Development within the plan area would be completed over a span of approximately 30 years. Therefore, it is estimated that approximately 45.5 acres of Important Farmland would be converted to non-agricultural use annually over the 30-year period. However, the overall conversion of the approximately 1,364 acres of Importance Farm as a result of the master plan implementation would be substantial according to the General Plan Policy AG-5 definition. Therefore, the project would result in a significant impact related to conversion of farmland to non-agricultural use.

Mitigation Measure AR-1 would require mitigation of farmland (Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Lands) at a 1:1 ratio, consistent with Policy AG-5 of the 2030 General Plan. However, even with this mitigation, the County recognizes that prime soils are a finite resource. When an area is permanently taken out of agricultural production, there has been a net loss of agricultural lands. Other agricultural lands may be preserved through compliance with mitigation, but new agricultural soils would not be created. There would be a substantial net-loss of agricultural production within Sacramento County as a result of the project, and impacts would be **significant and unavoidable**.

MITIGATION MEASURES

MITIGATION MEASURE AR-1: PRESERVATION OF FARMLAND

Prior to Sacramento County's approval of onsite grading permits or improvement plans within the portion of the Plan Area where Prime or Local Importance Farmland is impacted, whichever occurs first, the developers of the master plan shall demonstrate that adequate land has been set aside through participation in the South Sacramento Habitat Conservation Plan to offset the loss of Important Farmland within the portion of the Plan Area proposed for development. Acreage of land preserved shall, at a minimum, result in a 1:1 preservation ratio for the portion of the Plan Area under consideration. Farmland preservation can also be achieved through developing urban farms meeting the requirements identified in Sacramento County 2030 General Plan Policy AG-6.

IMPACT AR-2: RESULT IN CONVERSION OF FARMLAND TO NON-AGRICULTURAL USE DUE TO CONFLICT WITH EXISTING, ADJACENT AGRICULTURAL USE AND ZONING

Agricultural operations may create risks and nuisances for urban residences, schools, and businesses. Health risks and nuisances potentially created by agricultural operations in the plan area could include the following:

- exposure to pesticide and herbicide applications,
- exposure to smoke (from burning) and dust (from soil preparation),
- exposure to noise (from machinery and trucks),
- hazards to children (irrigation channels and ditches), and
- exposure to mosquitoes breeding in flooded fields.

Conversely, urban land uses and the associated population can create operational difficulties for agriculture. Negative effects of urban uses on agriculture could include the following:

- interference with agricultural operations (e.g., limitations on pesticide/herbicide applications, burning, operational hours);
- trespassing, vandalism, and theft because of the proximity of urban uses to agricultural areas; and
- land value impacts because of the proximity to urban areas which tends to increase land values in anticipation of future urban development. This increase reduces the probability that farmers would make long-term investments to maintain the productive potential of the land.

As shown in Figure 2-8, there are areas zoned for agricultural activity within and outside of the plan area. Existing uses of these areas include cropland along Elder Creek Road within the plan area. In addition, there are two nurseries in proximity to the plan area boundary (Matsuda's Nursery and Golden State Growers). Matsuda's Nursery is located on Florin Road east of the intersection of Florin Road and Excelsior Road. Golden State Growers is located on Elder Creek Road northwest of the intersection of Elder Creek Road and Hedge Avenue. Matsuda's Nursery is approximately 900 feet away from FPA C. Golden State Growers is approximately 900 feet away from the southwestern corner of the plan area. The southwestern corner of the plan area is designed for commercial use, mixed use, parkland, and open space.

Although proposed changes to the existing zoning designations would not occur in conjunction with adoption of the master plan, it is assumed that the plan area would be rezoned in the future to be consistent with the land use designations established in the WJHMP (refer to Table 2-1 in Chapter 2, "Project Description"). As described above, the plan includes an open space/urban farm designation that would be applied to three distinct areas, totaling approximately 393 acres. Per County code, these areas could be used for a variety of agricultural uses including limited row crop cultivation and animal husbandry, community gardens, and educational and agricultural processing facilities (e.g., olive oil press, canning machinery). The urban farms would be incorporated into the network of community spaces, and all processing of agricultural products would be 5 acres or less and would adhere to a minimum setback of 200 feet from any residential uses. Due to the placement and design of these areas and the setback requirements enforced through zoning, conflict with adjacent land uses is not anticipated. However, phased development of the WJHMP could result in construction of sensitive uses, such as residences, adjacent to existing agricultural uses that continue to operate in the plan area as buildout occurs. This would be a temporary condition during development of Districts 1 and 2 but may occur longer-term at the interface with the FPAs, which would retain their land use and agricultural zoning designations until subsequent entitlements are pursued. This evaluation assumes full conversion of designated Farmland (see Impact AR-1), and any land use conflicts within the plan area would not have the potential to result in additional conversion of land use.

However, extension of the UPA to include the entirety of the plan area would be required in conjunction with adoption of the WJHMP (as shown in Figure 2-17). Therefore, the project would extend the edge of urban development adjacent to existing agricultural land along the southwestern boundary of the plan area, as mapped in the FMMP and shown in Figure 5-1. This area is planned for future urbanization through separate proposals. Southeast of the plan area and east of Excelsior Road, there are areas of Unique Farmland and Grazing Land that are largely preserve areas or rural development.

As described above, conflicts associated with nuisance dust and noise, as well as trespassing and limitations on agricultural operations, could occur where agricultural land is adjacent to urban uses. Land use conflicts can result in the conversion of agricultural land to non-agricultural uses where restrictions are placed on existing agricultural operations or additional administrative burden results from addressing complaints. These conflicts could threaten the viability of agricultural businesses. Livestock grazing usually involves a lesser potential conflict than row crops because the intensity of the activity is reduced.

Some of the non-participating properties in the FPAs are zoned for agricultural use (see Figure 2-8 in Chapter 2, “Project Description”). The West Jackson Master Plan Overlay would be applied to the FPAs; however, these areas would retain their current General Plan land use designations (General Agriculture – 20 acre minimum and Agricultural-Urban Reserve) with adoption of the WJHMP. Most of these uses are smaller than 80 acres in size, and, therefore, cannot accommodate intensive agricultural operations that tend to be associated with major nuisances such as those listed above.

Given the lack of intensive farming in areas not already planned for urban development, impacts related to conflict with existing, adjacent agricultural uses would be **less than significant**.

Although significant impacts are not anticipated, Mitigation Measure AG-2 is included to ensure compliance with 2030 General Plan Policy AG-4 and not to reduce any potentially significant impact. This mitigation would require noticing to future property owners about potential inconveniences due to nearby agricultural activities. Mitigation Measure AG-2 would require property sellers or agents to provide a notice to prospective buyers for properties within 500 feet of existing agricultural activities. Implementation of Mitigation Measure AG-2 would ensure that the prospective buyers are aware that they could be subject to inconvenience or discomfort resulting from accepted farming activities. Purchasers of properties adjacent to Excelsior Road, Florin Road, and Elder Creek Road would receive notice through the title report that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County Right-To-Farm Ordinance (Sacramento County Code Chapter 14.05) and 2030 General Plan Policy AG-4.

MITIGATION MEASURES

MITIGATION MEASURE AR-2: PROVIDE RIGHT-TO-FARM NOTIFICATION

Prior to the settlement of the real estate transactions, properties sellers and/or agents shall provide a notice to the prospective buyers of properties within 500 feet of existing pasture, cropland, orchards or nurseries. The notice shall appear in the Title Report that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County Right-To-Farm Ordinance.

6 AIR QUALITY

INTRODUCTION

This chapter includes a discussion of existing air quality conditions, a summary of applicable air quality regulations, and an analysis of potential short-term and long-term air quality impacts that could result from implementation of the project. This analysis relies on the findings of the *West Jackson Highway Master Plan Air Quality and Greenhouse Gas Technical Report* (AQMP/GHGRP) prepared by ESA in April 2024 (Appendix B). Mitigation is developed as necessary to reduce significant air quality impacts to the extent feasible.

Comments to the notice of preparation expressed concern regarding increased traffic and associated air pollution within the plan area.

ENVIRONMENTAL SETTING

The plan area is located within the Sacramento Valley Air Basin (SVAB). The SVAB includes all of Butte, Colusa, Glenn, Sacramento, Shasta, Sutter, Tehama, Yolo, and Yuba Counties. The ambient concentrations of air pollutant emissions are determined by the number of emissions released by the sources of air pollutants and the atmosphere's ability to transport and dilute such emissions. Natural factors that affect transport and dilution include terrain, wind, atmospheric stability, and sunlight. Therefore, existing air quality conditions in the area are determined by such natural factors as topography, meteorology, and climate, in addition to the number of emissions released by existing air pollutant sources, as discussed separately below.

CLIMATE, METEOROLOGY, AND TOPOGRAPHY

The SVAB is a relatively flat area bordered by the north Coast Ranges to the west and the northern Sierra Nevada to the east. Air flows into the SVAB through the Carquinez Strait, the only breach in the western mountain barrier, and moves across the Sacramento River–San Joaquin River Delta (Delta) from the San Francisco Bay area.

The Mediterranean climate type of the SVAB is characterized by hot, dry summers and cool, rainy winters. During the summer, daily temperatures range from 50 degrees Fahrenheit (°F) to more than 100°F. The inland location and surrounding mountains shelter the area from much of the ocean breezes that keep the coastal regions moderate in temperature. Most precipitation in the area results from air masses that move in from the Pacific Ocean, usually from the west or northwest, during the winter months. More than half the total annual precipitation falls during the winter rainy season (November through February); the average winter temperature is a moderate 49°F. Also characteristic of SVAB winters are periods of dense and persistent low-level fog, which are most prevalent between storms. The prevailing winds are moderate in speed and vary from moisture-laden breezes from the south to dry land flows from the north.

The mountains surrounding the SVAB create a barrier to airflow, which leads to the entrapment of air pollutants when meteorological conditions are unfavorable for transport and dilution. The highest frequency of poor air movement occurs in the fall and winter when high-pressure cells are often present over the SVAB. The lack of surface wind during these periods, combined with the reduced vertical flow caused by a decline in surface heating, reduces the influx of air and leads to the concentration of air pollutants under stable metrological conditions. Surface concentrations of air pollutant emissions are highest when these conditions occur in combination with agricultural burning activities or with temperature inversions, which hamper dispersion by creating a ceiling over the area and trapping air pollutants near the ground.

May through October is ozone season in the SVAB. This period is characterized by poor air movement in the mornings with the arrival of the Delta sea breeze from the southwest in the afternoons. In addition, longer daylight hours provide a plentiful amount of sunlight to fuel photochemical reactions between reactive organic gases (ROG) and oxides of nitrogen (NO_X), which result in ozone formation. Typically, the Delta breeze transports air pollutants northward out of the SVAB; however, a phenomenon known as the Schultz Eddy prevents this from occurring during approximately half of the time from July to September. The Schultz Eddy phenomenon causes the wind to shift southward and blow air pollutants back into the SVAB. This phenomenon exacerbates the concentration of air pollutant emissions in the area and contributes to the area violating the ambient air quality standards.

Criteria Air Pollutants

Concentrations of criteria air pollutants are used to indicate the quality of the ambient air. A brief description of key criteria air pollutants in the SVAB is provided below. Emission source types and health effects are summarized in Table 6-1. Sacramento County's attainment status for the California Ambient Air Quality Standards (CAAQS) and the National Ambient Air Quality Standards (NAAQS) are shown in Table 6-2.

Ozone

Ozone is a photochemical oxidant (a substance whose oxygen combines chemically with another substance in the presence of sunlight) and the primary component of smog. Ozone is not directly emitted into the air but is formed through complex chemical reactions between precursor emissions of ROG and NO_X in the presence of sunlight. ROG are volatile organic compounds that are photochemically reactive. ROG emissions result primarily from incomplete combustion and the evaporation of chemical solvents and fuels. NO_X are a group of gaseous compounds of nitrogen and oxygen that result from the combustion of fuels.

Emissions of ROG and NO_X decreased from 2000 to 2010 and are projected to continue decreasing from 2010 to 2035 (CARB 2013). This is attributable to more stringent motor vehicle standards and cleaner burning fuels.

Table 6-1 Sources and Health Effects of Criteria Air Pollutants

Pollutant	Sources	Acute[1] Health Effects	Chronic[2] Health Effects
Ozone	Secondary pollutant resulting from the reaction of ROG and NO_X in the presence of sunlight. ROG emissions result from incomplete combustion and evaporation of chemical solvents and fuels; NO_X results from the combustion of fuels	increased respiration and pulmonary resistance; cough, pain, shortness of breath, lung inflammation	permeability of respiratory epithelia, the possibility of permanent lung impairment
Carbon monoxide (CO)	Incomplete combustion of fuels; motor vehicle exhaust	headache, dizziness, fatigue, nausea, vomiting, death	permanent heart and brain damage
Nitrogen dioxide (NO_2)	combustion devices, e.g., boilers, gas turbines, and mobile and stationary reciprocating internal combustion engines	coughing, difficulty breathing, vomiting, headache, eye irritation, chemical pneumonitis or pulmonary edema; breathing abnormalities, cough, cyanosis, chest pain, rapid heartbeat, death	chronic bronchitis, decreased lung function
Sulfur dioxide (SO_2)	coal and oil combustion, steel mills, refineries, and pulp and paper mills	Irritation of the upper respiratory tract, increased asthma symptoms	Insufficient evidence linking SO_2 exposure to chronic health impacts
Respirable particulate matter (PM_{10}), Fine particulate matter ($PM_{2.5}$)	fugitive dust, soot, smoke, mobile and stationary sources, construction, fires, and natural windblown dust, and formation in the atmosphere by condensation and/or transformation of SO_2 and ROG	breathing and respiratory symptoms, aggravation of existing respiratory and cardiovascular diseases, premature death	alterations to the immune system, carcinogenesis
Lead	metal processing	reproductive/ developmental effects (fetuses and children)	numerous effects including neurological, endocrine, and cardiovascular effects

Notes: NO_X = oxides of nitrogen; ROG = reactive organic gases.

[1] "Acute" refers to the effects of short-term exposures to criteria air pollutants, usually at fairly high concentrations.

[2] "Chronic" refers to the effects of long-term exposures to criteria air pollutants, usually at lower, ambient concentrations.

Table 6-2 Attainment Status Designations for Sacramento County

Pollutant	National Ambient Air Quality Standard	California Ambient Air Quality Standard
Ozone	Attainment (1-hour)[1]	Nonattainment (1-hour) Classification-Serious[2]
	Nonattainment (8-hour)[3] Classification=Moderate	Nonattainment (8-hour) Nonattainment (8-hour)
Respirable particulate matter (PM_{10})	Attainment (24-hour)	Nonattainment (24-hour)
		Nonattainment (Annual)
Fine particulate matter ($PM_{2.5}$)	Nonattainment (24-hour)	(No State Standard for 24-Hour)
	Attainment (Annual)	Attainment (Annual)
Carbon monoxide (CO)	Attainment (1-hour)	Attainment (1-hour)
	Attainment (8-hour)	Attainment (8-hour)
Nitrogen dioxide (NO_2)	Unclassified/Attainment (1-hour)	Attainment (1-hour)
	Unclassified/Attainment (Annual)	Attainment (Annual)
Sulfur dioxide (SO_2)[5]	(Attainment Pending) (1-Hour)	Attainment (1-hour)
		Attainment (24-hour)
Lead (Particulate)	Attainment (3-month rolling avg.)	Attainment (30-day average)
Hydrogen Sulfide	No Federal Standard	Unclassified (1-hour)
Sulfates		Attainment (24-hour)
Visibly Reducing Particles		Unclassified (8-hour)
Vinyl Chloride		Unclassified (24-hour)

[1] Air Quality meets federal 1-hour Ozone standard (77 FR 64036). EPA revoked this standard, but some associated requirements still apply. SMAQMD attained the standard in 2009. SMAQMD has requested EPA recognize attainment to fulfill the requirements.

[2] Per Health and Safety Code Section 40921.5(c), the classification is based on 1989–1991 data, and therefore does not change.

[3] 2015 Standard.

[4] 2010 Standard.

Source: CARB 2022a.

Nitrogen Dioxide

Nitrogen dioxide (NO_2) is a brownish, highly reactive gas that is present in all urban environments. The major human-made sources of NO_2 are combustion devices, such as boilers, gas turbines, and mobile and stationary reciprocating internal combustion engines. Combustion devices emit primarily nitric oxide (NO), which reacts through oxidation in the atmosphere to form NO_2. The combined emissions of NO and NO_2 are referred to as NO_X and are reported as equivalent NO_2. Because NO_2 is formed and depleted by reactions associated with photochemical smog (ozone), the NO_2 concentration in a particular geographical area may not be representative of the local sources of NO_X emissions.

Particulate Matter

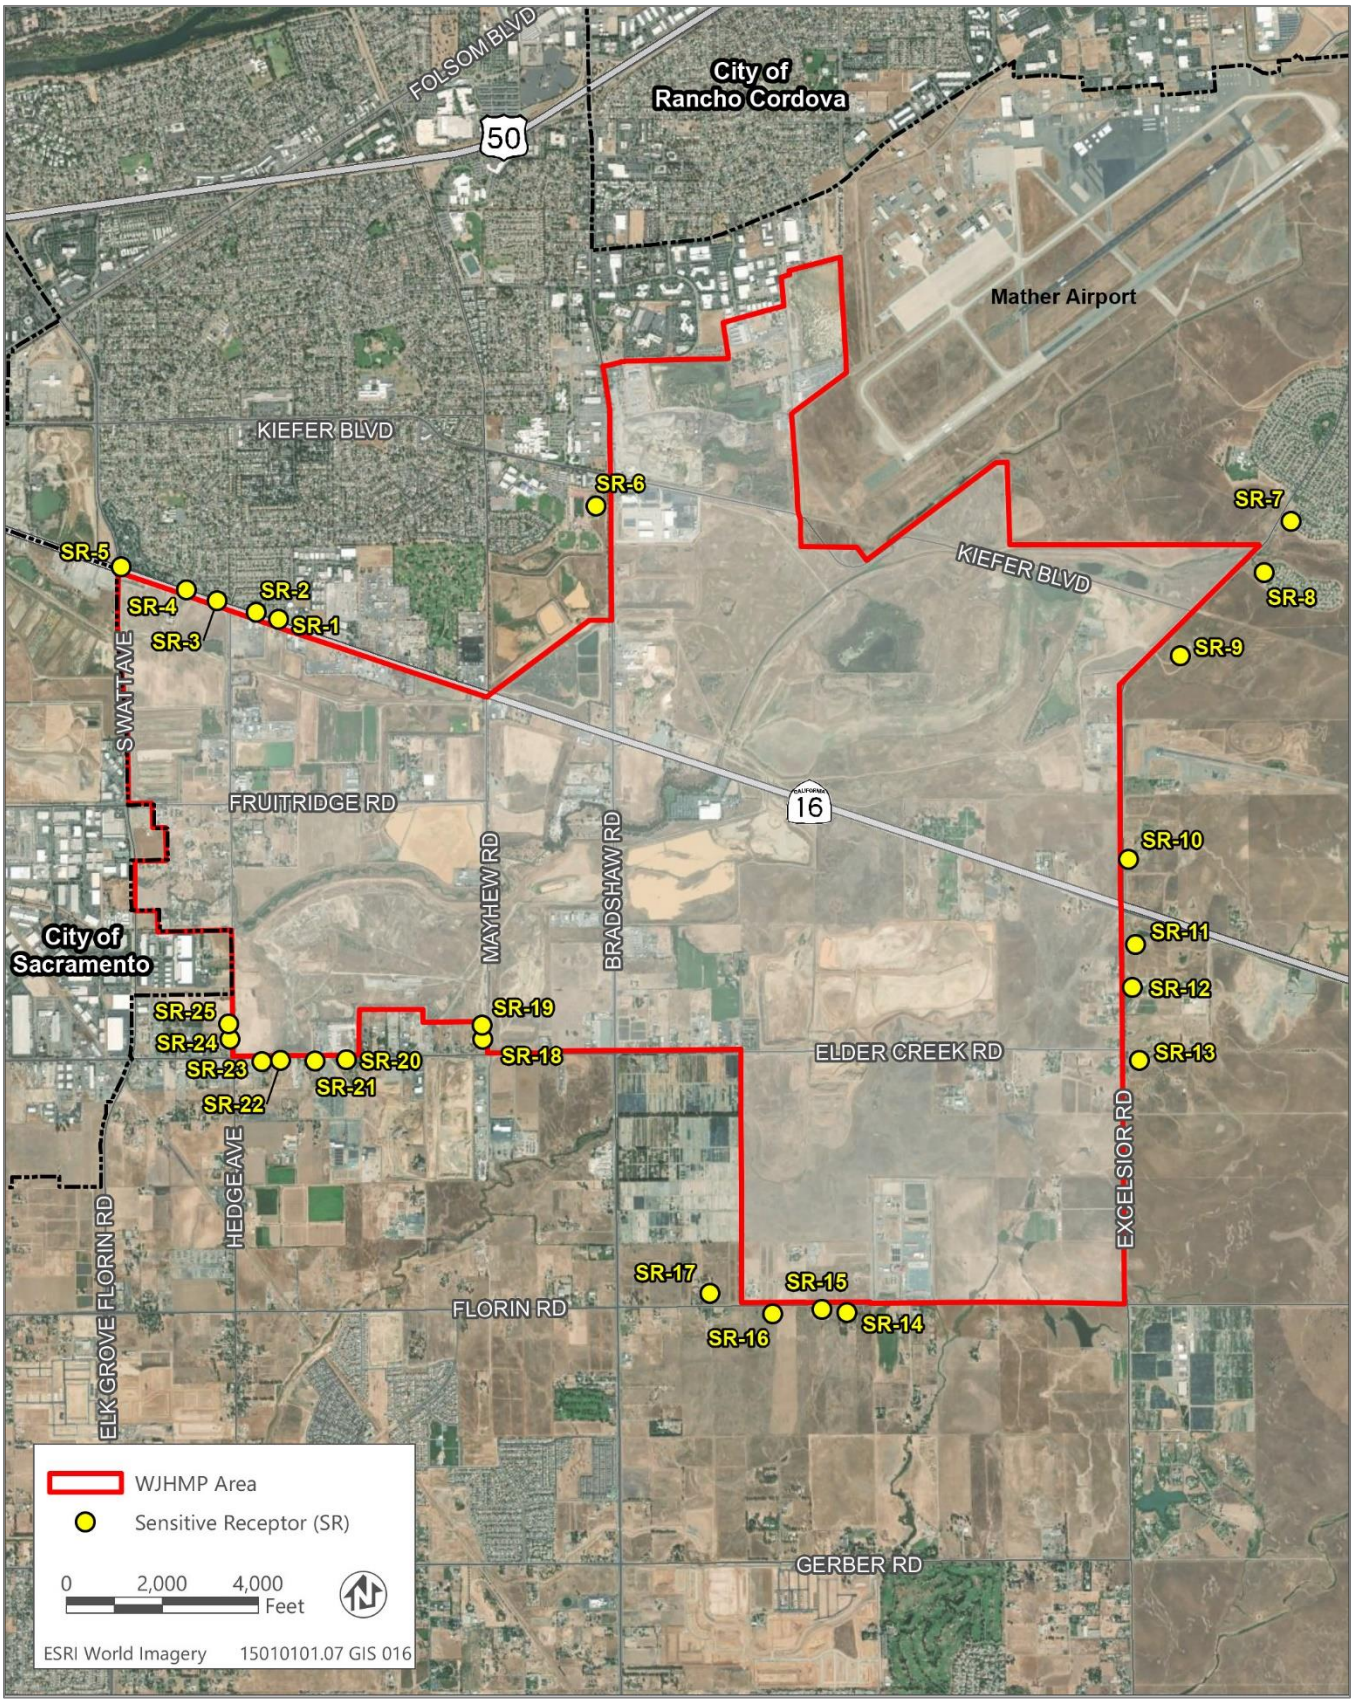
Respirable particulate matter with an aerodynamic diameter of 10 micrometers or less is referred to as PM_{10}. PM_{10} consists of particulate matter emitted directly into the air, such as fugitive dust, soot, and smoke from mobile and stationary sources, construction operations, fires and natural windblown dust, and particulate matter formed in the atmosphere by reaction of gaseous precursors (CARB 2013). Fine particulate matter ($PM_{2.5}$) includes a subgroup of smaller particles that have an aerodynamic diameter of 2.5 micrometers or less. PM_{10} emissions in the SVAB are dominated by emissions from area sources, primarily fugitive dust from vehicle travel on unpaved and paved roads, farming operations, construction and demolition, and particles from residential fuel combustion. Direct emissions of PM_{10} are projected to remain relatively constant through 2035. Direct emissions of $PM_{2.5}$ have steadily declined in the SVAB between 2000 and 2010 but are projected to increase very slightly through 2035 due to CARB's population projections (i.e., increased development and growth within the SVAB). Emissions of $PM_{2.5}$ in the SVAB are dominated by the same sources as emissions of PM_{10} (CARB 2013).

Toxic Air Contaminants

According to the *California Almanac of Emissions and Air Quality* (CARB 2013), health risks from toxic air contaminants (TACs) can largely be attributed to relatively few compounds, the most important being diesel PM (CARB 2013:5-2 to 5-4). Diesel PM differs from other TACs in that it is not a single substance, but rather a complex mixture of hundreds of substances. Although diesel PM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emissions control system is being used. Unlike the other TACs, no ambient monitoring data is available for diesel PM because no routine measurement method currently exists. The TACs for which data are available that pose the greatest existing ambient risk in California are benzene, 1,3-butadiene, acetaldehyde, carbon tetrachloride, hexavalent chromium, para-dichlorobenzene, formaldehyde, methylene chloride, and perchloroethylene. Diesel PM poses the greatest health risk among the 10 TACs mentioned. Overall, statewide emissions of diesel PM are forecasted to decline by 71 percent between 2000 and 2035 (CARB 2013: 3-8). The plan area is not located within 1,000 feet from any stationary or major TAC-emitting roadways; however, the Mather Airport is located directly to the east of the plan area boundary.

Odors

Odors are generally regarded as an annoyance rather than a health hazard. However, manifestations of a person's reaction to foul odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache).



With respect to odors, the human nose is the sole sensing device. The ability to detect odors varies considerably among the population and overall is quite subjective. Some individuals can smell very minute quantities of specific substances; others may not have

the same sensitivity but may have sensitivities to odors of other substances. In addition, people may have different reactions to the same odor; an odor that is offensive to one person may be perfectly acceptable to another (e.g., fast food restaurant). It is important to also note that an unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. This is because of the phenomenon known as odor fatigue, in which a person can become desensitized to almost any odor, and recognition only occurs with an alteration in the intensity.

Odor sources of concern include wastewater treatment plants, sanitary landfills, composting facilities, recycling facilities, petroleum refineries, chemical manufacturing plants, painting operations, rendering plants, food packaging plants, and cannabis (SMAQMD 2016). Several sources of odors are located within the vicinity of the plan area include the Sacramento Rendering Company Plant (2.25 miles east), Granite Hot Asphalt Plant (within the northern portion of the plan area), Teicher Hot Asphalt Plant (0.7 miles to the northwest), Florin-Perkins Landfill (0.75 miles to the west), and L&D Landfill (0.15 miles to the west).

Sensitive receptors

Sensitive receptors are generally considered to include those land uses where exposure to pollutants could result in health-related risks to sensitive individuals, such as children or the elderly. Residential dwellings, schools, hospitals, playgrounds, and similar facilities are of primary concern because of the presence of individuals particularly sensitive to pollutants and/or the potential for increased and prolonged exposure of individuals to pollutants. Sensitive receptors near the plan area include residences to the north, along Rose Parade Way, Hedge Avenue, Burst Court, Thornhill Drive, Prairie Trail Way, and other streets within the Rosemont Junction and Primrose neighborhoods. Additional receptors include Rosemont High School, Sierra Enterprise Elementary School, ABC School, Morgan Junior/Senior High School, Albert Einstein Middle School, Golden Empire Preschool, A.M. Winn Elementary School, George Washington Carver School of Arts and Science, Kitty Hawk School, Mather Youth Academy, and Mather Heights Elementary School. Figure 6-1 below depicts the locations of the nearest reception to the plan area. The project, itself, would also introduce new sensitive receptors.

Source: Adapted by Ascent in 2024.

Figure 6-1 Sensitive Receptors

REGULATORY SETTING

Air quality in the plan area is regulated through the efforts of various federal, State, regional, and local government agencies. These agencies work jointly, as well as individually, to improve air quality through legislation, planning, policymaking, education, and a variety of programs. The agencies responsible for improving the air quality in the SVAB are discussed below.

FEDERAL

CORPORATE AVERAGE FUEL ECONOMY STANDARDS

The National Highway Traffic Safety Administration regulates vehicle emissions through the Corporate Average Fuel Economy (CAFE) Standards.

The CAFE Standards, which were first enacted by Congress in 1975, set fleet-wide averages that must be achieved by each automaker for its car and truck fleet. The purpose of the CAFE Standards is to reduce energy consumption by increasing the fuel economy of cars and light trucks. On April 1, 2022, Transportation Secretary Pete Buttigieg unveiled new CAFE standards for 2024–2026 model year passenger cars and light-duty trucks, requiring new vehicles sold in the US to average at least 40 miles per gallon.

CLEAN AIR ACT

The Clean Air Act (CAA) required the US Environmental Protection Agency (EPA) to establish the NAAQS (42 United States Code Section 7409). As shown in Table 6-3, EPA has established primary and secondary NAAQS for the following criteria air pollutants: ozone, carbon monoxide (CO), NO_2, sulfur dioxide, PM_{10}, $PM_{2.5}$, and lead. The primary standards protect public health, and the secondary standards protect public welfare. The CAA also requires each state to prepare a state implementation plan (SIP) for attaining and maintaining the NAAQS. The federal CAA amendments of 1990 added requirements for states with nonattainment areas to revise their SIPs to incorporate additional control measures to reduce air pollution. Individual SIPs are modified periodically to reflect the latest emissions inventories, planning documents, and rules and regulations of the air basins as reported by their jurisdictional agencies. EPA is responsible for reviewing all SIPs to determine whether they conform to the mandates of the CAA and its amendments and whether implementation will achieve air quality goals. If EPA determines a SIP to be inadequate, a federal implementation plan that imposes additional control measures may be prepared for the nonattainment area. If an approvable SIP is not submitted or implemented within the mandated time frame, sanctions may be applied to transportation funding and stationary air pollution sources in the air basin.

Table 6-3 National and California Ambient Air Quality Standards

Pollutant	Averaging Time	California (CAAQS)[a,b]	National (NAAQS)[c]	
			Primary[b,d]	Secondary[b,e]
Ozone	1-hour	0.09 ppm (180 µg/m^3)	–	Same as primary standard
	8-hour	0.070 ppm (137 µg/m^3)	0.070 ppm (147 µg/m^3)	
Carbon monoxide (CO)	1-hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	Same as primary standard
	8-hour	9 ppm[f] (10 mg/m^3)	9 ppm (10 mg/m^3)	
Nitrogen dioxide (NO_2)	Annual arithmetic mean	0.030 ppm (57 µg/m^3)	53 ppb (100 µg/m^3)	Same as primary standard
	1-hour	0.18 ppm (339 µg/m^3)	100 ppb (188 µg/m^3)	—
Sulfur dioxide (SO_2)	24-hour	0.04 ppm (105 µg/m^3)	—	—
	3-hour	—	—	0.5 ppm (1300 µg/m^3)
	1-hour	0.25 ppm (655 µg/m^3)	75 ppb (196 µg/m^3)	—
Respirable particulate matter (PM_{10})	Annual arithmetic mean	20 µg/m^3	—	Same as primary standard
	24-hour	50 µg/m^3	150 µg/m^3	
Fine particulate matter ($PM_{2.5}$)	Annual arithmetic mean	12 µg/m^3	9.0 µg/m^3	15.0 µg/m^3
	24-hour	—	35 µg/m^3	Same as primary standard
Lead [f]	Calendar quarter	—	1.5 µg/m^3	Same as primary standard
	30-Day average	1.5 µg/m^3	—	—
	Rolling 3-Month Average	–	0.15 µg/m^3	Same as primary standard
Hydrogen sulfide	1-hour	0.03 ppm (42 µg/m^3)	No national standards	
Sulfates	24-hour	25 µg/m^3		
Vinyl chloride [f]	24-hour	0.01 ppm (26 µg/m^3)		
Visibility-reducing particulate matter	8-hour	Extinction of 0.23 per km		

Notes: µg/m^3 = micrograms per cubic meter; km = kilometers; ppb = parts per billion; ppm = parts per million.

[a] California standards for ozone, carbon monoxide, SO_2 (1- and 24-hour), NO_2, particulate matter, and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25 degrees Celsius (°C) and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[c] National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic means) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over three years, is equal to or less than the standard. The PM_{10} 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. The $PM_{2.5}$ 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the US Environmental Protection Agency for further clarification and current federal policies.

[d] National primary standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[e] National secondary standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] The California Air Resources Board has identified lead and vinyl chloride as toxic air contaminants with no threshold of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

Source: CARB 2016, EPA 2024.

TOXIC AIR CONTAMINANTS/HAZARDOUS AIR POLLUTANTS

TACs, or, in federal parlance, hazardous air pollutants (HAPs), are a defined set of airborne pollutants that may pose a present or potential hazard to human health. A TAC is defined as an air pollutant that may cause or contribute to an increase in mortality or in serious illness, or that may pose a hazard to human health. A substance that is listed as a HAP pursuant to subsection (b) of Section 112 of the CAA (42 United States Code Section 7412[b]) is considered a TAC. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations.

A wide range of sources, from industrial plants to motor vehicles, emit TACs. The health effects associated with TACs are quite diverse and generally are assessed locally, rather than regionally. TACs can cause long-term health effects, such as cancer, birth defects, neurological damage, asthma, bronchitis, and genetic damage, or short-term acute effects, such as eye-watering, respiratory irritation (a cough), running nose, throat pain, and headaches.

For evaluation purposes, TACs are separated into carcinogens and noncarcinogens based on the nature of the physiological effects associated with exposure to the pollutant. Carcinogens are assumed to have no safe threshold below which health impacts would not occur. This contrasts with criteria air pollutants, for which acceptable levels of exposure can be determined and for which ambient standards have been established (Table 6-3). Cancer risk from TACs is expressed as excess cancer cases per one million exposed individuals, typically over a lifetime of exposure.

EPA and, in California, the California Air Resources Board (CARB) regulate HAPs and TACs, respectively, through statutes (i.e., 42 United States Code Section 7412[b]) and regulations that generally require the use of the maximum achievable control technology or best available control technology (BACT) for toxics to limit emissions.

STATE

CARB is the agency responsible for coordination and oversight of State and local air pollution control programs in California and for implementing the California Clean Air Act (CCAA). The CCAA, which was adopted in 1988, required CARB to establish CAAQS (Table 3.2-1).

CRITERIA AIR POLLUTANTS

CARB has established CAAQS for sulfates, hydrogen sulfide, vinyl chloride, visibility-reducing particulate matter, and the above-mentioned criteria air pollutants. In most cases, the CAAQS are more stringent than the NAAQS. Differences in the standards are generally explained by the health effects studies considered during the standard-setting process and the interpretation of the studies. In addition, the CAAQS incorporates a margin of safety to protect sensitive individuals.

The CCAA requires that all local air districts in the state endeavor to attain and maintain the CAAQS by the earliest date practical. It specifies that local air districts should focus particular attention on reducing the emissions from transportation and areawide emission sources, and it provides air districts with the authority to regulate indirect emission sources.

CARB regulates the emission of criteria air pollutants through several programs, regulations, and plans. The 2022 State SIP Strategy (2022 SIP) serves as a compilation document of all actions taken by CARB and local air districts to further the attainment of the NAAQS. Pertinent regulations to the project included in the 2022 SIP include, the Advanced Clean Cars II Program, Advanced Clean Fleets, and Zero-Emissions Trucks Measure, which all serve to electrify the transportation sector through sales requirements for benchmark years (CARB 2022b).

Toxic Air Contaminants

TACs in California are regulated primarily through the Tanner Air Toxics Act (Assembly Bill [AB] 1807, Chapter 1047, Statutes of 1983) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588, Chapter 1252, Statutes of 1987). AB 1807 sets forth a formal procedure for CARB to designate substances as TACs. Research, public participation, and scientific peer review are required before CARB can designate a substance as a TAC. To date, CARB has identified more than 21 TACs and adopted EPA's list of HAPs as TACs. Most recently, particulate matter (PM) exhaust from diesel engines (diesel PM) was added to CARB's list of TACs.

After a TAC is identified, CARB then adopts an airborne toxics control measure for sources that emit that particular TAC. If a safe threshold exists for a substance at which there is no toxic effect, the control measure must reduce exposure below that threshold. If no safe threshold exists, the measure must incorporate the best available control technology for toxics to minimize emissions.

The Hot Spots Act requires that existing facilities that emit toxic substances above a specified level prepare an inventory of toxic emissions, prepare a risk assessment if emissions are significant, notify the public of significant risk levels, and prepare and implement risk reduction measures.

CARB has adopted diesel exhaust control measures and more stringent emissions standards for various transportation-related mobile sources of emissions, including transit buses, and off-road diesel equipment (e.g., tractors, generators). Over time, the replacement of older vehicles will result in a vehicle fleet that produces substantially lower levels of TACs than under current conditions. Mobile-source emissions of TACs (e.g., benzene, 1-3-butadiene, diesel PM) have been reduced significantly over the last decade and will be reduced further in California through a progression of regulatory measures (e.g., Low Emission Vehicle/Clean Fuels and Phase II reformulated gasoline regulations) and control technologies. With the implementation of CARB's Risk Reduction Plan and other regulatory programs, it is estimated that emissions of diesel PM will be less than half of those in 2010 by 2035. Adopted regulations are also expected to continue to reduce formaldehyde emissions emitted by cars and light-duty trucks. As emissions are reduced, it is expected that risks associated with exposure to the emissions will also be reduced.

LOCAL

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

CRITERIA AIR POLLUTANTS

The Sacramento Metropolitan Air Quality Management District (SMAQMD) is the primary agency responsible for planning to meet NAAQS and CAAQS in Sacramento County. SMAQMD works with other local air districts in the Sacramento region to maintain the region's portion of the SIP for ozone. The SIP is a compilation of plans and regulations that govern how the region and State will comply with the CAA requirements to attain and maintain the NAAQS for ozone. The Sacramento Region has been designated as a "moderate" 2015 8-hour ozone nonattainment area with an extended attainment deadline of June 15, 2019. The 2018 Sacramento Regional 2008 8-Hour Ozone Attainment and Further Reasonable Progress Plan was approved by CARB on November 16, 2017. The previous 2013 Update to the 8-Hour Ozone Attainment and Reasonable Further Progress Plan was approved and promulgated by EPA for the 1997 8-Hour Ozone Standard. EPA has not released a notice of approval and promulgation of the 2017 SIP (CARB 2017). At a public meeting held on October 26, 2023, CARB approved the 2023 Sacramento Regional Plan for the 2015 70-ppb 8-Hour Ozone Standard (2023 Plan). The 2023 Plan was prepared by the five local air districts of the Sacramento Federal Non-attainment Area (Sacramento Region, or SFNA), with the support of CARB.

SMAQMD has developed a set of guidelines for use by lead agencies when preparing environmental documents. The guidelines contain thresholds of significance for criteria pollutants and TACs, and also make recommendations for conducting air quality analyses. After SMAQMD guidelines have been consulted and the air quality impacts of a project have been assessed, the lead agency's analysis undergoes a review by SMAQMD. SMAQMD submits comments and suggestions to the lead agency for incorporation into the environmental document.

All projects are subject to adopted SMAQMD rules and regulations in effect at the time of construction. Specific rules relevant to the construction of future development in the WJHMP area may include the following:

- **Rule 201**: **General Permit Requirements.** Any project that includes the use of equipment capable of releasing emissions to the atmosphere may be required to obtain permit(s) from SMAQMD before equipment operation. The applicant, developer, or operator of a project that includes an emergency generator, boiler, or heater should contact SMAQMD early to determine whether a permit is required, and to begin the permit application process. Portable construction equipment (e.g., generators, compressors, pile drivers, lighting equipment) with an internal combustion engine greater than 50 horsepower must have a SMAQMD permit or CARB portable equipment registration.

- **Rule 202**: **New Source Review.** The purpose of this rule is to provide for the issuance of authorities to construct and permits to operate at new and modified stationary air pollution sources and to provide mechanisms, including emission offsets, by which authorities to construct such sources may be granted without interfering with the attainment or maintenance of ambient air quality standards.
- **Rule 207**: **Federal Operating Permit.** The purpose this rule is to establish an operating permitting system consistent with the requirements of Title V of the United States Code and pursuant to 40 FR Part 70. Stationary sources subject to the requirements of this rule are also required to comply with any other applicable federal, state, or SMAQMD orders, rules, and regulations, including requirements pertaining to prevention of significant deterioration pursuant to Rule 203, requirements to obtain an authority to construct pursuant to Rule 201, or applicable requirements under SMAQMD's new source review rule in the SIP.
- **Rule 402**: **Nuisance.** A person shall not discharge from any source whatsoever such quantities of air contaminants or other materials which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause or have natural tendency to cause injury or damage to business or property.
- **Rule 403**: **Fugitive Dust.** The developer or contractor is required to control dust emissions from earthmoving activities or any other construction activity to prevent airborne dust from leaving the project site. Fugitive dust controls include the following:
    - Water all exposed surfaces two times daily.
    - Cover or maintain at least 2 feet of free board on haul trucks transporting soil, sand, or other loose material on the site.
    - Use wet power vacuum street sweepers to remove any visible trackout mud or dirt onto adjacent public roads at least once a day.
    - Limit vehicle speeds on unpaved roads to 15 miles per hour.
    - All roadways, driveways, sidewalks, parking lots to be paved should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.
    - Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes.
    - Maintain all construction equipment in proper working condition according to manufacturer's specifications.
- **Rule 442: Architectural Coatings.** The purpose of this rule is to limit the emissions of volatile organic compounds from the use of architectural coatings supplied, sold, offered for sale, applied, solicited for application, or manufactured for use within Sacramento County.

- **Rule 902**: **Asbestos.** The developer or contractor is required to notify SMAQMD of any regulated renovation or demolition activity. Rule 902 contains specific requirements for surveying, notification, removal, and disposal of material containing asbestos.

In addition, if modeled construction-generated emissions for a project are not reduced to levels below SMAQMD's mass emission threshold (of 85 pounds per day [lb/day] for nitrogen oxide [NO_X], 80 lb/day or 13.2 tons per year (tpy) for PM_{10}, and 82 lb/day or 15 tpy for $PM_{2.5}$) after the standard construction mitigation is applied, then SMAQMD requires an offsite construction mitigation fee to purchase offsite emissions reductions. Such purchases are made through SMAQMD's Heavy Duty Incentive Program, through which select owners of heavy-duty equipment in Sacramento County can repower or retrofit their old engines with cleaner engines or technologies (SMAQMD 2019).

As discussed in greater detail below in the "Thresholds of Significance" and "Methodology" sections, the thresholds of significance have been developed in consideration of long-term regional air quality planning. Projects that are found to emit emissions in exceedance of these bright-line thresholds would generate a cumulatively considerable contribution of regional air pollution which could obstruct the region's attainment of the NAAQS and/or CAAQS or cause a localized exceedance of these concentration-based standards within the SVAB. Conversely, projects that emit levels of air pollution below these thresholds would not affect the SVAB's ability to attain the NAAQs and/or CAAQS.

TOXIC AIR CONTAMINANTS

At the local level, air districts may adopt and enforce CARB control measures for TACs. Under SMAQMD Rule 201 ("General Permit Requirements"), Rule 202 ("New Source Review"), and Rule 207 ("Federal Operating Permit"), all sources that possess the potential to emit TACs are required to obtain permits from SMAQMD. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including New Source Review standards and air toxics control measures. SMAQMD limits emissions and public exposure to TACs through a number of programs. SMAQMD prioritizes TAC-emitting stationary sources based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors. Sensitive receptors are people, or facilities that generally house people (e.g., schools, hospitals, residences), that may experience adverse effects from unhealthful concentrations of air pollutants.

HEALTH EFFECTS

SMAQMD has also issued *Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District, Sacramento, California,* which contains guidance on how to address the California Supreme Court decision in Sierra Club v. County of Fresno, 6 Cal.5th 502 (2018)—a court decision often referred to as the Friant Ranch decision (SMAQMD 2020a). In that decision, the California Supreme Court held that an EIR should "relate the expected adverse air quality impacts to likely health consequences or explain in meaningful detail why it is not feasible at the time of drafting

to provide such an analysis." SMAQMD's guidance recommends using the Minor Project Health Effects Tool to estimate the level of health effects for an emissions source that results in emissions at or below criteria air pollutant and precursor thresholds of significance. The sole input for the Minor Project Health Effects Tool is the project's geographical location, and the output of the Minor Project Health Effects Tool is based on that location and modeled emissions at 82 pounds per day (lb/day) of NO_X, ROG, or particulate matter, which are the highest thresholds of significance for each of these pollutants in the SMAQMD and neighboring air districts. Therefore, the Minor Project Health Effects Tool is used for projects with emissions at or below air district thresholds of significance. To estimate health effects for larger projects at strategic locations in the SFNA, a Strategic Area Project Health Effects Screening Tool (Strategic Area Project Tool) was developed with additional photochemical and health effects modeling for six locations at NO_X, ROG, and $PM_{2.5}$ emission rates two times and eight times the 82 lb/day thresholds of significance level. The user selects one of the six modeled locations and inputs the NO_x, ROG, and $PM_{2.5}$ emission rates for the proposed project. The Strategic Area Project Tool interpolates the health effects from the modeled emission rates to generate a health effects summary table for the user supplied emissions at the user selected location. Based on the magnitude of the project, the Strategic Area Project Health Effects Tool contained in the guidance was used to evaluate the project's incremental health effects. The Strategy Area Project II, "Rancho Cordova," was used for the model. Based on the impact determinations summarized below, the project's associated adverse health outcomes were only estimated for operational emissions.

ODORS

Although offensive odors rarely cause any physical harm, they can be very unpleasant, leading to considerable stress among the public and often generating citizen complaints to local governments and SMAQMD. SMAQMD's Rule 402 ("Nuisance") regulates odors.

SACRAMENTO COUNTY GENERAL PLAN

The Sacramento County General Plan contains the following policies from the Air Quality Element that are applicable to the project:

- **Policy AQ-1.** New development shall be designed to promote pedestrian/bicycle access and circulation to encourage community residents to use alternative modes of transportation to conserve air quality and minimize direct and indirect emission of air contaminants.
- **Policy AQ-3.** Buffers and/or other appropriate exposure reduction measures shall be established on a project-by-project basis and incorporated during review to provide for protection of sensitive receptors from sources of air pollution or odor. CARB's "Strategies to Reduce Air Pollution Exposure Near High Volume Roadways" Technical Advisory and the AQMD's "Mobile Sources Air Toxics Protocol" or applicable AQMD guidance shall be utilized when establishing these exposure reduction measures.

- **Policy AQ-4.** Developments which meet or exceed thresholds of significance for ozone precursor pollutants, and/or Greenhouse Gases (GHG) as adopted by SMAQMD, shall be deemed to have a significant environmental impact. An Air Quality Mitigation Plan and/or a Greenhouse Gas Reduction Plan shall be submitted to the County of Sacramento prior to project approval, subject to review and recommendation as to technical adequacy by SMAQMD.
- **Policy AQ-4A.** Residential zones should not be located adjacent to industrial zones (M-1 and M-2) or general agriculture zones (AG-10 to 160). In the event that a residential zone is located adjacent to an industrial or agricultural zone, the developer of the property(ies) being rezoned shall be required to implement exposure reduction measures developed in consultation with the SMAQMD.
- **Policy AQ-10.** Encourage vehicle trip reduction and improved air quality by requiring development projects that exceed the SMAQMD's significance thresholds for operational emissions to provide on-going, cost-effective mechanisms for transportation services that help reduce the demand for existing roadway infrastructure.
- **Policy AQ-11.** Encourage contractors operating in the county to procure and to operate low-emission vehicles, and to seek low emission fleet status for their off-road equipment.
- **Policy AQ-13.** Use California State Air Resources Board (ARB) and SMAQMD guidelines for Sacramento County facilities and operations to comply with mandated measures to reduce emissions from fuel consumption, energy consumption, surface coating operations, and solvent usage.
- **Policy AQ-17.** Promote optimal air quality benefits through energy conservation measures in new development.
- **Policy AQ-19.** Require all feasible reductions in emissions for the operation of construction vehicles and equipment on major land development and roadway construction projects.
- **Policy AQ-20.** Promote Cool Community strategies to cool the urban heat island, reduce energy use and ozone formation, and maximize air quality benefits by encouraging four main strategies including, but not limited to: plant trees, selective use of vegetation for landscaping, install cool roofing, and install cool pavements.
- **Policy AQ-21.** Support SMAQMD's particulate matter control measures for residential wood burning and fugitive dust.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan does not contain specific policies related to air quality.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan does not contain specific policies related to air quality.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

Implementing the project would have a significant impact related to air quality such that human health would be adversely affected if it would (SMAQMD 2020b):

- cause construction-generated criteria air pollutant or precursor emissions to exceed the SMAQMD-recommended thresholds of 85 lb/day for NOX, 80 lb/day or 13.2 tpy for PM10, and 82 lb/day or 15 tpy for PM2.5 after SMAQMD's Basic Construction Emission Control Practices (construction BMPs) have been implemented;
- result in a net increase in long-term operational criteria air pollutant or precursor emissions that exceed the SMAQMD-recommended thresholds of 65 lb/day for ROG and NOX, 80 lb/day or 13.2 tpy for PM10, and 82 lb/day or 15 tpy for PM2.5 after SMAQMD's BACT and operational BMPs have been applied;
- result in short-term construction and long-term operational local mobile-source CO emissions that would violate or contribute substantially to concentrations that exceed the 1-hour CAAQS of 20 ppm or the 8-hour CAAQS of 9 ppm;
- expose any off-site sensitive receptor to a substantial incremental increase in TACs emissions that exceed 10 in 1 million for carcinogenic risk (i.e., the risk of contracting cancer) and/or a noncarcinogenic hazard index of 1.0 or greater;
- conflict with or obstruct implementation of the applicable air quality plan; and/or
- result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

ISSUES NOT DISCUSSED FURTHER

All the issues identified in the significance criteria are addressed in the following analysis.

METHODOLOGY

Regional and local criteria air pollutant emissions and associated impacts, as well as impacts from TACs, CO concentrations, and odors were assessed in accordance with Sacramento County and SMAQMD-recommended methodologies using the findings of the AQMP/GHGRP prepared for the project (ESA 2024). The project's emissions were compared to SMAQMD's construction and operational thresholds.

CRITERIA AIR POLLUTANTS AND OZONE PRECURSORS

Construction-related emissions of criteria air pollutants and precursors were estimated using the California Emissions Estimator Model (CalEEMod) Version 2020.4.0 computer program (CAPCOA 2020), which was reviewed and approved for use in the project analysis by the SMAQMD (see Appendix B). Modeling was based on the proposed land use plan and project-specific information (e.g., size, number of residential units proposed, area to be graded, area to be paved), where available; reasonable assumptions based on typical construction activities; and default values in CalEEMod that are based on the project's location (e.g., meteorology, emissions factors) and land use types. The impact analysis includes general mitigation that would be applicable to all future construction projects. Future project-level analyses should utilize the SMAQMD screening methods to determine the appropriate level of analysis required.

Since the master plan would be built out based on market demand, the exact phasing of construction is unknown. It is anticipated that the buildout period would occur over 30 years based on the MTP/SCS economic analyses showing the overall anticipated development horizon for the region. A buildout period of 30 years is a conservative estimate given the size and amount of development allowed in the master plan. The master plan covers almost 6,000 acres of land and provides 16,484 residential units and over 13 million square feet of non-residential development. Other recently approved projects in the area such as the Mather South Master Plan and the NewBridge Specific Plan are not as large, covering 848 acres with 3,522 residential units and 1,095 acres with 2,915 residential units, respectively. As noted in the text above, the MTP/SCS contains a projected level of economic growth for the SACOG region and then estimates the number of new housing units to meet the employment levels that will support that economic growth. Projected growth patterns (i.e., the location of growth) are estimates, only, and growth may occur in areas identified in the MTP/SCS or in other areas approved later by local agencies. In addition, the "Future Planning Areas" for the master plan are likely beyond the 30-year horizon.

For this analysis, the first year of construction was modeled to approximate the worst-case construction emissions. Equipment used during the first year of construction would be equipped with engines that are expected to emit more criteria pollutant emissions than construction equipment used in later construction years. This is because construction equipment becomes cleaner over time as older, less efficient equipment is replaced through fleet turnover with newer, cleaner equipment that meets more stringent emission standards as required by CARB and EPA. Since the project would likely be built out over a 30-year period as discussed above, it is assumed that 1/30th of the proposed developments would be constructed in the year 2025. The following assumptions were used in CalEEMod to estimate emissions for year 1 (2025) construction activities. It is assumed that the master plan would require 500,000 cubic yards of soil import during the grading phase. Assuming the haul trucks used during project construction can carry 16 cubic yards of soil each and construction will be completed over a 30-year period, the first year of construction could result in 2,083 one-way haul truck trips associated with 16,667 cubic yards of soil. Assuming 1/30th of the project would be constructed in 2025, total soil import or 50,000 cubic yards, which

would result in 6,250 one-way haul truck trips. CalEEMod defaults for number of construction equipment per construction phase and daily worker and vendor trips were used. Additional information and model results for each of the analyses described above are presented in Appendix B.

The proposed development under the project is assumed to be fully built out in the year 2055. Since CalEEMod version 2020.4.0 only allows the user to enter operational years up to the year 2050, it was not possible to model an operational year 2055 in CalEEMod. Therefore, for this analysis, criteria pollutant emissions under the master plan were modeled for operational year 2050 using CalEEMod version 2020.4.0. This approach is conservative as emissions rates will likely be higher in 2050 than in 2055 due to continual improvements in vehicle technology, emission controls, and fuel efficiency. Although there are existing uses within the plan area, criteria pollutant emissions for these uses were not modeled due to their limited number, and emissions from these uses would be minor. It is also conservative to assume zero emissions from existing uses because these emissions would be subtracted from master plan emissions to determine the net change in emissions from the master plan. Since construction of the master plan is anticipated to begin in 2025, it is assumed that all buildings will be constructed to 2022 Title 24 energy efficiency standards (which was adopted August 11, 2021). Future Title 24 requirements were not modeled because the specific requirements are not known this time. The 2022 energy efficiency standards require solar for all new single-family homes and for all multifamily buildings up to three stories. For the purposes of this analysis, and in accordance with SMAQMD's recommended methodology for the preparation of AQMPs, the project's unmitigated emissions were modeled assuming that natural gas would be allowed within the plan area. Although the project is designed to be fully electric, the emissions reductions from this project design feature are captured in the AQMP and credited to the project.

For on-road vehicles, criteria pollutant emissions and GHG emissions were calculated using EMFAC2021 v1.0.2, which only allows the user to enter operational years up to 2050. Vehicle miles traveled (VMT) per speed bin is based on data provided in the VMT Analysis Memos (DKS Associates 2023; Kimley-Horn 2023), which evaluate the VMT effects of the WJHMP. Additional information and model results of the operational analysis of criteria air pollutants described above are presented in Appendix B. Refer to Chapter 19, "Transportation," in this EIR for further discussion of VMT.

The Sacramento County General Plan Policy AQ-4 requires that projects exceeding the SMAQMD operational threshold for ozone precursors (i.e., ROG and NO_X) prepare an air quality mitigation plan (AQMP), as recommended by SMAQMD. For projects that are included in the current SIP, SMAQMD recommends a 15 percent reduction of ozone precursors from mobile-source emissions. For projects not included in the current SIP, SMAQMD recommends a 35 percent reduction of ozone precursors from mobile-source emissions.

For the project, only the land uses west of Bradshaw Road are included in the SACOG's MTP/SCS and, therefore, are included within the SIP. The land uses proposed east of Bradshaw Road are not included in SMAQMD's SIP. SMAQMD's AQMP guidance does

not specify a percentage reduction to use for projects partially accounted for in the SIP. By calculating the master plan's VMT included in the SIP, a "blended rate" mitigated reduction goal of 29 percent below an unmitigated scenario could be used to show consistency with regional air quality plans. This blended rate reduction goal was developed through coordination with County and SMAQMD staff and represents the amount of VMT for the master plan land uses west of Bradshaw Road compared to the total WJHMP VMT. However, to provide a conservative analysis of the AQMP requirement for the master plan, a 35 percent reduction of ozone precursors from mobile-source emissions below an unmitigated scenario was used in the AQMP. In compliance with both the General Plan policies and SMAQMD guidance, the project has prepared an AQMP to define the processes by which emissions of ROG and NO_X would be reduced by 35 percent. The AQMP, including detail on and the derivation of the 35 percent reduction requirement, can be found in Appendix B.

West Jackson Highway Master Policies

The WJHMP includes the following policies related to air quality.

- **Policy 5.2.** Future development applications shall work with the County to implement the mobility system as shown in Figure 5.13 Transit Plan and Figure 5.14 Proposed Trails, which illustrates the non-vehicular system of multi-use trails, on-street bike lanes and transit facilities.
- **Policy 6.27.** A tree planting plan shall accompany all tentative map applications and can be provided in the form of a conceptual landscape plan.
- **Policy 9.2.** Future development shall provide access to multi-modal transit opportunities and access to a healthy mix of businesses, childcare, senior services, and housing. This is to encourage development that reduces VMT, decreases distances between jobs and housing, reduces traffic impacts, and improves housing affordability.
- **Policy 9.3.** Future development shall achieve improvements in overall public health by encouraging a healthier living environment that includes walkable neighborhoods, access to recreation and open space, healthy foods and public transit.

Impacts and Analysis

Impact AIR-1: Generate Construction Emissions of Criteria Air Pollutants and Precursors (ROG, NO_X, PM_{10}, and $PM_{2.5}$) that Exceed Standards

Construction emissions are described as "short-term" or temporary in duration. Although project construction is anticipated to occur for an extended period of approximately 30 years and individual construction projects would occur intermittently throughout the entire period, a worst-case construction year was modeled for 2025 representing build-out of 1/30th of the total plan area. This is considered conservative as emissions would

inherently decrease over the 30-year construction period of the project as regulatory mechanisms improve the fuel economy of heavy-duty construction equipment and on-road vehicles.

Typical construction activities could require all-terrain forklifts, cranes, pick-up and fuel trucks, compressors, loaders, backhoes, excavators, dozers, scrapers, pavement compactors, welders, concrete pumps and concrete trucks, and off-road haul trucks, as well as other diesel-fueled equipment. Construction-related activities would result in emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ (a subset of PM_{10}) from site preparation (e.g., excavation, clearing), off-road equipment, material delivery, worker commute trips, and other miscellaneous activities (e.g., building construction, asphalt paving, application of architectural coatings). Fugitive dust emissions of PM_{10} and $PM_{2.5}$ are associated primarily with site preparation and vary as a function of soil silt content, soil moisture, wind speed, acreage of disturbance, and VMT on and off the site. Emissions of the ozone precursors ROG and NO_X, are associated primarily with construction equipment and on-road mobile exhaust. Paving and the application of architectural coatings would result in off-gas emissions of ROG. PM_{10} and $PM_{2.5}$ are also contained in vehicle exhaust.

It is expected that construction would occur over a series of phases; however, the order in which the development areas would be constructed is unknown. While the WJHMP contains a land use map (see Chapter 2, “Project Description”), there is inherent uncertainty surrounding market forces and approval of individual development applications, which could affect the timing and phasing of project construction. Ultimately, construction phasing and activities would be driven by prevailing market conditions in any given year. Therefore, construction was assumed to be evenly spread by year. Conservative assumptions were used and individual construction phases (e.g., site preparation, grading, building construction) were overlapped to account for construction activities occurring simultaneously at different locations throughout the entire plan area in anticipation of periods with above-average construction activities. As such, reported emissions represent a conservative estimate of maximum daily emissions for each year of construction.

Table 6-4 summarizes the unmitigated maximum daily emissions modeled to result from the first possible year of construction in 2025. As noted above, as construction continues into the future, equipment exhaust emission rates would decrease as newer, more emission-efficient construction equipment replaces older, less efficient equipment. For assumptions and modeling inputs, refer to Appendix B.

Table 6-4 Summary of Unmitigated Maximum Daily Emissions of Criteria Air Pollutants and Precursors Associated with Project Construction (2025)

Scenario	ROG (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	PM_{10} (tpy)	$PM_{2.5}$ (lb/day)	$PM_{2.5}$ (tpy)
Worst-Case	1,134	166	24	4.5	8	3.2
SMAQMD Threshold of Significance	None	85	0[1]	0[1]	0[1]	0[1]
Exceeds Threshold?	NA	Yes	Yes	Yes	Yes	Yes

Notes: ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; lb/day = pounds per day; tpy = tons per year; SMAQMD = Sacramento Metropolitan Air Quality Management District.

Maximum daily emissions represent overlapping construction phases under a worst-case scenario in 2025. See Appendix B for details.

[1] SMAQMD recommends using a 0 lb/day and 0 tpy threshold of significance for evaluating construction-related emissions of PM_{10} and $PM_{2.5}$ prior to the implementation of best management practices or best available control technology. Following implementation of best management practices and/or best available control technology, construction emissions of PM_{10} are evaluated against a threshold of significance of 80 lb/day or 14.6 tpy and $PM_{2.5}$ is evaluated against a threshold of significance of 82 lb/day or 15 tpy.

Source: Modeled by ESA in 2024.

As shown above in Table 6-4, the project's unmitigated construction emissions would exceed SMAQMD's thresholds for NO_X, PM_{10}, and $PM_{2.5}$. This level of emissions could result in adverse health outcomes within the SVAB and would be **significant**.

Table 6-5 summarizes the project's mitigated emissions following the application of Mitigation Measures AIR-1a and 1b. By paying the appropriate off-site mitigation fee if and as required by Mitigation Measure AIR-1b, construction-generated emissions of NO_X would be reduced to a less-than-significant level. The fee calculation to offset daily NO_X emissions shall be based on the SMAQMD-determined cost to reduce one ton of NO_X applicable at the time (currently $30,000 per ton but subject to change in future years). As shown in Table 6-5, Mitigation Measures AIR-1a and 1b would be sufficient to reduce the project's construction emissions of NO_X, PM_{10}, and $PM_{2.5}$ to below SMAQMD's thresholds of significance. This impact would be **less than significant with mitigation**.

Table 6-5 Summary of Mitigated Maximum Daily Emissions of Criteria Air Pollutants and Precursors Associated with Project Construction (2025)

Scenario	ROG (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	PM_{10} (tpy)	$PM_{2.5}$ (lb/day)	$PM_{2.5}$ (tpy)
Worst-Case	1,133	37	21	1.6	6	.0
SMAQMD Threshold of Significance	None	85	80[1]	82[1]	14.6[2]	15[2]
Exceeds Threshold?	NA	No	No	No	No	No

Notes: ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; lb/day = pounds per day; tpy = tons per year; SMAQMD = Sacramento Metropolitan Air Quality Management District.

Maximum daily emissions represent overlapping construction phases under a worst-case scenario in 2025. See Appendix B for details.

[1] If all feasible BACT/BMPs are applied, then 82 lb/day and 15 tpy. Project complies with the California Building Code and is therefore subject to this threshold.

[2] If all feasible BACT/BMPs are applied, then 80 lb/day and 14.6 tpy. Project complies with the California Building Code and is therefore subject to this threshold.

Source: Modeled by ESA in 2024.

MITIGATION MEASURES

MITIGATION MEASURE AIR-1A: SMAQMD'S BASIC CONSTRUCTION EMISSION CONTROL PRACTICES

For all future land use development applications processed within the plan area, future project applicants, its designee, or subsequent developer(s), shall require its construction contractors to implement SMAQMD's Basic Construction Emission Control Practices in place at the time of construction, which currently include the following:

- water all exposed surfaces two times daily (exposed surfaces include, but are not limited to soil piles, graded areas, unpaved parking areas, staging areas, and access roads);
- cover or maintain at least 2 feet or free board space on haul trucks transporting soil, sand, or other loose material on the site and cover any haul trucks traveling along freeways or major roadways;
- use wet power vacuum street sweepers to remove any visible trackout mud or dirt onto adjacent public roads at least once a day (note: use of dry power sweeping is prohibited);
- limit vehicle speeds on unpaved roads to 15 miles per hour (mph);
- complete construction of all roadways, driveways, sidewalks, parking lots as soon as possible;
- building pads should be laid as soon as possible after grading unless seeding or soil binders are used;
- provide clear signage the entrances to construction sites that posts the requirement to minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes [required by California Code of Regulations, Title 13, sections 2449(d)(3) and 2485]; and
- maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determined to be running in proper condition before it is operated.

These measures shall be included in project improvement plans as a condition of approval.

MITIGATION MEASURE AIR-1B: SMAQMD'S ENHANCED EXHAUST CONTROL PRACTICES FOR NO_X AND EXHAUST PM

For all future land use development applications processed within the plan area, future project applicants, their designee, or subsequent developer(s), shall implement SMAQMD's Enhanced Exhaust Control Practices for NO_X and exhaust PM emissions. Before the issuance of grading and/or building permits, future project applicants, or its designee, shall submit to the County and SMAQMD an initial report of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used 8 hours or more during any portion of the construction project before any grading activities. The initial report shall include the horsepower rating, engine model year, and

projected hours of use for each piece of equipment. Future project applicants shall provide the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman. The information shall be submitted at least four business days before the use of subject heavy-duty off-road equipment. The report shall be updated and submitted monthly throughout the duration of the project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs.

- Before any grading activities, future project applicants, or its designee, shall provide a plan for approval by the County and SMAQMD demonstrating that the heavy-duty off-road vehicles (50 horsepower or more) to be used in the construction project, including owned, leased, and subcontractor vehicles, will achieve a project-wide fleet-average of 10 percent NO_X reduction (depending on available technology and engine Tier) compared to the most recent CARB fleet average. This plan shall be submitted in conjunction with the equipment inventory. Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available. If achievement of the aforementioned reductions over the statewide average are deemed infeasible by the County, SMAQMD, or construction contractor, the future project applicants shall ensure the construction fleet meets the lowest fleetwide emissions average possible, through the use of all available on-site emissions reduction measures (e.g., highest tier engines, emission control devices, cleaner burning fuel).
- The future project applicants, or its designee, shall submit a final report at the end of the job, phase, or calendar year, as pre-arranged with SMAQMD staff and documented in the approval letter, to demonstrate continued project compliance. If modeled construction-generated emissions of NO_X are not reduced to a level below SMAQMD's thresholds of significance by the application of the aforementioned mitigation measures, then the project developer must pay a mitigation fee into SMAQMD's off-site mitigation program.
- Once initial construction activities are finalized by the developer and all on-site mitigation has been exhausted, and before the issuance of grading and/or building permits, quantification of construction-related emissions shall be verified at the project level. As each project-level construction phase is finalized throughout the duration of the project buildout, the mitigation fee shall be calculated based on current information, available construction equipment, and proposed construction activities. As construction activities occur over the buildout period, the developer shall work with SMAQMD to continually update mitigation fees based on actual on-the-ground emissions. The final mitigation fees shall be based on the contractor equipment report provided by the developer to SMAQMD and shall reconcile any fee discrepancies due to schedule adjustments and increased or decreased equipment inventories. Equipment inventories and NO_X emission estimates for subsequent construction phases shall be coordinated with SMAQMD, and the off-site mitigation fee measure shall be assessed to any construction phase that would result in an exceedance of SMAQMD's mass emission threshold for NO_X.

IMPACT AIR-2: GENERATE LONG-TERM OPERATIONAL EMISSIONS OF CRITERIA AIR POLLUTANTS AND OZONE PRECURSORS (ROG, NO_X, PM_{10}, AND $PM_{2.5}$) THAT EXCEED STANDARDS

ANALYSIS OF PROJECT-RELATED OPERATIONAL CRITERIA POLLUTANTS

Development of the project would result in the generation of long-term operational emissions of ROG, NO_X, and particulate matter (PM_{10} and $PM_{2.5}$) from mobile, stationary, and area-wide sources. Mobile-source emissions of criteria pollutants and precursors would result from vehicle trips generated by residents, users of the parks, students at the schools, employee commute trips, and other associated vehicle trips (e.g., delivery of supplies, maintenance vehicles for commercial and retail land uses). Stationary and area-wide sources would include the combustion of natural gas for space and water heating (i.e., energy use), the use of landscaping equipment and other small equipment, the periodic application of architectural coatings, and ROG from the use of consumer products. It is foreseeable that as portions of the project are built out over the 30-year construction period, portions of the project may become operational prior to 2055 and would overlap with construction emissions; however, at this programmatic stage, the timing and location of future development is unknown. Therefore, overlapping emissions have not been quantified.

Table 6-6 summarizes the maximum daily and annual operation-related emissions of criteria air pollutants during the winter and summer seasons at full buildout. This is consistent with the AQMP prepared for the project, which calculates emission reductions from mitigation in tons per year (tons/year). Emissions were calculated based on proposed land uses and VMT values contained in the traffic study (DKS Associates 2023). As shown in Table 6-6, operation-related activities would result in project-generated daily emissions of NO_X, PM_{10}, and $PM_{2.5}$ that exceed the SMAQMD-recommended thresholds of significance.

As summarized in Table 6-7, PM_{10} and $PM_{2.5}$ emissions would also exceed SMAQMD's annual mass emissions thresholds of 14.6 and 15 tpy respectively. Notably, SMAQMD does not have a recommended annual threshold for ROG and NO_X.

Because ROG, NO_X, PM_{10}, and $PM_{2.5}$ would exceed their respective thresholds, operational emissions generated under full buildout of the project would conflict with long-term ozone planning efforts and/or contribute substantially to a net increase in concentrations of ozone for which Sacramento County is in nonattainment.

Projects that emit criteria air pollutants in exceedance of SMAQMD's thresholds would contribute to the regional degradation of air quality within the plan area that could result in adverse human health impacts. Acute exposure to criteria air pollutants can cause coughing, chest pain, shortness of breath, eye and throat irritation, lung scarring, and may aggravate preexisting cardiovascular and respiratory illness (e.g., asthma). Chronic exposure to criteria pollutants may result in permanent lung and heart impairment, chronic coughing, cancer, decreased immune function in children, and premature death. This would be a **significant** impact.

Table 6-6 Summary of Project Maximum Daily (Unmitigated) Operational Emissions of Criteria Air Pollutants at Full Buildout (2050)

Source Type	Maximum Daily Emissions (lb/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area[1]	1,086	16	8	8
Energy[2]	12	102	8	8
Mobile	128	122	414	105
Total Daily Emissions[3]	1,226	240	429	120
SMAQMD Threshold of Significance[3]	65	65	80[4]	82[4]
Exceeds Threshold?	Yes	Yes	Yes	Yes

Notes: lb/day = pounds per day; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.

1. Area-source emissions include emissions from landscaping, application of architectural coatings, and consumer products, and are estimated based on default model settings. It was assumed that none of the residential units would be equipped with a fireplace.

2. Energy emissions include emissions associated with natural gas consumption for space heating/cooling, and appliance use.

3. Mass emission significance criteria apply to the sum of area, energy, and mobile sources.

4. SMAQMD recommends a 0 lb/day threshold be applied to projects that do not include best management practices or best available control technology. SMAQMD's recommended BMP for land use development projects, which the project is characterized as, is compliance with the most recent version of the building code. The project would comply with the building code; therefore, SMAQMD's thresholds of 80 and 82 lb/day are applied to the project for PM_{10} and $PM_{2.5}$, respectively.

Source: Modeling conducted by ESA in 2024.

Table 6-7 Summary of Project Annual (Unmitigated) Operational Emissions of Criteria Air Pollutants and Precursors at Full Buildout (2050)

Source Type	Annual Emissions (tpy)	
	PM_{10}	$PM_{2.5}$
Area[1]	1	1
Energy[2]	1.5	1.5
Mobile	75	19
Total Annual Emissions	78	21
SMAQMD Threshold of Significance[3,4]	14.6	15
Exceeds Threshold?	Yes	Yes

Notes: tpy = tons per year; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; NA = not applicable.

1. Area-source emissions include emissions from landscaping, application of architectural coatings, and consumer products, and are estimated based on default model settings. It was assumed that none of the residential units would be equipped with a fireplace.

2. Energy emissions include emissions associated with natural gas consumption for space heating/cooling, and appliance use.

3. Mass emission significance criteria apply to the sum of area, energy, and mobile sources.

4. SMAQMD has adopted tpy operational thresholds for only PM_{10} and $PM_{2.5}$.

Source: Modeling conducted by ESA in 2024.

Long Term Regional Air Pollution

Consistent with SMAQMD's most recent Friant Ranch Guidance, the possible operational emissions of criteria air pollutants from implementation of the project were used to estimate foreseeable adverse health outcomes using SMAQMD's Strategic Area Project Health Effects Tool. Strategic Area Project II, "Rancho Cordova," was used as this Strategic Area is in closest proximity to the majority proposed rezone sites. Table 6-8 below summarizes the potential health effects in the region from the project.

Based on this modeling, operational emissions from implementation of the project may result in an additional 4 mortalities from ozone and $PM_{2.5}$ exposure compared to a background number of incidences of about 75,000 mortality incidences per year, or a 0.0053 percent increase in regional annual deaths. This increase in mortalities is negligible when compared to the rates at which other causes of death occur in the county according to the most recent Health Profile for Sacramento County (CDPH 2019). There is no established threshold of significance that addresses anticipated deaths; however, consistent with guidance from the Friant Ranch Decision, this information has been included to provide a meaningful level of detail to the public. Notably, as discussed under the "Methodology" section above, there is inherent difficulty in evaluating the exact location and degree of adverse health outcomes from project-level emissions. Moreover, the Strategic Area Project Health Effects Tool cannot account for personal information such as age, preexisting conditions, genetic propensities, and lifestyle choices that may contribute to a receptor's sensitivity to air pollution.

Table 6-8 Potential Annual Incremental Health Incidences Resulting from the Project Implementation

$PM_{2.5}$ Health Endpoint	Age Range	Incidences (Mean)	Percent (%) of Background Incidences	Total Number of Health Incidences (per Year)
Respiratory				
Emergency Room Visits	0-99	1.7	0.0095%	18,419
Hospital Admissions, Asthma	0-64	0.11	0.0061%	1,846
Hospital Admissions, All Respiratory	65-99	0.66	0.0033%	19,644
Cardiovascular				
Hospital Admissions, All Cardiovascular (less Myocardial Infarctions)	65-99	1.7	0.0095%	24,037
Acute Myocardial Infarction, Nonfatal	18-24	0.11	0.0061%	4
Acute Myocardial Infarction, Nonfatal	25-44	0.66	0.0033%	308
Acute Myocardial Infarction, Nonfatal	45-54	1.7	0.0095%	741
Acute Myocardial Infarction, Nonfatal	55-64	0.11	0.0061%	1,239
Acute Myocardial Infarction, Nonfatal	65-99	0.66	0.0033%	5,052
Mortality				
Mortality, All Causes	30-99	4.4	0.0098%	44,766

Ozone Health Endpoint	Age Range	Incidences (Mean)	Percent of Background Incidences	Total Number of Health Incidences (per Year)
Respiratory				
Hospital Admissions, All Respiratory	65-99	0.20	0.0010%	19,644

Total Incidences	**0-99**	**14.35**	**0.09294%**	**184,505**

Notes: $PM_{2.5}$ = fine particulate matter; NA = not applicable.

Source: Modeling conducted by Ascent 2024.

According to SMAQMD, a project should assess consistency with the SIP by asking the following question: "Would the project involve a change in a land use designation established by the applicable local land use plan and/or general plan?" According to SACOG, the household population of the master plan's footprint within the MTP/SCS Developing Community area is expected to increase from 630 in 2012 and 720 in 2020 to 13,000 in 2036. Dwelling unit counts in the area are expected to increase from 270 in 2012 and 2020 to 5,400 in 2036. Employment counts in the area are expected to increase from 2,200 in 2012 and 2,300 in 2020 to 3,000 in 2036. Assuming roughly half of the proposed development under the master plan is constructed by 2040, the master plan would result in more dwelling units than what was included in the SIP for 2040. In other words, the full extent of master plan development is not included in SACOG's growth projections included in the current SIP. Therefore, the project would not be consistent with the growth projections of the SIP (SACOG 2019).

NO_X, ROG, PM_{10}, and $PM_{2.5}$, after full-build-out of the project, would exceed SMAQMD's thresholds of significance. Unmitigated operational emissions would generate ozone precursor (ROG and NO_X) emissions that would exceed the significance thresholds established by SMAQMD and would therefore be considered significant for CEQA purposes.

When operational emissions exceed significance thresholds, SMAQMD recommends the development of an AQMP to minimize impacts, with guidance and suggested measures included in the *Recommended Guidance for Land Use Emission Reductions Version 4.0 (for Operational Emissions).* As discussed above in the "Methodology*"* section above, a "blended rate" mitigated reduction goal of 29 percent was used to show consistency with regional air quality plans. Nevertheless, to demonstrate that the master plan would adhere to SMAQMD's AQMP requirements, a more conservative 35 percent reduction rate was applied.

An AQMP was prepared demonstrating that the master plan could achieve the 35 percent reduction in ROG and NO_X emissions from project-related mobile sources after all proposed design features have been implemented; the AQMP can be found in Appendix B. Specific project design features included as a component of the project that

reduce VMT are listed below as they correspond to CAPCOA greenhouse gas mitigation measures (T-xx) and SMAQMD land use emission reduction measures (LUT-xx), including:

- The project is located in a suburban center within approximately 10 miles of the Sacramento downtown central business district and less than 5 miles from other existing high-density commercial/job center areas (LUT-2 and LUT-3).
- The project is located adjacent to other planned developments such that single-use trips are minimized, and there are more pass-by and diverted trips (LUT-3 and LUT-4).
- The project provides a compact mix of land uses in close proximity to each other with a highly connected street and trail network (LUT-3).
- Overall housing density is better than 7 dwelling units per acre (LUT-1).
- The project design includes locating at least four schools within the plan area, such that most students can walk to a local school (LUT-3 and LUT-4).
- The project design includes at least eight parks within the plan area, such that residents can walk/bike to enjoy the parks (LUT -3 and LUT-4).
- The project design includes access to high frequency bus service that connects to the Watt/Manlove light rail station (LUT-5).
- Bus routes are signalized in order to avoid traffic delays (T-27).
- The project design promotes a multi-modal system that makes public transit, walking, and bicycling viable and attractive travel choices for residents and employees. Features include:
- Adequate bike parking at non-residential locations (T-34, T-47).
- Showers/lockers and other end of trip facilities at non-residential buildings (T-10).
- Long-term bike parking facilities (T-34, T-47).
- The project includes an extensive pedestrian path and trail system that is convenient and accessible from homes, school, parks, employment, and shopping (LUT-8).
- Pedestrian and bike paths minimize any barriers to pedestrian/bicycle use, (e.g., fences, berms and other impediments are eliminated where possible) (LUT-8, T-18, T-20).
- The project subsidizes bus rapid transit lanes (T-27).
- The project funding and design would result in bus headways of 15 minutes or better (T-26).
- The project includes joining a Transportation Management Association (TMA) funded through assessments. Although the project would include a TMA, no VMT reduction from the TMA is assumed in the modeling of emissions (Appendix K).

- The project includes assessments for regional transportation improvements (T-27).
- Electric bike share and scooter share (T-22-B, T-22-C).
- Additional sidewalks within the plan area (T-18).
- The project would include a carpooling/rideshare program (T-8).

Mitigation Measure AIR-2, discussed below, would be applied to the project. Mitigation Measure AIR-2 requires that an AQMP that achieves a minimum 35 percent reduction compared to an "unmitigated" project scenario (i.e., utilizes CalEEMod VMT default values) be applied to the whole of the project. The adequacy of the AQMP shall be verified by SMAQMD through a formal letter certifying that the reductions achieve the 35 percent reduction target. Mitigation Measure AIR-2 would require the project to adhere to the most recent Tier 2 voluntary standards of the CalGreen Code, which would further reduce emissions from the mobile source sector. Mitigation Measure AIR-2 would also promote the use of low-VOC content consumer projects throughout the plan area. Mitigation Measure AIR-2 would reduce mobile source emissions through the electrification of heavy-duty trucks accessing the plan area. Further, Mitigation Measure AIR-2 would reduce areawide sources of emissions through the electrification of landscaping equipment. Finally, Mitigation Measure AIR-2 would reduce emissions from stationary sources through the application of best available control technology for generators.

However, complying with SMAQMD guidance to prepare an AQMP, in addition to the other measures presented above, would not inherently result in a less-than-significant impact as emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ could be in exceedance of the SMAQMD mass emissions thresholds for operational emissions. As shown in Tables 6-9 and 6-10, the project's mitigated emissions would still exceed SMAQMD's thresholds of significance for ROG, NO_X, PM_{10}, and $PM_{2.5}$.

Although the project may reduce operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ overall, these reductions would not be sufficient to meet SMAQMD's mass emissions thresholds; therefore, the mitigation measures contained in the AQMP would not be sufficient to reduce air pollutants to less-than-significant levels. Thus, the project's operations may contribute to the nonattainment status of the region and may conflict with the NAAQS and CAAQS. This contribution could result in increased exposure of populations to harmful concentrations of criteria air pollutants which could cause adverse health impacts such as acute and chronic respiratory and cardiovascular illness, suppressed immune function, and cancer.

Table 6-9 Summary of Project Maximum Daily (Mitigated) Operational Emissions of Criteria Air Pollutants at Full Buildout (2050)

Source Type	Maximum Daily Emissions (lb/day)			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Area[1]	1,086	16	8	8
Energy[2]	0	0	0	0
Mobile	118	93	382	96
Total Daily Emissions[3]	1,204	108	390	103
SMAQMD Threshold of Significance[3]	65	65	80[4]	82[4]
Exceeds Threshold?	Yes	Yes	Yes	Yes

Notes: lb/day = pounds per day; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter.

1. Area-source emissions include emissions from landscaping, application of architectural coatings, and consumer products, and are estimated based on default model settings. It was assumed that none of the residential units would be equipped with a fireplace.

2. Energy emissions include emissions associated with natural gas consumption for space heating/cooling, and appliance use.

3. Mass emission significance criteria apply to the sum of area, energy, and mobile sources.

4. SMAQMD recommends a 0 lb/day threshold be applied to projects that do not include best management practices or best available control technology. SMAQMD's recommended BMP for land use development projects, which the project is characterized as, is compliance with the most recent version of the building code. The project would comply with the building code; therefore, SMAQMD's thresholds of 80 and 82 lb/day are applied to the project for PM_{10} and $PM_{2.5}$, respectively.

Source: Modeling conducted by ESA in 2024.

Table 6-10 Summary of Project Annual (Mitigated) Operational Emissions of Criteria Air Pollutants and Precursors at Full Buildout (2050)

Source Type	Annual Emissions (tpy)	
	PM_{10}	$PM_{2.5}$
Area[1]	1	1
Energy[2]	0	0
Mobile	70	17
Total Annual Emissions	71	18
SMAQMD Threshold of Significance[3,4]	14.6	15
Exceeds Threshold?	Yes	Yes

Notes: tpy = tons per year; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; NA = not applicable.

1. Area-source emissions include emissions from landscaping, application of architectural coatings, and consumer products, and are estimated based on default model settings. It was assumed that none of the residential units would be equipped with a fireplace.

2. Energy emissions include emissions associated with natural gas consumption for space heating/cooling, and appliance use.

3. Mass emission significance criteria apply to the sum of area, energy, and mobile sources.

4. SMAQMD has adopted tpy operational thresholds for only PM_{10} and $PM_{2.5}$.

Source: Modeling conducted by ESA in 2024.

Projects that emit criteria air pollutants in exceedance of SMAQMDs thresholds would contribute to the regional degradation of air quality that could result in adverse human health impacts. Acute exposure to criteria air pollutants can cause coughing, chest pain, shortness of breath, eye and throat irritation, lung scarring, and may aggravate preexisting cardiovascular and respiratory illness (e.g., asthma). Chronic exposure to criteria pollutants may result in permanent lung and heart impairment, chronic coughing, cancer, decreased immune function in children, and premature death.

Therefore, compliance with SMAQMD's AQMP requirement and additional mitigation measures would not be sufficient to reduce emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ to levels below the applicable operational thresholds of significance. Thus, operational emissions of criteria air pollutants and ozone precursors would be **significant and unavoidable**.

MITIGATION MEASURES

MITIGATION MEASURE AIR-2: AIR QUALITY MANAGEMENT PLAN REDUCTION MEASURES

The project shall include the following quantifiable reduction measures included in the AQMP prepared for the project (Appendix B of the EIR), which would reduce the project's operational criteria air pollutants and ozone precursors by, at a minimum, 35 percent in comparison to the "unmitigated" project, as conditions of approval.

ELECTRIC VEHICLE CHARING INFRASTRUCTURE

Prior to the issuance of a certificate of occupancy for any project structure with parking, the future project applicants shall demonstrate compliance with the most recently adopted version of the California Green Building Standards (CALGreen Code) Tier 2 voluntary electric vehicle (EV) charging requirements or the mandatory requirements of the most recently adopted version of the County of Sacramento building code, whichever is more stringent. The installation of all EV charging equipment shall be included on the project drawings submitted for the construction-related permit(s) demonstrating the future development is meeting the Tier 2 voluntary EV requirements of the most recent version of the CalGreen code as verified by the County.

OPERATIONAL TRUCK EMISSIONS REDUCTIONS

The project applicants shall incorporate the following measures into the project contracts (as applicable) to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with operational on-road trucks, along with the potential health risk caused by exposure to toxic air contaminants from operational on-road trucks. These features shall be submitted to the County for review and approval prior to the issuance of building permits and shall be included on the project drawings submitted for the construction-related permit or on other documentation submitted to Planning and Environmental Review. ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions from project-related operational diesel trucks shall be reduced by implementing the following measures:

- Equip all truck delivery bays with electrical hook-ups for diesel trucks at loading docks to accommodate plug-in electric truck transport refrigeration units (TRUs) or auxiliary power units during project operations.

- Provide a notice on the lease to all new tenants or owners of the project or any portion thereof requiring any truck-intensive uses on the site, such as large grocery stores or distribution facilities with their own fleet of trucks, to use TRUs and auxiliary power units that are electric plug-in capable and trucks that use advanced exhaust technology (e.g., hybrid) or alternative fuels. Trucks equipped with diesel TRUs shall meet US EPA's Tier 4 emissions standards. This shall be enforced through oversight by the County and shall be included as part of contractual lease agreement language to ensure the tenants/lessees are informed of all ongoing operational responsibilities.
- Prohibit TRUs from operating at loading docks for more than thirty minutes, and post signs at each loading dock presenting this TRU limit.
- All newly constructed loading docks that are on a commercial or industrial property and can accommodate trucks with TRUs shall be equipped with electric vehicle (EV) charging equipment for heavy-duty trucks. This measure does not apply to temporary street parking for loading or unloading.
- Prohibit trucks from idling for more than two minutes, and post "no idling" signs at the site entry point, at all loading locations, and throughout the project site.

BEST AVAILABLE EMISSIONS CONTROLS FOR STATIONARY EMERGENCY GENERATORS

To reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with operation of any emergency generators that would be installed in the plan area, the future project applicants shall implement the following measures. These features shall be submitted to County Planning and Environmental Review for review and approval, and shall be included on the project drawings submitted for the construction-related permit(s) or on other documentation submitted to the lead agency prior to the issuance of any building permits:

- Permanent stationary emergency generators installed on-site shall have engines that meet or exceed CARB Tier 4 Off-Road Compression Ignition Engine Standards (California Code of Regulations Title 13, Section 2423). If the CARB adopts future emissions standards that exceed the Tier 4 requirement, the emissions standards resulting in the lowest ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions shall apply.
- As non-diesel-fueled emergency generator technology becomes commercially available, as permitted by SMAQMD, non-diesel-fueled generators shall be installed in new buildings, provided that alternative fuels used in generators, such as biodiesel, renewable diesel, natural gas, or other biofuels or other non-diesel emergency power systems, are demonstrated to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions compared to diesel fuel.
- For each new diesel backup generator permit submitted to air district for the proposed project, the future project applicants shall submit the anticipated location and engine specifications to the lead agency for review and approval prior to issuance of a permit for the generator. Once operational, all diesel backup generators shall be maintained in good working order for the life of the

equipment, and any future replacement of the diesel backup generators must be consistent with these emissions specifications. The operator of the facility at which the generator is located shall maintain records of the testing schedule and emergency operations for each diesel backup generator for the life of that diesel backup generator and shall provide this information for review to the County within three months of requesting such information.

- A non-diesel-fueled emergency generator shall ordinarily be considered commercially available if the generator is capable of serving the intended purpose, is approved by the local fire department, and is available for commercial purchase and installation within California. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such generators are commercially unavailable, the operator must submit documentation from a minimum of three (3) non-diesel-fueled emergency generator dealers demonstrating the inability to obtain the required non-diesel-fueled emergency generators needed within 6 months.

IMPACT AIR-3: CONFLICT WITH AN AIR QUALITY PLAN

The *Sacramento Regional 2023 8-Hour Ozone Attainment and Reasonable Further Progress Plan*, which is the current ozone attainment plan for the region, addresses attainment of the federal 8-hour ozone standard, while the *Triennial Report and Air Quality Plan Revision* and the *2017 Annual Progress Report* address attainment of the California 1-hour and 8-hour ozone standards. These are the latest plans issued by the SMAQMD, and they incorporate land use assumptions and travel demand modeling from SACOG.

According to SMAQMD, land use development projects that exceed emissions of 85 lbs/day of NO_X during construction would have the potential to obstruct the success of the regional ozone attainment plans and would therefore be considered significant and require mitigation. Emissions of ROG and NO_X from construction are discussed above in Impact AIR-1: Construction Emissions of Criteria Air Pollutants and Precursors (ROG, NO_X, PM_{10}, and $PM_{2.5}$). Both ROG and NO_X emission are expected to exceed the applicable significance thresholds as presented below; therefore, the project's construction impact would be considered significant.

For operations, land use development projects that exceed emissions of 65 lbs/day of ROG or NO_X during operational activities would have the potential to obstruct the success of the regional ozone attainment plans and would therefore be considered significant and require mitigation. In order to determine compliance with the applicable air quality plan with regard to operational emissions, the SMAQMD recommends comparing the project to the growth projections and VMT included in the MTP/SCS.

As discussed above in Impact AIR-2: Long-Term Operational Emissions of Criteria Air Pollutants and Ozone Precursors (ROG, NO_X, PM_{10}, and $PM_{2.5}$), development proposed by the project would be outside of the growth projections outside of the MTP/SCS. According to SACOG, the household population of the master plan's footprint within the

MTP/SCS Developing Community area is expected to increase from 630 in 2012 and 720 in 2020 to 13,000 in 2036. Dwelling unit counts in the area are expected to increase from 270 in 2012 and 2020 to 5,400 in 2036. Employment counts in the area are expected to increase from 2,200 in 2012 and 2,300 in 2020 to 3,000 in 2036. Assuming roughly half of the proposed development under the master plan is constructed by 2040, the master plan would result in more dwelling units than what was included in the SIP for 2040. In other words, the full extent of master plan development is not included in SACOG's growth projections included in the current SIP. Therefore, the project would not be consistent with the growth projections of the SIP and would conflict with long-term regional air quality planning in the SVAB. This impact would be **significant**.

Also discussed in Impact AIR-2: Long-Term Operational Emissions of Criteria Air Pollutants and Ozone Precursors (ROG, NO_X, PM_{10}, and $PM_{2.5}$), an AQMP was prepared for the project. Emission of ROG, NO_X, PM_{10}, and $PM_{2.5}$ were reduced, but not the degree that the project's emissions would be under SMAQMD's recommended daily and annual thresholds of significance. Therefore, compliance with SMAQMD's AQMP requirement and additional mitigation measures would not be sufficient to reduce emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ to levels below the applicable operational thresholds of significance. Thus, operational emissions of criteria air pollutants and ozone precursors would be **significant and unavoidable**.

MITIGATION MEASURES

Implement Mitigation Measure AIR-2

IMPACT AIR-4: RESULT IN SUBSTANTIAL MOBILE-SOURCE CO CONCENTRATIONS

Local mobile-source CO emissions near roadway intersections are a direct function of traffic volume, speed, and delay. Transport of CO is extremely limited because it disperses rapidly with distance from the source under normal meteorological conditions. However, under specific meteorological conditions, CO concentrations near roadways and/or intersections may reach unhealthy levels at nearby sensitive land uses, such as residential units, hospitals, schools, and childcare facilities. As a result, it is recommended that CO not be analyzed at the regional level, but at the local level.

Construction would occur over many years and, therefore, traffic-related to construction activities would also be spread over the duration of construction activities. As such, construction-generated traffic is not anticipated to result in large peaks in traffic volume at any one time over the course of construction. This analysis focuses on operation-related traffic.

Whether CO emissions generated by traffic at congested intersections have the potential to exceed, or contribute to an exceedance of, the 8-hour CAAQS of 9.0 micrograms per cubic meter ($\mu g/m^3$) or the 1-hour CAAQS of 20.0 $\mu g/m^3$, SMAQMD recommends a project's contribution of new vehicle trips should be compared to a screening criteria of 31,600 vehicle per hour at one affected intersection. At complete buildout, the project would generate up to 20,000 trips during the a.m. peak hour and up to 21,500 trips during the p.m. peak hour.

Moreover, in its most recent guidance, SMAQMD notes that "[o]ther pollutants such as CO, sulfur dioxide and lead are of less concern because operational activities are not likely to generate substantial quantities of these criteria air pollutants and the Sacramento Valley Air basin has been in attainment for these criteria air pollutants for multiple years" (SMAQMD 2020b).

Also, because of stricter vehicle emissions standards in newer cars, new technology, and increased fuel economy, CO emissions are expected to be substantially lower in future years than under existing conditions. Thus, project-generated local mobile-source CO emissions would not result in or substantially contribute to concentrations that exceed the 1-hour or 8-hour ambient air quality standards for CO. As a result, this impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT AIR-5: EXPOSURE OF SENSITIVE RECEPTORS TO TACS

The exposure of sensitive receptors to TAC emissions from project-generated construction and operational sources are discussed separately below.

CONSTRUCTION

Construction-related activities would result in temporary, intermittent emissions of diesel PM from the exhaust of off-road, heavy-duty diesel equipment for site preparation (e.g., demolition, clearing, grading); paving; application of architectural coatings; on-road truck travel; and other miscellaneous activities. For construction activity, diesel PM is the primary TAC of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations.

Particulate exhaust emissions from diesel-fueled engines (i.e., diesel PM) was identified as a TAC by CARB in 1998. The potential cancer risk from the inhalation of diesel PM, as discussed below, outweighs the potential for all other health impacts (i.e., non-cancer chronic risk, short-term acute risk) and health impacts from other TACs (CARB 2013). Studies show that diesel PM is highly dispersive. For instance, concentrations of diesel PM generated by freeway traffic decreased by approximately 70 percent at 500 feet from the source, and receptors must be near emission sources to result in the possibility of exposure to concentrations of concern and must be near for a long duration of time. With regard to exposure of diesel PM, the dose to which receptors are exposed is the primary factor used to determine health risk. Dose is a function of the concentration of a substance or substances in the environment and the duration of exposure to the substance. Dose is positively correlated with time, meaning that a longer exposure period would result in a higher level of health risk for any exposed receptor. Thus, the risks estimated for an exposed individual are higher if a fixed exposure occurs over a longer period of time. According to Office of Environmental Health Hazard Assessment (OEHHA), Health Risk Assessments, which determine the exposure of sensitive receptors to TAC emissions, should be based on a 70- or 30-year exposure period;

however, such assessments should be limited to the period/duration of activities associated with the project (OEHHA 2015:11-3). Based on the emission modeling conducted (see Appendix B), maximum daily exhaust emissions of PM_{10}, considered a surrogate for diesel PM, would not exceed 3 lb/day during the most intense season of construction activity. Furthermore, even during the most intense year of construction, emissions of diesel PM would be generated from different locations in the plan area rather than a single location because different types of construction activities (e.g., site preparation, building construction) would not occur at the same place at the same time. Consequently, it is important to consider that the use of off-road heavy-duty diesel equipment would be limited to the construction phase of up to 30 years. However, each individual construction activity within this 30-year period would be much shorter. As construction progresses, activity intensity and duration would vary throughout the site. As such, no single existing or future receptor (i.e., as part of the project) would be exposed to construction-related emissions of diesel PM for extended periods of time.

As the plan area is developed, construction from other future planned developments in Sacramento County could potentially overlap with the construction activities of the project, potentially exposing newly sited sensitive receptors within the plan area and adjacent developments including the NewBridge Specific Plan and the Jackson Township Master Plan, both located to the east of the plan area, and the Mather South Community Master Plan, located to the northeast of the plan area. However, any potential construction activity associated with these other planned future developments would be located over 2,000 feet from the site of any future receptors constructed as part of the project and, thus, would not be exposed to excessive levels of TACs associated with construction.

Regarding existing off-site receptors, residences are in the Rosemont Planning Area, approximately 500 feet to the north of the plan area. Given the locations of existing receptors relative to potential diesel PM emission sources, and the temporary and intermittent nature of construction activities within specific locations in the plan area (i.e., construction does not occur year round and does not occur in any one part of the plan area during the entire buildout period), the dose of any exposure to diesel PM of any one receptor would be very limited.

Nevertheless, based on the size of the master plan and the anticipated intensity of construction, it is expected that off-road construction equipment could be operating near existing and future residences for a duration lasting longer than the two-month exposure period recommended by OEHHA. Therefore, construction of the project could expose sensitive receptors to an incremental increase in cancer risk greater than 10 in 1 million or a hazard index greater than 1.0. This impact would be potentially significant.

Long-Term Operation

Operation of some land uses developed under the project would result in new sources of TACs associated with new vehicular trips on existing and new roadways, as well as new sources of diesel PM associated with commercial loading docks frequented by diesel-powered delivery trucks and backup diesel generators. New TAC sources could expose existing and future sensitive receptors to TAC emissions. The project would also locate new sensitive land uses in proximity to existing TAC sources associated with surrounding roadways.

In accordance with available guidance from CARB, freeways or urban roadways experiencing 100,000 or more vehicles per day could expose sensitive receptors to adverse health risks. The nearest roadway supporting over 100,000 or more trips per day is Highway 50, which is located approximately 5,300 feet to the north of the plan area. Using SMAQMD's Mobile Sources Air Toxics protocol, the portion of the plan area nearest Highway 50 is currently experiencing cancer risk exposure of 15 in one million from combined diesel PM and total organic gases emissions (SMAQMD 2020c). It is foreseeable the implementation of the project could exacerbate this existing adverse condition.

Additionally, as described above and in Chapter 19, "Transportation," several objectives within the WJHMP would require coordination with the County to support bicycle, pedestrian, and transit travel within the plan area. The project also includes a requirement to participate in a Transportation Management Association program to reduce emissions of air pollution.

In addition to new mobile sources on local roadways, the project would include the development of approximately 291 acres of General Commercial uses, 543 acres of Employment use, and 154 acres of Industrial use. These land uses may include loading docks for delivery trucks, resulting diesel PM exhaust emissions from idling trucks that could expose existing or new sensitive receptors to TACs, depending on the location of these new land uses and proximity to off-site or new on-site receptors.

The placement of new sources of diesel PM associated with commercial delivery trucks could expose new or existing sensitive receptors to increased TAC emissions. This impact would be potentially significant.

Mitigation Measure AIR-5a would require the future project applicants to site new receptors according to CARB's 2005 Land Use Handbook to avoid exposure of receptors to existing source of TACs. Mitigation Measure AIR-5b would require the preparation of a project-level HRA for future development in the plan area once specific project information is available. Mitigation Measures AIR-5c and 5d would reduce the potential for diesel PM exposure through engine requirements to either electrify or improve the efficiency of diesel-powered equipment. Although Mitigation Measure AIR-5b would require that each applicant shall prepare an HRA specific to each development under the project to determine the potential proximity of nearby sensitive receptors to future TAC emission sources, the exact location of sensitive receptors and their exposure to future TAC emissions is currently unknown. For these reasons, construction of the project would result in the exposure of nearby existing and future sensitive receptors to TAC emissions that would be considered **significant and unavoidable**.

MITIGATION MEASURES

MITIGATION MEASURE AIR-5A: CARB LAND USE SITING STANDARDS

The design guidelines and development standards of the master plan shall include consideration of CARB's *Air Quality and Land Use Handbook: A Community Health Perspective* recommendations in land use siting. These include the following.

- Prohibit siting new sensitive land uses within 500 feet of urban roads carrying 100,000 vehicles per day.
- Prohibit siting new sensitive land uses within 300 feet of a large gasoline station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation is recommended for typical gasoline-dispensing facilities.
- Prohibit siting new sensitive land uses within 300 feet of any dry-cleaning operation using perchloroethylene. For operations with two or more machines, provide 500 feet. For operations with three or more machines, consult the local air district. Do not site new sensitive land uses in the same building with dry-cleaning operations that use perchloroethylene.
- Obtain facility-specific information from SMAQMD where there are questions about siting a sensitive land use close to an industrial facility, including the amount of pollutant emitted and its toxicity, distance to nearby receptors, and types of emissions controls in place.

MITIGATION MEASURE AIR-5B: PROJECT-LEVEL CONSTRUCTION AND OPERATIONAL HEALTH RISK ASSESSMENT

Future project applicants shall prepare construction and operational health risk assessments (HRAs) specific to each proposed development in the plan area. For projects that do not introduce a new stationary source of TACs (i.e., residential development), an operational HRA need not be prepared. The HRAs shall be prepared by a qualified air quality analyst and submitted to the County of Sacramento for review and approval prior to project approval as a component of an initial entitlement application package. The HRAs shall be prepared based on the latest methodology recommended by the Office of Environmental Health Hazard Assessment (OEHHA) and the Sacramento Metropolitan Air Quality Management District (SMAQMD). The HRAs shall evaluate the development's potential health risk impacts pursuant to SMAQMD CEQA guidelines and thresholds. Specifically, each HRAs must evaluate the development's incremental increase in cancer risk, acute hazard index, chronic hazard index, and annual average concentrations of particulate matter in size fractions of 2.5 microns or less in diameter ($PM_{2.5}$) associated with the development's TAC emissions at all sensitive receptor locations within 1,000 feet of the development's boundaries. Impacts shall be identified by comparing health risks to the SMAQMD's current CEQA health risk thresholds (the current thresholds as of April 2024 are an incremental increase in cancer risk greater than 10 in one million or a hazard index greater than 1). The HRAs must also identify all feasible mitigation measures to reduce the development's potentially significant impacts to less-than-significant levels. Any mitigation measures reported in the HRAs shall be implemented by the applicants and enforced by the County of Sacramento.

MITIGATION MEASURE AIR-5C: CLEAN OFF-ROAD CONSTRUCTION EQUIPMENT

In order to reduce the impact of PM_{10} off-road equipment exhaust emissions during construction, the applicant shall ensure that all construction contracts stipulate the following as a component of the project's construction plans:

- Engine Requirements:
  - All portable engines, such as generators, shall be electric. If grid electricity is not available, propane or natural gas generators shall be used.
  - Electric engines shall be used for all equipment that is commercially available as plug-in or battery-electric equipment, to the maximum extent feasible during each construction phase and activity. Portable equipment shall be powered by grid electricity if available. Electric equipment shall include, but is not limited to, concrete/industrial saws, sweepers/scrubbers, aerial lifts, welders, air compressors, fixed cranes, forklifts, and cement and mortar mixers, pressure washers, and pumps. To qualify for an exception, future project applicants shall provide the County with evidence supporting its conclusion that electric equipment is not commercially available and shall use the next cleanest piece of off-road equipment in terms of diesel PM and $PM_{2.5}$.
  - Engines that cannot be electrically powered must meet or exceed either EPA or CARB Tier 4 Final or cleaner engines. Exceptions to the requirement for engines that meet Tier 4 Final emission standards shall include only select pieces of specialty equipment, such as those specified below, for which such engines may not be commercially available at the start of a construction phase requiring that equipment. Exceptions may be granted for certain pieces of equipment; examples include bore/drill rigs required for grading/shoring/excavation and for mobile cranes required for building construction. To qualify for an exception, future project applicants shall provide the County with evidence supporting its conclusion that equipment meeting Tier 4 Final standards is not commercially available and shall use the next cleanest piece of off-road equipment in terms of diesel PM and $PM_{2.5}$.
  - Engines shall be fueled with alternative fuels, including natural gas, propane, hydrogen fuel cell, and electricity, as commercially available and to the maximum extent feasible during each construction phase and activity.
  - Any other best technology available in the future may be included in the construction emissions minimization plan as substitutions for the above items a–d, provided that the project sponsor submits documentation to the lead agency demonstrating that (1) the technology would result in comparable ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions reductions and (2) it would not increase other pollutant emissions or exacerbate other impacts, such as noise. This may include new alternative fuels or engine technology for off-road equipment (such as electric or hydrogen fuel cell equipment) that is not available as of 2024.

- Idling time for off-road equipment shall be limited to 2 minutes, except as provided in exceptions to the applicable state regulations regarding idling for offroad equipment. Documentation shall be provided to equipment operators in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit.
- Construction operators shall be required to properly maintain and tune equipment in accordance with manufacturer specifications.

For the purpose of this mitigation measure, "not commercially available" is defined as either: (1) not being used for other large-scale projects in Sacramento County occurring at the same time; (2) cannot be obtained without significant delays to critical-path timing of construction; or (3) not available within the larger northern California region. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. For the County to make a determination that such equipment is commercially unavailable, the operator must submit documentation from a minimum of three (3) electric offroad equipment dealers demonstrating the inability to obtain the required electric equipment needed within 6 months.

MITIGATION MEASURE AIR-5D: CLEAN ON-ROAD CONSTRUCTION TRUCKS

Heavy-duty on-road construction trucks shall comply with the following, which would reduce PM_{10} and $PM_{2.5}$ emissions:

- Engine Requirements:
  - All on-road heavy-duty diesel trucks with a gross vehicle weight rating of 19,500 pounds or greater used at the plan area (such as haul trucks, water trucks, dump trucks, concrete trucks, and vendor trucks) shall be model year 2020 or newer.
  - Use alternative fuels as commercially available, such as natural gas, propane, hydrogen fuel cell, and electric vehicles or other fuels where the future project applicants can provide evidence which suggests that PM_{10} and $PM_{2.5}$ emissions would be reduced compared to conventional diesel fuel.
  - Any other best technology available in the future (i.e., not available as of 2023) may be used in lieu of or in addition to the above items, provided that the project sponsor submits documentation to the County demonstrating that (1) the technology would result in comparable PM_{10} and $PM_{2.5}$ emissions reductions and (2) that such measures would not increase other pollutant emissions or result in other impacts, such as noise. This may include new alternative fuels for on-road trucks.
  - An alternative-fueled and ZEV truck shall ordinarily be considered commercially available if the vehicle is capable of serving the intended purpose and is included in California's Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project, https://californiahvip.org/ or listed as available

in the US on the Global Commercial Vehicle Drive to Zero inventory, https://globaldrivetozero.org/. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such vehicles are commercially unavailable, the operator must submit documentation from a minimum of three ZEV dealers identified on the californiahvip.org website demonstrating the inability to obtain the required ZEVs or equipment needed within 6 months.

- Require the idling time for on-road vehicles be limited to 2 minutes, except as provided in exceptions to the applicable state regulations regarding idling for on-road vehicles. Documentation shall be provided to truck drivers in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit.

Impact AIR-6: Exposure to Odors Affecting a Substantial Number of People

With respect to operations, no common sources of substantial nuisance odors, such as wastewater treatment facilities or waste-disposal facilities are proposed as part of the project. However, the project would include an industrial land use category that would allow manufacturing, such as asphalt concrete plants, that could contribute odors. It is currently not known whether new industrial facilities that may be sources of odorous emissions would be constructed in these areas. While commercial uses could provide uses that may include sources of odorous emissions (e.g., fast-food restaurants) that could be perceived as offensive to some individuals, it is assumed that the size, location, and construction of these facilities would not create significant odor impacts. In addition, these uses may also receive additional environmental analysis in the future, and it is speculative to determine what specific commercial uses would be constructed.

Regarding land use compatibility of locating sensitive receptors in proximity to existing sources of odor in the region, there are several potential sources in the vicinity of the WJHMP Area, including the Sacramento Rendering Company plant (about 2.25 miles to the east at 11350 Kiefer Boulevard), Granite hot asphalt plant (within the northern portion of the plan area at 4291 Bradshaw Road), Teichert hot asphalt plant (about 0.7 miles to the northwest at 9760 Jackson Road), Florin-Perkins Landfill (approximately 0.75 miles to the west at 4201 Florin Perkins Road 95826) and L & D Landfill (about 0.15 miles to the west at 8635 Fruitridge Road.

SMAQMD enforces California Health and Safety Code Section 41700 prohibited discharge, and District Rule 402, Nuisance, which prohibits causing a public nuisance from odor. SMAQMD determines that businesses are a public nuisance for odor if they receive public complaints and are able to verify that the source is causing the odors. Both landfills handle primarily construction and demolition debris, which is not a source of substantial odors. According to SMAQMD, in the last three years (CY 2020-2023) the Florin-Perkins Landfill, Granite hot asphalt plant, and the L And D Landfill have received no public complaints and no notice of violations (NOVs). Within the same time period,

the Teichert hot asphalt plant has received two odor complaints and no NOVs. The Sacramento Rendering Company has received 287 odor complaints between 2020-2023, however the SMAQMD is precluded from enforcing odor nuisance at the facility due to the State of California Right to Farm Act. These facilities are within the SMAQMD odor screening distances (2 miles for asphalt batch plants and 4 miles for rendering plants) and, depending on whether these plants are still operational as the plan is developed (the Sacramento Rendering Plant has plans to relocate the plant to a more compatible area), would be a source of potential nuisance odors. In addition, the prevailing annual wind direction in the plan area is from the south and, therefore, the majority of the plan area would not be located directly downwind from the rendering plant or asphalt plants. However, since the future operational status of these plants is unknown and there have been substantial odor complaints associated with the facilities (289 total complaints as discussed above), the Sacramento Rendering Company plant and hot asphalt plants would represent potentially significant odor sources for future residents in the plan area. However, the WJHMP would not exacerbate the potential for these existing facilities to emit odors.

To address the potential conflict between the project and existing land uses, the County will require, as a condition of approval, that the deeds to all properties located within the plan area that are within 4 miles of the rendering plant or 2 miles of either the Granite or Teichert hot asphalt plants are accompanied by a written disclosure from the transferor, in a form approved by the County, advising any transferee of the potential adverse odor impacts from nearby odoriferous operations and requiring the transferee(s) to sign an acknowledgement that odors from the Sacramento Rendering Company plant or hot asphalt plant may be detectable at their property.

The WJHMP does not propose specific or unusual uses that would either result in new odor emissions or increase odor emissions from existing sources in a manner that would adversely affect a substantial number of people. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

This page is intentionally left blank.

7 AIRPORT COMPATIBILITY

INTRODUCTION

Mather Airport is immediately adjacent to the northeast perimeter of the plan area. For development near airports, special considerations are taken into account to address potential land use conflicts related to airport operations and the surrounding uses. This chapter describes the environmental and regulatory setting for airport compatibility in the plan area, identifies and analyzes impacts related to airport compatibility from implementation of the WJHMP, and as necessary, recommends mitigation measures to reduce or eliminate significant impacts.

During the notice of preparation (NOP) scoping process, commenters raised concerns about airport compatibility related to noise and hazardous wildlife attractants. A copy of the NOP and comment letters received in response to the NOP are included in Appendix A of this EIR.

ENVIRONMENTAL SETTING

AIRPORT LAND USE COMPATIBILITY PLANNING

Airport land use compatibility plans (ALUCPs), formerly called comprehensive land use plans (CLUPs), include policies and regulations to address the issues of airport noise and safety, with the intent of protecting airport operations from encroachment by incompatible land uses, as well as protecting citizens on the ground from the impacts of excessive noise and the potential for aircraft accidents. Under provisions of the California Public Utilities Code, Chapter 4, Article 35, Section 21670.1, Airport Land Use Commission Law, the Sacramento Area Council of Governments (SACOG) has been designated the Airport Land Use Commission (ALUC) for Sacramento, Sutter, Yolo, and Yuba Counties.

ALUCPs and CLUPs regulate land use in three major areas: safety zones, noise zones, and height restrictions. These restrictions are defined below. The plan area is subject to safety zones, noise contours, and height restrictions established in the Mather Airport ALUCP, as described below in the “Regulatory Setting” section.

SAFETY ZONES

The probability of airplane accidents is highest in the immediate vicinity of airports. Consequently, safety zones are delineated around airports and restrict land use. The densities of land uses allowed in these zones are inversely related to probability of an accident in the zone.

Noise Contours

Aircraft noise is one of the primary motivators for land use compatibility planning. Typically, the sound of aircraft operations is the most recognizable issue for people living and working in the vicinity of an airport. Depending on the size of the airport and the types of aircraft it accommodates, aircraft noise can be experienced over large areas.

The community noise equivalent level (CNEL) is used to describe noise exposure cumulatively for an annual-average day of aircraft operations. The annual-average day represents all aircraft operations for every day in a year divided by 365, the number of days in a year. This is intended to represent a typical day of operations within a study year. The CNEL for this annual-average day is calculated by mathematically combining the number of single noise events that occur during this period (24 hours) with how loud the events were and what time of day they occurred. The CNEL metric addresses the fact that noise events occurring after 7:00 p.m. and before 7:00 a.m. are considered more intrusive by adding noise penalties. The penalized time period is further subdivided into evening (7:00 p.m. through 9:59 p.m.) and nighttime (10:00 p.m. to 6:59 a.m.). CNEL treats every evening operation as though it were three operations and every nighttime operations as though it were ten operations. This “weighting” adds a 4.77 decibel (dB) penalty during the evening hours and a 10 dB penalty during the nighttime hours.

Noise that emanates away from airstrips and airplane flight paths is represented by concentric noise contours around the airport referred to as Theoretic Capacity Noise Contours. The contours delineate zones where land use is restricted, protecting citizens from the detrimental effects of exposure to excessive airplane noise. The contours are constructed using Federal Aviation Administration (FAA) approved modeling. The actual noise levels around an airport are a function of the number, time of day, and frequency of operations of each aircraft type. Noise levels are also influenced by the variations in monthly and seasonal flight schedule changes by the airlines. The contours are used to determine compatible land uses around the airport.

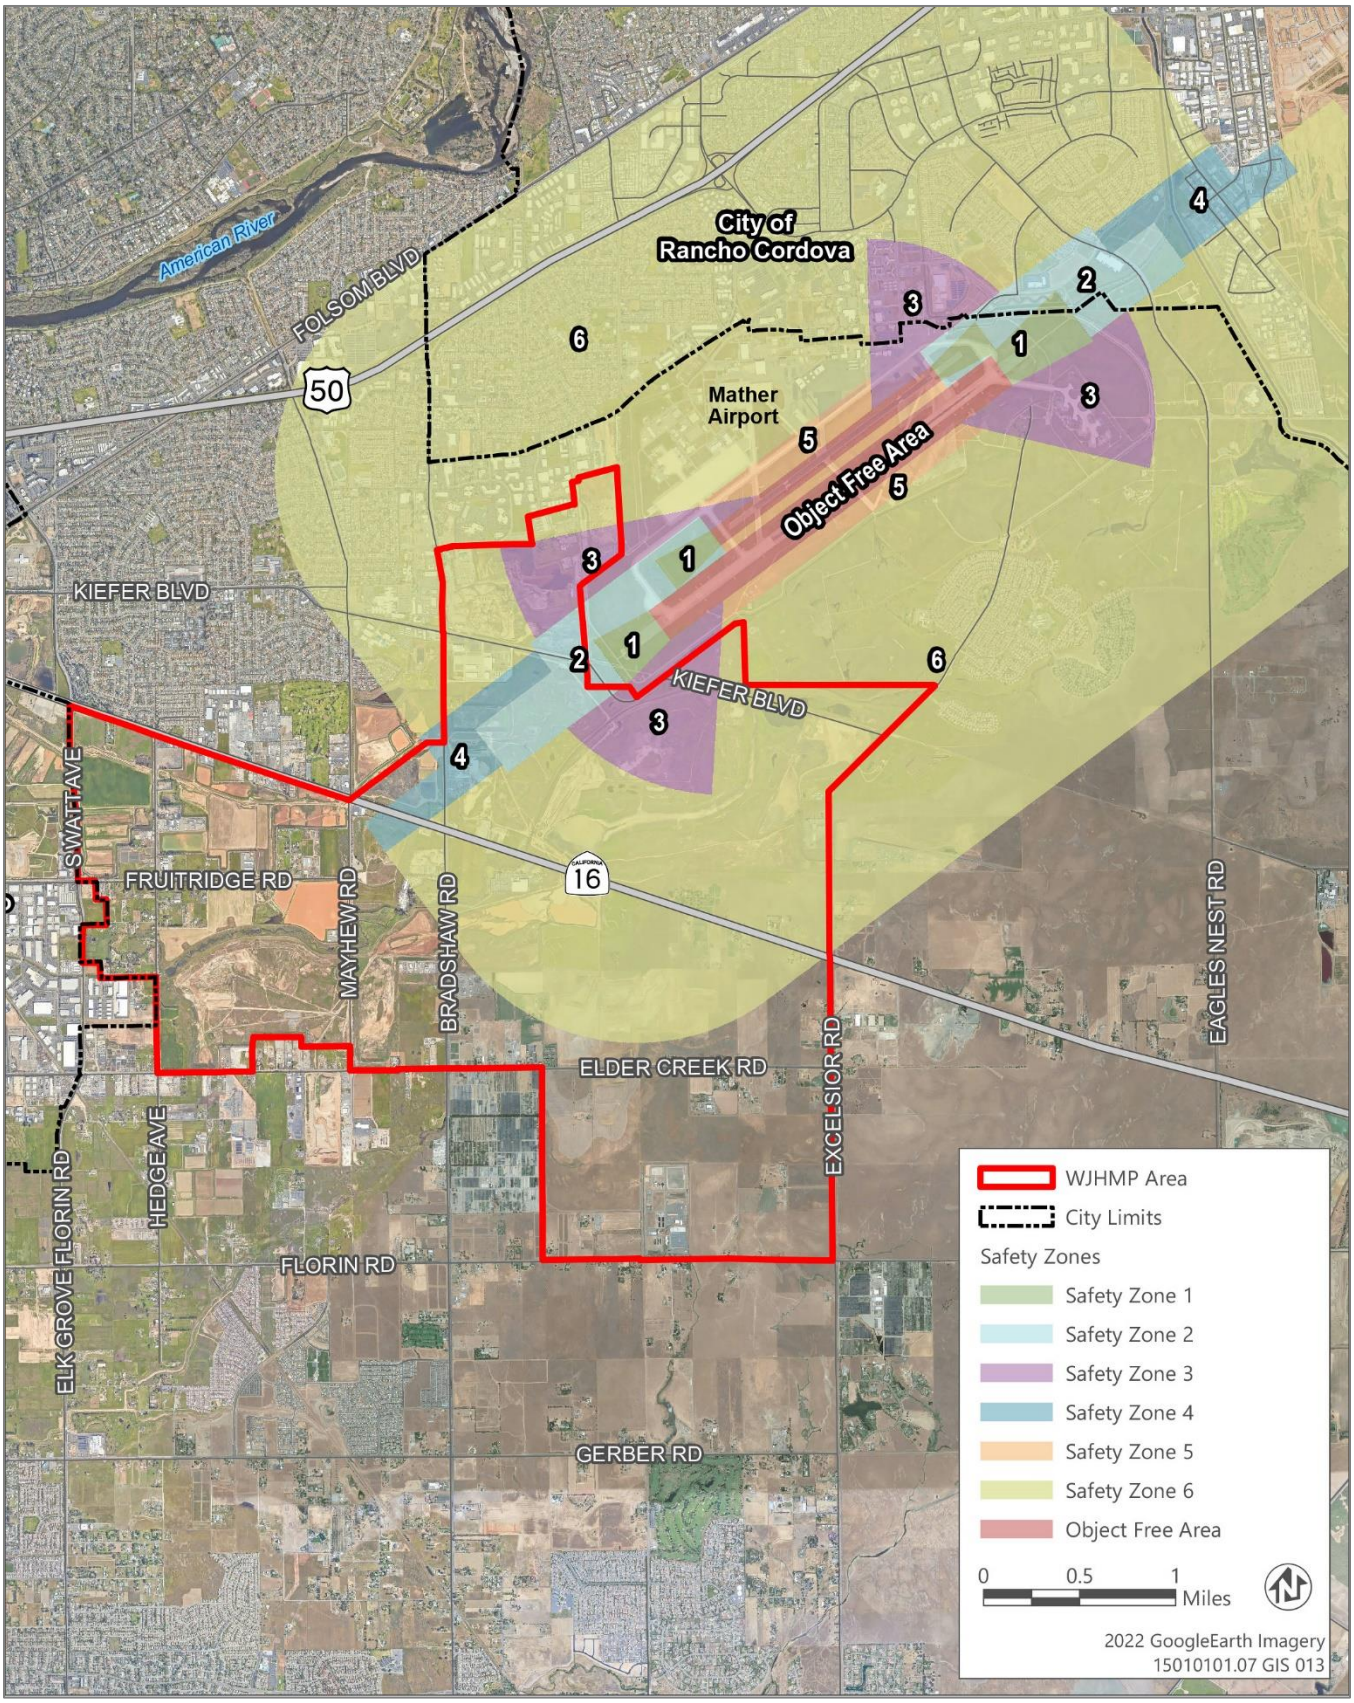
Height Restrictions

Buildings surrounding airports are prohibited from intruding into aircraft airspace except when permitted by the California Department of Transportation, Division of Aeronautics. Compliance with the height restrictions is tested by comparing the height of proposed projects with an imaginary surface surrounding each airport.

Mather Airport

Mather Airport is located within the unincorporated area of Sacramento County and is immediately adjacent to the northeast perimeter of the plan area. The airport is 2,239 acres in size and the airport elevation is 98.3 feet above mean sea level (AMSL) (SACOG 2022). Mather Airport is surrounded by a mix of residential, commercial, industrial, and open space land uses, including the Mather Preserve. The airport was originally established in 1918 as Mather Air Force Base, as a military base and pilot training school. The base went through a series of changes but continued to operate

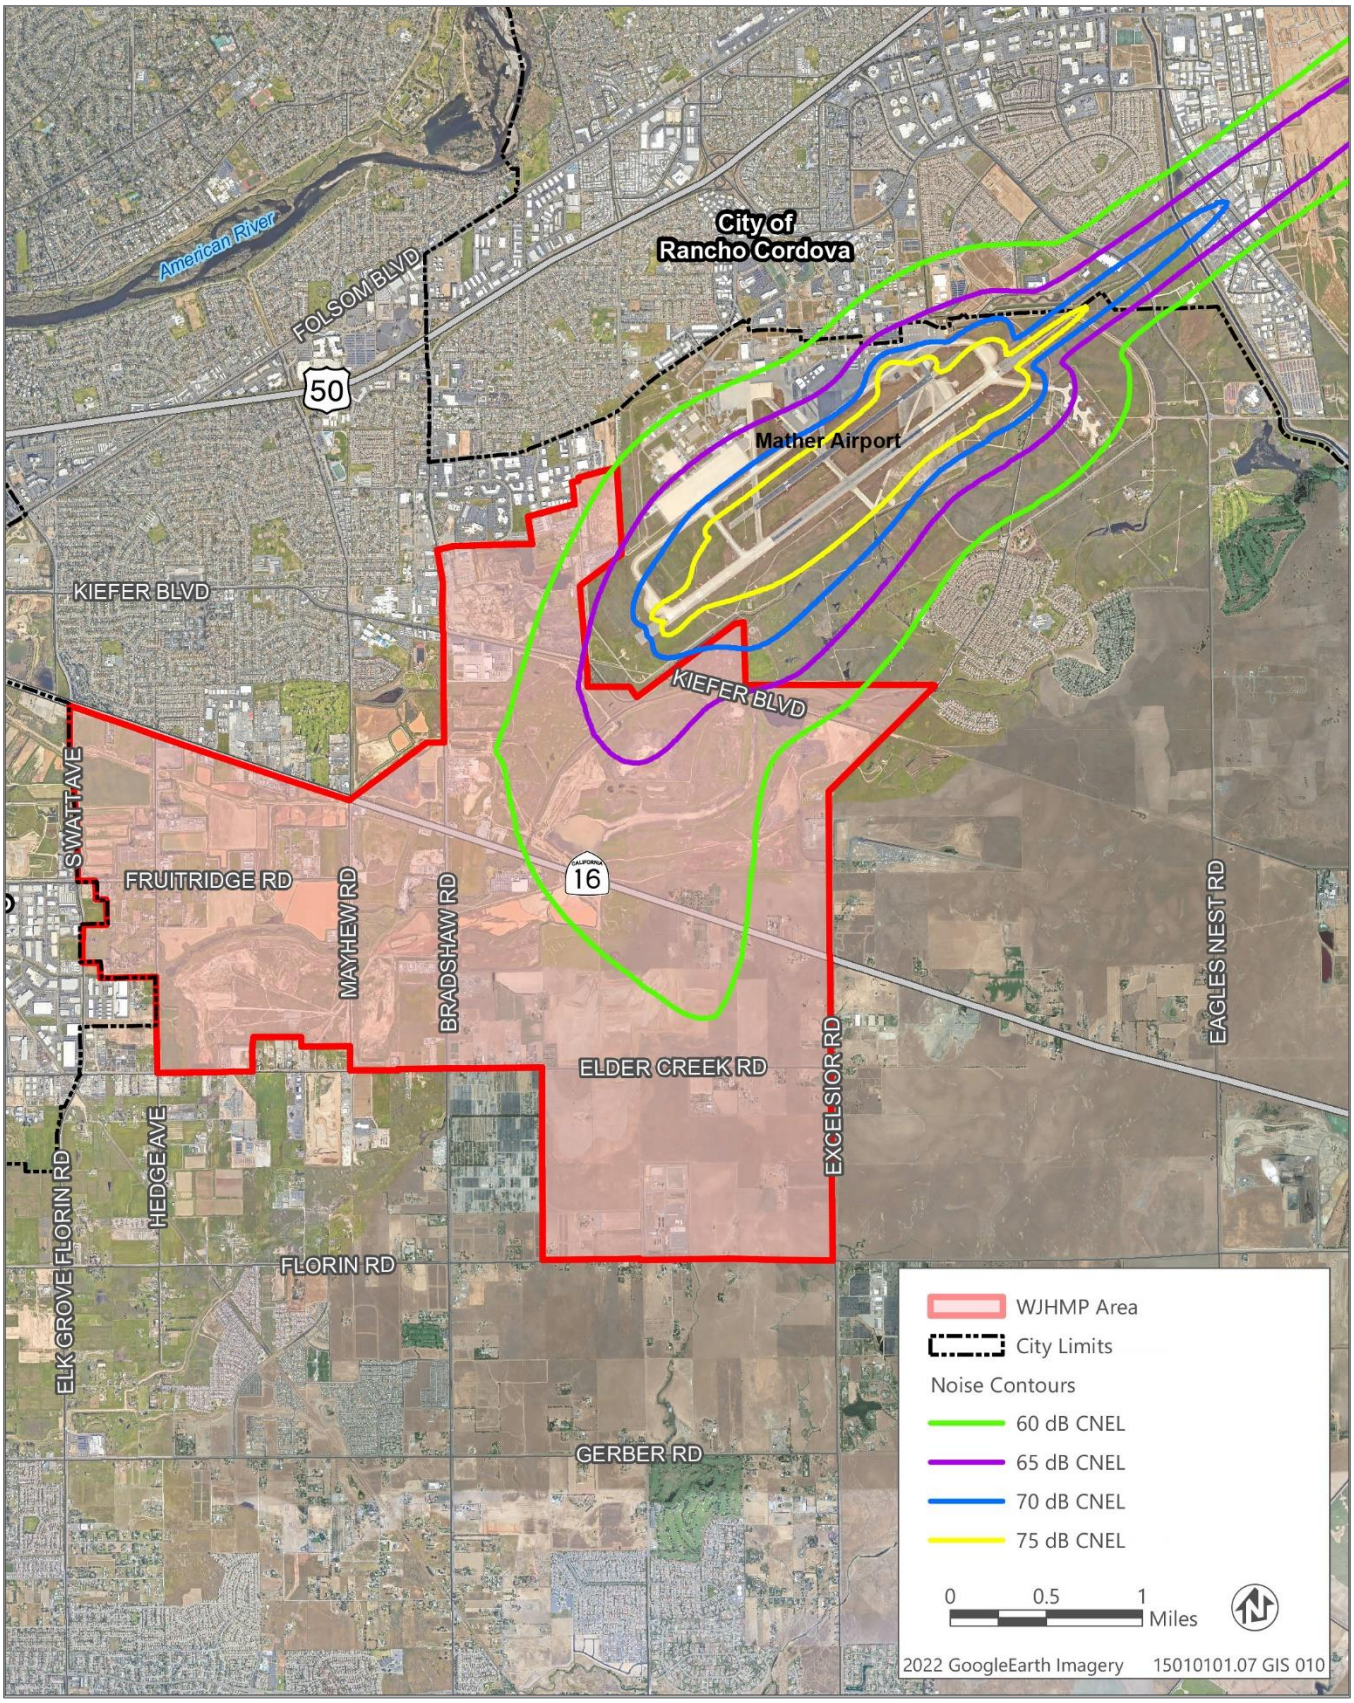
under the military until 1988 when the US Department of Defense decided to close it. The property was transitioned via lease to Sacramento County and officially reopened in May 1995 as Mather Airport, a civilian airport. In 2012, the property was purchased by Sacramento County. However, the airport continues to receive federal funding and limited military use continues.



Mather Airport includes two parallel runways that are situated in a southwest-northeast orientation and supports two helipads (North Helipad and South Helipad) located adjacent to the runways (SACOG 2022). The northern of the two runways is 6,040 feet long and 150 feet wide (a planned runway extension would increase the overall length of to 7,178 feet); and the southern runway is 11,301 feet long and 150 feet wide (SACOG 2022). Mather Airport accommodates the United Parcel Service for cargo services; regional general aviation demand, including corporate general aviation and recreational general aviation; and air taxis. Mather Airport's general aviation aircraft are primarily used for corporate, government, and recreational purposes (SCDA 2013).

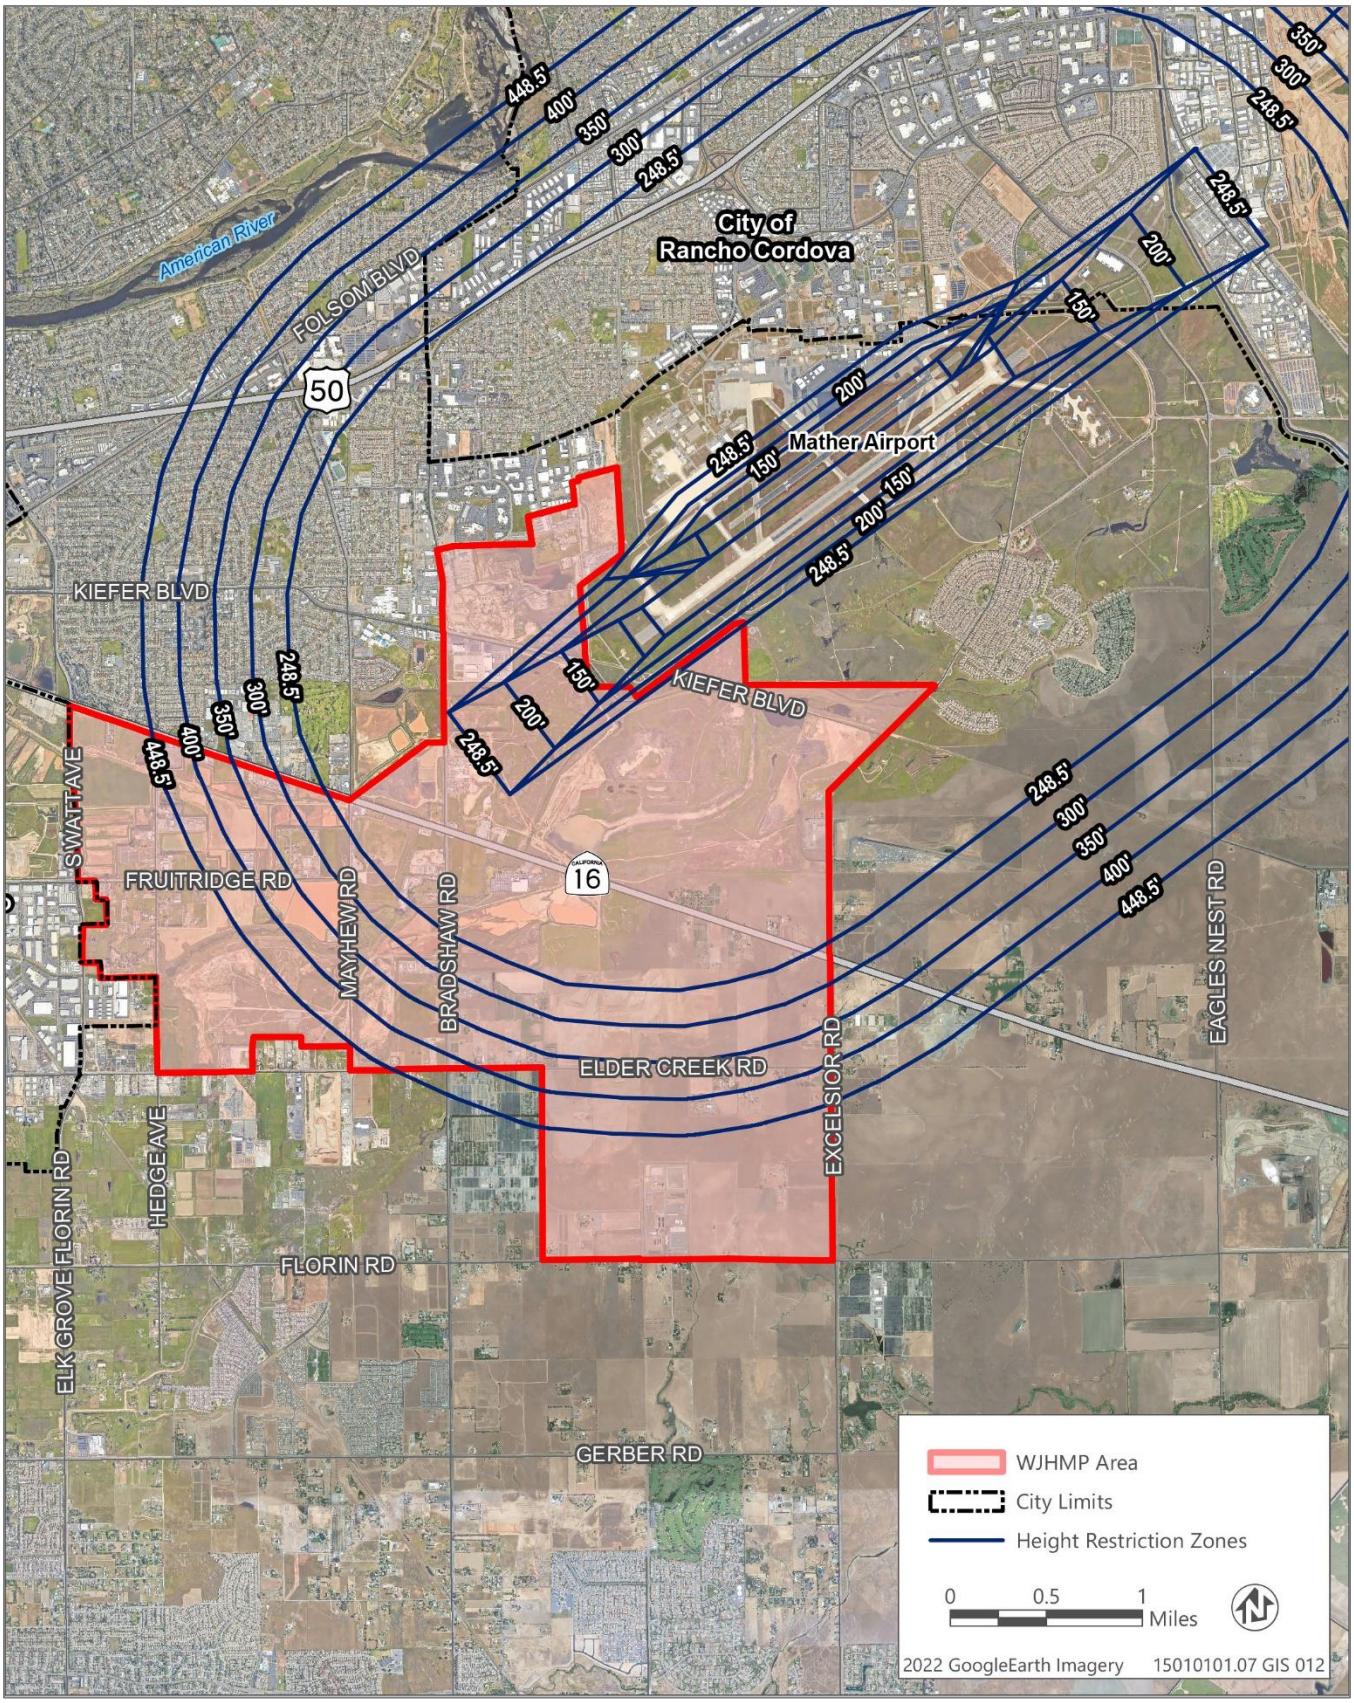
According to the Mather Airport airline landing statistics, Mather Airport saw 3,282 landings in 2019; 3,337 landings in 2020; 3,266 landings in 2021; 3,155 landings in 2022; and 3,029 landings in 2023 (SCDA 2019-2023). Mather Airport typically receives between 240 to 275 landings a month, with the majority of these being cargo planes. December typically has increased landings (325 to 450 landings) (SCDA 2019-2023). The majority of cargo operations occur during the evening and early morning hours at low-level overflights. Military operations consist of touch and go (take-off and landing operations), in which Air Force T-38 jet fighters are used. These aircraft are small, single-engine supersonic aircraft, which are quite loud. Touch and go operations occur at low level flight decks generally between 1,500 and 3,500 feet. Approximately 88 percent of all aircraft operations occur on the southern runway. Flights can take various flight paths depending on a variety of factors.

Mather Airport Land Use Planning



The Mather Airport ALUCP was adopted by SACOG in August 2022 and replaces the Mather Airport CLUP adopted by SACOG in May 1997. The updated ALUCP is based on the Mather Airport 2013 Revised Draft Master Plan and the FAA-approved 2014 Airport Layout Plan prepared by the Sacramento County Department of Airports. The 2013 Revised Draft Master Plan was not formally adopted.

The Mather Airport ALUCP provides land use compatibility guidelines and establishes planning boundaries for safety zones (Figure 7-1), noise (Figure 7-2), and height restrictions (Figure 7-3).



Source: Data received from Sacramento County in 2024 from SACOG; adapted by Ascent in 2024.

Figure 7-1 Mather Airport Safety Zones

Figure 7-2 Mather Airport Theoretic Capacity Noise Contours

Source: Adapted from the County of Sacramento in 2024; adapted by Ascent in 2024.

Figure 7-3 Mather Airport Height Restrictions

The specific policies in the ALUCP are focused around four compatibility factors. These factors include:

Noise – The aircraft noise policies promote the goals of the California Airport Noise Standards (California Code of Regulations, Title 21, Section 5000 et seq.) and the California Noise Insulation Standards (25 California Administrative Code Section 1092) by avoiding the establishment of noise-sensitive land uses in areas around the Airport that are exposed to significant levels of aircraft noise.

Safety – The safety policies minimize the potential number of future residents and land use occupants exposed to hazards related to aircraft operations such as aircraft accidents.

Airspace Protection – The airspace protection policies maintain the safe and efficient operation of the airspace around the airport by avoiding potential hazards to aircraft in flight and protecting the navigable airspace around the Airport consistent with the requirements of 14 Code of Federal Regulations Part 77, Safe, Efficient Use and Preservation of the Navigable Airspace, FAA Order 8260.3B, United States Standard for Terminal Instrument Procedures, and other relevant federal regulations.

Overflight Notification – The overflight notification policies address issues related to aircraft overflights by identifying the area within which flights to and from the airport occur frequently enough and at a low enough altitude to be noticeable by sensitive residents. Within this area, real estate disclosure notices are required, pursuant to state law (California Business and Professions Code Section 11010 and California Civil Code, Sections 1102.6 and 1103.4).

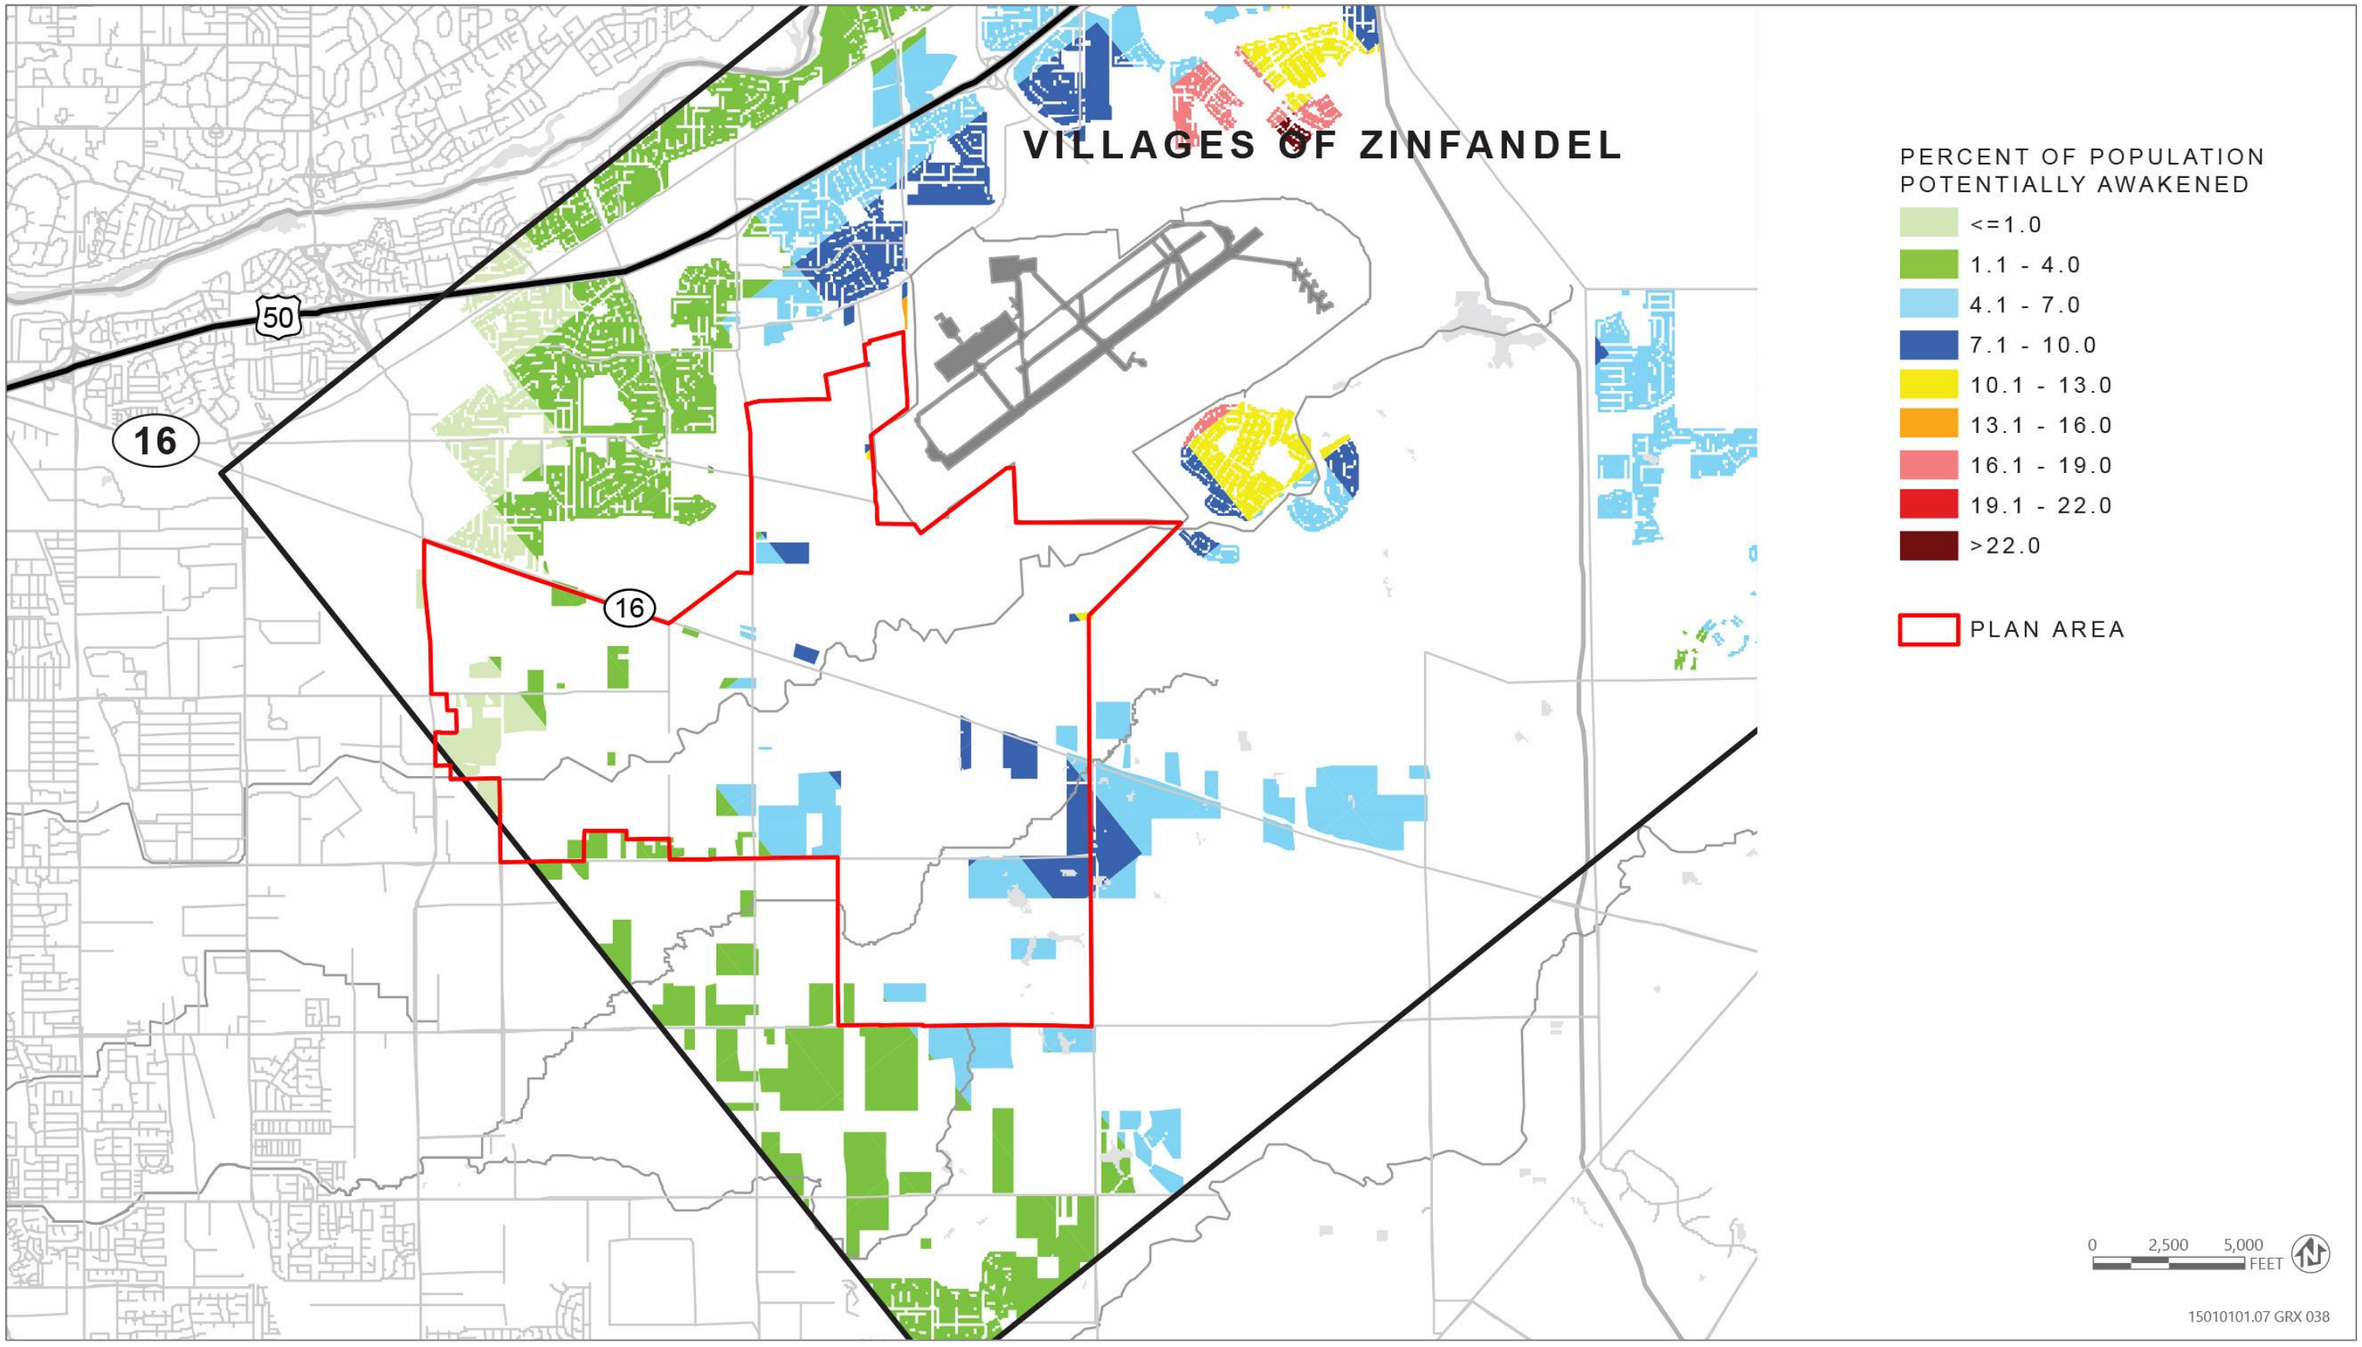
The airport land use compatibility policies and criteria in the ALUCP apply only to new development. Under state law, the ALUC has no jurisdiction over existing development, except for nonconforming uses that are proposed for expansion or redevelopment. The ALUCP is discussed in greater detail below.

Nighttime Awakenings and Single Event Noise Levels

The EIR for the Mather Airport Master Plan (Sacramento County 2014) includes a technical analysis of the percentage of population residing in the areas around Mather Airport potentially awakened by aircraft noise. The portion of population potentially awakened under the 2012 existing conditions scenario is shown in Figure 7-4. (Note: Areas with no existing population were not assigned a potential for awakenings and appear white.) Under 2012 existing conditions, less than 1 percent to 13 percent of the population of the plan area is estimated to be potentially awakened by existing airport operations. The analysis concludes that in the future, as a result of implementation of the Mather Airport Master Plan, the communities around Mather Airport would be subject to increases in the percent of the population potentially awakened due to forecasted growth in aircraft operations.

REGULATORY SETTING

FEDERAL



FEDERAL AVIATION ADMINISTRATION REGULATIONS

Federal Regulation Title 14 Part 77 establishes standards and notification requirements for objects affecting navigable airspace. Notification serves as the basis for FAA to:

- evaluate the effect of the construction or alteration on operating procedures,
- determine the potential hazardous effect of the proposed construction on air navigation,
- identify mitigating measures to enhance safe air navigation, and
- chart new objects.

Notification allows the FAA to identify potential aeronautical hazards in advance, thus preventing or minimizing the adverse impacts to the safe and efficient use of navigable airspace. Any person or organization who intends to sponsor any of the following construction or alterations must notify the Administrator of the FAA:

- any construction or alteration exceeding 200 feet above ground level;
- any construction or alteration:
    - within 20,000 feet of a public use or military airport which exceeds a 100:1 surface from any point on the runway of each airport with at least one runway more than 3,200 feet,
    - within 10,000 feet of a public use or military airport which exceeds a 50:1 surface from any point on the runway of each airport with its longest runway no more than 3,200 feet,
    - within 5,000 feet of a public use heliport which exceeds a 25:1 surface;
- any highway, railroad or other traverse way whose prescribed adjusted height would exceed that above noted standards;
- when requested by the FAA; and
- any construction or alteration located on a public use airport or heliport regardless of height or location.

Figure 7-4 Population Potentially Awakened by Aircraft Noise from Mather Airport

WILDLIFE ATTRACTANTS

The FAA provides guidance on certain land uses that have the potential to attract hazardous wildlife on or near public-use airports. The FAA also requires airports that receive Federal grant-in-aid assistance, such as Mather Airport, to utilize these guidelines for projects within their boundaries. Moreover, it recommends that land use planners and project developers use the FAA's guidance for privately owned or initiated projects on or near airports.

On February 21, 2020, the FAA released a revised *Advisory Circular for Hazardous Wildlife Attractants On or Near Airports* (AC 150/5200-33C, replacing AC 150/5200-33B) that provides guidance on certain land uses that have the potential to attract hazardous wildlife on or near public-use airports. It also discusses airport development projects (including airport construction, expansion, and renovation) affecting aircraft movement near hazardous wildlife attractants. The Advisory Circular, among other things, addresses stormwater detention facilities as potential hazardous wildlife attractants. According to the FAA, all stormwater facilities located within 10,000 feet of all airports' operations areas must drain within 48 hours of the design storm. Furthermore, for a 5-mile radius (nearly 20 square miles) the Advisory Circular discourages hazardous wildlife attractants, including detention basins that do not drain within 48 hours (FAA 2020).

STATE

STATE AIRPORT LAND USE POLICY

The State of California regulates airports under the authority of the Airport Land Use Commission Law, Chapter 4, Article 3.5, California Public Utilities Code. The objectives of the Airport Land Use Commission Law are to:

- protect public health, safety, and welfare through the adoption of land use standards that minimize the public's exposure to safety hazards and excessive levels of noise; and
- prevent the encroachment of incompatible uses around public-use airports, thereby preserving the utility of these airports into the future.

Under the provisions of the law, the ALUC is required to prepare an ALUCP for each public airport within its jurisdiction. The ALUCP or CLUP must be based on either a 20-year master plan or an airport layout plan if the Caltrans Division of Aeronautics decides that the existing airport layout plan is adequate for use in ALUCP/CLUP preparation.

State law requires that General Plans be made consistent with adopted ALUCPs and/or CLUPs. Consistency can be achieved through either of the following actions:

- Amending general/community plan elements and other land use regulations, where necessary, to be consistent with the ALUCP/CLUP, or prevent the encroachment of incompatible uses around public-use airports, thereby preserving the utility of these airports into the future; or

- In the event the Board of Supervisors does not agree with a provision of the plan, it can satisfy the consistency requirement for that provision by overruling the ALUC by a two-thirds vote. The overruling must, however, be made after a public hearing and must be based on specific findings that the proposed actions are consistent with the purposes of the Airport Land Use Commission Law.

Once consistency is achieved between the ALUCP/CLUP and County land use controls through either of the above two methods, State law requires that certain types of projects be referred to the ALUC for a determination of their consistency with an adopted ALUCP/CLUP. Such projects include amendments to the 2030 General Plan, or a community plan, and adoption or amendments to zoning ordinances that affect an area within an airport planning boundary as established by an ALUCP/CLUP. If the ALUC determines the project to be inconsistent, the County may overrule the ALUC by a two-thirds vote, again after a public hearing, and based on specific findings.

California Education Code

The Education Code includes provisions that apply to prospective school sites near airports. Section 39005 requires that school boards notify the Department of Education prior to acquiring title to property within 2 miles of an airport. The Department of Education then works with the Department of Transportation to investigate the proposed school site and presents recommendations concerning acquisition of the site to the board. Section 81036 sets forth similar requirements specific to community colleges.

Local

Mather Airport Airport Land Use Compatibility Plan

The Mather Airport Airport Land Use Compatibility Plan (ALUCP) was adopted by SACOG in August 2022. The ALUCP established new safety zones, noise contours, and height restrictions for Mather Airport. Sacramento County subsequently amended its General Plan Land Use and Noise Elements to incorporate the updated Mather Airport ALUCP, including the new safety zones and noise contours. The General Plan Amendments were adopted in December 2022.

Mather Airport Safety Zones

Consistent with State airport land use policy as described above, the purpose of having safety zones is to minimize the number of people exposed to hazards related to aircraft operations and accidents. Figure 7-1 depicts the adopted safety zones for Mather Airport. Portions of the plan area are located within Safety Zones 2, 3, 4, and 6. Proposed land uses within the safety zones must be evaluated in accordance with the safety compatibility criteria in the ALUCP, which are identified in Table 4-2 of the ALUCP and summarized below. The compatibility criteria identify maximum residential density, non-residential intensity, and allowable land uses for each of the six safety zones. The land uses shown in Table 4-2 of the ALUCP fall into one of three categories: compatible, conditionally compatible, and incompatible.

Safety zones for Mather Airport include the following:

Safety Zone 1 (Runway Protection Zone): No land uses identified in the ALUCP are considered compatible in Safety Zone 1.

Safety Zone 2 (Inner Approach/Departure Zone): Land uses considered by the ALUCP to be incompatible in Safety Zone 2 include the following:

- Outdoor Major Assembly Facilities
- Outdoor Large Assembly Facilities
- Outdoor Small Assembly Facilities
- Indoor Large Assembly Facilities
- Indoor Recreation/Small Assembly Facilities
- Congregate Care Facilities
- Child and Adult Day Care Facilities
- Family Day Care Home, Large
- School, K-12
- Family Day Care Home, Small
- In-Patient Medical Services
- Out-Patient Medical Services
- Public Safety Facilities
- Temporary Supportive Housing
- Hazardous Materials
- Heavy Industrial
- Light Industrial, High Intensity
- Renewables
- Major Utilities

Land uses considered conditionally compatible in Safety Zone 2 include the following:

- Single-Family Residential
- Multi-Family Residential
- Long-Term Lodging (>30 nights)
- Short-Term Lodging (> 30 nights)
- Adult Schools
- Libraries and Museums
- Major Retail
- Cemeteries, Mausoleums
- Local Retail
- Large Retail
- Eating/Drinking Establishments
- General Retail
- Office Uses
- Limited Retail/Wholesale
- Communications Facilities
- Minor Utilities
- Water Facilities
- Greenwaste Facilities
- Wildlife Preserve
- General Agricultural Uses
- Government and Local Agency Buildings
- Research and Development, Laboratory

The above uses could still be developed in Safety Zone 2 to be compatible with the ALUCP if limited to an intensity of 60 people per acre and 50 percent lot coverage, and appropriate measures to avoid attracting hazardous wildlife are taken where applicable.

Safety Zone 3 (Inner Turning Zone): Land uses considered incompatible in Safety Zone 3 include:

- Outdoor Major Assembly Facilities
- Outdoor Large Assembly Facilities
- Outdoor Small Assembly Facilities
- Indoor Large Assembly Facilities
- Indoor Recreation/Small Assembly Facilities
- Congregate Care Facilities
- Child and Adult Day Care Facilities
- Family Day Care Home, Large
- School, K-12
- Family Day Care Home, Small
- In-Patient Medical Services
- Major Retail
- Large Retail

Land uses considered conditionally compatible in Safety Zone 3 include the following:

- Single-Family Residential
- Multi-Family Residential
- Long-Term Lodging (>30 nights)
- Short-Term Lodging (>30 nights)
- Adult Schools
- Libraries and Museums
- Government and Local Agency Buildings
- Cemeteries, Mausoleums
- Out-Patient Medical Services
- Public Safety Facilities Temporary Supportive Housing
- Local Retail
- General Retail
- Eating/Drinking Establishments
- Limited Retail/Wholesale
- Office Uses
- Hazardous Materials
- Heavy Industrial
- Light Industrial, High Intensity
- Communications Facilities
- Renewables
- Major Utilities
- Water Facilities
- Greenwaste Facilities
- Wildlife Preserve
- General Agricultural Uses

Conditionally compatible non-residential land uses could still be developed to be compatible in Safety Zone 3 if limited to an intensity of 100 people per acre and 60 percent lot coverage, and appropriate measures to avoid attracting hazardous wildlife are taken where applicable. Residential land uses can be developed if limited to a density of 0.5 dwelling units per acre.

Safety Zone 4 (Outer Approach/Departure Zone): Land uses considered by the ALUCP to be incompatible in Safety Zone 4 include the following:

- Outdoor Major Assembly Facilities
- Outdoor Large Assembly Facilities
- Indoor Large Assembly Facilities
- Congregate Care Facilities
- Child and Adult Day Care Facilities
- Family Day Care Home, Large
- School, K-12
- Family Day Care Home, Small
- In-Patient Medical Services

Land uses considered conditionally compatible in Safety Zone 4 include the following:

- Outdoor Small Assembly Facilities
- Multi-Family Residential
- Single-Family Residential
- Short-Term Lodging (> 30 nights)
- Long-Term Lodging (>30 nights)
- Libraries and Museums
- Adult Schools
- Cemeteries, Mausoleums
- Government and Local Agency Buildings
- Public Safety Facilities
- Out-Patient Medical Services
- Office Uses
- Major Retail
- Heavy Industrial
- Hazardous Materials
- Communications Facilities
- Light Industrial, High Intensity
- Major Utilities
- Renewables
- Greenwaste Facilities
- Water Facilities
- General Agricultural Uses
- Wildlife Preserve
- Indoor Recreation/Small Assembly Facilities

Conditionally compatible non-residential land uses could still be developed to be compatible in Safety Zone 4 if limited to an intensity of 150 people per acre and 70 percent lot coverage, and appropriate measures to avoid attracting hazardous wildlife are taken where applicable. Residential land uses can be developed if limited to a density of 0.5 dwelling units per acre.

Safety Zone 5 (Sideline Zone): The majority of land area within Safety Zone 5 occurs on airport property, with only a portion extending onto 0.4 acres of an already developed parcel.

Safety Zone 6 (Airport Traffic Pattern Zone): No uses are identified as incompatible in the ALUCP. Conditionally compatible land uses include outdoor major assembly facilities such as stadiums, amphitheaters, and racetracks which are to be avoided

unless alternative sites cannot be identified. Congregate care facilities, child and adult day care facilities, and K-12 schools can be developed if limited to an intensity of 300 people per acre. Hazardous materials, communications facilities, and wildlife preserve uses can be developed if alternative sites elsewhere cannot be identified.

MATHER AIRPORT NOISE CONTOURS

Noise generated from aircraft operations can be bothersome to the public. The Mather Airport ALUCP defines airport noise contours and land uses that are incompatible with noises 60 CNEL or above. Therefore, the Mather Airport ALUCP has restricted uses within the 60-75+ CNEL noise contours to minimize the number of people exposed to bothersome noise from aircraft operations. Uses outside of these contours are not restricted.

As shown in Figure 7-2, a portion of the plan area is located within the Mather Airport 60 dB CNEL noise contour line, which generally prohibits certain types of sensitive land uses such as homes and schools. As explained above, these contours delineate zones with differing capacity, or ability to accommodate land uses, without exposing people to excessive airplane noise. The exposure maps are based on theoretical flight tracks, rather than radar data, and represent the “theoretic capacity” of the area.

MATHER AIRPORT HEIGHT RESTRICTIONS

According to the Mather Airport ALUCP, height standards for defining obstructions to air navigation are established by FAA and are defined in Federal Aviation Regulation (FAR) Part 77, *Objects Affecting Navigable Airspace*. The Mather Airport ALUCP further discusses the need for height restrictions as follows:

> Height restrictions are necessary to ensure that objects will not impair flight safety or decrease the operational capability of the airport. FAR Part 77 defines a series of imaginary surfaces surrounding airports. Any object or structure which would penetrate any of these imaginary surfaces is considered by the FAA to be an obstruction of air navigation.

As shown in Figure 7-3, a majority of the plan area would be subject to height restrictions; building heights could not exceed the height AMSL shown in the figure, which range from 150 feet to 448.5 feet.

MATHER AIRPORT PLANNING POLICY AREA

In 2006, the Board of Supervisors adopted the Airport Planning Policy Area (APPA) for Mather Airport, by Resolution 2006-1378, as an interim effort to ensure airport land use compatibility during a period of rapid development that was outpacing the rate at which airport master plans, environmental documentation, and ALUCPs could be updated.

The Mather APPA places specific limitations on conditions of new residential development within certain proximity to Mather Airport. Specifically, the Mather APPA includes the following conditions:

1. Prohibit new residential development inside the current Board approved 60 CNEL noise contour for Mather Airport.
2. Condition new residential land uses within the APPA boundary but beyond the current Board approved 60 CNEL noise contour for Mather Airport as follows:
   a. Minimum noise insulation to protect persons from excessive noise within new residential dwellings, including detached, single-family dwellings, that limits noise to 45 dB CNEL, with windows closed, in any habitable room.
   b. Notification in the Public Report prepared by the California Department of Real Estate disclosing to prospective buyers that the parcel is located within the applicable APPA and that aircraft operations can be expected to overfly that area at varying altitudes less than 3,000 feet above ground level (AGL).
   c. Execution and recordation with the Sacramento County Recorder of avigation easements prepared by the Sacramento County Counsel's Office on each individual residential parcel contemplated in the development in favor of the County of Sacramento. All avigation easements recorded pursuant to this policy shall, once recorded, be copied to the Director of Airports and shall acknowledge the property location within the appropriate APPA and shall grant the right of flight and unobstructed passage of all aircraft into and out of the appropriate airport.

   Exceptions: New accessory residential dwellings on parcels zoned Agricultural, Agricultural Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural, shall be exempt from the Airport Planning Policy Area's prohibitions.

These conditions are intended to increase the awareness of future residents of their possible exposure to aircraft operations, limit the potential for conflict between the airport and adjacent communities, and protect future airport development and aircraft operations flexibility.

The plan area is within the Mather APPA and a large portion of the plan area is located within the 60 CNEL noise contour. Therefore, both Conditions 1 and 2 apply to the project.

Sacramento County 2030 General Plan

The following Sacramento County 2030 General Plan policies are applicable to the project:

- **Policy LU-87.** Because land use decisions around airports by local governments have a direct impact on an airport's long-term viability and utility, proposed new land use projects and land use practices near airports within Sacramento County shall consider consistency with current federal, State, and local airport land use compatibility regulations, orders, policies, plans, standards and guidance pertaining to public safety and minimization of hazardous wildlife attractants within five statute miles of County airports.

- **Policy NO-2.** Proposals for new development within Sacramento County which may be affected by aircraft noise shall be evaluated relative to Table 4: *Land Use Compatibility for Aircraft Noise*, except in the following cases. Development proposals which may be affected by aircraft noise from Sacramento International Airport shall be evaluated relative to the Land Use Compatibility Plan prepared for Sacramento International Airport dated December 12, 2013, adopted herein by reference. Development proposals which may be affected by aircraft noise from Mather Airport shall be evaluated relative to the Land Use Compatibility Plan prepared for Mather Airport dated February 2021, adopted herein by reference, as well as applicable footnotes in Table 4.
- **Policy NO-3.** New residential development within the 60 CNEL noise contours adopted by the County for land use planning purposes at any airport or Helipad within Sacramento County shall be prohibited unless exceptions set forth in Table 4 [of the General Plan Noise Element] are found to be applicable. This policy is not applicable to Executive Airport.

  Footnotes 2, 6, and 7 of the General Plan Noise Element Table 4 state the following with respect to development of noise-sensitive uses within the Mather Airport noise contours:

  2. Single family detached residential units within the 60-65 dB CNEL noise contours of the Mather Airport Policy Area may be considered a compatible use if: (a) approved by the Board of Supervisors upon completion of Sacramento County's master plan process, including demonstration of compliance with LU-119 and LU-120; (b) an evaluation of potential noise and safety impacts pursuant to CEQA has occurred and appropriate noise mitigation measures to reduce interior noise levels to 45 dB have been included in the environmental document and adopted as conditions of approval; and (c) all of the requirements in Footnote 8 below are met. Second residential units are a compatible use within all CNEL ranges, subject to the condition that the proposed second unit be consistent with the provisions of Section 65852.1 and 65852.2 of the California Government Code.
  6. Compatible at Sacramento International Airport and Franklin Field only if the residential use is directly related to agricultural uses, such as dwelling units for the land owner, the owner's immediate family, or for employees. May be compatible at Mather Airport if approved by the Board of Supervisors as a component of a master plan and all criteria set forth in Footnote 2 above are satisfied. All residential units shall be designed to limit intruding noise such that interior noise levels do not exceed 45 CNEL, with windows closed, in any habitable room.
  7. New residential uses within 60 CNEL are not compatible, with the exception of accessory residential dwellings on parcels zoned Agricultural, Agricultural-Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural or single family dwellings as set forth in Footnote 2 above. Except as provided in Footnotes 2 and 6 above, new residential development

within the Mather Airport Policy Area boundaries but outside the 60 CNEL shall be subject to the following conditions:

A. Provide minimum noise insulation to provide 45dB within new residential dwellings, including detached single family dwellings, with windows closed, in any habitable room.

B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within the Mather Airport Policy Area.

C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento and recorded with the Sacramento County Recorder and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within the Mather Airport Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of Mather Airport.

New residential development within the Mather Airport Policy Area outside the 65 dB CNEL but inside the 60 dB CNEL shall be subject to Conditions A through C above and a County-approved noise analysis and mitigation to reduce interior noise impacts to 45 dB with windows closed, in any habitable room.

- **Policy NO-4.** New residential development within adopted Airport Policy Area boundaries, but outside the 60 CNEL, shall be subject to the following conditions:

A. Provide minimum noise insulation to 45 dB CNEL within new residential dwellings, including detached single family dwellings, with windows closed in any habitable room.

B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within an Airport Policy Area.

C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento, recorded with the Sacramento County Recorder, and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within an Airport Planning Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of the subject Airport.

Exceptions: New accessory residential dwellings on parcels zoned Agricultural, Agricultural-Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural and between the 60 and 65 CNEL contours, shall be permitted within adopted Airport Policy Area boundaries, but would be subject to the conditions listed above.

SACRAMENTO COUNTY GUIDANCE ON SINGLE EVENT NOISE METHODOLOGY

The Sacramento County General Plan Noise Element policies do not provide a noise standard specific to single events. However, the County has determined that single-event aircraft noise exposure and associated sleep disturbance impacts are to be

assessed in accordance with the Sacramento County General Plan Noise Element Policies NO-2 through NO-4 on aircraft noise. Those policies restrict new residential development to areas outside the 60 dB CNEL airport noise contours, require noise insulation to ensure interior noise levels do not exceed 45 dB CNEL within residences, require notification that prospective buyers are located within an APPA, and require that an avigation easement be recorded acknowledging the property is located within an APPA (Bollard Acoustical Consultants 2023).

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

Cordova Community Plan

The Cordova Community Plan, which was last updated in 2003, provides guidance for both new development and the redevelopment of existing land uses within the community plan area. The following policy in the plan is applicable to the WJHMP:

- **Policy UDNC-11.** Ensure that potentially incompatible and unsafe land uses are separated from residential uses by appropriate transition areas.

Vineyard Community Plan

The Vineyard Community Plan, which was developed in 1985, provides guidance for growth and development in the community plan area. The following policy in the plan is applicable to the WJHMP:

- **Policy CI 5.** Employment intensive industrial/commercial development will be opposed within the Mather Air Force Base accident potential zones (APZs).

Significance Criteria and Methodology

Significance Criteria

An impact on airport compatibility would be significant if implementation of the project would:

- result in a safety hazard for people residing or working in the vicinity of an airport/airstrip,
- expose people residing or working in the plan area to aircraft noise levels in excess of applicable standards,
- result in a substantial adverse effect upon the safe and efficient use of navigable airspace by aircraft, or
- result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks.

The California Supreme Court concluded in *California Building Industry Association v. Bay Area Air Quality Management District*, (2015) 62 Cal.4th 369, 377-378, "agencies subject to CEQA generally are not required to analyze how existing environmental conditions will impact a project's future users or residents. But when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users. In those specific instances, it is the project's impact on the environment—and not the environment's impact on the project—that compels an evaluation of how future residents or users could be affected by exacerbated conditions." With this ruling, the impact of existing conditions on a project are not considered an impact requiring consideration under CEQA, unless the project could exacerbate an existing environmental hazard or the lead agency elects to provide the analysis.

Issues Not Discussed Further

Change in Air Traffic Patterns

The project would not involve or affect air traffic movement because the project is a mixed-use development that would comply with height restrictions and does not contain a private airstrip. Therefore, there would be no impact on air traffic patterns. This issue is not discussed further in this EIR.

Methodology

The following analysis is based on review of the WJHMP and consistency with applicable regulations and planning documents, including the *FAA Advisory Circular for Hazardous Wildlife Attractants On or Near Airports* (AC 150/5200-33C), Mather Airport ALUCP (SACOG 2022), the Sacramento County General Plan (Sacramento County 2011), and the Sacramento County General Plan Noise Element (Sacramento County 2022). Additionally, this analysis incorporates material from the following reports prepared for the project, which are included in Appendix C:

- *Residential Construction and Testing Requirements for West Jackson Master Plan Residences Constructed Between the Mather Airport 60 and 65 dB CNEL Contours* (Bollard Acoustical Consultants 2022);
- *Noise and Vibration Analysis, West Jackson Highway Master Plan Area, Sacramento County, California* (Bollard Acoustical Consultants 2023); and
- *Wildlife Hazard Assessment for the West Jackson Highway Master Plan, Sacramento County, California* (ECORP Consulting 2023).

Industry Guidance on Single Event Noise and Sleep Disturbance

The following summary is from the *Noise and Vibration Analysis* prepared for the project (Bollard Acoustical Consultants 2023).

The Federal Interagency Committee on Aviation Noise (FICAN) has provided estimates of the percentage of people expected to be awakened when exposed to specific sound

exposure levels (SELs) inside a home. However, FICAN did not recommend a threshold of significance based on the percent of people awakened. According to the FICAN study, 10 percent of the population is estimated to be awakened when the SEL interior noise level reaches 81 A-weighted decibels (dBA). An estimated 5 to 10 percent of the population is affected when the SEL interior noise level is between 65 and 81 dBA, and few sleep awakenings (less than 5 percent) are predicted if the interior SEL is less than 65 dBA. The FICAN results focused on individual single-event sound levels but did not take into consideration how exposure to multiple single events affected sleep disturbance.

ANSI and the Acoustical Society of America (ASA) released a voluntary methodology to predict sleep disturbance in terms of the probability of awakening. ANSI's 2008 *Quantities and Procedures for Description and Measurement of Environmental Sound - Part 6: Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes* provides a method to predict sleep disturbance associated with noise levels in terms of indoor A-weighted sound exposure level (ASEL). The methodology was developed from about 10,000 subject-nights of observations primarily in homes near areas of routine jet aircraft takeoff and landings, railroads, roads, and highways. The methodology assumes that the individuals have no sleep disorders, normal hearing, and only applies to individuals over 18 years of age. The methodology also defines "disturbance" as being restricted to a behaviorally confirmed awakening.

While FICAN has a recommended means of predicting awakenings from a single aircraft event, the new ANSI methodology further refines this approach by taking into account the time since the person fell asleep and the ability to identify the probability of being awakened from multiple aircraft events over the course of the entire night. However, research performed by Bollard Acoustical Consultants questions the accuracy of the ANSI methodology.

Although the FICAN and ANSI methodologies provide a means by which the potential for awakenings due to single events can be predicted, neither methodology provides a recommended target level for acceptable single-event noise or percentage of awakening. Further, there is no industry consensus establishing recommended target levels for acceptable single-event noise or percentage of awakening.

West Jackson Highway Master Plan Policies

The WJHMP includes the following policies related to airport compatibility:

- **Policy 4.1.** Notification shall be provided to all prospective buyers that residential parcels are located within the Mather Airport Planning Policy Area and that aircraft operations occur over the Plan Area.
- **Policy 4.2.** Granting the right of flight and unobstructed passage of aircraft into and out of Mather Airport and recordation of the avigation easement shall be provided to the benefit of Sacramento County.

IMPACTS AND ANALYSIS

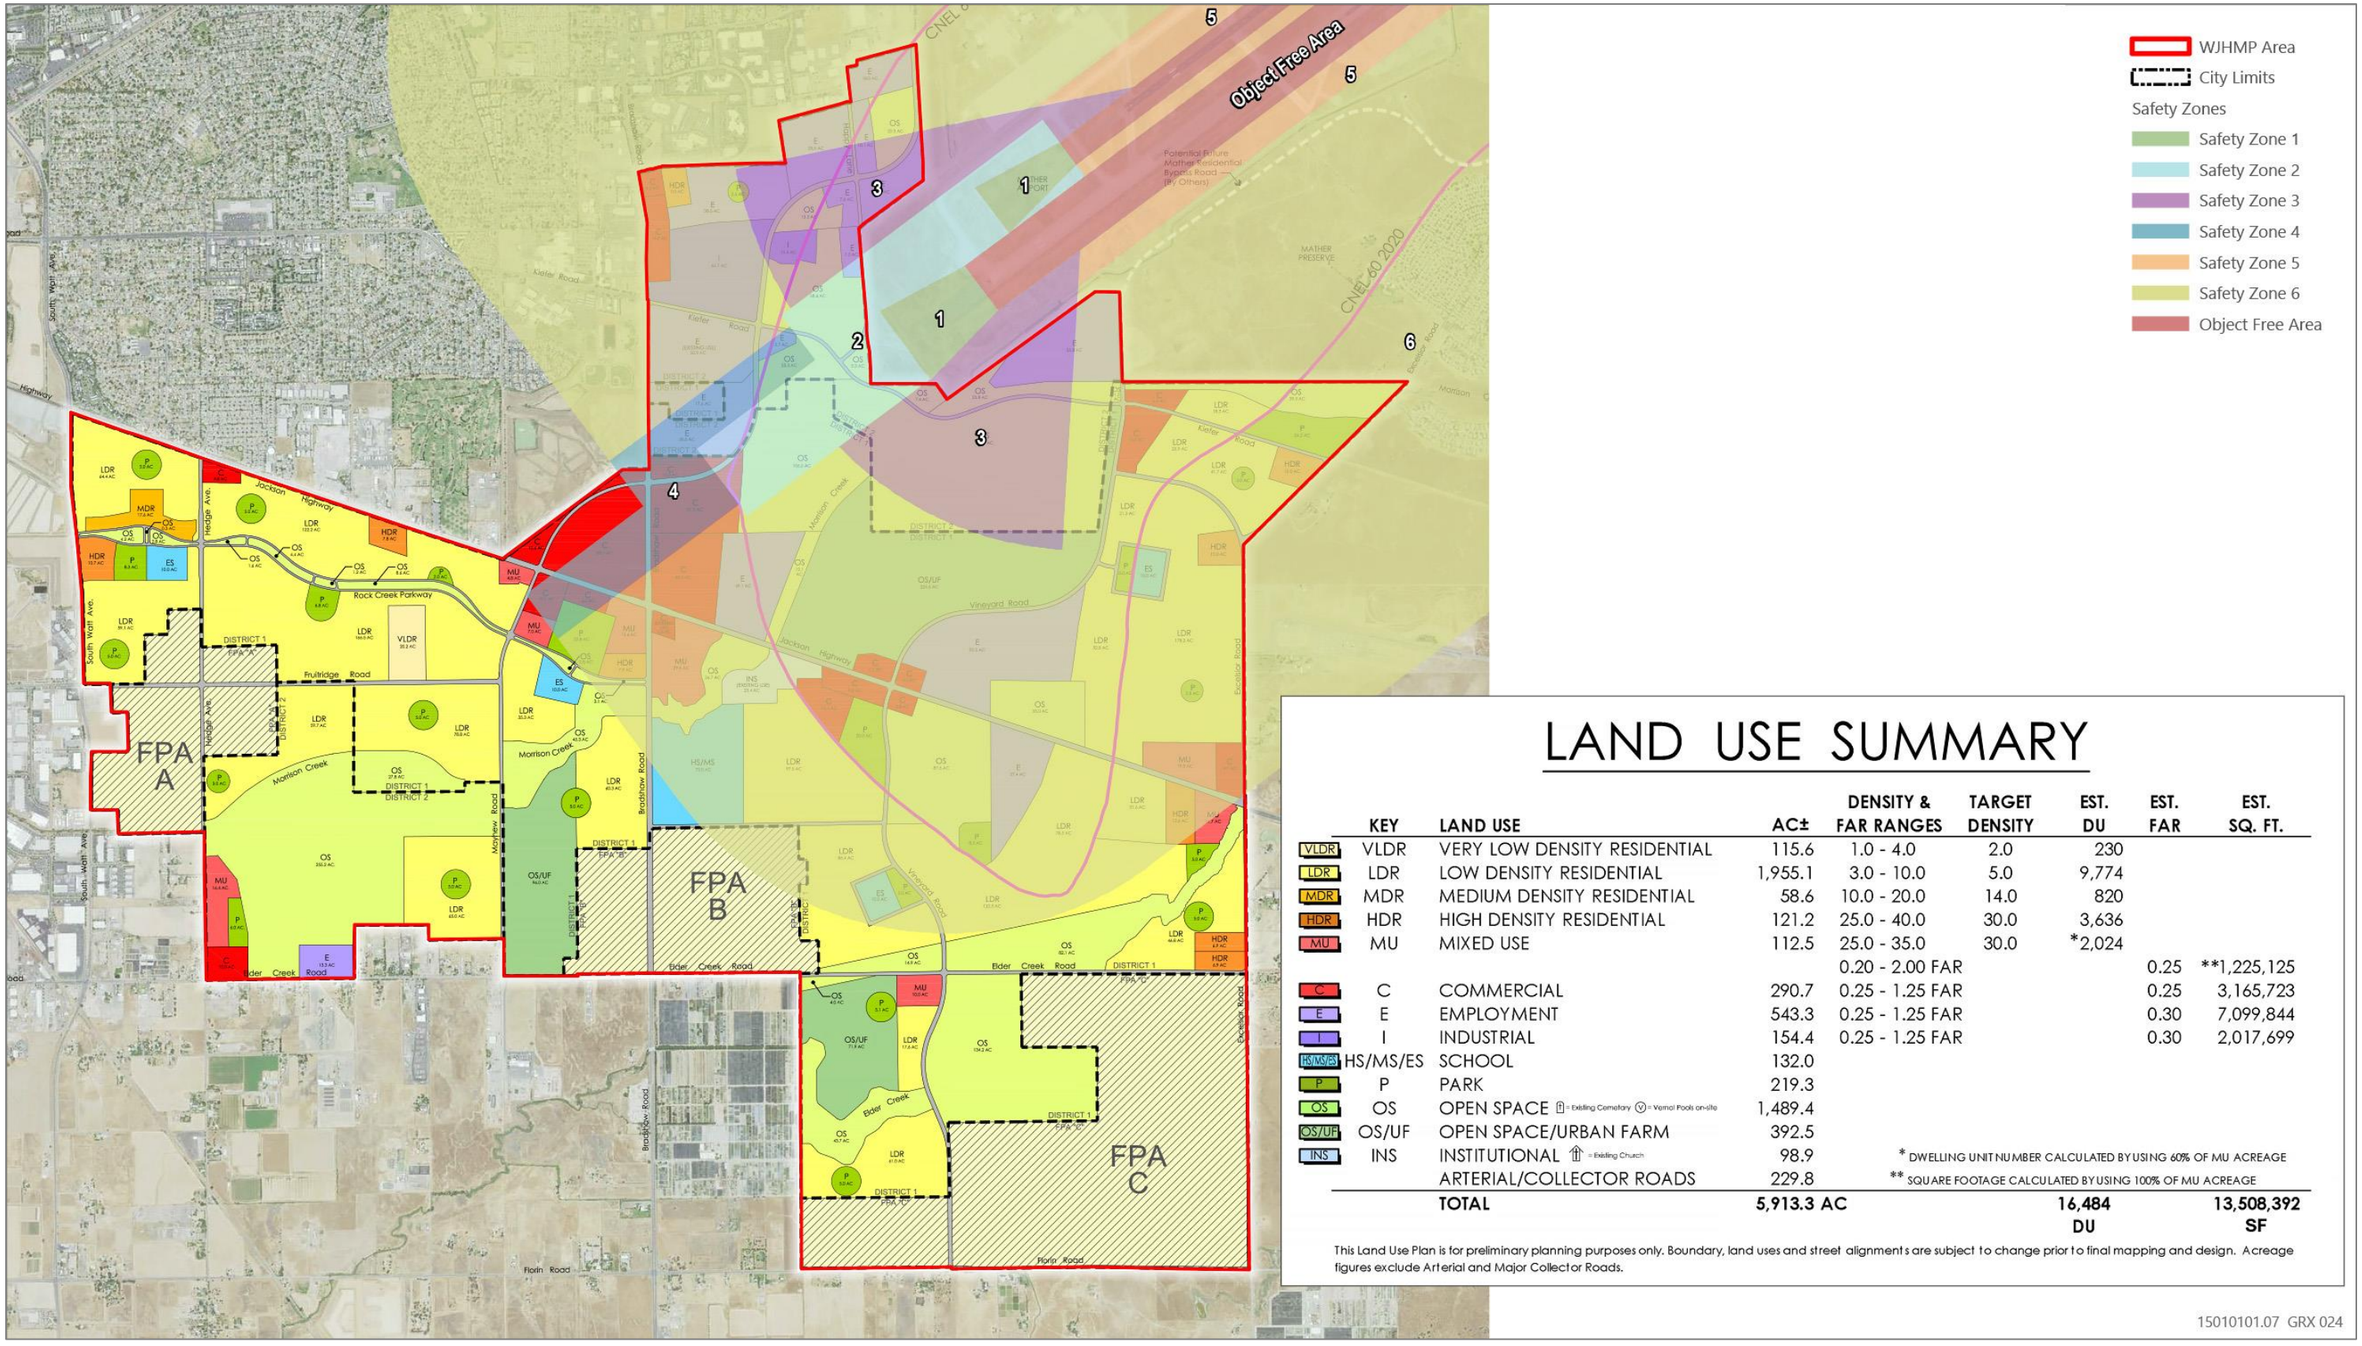
IMPACT AC-1: RESULT IN A SAFETY HAZARD TO PEOPLE LIVING AND WORKING IN THE VICINITY OF AN AIRPORT

Airport safety zones are established to minimize the number of people exposed to aircraft crash hazards. According to the Mather Airport ALUCP, portions of the plan area are located within safety zones 2, 3, 4, and 6 (Figure 7-5). Proposed land uses within the safety zones must be evaluated in accordance with the safety compatibility criteria in the ALUCP, which are identified in Table 4-2 of the ALUCP and summarized above. The compatibility criteria identify maximum residential density, non-residential intensity, and allowable land uses for each of the six safety zones. Future development applications within the Mather Airport safety zones would be required to be reviewed by the ALUC to ensure that proposed projects are compatible with the safety zones. Further, proposed school sites would be subject to the review detailed in the Education Code.

In safety zone 2, the plan area designates areas for open space, employment, and commercial land uses. Examples of compatible uses in this zone include wildlife preserve, retail, eating/drinking establishments, and office uses. Conditionally compatible uses could be developed in safety zone 2 if limited to an intensity of 60 people per acre and 50 percent lot coverage, and appropriate measures to avoid attracting hazardous wildlife are taken where applicable.

In safety zone 3, the plan area designates areas for open space, open space/urban farm, employment, and industrial land uses. Examples of compatible uses in this zone include wildlife preserve, general agricultural uses, retail, eating/drinking establishments, office uses, and industrial uses. Conditionally compatible non-residential land uses could be developed in safety zone 3 if limited to an intensity of 100 people per acre and 60 percent lot coverage, and appropriate measures to avoid attracting hazardous wildlife are taken where applicable. Residential land uses could be developed if limited to a density of 0.5 dwelling units per acre.

In safety zone 4, the plan area designates areas for open space, park, employment, and commercial land uses. Examples of compatible uses in this zone include wildlife preserve, indoor recreation/small assembly facilities, retail, eating/drinking establishments, office uses, out-patient medial services, and industrial uses. Conditionally compatible non-residential land uses could still be developed in safety zone 4 if limited to an intensity of 150 people per acre and 70 percent lot coverage, and appropriate measures to avoid attracting hazardous wildlife are taken where applicable. Residential land uses could be developed if limited to a density of 0.5 dwelling units per acre.



In safety zone 6, the least restrictive zone, the plan area includes a variety of planned land use designations, including residential (low- and high-density), school, open space, open space/urban farm, park, institutional, mixed use, commercial, employment, and industrial land uses. No land uses are identified as incompatible in safety zone 6, and conditionally compatible uses such as congregate care facilities and K-12 schools can be developed if the intensity does not exceed 300 people per acre.

As indicated above, planned development within the WJHMP can be accommodated under the compatibility criteria of the ALUCP with limitations on development intensity for certain land use types in specific situations. Further, pursuant to WJHMP Policy 4.1, all residential development within the APPA would be conditioned so that prospective homebuyers are notified via a public report disclosure by the California Department of Real Estate that the property is located within the APPA and that aircraft operations occur within the plan area. Pursuant to WJHMP Policy 4.2, all properties would be conditioned with an avigation easement.

Because proposed development in the plan area would be consistent with the uses allowed in the safety zones, future development applications within the Mather Airport safety zones would be required to be reviewed by the ALUC to ensure compatibility with the safety zones, and homebuyers would be notified that the property is located within the APPA and that aircraft operations occur within the area, the project would not create substantial safety hazards to people living and working in the vicinity of an airport. Therefore, this impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

Source: Image produced and provided by Wood Rodgers in 2023; safety zones received from Sacramento County in 2024 from SACOG; adapted by Ascent in 2024.

Figure 7-5 Mather Airport Safety Zones and Project Land Uses

IMPACT AC-2: RESULT IN EXPOSURE TO EXCESSIVE NOISE LEVELS ASSOCIATED WITH AIRPORT OPERATIONS

The plan area borders the southeastern portion of Mather Airport and proposed development would be subjected to noise generated from existing and projected future airport operations. A portion of the plan area is located within the CNEL 60 zone and proposed land uses would be required to comply with the ALUCP allowable uses. Proposed land uses include open spaces, employment, industrial, commercial, parks, open spaces/urban farms, and low-density residential. There are no land use restrictions outside this noise contour associated with the ALUCP, and these levels are within adopted General Plan noise standards.

The Noise and Vibration Analysis (Bollard Acoustical Consultants 2023) prepared for the project identifies existing noise sources within or affecting the plan area, quantifies baseline ambient noise and vibration conditions within the plan area, and identifies noise impacts and mitigation measures associated with development within the plan area. Potential short-term construction and long-term operational-source noise impacts are addressed in Chapter 16, “Noise.” Results of the analysis are summarized below.

24-Hour Average Aircraft Noise Exposure at Proposed Residential Uses within the Plan Area

As shown in Figure 7-6, most residential development proposed within the plan area is located outside of the Mather Airport 60 dB Ldn theoretical capacity (worst case) exterior noise contour. However, some residential development is proposed within the Mather Airport 60-65 CNEL noise contours, which is an area in which the Mather Airport ALUCP prohibits certain types of sensitive land uses such as homes. The WJHMP would, therefore, potentially conflict with this land use regulation. These residences could be exposed to substantial aircraft noise. As a result, this impact would be significant.

24-Hour Average Aircraft Noise Exposure at Proposed School Sites within the Plan Area

According to the County General Plan Noise Element, school uses are considered acceptable in aircraft noise environments up to 65 dB CNEL. Because no school uses are proposed within Mather Airport noise environments exceeding 65 dB CNEL, proposed schools would not be exposed to substantial aircraft noise and this impact would be less than significant.

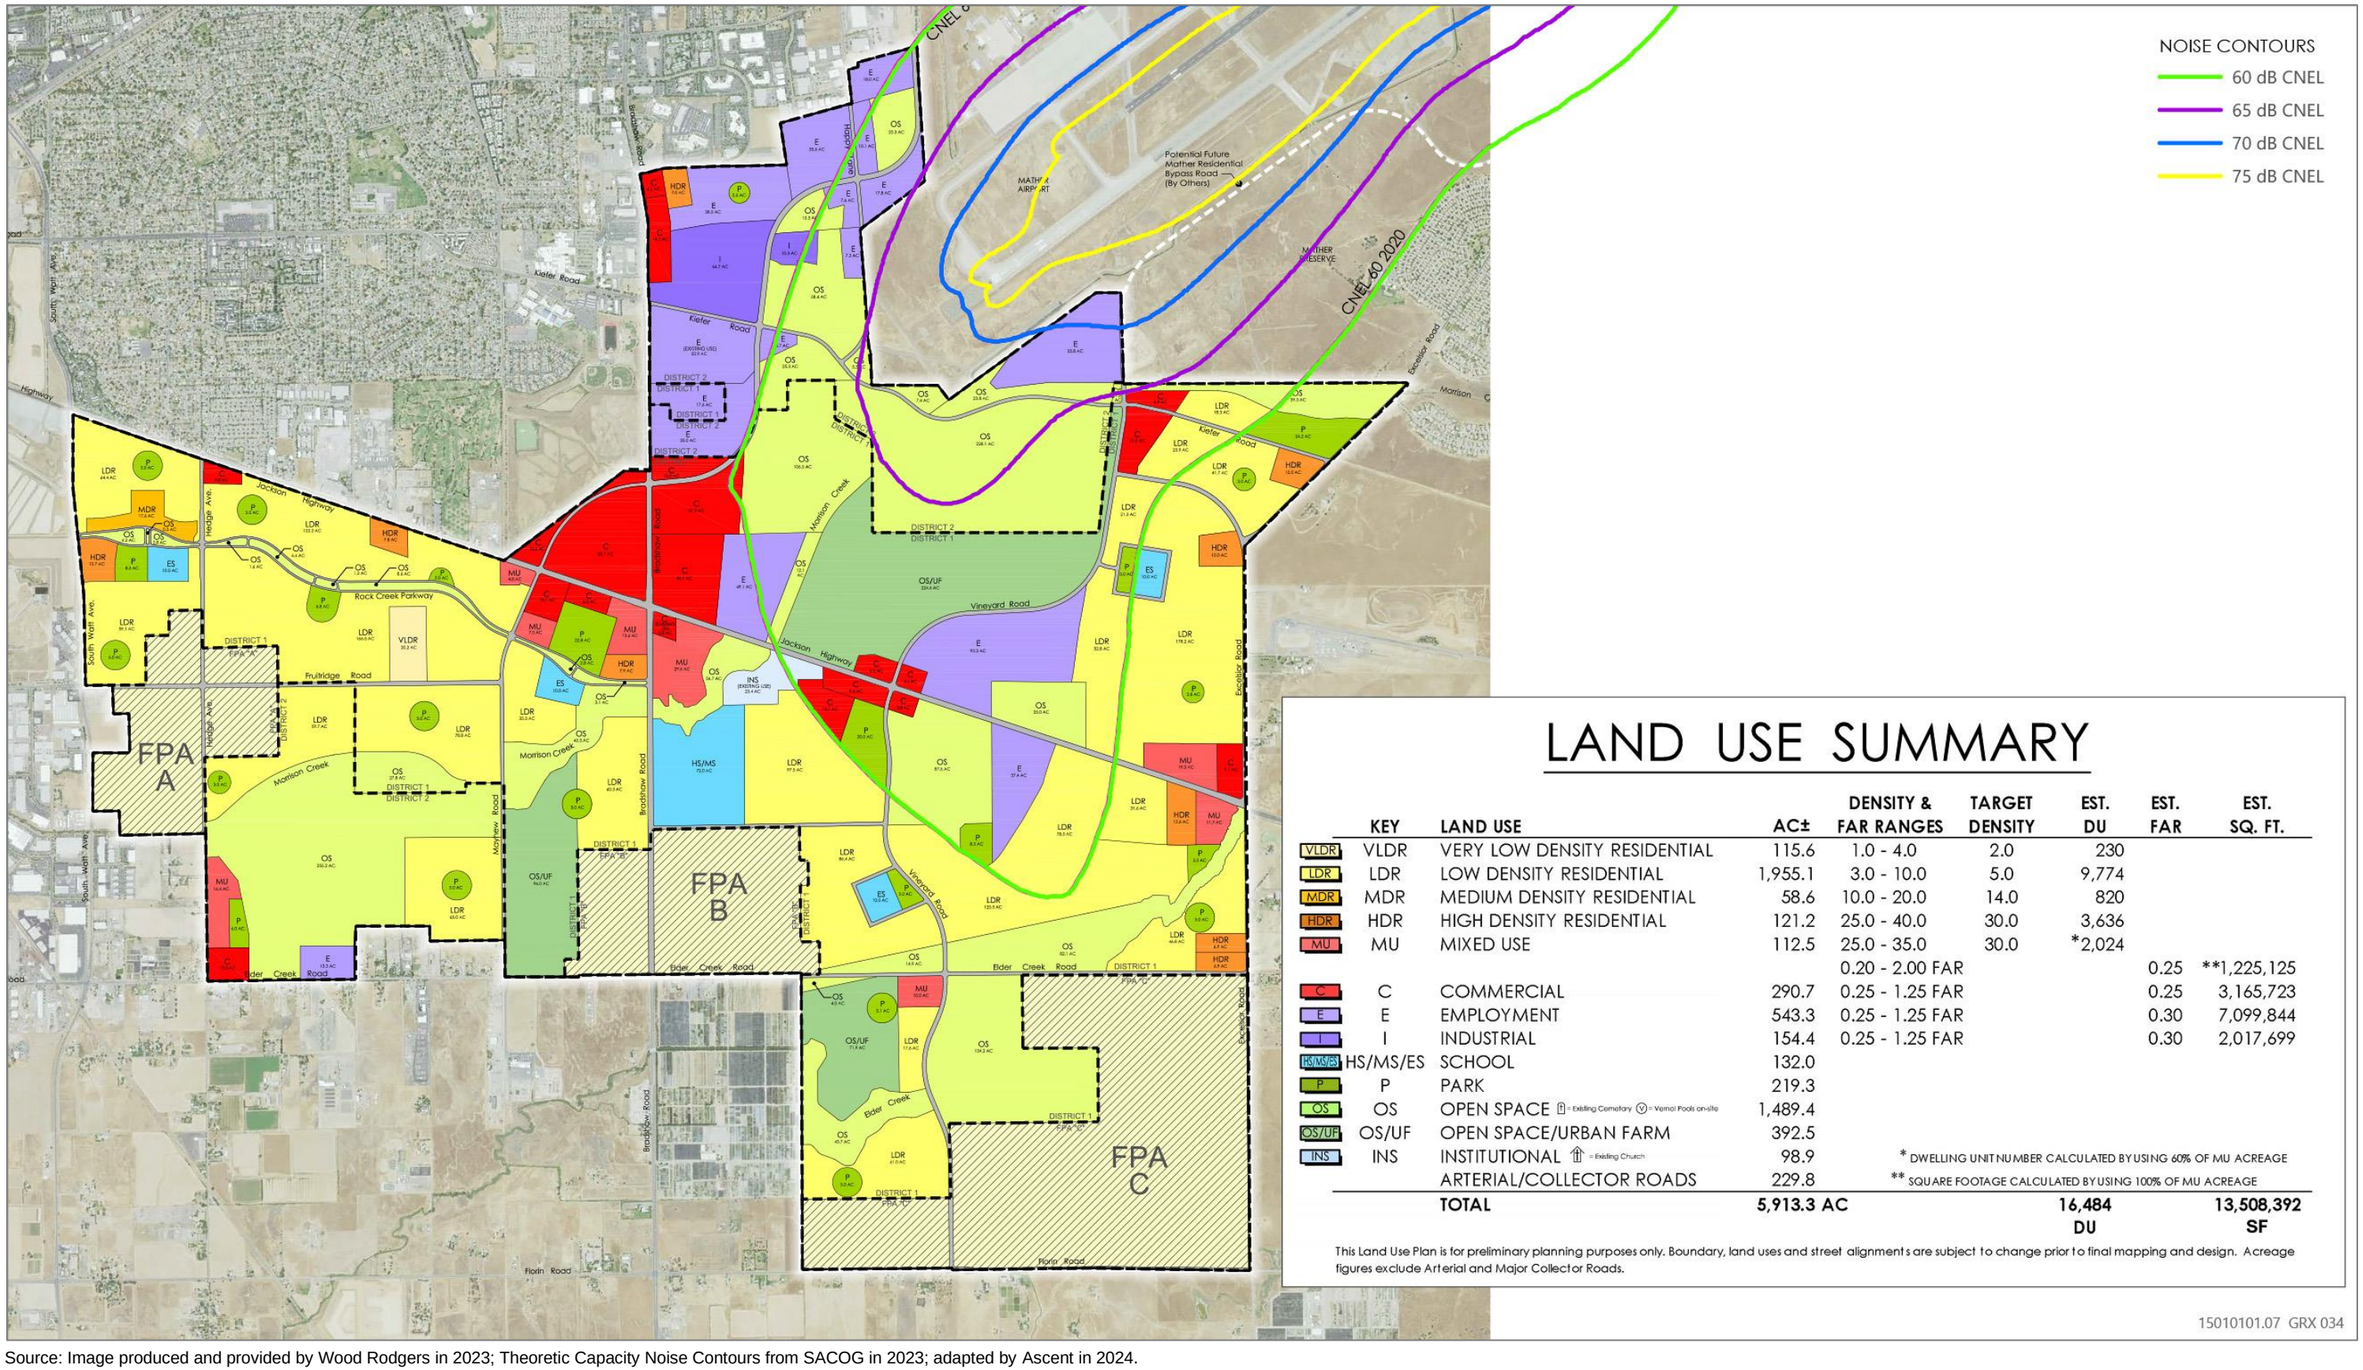
Single-Event Aircraft Noise Exposure and Sleep Disturbance at Proposed Residences within the Plan Area

As discussed above, the County has determined that single-event aircraft noise exposure and associated sleep disturbance impacts are to be assessed in accordance with the Sacramento County General Plan Noise Element Policies NO-2 through NO-4 on aircraft noise. Mitigation Measure AC-2a would require all residential development proposed within the Mather Airport 60 CNEL noise contours to include sufficient noise mitigation to satisfy the requirements of Sacramento County General Plan Policies NO-2,

NO-3, and NO-4. Those policies, which are listed above, restrict new residential development to areas outside the 60 dB CNEL airport noise contours (unless specific policy conditions are met), require noise insulation to ensure interior noise levels do not exceed 45 dB CNEL within residences, require notification that prospective buyers are located within an Airport Policy Area, and require that an avigation easement be recorded acknowledging the property is located within an APPA. Mitigation Measure AC-2b would require implementation of the Acoustical Testing Plan for Mather Airport for residences proposed within the 60-65 dB CNEL Mather Airport noise contours to further ensure compliance with these adopted General Plan policies.

Because prospective owners of residences constructed within the Airport Policy Area would be choosing to live in an environment where aircraft overflights occur, and because they would be properly notified of the presence of Mather Airport and, therefore, able to make an informed decision regarding purchasing a residence near an airport, and because interior noise levels must not exceed 45 dB CNEL within residences, Sacramento County has concluded that the satisfaction of the County's General Plan policies related to aircraft noise would ensure that no significant impacts occur with respect to aircraft single-event noise exposure and associated sleep disturbance. Therefore, this impact would be **less than significant with mitigation**.

MITIGATION MEASURES



MITIGATION MEASURE AC-2A: NOISE MITIGATION WITHIN THE MATHER AIRPORT 60 CNEL NOISE CONTOURS

All residential development proposed within the Mather Airport 60 CNEL noise contours shall include sufficient noise mitigation to satisfy the requirements of Sacramento County General Plan Policies NO-2, NO-3, and NO-4, including the footnotes to General Plan Noise Element Table 4.

MITIGATION MEASURE AC-2B: ACOUSTICAL TESTING PLAN FOR RESIDENCES WITHIN THE 60-65 DB CNEL MATHER AIRPORT NOISE CONTOURS

Implement the Acoustical Testing Plan for Mather Airport for residences proposed within the 60-65 dB CNEL Mather Airport noise contours (HMMH 2022). This testing plan shall be followed to ensure satisfaction of the County General Plan policies pertaining to Mather Airport noise exposure within new residential developments. The following measures, which shall be implemented for homes constructed between the 60 and 65 dB CNEL contours (Bollard Acoustical Consultants 2022):

1. The master permit plan set for each floorplan type to be built between the 60 and 65 dB CNEL contours shall include the following:
    a. All exterior door and window assemblies of each residence shall provide a minimum sound transmission class rating of 32 and a minimum outdoor-indoor transmission class (OITC) rating of 28, respectively.
    b. The exterior structural façade elements shall satisfy an OITC rating of at least 28. For example, exterior walls should achieve OITC 28 via an insulated 2x4 construction with gypsum board on the interior and siding over sheathing on the exterior.

LAND USE SUMMARY

KEY	LAND USE	AC±	DENSITY & FAR RANGES	TARGET DENSITY	EST. DU	EST. FAR	EST. SQ. FT.
VLDR	VERY LOW DENSITY RESIDENTIAL	115.6	1.0 - 4.0	2.0	230

Figure 7-6 Mather Airport Theoretic Capacity Noise Contours and Project Land Uses

c. All structural façade elements should be properly installed to prevent any noise leakage. Construction plans shall include notes stating that exterior doors shall compress the seals when fully closed and locked with a deadbolt.

d. Residential structures shall include positive flow ventilation systems designed to provide adequate fresh air circulation to allow all of the exterior windows and doors to remain closed to achieve the noise level reduction from aircraft operations.

2. The master permit plan set for each floorplan type to be built between the 60 and 65 dB CNEL contours, shall be reviewed by an acoustical consultant to ensure the designs will provide a minimum OITC rating of 25 for the exterior facades of habitable spaces of the residence. The findings of this review shall be provided to the County of Sacramento as a condition to issuance of building permits for homes conforming to a master permit set for a floorplan type.
3. In order to verify that homes are constructed in substantial conformance to a particular master permit plan set for a floorplan type and satisfy the design goal of achieving 25 dB noise level reduction (NLR), post-construction acoustical testing shall be conducted in conformance with the methodology prescribed in the Acoustical Testing Plan for Mather Airport (HMMH 2022).
4. Appropriate solar power capacity shall be provided to ensure compliance with Title 24 to account for the need to keep windows closed for acoustic isolation.

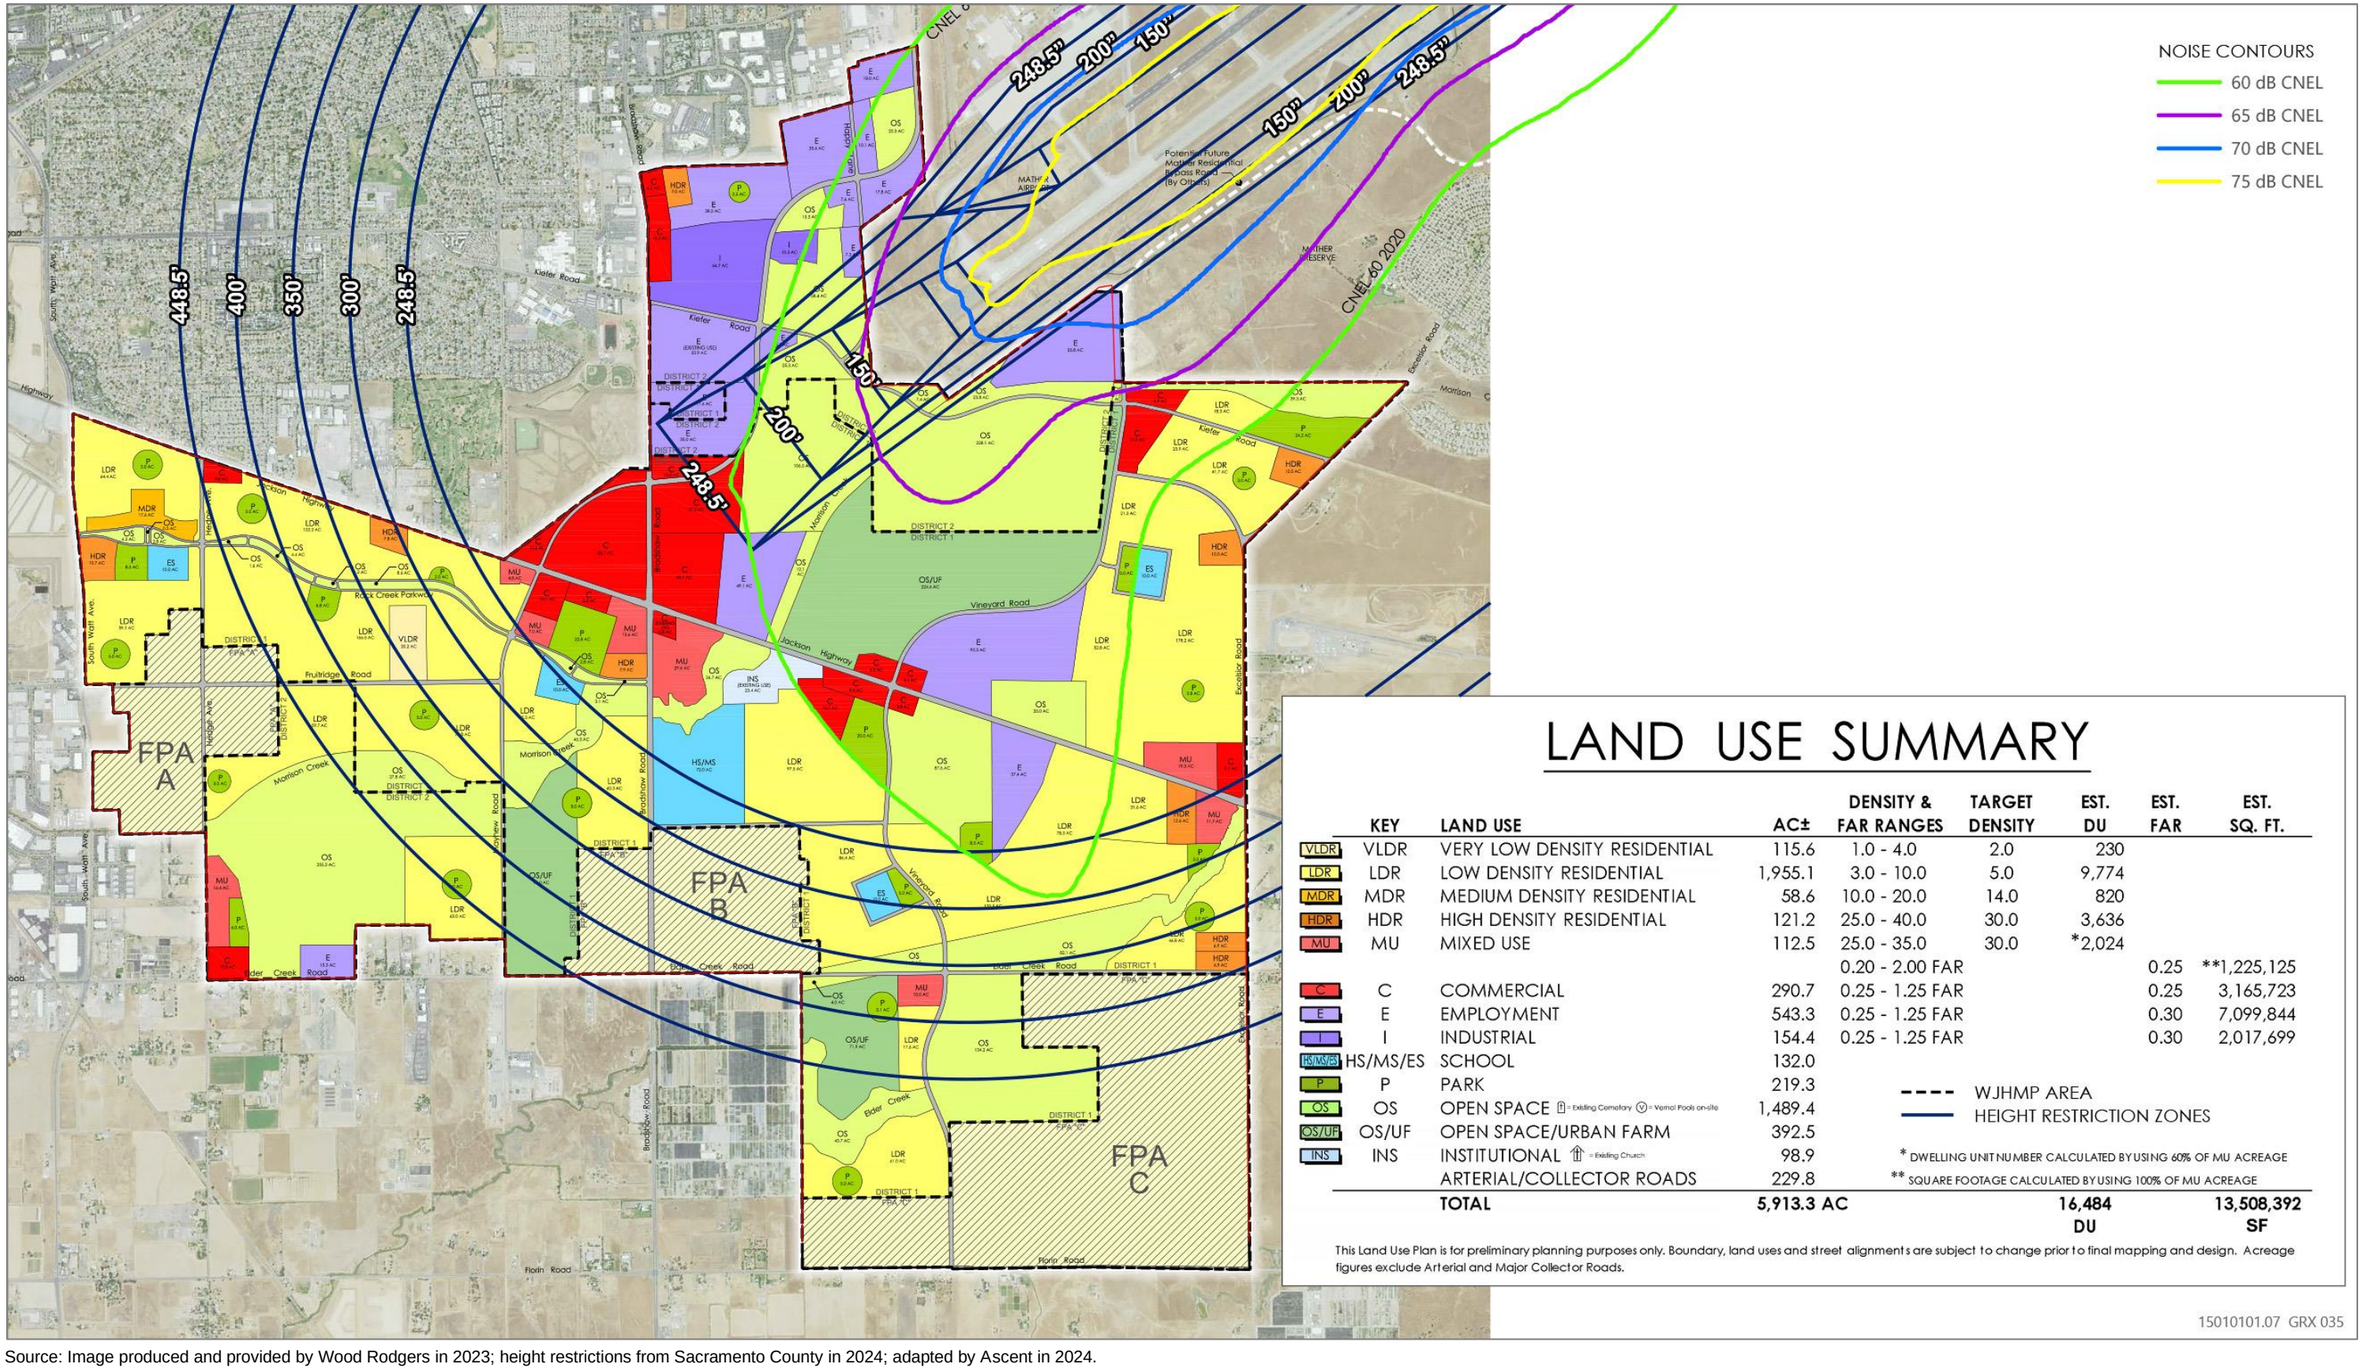
Impact AC-3: Result in Effects on Safe and Efficient Use of Navigable Airspace

Building Height Restrictions

The ALUCP includes height standards for buildings surrounding the airport that are most restrictive adjacent to the runway and become less restrictive further away. Navigable airspace could be adversely affected if building heights in the plan area exceed these designated height standards. The height restrictions that apply to the plan area are between 150 feet to 448.5 feet AMSL. Figure 7-7 illustrates the specific height restrictions that apply to the plan area. Height restrictions for structures are based off of their height AMSL in relation to Mather Airport. Mather Airport sits at an AMSL of 98 feet. The plan area borders the southeastern end of the airport and is relatively flat in the areas immediately surrounding the airport. These areas adjacent to the airport would have the strictest height requirements, limiting building heights to approximately 50 feet in the 150 feet AMSL restriction area, 100 feet in the 200 feet AMSL restriction area, and 150 feet in the 248.5 AMSL feet restriction area. Height restrictions are stricter for the area immediately surrounding the airport and the southern runway, and any development associated with the land uses identified in this area would need to comply with the prescribed building height restrictions. A majority of the area within the most restrictive height limitations would be zoned for open space or employment, where these parcels would already be restricted in height as discussed in Impact AC-1, above.

The project does not include specifications for building heights of the future development. All future development resulting from the project would be required to comply with the height restriction requirements stated in the ALUCP and depicted in Figure 7-7, as well as the County's objective development standards. Therefore, no buildings within the plan area would exceed the maximum building height limits and project related impacts to navigable airspace with respect to building heights would be **less than significant**.

Bird Strike Hazards



Navigable airspace can also be adversely affected by project features that could attract wildlife causing bird strike hazards. The Mather Airport ALUCP includes regulations and guidelines to limit the potential of wildlife hazards, such as bird strikes. Additionally, the FAA has established regulations and policies addressing land uses with potential to attract hazardous wildlife on and near airports.

Consistent with FAA regulations, a Wildlife Hazard Assessment (ECORP Consulting 2023) has been prepared to evaluate whether the project would increase the risk of bird-aircraft collisions and determine what measures should be taken to minimize any increase. The analysis focused on 14 species and species groups considered to pose the greatest risk to aircraft (potentially hazardous bird species), selected based on (1) their size and resulting potential for aircraft damage and (2) propensity to collide with aircraft determined from bird-aircraft collision data from Mather Airport, FAA's national collision data report and hazard assessment, and ECORP's knowledge of species in the region. SCDA has been consulted and has reviewed the Wildlife Hazard Assessment (SCDA 2023) that is included in Appendix C.

Results of the Wildlife Hazard Assessment are summarized below. The Wildlife Hazard Assessment considered four main components:

1. Land cover changes and associated changes in bird use;
2. The extent and conditions of stormwater flooding and associated bird use;
3. Frequencies of aircraft flights at various heights over the plan area, existing bird aircraft collision information, and relative frequency of flights at various heights by potentially hazardous bird species; and
4. The potential for synergistic effects, whereby conditions created within the plan area could result in increased travel by birds to and from the plan area that might cross aircraft flight paths.

Effects of land cover changes and flight heights were analyzed within 17 different subregions (analysis areas) of the plan area.

Source: Image produced and provided by Wood Rodgers in 2023; height restrictions from Sacramento County in 2024; adapted by Ascent in 2024.

Figure 7-7 Mather Airport Height Restrictions and Project Land Uses

LAND COVER ANALYSIS

Relative levels of bird use were determined based on habitat quality and quantity in the plan area as a whole and within individual analysis units. Species and species-group use was quantified by multiplying the species' relative abundances in various land cover types (on a scale of 0.0-1.0) by the area (in acres) occupied by the various land covers under existing and project conditions. The resulting quantities (habitat units) added across all land covers showed that development of substantial areas of grassland, wetlands, and agriculture would reduce habitat value and expected use (by 20-58 percent) for 11 of the 14 identified potentially hazardous species.

Habitat values under the assumed buildout of the WJHMP would increase for three species groups that favor residential areas and the resulting urban forest conditions: rock pigeon and European collared-dove (by 12 percent), Cooper's and red-shouldered hawks (by 100 percent), and yellow-billed magpie and American crow (by 12 percent). The increases in the hawks and corvids (magpie and crow) would not occur, however, until at least 20 years after trees are established in development areas and would gradually increase over a period of 20-70 years.

STORMWATER MANAGEMENT EFFECTS

With development of the WJHMP, stormwater would be more extensively managed to protect life and property. Stormwater flooding effects, analyzed as the conditions 48 hours after the peak of the 2-year and 10-year storm events, showed that the area inundated would decline as stormwater is conveyed, concentrated, detained, and evacuated through pumping. Overall, the area inundated after the 2-year event would decline by 83 percent and the area flooded after the 10-year event would decline by 84 percent compared to existing conditions.

Only six of the potentially hazardous bird species/groups make extensive use of flooded lands (Mute Swan, Canada Goose, ducks, gulls, and herons and egrets, and Bald Eagle). The decline in the amount and duration of flooding, along with the conversion of non-flooded areas to land covers with lower value for these species, demonstrates that the project would substantially reduce risks associated with bird use of flooded lands compared to existing conditions.

AIRCRAFT AND BIRD FLIGHT ANALYSIS

Aircraft flights were analyzed based on flights arriving and departing during November 15 to December 15, 2022. The rationale for choosing this period is described in Section 4.5.1 of the Wildlife Hazard Assessment. Flight paths provided by Sacramento Airports showed that aircraft flew over the plan area for 27 flight hours over that one-month period (i.e., 54 minutes/day). No aircraft crossed above the plan area at heights below 100 feet and only 1 percent of flight time (i.e., 32 seconds/day) occurred at 100 to 500 feet. No flights below 500 feet occurred above 10 of 17 analysis areas within the plan area. Roughly half of the flight-time was within 500-1,500 feet and the other half was above 1,500 feet.

Information on bird-aircraft collisions from Mather Airport showed a modest number of collisions (120 over 11 years). Most collisions occurred on or near the ground during takeoff and landing; species that spend most or all of their time on the ground comprised over half of the species identified during collisions. Therefore, most collisions did not occur over the plan area. Over three-fourths of species reported in Mather collisions were small (<500 grams) and only 4 (4 percent) were large (>1,200 grams). Nearly all large or moderate-sized species were considered a potentially hazardous species. Flight characteristics estimated for potentially hazardous species showed that most flights of all species occurred below 100 feet, a height at which few aircraft flights occurred above the plan area.

SYNERGISTIC EFFECTS

Synergistic effects are defined by FAA as two or more land uses that together may pose additional hazards, such as by creating a flight corridor between bird feeding and resting areas. Synergetic effects were evaluated based on species' uses of various land covers and other habitat elements for nesting, roosting, and foraging activities. The focus was on whether species moved among different land covers for these activities and whether the land covers that are used by these species increased or decreased with development of the WJHMP. Eleven of 14 potentially hazardous species or groups were expected to move among different land covers for different uses. Nine of these species were considered less likely to engage in synergistic movements under project than under existing conditions because the habitats they use would decline in abundance.

The rock pigeon, turkey vulture, and American crow were initially identified as species that had potential to be involved in synergistic effects with development of the WJHMP. Further evaluation, however, suggests that such effects are unlikely. Rock pigeons generally fly to agricultural lands which are located primarily east and south of the plan area and Mather Airport. Pigeons also can be discouraged through building design. Synergistic uses by crows appear unlikely because the species would increase mainly during the breeding season (when distant movements do not occur) and removal of grassland and agriculture in the plan area would reduce long-distance winter movements to the site. Roosting by migrating and wintering vultures in the Sacramento region tends to be highly localized and focused on large, older trees. Therefore, roost establishment would not occur until the urban forest matures (40-70 years) or may not occur at all.

OVERALL EFFECTS ON BIRD AIRCRAFT COLLISION RISK

As discussed in the Wildlife Hazard Assessment, the risk of bird-aircraft collisions is not expected to substantially increase with development of the WJHMP. Changes in land use are expected to reduce the potential for hazards. Changes in resulting bird use are similarly expected to decrease. The flight and collision analysis detailed in the Wildlife Hazard Assessment, and summarized above, demonstrates a relatively low risk with existing conditions, which may stay the same or decrease with development of the WJHMP. Synergistic effects are expected to decrease. Overall, the incidence of bird-aircraft collisions is not expected to increase, and rather is likely to decrease, as a result of buildout of the WJHMP. Therefore, project-related impacts on navigable airspace with respect to bird strike hazards at Mather Airport would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

8 BIOLOGICAL RESOURCES

INTRODUCTION

This chapter describes the biological resources that occur within WJHMP area; includes a description of applicable federal, state, and local regulations and policies that protect biological resources; identifies potential impacts to these resources; and recommends mitigation measures to reduce or eliminate impacts associated with the plan. The analysis focuses on impacts to the grassland and wetland habitats and the special-status species that rely on these habitats. Species covered include special-status plants, invertebrates, birds, amphibians, reptiles, and mammals.

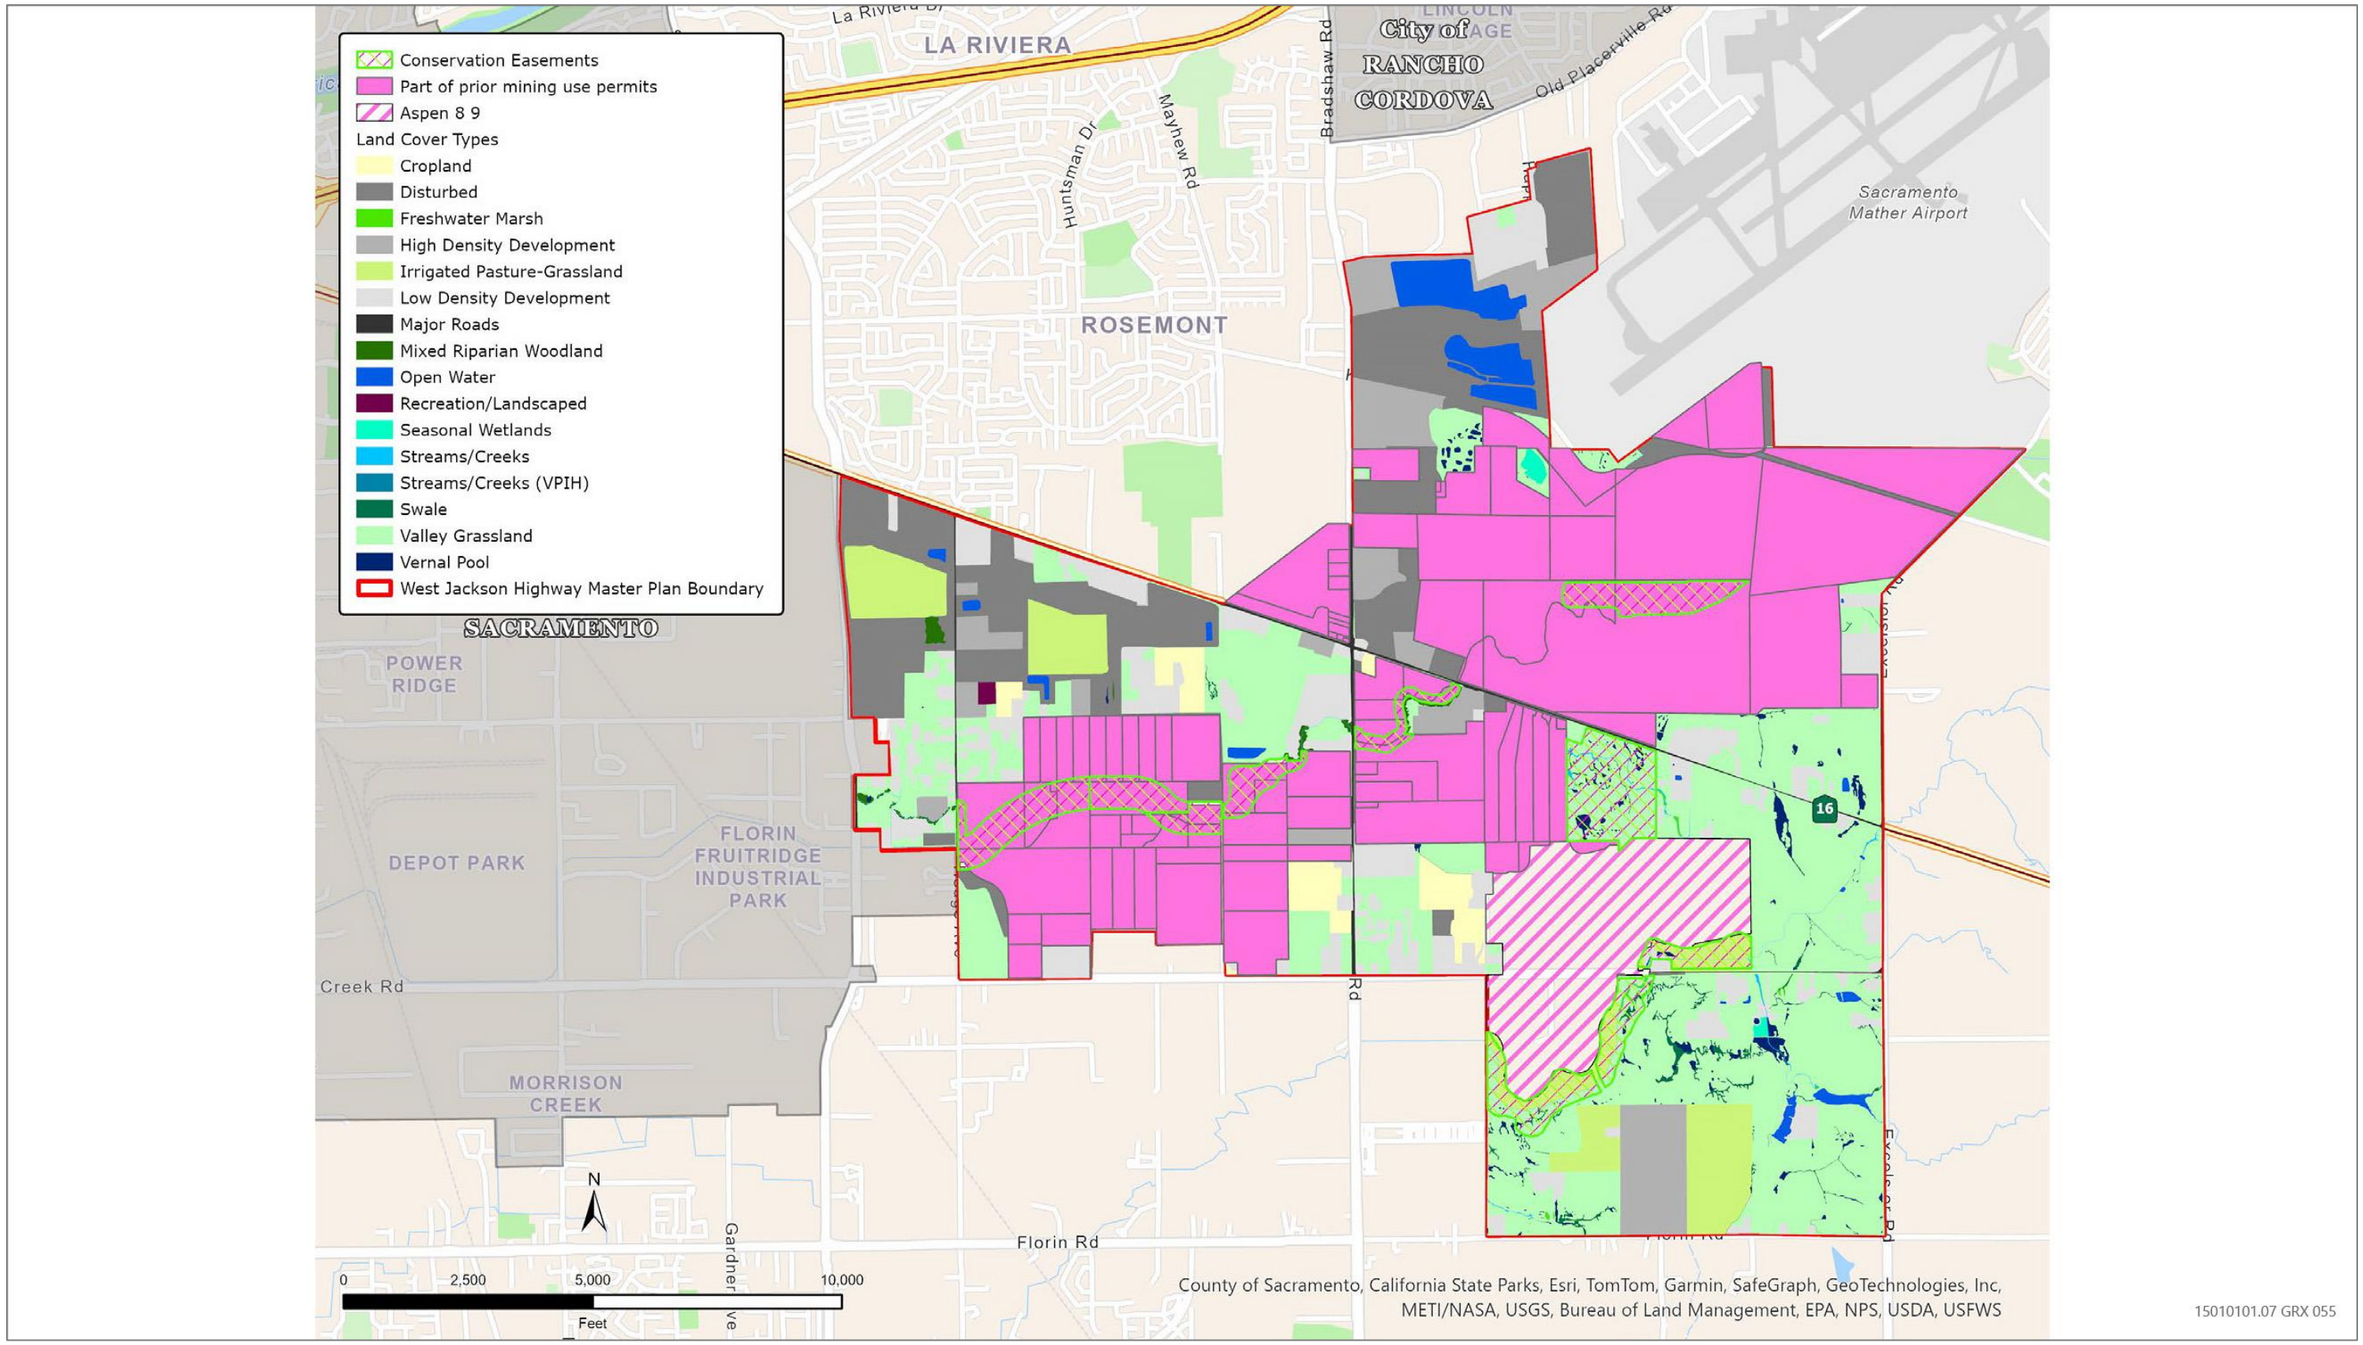
The impact analysis for this chapter for both participating and non-participating properties was done at a programmatic level. As described further below, the impact analysis is based on the SSHCP landcover basemap layer and 2023 Google Earth Pro aerial photography interpretation, as well as relevant analysis from prior mining projects located within the WJHMP area. No comments regarding biological resources were received in response to the notice of preparation.

ENVIRONMENTAL SETTING

The WJHMP area is in unincorporated Sacramento County and adjacent to the City of Sacramento to the west and Rancho Cordova to the northeast (see Figure 2-2 in Chapter 2, “Project Description,” of this EIR). The natural topography is primarily flat with vernal swales and pools intersected by small drainages and creeks. The elevation indiscernibly rises from the west to the east with overall site elevations ranging from less than 50 feet above sea level along the western border to above 110 feet above sea level along the eastern border. There are two perennial streams within the WJHMP area. Morrison Creek flows through the WJHMP area from the northeast to the southwest and a large portion of this creek is channelized. There is also Elder Creek, which is in the southeast quadrant of the WJHMP area. Water in these streams flows in a southwest direction towards the Sacramento River.

A major land use in the WJHMP area is aggregate mining, which has been in continuous operation since the 1930s. Mining activity has resulted in excavation pits with floors between 15 and 40 feet below grade. Besides mining, there are other developed areas including truck storage yards, warehouses and building and landscaping supply yards, and Camellia Memorial Lawn cemetery. There are also small commercial and agricultural-residential areas that are distributed along major roads.

HABITATS



The predominant natural habitat types in the WJHMP area are annual grassland interspersed with vernal pools, seasonal wetlands, and seasonal wetland swales. These and other habitat types are described in the following paragraphs and the acreage of each is provided in Table 8-1. Existing landcover conditions are shown in Figure 8-1.

Table 8-1 Habitat Types in the WJHMP Area

Habitat Type	Acres in WJHMP Area*
Valley Grassland	1,766.89
Irrigated Pasture-Grassland	590.71
Cropland	261.77
Mixed Riparian Woodland	34.82
Mixed Riparian Scrub	0.90
Open Water	132.64
Vernal Pool	61.14
Seasonal Wetlands	31.36
Swale	24.78
Streams/Creeks	14.35
Freshwater Marsh	5.20
Streams/Creeks (VPIH)	0.45
Disturbed	2,180.11
Low Density Development	460.54
High Density Development	294.75
Major Roads	40.11
Recreation/Landscaped	3.64

* Approximate only. Does not include possible habitat in inactive mining sites. Wetland delineation surveys will be needed to determine precise acreage amount for wetlands. VPIH Vernal Pool Invertebrate Habitat

Figure 8-1 WJHMP Land Cover Types

VALLEY GRASSLAND

Valley grassland habitat makes up most of the WJHMP area that has not been impacted by mining activity (and could also be present in inactive mining sites). Valley grasslands in the WJHMP area have been modified by past and current land uses, particularly by mining and agricultural activity. This vegetation type is dominated by naturalized annual grasses and weedy annual forbs, primarily of Mediterranean origin, that have replaced native wildflower fields, perennial grasslands, and scrub because of human disturbance. However, native annual and perennial wildflowers remain a characteristic component of the valley grassland habitat type. In the WJHMP area, valley grassland surrounds vernal pool complexes, providing an important upland element that may be used for species movement and dispersal between pools as well as nesting or estivation habitat for species that use the pools for foraging or for certain phases of their life cycle. Additionally, vernal pool ecology and functions (e.g., hydrologic cycle, nutrient cycling, water chemistry, food chain support, and plant-pollinator relationships) are dependent on surrounding grasslands.

Common grass species within the WJHMP area include soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), ripgut brome (*Bromus diandrus*), medusa head *(Elymus caput-medusae*), filaree (*Erodium botrys*), and perennial rye grass (*Festuca perennis*).

IRRIGATED PASTURE-GRASSLAND

The Irrigated Pasture-Grassland land cover includes hay production (alfalfa, clovers, and mixed grasses), seasonal summer pasture for livestock (primarily cattle), and year-round pasture for livestock (primarily cattle or horses). Irrigated Pasture-Grassland is typically seeded, cut/grazed, and reseeded on a regular basis on an approximately 5- to 7-year cycle before the fields are left fallow to rest, and the cycle is started over again. As a perennial crop grown for several years before removal and replacement, alfalfa provides good cover for rodents and time for establishment of a good prey base for raptors. Farming operations during the growing season consist of periodic flood irrigation and four to six mowings. Both types of operations result in temporary increases in prey availability.

CROPLAND

Cropland includes annual row and field crops (e.g., small grains, corn, tomatoes, melons, peppers, safflower, sunflower) and short-term perennial crops (e.g., asparagus).

MIXED RIPARIAN WOODLAND

Riparian land covers are associated with creeks and typically occur in the zone between the active stream channel and adjacent upland land covers. While “riparian” has various definitions, the SSHCP uses the National Research Council’s 2002 definition: “Riparian areas are transitional between terrestrial and aquatic ecosystems and are distinguished by gradients in biophysical conditions, ecological processes, and biota. They are areas through which surface and subsurface hydrology connect water bodies with their adjacent uplands. They include those portions of terrestrial ecosystems that significantly influence exchanges of energy and matter with aquatic ecosystems (i.e., a zone of influence).” Discontinuous riparian areas in the WJHMP area are adjacent to creeks.

Riparian ecosystems are highly dependent on landscape setting and numerous physical and biotic interactions. Riparian ecosystems provide essential foraging, shelter, and breeding habitat for several native plant and animal species, including both resident and migratory species.

The Mixed Riparian Woodland land cover type is distinguishable by an open canopy layer dominated by tall Fremont cottonwood trees. Beneath this open layer, a moderately dense mid-canopy layer is composed of tree species such as Oregon ash (*Fraxinus latifolia*), Goodding's black willow (*Salix gooddingii*), walnut (*Juglans* spp.), valley oak (*Quercus lobata*), and box elder (*Acer negundo*). In some areas, a subcanopy of dense riparian scrub dominated by willow species, including arroyo willow and sandbar willow, is present. A discontinuous shrub layer may also be present and includes species such as blue elderberry (*Sambucus nigra*), Himalayan blackberry (*Rubus armenicus*), coyote-brush (*Baccharis pilularis*), wild rose (*Rosa californica*), and wild grape (*Vitus californica*). The ground layer is sparsely to densely vegetated with herbaceous species.

Mixed Riparian Scrub

Mixed riparian scrub land cover type is interspersed with mixed riparian woodland. This landcover type consists of an open to dense shrubby thicket dominated by a mixture of willow species and immature stands of mixed riparian woodland tree species as those listed previously.

Vernal Pools

Vernal pools are seasonal ephemeral wetlands that fill and dry each year. In Central Valley annual grasslands, they form in shallow depressions that are underlain with a soil or a soil layer impermeable to water. In California's Mediterranean climate (rainy winter months followed by a hot, dry season), vernal pool soils typically become wetted in November. Water collects in the depressions and stands during late winter and early spring, then recedes as temperatures rise and rainfall diminishes. The soil, however, remains moist through April and May, then it desiccates and stays dry until the cycle begins again. The specific hydrological regime of vernal pool inundation—too short and unpredictable to support most aquatic species but long enough to eliminate upland species—is what characterizes vernal pools as ephemeral wetlands and differentiates them from other aquatic ecosystems such as alkali meadows and seasonally flooded emergent bulrush or tule marshes (Solomeshch et al. 2007).

Vernal pools support unique assemblages of highly specialized plants and animals that are adapted to the annual cycle of winter inundation and summer drought. Consequently, vernal pools are one of the few habitats in California still dominated by native plant and animal species (Rains et al. 2008). Many vernal pool plant genera and species are endemic to California, and their presence indicates the specific hydrology and water chemistry of the vernal pool. Vernal pools were once a very common element of the Central Valley landscape, but only a small portion has not been converted to agricultural and urban developments; consequently, many vernal pool taxa are now rare and endangered.

Central Valley vernal pools occur on many geological surfaces, but in all cases, vernal pools are underlain by a low-permeability layer such as claypans, hardpans (e.g., silica-cemented duripans), mudflows, or bedrock (Rains et al. 2008). Because vernal pools are associated with specific landforms, geologic formations, and soils (Smith and Verrill 1998), vernal pools tend to be clustered at the landscape scale, forming vernal pool complexes (Rains et al. 2006). Based on a vernal pool's landform, underlying geology, nature of the soil's water restricting layer, frequency of ponding, and ponding duration, Sawyer and Keeler-Wolf (1995) have identified five vernal pool types in northern California: basalt flow pools, claypan pools, hardpan pools, volcanic ashflow pools, and volcanic mudflow pools. The vernal pools within the WJHMP area have been classified as northern hardpan vernal pools (Hanes and Stromberg 1998), and have formed on old, very acidic, iron-silica cemented hardpan soils.

There are both natural and constructed vernal pools within the WJHMP area. Several natural vernal pool complexes are located in the center of the WJHMP area, east of Bradshaw Road and south of Jackson Road, and in the southeastern quadrant of the WJHMP area. There are also approximately 181 acres of constructed vernal pools and associated grassland habitat north of Jackson Road that were created to mitigate for the loss of vernal pools due to permitted mining activity.

There is a higher level of plant diversity, particularly of native plants, in vernal pools than there are in other wetland habitats such as seasonal wetlands. Many plants found in vernal pools are endemic (i.e., found only in these habitats) and have adapted to survive partially submerged conditions. Hydrophytes, or water-loving plants, observed by Gibson & Skordal, LLC. (Gibson & Skordal) in 2010 within the vernal pools included coyote thistle (*Eryngium castrense*), slender popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), creeping spike rush (*Eleocharis macrostachya*), Carter's buttercup (*Ranunculus bonariensis* var. *trisepalus*), rush (*Juncus* sp.), rabbit's-foot grass (*Polypogon monspeliensis*), dove weed (*Croton setigerus*), Fremont's goldfields (*Lasthenia fremontii*), white-headed navarretia (*Navarretia leucocephala*), and smooth goldfields (*Lasthenia glaberrima*). There are no special-status plant species documented within vernal pools in the WJHMP area, but Ahart's dwarf rush (*Juncus leiospermus* var*. ahartii*) and legenere (*Legenere limosa*) have been found in vernal pools at Mather Airport, 0.2 mile from the WJHMP area.

Seasonal Wetland

Seasonal wetland is a wetland that ponds for an extended period during a portion of the year. Seasonal wetlands generally fill during the rainy winter season then dry relatively slowly, typically in the summer or early fall. Seasonal wetlands tend to be isolated wetlands that occur within moderate to large depressional features along streams, creeks, and rivers; along the edges of open water, or scattered within the Valley Grassland land cover. In addition, some impounded drainages, excavated stock ponds, and graded or excavated former vernal pools can also be seasonal wetlands. The seasonal wetland land cover is often characterized by herbaceous annual and perennial species such as curly dock (*Rumex crispus*), sedges (*Carex* spp.), nutsedges (*Cyperus* spp.), spikerushes (*Eleocharis* spp), and occasionally cattail (*Typha* spp.).

Swale

The movement of surface water between vernal pools can occur in a network of narrow and intermittent surface “swales.” Swales are shallow ephemeral drainages found in flat to gently rolling Valley Grassland in association with vernal pool complexes, on soils with an impermeable layer. Swales convey runoff as shallow, gently sloping ephemeral wetlands during, and for short periods after, winter rainstorms. Soils within the swale land cover type may remain saturated during the winter and early spring, but dry by summer. Swales are associated with vernal pools and provide intermittent conduits between vernal pools for movement of surface water and propagules of vernal pool plant and animal covered species (seeds, cysts, eggs, and spores), and movement of amphibians. Swales support several native plant species commonly found in vernal pools. Swales also often include smaller shallow depressional features that may pond during the rainy season to provide suitable reproductive habitat for some vernal pool species, and may be considered vernal pools.

Open Water

Open water includes perennial or permanent features, such as natural or built ponds, lakes, and reservoirs. Open water may contain no vegetation, or non-rooted aquatic vegetation, such as algae, floating pondweeds, and other plants. Along shorelines, rooted, emergent vegetation may occur, forming freshwater marsh. Like freshwater marsh, open water habitat is used by numerous bird, mammal, amphibian, and reptile species.

Stream/Creek

The stream and creek land cover within the WJHMP includes streams identified by the US Army Corps of Engineers (USACE) such as small intermittent or perennial creeks. The stream/creek land cover type was mapped from aerial photographs. Where a river or stream channel was not discernable because of dense over story cover, the centerline of the channel has been approximated and buffered by a width of 6 feet.

Freshwater Marsh

Freshwater marsh occurs along the margins of streams and open water. Freshwater marsh is typically dominated by perennial herbaceous plant species such as cattails, tules (*Scirpus* spp.), and other emergent plant species, and is generally found along the edges of aquatic habitats such as ponds, lakes, and rivers.

Disturbed

The disturbed land cover type is defined as open-space areas that have been subject to previous or ongoing disturbances such as along roadsides, trails, and parking lots. Scraped or graded land, aggregate mining, and waste disposal sites are included in this land cover type. The disturbed land cover type is vegetated with diverse weedy flora. These areas are of special concern, as they tend to harbor and facilitate the spread of invasive plant species. Vascular plant species associated with the disturbed land cover typically include Johnson grass (*Sorghum halepense*), Canadian horseweed (*Conyza canadensis*), milk thistle (*Silybum marianum*), yellow-star thistle (*Centaurea solstitialis*), stinkwort (*Dittrichia graveolens*), and field bindweed (*Convolvulus arvensis*).

Low Density Development

The low-density development land cover type consists of relatively sparse residences and other structures, such as farm buildings, and small rural neighborhoods with large individual property sizes per house. Plant nurseries are also included in this category.

High Density Development

The high-density development land cover type includes urban and suburban residential neighborhoods, urban centers, industrial areas.

Major Roads

The major roads land cover type includes linear features with paved surfaces and can vary from large freeways to smaller arterial roads found within urban settings. Smaller roads not mapped as Major Roads were mapped as an element of High-Density or Low-Density Development.

Recreation/Landscaped

The recreation/landscaped land cover type includes gardens, parks, golf courses, and greenbelts. Most landscaped and recreation areas are planted with non-native grasses, shrubs, and trees. Species composition in urban habitats varies with planting design and climate. Most recreation and landscaped areas are regularly maintained by irrigation, mowing, pruning, or other management techniques.

Native and Nonnative Trees

Due to multiple participating and non-participating landowners, no comprehensive tree survey exists for the entire WJHMP area. Native trees in the plan area generally consist of valley oak, interior live oak, blue oak, willow, Fremont cottonwood, and boxelder that are scattered throughout the areas of undisturbed grassland and most common near the less-disturbed creek reaches. Landscape trees are also associated with existing roadways and structures.

County records for previously permitted mining projects indicate that a total of approximately 2,600 native oak trees have been planted within the plan area to mitigate for the loss of trees due to mining (Table 8-2).

Table 8-2 Oak Tree Mitigation Sites within WJHMP Area

Location of Mitigation Site	Project(s) Mitigated For	Number and Type of Native Trees Planted
Aspen V South – Morrison Creek riparian corridor	Aspen IV South and Aspen V South	351 valley oak (*Quercus lobata*). 139 interior live oak (*Quercus wislizeni*), 19 California box elder (*Acer negundo*), and 30 Oregon ash (*Fraxinus latifolia*).
Aspen V – Adjacent to drainage swale	Aspen IV South and Aspen V South	13 valley oaks, 6 interior live oak, and 4 Oregon ash.
Aspen III South and Vineyard I - Along realigned Morrison Creek stream bed	Vineyard I	874 valley oak, 633 blue oak (*Quercus douglasii*), 625 interior live oak, 220 Fremont cottonwood (*Populus fremontii*), 153 Oregon ash, 131 black walnut (*Juglans spp.*), 117 California box elder, 93 western sycamore (*Platanus racemosa*), 71 California buckeye (*Aesculus californica*), 36 Goodding's black willow (*Salix gooddingii*).

Source: data provided by Sacramento County in 2024.

Special-Status Species

A "special-status" species is one which has been identified as having relative scarcity and/or declining populations. Special-status species include those formally listed as threatened or endangered, those proposed for formal listing, candidates for federal listing, and those classified as species of special concern. Also included are those species considered to be "fully protected" by the California Department of Fish and Wildlife (CDFW), those granted "special animal" status for tracking and monitoring purposes, and those plant species considered to be rare, threatened, or endangered in California by the California Native Plant Society.

There are multiple status designations applied to animal and plant species; the relevant definitions are provided below[1]:

- *Endangered Species*: Any species which is in danger of extinction throughout all or a significant portion of its range.
- *Threatened Species*: Any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.
- *Species of Concern*: Any species with declining population levels, limited ranges, and/or other factors that make them vulnerable to extinction and may ultimately qualify the species for threatened or endangered status.

[1] Source: California and federal Endangered Species Acts, http://www.dfg.ca.gov/wildlife/nongame/ssc/, http://www.dfg.ca.gov/wildlife/nongame/t_e_spp/fully_pro.html, and http://www.cnps.org/cnps/rareplants/ranking.php.

- *Fully Protected*: The classification of Fully Protected was California's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Most have subsequently been defined as endangered or threatened, but there are exceptions.
- *California Rare Plant Ranks:* Plant taxa considered by CDFW to be "rare, threatened, or endangered in California" and assigned a California rare plant rank (CRPR) of 1A, presumed extinct in California and not known to occur elsewhere; 1B, considered rare or endangered in California and elsewhere; 2A, presumed extinct in California, but more common elsewhere and 2B, considered rare or endangered in California but more common elsewhere).

A list of special-status plant and wildlife species that are known or have the potential to occur in the WJHMP area was compiled based on review of background reports such as the Biological Resources Assessment prepared in 2018 by Madrone Ecological Consulting (Madrone) (Appendix E), previous studies conducted in the WJHMP area and adjacent properties (e.g., Mather Field Specific Plan area, Jackson Township Specific Plan area), and database searches. An unofficial species list was obtained from the USFWS Information for Planning and Consultation system (USFWS 2024); and the California Natural Diversity Database (CNDDB) Rarefind program and California Native Plant Society Inventory were queried for records of previously documented occurrences of special-status species in the Carmichael, Buffalo Creek, Florin, Rio Linda, Citrus Heights, Folsom, Sacramento East, Elk Grove, and Sloughhouse 7.5-minute quadrangles (CNDDB 2024; CNPS 2024). Pursuant to CDFW guidelines, a 9-quadrangle search area was used to query these databases (i.e., the quadrangle containing the WJHMP area plus the eight surrounding quadrangles).

Table 8-3 reports the species identified in the species searches as well as those covered under the SSHCP. The table reports the likelihood of an occurrence for each species within the WJHMP area based on habitat presence either on the site or in proximity of the site, survey results (if any), and species range and nearby recorded occurrences. A lack of reported sightings is not an indication that the species is not present; there may be many reasons that a species could be present, but unreported. For instance, the species may have been observed but not reported, may be present during times when observers are absent, or may be difficult to detect even when present. In addition, comprehensive or protocol-level surveys for the species may not have been completed in the area. For this reason, all species identified through database and literature review as potentially occurring in the general project vicinity and for which suitable habitat is present in the WJHMP area were considered as having potential to occur in the WJHMP area and are evaluated further in this document. Species for which suitable habitat is absent from the WJHMP area or whose known range does not include the WJHMP area were determined not to be affected by project implementation as described in Table 8-3. Species that are not present or were found to have a low potential of occurrence are not discussed further in subsequent analysis sections.

Table 8-3 Special-Status Species Matrix

Species	Status	Suitable Habitat	Potential for Project to Affect
Plants			
Ahart's dwarf rush *Juncus leiospermus var. ahartii*	CRPR 1B.2 SSHCP	Annual herb found along vernal pool margins and vernal swales. Blooms March-May. Elevation: 100 to 750 ft.	High Potential. The WJHMP area contains vernal pool habitat suitable for this species. There are no recorded occurrences of this species within the WJHMP area but there are recorded occurrences within 10 miles with the closest located approximately 1.25 miles to the east. SSHCP modeled habitat may be present in the southeast portion of the WJHMP area.
Boggs Lake hedge-hyssop *Gratiola heterosepala*	CE, CRPR 1B.2 SSHCP	Annual herb found along the margins of marshes and swamps and in vernal pools with clay soil. Blooms April-August. Elevation: 30 to 7,800 ft.	High Potential. The WJHMP area contains seasonal wetland and vernal pool habitat suitable for this species. There are no recorded occurrences of this species within the WJHMP area but there are nine recorded occurrences within 10 miles with the closest located approximately 1.25 miles to the east. SSHCP modeled habitat is present within portions of the WJHMP area.
Dwarf downingia *Downingia pusilla*	CRPR 2B.2 SSHCP	Species found in vernal pools and other seasonally inundated features. Blooms March-May. Elevation: 1-1,500 feet.	High Potential. The WJHMP area contains seasonal wetland and vernal pool habitat suitable for this species. There are no recorded occurrences of this species within the WJHMP area but there are four recorded occurrences within 10 miles with the closest occurrence approximately 5 miles to the southwest. There is a reported occurrence yet to be published by the CNDDB that is located near the WJHMP area's southern boundary. SSHCP modeled habitat is present within portions of the WJHMP area.
Legenere *Legenere limosa*	CRPR 1B.1 SSHCP	Annual herb found in vernal pools. Blooms April-June. Elevation: 0 to 2,900 ft.	High Potential. The WJHMP area contains vernal pool habitat suitable for this species. There are no recorded occurrences of this species within the WJHMP area but there are 26 recorded occurrences within 10 miles with the closest located approximately 0.2 miles to the east at Mather Airport. SSHCP modeled habitat is present within portions of the WJHMP area.

Species	Status	Suitable Habitat	Potential for Project to Affect
Pin cushion navarretia *Navarretia myersii* ssp. *Myersii*	CRPR 1B.1 SSHCP	Annual herb found in vernal pools and other seasonal wetlands. Blooms April-May. Elevation: 65 to 1,100 ft.	Moderate Potential. The WJHMP area contains seasonal wetland and vernal pool habitat suitable for this species. There are no recorded occurrences within the WJHMP area and only one recorded occurrence approximately 9 miles to the northeast. SSHCP modeled habitat is present within portions of the WJHMP area.
Sacramento Orcutt grass *Orcuttia viscida*	FE, CE, CRPR 1B.1 SSHCP	Small annual grass found in vernal pools in valley and foothill grasslands. Blooms: May-June. Elevation: 100 to 350 ft.	High Potential. The WJHMP area contains grassland and vernal pool habitat suitable for this species. There are no recorded occurrences of this species within the WJHMP area but there are nine recorded occurrences within 10 miles with the closest located approximately 3 miles to the east. SSHCP modeled habitat is present within the southeast portion of the WJHMP area.
Saline clover *Trifolium hydrophilum*	CRPR 1B.2	Annual fleshy species found in saline marshes or vernal pools. Blooms: April-June. Elevation: Below 1,000 feet.	Moderate Potential. The WJHMP area contains vernal pool habitat suitable for this species. There are no recorded occurrences within the WJHMP area and there are two recorded occurrences 9.5 miles to the southeast.
Sanford's arrowhead *Sagittaria sanfordii*	CRPR 1B.2 SSCHP	Perennial, rhizomatous, emergent herb found in shallow freshwater marshes and swamps, and various perennial waterways or ponds. Blooms: May-October. Elevation: 0 to 2,000 ft.	Present. The WJHMP area contains perennial waterways, seasonal wetland, and vernal pool habitat suitable for this species. Colonies of this species have been found within the WJHMP area, though most have been removed by permitted mining activities. SSHCP modeled habitat is present within portions of the WJHMP area.
Slender Orcutt grass *Orcuttia tenuis*	FT, CE, CRPR 1B.1 SSHCP	Small annual grass found in vernal pools in valley and foothill grasslands. Blooms: May-September. Elevation: 100 to 5,750 ft.	High Potential. The WJHMP area contains grassland and vernal pool habitat suitable for this species. There are no recorded occurrences of this species within the WJHMP area but there are three recorded occurrences within 10 miles of the WJHMP area with the closest located approximately 1.3 miles to the south. SSHCP modeled habitat is present within the southeast portion of the WJHMP area.

Species	Status	Suitable Habitat	Potential for Project to Affect
Woolly rose mallow *Hibiscus lasiocarpus var. occidentalis*	CRPR 1B.2	This species typically grows at elevations below 395 feet in freshwater-saturated riverbanks and low peat islands in sloughs. The plant is strongly associated with the Delta watershed (Madrone, 2018).	Not Present. The WJHMP area does not support the required habitat for this species.
Invertebrates			
Crotch bumble bee *Bombus crotchii*	SCE	Found primarily in California: mediterranean, Pacific coast, western desert, Great Valley, and adjacent foothills through most of southwestern California. Habitat includes open grassland and scrub. Nests underground.	High Potential. Open grassland habitat is present within the WJHMP area, WJHMP area is within current known distribution. There is a recent 2022 documented occurrence within 3.5 miles northeast of the WJHMP area.
Midvalley fairy shrimp *Branchinecta mesovallensis*	SSHCP	Occurs in vernal pools that are grass or mud-bottomed with clear to tea-colored water and are often in basalt flow depression pools in grasslands (Eriksen and Belk 1999)	Present. Vernal pool habitat is present within the WJHMP area and there are two recorded occurrences of this species within the WJHMP area. SSHCP modeled habitat is present within portions of the WJHMP area.
Ricksecker's scavenger beetle *Hydrochara rickseckeri*	SSHCP	Vernal pools, vernal swales, and seasonal wetlands that hold water for a minimum of 18 days.	High Potential. The WJHMP area contains seasonal wetland and vernal pool habitat suitable for this species and the species has been recorded northeast of the WJHMP area in Mather Airport. SSHCP modeled habitat is present within portions of the WJHMP area.
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT SSHCP	Breeds and forages exclusively on elderberry shrubs. Typically associated with riparian forest, riparian woodland, elderberry savanna, and other Central Valley habitats. Occurs only in the Central Valley of California. Prefers to lay eggs in elderberry stems 2–8 inches in diameter; some preference shown for "stressed" elderberry shrubs.	High Potential. There are no recorded occurrences within the WJHMP area but there are 30 recorded occurrences within 10 miles of the WJHMP area with the closest approximately 2 miles to the north along the American River. Riparian woodlands along Morrison Creek may provide suitable habitat for the species. SSHCP modeled habitat is present within portions of the WJHMP area.

Species	Status	Suitable Habitat	Potential for Project to Affect
Vernal pool fairy shrimp *Branchinecta lynchi*	FT SSHCP	Occurs in vernal pools, seasonally ponded areas within vernal swales, rock outcrop ephemeral pools, playas and alkali flats from Shasta County through most of the length of the Central Valley to Tulare County. Pools are grass or mud bottomed, with clear to tea-colored water, and are often in basalt flow depression pools in grasslands.	Present. The WJHMP area contains seasonal wetland and vernal pool habitat suitable for this species and there are five recorded occurrences of this species within the WJHMP area. SSHCP modeled habitat is present within portions of the WJHMP area.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE SSHCP	Occurs in vernal pools containing clear to highly turbid water.	Present. The WJHMP area contains vernal pool habitat suitable for this species and there are six recorded occurrences of this species within the WJHMP area. SSHCP modeled habitat is present within portions of the WJHMP area.
Fish			
Central Valley spring-run Chinook salmon *Oncorhynchus tshawytscha*	FT, CT (Spring Run) FE, CE (Winter Run)	Distribution occurs throughout the Sacramento River and through a portion of the American River, but the distribution maps do not include the Cosumnes River as habitat. (NMFS 2009)	Not Present. The WJHMP area does not support riverine habitat suitable for this species.
Central Valley steelhead *Oncorhynchus mykiss*	FT	Most of Sacramento County is within the distinct population segment area for this species. Critical habitat has been designated within Sacramento County on the Sacramento River, American River, Mokelumne River, and Dry Creek (both north and south creeks). Spawning has been documented on the Cosumnes River. (NMFS 2009)	Not Present. The WJHMP area does not support riverine habitat suitable for this species.

Species	Status	Suitable Habitat	Potential for Project to Affect
Longfin smelt *Spirinchus thaleichthys*	CT	The Bay-Delta population of this species migrates upstream to spawn in freshwater drainages and dies after spawning. Upon hatching, the young spend their first three months in freshwater before migrating downstream to brackish or marine habitats (Madrone 2018).	Not Present. The WJHMP area is outside of the current known distribution of the species.
Sacramento perch *Archoplites interruptus*	CSC	Once very abundant in water bodies throughout the Central Valley but has been adversely impacted by habitat destruction and introduction of non-native fishes. This species' eggs are vulnerable to predation due spawning on unprepared substrate and providing no further parental care (Madrone 2018).	Not Present. The WJHMP area is outside of the current known distribution of the species. The nearest recorded occurrence is approximately 9 miles to the west of the WJHMP area.
Amphibians			
California tiger salamander (Central Valley Pop) *Ambystoma californiense*	FT SSHCP	Endemic to annual grasslands and valley-foothill habitats in California. Adults spend most time in subterranean refugia, particularly in ground squirrel burrows. Seasonal ponds or vernal pools are required for breeding.	Not Present. The WJHMP area is outside of the current known distribution of the species. The WJHMP area is outside of the aquatic and upland SSHCP modeled habitat.
Western spadefoot *Spea hammondii*	FPT, CSC SSHCP	Occurs seasonally in grasslands, prairies, chaparral, and woodlands, in and around wet sites. Breeds in shallow, temporary pools (i.e., vernal pools) formed by winter rains. Takes refuge in burrows.	High Potential. There are suitable breeding habitats for this species within the WJHMP area. There are no recorded occurrences of this species within the WJHMP area but there are several recorded occurrences within 10 miles, some from 2023 just east of the WJHMP area. SSHCP modeled habitat is present within portions of the WJHMP area.

Species	Status	Suitable Habitat	Potential for Project to Affect
Reptiles			
Giant garter snake *Thamnophis gigas*	FT, CT SSHCP	Endemic to valley floors of the Sacramento and San Joaquin Valleys. Prefers freshwater marsh and low gradient streams. Has adapted to rice agriculture, drainage channels, and irrigation ditches. Requires permanent water, emergent vegetation, and upland habitat for basking and cover (USFWS, 1999).	Low Potential. SSHCP aquatic (non-high value habitat) and upland (non-high value habitat) modeled habitat is present within portions of the WJHMP area. However, the WJHMP area is located outside of the extant range of this species. Sacramento County populations are known only from the American Basin, Cosumnes-Mokelumne Basin, and Delta Basin and the nearest recorded occurrence is approximately 8.5 miles to the southwest (CNDDB 2024) and there is no feasible dispersal corridor between known breeding populations and WJHMP area.
Western pond turtle *Emys marmorata*	FPT, CSC SSHCP	Occurs in perennial ponds, lakes, rivers, and streams with suitable basking habitat (mud banks, mats of floating vegetation, partially submerged logs) and submerged shelter (Zeiner et. al., 1990). Require some slack- or slow-water aquatic habitat. Nests upland, on unshaded south-facing slopes with friable soils that have a high percentage of clay or silt (Jennings and Hayes, 1994).	Present. The WJHMP area contains perennial stream and pond habitat suitable for this species. There is one recorded occurrence of this species within the WJHMP area in Morrison Creek. SSHCP modeled habitat is present within portions of the WJHMP area.
Birds			
Cooper's hawk *Accipiter cooperi*	SSHCP	Nests and forages in a variety of woodland and forest habitats and urban areas, but generally in stands with mature trees and dense canopy closure. In the Central Valley, strongly associated with live oak woodland.	Present. The WJHMP area has suitable nesting and foraging habitats. Though there are no recorded CNDDB occurrences within the WJHMP area, this species was observed within the WJHMP area near a constructed emergent marsh. It was not clear whether a nesting site was observed (Madrone 2018). SSHCP modeled habitat is present within portions of the WJHMP area.

Species	Status	Suitable Habitat	Potential for Project to Affect
Tricolored blackbird *Agelaius tricolor*	FSC, CT SSHCP	Forages in agricultural lands and grasslands; nests in colonies in marshes, riparian scrub, and other areas that support cattails, tules, or dense thickets of shrubs or herbs. Requires open water and protected nesting substrate, such as flooded, spiny, or thorny vegetation.	Present. There is suitable nesting habitat within the WJHMP area. There are at least 10 recorded occurrences of nesting colonies scattered throughout the WJHMP area. Four nesting colonies were observed in the southeast quadrant of the WJHMP area (Aspen VIII mining site). SSHCP modeled nesting and foraging habitat is present within portions of the WJHMP area.
Western burrowing owl *Athene cunicularia hypugea*	CSC SSHCP	Found in open grasslands with low vegetation, golf courses, and disturbed/ruderal habitat in urban areas.	Present. Annual grassland in the WJHMP area provides foraging and nesting habitat. There is one recorded occurrence within the WJHMP area. SSHCP modeled habitat is present within portions of the WJHMP area.
Golden eagle *Aquila chrysaetos*	BEPA, CFP	Forages in open terrain such as grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats. Nests in rugged, open habitats with canyons and escarpments, typically on cliffs and rock outcroppings; however, it will also nest in large trees within open areas.	Present. The WJHMP area is out of the breeding range of this species, but suitable foraging habitats exist within the WJHMP area. There is one known wintering occurrence within the WJHMP area.
Ferruginous hawk *Buteo regalis*	SSHCP	Frequents open grasslands, sagebrush flats, desert scrub, low foothills surrounding valleys. Listed for preservation of wintering habitat.	Present. The WJHMP area annual grassland provides winter foraging habitat for this species. There is one reported occurrence within the WJHMP area. SSHCP modeled habitat is present within portions of the WJHMP area.
Swainson's hawk *Buteo swainsoni*	CT, SSHCP	Breeds in stands with few trees in juniper-sage flats, riparian areas, and oak savannah. Requires adjacent suitable foraging areas such as grasslands or grain fields supporting rodent populations (Zeiner et. al., 1990).	Present. Limited nesting habitat (i.e. trees) is present, but plentiful foraging habitat exists on the WJHMP area. There are numerous recorded occurrences within 10 miles of the WJHMP area with one occurrence approximately 0.2 mile to the north of the WJHMP area. The species has also been observed foraging within the WJHMP area. SSHCP modeled habitat is present within portions of the WJHMP area.

Species	Status	Suitable Habitat	Potential for Project to Affect
Northern harrier *Circus cyaneus*	CSC, SSHCP	Frequents meadows, grasslands, open rangelands, desert sinks, and fresh and saltwater emergent wetlands. The western population tend to breed in dry upland habitat.	Present. The WJHMP area annual grassland provides breeding and foraging habitat for this species. SSHCP modeled nesting and foraging habitat is present within portions of the WJHMP area.
White-tailed kite *Elanus leucurus*	CFP SSHCP	Forages in open grasslands and agricultural fields and marshes. Nests in mature trees in riparian zones, oak woodlands, or isolated trees within foraging habitat.	Present. Foraging and nesting habitat is present in the WJHMP area. This species has been observed within the WJHMP area and there is one record of nesting within the WJHMP area. SSHCP modeled foraging and nesting habitat is present within portions of the WJHMP area.
Greater sandhill crane *Grus canadensis tabida*	CT, CFP, SSHCP	Marsh and swamp, meadow and seep, wetland. Nests in wetland habitats in northeastern California; winters in the Central Valley. Prefers grain fields within 4-mile of a shallow body of water used as a communal roost site; irrigated pasture used as loafing sites.	Not Present. Although the species may be observed soaring overhead, the WJHMP area does not support habitat suitable for overwintering. The WJHMP area is outside of SSHCP modeled habitat for this species.
Loggerhead shrike *Lanius ludovicianus*	CSC, SSHCP	Loggerhead Shrikes inhabit open country with short vegetation and well-spaced shrubs or low trees, particularly those with spines or thorns. They frequent agricultural fields, pastures, old orchards, riparian areas, desert scrublands, savannas, prairies, golf courses, and cemeteries. Loggerhead Shrikes are often seen along mowed roadsides with access to fence lines and utility poles.	Present. Annual grassland provides suitable foraging habitat for this species. Shrubs and trees within the WJHMP area provide suitable nesting habitat, and the species has been observed along SR 16. SSHCP modeled nesting and foraging habitat is present within portions of the WJHMP area.
Song sparrow – Modesto population *Melospiza melodia*	CSC	The Modesto population is generally associated with freshwater emergent marshes dominated by cattails, willows, or tules. Nesting has been observed within Valley Oak riparian forests with dense understories of Himalayan blackberry (Madrone, 2018).	Low Potential. The WJHMP area is outside the known range of the species. Marsh and riparian habitats onsite are marginally suitable for this species. There are no recorded occurrences of this species in the WJHMP area but there are four recorded occurrences within 10 miles. The closest is approximately 8.5 miles to the southwest.

Species	Status	Suitable Habitat	Potential for Project to Affect
Purple martin *Progne subis*	CSC	This species is a colonial nester and uses natural cavities and created nesting sites with low tree canopy cover at the nest height. Tree nest sites are often located in the upper slopes of hilly and mountainous terrain (Airola and Williams 2008). This species forages in open areas near lakes, ponds, marshes, or other water features (Madrone, 2018).	Low Potential. Both natural nesting cavities and foraging habitats exist within the WJHMP area, although the regional population is known only to nest in weepholes under bridge crossings. There are no known occurrences of nesting colonies within the WJHMP area, but this species has been reported nesting 3 miles to the northwest.
Bank swallow *Riparia riparia*	CT	Requires vertical banks and cliffs with fine-textured or sandy soils near streams, rivers, ponds, lakes, and the ocean for nesting. Feeds primarily over grassland, shrubland, savannah, and open riparian areas. Primarily listed for destruction of nesting habitat.	Low Potential. The WJHMP area does not support suitable breeding habitat. Grassland habitat may provide suitable foraging habitat for the species. There are no recorded occurrences within the WJHMP area but there are five recorded occurrences within 10 miles of the WJHMP area. The closest is approximately 4.5 miles to the northwest.
Least Bell's Vireo *Vireo belli pusillus*	FE, CE	This species was once abundant in riparian woodlands throughout the Central Valley but is now generally restricted to Southern California in lowland riparian corridors (Madrone, 2018).	Low Potential. This species is generally believed to be extirpated from the area. The riparian woodlands within the WJHMP area are not dense enough to provide suitable habitat for the species. There are no known occurrences of this species within the WJHMP area and there is a historical (from 1877) occurrence approximately 9.3 miles to the northwest.
Yellow-headed blackbird *Xanthocephalus xanthocephalus*	CSC	This bird breeds in California from April to June and many migrate to Mexico and Costa Rica. Some populations are known to over-winter in California. This species has often been observed in grasslands, agricultural fields, and other open areas during migration.	Low Potential. There are both suitable nesting and foraging habitats within the WJHMP area. There are no known recorded occurrences in the WJHMP area but there is an 1899 recorded occurrence approximately 8.5 miles to the southwest. However, this is a poorly documented occurrence.

Species	Status	Suitable Habitat	Potential for Project to Affect
Mammals			
Western red bat *Lasiurus frantzii (= blossevillii)*	CSC SSHCP	Cismontane woodland, lower montane coniferous forest, riparian forest, riparian woodland. Roosts primarily in trees, 2-40 feet above ground, from sea level up through mixed conifer forests. Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging.	Moderate Potential. Riparian habitat within the WJHMP area provides habitat for this species. There are no known occurrences in the WJHMP area, but limited surveys have been conducted. SSHCP modeled roosting and foraging habitat is present within portions of the plan area.
American badger *Taxidea taxus*	CSC SSHCP	Occurs in a variety of habitats, including grasslands and oak woodlands with friable soils for digging.	Moderate Potential. Within the WJHMP area, there are open space areas consisting of grasslands and croplands that provide suitable habitats for this species. The WJHMP area has one historical occurrence in the northeast quadrant. SSHCP modeled habitat is present within portions of the plan area.

STATUS CODES:

Federal

FE = Formally listed as endangered under the ESA

FT = Formally listed as threatened under the ESA

FSC = Federal Species of Concern

PT = Proposed threatened

BEPA = Protected under Bald and Golden Eagle Protection Act

State

CE = Formally listed as endangered under CESA

CT = Formally listed as threatened under CESA

CFP = Fully Protected under California Fish and Game Code

CSC = California Species of Special Concern (no formal protection other than CEQA consideration)

California Rare Plant Rank (CRPR)

CRPR 1B = Plants rare, threatened, or endangered in California and elsewhere

CRPR 2B = Plants rare, threatened, or endangered in California, but more common elsewhere

CRPR Extensions

0.1 = Seriously endangered in California

0.2 = Fairly endangered in California

SSHCP = Species that are covered in the SSHCP and considered by Sacramento County to meet the definition of rare as described in Section 15380 of the State CEQA Guidelines

Sources: CDFW 2024, CNPS 2024, USFWS 2024, County of Sacramento 2018, Madrone 2018.

REGULATORY SETTING

FEDERAL

The two major federal laws regulating impacts to wetlands and wildlife species are the Clean Water Act (CWA) (Sections 404 and 401) and the Endangered Species Act (ESA) (Sections 7, 9, and 10). USACE is responsible for administering the CWA, Section 404, with the US Environmental Protection Agency serving in an oversight capacity. USFWS (with jurisdiction over plants, wildlife, and resident fish) and National Oceanic and Atmospheric Administration, National Marine Fisheries Service (NMFS) (with jurisdiction over anadromous fish and marine fish and mammals) are responsible for administering ESA Sections 7, 9, and 10. The regional water quality control board (RWQCB) is the regulatory agency that enforces Section 401 of the CWA.

CLEAN WATER ACT SECTION 401 AND SECTION 404

USACE regulates discharge of dredged or fill material into waters of the United States under Section 404 of the CWA. Waters of the United States are generally defined as "navigable waters," which are traditional navigable waters that are or were used for commerce or may be used for interstate commerce; tributaries of navigable waters; and wetlands adjacent to navigable waters. "Discharge of fill material" is defined as the addition of fill material into waters of the United States, including, but not limited to the following: placement of fill that is necessary for the construction of any structure or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes and subaqueous utility lines (33 CFR Section 328.2[f]).

Under Section 401 of the CWA, an activity requiring a CWA Section 404 permit must obtain a state water quality certification to ensure state water quality standards are not violated. In California, the authority to grant water quality certification is delegated by the State Water Resources Control Board to the nine RWQCBs. The applicable RWQCB for the WJHMP area is the Central Valley RWQCB. Under CWA Section 401, applicants for a federal license or permit to conduct activities that may result in the discharge of a pollutant into waters of the United States must apply for water quality certification from the state. Therefore, all projects with a federal component that may affect state water quality (including projects that require federal agency approval, such as a Section 404 permit) must comply with CWA Section 401. As part of the permitting process under Section 404, applicants would be required to apply for water quality certification from the Central Valley RWQCB.

FEDERAL ENDANGERED SPECIES ACT

Under the ESA of 1973, the Secretary of the Interior and the Secretary of Commerce jointly have the authority to list a species as endangered or threatened. The ESA defines "endangered" species as any species in danger of extinction throughout all or a significant portion of its range. A "threatened" species is any species that is likely to

become an “endangered” species within the foreseeable future throughout all or a significant portion of its range. “Candidate” species are those for which USFWS has enough information to propose listing as endangered or threatened. “Proposed” species are those candidate species that USFWS has found warrant listing as endangered or threatened and were officially proposed as such in a Federal Register notice. A species that has been “delisted” is one whose population has met its recovery goal target and is no longer in jeopardy of extinction.

Taking of federally listed fish and wildlife species is prohibited under Section 9 of the ESA. To “take” is defined by the ESA (Section 2[19]) to mean “to harass, harm, pursue, hunt, shoot, would, kill, trap, capture, or collect, or attempt to engage in any such conduct.” Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR Section 17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR Section 17.3).

Because Section 9 explicitly prohibits the taking of “fish or wildlife” species only and provides separate protections for plants that do not include prohibition of take, case law has determined that incidental take of plants is not prohibited under the ESA, but federal agencies need to consider the effects of their actions on listed plant species to ensure they are not likely to jeopardize the continued existence of a listed species and consultation with USFWS is required to make this determination. In the case of plants, USFWS issues ‘Conservation Recommendations’ rather than Incidental Take Statements where an action is likely to adversely affect, but not likely to jeopardize, a threatened or endangered plant species. Conservation recommendations are discretionary, not mandatory. If the conclusion is that the action is likely to jeopardize a listed plant, USFWS issues reasonable and prudent alternatives and mandatory measures to avoid jeopardy.

All federal government agencies must review their actions and determine if a “may affect” determination is made with respect to a federally listed or proposed species. If the federal agency makes a “may affect” determination, it is then required to formally consult with USFWS or NMFS.

For federal agencies, the consultation is conducted under Section 7 of the ESA. The agency submits a Biological Assessment to USFWS that evaluates the potential adverse effects to federally listed species. USFWS, or NMFS, in the case of anadromous fish, then prepares a Biological Opinion that addresses the requirements that must be followed to avoid, minimize, and compensate for impacts to federally listed species and their habitats.

For non-federal agencies or individuals (i.e., private applicants), the consultation is conducted under Section 10 of the ESA. The agency or individual submits an incidental take[2] permit application to USFWS accompanied by a habitat conservation plan (HCP). The purpose of the habitat conservation planning process associated with the permit is to ensure that there is adequate minimization and mitigation of the effects of the authorized incidental take. The purpose of the permit is to authorize the incidental take of a listed species, not to authorize the activities that result in take.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1916 established federal responsibilities for the protection of nearly all species of birds, their eggs, and nests. Section 16 USC 703–712 of the Act states “unless and except as permitted by regulations, it shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture, or kill” a migratory bird. A migratory bird is any species or family of birds that live, reproduce, or migrate within or across international borders at some point during their annual life cycle. Currently, there are 836 migratory birds protected nationwide by the MBTA, of which 58 are legal to hunt.

State

The four most important state laws regulating wildlife species, streams, and wetlands are the California Endangered Species Act (CESA) (Section 2081), Section 1600 of the Fish and Game Code, Section 401 of the CWA, and the Porter-Cologne Water Quality Control Act. The first two are administered by CDFW, and the latter is administered by the state through the RWQCBs.

California Endangered Species Act

CESA (established in Fish and Game Code Section 2050) generally parallels the main provisions of the ESA and is administered by CDFW for most terrestrial species, with assistance from the National Oceanic and Atmospheric Administration Fisheries for most freshwater fishery species. CESA prohibits the taking of state listed species except as otherwise provided by state law. Unlike the ESA, CESA extends the take prohibitions to not only listed species but also for species petitioned for listing. “Take” is defined in Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Authorization for take of state-listed species can be obtained through a California Fish and Game Code Section 2081 incidental take permit. If a species is protected by both the ESA and CESA, a consistency determination may be issued if CDFW finds that the federal permit is consistent with the requirements of CESA. Section 2081 of CESA identifies the following criteria that must be met for CDFW to authorize the take of endangered, threatened, or candidate species:

[2] Incidental take is take of listed fish or wildlife species that results from, but is not the purpose of, carrying out an otherwise lawful activity conducted by a federal agency or applicant (50 CFR 402.2).

- The taking of a listed or candidate species can be minimized and fully mitigated.
- The take would not jeopardize the continued existence of the species.
- Authorization for take must be based on the best scientific material that is reasonably available, and that due consideration will be given to the species' ability to survive and reproduce.

California Fish and Game Code

Animals and Plants

Section 3503 makes it unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by the Fish and Game Code or any regulation made pursuant thereto. Section 3503.5 makes it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by the Fish and Game Code or any regulation adopted pursuant thereto. Section 1908 prohibits the import, take, possession, or sale of native plants determined by the Fish and Game Commission to be rare or endangered, except as incidental to the possession or sale of real property. Sections 3511, 4700, 5050 state that Fully Protected animals or parts thereof may not be taken or possessed at any time.

Lake and Streambed Alteration

Fish and Game Code Section 1602 requires any person, state or local governmental agency, or public utility to notify CDFW before beginning any activity that will do one or more of the following: 1) substantially obstruct or divert the natural flow of a river, stream, or lake; 2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or 3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake. Fish and Game Code Section 1602 applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the state.

Notification is generally required for any project that will take place in the vicinity of a river, stream, or lake. CDFW will determine whether a Lake or Streambed Alteration Agreement is required for the activity. An agreement will be required if the activity could substantially adversely affect an existing fish and wildlife resource. If an agreement is required, it will be prepared by CDFW in coordination with the applicant. The agreement will include measures, as necessary, to protect fish and wildlife resources while conducting the project.

California Native Plant Protection Act

State listing of plant species began in 1977 with the passage of the California Native Plant Protection Act (NPPA), which directed CDFW to carry out the legislature's intent to "preserve, protect, and enhance endangered plants in this state." The NPPA gave the California Fish and Game Commission the power to designate native plants as endangered or rare and to require permits for collecting, transporting, or selling such plants. CESA expanded on the original NPPA and enhanced legal protection for plants.

CESA established threatened and endangered species categories and grandfathered all rare animals—but not rare plants—into the act as threatened species. Thus, three listing categories for plants are employed in California: rare, threatened, and endangered. Sixty-four species, subspecies, and varieties of plants are protected as rare under the NPPA. The act prohibits take of endangered or rare native plants but includes exceptions for agricultural and nursery operations; for emergencies; and, after proper notification of CDFW, for vegetation removal from canals, roads, and other building sites, changes in land use, and other situations.

Porter-Cologne Water Quality Control Act

This Act (State Water Code Section 13020) mandates that all the waters of the state be protected, that activities and factors affecting water quality be regulated to attain the highest water quality "within reason," and that the state be prepared to exercise its power and jurisdiction to protect water quality from degradation. Waters of the state are defined as any surface or groundwater within the boundaries of the state. The RWQCBs issue permits, with varying conditions, to allow the discharge of dredge or fill material or a waiver of waste discharge into waters of the state.

State Wetland Procedures

The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (State Wetland Procedures), as prepared by the State Water Resources Control Board, went into effect on May 28, 2020. The Procedures consist of four major elements: 1) a wetland definition; 2) a framework for determining if a wetland feature is a water of the state; 3) wetland delineation procedures; and 4) procedures for the submittal, review, and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities. The Procedures include a definition for wetland waters of the state that include (1) all wetland waters of the United States; and (2) aquatic resources that meet both the soils and hydrology criteria for wetland waters of the United States but lack vegetation.

The State Water Resources Control Board has adopted the following definition of wetlands:

> An area is wetland if, under normal circumstances, (1) the area as continuous or recurrent saturation of the upper substrate caused by groundwater or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

Local

Sacramento County 2030 General Plan

The 2030 General Plan contains numerous goals, policies, concepts, and strategies to protect and/or preserve biological resources. The following policies are applicable to the project.

- **Policy AG-17.** The establishment of conservation easements combining preservation of agricultural uses, habitat values, and open space on the same property should be encouraged where feasible.
- **Policy CI-60.** Encourage maintenance of natural roadside vegetation and landscaping with native plants which usually provide the best habitats for native wildlife.
- **Policy CO-25.** Support the preservation, restoration, and creation of riparian corridors, wetlands, and buffer zones.
- **Policy CO-58.** Ensure no net loss of wetlands, riparian woodlands, and oak woodlands.
- **Policy CO-59.** Ensure mitigation occurs for any loss of or modification to the following types of acreage and habitat function:
    - vernal pools,
    - wetlands,
    - riparian,
    - native vegetative habitat, and
    - special-status species habitat.
- **Policy CO-60.** Mitigation should be directed to lands identified on the Open Space Vision Diagram and associated component maps (please refer to the Open Space Element).
- **Policy CO-61.** Mitigation should be consistent with Sacramento County-adopted habitat conservation plans.
- **Policy CO-62.** Permanently protect land required as mitigation.
- **Policy CO-64.** Consistent with overall land use policies, the County shall support and facilitate the creation and biological enhancement of large natural preserves or wildlife refuges by other government entities or by private individuals or organizations.
- **Policy CO-65.** Create a network of preserves linked by wildlife corridors of sufficient size to facilitate the movement of species.
- **Policy CO-66.** Mitigation sites shall have a monitoring and management program including an adaptive management component including an established funding mechanism. The programs shall be consistent with Habitat Conservation Plans that have been adopted or are in draft format.
- **Policy CO-68.** Preserves shall be planned and managed to the extent feasible so as to avoid conflicts with adjacent agricultural activities (Please also refer to the Agricultural Element).

- **Policy CO-69.** Avoid, to the extent possible, the placement of new major infrastructure through preserves unless located along disturbed areas, such as existing roadways.
- **Policy CO-70.** Community Plans, Specific Plans, Master Plans, and development projects shall:
    - Include the location, extent, proximity, and diversity of existing natural habitats and special status species in order to determine potential impacts, necessary mitigation and opportunities for preservation and restoration.
    - Be reviewed for the potential to identify non-development areas and establish preserves, mitigation banks and restore natural habitats, including those for special-status species, considering effects on vernal pools, groundwater, flooding, and proposed fill or removal of wetland habitat.
    - Be reviewed for applicability of protection zones identified in this Element, including the Floodplain Protection Zone, Stream Corridor Ordinance, Cosumnes River Protection Combining Zone, and the Laguna Creek Combining Zone.
- **Policy CO-71.** Development design shall help protect natural resources by:
    - Minimizing total built development in the floodplain, while designing areas of less frequent use that can support inundation to be permitted in the floodplain,
    - Ensuring development adjacent to stream corridors and vernal pools provide, where physically reasonable, a public street paralleling at least one side of the corridor with vertical curbs, gutters, foot path, street lighting, and post and cable barriers to prevent vehicular entry.
    - Projects adjacent to rivers and streams shall integrate amenities, such as trail connectivity, that will serve as benefits to the community and ecological function.
    - Siting of wetlands near residential and commercial areas should consider appropriate measures to minimize potential for mosquito habitation.
    - Development adjacent to stream corridors and vernal pools shall be designed in such a manner as to prevent unauthorized vehicular entry into protected areas.
- **Policy CO-75.** Maintain viable populations of special-status species through the protection of habitat in preserves and linked with natural wildlife corridors.
- **Policy CO-78.** Plans for urban development and flood control shall incorporate habitat corridors linking habitat sites for special status species. (Please also refer to the Open Space Element for related policies.)
- **Policy CO-83.** Preserve a representative portion of vernal pool resources across their range by protecting vernal pools on various geologic landforms, vernal pools that vary in depth and size, and vernal pool complexes of varying densities; in order to maintain the ecological integrity of a vernal pool ecosystem.

- **Policy CO-84.** Ensure that vernal pool preserves are large enough to protect vernal pool ecosystems that provide intact watersheds and an adequate buffer, have sufficient number and extent of pools to support adequate species populations and a range of vernal pool types.
- **Policy CO-86.** Limit land uses within established preserves to activities deemed compatible with maintenance of the vernal pool resource, which may include ranching, grazing, scientific study, and education.
- **Policy CO-91.** Discourage introductions of invasive nonnative aquatic plants and animals.
- **Policy CO-134.** Maintain and establish a diversity of native vegetative species in Sacramento County.
- **Policy CO-135.** Protect the ecological integrity of California Prairie habitat.
- **Policy CO-138.** Protect and preserve non-oak native trees along riparian areas if used by Swainson ’s hawk, as well as landmark and native oak trees measuring a minimum of 6 inches in diameter or 10 inches aggregate for multi-trunk trees at 4.5 feet above ground.
- **Policy CO-139.** Native trees other than oaks, which cannot be protected through development, shall be replaced with in-kind species in accordance with established tree planting specifications, the combined diameter of which shall equal the combined diameter of the trees removed.
- **Policy CO-145.** Removal of nonnative tree canopy for development shall be mitigated by creation of new tree canopy equivalent to the acreage of nonnative tree canopy removed. New tree canopy acreage shall be calculated using the 15-year shade cover values for tree species.
- **Policy CO-147.** Increase the number of trees planted within residential lots and within new and existing parking lots.
- **Policy CO-149.** Trees planted within new or existing parking lots should utilize pervious cement and structured soils in a radius from the base of the tree necessary to maximize water infiltration sufficient to sustain the tree at full growth.
- **Policy LU-15.** Planning and development of new growth areas should be consistent with Sacramento County-adopted Habitat Conservation Plans and other efforts to preserve and protect natural resources.
- **Policy OS-1.** Actively plan to protect, as open space, areas of natural resource value, which may include but are not limited to wetlands preserves, riparian corridors, woodlands, and floodplains associated with riparian drainages.
- **Policy OS-2.** Maintain open space and natural areas that are interconnected and of sufficient size to protect biodiversity, accommodate wildlife movement and sustain ecosystems.

- **Policy OS-9.** Open space easements obtained and offered as mitigation shall be dedicated to the County of Sacramento, an open space agency, or an organization designated by the County to protect and manage the open space. Fee title of land may be dedicated to the County, the open space agency, or organization provided it is acceptable to the appropriate department or agency (Please also refer to Section V of the Conservation Element for related policies).

The major goal outlined in the Conservation Element of the General Plan is the management and protection of natural resources for the use and enjoyment of present and future generations, while maintaining the long-term ecological health and balance of the environment. In addition to the Conservation Element goals and objectives, the Open Space Element further identifies two key concepts that form the basis of the goals, objectives and policies contained in the element: (1) protecting the urban edge and (2) establishing natural area linkages.

The urban edge is defined as the Urban Services Boundary (USB) in the Land Use Element. This boundary is the ultimate boundary of the urban area and is based upon natural and environmental constraints to urban growth. Protection of the urban edge allows accommodation of large scale urban development, while maintaining substantial rural, natural open space areas. Confining urban development within the USB prevents urban sprawl into the rural and open space areas of the county; protecting the urban edge protects the existing open space and rural areas of the county from being lost to development.

Open space linkages increase the ecological value of the open space lands by connecting ecosystems and wildlife habitats. This is beneficial to species higher in the food chain since mammals and birds of prey require considerable supporting territory. When the habitat is reduced to isolated patches, the long-term viability of the species is threatened. Furthermore, the establishment of natural habitat corridors facilitates migration of species between breeding populations, thus enlarging the gene pool and helping to ensure genetically diverse and healthy populations of individual species. In the rural areas of the county, contiguous open space already exists, allowing for preservation of larger, high quality natural areas.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and the Vineyard Community Plan.

Cordova Community Plan

- **Policy ROS-7.** Protect and preserve sensitive environmental areas and wildlife habitats including wetlands, riparian corridors, annual grasslands, and floodplains; and encourage restoration and educational opportunities (e.g., public walkways and informational signage) for such areas when appropriate.

VINEYARD COMMUNITY PLAN

- **Policy NER-3.** Protect natural areas from the effects of urbanization through the utilization of appropriate zoning techniques which support local, state, and federal preservation policies.
- **Policy NER-4.** Protect vernal pools and potential endangered species such as the Sacramento Orcutt Grass by evaluating development WJHMP areas on a case-by-case basis for the presence of vernal pools and inventorying those sites where pools are found.

SOUTH SACRAMENTO COUNTY HABITAT CONSERVATION PLAN

The South Sacramento County Habitat Conservation Plan (SSHCP) is a regional approach to conserving species and addressing issues related to urban development, habitat conservation, open space preservation, and agricultural protection. To develop the SSHCP, the County is partnered with Rancho Cordova, Galt, the Sacramento Regional County Sanitation District, the Capital Southeast Connector Joint Powers Authority, and the Sacramento County Water Agency. The intent of the SSHCP is to minimize regulatory hurdles and streamline the permitting process for projects that engage in development-related activities inside the urban development area (UDA). The UDA corresponds to land within the county's urban service boundary, and to land within the city limits of Rancho Cordova and Galt, and Galt's adopted sphere of influence. The SSHCP consolidates environmental efforts to protect and enhance vernal pool habitat and other aquatic and upland habitats to provide ecologically viable conservation areas in south Sacramento County for numerous species. The SSHCP provides a mechanism by which the County and its partners are authorized to issue permits that allow landowners to engage in specific development activities (Covered Activities) that could result in the incidental take of listed species (covered species). The intent is that the County and its partners have adopted a developer-paid fee system based on loss of habitat acreage, habitat type, and long-term management costs. Fees are used to fund the habitat preservation, restoration, and management elements of the SSHCP. The final SSHCP and supporting EIR/EIS were approved and certified, respectively, by the County Board of Supervisors and the issuance of permits by the resource agencies has been completed.

Covered Activities include activities and projects related to urban development and associated infrastructure. Covered Activities are allowable under the SSHCP's Incidental Take Permits and can use the SSHCP to mitigate impacts that result from implementation of the Covered Activity. Covered Activities must comply with all SSHCP requirements, including SSHCP avoidance and minimization measures (AMMs).

The SSHCP calls for the preservation of land within the PPU that encompass areas where important SSHCP covered species resources are present. The SSHCP Conservation Strategy is based on the principles of conservation biology and landscape ecology and the nature, quality, and geographic distribution of the resources in the SSHCP plan area. The SSHCP plan area was divided into eight Preserve Planning Units (PPUs) to assist with the development of an adequate SSHCP Conservation Strategy. The plan area is in PPU 2 and PPU 3.

PPU 2 encompasses approximately 9,271 acres located in the northern portion of the SSHCP. It is anticipated that a majority of PPU 2 will eventually be urbanized. Under the SSHCP, approximately 584 total acres in PPU 2 will be preserved in a connected SSHCP Preserve System. SSHCP Preserves in PPU 2 will also be directly connected to existing preserves within PPU 2, and in PPU 3 (Vernal Pool Prairie Preserve) to the south by Linkage Preserve L-5 (Jackson Linkage), which is outside of the WJHMP area.

PPU 3 encompasses 14,303 acres located in the northwestern portion of the plan area. Approximately 1,815 acres in PPU 3 will be preserved under the SSHCP. The preserve design focus for PPU 3 is to connect two large existing preserves: 1,160 acres of existing preserve in the northern portion of PPU 3 and 560 acres of existing preserve in the central portion. This will be accomplished by establishing a new Core Preserve (Core Preserve C-3), which will total approximately 1,046 acres. Two Satellite Preserves will be established in PPU 3: Satellite Preserves S-7 (91 acres) and S-9 (31 acres). In addition, the Laguna Creek Wildlife Movement Corridor within PPU3 is approximately 250 acres. All of these proposed preserves would be outside of the WJHMP area, although there is an existing preserve west of Excelsior Road.

The plan area is within the UDA, which the SSHCP assumed would eventually be developed.

Sacramento County Tree Ordinance

The Sacramento County Tree Preservation and Protection Ordinance (Chapter 19.12 of the County Code) states that “it shall be the policy of the County to preserve all trees possible through its development review process.” In addition, the “approving body shall have the authority to adopt mitigation measures as conditions of approval for projects in order to protect other species of trees.” This protection is afforded to native oak trees, other native trees, and landmark trees (defined in Section 19.04.030 of the County Code as “an especially prominent or stately tree on any land in Sacramento County”). Furthermore, the Sacramento County General Plan Conservation Element Policy CO-138 states that the County will “protect and preserve non-oak native trees along riparian areas if used by Swainson’s Hawk, as well as landmark and native oak trees measuring a minimum of 6 inches in diameter or 10 inches aggregate for multi-trunk trees at 4.5 feet above ground.” The County has developed the following list of native oak and specific non-oak native trees which are considered during environmental analysis:

- Valley Oak/*Quercus lobata*
- Interior live oak/*Quercus wislizenii*
- Blue oak/*Quercus douglasii*
- Coast live oak/*Quercus agrifolia* (in Delta area)
- Oracle oak/*Quercus X morehus*
- Native oak hybrids
- California sycamore/*Platanus racemosa*

- Northern California black walnut/*Juglans californica v. hindsii*
- Oregon ash/*Fraxinus latifolia*
- Goodding's black willow/*Salix gooddingii*
- Box elder/*Acer negundo v. californicum*
- White alder/*Alnus rhombifolia*
- California buckeye/*Aesculus californica*

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

Impacts to biological resources would be considered significant if implementation of the project would:

- have a substantial adverse effect on protected surface waters, as defined by the California Water Code, USACE Wetland Delineation Manual (1987 ed.) and/or as defined by Sections 401 and 404 of the Clean Water Act (including, but not limited to, seeps, vernal pools, swales, drainages, and perennial waterways) through direct removal, filling, hydrological interruption, or other means;
- have a substantial adverse effect, either directly or through habitat modification, on any species identified as a special-status species in local or regional regulatory guidance, plans, policies, or regulations or by CDFW or USFWS;
- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- conflict with any local policies or ordinances protecting biological resources; or
- conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or approved local, regional, or state habitat conservation plan.

ISSUES NOT DISCUSSED FURTHER

All the issues identified in the significance criteria are addressed in the following analysis.

METHODOLOGY

The methodologies used to determine significance rely on documents published by or endorsed by regulatory agencies. The applicable documents and methods are cited and described in the applicable impact discussions below. In the absence of such published documents, the analyses rely on the general definitions of significance.

Due to the programmatic nature of this EIR, where more detailed site-specific information is not available, analysis from the Final Environmental Impact Report for the SSHCP has been incorporated. The SSHCP FEIR (SCH Number 2008062030) (Sacramento County 2018) was certified by the Sacramento County Board of Supervisors on September 11, 2018 (County Control No. 2003-0637). The FEIR for the SSHCP is available for review at Sacramento County Planning and Environmental Review, 827 7th Street, Room 225 Sacramento, CA 95814 and is hereby incorporated by reference in accordance with State CEQA Guidelines Section 15150.

In addition, biological surveys were conducted, and a report was prepared for portions of the WJHMP area. Information from the following report is incorporated into the impact analysis and the entire report is included in the appendices.

- Biological Resources Assessment – West Jackson Highway Master Plan prepared by Madrone Ecological Consulting, LLC dated December 2018 (Appendix F).

Note that the biological report was only prepared for participating properties within the WJHMP area. This includes most of Districts 1 and 2 but does not cover any portion of the FPAs. Therefore, this analysis uses the land cover mapping conducted for the SSHCP to approximate the habitat types and acreages within the plan area, as provided in Table 8-1 and Figure 8-1. The County then separated the prior mining projects that have had various mitigation obligations from the remaining plan area and basemap data to determine the acreages of the various SSHCP habitat types that would be subject to mitigation (i.e., those outside of the prior mining areas). Table 8-4 summarizes the acreage of each habitat type on unmined properties potentially converted due to buildout of the WJHMP. Figure 8-1 shows the unmined areas reflected in these totals. For the purpose of this evaluation, it is assumed that all remaining habitat within the illustrated land cover types shown in Table 8-4 would be fully converted to a developed land cover and the associated habitat values of these land cover types would be lost. The acreages in Table 8-4 represent a conservative estimate, as these acreages also include several areas currently under conservation easements, the value habitat of which would continue to be protected in perpetuity. This methodology provides a reasonable, programmatic assessment of the plan area.

Table 8-4 WJHMP Habitat Loss, by SSHCP Land Cover Type

SSHCP Cover type	Acres Converted
Cropland	93.46
Freshwater Marsh	2.88
Irrigated Pasture-Grassland	262.34
Mixed Riparian Woodland	12.30
Open Water	106.93
Seasonal Wetlands	7.12
Streams/Creeks	7.65
Streams/Creeks (VPIH)	0.45
Swale	21.56
Valley Grassland	1,382.28
Vernal Pool	37.41

Source: Data provided by Sacramento County in 2024.

West Jackson Highway Master Plan Policies

The proposed WJHMP does not include policies related to biological resources.

Impacts and Analysis

Impact BR-1: Result in Loss of Wetlands and Surface Waters

Project level wetland delineations have not been prepared for the WJHMP area. Based on mapping performed for the SSHCP, however, both wetlands (i.e., aquatic habitats that have wetland vegetation, hydric soils, and wetland hydrology) and other waters (i.e., aquatic habitats that have an ordinary high-water mark but do not meet all three wetland criteria) are located in the plan area (see Figure 8-1). These wetlands may be under state or federal jurisdiction. The distribution and character of the wetlands and other waters in the plan area has been influenced by former and ongoing mining operations. The mining sites were surveyed as part of the applicable use permit application and mitigation for loss of historical wetlands has occurred onsite.

The WJHMP includes 1,489 acres proposed to be open space, some of which would coincide with existing wetlands. While this open space could continue to support the existing vernal pools, the designation does not provide for in perpetuity protection of existing habitat. At this time, the WJHMP is not proposing conservation easements on site beyond what is already in effect. Only areas under easement can be assumed to not be impacted; all other waters have been conservatively assumed to have direct impacts. Areas of existing conservation easements include two separate areas along Morrision Creek, Elder Creek, and an 82-acre preserve located south of Jackson Highway and approximately 1 mile east of the intersection of Jackson Highway with Bradshaw Road that is under a conservation easement held by CDFW.

The County used ArcGIS software and the SSHCP Land Coverage map to approximate the acreage of wetlands and other waters in absence of a formal delineation report. The SSHCP assumed that all of the area within the UDA – except the existing preserves identified above - would be developed at some point and, thus, wetlands in that area would be affected or removed by covered project activities. Based on the SSHCP Land Coverage Map, 184 acres of wetlands and other waters would be disturbed or removed to accommodate development within the WJHMP area. For the WJHMP area, waters and acreage are not final and a formal verified wetland delineation and permitting pursuant to the SSHCP would be required prior to development in the WJHMP area. The WJHMP area also contains constructed/restored lands including constructed vernal pools, marshes, depressional seasonal wetlands, seasonal wetland swales, a low flow corridor, and channels adjacent to wetlands (Madrone 2018). Features constructed as part of mitigation for impacts to wetlands from mining activities would be identified through these subsequent reviews.

There are two general types of impacts to wetland habitats: direct and indirect. A direct impact refers to an effect caused by a project that occurs at the same time and place as the project itself. A direct impact occurs when a wetland is destroyed by construction activities within the wetland margin; the SSHCP analysis for Effects of the Vernal Pool Ecosystem states that if a Covered Activity project footprint overlays any portion of a vernal pool, then the entire pool is directly affected. An indirect impact occurs when activities near the wetland cause secondary effects, such as hydrologic changes that reduce the amount of water flowing to the wetland, or drift of pesticides and other pollutants into the wetland. For vernal pools and similar wetlands that may contain federally listed species, the rule of thumb for total avoidance of both direct and indirect impacts requires that construction and other activities occur at least 250 feet from the wetland[3]. For other surface waters, the County uses a buffer of 50 feet as a rule of thumb for avoiding direct and indirect impacts. Note that these rules may be supplanted by site-specific analyses of hydrologic and other conditions. Potential direct and indirect impacts are discussed further below.

Direct Impacts

Based on ArcGIS analysis of SSHCP land cover mapping, there are estimated to be 184 acres of wetlands and other waters within the WJHMP area that would be lost due to buildout of the WJHMP. Some areas included within this total are within existing conservation easements (as shown in Figure 8-1) and may be preserved. However, because final site designs are not known, this analysis assumes that all wetlands would be directly impacted by development.

No current wetland delineations have been conducted in Districts 1 and 2 and no applications for CWA Section 404 permits for wetland loss have been submitted. Thus,

[3] Programmatic Formal Endangered Species Act Consultation on Issuance of 404 Permits for Projects with Relatively Small Effects on Listed Vernal Pool Crustaceans Within the Jurisdiction of the Sacramento Field Office, California (February 28, 1996).

the amount of waters of the United States and waters of the state within Districts 1 and 2 that would be directly removed has not been determined by USACE or the Central Valley RWQCB at this time. Future projects within the WJHMP area would be required to submit wetland delineations to the USACE for verification and the County and for extension of Clean Water Act permit coverage und the SSHCP. The acreage of affected wetlands would be refined through this process.

Indirect Impacts

As described above, all wetlands outside of existing conservation easements are assumed to be directly impacted by the WJHMP for the purpose of this analysis. Since open space areas within the plan area would allow different uses such as recreational trails and detention basins, wetlands within "Open Space" that are not directly impacted may still be indirectly affected by incompatible activities within the wetland buffer. Potential indirect impacts on water quality and hydrology could result from urban runoff, erosion, and siltation. Indirect impacts from intrusion of humans and domestic animals, litter and dumping, introduction of invasive plant species, and alterations to individual wetland watersheds could degrade habitat for vernal pool invertebrates in off-site wetlands and wetlands retained in on-site open spaces. As explained further in Chapter 14, "Hydrology, Drainage, and Water Quality," compliance with the requirements of the Sacramento County Stormwater Ordinance (Sacramento County Code 15.12), Land Grading and Erosion Control Ordinance (Sacramento County Code 16.44), and the state's General Stormwater Permit for Construction Activities, preparation and implementation of a site-specific stormwater pollution prevention plan (SWPPP) and Best Management Practices, implementation of Low Impact Development Standards, and implementation of the drainage plan outlined in the WJHMP master drainage plan, would address the project's potential to substantially impair the quality of surface waters.

Summary

Based on SSHCP GIS analysis, the WJHMP area has approximately 184 acres of wetland habitat outside of the previously mined areas that is assumed to be directly impacted by development for the purpose of this analysis. The land use plan designates approximately 1,489 acres as Open Space which has natural and created wetlands. However, the project does not propose new easements to protect the remaining habitat in perpetuity. As described above, the open space in the plan area is intended to serve several community functions, including stormwater detention, farmland, and passive recreation. As a result, the wetlands in these areas would be subject to indirect impacts from intrusion of humans and domestic animals; litter and dumping; alteration of individual wetland watershed area; and introduction of invasive plant species could degrade habitat for vernal pool invertebrates in offsite wetlands and wetlands retained onsite. Direct and indirect impacts could occur because urban development is proposed within and around wetland areas.

To address the potential loss of wetlands and surface waters, the Project Applicants and any subsequent developers within the WJHMP area would be required through Mitigation Measure BR-1a to prepare a site-specific biological resources assessment in accordance with the Sacramento County Guidelines for SSHCP Biological Resources

Reports prior to an entitlement application being deemed complete. The report shall contain information that documents existing landcover habitats as defined in the SSHCP and an assessment of species occurrences and potential habitat for SSHCP covered species. Based on the findings of this report, Mitigation Measure BR-1b would require developers to participate in the SSHCP and must obtain coverage through the Aquatic Resources Program (ARP). The ARP is a local jurisdiction based aquatic resources permit program that adds to the strength of the SSHCP framework of protection of natural communities and native plant and wildlife species, including protection of aquatic resources. A primary goal of ARP implementation is to achieve an overall no net loss of aquatic resources functions and services. While the ARP focuses on a permit program to address impacts to aquatic resources and the SSHCP focuses on permitting related to incidental take of species, both permitting processes are done in conjunction with one another and consist of:

- A programmatic general permit (PGP), founded on a local aquatic resources protection program and designed to reduce duplication with that program, for covered activities with minimal individual and cumulative effects on aquatic resources. The PGP is implemented by the three land-use authority Permit Applicants (i.e., Sacramento County, Galt, and Rancho Cordova).
- A regional general permit (RGP), for covered activities with minimal individual and cumulative effects on aquatic resources that do not qualify for the PGP.
- A procedure for issuing Letters of Permission (LOP procedure) for covered activities with more than minimal effects, but less-than-significant effects, on the human environment, including aquatic resources.
- An abbreviated process for issuing standard permits (abbreviated SP) for other covered activity impacts that do not qualify for the PGP or the LOP procedure. The abbreviated SP process is used for the small number of SSHCP covered activities requiring authorization under CWA 404 that may significantly affect the human environment under NEPA, requiring the preparation of an EIS.

The CWA 404 permit strategy relies, at all levels of permitting, on the SSHCP to address avoidance, minimization and requirements for compensatory mitigation for impacts to aquatic resources. Key to satisfying compensatory mitigation requirements, payment of SSHCP-required fees dually fulfills a USACE-approved South Sacramento In Lieu Fee Program established by the SSHCP Permittees, which relies on the compensatory mitigation ratio requirements for aquatic resources contained in the SSHCP (vs. project-by-project compensatory mitigation evaluation).

The SSHCP includes AMM's that aim to protect aquatic resources. Each subsequent project is reviewed for compliance and consistency with the SSHCP during the project design phase. These AMMs include:

- STREAM-2 (UDA Stream Setbacks), which requires a 100-foot setback from the top of bank on both sides of Morrison Creek and Elder Creek, or if a stream reach supports woody riparian vegetation, the setback must be equal to the riparian edge plus 25 feet or the 100-foot setback, whichever is greater. If trails are located within the stream setback, the nearest edge of the trail must be located at least 50 feet from the top of the bank,

- STREAM-3 (Minor Tributaries to UDA Streams), which requires a 25-foot setback measured from the top of the bank on both sides of the stream applied to all avoided first and second order tributaries to Morrison Creek and Elder Creek. Refer to Objective W6 in Chapter 7 (Table 7-1) of the SSHCP regarding avoided first and second order tributaries (which require that covered activities avoid a minimum of 20 percent of first and second order tributaries). Trails are not permitted within headwater ephemeral stream setbacks.

ROAD-2 (Wildlife Crossing Structures), which applies to road projects that are Urban Development Covered Activities (see SSHCP Section 5.2.1) or are Rural Transportation Covered Activities (see SSHCP Section 5.2.3). This AMM requires these projects to include an adequate number of wildlife crossing structures (as depicted in SSHCP Figure 5-10). An adequate number of wildlife crossing structures within the UDA and outside the UDA provide for continued dispersal and movement of native wildlife throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Objectives (see SSHCP Chapter 7).

By obtaining all required permits, paying all required SSHCP/In Lieu fees and meeting all AMMs in the SSHCP, the impacts to wetlands and surface waters would be reduced to **less than significant with mitigation**.

MITIGATION MEASURES

MITIGATION MEASURE BR-1A: SITE SPECIFIC BIOLOGICAL REPORTS

Prior to an entitlement application being deemed complete, future projects within the WJHMP area shall prepare a site specific biological resources assessment in accordance with the Sacramento County Guidelines for SSHCP Biological Resources Reports. The report shall contain information that documents existing landcover habitats as defined in the SSHCP and an assessment of species occurrences and potential habitat for SSHCP covered species. If potentially state or federal jurisdictional waters occur onsite, then an aquatic resources delineation shall also be prepared.

MITIGATION MEASURE BR-1B: SOUTH SACRAMENTO HABITAT CONSERVATION PLAN PARTICIPATION

Future project applicants shall participate in the South Sacramento Habitat Conservation Plan (SSHCP). Prior to the approval of grading permits, civil improvement plans, or building permits (whichever occurs first),

- project applicants shall prepare project plans in accordance with the SSHCP, and follow all avoidance and minimization measures (AMMs) outlined in the SSHCP. To compensate for the permanent loss of terrestrial and aquatic SSHCP landcover types, project applicants shall complete payment of all SSHCP landcover mitigation fees pursuant to the current fee schedule, or land dedications to compensate for losses of terrestrial and aquatic landcovers AMMs currently provided in the SSHCP are included in Appendix F.

Species specific AMMs include compliance with the following, as applicable and identified in project level biological surveys per Mitigation Measure BR-1a.

- Ahart's dwarf rush,
- Boggs lake hedge-hyssop,
- legenere,
- dwarf downingia,
- pin cushion navarretia,
- Sacramento orcutt grass,
- saline clover,
- Sanford's arrowhead,
- slender orcutt grass,
- Crotch bumble bee,
- midvalley fairy shrimp,
- vernal pool tadpole shrimp,
- vernal pool fairy shrimp,
- Ricksecker's scavenger beetle,
- valley elderberry longhorn beetle,
- western spadefoot,
- giant garter snake,
- western pond turtle,
- Cooper's hawk,
- tricolored blackbird,
- western burrowing owl,
- golden eagle,
- ferruginous hawk,
- Swainson's hawk,
- northern harrier,
- white-tailed kite,
- loggerhead shrike,
- western red bat, and
- American badger.

IMPACT BR-2: HAVE A SUBSTANTIAL ADVERSE EFFECT ON SPECIAL-STATUS MAMMALS

AMERICAN BADGER

The American badger (*Taxidea taxus*) is a California species of special concern. This burrowing mammal is carnivorous and feeds on small mammals, lizards, snakes, insects and carrion (Madrone 2018). Families may share the territory of a female, but males are usually solitary except during breeding season. The American Badger has no natural enemies and can be found in a variety of habitats, including grasslands and oak woodlands. This animal digs burrows for cover in relatively crumbly soil and frequently reuses old burrows. Mating season is during the summer and early fall and the young are born in burrows (Messick and Hornocker 1981).

Annual grassland within the WJHMP area provides suitable habitat for the American Badger and there is one known 1991 CNDDB occurrence (#73) of this species within the WJHMP area. This occurrence was located southwest of Mather Airport in mining sites that are north of Jackson Road (Granite I, Aspen V and Aspen VI)) between Bradshaw Road and Excelsior Road. Therefore, there is high potential for this species to den and forage in the WJHMP area and project development could result in direct mortality of individuals or loss of natal dens resulting in death of young either directly through destruction of the den or indirectly through disturbance that causes the mother

to abandon her kits. There have not been any recent local sightings of American badger since the 1991 CNDDB occurrence and the WJHMP area would represent the boundary between open space and the Sacramento urban area. American badger require large tracks of land for every individual territory and the area surrounding the WJHMP area is experiencing high development which would reduce the likelihood of this species from reestablishing. Nevertheless, the loss of foraging habitat from the WJHMP area is not expected to decrease survival or reproduction of the species in the area because much of the annual grassland habitat will be preserved as open space within the WJHMP area and would continue to provide adequate foraging habitat to support the local population. American badger has experienced drastic declines, particularly in the Central Valley, and has been extirpated from many areas in southern California (Williams 1986). Loss of individuals within the WJHMP area could diminish the local population of this species and decrease reproductive potential, which could contribute to further declines.

Implementing Mitigation Measures BR-1a, BR-1b, and BR-2 would reduce potentially significant impacts on American badger to **less than significant with mitigation** because these measures require project proponents to participate in the SSHCP, which includes land dedication and in-lieu fees which would offset the loss of foraging and denning habitat from the plan area, Mitigation Measure BR-2 requires pre-construction surveys for active dens in the construction area and within 500 feet of the construction area be identified, avoided, and monitored so that project construction would not result in abandonment of young or direct mortality of individuals.

MITIGATION MEASURES

Implement Mitigation Measures BR-1a and BR-1b.

MITIGATION MEASURE BR-2: AMERICAN BADGER SURVEYS AND ACTIVE DEN AVOIDANCE

Before construction activities within suitable habitat for American badger, a qualified biologist shall conduct surveys to identify any American badger burrows/dens. These surveys shall be conducted not more than 15 days before the start of construction. If occupied burrows are not found, further mitigation will not be required. If occupied burrows are found, CDFW shall be notified and impacts to active badger dens shall be avoided by establishing exclusion zones around all active badger dens, within which construction-related activities shall be prohibited until denning activities are complete or the den is abandoned. A qualified biologist shall monitor each den once per week to track the status of the den and to determine when a den area has been cleared for construction.

IMPACT BR-3: HAVE A SUBSTANTIAL ADVERSE EFFECT ON SPECIAL-STATUS BIRDS

Based on the species table and types of habitat present on or near the WJHMP area, the following special-status bird species are identified as having potential to occur on or near the WJHMP area: burrowing owl (*Athene cunicularia*), Cooper's hawk (*Accipiter cooperii*), ferruginous hawk (*Buteo regalis*), golden eagle (*Aquila chrysaetos*), Swainson's hawk (*Buteo swainsoni*), tricolored blackbird (*Agelaius tricolor*), and white-tailed kite (*Elanus leucurus*). This impact discussion also addresses nesting raptors in general, which are afforded minimum protections pursuant to the California Fish and Game Code regardless of status.

Swainson's Hawk

The Swainson's hawk is listed as a threatened species by the State of California. It is a migratory raptor typically nesting in or near valley floor riparian habitats during spring and summer months. Swainson's hawks were once common throughout the state, but various habitat changes, including the loss of nesting habitat (trees) and the loss of foraging habitat through the conversion of native Central Valley grasslands to certain incompatible agricultural and urban uses has caused an estimated 90 percent decline in their population.

Swainson's hawks feed primarily on small mammals, birds, and insects. Their typical foraging habitat includes native grasslands, alfalfa, and other hay crops that provide an abundant small mammal prey base and prey accessibility (ability to visually detect and capture the prey). Certain other row crops and open habitats also provide some foraging habitat. The availability of productive foraging habitat near a Swainson's hawk's nest site is a critical requirement for nesting and fledgling success. In central California, about 85 percent of Swainson's hawk nests are within riparian forest or remnant riparian trees; however, this is thought to be a function of nest tree availability rather than dependence on riparian forest and Swainson's hawks will use a variety nesting habitats (Estep 1989, England et al. 1997, Anderson et al. 2007). Their nest trees are almost always selected along the edges of tree stands or woodlands and not on the interior of them because this is a visually oriented species that requires large, wide-open spaces and visibility from the nest (England et al. 1997; Estep 2009).

The standard methodology for mitigating loss of Swainson's hawk foraging habitat is through participation in the SSHCP. Acreages of natural habitat are calculated on a per project basis. Projects pay mitigation fees commensurate with the impact to the site specific landcover type (i.e., cropland, irrigated pasture-grassland, valley grassland, vernal pool, seasonal wetland, and swale). The CNDDB and SSHCP show that there are known Swainson's hawks nesting occurrences within the WJHMP area. Additionally, SSHCP modeled habitat for Swainson's hawk shows that the WJHMP area supports Non-High Value Foraging Habitat. The SSHCP considers cropland, irrigated pasture-grassland, valley grassland, vernal pool, seasonal wetland, and swale land cover types as potential Swainson's hawk foraging habitat. For the purpose of this assessment, the full plan area is assumed to be developed, including open space areas that may retain limited habitat value. SSHCP land cover mapping shows that there are approximately 93 acres of cropland, 1,382 acres of valley grassland and 262 acres of irrigated pasture-grassland, 37 acres of Vernal Pool, 7 acres of seasonal wetland, and 22 acres of swale within the plan area that are outside of the previously mined areas and would be converted through development of the WJHMP.

However, because mining reclamation plans required by Sections 3708 and 3711 of the State Mining and Geology Board's (SMGB) Reclamation Regulations could potentially restore habitat within mining areas, the County supplemented this standard methodology to assess impacts to Swainson's hawk habitat. The County reviewed each mining project's environmental document to determine whether Swainson's hawk habitat has been affected by the mining project and whether the habitat would need to

be restored through a reclamation plan. Therefore, this methodology assumes a future baseline condition where some previously degraded Swainson's hawk habitat in mining areas has been restored to a condition suitable for Swainson's hawk foraging consistent with previously adopted mitigation measures, conditions of approval, or applicable SMGB regulations.

Staff prepared a set of criteria to determine whether the post-reclamation condition of a mining site would provide habitat suitable for Swainson's hawk foraging. The criteria include the following:

- The mining project's environmental document identified the loss of Swainson's hawk habitat.
- The mining project's environmental document recommends crops that are suitable for Swainson's Hawk foraging to mitigate loss of habitat as a condition for mining project approval.
- The proposed land uses in the mining project's reclamation plan include agriculture and open space.

Post-reclamation farmland and open space areas (including mining pit slopes) are expected to comprise an environmental system that supports successful Swainson's hawk foraging. The only areas within mining projects that cannot be considered habitat are stormwater detention areas. Staff also concluded that post-reclamation farmland and open space areas would maintain 100 percent of their habitat value. Thus, for purposes of assessing the project's impact to Swainson's hawk habitat, the entire mining WJHMP area, with the exception of stormwater detention areas, would have a post-reclamation habitat condition suitable for Swainson's hawk foraging and these areas will maintain 100 percent of their habitat value.

By using these criteria, staff identified eight mining projects that will have post-reclamation habitat conditions suitable for Swainson's hawk foraging (Table 8-5). Four of the projects are located north of SR 16 (Aspen V and Va, Aspen VI, and Granite 1) and share the same environmental document (*Morrison Creek Mining Reach Upstream (North) of Jackson Highway DEIR/DEIS*) while the remaining four projects are located south of Jackson Highway and also share the same environmental document (*Morrison Creek Mining Reach Downstream of Jackson Highway DEIR/DEIS*). Both environmental documents state that the mining projects affected Swainson's hawk habitat, but only the *Morrison Creek Mining Reach Downstream of Jackson Highway DEIR/DEIS* identified the impact to habitat to be significant. Both environmental documents also recommended as a mitigation measure that post-reclamation agricultural areas be planted only with crops that are suitable for Swainson's hawk foraging and use permits for all eight mining projects include this measure as a condition of approval. Proposed post-reclamation land uses in the eight mining projects would be agriculture, wetlands and open space – land uses that support successful Swainson's hawk foraging. The only proposed post-reclamation land use that does not support Swainson's hawk foraging was stormwater detention area.

Table 8-6 shows the number of acres that will have habitat value for the Swainson's hawk within mining projects after habitat is restored through implementation of reclamation plans. Reclamation of mining projects would result in creation of an estimated 2,047 acres of habitat that may be subject to impacts from the WJHMP. Mining projects that will have the most acres of habitat include Aspen VI (703 acres), Vineyard 1 (363 acres) and Granite 1 (294 acres).

Table 8-5 Criteria to Identify Swainson's Hawk Habitat in Previously Mined Areas

Mining Project	Criterion 1: Environmental Document Identifies Loss of Habitat for Swainson's Hawk	Criterion 2: The Environmental Document Recommends Crops That Are Suitable for Swainson's Hawk Foraging to Mitigate for Loss of Habitat	Criterion 3: The Proposed Land Uses in the Mining Project's Reclamation Plan Includes Farmlands and Wetlands
Aspen V, Va	**MEETS CRITERION** 10. The proposed project would result in the temporary loss of potential foraging habitat of moderate value and potential nest sites for Swainson's hawk, in those areas that would be reclaimed to wetlands and agriculture (assuming that crops suitable for Swainson's hawk foraging are planted). Those portions of the project that would serve as stormwater detention areas would represent a loss of suitable foraging habitat for Swainson's hawk. *(Morrison Creek Mining Reach Upstream (North) of Jackson Highway DEIR/DEIS, Control Numbers 89-1194, 89-1195 and 94-0654, pp. 5-30,31)*	**MEETS CRITERION** 5. The following mitigation is recommended to minimize potential impacts to Swainson's hawk, burrowing owl and other species. The measures listed below are related to the aforementioned species only. d. The post-reclamation agricultural areas shall be planted only with crops that are suitable for Swainson's hawk foraging; these crops shall be approved by the CDFG (California Department of Fish and Game). *(Morrison Creek Mining Reach Upstream (North) of Jackson Highway DEIR/DEIS, Control Numbers 89-1194, 89-1195 and 94-0654, p. 5-38)*	**MEETS CRITERION** Mining plan area to be used for agriculture. Agriculture area is suitable for Swainson's hawk foraging (with the right crops). Aspen V and Va Reclamation Plan
Aspen VI			**MEETS CRITERION** Mining plan area to be used for agriculture or pond. Agriculture area is suitable for Swainson's hawk foraging (with the right crops). The pond areas are not suitable for Swainson's hawk foraging. Aspen VI Reclamation Plan
Granite 1			**MEETS CRITERION** Mining plan area to be used for agriculture or open space. Agriculture area is suitable for Swainson's hawk foraging (with the right crops). Granite 1 Reclamation Plan

Mining Project	Criterion 1: Environmental Document Identifies Loss of Habitat for Swainson's Hawk	Criterion 2: The Environmental Document Recommends Crops That Are Suitable for Swainson's Hawk Foraging to Mitigate for Loss of Habitat	Criterion 3: The Proposed Land Uses in the Mining Project's Reclamation Plan Includes Farmlands and Wetlands
Aspen III South	**MEETS CRITERION:** "The proposed project would result in the temporary loss of approximately 880 acres of potential foraging habitat with potential nest sites for Swainson's hawk, a State threatened species in those areas that would be reclaimed to agriculture and wetlands (assuming that crops suitable for Swainson's hawk foraging are planted. *(Significant Impact)* *(Morrison Creek Mining Reach Downstream of Jackson Highway FEIR/FEIS, Control Numbers 90-1607, 91-0118, 94-0484, 94-0671, p. 5-54)*	**MEETS CRITERION:** 4."The following mitigation is recommended to minimize potential impacts to Swainson's hawk, burrowing owl and other species. The measures listed below are related to the aforementioned species only. d. The post-reclamation agricultural areas shall be planted only with crops that are suitable for Swainson's hawk foraging; these crops shall be approved by the CDFG." *(Morrison Creek Mining Reach Downstream of Jackson Highway FEIR/FEIS, Control Numbers 90-1607, 91-0118, 94-0484, 94-0671, p. 5-61)*	**MEETS CRITERION:** Reclamation Plan does not identify post-reclamation land uses. However the Project Use Permit requires the mining project proponents prepare a plan for the preservation and salvage of topsoil resources suitable for sustaining economically viable agriculture uses (Aspen III South Use Permit (94-UPB-0484), Condition 47; Aspen IV South Use Permit (90-CZB-UPB-1607), Condition 49, Aspen V South Use Permit (94-CZB-UPB-0671), Condition 42.

Table 8-6 Swainson's Hawk Habitat Mitigation Acres in Mining Projects After Reclamation

Mining Project	Acreage	Acres with Habitat Value	Compensatory Mitigation Acres[1]
District 1			
Aspen III South	106.5	106.5	106.5
Aspen IV South	179.6	179.6	179.6
Aspen V South	230.4	230.4	230.4
Aspen V and Va	169.8	169.8	169.8
Aspen VI	703.1	672.0	672.0
Total	**1389.5**	**1,358.4**	**1,358.4**
District 2			
Granite 1	294.0	294.0	294.0
Vineyard 1	363.0	363.0	363.0
Total	**657.0**	**657.0**	**657.0**
Grand Total	**2,046.5**	**2,015.4**	**2,015.4**

Notes: 1 Compensatory mitigation acres depends on Post-Reclamation Plan requirements.

There is one additional mining project that does not meet either methodology. The newest mining project, Aspen VIII/IX, has already mitigated the permanent conversion of a total of 355 acres of Swainson's hawk foraging habitat; further mitigation is not required for these properties.

SUMMARY

The WJHMP area is within 10 miles of recorded nesting sites. A large portion of the WJHMP area currently provides habitat for the Swainson's hawk foraging and mining reclamation plans are required to provide additional foraging habitat. Sacramento County analysis of remaining farmland types and SSHCP cover types that provide suitable Swainson's hawk foraging habitat shows a total 1,804.17 acres affected by the project that will be required to obtain compensatory mitigation to offset the loss of foraging habitat.

Table 8-7 Summary of Swainson's Hawk Foraging Habitat in the WJHMP Area

Location	Total Acreage
SSHCP mapped area outside of previously mined sites	1,804
Restoration area within the previously mined sites	2,015
Total foraging habitat lost	3,819

Source: Compiled by Ascent in 2024

Construction activities during the breeding season (defined as March 1—September 15 for Swainson's hawk) near active nest trees could disturb Swainson's hawks or other raptors if they are nesting nearby. Construction disturbance could result in nest abandonment, failure, and/or mortality of chicks or eggs. Other Swainson's hawk and other raptor nests located near construction activities could also be disturbed or fail as a result of project construction during the breeding season.

Development of the WJHMP area would result in substantial loss of Swainson's hawk foraging habitat. This loss would contribute to the ongoing decline of valuable habitat in the Sacramento Valley, affecting a species already listed as threatened under CESA. The conversion of cropland, irrigated pasture-grassland, valley grassland, vernal pool, seasonal wetland, and swale to other uses would substantially reduce available foraging habitat for locally nesting Swainson's hawks. This, in turn, may lead to displacement of nesting pairs, reduced reproductive potential, and decreased survival rates. The impact extends not only to Swainson's hawks nesting in the vicinity of the WJHMP area but also those nesting within 10 miles. This would be a significant impact.

Mitigation Measures BR-1a and BR-1b would require that the Project Applicants or subsequent developers conduct site-specific habitat surveys and participate in the SSHCP, including implementation of all applicable AMMs, such as SWHA-1 (Swainson's Hawk Surveys), SWHA-2 (Swainson's Hawk Pre-Construction Surveys), SWHA-3 (Swainson's Hawk Nest Buffer), SWHA-4 (Swainson's Hawk Nest Buffer Monitoring), and SWHA-5 (Swainson's Hawk Nest Tree Avoidance). Implementation of Mitigation Measure BR-1a and BR-1b would reduce impacts on Swainson's hawk, because Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b requires participation in the SSHCP, and payment of in lieu fees for impacts to waters and terrestrial habitats which would result in preservation of Swainson's hawk foraging habitat in a coordinated and interconnected SSHCP reserve system that considers the species' requirements at a regional scale rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. Implementation of SSHCP AMMs would help avoid or minimize potential effects from construction on Swainson's hawk by requiring pre-construction surveys, implementation of nest buffers, nest buffer monitoring during construction, and Swainson's hawk nest tree avoidance. The impact of the project on Swainson's hawk would therefore be reduced to **less than significant with mitigation**.

Burrowing Owl

The burrowing owl is a California species of special concern. On March 5, 2024, the California Fish and Game Commission (Commission) received a petition to list burrowing owl as a threatened or endangered species under CESA (Fish and Game Commission 2024). The evaluation of the petition is still pending. Burrowing owl habitat can be found in annual and perennial grasslands, deserts, and arid scrublands characterized by low-growing vegetation (Zarn 1974). Suitable owl habitat may also include trees and shrubs if the canopy covers less than 30 percent of the ground surface. Burrows are an essential component of burrowing owl habitat. Both natural and

artificial burrows provide protection, shelter, and nesting habitat for burrowing owls (Henny and Blus 1981). Burrowing owls typically use burrows made by fossorial mammals, such as ground squirrels or badgers, but also use human-created structures such as cement culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement.

Burrowing owls may use a site for breeding, wintering, foraging, and/or migration stopovers. Breeding season takes place from February 1 to August 31 and wintering takes place from September 1 to January 31. Occupancy of burrowing owl habitat can be verified at a site by detecting a burrowing owl, its molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance. Burrowing owls exhibit high site fidelity, reusing burrows year after year (Rich 1984).

The annual grasslands, croplands, and restored agriculture lands within the WJHMP area provide habitats suitable for burrowing owl foraging, nesting, and wintering. There is one recorded CNDDB occurrence (#487) of this species within the WJHMP area. This occurrence was documented southwest of Mather Airport in the Granite I, Aspen V, and Aspen VI mining sites north of Jackson Road and between Bradshaw Road and Excelsior Road. There are more recent observations of burrowing owl just east of the WJHMP area (CNDDB 2024).

The potential presence of burrowing owls cannot be ruled out without protocol-level surveys. During site grading and other ground disturbances that destroy occupied burrows or nest sites, adults, eggs, and juveniles could be killed. Burrowing owls are highly dependent on burrows for survival, and displacing individuals from their burrows can have indirect impacts. These include predation risk, increased energetic costs, heightened stress, and the need to find and compete for new burrows—factors that may lead to reduced reproduction or mortality. Additionally, construction disturbances might cause nearby nesting pairs to abandon their nests, resulting in mortality of chicks and eggs. The loss of occupied burrowing owl habitat or the mortality of adults, chicks, or eggs would constitute a potentially significant impact.

The Project Applicants or subsequent developers would implement Mitigation Measures BR-1a and BR-1b which require site-specific biological resource assessments and participation in the SSHCP. To obtain coverage under the SSHCP developers would be required to and comply with the AMMs as described in the SSHCP including WBO-1 (Western Burrowing Owl Surveys), WBO-2 (Western Burrowing Owl Pre-Construction Surveys),WBO-3 (Burrowing Owl Avoidance), WBO-4 (Burrowing Owl Construction Monitoring), WBO-5 (Burrowing Owl Passive Relocation), WBO-6 (Burrowing Owl Timing of Maintenance Activities), and WBO-7 (Rodent Control). Implementation of Mitigation Measure BR-1a would require project-level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP and payment of in lieu fees for impacts to waters and terrestrial habitats which would result in preservation of burrowing owl nesting and foraging habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale, rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. Implementation of

SSHCP species specific AMMs would ensure that burrowing owls surveys are conducted, avoidance measures and construction monitoring are implemented and active nests are not disturbed during the nesting season. The impact of the project on burrowing owl would therefore be reduced to **less than significant with mitigation**.

Cooper's Hawk

According to the SSHCP's Species Accounts, the Cooper's hawk uses a variety of woodland and forest habitats within its range. In California's Central Valley and adjacent foothills, this species is associated strongly with live oak woodland (County of Sacramento et al. 2018). The Cooper's hawk can also breed in urban and suburban areas. Urban nest sites include isolated trees that are in proximity to residential houses. Using concealment, Cooper's hawks use a series of surprise attacks to catch their prey. There is no published regulatory guidance on mitigation of foraging habitat for this species.

There are no recorded CNDDB occurrences of Cooper's hawks within the WJHMP area. This species was removed from California's species of special concern list in 2008, but it is still tracked in the CNDDB. This species has been observed in the vicinity of the constructed marsh on the Granite I and Aspen VI mining sites (Madrone 2018). The WJHMP area does have riparian woodlands and adjacent annual grasslands that can provide suitable nesting and foraging habitats, respectively.

Existing riparian woodlands, which are the main nesting habitat for this species, would be preserved as open space within the WJHMP area. The project would result in loss of grassland, which is a foraging habitat for the Cooper's hawk.

Project construction could remove or disturb active nests of Cooper's hawk potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. Loss of chicks and eggs of this species could reduce local population levels and contribute to a trend toward this species being added back to the California species of special concern list in the future, which would be a potentially significant impact. This seems unlikely, however, since Cooper's hawk population numbers have rebounded across the state and nationwide since the late 1990s to mid-2000s, and it appears to have adapted quite well to urban living.

However, the project is a Covered Activity and coverage under the SSHCP would be required. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP and payment of in lieu fees for impacts to waters and terrestrial habitats, as well as implementation of AMMs as described in the SSHCP including RAPTOR-1 (Raptor Surveys), RAPTOR-2 (Raptor Pre-Construction Surveys), RAPTOR-3 (Raptor Nest/Roost Buffer), and RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring). This mitigation would reduce impacts on Cooper's hawk because participation in the SSHCP would result in preservation of nesting and foraging habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term The impact of the project on Cooper's hawk would be reduced to **less than significant with mitigation**.

Northern Harrier

Northern harrier is a species of special concern. This species is a year-round resident of the Central Valley. However, it occurs more broadly and in much greater numbers during migration and winter than during the breeding season. Northern harriers breed and forage in a variety of open (treeless) habitats that provide adequate vegetative cover, an abundance of suitable prey, and scattered hunting, plucking, and lookout perches. In the WJHMP area such habitats include weedy borders of streams, annual grassland (including those with vernal pools), weed fields, and ungrazed or lightly grazed pastures. Harriers are ground nesters, mostly within patches of dense, often tall, vegetation in undisturbed areas (Shuford et al. 2008).

Portions of the WJHMP area fall within SSHCP foraging and nesting modeled habitat. Although there are no recorded nesting occurrences of northern harriers in the CNDDB, iNaturalist has a few observations of foraging northern harriers east of the WJHMP area.

The project would potentially remove both modeled breeding and foraging habitat for northern harrier through habitat conversion. Due to ongoing disturbance at the WJHMP area, the plan area likely provides marginal breeding habitat. The analysis of loss of Swainson's hawk foraging habitat would apply to northern harrier and the mitigation for loss of Swainson's hawk foraging habitat would ensure that impacts to northern harrier are also addressed. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP and payment of in lieu fees for impacts to waters and terrestrial habitats. Implementation of AMMs described in the SSHCP, including RAPTOR-1 (Raptor Surveys), RAPTOR-2 (Raptor Pre-Construction Surveys), RAPTOR-3 (Raptor Nest/Roost Buffer), and RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring), would reduce impacts on northern harrier, because participation in the SSHCP would result in preservation of nesting and foraging habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term The impact of the project on northern harrier would be reduced to **less than significant with mitigation**.

White-Tailed Kite

White-tailed kite is a CDFW fully protected species. This species is a yearlong resident in valley lowlands and it is rarely found away from agricultural areas. Its nests are placed near the top of dense oak, willow, or other tree stand; usually 20-100 feet above ground. The nest is located near an open foraging area. Typical nests and roost are found in groves of dense, broad-leafed deciduous trees. This species seldom hunts more than 0.5 mile from nest when breeding (Zeiner et al. 1990).

Portions of the WJHMP area fall within SSHCP foraging modeled habitat. This species has been observed within Aspen VIII and Aspen IX (Madrone 2018), and the CNDDB records include one presumed extant occurrence of nesting within the WJHMP area near the west side of Aspen VIX. The larger trees within the WJHMP area provide suitable nesting habitat while the open areas, including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands provide suitable foraging habitat (Madrone 2018).

The project would potentially remove both trees potentially used for nesting and foraging habitat for white-tailed kite through habitat conversion. Construction activities may impact nesting white-tailed kites if they nest in the WJHMP area. Construction activities may also disturb raptor nests that occur within 500 feet of the WJHMP area. Project construction could remove or disturb active nests, potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. Destruction of any raptor nest is a violation of MBTA and Section 3503.5 of the California Fish and Game Code and white-tailed kite is also a fully protected species.

The project is a Covered Activity and coverage under the SSHCP will be required. Implementing Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP and payment of in lieu fees for impacts to waters and terrestrial habitats. Implementation of AMMs including RAPTOR-1 (Raptor Surveys), RAPTOR-2 (Raptor Pre-Construction Surveys), RAPTOR-3 (Raptor Nest/Roost Buffer), and RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring), as described in the SSHCP, would reduce impacts on white-tailed kite. Participation in the SSHCP would result in preservation of foraging habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale, rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. The SSHCP RAPTOR AMMs would also require pre-construction surveys for nesting raptors, implementation of no-disturbance buffers around active nests, and construction nesting monitoring if needed. The impact of the project on white-tailed kite would therefore be reduced to **less than significant with mitigation**.

Ferruginous Hawk

According to the CDFW life history account for the ferruginous hawk, the species is an uncommon winter resident and migrant at lower elevations and open grasslands in the Central Valley. The species requires large, open tracts of grasslands, sparse shrub cover, or desert habitats with elevated structures for nesting. This species does not breed in California and is a migratory, seasonal visitor that generally arrives in California in September and departs by mid-April (Zeiner et al. 1990).

The project would remove winter foraging habitat for Ferruginous hawk through habitat conversion. The analysis of loss of Swainson's hawk foraging habitat would also apply to Ferruginous hawk, and the mitigation for loss of Swainson's hawk foraging habitat would ensure that impacts to foraging habitat for Ferruginous hawk are also addressed. Loss of foraging habitat in the WJHMP area would not be expected to result in a substantial adverse effect on this species because other existing and planned preserves and open grassland habitat in the vicinity would continue to provide adequate foraging habitat to support local population numbers and individuals would not be permanently displaced from the area. Thus, the project would have a **less-than-significant** impact **with mitigation** on ferruginous hawk.

Golden Eagle

The golden eagle is a Fully Protected species under California Fish and Game Code. According to the CDFW life history account for the golden eagle, the species is an uncommon permanent resident migrant throughout California, but it is not known to nest in the Central Valley. The species uses rolling foothills and mountain terrain, wide arid plateaus deeply cut by streams and canyons, open mountain slopes, and cliffs and rock outcrops – features that are not present in the Central Valley (Zeiner et al. 1990). There is one historical observation of wintering golden eagles in the WJHMP area, southwest of Mather Airport, between Kiefer Blvd, Bradshaw Road, Jackson Road and Excelsior Road (Madrone 2018) and there are three more recent observations east of the WJHMP area (iNaturalist 2024a). The WJHMP area has annual grasslands, croplands, and restored agricultural lands which could provide suitable foraging habitat for the golden eagle.

The project would remove foraging habitat for the species. The loss of foraging habitat from the WJHMP area would not be expected to result in a substantial adverse effect on this species because other existing and planned preserves and open grassland habitat in the vicinity would continue to provide adequate foraging habitat to transient golden eagles and individuals would not be permanently displaced from the area. The provisions of the SSHCP and the conservation strategy would still be applicable and would still benefit golden eagle, even though it is not a covered species. The project would have a **less-than-significant** impact on golden eagle.

Nesting Raptors

Raptors are defined as members of the order Falconiformes (vultures, eagles, hawks, and falcons) and the order Strigiformes (owls). Common species of raptors found locally include red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), American kestrel (*Falco sparverius*), barn owl (*Tyto alba*), and great horned owl (*Bubo virginianus*). The SSHCP includes loggerhead shrike within the covered raptor species; therefore, AMMs for covered raptors applies to loggerhead shrike.

Raptors and their active nests are protected by the California Fish and Game Code Sections 3503.5, 3511, and 3513. The Code states the following: “It is unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird.” Because most raptors migrate they are also protected by the federal MBTA, which states, “unless and except as permitted by regulations, it shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture, or kill” a migratory bird. As defined in Section 3(18) of the ESA, the term “take” means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Causing a bird to abandon an active nest may cause harm to egg(s) or chick(s) and is therefore considered “take.”

The WJHMP area contains large areas of open annual grassland. Mature trees of sufficient size to support tree-nesting raptors are located along Morrison Creek near Bradshaw Road. Some hawk species less susceptible to human disturbance may use these trees. Raptors, in general, build nests in large mature trees; though there are some ground-nesting species such as the burrowing owl (refer to species-specific discussions, below) and northern harrier.

The WJHMP area provides suitable nesting habitat for many common raptors and other common nesting birds. Construction activities may impact nesting raptors if they occur in the WJHMP area. Construction activities may also disturb raptor nests that occur within 500 feet of the WJHMP area. Project construction could remove or disturb active nests, potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. While loss of nests of common raptor species (e.g., red-tailed hawk, American kestrel, and barn owl) would not be considered a significant impact because it would not result in a substantial effect on their populations locally or regionally, cause any population to drop below self-sustaining levels, or result in a trend toward these species being listed as threatened or endangered, destruction of any raptor nest is a violation of MBTA and Section 3503.5 of the California Fish and Game Code.

However, the project is a Covered Activity and coverage under the SSHCP will be required. Implementing Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP and payment of in lieu fees for impacts to waters and terrestrial habitats, and compliance with the plan policies and requirements. Participation in the SSHCP would result in preservation of foraging habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale, rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. Mitigation Measure BR-3 would also require pre-construction surveys for common nesting birds (including common raptors), implementation of no-disturbance buffers around active nests and construction nesting monitoring if needed. The impact of the project on common nesting raptors would therefore be reduced to **less than significant with mitigation**.

Common Nesting Birds

Vegetation removal and ground disturbances associated with implementation of the project would result in direct destruction of nests of birds protected under the MBTA and California Fish and Game Code Section 3503. Project construction would also result in disturbance of breeding birds causing nest abandonment by the adults and mortality of chicks and eggs. While loss of some nests of common migratory bird species (e.g., killdeer, house finch, mourning dove, American robin, and California scrub jay) would not be considered a significant impact because it would not result in a substantial effect on their populations locally or regionally, destruction of any migratory bird nest is a violation of the MBTA and Section 3503.5 of the California Fish and Game Code.

Mitigation Measure BR-3 would require preconstruction surveys to identify active nests and measures to avoid or minimize disturbances of active nests so that project construction would not result in nest abandonment and loss of eggs or young. The impact of the project on common nesting birds would therefore be reduced to **less than significant with mitigation**.

Tricolored Blackbird

The tricolored blackbird is state listed as threatened and is currently in decline throughout the state. According to the CDFW life history account for the tricolored

blackbird, the species is mostly a resident in California, and common locally throughout the Central Valley. The species is a colonial nester which breeds near fresh water, preferably in emergent wetland with tall, dense cattails or tules, but also in thickets of willow, blackberry, wild rose, and tall herbs. Nesting colonies usually support a minimum of 50 pairs. The species feeds in grassland and cropland habitats. The usual breeding season is mid-April to late July.

According to the CNDDB data, there have been at least 10 presumed extant occurrences of nesting colonies of tricolored blackbirds scattered throughout the WJHMP area in Granite 1, Aspen IV, Aspen V South, Aspens VI through IX, and FPA-C (CNDDB occurrences #177, #305-6, #349, #390, #483, #485, #499, #500 and #743). There were also four nesting colonies observed in the eastern portion of Aspen VIII in 2013-14 (Madrone 2018).

Both foraging and nesting habitats of the tricolored blackbird exist throughout the WJHMP area. Increased noise and human activity during construction that occurs during the breeding season (generally March through August) could disturb nesting tricolored blackbirds if an active colony is located near (within 0.25 mile) of the construction area. These activities could result in nest abandonment and the incidental loss of fertile eggs or nestlings. The loss of foraging habitat from the WJHMP area would not be expected to result in a loss of reproductive success for a nesting colony because the proposed preserve and other existing and planned preserves in the vicinity would continue to provide adequate foraging habitat to support the local population and nesting colonies would not be displaced due to this loss of foraging habitat, but project construction could cause nest abandonment if a colony is nesting within the WJHMP area. Abandonment of active tricolored blackbird colonies and associated loss of numerous nests containing eggs or young could result in a substantial decline in the local nesting population of tricolored blackbirds and contribute to the statewide decline of this species that has recently been listed as threatened by the California Fish and Game Commission because of rapid declines in population numbers and substantial widespread habitat loss.

However, the project is a Covered Activity and coverage under the SSHCP will be required. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP, payment of in lieu fees for impacts to waters and terrestrial habitats, and compliance with the plan policies and requirements, as well as implementation of SSHCP species specific AMMs, including TCB-1 (Tricolored Blackbird Surveys), TCB-2 (Tricolored Blackbird Pre-Construction Surveys), TCB-3 (Tricolored Blackbird Nest Buffer), TCB-4 (Tricolored Blackbird Nest Buffer Monitoring), and TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves). This mitigation would reduce impacts on tricolored blackbird. Participation in the SSHCP would result in preservation of foraging habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale rather than, project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. The SSHCP AMMs would also require surveys for tricolored blackbird, pre-construction surveys for tricolored blackbird, implementation of

no-disturbance buffers around active nests, and construction nesting monitoring throughout the nesting season, and also addresses timing of pesticide use and harvest timing on Agricultural Preserves. The impact of the project on tricolored blackbird would therefore be reduced to **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measures BR-1a and BR-1b.

MITIGATION MEASURE BR-3: COMMON BIRD (INCLUDING RAPTORS) NESTING SURVEYS AND ACTIVE NEST AVOIDANCE

Tree removal and tree trimming activities shall be confined between September 1 and the end of February. If tree removal or tree trimming occurs between November 15 and the end of February, a pre-activity survey for nesting great-horned owl shall take place as they tend to start nesting in mid-November in our region.

To minimize potential loss or disturbance of raptors and active common bird nests, project activities, including removal of ground vegetation, shall occur during the non-breeding season. If all suitable nesting habitat is removed during the non-breeding season, no further mitigation is required.

If it is not feasible to remove vegetation prior to the breeding season (March 1-August 31), the project proponent will retain a qualified biologist to conduct pre-activity surveys for nesting birds on and within 500 feet of disturbance activities. The surveys will be conducted no more than 7 days before ground disturbance activities commence (including vegetation removal).

If active bird nests are found, the qualified biologist shall establish buffers around nests that are sufficient to ensure that breeding is not likely to be disrupted or adversely affected by construction. Buffers around active common bird nests will be a minimum of 50 feet. Buffers around raptor nests, besides Swainson's hawk, will be a minimum of 500 feet, unless the qualified biologist determines that smaller buffers would be sufficient or greater buffers are needed to avoid impacts to nesting birds.

Factors to be considered for determining buffer size will include: the presence of natural buffers provided by vegetation or topography; nest height; locations of foraging territory; and baseline levels of noise and human activity. Buffers will be maintained until young have fledged or the nests become inactive.

IMPACT BR-4: HAVE A SUBSTANTIAL ADVERSE EFFECT ON SPECIAL-STATUS REPTILES

WESTERN POND TURTLE

The western pond turtle is a California species of special concern and proposed threatened under the ESA (USFWS 2023). Western pond turtle is an aquatic turtle that usually leaves the aquatic site to reproduce, to aestivate, or to overwinter. Western pond turtles require some slack- or slow-water aquatic habitat. High-gradient streams

with minimal cover or basking habitat are not suitable. In pond environments, the species typically only leaves the water to reproduce, whereas in stream environments, the turtles more commonly leave the water to aestivate or overwinter in addition to leaving for reproduction. Western pond turtles leave the water to overwinter in October or November, and typically become active in March or April. Mating typically occurs in late-April or early-May but may occur year-round. Most egg laying occurs in May or June but may occur as early as April or as late as August. The hatchlings remain in the nest over the winter, and emerge in the spring. Suitable nesting locations have dry soils (usually in a substrate with a high clay or silt fraction) on a slope that is unshaded and may be at least partially south-facing. The nest site can be up to 1,640 feet from the aquatic habitat, but it is more typical for the nest to be within 650 feet of aquatic habitat.

According to the information presented in the Biological Resource Assessment prepared for the project, there is one known CNDDB occurrence (#433) of western pond turtle within the WJHMP area, in Morrison Creek. Suitable aquatic and upland habitat within the WJHMP area includes ponds, industrial ponds, channels, and some of the ditches and the upland areas surrounding these aquatic habitats.

Construction activities would result in grading of uplands surrounding aquatic habitats that would potentially crush or bury western pond turtle or their nests, which would result in mortality of individual turtles and loss of reproduction should western pond turtles be present and nesting onsite. The loss of aquatic habitat and nests of western pond turtle due to construction activities would further reduce the population of this species in the region.

The project is a Covered Activity and coverage under the SSHCP would be required. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP, payment of in lieu fees for impacts to waters and terrestrial habitats, and compliance with plan policies and requirements, as well as implementation of SSHCP AMMs, including WPT-1 (Western Pond Turtle Surveys), WPT-2 (Western Pond Turtle Work Window), WPT-3 (Western Pond Turtle Monitoring), WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion, WPT-5 (Avoid Western Pond Turtle Entrapment), WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat), WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit), WPT-8 (Western Pond Turtle Encounter Protocol), and WPT-9 (Western Pond Turtle Post-Construction Restoration) would reduce impacts on western pond turtle. Participation in the SSHCP would result in preservation of aquatic and upland habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale, rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. The SSHCP WPT AMMs also require surveys to identify and avoid western pond turtle habitat, provide work windows for work within western pond turtle habitat, require monitoring during work, and provide aquatic habitat work guidelines, entrapment avoidance, speed limit within upland habitat for western pond turtle, encounter protocol, and requirements for post-construction restoration. Implementation of Mitigation Measures BR-1a and BR-1b would reduce potential impacts on western pond turtle to **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measures BR-1a and BR-1b.

IMPACT BR-5: HAVE A SUBSTANTIAL ADVERSE EFFECT ON SPECIAL-STATUS AMPHIBIANS

WESTERN SPADEFOOT

The western spadefoot is a California species of special concern. This species occurs in shallow, seasonal wetlands, typically vernal pools, in valley and foothill habitats such as grasslands, open chaparral, sage scrubland, short-grass plains, and pine woodlands. Western spadefoot occurs in both grazed and ungrazed habitats. Adult spadefoots occupy burrows up to 3 feet in depth in upland habitat during dry periods to avoid desiccation (Zeiner et al. 1990). Individuals may remain in these burrows for eight to nine months. Most surface activity is nocturnal. The spadefoot leave their upland burrows for seasonal wetlands or vernal pools during the breeding season, which lasts from January to August, depending on rainfall. It appears that vernal pools and other temporary wetlands may be optimal for breeding due to the absence or reduced abundance of both native and nonnative predators (bullfrogs, fish, and crawfish), many of which require more permanent water sources. Current research on amphibian conservation suggests that average upland habitat utilization falls within 1,200 feet of aquatic habitats (USFWS 2005).

The WJHMP area provides suitable breeding and non-breeding habitat to support western spadefoot. Wetland and vernal pool complexes within the WJHMP area vary in size and depth and some retain water for several months. The surrounding upland area is annual grassland. There is no published regulatory guidance on habitat mitigation for this species. According to the Vernal Pool Recovery Plan (USFWS 2005), the western spadefoot was added as a Species of Concern in 2004 by CDFW and was proposed as threatened by USFWS in 2024.

The project would result in the loss of vernal pool and surrounding upland habitat, and construction activities within the WJHMP area could result in the crushing of individual western spadefoots, the disruption of reproduction, and loss of eggs or tadpoles.

In addition to the direct removal of habitat and loss of individuals, implementation of the project could result in indirect impacts on western spadefoot as well. Potential indirect effects on individuals may include mortality related to an increase in vehicular traffic; mortality from landscaping maintenance activities including mowing, raking, weed whacking; noise and vibration disturbance causing toads to break dormancy; and exposure to herbicides, pesticides, and other toxins. Indirect effects on western spadefoot habitat retained in the WJHMP area open space areas could result in habitat degradation leading to lower reproductive success of western spadefoot, and eventual elimination of this species from the affected habitat. These indirect effects could include reduction in water quality and altered hydrology, litter and dumping, predation by domestic animals (e.g., cats), and introduction of invasive plant species.

Direct and indirect effects could reduce local population numbers of a species that is rare in the region and statewide and has already experienced substantial declines and ongoing habitat losses. Loss and degradation of habitat and reduction in population numbers could contribute to a trend toward state or federal listing for western spadefoot.

The project is a Covered Activity and participation in the SSHCP will be required. Implementation of Mitigation Measure BR-1a, Mitigation Measure BR-1b, and implementation of SSHCP AMMs, including WS-1 (Western Spadefoot Work Window), WS-2 (Western Spadefoot Exclusion Fencing), WS-3 (Western Spadefoot Monitoring), WS-4 (Avoid Western Spadefoot Entrapment), WS-5 (Erosion Control Materials in Western Spadefoot Habitat), and WS-6 (Western Spadefoot Encounter Protocol) would reduce impacts on western spadefoot to. Participation in the SSHCP would result in preservation of aquatic and upland habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale, rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. The SSHCP WS AMMs provide work windows for work within modeled western spadefoot habitat, exclusion fencing requirements, monitoring during work, entrapment avoidance, erosion control material requirements, and encounter protocol requirements. Implementation of Mitigation Measures BR-1a and BR-1b would reduce the impact on western spadefoot to **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measures BR-1a and BR-1b.

IMPACT BR-6: HAVE A SUBSTANTIAL ADVERSE EFFECT ON SPECIAL-STATUS INVERTEBRATES

Midvalley fairy shrimp, vernal pool fairy shrimp, and vernal pool tadpole shrimp are known to occur in the WJHMP area. Ricksecker's water scavenger beetle, valley elderberry longhorn beetle, and Crotch's bumble bee have a high potential to exist within the WJHMP area. Midvalley fairy shrimp, vernal pool fairy shrimp, vernal pool tadpole shrimp, and Ricksecker's water scavenger beetle are associated with vernal pool and wetland environments and are not readily observed through casual observation. Discussion of midvalley fairy shrimp, vernal pool fairy shrimp, and vernal pool tadpole shrimp is presented under "Vernal Pool Crustaceans," below, because the same mitigation requirements are applied to all three species. Ricksecker's water scavenger beetle, valley elderberry longhorn beetle, and Crotch's bumble bee are discussed separately.

VERNAL POOL CRUSTACEANS

Vernal pool habitats may be subject to either direct or indirect impacts. Indirect impacts may be caused because development in proximity of a vernal pool could deliver runoff polluted with urban contaminants and introduce non-native species associated with development landscaping. Development may also reduce the size of the watershed that supports the vernal pool, by diverting runoff that once went into the vernal pool into a

storm drainage system. This watershed reduction could cause a reduction in the depth and/or duration of ponding. Shorter inundation durations may mean a change in pool temperature, depth, and pH. Features that may have been utilized by species that required specific inundation durations for the completion of breeding cycles may no longer provide suitable habitat. The SSHCP assumes all modeled habitat to be potential habitat for vernal pool crustaceans, including vernal pools, seasonal wetlands and swales. The programmatic consultation indicates that all habitats within 250 feet of proposed development may be subject to indirect impacts. The same approach is used to assess onsite indirect impacts to vernal pools within the SSHCP. Thus, all development must occur a minimum of 250 feet from the margin of any vernal pool in order to achieve total avoidance of impacts, unless a lesser buffer is approved by USFWS. Indirect impacts to preserves are calculated using a modeled watershed approach under the SSHCP. The project is not expected to impact existing or known proposed SSHCP preserves.

The SSHCP permit strategy relies on the USFWS biological opinion (BO) that includes all future SSHCP covered activities requiring a CWA 404 permit, eliminating the need for individual project-by-project consultations under ESA Section 7. Compensatory mitigation for the loss of vernal pool habitat is satisfied through the SSHCP by purchasing credits from the South Sacramento (in-lieu fee) ILF Program. The ILF program was established compliant with the 2008 federal mitigation rule (33 CFR Part 332), and is fully synergized with the SSHCP's fees for the applicable land cover type (e.g., vernal pools). The ILF program utilizes the compensatory mitigation ratio requirements for aquatic resources required by the SSHCP, which consist of a 1:1 ratio of re-establishment/establishment (i.e., net gain) with respect to loss, for all potential waters of the United States. In addition to the ILF program, the SSHCP mitigation fees provide funding for habitat preservation to mitigate (1:1) for direct and/or indirect impacts to SSHCP covered species habitat.

Approximately 6.4 acres of the WJHMP area is within a section of the Mather Core Area of the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005). This area is within a previously disturbed mining area, and rural residential area with annual grassland. No surveys have been conducted within the rural residential area that still supports annual grassland to assess if there is suitable habitat for vernal pool crustaceans.

Historical surveys for vernal pool crustaceans have been conducted within participating properties. Gibson & Skordal conducted protocol vernal pool crustaceans surveys during the 2009-2010 and 2010-2011 wet seasons in the following areas: the eastern part of Aspen III, Aspen V South (North Parcel), Aspen VII South, and Mayhew. These areas were evaluated because they had either been undisturbed by past mining activities, or in the case of the Mayhew property, there had been a lack of long-term maintenance. Vernal pool tadpole shrimp and vernal pool fairy shrimp were observed within the Aspen VII South Study Area during both sampling seasons. No target vernal pool crustaceans were observed within the remaining properties surveyed during the 2009 to 2011 efforts.

Because there are large areas of natural and constructed vernal pools within the WJHMP area, numerous CNDDB occurrences have been recorded. There have been five occurrences of vernal pool fairy shrimp, six occurrences of vernal pool tadpole shrimp, and two occurrences of midvalley fairy shrimp. Additionally, vernal pool tadpole shrimp were observed in a vernal pool near SR 16 within the Aspen VII Study Area during plant surveys in 2008 conducted by Gibson & Skordal. EcoAnalysts, Inc. also performed surveys on Aspen IX in 2006 and Aspen V, Aspen V South, and Aspen IV South in 2008; Vernal pool tadpole shrimp and vernal pool fairy shrimp were present within the Aspen IX survey area; vernal pool tadpole shrimp and vernal pool fairy shrimp were observed within the Aspen V and Aspen V South study areas. No vernal pool crustaceans surveys have been conducted within non-participating parcels and, thus, it is possible for suitable habitat and listed vernal pool crustaceans to be present.

The Biological Resource Assessment (Madrone 2018) for the project noted that vernal pool branchiopods have been documented in the area, and there is moderate potential for species to occur onsite. The SSHCP base-mapping efforts indicate vernal pools and seasonal wetlands are present onsite, which provide potential habitat for vernal pool crustacean species. The project site is estimated to support approximately 59 acres of aquatic resources suitable for vernal pool crustaceans that the project would directly impact. Final acreages of vernal pool habitat would be determined during the SSHCP permitting process.

Wetland and water features on and off-site may provide potential habitat for vernal pool crustaceans, and known records for vernal pool species occur in the plan area and vicinity. The protocol under the SSHCP assumes that the delineated onsite and offsite wetlands may be vernal pool habitat and potentially contain special status vernal pool crustaceans, even if there are no documented occurrences in the waters.

The project is a Covered Activity and coverage under the SSHCP would be required. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP and payment of in lieu fees for impacts to waters and terrestrial habitats. Implementation of Mitigation Measures BR-1a and BR-1b would reduce potential impacts on vernal pool crustaceans to **less than significant with mitigation**.

Ricksecker's Water Scavenger Beetle

The Ricksecker's water scavenger beetle is an aquatic beetle that lives in weedy, shallow, open water, associated freshwater seeps, springs, farm ponds, vernal pools, and slow-moving stream habitats. The USFWS species profile[4] only contains listing status and a general map, as little is known about the life history of the species. It is listed primarily due to its association with in-decline habitats, rather than based on known population trends. The beetle is known to co-occur with vernal pool fairy shrimp. There are no recorded occurrences of Ricksecker's water scavenger beetle in the

[4] http://ecos.fws.gov/speciesProfile/profile/speciesProfile.action?spcode=I0FE.

WJHMP area. However, because there is suitable habitat within the WJHMP area and there is a CNDDB recorded occurrence (#5) nearby at Mather Airport, this species is likely to occur in the WJHMP area.

Since population trends have not been well established, it is unclear to what extent the species relies on the rarer vernal pool and seasonal wetland habitats versus more abundant surface water types. For the purposes of this analysis, it is assumed that local populations of the species have at least some dependency on vernal pool and seasonal wetland habitats, since this is the more conservative assumption and the WJHMP area is within an area described as vital for the conservation of vernal pool habitats.

The project is a Covered Activity under the SSHCP and coverage under the SSHCP would be required. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP, including payment of in lieu fees for impacts to waters and terrestrial habitats. Compliance with the plan policies and requirements of the SSHCP would reduce impacts on Ricksecker's water scavenger beetle to **less than significant with mitigation** because participation in the SSHCP would result in preservation of aquatic and upland habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale rather than, project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term.

Valley Elderberry Longhorn Beetle

The valley elderberry longhorn beetle is federally listed as threatened. This species can be found in the Central Valley and adjacent foothills, below 500 feet elevation, and is associated with blue elderberry shrubs (*Sambucus mexicana*), where it spends its entire life cycle. The beetle's life is comprised of four stages; egg, larva, pupa, and adult. The eggs are deposited in the bark of an elderberry shrub and after hatching, the larvae burrow into the stems where they may remain for as long as 2 years before continuing the last two stages of their life cycle (Madrone 2018). This species often occurs within or near riparian corridors comprised of blue elderberry, willow (*Salix* spp.), cottonwood (*Populus fremontii* ssp. *fremontii*), wild grape (*Vitis californica*), and box elder.

The range of the valley elderberry longhorn beetle has diminished greatly due to the removal of 90 percent of riparian forests in the Central Valley for agriculture and urban development. Extensive use of pesticides, grazing, and other mismanagement has degraded much of the riparian habitat that remains. Besides habitat removal and degradation, the beetle has limited dispersal capabilities. All of these factors have contributed to the species' current limited habitat range comprising scattered areas in the Central Valley (Barr 1991; Madrone 2018).

There are no known CNDDB occurrences of valley elderberry longhorn beetle within the WJHMP area but there are thirty recorded occurrences within 10 miles of the WJHMP area. The closest occurrence (#282) is approximately 2 miles to the north along the American River. The riparian forest along the Morrison Creek corridor could provide habitat for elderberry shrubs and associated valley elderberry longhorn beetles. The beetle also has been known to occur outside of riparian corridors.

Although historical surveys have been conducted in different parcels, these surveys took place in 2006 for Aspen IV South parcel, 2010 for District 1 Participating Properties: Aspen II, Aspen III, Aspen III South, the northern Aspen V parcel, portions of Aspen V South, Aspen VII, Aspen VII South, and Mayhew, and 2013-2014 for Aspen VIII and Aspen IX with negative findings for elderberry shrubs (Madrone 2018). These surveys took place more than a decade ago and elderberry shrubs could have sprouted and matured since that time providing suitable habitat for the valley elderberry longhorn beetle. Portions of the WJHMP area are within SSHCP modeled habitat for the species. The non-participating properties have not been surveyed and elderberry shrubs may be present in those areas. Should elderberry shrubs occur on the non-participating properties or on the participating properties, then future construction in the plan area could remove elderberry shrubs or result in decreased vigor of shrubs due to creation of dust during construction. The loss or decrease in vigor of elderberry shrubs may result in a further reduction in the population of valley elderberry longhorn beetle, which is currently listed as threatened under the ESA.

The project is a Covered Activity and participation in the SSHCP would be required. Valley elderberry longhorn beetle is a covered species under the SSHCP. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP, including payment of in lieu fees for impacts to waters and terrestrial habitats and compliance with plan policies and requirements, as well as implementation of AMMs including VELB-1 (Valley Elderberry Longhorn Beetle Avoidance). Participation in the SSHCP would result in preservation of habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale, rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. Implementation of VELB-1 would require surveys for the presence of elderberry shrubs within 100 feet of the project area, if a covered activity is planned within modeled habitat for valley elderberry longhorn beetle. VELB-1 requires protocol level surveys if elderberry shrubs are found and directs avoidance of direct and indirect impacts within 20 feet and between 20-100 feet of construction, respectively. VELB-1 also requires that any direct loss of elderberry shrubs be compensated according to USFWS Conservation Guidelines for the Valley Elderberry Longhorn Beetle (USFWS 1999). Therefore, project impacts on valley elderberry longhorn beetle would be reduced to **less than significant with mitigation**.

Crotch's Bumble Bee

Crotch's bumble bee was designated, by the California Fish and Game Commission, as a candidate for listing as endangered under CESA on June 12, 2019. A November 13, 2020, court decision by the Superior Court of Sacramento ruled that insects are not eligible for listing under CESA and vacated the candidacy of bumble bee species. CDFW appealed this decision, and on May 31, 2022, the Third District Court of Appeal in Sacramento ruled that insects are eligible for listing under CESA, and the candidacy of Crotch's bumble bee has been reinstated. The designation of Crotch's bumble bee as a candidate for listing under CESA occurred after the completion of the SSHCP, so this species is not a covered species under the plan.

Crotch's bumble bee has recently undergone a decline in abundance and distribution and is no longer present across much of its historic range. In the Central Valley, there has been extensive agricultural intensification, and the southern part of its range is experiencing rapid urbanization. In June 2023, CDFW released Survey Considerations for CESA Candidate Bumble Bee Species, which included survey and mitigation guidance for Crotch's bumble bee and three other candidate bumble bee species, as well as updated current range maps for each species (CDFW 2023). In California, Crotch's bumble bee's current range includes the Mediterranean region (ecoregion encompassing the greater Central Valley, Sierra foothills and central coast ranges of California south to Mexico), Pacific Coast, Great Valley, and adjacent foothills through most of southwestern California. This range encompasses all of Sacramento County, including the WJHMP area (CDFW 2023).

Bumble bees have three basic habitat requirements: suitable nesting sites for the colonies, availability of nectar and pollen from floral resources throughout the duration of the colony period (spring, summer, and fall), and overwintering sites for the queens. The long-term productivity of bumble bee populations is affected by the quantity and quality of nectar and pollen available and the proximity of these resources to nesting habitat. In California, Crotch's bumble bees typically inhabit open grassland and scrub habitats (Xerces Society 2018). Crotch's bumble bees nest underground and likely use, at least in part, old rodent burrows (Williams et al. 2014; Xerces Society 2018). Some bumble bees favor nest sites near woody transitional habitats and nest in holes or crevices in leaf litter, beneath woody debris, at the base of a tree, in herbaceous plant debris, or near grass clumps (Lanterman et al. 2019).

Crotch's bumble bees are generalist foragers and have been reported visiting a wide variety of flowering plants (Xerces Society 2018). Crotch's bumble bee has a very short tongue, which is best suited to forage at open flowers with short corollas (Xerces Society 2018). Very little is known about the hibernacula, or overwintering sites utilized by Crotch's bumble bees. Generally, bumble bees overwinter in soft, well-drained, disturbed soil (Goulson et al. 2010; Liczner and Colla 2019), or under leaf or needle litter or other debris (Williams et al. 2014, 2019) in woody forest edges (CDFW 2023). Overwintering likely occurs primarily in woodlands. Overwintering queens may prefer shaded areas near trees in areas without dense vegetation and north-facing slopes (Liczner and Colla 2019; Williams et al. 2019). Bumble bees in California have been documented overwintering under 1–2 inches of duff, between leaf/needle litter and mineral soil (Williams et al. 2014).

In the Survey Considerations for CESA Candidate Bumble Bee Species, CDFW recommends reviewing the CNDDB, iNaturalist (a citizen science database), and Bumblebee Watch databases for recorded observations in the vicinity of a given WJHMP area (CDFW 2023). The CNDDB includes a Crotch's bumble bee occurrence 3.6 miles northeast of the WJHMP area (CNDDB 2024). The iNaturalist and Bumblebee Watch databases include numerous recent occurrences in the vicinity of the plan area, in part due to efforts to better document these species in light of the potential listing under CESA. Crotch's bumble bees have been documented in Sacramento County during late-spring and summer months (i.e., May, June, July) from 2020–2023 (Xerces

et al 2024; iNaturalist 2024b). Reported occurrences show that Crotch's bumble bees have been observed foraging on multiple native and nonnative flowering plant species, including sage (*Salvia* spp.); yarrow (*Achillea millefolium*); milkweed (*Asclepias* sp.); hairy vetch (*Vicia villosa*); lupine (*Lupinus* spp.); wild radish (*Raphanus sativus*), and species in the genera *Phacelia*, *Monardella,* and *Penstemon*.

Implementation of the project would include ground disturbance, grading, and vegetation removal within habitats that contain foraging, nesting, or overwintering habitat, and could, therefore, result in direct loss of bumble bees. Bumble bees could be killed while foraging aboveground by vehicles, heavy machinery, or other equipment used to remove vegetation if these activities are conducted where foraging habitat Is present (i.e., flowering plants). Underground bumble bee nests could be crushed or accidentally uncovered and exposed to the elements and predators during vegetation removal, grading, or digging activities if these activities are conducted where nesting habitat is present (i.e., rodent burrows, leaf litter, woody debris, grass clumps). Overwintering queens could be crushed or accidentally uncovered and exposed to the elements and predators during vegetation removal, grading, or digging activities if these activities are conducted where overwintering habitat is present (i.e., woodlands, woody forest edges, leaf/needle litter in these areas).

Implementation of the project could result in loss of individual Crotch's bumble bees or Crotch's bumble bee nests and loss of foraging and breeding habitat for the species. It is not known if the plan area supports a high concentration of bumble bee colonies due to the historical disturbance however, as the land has sat idle or been restored during reclamation, it is possible bumble bees have recolonized these areas. While loss of individual Crotch's bumble bees or a colony as a result of project activities may not cause the population to drop below self-sustaining levels, threaten to eliminate the species, or substantially reduce the range of the species, the population status of this species is poorly understood, and loss of a colony could have a substantial adverse effect on the regional population its long-term viability.

Implementation of Mitigation Measures BR-6a, BR-6b, and BR-6c would reduce the impact on Crotch's bumble bee by requiring habitat assessment for Crotch's bumble bee, implementation of a limited operating period, if feasible or applicable, focused surveys for bumble bees, and implementation of measures to avoid mortality of the Crotch's bumble bees if nests or overwintering queens are detected. If Crotch's bumble bees are found and avoidance is not feasible, Mitigation Measure BR-6c requires project proponents to obtain an ITP from CDFW and implement all take minimization and avoidance measures included in the ITP. Impacts would be **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measure BR-1a and BR-1b.

MITIGATION MEASURE BR-6A: HABITAT ASSESSMENT FOR CROTCH'S BUMBLE BEE HABITAT

For areas that have potential to provide foraging, nesting, or overwintering habitat for Crotch's bumble bees (i.e., most areas that do not solely contain developed land covers, including gardens and some other urban landscaping in otherwise developed areas):

- A qualified biologist shall assess the WJHMP area through a desktop analysis and site visit to determine whether the WJHMP area contains foraging, nesting, or overwintering habitat for Crotch's bumble bee. If the site visit does not occur during the blooming season for most flowering plants, historic aerial imagery will be referenced and a conservative approach will be used to determine whether potential foraging habitat for the species is present.
- If habitat suitable for Crotch's bumble bee is determined not to be present on the WJHMP area, then further mitigation would not be required.
- If habitat suitable for Crotch's bumble bee is determined to be present on the WJHMP area, then Mitigation Measure BR-6b and Mitigation Measure BR-6c shall be implemented.

MITIGATION MEASURE BR-6B: LIMITED OPERATING PERIOD DURING THE CROTCH'S BUMBLE BEE COLONY ACTIVE PERIOD

For WJHMP areas that contain foraging habitat only, or foraging habitat and nesting habitat for Crotch's bumble bee (i.e., no overwintering habitat), initial ground-disturbing work (e.g., grading, vegetation removal, staging) shall take place between August 15 and March 15, if feasible, to avoid impacts on nesting Crotch's bumble bees.

If this limited operating period is determined to be infeasible, Mitigation Measure BR-6c shall be implemented.

MITIGATION MEASURE BR-6C: FOCUSED SURVEYS AND AVOIDANCE MEASURES FOR CROTCH'S BUMBLE BEE

WJHMP areas that contain overwintering habitat likely also contain foraging and nesting habitat. Therefore, Crotch's bumble bees may be present in these WJHMP areas year-round, there is no limited operating period that would completely avoid impacts on Crotch's bumble bee.

If the limited operating period for WJHMP areas that contain foraging habitat only or foraging habitat and nesting habitat (i.e., no overwintering habitat) is determined to be infeasible, or for WJHMP areas that contain overwintering habitat, the following shall be implemented:

- Future project applicants shall retain a qualified biologist familiar with bumble bees of California and experienced using survey methods for bumble bees. The qualified biologist shall conduct a habitat assessment and focused survey for Crotch's bumble bee before the start of any ground-disturbing activities. Surveys shall be performed when Crotch's bumble bee is most likely to be identified, typically from April through August when floral resources and ideal weather conditions are present, and shall follow the methods in Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species (CDFW 2023) or any subsequent protocol approved by CDFW.

- Future project applicants shall submit a survey report to CDFW within 1 month of survey completion and shall notify CDFW within 24 hours if Crotch's bumble bees are detected.
- If Crotch's bumble bees are detected during the focused survey, appropriate avoidance measures shall be implemented. Avoidance measures may include, but not be limited to, the following:
    - Protective buffers shall be implemented around active nesting colonies or overwintering queens until these sites are no longer active. A qualified biologist, in consultation with CDFW, shall determine the appropriate buffer size to protect nesting colonies or overwintering queens.
    - If impacts on Crotch's bumble bee cannot be avoided, future project applicants shall obtain an incidental take permit (ITP) from CDFW and shall implement all avoidance measures included in the ITP and will provide compensatory mitigation for loss of Crotch's bumble bee habitat as specified in the terms of the ITP. While Crotch's bumble bee is not covered by the SSHCP; participation in the SSHCP would result in preservation of grassland habitat to offset the loss of Swainson's hawk foraging habitat, which could simultaneously offset the loss of habitat for Crotch's bumble bee.

IMPACT BR-7: HAVE A SUBSTANTIAL ADVERSE EFFECT ON SPECIAL-STATUS PLANTS

A variety of plant species are adapted to the hydrologic and soil conditions present in vernal pools, and are therefore endemic to these unique habitats. Vernal pool habitats have dramatically declined in California, and as a result many of the plant species associated with vernal pools have likewise declined. Vernal pool-associated special-status plant species found in Sacramento County are: Ahart's dwarf rush (*Juncus leiospermus var. ahartii*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii ssp. myersii*), Sacramento Orcutt grass (*Orcuttia viscida*), and slender Orcutt grass (*Orcuttia tenuis*). All these species except for pincushion navarretia have a high potential of being located within the WJHMP area.

Although special-status plant surveys have been conducted on various WJHMP area parcels, these surveys took place in 2006 for Aspen IV South parcel, 2010 for District 1 Participating Properties: Aspen II, Aspen III, Aspen III South, the northern Aspen V parcel, portions of Aspen V South, Aspen VII, Aspen VII South, and Mayhew, and 2013-2014 for Aspen VIII and Aspen IX. Negative findings for special-status plants were reported; except for Sanford's arrowhead, which was observed within several ditches on the Aspen VIII site, but these colonies were subsequently extirpated by permitted mining activities (Madrone 2018). There are large parcels where ongoing mining operations and other disturbances are taking place, but there are other parcels where there is still habitat suitable for some special-status plant species to occur and the surveys are outdated according to agency standards. Non-participating parcels have not been surveyed and they could provide suitable habitat for special-status plants; therefore, the potential for these species to occur in the WJHMP area cannot be ruled out.

Ahart's Dwarf Rush

Ahart's dwarf rush CRPR 1B species. It is an erect annual herb that grows along the edges of seasonal vernal pools and swales within Central Valley and foothill grasslands. This plant is strictly adapted to the vernal pool hydrologic cycle (South Sacramento Habitat Conservation Plan 2018). Ahart's dwarf rush blooms from March to May and can be found at elevations between 100 and 750 feet (Madrone 2018). The WJHMP area has natural and constructed vernal pools that could provide habitat for this plant species. There are no known CNDDB occurrences of this plant species in the WJHMP area, although there is one known occurrence (#8) nearby at Mather Airport, approximately 1.25 miles to the east of the WJHMP area.

Boggs Lake Hedge-Hyssop

Boggs Lake hedge-hyssop is state listed as endangered. This plant species is a small erect annual herb with hollow stems that grows in vernal pools but could also appear around the edges of lakes and ponds. Bogg's Lake hedge-hyssop can be found at elevations between 30 and 7,800 feet and blooms from April to August (Madrone 2018). The WJHMP area has natural and constructed vernal pools and natural and constructed ponds that provide potential habitat for this plant species. This plant is known to spread to human-made hydrologic features from occupied vernal pool landscapes. There are no known CNDDB occurrences of the Bogg's Lake hedge-hyssop within the WJHMP area but there are nine recorded occurrences within 10 miles of the WJHMP area with the closest CNDDB occurrence (#84) located approximately 1.25 miles to the east at Mather Airport.

Dwarf Downingia

Dwarf Downingia is a CRPR 2B species. This small herb is strongly associated with vernal pools and similar seasonal wetland features. Like other vernal pool plant species, such as the Ahart's dwarf rush, dwarf downingia is strictly adapted to the vernal pool hydrologic cycle. This plant blooms from March to May at elevations between 1 and 1,500 feet (Madrone 2018). Shorter stemmed plants can be erect while longer stemmed plants can sprawl horizontally, forming dense colonies or mixing with other vernal pool species (County of Sacramento et al. 2018).

There are no known CNDDB occurrences within the WJHMP area but there are four recorded occurrences within 10 miles of the WJHMP area, with the closest CNDDB occurrence (#54) approximately 5 miles to the southwest. In 2016, this plant species was observed during rare plant surveys for a mining project (Vineyard South) adjacent to the WJHMP area to the south; however, this observation was not reported to the CNDDB. The WJHMP area has natural and constructed vernal pools and natural and constructed ponds that provide potential habitat for dwarf downingia. This plant species is known to spread to human-made hydrologic features from nearby occupied vernal pool landscapes.

Legenere

Legenere is a CRPR 1B species. It is a weakly erect or decumbent annual herb that grows in medium to large vernal pools that are relatively deep. The plant has yellow flowers, which are produced between May and June and extend from the main body of the plant on long, slender pedicels; however, the flowers often lack petals making them inconspicuous and difficult to find. This species occurs in drying beds of vernal pools in valley grassland habitat ranging from sea level to 1,400 feet in elevation. It has been found throughout the Sacramento Valley. There are no CBDDB occurrences of Legenere within the WJHMP area but there are 26 CNDDB occurrences within 10 miles with the closest (#44) located at Mather Airport, approximately 0.2 miles to the east of the WJHMP area.

Slender Orcutt Grass

Slender Orcutt grass is state listed as threatened and federally listed as endangered. This species is an annual herb found in vernal pools. The plant has stems that are 5 to 15 centimeters long, are weakly tufted, and mostly erect with leaves that are sparsely hairy and covered with sticky fluid. Flowering stems often branch from the upper half of the stem with each branch ending in a single spike-like flower. Slender Orcutt grass grows at elevations between 100 and 5,800 feet and blooms from May to October (Madrone 2018). This plant is strictly adapted to the vernal pool hydrological cycle. It occupies a wider range of vernal pool sizes and vernal wetland types and occurs over a greater geographical area and variety of landform types than other Orcutt grasses. Slender Orcutt grass also has a tendency to occupy newly available habitats including stock ponds (where seed sources are available) and constructed or hydrologically enhanced vernal pools.

There are no CNDBB occurrences within the WJHMP area but there are three recorded occurrences within 10 miles of the WJHMP area, with the closest (#16) located approximately 1.3 miles to the south on the west side of Laguna Creek. There is potential habitat within the WJHMP area for the slender Orcutt grass due to the presence of natural and constructed vernal pools.

Sacramento Orcutt Grass

Sacramento Orcutt grass is listed as an endangered species under the ESA and CESA. It is a small, densely tufted, annual grass. It grows to about 1 to 4 inches tall. Like all species of Orcutt grasses, plants are covered with small glandular hairs that are sticky and aromatic. The plant has few to many stems and spike-like inflorescences clustered near the apex. Orcutt grasses are strongly adapted to the more extreme hydrological cycles encountered in the spectrum of vernal pool types. For example, they are typically associated with larger and/or deeper vernal pools. Orcutt grass plants are able to produce most of their aboveground vegetative growth, as well as flowers and seed as the vernal pools dry down in late spring and early to mid-summer (Crampton 1959). Sacramento Orcutt grass seeds germinate during the later spring months after cessation of winter rains as the shallow water at the pool margins begins to warm and recede. Sacramento Orcutt grass plants flower and set seed as the margins and basin of the vernal pools dry from April through July.

There are no known CNDDB occurrences of Sacramento Orcutt grass in the WJHMP area but there are nine occurrences within 10 miles of the WJHMP area with the closest CNDDB occurrence (#17) approximately 3 miles to the east. Habitat for Sacramento Orcutt grass exists within the WJHMP area due to the presence of natural and constructed vernal pools.

According to the USFWS 5-year review report prepared as part of the Recovery Plan, there are eight identified populations of Sacramento Orcutt grass within the county. The greatest threats to Sacramento Orcutt grass are development and invasive species. Invasive species may be introduced from private gardens and landscaping that surround preserved areas (USFWS 2008). Measures should be taken to reduce the threat of invasive species to existing wetland complexes that are retained within the WJHMP area.

Summary

Project implementation would result in removal of vernal pool habitat suitable for special-status vernal pool plants. The loss of occupied habitat could reduce local and regional population numbers of plant species that are rare, increasing the potential that these species could become listed as threatened or endangered under CESA or the ESA in the future. The loss of vernal pool grasses already listed as threatened/endangered, and loss of their habitat, would interfere with recovery goals for these species and could further reduce their overall population numbers.

The project is a Covered Activity and participation in the SSHCP would be required. Ahart's dwarf rush, Boggs Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass and Sanford's arrowhead are covered species under the SSHCP. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP, payment of in lieu fees for impacts to waters and terrestrial habitats, and compliance with SSHCP policies and requirements, as well as implementation of AMMs including PLANT-1 (Rare Plant Surveys), PLANT-2 (Rare Plant Protection), ORCUTT-1 (Orcutt Grass Surveys), and ORCUTT-2 (Orcutt Grass Protection). Participation in the SSHCP would result in preservation of habitat in a coordinated and interconnected SSHCP reserve system that considers the species requirements at a regional scale rather than project-by-project, and presents a coordinated conservation strategy to maintain species viability in the region over the long term. Implementation of AMMs PLANT-1, PLANT-2, ORCUTT-1, and ORCUTT-2 would require rare plant protocol surveys if the covered activity occurs within modeled habitat for any of the covered plant species. These AMMs also require the protection of covered plant species detected within an area proposed to be disturbed by a covered activity, or that is detected within 250 feet of the area proposed to be disturbed, until the implementing entity assures one unprotected occurrence of the species is protected within a SSHCP Preserve before any ground disturbance occurs at the project site. ORCUTT-1 requires that if a covered activity project site is located within or adjacent to (within 1 mile of) the Mather Core Recovery Area and contains vernal pool land cover type, the project will be surveyed for Sacramento and slender Orcutt grass by an

approved biologist following CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities dated March 20, 2018 or most recent CDFW guidelines to determine if Sacramento and/or slender Orcutt grass is present. ORCUTT-2 requires that where known or new Sacramento or slender Orcutt grass occurrences are found, they will be protected within an SSHCP Preserve that is at least 50 acres. The occurrence will be located interior to the Preserve at a distance of no less than 300 feet from the edge of the Preserve boundary. If a Third-Party Project Proponent encounters a previously undiscovered occurrence of Sacramento or slender Orcutt grass on a Covered Activity project site, the Third-Party Project Proponent will contact the Implementing Entity or Land Use Authority Permittee with authority over the project, who will coordinate with the Wildlife Agencies for written concurrence of avoidance to ensure that the project does not cause take of the species. Therefore, project impacts on special-status plants would be reduced to **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measures BR-1a and BR-1b.

IMPACT BR-8: RESULT IN THE LOSS OF TREES

NATIVE TREES

Sacramento County has identified the value of its native and landmark trees and has adopted measures for their preservation. The Tree Ordinance (Chapter 19.04 and 19.12 of the County Code) provides protections for landmark trees and heritage trees. The County Code defines a landmark tree as “an especially prominent or stately tree on any land in Sacramento County, including privately owned land” and a heritage tree as “native oak trees that are at or over 19” diameter at breast height (dbh).” Chapter 19.12 of the County Code, titled Tree Preservation and Protection, defines native oak trees as valley oak (*Quercus lobata*), interior live oak (*Quercus wislizenii*), blue oak (*Quercus douglasii*), or oracle oak (*Quercus morehus*) and states that “it shall be the policy of the County to preserve all trees possible through its development review process.” It should be noted that to be considered a tree, as opposed to a seedling or sapling, the tree must have a diameter at breast height (dbh) of at least 6 inches or, if it has multiple trunks of less than 6 inches each, a combined dbh of 10 inches. The Sacramento County General Plan Conservation Element policies CO-138 and CO-139 also provide protections for native trees.

Native trees other than oaks include Fremont cottonwood, California sycamore, California black walnut, Oregon ash, western redbud (*Cercis occidentalis),* gray pine (*Pinus sabiniana*), California white alder (*Alnus rhombifolia*), boxelder, California buckeye (*Aesculus californica*), narrowleaf willow (*Salix exigua*), Goodding’s black willow, red willow (*Salix laevigata*), arroyo willow (*Salix lasiolepis*), shining willow (*Salix lucida*), Pacific willow (*Salix lasiandra*), and dusky willow (*Salix melanopsis*).

Due to multiple participating and non-participating landowners in the WJHMP area, no comprehensive tree survey exists for the entire WJHMP area. Site specific surveys

were conducted prior to the approval of each previously mining project within the WJHMP area. The previously mining projects were subject to mitigation requirements associated with the tree removal at the time of mining. To satisfy mitigation requirements, a number of new tree plantings have taken place in the WJHMP area over the last several decades (see Table 8-2).

Nonnative Tree Species

The distribution of nonnative trees varies within the WJHMP area based on whether an area has been disturbed by mining activity. In active and closed mining sites, nonnative trees are sparse due to the removal of vegetation and topsoil by mining activity. Without the project, both active and closed mining areas would likely remain treeless because reclamation plans for mining sites usually require the planting of crops. Most of the nonnative trees that exist in mining areas are planted along the edge of excavation sites to be used as visual screening. Other nonnative trees established themselves along the edges of industrial ponds, along ditches, or on mining pit slopes.

In areas that have not been disturbed by mining, there are clusters of nonnative trees planted as landscaping at homesteads and businesses. The Bethany Slavic Missionary Church near the intersection of Bradshaw Road and Jackson Road has a large parking lot with shade trees. There are two large clusters of nonnative trees at two cemeteries within the WJHMP area.

The goal of the General Plan policies related to nonnative trees is to replace existing urban tree canopy that is removed due to development. Urban tree canopies provide many benefits: improved air quality by removing pollutants, shading structures, reducing the urban heat island effect and reducing energy costs associated with cooling buildings, and capturing and filtering stormwater. In the context of a large master plan such as the project, tree removal is anticipated to occur in phases. As each development phase happens, new tree plantings would occur. The Countywide Design Guidelines, in general, require the planting of new trees in all new single-family lots, commercial building sites, parking lots, and street frontages. In general, these planting requirements result in a tree canopy that far exceeds what currently exists in the WJHMP area, particularly in former mining areas.

Summary

The degree of impact on native trees that would result from development and redevelopment associated with the WJHMP area is uncertain at this time because specific parcel development plans are not part of the project. Based on the project's land use plan, oak tree mitigation sites within the WJHMP area where over 2,600 native oak trees have been planted (Table 8-2) are within designated open space areas. Impacts (i.e., direct removal or tree mortality from damage to tree roots or soil compaction) could occur to native trees that are in areas designated for development. As project-level plans are developed, subsequent project submittals would be required to submit a site-specific arborist report, identify all native and non-native trees onsite as well as any proposed tree removal, and identify remaining trees on and off-site that would be potentially subject to impacts during construction. I of Mitigation Measure BR-

8a provides for the protection and preservation of native tree resources within the WJHMP area, or compensation for the loss of healthy native trees consistent with General Plan policy. Mitigation Measure BR-8b establishes construction protocol for the protection of native trees during construction. Impacts to native trees from development in accordance with the project would be **less than significant with mitigation**.

MITIGATION MEASURES

MITIGATION MEASURE BR-8A: ARBORIST REPORT AND NATIVE TREE PROTECTION

i. Project proponents of subsequent development projects within the WJHMP area shall submit an arborist report for the project impact areas when appropriate habitat exists. The report shall include the species, diameter at breast height (dbh), dripline, and health of the trees present, and shall be prepared by an ISA certified arborist. The report shall include an exhibit that shows the trees and their driplines in proximity to the project improvements. The report shall identify any tree proposed for removal and shall quantify any encroachment from project equipment or facilities within driplines of native trees.

ii. The removal of native trees shall be compensated for by planting in-kind native trees equivalent to the dbh inches lost, based on the ratios listed below, at locations that are authorized by the Environmental Coordinator. On-site preservation of native trees that are less than 6 inches dbh may also be used to meet this compensation requirement.

    Replacement tree planting shall be completed prior to approval of grading or improvement plans, whichever comes first.

    Equivalent compensation based on the following ratio is required:

    - one preserved native tree < 6 inches dbh on-site = 1 inch dbh,
    - one D-pot seedling (40 cubic inches or larger) = 1 inch dbh,
    - one 15-gallon tree = 1 inch dbh,
    - one 24-inch box tree = 2 inches dbh, and
    - one 36-inch box tree = 3 inches dbh,

Prior to the approval of Improvement Plans or Building Permits, whichever occurs first, a Replacement Tree Planting Plan shall be prepared by a certified arborist or licensed landscape architect and shall be submitted to the Environmental Coordinator for approval. The Replacement Tree Planting Plan(s) shall include the following minimum elements:

1. species, size and locations of all replacement plantings and < 6-inch dbh trees to be preserved;
2. method of irrigation;

3. if planting in soils with a hardpan/duripan or claypan layer, include the Sacramento County Standard Tree Planting Detail L-1, including the 10-foot deep boring hole to provide for adequate drainage;
4. planting, irrigation, and maintenance schedules;
5. identification of the maintenance entity and a written agreement with that entity to provide care and irrigation of the trees for a 3-year establishment period, and to replace any of the replacement trees which do not survive during that period; and
6. designation of 20-foot root zone radius and landscaping to occur within the radius of trees < 6 inches dbh to be preserved on-site.

No replacement tree shall be planted within 15 feet of the driplines of existing native trees or landmark size trees that are retained on-site, or within 15 feet of a building foundation or swimming pool excavation. The minimum spacing for replacement native trees shall be 20 feet on-center. Examples of acceptable planting locations are publicly owned lands, common areas, and landscaped frontages (with adequate spacing). Generally unacceptable locations are utility easements, under overhead utility lines, private yards of single-family lots (including front yards), and roadway medians.

Native trees <6 inches dbh to be retained on-site shall have at least a 20-foot radius suitable root zone. The suitable root zone shall not have impermeable surfaces, turf/lawn, dense plantings, soil compaction, drainage conditions that create ponding (in the case of oak trees), utility easements, or other overstory tree(s) within 20 feet of the tree to be preserved. Trees to be retained shall be determined to be healthy and structurally sound for future growth by an ISA Certified Arborist subject to Environmental Coordinator approval.

If tree replacement plantings are demonstrated to the satisfaction of the Environmental Coordinator to be infeasible for any or all trees removed, then compensation shall be through payment into the County Tree Preservation Fund. Payment shall be made at a rate of $325.00 per dbh inch removed but not otherwise compensated, or at the prevailing rate at the time payment into the fund is made.

MITIGATION MEASURE BR-8B: NATIVE TREE CONSTRUCTION PROTECTION

a) With the exception of the native trees removed and compensated for through Mitigation Measure BR-8a, all healthy native trees that are 6 inches dbh or larger on the WJHMP area, all portions of adjacent off-site healthy native trees that are 6 inches dbh or larger and have driplines that extend onto the WJHMP area, and all off-site healthy native trees that are 6 inches dbh or larger and could be damaged by utility installation and/or improvements associated with this project, shall be preserved and protected as follows:
    1. A circle with a radius measurement from the trunk of the tree to the tip of its longest limb shall constitute the dripline protection area of the tree. Limbs shall not be cut back to change the dripline. The area beneath the dripline is a critical portion of the root zone and defines the minimum protected area to sustain the tree. Removing limbs which make up the dripline does not change the protected area.

2. Chain link fencing or a similar protective barrier shall be installed one foot outside the driplines of the native trees prior to initiating project construction to avoid damage to the trees and their root systems.
3. No signs, ropes, cables (except cables which may be installed by a certified arborist to provide limb support) or any other items shall be attached to the native trees.
4. No vehicles, construction equipment, mobile home/office, supplies, materials or facilities shall be driven, parked, stockpiled or located within the driplines of the native trees.
5. Any soil disturbance (scraping, grading, trenching, and excavation) is to be avoided within the driplines of the native trees. Where this is necessary, an ISA Certified Arborist will provide specifications for this work, including methods for root pruning, backfill specifications and irrigation management guidelines.
6. All underground utilities and drain or irrigation lines shall be routed outside the driplines of native trees. Trenching within protected tree driplines is not permitted. If utility or irrigation lines must encroach upon the dripline, they should be tunneled or bored under the tree under the supervision of an ISA Certified Arborist.
7. If temporary haul or access roads must pass within the driplines of oak trees, a roadbed of six inches of mulch or gravel shall be created to protect the root zone. The roadbed shall be installed from outside of the dripline and while the soil is in a dry condition, if possible. The roadbed material shall be replenished as necessary to maintain a 6-inch depth.
8. Drainage patterns on the site shall not be modified so that water collects or stands within, or is diverted across, the dripline of oak trees.
9. No sprinkler or irrigation system shall be installed in such a manner that it sprays water within the driplines of the oak trees.
10. Tree pruning that may be required for clearance during construction must be performed by an ISA Certified Arborist or Tree Worker and in accordance with the American National Standards Institute (ANSI) A300 pruning standards and the International Society of Arboriculture (ISA) “Tree Pruning Guidelines”.
11. Landscaping beneath the oak trees may include non-plant materials such as boulders, decorative rock, wood chips, organic mulch, and non-compacted decomposed granite. Landscape materials shall be kept 2 feet away from the base of the trunk. The only plant species which shall be planted within the driplines of the oak trees are those which are tolerant of the natural semi-arid environs of the trees. Limited drip irrigation approximately twice per summer is recommended for the understory plants.
12. Any fence/wall that will encroach into the dripline protection area of any protected tree shall be constructed using grade beam wall panels and posts or piers set no closer than 10 feet on center. Posts or piers shall be spaced in such a manner as to maximize the separation between the tree trunks and the posts or piers in order to reduce impacts to the trees.

13. For a project constructing during the months of June, July, August, and September, deep water trees by using a soaker hose (or a garden hose set to a trickle) that slowly applies water to the soil until water has penetrated at least 1 foot in depth. Sprinklers may be used to water deeply by watering until water begins to run off, then waiting at least an hour or two to resume watering (provided that the sprinkler is not wetting the tree's trunk). Deep water every 2 weeks and suspend watering 2 weeks between rain events of 1 inch or more.

IMPACT BR-9: DISTURBANCE OF RIPARIAN HABITATS

Morrison Creek and Elder Creek run through the WJHMP area. For the most part, these streams do not support riparian vegetation within the WJHMP area; however, there are small stands of riparian vegetation in some portions of these streams, such as the area along Morrison Creek west of Bethany Slavic Missionary Church continuing through the Mayhew and Aspen IV South parcels and the natural Morrison Creek channel within FPA A west of Hedge Avenue. Since these areas are within unsurveyed parts of the WJHMP area, the condition, species composition, and function of riparian habitat is not known. These areas would be subject to disturbance from future construction.

Future development projects within the WJHMP area are a Covered Activity and participation in the SSHCP would be required. Implementation of Mitigation Measure BR-1a would require project level reports to identify resources on site and Mitigation Measure BR-1b would require participation in the SSHCP, payment of in lieu fees for impacts to waters and terrestrial habitats, and compliance with SSHCP policies and requirements. Implementation of AMMs such as STREAM-2 (UDA Stream Setbacks) which requires a minimum setback of 100 feet from the top of bank measured in aerial perspective on both side of Elder and Morrison Creek, STREAM-3 (Minor Tributaries to UDA Streams) which requires a 25-foot setback measured from the top of the bank on both sides of the stream channel that would be applied to all avoided first and second order tributaries and also prohibits trails within headwater ephemeral stream setbacks, STREAM-4 (Minimize Effects from Temporary Channel Re-Routing) which provides measures to follow to minimize effects from temporary channel re-routing for urban development covered activities, and STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening) which also provides project design guidelines for urban development covered activities that require a stream, creek, or drainage re-routing would reduce impacts on streams and associated riparian habitat. Participation in the SSHCP would result in preservation of habitat in a coordinated and interconnected SSHCP reserve system that considers minimizing indirect effects of adjacent Covered Activities on hydrologic functions of WJHMP area waterways, including water quality, and would avoid or reduce undesired disturbances to sensitive resources at a regional scale, rather than project-by-project. This presents a coordinated conservation strategy to maintain species viability in the region over the long term; therefore, project impacts on riparian habitat will be reduced to **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measures BR-1a and BR-1b.

IMPACT BR-10: INTERFERE WITH THE MOVEMENT OF ANY NATIVE RESIDENT OR MIGRATORY SPECIES OR IMPEDE THE USE OF NATIVE WILDLIFE NURSERY SITES

The WJHMP area is to the west of Mather Preserve and other undeveloped lands. The WJHMP area may facilitate local movement of terrestrial and aquatic species to and from these areas; however, due to ongoing mining activities, the value of the north section of the WJHMP area for movement of native or migratory species may be limited. The WJHMP area borders urban and industrial areas to the north and west and, thus, there is limited available habitat that facilitates movement to the north and west outside of the WJHMP area except through existing developed drainage channel corridors. The project includes open space and open space/urban farm areas generally along and connecting Morrisson and Elder Creeks that could allow local continued movement of species between the existing preserve and undeveloped areas. Furthermore, implementation of Mitigation Measure BR-3 requires that tree removal and tree trimming activities occur between September 1 and the end of February. It also requires that if tree removal or trimming occurs between November 15 and the end of February a pre-activity survey for great horned owl be conducted. Implementation of Mitigation Measure BR-3 also requires that project activities, including removal of ground vegetation occur during the non-breeding season and if that is not feasible, then pre-activity nesting bird surveys are required. If active bird nests are found, non-disturbance buffers around the nests would be implemented to ensure that breeding is not likely to be disrupted. Implementation of Mitigation Measures BR-1a and BR-1b, along with BR-3 and covered species-specific AMMs as well as ROAD-1 (Road Project Location), ROAD-2 (Wildlife Crossing Structures), ROAD-3 (Roadside Pesticide Use) would reduce the potential for the WJHMP to interfere substantially with the movement of native resident species, migratory species, or nursery sites and the impacts of the project would be **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measures BR-1a, BR-1b, and BR-3.

IMPACT BR-11: RESULT IN POTENTIAL INCONSISTENCY WITH THE SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

The proposed project's design and construction must comply with all SSHCP requirements, including SSHCP AMMs. The SSHCP is a habitat-based plan in which mitigation fees are based on impacts to habitat or land cover rather than impacts to individual species.

The baseline mapping for the SSHCP Landcovers is illustrated in Figure 8-1. The landcover outlined in the baseline map is an interpretation of habitat based on remote sensing analysis over a number of years prior to adoption of the SSHCP. Therefore, these landcovers are intended to serve as a guide as to what may be present on the project site and are intended to be updated. During the local impact authorization process, these landcovers would be refined, and calculation of project mitigation impact fees would be based on project specific survey and wetland delineation data.

As discussed in Impact BR-6, a small portion of the project site (approximately 6.4 acres) is located within the Mather Core Area of the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (USFWS 2005), which is a Zone 1 core area having the highest priority for recovery. As stated in the Recovery Plan, the Mather Core Area has specific conservation goals, including protecting 95 percent of suitable habitat for vernal pool tadpole shrimp, slender Orcutt grass, and Sacramento Orcutt grass, and protecting 85 percent of suitable habitat for vernal pool fairy shrimp. The SSHCP developed the Conservation Strategy by using the best available scientific information including the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon, and the most recent (to 2018) USFWS 5-Year Reviews of each federally listed covered species. Thus, the recovery needs for this region identified in the recovery plans and reviews informed, and are incorporated into, the SSHCP Conservation Strategy. Additional design features and SSHCP AMMs would also be employed to ensure that habitat linkage function are maintained (such as AMM Road-2) adjacent to the existing PPU 3 preserve west of Excelsior Road.

The plan area is within the UDA, which the SSHCP assumed would eventually be developed. The WJHMP is outside of the known planned preserves for PPU 2 and conceptual preserves for PPU 3. The mitigation contained in this chapter, including application of SSHCP AMMs, would be consistent with the SSHCP Conservation Strategy and the adopted SSHCP mitigation and monitoring protocols. The Project Applicants or subsequent developers would be required to obtain a signed SSHCP authorization form from the Environmental Coordinator for potential impacts to terrestrial and aquatic habitats. The project will comply with the requirements of the SSHCP, including adherence to the Avoidance and Minimization Measures (Appendix F), as well as payment of fees to support the overall SSHCP Conservation Strategy. The project is consistent with, and aids in the goals set forth in the proposed SSHCP. Impacts with regard to consistency with the SSHCP would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

This page is intentionally left blank.

9 CLIMATE CHANGE

INTRODUCTION

This chapter presents a summary of the current state of climate change science and greenhouse gas (GHG) emissions sources in California, a summary of applicable regulations, quantification of GHG emissions generated by the project, a discussion about their potential contribution to global climate change. For the purposes of this analysis, GHG emissions are measured as metric tons of carbon dioxide equivalent ($MTCO_2e$). The atmospheric impact of a GHG is based on the global warming potential (GWP) of that gas. GWP is a measure of the heat trapping ability of one unit of a gas over a certain timeframe relative to one unit of carbon dioxide (CO_2). The GWP of CO_2 is one (IPCC 2014). Consistent with the methodology used by the California Air Resources Board (CARB) in estimating statewide GHG emissions, this analysis uses GWP values from the Fourth Assessment Report Values by the Intergovernmental Panel on Climate Change (IPCC). This analysis relies on the findings of the *West Jackson Highway Master Plan Air Quality and Greenhouse Gas Technical Report* (AQMP/GHGRP) prepared by ESA in April 2024 (Appendix B).

Comments expressing concern regarding increased traffic and associated GHG emissions in the plan area were submitted in response to the notice of preparation (NOP). These issues are considered below. The NOP and comments received in response to it are presented in Appendix A.

ENVIRONMENTAL SETTING

THE PHYSICAL SCIENTIFIC BASIS OF GREENHOUSE GAS EMISSIONS AND CLIMATE CHANGE

Certain gases in the earth's atmosphere, classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the atmosphere from space. A portion of the radiation is absorbed by the earth's surface, and a smaller portion of this radiation is reflected toward space. The absorbed radiation is then emitted from the earth as low-frequency infrared radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on earth.

Prominent GHGs contributing to the greenhouse effect are CO_2, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Human-caused emissions of these GHGs in excess of natural ambient concentrations are found to be responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the earth's climate, known as global climate change or global warming. It is "extremely likely" that more than half of the observed increase in global average surface

temperature from 1951 to 2010 was caused by the anthropogenic increase in GHG concentrations and other anthropogenic forcing (IPCC 2014).

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants, which are pollutants of regional and local concern. Whereas most pollutants with localized air quality effects have relatively short atmospheric lifetimes (approximately 1 day), GHGs have long atmospheric lifetimes (1 year to several thousand years). GHGs persist in the atmosphere long enough to be dispersed around the globe. Although the lifetime of any GHG molecule depends on multiple variables and cannot be determined with any certainty, it is understood that more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, and other forms of sequestration. Of the total annual human-caused CO_2 emissions, approximately 55 percent are estimated to be sequestered through ocean and land uptake every year, averaged over the last 50 years, whereas the remaining 45 percent of human-caused CO_2 emissions remain stored in the atmosphere (IPCC 2013).

The quantity of GHGs in the atmosphere responsible for climate change is not precisely known, but it is considered to be enormous. No single project alone would measurably contribute to an incremental change in the global average temperature or to global or local climates or microclimates. From the standpoint of CEQA, GHG impacts relative to global climate change are inherently cumulative.

Greenhouse Gas Emission Sources

Emissions of CO_2 are byproducts of fossil fuel combustion. Methane, a highly potent GHG, primarily results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) and is largely associated with agricultural practices, landfills, and forest fires. Nitrous oxide is also largely attributable to agricultural practices and soil management. CO_2 sinks, or reservoirs, include vegetation and the ocean, which absorb CO_2 through sequestration and dissolution (CO_2 dissolving into the water) and are two of the most common processes for removing CO_2 from the atmosphere.

As discussed previously, GHG emissions are attributable in large part to human activities. The total GHG inventory for California in 2020 was 370 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) (CARB 2022c). This is less than the 2020 target of 431 $MMTCO_2e$ as mandated by Assembly Bill (AB) 32.

A GHG inventory for the county of was prepared in 2023 for the year 2021 and is summarized in Table 9-1. As shown below, on-road vehicles and residential, commercial, and industrial energy consumption constitute the greatest sources of emissions.

Table 9-1 Sacramento County Greenhouse Gas Emissions Inventory for 2021

Emissions Sector	2021 ($MTCO_2e$/year)	Percent of Total
On-Road Vehicles	1,740,212	43%
Off-Road Vehicles	107,174	3%
Residential Building Energy	878,308	22%
Commercial Industrial Building Energy	555,596	14%
High-Global Warming Potential Gases	317,796	8%
Agriculture	266,470	7%
Solid Waste	156,744	4%
Water and Wastewater	33,262	<1%
Total	**44,055,562**	**100%**

Notes: Totals may not equal the sum of the numbers because of independent rounding.

$MTCO_2e$ = metric tons of carbon dioxide equivalent.

Source: Sacramento County 2023.

EFFECTS OF CLIMATE CHANGE ON THE ENVIRONMENT

According to IPCC, which was established in 1988 by the World Meteorological Organization and the United Nations Environment Programme, global average temperature will increase by 3.7 to 4.8 degrees Celsius (°C) (6.7 to 8.6 degrees Fahrenheit [°F]) by the end of the century unless additional efforts to reduce GHG emissions are made (IPCC 2014: 10). According to *California's Fourth Climate Change Assessment*, with global GHGs reduced at a moderate rate California will experience average daily high temperatures that are warmer than the historic average by 2.5 °F from 2006 to 2039, by 4.4 °F from 2040 to 2069, and by 5.6 °F from 2070 to 2100; and if GHG emissions continue at current rates then California will experience average daily high temperatures that are warmer than the historic average by 2.7 °F from 2006 to 2039, by 5.8 °F from 2040 to 2069, and by 8.8 °F from 2070 to 2100 (OPR et al. 2018).

Since its previous climate change assessment in 2012, California has experienced several of the most extreme natural events in its recorded history: a severe drought in 2012–2016, an almost nonexistent Sierra Nevada winter snowpack in 2014-2015, increasingly large and severe wildfires, and back-to-back years of the warmest average temperatures (OPR et al. 2018). According to the California Natural Resource Agency's *Safeguarding California Plan: 2018 Update*, California experienced the driest 4-year statewide precipitation on record from 2012 through 2015; the warmest years on average in 2014, 2015, and 2016; and the smallest and second smallest Sierra snowpack on record in 2015 and 2014 (CNRA 2018). According to the National Oceanic and Atmospheric Administration and the National Aeronautics and Space Administration, 2016, 2017, and 2018 were the hottest recorded years in history (NOAA 2019). In contrast, the northern Sierra Nevada experienced one of its wettest years on record during the 2016-2017 water year (CNRA 2018). The changes in precipitation exacerbate wildfires throughout California through a cycle of high vegetative growth coupled with dry, hot periods which lowers the moisture content of fuel loads. As a result, the

frequency, size, and devastation of forest fires has increased. In November 2018, the Camp Fire destroyed the town of Paradise in Butte County and caused 85 fatalities, becoming the state's deadliest fire in recorded history, and the largest fires in the state's history have occurred in the 2018–2020 period. Moreover, changes in the intensity of precipitation events following wildfires can also result in devastating landslides. In January 2018, following the Thomas Fire, 0.5 inch of rain fell in 5 minutes in Santa Barbara, causing destructive mudslides formed from the debris and loose soil left behind by the fire. These mudslides resulted in 21 deaths.

As temperatures increase, the amount of precipitation falling as rain rather than snow also increases, which could lead to increased flooding because water that would normally be held in the snowpack of the Sierra Nevada and Cascade Range until spring would flow into the Central Valley during winter rainstorm events. This scenario would place more pressure on California's levee/flood control system (CNRA 2018). Furthermore, in the extreme scenario involving the rapid loss of the Antarctic ice sheet and the glaciers atop Greenland, the sea level along California's coastline is expected to rise 54 inches by 2100 if GHG emissions continue at current rates (OPR et al. 2018).

Temperature increases and changes to historical precipitation patterns will likely affect ecological productivity and stability. Existing habitats may migrate from climatic changes where possible, and those habitats and species that lack the ability to retreat will be severely threatened. Altered climate conditions will also facilitate the movement of invasive species to new habitats, thus outcompeting native species. Altered climatic conditions dramatically endanger the survival of arthropods (e.g., insects, spiders) which could have cascading effects throughout ecosystems (Lister and Garcia 2018). Conversely, a warming climate may support the populations of other insects such as ticks and mosquitos, which transmit diseases harmful to human health such as the Zika virus, West Nile virus, and Lyme disease (European Commission Joint Research Centre 2018).

Changes in temperature, precipitation patterns, extreme weather events, wildfires, and sea-level rise have the potential to threaten transportation and energy infrastructure, crop production, forests and rangelands, and public health (CNRA 2018; OPR et al. 2018). The effects of climate change will also have an indirect adverse impact on the economy as more severe natural disasters cause expensive physical damage to communities and the state.

Regulatory Setting

Federal

Clean Air Act

In *Massachusetts et al. v. Environmental Protection Agency et al.,* 549 U.S. 497 (2007), the Supreme Court of the United States ruled that CO_2 is an air pollutant as defined under the federal Clean Air Act (CAA) and that the US Environmental Protection Agency (EPA) has the authority to regulate GHG emissions. In 2010, EPA started to address GHG

emissions from stationary sources through its New Source Review permitting program, including operating permits for “major sources” issued under Title V of the CAA.

Corporate Average Fuel Economy Standards

The National Highway Traffic Safety Administration regulates vehicle emissions through the Corporate Average Fuel Economy (CAFE) standards. On April 1, 2022, the Secretary of Transportation unveiled new CAFE standards for 2024–2026 model year passenger cars and light-duty trucks. These new standards require new vehicles sold in the United States to average at least 40 miles per gallon and apply to all states except those that enforce stricter standards.

State

Plans, policies, regulations, and laws established by the state agencies are generally presented in the order they were established.

Statewide GHG Emission Targets and Climate Change Scoping Plan

Reducing GHG emissions in California has been the focus of the State government for approximately two decades. GHG emission targets established by the State legislature include reducing statewide GHG emissions to 1990 levels by 2020 (AB 32 of 2006) and reducing them to 40 percent below 1990 levels by 2030 (Senate Bill [SB] 32 of 2016). Executive Order S-3-05 calls for statewide GHG emissions to be reduced to 80 percent below 1990 levels by 2050. This target was superseded by AB 1279, which codifies a goal for carbon neutrality and reduced emissions by 85 percent below 1990 levels by 2045. These targets are in line with the scientifically established levels needed in the U.S. to limit the rise in global temperature to no more than 2 degrees Celsius, the warming threshold at which major climate disruptions, such as super droughts and rising sea levels, are projected; these targets also pursue efforts to limit the temperature increase even further to 1.5 degrees Celsius (United Nations 2015).

CARB adopted the *Final 2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan) on December 16, 2022, which traces the State’s pathway to achieve carbon neutrality and an 85 percent reduction in 1990 emissions goal by 2045 using a combined top-down, bottom-up approach under various scenarios. It identifies the reductions needed by each GHG emission sector (e.g., transportation [including off-road mobile source emissions], industry, electricity generation, agriculture, commercial and residential, pollutants with high global warming potential, and recycling and waste) to achieve these goals (CARB 2022a).

The state has also passed more detailed legislation addressing GHG emissions associated with transportation, electricity generation, and energy consumption, as summarized below.

Transportation-Related Standards and Regulations

As part of its Advanced Clean Cars program, CARB established more stringent GHG emission standards and fuel efficiency standards for fossil fuel–powered on-road

vehicles than EPA. The program's initial goal requiring zero-emission vehicle (ZEV) regulation (i.e., battery, fuel cell, and plug-in hybrid electric vehicles [EVs]) to account for up to 15 percent of California's new vehicle sales by 2025 was superseded by Executive Order N-79-20, which directed the state to scale out the sales of internal combustion engines to 100 percent ZEV sales by 2035. The Advanced Clean Cars II Program was adopted by CARB in August 2022, and provides the regulatory framework for ensuring the sales requirement goal of Executive Order N-79-20 to ultimately reach 100 percent ZEV sales in the state by 2035.

Executive Order B-48-18, signed into law in January 2018, requires all State entities to work with the private sector to have at least 5 million ZEVs on the road by 2030, as well as 200 hydrogen-fueling stations and 250,000 EV-charging stations installed by 2025. It specifies that 10,000 of these charging stations must be direct-current fast chargers.

CARB adopted the Low Carbon Fuel Standard (LCFS) in 2007 to reduce the carbon intensity (CI) of California's transportation fuels. Low-CI fuels emit less CO_2 than other fossil fuel–based fuels such as gasoline and fossil diesel. The LCFS applies to fuels used by on-road motor vehicles and off-road vehicles, including construction equipment (Wade, pers. comm., 2017).

In addition to regulations that address tailpipe emissions and transportation fuels, the state legislature has passed regulations to address the amount of driving by on-road vehicles. Since passage of SB 375 in 2008, CARB requires metropolitan planning organizations (MPOs) to develop and adopt sustainable communities strategies (SCSs) as a component of the federally-prepared regional transportation plans (RTPs) to show reductions in GHG emissions from passenger cars and light-duty trucks in their respective regions for 2020 and 2035 (CARB 2018). These plans link land use and housing allocation to transportation planning and related mobile-source emissions.

The Sacramento Area Council of Governments (SACOG) serves as the MPO for Sacramento, Placer, El Dorado, Yuba, Sutter, and Yolo Counties, excluding those lands located in the Tahoe Basin. The plan area is in Sacramento County. Under the most recent targets of SB 375 (i.e., achieve a per capita reduction in automobile emissions of 7 percent and 19 percent below the 2005 level by 2020 and 2035, respectively), SACOG completed and adopted its most recent 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) in November 2019 (SACOG 2019). CARB's technical evaluation of the 2020 MTP/SCS confirmed that the plan is sufficient to meet the reduction targets of SB 375 (CARB 2020). SACOG is currently in the process of updating its MTP/SCS with approval scheduled for late 2025.

Legislation Associated with Electricity Generation

The State has passed legislation requiring the increasing use of renewables to produce electricity for consumers. California utilities are required to generate 33 percent of their electricity from renewables by 2020 (SB X1-2 of 2011); 52 percent by 2027 (SB 100 of 2018); 60 percent by 2030 (also SB 100 of 2018); and 100 percent by 2045 (also SB 100 of 2018).

Building Energy Efficiency Standards (Title 24, Part 6)

The energy consumption of new residential and nonresidential buildings in California is regulated by the California Energy Code. The code was established by California Energy Commission (CEC) in 1978 in response to a legislative mandate to create uniform building codes to reduce California's energy consumption and provide energy-efficiency standards for residential and nonresidential buildings. CEC updates the California Energy Code every 3 years, typically including more stringent design requirements for reduced energy consumption, which results in the generation of fewer GHG emissions.

The 2022 California Energy Code went into effect on January 1, 2023. The 2022 California Energy Code advances the onsite energy generation progress started in the 2019 California Energy Code by encouraging electric heat pump technology and use, establishing electric-ready requirements when natural gas is installed, expanding solar photovoltaic (PV) system and battery storage standards, and strengthening ventilation standards to improve indoor air quality. CEC estimates that the 2022 California Energy Code will save consumers $1.5 billion and reduce GHG emissions by 10 million $MTCO_2e$ over the next 30 years (CEC 2021).

California Green Building Standards (Title 24, Part 11)

The California Green Building Standards, also known as CALGreen, is a reach code (i.e., optional standards that exceed the requirements of mandatory codes) developed by CEC that provides green building standards for statewide residential and nonresidential construction. The current version is the 2022 CALGreen Code, which took effect on January 1, 2023. As compared to the 2019 CALGreen Code, the 2022 CALGreen Code strengthened sections pertaining to EV and bicycle parking, water efficiency and conservation, and material conservation and resource efficiency, among other sections of the CALGreen Code. The CALGreen Code sets design requirements equivalent to or more stringent than those of the California Energy Code for energy efficiency, water efficiency, waste diversion, and indoor air quality. These codes may be adopted by local agencies that enforce building codes and used as guidelines by state agencies for meeting the requirements of Executive Order B-18-12.

Local

Sacramento County 2030 General Plan

The Sacramento County General Plan contains the following GHG-related policies that are applicable to the project:

- **Policy AQ-4.** Developments which meet or exceed thresholds of significance for ozone precursor pollutants, and/or Greenhouse Gases (GHG) as adopted by the Sacramento Metropolitan Air Quality Management District (SMAQMD), shall be deemed to have a significant environmental impact. An Air Quality Mitigation Plan and/or a Greenhouse Gas Reduction Plan shall be submitted to the County of Sacramento prior to project approval, subject to review and recommendation

as to technical adequacy by the Sacramento Metropolitan Air Quality Management District.

- **Policy LU-115.** It is the goal of the County to reduce greenhouse gas emissions to 1990 levels by the year 2020. This shall be achieved through a mix of State and local action.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan does not include objectives or policies specific to GHG emissions or climate change.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan does not include objectives or policies specific to GHG emissions or climate change.

SACRAMENTO COUNTY CLIMATE ACTION PLANNING

The Sacramento County Phase 1 Climate Action Plan Strategy and Framework document (Phase 1 CAP) was adopted on November 9, 2011, by the Sacramento County Board of Supervisors. The Phase 1 CAP includes a GHG inventory for the unincorporated areas of Sacramento County for 2005, a GHG emission reduction target, and goals and implementation measures developed to help the County reach these goals. Reduction strategies address GHG emissions associated with transportation and land use, energy, water, waste management and recycling, and agriculture and open space. The County's goals related to transportation and energy use include the following:

- Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel and encourage increased fuel efficiency in community vehicles;
- Increase the use of alternative and lower carbon fuels in the County-owned vehicle fleet and facilitate their use in the community;
- Reduce total vehicle miles traveled per capita in the community and region;
- Improve energy efficiency of existing and new buildings in the unincorporated county;
- Improve energy efficiency of operating County-owned infrastructure (roads, water, waste, buildings, etc.); and
- Decrease use of fossil fuels by transitioning to renewable energy sources.

- The Phase 1 CAP is a strategy and framework document. The County adopted the Phase 2A CAP (Government Operations) on September 11, 2012. Neither the Phase 1 CAP nor the Phase 2A CAP are "qualified" plans through which subsequent projects may receive CEQA streamlining benefits.
- Sacramento County began work on an updated communitywide CAP (Phase 2B CAP) in 2016. The commitment to a Communitywide CAP is identified in General Plan Policy LU-115 and associated Implementation Measures F through J on page 117 of the General Plan Land Use Element. This commitment was made in part due to the County's General Plan Update process and potential expansion of the Urban Policy Area to accommodate new growth areas. General Plan Policies LU-119 and LU-120 were developed with SACOG to be consistent with smart growth policies in the SACOG Blueprint, which are intended to reduce vehicle miles traveled (VMT) and GHG emissions. In addition to reducing GHG emissions in Sacramento County, the CAP is intended to serve as a climate change resiliency plan to ensure that the County is prepared for the physical effects of climate change. In 2021, the County released an updated GHG inventory (see Table 9-1, above) and a Climate Change Vulnerability Assessment, which identified extreme heat and increased flooding as the most likely adverse impacts on Sacramento County.

The Phase 2B CAP was re-initiated in early 2020. In March of 2021, the draft Phase 2B CAP was released by the County for public review. On September 7, 2021, a Final Draft CAP and Addendum to the 2030 General Plan EIR was released for public review. The County revised the CAP a second time and released the Revised Final Draft CAP and Revised Addendum to the 2030 General Plan EIR on February 17, 2022. These documents were presented at a Board of Supervisors workshop on March 23, 2022. The County received more than 85 comment letters on the Revised Final Draft CAP leading up to the Board workshop on March 23, 2022. Based on input from the Board of Supervisors during the September 27, 2022, hearing on the CAP, a revised CAP and subsequent EIR are being prepared.

Sacramento Metropolitan Air Quality Management District

SMAQMD is the primary agency responsible for addressing air quality concerns in all of Sacramento County. Its role is discussed further in Chapter 6, "Air Quality," of this EIR. In its CEQA Guide, SMAQMD recommends methods for analyzing GHG emissions in CEQA analyses for project- and program-level analyses and offers multiple potential GHG reduction measures for land use development projects. SMAQMD developed thresholds of significance to provide a uniform scale to measure the significance of GHG emissions from land use and stationary source projects in compliance with CEQA to align with the statewide GHG target of 40 percent below 1990 levels by 2030 with the passage of SB 32 for land use development projects (SMAQMD 2021).

SMAQMD's newly published guidance to address GHG emissions was released in February 2021. SMAQMD recommends that a 1,100 $MTCO_2e$ be applied as a bright-line threshold of significance for evaluating construction emissions of GHGs. SMAQMD also recommends a tiered approach to evaluating the significance of operational

emissions. All projects are required to implement the following tier 1 best management practices (BMPs):

- BMP 1 – Projects shall be designed and constructed without natural gas infrastructure.
- BMP 2 – Projects shall meet the current CalGreen Tier 2 standards, except all-electric vehicle capable spaces shall instead be electric vehicle ready.

Projects can be screened out by comparing their attributes to the SMAQMD's operational screening levels table (when project emissions would equivalent to 1,100 $MTCO_2e$ per year or less), including the implementation of tier 1 BMPs. If the project emissions exceed the screening level, or the project fails to implement tier 1 BMPs, projects must implement tier 2 practices (i.e., BMP 3), which consists of reducing the project's VMT to meet the following requirements of the standards developed by the Governor's Office of Planning and Research pursuant to SB 743 (see Chapter 19, "Transportation," for a summary of this bill):

- BMP 3 – Achieve the following VMT reduction targets compared to a county regional average:
  - 15 percent for residential projects,
  - 15 percent for office projects, and
  - a no net increase in VMT for retail projects.

Projects that cannot meet the tier 2 BMP 3 requirements must implement all feasible mitigation to reduce emissions.

Notably, while SMAQMD's guidance was developed in consideration of nearer-term statewide GHG reduction goals (i.e., a 40-percent reduction from 1990 statewide inventory by 2030), SMAQMD's recommended BMPs are reflective of the Bay Area Air Quality Management District's (BAAQMD's) thresholds for determining significance in its 2022 CEQA Air Quality Guidelines. As stated in its Justification Report, BAAQMD's thresholds were designed to ensure that local governments do their "fair share" to contribute to the statewide goal of achieving carbon neutrality by 2045, as codified in AB 1279 (BAAQMD 2023). Moreover, SMAQMD's tier 1 and tier 2 BMPs are similar to the direction provided in Appendix D, "Local Actions," of the 2022 Scoping Plan which identifies building decarbonization, VMT reductions, and the electrification of the mobile source sector as key priority areas that local jurisdictions can target to do their "fair share" in assisting the state in meeting its long-term goal of carbon neutrality by 2045 (CARB 2022b).

Because SMAQMD's tier 1 and tier 2 BMPs would result in building decarbonization, VMT reductions, and the infrastructure to support EVs, they are considered appropriate thresholds for use in this analysis.

Chapter 9, "Program-Level Analysis of General Plans and Area Plans," of SMAQMD's CEQA Guide also provides guidance for assessing the significance of a general plan or

area plan's GHG emissions. As a master plan, the project would meet the criteria of an area plan and, therefore, SMAQMD's guidance for area plans will be used in this analysis (SMAQMD 2020). SMAQMD recommends that program-level analyses "incorporate development policies, standards, and mitigation measures achieving GHG reductions that result in a less-than-significant impact with respect to GHG emissions, this could alleviate the need to evaluate and mitigate GHGs at the project level for projects that are found to be consistent with the general or area plan" (SMAQMD 2020: 9-9). This recommendation for program level analysis can also be satisfied through the development of a qualified CAP that accompanies a general plan.

As noted in Chapter 9 of SMAQMD's CEQA Guide, '[t]he construction-generated emissions associated with the build-out of a general or area plan should be evaluated in the same manner as construction emissions associated with an individual project, as discussed in Chapter 3, Construction Generated Air Pollutant and Precursor Emissions. In summary, maximum daily construction-generated emissions should be estimated and then compared to the District's thresholds of significance" (SMAQMD 2020). Additionally, program-level analyses must consider incorporating the project-level operational BMPs enumerated above.

Significance Criteria and Methodology

Significance Criteria

A climate change resources impact would be significant if implementation of the project would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or that would otherwise conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

The significance criteria used to evaluate project impacts on climate change under CEQA are based on Section 15064 of the CEQA statute and relevant portions of Appendix G of the State CEQA Guidelines, which recommend that a lead agency consider a project's consistency with relevant, adopted plans and discuss any inconsistencies with applicable regional plans, including plans to reduce GHG emissions.

With respect to GHG emissions, State CEQA Guidelines Section 15064.4(a) states that lead agencies "shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions resulting from a project. The CEQA Guidelines note that an agency has the discretion to either quantify a project's GHG emissions or rely on a "qualitative analysis or performance-based standards" (Section 15064.4[a]). A lead agency may use a "model or methodology" to estimate GHG emissions and has the discretion to select the model or methodology it considers "most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change" (Section 15064.4[c]). The

CEQA Guidelines provide that the lead agency should consider the following factors when determining the significance of impacts from GHG emissions on the environment (Section 15064.4[b]):

- The extent a project may increase or reduce GHG emissions as compared to the existing environmental setting.
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

CEQA Guidelines Appendix G is a sample Initial Study checklist that includes a number of factual inquiries related to the subject of climate change, as it does on a whole series of additional environmental topics. Notably, lead agencies are under no obligation to use these inquiries in fashioning thresholds of significance on these subjects, or indeed on any subject addressed in the checklist. (*Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1068.) Rather, with few exceptions, "CEQA grants agencies discretion to develop their own thresholds of significance." (*Ibid*.) Even so, it is a common practice for lead agencies to take the language from the inquiries set forth in Appendix G and to use that language in fashioning thresholds. The County has done so here. SMAQMD as provided written approval and concurrence with the net zero threshold applied in this analysis (see Appendix B).

Since California's legislative mandate to reduce total projected GHG emissions to 1990 levels by the year 2020 has been achieved, the focus is now on reducing emissions 40 percent below 1990 levels by the year 2030 (SB 32), 85 percent below 1990 levels by 2045 (AB 1279), and carbon neutrality by 2045 (AB 1279). To achieve these targets, future development must be planned and implemented in the most GHG-efficient manner possible. As noted above under the Heading, "Sacramento County Climate Action Plan," the County does not currently have an adopted CAP for CEQA streamlining.

Development under the project would extend beyond 2030 (i.e., assumed buildout year of 2055). Therefore, the most relevant legislation applied to this analysis are the goals of AB 1279 (i.e., an 85 percent reduction from 1990 GHG levels and carbon neutrality by 2045). To demonstrate that the project would be consistent with the statewide goal of carbon neutrality by 2045, a net zero threshold has been applied in this analysis. This threshold has been endorsed by the County and is considered more stringent than what is recommended by SMAQMD; however, it is not intended to set precedent or formally endorsed by the County for all future projects.

A net zero increase of GHG emissions would eliminate a project's incremental contribution to climate change. With no increase in GHG emissions compared to existing conditions, any potential inconsistencies with relevant GHG reduction plans would be avoided. Therefore, if a project demonstrates that it may be implemented and

operated without increasing emissions of GHGs as compared to baseline conditions, the project's contribution to global climate change would be less than significant.

Issues Not Discussed Further

All the issues identified in the significance criteria are addressed in the following analysis.

Methodology

Construction-related emissions of criteria air pollutants and precursors were estimated using the California Emissions Estimator Model (CalEEMod) Version 2020.4.0 computer program (CAPCOA 2020), which was reviewed and approved for use in the project analysis by the SMAQMD (see Appendix B). Modeling was based on the proposed land use plan and project-specific information (e.g., size, number of residential units proposed, area to be graded, area to be paved), where available; reasonable assumptions based on typical construction activities; and default values in CalEEMod that are based on the project's location (e.g., meteorology, emissions factors) and land use types. This analysis relies on the findings of the AQMP/GHGRP prepared for the project (ESA 2024).

Since the WJHMP would be built out based on market demand, the exact phasing of construction is unknown. It is anticipated that the buildout period would occur over 30 years based on the MTP/SCS economic analyses showing the overall anticipated development horizon for the region. A buildout period of 30 years is a conservative estimate given the size and amount of development allowed in the WJHMP. The WJHMP covers almost 6,000 acres of land and provides 16,484 residential units and over 13 million square feet of non-residential development. As noted in the text above, the MTP/SCS contains a projected level of economic growth for the SACOG region and then estimates the number of new housing units to meet the employment levels that will support that economic growth. Projected growth patterns (i.e., the location of growth) are estimates, only, and growth may occur in areas identified in the MTP/SCS or in other areas approved later by local agencies. In addition, construction of the future planning areas under the WJHMP likely would occur beyond the 30-year horizon.

For this analysis, the first year of construction was modeled to approximate the worst-case construction emissions. Equipment used during the first year of construction would be equipped with engines that are expected to emit more criteria pollutant emissions than construction equipment used in later construction years. This is because construction equipment becomes cleaner over time as older, less efficient equipment is replaced through fleet turnover with newer, cleaner equipment that meets more stringent emission standards as required by CARB and EPA. Since the project would likely be built out over a 30-year period as discussed above, it is assumed that 1/30th of the proposed developments would be constructed in the year 2025. The assumptions were used in CalEEMod to estimate emissions for year 1 (2025) construction activities are discussed further below.

It is assumed that implementing the WJHMP would require 500,000 cubic yards of soil to be imported during the grading phase. Assuming the haul trucks used during project construction can carry 16 cubic yards of soil each and construction would be completed over a 30-year period, the first year of construction could result in 2,083 one-way haul truck trips associated with 16,667 cubic yards of exported soil. Assuming 1/30th of the project would be constructed in 2025, total soil import or 50,000 cubic yards, which would result in 6,250 one-way haul truck trips. CalEEMod defaults for number of construction equipment per construction phase and daily worker and vendor trips were used. Additional information and model results for each of the analyses described above are presented in Appendix B.

The WJHMP is assumed to be fully built out in the year 2055. Since CalEEMod version 2020.4.0 allows the user to enter operational years only up to the year 2050, it was not possible to model an operational year 2055 in CalEEMod. Therefore, for this analysis, GHG emissions under the WJHMP were modeled for operational year 2050 using CalEEMod version 2020.4.0. This approach is conservative as emissions rates will likely be higher in 2050 than in 2055 due to continual improvements in vehicle technology, emission controls, and fuel efficiency. Although there are existing uses within the plan area, GHG emissions for these uses were not modeled due to their limited number, and emissions from these uses would be minor. It is also conservative to assume zero emissions from existing uses because these emissions would be subtracted from WJHMP emissions to determine the net change in emissions under the WJHMP. Since construction under the WJHMP is anticipated to begin in 2025, it is assumed that all buildings would be constructed to 2022 Title 24 energy efficiency standards (which was adopted August 11, 2021). Future Title 24 requirements were not modeled because the specific requirements are not known this time. The 2022 energy efficiency standards require solar for all new single-family homes and for all multifamily buildings up to three stories.

For on-road vehicles, criteria pollutant emissions and GHG emissions were calculated using EMFAC2021 v1.0.2, which only allows the user to enter operational years up to 2050. VMT per speed bin was based on data provided in the VMT Analysis Memos (DKS Associates 2023; Kimley-Horn 2023), which evaluate the VMT effects of the WJHMP. Additional information and model results of the operational analysis of GHG emissions described above are presented in Appendix B. Refer to Chapter 19, “Transportation,” in this EIR for further discussion of VMT.

Solid waste, area sources (i.e., landscaping equipment), and water and wastewater were derived using CalEEMod defaults for the proposed land uses under the project.

Additionally, implementation of the WJHMP would result in a potential net addition in carbon sequestration capacity due to land use change and the planting of new trees. The carbon sequestration credit from these activities was estimated using project-specific information provided by the Project Applicants and vegetation defaults provided by CalEEMod. For the purposes of a conservative analysis of GHG sequestration, trees associated with open space parcels were excluded from the total to avoid double-counting credit from open space land use changes.

WEST JACKSON HIGHWAY MASTER PLAN POLICIES

The WJHMP includes the following policies related to climate change:

- **Policy 5.2.** Future development applications shall work with the County to implement the mobility system as shown in Figure 5.13 Transit Plan and Figure 5.14 Proposed Trails, which illustrates the non-vehicular system of multi-use trails, on-street bike lanes and transit facilities.
- **Policy 6.27.** A tree planting plan shall accompany all tentative map applications and can be provided in the form of a conceptual landscape plan.
- **Policy 9.2.** Future development shall provide access to multi-modal transit opportunities and access to a healthy mix of businesses, childcare, senior services, and housing. This is to encourage development that reduces VMT, decreases distances between jobs and housing, reduces traffic impacts, and improves housing affordability.
- **Policy 9.3.** Future development shall achieve improvements in overall public health by encouraging a healthier living environment that includes walkable neighborhoods, access to recreation and open space, healthy foods and public transit.
- **Policy 10.1.** Any codes, covenants and restrictions (CC&R's) shall permit the installation of facilities to collect, store or utilize solar energy on buildings.
- **Policy 10.2.** Shopping centers, office complexes, parks 5 acres or greater and public places will have preferentially located parking spaces and charging stations for electric vehicles.
- **Policy 10.3.** All buildings and landscaping shall be designed to conserve water in compliance with the water agency requirements, which may include the use of advanced plumbing fixtures, high efficiency irrigation systems, low water use plant palette, water use monitoring systems and rain water harvesting systems.
- **Policy 10.4.** Within open space areas, support urban farms and the preservation of grasslands and planting of native trees, where feasible, to provide habitat and foraging for wildlife, as well as for carbon sequestration, shade for residents, and open space users. Plant native plants and trees where feasible and remove non-native trees that are potential fire hazards and high voc-emitting species, such as eucalyptus.

IMPACTS AND ANALYSIS

IMPACT CC-1: RESULT IN PROJECT-GENERATED GHG EMISSIONS AND POTENTIAL INCONSISTENCY WITH PLANS AND REGULATIONS

As explained above, a net zero threshold has been applied in this analysis to demonstrate that the project would be consistent with the statewide goal of carbon

neutrality by 2045. Because this threshold is established relative to total emissions, GHG emissions from construction and operation of the WJHMP are evaluated together.

Construction-related activities would generate emissions of GHGs from the operation of off-road equipment, material delivery, worker commute trips, and other miscellaneous activities. Construction activities in the modeling were estimated for a worst-case scenario in 2025. GHG emissions from construction equipment are anticipated to become progressively less as emissions factors for off-road construction equipment improve and the availability of higher-tiered engines increases. Construction emissions are not factored into the total CO_2e emissions presented in Table 9-2; however, for specific construction assumptions and modeling inputs, refer to Appendix B. Based on the modeling performed for the project, construction of the project would generate a total of approximately 4,370 $MTCO_2e$ per year in 2025. These construction emissions would exceed SMAQMD's construction threshold of significance of 1,100 $MTCO_2e$ per year. For projects expected to exceed the 1,100 $MTCO_2e$ threshold, SMAQMD has established specific best management practices that are understood to effectively reduce construction emissions.

Mitigation Measure CC-1a would require future project applicants to implement various construction-related measures that reduce GHG emissions including efficient engines, use of renewable fuels and electric equipment, limiting idling, and promotion of carpooling for construction workers. Construction emissions would be further reduced through the implementation of Mitigation Measure AIR-1a, which mirrors many measures under Mitigation Measure CC-1a. Measures included in the project design and proposed mitigation measures would fulfill SMAQMD's construction best practice requirements.

The project is assumed to be built out in 2055. Project operations would generate GHG emissions from routine operation of the proposed land uses, such as travel to and from the project, and landscaping equipment. GHGs would be indirectly emitted from electricity consumption, solid waste disposal at the landfills, water and wastewater treatment, and refrigerants. Based on the modeling prepared for the project, during the first year of project buildout, the project (assumed 2050 based on limitations in CalEEMod) would generate approximately 81,292 $MTCO_2e$ per year (19,291 $MTCO_2e$ per year and 62,011 $MTCO_2e$ per year for residential and nonresidential development, respectively).

Table 9-2 summarizes the total emissions from the project. Notably, while the project is proposed as fully electric, the unmitigated scenario captures emissions from the combustion of natural gas. The following project design features have been included in this analysis, based on the requirements of Mitigation Measures CC-1b and CC-1b:

- energy efficient street lighting fixtures,
- solar panel roofs,
- compliance with 2022 CALGreen Code, including mandatory energy efficiency measures,

- compliance with the 2022 Title 24 Energy Standards,
- restriction of wood-burning devices (i.e., only natural gas fireplaces permitted, if any),
- water conservation measures (turf reduction [approximately 28 percent reduction from residential and 20 percent for parks] and irrigation controllers),
- conversion of existing maintained industrial supporting property to support different vegetation land use types, and
- planting of over 82,000 new trees.

Table 9-2 Summary of Project Annual (Unmitigated) Operational Emissions of Greenhouse Gases at Full Buildout (2050)

Source Type	$MTCO_2e$/year	
	Residential	Nonresidential
Area[1]	284	1
Energy[2]	9,052	12,177
Mobile	18,865	42,032
Solid Waste	6,032	16,322
Water and Wastewater	666	1,361
Sequestration (Planted Trees)	-2,094	-991
Sequestration (Land Use Cover Changes)	-13,525	-9,890
Total GHG Emissions	19,281	62,011
Threshold of Significance[3]	0	0
Exceeds Threshold?	Yes	Yes

Notes: $MTCO_2e$/year = metric tons of carbon dioxide equivalent per year.

1. Area-source emissions include emissions from landscaping, application of architectural coatings, and consumer products, and are estimated based on default model settings. It was assumed that none of the residential units would be equipped with a fireplace.

2. Energy emissions include emissions associated with natural gas consumption for space heating/cooling, and appliance use.

Source: Modeling conducted by ESA in 2024.

For unmitigated conditions, a majority of the projected operational GHG emissions for the project are from mobile sources (57 percent), followed by solid waste (21 percent) and energy (20 percent). This level of emissions exceeds the net zero threshold applied to the project.

Table 9-3 summarizes the project's mitigated emissions. This emissions estimate accounts for fully electric development and EV charging stations meeting the tier 2 voluntary requirements of the current 2022 CALGreen Code.

Table 9-3 Summary of Project Annual (Mitigated) Operational Emissions of Greenhouse Gases at Full Buildout (2050)

Source Type	$MTCO_2e$/year	
	Residential	Nonresidential
Area[1]	284	1
Energy[2]	129	241
Mobile	4,906	11,190
Solid Waste	6,032	16,322
Water and Wastewater	666	1,361
Sequestration (Planted Trees)	-2,094	-991
Sequestration (Land Use Cover Changes)	-13,525	-9,890
Total GHG Emissions	-3,601	18,234
Threshold of Significance[3]	0	0
Exceeds Threshold?	No	Yes

Notes: $MTCO_2e$/year = metric tons of carbon dioxide equivalent per year.

1. Area-source emissions include emissions from landscaping, application of architectural coatings, and consumer products, and are estimated based on default model settings. It was assumed that none of the residential units would be equipped with a fireplace.

2. Energy emissions include emissions associated with natural gas consumption for space heating/cooling, and appliance use.

Source: Modeling conducted by ESA in 2024.

As shown in Table 9-3, after implementation of identified on-site mitigation measures and allowing for sequestration credit associated with land use cover changes throughout the plan area, it is estimated that residential land uses would emit -3,601 $MTCO_2e$ per year total or -0.22 $MTCO_2e$ per dwelling unit and nonresidential land uses would emit 18,234 $MTCO_2e$ per year total or 1.02 $MTCO_2e$ per year per thousand square feet of development.

Additionally, Mitigation Measure CC-1b would require future development to demonstrate to the County the use of low-GWP refrigerants in appliances. Mitigation Measure AIR-2 would reduce GHG emissions directly through incorporating EV charging stations throughout the plan area, improved fuel efficiency and idling restrictions of heavy-duty trucks, electrification of transport refrigeration units (TRUs), and use of alternative fuel–powered or electric generators.

Mitigation Measure CC-1c would require that each future nonresidential and mixed-use development project implemented under the project shall prepare a GHGRP prior to the start of project construction activities. The GHGRP shall document project-related GHG emissions, including the effect of GHGRP measures and the net incremental emissions reductions required to achieve the net-zero threshold relative to the buildout year of each project. The GHGRP shall quantify how each future nonresidential and mixed-use development would be required to meet the net zero GHG emissions thresholds required at buildout. Implementation of the GHGRPs for each future development project is intended to show how total project GHG emission reductions by the year 2050

would meet the net-zero threshold. Projects that demonstrate a net zero threshold would not conflict with the ultimate statewide goal of carbon neutrality by 2045 as described in the 2022 Scoping Plan; therefore, meeting the net zero target discussed in this analysis would not conflict with the 2022 Scoping Plan. Construction and operational GHG emissions impact would be **less than significant with mitigation**.

MITIGATION MEASURES

Implement Mitigation Measures AQ-1a and AQ-2.

MITIGATION MEASURE CC-1A: CONSTRUCTION GHG EMISSIONS REDUCTION

County approval of any grading or improvement plans shall include the following SMAQMD Construction GHG Emissions Reduction Measures:

- Improve fuel efficiency from construction equipment:
  - Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to no more than 2 minutes (5-minute limit is required by the state airborne toxics control measure [Title 13, Sections 2449(d)(3) and 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site.
  - Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determined to be running in proper condition before it is operated.
  - Train equipment operators in proper use of equipment.
- Perform on-site material hauling with trucks equipped with on-road engines.
- Use alternative fuels for generators at construction sites such as propane or solar, or
- Use electrical power, as feasible for each construction site and development project.
- Use a CARB-approved low carbon fuel for construction equipment, such as renewable diesel, if commercially available and feasible for use, in construction equipment for each construction site and development project (NOx emissions from the use of low carbon fuel must be reviewed and any increases in NOx through the use of low carbon fuel must be mitigated.)
- Encourage and provide carpools, shuttle vans, transit passes and/or secure bicycle parking for construction worker commutes.
- Reduce electricity use in the construction office by using compact fluorescent bulbs, powering off computers every day, and replacing heating and cooling units with more efficient ones.
- Recycle or salvage non-hazardous construction and demolition debris (goal of at least 75 percent by weight).

- Use locally sourced or recycled materials for construction materials (goal of at least 20 percent based on costs for building materials, and based on volume for roadway, parking lot, sidewalk and curb materials). Wood products utilized should be certified through a sustainable forestry program.
- Minimize the amount of concrete for paved surfaces or utilize a low carbon concrete option.
- Produce concrete on-site if determined to be less emissive than transporting ready mix and if feasible for each construction site and development project.
- Use SmartWay certified trucks for deliveries and equipment transport.
- Develop a plan to efficiently use water for adequate dust control.

MITIGATION MEASURE CC-1B: REFRIGERANT EMISSIONS

Prior to the issuance of building permits, the future project applicants shall demonstrate to the County that low-global warming potential refrigerants in heat pumps shall be installed in residential and nonresidential buildings, such as for HVAC systems, water heaters, and refrigeration.

MITIGATION MEASURE CC-1C: GREENHOUSE GAS REDUCTION PLAN

Prior to the approval of entitlements, improvement plans, or grading permits, each future nonresidential or mixed-use development project implemented under the plan area buildout shall prepare a GHG Reduction Plan meeting the requirements stipulated in Appendix B of this Draft EIR. Future nonresidential development must demonstrate that additional measures contribute its "fair share" toward reducing project-wide GHG emissions 18,234 $MTCO_2e$ per year or 1.02 $MTCO_2e$ per year per 1,000 square feet of non-residential development. Considering the total development area, a hypothetical 100,000 square foot nonresidential project would represent 0.56 percent of the total nonresidential development area and would be required to show a GHG emissions reduction or savings of 102 $MTCO_2e$ per year, which would represent 0.56 percent of the 18,234 $MTCO_2e$ per year reduction required for the nonresidential development in the plan area.

A combination of the following mechanisms may be used to demonstrate compliance with the project's reduction targets:

- *Compliance with the Sacramento County Communitywide Climate Action Plan (CAP).* If Sacramento County has adopted a Revised CAP that aligns with the long-term targets of AB 1279, compliance with provisions of the CAP may be applied.
- *Reduce Vehicle Miles Traveled*. Reduce VMT traveled by project residents and employes through the implementation of reasonable design measures such as:
  - improve or increase access to transit;
  - increase access to common goods and services, such as groceries, schools, and daycare;

- incorporate affordable housing into the project;
- orient the project toward transit, bicycle and pedestrian facilities;
- improve pedestrian or bicycle networks, or transit service;
- provide traffic calming;
- provide bicycle parking;
- limit or eliminate parking supply;
- unbundle parking costs;
- provide parking cash-out programs;
- implement roadway pricing;
- implement or provide access to a commute reduction program;
- provide car-sharing, bike sharing, and ride-sharing programs;
- provide transit passes;
- shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services;
- provide telework options;
- provide incentives or subsidies that increase the use of modes other than single-occupancy vehicle;
- provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms;
- provide employee transportation coordinators at employment sites; and
- provide a guaranteed ride home service to users of non-auto modes.

- *Promote Electric and Alternative-Fuel Vehicles*. Promote the use of alternative fuel and electric vehicles through implementation of reasonable and feasible design measures, such as:
  - develop and implement electric vehicle charging infrastructure plan;
  - install electric vehicle charging stations at residential and commercial buildings; and
  - install electric vehicle charging and natural gas fueling stations at public facilities, such as at parking lots and retail centers.
- *Minimize Energy Demand*. Construct and operate an environmentally sound project that minimizes electricity demand through implementation of reasonable and feasible design measures, such as:
  - exceed 2022 Title 24 Energy Efficiency requirements;
  - electrify loading docks to reduce emission from engine idling of transport refrigeration units;

  - install all-electric appliances, including water heaters and heating, ventilation, and air conditioning (HVAC) systems;
  - implement indoor water use efficiency;
  - use energy efficient street lighting fixtures;
  - include of electric vehicle parking infrastructure;
  - institute a composting and recycling program in excess of local standards; and
  - implement an Urban Forestry Management Plan to reduce the urban heat island effect.
- *On-Site Renewable Energy Use*. During the design phase, conduct analysis to optimize on-site renewable energy use to reduce further reduce project GHG emissions, based on the site layout, environmental factors, and viable technology available as confirmed in a formal report submitted for County approval. Specific actions may include:
  - On-site carbon-zero renewable energy capable of serving energy needs of any urban development in the plan area, including energy needed for streetlights, sewer pumps, drainage pumps, traffic signals, and water pumps.
  - Residential photovoltaic systems designed to be scalable over time to accommodate varying energy demands.
- *Renewable Power Purchase Agreement*. Procure renewable energy from off-site sources within California via purchases from one or more of the following, depending on regulatory feasibility and availability: (a) Sacramento Municipal Utility District (SMUD); (b) a community choice aggregator such as the joint SMUD agreement with Valley Clean Energy and the East Bay Community Energy; or (c) other renewable energy provider.
- *Renewable Energy Certificates*. Procure and retire Renewable Energy Certificates (also known as RECs, green tags, Renewable Energy Credits, Renewable Electricity Certificates, or Tradable Renewable Certificates) for projects or activities located in California as confirmed in a formal report submitted for County approval.
- *Purchase Real, Quantifiable, Permanent, Verifiable, Enforceable, and Additional Carbon Offsets.* If, following the application of all feasible on-site GHG reduction measures listed above would continue to generate GHG emissions exceeding the nonresidential target of 102 $MTCO_2e$ per year per 1,000 square feet, the future project applicants shall offset the remaining GHG emissions by funding activities that directly reduce or sequester GHG emissions or by purchasing and retiring carbon credits as confirmed in a formal report submitted for County approval.

  To the degree that a project relies on GHG mitigation measures, Sacramento County, SMAQMD, and CARB recommend that project applicants prioritize on-site design features, such as those listed under above and direct investments in

GHG reductions within the vicinity of the plan area to provide potential air quality and economic co-benefits locally. While emissions of GHGs and their contribution to climate change is a global problem, emissions of air pollutants, which have an adverse localized effect, are often emitted from similar activities that generate GHG emissions (i.e., mobile, energy, and area sources). For example, direct investment in a local building retrofit program could pay for cool roofs, solar panels, solar water heaters, smart meters, energy efficient lighting, energy efficient appliances, energy efficient windows, insulation, and water conservation measures for homes in the plan area. Other examples of local direct investments include financing installation of regional electric vehicle charging stations, paying for electrification of public school buses, and investing in local urban forests. These investments would not only achieve GHG reductions, but would also directly improve regional and local ambient air quality. However, to adequately mitigate GHG emissions 102 $MTCO_2e$ per year per 1,000 square feet, it is critical that any such investments in actions to reduce GHG emissions meet the criteria of being real, quantifiable, permanent, verifiable, enforceable, and additional, consistent with the standards set forth in Health and Safety Code Section 38562, subdivisions (d)(1) and (d)(2) through the submittal of a formal report for County approval demonstrating that offsets meet these criteria. Such credits shall be based on protocols approved by CARB, consistent with Section 95972 of Title 17 of the California Code of Regulations. The future project applicants shall not use offset projects originating outside of California, except to the extent that the quality of the offsets, and their sufficiency under the standards set forth herein, can be verified by the County or SMAQMD. Such credits must be purchased through one of the following: (i) a CARB-approved registry, such as the Climate Action Reserve, the American Carbon Registry, and the Verified Carbon Standard; (ii) any registry approved by CARB to act as a registry under the California Cap and Trade program; or (iii) through the California Air Pollution Control Officers Association's (CAPCOA's) GHG Rx and SMAQMD.

10 CULTURAL RESOURCES

INTRODUCTION

Under CEQA, lead agencies must consider the effects of their projects on cultural resources. This chapter describes the potential impacts on cultural resources that could occur as a result of implementation of the proposed project.

Cultural resources may include historic buildings and structures, historic districts, historic sites, culturally sacred sites, precontact and historic-era archaeological sites, and other precontact and historic objects and materials.

This chapter includes both environmental and regulatory settings followed by an accounting of the archival research that was conducted within the plan area and an analysis of any potential impacts on cultural resources associated with implementing the proposed project.

No comments on the notice of preparation (NOP) pertain to cultural resources. The NOP and comments received on the NOP are presented in Appendix A.

ENVIRONMENTAL SETTING

PRECONTACT HISTORY

Occupation in the Sacramento Valley during the precontact period is estimated to have occurred as early as 12,000 years ago, but only a few archaeological sites have been identified that predate 5,000 years ago. Precontact material culture in central California (including the Sacramento Valley) subsequent to the Paleoindian Period has been categorized according to “horizons” or “patterns” that define broad technological, economic, social, and ideological elements over long periods of time and large areas. The taxonomic system historically used for central California is a tripartite classification scheme with Early, Middle, and Late Horizons. This Central California Taxonomic System (CCTS) was the result of efforts of a number of researchers and was refined after the advent of radiocarbon dating. Today, a series of generalized periods associated with regionally based “patterns” are typically used as part of the CCTS for the Sacramento Delta area, San Francisco Bay area, and North Coast ranges. Smaller units of patterns are referred to as “aspects” and “phases” (WAVE 2013).

Several regionally based patterns have been described, of which three are specific to Central Valley prehistory and the current project area. Referred to as the Windmiller Pattern, Berkeley Pattern, and Augustine Pattern, each represents a general pattern of resource exploitation, as identified between 4500 years before present (BP) and the beginning of Euro-American contact. These patterns are present within the following

horizon sequences: Early Horizon/Windmiller Pattern, Middle Horizon/Berkeley Pattern, and Late Horizon/Augustine Pattern (WAVE 2013).

Windmiller Pattern (4500–2500 BP)

Some of the earliest well-documented evidence for human occupation in the region is found at sites characteristic of the Windmiller Pattern during the Middle Archaic Period. The Windmiller Pattern was first identified at the Windmiller site near the Cosumnes River in Sacramento County. The archaeological record during the Windmiller period indicates that people practiced a mixed procurement strategy of both game and wild plants as a part of a seasonal round (WAVE 2013).

Windmiller Pattern sites often contain manos and metates (grinding stones), as well as many mortar fragments, indicating that acorns and/or various seeds formed an important part of the diet. Numerous faunal remains (e.g., deer, elk, pronghorn, rabbits, and waterfowl) have been documented at Windmiller Pattern sites, along with large quantities of projectile points. The presence of angling hooks and baked clay artifacts possibly used as net or line sinkers, along with the remains of sturgeon, salmon, and smaller fishes, indicate that fishing was an additional source of food. Ground and polished charmstones, impressions of twined basketry, shell beads, bone tools, and other baked clay items also have been found at Windmiller Pattern sites. Mortuary practices included burials, accompanied by grave goods, in cemeteries that were separate from the habitation sites (WAVE 2013).

Berkeley Pattern (2500 BP–500)

Over a 1,000-year period, a more specialized subsistence regime called the Berkeley Pattern or Middle Horizon emerged. The Berkeley Pattern was initially identified at the West Berkeley site in Alameda County on the east side of the San Francisco Bay. Artifactual and chronological evidence suggest that this subsistence pattern developed in the San Francisco Bay region and spread to surrounding coast and Central Valley locales. An increase in the occurrence of mortars and pestles, along with a decrease in manos and metates, likely signifies a greater reliance on acorns as a dietary staple during the Berkeley Pattern. The archaeological record, which is dominated by large shell-midden/mound sites, also demonstrates that most Berkeley Pattern sites located near or in the vicinity of water (both fresh and salt) made intensive use of aquatic resources. The artifact assemblage also includes shell beads and ornaments, as well as numerous types of bone tools. Interment, the act of burial in the ground, continues to dominate mortuary practices, but some evidence of cremation is also found at Berkeley Pattern sites (WAVE 2013).

Augustine Pattern (500–1769)

The Augustine Pattern is evidenced by a number of changes in subsistence, foraging, and land use patterns that reflect the beginnings of patterns associated with post-contact period Native American groups in the area. The Augustine Pattern was identified at the Augustine site in the Sacramento–San Joaquin Delta. Tools and cooking implements associated with the Augustine Pattern include shaped mortars and pestles, hopper mortars, bone awls, and the bow and arrow. Pottery vessels, known as

Cosumnes Brownware, are found in some parts of the Central Valley and most likely developed during this period from the earlier baked clay industry (WAVE 2013).

A substantial increase in the intensity of subsistence exploitation, including fishing, hunting, and gathering (particularly acorns), is evident in the archaeological record, correlating directly with evidence for population growth. During this period, an increase in sedentism led to the development of social stratification, accompanied by a shift to elaborate ceremonial and social organization. Exchange networks, with the use of clamshell disk beads as currency, also developed during the Augustine Pattern. Mortuary practices during this period included flexed burials and pre-interment burning of offerings in a grave pit, as well as cremation of high-status individuals (WAVE 2013).

Post-Contact History

Mexican Period (1822-1848)

With the opening by Mexico of California to Americans after the revolution, the fur trappers began exploring west of the Sierra Nevada mountains. The first trapper to enter California was Jedediah Smith, whose small party trapped and explored along the Sierra Nevadas in 1826. They entered the Sacramento Valley in 1827, traveling along the Cosumnes and American Rivers and camping near Wilton and the Rosemont section of modern-day Sacramento (WAVE 2013).

Between 1830 and 1833, large numbers of the indigenous population in the Sacramento Valley died from disease, likely introduced by the American trappers and/or the local Mexican population. Disease exterminated whole tribes along the American, Merced, Tuolumne, and Yuba Rivers. In 1837, the Sacramento Valley was hit by a second epidemic, which further decimated indigenous Californians. A number of land grants were issued in the Sacramento area; John Sutter received the two largest land grants in the Sacramento Valley. In 1839, Sutter founded a trading and agricultural empire called New Helvetia, which was headquartered at Sutter's Fort near the divergence of the Sacramento and American Rivers, in Valley Nisenan territory (WAVE 2013).

American Period (1848-Present)

Victory in the Mexican–American War (1846–1848) resulted in Mexico releasing its northern territories (now the states of California, Arizona, Colorado, New Mexico, and part of Utah) to the United States under the Treaty of Guadalupe Hidalgo in 1848. Even though California became a territory of the United States, the full impact of "Americanization" would not occur until the discovery of gold in 1848. The discovery of gold on the American River at Sutter's Mill had a devastating impact on the lives of indigenous Californians in the Central Valley and all along the foothills of the Sierra Nevada (WAVE 2013).

One year after the discovery of gold, nearly 90,000 people had journeyed to the gold fields of California, creating the bustling Gold Rush boomtown of Sacramento. As the more easily obtainable gold (i.e., placer gold) disappeared along the rivers and other waterways, mining shifted toward more industrialized methods of extraction, including

hydraulic and dredge mining. Hydraulic mining was outlawed in the 1880s, although dredge mining continued at a smaller scale than during the Gold Rush in the western Sierra foothills into the 1950s. Extensive dredge tailings along the American River bear witness to this environmentally destructive mining method (WAVE 2013).

With the completion of the transcontinental railroad in 1869, thousands of new settlers poured into the state during the second half of the nineteenth century. California was fast becoming a national leader in the production of agricultural products. The vast Central Valley's fertile soil, combined with numerous irrigation canals, promoted the growth of large amounts of fruits, vegetables, and nuts, as well as vineyards, livestock (cattle and sheep), and field crops, such as hay, cotton, rice, and barley. In the Sacramento area, land-based agriculture and livestock (sheep, beef, and dairy cattle) became the dominant industry. Primary agricultural products included rice, vegetables, and hay, as well as fruits and nuts (WAVE 2013).

LOCAL HISTORY

A portion of the plan area is within the Rio de Los Americanos land grant, a parcel of 35,521 acres granted to William Alexander Leidesdorff by Governor Manuel Micheltorena in 1844. When Leidesdorff died without leaving a will in 1848, Joseph L. Folsom acquired the land, thus giving the present-day town of Folsom, which is located in the northern portion of the rancho, its name (WAVE 2013).

Jackson Road, which bisects the plan area, was initially a stagecoach route that connected Sacramento with the goldfields during the Gold Rush era. An 1866 Government Land Office (GLO) plat map shows the road meandering to the southeast of the Rancho de Los Americanos land grant and is called the "new road to Jackson." By 1911, Jackson Road was in its present-day location as shown by the USGS 1911 Mills (scale 1:31,680) historic quadrangle map (WAVE 2013:18).

CENTRAL CALIFORNIA TRACTION COMPANY RAILROAD

The abandoned tracks of the Central California Traction Company Railroad (CCTC-RR) run approximately 1 kilometer southwest of the project area. The railroad was incorporated in 1905 as one of several interurban railways operating in the Sacramento Valley in the early part of the twentieth century. Originally an electric railway, parts of the railroad line remained operational as a diesel-powered freight line until June 1998. The main line ran between Sacramento and Stockton, with a branch line running to Lodi. Passenger service was discontinued in 1933, and the CCTC-RR's original electric equipment was replaced by diesel engines in 1947. Freight service through Sacramento ended in 1998, but the CCTC-RR is still in operation, servicing the Port of Stockton (WAVE 2013).

19TH-20TH CENTURY AGRICULTURE

During the latter half of the 19th century, new immigrants raised cattle, maintained dairy operations, and cultivated dry crops and row crops, transforming the plan area and surrounding areas into a major agricultural area once referred to as the "Strawberry Capital of the World." In the early 20th century, many farmers in the area were part of a

growing Japanese American community. With the advent of rail service, and then roadways and the automobile in the 1920s, farming operations began to move outward from Sacramento and the need for farming in close proximity to urban areas began to fade. The years leading up to World War II brought numerous changes to the plan area as the demand increased for homes, businesses, and roadways to serve the Sacramento region. In response to these changes, mining operations began in the area during the 1930s to provide the construction materials necessary to support growth in the Sacramento region. In the years following World War II, growth in the Sacramento region surged and mining activity with pockets of industrial and rural residential development dotted the landscape (Peper and Lemke Waste 2009).

SACRAMENTO MATHER AIRPORT

Mather Field (originally Mills Field) is located adjacent to the northeast portion of the plan area and was built during World War I as a pilot training base and airfield. Besides field training exercises, the base was not in use between 1923 and the beginning of World War II. During World War II, the base was reconstructed and became the primary stopover point for troops traveling to and from the Pacific theater of combat. After the war, the Air Force made the field a permanent facility and renamed the field Mather Air Force Base. From 1958 to 1989, Mather Air Force Base was the home of the Strategic Air Command B-52 squadron and the 3535th Navigator Training Wing (redesignated as the 323rd Flying Wing in 1973), which was responsible for training pilots, navigators, and bombardiers. Mather Field went through another transition when it was closed as an Air Force base as a result of the Base Realignment and Closure Act, and was reopened in 1995 as Sacramento Mather Airport, servicing cargo flights (WAVE 2013:19).

REGULATORY SETTING

FEDERAL

NATIONAL HISTORIC PRESERVATION ACT

Cultural resources are considered during federal undertakings chiefly under Section 106 of the National Historic Preservation Act (NHPA) of 1966 (as amended) through one of its implementing regulations, 36 CFR 800 (Protection of Historic Properties). Section 106 of NHPA (16 USC 470f) requires federal agencies to take into account the effects of their undertakings on any district, site, building, structure or object that is included in or eligible for inclusion in the National Register of Historic Properties (NRHP) and to afford the Advisory Council on Historic Preservation a reasonable opportunity to comment on such undertakings (36 CFR 800.1). Under Section 106, the significance of any adversely affected cultural resource is assessed and mitigation measures are proposed to reduce any impacts to an acceptable level. Significant cultural resources are those resources that are listed, or are eligible for listing, on the NRHP per the criteria listed at 36 CFR 60.4 (Advisory Council on Historic Preservation 2000) below:

> In order for a cultural resource to be considered a “historic property” under NRHP criteria (i.e., eligible for inclusion on the NRHP), it must be demonstrated that the

resource possesses *integrity* of location, design, setting, materials, workmanship, feeling and association, and must meet at least one of the following four criteria delineated by Section 106, as listed in 36 CFR 60.4:

(a) That are associated with events that have made a significant contribution to the broad patterns of our history; or

(b) That are associated with the lives of persons significant in our past; or

(c) That embody the distinctive characteristics of a type, period or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

(d) That have yielded, or may be likely to yield, information important in prehistory or history.

STATE

CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA requires public agencies to consider the effects of their actions on “historical resources,” “unique archaeological resources,” and “tribal cultural resources.”

A *historical resource* is a resource listed, or determined to be eligible for listing, in the California Register of Historical Resources (CRHR) (Section 21084.1); a resource included in a local register of historical resources (Section 15064.5[a][2]); or any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant (Section 15064.5[a][3]). Sacramento County does not currently have a local register.

Public Resources Code (PRC) Section 5024.1, Section 15064.5 of the Guidelines, and Sections 21083.2 and 21084.1 of the Statutes of CEQA were used as the basic guidelines for the cultural resources study. PRC Section 5024.1 requires evaluation of historical resources to determine their eligibility for listing on the CRHR. The purpose of the register is to maintain listings of the state's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing on the NRHP.

If it can be demonstrated that a project will cause damage to a *unique archaeological resource*, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (Section 21083.2[a], 21083.2[b], and 21083.2[c]). Section 21083.2(g) describes a unique archaeological resource as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.

3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

California Register of Historical Resources

The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing on the NRHP, enumerated above, and require similar protection to what NHPA Section 106 mandates for historic properties. According to PRC Section 5024.1(c)(1-4), a resource is considered *historically significant* if it meets at least one of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

2. Is associated with the lives of persons important in our past;

3. Embodies the distinctive characteristics of a type, period, region or method of installation, or represents the work of an important creative individual, or possesses high artistic values; or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

Similar to the NRHP, a historical resource must meet one of the above criteria and retain integrity to be listed in the CRHR. The CRHR uses the same seven aspects of integrity used by the NRHP.

Inadvertent Discovery of Human Remains

California law protects Native American burials, skeletal remains and associated grave goods regardless of their antiquity and provides for the sensitive treatment and disposition of those remains (Section 7050.5 of the Health and Safety Code and PRC 5097.9).

When human remains are discovered, the protocol to be followed is specified in California Health and Safety Code, which states:

> In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of Section 27492 of the Government

> Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of death, and the recommendations concerning treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code.

State CEQA Guidelines Section 15064.5(e) requires that excavation activities be stopped whenever human remains are uncovered and that the County coroner be called in to assess the remains. If the County coroner determines that the remains are those of Native Americans, the NAHC must be contacted within 24 hours. At that time, the lead agency must consult with the appropriate Native Americans, if any, as timely identified by the NAHC. Section 15064.5 directs the lead agency (or applicant), under certain circumstances, to develop an agreement with the Native Americans for the treatment and disposition of the remains.

In addition to the mitigation provisions pertaining to accidental discovery of human remains, the State CEQA Guidelines also require that a lead agency make provisions for the accidental discovery of historical or archaeological resources, generally. Pursuant to Section 15064.5(f), these provisions should include "an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be an historical or unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation should be available. Work could continue on other parts of the building site while historical or unique archaeological resource mitigation takes place."

LOCAL

SACRAMENTO COUNTY 2030 GENERAL PLAN

The 2030 General Plan Conservation Element contains the following policies:

- **Policy CO-150**. Utilize local, state and national resources, such as the NCIC [North Central Information Center], to assist in determining the need for a cultural resources survey during project review.
- **Policy CO-154.** Protection of significant prehistoric, ethnohistoric and historic sites within open space easements to ensure that these resources are preserved in situ for perpetuity.
- **Policy CO-155.** Native American burial sites encountered during preapproved survey or during construction shall, whenever possible, remain in situ. Excavation and reburial shall occur when in situ preservation is not possible or when the archeological significance of the site merits excavation and recording procedure. On-site reinterment shall have priority. The project developer shall provide the burden of proof that off site reinterment is the only feasible alternative. Reinterment shall be the responsibility of local tribal representatives.

- **Policy CO-157.** Monitor projects during construction to ensure crews follow proper reporting, safeguards, and procedures.
- **Policy CO-158.** As a condition of approval for discretionary permits, a procedure shall be included to cover the potential discovery of archaeological resources during development or construction.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

Cordova Community Plan

The Cordova Community Plan does not contain specific policies related to cultural resources.

Vineyard Community Plan

The Vineyard Community Plan does not contain specific policies related to cultural resources.

Significance Criteria and Methodology

Significance Criteria

An impact on cultural resources would be significant if implementation of the project would:

- cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5 of the State CEQA Guidelines;
- cause a substantial change in the significance of an archaeological resource pursuant to Section 15064.5 of the State CEQA Guidelines; or
- disturb and human remains, including those interred outside of dedicated cemeteries.

Issues Not Discussed Further

All the issues identified in the significance criteria are addressed in the following analysis.

Methodology

For the purposes of the impact discussion, “historical resource” is used to describe built-environment historic-period resources. Archaeological resources (both precontact and historic-period), which may qualify as “historical resources” pursuant to CEQA, are analyzed separately from built-environment historical resources.

DISCLOSURE OF CULTURAL RESOURCES INFORMATION

Public disclosure of site-specific cultural resources information is expressly exempt from the California Public Records Act, Government Code Sections 6250-6270. Furthermore, information obtained during Native American consultation or through consultation with the local and state agencies, including NCIC, should remain confidential and is exempt from public disclosure under Senate Bill 922. Additionally, Sacramento County staff has signed an "Agreement to Confidentiality" with the NCIC that states that site specific information will not be distributed or released to the public or unauthorized individuals. An authorized individual is a professional archaeologist or historian that qualifies under the Secretary of the Interior's standards to view confidential cultural resources materials.

INFORMATION CENTER RECORD SEARCH

In accordance with Sacramento County General Plan Policy CO-150 and standard professional practice, an extensive search of data maintained by the NCIC of the California Historical Resources Information System at California State University, Sacramento, including state and federal listings of significant cultural resources and associated data bases was conducted by WAVE Consulting (WAVE) on August 19, 2013, and September 4, 2013. In addition to official maps and records, the following sources of information at the NCIC were conducted as part of the record search.

- NRHP – Listed Properties;
- CRHR;
- California Inventory of Historical Resources;
- California State Historical Landmarks;
- California Points of Historical Interest;
- Office of Historic Preservation Historic 2012 Property Directory and Determinations of Eligibility;
- 2010 Caltrans Bridge Inventory;
- 1857 Rio de Los Americanos Rancho Plat for Township 7 North, Range 6 East;
- 1857 Rio de Los Americanos Rancho Plat for Township 8 North, Range 6 East;
- 1856 GLO Plat of Township 7 North, Range 6 East;
- 1866 GLO Plat of Township 8 North, Range 6 East;
- 1908 USGS Elk Grove quadrangle scale 1:31,680, and;
- 1911 USGS Mills quadrangle scale 1:31,680.

The records search by WAVE indicates that 27 cultural resources studies have been conducted within the plan area and three more studies have been conducted within a 0.5-mile radius of the plan area. As a result of these previous surveys, 24 cultural resources have been previously recorded within the plan area and an additional six resources have been recorded with a 0.5-mile radius of the plan area. Of the resources

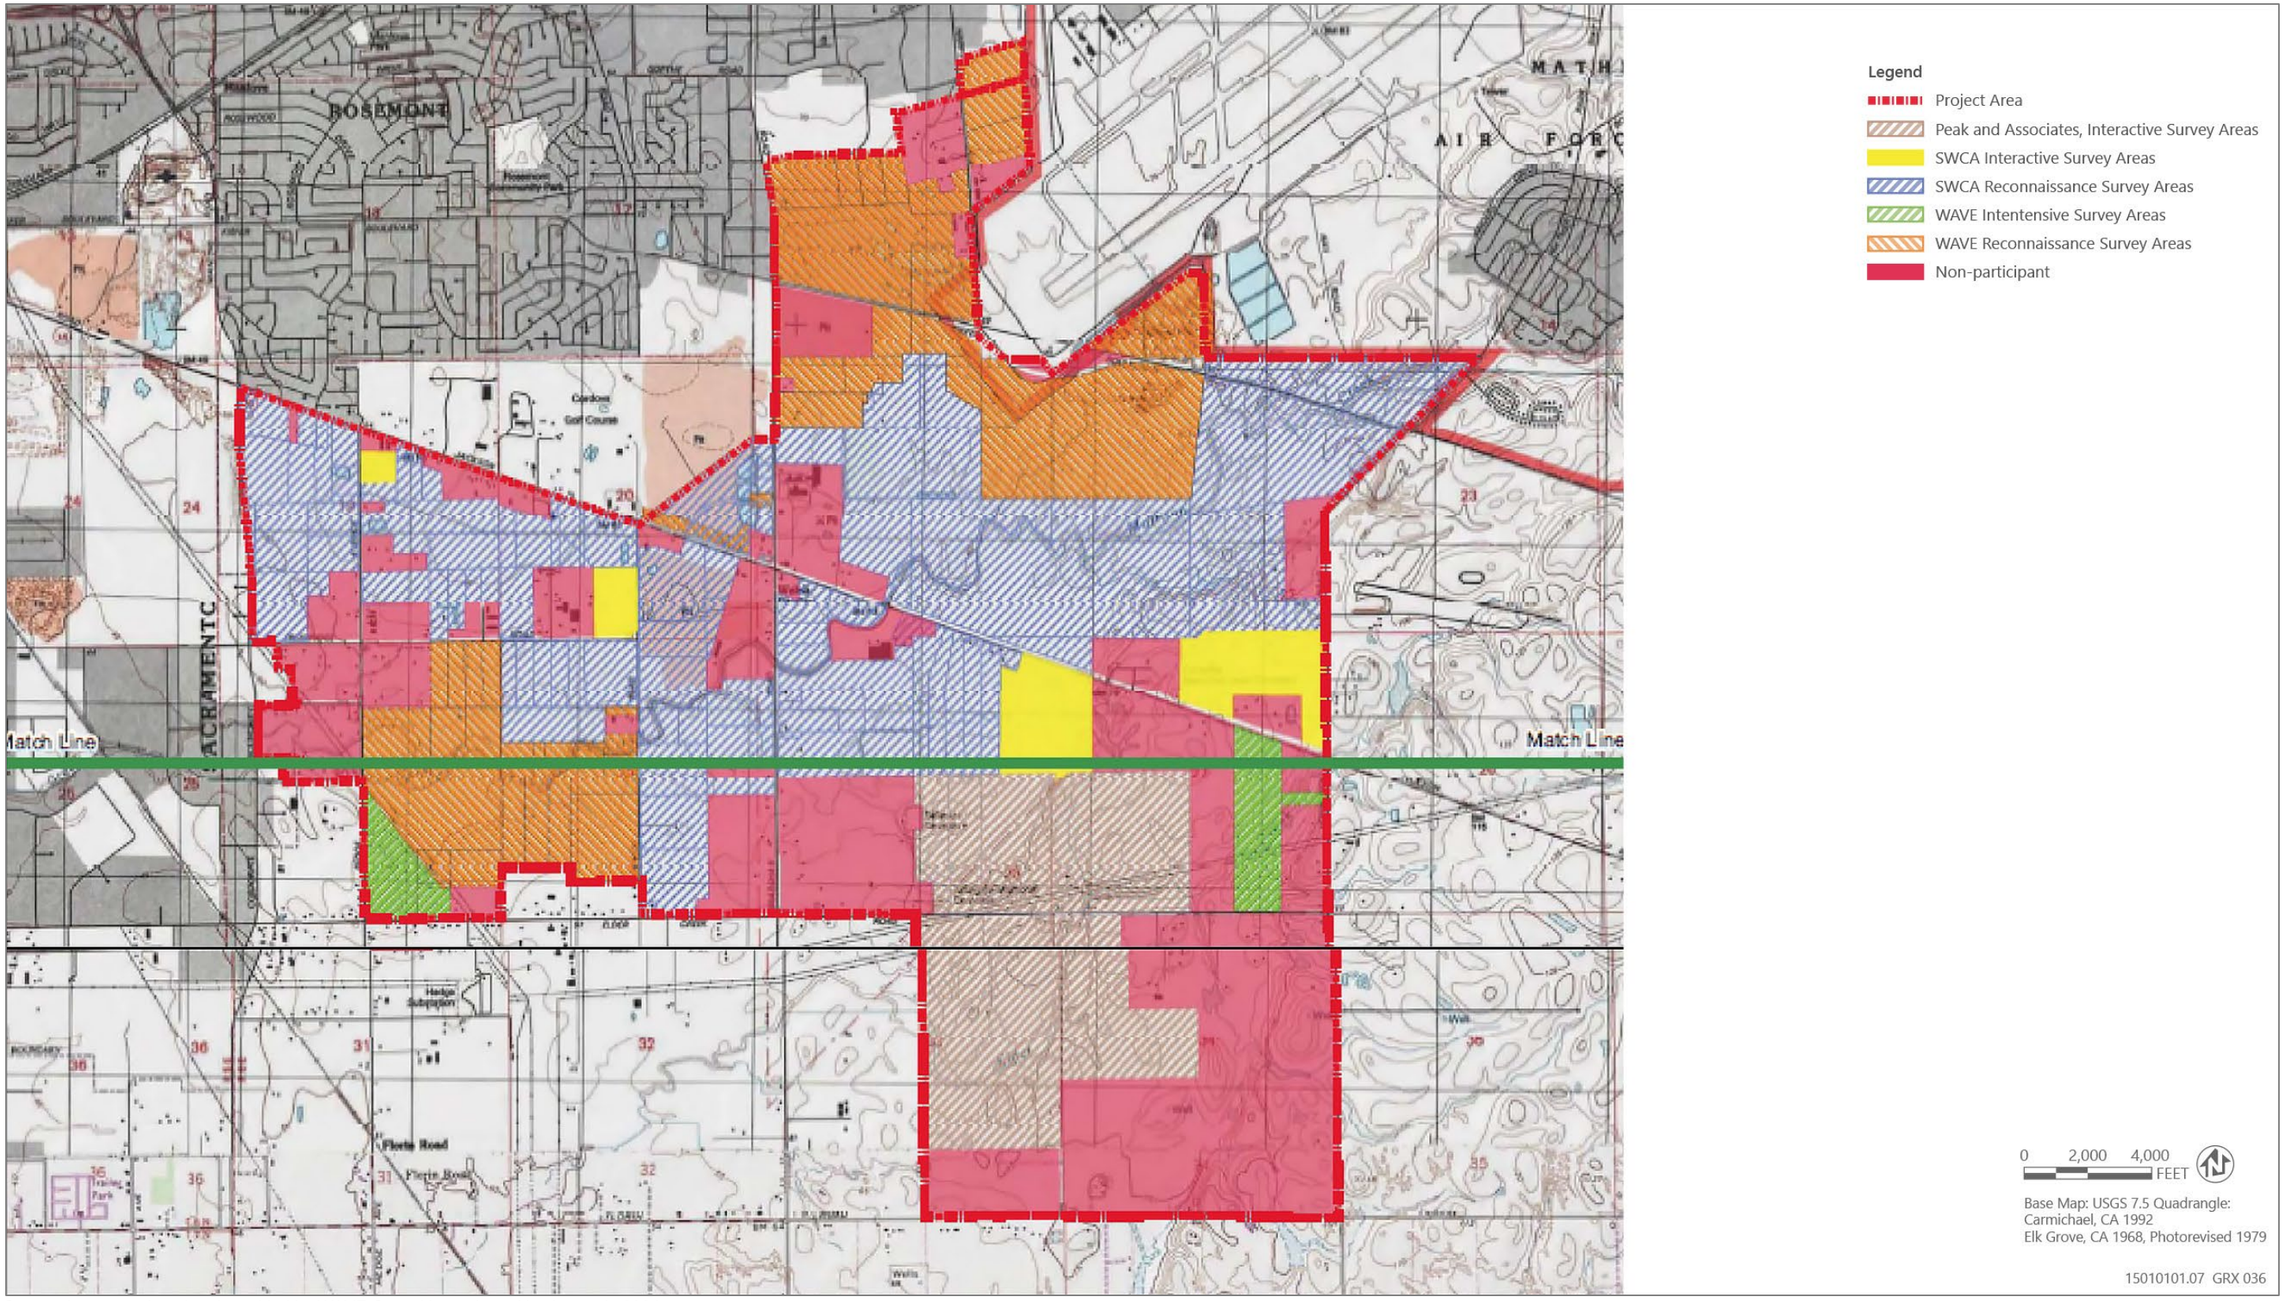
found within the plan area, 16 are historic buildings, three are historic structures (irrigation system, reservoir system, and well system), two are historic artifact scatters, two are historic objects (concrete trough and well/pump system), and one is the foundational remains of an historic farmstead (WAVE 2013: 21).

WAVE also looked at early plat and USGS maps, which can provide additional information regarding historic use of a study area.

Previous Field Assessments

In 2006, Peak & Associates and NORCAL Geophysical Consultants, Inc. conducted surveys of a portion of the plan area (Figure 10-1). A pedestrian survey was completed of the entire site and in select areas ground penetrating radar and trenching was also used to identify potential resources. Three new historic period sites were recorded as a result and documented in their 2007 report, *Determination of Eligibility and Effect for Aspen VIII and Aspen IX Projects, Sacramento County, California*.

In 2009, SWCA conducted a pedestrian survey of a portion of the plan area (Figure 10-1). The results of this effort are documented in their report, *Draft Cultural Resources Survey for the Rock Creek County Phase of the Rock Creek Project, Sacramento, Sacramento County, California*.



In 2013, WAVE archaeologists conducted a pedestrian survey of the plan area (Figure 10-1). The field survey was broken into two methods, one method for mined properties and one method for unmined properties. All previously recorded cultural resources identified during the literature search were re-visited in order to ascertain current resource condition and provide DPR series 523 form updates if necessary (WAVE 2013: 29). Of the 24 previously recorded resources within the plan area, 11 of these resources had been destroyed, six resources were unaltered, four resources were on non-participant properties, two resources were updated by WAVE, and one resource location could not be verified. The pedestrian and reconnaissance surveys conducted by WAVE (during 2013 and for SWCA's 2009 study) did not identify any precontact resources in the plan area. These surveys did not include the non-participant properties.

The results of their field study and review of existing documentation led WAVE to conclude that none of the resources surveyed in the plan area meet the criteria of eligibility for the CRHR or the NRHP and are not considered historical resources or unique archeological resource as defined by CEQA.

West Jackson Highway Master Policies

The proposed WJHMP does not include policies related to cultural or tribal cultural resources.

Figure 10-1 Survey Areas

IMPACTS AND ANALYSIS

This analysis is based on the Cultural Resources Survey of the West Jackson Highway Master Plan, Sacramento County, California (WAVE 2013).

IMPACT CR-1: CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF A BUILT-ENVIRONMENT HISTORICAL RESOURCE

As discussed previously, the results of the field survey and review of prior surveys within the plan area led WAVE to conclude that none of the resources surveyed in the plan area meet the criteria of eligibility for the NRHP or CRHR and are therefore not considered historical resources as defined by CEQA.

There are no previously recorded historical resources on the non-participant properties (see Figure 10-1); however, there are existing and former homesteads that have not been surveyed or evaluated on the non-participant properties. There is a potential that some of these buildings could be historically significant. With implementation of the project, there would be the potential for alteration to or destruction of a building or structure that has not been evaluated as eligible for listing as a historic resource; this could result in a substantial adverse change in its historical significance. Programmatically, the alteration or demolition of these historic age buildings and structures that have not been surveyed and evaluated is potentially significant.

Future environmental analysis, including a survey and evaluation of all previously unevaluated, historic-age buildings and structures, would need to be completed prior to land development. Mitigation is recommended below to ensure that surveys and evaluations are completed for the historic-age buildings and structures within the FPAs. The mitigation would require that historical resources are recorded prior to alteration or demolition. Nevertheless, State CEQA Guidelines Section 15126.4(b)(2) notes that in some circumstances, documentation of a historical resource will not mitigate the effects of demolition of that resource to a less-than-significant level because the historic resources would no longer exist. Therefore, impacts associated with non-participant properties would be **significant and unavoidable**.

MITIGATION MEASURES

MITIGATION MEASURE CR-1: HISTORIC RESOURCE SURVEYS ON NON-PARTICIPANT PROPERTIES PRIOR TO DEVELOPMENT

Prior to the development or redevelopment of non-participant properties, during the entitlement phase or design review, whichever is first, intensive historic resources surveys will be required for all historic-age buildings and structures. Buildings or structures 50 years old or older will be documented on a California Department of Parks and Recreation 523 forms and their significance shall be assessed by a qualified architectural historian and evaluated against National Register of Historic Places and

California Register of Historical Resources criteria. For buildings or structures that do not meet significance and integrity criteria, no further mitigation is required.

If historical resources are determined to be present, then the potential impacts of any proposed future projects must be determined and all appropriate measures will be implemented. If the project cannot avoid modifications to a historic building or structure, the following protocol shall be followed:

(i) If the building or structure can be preserved on-site, but remodeling, renovation or other alterations are required, this work shall be conducted in compliance with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings.

(ii) If a significant historic building or structure is proposed for major alteration or renovation, or to be moved and/or demolished, a qualified architectural historian shall thoroughly document the building and associated landscaping and setting. Documentation shall include still and video photography and a written documentary record of the building to the standards of the Historic American Building Survey or Historic American Engineering Record, including accurate scaled mapping, architectural descriptions, and scaled architectural plans, if available. The record shall be accompanied by a report containing site-specific history and appropriate contextual information. This information shall be gathered through site specific and comparative archival research, and oral history collection as appropriate. A copy of the record shall be provided to the appropriate repositories, which could include the Center for Sacramento History and the North Central Information Center.

IMPACT CR-2: CAUSE A SUBSTANTIAL ADVERSE CHANGE TO AN ARCHAEOLOGICAL RESOURCE

The cultural resource reports, prepared for the majority of the plan area, did not identify any significant archaeological resources. In addition, approximately half of the plan area has been mined for aggregate resources, resulting substantial excavation and ground disturbance that diminishes the potential for future discovery of archeological resources on these sites. However, this does not preclude the possibility of buried archaeological materials or previously undiscovered surface resources within the plan area. In addition, a portion of the plan area has not been surveyed and it is unknown whether there may be archaeological resources. CEQA requires that lead agencies protect both known and unknown resources. This is supported by County General Plan Policies CO-157 and CO-158. Additionally, mitigation is recommended to ensure that all work shall be halted until a qualified archaeologist may evaluate the resource encountered and next steps are identified if significant archaeological resources are discovered in the event that archaeological resources are discovered during implementation phases.

During implementation of future project-specific activities, there remains a potential to encounter buried or as yet undiscovered archaeological resources during land clearing

and construction work. Buried resources may consist of historic remains such as structural features (e.g., foundations, cellars) or buried trash deposits containing glass, ceramics and metal, or the resources may be of precontact origin containing chipped stone, shell, bone, and other remains. Significant impacts could result if a resource is damaged accidentally during construction or removed from its original location. Implementation of mitigation measures would reduce impacts associated with archaeological resources to a **less-than-significant level** because they would require the performance of professionally accepted and legally compliant procedures for the discovery and protection of previously undocumented significant archaeological resources.

MITIGATION MEASURES

MITIGATION MEASURE CR-2A: ARCHAEOLOGICAL SURVEYS

If ground disturbing activities are planned within areas that have not been surveyed for archaeological resources within 5 years, the following shall be required:

1. Future project applicants shall retain an archaeologist meeting the Secretary of the Interior's Professional Standards to conduct intensive archaeological surveys of the site. If archaeological material is discovered, the archaeologist shall prepare a site record, and determine whether it qualifies as a historical resource or a unique archaeological resource under the criteria of CEQA Guidelines Section 15064.5. If the archaeological site does not qualify, or if no resource is present within the project's area of effects, no further mitigation is required. Following field investigations, a technical report describing the survey should be prepared and filed with the appropriate Information Center of the California Historical Resources Information System.

2. Based on this review, if deemed necessary by the qualified professional archaeologist appropriate, a subsurface testing program will be developed and implemented to determine if the property meets criteria to be listed on the CRHR and/or the NRHP. The course of the testing program should be clearly delineated in a research design which outlines prehistory of the area; research domains, questions, and data requirements; research methods inclusive of field and laboratory studies; report preparation; and significance criteria.

3. If, based on the results of field investigations, resources were identified as being significant the following mitigation would apply:

    a. Total Avoidance: Redesign the proposed project to preserve and protect all significant cultural resources. This would reduce impacts to less than significant levels.

    OR, if a redesign is determined infeasible by the Environmental Coordinator, then,

b. Data Recovery: After all design options have been exhausted that would result in the preservation of significant resources, institute a data recovery program to the satisfaction of the Environmental Coordinator.

MITIGATION MEASURE CR-2B: ARCHAEOLOGICAL MONITORING BY AN SOI-QUALIFIED ARCHAEOLOGIST

A cultural resources awareness training program will be provided to all construction personnel active on the project site during earth moving activities. The first training will be provided prior to the initiation of ground disturbing activities. The training will be developed and conducted in coordination with a qualified archaeologist meeting the United States Secretary of Interior guidelines for professional archaeologists. The program will include relevant information regarding sensitive cultural resources, including applicable regulations, protocols for avoidance, and consequences of violating State laws and regulations. The worker cultural resources awareness program will also describe appropriate avoidance and minimization measures for resources that have the potential to be located on the project site and will outline what to do and whom to contact if any potential archaeological resources or artifacts are encountered.

For all initial ground disturbing activities, a qualified archaeologist meeting the United States Secretary of Interior guidelines for professional archaeologists will monitor ground- disturbing activities. The monitor shall complete daily monitoring logs that describe each day's activities, including construction activities, locations, soil, and any cultural materials identified.

MITIGATION MEASURE CR-2C: INADVERTENT DISCOVERIES

If subsurface deposits believed to be cultural in origin are discovered during construction, then all work must halt within a 100-foot radius of the discovery. A qualified professional archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for precontact and historic-period archaeology, shall be retained at the expense of future project applicants to evaluate the significance of the find. If it is determined due to the types of deposits discovered that a Native American monitor is required, the Guidelines for Monitors/Consultants of Native American Cultural, Religious, and Burial Sites as established by the Native American Heritage Commission shall be followed, and the monitor shall be retained at the future project applicants' expense.

Work cannot continue within the 100-foot radius of the discovery site until the archaeologist conducts sufficient research and data collection to make a determination that the resource is either 1) not cultural in origin; or 2) not potentially eligible for listing on the National Register of Historic Places or California Register of Historical Resources.

If a potentially eligible resource is encountered, then the archaeologist, Sacramento County, and the future project applicants shall arrange for either 1) total avoidance of the resource, if possible; or 2) test excavations or total data recovery as mitigation. The determination shall be formally documented in writing and submitted to Sacramento

County Planning and Environmental Review as verification that the provisions of CEQA for managing unanticipated discoveries have been met.

IMPACT CR-3: DISTURB HUMAN REMAINS

Based on documentary research, no evidence suggests that any precontact or historic-period marked or un-marked human interments are present within or in the immediate vicinity of the plan area. However, the location of grave sites and Native American remains can occur outside of identified cemeteries or burial sites. Therefore, there is a possibility that unmarked, previously unknown Native American or other graves could be present within the plan area and could be uncovered by project-related construction activities.

PRC Section 5097.94 and Section 7050 of the California Health and Safety Code protect Native American burials, skeletal remains and grave goods, regardless of age and provide method and means for the appropriate handling of such remains. If human remains are encountered, work would halt in that vicinity and the County coroner would be notified immediately. If the human remains are of Native American origin, the coroner must notify the NAHC within 24 hours of such identification. Sacramento County Policy CO-155 requires that if burials are discovered that they remain in situ whenever possible. Through compliance with existing regulations, this impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

This page is intentionally left blank.

11 ENERGY

INTRODUCTION

This chapter describes the existing conditions for energy in the unincorporated county and evaluates the potential effects that implementation of the project may have on energy. Specifically, this chapter evaluates the potential for the project to result in impacts related to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction and operation, and conflicts with state or local plan for renewable energy or energy efficiency.

Comments submitted in response to the notice of preparation (NOP) related to energy and the potential need for additional electrical infrastructure and the need to preserve some existing infrastructure. These concerns, as applicable, are addressed below. The NOP and comments received in response to it are presented in Appendix A.

EXISTING ENERGY ENVIRONMENTAL SETTING

ENERGY FACILITIES AND SERVICES

ENERGY FACILITIES AND SERVICES IN SACRAMENTO COUNTY

Electric services are provided to the county by the Sacramento Municipal Utility District (SMUD).

ENERGY TYPES AND SOURCES

California relies on a regional power system composed of a diverse mix of natural gas, renewable, hydroelectric, and nuclear generation resources. One-third of energy commodities consumed in California is natural gas. In 2022, renewable resources, including hydroelectric power and small-scale, customer-sited solar power, accounted for 49 percent of California's in-state electricity generation. Natural gas fueled another 42 percent while nuclear power supplied almost all the rest (EIA 2023).

In 2022, SMUD provided its customers with 23 percent eligible renewable energy (i.e., biomass combustion, geothermal, small scale hydroelectric, solar, and wind) and 25 percent and 46 percent from large-scale hydroelectric and natural gas, respectively (CEC 2023a). The contribution of in- and out-of-state power plants depends on the precipitation that occurred in the previous year, the corresponding amount of hydroelectric power that is available, and other factors.

ALTERNATIVE FUELS

A variety of alternative fuels are used to reduce demand for petroleum-based fuel. The use of these fuels is encouraged through various statewide regulations and plans (e.g., Low Carbon Fuel Standard, Assembly Bill (AB) 32 Scoping Plan and subsequent

updates). Conventional gasoline and diesel may be replaced (depending on the capability of the vehicle) with many transportation fuels, including:

- biodiesel,
- electricity,
- ethanol (E-10 and E-85),
- hydrogen,
- natural gas (methane in the form of compressed and liquefied natural gas),
- propane,
- renewable diesel (including biomass-to-liquid),
- synthetic fuels, and
- gas-to-liquid and coal-to-liquid fuels.

California has a growing number of alternative fuel vehicles through the joint efforts of California Energy Commission (CEC), California Air Resources Board (CARB), local air districts, federal government, transit agencies, utilities, and other public and private entities. As of April 2024, California contained nearly 19,000 publicly available alternative fueling stations (AFDC 2024).

Energy Use for Transportation

In 2021, the transportation sector comprised the largest end-use sector of energy in the state totaling 37.8 percent, followed by the industrial sector totaling 23.2 percent, the residential sector at 20.0 percent, and the commercial sector at 19.0 percent (EIA 2023). On-road vehicles use about 90 percent of the petroleum consumed in California. CEC reported retail sales of 448 million and 45 million gallons of gasoline and diesel, respectively, in Sacramento County in 2021 (the most recent data available) (CEC 2023b).

Energy Use and Climate Change

Scientists and climatologists have produced evidence that the burning of fossil fuels by vehicles, power plants, industrial facilities, residences, and commercial facilities has led to an increase of the earth's temperature. For an analysis of greenhouse gas (GHG) production and the project's impacts on climate change, refer to Chapter 9, "Climate Change."

EXISTING ENERGY REGULATORY SETTING

FEDERAL

ENERGY POLICY AND CONSERVATION ACT AND CAFE STANDARDS

The Energy Policy and Conservation Act of 1975 established nationwide fuel economy standards to conserve oil. Pursuant to this act, the National Highway Traffic and Safety Administration, part of the US Department of Transportation (DOT), is responsible for revising existing fuel economy standards and establishing new vehicle economy standards.

The Corporate Average Fuel Economy (CAFE) program was established to determine vehicle manufacturers' compliance with the government's fuel economy standards. Compliance with the CAFE standards is determined based on each manufacturer's average fuel economy for the portion of their vehicles produced for sale in the county. EPA calculates a CAFE value for each manufacturer based on the city and highway fuel economy test results and vehicle sales. The CAFE values are a weighted harmonic average of the EPA city and highway fuel economy test results. Based on information generated under the CAFE program, DOT is authorized to assess penalties for noncompliance. Under the Energy Independence and Security Act of 2007 (described below), the CAFE standards were revised for the first time in 30 years.

ENERGY POLICY ACT OF 1992 AND 2005

The Energy Policy Act of 1992 (EPAct) was passed to reduce the country's dependence on foreign petroleum and improve air quality. The EPAct includes several parts intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. The EPAct requires certain federal, state, and local government and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. In addition, financial incentives are included in the EPAct. Federal tax deductions are allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the act to consider a variety of incentive programs to help promote AFVs. The Energy Policy Act of 2005 provides renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

ENERGY INDEPENDENCE AND SECURITY ACT OF 2007

The Energy Independence and Security Act of 2007 is designed to improve vehicle fuel economy and help reduce US dependence on oil. It represents a major step forward in expanding the production of renewable fuels, reducing dependence on oil, and confronting global climate change. The Energy Independence and Security Act of 2007 increases the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022, which represents a nearly fivefold increase over current levels. It also reduces US

demand for oil by setting a national fuel economy standard of 35 miles per gallon by 2020—an increase in fuel economy standards of 40 percent.

By addressing renewable fuels and the CAFE standards, the Energy Independence and Security Act of 2007 builds upon progress made by the Energy Policy Act of 2005 in setting out a comprehensive national energy strategy for the 21st century.

STATE

WARREN-ALQUIST ACT

The 1974 Warren-Alquist Act established the California Energy Resources Conservation and Development Commission, now known as CEC. The creation of the act occurred as a response to the state legislature's review of studies projecting an increase in statewide energy demand, which would potentially encourage the development of power plants in environmentally sensitive areas. The act introduced state policy for siting power plants to reduce potential environmental impacts and sought to reduce demand for these facilities by directing CEC to develop statewide energy conservation measures to reduce wasteful, inefficient, and unnecessary uses of energy. Conservation measures recommended establishing design standards for energy conservation in buildings, which ultimately resulted in the creation of the Title 24 Building Energy Efficiency Standards (California Energy Code). These standards are updated regularly and remain in effect today. The act additionally directed CEC to cooperate with the Governor's Office of Planning and Research, the California Natural Resources Agency, and other interested parties in ensuring that a discussion of wasteful, inefficient, and unnecessary consumption of energy is included in all CEQA documents required on local projects.

STATE OF CALIFORNIA ENERGY ACTION PLAN

CEC is responsible for preparing the state energy plan, which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The current plan is the 2003 *Energy Action Plan* (2008 update), which calls for the state to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assisting public agencies and fleet operators in implementing incentive programs for zero-emission vehicles and addressing their infrastructure needs, as well as encouraging urban design that reduces vehicle miles traveled (VMT) and accommodates pedestrian and bicycle access.

ASSEMBLY BILL 2076: REDUCING DEPENDENCE ON PETROLEUM

Pursuant to AB 2076 (Chapter 936, Statutes of 2000), CEC and CARB prepared and adopted a joint agency report in 2003, *Reducing California's Petroleum Dependence.* Included in this report are recommendations to increase the use of alternative fuels to 20 percent of on-road transportation fuel use by 2020 and 30 percent by 2030, increase the efficiency of motor vehicles, and reduce per capita VMT (CEC and CARB 2003).

Further, in response to CEC's 2003 and 2005 Integrated Energy Policy Reports (IEPRs), the governor directed CEC to take the lead in developing a long-term plan to increase alternative fuel use.

A performance-based goal of AB 2076 was to reduce petroleum demand to 15 percent below 2003 demand by 2030.

Integrated Energy Policy Report

Senate Bill (SB) 1389 (Chapter 568, Statutes of 2002) required CEC to conduct assessments and forecasts of all aspects of energy industry supply, production, transportation, delivery and distribution, demand, and prices. CEC uses these assessments and forecasts to develop energy policies that conserve resources, protect the environment, ensure energy reliability, enhance the state's economy, and protect public health and safety (PRC Section 25301[a]). This work culminated in preparation of the first IEPR.

CEC adopts an IEPR every 2 years and an update every other year. The 2023 IEPR, which is the most recent IEPR, was adopted February 2024. The 2023 IEPR provides a summary of priority energy issues currently facing the state, outlining strategies and recommendations to further the state's goal of ensuring reliable, affordable, and environmentally responsible energy sources. Energy topics covered in the report include progress toward statewide renewable energy targets and issues facing future renewable development; efforts to increase energy efficiency in existing and new buildings; progress by utilities in achieving energy efficiency targets and potential; improving coordination among the state's energy agencies; streamlining power plant licensing processes; results of preliminary forecasts of electricity, natural gas, and transportation fuel supply and demand; future energy infrastructure needs; the need for research and development efforts to statewide energy policies; and issues facing California's nuclear power plants (CEC 2024).

California Renewables Portfolio Standard

SB X1-2 of 2011 required all California utilities to generate 33 percent of their electricity from renewables by 2020. SB 100 of 2018 sets a three-stage compliance period requiring all California utilities, including independently owned utilities, energy service providers, and community choice aggregators, to generate 52 percent of their electricity from renewables by December 31, 2027; 60 percent by December 31, 2030; and 100 percent carbon-free electricity by December 31, 2045. On September 16, 2022, SB 1020 was signed into law. This bill supersedes the goals of SB 100 by requiring that eligible renewable energy resources and zero-carbon resources supply 90 percent of all retail sales of electricity to California end-use customers by December 31, 2035, 95 percent of all retail sales of electricity to California end-use customers by December 31, 2040, 100 percent of all retail sales of electricity to California end-use customers by December 31, 2045, and 100 percent of electricity procured to serve all state agencies by December 31, 2035.

Senate Bill 350: Clean Energy and Pollution Reduction Act of 2015

The Clean Energy and Pollution Reduction Act of 2015 (SB 350) requires doubling of the energy efficiency savings in electricity and natural gas for retail customers through energy efficiency and conservation by December 31, 2030.

California Building Energy Efficiency Standards (Title 24, Part 6)

The energy consumption of new residential and nonresidential buildings in California is regulated by the California Energy Code. The code was established by CEC in 1978 in response to a legislative mandate to create uniform building codes to reduce California's energy consumption and provide energy-efficiency standards for residential and nonresidential buildings. CEC updates the California Energy Code every 3 years, typically including more stringent design requirements for reduced energy consumption, which results in the generation of fewer GHG emissions.

The 2022 California Energy Code went into effect on January 1, 2023. The 2022 California Energy Code advances the on-site energy generation progress started in the 2019 California Energy Code by encouraging electric heat pump technology and use, establishing electric-ready requirements when natural gas is installed, expanding solar photovoltaic (PV) system and battery storage standards, and strengthening ventilation standards to improve indoor air quality. CEC estimates that the 2022 California Energy Code will save consumers $1.5 billion and reduce GHGs by 10 million metric tons of carbon dioxide-equivalent over the next 30 years (CEC 2022).

California Green Building Standards (Title 24, Part 11)

The California Green Building Standards, also known as CALGreen, is a reach code (i.e., optional standards that exceed the requirements of mandatory codes) developed by CEC that provides green building standards for statewide residential and nonresidential construction. The current version is the 2022 CALGreen Code, which took effect on January 1, 2023. As compared to the 2019 CALGreen Code, the 2022 CALGreen Code strengthened several sections, including those pertaining to electric vehicle (EV) and bicycle parking, water efficiency and conservation, and material conservation and resource efficiency. The CALGreen Code sets design requirements equivalent to or more stringent than those of the California Energy Code for energy efficiency, water efficiency, waste diversion, and indoor air quality. These codes are adopted by local agencies that enforce building codes and used as guidelines by state agencies for meeting the requirements of Executive Order B-18-12.

Legislation Associated with Greenhouse Gas Reduction

The state has passed legislation that aims to reduce GHG emissions. The legislation often has an added benefit of reducing energy consumption. SB 32 requires a statewide GHG emission reduction of at least 40 percent below 1990 levels by no later than December 31, 2030. Executive Order S-3-05 sets a long-term target of reducing statewide GHG emissions by 80 percent below 1990 levels by 2050.

SB 375 aligns regional transportation planning efforts, regional GHG emission reduction targets, and land use and housing allocation. The Advanced Clean Cars II program, approved by CARB in 2023, combines the control of GHG emissions and criteria air pollutants and the increase in the number of zero-emission vehicles into a single package of standards. The program's zero-emission vehicle regulation requires battery, fuel cell, and/or plug-in hybrid electric vehicles to account for up to 100 percent of California's new vehicle sales by 2035.

Implementation of the state's legislation associated with GHG reduction will have the co-benefit of reducing California's dependency on fossil fuel and making land use development and transportation systems more energy efficient.

More details about legislation associated with GHG reduction are provided in the regulatory setting of Chapter 9, "Climate Change."

LOCAL

SACRAMENTO COUNTY 2030 GENERAL PLAN

The following 2030 General Plan policies pertaining to energy use are applicable to the project:

- **Policy EN-5.** Reduce travel distances and reliance on the automobile and facilitate increased use of public transit through appropriate land use plans and regulations.
- **Policy EN-10.** Continue implementation of the Bikeways Master Plan and develop standards for neighborhood bikeways and pedestrian-ways, incorporating them into Neighborhood Planning Standards.
- **Policy EN-11.** Promote the location within the Sacramento area of those industries which are labor intensive, utilize solar energy systems, and are consistent with other policies in terms of environmental protection.
- **Policy EN-12.** Encourage industry located or locating in the Sacramento area to participate in cogeneration of power.
- **Policy EN-14.** Develop or revise design standards relating to building solar orientation, landscaping, impervious surfaces, and parking space requirements to conserve energy.
- **Policy EN-16.** Promote the use of passive and active solar systems in new and existing residential, commercial, and institutional buildings as well as the installation of solar swimming pool heaters and solar water and space heating systems.
- **Policy EN-17.** Support the development and improvement of solar space cooling systems.
- **Policy EN-18.** Develop and implement standards for the protection of the solar rights of property owners.

- **Policy EN-19.** Support the development and use of renewable sources of energy, including but not limited to biomass, solar, wind, and geothermal.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities within the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

Cordova Community Plan

The Cordova Community Plan does not contain objectives related to energy that would apply to the project.

Vineyard Community Plan

The Vineyard Community Plan, which was developed in 1985, provides guidance for growth and development in the community planning area. Policies identified in the plan that are applicable to the project include:

- **Policy FU 6.** Water conservation, waste handling and energy-efficient designs at least to minimum County standards will be encouraged in all residential developments.

Sacramento County Climate Action Planning

On November 9, 2011, the County of Sacramento adopted the Climate Action Plan – Strategy and Framework, which presented a framework for reducing GHG emissions and developing the second phase of the Climate Action Plan (CAP). The County is currently working to develop the Sacramento County Climate Action Plan 2024 (2024 CAP) to address communitywide emissions. The 2024 CAP has not yet been adopted and is, therefore, not applicable to this project. In addition, because crucial laws and regulations, such as AB 1279 and Executive Order B-48-18, have been passed and implemented since the development of the 2011 CAP (the next most-recent iteration of the County's CAP), the GHG reduction goals and strategies in the 2011 CAP are outdated. For this reason, the 2011 CAP is not used in this analysis.

Sacramento County Zoning Code

Sacramento County Zoning Code (Zoning Code) Section 5.9.3.A, Electric Vehicle Parking, contains regulations specific to energy. Specifically, the Zoning Code states that electric vehicle parking spaces shall be provided as required by the California Green Building Standards Code and subject to approval by the Chief Building Inspector. Electric vehicle charging stations above the number required by the Green Building Standards may qualify for parking reductions, as addressed in Section 5.9.5.C.1. Parking spaces designated for electric vehicle charging stations shall be counted toward meeting the minimum parking requirement.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

An impact related to energy resources would be significant if implementation of the project would:

- result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy, or wasteful use of energy resources, during project construction or operation or
- conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

ISSUES NOT DISCUSSED FURTHER

All the issues identified in the significance criteria are addressed in the following analysis.

METHODOLOGY

This analysis utilizes modeling methods and data from an air quality- and GHG-focused technical report prepared for the project by ESA (ESA 2024). See Appendix B for the complete technical report and associated modeling details.

Construction- and operation-related energy consumption by the project was measured in megawatt-hours (MWh) of electricity, million British thermal units (MMBtu) of natural gas, gallons of gasoline, and gallons of diesel fuel. Energy consumption estimates were calculated using a combination of the California Emissions Estimator Model (CalEEMod) version 2020.4.0 computer program and fuel efficiency and consumption estimations for on-road operational vehicles which were derived from EMFAC 2021 data. Where project-specific information was not known, CalEEMod default values based on the project's location were used.

Modeling construction-related fuel consumption requires detailed information about the construction schedule, the number and type of construction equipment used, the daily usage hours of equipment, specific equipment horsepower, and other information that cannot be known at the master plan stage. Therefore, model defaults were utilized and scaled to the approximate fleet size required to carry out construction activities at the plan scale. As the emissions factors for construction equipment represent current data, the construction fuel consumption estimate is considered conservative as it is likely that newly developed construction equipment will become progressively more fuel efficient throughout the 30-year construction period.

The proposed developments under the WJHMP are assumed to be fully built-out in the year 2055. Since CalEEMod version 2020.4.0 only allows the user to enter operational years up to the year 2050, it is not possible to model an operational year 2055 in CalEEMod. Therefore, for the purpose of this analysis, criteria pollutant emissions were

modeled for operational year 2050 using CalEEMod version 2020.4.0. This approach and the resulting emissions estimates are considered conservative as emissions rates will likely be higher in 2050 than in 2055 due to continual improvements in vehicle technology, emission controls, and fuel efficiency.

Regarding operations, VMT data was provided by DKS Associates. Model defaults were used to estimate electricity use based on land use type. Notably, the energy and fuel consumption estimations for on-road operational vehicles from EMFAC 2021 only project out to the year 2050. Therefore, projected energy and fuel consumption by vehicle category for 2050 were used to estimate operational vehicle fuel consumption.

WEST JACKSON HIGHWAY MASTER POLICIES

The WJHMP includes the following guiding goals and objectives related to energy.

- **Policy 9.2.** Future development shall provide access to multi-modal transit opportunities and access to a healthy mix of businesses, childcare, senior services, and housing. This is to encourage development that reduces VMT, decreases distances between jobs and housing, reduces traffic impacts, and improves housing affordability.
- **Policy 10.1.** Any codes, covenants and restrictions (CC&R's) shall permit the installation of facilities to collect, store or utilize solar energy on buildings.
- **Policy 10.3.** All buildings and landscaping shall be designed to conserve water in compliance with the water agency requirements, which may include the use of advanced plumbing fixtures, high efficiency irrigation systems, low water use plant palette, water use monitoring systems and rain water harvesting systems.

IMPACTS AND ANALYSIS

IMPACT EN-1: RESULT IN WASTEFUL, INEFFICIENT, OR UNNECESSARY CONSUMPTION OF ENERGY

CONSTRUCTION ENERGY

Energy would be required to operate construction equipment and to produce and transport construction materials associated with construction of the project. It is assumed that this construction would occur over a period of 30 years with activities commencing in 2025 and concluding in 2055. The one-time energy expenditure required to construct the physical buildings and infrastructure associated with the project would be nonrecoverable. Most energy consumption would result from operation of construction equipment and vehicle trips associated with commutes by construction workers and haul trucks supplying materials. See Table 11-1, below, for an estimate of fuel needed for construction activities associated with the project.

Table 11-1 Construction Energy Consumption

Vehicle Type	Diesel (Gallons)[1]	Gasoline (Gallons)[2]
Annual Project Construction Fuel Consumption		
Off-Road Equipment	123,823	—
On-Road Trucks	809,504	—
Worker Commute Vehicles	—	1,417
Total	**933,326**	**1,417**
Total Project Construction Fuel Consumption (30 Years)		
Off-Road Equipment	3,714,679	—
On-Road Trucks	24,285,115	—
Worker Commute Vehicles	—	**42,500**
Total	**27,999,794**	**42,500**

[1] Diesel gallons include off-road equipment and on-road gallons from worker and vendor trips.

[2] Gasoline gallons include on-road gallons from worker trips.

Source: Modeling conducted by ESA in 2024; calculations by Ascent in 2024.

Approximately 31,618,000 gallons of gasoline and 28,000,000 gallons of diesel would be consumed to enable project construction over the 30-year construction phase. Annually, project construction would consume approximately 1,054,000 gallons of gasoline and 933,000 gallons of diesel. The energy needs for project construction would be temporary and would not be anticipated to require additional capacity or increase peak or base period demands for electricity or other forms of energy. Construction equipment use and associated energy consumption would be typical of that associated with the construction of new residential and commercial projects in a suburban setting.

Building Energy

Implementation of the project would increase electricity consumption in the region relative to existing conditions. The total increase in electricity demand associated with the project is estimated at 407.5 gigawatt hours per year. All development in the plan area would be all-electric and would, therefore, not result in the consumption of natural gas. Consequently, this would result in increased electricity demand. For a list of assumptions made to estimate operational energy consumption, see the full technical report prepared by ESA in Appendix B. Table 11-2, below, provides a summary of the estimated annual energy consumption associated with operation of the project.

Table 11-2 Operational Energy Consumption

Land Use/Energy Type	Energy Consumption	Units
Electricity	407.5	GWh/year
Natural Gas	0	MMBTU/year

Notes: GWh/year = gigawatt-hours per year; MMBTU = million British thermal units.

Source: Modeling conducted by ESA in 2024; calculations by Ascent in 2024.

All development under the proposed project would, at a minimum, be built to meet the 2022 California Energy Code requirements. The 2022 California Energy Code requires the use of efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, and strengthens ventilation standards (CEC 2022). All buildings that would be developed in the plan area would be required to comply with the California Energy Code standards for building energy efficiency. As construction of the land uses proposed under the project proceeds through 2055, the California Energy Code will continue to be updated on a triennial basis with the expectation that the mandatory requirements of the code will require increasingly more stringent energy efficiency requirements. This would result in increased building energy efficiency over time as buildings continue to be developed. Indirect energy use would include wastewater treatment and solid waste removal.

In addition to planning for the development of new commercial and industrial uses, the project would also serve the purpose of creating additional housing in Sacramento County. According to the Sacramento County 2023 Affordable Housing Needs Report prepared by the California Housing Partnership Corporation in collaboration with the Sacramento Housing Alliance, 55,711 low-income renter households in Sacramento County do not have access to an affordable home. Additionally, in 2022 there were only 3,706 beds available in the interim and permanent housing supply for persons experiencing homelessness in Sacramento County (CHPC and SHA 2023). As stated in Chapter 15, “Land Use,” the project is required to accommodate greater than 90 percent of its share of the unincorporated county’s proportional obligation of the regional housing needs allocation (RHNA). Current RHNA obligation is 33.6 percent of the housing stock. Ninety percent of that obligation would require that 30.2 percent of the housing stock in the WJHMP is suitable for low and very-low income units. The project includes 5,660 residential units designated High Density Residential or Mixed Use with target densities of 30 units per acre. This accounts for 34 percent of the units in the WJHMP and satisfies the WJHMP’s share of the County’s overall RHNA obligation. Therefore, the use of energy is necessary to provide additional housing to the region and would not be considered inefficient or wasteful.

Transportation Energy

Residential and commuter trips would make up the majority of VMT associated with the project, while truck trips associated with industrial land uses and occasional maintenance and delivery trips would account for the remaining VMT. The net fuel consumption associated with project-related vehicle trips would not be considered wasteful, inefficient, or unnecessary in comparison to other similar developments in the region. As described further in Chapter 19, “Transportation,” total VMT would be reduced to below County thresholds through the implementation of the WJHMP TMA.

State and federal regulations regarding fuel efficiency standards for vehicles in California are designed to reduce wasteful, inefficient, and unnecessary use of energy for transportation. Additionally, regulations pertaining to EV vehicle use and EV infrastructure would reduce energy consumption over time by reducing the combustion

of fossil fuel used for transportation and increasing the use of electricity generated by renewables for the purpose of powering EVs.

Annual VMT associated with the project would be approximately 1,124,159,173 and would result in fuel demand of an estimated 31,435,834 gallons of gasoline per year and 9,913,396 gallons of diesel per year. Operational transportation-related fuel estimates are summarized in Table 11-3.

Table 11-3 Operational Fuel Use

Source	Gasoline (gal/year)	Diesel (gal/year)
Mobile (Total for Project)	31,435,834	9,913,396

Notes: gal/year = gallons per year.

Source: Modeling conducted by ESA in 2024; calculations by Ascent in 2024.

Summary

The project would increase energy consumption for temporary construction activities related to vehicle use and material transport. However, construction activities would be temporary and would not increase long-term energy or fuel demand. Construction activities would consume the necessary amount of fuel and energy to complete work in an efficient and timely manner. Once operational, the project would increase transportation and building energy demand, as well as provide additional housing in the county by meeting the requirement of the percentage of low and very low-income residential units required by state law per the County's current Housing Element based on the RHNA.

According to Appendix F of the State CEQA Guidelines, the means to achieve the goal of conserving energy include decreasing overall per capita energy consumption, decreasing reliance on oil, and increasing reliance on renewable energy sources.

The Master Plan addresses the topic of energy efficient design and on-site energy production. New residential construction will adhere to the most current Title 24 standards and strive to incorporate the latest green technology. The WJHMP includes goals and objectives to improve energy efficiency and increase the utilization of renewable energy. For example, Objective 4.2.1 aims to maximize energy efficiency through compact development within the plan area while Objective 4.2.3 would increase the utilization of passive energy efficient features such as cool roofs and/or solar PV production. Policy 9.2 requires future development to provide access to multi-modal transit opportunities to reduce VMT and transportation-related energy consumption. Energy consumption associated with the built environment would be reduced through water efficiency requirements (Policy 10.3) and Policy 10.1 establishes that any CC&Rs for future developments in the plan area shall permit the installation of facilities to collect, store or utilize solar energy on buildings. This would increase energy efficiency and, therefore, reduce per capita energy consumption, by increasing the number of people served by energy infrastructure in the plan area. The use of public transit and

alternative modes of transportation would reduce single-occupancy vehicle trips and, therefore, reduce the consumption of fossil fuel for transportation.

Additionally, all development within the WJHMP would be all-electric and would, therefore, not include any natural gas utilities. In terms of utilities, electricity is considered more efficient than natural gas because electricity from the grid may be sourced from renewable sources such as hydroelectric, solar, wind, and geothermal. As stated above under "Existing Energy Environmental Setting," SMUD, which supplies electricity to the project area, provided its customers with 23 percent eligible renewable energy (i.e., biomass combustion, geothermal, small scale hydroelectric, solar, and wind) and 25 percent and 46 percent from large-scale hydroelectric and natural gas, respectively (CEC 2023a). Being that SB 1020 requires that eligible renewable energy resources and zero-carbon resources supply 90 percent of all retail sales of electricity to California end-use customers by December 31, 2035, 95 percent of all retail sales of electricity to California end-use customers by December 31, 2040, and 100 percent of all retail sales of electricity to California end-use customers by December 31, 2045, electricity supplied to the project area would become increasingly renewable over the project's buildout period.

For these reasons, the use of energy for construction and operation (i.e., building and transportation energy) of the project would not be considered wasteful, inefficient, or unnecessary. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT EN-2: CONFLICT WITH OR OBSTRUCT A STATE OR LOCAL PLAN FOR RENEWABLE ENERGY OR ENERGY EFFICIENCY

Relevant plans that pertain to the efficient use of energy include the Energy Efficiency Action Plan, which focuses on energy efficiency and building decarbonization (CEC 2019), as well as the 2022 Scoping Plan. Because the project would be-all electric, would result in increasingly energy efficient buildings, and would reduce VMT by 43,003 compared to the regional average by increasing development density (see Impact TR-3 in Chapter 19, "Transportation"), the project would align with the building decarbonization and fossil fuel reduction goals of both the 2022 Scoping Plan and the Energy Efficiency Action Plan. The WJHMP would, therefore, not impede the implementation of these plans to achieve the state's goals of reducing fossil fuel consumption and increasing energy efficiency.

A key focus of the 2022 Scoping Plan is strategies for reducing California's dependency on petroleum to provide consumers with clean energy options that address climate change, improve air quality, and support economic growth and clean sector jobs. The electricity sector is identified as one of the largest contributors to GHG emissions in the state (CARB 2022: 182). The 2022 Scoping Plan identifies actions needed to achieve the AB 1279 target of 85 percent below 1990 levels by 2045. These actions include transitioning to all electric appliances beginning in 2026 for residential land uses and

2029 for commercial land uses (CARB 2022). The 2022 Scoping Plan also states that vehicles must transition to zero-emission technology to decarbonize the transportation sector (CARB 2022: 185). Therefore, improving energy efficiency and transitioning to all-electric energy in the built environment and transportation sectors is a crucial component to achieving the state's GHG reduction and carbon neutrality goals. As discussed in the preceding impact, although implementation of the project has the potential to result in the overall increase in consumption of energy resources during construction and operation of new buildings and facilities, energy conservation and generation features would be incorporated into new development through compliance with existing regulations (including the installation of energy efficient appliances aligning with the Energy Efficiency Action Plan). These features would also align with the GHG reduction and energy efficiency goals of the 2022 Scoping Plan. Additionally, the 2022 CALGreen requires installation of EV charging stations, which would also align with the goal of reducing fossil fuel consumption set forth in the 2022 Scoping Plan. Similarly, the project includes high-density housing and mixed-use development. This would reduce VMT by decreasing the length of commuter and residential trips as well as by increasing the viability of alternate modes of transportation such as public transportation, walking, and biking. This would align with the VMT reduction goals of both the 2022 Scoping Plan and the Energy Efficiency Action Plan. Furthermore, the project would also align with many of the energy-related policies and implementation measures included in the 2030 General Plan. Specifically, Policy EN-5, which encourages projects that reduce travel distances and reliance on the automobile.

All future buildings under the project would be all electric and would not feature natural gas utilities. The 2022 Scoping Plan identifies the transition away from the use of fossil fuels in all applications as key to the achievement of the goal of reducing statewide GHG emissions (CARB 2022). Because the project would not include natural gas infrastructure, it would align with the fossil fuel reduction goals of the 2022 Scoping Plan. The Energy Efficiency Action Plan identifies decarbonization as one of its primary goals. Building decarbonization is the effort to reduce or eliminate GHG emissions from buildings (CEC 2019). According to the Energy Efficiency Action Plan, buildings account for about 12 percent of statewide direct emissions (emissions generated on-site), primarily from onsite natural gas combustion for space and water heating. By excluding natural gas from future building design, the project would align with the goal of the Energy Efficiency Action Plan to decarbonize buildings. Therefore, the project would not conflict with the Energy Efficiency Action Plan.

Because the project would be all-electric, would result in increasingly energy efficient buildings, and would reduce VMT by increasing development density, the project would align with the building decarbonization and fossil fuel reduction goals of both the 2022 Scoping Plan and the Energy Efficiency Action Plan and would, therefore, not impede the implementation of these plans to achieve the state's goals of reducing fossil fuel consumption and increasing energy efficiency. For these reasons, the project would align with the reduction goals of both the 2022 Scoping Plan and the Energy Efficiency Action Plan. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

12 GEOLOGY, SOILS, AND MINERAL RESOURCES

INTRODUCTION

This chapter describes the geologic and soil setting within the plan area and vicinity, including descriptions of potential geologic hazards and the presence of mineral resources. Paleontological resources are also addressed. The agricultural suitability of the plan area is addressed in Chapter 5, “Agricultural Resources,” of this EIR. No comments regarding geology, soils, or mineral resources were received in response to the notice of preparation.

ENVIRONMENTAL SETTING

REGIONAL GEOLOGY

The present-day landscape of Sacramento County has been shaped over time by the ongoing processes of erosion and deposition. Material eroded from the ancestral Sierra Nevada, formed over 100 million years ago, was deposited onto the Sacramento Valley floor. Approximately 10 to 15 million years ago tectonic uplifts altered the geomorphology of the Sierra Nevada. Glaciation, volcanism, and erosion followed the uplifting, adding layers of sediment to the valley floor. Under the present geologic conditions, the alteration of the local geomorphology continues through stream erosion of the valley sediments and subsequent deposition in adjacent floodplains.

A "geomorphic province" is composed of an area of similar geologic origin and erosional/depositional history. Sacramento County is situated in portions of two geomorphic provinces. By far the largest portion of the county lies in the Great Valley province. A small area in the eastern part of the county is in the Sierra Nevada province. The Great Valley province is further divided into four geomorphic subunits; the plan area is within the Alluvial Plain geomorphic subunit, as described below:

> Alluvial Plain - To the east of the Sacramento River floodplain is an extensive area of former floodplain that has been highly dissected by subsequent stream erosion. This geomorphic subunit is comprised of older, Quaternary, deposits. This area is underlain by soil, which is characterized by layers of hardpan or dense, impervious clay.

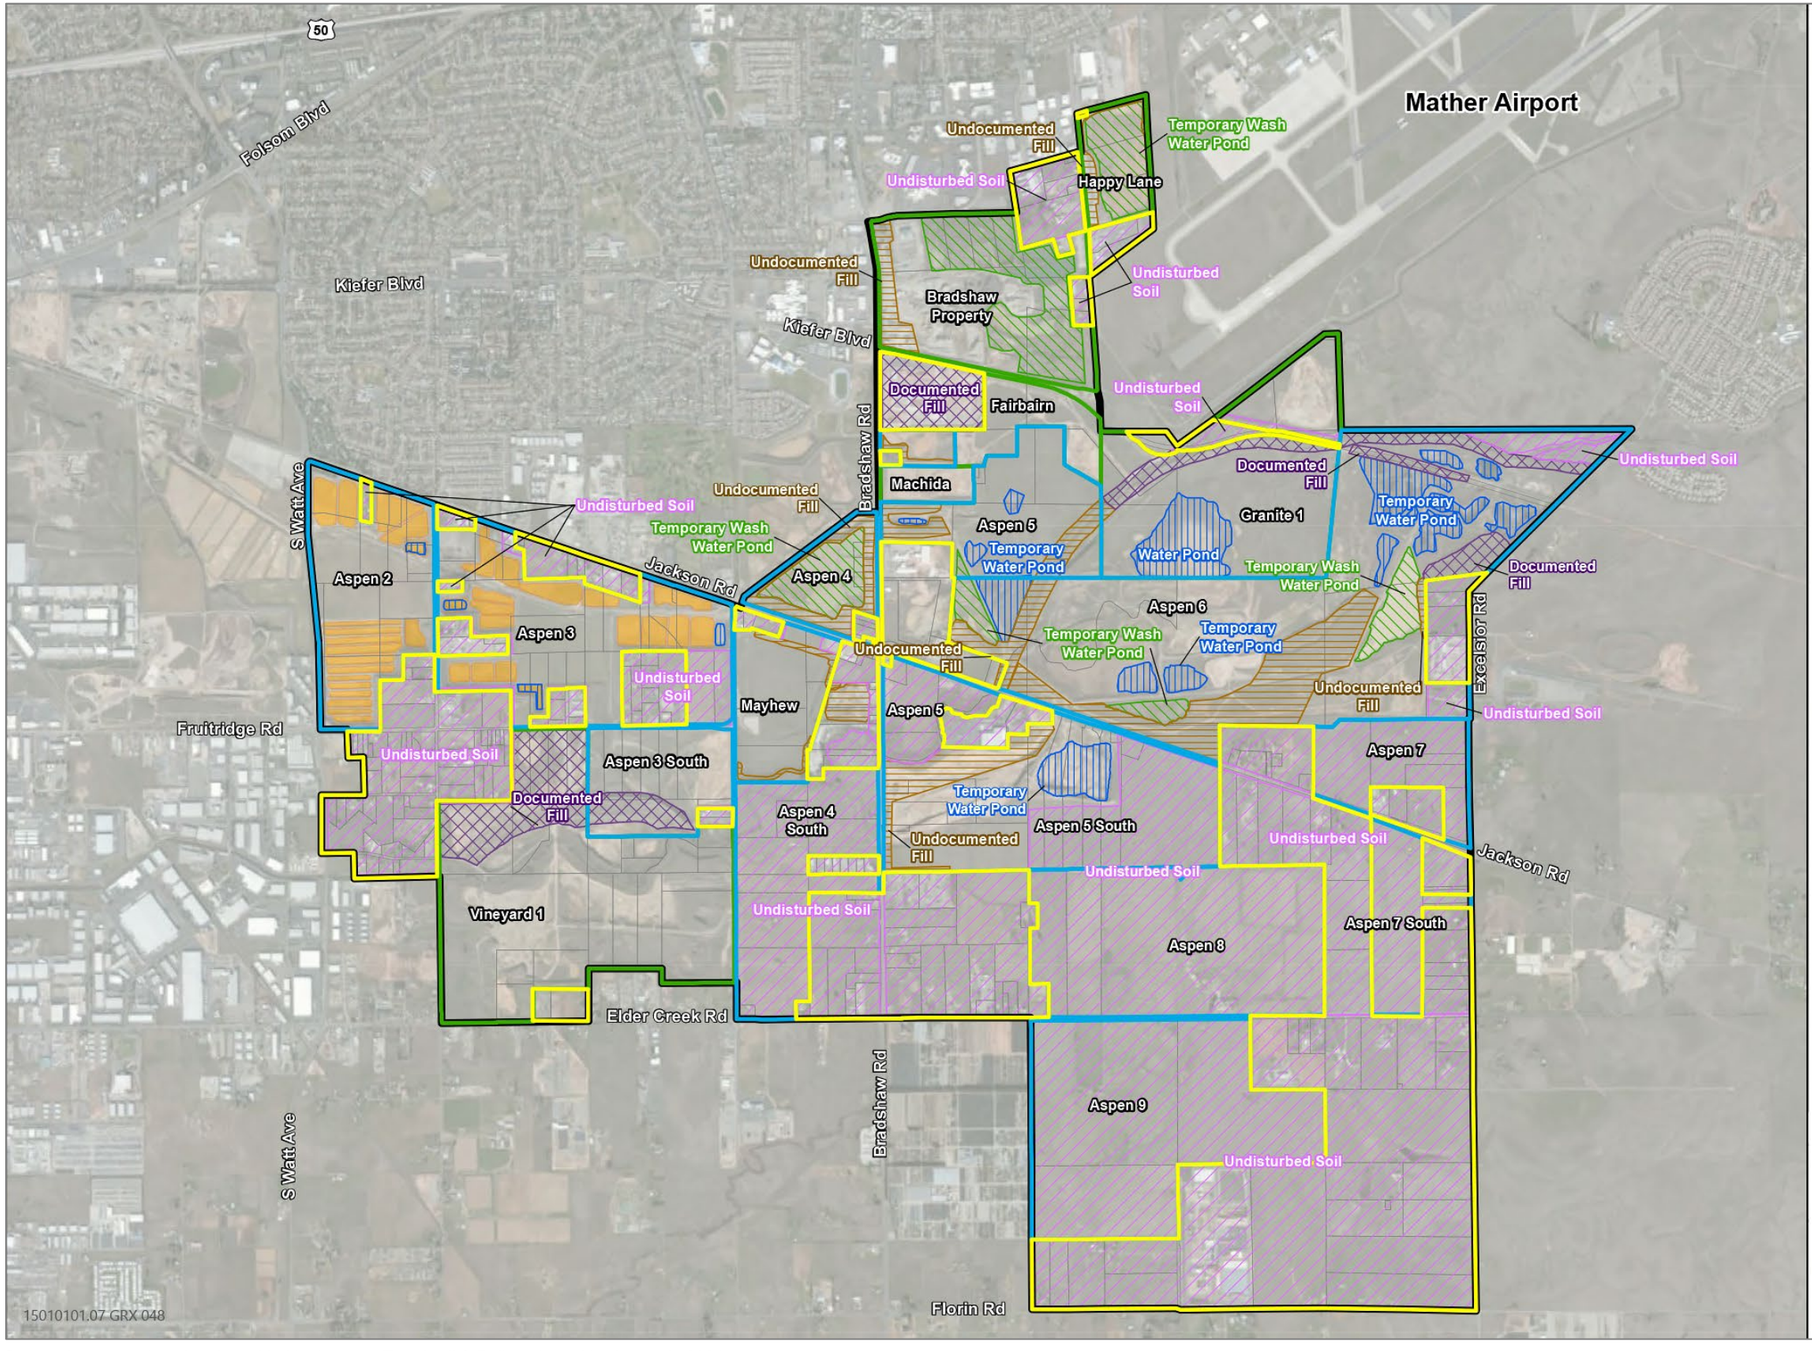
PLAN AREA GEOLOGY

The plan area is located in an area heavily underlain by sediment. Aggregate mining has been a dominant activity near and within the plan area since the 1930s. A large portion of the plan area is still in various stages of gravel mining (e.g., active sand and gravel extraction areas, sedimentation ponds, drying beds, material conveyance, reclamation). A result of past and present mining activity is a landscape characterized by large mining pits with floors that are between 25 and 40 feet below grade with steep

slopes. Some of the mined areas have fill of variable thicknesses. This fill includes documented and undocumented fill, drying beds, and sediment within wash water ponds (see Figure 12-1).

Seismic Hazards

Faults in the Vicinity



Active faults are largely considered those that have had movement within the last 11,000 years (within the Holocene or Historic time periods). There are no active faults located in the county; however, there is one known subsurface, inactive fault in northern Sacramento County, called the Willows Fault, which is in the vicinity of Citrus Heights near Antelope Road and is presumably inactive, with its last activity occurring 1.6 million years ago or longer. In addition to the Willows Fault, there are several subsurface inactive faults in the Delta. The Midland fault extends north from Bethel Island in the Delta to east of Lake Berryessa. Studies done on this fault suggest that activity may have occurred during the Pleistocene age and potentially even the Holocene age (10,000 to 200 years old); however, according to the California Geological Survey (CGS), Holocene activity is unconfirmed. This fault has been identified to be a pre-Quaternary fault (active 1.6 million years ago or longer). Another unnamed Delta fault is located further west of the Midland Fault. It is concealed where it passes beneath the westernmost tip of Sacramento County and may have been active within the past 11,000 years, although exact times of displacement are unknown. Oil and gas companies exploring the Delta area's energy potential have identified several subsurface faults, none of which show any recent surface rupture.

The Bear Mountain fault zone, which is associated with the Foothills Fault system, is located east of Sacramento County and trends northwest-southeast through Amador and El Dorado Counties. The portion of this fault zone closest to the county was last active at least 1.6 million years ago. According to CGS, faults in the Foothills Fault system are largely characterized by very slow slip rates (generally less than 0.01 millimeter per year) and seismic events occur in infrequent intervals.

The nearest known active fault that has been mapped on the C.W. Jennings Fault Activity Map is the Dunnigan Hills Fault located approximately 44 miles to the northwest of the plan area, although evidence of Holocene displacement is questionable (CGS 2010).

Potential for Seismic Activity

The intensity of ground shaking and its potential impact on structures is determined by the physical characteristics of the underlying soil and rock, building materials and workmanship; earthquake magnitude; location of the epicenter; and the character and duration of ground motion. Much of the county is located on alluvium, which increases the amplitude of earthquake waves. Ground motion lasts longer and waves are amplified on loose, water-saturated materials as compared with solid rock. As a result, structures located on alluvium typically suffer greater damage than those located on solid rock.

Figure 12-1 Geotechnical Constraints in the Plan Area

While Sacramento County has experienced relatively little seismic activity, faulting in neighboring regions, especially the San Francisco Bay area and the Sierra Nevada, suggests that the county could be affected by future ground motion originating elsewhere.

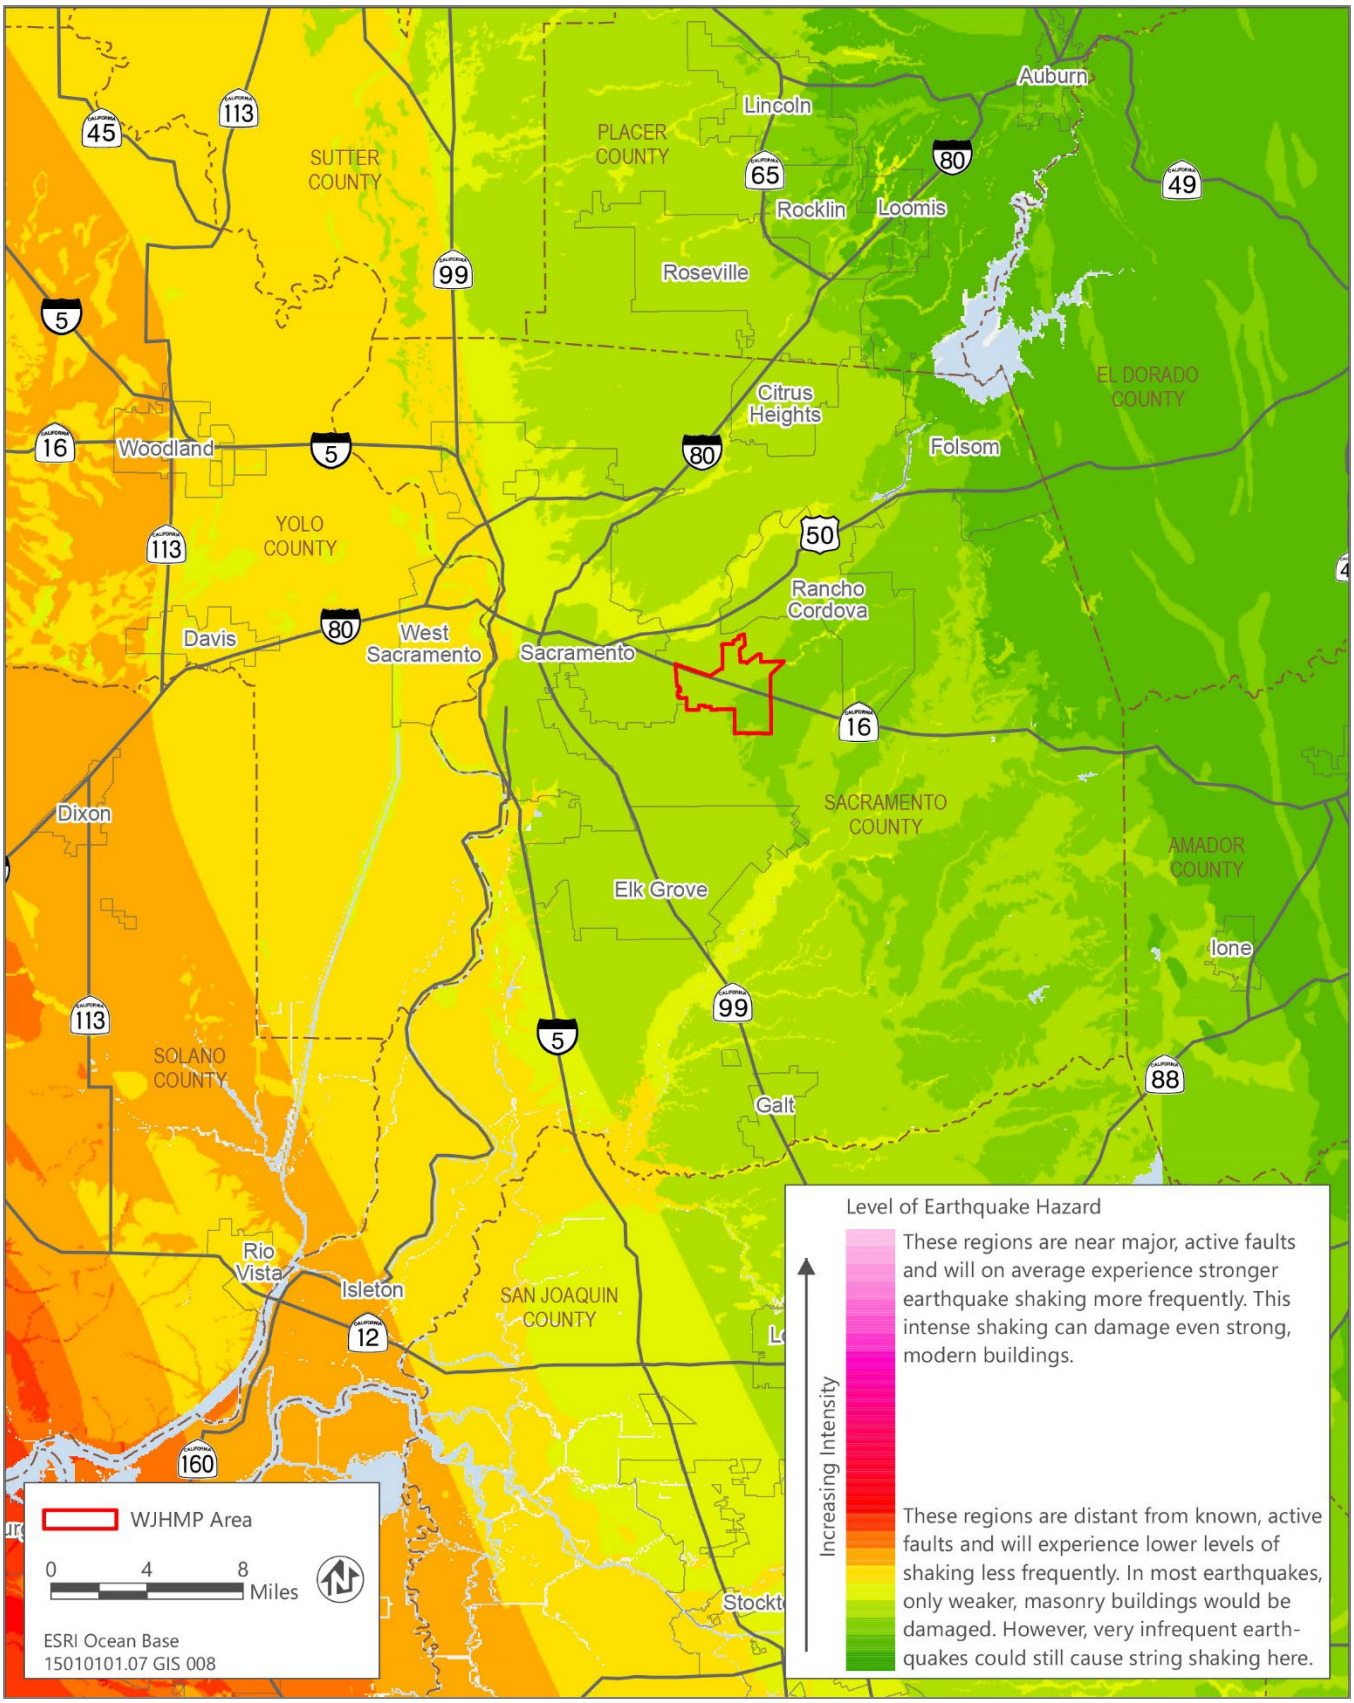
The CGS has prepared a map of the state which shows the earthquake shaking potential of areas throughout California based primarily on an area's distance from known active faults. The map shows the east and central portions of the county in a relatively low intensity groundshaking zone, while the westernmost portion of the county is in a relatively moderate groundshaking zone (see Figure 12-2). The county, including the plan area, is located in an area which is noted to have some of the lowest groundshaking potential in the state.

LIQUEFACTION

Liquefaction is a process whereby the strength and stiffness of a soil is reduced by earthquake shaking or rapid cyclic loading. Sacramento County has two areas that have been suggested as posing potential liquefaction problems - the downtown Sacramento area and the Delta. The plan area is not located within or near the Delta or downtown Sacramento. However, past mining activities within the plan area could have created areas that are vulnerable to liquefaction particularly in areas where there are loose soils such as sedimentation ponds, wash water ponds, and drying beds.

SOILS AND SOIL HAZARDS

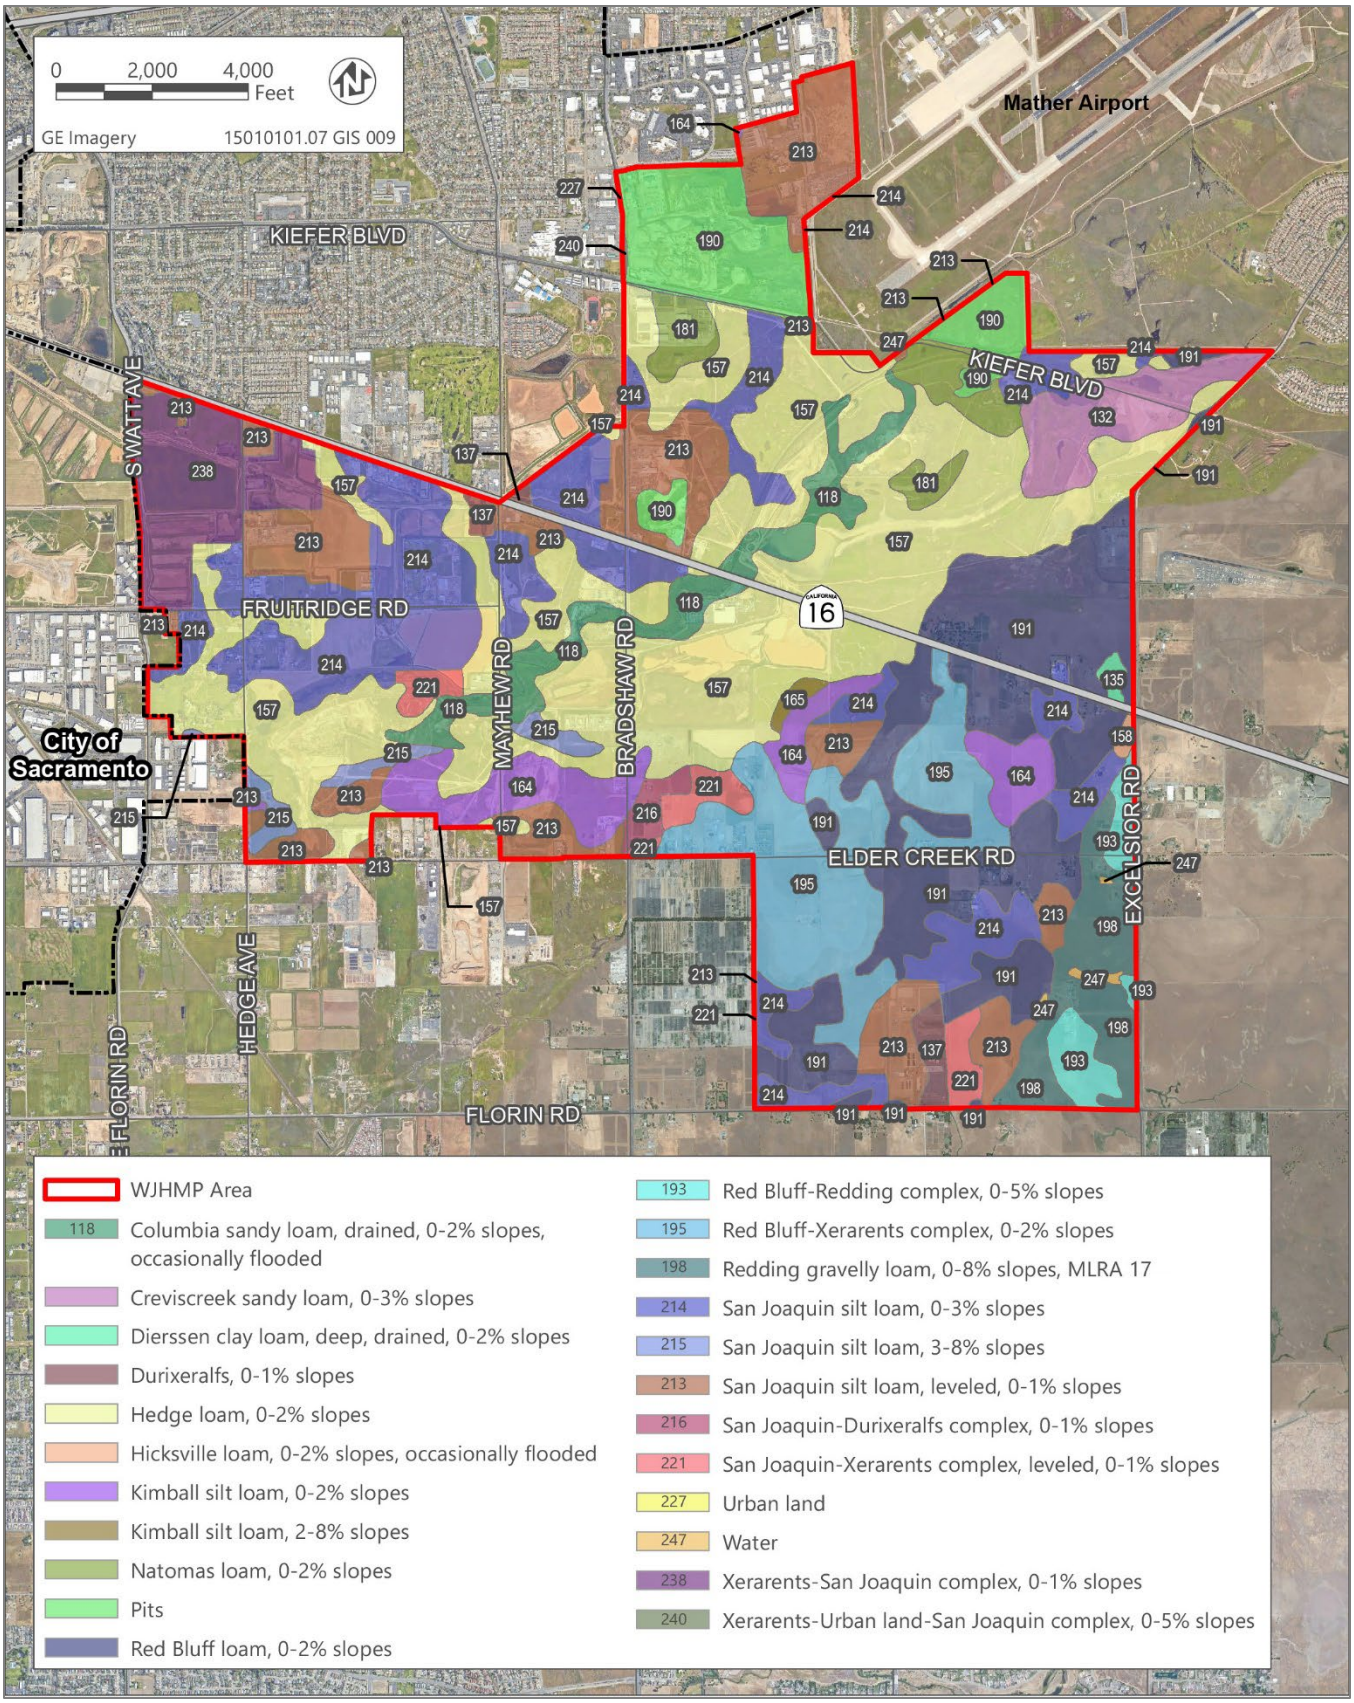
SOIL TYPES



The soils of Sacramento County can be separated into three general classifications based on geographic factors: Delta soils, flood basin soils, and bench soils. The plan area is located within a portion of the county generally underlain by bench soils. Bench soils, elevated above the spreading basins, are river terraces. Due to erosion and leaching, these soils lack the high percentage of organic material found in the Delta and flood basin soils.

GENERAL SOIL MAP UNITS

Soils in Sacramento County can also be divided into eight broad landscape classifications, or groups, which are further divided into 16 soil associations. These soil associations are landscapes that have distinctive patterns of soils, relief, and drainage. The majority of soils located in the plan area are moderately well-drained soils that are moderately deep over a cemented hardpan, and well-drained and moderately well-drained soils that are very deep.



DETAILED SOIL MAP UNITS

Soil types can also be further classified into detailed soil map units, which can be used more specifically to determine the suitability and development potential of specific uses within a soil unit. For example, some soil units may have more potential for erosion or expansion, which may affect what types of land uses or structures are appropriate within that area. Each soil map unit is given a number, as shown in Figure 12-3 and Table 12-1. The plan area contains 20 specific soil units and areas of water, pits, and urban land.

Soil Hazards

Different types of soil have different characteristics, and some may be more suitable for development than others. Based on these characteristics, some soil types may be more prone to certain soil hazards, such as those described below.

Subsidence

Subsidence is the gradual settling or sinking of the earth's surface with little or no horizontal motion. Sacramento County is affected by five types of subsidence: compaction of unconsolidated soils by earthquake shaking, compaction by heavy structures, the erosion of peat soils, peat oxidation, and fluid withdrawal. The pumping of water for residential, commercial, and agricultural uses from subsurface aquifers causes the greatest amount of subsidence in Sacramento County.

Settlement

Settlement (downward soil movement due to settling or weight from above) can cause major structural damage to a building. The plan area is vulnerable to settlement because of the presence of existing fill, drying beds, and wash water ponds. Settlement will occur in fill areas due to the weight of new fill and foundation pressures. Settlement will also occur in drying beds and wash water ponds due to consolidation-related settlement of drying bed material and sediment in wash water ponds. Factors that can influence the extent and rate of settlement include the amount of new fill placed, foundation system type, foundation loads, and thickness of drying bed material where present (LTR 2014: 21).

Expansive Soils

Expansive soils represent approximately one-third of all soil types in Sacramento County. These soils are largely composed of clays, which greatly increase in volume when water is absorbed and shrink when dried. Expansive soils are of concern because building foundations may rise during the rainy season and fall during the dry season in response to the clay's action. If movement varies under different parts of the building, the result is that foundations crack, structural portions of the building are distorted, and doors and windows are warped so that they do not function properly.

The plan area is vulnerable to soil expansion due to the presence of drying beds and wash water ponds. Soil in drying beds and wash water ponds includes sand, clay, and silt with moderate to high expansion potential.

Landslides

Landslide is a general term used for a falling mass of soil and rock. The topography of the unmined area is relatively flat, so the potential for landslide risk would be very low. The plan area does include mining pit slopes which have the potential for landslides, particularly if the slopes are comprised of less stable material. However, mining pit slopes are required to maintain slope stability standards during mining as well as part of quarry reclamation during closure to protect the public safety and the environment, which would reduce the potential for landslide risk.

SOIL EROSION

Erosion is a natural geological process by which landforms are worn down or reshaped by wind and water and the eroded material is deposited elsewhere. While natural erosion of undisturbed areas occurs in Sacramento County, it does not appear to pose a significant hazard to property. The principal area of erosion in the county is along portions of the American River bluffs.

Sacramento County, through grading and drainage ordinances, provides measures to limit or restrict construction practices which might cause erosion. For mining sites within the plan area, the State requires reclamation plans that have site-specific sediment and erosion control criteria that are used for the monitoring and reclamation of these mining sites through the Surface Mining and Reclamation Act (SMARA).

NATURALLY OCCURRING ASBESTOS

Asbestos is a naturally occurring, fibrous silicate mineral mined for its useful properties, such as thermal insulation, chemical and thermal stability, and high tensile strength (greater resistance to longitudinal stress before rupturing). It was at one time commonly used as an acoustic insulator and for thermal insulation in building materials. It is often found occurring naturally in ultramafic rock, a rock closely related to serpentinite, but can also be associated with other rock types in California, though much less frequently than serpentinite and/or ultramafic rock.

Asbestos is classified as a known human carcinogen by state, federal, and international agencies and is identified as a toxic air contaminant. Asbestos poses a health risk only when it becomes friable, such as through disturbance or damage, and can cause serious health problems including lung disease and cancer if inhaled into the lungs.

Because it occurs naturally, asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading for development projects, and at quarry operations (broken or crushed serpentinite and ultramafic rocks) in areas where is occurs. The Sacramento Metropolitan Air Quality Management District (SMAQMD) determined that naturally occurring asbestos is present within areas of eastern Sacramento County, particularly along the county's boundary within El Dorado County, including within the city of Folsom and the unincorporated community of Rancho Murieta. However, all of the areas with naturally occurring asbestos are located east of Grant Line Road. Asbestos is not anticipated to be located within, or in the vicinity of, the plan area.

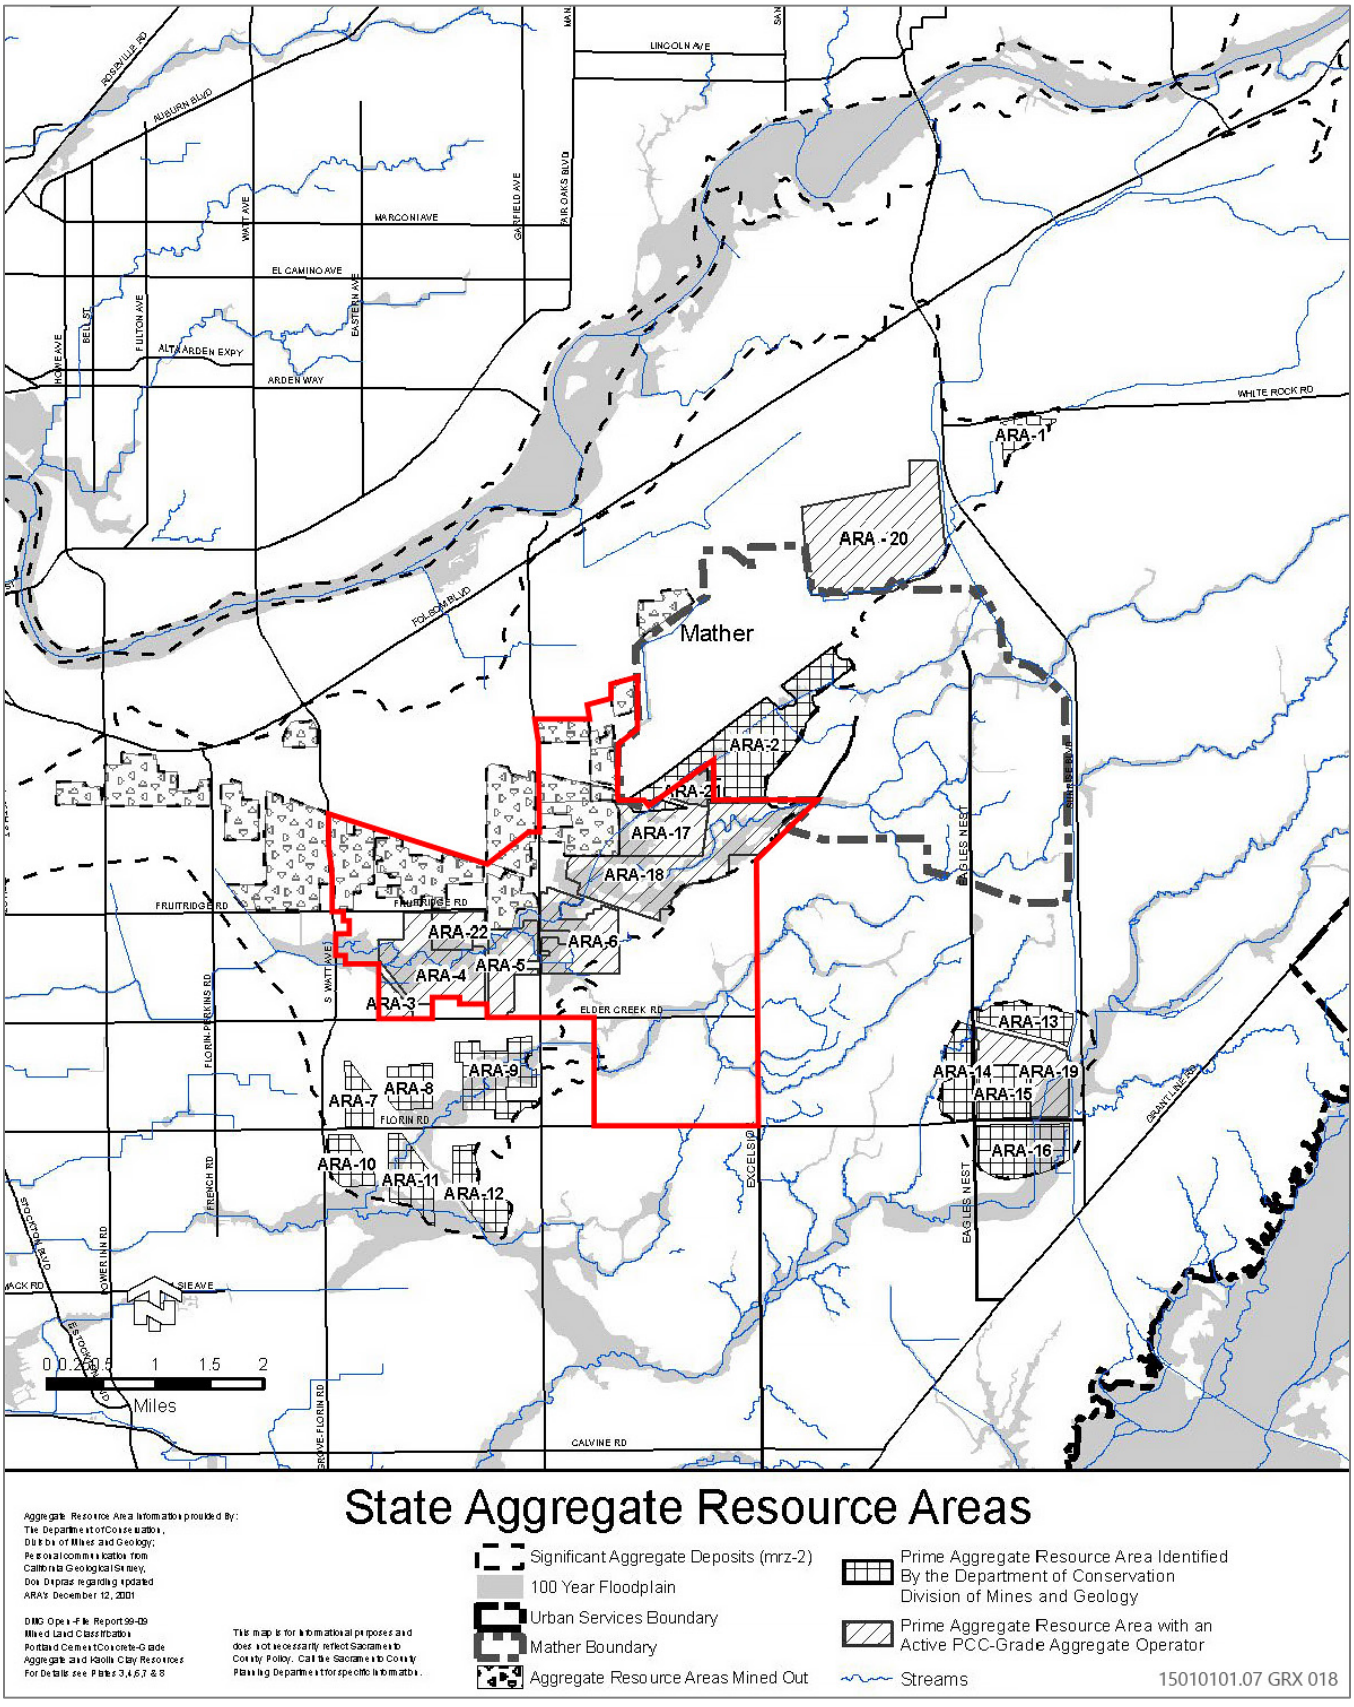
MINERAL RESOURCES

Mineral resources in Sacramento County include sand, gravel, clay, gold, silver, peat, topsoil, lignite, natural gas, and petroleum. The principal resources in production are aggregate (sand and gravel) and natural gas. Resource conservation issues associated with natural gas production and the lesser minerals are not currently considered vital within Sacramento County and conservation issues related to mineral resources focus primarily on aggregate production.

The Aggregate Resource Areas (ARAs) are areas identified by the County as having valuable mineral resources and are to be protected by the County as open space until the area is mined. According to Figure 12-4, approximately two-thirds of the plan area is within an area that has significant aggregate deposits. The western and northern portions of this area have been mined out, but the remainder are still Prime ARAs, as identified by the Department of Conservation.

SMARA requires the State Geologist to classify land into Mineral Resource Zones (MRZ) based on the known or inferred mineral resource potential of that land. MRZs are divided into six categories. The categories for establishing MRZ's are as follows:

MRZ-1: Areas where available geologic information indicates that little likelihood exists for the presence of significant mineral resources.



MRZ-2a: Areas underlain by mineral deposits where geologic data indicate that significant resources are present. Areas classified MRZ-2a contain discovered mineral deposits that are either measured or indicated reserves as determined by such evidence as drilling records, sample analysis, surface exposure, and mine information. Land included in the MRZ-2a category is of prime importance because it contains known economic mineral deposits.

MRZ-2b: Areas underlain by mineral deposits where geologic information indicates that significant inferred resources are present. Areas classified MRZ-2b contain discovered mineral deposits that are significant inferred resources as determined by their lateral extension from proven deposits or their similarity to proven deposits. Further exploration work could result in upgrading areas classified MRZ-2b to MRZ-2a.

MRZ-3a: Areas containing known mineral occurrences of undetermined mineral resource significance. Further exploration work within these areas could result in the reclassification of specific localities into MRZ-2a or MRZ-2b categories. MRZ-3 is divided on the basis of knowledge of economic characteristics of the resource.

MRZ-3b: Areas containing inferred mineral occurrences of undetermined mineral resource significance. Land classified MRZ-3b represents areas in geologic settings that appear to be favorable environments for the occurrence of specific mineral deposits. Further exploration work could result in the reclassification of all or part of these areas into the MRZ-2a or MRZ-2b categories.

MRZ-4: Areas of no known mineral occurrences where geologic information does not rule out either the presence or absence of significant mineral resources.

Source: Conservation Element, Sacramento County General Plan of 2005-2030.

Figure 12-4 Aggregate Resource Areas

As shown in the MRZ definitions above, MRZ-2a and MRZ-2b are the areas containing substantial aggregate resources. These areas contain geologic evidence which indicates that valuable resources are available and are of primary concern. The areas within the plan area identified by Figure 12-4 as Prime ARAs are located in these zones. Mining areas within the plan area are located in MRZ-1.

PALEONTOLOGICAL

The Society of Vertebrate Paleontology (SVP) has established guidelines for the identification, assessment, and mitigation of adverse impacts on nonrenewable paleontological resources (SVP 2010). Most practicing paleontologists in the United States adhere closely to the SVP's assessment, mitigation, and monitoring requirements as outlined in these guidelines, which were approved through a consensus of professional paleontologists and reflect the currently accepted standard practices. Many federal, state, county, and city agencies have either formally or informally adopted the SVP's standard guidelines for the mitigation of adverse construction-related impacts on paleontological resources. The SVP has helped define the value of paleontological resources and, in particular, indicates the following:

- Vertebrate fossils and fossiliferous (fossil-containing) deposits are considered significant nonrenewable paleontological resources and are afforded protection by federal, state, and local environmental laws and guidelines.
- A paleontological resource is considered to be older than recorded history, or 5,000 years before present, and is not to be confused with an archaeological resource.
- Invertebrate fossils are not significant paleontological resources unless they are present within an assemblage of vertebrate fossils or they provide undiscovered information on the origin and character of the plant species, past climatic conditions, or the age of the rock unit itself.
- A project paleontologist, special interest group, lead agency, or local government can designate certain plant or invertebrate fossils as significant.

In accordance with these principles, the SVP outlined criteria for screening the paleontological potential of rock units and established assessment and mitigation procedures tailored to such potential (SVP 2010). Table 12-2 lists the criteria for high-potential, undetermined, and low-potential rock units.

Table 12-2 Paleontological Potential Criteria

Paleontological Potential	Description
High	Geologic units from which vertebrate or significant invertebrate or plant fossils have been recovered. Only invertebrate fossils that provide new information on existing flora or fauna or on the age of a rock unit would be considered significant.
Undetermined	Geologic units for which little to no information is available.
Low	Geologic units that are not known to have produced a substantial body of significant paleontological material.

Source: SVP 2010.

Sacramento County is not located in an area considered to be highly sensitive for paleontological resources present in fossil-bearing soils and rock formations, although few areas are considered sensitive. The plan area is not located within an area considered sensitive paleontological resources and most of the area has been excavated and/or filled. Although not discussed in the SVP standards, artificial fills, surface soils, and high-grade metamorphic rocks do not contain paleontological resources. While such materials were originally derived from rocks, they have been altered, weathered, or reworked such that the discovery of intact fossils would be rare. Therefore, there is little potential for the plan area to contain fossils or paleontological resources (Sacramento County 2010:15-9).

REGULATORY SETTING

FEDERAL

UNIFORM BUILDING CODE

Development within the State of California is required to at least adhere to the provisions of the Uniform Building Code (UBC). The UBC sets forth minimum standards related to development, seismic design, building siting and grading. Local jurisdictions typically adopt standards that are as stringent, if not more stringent, than those of the UBC. California has adopted the UBC but has amended it to better meet the need of the specific conditions of California.

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT AND WASTE DISCHARGE REQUIREMENTS FOR CONSTRUCTION

The National Pollutant Discharge Elimination System (NPDES) permit program in California has been delegated to the SWRCB and RWQCBs. The goal of the NPDES nonpoint source regulations is to improve the quality of stormwater discharged to receiving waters to the “maximum extent practicable” through the use of best management practices (BMPs). Compliance with the NPDES General Construction Permit requires that any construction activity affecting 1 acre or more obtain the General Construction Activity Storm Water Permit. Permit applicants are required to submit a notice of intent to the SWRCB and to prepare a stormwater pollution prevention plan

(SWPPP), which identifies BMPs that will be implemented to reduce construction effects on receiving water quality. The BMPs include sediment and erosion control measures and other measures to control potential chemical contaminants. Examples of construction BMPs identified in SWPPPs include: using temporary mulching, seeding, or other stabilization measures to protect uncovered soils; storing materials and equipment to ensure that spills or leaks cannot enter the storm drain system or surface water; developing and implementing a spill prevention and cleanup plan; installing traps, filters, or other devices at drop inlets to prevent contaminants from entering storm drains; and using barriers, such as straw wattles or silt fencing, to minimize the amount of uncontrolled runoff that could enter drains or surface water.

Construction activities subject to the general construction activity permit include clearing, grading, stockpiling, and excavation. Dischargers are required to eliminate or reduce nonstormwater discharges to storm sewer systems and other waters. The permit also requires dischargers to consider the use of post-construction permanent BMPs that would remain in service to protect water quality throughout the life of the project. All NPDES permits also have inspection, monitoring, and reporting requirements. The General Permits also require permittees to develop a Construction Site Storm Water Runoff Control Program and a Post Construction Storm Water Management Program.

State

Alquist-Priolo Earthquake Fault Zoning Act

The 1972 Alquist-Priolo Earthquake Fault Zoning Act regulates development near active faults to mitigate the hazard of surface fault rupture. Under this act, the State Geologist is required to delineate earthquake fault zones along known active faults in California. Cities and counties affected by these zones must regulate certain developments within these zones and withhold development permits for sites until geologic investigations demonstrate that they are not threatened by surface displacements from future faulting. For the purposes of this act, an active fault is defined as a fault that has “had surface displacement within Holocene time” (about the last 11,000 years). Sacramento County is not affected by Earthquake Fault Zones.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 requires the State Geologist to delineate liquefaction and earthquake-induced landslide hazard zones in the state. Cities and counties affected by these hazard zones must regulate certain developments within these zones and withhold development permits for sites until geologic investigations demonstrate they are not threatened by liquefaction, earthquake, or induced landsliding during future earthquakes. Sacramento County is located outside of the Seismic Hazard Mapping Zones (CGS 2023).

California Uniform Building Code

The California Uniform Building Code (CBC) contains the minimum standards for design and construction in California. All development in California is subject to the regulations of

the CBC. Local standards other than the code may be adopted if those standards are stricter. The code adopts all the standards associated with seismic engineering detailed in the UBC. The CBC is adopted and incorporated into Title 16 of the Sacramento County Code and all construction, alteration, moving, demolition, repair and use of any building or structure within Sacramento County shall be made in conformance with the CBC.

Surface Mining and Reclamation Act

SMARA establishes state policy for the reclamation of mined lands and the conduct of surface mining operations to minimize adverse environmental impacts and to reclaim mined land to a usable condition. SMARA is comprised of two primary elements that together govern the reclamation of mined lands:

- California Surface Mining Reclamation Act of 1975, as amended (Public Resource Code §2710 et seq.); and
- State Mining and Geology Board implementing regulations (California Code of Regulations, Title 14, §3500 et seq.).

This law and its implementing regulations require review and enforcement of mandated reclamation plans for each mine. These plans are required to identify the proposed or potential end uses that mined land will be returned to after completion of mining. Financial assurances (guarantees, such as a performance bond or letter of credit) are required to be posted by the operator with the County to ensure that reclamation can still be accomplished in the case of abandonment or in the event that the mine operator does not fulfill its reclamation obligations. SMARA also requires that an annual inspection be conducted to review the progress of reclamation, compliance with an approved reclamation plan, and to ensure that the financial guarantee amount is appropriate.

SMARA reclamation plans are required to have the following components that are related to geology and soils of mining sites:

- A map showing the existing and final topography of the mined lands.
- A description of measures to protect public health and safety.
- A description of proposed or potential end uses.
- A description of the impact of reclamation on future mining in the area.
- A description of the environmental setting of the mine, including geology, soils, and seismicity.
- A description of the effects of reclaimed conditions on surrounding land uses.
- A demonstration that final slopes will have a minimum factor of safety for the end use.
- A description of the manner in which backfilling, regrading, slope stabilization, scarification, ripping, and recontouring will occur.
- A description of drainage, sediment, and erosion control measures, with an emphasis on protecting surrounding land and water resources.

- A description of the manner in which topsoil will be salvaged and resoiling will occur.
- A description of the manner in which the site will be revegetated, including performance standards and monitoring.

Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations

The California Air Resources Board has adopted an Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations (17 CCR 93105). SMAQMD has mapped areas of serpentine and ultramafic rock in eastern Sacramento County and determined that these areas are subject to the ATCM (SMAQMD 2017). The plan area is not in the portion of the county subject to the ATCM.

NPDES Construction General Permit for Stormwater Discharges Associated with Construction Activity

Dischargers whose projects disturb 1 or more acres of soil, or whose projects disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 or more acres, are required to obtain coverage under SWRCB's Construction General Permit (Order WQ 2022-0057-DWQ). Construction activity subject to this permit includes clearing, grading, and disturbances to the ground, such as stockpiling or excavation.

Coverage under the Construction General Permit is obtained by submitting permit registration documents to SWRCB that include a risk-level assessment and a site-specific storm water pollution prevention plan (SWPPP) that identifies an effective combination of erosion control, sediment control, and non-stormwater best management practices (BMPs). The Construction General Permit requires that the SWPPP define a program of regular inspections of the BMPs and, in some cases, sampling of water quality parameters.

NPDES Industrial General Permit for Stormwater Discharges Associated with Industrial Activity

Businesses, including but not limited to manufacturing, mining, recycling, salvage, auto dismantling, transportation with on-site maintenance or fueling, hazardous waste storage or treatment, and cement production, are required to obtain coverage under the State General Industrial Permit (SWRCB's Water Quality Order No. 97-03-DWQ). The State of California requires that these facilities file a Notice of Intent (NOI), which is an application for permit coverage, and develop a SWPPP, as well as conduct monitoring and sampling to determine if pollutants are leaving the facility in stormwater runoff.

Local

Land Grading and Erosion Control

The Sacramento County Land Grading and Erosion Control Ordinance (Sacramento County Code Ch. 16.44) was established to minimize damage to surrounding properties

and public rights-of-way; limit degradation to the water quality of watercourses; and curb the disruption of drainage system flow caused by the activities of clearing, grubbing, grading, filling, and excavating land. The ordinance establishes administrative procedures, minimum standards of review, and implementation and enforcement procedures for the control of erosion and sedimentation that are directly related to land grading activities.

Surface Mining Ordinance

The County's Surface Mining Ordinance is established in Chapter 20.04 of the County Code. The purpose and intent of Chapter 20.04 of the County Code is to ensure the continued availability of important mineral resources, while regulating surface mining operations as required by SMARA, PRC Section 2007 (relating to annual reporting requirements), and State Mining and Geology Board regulations for surface mining and reclamation practice, to ensure that:

- Adverse environmental effects are prevented or minimized and mined lands are reclaimed to a usable condition which is readily adaptable for alternative land uses.
- The production and conservation of minerals are encouraged, while giving consideration to values relating to recreation, watershed, wildlife, range and forage, and aesthetic enjoyment.
- Residual hazards to public health and safety are eliminated.

Sacramento County 2030 General Plan

The following 2030 General Plan policies pertaining to geology and soils are applicable to the project.

- **Policy SA-1.** The County shall require geotechnical reports and impose the appropriate mitigation measures for new development located in seismic and geologically sensitive areas.
- **Policy AG-28.** The County shall actively encourage conservation of soil resources.
- **Policy CO-161.** As a condition of approval for discretionary projects, require appropriate mitigation to reduce potential impacts where development could adversely affect paleontological resources.
- **Policy CO-162.** Projects located within areas known to be sensitive for paleontological resources, should be monitored to ensure proper treatment of resources and to ensure crews follow proper reporting, safeguards and procedures.
- **Policy CO-163.** Require that a certified geologist or paleoresources consultant determine appropriate protection measures when resources are discovered during the course of development and land altering activities.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community Plans relevant to the WJHMP are the Cordova Community Plan and the Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan does not contain specific policies related to geology, soils, or mineral resources.

VINEYARD COMMUNITY PLAN

- **Policy NER 7.** Continue to utilize the Surface Mining Combining Zone for the preservation of aggregate resources and for the protection of area residents through mitigation provisions contained within that zone.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

Impacts to geology, soils, and mineral resources would be significant if implementation of the project would:

- directly or indirectly cause potentially substantial adverse effects, including the risk of loss, injury, or death involving:
    - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist of the area or based on other substantial evidence of a known fault,
    - strong seismic ground shaking,
    - seismic-related ground failure, including liquefaction,
    - landslides, or
    - unsafe exposure to naturally occurring asbestos;
    - result in substantial soil erosion or the loss of topsoil;
- be located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;
- be located on expansive soil as defined in Table 18-1-B of the Uniform Building Code, creating substantial direct or indirect risks to life or property;

- have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water;
- directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, or
- result in the loss of availability of a known mineral resource that would be of value to the region or the state or a locally important mineral resource recovery site delineated on a land use plan.

ISSUES NOT DISCUSSED FURTHER

ADVERSE EFFECTS ASSOCIATED WITH RUPTURE OF AN EARTHQUAKE FAULT, SEISMIC GROUND SHAKING, SEISMIC-RELATED GROUND FAILURE, OR LANDSLIDES

There are no known earthquake faults located within the plan area, or in the vicinity, so there would be no risk of fault rupture. In addition, Sacramento County is in one of the areas least prone to earthquake shaking potential, as depicted in Figure 12-2. Further, compliance with the Uniform Building Code would ensure that buildings are built to withstand minor groundshaking. Though there is topographical variation on the site, there are no major bluffs or other features that would make the plan area susceptible to damage related to landslides. Based on the existing regulatory framework that governs new development within Sacramento County, which addresses safety issues and requires that development adhere to the CBC and other relevant policies, regulations, and design standards related to seismic activity, seismically induced groundshaking effects are not expected to be substantial hazards. The project would not exacerbate any risk of exposure of people or structures to adverse effects related to fault rupture, strong seismic ground-shaking, or landslides. Therefore, the potential for these geologic hazards will not be discussed further in this chapter.

It is also important to note that environmental impact analyses under CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents unless the project might cause or risk exacerbating environmental hazards or conditions that already exist (CCR Section 15126.2[a]). In those specific instances, it is the project's impact on the environment and not the environment's impact on the project that compels an evaluation of how future residents or users may be affected by exacerbated conditions (*California Building Industry Association v. Bay Area Air Quality Management District* [2015] 62 Cal. 4th 369). Project construction and operation would not create new seismic events or exacerbate existing seismic hazards, because the project improvements would involve limited excavation that would not alter existing geologic, seismic, and fault conditions in the region.

EXPOSURE TO NATURALLY OCCURRING ASBESTOS

The plan area is not located in or near an area with naturally occurring asbestos. There is no potential for substantial adverse effects due to naturally occurring asbestos exposure and this topic is not discussed further.

USE OF SEPTIC TANKS OR ALTERNATIVE WASTEWATER DISPOSAL SYSTEMS

All future development within the plan area would be connected to the public sewer system, and the use of septic tanks or alternative wastewater disposal systems would not be required. As a result, there would be no impact involving septic systems.

METHODOLOGY

In general, the geotechnical characteristics of the plan area determine the potential for structural and safety hazards, as well as mineral resource impacts that could occur with development of the project. Existing conditions data was summarized from the previously identified documents and resources as well as geotechnical reports prepared by LTR which can be found in Appendix G of this EIR. LTR has divided its analysis between participant properties (i.e., the applicant-controlled properties in Districts 1 and 2) and non-participant properties in the Future Planning Areas. The project was analyzed in terms of its consistency with Sacramento County General Plan policies and potential for geologic or soils-related hazards to people and property in the plan area, as well as potential for mineral resource impacts.

WEST JACKSON HIGHWAY MASTER POLICIES

The proposed WJHMP does not include policies related to geology, soils, and mineral resources.

IMPACTS AND ANALYSIS

IMPACT GS-1: EXACERBATE UNSTABLE SOIL CONDITIONS

The results of LTR's preliminary geotechnical investigation showed that in general the fill and native soil within the plan area are not saturated and are "sufficiently stiff and dense to resist soil liquefaction, lateral spreading[1], and cyclic densification[2] with the exception of sediments in wash water ponds." The locations of the wash water ponds are shown in Figure 12-1. Some of the sediments in the wash water ponds in mining sites may consist of fine grained, loose silty sand and sand. However, the magnitude of liquefaction-induced settlements in the wash water ponds has not been evaluated. Therefore, mitigation for these areas should include prohibiting development in former wash pond areas until the magnitude of potential liquefaction in these areas is evaluated (LTR 2014: 20-21). Common geotechnical practices and soil conditioning could be used to effectively remediate the liquefaction potential. Impacts would be **less than significant with mitigation**.

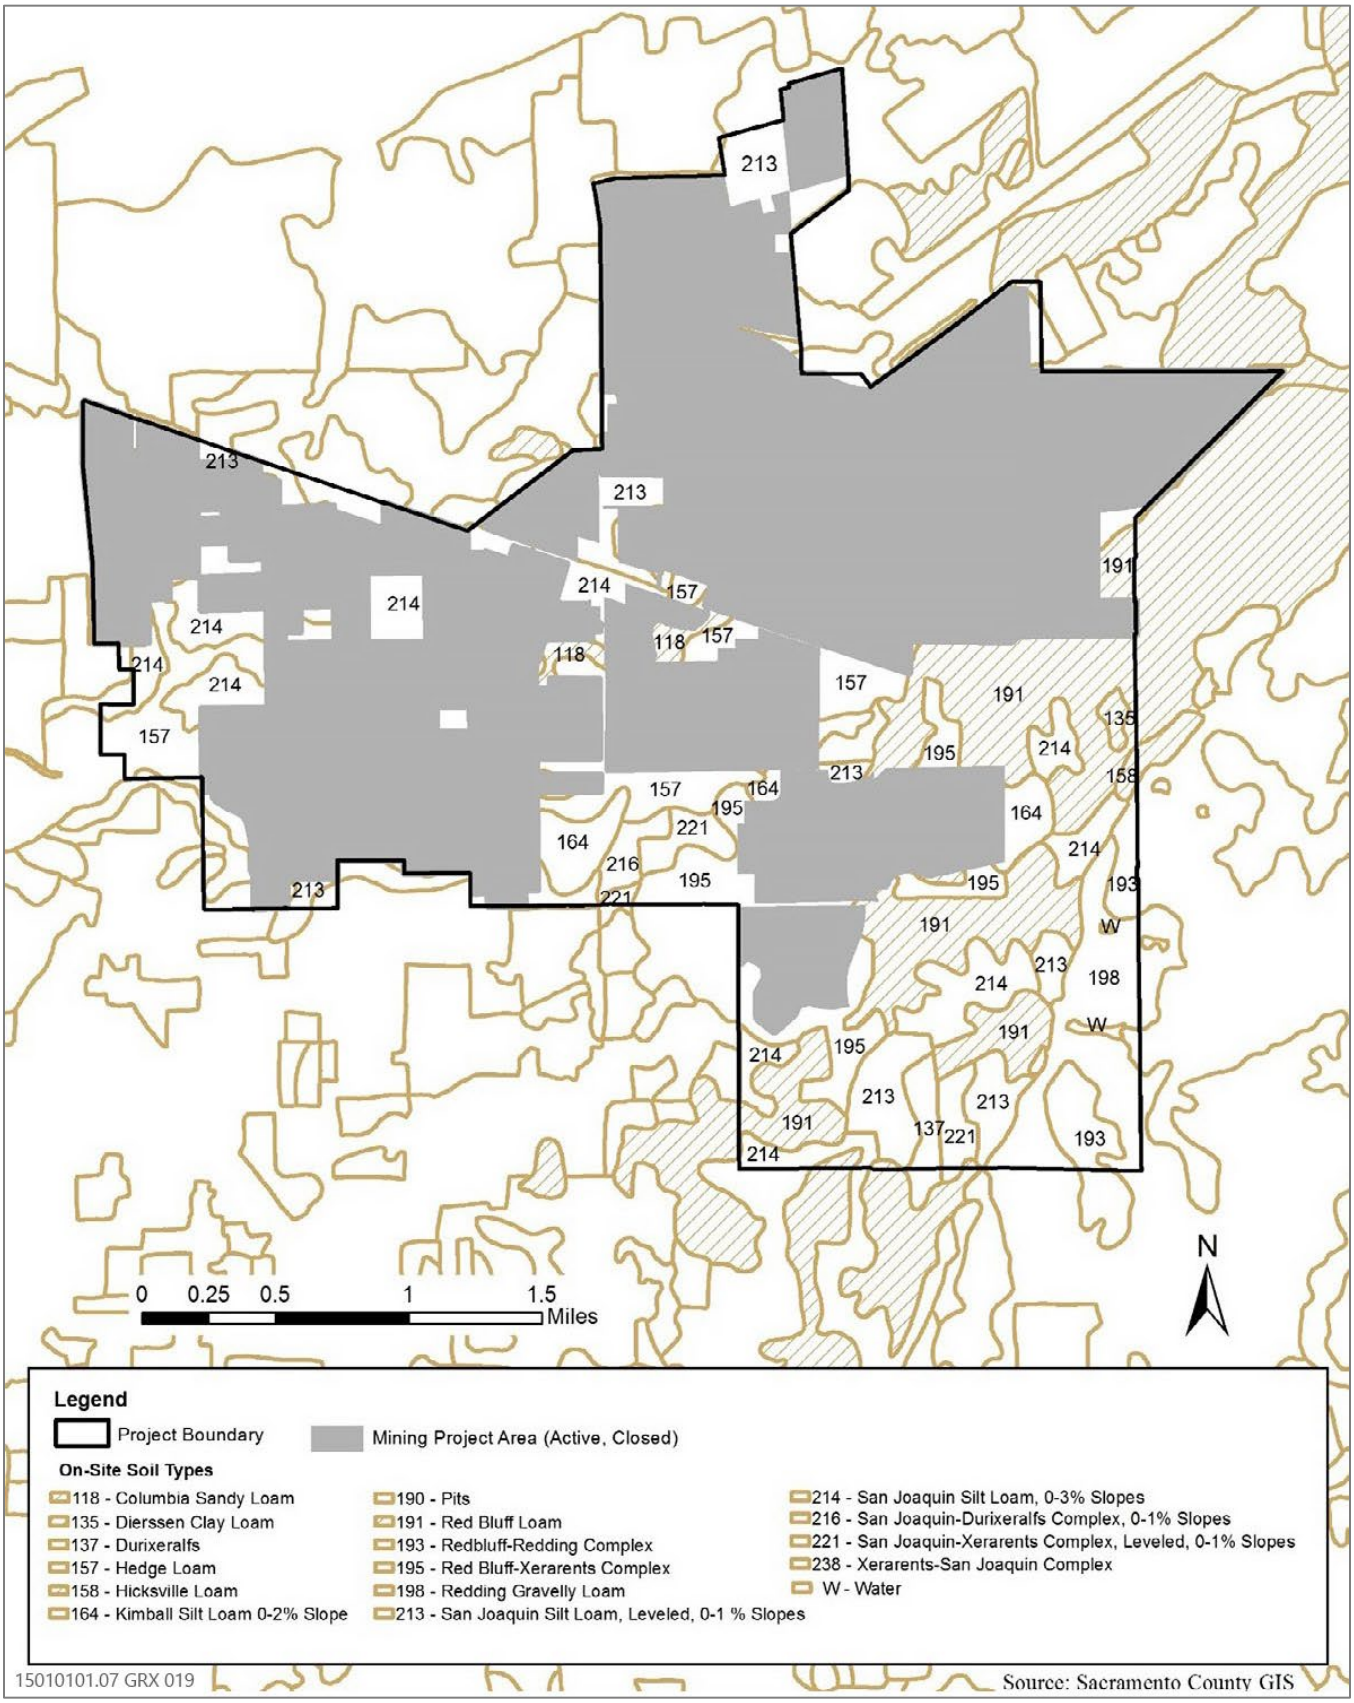
---

[1] Lateral spreading is the limited, lateral movement of gently to steeply sloping, saturated soil deposits caused by earthquake-induced liquefaction.

[2] Cyclic densification is a phenomenon in which non-saturated, loose soil is densified by earthquake vibrations, causing ground-surface settlement.

MITIGATION MEASURES

MITIGATION MEASURE GS-1: LIQUEFACTION REMEDIATION OF WASH WATER PONDS



Prior to development in areas that have sediment from wash water ponds future project applicants or their designee shall prepare a technical study to identify the liquefaction potential of the area. The technical study shall include all necessary measures to provide sufficient stability to resist soil liquefaction. A technical report documenting the effectiveness of such measures in eliminating soil liquefaction shall be provided to the County prior to approval of future entitlements.

IMPACT GS-2: RESULT IN SUBSTANTIAL SOIL EROSION

According to the National Resources Conservation Service (NRCS) web soil survey, there are 20 different soil units within the plan area. However, aggregate mining activity of applicant properties has disturbed or removed many of the soil units identified in the NRCS survey. Figure 12-5 shows active and closed/reclaimed mining sites and NCRS survey soil units outside of mining sites. Most of the soil units outside of mining sites are located in the southeastern portion of the plan area. The Soil Survey of Sacramento County, California, issued by the US Department of Agriculture Natural Resources Conservation Service (2023) indicates that soils outside of mining sites range in depth from very deep to shallow and range in hazard of erosion potential from slight to moderate. The soil units identified as having a moderate erosion hazard (units 193 and 198) are comprised of more than one soil type – one of which was determined to have a slight to moderate erosion hazard. Both soil units are located in the southeastern corner of the plan area where residential and commercial uses are proposed.

The project would comply with the Sacramento County Land Grading and Erosion Control Ordinance (Sacramento County Code Ch. 16.44). The ordinance was established to minimize damage to surrounding properties and public rights-of-way; limit degradation to the water quality of watercourses; and curb the disruption of drainage system flow caused by the activities of clearing, grubbing, grading, filling, and excavating land. The ordinance establishes administrative procedures, minimum standards of review, and implementation and enforcement procedures for the control of erosion and sedimentation that are directly related to land grading activities.

The project would also comply with the NPDES Construction General Permit, which requires that any construction activity affecting 1 acre or more of soil implement a SWPPP, which identifies BMPs to reduce construction effects on receiving water quality. Development of industrial facilities within the plan area would comply with the NPDES Industrial General Permit, which also requires development of a SWPPP and implementation of BMPs to reduce pollutants in stormwater runoff. The BMPs include sediment and erosion control measures and other measures to control potential chemical contaminants. Also refer to Chapter 14, “Hydrology and Water Quality.”

Source: Provided by Sacramento County in 2017

Figure 12-5 Mining Areas

Because development projects are subject to the County Land Grading and Erosion Control Ordinance and the State Water Resources Control Board stormwater permitting requirements, any development in the plan area would be subject to erosion and sediment control measures as a matter of course. As such, the project would not result in substantial soil erosion or the loss of topsoil and impacts to soil resources are considered to be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT GS-3: RESULT IN SOIL SUBSIDENCE

Areas that potentially have large amounts of fill within the plan area are along proposed roadways and in drying beds located in mining areas. Fill areas that are underlain by drying bed material would have potential for additional settlement caused by the consolidation of the drying bed material. Compression may vary from 0.5 inch for fill up to 5 feet thick to about 5 inches for fill on the order of 35 feet thick. Most of this settlement would occur during and shortly after construction (LTR 2014: 21). Because site grades over drying beds would be raised from 5 feet to 20 feet, with some areas requiring 30 feet of fill, the resulting weight of this new fill would result in consolidation settlement of approximately 1.5 to 12 inches. Building foundations underlain by 15 or more feet of new fill would not have additional settlement because of relatively light foundation pressures. However, building foundations underlain by less than 15 feet of new fill *and* drying bed material may settle an additional 0.25 to 0.66 inches (LTR 2014: 22).

Because the amount of settlement would vary by location, the ability of fills and disturbed native soil to safely support planned structures should be evaluated on a case-by-case basis through site-specific geotechnical studies (LTR 2014: 21). Sacramento County requires completed geotechnical reports for each project within areas known to contain fill in order identify potential hazards that may impact a project, as well as measures to eliminate the hazardous soil conditions. The geotechnical report would identify appropriate actions to address subsidence, such as soil amendments to achieve a specific soil composition and requirements for soil compaction. These projects would also adhere to the CBC, which would ensure the maximum necessary protection available for development within areas known to contain documented and undocumented fill and would avoid substantial risk to life and property. Therefore, although the WJHMP would result in development of potentially unstable soils, which could be affected by construction, the project would not result in substantial on- or offsite subsidence following completion of required studies and compliance with established building regulations. Impacts would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT GS-4: EXPOSURE TO LANDSLIDES

LTR conducted a slope stability analysis on mining areas that had the tallest and steepest slopes. This included permanent fill slopes between 1.5:1 and 2:1 (horizontal:vertical). The LTR analysis indicated that permanent slopes in the range of 1.5:1 to 2:1 have a Factor of Safety ranging from 1.65 to 1.88. A Factor of Safety is the ratio of the allowable stress to the actual stress. A Factor of Safety of 1 represents that the stress is at the allowable limit; less than 1 represents likely failure, and greater than 1 represents the stress is within the allowable limit. The higher the number of Factor of Safety, the safer the structure or product is. The minimum static Factor of Safety for permanent slopes should typically be 1.5:1 or greater, which is a typical standard by which Sacramento County and the State Department of Conservation's Division of Mine Reclamation evaluate the long-term stability of reclaimed mining slopes. Thus, permanent slopes within the plan area would not be susceptible to landslides during static conditions. LTR also conducted a seismic stability evaluation and concluded that the risk of landslide on slopes inclined at 1.5:1 or shallower during a strong earthquake is low (LTR 2014: 24).

Slopes with exposed sand and gravel may be susceptible to erosion and shallow surface instability. However, according to LTR, these types of failures would generally be less than 5 feet thick and pose no risk to the overall stability of the slopes. For mitigating this condition, LTR recommends making the slope shallower, landscaping, installing slope armor such as rip rap, and/or performing routine maintenance (LTR 2014: 24).

Permanent slopes in the plan area have Factors of Safety that are considered appropriate for permanent slopes. Mitigation is required to address the potential for minor slope failures on exposed slopes of 1.5:1 or steeper. Possible minor failures such as sloughing or slumping pose minimal risk to overall slope stability and could be mitigated; impacts would be **less than significant with mitigation**.

MITIGATION MEASURES

MITIGATION MEASURE GS-4: EROSION PROTECTION ON EXPOSED SLOPES

To prevent erosion and shallow surface instability, there shall be a condition of approval for the project that slope stabilization features such as landscaping and/or slope armor (such as rip rap) shall be installed on all exposed slopes of 1.5:1 or steeper during construction of urban development. Conditions of approval for the project shall also require the project applicant to provide routine maintenance of the landscaping and slope armor.

IMPACT GS-5: EXPOSURE TO EXPANSIVE SOILS

Low to moderate expansion potential exists in near-surface soil and the majority of fill, both of which are comprised of sand, clay, and silt. Moderate to high expansion potential exists in some of the soil (also comprised of sand, silt, and clay) located in drying beds and wash water ponds (LTR 2014: 23).

Development in the plan area may result in the addition of new structures and roadways located in areas containing expansive soils that could cause structural damage to both foundations and roads. To address this, the construction permitting process within Sacramento County requires completed geotechnical reports for development located within areas known to contain expansive soils; the purpose of this is to identify potential hazards that may impact a project as well as measures to eliminate the hazardous soil conditions. Measures related to eliminating potential hazards of expansive soils can include the excavation of silts and clays to a suitable depth, the replacement of these materials with engineered fill and compacted granular fill material, or the mixing of onsite soils to achieve a consistent soil composition. Implementation of these measures effectively removes expansive soils from an area or ensures that any expansion and contraction under the foundation is evenly distributed. In addition, structural design of any development in the plan area must conform to the criteria detailed in the UBC and CBC (Chapters 16, 18, 33 and the Appendix to Chapter 33).

Any project-related development would need to adhere to the existing UBC and CBC, which would ensure the maximum necessary protection available for development within areas known to contain expansive soils. Therefore, implementation of the project would not exacerbate any risk to life or property from impacts related to expansive soils; this impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT GS-6: POTENTIAL DESTRUCTION OF BURIED PALEONTOLOGICAL RESOURCES

Construction of the project would involve grading activities and trenching for infrastructure development. As described above, the plan area is not located within an area considered sensitive paleontological resources and most of the area has been excavated and filled. However, ground disturbing activities would have the potential to unearth buried paleontological resources.

With the implementation of the Mitigation Measure GS-6, below, impacts would be reduced to **less than significant with mitigation** because construction workers and operational personnel would be alerted to the possibility of encountering paleontological resources and professionally accepted and legally compliant procedures for the discovery of paleontological resources would be implemented in the event of a find.

MITIGATION MEASURES

MITIGATION MEASURE GS-6: ON-SITE TRAINING FOR PALEONTOLOGICAL RESOURCES

Future project applicants, subsequent developers, or their designee, shall retain a qualified paleontologist to conduct an on-site training that will alert all construction personnel and operational staff about the possibility of encountering fossils. The appearance and types of fossils likely to be seen during construction will be described.

Construction personnel shall be trained in the proper notification procedures should fossils be encountered.

If paleontological resources are discovered during earthmoving activities, operations shall immediately be immediately halted within 100 feet of the find and the County Environmental Coordinator shall be notified. Future project applicants, subsequent developers, or their designee, shall retain a qualified paleontologist for identification and salvage of fossils so that construction delays can be minimized. If large specimens are discovered, the paleontologist shall have the authority to halt or divert grading and construction equipment while the finds are removed. The paleontologist shall be responsible for implementing all tasks summarized below:

- In the event of discovery, salvage of unearthed fossil remains, typically involving simple excavation of the exposed specimen but possibly also plaster-jacketing of large and/or fragile specimens, or more elaborate quarry excavations of richly fossiliferous deposits.
- Recovery of stratigraphic and geologic data to provide a context for the recovered fossil remains, typically including description of lithologies of fossil-bearing strata, measurement and description of the overall stratigraphic section, and photographic documentation of the geologic setting.
- Laboratory preparation (cleaning and repair) of collected fossil remains to a point of curation, generally involving removal of enclosing rock material, stabilization of fragile specimens (using glues and other hardeners), and repair of broken specimens.
- Cataloging and identification of prepared fossil remains, typically involving scientific identification of specimens, inventory of specimens, assignment of catalog numbers, and entry of data into an inventory database.
- Preparation of a final report summarizing the field and laboratory methods used, the stratigraphic units inspected, the types of fossils recovered, and the significance of the curated collection.

IMPACT GS-7: OBSTRUCTION OF ACCESS TO MINERAL RESOURCES

As noted above, mineral resources in Sacramento County have been classified in a number of ways over the years, including as MRZs, ARAs, and MRAs. Although the MRZs (broad categories that take into account only geological factors) indicate that much of the county lies over mineral resources ranging from areas with “known mineral occurrences of undetermined mineral resource significance” to “areas underlain by mineral deposits where geologic data indicate that significant measured resources are present,” only a relatively small portion of the county lies over known high-quality mineral resources that are available for extraction. These areas, which reflect the most recent mineral resource classification for the county, are the ARAs.

Mining operations have been occurring within the plan area vicinity since the 1930s but there are still a number of ARAs within the plan area where the aggregate has not been completely extracted. Figure 12-4 shows that ARAs 3, 4, 5, 6, 17, 18 and 21 are located

within the plan area. It is reasonable to assume that the project would not obstruct access to mineral resources in these ARAs. Both Project Applicants are in the mineral extraction business and their primary goal is to remove as much aggregate from the plan area as possible before developing the plan area with urban uses. This is reflected in the Project Applicants' request to keep the existing Aggregate Resource Area overlay in place on the General Plan Land Use Diagram and the existing Surface Mining Combining Zone overlay in the Cordova and Vineyard Community Plan land use diagrams.

The only scenario where the project may obstruct access to mineral resources is where urban development in applicant properties obstructs the extraction of minerals in non-applicant properties. However, most of the mining in the plan area is complete. There are limited mineral resources within the plan area that are suitable for resources extraction. Although non-applicant properties may lack access to an on-site processing plant, mined materials can be transported by truck or conveyor to existing plants for processing. The project would not obstruct extraction of the remaining minerals in the plan area. In addition, because most of the mining is complete, the project would result in a beneficial use of the plan area to provide housing and employment opportunities to the region. Therefore, implementation of the WJHMP would have a low potential to result in the loss of availability of mineral resources; impacts will be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

13 HAZARDS AND HAZARDOUS MATERIALS

INTRODUCTION

This chapter describes the hazardous materials and waste in the plan area resulting from past and ongoing uses of the property, includes a description of applicable federal, state and local regulations and policies that influence hazardous materials and waste, and identifies the project's potential to create a significant hazard for the public or the environment. The term "hazardous substances," as used herein, refers to both hazardous materials and hazardous wastes. Sacramento County uses the definition of "hazardous materials" from the California Health and Safety Code, Division 20, Chapter 6.95, Section 25501, which states:

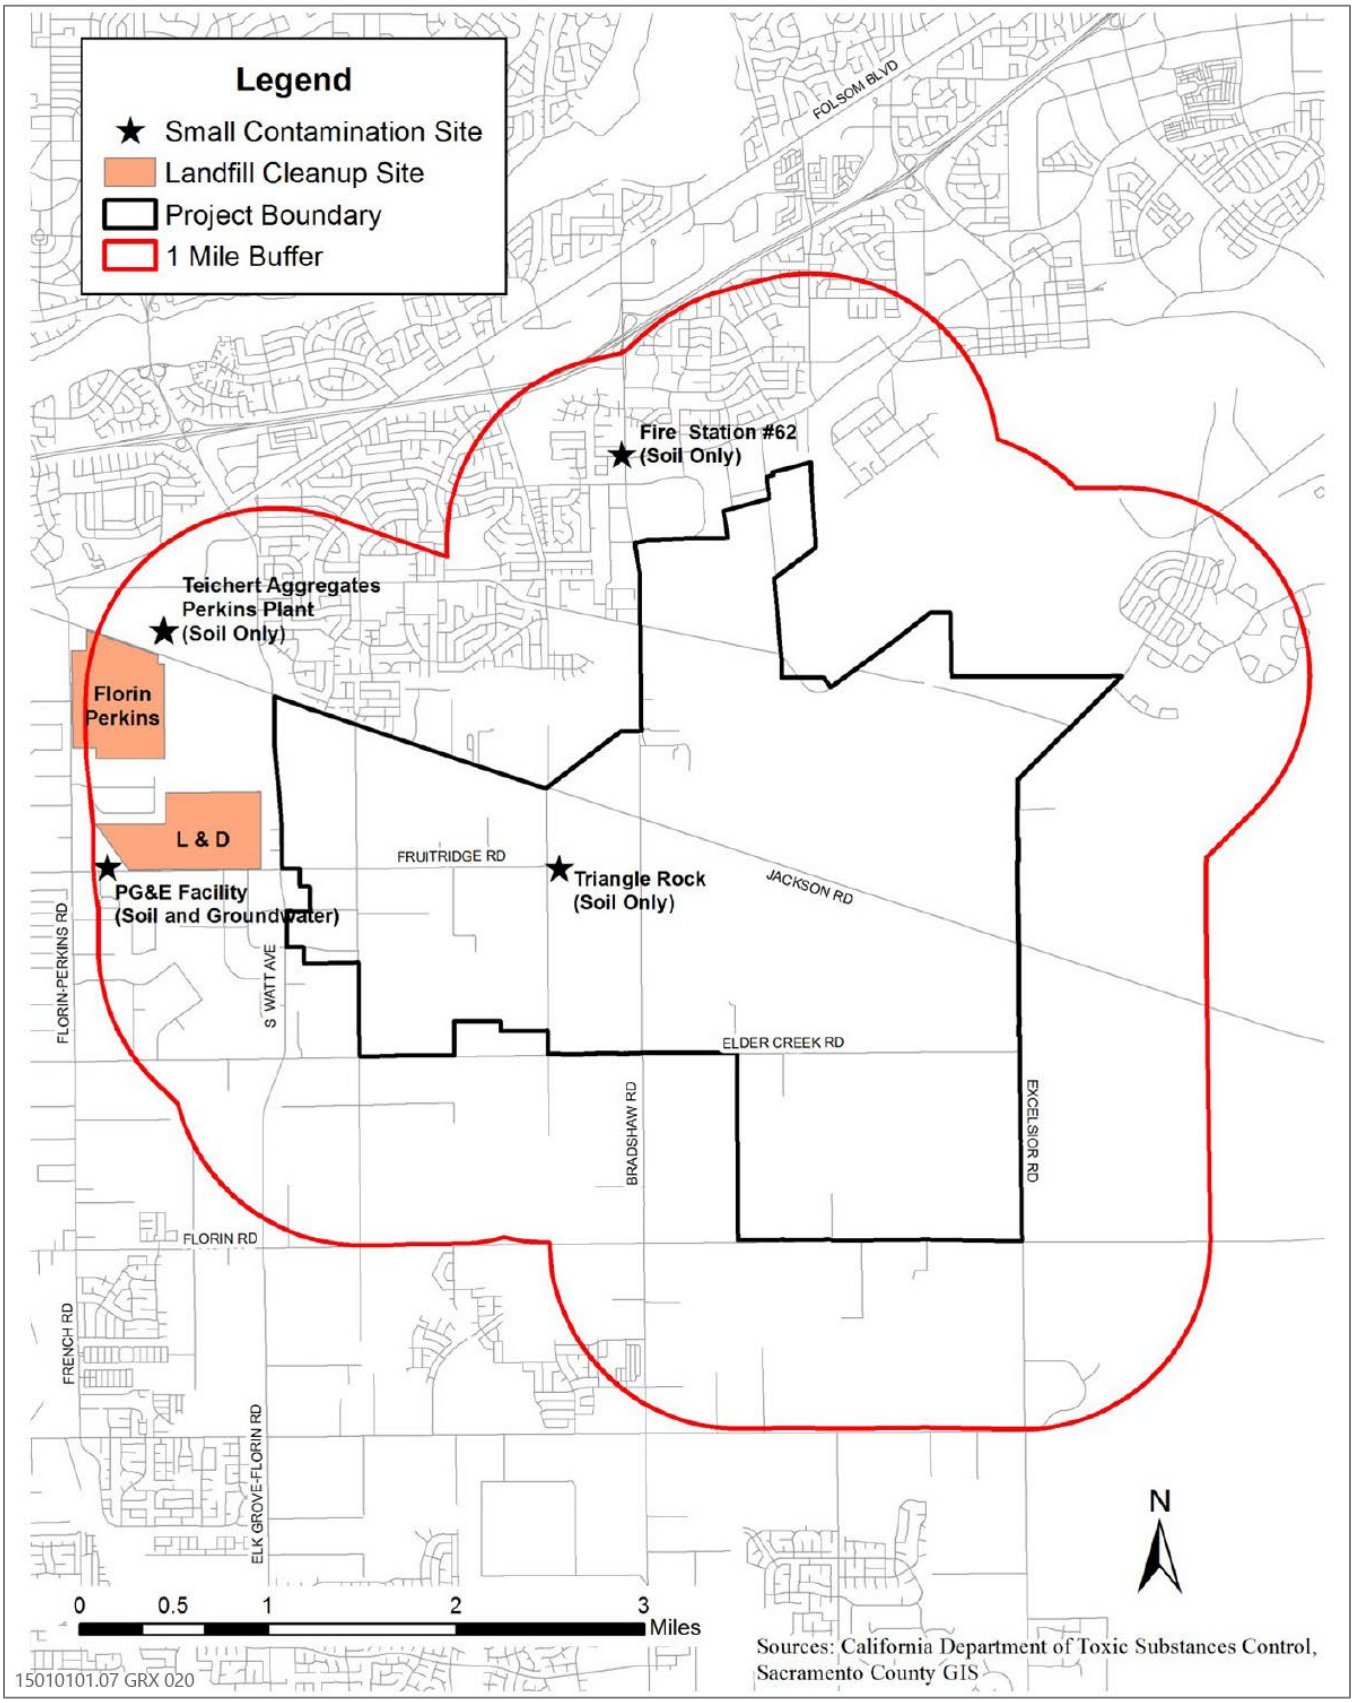
> "Hazardous material" means a material that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. "Hazardous materials" include, but are not limited to, hazardous substances, hazardous wastes, and any material that a handler or the unified program agency (administering agency) has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment."

This definition is not limited to just those chemicals with long-term detrimental effects. It also includes materials that present a hazard because of their physical nature (i.e., those that are explosive, corrosive, or flammable). In addition to hazardous materials, this chapter also addresses emergency response plans and wildland fire hazards. Airport land use consistency, including potential safety hazards, is addressed in Chapter 7, "Airport Compatibility." No comments regarding hazards and hazardous materials were received in response to the notice of preparation.

ENVIRONMENTAL SETTING

HAZARDOUS MATERIALS

The plan area is located in an area historically used for mining, agriculture, and rural home sites. In addition, there are industrial areas which include warehouses, landscape supply yards, construction materials processing plants, and truck and equipment yards. Typical sources of hazardous materials include known contaminated properties; businesses that handle (use and/or collect) contaminants; household contaminants; landfills; lead-based paint; asbestos (in buildings predating 1970); and pesticides, fertilizers, and petrochemicals associated with agriculture. These sources can contaminate soil, ground and/or surface water, and buildings.



As described further below, former and existing uses of the plan area and immediate vicinity have resulted in a couple large remediation sites, as well as landfill sites, with known contamination documented by local, state, and federal agencies.

Known Small Contamination Sites

There are many types of businesses that handle hazardous wastes or materials, including automotive businesses, gas stations, buildings supplies (concrete, painting, lumber, etc.), and dry cleaners. For many of these businesses, the contamination source is an above-ground or underground storage tank that has developed a leak. The contaminants may be contained solely within the surrounding soils, or they may pass into groundwater and cause a migrating contamination plume. There are four small disclosed known contaminated sites within one 1 mile of the plan area (Figure 13-1). The following is a description of each site.

- Triangle Rock (within the plan area): Minor petroleum contamination occurred at this Leaking Underground Storage Tank (LUST) cleanup site within the plan area. According to Sacramento County Environmental Management Department (EMD) staff (Hawkins, pers. comm., 2015), the leaking tank was removed from the site in 1997 and soil remediation has subsequently been completed. Central Valley Water Board evaluated Site conditions against the criteria in the Low-Threat Closure Policy and determined the Site poses a low threat to human health, safety, and the environment. The Central Valley Water Board issued a No Further Action letter and closed the case on October 30, 2022 (SWRCB 2024a).
- PG&E Facility (outside the plan area): This is another LUST cleanup site that is 0.9 miles west of the plan area. Remediation efforts included both soil and groundwater remediation. Groundwater monitoring was initiated in October 2003. Nine wells were monitored quarterly. According to Sacramento County Environmental Management Department (EMD) staff (Erickson, pers. comm., 2015), the groundwater plume moved south across Fruitridge Road and not east toward the plan area. Remediation has since been completed, and the case was closed on December 20, 2017 (SWRCB 2024b).
- Teichert Aggregates Perkins Plant (outside the plan area): Soil contamination resulting from mercury was discovered at the facility. Remediation has since been completed, and the case was closed on January 21, 2009 (SWRCB 2024b).
- Fire Station #62 (outside the plan area): Soil contamination resulting from gasoline was discovered at the station. Remediation has since been completed, and the case was closed on November 10, 1987 (SWRCB 2024c).

All known small contamination sites identified above have since remediated and the cases have been closed. There is no further action needed, and there is no potential for impacts.

Source: Data adapted by Ascent in 2024.

Figure 13-1 Small Contamination Sites and Landfill Cleanup Sites

KNOWN LARGE CONTAMINATED SITES

The nearest Superfund sites listed in the US Environmental Protection Agency's (EPA's) National Priorities List are within the former Mather Air Force Base (AC&W Disposal Site) approximately 1.0 mile to the northeast and the former Sacramento Army Depot approximately 1.4 miles to the west (EPA 2023). These sites are large areas of contamination and are discussed below.

MATHER AIR FORCE BASE

Mather Air Force Base (Mather AFB) hosted military operations from 1918 until it was decommissioned in 1993. Since the base was decommissioned, most of the land formerly occupied by the base has been transferred to the ownership of Sacramento County, and the airfield now operates as a public airport. As is common with operational and decommissioned military bases, several areas of Mather AFB have been contaminated with or contain hazardous materials that were used during base operations. Approximately 89 contaminated sites have been identified within Mather AFB as a result of aircraft fueling and maintenance activity, fire protection training, corrosion control, past disposal activities, and landfilling; 75 of these sites have been remediated. Key contaminants include solvents, petroleum products, and various solid wastes. In addition, pesticides, herbicides, asbestos, PCBs, radon, ordnance, metals (including lead), low-level radioactive waste, landfill gases, and medical waste that were used, stored, or generated as part of base operations have been identified as potential sources of contamination.

Because Mather AFB was operated as a federal military installation, EPA, US Department of Defense, US Air Force, California EPA, and the California Department of Toxic Substance Control (DTSC) oversee hazardous substances investigations and remediation. Remediation is currently underway at several locations at the former Mather AFB. Existing soil contamination is undergoing remediation using in situ treatment (soil vapor extraction [SVE] and/or bioventing) and excavation and transport of contaminated soils to an on-site ex situ bioremediation facility. There are currently nine sites with active SVE/biovent remediation. Three on-site landfills have been capped and closed, and a minimum of 30 years of post-closure monitoring and maintenance is being conducted. Soil sampling is also occurring at the location of two above-ground storage tanks.

Two contaminated groundwater plumes have migrated beyond the property boundaries of Mather AFB and have extended into the plan area. The Site 7 Plume has migrated approximately 4,000 feet to the southwest, beyond Mather AFB's southern boundary and into the northeast portion of the plan area. The source of this plume was a former borrow pit used as a landfill that was located near the plan area.

Remediation is currently underway at several locations at the former Mather AFB. A complex network of extraction wells has been installed to control the plume migration. Groundwater is extracted from these wells, treated and then discharged back into the groundwater system. This process is being used to remediate the Site 7 Plume. Long-

term groundwater monitoring supplements active remediation. Post-closure groundwater monitoring is also required for the closed Site 7 landfill (URS Group 2015: ES-3).

FORMER SACRAMENTO ARMY DEPOT

The Sacramento Army Depot (Depot) was a supply depot operated by the US Army (Army) that functioned primarily as a receiving, maintenance, and disposal site for various electronic materials. The Depot was in operation as a military base between 1945 and 1995. The main source of contamination within the Depot was from the metal-plating operations and associated solid waste and waste waters. The wastes were burned and/or buried or discharged into unlined sewage lagoons at the Depot site (EPA 1995). Investigations by the Army during the 1980s identified a former burn pit as a source of volatile organic compound (VOC) groundwater contamination. Groundwater sampling yielded evidence of contamination expanding beyond Depot boundaries. Additional investigations identified four sites that had the highest potential for release of contaminants to the environment. Contaminants detected at the site include semi-volatile and VOCs, pesticides, polychlorinated biphenyls (PCBs), and metals (EPA 2024).

VOCs have been detected in groundwater on- and offsite. Heavy metals have also been detected in onsite groundwater in Morrison Creek sediment immediately downstream of the Depot. Two contaminated plumes were identified beneath the Depot with one plume containing the greatest concentration of VOC detected at the Depot while the other plume was a smaller VOC-contaminated plume (EPA 1995).

Soil remediation was conducted on three of the contamination sites and groundwater extraction and treatment was conducted on the fourth site. Soil vapor extraction was performed on the former burn pit and another site that had contamination due to tank leakage. Soil excavation, stabilization and consolidation were implemented for the third soil remediation site that was an oxidation lagoon. During the 1990s the Army installed groundwater treatment units and a network of vertical and horizontal groundwater extraction wells for groundwater remediation. The groundwater treatment units were shut down in February 2000 due to VOC concentrations in the groundwater meeting Sacramento County sanitary sewer system discharge requirements. Currently, groundwater is being pumped from eight extraction wells and discharged directly to the Sacramento Regional Wastewater Treatment Plant (EPA 1995). Furthermore, the Depot is located southwest of the plan area where groundwater flows east to west, advancing groundwater further away from the plan area.

LANDFILL SITES

L AND D LANDFILL

The L and D Landfill site is near the western boundary of the plan area (0.1 miles to the west) and is comprised of two waste management units, LF-1 and LF-2. LF-1 is the original unlined portion of the landfill and is comprised of the East Pit and the West Pit. LF-2 is lined and includes a leachate collection and removal system. Disposal activities occurred in the LF-1 management unit from the mid-1970s to the 1990's. In 1996,

disposal activities were transferred to the LF-2 unit and this unit is still in operation (SCS Engineers 2017:1).

Since 1987, monitoring wells at the landfill have detected VOCs in groundwater samples. There are two distinct aquifer zones beneath the site. The current groundwater extraction system is comprised of seven extraction wells along the southern perimeter of the site and one well on the eastern border (SCS Engineers 2017:3). In addition to this groundwater extraction system, the landfill operates a landfill gas (LFG) extraction system to prevent VOC's from escaping to groundwater and to control lateral migration of LFG. This system will continue to be inspected and maintained during the 30-year post-closure period, or as long a gas continues to be detected at levels requiring control (Raney 2015:6.0-26). There are also networks of background and detection monitoring wells and corrective action wells. Groundwater monitoring includes groundwater, leachate, surface water, and air stripper sampling (SCS Engineers 2017:26).

FLORIN PERKINS LANDFILL

The Florin Perkins Landfill (FPL) is a closed landfill site that is 0.6 miles to the west of the plan area. Groundwater flows to the southeast (toward the plan area) from the FPL site.

Located on a site that was extensively mined, FPL operated between February 1994 and February 2005. The landfill is comprised of three fill areas – the North Fill Area, South Fill Area, and East Fill Area. Prior to January 2005, the landfill was permitted to accept non-hazardous solid and inert waste. There are eleven monitoring wells on site, which are designated as background, detection, or corrective action monitoring wells, depending on their location relative to a fill area. Some of these monitoring wells function as both detection and background monitoring wells, depending on which fill area is monitored. Samples from offsite ground water monitoring wells are also collected. Since 2002, groundwater samples have been collected semi-annually. Tests on groundwater below the landfill have detected elevated concentrations of two VOCs, methylene chloride, and trichlorofluoromethane (TCFM). TCFM in groundwater could be hazardous to receptors because it is a dense slightly soluble organic compound that could be inhaled in vapor form (Raney 2015:4.0-11). As of October 29, 2021, the latest compliance inspection reported minor violations and determined that the FPL was between 90 to 95 percent successfully remediated (DTSC 2023).

LEAD, ASBESTOS, AND OTHER HAZARDOUS MATERIALS IN BUILDINGS

Lead and lead compounds have historically been used in many products found around our homes, for example: paint, ceramics, pipes, plumbing materials, gasoline, batteries, ammunition and cosmetics. In 1978, the Federal government banned the use of lead-based paint in housing. There are a few structures within the plan area that were built prior to 1978 and could contain lead-based paint.

Asbestos is a naturally occurring, fibrous silicate mineral that was commonly used as an acoustic insulator and in thermal insulation (fire proofing and other building materials) prior to 1989, when it was banned by the US EPA due the health issues it can cause if

the fibers are inhaled. Some of the older structures within the plan area could contain asbestos. In addition to being used in building materials, asbestos can also be found occurring naturally in portions of eastern Sacramento County, within Folsom, south of Folsom, and Rancho Murieta. As discussed in Chapter 12, “Geology, Soils, and Mineral Resources,” asbestos does not occur naturally within the plan area or the vicinity.

In addition, other common items present in buildings, such as electrical transformers, fluorescent lighting, electrical switches, heating/cooling equipment, and thermostats, can contain hazardous materials that may pose a health risk if not handled and disposed of properly. Among these hazardous materials are PCBs, which were used in hundreds of industrial and commercial applications because of their non-flammability, chemical stability, high boiling point, and electrical insulating properties. Equipment in the plan area that might contain PCBs includes electrical equipment and thermal insulation material (e.g., fiberglass, felt, foam, or cork). Older, pole-mounted electrical transformers can also contain PCBs.

Transport of Hazardous Materials

Hazardous materials, hazardous wastes, and petroleum products are a subset of the goods routinely shipped along the transportation corridors adjacent to the plan area. In California, unless specifically exempted, it is unlawful for any person to transport hazardous waste unless the person holds a valid registration issued by the DTSC. Three agencies maintain searchable databases that track hazardous material releases in reportable quantities: EPA maintains the Hazardous Materials Incident Report System that contains data on hazardous material spill incidents reported to the US Department of Transportation (DOT); the California Office of Emergency Services (OES) maintains the California Hazardous Materials Incident Report System that contains information on reported hazardous material accidental releases or spills; and SWRCB’s Site Cleanup Program maintains information on reported hazardous material accidental releases or spills. DOT also provides grants to local agencies for preparation and training for hazardous materials incidents through its Hazardous Materials Emergency Preparedness Program administered by OES.

Sensitive Receptors

There are sensitive receptors within the plan area boundaries but because of the semi-rural nature of the area, the density of these receptors is low. There are no hospitals, daycare centers, or senior care facilities currently located within the plan area. However, there is an elementary school (Sierra Enterprise) within the plan area. Additional sensitive receptors located near the plan area are depicted in Chapter 6, “Air Quality”, Figure 6-1.

Schools

Children are particularly susceptible to long-term effects from emissions of hazardous materials. Therefore, locations where children spend extended periods of time, such as schools, are particularly sensitive to hazardous air emissions and accidental release associated with the handling of extremely hazardous materials, substances, or wastes.

The only school located within the plan area is Sierra-Enterprise Elementary School, located along the western plan area boundary. Other nearby schools include Golden Empire Elementary School and Rosemont High School in the Elk Grove School District, which are located roughly 0.4 miles and 0.5 miles northwest of the plan area, respectively.

Wildland Fire Hazards

While all of California is subject to some degree of wildfire hazard, there are specific features that make certain areas more hazardous. The California Department of Forestry and Fire Protection (CAL FIRE) is required by law to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors (Public Resources Code [PRC] 4201-4204 and Government Code 51175-89). When development spreads into less densely populated, often hilly areas, it increases the number of people living in areas that are prone to wildfire.

The plan area is within a local responsibility area that CAL FIRE has identified as a non–very high fire hazard severity zone (CAL FIRE 2023). The Sacramento Metropolitan Fire District is responsible for providing fire protection services to the plan area.

Regulatory Setting

Federal

EPA has primary responsibility for enforcing and implementing federal laws and regulations pertaining to hazardous materials. Applicable regulations are contained mainly in Titles 29, 40, and 49 of the CFR. Hazardous materials, as defined in the CFR, are listed in 49 CFR 172.101. Management of hazardous materials is governed by the laws summarized below. These laws and associated regulations include specific requirements for facilities that generate, use, store, treat, and/or dispose of hazardous materials.

40 CFR 112 requires specific facilities to prepare, amend and implement Spill Prevention Control and Countermeasures (SPCC) plans. The SPCC rule is part of the Oil Pollution Prevention regulation, the purpose of which is to prevent oil discharges to navigable waters and adjoining shorelines. The SPCC rule applies to facilities that are engaged in drilling, producing, gathering, storing, processing, refining, transferring, distributing, using or consuming of oil and store oil above or below ground in volumes greater than 1,320 U.S. gallons and 42,000 U.S. gallons, respectively.

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) is the principal federal legislation regulating hazardous waste. Under the RCRA, EPA regulates the generation, transportation, treatment, storage, and disposal of hazardous substances. RCRA imposes reporting, permitting, and operational control requirements on businesses or individuals that generate, treat, store, or dispose of hazardous materials or hazardous waste. RCRA is implemented by Title 40 of the Code of Federal Regulations. The 1984 amendments to RCRA involve stringent monitoring of landfills and underground storage

tanks for hazardous substances. EPA has delegated authority for many RCRA requirements to DTSC.

Comprehensive Environmental Response, Compensation and Liability Act

In response to the need to clean up hazardous waste sites created before implementation of RCRA, Congress enacted the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) in 1980. CERCLA, also called the Superfund Act, provided broad federal authority and created a trust fund for addressing releases and threatened releases of hazardous substances that could endanger public health or the environment.

EPA is responsible for compiling the National Priorities List for known or threatened release sites of hazardous substances, pollutants, or contaminants and provides oversight of Superfund investigation/remediation projects, evaluates remediation technologies, and develops hazardous materials disposal restrictions and treatment standards. The former Mather AFB and Depot are listed as national Superfund sites with ongoing remediation activities at several sites on each former base property.

Superfund Amendments and Reauthorization Act

The risk of exposure to hazardous waste as a result of RCRA and CERCLA was addressed in the Superfund Amendments and Reauthorization Act (SARA) of 1986. As a result of SARA, the federal Occupational Safety and Health Administration (OSHA) published hazardous waste cleanup regulations in 29 CFR 1910.120.

Toxic Substances Control Act

The Toxic Substances Control Act provides EPA with authority to require reporting, recordkeeping and testing, and restrictions related to chemical substances and/or mixtures. The Toxic Substances Control Act addresses the production, import, use, and disposal of specific chemicals including PCBs, asbestos, radon, and lead-based paint.

Clean Air Act

Regulations under the Clean Air Act (42 USC 7401 et seq., as amended) are designed to prevent accidental releases of hazardous materials. The regulations require facilities that store more than a threshold quantity of regulated substances to develop a risk management plan that includes hazard assessments and response programs to prevent accidental releases of listed chemicals.

Occupational Safety and Health Administration Worker Safety Requirements

OSHA is responsible for ensuring worker safety. OSHA sets federal standards for implementation of workplace training, exposure limits, and safety procedures for handling hazardous substances and addressing other potential industrial hazards. OSHA also establishes criteria by which each state can implement its own health and safety program. The Hazard Communication Standard (CFR Title 29, Part 1910) requires that workers be informed of the hazards associated with the materials they

handle. Workers must be trained in safe handling of hazardous materials, use of emergency response equipment, and building emergency response plans and procedures. Containers must be labeled appropriately, and material safety data sheets must be available in the workplace.

Hazardous Materials Transportation Act

DOT has developed regulations in Titles 10 and 49 of the CFR pertaining to the transport of hazardous substances and hazardous wastes. The Hazardous Materials Transportation Act is administered by the Research and Special Programs Administration of DOT. The act provides DOT with a broad mandate to regulate the transport of hazardous materials, with the purpose of adequately protecting the nation against the risk to life and property that is inherent in the commercial transportation of hazardous materials. DOT regulations that govern the transportation of hazardous materials are applicable to any person who transports, ships, causes to be transported or shipped, or who is involved in any way with the manufacture or testing of hazardous materials packaging or containers.

Federal Insecticide, Fungicide, and Rodenticide Act

Pesticides are regulated under the Federal Insecticide, Fungicide and Rodenticide Act by EPA. This includes labeling and registration of pesticides as to how they may be used. EPA delegates pesticide enforcement activities in California to the California Department of Pesticide Regulation, under Title 3 of the California Code of Regulations and the California Food and Agriculture Code. The California Department of Pesticide Regulation registers pesticides for use in California, and licenses pesticide applicators and pilots, advisors, dealers, brokers, and businesses.

State

California Hazardous Materials Release Response Plans and Inventory Law

This law requires preparation of hazardous materials business plans and disclosure of hazardous materials inventories. Such plans must include an inventory of hazardous materials handled, as well as facility floor plans showing where hazardous materials are stored, an emergency response plan, and emergency response procedures that provide for employee training (California Health and Safety Code, Division 20, Chapter 6.95, Article 1). The business plan program is administered by the California Emergency Management Agency.

Occupational Safety and Health Administration Worker Safety Requirements

The California Occupational Safety and Health Administration (Cal/OSHA) regulations for the use of hazardous materials in the workplace (CCR Title 8) require safety training, available safety equipment, accident and illness prevention programs, hazardous-substance exposure warnings, and preparation of emergency action and fire prevention plans. Cal/OSHA enforces regulations on hazard communication programs and

mandates specific training and information requirements. These requirements include procedures for identifying and labeling hazardous substances, providing hazard information about hazardous substances and their handling, and preparing health and safety plans to protect workers and employees at hazardous-waste sites. Employers must make material safety data sheets available to employees and document employee information and training programs.

California Accidental Release Prevention Program

The goal of the California Accidental Release Prevention Program (CCR Title 19, Division 2, Chapter 4.5) is to reduce the likelihood and severity of consequences of any releases of extremely hazardous materials. Any business that handles regulated substances (i.e., chemicals that pose a major threat to public health and safety or the environment because they are highly toxic, flammable, or explosive, including ammonia, chlorine gas, hydrogen, nitric acid, and propane) must prepare a risk management plan. The risk management plan is a detailed engineering analysis of the potential accident factors present at a business and the measures that can be implemented to reduce this accident potential. The plan must provide safety information, hazard data, operating procedures, and training and maintenance requirements. The list of regulated substances is found in Article 8, Section 2770.5 of the program regulations.

Emergency Response to Hazardous Materials Incidents

California has developed an emergency response plan to coordinate emergency services provided by federal, State, and local governments and private agencies. Response to hazardous material incidents is one part of this plan. The plan is managed by the California Emergency Management Agency, which coordinates the responses of other agencies, including the California Environmental Protection Agency (Cal/EPA), the California Highway Patrol, the California Department of Fish and Wildlife, and regional water quality control boards (RWQCBs).

California Government Code Section 65962.5 (Cortese List)

The provisions of California Government Code Section 65962.5 are commonly referred to as the “Cortese List” (after the legislator who authored the law). The Cortese List is a planning document used by State and local agencies to comply with CEQA requirements in providing information about the location of hazardous materials release sites. Section 65962.5 requires Cal/EPA to develop an updated Cortese List at least annually. DTSC is responsible for a portion of the information contained in the Cortese List. Other State and local government agencies in California, such as the State Water Resources Control Board, must provide additional information. There are no sites on the Cortese list in the plan area.

Asbestos Abatement

Asbestos abatement efforts must be completed in compliance with 7 CCR Section 5208, 8 CCR Section 1529, and 8 CCR Sections 341.6 through 341.14. The regulations in 7 CCR Section 5208 implement worker exposure limits, require exposure monitoring, implement compliance programs, require employee protection and hazard

communication, and require employee medical surveillance and reporting. Asbestos exposure for construction work is regulated by 8 CCR Section 1529, which includes exposure limits and procedures for handling and removal. Requirements for transport and disposal are included in 8 CCR Sections 341.6 through 341.14.

Section 19827.5 of the California Health and Safety Code, adopted January 1, 1991, prohibits local agencies from issuing demolition or alteration permits until the applicant has demonstrated compliance with applicable regulations. If there is 100 square feet or more of asbestos-containing material, renovation or demolition of buildings containing asbestos must be conducted by a licensed contractor and the work must comply with requirements included in 8 CCR Sections 1529 and 341.6 through 341.14. Cal/OSHA must be notified 10 days before the start of construction and demolition activities. Asbestos encountered during demolition of an existing building must be transported and disposed of at an appropriate facility. The contractor and hauler of the material must file a hazardous-waste manifest that provides disposal details.

Lead and Lead-Based Paint Abatement

Regulation of lead and lead-based paint is described in 29 CFR 1926.62 and 8 CCR Section 1532.1. These regulations cover the demolition, removal, cleanup, transportation, storage, and disposal of lead-containing material. The regulations outline the permissible exposure limit, protective measures, and monitoring. Cal/OSHA's Lead in Construction Standard requires notification and a lead compliance plan with safe work practices.

California Education Code

Sections 17071.13, 17072.13, 17210, 17210.1, 17213.1-3, and 17268 of the California Education Code became effective January 1, 2000. Together, they establish requirements for assessments and approvals regarding toxic and hazardous materials that school districts must follow before receiving final site approval from the Department of Education and funds under the School Facilities Program. For example, the site approval package must include written determinations regarding the presence of hazardous wastes or pipelines carrying hazardous substances on the site (the adopted CEQA document is often used for these purposes). In addition, Section 17213(b) requires the local education agency to consult with the applicable air district to identify facilities within 0.25 mile of the proposed site that might reasonably be anticipated to emit hazardous air emissions or handle hazardous materials, substances, or wastes and prepare written findings that either there are not such facilities, the facilities do not pose a health risk, or corrective measures will be taken (consistent PRC Section 21151.8). The code also requires that a Phase I Environmental Site Assessment (ESA) is conducted according to the American Society of Testing and Materials standards (ASTM E-1527-2000) and transmitted to DTSC. If the Phase I ESA concludes that further investigation is needed or DTSC requires it, a preliminary endangerment assessment (PEA) must be completed under DTSC oversight and review. The PEA includes the sampling of soils and risk assessment to determine whether a release of hazardous material has occurred, if there is a threat of release, and if a naturally occurring hazardous material poses a significant health risk.

California Fire Code

The California Fire Code (CFC) is Chapter 9 of CCR Title 24. It is the primary means for authorizing and enforcing procedures and mechanisms to ensure the safe handling and storage of any substance that may pose a threat to public health and safety. The CFC regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. The CFC and the California Building Code use a hazard classification system to determine what protective measures are required to protect fire and life safety. These measures may include construction standards, separations from property lines, and specialized equipment. To ensure that these safety measures are met, the CFC employs a permit system based on hazard classification. The CFC is updated every 3 years.

California Code of Regulations, Title 14

Title 14 of the CCR sets forth the minimum development standards for emergency access, fuel modification, setback, signage, and water supply, which help prevent damage to structures or people by reducing wildfire hazards.

Local

Sacramento County Emergency Management Department

The Hazardous Materials Division of Sacramento County EMD is the designated Certified Unified Program Agency (CUPA) for Sacramento County. The Sacramento County EMD has a 24-hour hazardous materials incident response team and responds to incidents involving chemical releases, as well as any other hazardous materials situations. As the CUPA, the Hazardous Materials Division is responsible for implementing the following hazardous materials and hazardous waste program elements for Sacramento County:

- Aboveground Petroleum Storage Act (APSA),
- California Accidental Release Prevention Program (Cal ARP),
- Hazardous Material Release Response Plans and Inventories,
- Hazardous Waste Generation, including on-site treatment under Tiered Permitting,
- Spill Prevention Control and Countermeasure Plan (SPCC),
- Underground Storage Tanks (UST), and
- Uniform Fire Code Hazardous Materials Management Plans and Inventories.

Sacramento County Office of Emergency Services

The Sacramento County Office of Emergency Services (SacOES) has the primary responsibility for preparedness and response activities and addresses disasters and emergency situations within Sacramento County. SacOES is responsible for alerting and notifying appropriate agencies when disaster strikes; coordinating all agencies that respond; ensuring resources are available and mobilized in times of disaster;

developing plans and procedures in response to and recovery from disasters; and developing and providing preparedness materials for the public.

Sacramento Metropolitan Air Quality Management District Asbestos Program

The Sacramento Metropolitan Air Quality Management District regulates asbestos in building materials. The program applies to renovations or demolitions of jurisdictional structures in Sacramento County that include asbestos. This program requires an asbestos survey to identify all of the asbestos in building materials and abatement by a licensed asbestos contractor.

Sacramento County Local Hazard Mitigation Plan

The *Sacramento County Local Hazard Mitigation Plan* (Sacramento County 2021), as amended, includes a risk assessment of existing hazards such as severe weather, dam failure, flooding, earthquakes, wildfire, drought, health hazards, landslides, and volcanoes, and a mitigation strategy. The plan includes countywide recommended action items to reduce the economic effects and the loss of life and property.

Sacramento County Evacuation Plan

The Sacramento County Evacuation Plan is developed as an Annex to the Sacramento County 2008 All-Hazards Emergency Operations Plan (Sacramento County 2008). The purpose of this evacuation plan is to document the agreed upon strategy for the County's response to emergencies that involve the evacuation of persons from an impacted area to a safe area. This involves coordination and support for the safe and effective evacuation of the general population, and for those who need additional support to evacuate. Focus areas within this evacuation plan include public alert and warning, transportation, and care and shelter.

Primary evacuation routes are established for each of the seven County Sheriff Districts. These include major interstates, highways, and prime arterials within Sacramento County, including Jackson Hwy (SR 16). Local jurisdictions work with the County, and especially the Operation's Section, Law Enforcement Branch and the Evacuation Movement Unit to identify and update evacuation routes and evacuation transfer points. The primary evacuation routes will usually be major interstates and other highways, and major roadways within and out of the county - unless otherwise determined by the County DOT. During an evacuation, County DOT traffic engineers calculate traffic flow capacity and decide which of the available traffic routes should be used to move people in the correct directions.

Sacramento County 2030 General Plan

The following policies of the 2030 General Plan would apply to the project:

- **Policy HM-4.** The handling, storage, and transport of hazardous materials shall be conducted in a manner so as not to compromise public health and safety standards.

- **Policy SA-23.** The County shall require that all new development meets the local fire district standards for adequate water supply and pressure, fire hydrants, and access to structures by firefighting equipment and personnel.
- **Policy SA-27.** The County shall require, where appropriate, the use of fire resistant landscaping and building materials for new construction developments that are cost effective.
- **Policy SA-29.** The County and fire districts will work together to regulate hazardous materials to mitigate emergency responses.
- **Policy SA-31.** The County shall continue to maintain, periodically update, and test the effectiveness of its Emergency Response Plan.
- **Policy SA-33.** The County shall continue its coordinative efforts, including evacuation planning, with service agencies, the cities within the County, and cities within surrounding counties.
- **Policy SA-35.** The County shall ensure that the siting of critical emergency response facilities such as hospitals, fire, sheriff's offices and substations, and other emergency service facilities and utilities have minimal exposure to flooding, seismic and geological effects, fire, and explosions.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

Cordova Community Plan

The Cordova Community Plan does not contain objectives related to hazardous materials that are applicable to the project.

Vineyard Community Plan

The Vineyard Community Plan does not contain policies related to hazardous materials that would apply to the project.

Significance Criteria and Methodology

Significance Criteria

Impacts to hazards and hazardous materials would be significant if implementation of the project would:

- create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;

- create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
- emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school;
- be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment;
- impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or
- expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.

Issues not Discussed Further

Airport Safety Hazards

Project impacted related to airport safety hazards are addressed in Chapter 7, “Airport Compatibility.” Therefore, this issue is not discussed further in this chapter.

Methodology

A review of two databases and two lists was conducted to assemble a list of hazardous materials storage and use, and known contaminated sites within the vicinity of the plan area. Envirostor is a database maintained by the State DTSC and holds information on investigation, cleanup, permitting, and corrective actions that are planned, are being conducted, or have been completed under the DTSC’s oversight. Envirostor was reviewed and a list of sites was generated. GeoTracker is a second database that is maintained by the State Water Resources Control Board and tracks regulatory data about underground fuel tanks, fuel pipes, and public drinking water supplies. Toxic Site Clean-Up Site Specific Report (Toxic Site) is a County-generated and maintained list that shows a list of known contaminated sites. Finally, the County’s Master List of Business Facilities identifies businesses in Sacramento County that store and use hazardous materials. Each of these databases lists sites with active, inactive, certified, de-listed, no further action, and refer to other agency statuses. A site that is listed as closed is one at which remediation and cleanup activities are complete. Finally, this analysis is further based on the information and recommendations in the 2014 Mather Groundwater Monitoring Report prepared by URS Group, Inc. and the Final 2018 Five-Year Review Report of the Depot prepared by the Department of Defense.

West Jackson Highway Master Policies

The proposed WJHMP does not include policies related to hazards and hazardous materials.

IMPACTS AND ANALYSIS

IMPACT HAZ-1: ACCIDENTAL RELEASE DUE TO TRANSPORT, USE, OR DISPOSAL OF HAZARDOUS MATERIALS

CONSTRUCTION

Construction activities associated with future development would temporarily increase the regional transport, use, storage, and disposal of hazardous materials and petroleum products (such as diesel fuel, lubricants, paints and solvents, and cement products containing strong basic or acidic chemicals) that are commonly used at construction sites. Hazardous waste generated during construction may consist of welding materials, fuel and lubricant containers, paint and solvent containers, and cement products containing strong basic or acidic chemicals.

Hazardous materials transported by truck use many of the same freeways, arterials, and local streets as other traffic. This creates a risk of accidents and associated release of hazardous materials for other drivers and for people along these routes. Although the transport of hazardous materials could result in accidental spills, leaks, toxic releases, fire, or explosion, the US DOT Office of Hazardous Materials Safety prescribes strict regulations for the safe transportation of hazardous materials, as described in Title 49 of the CFR. These standard accident and hazardous materials recovery training and procedures are enforced by the State and followed by private State-licensed, certified, and bonded transportation companies and contractors.

Further, pursuant to 40 CFR 112, the project would be required to prepare a spill prevention and treatment plan for rapidly, effectively, and safely cleaning up and disposing of any spills or releases that may occur during construction. As required under state and federal law, notification and evacuation procedures for site workers and local residents would be included as part of the plan in the event of a hazardous materials release during construction. In addition to 40 CFR 112, SWRCB Construction General Permit (2023-0102 DWQ) requires spill prevention and containment plans to avoid spills and releases of hazardous materials and wastes into the environment. Inspections would be conducted to verify consistent implementation of general construction permit conditions and best management practices (BMPs) to avoid and minimize the potential for spills and releases, and of the immediate cleanup and response thereto. BMPs include, for example, the designation of special storage areas and labeling, containment berms, coverage from rain, and concrete washout areas. In addition, workplace rules administered by the California Occupational Safety and Health Administration (enacted by the California Code of Regulations) ensure that the hazards of all chemicals are evaluated and that information concerning chemical hazards is transmitted to employees. This is accomplished through container labeling and other warnings, Material Safety Data Sheets, and employee training. Compliance with the aforementioned regulations would minimize the potential risk of a spill or accidental release of hazardous materials during construction.

Operation

Development of the project would increase the commercial, industrial and household use of potentially hazardous materials within the plan area. Specific uses, such as dry cleaners and gas stations, would involve routine transport, use, and disposal of hazardous materials. Exposure to hazardous materials could cause various short-term and/or long-term health effects. Possible health effects could be acute (immediate, or of short-term severity), chronic (long-term, recurring, or resulting from repeated exposure), or both. Acute effects, often resulting from a single exposure, could result in nausea, vomiting, headache, dizziness, or burns. Chronic exposure could result in systemic damage or damage to organs, such as the lungs, liver, or kidneys. Health effects would be specific to each hazardous material.

The operation of businesses that use, create, or dispose of hazardous materials is regulated and monitored by federal, State, and local regulations that provide protection to the public and the environment from the hazardous materials manufactured within, transported to, and disposed within the region. RCRA, Title 22 of the CCR, and the Hazardous Waste Control Law regulate the generation, transportation, treatment, storage, and disposal of hazardous waste. In addition, 40 CFR 112 requires facilities that have an aggregate aboveground oil (e.g., petroleum, oil mixed with wastes other than dredged spoil, and vegetable oil) storage capacity greater than 1,320 gallons, or a completely buried storage capacity greater than 42,000 gallons to prepare and implement a spill prevention and treatment plan. These laws impose regulatory systems for handling hazardous waste in a manner that protects human health and the environment.

Facilities that would use hazardous materials on-site would be required to obtain permits and comply with appropriate regulatory agency standards designed to avoid hazardous waste releases and protect public health. Regulated activities would be managed by the Sacramento County EMD, the designated CUPA, and would be required to comply with CCR Title 8, “Industrial Relations,” for workplace regulations addressing hazardous materials, as well as Title 26, “Toxics.” Title 26, Division 6 contains requirements for California Highway Patrol (CHP) enforcement of hazardous materials storage and rapid-response cleanup in the event of a leak or spill. Compliance with these regulations would reduce the potential for accidental release of hazardous materials during future construction and operation and would minimize both the frequency and the magnitude if such a release occurs.

For household materials use, all products offered for sale are required to be labeled appropriately to ensure safe use, storage, and disposal, and residents are required to use these materials consistent with labeling requirements. Laws regarding the safe disposal of hazardous materials apply to residents, just as they apply to businesses. The Sacramento County Department of Waste Management and Recycling operates multiple household hazardous waste drop-off locations, and also transports garbage collected from bins to the North Area Recovery Station, where household hazardous waste is separated for proper disposal. For more information about solid waste collection, refer to Chapter 18, “Public Utilities.”

Because future projects within the WJHMP would implement and comply with federal, state, and local hazardous materials regulations and codes monitored by the state (e.g., Cal/OSHA, DTSC, CHP, California DOT) and/or local jurisdictions (e.g., Sacramento Metropolitan Fire District and Sacramento County Environmental Management Department), impacts related to creation of significant hazards for employees and the general public through routine transport, use, and disposal of hazardous materials would be unlikely; this impact would be **less than significant**.

MITIGATIONS MEASURES

No mitigation is required.

IMPACT HAZ-2: POTENTIAL FOR RELEASE OF HAZARDOUS MATERIALS FROM UNDOCUMENTED OR DOCUMENTED SITES OF CONTAMINATION

The plan area consists mostly of vacant, undeveloped land; however, there are industrial areas which include warehouses, landscape supply yards and truck and equipment yards. Further, the plan area was historically used for mining, agriculture, and rural home sites. Mining and construction material processing activities are still occurring within the plan area. Construction would involve site grading, excavation, trenching, and demolition and construction of buildings. Future construction and groundwork activities within the plan area could result in the exposure of construction workers and the public to hazardous materials if they are present within the soil and/or groundwater within the site. Such exposure could pose health risks to those who come in contact with contaminated soil and groundwater.

UNDOCUMENTED ON-SITE HAZARDOUS MATERIALS

Construction activities that disturb subsurface materials could encounter previously unidentified contamination from past practices, or placement of undocumented fill, or even unauthorized disposal of hazardous wastes. Due to historical use for agricultural purposes, it is anticipated that residue from pesticides, fertilizers, and other agricultural chemicals may be present on the site. In addition, build-up of agricultural chemicals and potential for fuel tanks constitutes a risk during ground disturbance. Although current agricultural practices do not generally employ toxic chemicals with long-persistence, chemicals formerly used in agriculture included heavy metals and organic compounds, such as DDT, which may persist in soil for decades. These residues could potentially pose a health risk to persons coming into contact with those chemicals. Similarly, lands used for operations associated with mining, construction materials processing, and equipment yards could contain existing contamination; particularly if use predates regulations related to the proper use and disposal of potentially hazardous materials. Encountering these hazardous materials could expose workers, the public, or the environment to adverse effects depending on the volume, materials involved, and concentrations.

If contaminated soils and/or groundwater (i.e., identifiable by soil staining or odors) are encountered during construction activities, work would cease until appropriate worker health and safety precautions, as specified by CCR Title (Section 5194) promulgated by

Cal/OSHA, are implemented. A qualified hazardous materials specialist would be notified for an evaluation and the appropriate regulatory agency would be contacted. If deemed necessary by the appropriate agency, remediation would be undertaken in accordance with existing federal, State, and local regulations/requirements and guidelines established for the treatment of hazardous substances. Work would cease in the contaminated area until the nature and extent of contamination have been established, and proper disposal or remediation has occurred. This would likely require removal from the site and transportation to an EPA-approved disposal facility by a USDOT-certified hazardous waste transporter. The designation of encountered contamination would be based on the chemicals present and chemical concentrations detected through laboratory analysis. Based on the analytical results, appropriate disposal of the material in accordance with EPA, DTSC, and RWQCB guidelines would be implemented.

Lead, Asbestos, and Other Hazardous Building Materials

Existing structures are believed to contain hazardous materials, including asbestos, lead, and heavy metals – primarily because many of the existing structures were constructed when the use of these materials was not heavily restricted. Demolition of structures could result in inadvertent release or improper disposal of debris containing potentially hazardous materials; however, federal, state, and local regulations have been developed to address potential impacts related to the handling and disposal of hazardous materials during demolition. Potential impacts would be minimized through adherence to regulatory standards that prescribe specific methods of material characterization and handling.

Federal and state regulations govern the demolition of structures where materials containing lead and asbestos are present. Asbestos and lead abatement must be performed and monitored by contractors with appropriate certifications from the State Department of Health Services. In addition, Cal/OSHA has regulations concerning the use of hazardous materials, including requirements for safety training, availability of safety equipment, hazardous materials exposure warnings, and emergency action and fire prevention plan preparation. Cal/OSHA enforces the hazard communication program regulations, which include provisions for identifying and labeling hazardous materials, describing the hazards of chemicals, and documenting employee-training programs. All demolition that could result in the release of lead and/or asbestos must be conducted according to Cal/OSHA standards. Specific actions required by law include the following:

- **Asbestos**. When a project applicant applies for a demolition or renovation permit through the County Building Department, the applicant would be required to get a permit from the local air district (Sacramento Metropolitan Air Quality Management District). As part of the permit process, the applicant would need to show compliance with federal regulations and Air District Rule 902, which requires a survey for asbestos before demolition. Any asbestos found would require abatement. Any asbestos would be removed and disposed of by an accredited contractor in compliance with federal, state, and local regulations

(including the Toxic Substances Control Act and the National Emission Standard for Hazardous Air Pollutants). Compliance with these regulations would result in the safe disposal of asbestos-containing materials.

- **Lead-based paint or other coatings.** Exposure to, and containment of, lead is regulated by DTSC and the California Code of Regulations Title 8 and Title 22. A survey for indicators of lead-based coatings would be conducted before demolition to further characterize the presence of lead. For the purposes of compliance with Cal/OSHA regulations, all coated surfaces would be assumed to potentially contain lead. There is also a potential for soil contamination because of deposition of deteriorated (i.e., flaked, peeled, chipped) lead-based paint adjacent to structures where lead-based exterior paints were used. Loose or peeling paint may be classified as a hazardous waste if concentrations exceed total threshold limits. Cal/OSHA regulations require air monitoring, special work practices, and respiratory protection during demolition where even small amounts of lead have been detected.
- **Heavy metals and PCBs.** Spent florescent light bulbs and ballasts, thermostats, and other electrical equipment may contain heavy metals, such as mercury, or PCBs. If concentrations of these materials exceed regulatory standards, they would be handled as hazardous waste in accordance with hazardous waste regulations.

DOCUMENTED SITES OF HAZARDOUS MATERIALS RELEASE

The project would result in the construction adjacent to land that was previously used in conjunction with Mather AFB, which is a Superfund site with ongoing cleanup activities. There are 89 cleanup sites identified in the Marth AFB. Although, it is unknown if groundwater contamination from past Marh AFB activities has affected any of the properties located within the plan area, 75 of the 89 identified in Mather AFB have gone through remediation. The remaining sites are undergoing remediation or awaiting official closure documentation (AFCEC 2011). However, the district area designated for open space/urban farm north of Jackson Highway is downgradient from the Site 7 Plume that extends from the former Mather AFB. If the urban farm is planning to use on-site groundwater, then mitigation measures such as installation of monitoring wells and regular sample testing from those wells will be required.

The former Depot is approximately 1.4 miles west of the plan area and downgradient. Groundwater remediation was discontinued at this Superfund site after VOC concentrations in the groundwater met Sacramento County sanitary sewer system discharge requirements (DOD 2018). The latest 5-year review (2018) concluded that remedial actions at the site are consistent with the remedy selected by EPA and, thus, the actions continue to be effective in protecting human health and the environment in the short term. Enforcement of institutional controls and maintenance of the soil cover will ensure long-term protection (DOD 2018). Additionally, groundwater flows from east to west, away from the plan area.

Besides the Superfund sites, there are two landfill sites that are in proximity to the plan area that are sources of contaminated groundwater. L and D Landfill is 0.1 mile to the

west of the plan area. VOCs have been detected in groundwater under the landfill site. In response, an extensive network of groundwater extraction wells, landfill gas extraction wells, and groundwater monitoring wells have been installed. Groundwater elevation monitoring during the third and fourth quarters of 2016 indicated a groundwater cutoff along the south boundary of the landfill site. The groundwater gradient has consistently been observed to flow to the south towards the groundwater extraction wells. Along the eastern border of the landfill site (border closest to the plan area), the flow appears to be in southwesterly direction away from the plan area and toward the extraction wells. The Semi-Annual and Annual 2016 Monitoring Report for the L and D Landfill concluded that this southerly flow pattern is evidence that the groundwater extraction wells are effective in capturing and treating groundwater before it leaves the site (SCS Engineers 2017:26).

The Florin Perkins Landfill is a closed landfill site that is 0.6 mile west of the plan area. Elevated levels of VOCs (methylene chloride and TCFM have been detected in groundwater below the landfill. Groundwater flow is to the southeast (toward the plan area); however, it appears that TCFM contamination is generally localized at the landfill site. Recent detections of TCFM off site are at levels that are lower than what was measured in 2015 and are far below the California maximum contaminant level (MCL) of 150 ppb and the Public Health Goal MCL level of 700 ppb (Dunn Environmental 2017:54).

Conclusion

Based on the above information, groundwater contamination from the known contamination sites are contained or are in the process of being contained. Furthermore, the potable water needs for the residential and commercial components of the project will not be met through extraction of local groundwater, but will be served by the Sacramento County Water Agency and Cal American Water. However, due to the possibility of encountering contaminated groundwater during ground disturbance, these portions of the plan area require further investigation. This impact would be **less than significant with mitigation**.

Mitigation Measures

Mitigation Measure HAZ-2a: Phase I Environmental Site Assessment

Prior to approval of projects plans, grading permits, and/or demolition permits for properties in the plan area that have not already been evaluated for the presence of hazardous materials and hazardous conditions, Phase I Environmental Site Assessments (ESAs) shall be prepared by a qualified professional. Each Phase I ESA shall assess the potential for hazards and provide recommendations whether additional investigation (Phase II ESA, see Mitigation Measures HAZ-2B) should be completed. The County shall not issue a grading or building permit for a site where contamination has been identified until remediation or effective site management controls appropriate for the site use have been completed consistent with applicable regulations and to the satisfaction of the Sacramento County Planning and Environmental Review Division, the California Department of Substances Control, and/or Central Valley Regional Water

Quality Control Board, as appropriate. All applicable recommendations from the Phase I ESA shall be incorporated into the future project as required conditions of approval.

If the Phase I ESA determines there are no recognized environmental conditions, no further action is required. However, the County shall ensure any grading or project plan or building permit includes a statement that if hazardous materials contamination is discovered or suspected during construction activities, all work in the vicinity of the contamination shall stop immediately until a qualified professional has evaluated the site and determined an appropriate course of action.

MITIGATION MEASURE HAZ-2B: PHASE II ENVIRONMENTAL SITE ASSESSMENT

If determined necessary, a Phase II ESA shall be conducted to determine the lateral and vertical extent of soil, groundwater, and/or soil vapor contamination, as recommended by the Phase I ESA. The Phase II ESA shall be prepared by the project applicant prior to issuance of grading or building permit. The Phase II shall include recommendations for remediation activities if contaminants are detected in the subsurface at the project site and/or contaminants are present at concentrations exceeding hazardous waste screening thresholds for contaminants in soil and/or groundwater (CCR Title 22, Section 66261.24 Characteristics of Toxicity). All recommendations for remediation activities and additional studies from the Phase II ESA shall be incorporated into the future project as required conditions of approval.

MITIGATION MEASURE HAZ-2C: HAZARDOUS MATERIALS CONTINGENCY PLAN

Prior to issuance of a grading or building permit, the County shall require that the applicant provide a hazardous materials contingency plan to Sacramento County EMD. The plan will describe the necessary actions that would be taken if evidence of contaminated soil or groundwater is encountered during construction. The contingency plan shall identify conditions that could indicate potential hazardous materials contamination, including soil discoloration, petroleum or chemical odors, and presence of underground storage tanks or buried building material.

The plan shall include the provision that, if at any time during the course of constructing the project, evidence of soil and/or groundwater contamination with hazardous material is encountered, the contractor, future project applicants, or their designee, shall immediately halt construction and contact Sacramento County EMD. Work shall not recommence until the discovery has been assessed/treated appropriately (through such mechanisms as soil or groundwater sampling and remediation if potentially hazardous materials are detected above threshold levels) to the satisfaction of Sacramento County EMD, RWQCB, and DTSC (as applicable). The plan, and obligations to abide by and implement the plan, shall be incorporated into the construction and contract specifications of the project.

Impact HAZ-3: Result in Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste within 0.25 Mile within an Existing or Proposed School

The only existing school within the plan area is Sierra-Enterprise Elementary School. However, five new schools are proposed as part of the project: a joint high school and middle school campus located in the center of the plan area and four elementary schools throughout the plan area. The school sites would be generally surrounded by parks and residential development.

For new schools, the California Education Code, including *Education Code* Section 17213(b), establishes requirements for assessments and approvals that address the potential for existing contamination on the site, and whether nearby land uses might reasonably be anticipated to emit hazardous air emissions or handle hazardous materials. Assessment of existing contamination is conducted in coordination with DTSC's School Property Evaluation and Cleanup Division, which is responsible for assessing, investigating, and cleaning up proposed school sites. This Division ensures that selected properties are free of contamination or, if the properties were previously contaminated, that they have been cleaned up to a level that protects the students and staff who will occupy a new school. All proposed school sites that would receive State funding for acquisition or construction are required to go through a rigorous environmental review and cleanup process under DTSC's oversight.

Further, because the plan area would be developed in phases, there is a potential that schools proposed as part of the project would be in operation during both construction and operation of adjacent land uses. During construction, demolition, and excavation activities, projects could potentially produce hazardous air emissions or involve the handling of hazardous wastes. During operation, projects could use and produce hazardous materials that may be transported on roadways in the plan area. As discussed above, all projects would comply with federal and state regulations that are designed to reduce the potential for the release of large quantities of hazardous materials and wastes into the environment to an acceptable level. As a result, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact HAZ-4: Impair Implementation of or Physically Interfere with an Adopted Emergency Response Plan or Emergency Evacuation Plan

Emergency response plans are maintained at the federal, state, and local level for all types of disasters, including human-made and natural. Emergency response plans include elements to maintain continuity of government, emergency functions of governmental agencies, mobilization, and application of resources, mutual aid, and public information. In the event of an emergency that would require citizens to evacuate,

Sacramento County would implement its emergency operations plan, evacuation plan, and mass care and shelter plan, as provided in the Sacramento County Evacuation Plan (Sacramento County 2008).

Construction activities could result in temporary lane closures, increased truck traffic, and other roadway effects that could slow or stop emergency vehicles, temporarily increasing response times and impeding existing services. Construction activities in the plan area do not, however, have the potential to substantially hinder emergency response activities or physically interfere with established evacuation routes. Projects requiring encroachment permits for temporary construction activities in public roadways that could be used for emergency response or evacuation are required to prepare traffic mitigation plans that address traffic control during the period the project is occurring within public right-of-way. To address any temporary road closures that would be required during construction, standard construction mitigation includes notification of emergency responders.

The project does not contain any uses or features that would create interference with emergency response once the plan area is built out. The proposed roadway network would be a connected grid pattern, consistent with County Department of Transportation (County DOT) standards, which would provide for easy navigation of streets throughout the plan area. Proposed roadway improvements include some of the thoroughfares within the plan area, which include Jackson Highway, South Watt Avenue, Bradshaw Road, Kiefer Boulevard, Routier Road Extension, Florin Road, and Elder Creek Road. Direct access points would be located at sufficient intervals from each other and from public roads to maintain the safety and the traffic carrying capacity of the roadway. In addition, the project includes two new fire stations within the plan area that would provide emergency response to the entire plan area and beyond in less than 4 minutes (refer to Chapter 17, “Public Services,” for additional discussion).

Although the project would result in new population of residents and employees in an area of the county that does not currently support these types of dense land patterns, the project is not anticipated to impair the implementation of existing emergency response or evacuation plans. This is because the buildout of the project would be gradual, over a roughly 30-year period, and the County’s emergency plans are adaptive. It is anticipated that these plans would be updated to reflect changes in land use patterns. Although the plan area is located within the 100-year flood hazard areas and designated as Special Flood Hazard Areas, the project would include new flood control facilities and other improvements (e.g., raising areas above the floodplain, constructing levees for protection, and construction of spur levees to tie into existing high ground) to achieve required flood protection (as discussed in Chapter 14, “Hydrology and Water Quality”). Implementation of these flood control improvements would protect the plan area from the 100-year and 200-year flood events and would not impair flood evacuation routes. The potential for construction activities or development to impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT HAZ-5: EXPOSE PEOPLE OR STRUCTURES TO WILDLAND FIRES

CAL FIRE has designated the areas as a non–very high fire hazard severity zone (CAL FIRE 2023), which is defined as an area not prone to intense, damaging wildfires. The plan area is within a Local Response Area (LRA) where fire protection is provided by Metro Fire. (See Chapter 17, "Public Services," for further discussion of Metro Fire Department's facilities and response times).

However, the project proposes siting relatively dense residential land use within proximity to a large open space area. In the event of a grass fire within or adjacent to the plan area, Metro Fire would respond. To address potential hazards and increased demand, the project includes provisions for two new fire stations. Further, new construction is subject to the CFC and Title 14 of the CCR, which includes safety measures to minimize the threat of fire damage to people and structures. As required by Policy SA-23 in the Sacramento County General Plan, plans for specific facilities would be provided to Metro Fire for review and comment regarding: adequacy of water supply; site design for fire department access into and around structures; ability for a safe and efficient fire department response; traffic flow and ingress/egress for residents and emergency vehicles; site-specific built-in fire protection; and potential impacts to emergency services and fire department response. Therefore, future development within the plan area would not be exposed to significant risks of wildfire. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

14 HYDROLOGY, DRAINAGE, AND WATER QUALITY

INTRODUCTION

This chapter identifies the regulatory context and policies related to hydrology and water quality, describes the existing hydrologic conditions in the plan area, and evaluates potential hydrology and receiving water-quality impacts of the project. Potential effects on sewer/wastewater, and drainage/stormwater facilities are addressed in Chapter 18, "Public Utilities." Potential effects on the capacity of Sacramento County's water supply and groundwater are discussed in Chapter 20, "Water Supply."

In response to the release of the notice of preparation (NOP), the County received information from the Central Valley Regional Water Quality Control Board (RWQCB) and the Central Valley Flood Protection Board regarding applicable permit requirements. As appropriate, these regulatory requirements are described below and considered in the analysis. The NOP and comments received in response to it are presented in Appendix A.

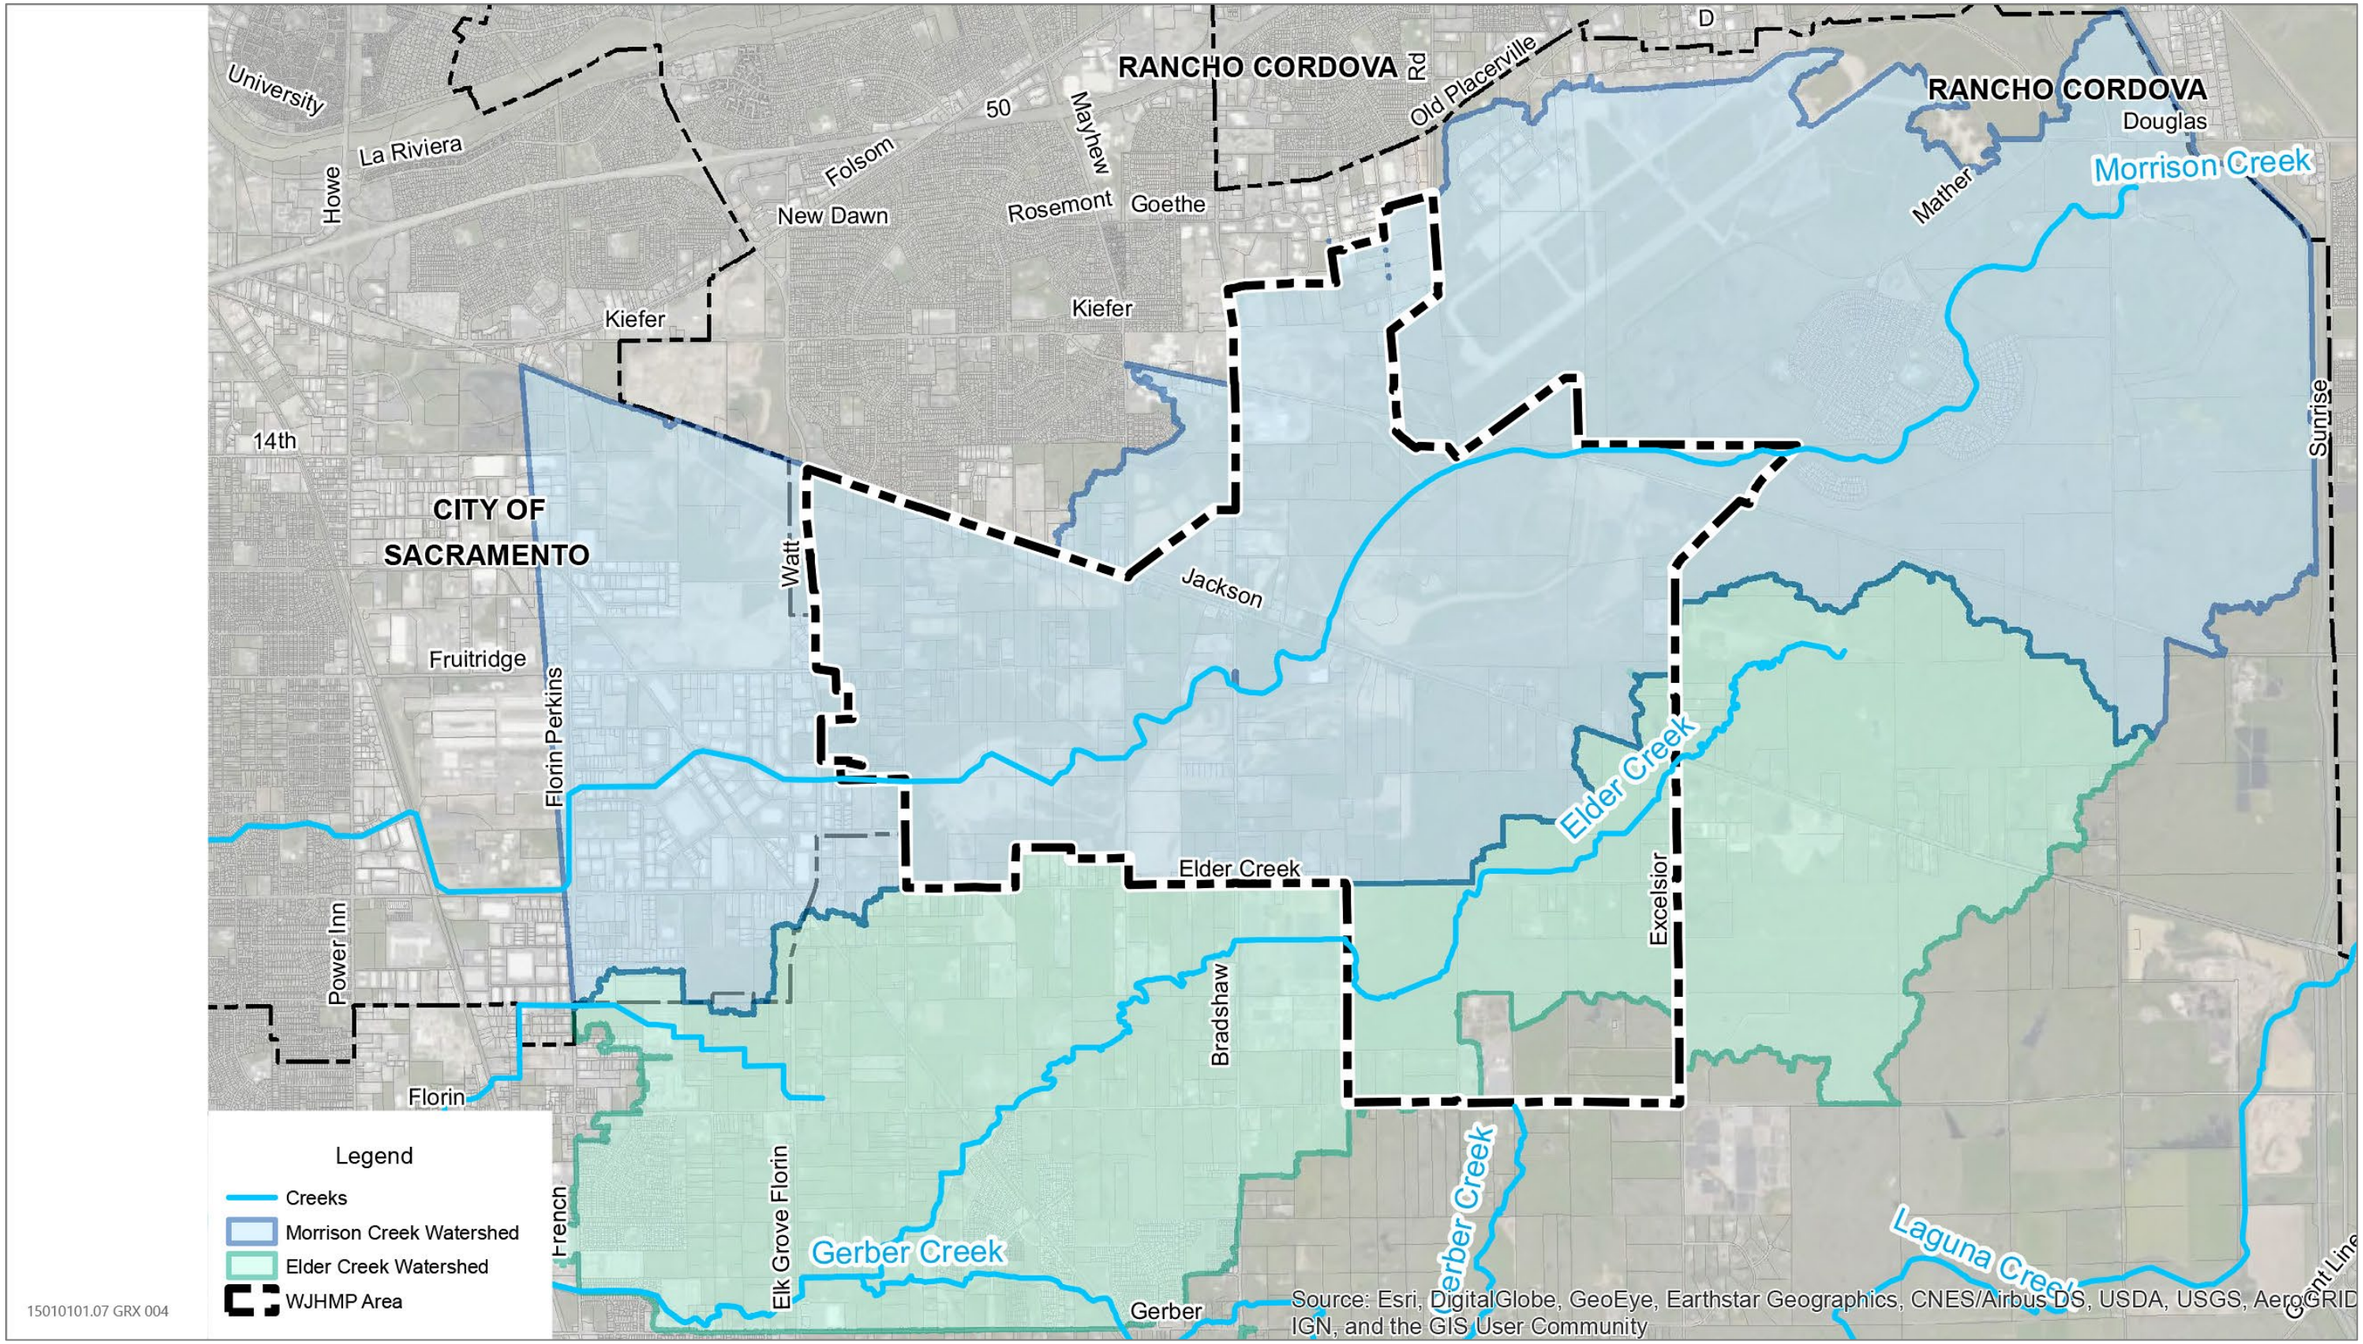
ENVIRONMENTAL SETTING

HYDROLOGY AND DRAINAGE

REGIONAL AND LOCAL HYDROLOGY

The plan area is located within the Sacramento River Hydrologic Region. The Sacramento River is the largest watershed in the state of California, encompassing approximately 27,000 square miles and carries approximately 30 percent of the state's total surface water (NOAA 2022). The Sacramento River Hydrologic Region extends from Chipps Island in Solano County to Goose Lake in Modoc County and is bounded by the Sierra Nevada to the east, the Coast Ranges to the west, the Cascade Range and Trinity Mountains to the north, and the Sacramento-San Joaquin River Delta to the south (DWR 2013). Several principal rivers are located within the Sacramento River Hydrologic Region such as the Feather River, Yuba River, American River, Clear Creek, Battle Creek, Cottonwood Creek, Mill Creek, Deer Creek, and Butte Creek.

The plan area is within the Morrisson Creek and Elder Creek watersheds, which are both components of the Morrison Creek Stream Group that contribute flows to the Sacramento River (NOAA 2022). The Morrison Creek stream group ultimately drains to the Beach Stone Lakes (BSL) area, which has a history of flooding because of upstream runoff, direct precipitation in the area, and backwater from the Cosumnes and Mokelumne Rivers during periods of flooding and high river stages. Sacramento County has elected not to undertake structural flood protection in this area considering various environmental and institutional factors.



The Folsom and Nimbus Dams are located on the American River. The Nimbus Dam, located approximately 7.5 mile northeast of the plan area, re-regulates water released from the Folsom Dam and diverts water to the Folsom South Canal. Water that is not diverted to the canal is released into the Lower American River (DWR 2013). The Folsom Dam, approximately 13.6 miles northeast of the plan area, was built for flood control and provides water storage for municipal, irrigation and hydroelectric purposes (NOAA 2022). The Folsom Dam is part of the Central Valley Project (CVP), a complex, multi-purpose network of dams, reservoirs, canals, hydroelectric powerplants, and other facilities used to reduce flood risk for the Central Valley. The CVP supplies domestic and industrial water to the valley and major urban centers in the greater Sacramento area and San Francisco Bay Area, enhances water quality, produces electrical power, and provides water to restore and protect fish and wildlife (Reclamation 2023).

Plan Area Hydrology and Drainage

Two waterways traverse the plan area, Morrison Creek and Elder Creek (Figure 14-1). Morrison Creek is located within the northern portion of the plan area and Elder Creek is located within the southern portion of the plan area. The Elder Creek watershed consists of the main creek fed by three upstream branches; the confluence of these branches is about 1,900 feet northwest of the intersection of Elder Creek Road and Excelsior Road, located in the southeast edge of the plan area. Both Morrison and Elder Creek are characterized as meandering streams with relatively shallow depths (3-6 feet) and narrow streambed (6-20 feet wide), which are bordered by a shallow, broad floodplain (100-2,000 feet wide). As shown in Figure 14-1, approximately 80 percent of plan area is within the Morrison Creek watershed.

Given the generally undeveloped nature of the plan area, existing drainage facilities are limited primarily to Morrison Creek, Elder Creek, roadside ditches, bridges, and culverts. A Master Drainage and Flood Control Study was prepared by Wood Rodgers in support of the WJHMP. As discussed in the *West Jackson Highway Master Plan Master Drainage and Flood Control Study* (Appendix H), significant mining activity has occurred within the plan area over the last several decades, which has modified the landscape and drainage patterns of the Morrison Creek watershed.

As described in Chapter 2, “Project Description,” heavy modification from mining of the plan area has resulted in topography that is varied, with site elevations ranging from approximately 30 to 65 feet above mean sea level (see Figure 2-4). Numerous parcels bordering Morrison Creek to the north and south have been mined for construction-grade aggregates, which caused Morrison Creek to be realigned along two reaches. The first reach from Hedge Avenue to Mayhew Avenue was completed in 2014 and the second reach from Jackson Highway to Excelsior Road was completed in the early 2000s. The mined areas adjacent to Morrison Creek, as well as other mined areas several thousand feet north and south of the creek, are now below existing grade. The realigned Morrison Creek is retained within its banks by existing ground or embankments functioning as levees. Although portions of the mined areas historically flowed to Morrison Creek, many currently do not drain and the areas function as stormwater retention basins. Upstream of Jackson Highway, in the northeastern portion of the plan area, Morrison Creek spills over

Source: Image produced and provided by Wood Rodgers in 2023, adapted by Ascent in 2023.

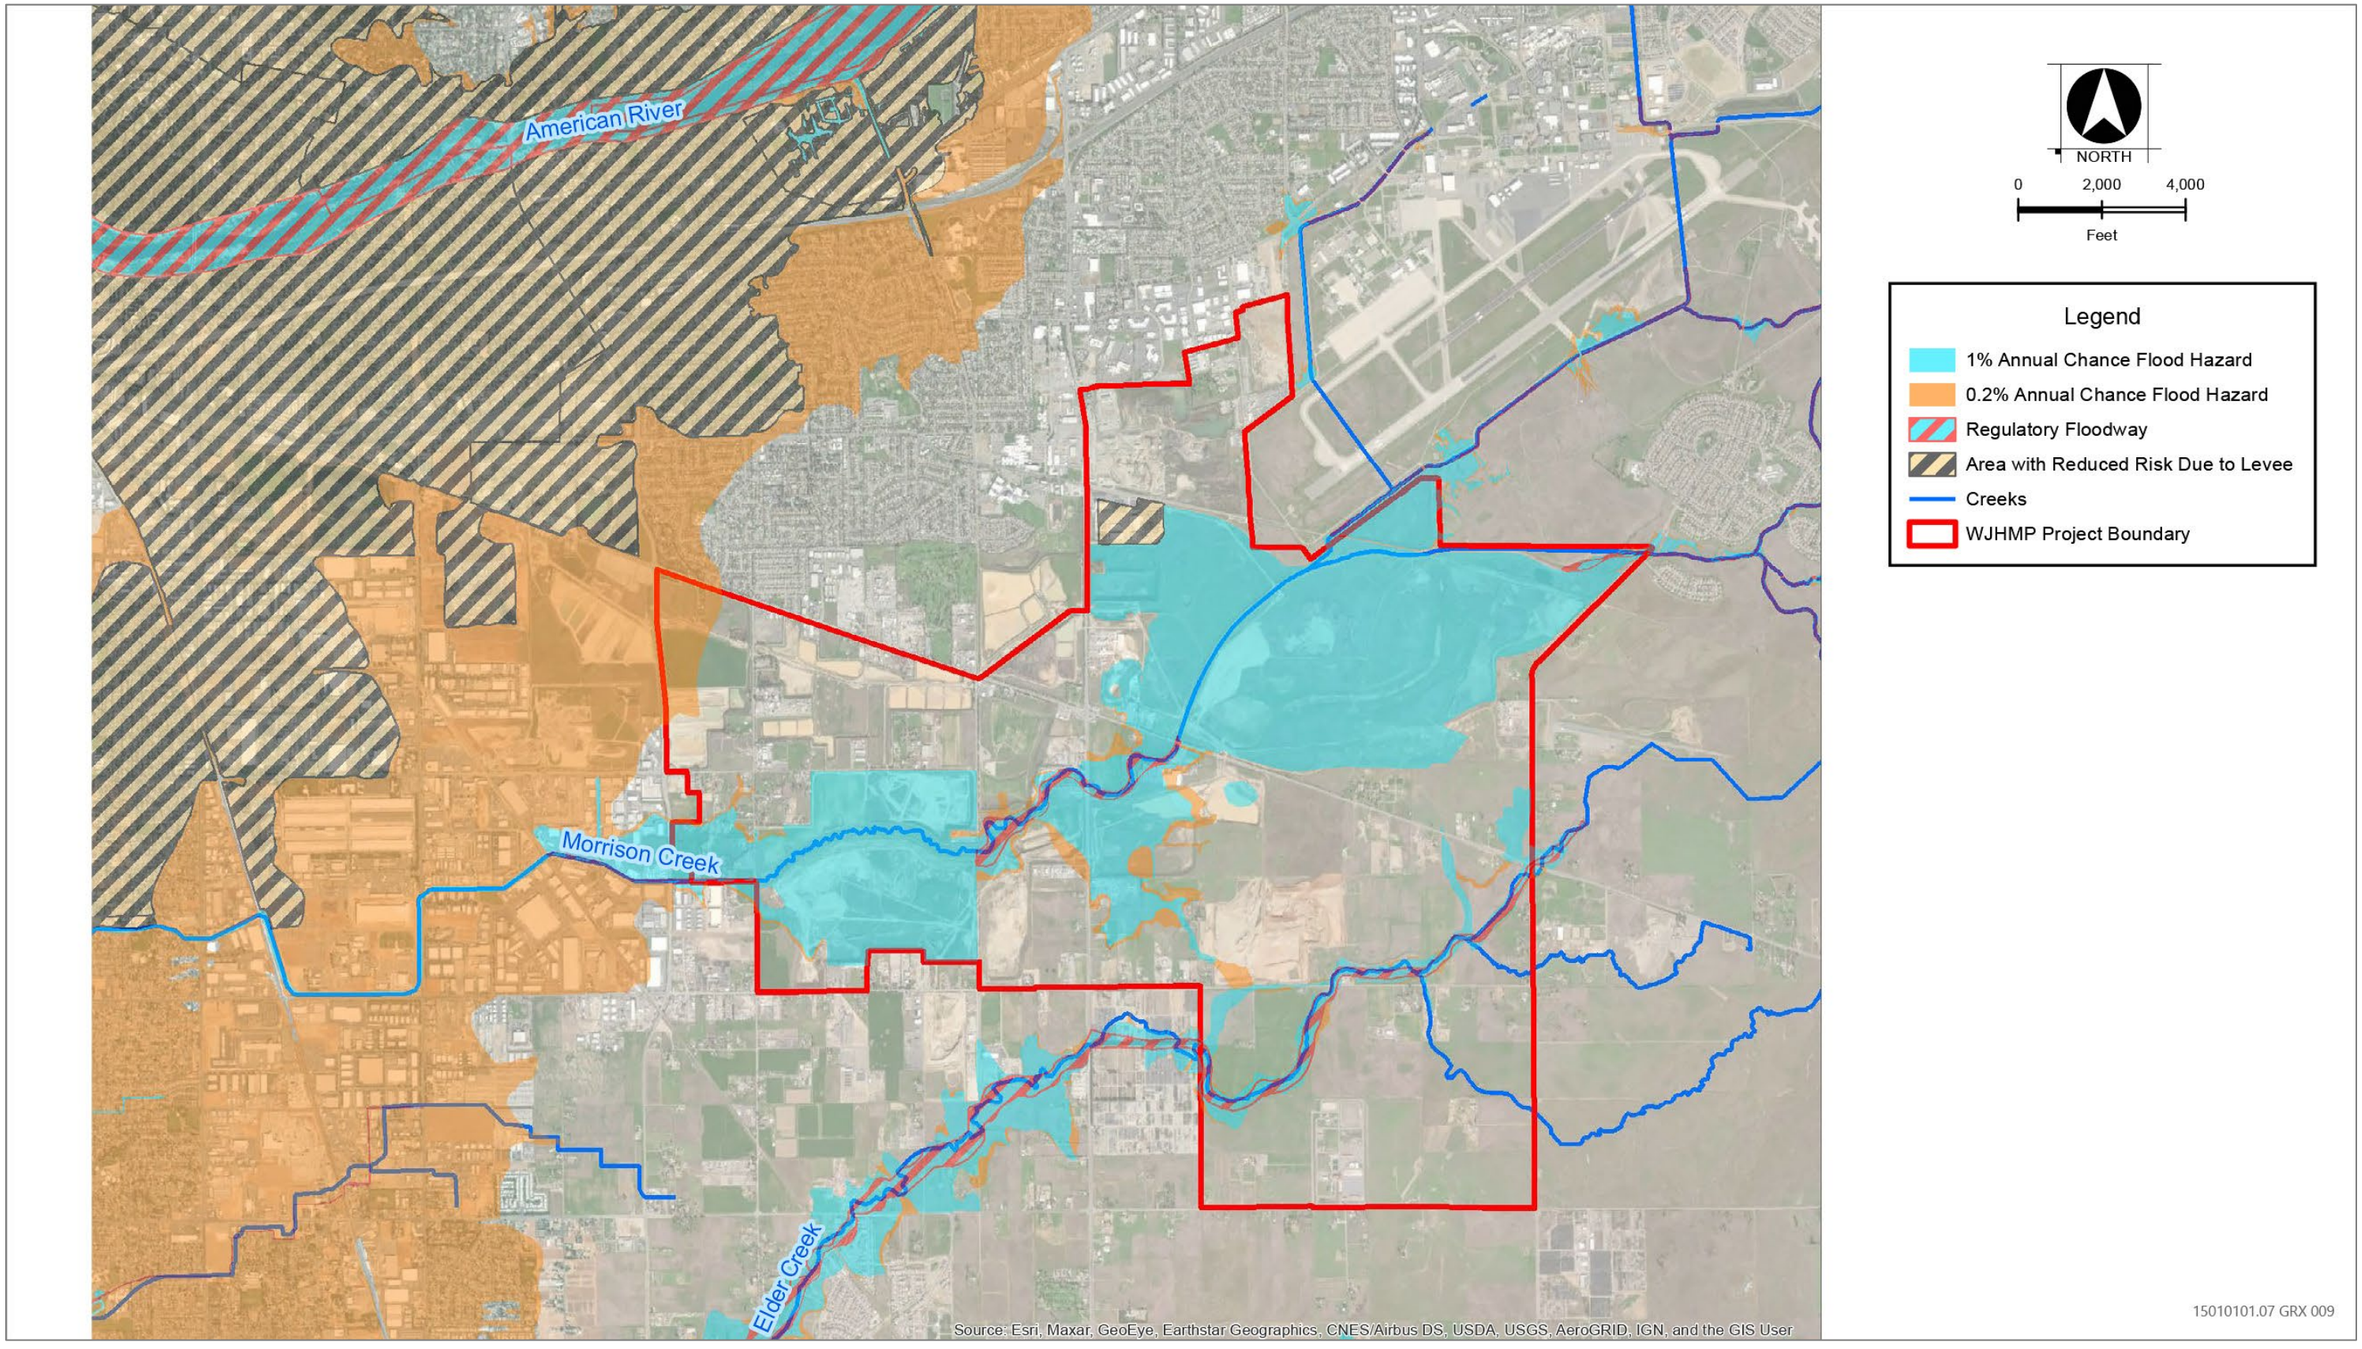
Figure 14-1 Watersheds

an approximately 800-foot-long weir structure during periods of high flow and the plan area detains runoff from the upstream watershed (Wood Rodgers 2022). Historically, runoff from Morrison Creek drained into the Sacramento River; however, when levees were constructed along the Sacramento River, the flows were diverted into Beach Lake and Stone Lake. Eventually, these flows ultimately drain to the Sacramento/San Joaquin Delta via Snodgrass Slough and the Mokelumne River.

The upstream watershed contains a non-jurisdictional dam facility (Mather Dam) which holds approximately 850 acre-feet of storage at a depth of less than 6 feet. Several of the mined areas are connected by conveyor tunnels, interim facilities for mining operations, at South Watt Avenue, Hedge Avenue, Bradshaw Road, Jackson Highway and Fruitridge Road. The conveyor tunnels are interim facilities for mining operations and are not intended to alter the future drainage pattern.

Flood Conditions

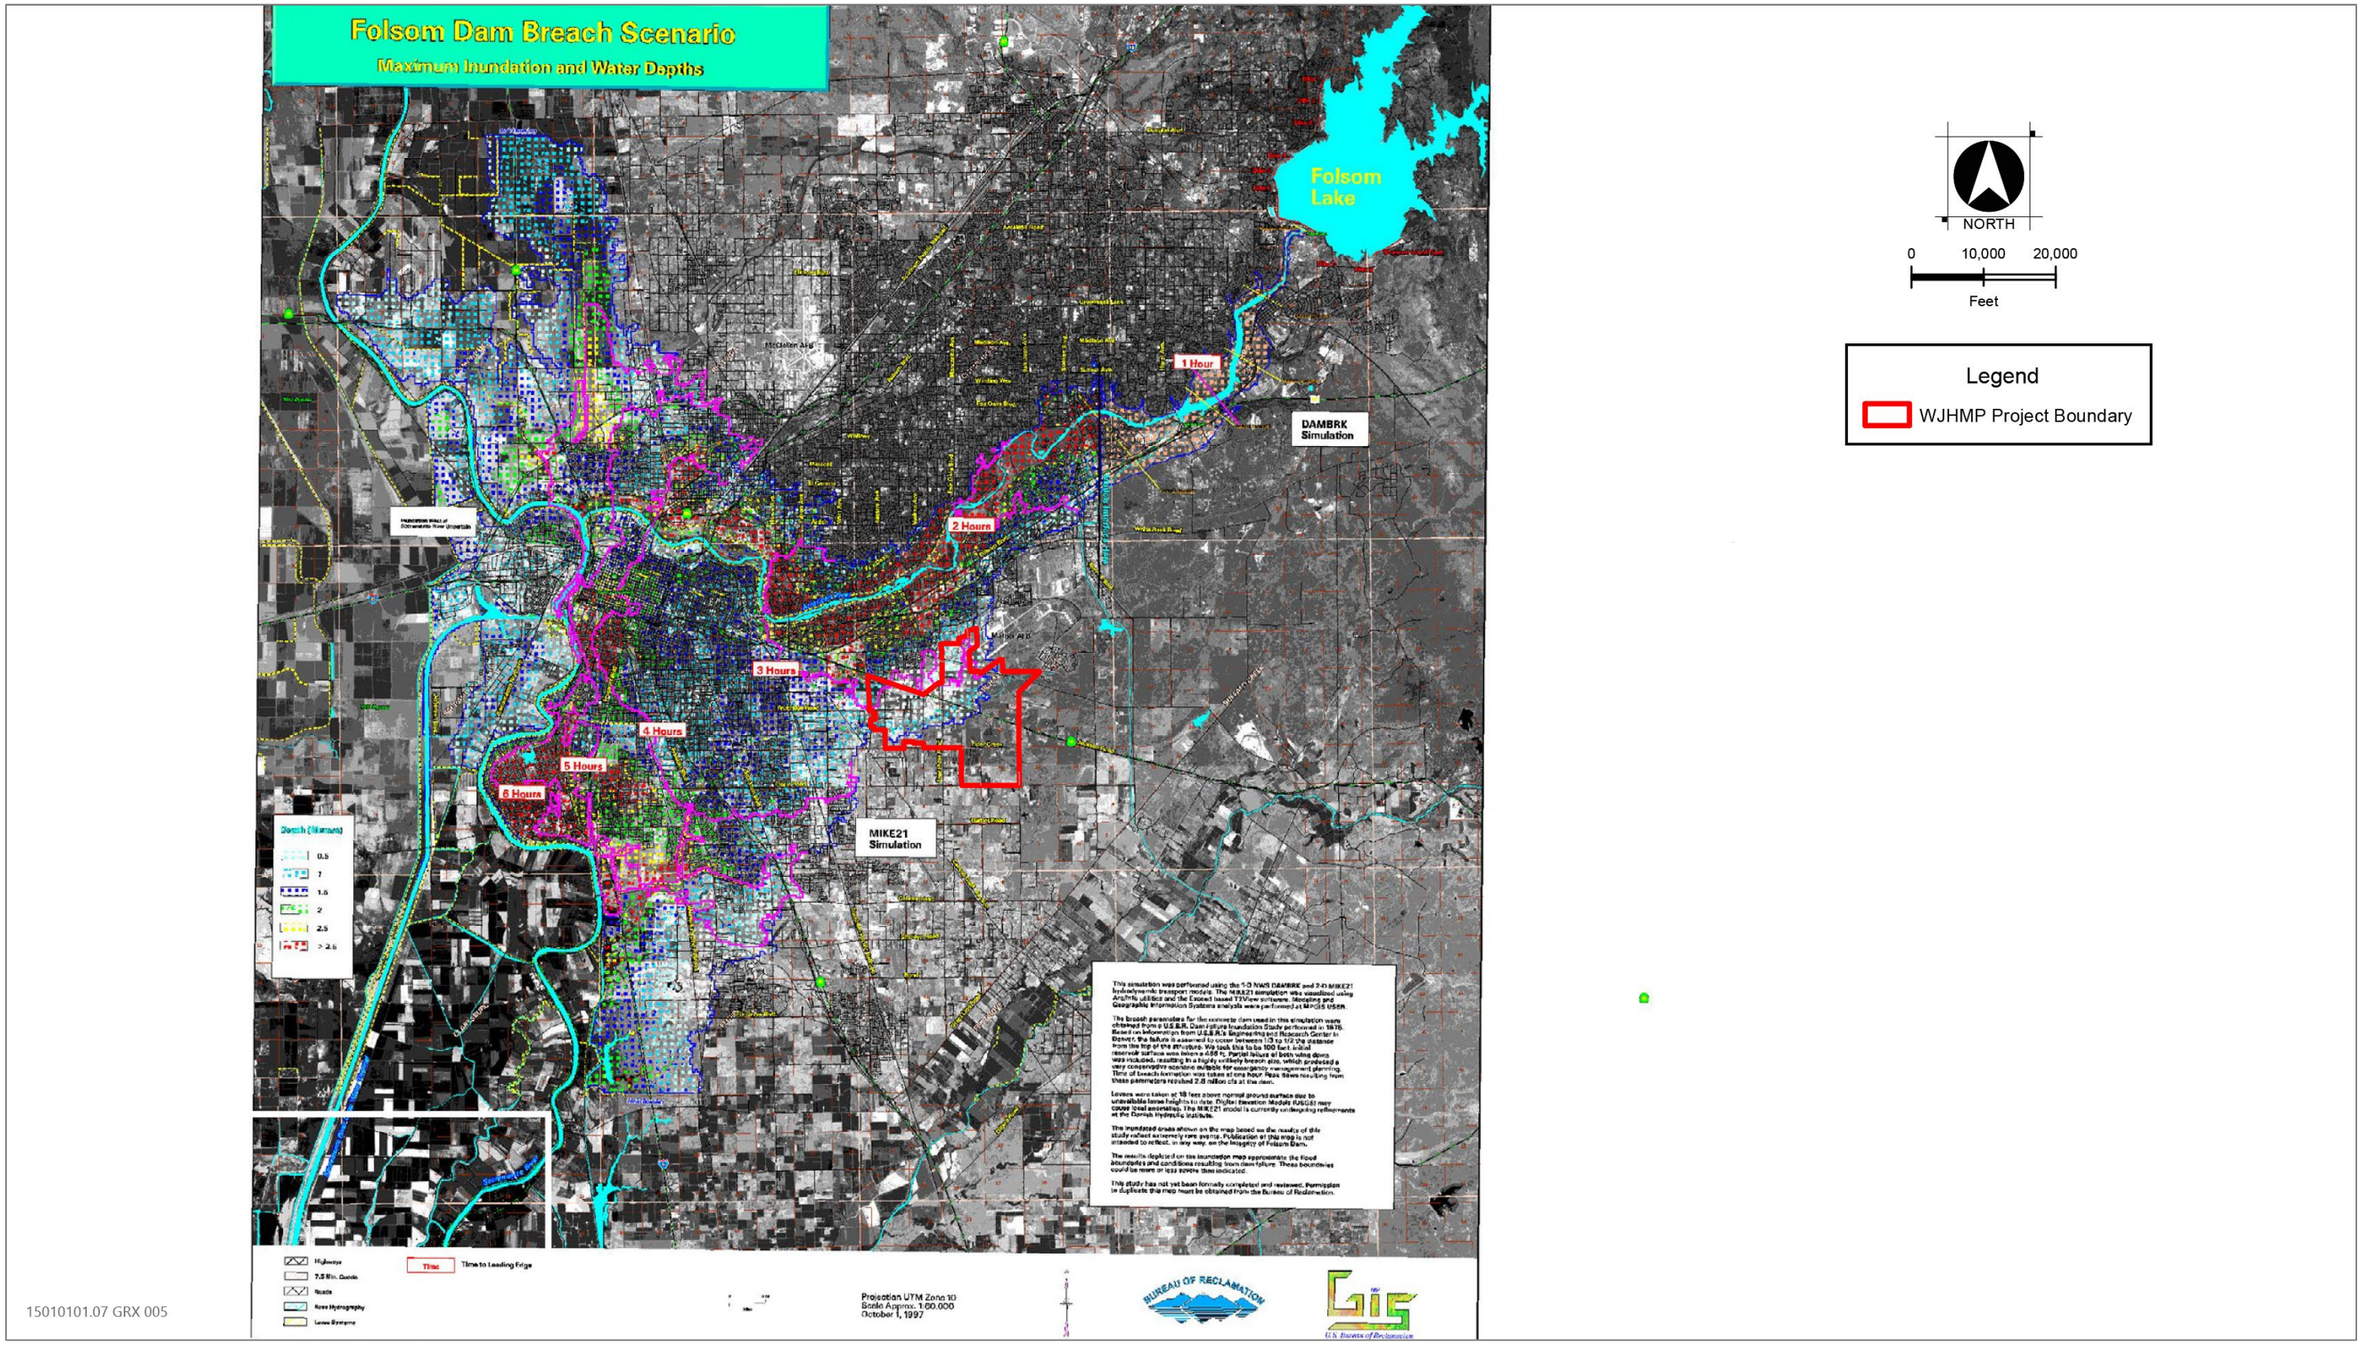
The Federal Emergency Management Agency (FEMA) National Flood Hazard Layer maps predict flood conditions. Flood hazards can be defined based on the potential to be affected by a 100-year (1 percent chance of flooding), 200-year (0.5 percent annual chance of flooding), or 500-year flood (0.2 percent annual chance of flooding). A majority of the plan area is within the 100-year flood zone. There are also areas within the 500-year floodplain (DWR 2023). Figure 14-2 displays the flood zone locations of the 100-year and 500-year floodplains within the plan area.



The plan area is within inundation zone of the Folsom Dam, particularly the northwestern portion of the plan area, shown in Figure 14-3. The northwestern portion of the plan area that is within the Folsom Dam's inundation zone, also contains active and closed/reclaimed mining sites, further discussed in Section 3.12, "Geology and Soils." The plan area is within the 0.5-1 feet of maximum depth zones of inundation, taking approximately two to three hours for maximum water depth to be met. However, the maximum depth zones of inundation do not account for depths of mined areas. While the potential for dam failure is low, damage and potential loss of life is high. Additionally, Mather Dam is approximately 2.3 miles northeast of the plan area. While there are no inundation maps for the Mather Dam, in the event of a dam failure, it is assumed that the weir on Morrison Creek and associated basin would have the capacity accommodate inflow, preventing the potential of flooding (Wood Rodgers 2022). Failure of either the Cordova Meadows Levee or the Sunriver Levee along the American River could also potentially result in the inundation of properties north of the plan area (City of Rancho Cordova 2006).

Groundwater Hydrology

The Sacramento River Hydrologic Region contains 88 recognized alluvial groundwater basins and subbasins and underlies approximately 7,800 square miles (DWR 2013). The largest and most heavily used groundwater basins in the hydrologic region are located within the Sacramento Valley Groundwater Basin. The Sacramento Valley Groundwater Basin is comprised of 21 subbasins, four of which are located within Sacramento County; the North American, South American, Cosumnes, and Solano



subbasins. Under the Sustainable Groundwater Management Act (SGMA), the formation of Groundwater Sustainability Agencies (GSAs) is required to provide governance over each groundwater subbasin in the state. Sacramento County accepted GSA responsibility for unmanaged areas in three of the four subbasins. The plan area is located within the Sacramento Valley Groundwater Basin, specifically within the South American Subbasin. The South American Subbasin is a high priority subbasin and is generally bounded by the American River, the Sacramento River, the Cosumnes River, and the eastern Sacramento County line. The South American Subbasin shares boundaries with five adjacent subbasins; the Yolo Subbasin to the northwest, Solano Subbasin to the southwest, North American Subbasin to the north, and the Eastern San Joaquin and Cosumnes Subbasins to the south. Within the South American Subbasin, six local entities formed GSAs; Sacramento Central Groundwater Agency (SCGA), Omochumne-Hartnell Water District (OHWD), Sloughhouse Resource Conservation District (SRCD), North Delta GSAs (NDGSA), Reclamation District 551 (RD 551), and Sacramento County. The GSAs agreed to work together and developed and implemented a Groundwater Sustainability Plan (GSP) for the South American Subbasin. The GSP includes a comprehensive groundwater subbasin description, which was used in the development of a regional surface water and groundwater model that quantifies current water budgets and projects future conditions associated with population growth, land use changes, water conservation, climate change, and consideration of beneficial projects that are planned to occur the next five to ten years. The GSP also includes an assessment of the impacts of predicted future groundwater levels on beneficial users, including groundwater-dependent ecosystems, shallow wells, and interconnected surface water (SASb 2021).

Groundwater levels within the South American Subbasin have fluctuated within each year due to seasonal recharge and use variations; over a year or series of years due to short-term droughts and wet periods; and over decades due to changes in land and water use or longer-term hydrologic conditions. Like most of California, groundwater levels in the South American Subbasin typically decline in summer and fall and increase in winter and spring. The summer and fall are periods of reduced natural recharge from precipitation and streamflow and also are periods of higher groundwater production to meet higher urban and agricultural demands during that period. Conversely, the winter and spring have higher recharge and lower groundwater production. The magnitude of seasonal fluctuation in groundwater levels depends on the connectivity of the aquifer with surface recharge sources, the volume and depth of groundwater production in the area, and aquifer characteristics. Several wells in the eastern portion of the subbasin, specifically wells located generally along Laguna Creek from near Douglas Road to just south of Jackson Highway, show a relatively steady decline in groundwater levels (SASb 2021).

Figure 14-2 FEMA Floodplain

Source: Image produced and provided by Wood Rodgers in 2022, adapted by Ascent in 2023.

Figure 14-3 Folsom Dam Breach Inundation

The Central Basin, a locally defined subarea of the Sacramento Groundwater Basin, overlaps with the South American Subbasin. The Central Basin lies south of the American River, east of I-5 and the Sacramento River, and north of the southern boundary of the Omochumne-Hartnell Water District and the Cosumnes and Mokelumne Rivers. The plan area resides within the central northern portion of the Central Basin. Groundwater in the Central Basin is generally classified as occurring in a shallow aquifer zone or in an underlying deeper aquifer zone. Within the Central Basin, the shallow aquifer extends approximately 200 to 300 feet below the ground surface and, in general, water quality in this zone is considered to be good with the exception of arsenic detections in a few locations. The shallow aquifer is typically used for private domestic wells requiring no treatment unless high arsenic values are encountered, causing owners to possibly target other water-bearing strata. The deep aquifer is separated from the shallow aquifer by a discontinuous clay layer that serves as a semi-confining layer for the deep aquifer. The base of the potable water portion of the deep aquifer averages approximately 1,400 feet below ground surface. Water in the deep aquifer typically has higher concentrations of total dissolved soils (TDS), iron, and manganese. Groundwater used in the Central Basin is supplied from both the shallow and deeper aquifer systems (SCGA 2006).

Recharge to the local aquifer system occurs along active river and stream channels where extensive sand and gravel deposits exist, particularly along the American, Cosumnes, and Sacramento River channels. Additional recharge occurs along the eastern boundary of Sacramento County at the transition point from the consolidated rocks of the Sierra Nevada to the alluvial deposited basin sediments. This typically occurs through fractured granitic rock that makes up the Sierra Nevada foothills. This recharge is classified as subsurface recharge along with underground flow into and out of the Central Basin with adjacent groundwater basins. Other sources of recharge within the area include deep percolation from applied surface water, precipitation, and small streams (SCGA 2006). The Central Basin is currently managed by the Sacramento Central Groundwater Authority, which has also adopted a management plan, the Central Sacramento County Groundwater Management Plan (CSCGMP), consistent with the Sacramento Water Forum objectives that addresses groundwater decline and quality in the Central Basin. Although the plan area includes streams that may have historically provided groundwater infiltration, aggregate mining has removed the permeable substrate in portions of the plan area. Where the impermeable clay layer is exposed (for example, in the northeastern portion of the plan area), groundwater recharge is likely limited.

Water Quality

Surface Water Quality

Surface water quality conditions of the rivers and streams within Sacramento County are affected by natural watershed conditions, such as seasonal weather and temperature patterns; seasonal surface hydrologic runoff and groundwater exchange characteristics of the watershed; runoff or atmospheric deposition of natural chemical or biological matter associated with soil, vegetation, and animal wastes; and long-term climatic patterns (e.g.,

droughts). The primary sources of potential contamination discharges associated with human-related activities in the county include urban stormwater runoff, agricultural runoff, and municipal wastewater treatment plant discharges.

EPA has identified existing water quality impairments in both Morrison Creek and Elder Creek downstream of the plan area. Morrison Creek and Elder Creek are both listed on the Clean Water Act (CWA) Section 303(d) Impaired Waters List. The 2022 Waterbody Report for Morrison Creek identifies the creek's warm freshwater habitat as impaired with diazinon from urban runoff/storm sewers, and pentachlorophenol and pyrethroids from unknown sources. The 2022 Waterbody Report for Elder Creek identifies the creek's warm freshwater habitat as impaired for chlorpyrifos and diazinon from urban runoff/storm sewers and pyrethroids from unknown sources (EPA 2022a, 2022b).

Groundwater Quality

Groundwater quality can be affected by many things, but the chief controls on the characteristics of groundwater quality are the source and chemical composition of recharge water, properties of the host sediment, and history of discharge or leakage of pollutants.

Groundwater quality in the subbasin is generally good and meets local needs for municipal, domestic, and agricultural uses. Several water quality parameters including nitrate, TDS, arsenic, hexavalent chromium, and per- and polyfluoroalkyl substances (PFASs) have been monitored at numerous wells in the subbasin over time (SASb 2021). As discussed further in Chapter 13, "Hazards and Hazardous Materials," there are known occurrences of groundwater contamination in the vicinity of the plan area. However, exceedances of water quality parameters may be caused by localized conditions and generally are not reflective of regionally poor groundwater quality (SASb 2021).

Per the CSCGMP, water quality analysis of the aquifers underlying the Central Basin has shown that groundwater found in the upper aquifer system is of higher quality than that found in the lower aquifer system. This is due to the lower aquifer containing higher concentrations of iron and manganese. The lower aquifer system also has higher concentrations of TDS, although this aquifer typically meets water quality standards as a potable water source. At depths of approximately 1,400 feet or greater, the TDS concentration exceeds 2,000 milligrams per liter and groundwater is considered non-potable unless treated by reverse osmosis. Water from the upper aquifer generally does not require treatment, other than disinfection for public drinking water systems, unless high arsenic values are encountered (SCGA 2006). Additionally, per the Sacramento County Water Agency (SCWA) Zone 40 Water Supply Master Plan, source groundwater in Zone 40 meets all primary and secondary California Code of Regulations Title 22 drinking water quality standards, with the exception of iron, manganese, and arsenic. As discussed in Chapter 20, "Water Supply", the groundwater supplied to Zone 40 wells are connected to groundwater treatment plants (GWTPs) and from wells that pump directly into the distribution system. Each GWTP facility consists of wells that are manifolded into a treatment plant, a ground level storage tank, and a pump station. Treated water from the GWTPs then flows into the ground level storage tanks and is pumped into the distribution system. Cal Am customers are served by direct feed

groundwater wells, with iron and manganese treatment facilities in its Suburban-Rosemont system.

Climate Change

As discussed and analyzed in Appendix H, Morrison Creek was evaluated for potential impacts from climate change. The study showed that climate change would increase the volume and flow rates within Morrison Creek, above the existing weir and basin in the northeastern portion of the plan area.

Regulatory Setting

Federal

Clean Water Act

The US Environmental Protection Agency (EPA) is the lead federal agency responsible for water quality management. The CWA is the primary federal law that governs and authorizes water quality control activities by EPA, as well as the states. Various elements of the CWA address water quality. These are discussed below.

CWA Water Quality Criteria/Standards

Pursuant to federal law, EPA has published water quality regulations under Title 40 of the Code of Federal Regulations (CFR). Section 303 of the CWA requires states to adopt water quality standards for all surface waters of the United States. As defined by the act, water quality standards consist of designated beneficial uses of the water body in question and criteria that protect the designated uses. Section 304(a) requires EPA to publish advisory water quality criteria that accurately reflect the latest scientific knowledge on the kind and extent of all effects on health and welfare that may be expected from the presence of pollutants in water. Where multiple uses exist, water quality standards must protect the most sensitive use. As described in the discussion of state regulations below, the State Water Resources Control Board (SWRCB) and its nine RWQCBs have designated authority in California to identify beneficial uses and adopt applicable water quality objectives.

CWA Section 303(d) Impaired Waters List

Under Section 303(d) of the CWA, states are required to develop lists of water bodies that do not attain water quality objectives after implementation of required levels of treatment by point source dischargers (municipalities and industries). Section 303(d) requires that the state develop a total maximum daily load (TMDL) for each of the listed pollutants. The TMDL is the amount of the pollutant that the water body can receive and still comply with water quality objectives. The TMDL is also a plan to reduce loading of a specific pollutant from various sources to achieve compliance with water quality objectives. No TMDL has been recorded by EPA for Morrison Creek or Elder Creek. In California, implementation of TMDLs is achieved through water quality control plans, known as Basin Plans, of the RWQCBs.

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

The National Pollutant Discharge Elimination System (NPDES) permit program was established in the CWA to regulate municipal and industrial discharges to surface waters of the United States. NPDES permit regulations have been established for broad categories of discharges including point source waste discharges and nonpoint source stormwater runoff. Each NPDES permit identifies limits on allowable concentrations and mass emissions of pollutants contained in the discharge. Sections 401 and 402 of the CWA contain general requirements regarding NPDES permits.

"Nonpoint source" pollution originates over a wide area rather than from a definable point. Nonpoint source pollution often enters receiving water in the form of surface runoff and is not conveyed by way of pipelines or discrete conveyances. Two types of nonpoint source discharges are controlled by the NPDES program: discharges caused by general construction activities and the general quality of stormwater in municipal stormwater systems. The goal of the NPDES nonpoint source regulations is to improve the quality of stormwater discharged to receiving water to the maximum extent practicable. The RWQCBs in California are responsible for implementing the NPDES permit system (see the "State" section, below).

NATIONAL FLOOD INSURANCE ACT

FEMA is tasked with responding to, planning for, recovering from and mitigating against disasters. The Federal Insurance and Mitigation Administration within FEMA is responsible for administering the National Flood Insurance Program (NFIP) and administering programs that aid with mitigating future damages from natural hazards.

FEMA prepares Flood Insurance Rate Maps (FIRMs) that delineate the regulatory floodplain to assist local governments with the land use planning and floodplain management decisions needed to meet the requirements of NFIP. Floodplains are divided into flood hazard areas, which are areas designated per their potential for flooding, as delineated on FIRMs. Special Flood Hazard Areas are the areas identified as having a 1 percent chance of flooding in each year (otherwise known as the 100-year flood). In general, the NFIP mandates that development is not to proceed within the regulatory 100-year floodplain if the development is expected to increase flood elevation by 1 foot or more.

STATE

CALIFORNIA PORTER-COLOGNE ACT

California's primary statute governing water quality and water pollution issues with respect to both surface waters and groundwater is the Porter-Cologne Water Quality Control Act of 1970 (Porter-Cologne Act). The Porter-Cologne Act grants SWRCB and each of the nine RWQCBs power to protect water quality, and is the primary vehicle for implementation of California's responsibilities under the CWA. The applicable RWQCB for the proposed project is the Central Valley RWQCB. SWRCB and the Central Valley RWQCB have the authority and responsibility to adopt plans and policies, regulate discharges to surface and groundwater, regulate waste disposal sites, and require

cleanup of discharges of hazardous materials and other pollutants. The Porter-Cologne Act also establishes reporting requirements for unintended discharges of any hazardous substances, sewage, or oil or petroleum products.

Under the Porter-Cologne Act, each RWQCB must formulate and adopt a Water Quality Control Plan (known as a “Basin Plan”) for its region. The Basin Plan for the Central Valley Region includes a comprehensive list of water bodies within the region and detailed language about the components of applicable Water Quality Objectives (WQOs). The Basin Plan recognizes natural water quality, existing and potential beneficial uses, and water quality problems associated with human activities throughout the Sacramento and San Joaquin River Basins. Through the Basin Plan, the Central Valley RWQCB executes its regulatory authority to enforce the implementation of TMDLs, and to ensure compliance with surface WQOs. The Basin Plan includes both narrative, and numerical WQOs designed to provide protection for all designated and potential beneficial uses in all its principal streams and tributaries. Applicable beneficial uses include municipal and domestic water supply, irrigation, non-contact and contact water recreation, groundwater recharge, freshwater replenishment, hydroelectric power generation, and preservation and enhancement of wildlife, fish, and other aquatic resources.

The Central Valley RWQCB also administers the adoption of waste discharge requirements (WDRs), manages groundwater quality, and adopts projects within its boundaries under the NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit) and NPDES General Permit for Stormwater Discharges Associated with Industrial Activities (Industrial General Permit).

NPDES Construction General Permit for Stormwater Discharges Associated with Construction Activity

Dischargers whose projects disturb 1 or more acres of soil, or whose projects disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 or more acres, are required to obtain coverage under SWRCB’s Construction General Permit (Order WQ 2022-0057-DWQ). Construction activity subject to this permit includes clearing, grading, and disturbances to the ground, such as stockpiling or excavation.

Coverage under the Construction General Permit is obtained by submitting permit registration documents to SWRCB that include a risk-level assessment and a site-specific storm water pollution prevention plan (SWPPP) that identifies an effective combination of erosion control, sediment control, and non-stormwater best management practices (BMPs). The Construction General Permit requires that the SWPPP define a program of regular inspections of the BMPs and, in some cases, sampling of water quality parameters.

NPDES Industrial General Permit for Stormwater Discharges Associated with Industrial Activity

The Statewide General Permit for Stormwater Discharges Associated with Industrial Activities, Order 2014-0057-DWQ (Industrial General Permit) implements the federally

required stormwater regulations in California for stormwater associated with industrial activities discharging to waters of the United States. The Industrial General Permit regulates discharges associated with 9 federally defined categories of industrial activities. The SWRCB and RWCB implement and enforce the Industrial General Permit. This General Permit regulates industrial storm water discharges and authorized non-storm water discharges (NSWDs) from specific categories of industrial facilities, and industrial storm water discharges and authorized NSWDs from facilities designated by the Regional Water Boards to obtain coverage under this General Permit. This General Permit does not apply to industrial storm water discharges and NSWDs that are regulated by other individual or general NPDES permits.

NPDES Stormwater Permit for Discharges from Small Municipal Separate Storm Sewer Systems

CWA Section 402 mandates permits for discharges from municipal separate storm sewer systems (MS4s). Phase I MS4 regulations cover municipalities with more than 100,000 residents, certain industrial processes, and larger-site (5 acres and up) construction activities. Phase II small MS4 regulations require stormwater management plans to be developed by municipalities with fewer than 100,000 residents and construction activities that disturb 1 to 5 acres of land. In 2013, SWRCB adopted a Statewide Phase II Small MS4 General Permit to efficiently regulate discharges from numerous qualifying MS4s under a single permit. Small MS4s are characterized as either “traditional” or “non-traditional.” Stormwater is runoff from rain or snow melt that runs off surfaces such as rooftops, paved streets, highways or parking lots and can carry with it pollutants such as oil, pesticides, herbicides, sediment, trash, bacteria and metals. The runoff can then drain directly into a local stream, lake or bay. Often, the runoff drains into storm drains which eventually drain untreated into a local water body.

Permittees covered under the General Permit must develop and implement an education and outreach program, a public involvement and participation program, a construction site runoff control program, and a post-construction stormwater management program. The post-construction stormwater management program must include the implementation of site design measures for all projects that create and/or replace between 2,500 and 5,000 square feet of impervious surfaces. Projects that create and/or replace 5,000 square feet or more of impervious surfaces must implement low-impact development design standards addressing site planning/design, stormwater pollutant source control, runoff reduction, stormwater treatment, and hydromodification management.

Basin Plans

NPDES permits and Erosion Control Programs are required for the construction of infrastructure and pumping facilities. The CWA requires that water resources be protected from degradation caused by waste discharges and requires that identified beneficial uses be maintained. The RWQCB’s basin plan for the Central Valley Region identifies the designated beneficial uses of groundwater and surface water bodies and contains water quality objectives and standards established to protect those uses.

The County of Sacramento received a municipal NPDES permit for stormwater discharges from the Central Valley RWQCB. Under this permit, permittees are required to develop, administer, implement, and enforce a comprehensive stormwater management program (CSWMP) to reduce pollutants in urban runoff to the maximum extent practicable. The CSWMP implemented by the County is a multi-faceted, dynamic program which is designed to reduce stormwater pollution to the maximum extent practicable. The CSWMP emphasizes all aspects of pollution control including but not limited to public awareness and participation, source control, regulatory restrictions, water quality monitoring, and treatment control. The County has established a Stormwater Ordinance (Sacramento County Code Chapter 15.12), as described below. The Stormwater Ordinance prohibits the discharge of unauthorized non-stormwater to the County's stormwater conveyance system and local creeks. It applies to all private and public projects in the county, regardless of size or land use type. In addition, Sacramento County Code Chapter 16.44 (Land Grading and Erosion Control) requires private construction sites disturbing one or more acres or moving 350 cubic yards or more of earthen material to obtain a grading permit. To obtain a grading permit, project proponents must prepare and submit for approval an erosion and sediment control plan describing erosion and sediment control BMPs that will be implemented during construction to prevent sediment from leaving the site and entering the County's storm drain system or local receiving waters. Construction projects not subject to Sacramento County Code Chapter 16.44 are subject to the Stormwater Ordinance (Sacramento County Code Chapter 15.12), described above.

Applicable projects applying for a County grading permit must show proof that a notice of intent (NOI) has been filed and must submit a copy of the SWPPP. Although the County has no enforcement authority related to the Construction General Permit, the County is required by its Municipal Stormwater Permit (Order Number R5-2008-0142) to verify that the SWPPP program includes six minimum components (public education and outreach on stormwater impacts, public involvement participation, illicit discharge detection and elimination, construction site storm water runoff control, post-construction storm water management in new development and redevelopment, and pollution prevention/good housekeeping for municipal operations).

In addition to the above construction controls, new development is required to include treatment of urban runoff using the BMPs required by the current standard defined in the Stormwater Quality Design Manual for the Sacramento Region. The BMPs include a number of options for treatment including simple grassy swales and rain gardens, to more complex systems that use cisterns, pumps, and sand filters.

CALIFORNIA WATER CODE

The California Water Code is enforced by the California Department of Water Resources (DWR). The mission of DWR is "to manage the water resources of California in cooperation with other agencies, to benefit the State's people, and to protect, restore, and enhance the natural and human environments." DWR is responsible for promoting California's general welfare by ensuring beneficial water use and development statewide.

GROUNDWATER MANAGEMENT

Groundwater Management is outlined in the California Water Code, Division 6, Part 2.75, Chapters 1-5, Sections 10750 through 10755.4. The Groundwater Management Act was first introduced in 1992 as Assembly Bill (AB) 3030, and has since been modified by Senate Bill (SB) 1938 in 2002, AB 359 in 2011, and the SGMA (SB 1168, SB 1319, and AB 1739) in 2014. The intent of the Acts is to encourage local agencies to work cooperatively to manage groundwater resources within their jurisdictions and to provide a methodology for developing a Groundwater Management Plan.

The SGMA became law on January 1, 2015, and applies to all groundwater basins in the state (Water Code Section 10720.3). By enacting the SGMA, the legislature intended to provide local agencies with the authority and the technical and financial assistance necessary to sustainably manage groundwater within their jurisdiction (Water Code Section 10720.1). Pursuant to the SGMA, any local agency that has water supply, water management or land use responsibilities within a groundwater basin may elect to be a "groundwater sustainability agency" for that basin (Water Code Section 10723). The Sacramento Central Groundwater Authority has notified DWR that it has elected to become a GSA pursuant to Water Code Section 10723.8, and intends to undertake sustainable groundwater management in area roughly coincident with the Sacramento Valley Groundwater Basin, South American Subbasin.

STATE PLAN OF FLOOD CONTROL

Section 9110(f) of the California Water Code defines the SPFC as follows, "'State Plan of Flood Control' means the state and federal flood control works, lands, programs, plans, policies, conditions, and mode of maintenance and operations of the Sacramento River Flood Control Project described in Section 8350, and of flood control projects in the Sacramento River and San Joaquin River watersheds authorized pursuant to Article 2 (commencing with Section 12648) of Chapter 2 of Part 6 of Division 6 for which the board or the department has provided the assurances of nonfederal cooperation to the United States, and those facilities identified in Section 8361."

The SPFC encompasses a wide network of facilities, which range from major structures such as levees, drainage pumping plants, drop structures, dams and reservoirs, and major channel improvements, to minor components such as stream gauges, pipes, and bridges.

CENTRAL VALLEY FLOOD PROTECTION ACT

The Central Valley Flood Protection Act of 2008 establishes the 200-year flood event as the minimum level of protection for urban and urbanizing areas. As part of the state's FloodSAFE program, those urban and urbanizing areas protected by flood control project levees must receive protection from the 200-year flood event level by 2025. The DWR and Central Valley Flood Protection Board (CVFPB) collaborated with local governments and planning agencies to prepare the 2012 Central Valley Flood Protection Plan (CVFPP) (DWR 2012), which the CVFPB adopted on June 29, 2012. The objective of the 2012 CVFPP is to create a system-wide approach to flood management and protection improvements for the Central Valley and San Joaquin

Valley. The Central Valley Flood Protection Act calls for updates to the CVFPP every 5-years. The 2022 CVFPP Update is the latest update of the plan.

Urban Levee Design Criteria

The purpose of the Urban Levee Design Criteria (ULDC) is to provide engineering criteria and guidance for civil engineers to follow in meeting the requirements of California's Government Code Sections 65865.5, 65962, and 66474.5 with respect to Findings that levees and floodwalls in the Sacramento-San Joaquin Valley provide protection against a flood that has a 1-in-200 chance of occurring in any given year, and to offer this same guidance to civil engineers working on levees and floodwalls anywhere in California. The ULDC also provides engineering criteria and guidance for DWR's urban levee evaluations and participation in urban levee projects. The ULDC may be updated from time to time, either in its current form or as regulations in the California Code of Regulations. The ULDC was developed through a collaborative stakeholder involvement process with representatives from cities, counties, flood agencies, and state and federal agencies.

Local

Sacramento County 2030 General Plan

The Agricultural, Conservation, and Safety Elements of the 2030 General Plan contain the following policies that are applicable to the project:

- **Policy AG-29.** The County shall minimize flood risks to agricultural lands resulting from new urban developments by:
    - Requiring that such developments incorporate adequate runoff control structures and/or
    - Assisting implementing comprehensive drainage management plans to mitigate increased risks of farmland flooding resulting from such developments.
- **Policy CI-65.** Incorporate Low Impact Design (LID) techniques to the greatest extent feasible to improve water quality runoff and erosion control, infiltration, groundwater recharge, visual aesthetics, etc. LID techniques may include but are not limited to:
    - Bioretention techniques, such as filtration strips, swales, and tree box filters
    - Permeable Hardscape
    - Green roofs
    - Erosion and sediment controls
    - Reduced street and land widths where appropriate

- **Policy CO-24.** Comply with the Sacramento Areawide National Pollutant Discharge Elimination System Municipal Stormwater Permit (NPDES Municipal Permit) or subsequent permits, issued by the Central Valley Regional Water Quality Control Board (Regional Board) to the County, and the Cities of Sacramento, Elk Grove, Citrus Heights, Folsom, Rancho Cordova, and Galt (collectively known as the Sacramento Stormwater Quality Partnership [SSQP]).
- **Policy CO-26.** Protect areas susceptible to erosion, natural water bodies, and natural drainage systems.
- **Policy CO-28**. Comply with other water quality regulations and NPDES permits as they apply to County projects or activities, such as the State's Construction General Permit and Aquatic Pesticides Permit.
- **Policy CO-30.** Require development projects to comply with the County's stormwater development/design standards, including hydromodification management and low impact development standards, established pursuant to the NPDES Municipal Permit.
- **Policy CO-31.** Require property owners to maintain all required stormwater measures to ensure proper performance for the life of the project.
- **Policy CO-93.** Discourage fill in the 100-year floodplain (Please also refer to CO-117).
- **Policy CO-94.** Development within the 100-year floodplain and designated floodway of Sacramento streams, sloughs, creeks or rivers shall be:
  - Consistent with policies to protect wetlands and riparian areas; and
  - Limited to land uses that can support seasonal inundation.
- **Policy CO-107.** Maintain and protect natural function of channels in developed, newly developing, and rural areas.
- **Policy CO-114.** Protect stream corridors to enhance water quality, provide public amenities, maintain flood control objectives, preserve and enhance habitat, and offer recreational and educational opportunities.
- **Policy CO-117.** Public roads, parking, and associated fill slopes shall be located outside of the stream corridor, except at stream crossings and for purposes of extending or setting back levees. The construction of public roads and parking should utilize structural materials to facilitate permeability. Crossings shall be minimized and be aesthetically compatible with naturalistic values of the stream channel.
- **Policy CO-118.** Development adjacent to waterways should protect the water conveyance of the system, while preserving and enhancing the riparian habitat and its function.
- **Policy CO-126.** Prohibit obstruction or underground diversion of natural waterways.

- **Policy SA-5.** A comprehensive drainage plan for major planning efforts shall be prepared for streams and their tributaries prior to any development within the 100-year floodplain defined by full watershed development without channel modifications. The plan shall:
  a. Determine the future 100-year flood elevations associated with planned and full development of the watershed;
  b. Determine the future 100-year floodplain boundaries for both flood elevations (planned and full development) based on minimum 2-foot contour intervals;
  c. Assess the feasibility of gravity drainage into the existing flowline of the stream;
  d. Assess the feasibility of alternative means of drainage into the stream;
  e. Identify potential locations for sedimentation ponds and other stormwater treatment facilities;
  f. Determine practical channel improvements and/or detention basins to provide the flood control needs of the proposed development;
  g. Determine the location and extent of marsh, vernal pool and riparian habitat;
  h. Develop measures for protecting and mitigating natural habitat;
  i. Develop measures for protecting and mitigating for federal and state listed endangered species;
  j. Develop and ensure implementation of measures that would reduce vector larvae;
  k. Identify appropriate plant species to be included as part of the natural features of the comprehensive drainage plan.

- **Policy SA-14.** The County shall require, when deemed to be physically or ecologically necessary, all new urban development and redevelopment projects to incorporate runoff control measures to minimize peak flows of runoff and/or assist in financing or otherwise implementing Comprehensive Drainage Plans.
- **Policy SA-16.** Deny creation of parcels that do not have buildable areas outside the 100- year floodplain unless otherwise allowed in the Floodplain Management Ordinance.
- **Policy SA-17.** For residential zoning, the area outside the 100-year floodplain must be contiguous or reasonably situated to provide buildable area for a residence and associated structures. Examples of structures include swimming pools, sheds, barns, detached garages, and other outbuildings that are normally associated with residential development. There may be exceptions (such as the Delta area) as allowed in the Floodplain Management Ordinance.
- **Policy SA-18.** Vehicular access to the buildable area of newly created parcels must be at or above the 10-year flood elevation. Exceptions may be made when the existing public street from which access is obtained is below the 10-year

flood elevation. There may be exceptions (such as the Delta area) as allowed in the Floodplain Management Ordinance.

- **Policy SA-22.** Areas within a 100-year floodplain shall not be upzoned to a more intensive use unless and until a Master Drainage Plan is prepared that identifies areas of the floodplain that may be developed.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities within the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan, which was last updated in 2003, provides guidance for both new development and the redevelopment of existing land uses within the community planning area. Objectives identified in the plan that are applicable to the project include:

- **Policy PS-3.** Provide adequate drainage and flood protection for all urbanized portions of the community.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan, which was developed in 1985, provides guidance for growth and development in the community planning area. Policies identified in the plan that are applicable to the project include:

- **Policy PF 3.** Restrict urban and rural development from encroaching into the 100-year floodplain.
- **Policy PF 6.** All types of urban development proposals must be accompanied by a detailed public services plan and specific timing and funding programs for the implementation and maintenance of services.

SACRAMENTO COUNTY DEPARTMENT OF WATER RESOURCES

The Sacramento County Department of Water Resources (County DWR) maps local 100-year floodplains that may not be identified by FEMA. Local floodplains in the county are typically mapped either in response to an area having flooding problems, or in response to a request by a property owner to make modifications to their parcel. In such circumstances, County DWR staff investigate the property and determine the floodplain elevation on the property, if feasible, or require a drainage study. Floodplains, whether local or FEMA, are regulated by the provisions of the Sacramento County Floodplain Management Ordinance, Improvement Standards, and Local Floodplain Management Plan.

All new developments and drainage improvements within the county are required to follow specific guidelines in design, rehabilitation, and maintenance of drainage facilities and natural waters as set forth by County DWR. The County's 2030 General Plan and Drainage Master Plan Program require that no adverse downstream impact shall occur

due to development. This is achieved by ensuring that the proposed improvements result in no water surface increases outside of the plan area upstream or downstream and that there are no peak flow increases downstream (i.e., the maximum rate of discharge and corresponding water levels would not be greater than under existing conditions). Other elements for consideration revolve around public health and safety issues, maintaining compliance with regulatory agencies, and providing the public with natural-appearing features. Additionally, dual use facilities including parks (active and passive) and trails are encouraged.

SACRAMENTO COUNTY FLOODPLAIN MANAGEMENT ORDINANCE

A Local Floodplain Management Plan is required for a community to participate in the NFIP Community Rating System. The original plan for Sacramento County was prepared in 1997 and was adopted by the Sacramento County Board of Supervisors on September 16, 1997 (Resolution 97-1112). The plan was later updated in 2001. The Floodplain Management Ordinance specifically describes what types of development activities are allowed and how proposed development may be permitted.

A Floodplain Management Plan is a comprehensive plan that describes how a community will deal with its flooding problem(s) and protect the natural and beneficial functions of its floodplain. The plan identifies the major watersheds and watercourses within the unincorporated area of Sacramento County, the flooding problems associated with these watercourses, and the measures being taken to minimize the flood risk for each watercourse. The goals of the Local Floodplain Management Plan are:

- protect new development from the potential of flooding from a 100-year flood event, and
- identify possible activities to reduce the potential of flood damage to existing structures.

All proposed development activity in floodplains -- those areas designated by FEMA on the FIRMs for Sacramento County (Community Number 060262) and other areas subject to flooding -- must be reviewed and permitted by the County's Floodplain Administrator (County DWR) before construction.

SACRAMENTO COUNTY STORMWATER ORDINANCE

The County has established a Stormwater Ordinance (Sacramento County Code Chapter 15.12). The Stormwater Ordinance prohibits the discharge of unauthorized non-stormwater to the County's stormwater conveyance system and local creeks. It applies to all private and public projects in the county, regardless of size or land use type.

SACRAMENTO COUNTY GRADING ORDINANCE

Sacramento County Code Chapter 16.44 (Land Grading and Erosion Control) requires private construction sites disturbing 1 or more acres or moving 350 cubic yards or more of earthen material to obtain a grading permit. To obtain a grading permit, project proponents must prepare and submit for approval an Erosion and Sediment Control Plan describing erosion and sediment control BMPs that will be implemented during

construction to prevent sediment from leaving the site and entering the County's storm drain system or local receiving waters. Construction projects not subject to Sacramento County Code Chapter 16.44 are subject to the Stormwater Ordinance (Sacramento County Code Chapter 15.12), described above.

Projects applying for a County grading permit must show proof that an NOI has been filed with the SWRCB and must submit a copy of the SWPPP. Although the County has no enforcement authority related to the Construction General Permit, the County is required by its Municipal Stormwater Permit (Order Number R5-2008-0142) to verify that the SWPPP program includes six minimum components (public education and outreach on storm water impacts, public involvement participation, illicit discharge detection and elimination, construction site storm water runoff control, post-construction storm water management in new development and redevelopment, and pollution prevention/good housekeeping for municipal operations).

Stormwater Quality Design Manual for the Sacramento Region

The Sacramento Stormwater Quality Partnership, which includes Sacramento County and the Cities of Citrus Heights, Elk Grove, Folsom, Galt, Rancho Cordova, and Sacramento, has prepared a Stormwater Quality Design Manual for the Sacramento Region (Sacramento Stormwater Quality Design Partnership 2018). This manual is intended to satisfy the regulatory requirements of each jurisdiction's respective municipal stormwater permits. The manual outlines planning tools and requirements to reduce urban runoff pollution to the maximum extent practicable from new development and redevelopment projects.

New development is required to include treatment of urban runoff using the BMPs defined in the Stormwater Quality Design Manual for the Sacramento Region. The BMPs include a number of options for treatment, from simple grassy swales and rain gardens to more complex systems that use cisterns, pumps, and sand filters.

Sacramento Hydromodification Management Plan

The revised draft Sacramento County Stormwater Quality Partnerships Hydromodification Management Plan (HMP) was released in 2013 and finalized in 2017. Through the HMP, projects would be required to incorporate LID measures from a menu of improvements based on a credit system.

Central Sacramento County Groundwater Management Plan

The Central Sacramento County Groundwater Basin stakeholders, in coordination with the Sacramento County Water Agency and the Water Forum Successor Effort have developed the CSCGMP. The CSCGMP represents a critical step in establishing a framework for maintaining a sustainable groundwater resource for the various users overlying the basin in Sacramento County between the American and Cosumnes Rivers. The CSCGMP was prepared in accordance with AB 3030 and SB 1938, the SGMA, as amended.

South American Subbasin Groundwater Sustainability Plan

The SGMA, passed by the California legislature in 2014, requires local entities to jointly assess groundwater conditions in their local areas and to develop a GSP by a specified deadline to ensure that sustainable conditions are achieved within 20 years of GSP adoption. An effective and efficient groundwater management plan is critical to the health and welfare of the people, the environment, and all other uses and users of groundwater in a local area. Six local entities responded to the mandate of SGMA and formed GSAs within the South American Subbasin. SCGA, OHWD, SRCD, NDGSA, Reclamation District 551 (RD 551), and Sacramento County, henceforth "the GSAs," have agreed to work together to develop and implement a GSP for the South American Subbasin.

Significance Criteria and Methodology

Significance Criteria

An impact on hydrology, drainage, or water quality would be significant if implementation of the project would:

- violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality;
- substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would:
    - result in substantial erosion or siltation on- or off-site,
    - result in flooding on-site or off-site,
    - create or contribute runoff water that would exceed the capacity of existing or planned stormwater-drainage systems or provide substantial additional sources of polluted runoff, or
    - impede or redirect flood flows;
- in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation; or
- conflict with or obstruct implementation of a water quality control plan (i.e., Basin Plan) or sustainable groundwater management plan.

Issues Not Discussed Further

Risk Release of Pollutants due to Inundation in Tsunami or Seiche Zones

Because of the distance from the nearest open water body, the Pacific Ocean (more than 100 miles to the west), and the nearest lake, Folsom Lake (more than 13 miles to the northeast), the project would not be affected by inundation as a result of seiche or tsunami. Therefore, this issue is not considered further in this analysis.

Methodology

Evaluation of potential hydrologic and water quality impacts is based on a review of existing documents and studies that address water resources in the vicinity of the plan area, including the *West Jackson Highway Master Plan Master Drainage and Flood Control Study* (Wood Rodgers 2022), which is attached to this document as Appendix H. Information obtained from these sources was reviewed and summarized to describe existing conditions and to identify potential environmental effects, based on the standards of significance presented in this section. In determining the level of significance, the analysis assumes that the project would comply with relevant federal, state, and local laws, ordinances, and regulations.

West Jackson Highway Master Plan Policies

The proposed WJHMP includes the following policy related to hydrology.

- **Policy 7.4.** Construct the storm water conveyance system, detention/ water quality basins as multi-purpose facilities to provide recreation opportunities in conjunction with drainage functions.

Impacts and Analysis

Impact HYD-1: Violate Water Quality Standards

Construction Impacts

Construction activities may include various land-disturbing activities (e.g., grading, excavation, and trenching) over approximately 5,913 acres, which would expose soils and increase the potential for soil erosion and sedimentation in runoff. Construction and development of the plan area is anticipated to occur over multiple phases and over several decades. Water quality impacts could occur during construction from increased soil erosion and sedimentation because of clearing vegetation, alteration of drainages, and grading. Construction also involves solvents, paints, concrete, and other materials that have the potential to contact and reduce water quality of stormwater runoff from construction sites.

The Sacramento County Stormwater Ordinance (Sacramento County Code Chapter 15.12) prohibits the discharge of unauthorized non-stormwater to the County's

stormwater conveyance system and local creeks. Non-stormwater refers to the prohibition on disposing of extra paint, oils, or other such materials into the stormwater system, as well as wash-water. The Stormwater Ordinance applies to all private and public projects in the county, regardless of size or land use type. In addition, the Land Grading and Erosion Control Ordinance (Sacramento County Code Chapter 16.44) requires private construction sites disturbing 1 or more acres or moving 350 cubic yards or more of earthen material to obtain a grading permit. To obtain a grading permit, project proponents must prepare, and submit for approval, an Erosion and Sediment Control Plan describing erosion and sediment control BMPs that will be implemented during construction to prevent sediment from leaving the site and entering the County's storm drain system or local receiving waters.

In addition to complying with the County's ordinances and requirements, construction sites disturbing 1 or more acres are required to comply with the state's General Stormwater Permit for Construction Activities. The Construction General Permit is issued by SWRCB and enforced by the Central Valley RWQCB. Coverage is obtained by submitting an NOI to SWRCB before construction. The General Permit requires preparation and implementation of a site-specific SWPPP that must be kept on site at all times for review by the state inspector. The SWPPP must include BMPs designed to prevent construction pollutants from contacting stormwater and keep products of erosion from moving off-site into receiving waters throughout the construction and life of the project. In addition to erosion and sediment controls, the project must have BMPs in place to keep other construction-related wastes and pollutants out of the storm drains. Such practices include filtering water from dewatering operations, providing proper washout areas for concrete trucks and stucco/paint contractors, containing wastes, managing portable toilets properly, and dry sweeping instead of washing down dirty pavement. Applicable projects applying for a County grading permit must show proof that an NOI has been filed and must submit a copy of the SWPPP.

Depending on scheduling, construction could occur during multiple rainy seasons (October 1 through April 30). Because of the increase in exposed surfaces and the earth-moving activities, the potential for erosion and sedimentation is higher during the rainy season. Therefore, any project developed within the plan area must include an effective combination of erosion, sediment, and other pollution control BMPs in compliance with the County ordinances and the state's Construction General Permit. Examples of erosion control techniques include stabilized construction entrances, tackified mulch, 3-step hydroseeding, spray-on soil stabilizers, and anchored blankets. Sediment controls help to filter sediment out of runoff before it reaches the storm drains and local waterways. Examples include rock bags to protect storm drain inlets, staked or weighted straw wattles/fiber rolls, and silt fences.

With adherence to County ordinances, 2030 General Plan Policy CO-28, and the state's Construction General Permit and implementation of the required BMPs, construction activities would result in **less-than-significant** water quality impacts.

Operation Impacts

Development associated with implementation of the WJHMP has the potential to increase the pollutant load of stormwater discharges. Vehicles deposit heavy metals, oils, and other substances onto roadways, parking lots, and driveways; residents wash their cars in streets and driveways and the water picks up soaps, waxes, and the dirt, oils, and heavy metals from the cars; and people maintaining landscaping areas use pesticides and fertilizers. Industrial land uses may generate discharges of wash water and process water with trace levels of contamination. Water carries these and other pollutants into storm drains, where the water flows without treatment directly into the streams that provide drinking water, recreation, and wildlife habitat. This runoff could increase pollutant loads to such an extent that the waterway becomes impaired. Water temperatures can be increased, which affects the health of many organisms that live in the creeks. Nutrients in fertilizers can cause water quality problems because they can promote blooms of algae. Increases in stormwater discharge amounts or velocity have the potential to greatly accelerate downstream erosion and impair stream habitat in natural drainage systems.

There is potential for development of the plan area to cause or contribute to a long-term increase in discharges of urban contaminants into the stormwater drainage system compared to existing conditions. In accordance with the federal CWA, California Porter-Cologne Act and California Water Code, Industrial General Permit, County stormwater management regulations such as 2030 General Plan Policies CO-24, CO-30, and SA-14 (discussed above), new construction must maintain pre-project hydrology and incorporate proper pollutant source controls, minimize pollutant exposure outdoors, and treat stormwater runoff through proper BMPs when source control or exposure protection are insufficient for reducing runoff pollutant loads.

LID measures, such as disconnected roof drains, amended soils, tree planting, and separated pavement areas, would also be required by the County under 2030 General Plan Policy CI-65 and Sacramento HMP to reduce the amount of stormwater that would runoff from the developed areas by reducing effective imperviousness in the plan area, and by promoting infiltration and pre-treatment. At the time of grading applications, individual projects would be required to develop a hydrograph management plan that indicates the LID measures. As discussed further in Impact HYD-3, runoff would be attenuated through a system of detention basins that would be designed to either gravity drain or pump collected drainage, into the Morrison Creek and Elder Creek watersheds.

A review of the 303(d) list of impaired waterways indicates that Morrison Creek is impaired with diazinon (an insecticide) from urban runoff/storm sewers and pentachlorophenol (a pesticide and disinfectant) and pyrethroids (an insecticide) from unknown sources and Elder Creek is impaired with chlorpyrifos (a pesticide) and diazinon from urban runoff/storm sewers and pyrethroids from unknown sources (SWRCB 2023). These contaminants are generally associated with agricultural practices. The project would result in the conversion of agricultural land in the plan area to urban uses. This would limit the potential for the plan area to contribute the

insecticides and pesticides for which these waterways are listed to Morrison Creek and Elder Creek. Development consistent with the WJHMP would introduce the potential for urban contaminants such as fertilizers, soaps, and oils to be introduced into the stormwater system. However, the drainage system in the plan area has been developed using stormwater water quality design features to reduce the contaminant load in area stormwater prior to release into surface waterways and all future development would comply with regulations established to minimize the potential for release of pollutants. Therefore, implementation of the WJHMP would be consistent with NPDES regulations and would not cause a net increase of the pollutants for which the waterways are listed.

Compliance with the 2030 General Plan, County Stormwater Ordinance, the requirements of the NPDES MS4 permit, NPDES Industrial General Permit, and implementation of LID Standards would minimize the potential that implementation of the WJHMP would cause a violation of a water quality standard or waste discharge requirement. Therefore, implementation of the WJHMP would not result in substantial increases of polluted runoff and impacts to water quality would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT HYD-2: SUBSTANTIALLY DECREASE GROUNDWATER SUPPLIES OR INTERFERE SUBSTANTIALLY WITH GROUNDWATER RECHARGE

The quantity of groundwater in the eastern portion of the South American Subbasin, where the plan area is located, has been steadily declining due to unconfirmed causes. Per the CalAm and SCWA Domestic Water Studies, implementation of the WJHMP and future development would result in estimated total average annual water demand of 9,060 acre-feet per year, a total average day demand of 5,617 gallons per minute (GPM), a total maximum day demand of 11,233 GPM, and a total peak hour demand of 22,466 GPM. The WJHMP does not propose development of new wells within the plan area. The southern portion of the plan area is located within Zone 40 of the SCWA, which has a groundwater supply capacity of 68.17 million gallons per day (MGD), with an anticipated expansion of 63.83 MGD. Zone 40 also consists of 41 wells with a reasonable design capacity of 62.6 MGD. The northern portion of the plan area is located within the CalAm service area, which has a has a firm capacity of existing well supply sources of 24.6 MGD. Approximately 93 percent of the CalAm water supply is from groundwater sources, with the remainder of surface water coming through purchases with adjacent City of Sacramento and SCWA water purveyors. Impacts related to supplying potable water to development in the WJHMP Area are further discussed in Chapter 20, “Water Supply.”

Future development projects under the proposed plan would result in new impervious surfaces throughout the 5,913 acres of the plan area and its proposed residential, commercial, employment, mixed use, industrial, institutional, school, park, and open space land uses and could reduce rainwater infiltration and groundwater recharge in those areas. However, as noted in Impact HYD-1, on-site LID and BMPs would be incorporated into each project’s design, consistent with the 2030 General Plan policies,

such that the stormwater runoff would be redirected to local detention basins prior to being discharged back to the Morrison and Elder Creek systems. Additionally, the 1,882 acres designated for open space and open space/urban agriculture would allow minimal development that would not increase impervious surfaces in a manner that would substantially impede groundwater recharge. Because the detention basins would temporarily retain stormwater within the designated open space in the plan area, the detention basins would facilitate groundwater recharge within the plan area. Compliance with County General Plan Policies CI-65, CO-24, CO-28, CO-30, and CO-31, the County's Municipal Storm Water Permit, the Stormwater Quality Design Manual for the Sacramento Region, the South American Subbasin Groundwater Sustainability Plan, Central Sacramento County Groundwater Management Plan's would result in implementation of BMPs to improve and provide groundwater recharge and to prevent depletion of groundwater supplies. Therefore, the WJHMP would result in a **less-than-significant** impact related to groundwater supply, recharge, and quality.

MITIGATION MEASURES

No mitigation is required.

IMPACT HYD-3: SUBSTANTIALLY ALTER THE EXISTING DRAINAGE PATTERN OF THE PLAN AREA SUCH THAT SUBSTANTIAL EROSION, FLOODING, OR POLLUTED RUNOFF COULD OCCUR

Development within the plan area would alter the existing drainage pattern of the site. The *West Jackson Highway Master Plan Master Drainage and Flood Control Study* (Appendix H) analyzes the drainage requirements for buildout at plan level and identifies the drainage facilities required to maintain downstream drainage impacts at or below existing conditions. The study establishes a conceptual backbone drainage system, tributary watersheds, the location of drainage facilities, pre-development and post-development flows, required flood detention and post-project water quality conditions. As summary of the proposed drainage for the plan area is provided as Figure 2-12 in Chapter 2, "Project Description."

Within the 18 watersheds described in the Master Drainage & Flood Control Study, the plan includes 26 proposed detention basins and seven pump stations. Pump stations are proposed where the elevation of the detention basin is below the elevation of the discharge creek and gravity flow into the creek is not possible. The pumped detention basins would use a single duty pump to evacuate a 2-year storm event in 48 hours to reduce the amount of flow and to provide a 200-year level of flood protection. The final assumed pumping capacities and rates for each pumped basin are summarized in Table 14-1. Gravity basins were designed with a stepped outlet to accommodate peak flows associated with the 2-year, 10-year, and 100-year storm events.

Table 14-1 Pump Station Summary

Basin	Pump Number[1]	Pump Start Water Surface Elevation (feet)	Design Flow (cubic feet per second [cfs])	Pump Shutoff at Morrison Creek Flow (cfs)
Watershed WJP1 [2]	1 [3]	27.5	65	300
	2	32.2	65	500
	3	35	65	565
Watershed WJP2	1	31	4	—
	2	34	4	—
Watershed WJP3 [4]	1 [5]	5.5	15	345
	2	8.5	15	635
	3	15	15	650
Watershed WJP [4]	1	2	7.5	350
	2	10	7.5	550
Watershed WJP [5]	1	11	10	—
Watershed WJP [6]	1	51	4	—
	2	54	4	—
Watershed WJG106 [6]	1	60	1	—

Notes:

[1] Table shows duty pumps required for design flows. All pumped basins to have redundancy for the largest required pump.

[2] Full pumping capacity is used when the basin water surface elevation is above 50 feet.

[3] Pump turns back on if basin water surface elevation hits 35 feet and Morrison Creek Flow is below 565 cfs in order to accommodate large storm events.

[4] Full pumping capacity is used when the basin water surface elevation is above 20 feet.

[5] Pump turns back on if basin water surface elevation hits 15 feet and Morrison Creek Flow is below 620 cfs in order to accommodate large storm events.

[6] While a pump station will be required for part of the drainage shed, the pump is intended to discharge into a gravity conveyance system and gravity basin prior to discharging to Morrison Creek. Therefore, it is annotated with a gravity designation.

Source: Wood Rodgers 2022.

Detention facilities would be constructed to attenuate storm water runoff to predevelopment levels. Mined areas that historically gravity drained to Morrison Creek would utilize detention basins and pump stations to pump back into Morrison Creek at reduced flows compared to their historical predevelopment drainage flows (Figure 2-11). The piped drainage systems would discharge to either a constructed channel along the future Rock Creek Parkway or detention basins prior to being discharged to Morrison or Elder Creeks. The open channel and detention basins would provide additional water quality benefits, runoff reduction, stormwater infiltration, groundwater recharge, and evapotranspiration. The open channel along Rock Creek Parkway would have varying widths of 50 to 300 feet, incorporating a low-flow channel and gradual side slopes, and would provide additional stormwater detention volume for 100-year through 500-year

events prior to discharge or pumping to Morrison Creek. The areas within the plan area that have not undergone mining activities and currently drain to Morrison Creek or Elder Creek would continue to drain into the two creeks.

The existing weir and detention basin along Morrison Creek located in the northeastern portion of the plan area would also continue to attenuate flows. Peak flows would enter the detention basin through the weir and would be gradually pumped back into the Morrison Creek system. The attenuation of peak flows within the project area would reduce flows downstream, while providing opportunities to pump storm drain discharges from within the plan area back into the system.

These detention basins would address hydromodification and stormwater quality; slowing stormwater flows reduces the potential for erosion, controlling the outfall between the detention basins and the natural waterways reduces the potential for flooding, and storing water in basins can improve stormwater quality when entrained sediments and other potential pollutants settle to the bottom of the basin. A creek flow monitoring station would be set at the discharge points of the pumps, and pumps would be turned off when the creek is at the flow threshold. Additional pumps in the detention basin would turn on as the stage of the basin increases so that the maximum pumping capacity would only be fully used during less frequent storm events.

Conceptual modeling was used to demonstrate that the detention basin footprints presented in the Master Drainage & Flood Control Study are adequate. The drainage study analyzes three independent phases for development of drainage infrastructure: Phase A, the northern half of the plan area; Phase B, the western portion of the plan area; and Phase C, the southern half of the plan area. The report indicates that development of each interior basin can occur independently, subject to any flood control improvements required to facilitate development described in Impact HYD-4. Within Watershed WJP3, which spans Phase B and Phase C, any development was determined to require construction of the detention basin and associated pump stations identified in Table 14-1.

With the implementation of the drainage plans developed in the Master Drainage & Flood Control Study, overall offsite flows for both Elder Creek and Morrison Creek would not exceed existing discharge rates and the project would provide onsite stormwater management. However, specific details related to hydromodification and stormwater quality are provided in this Master Drainage & Flood Control Study at the plan level and are anticipated to be accommodated within individual watersheds as onsite facilities during future entitlement stages as required for tentative mapping. County requirements are stipulated in the Sacramento Region's Stormwater Quality Design Manual for both hydromodification and storm water quality and additional flow attenuation features may be required to comply with the County's HMP.

In addition, although the drainage systems in the post-development condition is anticipated to incorporate LID and hydromodification principles to reduce urban runoff, improve water quality, and implement the County's Municipal Storm Water Permit (MS4 Permit), specific LID facilities would to be planned during subsequent entitlement applications. The Master Drainage & Flood Control Study does not detail which LID

facilities would be utilized or where they will be located, but assumes that these measures can and would be implemented as development occurs. Implementation would utilize the tool known as the Sacramento Area Hydrology Model (which was developed by Clear Creek Solutions, Inc., dated March 2013). Due to the uncertainty inherent in this level of design, this impact is potentially significant.

At implementation, the Project Applicants or subsequent developers would identify specific LID techniques that achieve the results assumed in the study. Mitigation Measure HYD-3a would require evidence that the suite of LID techniques implemented at the project-level would meet the HMP criteria and achieve the credits assumed in the modeling. Mitigation Measure HYD-3b would require County approval of all project-level detention basin and channel designs prior to implementation. Implementation of Mitigation Measures HYD-3a and HYD-3b would ensure that the project would be required to demonstrate that the design features described above would mitigate the development's potential to generate substantial erosion, siltation, or other environmental harm through the proposed drainage modifications. Impacts related to hydromodification would be **less than significant with mitigation**

MITIGATION MEASURES

MITIGATION MEASURE HYD-3A: PROJECT-LEVEL DRAINAGE STUDIES

Before approval of future tentative maps, the Project Applicant(s) or future developer(s) shall submit a drainage study in accordance with the requirements outlined in the Sacramento Stormwater Quality Partnership's 2018 Stormwater Quality Design Manual (or subsequent updates) and Sacramento County's Hydromodification Management Plan. Project-level studies must identify the applicable watersheds and associated basins and pumping features described in the Master Drainage & Flood Control Study. The study shall describe permanent stormwater quality treatment facilities and low-impact design techniques that will be incorporated and provide evidence that the techniques satisfy the assumptions in the Master Drainage & Flood Control Study prepared for the project and ensure no exceedance of existing discharge rates.

MITIGATION MEASURE HYD-3B: DETAILED DRAINAGE DESIGNS

Prior to construction of all drainage improvements, detailed plans for the design of the improvements that demonstrate the proposed improvements will achieve the primary functions of flood conveyance and stormwater quality treatment while minimizing maintenance requirements shall be submitted to the County DWR for review and approval.

IMPACT HYD-4: RISK RELEASE OF POLLUTANTS DUE TO INUNDATION IN FLOOD HAZARD ZONES

As discussed in the "Environmental Setting" section, the plan area is located within the 100-year flood hazard areas (Zone A, AE, and AO), and designated as Special Flood Hazard Areas (SFHAs). Smaller portions of the plan area are located within the 100 to 500 year flood area (shaded Zone X). The NFIP's floodplain management regulations must be enforced in SFHAs like the 100-year flood zone, requiring the purchase of flood

insurance (FEMA 2023). As discussed in Impact HYD-3, a drainage master plan was completed (Appendix H) pursuant to General Plan Policy SA-5 to analyze the planned drainage and flood control facilities for the WJHMP to ensure that the project maintains downstream drainage impacts at or below existing conditions. The drainage master plan also demonstrates that all areas planned for development can be removed from the flood hazard area, consistent with the assumptions of the County's General Plan EIR (Sacramento County 2010: 7-26) and would provide flood control that meets or exceed 200-year standards for the plan area.

The proposed new flood control facilities are shown in Figure 14-5. Other improvements include raising areas above the floodplain, constructing levees for protection, and construction of spur levees to tie into existing high ground; closure of the tunnels at Fruitridge Road, Jackson Highway, and Bradshaw Road; and new levees to achieve required flood protection. Implementation of these flood control improvements would protect the plan area from the 100-year and 200-year flood events.

Due to the size of the plan area, development would not occur at once, and would instead be phased over several decades. The two land use districts established in the plan area for development purposes, have been further divided into Flood Improvement Areas, shown in Figure 14-4. These Flood Improvement Areas establish the required flood control improvements for sub-areas of the plan area and assist in future phasing considerations, as well as supporting the development of project's Public Facilities Financing Plan:

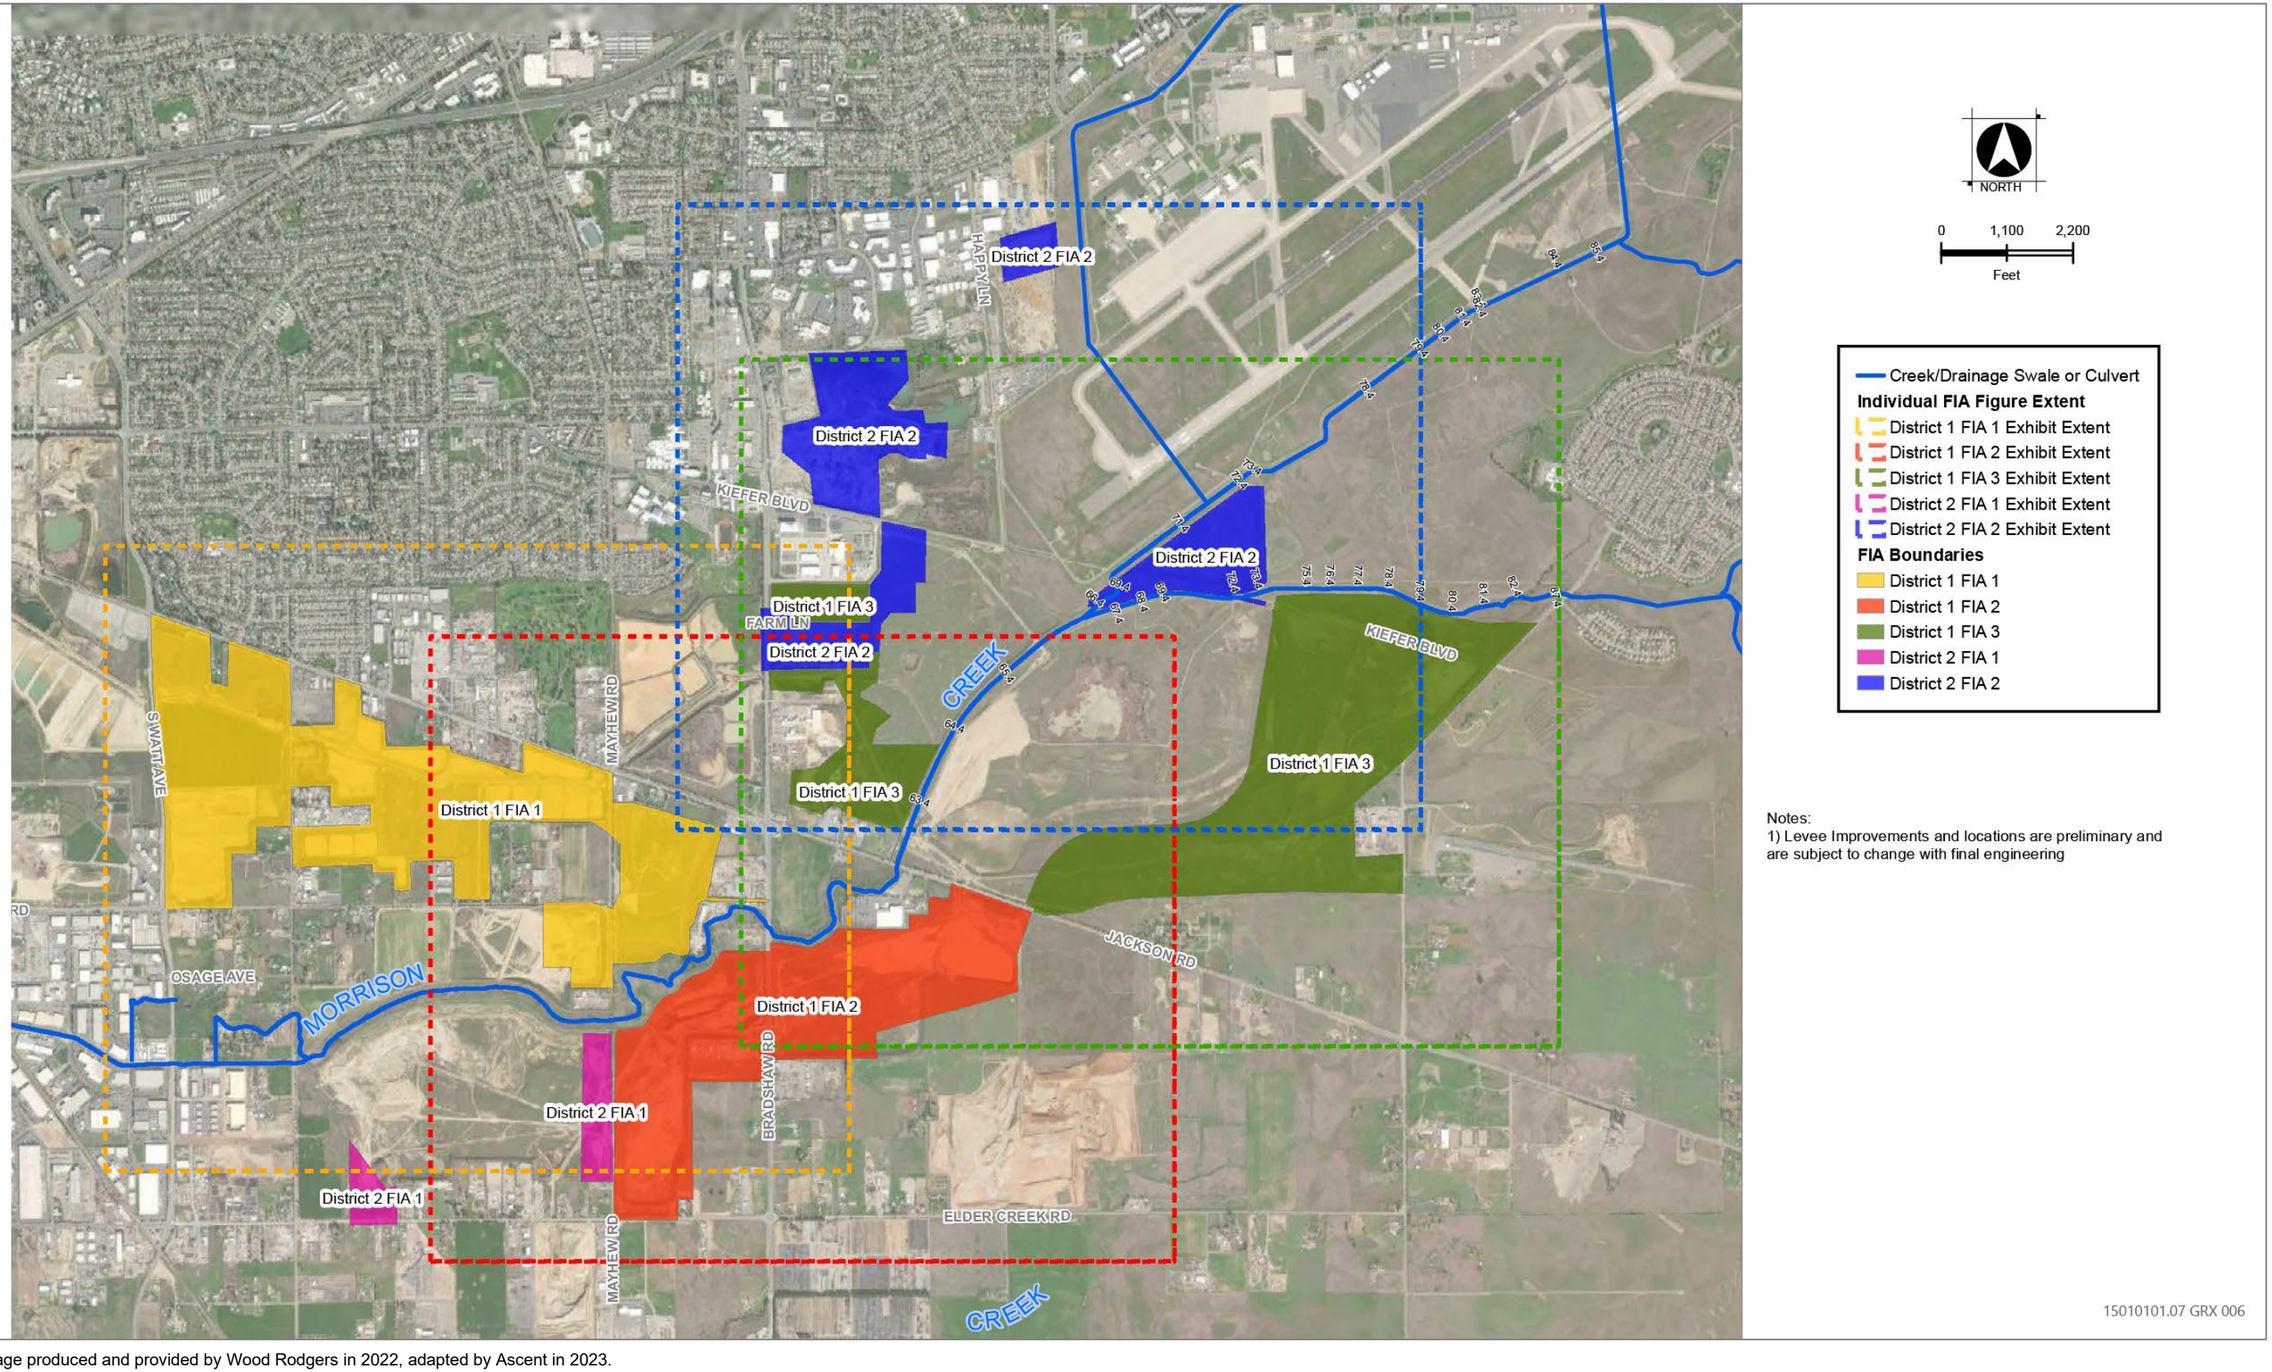
- Flood Improvement Area 1 in District 1 would include planned high ground areas to connect into existing high grounds, tunnel closure structure at Fruitridge Road, new levees to achieve required flood protection, and spur levees to tie into existing high grounds.
- Flood Improvement Area 2 in District 1 would require a levee along Mayhew Road if the southern levee of Morrison Creek cannot, or is not, certified. Where high ground is constructed along the east side of Mayhew Road, the levee road can be omitted. If District 2- Flood Improvement Area 1 is constructed, then Mayhew Road would need to be raised. Anticipated improvements would include raising existing ground to above the 200-year water surface elevation of Morrison Creek and the adjacent detention basin, tunnel closure structures at Jackson Highway and Bradshaw Road, and raising existing roads or building levees on the land side of existing roads.
- Flood Improvement Area 3 in District 1 would require a levee geotechnical analysis which would determine whether the portion of Jackson Highway between Morrison Creek and the setback levee should be evaluated as a levee. Ultimately, it is anticipated that FEMA will determine whether these potential levees are classified as levees. New levees would be constructed to achieve required flood protection and tunnel closure structures would be located at Jackson Highway.

- Flood Improvement Area 1 in District 2 would raise areas above floodplains or would construct levees/flood walls for protection.
- Flood Improvement Area 2 in District 2 would raise areas above floodplains or would construct levees/flood walls for protection and a tunnel closure structure would be located at Bradshaw Road.

As discussed in Appendix H, all planned levee and flood control facilities (detention and pumping) behind levees would be required to be submitted to FEMA to ensure that structures are designed, constructed, certified, and accredited in accordance with 44 CFR 65.10, before FEMA modifies their FIRMs. The proposed levee along the south side of Morrison Creek downstream of Excelsior Road provides protection in the event that the Mather Dam fails. The design of the proposed levee is considered adequate since there is freeboard under a dam break scenario. Elsewhere in the plan area, the effects of the Mather Dam failure breach flows are negligible due to the weir on Morrison Creek and capacity of the associated basin to accommodate inflow from a catastrophic Mather Dam failure. While portions of the plan area are within the inundation zone of the Folsom Dam, specifically the northwestern portions of the plan area, the probability of dam failure is low. For the areas within the inundation zone, evacuation maps and rescue plans will be prepared by the California Division of Safety of Dams (DSOD) in coordination with County staff prior to development within such inundation areas.

All drainage and flood control facilities would be designed to meet stringent ULDC requirements for the construction of levees to protect populations at risk. The ULDC standard is achieved with limited/controlled flows entering Morrison Creek, and top-of-levee design elevations set a minimum of 3 feet above the maximum 200-year storm with climate change. Although a portion of the plan area is within the 100-year flood zone, existing regulations, such as the State Plan of Flood Control, Sacramento County Floodplain Management Ordinance, General Plan policies, and the policies related to floodplain management in the Cordova Community Plan and Vineyard Community Plan, would reduce the risks associated with development in these areas. Improvements to the plan area would include raising areas above the floodplain, constructing levees or floodwalls for protection, and construction of spur levees to tie into existing high ground, closure of tunnels at Fruitridge Road, Jackson Highway, and Bradshaw Road, and new levees to achieve required flood protection. As stated in Appendix H, all planned levee and flood control facilities (detention and pumping) behind levees would need to be submitted to FEMA to ensure the structures are being designed, constructed, certified, and accredited in accordance to 44 CFR 65.10 and meet ULDC 200-year requirements and all state and federal flood protection requirements for the plan area. Additionally, the WJHMP proposes primarily open space and park land uses within the vicinity of the floodplain, consistent with General Plan Policies CO-93 and CO-94. The WJHMP would be required to comply with all policies and regulations associated with flood hazards.

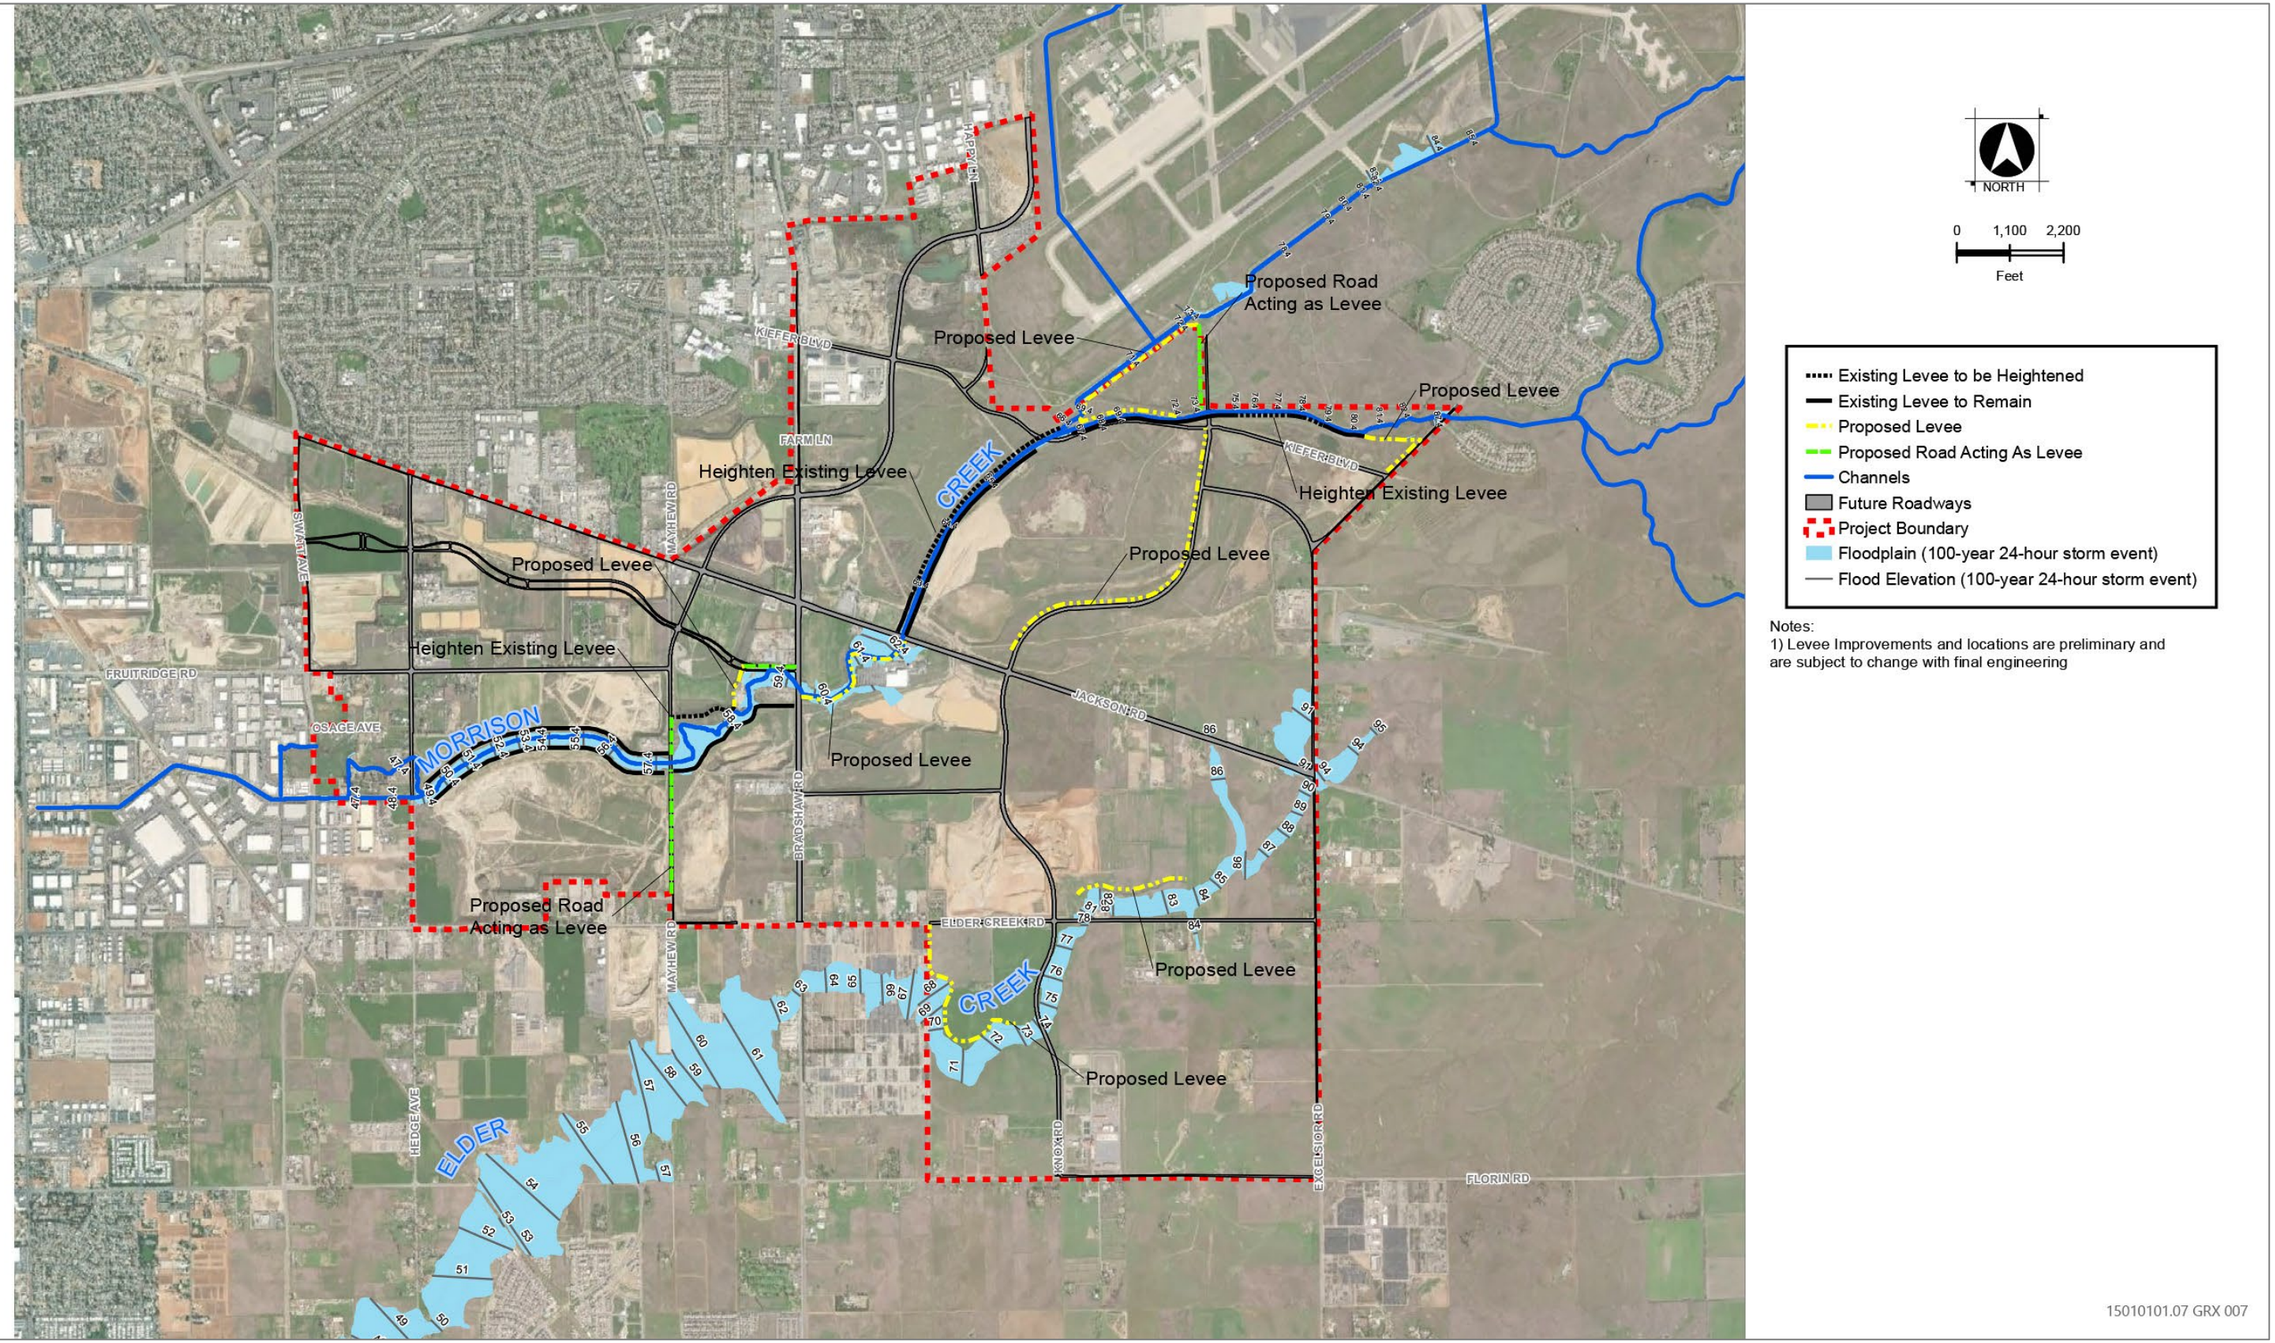
Implementation of the WJHMP would require compliance with the *Master Drainage and Flood Control Study* (Appendix H), State Plan of Flood Control, Sacramento County Floodplain Management Ordinance, Cordova Community Plan and Vineyard Community Plan policies, and applicable General Plan policies, mitigating potential



impact of flood hazards. Compliance with the Sacramento County Floodplain Management Ordinance would ensure that no residence is placed within a flood hazard area, and that people or structures will not be exposed to a significant risk involving flooding (Sacramento County 2010: 7-44). The *Master Drainage and Flood Control Study* (Appendix H) concluded that the flood protection improvements planned are anticipated to improve the level of flood safety for the plan area and downstream properties by providing a reliable levee and weir system to reduce peak flows in Morrison and Elder Creeks. The study demonstrates that the plan area could be safely developed with urban land uses without adversely affecting predevelopment conditions in the Morrison and Elder Creeks systems and that the project would meet all flood safety requirements. However, it remains uncertain at this time whether the drainage infrastructure improvements would be constructed in phases, and whether non-participating property owners would grant permission for improvements on their property. Due to the uncertainty inherent in this level of design, this impact is potentially significant.

Prior to any modifications to the existing floodplain, approval of a CLOMR from FEMA would be required. In-kind replacement for any loss in flood storage capacity due to floodplain modifications must be provided to prevent downstream flooding impacts consistent with the applicable 2030 General Plan and Community Plan policies listed above. Mitigation Measure HYD-4 would ensure that the project is implemented according to FEMA requirements and would not result in flooding during phased development or with buildout. Impacts would be **less than significant with mitigation**.

MITIGATION MEASURES



MITIGATION MEASURE HYD-4: CONDITIONAL LETTER OF MAP REVISION

Prior to any modification of the existing FEMA mapped floodplain in the Morrison Creek and Elder Creek watersheds in the plan area, the Project Applicant(s) or subsequent developer(s) shall obtain approval of a Conditional Letter of Map Revision (CLOMR) from FEMA. In addition, the Project Applicant(s) or subsequent developer(s) shall provide in-kind replacement for any loss in flood storage capacity resulting from floodplain modifications.

Figure 14-5 Preliminary Levee Locations

IMPACT HYD-5: CONFLICT WITH A WATER QUALITY CONTROL PLAN OR SUSTAINABLE GROUNDWATER MANAGEMENT PLAN

The Basin Plan for the Sacramento and San Joaquin River Basin, and the Central Sacramento County Groundwater Management Plan and the Groundwater Sustainability Plan for the South American Subbasin are the guiding documents for water quality and sustainable groundwater management in the plan area. The Basin Plan for the Sacramento and San Joaquin River Basin includes a summary of beneficial water uses, water quality objectives needed to protect the identified beneficial uses, and implementation measures. Water quality standards are established for all the ground and surface waters of the region within the Basin Plan for the Sacramento and San Joaquin River Basin. As discussed in Impact HYD-1, impacts related to water quality during construction and operation of future projects in the plan area would be less than significant. As discussed in the "Regulatory Setting" section, the CSCGMP was prepared in conformance with AB 3030 and SB 1938. The CSCGMP has been developed to establish a framework for maintaining a sustainable groundwater resource for the various users overlying the Central Sacramento County Groundwater Basin. The plan area falls within the South American Subbasin that is under the jurisdiction of six local entities that have formed GSAs. The entities prepared and adopted an approved GSP, which the basin is managed under as part of compliance with the SGMA and CSCGMP. Development under the proposed WJHMP would be consistent with the GSP and would not decrease groundwater supplies or interfere substantially with groundwater recharge such that the WJHMP may impede sustainable groundwater management of the basin, as growth and associated water demand within the South American Subbasin (including development under the WJHMP) was considered in the GSP when determining the basin's groundwater supplies. The required stormwater BMPs and retention basins would be designed to reduce runoff below that occurs currently during storm events and ensure groundwater recharge from the plan area to the extent possible. Additionally, the WJHMP's water demand is not expected to exceed the County's groundwater supplies in any Normal, Single Dry, or Multiple Dry Year through the year 2045, as further discussed in Chapter 20, "Water Supply," and the WJHMP would not conflict with a sustainable groundwater management plan. Through compliance with the Stormwater Quality Design Manual for the Sacramento Region, SWPPPs, SGMA, CSCGMP, and General Plan policies, the WJHMP would have a **less-than-significant** impact related to conflicting or obstructing implementation of a basin plan or sustainable groundwater management plan.

MITIGATION MEASURES

No mitigation is required.

IMPACT HYD-6: RESULT IN POTENTIAL CLIMATE CHANGE EFFECTS ON THE PROJECT

As analyzed in Appendix H, low and high scaling factors, representing a change in the runoff expected with climate change, were used to determine if project design changes would be required under a range of potential climate change conditions. The study

outlines climate scaling factors that could be applied to various nearby watersheds. The scaling factors were used to adjust the precipitation-depth factors of the modeling, resulting in scaled hydrographs for these hypothetical scenarios. Of the watersheds for which climate change predictions are available, Arcade Creek and Pleasant Grove Creek were determined most like Morrison Creek and Elder Creek within the plan area. Scaling factors were derived from the analysis for three design events (200-year, 200-year 24-hour storm, and 200-year 20-day storm events) and five different durations (1, 3, 7, 10, 15, and 30 days).

Under the scenario that uses the flow rate predictions for Arcade Creek, modeling demonstrates that the climate change flow would not exceed 1.0 cubic feet per second in the channels or detention basins within the plan area. The study determined that climate change would increase the elevation and flow within Morrison Creek; however, the analysis showed minimal change in elevation and flow between existing and ultimate climate change conditions downstream of the weir and detention basin within the plan area. Planned interior detention basins were also analyzed for climate change impacts. Planned detention basins that drain by gravity would meet the freeboard requirements for the 100-year storm event are met when applying the scaling factor for climate change. Pumped detention basins WJP2, WJP3, WJP5, and WJP6 would require additional storage capacity to accommodate climate change flows and volumes. As described above, high water flows in Morrison Creek would spill via weir onto a detention basin the adjacent, previously mined area in the northeast portion of the plan area (WJP1 in Figure 2-12). Additional pumps may be effective in directing excess stormwater from the area east of the proposed setback levee to the basin. In addition, areas adjacent to the WJP4 and WJP5 detention basins where mining has occurred would be reclaimed as open space areas, which could be flooded to provide climate change resilience. Ultimately, development within the plan area is designed for climate resiliency through its proposed flood protection improvements, including the reliable levee and weir systems.

The County has not adopted guidance for evaluation of project effects on flood potential in light of climate change or established a regional solution to addressing flooding because of climate change. Therefore, there is not a clear threshold upon which to measure project effects. It would be speculative to reach a conclusion regarding the actual degree to which the project would be able to adequately accommodate the increased flows from a climate change scenario. Nonetheless, it is acknowledged that some level of planning may be required by the County to address a regional solution to the potential hydrologic impacts that could occur with climate change. Therefore, the County is requiring the implementation of Mitigation Measure HYD-6.

MITIGATION MEASURES

MITIGATION MEASURE HYD-6: HYDROLOGIC ANALYSIS FOR A CLIMATE CHANGE SCENARIO

At the time of submittal of backbone infrastructure plans, the Project Applicant or subsequent developers of the master plan shall submit a hydrologic analysis that is based upon adopted County guidance regarding a reasonably foreseeable climate change scenario. Based on the results of the hydrologic analysis and if impacts are

identified, the Project Applicant shall implement all feasible design measures within the Project's drainage system to adequately maintain pre-project flows with consideration of climate change effects. Potential improvements could include larger and additional culverts at roadway crossings and deepening the existing basin(s) within the Plan Area that would be subject to over-topping. Basin deepening would require minimal construction-related impacts including excavation and hauling of an additional increment of soil from the site. These construction-related impacts have been evaluated throughout this EIR.

Alternatively, if the County has adopted a regional solution for flooding related to climate-change, the Project Applicant or subsequent developers of the master plan shall contribute its fair share towards funding the construction of the regional solution.

If the County has not developed a regional solution or has not adopted guidance for evaluating hydrologic climate-related impacts, the Project Applicant or subsequent developers of the master plan shall prepare and submit a hydrologic analysis that is based on the best available technical information at that time, in consultation with the County's Department of Water Resources and the Office of Planning and Environmental Review.

IMPACT HYD-7: CONTRIBUTE TO FLOODING OF BEACH STONE LAKES

PROPOSED PROJECT

The plan area is located approximately 15 miles upstream of the BSL area, within the Morrison Creek Stream Group that contributes runoff to the BSL area. As described above, the BSL area is subject to flooding during large rain events and no plans for structural improvement are currently in process to address this deficiency. The project could exacerbate the existing offsite flooding conditions in the BSL area if it would result in flows that contribute to an increase in floodplain depth.

With the implementation of the drainage plans developed in the Master Drainage & Flood Control Study, overall offsite flows for both Elder Creek and Morrison Creek would not exceed existing discharge. As described above in Impact HYD-3, the weir on Morrison Creek and proposed network of detention basins are anticipated to attenuate flows from the plan area. Peak flows would enter the detention basin through the weir and would be gradually pumped back into the Morrison Creek system. However, project-level drainage studies and detailed drainage designs would be necessary to validate the design assumptions in the Master Drainage & Flood Control Study. These studies are required by Mitigation Measures HYD-3a and HYD-3b, respectively.

In addition, the County has adopted and levied the Beach Stone Lake Flood Volume Mitigation Fee to address the contribution of upstream projects to flooding impacts in the BSL area. Development projects in the Morrison Creek Stream Group that increase the potential for flooding in the BSL area are required to pay fees that fund the County's efforts to address flooding. Mitigation Measure HYD-7 requires either assurance that no net project-related increase in flood volume in Beach Stone Lakes would occur or payment into the County's BSL mitigation fund, which provides financial assistance to

the programs the County has in place to reduce the cumulative flooding impact. Based on the plan-level flood control study, which indicates that stormwater outflows from the plan area would be metered to address the potential for the plan area to contribute to offsite flooding, this impact would be **less than significant with mitigation**.

MITIGATION MEASURES

MITIGATION MEASURE HYD-7: BEACH STONE LAKE MITIGATION

The Project Applicant(s) and subsequent developer(s) shall mitigate downstream impacts by either of the following options:

a. Payment of the Beach Stone Lakes Mitigation Fee (Sacramento County Water Agency Zone 11A).

b. Ensuring no net project-related increase in volume in Beach Stone Lakes by metering outflow from the plan area, increasing storage capacity of onsite facilities, directing drainage into downstream facilities offsite, or other regional drainage solutions as determined by the County Department of Water Resources.

15 LAND USE, POPULATION, AND HOUSING

INTRODUCTION

This chapter describes land use conditions on and in the vicinity of the plan area and identifies land use–related laws, regulations, and plans relevant to the project. It also evaluates potential land use–related impacts that could occur with implementation of the project. Specifically, it evaluates whether implementing the project would physically divide an established community; conflict with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect; or displace substantial numbers of people or housing. The physical environmental effects associated with construction and operation of the project, many of which pertain to issues of land use compatibility (e.g., noise, aesthetics, air quality), are evaluated in other chapters of this Draft EIR. Consistency with airport planning documents and the potential for the project to create an airport-related safety hazard for people residing or working in the area are addressed in Chapter 7, “Airport Compatibility.” Consistency with the South Sacramento Habitat Conservation Plan is addressed in Chapter 8, “Biological Resources.”

Comments on land use submitted in response to the notice of preparation (NOP) expressed concerns related to the creation of adjacent incompatible land uses. These concerns are addressed below and in other resource chapters, as appropriate. The NOP and comments received in response to it are presented in Appendix A.

ENVIRONMENTAL SETTING

SACRAMENTO COUNTY DEMOGRAPHICS

Sacramento County is 994 square miles and includes seven incorporated cities. The population of unincorporated Sacramento County was 597,614 in January 2024, a 0.4 percent decrease in population from the same time a year earlier. With the population of the incorporated cities included, the population of the county was 1,578,938 in January 2024. Population grew for the county in total by 0.1 percent from 2023 to 2024, which is slightly less than the statewide growth of 0.2 percent (DOF 2024).

There were 228,692 households in the unincorporated county In January of 2024, a 0.2 percent increase from the same time a year earlier. The county in total had 606,021 housing units and an overall rate of growth of 0.8 percent between 2023 and 2024, indicating that housing growth is currently stronger in the incorporated cities and is in alignment with the 0.8 percent rate of housing growth reported statewide (DOF 2024).

REGIONAL SETTING

The plan area is located on the eastern edge of the Sacramento metropolitan area (see Figure 2-1). Surrounding land uses include a mix of industrial, residential, employment,

mining, and agricultural uses. West of the plan area, in the city of Sacramento, are industrial facilities (warehouses, storage yards, manufacturing), employment centers, and mining sites. Approximately 230 acres of land at the southwestern corner of Jackson Highway and South Watt Avenue, in the city of Sacramento, are owned by Teichert. The site, formerly used for mining, is currently used for wash ponds, drying facilities, and a conveyor belt system that transports raw aggregate from nearby mining sites to the Teichert Perkins facility. The company's Aspen 1-New Brighton development, a mixed-use project that will include residential, commercial, and other uses, is planned for this site.

Land uses north of the western portion of the plan area (west of Bradshaw Road) include the unincorporated community of Rosemont, which has predominantly lower- density single-family neighborhoods and small neighborhood commercial centers. Other uses in this area include the Cordova Golf Course and industrial uses, such as warehouses and landscape supply yards. Land uses north of the eastern portion of the plan area (east of Bradshaw Road) include Mather Airport (the former Mather Air Force Base), which is now used primarily as an air cargo facility and business park that provides predominately aviation services. The runways of Mather Airport are located approximately one-quarter mile northeast of the northern portion of the plan area. Rosemont High School, operated by Sacramento City Unified School District, is located adjacent to the plan area, at the southwestern corner of Kiefer Boulevard and Bradshaw Road.

East of the plan area are agricultural and agricultural-residential properties and the Sacramento Raceway, which are located in the Jackson Township Specific Plan area. The master-planned community is expected to include up to 6,143 housing units; 2 million square feet of commercial, office, and mixed-use development; schools; a fire station and community center; parks; and a large wetland preserve.

South of the plan area are rural residential properties, agricultural land, mining land, and a commercial nursery. This land is part of the Florin-Vineyard Community Plan area and the North Vineyard Station Specific Plan area. These communities are planned to support residential, commercial, and industrial land uses and are in the process of building out.

Plan Area Setting

The plan area occupies approximately 5,913 acres east of South Watt Avenue in the Vineyard and Cordova communities, in an unincorporated area of Sacramento County. The plan area boundaries are generally the city of Sacramento to the west; Jackson Highway (State Route 16), Kiefer Boulevard, and Goethe Road to the north; Excelsior Road to the east; and Elder Creek Road and Florin Road to the south (see Figure 2-2).

Land Use Designations

The predominant Sacramento County General Plan land use designations in the plan area are Extensive Industrial (2,385 acres), Agricultural-Urban Reserve (1,722 acres), and General Agriculture (1,713 acres) (see Figure 2-6). Relatively small areas are designated Intensive Industrial (72 acres), Commercial and Offices (17 acres), and

Public and Quasi-Public (4 acres). In addition, portions of the plan area contain an aggregate resource area overlay. Pursuant to General Plan Policy CO-37, the County applies the aggregate resources combining land use category to areas determined to contain mineral resources that are appropriate for mining.

Lands in the plan area south of Jackson Highway and a portion north of Jackson Highway are in the Vineyard Community Plan area (see Figure 2-5). The remainder of the plan area north of Jackson Highway is in the Cordova Community Plan area (see Figure 2-5). The following community plan land use designations are in the plan area (see Figure 2-7):

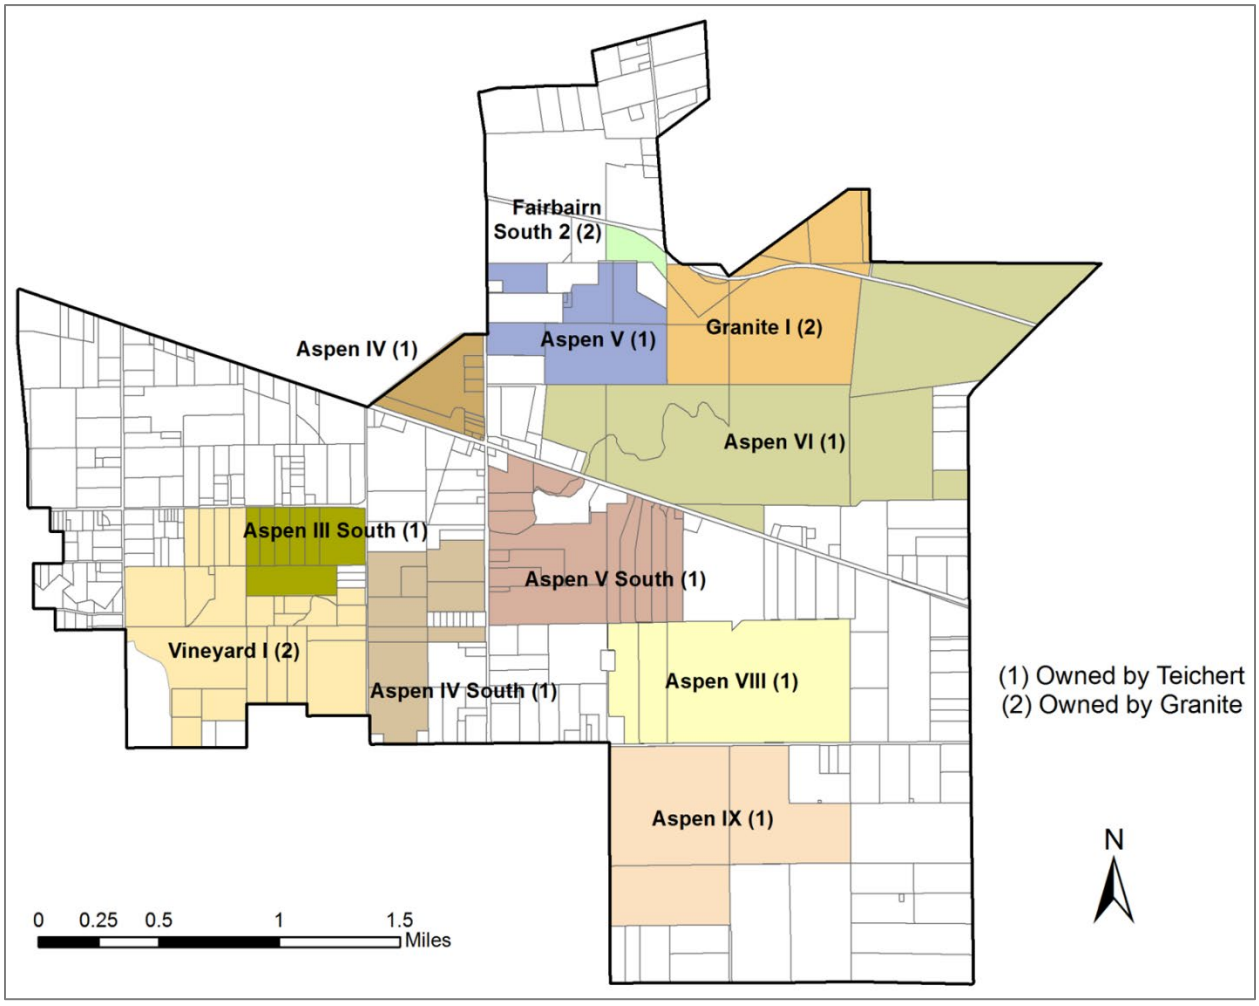
- Permanent Agriculture (AG-20)
- Permanent Agriculture (AG-40)
- Permanent Agriculture (AG-80)
- Permanent Agriculture (AG-160)
- Agricultural-Residential 1
- Agricultural-Residential 2
- Shopping Center
- Limited Commercial
- Light Industrial
- Heavy Industrial
- Industrial Reserve
- Major Roads

ZONING

Most of the plan area is zoned either industrial (M-1, M-2, IR) or agricultural (AG-20 to AG-160) (see Figure 2-8**Error! Reference source not found.Error! Reference source not found.**). Small areas are zoned agricultural-residential (AR-1, AR-2) and commercial (LC). Approximately two-thirds of the plan area has a surface mining (SM) overlay.

The full list of zoning designations in the plan area is as follows:

- AG-20: Agriculture 20 acres
- AG-20(SM): Agriculture 20 acres (Surface Mining)
- AG-40: Agriculture 40 acres
- AG-80: Agriculture 80 acres
- AG-80(SM): Agriculture 80 acres (Surface Mining)
- AG-160: Agriculture 160 acres



- AG-160(SM): Agriculture 160 acres (Surface Mining)
- AR-1: Agricultural-Residential 1 acre
- AR-2: Agricultural-Residential 2 acres
- IR: Interim Agricultural Reserve
- IR(SM): Interim Agricultural Reserve (Surface Mining)
- LC(SM): Light Commercial (Surface Mining)
- GC: General Commercial
- M-1: Light Industrial
- M-1(SM): Light Industrial (Surface Mining)
- M-2: Heavy Industrial
- M-2(SM): Heavy Industrial (Surface Mining)

The intended uses in these land use zones are as follows:

- M-1 (Light Industrial): This zone allows development of industrial uses that include fabrication, manufacturing, assembly, or processing of materials that for the most part are already in processed form and that do not in their maintenance, assembly, manufacture, or plant operation create smoke, gas, odor, dust, sound, or other objectionable influences that might be obnoxious to persons conducting business or residing in this or any other zone.
- M-2 (Heavy Industrial): This zone allows uses allowed in the M-1 zone and allows industrial uses not allowed in the M-1 zone.
- IR (Interim Agricultural Reserve): This zone allows residential and open space uses and a limited number of additional uses.
- AG-20 to AG-160 (Agriculture): These zones allow agricultural uses on parcels that are a minimum 20 acres in size.
- AR-1 and AR-2 (Agricultural-Residential): These zones allow residential uses and a limited number of agricultural uses on 1- and 2-acre parcels.
- GC (General Commercial): This zone allows a wide choice of commercial uses, including warehousing operations, auto repair shops, and service stations. This zone is intended to be used in those locations along major streets and in commercial subdivisions where uses would not adversely affect the surrounding development.
- LC (Light Commercial): This zone allows a wide choice of retail goods and services in locations where individual small lots are desired. It is intended to be used in those locations along major streets and in commercial subdivisions where unlimited commercial uses are not appropriate or would not be compatible with the surrounding development.

Land Uses

The plan area mostly comprises existing and former aggregate mining areas and agricultural properties. Aggregate mining has been the dominant land use in the area since the 1930s. The project applicants—Teichert, and Granite—separately own a total of approximately 4,079 acres of the plan area. Teichert owns approximately 3,016 acres, and Granite owns approximately 1,063 acres. In total, the properties owned by the project applicants represent 69 percent of the plan area. These properties primarily include aggregate mining sites used for sand and gravel extraction, many of which have already been reclaimed. Although most of the mining in the plan area is complete, considerable portions of the project applicants' properties still support various construction- and mining-related activities. The project applicants have 11 aggregate mining sites in the plan area (Figure 15-1), of which Granite 1, Aspen III South, Aspen VIII, and Aspen IX are still in operation. The Granite 1 mine is currently idle. The Vineyard 1 and Aspen VI mines are in the process of reclamation. Electric conveyor systems cross many of these mining properties and transport mined materials to the existing construction materials processing plants operated by Teichert and Granite.

Source: Provided by Sacramento County in 2023.

Figure 15-1 Active Mining Sites in Plan Area

Other industrial uses in the area include truck storage yards, warehouses, and building and landscaping supply yards. Many of the building and landscaping supply businesses are located adjacent to Jackson Highway.

The approximately 1,834-acre portion of the plan area not owned by the project applicants (referred to as the nonparticipating properties) is made up primarily of agricultural properties and generally is located in the eastern and southeastern portions of the plan area. Properties with agricultural zoning are largely devoted to rural residential, grazing, and passive open space uses. A limited amount of agricultural activities occur on these properties. Small commercial and agricultural-residential areas are also present in the plan area. Three rural residential neighborhoods in the area have clusters of homes on 1- to 5-acre lots. Elk Grove Unified School District operates an elementary school (Sierra Enterprise) in the plan area, at the intersection of Hedge Avenue and Fruitridge Road. Figure 2-3 identifies the parcels owned by Teichert and Granite, as well as the nonparticipating properties in the plan area.

South Watt Avenue and Excelsior Road are along the western and eastern boundaries of the plan area, and Kiefer Road and Florin Road are along the north and south boundaries, respectively. Internal roadways include Jackson Highway and Elder Creek Road, which cross the plan area in an east-west direction, and Hedge Avenue, Mayhew Road, and Bradshaw Road, which cross the area in a north-south direction. All these roads are two-lane roadways except for Bradshaw Road, which is a four-lane roadway.

Regulatory Setting

Federal

No federal plans, policies, regulations, or laws related to land use are applicable to the project.

State

California Government Code Section 65300

California Government Code Section 65300 et seq. establishes the obligation of cities and counties to adopt and implement general plans. The general plan is a comprehensive, long-term, and general document that describes plans for the physical development of a city or county and of any land outside its boundaries that, in the city's or county's judgment, bears relation to its planning. The general plan addresses a broad range of topics, including at a minimum land use, circulation, housing, conservation, open space, noise, and safety. In addressing these topics, the general plan identifies the goals, objectives, policies, principles, standards, and plan proposals that support the city's or county's vision for the area. The general plan typically addresses the physical character of an area over a 20-year period. Although the general plan serves as a blueprint for future development and identifies the overall vision for the planning area, it remains general enough to allow for flexibility in the approach taken to achieve the plan's goals.

California Government Code Section 65800

The State Zoning Law (California Government Code Section 65800 et seq.) establishes that zoning ordinances, which are laws that define allowable land uses in a specific zone district, are required to be consistent with the general plan and any applicable specific plans. When amendments to the general plan are made, corresponding changes in the zoning ordinance may be required within a reasonable time to ensure that the land uses designated in the general plan also would be allowable by the zoning ordinance (Section 65860[c]).

California Government Code

Preparation of, adoption of, and amendments to a city or county general plan is authorized by Section 65350 et seq. of the Government Code. Government Code Section 65350.5 mandates that before the adoption or substantial amendment of a city's or county's general plan, the planning agency shall review and consider all the following actions:

(a) An adoption of, or update to, a groundwater sustainability plan or groundwater management plan pursuant to Part 2.74 (commencing with Section 10720) or Part 2.75 (commencing with Section 10750) of Division 6 of the Water Code or groundwater management court order, judgment, or decree.

(b) An adjudication of water rights.

(c) An order or interim plan by the State Water Resources Control Board pursuant to Chapter 11 (commencing with Section 10735) of Part 2.74 of Division 6 of the Water Code.

Refer to Chapter 20, "Water Supply," for further discussion.

Regional

Sacramento Area Council of Governments' Blueprint

The Sacramento Area Council of Governments (SACOG) is an association of local governments in the six-county Sacramento region that includes Sacramento County. SACOG's multifaceted support extends to local governments, addressing such diverse issues as transportation planning, funding assistance, airport planning, and housing affordability.

SACOG's Blueprint is a smart growth vision for the region that was adopted by the SACOG Board of Directors in 2004. It is SACOG members' plan to build a connected region that includes transportation options for residents, affordable housing for the region's growing population, and equitable investments that give all community members access to a safe and healthy region.

The Blueprint is intended to be advisory and to guide the region's transportation planning and funding decisions. It is based on the following seven principles (SACOG n.d.):

- **Transportation Choice**: Developments should encourage people to walk, bike, use public transit, or carpool to their destinations.
- **Compact Development**: Creating environments that are more compactly built and use space in an efficient but attractive manner helps to encourage more walking, biking, and transit use and shorter auto trips.
- **Mixed-Use Development**: Building homes, shops, entertainment, offices, and even light industrial uses near each other can create active, vital neighborhoods. The mix of uses can occur on many different scales and be either vertical (such as a single building with a ground floor business and residences on upper floors) or horizontal (with a combination of uses in close proximity). Mixed-use projects function as local activity centers, contributing to a sense of community, where people tend to walk or bike to destinations and interact more with each other.
- **Housing Choice and Diversity**: Providing a variety of places where people can live—apartments, townhomes, condominiums, and single-family detached homes of varying lot sizes—creates opportunities for the variety of people who need them: families, singles, seniors, and people with special needs.
- **Use of Existing Assets**: In urbanized areas, development on infill or vacant lands, intensification of the existing use (for example, adding additional buildings to a low-density shopping center), or redevelopment can make better use of existing public infrastructure, including roads.
- **Natural Resource Conservation**: Developments should incorporate public use open space (such as parks, town squares, trails, and greenbelts) to help create a sense of community and attractive neighborhoods. Additionally, conserving natural places and resources, including open space, agriculture, and wildlife and habitat areas, contributes to improving quality of life by providing cleaner air and outdoor experiences.
- **Quality Design**: The design details of any land development (such as relationship to the street, placement of garages, facades, sidewalks, street widths, landscaping) are all factors that influence the attractiveness of living in a compact development and facilitate the ease of walking within and in and out of a community.

Although the Blueprint is not a regulatory document, Sacramento County General Plan Policy LU-113 calls for the County to work with SACOG to support implementation of the Blueprint's policies and land use objectives and General Plan Policy LU-120 requires evaluation of consistency with regional planning efforts.

Sacramento Area Council of Governments' Metropolitan Transportation Plan/Sustainable Communities Strategy

SACOG, in coordination with each member city and county, is responsible for preparing and updating the MTP/SCS for the region every 4 years and for preparing and adopting the corresponding Metropolitan Transportation Improvement Program (MTIP) every 2 years. The MTP/SCS provides a 20-year transportation vision and corresponding list of projects, whereas the MTIP, which covers 4 years, is a comprehensive listing of transportation projects that receive federal funds, require a federal action, or are regionally significant. The current MTP/SCS was adopted by the SACOG Board of Directors on November 18, 2019 (SACOG 2019).

In each MTP update cycle, SACOG prepares a regional growth and land use forecast to identify the general location of different types of land uses, residential densities, employment intensities, and natural resource areas. Preparing the forecast is a critical step toward planning for future transportation needs, improving air quality, and meeting climate change goals.

As described in Appendix D, "2020 MTP/SCS Land Use Forecast Documentation," of the MTP/SCS, new development in the plan area and other areas along Jackson Highway is part of the County's long-term vision. Development in these areas is not identified within the current MTP/SCS planning period (i.e., through 2040).

SACOG has begun the process of updating the MTP/SCS, which is expected to be finalized in 2025.

Local

Sacramento County 2030 General Plan

The Sacramento County General Plan presents a set of goals, objectives, policies, implementation measures and maps that form a blueprint for physical development in the unincorporated county. On November 9, 2011, the Sacramento County Board of Supervisors adopted an updated General Plan. Since then, two elements—the Environmental Justice Element and the Housing Element—have been adopted. The other elements have been amended multiple times.

The General Plan provides an inventory of land supply in the county, and it projects the amount and location of land and development that will be required to accommodate future populations and economic growth through 2030. The Land Use and Environmental Justice Elements provide land development guidance through the implementation of Policies LU-1 through LU-128 and EJ-19 (Sacramento County 2022, 2019). The land use policies presented below are those that are both pertinent to the project and intended to avoid an environmental effect. Although the land use policies are drawn from the Land Use Element, many are intended to avoid impacts related to other impact areas, such as public services and air quality.

- **Policy LU-12.** The County will prohibit land use projects which are not contiguous to the existing UPA, city boundaries, or existing planned communities or master project areas (i.e. leapfrog development).
- **Policy LU-13.** A Public Facilities/Infrastructure Master Plan shall be prepared to identify the major facilities required to serve new development in urban growth areas. A Public Facilities Financing Plan shall be prepared and approved by the Board of Supervisors prior to or concurrent with the approval of any zoning for any urban uses in urban growth areas. The Financing Plan shall include a Public Facilities/Infrastructure Master Plan describing required major infrastructure improvements necessary to support proposed developments, and present a detailed plan for the phasing of capital improvements and identifies the extent, timing and estimated costs of all necessary infrastructure.
- **Policy LU-19.** Incompatible urban land uses should be buffered from one another by methods that retain community character, and do not consume large land areas or create pedestrian barriers.
- **Policy LU-21.** Promote a better balance of employment, neighborhood services, and different housing types by reviewing development projects and the surrounding community and designing new projects wherever feasible so that they maintain or improve the mix of uses in the community.
- **Policy LU-22.** Specific Plans and Community Plans should provide a balance of employment, neighborhood services, and different housing types wherever feasible.
- **Policy LU-23.** Providing compact, mixed use developments shall be an integral part of all master planning efforts for new growth areas and commercial corridors.
- **Policy LU-25.** Depending on its emphasis, a mixed use development may include the following proportions of different uses, shown as percentages of the site area [see Table 15-1]:

Table 15-1 Emphasis of Development

Use	Commercial	Office	Residential
Retail	50–70%	10–30%	10–30%
Office	0–20%	50–70%	0–30%
Residential	20–40%	0–30%	50–80%
Public	10–30%	10–30%	10–30%

NOTE: Commercial uses refer to the LC and SC zones. Office uses refer to the BP and MP zones. Residential uses refer to the RD-5 through RD-50 zones.

- **Policy LU-34.** Developments in the areas designated on the Land Use Diagram as Transit Oriented Development shall be designed in a manner that conforms to the concepts of transit-oriented development, including:
    - High intensity, mixed-use development concentrated in a Core Area within an easy walk (one quarter mile) of a transit stop on the Trunk or Feeder Line Network.

- An emphasis on neighborhood support commercial services at street level in the Core Area that can serve the residents of the Core and surrounding Secondary Areas, with other employment encouraged in the TODs created along the Trunk Line Network.
- A pleasant walking environment created through good land use design, short distances, amenities, and streetscape features.
- Direct, multiple linkages, especially for bicycles and pedestrians, between the Core Area and the surrounding Secondary Area.

- **Policy LU-35.** The primary concepts in LU-34 should be employed wherever feasible in new urban development.
- **Policy LU-36.** Community Plans and Specific Plans shall employ the primary concepts in LU-34 in designating locations for higher intensity mixed use development and designing circulation and pedestrian networks.
- **Policy LU-38.** Community Plans, Specific Plans, and development projects shall be designed to promote pedestrian movement through direct, safe, and pleasant routes that connect destinations inside and outside the plan or project area.
- **Policy LU-46.** Assure that regionally-oriented commercial and office uses and employment concentrations have adequate road access, high frequency transit service and an adequate but efficient supply of parking.
- **Policy LU-71.** Reduce the energy impacts from new residential and commercial projects through investigation and implementation of energy efficiency measures during all phases of design and development.
- **Policy LU-89.** Support planning for and development of mixed use centers and urban villages along commercial corridors to improve quality of life by creating diverse neighborhood gathering places, supporting enhanced transit service and non-automative travel, stimulating local economic development, eliminating blight and balancing land uses.
- **Policy LU-94.** Use design review to ensure that new commercial and residential development projects are designed to be compatible with existing neighborhoods and improve quality of life.
- **Policy LU-110.** County departments shall coordinate with public service providers independent from County government, including schools, parks and recreation, reclamation, water, transit, electric and other service districts, in developing financial and service planning strategies consistent with the General Plan policies.
- **Policy LU-113.** The County shall work with SACOG to support implementation of Blueprint's policies and land use objectives.
- **Policy LU-119.** The County shall only accept applications to expand the UPA or initiate an expansion of the UPA or any Master Plan processes outside of the existing UPA if the Board finds that the proposal meets the following:

- *Parallel processes to expand UPA and prepare Master Plans*: Proposed additions to the UPA will only be considered when accompanied by a request to initiate a Master Plan process for all land encompassed by the proposed UPA expansion boundary. Likewise, requests to initiate a Master Plan process outside the UPA will only be considered when accompanied by a request to expand the UPA to include all land encompassed by the proposed Master Plan.[1]
- *Project Justification Statement and Outreach Plan*: Proposed UPA expansions/Master Plan processes must be accompanied by both a "Justification Statement" and an "Outreach Plan." The Justification Statement shall be a comprehensive explanation of the proposed request and the development it would allow. It must include background information, reasoning, and the goal(s) and benefits of the proposed project. The Outreach Plan shall describe how the project proponent plans to inform and engage neighbors and members of the general public about the proposed UPA expansion and project.
- *Proximity to existing urbanized areas*: Proposed UPA expansions/Master Plan processes must have significant borders that are adjacent to the existing UPA or a city boundary. As a guideline, "significant borders" generally means that the length of the boundary between the existing UPA or city boundary and the proposed UPA expansion/Master Plan should be 25 percent of the length of the boundary of the UPA expansion area.
- *Logical, comprehensive, and cohesive planning boundaries*: Proposed UPA expansions/Master Plan processes must consist of a contiguous set of parcels that have a regular outside boundary consistent with the logical planning boundary illustrations below. All parcels within this boundary must be included in both the proposed UPA expansion and proposed Master Plan area.

Example of logical planning boundary | Example of logical planning boundary | Example of illogical planning boundary | Example of illogical planning boundary

[1] A "Master Plan" is defined as a plan that meets the requirements and intent of the Specific Plan statutes contained in Government Code §65450–65457, which requires a land use plan, a circulation plan, an infrastructure plan, and implementation measures. The requirement for a "Master Plan" might be fulfilled by a variety of planning tools, including a Specific Plan, a Community Plan, a Special Planning Area, a development agreement, or any combination thereof.

- **Policy LU-120.** The County shall only consider approval of a proposed UPA expansion and/or Master Plan outside of the existing UPA if the Board finds that the proposed project is planned and will be built in a manner that[2]:
  - meets all of the requirements per PC-1 through PC-10, and;
  - meets ONE of two alternative performance metrics:
    - Alternative #1 - Criteria-Based
    - Alternative #2 - VMT/Greenhouse Gas Emissions Reduction Metric

  PC-1. Vision for connection to other adjacent existing and potential future development areas.

  Required: Include a vision of how the development will connect to other adjacent existing and potential future development areas within the USB, including how roadways, transit, sewer, and water could occur within all adjacent areas.

  PC-2. Housing choice.

  Required: A variety of housing types and densities, including single-family homes, duplexes, triplexes, accessory dwelling units, townhomes, condominiums, apartments and similar multi-family units, in a variety of settings including both residential neighborhoods and mixed use nodes.

  PC-3. Quality.

  Required: Design guidelines, development standards and/or similar assurances that will require high-quality development consistent with the vision set forth in the Master Plan.

  Discussion: The County's General Plan contains numerous policies that address quality of new development, but does not provide specific details regarding how a particular Master Plan will be planned and built to ensure that quality is achieved. Conversely, many of the County's tools used to implement the General Plan (such as zoning) provide specific details about how land can be used and developed, but do not necessarily address quality. The Master Plan is the bridge between the broad-based General Plan and fine-grained implementation tools like zoning, making it the ideal context to address the quality of development expected within its boundaries.

  Master Plans should provide specific details regarding the quality envisioned for the project and appropriate standards to ensure that it will be built out over time in a manner that achieves the stated vision.

[2] Some areas within a Master Plan may have existing uses that are not likely to change and are appropriate to remain. If the Master Plan designates such areas with a land use category that reflects that existing use, the Board may exclude these areas for purposes of determining consistency with these criteria.

Detailed design guidelines and firm development standards can be excellent tools for creating certainty that quality will be achieved. Elements of quality to be addressed may include:

Building form, including architectural styling, materials, articulation, orientation, size, massing, etc.

"Theming" at the neighborhood or community level, including consistent signage, materials, landscaping, and other elements

Amenities provided beyond those required by law

The public realm

- Relationship between uses

PC-4. Accommodate the percentage of low and very low income residential units required by state law per the County's current Housing Element based on the Regional Housing Needs Allocation (RHNA).

Required: Accommodate ≥90 percent of the obligation per RHNA (currently ~33% of units accommodated in RD-20 or higher).

Discussion: State law (California Government Code Section 65583) requires cities and counties to provide "adequate" sites with appropriate zoning, development standards, infrastructure, and public services to facilitate and encourage the development of a variety of types of housing for all income levels.

State law requires SACOG to periodically adopt a Regional Housing Needs Plan (RHNA) for the six-County region. The RHNA determines each jurisdiction's "fair share" of the region's housing needs per a methodology established by state law and approved by the California Department of Housing and Community Development (HCD). The purpose of this is to avoid over-concentration of low-income households in any one community.

As part of periodic Housing Element updates required by state law, the County must create a land inventory that identifies vacant and underutilized land available for residential development within the unincorporated area. This land inventory is used to demonstrate how the County can accommodate its "fair share" of the region's housing needs as determined by the RHNA, including how it will provide adequate sites for low and very low households. Currently, 37 percent of the units allocated to the County per the RHNA are for low and very low households and must be accommodated on land zoned for 20 dwelling units per net acre (RD-20) or greater.

Requiring Master Plans to be consistent with this criterion ensures that they are contributing their "fair share" of adequate sites toward the County's overall obligation per state law. It represents the "break even" point where the County's ability to meet state law neither helped nor

hurt by adoption of the Master Plan. If numerous Master Plans were adopted with a considerably lower percentage of its units accommodated on land zoned RD-20 or greater, the County could fall short of adequate sites over time and be forced again to rezone properties in existing communities or planned growth areas, or face other negative consequences such as a moratorium on issuing building permits.

PC-5. Pedestrian- and transit-oriented design.

Required: Pedestrian- and transit-oriented design, including:

- Sidewalks and bike routes along interconnected streets with short block lengths and a high intersection density.
- Prominent pedestrian and bicycle network.
- Few if any cul-de-sacs.
- Pedestrian and bike connections at the ends of all cul-de-sacs unless infeasible due to topography or similar impediments inherent in the project site.

PC-6. Infrastructure Master Plan and Financing Plan.

Required: Inclusion of an Infrastructure Master Plan and Financing Plan that include the following:

- The Infrastructure Master Plan shall identify required public facilities and infrastructure (including roads, transit, water, sewer, storm drainage, schools, fire, park, library, and other needed community facilities) and associated costs for the development of the proposed UPA expansion/Master Plan;

The Financing Plan shall:

  - Include an infrastructure phasing analysis that examines development through buildout taking into consideration potential development activities, facilities requirements and constraints;
  - Identify the phase or timing for when the facilities are needed;
  - Identify the funding mechanisms proposed to pay for the identified infrastructure and facilities;
  - Demonstrate that infrastructure requirements and the associated costs are reasonably balanced throughout each development phase and outline solutions for any potential constraints and/or shortfalls for any given phase.

PC-7. Services Plan.

Required: Inclusion of a Services Plan to demonstrate:

that provision of services to the proposed UPA expansion/Master Plan are cost-neutral to the County's General Fund and existing ratepayers;

that the operations and maintenance costs stemmed from the required public facilities and infrastructure for the development of the proposed UPA expansion/Master Plan are cost-neutral to the County's General Fund and existing ratepayers; and

that existing levels of municipal services will not be negatively impacted by approval and buildout of the proposed UPA expansion/Master Plan.

PC-8. Consistency with County-adopted plans.

Required: Consistency with all applicable County adopted plans not sought to be amended by the proposed project.

PC-9. Consideration of regional planning efforts.

Required: Inclusion of a discussion/analysis of how the proposed UPA expansion/Master Plan relates to broad-based and regional planning efforts, such as SACOG's adopted Blueprint Vision and Metropolitan Transportation Plan, Sacramento County's Visioning documents created for the Jackson Highway and Grant Line East Areas, any applicable Habitat Conservation Plan(s), the Sacramento Metropolitan Air Quality Management District's State Implementation Plan, and Regional Transit's Master Plan.

PC-10. Consideration of jobs-housing balance.

Required: Inclusion of a discussion/analysis of the proposed UPA expansion/Master Plan's jobs-housing balance. Master Plans should provide an internal jobs-housing balance and/or improve the jobs housing balance within the project's vicinity.

Alternative #1 – Criteria-Based

To satisfy this alternative, the Board must find that the proposed project is planned and will be built in a manner that:

- meets all of the requirements per the criteria below, and
- qualifies for a minimum of 18 points (out of a possible 24) per the criteria below

CB-1. Minimum net density.

Required: Minimum density of at least 7 dwelling units per net acre if using "double net" methodology or 9.3 dwelling units per acre if using "triple net" methodology.

Points:

1. ≥8 dwelling units per acre if using "double net" methodology, or ≥10.6 dwelling units per acre if using "triple net" methodology.	3 points
2. ≥9 dwelling units per net acre if using "double net" methodology, or ≥12 dwelling units per acre if using "triple net" methodology.	4 points
3. ≥10 dwelling units per net acre if using "double net" methodology, or ≥13.3 dwelling units per acre if using "triple net" methodology.	5 points

Discussion and definitions:
Double net density methodology: Double net density shall be calculated by considering land area dedicated exclusively to residential and mixed-use residential areas, **including** land for streets and alleys internal to the residential and mixed use residential areas. All other lands are excluded from this calculation, including streets not internal to the residential or mixed use areas, parks, schools, detention basins, other infrastructure, and services needed to support the development, and non-residential uses such as commercial areas, offices, and open space. This methodology shall be used if the Master Plan does not contain details regarding the location, size and extent of streets internal to residential and mixed use areas. A graphic representation of this methodology is provided below, with blue shading representing the residential and mixed use areas included in the calculation.

Triple net density methodology: Triple net density shall be calculated by considering land area dedicated exclusively to residential and

mixed-use residential areas, **excluding** land for streets and alleys internal to the residential and mixed use residential areas. All other lands are excluded from this calculation, including streets not internal to the residential or mixed use areas, parks, schools, detention basins, other infrastructure, and services needed to support the development, and non-residential uses such as commercial areas, offices, and open space. This methodology may only be used if the Master Plan contains sufficient details regarding the location, size and extent of streets internal to residential and mixed use areas. A graphic representation of this methodology is provided below, with blue shading representing the residential and mixed use areas included in the calculation.

Allowable deviations from density calculations: Certain lands may be excluded from the density calculation to allow for larger lot residential development and/or a transitional zone between urban uses within the USB and rural uses beyond, including:

- Land within ¼ mile of the USB, OR
- Up to 10% of the net residential acreage.

Definition of "dwelling units": Dwelling units shall include single family homes, duplex and triplex units, condominium units, townhomes, apartment and multiple-family units, and residential units in mixed use buildings. Residential units in congregate care facilities and in the residential portion of a university may be counted when calculating a master plan's overall density if the County finds that the Master Plan includes assurances that these units will be built. Each planned accessory unit that is allowed "by right" per the Master Plan's design

guidelines, development standards and zoning will be counted as ½ a dwelling unit. If the County finds that the Master Plan includes assurances that planned accessory dwelling units will be built to habitable standards and rented or sold to people outside the family resident in the primary unit, they will be counted as one dwelling unit. Hotel rooms and other similar transient housing will not be considered as dwelling units.

CB-2. Proximity of residential units to amenities.

Required: ≥80 percent of all residential units located within one mile of at least three of the following existing or planned amenity categories:

- Public elementary, middle, or high school
- Park or recreational facility
- Grocery store, drug store or commercial center
- Office or industrial employment center
- Civic use (e.g. library, post office, community garden, urban farm)
- Preschool, childcare or senior care facility
- Medical offices or facilities

Points:

1. ≥**85** percent of all units located within one mile of at least three of the amenity categories	2 points
2. ≥**90** percent of all units located within one mile of at least three of the amenity categories	3 points
3. ≥**90** percent of all units located within one mile of at least **four** of the amenity categories	4 points

CB-3. Mixed use.

Required: Include a mixed use designation, overlay, and/or zoning category that allows vertical mixed use by right, provides uninterrupted pedestrian connections, and prohibits barriers between different uses.

Points:

1. At least 5 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical).	2 points
2. At least 10 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical).	3 points
3. At least 15 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical) or assurances that at least 5 percent of the residential units will be located and built within vertically integrated mixed-use buildings.	4 points

Discussion: Mixed use shall be defined as "residential uses and at least one or more different use integrated vertically and/or horizontally in conformance with a coherent plan with significant functional, aesthetic, and physical integration of project components including, but not limited to, pedestrian and vehicle circulation, jointly accessible common areas and shared parking, and shared architectural, landscaping, lighting and signage themes." Mixed use zoning shall allow vertical mixed use by right, provide uninterrupted pedestrian connections, and prohibit barriers between different uses.

CB-4. Transit.

Required: ≥65 percent of all residential units located within ½ mile of existing or planned transit service, which consists of light rail, streetcars, buses, vanpools and/or shuttles, that connects with regional public transit service.

Points:

Proximity

1. ≥70 percent of residential units located within ½ mile of existing or planned transit service	2 points
2. ≥75 percent of residential units located within ½ mile of existing or planned transit service	3 points
3. ≥80 percent of residential units located within ½ mile of existing or planned transit service	4 points

Headways

1. Transit service with headways of 60 minutes or less during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.)	1 point
2. Transit service with headways of 30 minutes or less during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.)	2 points
3. Transit service with headways of 15 minutes or less during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.)	3 points

Discussion: "Planned transit service" shall be defined as service identified in SACOG's Metropolitan Transportation Plan (MTP), Regional Transit's (RT) Short Range Transit Plan (SRTP), and/or service to be provided as part of the Master Plan and funded via a secure financial mechanism (example: CSA 10; North Natomas TMA/developer fees). The MTP has a 20+ year planning horizon and is updated every four years; the SRTP has a 10-year planning horizon and is updated every year. Both the MTP and SRTP must be "financially constrained" in that only those transportation projects and programs for which funding is reasonably expected to be available may

be included in the plan. Therefore, there is a high likelihood that transit service identified in these plans will ultimately be provided. Service to be provided as part of a Master Plan and funded via a secure financial mechanism would provide similar assurances that identified service will ultimately be provided.

In contrast, transit service envisioned in RT's long-range TransitAction Plan cannot be implemented until a significant new revenue source is secured, making such service far more speculative. For example, a new ½ cent sales tax increase would only partially fund transit service envisioned in the TransitAction Plan. Therefore, service(s) identified in the TransitAction Plan and similar visioning documents will not be considered "planned transit service" for purposes of determining consistency with this criterion.

CB-5. Proximity to employment.

Required: Analysis of existing employment/jobs within a five mile radius of the proposed UPA expansion/Master Plan boundary.

Points:

1. <50,000 existing employees/jobs within a 5 mile radius of the proposed project	2 points
2. Between 50,000-100,000 existing employees/jobs within a 5 mile radius of the proposed project	3 points
3. >100,000 existing employees/jobs within a 5 mile radius of the proposed project	4 points

Alternative #2 – Vehicle Miles Travelled (VMT)/Greenhouse Gas (GHG) Emission Metrics

To satisfy this alternative, the Board must find that the proposed project is planned and will be built in a manner that results in:

- ≤14 vehicle miles travelled (VMT) per resident per day (or the equivalent VMT per *household* per day)

OR

- ≤Equivalent GHG per capita per day from cars, light trucks, and medium trucks (less than 8,500 Gross Vehicle Weight).

Discussion: While consistency with the criteria in Alternative #1 provides a level of certainty that a proposed project will achieve particular outcomes, *measuring* the actual projected outcome(s) of the project is a viable alternative. These projected outcomes can be compared against pre-defined metrics to determine the project's "performance." VMT and greenhouse gas (GHG) emissions are logical metrics because a project's performance in these areas is directly correlated to the project's ability to achieve the same goals and mandates (relative to air quality, transportation, land use, infrastructure, and GHG emissions) as the criteria

in Alternative #1. Additionally, VMT and GHG are very closely related; the mix of vehicles that residents use for their daily travel has a relatively narrow range of GHG emissions per mile traveled. Given the direct correlation between improved VMT and associated reductions in GHG emissions, this alternative directly addresses goals and mandates relative to recent state laws aimed at reducing GHG emissions, including AB 32, SB 375 and SB 97.

VMT is easily measured using standard travel demand analysis methods. Multiple traffic models exist for conducting such analysis. Given the long-range nature of the General Plan and the ever-evolving nature of traffic models, it does not make sense to require use of a specific model to determine compliance with this alternative. However, to ensure that a credible model is employed, the project proponent and County staff (including SACDOT, Planning and Environmental Review, etc.) will discuss the merits of available models and determine which will be used to determine compliance with this alternative prior to starting the analysis.

The 14 VMT per capita can be translated into a 13 lbs. of GHG per capita by using the same assumptions that SACOG is required to use for calculating SB375 GHG targets. These assumptions are that this travel will use cars, light trucks, and medium trucks (less than 8,500 Gross Vehicle Weight), and that vehicle and fuel improvements are not included. If the technology improvements are included (fuel economy increases and a 10% reduction in the carbon content of gasoline), then the GHG metric would be 8 lbs. of GHG per capita.

- **Policy LU-123.** Before granting approval of an amendment to the Land Use Diagram, the Board of Supervisors shall find that:
  - the request is consistent with the objectives and policies of the General Plan;
  - the request is consistent with the goals and objectives of a Sacramento County-adopted Habitat Conservation Plan;
  - approval of the proposal will not adversely affect the fiscal resources of the County;
  - the project will be consistent with the performance standards in this Plan and, for urban uses in urban growth areas, the project complies with the requirements of LU-13.
- **Policy EJ-19.** When planning for new development in new communities, the features below shall be incorporated for their public health benefits and ability to encourage more active lifestyles, unless environmental constraints make this infeasible. In existing communities, the features below shall be considered, as appropriate and feasible:

  a) Where appropriate, compact, mixed use development and a balance of land uses including schools, parks, jobs, retail and grocery stores, so that everyday needs are within walking distance of homes.

b) Grid or modified-grid pattern streets, integrated pathways and public transportation that connect multiple destinations and provide for alternatives to the automobile.

c) Wide sidewalks, shorter blocks, well-marked crosswalks, on-street parking, shaded streets and traffic-calming measures to encourage pedestrian activity.

d) Walkable commercial areas with features that may include doors and windows fronting on the street, street furniture, pedestrian-scale lighting, and served by transit when feasible.

e) Open space, including important habitat, wildlife corridors, and agricultural areas incorporated as community separators and appropriately accessible via non-vehicular pathways.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan, first adopted by the Sacramento County Board of Supervisors in 1978 and most recently updated in 2003, governs properties in the Cordova Community Planning Area but outside the boundaries of the city of Rancho Cordova (Sacramento County 2003). The 59-square-mile planning area is generally bordered by the American River and the city of Folsom on the north; Prairie City Road, Grant Line Road, and White Rock Road on the east; Douglas Road, Kiefer Boulevard, and Jackson Highway on the south; and the city of Sacramento and Watt Avenue/South Watt Avenue on the west. A portion of the WJHMP area north of Jackson Highway is in the Cordova Community Plan area. The plan provides a foundation for Sacramento County and the City of Rancho Cordova to coordinate on land use strategies, particularly for development along Folsom Boulevard and near light-rail stations. The following land use–related policies identified in the plan are applicable to the project:

- **Policy LU-2.** Emphasize high technology industry, business park uses, and industries such as manufacturing and distribution that provide support for Mather air-cargo operations.
- **Policy LU-3.** Promote a balance between the growth of the air-cargo industry at Mather with the need for housing and residential lifestyles in adjacent neighborhoods.
- **Policy LU-5.** Promote mixed-use concepts that capitalize on synergies between and among different types of land use (e.g., residential and office).
- **Policy LU-6.** Promote high quality, efficient and cohesive land utilization that minimizes negative impacts on adjacent neighborhoods and infrastructure (e.g., traffic congestion and visual blight).

- **Policy LU-8.** Continue the tradition of joint development of parks and schools.
- **Policy LU-10.** Recognize the diversity of the population (based on age, culture and economic status) within the community planning boundaries, and plan land uses according to the needs of this population.

The Cordova Community Plan also includes the following urban design and neighborhood character policies and housing policies that may apply to the project:

- **Policy UDNC-1.** Provide for commercial districts in new neighborhoods that are integrated into and physically connect with those adjacent neighborhoods.
- **Policy UDNC-2.** Encourage architecture and building design that promotes pedestrian and other multi-model forms of access.
- **Policy UDNC-4.** Promote neighborhoods that are reflective of a diverse population, and are competitive with other communities in the region in terms of their value and desirability.
- **Policy UDNC-5.** Ensure that new development reflects local history and architecture, neighborhood concerns, and incorporates features that will help integrate the development into the fabric of the community.
- **Policy UDNC-7.** Encourage the formation of distinct but integrated commercial districts with appropriate focal points, core activity areas, and supporting amenities.
- **Policy UDNC-8.** Promote high quality architecture, landscape, and streetscape features that enhance the character and identity of activity areas.
- **Policy UDNC-9.** Promote pedestrian-friendly, human-scale urban environments that provide safe and pleasant places for people to live and work.
- **Policy UDNC-11.** Ensure that potentially incompatible and unsafe land uses are separated from residential uses by appropriate transition areas.
- **Policy UDNC-13.** Promote the undergrounding of all electrical utilities.
- **Policy H-1.** Promote a balance for the jobs to housing ratio that will support the community position as a regional employment center.
- **Policy H-2.** Promote the development of strong and safe residential neighborhoods with convenient access to community and urban amenities including parks, public transit, schools, shopping, and other services.
- **Policy H-9.** Ensure an adequate mix of housing affordability dispersed throughout the community.
- **Policy H-10.** Encourage a variety of lot sizes and housing types to promote social and economic diversity, and to provide greater variation visibly for neighborhoods.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan, adopted by the Sacramento County Board of Supervisors in 1985, governs properties in the 37-square-mile Vineyard community (Sacramento County 1985). The community is generally bounded by Kiefer Boulevard and Jackson Highway on the north, Grant Line Road and Sunrise Boulevard on the east, Calvine Road on the south, and South Watt Avenue/Elk Grove-Florin Road on the west. A portion of the community area extends north of Jackson Highway to Kiefer Boulevard and along Kiefer Boulevard from approximately one-quarter mile east of Bradshaw Road on the west to Sunrise Boulevard on the east. Lands in the WJHMP area south of Jackson Highway and a portion north of Jackson Highway are in the Vineyard Community Plan Area.

The Vineyard Community Plan was intended to be a guide for future growth and development in the Vineyard area. However, many of the community plan's land use assumptions are now obsolete because of substantial land use changes that have occurred since its adoption. For example, the plan assumed that the Vineyard community would retain its rural character. Instead, large areas of Vineyard developed after the County's 1993 General Plan opened the area to urban development.

The following natural environmental resources, agricultural-residential, commercial/industrial, and future urbanization policies from the Vineyard Community Plan apply to the project:

- **Policy NER 6.** Require buffering and appropriate screening between commercial/industrial development and residential land use and between commercial/industrial development and agricultural uses.
- **Policy AR 1.** Buffer, through incremental zoning, agricultural-residential development from industrial and agricultural land uses.
- **Policy CI 3.** Industrial proposals should be accompanied by a public services plan, the scope of which will depend on the extent and complexity of the proposal.
- **Policy CI 4.** Commercial/industrial development must be adequately buffered from adjacent residential or agricultural uses with screening, open space or less dense development, or other means.
- **Policy FU 1.** Buffer, through incremental zoning, residential development from industrial and agricultural land use areas.
- **Policy FU 2.** Urban residential development will only be considered in those areas contiguous to approved urban uses and designated for future urban growth, and only when negative impacts upon the Vineyard community are mitigated to the greatest extent possible.
- **Policy FU 7.** Urban land use proposals should minimize encroachment upon open space areas and maximize infrastructure effectiveness through measures such as clustered design and contiguous development.

Sacramento County Zoning Code

The Sacramento County Zoning Code was adopted to implement the policies of the Sacramento County General Plan in order to preserve resources and protect the public health, safety, and general welfare of the residents of Sacramento County (Sacramento County 2023). It applies to all land, buildings, structures, and uses thereof located in Sacramento County outside of incorporated municipalities. The code regulates the use, placement, spacing, size, and nature of buildings and parcels of land to promote orderly development. It also establishes land use zones and describes the purposes, permitted uses, special conditions, and prohibitions for the different zones.

The current zoning in the plan area is described above, in the "Zoning" section of the "Plan Area Setting" section, and shown in Figure 2-8. Requests for zoning changes are reviewed for consistency by the Sacramento County Planning and Environmental Review Division.

Urban Services Boundary and Urban Policy Area

One of the strategies of the General Plan Land Use Element is the logical progression of urban development. Two mechanisms to implement this strategy are the Urban Services Boundary (USB) and Urban Policy Area (UPA). The USB indicates the ultimate boundary of the urban area in the unincorporated county. It is intended to be a permanent growth boundary not subject to modification except under extraordinary circumstances. The UPA defines the area in the USB expected to receive urban levels of public infrastructure and services during the planning period of the General Plan (Figure 2-2). The UPA should be adjusted only when found to be consistent with policies pertaining to expanding or amending the UPA. Defining the UPA is of key importance in the provision of urban services and infrastructure to the unincorporated county because it provides the geographic basis for infrastructure master plans, particularly for water and sewerage, which require large capital investment and a relatively long lead time for the installation of capital improvements.

The UPA and the USB are designed to promote maximum efficiency of land uses and protection of the county's natural resources. The USB allows for the permanent preservation of agriculture and rangelands, critical habitat, and natural resources, whereas the UPA concentrates and directs growth in previously urbanized areas, limiting arbitrary and sprawling development patterns. These two growth boundaries work in tandem to manage and direct future development, as well as provide infrastructure and service providers with intermediate and ultimate growth boundaries to use to plan for future expansion.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

A land use impact would be significant if implementation of the project would:

- physically divide an established community;
- cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect;
- induce substantial unplanned population growth in the area, either directly or indirectly; or
- displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

ISSUES NOT DISCUSSED FURTHER

All the issues identified in the significance criteria are addressed in the following analysis.

As stated previously, consistency with airport planning documents is addressed in Chapter 7, “Airport Compatibility,” and consistency with the South Sacramento Habitat Conservation Plan is addressed in Chapter 8, “Biological Resources.”

METHODOLOGY

An evaluation of the potential land use impacts associated with implementation of the project was based on a review of planning documents, including the various components and policies of the Sacramento County General Plan, the Cordova Community Plan, and the Vineyard Community Plan, as well as other County regulations affecting planning and implementation of the proposed General Plan.

WEST JACKSON HIGHWAY MASTER PLAN POLICIES

The WJHMP includes the following policy related to land use:

Policy 4.5.1: Continuation of Operations

1. All existing buildings, structures, equipment, and uses within the Plan Area shall be allowed to continue to operate so long as they are consistent with prior project approvals. Existing uses may also expand, provided doing so is consistent with this Master Plan’s adopted design guidelines. It is the intent of this Master Plan to allow and to promote the continuation of construction materials production operations until such time as they are complete and able to transition to the land uses identified in this Master Plan or established by future development approvals. Existing land uses include but are not limited to the following:

a) Surface mining and reclamation.
b) Aggregate pre-wash facility.
c) Crushing and screening.
d) Conveyor line and related facilities.
e) Soil drying beds and silt ponds.
f) Water ponds and related facilities.
g) Ready-mix concrete batch plants.
h) Asphaltic-concrete batch plants.
i) Construction materials recycling.
j) Such other uses that are allowed or may be allowed under already-approved or future mining and/or reclamation entitlements.

Impacts and Analysis

Impact LU-1: Physically Divide an Established Community

The plan area is south of the unincorporated community of Rosemont and east of the industrial business park community located on the edge of the city of Sacramento. Uses present in the plan area are active and reclaimed surface mining sites; industrial properties, such as storage, trucking, and rock processing and sales; and limited rural residential, commercial, institutional, and agricultural uses. An established community is not located in the plan area. Implementing the project would remove physical barriers by connecting formerly mined areas through development of residential, mixed use, commercial, industrial, and other uses, as well as development of an extensive network of streets and off-street trails that would connect uses in and between the districts proposed under the project. Therefore, implementing the project would not physically divide an established community. This impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact LU-2: Cause a Significant Environmental Impact Due to a Conflict with Any Land Use Plan, Policy, or Regulation Adopted for the Purpose of Avoiding or Mitigating an Environmental Effect

Consistency with Urban Policy Area/General Plan Growth Management Policy

The plan area is located within the USB, which serves as the ultimate boundary of the urban area in the unincorporated county. This boundary is based on jurisdictional, natural, and environmental constraints to urban growth. It is intended to be a permanent

growth boundary not subject to modification except under extraordinary circumstances. The UPA is the area within the USB expected to receive urban levels of public infrastructure and services during the planning period of the General Plan. Approximately 69 acres of the plan area is in the UPA; the remainder of the plan area is south and east of the UPA. The UPA boundary would need to be extended to encompass the plan area (see Figure 2-14). This change to the UPA boundary, which would expand the extent of the area in which growth can occur beyond the area anticipated in the General Plan, would require an amendment to the General Plan. For the County Board of Supervisors to approve this amendment, the requirements of General Plan Policies LU-119 and LU-120 must be met.

According to Policy LU-119, proposed UPA expansions must have "significant borders" that are adjacent to the existing UPA or a city boundary, and the boundary of the expansion must be logical. (In general, a border is "significant" if the length of the boundary between the existing UPA or city boundary and the proposed UPA expansion is at least 25 percent of the length of the boundary of the UPA expansion area.) Currently, the UPA boundary surrounds the plan area on three sides. In addition, expanding the UPA boundary to encompass the plan area would result in a more cohesive UPA in the vicinity of the plan area. The portion of the plan area boundary that would be part of the new UPA boundary would not be irregular and would form a logical edge (see Figure 2-14). The proposed expansion of the UPA is consistent with this policy.

General Plan Policy LU-120 is intended to reduce impacts of many different types—such as growth inducement, unacceptable operating conditions on roadways, poor air quality, and lack of appropriate infrastructure—by establishing design criteria for all amendments to the UPA. A project must be consistent with the policy before it may be considered for approval. The County has determined, based on review of the project characteristics described in the WJHMP, that the project would meet the requirements of Policy LU-120. As described above, projects must meet one of two alternative performance metrics to satisfy the requirements of this policy: Alternative #1 - Criteria-Based or Alternative #2 - VMT/GHG Reduction Metric. With participation in the Transportation Management Association (TMA) program included in the project and described in Chapter 19, "Transportation," of this EIR, VMT per resident would be reduced from 14.29 to 13.99 and would satisfy the "Alternative #2" requirement (Kimley-Horn 2023: Table 4).

The project has been deemed generally consistent with performance criteria PC-1 through PC-10; however, the project has achieved a total of 15 points in the criteria-based standards (CB-1 through CB-5) that are established as the "Alternative #1" performance metric option. Twenty-four points are possible for the criteria-based standards, and a total of 18 points is required. Table 15-2 summarizes how the project complies with performance criteria PC-1 through PC-10, and Table 15-3 summarizes how it complies with performance metrics CB-1 through CB-5, as outlined in Policy LU-120. The criteria-based standards are applied in this analysis for informational purposes.

Table 15-2 WJHMP Consistency Determination

Performance Criteria	Consistency Discussion
PC-1: Vision for connection to other adjacent existing and potential future development areas **Required:** Include a vision of how the development will connect to other adjacent existing and potential future development areas within the USB, including how roadways, transit, sewer, and water could occur within all adjacent areas. **Determination:** Consistent	The project would provide linkages between existing and planned development through a connected roadway network, trail network, public transit, and infrastructure. The proposed Street Master Plan identifies thoroughfares and arterials that would connect the residential neighborhoods and employment centers in the plan area with adjacent areas. Roadways in the plan area would connect with the established roadway system, which provides several access points to the plan area. The project would include a combination of bike and pedestrian trails, transit shuttles, local bus service, and bus rapid transit. The plan area is located along major planned transit corridors on Jackson Highway, South Watt Avenue, Bradshaw Road, and Excelsior Road, and the plan area is close to the Watt/Manlove Transit Priority Area and its light rail station. The project's wastewater system would connect with the sewer trunk system in the plan area owned and operated by the Sacramento Area Sewer System and the interceptor system in the area owned and operated by the Sacramento Regional County Sanitation District. The project's water supply system would connect with existing Sacramento County Water Agency and California American Water infrastructure in the area.
PC-2: Housing choice **Required**: A variety of housing types and densities, including single-family homes, duplexes, triplexes, accessory dwelling units, townhomes, condominiums, apartments and similar multi-family units, in a variety of settings including both residential neighborhoods and mixed-use nodes. **Determination:** Consistent	The project includes a maximum of 16,484 residential units in four density ranges. The variety of housing choices includes apartments, condominiums, townhouses, and single-family detached homes. In addition, the project encourages the provision of residential accessory dwellings, such as "granny flats" above garages, detached in-law structures, and multigenerational architecture in all residential neighborhoods. The plan area would include neighborhood centers in two districts and three future planning areas, and more than 2,000 dwelling units would be located in mixed-use areas in the plan area.
PC-3: Quality **Required**: Design guidelines, development standards and/or similar assurances that will require high-quality development consistent with the vision set forth in the Master Plan. **Determination:** Consistent	The project design guidelines would incorporate the Countywide Design Guidelines with some modifications to amplify the Countywide guidelines and promote high quality development. The modifications would result in standards that tailored to the plan, which would ensure consistent high-quality design in the community. The design guidelines describe principles and attributes for consistent streetscapes, entry features, walls and fencing, identification signage, landscape

Performance Criteria	Consistency Discussion
	elements, residential design, and other site-design specific considerations.
PC-4: Accommodate the percentage of low and very low income residential units required by state law per the County's current Housing Element based on the Regional Housing Needs Allocation (RHNA) **Required**: Accommodate ≥90 percent of the obligation per RHNA. **Determination:** Consistent	The project is required to accommodate greater than 90% of its share of the unincorporated county's proportional obligation of the RHNA. Current RHNA obligation is 33.6% of the housing stock. In accordance with the current RHNA for Sacramento County, the project is required to provide 30.2% of the proposed housing stock in land designated as being developed at 30 units/acre or greater. The project includes 5,660 residential units designated High Density Residential or Mixed Use. These designations have a density range of 25 to 40 and 25 to 35 units per acre, respectively, and account for 34.3% of the proposed dwelling units. Therefore, even with the allowed variation in density, the plan is anticipated to satisfy the project's share of the County's overall RHNA obligation.
PC-5: Pedestrian- and transit-oriented design **Required**: Pedestrian- and transit-oriented design, including: • Sidewalks and bike routes along interconnected streets with short block lengths and a high intersection density. • Prominent pedestrian and bicycle network. • Few if any cul-de-sacs. • Pedestrian and bike connections at the ends of all cul-de-sacs unless infeasible due to topography or similar impediments inherent in the project site. **Determination:** Consistent	The project would use bicycle and pedestrian trails strategically to connect neighborhoods and different land uses and to allow connectivity to key intersections, schools, and commercial centers to promote connectivity with adjacent areas. The bikeway system would consist of Class I, II, and III facilities and make use of the existing Morrison Creek and Elder Creek parkway trail systems and the proposed Rock Creek parkway trail system. Parkways and trails in the plan area would provide pedestrian connections among land uses and open spaces.
PC-6: Infrastructure Master Plan and Financing Plan **Required**: Inclusion of an Infrastructure Master Plan and Financing Plan that include the following: • The Infrastructure Master Plan shall identify required public facilities and infrastructure (including roads, transit, water, sewer, storm drainage, schools, fire, park, library, and other needed community facilities) and associated costs for the development of the proposed UPA expansion/Master Plan; • The Financing Plan shall: o Include an infrastructure phasing analysis that examines development through buildout taking into consideration potential development activities, facilities requirements and constraints; o Identify the phase or timing for when the facilities are needed;	The WJHMP presents the framework for proposed infrastructure improvements necessary to support development of the plan area. It describes the infrastructure needed for the project (sanitary sewer, water, storm drainage and flood control, electricity, natural gas, communications, and solid waste), as well as the sizing and timing of facilities. Interim facilities are identified as needed. Infrastructure would be constructed, dedicated, and easements provided consistent with the WJHMP and applicable standards and requirements of Sacramento County. A Public Facilities Financing Plan, which would be adopted as part of the WJHMP, provides a strategy for financing backbone infrastructure and other public facilities required to serve the proposed land uses in the plan area. It includes: • a summary of major backbone infrastructure and public facilities required and the associated costs, • an allocation of costs to various land uses,

Performance Criteria	Consistency Discussion
o Identify the funding mechanisms proposed to pay for the identified infrastructure and facilities; o Demonstrate that infrastructure requirements and the associated costs are reasonably balanced throughout each development phase and outline solutions for any potential constraints and/or shortfalls for any given phase. **Determination:** Consistent	• analysis of phasing requirements and existing funding sources, and • recommendations for potential mechanisms to fund the unfunded major required public improvements.
PC-7: Services Plan **Required**: Inclusion of a Services Plan to demonstrate: • that provision of services to the proposed UPA expansion/Master Plan are cost-neutral to the County's General Fund and existing ratepayers; • that the operations and maintenance costs stemmed from the required public facilities and infrastructure for the development of the proposed UPA expansion/Master Plan are cost-neutral to the County's General Fund and existing ratepayers, and; • that existing levels of municipal services will not be negatively impacted by approval and buildout of the proposed UPA expansion/Master Plan. **Determination:** Consistent	The Urban Services Plan prepared for the project demonstrates that: • the provision of services would be cost-neutral to the County's General Fund and existing ratepayers, • the operations and maintenance costs for the required public facilities and infrastructure would be cost-neutral to the County's General Fund and existing ratepayers, and • the existing levels of municipal services would not be negatively affected by approval and buildout of the WJHMP.
PC-8: Consistency with County adopted plans **Required**: Consistency with all applicable County adopted plans not sought to be amended by the proposed project. **Determination:** Consistent	The project includes proposed amendments to make the project consistent with County-adopted plans that affect the plan area, including the 2030 General Plan, Cordova Community Plan, Vineyard Community Plan, and Active Transportation Plan.
PC-9: Consideration of regional planned efforts **Required**: Inclusion of a discussion/analysis of how the proposed UPA expansion/Master Plan relates to broad-based and regional planning efforts, such as SACOG's adopted Blueprint Vision and Metropolitan Transportation Plan, Sacramento County's Visioning documents created for the Jackson Highway and Grant Line East Areas, any applicable Habitat Conservation Plan(s), the Sacramento Metropolitan Air Quality Management District's State Implementation Plan, and Regional Transit's Master Plan. **Determination:** Consistent	SACOG Blueprint and 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS). The plan area was not identified for growth in the 2020 MTP/SCS by 2040. However, the MTP/SCS does assume 154,500 new residential units in unincorporated Sacramento County between 2016 and 2040. The project is consistent with regional planning efforts and the SACOG Preferred Blueprint Scenario and Blueprint planning principles and has considered regional planned efforts in the development of the land use plan. Policies for Jackson & Grant Line East Visioning Areas. The land use pattern envisioned for the Jackson Visioning Area includes low-, medium-, and high-density residential uses; mixed uses; community commercial; neighborhood center; employment district; and open space uses. The land use pattern of the project is generally consistent with

Performance Criteria	Consistency Discussion
	the land use pattern envisioned for the Jackson Visioning Area. South Sacramento Habitat Conservation Plan. The project is a covered activity under the SSHCP and would be consistent with the SSHCP. (See Chapter 8, "Biological Resources.") Sacramento Metropolitan Air Quality Management District's State Implementation Plan. The WJHMP is anticipated to exceed the dwelling units assumed in the State Improvement Plan for 2040. Therefore, buildout of the WJHMP may be inconsistent with the growth projections in the State Improvement Plan. However, the plan is generally consistent with Sacramento Metropolitan Air Quality Management District's regional planning efforts, which anticipate growth in this area. (See Chapter 6, "Air Quality.") Sacramento Regional Transit District Strategic Plan. The project includes transit facilities and service complementary to the bus rapid transit routes planned on Jackson Highway and Sunrise Boulevard, including transit routes and stops in the plan area. (See Chapter 19, "Transportation.")
PC-10: Consideration of jobs-housing balance Required: Inclusion of a discussion/analysis of the proposed UPA expansion/Master Plan's jobs-housing balance. Master Plans should provide an internal jobs-housing balance and/or improve the jobs housing balance within the project's vicinity. **Determination:** Consistent	The WJHMP includes employment-generating land uses (commercial, mixed use, office, industrial, school). It is anticipated to generate approximately 29,233 jobs, or approximately 1.7 jobs per housing unit. These job opportunities are anticipated to contribute to a reduction in overall vehicle miles traveled in the region by helping to correct the existing jobs imbalance in the vicinity of the plan area.

Table 15-3 WJHMP Criteria-Based Standards Determination

Criteria	Requirement	Point Allocation	Evaluation	Points Achieved
CB-1: Minimum net density	Minimum density of at least 7 dwelling units per net acre if using "double net" methodology or 9.3 dwelling units per acre if using "triple net" methodology.	≥8 dwelling units per acre if using "double net" methodology, or ≥10.6 dwelling units per acre if using "triple net" methodology = **3 points** ≥9 dwelling units per acre if using "double net" methodology, or ≥12 dwelling units per acre if using "triple net" methodology = **4 points** ≥10 dwelling units per acre if using "double net" methodology, or ≥13.3 dwelling units per acre if using "triple net" methodology = **5 points**	Triple net density calculation: 16,484 du/2,363 acres = 6.9 du/ac.	0
CB-2: Proximity of residential units to amenities	≥80 percent of all residential units located within one mile of at least three of the following existing or planned amenity categories: • Public elementary, middle, or high school • Park or recreational facility • Grocery store, drug store or commercial center • Office or industrial employment center • Civic use (e.g. library, post office, community garden, urban farm) • Preschool, childcare or senior care facility • Medical offices or facilities	≥85 percent of all units located within one mile of at least three of the amenity categories = **2 points** ≥90 percent of all units located within one mile of at least three of the amenity categories = **3 points** ≥90 percent of all units located within one mile of at least four of the amenity categories = **4 points**	Under the WJHMP, 98 percent of the residential units would be located within 1 mile of at least four planned or existing amenities.	4
CB-3: Mixed use	Include a mixed use designation, overlay, and/or zoning category that allows vertical mixed use by right, provides uninterrupted pedestrian connections, and prohibit barriers between different uses.	At least 5 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical) = **2 points** At least 10 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical) = **3 points**	There is no assurance of mixed use provided.	0

Criteria	Requirement	Point Allocation	Evaluation	Points Achieved
		At least 15 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical) or assurances that at least 5 percent of the residential units will be located and built within vertically integrated mixed-use buildings = **4 points**		
CB-4: Transit	≥65 percent of all residential units located within ½ mile of existing or planned transit service, which consists of light rail, streetcars, buses, vanpools and/or shuttles, that connects with regional public transit service.	≥70 percent of residential units located within ½ mile of existing or planned transit service = **2 points** ≥75 percent of residential units located within ½ mile of existing or planned transit service = **3 points** ≥80 percent of residential units located within ½ mile of existing or planned transit service = **4 points**	Approximately 83 percent of residences would be within 0.5 mile of the proposed transit service route.	4
CB-4: Headways		Transit service with headways of 60 minutes or less during peak hours (Monday through Friday from 7–9 a.m. and 4–6 p.m.) = **1 point** Transit service with headways of 30 minutes or less during peak hours (Monday through Friday from 7–9 a.m. and 4–6 p.m.) = **2 points** Transit service with headways of 15 minutes or less during peak hours (Monday through Friday from 7–9 a.m. and 4–6 p.m.) = **3 points**	At full buildout, transit service would have headways of 15 minutes or less during peak hours.	3
CB-5: Proximity to employment	Analysis of existing employment/jobs within a 5-mile radius of the proposed UPA expansion/Master Plan boundary.	<50,000 existing employees/jobs within a 5 mile radius of the proposed project = **2 points** Between 50,000–100,000 existing employees/jobs within a 5 mile radius of the proposed project = **3 points** >100,000 existing employees/jobs within a 5 mile radius of the proposed project = **4 points**	According to Sacramento Area Council of Governments 2020 data, approximately 243,234 jobs are located within 5 miles of the plan area.	4
		TOTAL POINTS		**15**

Notes: ac = acre; du = dwelling units.

Consistency with General Plan Policies Related to Public Services and Utilities

Compliance with General Plan Policies LU-13, LU-66, LU-110, and LU-123 is intended to ensure that minimum service standards for public services and utilities are met. The policies address a variety of issues, including the need to ensure that adequate facilities would be constructed and that funding is secured for construction and that service providers are contacted to ensure that service planning is adequate. These issues are discussed in detail in Chapter 11, "Energy;" Chapter 17, "Public Services;" Chapter 18, "Public Utilities;" and Chapter 20, "Water Supply," of this EIR, but a brief summary is provided here. The project includes a Public Facilities Financing Plan, which was submitted to all the applicable service entities for review and approval. Long-term funding sources have been identified for the maintenance of public services and utilities. Implementing the project would not result in any substantial environmental impacts related to conflicts with General Plan policies that pertain to public services or utilities.

Consistency with General Plan Policies Related To Transportation and Air Quality

Compliance with General Plan Policies LU-21, LU-22, LU-23, LU-25, LU-34, LU-35, LU-36, LU-38, LU-46, and LU-71 can reduce the impacts of a project related to transportation and air quality. (Although the proposed master plan is not identified on the Land Use Diagram, Policies LU-35 and LU-36 do apply and are linked to Policy LU-34.) These policies address provision of a mix of uses, adequate pedestrian circulation, access to nonvehicular transportation, and reduction in energy demand. Providing a mix of uses and access to nonvehicular travel modes can reduce traffic congestion and reduce total trip lengths, which in turn reduce pollutant emissions. Reducing energy demand reduces pollutant emissions generated by the provision of energy. These issues are discussed in more detail in Chapter 6, "Air Quality," and Chapter 19, "Transportation," of this EIR, but a summary is provided here.

The project includes a mix of uses; different housing types; and a multimodal transportation system that includes pedestrian paths, bicycle paths, and a transit system. The project includes two large commercial areas, both of which would be a combination of commercial uses and mixed use. One is envisioned near the Bradshaw Road/Jackson Highway intersection. The other would be located at the Excelsior Road/Jackson Highway intersection.

General Plan Policy LU-25 establishes various relative proportions of land use types (i.e., commercial, office, and residential) that are appropriate depending on the emphasis of the proposed development. The master plan assumes 60 percent of the mixed-use area would be used for residential. This is consistent with mixed use development that has a residential emphasis, as identified in Policy LU-25. Eight mixed-use areas encompassing a total of 112.5 acres have been identified for Districts 1 and 2. An estimated 2,024 dwelling units, along with an estimated 1,225,125 square feet of commercial and office uses, would be located in these areas.

General Plan policies in the Air Quality Element that are applicable to the proposed project include Policy AQ-1, requiring that new development shall be designed to promote pedestrian/bicycle access and circulation to encourage community residents to use alternative modes of transportation to conserve air quality and minimize direct and indirect emission of air contaminants and Policy AQ-20 to promote Cool Community strategies to cool the urban heat island, reduce energy use and ozone formation, and maximize air quality benefits. In addition, the County supports SMAQMD's particulate matter control measures for residential wood burning and fugitive dust (Policy AQ-21). As described above, the WJHMP is consistent with these design principles. Finally, through Policy AQ-19, the County requires all feasible reductions in emissions for the operation of construction vehicles and equipment on major land development and roadway construction projects. Mitigation to address construction emissions is included in Chapter 6 of this EIR.

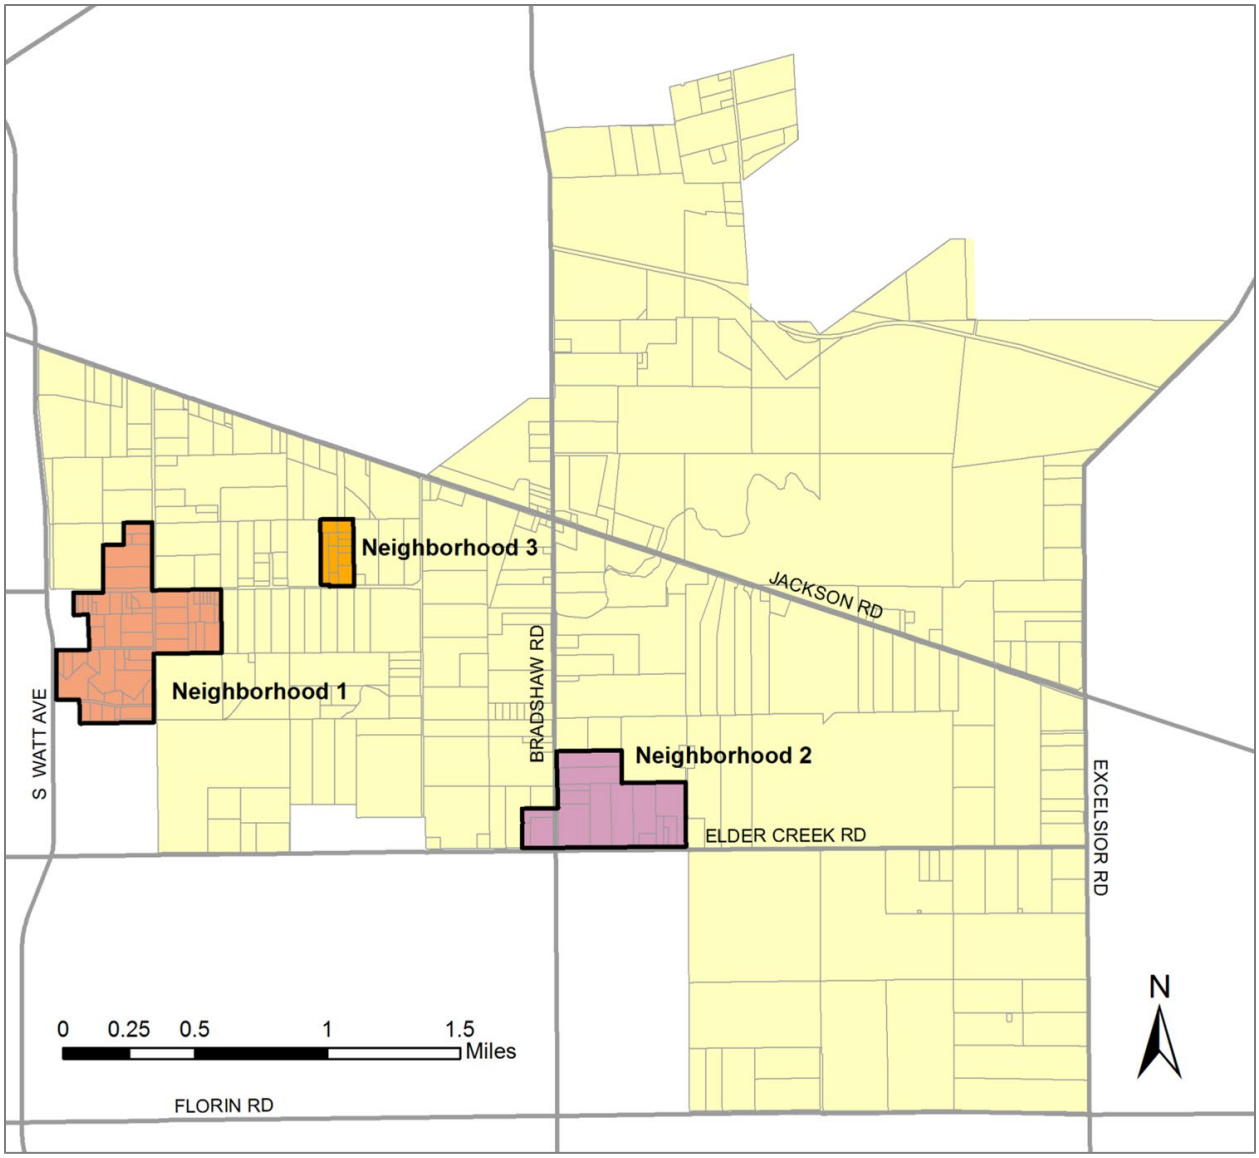
The Circulation Element of the General Plan provides the framework for County decisions concerning the countywide transportation system and includes several policies with which the WJHMP would be consistent. For example, Policy CI-34 calls for the construction and maintenance of bikeways and multi-use trails to minimize conflicts between bicyclists, pedestrians, and motorists and Policy CI-35 requires new development to install bicycle and pedestrian facilities in accordance with the Sacramento County Improvement Standards and/or pay their fair share portion to implement the multi-use trail system identified in the Sacramento County Active Transportation Plan. The WJHMP is consistent with General Plan policies which detail how the circulation system would be improved to meet the needs of all users. Several objectives established in the WJHMP support bicycle and pedestrian travel within the WJHMP area (see Objectives 2, 3, 4, 6, and 9).

Although implementing the project would result in significant impacts related to air quality and transportation, those impacts would not be the result of conflicts with General Plan policies.

Consistency with General Plan Policies Related to Land Use Compatibility

Policy LU-19 states that appropriate buffers should be placed between incompatible uses, and Policy LU-94 states that new development should be compatible with existing development. There are numerous industrial and residential uses in the plan area and agricultural uses in and adjacent to the plan area. In addition, there are limited mining operations that would continue production during early buildout of the plan. The WJHMP has been comprehensively planned to create a cohesive community that is integrated with the existing and planned land uses of several surrounding jurisdictions.

The effects of these existing land uses on proposed residential uses is largely outside the scope of this EIR, which is intended to evaluate the effects of implementing the WJHMP on the physical environment. However, future development of the plan area would require subsequent action by the Board at the time that specific developments are proposed. As required through General Plan Policy LU-94, the County would use the design review process for these proposals to ensure that new commercial and



residential development projects are designed to be compatible with existing neighborhoods.

Existing Residential Areas

The following three clusters of residential dwellings (neighborhoods) are located in the plan area:

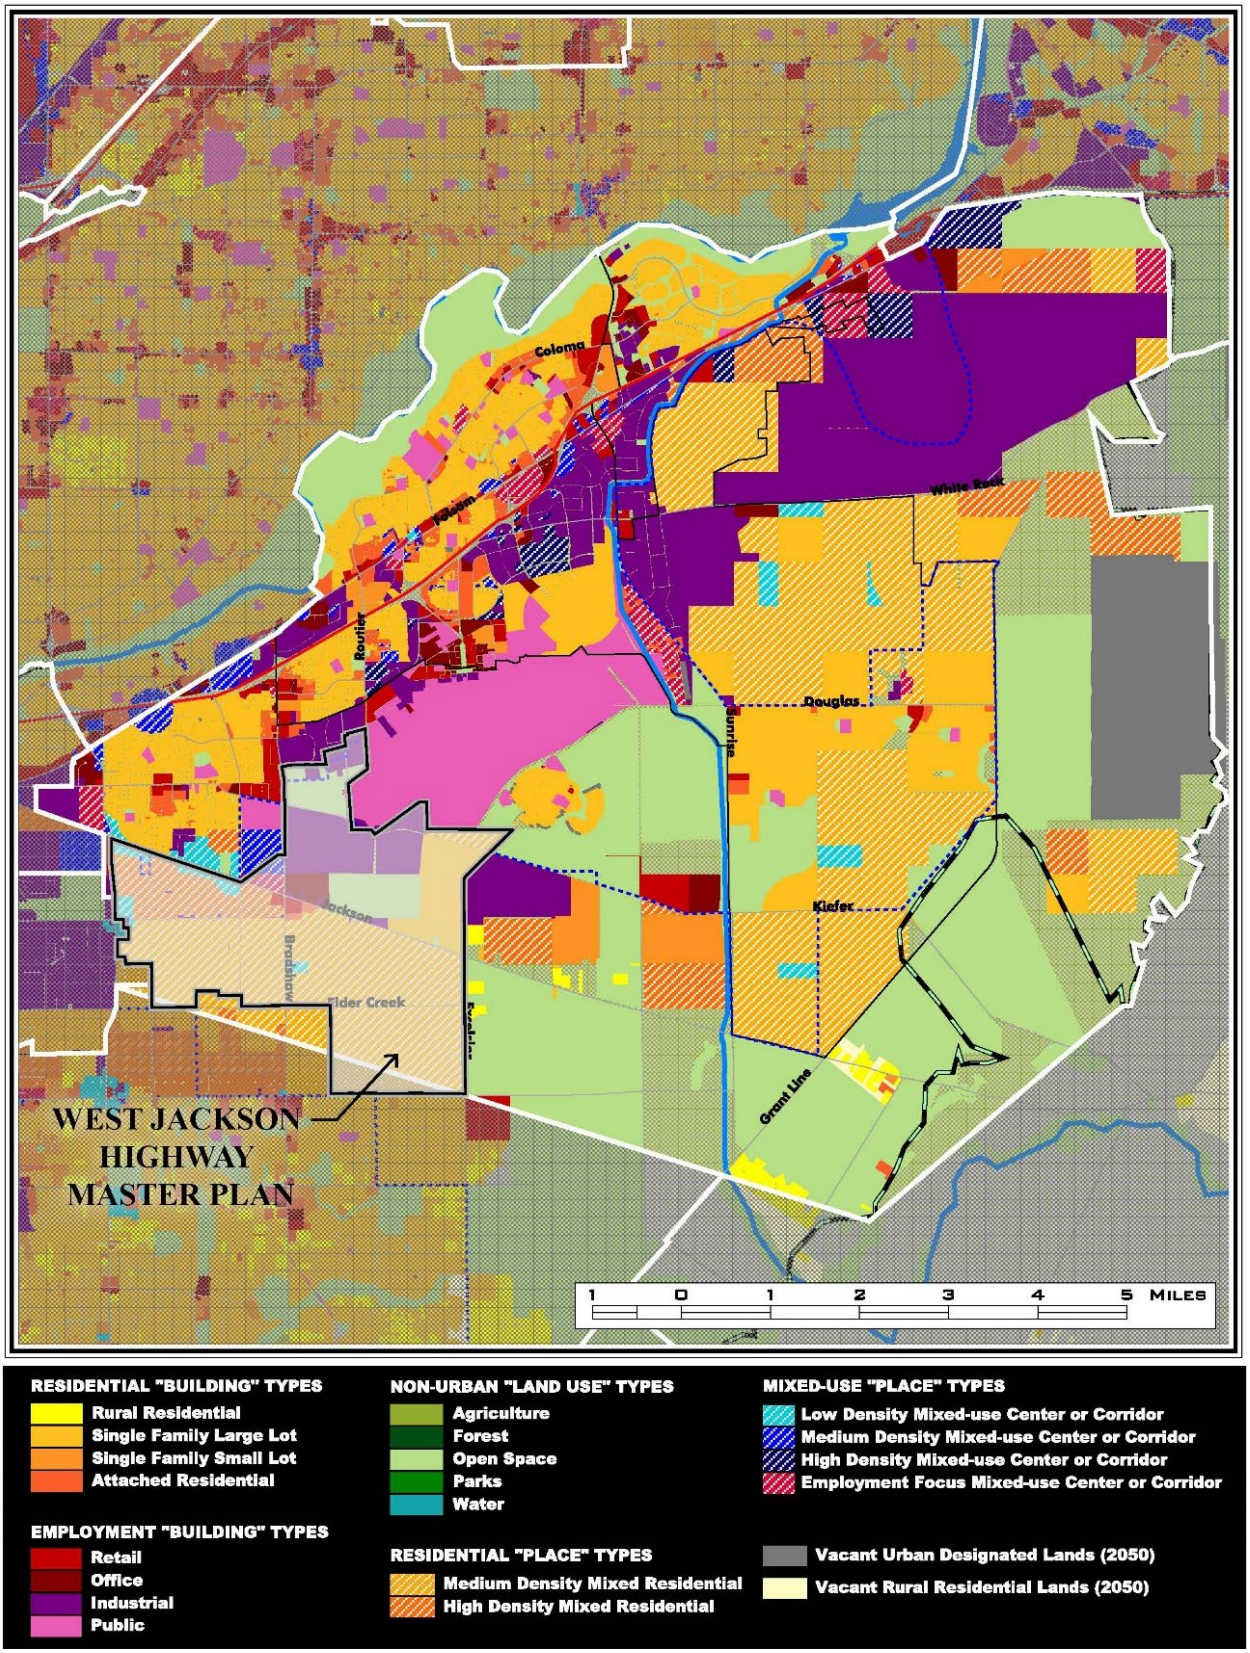
- The first neighborhood is along the western border of the project between South Watt Avenue and Hedge Avenue (Neighborhood 1 in Figure 15-2). This neighborhood occupies approximately 163 acres and is composed of 43 residences on 1- to 10-acre lots with most of the residences on lots of less than 5 acres. Industrial and vacant lots are also in the area. Existing industrial parks in the city of Sacramento are west of the neighborhood.
- The second neighborhood, located at the intersection of Bradshaw Road and Elder Creek Road (Neighborhood 2 in Figure 15-2), includes houses on 1- to 12-acre-plus lots. The neighborhood occupies approximately 107 acres and has 11 residences. Some vacant lots are also in this area.
- The third neighborhood, which is the smallest of the three neighborhoods (Neighborhood 3 in Figure 15-2), is located north of Fruitridge Road, between Hedge Avenue and Bradshaw Road. This neighborhood occupies approximately 20 acres and has 14 residences on 1- to 4-acre lots. Mining sites are adjacent to the north and west of this neighborhood.

The project designates the first and second neighborhoods as FPAs. There is no land use plan for FPAs, and urban development would not be allowed until a master plan is adopted for these areas. Therefore, the existing character of these neighborhoods would not change unless property owners want urban levels of development for their area and complete a master planning process. The third neighborhood is designated by the project as Very Low Density Residential. The project would allow current uses to continue. Planned land uses around the established neighborhoods include Low Density Residential, Open Space, and school uses that would be compatible with existing development and would provide supportive infrastructure to the area. Neighborhood 2 is within FPA B and east of, but not immediately adjacent to, an area designated as Open Space/Urban Farm. Although this designation allows for intensive agricultural uses, such as processing facilities, low density residential uses are generally consistent with agricultural operations and no land use conflicts are anticipated due to the distance to any potential processing facilities (all agricultural processing facilities would be setback a minimum of 200 feet from any residential uses).

Source: Provided by Sacramento County in 2023.

Figure 15-2 Residential Neighborhoods in Plan Area

EXISTING AGRICULTURAL AREAS



Agricultural areas are located in the plan area and adjacent to the area to the east. In addition, two nurseries are adjacent to the plan area. Possible land use conflicts include noise, odors, pesticide spray, and dust from agricultural areas, as well as noise, visual, and crime impacts from urban areas. Two mitigation measures identified in Chapter 5, "Agricultural Resources," would be available to mitigate these potential impacts. Mitigation Measure AR-2a, "Establish Agricultural Buffers," requires a minimum buffer of 200 feet between the property lines of residential areas and areas of agricultural activity in the plan area. This buffer could be reduced to a minimum of 100 feet if a vegetation screen of evergreen trees is planted and at least 50 feet of this buffer is vegetated with trees. Mitigation Measure AR-2b, "Provide Right-to-Farm Notification," requires new homeowners within 500 feet of existing pasture, cropland, orchards, or nurseries to

receive a recorded notice that would appear in the title report that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County Right-to-Farm Ordinance. In addition, Mitigation Measure AR-1 would require the preservation of farmland consistent with General Plan Policy AG-5.

Consistency with the SACOG Blueprint and Policies LU-23, LU-113, and EJ-19

The Blueprint concept plan for the plan area is presented in Figure 15-3. The figure depicts conceptual buildout in 2050. The plan is not intended for parcel-level interpretation and should not be construed as depicting specific, preferred development locations. Rather, the plan should be interpreted as displaying preferred overall patterns. In this context, the Blueprint indicates that development should be city-centric, focusing growth within the confines of incorporated city boundaries as a logical buildout from existing urban areas. As shown in Figure 15-3, the plan area is identified by the Blueprint as having a mixture of urban land uses and therefore is in the area assumed to be developed by 2050. The sections below discuss the project's conformity with the seven Blueprint principles (transportation choice, compact development, mixed-use development, housing choice and diversity, use of existing assets, natural resource conservation, and quality design), which are also captured by General Plan Policies LU-23, LU-113, and EJ-19.

Policy LU-23 states that compact, mixed-use developments shall be an integral part of all master planning efforts for new growth areas and commercial corridors. Policy LU-113 states that the County shall work with SACOG to support implementation of the Blueprint's policies and land use objectives. To improve public health and encourage more active lifestyles, Policy EJ-19 states that the following features shall be incorporated into new development and considered, as appropriate and feasible, in existing communities: compact, mixed-use development and a balance of land uses within walking distance of homes; grid or modified-grid pattern streets, integrated pathways, and public transportation that connect multiple destinations and provide for alternatives to the automobile; wide sidewalks, shorter blocks, and other features to encourage pedestrian activity; walkable commercial areas that have features such as doors and windows fronting on the street, street furniture, and pedestrian-scale lighting and that are served by transit when feasible; open space incorporated as community separators and accessible using nonvehicular pathways.

Source: Provided by Teichert in 2024.

Figure 15-3 Preferred Blueprint Scenario in Plan Area

TRANSPORTATION CHOICE

The project includes a wide range of transportation choices, including six-lane thoroughfares, four-lane arterials, two-lane community boulevards, two-lane neighborhood collectors, and residential streets for vehicles. The mass transit system, which would be operated by Sacramento Regional Transit, would connect with the light rail system. It would initially use a combination of transit shuttles, local bus service, and bus rapid transit but is expected to evolve in response to technology and ridership patterns changes. The plan area also would include approximately both on-street bicycle lanes and off-street multiuse trails, including regional trails that would generally follow Rock Creek Parkway, Morrison Creek, Elder Creek, and Vineyard Road.

In addition, the project includes a mandatory communitywide Transportation Management Association that would have programs that provide employees with a guaranteed ride home if, for example, an employee is required to work later than when the last available carpool leaves or transit options are available; require each employer to participate in an individual monitoring program or a vanpool program; and provide a ridesharing program throughout the project employment community. The project would conform with this Blueprint principle. Refer to Chapter 19, “Transportation,” for further discussion of the transportation infrastructure included in the proposed project.

COMPACT DEVELOPMENT

Compact building and community design is reflected in higher-density development, cluster development, and the use of smaller buildings. Compact development encourages more walking, biking, and transit use and shorter auto trips. Land designated for Medium Density Residential (target density of 14 dwelling units per acre), High Density Residential (target density of 30 dwelling units per acre), and Mixed Use (target density of 30 dwelling units per acre) would provide nodes of compact development along major transportation corridors, including Rock Creek Parkway and SR 16.

MIXED-USE DEVELOPMENT

Areas zoned for mixed-use development—typically, a combination of residences, shops, entertainment, and offices—function as local activity centers, and the variety of uses in a single location often allows residents to walk or bike to destinations. The WJHMP includes a total of 112.5 acres of mixed-use development in eight locations in the plan area. The proposed mixed uses in the plan area would include an estimated 2,024 dwelling units (at a residential density range of 25–35 dwelling units per acre) and an estimated 1,225,125 square feet of nonresidential uses. All the mixed-use development is proposed along major roadways, and more than 40 acres of the development are proposed at the intersection of Jackson Highway and Bradshaw Road. The project would conform with this Blueprint principle.

HOUSING CHOICE AND DIVERSITY

The WJHMP has been designed to provide a wide variety of housing options, including apartments, condominiums, townhouses, and single-family detached homes. In addition, the WJHMP encourages development of residential accessory dwellings, such

as “granny flats” above garages, detached in-law structures, and multigenerational architecture, in all residential neighborhoods.

Of the estimated 16,484 residential units proposed under the project, 230 units would be developed in areas zoned Very Low Density Residential, 9,774 units would be developed in areas zoned Low Density Residential, 820 units would be developed in areas zoned Medium Density Residential, 3,636 units would be developed in areas zoned High Density Residential, and 2,024 units would be developed in areas zoned Mixed Use.

USE OF EXISTING ASSETS

This principle typically relates to development on infill or vacant lands in urbanized areas, intensification of existing development, and redevelopment—all means of avoiding development on greenfields. Although minimal existing urban development is located in the plan area, two-thirds of the area consists of previously mined lands (reclaimed mining sites). In addition, the project encourages the logical and phased progression of development from the existing urban lands adjacent to the plan area (the Rosemont community to the north and industrial business parks in the city of Sacramento to the west). The project would conform with the intent of this Blueprint principle.

NATURAL RESOURCE CONSERVATION

The Blueprint recognizes that loss of open space resources is an inherent part of development in greenfield areas and does not suggest that greenfield development should be prohibited or avoided altogether. The natural resource conservation principle emphasizes the importance of both incorporating public use open space and conserving natural places and resources, including open space, agriculture, and wildlife and habitat areas.

The WJHMP proposes a mix of open space, parks, and recreation amenities, including a community park, neighborhood parks, pocket parks, linear parks, detention basin parks, open space, utility easements, drainage corridors, wetland avoidance areas, and a large trail network. The WJHMP also includes a network of approximately 1,489 acres of open space. Open space corridors in the plan area have been designed to protect streams and wetlands and accommodate planned stormwater detention and drainage features, utility easements, and transit and trail corridors.

As discussed in Chapter 8, “Biological Resources,” the project is a covered activity under the SSHCP. Development of the plan area is anticipated in the SSHCP. Coverage under the SSHCP will be required and the project would contribute to regional habitat conservation through participation in the SSHCP.

QUALITY DESIGN

The WJHMP Design Guidelines, which are based on the County Design Guidelines, ensure land use compatibility and high-quality design in neighborhoods in Districts 1 and 2. They address such considerations as grading and elevations, landscape buffers, setbacks, roadway layout, and the siting of facilities and future parcels. They promote

compatibility between existing and new land uses and set forth an architectural palette for designing public and private spaces accordingly. The guidelines would be used to create a variety of building facades and treatments that retain a unified theme. The WJHMP Design Guidelines would be implemented through subsequent tentative maps and zoning. Because the design guidelines delineate criteria that would foster a sense of place, the project would conform with this Blueprint principle.

SUMMARY OF SACOG BLUEPRINT ANALYSIS

The WJHMP presents a wide variety of transportation choices, includes compact community development in strategic areas, includes mixed-use development along major roadways, presents an array of housing choices, is located primarily on reclaimed mining sites and encourages the logical and phased progression of development from the urban lands adjacent to the plan area, includes nearly 1,500 acres of open space and more than 200 acres of parklands and protects the most sensitive natural resources in the plan area, and includes design guidelines that would ensure land use compatibility and high-quality design and foster a sense of place. Overall, the WJHMP conforms with the seven Blueprint principles.

CONSISTENCY WITH CORDOVA COMMUNITY PLAN

The Cordova Community Plan is an extension of the General Plan and provides specific guidance for the development of the area addressed by the community plan, including a portion of the WJHMP area north of Jackson Highway. The project implements the vision of the Cordova Community Plan expressed in the policies presented in the "Regulatory Setting" section. Consistency with the applicable community plan policies is evaluated in Chapters 4 through 20 of this EIR.

Specific to land use, the project would be consistent with Policies LU-5, LU-6, LU-8, and LU-10. The project promotes mixed-use development, development that is orderly and well designed, joint development of parks and schools, and a range of housing types to address a population diverse in age and economic status. The WJHMP Design Guidelines, which are based on the County Design Guidelines, would ensure a unified landscaping, signage, and neighborhood-themed aesthetic. The project is intended to be pedestrian and bicycle friendly and would incorporate trails, sidewalks, bicycle lanes, and civic open space throughout the WJHMP area as a means of integrating the different land uses and neighborhoods included in the project. The job opportunities anticipated under the project are expected to contribute to a reduction in overall vehicle miles traveled in the region by helping to correct the existing jobs imbalance in the vicinity of the plan area. For these reasons, the project would be consistent with the Cordova Community Plan policies applicable to the WJHMP area.

CONSISTENCY WITH VINEYARD COMMUNITY PLAN

The Vineyard Community Plan includes goals and objectives that serve as guidelines for the future development of the community plan area. Lands in the WJHMP area south of Jackson Highway and a portion north of Jackson Highway are in the Vineyard Community Plan Area.

Specific to land use, the project is largely consistent with community plan policies emphasizing the need to use buffers, screening, or incremental zoning between potentially conflicting land uses (Policies NER 6, AR 1, CI 4, and FU 1). Specifically, the community plan requires a buffer or screening between commercial/industrial development and residential or agricultural uses. Similarly, it requires that incremental zoning be used between agricultural-residential or residential development and industrial or agricultural land uses. Under the project, such conflicts would generally be avoided through development consistent with the proposed WJHMP land use plan, which has been developed to minimize conflicts between future land uses.

Regarding the need for a public services plan identified in the Vineyard Community Plan (Policy CI 3), an Urban Services Plan has been prepared for the project. The plan demonstrates that the provision of services would be cost-neutral to the County's General Fund and existing ratepayers, the operations and maintenance costs for the required public facilities and infrastructure would be cost-neutral to the County's General Fund and existing ratepayers, and the existing levels of municipal services would not be negatively affected by approval of the WJHMP and buildout of the plan area.

Summary

The project would not conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect in a manner that would cause a significant environmental impact. With implementation of resource-specific mitigation measures identified throughout this EIR, the project would be consistent with the County's General Plan growth management policies, as well as policies related to public services, utilities, transportation, and air quality. In addition, the project is consistent with the SACOG Blueprint and applicable community plans. For these reasons, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact LU-3: Induce Substantial Unplanned Population Growth

The project would result in substantial population growth, both directly through changes in land use designations that allow residential development and indirectly through the extension and expansion of roads and other infrastructure. As described above in Impact LU-2, although this growth is currently outside the UPA and inconsistent with the County's adopted General Plan land use diagram, the project is consistent with applicable growth management policies in the General Plan. In addition, because the plan has been in development for nearly two decades, the growth forecast in this plan has been considered in the infrastructure planning efforts of the County and private service providers. Further, as explained in Chapter 2, "Project Description," the County has processed this application concurrent with several other adjacent plans that could affect the regional pattern of land use in a manner that effects natural resources such as air quality and biological resources and changes in transportation and infrastructure

needs. The cumulative impacts of these developments are disclosed in Chapter 21 of this EIR. Therefore, the County has planned for population growth in the Jackson Highway corridor and the direct and indirect effects of the WJHMP are disclosed in this EIR. This impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact LU-4: Displace Substantial Numbers of Existing People or Housing, Necessitating the Construction of Replacement Housing Elsewhere

Existing housing in the approximately 5,913-acre plan area is limited. Mining has been a prevalent land use in the plan area for decades, so much of the area is occupied by active and reclaimed surface mining sites. Other uses on-site include industrial properties, such as storage, trucking, and rock processing and sales, as well as limited commercial, institutional, and agricultural uses. Pockets of rural residential housing are located in several locations in the plan area. Implementation of the project involves development of an estimated 16,484 new housing units. No housing is present in applicant-controlled portions of the plan area, and existing land uses in the remainder of the plan area, where the rural residential housing is located, would be allowed to continue following project adoption. If plan implementation results in the future redevelopment of land, particularly in the FPAs, any associated loss of housing would be sufficiently replaced with the 16,484 housing units anticipated within the plan area at buildout. Therefore, implementation of the project would not displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere. This impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

16 NOISE

INTRODUCTION

This chapter includes a summary of applicable regulations related to noise and vibration, a description of ambient noise conditions, and an analysis of potential short-term construction and long-term operational-source noise impacts associated with the plan area. Mitigation measures are recommended as necessary to reduce significant noise impacts. The analysis within this chapter is based on the Noise and Vibration Analysis prepared for the WJHMP (Bollard Acoustical Consultants 2023). The analysis is included as Appendix I of this EIR and incorporated herein. Additional data is provided in Appendix J, "Noise Modeling Calculations." Potential exposure to excessive noise levels associated with airport operations is discussed in Chapter 7, "Airport Compatibility," and is not discussed further in this chapter.

No comments were received regarding noise and vibration in response to the notice of preparation (NOP). The NOP and comments received in response to it are presented in Appendix A.

ENVIRONMENTAL SETTING

ACOUSTIC FUNDAMENTALS

Before discussing the noise setting for the project, background information about sound, noise, vibration, and common noise descriptors is needed to provide context and a better understanding of the technical terms referenced throughout this chapter.

SOUND, NOISE, AND ACOUSTICS

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air) to a human ear. Noise is defined as loud, unexpected, annoying, or unwanted sound.

In the science of acoustics, the fundamental model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receiver determines the sound level and characteristics of the noise perceived by the receiver. The field of acoustics deals primarily with the propagation and control of sound.

FREQUENCY

Continuous sound can be described by frequency (pitch) and amplitude (loudness). A low-frequency sound is perceived as low in pitch. Frequency is expressed in terms of cycles per second, or hertz (Hz) (e.g., a frequency of 250 cycles per second is referred to as 250 Hz). High frequencies are sometimes more conveniently expressed in

kilohertz or thousands of hertz. The audible frequency range for humans is generally between 20 Hz and 20,000 Hz.

Sound Pressure Levels and Decibels

The amplitude of pressure waves generated by a sound source determines the loudness of that source. Sound pressure amplitude is measured in micro-Pascals (mPa). One mPa is approximately one hundred billionths (0.00000000001) of normal atmospheric pressure. Sound pressure amplitudes for different kinds of noise environments can range from less than 100 to 100,000,000 mPa. Because of this large range of values, sound is rarely expressed in terms of mPa. Instead, a logarithmic scale is used to describe sound pressure level (SPL) in terms of decibels (dB).

Addition of Decibels

Because decibels are logarithmic units, SPLs cannot be added or subtracted through ordinary arithmetic. Under the decibel scale, a doubling of sound energy corresponds to a 3-dB increase. In other words, when two identical sources are each producing sound of the same loudness at the same time, the resulting sound level at a given distance would be 3 dB higher than if only one of the sound sources was producing sound under the same conditions. For example, if one idling truck generates an SPL of 70 dB, two trucks idling simultaneously would not produce 140 dB; rather, they would combine to produce 73 dB. Under the decibel scale, three sources of equal loudness together produce a sound level of approximately 5 dB louder than one source.

A-Weighted Decibels

The decibel scale alone does not adequately characterize how humans perceive noise. The dominant frequencies of a sound have a substantial effect on the human response to that sound. Although the intensity (energy per unit area) of the sound is a purely physical quantity, the loudness or human response is determined by the characteristics of the human ear.

Human hearing is limited in the range of audible frequencies, as well as in the way it perceives the SPL in that range. In general, people are most sensitive to the frequency range of 1,000–5,000 Hz and perceive sounds within this range better than sounds of the same amplitude with frequencies outside of this range. To approximate the response of the human ear, sound levels of individual frequency bands are weighted, depending on the human sensitivity to those frequencies. Then, an “A-weighted” sound level (expressed in units of A-weighted decibels) can be computed based on this information.

The A-weighting network approximates the frequency response of the average young ear when listening to most ordinary sounds. When people make judgments of the relative loudness or annoyance of a sound, their judgment correlates well with the A-scale sound levels of those sounds. Thus, noise levels are typically reported in terms of A-weighted decibels. Table 16-1 describes typical A-weighted noise levels for various noise sources.

Table 16-1 Typical A-Weighted Noise Levels

Common Outdoor Activities	Noise Level (dB)	Common Indoor Activities
	— 110 —	Rock band
Jet fly-over at 1,000 feet	— 100 —	
Gas lawn mower at 3 feet	— 90 —	
Diesel truck at 50 feet at 50 miles per hour	— 80 —	Food blender at 3 feet, Garbage disposal at 3 feet
Noisy urban area, daytime, Gas lawn mower at 100 feet	— 70 —	Vacuum cleaner at 10 feet, Normal speech at 3 feet
Commercial area, Heavy traffic at 300 feet	— 60 —	
Quiet urban daytime	— 50 —	Large business office, Dishwasher next room
Quiet urban nighttime	— 40 —	Theater, large conference room (background)
Quiet suburban nighttime	— 30 —	Library, Bedroom at night
Quiet rural nighttime	— 20 —	
	— 10 —	Broadcast/recording studio
Lowest threshold of human hearing	— 0 —	Lowest threshold of human hearing

Source: Caltrans 2013: Table 2-5.

HUMAN RESPONSE TO CHANGES IN NOISE LEVELS

The doubling of sound energy results in a 3-dB increase in the sound level. However, given a sound level change measured with precise instrumentation, the subjective human perception of a doubling of loudness will usually be different from what is measured.

Under controlled conditions in an acoustical laboratory, the trained, healthy human ear can discern 1-dB changes in sound levels when exposed to steady, single-frequency ("pure-tone") signals in the mid-frequency (1,000–8,000 Hz) range. In general, the healthy human ear is most sensitive to sounds between 1,000 and 5,000 Hz and perceives both higher and lower frequency sounds of the same magnitude with less intensity (Caltrans 2013: 2-18). In typical noisy environments, changes in noise of 1–2 dB are generally not perceptible. However, it is widely accepted that people can begin to detect sound level increases of 3 dB in typical noisy environments. Further, a 5 dB increase is generally perceived as a distinctly noticeable increase, and a 10-dB increase is generally perceived as a doubling of loudness (Caltrans 2013: 2-10). Therefore, a doubling of sound energy (e.g., doubling the volume of traffic on a highway) that would result in a 3-dB increase in sound would generally be perceived as barely detectable.

VIBRATION

Vibration is the periodic oscillation of a medium or object with respect to a given reference point. Sources of vibration include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) and those introduced by human activity (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, (e.g., operating factory machinery) or transient in nature (e.g., explosions). Vibration levels can be depicted in terms of amplitude and frequency relative to displacement, velocity, or acceleration.

Vibration amplitudes are commonly expressed in peak particle velocity (PPV) or root-mean-square (RMS) vibration velocity. PPV and RMS vibration velocity are normally described in inches per second (in/sec) or in millimeters per second. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is typically used in the monitoring of transient and impact vibration and has been found to correlate well to the stresses experienced by buildings (FTA 2018: 110; Caltrans 2020: 6).

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response. It takes some time for the human body to respond to vibration signals. In a sense, the human body responds to average vibration amplitude. The RMS of a signal is the average of the squared amplitude of the signal, typically calculated over a 1-second period. As with airborne sound, the RMS velocity is often expressed in decibel notation as vibration decibels (VdB), which serves to compress the range of numbers required to describe vibration (FTA 2018: 110; Caltrans 2020: 7). This is based on a reference value of 1 micro inch per second.

The typical background vibration-velocity level in residential areas is approximately 50 VdB. Ground vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels (FTA 2018: 120; Caltrans 2020: 27).

Table 16-2 summarizes the general human response to different ground vibration-velocity levels.

Table 16-2 Human Response to Different Levels of Ground Noise and Vibration

Vibration-Velocity Level	Human Reaction
65 VdB	Approximate threshold of perception.
75 VdB	Approximate dividing line between barely perceptible and distinctly perceptible. Many people find that transportation-related vibration at this level is unacceptable.
85 VdB	Vibration acceptable only if there are an infrequent number of events per day.

Notes: VdB = vibration decibels referenced to 1 µ inch/second and based on the root mean square (RMS) velocity amplitude.

Source: FTA 2018: 120.

Typical outdoor sources of perceptible ground vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur to fragile buildings. Construction activities can generate sufficient ground vibrations to pose a risk to nearby structures. Constant or transient vibrations can weaken structures, crack facades, and disturb occupants (FTA 2018: 113).

Ground vibration levels generated by construction activity can be transient, random, or continuous. Transient construction vibrations are generated by blasting, impact pile driving, and wrecking balls. Continuous vibrations are generated by vibratory pile drivers, large pumps, and compressors. Random vibration can result from jackhammers, pavement breakers, and heavy construction equipment.

Common Noise Descriptors

Noise in our daily environment fluctuates over time. Various noise descriptors have been developed to describe time-varying noise levels. The following are the noise descriptors used throughout this chapter.

Equivalent Continuous Sound Level (L_{eq}): L_{eq} represents an average of the sound energy occurring over a specified period. In effect, L_{eq} is the steady-state sound level containing the same acoustical energy as the time-varying sound level that occurs during the same period (Caltrans 2013:2-48). For instance, the 1-hour equivalent sound level, also referred to as the hourly L_{eq}, is the energy average of sound levels occurring during a 1-hour period and is the basis for noise abatement criteria used by the California Department of Transportation (Caltrans) and Federal Transit Administration (FTA) (Caltrans 2013: 2-47; FTA 2018: Table 3-1).

Percentile-Exceeded Sound Level (L_x): L_x represents the sound level exceeded for a given percentage of a specified period (e.g., L_{10} is the sound level exceeded 10 percent of the time, and L_{90} is the sound level exceeded 90 percent of the time) (Caltrans 2013: 2-48).

Maximum Sound Level (L_{max}): L_{max} is the highest instantaneous sound level measured during a specified period (Caltrans 2013: 2-48; FTA 2018: Table 3-1).

Day-Night Level (L_{dn}): L_{dn} is the energy average of A-weighted sound levels occurring over a 24-hour period, with a 10-dB “penalty” applied to sound levels occurring during nighttime hours between 10 p.m. and 7 a.m. (Caltrans 2013: 2-48; FTA 2018: Table 3-1).

Community Noise Equivalent Level (CNEL): CNEL is the energy average of the A-weighted sound levels occurring over a 24-hour period, with a 10-dB penalty applied to sound levels occurring during the nighttime hours between 10 p.m. and 7 a.m. and a 5-dB penalty applied to the sound levels occurring during evening hours between 7 p.m. and 10 p.m. (Caltrans 2013: 2-48).

Vibration Decibels (VdB): VdB is the vibration velocity level in decibel scale (FTA 2018: Table 5-1).

Peak Particle Velocity (PPV): PPV is the peak signal value of an oscillating vibration waveform. Usually expressed in inches/second (in/sec) (FTA 2018: Table 5-1).

Sound Propagation

When sound propagates over a distance, it changes in level and frequency content. The manner in which a noise level decreases with distance depends on depends on geometric spreading, ground absorption, atmospheric effects, and shielding by natural or human-made features, described in detail below.

Geometric Spreading

Sound from a localized source (i.e., a point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Roads and highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources, thus propagating at a slower rate in comparison to a point source. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source.

Ground Absorption

The propagation path of noise from a source to a receiver is usually very close to the ground. Noise attenuation from ground absorption and reflective-wave canceling provides additional attenuation associated with geometric spreading. Traditionally, this additional attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 feet. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver, such as soft dirt, grass, or scattered bushes and trees), additional ground-attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the attenuate rate associated with cylindrical spreading, the additional ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance. This would hold true for point sources, resulting in an overall drop-off rate of up to 7.5 dB per doubling of distance.

Atmospheric Effects

Receivers located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels, as wind can carry sound. Sound levels can be increased over large distances (e.g., more than 500 feet) from the source because of atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also affect sound attenuation.

SHIELDING BY NATURAL OR HUMAN-MADE FEATURES

A large object or barrier in the path between a noise source and a receiver attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Natural terrain features (e.g., hills and dense woods) and human-made features (e.g., buildings and walls) can substantially reduce noise levels. A barrier that breaks the line of sight between a source and a receiver will typically result in at least 5 dB of noise reduction (Caltrans 2013:2-41; FTA 2018:16). Barriers higher than the line of sight provide increased noise reduction (FTA 2018: 16). Vegetation between the source and receiver is rarely effective in reducing noise because it does not create a solid barrier unless there are multiple rows of vegetation (FTA 2018: 15, 104, 106).

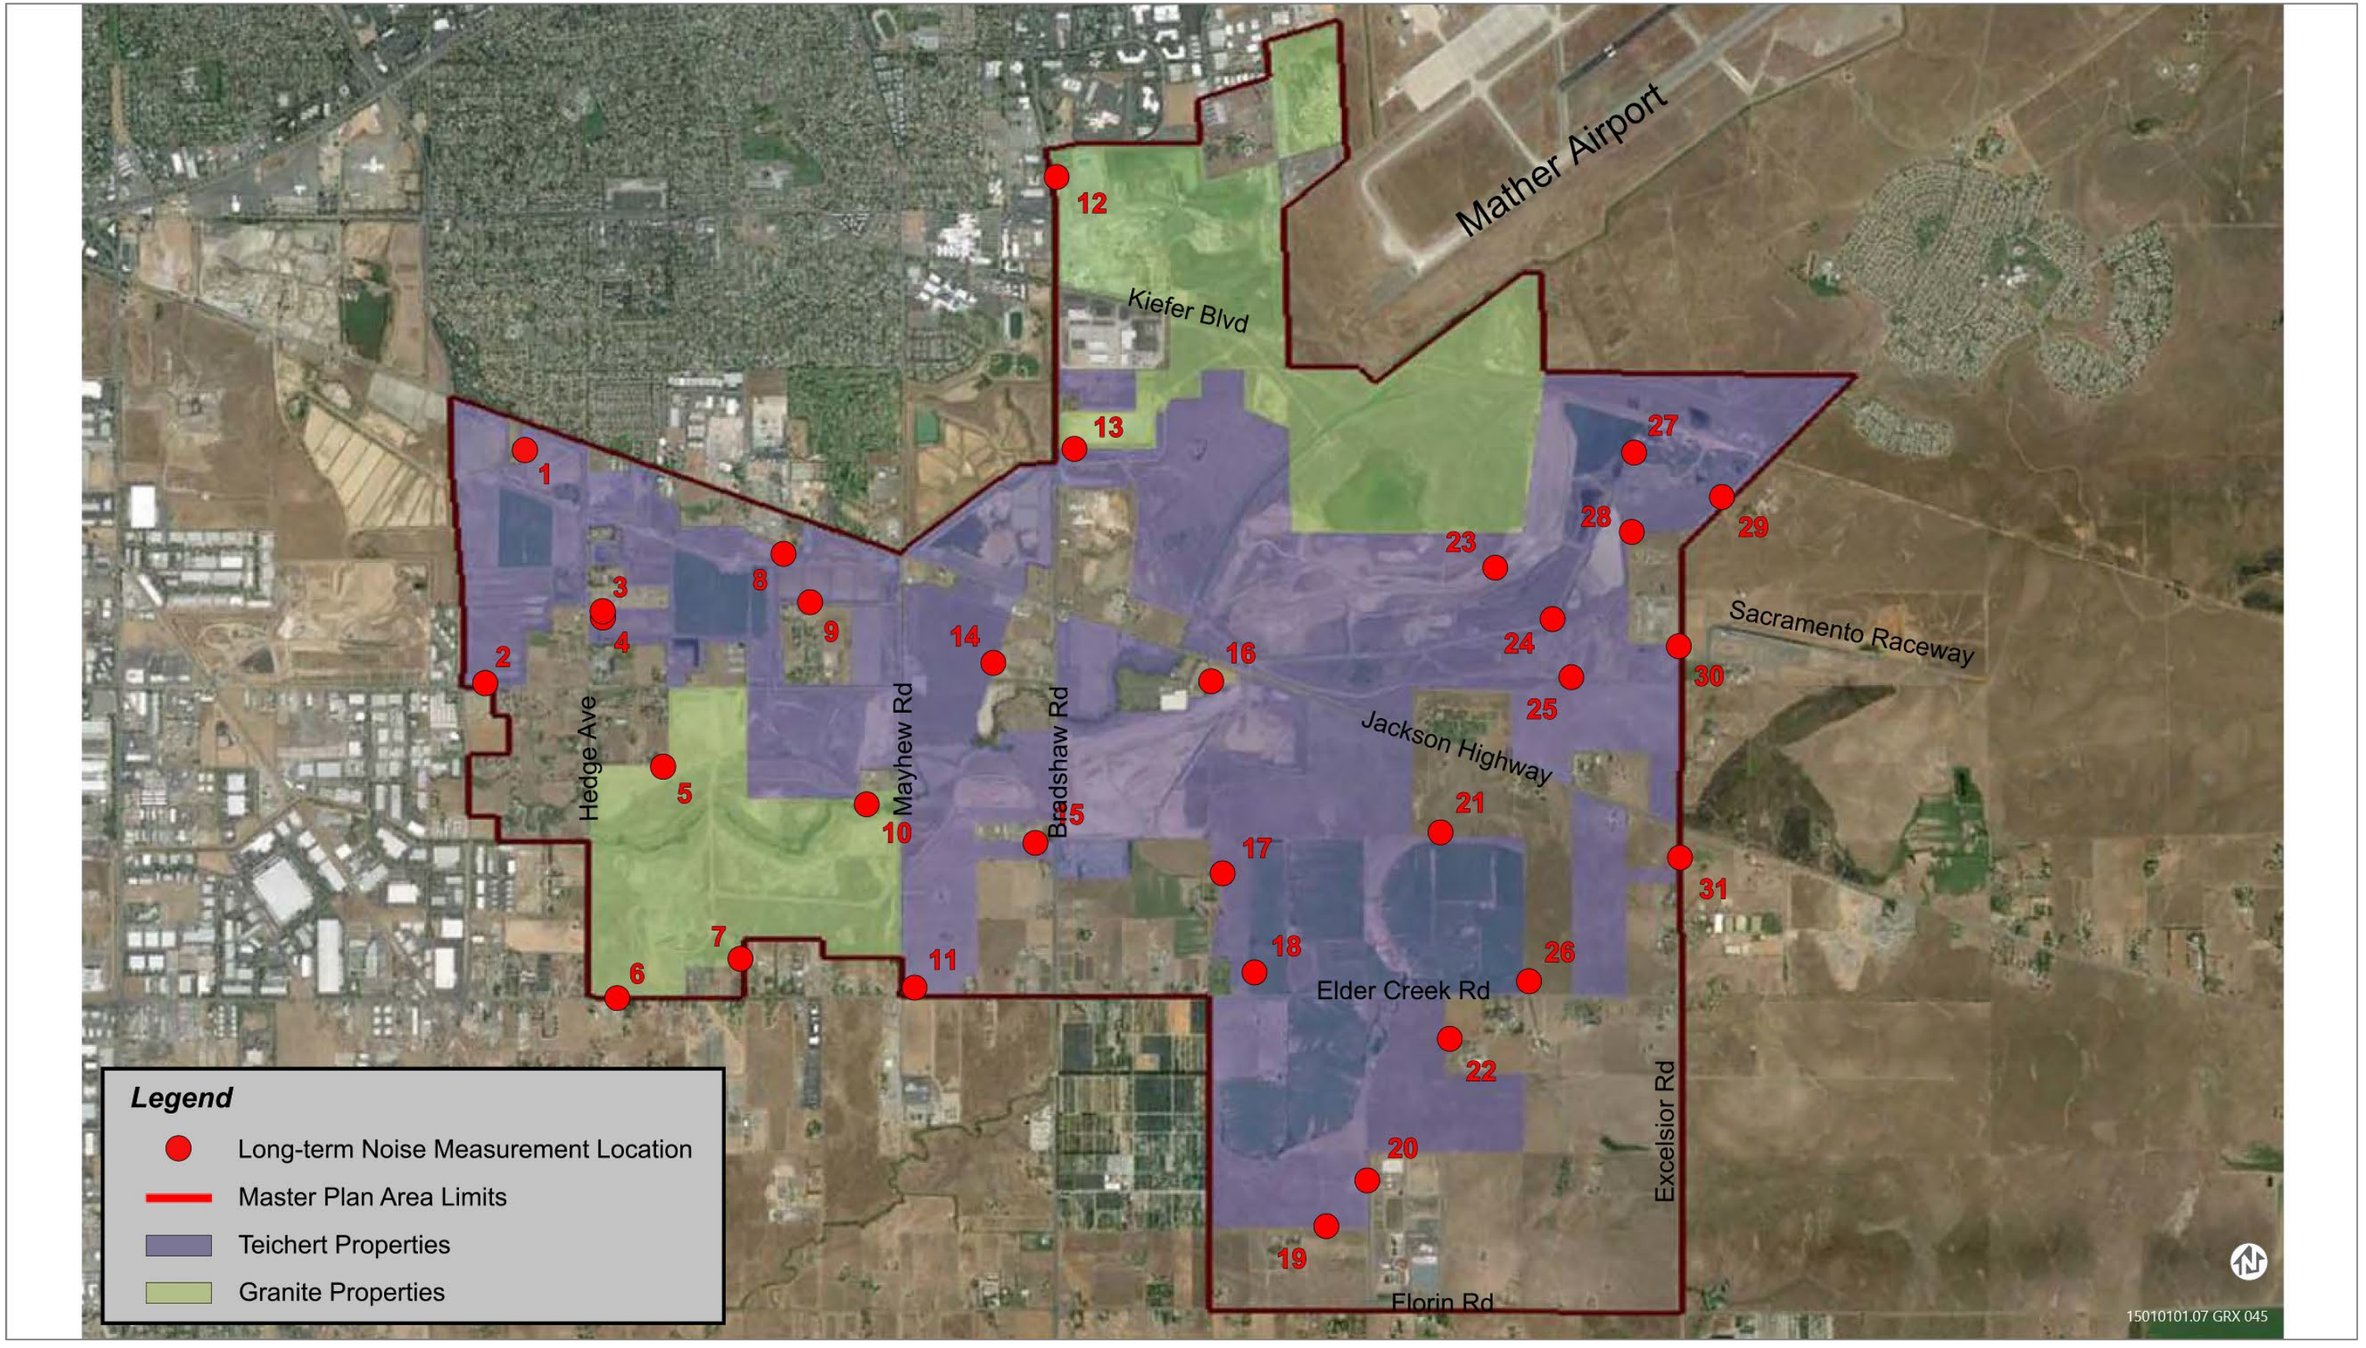
EXISTING CONDITIONS

EXISTING NOISE- AND VIBRATION-SENSITIVE LAND USES

Noise-sensitive land uses are generally considered to include those uses where noise exposure could result in health-related risks to individuals, as well as places where quiet is an essential element of their intended purpose. The General Plan defines a noise sensitive outdoor area as the primary outdoor activity area associated with any given land use at which noise sensitivity exists and the location at which the County's exterior noise level standards are applied (Sacramento County 2022a: 3).

Residential dwellings are of primary concern because of the potential for increased and prolonged exposure of individuals to both interior and exterior noise levels, and because of the potential for nighttime noise to result in sleep disruption if a project consists of nighttime construction. Additional land uses such as schools, transient lodging, historic sites, cemeteries, parks, and places of worship are also generally considered sensitive to increases in noise levels. Buildings and structures within these land use types are considered vibration-sensitive in addition to commercial and industrial buildings. The nearest noise-sensitive receptors include single-family homes adjacent to the northeastern perimeter of the WJHMP area on the north side of State Route (SR) 16 (Jackson Highway); an elementary school within the southwestern portion of the WJHMP area; and residences and churches within the WJHMP area.

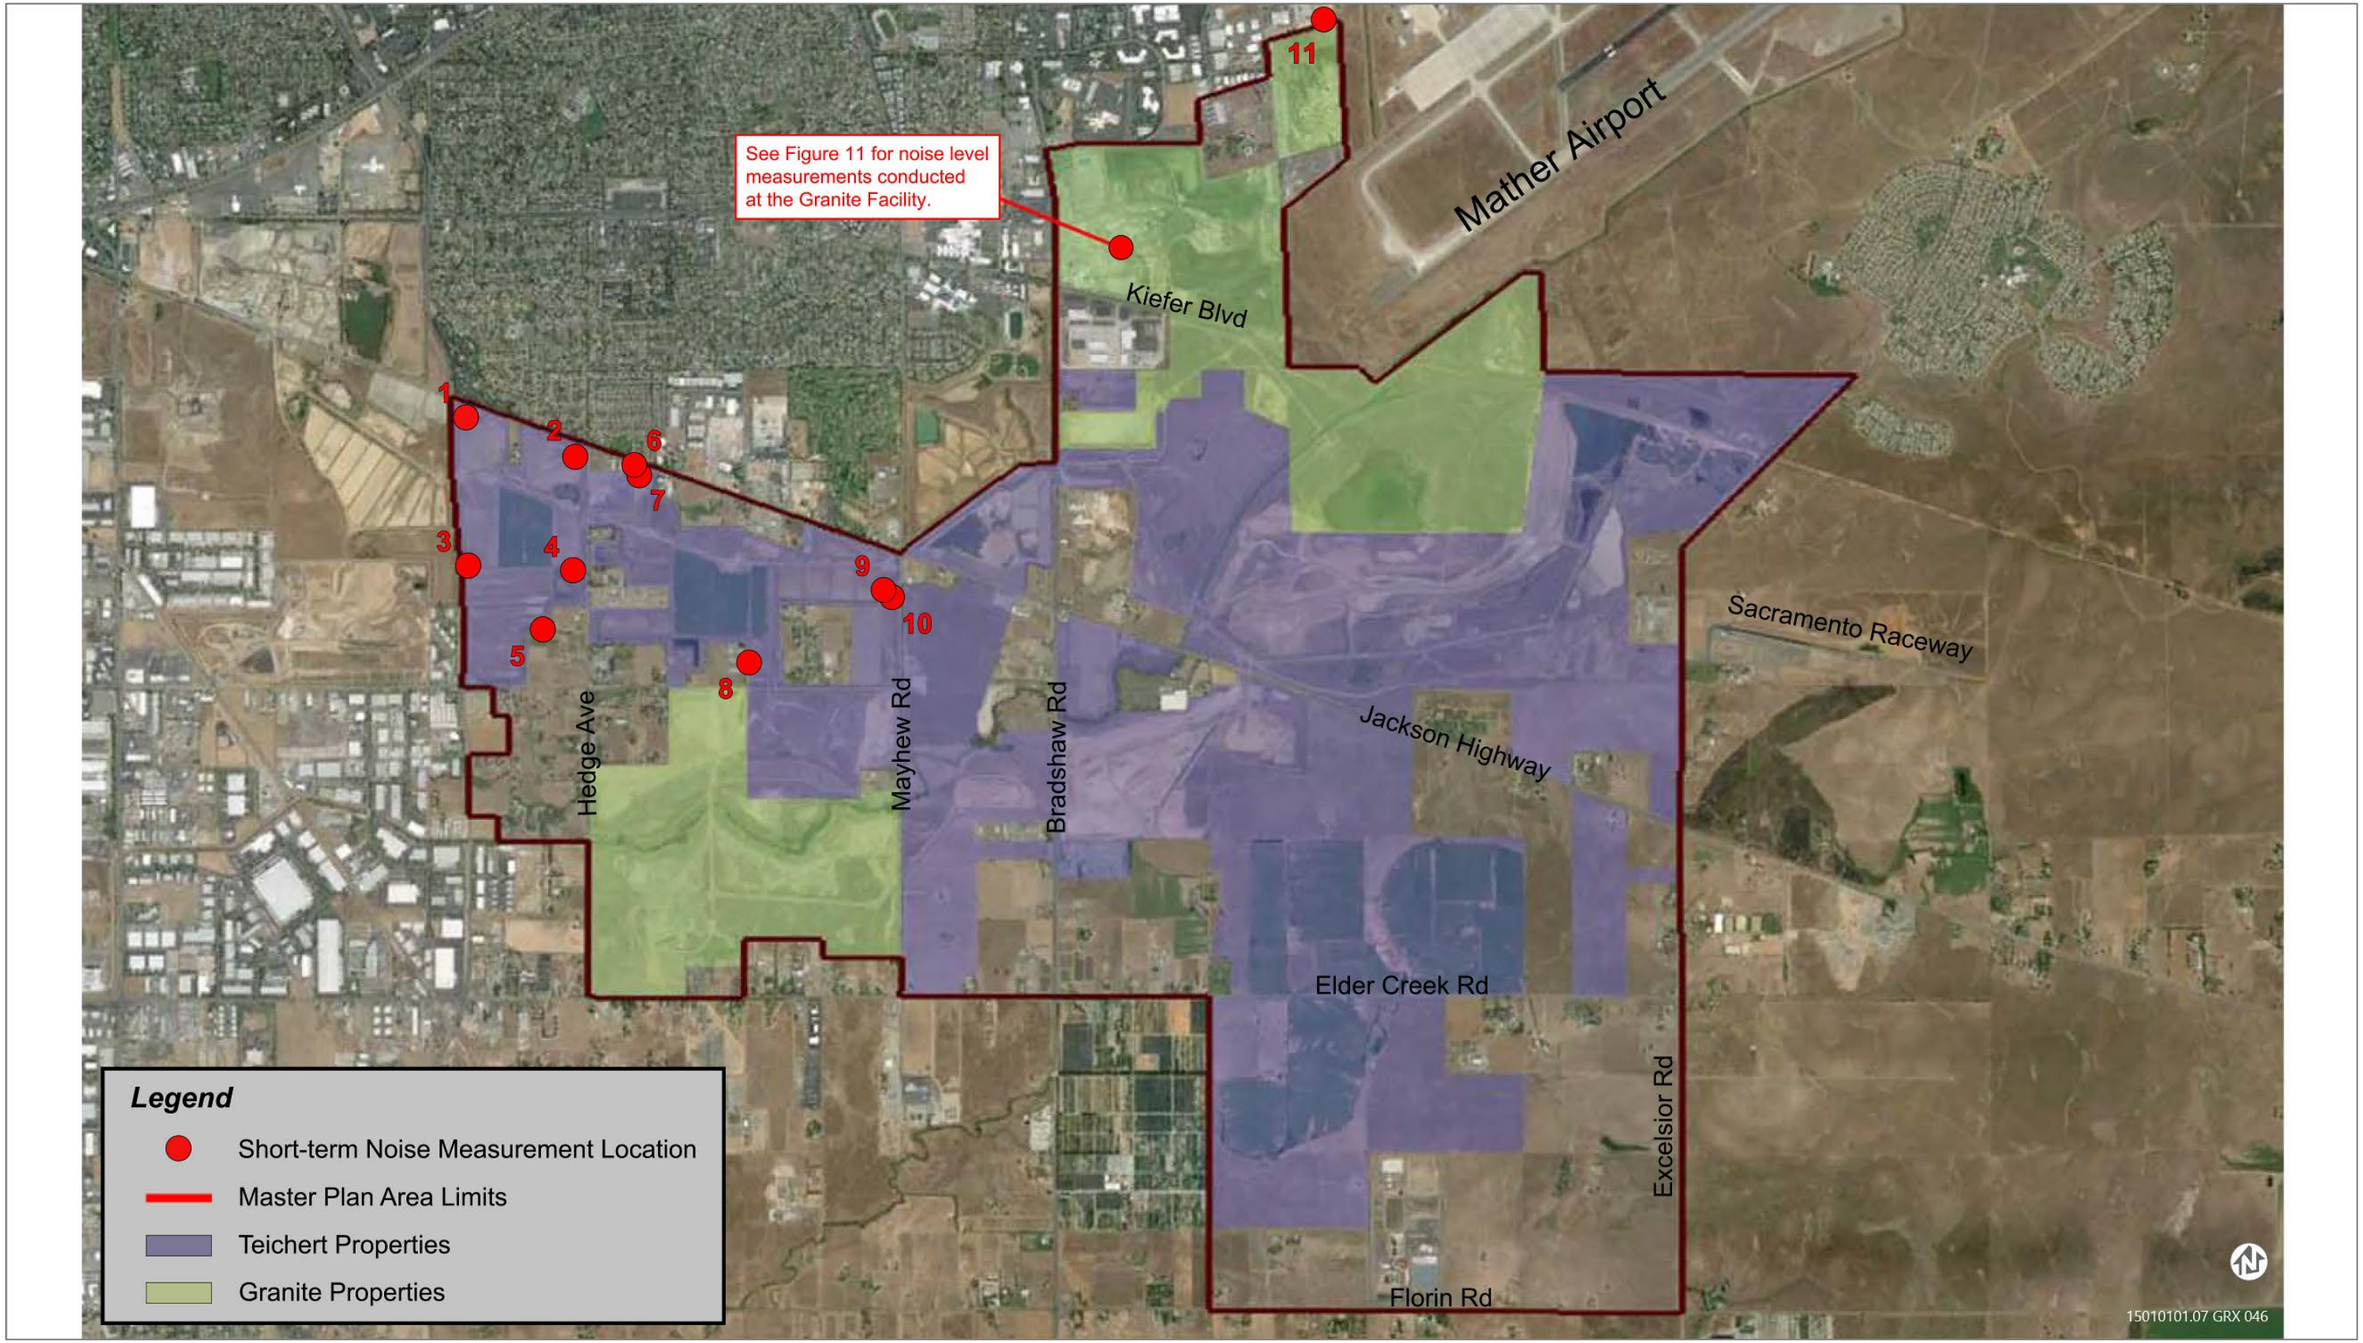
EXISTING NOISE SOURCES AND AMBIENT LEVELS



The noise environment in Sacramento County is defined primarily by transportation, which includes car, aircraft, and train traffic. Specifically, the most pervasive noise source affecting the WJHMP area is the traffic on Jackson Highway and other major arterial roadways. Mather Airport is located immediately adjacent to the northeastern boundary of the plan area, and the airport noise contours extend into the WJHMP area (refer to Chapter 7, "Airport Compatibility," in this EIR for further discussion). In addition to transportation noise sources, there are also stationary noise sources within the county, including manufacturing, commercial, and industrial uses. Existing noise sources within the WJHMP area include transportation noise, industrial activities such as storage, trucking, and aggregate mining and processing, and noise sources associated with residential, institutional, and agricultural uses. Although the Sacramento

Raceway is located within the Jackson Township Specific Plan area, adjacent to the WJHMP area, the raceway closed in November 2023.

To characterize the existing ambient noise environment within the WJHMP area, long-term (24-hour continuous) noise monitoring was conducted at 31 locations within the plan area in 2013 as shown in Figure 16-1. Supplemental ambient noise monitoring was conducted at six of the long-term noise monitoring locations in 2017, and again in 2022 to verify that the 2013 data remains representative of current ambient noise conditions within the plan area.



Short-term ambient noise levels measurements were also conducted at 11 locations shown in Figure 16-2. The locations of the noise monitoring conducted at the Granite Facility are shown in Figure 16-3.

Larson Davis Laboratories Model 820, LXT, and 831 precision integrating sound level meters were used for the ambient noise level measurement surveys. The meters were calibrated before use with Larson Davis Laboratories Model CAL200 acoustical calibrators to ensure measurement accuracy. The measurement equipment meets all pertinent specifications of the American National Standards Institute. The results of the ambient noise measurement survey are summarized below in Tables 16-3 and 16-4. It is important to note that several of the parcels within the WJHMP area are former aggregate excavation sites and are therefore lower (i.e., depressed) relative to the surrounding ground elevation. Additionally, because multiple noise measurements were taken at the same noise monitoring location (e.g., LT-1), several of the noise monitoring locations listed in Table 16-3 include a range of noise levels.

As shown in Tables 16-3 and 16-4, existing noise levels within the WJHMP area vary depending on the location of the site relative to major noise sources and the topographic shielding to the site.

TRANSPORTATION NOISE

Several major roadways are located within and near the WJHMP area and contribute a notable amount of noise to the ambient environment. These roadways include SR 16 (Jackson Highway), Excelsior Road, and Bradshaw Road. Noise levels along roadways are affected by various traffic characteristics, including average daily traffic (ADT) volumes, vehicle mix, roadway conditions, vehicle speed, and the gradient of the roadway. Additionally, the extent to which nearby land uses are affected by existing traffic noise depends on multiple factors, including their respective proximity to the roadways, shielding provided by intervening terrain and structures, and their individual sensitivity to noise. Transportation noise data for all modeled roadways, including distances to the 70 dB, 65 dB, and 60 dB L_{dn} contours, are presented in Table 16-5.

RAILROAD NOISE

The heavy rail operators within Sacramento County are the Union Pacific Railroad, Burlington Northern Santa Fe, and Amtrak. The unincorporated county is also served by Regional Transit Light Rail. The Amtrak San Joaquins line operates between the San Francisco Bay Area and Bakersfield and is located approximately 1.90 miles west of the WJHMP area.

STATIONARY SOURCES

Existing and former aggregate mining areas and agricultural zone properties comprise the majority of the WJHMP area. For example, Granite operates an aggregate processing facility at the northeast corner of Bradshaw Road and Kiefer Boulevard. The noise study prepared for this analysis conducted short-term noise level measurements at 13 locations at this site on August 15, 2013. The noise level measurements are shown in Table 16-6. As shown in Table 16-6, noise levels at this site range from 67 dB L_{eq} to 81 dB L_{eq} which are similar to the typical noise levels for a commercial area (i.e., 60 dBA) and noisy urban area (i.e., 70 dBA) as shown in Table 16-1.

Table 16-6 Granite Facility Short-Term Noise Level Measurements

Short-Term Measurement Location	Measured Noise Level dB L_{eq}	Measured Noise Level dB L_{max}
1	80	82
2	76	77
3	70	73
4	80	83
5	73	78
6	70	81
7	78/72	82/75
8	80	81
9	67/73	65/77
10	70	72
11	81	82
12	76	79
13	72	77

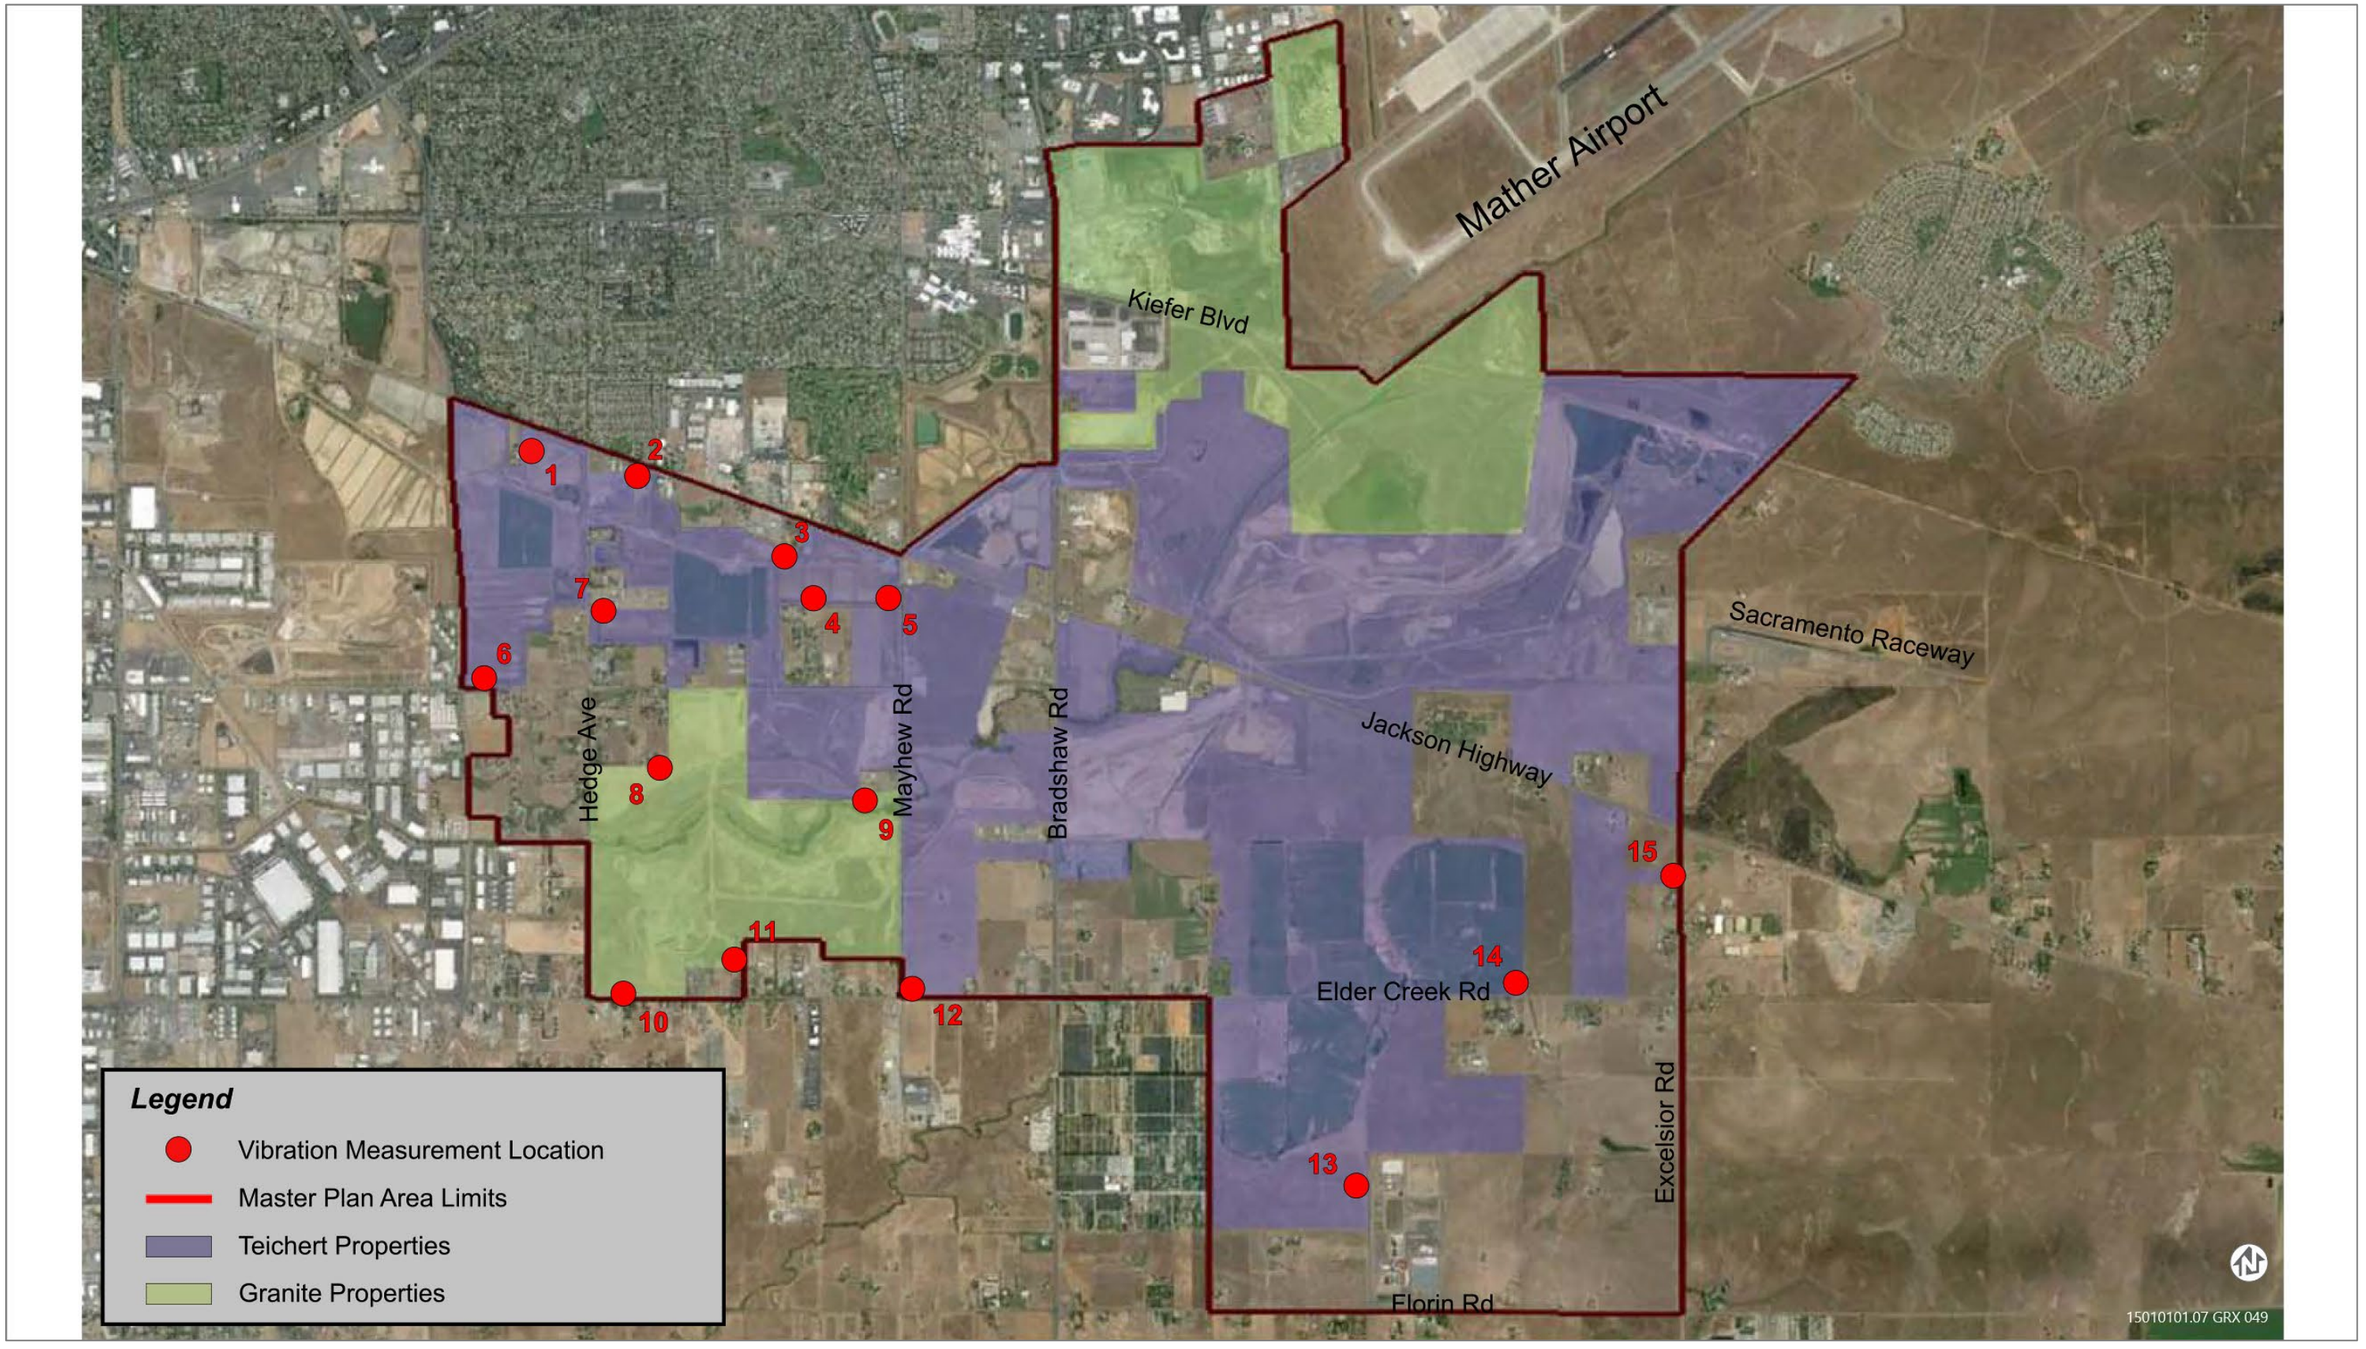
Notes: L_{eq} = equivalent continuous sound level; L_{max} = Maximum sound level.

Source: Bollard Acoustical Consultants 2023: Figure 11A.

There are industrial uses including truck storage yards, warehouses, and building and landscaping supply yards throughout the WJHMP area, although most building and landscaping supply businesses are adjacent to Jackson Highway. Agricultural land uses also make up a large portion of the WJHMP area and are generally located within the eastern and southeastern portions of the WJHMP area. Daily activity of certain industrial and agricultural uses generate noise, especially those that use heavy equipment as part of normal operations such as shipping and loading, concrete crushing, and recycling.

EXISTING VIBRATION ENVIRONMENT

To quantify the baseline vibration levels within the WJHMP area, a series of baseline vibration measurements were conducted in 2013. Supplemental vibration surveys were conducted again in 2017 to verify that the 2013 vibration data remain representative of current baseline conditions within the WJHMP area.



As shown in Figure 16-4, 15 monitoring locations were selected to be generally representative of a variety of locations within the WJHMP area, and due to the low measured vibration levels, it was determined that baseline vibration monitoring at additional sites was not warranted. The vibration measurements were conducted using a Larson-Davis Laboratories Model HVM-100 Vibration Analyzer with a PCB Electronics Model 353B51 ICP Vibration Transducer. Table 16-7 details measured existing vibration levels.

Table 16-7 Measured Baseline Vibration Levels (PPV in/sec)

Short-Term Site[1]	Date	Time	Vibration Level
1	8/13/13	11:05 a.m.	0.00331
2	8/13/13	12:17 p.m.	0.00404
3	8/13/13	11:53 a.m.	0.00257
4	8/13/13	2:32 p.m.	0.00220

11	8/15/13	10:42 a.m.	0.01280
12	8/29/13	10:50 a.m.	0.00367
13	8/29/13	11:35 a.m.	0.00624
14	8/29/13	11:59 a.m.	0.00367
15	8/29/13	12:19 p.m.	0.00257

Notes: PPV = peak particle velocity; in/sec = inches per second.
[1] The general range at which vibration becomes distinctly to strongly perceptible is approximately 0.10 in/sec PPV.
Source: Bollard Acoustical Consultants 2023: Table 12.

As shown in Table 16-7, all measured existing vibration levels within the WJHMP area were below the threshold of perception (i.e., 0.10 in/sec PPV). See Appendix I for details.

Figure 16-4 Vibration Monitoring Locations

REGULATORY SETTING

FEDERAL

FEDERAL NOISE CONTROL ACT OF 1972

The Federal Noise Control Act of 1972 established a requirement that all federal agencies must comply with applicable federal, state, interstate, and local noise control regulations. Federal agencies also are directed to administer their programs in a manner that promotes an environment free from noise that jeopardizes public health or welfare.

FEDERAL TRANSIT ADMINISTRATION

To address the human response to ground vibration, the FTA has set forth guidelines for maximum-acceptable vibration criteria for different types of land uses. These guidelines are presented in Table 16-8. FTA has also established construction vibration damage criteria, shown in Table 16-9.

Table 16-8 Ground-Borne Vibration Impact Criteria for General Assessment

Land Use Category	GVB Impact Levels (VdB re 1 micro-inch/second) Frequent Events[1]	GVB Impact Levels (VdB re 1 micro-inch/second) Occasional Events[2]	GVB Impact Levels (VdB re 1 micro-inch/second) Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations.	65[4]	65[4]	65[4]
Category 2: Residences and buildings where people normally sleep.	72	75	80
Category 3: Institutional land uses with primarily daytime uses.	75	78	83

Notes: GVB = Ground-Borne Vibration; VdB = vibration decibels referenced to 1 µ inch/second and based on the root mean square (RMS) velocity amplitude.

[1] "Frequent Events" is defined as more than 70 vibration events of the same source per day.

[2] "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.

[3] "Infrequent Events" is defined as fewer than 30 vibration events of the same source per day.

[4] This criterion is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research would require detailed evaluation to define acceptable vibration levels.

Source: FTA 2018: 123–126.

Table 16-9 FTA Construction Damage Vibration Criteria

Land Use Category	PPV in/sec
Reinforced-concrete, steel or timber (no plaster)	0.5
Engineered concrete and masonry (no plaster)	0.3
Non-engineered timber and masonry buildings	0.2
Buildings extremely susceptible to vibration damage	0.12

Notes: PPV = peak particle velocity, in/sec = inches per second.

Source: FTA 2018.

Federal Interagency Committee on Noise

The Federal Interagency Committee on Noise (FICON) provides guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these criteria have been applied to other sources of noise similarly described in terms of cumulative noise exposure metrics such as the L_{dn}. Table 16-10 details criteria established by FICON to evaluate increases in ambient noise levels.

Table 16-10 Federal Interagency Committee on Noise Recommended Criteria for Evaluation of Increases in Ambient Noise Levels

Ambient Noise Level without the Project (L_{dn})	Increase Required for Significant Impact
<60 dB	5.0 dB, or greater
60-65 dB	3.0 dB, or greater
>65 dB	1.5 dB, or greater

Source: FICON 1992.

State

California Building Code Sound Transmission Standards

Noise within habitable units that is attributable to external sources is regulated by the California Building Standards codified in the California Code of Regulations, Title 24, Part 2, Section 1206. These standards are enforceable at the time of construction or during occupancy and apply to habitable units with common interior walls, partitions, and ceilings or those adjacent to public areas, such as halls, corridors, stairways, and service areas. Under these standards, the interior noise levels attributable to exterior sources shall not exceed 45 dB in any habitable room. The noise metrics used to measure these levels can be L_{dn} or CNEL, consistent with the local general plan. An acoustical analysis documenting compliance with the interior sound level standards shall be prepared for structures containing habitable rooms. Under Public Resources Code Section 25402.1(g), all cities and counties in the state are required to enforce the adopted California Building Code, including these standards for noise in interior environments.

California Department of Transportation

In 2020, Caltrans published the Transportation and Construction Vibration Guidance Manual (Caltrans 2020). The manual provides general guidance on vibration issues associated with construction and operation of projects in relation to human perception and structural damage. Table 16-11 presents recommendations for levels of vibration that could result in damage to structures exposed to continuous vibration.

Table 16-11 Caltrans Recommendations Regarding Levels of Vibration Exposure

PPV (in/sec)	Effect on Buildings
0.4-0.6	Architectural damage and possible minor structural damage
0.2	Risk of architectural damage to normal dwelling houses
0.1	Virtually no risk of architectural damage to normal buildings
0.08	Recommended upper limit of vibration to which ruins and ancient monuments should be subjected
0.006-0.019	Vibration unlikely to cause damage of any type

Notes: PPV = peak particle velocity; in/sec = inches per second.

Source: Caltrans 2020: 38.

LOCAL

SACRAMENTO COUNTY 2030 GENERAL PLAN

The Sacramento County 2030 General Plan Noise Element was adopted in December 1993 and most recently amended in December 2022. The following General Plan policies related to noise and vibration are applicable to the project.

- **Policy NO-1.** The noise level standards for noise-sensitive areas of *new* uses affected by traffic or railroad noise sources in Sacramento County are shown by Table 1 [presented as Table 16-12 of this EIR]. Where the noise level standards of Table 1 are predicted to be exceeded at new uses proposed within Sacramento County which are affected by traffic or railroad noise, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 16-12 standards.

Table 16-12 Noise Standards for New Uses Affected by Traffic and Railroad Noise

New Land Use	Sensitive Outdoor Area – L_{dn}	Sensitive Interior Area – L_{dn}
All Residential[5]	65	45
Transient lodging[3,5]	65	45
Hospitals and nursing homes[3,4,5]	65	45
Theaters and auditoriums[3]	None	35
Churches, meeting halls, schools, libraries, etc.[3]	65	40
Office buildings[3]	65	45
Commercial buildings[3]	None	50
Playgrounds, parks, etc.	70	None
Industry[3]	65	50

[1] Sensitive areas are defined in acoustical terminology section.

[2] Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.

[3] Where there are no sensitive exterior spaces proposed for these uses, only the interior noise level standard shall apply.

[4] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation either by hospital staff or patients.

[5] If this use is affected by railroad noise, a maximum (L_{max}) noise level standard of 70 dB shall be applied to all sleeping rooms to reduce the potential for sleep disturbance during nighttime train passages.

- **Policy NO-5.** The interior and exterior noise level standards for noise-sensitive areas of new uses affected by existing non-transportation noise sources in Sacramento County are shown by Table 2 [presented as Table 16-13 in this EIR]. Where the noise level standards of Table 16-13 are predicted to be exceeded at a proposed noise-sensitive area due to existing non-transportation noise sources, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 2 [presented as Table 16-13 in this EIR] standards within sensitive areas.

Table 16-13 Non-Transportation Noise Standards Median (L_{50})/Maximum (L_{max})

New Land Use	Outdoor Area	Outdoor Area	Interior
	Daytime	Nighttime	Day and Night
All Residential	55 / 75	50 / 70	35 / 55
Transient lodging[4]	55 / 75	---	35 / 55
Hospitals and nursing homes[5,6]	55 / 75	---	35 / 55
Theaters and auditoriums[6]	---	---	30 / 50
Churches, meeting halls, schools, libraries, etc.[6]	55 / 75	---	35 / 60
Office buildings[6]	60 / 75	---	45 / 65
Commercial buildings[6]	---	---	45 / 65
Playgrounds, parks, etc[6]	65 / 75	---	---
Industry[6]	60 / 80	---	50 / 70

[1] The Table 2 standards shall be reduced by 5 dB for sounds consisting primarily of speech or music, and for recurring impulsive sounds. If the existing ambient noise level exceeds the standards of Table 2, then the noise level standards shall be increased at 5 dB increments to encompass the ambient.

[2] Sensitive areas are defined in the acoustic terminology section.

[3] Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.

[4] Outdoor activity areas of transient lodging facilities are not commonly used during nighttime hours.

[5] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.

[6] The outdoor activity areas of these uses (if any) are not typically utilized during nighttime hours.

[7] Where median (L50) noise level data is not available for a particular noise source, average (Leq) values may be substituted for the standards of this table provided the noise source in question operates for at least 30 minutes of an hour. If the source in question operates less than 30 minutes per hour, then the maximum noise level standards shown would apply.

- **Policy NO-6.** Where a project would consist of or include non-transportation noise sources, the noise generation of those sources shall be mitigated so as not exceed the interior and exterior noise level standards of Table 2 [presented as Table 16-13 in this EIR] at existing noise-sensitive areas in the project vicinity.
- **Policy NO-7.** The “last use there” shall be responsible for noise mitigation. However, if a noise-generating use is proposed adjacent to lands zoned for uses which may have sensitivity to noise, then the noise generating use shall be responsible for mitigating its noise generation to a state of compliance with the

Table 2 [presented as Table 16-13 in this EIR] standards at the property line of the generating use in anticipation of the future neighboring development.

- **Policy NO-8.** Noise associated with construction activities shall adhere to the County Code requirements. Specifically, Section 6.68.090(e) addresses construction noise within the County.
- **Policy NO-9.** For capacity enhancing roadway or rail projects, or the construction of new roadways or railways, a noise analysis shall be prepared in accordance with Table 3 [presented as Table 16-14 in this EIR] requirements. If projected post-project traffic noise levels at existing uses exceed the noise standards of Table 1 [presented as Table 16-12 in this EIR], then feasible methods of reducing noise to levels consistent with the Table 16-12 standards shall be analyzed as part of the noise analysis. In the case of existing residential uses, sensitive outdoor areas shall be mitigated to 60 dB, when possible, through the application of feasible methods to reduce noise. If 60 dB cannot be achieved after the application of all feasible methods of reducing noise, then noise levels up to 65 dB are allowed.

Table 16-14 Requirements for Acoustical Analyses Prepared in Sacramento County

An acoustical analysis prepared pursuant to the Noise Element shall:
Be the responsibility of the applicant.
Be prepared by qualified persons experienced in the fields of environmental noise assessment and architectural acoustics.
Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions.
Estimate projected future (20 years) noise levels in terms of the Standards of Tables 1 and 2 [presented as Tables 16-6 and 16-8 in this EIR] and compare those levels to the adopted policies of the Noise Element.
Recommend appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element.
Estimate interior and exterior noise exposure after the prescribed mitigation measures have been implemented.

If pre-project traffic noise levels for existing uses already exceed the noise standards of Table 16-12 and the increase is significant as defined below [shown as Table 16-15 in this EIR], feasible methods of reducing noise to levels consistent with the Table 16-12 standards should be applied. In no case shall the long-term noise exposure for non-industrial uses be greater than 75 dB; long-term noise exposure above this level has the potential to result in hearing loss.

A significant increase is defined as follows:

Table 16-15 Sacramento County Noise Significance Thresholds

Pre-Project Noise Environment (L_{dn})	Significant Increase
Less than 60 dB	5+ dB
60–65 dB	3+ dB
Greater than 65 dB	1.5+ dB

- **Policy NO-12.** All noise analyses prepared to determine compliance with the noise level standards contained within this Noise Element shall be prepared in accordance with Table 3 [presented as Table 16-14 in this EIR].
- **Policy NO-13.** Where noise mitigation measures are required to satisfy the noise level standards of this Noise Element, emphasis shall be placed on the use of setbacks and site design to the extent feasible, prior to consideration of the use of noise barriers.
- **Policy NO-14.** Noise analyses prepared for multi-family residential projects, town homes, mixed-use, condominiums, or other residential projects where floor ceiling assemblies or party-walls shall be common to different owners/occupants, shall be consistent with the State of California Noise Insulation standards.
- **Policy NO-15.** The County shall have the flexibility to consider the application of 5 dB less restrictive exterior noise standards than those prescribed in Tables 1 and 2 [presented as Tables 16-12 and 16-13 in this EIR, respectively] in cases where it is impractical or infeasible to reduce exterior noise levels within infill projects to a state of compliance with the Tables 16-12 or 16-13 standards. In such cases, the rationale for such consideration shall be clearly presented and disclosure statements and noise easements should be included as conditions of project approval. The interior noise level standards of Tables 16-12 or 16-13 would still apply. The maximum allowable long-term noise exposure permissible for non-industrial uses is 75 dB.
- **Policy NO-16.** The following sources of noise shall be exempt from the provisions of this Noise Element:

  a. Emergency warning devices and equipment operated in conjunction with emergency situations, such as sirens and generators which are activated during power outages. The routine testing of such warning devices and equipment shall also be exempt provided such testing occurs during daytime hours.

  b. Activities associated with events for which a permit has been obtained from the County.

Sacramento County Code

Chapter 6.68 of the Sacramento County Code addresses noise control in the county. The County Code sets limits for exterior noise levels on some designated agricultural-

residential and all residential properties. The standards found in the County Noise Control Ordinance are based on the duration of noise on private property over 1-hour periods. The ordinance is primarily concerned with regulating noise other than noise generated by transportation noise sources (e.g., passing cars or aircraft flyovers). The ordinance limits the duration of noise based on many factors, including the type of source, tonal characteristics of the source, ambient noise levels, and time of day, by utilizing a system of noise criteria not to be exceeded based on the duration of noise over any given hour.

Section 6.68.070 of the Sacramento County Code contains exterior noise standards for residential zoning districts. In recognition of ambient noise, the ordinance allows the standards set forth in Table 16-16 to be adjusted in 5 dB increments to encompass the ambient noise level. For example, if the ambient noise level for a given hour was 57 dB, the daytime L_{50} noise standard would be increased to 60 dB. The Noise Control Ordinance also states that each of the standards identified in Table 16-16 should be reduced by 5 dB for impulsive or simple tone noises, or for noises consisting of speech or music.

Table 16-16 Sacramento County Noise Ordinance

Cumulative Duration of the Intrusive Sound	Descriptor	Exterior Noise Standard, dB	Exterior Noise Standard, dB
		Daytime (7 a.m. – 10 p.m.)	Nighttime (10 p.m. – 7 a.m.)
30 – 60 minutes per hour	L_{50}	55	50
15 – 30 minutes per hour	L_{25}	60	55
5 – 15 minutes per hour	L_{08}	65	60
1 – 5 minutes per hour	L_{02}	70	65
Level not to be exceeded at any time	L_{max}	75	70

Source: Sacramento County, Noise Control Ordinance, Chapter 6.68.070.

Section 6.68.090 of the County Code provides exemptions to all noise regulations specified within Chapter 6.68 of the Code. Exemptions applicable to the project include:

- Noise sources associated with construction, repair, remodeling, demolition, paving or grading of any real property, provided said activities do not take place between the hours of 8:00 p.m. and 6:00 a.m. on weekdays and Friday commencing at 8:00 p.m. through and including 7:00 a.m. on Saturday; Saturdays commencing at 8:00 p.m. through and including 7:00 a.m. on the next following Sunday and on each Sunday after the hour of 8:00 p.m. Provided, however, when an unforeseen or unavoidable condition occurs during a construction project and the nature of the project necessitates that work in process be continued until a specific phase is completed, the contractor or owner shall be allowed to continue work after 8:00 p.m. and to operate machinery and equipment necessary until completion of the specific work in progress can be

brought to conclusion under conditions which will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner; and

- Noise sources associated with maintenance of residential area property, provided said activities take place between the hours of 6:00 a.m. and 8:00 p.m. on any day except Saturday or Sunday, or between the hours of 7:00 a.m. and 8:00 p.m. on Saturday or Sunday.

The County Code also includes specific regulations about the use of noise-generating mechanical equipment. Section 6.68.120 Machinery, Equipment, Fans, and Air Conditioning establishes the following:

a. It is unlawful for any person to operate any mechanical equipment, pump, fan, air conditioning apparatus, stationary pumps, stationary cooling towers, stationary compressors, similar mechanical devices, or any combination thereof installed after July 1, 1976, in any manner so as to create any noise which would cause the maximum noise level to exceed:

    1. 60 dB at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level;

    2. 55 dB in the center of a neighboring patio three to five feet above ground level;

    3. 55 dB outside of the neighboring living area window nearest the equipment location. Measurements shall be taken with the microphone not more than three feet from the window opening but at least three feet from any other surface.

SACRAMENTO COUNTY DESIGN GUIDELINES

The Sacramento County Countywide Design Guidelines provide a set of cohesive design principles and criteria that supports and implements the goals of the General Plan. There are separate sections for single- and multi-family dwellings; office, business park, and industrial development; and new communities. The purpose of design guidelines is to create design recommendations and standards for review of projects that are easy to understand and will result in well-designed and sustainable projects that raise the overall design quality of development occurring within the county. The Countywide Design Guidelines serve as the basis for the WJHMP Design Guidelines (Appendix B of the WJHMP) which would provide further specificity for design in District 1 and District 2 of the WJHMP area. The remainder of the WJHMP area would be subject to Countywide Design Guidelines, including the following design policies, which pertain specifically to noise impacts for development projects (Sacramento County 2022b).

SINGLE-FAMILY DESIGN STANDARDS

2.2.2 LOT SIZE AND CONFIGURATIONS

Each project that proposes to divide land should result in lots that are consistent with and well suited to the land use designations and policies set forth in the General Plan

and in any adopted community plans, including both maps and texts. Potential population densities of residential lots should not exceed the densities set forth in the General Plan or community plans, or unless otherwise specified in the Zoning Code.

- Lots that back onto an arterial roadway or are adjacent to a land use with a higher intensity nonresidential zoning classification should incorporate landscaped buffer areas and deeper rear yards to mitigate potential noise, air quality, aesthetics, and land use compatibility impacts.

MULTI-FAMILY DESIGN STANDARDS

3.11.1 FENCING/WALLS

Fencing shall be consistent with the overall architectural style or motif of the development and not obstruct physical or visual access.

- Sound walls, masonry walls, and fences shall be designed with changes in plane, height, material, and material texture. Masonry walls shall change material, plane, or height every 50 feet. Fences shall have a masonry column every 40 feet. Tubular steel or iron architectural fencing may be continuous in height and material and are not required to provide masonry columns.

COMMERCIAL DESIGN GUIDELINES

4.2.5 PARKING LOTS AND DRIVEWAYS

Parking areas should incorporate best practices that include: trees, lighting, landscaped storm water features, cool and pervious pavement and pavers. Plant trees and shrubs to soften the overall impact of parking areas and to provide shade and noise reduction, heat island cooling and improved air quality.

4.2.6 DRIVE-THROUGH BUSINESSES AND AUTOMOBILE SERVICE STATIONS

SITE AND DISTRICT DESIGN

Locate noise-generating uses, including drive through speakers and music, repair shop operations and machinery, car wash openings, vacuum stations, loading and refuse areas and stacking lanes away from sensitive uses (e.g., housing, schools, and day care centers). Where this cannot be avoided, buffer noise impacts with landscaping or landscaped berms and attenuating fencing in accordance with the landscape and screening requirements of the County Zoning Code.

LANDSCAPING

Landscaping and other screening should be installed to control the effects of facility operations, such as light, noise, and vehicular movement adjacent to an existing residential or agricultural-residential use or zoning district and other sensitive uses. Refer to the County Zoning Code for landscape buffer and screening requirements adjacent to residential and agricultural-residential zoning districts.

4.2.8 Transition to Residential Areas

Renovated and new projects should be designed to enhance adjacent residential neighborhoods and promote active transportation from these neighborhoods, rather than automobiles for short trips. Projects should be designed to reduce the visual, noise, and use impacts on adjacent residential areas.

- Placing loading and service areas adjacent to residential areas is discouraged. Site circulation and placement of loading areas should be incorporated into the project so that it is screened and held back from residential areas. Where screening walls are required, they shall be designed as a natural extension of the architectural and landscaping concepts for the project. Evergreen trees should be used for screening and to help with noise reduction.

4.6 Operational Elements

- Business hours should generally be confined to between 6:00 a.m. and 11:00 p.m. and may be further reduced depending on proximity to nearby residential uses.
- Noise generating activities, such as loading and unloading, should be confined to normal business hours, and should be minimized during the early and late hours, especially when located near residential uses. Compliance with the County Noise Ordinance is required.

Office, Business Park, Institutional and Industrial Development Design Guidelines

5.2.1 Project Design Objectives

Office, business park, institutional, and industrial developments should be planned to accomplish both functional and business district or neighborhood design objectives.

- The interface of office, business park, institutional, and industrial developments with other types of uses, particularly residential, should be planned carefully. The transition in scale, use, visual privacy, noise, odors, operational hours and traffic flow should respect the needs and livability of adjacent neighborhoods.
- Industrial parks or projects should be clearly separated from residential areas with adequate buffers to them for noise, vehicular, and development scale impacts.
- Landscaping and screening should be used to control the effects of facility operations, such as light, noise, and parking.

Village Centers/Mixed-Use Design Guidelines

6.2.2 Connections to the Community

- Unnecessary tall concrete block sound walls should not separate commercial uses from residential uses. Where sounds walls exist or are necessary, provide breaks in the sound walls for access from adjacent neighborhoods and designed as “live-ends.”

- When designing sound walls, pedestrian and bicycle connections to adjacent neighborhood can include “live-end” features. Also in cul-de-sacs, “live-ends” provide for pedestrian access at the ends of adjoining streets, open spaces, parking lots while permitting the access point to be used as a common outdoor space. “Live-ends” should be landscaped and can include benches, providing nice areas for sitting and socializing.

6.2.4 Block Sizes, Lot Patterns and Building Orientation

- Special siting and building design strategies that protect residential livability near service areas should be incorporated into project design. Avoid trash enclosures, loading docks or other noise-generating areas in close proximity to residential uses. If proximity is unavoidable, establish operational requirements for noise and odors to residents.

6.2.5 Parking

- Parking areas should incorporate designs that include trees, lighting, landscaped storm water features, cool and pervious pavement, and pavers. Plant trees and shrubs to soften the overall impact of parking areas and to provide shade and noise reduction, heat island cooling and improved air quality.
- Parking for commercial or mixed-use buildings should be designed and located to mitigate noise and visual impact on adjoining residential neighborhoods.

6.3.6 Service Areas

- Provide sound-attenuation features around noise-generating areas such as trash enclosures and loading docks. Such features may include fully enclosed loading docks and higher dock walls.
- Locate noise-generating services so that vehicular service drives have a minimized noise impact on any adjacent residential uses.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities within the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

Cordova Community Plan

The Cordova Community Plan was adopted by the County Board of Supervisors in May 2003. The northern portion of the WJHMP area falls within the Cordova Community Plan. There are no policies included in the Cordova Community Plan that pertain to noise and vibration.

Vineyard Community Plan

The Vineyard Community Plan was developed in 1985 and was intended to provide guidance for future development in the planning area. However, because of land use changes since its adoption, many of the Vineyard Community Plan’s land use

assumptions are obsolete. The plan assumed that the Mather Air Force base would continue as a military facility and that its associated noise impacts would have a major influence on land uses within the Vineyard community. However, subsequent to the Vineyard Community Plan adoption, the military base closed and was converted to a civilian airfield and air cargo facility. Consequently, the potential for substantial noise impacts has been reduced. The following policies that pertain to noise and vibration are included in the Vineyard Community Plan (Sacramento County 1985).

- **Policy NER 6.** Require buffering and appropriate screening between commercial/industrial development and residential land use and between commercial/industrial development and agricultural uses.
- **Policy CI 4.** Commercial/industrial development must be adequately buffered from adjacent residential or agricultural uses with screening, open space or less dense development, or other means.
- **Policy FU 1.** Buffer, through incremental zoning, residential development from industrial and agricultural land use areas.

Significance Criteria and Methodology

Significance Criteria

Based on Appendix G of the State CEQA Guidelines, noise policies and standards in the County Municipal Code, the General Plan Noise Element, and FTA and Caltrans vibration and noise standards, an impact related to noise or vibration would be significant if implementation of the project would:

- Generate a substantial temporary increase in noise levels at noise-sensitive land uses that exceed the following standards:
  - Construction noise would result in a significant impact if activities were to take place between the hours of 8:00 p.m. and 6:00 a.m. on weekdays and between the hours of 8:00 p.m. and 7:00 a.m. on Saturday and Sunday,
  - and exceed nighttime exterior noise standards (i.e., 50 dB L_{eq}) described in the County Code Section 6.68.07.
- Generate short-term construction vibration or expose sensitive land uses to long-term operational vibration sources that exceed the following Caltrans and FTA guidance for vibration impacts related to structural damage and human response, respectively:
  - Structural damage for normal dwelling houses 0.20 PPV in/sec (Table 16-9)
  - Human Response (Table 16-8)
    - For frequent events (i.e., more than 70 events per day): 65 VdB
    - For occasional events (i.e., 30-70 events per day): 75 VdB, or

    - For infrequent events (i.e., fewer than 30 events per day): 80 VdB.
- Generate a substantial permanent increase in traffic noise levels at noise-sensitive land uses that exceed the following standards established by the County General Plan:
    - Exceed the noise standard of 65 dB L_{dn} for residential uses per General Plan Policy NO-1 (Table 16-12) as a result of buildout of the project; or
    - Where Table 16-12 standards are currently exceeded for applicable land uses, result in a substantial increase in noise per General Plan Policy NO-9 (Table 16-14) as follows:
        - +5 dB increase where baseline levels are below 60 dB L_{dn}
        - +3 dB increase where baseline levels are between 60 and 65 dB L_{dn}
        - +1.5 dB increase where baseline levels exceed 65 dB L_{dn}
- Generate a substantial permanent increase in stationary noise at noise sensitive land uses that exceed the following standards established by the County General Plan:
    - General Plan Policy NO-6, Sacramento County Non-Transportation Noise Standards (Table 16-13)
    - County Code Section 6.68.120 Machinery, Equipment, Fans, and Air Conditioning
        - 60 dB at any point at least one foot inside the property line of the affected residential property and three to five feet about ground level;
        - 55 dB in the center of a neighboring patio three to five feet above ground level;
        - 55 dB outside of the neighboring living area window nearest the equipment location. Measurements shall be taken with the microphone not more than 3 feet from the window opening but at least 3 feet from any other surface.

Issues Not Discussed Further

Operational Vibration

Implementation of the WJHMP would not result in any new or additional major sources of ground vibration, such as commercial railways, passenger rail transit lines, or major transit stations. Long-term operational activities associated with implementation of the WJHMP are not anticipated to result in permanent or substantial levels of ground vibration and are not discussed further.

METHODOLOGY

CONSTRUCTION NOISE

To assess potential short-term (construction-related) noise impacts, sensitive receptors and their relative exposure were identified. Project-generated construction source noise levels were determined based on methodologies, reference emission levels, and usage factors from FTA's *Guide on Transit Noise and Vibration Impact* Assessment methodology (FTA 2018) and FHWA's *Roadway Construction Noise Model User Guide* (FHWA 2006). Reference levels for noise emissions for specific equipment or activity types are well documented and the usage thereof common practice in the field of acoustics.

Predicted noise levels at nearby noise-sensitive land uses were modeled using typical reference noise levels and load factors associated with construction equipment, derived from the FHWA's Roadway Construction Noise Model (FHWA 2006). As detailed in Chapter 2, "Project Description," for the purpose of this analysis, construction is assumed to begin in 2025 and end in 2055, with construction activities allocated evenly through the 30-year duration of the construction period. Each year would be roughly assumed to entail 1 month of site preparation, 4 months of grading, 5 months of building construction, 1 month of paving, and 1 month of architectural coating application.

To remain conservative, construction noise was modeled for construction phases that typically use the loudest equipment (e.g., site preparation). The site preparation phase typically generates the most substantial noise levels because on-site equipment associated with grading, compacting, and excavation are the noisiest. Site preparation equipment and activities include backhoes, bulldozers, loaders, and excavation equipment (e.g., graders and scrapers). Building construction similarly uses louder pieces of equipment. For example, building of large structural elements and mechanical systems could require the use of a crane for placement and assembly tasks, which may also generate louder noise levels. Although a detailed construction equipment list is not currently available, based on the types of construction activities associated with the WJHMP (e.g., site grading, building construction) it is expected that the primary sources of noise would include backhoes, dozers, and graders. Noise levels for common construction equipment and activities at 50 feet are shown in Table 16-17. The construction noise modeling assumes that, because development associated with the WJHMP would occur over many decades, noise sensitive land uses built during initial development phases could be occupied during subsequent phases of construction. Therefore, modeling assumes that construction could occur within 50 feet from noise-sensitive land uses.

Seven construction noise modeling scenarios were run to capture each phase of construction. Modeling assumed that construction equipment would be operating simultaneously. The first scenario represents the site preparation phase and assumes that up to four pieces of equipment (compactor, dozer, backhoe, roller) could be operating simultaneously at any one location in the plan area. The second noise modeling scenario represents grading and assumes that four pieces of construction

equipment (dozer, two graders, loader) could be operating at the same time at any one location. The third noise modeling scenario represents building construction and assumes that five pieces of construction equipment (impact pile driver, grader, crane, loader, and truck) would be operating simultaneously at any one location. However, because not all projects under the WJHMP would include pile driving, the fourth modeling scenario represents building construction without pile driving. The fifth noise modeling scenario represents nighttime construction activity and assumes that three pieces of construction equipment for concrete pouring (two concrete mixer trucks, one concrete pump truck) would be operating simultaneously at any one location. The sixth modeling scenario represents paving and assumes that five pieces of equipment for paving (drum mixer, paver, roller, tractor, loader) would be operating simultaneously at any one location within the WJHMP area. The seventh modeling scenario represents architectural coating and assumes that two air compressors would be operating simultaneously at any one location.

Construction Vibration

To assess potential short-term construction-related vibration impacts, project-generated construction vibration levels were determined based on methodologies, reference emission levels, and usage factors from FTA's *Guide on Transit Noise and Vibration Impact Assessment* methodology (FTA 2018). Reference levels for vibration emissions for specific equipment types are well documented and commonly used in the field of acoustics. Sacramento County has no adopted vibration standards. As a result, Caltrans-recommended criteria are used in this analysis (Caltrans 2020).

Operational Noise

Non-Transportation Noise

With respect to non-transportation noise sources (e.g., stationary noise sources) associated with implementation of the WJHMP, the assessment of long-term (operational-related) impacts was based on measured noise levels, reference noise emission levels for activities and equipment typically associated with residential, industrial, and commercial operation (e.g., heating, ventilation, and air conditioning [HVAC] units), and standard attenuation rates and modeling techniques.

Transportation Noise

Assessment of potential long-term (operational) noise impacts resulting from increases in traffic volumes on the surrounding roadway network due to development under the WJHMP was conducted using calculations consistent with the FHWA Traffic Noise Model and project-specific traffic data. To assess noise impacts, traffic noise levels under existing and existing plus project conditions for affected roadway segments were modeled. The analysis is based on the reference noise factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and ground attenuation factors. The modeling conducted does not account for the acoustic dampening effects of any natural or human-made shielding (e.g., vegetation, the presence of walls or buildings) or reflection

off building surfaces; and thus, modeled noise levels may be overestimated where such shielding exists.

West Jackson Highway Master Plan Policies

The proposed WJHMP does not include policies related to noise or vibration.

Impacts and Analysis

Impact NO-1: Exceed County Standards during Construction

Implementation of the WJHMP would involve the construction of various land use developments, including residential, commercial, and industrial projects. Implementation of the WJHMP would also result in the development of new roadways and infrastructure, which would occur simultaneously with the development of the land uses. Construction is assumed to begin in 2025 and end in 2055, with construction activities allocated evenly throughout the 30-year duration of the construction period in response to market demand.

Development projects under the WJHMP would generate temporary noise level increases on, and adjacent to, individual construction sites. However, specific details regarding the timing, duration, and magnitude of construction activities for individual development are currently unknown. In some cases, construction activities would occur near existing residences and other noise-sensitive receptors and extend over the course of several weeks to months, or even longer depending on the individual development type and other project- and location-specific circumstances.

Construction noise can be characterized based on the type of construction activity and associated equipment needed. In this analysis, it is evaluated by considering the noise levels associated with site preparation and grading; vertical construction (e.g., residential, commercial, or other structures) with and without pile driving; nighttime construction; paving; and architectural coating as these are the construction activities anticipated to result from the buildout of the WJHMP. Reference noise levels for typical construction equipment required for these activities are shown below in Table 16-17.

The operation of each piece of off-road equipment within the WJHMP area would not be constant throughout the day, as equipment would be turned off when not in use. Noise levels associated with construction activity are of increased concern during nighttime hours (i.e., 8:00 p.m. to 6:00 a.m.) when community activities typically decrease. Construction noise levels occurring during noise sensitive hours are more pronounced and could cause increased annoyance, as well as potential sleep loss for noise-sensitive land uses (e.g., residential) near the construction activity.

Table 16-17 Reference Noise Levels from Typical Construction Equipment

Equipment	Typical Noise Level 50 Feet from the Source, dB
Air Compressor	80
Backhoe	80
Compactor	82
Concrete Mixer	85
Concrete Pump	82
Crane, Mobile	83
Dozer	85
Generator	82
Grader	85
Loader	80
Paver	85
Pile-driver (Impact)	101
Pile-driver (Sonic)	95
Pneumatic Tool	85
Pump	77
Roller	85
Truck	84

Source: FTA 2018: Table 7-1.

Because there are no detailed construction plans for individual development that would occur within the WJHMP, it is not possible to determine the exact noise levels that would result from project construction. Seven construction noise scenarios were conducted for this analysis using equipment typical of each phase of construction. Based on reference noise levels for typical construction equipment, site preparation could result in noise levels of approximately 81.7 dB L_{eq} and 87.2 dB L_{max} at 50 feet from the source. Site grading could result in noise levels of approximately 85.4 dB L_{eq} and 89.4 dB L_{max} at 50 feet from the source. Building construction activities with and without pile driving could result in noise levels of approximately 94.3 dB L_{eq} and 101 dB L_{max} and 82.8 dB L_{eq} and 87.4 dB L_{max} at 50 feet from the source, respectively. Paving could result in noise levels of approximately 83.6 dB L_{eq} and 89.0 dB L_{max} and architectural coating could result in noise levels of approximately 77.0 dB L_{eq} and 81.0 dB L_{max}. See Appendix J for modeling inputs and results. The County has established standards for acceptable exterior noise levels (i.e., 55 dB L_{eq}) in Section 6.68.070 of the County Code. Section 8.68.090 of the County Code states that noise sources associated with construction between the hours of 6:00 a.m. and 8:00 p.m. Monday through Friday and between the hours of 7:00 a.m. and 8:00 p.m. on Saturday and Sunday, are exempt from County noise standards.

The loudest “worst case” construction activity (i.e., building construction with the use of a pile driver) would result in noise levels of 94.3 dB L_{eq} and 101 dB L_{max} at 50 feet. This activity would result in a 50+ dB increase in ambient noise levels compared to an existing ambient noise level of 39 dB, the lowest existing noise level in the plan area (see Table 16-4). A 5-dB increase is generally perceived as a distinctly noticeable increase, and a 10-dB increase is generally perceived as a doubling of loudness (Caltrans 2013: 2-10). The increase in noise levels would be perceived as more than a doubling of existing noise levels and would result in a substantial increase in temporary noise at offsite sensitive receptors. However, this noise modeling represents the worst-case scenario for building construction noise due to the inclusion of the impact pile driver equipment. Generally, an impact pile driver would not be used during typical construction activities. Additionally, an exterior-to-interior noise reduction from standard buildings would be expected to achieve at least a 15 dB reduction (Caltrans 2013) and, thus, interior noise levels at nearby structures would be substantially lower than exterior noise levels. Furthermore, a substantial increase in noise itself does not necessarily constitute a significant noise impact, as long as overall noise exposure is below an acceptable level (FTA 2018). Given the size of the WJHMP area, there could be temporary, substantial increases in noise levels but construction activities would not affect any one area for extended periods of time and individual receptors’ exposure to increased noise would be limited. As detailed above, most construction would occur during daytime hours when construction noise is exempt from County noise standards pursuant to County Code Section 6.68.090 and when people are less likely to be disturbed or awakened.

Although construction activities are anticipated to occur primarily during the daytime hours when sensitive receptors are less sensitive to increased noise levels, nighttime construction could be required for some construction if there are tasks that must be done continuously until completed (e.g., concrete pouring) or that require road closures. Section 6.68.09(e) of the County Code currently allows nighttime construction under specific circumstances. Construction activities would only be permitted during nighttime hours in the event of an unforeseen or unavoidable condition and when the nature of the project necessitates that work in process be continued until the phase is completed, such as pouring of concrete for some foundation designs. In the absence of County noise standards specific for nighttime construction, nighttime construction noise scenarios are compared to the County nighttime exterior noise standard included in Section 6.68.07 of the County Code. These noise levels have been adjusted according to the cumulative duration of the intrusive sound. For example, if the cumulative period is 5 to 15 minutes per hour, then the standard is adjusted by 10 dB to 60 dB during nighttime hours. If the cumulative period is 30 minutes per hour, no adjustments are made and the standard remains at 50 dB during the nighttime, functionally similar to the average hourly noise level of L_{eq}. Therefore, this analysis evaluates whether potential nighttime construction activity could exceed a nighttime exterior noise standard of 50 dB L_{eq} between the hours of 10:00 p.m. and 7:00 a.m. The most likely noise intensive nighttime construction activity that could occur under the WJHMP would be a nighttime concrete pour. If a nighttime concrete pour were required, it could generate noise levels of up to 79.5 dB L_{eq} at 50 feet from the source and exceed applicable noise standards of 50 dB L_{eq} within 1,489 feet of the source (See Appendix J for detailed modeling inputs).

Due to the programmatic nature of this analysis, it cannot be determined if nighttime construction noise would be needed at sites within 1,489 feet of noise sensitive land uses. Because these details are unknown, it is not possible to conclude that future development associated with implementation of the WJHMP would avoid generation of substantial temporary construction noise levels that exceed County standards during nonexempt hours. Therefore, this impact would be potentially significant.

Implementation of Mitigation Measure NO-1 would reduce nighttime construction noise at nearby noise-sensitive receptors by ensuring proper equipment use; locating noise-generating equipment away from sensitive land uses; and requiring the use of enclosures, shields, and noise curtains (noise curtains can reduce noise by up to 10 dB [EPA 1971]). However, because it cannot be assured that nighttime construction would not be needed and that, if needed, the applicable noise standards could be met, this impact would remain **significant and unavoidable**.

MITIGATION MEASURES

MITIGATION MEASURE NO-1: NIGHTTIME CONSTRUCTION NOISE CONTROL PLAN

This mitigation measure shall apply to sites where construction would take place outside of the timeframes exempt from County Code noise standards as defined in Section 8.68.090 of the County Code (i.e., between 8:00 p.m. and 6:00 a.m. Monday through Friday and between the hours of 8:00 p.m. and 7:00 a.m. Saturday and Sunday), and within 1,500 feet of a sensitive receptor. Prior to commencement of any nighttime construction activity, the future project applicants, in coordination with selected construction contractors, and a qualified acoustical professional, shall prepare a nighttime construction noise control plan based on finalized project-specific information (e.g., specific equipment, construction location). This plan shall be submitted to the County for review prior to project construction. The plan shall include:

- a detailed description of the proposed nighttime construction activities.
- a list of equipment used during all nighttime construction activities.
- projected noise levels generated during the nighttime construction activities at surrounding noise-sensitive land uses.
- location(s) of sensitive receptors in relation to the proposed nighttime construction activities, and
- designation of a disturbance coordinator.

The following noise control measures (or other equally effective measures approved by the County) shall be included in the plan as necessary to reduce noise levels to the appropriate threshold (i.e., 50 dB L_{eq}), to the extent feasible, at the nearest sensitive receptor.

- For construction activity that would occur within a clear line-of-sight of offsite sensitive receptors, temporary noise curtains shall be installed as close as possible to the noise-generating activity such that the curtains obstruct the direct

line of sight between the noise-generating construction activity and the nearby sensitive receptors. Temporary noise curtains shall consist of durable, flexible composite material featuring a noise barrier layer bound to sound-absorptive material on one side. The noise barrier layer shall consist of rugged, impervious, material with a surface weight of at least one pound per square foot and be designed to result in a 10-dB reduction at the sensitive receptor location.

- Noise-reducing enclosures and techniques shall be used around stationary noise-generating equipment (e.g., concrete mixers, generators, compressors) to break the line of sight between the noise source and receiver. Techniques used could greatly vary depending on equipment type and project-specific information.
- Heavy-duty equipment shall be operated at the lowest operating power possible and shall be restricted in close proximity to sensitive receptors.
- All heavy construction equipment and all stationary noise sources shall have manufacturer-installed mufflers. Mufflers and noise suppressors shall be properly maintained and tuned to ensure proper fit, function, and minimization of noise.
- Where available and feasible, equipment with back-up alarms shall be equipped with either audible self-adjusting backup alarms or alarms that only sound when an object is detected. Self-adjusting backup alarms shall automatically adjust to 5 dB over the surrounding background levels. All non-self-adjusting backup alarms shall be set to the lowest setting required to be audible above the surrounding noise levels.
- Construction scheduling and phasing shall be designed so that impact equipment (e.g., pile drivers) is not used between 8:00 p.m. and 6:00 a.m. on Monday through Friday or between 8:00 p.m. and 7:00 a.m. on Saturday and Sunday.

IMPACT NO-2: GENERATE EXCESSIVE CONSTRUCTION VIBRATION

Construction activities generate varying degrees of temporary ground vibration, depending on the specific construction equipment used and activities involved. Construction-related vibration has the potential to damage structures, cause cosmetic damage (e.g., crack plaster), or disrupt the operation of vibration-sensitive equipment. Vibration can also be a source of annoyance to individuals who live or work close to vibration generating activities.

Typical construction activities, such as site preparation and grading, may generate substantial vibration near the source. When evaluating construction-related vibration impacts, the activities with the greatest potential to cause impacts (i.e., structural damage or disturbance to sensitive land uses) are the primary focus. Table 16-18 provides reference vibration levels associated with various pieces of construction equipment that generate the highest levels of vibration.

Table 16-18 Vibration Source Levels for Construction Equipment

Equipment	PPV at 25 feet, in/sec	Root Mean Square at 25 Feet (VdB)
Pile Driver (impact)	0.644 - 1.518	104-112
Pile Driver (sonic)	0.17 - 0.734	93 - 105
Clam shovel drop (slurry wall)	0.202	94
Hydromill (slurry wall)	0.008- 0.017	66-75
Vibratory Roller	0.210	94
Hoe Ram	0.089	87
Large Bulldozer	0.089	87
Caisson drilling	0.089	87
Loaded Trucks	0.076	86
Jackhammer	0.035	79
Small bulldozer	0.003	58

Notes: PPV = peak particle velocity.

Source: FTA 2018: Table 7-4.

As discussed under Impact NO-1, specific construction activities, proximity of equipment to structures and sensitive land uses, and specific duration of individual construction projects are not known at this time. Therefore, this analysis evaluates the potential for impacts to occur at a programmatic level based on typical construction equipment that could be used for building construction.

Based on reference levels included in Table 16-18, pile driving generates the highest vibration levels (i.e., 1.518 in/sec PPV at 25 feet). Pile driving could potentially be used during construction of new residential, commercial, or other land uses, as well as other infrastructure associated with development. Therefore, pile driving is of greatest concern when evaluating construction-related vibration impacts. Based on the reference vibration levels for typical construction equipment shown in Table 16-18, the piece of equipment that could generate the second greatest level of ground vibration would be a vibratory roller (i.e., 0.210 in/sec PPV at 25 feet). In addition to building construction, road improvement projects (e.g., constructing roadways) often require the use of vibratory rollers which, when operated close to existing structures, can result in increased levels of annoyance.

Vibration Annoyance

FTA vibration annoyance potential criteria depend on the frequency of vibration events. As shown in Table 16-8, when vibration events occur from the same source more than 70 times per day, as would likely be the case with pile driving, they are considered “frequent events.” Frequent events in excess of 72 VdB are considered to result in a significant vibration annoyance impact (FTA 2018). For construction activities involving pile driving, based on the recommended procedure for applying propagation adjustments to reference levels for a typical pile driver, vibration levels could exceed the threshold of significance for disturbance to a sensitive land use within 537 feet of construction activities. Because the use of a vibratory roller would likely not require

frequent use, this analysis applies the FTA criterion of 75 VdB threshold for occasional events. For construction activities that would include the use of a vibratory roller, vibration levels from construction could exceed the threshold of significance for disturbance to a sensitive land use within 108 feet of construction activities (see Appendix J for modeling details). It is unknown at this time where construction activities involving the use of a pile driver or vibratory roller would be required and to what extent they would occur. Therefore, it is possible that construction activities using an impact pile driver or vibratory roller could occur within 537 feet or 108 feet of a sensitive receptor.

Vibration Damage

According to the FTA, impact pile driving generates ground vibration levels of 1.518 in/sec at 25 feet. Based on FTA's recommended procedure for applying a propagation adjustment to these reference levels, vibration levels from impact pile driving could exceed the FTA threshold of significance of 0.2 in/sec PPV for structural damage to non-engineered timber and masonry buildings within 97 feet of pile-driving activities. It is unknown at this time where pile driving activities would be required and to what extent they would occur. Therefore, it is possible that construction activities using a pile driver could occur within 97 feet of an occupied structure.

Based on the reference vibration levels for typical construction equipment included in Table 16-18, the piece of equipment that could generate the second greatest level of ground vibration would be a vibratory roller. According to the FTA, vibratory rollers generate ground vibration levels of 0.210 in/sec PPV at 25 feet. Based on the recommended procedure for applying a propagation adjustment, vibration levels from the use of a vibratory roller could exceed the threshold of significance of 0.20 in/sec PPV for structural damage within 26 feet of vibratory roller activities (see Appendix J for modeling details). Because the location of vibratory roller activities is currently unknown, it is possible that construction activities using a vibratory roller could occur within 26 feet of a structure. Vibration levels from impact pile driving and vibratory rollers would exceed the threshold of significance of 0.2 in/sec for structural damage within 96 feet and 26 feet of construction vibratory equipment, respectively (see Appendix J for details).

Summary

Because the location of construction activities is currently unknown, the possibility remains for construction activities that generate vibration to occur within the distances identified above, resulting in potential disturbances to sensitive land uses and/or structural damage. Therefore, this impact would be potentially significant.

Implementation of Mitigation Measure NO-2 would serve to reduce potential vibration impacts from construction activities by requiring minimum setbacks to sensitive land uses, monitoring vibration levels during construction, requiring use of alternative equipment when appropriate, and establishing restrictions on hours of use to avoid impacts during more sensitive times of day. These measures would ensure that construction activities within the WJHMP area would reduce the potential exposure to

excessive groundborne vibration levels and ensure that construction vibration levels would not impact persons or buildings. Therefore, this impact would be **less than significant with mitigation**.

MITIGATION MEASURES

MITIGATION MEASURE NO-2: VIBRATION CONTROL PLAN

This mitigation measure would apply to construction activity involving pile driving located within 97 feet of any building, to reduce the potential for structural damage, and within 537 feet of an occupied residence or building, to minimize the disturbance from pile-driving activities; or vibratory roller activities located within 26 feet of any building in order to reduce the potential for structural damage, and within 96 feet of an occupied residence or building to minimize the disturbance from vibratory roller activities.

A vibration control plan shall be developed by the construction contractor(s) to be submitted to and approved by Sacramento County before issuance of any improvement plans or grading permits for the project. The plan shall consider all potential vibration-inducing activities that would occur within the distance parameters described above and include various measures, setback distances, precautions, monitoring programs, and alternative methods to traditional pile driving or other vibration intensive activities with the potential to result in structural damage or adverse impacts to sensitive receptors. The following vibration control measures (or other equally effective measures approved by the County) shall be included in the plan:

- To prevent structural damage minimum setback requirements for different types of ground vibration-producing activities (e.g., pile driving, vibratory roller) for the purpose of preventing damage to nearby structures shall be established based on the proposed pile-driving activities and locations, once determined. Factors to be considered include the specific nature of the vibration producing activity (e.g., type and duration of pile driving), local soil conditions, and the fragility/resiliency of the nearby structures as determined by a site-specific building survey, documentation related to building integrity, or other appropriate methods determined by a qualified engineer. Established setback requirements (e.g., 97 feet) can be breached if a project-specific, site-specific analysis is conducted by a qualified geotechnical engineer or ground vibration specialist that indicates that no structural damage would occur at nearby buildings or structures.
- To prevent disturbance for sensitive land uses, minimum setback requirements for different types of ground vibration producing activities (e.g., pile driving, vibratory roller) shall be established based on the proposed activities and locations, once determined. Established setback requirements (e.g., 537 feet) can be breached only if a project-specific, site-specific, technical adequate ground vibration study indicates that the buildings would not be exposed to ground vibration levels in excess of 72 VdB, and ground vibration measurements performed during the construction activity confirm that the buildings are not being exposed to levels in excess of 72 VdB.

- All vibration-inducing activity within the distance parameters described above shall be monitored and documented for ground vibration noise and vibration noise levels at the nearest sensitive land use and associated recorded data submitted to Sacramento County so as not to exceed the recommended vibration damage and annoyance standards, respectively.
- Alternatives to traditional pile driving (e.g., sonic pile driving, jetting, cast-in-place or auger cast piles, non-displacement piles, pile cushioning, torque or hydraulic piles) shall be considered and implemented where feasible to reduce vibration levels.
- Limit vibration-inducing vibratory and impact activities (e.g., pile driving, vibratory rollers, jackhammers) to the daytime hours between 6:00 a.m. and 8:00 p.m. Monday through Friday and between 8:00 a.m. and 8:00 p.m. on Saturday and Sunday.
- Operate all vibration inducing impact equipment as far away from vibration-sensitive sites as reasonably possible.
- Phase pile-driving and high-impact activities so as not to occur simultaneously with other construction activities, to the extent feasible. The total vibration level produced could be significantly less when each vibration source is operated at separate times.

IMPACT NO-3: GENERATE A SUBSTANTIAL PERMANENT INCREASE IN TRAFFIC NOISE LEVELS

Implementation of the WJHMP would result in the generation of new vehicle trips from the development of new land uses (e.g., residential, commercial, office land uses) in the WJHMP area. Land use development that results in traffic changes can result in long-term traffic noise increases (or decreases) on roadways in and surrounding the WJHMP area and, thus, could result in exposure of existing receptors to substantial permanent noise increases. Traffic noise modeling was conducted for existing and existing plus project conditions using ADT volumes for affected roadway segments. Table 16-19 compares modeled noise levels along roadways in the WJHMP area under existing conditions to those with the project. To provide a point of comparison for existing and future noise conditions, noise levels were calculated at a distance of 100 feet from the roadway centerline. Noise levels at receptors farther away from roadway noise sources, or in locations with intervening topography, vegetation, or structures, would be lower than shown in Table 16-19. See Appendix I for more detailed information regarding traffic noise calculations.

In accordance with General Plan Policy NO-1, an increase in traffic noise would result in significant impacts if traffic noise levels would exceed the maximum allowable exterior noise level of 65 dB L_{dn} for residential land uses. A substantial increase in traffic noise levels would occur if noise levels exceeded those outlined in General Plan Policy NO-9 (i.e., would result in a 5+ dB increase where existing noise levels are less than 60 dB L_{dn}; a 3+ dB increase where existing noise levels are between 60 and 65 dB L_{dn}; or an

increase of 1.5+ dB or greater at locations where existing exterior noise levels exceed 65 dB L_{dn}).

Notes: Bold = Noise level exceeding the County threshold for transportation noise levels at residential receptors (Table 16-12), or exceeding the significant increase thresholds (Table 16-14).

Source: Bollard 2023 Acoustical Consultants: Table 13.

As shown in Table 16-19, implementation of the WJHMP would result in an increase in traffic noise ranging from 0.1 to 13.1 dB L_{dn} along a majority of studied roadway segments; a decrease in noise along 29 studied roadway segments; and no change to noise levels along 11 roadway segments. Fifty-one of the modeled roadway segments would result in a substantial increase in noise as defined by General Plan Policy NO-9 with implementation of the WJHMP. The roadway segments that would experience a substantial increase in traffic noise were further analyzed to identify the presence of noise-sensitive receptors (e.g., residences) and any existing sound barriers. There are existing sensitive receptors present within 100 feet of roadway segments within the WJHMP area (Bollard Acoustical Consultants 2023: 71). Thus, traffic noise increases associated with development under the WJHMP would result in substantial increases in traffic noise that would be perceptible to existing sensitive receptors.

Additionally, with implementation of the WJHMP, new sensitive receptors (e.g., residences, schools) would be located throughout the plan area. As detailed under General Plan Policy NO-1, traffic noise levels that exceed 65 dB L_{dn} at all new land uses, except for “theaters and auditoriums, commercial buildings, and playgrounds, parks, etc.”; and traffic noise levels that exceed 70 dB L_{dn} at “playgrounds, parks, etc.” would result in a significant impact. As described above, portions of the WJHMP area that are former aggregate mining sites are substantially depressed relative to the local roadway network. As a result, noise-sensitive land uses developed within substantially depressed portions of the WJHMP area would experience a substantial decrease in traffic noise exposure; specifically, noise levels approximately 10 dB to 15 dB lower than those shown in Table 16-19.

Development under the WJHMP would comply with applicable General Plan policies that pertain to noise. As required by General Plan Policy NO-9, a noise analysis would be prepared for the construction of new roadways or capacity enhancing roadway projects, and feasible methods of reducing noise to levels consistent with the standards contained in Table 16-12 would be implemented. Additionally, General Plan Policy NO-1 requires that, where noise standards for new uses affected by traffic noise are predicted to be exceeded, appropriate noise mitigation be included in the individual project design to reduce projected noise levels to a state of compliance with applicable standards (i.e., exterior noise level of 65 dB L_{dn} and interior noise level of 45 dB L_{dn} for residential uses). Project design would emphasize the use of setbacks and site design to shield noise-sensitive uses to the extent feasible prior to the consideration of noise barriers in accordance with General Plan Policy NO-13. Compliance with these policies would ensure that future development with the potential to exceed acceptable noise compatibility standards would be thoroughly evaluated and that appropriate sound attenuation techniques would be implemented. Although compliance with these General Plan policies would reduce the potential for noise levels to exceed County standards, future project-specific components and the details of all development under the WJHMP, including the feasibility and effectiveness of noise attenuation measures (e.g., setbacks, building insulation, sound barriers), are currently unknown. Therefore, it is not possible to conclude that existing and new development related to the buildout of the WJHMP would meet noise standards in relation to traffic noise and, thus, this impact would be potentially significant.

Mitigation Measure NO-3a requires the use of alternative pavement materials which would reduce vehicular noise generation, Mitigation Measure NO-3b requires roadway design features to be considered and implemented along roadways that would experience a substantial increase in noise with implementation of the WJHMP; and Mitigation Measure NO-3c requires new development to attenuate interior noise levels to appropriate levels. However, although the implementation of these mitigation measures would reduce traffic noise impacts on sensitive receptors to the extent feasible, it is not possible to guarantee that long-term traffic noise associated with development under the WJHMP would be reduced to below the applicable thresholds. Therefore, this impact would be **significant and unavoidable**.

MITIGATION MEASURES

MITIGATION MEASURE NO-3A: RUBBERIZED ASPHALT

The County shall require the use of rubberized asphalt rubberized hot-mix asphalt (RHMA) or another equally effective type of noise-reducing pavement along (a) future roadway construction within the WJHMP and (b) at the time of the next repaving of the roadway segment. The RHMA overlay shall be designed with appropriate thickness and rubber component quantity (typically 15 percent by weight of the total blend), such that traffic noise levels are reduced by an average of 4 to 6 dB (noise levels vary depending on travel speeds, meteorological conditions, and pavement quality) as compared to noise levels generated by vehicle traffic traveling on standard asphalt.

MITIGATION MEASURE NO-3B: S NEW, EXPANDED, OR EXTENDED ROADWAY NOISE REDUCTION

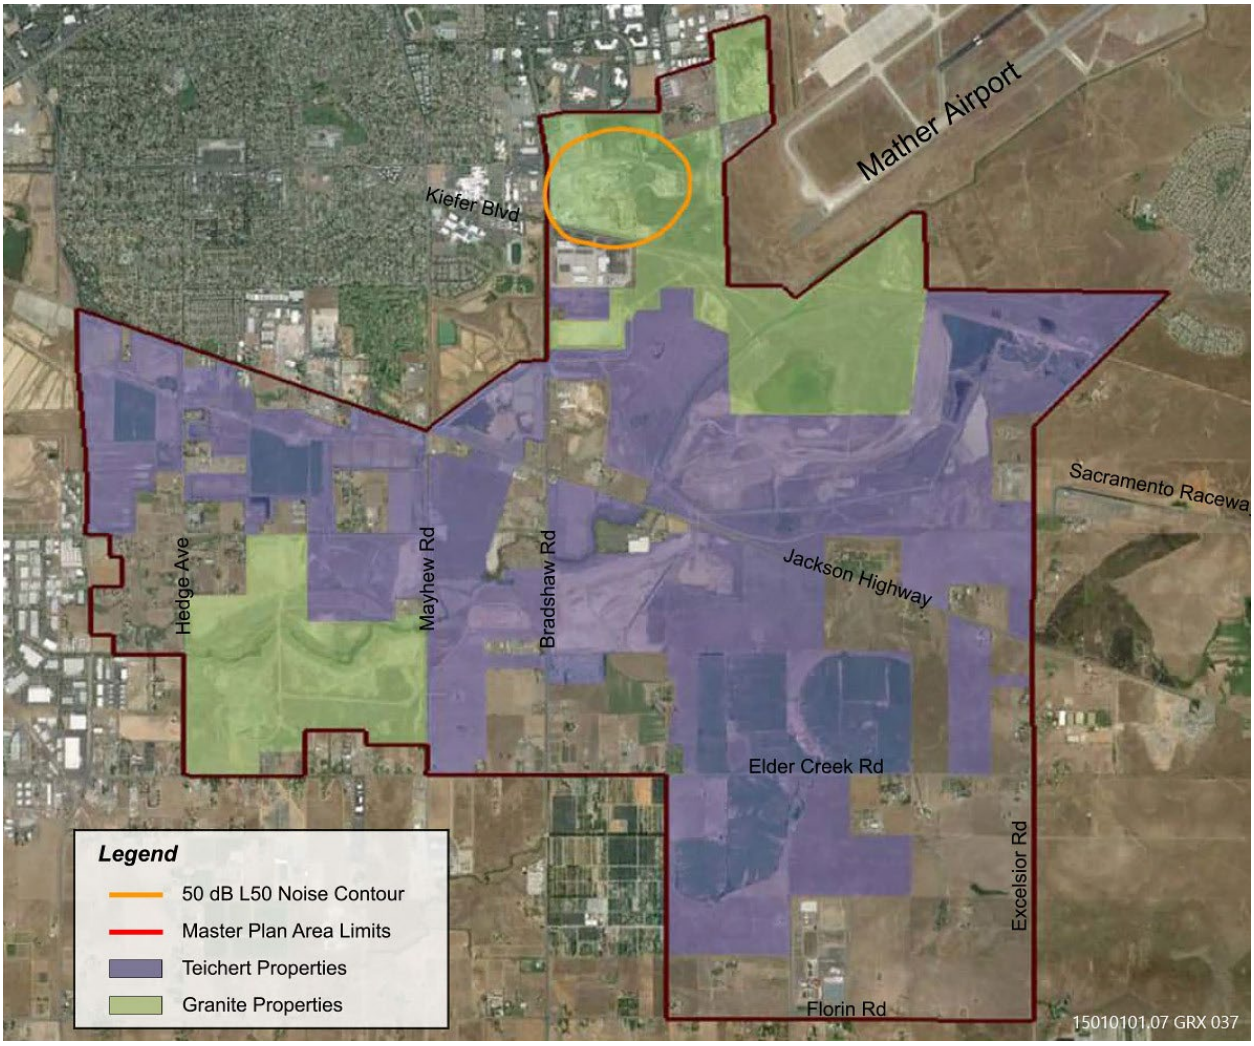
Before finalizing roadway design for roadway expansion or new roadway construction associated with the WJHMP, a design-level acoustical analysis shall be prepared to identify specific roadway design considerations, which shall be incorporated into final road design and approved by Sacramento County for roadways identified in Table 16-19 that result in a substantial increase in noise. The following design features shall be considered:

- Roadway design shall provide sufficient setback between any occupied structures or planned future structures that are defined as sensitive land uses by Sacramento County and the roadway to minimize noise exposure and meet County noise standards.
- In locations where setback is not feasible to reduce noise levels at existing sensitive receptors from new or expanded roadways, the County shall coordinate with property owners of the existing sensitive receptors regarding installation of sound barriers along property lines to minimize traffic noise to meet applicable County exterior noise standards and, if necessary, interior noise standards.

MITIGATION MEASURE NO-3C: ACOUSTICAL ASSESSMENTS FOR ALL NEW LAND DEVELOPMENTS

The County shall require a design-level acoustical assessment to be prepared and submitted alongside the project application for all new land use development projects associated with the WJHMP that would be located within the noise contours defined

under General Plan Policy NO-1 and identified in Table 16-12 of this EIR. Specifically, for all new land use developments, except for "playgrounds, parks, etc.," located within the 65 dB L_{dn} traffic noise contour; and for "playgrounds, parks, etc.," located within the 70 dB L_{dn} traffic noise contour the County shall require an acoustical assessment to be prepared. The acoustical assessment shall evaluate the compatibility of the proposed development in comparison to applicable County noise standards and provide recommendations to achieve acceptable interior noise levels appropriate to the land use. Noise control measures may include building façade improvements; mechanical ventilation for all schools and residences; increased vegetation; roadway pavement improvements and maintenance; and site design features. If such measures are not sufficient to reduce noise levels and there are no other feasible alternatives that could be implemented, a sound barrier may be constructed.



IMPACT NO-4: EXPOSE NEW OR EXISTING SENSITIVE RECEPTORS TO NEW STATIONARY NOISE SOURCES

This impact assesses the long-term exposure of existing and new sensitive receptors to increased long-term (operational) noise levels from proposed development of the WJHMP, which would result in industrial, residential, commercial, and office land uses. Noise sources associated with these land uses include mechanical equipment such as HVAC equipment; loading dock operations; residential maintenance; outdoor activities (e.g., residential landscaping); and vehicular and human activity in parking lots. Other stationary noise sources of concern typically include generators, pumps, air compressors, back-up alarms, and similar machinery that can be associated with office/business, residential, commercial, and industrial uses. Industrial land use would be limited to the northern portion of the WJHMP area to prevent disruption to other land uses. Vehicular and human activity in parking lots, outdoor activities, and voices would be intermittent in nature and would vary considerably depending on the specific characteristics of the site. These activities also tend not to be of a level of frequency that would disturb existing sensitive receptors (e.g., residences, schools, or libraries) and would mostly occur during the daytime, when receptors are least sensitive. Activities associated with industrial and commercial land uses (e.g., loading dock activity) and the use of mechanical equipment could result in sustained levels of permanent noise that affect sensitive receptors. Therefore, this analysis focuses on noise from mechanical equipment; loading dock activity; and industrial facility operations.

EXISTING INDUSTRIAL MINING FACILITIES

Mining operations in the plan area generate noise associated with mining, transport of materials via conveyor, and processing of aggregate materials. Granite operates an aggregate processing facility at the northeast corner of Kiefer Boulevard and Bradshaw Road (i.e., the proposed location for industrial uses under the WJHMP). Noise measurements were conducted to determine the distance from the Granite operations to the 55 dB and 50 dB L_{50} noise contours, because within these distances the County daytime and nighttime noise standards would be exceeded, respectively (per General Plan Policy NO-5). Until the Granite facility ceases operations, the noise generated from this facility is expected to remain at the identified levels. The facility's 50 dB L_{50} noise

contour extends into areas planned for future commercial and high-density residential land uses as shown in Figure 16-5. (Bollard Acoustical Consultants 2023: Figure 11B). Thus, if the Granite aggregate facility were to remain in operation after construction of the residential development proposed under the WJHMP, the County residential nighttime noise standard (i.e., 50 dB L_{50}) would be exceeded.

Source: Image produced and provided by Bollard Acoustical Consultants.

Figure 16-5 Granite Industrial 50 dB Noise Contour

Additionally, ongoing aggregate excavation and conveyance of materials to the processing plants could continue alongside residential development within the WJHMP area. Noise measurements from conveyor belt operations indicate that the 55 dB L_{50} noise contour is located approximately 350 feet from the operating conveyor and the 50 dB L_{50} noise contour is located approximately 700 feet from the conveyor (Bollard Acoustical Consultants 2023: 55). The location of conveyors changes depending on the location of excavation and reclamation activities. If sensitive receptors were constructed within 700 feet of conveyor operations, applicable County noise levels would be exceeded. Per WJHMP Goal 5, buffers and/or transitional land uses would be

developed between residential and industrial land uses to avoid future land use conflicts. Specifically, with implementation of the WJHMP, the industrial site would be surrounded by employment and commercial land uses. Noise associated with these land uses would be lower or similar to that of existing hourly noise levels (e.g., 70 dB L_{eq}) at existing industrial land uses (see Table 16-6). The doubling of sound energy would result in a 3 dB increase in sound. However, a 3 dB increase in sound is generally perceived as barely detectable, and thus would not be considered a substantial increase in noise. Additionally, in compliance with General Plan Policy NO-5, appropriate noise mitigation measures would be included in individual project design to reduce projected noise levels to a state of compliance with established standards for residential uses. However, because it is not possible to guarantee that conveyors would be located far enough from sensitive receptors to avoid substantial noise exposure, noise levels from industrial uses could exceed County daytime and nighttime noise standards.

Loading Dock and Delivery Activity

The WJHMP proposes a variety of commercial and employment land uses throughout the plan area including national chain stores, office complexes, and light industrial uses (e.g., manufacturing, research, warehousing). Commercial and light industrial land uses could include loading dock areas that generate noise levels that exceed County non-transportation noise standards. Noise sources associated with general activity in a loading dock area are usually short term and can include activities such as onsite truck circulation, truck idling, movement of material goods, and the operation of forklifts. Based on a noise measurement conducted by Ascent on April 20, 2023, at the loading and unloading dock at an Anheuser Bush facility, noise from delivery truck activity can be as loud as 59 dBA L_{eq} at 100 feet (Ascent 2023). Based on this information, loading dock activities within 160 feet of a sensitive receptor would exceed the County exterior residential daytime noise standard of 55 dB L_{eq}. Loading dock activities within 325 feet of a sensitive receptor would exceed the County exterior residential nighttime noise standard of 50 dB L_{eq}. Per Section 4.5.6 of the WJHMP, Countywide Design Guidelines would be implemented through subsequent tentative maps and zoning. Section 5.2.1 of the County Design Guidelines specifies that industrial parks or projects should be clearly separated from residential areas and incorporate adequate buffers for noise impacts, and landscaping and screening should be used to control the effects of facility operations. Additionally, General Plan Policy NO-7 states that if a noise-generating use (i.e., commercial land use) is proposed adjacent to lands zoned for noise sensitive uses (e.g., residential), then the noise-generating use shall be responsible for mitigating its noise generation to a state of compliance with County standards included in Table 16-13 of this EIR. Further, per Section 4.4.2 of the WJHMP, commercial and employment land uses proposed under the WJHMP that would allow for idling trucks (e.g., national chain stores, repair facilities, storage yards, or truck terminals) would not be used to buffer residential uses unless adequate screening, setbacks, and landscaping are established. However, because it is not possible to guarantee that commercial and employment land uses would be located far enough from sensitive receptors to avoid substantial noise exposure, noise levels from loading docks and delivery activity could exceed County daytime and nighttime noise standards.

Mitigation Measure NO-4b would require that future project applicants reduce noise to established standards through measures known to limit noise exposure to sensitive receptors. Therefore, noise associated with loading dock and delivery activity would not result in substantial noise increases at sensitive receptors during the sensitive times of day.. Through adherence to these policies and Mitigation Measure NO-4b, loading dock and delivery activity would not exceed County noise standards.

Mechanical Equipment

Mechanical noise equipment (e.g., HVAC systems) would be the primary noise source associated with residential developments and commercial uses. HVAC equipment is a common noise source associated with land use development and currently exists in the WJHMP area; thus, the additional equipment associated with proposed facilities would not represent a new noise source in the area. Section 6.68.120 of the Sacramento County Code includes specific regulations regarding noise levels generated by mechanical equipment. Specifically, the regulation states that any new development that includes any mechanical equipment, pump, fan, air conditioning apparatus, stationary pumps, stationary cooling towers, stationary compressors, similar mechanical devices, or any combination thereof, shall not allow noise levels from this equipment to exceed 60 dB at 1 foot inside the property line of the affected residential property or exceed 55 dB outside the neighboring living area window nearest the equipment location. Noise levels from HVAC equipment vary depending on the unit efficiency, size, and location, but generally range from 45 to 70 dB L_{eq} at a distance of 3 feet (Carrier 2022). For a more conservative analysis, HVAC units were assumed to operate at a noise level of 70 dB L_{eq} at 3 feet. At this noise level, HVAC units would exceed the County's noise standard for mechanical equipment of 60 dB and 55 dB within 10 feet and 17 feet, respectively, of HVAC equipment. Because it is not known at this time where individual developments associated with the project would be specifically located, details regarding the location of HVAC units are not known. However, subsequent development associated with the WJHMP would be required to comply with applicable County guidelines, standards, and specifications related to operational noise. Specifically, pursuant to General Plan Policy NO-6 projects proposed within the plan area that would include non-transportation noise sources would be required to identify mitigation and demonstrate that the project would not result in exceedance of the interior and exterior noise level standards presented as Table 16-13 in this EIR at existing noise-sensitive areas in the project vicinity. Adherence to this policy would ensure that noise generated by future land uses, including employment, commercial and industrial developments and associated mechanical equipment would not exceed County noise standards or result in substantial noise increases during sensitive times of day.

Summary

As detailed above, implementation of the WJHMP would result in the development of various land uses, which would include new noise generating stationary equipment, as well as land uses with new noise-generating activity areas (e.g., loading docks). Although the land use plan provides the location of each of the new land uses, the specific location of new stationary equipment and noise-generating activity areas within these land uses is unknown. As a result, development that would include stationary

equipment or noise generating activity areas (e.g., industrial conveyors) could fall within distances that would result in noise levels that exceed County standards. Subsequent development would be required to comply with applicable General Plan policies, County guidelines, standards, and specifications related to operational noise. As discussed, the County Design Guidelines include design policies that encourage buffers, setbacks, and architectural and landscaping strategies to reduce noise impacts. In addition, General Plan Policy NO-7 requires a noise-generating use proposed adjacent to lands zoned for uses which may have sensitivity to noise to mitigate noise generation to a state of compliance with the standards presented in Table 16-13 in this EIR. However, because the location of stationary equipment or noise generating activity is not fully known, these sources could still exceed County standards and sensitive receptors. Therefore, this impact would be potentially significant.

Mitigation Measure NO-4a requires new noise sensitive land uses within the 50 dB L_{50} noise contour of existing industrial land uses north of Kiefer Boulevard to use site design to reduce noise exposure and to conduct a site-specific noise study prepared by a qualified acoustical engineer addressing interior and exterior noise levels before the issuance of building permits. This measure would ensure that noise sensitive land uses maintain exterior noise levels of 55 dB L_{50} and 75 dB L_{max} during the daytime and 50 dB L_{50} and 70 dB L_{max} during the nighttime, consistent with County standards. In addition, Mitigation Measure NO-4b would establish setback requirements specific to the plan area that would augment the County's existing standards in General Plan Policy NO-7. Therefore, this impact would be **less than significant with mitigation incorporated**.

MITIGATION MEASURES

MITIGATION MEASURE NO-4A: DESIGN STRATEGIES FOR PROPOSED SENSITIVE LAND USES

This mitigation measure would apply to noise sensitive land uses developed as part of the WJHMP that would be located within 1,000 feet of existing or proposed industrial land uses.

To prevent future noise sensitive receptors from disturbance associated with existing and proposed industrial land uses within the WJHMP, design principles and strategies shall be used to reduce noise exposure to sensitive land uses in compliance with the WJHMP Design Guidelines, County Design Guidelines, and County noise standards. Common design principles to reduce noise exposure to sensitive land uses that shall be considered during the site design process include:

- increasing the distance between the noise source and the receiver,
- locating barrier-type buildings parallel to the noise source,
- orienting the residences and outdoor activity areas for those residences away from the noise source, and
- arranging the site plan to use buildings as noise barriers.

Upon application for entitlements, all future project applicants proposing a noise-sensitive land use within 1,000 feet of an existing or proposed industrial land use shall provide to the County a site-specific noise study prepared by a qualified acoustical professional/engineer addressing exterior noise levels for applicable noise sensitive land uses and interior noise levels in residential units. The noise study shall confirm, using approved calculation methodologies, that building design (e.g., building orientation) and building materials as well as exterior design features (e.g., fences, walls, and landscaping features) are sufficient to maintain, consistent with Sacramento County non-transportation noise standards, exterior noise levels of 55 L_{50} and 75 L_{max} during the daytime and 50 L_{50} and 70 L_{max} during the nighttime. If the study shows such standards would not be met with the site design as proposed, the future project applicants or subsequent developers shall implement recommendations of the study that are shown to achieve the standards.

MITIGATION MEASURE NO-4B: NOISE ATTENUATION FEATURES FOR PROPOSED COMMERCIAL, EMPLOYMENT, AND INDUSTRIAL LAND USES

Land use developments proposed under the WJHMP that include substantial truck activity (e.g., warehouses, grocery stores, repair facilities, storage yards, and truck terminals) and are proposed within 325 feet of existing or proposed residential developments shall be required to provide noise attenuation features to reduce noise generated by on-site truck and delivery activity to levels that are below County daytime residential noise standards (i.e., 55 dB L_{50}).

These features may include:

- site design features, including buildings and soundwalls, sited between the noise-generating activity and the residential land; and
- vegetative screening that fully restricts the line of sight between the noise-generating activity and the residences; or
- setbacks between the noise-generating activity and the residences.

The proposed noise attenuation features shall be demonstrated to reduce noise exposure such that the median daytime noise level on the nearest point of the residential parcel does not exceed the median daytime noise level (L_{50}) of 55 dB. Future project applicants shall be required to demonstrate compliance with these requirements at the time of application for subsequent tentative maps or development applications.

This page is intentionally left blank.

17 PUBLIC SERVICES

INTRODUCTION

This chapter describes the existing public services and facilities, including fire protection, law enforcement, public schools, parks, and libraries, and potential effects on service attributable to the project. Impacts are evaluated in relation to the actions needed to provide the services that could potentially lead to adverse physical environmental effects. Wastewater and solid waste are addressed in Chapter 18, "Public Utilities," water supply and associated water infrastructure needs are addressed in Chapter 20, "Water Supply", electrical infrastructure is addressed in Chapter 11, "Energy", and transit services are addressed in Chapter 19, "Transportation."

The Southgate Recreation and Park District, Walk Sacramento, and the Cordova Recreation and Park District submitted comments on the notice of preparation indicating discrepancies in the master plan's parkland dedication and recommending relocation of a proposed elementary school and middle/high school campus site closer to residential densities and away from higher volume and speed roadways. These issues are discussed below.

ENVIRONMENTAL SETTING

The project is located within the Urban Services Boundary (USB) but is mostly outside of the Urban Policy Area (UPA). The UPA defines the area expected to receive urban levels of public infrastructure and services within a 20-year planning period. To receive urban public services, land must be within both the UPA and USB. For more information on the USB and UPA, please refer to Chapter 15, "Land Use."

The County requires the preparation of Urban Services Plans for all master plan projects. Through this plan the project applicant must demonstrate that the proposed development is cost-neutral to the County's general fund and existing taxpayers/ratepayers, as required by the land use policies in the General Plan. The Urban Services Plan is prepared separate from the evaluation of the project in this EIR.

FIRE PROTECTION AND EMERGENCY RESPONSE

The plan area is within the service area of the Sacramento Metropolitan Fire District (Metro Fire). Metro Fire is a special district that serves a population of over 720,000 in a 359 square mile service area in Sacramento County (Metro Fire 2023a). In 2013, Metro Fire issued the Fire Department Growth Analysis, which reviewed the number and location of new fire stations that would be required to meet 1st Due and 1st Alarm response requirements (areas that have over 1,000 people per square mile, the standard travel time is 4 minutes with an overall reflex time of 7 minutes), taking into consideration the various planning areas where development is proposed. This analysis

was used to perform a capital facilities impact fee study and analysis which determined the portion of the project facilities' cost attributable to new development over the ensuing 20-year planning horizon (Metro Fire 2023b). As a special district, Metro Fire is governed by a Board of Directors; each member is elected by the voters within a geographical area, or division, of Metro Fire's operational area. Operations include Fire and Rescue, Emergency Medical, Training and Safety, Special Operations, Homeland Security, Fire Investigation, and Health and Wellness Divisions.

Metro Fire uses a response standard of 4 minutes for First Due travel time with an overall reflex time of 7 minutes. The performance standard for an "Effective Response Force" to a building fire incident is to have three engines, one ladder truck, and one battalion chief to the incident within 8 minutes (Metro Fire 2018). The nearest fire station is Station 62 located on Bradshaw Road, approximately 0.8 miles north of the plan area. Another fire station is Station 54 located off of Fredric Avenue east of South Watt Avenue, approximately 1.5 miles northwest of the plan area. Metro Fire is currently in the process of planning two more stations surrounding the plan area due to planned and approved development in the city of Rancho Cordova, the Vineyard Community, and the proposed master plan areas surrounding the plan area, including two new fire stations located in the plan area.

Law Enforcement

The plan area is within the service area of the Sacramento County Sheriff's Department (SSD), which provides law enforcement services in the unincorporated county. Local law enforcement services include response to calls for service and trouble spots, investigations, surveillance, and routine patrolling. Demand for law enforcement services grows with population. The County maintains a goal of having one sheriff's deputy per 1,000 residents (Sacramento County 2010). The nearest SSD substation is the Kilgore Station East Division, which is located approximately 4 miles northeast of the plan area in Rancho Cordova. SSD staff assigned to the substation provide general law enforcement services to Rancho Cordova, Rosemont, Lincoln Village, Gold River, Mather, and Butterfield-Riviera East. The East Division provides patrol, investigative, Problem Oriented Policing, report writing, crime prevention, and crime analysis functions (SSD 2023).

Schools

The plan area is within the service area of the Elk Grove Unified School District (Elk Grove USD) and of the Sacramento City Unified School District (City USD). The Elk Grove USD covers 320 square miles and includes the communities of Florin, Franklin, Laguna Creek, Laguna West, Rancho Murieta, Sheldon, Sloughhouse, Valley Hi, Vineyard, Wilton, the city of Elk Grove, and parts of the cities of Sacramento and Rancho Cordova. Elk Grove USD operates 43 elementary schools, nine middle schools, nine comprehensive high schools, five alternative education schools, one charter school, one virtual online K-8 program, one special education school and one adult education school (Elk Grove USD 2023a). During the 2022-2023 school year, the Elk

Grove USD had a total enrollment of 62,957 students, and City USD had a total enrollment of 43,066 (CDE 2023a; 2023b).

The plan area is currently located within the attendance area of Sierra Enterprise Elementary School for grades K-6, Katherine L. Albiani Middle School for grades 7-8, and Pleasant Grove High School for grades 9-12. According to Elk Grove USD's online school locator, Katherine Albiani Middle School is currently overcrowded. Students moving to the attendance area are being redirected to Smedberg Middle School. Pleasant Grove High School is also currently overcrowded and students are being redirected to Sheldon High School (Elk Grove USD 2023b). Elk Grove USD may adjust attendance boundaries as needed in the future to accommodate changes in population and as new school facilities are built.

The northernmost portion of the plan area is located within the City USD attendance area. The closest school to the plan area is Golden Empire Elementary School, which is located less than 1 mile north within the Carmichael community and is part of the City USD. Other nearby schools include Rosemont High School and Albert Einstein Middle School part of the City USD, which are located approximately 1.1 miles and 1.7 miles north of the plan area, respectively.

Parks and Recreation Services

The plan area is located within the Cordova Recreation and Park District (CRPD) and the Southgate Recreation and Park District (SRPD). The CRDP serves approximately 120,000 residents within the city of Rancho Cordova and the unincorporated communities of Rosemont, Gold River, Larchmont, Riviera East, and Mather. CRPD is an independent, special district within the county and is governed by an elected board. CRPD owns and operates over 600 acres of SPLS and parkland, including over 43 parks and facilities (CRPD 2023). The closest CRDP parks to the plan area are Primrose Park and Cordova Golf Course. Both parks are located along the northwestern boundary of the plan area. Primrose Park offers a playground, three picnic areas, and a full-size soccer field. Cordova Golf Park is a full-service facility with an 18-hole course, driving range, grass and mat hitting stations, practice putting green, and pro-shop.

The SRDP serves approximately 120,000 residents of the 52-square mile unincorporated South Sacramento community that lies east of Sacramento, south of Rancho Cordova and north of Elk Grove. SRPD is an independent, special district that is governed by an elected five-member board of directors. The SRPD currently maintains 47 parks, 6 community centers, 2 aquatic facilities, and numerous landscape corridors and nature preserves (SRPD 2023). The closest SRPD parks to the plan area are Dunmore Park Preserve Area and the Don & Brenda Nottoli Community Park, located approximately 1 mile south and southwest, respectively. The Don & Brenda Nottoli Community Park offers 14 acres of community parkland equipped with playground features, sports fields, picnic shelters, and a dog park. The Dunmore Park Preserve Area is an actively managed habitat preserve. Although public access to the preserve is limited, the open space provides some passive recreation opportunities.

Libraries

The Sacramento Public Library System (SPLS), operated by the Sacramento Public Library Authority, provides library services to the residents of Sacramento County as well as the incorporated cities of Sacramento, Elk Grove, Rancho Cordova, Citrus Heights, Galt, and Isleton. The library system is comprised of interdependent branches providing services to all residents. SPLS includes 28 locations and serves approximately 1.4 million residents. Branches are grouped by services, geography, and usage patterns to provide efficient and economical services to the residents of the county. The nearest library to the plan area is the Rancho Cordova Community Library, located approximately 3.5 miles north along Folsom Boulevard.

The Library Facility Master Plan (Sacramento Public Library Authority 2007) for SPLS sets forth general standards and criteria for the renovation and construction of all new libraries. Existing and future library needs are largely population driven (e.g., for every 30,000 residents in a community, at least one full-service library is required). Ideally, new libraries provide 0.4 to 0.6 square feet per capita. The Facility Master Plan indicates that the Vineyard area will require two to three new library facilities to serve anticipated growth. The Library Facility Master Plan identifies these new branches as planned for construction in 2015 and 2025. Although no Vineyard branch has yet been developed, the 2023 Facilities Vision Plan (Sacramento Public Library 2023) continues to identify a new library in the Vineyard area.

Regulatory Setting

Federal

There are no federal policies or regulations applicable to the analysis of public services.

State

Leroy F. Greene School Facilities Act

The Leroy F. Greene School Facilities Act of 1998 established a State program to provide per-pupil funding for new construction and modernization of existing school facilities. The act limits the power of cities and counties to require mitigation of school facilities as a condition of approving new development and authorizes school districts to assess fees (at various levels) to directly offset the costs associated with increased capacity as a result of new development.

California Education Code

The California Education Code authorizes the California Department of Education to develop site selection standards for school districts. The California Department of Education School Facilities Planning Division has prepared a School Site Selection and Approval Guide that provides criteria for location appropriate school sites in the State of California.

California Government Code Section 66477

California Government Code Section 66477 (Quimby Act) allows local governments to exact land dedications or in lieu fees for park purposes from new subdivisions. The law prescribes a standard consistent with the circumstances of each park district based on a minimum of 3 acres and a maximum of 5 acres per 1,000 residents. Sacramento County's Office of Planning and Environmental Review oversees these requirements in the unincorporated area.

Local

Sacramento County Code, Title 22

Title 22 of the Sacramento County Code provides directions for calculating park acreage requirements for residential developments. Depending on the park district, residential developments are required to provide dedicated land for park construction or pay in-lieu fees.

The plan area is located within the CRPD and SRPD. As shown in Table 17-1, Title 22 sets a standard of 4.87 acres per 1,000 persons for land dedication or in lieu fees for CRPD based on land use type. Furthermore, as shown in Table 17-2, Title 22 sets a standard of 5.00 acres per 1,000 persons for land dedication or in lieu fees for SRPD based on land use type. These per-person dedication requirements are further refined with dedication factors that reflect the type of dwelling unit.

Table 17-1 Title 22 Parkland Dedication Requirements for Cordova Park and Recreation District

Acreage Dedication Requirement	Single Family Residential Factor	Multiple Family Residential Factor
4.87 acres per 1,000 residents	0.0142	0.0119

Sacramento County 2030 General Plan

The following policies of the 2030 General Plan would apply to the project:

- **Policy LU-65.** Levels of service shall be consistent with policies in this Plan, or where none are applicable, shall use Federal and State environmental standards and commonly accepted industry norms and standards as guidelines.

- **Policy LU-66.** Assure service availability, adequacy, and funding at each stage of the development process for all public services for the life of the project consistent with the intent of the adopted Public Facilities Financing Plan and accompanying Phasing Plan.
- **Policy LU-67.** Funding to construct community and regional facilities located in new growth areas shall be based on broad based funding. Developments within new growth areas shall participate, when possible, in a program to fund the construction of community and regional facilities.
- **Policy LU-69.** Supplemental mitigation fees may be established by the Board of Supervisors provided they find that supplemental fees are critical and necessary to meet the facility funding needs of a service provider and that traditional methods are inadequate.
- **Policy PF-29.** Schools shall be planned as a focal point of neighborhood activity and interrelated with neighborhood retail uses, churches, neighborhood and community parks, greenways and off-street paths whenever possible.
- **Policy PF-30.** New elementary schools in the urban area should be planned whenever possible so that almost all residences will be within walking distance of the school (one mile or less) and all residences are within two miles of a school.
- **Policy PF-31.** Schools shall be planned adjacent to neighborhood parks whenever possible and designed to promote joint use of appropriate facilities. The interface between the school and park shall be planned with an open design and offer unobstructed views to promote safety.
- **Policy PF-32.** Elementary schools shall not be located along arterials and thoroughfares. Junior high and high schools should be located near roadways with adequate capacity and should provide adequate parking to facilitate the transport of students.
- **Policy PF-34.** All school site plans shall be designed to minimize traffic speed and maximize traffic flow around the school, allowing for several access points to and from the site.
- **Policy PF-35.** New schools should link with planned bikeways and pedestrian paths wherever possible.
- **Policy PF-38.** Land dedications or reservations for schools should meet state guidelines for school parcel size. Where more than one owner or development project is involved, there shall be appropriate assurances and conditions to assure that requisite acreage can and will be assembled to meet facility site requirements.
- **Policy PF-39.** Specific Plans shall show the location of future school sites based upon adopted school district master plans and criteria in the General Plan.
- **Policy PF-42.** Share capital costs of library construction and renovation for existing residents through bond financing or other appropriate measures and by new residents and workers through fees on new development.

- **Policy PF-43.** Include community library needs among facilities to be financed by financing districts created in new urban areas.
- **Policy PF-45.** New commercial development in financing districts shall contribute to library financing such that fees based on projected employment are approximately equivalent to the fees for an equivalent number of new residents.
- **Policy PF-46.** Incorporate planned libraries into community and specific plans for new development.
- **Policy PF-53.** Design neighborhoods and buildings in a manner that prevents crime and provides security and safety for people and property; when feasible.
- **Policy PF-54.** Require new development to install fire hydrants and associated water supply systems which meet the fire flow requirements of the appropriate fire district.
- **Policy PF-55.** New development shall provide access arrangements pursuant to the requirements of the California Fire Code.
- **Policy PF-57.** New development, redevelopment or traffic signal replacement shall require the installation of emergency signal activation systems in all street improvements requiring signalization when requested by a fire district.
- **Policy PF-58.** Traffic calming measures should be used wherever possible in a manner that does not delay emergency vehicle responses.
- **Policy PF-59.** Alternative methods of fire protection and access must be instituted if access is reduced to emergency vehicles.
- **Policy PF-60.** Require that structures of four stories or more in height provide on-site equipment and facilities to the satisfaction of the appropriate fire district, consistent with industry norms and standards.
- **Policy PF-61.** Mitigation fees may be established by the Board of Supervisors or Fire Districts for the purpose of funding adequate fire protection and emergency medical response facilities provided they find that such fees are critical and necessary to meet the facility funding needs of the fire district and that existing methods of financing are inadequate.
- **Policy PF-63.** Mitigation fees established by County ordinance or Fire District shall, together with other reasonably assured sources of funding identified in the fire district's financing plan, be sufficient to implement the adopted financing plan.
- **Policy PF-64.** No building permit for new residential or commercial construction shall be issued when there is a Board of Supervisors certified fire district financing plan for any applicable fire district, which provides for mitigation fees, until the applicant has contributed all required mitigation fees.
- **Policy PF-122.** To help assure that local recreation and park district Master Plan standards for levels of service may be achieved and maintained, the County may require new development to dedicate land, pay in-lieu fees, development impact fees, or otherwise contribute a fair share to the acquisition and development of

parks and recreation facilities. For development in infill areas where land dedication may not be practical, the County in cooperation with the affected park district may explore creative alternatives for providing park and recreation facilities.

- **Policy PF-123.** At a minimum, new residential developments approved by the County shall provide sites for local parks for their prospective residents consistent with the Quimby Act and the land dedication standards for each local recreation and park district adopted by Sacramento County in Chapter 22.40 of the Sacramento County Code. These requirements may be satisfied by land dedication, payment of fees in lieu of dedication, or on-site improvements per the provisions of Chapter 22.40, which will be regularly updated to reflect changing demography. These include the baseline standard of three acres of land for parks per 1,000 residents or in cases where existing parklands within a park district exceed three acres per 1,000 population, that higher ratio shall be the standard for new developments up to a maximum of five acres of land for parks per 1,000 residents based on calculations specified in SCC Chapter 22.40.
- **Policy PF-125.** The County shall promote the provision of on-site recreational amenities and gathering places that are available to the public by large scale development projects and may consider providing incentives such as density bonuses or increases in building coverage for that purpose.
- **Policy PF-127.** Require new residential developments to participate in park O & M financing mechanisms where established by local park districts or the County.
- **Policy PF-128.** Encourage park development adjacent to school sites and the formation of joint use agreements between school and park districts.
- **Policy OS-10.** Sacramento County shall seek to attain the County Regional Park System standard of 20 acres of regional parkland per 1,000 population.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community Plans relevant to the WJHMP are the Cordova Community Plan and the Vineyard Community Plan (Sacramento County 2003, 1985).

CORDOVA COMMUNITY PLAN

- **Policy LU-8.** Continue the tradition of joint development of parks and schools.
- **Policy ROS-1.** Promote a high quality network of parks and open space that provides a mix of passive and active recreational opportunities for community residents.
- **Policy ROS-2.** Ensure a balanced mix of passive and active recreation opportunities in open space areas, and promote the environmental sustainability of these resources.
- **Policy ROS-6.** Encourage developers to work closely with the Cordova Recreation and Park District in the identification and development of new park sites.

- **Policy PS-6.** Ensure the availability and accessibility of public services for all segments of the population.
- **Policy PS-7.** Promote the concept of coordinated development of a single site by multiple agencies (e.g., fire, libraries, schools and parks) to provide greater convenience for the public.
- **Policy PS-9.** Promote suitable fire protection/prevention measures for all developments.
- **Policy PS-10.** Ensure that all library sites are adequately served by public transit.
- **Policy PS-11.** Promote coordination between the Sheriff and RT in matters related to safety in public transit use.
- **Policy ED-4.** Promote neighborhood participation in school site planning of facilities, services and connectivity.
- **Policy ED-5.** Ensure adequate school facilities to serve newly developing areas.

VINEYARD COMMUNITY PLAN

- **Policy PF 4.** Require all residential development proposals submitted to the County for approval be coordinated with the school district.
- **Policy PF 5.** Require development and maintenance of an adequate fire suppression water supply for all new development.
- **Policy PF 6.** All types of urban development proposals must be accompanied by a detailed public services plan and specific timing and funding programs for the implementation and maintenance of services.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

A public services impact would be significant if implementation of the project would:

- Result in substantial adverse physical impacts associated with the provision of emergency services and fire protection services;
- Result in substantial adverse physical impacts associated with the provision of law enforcement services;
- Result in substantial adverse physical impacts associated with the provision of public school services;
- Result in substantial adverse physical impacts associated with the provision of park and recreation services, or result in substantial physical deterioration of an existing facility due to increased use; or

- Result in substantial adverse physical impacts associated with the provision of library services.

Issues not discussed Further

All the issues identified in the significance criteria are addressed in the following analysis.

Methodology

The following evaluation of potential impacts associated with public services was based on a review of existing services and demand projections from the development of the project. This analysis is based on the assumption that the plan area would be developed in a manner generally consistent with the land use diagram and proposed General Plan amendments described in Chapter 2, "Project Description." As such, it is assumed that the UPA would be expanded to include approximately 5,844 additional acres of the plan area (total of 5,913 acres) and would support an additional 45,661 residents and approximately 30,700 employees. The calculations of projected demand for public services are based on facility plans or comments received from the applicable public service purveyors.

West Jackson Highway Master Policies

The WJHMP includes the following policies related to public services.

- **Policy 6.1.** Locations of major parks and open space areas in the Plan Area are shown in Figure 6.2, "Parks and Open Space Plan." Final park locations and sizes shall be determined during the subdivision process in collaboration with the park district in which the subdivision map is located.
- **Policy 6.2.** Quimby requirements shall be based upon the respective park district in which subdivision maps are located. In the event that a subdivision encompasses both park districts, park requirements shall be negotiated with each respective district.
- **Policy 6.3.** Parkland dedication factors shall be based upon Sacramento County Code Section 22.40.045 and requires 4.87 acres per 1,000 residents for Cordova Recreation and Park District and 5.0 acres per 1,000 residents for Southgate Recreation Parks District.
- **Policy 6.4.** Community parks should generally be 15 acres or more in size with active programming and with access to major roadways.
- **Policy 6.5.** Final locations of neighborhood parks shall be determined during the tentative subdivision map process.
- **Policy 6.6.** Where determined to be appropriate by the applicable park district and school board, neighborhood parks of 5 acres or more should be co-located with public schools.

- **Policy 6.8.** Various complimentary park themes and layouts should be established within the Plan Area. Some parks may have more sports field uses while others may include more passive uses such as grassy areas for informal play or natural areas with pedestrian trails. A wide variety of recreational opportunities shall be provided throughout the Plan Area with the objective of meeting the programming requirements of the Cordova and Southgate Recreation and Park Districts as applicable.
- **Policy 6.10.** Encourage the location of Community Gardens within parks and open space areas.
- **Policy 6.11.** Encourage the location of Community Gardens within parks and open space areas.
- **Policy 6.12.** Neighborhood parks of less than 2 acres that are intended for recreational use shall include limited programming for passive and active uses.
- **Policy 6.13.** Parks that are less than 2 acres may be designed as image parks that may include neighborhood identity signage and native, ornamental and edible plantings to enhance the visual appearance of the neighborhood.
- **Policy 6.14.** All Parks within the Plan Area shall adhere to local water conservation strategies.
- **Policy 6.15.** Neighborhood parks should generally have street frontages on at least two sides except those abutting open spaces, trails, drainage channels, school sites, and public spaces.
- **Policy 6.18.** Where feasible, pedestrian and bicycle trail systems shall be provided in or along open space areas with an emphasis on trail connectivity to area-wide systems.
- **Policy 6.24.** Sloped areas may be utilized for agricultural production including urban farming and community gardens.
- **Policy 8.1.** Implement the siting of new school sites and facilities in coordination with the respective school districts. These locations shall be located within the Master Plan area as approximately shown in Figure 8.3.
- **Policy 8.2.** Implement the siting of Sheriff's Department stations or substations within the Master Plan area which shall be allowed in all commercial, industrial and residential areas in accordance to County zoning. Stations in residential areas must be located on an arterial road or on a lot at least twice the minimum lot size for the zone.
- **Policy 8.3.** Implement the siting of Fire Department stations within the Master Plan area which shall be allowed in all commercial, industrial and residential areas in accordance to County zoning. Stations in residential areas must be located on an arterial road or on a lot at least twice the minimum lot size for the zone.

Impacts and Analysis

Impact PS-1: Result in substantial Adverse Physical Impacts Associated with the Provision of Fire Protection and Emergency Services

The plan area is within the service area of Metro Fire. As discussed above, Metro Fire uses a response standard of 4 minutes for First Due travel time with an overall reflex time of 7 minutes. The project would increase the demand for Metro Fire's fire protection and emergency services. This increase in demand would require additional staff and fire facilities in order to maintain service levels and to ensure that adequate fire protection is provided.

Metro Fire recently completed updating its growth analysis to take into account existing and anticipated future development south of Highway 50 within the incorporated and unincorporated areas of the county. Metro Fire has indicated that development within the plan area would contribute to an increase in the need for fire protection, including additional staffing, vehicles, equipment and stations. According to the service delivery plan, there is a possible need for two additional stations. This EIR assumes two new fire stations, as provided by Objective 8.6 of the WJHMP, meeting the sizing and siting criteria required by Metro Fire. The Project Applicants have agreed to provide sites of Metro Fire's choosing within the plan area in accordance with the objectives and policies of the master plan document. The final locations would be determined in conjunction with Metro Fire representatives at the time of the first Tentative Map.

The General Plan contains policies that allow the Board of Supervisors to establish mitigation fees for the purpose of funding adequate fire protection and emergency medical response facilities, provided they find that such fees are critical and necessary to meet the facility funding needs of the fire district. The fire districts that receive such funds must maintain Insurance Service Office (ISO) ratings of 3 for hydrant areas and 8 for non-hydrant areas and a response time of 5 minutes for emergency calls, where staffing levels are adequate. According to Metro Fire, the two future stations in the plan area would enable first response fire protection services to be provided to the entire plan area, as well as areas beyond, within 4 minutes of travel time, consistent with their response standard (Metro Fire 2014). Additionally, the policies contained in the General Plan require that new buildings and neighborhoods meet the requirements of the California Fire Code, and that access and fire hydrants are adequate.

Land within the plan area would be dedicated to Metro Fire as a part of WJHMP implementation. Two new fire stations would serve the entirety of the plan area, and no other fire protection or emergency services facilities would be required to serve the project. Because these facilities are located within the plan area, the environmental impacts associated with the development of these facilities are evaluated throughout this EIR. No additional off-site facilities would be needed. Therefore, impacts associated with fire protection and emergency services would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT PS-2: RESULT IN SUBSTANTIAL ADVERSE PHYSICAL IMPACTS ASSOCIATED WITH THE PROVISION OF LAW ENFORCEMENT

The project includes a maximum of 16,484 residential units which, according to the WJHMP, would provide housing for an estimated 45,661 new residents within the plan area, as well as non-residential users. This would increase demand for law enforcement services within the plan area.

The County maintains a goal of having one sheriff's deputy per 1,000 residents (Sacramento County 2010). With the addition of 45,661 residents, an estimated 46 additional officers could be needed. To support these additional officers, SSD may need to hire administrative staff or construct new facilities. Although the proposed development along the Jackson Highway corridor would cause the need for additional SSD staff and equipment, as of the writing of this EIR, SSD has not indicated that they need space for a new facility within the plan area or offsite, although they could request space for such a facility at a later date. Should SSD request land for a new station or substation within the plan area, it would be accommodated within one of the areas proposed for commercial, industrial, or residential uses. In that case, the potential impacts to the environment associated with construction and operation of such a facility are addressed throughout this EIR.

The project would provide funding in the form of development impact fees and ongoing property taxes that would provide funding for additional staffing and equipment needed to maintain and improve service levels for law enforcement within the plan area and the surrounding areas. Additionally, to facilitate future infrastructure in the plan area, the WJHMP includes Policy 8.2, which allows Sheriff's Department stations and substations in all commercial, industrial, and residential areas. Further, construction of an SSD facility within the plan area would not result in any physical impacts that are not already an inherent part of overall project impacts. Therefore, this impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT PS-3: RESULT IN SUBSTANTIAL ADVERSE PHYSICAL IMPACTS ASSOCIATED WITH THE PROVISION OF SCHOOLS

Development of the project would increase the local student population. Based on student generation rates provided by Elk Grove USD and State of California criteria, the proposed WJHMP estimates that student enrollment resulting from the project would be approximately 10,375 additional students, with approximately 5,544 elementary school students, 1,758 middle school students, and 3,073 high school students. Full buildout of the plan area is anticipated to require six elementary schools, a middle school, and a

high school. The project designates four sites for elementary schools that are each approximately 10 acres in size and a 70-acre site is designated for a joint high school and middle school. Additionally, one existing elementary school site currently exists within the plan area. The location of an additional two elementary school sites would be determined when a future specific plan, master plan amendment, or subsequent entitlements are prepared for the FPAs. All the schools would be located within the Elk Grove USD. Due to the limited number of residential units proposed within City USD, students within its district boundaries would be served by existing schools outside of the plan area. Moreover, the project would not require the construction of additional schools outside of the plan area because the project proposes to provide adequate school facilities based on student yield generation provided in Table 17-3. Table 17-3 recreates Table 8.1 from the Master Plan.

Table 17-3 Student Yield Generation

School District	Single Family Units	Multi-Family Units	Student Yield K-6	Student Yield 7-8	Student Yield 9-12	Elementary Schools Needed 750 Students	Middle Schools Needed 1,200 Students	High Schools Needed 2,200 Students
Elk Grove Unified	10,824	5,660	5,444	1,723	3,014	6.40	1.44	1.37
Sacramento City Unified	0	210	100	35	59	0	0	0
Total	**10,824**	**5,870**	**5,544**	**1,758**	**3,073**	**6**	**1**	**1**

Source: West Jackson Highway Master Plan, Table 8.1.

Note: Due to the limited number of residential units within the City USD, generation rates for Elk Grove USD were used for the purposes of Table 17-3.

The four elementary school sites identified in the WJHMP would be co-located with public park sites to encourage joint use of the facilities. Each elementary school would be centrally located to serve as a focal point of the neighborhood and combined with other land uses to create activity centers for their respective neighborhoods. The high school/middle school site would also be located adjacent to open space at a location that provides accessibility to the residents within the plan area, including FPAs.

Elk Grove USD has been working with the Project Applicants to ensure adequate school facilities are provided within the plan area. The number and location of school sites shown on the current plan would accommodate additional students generated by the project. Proposed school construction would occur within the plan area boundaries in areas designated for developed uses, consistent with the master plan. Construction of these schools within the plan area and are part of the project, and the environmental impacts associated with the construction and operation of the schools are evaluated throughout this EIR.

Further, future project applicants would be required to pay all applicable State-mandated school impact fees to Elk Grove USD at the time of development (i.e., issuance of building permits). The County would determine the assessable square

footage that would be subject to the fee at that time. Elk Grove USD would determine the capacity of existing schools at the time of build-out of the plan area and the need for new school facilities and would oversee the environmental review and development of new facilities. In the event that school impact fees are not adequate to cover the need for new school facilities, Elk Grove USD has the ability to raise fees as necessary. The California Legislature has declared that payment of the applicable school impact fee is deemed to be full and adequate mitigation under CEQA for impacts on school facilities (California Government Code Section 65996). Furthermore, development of the school sites in the plan area are programmatically covered in this EIR.

The project includes five school sites, plus an additional two undetermined sites in FPAs, which would fulfill the demand generated by the project. Construction of these schools would not result in any substantial physical impacts specific to public services that are not already an inherent part of overall project impacts. Impacts specific to public facility construction related to school services are **less than significant**.

It is possible that future residential development within the plan area would generate demand for school facilities that are not met by the proposed school sites for some period of time as the plan area builds out. Depending upon the timing of construction of new school facilities relative to residential development within the plan area, future students could be bused or driven to off-site schools within the Elk Grove USD boundaries for a short period of time.

MITIGATION MEASURES

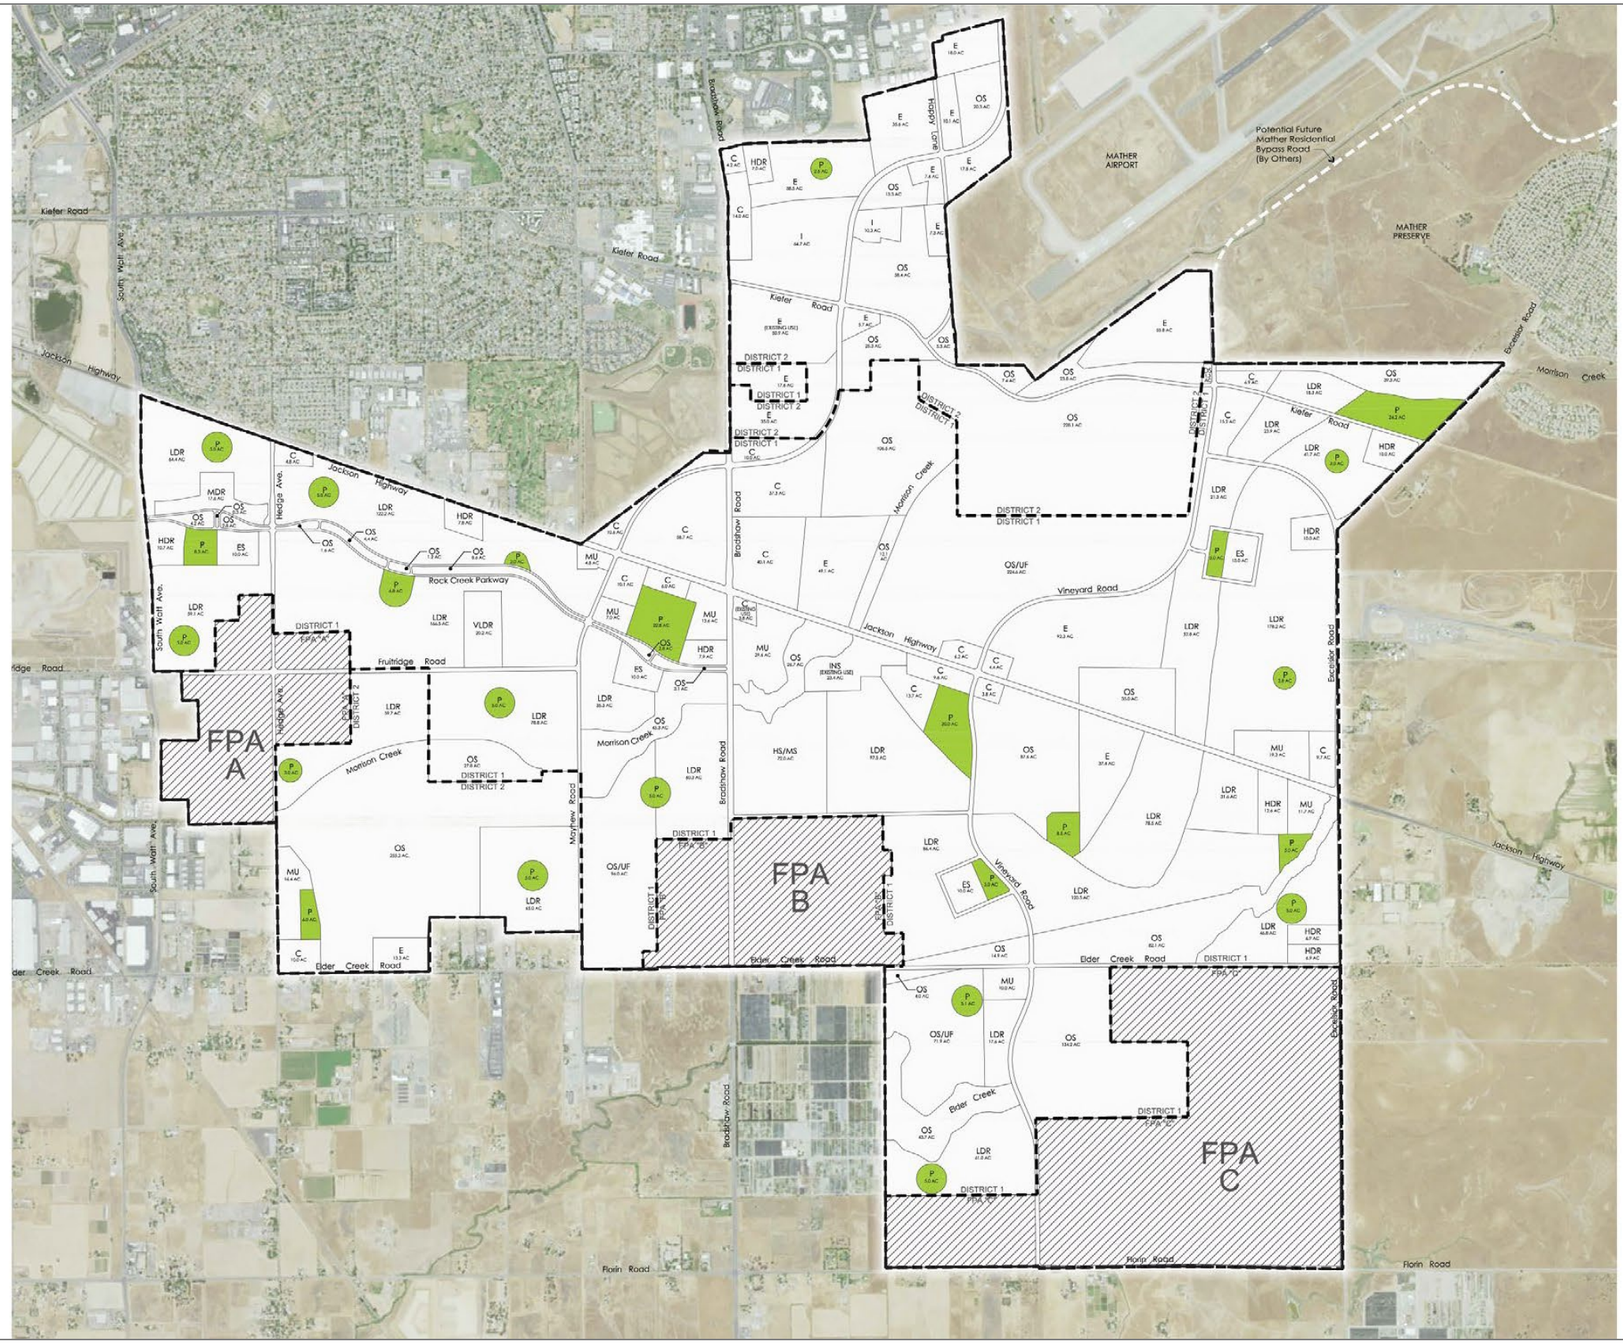
No mitigation is required.

IMPACT PS-4: RESULT IN SUBSTANTIAL ADVERSE PHYSICAL IMPACTS ASSOCIATED WITH THE PROVISION OF PARKS AND RECREATION SERVICES OR SUBSTANTIAL PHYSICAL DETERIORATION OF AN EXISTING FACILITY

The project includes 24 neighborhood parks (totaling 219.3 acres) that would be distributed throughout the plan area, four of which are adjacent to the proposed elementary school sites. The remaining neighborhood parks would be generally located adjacent to the regional and local trail system within the proposed greenbelt areas along Rock Creek Parkway, including LDR areas to provide for easy pedestrian and bicycle access throughout the plan area. The neighborhood parks range in size from 2.0 to 24.2 acres and would provide a variety of facilities that would accommodate local recreational needs. The park facilities are anticipated to include play areas for children, open turf areas, areas for organized sports, picnic areas, and spaces for small groups of people to gather and recreate.

The proposed Rock Creek Parkway is expected to vary in width up to 300 feet wide in some locations and would contain separate roadways along the outer edge of the parkway. Rock Creek Parkway is designed to accommodate future transit, and a large swath of land in the center (designated as Open Space) which is intended to accommodate drainage as well as pedestrian/bicycle trails. Rock Creek Parkway will

traverse the central portion of the plan area and the trails of Rock Creek Parkway will connect with the trails of the recreated portion of Morrison Creek; the intent is to provide alternative modes of transportation throughout the plan area. Finally, the Master Plan includes a land use designation of Open Space/Urban Farm for 392.5 acres, which in addition to open space uses, will allow community-based agriculture and education within the plan area.



The project has been designed so that most homes would be located within close proximity of major gathering facilities, including the parks. See Figure 17-1 for a map depicting the distribution of park facilities the plan area. In total, the project would provide for a total of 219.3 acres of developed parkland.

The Quimby Act and the General Plan require a minimum of 3 and a maximum of 5 acres of parkland per 1,000 residents. As described in the Regulatory Setting, above, Title 22 provides parkland calculation factors to assist in determining the appropriate amount of parkland required for projects located within the CRPD based on housing type. Parkland dedication factors based upon Sacramento County Code Section 22.40.045 requires 4.87 acres per 1,000 residents for CRPD and 5.00 acres per 1,000 residents for Southgate Recreation and Parks District. However, park acreage for the plan area is based on the General Plan's requirement of 5.00 acres of improved parkland for every 1,000 residents, using the dwelling unit equivalent factors established in Section 22.40.045 of the Sacramento County Code. Tables 17-4 and 17-5, below, presents these factors and the project's parkland dedication requirement.

Table 17-4 Parkland Dedication Requirements - Southgate

	Dwelling Units	Factor	Acres Required	Acres to be Provided
VLDR & LDR	4,171	0.0146	60.9	
MDR	0	0.0122	0.0	
HDR	789	0.0100	7.9	
MU	882	0.0100	8.8	
Total	**5,842**		**77.6**	**124.6**

Source: West Jackson Highway Master Plan, Table 6.1; Section 22.40.045 of the Sacramento County Code.

Note: Park locations shown are for preliminary planning purposes only. Final locations will be determined during the subdivision map process

	Dwelling Units	Factor	Acres Required	Acres to be Provided
VLDR & LDR	3,806	0.0142	54.0	
MDR	246	0.0142	3.5	
HDR	1,602	0.0119	19.1	
MU	1,339	0.0119	15.9	
Total	**6,993**		**92.5**	**94.7**

Source: West Jackson Highway Master Plan, Table 6-1; Section 22.40.045 of the Sacramento County Code.

The project would provide 219.3 acres of developed parkland, as well as an additional 1,882 acres of open space. Based on the parkland calculation factors from Title 22 of the Sacramento County Code, the project would be required to provide 170.1 acres of developed parkland, leaving a surplus of 49.2 acres of additional parkland acreage above what is needed to fulfill the parkland requirement.

In addition, although funding is not an impact on the physical environment, a Public Facilities Financing Plan has been prepared for the project to ensure that adequate funding is available to CRPD and Southgate for development, maintenance, and programming of parks and recreational facilities within the plan area.

The project is consistent with the requirements of the Quimby Act and the General Plan. The WJHMP has been designed so that residents of the plan area would have convenient access to developed parklands. For this reason, it is assumed that future residents would primarily use the proposed parks within the plan area. The construction of parks within the plan area would not result in any substantial physical impacts specific to public services that are not already an inherent part of overall project impacts evaluated throughout this EIR. Therefore, the project would not increase the demand for existing park services such that a substantial physical deterioration of existing facilities would result. Impacts would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT PS-5: RESULT IN SUBSTANTIAL ADVERSE PHYSICAL IMPACTS ASSOCIATED WITH THE PROVISION OF LIBRARIES

Future residents of the plan area would increase the demand for library services provided by the SPLS. The Sacramento Public Library Authority has planned for growth along the Jackson Highway corridor and has planned new facilities in the Vineyard Community. The nearest full-service branch is the Rancho Cordova branch, which could also serve plan area residents. The project includes a funding mechanism through the public facilities fee program for library upgrades to accommodate the expected population of the project. This would allow the SPLS to implement the Library Master Plan, which accommodates planned growth in the surrounding area.

The SPLS is planning to develop two new libraries south of the plan area within the Vineyard community and another library north of the plan area within the Cordova community. Specific locations have not yet been identified. These general locations are outside the plan area; however, because these locations are in close proximity to the plan area, the facilities could serve plan area residents once they come online. In its 2023 Library Master Plan, the Sacramento Public Library Authority identifies a new library hub within the Vineyard Community. As a hub facility, this new library would provide a larger space to serve the surrounding community, including the plan area. This hub library would also host larger materials collections and provide regional library service support functions, including supporting high numbers of visits and checkouts, larger collections, and the full range of modern library spaces (Sacramento Public Library 2023).

The project would be accommodated by planned facilities. Final siting and evaluation of these facilities would be conducted by the Sacramento Public Library Authority and is outside the jurisdiction of the Project Applicants. Separate environmental review would be required for off-site library facilities, and implementation of mitigation measures to address substantial, adverse physical impacts would be the responsibility of the County.

As described above, at least one library is planned in the immediate vicinity of the plan area. Because the exact location is unknown at this time, the potential for the facility to result in substantial adverse physical effects cannot be determined without a great deal of speculation. However, the County anticipates that feasible mitigation would be available to substantially address these and other effects of constructing the new library facilities. Furthermore, the project includes a funding mechanism through the public facilities fee program for library upgrades to accommodate the expected population of the project. This would allow the SPLS to implement the Library Master Plan, which accommodates planned growth in the surrounding area. Construction of a new library would not result in any substantial physical impacts specific to public services that are not already an inherent part of overall project impacts. Therefore, the project would not result in substantial adverse physical impacts associated with the provision of library services. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

18 PUBLIC UTILITIES

INTRODUCTION

This chapter addresses wastewater and solid waste. The analysis describes relevant master planning of the utility services and whether the infrastructure and demands of the project and within the initial phases of development in District 1 and District 2 are consistent with the utility master plans. The WJHMP is intended to build upon the existing assets and opportunities of the plan area and guide future development in a manner consistent with adjacent development and the General Plan's goals and policies, including those related to public utilities.

Comments related to wastewater and adequate municipal services for the plan area were submitted in response to the notice of preparation (NOP). One comment from Sacramento Regional County Sanitation District (Regional San, now part of Sacramento Area Sewer District [SacSewer]) expressed concern about on-site and off-site environmental impacts of utilities, which are addressed below. There were no comments related to solid waste, communication, stormwater management, or natural gas service availability. For a discussion of water supply and associated water infrastructure needs, refer to Chapter 20, "Water Supply." Electrical infrastructure is evaluated in Chapter 11, "Energy." The NOP and comments received in response to it are presented in Appendix A.

ENVIRONMENTAL SETTING

URBAN SERVICES BOUNDARY

With the exception of 69 acres, the plan area is located outside, but immediately adjacent to, the existing Urban Policy Area and is within the Urban Services Boundary (USB). The USB identifies the limits of the area where unincorporated urban growth is expected to occur beyond the 20-year General Plan planning period and indicates the ultimate boundary of the urban area in the unincorporated county. This boundary is based upon jurisdictional, natural, and environmental constraints to urban growth. Originally established with the 1993 County General Plan, it was refined as a part of the County's 2011 General Plan Update. The purpose of the USB is to allow for the planning of necessary infrastructure, such as sewer pipelines, which have service lives longer than 20 years (Sacramento County 2016; SacSewer 2020). Several service providers have developed long-range infrastructure master plans based on the USB boundaries.

SEWER SERVICE

SACRAMENTO AREA SEWER DISTRICT

SacSewer provides local wastewater collection and conveyance services and infrastructure throughout the Sacramento region. SacSewer maintains and provides wastewater collection and conveyance from the local residences and businesses in the urbanized, unincorporated areas of Sacramento County; the cities of Elk Grove, Rancho Cordova, and Citrus Heights; portions of the city of Sacramento; and a small area in the city of Folsom. The service area covers approximately 270 square miles and has a population of over 750,000. SacSewer funds and maintains sewer trunk (1 million gallons per day [mgd] and greater) conveyance facilities and maintains collector/local conveyance facilities. SacSewer operates both the smaller local pipelines and the larger regional interceptors. The *SacSewer Sewer System Capacity Plan: 2020 Update* contains planning information to address existing and buildout sewer capacity needs for its service area (SacSewer 2020).

The plan area is within SacSewer's existing service area and there is existing infrastructure in the plan area, including gravity mains, force mains, and interceptors. Sewer service to the plan area would be provided via the existing Central Interceptor located in South Watt Avenue at the western edge of the plan area, the existing Northeast Interceptor along Fruitridge Road (located in the northwest portion of the plan area), and the existing Bradshaw Interceptor along Bradshaw Road (located in the central portion of the plan area). Except for these interceptor sewers, sewer facilities are limited within the plan area (Wood Rodgers 2014). Existing sewer infrastructure is shown on Figure 2-11 in Chapter 2, "Project Description."

Further, the plan area is within the study area for SacSewer's Sewer System Capacity Plan. The Sewer System Capacity Plan identifies future trunk expansion sheds around the plan area and assumes flow from an average of six equivalent single-family dwellings (ESDs) per acre in the area (SacSewer 2020). Proposed facilities identified in the 2020 Sewer System Capacity Plan that would serve the plan area include the CE Gravel West Trunk, BR Gravel East Trunk, BR Florin Trunk and BR Elder Creek Trunk. Sewer conveyance in the region would be built into the roadways.

ECHOWATER RESOURCE RECOVERY FACILITY

As indicated above, wastewater flows collected from SacSewer's interceptors are ultimately transported into the EchoWater Resource Recovery Facility. The EchoWater Project is located northwest of Elk Grove and is owned and managed by SacSewer. Currently, the EchoWater Project has a National Pollutant Discharge Elimination System (NPDES) permit issued by the Central Valley Regional Water Quality Control Board (RWQCB) for discharge of up to 181 mgd average dry-weather flow of treated effluent into the Sacramento River. As of 2023, the EchoWater Project received and treated an average of 135 mgd each day, which was released for discharge and water recycling programs, namely the Harvest Water Project, one of the largest agricultural water recycling projects in the State of California (Regional San 2023).

Updates to the EchoWater Resource Recovery Facility were completed in 2023 to achieve permit and settlement requirements for ammonia and nitrate and compliance with pathogen requirements. The updates to the EchoWater Project are designed to remove 99 percent of ammonia and 89 percent of nitrogen from the wastewater through tertiary treatment. The result of this upgrade is cleaner treated water for discharge to the Sacramento River, which benefits the Sacramento-San Joaquin Delta downstream. The expansion also provides a drought-resistant source of recycled water for non-potable uses—like irrigating local agriculture and supporting habitat land for the Harvest Water program (Regional San 2023).

With conservation measures over the past three decades, per capita water use has decreased, which is a trend that is expected to continue (Regional San 2014: 6-2). In 2014, SacSewer (then Regional San) predicted that per capita consumption would fall 25 percent over the next 20 or more years through the ongoing installation and use of water meters, as well as compliance with recent conservation mandates. As such, substantial additional conservation is expected throughout the service area, which would allow the existing 181 mgd average dry-weather flow capacity to be adequate for at least 40 more years (Regional San 2014:6-2).

Stormwater Drainage

Stormwater is runoff from rain that drains off surfaces such as rooftops, paved streets, highways, or parking lots and can carry with it pollutants such as oil, pesticides, herbicides, sediment, trash, bacteria, and metals. The runoff can then drain directly into a local stream, lake, or bay. Often, the runoff drains into storm drains that eventually drain untreated runoff into a local water body.

Stormwater in the plan area historically flowed to Morrison Creek and Elder Creek. There is no formal stormwater infrastructure in the plan area; however, several previously mined areas now retain stormwater, connected by conveyor tunnels at South Watt Avenue, Hedge Avenue, Bradshaw Road, Jackson Road, and Fruitridge Road (Wood Rodgers 2022). Refer to Chapter 14, “Hydrology, Drainage, and Water Quality,” for further discussion of existing hydrology in the plan area.

Electricity and Natural Gas

In the WJHMP area, electricity is provided by Sacramento Municipal Utility District (SMUD), and natural gas service is provided by Pacific Gas and Electric Company. SMUD has existing 12-kilovolt and 69-kilovolt electric transmission and bulk substation infrastructure in the plan area. Chapter 9, “Climate Change,” and Chapter 11, “Energy,” include more information on climate change initiatives to reduce the demand for natural gas and electricity in the plan area.

Communications

Communication services in the plan area for mobile communication and wireless networks include the following providers: Frontier Communications, Consolidated Communications, and AT&T. These providers offer both voice and data communication services.

Solid Waste

Sacramento County Department of Waste Management and Recycling

Sacramento County Department of Waste Management and Recycling provides solid waste, recycling, and green waste services within the plan area. Services for residential homes include weekly garbage collection, bi-weekly collection of mixed recyclables, bi-weekly collection of green waste, monthly street sweeping and one annual appointment-based bulky waste collection. Solid waste and recycling services for multi-family apartments (five units or more), commercial and business solid waste services are performed on a contract basis with franchised haulers that are permitted to provide services in Sacramento County.

Kiefer Landfill

The Waste Management and Recycling Department operates the Kiefer Landfill at Keifer Boulevard and Grant Line Road. Kiefer Landfill is classified as a Class III municipal solid waste landfill and is permitted to accept general residential, commercial, and industrial refuse for disposal, including municipal solid waste, construction and demolition debris, green materials, agricultural debris, dead animals, and other designated debris. The landfill facility occupies 1,084 acres and is surrounded by a 3,000-acre open space buffer. The landfill itself occupies a 250-acre footprint and is permitted to grow to up to 660 acres in size. As of 2017, it had a remaining capacity of over 77 million cubic yards and has increased sustainable practice programs to continue to serve the region (Sacramento County 2017). Kiefer Landfill's anticipated "ceased operations date" (the estimated date when the facility will reach its permitted capacity), which anticipates future growth, is 2064 (CalRecycle 2023).

Regulatory Setting

Federal

Clean Water Act

The Clean Water Act (CWA) employs a variety of regulatory and nonregulatory tools to reduce direct pollutant discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff. The US Environmental Protection Agency (EPA) established primary drinking water standards in Section 304 of the CWA. States are required to ensure that the public's potable water meets these standards.

Section 402 of the CWA creates the NPDES regulatory program. Point sources must obtain a discharge permit from the proper authority (usually a state, sometimes EPA, a tribe, or a territory). NPDES permits cover various industrial and municipal discharges, including discharges from storm sewer systems in larger cities, stormwater associated with numerous kinds of industrial activity, runoff from construction sites disturbing more than 1 acre, and mining operations. All so-called "indirect" dischargers are not required to obtain NPDES permits. "Indirect" dischargers send wastewater into a public sewer

system, which carries it to the municipal sewage treatment plant, through which it passes before entering a surface water.

The Municipal Stormwater Permitting Program regulates stormwater discharges from municipal separate storm sewer systems (MS4s). Sacramento County is an MS4 co-permittee with the Cities of Citrus Heights, Folsom, Galt, Rancho Cordova, Sacramento, and Elk Grove. NPDES permits are issued for 5-year terms.

The quality of the effluent that can be discharged to waterways in the Sacramento area by the SRWTP is established by the Central Valley RWQCB through waste discharge requirements (WDRs) that implement the NPDES permit. WDRs are updated at least every 5 years. A new permit must be issued in the event of a major change or expansion of the facility. In April 2021, the Central Valley RWQCB issued Order No. R5-2021-0019-01, NPDES No. CA 0077682, to SacSewer (then Regional San) for the Echo Water facility, which treats wastewater from its service area before discharging the treated effluent into the Sacramento River. The Central Valley RWQCB amended the NPDES permit (R5-2021-0019-01) to include the production of recycled water by the EchoWater Project in accordance with the 2018 conditionally accepted Title 22 Engineering Report by the Division of Drinking Water. The water quality objectives established in the Central Valley RWQCB Basin Plan are protected, in part, by Order No. R5-2021-0019-01, NPDES No. CA 0077682. Currently, the SRWTP is permitted for a discharge of up to 181 mgd of treated effluent into the Sacramento River.

STATE

CALIFORNIA INTEGRATED WASTE MANAGEMENT ACT AND CALRECYCLE

The Integrated Waste Management Act of 1989 is the result of two pieces of legislation, Assembly Bill (AB) 939 and Senate Bill (SB) 1322, which created the California Integrated Waste Management Board (later renamed the California Department of Resources Recycling and Recovery [CalRecycle]). The Integrated Waste Management Act mandated a goal of 25 percent diversion of each city's and county's waste from disposal by 1995 and 50 percent diversion in 2000, with a process to ensure environmentally safe disposal of waste that could not be diverted.

CalRecycle is the state agency designated to oversee, manage, and track California's 92 million tons of waste generated each year. They provide grants and loans to help California cities, counties, businesses and organizations meet the state's waste reduction, reuse and recycling goals.

SB 1016, signed into law on September 26, 2008, represents a fundamental shift in the way local jurisdictions are measured for compliance with state diversion mandates. Jurisdictions are now evaluated based on the implementation of programs that measure per capita waste disposal, rather than diversion percentage.

SB 1383, signed into law in 2016, requires that organic materials are kept out of landfills and targets a 50 percent reduction of statewide organic waste disposal from the 2014 level by 2020, and a 75 percent reduction by 2025. The bill grants CalRecycle

regulatory authority to achieve the organic waste disposal reduction targets and establishes an additional target that no less than 20 percent of currently disposed edible food is recovered for human consumption by 2025.

LOCAL

SACRAMENTO COUNTY CODE

County Code 6.32.005, On-site Management of Wastewater provides a comprehensive on-site wastewater management program by adopting minimum standards for the siting, design, construction, installation, repair, modification, operation, replacement, maintenance, monitoring, and destruction of on-site wastewater treatment systems and for the storage, processing, treatment, handling and transportation of wastewater in Sacramento County.

SACRAMENTO AREA SEWER DISTRICT SYSTEM CAPACITY PLAN

SacSewer's System Capacity Plan comprehensively addresses existing and buildout sewer capacity needs. Existing capacity needs are based on SacSewer's current sewer system conditions. Buildout capacity needs are based on providing sewer service to the entire SacSewer service area in the future. The plan estimates ESDs and updates the conceptual plans for providing sewer service to future development.

SACRAMENTO REGIONAL SOLID WASTE AUTHORITY

The Sacramento Regional Solid Waste Authority (SWA) is a joint powers authority of Sacramento County and the City of Sacramento. SWA was formed in December 1992 to assume responsibility for solid waste, recycling, and disposal needs for businesses and apartment complexes in the Sacramento area. SWA regulates commercial solid waste collection by franchised haulers and offers recycling services to multi-family dwelling units.

SWA ORDINANCES

The SWA has adopted three recycling ordinances that target three distinct waste streams: (1) the Business Recycling Ordinance, adopted in 2007 for commercial generators who subscribe to 4 cubic yards or more of refuse service per week; (2) the Certification of Construction and Demolition (C&D) Debris Sorting Facilities Ordinance, adopted in 2008, which creates a program for mixed C&D facilities that dovetails with both city and county C&D ordinances for builders; and (3) the Multifamily Recycling Ordinance, adopted in 2009, which requires owners of multifamily properties with more than five units to subscribe to a recycling service for their tenants.

WEEKLY CURBSIDE ORGANICS COLLECTION

To comply with SB 1383 and CalRecycle's green waste targets, curbside green waste collection began in SWA territory in 2022. All residents must separate organics from their garbage and put organic material into the organics waste bin.

SACRAMENTO COUNTY 2030 GENERAL PLAN

The majority of the policies in the General Plan pertain to service providers and not to development projects. The policies in the Public Facilities Element that support the County's Solid Waste Services strategies and are relevant to the project relate to fees to support adequate waste facilities. The following policies of the 2030 General Plan would apply to the project:

- **Policy LU-62.** Community and Specific Plans for agricultural-residential areas shall provide for the extension of public sewer and water systems to one and two acre lots.
- **Policy LU-73.** Sewer and water treatment and delivery systems shall not provide for greater capacity than that authorized by the General Plan.
- **Policy LU-109.** County departments shall coordinate implementation of electric service delivery, air quality, water supply, transportation, drainage/flood control, solid waste disposal/recycling, and hazardous waste management plans in conjunction with vested public and quasi-public agencies.
- **Policy PF-6.** Interceptor, trunk lines, and flow attenuation facilities shall operate within their capacity limits without overflowing.
- **Policy PF-7.** Although sewer infrastructure will be planned for full urbanization consistent with the Land Use Element, an actual commitment of additional sewer system capacity will be made only when the land use jurisdiction approves development to connect and use the system.
- **Policy PF-8.** Do not permit development which would cause sewage flows into the trunk or interceptor system to exceed their capacity.
- **Policy PF-9.** Design trunk and interceptor systems to accommodate flows generated by full urban development at urban densities within the ultimate service area. System design may take into consideration land that cannot be developed for urban uses due to long-term circumstances including but not limited to conservation easements, floodplains, public recreation areas etc. This could include phased construction where deferred capital costs are appropriate.
- **Policy PF-10.** Development along corridors identified by the Sanitation Districts in their Master Plans as locations of future sewerage conveyance facilities shall incorporate appropriate easements as a condition of approval.
- **Policy PF-11.** The County shall not support extension of the regional interceptor system to provide service to areas within the unincorporated County which are beyond the Urban Service Boundary. This shall not prohibit the County from supporting the extension of the regional interceptor system to areas outside the USB which are being proposed for annexation to a city.
- **Policy PF-14.** Independent community sewer systems shall not be established for new development.

- **Policy PF-15.** Support CSD-1 and SRCSD policies to fund new trunk and interceptor capital costs through connection fees for new development.
- **Policy PF-16.** Support SRCSD policy to fully fund treatment plant operation through monthly service charges to system users. Fund treatment plant expansion and upgrades and existing trunk and interceptor replacements or improvements through connection fees or other revenue sources.
- **Policy PF-18.** New development projects which require extension or modification of the trunk or interceptor sewer systems shall be consistent with sewer facility plans and shall participate in established funding mechanisms. The County should discourage development projects that are not consistent with sewer master plans or that rely upon interim sewer facilities, particularly if the costs of those interim facilities may fall on ratepayers. Prior to approval of a specific Commercial Corridor redevelopment project which requires extension or modification of the trunk or interceptor sewer systems, a sewer study and financing mechanism shall be prepared and considered along with the proposed Corridor redevelopment project, in consultation with the Sacramento Area Sewer District.
- **Policy PF-19.** Extension or modification of trunk or interceptor sewer systems that are required for new developments shall be consistent with sewer facility plans and shall participate in an established funding mechanism. New development that will generate wastewater for treatment at the SRWTP shall not be approved if treatment capacity at the SRWTP is not sufficient to allow treatment and disposal of wastewater in compliance with the SRWTP's NPDES Permit.
- **Policy PF-20.** Support the implementation of recycling programs for the unincorporated area of Sacramento County through the Source Reduction and Recycling Element of the County Integrated Waste Management Plan in order to meet the requirements of AB 939.
- **Policy PF-23.** Solid waste collection, handling, recycling, composting, recovery, transfer and disposal fees shall recover all capital, operating, facility closure and maintenance costs.
- **Policy PF-24.** Solid waste disposal fees and rate structures shall reflect current market rates and provide incentives for recovery.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan, which was developed in 1985, provides guidance for growth and development in the community planning area. Policies identified in the plan that are applicable to the WJHMP include:

- **Policy PF 1.** To provide adequate and appropriate infrastructure and public service to all residents and businesses of the Vineyard community.
- **Policy PF 2.** Restrict the premature or unnecessary extension of public sewage systems into or through open, undeveloped areas which would promote non-contiguous development.
- **Policy FU 3.** All types of urban development proposals must be accompanied by a detailed public service plan and specific timing and funding programs for the implementation and maintenance of services.
- **Policy FU 4.** Urban developers shall provide public sewer and surface water facilities and shall bear the full cost of providing these facilities within the proposed development and a fair share of any associated costs outside the development.
- **Policy FU 6.** Water conservation, waste handling and energy-efficient designs at least to minimum County standards will be encouraged in all residential developments.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan, which was last updated in 2003, provides guidance for both new development and the redevelopment of existing land uses within the community planning area. Objectives identified in the plan that are applicable to the WJHMP include:

- **Objective PS-1.** Provide a well-planned sewer service with adequate capacity to serve the community and accommodate new growth areas during the identified planning period.
- **Objective PS-4.** Provide and maintain a solid waste collection and disposal service for all areas of the community, while reducing the amount of solid waste generated within the community area through reduction and recycling.
- **Objective PS-6.** Ensure the availability and accessibility of public services for all segments of the population.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

An impact related to wastewater or solid waste would be significant if implementation of the project would:

- require or result in the relocation or construction of new or the expanded wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunication facilities, the construction of which could cause environmental effects;

- result in a determination by the waste water treatment provider, which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments;
- generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; or
- result in non-compliance with federal, state, and local management and reduction statutes and regulations related to solid waste.

Issues Not Discussed Further

Adverse Effects Associated with Construction of Natural Gas Infrastructure

The WJHMP would be an all-electric development; no natural gas infrastructure has been planned for future buildings. As a result, there would be no potential for adverse effects associated with construction of natural gas infrastructure to serve the project. This issue is not discussed further.

Compliance with Federal, State, and Local Management and Reduction Statutes and Regulations Related to Solid Waste

Future development of the plan area would generate solid waste associated with domestic use (e.g., food waste, paper, limited medical-related waste) and construction-related waste from grading, clearing, and erecting buildings. Construction and operation of the future development in the plan area would follow all relevant federal, state, and local statutes and regulations associated with collection and disposal of waste generated at the site. Thus, there would be no impact related to violation of solid waste laws and regulations. This topic is not discussed further.

Methodology

The following analysis is based on the estimated population, buildout assumptions from the WJHMP, and land use plans described in Chapter 2, "Project Description," as well as applicable utility master plans to assess existing public utilities capacity and future needs. The analysis of sewer capacity is based on the results of a study that was prepared for the WJHMP by design firm Wood Rodgers to estimate service standards and needs for the sewer service to the plan area. The generation rates published by the applicable oversight agencies have been applied to determine the potential volume of wastewater and solid waste produced under full buildout of the WJHMP. Disposal rates and landfill estimates are drawn from CalRecycle data. The data is compared to the available capacity of the infrastructure to determine if the WJHMP can be accommodated, or if additional capacity would be needed.

WEST JACKSON HIGHWAY MASTER POLICIES

The WJHMP includes the following policies related to public infrastructure:

- **Policy 7.1.** Future developments within the Plan Area shall coordinate with local service purveyors to ensure the provision of services in conjunction with project phasing.
- **Policy 7.3.** Adequate wastewater infrastructure shall be installed to meet the needs of the Plan Area.

IMPACTS AND ANALYSIS

IMPACT PU-1: RESULT IN ADVERSE EFFECTS ASSOCIATED WITH CONSTRUCTION OF EXPANDED WASTEWATER TREATMENT INFRASTRUCTURE

Development of the WJHMP would require increased municipal wastewater service. As indicated in Chapter 2, “Project Description,” the project would include annexation of the plan area into the Urban Planning Area. With annexation, SacSewer would be the local wastewater collector and continue to build infrastructure to accommodate development as it occurs. SacSewer already operates gravity mains, force mains, and interceptors in the plan area.

Through Policy 7.3, the WJHMP commits to the installation of wastewater infrastructure that adequately meets the needs of the plan area. Generally, future development would connect to the existing infrastructure within and immediately adjacent to the plan area. As described further below, the impacts associated with construction of infrastructure within the boundaries of the plan area would be within the scope of the analysis presented throughout this EIR. The Sanitary Sewer Study (Wood Rodger 2023), which has been reviewed by SacSewer, also identified limited offsite improvements that would be necessary to provide service to the plan area.

As illustrated in Figure 2-11 and described above, there are two existing interceptor lines within the plan area, the Bradshaw Interceptor and the Northeast Interceptor. In addition, the Central Interceptor is located within South Watt Avenue at the western boundary of the plan area. The interceptors connect to drain south and west to the EchoWater Resource Recovery Facility. A new interceptor is proposed along Florin Road. From Excelsior Road west to the edge of the plan area near Bradshaw Road, the construction of this trunk line would occur within the road right of way and the area of disturbance assumed throughout this EIR. From the edge of the plan area to the existing Bradshaw Interceptor along Morrison Creek (approximately 1.5 miles), the new interceptor would be constructed within the right of way of Florin Road outside of the plan area. Similarly, trunk line extensions would occur along Jackson Highway for approximately 0.5 mile east of the plan area and less than 0.5 mile along Elder Creek Road between Hedge Avenue and South Watt Avenue. Substantial adverse

environmental effects are not anticipated to result from construction of this infrastructure within the previously disturbed and actively managed roadways.

The Sanitary Sewer Study demonstrates that it is possible to provide sewer service for the project and technical compliance with the Sewer System Capacity Plan (SacSewer 2020). The study creates a schematic of backbone trunk system but does not include lateral mains because street patterns are not yet defined in the WJHMP area. The new infrastructure required for the project would be located within road rights-of-way. Major sheds in the plan area were divided into sub-sheds and combined, were possible, to limit infrastructure needs, and then assigned estimated ESDs, which are used to analyze contributions to nodes on the collection system. The areas that were mined would need to be serviced by lift stations due to the resultant topographic variations of the plan area. Areas that were not mined within the WJHMP would use a gravity main to sewer the sub-sheds. Necessary infrastructure size was calculated with an iterative process and phasing was created to serve initial construction within the WJHMP area.

The Sacramento County Code regulates public sewage systems within the county. The County Code Chapter 6.32 and NPDES General Construction Permit regulate on-site management of wastewater and land grading and erosion control requirements for construction related to connection, design, and operation of wastewater systems to ensure public safety and to lessen environmental impacts. Wastewater service for proposed development is subject to regulatory review and compliance with the System Capacity Plan (SacSewer 2020) to minimize environmental effects of wastewater system expansion.

For areas outside of the urbanized area, SacSewer's Sewer System Capacity Plan assumes that potential densities could be similar to those projected for near-term urban development. The Sanitary Sewer Study assumes that the project would generate 27,133 ESDs, with an average density of 4.6 ESDs per acre over the 5,913 acres of the plan area, and demonstrates the system capacity is adequate with build out of lift stations and associated trunk lines in the WJHMP area (Wood Rodgers 2023). The Sanitary Sewer Study demonstrates consistency with the assumptions in SacSewer's 2020 Sewer Capacity Plan, and compliance with Sacramento County 2023 General Plan Policies PF-9 and PF-18, which would require sewer systems to accommodate flows generated by urban development in the service area while being in compliance with sewer facility plans.

Construction of wastewater infrastructure would require ground disturbance and trenching within the plan area. These activities are within the scope of the development identified for the WJHMP and the effects are evaluated throughout this EIR. For example, Chapter 6, "Air Quality," Chapter 9, "Climate Change," and Chapter 16, "Noise," evaluate increases in air pollutant and greenhouse gas emissions, and noise levels associated with all construction activities, including any ground disturbance needed for connecting to existing water infrastructure, as well as increases in emissions associated with the project's water demands. Chapter 8, "Biological Resources," evaluates the effects of ground disturbance on habitats and special status species. Chapter 10, "Cultural Resources," evaluates the potential impacts that trenching and

excavation, including any ground disturbance needed for connecting to existing water infrastructure, may have on buried resources. Chapter 12, “Geology, Soils, and Mineral Resources,” Chapter 13, “Hazards and Hazardous Materials,” and Chapter 14, “Hydrology, Drainage, and Water Quality,” evaluate the potential impacts that trenching and excavation, including any ground disturbance needed for connecting to existing infrastructure, may have related to erosion and siltation, degradation of water quality, and the release of contamination into the environment.

The anticipated demand for sewer services and proposed on- and off-site wastewater infrastructure would be consistent with regional projections developed by SacSewer. Implementation of the mitigation measures identified throughout this EIR and compliance with the Sacramento County Code and General Construction Permit would address areas of potential effects associated with the construction of necessary infrastructure within the plan area. The limited off-site wastewater trunk line and interceptor connections would not be anticipated to result in substantial adverse environmental effects due to location within developed road rights of way with the implementation of standard best practices. There would be a **less-than-significant** impact associated with construction of expanded wastewater treatment infrastructure.

Mitigation Measures

No mitigation is required in addition to the measures proposed for other ground-disturbing activities associated with the project.

Impact PU-2: Result in Adverse Effects Associated with Construction of Stormwater Infrastructure

The WJHMP includes a stormwater delivery and storage network within the plan area and would not require off-site infrastructure improvements. The master drainage system features a trunk drainage conveyance system that includes culverts that are designed to distribute stormwater flows to a concentrated network of 26 detention basins. The detention basins would attenuate the stormwater flows, discharging through gravity or managed pumping to the planned Rock Creek Parkway open drainage channel, Morrison Creek, or Elder Creek. The WJHMP has incorporated low-impact design and runoff reduction features for stormwater improvement facilities within the planning document. Piped drainage systems are proposed to connect the development to the basin detention system. The pipes would discharge to either a constructed natural channel along the future Rock Creek Parkway or detention basins prior to being discharged to Morrison or Elder Creeks. The pipes to connect the drainage systems would be constructed along roadways and trails to the extent possible and would be between 8 and 36 inches in diameter throughout the system. As described above in Impact PU-1, the physical environmental effects of constructing this infrastructure are evaluated throughout this EIR.

The detention basins and piped stormwater drainage systems would be designed to reduce adverse effects of construction, operation, and maintenance of stormwater infrastructure through compliance with the Stormwater Quality Design Manual for the

Sacramento Region, NPDES General Construction Permit to regulate land grading and erosion control requirements for construction related to connection, design, and operation of drainage systems to ensure public safety and to lessen environmental impacts, storm water pollution prevention plans, required stormwater best management practices, General Plan policies, and low-impact design features.

Construction of stormwater infrastructure would require ground disturbance and trenching within the plan area. As discussed above in Impact PU-1, these activities are within the scope of the development identified for the WJHMP and the effects of these facilities are evaluated throughout this EIR. Stormwater infrastructure within the plan area would not generate separate or additional environmental effects. This impact would be **less than significant**.

Mitigation Measures

No mitigation is required in addition to the measures proposed for other ground-disturbing activities associated with the project.

Impact PU-3: Result in Adverse Effects Associated with Construction of Electric Power and Telecommunications Facilities

The WJHMP would demand substantially more energy than is currently used in the plan area, particularly due to growth related to new residences, office space, and retail. Telecommunication facilities would be installed to provide internet services to residential and nonresidential buildings. The types of impacts anticipated to result from implementation of the WJHMP would include the construction of new electrical substations infrastructure, in addition to the existing bulk substation, and the construction or undergrounding of energy transmission and/or distribution lines. These infrastructure improvements would be within the plan area and are comprehensively analyzed in this EIR. For example, distribution lines to individual parcels would be extended from existing infrastructure adjacent to and within the WJHMP area as development occurs. The potential for cumulative development in the Jackson Highway area to result in additional infrastructure demands is discussed in Chapter 21, "Summary of Impacts and Their Disposition." Refer to the "Cumulative Impacts" subsection for a discussion of offsite electrical facilities that could result from cumulative energy demand in the area. The providers would review future tentative subdivision maps at the time of future entitlement requests and provide the requirements to extend service for telephone, cable TV, and high-speed data line services to each map area at the time of the processing of the map. This impact would be **less than significant**.

Mitigation Measures

No mitigation is required in addition to the measures proposed for other ground-disturbing activities associated with the project.

IMPACT PU-4: EXCEED THE CAPACITY OF THE WASTEWATER TREATMENT PROVIDER

As discussed above, the EchoWater Project is permitted to treat and release 181 mgd of wastewater into the Sacramento River. With conservation measures over the past three decades, per capita water use has decreased, which is a trend that is expected to continue (Regional San 2014: 6-2). As of 2023, the EchoWater Project received and treated an average of 135 mgd each day (Regional San 2023). That leaves a capacity for 46 mgd of wastewater that could be treated at the facility. The 2023 Sewer Study Amendment for the WJHMP area notes that approximately 27,133 ESD's (or 8.4 mgd average dry weather flow) of wastewater would be generated from the project (Wood Rodgers 2023). This estimated wastewater use number is based on the 2013 SacSewer Standards and Specifications (Wood Rodgers 2023). The project is proposed to span 5,913 acres, which would mean the project would generate approximately 8.4 mgd of average dry weather flow of wastewater that would be treated at the EchoWater facility.

Implementing the project would increase the existing treatment plant flows but would be within EchoWater's 181 mgd daily capacity and SacSewer's System Capacity Plan. Therefore, it is anticipated that EchoWater would have adequate capacity to treat wastewater flows generated by future development. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT PU-5: GENERATE SOLID WASTE IN EXCESS OF STATE STANDARDS OR IN EXCESS OF THE CAPACITY OF LOCAL INFRASTRUCTURE

Buildout of the project would result in approximately 45,661 new residents. CalRecycle estimates a daily per resident disposal rate of 6.7 pounds (CalRecycle 2021). This results in an estimated generation rate of 139 tons per day upon buildout of the project that would be collected by the County and transferred to Kiefer Landfill. CalRecycle reports that in 2022 unincorporated Sacramento County disposed of 4.6 pounds per day per resident, which is below the area's target of 7.7 pounds per day per resident and is in compliance with AB 939's waste diversion requirements (CalRecycle 2022). This estimate is less than the statewide average, which Keifer Landfill would continue to be able to accommodate, see Table 18-1. Kiefer Landfill's permitted capacity is approximately 117 million cubic yards. As of 2005, the landfill had a remaining capacity of approximately 113 million cubic yards (i.e., 96 percent remaining) (CalRecycle 2023). The estimated closure date for Kiefer Landfill is 2064. The project would produce less than 1 percent of the 10,815-ton permitted daily throughput for the facility. This small increase in solid waste would not consume a substantial proportion of the available permitted capacity and would not result in the need to expand or construct new landfill facilities.

Table 18-1 Solid Waste Contributions to Keifer Landfill

California Average Solid Waste Disposal (lbs/person/day)	Estimated Waste Generation (tons/day)	Unincorporated Sacramento County Average Solid Waste Disposal (lbs/person/day)	Estimated Waste Generation (tons/day)	Keifer Landfill Daily Limit (tons)
6.7	138.8	4.6	95.27	10,815
Percentage of Keifer Landfill daily permitted capacity	**1.2%**		**0.8%**	

Notes: lbs = pounds; 1 ton is equal to 2,204.6 lbs.

Sources: CalRecycle 2021, 2022; Sacramento County 2016.

With the implementation of SB 1383 (2016) Sacramento County now offers weekly organic waste collection services to residents. As the program gains popularity and as residents become familiar with the program, more waste will be diverted from the landfill per capita. Due to increasing green waste diversions, the above estimations of the WJHMP contributing 1 percent of Keifer's Landfill's daily throughput is conservation. The use of organic waste collection will contribute less waste to the Kiefer Landfill and may, therefore, cause less impact than analyzed above on Keifer Landfill from the WJHMP development.

Based on the available capacity of Kiefer Landfill, the rise in green waste diversions from the landfill waste stream, the portion of the permitted capacity that the WJHMP is estimated to use, and the estimated closure date for the landfill, the WJHMP would be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs. Commercial and industrial waste generated by the project would be collected by franchise haulers and may be transported to landfills outside of the county. The impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

19 TRANSPORTATION

INTRODUCTION

This chapter evaluates the potential transportation impacts resulting from implementation of the WJHMP. It describes the applicable federal, state, and local transportation regulations and policies; discusses the existing roadway network and transportation facilities within the WJHMP area; and analyzes the potential impacts from implementation of the WJHMP on the transportation system. Mitigation measures that would reduce impacts, where applicable, are also discussed. The analysis in this chapter is based on analyses and findings of the Local Traffic Study and the Vehicle Miles Traveled (VMT) Analysis Memos prepared for the WJHMP (DKS Associates 2024; DKS Associates 2023; Kimley-Horn 2023), which evaluate the effects of the WJHMP based on County CEQA significance thresholds contained within the County General Plan and Transportation Analysis Guidelines (TAG). Pursuant to Senate Bill (SB) 743, Public Resources Code Section 21099, and California Code of Regulations Section 15064.3(a), generally, VMT is the most appropriate measure of transportation impacts and a project's effect on automobile delay shall no longer constitute a significant impact under CEQA. Please note that the Local Traffic Study used level of service (LOS) as the metric to determine impacts related to traffic operations which informed the safety hazards analysis herein (Impact TR-4 below). The Local Traffic Study and VMT Memos are included as Appendix K of this EIR.

Comments received regarding transportation in response to the notice of preparation (NOP) expressed concerns about bicycle and pedestrian facilities, transportation demand management, and access to public transit. As detailed above, the transportation analysis herein evaluates impacts using VMT and does not include LOS analysis as it relates to vehicle delay. Therefore, comments related to congestion are not addressed herein. The NOP and comments received in response to it are presented in Appendix A.

ENVIRONMENTAL SETTING

This section describes the existing environmental setting, which is the baseline scenario against which project-specific impacts are evaluated. The environmental setting for transportation includes descriptions of roadway, transit, bicycle, and pedestrian facilities.

ROADWAY SYSTEM

County roadways are classified as freeways, thoroughfares, arterials, collectors, and local streets. A description of each, as described in the County General Plan, is provided below:

- **Freeways** are multilane divided highways with a minimum of two lanes for the exclusive use of traffic in each direction and full control of access without traffic

interruption. Freeways provide for high-speed through-traffic movement on continuous routes. Freeways connect points within the county and link the county to other parts of the state. The following major freeways traverse the unincorporated county: Interstate (I)-5, I-80, State Route (SR) 99, SR 16, and United States (US) 50.

- **Thoroughfares** provide for mobility within the county, carrying through traffic on continuous routes and providing transportation links between major residential, employment, commercial, and retail areas.
- **Arterials** provide for a link between thoroughfares with their limited access and through movement capacity and collectors which have greater access and serve local streets. Arterials can also provide mobility and direct access within commercial and retail corridors through two-way left-turn lanes.
- **Collectors** provide for mobility within communities and connect local roads to thoroughfares and arterials.
- **Local streets** provide direct access to abutting property and connect with other local roads and collectors. Local streets are typically developed as two-lane undivided roadways (Sacramento County 2022a: 7-8).

Existing Roadways

The following key roadways provide regional and local access into the WJHMP area:

- **US 50** is an east-west freeway that extends from the I-80 junction in West Sacramento to Canal Street in the city of Placerville where it continues as a highway across the Sierra Nevada to South Lake Tahoe and Nevada.
- **SR 16**, also referred to as Jackson Highway, is a freeway that generally travels west-northwest to east-southeast from Folsom Boulevard to the west into Amador County to the east. It is generally a two-lane roadway with some wider width at intersections.
- **Bradshaw Road** is a north-south arterial roadway that crosses through the WJHMP area. To the north, Bradshaw Road provides access to US 50, Folsom Boulevard, and the city of Rancho Cordova. To the south, Bradshaw Road continues to Grant Line Road in the city of Elk Grove. Bradshaw Road has two to six through lanes.
- **Elder Creek Road** is an east-west collector roadway with two to four through lanes that crosses the WJHMP area. To the west, Elder Creek Road extends to Stockton Boulevard where it becomes 47th Avenue. To the east, Elder Creek Road extends to Excelsior Road.
- **Excelsior Road** is a two lane north-south minor collector roadway that forms the eastern boundary of the plan area. The roadway becomes Mather Boulevard north of the Independence at Mather community. To the south, Excelsior Road extends to Sheldon Road in the city of Elk Grove.

- **Florin Road** is an east-west arterial roadway that forms the southern boundary of a portion of the WJHMP area. To the west, Florin Road terminates at Riverside Boulevard in the Pocket area of the city of Sacramento. It provides access to SR 99 and I-5. To the east, Florin Road extends to Sunrise Boulevard. Florin Road has two to six through lanes.
- **Fruitridge Road** is an east-west arterial roadway that crosses and becomes a collector roadway within the WJHMP area. To the west, the roadway provides access to SR 99 and extends to South Land Park Drive in the city of Sacramento. To the east, Fruitridge Road extends to Mayhew Road. Fruitridge Road has two to four through lanes.
- **Kiefer Boulevard** is an east-west local roadway that crosses the WJHMP area. The roadway consists of two segments, divided by Mather Airport. The western segment extends from Florin-Perkins Road in the city of Sacramento through the Rosemont community to Happy Lane. This segment has two to four through lanes. East of Mather Airport, the roadway begins at Eagles Nest Road and continues easterly to Jackson Highway as a two-lane roadway.
- **Mayhew Road** is a north-south roadway that crosses the WJHMP area. The roadway consists of three segments. The northern segment, which is a two-lane major collector roadway with extra turning lanes, begins at Folsom Boulevard to the north and extends south to a dead-end in a residential area of the Rosemont community south of Oxwood Drive/Calibra Lane. The central segment, which is a two-lane local roadway, begins at a dead-end in a commercial area north of Jackson Highway and extends south to a dead-end south of Fruitridge Road. The southern segment, also a two-lane local road, extends northerly from Elder Creek Road to a dead-end. South of Fruitridge Road, the roadway continues as Mattos Lane.
- **South Watt Avenue** forms the western boundary of a portion of the WJHMP area. The north-south principal arterial roadway extends north to Folsom Boulevard where it becomes Watt Avenue. Watt Avenue provides access to US 50 and extends northerly across the American River. To the north, it provides access through northern Sacramento County to I-80 and into Placer County. To the south, South Watt Avenue extends to Florin Road, where it becomes Elk Grove Florin Road. Elk Grove Florin Road extends to Stockton Boulevard in the city of Elk Grove. South Watt Avenue has two to six through lanes.

Transit System

The Sacramento Regional Transit District (SacRT) operates over 82 bus routes (fixed-route, microtransit, and dial-a-ride), 44 miles of light rail, and Americans with Disabilities Act (ADA) paratransit services within a 440-square-mile service throughout Sacramento County. Buses operate daily from 5:00 a.m. to 11:00 p.m. every 15 to 60 minutes, depending on the route. Light rail transit (LRT) trains begin operation at 4:00 a.m. with service every 15 minutes during the day and every 30 minutes in the evening. Blue Line and Gold Line trains operate daily until approximately 12:30 a.m., and Green Line trains only operate Monday through Friday (SacRT 2023a). Passenger amenities include 53

LRT stations, 30 bus and light rail transfer centers, and 22 free park-and-ride lots. SacRT also serves over 3,200 bus stops throughout Sacramento County (SacRT 2023a).

SacRT Gold Line LRT service is located parallel to Folsom Boulevard north of the WJHMP area. Nearby stations include College Greens, Watt/Manlove, Starfire, Tiber, and Butterfield from west to east. The closest Gold Line LRT station is the Watt/Manlove station which is approximately 1 mile north of the WJHMP area. SacRT also contracts with the City of Rancho Cordova to operate the Rancho CordoVan shuttle services. There are three routes that serve the local communities in Rancho Cordova: Route 175, Route 176, and Route 177. The Rancho CordoVan stop that is nearest to the WJHMP area is located on Justinian Drive, approximately 2.8 miles east of the WJHMP area.

SacRT bus Route 72 runs along Keifer Avenue, north of the WJHMP area. The Route 72 bus stops nearest to the WJHMP area are located along Branch Center Road, approximately 0.18 miles west of the WJHMP perimeter. Elk Grove Commuter Route E19 runs northeast from Laguna and Harbor Point to Butterfield LRT on Bradshaw Road, which passes directly through the WJHMP area. There is a Route 19 bus stop located at Bradshaw Road and Kiefer Boulevard adjacent to the eastern perimeter of the WJHMP area. Table 19-1 includes additional information about the route, frequency, and span of Routes 72 and E19.

Table 19-1 SacRT Bus Route Schedule Summary

Route	Weekday		Saturday		Sunday and Holidays	
	Frequency (min)	Span	Frequency (min)	Span	Frequency (min)	Span
72 – Mather Field/Mills to Watt/Manlove	30	5:45 a.m. – 9:30 p.m.	60	7:30 a.m. – 9:00 p.m.	60	7:30 a.m. – 8:00 p.m.
E19 – Laguna & Harbor Point to Butterfield LRT	Laguna & Harbor Point to Butterfield LRT: • 3 morning buses approx. every 60 minutes starting at 4:45 a.m. • 1 afternoon bus at 3:30 p.m. Butterfield LRT to Laguna & Harbor Point: • 1 morning bus at 5:45 a.m. • 3 afternoon buses approx. every 60 minutes starting at 2:45 p.m.		No service	-	No service	-

Note: Schedule time span noted to the nearest 15 minutes.

Source: SacRT 2023a.

Bicycle System

The bicycle system in the county is composed of bikeways and shared use paths along with amenities that improve safety, comfort, and convenience for people biking. The County Active Transportation Plan classifies bicycle facilities into the following types (Sacramento County 2022a: 50):

- **Shared-Use Paths (Class I)**: Dedicated paths for walking and bicycling completely separate from the roadway.
- **Bicycle Lanes (Class II)**: Striped lanes for bicyclists. Bicycle lanes can also include striped "buffer" areas between the bicycle and travel lane or between the bicycle lane and parked cars (sometimes both).
- **Buffered Bicycle Lane (Class IIB):** Bicycle lanes that include a striped "buffer" area either between the bicycle lane and the travel lane or between the bicycle lane and parked cars (sometimes in both locations).
- **Bicycle Routes (Class III)**: Signed routes for bicyclists on low-speed, low-volume streets where roadway space is shared with motorists.
- **Bicycle Boulevard (Class IIIB)**: Routes on low-speed, low-volume streets where roadway space is shared with people driving, enhanced with traffic calming features or other treatments to prioritize the comfort of people biking.
- **Separated Bikeway (Class IV)**: On-street bicycle facilities with a physical barrier between the bicycle lane and motor vehicle lane(s). Barriers can include bollards, curbs, elevation, or parking. These facilities may be bidirectional or unidirectional.

As of 2022, the unincorporated county's bicycle system was comprised of approximately 304 miles of bicycle facilities including approximately 64 miles of shared-use paths, 224 miles of bicycle lanes, 2 miles of buffered bicycle lanes, and 14 miles of bicycle routes. There are Class II bicycle lanes present along South Watt Avenue and Bradshaw Road within the WJHMP area. The County's Active Transportation Plan recommends 108 miles of upgraded bicycle facilities and 1,110 miles of new dedicated bicycle corridors totaling 1,522 miles of recommendations across unincorporated Sacramento County (Sacramento County 2022a: 104).

Pedestrian System

The pedestrian system in the county is composed of sidewalks and shared use paths. The County Active Transportation Plan classifies pedestrian facilities into the following four types:

- **Vertical Curbs**: Curbs rise straight up to the sidewalk level and are the current standard within Sacramento County.
- **Rolled Curbs**: Curbs are sloped and can allow vehicles to encroach onto the sidewalk, providing more roadway width at the expense of pedestrian pathway conflicts.
- **Attached Sidewalks**: Connect directly to the curb and provide minimal lateral separation from the roadway.
- **Detached Sidewalks**: Separated from the curb with a buffer area, typically a planting strip or special paving material to provide greater separation from the roadway (Sacramento County 2022a: 39).

As of 2022, there were approximately 1,100 miles of roads throughout the unincorporated county. Approximately 13 percent of these roads had sidewalks on both sides of the street, 21 percent had sidewalks on one side of the street, and 66 percent of streets had no sidewalks (Sacramento County 2022a: 40). There are sidewalks along the eastern side of Bradshaw Road between Kiefer Boulevard and the southern edge of the Sacramento Municipal Utility District (SMUD) East Campus Operation Center; along the southern portion of Kiefer Boulevard between Bradshaw Road and the eastern frontage of the SMUD East Campus Operations Center; and along the Elder Creek Road/Bradshaw Road within the WJHMP area.

Regulatory Setting

Federal

No federal plans, policies, regulations, or laws related to transportation are applicable to the WJHMP. However, federal regulations related to the ADA, Title VI, and environmental justice relate to transit service.

State

California Department of Transportation

The California Department of Transportation (Caltrans) is the state agency responsible for the design, construction, maintenance, and operation of the California State Highway System, as well as the segments of the Interstate Highway System that lie within California. Caltrans District 3 is responsible for the operation and maintenance of SR 16 that runs through the WJHMP area. Caltrans requires a transportation permit for any transport of heavy construction equipment or materials that necessitates the use of oversized vehicles on state highways.

Transportation Impact Study Guide

The Caltrans Transportation Impact Study Guide (TISG) was prepared to provide guidance to Caltrans Districts, lead agencies, tribal governments, developers, and consultants regarding Caltrans' review of a land use project or plan's transportation analysis using a VMT metric. This guidance is not binding on public agencies, and it is intended to be a reference and informational document. The TISG replaces the Guide for the Preparation of Traffic Impact Studies and is for use with local land use projects, not for transportation projects on the State Highway System (Caltrans 2020).

Senate Bill 743

SB 743, passed in 2013, required the Governor's Office of Planning and Research (OPR) to develop new State CEQA Guidelines that address traffic metrics under CEQA. As stated in the legislation, upon adoption of the new guidelines, "automobile delay, as described solely by LOS or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the guidelines, if any."

OPR published its proposal for the comprehensive updates to the State CEQA Guidelines in November 2017, which included proposed updates related to analyzing transportation impacts pursuant to SB 743. These updates indicated that VMT would be the primary metric used to identify transportation impacts. In December of 2018, OPR published the most recent version of the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR 2018), which provides guidance for VMT analysis. The Office of Administrative Law approved the updated State CEQA Guidelines and, as of July 1, 2020, implementation of California Code of Regulations Section 15064.3 of the updated CEQA Guidelines applies statewide.

Regional

Sacramento Area Council of Governments

The Sacramento Area Council of Governments (SACOG) is an association that includes the Counties of El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba. SACOG is required to prepare a long-range transportation plan and assists in planning for transit, bicycle networks, clean air, and airport land uses.

Metropolitan Transportation Plan/Sustainable Communities Strategy

As a metropolitan transportation organization, SACOG is responsible for preparing and updating the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) and the corresponding Metropolitan Transportation Improvement Program (MTIP) for the six-county Sacramento region. The MTP addresses all modes of transportation, including public transit, automobile, bicycle, and pedestrians, and is updated every 4 years. The purpose of the MTP/SCS is to establish regional access and mobility goals; identify present and future transportation needs, deficiencies, and constraints within the transportation system; analyze potential solutions; estimate available funding; and propose investments. On November 18, 2019, the SACOG Board of Directors adopted the 2020 update to the MTP/SCS (SACOG 2019). The next update to the MTP/SCS is scheduled for 2025.

Metropolitan Transportation Improvement Program

SACOG prepares and adopts the MTIP approximately every 2 years. The MTIP is a short-term listing of surface transportation projects that receive federal funds, are subject to federally required action, or are regionally significant. SACOG adopted the 2023-2026 MTIP in September 2022. The 2023-2026 MTIP covers 4 years of programming: federal fiscal years 2023-2026. The project listing in the MTIP provides a detailed description for each individual project in the 2023-2026 MTIP, including those in Sacramento County.

SACOG approved the *Regional Bicycle, Pedestrian, and Trails Master Plan* in April 2015. The plan envisions a complete transportation system that supports healthy living and active communities where bicycling and walking are viable and popular travel choices in a comprehensive, safe, and convenient network (SACOG 2015). The goals of the *Regional Bicycle, Pedestrian, and Trails Master Plan* inform the goals set forth in the County Active Transportation Plan. The *Regional Bicycle, Pedestrian, and Trails*

Master Plan is intended to guide the long-term decisions for the Bicycle and Pedestrian Funding Program. The projects included in the plan are regionally significant projects that require at least partial regional funding. This plan is not fiscally constrained, so it contains at least 20 years' worth of projects.

Sacramento Region Trail Network Action Plan

The Sacramento Region Trail Network Action Plan was adopted by SACOG in July 2022 (SACOG 2022). It establishes a vision for walking, biking, and rolling throughout the region by planning for a network of trails that reaches key destinations and closes existing gaps. The Sacramento Region Trail Network Action Plan establishes the baseline environment, identifies a proposed network of facilities, and sets forth goals for the regional trail network. The Regional Trail Network Action Plan prioritizes trails that would help meet regional goals, many of which are in Sacramento County and included in the County Active Transportation Plan.

Sacramento Regional Transit District Strategic Plan

SacRT's Strategic Plan outlines the highest priority projects that the agency will work on over the 2021-2025 fiscal years. The plan includes SacRT's mission, vision, and values; annual goals; specific work plan tactics; and introduces a comprehensive performance scorecard system that will be used to monitor organizational and division performance on a quarterly basis (SacRT 2020).

Sacramento Regional Transit District Design Guidelines for Bus and Light Rail Facilities

The SacRT Design Guidelines for Bus and Light Rail Facilities assist SacRT in providing consistent, high-quality facilities that encourage public transit operation. The guidelines provide a general framework for project development and design to promote convenient, comfortable, and safe bus and light rail facilities for transit users (SacRT 2023b).

Local

Sacramento County 2030 General Plan

The Circulation Element of the General Plan provides the framework for County decisions concerning the countywide transportation system, which includes various transportation modes and related facilities (Sacramento County 2022b). The Circulation Element also identifies measures to establish and support an integrated and balanced multi-modal transportation system. The following General Plan policies are applicable to the project:

- **Policy CI-1.** Provide complete streets to provide safe and efficient access to a diversity of travel modes for all urban, suburban and rural land uses within Sacramento County except within certain established neighborhoods where particular amenities (such as sidewalks) are not desired. Within rural areas of the County, a complete street may be accommodated through roadway shoulders of sufficient width or other means to accommodate all modes of travel.

- **Policy CI-2.** Promote continued mobility for individuals whose access to automobile transportation is limited by age, illness, income, desire, or disability.
- **Policy CI-3.** Travel modes shall be interconnected to form an integrated, coordinated and balanced multi-modal transportation system, planned and developed consistent with the land uses to be served.
- **Policy CI-4.** Provide multiple transportation choices to link housing, recreational, employment, commercial, educational, and social services.
- **Policy CI-5**. Land use and transportation and development should be cohesive, mutually supportive, and complement the objective of reducing per capita VMT. The standards shown in Table CI-1 [presented as Table 19-2 in this EIR] shall be used as thresholds of significance for all projects subject to CEQA. Where the VMT level standards of Table CI-1 [presented as Table 19-2 in this EIR] are predicted to be exceeded, all feasible mitigation measures shall be included to reduce projected VMT levels.

Table 19-2 Significance Thresholds for CEQA Transportation Analysis for Development Projects

Project Type[1]	VMT Significance Criteria
Residential	Project VMT per capita exceeds 85 percent of the regional average VMT per capita
Office/Business Professional	Project VMT per employee exceeds 85 percent of the regional average VMT per employee
Industrial	Project VMT per employee exceeds the regional average VMT per employee
Regional Retail	Net increase in regional VMT
Regional Public Facilities/Services	Net increase in regional VMT
Redevelopment	Projects that result in a decrease to existing regional total VMT are presumed to have a less-than-significant VMT impact; otherwise, apply the relevant threshold based on the proposed land use (treating existing use as vacant)
Mixed Use	Apply the relevant threshold to each land use component individually
Phase	Apply the relevant threshold to each phase independently
Land Development with Roadway Component	For locally-serving roadways, the significance determination is based on the land use component. For regional roadways, apply thresholds of significance for transportation projects

[1] As defined in the Sacramento County Transportation Analysis Guidelines, Appendix A.

Source: Sacramento County 2020: Table 3-3.

- **Policy CI-6.** Provide support for community based corridor planning processes on existing roadways with excess vehicle capacity within built communities to optimize the public right-of-way by utilizing the excess width for other modes of

travel or public amenities such as bike lanes, landscaping, walkways, parking, or medians.

- **Policy CI-7.** Plan and construct transportation facilities as delineated on the Transportation Plan of the Sacramento County General Plan. Transportation facilities shall be consistent with the Sacramento County Improvement Standards and Construction Specifications, the Connector Project Design Guidelines, and supplemented by the California Department of Transportation (Caltrans) design standards. The County may deviate from the adopted County Improvement Standards and Construction Specifications in circumstances where conditions warrant special treatment. The Capital SouthEast Connector, as designated in the Transportation Plan map, shall be consistent with the most current JPA-approved "Capital SouthEast Connector JPA Project Design Guidelines," provided that the Project Design Guidelines will not be applied to diminish or alter the rights of County-approved projects and provided that the design exception process within the Project Design Guidelines is not amended to diminish the County's land use authority to approve future projects proximate to or its authority to determine access to the Capital SouthEast Connector.

  The Capital SouthEast Connector is intended to serve the transportation demand for both existing land uses and future growth within the Urban Services Boundary (USB). The County reserves all of its rights and powers to assure that sufficient access to and from the Connector roadway is available to accommodate the existing land uses as well as the future growth within the USB. For areas of the unincorporated County outside of the USB, the County will limit access to and from the Connector roadway to only accommodate the existing and future land uses permitted outside of the USB.

- **Policy CI-8.** Maintain and rehabilitate the roadway system to maximize safety, mobility, and cost efficiency.
- **Policy CI-10.** Land development projects shall be responsible to provide improvements which address the project's adverse effects on local and regional roadways.
- **Policy CI-12.** To preserve public safety and local quality of life on collector and local roadways, land development projects shall incorporate appropriate treatments of the Neighborhood Traffic Management Program.
- **Policy CI-13.** Collaborate with regional transportation planning agencies and neighboring jurisdictions to provide cross jurisdictional mobility.
- **Policy CI-16.** The County supports creating communities that promote access and mobility for all modes of travel through the development of roadway networks based on a grid or modified grid layout.
- **Policy CI-19.** Collaborate with transit service providers to provide transit services within the County that are responsive to existing and future transit demand.

- **Policy CI-20.** Promote transit services in appropriate commercial corridors and where population and employment densities are sufficient or could be increased to support those transit services.
- **Policy CI-21.** Collaborate with neighboring jurisdictions and other agencies to achieve land use patterns and densities in areas planned for development that support transit services, preserve adequate rights-of-way, and enhance transit services in the designated transit corridors.
- **Policy CI-23.** Consider the transit needs of senior, disabled, low-income, and transit-dependent persons in making recommendations regarding transit services.
- **Policy CI-26.** Consider the expansion of Neighborhood Shuttle Services in unincorporated area communities.
- **Policy CI-29.** The County shall work with transit service providers to establish and implement development guidelines to maximize the ability of new development and redevelopment to support planned transit services. New development and redevelopment shall have an orientation to travel patterns that are conducive to transit service. This will include concentration of development in centers and along linear corridors such that trip origins and destinations are concentrated near transit services.
- **Policy CI-30.** The County shall collaborate with transit service providers to promote the phased implementation of transit services to all growth areas as development occurs.
- **Policy CI-32.** Develop a comprehensive, safe, convenient and accessible bicycle and pedestrian system that serves and connects the County's employment, commercial, recreational, educational, social services, housing and other transportation modes.
- **Policy CI-34.** Construct and maintain bikeways and multi-use trails to minimize conflicts between bicyclists, pedestrians, and motorists.
- **Policy CI-35.** The applicant/developer of land development projects shall be responsible to install bicycle and pedestrian facilities in accordance with Sacramento County Improvement Standards and may be responsible to participate in the fair share funding of regional multi-use trails identified in the Sacramento County Active Transportation Plan.
- **Policy CI-36.** Collaborate with neighboring jurisdictions and regional agencies to coordinate planning and development of the County's bikeways, pedestrian facilities and multi-use trails with those of neighboring jurisdictions, and to support a regional bicycle and pedestrian network.
- **Policy CI-38.** Design and construct pedestrian facilities to ensure that such facilities are accessible to all users.
- **Policy CI-40.** Whenever possible, the applicant/developer of new and infill development projects shall be conditioned to fund, implement, operate and/or

participate in transportation systems management (TSM) programs to manage travel demand associated with the project.

- **Policy CI-43.** The County shall promote transit-supportive programs in new development, including employer-based trip-reduction programs (employer incentives to use transit or non-motorized modes), "guaranteed ride home" for commute trips, and car-share or bike-share programs.
- **Policy EJ-20.** The County will continue to support walking and bicycling by requiring smart growth streets (bike lanes, and sidewalks separated from the roadway with trees and planted landscaping) in transit priority areas, in Environmental Justice Communities and in new communities and developments wherever practicable.
- **Policy EJ-21.** Provide safe, low stress, interesting and convenient environments for pedestrians and bicyclists, including inviting and adequately lit streetscapes, networks of trails, paths, parks, and open spaces that connects residences with key destinations, and encourages regular exercise and the reduction of vehicular emissions.
- **Policy LU-39.** Support implementation of the ADA Transitional Plan and the Pedestrian Master Plan to create a network of safe, accessible and appealing pedestrian facilities and environments.
- **Policy LU-40.** Employ appropriate traffic calming measures in areas where pedestrian travel is desirable but made unsafe by a high volume or excessive speed of automobile traffic. Preference shall be given to measures that slow traffic and improve pedestrian safety while creating the least amount of conflict with emergency responders.
- **Policy LU-42.** Master planning efforts for new growth areas shall provide for separated sidewalks along all arterials and thoroughfares to make walking a safer and more attractive transportation option.
- **Policy PF-55.** New development shall provide access arrangements pursuant to the requirements of the California Fire Code.

Transportation Analysis Guidelines

The TAG was adopted by the County Board of Supervisors in October 2020. The TAG outlines screening criteria by which projects may be exempt from VMT analysis and provides methodologies to analyze a project's VMT if screening criteria are not met (Sacramento County 2020). As detailed above, a project's effect on automobile delay is no longer a consideration when identifying a significant impact under CEQA; thus, the portions of the TAG not directly applicable to CEQA are not included here. The TAG and the County General Plan specify VMT per capita as the metric used to evaluate residential projects. It includes all vehicle "tours" (both work/commute vehicle tours and non-work vehicle tours) that start and end at residential units. The VMT from these tours are grouped and summed to the home location of those tours. The VMT for each home is then summed for all homes in a particular area and divided by the total population of that area to arrive at VMT per capita (Sacramento County 2020: 17).

The TAG and County General Plan also specify VMT per employee as the metric used to evaluate non-residential land uses. It includes all vehicle commute tours that begin and end at an employment location. The VMT for commute tours are summed to the employment location of each tour. The commute VMT for all employment locations in the particular area are summed and divided by the total employment of that area to arrive at VMT per employee (Sacramento County 2020: 17). The TAG also includes guidelines and requirements for multimodal (bicycle, pedestrian, and transit) transportation analysis, hazards related to design, on-site circulation, and construction. The TAG establishes thresholds of significance for project-generated VMT (Table 19-2) and recommendations for applying them, as described below:

- **Residential** – aggregate all residential land uses and compare the resulting VMT per Capita to the regional average. The threshold is exceeding 85 percent of the regional average VMT per Capita per Table 19-2. (>15.0 VMT per capita).
- **Office/Business Professional Employment** – aggregate all office/business professional employment land uses and compare the resulting VMT per employee to the regional average. The threshold is exceeding 85 percent of the regional average VMT per employee per Table 19-2 (>13.9 VMT per employee).
- **Industrial Employment** – aggregate all industrial employment land uses and compare the resulting VMT per employee to the regional average. The threshold is exceeding the regional average VMT per employee per Table 19-2 (>16.4 VMT per employee).
- **Retail and Public Facilities/Services** – evaluate the effect that adding these land uses has on regional VMT. The threshold is an increase in total regional VMT.
- **Roadway Capacity** – The threshold is a net increase in regional VMT.

Active Transportation Plan

The 2022 Active Transportation Plan for unincorporated Sacramento County is the guiding document for achieving the County's goal to build a balanced transportation system that supports and encourages active modes of travel. The Active Transportation Plan analyzes existing conditions and provides policy, program, and infrastructure recommendations to improve active transportation within the unincorporated county (Sacramento County 2022a). Note that the 2022 Active Transportation Plan replaced the Sacramento County Bicycle Master Plan (2011) and the Sacramento County Pedestrian Master Plan (2007).

Dynamic Implementation Tool

The County has developed an approach to identify and require the construction of necessary transportation improvements sensitive to the location of individual developments. The result of this approach is the Dynamic Implementation Tool. For development proposed in the Jackson Highway Corridor, the tool can estimate vehicle trips that would be generated from those new developments, where new vehicle trips would be distributed, and if such trips would result in congestion (i.e., reduced LOS

standard) along specific roadways or intersections (Sacramento County 2021). The County can use the tool to determine appropriate improvements and assign funding and/or construction responsibility as development is implemented. Specifically, the tool is used to calculate new roadway traffic volumes and intersection turn movements, and County staff analyze this data to determine which roadways would be impacted and the improvements required to alleviate impacts on the transportation network (Sacramento County 2021).

County Code of Ordinances

Chapter 10 of the Sacramento County Code addresses vehicles, parking, and traffic. Chapter 16 provides regulations related to building and construction, and Chapter 17 provides regulations related to fire prevention including the County's adoption of the 2022 California Fire Code.

Community Plans

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

Cordova Community Plan

The Cordova Community Plan, which was last updated in 2003, provides guidance for both new development and the redevelopment of existing land uses within the community planning area. The Cordova Community Plan contains the following objectives related to transportation:

- **Policy LU-3.** Promote linkages between LRT station and adjacent land uses, particularly within a 1/4-mile radius of the LRT station.
- **Policy UDNC-9.** Promote pedestrian-friendly, human-scale urban environments that provide safe and pleasant places for people to live and work.
- **Policy TC-1.** Promote a high-quality multi-modal transportation system by reducing mobile-source emissions and reliance on the personal automobile.
- **Policy TC-4.** Encourage linkages between LRT stations and adjacent land uses, particularly within a 1/4-mile radius of the LRT station, and encourage the design of employment centers to be convenient for walk-on patrons of LRT.
- **Policy TC-5.** Promote public transit services to all employment and activity centers; or alternatively, encourage the formation of privately funded shuttle bus services within the community.
- **Policy TC-6.** Promote the location of convenient LRT stations to provide access for all segments of the population to a broad range of neighborhoods, employment centers, retail and community services.
- **Policy TC-7.** Promote a high-quality off-street bicycle/pedestrian system that connects all major employment and activity centers.

- **Policy TC-8.** Ensure adequate pedestrian circulation by sidewalks or similar means within and between land uses.
- **Policy TC-9.** Ensure adequate bicycle provisions within new land uses to encourage bicycle usage.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan, which was developed in 1985, provides guidance for growth and development in the community planning area. The following Vineyard Community Plan policy applies to the WJHMP:

Public Facilities/Services, Goals and Objectives 1: To provide adequate and appropriate infrastructure and public services to all residents and businesses of the Vineyard Community.

COUNTYWIDE DESIGN GUIDELINES AND CASE STUDIES

The Countywide Design Guidelines and Case Studies (Design Guidelines) apply to the unincorporated county and include design strategies that support the County in creating a built environment that is healthy, sustainable, livable, and promotes active transportation choices (Sacramento County 2022c).

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

This analysis uses significance criteria based on Section 15064.3 and Appendix G of the State CEQA Guidelines, the Sacramento County General Plan, and the County TAG.

BICYCLE AND PEDESTRIAN FACILITY IMPACTS

Impacts on bicycle and pedestrian facilities would be significant if implementation of the project would:

- eliminate or adversely affect an existing bikeway or pedestrian facility in a way that would discourage its use,
- interfere with the implementation of a planned bikeway as shown in the County Active Transportation Plan or conflict with the County Active Transportation Plan, or
- result in unsafe conditions for bicyclists or pedestrians.

TRANSIT FACILITY IMPACTS

Impacts on the transit system would be significant if implementation of the project would:

- adversely affect public transit operations or
- fail to adequately provide access to transit.

VMT Impacts

Impacts on VMT would be significant if implementation of the project would:

- exceed 85 percent of the existing regional average VMT per capita for residential uses,
- exceed 85 percent of the existing regional average VMT per employee for office employment,
- exceed 100 percent of the existing regional average VMT per employee for industrial employment,
- result in a net increase between regional VMT plus project without regional retail component and regional VMT plus project with regional retail component, or
- result in a net change in regional VMT as a result of widening roadways not already identified in the SACOG MTP/SCS.

Transportation Hazards

Impacts related to transportation hazards would be significant if implementation of the project would:

- substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

Emergency Access

Impacts on emergency access would be significant if implementation of the project would:

- result in inadequate emergency access.

Issues Not Discussed Further

Construction VMT

Construction activities associated with the project would not result in long-term increases in vehicular trips along roadways in and around the plan area because construction would be temporary and intermittent in nature. Additionally, the VMT generated by construction workers during project construction would not be newly generated; instead, it would be redistributed throughout the regional roadway network based on the different work sites in which workers travel to each day. Because the plan area is in proximity to population centers (e.g., city of Sacramento, city of Rancho Cordova, and city of Folsom), construction workers would not be anticipated to travel greater than typical distance to the plan area. Therefore, construction would redistribute worker trips otherwise associated with the construction industry in the region and would not generate a substantial number of trips over existing conditions. This issue is not discussed further.

METHODOLOGY

BICYCLE AND PEDESTRIAN ANALYSIS

The bicycle and pedestrian analyses evaluate if the WJHMP would either directly or indirectly, disrupt existing bicycle or pedestrian programs or facilities; interfere with the implementation of a planned bicycle or pedestrian facility; or create a physical or operational transportation outcome that conflicts with applicable bicycle or pedestrian system plans, guidelines, policies, or standards.

TRANSIT ANALYSIS

The transit analysis evaluates if the WJHMP would, either directly or indirectly, disrupt existing transit services or facilities; interfere with the implementation of a planned transit facility; or create physical or operational transportation outcomes that conflict with desired conditions expressed in transit policies adopted by the County or SacRT for their respective facilities in the unincorporated county.

VMT ANALYSIS

The VMT analysis relies on the County TAG and OPR Technical Advisory to evaluate the VMT that would result from implementing the WJHMP. County guidelines require that each land use associated with a project be analyzed separately when identifying impacts. Therefore, in accordance with the County TAG, VMT per capita for residential land uses and VMT per employee for commercial (office and industrial) uses were used. Additionally, total net change was used as the VMT metric for regional retail, as recommended by OPR. For land uses that cannot be screened out and are subject to further VMT analysis, the WJHMP VMT per capita and/or VMT per employee are compared to a threshold of 85 or 100 percent of the regional average for each metric, as applicable. Regional averages are calculated to be consistent with the SACOG activity-based travel demand model (SACSIM19), which is used by local jurisdictions for regional transportation impact analyses. The individual impacts on VMT are quantified based on housing, employment, new project roadways, roadway widenings, and retail associated with the WJHMP. However, SACSIM is limited in its ability to represent all project features, such as the implementation of a Transportation Management Association (TMA) program. Therefore, an off-model analysis was also performed to calculate the VMT reductions for each land use type (see Appendix K for detailed VMT methodology and outputs). The methodology for each individual impact, as well as the overall effect on VMT from the project, are detailed below.

VMT PER CAPITA (RESIDENTIAL USES)

As detailed above, the residential uses associated with implementation of the WJHMP would result in a significant impact if the project's VMT per capita exceeds 85 percent of the baseline (no project) regional average VMT per capita. To calculate the VMT per capita metric for the WJHMP, all residential units and their associated households and population were incorporated into a modified "existing plus project" version of the SACSIM19 model. The residential units were isolated into their own traffic analysis zones (TAZs) so that their daily travel tours per person could be isolated from other land

uses. The results were then compared to the results of the regionwide "existing no project" model to determine if the WJHMP exceeds the applicable thresholds.

VMT PER EMPLOYEE (OFFICE AND INDUSTRIAL USES)

As detailed above, the office uses associated with the WJHMP would result in a significant impact if the project's VMT per employee exceeds 85 percent of the baseline (no project) regional average VMT per employee. Additionally, the industrial uses associated with implementation of the WJHMP would result in a significant impact if the project's VMT per employee exceeds 100 percent of the baseline (no project) regional average VMT per employee. VMT for commute tours were summed to the employment location of each tour. The commute VMT for all employment locations in the WJHMP area was summed and divided by the total employment of the WJHMP area. Office VMT per employee was calculated based on results from TAZs that contain predominately office land uses. Industrial VMT per employee was calculated based on results from TAZs that contain predominantly industrial land uses. The results were then compared to the results of the regionwide "existing no project" model to determine if the WJHMP exceeds the applicable thresholds.

ROADWAY NETWORK VMT ASSESSMENT

The WJHMP would involve the widening of existing roadways and construction of new roadways. As detailed above, roadway projects associated with implementation of the WJHMP would result in a significant impact if there is a net increase between regional VMT plus project without roadway widenings and regional VMT plus project with roadway widenings. These capacity enhancements could induce VMT due to changes in travel demand, route, and/or mode choice. As discussed in the TAG, roadway projects that are not included in the MTP/SCS must be evaluated to determine potential transportation impacts. Consistent with the TAG, existing or future roadway widenings not identified in the MTP/SCS were modeled with and without project added roadway capacity to yield the net change in regional VMT. The SACSIM19 model was run with and without the regional roadway widenings anticipated as a result of the WJHMP but with all other components of the WJHMP included.

RETAIL VMT

As detailed above, the retail projects associated with implementation of the WJHMP would result in a significant impact if there is a net increase between regional VMT plus project without regional retail and regional VMT plus project with regional retail. Local serving retail is defined as generally having up to 200,000 square feet of total gross floor area in growth areas, or with a market area of 3 miles or less. The OPR Technical Advisory provides that, because local-serving retail improves retail destination proximity it tends to shorten trips and reduce VMT, and thus can be presumed to create a less than significant impact. Some retail land use designations within the WJHMP area were determined to fit within the definition of local serving retail and as such, were screened from further VMT analysis. However, most commercial parcels within the WJHMP area are on sites large enough to be considered regional (i.e., over 200,000 square feet based on floor area ratios). Therefore, the SACSIM19 model was run once with the full project and once without the full project minus the regional retail components in order to

determine the change in net regionwide VMT that could be associated with the regional retail portions of the WJHMP.

TRANSPORTATION MANAGEMENT ASSOCIATION PARTICIPATION

The WJHMP includes a mandatory communitywide TMA program to reduce vehicle trips. The WJHMP TMA program would require mandatory participation (i.e., funding) from all residents and employers within the WJHMP area. The calculations to determine VMT reductions for each component of the TMA program are based on Sacramento County TMA participation and calculations provided in the California Air Pollution Control Officers Association Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health Equity (CAPCOA 2021). Please see Appendix K for a detailed discussion of the methodology and inputs for analysis of the WJHMP TMA program.

OVERALL EFFECT ON VMT

To evaluate the overall VMT that would result from implementation of the WJHMP, each of the separate VMT metrics described above were translated into absolute VMT over or under that allowed by the County TAG so that the effects of each of the WJHMP components could be accurately combined. To translate VMT per capita and VMT per employee into absolute VMT, the number of anticipated residents and the number of anticipated employees were multiplied by the amount the VMT exceeds or falls below the applicable threshold.

TRANSPORTATION HAZARDS AND EMERGENCY ACCESS

The transportation hazards and emergency access analyses evaluate if the WJHMP would, directly or indirectly, substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment); or result in inadequate emergency access. The transportation hazards analysis relies on the Local Traffic Study prepared for the WJHMP which examines the transportation safety implications of implementing the WJHMP (DKS Associates 2023).

WEST JACKSON HIGHWAY MASTER PLAN POLICIES

The proposed WJHMP includes the following policies related to transportation:

- **Policy 5.1.** Future development applications shall work with the County to implement the roadway system as shown in Figure 5.2 and the street sections summary, Table 5.1.
- **Policy 5.2.** Future development applications shall work with the County to implement the mobility system as shown in Figure 5.13 Transit Plan and Figure 5.14 Proposed Trails, which illustrates the non-vehicular system of multi-use trails, on-street bike lanes and transit facilities.

IMPACTS AND ANALYSIS

IMPACT TR-1: ADVERSELY AFFECT AN EXISTING BICYCLE AND PEDESTRIAN FACILITY, INTERFERE WITH THE IMPLEMENTATION OF A PLANNED BIKEWAY, OR RESULT IN UNSAFE CONDITIONS FOR BICYCLISTS OR PEDESTRIANS

Implementation of the WJHMP would include a variety of residential, commercial, office, industrial, agricultural, recreational, open space, natural preserve, public, and educational uses. The increase in residential and employment opportunities within the WJHMP area would presumably increase the demand for bicycle and pedestrian facilities. As described above, there are Class II bicycle lanes present along South Watt Avenue and Bradshaw Road within the WJHMP area and sidewalks along segments of Bradshaw Road, Kiefer Boulevard and Elder Creek Road. The WJHMP would not adversely affect or damage these existing facilities. Instead, implementation of the WJHMP would involve the construction of an extensive bicycle and pedestrian network consisting of off-street trails and Class I and Class II bicycle facilities that would support and encourage increased use of alternative modes transportation (see Figure 2-20 in Chapter 2, “Project Description”). Individual development projects associated with the WJHMP would be required to be consistent with County plans, policies, and programs.

For example, several General Plan policies pertain to the implementation and accommodation of alternative modes of transportation to result in a safe, integrated, and efficient transportation network that serves bicyclists and pedestrians. Specifically, General Plan Policy CI-34 calls for the construction and maintenance of bikeways and multi-use trails to minimize conflicts between bicyclists, pedestrians, and motorists. General Plan Policy CI-35 requires new development to install bicycle and pedestrian facilities in accordance with the Sacramento County Improvement Standards and/or pay their fair share portion to implement the multi-use trail system identified in the Sacramento County Active Transportation Plan. General Plan Policy CI-36 describes collaboration with neighboring jurisdictions to coordinate planning and development of County bikeways, pedestrian facilities, and multi-use trails, and to support a regional bicycle and pedestrian network.

The WJHMP is consistent with General Plan policies which detail how the circulation system would be improved to meet the needs of all users. Several objectives established in the WJHMP support bicycle and pedestrian travel within the WJHMP area (see Objectives 2, 3, 4, 6, and 9). Through WJHMP Policy 5.2, future development applications would be required to work with the County to implement the mobility system non-vehicular system of multi-use trails, on-street bike lanes, and transit facilities identified in the WJHMP. As a result, subsequent development associated with the WJHMP would provide sidewalks and bicycle lanes on all collector, arterial, and thoroughfare roadways in compliance with County Improvement Standards and Design Standards.

The County Active Transportation Plan includes recommendations for upgraded and new bicycle and pedestrian facilities throughout the WJHMP area. Although many of the bicycle facilities proposed under the WJHMP align with those included in the most recent

County Active Transportation Plan, the WJHMP would request several entitlements, including a General Plan amendment to modify the Land Use Diagram and Transportation Plan of the 2030 General Plan, and recognize the proposed land uses, streets, and bikeways on the Transportation Plan Amendment diagram (Figure 2-19) and Active Transportation Plan Amendment diagram (Figure 2-20). If adopted, the WJHMP would become the primary land use documents for the WJHMP area and would stipulate allowable uses and designs. Future developments would be required to incorporate improvements consistent with applicable County guidelines, standards, and specifications related to bicycle and pedestrian facilities. This would include the most recently adopted version of the Active Transportation Plan at the time of project consideration. Implementation of the WJHMP would improve existing bicycle and pedestrian facilities and offer new routes not currently available in the area. Therefore, development associated with the WJHMP would not conflict with adopted policies, plans, or programs for bicycle and pedestrian facilities. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT TR-2: ADVERSELY AFFECT PUBLIC TRANSIT OPERATIONS OR FAIL TO PROVIDE ACCESS TO TRANSIT

Public transit is not currently provided throughout the WJHMP area. As detailed above in the “Environmental Setting” section, the closest transit stop serves the Elk Grove Commuter E19 Route and is located near the intersection of Bradshaw Road and Kiefer Boulevard adjacent to the eastern perimeter of the WJHMP area. The WJHMP area is, however, located along major planned transit corridors on Jackson Highway, South Watt Avenue, Bradshaw Road, and Excelsior Road. As the implementation of the WJHMP increases residences and employment centers over time, it can be expected that transit ridership and demand for transit services would also increase. However, the OPR Technical Advisory states that agencies generally should not treat the addition of new transit users as an adverse impact (OPR 2018). As shown in Figure 2-19, the project would, through the provision of an interconnected street system, facilitate connections to future transit stops within the WJHMP area. All projects associated with the WJHMP that could result in physical impacts to the transportation network would be required to meet County standards such as those included in the County Improvement Standards and the most recently adopted SacRT *Design Guidelines for Bus and Light Rail Facilities*, which requires transit facilities to be designed to promote convenient, comfortable, and safe bus facilities for transit users.

Several General Plan policies pertain to the implementation and accommodation of transit services. For example, General Plan Policy CI-29 states that new development shall have an orientation to travel patterns that are conducive to transit service, including the concentration of development along linear corridors such that trip origins and destinations are concentrated near transit services. Per Section 5.4, “Transit,” of the WJHMP, proposed transit service within the WJHMP would be located within a half mile of approximately 88 percent of WJHMP residential uses, thus providing improved proximity and connections between residential, commercial, and employment uses to

transit service. In addition, the WJHMP proposes bus rapid transit lanes along SR 16 and mixed use lanes within the plan area that would support frequent transit service and enhance to the County's transportation plan for the area (refer to Figure 2-19 in Chapter 2, "Project Description," of this EIR). WJHMP Policy 5.2 would require future applicants to work with the County to implement the proposed mobility system (e.g., proposed transit facilities) and thus, would augment transit operations in the area. Future development under the WJHMP would enhance public transit facilities and provide adequate access to transit. Therefore, this impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT TR-3: GENERATE VMT THAT EXCEEDS COUNTY STANDARDS

As detailed above in the "Methodology" section of this chapter, in accordance with the County TAG, the VMT Memo analyzed the VMT of each WJHMP component individually based on their respective threshold of significance. Table 19-3 shows the VMT of each individual component of the project.

Table 19-3 Project-Generated VMT by Component

Project Component	Regional VMT Metric	Existing (No Project) Regional VMT	Project-Specific VMT	Project-Specific VMT as Percentage of Regional Average	Applicable Threshold	Exceeds Applicable Threshold
Residential	VMT per capita	20.20	14.29	70.70%	85% of the regional average	No
Office	VMT per employee	16.04	16.23	101.1%	85% of the regional average	Yes
Industrial	VMT per employee	16.04	14.63	91.2%	100% of the regional average	No
Project Roadways Beyond MTP/SCS	Net Increase in Regional VMT	—	—	—	Any net increase in regional VMT	Yes
Regional Serving Retail	Net Increase in Regional VMT	—	—	—	Any net increase in regional VMT	Yes

Source: Data provided by DKS in 2023.

As shown in Table 19-3, the residential component of the WJHMP is anticipated to generate 14.29 VMT per capita, which is approximately 71 percent of the regional average, below the applicable threshold of 85 percent. The office component of the WJHMP is estimated to generate 16.23 VMT per employee, which exceeds the applicable threshold of 85 percent of the regional average VMT per employee for office projects. Finally, the industrial component of the WJHMP would generate 14.63 VMT

per employee, which would not exceed the threshold of 16.4 VMT per employee for industrial projects as detailed in the County TAG and County General Plan.

The WJHMP would also include the construction of new roadways and the implementation of roadway capacity enhancements. Roadway expansions are included in the plan due to the modeled potential for degradation of operation conditions on several roadways in the vicinity of the plan area. Regional VMT was calculated for the proposed roadway widenings. The regionwide VMT without the roadway widenings would be 59,172,494 and the regionwide VMT with the roadway widenings would be 59,188,647, an increase of 16,153 VMT. The WJHMP would also include the construction of new roadways and the implementation of roadway capacity enhancements. These capacity enhancements would add 24.2 lane miles of roadways to the County regional roadway system compared to what was identified in the MTP.

Although the TAG recommends analyzing project components individually, to consider the overall effect of the WJHMP on VMT, a “VMT Budget” that accounts for the various components of the WJHMP was created to reconcile the VMT “savings” and “exceedances” of the WJHMP. As shown in Table 19-4, the WJHMP VMT per capita falls below the 85 percent regional threshold for a total of -112,637 VMT; the WJHMP VMT per office employee exceeds the 85 percent threshold for a total of 40,982 excess VMT; and the WJHMP VMT per industrial employee falls below the 100 percent threshold for a total of -4,774 VMT per industrial employee. This results in a total net change in VMT compared to regional thresholds of -76,429 daily VMT. Additional increases in VMT from implementation of the WJHMP include an additional 21,880 VMT due to project roadways beyond the MTP/SCS, an additional 16,153 VMT due to roadway widenings to address deficiencies, and an additional 44,810 VMT associated with regional serving retail. Therefore, the total increase in regionwide VMT resulting from implementation and buildout of the WJHMP would be 6,414 VMT (i.e., -76,429 VMT + 82,843 VMT).

Table 19-4 WJHMP Absolute VMT

Metric	No Project	Plus WJHMP	% of Regional Average	VMT Over or Under Threshold
VMT Per Capita	20.20	14.29	70.7	-112,637
VMT Per Office Employee	16.04	16.23	101	40,982
VMT Per Industrial Employee	16.04	14.63	91.2	-4,774
WJHMP Absolute VMT				**-76,429**
Project Roadways Beyond MTP/SCS VMT	—	—	—	21,880
Roadway Widenings to Address Deficiencies VMT	—	—	—	16,153
Regional Serving Retail VMT	—	—	—	44,810
WJHMP Total VMT Compared to Threshold				**6,414[1]**

Notes: VMT = vehicle miles traveled; % = percent

[1] (i.e., -76,429 +82,843)

Sources: DKS Associates 2023; Kimley Horn 2023.

As summarized below in Table 19-5, with implementation of the mandatory communitywide TMA program included in the project, VMT would be reduced for residential, office, and industrial uses.

Table 19-5 Overall Effect of the WJHMP on VMT

Metric	Total VMT
Residential VMT with WJHMP TMA program	-11,737
Office VMT with WJHMP TMA program	-31,587
Industrial VMT with WJHMP TMA program	-6,093
Net WJHMP VMT after TMA program	**-49,417**
Net WJHMP VMT compared to threshold	**-43,003[1]**

Notes: TMA = Transportation Management Association; VMT = vehicle miles traveled: WJHMP = West Jackson Highway Master Plan.

[1] (i.e., 6,414 + -49,417)

Source: Kimley Horn 2023.

With implementation of the TMA program, VMT per office employee would be reduced from 16.23 to 14.23, VMT per capita for residential development would be reduced from 14.29 to 13.99, and VMT per industrial employee would be reduced from 14.63 to 12.83. Both VMT per capita (i.e., 13.99) and VMT per industrial employee (i.e., 12.83) would be below the County thresholds of 17.17 VMT per capita and 16.04 VMT per industrial employee, respectively. As shown in Table 19-5, when incorporating the 12.3 percent reduction achieved by implementing the WJHMP TMA program for non-residential uses and 2.1 percent reduction for residential uses, VMT would be reduced by 11,737 VMT for residential uses, 31,587 VMT for office uses, and 6,093 VMT for industrial uses. In total, implementation of the WJHMP TMA program would result in an overall VMT reduction of -49,417 VMT. After implementation of the TMA program, the WJHMP would result in a net total of -43,003 VMT compared to the County thresholds. Although specific components of the WJHMP exceed County VMT thresholds, net total VMT would be reduced to below County thresholds through the implementation of the WJHMP TMA program. Therefore, this impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT TR-4: SUBSTANTIALLY INCREASE HAZARDS DUE TO A GEOMETRIC DESIGN FEATURE OR INCOMPATIBLE USES

CONSTRUCTION

Construction of individual projects associated with the WJHMP would be localized and temporary. However, construction activity could result in increased transportation-related hazards (e.g., heavy vehicle movement, the transport of equipment and materials to the plan area). Additionally, the construction of new roadways and roadway widenings associated with the WJHMP could result in temporary lane closures and detours. In accordance with General Plan Policy CI-7, new and improved roadways

would be consistent with the Sacramento County Construction Specifications and Improvement Standards which address potential design hazards including sight distance, driveway placement, and signage.

The construction contractor(s) of individual projects within the WJHMP area would be required to obtain encroachment permits for all construction work performed within County right-of-way (Sacramento County 2023). Additionally, per Section 12-4.02 of the County Standard Construction Specifications, the preparation and implementation of a traffic control plan would be required for all construction work performed within the road right-of-way that modifies vehicular, bicycle, and/or pedestrian traffic patterns (Sacramento County 2016). Each traffic control plan is required to be developed in accordance with the latest version of the California Manual on Uniform Traffic Control Devices, which ensures the provision of reasonably safe and effective movement of all roadway users in a traffic control area. Construction would be localized and temporary and would not introduce a permanent hazardous condition to the surrounding roadway network. Additionally, encroachment permit applications and traffic control plans would be subject to County review prior to approval, thus ensuring that construction activities would comply with local and industrywide safety standards.

Operations

Future development within the WJHMP area would be required to meet all applicable County guidelines and regulations for development projects, including General Plan Policy CI-10, which addresses a project's adverse effects on local roadways and Policy CI-40, which requires new development projects to fund, implement, operate, and/or participate in transportation system management programs to manage travel demand associated with the project. On-site design would comply with street improvement standards detailed in Chapter 12 of the County Code as well as the design guidelines included in Section 4 of the County Improvement Standards. Additionally, per Section 2-1 of the County Improvement Standards, complete plans for all proposed streets and bikeways are required to be submitted to the County Engineering Division of the Office of Development and Code Services, for approval, thus ensuring that implementation of the WJHMP would not result in conflicting uses. Further, the WJHMP includes objectives, such as Objectives 3, 6, 7, and 9, that support a safe, comprehensive, and interconnected transportation system.

Although the WJHMP would be designed to meet County standards, the Local Traffic Study found that implementation of the WJHMP could increase congestion in a manner that could increase safety impacts from queuing and potential bicycle/pedestrian/vehicular conflicts at several intersections. For example, queueing that extends beyond the turn pocket or into surrounding intersections could disrupt pedestrian, bicycle, and vehicular movement resulting in potential conflicts between all modes of transportation. The Local Traffic Study identified roadways and intersections within and surrounding the plan area that could be adversely affected such as Bradshaw Road/Elder Creek Road and SR 16/Bradshaw Road. Therefore, implementation of the WJHMP could potentially substantially increase hazards during operations.

SUMMARY

Development associated with the WJHMP would be required to adhere to all County design guidelines and development standards. Additionally, all projects would be subject to County review, which would ensure that projects would meet applicable design guidelines and standards. However, the Local Traffic Study determined that implementation of the WJHMP could disrupt vehicular movement on existing and new roadways within the WJHMP, thus increasing the potential for safety hazards from queuing and/or potential bicycle/pedestrian/vehicular conflicts. Therefore, this impact would be potentially significant.

The implementation of Mitigation Measures TR-4A, TR-4B, and TR-4C would require responsible applicants of subsequent development under the WJHMP to implement improvements along affected roadways and associated intersections to reduce anticipated safety hazards from substantial congestion. These modifications would include the installation of traffic signals, grade separation, bus rapid transit lanes, and bus queue jumps. However, because the County does not have authority over roadways located outside of County jurisdiction and transit improvements, it cannot be guaranteed that all recommended improvements would be made. Therefore, this impact would be **significant and unavoidable.**

MITIGATION MEASURES

MITIGATION MEASURE TR-4A: INSTALL TRAFFIC SIGNALS THROUGHOUT WJHMP AREA

If the County determines, through application of the Dynamic Implementation Tool or similar means, that any subsequent entitlement would result in roadway design deficiencies, the applicant for the development shall be required to construct or fund the improvement. Required traffic signal installations will include the following improvements proposed in the Local Traffic Study, as determined appropriate by the County:

- Hedge Avenue and Florin Road,
- Happy Lane and Old Placerville Road,
- Excelsior Road and Gerber Road,
- Eagles Nest Road and Jackson Road,
- Excelsior Road and Calvine Road,
- Douglas Extension/Douglas Road and Mather Road, and
- Mayhew Road and Rock Creek Parkway eastbound and westbound.

MITIGATION MEASURE TR-4B: ROADWAY DESIGN IMPROVEMENTS

If the County determines, through application of the Dynamic Implementation Tool or similar means, that any subsequent entitlement would result in roadway design deficiencies, the applicant shall be required to construct or fund the improvement. Required physical roadway modifications will include the following improvements proposed in the Local Traffic Study, as determined appropriate by the County:

- **Watt Avenue and Folsom Boulevard**: Configuration involving grade separation of the northbound and southbound through movements of Watt Avenue. Access to and from Folsom Boulevard would be accomplished via on and off ramps from the left lanes of Watt Avenue to a single signalized intersection. A bus rapid transit lane along Watt Avenue would also intersect Folsom Boulevard at the traffic signal.
- **Watt Avenue and Kiefer Boulevard**: The ultimate improvement would involve a tight diamond interchange. The through movements (and bus rapid transit lane) on Watt Avenue would be grade separated from Kiefer Boulevard. Access to and from Kiefer Boulevard would be accomplished via on and off-ramps at two signalized intersections along Kiefer Boulevard.
- **Watt Avenue and Jackson Road**: Improvements would include the implementation of a standard six-by-six signalized intersection (two left-turn lanes, three through lanes, and one right-turn lane, on each approach) with three modifications.
  - The southbound left-turn movement would be grade separated;
  - The westbound right-turn movement would be grade separated; and
  - Three northbound left-turn lanes.
- **Bradshaw Road and Jackson Road**: Improvements would involve grade separating the northbound and southbound through movements.
- Grant Line Road and Prairie City Road, White Rock Road, Douglas Road, Kiefer Boulevard, Jackson Road, and Sunrise Boulevard: Implementation of grade separated intersections.

Each of these intersections have unique travel movements, volumes and existing context sensitive conditions (potential environmental issues, right-of-way, physical constraints), and the special treatments utilized at each location shall be studied to select the treatments that address the operational deficiency as it relates to safety, while avoiding or minimizing other operational or environmental implications. Other equivalent treatments may be selected to the satisfaction of the Department of Transportation to mitigate safety impacts.

MITIGATION MEASURE TR-4C: BUS QUEUE JUMPS

The responsible project applicant(s), County, and Sacramento Regional Transit District (SacRT) shall work in coordination to implement bus queue jump lanes at signalized intersections to provide dedicated channelization for buses that allow buses to approach and traverse an intersection in priority position as deemed necessary. Bus queue jumps are only recommended where volume of right-turning vehicles would not cause significant interference with transit operations; locations where right turn volumes are less than 200 vehicles per hour per lane would meet this criteria (DKS 2024: 142). Bus queue jumps shall meet the following infrastructure and geometric improvements unless otherwise agreed upon by the County and SacRT:

- Extend the right turn pocket on the approach (or construct a right turn pocket if one has not previously been identified) long enough to extend past the end of queue for the adjacent through travel lanes;
- Install signal heads for the right turn lane to allow for dedicated right turn phase and bus through phase;
- Build a dedicated receiving lane and far-side bus stop for intersections where a nearby bus stop is desired; and
- Install "No Right turn on red" blank out signs on the perpendicular approaches to the transit queue jump which would be activated based on bus calls for the queue jump.

As identified in the Local Traffic Analysis, at a minimum, the following locations for bus queue jump lanes shall be considered:

- Jackson Road and Excelsior Road (southbound, westbound, and eastbound);
- Vineyard Road and Jackson Road (southbound and westbound);
- Mayhew Road and Jackson Road (all directions of travel);
- South Watt Avenue and Jackson Road (northbound); and
- South Watt Avenue and Kiefer Boulevard (southbound).

IMPACT TR-5: RESULT IN INADEQUATE EMERGENCY ACCESS

Implementation of the WJHMP would include the construction of new roadway connections which would provide a high level of connectivity throughout the WJHMP area. Additionally, per Objective 8.6 of the WJHMP, two new fire stations would be developed in the WJHMP area if deemed necessary by the Sacramento Metropolitan Fire District, thus enhancing emergency services within the WJHMP area and surrounding communities if implemented. In addition, County General Plan Policies PF-55 and CI-7 relate to emergency access and are applicable to development associated with the WJHMP.

General Plan Policy CI-7 requires that transportation facilities are consistent with County standards, including the County Standard Construction Specifications. Section 12-3.03 of the County Standard Construction Specifications requires that a project contractor provide for the uninterrupted passage of emergency vehicles through or around a work area, at all times. Additionally, General Plan Policy PF-55 requires that new development provide access arrangements pursuant to the California Fire Code, adopted by reference in Section 17.04.010 of the County Code. Section 503.1.1 of the 2022 California Fire Code ensures that fire apparatus roads are provided for every facility, building, or portion of a building construction or moved into or within the jurisdiction. Additionally, Section 503.2.1 of the 2022 California Fire Code requires that the width of an unobstructed roadway measure no less than 20 feet to provide adequate access for fire and emergency responders. Therefore, required adherence to the California Fire Code and the County Standard Construction Specifications would ensure

that adequate emergency access is provided throughout the WJHMP area as individual projects are developed.

Additionally, applications for individual projects within District 1 and 2 under the WJHMP would be submitted to the County Department of Planning & Environmental Review to ensure consistency with the WJHMP and other applicable County regulatory documents. Therefore, due to the required adherence to local and state emergency access and design standards, implementation of the WJHMP would not result in inadequate emergency access. This impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

This page is intentionally left blank.

20 WATER SUPPLY

INTRODUCTION

The following chapter addresses the ability of the existing water service provider to supply drinking water to the project. The analysis describes relevant master planning of the utility services and whether the infrastructure and demands of the project are consistent with the utility master plans.

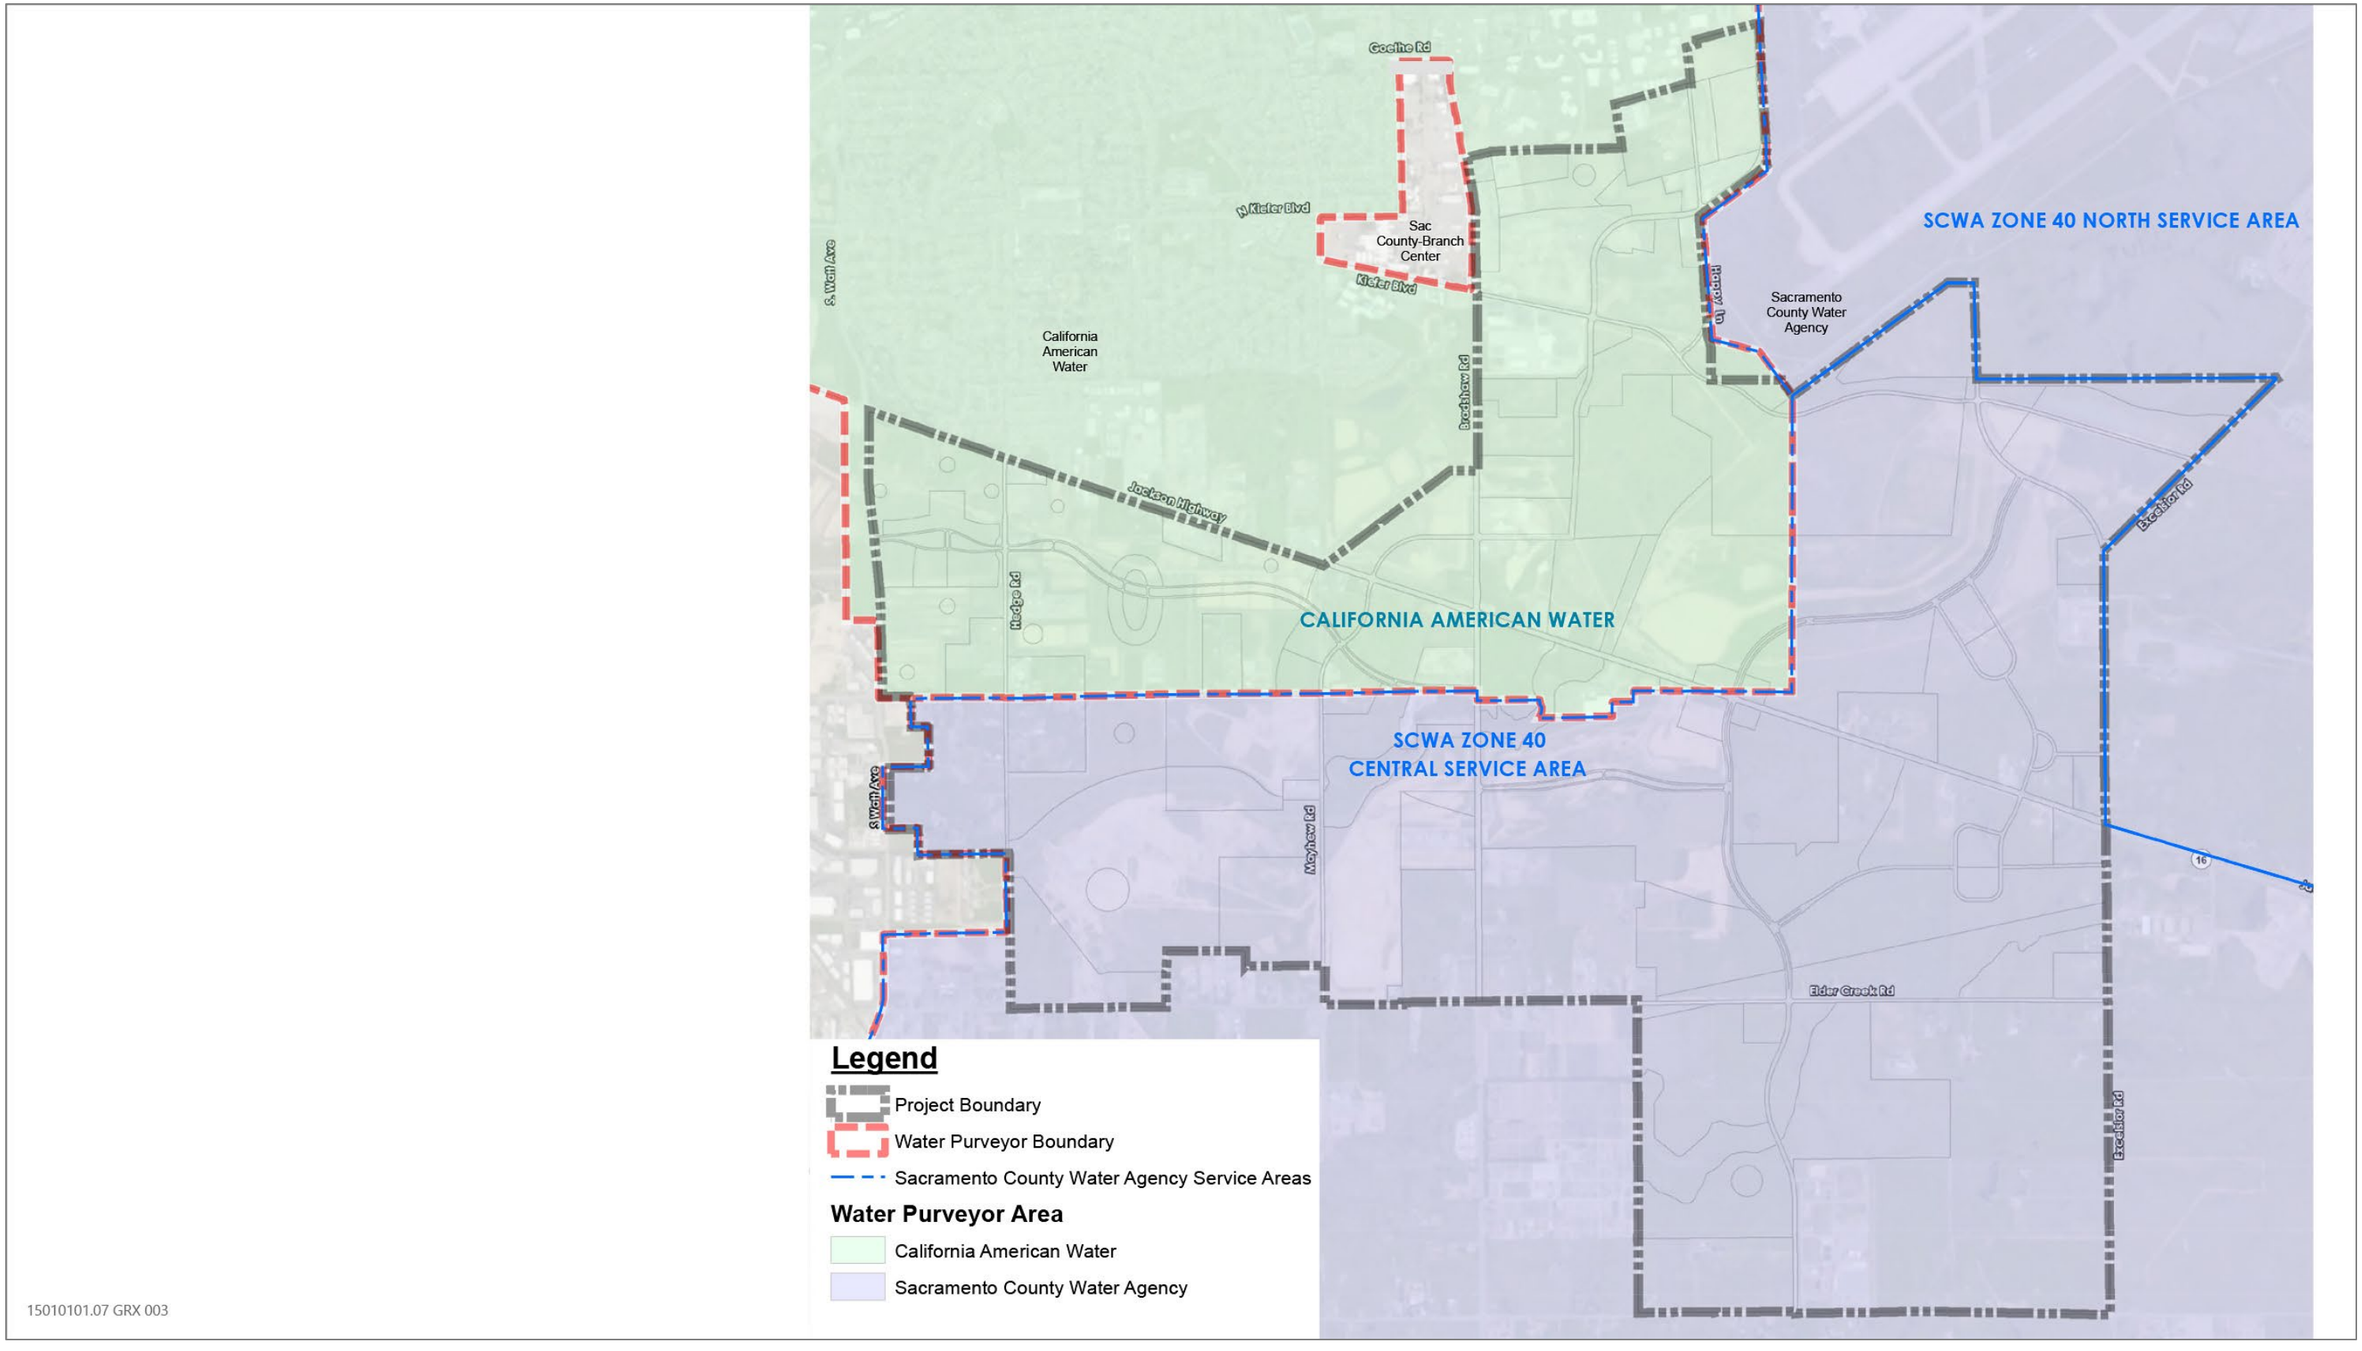
During the notice of preparation (NOP) scoping process, the County received one comment from the Cordova Community Planning Advisory Council regarding the sources of water. The comment is addressed in the "Environmental Setting" section below. The NOP and comments received in response to the NOP are provided in Appendix A.

ENVIRONMENTAL SETTING

WATER PURVEYORS

The plan area is located within the service areas of the Sacramento County Water Agency (SCWA) and the California American Water Company (Cal Am) (Figure 20-1). The amount of water available to these two purveyors to supply the plan area is defined by their individual water rights, surface water contracts, groundwater pumping limitations, and infrastructure necessary to treat, pump, and deliver water.

SACRAMENTO COUNTY WATER AGENCY



Approximately 4,021 acres of the plan area is within SCWA's Zone 40. The Zone 40 service area is the largest area served by SCWA and is further subdivided into the North Service Area (NSA), the Central Service Area (CSA), and the South Service Area (SSA). NSA is located south of the American River and includes part of the City of Rancho Cordova. CSA is located to the south of NSA and is supplied by surface water from the Vineyard Surface Water Treatment Plant (SWTP) and groundwater. SSA is located south of CSA and to the west of Highway 99. The plan area is located within CSA of Zone 40.

Zone 40 is in the central portion of the county, and has traditionally been a largely rural, agricultural region. Zone 40 plans, acquires, constructs, and operates facilities for the conjunctive use of groundwater and surface water in the area of influence of the South American Subbasin (SASb), described in detail below under the "Groundwater" section. Once planned facilities have been constructed by SCWA, they are operated and maintained by Zone 41, which retails the water to customers. Zone 40 and 41 have largely overlapping jurisdictional boundaries.

SCWA operates a conjunctive use program in Zone 40. Conjunctive use means relying heavily on surface water in years when there is plenty of water and more heavily on groundwater in years that are dry. SCWA generally takes its surface water through an intake on the Sacramento River near Freeport. The water is then treated and distributed to customers. In dry years, less surface water is available and SCWA operates a system of wells and groundwater treatment plants to extract and serve groundwater. SCWA utilizes this conjunctive use program to manage surface water and groundwater supplies to maximize the yield of available water resources with the least adverse impact to either the river system or the groundwater aquifers (SCWA 2023). Using surface water and groundwater conjunctively makes it easier for SCWA to meet demands in a single dry year or in multiple dry years. The goal of the conjunctive use program is to meet all demands during wet and dry years.

California American Water Company

Cal Am delivers water service throughout California. Approximately 1,892 acres of the plan area is within Cal Am's Suburban-Rosemont Public Water System (PWS). The Suburban-Rosemont PWS service area covers approximately 13,600 acres in Sacramento County south of the American River. It is bordered to the north by the American River and to the west by the Mather Airport. The Suburban-Rosemont PWS service area extends to Fruitridge Road in the south and approximately 1 mile west of Watt Avenue in the west (Murraysmith 2021). The Suburban-Rosemont PWS services primarily residential and commercial customers.

Figure 20-1 Water Purveyors

SURFACE WATER

SACRAMENTO COUNTY WATER AGENCY

Initial water demands of the project could be met with groundwater. SCWA would exercise its right as a groundwater appropriator to extract groundwater from the basin for delivery to the project; surface water would be from existing entitlements diverted from the Sacramento River and treated at the Vineyard SWTP. In the long-term, the water demands for the project would be met in accordance with the conjunctive use program. The surface water supplies associated with SCWA's conjunctive use program fall into the following water rights and contracts (SCWA 2024):

- Purchased water supplies available through a current United States Bureau of Reclamation (Reclamation) Central Valley Project (CVP) contract.
- Purchased water available through the City of Sacramento for use within the American River Place of Use (POU).
- Water supplies available through State Water Resources Control Board (SWRCB) Permit 21209.
- SWRCB Appropriative Water Right License 1062
- SWRCB Appropriative Water Right License 4060
- Agreement Between Sacramento County, SCWA and Aerojet with respect to Transfer of Groundwater Extraction and Treatment (GET) Water
- Contract Between State of California Department of Water Resources (DWR) and North Delta Water Agency
- 2002 Wholesale Agreement Between SRCSD and SCWA
- 2004 Agreement with the City of Sacramento for Wholesaling and/or Wheeling Water Service for Sacramento International Airport and Metro Air Park
- 2000 Agreement Between City of Sacramento and the Sacramento County Water Agency to Treat and Deliver (Wheel) Surface Water
- 2000 Memorandum of Understanding Regarding the Operation of A Water System Interconnection at 2750 Mercantile Drive
- Fruitridge Vista Water Company Contract now held by Cal American Water Company

The project is included in the SCWA's 2020 Urban Water Management Plan (UWMP). The SCWA 2020 UWMP describes SCWA's projected water demands through 2045 (Table 20-1).

Table 20-1 Zone 40 Water Supply Availability Through 2045 (AFY)

Total Supply		2025	2030	2035	2040	2045
Normal		159,096	164,096	174,096	174,096	174,096
Single Dry Year		87,199	92,676	103,926	105,176	107,676
Multi-Year Drought	Year 1	111,954	118,386	132,136	135,886	143,386
	Year 2	99,576	105,531	118,031	120,531	125,531
	Year 3	87,199	92,676	103,926	105,176	107,676
	Year 4	95,054	100,531	111,781	113,031	115,531
	Year 5	107,431	113,386	125,886	128,386	133,386

Source: SCWA 2021: Table 3-50.

California American Water

Cal Am has an agreement with the City of Sacramento to purchase water. The agreement was revised in 2010 to receive a maximum of 3.46 million gallons per day (MGD) of non-firm supply during off-peak periods from October 15 through May 14, plus an additional 2.3 MGD of firm capacity, for a total of 5.76 MGD. Because the non-firm capacity of 3.46 MGD can only be used during seven months of the year, the total yearly amount available is estimated to be 1,576 MG (Cal Am 2024). In a dry year or multiple dry years, it is assumed that only the firm supply would be available. Additionally, this agreement includes three of Cal Am's service areas, so it is assumed that this firm supply would be available to each of these service areas proportional to their respective demands (Cal Am 2024). For the Suburban-Rosemont PWS, this equates to 403 MG. Cal Am's annual surface water supply for the Suburban-Rosemont PWS is summarized as follows (Cal Am 2024):

- Normal Year – 1,576 MG
- Single Dry Year – 403 MG
- Multiple Dry Years – 403 MG

Groundwater

Groundwater Basin and Conditions

The groundwater basin underlying Sacramento County has been utilized for domestic, agricultural, and urban water supply since the mid-1800s. In the 1940s, groundwater extractions began to exceed levels of recharge, which caused a gradual lowering of groundwater levels in the region (DWR 1974). There are two primary groundwater subbasins in Sacramento County that are described in the DWR Bulletin 118: the Sacramento Valley Basin – North American Subbasin (5-21.64) and the Sacramento Valley Basin – SASb (5-21.65). The project is located in SASb.

SASb is roughly bound by the American River to the north, the Sacramento River to the west, the Cosumnes and Mokelumne Rivers to the south, and the Sierra foothills to the

east. Groundwater in SASb generally occurs in a shallow aquifer zone or in an underlying deeper aquifer zone. Within SASb, the shallow aquifer extends approximately 200 to 300 feet below ground surface (bgs). Water quality in the shallow aquifer zone is considered good, with the exception of arsenic detections in a few locations. The shallow aquifer is typically used for private domestic wells requiring no treatment unless high arsenic values are encountered, causing owners to possibly target other water-bearing strata (SCWA 2021).

The deep aquifer is separated from the shallow aquifer by a discontinuous clay layer that serves as a semi-confining layer for the deep aquifer. The base of the potable water portion of the deep aquifer averages approximately 1,400 feet bgs. Water in the deep aquifer typically has higher concentrations of total dissolved solids, iron, and manganese. Groundwater used in SASb is supplied from both the shallow and deeper aquifer systems (SCWA 2021).

GROUNDWATER SUPPLIES

SACRAMENTO COUNTY WATER AGENCY

The plan area is largely located within SCWA's Zone 40. Zone 40 has a total of 41 wells. These wells also draw water from SASb and have a reasonable design capacity of 62.6 MGD (SCWA 2021). Table 20-2 summarizes the Zone 40 projected groundwater production through 2045.

Table 20-2 Zone 40 Projected Groundwater Production through 2045 (AFY)

Total Supply		2025	2030	2035	2040	2045
Normal		41,000	46,000	56,000	56,000	56,000
Single Dry Year		41,000	46,000	56,000	56,000	56,000
Multi-Year Drought	Year 1	41,000	46,000	56,000	56,000	56,000
	Year 2	41,000	46,000	56,000	56,000	56,000
	Year 3	41,000	46,000	56,000	56,000	56,000
	Year 4	41,000	46,000	56,000	56,000	56,000
	Year 5	41,000	46,000	56,000	56,000	56,000

Source: SCWA 2021: Table 3:31.

CALIFORNIA AMERICAN WATER COMPANY

A portion of the plan area is located within Cal Am's Suburban-Rosemont PWS. The Suburban-Rosemont PWS is primarily served by groundwater wells. These wells draw water from SASb. The Suburban-Rosemont PWS currently has 25 operational groundwater wells with a total capacity of 19,319 gallons per minute. The firm capacity of these wells (the capacity with the largest well out of service) is approximately 17,654 gallons per minute or 9,279 MG per year (Cal Am 2024).

WATER INFRASTRUCTURE

SACRAMENTO COUNTY WATER AGENCY

SURFACE WATER FACILITIES

SCWA surface water supplies for Zone 40 are diverted from the Sacramento River at Freeport and through the City of Sacramento's Sacramento River SWTP. Surface water diverted from the Sacramento River at the Freeport diversion structure is conveyed through the Freeport Regional Water Authority pipeline, treated at the Vineyard SWTP, and then delivered to the Zone 40 service area. In 2011, the Freeport Regional Water Authority completed the Sacramento River diversion at Freeport and a conveyance pipeline. The 84-inch-diameter pipeline starts at the Freeport intake, crosses Interstate 5 and Highway 99 to the east, and then parallels Gerber Road to a bifurcation at Vineyard Road. A SCWA owned 60-inch diameter pipeline then conveys water north from this point to the Vineyard SWTP.

The current capacity of the Vineyard SWTP is 50 MGD with an ultimate capacity of 100 MGD. Treatment facilities include coagulation, flocculation, sedimentation, filtration, and chlorine disinfection. The plant is also provided with solids-handling facilities. Other facilities include a clear well / chlorine contact tank, an electrical building, and treated water pump station. The Vineyard SWTP's current 50 MGD capacity is more than adequate to supply CSA's current maximum day demand (SCWA 2016).

EXISTING GROUNDWATER FACILITIES

Groundwater is supplied to Zone 40 from wells that that are connected to groundwater treatment plants (GWTPs) and from wells that pump directly into the distribution system (direct feed). Each GWTP facility consists of wells that are manifolded into a treatment plant, a ground level storage tank, and a pump station. Most GWTPs are supplied by more than one well. The existing GWTPs use oxidation and filtration with a manganese zeolite (green sand) filter media for iron and manganese treatment. Treated water from the GWTPs flows into the ground level storage tanks and is subsequently pumped into the distribution system. The pump stations are typically sized larger than the GWTP capacities so that peak hour supply can be pumped to the distribution system from the storage tanks (SCWA 2016).

CSA is supplied water from the Vineyard SWTP and five GWTPs. There are also three direct feed wells that supply CSA. In the case of the Dwight Road GWTP in SSA, the pump station is sized larger than the GWTP to also pump the Franklin Intertie supply into SSA. The direct feed wells pump directly into the distribution system and do not require treatment. Direct feed wells are located in some areas of CSA and SSA. SCWA also has some wells that were drilled and planned to be equipped in the future. The existing capacity of groundwater facilities is sufficient to meet CSA's existing water demand (SCWA 2016).

PLANNED FACILITIES

SCWA is planning to develop a West Jackson GWTP. The future West Jackson GWTP will be used to supply CSA with a capacity of 18.0 MGD (SCWA 2016).

CALIFORNIA AMERICAN WATER COMPANY

As discussed above, the Suburban-Rosemont service area is served primarily by groundwater wells. Cal Am's existing water supply facilities in the plan area include a network of groundwater wells. Cal Am requires project applicants to provide the necessary infrastructure to convey water to the proposed development, including water mains and peaking facilities (e.g., tank[s] and pump station[s]).

REGULATORY SETTING

FEDERAL

UNITED STATES BUREAU OF RECLAMATION

The Bureau of Reclamation is part of the United States Department of the Interior and is responsible for the development and conservation of much of the water resources in the western United States. The Bureau operates Folsom Dam, Nimbus Dam, and the Folsom South Canal. While the original purpose of the Bureau was to provide for the reclamation of arid and semiarid lands in the west, the agency's current mission covers a wider range of interrelated functions. These functions include providing municipal and industrial water supplies through the Central Valley Project; generating hydroelectric power; providing irrigation water for agriculture; improving water quality, flood control, and river navigation; providing river regulation, control, and fish/wildlife enhancement; offering water-based recreation opportunities; and conducting research on a variety of water-related topics.

STATE

CALIFORNIA DEPARTMENT OF WATER RESOURCES

DWR is responsible for the preparation of the California Water Plan, management of the State Water Project, protection and restoration of the Sacramento-San Joaquin River Delta, regulation of dams, provision of flood protection, and other functions related to surface water and groundwater resources. DWR is also responsible for categorizing groundwater basins in the state for sustainable management as required by the Sustainable Groundwater Management Act of 2014 (SGMA). SGMA is discussed in more detail below.

STATE WATER RESOURCES CONTROL BOARD

SWRCB was established in 1967 to administer water rights and protect water quality. SWRCB and its nine regional water quality control boards administer water rights and enforce pollution control standards. SWRCB is responsible for the granting of water right permits and licenses through an appropriation process following public hearings and appropriate environmental review by applicants and responsible agencies. In granting water right permits and licenses, SWRCB must consider all beneficial uses, including water for downstream human and environmental uses.

URBAN WATER MANAGEMENT PLANNING ACT

Pursuant to California Water Code Sections 10610-10657, as last amended by Senate Bill (SB) 318 in 2004, the Urban Water Management Planning Act requires all urban water suppliers with more than 3,000 service connections or water use of more than 3,000 acre-feet per year (AFY) to submit an urban water management plan (UWMP) to DWR every 5 years and update the plan on or before December 31 in years ending in 5 and 0. Amendments to SB 318 have focused on ensuring that UWMP emphasizes and addresses drought contingency planning, water demand management, reclamation, and groundwater resources.

CALIFORNIA WATER CODE

Water Code Section 10910 et seq. defines the projects for which the preparation of a water supply assessment (WSA) is required, as well as the lead agency's responsibilities related to WSA. The Water Code also clarifies the roles and responsibilities of the lead agency under CEQA and of the water supplier with respect to describing current and future supplies compared to current and future demands. A WSA is required for:

- A proposed residential development of more than 500 dwelling units;
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- A proposed hotel or motel, or both, having more than 500 rooms;
- A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area;
- A mixed-use development that includes one or more of the uses described above;
- A development that would demand a volume of water equivalent to or greater than the volume of water required by a 500-dwelling unit project; and
- For lead agencies with fewer than 5,000 water service connections, any new development that would increase the number of water service connections in the service area by 10 percent or more.

Under Section 10910 of the Water Code, the lead agency must identify the affected water supplier and ask the supplier whether the new demands associated with the project are included in the supplier's UWMP. If UWMP includes the demands, it may be incorporated by reference in the WSA. If there is no public water system to serve the project, the lead agency must prepare a WSA.

SENATE BILL 221

SB 221 requires a city or county to include as a condition of approval of any tentative map, parcel map, or development agreement for certain residential subdivisions a requirement that a "sufficient water supply" be available. Proof of a sufficient water

supply must be based on a written verification from the public water system that would serve the development.

Sustainable Groundwater Management Act of 2014

SGMA became law on January 1, 2015 and applies to all groundwater basins in the state (Water Code Section 10720.3). By enacting the SGMA, the legislature intended to provide local agencies with the authority and the technical and financial assistance necessary to sustainably manage groundwater within their jurisdiction (Water Code Section 10720.1).

SGMA requires DWR to categorize each groundwater basin in the state as high, medium, low, or very low priority (Water Code Sections 10720.7, 10722.4). All basins designated as high- or medium-priority basins must be managed by a groundwater sustainability agency (GSA) under a groundwater sustainability plan (GSP) that complies with Water Code section 10727, et seq. If required to be prepared, GSPs must be prepared by January 31, 2020 for all high- and medium-priority basins that are subject to critical conditions of overdraft, as determined by DWR, or by January 31, 2022 for all other high- and medium-priority basins. In lieu of preparation of a GSP, a local agency could submit an alternative that complies with SGMA no later than January 1, 2017 (Water Code Section 10733.6).

California Model Water Efficient Landscape Ordinance

The California Model Water Efficient Landscape Ordinance (MWELO) sets restrictions on outdoor landscaping. Because Sacramento County is a “local agency” under MWELO, it must require project applicants to prepare plans consistent with the requirements of MWELO for review and approval by the County. MWELO was most recently updated by DWR and approved by the California Water Commission on July 15, 2015. All provisions became effective on February 1, 2016. The revisions, which apply to new construction with a landscape area greater than 500 square feet, reduced the allowable coverage of high-water-use plants to 25 percent of the landscaped area. MWELO also requires use of a dedicated landscape meter on landscape areas for residential landscape areas greater than 5,000 square feet or non-residential landscape areas greater than 1,000 square feet and requires weather-based irrigation controllers or soil-moisture based controllers or other self-adjusting irrigation controllers for irrigation scheduling in all irrigation systems.

California Green Building Standards Code

Chapter 4, Division 4.3 of the 2022 California Green Building Standards Code (CALGreen) requires conservation of water used indoors, outdoors, and in wastewater conveyance associated with residential land use. These include requiring the installation of water conserving plumbing fixtures and fittings, and requirements for outdoor potable water use in land use areas consistent with MWELO. Chapter 5, Division 5.3 includes standards for indoor and outdoor water use associated with non-residential land uses.

LOCAL

WATER FORUM AGREEMENT

The Water Forum is made up of a diverse group of businesses, agricultural leaders, environmentalists, citizen groups, water managers, and local governments from Sacramento, Placer, and El Dorado Counties. These stakeholders came together in 2000 to form an agreement for water management with the goals of providing a reliable and safe water supply for the region's economic health through the year 2030 and preserving the fishery, wildlife, recreation, and aesthetic values of the lower American River. The Water Forum Agreement was formalized through a Memorandum of Understanding whereby all signatories agreed to carry out the actions specified for them (Water Forum 2015). Sacramento Central Groundwater Authority (SCGA) relied on the negotiated volume of groundwater production referred to in the Water Forum Agreement as the basis for the groundwater yield thresholds.

SACRAMENTO COUNTY WATER AGENCY ZONE 40 WATER SUPPLY MASTER PLAN

The Water Forum Agreement is the foundation for the Zone 40 Water Supply Master Plan (WSMP), which was adopted in February 2005 by SCWA. The Zone 40 WSMP describes available water supply and makes recommendations to meet future water demands in Zone 40 through 2030 through implementation of a regional conjunctive use program that balances the use of groundwater, surface water, and recycled water supplies. SCWA prepared amendments to the 2005 Zone 40 WSMP to address the sufficiency of water supply for WJHMP, Jackson Township, and NewBridge projects (SCWA 2016).

SACRAMENTO COUNTY WATER AGENCY ZONE 40 2016 WATER SUPPLY INFRASTRUCTURE PLAN

In 2006, SCWA prepared the Water Supply Infrastructure Plan (WSIP), which identified the water supply infrastructure needs necessary to support the buildout of Zone 40. SCWA updated the plan in 2016 to reflect changes in the Zone 40 water supply portfolio, adoption of the Sacramento County General Plan, and completion of the Freeport Regional Water Project. The 2016 WSIP includes water demand factors, growth projections, and estimates of projected water demand and supply (SCWA 2016). It also identifies recommended infrastructure types, locations, and timing to meet future demand through buildout. WJHMP is within the buildout area of the 2016 WSIP.

SACRAMENTO AMERICAN SUBBASIN GROUNDWATER SUSTAINABILITY PLAN

SASb has been designated by DWR as a high priority subbasin. There are six local entities that responded to the mandate of SGMA and formed GSAs within SASb: SCGA, Omochumne-Hartnell Water District (OHWD), Sloughhouse Resource Conservation District (SRCD), North Delta GSAs (NDGSA), Reclamation District 551 (RD 551), and Sacramento County. The six GSAs agreed to work together to develop and implement a GSP for SASb. SCWA and Cal Am are members of the SCGA GSA. The South American Subbasin Groundwater Sustainability Plan (SASb GSP) was prepared in

October 2021 by the six local GSAs. The SASb GSP identified the sustainable yield[1] for SASb to be at or below 235,000 AFY (South American Subbasin Groundwater Sustainability Agencies 2021). Projects and management actions that would contribute to the achievement of the sustainability goal of the SASb GSP include the following:

- Existing projects that include diversification of water supplies (Freeport Regional Water Project, Vineyard SWTP, and conjunctive use improvements).
- Near-term planned projects that include the Sacramento Regional County Sanitation District Harvest Water project, OHWD Groundwater Recharge Project, Regional Conjunctive Use Program, and Sacramento Area Flood Control Agency Flood-MAR.

Sacramento County 2030 General Plan

The following policies of the 2030 General Plan are applicable to the project:

- **Policy AG-27.** The County shall actively encourage groundwater recharge, water conservation and water recycling by both agricultural and urban water users.
- **Policy CO-1.** Support conjunctive use water supply for development.
- **Policy CO-7.** Support the Water Forum Agreement Groundwater Management Element. Prior to approving any new development water supply plan shall be approved that demonstrates consistency with an adopted groundwater management plan.
- **Policy CO-9.** Developments in areas with significant contamination shall utilize remediated groundwater as part of their water supply when feasible.
- **Policy CO-14.** Support the use of recycled wastewater to meet non-potable water demands where financially feasible.
- **Policy CO-16.** Ensure developments are consistent with the County Water Efficient Landscape Ordinance, which shall be updated as needed to conform to state law.
- **Policy CO-22.** Support water management practices that are responsive to the impacts of Global Climate Change such as groundwater banking and other water storage projects.
- **Policy CO-23.** Development approval shall be subject to a finding regarding its impact on valuable water-supported ecosystems.
- **Policy CO-34.** Development applications shall be subject to compliance with applicable sections of the California Water Code and Government Code to

[1] Sustainable yield is defined for SGMA purposes as “the maximum quantity of water, calculated over a base period representative of long-term conditions in the basin and including any temporary surplus, that can be withdrawn annually from a groundwater supply without causing an undesirable result.” (Clean Water Act Section 10721 (w)).

determine the availability of an adequate and reliable water supply through the Water Supply Assessment and Written Verification processes.

- **Policy CO-35.** New development that will generate additional water demand shall not be approved and building permits shall not be issued if sufficient water supply is not available, as demonstrated by Water Supply Assessment and Written Verification processes.
- **Policy CO-36.** Water supply entitlements will be granted on a first come first serve basis to optimize the use of available water supplies.
- **Policy LU-73.** Sewer and water treatment and delivery systems shall not provide for greater capacity than that authorized by the General Plan.
- **Policy PF-2.** Municipal and industrial development within the Urban Service Boundary but outside of existing water purveyors' service areas shall be served by either annexation to an existing public agency providing water service or by creation or extension of a benefit zone of the SCWA.
- **Policy PF-4.** Connector fees for new development shall cover the fair share of costs to acquire and distribute surface water to the urban area.
- **Policy PF-5.** New treatment facilities and all facility operations shall be funded by beneficiaries.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community Plans relevant to the WJHMP are the Cordova Community Plan and the Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

- **Policy PS-2.** Provide a reliable, contaminant-free, long-term source of water to serve the community, which protects the groundwater aquifer(s) from long-term damage attributable to drawdown by the use of public/private wells.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan does not contain specific policies related to water supply.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

A water supply impact would be significant if implementation of the project would:

- Require or result in the construction of new, or the expansion of existing, water facilities, the construction of which could cause significant environmental effects.
- Have insufficient water supplies available to serve the project and reasonably foreseeable development during normal, dry, or multiple dry years.

- Result in a service demand that cannot be met by existing or reasonably foreseeable future service capacity.
- Contribute to groundwater pumping to serve project growth such that the average annual sustainable yield of 235,000 acre-feet for the South American Subbasin Basin is exceeded.
- Interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level.

Issues not Discussed Further

Groundwater Recharge

Project impacts related to groundwater recharge and conflict with a sustainable groundwater management plan are discussed in Impact HYD-2 and Impact HYD-5 of Chapter 14, "Hydrology, Drainage, and Water Quality," respectively. Therefore, these topics are not discussed further in this chapter.

Methodology

The evaluation of water supply is based on review of the following documents and technical studies:

- The SASb GSP (South American Subbasin Groundwater Sustainability Agencies 2021)
- Zone 40 Water System Infrastructure Plan (SCWA 2016)
- SCWA 2020 UWMP (SCWA 2021)
- Cal AM 2020 UWMP for Sacramento Main District (Murraysmith 2021)
- SCWA Water Supply Assessment for West Jackson Highway Master Plan (SCWA 2024)
- Cal Am Water Supply Assessment for West Jackson Highway Master Plan (Cal Am 2024)

West Jackson Highway Master Policies

The proposed WJHMP includes the following policy related to water supply.

- **Policy 7.2.** Sufficient water resources shall be identified, and the necessary transmission and storage facilities shall be constructed to provide potable water to meet the Plan Area needs.

IMPACTS AND ANALYSIS

IMPACT WS-1: ENVIRONMENTAL EFFECTS DUE TO THE CONSTRUCTION OF NEW OR THE EXPANSION OF EXISTING WATER FACILITIES

Implementation of the project would require on-site and off-site water line extensions to the existing SCWA and Cal Am infrastructure surrounding the plan area. On-site water transmission lines would be routed throughout the plan area. Generally, the on-site transmission system would consist of 16-inch to 24-inch mains. A grid of 8-inch to 12-inch distribution mains would extend from the transmission system to serve local developments. Off-site improvements would consist of SCWA's transmission mains looping to the Vineyard SWTP along Florin Road and Elder Creek Road, a 24-inch Cal Am water line extending to Folsom Boulevard within Watt Avenue, and a 12-inch Cal Am water line extending north in Mayhew Road to the existing domestic water facilities at Oxwood Drive. The existing and proposed water infrastructure are shown in Figure 2-10 in Chapter 2, "Project Description." Water infrastructure would be phased with development to meet end user demands as well as operational criteria of the system.

Connections to SCWA's and Cal Am's water systems are considered part of the project. The impacts associated with their construction are analyzed in other chapters of this EIR. For example, Chapter 6, "Air Quality," Chapter 9, "Climate Change," and Chapter 16, "Noise," evaluate increases in air pollutant and greenhouse gas emissions, and noise levels associated with all construction activities, including any ground disturbance needed for connecting to existing water infrastructure, as well as increases in emissions associated with the project's water demands. Chapter 8, "Biological Resources," evaluates the potential impacts to special-status species and sensitive habitats resulting from ground disturbance activities (e.g., trenching and excavation) needed for connecting to existing water infrastructure. Chapter 10, "Cultural Resources," evaluates the potential impacts that trenching and excavation, including any ground disturbance needed for connecting to existing water infrastructure, may have on buried resources. Chapter 12, "Geology and Soils," Chapter 13, "Hazards and Hazardous Materials," and Chapter 14, "Hydrology and Water Quality," evaluate the potential impacts that trenching and excavation, including any ground disturbance needed for connecting to existing infrastructure, may have related to erosion and siltation, degradation of water quality, and the release of contamination into the environment.

As required by law, utility connections would be constructed in accordance with all applicable building codes and standards to ensure an adequately sized and properly constructed transmission and conveyance system. Any necessary connections would be constructed prior to building occupancy and in a manner that would minimize the potential for utility service disruption of existing uses.

Based on the above discussion, the project would not result in significant environmental effects from the construction of water infrastructure needed to serve the project. The impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

IMPACT WS-2: RESULT IN DEMAND FOR WATER THAT CANNOT BE MET BY EXISTING OR REASONABLY FORESEEABLE FUTURE SERVICE CAPACITY

As discussed in the "Environmental Setting" section above, SCWA and Cal Am would be the water purveyors supplying water to serve development within the plan area. Two WSAs, one from Cal Am and one from SCWA, have been prepared in accordance with the California Water Code Section 10910, which demonstrate that the planned water supplies for SCWA's Zone 40 and Cal Am's Suburban-Rosemont PWS would be sufficient to meet the demands of the project in addition to the existing and projected water supply obligations for a 20-year period (see Appendix L). Although the buildout of the project would take longer than 20 years to complete, the WSAs were prepared in accordance with the California Water Code Section 10910 to determine whether there are sufficient water supplies to serve the project during normal, single dry, and multiple dry year for a 20-year period between 2025 and 2045. The proposed water demands and supplies for the plan area within SCWA and Cal Am service areas are described below.

SACRAMENTO COUNTY WATER AGENCY

SCWA prepared a WSA in accordance with the California Water Code Section 10910, which demonstrates that the planned water supplies for Zone 40 would be sufficient to meet the demands of the project in addition to the existing and projected water supply obligations through 2045. The proposed lands uses and projected water demand for the project within Zone 40 service area are summarized in Table 20-3.

Table 20-3 Proposed Land Use and Water Demands Estimate for the Project in SCWA Zone 40

Land Use	Unit Water Demand Factor (AFY per acre)	Area (acre)	Water Demand (AFY)[a]
Residential Designation			
Multi-family Residential (low density)	2.44	41	100.0
Multi-family Residential (high density)	3.33	149	496.2
Single Family	2.13	1,511	3,218.4
Rural Estate	1.37	95	130.2
Subtotal – Residential	—	1,796	3,944.8

Land Use	Unit Water Demand Factor (AFY per acre)	Area (acre)	Water Demand (AFY)[a]
Non-Residential Designation			
Light Industrial	2.02	79	159.6
Commercial	2.02	303	612.1
Public Recreation	2.80	281	786.8
Public	0.81	76	61.6
Right-of-Way	0.818	131	23.6
Vacant	—	1,355	—
Subtotal – Non-Residential	—	2,225	1,643.7
Total without System Loss	—	-	5,588.5
System Loss (7.5 percent)	—	-	419.2
TOTAL	**—**	**4,021**	**6,007.7**

a Minor discrepancies occur due to rounding.

Source: SCWA 2024.

As shown in Table 20-3, the project is anticipated to have an annual average water demand of approximately 6,008 AFY (including 7.5 percent system losses) at buildout. The project's estimated demands for water are accounted for in the SCWA 2020 UWMP. While it is probable that the buildout of WJHMP would take more than 20 years to complete, construction of the project is assumed to begin in 2025 and be completed in 2045 for the purpose of water supply planning. The projected water demands were incorporated into the 2020 UWMP in 5-year increment, as shown in Table 20-4, with 2045 assumed to reflect full buildout of the plan area.

Table 20-4 Projected Water Demand Growth in 5-Year Increments for the Project (AFY)

	2025	2030	2035	2040	2045
Projected Water Demand	1,201	2,401	3,602	4,802	6,008

Source: SCWA 2024.

Within CSA of Zone 40, treated surface water would be provided to the plan area from the Vineyard SWTP. The Vineyard SWTP's current 50 MGD capacity is more than adequate to supply CSA's current maximum day demand (SCWA 2016). With an ultimate capacity of 100 MGD, the Vineyard SWTP would be capable of supplying treated water needs of the CSA for the near term. There would be adequate water available to meet the project's annual water demand for normal and dry years because current surface water supplies alone are demonstrated to exceed the projected buildout water demand for Zone 40, including the project, through 2045, as illustrated below in Table 20-5.

Table 20-5 Zone 40 Surface Water Supply Reliability Through 2045, in 5-Year Increments (AFY)

Water Year	2025	2030	2035	2040	2045
Normal Year					
Total Supply	159,096	164,096	174,096	174,096	174,096

Source: SCWA 2021: Tables 5-3 and 5-4.

California American Water Company

Cal Am also prepared a WSA for the project, which demonstrates that the planned water supplies for the Suburban-Rosemont PWS would be sufficient to meet the demands of the project in addition to the existing and projected water supply obligations

through 2045. The proposed lands uses and projected water demand for the project within the Suburban-Rosemont PWS are summarized in Table 20-6.

Table 20-6 Proposed Land Use and Water Demands Estimate for the Project in Cal Am Suburban-Rosemont PWS

Land Use	Area (acre)	Average Annual Demand (MG)	Average Day Demand (gallon per minute)	Maximum Day Demand (gallon per minute)	Peak Hour Demand (gallon per minute)
Residential Designation

Source: Cal Am 2024.

As shown in Table 20-6, the project is anticipated to have an annual average water demand of approximately 996 MG within the Suburban-Rosemont PWS. As explained in the Cal Am WSA, the 2020 UWMP for Suburban-Rosemont does not include the anticipated 996 MG water demands from the project. However, there have been no significant changes or updates to demand projections for Cal Am's Suburban-Rosemont PWS since the 2020 UWMP. Historical demands from the past 5 years are presented in Table 20-7.

Table 20-7 Cal Am Suburban-Rosemont PWS Historical Water Demands

Year	2018	2019	2020	2021	2022
Demand (MG)	2,691	2,629	2,872	2,622	2,699

Source: Cal Am 2024.

Future water demands for the Suburban-Rosemont PWS are estimated by applying historical growth rates as well as the projected demands for the project. As described above for the SWCA assessment, this analysis conservatively assumes that the project construction would begin in 2025 and conclude in 2045. It is assumed that 25 percent of the project would be completed by 2030, 50 percent completed by 2035, 75 percent completed by 2040, and 100 percent completed by 2045. Therefore, 25 percent of the estimated project water demand is applied to projected demands for Suburban-Rosemont PWS in 2030, 50 percent of the estimated project water demand is applied in 2035, 75 percent of the estimated project water demand is applied in 2040, and 100 percent the estimated project water demand is applied in 2045. The overall projected water demands for the Suburban-Rosemont PWS through 2045 are summarized in Table 20-8.

Table 20-8 Projected Water Demands for Cal Am Suburban-Rosemont PWS

Year	2023	2024	2025	2030	2035	2040	2045
Demand (MG)	2,709	2,718	2,727	3,024	3,322	3,620	3,920

Source: Cal Am 2024.

Cal Am's Suburban-Rosemont PWS is served primarily by 25 groundwater wells. These wells draw water from SASb. Actual groundwater withdrawals from SASb for the past 5 years are shown in Table 20-9.

Table 20-9 Suburban-Rosemont PWS Historical Groundwater Withdrawals

Year	2018	2019	2020	2021	2022
Groundwater Withdrawal (MG)	2,570	2,466	2,531	2,622	2,590

Source: Cal Am 2024.

As described above under the "Environmental Setting" section, the 25 operational wells serving the Suburban-Rosemont PWS have a firm capacity of 9,279 MG per year. Cal Am also has an agreement with the City of Sacramento to purchase water. With this agreement, the Suburban-Rosemont PWS receives approximately 1,576 MG of water per year during normal year and 403 MG of water per year during single dry years and multiple dry years from the City of Sacramento. Therefore, the total water supplies for the Suburban-Rosemont PWS are as follows:

- Normal Year – 10,855 MG (9,279 MG plus 1,576 MG)
- Single Dry Year – 9,682 MG (9,279 MG plus 403 MG)
- Multiple Dry Year – 9,682 MG (9,279 MG plus 403 MG)

Table 20-10 summarizes the total water supplies, demands (including the average annual water demand for project), and surplus within the Cal Am Suburban-Rosemont PWS through 2045 during normal year, single dry year, and multiple dry years.

Table 20-10 Suburban-Rosemont PWS Water Supply Reliability Through 2045 (MG per year)

Water Year	2022	2025	2030	2035	2040	2045
Normal Year						
Total Supply	10,855	10,855	10,855	10,855	10,855	10,855
Total Demand	2,699	2,727	3,024	3,322	3,620	3,920
Surplus	8,156	8,128	7,831	7,533	7,234	6,935
Single Dry Year						
Total Supply	9,682	9,682	9,682	9,682	9,682	9,682
Total Demand	2,699	2,727	3,024	3,322	3,620	3,920
Surplus	6,983	6,955	6,658	6,360	6,061	5,762
Multiple Dry Year						
Total Supply	9,682	9,682	9,682	9,682	9,682	9,682
Total Demand	2,699	2,727	3,024	3,322	3,620	3,920
Surplus	6,983	6,955	6,658	6,360	6,061	5,762

Source: Cal Am 2024.

According to California Code of Regulations, Title 22 Section 64554, a public water system's water source(s) shall have the capacity to meet the system's maximum day demand. Table 20-11 presents a comparison of maximum day demand versus supply for the Suburban-Rosemont PWS.

Table 20-11 Maximum Day Demand and Supply Throughout 2045 (MG per day)

Year	2023	2024	2025	2030	2035	2040	2045
Normal Year							
Supply	27.7	27.7	27.7	27.7	27.7	27.7	27.7
Maximum Day Demand	14.1	14.2	14.2	15.9	17.5	19.1	20.7
Surplus	13.6	13.5	13.5	11.9	10.3	8.6	7.0
Single Dry Year							
Supply	26.5	26.5	26.5	26.5	26.5	26.5	26.5
Maximum Day Demand	14.1	14.2	14.2	15.9	17.5	19.1	20.7
Surplus	12.4	12.3	12.3	10.6	9	7.4	5.8

Year	2023	2024	2025	2030	2035	2040	2045
Multiple Dry Year							
Supply	26.5	26.5	26.5	26.5	26.5	26.5	26.5
Maximum Day Demand	14.1	14.2	14.2	15.9	17.5	19.1	20.7
Surplus	12.4	12.3	12.3	10.6	9	7.4	5.8

Note: Maximum day demand and supply during normal year are obtained from the Cal Am Water Supply Assessment for West Jackson Highway Master Plan (Cal Am 2024). Water supplies during single dry year and multiple dry year are calculated based on the water supplies shown in Table 20-10. Maximum day demands during single dry year and multiple dry year are assumed to be the same as maximum day demand during normal year.

Source: Cal Am 2024.

As shown in Table 20-10, there would be sufficient water supplies to serve the project's average annual demand through 2045 during normal year, single dry year, and multiple dry year. Table 20-11 shows that there would be sufficient water supplies to serve the project's maximum day demand through 2045 during normal year, single dry year, and multiple dry year.

Summary

As analyzed above, SCWA and Cal Am would have sufficient water supplies to serve the project through 2045. Therefore, the project would not result in demand for water that cannot be met by existing or reasonably foreseeable future service capacity. The impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact WS-3: Contribute to Groundwater Pumping Such That the Average Annual Sustainable Yield for the South American Subbasin Basin is Exceeded

The SASb GSP identifies the sustainable yield for SASb at or below 235,000 AFY, representing the long-term average annual groundwater pumping for SASb that would not result in significant and unreasonable impacts (South American Subbasin Groundwater Sustainability Agencies 2021). The Cal Am 2015 UWMP, SCWA 2020 UWMP, and SCWA conjunctive use program were included in the development of the SASb GSP's water budget and sustainable yield.

Sacramento County Water Agency

As explained in the SCWA WSA, the project water demands have been included and addressed in the SCWA 2020 UWMP, which has been included in the development of the SASb sustainable yield of 235,000 AFY. Implementation of the project would not generate additional water demands that may exceed the annual sustainable yield of SASb. SCWA is a signatory to the Water Forum Agreement and a member of the SCGA GSA, SCWA has committed to the implementation of the SASb GSP and to meet the groundwater sustainability goal of the SASb GSP. In addition, project water demands

within Zone 40 would be met by conjunctive use of groundwater and surface water. The conjunctive use program relies on an abundance of surface water in wet years when as much surface water as possible is diverted, within entitlement limitations, minimizing the use of groundwater. The project water demands would be met through the conjunctive use of surface and groundwater supplies and adequate supplies would be available such that overdraft of SASb would not occur.

California American Water Company

The project was not included in the Cal Am 2015 UWMP or 2020 UWMP. Therefore, the water demand from the project was not included in the development of the SASb sustainable yield of 235,000 AFY. Implementation of the project would generate additional water demands that may exceed the annual sustainable yield of SASb. As shown in Table 20-10 and Table 20-11, there would be adequate water supplies available to serve the Suburban-Rosemont PWS, including the project. In addition, Cal Am is a member of the SCGA GSA, which would require Cal Am to implement the SASb GSP to achieve the SASb sustainability goal of protecting and ensuring the long-term viability of groundwater resources for domestic, urban, agricultural, industrial, and environmental beneficial users of groundwater. Therefore, the project would not result in overdraft of SASb.

Summary

As described above, there would be adequate water supplies available to serve the project within both the SCWA and Cal Am service areas. SCWA and Cal Am are members of the SCGA GSA and would be required to implement the SASb GSP and to maintain the long-term average annual groundwater sustainable yield of 235,000 AFY of SASb. Implementation of the project would not contribute to groundwater pumping that would exceed the average annual sustainable yield for SASb. The impact would be ***less than significant***.

Mitigation Measures

No mitigation is required.

21 TRIBAL CULTURAL RESOURCES

INTRODUCTION

Under CEQA, lead agencies must consider the effects of their projects on tribal cultural resources. This chapter describes the potential impacts on tribal cultural resources that could occur as a result of implementation of the proposed project.

Tribal cultural resources, as defined by Assembly Bill (AB) 52, Statutes of 2014, in Public Resources Code (PRC) Section 21074, are sites, features, places, cultural landscapes, sacred places and objects, with cultural value to a Tribe. A Tribal cultural landscape is defined as a geographic area (including both cultural and natural resources and the wildlife therein), associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values.

This chapter includes both environmental and regulatory settings followed by an accounting of the archival research that was conducted within the plan area and an analysis of any potential impacts on cultural resources associated with implementing the proposed project.

The comments on the notice of preparation (NOP) pertaining to tribal cultural resources were provided by the Native American Heritage Commission (NAHC). The NAHC's letter outlined the obligations under CEQA to evaluate potential impacts on cultural resources and the obligations for consultation with tribes under AB 52 and Senate Bill (SB) 18. The NOP and comments received on the NOP are presented in Appendix A.

ENVIRONMENTAL SETTING

ETHNOGRAPHY

The plan area lies 5 miles west of the former territory of the Plains Miwok *Amuchamne* tribelet. The Plains Miwok were recognized as a distinct language group as early as 1806 when Spanish explorers first entered the region. The *Amuchamne* tribelet was the northernmost tribelet on the Cosumnes River drainage within the boundaries of the Sacramento Valley. Missionization of the *Amuchamne* people began in 1834-1835 but the *Amuchamne* were the only organized Cosumnes River Miwok village to survive the Gold Rush. Sometime between 1850 and 1870, the people of *Amuchamne* moved their village to the outskirts of Elk Grove possibly in response to several factors including an influx of Nisenan in the Michigan Bar area after the discovery of gold at this location.

PLAINS MIWOK

Plains Miwok are members of the Utian Language Family of the Penutian Stock. Plains Miwok inhabited the lower reaches of the Mokelumne and Cosumnes Rivers and the banks of the Sacramento River from Rio Vista to Freeport (JCC 2020:6.4).

The basic social and economic group of Plains Miwok was the family or household unit, with the nuclear and/or extended family forming a corporate unit. These basic units were combined into distinct, named village or hamlet groups, which functioned as headquarters of a localized patrilineage. Lineage groups were important political and economic units that combined to form tribelets, with the largest sociopolitical unit of Plains Miwok numbering between 300 and 500 persons (JCC 2020:6.4).

Each tribelet had a chief or headman who exercised political control over the villages that comprised it. Tribelets assumed the name of the head village where the chief resided. The office of tribelet chief was hereditary, with the chieftainship being the property of a single patrilineage within the tribelet. The office usually passed from father to son, but in the absence of a male heir a daughter could assume the office of chief (JCC 2020:6.4).

Plains Miwok built a variety of structures including residential dwellings, ceremonial structures, semisubterranean sweat lodges, and menstruating huts. The typical dwelling was a thatched house, consisting of a conical framework of poles that was covered by brush, grass, or tules. Semi subterranean earth lodge roundhouses were also built for ceremonial gatherings, assemblies, local feasts, and housing visitors (JCC 2020:6.4-5).

A variety of flaked and ground stone tools were common among Plains Miwok (e.g., knives, arrow and spear points, and rough cobble and shaped pestles). Plains Miwok imported obsidian, which was a highly valued material for tool manufacture. They also maintained trading relationships with neighboring groups for commodities such as salt, marine shells, and basketry. In addition, other tools and weapons were made of bone and wood, including both simple and sinew-backed bows, arrow shafts and points, looped stirring sticks, flat-bladed mush paddles, pipes, and hide preparation equipment. Cordage was made from plant material and used to construct fishing nets and braided and twined tumplines. Soaproot brushes were commonly used during grinding activities to collect meal and/or flour (JCC 2020:6.5).

Fishing formed a large component of Plains Miwok subsistence activity. Consequently, they used an extensive assemblage of fishing-related implements and facilities including spears; cordage lines with bone fishhooks; harpoons with detachable points; dams for stream diversion; nets of cordage and basketry; weirs; and an array of fish traps. In addition, tules, lashed logs, and bark rafts were used to acquire resources and facilitate travel (JCC 2020:6.5).

Specialized food processing and cooking techniques used by Plains Miwok included grinding and leaching of ground acorn and buckeye meal. Acorns, buckeyes, pine nuts, seeds and other plant foods, and meat were routinely processed using bedrock mortars and pestles. A soaproot brush was used to sweep meal into mortar cups and collect flour. Fist-sized, heated stones were used to cook and/or warm liquid-based foods such as acorn gruel. In addition to these plant resources, other plants may have been managed, primarily by controlled burning, for both food (e.g., edible grasses and seed producing plants) and the manufacture of baskets and other useful equipment (JCC 2020:6.5).

Contemporary Native American Setting

Tribes view themselves as contemporary stewards of their culture and the landscape, representing a continuum from the past to the present. They are resilient, vibrant, and active in the community. Tribes maintain their connection to their history and ongoing culture by practicing traditional ceremonies, engaging in traditional practices (e.g., basketry), and conducting public education and interpretation. The acknowledgement of Native American history and the persistence of Tribal knowledge are recognized and evaluated under CEQA. Contemporary Californian Native American tribes with ancestral connections to the study area include the United Auburn Indian Community of the Auburn Rancheria (United Auburn), Shingle Springs Band of Miwok Indians (SSBMI), Ione Band of Miwok Indians, and Wilton Rancheria.

These tribes today maintain connection to their history and culture in a multitude of ways, including through ceremony, language and traditional knowledge instruction, community service, and tribal governance. For example, a “Big Time” is typically celebrated every September to mark the start of autumn and acorn gathering time at Chaw’se Grinding Rock State Park in Pine Grove. This celebration includes serving traditional foods, traditional dancing, healing rituals, and worship in the roundhouse. Language and traditional skill classes are offered by most of the tribes, including by the SSBMI which has a Traditional Ecological Knowledge department to assist members with learning about respectful and traditional uses of plants and animals, and the United Auburn who has a Pre-K through 8th grade school where key aspects of Indian culture and critical thinking are taught to prepare tribal members to face future challenges (Private School Review 2022; SSBMI 2022a). Tribal community service departments provide family support services to adults and children in order to promote the health and well-being of tribal community members and their families as well as connection to their heritage. Common services offered by all tribes include Indian Child Welfare Act (ICWA) advocacy and intervention, housing assistance, health care assistance, Elder programs, and grants and scholarships for higher education (Ione Band of Miwok Indians 2022; SSBMI 2022a; United Auburn 2022; Wilton Rancheria 2022a). Governance on tribal lands is typically outlined by tribally prepared constitutions, codes and/or ordinances, and are carried out by tribal departments which are in turn typically overseen by the tribal council. This includes the office of Tribal Historic Preservation Officer. Because tribes retain inherent sovereign powers over their members and territory, SSBMI and the Wilton Rancheria also have Tribal Courts which serve as culturally- sensitive, independent judicial forums where tribal cultural values are held at the forefront of dispute resolutions (SSBMI 2022b; Wilton Rancheria 2022b).

Regulatory Setting

Federal

There are no federal regulations that pertain to tribal cultural resources for this project.

STATE

CALIFORNIA REGISTER OF HISTORICAL RESOURCES

All properties in California that are listed in or formally determined eligible for listing in the National Register of Historic Places (NRHP) are also listed in the California Register of Historical Resources (CRHR). The CRHR is a listing of State of California resources that are significant in the context of California's history. It is a Statewide program with a scope and with criteria for inclusion similar to those used for the NRHP. In addition, properties designated under municipal or county ordinances are also eligible for listing in the CRHR.

A historical resource must be significant at the local, State, or national level under one or more of the criteria defined in the California Code of Regulations Title 15, Chapter 11.5, Section 4850 to be included in the CRHR. The CRHR criteria are tied to CEQA because any resource that meets the criteria below is considered a significant historical resource under CEQA. As noted above, all resources listed in or formally determined eligible for listing in the NRHP are automatically listed in the CRHR.

The CRHR uses four evaluation criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

(2) Is associated with the lives of persons important in our past;

(3) Embodies the distinctive characteristics of a type, period, region or method of installation, or represents the work of an important creative individual, or possesses high artistic values; or

(4) Has yielded, or may be likely to yield, information important in prehistory or history.

Similar to the NRHP, a historical resource must meet one of the above criteria and retain integrity to be listed in the CRHR. The CRHR uses the same seven aspects of integrity used by the NRHP: location, design, setting, materials, workmanship, feeling, and associations.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA requires lead agencies to consider whether projects will affect *tribal cultural resources*. PRC Section 21074 states:

a) "Tribal cultural resources" are either of the following:

1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:

A) Included or determined to be eligible for inclusion in the California Register of Historical Resources.

B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.

2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

b) A cultural landscape that meets the criteria of subdivision (a) is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape.

c) A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a "nonunique archaeological resource" as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Native American Burials and Inadvertent Discoveries

California law protects Native American burials, skeletal remains and associated grave goods regardless of their antiquity and provides for the sensitive treatment and disposition of those remains (Section 7050.5 of the Health and Safety Code and PRC 5097.9).

When human remains are discovered, the protocol to be followed is specified in California Health and Safety Code, which states:

> In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of Section 27492 of the Government Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of death, and the recommendations concerning treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code.

State CEQA Guidelines Section 15064.5(e) requires that excavation activities be stopped whenever human remains are uncovered and that the County coroner be called in to assess the remains. If the County coroner determines that the remains are those of

Native Americans, the NAHC must be contacted within 24 hours. At that time, the lead agency must consult with the appropriate Native Americans, if any, as timely identified by the NAHC. Section 15064.5 directs the lead agency (or applicant), under certain circumstances, to develop an agreement with the Native Americans for the treatment and disposition of the remains.

In addition to the mitigation provisions pertaining to accidental discovery of human remains, the State CEQA Guidelines also require that a lead agency make provisions for the accidental discovery of historical or archaeological resources, generally. Pursuant to Section 15064.5(f), these provisions should include "an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be an historical or unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation should be available. Work could continue on other parts of the building site while historical or unique archaeological resource mitigation takes place."

Senate Bill 18

SB 18 (Burton, Chapter 905, Statutes of 2004) requires local governments to consult with state- and federally recognized Native American tribes prior to making certain planning decisions and to provide notice to the tribes at certain key points in the planning process. These consultation and notice requirements apply to adoption and amendment of both general plans and specific plans. The principal objective of SB 18 is to preserve and protect cultural places of California Native Americans. SB 18 is unique in that it requires local government consultation with Native American tribes in early stages of land use planning, extends to both public and private lands, and includes both state- and federally recognized Native American tribes. The California Civil Code was amended by SB 18 and now allows state-recognized California Native American tribes to acquire and hold conservation easements.

Assembly Bill 52

Pursuant to AB 52 (Statutes of 2014), "[a] project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment" (PRC Section 21084.2.). To help determine whether a project may have such an effect, a lead agency is required to consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a proposed project. That consultation must take place prior to the determination of whether a negative declaration, mitigated negative declaration, or EIR is required for a project (PRC Section 21080.3.1).

As stated in Section 11 of AB 52, this act shall apply only to a project that has a NOP or a notice of negative declaration or mitigated negative declaration filed on or after July 1, 2015. The revised NOP for this EIR was filed with the State Clearinghouse on April 26, 2017. Therefore, this EIR is subject to AB 52.

LOCAL

SACRAMENTO COUNTY 2030 GENERAL PLAN

The 2030 General Plan Conservation Element contains the following policies:

- **Policy CO-150**. Utilize local, state and national resources, such as the NCIC [North Central Information Center], to assist in determining the need for a cultural resources survey during project review.
- **Policy CO-151.** Projects involving an adoption or amendment of a General Plan or Specific Plan or the designation of open space shall be noticed to all appropriate Native American tribes in order to aid in the protection of traditional tribal cultural places.
- **Policy CO-154.** Protection of significant prehistoric, ethnohistoric and historic sites within open space easements to ensure that these resources are preserved in situ for perpetuity.
- **Policy CO-155.** Native American burial sites encountered during preapproved survey or during construction shall, whenever possible, remain in situ. Excavation and reburial shall occur when in situ preservation is not possible or when the archeological significance of the site merits excavation and recording procedure. On-site reinterment shall have priority. The project developer shall provide the burden of proof that off site reinterment is the only feasible alternative. Reinterment shall be the responsibility of local tribal representatives.
- **Policy CO-157.** Monitor projects during construction to ensure crews follow proper reporting, safeguards, and procedures.
- **Policy CO-158.** As a condition of approval for discretionary permits, a procedure shall be included to cover the potential discovery of archaeological resources during development or construction.

COMMUNITY PLANS

Community plans provide goals and policies that guide the physical development of individual communities in the county. Community plans relevant to the WJHMP are the Cordova Community Plan and Vineyard Community Plan.

CORDOVA COMMUNITY PLAN

The Cordova Community Plan does not contain specific policies related to tribal cultural resources.

VINEYARD COMMUNITY PLAN

The Vineyard Community Plan does not contain specific policies related to tribal cultural resources.

SIGNIFICANCE CRITERIA AND METHODOLOGY

SIGNIFICANCE CRITERIA

An impact on tribal cultural resources would be significant if implementation of the project would:

- cause a substantial adverse change in the significance of a tribal cultural resource.

ISSUES NOT DISCUSSED FURTHER

All the issues identified in the significance criteria are addressed in the following analysis.

METHODOLOGY

DISCLOSURE OF CULTURAL RESOURCES INFORMATION

Public disclosure of site-specific cultural resources information is expressly exempt from the California Public Records Act, Government Code Sections 6250-6270. Furthermore, information obtained during Native American consultation or through consultation with the local and state agencies, including NCIC, should remain confidential and is exempt from public disclosure under Senate Bill 922. Additionally, Sacramento County staff has signed an "Agreement to Confidentiality" with the NCIC that states that site specific information will not be distributed or released to the public or unauthorized individuals. An authorized individual is a professional archaeologist or historian that qualifies under the Secretary of the Interior's standards to view confidential cultural resources materials.

NATIVE AMERICAN CONSULTATION

In accordance with SB 18 and Sacramento County General Plan Policy CO-151, County staff requested a sacred lands file search and Native American contact list from the Native American Heritage Commission (NAHC) on February 21, 2017. SB 18 requires that local governments contact and consult with local tribes for projects that require General Plan amendments. The reply from the NAHC, dated and received February 27, 2017, included a consultation list of tribes who may have traditional lands or cultural places within the plan area.

Staff subsequently sent two sets of SB 18 letters requesting information regarding the plan area on May 1, 2017, and May 16, 2017, to the seven Native American tribal representatives identified by the NAHC who might have knowledge of the area. Follow-up telephone calls were placed on July 5, 2017. Three of the tribal representatives were also on the AB 52 consultation list. Four responses were received by email and mail and are summarized below:

- May 16, 2017, email from Mr. Marcos Guerrero, Cultural Resources Manager, United Auburn Indian Community of the Auburn Rancheria (United Auburn). Mr. Guerrero requested a copy of the cultural resources survey.
- May 31, 2017, email from Ms. Cherilyn Neider, Administrative Assistant, United Auburn. Ms. Neider requested consultation. However, according to Mr. Guerrero (email dated June 1, 2017), a consultation and tribal monitor were not needed based on the information that was sent to him in response to his May 16, 2017, request.
- May 22, 2017, letter from Mr. Robert C. Columbro, Tribal Historic Preservation Officer, Buena Vista Rancheria of Me-Wuk Indians. Mr. Columbro declined consultation.
- June 14, 2017, letter from Mr. Daniel Fonseca, Tribal Historic Preservation Officer, Shingle Springs Rancheria. Mr. Fonseca requested the cultural resources survey and continued consultation through updates as the project progresses.

On April 12, 2022, AB 52 letters were sent to three tribes: the Ione Band of Miwok Indians, United Auburn, and Wilton Rancheria. The County requested information regarding sites, traditional cultural properties, or other cultural resource considerations within the plan area. No requests for consultation were received by the County.

On September 22, 2023, the Sacramento County Planning and Environmental Review Division (PER) distributed updated AB 52 notification letters. Notices were sent to the following registered consulting parties of the County:

- Chairperson Sara Dutschke, Ione Band of Miwok Indians;
- Chairperson Gene Whitehouse, United Auburn Indian Community; and
- Director Steven Hutchason, Wilton Rancheria.

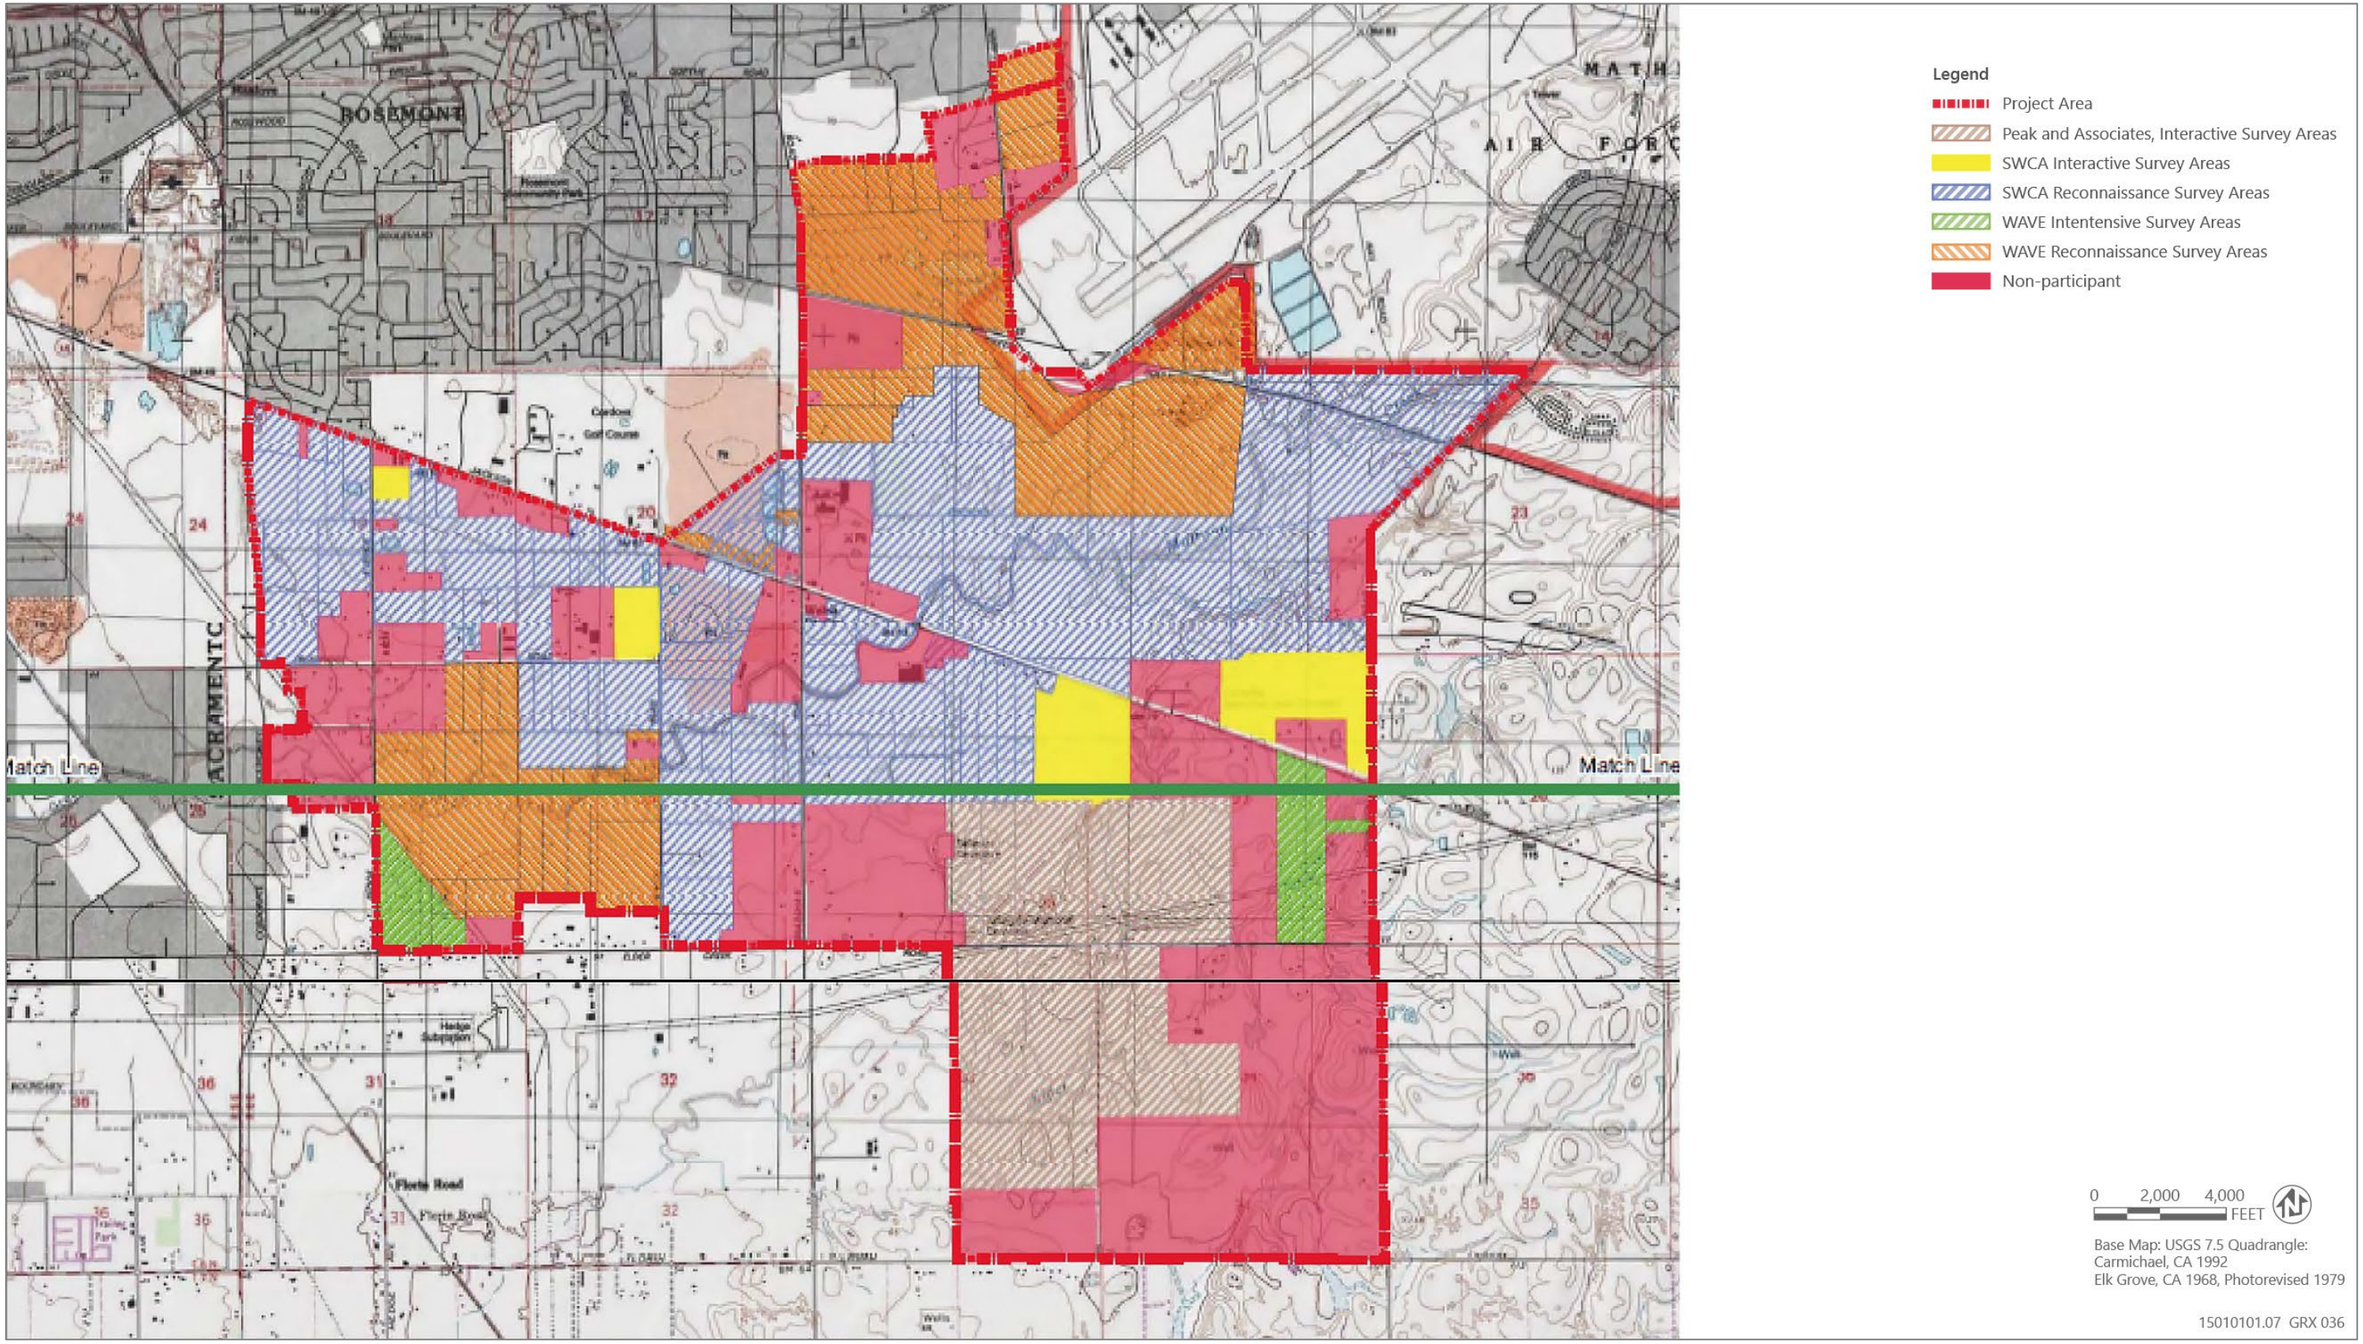
On October 18, 2023, Wilton Rancheria formally opened consultation on the project during their monthly consultation meeting with Sacramento County PER, requesting a site tour of the open space buffer proposed in the WJHMP.

On April 11, 2024, Wilton Rancheria conducted a tribal cultural survey of selected areas of the plan area. During the survey, no tribal cultural resources were identified. Wilton representatives provided comments on the overall viewshed within the Morrison Creek green space and were concerned about the likelihood of isolated resource discoveries throughout the plan area, because the history of disturbance within the plan area has heightened the chance that resources may be displaced in unexpected locations.

On May 29, 2024, Sacramento County PER sent draft mitigation measures to Wilton Rancheria for review. These measures address ongoing tribal monitoring and inadvertent discoveries response throughout the construction and development process. Wilton Rancheria agreed with these proposed mitigations and closed consultation on June 4, 2024.

Information Center Record Search

In accordance with Sacramento County General Plan Policy CO-150 and standard professional practice, an extensive search of data maintained by the NCIC of the California Historical Resources Information System at California State University, Sacramento, including state and federal listings of significant cultural resources and associated data bases was conducted by WAVE Consulting (WAVE) on August 19, 2013, and September 4, 2013.



The records search by WAVE indicates that 27 cultural resources studies have been conducted within the plan area and three more studies have been conducted within a 0.5-mile radius of the plan area. As a result of these previous surveys, 24 cultural resources have been previously recorded within the plan area and an additional six resources have been recorded with a 0.5-mile radius of the plan area. None of the resources identified were precontact/indigenous in nature (WAVE 2013: 21).

Previous Field Assessments

In 2006, Peak & Associates and NORCAL Geophysical Consultants, Inc. conducted surveys of a portion of the plan area (Figure 21-1). A pedestrian survey was completed of the entire site and in select areas ground penetrating radar and trenching was also used to identify potential resources. In 2009, SWCA conducted a pedestrian survey of a portion of the plan area. In 2013, WAVE archaeologists conducted a pedestrian survey of the plan area. The pedestrian and reconnaissance surveys conducted by WAVE (during 2013 and for SWCA's 2009 study) did not identify any precontact resources in the plan area. These surveys did not include the non-participant properties.

West Jackson Highway Master Policies

The proposed WJHMP does not include policies related to cultural or tribal cultural resources.

Source: Image produced and provided by WAVE Consulting, adapted by Ascent in 2024.

Figure 21-1 Survey Areas

IMPACTS AND ANALYSIS

This analysis is based on the outcome of tribal consultation under AB 52 and the Cultural Resources Survey of the West Jackson Highway Master Plan, Sacramento County, California (WAVE 2013).

IMPACT TCR-1: CAUSE A CHANGE IN SIGNIFICANCE OF A TRIBAL CULTURAL RESOURCE

There are no known tribal resources located within the plan area. A search of the NAHC's sacred lands file database did not reveal any known tribal resources. Two sets of correspondence were sent to the tribes in 2017 that requested information under SB 18 and asked if the tribes had concerns regarding known or suspected sites of Native American significance. Four tribes responded, two declined consultation and one requested consultation through updates as the project progresses. None of the responses stated specifically that known resources are located within the plan area, but one requested to review the studies. Per AB 52, on September 22, 2023, letters were sent to three tribes: the Ione Band of Miwok Indians, United Auburn, and Wilton Rancheria. The County requested information regarding sites, traditional cultural properties, or other cultural resource considerations within the plan area. As described above, Wilton Rancheria requested consultation in October of 2023 and performed a site survey in April of 2024. No tribal cultural re sources were identified during the limited surveys conducted by Wilton Rancheria representatives. Nevertheless, tribal cultural resources could be present within the plan area and discovery could occur in unexpected locations due to the history of disturbance in the area.

California law recognizes the need to protect tribal cultural resources from inadvertent destruction and the procedures for the treatment of tribal cultural resources are contained in PRC Section 21080.3.2 and Section 21084.3(a). Within 14 days after the County determines that it may undertake a project, the County must provide formal notification to the California Native American tribes that have requested notification of proposed projects in the lead agency's jurisdiction. The County would be required to begin the consultation process with the tribes that have requested consultation within 30 days of receiving the request for consultation. Compliance with PRC Section 21080.3.2 and Section 21084.3(a) would provide an opportunity to avoid or minimize the disturbance of any identified tribal cultural resources, and to appropriately treat any remains that are discovered.

Mitigation Measure TCR-1a and TCR-1b would require tribal monitoring and inadvertent discoveries response throughout the construction and development process. Wilton Rancheria agreed with these proposed mitigations and closed consultation on June 4, 2024. With implementation of Mitigation Measures TCR-1a and TCR-1b, impacts on potentially significant tribal cultural resources would be **less than significant**.

MITIGATION MEASURES

MITIGATION MEASURE TCR-1A: INVENTORY AND SIGNIFICANCE EVALUATION OF TRIBAL CULTURAL RESOURCES

Upon submittal of subsequent development applications, the Project Applicant(s) or subsequent developer(s) shall coordinate with the County and consulting Native American tribes (tribes) for each project-specific area. The tribes shall be offered the opportunity to identify portions of the project site that could be sensitive or potentially sensitive for tribal cultural resources.

Tribes may request additional testing and boundary delineation prior to the disturbance of any potential tribal cultural resource site. In consultation with County, the treatment plan may include identification methods including, but not limited to, canine forensic surveys, ground penetrating radar, vegetation clearing for surface visibility, and/or subsurface testing.

When subsequent development applications are deemed complete, the tribes shall be provided the following information for each subsequent notification to assist in their determination of the potential to impact tribal cultural resources:

- map(s) and verbal description of the project-specific area that delineates both the horizontal and vertical extents of where a project could result in impacts, including both direct and indirect, on tribal cultural resources;
- descriptions of proposed ground disturbances and construction activities;
- the results of an updated records search of the project-specific area from the Northwest Information Center of the California Historical Resources Information System;
- the results of an archaeological sensitivity analysis to assess the potential for buried archaeological resources using geologic and historic maps, soils data, and other sources; and
- the results of an archaeological field survey. Tribes may also request separate tribal cultural surveys.

If the consulting Native American tribe(s) determine that a tribal cultural monitor is warranted for a project, the tribe(s) shall be offered the opportunity to engage in compensated construction monitoring. Tribes must be contacted for the opportunity to monitor each separate development stage. For monitoring, the provisions of Mitigation Measure CUL-2b will be followed.

If potentially significant impacts on tribal cultural resources that qualify as historical resources (per State CEQA Guidelines Section 15064.5) are identified, a treatment plan for avoiding or minimizing such impacts shall be developed, in coordination with tribes. Measures for avoiding or minimizing impacts include:

- avoidance and preservation of the resources in place, including planning and construction to avoid the resources and protect the cultural and natural context or planning greenspace, parks, or other open space to incorporate the resources with culturally appropriate protection and management criteria;
- treating the resource with culturally appropriate dignity taking into account the tribal cultural values and meaning of the resource, including:
    - protecting the cultural character and integrity of the resource;
    - protecting the traditional use of the resource;
    - protecting the confidentiality of the resource;
    - permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places; or
    - protecting the resource.

The consultation shall be considered concluded when (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.

MITIGATION MEASURE TCR-1B: TRIBAL REPATRIATIONS

In the event that remain-in-place measures are infeasible for disturbed human remains, the Project Applicant(s) or subsequent developer(s), in consultation with tribal and County representatives, shall identify an on-site repatriation location with conservation easement. This shall include an agreement to maintain resource location confidentiality.

Tribes may request additional materials and monitoring in the event of human remains discovery. This may include, but is not limited to, on-site storage of remains in a locked, air-conditioned facility with access controlled by tribal monitors, materials required for appropriate recovery and reinternment, and physical control mechanisms such as subsurface coverings and above-ground deterrents such as site fencing.

This page intentionally left blank.

22 SUMMARY OF IMPACTS AND THEIR DISPOSITION

This chapter provides (1) a summary of the project's potential impacts, including significant and unavoidable impacts, impacts that can be reduced to a less-than-significant level with mitigation, and impacts that would be less than significant without mitigation; (2) a discussion of the significant and irreversible environmental changes that would be caused by the project; (3) an evaluation of the cumulative impacts of the project; and (4) an evaluation of the project's potential for growth-inducing impacts.

SUMMARY OF IMPACTS BY SIGNIFICANCE DETERMINATION

The following provides a summary of the conclusions reached in the evaluation of the project in Chapters 4–21 of this Draft EIR. For a tabulated summary of the project's potential impacts, applicable mitigation measures, and significance determinations, refer to Table ES-1 in the Executive Summary.

SIGNIFICANT EFFECTS THAT CANNOT BE AVOIDED

Section 15126.2(b) of the State CEQA Guidelines requires that an EIR describe any significant impacts that cannot be avoided, even with the implementation of feasible mitigation measures. The evaluation of resources in Chapters 4–21 of this EIR identifies significant and unavoidable impacts in the following categories:

- Impact AE-1: Degradation of Existing Character or Quality of Public Views of the Plan Area and Its Surroundings
- Impact AE-2: New Sources of Light or Glare
- Impact AR-1: Convert Farmland to Non-Agricultural Uses
- Impact AIR-2: Generate Long-Term Operational Emissions of Criteria Air Pollutants and Ozone Precursors (ROG, NO_X, PM_{10}, and $PM_{2.5}$) that Exceed Standards
- Impact AIR-3: Conflict With an Air Quality Plan
- Impact AIR-5: Exposure of Sensitive Receptors to TACs
- Impact CR-1: Cause a Substantial Adverse Change in the Significance of a Built-Environment Historical Resource
- Impact NO-1: Exceed County Standards During Construction
- Impact NO-3: Generate a Substantial Permanent Increase in Traffic Noise Levels
- Impact TR-4: Substantially Increase Hazards Due to a Geometric Design Feature or Incompatible Uses

SIGNIFICANT EFFECTS THAT COULD BE AVOIDED WITH IMPLEMENTATION OF MITIGATION MEASURES

The following impacts were determined to be less than significant with mitigation:

- Impact AR-2: Result in Conversion of Farmland to Non-Agricultural Use Due to Conflict with Existing, Adjacent Agricultural Use and Zoning

- Impact AIR-1: Generate Construction Emissions of Criteria Air Pollutants and Precursors (ROG, NO_X, PM_{10}, AND $PM_{2.5}$) that Exceed Standards
- Impact AC-2: Result in Exposure to Excessive Noise Levels Associated with Airport Operations
- Impact BR-1: Result in Loss of Wetlands and Surface Waters
- Impact BR-2: Have a Substantial Adverse Effect on Special-Status Mammals
- Impact BR-3: Have a Substantial Adverse Effect on Special-Status Birds
- Impact BR-4: Have a Substantial Adverse Effect on Special-Status Reptiles
- Impact BR-5: Have a Substantial Adverse Effect on Special-Status Amphibians
- Impact BR-6: Have a Substantial Adverse Effect on Special-Status Invertebrates
- Impact BR-7: Have a Substantial Adverse Effect on Special-Status Plants
- Impact BR-8: Result in the Loss of Trees
- Impact BR-9: Disturb Riparian Habitats
- Impact BR-10: Interfere With the Movement of any Native Resident or Migratory Species or Impede the Use of Native Wildlife Nursery Sites
- Impact CC-1: Result in Project-Generated GHG Emissions and Potential Inconsistency With Plans and Regulations
- Impact CR-2: Cause a Substantial Adverse Change to an Archaeological Resource
- Impact GS-1: Exacerbate Unstable Soil Conditions
- Impact GS-4: Exposure to Landslides
- Impact GS-6: Potential Destruction of Buried Paleontological Resources
- Impact HAZ-2: Potential for Release of Hazardous Materials from Undocumented or Documented Sites of Contamination
- Impact HYD-3: Substantially Alter the Existing Drainage Pattern of the Plan Area Such That Substantial Erosion, Flooding, or Polluted Runoff Could Occur
- Impact HYD-4: Risk Release of Pollutants Due to Inundation in Flood Hazard Zones
- Impact HYD-7: Contribute to Flooding of Beach Stone Lakes
- Impact NO-2: Generate Excessive Construction Vibration
- Impact NO-4: Expose New or Existing Sensitive Receptors to New Stationary Noise Sources
- Impact TCR-1: Cause a Change in Significance of a Tribal Cultural Resource

Effects Found Not to Be Significant

The following impacts were determined to be less than significant:

- Impact AIR-4: Result in Substantial Mobile-Source CO Concentrations
- Impact AIR-6: Exposure to Odors Affecting a Substantial Number of People
- Impact AC-1: Result in a Safety Hazard to People Living and Working in the Vicinity of an Airport
- Impact AC-3: Result in Effects on Safe and Efficient Use of Navigable Airspace
- Impact BR-11: Result in Potential Inconsistency with the South Sacramento Habitat Conservation Plan
- Impact CR-3: Disturb Human Remains

- Impact EN-1: Result in Wasteful, Inefficient, or Unnecessary Consumption of Energy
- Impact EN-2: Conflict With or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency
- Impact GS-2: Result in Substantial Soil Erosion
- Impact GS-3: Result in Soil Subsidence
- Impact GS-5: Exposure to Expansive Soils
- Impact GS-7: Obstruction of Access to Mineral Resources
- Impact HAZ-1: Accidental Release Due to Transport, use, or Disposal of Hazardous Materials
- Impact HAZ-3: Result in Hazardous Emissions or Handle Hazardous or Acutely Hazardous Materials, Substances, or Waste Within 0.25 Mile Within an Existing or Proposed School
- Impact HAZ-4: Impair Implementation of or Physically Interfere With an Adopted Emergency Response Plan or Emergency Evacuation Plan
- Impact HAZ-5: Expose People or Structures to Wildland Fires
- Impact HYD-1: Violate Water Quality Standards
- Impact HYD-2: Substantially Decrease Groundwater Supplies or Interfere Substantially With Groundwater Recharge
- Impact HYD-5: Conflict With a Water Quality Control Plan or Sustainable Groundwater Management Plan
- Impact LU-1: Physically Divide an Established Community
- Impact LU-2: Cause a Significant Environmental Impact Due to a Conflict With any Land Use Plan, Policy, or Regulation Adopted for the Purpose of Avoiding or Mitigating an Environmental Effect
- Impact LU-3: Induce Substantial Unplanned Population Growth
- Impact LU-4: Displace Substantial Numbers of Existing People or Housing, Necessitating the Construction of Replacement Housing Elsewhere
- Impact PS-1: Result in Substantial Adverse Physical Impacts Associated With the provision of Fire Protection and Emergency Services
- Impact PS-2: Result in Substantial Adverse Physical Impacts Associated With the Provision of Law Enforcement
- Impact PS-3: Result in Substantial Adverse Physical Impacts Associated With the Provision of Schools
- Impact PS-4: Result in Substantial Adverse Physical Impacts Associated With the Provision of Parks and Recreation Services or Substantial Physical Deterioration of an Existing Facility
- Impact PS-5: Result in Substantial Adverse Physical Impacts Associated With the Provision of Libraries
- Impact PU-1: Result in adverse Effects Associated With Construction of Expanded Wastewater Treatment Infrastructure
- Impact PU-2: Result in Adverse Effects Associated With Construction of Stormwater Infrastructure
- Impact PU-3: Result in Adverse Effects Associated With Construction of Electric Power and Telecommunications Facilities

- Impact PU-4: Exceed the Capacity of the Wastewater Treatment Provider
- Impact PU-5: Generate Solid Waste in Excess of State Standards or in Excess of the Capacity of Local Infrastructure
- Impact TR-1: Adversely Affect an Existing Bicycle and Pedestrian Facility, Interfere With the Implementation of a Planned Bikeway, or Result in Unsafe Conditions for Bicyclists or Pedestrians
- Impact TR-2: Adversely Affect Public Transit Operations or Fail to Provide Access to Transit
- Impact TR-3: Generate VMT That Exceeds County Standards
- Impact TR-5: Result in Inadequate Emergency Access
- Impact WS-1: Environmental Effects Due to the Construction of New or the Expansion of Existing Water Facilities
- Impact WS-2: Result in Demand for Water That cannot be Met by Existing or Reasonably Foreseeable Future Service Capacity
- Impact WS-3: Contribute to Groundwater Pumping Such That the Average Annual Sustainable Yield for the South American Subbasin Basin is Exceeded

IRREVERSIBLE ENVIRONMENTAL CHANGES

CEQA requires that EIRs assess whether a project would result in significant irreversible changes to the physical environment. The State CEQA Guidelines discuss three categories of significant irreversible changes that should be considered. Each is addressed below. Although the project would require commitment of resources, these environmental changes are not considered significant for the purposes of this analysis. The primary irreversible environmental change associated with the project involves the permanent conversion of undeveloped and rural land with associated habitat values to a mix of land uses including residential, commercial, industrial, recreational, farming, and employment.

CHANGES IN LAND USE THAT COMMIT FUTURE GENERATIONS

Site preparation, construction, and operation of the project would irreversibly commit future generations to urban land uses on approximately 3,812 acres of the approximately 5,913-acre plan area. The remaining 2,101 acres would be maintained as a combination of parks, open space, and open space/urban farm.

IRREVERSIBLE DAMAGE FROM ENVIRONMENTAL ACCIDENTS

No significant environmental damage, such as accidental spills or explosion of a hazardous material, is anticipated with development of the WJHMP. The use of hazardous materials, including standard construction supplies, household hazardous waste, and industrial uses, would occur in compliance with regulations and oversight mechanisms. Remediation of previously contaminated sites within the plan area would be completed as part of the project, and materials would be properly disposed of in accordance with federal, state, and local regulations.

CONSUMPTION OF NONRENEWABLE RESOURCES

Consumption of nonrenewable resources includes increased energy consumption, conversion of agricultural lands, and lost access to mining reserves. Although there is an established mineral resource overlay in the zoning within the plan area, the aggregate resources have, or will be, fully exhausted prior to development of the land uses identified in the plan. As such, developing the property would not result in loss of access to mineral resources. Implementation of the project would convert approximately 1,500 acres of Important Farmland to non-agricultural use, including 31 acres of Prime Farmland, 667 acres of Farmland of Statewide Importance, 796.5 acres of Farmland of Local Importance, and 5.4 acres of Unique Farmland (see Table 5-2). This represents roughly 66 percent of the average annual conversion of Important Farmland in Sacramento County (see Table 5-1).

Project construction would consume fossil fuels and other non-renewable or slowly renewable resources through the operation of vehicles and equipment for site grading and construction activities. Other resources, including materials such as wood products, metals, cement, asphalt, and other products, would be used or consumed during project construction or would be permanently committed as project materials. Operation of the project would also require additional electricity and water; however, the scale of such consumption would be typical for a mixed-use development of this size. For further discussion of energy use, refer to Chapter 11, “Energy.”

CUMULATIVE IMPACTS

The State CEQA Guidelines Section 15355 defines a cumulative impact as “two or more individual effects which, when considered together, are considerable.” An individual effect need not itself be significant to result in significant cumulative effects; the impact is the result of the incremental effects of the project combined with the effects of “other closely related past, present, and reasonably foreseeable probable future projects.” CEQA does not define “closely related,” but 40 Code of Federal Regulations 1508.25 indicates that a “closely related” project is one which is automatically triggered by the project; one which cannot proceed without the project first proceeding (mutual dependency); one which requires the project for justification or is an interdependent part of the same action; or one which is a similar action with common timing, geography, and other features.

The requirements for a cumulative analysis are described in CEQA Guidelines Section 15130. A cumulative analysis “need not provide as great detail as is provided for the effects attributable to the project alone.” The analysis should focus on analyzing the effects of the project to which other projects contribute, to the extent practical and reasonable.

The significance criteria used for analysis are the same as those used throughout the topical chapters of the EIR. Section 15130(a)(3) states that a project’s contribution to an impact is “less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures to alleviate the cumulative

impact. The lead agency shall identify facts and analysis supporting its conclusion that the contribution will be rendered less than cumulatively considerable."

CUMULATIVE IMPACT ANALYSIS METHODOLOGY

State CEQA Guidelines Section 15355 defines a cumulative impact as two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time. Section 15130(a)(3) of the State CEQA Guidelines states that an EIR may determine that a project's contribution to a significant cumulative impact will be rendered less than cumulatively considerable, and thus not significant, if a project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact.

For purposes of this EIR, the project would have a significant cumulative effect if it meets either one of the following criteria:

- The cumulative effects of related projects (past, current, and probable future projects) without the project are not significant but the project's incremental impact is substantial enough, when added to the cumulative effects, to result in a significant impact; or
- The cumulative effects of related projects (past, current, and probable future projects) without the project are already significant and the project represents a considerable contribution to the already significant effect. The standards used herein to determine "considerable contribution" are that the impact either must be substantial or must exceed an established threshold of significance.

The analysis herein evaluates whether, after adoption of project-specific mitigation, the residual impacts of the project would cause a cumulatively significant impact or would contribute considerably to existing/anticipated (without the project) cumulatively significant effects.

SCOPE OF THE CUMULATIVE ANALYSIS

The State CEQA Guidelines (Section 15130) identify two basic methods for establishing the cumulative environment in which the project is to be considered: (1) the use of a list of past, present, and probable future projects; or (2) the use of adopted projections from a general plan, other regional planning document, or a certified EIR for such a planning document. This analysis is primarily based on the latter approach but is supplemented with details about regionally significant proposed projects. The effects of past and present projects on the environment are reflected by the existing conditions in the plan area. Probable future projects are those in the project vicinity that have the possibility of interacting with the project to generate a cumulative impact (based on proximity and construction schedule) and either:

- are partially occupied or under construction,
- have received final discretionary approvals,

- have applications accepted as complete by local agencies and are currently undergoing environmental review, or
- are proposed projects that have been discussed publicly by an applicant or that otherwise become known to a local agency and have provided sufficient information about the project to allow at least a general analysis of environmental impacts.

The cumulative environmental setting for all resource areas, with the exception of transportation and noise, is based upon the development forecasts of the Sacramento Area Council of Governments' (SACOG's) adopted 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) development forecast. The MTP/SCS included development projections for Sacramento County and its incorporated cities, as well as for adjacent counties and cities, based on adopted and in-development General Plans, Specific Plans, and Community Plans in each jurisdiction. Reasonably foreseeable development areas already considered in the MTP/SCS include the 2030 General Plan, the Cordova Community Plan, Florin-Vineyard Community Plan, Mather Field Specific Plan, along with other planned development in Sacramento County and the city of Rancho Cordova. The above baseline cumulative setting was then augmented with current data on approved, proposed and reasonably foreseeable projects in Sacramento County. These include several master plan proposals within the project area, including the NewBridge Specific Plan, Mather South Community Master Plan, and Jackson Township Specific Plan.

Table 22-1, below, includes a brief description of the projects considered in the cumulative analysis of transportation and the related assessment of greenhouse gas (GHG) emissions and transportation noise. The projects listed include all reasonably foreseeable development at the time that the transportation study was initiated in 2017.

Table 22-1 Cumulative Project List

Project Number	Project Name	Location	Description	Status
Unincorporated Sacramento County				
1	Vineyard Springs Comprehensive Plan	South-central portion of Sacramento County	2,650 acres bounded by Gerber Road to the north, Calvine Road to the south, Excelsior Road on the east, and Bradshaw Road on the west	Approved 2000
2	North Vineyard Station Specific Plan	South-central portion of Sacramento County	1,594 acres bound by Florin Road to the north, Gerber Road to the south, Vineyard Road to the east, and Elder Creek on the west	Approved 1998
3	Florin Vineyard Gap Community Plan	Within the community plan areas of Vineyard and South Sacramento	3,872 acres bounded by Elder Creek Road on the north, Bradshaw Road on the east, Churchill Downs neighborhood to the south, and Union Pacific Railroad tracks on the west	Approved 2010

Project Number	Project Name	Location	Description	Status
4	Mather Airport Master Plan	10425 Norden Ave, Mather	Establishes a program for modifications of existing facilities and development of new facilities through 2035	Approved 2014, Amended 2016
5	Cordova Hills	Southeastern Sacramento County	2,669 acres east and adjacent to Rancho Cordova	Approved 2013
6	Easton Project, including Glenborough at Easton and Easton Place	Within Cordova Community Planning Area	1,391 acres south of Highway 50 and east of Rancho Cordova	Approved 2008
7	NewBridge Specific Plan	Eastern Sacramento County along SR 16	1,095 acres	Approved
8	Mather South Community Master Plan	Eastern Sacramento County along SR 16	884 acres located northeast of the plan area	Approved
9	Jackson Township Specific Plan	Eastern Sacramento County along SR 16	1,391 acres east of Excelsior Road and SR 16, west of Eagles Nest Road, and south of Keifer Boulevard	Approved
10	Capital SouthEast Connector Expressway	Link I-5 and Highway 99 South of Elk Grove to Highway 50 East of El Dorado Hills	Designed to provide congestion relief	Preliminary design
11	Stoneridge Quarry	Eastern Sacramento County south of Highway 50	Quarry mining and processing of materials on 619 acres of a 1,360-acre property	Approved 2011
12	Teichert Quarry	Eastern Sacramento County south of Highway 50	Quarry mining and operation of a processing plant on 380 acres of a 584-acre property for 25 years	Approved 2010
13	Milgate Quarry	Eastern Sacramento County south of Highway 50	Quarry mining on 194 acres for 50 years	Currently Inactive
14	Upper Westside Specific Plan	Northwest Sacramento County, west of Interstate 80	Proposed Specific Plan for 2,066 acres	In Process

Project Number	Project Name	Location	Description	Status
15	GrandPark Specific Plan	Northwest Sacramento County, east of State Route 99, north of Elkhorn Boulevard	Proposed Specific Plan for 5,675 acres	In Process
16	Metro Air Park	Northwest Sacramento County, north of Interstate 5	Approximately 1,867 acres, Industrial/Office park	Approved
17	Elverta Specific Plan	Northern Sacramento County, bounded by Gibson Ranch on the east, U Street on the South, various property lines approximately 1,350 feet west of Palladay Road on the west	1,820 acres of residential, ag-res, commercial, parks, schools	Approved 2007
18	Northborough (within Elverta Specific Plan)	East of 16th Street in Elverta Specific Plan	298 acres within Elverta Specific Plan, including 1,127 residential units, parks, and school	Approved 2017
19	Sacramento International Airport Master Plan	Northwest Sacramento County, north of Interstate 5	Updates a program for modifications of existing facilities and development of new facilities through 2035	Approved 2022
City of Rancho Cordova				
20	Arboretum	Within the Grant Line North Planning Area	1,349 acres bounded by Highway 16 to the south, Grant Line Road to the east, Kiefer Boulevard to the north, and Sunrise Boulevard to the west	Currently Inactive
21	Suncreek Specific Plan	Located in southern Rancho Cordova	1,265 acres located east of the Folsom Canal	Approved 2013
22	Sunridge Ranch Specific Plan	Located in southern Rancho Cordova	2,606 acres south of Douglas Road, east of Sunrise Boulevard, and north of Grantline Road	Approved 2002
23	Rio del Oro Specific Plan	Located in central Rancho Cordova	3,828 acres south of White Rock Road, east of Sunrise Boulevard, and north of Douglas Road	Approved 2010
24	Westborough Specific Plan	Located in central Rancho Cordova	1,695 acres north of White Rock Road and including Rancho Cordova Parkway	In Process

Project Number	Project Name	Location	Description	Status
25	Rancho Cordova General Plan	City of Rancho Cordova	All land uses assumed in the City of Rancho Cordova General Plan	Approved
City of Folsom				
26	Folsom South of 50 Specific Plan	Eastern Sacramento County, south of US 50 and west of Folsom city limits	3,510 acres south of US 50, north of White Rock Road, east of Prairie City Road, and west of Sacramento/El Dorado County Line	Approved 2011, Proposed Amendments in Process
City of Sacramento				
27	Aspen 1/New Brighton	Eastern city of Sacramento at county line	232 acres at the corner of SR 16 and Watt Avenue	Approved 2015
28	Arena Reuse/Innovation Park/CNU Medical Center Campus	Located in northern city of Sacramento	Reuse of the former Sleep Train Arena in North Natomas, includes California Northstate University Medical Center Campus.	Approved
29	Northlake	Northern city of Sacramento, west of State Route 99, north of Interstate 5	577± acres located at the southwest corner of the intersection of Elkhorn Boulevard and Highway 99.	Approved 2008
30	Downtown/Central City Specific Plan	Downtown Sacramento	Generally bounded by the Sacramento River to the west, Business 80 to the east, the American River on the north (excluding the River District and Railyards)	Approved 2018
31	Panhandle	Northeast city of Sacramento	589± acres in the city of Sacramento, which includes the land north of Del Paso Road, south of Elkhorn Boulevard, west of Sorento Road/E. Levee Road, and east of the developed neighborhoods known as Natomas Park and Regency Park	Approved 2018
32	West Broadway Specific Plan	Central city of Sacramento	292 acres area generally bounded by the Sacramento River on the west; US Highway 50 and Broadway on the north; Muir Way and 5th Street on the east; and 4th Avenue on the south.	Approved 2020

Project Number	Project Name	Location	Description	Status
33	Railyards	North of Downtown Sacramento, east of I-5	244 acres formerly used by Union Pacific Railroad, entitled for dense urban residential neighborhoods, a historic museum, a shopping and market district, a regional intermodal transit station, a county courthouse, a medical campus, a soccer stadium, pedestrian-oriented streets, shopping and entertainment complexes, riverfront access, and high-rise mixed-use buildings	Approved 2016
34	River District Specific Plan	North of Downtown Sacramento, east of I-5	773 acres including a transit-oriented mixed use urban environment that would include 8,144 dwelling units, 3.956 million square feet of office, 854,000 square feet of retail/wholesale, 1.463 million square feet light industrial, and 3,044 hotel units.	Approved 2011
City of Elk Grove				
35	Southeast Industrial Area	East of Grant Line Road and SR 99	Southeast Industrial Area (382 acres annexed to city of Elk Grove in 2019), potential for additional 189 acres to be annexed in future	Approved 2019
36	Elk Grove Crossing Specific Plan	Within the Kammerer/Hwy 99 Sphere of Influence Area between the future extension of Big Horn Boulevard on the west and the future extension of Murphy's Corral Road on the east.	319 acres including high and medium density residential, commercial, office, retail, entertainment, and light industrial/"flex" uses.	In process

Project Number	Project Name	Location	Description	Status
37	Southeast Policy Area (SEPA)	North of Kammerer Road, east of Bruceville Road, west of Hwy 99	1,200 acres including industrial/"flex" uses, mixed use, offices, parks, schools, and residential uses.	SEPA approved 2014, land use amendment that established the Livable Employment Area Community Plan that includes the approved Elk Grove Zoo site was approved in 2023
38	Bilby Ridge	South of Bilby Road, north of the Planned Kammerer Road extension, between Bruceville Road and Willard Parkway	484 acres planned for residential, retail, service commercial, schools, parks, and open space	In process
39	Lent Ranch/Elk Grove Promenade	North of Kammerer Road, west of Hwy 99	Approximately 270 acres including commercial, office uses	Approved. Land use amendment that established the Livable Employment Area Community Plan was approved in 2023

Source: Provided by Sacramento County in 2022-2024.

CUMULATIVE ISSUE AREAS

Cumulative impacts for each technical area are discussed below. Significance criteria, unless otherwise specified, are the same for cumulative impacts as project impacts for each environmental topic area. With the exception of resource categories in which separate modeling of cumulative conditions has been conducted for evaluation against the established threshold (i.e., air quality, noise, transportation), resource evaluations are presented wholistically below. When considered in relation to other probable future projects, cumulative impacts to some resources could be significant and more severe than those caused by the project alone.

AESTHETICS

CUMULATIVE SETTING

The viewshed for the cumulative aesthetics setting is eastern Sacramento County, which encompasses the plan area and vicinity and includes viewing groups which are mostly composed of people traveling along arterial roadways which traverse the viewshed, such as Jackson Highway (State Highway 16), Kiefer Boulevard, Goethe Road, Elder Creek Road, Florin Road, and Excelsior Road. As described in Chapter 4, "Aesthetics," of this EIR, this is a non-urbanized area that has experienced substantial disturbance and is planned for increasing urbanization. The overall visual character of the area has been shaped by past mining activity, industrial development (including Mather Airport), and development of single-family homes.

The viewshed is within the Urban Services Boundary of the existing Sacramento County General Plan, and as such, is anticipated to develop with urban uses over the coming decades. In addition to the plan area, the projects listed above are in the general vicinity of the Jackson Highway corridor and are currently being processed by the County. Therefore, they are considered within the cumulative evaluation. The approved Jackson Township Specific Plan area is located immediately east of the plan area and includes approximately 1,391 acres and is planned to include up to 6,143 housing units. The approved Florin-Vineyard Community Plan area and the North Vineyard Station Specific Plan are located adjacent to the southern border of the plan area and include approximately 1,595 acres and 3,872 acres, respectively. The plan area is bordered by the city of Sacramento to the west and the unincorporated community of Rosemont to the north. In total, the four master plans (including the project) cover approximately 12,771 acres and would provide for additional residential and commercial development.

The introduction of anticipated growth in largely undeveloped, non-urbanized areas would add bulk, scale, and massing that could be visually prominent compared to the existing landscape. This could degrade existing visual character and/or quality of public views in non-urbanized areas. Depending on the design and siting of new developments in non-urbanized areas, these new views could potentially result in degradation of existing visual character or quality of public views of sites and their surroundings (SACOG 2019). The anticipated change in the visual character of the region would result in a significant impact in the cumulative condition.

CUMULATIVE IMPACTS EVALUATION

As discussed in Chapter 4, "Aesthetics," development of the project would not result in significant impacts related to scenic resources or light or glare. The project would comply with County lighting policies and standards and would also use fixtures approved by the International Dark Sky Association through implementation of Mitigation Measure AE-2. However, the project would result in significant and unavoidable impacts related to visual character because of the anticipated permanent conversion of undeveloped rural land to developed uses. While the project includes adoption of design guidelines and development standards and would implement a cohesive landscaping program to ensure an attractive new development that would integrate the new uses, the change in visual character would be permanent and drastic,

regardless of whether or not the new development community would be visually appealing. To sensitive viewer groups, particularly area residents, this could be perceived as a substantial degradation.

Besides design guidelines and policies that would guide the visual characteristics of development, including landscaping, building design standards, setbacks, and massing, which are already required for the project, no other feasible mitigation is available to reduce the magnitude of visual changes that would occur. While the project would represent a relatively small portion of the overall conversion of the area, each large-scale development contributes to the permanent change in visual character in a way that induces further change, and the project would have a considerable contribution to the overall significant and unavoidable impact. There is no mitigation available to reduce the impacts related to the change in visual character and, thus, the project would result in a considerable contribution to a **significant and unavoidable** cumulative impact.

MITIGATION MEASURES

No mitigation is available to reduce the impacts related to changes in visual character.

AGRICULTURAL RESOURCES

CUMULATIVE SETTING

The cumulative setting for agricultural resources is the SACOG region, which includes the areas surrounding and adjacent to the plan area. The 2019 EIR for the SACOG MTP/SCS estimates that approximately 0.1 percent of all existing FMMP-designated farmland in the SACOG region will be converted to non-agricultural uses as a result of planned development (SACOG 2019). Land surrounding the plan area, particularly along its southern border, includes Important Farmland. Furthermore, lands converted from agricultural use to non-agricultural use typically do not return to agricultural use at a later date but become part of a more urban condition. As described in Chapter 5, “Agricultural Resources,” over the 6-year period from 2014 to 2020, the California Department of Conservation estimates that the total acreage of Important Farmland in Sacramento County decreased by approximately 2,335 acres annually, with notable losses to Prime Farmland and gains in Unique Farmland (DOC 2016, 2020). The documented past conversion of agricultural lands combined with the projected loss of farmland due to anticipated regional development is an existing significant cumulative impact in the cumulative condition.

CUMULATIVE IMPACTS EVALUATION

Implementation of the project would convert approximately 1,500 acres of Important Farmland to non-agricultural use, including 31 acres of Prime Farmland, 667 acres of Farmland of Statewide Importance, 796.5 acres of Farmland of Local Importance, and 5.4 acres of Unique Farmland (see Table 5-2). This represents roughly 66 percent of the average annual conversion of Important Farmland in Sacramento County (see Table 5-1) and constitutes a significant loss under 2030 General Plan Policy AG-5, which defines substantial loss of farmland as conversion of more than 50 acres of farmland designated as Prime Farmland, Farmland of Statewide Importance, Unique Farmland,

Farmland of Local Importance, and Grazing Land located outside of the Urban Services Boundary (USB).

Mitigation Measure AG-1 would result in preservation of land in a manner that is consistent with Policy AG-5 of the 2030 General Plan. However, because prime soils are a finite resource and new agricultural soils would not be created there would be a substantial net-loss of agricultural production within Sacramento County. Conversion of approximately 1,364 acres of Important Farmland to non-agricultural use is considered a substantial contribution to a significantly adverse cumulative condition. The cumulative impact is **significant and unavoidable**.

MITIGATION MEASURES

Implement Mitigation Measure AG-1.

AIR QUALITY

CUMULATIVE SETTING

The plan area is within the jurisdiction of the Sacramento Metropolitan Air Quality Management District (SMAQMD). The SMAQMD jurisdictional boundary is considered the cumulative project boundary. Sacramento County is currently in nonattainment for ozone, respirable particulate matter (PM_{10}), and fine particulate matter ($PM_{2.5}$) with respect to the California ambient air quality standards (CAAQS) and is in nonattainment for ozone and $PM_{2.5}$ with respect to the national ambient air quality standards (NAAQS).

Ozone impacts are the result of cumulative emissions from numerous sources in the region and transport from outside the region. Ozone is formed in chemical reactions involving reactive organic gases (ROG), oxides of nitrogen (NO_X), and sunlight. All but the largest individual sources emit NO_X and ROG in amounts too small to have a measurable effect on ambient ozone concentrations by themselves. However, when all sources throughout the region are combined, they can result in severe ozone problems.

Particulate matter (PM), including PM_{10} and $PM_{2.5}$, have a similar cumulative regional emphasis when they are entrained into the atmosphere and build to unhealthful levels over time. PM also has the potential to cause significant local problems during periods of dry conditions accompanied by high winds, and during periods of heavy earth–disturbing activities. PM may have cumulative local impacts if, for example, several unrelated grading or earth moving activities are underway simultaneously at nearby sites. Operation-related PM is less likely to result in local cumulative impacts as operational PM sources tend to be spread throughout the region (i.e., vehicles traveling on roads), not affecting any one receptor. However, substantial increases in traffic on roadways already experiencing high traffic volumes may result in considerable contributions to nearby existing land uses.

Although carbon monoxide (CO) can accumulate with traffic at intersections, it is recommended to be evaluated locally, and not regionally because it disperses rapidly with distance from the source under normal meteorological conditions. Toxic air contaminants (TACs) behave similarly. As discussed in Chapter 6, “Air Quality,” TAC concentrations substantially decrease within a distance of 500 feet from a source;

therefore, it is unlikely that project-related sources of TACs would combine with emissions from other projects in the area to produce adverse TAC concentration. Therefore, CO and TACs are not significant at a regional air-basin level.

Because of the existing nonattainment status of Sacramento County (as discussed above), there is an existing adverse cumulative condition regarding air quality. Therefore, ROG, NO_X, and PM emissions from cumulative development (see Chapter 6, "Air Quality," Table 6-2) are cumulatively significant in the air basin. The discussion below addresses whether the project's contribution is considerable.

CUMULATIVE IMPACTS EVALUATION

A cumulative impact analysis is provided for each of the air quality topics addressed in the project impact analysis in consideration of other planned future developments within the plan area.

CONSTRUCTION EMISSIONS OF CRITERIA AIR POLLUTANTS AND PRECURSORS

Sacramento County and the Sacramento Valley Air Basin (SVAB) are in state and federal nonattainment for ozone and PM air quality standards. Construction activities in the region would add additional ozone and PM emissions into the SVAB that may conflict with attainment efforts. project-related construction emissions of NO_X would exceed the applicable mass emission threshold established by SMAQMD.

Mitigation Measure AIR-1a would reduce construction-related exhaust and fugitive dust emissions by requiring dust suppression and limiting equipment idle time. Thus, considering that worst-case scenario construction-related activities would not exceed SMAQMD-adopted thresholds for PM and mitigation is in place to further reduce these emissions, construction-related PM emissions would not result in substantial concentrations at nearby receptors. Given that construction-related emissions would be mitigated to the extent feasible, construction-related emissions would not exceed SMAQMD's cumulative thresholds for criteria pollutants and ozone precursors.

Although it is foreseeable that construction emissions from cumulative projects constructed in close proximity to the plan area (e.g., Mather, NewBridge, and Jackson Township) would produce construction emissions in exceedance of the SMAQMD's mass emissions thresholds, SMAQMD develops its thresholds of significance in consideration of achieving attainment status under the CAAQS and NAAQS and has determined that projects that demonstrate emissions below these thresholds would not have a cumulatively considerable contribution to regional air quality degradation.

The Project Applicants or subsequent developers of the specific plan would be required to apply exhaust control measures to heavy-duty equipment and pay a mitigation fee for every day that NO_X emissions exceed the threshold of 85 pounds per day (lb/day) adopted by SMAQMD provided under Mitigation Measure AIR-1b in Chapter 6, "Air Quality." The mitigation fee program is designed to reduce emissions throughout the SMAQMD jurisdiction through various measures such as installing newer engines on construction equipment or installing US Environmental Protection Agency–certified woodstoves in the place of non-certified woodstoves in residential units. Incorporation of this mitigation would ensure that all additional NO_X emissions would be offset through

the SMAQMD program and, therefore, project construction would not result in a considerable contribution to the regional air quality condition and would not interfere with attainment of CAAQS or NAAQS.

SMAQMD recommends using a 0 lb/day and 0 tons per year (tpy) threshold of significance for evaluating construction-related emissions of PM_{10} and $PM_{2.5}$ prior to the implementation of best management practices (BMPs) or best available control technology. Regarding PM_{10} and $PM_{2.5}$, project construction would exceed SMAQMD thresholds prior to mitigation (see Chapter 6, "Air Quality," Table 6-4). Following implementation of BMPs and/or best available control technology, construction emissions of PM_{10} are evaluated against a threshold of significance of 80 lb/day or 14.6 tpy and $PM_{2.5}$ is evaluated against a threshold of significance of 82 lb/day or 15 tpy. The project would include BMPs and/or best available control technology and would be evaluated against the latter thresholds. The project's short-term project-generated construction emissions would be a **less-than-significant** cumulative impact.

MITIGATION MEASURES

Implement Mitigation Measures AIR-1a and AIR-1b.

LONG-TERM OPERATIONAL EMISSIONS OF CRITERIA AIR POLLUTANTS AND PRECURSORS

Air districts in California develop air quality attainment plans designed to reduce emissions of ozone precursors enough to attain the federal ozone standard by the earliest practicable date. Air quality attainment plans include a multitude of air pollution control strategies. When developing air quality attainment plans, air districts account for the emissions from all present and future development in the region by relying on city and county general plans. Thus, projects that are consistent with adopted general plans and the most recent air quality attainment plans would not conflict with regional air quality planning efforts and the ability of the region to meet reduction targets set by the adopted plans. In cases where projects are proposed that were not included in the adopted general plan or accounted for in regional air quality projects, SMAQMD has developed guidance and determined the level of emissions reduction that would be considered feasible, thus not conflicting with regional air quality attainment status. The project was not included in the most current State Implementation Plan (the air quality plan for the region) and is anticipated to have significant operational air quality impacts. Thus, SMAQMD has recommended that the project achieve a 35-percent reduction in mobile-source operational emissions.

As discussed in Chapter 6, "Air Quality," Mitigation Measure AIR-2a would be applied to the project. Mitigation Measure AIR-2a requires that the project develop an SMAQMD-verified Air Quality Management Plan that demonstrates that the project is able to reduce operational emissions of criteria air pollutants and ozone precursors to SMAQMD's 35-percent reduction target as compared to an "unmitigated" scenario (i.e., modeled emissions based on default vehicle miles traveled [VMT] values in the California Emissions Estimator Model [CalEEMod]) against a "mitigated" scenario (i.e., modeled emissions using VMT values derived from a traffic study conducted for the project). However, compliance with this requirement may not reduce emissions to below the applicable mass emissions thresholds. Mitigation Measure AIR-2b would require the

project to adhere to the most recent Tier 2 voluntary standards of the California Green Building Standards (CALGreen Code), which would further reduce emissions from the mobile source sector. Mitigation Measure AIR-2c would promote the use of low-VOC content consumer projects throughout the plan area. Mitigation Measure AIR-2d would reduce mobile source emissions through the electrification of heavy-duty trucks accessing the plan area. Further, Mitigation Measure AIR-2e would also reduce areawide sources of emissions through the electrification of landscaping equipment. And Mitigation Measure AIR-2f would reduce stationary sources through the application of best available control technology for generators. While these measures would reduce operational emissions, they would not be sufficient to reduce emissions to SMAQMD's thresholds of significance.

Therefore, operation-related emissions for the project would likely exceed SMAQMD thresholds for NO_X and PM_{10}. Projects that exceed established SMAQMD thresholds of significance would contribute to the regional, and thus cumulative, air quality conditions. The project would likely emit levels of emissions that would exceed SMAQMD's mass emissions thresholds. This would be a considerable contribution to a **significant and unavoidable** cumulative impact.

MITIGATION MEASURES

Implement Mitigation Measures AIR-2.

MOBILE-SOURCE CO CONCENTRATIONS

As described in Chapter 6, "Air Quality," project implementation would result in less-than-significant local mobile-source CO-related air quality impacts from construction and operation. SMAQMD recommends a project's contribution of new vehicle trips should be compared to a screening criteria of 31,600 vehicles per hour at one affected intersection. At buildout, the project would generate up to 20,000 trips during the a.m. peak hour and up to 21,500 trips during the p.m. peak hour.

CO emission factors in future years are expected to be lower than current levels because of more stringent vehicle emissions standards and improvements in vehicle emissions technology. Ambient local CO concentrations under future, cumulative conditions would continue to decline. Therefore, 1- and 8-hour CO concentrations for the future cumulative conditions would not be anticipated to exceed the significance thresholds of 20 parts per million (ppm) and 9 ppm, respectively. Consequently, the project's contribution to cumulative CO impacts would not be cumulatively considerable and would result in a **less-than-significant** cumulative impact.

MITIGATION MEASURES

No mitigation is required.

EXPOSURE OF SENSITIVE RECEPTORS TO TACS

As discussed in Chapter 6, "Air Quality," the project would generate significant health risks associated with TACs because it could expose any single receptor to a level of cancer risk that exceeds an incremental increase of 10 in one million, or to a noncarcinogenic hazard index of 1. The project may result in the construction and

operation of industrial sources of pollution; therefore, TAC emissions could be substantial and exceed thresholds. Mitigation Measures AIR-5a, AIR-5b, AIR-5c, and AIR-5d would reduce the potential for exposure to substantial concentrations of TAC emissions through adherence to siting requirements recommended by the California Air Resources Board, preparation of project-level health risk assessments, and use of clean on- and off-road construction equipment.

This mitigation would reduce TAC emissions from subsequent projects in the plan area; however, given the plan-level and programmatic nature of the project, TAC emissions may cumulatively combine to result in a cumulatively considerable significant impact. This would be a considerable contribution to **significant and unavoidable** cumulative impact.

MITIGATION MEASURES

Implement Mitigation Measures AIR-5a through AIR-5d.

EXPOSURE OF SENSITIVE RECEPTORS TO ODORS

As discussed in Chapter 6, “Air Quality,” the project would generate temporary odors during construction and new odor sources associated with the commercial and educational land uses (e.g., delivery truck idling at commercial loading zones, odors associated with certain land uses such as dry cleaners). Construction-related odors would be minimal, temporary, and would cease once construction is complete. Because of the localized character of odor-related impacts, as well as the site-specific design measures in place to reduce odor exposure, the project’s contribution to odor issues would not be cumulatively considerable and would not result in a considerable contribution such that a new significant cumulative impact would occur. Cumulative odor impacts would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

AIRPORT COMPATIBILITY

CUMULATIVE SETTING

The cumulative boundary for airport compatibility is generally the areas in the immediate vicinity near the jurisdictional boundary of the *Mather Airport Airport Land Use Compatibility Plan* (ALUCP) (SACOG 2022). The plan area is located southeast of and adjacent to Mather Airport, and a portion of the plan area is located within the ALUCP boundary. Most of the airport operations occur north of the runway, which is centrally located within the airport boundary; however, the airport traffic control tower, as well as some hangar space and numerous installation restoration program sites are located south of the runway. The airport is 2,253 acres in size and is surrounded by a mix of residential, commercial, industrial, and open space land uses, including the Mather Preserve. Mather Airport includes two parallel runways that have a northeast/southwest orientation and typically receives between 240 to 275 landings a month, with the majority of these being cargo planes (SCDA 2019-2023). Approximately 88 percent of

all aircraft operations occur on the southern runway, which is the longer one of the two. Through the ALUCP, land use is regulated to ensure that potential incompatibilities from new development do not occur.

Cumulative development identified in the SACOG MTP/SCS, including development of the NewBridge, Mather South, and Jackson Township projects, would result in new residents in the vicinity. It is assumed that all projects in the region would be developed in compliance with the adopted ALUCP. No existing cumulative airport compatibility issues are present within the plan area.

Cumulative Impacts Evaluation

The project would introduce new sensitive receptors adjacent to Mather Airport and within the ALUCP. Mitigation Measure AC-2a would require all residential development proposed within the Mather Airport 60 CNEL noise contours to include sufficient noise mitigation to satisfy the requirements of Sacramento County General Plan Policies NO-2, NO-3, and NO-4. Mitigation Measure AC-2b would require implementation of the Acoustical Testing Plan for Mather Airport for residences proposed within the 60-65 dB CNEL Mather Airport noise contours to further ensure compliance with these adopted General Plan policies. The project would not result in a considerable contribution such that a new significant cumulative impact would occur. Therefore, cumulative airport compatibility impacts would be **less than significant with mitigation**.

Mitigation Measures

Implement Mitigation Measures 2a and 2b.

Biological Resources

Cumulative Setting

Generally, the geographic extent of cumulative impacts on biological resources consists of Sacramento County and the Central Valley region of California that supports similar biological resource values and functions to those of the plan area. Past and present actions by humans have substantially altered biological resources in the Central Valley region of California, including Sacramento County, specifically, compared to historical conditions. Among the most important of these past actions have been conversion of natural vegetation and habitats to agricultural and developed land uses; fill and alteration of aquatic habitats; flood control and water supply projects; and the introduction of invasive species, which in many cases have competed with, preyed upon, and degraded habitat for native species. More recently, the large-scale conversion of agricultural habitats to urban land uses has resulted in substantial loss of habitat for species such as state-listed Swainson's hawk that have adapted to use agricultural habitats in response to loss of their natural habitats.

Past, present, and foreseeable future urbanization in Sacramento County has contributed, and continues to contribute substantially to the loss of grassland, wetland, and agricultural habitats that are important to many species in the region, including state and federally listed species like Swainson's hawk, vernal pool fairy shrimp, and vernal pool tadpole shrimp. The continued conversion of natural habitats would contribute to

the ongoing decline of these habitats in the region and in the state. This represents an existing significant cumulative impact.

Cumulative Impacts Evaluation

The project would result in conversion of annual grassland, vernal pools, wetlands, ponds and marshes, riparian woodlands, and native and nonnative trees that provide habitat for common and special-status species, as well as the potential loss of individuals of common and special-status species. For the habitat conversion and special-status species covered under the South Sacramento Habitat Conservation Plan (SSHCP), the Project Applicants would obtain coverage and implement SSHCP avoidance and minimization measures (AMMs), as required by Mitigation Measure BR-1b. Additional mitigation measures identified in Chapter 8, "Biological Resources," would avoid or minimize impacts to non-covered species and would reduce impacts to a less-than-significant level.

The project and related projects would contribute to the countywide conversion of open space land to non-open space uses. However, the SSHCP was developed to minimize and mitigate impacts on plant and wildlife habitat (and associated species) resulting from this regional loss of open space lands. The SSHCP relies, in part, on compensation for such conversion through preservation of agricultural lands and preservation and creation of natural habitats to be managed in perpetuity through the establishment of conservation easements and preserves. The goal of the SSHCP is to provide approximately 36,282 acres of habitat preserve (Sacramento County et al. 2018).

Mitigation Measure BR-1b includes preparing project plans in accordance with the SSHCP, following AMMs outlined in the SSHCP, and paying fees or land dedications to compensate for losses of wetlands and other waters. Mitigation Measures BR-2 through BR-8 would require species-specific activities such as pre-construction surveys, buffers, and monitoring, as well as permits from the appropriate regulatory agencies and the implementation of AMMs included in those permits. As a result, the project's contribution to cumulative impacts on biological resources would not be cumulatively considerable. Therefore, cumulative impacts related to biological resources would be **less than significant with mitigation**.

Mitigation Measures

Implement Mitigation Measures BR-1a, BR-1b, BR-2, BR-3, BR-6a, BR-6b, BR-6c, and BR-8.

Climate Change

Cumulative Setting

Prominent GHG emissions contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Human-caused emissions of these GHGs in excess of natural ambient concentrations are responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the earth's climate, known as global climate

change or global warming. Climate change is a global problem caused by global pollutants and is inherently cumulative. Therefore, the cumulative setting for climate change is global, and there is an existing significant cumulative impact.

Cumulative Impacts Evaluation

Development of the project would result in the production of GHG emissions during construction activities and throughout the operational period of the project, attributed to vehicle use, energy use, waste generation, water treatment and distribution, and other area sources. With the implementation of mitigation, the project would reduce GHG emissions generated on-site through excluding natural gas combustion on-site, implementing Tier 2 CALGreen requirements for electric vehicle charging stations, and reducing VMT through various mechanisms (e.g., participation in a Transportation Management Association, incorporation of traffic calming measures and pedestrian facilities, promotion of transit access points), among other on-site GHG reduction strategies.

It is important to note that the development of the plan area in conjunction with surrounding future planned development would provide regional VMT reductions compared to the project alone. The four large-scale development projects in unincorporated Sacramento County (i.e., Mather South Community Master Plan, NewBridge Specific Plan, and Jackson Township Specific Plan, and WJHMP) would provide additional community amenities (e.g., shopping, jobs, entertainment) and transportation networks that would support development associated with the project, resulting in a decrease in VMT associated with WJHMP. Specifically, as identified in Appendix K, the project would result in VMT that is less than the cumulative, regional per resident VMT target level (set at 15 percent below the regional average) due to design features described in Chapter 9, “Climate Change.” This corresponds to a 66-percent reduction in mobile-source GHG emissions and a 55-percent reduction in total operational GHG emissions when compared to modeling defaults. Considering incorporated mitigation measures, future anticipated reductions in project-generated VMT, and the continuation of GHG-reducing state regulations, long-term operational GHG emissions are anticipated to be lower than those estimated in Chapter 9, “Climate Change.” Although an existing cumulative adverse condition exists, the project would not result in a cumulatively considerable contribution to an existing adverse cumulative condition and this impact would be **less than significant with mitigation**.

Mitigation Measures

Implement Mitigation Measures CC-1a, CC-1b, and CC-1c.

Cultural Resources

Cumulative Setting

The geographic scope of potential cumulative impacts related to cultural resources is the Sacramento County portion of the SACOG region. Historical built environment resources are more prevalent in urban areas of the SACOG region that were initially developed more than 50 years ago. Outside of urban areas, examples of historical built

environment resources include historic mines, rural residences and barns, roads, bridges, canals, and rural landscapes.

Archaeological resources exist throughout the cumulative area and are most likely to be intact in areas that have not been previously disturbed through urbanization or mining. Because all significant archaeological resources are unique and nonrenewable members of finite classes, all adverse effects or negative impacts erode a dwindling resource base. The loss of any one archaeological site affects all others in a region because these resources are best understood in the context of the entirety of the cultural system of which they are a part. The cultural system is represented archaeologically by the total inventory of all sites and other cultural remains in the region. Together, the potential direct regional impacts on historical or unique archaeological resources related to the projected land use pattern could result in substantial alteration or removal of an archaeological resource (SACOG 2019). Therefore, because of past and current projects, cumulative impacts to cultural resources in Sacramento County are significant in the cumulative context.

CUMULATIVE IMPACTS EVALUATION

As described in Chapter 10, “Cultural Resources,” of this EIR, there is a potential that existing and former homesteads that have not been surveyed or evaluated on the non-participant properties could be historically significant. With implementation of the project, there would be the potential for alteration to or destruction of a building or structure that has not been evaluated as eligible for listing as a historic resource; this could result in a substantial adverse change in its historical significance.

The project would result in ground-disturbing activities during construction and have the potential to unearth previously unidentified cultural resources. Significant archaeological resources have not been identified in the plan area. Approximately half of the plan area has been mined for aggregate resources, resulting substantial excavation and ground disturbance that diminishes the potential for future discovery of archeological resources on these sites. However, this does not preclude the possibility of buried archaeological materials or previously undiscovered surface resources within the plan area. In addition, a portion of the plan area has not been surveyed and it is unknown whether there may be archaeological resources. CEQA requires that lead agencies protect both known and unknown resources. This is supported by County General Plan Policies CO-157 and CO-158. Additionally, mitigation is recommended to ensure that all work shall be halted until a qualified archaeologist may evaluate the resource encountered and next steps are identified if significant archaeological resources are discovered in the event that archaeological resources are discovered during implementation phases.

Buried resources may consist of historic remains such as structural features (e.g., foundations, cellars) or buried trash deposits containing glass, ceramics and metal, or the resources may be of precontact origin containing chipped stone, shell, bone, and other remains. Significant impacts could result if a resource is damaged accidentally during construction or removed from its original location. Implementation of mitigation measures would reduce impacts associated with archaeological resources to a less-than-significant level because they would require the performance of professionally

accepted and legally compliant procedures for the discovery and protection of previously undocumented significant archaeological resources. With mitigation, the project would not result in a considerable contribution to a significant cumulative impact related to cultural resources. The cumulative impact would be **less than significant**.

MITIGATION MEASURES

Implement Mitigation Measures CR-1, CR-2a, and CR-2b.

ENERGY

CUMULATIVE SETTING

The geographic area considered for cumulative impacts regarding energy use is Sacramento County and the service area for Sacramento Municipal Utility District (SMUD). SMUD employs programs and mechanisms to support provision of services for new developments to be built within their service territory. The most common mechanism includes connection fees to recoup the cost of infrastructure required to service new developments through standard billing services. Additionally, energy efficiency, power management strategies, and conservation measures that reduce energy demand in existing development can serve to reduce additional energy infrastructure and services required for new development.

SMUD purchases, generates, and distributes electric power to a 900-square-mile service area in Sacramento County. Electricity purchased and produced by SMUD is generated from a variety of sources including hydro generation; cogeneration plants; advanced and renewable technologies such as wind, solar, and biomass/landfill gas power; and power purchased on the wholesale market. Various federal, state, and local regulations govern the use of energy to limit the potential for wasteful, inefficient, or unnecessary consumption of energy. There is not an existing adverse cumulative condition related to inefficient use of energy.

Sacramento County is currently processing or has recently approved four specific and community master plans within the Jackson Highway (SR 16) corridor, each of which is undergoing a separate evaluation for environmental impacts. Buildout of the plans, if approved, would occur across a 20-plus year horizon. The projects include the NewBridge Specific Plan, the WJHMP, the Jackson Township Specific Plan, and the Mather South Community Master Plan. The total impact of these plans would result in the development of over 9,247 acres and would include at least 27,425 dwelling units, and over 20 million square feet of commercial, retail, office, and other nonresidential uses. In anticipation of the increased energy demand that would result from the implementation of these plans, the following new electrical infrastructure would be required to serve all four developments combined:

- one new bulk substation: Jackson Bulk Electrical substation;
- eight project-specific distribution substations located on-site throughout the plan areas;
- two expanded project-specific distribution substations within the WJHMP area; and

- ancillary infrastructure including on-site and off-site distribution, subtransmission, and connections to existing transmission lines in the area.

The above infrastructure would be needed to provide adequate service for the development of each new community while continuing to maintain adequate service levels for the existing development within the area. The bulk electrical substation and off-site transmission and subtransmission lines are not specific to any one of the projects but are needed to meet the cumulative needs for all the projects in combination with existing development.

Based on the size and land uses included within each project, SMUD has estimated the following future energy demand:

- Mather South Community Master Plan - 27 megawatts (MW),
- Jackson Township Specific Plan - 44 MW,
- NewBridge Specific Plan - 21 MW, and
- WJHMP - 223 MW.

ELECTRICAL INFRASTRUCTURE NEEDS

DISTRIBUTION SUBSTATIONS

The following description generally summarizes the requirements for new SMUD distribution substations, such as those that will be located within each of the specific and community master plan areas. While exact design specifications are not available, this summary provides a good faith effort at evaluating the size, capacity, infrastructure, and design of each of the distribution substations to analyze the potential environmental impacts associated with the infrastructure.

Each of the eight substations would be approximately 1.5 acres in size and would be energized by connecting to 69,000 volt (69 kilovolt [kV]) subtransmission lines that are supplied by the proposed Jackson Bulk Substation (described in detail below) and existing SMUD Bulk Substations. Bulk substations typically step-down transmission line voltage of 230 kV to subtransmission voltage of 69 kV through power transformers. The distribution substations would in turn step down the electricity supply to 12 kV for delivery to residential neighborhoods. Each distribution substation would include up to two transformers, eight capacitor banks, two backup battery systems, two metal clad switchgears, and two poles with a disconnect switch. Substations will require an access road at least 20 feet wide if the access roads are straight and 24 feet wide if there are turns. The distribution substations would receive electricity from 69-kV subtransmission lines. SMUD's standard construction for subtransmission lines is overhead construction with poles that if pole-mounted would be approximately 65 feet tall. The distribution substations would distribute electricity via underground and/or overhead 12-kV lines to neighborhoods. Permanent utility easements would be required. Construction of the distribution substations would occur over a 1-year period.

Implementing the WJHMP would require the expansion of two existing distribution substations, one on the east side of Happy Lane south of Old Placerville Road and one along the west side of Mayhew and north of SR 16. The expansion of these distribution

substations would result in impacts to the adjacent parcels. The project would also require four new distribution substations, near Fruitridge Road and Hedge Avenue; SR 16 and Vineyard Road extension; Fruitridge Road and Bradshaw Road; Excelsior and Kiefer Boulevard; and Florin Road and Vineyard Road. The project may also result in the removal of an existing distribution substation if no longer required by the existing customer, near Kiefer Boulevard and Bradshaw Road.

The four existing 230-kV transmission lines that are located south of SR 16 and described above, also run along the northern portion of the WJHMP area. The cumulative projects would require seven new 69-kV subtransmission lines, including one along Kiefer Boulevard, one along Happy Lane, one along SR 16, one along Vineyard Road, one along Bradshaw Road, one along the east/west road between Bradshaw Road and Vineyard Road, and one along Hedge Avenue.

BULK SUBSTATION LOCATION

SMUD would require the dedication of approximately 22 acres of land north of the existing Cordova-Hedge and Cordova-Pocket 230-kV transmission lines that are located within a utility easement south of SR 16. Two options have been identified for the location of this substation.

Option 1 is located adjacent to the southeast corner of SR 16 and Excelsior Road and is not located within any of the four proposed master plan projects discussed above. It is located within parcels APN 067-0050-039-0000 and 067-0050-040-0000. The parcels also include two single-family, detached homes and are designated as AG-160 (Agricultural-160 Acres). There are two retention ponds on the site which are designated wetlands and included in the US Fish and Wildlife Service National Wetland Inventory. The substation location for Option 1 is located approximately 680 feet north of the nearest sensitive receptors. The site is located directly south of SR 16 and north of two SMUD 230-kV transmission lines, and two PG&E lines, that run through the proposed south-easterly portion of the WJHMP area.

Option 2 is located approximately 2,000 feet south of SR 16 and 2,000 feet west of Excelsior Road and is within the project boundary of the WJHMP area. This location is within a civic/employment designated portion of the master plan.

BULK SUBSTATION INFRASTRUCTURE

BULK SUBSTATION

The bulk substations would step down transmission line voltage of 230 kV to subtransmission voltage of 69 kV for distribution to distribution substations located within the four community and master plan areas. The bulk substation area would be graded and partially covered in crushed gravel, except where concrete foundations for the control building, transformers, circuit breakers and other equipment, oil containment, metal clad switchgear, and paved access roads would be built.

The main components of a bulk substation are the power transformers, steel structures, switches, control and relay equipment, circuit breakers, capacitor banks, electrical busses, cables and control building. Each power transformer would be approximately 35 feet tall, and would contain approximately 25,000–30,000 gallons of insulating mineral

oil. The maximum average sound level for each transformer would not exceed 80 decibel A-weighting (dBA) measured at a distance of 6 feet around the periphery of the transformer.

The bulk substation would also include circuit breakers and circuit switchers to receive and distribute electricity. Circuit breakers would be approximately 25 feet tall and would contain sulfur hexafluoride (SF_6) or other insulating medium. Sound levels would not exceed 140 decibels measured at 50 feet around the perimeter of the circuit breaker. Noise generated by the circuit breaker is typically intermittent.

The bulk substation also includes pad-mounted transformers which will contain approximately 85 gallons of insulating oil, which is typically nontoxic and biodegradable natural ester oil. The bulk substation would also include battery systems using lead acid, which would be located inside the control building. Other optional electrical components may be included which utilize mineral oil for insulation.

Electrical Bus

The bulk substation would include a network of steel structures that would support equipment, electrical buses, varying in height from approximately 16 to 80 feet tall. The electrical bus would support equipment such as insulators and would support overhead conductors entering the bulk substation from the interconnecting transmission and subtransmission overhead lines.

Control Building

The bulk substation would include a control building up to 50 feet high. The control building would be constructed with masonry block, concrete, or steel walls. The control building would include a restroom for employees and would be connected to municipal water and sewer if available.

Access Road

The bulk substation would require two access roads at least 20 feet wide if the access roads are straight and 24 feet if there are turns.

Bulk Substation Fencing, Landscaping, and Lighting

To maintain security and public safety, a minimum 10-foot-tall fence would be installed around the perimeter of the bulk substation site. SMUD would work with Sacramento County to determine the most appropriate landscaping and screening improvements. Lighting would be included as required by the National Electrical Safety Code for substation operation. The installed lighting system would be designed for purposes of nighttime operations and maintenance and would be oriented to minimize glare onto surrounding property.

Transmission Lines

Transmission and subtransmission lines would be required to receive electricity from the grid at the Jackson Bulk Substation and distribute to the distribution substations. The receipt and distribution of electricity along electrical lines would require the dedication of a utility easement. Receipt of electricity from the grid would occur by connecting the

Jackson Bulk Substation to the two SMUD 230-kV transmission lines. To make these connections, SMUD would install new steel poles up to 130 feet tall to the location of the new bulk substation. The number of new transmission poles needed would be determined by the distance between the new bulk substation and the existing transmission line right of way. Two poles at a minimum would be required. Distribution of electricity would occur across existing and new 69-kV wood or steel subtransmission poles approximately 65 feet tall or along underground lines. The additional cost of underground 69-kV subtransmission would be borne by the applicant requesting the facilities be installed underground and would require a feasibility study.

CONSTRUCTION, OPERATION, AND MAINTENANCE

Construction of the Jackson Bulk Substation would occur over approximately 2 years, in typical construction phases. During normal operations, the bulk substation would be operated remotely and continuously. Bulk substation maintenance would occur on a regular basis from two to four times per month for internal inspections and four times per year for perimeter maintenance. Major maintenance would occur about once every 3 years.

CUMULATIVE IMPACTS EVALUATION

RESULT IN WASTEFUL, INEFFICIENT, OR UNNECESSARY CONSUMPTION OF ENERGY

Impact EN-1 concludes that the project would not result in the wasteful or inefficient use of energy because the project would not use natural gas or natural gas infrastructure, complying with the California Energy Code. Similarly, Impact EN-2 concludes that the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. The project would incorporate various design features, such as prohibiting on-site natural gas infrastructure. Additionally, Mitigation Measures CC-1a, CC-1b, and CC-1c would reduce the project's overall energy consumption through decreasing gasoline and diesel fuel emissions. Proposed development surrounding the plan area would be subject to individual environmental analysis and mitigation impacts and would be required to comply with federal, state, and local requirements related to energy. Because implementing the project would not result in the wasteful or inefficient use of energy and the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency, the project's contribution to cumulative energy use **would not be cumulatively considerable**.

CUMULATIVE IMPACTS OF SMUD SUBSTATION CONSTRUCTION

Energy demand from the project would not combine with the anticipated energy demand of cumulative projects in the region to result in wasteful, inefficient, or unnecessary consumption of energy. However, implementation of the four proposed master plans would result in a substantial increase in the regional demand for energy and the subsequent need to develop new supportive infrastructure (i.e., one bulk substation, eight distribution substations, two expanded distribution substations, transmission lines, subtransmission lines, and accessory infrastructure). All new project-specific distribution substations would be located within the project boundaries of their associated maps,

with the exception of the expanded distribution substations required by the WJHMP project.

The Jackson Bulk Substation (bulk substation) and ancillary facilities, however, would be at least partially located outside of the boundaries of these master plans. Should Option 1 be selected for the bulk substation, it would be located off-site for the four master plans. For infrastructure located within project boundaries, impacts would be addressed as direct impacts within the appropriate resource areas within each project's EIR. However, because in most cases Option 1 and Option 2 would not be located within project boundaries of the four proposed Jackson Highway master plans, an evaluation of cumulative impacts associated with each location is provided below. Table 22-2 includes an evaluation of the potential impacts of the new bulk substation if it were to be developed in either location. This analysis is programmatic in nature; a more detailed CEQA analysis will be performed by SMUD before construction of any of the proposed substations which will determine the environmental impacts and respective mitigation measures.

Table 22-2 Summary of Potential Environmental Impacts from Jackson Bulk Substation Construction and Operation

Affected Resources	Potential Impacts
Aesthetics and Visual Resources	The aesthetic and visual characteristics of the proposed sites for Option 1 and 2 are similar and are characterized by grassland, rural residential homes, and agricultural land uses. The surrounding area is currently relatively rural, but with implementation of the Jackson Bulk Substation, eight distribution substations, and proposed community and master plan projects, would gradually transition to an urbanized community. The proposed bulk substation would be typical of other bulk substations in the region and would include a two-story control building, transformers (approximately 35 feet tall), power circuit breakers (approximately 25 feet tall), a network of steel structures to support electrical equipment (up to 100 feet tall), and overhead conductors entering the substation from the interconnecting subtransmission and transmission overhead lines (up to 130 feet tall). Project construction would temporarily disrupt the existing visual environment as project materials would be staged and workers would be present on-site during the construction phase which would be approximately 2 years. However, these changes in the existing visual environment would be temporary, and consistent with the overall change to existing visual context in the SR 16 corridor because of multiple large proposed master plans. Under both options, the bulk substation would be located adjacent to urbanizing areas and SR 16, and would be typical of supportive urban infrastructure seen in the community. The overall visual transformation of the surrounding areas is addressed in the project-specific visual resources chapter of this EIR and is inclusive of supporting infrastructure needed to support the community. As described therein, the Franklin Bulk Substation Mitigated Negative Declaration concluded that the project would result in less than significant impacts. No scenic resources nor scenic vistas are located on or adjacent to the sites or nearby for either Option 1 or Option 2. While development of the bulk substation would result in the visual transformation of the site from a rural character to urban infrastructure, its development would be completed in concert with the overall urbanization of the surrounding area such that construction of this facility would not result in the substantial degradation of views of the site. As described

Affected Resources	Potential Impacts
	above, nighttime lighting would be included for safety and maintenance purposes but would be shielded and directionally controlled to prevent impacts to nearby sensitive land uses. Overall, the project would not result in a considerable contribution to a new significant cumulative impact related to visual resources. Cumulative impacts would be less than significant.
Air Quality	Construction of the Jackson Bulk Substation and related infrastructure components under Options 1 and 2 would involve the use of off-road heavy-duty construction equipment. Construction of the bulk substation would be typical of construction activity for the project type and size. Use of this equipment during various construction phases would result in emissions of fugitive dust, diesel particulate matter, and other criteria air pollutants. It is anticipated that certain phases in the construction of the substation may result in fugitive dust emissions and criteria air pollutants which exceed applicable standards set by the Sacramento Metropolitan Air Quality Management District (SMAQMD). Given the proximity of both Option 1 and Option 2 to existing sensitive receptors, the use of construction equipment may also expose sensitive receptors to substantial pollutant concentrations. As a result, construction activity associated with bulk substation construction could result in significant air quality impacts. Construction of the bulk substation would be the responsibility of Sacramento Municipal Utility District (SMUD) and would not be subject to the control of the County. Nonetheless, SMUD would be responsible for implementing appropriate mitigation developed in consultation with regulatory agencies to mitigate air quality impacts. Such mitigation could include construction practice and equipment limitations and renewable energy features. With implementation of mitigation, project-related impacts associated with the bulk substation could be reduced to a less-than-significant level. Mitigation Measure CU-2 below is recommended to reduce the project's contribution to impacts, specifically a reduction in fugitive dust emissions through the implementation of Fugitive Dust Control Plan during project construction. Mitigation Measure CU-3 below is recommended to reduce the project's contribution to impacts, specifically oxides of nitrogen (NO_X) emissions during project construction through the implementation of NO_X reduction measures. However, even with implementation of this mitigation, cumulative construction-related air quality impacts could result in emissions above SMAQMD's thresholds for certain pollutants and, therefore, cumulative impacts would remain considerable and significant and unavoidable. Operation of the bulk substation under Option 1 or 2 would result in emissions associated with routine maintenance tasks including worker commute trips and the use of maintenance equipment, as needed. Similar to existing facilities such as the Franklin Bulk Substation, emissions during operations would be limited over the lifetime of the project and no permanent staff would be expected to be stationed at the facility. Therefore, no significant operational impacts would be expected, and this would not result in a considerable contribution to a significant cumulative impact. Cumulative impacts related to operations would be **less than significant**.
Biological Resources	The site for Option 1 includes two single-family, detached homes on large lots which are surrounded by grassland habitat. There are also two retention ponds located within the parcel that are designated wetlands and could be disturbed during construction. The site for Option 2 is located within the project boundary of the West Jackson Highway Master Plan and consists of grassland habitat. Disturbance of special-status plant species and wildlife as well as their habitats could occur because of construction activities for the development of either

Affected Resources	Potential Impacts
	Option 1 or Option 2. The total area of disturbance for development of the bulk substation would be a maximum of approximately 22 acres. SMUD would be responsible for implementing appropriate mitigation developed in consultation with resource agencies to mitigate the impacts to special-status species and their habitats. Mitigation Measure CU-4 General Construction Measures, Mitigation Measure CU-5 Pre-Construction Surveys, Mitigation Measure CU-6 Avoid Disturbance or Harm to Wildlife Species below is recommended to reduce the project's contribution to construction-related impacts. Development of the project would contribute to the loss of biological resources within the region, but due to the relatively small amount of anticipated impacts this is not a considerable contribution to a significant cumulative biological resources impact. Mitigation Measure CU-7, Clean Water Act Permitting, and Mitigation Measure CU-8, Compensate for Permanent Loss of Wetlands below is recommended to reduce the project's contribution to this impact. However, even with implementation of the mitigation measures listed above cumulative construction-related impacts would remain **considerable and significant and unavoidable**.
Cultural Resources	Construction activities for the development of the Jackson Bulk Substation and related infrastructure under Option 1 or Option 2 would involve ground disturbance, grading, and trenching activities that could result in the uncovering of previously undiscovered cultural resources on the site. Mitigation Measures CU-9 and CU-10 are recommended to minimize the potential for the project to result in potential impacts on cultural resources. With mitigation, the project would not result in a considerable contribution to a significant cumulative impact. Cumulative impacts would be **less than significant**.
Geology and Soils	Construction activities for the development of the Jackson Bulk Substation and related infrastructure under Option 1 or Option 2 would involve ground disturbance, grading, and trenching activities that could result in activities which expose soils and result in accelerated erosion. Construction activity could result in the movement of soils to other locations in the plan area to assist in the leveling the site. Because the project would disturb more than 1 acre of ground surface, the project would be required to comply with the Sacramento County Land Grading and Erosion Control Ordinance (Sacramento County Code Ch. 16.44). The ordinance establishes administrative procedures, minimum standards of review, and implementation and enforcement procedures for the control of erosion and sedimentation that are directly related to land grading activities. In addition to complying with the County's ordinances, because the construction site would disturb more than 1 acre, it would be required to comply with the state's General Stormwater Permit for Construction Activities, which is Mitigation Measure CU-11. The Construction General Permit is issued by the State Water Resources Control Board and enforced by the Regional Water Quality Control Board and requires preparation and implementation of a site-specific Stormwater Pollution Prevention Plan (SWPPP) that must always be kept on site for review by the state inspector. As such, the project would not result in substantial soil erosion or the loss of topsoil and would not contribute considerably to a significant cumulative impact. Cumulative impacts would be **less than significant**.
Greenhouse Gas Emissions	Operation of the Jackson Bulk Substation under Option 1 or 2 would result in greenhouse gas (GHG) emissions associated with routine maintenance tasks including worker commute trips and the use of maintenance equipment, as

Affected Resources	Potential Impacts
	needed. Similar to existing facilities such as the Franklin Bulk Substation, GHG emissions during operations would be limited over the lifetime of the project and no permanent staff would be expected to be stationed at the facility. Construction of the project and related infrastructure components under Option 1 or Option 2 would involve the use of off-road heavy-duty construction equipment resulting in GHG emissions and vehicle miles associated with construction worker commute trips. The full design and construction details for the bulk substation are not known at this time. However, the Franklin Bulk Substation, which is similar in size to the Jackson Bulk Substation, resulted in 1,230 metric tons of carbon dioxide equivalent ($MTCO_2e$) during the initial year of construction. Based on similar size of the Jackson Bulk Substation, GHG emissions during the initial year of construction could potentially exceed SMAQMD's significance threshold of 1,100 $MTCO_2e$/year for construction activity. Therefore, implementation of Mitigation Measure CU-12 (described below) is suggested to reduce construction-generated GHG emissions to below 1,100 $MTCO_2e$/year. With implementation of the Mitigation Measure CU-12, the project would not result in a considerable contribution to a significant cumulative impact. Cumulative impacts would be **less than significant**.
Hazards and Hazardous Materials	Construction of the Jackson Bulk Substation and related infrastructure components under Option 1 or Option 2 would involve the transport and use of hazardous materials. These include mineral oil used to insulate transformers which would be in sealed transformer equipment, substation battery backup systems, containing liquid sulfuric acid, which would be in sealed cases, and petroleum products for use in construction equipment. As part of the SWPPP required for the project, a Spill Prevention and Response Plan would be implemented and would include action measures to minimize the potential release of hazardous materials into the environment. Mitigation Measures CU-13, CU-14, and CU-15 are suggested to ensure impacts of a potential release of hazardous materials into the environment are reduced to the largest degree possible. Mitigation Measure CU-13 requires environmental training on best management practices (BMPs) that would be employed for phases of construction in which hazardous materials are encountered. Mitigation Measure CU-14 requires the development of a Hazardous Substance Control and Emergency Response Plan. The plan would include BMPs for avoiding hazardous materials spills and specific measures to implement if a hazardous materials spill does occur. Operation the substation would require the storage and use of mineral oil on-site for the purpose of insulating the substation transformers. As part of Mitigation Measure CU-15, a Spill Prevention, Control, and Countermeasures Plan would be prepared to identify storage devices and containment measures for spill events. For operation of the project, Mitigation Measure CU-16 is also suggested, which would require the preparation of A Hazardous Materials Business Plan (HMBP), if operation of the project required the handling or storage of hazardous materials equal to or greater 55 gallons for liquids, 500 pounds for solids and 200 cubic feet (at standard temperature and pressure) for compressed gases. The HMBP would also include an operation specific emergency response plan for the specific type of hazardous materials used on site. Although hazardous material would be used on site, with the implementation of Mitigation Measures CU-13 through CU-15, the risks for the accidental release of hazardous materials into the environment would be reduced such that the project would not result in a considerable contribution to a significant cumulative impact. Cumulative impacts would be **less than significant**.

Affected Resources	Potential Impacts
Hydrology and Water Quality	Construction of the Jackson Bulk Substation at Option 1 or Option 2 would result in increased sediment erosion because of ground disturbance associated with activities such as grading, trenching, foundation installation, fence construction, and road improvements. Increased erosion could affect water quality in on-site and off-site water bodies. Substation construction could also result in the degradation of water quality from runoff of petroleum-based products associated with the use of construction equipment. Option 1 contains wetland features and Option 2 contains two retention basins that are identified as freshwater ponds and classified as part of the Palustrine System, which includes all nontidal wetlands dominated by trees, shrubs, persistent emergents, emergent mosses or lichens, as well as all such wetlands that occur in tidal areas where salinity due to ocean-derived salts is below 0.5 ppt. Substation construction could result in changes in drainage patterns on the site. Substation construction would be required to comply with the Sacramento County Land Grading and Erosion Control Ordinance (Sacramento County Code Ch. 16.44). As discussed in the "Geology and Soils" section, above, because the construction site would disturb more than 1 acre, it would also be required to comply with the state's General Stormwater Permit for Construction Activities which is issued by the State Water Resources Control Board and enforced by the Regional Board. This permit would require the preparation and implementation of a site-specific SWPPP. Based on the results of this permitting process, if deemed applicable, standard erosion control measures would be implemented to protect water quality consistent with Regional Water Quality Control Board and County requirements. The use of standard control measures through the permitting process would ensure that substation construction activity would not violate any water quality standards or waste discharge requirements. Implementation of standard construction-related hydrology and water quality measures listed below as well as implementation of Mitigation Measures CU-11, and CU-13 through CU-15 would feasibly reduce this impact. Further, the facility would be designed to meet current state and County stormwater and water quality standards for the operation of the facility such that no significant operational hydrology and water quality impacts would occur. Therefore, the project would not result in a considerable contribution to a significant cumulative hydrology or water quality impact. Cumulative impacts would be **less than significant**.
Noise and Vibration	Construction activities for the development of the Jackson Bulk Substation and related infrastructure under Option 1 or Option 2 would involve the use of off-road heavy-duty construction equipment resulting in noise and vibration levels that could result in impacts on nearby sensitive receptors (e.g., residential land uses). Site construction characteristics would be similar to those in Mather South Community Master Plan (i.e., construction activity occurring in close proximity to sensitive receptors). Existing noise sensitive receptors exists approximately 2,035 feet east of the substation location in Option 1 and within approximately 680 feet south of the plan area boundary for Option 2. Construction activities would be intermittent and temporary in nature. Construction activities occurring during the quieter nighttime hours are of particular concern. If construction activities were to occur during the nighttime hours this could result in increased levels of annoyance and potential for sleep disruption to occupants of nearby dwellings. Construction of the substation would be the responsibility of SMUD and would not be subject to the control of the County. Nonetheless, SMUD would be responsible for implementing appropriate mitigation developed in consultation with regulatory agencies to mitigate noise impacts. As such, construction noise mitigation strategies

Affected Resources	Potential Impacts
	identified within Mitigation Measure CU-17 are proposed to mitigate substation construction activity on nearby noise sensitive receptors and could feasibly reduce this impact to below a level of significance. In general, this mitigation can and should be implemented by SMUD and would generally include the limitation of construction activity to daytime hours as prescribed in the Sacramento County Noise Ordinance. Although this mitigation would help to reduce potential impacts on nearby sensitive receptors, because the full detail of construction activity is not known at this time, including the type and amount of construction equipment to be used as well as when construction activity would occur, noise impacts may still occur. A 224 mega-volt ampere transformer is estimated to generate a maximum noise level of 80 dBA L_{eq}/L_{50} at 6 feet. Because the exact size of the proposed bulk substation is unknown at this point, there is potential for an impact to occur if noise sensitive receptors could be affected by operations of the bulk substation. Mitigation could include the siting of noise-generating equipment away from sensitive receptors. With implementation of mitigation, project-related impacts would be reduced to below a level of significance. Mitigation Measure CU-16 below is recommended to reduce the project's contribution to a new significant cumulative impact. Cumulative impacts would be **less than significant**.
Transportation	Construction activities for the development of the Jackson Bulk Substation under Option 1 or Option 2 would result in construction-related commute and haul trips that could temporarily increase traffic volumes on local roadways. Construction of the facility would take place over approximately 2 years and would be temporary. Construction of the bulk substation would be the responsibility of SMUD and would not be subject to the control of the County. Nonetheless, SMUD would be responsible for implementing appropriate construction-traffic measures to ensure adequate access to and from the facility would be maintained. SMUD would also be required to coordinate with the County regarding construction-traffic management plans consistent with the Sacramento County Department of Transportation's Construction Traffic Management Program (Chapter 6 of the County's Project Delivery Manual). Therefore, no significant construction-related traffic impacts would occur. The facility would not require any permanent staff and would only require periodic maintenance. Therefore, this facility would not result in the substantial generation of operational traffic such that significant traffic impacts to local roadways and intersections would occur. Overall, the project would not result in a considerable contribution to a significant cumulative impact related to traffic impacts. Cumulative impacts would be **less than significant**.

MITIGATION MEASURES

Mitigation Measure CU-E-1: Coordinate with SMUD

The project applicants for the NewBridge Specific Plan, the WJHMP, the Jackson Township Specific Plan, and the Mather South Community Master Plan, shall each coordinate with SMUD to identify the timing of construction of the Jackson Bulk Substation and seek to facilitate efficiencies in grading and pre-construction activities as feasible, as a condition of project approval.

AIR QUALITY

Mitigation Measure CU-E-2: Develop and Implement a Dust Control Plan

SMUD shall develop a Fugitive Dust Control Plan (FDCP) for the bulk substation. The FDCP shall be prepared before the start of construction activities. Measures to be included in the plan include, but are not limited to, the following:

a. Water all exposed surfaces at least two times daily when soil moisture conditions have the potential to result in dust generation. Exposed surfaces include, but are not limited to soil piles, graded areas, unpaved parking areas, staging areas, and access roads.

b. Cover or maintain at least two feet of freeboard space on haul trucks transporting soil, sand, or other loose material on the site. Any haul trucks that would be traveling along freeways or major roadways should be covered.

c. Use wet power vacuum street sweepers to remove any visible track out mud or dirt onto adjacent public roads at least once a day. Use of dry power sweeping is prohibited.

d. Limit vehicle speeds on unpaved roads to 15 miles per hour (mph).

e. Temporary construction entrances shall be stabilized to control fugitive dust emissions.

f. The FDCP shall identify a designated person or persons to monitor the fugitive dust emissions and enhance the implementation of the measures, as necessary, to minimize the transport of dust off-site and to ensure compliance with identified fugitive dust control measures. Their duty hours shall include holidays and weekend periods when work may not be in progress. The names and telephone numbers of such persons shall be provided to the SMAQMD Compliance Division before the start of any grading, or earthwork.

g. Signs shall be posted at the substation site entrance a minimum of 30 days prior to initiation of project construction. The signs shall include the following information: (a) Project Name; (b) Anticipated construction schedule(s); and (c) Telephone number(s) for designated construction activity monitor(s) or, if established, a complaint hotline. The designated construction monitor shall document and immediately notify SMUD and SMAQMD of any air quality complaints received. If necessary, the contractor will coordinate with SMUD and SMAQMD to identify any additional feasible measures and/or strategies to be implemented to address public complaints.

Mitigation Measure CU-E-3: Implement NOx Reduction Measures

Consistent with SMAQMD-recommended “basic” and “enhanced” NO_x reduction measures, the following measures shall be implemented during bulk substation construction:

Basic Measures:

a. Minimize idling time of diesel-powered equipment either by shutting equipment off when not in use or reducing the time of idling to 5 minutes (required by California Code of Regulations, Title 13, Sections 2449[d][3] and 2485). Provide clear signage that posts this requirement for workers at the entrances to the site.

b. Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determine to be running in proper condition before initial use in the project area. Documentation verifying compliance with this measure shall be retained on site and provided to SMAQMD upon request.

c. When leasing equipment, the contractor shall use alternatively fueled equipment (e.g., electric, propane, etc.), in lieu of diesel- or gasoline fueled equipment, whenever possible and to the extent practicable.

Enhanced Measures:

d. A comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that would be used in aggregate of 40 or more hours during substation construction shall be submitted to the SMAQMD.

   - The inventory shall include the horsepower rating, engine model year, and projected hours of use for each piece of equipment.
   - The contractor shall provide the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman.
   - This information shall be submitted at least four business days before the use of subject heavy-duty off-road equipment.
   - The inventory shall be updated and submitted monthly throughout the duration of the project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs.

e. A plan shall be submitted to the SMAQMD demonstrating that combined emissions from heavy-duty off-road equipment (50 horsepower or more), construction vehicles, and haul truck to be used during substation construction, including owned, leased, and subcontractor vehicles, will achieve NO_x reductions sufficient to demonstrate compliance with the SMAQMD's maximum allowable mass emissions threshold of 85 pounds per day (lb/day) of NO_x.

   - The plan shall include an inventory of all off-road equipment and haul trucks to be used during construction.
   - Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, limitations on the use of off-road equipment and/or haul trucks, changes in construction schedules, the payment of mitigation fees to the SMAQMD, and/or other options as they

become available. The SMAQMD's Construction Mitigation Calculator can be used to identify an equipment fleet that achieves this reduction.

f. SMUD shall ensure that emissions from all off-road diesel powered equipment used in the project area do not exceed 40% opacity for more than three minutes in any one hour.

- Any equipment found to exceed 40-percent opacity (or Ringelmann 2.0) shall be repaired immediately.
- Non-compliant equipment shall be documented and a summary provided to SMAQMD monthly. A visual survey of all in-operation equipment shall be made at least weekly.
- A monthly summary of the visual survey results shall be submitted throughout the duration of the project, except that the monthly summary shall not be required for any 30-day period in which no construction activity occurs. The monthly summary shall include the quantity and type of vehicles surveyed as well as the dates of each survey.

Once more detailed construction information becomes available, a refined emissions modeling analysis can be performed to determine if all or a portion of the above "Enhanced Measures" should be implemented to demonstrate compliance with SMAQMD's maximum allowable mass emissions threshold of 85 lb/day of NO_x.

This analysis shall be conducted in accordance with applicable SMAQMD-recommended methodologies.

BIOLOGICAL RESOURCES

Mitigation Measure CU-E-4: Implement General Construction Measures

The following general construction measures shall be implemented to avoid impacts to biological resources during construction of the bulk substation:

- Construction personnel shall minimize the work area footprint and the duration at a work area site, to the extent possible.
- Construction personnel shall use existing paved and unpaved roads to access the work area where present. Vehicles and equipment shall be parked on pavement, existing roads, and previously disturbed areas to the maximum extent feasible.
- Trash dumping, littering, open fires (such as barbecues), hunting, and pets shall be prohibited in work areas.

Mitigation Measure CU-E-5: Conduct Pre-Construction Surveys

The following measures shall be implemented to avoid impacts to special-status plants during construction of the bulk substation:

- Pre-construction surveys for special-status plants will be conducted within 250 feet of the SMUD project area, where access is possible, during the appropriate bloom period for identification.
- If surveys for special-status plants cannot be completed during the appropriate bloom period, topsoil (upper 2-4 inches) in the appropriate habitat for the surveyed species where ground disturbance will occur will be stockpiled before construction and respread after construction in suitable areas
- If any special-status plant species are found in the SMUD project area, orange or yellow construction flagging or fencing will be erected to provide a 20-foot -buffer area around the population to prevent encroachment by construction activities, if possible given the location of the population. The fencing will be maintained until construction is complete.
- If any special-status plant species are found in the SMUD project area and avoidance is not possible due to the location of the population, SMUD will consult with the appropriate resource agencies (California Department of Fish and Wildlife and/or California Native Plant Society) to develop mitigation and/or compensation measures needed to reduce the impact to a less than significant level.
- Where it is not feasible to avoid special-status plant locations within construction areas, seed collection and transplanting shall be performed for annual plant species in suitable areas.
- If an affected special-status plant is a perennial species, native plant nursery propagation shall be performed as well as planting within suitable areas.
- All special-status plant restoration and planting areas shall be monitored for a minimum of one year.

Mitigation Measure CU-E-6: Avoid Disturbance or Harm to Wildlife Species

Following preconstruction surveys and initiation of project construction, it is possible that wildlife species could subsequently enter or return to the plan area. The following measures will be implemented to avoid disturbance or harm to these species:

- If any special-status species or other wildlife species are observed in the plan area during construction, construction will cease until the species is allowed to move out of harm’s way on their own accord.
- If they cannot be allowed to move out of harm’s way on their own accord, SMUD field crews shall contact SMUD Environmental Services at (916) 732-5836, who will report the sighting to the appropriate agency (US Fish and Wildlife Service and/or California Department of Fish and Wildlife). SMUD Environmental Management will have authority to stop activities until appropriate corrective

measures have been completed or it is determined that the individual will not be harmed. Capture and relocation of trapped or injured species can only be attempted by agency-approved biologists.

Mitigation Measure CU-E-7: Obtain Clean Water Act Permits

SMUD will obtain relevant Clean Water Act (CWA) permits (Sections 404 and 401). Additionally:

- All proposed discharges of dredge or fill material into waters of the United States will first be authorized by the US Army Corps of Engineers (USACE), pursuant to Section 404 of the CWA. All USACE permit conditions will be implemented.
- Pursuant to Section 401 of the CWA, SMUD will obtain Water Quality Certification from the Regional Water Quality Control Board for the proposed project.

Mitigation Measure CU-E-8: Compensate for Permanent Loss of Wetlands

SMUD will compensate for the permanent loss of wetland habitat through the purchase of mitigation credits at a 1:1 creation ratio from the SMUD Nature Preserve Mitigation Bank or an alternative USACE-approved mitigation bank. This mitigation requirement may be refined or superseded by the terms of the USACE Section 404 permit for the project.

CULTURAL RESOURCES

Mitigation Measure CU-E-9: Conduct Cultural Resource Surveys

SMUD shall complete cultural resource surveys before any ground disturbing activities or construction activities associated with the bulk substation. Surveys will be completed prior to any ground disturbing activities or the project construction activities to inventory and evaluate cultural resources affected by the project, or affected by any components that might be added to the project, or any existing components that may be modified.

Mitigation Measure CU-E-10: Prepare and implement Archaeological Resource Management and Treatment Plan to Address Significant or Unique Archaeological Resources

In the case of the inadvertent discovery of a resource that is listed or eligible for listing in the National Register of Historic Places or California Register of Historical Resources or of a unique archaeological resource as defined by CEQA, SMUD will have a qualified archaeologist prepare and implement an Archaeological Resource Management and Treatment Plan that specifies the treatment of the resources. Before implementation, this document shall be submitted for review to SMUD as CEQA Lead Agency. This plan shall be tailored to the specific needs of the project and the particular resources present there. The proposed Archaeological Resources Management and Treatment Plan must minimally address the following:

A general research design shall be developed that:

- Charts a timeline of all research activities.

- Recapitulates any existing paleo-environmental, prehistoric, ethnohistoric, ethnographic, and historic contexts to create a comprehensive historic context for the plan area.
- Poses research questions and testable hypotheses specifically applicable to the resource types encountered.
- Clearly articulates why it is in the public's interest to address the research questions that it poses.
- Artifact collection, retention/disposal, and curation policies shall be discussed, as related to the research questions formulated in the research design. These policies shall apply to archaeological materials and documentation resulting from evaluation and data recovery of the resource.
- Person(s) expected to perform each of the tasks, their responsibilities, and the reporting relationships between project construction management and the mitigation and monitoring team shall be identified.
- The manner in which Native American observers or monitors shall be included, the procedures to be used to select them, and their roles and responsibilities shall be described.
- All impact-avoidance measures (such as flagging or fencing) to prohibit or otherwise restrict access to sensitive resource areas that are to be avoided during ground disturbance, construction, and/or operation shall be described. Any areas where these measures are to be implemented shall be identified. The description shall address how these measures would be implemented before the start of ground disturbance and how long they would be needed to protect the resources from project-related impacts.
- The commitment to curate of all archaeological materials retained as a result of the archaeological investigations (survey, testing, data recovery), in accordance with CEQA Lead Agency requirements and the California State Historical Resources Commission's Guidelines for the Curation of Archaeological Collections, into a retrievable storage collection in a public repository or museum shall be stated.

GEOLOGY AND SOILS

Mitigation Measure CU-E-11: Implement a Storm Water Pollution Protection Plan

SMUD shall prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) that includes erosion control measures and construction waste containment measures to ensure that waters of the United States and the state are protected during and after project construction. The SWPPP shall include site design measures to minimize off-site storm water runoff that might otherwise affect surrounding habitats. The SWPPP would also include a Spill Prevention and Response Plan (SPRP) and a construction-specific Hazardous Substance Control and Emergency Response Plan (HSCERP) to minimize the potential for accidental releases of hazardous materials into the environment.

The SWPPP shall be prepared with the following objectives: (a) to identify pollutant sources, including sources of sediment, that may affect the quality of storm water discharges from the construction of the project; (b) to identify BMPs to reduce or eliminate pollutants in storm water discharges and authorized non-storm water discharges from the site during construction; (c) to outline and provide guidance for BMPs monitoring; (d) to identify project discharge points and receiving waters; (e) to address post-construction BMPs implementation and monitoring; and (f) to address sedimentation, siltation, turbidity, and non-visually detectable pollutant monitoring, and outline a sampling and analysis strategy.

The contractor shall implement the SWPPP including all BMPs and perform inspections of all BMPs. Potential SWPPP BMPs could include, but would not be limited to the following:

- Placing fiber rolls around on-site drain inlets to prevent sediment and construction-related debris from entering inlets.
- Placing fiber rolls along the perimeter of the site to reduce runoff flow velocities and prevent sediment from leaving the site.
- Placing silt fences down-gradient of disturbed areas to slow down runoff and retain sediment.
- Stabilizing construction entrance to reduce the tracking of mud and dirt onto public roads by construction vehicles.
- Staging and covering excavated and stored construction materials and soil stockpiles in stable areas to prevent erosion.

The construction-specific SPRP and HSCERP shall include preparations for quick and safe cleanup of accidental spills. It shall prescribe hazardous materials handling procedures for reducing the potential for a spill during construction and shall include an emergency response program to ensure quick and safe cleanup of accidental spills. The plan shall identify areas where refueling and vehicle maintenance activities and storage of hazardous materials, if any, will be permitted, with secondary containment.

Construction personnel shall not refuel or conduct equipment maintenance activities within 250 feet of any aquatic features. The SPRP and HSCERP shall identify BMPs in the event a spill occurs. BMPs may include but are not limited to the following: use of oil-absorbent materials, tarps, and storage drums to contain and control any minor releases; and storage and use of emergency-spill supplies and equipment in locations adjacent to work and staging areas.

GREENHOUSE GAS EMISSIONS

Mitigation Measure CU-E-12: Implement Greenhouse Gas Reduction Measures

Prior to project construction, SMUD shall provide a plan to SMAQMD which demonstrates that the combined emissions from all off-road equipment, construction vehicles, and haul truck to be used in the construction project will implement GHG reduction strategies demonstrating that annual GHG emissions would be the

SMAQMD's construction mass emissions threshold of 1,100 metric tons of carbon dioxide equivalent per year ($MTCO_2e$/year).

- The plan shall include an inventory of all off-road equipment and haul trucks to be used during construction.
- Strategies for reducing GHG emissions could include the use of alternative fuels, changes in construction schedules, the phasing of haul truck trips. and/or other options as they become available.

If more detailed construction information becomes available a refined emissions modeling analysis can be performed. This analysis shall be conducted in accordance with applicable SMAQMD-recommended methodologies. The analysis shall include reduction measures sufficient to ensure construction activity would not exceed SMAQMD's mass emissions threshold of 1,100 $MTCO_2e$/year.

HAZARDS AND HAZARDOUS MATERIALS

Mitigation Measure CU-E-13: Conduct Worker Training for Hazardous Materials

SMUD shall establish an environmental training program to communicate environmental concerns and appropriate work practices to all field personnel, including spill prevention, emergency response measures, and proper BMP implementation. All personnel will review all site-specific plans, including, but not limited to, the project's SWPPP, health and safety plan, and fugitive dust control plan.

Mitigation Measure CU-E-14: Prepare and Maintain Spill Prevention, Control, and Countermeasures Plan

SMUD shall prepare and maintain an operation-specific Spill Prevention, Control, and Countermeasures Plan (SPCC Plan) in accordance with state and federal requirements, including 40 Code of Federal Regulations 112. The SPCC Plan shall identify engineering and containment measures for preventing oil releases into waterways. An SPCC Plan is required when there is over 1,320 gallons of petroleum products on-site (excluding vehicles).

Mitigation Measure CU-E-15: Evaluate Applicability of Hazardous Materials Business Plan

SMUD will evaluate applicability of the Hazardous Materials Business Plan (HMBP) requirements (the project would use or store hazardous materials equal to or greater than 55 gallons of liquids, 500 pounds of solids and/or 200 cubic feet [at standard temperature and pressure] of compressed gases) and file operation-specific HMBP in accordance with local, state, and federal laws. The HMBP shall identify site activities, provide an inventory of hazardous materials used on-site, provide a facilities map, and identify an emergency response plan/contingency plan.

NOISE AND VIBRATION

Mitigation Measure CU-E-16: Limit Construction Activity to Daytime Hours

Per Sacramento County Noise Ordinance requirements (Sacramento County Code Section 6.68), construction activity associated with the development of the Jackson Bulk Substation shall be limited to the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between 7:00 a.m. and 8:00 p.m. on weekends.

Significance after Mitigation

Future project applicants for each of the community and master plan projects would be required to comply with Mitigation Measure CU-1 to coordinate with SMUD during the grading and pre-construction activities to facilitate efficiencies where feasible.

Additionally, the specific design and siting details for the construction and operation of the bulk substation are not known at this time. The EIR has provided an analysis of the potential project and cumulative impacts associated with development of the bulk substation and other ancillary off-site facilities (e.g., power lines) based upon the best available information at this time. Development of the facility is the responsibility of SMUD as the utility provider and SMUD can and should mitigate impacts related to development. Additional or substitute mitigation may be available when a specific site and the design of the project is known. Where standard development policies and requirements can be implemented to reduce impacts, they have been assumed in the above analysis. However, until specific site and design plans are developed, it is unknown whether specific impacts related to air quality, biological resources, greenhouse gas emissions, noise can be reduced. Therefore, at the program-level it is not possible to guarantee that all impacts related to would be able to be mitigated and this EIR conservatively assumes that the project would have cumulatively considerable and **significant impacts** related to these resources.

GEOLOGY, SOILS, AND MINERAL RESOURCES

CUMULATIVE SETTING

Impacts on geology and soils are generally localized and do not result in regionally cumulative impacts. Unless a project would alter the soils and rock underlying other adjacent projects or affect surrounding land due to landslides, impacts related to geology and soils would be limited to the plan area. The geographic scope of cumulative impacts related to geology and soils, therefore, includes only projects immediately adjacent to the plan area. Because the region is generally level, not seismically active, and has a low probability of ground shaking, the risk of ground failure, including liquefaction and landslides caused by earthquakes is also generally low. The risk of surface fault rupture in the SACOG region is generally low because of the scarcity of active faults. Section 1803.7 of the 2019 California Building Code (CBC) requires preparation of a geohazard reports for all proposed construction, with few exceptions. The purpose of the engineering report is to identify geologic and seismic conditions that may require mitigation. The reports, which are prepared by a California certified engineering geologist in consultation with a California-registered geotechnical engineer, assess the nature of the site and potential for earthquake damage based on

appropriate investigations of the regional and site geology, project foundations conditions, and potential seismic shaking at the site. In connection with grading, foundation, building, and other site development permits, the local jurisdiction reviews the geotechnical investigation and recommendations and imposes permit requirements based on the geotechnical recommendations and CBC provisions. Recommended corrective measures, such as structural reinforcement and replacing native soils with engineered fill, must be incorporated into project designs. Developments must also adhere to local building code requirements for seismic safety, which identify and require specified construction techniques that aid in structural resistance to ground shaking (SACOG 2019).

Generally, earthwork and ground-disturbing activities, unless below minimum requirements, require a grading permit, compliance with which minimizes erosion, and local grading ordinances ensure that construction practices include measures to protect exposed soils such as limiting work to dry seasons, covering stockpiled soils, and use of straw bales and silt fences to minimize off-site sedimentation. Additional reports, such as a soil engineering report, engineering geology report, or plans and specifications for grading may be required by the local building or engineering departments, depending on the development proposal. Earthwork recommendations for improved erosion controls, based on site conditions, would be incorporated into the project construction documents. Development that disturbs more than 1 acre is subject to compliance with a NPDES permit, including the implementation of BMPs, some of which are specifically implemented to reduce soil erosion or loss of topsoil, and the implementation of a SWPPP through the local jurisdiction. BMPs that are required under a SWPPP would include erosion prevention measures that have proven effective in limiting soil erosion and loss of topsoil. Projects that would disturb less than 1 acre would be subject to the CALGreen requirements related to stormwater drainage that have been designed to prevent or reduce discharges of sediments through BMPs that include on-site retention and filtration. Generally, once construction is complete and exposed areas are revegetated or covered by buildings, asphalt, or concrete, the erosion hazard is substantially eliminated or reduced. Existing regulatory requirements specify mandatory and relatively prescriptive actions that must occur during project development. There are regulations in place that would effectively reduce the potential for loss of topsoil or erosion impacts (SACOG 2019).

The Sacramento County General Plan EIR concluded that geologic conditions are highly localized and implementation of the General Plan would not make a cumulatively considerable contribution to this less-than-significant cumulative effect (Sacramento County 2010). Therefore, no significant cumulative geology or soils impacts are present on or near the plan area.

Although the plan area does not include land containing valuable mineral resources that have not been, or would not be, fully extracted prior to buildout of the master plan, development of adjacent properties could preclude mining operations in a manner that could be considered significant in a cumulative setting. Cumulative development could result in a reduction in availability of important designated mineral resources by making certain mineral resources inaccessible for future extraction.

The geographic scope of potential cumulative impacts related to paleontological resources is the plan area and the immediate geographic area, including Sacramento County. Because all significant paleontological resources are unique and nonrenewable members of finite classes, all adverse effects or negative impacts erode a dwindling resource base. The loss of any one paleontological site affects all others in a region because these resources are best understood in the context of the entirety of the system of which they are a part. The system is represented by the total inventory of all sites and other paleontological remains in the region. Therefore, because of past and current projects, cumulative impacts to paleontological resources in Sacramento County are significant.

Cumulative Impacts Evaluation

The plan area is not located within an active seismic fault area. The project would not result in a reduction in the availability of (i.e., access to or removal of) any mineral resource, because all resource that exists within the plan area would be fully exhausted prior to development. Additionally, the project would not result in the closure of adjacent mining resources. The project would be constructed in accordance with the most recent version of the California Building Code, which includes construction and seismic safety requirements and recommendations contained in project-specific geotechnical reports (i.e., Mitigation Measures GS-1 and GS-4). However, there is a potential for the project to encounter paleontological resources, which would require implementation of Mitigation Measure GS-6.

It is anticipated that any potential impacts associated with geologic, soil conditions, and paleontological resources could be mitigated within the plan area and other nearby project sites. The project would not result in a considerable contribution to the significant cumulative paleontological resources impact such that a new significant cumulative geology and soils impacts would occur. Therefore, cumulative impacts related to geology, soils, and mineral resources would be **less than significant with mitigation**.

Mitigation Measures

Implement Mitigation Measures GS-1, GS-4, and GS-6.

Hazards and Hazardous Materials

Cumulative Setting

Although some hazardous materials releases can cover a large area and interact with other releases (e.g., atmospheric contamination, contamination of groundwater aquifers), incidents of hazardous materials contamination are more typically isolated to a small area, such as leaking underground storage tank sites or releases at individual businesses. These relatively isolated areas of contamination typically do not interact in a cumulative manner with other sites of hazardous materials contamination. Impacts related to emergency vehicle access and evacuation are considered site specific and are not cumulative. Additionally, the Sacramento County General Plan EIR concluded that implementation of the General Plan would not result in a cumulatively considerable contribution to cumulative hazard impacts (Sacramento County 2010).

The general vicinity of Mather Airport was utilized for military operations for most of the 20th century and contains contaminated soils and groundwater from these past uses. While most of the contamination on-site has been identified and remediated, it is possible that pre-construction surveys could determine that new sources of contamination are present. However, there is no record of existing contamination within or immediately adjacent to the plan area. Therefore, the existing cumulative condition is less than significant.

Cumulative Impacts Evaluation

The project could exacerbate the existing hazardous waste conditions near the plan area if it were to result in additional contamination or increase the risk of hazardous materials exposure during the transport, use, and disposal of hazardous materials. The project would be required to comply with federal, state, and local hazardous materials regulations and codes monitored by the state and/or local jurisdictions, which may include preparation of a site-specific Health and Safety Plan, conducting soil sampling before construction activities begin, preparation of a contaminated soil contingency plan, and notification of future landowners of the potential for hazardous materials. As identified in Chapter 13, "Hazards and Hazardous Materials," hazard impacts related to the project would be limited to potential on-site contamination and would be mitigated to a less-than-significant level through implementation of Mitigation Measures HM-2a through HM-2c. Therefore, the project would not result in a considerable contribution to a significant cumulative impact related to hazards. Cumulative impacts related to hazards and hazardous materials would be **less than significant with mitigation**.

Mitigation Measures

Implement Mitigation Measures HAZ-2a, HAZ-2b, and HAZ-2c.

Hydrology, Drainage, and Water Quality

Cumulative Setting

The plan area is within the Morrison and Elder Creek watersheds, as the two creeks run through the plan area. The Morrison and Elder Creeks are the cumulative watershed boundary for the evaluation of cumulative effects. Development of past, present, and future projects in the area could have a significant cumulative effect on hydrology and water quality due to changes in permeability of land surfaces and the potential for increased pollutants within groundwater and surface water. The Morrison Creek stream group ultimately drains to the Beach Stone Lakes area, which has a history of flooding because of upstream runoff, direct precipitation in the area, and backwater from the Cosumnes and Mokelumne Rivers during periods of flooding and high river stages.

Non-point source water pollution from the combination of past, present, and future projects in the Morrison and Elder Creek watersheds may contribute to a general degradation of water quality over time. With increased urbanization, new land uses and associated impermeable surfaces have resulted in runoff of various pollutants into local and regional waterways. A variety of programs have been implemented with the goal of halting degradation of water quality and reversing this trend. Several state and federal

agencies are involved in these programs, many of which are required by or originate in the federal CWA. Nonetheless, a cumulative adverse water quality condition exists.

CUMULATIVE IMPACTS EVALUATION

The County of Sacramento currently implements several County ordinances such as the Sacramento County Stormwater Ordinance and the Land Grading and Erosion Control Ordinance; the National Pollutant Discharge Elimination System (NPDES) General Construction Permit; 2030 General Plan Policies CI-65, CO-24, CO-28, CO-30, and SA-14; as well as required BMPs and Low Impact Design (LID) standards. As discussed in Impact HYD-1, compliance with these policies, permits, and regulations would reduce the generation of water pollutants to the maximum extent practicable, consistent with the goals of the State Water Resources Control Board and the Central Valley Regional Water Quality Control Board water quality criteria and stormwater regulations through the use of structural and nonstructural BMPs.

As described in Chapter 14, “Hydrology, Drainage, and Water Quality,” most of the plan area is located within an area designated by FEMA to be within the 100-year floodplains, as well as the 500-year floodplains. Development within the plan area may create impervious and pervious surfaces that could alter the drainage pattern of the plan area, with the development of new land uses consisting of hardscapes. However, implementation of BMPs and LID stormwater management components; Urban Levee Design Criteria requirements; State Plan of Flood Control; Sacramento County Floodplain Management Ordinance; Cordova Community Plan Policy PS-3; Vineyard Community Plan Policy PF 3; 2030 General Plan Policies AG-29, CO-93, CO-94, SA-5, SA-16, SA-17, and SA-22; as well as implementing flood protection improvements planned within the WJHMP would improve the level of flood safety for the plan area and downstream properties by providing a reliable levee and weir system to reduce peak flows in Morrison and Elder Creeks, as concluded within Appendix H. Implementation of the stated regulations and policies would minimize the potential for substantial erosion, flooding, or polluted runoff by achieving limited/controlled flows entering Morrison Creek and through the development of detention basins proposed within the WJHMP.

While the WJHMP would introduce impervious surfaces that have the potential to interfere with groundwater recharge, incorporation of LID and BMPs in each future project’s design would redirect stormwater runoff to local detention basins within proposed open spaces to aid in groundwater recharge. In addition, compliance with 2030 General Plan Policies CI-95, CO-24, CO-28, CO-30, and CO-31, the County’s Municipal Storm Water Permit, the Stormwater Quality Design Manual for the Sacramento Region, the South American Subbasin Groundwater Sustainability Plan, and the Central Sacramento County Groundwater Management Plan would prevent degradation of groundwater supply, quality, and recharge. Mitigation Measure HYD-3a would require evidence that the suite of LID techniques implemented at the project-level would meet the Sacramento County Stormwater Quality Partnerships Hydromodification Management Plan criteria and achieve the credits assumed in the modeling. Mitigation Measure HYD-3b would require County approval of all project-level detention basin and channel designs prior to implementation. The plan-level flood control study indicates that stormwater outflows from the plan area would be metered to address the potential

for the plan area to contribute to offsite flooding, including in the Beach Stone Lakes area. Mitigation Measure HYD-7 requires either assurance that no net project-related increase in flood volume in Beach Stone Lakes would occur or payment into the County's BSL mitigation fund, which provides financial assistance to the programs the County has in place to reduce the cumulative flooding impact.

The WJHMP's contribution to the significant cumulative impact would be less than cumulatively considerable. Overall, cumulative impacts related to hydrology, drainage, and water quality would be **less than significant**.

MITIGATION MEASURES

Implement Mitigation Measures HYD-3a, HYD-3b, HYD-4, and HYD-7.

LAND USE, POPULATION, AND HOUSING

CUMULATIVE SETTING

The plan area is located on the eastern edge of the Sacramento metropolitan area. Surrounding land uses include a mix of industrial, residential, employment, mining, and agricultural uses, as well as undeveloped property that is currently being planned for development. Impacts related to consistency with land use plans or policies would generally be localized and would not combine to result in cumulative impacts.

Population growth, by itself, is not considered a significant cumulative effect because it is not an environmental impact. However, population growth, and the related need for housing and infrastructure, does lead to conversion of land to other uses, the impacts of which are considered in the appropriate chapters of this EIR.

CUMULATIVE IMPACTS EVALUATION

As discussed in Chapter 15, "Land Use, Population, and Housing," development of the project would not result in a significant impact related to physically dividing an established community; causing a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect; or displacing substantial numbers of people or housing, necessitating the construction of replacement housing elsewhere. Further, although implementing the project would increase development density, such development would be generally consistent with the County's vision for growth in the Jackson Highway corridor. To obtain consistency with the General Plan, the project includes a General Plan Amendment to move the Urban Policy Area (UPA) boundary south and east to include the portion of the plan area not already included within the UPA boundary. It also includes a General Plan amendment to amend the Land Use Diagram so that it is consistent with the land uses proposed under the project. As a result, the project's contribution to cumulative impacts would not be cumulatively considerable. Therefore, cumulative impacts related to land use, population, and housing would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

NOISE

CUMULATIVE SETTING

The geographic area considered for cumulative impacts regarding noise levels is Sacramento County. The cumulative evaluation also includes the NewBridge, Mather South, and Jackson Township projects. The projects and their associated traffic volume impacts were taken into consideration for the Traffic Impact Analysis (TIA) and noise study conducted for this EIR and have been included in this cumulative noise analysis. Consistent with the TIA analysis, the cumulative noise analysis also takes into consideration development forecasts for the county included in SACOG's 2020 MTP/SCS including anticipated development projects within incorporated cities in the county.

The primary factors analyzed in the cumulative impact analysis are cumulative traffic noise levels and potential noise and vibration impacts from cumulative construction activity. Cumulative airport noise is addressed above under, "Airport Compatibility."

CUMULATIVE IMPACTS EVALUATION

CONSTRUCTION NOISE AND VIBRATION

Because construction noise and vibration are localized effects, only construction projects that occur close to one another could combine to result in a cumulative noise or vibration effect. Cumulative impacts from construction-generated noise and vibration could result if other future planned construction activities were to occur in close proximity to individual project sites. Noise associated with construction activities is of primary concern within proximity of sensitive land uses. Implementation of Mitigation Measure NOI-1 would reduce construction noise levels and ensure that exposure from on-site construction noise at off-site noise-sensitive receivers would be minimized.

Vibration associated with construction activities is of primary concern within proximity of sensitive land uses. At increasing distances from the source, vibration levels dissipate rapidly and have less potential to cause disturbance to people or damage to structures. Vibration generated from construction would occur for brief and intermittent periods of time. Implementation of Mitigation Measure NOI-2 would reduce vibration levels at off-site noise sensitive receptors. In consideration of other future development, vibration impacts would remain local and would not combine with vibration sources from other construction activities, even if construction activities at other future development were to occur simultaneously with project construction activities. Therefore, when combined with past, present, and reasonably foreseeable future projects, the project's contribution to cumulative construction noise and vibration impacts would be less than cumulatively considerable and the cumulative impact would be **less than significant.**

MITIGATION MEASURES

Implement Mitigation Measures NO-1 and NO-2.

TRAFFIC NOISE

Implementation of the WJHMP, and the three other master plans in the immediate vicinity, would result in the generation of new vehicle trips from the development of new land uses throughout the region. These new vehicle trips would result in traffic volume increases and subsequent increases in traffic-related noise levels on various roadway segments. Table 22-3 presents the predicted traffic noise levels for cumulative and cumulative plus project scenarios.

Table 22-3 Cumulative Plus Project Traffic Noise Levels (L_{dn} at 100 feet)

Zinfandel	Collector MS-4	Kiefer	64.5	65.8	1.3

Notes: dB = decibel; L_{dn} = day-night sound level.
Source: Bollard Acoustical Consultants 2024.

As shown in Table 22-3, several roadway segments under both cumulative and cumulative plus project scenarios are anticipated to experience an increase in traffic noise levels. Additionally, several roadways would experience a significant increase in traffic noise levels above existing conditions. Therefore, cumulative traffic noise from implementation of the WJHMP would exceed County noise standards.

It cannot be guaranteed to what extent the implementation of Mitigation Measures NO-3a, NO-3b, and NO-3c would reduce impacts from traffic noise. Therefore, there would be a cumulatively considerable contribution to the cumulative condition and the impact would be **significant and unavoidable**.

MITIGATION MEASURES

Implement Mitigation Measures NO-3a, NO-3b, and NO-3c.

STATIONARY NOISE

Cumulative impacts related to on-site operational and stationary noise sources are site specific, dissipate with distance from the source, and typically result in cumulative impacts only when project-generated noise is located close to other off-site noise sources. Implementation of the WJHMP would result in residential, commercial, and industrial land uses that include stationary noise sources such as heating, ventilation, and air conditioning units. The specific locations of new stationary equipment at the project level are unknown and could exceed the County noise threshold for stationary sources. Implementation of Mitigation Measures NO-4a and NO-4b would require appropriate site design and setbacks to reduce noise exposure for noise sensitive land uses. However, stationary noise sources are generally limited to the vicinity of individual project sites and would generally not combine with other stationary equipment in the overall area to result in a cumulative effect. Therefore, the project would not result in a

cumulatively considerable contribution to a cumulative impact related to stationary noise and this impact would be **less than significant**.

MITIGATION MEASURES

Implement Mitigation Measures NO-4a and NO-4b.

PUBLIC SERVICES

CUMULATIVE SETTING

The cumulative context for police protection, fire protection, and emergency services is the County of Sacramento, which is the service area for both the Sacramento County Sheriff's Department and Sacramento Metropolitan Fire District (Metro Fire), respectively. The cumulative context for school services is the Elk Grove Unified School District and the Sacramento City Unified School District. Finally, the cumulative context for parks and recreation facilities is the Cordova Recreation and Park District (CRPD) and the Southgate Recreation and Park District within the county. Existing services in the plan area are sufficient to meet existing demand. There is not an existing cumulative impact related to public services.

CUMULATIVE IMPACTS EVALUATION

As noted in Chapter 17, "Public Services," the project would construct adequate public services facilities and infrastructure consistent with anticipated demand of new residents and employees. Further, payment of development impact fees and property taxes would mitigate impacts to public services. Land within the plan area would be dedicated to Metro Fire as a part of WJHMP implementation for the development of two new fire stations to serve the entirety of the plan area, and no other fire protection or emergency services facilities would be required to serve the project. The project also includes five school sites, plus an additional two undetermined sites, which would fulfill the demand for schools generated by the project. Additionally, the project includes 24 neighborhood parks (totaling approximately 219 acres) that would be distributed throughout the plan area, as well as approximately 1,489 acres of open space. The project also includes a land use designation of Open Space/Urban Farm for approximately 393 acres, which in addition to open space uses, and would allow community-based agriculture and education within the plan area. A Public Facilities Financing Plan has been prepared for the project to ensure that adequate funding is available to CRPD and Southgate for development, maintenance, and programming of parks and recreational facilities within the plan area.

The projects identified in Table 22-1 would be subject to standards similar to those described for the project, which would require the development of new/expanded facilities to accommodate project demands and/or payment of development impact fees and property taxes to fund adequate levels of public services. Therefore, cumulative impacts to public services would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

PUBLIC UTILITIES

CUMULATIVE SETTING

The WJHMP is in the service area of the Sacramento Area Sewer District. Wastewater is routed to the EchoWater Resource Recovery Facility before it is treated and discharged into the Sacramento River. There is currently capacity within the regional wastewater infrastructure. Solid waste processing services are provided by the Sacramento County Department of Waste Management and Recycling. Kiefer Landfill would serve the solid waste disposal needs of the project residents, and the permitted landfill capacity is anticipated to serve the County's needs through 2064, including future growth. Cumulative development would be required to demonstrate an adequate capacity of public utilities before project approval. Cumulative development would be required to contribute fair share funding to fund necessary expansion of utility infrastructure and conduct appropriate CEQA analyses to evaluate potential environmental impacts of utility relocation, construction, or expansion. There is not an existing cumulative impact related to public utilities.

CUMULATIVE IMPACTS EVALUATION

The on-site and off-site sewer infrastructure described for the WJHMP are designed to handle cumulative conditions, and the analysis in Chapter 18, "Public Utilities," concludes that capacity would be sufficient. Direct impacts would be less than significant and the WJHMP would not result in a cumulatively considerable contribution to a significant cumulative impact. Similarly, solid waste disposal would be provided by Kiefer Landfill, which has sufficient remaining permitted capacity to accommodate waste generated by the WJHMP. Because of these requirements, project-related cumulative impacts would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

TRANSPORTATION

CUMULATIVE SETTING

The geographic scope of analysis for cumulative impacts related to VMT includes the Sacramento region, based on the County Transportation Analysis Guidelines. The geographic scope for the analysis of the impacts related to a program, plan, ordinance, or policy addressing the circulation system, substantially increasing hazards due to geometric features or incompatible uses, and inadequate emergency access, would be different than the geographic scope for the VMT analysis, which would include all past, present, and probable future projects that would have the potential to affect the same transit, roadway, bicycle, and pedestrian facilities within the WJHMP area and the interconnected circulation system of Sacramento County.

CUMULATIVE IMPACTS EVALUATION

CUMULATIVE IMPACTS ON TRANSIT, BICYCLE, AND PEDESTRIAN FACILITIES

Development associated with the WJHMP would occur incrementally over time. Combined with other cumulative development in the area, the demand for transit service and facilities, bicycle facilities, and pedestrian facilities is anticipated to increase. The WJHMP would include the implementation of improvements to transit, bicycle, and pedestrian facilities to enhance connectivity within the WJHMP area and support the increased use of alternative modes of transportation. Future development under the WJHMP would be subject to and would implement General Plan and Active Transportation Plan policies applicable to transit, bicycle, and pedestrian facilities and service. Additionally, subsequent development projects under the WJHMP would be subject to all applicable County guidelines, standards, and specifications related to transit, bicycle, and pedestrian facilities. Therefore, the contribution of the WJHMP to substantial effects related to transit, bicycle, and pedestrian facilities would be less than cumulatively considerable. Cumulative impacts would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

CUMULATIVE VMT IMPACTS

The significance threshold for the cumulative VMT analysis is existing VMT per capita, consistent with County guidelines. The cumulative VMT analysis evaluates whether the WJHMP would result in an increase in regionwide VMT from the cumulative scenario to the cumulative plus project scenario. Table 22-4 provides a summary of the Cumulative No Project and Cumulative Plus Project conditions, as well as the thresholds and the percentage by which the project would have to reduce its relative VMT to equal the regional threshold.

Table 22-4 Cumulative VMT Assessment

Scenario	Threshold	Cumulative No Project	Cumulative Plus Project	Project's Contribution to Cumulative VMT	Reduction Needed for Cumulative Plus Project to Achieve Threshold
Average VMT/Capita	17.17 (15% Below Regional Average)	18.40	12.98	-5.42	-32.3%
Average VMT/Employee (Office)	13.64 (15% Below Regional Average, Office)	13.31	13.02	-0.29	-4.8%
Average VMT/Employee (Industrial)	16.04 (Regional Average Industrial)	13.31	11.81	-1.5	-35.8%

Notes: VMT = vehicle miles traveled.

Source: Kimley-Horn 2023.

As shown in Table 22-4, the cumulative VMT per capita would be 32.3 percent below the regional threshold for residential uses, the cumulative VMT per employee for industrial development would be 35.8 percent below the applicable regional threshold, and cumulative VMT per employee for office development would be 4.8 percent below the applicable threshold with implementation of the WJHMP.

As illustrated in Table 22-4, average VMT per capita is anticipated to exceed County thresholds in the cumulative scenario without the project. This would result in an adverse cumulative condition. However, the project would decrease per capita VMT by 5.42 and reduce overall VMT below the County threshold. The project would also decrease cumulative no project average VMT per office employee by 0.29 and cumulative no project average VMT per industrial employee by 1.5; thus, reducing cumulative plus project VMT further below County thresholds. Therefore, the project would not result in a substantial contribution to cumulative VMT.

As described in Chapter 19, “Transportation,” the WJHMP would include the implementation of a Transportation Management Association (TMA) program. When implemented, the TMA would result in a 12.3-percent reduction of WJHMP VMT per office employee. Therefore, after implementation of the TMA, VMT per employee would be reduced to below the County threshold and the cumulative VMT impact from the WJHMP would not be cumulatively considerable. Cumulative VMT impacts would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

CUMULATIVE TRANSPORTATION HAZARDS DUE TO A DESIGN FEATURE OR INCOMPATIBLE USES

Cumulative transportation hazards could result if other future planned construction activities were to take place near construction in the WJHMP area. The WJHMP is one of four major planning applications for future urban growth along the Jackson Highway Corridor. These four master plans cover approximately 9,250 acres and are anticipated to be built over several decades. Construction of individual developments associated with the WJHMP would be temporary and short-term. Although temporary, because of the magnitude of these projects, potential duration of construction, and the number of roadways that would be affected, there could be increased potential for transportation hazards. However, the contractor(s) for individual projects associated with the WJHMP would need to prepare and implement a Construction Traffic Control Plan that meets the standards required by County Right of Way Management. The traffic control plan templates provided by the County are developed in conformance with the latest California Manual on Uniform Traffic Control Devices and would reduce the potential for transportation hazards during construction of individual projects.

Additionally, all transportation-related infrastructure improvements would be subject to, and designed in accordance with, applicable roadway design and safety guidelines. The implementation of Mitigation Measures TR-4A, TR-4B, and TR-4C would require responsible applicants of subsequent development within the plan area to implement improvements along affected roadways and associated intersections to reduce anticipated safety hazards from substantial congestion. The mitigation requirements are

intended to specifically correlate the anticipated traffic hazards in the cumulative condition with the project's contribution to traffic volume and influence on anticipated traffic patterns. Modifications identified through the mitigation approach may include the installation of traffic signals, grade separation, bus rapid transit lanes, and bus queue jumps. However, because the County does not have authority over roadways located outside of County jurisdiction or over transit improvements, it cannot be guaranteed that all recommended improvements would be made. Therefore, the project may result in a cumulatively considerable contribution to regional traffic hazards and cumulative impacts would be **significant and unavoidable**.

MITIGATION MEASURES

No mitigation is available to reduce the impacts related to transportation hazards and design features outside of the County's jurisdiction.

CUMULATIVE IMPACTS ON EMERGENCY ACCESS

Cumulative impacts associated with emergency access or road design are primarily a localized effect. As such, the cumulative projects with the potential to result in a significant cumulative impact would be the projects located in the immediate vicinity of the WJHMP area. Implementation of the individual developments under the WJHMP would be subject to, and constructed in accordance with applicable roadway design and safety guidelines. Mitigation Measures TR-4A, TR-4B, and TR-4C would require responsible applicants of subsequent development under the WJHMP to implement improvements along affected roadways and associated intersections to reduce anticipated safety hazards from substantial congestion. Additionally, individual developments would be subject to review by Metro Fire to ensure that adequate emergency access is provided and maintained at subsequent developments under the WJHMP. Further, all projects within the vicinity of the WJHMP area would need to demonstrate that they would not impede emergency access or cause a potential transportation-related hazard. Therefore, the contribution of the WJHMP to substantial effects related to emergency access would be less than cumulatively considerable and the cumulative impact would be **less than significant**.

MITIGATION MEASURES

Implement Mitigation Measures TR-4a, TR-4b, and TR-4c.

WATER SUPPLY

CUMULATIVE SETTING

The plan area is located in unincorporated Sacramento County, within the service areas of the Sacramento County Water Agency (SCWA) and the California American Water Company (Cal Am). Several other projects are located nearby, including NewBridge, Mather South, and Jackson Township. The portion of the county where these projects would be developed is largely rural and sparsely developed. Regional water infrastructure is present near the plan area. Population growth and local regulation of associated development within the county prevent the occurrence of existing cumulative water supply impacts by implementing the *Sacramento County 2030*

General Plan that includes a policy framework that ensures adequate capacity exists to support proposed development.

CUMULATIVE IMPACTS EVALUATION

As described in Chapter 20, "Water Supply," SCWA has been planning for and implementing regional water supply infrastructure upgrades in the Zone 40 area that serves the plan area and vicinity. As a result, the Zone 40 Water Supply Master Plan has been developed to address the sufficiency of water supply for WJHMP, Jackson Township, and NewBridge projects (SCWA 2016). Additionally, the Water Supply Improvement Plan (WSIP) has been prepared to address specific infrastructure needs to support the buildout of Zone 40. The 2016 WSIP includes water demand factors, growth projections, and estimates of projected water demand and supply (SCWA 2016).

Chapter 20, "Water Supply," evaluates the project's consistency with programs intended to ensure comprehensive, regional management of water resources. As described in Chapter 20, two Water Supply Assessments, one from Cal Am and one from SCWA, have been prepared in accordance with the California Water Code Section 10910, which demonstrate that the planned water supplies for SCWA's Zone 40 and Cal Am's Suburban-Rosemont Public Water System would be sufficient to meet the demands of the project in addition to the existing and projected water supply obligations through 2045 (see Appendix L). Therefore, the project would not result in demand for water that cannot be met by existing or reasonably foreseeable future service capacity.

SCWA and Cal Am are members of the Sacramento Central Groundwater Authority groundwater sustainability agency and would be required to implement the South American Subbasin Groundwater Sustainability Plan and to maintain the long-term average annual groundwater sustainable yield of 235,000 acre-feet per year of South American Subbasin (SASb). Thus, implementation of the project would not contribute to groundwater pumping that would exceed the average annual sustainable yield for SASb.

Similar to the project, cumulative development would be required to demonstrate an adequate water supply before project approval. Additionally, cumulative development would be required to contribute fair share funding to fund necessary new or expansion of water supply infrastructure and conduct appropriate CEQA analyses to evaluate potential environmental impacts of infrastructure relocation, construction, or expansion. Therefore, the project would not result in a considerable contribution such that a significant cumulative impact related to water supply would occur. The cumulative impact would be **less than significant**.

MITIGATION MEASURES

No mitigation is required.

TRIBAL CULTURAL RESOURCES

CUMULATIVE SETTING

The geographic scope of potential cumulative impacts related to tribal cultural resources is the former territory of the Plains Miwok within the SACOG region. The Sacramento Valley floodplains and the banks of rivers and large streams in the valley and adjacent foothills were occupied and used during the prehistoric, ethnohistoric, and historic periods with the result that archaeological resources, including human remains, are widespread and numerous within the region. River and stream drainages were often the prime locations for Native American village sites or processing camps, and for mining camps, ranches and farms, towns, and streamside transportation networks during the historic period. Prehistoric sites frequently took the form of mounds raised above the natural ground surface, but the upper portions of many of these sites are no longer visible—destroyed by modern agricultural practices, land reclamation, dam and levee construction, hydraulic or dredge mining, or Euro-American settlement. Intermittent flooding has also deposited layers of alluvium and buried intact archaeological sites below grade with no surface manifestations. Features of historic-era archaeological sites, such as privies, trash pits, wells, foundations, and burials, have also been concealed by later land uses and discovered during subsequent development (SACOG 2019).

Because all significant tribal cultural resources are unique and nonrenewable members of finite classes, all adverse effects or negative impacts erode a dwindling resource base. The loss of any one resource affects all others in a region because these resources are best understood in the context of the entirety of the cultural system of which they are a part. Therefore, because of past and current projects, cumulative impacts to cultural resources in Sacramento County are significant.

CUMULATIVE IMPACTS EVALUATION

No tribal cultural resources are known to occur in the area, which has been substantially disturbed by past agricultural and mining activities. Nevertheless, construction activities for future projects, including earth-moving, excavation, and use of heavy equipment that may cause ground compaction, may disturb or destroy any previously undisturbed and significant tribal cultural resources or deposits. With mitigation, the project would not result in a considerable contribution to a significant cumulative impact related to tribal cultural resources. The cumulative impact would be **less than significant**.

MITIGATION MEASURES

Implement Mitigation Measures TCR-1a and TCR-1b.

GROWTH INDUCEMENT

Growth can be induced through the elimination of obstacles to growth, through the stimulation of economic activity within the region, or through the establishment of policies or other precedents that directly or indirectly encourage additional growth. An EIR must discuss ways in which a project could directly or indirectly foster economic or population growth, or result in the construction of additional housing (Section 15126.2[d] of the State CEQA Guidelines). Although growth inducement itself is not considered an environmental effect, it could potentially lead to adverse environmental effects. Examples of projects likely to have significant growth-inducing impacts include extensions or expansions of infrastructure systems beyond what is needed to serve project-specific demand, and development of new residential subdivisions or industrial parks in areas that are only sparsely developed or are underdeveloped.

The project would result in growth in the unincorporated area of the county by planning a mixture of residential, commercial, industrial, recreational, farming, and employment land uses in an area that is primarily undeveloped. A portion (approximately 69 acres) of the WJHMP area is within the UPA and most of the WJHMP boundary (approximately 87 percent) is immediately adjacent to the UPA (see Figure 2-2 in Chapter 2, “Project Description”). The entire WJHMP area is within the USB.

The UPA boundary would need to be moved south and east to encompass the plan area (see Figure 2-14 in Chapter 2, “Project Description”). This change to the UPA boundary, which would expand the extent of the area in which growth can occur beyond the area anticipated in the General Plan, would require an amendment to the General Plan. As a result of extending the UPA, adjacent areas south of SR 16 (also referred to as Jackson Highway), which are currently zoned and used for agriculture, would be adjacent to the UPA. This area is within the USB and could be subject to increased development pressure following project implementation because it would be adjacent to the UPA. However, it is worth noting that a large portion of the area south of SR 16 directly east of, and adjacent to, the plan area is identified as an existing preserve area in the SSHCP and, thus, development pressure to the east may be reduced.

The County has adopted policies that support the eventual development of the area between the UPA and USB. Sacramento County 2030 General Plan Policies LU-119 and LU-120 set the standards for UPA expansion, and the Division of Planning and Environmental Review has determined that the project meets these standards (see Chapter 15, “Land Use, Population, and Housing”). Implementing a policy in the manner it was intended to be applied is not precedent setting. Further, there are pending draft and recently approved land use plans that border the plan area to the east and the south (see Figure 2-4 in Chapter 2, “Project Description”) that further support the County’s intent to allow growth and development in the area. Because the area is anticipated for future development, infrastructure (including roads) has been sized to accommodate buildout and the project includes the extension of utilities beyond what is currently planned in the near-term by the providers. This concurrent planning process has been implemented through the County to encourage well-planned growth and is consistent with the growth identified in the Sacramento Area Council of Governments’

2004 Blueprint and the 2030 General Plan. The development of these adjacent areas is separate from, and in no way reliant on, the project.

The decision to allow any subsequent projects that result from induced growth would be the subject of separate discretionary processes by the respective lead agency(ies). Because the decision to allow growth is subject to separate discretionary decision making, and such decision making is itself subject to CEQA, this analysis of growth-inducing effects is not intended to determine site-specific environmental impacts and specific mitigation for any potentially induced growth. Rather, the discussion is intended to disclose the potential for environmental effects to occur more generally, such that decision makers are aware that additional environmental effects are a possibility if growth-inducing projects are approved. The decision of whether impacts do occur, their extent, and the ability to mitigate them is appropriately left to consideration by the agency responsible for approving such projects at the time complete applications for development are submitted.

COUNTY OF SACRAMENTO
PLANNING AND ENVIRONMENTAL REVIEW DIVISION
REVISED NOTICE OF PREPARATION

APRIL 26, 2017

TO: ALL INTERESTED PARTIES

SUBJECT: REVISED NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR WEST JACKSON HIGHWAY MASTER PLAN (CONTROL NUMBER: PLNP2008-GPB-CZB-ZOB-00240)

Sacramento County will be the CEQA Lead Agency for preparation of an Environmental Impact Report (EIR) for a project known as WEST JACKSON HIGHWAY MASTER PLAN. This Notice of Preparation has been sent to responsible and trustee agencies and involved federal agencies pursuant to Section 15082 of the CEQA Guidelines. Agencies should comment on the scope and content of the environmental information that is germane to the agencies' statutory responsibilities in connection with the proposed project. Due to the time limits mandated by State law, your response must be sent at the earliest possible date, but not later than 30 days after receipt of this notice.

On February 15, 2017, an NOP for the Revised Project was issued; however there was subsequently a need to revise the Project further. This NOP reflects the outcome of those discussions and supersedes the NOP that was released on February 15, 2017

The project description, location, and the probable environmental effects are contained in the attached materials and may also be viewed online at:

https://planningdocuments.saccounty.net/ViewProjectDetails.aspx?ControlNum=PLNP2008-00240

Please send your Agency's response to this Notice to:

Catherine Hack, Environmental Coordinator
Department of Community Development
Planning and Environmental Review Division
827 7th Street, Room 225, Sacramento, CA 95814
or via e-mail at: CEQA@saccounty.net.

Your response should include the name of a contact person in your agency.

Agencies with specific questions about the project should contact Tim Kohaya, Project Manager, at (916) 874-5982 for further information.

PROJECT TITLE:

WEST JACKSON HIGHWAY MASTER PLAN

CONTROL NUMBER:

PLNP2008-GPB-CZB-00240

PROJECT PROPONENT(S):

Majority Property Owners

Teichert Land Company
Attn: Norm Eilert

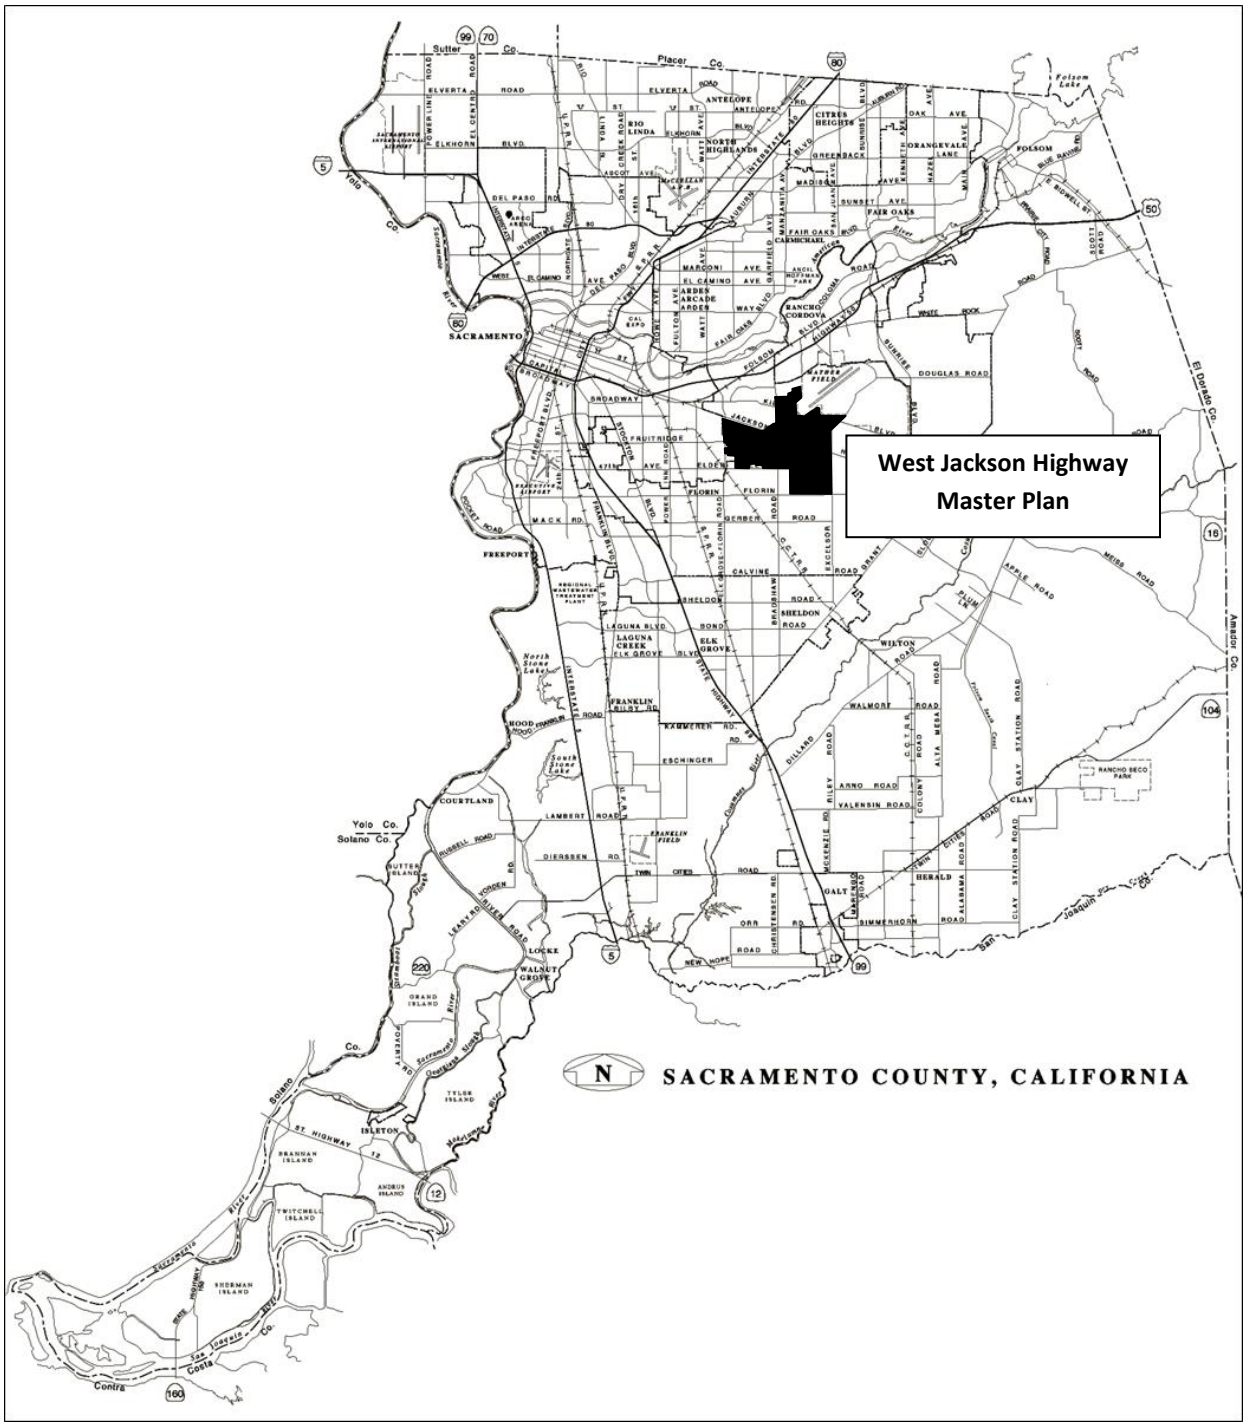
Granite Construction Company, a California Corporation
Attn: Yasha Saber (Project Manager)

Applicants:

Stonebridge Properties, LLC
Attn: Mike Isle (Project Manager)

Granite Construction Company, a California Corporation
Attn: Yasha Saber (Project Manager)

Architect/Engineer:



Wood Rodgers (Engineer)
Attn: Tim Crush

SWA (Landscape Architect)
Attn: Sean O'Malley

PROJECT LOCATION:

The proposed Project is located along State Route 16 (Jackson Highway) in generally the geographic center of Sacramento County (Plate NOP-1). The Project boundaries are generally Jackson Highway, Kiefer Boulevard and Goethe Road to the north, portions of Elder Creek Road and Florin Road to the south, the City of Sacramento to the west and Excelsior Road to the east (Plate NOP-2).

Plate NOP-1: Regional Location

ENVIRONMENTAL/LAND USE SETTING

The West Jackson Highway Master Plan (WJHMP) project area is located within the unincorporated portion of Sacramento County and is located adjacent to the City of Sacramento to the west and City of Rancho Cordova to the northeast. Existing and proposed urban development surrounds the Project Area. Plate NOP-3 is a context map that shows these various developments. West of the Project Area are industrial uses within the boundaries of the City of Sacramento; however, it should be noted that in 2015 the City of Sacramento adopted a new General Plan which designates this area for new residential, commercial and employment land uses. Adjacent to and west of the Project Area is Teichert Land Company's Aspen 1 - New Brighton project, located within the boundaries of the City of Sacramento. The Aspen 1- New Brighton project consists of 133.5 acres of land designated for single-family residential, located in the northwest, center and southeast portion of the Aspen 1 site. The 133.5 acres includes an elementary school. In the central and southern portions of the Aspen 1 site, 43.1 acres are designated for multi-family residential/mixed-use land uses. The Aspen 1 - New Brighton project also includes the designation of 13.1 acres of Shopping Center located in the northeastern portion of the site; 14.4 acres for parks/open space in three separate areas of the site; and 28.2 acres for Urban Farm uses in the southwest portion of the site. The project will have a total of 1,365 dwelling units and 130,000 square feet of commercial space. The Aspen 1- New Brighton project and the proposed WJHMP project have been designed to be compatible with each other.

Just north of the Project Area is a residential neighborhood known as the Rosemont community. The land north of the Project Area is almost entirely built out. Agricultural residential uses are located south of the Project Area; however, this area is a part of the previously approved Florin-Vineyard "Gap" Community Plan which consists primarily of rezones from agricultural/agricultural-residential land uses to low density residential land uses. Further south is the North Vineyard Station Specific Plan that also primarily consists of rezones from agricultural-residential to low density residential land uses.

The lands east of the Project Area are largely comprised of agricultural-residential land uses, but are now proposed for future development similar to the proposed Project in concurrent applications known as NewBridge (County Control Number PLNP2010-00081), Jackson Township (County Control Number PLNP2011-00095) and Mather South (County Control Number PLNP2013-00065). Jackson Township is adjacent to the east of the Project. The Sacramento Raceway is just east of the Project Area and is located in the Jackson Township project area. Events at the Sacramento Raceway include drag racing and motocross.

Mather Airport is located just north/northeast of the Project Area. The runways of Mather Airport are located at the northern boundary of the Project Area (refer to Plate NOP-4). Mather Airport is the former Mather Air Force Base and is now primarily used as an air cargo facility and business park (largely aviation services).

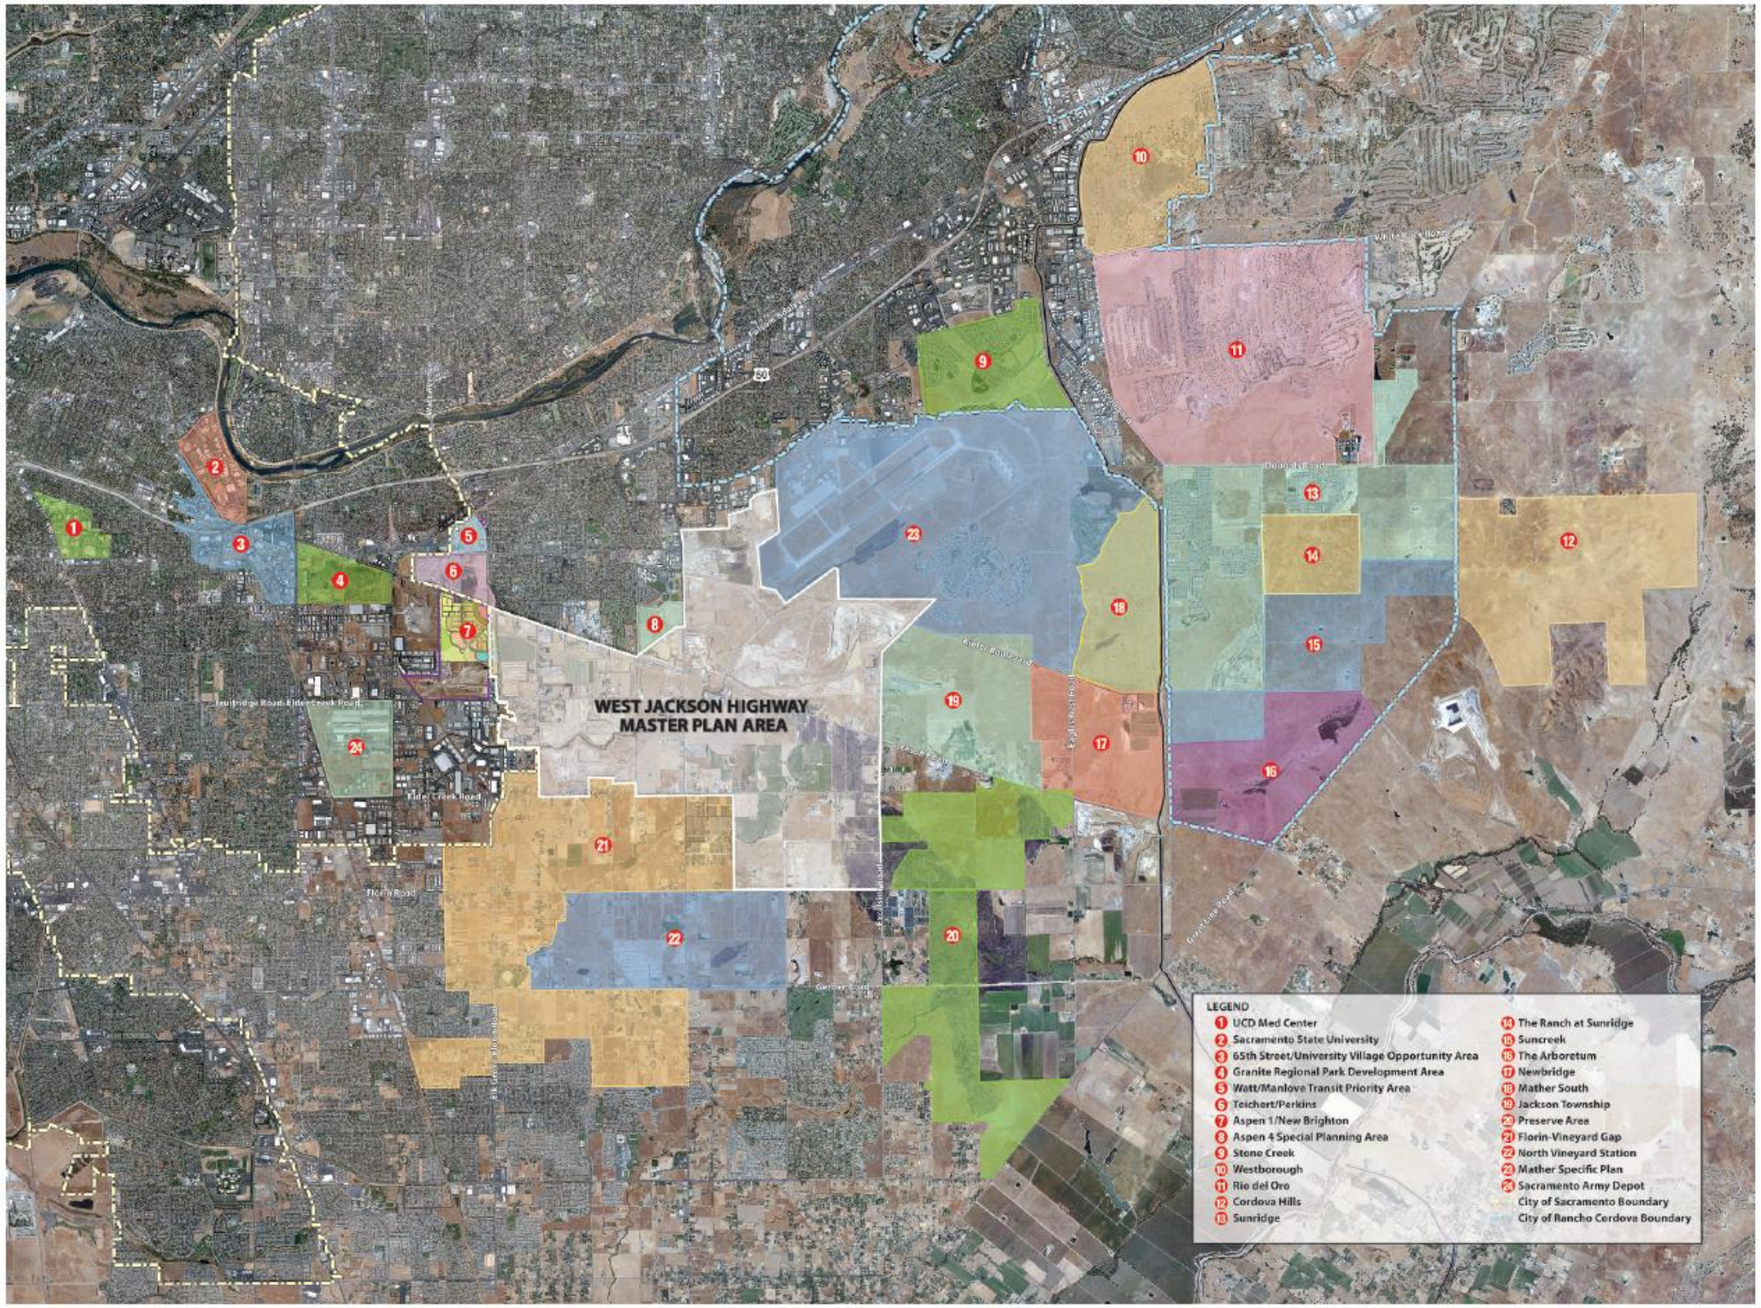
Plate NOP-3: Context Map



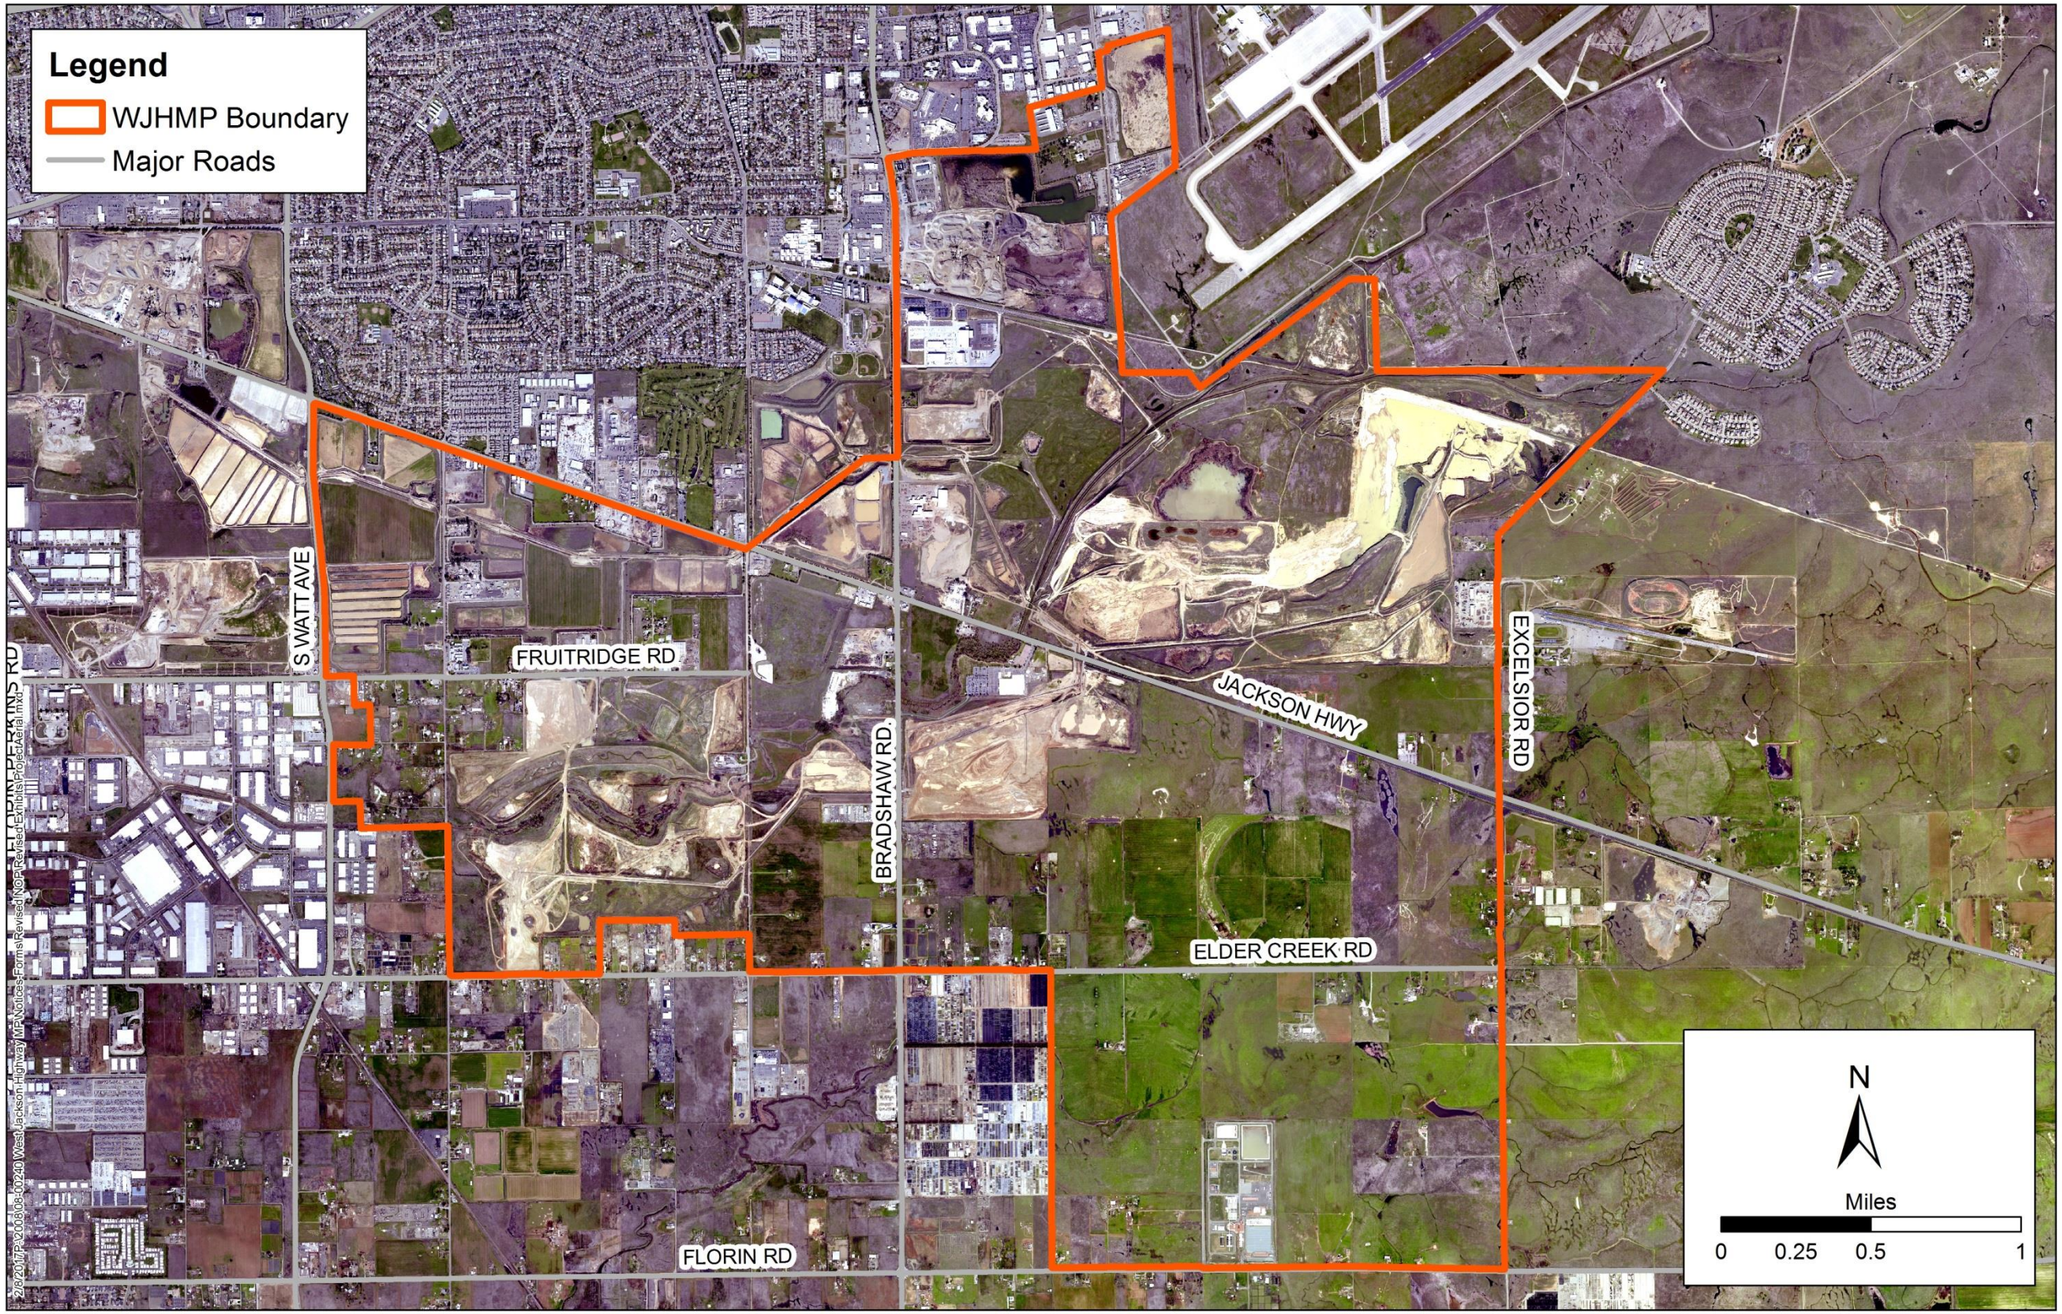


Plate NOP-4: Aerial Photo (Dated 2014) of Project Area

REVISED PROJECT DESCRIPTION

On September 10, 2013, a Notice of Preparation (NOP) was issued for the WJHMP for a land use project which is now, in this NOP, designated the "Original Project". Since that time, the Project Applicants and County of Sacramento staff have reviewed the results of several CEQA-related studies, consulted numerous stakeholders, and had extensive conversations concerning how the Original Project might adversely impact the environment. As that information has become available, the Project Applicants, along with County staff, have worked to modify the Original Project so as to lessen its environmental impacts, all of which has resulted in the "Revised Project" (or the "Project" as appropriate) which is the subject of this NOP. A precise description of that project and the reasons for the various changes are discussed below. On February 15, 2017, an NOP for the Revised Project was issued; however there was subsequently a need to revise the Project further. The Elk Grove Unified School District (EGUSD) wanted more location specificity for possible sites of the proposed middle/high school. In response, the Project Applicants had a series of discussions with the EGUSD to determine specific location options for the facility. This NOP reflects the outcome of those discussions and supersedes the NOP that was released on February 15, 2017.

The Project Area has various land uses and is currently designated by the Sacramento County General Plan as the following: General Agriculture (1,713.3 acres), Agricultural-Urban Reserve (1,722.2 acres), Extensive Industrial (2,384.5 acres), Intensive Industrial (72.1 acres), Commercial & Offices (16.8 acres), and Cemetery, Public/Quasi-Public (4.4 acres). In addition, portions of the Project Area contain an Aggregate Resource Area overlay. Of the entire 5,913± acres of the Project Area, the applicants collectively own 4,079± acres – Teichert owns 3,016± acres and Granite owns 1,063± acres. Thus, the applicant controlled properties represent 69% of the total Project Area acreage. The properties owned by the applicants primarily include aggregate mining sites used for sand and gravel extraction, many of which have already been reclaimed. Although most of the mining is complete, some of the Project Applicants' properties continue to support various mining related activities. The Revised Project Area is mostly comprised of existing and former mining properties – as mining activities have dominated the landscape since the 1930's, the Project Area is not highly developed. The remaining land uses within the Project Area are comprised of a mixture of rural residential, institutional, agricultural and industrial properties. Refer to Plate NOP-4 for an aerial photo (dated 2014) of the Project Area.

PROPOSED LAND USES

The Revised Project involves a series of entitlements which are listed below in order to establish a master planned community. The proposed Master Plan creates two District Plan Areas (labeled as District 1 and District 2), three Future Planning Areas (FPA) (labeled as FPA A, B and C), as well as general land use policies and development standards. The District Plans establish specific land uses, policies and development standards for the properties within the District Areas. Although future land uses for the FPAs will be established by the Master Plan, there will be no rezones in these areas. It is anticipated that the landowners within the FPAs will initiate District Plans or Specific

Plans in the future to comprehensively plan those areas. Should the landowners in those areas contemplate changing existing land uses within the FPA, such future use must be consistent with the provisions of the Master Plan. The applicants do not own property within the FPAs.

Overall, the Revised Project includes a mixture of residential, recreational, and employment nodes intended to reduce auto usage within the Master Plan Area and support the provision and use of transit alternatives. The Revised Project's Land Use Plan is depicted in Plate NOP-5 and the land uses are further described below:

RESIDENTIAL

The Revised Project includes five different types of residential land uses, all of which are categorized based on the proposed density. The residential land uses in Districts 1 and 2 account for a total of approximately 2,100.8± acres of the Project Area and are intended to provide for a wide diversity of housing types. The five residential types are:

- Very Low Density Residential (0.1 – 4.0 units/acre)
- Low Density Residential (3.0 – 8.0 units/acre)
- Medium Density Residential (7.0 – 18.0 units/acre)
- High Density Residential (20.0 – 30.0 units/acre)
- Mixed Use (20.0 – 30.0 units/acre)

The project will comply with the affordable housing ordinance in effect at the time of project approval. To achieve compliance, the Project's different Districts and FPAs may prepare individual Affordable Housing Plans for their respective District or FPA.

SCHOOLS, OPEN SPACE AND PARK USES

The size and number of parks and schools have been proposed based on the acreage or number of dwelling units of the proposed residential component of the Revised Project. The ratios are based on the requirements of the Southgate and Cordova Recreation and Park Districts and the Elk Grove Unified School District (EGUSD). There are four proposed elementary schools in District 1 and one proposed middle/high school that would be located within either District 1 or 2. The ultimate location for the middle/high school will be determined by EGUSD at a time of their choosing. However, for purposes of analyzing project impacts, there will be two proposed specific sites for the middle/high school. The first middle/high school site is 70 acres and is located on the west side of Mayhew Road near the Mayhew Road/Elder Creek Road intersection. This site is part of the Revised Project and Option 2 land use plans (Plate NOP-5 and Plate **NOP-13**). The second middle/high school site is 84 acres and is located on the west side of Vineyard Road near the Vineyard Road/Elder Creek Road intersection. This second site is part of the Option 1 and Option 3 land use plans (Plate NOP-12 and Plate **NOP-14**). Both of these sites have been determined by the EGUSD to have the level of feasibility to analyze in the Draft EIR.

The Revised Project designates a total of 1,469.5± acres as Open Space, which includes preserving the existing two vernal pool complexes within the Project Area. The proposed Rock Creek Parkway is expected to vary in width up to 300 feet wide in some locations and will contain separated roadways along the outer edge of the parkway. Rock Creek Parkway will include right-of-way for a future transit line, and a large swath of land in the center (designated as Open Space) which is intended to accommodate drainage as well as pedestrian/bicycle trails. Rock Creek Parkway will traverse the central portion of the Project Area and the trails of Rock Creek Parkway will connect with the trails of the recreated portion of Morrison Creek; the intent is to provide alternative modes of transportation throughout the Project Area. The Project also incorporates 162.2± acres of parks, dispersed throughout the Project Area. Finally, the Revised Project includes a land use designation of Open Space/Urban Farm for 476.3± acres, which in addition to open space uses, will allow community based agriculture and education within the Project Area.

EMPLOYMENT USES

The Revised Project provides for a mix of approximately 1,300.9± acres of commercial, employment and industrial land uses and 120.9 acres of mixed use. These uses are located throughout the Project Area in order to provide jobs and services in close proximity to residences. In addition, the land use plan has been designed around the 60 dB (decibel) Community Noise Equivalency Level (CNEL) contour line of Mather Airport. The Mather Airport Community Land Use Plan (CLUP) identifies land uses that are 'compatible', 'compatible subject to conditions' or 'incompatible' within specified Mather CNEL noise contours, which are based on guidelines for height, noise and safety near airports. The Mather Airport CLUP classifies residential uses as incompatible within the 60-65 dB CNEL. Due to these restrictions, the applicants have designed the land use plan to exclude residential land uses within this contour and place other land uses such as retail commercial, employment, industrial and open space uses. This results in a concentration of employment uses in the geographic center of the Project Area.

REQUESTED ENTITLEMENTS:

1. A **General Plan Amendment** to:

    a. Amend the Urban Policy Area (UPA) boundary south and east to include approximately 5,844 acres of the West Jackson Highway Master Plan Area (see Plate NOP-6). *Note: Approximately 69.3 acres of the Master Plan Area is currently within the UPA.*

    b. Amend the Land Use Diagram from Agricultural-Urban Reserve, General Agriculture, Extensive Industrial, Intensive Industrial, Commercial and Offices and Cemetery, Public/Quasi Public, to Low Density Residential, Medium Density Residential, Mixed Use, Commercial and Office, Recreation, Intensive Industrial, Extensive Industrial, General Agriculture, Agricultural-Urban Reserve, and Cemetery, Public/Quasi Public for approximately 5,913 acres (see Plate NOP-7). *Note: Amendments to the*

land use designations listed above will not affect the designation of the existing Aggregate Resource Area Overlay, which will remain in place.

c. Amend the Land Use Element and Land Use Consistency Matrix to add a West Jackson Highway Master Plan Combining Land Use designation.

d. Amend the Land Use Diagram to apply the West Jackson Highway Master Plan Combining Land Use Designation to the entire 5,913 acre Plan Area.

e. Amend the Land Use Diagram to include a Mixed Use Land Use Designation.

f. Amend the General Plan Transportation Plan to show proposed roadway alignments and transit routes as shown in the Transportation Plan Amendment Diagram dated April 2017 (Plate NOP-8). *Note: Changes to transit routes shown on the Transportation Plan do not require amendments to the General Plan Transportation Plan.*

g. Amend the Bikeway Master Plan to add on- and off-street bikeways as shown in the Bikeways Master Plan Amendment Diagram dated April 2017 (Plate NOP-9).

2. A **Community Plan Amendment** to:

a. Amend the Cordova Community Plan to add a West Jackson Highway Master Plan Overlay and apply it to the approximately 1,114 acres of the Master Plan Area located within the boundaries of the Cordova Community Plan.

b. Amend the Cordova Community Plan land use designations of the parcels located in the District 1 and District 2 Area Plans from Permanent Agriculture (AG-20), Limited Commercial, Light Industrial, Heavy Industrial, Industrial Reserve and Major Roads to West Jackson Highway Master Plan for approximately 1,114 acres (see Plate NOP-10). Note: Amendments to the land use designations listed above will not affect the designation of the existing Surface Mining Combining Zone, which will remain in place.

c. Amend the Vineyard Community Plan to add a West Jackson Highway Master Plan Overlay and apply it to the approximately 3,777 acres of the Master Plan Area located within the boundaries of the Vineyard Community Plan.

d. Amend the Vineyard Community Plan land use designations of the parcels located in the District 1 and District 2 Area Plans from Permanent Agriculture (AG-20), Permanent Agriculture (AG-40), Permanent Agriculture (AG-80), Permanent Agriculture (AG-160), Agricultural-Residential-1 (AR-1), Agricultural-Residential-2 (AR-2), Shopping Center,

Light Industrial, Heavy Industrial, and Industrial Reserve to West Jackson Highway Master Plan for approximately 3,777 acres (see Plate NOP-10). Note: Amendments to the land use designations listed above will not affect the designation of the existing Surface Mining Combining Zone, which will remain in place.

3. Adoption of the West Jackson Highway Master Plan for approximately 5,913 acres.

4. Adoption of the District 1 Area Plan including a Land Use Diagram, Design Guidelines, and Development Standards.

5. Adoption of the District 2 Area Plan including a Land Use Diagram, Design Guidelines, and Development Standards.

6. A Rezone to change the zoning designations within designated properties to Special Planning Area (Plate NOP-11).

7. A Development Agreement for the District 1 Area Plan by and between the County of Sacramento and Teichert Land Company.

8. A Development Agreement for the District 2 Area Plan by and between the County of Sacramento and Granite Construction Company.

9. Adoption of a Public Facilities Financing Plan for West Jackson Highway Master Plan that includes a Capital Improvement Program and Financing Plan.

10. Adoption of an Urban Services Plan for West Jackson Highway Master Plan.

11. A Water Supply Master Plan Amendment to amend the Existing Zone 40 Water Supply Master Plan to include provision of water service to the West Jackson Highway Master Plan Area.

12. Approval of the Water Supply Assessment for West Jackson Highway: Required by the California Water Code to link land use and water supply planning activities.
